President, Mr. W. Tate, M.P.; vice-presidents, Messrs. C. Barry, Clarke, and L'Anson; honorary secretaries, Mr. Wyatt Papworth (in place of a gentleman proposed by council) and Professor Donaldson (foreign correspondence); ordinary members of council, Messrs. Christian, C. F. Hayward, Edmeston, Marzable, C. G. Nelson, Pearson, South; (new names) Blomfield, Curry, C. Fowler, E. W. Godwin, Hakewill, R. J. Johnson (New Castle-upon-Tyne), Worthington (Manchester), and Bryon, Edinburgh; treasurer, Sir W. R. Farquhar; honorary solicitor, Mr. F. Ouvry.

Mr. Henry Baker was placed on the District Surveyor's Examination Board in lieu of the late Mr. Ashpitel.

SALISBURY CATHEDRAL RESTORATION.

A REPORT from the dean and chapter has been laid before the cathedral restoration committee. The following is an abstract from it:—

"The restoration of the exterior of the cathedral, commenced by the dean and chapter in 1863, and continued since 1864 by the aid of a public subscription, is at length on the eve of completion.

The first operation was to consolidate the foundations with fresh concrete. The stonework was then repaired or renewed; a channel, coated with Portland cement, was carried round the building, and the whole was effectively drained. At the same time the earth, which to the height of between 2 ft. or 3 ft. had been heaped up against the walls, was cleared away. The plinth and base moldings of the edifice being thus uncovered, its architectural effect has been strikingly improved. The surface of the churchyard has since been lowered to the same level by the dean and chapter, from funds at their own disposal."

On a careful survey of the exterior, it was found that most of the flying buttresses were in a dangerous state. Some of them have been entirely rebuilt, and the rest have been substantially repaired. The finials, pinnacles, parapet copings, and mullions, throughout the building, many of them in a state of dilapidation and decay, have been made good. The decayed shafts, capitals, and bases of the numerous windows have been thoroughly restored. These were originally of Purbeck marble, a material pecuniarily liable to decay. It was therefore resolved, by the recommendation of Mr. Scott, to employ in repairing them a variety of the Devonshire marble, as being more durable and less costly than the Purbeck. The juxtaposition of these two kinds of marble, differing as they do in external appearance, offended the eye. In order to soften the contrast a process of rubbing and oiling the surfaces of both is now being employed, under the sanction of Mr. Scott, with a view of assimilating, as nearly as possible, the colour of the new to that of the old material. The result of the experiment has, thus far, been highly satisfactory.

We next come to what was justly considered the most important part of our great work—the strengthening of the tower, and the ensuring thereby the safety of the noble fabric itself. The grand object was to strengthen loading the piers in the nave. This object has been fully accomplished by means of an ingenious and elaborate system of iron ties, devised by Mr. Shields, the eminent civil engineer, whom Mr. Scott had called in to assist him in this delicate operation."

The interior of the tower having also been restored,—

"Attention was next directed to the west front, every part of which stood lamentably in need of renovation or repair. The stone and marble work throughout has been restored, and the enriched moldings of the porch, on which a great deal of time and labour has been bestowed, are now far advanced. The restoration of the west front could not be regarded

as complete without an attempt being made to replace a portion, at least, of the statues that anciently adorned it. The late Professor Cockerell has stated that there were originally on the exterior of the cathedral 180 figures, of which 123 stood on the west front. From a minute examination of them it was inferred that the whole series of the west front formed what is termed a *Te Deum* or theological schema.

In accordance with this was the plan of restoration proposed by Mr. Scott, and by his advice entrusted for execution to a sculptor of rising reputation, Mr. Redfern. The work, begun about two years ago, and still in progress, may be thus briefly described:—In the panel of the great gable of the west front is a colossal figure of our Saviour, seated in majesty. Ranged in successive tiers below this grand central figure there will be in the first tier figures of angels; in the second, of prophets and patriarchs; in the third, of apostles and evangelists; in the fourth and fifth, of saints, martyrs, and founders. It will be observed that in this plan apostles and evangelists are placed below prophets and patriarchs. The remains of two figures, those of St. Peter and St. Paul, proved that this must have been the order in which they originally stood, as, in fact, both the number and distribution of the niches admitted of no other arrangement.

Of the entire number of statues required to fill the niches of the west front, about fifty will soon have been fixed in their places, exclusive of eight ancient mutilated figures which have been restored by Mr. Redfern. For the further prosecution of this portion of the work there are no available funds."

The surplus in the hands of the treasurer may be estimated at 3,900*l.* With so inadequate a sum at our command it would be idle to attempt so costly an undertaking as the entire restoration of the exterior. The lady-chapel may be considered the fittest part of the work to be first taken in hand, as the cost of its restoration, according to an estimate approved by Mr. Scott, will not exceed the limits of our resources."

The committee having, at the meeting just held, decided on the restoration of the lady-chapel, that work will be immediately commenced.

From the financial statement appended to the report we learn that the subscriptions for the general and special objects of the restoration, together with the interest, amounted to 16,525*l.* 15*s.* 8*d.*

THE CHAPEL OF ST. JOHN'S COLLEGE, CAMBRIDGE.

THE new chapel was opened on Wednesday last. St. John's College was originally a hospital for poor and infirm persons, and certain religious brethren under the rule of St. Augustine.

Bishop Balsham, of Ely, in 1280, attempted to add to the old institution a college for scholars on the model of that just then established at Oxford by Walter de Merton. This, however, failing, owing to alterations arising between the members of the old and new foundations, he removed, in 1284, his college to where Peterhouse now stands, and the old hospital of St. John, reverting to its former position, continued unmolested till the reign of Henry VII., when the Lady Margaret, the king's mother, determined to convert it into a college, which was effected under her will by her executor, Bishop Fisher, between the years 1509 and 1516, in which latter year the chapel was re-consecrated. This chapel—a not very decorative building—apparently of the sixteenth century, being found very insufficient for the present demands of the college, it was some few years back determined to rebuild it, and Mr. G. Gilbert Scott was appointed the architect.

Finding the old chapel to be in reality the chapel of the original hospital, and to be a building of the latter portion of the thirteenth century transformed into a sixteenth century structure, the architect proposed, as an alternative scheme to designing the new chapel, that the old one, restored, so far as possible, to its original design, might form an *aisle*. This, however, being considered hardly compatible with the practical uses of a college chapel, was not adopted, and a wholly new chapel was determined on.

The form adopted is one which, though frequent in Oxford, had not hitherto been adopted in Cambridge. It is that in which the ante-chapel forms a kind of western transept. This happened to be peculiarly suitable to the position of the new chapel; and, as it originated at Oxford in the incomplete cruciform church which forms the chapel of Merton, it may not be inappropriate (though the association was accidental) to a college in the sister University of which the earliest scheme was founded on the model of Merton.

The chapel proper is internally 143 ft. long by 34 ft. wide, and is terminated with an apse of five bays. The ante-chapel is 78 ft. by 32 ft. The extreme length of chapel from east to west outside is 193 ft. 1 in.; breadth, north to south, 52 ft.; extreme length of ante-chapel from north to south, 89 ft.; breadth, east to west, 50 ft. The exterior height of the chapel is

50 ft. to the top of the parapet, 80 ft. to the ridge of the roof. The tower is 42 ft. square outside; its height is 140 ft. to the top of the parapet, and 163 ft. to the top of the pinnacles.

In the demolition of the "labyrinth," the curious chapel of the Old Hospital of Canons Regular, founded A.D. 1134, to which the college succeeded, was revealed. Its stylo is the earliest type of Early English. An account of it has been published by Professor C. Cardale Bingham. The arches of its piscina have been placed in *memoriam* in the new chapel.

The stalls lately in the old chapel have been transferred to the eastern division of the choir.

The style of architecture adopted is not that of the period of the royal foundress of the college, but that of the age of its intended founder, Bishop Balsham; which is, in point of fact, the precise style of the earlier portions of the old chapel: for, though it is hardly to be supposed that Balsham erected the chapel during the short period of his abortive lordship of the college, 1280-1284, it is, nevertheless, probable that the impulse given by his intentions may have led the authorities of the Hospital of St. John to re-erect their chapel; for the character of the old parts which remain is just that of Balsham's time.

The closest types of the architectural details of the new chapel may be said to be Newstead Abbey, and the nave of Lichfield.

When the design was first made, no tower was contemplated, but only a *flèche*, at the intersection of the roofs of the chapel and ante-chapel,* but shortly after the commencement an old member of the college, Mr. Henry Hoare, who had laid the cornerstone of the building, made the munificent proposal—contingent on his living long enough to carry it out—to erect a tower similarly placed to that of Merton, at a cost of about 5,000*l.* Mr. Hoare's lamented death, the result of an accident, cut his generous intention short before the work was quite half complete, but the college undertook the perfecting of his undertaking.

Internally the chapel is roofed with an arched ceiling of oak, which has been splendidly decorated by Messrs. Clayton & Bell.

It consists of nineteen bays. In the central bay at the east end is a representation of Our Lord in Majesty. The other eighteen bays contain figures of illustrious of the eighteen Christian centuries after the first century, each bay being appropriated to a century. The centuries proceed from east to west: the even centuries on the north side, the odd centuries on the south side.

The known cost of the chapel up to the present date may be roughly stated at 53,000*l.*, not including the cost of the organ or of the painted windows.

The reconstruction of the organ, including the water-blowing apparatus, has involved an expenditure of 1,130*l.* The question of the case is not yet settled.

The painted windows are the gifts of various donors. The five windows of the apse are the gift of the Earl of Powis, High Steward of the University. The great west window is the gift of *Members of the College in statu pupillari*; and cost 1,510*l.*

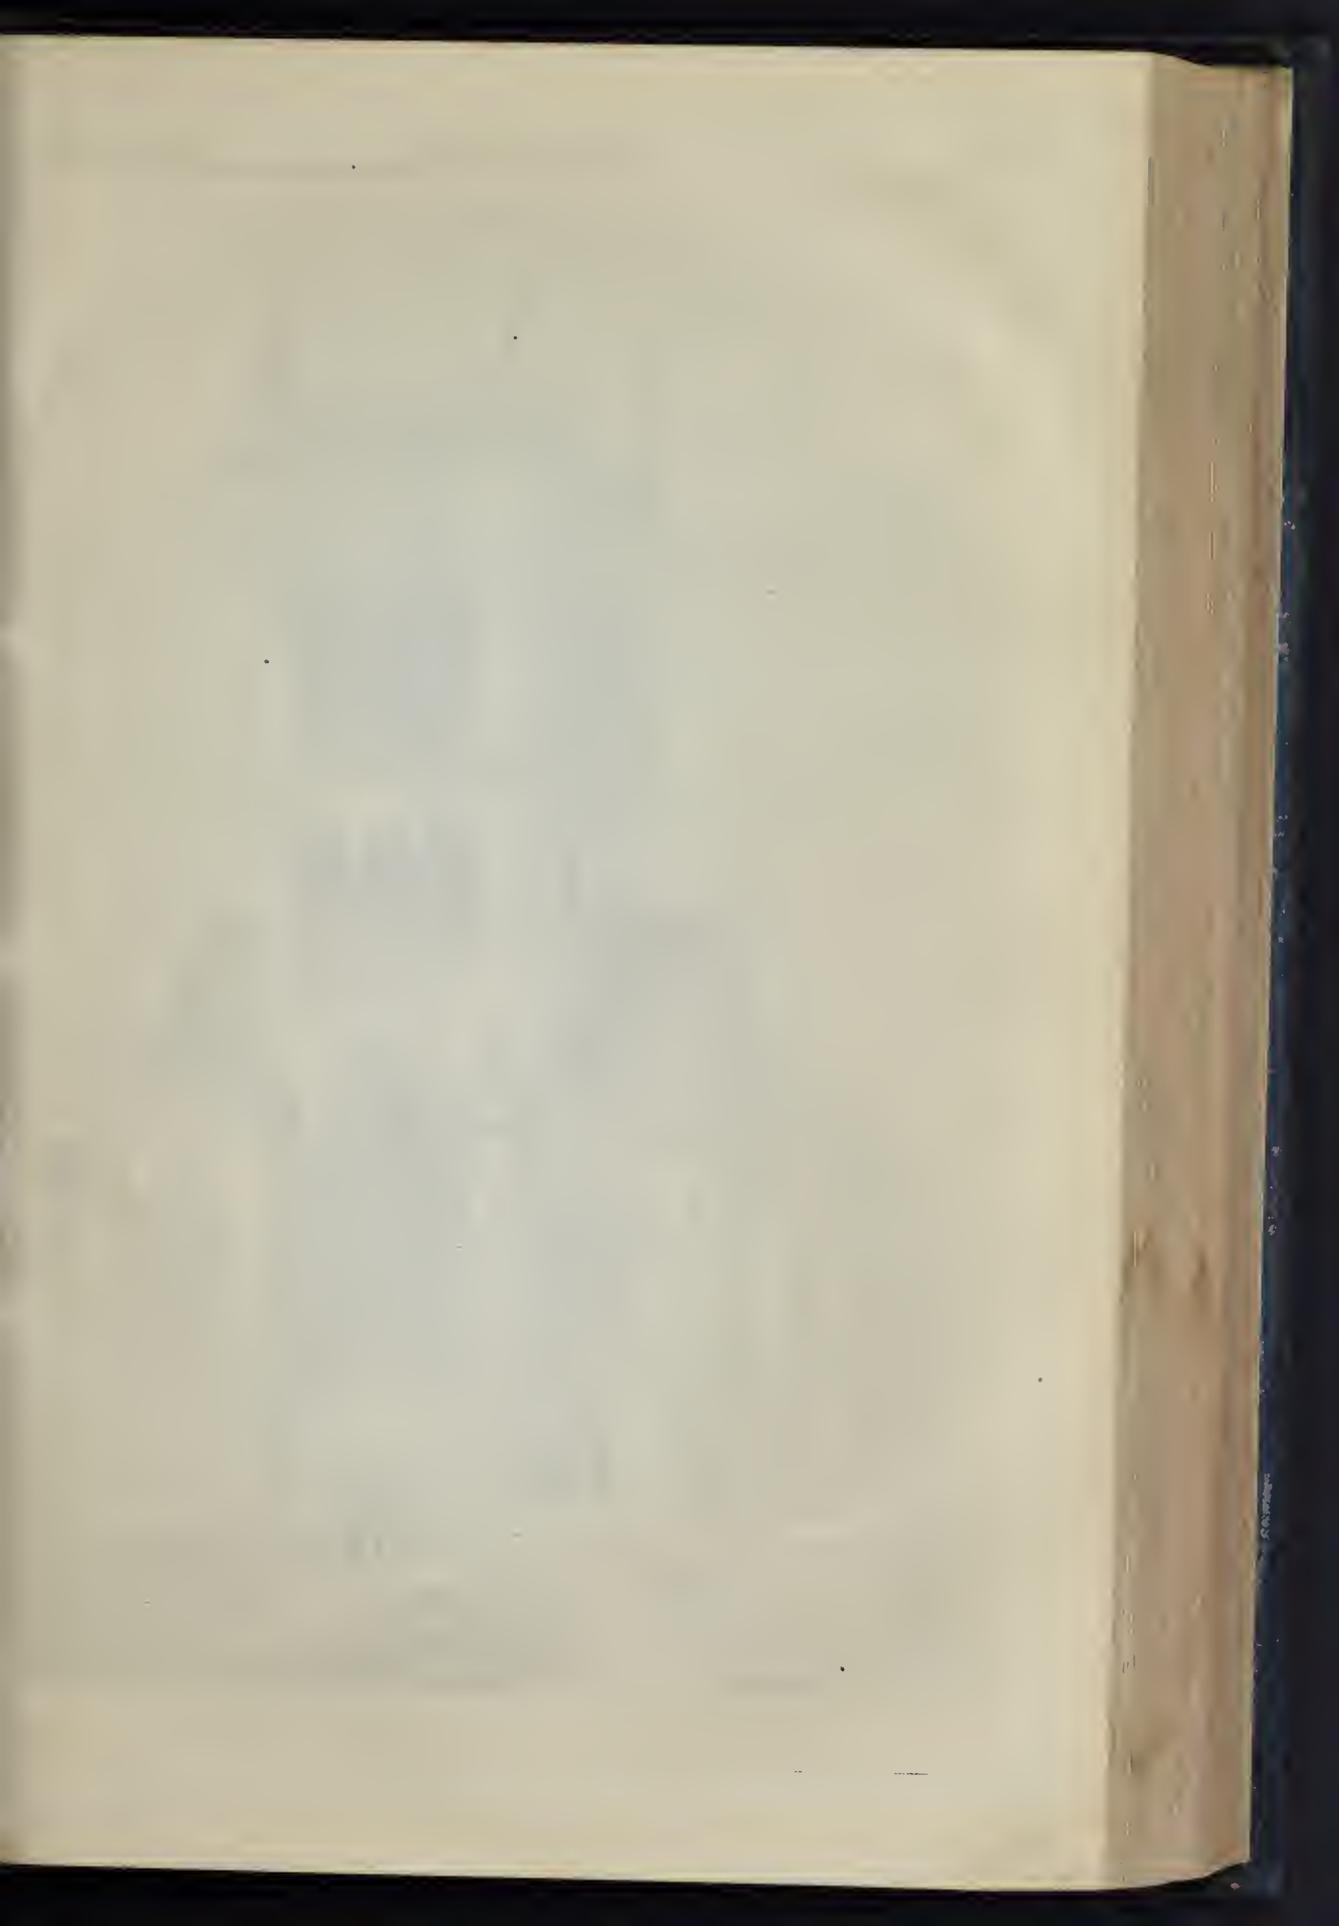

The six following side windows of the choir of the chapel are ordered at a cost of 276*l.* each.

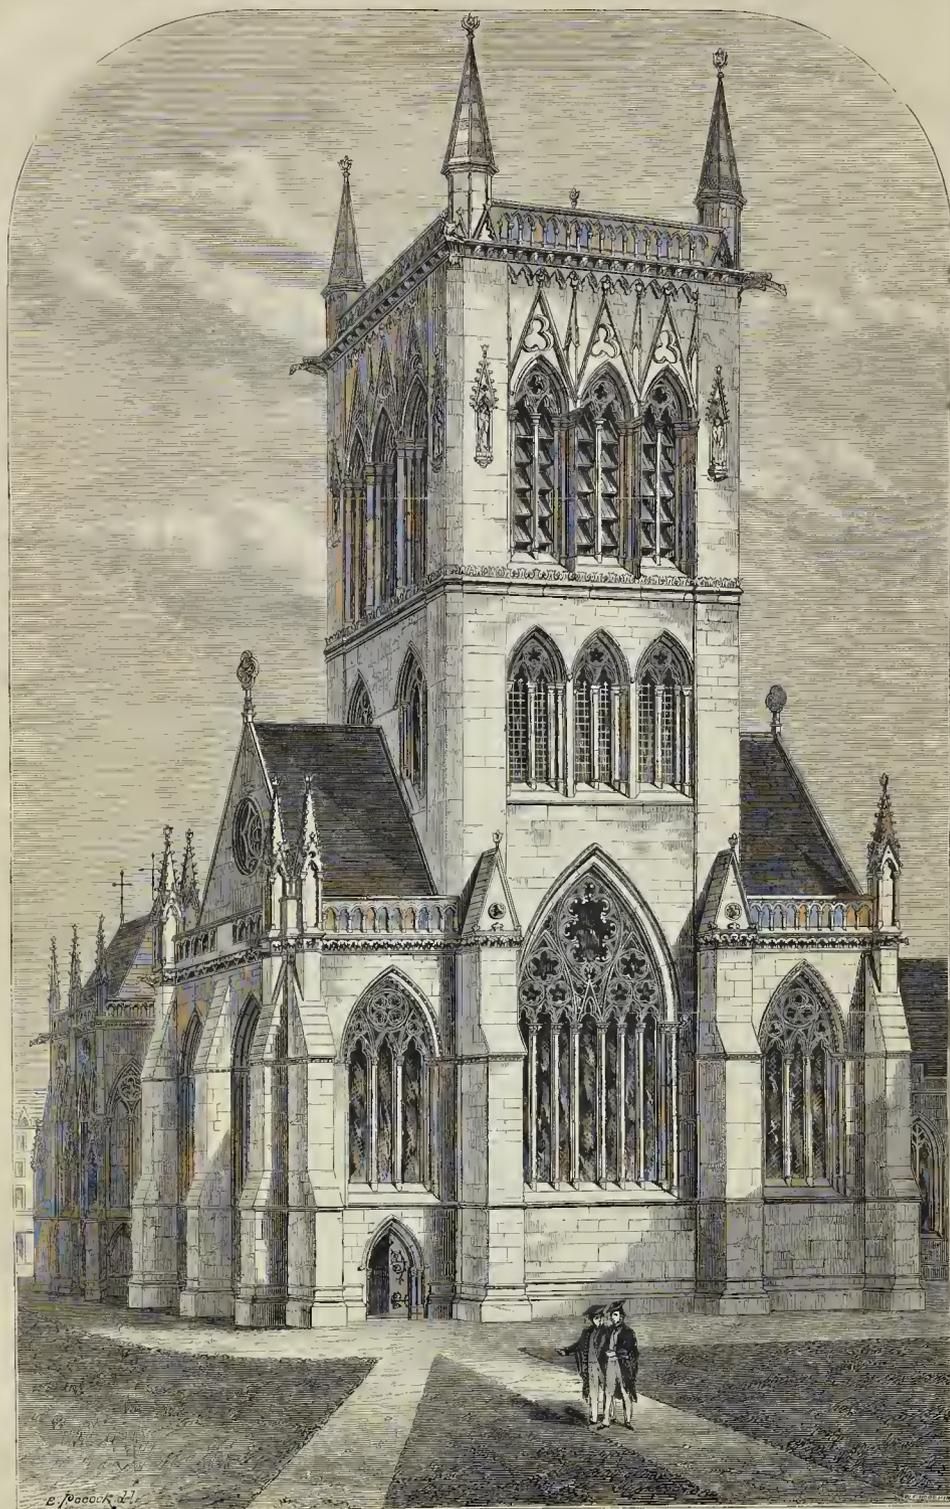

The erection of the chapel has occasioned the erection of a new master's lodge, the extension of the Great Hall, and that of the old gallery of the college—a noble Jacobean apartment, henceforth to be used as the "Combination Room," or withdrawing-room of the fellows.

The following are the names of those who have been concerned in the erection:—contractors, Messrs. Jackson & Shaw, Westminster; stone carvers, Messrs. Farmer & Brindley, London; wood carvers, Messrs. Rattee & Kett, Cambridge; glass painters, of the apse windows, the great west window, and the side windows in the chapel, Messrs. Clayton & Bell, London; of the window in the north transept of the ante-chapel, in memory of Professor Blunt, Messrs. John Hardman & Co., Birmingham; of the two windows to be placed in the north transept of the ante-chapel, in memory of Dr. Tatham, late master, Mr. Wallis, Newcastle. Organ-builders, Messrs. William Hill & Son, London; clerk of the works, Mr. W. M. Cooper.

We have no hesitation in placing the interior of this building amongst the most successful achievements of Mr. Scott.

* The design as at first arranged will be found in our vol. xxi. (1863), p. 225. We now give an interior and exterior view of the building as completed.

THE CHAPEL OF ST. JOHN'S COLLEGE, CAMBRIDGE: WEST FRONT.
PROFESSOR G. G. SCOTT, R.A., ARCHITECT.

THE CHAPEL OF ST. JOHN'S COLLEGE, CAMBRIDGE: INTERIOR, LOOKING EAST.

THE TRADE-UNION REPORT AND THE BILL FOUNDED THEREON. WHOM DOES IT CONCERN?

Sir,—Since I addressed a few thoughts to my fellow-workmen on the dangerous tendencies contained in the Report of the Minority Commissioners, a Bill based on these conclusions has been presented to Parliament. Feeling great interest in the question, I have in my rambles about London made inquiries as to the opinions of workmen on the above important matter, and I have found in a majority of cases they did not know of the existence of the Report, or anything of the Trade-Union Bill. And yet we are supposed to live in a reading and thinking age. I therefore could not but ask myself the question, Whom does it concern?

Did I not know that this subject was one of vital importance to both master and man, I should not have troubled you again. It would appear that our country, which has been up to the present time so far ahead of all nations in the industrial arts, had determined to let other nations who are yet young in the race carry away the industrial prize. The apathy of all classes in relation to the trade-union question is a potent sign that Englishmen are oblivious to the consequences which will ensue on the passing of a Bill based on one of the most absurd and inconsistent reports ever presented to Parliament.

The apologists and supporters of trade societies would, if they were able, make them universal, and the Bill is at least a long step in that direction, and if carried in its present form will give power to a class of men who have disregarded liberty and justice when in opposition to their so-called interests.

One of the very strange things in connexion with it is that the promoters and supporters of the Bill class themselves as ardent supporters of civil and religious liberty, and yet offer to the House of Commons a measure to suppress all rights of a large portion of the people. It is high time the working men of this country were taught the true bearing of the labour question, as they now are pursuing the shadow and are fast losing the substance. The report of the minority informs the world that the operations of unions have had no depressing effect upon the trade of this country. In last week's papers I noticed the members of various working men's clubs had been visiting the new St. Thomas's Hospital, and an address was delivered on its special features. I have no doubt as to its being highly interesting, but one explanation appeared to be wanting to clear away the mist which now obscures the working men's industrial vision. In my opinion, no part of the address would have been of greater importance than that relating to foreign industrial competition, as illustrated in the progress of the building,—the ironwork for it is sent from Belgium, and the joinery from Sweden,—and the causes which have led to such results. There is nothing the working men want at present more than plain-speaking; they have been flattered too long, and their eulogists have led them to believe that they are and always will be at the head of the world in manufacturing productiveness, and that the labour of one Englishman is worth that of two or more foreigners. At any rate, an opportunity appeared to have been lost to enforce upon working men the necessity of being cautious in their dealings with capital, and not, like the calf, quarrel with "their feed of hay because it is not clover." The iron trade is, and has been for some long time past, in a depressed state; thousands of moulders and others have been out of employment; and, without some alterations take place, the ironfounders' trade society will not be able much longer to meet the demands upon it. The building trade is certainly not in a flourishing condition. Workmen in that trade have been led to believe there was no limit to their demands if they were well combined; and all they had to do when the society was consolidated, was to knock at the employers' door and receive an advance of wages, and exceptional circumstances have lent aid to that fatal supposition. How often is one obliged to hear from workmen who have never read or thought for a single moment on the causes which affect the rate of wages, or the forces at work to counteract their combinations, that if they were thoroughly united they could do whatever they pleased. It appears that whatever is granted to the demands of the unionists, it is but the prelude to other requirements. In fact, they are looking for the trade

millennium, when there is to be eight hours' work, eight hours' play, and 8s. per day. Unions are not defensive, but aggressive associations; and, if the destruction of the trade of the country is not aimed at by those who govern, and we do not exactly know what follies they will commit, this we know, they are frittering away valuable time upon a question which involves nothing in comparison with the education of the masses on industrial and economical subjects. Whilst they are quarrelling over the few millions of pounds involved in the disendowing a branch of the national church, the industrial sway is gradually, but surely, slipping away from us, and doctrinaires are proposing schemes to hasten it on, and Government, it is said, will not oppose. It is a fact not to be denied that not only are foreign nations supplying their own wants, but they are outselling us in our home markets, and are extending their forces to other countries. The strides they have made in all branches of industry are far greater than those of England. The Paris Exhibition showed that in most cases they were on a level with us, and where beauty of design was required we were far behind. It is said there are none so blind as those who will not see, and that appears to be the case with the Minority Commissioners, as most of the cases they have cited in support of their theory, and as hearing on production, are fallacious, and not founded on experience, and are still further calculated to mislead those who will not see the practical results of our past industrial policy and example. The glass trade is one chosen as illustrative of the advantages which unions confer. The members of that trade enforce their rules with great strictness, limit apprentices, and boast of how much they yearly pay to their members out of the wants of the community, regulate the demand, and fix an extra price for their produce: they at once clash with the demands of the public, whose interest is to get their article at a marketable price, and, if not produced here, the trade goes elsewhere. Under trade restriction, the glass trade languishes in this country, and a large part of the glass used is the product of foreigners, whose business is flourishing, and is daily enlarging its borders. I find I have again outrun my intentions, and have not said all I intended at the beginning of this letter; but feeling that this question does concern the nation, and is of vital importance to our good name and commerce; and as I know the readers of the *Builder* are thinkers; I hope a working man's plain-speaking will cause them to perceive the ultimate issue in regard to the above questions.

JACK PLANE.

THE SOCIAL POSITION OF THE PROVINCIAL ARCHITECT.

Sir,—The social position of the provincial architect "is a most trying one to that generally unfortunate individual. As one of the class, I wish to put upon record a few of my own experiences as some small contribution to the history of architectural revival in this nineteenth century of our Lord. I will pass over my preparation in London for the practice of what I considered the noblest profession, simply stating that I was regularly articled to a gentleman standing high in the profession—a gentleman, too, by birth and education. I had, I believed, made the most of my time: had attended Professor Donaldson's lectures; worked at the Architectural Museum when it found shelter in Cannon-row, Westminster; and had been a student of the Institute. One day in autumn I found myself some two hundred miles from the metropolis, with unlimited funds of hope, some amount of self-complacency, and the very highest opinion of my own calling. From circumstances over which I had no control, I did not set up my carriage; I did not even take the lease of a good-sized professional-looking house, and furnish it with that comfort, combined with elegance, which ought to have at once stamped me as one who could design an edifice possessing those attributes. Thus you will perceive, sir, that I had nothing but my profession to give me any social standing whatever. From the introductions given to me, I was soon thrown amongst well-to-do doctors, lawyers, and country squires, as well as yeomen, and that highly-intelligent class who enlighten their fellows when they sit in solemn council as aldermen. I was not long in discovering that I was looked upon as a queer fish,—neither one thing nor the other: am-

phibious probably. They could not get me to swim easily in trade, and they would not let me walk side by side with professions. John Jones, the mason, had two years before writ in bold characters on brass "architect." Truly John Jones wrote a peculiar hand: his English was oftentimes questionable; but what of that? There were two architects in the town, and were not their names William Surde and John Jones? Was it to be supposed for an instant that any father claiming any standing would have dreamed of making his son an architect, and only equal to John Jones? The thing was too ridiculous for a dream,—too horrible for a nightmare. Those who professed friendly feelings for me were candid enough to express their wonder at my following such a "business;" and one day whilst dining with an old gentleman headwinded in a most parental manner to give up my "trade" and take to medicine or law as more fitting for a man of any education whatever. I explained that a professor of architecture was no tradesman, that he was as good as any doctor, lawyer, parson, or independent gentleman; that from the nature of his profession his general acquirements were, or should be, greater; that as a rule his education had been as good; that travel should have enlarged his mind, and the study of the ancient monuments enriched it with a knowledge of the most enlightened peoples who had inhabited the globe. All this, however, went for nothing in the face of John Jones being an architect. Where was his education? Where was his travel lore?—and yet I could not unarchitecturalise him. The fact is, John Jones entirely put out my light socially, not by shining brighter, but by the density of his smoke; and at the present time there is a good deal of the same sort of smoke dimming many another professional light, not necessarily architectural. I fear, sir, we must for some time bear our evils patiently. It certainly is annoying to have to meet John Jones,—to have to listen to the chairman of a committee whilst he calls your attention to matters of detail in your plans which John Jones declares are mistakes; that your roof will not stand, because the tie-beam is not of sufficient scantling to keep up the king-post; that this beam does not require trussing, and that that chimney will not draw because it is too high. It is even worse if you are a young man, and happen to attend the hunt or Infirmary ball, to be coldly informed by Dr. Femm's pretty daughter that "Thanks; I'm quite full," and then to see that snob, Quillet, the conveyancer, lead her off in triumph. What use is it that you can talk Blacklows, the curate's, head off when his social status is looked upon as so superior to yours by both the wife and daughters of William Bohbin, esq., that you cannot get listened to. Besides, it is dangerous for a man who is so looked upon to show that he knows more than he is given credit for. Such a course ensures a certain amount of snubbing.

There are many arguments, no doubt, which might be used to prove that architects are no worse off than painters or sculptors; that they have no right to wish to take higher ground than either. Undoubtedly any one can call himself a painter or sculptor as easily as he can an architect; yet we do not hear any cry out from either of those professions, whereas it is a well-known fact that few men are so illiterate as a body—few men more egotistical. The reason is clear enough. Painters and sculptors have not to meet their patrons face to face as architects have; they fly at high game, fame and future, or obscurity and death; they choose to live in a world of their own, and they can do so—an architect cannot. He can no more live without seeing his client than a surgeon can perform an amputation without seeing his patient; hence the necessity of social intercourse, and hence his feeling of humiliation when treated otherwise than as a member of society whose acquirements entitle him to those amenities so readily accorded to the three acknowledged professions. I have found that it is only amongst certain classes that architects are looked upon as socially inferior to men who have chosen physic, law, or the Church; that class who really are able to give good commissions—the aristocracy,—those of the public who are better acquainted with the nobility of our calling than any other section, never behave otherwise than courteously, do full honour to our art and to us. Knowing this, we can either go on our way rejoicing, careless of the little slights of ignorance, doing our duty, and proving ourselves inferior to none by behaving like gentlemen, or we must firmly close our doors, diplomas must be granted, and

granted only after such a course of training as will convince the public that there is more in architecture than a name. But we cannot blame the public for the non-appreciation of a thing of which they know nothing. We must look upon ourselves as a small army who have flocked to the standard of a fair but unknown virgin. We have sworn to uphold her fame and to prove her fair, and we have chosen no easy task. We are often looked upon as simple enthusiasts, a sort of rabble without generals. Our leading men, except to a few initiated, are unknown, whereas a galaxy of famous and world-renowned men dazzles in any other profession. In time, and as we become a wealthy and striving portion of the community, our influence will be felt. When the wills of our most successful brethren shall have been proved at not less than six figures, as I have no doubt they will be, the moral influence in this money-getting country will be soon apparent. Most of us at present are looked upon as needy and seedy; but go to any town you like, be the population three thousand or three hundred thousand, you will find one or more wealthy men who have made their fortune by their profession. In how many towns do you find architects similarly situated. This sets me a moralizing: so I leave the continuance of the thought to others, and will close this by saying that, as a profession, we owe you, sir, much. The high character of the *Builder*, its wide circulation, and its readiness at all times to advance our just claims, have had great and due weight with the reading and learned community, and no doubt its usefulness to us will continue to increase, and thereby elevate our "social position." B. M.

THE FUTURE OF BRICKWORK.

I HAVE read with much interest the article in your last impression of the *Builder* on "The Future of Brickwork," and am fully impressed with the idea that a new era is dawning with regard to the internal and external decoration of buildings. I believe the time is not far distant when glazed surfaces in a rich variety of colours will supersede the present mode of "daubing" with cement and stucco, which not only in many instances offends the eye, but has to be renewed periodically, like a cast-off garment. I am further convinced of this from the fact that an indestructible glazed surface can at the present time be produced on bricks, in various tints, made of common red clay. I have myself been experimenting for several years with the various red and fire clays of England and Scotland, and have produced a durable red, black, white, blue, green, and yellow, which I have laid on the bricks in the clay state, by which means I save the cost of twice burning. I may also say, that the expense of producing bricks by this process will not exceed 10s. per 1,000 over the cost of ordinary pressed bricks. Doubtless others have been, and are now, experimenting in a similar way, which will probably lead to a complete revolution in the decoration of public and private buildings. The great point to be attained is to produce a glazed surface of varied colours on the same material at a price which will compete with the present mode of embellishment. When that is accomplished, I believe architects will only require to see it in order to adopt it universally.

ALPHA.

THE IMPERIAL GAS COMPANY'S BILL.

THE Metropolitan Board of Works, in a "Statement of the Course taken by the Board with regard to the Imperial Gas Company's Bill now before Parliament," after pointing out the objections stated on their behalf, and the amendments urged in committee on the Bill, go on to say:—

"The committee, however, found the preamble of the Bill proved, and at the same time intimated the extent to which they were prepared to amend the Bill, viz., to reduce the price to 3s. 9d. after the 1st January, 1871, making no alteration in the illuminating power; to limit the dividend on the additional ordinary share capital to 7 per cent. and on the preference capital to 6 per cent., and to strike out of the Bill the power to purchase or take on lease coal-mines and collieries."

On the committee declaring the preamble proved, and also adopting the somewhat unusual course of adding to it the express alterations which they intended to make in the clauses, and those amendments not comprising a public audit, an independent testing of gas, and proper provisions as to reserved fund and other important principles, it was obvious that the Board would have to present their views to the House of Lords; and, consistently with ordinary practice and prudence, it was important not to prejudice any step in the House of Lords by accepting a portion only of the required clauses in the House of Commons, but to seek the insertion of what might be

necessary in the House of Lords, where the whole question of preamble and clauses would be open. And the Board at once gave directions for a petition to the House of Lords, and this took place before the debate in the House of Commons on Wednesday last.

The Bill having now been referred back to the committee by the House of Commons, the Board propose to appear before them again by counsel, to urge the same points as before, viz., the expediency and necessity of applying to the Imperial Gas Company the terms and conditions imposed by the Act of last session on the companies supplying the City; and the Board earnestly trust that the result will be such as will be acceptable to the consumers."

It is earnestly to be hoped that the Imperial Gas Company will be compelled to improve their gas. The quality of it has long been disgraceful, and such as this Company would not have dared to impose upon the public by charging for at the rate they do had there been any actual competition. Even the Company must have been ashamed of it, for when their Bill came to be under consideration they immensely improved its quality, as I by this flash process they expected to blind the eyes of the gas-consumers, or the committee on their Bill, to their past misconduct, and ensure a clear way for its future continuance. To present the public with infamous gaslight such as theirs, at the price they charge, is little short of obtaining money under false pretences.

THE ARCHITECTURAL ASSOCIATION'S VISITS.

THE works selected for the out-door practical lessons which have been wisely established as features by the Architectural Association have been from time to time noticed in the *Builder*. On Saturday last the new bridge at Blackfriars and the Holborn Viaduct were chosen, and were visited by a party of between fifty and sixty members, including some well-known names. They were received at Blackfriars Bridge by Mr. F. W. Bryant, the resident engineer, and after inspecting the drawings, were shown over the works. The bridge, as our readers know, is of iron, resting on piers of solid masonry, and crosses the river in five spans, the centre one of which has an opening of 185 ft. with a height of 25 ft. above high water level. Its length is 1,280 ft., and its total width is 75 ft., the roadway being 45 ft., and the two pavements each 15 ft. wide. It is expected to be ready for public use some time in August. We have so lately given particulars that repetition is unnecessary.* After tendering their acknowledgments to Mr. Bryant, the party proceeded to the Holborn Viaduct. As this also has been so recently fully described in the *Builder* (see p. 320, ante), we will only remark that considerable time was spent, under guidance of Mr. Blashill, in viewing the subways and other practical features of this interesting work, and that the party separated at a late hour in the afternoon much pleased with the time so profitably employed. Since our last visit rapid progress has been made, and pipes are now being laid for the use of the Pneumatic Despatch Company beneath the viaduct. A new paragonage-house for the parish of St. Andrew, Holborn, is about to be commenced, Mr. Teulon acting as architect. This will stand close to the present church, and the site is now being prepared.

THE SEWAGE QUESTION.

ETON.—The Eton Local Board of Health have determined to adopt the report and plan of Messrs. Ripley & Simonds, architects, for the drainage of Eton College and town. The system adopted is the separate one, with the purchase of land for sewage utilization and irrigation. The cost is estimated at 8,000l.

MERTHYR.—The town of Merthyr Tydfil has fallen into the same difficulty which has entailed so much anxiety and expense to the local authorities of Cheltenham, Leamington, and other English towns—namely, not knowing what to do with its sewage. The Local Board of Health having expended 30,000l. in draining the town, discharged the sewage into the River Taff, but a Chancery suit was commenced against them by Mr. Nixon, a coal owner, and an *ad interim* injunction was granted to restrain them from discharging into the river. The suit is still proceeding, and the board have been discussing various schemes for getting over the difficulty. The valley at the point where the sewer discharges is so narrow

that not a quarter of the area of land necessary to receive the whole of the sewage is obtainable. Another scheme has been devised by the board's engineer, and adopted, which is, to continue the main sewer some seven miles further down the valley, to a point 4 miles above Pontypridd, where it widens considerably. Here there is a large tract of common land suitable for the purposes of irrigation, and which may be acquired on easy terms. About 400 acres will be required for the effective disposal of all the sewage of the town, and the cost of continuing the main conduit to this land, and preparing it for the sewage, is estimated at 20,000l.; but, on the other hand, it is calculated, from what has been done in other districts, that in the course of a short period the soil will have been so much improved by the application of sewage as to command good tenants at rents that will cover the outlay.

STROUD.—Mr. J. H. Groome, of Earl Soham, says, in a letter to the *Suffolk Chronicle*,—"My pastures, manured with 5 cwt. per acre of the Stroud sewage grass manure—a compound manure—of which the deposit obtained by the now well-known Stroud process is the basis, fully come up to their condition after like treatment in 1865 and 1866, and the experiment made in 1868, viz., laying down half an acre of land in permanent pasture, with the same amount per acre of the same manure and no other, is this spring quite as successful in its continuous growth as it was last autumn. The sewage of towns, treated by the process in use at Stroud, will be a cheap source of that which all farmers want—a really good grass manure."

PAVEMENT AND SLATE IN SCOTLAND.*

A SERIES of able and useful papers appeared, not long ago, in the weekly *Scotsman* newspaper, and we quoted from them at some length while they were in course of issue. They now form a goodly volume of about 500 pages, treating of coal-mines, the manufacture of iron and iron manufactures, shipbuilding, railways, plate and jewelry, manufactures in metals; woollen, cotton, linen, and jute manufactures; dyeing, sowing, muslin manufactures, fishing-nets, paper and paper-changings, floorcloths, leather, india-rubber, glass and earthenware, granite, freestone, pavement, and slate quarrying, brewing, distilling, sugar-refining, confectionary, preserved provisions, mineral oils and paraffine, printing and publishing, and fisheries. The volume is valuable.

We shall glean a few particulars from the paper on pavement and slate.

The pavement quarries of Caithness are of considerable extent and importance, and their produce has a world-wide reputation. The working of the quarries and the dressing of the stones constitute a considerable part of the industry of the county, employing more persons than any other kind of trade, exclusive of agriculture and fishing.

The Caithness flagstones belong to the middle formation of the Old Red Sandstone. Great numbers of fossil fish and plants are found intercalated among the flag-beds of commerce, having been buried in the ancient mud of the Old Red waters. These fossils appear on almost every slab of Caithness pavement, but although the fish remains lie by thousands, it is seldom that anything like a perfect specimen is got. However, they are beautiful in their ruin—their blackened, enamelled, and glistening scales and plates standing out in contrast with the sober grey of the matrix. The flag-beds have suffered much in geological ages from dislocations by "faults" and other causes.

Sir Roderick Macpherson says,—"The peculiar tenacity and durability of the flag-stones is due to the manner in which silica and alumina are cemented together by certain proportions of calcareous and bituminous (organic) matter."

As a proof of the durability of the Caithness pavement, a circumstance which occurred a few years ago is mentioned. A fire broke out in a building in Leith Walk, Edinburgh, and the hose for the engines was laid across the road. The ordinary traffic line being thus impeded, the cabs, carts, and wagons, some of the latter heavily laden, took to the footway, and the consequence was that for nearly 200 yards the sandstone flags—from the north of England and other places—were broken under the unusual weight, whereas a portion, several feet in width,

* "The Industries of Scotland," by David Bremner, Edinburgh: A. & C. Black, 1869.

* See p. 163, ante.

of the same road, laid with Caithness flags, here all the traffic without being injured.

The principal pavement quarries in the county are situated on a line extending from the parish of Orlig, on the shores of the Pentland Firth, to the parish of Reay, in the west—a distance of ten or twelve miles. Another run of pavement commences at the seaside four miles south from Wick, and extends westward to the parish of Halkirk, in the centre of the county. The first exportation of pavement was made from quarries on the Crown lands of Scarshater, formerly belonging to the bishopric of Caithness, and situated near Thurso.

The principal flagstone quarries in Caithness are those of Castlehill, which are worked by the proprietor, Mr. Traill, M.P., under the management of Mr. M. Benth, who has been in charge for nearly forty years. Although these quarries are the most important in the county, they are not the oldest.

The pavement quarries have had a marked effect on the wages of the labouring classes in Caithness, which have risen from 7s. or 8s. a week to from 12s. to 18s. There are no statistics of the quantities of pavement exported annually from Caithness, but it is roughly estimated that from 500,000 to 600,000 superficial yards are shipped every year, the value of which is from 70,000l. to 80,000l.

The date at which slate for covering houses came into use in Scotland is not known, but there is good reason for believing that it was at least three centuries ago. Though slate suitable for roofing purposes exists in various localities, the earliest used would appear to have been derived from the island of Easdale, which for upwards of 200 years has been one of the chief sources of supply. It is stated that among the ruins of a castle in the north of Scotland, which was built in the fifteenth century, fragments of slate similar to that obtained at Easdale were discovered. There is evidence that the Falconer's Castle at Appin was in 1631 roofed with Easdale slates. Ardmaddy Castle, a seat of the Earl of Breadalbane, built in 1676, was covered with slates of the same kind. In the latter case they were fastened with wooden pegs, and have withstood the tempests of nearly two centuries without requiring to be replaced. Of greater extent than the Easdale quarries, and of equal fame, though some years younger, are those of Ballachulish. The other slate quarries in Scotland are not of much account.

Easdale forms one of the group of small islands which skirt the coast of Argyll between Crinan and Oban, and lies close to the south-west point of the island of Seil.

Mr. John White, who was manager of the Easdale quarries for upwards of twenty years, gives an account of the disposal and character of the slates. He says:—

"The slate-heads appear in two seams, which are much contorted throughout the whole extent of the island. These seams are made up of different beds, ranging in thickness from a few inches to many feet, like our sand-stones and limestones, but frequently so closely united that only a practised eye can detect a line of contact; whilst the superinduced phenomenon of cleavage constitutes a distinct dissimilarity between them and the other rocks referred to. It may be noticed, as an indication of a sedimentary character of these slate rocks, that there is a decided difference in the quality of the upper and lower portions of the thicker beds, the former being fine grained and smooth, and the latter coarse and gritty—the feature which we recognise as ensigns to that exhibited by other rocks of sedimentary origin."

The slate-seams extend across the channel, 150 yards in width, which separates Easdale from Seil, and crop up on the shore of the latter island, where they are worked at two points, known locally as the Ellenabeich Quarries.

The principal quarry at Ellenabeich is about 450 ft. in length, 250 ft. in width, and 160 ft. in depth. The Windmill Quarry in Easdale is 250 ft. in length and breadth, and 120 ft. in depth. Two powerful steam-engines are employed for raising the material and keeping the quarries clear of water. About 300 men and boys are employed. The number of slates turned out annually cannot be less than from 7,000,000 to 9,000,000; the average from 1842 to 1861 was 7,000,000. Taking the value of the slates at the quarries to be 2l. a thousand, the total produce will, according to the lowest computation, be worth about 14,000l. a year. The slates are well known in the market, and command a ready sale—it being no uncommon thing to find above a dozen vessels, of an aggregate burthen of over 1,500 tons, waiting their turn for loading.

The Ballachulish slate quarries are situated in the north of Argyllshire, on the shores of

Loch Leven, about two or three miles from the scene of the tragic massacre of Glencoe. There are two quarries about half a mile apart. The slates are divided into four classes—viz., "duchess," "countess," "sizable," and "undersized." The first-mentioned are the largest, being 24 in. long by 12 in. broad; while the "countess" slates are 20 in. by 10 in. The other two classes are smaller. The number of men and boys employed is about 400, and 15,000,000 slates are turned out annually.

There are also slate quarries at Dunkeld, Luss, Aherfoyle, and Craiglea. Those of Craiglea are the most important. They are situated on the Logioilmond estate (the property of the Earl of Mansfield), and are about fourteen miles north-west from Perth. Under the skillful management of Mr. John White, who was manager of the Easdale Quarries, they are being opened up on an extensive scale. The slate vein is of excellent quality, and has this peculiarity, that, while one portion of it supplies slates of a dark blue colour, those obtained from the other portion are of a sea-green hue; but otherwise there is no appreciable difference between them.

CHURCH DECORATION.

ST. OLAVE'S CHURCH, Marygate, York, has been re-opened, after partial decoration. A design was prepared by Mr. J. W. Knowles, mural decorator, by whom the work has been carried out. Around the east window two borders have been painted, one on the face of the wall, and the other in a deep hollow which runs around the outer edge of the window. The former is composed of leaves and flowers alternately, buff and gold, on a sage-green ground, and the latter is of a pointed design, having one side brown and the reverse buff for a ground, and on which the pattern is red and grey. The wall spaces on each side of the window, as high as the cuspings of the lights, is covered with a quatrefoil diaper of sage-green, filled in with foliated crosses in red, and six pointed stars in gold. Across the top of this diaper work is a crested border of buff and gold on a deep red ground, and at the base a foliated one in buff and brown on a gold ground. The portion of the wall above this diaper is a diaper composed of lozenges of scarlet on a green ground, each lozenge being alternately covered with gold and pink *rose-de-lis*, and the cresting at the top of the rosettes is picked out in gold. The wall all round the church is painted 6 ft. high of a dull red, with an ornamental border, and the top edge of green leaves, divided at intervals by gold Maltese crosses and grey flowers. One side of a pillar (the rest of which are at present painted stone colour) has been decorated, and it has been proposed to extend this additional embellishment to the whole of the pillars at a future time.

THE TRADES MOVEMENT.

Trade Unions Bill.—At a recent meeting of the trades' delegates it was resolved that a large public meeting should be held in June, to give an opportunity to the operatives and others for a full discussion and declaration of opinion on this question. A petition to the House of Commons on the question of trade-unions has also been agreed to, disclaiming any desire for a relaxation of the criminal laws, while urging the need of legislation to give proper status to their societies.

Wolverhampton.—This town is now numbered amongst those—nearly thirty in all—where the stonemasons are on strike. The conditions to which they object are payment by the hour instead of by the week (though they are the only class of men employed by Wolverhampton builders who are not already paid by the hour) for the settlement of disputes between masters and men. The labourers have given notice of a demand for a rise in wages of 4d. per hour, which would make 4½d., their present pay being 4d. per hour. The masters refuse to grant the request, but both parties have agreed to arbitration. The relations between masters and men in the other branches of the trade are of an amicable character.

Manchester.—The board of arbitration being divided as to the disputes between the carpenters and joiners and their employers, Mr. Kettle, as umpire, decided:—"That the wages of car-

penters and joiners, of fair average skill, shall be from the 1st of May, 1869, to 1st May, 1870, 7½d. per hour, excepting for men working upon unprotected buildings, under rule 3; and carpenters and joiners working under that rule shall be paid 7½d. per hour, from the 20th October, 1869, to 20th February, 1870." Mr. Kettle decided against the application of the men for a reduction of the hours of labour. Between 600 and 700 unionist plasterers were to cease work on Saturday.

Bolton.—Mr. S. Pope, recorder, has consented to act as arbitrator between the master joiners and the men in their dispute. The masters, to the number of about 150, are still out.

Sheffield.—A meeting of the Master Carpenters' and Joiners' Association has been held, and the following resolution was unanimously passed:—

"That the members of this Association still adhere to the notice given to the operative carpenters and joiners to pay by the hour for the future."

A meeting of the master huddlers was also held, Mr. Rodley in the chair. It was stated that there were 27 bricklayers, 136 masons, and 70 labourers who had refused to continue at work on the hour system. The meeting unanimously resolved to adhere to the hour system, believing it to be alike advantageous to the men and an advance of wages, the masters would be spared a great amount of inconvenience, and the wishes of the general public would be met by substituting the hour for the day system. There are two other grievances the masters are desirous of having redressed. At present worked stone is not allowed to be brought into the town. The masters wish to be able to have stone worked at the quarry or where it is going to be used, and either by hand or by machine at their pleasure. In the carpenters' and joiners' trade the men will take piecework from their masters; in the masons' and bricklayers' trade they will not, and the masters wish this anomaly to be done away with. They are, however, quite willing to have all the points in dispute settled by an arbitration, if the men will consent to that course being adopted.

Bradford.—The unionists locked out have held a meeting to consider their position. Pleasure was expressed that the number of masons locked out was only 139, and not 250, as had been supposed. It was also stated that thirty-four masters, three of whom were connected with the association, will, as well as others whose names were not given, continue to employ their men as hitherto, regardless of the notice given by the Masters' Association, on the ground that the contracts they have in hand will not permit their doing otherwise without incurring serious inconvenience and loss. These masters, it was said, were at present employing no fewer than 800 masons, while the associated masters do not on an average employ more than twelve men each, and at the present time in the aggregate are employing only 139. From these alleged facts it was contended that the lock-out would not be of long continuance.

Glasgow.—The operative house-painters have struck for an advance of wages, from 6d. to 6½d. per hour, to commence on the 3rd of May. The ship-painters have made a similar request.

Crieff.—Some time ago, the operative masons of Crieff intimated to their employers that, on and after the 1st of May, they would work only nine hours a day. It seems that none of the masters replied to the request made, but at five o'clock the men dropped work, having completed nine hours. The result of the demand made was, that all the journeymen working at the Hydropathic establishment, and other large jobs in Broich-terrace, were paid their wages and "locked out;" but the dispute has terminated much sooner than was anticipated. It seems that according to the union rules the men acted irregularly in regard to the nine hours movement, which, together with the determination of the masters to resist the demand, brought the dispute to a close. All the journeymen resumed work on the old terms.

Kirkcaldy.—The masons, who have for some time past been engaged upon several large buildings in town and neighbourhood, have left off working. The rate of wages of late has been 5½d. per hour; the demand is now 6d. per hour. Employers have refused this. The proprietors of several of the large buildings which have been in progress are not in present circumstances inclined to push the contractors, so that there is little hope of the demand being speedily

granted. This movement on the part of the masons is also affecting very materially a number of labourers, joiners, plasterers, slaters, and others.

RUSSIAN, &c., GREAT BELLS.

Str.—Mr. Walesby, in his interesting notice of Moscow bells, from Dr. Lyell, has omitted to mention the largest bell now in use; and mounted high up in the (Kremlin) Tower of *Ivan Veliki*, about 300 ft. high.

This is called the *Belshoi* (Great) as the other is, the *Isor* (Royal) *Kolobok*. To the best of my recollection it weighs about 125,000 lb. English, and was re-cast about 1820, not many years after the wretched French retreat. (Is the asserted local "chime" to which the words "Those Evening Bells," &c., were adapted above forty years ago, forgotten?) There are many other bells in that tower; one of them called the *Belsotnoi*, weighing, if my memory serves me, about 27,000 lb., but the smallest except two or three.

In a penny publication I lately read of two large "turret bells" at *Cologne Cathedral*, giving their "Bonrdon" at funerals, as for Royal ones; at *Notre Dame*; weighing "two hundred and twenty cwt." This is, I presume, the united weight; and, if about equal, each would be a trifle heavier than our "St. Paul's."

Can any one guess the weight of the former "Siv" (in the time of Aldrich) great bells at *Christchurch*, Oxford, brought from *Osney Abbey*; to hear which chimed, it is said, foreigners had come down expressly from London?

Also, could Mr. W., as an accomplished campanologist, give us any cause for *five* being much the most accustomed (unless for small churches) or "orthodox" number before the Reformation? Almost the only instance of *sight* I have met with was in the "inventory" (of "goods") of *Peakesbury Abbey*.

J. D. PARRY.

TECHNICAL EDUCATION.

THE first annual meeting in connexion with the Manchester and Salford Building Trades Institute for Technical Instruction, which was established about twelve months since by the Amalgamated Society of Carpenters and Joiners, was held on Tuesday evening last in John's Schools, Garside-street. Mr. Isaac Holden, architect, presided.

The Chairman, in the course of his opening remarks, said that technical education at the present time was very different from what it was at the time when the axe only was used in the forest. Men had now to produce highly ornamental structures, not only in form and character, but they required skilful arrangement in order to give them strength and security. Technical education, therefore, became of the utmost importance to every artisan. Men pursued this knowledge not only for their own benefit, but for the benefit of their employers. Skilful mechanics were always in demand, and it was well that men should bear that in mind. He was pleased to find that this institution had been originated by the workmen themselves; and if they continued to work together they would form not only a powerful body of men of intelligence and ability, but a body of men capable of controlling their own destinies.

The number of members for the past year has averaged 62 per quarter.

THE ROYAL ACADEMY, BURLINGTON HOUSE.

Str.—On reading your description of Mr. Sydney Smirke's clever and well-arranged building of the new Royal Academy, it is to be regretted that, as shown by the plan, though there was a room assigned solely for architecture, the architects now should be deprived of that room, by having it appropriated to painting, although the painters have already the lion's share of the exhibition rooms. If the lecture-hall is for the future to be appropriated to architecture during the exhibition, I would ask whether the platforms could not be made moveable, as in the old Academy rooms and other buildings, as there is so much awatage room in the basement, and the architects would then have fair play?

A SUBSCRIBER.

GOOD DINNERS.

Royal Literary Fund.—The dinner in aid of this important corporation, which took place at Willis's Rooms on the 5th instant, under the presidency of Lord Stanley, was a brilliant affair. About 170 gentlemen sat down, and 60 ladies occupied settees at the end of the room. Lord Stanley pronounced a warm eulogium on the institution. The Hon. W. Egerton, M.P., Sir John Burgoyne, Capt. Sherrard Osborne, Viscount Strafford de Redcliffe, Mr. Reverdy Johnson, Lord Justice Gifford, Mr. A. Trollope, Sir John Simeon, Professor Blackie, and others, spoke. Mr. Godwin, as a member of the committee, announced that the donations amounted to about 980*l.*, and the Chairman informed the meeting that the late Mr. Brown, a member of the great publishing firm of Longmans, had bequeathed to the fund a sum of 3,000*l.*, being, with a single exception—that of the Newton bequest sixty years ago—the largest contribution ever made by a private individual.

The Artists' General Benevolent Fund.—The dinner on Saturday evening last, presided over by Lord John Manners, was a great success. About 180 persons sat down, and Mr. Hardwick, as treasurer, announced that the subscriptions amounted to over 1,500*l.* Mr. Millais, R.A., the new honorary secretary, had evidently worked well. The speakers, in addition to the chairman, were Sir Francis Grant, A.R.A., General Wood, Mr. A. Trollope, Mr. Frederick Taylor, Mr. O'Neil, Lord Malmesbury, Mr. Godwin, Sir Coutts Lindsay, Mr. Marcus Stone, and others. We understand the committee also offered a building for the reception and education of the children of artists. Unless to a considerable extent endowed, they should deliberate well before accepting it.

KIDDERMINSTER INFIRMARY COMPETITION.

THE committee have held a meeting to reconsider a resolution passed on the 23rd of December, limiting the sum to be expended on the building to 4,000*l.*, "with a view of rescinding the same, and of granting enlarged powers to your committee, this sum being found quite inadequate to meet the estimated cost of the approved plan, combining, as it does, all the requirements of the honorary surgeons."

In consequence of this a correspondent justly writes:—

"As the author of one of the rejected designs in the late competition for this building, I cannot allow this additional call to be made upon the subscribers without entering my protest against the action of the committee in having chosen, from out of eighteen designs, one which it was easily to be seen would cost 40 per cent. more than the sum to which competitors were restricted, viz., 4,000*l.* I made a careful survey of the whole of the drawings whilst they were on view in the Corn Exchange, and, therefore, I have no hesitation in stating that there were three (or more) designs there, either of which was more conformable with the 'Instructions' issued by the committee, than the selected one is, and that either of them could be erected for 1,000*l.* less than it can be. Had the committee taken the notice of an intelligent, professional man, and acted upon it, I feel sure that the competition would have been decided more by merit and less by personal friendships; and that those gentlemen, whose designs were returned to them *carriage to pay*, would have had the consolation of feeling that, at least, fair play had been awarded them."

THE PICTURES AT THE ACADEMY.

Str.—Is it possible that no better plan can be devised for hanging the pictures at the Royal Academy than the barbarous one of driving into the walls the large and unsightly nails visible in every direction?

The damage to the frames in several instances is perfectly apparent, and the state of the walls after a few years of such honeycombing is very easily imagined. Is it no one's business, moreover, to give the glasses a clean after the pictures are hung?

I cannot help thinking that, now the pictures are all hung a fair distance from the floor-line, a protecting bar, which would not interfere at all with the view, is very desirable, to keep the visitors a reasonable distance from the walls. In more than one instance, during my visit, I saw an individual, without the slightest compunction, pass in a crowded corner between the crowd and the pictures, brushing his shoulders right against the painted surface, and, I should imagine, by no means improving it.

CONDITION OF WATER.

Str.—In "W. R.'s" communication, which appeared in your edition of May 1, on this subject, he states, "it is not these salts, *per se*, which cause disease, but rather that their presence and derivation are indicative of some latent and subtle power, the nature of which we know not, but whose property is to generate and propagate certain forms of sickness when taken into the system." If this be the case, I presume it would be practicable to remove the insidious salts from impure water, at least temporarily, and still to leave the latent and subtle power, which is the real cause of sickness. Therefore, a system of filtration may be adopted which removes the indications of im-

purity, but leaves this "unknown power" to work its mischief the more sulkily. Such a theory cannot but fill with apprehension the minds of those whose domestic water-supply is obtained from a river contaminated by the sewage of several towns whose collective inhabitants number more than 100,000, and by the refuse of a great number of worsted-mills.

Obtaining filtered water from such a source is, I hope, a sufficient apology for tendering these remarks, and calling attention to "W. R.'s" theory. X. S.

A BUILDER'S COMPLAINT.

Str.—Permit me through your valuable paper to call the attention of builders and contractors to an increasing evil which is damaging to the interests of both builders and architects. The evil to which I allude, is that of building materials—merchants who are frequently supplying bricks, sand, lime, ballasts, timber, &c., to persons not in the trade as builders, at prices as low and sometimes lower than to builders, the effect of which is, that many gentlemen who require buildings erected, get hold of a builder's foreman or ex-clerk of works, who may be able to draw a little, and thus with his assistance get out their own plans, employ their own workmen, purchase their own materials, and under a false impression of effecting a saving of money, dispense with the services of both architect and builder; and this is traceable to the temptation offered of cheap materials; and what is worse, in most instances when the building is completed, the proprietors think they have effected a large saving, and though it is a delusion, yet never having had any estimate from a builder, they remain happy in their ignorance.

If you will kindly call the attention of the trade to this subject, I think some of your readers will be ready to suggest a remedy for such an evil. A BUILDER.

THE OLD GRAVE-YARDS IN LONDON.

Str.—Many of your readers may have observed the neglected state of the dilapidated burial places, which, once sacred when they paid, are now disregarded by clerical disease, disincanting disease, discontinued, disgraceful. Disrespect is heaped on the departed. Stacks of timber are the lot of some, but that is a *deal* better than what others have to bear; houses have been erected on our grandfathers' stomachs,—but will they bear up bodily against it? Another sacred resting-place is converted into a rubbish depository, a home for carts and harrows, refuse from fish-shops, and serves as a canine gallop, where poor Pinchbeck is converted to *Pinch*. I verily believe the owners (?) of these yards would sell the clay to make bricks, if an offer were made. Take precedent from "Old Toxy Philozer."

ROMAN PAVEMENT IN LONDON.

WITHIN the last few days a discovery has been made of a Roman tessellated pavement, in course of excavating at the corner of the Poultry, for the formation of the new street from the Mansion House to Blackfriars. The pavement lies about 17 ft. from the surface of the ground, and, as far as can be at present ascertained, is in excellent preservation. It is evidently of some extent. Adjoining the pavement are the foundations of Roman walls, with other evidences of extensive buildings.

THE COLOURING OF ARCHITECTURAL ARTISTS.

In examining Mr. Petit's sketches, at the Architectural Exhibition, one cannot help being struck with the great uniformity of colouring which pervades them. Whether it is a building in London, Rome, or Jerusalem that is represented, the same tints prevail. This mode of treatment, although very pleasing to the eye, gives a very unreal effect to the subjects; for what Londoner would recognise his smoke-dried St. Paul's under the garb which Mr. Petit has given it?

It is to be feared that many architectural artists are guilty of the same deception, and aim in their drawings at producing a pleasing effect rather than a true representation of the stern realities of actual building. E. W. T.

PHOTOGRAPHIC TELL-TALE.

Str.—I perceive in the *Builder* a suggestion for a photographic "tell-tale." In anticipation of the "smiles" which will greet its advent, let me state that I have often, in earnest fun, told, at the dinner-table, to the alarm of my present, that a contrivance was in embryo by which the whole of the proceedings of an interior might be made as plain as an illustrated book; that this would be done by a roll of sensitive paper released by clockwork, and set in some concealed spot commanding the fullest view of room or chamber, and so adjusted as to photograph every two minutes if necessary; and that, when the master returned, he could thus spread out before him all the transactions of the past time.

I claim nothing for the notion, having already been mischievously rewarded for the confirmation I have occasioned, and the cries of "Shame!" from some, and "What next?" from others, most seriously ejaculated. J. G. F.

THE KUNG CHERRY.

Some years ago Chinese seed chestnuts were introduced in a growing state by means of Vardian cases into India. Is it not possible to introduce the Kung Cherry-tree,—which perhaps may have been introduced into Russia from Tibet or Tartary by some recluse monks or anchorite,—into this country? Amongst the term-swept and almost treeless Orkney, or Western Isles, even in the Island of Lewes, the division of land is marked by rows of docks, whose stems make the creels or hedges in which the poor inhabitants carry out manure. Might not such a tree, if it could be introduced, be of great practical utility and benefit, as people go far and near to see a single tree?

Elder and sycamore stand the sea-breezes: is it not possible to introduce the seeds of these also?
CIVIS LONDINENSIS.

COMPETITIONS.

Hull.—St. Silas's Church Competition.—At the last meeting of the committee, the second premium was awarded to the plans bearing the motto "Well considered." The design is by Mr. F. W. Hagen, of Hull.

Lambeth Workhouse.—The premiums for the infirmary were awarded as stated in our last. We have now to add that the first premium for design for workhouse has been given to Messrs. L. & C. Harston, for design mentioned as "K," in our notice.

Miscellaneous.

Rossini's Last Work.—There has been a great struggle for Rossini's last work, the "Messe solennelle." It is now definitely understood that this great work is secured for England, the proprietor of the copyright (for purposes of publication in England) being Mr. Thomas Chappell. Rossini's Mass will be produced by the directors of the United Opera, London, in St. James's Hall, on the 19th inst. It will be illustrated by the talents of the first vocal artists; and the choruses will be sung by a body of chorists who are unrivalled.

Cardiff Free Library and Museum.—It is proposed by Mr. Price, the honorary secretary of this institution, to erect a new building for the Free Public Library, Museum, Gallery of Art, Schools of Science and Art, and Lecture Theatre, and to make application to the town council to appropriate to this use the piece of land in the rear of the new post-office, known as "Mr. Stockdale's Garden." The building, under the Libraries Act, would become town property, and no corporation might be asked to build a theatre, with entrance direct from the town-hall. Mr. Price estimates that the cost of the several buildings would be approximately as follows, viz.—The schools of science and art, 1,750*l.*; gallery of art, 540*l.*; museum, 2,500*l.*; library and reference room, newspaper and magazine reading-room, 4,740*l.*; lecture theatre, 3,370*l.*; total, 12,900*l.*

Metropolitan Tramways.—There is now a very fair prospect of improved street conveyance in large sections of the metropolis. Street tramways are likely to have a trial in London, under conditions carefully considered. The select committee of the House of Commons to which the three tramway bills were referred has accomplished its work. The bills, which will now be referred to the House of Commons, and most probably passed, provide for the establishment of three chief lines of tramway,—two on the south of the Thames and one on the north. The lines south of the Thames are one connecting Fimlico with Peckham and Greenwich, and another connecting the new thoroughfare of Southwark-street with Brixton and Clapham. The northern line is from Whitechapel Church to Stratford. In all cases the fares are fixed by the bill, and not more than 2d. is to be charged for any distance under two miles.

Metropolitan Improvements.—Southwark Park will be opened to the public by Sir John Thwaites on the 19th inst. On Friday the Metropolitan Board of Works decided to contribute 7,000*l.*, one-half of the cost of an improvement in Royal Mint-street, Whitechapel; and 306*l.*, one-half of the cost of an improvement to be carried out by the St. Olave's District Board of Works, by setting back the premises 60 and 61, Coley-street.

Towns Drainage and Sewage Utilization Company.—A new company with this title has been incorporated by special Acts of Parliament, 30 & 31 Vict., c. 173, and 31 & 32 Vict., c. 175. The consulting engineers are Messrs. James Beunles and G. B. Bruce, and the acting engineer is Mr. J. Bailey-Denton. The subject is one requiring a peculiar knowledge, which cannot be commanded without heavy expense, and which is scarcely available for small towns and local districts. Hence, says the prospectus, the necessity for some central authority on the subject, easily accessible, and possessed of the latest information;—and it is this want which the company seek to supply. It is also intended by the company to assist the local authorities of towns in disposing of their sewage with the least outlay and taxation, by acting as a medium between the sewer authorities and farmers. The company will be prepared to advise upon and to treat for the preparation of plans and the construction of works necessary for the supply of water to towns and districts at present insufficiently provided.

Fall of a House in Oxford.—Labourers in the employ of Mr. John Dover, builder, had been engaged in digging the foundation of a house about to be erected on land having a frontage to the High-street, in St. Clement's parish. The excavations were made close to a house, the foundation of which was so far undermined that the whole of the external wall, from the roof to the ground, fell. Fortunately, the men were engaged in digging the foundation of a second house adjoining, and escaped without being injured. On the previous evening the inmates of the house discovered that something was wrong, in consequence of their being unable to fasten the back door, but although the dangerous state of the outer wall became more apparent on the following day, nothing was done to shore it up and prevent it from falling. The inmates had left the house a short time when it fell.

New Indian Railway.—Operations in connexion with the survey and laying out of a new and important line of railway communication have just been commenced by a staff of British civil engineers. The line is designed to connect Carwar, on the Malabar coast, and the cotton districts of Hooblee and Dbarwar, with the probability of its being carried through into the Madras Presidency. The line is to be designated "The Southern Mahratta and Mysore Railway." There will be formidable difficulties to contend with in "carrying the line up the densely-jungled ghat," with an elevation of some 1,500 feet. The undertaking is to be carried out under the direct orders of Government. The Duke of Argyll has devolved the chief responsibility on Mr. Buchanan, C.E., London.

Building for Royal Society for Prevention of Cruelty to Animals.—The foundation stone of a new building, in course of erection for the purposes of this society, in Jermyn-street, St. James's, has been laid. A statistical record of the origin and progress of the society states that since its formation in 1824 upwards of 16,000 convictions in cases of aggravated cruelty have been obtained by means of its officers. The yearly income of the society is nearly 4,000*l.*, and the cost of the present building will be about 3,000*l.* The freehold for the site, contributed by Mr. George Wood, one of the trustees, is valued at 5,000*l.*

The South Staffordshire Industrial and Fine Arts Exhibition.—On Tuesday the South Staffordshire Industrial and Fine Arts Exhibition, Wolverhampton, was opened by Lord Granville in the hall which has been erected for the purpose in the grounds attached to Molineux House. The building, which is of iron and glass, forms a central nave 150 ft. long by 60 ft. in width, and 18 ft. high at the spring of the roof, which is semi-octagonal, and rises to a height of 45 ft. from the floor. Around the building is a Fine Arts Gallery, containing nearly 800 oil and water-colour paintings. The objects of industry exhibited are placed on the floor and outside the building. The architect and designing decorator of the Exhibition-hall was Mr. Bidlake, of Wolverhampton, and the contractors were Messrs. Clarke & Co., of the same town.

A Leprosy Hospital for Jerusalem.—The Marquis of Bute, says a Roman Catholic paper, in token of gratitude for his conversion, and as a thank-offering, is about founding and endowing a magnificent hospital for lepers in Jerusalem.

New Fever Hospital for Bradford.—The Board of the Bradford Infirmary have let the works for this building to the following contractors:—Excavators' and masons' work, S. Holdsworth; carpenters' and joiners' work, W. Crabtree; plumbers' and glaziers' work, J. Schofield; slaters' work, Hill & Nelson; painters' work, Brown & Pullen; the total cost being 8,500*l.* The building is arranged to accommodate forty-eight patients. The site, approaches, boundary walls, &c., are estimated to cost 4,000*l.* The architects are Messrs. Andrews, Son, & Pepper.

The late Sir Wentworth Dilke.—We record with feelings of extreme regret the death of Sir Charles Wentworth Dilke, intimately associated for many years past with International Exhibitions, the Royal Horticultural Society, and the Society of Arts. The deceased baronet has left two sons,—not one only, as stated in some of the newspapers,—namely, the present member for Chelsea, and Mr. Ashton Dilke, who had accompanied his father to St. Petersburg, where the event that many besides personal friends will deplore took place.

Memorial Hospital at Leek.—A memorial cottage hospital is about to be erected at Leek by Mrs. Alsop, as a gift to the town in memory of her late husband, Mr. James Alsop, J.P. The arrangements of the plan comprise, on the ground floor, a male ward, acute-case ward, waiting and committee rooms, kitchen, scullery, pantry, store, bath-room, and closet, with other conveniences, and a detached mortuary. On the upper floor are female ward, acute-case ward, operating-room and medical stores, nurses' bedrooms and stores, bath-room, and closet. Mr. Sugden, of Leek, is the architect.

Reminiscences of Authors.—On the 6th inst. Mr. S. C. Hall, P.S.A., delivered his now famous lecture on the Authors of the First Half of this Century, in the rooms of the Society for the Encouragement of the Fine Arts, Conduit-street, to a large audience. The chair was taken by Sir Dighy Wyatt, and Mr. S. C. Hall commenced by stating that having had frequent and peculiar opportunities of intimacy with the distinguished men and women of his time, he was about to give portraits of some of those whom he had known, entirely drawn from personal remembrance. He then sketched graphic and interesting accounts of Hannah More, Samuel Rogers, James Montgomery, Ebenezer Elliott, Thomas Moore, Miss Landon, Amelia Opie, Charles Lamb, Samuel Taylor Coleridge, Leigh Hunt, Professor Wilson, Hood, and many others. The lecture was vividly and impressively delivered, and was listened to with the closest attention, now and then interrupted with bursts of applause.

St. John's Church, Croydon.—The artisans engaged in restoring the parish church at Croydon, which was destroyed by fire, as our readers may remember, on the 5th of January, 1867, are making progress. An oak pulpit is in process of construction by Mr. Ruddle, of Peterborough. An alabaster font, with stone base, and reeded with centre of alabaster and sides of Caen stone, and altar-rail in oak, all from designs by Mr. G. G. Scott, are being executed by Mr. Farmer, of Westminster-road, by whom the whole of the carving of the exterior and interior of the church will be done. The prayer-desk, also from a design by Mr. Scott, will be carved and presented by Mr. Gaskin, of Croydon. Messrs. Hill, of Euston-road, are engaged in building the new organ. The peal of eight bells and a clock have been designed by Mr. E. B. Denison, Q.C. The bells are being cast by Mr. Taylor, of Loughborough, and the clock is in the hands of Messrs. Gillett & Bland, of Croydon.

Death of the York City Surveyor.—The sudden death is announced of Mr. Thomas Pickersgill, the city surveyor of York. He was seized with illness in the street, and died in a few minutes in a shop. Fatty degeneration of the heart is said to have been the cause of his death. He had on previous occasions suffered somewhat similar attacks.

Proposed New Town-hall for Lincoln.—At the meeting of the town council it has been resolved that a new town-hall is required, and a committee has been appointed to select a suitable site, and to report to a future meeting. The County Court authorities are expected to contribute 8,000*l.* or 9,000*l.*, and Mr. Alderman Brogden proposes that the Corporation should add 8,000*l.*, and give the site, valued at 4,000*l.*

The Brighton Drainage.—At the last week's meeting of the town council, the Works Committee reported the receipt of the following tenders for the construction of a tubular iron outfall near the western boundary of the borough. The surveyor's estimate was 7,000l. From Mr. J. Phillips, London, 6,400l.; Messrs. G. Cheesman & Co., Brighton, 8,400l.; J. Harris & Son, Rotherhithe, 6,943l. 10s.; W. Webster, London, 9,900l.; J. Kirk, Woolwich, 5,324l.; T. Middleton & Co., Lindfield, 6,749l.; and Dickenson & Oliver, 8,500l. The committee recommended the acceptance of the tender of Mr. Kirk, and approved of his arreties. The proceedings were confirmed. The Borough Surveyor (Mr. Lockwood) then reported upon the appointment of a Clerk of the Works to superintend the new groynes and storm outlet opposite the Junction-road; and the Works Committee appointed Mr. Charles D. Rickards at a salary of 2l. 10s. per week.

Family Monument to the late Bishop Lonsdale.—A monument has just been erected in Eooseshall churchyard, over the grave of Bishop Lonsdale, by the members of his family. The monument is in the form of a memorial cross, of early architecture. It rests on an octagon base of grey Aberdeen granite, rising two steps, and measuring 8 ft. 4 in. across. In the centre of this base is fixed a square block of the same material, with the sides sloped away from the top. Out of this block or plinth springs the shaft of the cross, the upper limbs of which are connected by a circle. With the exception of the octagon base, which is tooled down smooth and level, the whole of the monument is highly polished. The dark blue colour of the polished granite contrasts with the light grey tint of the unpolished base. The monument measures about 11 ft. 6 in. in height. The stone was wrought, polished, and engraved at Messrs. Fraser's Granite Works, Aberdeen, under the direction of the contractors, Messrs. Bevers, of Southwark. Mr. Gilfert Scott designed the memorial.

The Thames Embankment.—Most readers are aware that the Metropolitan District Railway Company, which obtained powers to make a line under the Embankment, have failed to carry out their powers up to the present moment, and have thus delayed, and are still delaying, its completion. This has involved a great expense on the Board of Works, and thus, of course, on those who provide the money; but the worst loss has not yet been reached, and there is great probability, not only of the final opening of the Embankment being delayed, but of a further outlay falling upon the ratepayers. A large staff of officials has been retained and paid which would have been dispensed with but for the delay. The public are also losing the interest on about two millions of money expended on the Embankment, which is lying idle, and has been (through the delay of the railway company) lying idle for two years. Moreover, the 200,000l. which the company was bound to pay to the Metropolitan Board for the privilege of making the railway in the Embankment has not been paid.

Memorial of the Slingsby Hunting Accident.—A monument is to be erected in York Minster to the memory of Sir Charles Slingsby and of those others who lost their lives in a late hunting accident. Hitherto there have been two proposals; an obelisk at Newby or a memorial bridge over the Ure on the site of the present ferry. The committee of subscribers have, however, determined in favour of a cenotaph in the Minster.

Monument to Dr. Whewell.—The Master and Fellows of Trinity College, Cambridge, have just decided to entrust to Mr. Woolner the execution of a monument to Dr. Whewell, which is to be placed in the ante-chapel of the college.

Exmouth.—The new docks have been thrown open to the public. The works were commenced in 1856 by a company with a capital of 60,000l. A new market, built at a cost of 6,000l., and a new hotel, which cost 8,000l., have also been opened. The principal improvements have been carried out by the Hon. Mark Rolle.

Rotherham.—Mr. George Jennings, late Assistant Surveyor to the Rotherham Board of Health, has been appointed to the offices of Surveyor and Inspector of Nuisances to the Rotherham and Kimberworth Local Board of Health, rendered vacant by the resignation of Mr. J. H. Jagger.

To Remove Old Putty.—Many persons destroy their window sash encroaching to remove old putty. This may be obviated by applying a hot poker to the putty, which will then readily yield to the knife and leave the sash clean. Care must be taken not to touch the glass with the poker, nor even to let it stop too near it.

Query.—One of the "Things not generally known," is that steam will, by direct impact, ignite dry wood or other inflammable substances. The "Scientific American" mentions a case in which a portion of dry pipe was lighted by steam from a boiler 12 ft. off!

The Sewage at Barking.—Matters are looking serious at the northern outfall, as we have more than once expressed fears would be the case. Mr. Robert Rawlinson, C.B., has been directed by the Home Office to examine into and report on the circumstances.

To Stop a Leak.—Beat yellow soap and whitening, with a little water, into a thick paste. Rub this over the part where the leakage is, and it will be instantly stopped.

TENDERS.

For four cottages, Uttoxeter-road, Derby, for Mr. W. Halliday. Messrs. Thompson & Young, architects:—
 Bridgcat £389 0 0
 Craddock 811 15 1

AS TIME, STOREKEEPER, or CLERK used to either. Served an apprenticeship in the ironmongery trade. Fifteen years' experience. Married. Aged 29.—Address, A. A. F. 25, Fleet-street, Hampley, N.W.

TO BUILDERS, DECORATORS, and ESTATE AGENTS.
A YOUNG MAN, thoroughly competent in all branches of House Decorating, is desirous of a constant SITUATION. Five years in last situation as working foreman. First-class references as to character and ability.—Address, A. B. 39, Murray-street, Hoxton, N.

TO ARCHITECTS.
A GENTLEMAN requires a RE-ENGAGEMENT as ASSISTANT. Has had many years' experience, and is well up in perspective.—Address, ARCHITECT, No. 33, Gloucester-street, Queen-square.

TO ARCHITECTS and BUILDERS.
AN experienced and thoroughly qualified ASSISTANT in want of an ENGAGEMENT, temporary or otherwise. Is a good practical draughtsman, quantity surveyor, measure, and valuer, &c.—Address, ALPHA BETA, No. 3, College-street, Vine-street, York-road, Lambeth, S.E.

TO ARCHITECTS and SURVEYORS.
A JUNIOR ASSISTANT, aged 20, is anxious for an ENGAGEMENT. Has a good head in a neat draughtsman. Can raise dimensions, and abstract brickwork. No objection to the country.—Address, M. E. 2, Inverness Cottage, North-end, Kingston-upon-Thames.

TO ARCHITECTS.
A GOOD GOTHIC and PERSPECTIVE DRAUGHTSMAN requires a SITUATION as ASSISTANT. Can design, prepare, & make drawings, details, &c., and is well up in the general duties of an office. L-1 has experience in construction of a dome of employer, with whom he has been four years.—Address, C. F. 49, New-street, St. John's, Barbican, S.E.

AN ARCHITECT'S ASSISTANT wishes for an immediate RE-ENGAGEMENT in Town. Accustomed to the preparation of working and detail drawings, and is well up in the general duties of an office. L-1 has experience in construction of a dome of employer, with whom he has been four years.—Address, C. F. 49, New-street, St. John's, Barbican, S.E.

TO UPHOLSTERERS and CARPET MAKERS.
A PRACTICAL ARTIST, of great experience in their line, and thoroughly up to date in making small and working designs and drawings in any style, is open to an ENGAGEMENT.—Address, H. W. 21, Mount-street, Liverpool.

TO BUILDERS.
A JUNIOR ASSISTANT, aged 20, desires an ENGAGEMENT. Has had some London or suburban salary not much an object as employment.—Address, L. G. 16, Lyndhurst Grove, Lyndhurst-road, Peckham.

TO BUILDERS.
A CARPENTER requires a JOB. Bench or flatwork. Has been in London or suburbs.—Address, E. T. 14, Salisbury-crescent, Salisbury-row, L. 10, Whitechapel.

TO ARCHITECTS.
A THOROUGHLY practical CLERK of WORKS is desirous of an ENGAGEMENT. Fully qualified to superintend the erection of any extensive works. First-class testimonials.—Address, G. N. T. care of Mr. Waggoner, 10, Vintners-square, Brydon-street, Covent Garden.

TO ARCHITECTS and BUILDERS.
A THOROUGHLY efficient BUILDERS CLERK desires a RE-ENGAGEMENT. Is a good estimator and measurer.—Address, HOUSEKEEPER, 8, Cray-cy, E.C.

AN ARCHITECTURAL ASSISTANT seeks a RE-ENGAGEMENT. Working drawings, perspective, detail, &c. Specimens shown. Salary 15 guineas.—Address, L. V. 21, Hatton-road, Essex-road, Islington.

TO BUILDERS and CONTRACTORS.
A THOROUGHLY practical GENERAL FOREMAN requires a RE-ENGAGEMENT. Take the entire Charge of a Job. Town or country. A Joiner by trade. Good references.—Address, R. 120, Cambridge-street, Finsbury, S.W.

A JUNIOR ARCHITECT and QUANTITY SURVEYOR'S ASSISTANT, aged 21, is now DISENGAGED. Six years' experience. Neat draughtsman. Good practical knowledge of contract law, details, specifications, &c. and good assistance at quantities. Highest references, and specimens shown. Moderate salary required.—Address ASSISTANT, 2, Queen-square, Bloomsbury.

TO ARCHITECTS.
A JUNIOR ASSISTANT requires an ENGAGEMENT. Six years' experience: three years with best employers. Good references.—Apply to F. W. M. 33, Cambridge-terrace, Lupat-street, Finsbury.

TO ARCHITECTS and SURVEYORS.
A RESPECTABLE Young Man, recently engaged in City Architects' and Civil Engineering Offices, desires an ENGAGEMENT in similar establishments. Good references.—Address, A. B. 34, Church-street, Lambeth, S.E.

TO ARCHITECTS and SURVEYORS.
AN ENGAGEMENT is desired by an experienced designer and surveyor, who has been engaged some years in carrying out all classes of building. Can undertake the entire management of an office. Only moderate terms accepted.—Address, M. A. 2, Queen-square, Bloomsbury.

TO RESPECTABLE middle-aged Man wishes to meet with a SITUATION in the above line. He was in business many years for himself, and has a practical knowledge of the whole of L. Country not objected to.—Address, A. M. 19, New-street, Liverpool.

TO ARCHITECTS and SURVEYORS.
A FIRST-CLASS DRAUGHTSMAN and QUANTITY TAKER is open to a RE-ENGAGEMENT. References from London architects.—Address, F. M. 19, King's-terrace, Stanley Ridge, Fulham.

A GOOD GENERAL ASSISTANT will be shortly dispensed. First-rate designer and draughtsman, and has had experience in QUANTITY, ARCHITECTS, &c. Highest references.—Address, N. 132, Bowdoin.

TO ARCHITECTS.
A GENERAL ASSISTANT, of varied experience, is desirous of a RE-ENGAGEMENT. Specimens, References, and testimonials. Personal interview. If desired free of expense.—Address, M. T. Post-office, Southampton.

A BOLTON OF FIRE INSURANCE
 IMPERIAL FIRE OFFICE
 No. 1, Old Broad-street, and 17, Pall-mall.
 Established 1823.
 Subscribed and received Capital £1,000,000.
 Insurances can be effected both at Home and Abroad at Moderate Rates of Premium, and ENTIRELY FREE OF DUTY after Midsummer; inasmuch as the exact proportion will be shared provisionally.
 Claims liberally and promptly settled.
JAMES HOLLAND, Superintendent.

HAND-IN-HAND FIRE and LIFE
 MUTUAL INSURANCE OFFICE, 1, NEW BRIDGE STREET, BLACKFRIARS, E.C.
 The oldest Office in the Kingdom. Instituted for Fire Business, A.D. 1696. Retained to the L. 1859.
 The whole of the profits divided yearly amongst the members.
 Fire Department—65 per cent. of the Premiums paid on First-class Risks.
 Life Department—60 per cent. of the Premiums on all Policies of the first series.
 Accumulated Capital (31st December, 1858)—1,502,374.
 The Directors are willing to appoint as Agents, persons of good position and character.

IRONFOUNDRY TO BE LET, with im-
 mediate possession, an old-established IRONFOUNDRY, with steam power, situated at HICKLEY, N.B. Low rent, small premium for lease. Also can be let with the above, a CAPTAIN AT RESIDENCE, suitable for an architect's office. A good position in a quiet neighbourhood. Also a CAPITAL WORKSHOP, lately occupied by a Millwright. HORSE BRICK CART, and HARNESS FOR SALE, from a country gentleman, just completed a good one. Also, an Extra BRICK CART and HARNESS.—Apply to Mr. ROBT. PERKINS, Buller-street, Chancery-lane, Finsbury, S.W.

500 YARDS OF EXCELLENT SAND and GRAVEL FOR SALE, from 1s. 6d. to 2s. 3d. per perch. The sand is from the Southampton street, Southampton. For application to FREDERICK RODNEY, at the Pit; or at the Office 120, White-street, Cambridge.

TO TIMBER DEALERS and OTHERS.— WANTED to PURCHASE, for immediate Cash, about 2000 cubic feet of the following description of timber:—Sawn timber, LATHS, Shed lowest prices by letter, or C. C. care of Housekeeper Lincoln's Inn-fields.

The Builder.

VOL. XXVII.—No. 1372.

Royal Academy Exhibition.

AYING another shilling for another look at the pictures, and feeling very gratified at what we have seen of them, as well as grateful for the improved conditions under which we can see all, two thoughts occur in the turning of a turnstile, as some one more than whispered, "Oh, hang the pictures, I've come to see the rooms." Hang the pictures, indeed! Who is to do it to please everybody? We thought, how far the happier of the two must the Royal Academician be who is to be hung, compared with him who is to do the hanging; and what a delightful state of things would be brought about if everybody's individual notion of its necessary reform were some day to be realized in the future existence of an institution so strong in its present growth of a hundred years, as to be very well able to defy some very strong attacks from those who would prune and graft, with little respect for the stem, even, if they could get no new fruit from the old tree. But so long as visitors may come and visitors may go, the Royal Academy will go on for ever,—if another aim be brooked. We cannot shut our eyes, however, to its shortcomings and mistakes.

Mr. Watts, in his impressive indication of almost entire obliteration and intended universal renovation such as he presents in his imaginative conception of "The Return of the Dove" (45) over the vest plain of subsiding water, to the mark that contains the little remnant of all that moved, breathed, lived or quarrelled; wept or made merry; worked or rested in the on-civing world, perhaps, allegorises the only real means of adjusting some difficulties. Mr. Watts is a poet as well as a painter; and though his other pictures of this year's exhibition, are not so well represented as on some former occasions, high qualities distinguish his embodiment of chivalry protecting innocence and virtue in "The Red Cross Knight and his" (125).

Mr. Herbert's most remarkable production is a large desert scene (134), "Gazelle Hunters of North Africa," in unexpected and too-close-to-be-pleasant proximity to a lion and lioness unmistakably intent on making game of them unless they are anticipated and made game of: the bare, sun-burnt waste of rock and sand with a sign of vegetation to deny its barrenness; the wide expanse of sky, with no cloud that would promise moisture—admirably convey the idea of parched desolation and an atmosphere in which a tight cravat would be intolerable. A richly executed study of a "Girl of Lower Egypt," descendant of Amron the Victorious, (36), too peculiar personally, figuratively and with regard to costume, to admit of a doubt of her being faithfully portrayed; and "Mary Magdalene" at the tomb of the Saviour on the day of his crucifixion (416), are at once to be

identified, by the clear and somewhat hard style of the manipulation, as emanating from one of the very best of British artists.

Besides a grand classic rendering of "Hero lighting the Beacon to guide Leander across the Hellespont" (108), wherein nude nature has been mystified by moonshine and fire-light into decorous dress, though the physical description of the heroine—to say the best and the worst of it—at least equals her poetical development, Mr. Armitage contributes a profile of an Egyptian lady, regarding with mixed concern and curiosity a sick chameleon (272), than whom, if Cleopatra were more beautiful, Antony must have been no weaker than big schoolboys could consider him. His chief work, however, is the smallest; for this is marked by great originality of treatment and of high value by reason of its subject. Mr. Armitage illustrates the Gospel of St. Matthew, iv. 21, "Christ calling the Apostles James and John, the Sons of Zebedee" (365), with a propriety of sentiment and a sufficiently realistic probability of scene and circumstances that conduce very much to gaining consideration and respect for the picture. He also exhibits two clever portraits.

To any one who needs food for reflection,—but who can need it, with their own pocket edition of the world's business troubles and trials for their own special and immediate cogitation?—yet to those so happily exceptional, an exhibition of pictures is a mine of inexhaustible resource; its varied contents offer a vein to the major part of imaginative misers,—gold to all.

Mr. Ward's telling picture of "Grinling Gibbons's first introduction at Court" (144) indicates a double lesson; one, to those whose common apostrophe is "What odds? It will be all one a hundred years hence!" Another, to the grumblers, who would have least cause to grumble if they had a real one, and gave less time to their pet propensity: there is far less hope for the hopeful, who found their too sanguine belief on a fortuitous show of early good fortune: disappointment in the long run awaits nearly all such, and it is far better to begin with failure than to end with it; and to recollect that platitudes is not always "foolish talk." Mr. Ward's picture illustrates a passage in "Evelyn's Diary," describing how Grinling Gibbons, having been introduced to Charles II., who has been astonished by his workmanship in a curious specimen of carving, has been commanded to show it to the Queen, who, from the fact of its being a crucifix, would, in his Majesty's opinion, have been likely to appreciate it as much or more than himself, and have bought it; "but when his Majesty was gone, a French peddling woman, one Madame de Boord, who used to bring petticoats, and fans, and habiles out of France to the ladies, began to find fault with several things in the work, which she understood no more than an ass or a moakie," very much to Evelyn's indignation, who summarily relieves the Queen of the cause of question, by ordering the porter who brought the work of art to take it away. The anecdote is very perspicuously related by the artist, who has found a congenial theme to expatiate on: his aptitude for characterization, knowledge of the costume and customs of the period, and fine taste for colour and effect, have conduced to the production of a thorough realization of the incident. The name of Grinling Gibbons will be associated with perfect skill in wood-carving so long as the art exists; his patient endurance is one example of many to encourage merit that waits for acknowledgment.

It will be all one, it may be supposed, with most of us a hundred years hence, so far as mundane relationships are concerned,—unless like the Pole of recent report, whose hair regained colour at eighty or ninety years of age, and who died comparatively youthful at 130;—and all one at last with those who, coming after

us, live to take their turn at the wheels that keep Time's clock going for them; for they will share the same senses and the same want of them; the same dispositions and proclivities; the same or similar chances of success or failure; the same fallacies and the same discontent, which is a virtue, for without it there would be no energy, no effort, and no such results as a steady determination not to be satisfied easily frequently obtains:—

"The time of life is short—
To spend that shortness wisely, were too long,
If life did ride upon a dial's point,
Still ending at the arrival of an hour."

So grumble whilst you work, but strictly with aad at yourself—not loudly.

Did Luther ever dream of all the influence his dissent from Papal authority would have over the Christian world? Mr. Ward depicts him as the monk who, in his youth and interpretative genius found more than words in the Holy Book so long hidden from custom-bleared eyes. The painter could not show the thoughtful, wasted face and form of the student whose new belief was almost a terror to himself; and this he has done most successfully by means of fit apprehension of character and vigorous imitative painting.

Mrs. Ward has painted the Young Pretender (211) in his happier discontented days, recognising some poor exiled Jacobites, who are glad to kiss his hand extended with kindly grace to raise them as they kneel in homage to the shadow of royalty that has darkened the sunshine of their world's prosperity; but they are loyal gentlemen, and are well repaid as the princely boy expresses his grateful appreciation of their services. "He told them he had often heard of their valour, and that it made him proud, and that he had wept for their misfortunes as much as he had done for those of his own parents; but he hoped a day would come that would convince them that they had not made such great sacrifices for ungrateful princes." Miss Strickland is fortunate in having so powerful and so graceful an illustrator as Mrs. Ward to point the interest of her anecdote: one whose susceptibilities enable her to comprehend the full force of its touching nature, and whose fine taste and great skill give her so much command in securing the sympathy of others. In her many successes, she has never succeeded better in narrating any incident selected for recording than in this, of broken-down but still devoted loyalty; or in depicting the grief-worn ailing exiles in such strong contrast with the bright hopefulness of the boy; their cynosure and the picture's tone.

Mr. Marcus Stone is the Harrison Adamsworth of the palette and the brush; his dramatic representation of "The Princess Elizabeth obliged to attend Mass by her Sister, Mary" (60), has derived more romantic interest from his method of relating the incident than a less demonstrative and more probable version of it could possibly have given. The bigoted queen sits gloating on the all-sufficiency of ceremony and outward show to bring religious comfort whilst the princess at her side sits in quiet but determined disregard of priests, censuring acolytes and of the plotting Spanish and French ambassadors alike, who, in adjoining stalls, are signifying their observation of Elizabeth's behaviour as she trifles with her riags, and looks into vacant space—of which the painter has provided plenty—by stealthily exobanging whispered remarks. Mr. Stone paints very boldly and precisely, and shows great discrimination in his choice of costume and accessories; but he shares in a prevailing mistake of giving his actors so much stage room that they lose their proper importance; the carpet is too often now made the first object for consideration in precedence of what may happen to be on it by rights. Mr. Orchardson is less amenable in this respect than usual, though his manner of painting is even more dexterous and fascinating than ever; so much so,

that the admiration it exacts condones the objection, if it exists. "The Duke's Antechamber" (103) is well filled with such an assemblage of applicants for patronage, favour, and assistance, as dependency, toadyism, and exigence, would be likely to bring together at the hour that his Highness might be most approachable. The first to have admission to his presence is the scrivener to provide means for the indulgence of His Greatness in his weakness; for there is show enough to indicate that the fawner and flatterer find a ready ear and an open hand. The poet, with his eulogy; the pharmacist, with his new drug or wash; the musician, with a pretty tune he hopes his ducal lightness will dance to, or maybe an opera dedicated in consideration of a high note that few besides his mellifluous-voiced grace could reach; the artificer in precious metals, with a design on gold that can never be carried out without his patron's assistance; the jester, the monk, the hilly and sneak, and an old retainer, or tenant, or soldier, who, with some real claim to it, is less sure of a welcome than any of them, although he has a pretty daughter. This is a very capital picture, and although it can boast no novelty of design, little invention, the skill that is manifested in its production gives new interest to an old subject, and individualizes it as a remarkable work.

In any desire Mr. Yeames may have had to concentrate attention on his excellent technical performance. "The Fugitive Jacobite" (148), he has absolutely and literally been floored, by himself. Why will so clever, so agreeable an artist make "his room to be preferred to his company?" The interior is a tapestried chamber in an ancestral mansion; the hunted man is about to clamber up the chimney, assisted by the means of a ladder—it must be a short one to have been placed where it is—members of his family anxiously cluster about him; one tall sister keeping watch from the window, whilst a younger one sits in serene unconcernedness of impending danger; for her worldly experiences might be amplified in half a "duodecimo" sheet, at the rate of one page a year; all she knows of territory at present is, that it bears flowers; and the toast, "Over the Water," has with her a mental connexion with butter and milk—never bloodshed—to make it at all comprehensible. May be it is the same little sister who comes pattering down stairs, and whose "Alarming Footsteps" disturb the lovers in a smaller and very pretty picture by Mr. Yeames, with a nice effect, but no cause; for little sister has Utopian views, and thinks it only just and proper, and a very natural state of things, for all to be fond of each other; and if anything like civil or unenvil strife were imminent, her advice would be, that everybody should kiss everybody else, and be friends (432).

Mr. Horsley, too, is fond of disclosing lovers' secrets; he takes a merry, mischievous delight and some pains to show how carefully the pretty damsel of a time gone by guarded from sudden surprises "The Secret Interview" she gave her gallant swain (498), or to what advantage a daring, sancy youth turned the opportunity when the usually wide-awake guardian was "Caught Napping," to kiss the fair hand of her wicked, winsome charge (397). The tender passion again may have influenced "The Gaoler's Daughter," and have given her motive to cull the bunch of sweet blossoms she holds in her hand, as she confronts her father, whose office is less kindly than his cheery face, for he regards her as so much the more typical of bright golden sunshine to lighten his heart and light up his dismal home, from the very dismalness of that home when she is absent and the disagreeableness of his calling (176). These examples of Mr. Horsley's familiar style have the old qualities of luminousness and pleasant colour, and show incontestable evidence of great proficiency in a rather restricted practice of his art.

If Mr. Marks is at once to be identified with his works, it is not from repetition of their subjects, but from the repeated evidence they bring of his originality, and the aptitude he possesses of distinguishing all men he portrays as men of Mark's. His hand of musicians conducted by the supercilious "stick-in-waiting" to "The Minister's Gallery" (69) are each individualized by some physical peculiarity that is curiously indicative of what manner of men they are, from the pale nervous enthusiast whose soul is in his fiddle, to the drummer who knows he was born to make a noise in the world. Refinement and clever, careful workmanship help very much to give value to this painting.

Refinement degenerates to weakness in Mr. G. Leslie's snper-delicate and evanescent young lady in white muslin and "Celia's Arbour" (133). She is a dream of gracefulness—a phantom of prettiness; and her unreality is shared by the fair victim of "Cupid's Curse" (281), who it may be feared will be the greater sufferer of the two, for the deceiver who could have proved himself unfaithful to one so touching, so tender, and so trusting, must be a hardened criminal indeed. May he who has changed old love for new, find that he has changed for worse!

Mr. Creswick's landscapes have the same charm as ever: whether in avenues for shade and shelter in "Sunshine and Showers" (70), or in more open space to court fresh, soft breezes, one has but need to follow him in his pathways through homely scenes to feel as national and as convinced of their delightful nature as he himself must be. Whether it be "The Windings of a Rocky Stream" (107), or "An old English Village on the Banks of a River" (305), or such homesteads as "Moorland Cottages" offer to his view, he is equally at home in transferring them to canvas, and asserting that there is little travel wanted to prove the world to be beautiful, and that the humblest, even, may dwell in picturesque wealth, at all events.

ARCHITECTURAL SERIALS IN AMERICA.

We trust that the increase in America of the number of periodicals devoted to architecture and kindred topics, may be a proof of improved taste on the part of the people. Possibly no other country can show so enormous an amount of buildings of every description, yearly erected; and we can conceive that the inventive genius of a race so peculiarly gifted as the Americans in mechanical contrivances, has found abundant scope in the perfecting of all kinds of ingenious appliances to lessen labour, and add to comfort and convenience; but as yet we see more evidence of the improvement and skill of the builder than of the architect, more credit to be due to the constructor than to the designer. Americans are eminently a practical people; buildings they must and will have, and of the best; qualities of workmanship and contrivances for convenience they can judge of, and they have sense enough to insist upon these; but for artistic finish and for architectural taste they have no means of applying a standard, other than perhaps the last costly structure that has been put up, and so they have to content themselves with what their architect can best give them. What his best may be can be fairly seen in the illustrations of the many journals that are devoted to architectural art, and from the descriptions of unprejudiced visitors, as well as those of their own writers, so that we shall not be thought illiterate in asserting that the general design of American buildings is, at present inferior to their construction. The causes of this are probably the very recent recognition of architecture as a profession, and the scarcity of properly qualified men as professors. Now, however, that there are American Architectural Institutes, and a plentiful supply of serials devoted to architectural literature, there is every hope that a sensible improvement will be seen.

We have at this moment on our table many numbers of publications devoted to the building arts, and may mention the *Manufacturer and Builder*, a *Practical Journal of Industrial Progress*, published in New York, a large closely filled folio of some thirty pages; the *American Builder and Journal of Art*, published in Chicago, a three-column quarto of twenty pages; and the *Architectural Review and American Builders' Journal*, published in Philadelphia, a large octavo of sixty-two pages. There are others, but these will fairly serve as examples of what our friends on the other side of the Atlantic are doing in the cause of professional progress.

The first on our list, the *Manufacturer and Builder*, is mainly devoted to practical details of constructional industry. Amongst its contents is an instructive article upon brickmaking, in which we should gather that more care is usually taken in the manufacture and selection of ordinary bricks than is attempted here, and that few others but moulded bricks are in general use. Machinery is largely employed, and manual labour as far as possible is dispensed with. A practical hint is elsewhere given which may be of use to our operatives, as to the hardening of cutting tools, which is, that if the point of the tool whilst in use is kept constantly moistened

with petroleum, the blunting of the edge will be prevented. "Steel tempered to a light yellow has been turned with the greatest facility by using a mixture of two parts of petroleum and one of oil of turpentine." Some papers upon warming and ventilation appear, and a sensible remark is made as to the absolute necessity of some motive power to give force to the adit of impure air, however heated, showing that holes alone will not always do this; however protected from downward drafts—as some adepts seem to think. The illustrations in this serial, which appears every Saturday, are not numerous, but they are generally unostentatious and to the point, and are well executed.

A facade of an iron church in course of erection by the Novelty Iron Works is exhibited, which, for the sake of truth in art, we hope will not be often repeated throughout the country. Iron buildings by the way are numerous in New York, and are often of enormous dimensions. They are generally painted white in imitation of marble, and are usually profusely ornamented. The editor seems very proud to be able to announce to his readers—in large capitals—that "Henry Ward Beecher is positively engaged as a regular contributor," and short articles accordingly appear from that gentleman's pen in the "Home Department." One is on "Too many Irons in the Fire," in which the writer says it is impossible for a workman to have too many, meaning that an artisan cannot make himself master of too many trades. He says,—

"A working man should be anxious to understand every trade that touches his trade. A man with a single trade is like a knife with a single blade. Every blade in addition makes it a better knife, up to the point when it becomes too bulky for convenient use. And this figure very well illustrates the benefit of being able to pursue several different avocations. If the blade of a one-bladed knife breaks, there is an end of it; but if it has two blades, it is serviceable yet."

The architectural designs in this serial are principally of cottages and villas, which seem simple and convenient, and are not noticeable in any special way excepting for the unaccountable omission of all external evidence of chimneys, although fireplaces of usual construction appear in their proper places in the plans (see pp. 56 and 69). From the details of cost we gather that expenses of building have largely increased in the United States, and that they must be in excess of our prices as now ruling here.

The *American Builder and Journal of Art* is somewhat similar in scope to the last mentioned serial. It appears once a month only, and contains a number of short, well-arranged papers of an interesting and useful nature. We find from them that, ingenious as American artisans undoubtedly are, they have not forgotten to apply their cunning to all sorts of tricks in building and that "scampering" builders and crafty land lords are to be found as plentifully there as here! The editor seems to feel this so strongly that he makes it the theme of his personal chat with his readers. Thus he moralizes:—

"And we would like to express an opinion here of the character of many men who build houses in Chicago to rent. In our opinion they are not saints. Their houses will not be preserved as miracle-working relics. When these men die, and they die slowly, their remains will not be disturbed. But where will their spirits go? Will their spiritual houses be constructed of green lumber, and will the poor souls pay exorbitant rent in a land where cobwebs pouring through chink and cranny will cause the naked souls to shiver? We hope these conscientious builders will yet reform; we trust they will repeat our builder's purgatory greets them."

The frequency of fires in America is often alluded to, and if the statements of the Fire Marshal of New York are to be relied on, two thirds of the fires in that city are traceable to the use of short hot-air furnaces.

A short practical paper appears on rat-proof buildings, beseeching the aid of skilled architects to contrive some reliable mode of rat-proof construction, and offering some startling statistics of the ravages in Chicago by these destructive rodents.

The illustrations are of large commercial buildings already existing in Chicago, which, though possessing but slight architectural character, seem commodious and serviceable, and country residences of moderate size. In the latter, Mansard roofs seem to be the prevailing features, with an odd jumble of details which we notice here and elsewhere, the designers a careful to claim as "French." In these decorations are principally wooden embellishments on brick walls. The execution of the illustrations is fairly good, and the buildings represented are undoubtedly useful examples for a practical people, but they are not very instructive.

tive as artistic models. The letterpress is, however, copious, and the articles are written in a pithy style. In fact, on reading the various publications now before us, we are struck with the agreeable absence of what the Americans themselves call "tall" writing, and congratulate the writers on their simplicity of diction as well as on the practical value of their remarks.

The *Architectural Review and American Builders' Journal*, is a magazine of considerable literary pretension. It appears monthly, is printed in large type, and is somewhat widely spread upon the page. The contents show rather more of the process called "padding" than the periodicals before alluded to, and the arrangement of the articles is not nearly so well preserved. The editor apologises for the difficulty in obtaining engravers of architectural subjects, and regrets that "American engravers have not as yet seen fit to pay much attention to the study of architecture, and especially in the minutia of details." He, however, seems to overlook the fact that something is required also of the draughtsman, and that the latter must do his part before the engraver can have a fair chance. The illustrations are inferior to some in the other similar publications we have looked over, and as most of them are designs by the editor himself, there seems less reason for their being carelessly or inefficiently produced. A portion of the magazine is devoted to descriptions of European examples, and a series of papers appears on "The Ministers of England," giving short notices of Canterbury and York, pleasantly and instructively written. Landscape gardening receives much attention in America, so accordingly papers are given thereon, which, like many on the same subject, are too theoretic to be of any real use. There are in fact but very few general rules that can be laid down as to the practice of this delightful art, and although no subject is more pleasant to gossip upon, or can be more agreeably and poetically treated by a ready and fanciful pen, it is very difficult to give any really useful directions excepting in the most general and cursory manner.

In an article upon Street Architecture, the editor deprecates the hypercriticism of his English brethren, who, he says, ought to be taken to task for at times undeserved severity. He says,—"Even the *London Builder*, usually disposed to be lenient to our errors of judgment, spoke in one of its leaders of the American tricky use of wood as a means of embellishment. Now no people in the world have more to answer for in the 'tricky' sense than the English builders. The most palatial terraces of the fashionable West-end of London are but mockeries, a sham, a composition of plaster on lath. And of such are the most of those grand compilations of London street-architecture." The writer forgets that it was not wooden buildings as such that were found fault with, or the wooden ornamentation thereof, but the imitation of stone by paint and sand upon the wood, and the almost constant use of wood for decorated portions of expensive stone buildings, for which there seemed no excuse. The editor's fellow-countrymen have pointed out, how even the Fifth Avenue itself is a sham as to much of its seeming stone work, and that the costly marble Grace Church has a wooden spire crocketed and elaborately decorated, but painted white to look like the rest of the material. But let this pass; we have plenty of our own shortcomings, and have no wish to toss back and forth unkind countercharges.

We are glad instead to be able to congratulate our American friends on a sudden outburst of architectural periodical publications, and to heartily wish them God-speed in the cause of industrial and artistic progress.

MATERIALS FOR A HISTORY OF OIL PAINTING.*

LADY EASTLAKE informs us she has been obliged to make some alteration in the first of the chapters of the second volume of "Materials for a History of Oil-painting," left in a state of preparation by the late president of the Royal Academy. Sir Charles Eastlake had followed Vasari in looking upon the Portinari chapel, in Maria Nuova, Florence, as an important centre of the productions of early effort in oil-painting, or that it had formed a kind of nursery of the art of oil painting in Central Italy.† Certain of some inaccuracies in Vasari, and suspicious of

more, he does not, however, seem to have discovered any error here. But the researches of Signor Cavalasolle have shown that the chapel was not the scene of the fresco by Andrea del Castagno and Domenico Veneziano; for though the records of the hospital attached to S. Maria Nuova prove that both worked there, they also show that an interval of six years occurred between the termination of Domenico's long labours and the commencement of those of Andrea. Moreover, it is ascertained almost beyond doubt, that they did not practise what is called oil-painting. They used oil, as the records also show, but this was in common use in processes of wall-painting, long before the invention of oil-painting. The Portinari family were not the less patrons of art, and, Lady Eastlake considers, as partners of the Medici and agents for them in foreign parts, and in their employment of Memling and Hugo Van der Goes, they occupied a position in Florence, with a corresponding influence on Florentine art that should not be unrepresented. She has, therefore, not plucked them from the page altogether, but simply suppressed such passages as later investigations have proved to be incorrect. Dante's Beatrice, Folco Portinari, who founded the hospital above mentioned, and employed Cimabue to depict of a Madonna for its chapel. With the exception of the omission, then, of the statement of the joint practice of oil-painting by Domenico Veneziano and Andrea del Castagno, in the chapel of this family, no alteration has been made in the materials edited by Lady Eastlake. They are supplemented, however, with a series of professional essays written by Sir Charles for publication, but which have hitherto lain by, notwithstanding some of them were written more than forty years ago.

The productions of the brothers Pollaiuoli are now believed to be the earliest examples of Italian oil painting extant. An account of these artists, with a notice of Antonio da Messina, the Sicilian, who visited Flanders to learn the secret, occupies a large portion of the first chapter. Their works are described, and the dates of them given; and the slow progress the new art made at first indicated. The Florentine artists could admire the drawings and designs of these masters, but their method found no great favour with them. The old preferred the manner with which they were accustomed to the innovation, and even young and rising men, influenced by these, doubtless, hesitated to accept the new practice. Domenico Ghirlandajo sentiment when he said that painting consisted in sure durability was mosaic. The experiments that with Hubert Van Eyck arrived at the result that was at first so little appreciated are next given with every technical detail. Resistance to humidity was one of the great points gained by his process; and for a long time this was the only quality the Italians allowed it to possess. They confined the use of it to out-door objects where its imperviousness to damp was a consideration, such as standards carried in processions, canopies, and, Sir Charles adds, caparisons for horses. But at the time that Pollaiuoli was painting his celebrated picture of St. Sebastian for the chapel of St. Sebastiano a' Servi, which was the first example of the application of the new mode to altar-pieces, there were three young men studying with Andrea Verocchio, who eventually embraced the new style with rapture, and created an enthusiasm in its favour. These were Pietro Perugino, Leonardo da Vinci, and Lorenzo di Credi. Their progress with that of the method and modifications they adopted are next minutely described, their movements followed, the society by which they were surrounded indicated, and their works enumerated. Here we have a sight of Leonardo as he went about Milan, quoted from a contemporary writer:

"He was wont to go early in the morning,—I have often seen and watched him,—and ascend the scaffolding (for the picture of the Last Supper is somewhat high from the ground); he would continue painting there from sunrise to twilight, forgetting his meals, and never laying aside his would not touch the work; yet, he sometimes stood for an hour or two in the day merely looking at it, and as if passing judgment on his figures. I have also seen him (as July sun, from the Corte Vecchia, where he was modelling what depends horse in clay, and hasten to the Madonna delle Grazie, there, having ascended the scaffolding, he would take his pencil, and, after giving one or two touches to the figure, he would sit all at once quit the convent."

The next figure that is made to walk across

* About the height of a man; not more.

the canvas is that of Francesco Francia. In the notice of the works of this artist, as of those just mentioned, the most minute technicalities are elaborately dwelt upon. His treatment of the darker colours and deep shadows, the solidity and fusion of his flesh tints and other distinctions are explained with greater fullness than the subjects of his pictures. At every page we are impressed with the fact that this history of painting is the work of a painter, for painters. Sir Charles thus accounts for the fact that such technicalities have been hitherto unnoticed. He says the impressions which great works produce upon the mind are so removed from the consideration of their mechanical parts; but his attention is professedly confined to these material qualities. Hence he has shown us Francia, as indeed Leonardo, Perugino, and the other artists mentioned, not in grand reveries of visions of inexpressible beauty, but as busy with varnishes, distilling oils, grinding colours, determining grounds for shadows, vehicles for lights, hatching, scumbling, and covering too hastily considered work with "pentimenti" or after-thoughts. "There are several pictures under it, some better, some worse," said Sir Joshua Reynolds of his painting of the "Infant Hercules;" and many of the Italian masters might have made the same remark of their chefs-d'œuvre. Raffaele, Fra Bartolomeo, Mariotto Albertinelli, are next successively examined from this technical point of view. Then are arraigned Ridolfo Ghirlandajo, Granacci, Bugiardini, whose flesh tints are described as less thin than those of their predecessors, and their darks more prominent than lights; and after them Andrea del Sarto, and his friend and fellow-worker, Franciabigio, are examined, and the "transparent system" of the former noted, as expressed in thin flesh, prominent darks, and blues, and greens being protected with vehicle, as well as lakes in a less degree; and his ultimate practice of the "semi-solid system" as exemplified in his copy of Raffaele's "Leo X."

Correggio is treated at greater length than any other painter. First of all, the unpleasant association of his name with poverty is discovered. "The great painter, though not wealthy," we are told, "was in easy circumstances, and was sufficiently well paid, as appears by existing contracts and receipts, for the works he undertook. The works themselves—among others, the cupolas of two churches—would not have been confided to an indigent professor; and, as Lanzi and others justly remark, the artist himself spared no time, study, or expense in the execution of the important commissions he received, and grudged no outlay on the materials of his pictures. Documents further prove that purchases of land were the result of his increasing fortune, and that his family inherited from him a considerable property." Thus removed from the once current tradition that he was a spectacle Seneca tells us the gods look upon with pleasure, a virtuous man struggling with misfortunes, Correggio still stands before us an unappreciated man. Art-critics are so absorbed with interest in the early Italian and Flemish schools, according to Sir Charles, that they have yet no sympathy for the great painters of Venice and Parma; and a representative of "the new German tendency" even goes so far in the path of depreciation as to date the moral decline of art from "the effeminate Correggio." His occasional trivial treatment of sacred subjects, his unsatisfactory arrangement of drapery, his want of attention to the leading lines of the architecture he was called upon to embellish, his "hot shadows," and other defects, are freely acknowledged; but the effect of these is overpowered in the warmth of the recognition of his fascinating and delicate powers of light and shade, the sweetness, richness, and homeliness of his "transcendent genius." The foreshortening of the human figure seems to have occupied this painter's attention and care. Some of the figures in his cupolas could not have been drawn except by the aid of clay models, as they are in positions it would be impossible for living models to sustain. Such assistance as he required in this matter was given him, Sir Charles concludes, by Antonio Begarelli, of Modena. A rapid glance at his works in their chronological order, with remarks on his technical methods and materials in each, follows:—

"Every method was familiar to Correggio; the drawings and studies for his frescoes, which are preserved in various collections, are generally executed, or at least completed, in red chalk, and exhibit the most profound knowledge of foreshortening, the most delicate feeling for roundness, and a thoroughly practised hand. His love of gradation

* Materials for a History of Oil Painting. By Sir L. Eastlake, P.R.A. Second volume. London: Longmans, Green, & Co., 1869.

and of the impenetrable union of half-tints led him to use the 'stump,' or some similar mechanical means. Among other materials, he appears sometimes to have employed coloured crayons, or, at all events, to have produced drawings similar to crayon drawings."

In a minute manner is Correggio attended throughout all his undertakings, till his death at the age of forty. His beautiful finish and softness are attributed in some degree to the perfection of the under-painting, the nature of which is also elaborately described. He is supposed to have used amber varnish; which supposition has been thought to be recently confirmed by the analysis of a portion of a damaged picture, by the late Professor Moreni, of Parma. But it appears to us there is rather an uncomfortable degree of uncertainty yet attending this inquiry, because, as related by Sir Charles, the particular fragment analysed was a part of the "Procession to Calvary" in the gallery at Parma, which, though attributed by some to Correggio, is by others supposed to be the work of Anselmi. The last chapter relates to Venetian methods, as practised by Giorgione among others; and here, says Lady Eastlake, "the manuscript of the second volume of 'Materials for a History of Oil Painting' stops short." To remedy this incompleteness the selection from the professional essays and memoranda, we have mentioned, was made. The first of these is upon colour, light, shade, and Correggio. Here we have the difference in the technicalities of the Venetian and Flemish schools again defined with a precision that must be grateful to students when first brought to a contemplation of their mysteries. This is followed by remarks on the necessity for definitions, on negative lights and shades, natural harmonies, contrasts, finish, space, and effect; some of them being expressed in a few lines. Chiaroscuro preparations are gone into at greater length: indeed, it would be unreasonable to require more exact descriptions of processes than are here given. The painstaking with which the essays on oiling out, on vehicles for shadows, on transparent painting, on warm outlines and shadows, on toning, texture, scrubbing and retouching, and glazing, is a remarkable feature. In an essay on "the gem-like quality," in which it is remarked, forcibly, that it is a defect in a picture for anything in it to be capable of being likened to something else, we have an amusing summary of some terms in use in art-criticism:—"A picture, for instance, is said to be golden, to be silvery, to be gem-like, to be mossy, to be woolly, to be wooden, to be tinny, &c.," out of which list the term gem-like is considered most laudatory, because it includes such qualities as nearly sparkling, velvety, glittering, pure, and definite. The mode of attaining this appearance is detailed. That no labour should be apparent is another truth impressed in these essays. "The idea of power is always conveyed when we have an impression that the actor, whatever he may be doing, can or could do more than he actually does, that the strength shown is only a part of the strength that might be shown." In support of this statement we are given Addison's reply to a reproach from a friend for having sent him a long answer to a letter, "I had not time to write a short one." How to compose and paint a single head is the subject of a strotfully professional paper. This is followed by one of more general interest on subjects for painting, in which it is laid down that though in descriptions the actors should be "morally interesting," in a picture it was necessary that what is being done, more than who is doing, should be of interest. Michelangelo, in his choices of subjects, disdained to paint cloth, and delighted to depict the human form nude, from a desire to express Nature in its grandest aspects. This feeling, in different degrees of intensity, has actuated, and will continue to actuate thousands. Human beings must ever be the most interesting subjects for paintings; and of these the youthful and beautiful will over be the more admired. The author says "the exhibition of female beauty will always first attract the eye. But although interest in the object and beauty in colouring may be thus secured, a picture may still need some moral interest—that is, the feelings must be interested; and, lastly, the intellect may be addressed by as much attention to costume or history as can be kept subordinate to more proper claims." The volume concludes with a fragment from a journal book of 1828, on the means and end of art, in which it is shown that the primary appeal made by art to the senses should be connected with another addressed to the feelings, prompting noble and ennobling aspirations and sympathies.

ON TECHNICAL EDUCATION IN FRANCE.

BY A GRADUATE OF THE ÉCOLE CENTRALE.

In describing the system of technical education as it existed in France in 1853, when I left the "École Centrale," I shall endeavour to show that our neighbours are better supplied than we are with schools or colleges for the study of the applied sciences, a branch of education almost ignored in England, as will be seen hereafter.

Technical education, as recently defined by Mr. Gladstone in a public meeting, includes professional education; in France, the expressions *enseignement technique* and *enseignement professionnel* signify two different things: the former implies just as much as it is necessary to acquire proficiency in the useful arts, the latter includes the higher branches of the applied sciences. It must not be supposed, however, that science and art are strictly separate; on the contrary, they are taught together, as one assists the other, and the rudiments of both are considered in France, and I believe justly, to form the basis of a serious education. Literary education is not considered or referred to in any way, for obvious reasons, in this paper.

The *enseignement technique* begins in the "Écoles primaires," or "Schools of Elementary Instruction," which are supported by the "Communes." In these schools young pupils learn reading, writing, grammar, arithmetic, mensuration on the metric principle, and drawing, more or less, usually ornament.

The instruction commenced in the "primary" schools may be completed in one of the four following schools, called "Écoles d'Arts et Métiers," viz.:—Châlons, Angers, Aix, St. Étienne. The three first are considered the best for foremen, and managers of works or manufacturers; the last is especially devoted to the training of colliery viewers, or managers of mines. This school is known as the "École des Mineurs" (not "des Mines"), and has acquired no little celebrity from the fact that Boussingault, the eminent agricultural chemist, and Fourneyron, inventor of the turbine, studied there together.

The courses in these four schools include mathematics, drawing, surveying, and the rudiments of chemistry and physics.

The institutions reserved for the *enseignement professionnel* are so numerous that I cannot make an accurate nomenclature of them without referring to official documents, which are out of my reach at present; here is the list to the best of my recollection:—

Mathematics.—Collège Sainte-Barbe, Louis-le-Grand, Collège de France, Collège Chaptal, École Polytechnique (Paris).

Chemistry.—(Natural Science) Sorbonne, Jardin des Plantes (Paris).

Fine Arts (drawing, painting, architecture, music).—École des Beaux Arts (Paris).

Medicine, Surgery, Anatomy.—École de Médecine, École Vétérinaire d'Alfort (Paris).

Artillery and Military Engineering.—École d'Application de Metz (Moselle).

Navigation.—École Navale de Brest.

Woods and Forests.—École Forestière de Nancy (this school is only for the civil service).

Civil and Mechanical Engineering.—École Impériale des Pons et Chaussées, Paris.

Mines and Metallurgy.—École des Mines, Paris.

Practical School (Arts, Manufactures, Civil and Mechanical Engineering).—École Centrale des Arts et Manufactures, Paris.*

* THE ÉCOLE CENTRALE.—This unique school is due to the initiative of the late M. Auguste Perdonnet, our kind friend and adviser, whom the students were accustomed to call "Father." His life was spent in endeavouring, with variable success, and notwithstanding the most strenuous opposition on the part of the public functionaries, to introduce in France liberal, and especially English institutions. His greatest achievement, probably, was the foundation, with the assistance of the late Laval, and of several eminent professors, of the "École Centrale des Arts et Manufactures," on a plan and principles quite unprecedented in France. This school, which is entirely self-supporting, is at the same time "technique" and "professional," being equally efficient for manufacturers and for consulting engineers. The tuition costs about 32l. per annum for three years, and for out-door pupils—no boarders being admitted. In my time there were eighteen professors, many of whom were eminent men. The diplomas awarded by the Council of the École Centrale are generally recognised on the Continent as a sufficient guarantee of professional capacity.

The courses are divided into four departments, or *spécialités*:—

1. Builders (*constructeurs*), including railway engineers.
2. Chemists, or manufacturers.
3. Machinery.
4. Metallurgists.

The École Centrale is represented all over the world by engineers, manufacturers, townsmen, and professors. A free library for the working-classes has been added to this school within the last few years; and free courses of lectures, similar to those of the "Conservatoire des Arts et Métiers," have been instituted by M. Perdonnet,

Three of the institutions I have just enumerated are what I call special district schools; that is to say, they are placed in the districts best suited for the acquirement of the arts and sciences to which they are devoted. These special district schools are the Naval School, in the military harbour of Brest; the School of Forests, in the wooded valley of the Menrthe; and the School of Miners, in the coal-district of the Haute-Loire (St. Étienne). The School of Metz may also be considered a special district school, being surrounded by hills, affording good practice in military, and especially in "contour" surveying.

The above educational establishments are mostly maintained at the expense of the State; they are all under the control and supervision of Government.

Some of them are the exclusive property of the State, and admit only of in-door pupils, being destined to train students for the public services: École Polytechnique, École Forestière, and École d'Application.

Others are maintained by the State, but are open to all comers—students paying fees for examinations, but not for the lectures: École de Médecine.

Those of Châlons, Aix, Angers, and St. Étienne are supported by the State.

The École Centrale is entirely self-supporting. Most of the institutions enumerated above are of recent foundation, having been established since 1789. The École Polytechnique was instituted by Monge, by order of Napoleon I.

The schools or colleges are liberally supplemented and assisted, first by the numerous libraries and museums, which are maintained at the expense of the State in all the large cities; and, secondly, by several establishments, such as the "Conservatoire des Arts et Métiers," where courses of lectures are open gratuitously, to all students, for a season of three, four, five, or six months. These courses are very numerous. The evening lectures are especially organized for the working-classes, although no distinction is made in admitting students. In Paris the public lectures usually begin in November, ending in April or thereabouts.

But the most wonderful instance of Government liberality is in the chemical laboratories of the École des Mines and of the Jardin des Plantes. In the former, any person bringing a specimen of a mineral will receive an analysis of it, free of expense; in the latter, students of any class or age (provided they have a sufficient knowledge of chemistry) are initiated, gratuitously, in the mysteries of chemical analysis, under the supervision of eminent professors.

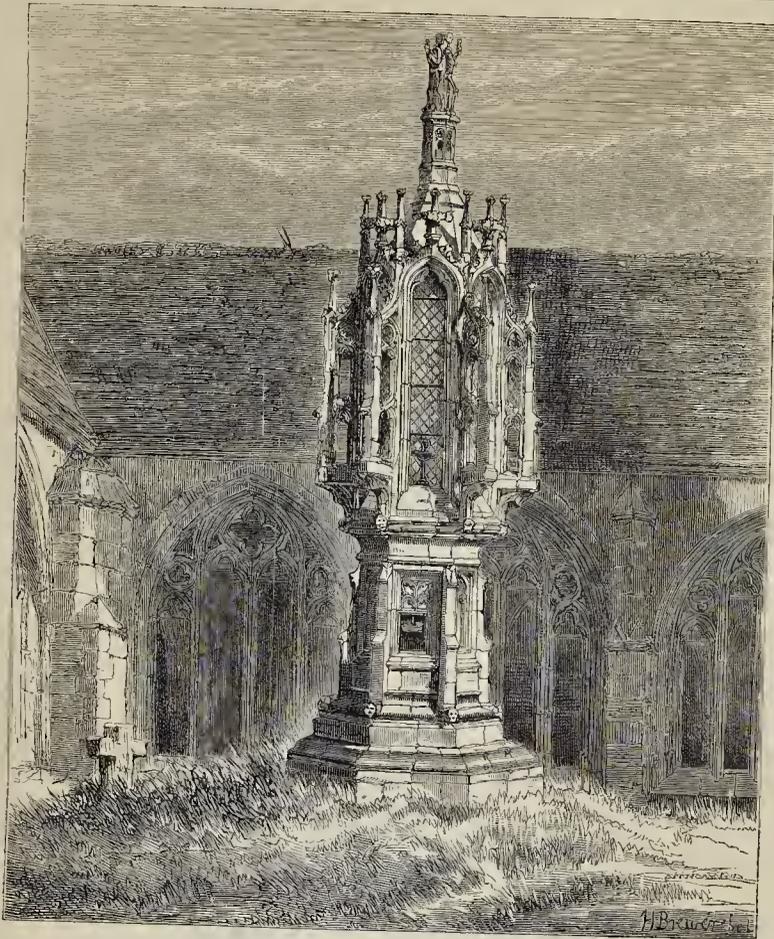

There is, probably, no country in the world, not even Germany, offering such facilities for studying the applied sciences as are found in France, and especially in Paris.

The French educational system includes art, pure science, and applied science. The strength of France is undoubtedly in the latter. If we inquire, with the assistance of a good biographical dictionary, which of the civilized nations has contributed the most to the progress of art and science, we shall find that in pure science England stands unrivalled; that our list of inventors is so long as to equal, probably, that of all the inventors of the European continent put together; whereas in the applied sciences we are far behind the French. As to art, we may not be on the top of the list, but we have schools of art, such as South Kensington, which ought to be sufficient to maintain England's reputation in that respect.

Bursaries.—In all the schools or colleges recognized by the State, a certain number of poor students are admitted to follow the courses or classes without paying any fee or subscription. These students (*boursiers*) are elected among the most talented and promising students in the junior classes; for instance, if a pupil has distinguished himself in the "École Primaire," being deserving of assistance in other respects, he will be admitted to any of the upper classes without payment; on two conditions, however:—1st. He must be recommended by his previous professors; and, 2nd. He must pass a preliminary examination.

Results.—The following are the most palpable results of the French system of technical edu-

with the assistance of the professors. There are too many gratuitous lectures in France; the working-men attach little value to them, and frequently go to the lecture-rooms merely for the sake of warming themselves at the expense of the Government. Very few follow the courses regularly from first to last; and I have seen many bring their own newspapers to the "Amphithéâtre," and read them during the lectures.

ANCIENT CEMETERY LANTERN, MÜNSTER CATHEDRAL, WESTPHALIA, GERMANY.

education as described above, that is to say, "enseignement technique et professionnel".

1. The poorest and most obscure student may acquire reliable scientific information, and gradually raise himself to the highest positions in the world of arts and sciences.
2. The army and navy are constantly supplied with officers of first-class talent and ability.
3. Managers of manufactories, or of mines, and ironmasters, being accustomed to calculate forces and materials with precision, are able to work economically; that is to say, to obtain the greatest results with the smallest possible expenditure.
4. Graduates of some of the special schools, but especially of the Ecole Centrale, are disseminated all over the civilized world, spreading the arts and sciences, and furthering the progress of engineering, trade, and manufacture.

Conclusion.—The above suffices to show that the applied sciences constitute the strength of France.

We may take a lesson from our neighbours. We have schools of art, and unrivalled engineering works. What we are deplorably deficient in is schools for the applied sciences. There is no institution in England to be compared to the Ecole Centrale. We have few, if any, special district schools, such as that of St. Etienne.

I have no information on technical education in Germany. I expect it will be necessary to copy some of the German, and some of the French, institutions. I do not suppose it will be difficult to obtain information from Austria, Prussia, and Belgium. As to the French, I have

lived long enough among them to be assured that they will communicate all requisite particulars, and answer any reasonable request, without jealousy or *arrière pensée* of any kind.

I would suggest, however, not to copy foreign institutions too closely; and I think that the "special district" system I have alluded to could be extended in England with advantage. If my opinion on this subject were of any value, I should advise reserving London for the purely scientific schools, and placing the special establishments in the provinces; for instance:—*Mines and Metallurgy* in the Black Country, or in South Wales; *Mechanical Engineering* in Manchester; *Chemistry* in Glasgow; *Hydraulics* in the West of Ireland,—the foundation of a college in the West of Ireland would, perhaps, counterbalance, to a certain extent, the evil results of absenteeism; *Navigation* at Plymouth or Liverpool; and so with all the departments. The special district schools would offer the unquestionable advantage of being accessible to mechanics.

I see no reason why the technical schools of England should not be self-supporting, as the Ecole Centrale, though it might be expedient to apply to Government, in the first instance, to raise the required capital.

W. O'BRIEN, C.E.

Feversham Memorial.—On Monday the foundation-stone of the memorial of the late Earl Feversham, consisting of a market cross, was laid at Helmsley by his son, the present earl.

CEMETERY LANTERNS.

Our illustration represents a very perfect and beautiful cemetery lantern existing in the court of the cloisters at Münster Cathedral in Westphalia. It will be seen upon referring to our engraving that the glazing and pulley are still perfect, and we know of very few examples where this is the case.

It is highly probable that in the Middle Ages every cemetery possessed one or more of these lanterns, which were lighted upon All Souls' Eve and other anniversaries. Those who have lived in Roman Catholic countries will doubtless remember the illumination of the churchyards on All Souls' Eve. We remember seeing the cemetery at Würzburg, in Bavaria, lighted up by several hundred little glass lamps. In many parts of Germany the graves are supplied with metal and sometimes stone lanterns for this purpose. Ancient stone lanterns of this description attached to graves may be seen in the cloisters of Ratisbon Cathedral.

We are not aware of the existence of either cemetery lanterns or lamps attached to tombs anywhere in England, but some have been of opinion that the Irish round towers were used for this purpose.

Germany is very rich in cemetery lanterns, most of the churches in Bavaria possessing one or more ancient examples. The most perfect ones we are acquainted with are to be found at Ochsenfurth, Grünfeld, Ratisbon, and Saltzfeld. At Hadringfeld is a cemetery lantern attached to an ancient stone pulpit in the churchyard.

ACOUSTICS AND BUILDINGS.

Two lectures on this subject have been delivered by Mr. W. Fletcher Barrett (of the International College, Springfield) to the Royal Engineers at the Brompton Barracks, Chatham. We print a portion of them:—

The reflection of sound has often been used as a valuable auxiliary in the acoustical arrangement of a building. One of the most remarkable instances of this kind was published in the *Philosophical Magazine* for 1830. A church had been erected in Sheffield in which the preacher was altogether unheard, however great his exertion. Various unsuccessful expedients were tried until the incumbent, happily in this case a scientific man, had a large parabolic reflector of light wood constructed and so suspended that the pulpit was in the focus of the parabola. By such an arrangement the rays of sound issuing from the focus of the mirror would be thrown forward as a parallel beam. The consequence of this was that every word uttered in the pulpit could be distinctly heard throughout the church; indeed, the speaker was more distinctly heard at the far end of the church than at the intermediate portions, because this parallel beam of sound was directly cast upon those in the distant gallery. Unfortunately, however, the reflector acted in both directions. If any one whispered in that distant gallery the sound of the whisper was gathered into the focus of the reflector. The preacher placed in that focus thus heard all the remarks that happened to be made by the people sitting in the gallery, and, as it was anything but pleasant to preach and listen to criticism on the sermon at the same time, the reflector after awhile had to be taken down. The inconvenience of this reverse action might in some measure have been obviated by placing the pulpit not perfectly in the focus of the reflector. In St. Paul's Cathedral a metallic mirror was successfully used to prevent the passage of sound into the roof, and thus removed the unpleasant reverberation which before ensued when the building was used for the evening services. The mirror here employed was of hyperbolic section, placed over the pulpit with the convex side downwards. The sound of the preacher's voice falling upon this convex surface was thus prevented ascending into the dome, and was reflected down upon the people below, who, in consequence, heard with much greater distinctness than those in the gallery on either side. Many other useful applications of the reflection of sound to remedy acoustical defects in buildings might be given, but these will be sufficient to show that, with judgment, you may either properly avoid, or safely seek, its aid in the structures you may be called upon to erect or acoustically to improve.

As already remarked, the reflection of sound explains to us the cause of echo, often so serious a defect in a building. In fact, upon the right use of reflection, or the wrong use of it, depends, to some extent, the right or wrong acoustical construction of a building. Bear in mind, then, that whilst any smooth surface will reflect sound, a broken or rough surface will disperse or absorb sound. Hence, when we wish to get rid of the echo in buildings, if the echo proceed from a distant wall, we may hang curtains or carpets over that wall, and the sound striking the wall will then be absorbed. If the echo come from the roof, hanging a sail-cloth or drapery overhead will cure the defect. Some such simple plan as is here indicated has been generally found to destroy echoes in badly-constructed buildings, and several instances of its success have occurred in my own experience. By breaking up the reflecting surface we accomplish the same end as by placing a curtain. If, therefore, the ceiling be broken up with rafters, or interspersed with hollows, or the end walls have recesses of any kind, we shall have echo, to a certain extent, prevented.

Owing, therefore, to the disturbance arising from reflection you will see why a room of a rectangular form, with a flat ceiling, a flat floor, and flat walls meeting the ceiling and floor at right angles, is a room constructed on bad acoustical principles. Within certain limits the more you depart from this principle the better will your building be for acoustic purposes. Make one of the dimensions of your room longer than the other, and curve the ends of your room and you will improve the acoustic properties of your structure. Make your ceiling not flat, but curved—as the ancients were fond of doing, and as Sir Christopher Wren has done in many of the churches he has built—and you will have a

better building to hear in. Acoustically speaking, it is better also to have a low ceiling rather than a high one, because thereby the decay of sound in one direction is lessened, and if your ceiling be very low your room practically becomes a huge speaking-tube.

I must now allude to an effect which has been very obscurely understood until recently, when the investigations of Mr. Scott Russell have thrown considerable light on the subject. It is found that if a speaker be placed very near a wall the sound of his voice is wonderfully lost, whereas if he stand at some distance from the wall he is heard very much better. Frequently I have noticed, when speaking close to a wall in some regularly-constructed hall, that the sound of my voice has completely traversed along the walls of the building and come back to me again, while I have felt an utter inability to make the audience hear. Now, the chief cause of this may be deduced from Mr. Scott Russell's experiments on waves. That gentleman has established the fact that when a wave of water meets a rigid unbroken obstacle, it is regularly and wholly reflected if the incident angle be greater than 45° . If, however, it make an angle of less than 45° , the wave will be imperfectly reflected; and if the angle of incidence be 30° , or less, the wave is not reflected at all. What then becomes of the wave? It rolls along the reflecting surface. If, then, a water wave strike a river-bank at a less angle than 30° —say at a quarter of a right angle,—instead of bounding

form of whispering-galleries, there is another, arising from the nature of the sound uttered. Loud open words are not propagated through such galleries with anything like the facility of a subdued whisper; in fact, to be heard at all you must speak softly. Now, it is the sibilant character of a whisper that gives it this peculiarity, and there is evidently much of interest and much yet unknown in the singular behaviour of sibilant sounds. Curiously enough, taken in connexion with what I have just been saying, the Astronomer Royal long ago arrived at the conclusion that the sounds of *s* or *z* resemble in their mode of propagation the rush of a bore on a river, and has compared them to a broken-headed sea, which meeting an embankment is not regularly reflected as the larger waves would be, but runs along the bank as a roller. The same authority also states that sibilants are not capable of being returned by reflection like an ordinary echo; and I may add a further peculiarity, viz., that it is this class of sounds which have the most profound effect on those recently-discovered and wonderful phoscesopes, sensitive flames.

I wish now to direct your attention to a further illustration of the value of a curved over a flat surface for the reflection of sound. You will remember what I said in the last lecture regarding the loss of sound by rolling round the walls of a building, a phenomenon which occurs when the sound-waves meet the wall at a very oblique angle. Now, let S, fig. 1, be a speaker standing

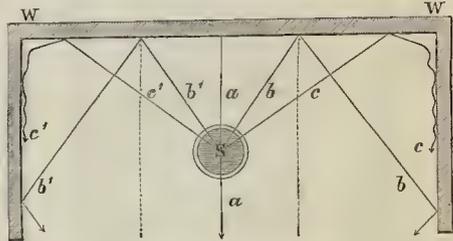

FIG. 1.

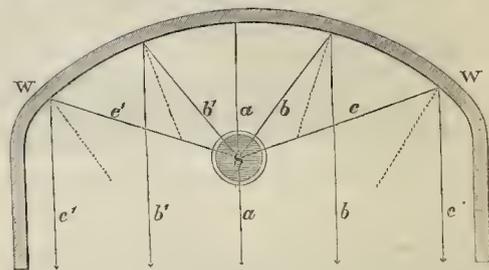

FIG. 2.

off on the other side, it will cling to the bank and thenceforward progress as a roller. You can often notice this effect when on board a river-steamer; the commotion produced by the paddle-wheels constantly diverges from the source, and when it reaches the banks frequently strikes them at an angle of less than 30° , and a long roller spreading along the shore is the result. Well, the wave of sound is in every way analogous to the wave of water. When that portion of my voice which reaches the wall strikes it at less than 30° , no reflection takes place, but a roller of sound proceeds around the room. Now you will understand why a pulpit placed near a wall is in a bad place; because you have the speaker's voice striking the wall at a very obtuse angle, a large portion at less than 30° , and hence the sound goes rolling round the building, often coming back to the speaker himself, so that he hears a distressing repetition of his own voice. If the acoustic defect of a building be of this kind, it may be obviated by placing the speaker farther from the wall, breaking up into recesses the wall behind, or fixing a suitable curved reflector behind the speaker.

This rolling of sound is undoubtedly the chief cause of the effect noticed in whispering-galleries. For here the voice is purposely directed along the wall, so that almost the whole of the sound strikes the surface at an angle under 30° . But besides this cause, and also the semi-tubular

near to a flat wall, W W. The sound diverging in all directions from S, will strike the wall at every angle. Let us consider the three rays of sound a, b, c; the first will reach the wall W W perpendicular to its surface, and will be reflected straight back in the direction of the arrow; b will strike the wall at an angle, but still, nevertheless, will be reflected; c reaches the wall at an angle approaching 30° , and consequently is not regularly reflected, but thenceforth propagated in part as a roller round the room. This of course occurs with all the rays falling on the two extreme ends of W W; and you will further notice that the nearer S is to W W, the greater the obliquity of the incident rays, and the larger will be the number of rays than abstracted from the total volume of sound.

But imagine the more distant portions of W W to be bent forward, the incident rays remaining the same, they will now meet the wall at a less oblique angle, and this is the point to be gained. Hence, as will be seen from fig. 2, those rays which before were not reflected are now sent forward with the others. Still more perfectly would this be the case if the wall had a parabolic curve, and the speaker were placed in what would be the principal focus of that curve.

* That is, 30° from the reflecting surface. I have put it thus for the sake of simplicity, but usually the angle is measured from the normal to the reflecting surface.

There is such a thing as a complete sound shadow, and there is a partial sound shadow, corresponding to, though not produced in the same way, as what in optics we should call an *umbra* and a *penumbra*. Hence, just as we require a clear line of sight to see a speaker well, so we require a clear line of sound to hear a speaker well. Architects have sought to obtain this by a proper arrangement of the seats in a building. Perhaps one of the most successful forms which has yet been adopted is that by which the seats in a building are not arranged in a perfectly straight line gradually rising upwards, but in a curved line. In this way the sound of the speaker's voice, unobstructed in any way, can reach the persons on those seats. Such a curved arrangement has been termed an "isocoustic curve," and I believe has proved successful in those buildings where it has been tried.

We must now turn our attention to another and most important point in the acoustics of buildings; viz.—The reinforcement of sound. Every one knows that in some buildings it is extremely difficult to make an ordinary voice heard beyond the vicinity of the speaker. The speaker labours and exerts himself to the utmost, but fails to make himself heard. A gentleman once said to me, after he had been speaking in the Rotunda at Dublin, "It appears as if some one were in front soaking up my words with a sponge as soon as the syllables had left my mouth." All the efforts of the speaker are thus exerted in sustaining his voice; his attention is diverted from what he is saying, and a miserable failure is often the result. On the other hand, we all know that in some places large audiences can be addressed with perfect ease, the reaction of the attentive listeners upon the speaker giving increased strength and stimulus to his utterance. Now, can we discover the cause of this difference? The loss of sound by improper reflection does not account for it by any means, for we may find buildings on precisely the same model, and yet with very different acoustic properties. What, then, is the cause? You will notice that if there be two buildings of equal size and similar shape, and one building be better for hearing in than the other, that building will in all probability have more wood lining its interior than the other. I could not adduce a better example of this than is to be found in the theatre of the Royal Institution of Great Britain. The shape of this theatre is semicircular, with the seats sloping upwards; but the great point in that this theatre is entirely lined with wood. Imitations in the shape of this theatre have, I understand, been made in England and on the Continent, and have in some cases failed, simply from the omission of this most important item of exposed wood. Again, the recently destroyed Opera-house in the Haymarket was noticeable for its excellent acoustic properties, its structure interiorly was chiefly of wood; and so with many other buildings, both ancient and modern. The theatres of the Romans, for instance, were notable for their good acoustic effects; and these theatres were almost uniformly constructed of wood in the interior.

What, now, is the action of the wood? It is to reinforce by its own vibrations the sound of the speaker's voice. When the string of a musical instrument is caused to vibrate, by its own motion it can stir but a very small portion of air; but when this string is associated with a surface of wood, it throws that wood into vibration, and thus creates a vibratory area of much larger surface, which produces a correspondingly greater disturbance of the air. In a piano, or harp, or violin, we do not hear the sound of the strings of any of these instruments, but we hear the sound of the wood to which those strings are attached. I can illustrate this very convincingly, I think, by means of two wires which have been differently strung on to the bracket above. One is merely depending from a cord which is tied to the iron bracket. Thus arranged, this wire cannot throw any wood into vibration, for the cord completely cuts off the wooden floor of this room; the other exactly similar wire is first connected with this wooden tray, which is also suspended by a cord from the bracket. A weight of 25 lb. strains each of these wires. I now pluck the first wire; you hear no sound, for the wire by itself is incompetent to disturb the air around to any great extent. I turn to the other wire and pull it aside; immediately you notice a marvellous difference; the sound is loud and full. This increased loudness is simply produced by the wood overhead, which plays the part of an ordinary sound-board. Here, then,

as in all cases of stringed instruments, it is the vibration of the board that you hear, not that of the wire, although the latter is the exciting cause of the former.

I now wish to direct your attention to the fact that these inaudible sonorous vibrations can be propagated through a considerable length of matter, and be made to give rise to audible vibrations at the distant extremity. Here, for instance, is a wire firmly attached to that wooden screen. The wire, as we know, is a conductor of sound. If now I excite some slight vibration in the near end of the wire, by filing it, for example, the crepitation travels up the wire with the velocity of sound, reaches the screen, and there for the first time becomes audible; simply because it has thrown the wood of which that screen is composed into vibration. Now, just as that wire conveyed sonorous vibrations throughout its length, and just as that surface of wood made those vibrations audible, so the air can transmit the sound of my voice,—in one direction in the near end of the wire, and can there now be a doubt in your mind as to the action of the wood when these audible vibrations reach its surface? Not only are you aware of the fact that a sound-board behind a speaker will increase the distinctness of his voice, but you can visualize the manner by which this augmentation is produced.

Let us now inquire into the value of different materials as regards this reinforcement of sound. This important point we can at once experimentally determine by means of the apparatus before me. Here are a set of boxes, each provided with a little door at its side, which, together with the whole interior of the box, is thickly padded, for the purpose of rendering them "sound-tight." I now start this little musical-box, and, opening the doors, place it within the innermost chamber, shutting all the padded doors after it. The music of the instrument now ceases to be heard, for it has been utterly quenched by the absorbing surfaces through which it struggles in vain to pass. A small aperture, protected by little valves of felt, runs through all the boxes. Through this aperture I now thrust a light wooden rod; the wood is a conductor of sound, and as its extremity strikes the musical-box within, you hear a feeble sound of the music, apparently emanating from the free end of the rod. On the top of the rod I lay a disc of wood, and now you hear the music as plainly as if the origin of it were outside. The wooden disc reinforces the sound conducted up the rod by exposing a large surface, which can easily be thrown into vibration. Instead of the wood I now substitute this piece of slate, placing it on the top of the rod; now you perceive but little reinforcement of the sound. I take a tile, and you hear a feeble augmentation. I take a cake of plaster broken from a wall, and there is now, practically, no reinforcement of the sound. I take one of these tuning-fork boxes, made of very light wood, and containing an open mass of air in the interior, and placing it on the top of the rod, you observe this powerful reinforcement.

The extreme importance of this experiment in its practical application to buildings will at once be seen. Imagine the interior of a building lined with plaster, with wood, or with stone, and instead of this musical-box as the source of sound, substitute the voice of a speaker; further, let the air between the speaker and the walls around him. The walls of such a building, if covered with plaster, slate, or stone, would be almost or altogether unable thus to strengthen the sound of a speaker's voice; whereas if covered with wood the voice would be strongly reinforced. This, then, is the explanation why, in buildings lined with wood, speaking is so very much easier than in corresponding structures the interior of which is plaster or stone. Curiously enough, there is in the very room in which I am speaking an illustration of this fact. For this lecture-room was, I understand, most imperfect for auditory purposes, and most painful to speak in. An alteration was therefore made, and these side pieces formed of wood, were erected behind the speaker. Moreover, within these side pieces are air-chambers which, as we shall explain directly, further strengthen this reinforcement. Speaking within this room is now perfectly easy, simply from the fact that everything I say is taken up and reinforced by the vibration of the wooden screens behind me. Before quitting this subject, I would just allude to a fact which has often been noticed by architects; and that is, that in buildings which are newly plastered

there is more difficulty found in speaking, than in old buildings. It is noticed that as the plaster becomes dry, the acoustic properties of the building improve. The reason of this is probably to be found in the fact that the drying of the plaster makes that material more homogeneous, and thus increases the elasticity of its structure. When dry the plaster is therefore, to a certain extent, able to accept and give out these vibrations, which in its moist, unelastic state, it would have been altogether unable to do.

We are now in a position to advance a step further, and can investigate the reinforcement of the voice of the speaker, derived from quite another cause. If I speak in front of this membrane which is stretched over a frame, you will hear certain of my words reinforced, but you will not hear *all* of those words reinforced. When our musical-box was placed upon the table you heard *every* note reinforced. Here on the contrary when I speak, you hear this loud deep tone occasionally coming out. What is the cause of this strange effect? In the membrane we have a *sympathetic* vibration, which was not the case in the reinforcement by the wood previously. The apparent sympathy between the membrane and certain tones I will try to make evident. To the centre of this membrane I have attached a light concave mirror about the size of a sixpenny-piece. From this mirror I can reflect a strong beam of light on to the screen. You will find that every time the membrane reinforces the sound of my voice, that patch of light thrown by the mirror upon the screen will begin to quiver. This quivering is derived from the shaking of the membrane; thus showing you there exists a sympathy between the tension of the membrane and certain of the notes in my voice.

Important as are these considerations, some, however, may be inclined to say, "Of what use to us are they?" Gentlemen, the truest use of knowledge, its application to the benefit of mankind, is never seen at once; and a proper insight of the true value of scientific inquiry lies far below mere surface observation. Acquaint yourselves well with the principles of your study, and you will be at no loss to use them, for practical applications will constantly unfold themselves to the properly cultured mind. For example, from the facts already placed before you, it is easy to see how valuable an aid the resonance of the column of air contained in a building would be to a speaker's voice, if that air could be properly sub-divided and attuned. The ancient Greeks, whose theatres were built chiefly of stone or marble, sought to make up the lacking reinforcement, owing to the want of elastic materials in these structures, by employing the aid of resonance. A series of hollow bronze or earthenware vessels, of carefully graduated sizes, were placed beneath the seats of their theatres. These vessels, termed "echeia," were found greatly to strengthen the speaker's voice, more particularly when the speaking was intoned. For each selection from the speaker's voice a note which was in unison with itself, and by its resonance reinforced that note. Likewise there can be no doubt that the cavities which exist in the construction of buildings act in a similar manner. The air enclosed within hollow spaces below the floor, or above the ceiling, more or less, accommodates itself to the vibration occasioned by the speaker's voice. Hence, where there are these cavities, the resonance is powerful, and often very useful. Thus, in the theatre of the Royal Institution, to which I referred just now, there are open spaces beneath the seats, below the floor, and behind the wooden walls, all of which aid greatly to the resonance and good acoustic properties of that building. In the opera-houses of Italy it is, I believe, the custom to have below the orchestra hollow spaces, and the orchestra itself is constructed of thin wood. The acoustic success which must attend an orchestra thus constructed will, however, largely depend upon the fact that by placing the floor over a hollow space we give increased elasticity to that surface, and therefore bring the vibration of the wood more powerfully into play.

Now this strengthening of the voice by resonance differs from the prevention of its decay by proper reflection and condensation, inasmuch as whilst the two latter give increased loudness without increased smoothness, resonance, on the other hand, gives a musical character or richness to the voice of the speaker. This property, indeed, in some cases, as in the vaulted roof of cathedrals, may often be so great as to be a disadvantage unless the speaker intones his voice

so as to keep time to the musical resonance of the building. And here we have probably the philosophy of the origin and practice of intoning services in cathedrals.

The reason why resonance imparts a musical character to the voice I will endeavour to explain. Here is a narrow slit through which I blow, and you hear, as the result, an unpleasant rustling sound, nothing more. Over this slit I place this wooden tube; blowing once more you now hear a rich musical note. In fact, I have constructed an organ pipe, the philosophy of which you doubtless already perceive. The column of air within the tube placed over the slit, selects from the rustling sound a note to which it can respond. Entering into vibration the air reacts upon the confused rustle at the slit, and thereat urges greater motion with its own period of motion, and thus augments the volume of the sound. The music of an organ is therefore solely due to the resonance of its pipes. Pipes of varying length will respond to various notes, though placed over the self-same slit; because, as I have already said, the buzzing noise at the slit contains a mixed multitude of notes, from which the pipe selects and responds to the note proper to itself. Just as here, when I hold a number of tuning-forks of different pitch over one of our resonant jars you hear a loud resonance, but if I take away one, two, three, of these forks, you still hear the resonance equally loud. If, however, I restore the others and remove this one, the resonance is gone. Amongst the several notes sounding in its neighbourhood, the column of air can reinforce only that note whose rate of vibration is coincident with its own.

The effect of resonance in raising sounds to the dignity of music cannot perhaps be better shown than in the following experiment. I have here a tiny gas flame, which, whilst burning, originates a feeble vibration, chiefly from the inaudible explosions which occur during the combustion of the gas. If I enclose the flame within a tube, the draught thus created will render these explosions more pronounced, and at the same time the resonance of the column of air within the tube will impart to those explosions a musical character. Here, too, the vibrations of the flame, which apparently consist in its rapid extinction and re-ignition, are now forced into a rate which synchronizes with the rate of vibration of the resonant air within the tube. A longer tube placed over this flame gives, as you hear, a lower note; this tin tube, 14 ft. long, and nearly 4 in. wide, placed over a larger flame, gives this loud low organ note, forcible enough to shake the very floor of this room.

We must now inquire how the large volume of air in a building can reinforce the comparatively rapid vibrations of a speaker's voice. At first sight it would seem unlikely that this could be the case, the length of a building being so vast in comparison with the length necessary to respond to the sound of the voice. This difficulty, however, in a measure is removed by the fact that the general mass of air in a building can subdivide itself, can split up spontaneously into aliquot portions, and thus vibrating give rise to a resonance which would otherwise be impossible. The air inside this organ-pipe, for example, when I blow gently, divides itself into two vibrating parts; when I blow more strongly the air has divided itself into three vibrating parts with surfaces of comparative rest between. It would take me too far astray, and would besides be impossible in this limited time if I were to explain why this is. That such a division and subdivision do take place can be shown experimentally by lowering this little membrane into the pipe, when you hear it alternately silent, and sounding as I raise and lower it.

And there can, I think, be little doubt that the air within a building behaves very much like the air in the interior of a gigantic organ-pipe. The entire mass of air in a large room, if it could be thrown into vibration as a whole, would yield a note of a pitch so low as to be quite inaudible. By subdivision, its parts can, however, vibrate more rapidly, and give rise to that resonance which is often called the note of a room. This note you may observe by making a noise in a room; a sharp ear can then often detect a faint musical sound lingering after the noise. So in speaking it is desirable to find the note of the room, and endeavour to pitch the voice to suit that note.

This brings us to the question, what determines these subdivisions?—for as they determine to some extent the acoustic properties of a room, whatever influences them must be important. An altogether satisfactory answer I cannot give.

Two points, however, seem worthy of consideration—namely, the dimensions of a room, and the presence of rows of pillars in a regular series, recesses, &c., all of which, more or less, favour subdivision. In a flute, for example, the note can be raised by uncovering the holes, these holes determining the nodes of the vibrating column of air within the tube. Probably an action somewhat analogous may occur in a building. The dimensions, however, are also important. It appears that for good acoustic properties a building should be so constructed that its different dimensions shall be in some simple relationship to each other. An analogous effect is well known in music, for if two notes have the simplest possible relationship to each other's rate of vibration, as 1 to 2, or an octave, the combination of those two notes is more harmonious than any other combination. Next to this would be the rate of 2 to 3, or the fifth, and next the ratio of 3 to 4, or the interval of a fourth; the harmony decreasing with the simplicity of the combination. Further, in the case of three numbers a musical or harmonic proportion exists when the first is to the third as the difference of the first and second is to the difference of the second and third: thus, 2, 3, 6 are in harmonic proportions because 2 : 6 :: 1 : 3. And that an approach to an harmonic proportion between the three dimensions of a building is better than an unymmetrical arrangement gains some support by citing the following proportions of buildings famous for their good acoustic properties.

FREE TRADE HALL, MANCHESTER.

Height, 52 ft., or as 2; unit, 26 ft.
Width, 78 ft., " 3.
Length, 130 ft., " 5.

ROYAL INSTITUTION THEATRE.

Height, 30 ft., or as 2; unit, 15 ft.
Length, 45 ft., " 3.
Width, 60 ft., " 4.

WESTMINSTER CHAPEL.

Height, 50 ft., or as 2; unit, 24 ft.
Width, 67 ft., " 3.
Length, 120 ft., " 5.

In all you will perceive a very simple ratio of their proportions. The last quoted is a building recently erected, and has proved a great acoustic success. Besides its excellent proportions, this building has in its interior a smooth apex behind the speaker, which may assist by reflecting the voice, and certainly with the curved ceiling prevents the waste of sound arising from oblique incidence. Then the extensive wooden ceiling and other wood surfaces, greatly aid by their reinforcement; and finally the large hollow spaces above the roof and below the building afford cavities where resonance can take place. I am inclined to attribute to this form of ceiling great value in the acoustic construction of large buildings.

Such, then, is a rapid and confessedly imperfect outline of some of the more important points connected with the acoustics of buildings. Summing up what should be avoided, and what it is desirable to secure in the construction of buildings as regards speaking, what we have learnt can be comprised under three heads.

I.—We have to avoid the waste of voice: (a) by the production of rollers of sound from oblique incidence; (b) by echo and reverberation from improper reflection.

II.—We have to secure the prevention of the decay of voice: (a) by condensation of the sound; (b) by proper reflection; and (c) by a proper arrangement of the seats.

III.—We have to secure a reinforcement of the voice: (a) by lining the interior of a building with elastic materials, such as wood, and, where possible, having the ceiling of the same; (b) by employing the resonance of cavities within a building, having spaces above its ceiling and below its floors; (c) by endeavouring to obtain some simple ratio between the various dimensions of the room.

New Town Hall for Leicester.—At a special meeting of the Leicester Town Council held on Tuesday, it was decided by a majority of 37 (27 votes against 24), to devote 3,000 square yards of land, originally purchased at 30s. a yard, to the erection of a new Town Hall (about 2,000 yards to be appropriated to municipal buildings, and the remainder to a large hall to be built at a future time), the present Guildhall, which has been used for about 370 years, being inadequate for the requirements of the borough.

REPORT ON ARCHITECTURAL EDUCATION.

A COMMITTEE of members of the Royal Institute of British Architects, and delegates from various cognate societies have been considering for a long time past—first, the expediency of establishing a "School of Art accessory to Architecture;" and secondly, the question of Architectural Education generally. After many meetings, the following Report has been agreed on, and has been sent to us for publication:

The committee appointed by you to consider the propriety of establishing a "School of Art accessory to Architecture," in consideration of the advantages likely to be obtained in a short time by the reconstruction of the Architectural Museum, and by new arrangements at the Royal Academy and University College, have hesitated to recommend at present the foundation of a "School of Art accessory to Architecture;" but have deemed it expedient in commencing their labours not only to investigate that question, but to extend their inquiries over the whole range of architectural education.

Your committee considered that, in order to have a sound and accepted basis on which to work, they could not do better than avail themselves of the experience gained in establishing the voluntary architectural examination.

This scheme was undertaken by the Royal Institute of British Architects, the council of which body having been twice memorialized upon the subject by the Architectural Association, formally propounded the subject to the Liverpool, Birmingham, Edinburgh, Glasgow, and Northern societies, and to the Architectural Association in 1850. Upon their replies in 1851, a committee of twenty-six members of the Institute was appointed to prepare a curriculum and bye-laws. This committee, after an inquiry into the nature of the examinations held in the civil and military services, the medical and legal professions, King's and University Colleges, and the architectural schools on the Continent, submitted to the Royal Institute of British Architects a course and regulations of examination upon subjects with which it was considered that every architect should be acquainted. The Institute having given them its valuable consideration, accepted them as tests of architectural knowledge, and incurred great expense in carrying them into effect.

The Institute thus established two examinations, one in the class of proficiency, and the other, of a higher grade, in the class of distinction. The first examination took place in 1853, and twenty-two candidates have passed; nineteen in the class of proficiency, and three in the class of distinction.

The following are the subjects in which it was considered advisable to examine all candidates who presented themselves in the class of proficiency:—Design and Drawing, Mathematics, Geometrical Drawing and Mensuration, Professional Practice, Physics, Materials, Construction, and the History and Literature of Architecture.

The scheme of this examination, as is well known, has not yet achieved the success which was anticipated; but your committee, feeling that it was a step in the right direction, and from the commencement of their labours that on a more general or complete scheme should be based on that establishment. Your committee has carefully investigated the whole subject, and has arrived at the conclusion that its failure in deficiency of candidates is not due to any inherent defects in the examination, but, amongst others, to the four following important causes:—

1st. The absence of a formal certificate of having passed the examination.

2nd. The want of such a stimulus or pressure, as would make the passing of the examination professionally necessary.

3rd. Inefficient preliminary education.

4th. Want of system in architectural education.

* The committee consisted of the following gentlemen:—Royal Institute of British Architects—Messrs. W. Pite, M.P., F.R.S.; F. B. Cockerell; G. Godwin, F.R.S.; Owen Jones; A. Waterhouse; Professor T. H. Mayer Lewis. Royal Academy—Messrs. E. M. Barry, A.R.A.; E. W. Cooke, R.A.; P. Hardwick, R.A.; S. Smirke, R.A.; R. Westmacott, R.A. Architectural Museum—Messrs. A. J. B. Boreford Hopps, M.P.; J. Clarke, F.S.A.; J. Ruskin, M.A.; G. G. Scott, R.A. Architectural Association—Messrs. L. W. Ridgway, R.A.; E. P. Sneyers; E. J. Taverer; W. White, F.S.A. Architectural Exhibition—Messrs. W. Burgess; R. W. Edis; R. Plimbe; T. R. Smith. Added by the committee—Messrs. G. E. Howard; C. G. Nelson; J. T. Fry; J. P. Seddon; G. E. Street, A.R.A.; Sir M. D. Wyatt.

With reference to the certificate, the chief objections hitherto brought forward have been: 1st. That such certificate might be improperly used; and 2nd. That it might be possible for a student to work up the whole subject and pass through the examination without having received any practical training in an office. Now, although your committee doubt whether the first subject of the voluntary examination could be passed by any one who had not worked a long time in an office, they think that this latter objection could be remedied if a rule were laid down that no passed student could receive the certificate until he was able to produce a testimonial to the effect that he had worked for, at least, four years in an architect's office, this term to be committed to three years in the case of those who had continued their education at either of the universities, in the Science Schools of King's College, or any other recognized body.

The first objection does not seem to have any reasonable foundation. Your committee propose, therefore, "that a certificate be granted to all who pass the Voluntary Architectural Examination;" subject to the above regulations.

Respecting the second question, such stimulus or pressure can only arise from such a feeling on the part of the profession and the public as would induce students to submit themselves for examination. This must necessarily be a work of time, and would naturally develop itself when a more perfect system of architectural education became established; at the same time your committee have deemed it expedient to suggest—"That at some future period the Membership of the Institute be made dependent on the passing of the Voluntary Architectural Examination in the Class of Proficiency."

With regard to the third cause of failure, one which it is almost beyond the power of the architectural societies to remedy, viz., "the inefficiency of preliminary education," it is felt by many of those who take pupils, that a very large number of them come to their offices very inefficiently educated; not only are they totally unacquainted with drawing of any kind, but even their knowledge of mathematics and the elements of physics, is so exceedingly limited as to cause the greatest possible hindrance to their training in the office. Your committee, therefore, are glad to recognise the great efforts now being made by the Society of Arts and other bodies to enlarge the sphere of general education, so as to embody proper instruction in science and art; and they feel sure that these efforts will result in great service to the architectural profession.

It is, however, to the fourth reason given for the failure of the voluntary architectural examination scheme (viz., the want of system in architectural education), that your committee have given their most serious attention, because they believe that it will be possible, without incurring much expense, and without departing from the objects for which it was founded, for the Institute to adopt certain measures which, while raising the standard of the profession, will increase its own strength.

The complaint generally expressed by the students of the profession is, that there seems to be no curriculum laid down to indicate the progressive course of study by which the numerous subjects should be taken up *seriatim*; so that it often happens that at the termination of their articles or period of study they are ignorant of many of the most essential qualifications required for architectural practice. In consequence of the shortened period of pupilage and the increased number of subjects with which it is necessary that the student should be acquainted, it is found that sufficient time is not afforded for acquiring the necessary architectural knowledge by routine alone; more preliminary training, therefore, in elementary knowledge is required, in order that during the first and second years' study in the office the student should more readily understand what he is working upon, thus learn more quickly, and lose less time. It was assumed, that by establishing an examination setting forth the series of subjects with which an architect should be acquainted, and giving a list of books to be read and studied at leisure, there could no longer be any excuse for the student to say that he did not know what he had to learn, or where he could learn it. But the result has proved that books alone are not sufficient, and that without any of the progressive series of tests or examinations, such as are held in all colleges and schools, the student shrinks from taking all the subjects at one time to pass them in three days' examination. Your committee, to remedy this defect,

recommend, therefore, "that a preliminary examination be held in elementary subjects, open to all students who have been at least one year in an architect's office;" and that those who prefer to wait for the final examination be then required to pass also in these elementary subjects.

Your committee feel that the prescription of a curriculum of study for the young architect entails very important inquiry, and is one of the most serious questions which has ever been brought before the profession.

It is objected that, of some of the subjects demanded for the voluntary architectural examination, sufficient knowledge is obviously not to be obtained in any architect's office, and it becomes therefore necessary to see whether certain courses of instruction which exist outside the profession could be made subservient to an improvement in architectural education.

Taking up the subjects of the examination, it is found, in addition to office education, that in *Architectural Drawing* instruction is to be obtained at South Kensington.

In *Freehand Drawing*.—At South Kensington, South Lambeth, other Governmental, and private drawing schools.

In *Elementary Design*.—To a limited extent only, in the classes of the Architectural Association.

In *Perspective*.—At the above-named schools, and at the Royal Academy to their students.

In *Mathematics, Physics, Mensuration, &c.*—Complete courses at King's and University Colleges.

In *Materials and Construction*.—At King's College in the day time; and at University College in the evening.

And in *History of Architecture*.—At University College.

With all these extraneous courses of lectures existing, your committee were surprised to find that they are taken so little advantage of; there being but a very limited number who ever attend the Governmental schools of drawing, or the courses given at University College, and hardly any the valuable courses at King's College. These latter, however, are held in the daytime; and as yet no steps have been taken to allow of pupils attending them during office hours. With regard to evening classes, your committee are of opinion that it must be accepted as a fact, that in the architectural as well as in other professions no evening courses of lectures are likely to attract many of the younger members, unless there be some more serious advantage to be derived from so doing than that of simple improvement: thus they consider, whether drawing, construction, materials, &c., are amongst the parts of architectural education, and same in other professions; and the medical student would object to attend courses of lectures on chemistry or physiology if given in the evening. Your committee feel, therefore, that unless this be accepted as a fact, and opportunity be given to pupils, both in London and provincial towns, to attend certain day courses, the number of which should be recognised by the Institute, no very great improvement can be grafted on the present system of architectural education.

The next important question which your committee considered was whether any additions to, or modifications in, existing institutions could be made so as to bring them more effectually within the reach of architectural students, and improve their education. And here it is to be hoped that the Architectural Museum, in its new premises, will be able to hold out such advantages as can easily be made available. Instruction in freehand drawing from the ornamental casts of all periods and countries will be given there, and those who attend will be under the supervision of some of our first architects; whereby the objections made to sending pupils out of the office to draw at South Kensington or the British Museum will no longer hold good.

The Royal Academy, from want of room, have hitherto been compelled to withhold from architectural students the instruction afforded to painters and sculptors; but in their new premises, with a large and well-lighted room, they will be able to establish (and would doubtless be willing to do so, on the recommendation of the Institute) schools for architectural drawing, and for freehand drawing from the antique and the ornamental cast.

The complete courses of instruction at King's College are established for the special training of civil and mechanical engineers. There are, however, many architects who have profited

much by attending them, and there are few subjects treated there with which an architect ought not to be conversant. The authorities of the College would probably be glad to extend these courses so as to admit of the special instruction of the architectural student.

University College has the reputation of having established the only Art Professorship in England—that of Architecture; and there is now a Bill before Parliament to enable them to establish a Faculty of Arts, in addition to those of Science and of Medicine, which they now possess. The artistic education of the architect, therefore, which is so much required, it is hoped will eventually be obtained there. They have also just taken into consideration the establishment of an engineering school, somewhat similar to that of King's College, but in which a diploma (as a sort of incentive to work) will be granted in conjunction with the Institute of Civil Engineers. It is proposed to give the diploma only to those who have worked after leaving the college for at least two years in an engineer's office, and obtained the engineer's certificate as to practical knowledge.

With the science and art schools, therefore, which will soon be established at University College, and with the lectures on materials, construction, and history of architecture, in conjunction with the practical training to be received in the office, a complete course of architectural education might be obtained. But in order to turn all this to good account, it is requisite that, with the other opportunities for obtaining architectural knowledge, it should be reduced to a comprehensive scheme, to be readily understood by architects, students, and the public generally.

Your committee believe that the British Museum, the South Kensington, and other Museums might be turned to more account towards the furtherance of improvement in artistic education, if lectures could be given on the students' days, by competent persons, on the marvellous collections of works of art contained in them. The value of a course of lectures, for instance, on Athenian sculpture, with the actual examples of the Parthenon frieze to illustrate the lecturer's remarks, could not but prove of the greatest utility.

Your committee would be most unwilling that any attempt at a centralization of architectural education in London should be made; they recommend, therefore, that, upon the adoption of this report, circulars be sent round to all the *bona fide* architectural societies in Great Britain, to seek for their co-operation, as their support would be needed to establish throughout the country a complete and recognised course of architectural education.

Your committee have heard with pleasure that the Architectural Association are now taking steps to establish courses of lectures on subjects specially connected with the profession, not now sufficiently provided for in office instruction, for those students who are not able to attend other courses in the daytime; and your committee earnestly recommend the Institute to co-operate with that body, and assist it in its endeavours. A course of fifteen lectures on physics and chemistry has already been established, and others are forthcoming in statics and dynamics, professional practice, geology, descriptive geometry, with practical application in the cradling and centring for vaults, &c. The committee think also that the figure drawing class of the Architectural Association, which was established four years ago, might, with the assistance of the Institute, be extended and placed on a firmer footing.

Your committee believe also that, in order to recognise and promote attendance at the courses of lectures before cited, the certificates of having passed certain examinations might be taken into account when the student presents himself for the voluntary architectural examination.

Your committee beg to recommend, therefore, to the serious attention of the Royal Institute of British Architects, as the senior and only chartered body of the profession, the following propositions:—

1st. "That a text-book or pamphlet should be prepared, containing a complete curriculum of study for the architectural student, pointing out where and when (in addition to office instruction) courses of lectures specially pertaining to the profession can be obtained with advantage, and giving a limited number of books in which the best information is to be had in a condensed form. In this text-book the greatest possible publicity should be given to the course of lectures which are given by our architectural professors, and to

the imperative necessity of attending schools in which any instruction in freehand and figure-drawing is to be obtained. This hook should take into account the numerous honorary prizes offered by the Royal Institute of British Architects, by the Royal Academy, by University and King's College, and by the Architectural Association; it should suggest at what period these might be competed for with advantage; and, finally, it should set forth how all these courses of instruction should tend to the passing of the Voluntary Architectural Examination, which should be placed before the student as the goal to which he must of necessity attain. The committee are further of opinion that the Institute should ask for the co-operation of the Architectural Association, which, now numbering over 600 students, could materially support it in the furtherance of their scheme."

Your committee recommend that in this text-book great importance be attached to the advantage of travelling in England and on the Continent, as the best and almost the only means of becoming acquainted with the works of our ancestors, without which it is impossible to design; pointing out that those who have acquired the greatest reputations as architects and designers have done so in consequence of their knowledge, and not ignorance, of precedent.

2nd. "That a certificate be granted to all who pass the Voluntary Architectural Examination established by the Institute, and in addition, that some especial incentive should be given by the Institute, endeavouring, if possible, to found a money scholarship for the pupil who shall pass first each year; or if this cannot be at once managed, by giving one or more medals."

3rd. "That at some future period the membership of the Institute be made dependent on the passing of the Voluntary Architectural Examination in the Class of Proficiency."

4th. "That a preliminary examination be held in elementary subjects, open to all students who have been at least one year in an architect's office."

5. "That the Institute should assist the Architectural Association to carry out the drawing school which it was proposed by that Society to establish this session."

And 6th. "That an Architectural Committee be appointed, consisting of members of the Royal Institute of British Architects, of the Architectural Association, of the Architectural Museum, of the Architectural Exhibition, and delegates from provincial societies, to assist in the compilation of the text-book or pamphlet above recommended, and put themselves in communication with institutions outside the profession, to obtain their co-operation and assistance."

THE UNION BANK, HUDDERSFIELD. YORKSHIRE.

This building, for the Halifax and Huddersfield Union Banking Company, is amongst the most recent structures in this thriving and important town. Its erection was greatly retarded by a local strike of masons, which occurred in the summer of 1865, and lasted eighteen consecutive weeks.

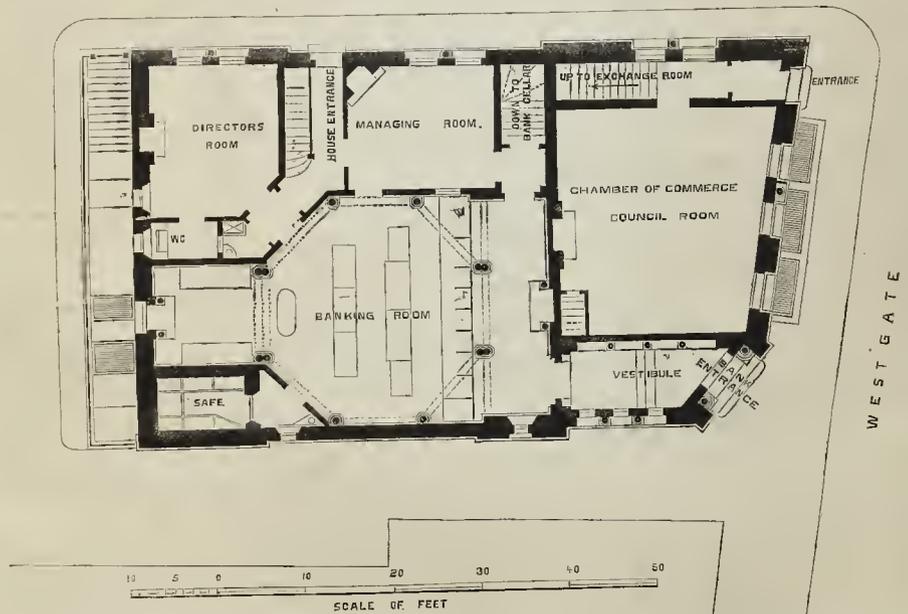

Designs were obtained in limited competition from three architects in 1864, and the plans of Messrs. Paull & Ayliffe, of Manchester, were selected. The works were in great part carried out under their joint superintendence; but after a dissolution of partnership, were completed by Mr. Paull. The walls are built of rubble stone, faced with fine-tooled ashlar wall-stones, in regular courses, and lined with brickwork. The front apartments on the ground and first floors were arranged for the Huddersfield Chamber of

Commerce, the upper room being used as an exchange and news-room, and the lower for council meetings.

The banking-room is lighted by a dome, containing stained glass by Edmondson & Son, of Manchester. This room is octagonal. It is well finished, the columns being of Aberdeen red granite; the carved capitals and bases, &c., of freestone; and the mouldings of Keene's cement. The fittings are executed in wainscot oak, with Spanish mahogany counter and desk tops, and ebony mountings, all arranged under the special oversight of Mr. James Bowman, of Halifax, the managing director. Vaulted cellars extend throughout the basement, warmed and ventilated for deposit of valuables, and two spacious safes are provided, fitted up with galvanized iron shelving and wrought-iron doors.

The arrangements include a residence for the cashier, the kitchen being on the first floor, same as the dining and drawing rooms, and communicating with the basement by a balance-lift. The external shafts in the elevations are from Messrs. Freeman's granite quarries at Penryn. The carving was executed by Mr. W. Green, of Manchester. Mr. Dovey, of Manchester, supplied the gas-fittings and other internal metal-work. The building was erected by local contractors as follows:—Masons' work by Messrs. Graham & Sons; carpenters' and joiners' work by Messrs. Fawcett & Sons; slating by Messrs. Goodwin; plastering by Mr. Jovitt; plumbing and glazing by Messrs. Lidster & Armitage; smiths' and founders' work by Mr. G. Scholefield; and painting by Messrs. Webster & Depledge. The clerk of the building and fittings, exclusive of site, was about 8,500l. The internal decorative painting is to be executed during the summer of this year under the direction of Messrs. Paull & Robinson.

THE UNION BANK AND CHAMBER OF COMMERCE, HUDDERSFIELD.
MESSRS. H. J. PAULL & O. AYLIEFE, ARCHITECTS.

RECENT WORK OF THE ROYAL ENGINEERS.

The seventeenth volume of papers by officers of the Royal Engineers, on subjects connected with the duties of the corps, is now published.* The editor, Lieut.-col. Hutchinson, remarks that he expected it would have been enriched by a paper from Lord Napier of Magdala upon the Abyssinian campaign, but in this particular he has been disappointed. Two papers on this subject are, however, among the contents of the volume, though neither of them is from the pen of the great commander. One of these is a report by Lieut.-col. St. Clair Watkins, R.E., giving an account of the operations of the engineer department in Abyssinia, with details of all the works executed, accompanied by plans of the port, coast, depôts, camp of Zoolla, and the railway line. A stone pier, jutting out 900 ft. into the sea, with a tramway on it, and on to the beach beyond, to facilitate the landing of the army and its stores; a road, 50 ft. wide, through the jungle from this pier to the camp, 14 mile distant; the cleansing of the old village wells, and the construction of twenty new ones, for the watering of 2,000 men and 2,000 animals; a large store-shed; and a water-shot about half the length of the pier, raised on trestles above the sea, for conveying to the shore sweet water condensed by H.M.S. *Satellita*, were among the first works executed, and are minutely described here. Lieut.-col. Watkins states that the difficulties of constructing a railway with unprofessional labour were enhanced by the fact of five different descriptions of rails being sent out, calling for four different modes of fixing, and that five out of ten of the fish-plate bolts did not fit those on the rails. After this harassing experience, he comes to the conclusion that railways required for the operations of war should be carried out as a civil work, by engineers and contractors, who make it their business to construct them. An estimate by a contractor was given for this railway at 72,000*l.*, exclusive of rails and plant. The cost, as incurred by the Royal Engineers, was 6,000*l.*, exclusive of rails and plant. Out of this large margin the contractors would have had to supply labour and superintendence. The second Abyssinian paper relates only to the position and leading features of Magdala and its construction. Lieut. T. J. Willans describes one entrance into the place as a small double-storied hut, built of stone and mud, in which was a stout timber door, 4 ft. wide only, with a window over it for the defenders to guard it from; but the dwellings seem to have been built exclusively of wicker work and thatch. A paper relating to Prussian siege operations by Col. Lennox is of much professional interest, showing as it does the Prussian army organization, methods of construction, mining, &c. In this volume, too, are to be found the reports on the Paris exhibition, by Capt. Stotherd, describing the Austrian military equipment, system of submarine mines, telegraphic and electrical apparatus, and both naval and military visual and sighting apparatus. A sketch of the military proceedings in New Zealand, since tranquillity was restored in 1861, by Major-general Monld, C.B., has some important deductions in it. The first engineering work undertaken under the auspices of the new governor, Sir Geo. Grey, was the Great South Road, which cost 2,930*l.* per mile. The next proceeding was the construction of a court-house, for the erection of which a quantity of timber was brought to the site, when the natives got alarmed, fearing that something more than a court-house was intended, and removed the whole of it. To punish this proceeding fresh hostilities were commenced, which only terminated in 1866; and then, as we know, but temporarily. The natives resist the most urgent solicitations for the construction of roads, believing that this concession would involve their loss of right to the land. Good road-making is, however, the surest mode of conquest. The Romans made roads in Britain; the Highlanders were never settled till great roads threaded their most mountainous districts; the North American Indians are only subjugated by the pushing forward of roads through their almost impenetrable forests; and the only errors committed by Sir Henry Smith, according to the Duke of Wellington, was his omission to leave great military roads in the Kafirs' country. The

desirability of good modes of communication settled, Major-general Monld next considers the conditions under which they should be made. This able paper is accompanied by a map of the territory, a sketch of Waikato Delta, a plan of the Maori works, a plan of Paterangi, another of the native entrenchment at Pooipoo, plans of the most considerable Bays, and a plan and section of Puke Hina Hina, or the Gate Pa, Taranaki, showing the maze-like system of the rifle-pits, but dwellings, and palisades. Besides these graphic particulars of works of military construction undertaken by the English army in foreign parts and distant colonies, there are several good papers on such miscellaneous subjects as the application of photography to surveying, revolving musket-proof mantlets, and a diagram illustrating the course of promotion in the corps of royal engineers, which we must be permitted to say appears to be very zig-zag.

POTTS' SYSTEM OF VENTILATION.

The use of a hollow cornice communicating with the exterior of a room to bring in fresh air or take out foul is not an unknown arrangement. We have used it ourselves on several occasions, and at intervals ranging over some years. Nevertheless, the system patented by Mr. Potts is his own, and certainly deserves attention. In this the perforated cornice is formed into two passages, the one next the ceiling, and which communicates by valves with the chimney or other flue, is for the vitiated air, and the lower one, open to the external atmosphere for fresh air. The latter is not perforated near the entrance, so as to give the air a direction along the channel. We have seen the cornice in a billiard-room, where it is found very serviceable. The size of the channels, of the perforations, and of the openings of entrance and exit must of course be apportioned to the size and purpose of the apartment. Mr. Potts forms the cornice of various materials: zinc, or sheet brass, usually; sometimes partly of plaster, especially where old cornices are to be converted. Some houses in Kew and some taverns in the City are being provided with these ventilating cornices, and there is little doubt that as to the value and simplicity of the system become known, it will be more extensively adopted. It is likely to be tried, we are glad to hear, in the Justice Court at the Mansion House.

CHURCHES IN DEVON.

Clyst St. Mary Church.—This church was reopened on Easter Sunday after works of restoration. It had suffered almost a travestie in some alterations made more than thirty years since; Italian windows, cornices, &c. having, together with a thick coating of cement over the exterior, effectually disguised the originally Gothic church. The present improvements consist in inserting four traceried windows, one of which, in the chancel, has been filled with stained glass by Messrs. Lavers, Barrand, & Westlake. Some new open seats have been constructed, also a pulpit of wainscot, the chancel arch restored, and the avenues laid with Minton's tiles. The ceilings, of cradle form, have been divided into compartments, with ribs and bosses; copings and crosses erected on two gables. The works have been carried out through the exertions of the rector, Rev. S. Warner, under the superintendence of Mr. Ashworth, architect, by Messrs. Moass & Sons, builders, of Exeter.

Bishopscynnynton.—The parish church has been reopened for divine service, after considerable works of restoration. The work was commenced in July last, and the outlay has amounted to about 1,300*l.* The chancel has had a ceiling removed and the roof for the most part renewed, the old principals and arched braces doing duty in an open boarded roof. A new reredos of Bath stone has been erected at the east end; and a new two-light stained glass window from Mrs. Beer's establishment has been erected to the memory of the late Rev. Canon Hsherden. The south aisle has had its cradle-roof uncovered, repaired throughout, and related, and carved bosses fixed at the intersections of the ribs. Three new Bath stone windows have been put in, and the west wall rebuilt. The nave roof, a cradle plastered between the ribs, has been adorned with carved bosses. The church has been re-seated throughout with red deal open seats, the hench ends and fronts having tracery. The plastering has been removed from the walls, and the whole interior exhibits the stone, having

pointed joints. Two old windows on the north side have been repaired and reglazed. The floors of the avenues are laid with Haywood's black and red tiles. The font, a Norman one, has been restored by supplying four shafts in Purbeck stone. The tower of the church requires much repair, which has yet to be undertaken. The Rev. J. Thorne, the rector, has been the chief promoter of the work, aided by contributions of friends, the Bishop of Exeter giving to the amount of 500*l.* The work has been carried out, under the superintendence of Mr. Ashworth, of Exeter, architect, by Mr. Cook, of South Molton, builder; the Bath stone work by Mr. Gould, of Barnstaple; the stone carving by Mr. Hems, and wood carving by Mr. Sendell, both of Exeter.

NOTES FROM PARIS.

The exterior of the new Vaudeville Theatre, at the corner of the Boulevard des Capucines and the Rue de la Chaussée-d'Antin, is a simple semicircular pavilion, planted between two high mansions. M. Magné is the architect of this building, which does him much credit. The inside decorations are completed, the colouring being of a very harmonious clear tone. There is a profusion of gilding; but it is used to such good advantage that it does not appear tawdry or out of place. The lighting is a sort of partnership of the sunlight and the open chandelier; in fact, it is obtained by a lustre in demi-relief. On the front of the stage the footlights consist of a new species of burner invented by M. Sahu, which he calls reversed-flame burner (*bec à flamme renversée*), every light being under a glass shade nopen at the top; so that there is no possibility of the dress of an actress taking fire from that cause. Similar lights, our readers know, have been used in England. The ceiling has four allegorical paintings by M. Mazerolles—Folly, Mnsic, Drama, and Tragedy. Their conception is very poor, some jovial figures being seated on clouds and likely to fall through; still, it has a moral which the author never dream-d of; for how many new dramas and *opéras comiques* have lately fallen through the happy clouds and *réves* of a good reception never to be lifted to the skies of public favour! We may add that the circular *foyer* of this theatre is charming; the machinery in the house is of first-rate conception and power, and is worked by a six-horse power engine.

The ancient Vaudeville, on the Place de la Bourse, now in course of demolition, afforded much amusement to the *dilettanti* during the removal of the pieces of machinery, some of which are of large dimensions. The principal doorway had to be enlarged by taking down a portion of the walling.

The new Opera proceeds slowly but regularly, all hands being employed (there are not many) in putting the *salle* into shape for the decorators, and in finishing the dome. The façades are terminated, except the crowning statues, which have yet to be raised. There were circular refuges and candelabra facing the Opera, and in a line with the two footways of the Boulevard. These have been suppressed, and four others of smaller dimensions on each side of the axis of the Opera, two on each side of the Boulevard, substituted.

A few days ago the fifth pavilion of the Halles Centrales, intended for the sale of offal, was formally opened to the public. This pavilion completes this magnificent construction, the most perfect of all the establishments of this class throughout the world. To the first emperor is due the idea of the general reform of the Halles Centrales, a project the execution of which was only commenced in the reign of Louis-Philippe, under the administration of M. de Ramhuteau, whose name is affixed to a wide and well-built street leading from the Rue du Temple to the Halles. The excellent arrangements and magnificent structures which now form the group are, however, due to the actual administration, and the sum of money expended up to the present day, so as to complete the structure, has been 2,400,000*l.* To M. Victor Baltard, municipal architect, is due the creation of the special style of architecture, so completely and so perfectly applied to the modern exigencies of the supply, on an immense scale, of wholesome food of the best quality.

According to official returns, in 1816, Paris contained 710,000 souls; in 1826, 890,000; in 1836, 909,000; in 1846, 1,053,000; in 1856, 1,174,000 (at this period the population inside the fortifications was 1,525,942); in 1866 (after

* Papers on Subjects connected with the Duties of the Corps of Royal Engineers, contributed by Officers of the Royal Engineers. New Series. Vol. xvii. Printed by Jackson & Son, Woolwich, 1869.

the spread of Paris to the fortifications), 1,826,274.

From a statistical return just published, we find that the first omnibus circulated in Paris in 1653 by letters patent granted to the Duke de Ronbanc, and the Marquis de Crenan. During 1868 the General Omnibus Company had in service 694 carriages. Each performed, on an average, 91,260 metres; this, for 682 omnibuses daily at work, gives 22½ millions of kilometres for the entire year, or about 13½ millions of miles. The number of effective horses in stable was 8,227 per day; 12 were daily yoked to each of the 682 omnibuses; the average mileage done by each horse was 9·6 miles. The number of passengers conveyed during 1868 was 113,348,031. In Paris and the annexed communes the company possess 43 stables, coach-yards and forage-stores, and 4 carriage workshops: these latter, in 1868, employed a staff amounting to 591 men per day, the daily wages being, on an average, 4s. 5½c. 18m., giving an annual amount of wages of 32,155l. The whole working expenses of the company for the year amounted to 881,974l.; receipts, 928,824l.; profit for the year 1868, 46,850l. This, at 4 per cent., would represent a capital of 1,171,250l.

At the Louvre, on the four sides of the Salle des États, up to a convenient height, have been arranged nearly three hundred paintings of the Dutch and Flemish masters. This collection is a most valuable one, and appears to be worth at least half a million sterling. Owing to the loud complaints of artists and amateurs of all classes, the pictures temporarily stolen from the galleries of the Louvre have been given back to their rightful owner, the public. Now it is the turn of the miniatures. The portraits of Saint-Mégrin and of Balsac d'Entragues, of Sainte-Genève, and other marvels of the Savogent collection, have already reappeared in the Miniature Gallery. They have been wisely placed in a shady spot, whereas, exposed to the sun in their former place, many of these valuable pieces were being spoiled.

On the 1st of May the hawthorn kept up its annual name by showering into the streets of Paris cart-loads of "Mai," as the French call it also. Hundreds of hand-carts circulated for some days, laden with single white, single red, and double red, the latter being a most profuse clustering of microscopic roses. Every workman could provide himself, for one sou, with a branch 3 ft. long, and, at the present moment, every young girl can have a respectable bouquet of lilies of the valley for the same sum at any of the markets. As these come from the provinces, the quantities of may and mugnets brought in daily by train to Paris must this year have been enormous.

STEAM POWER IN LAND CULTIVATION.

An opportunity has been afforded by Mr. Webb, of Smallwood Manor, near Uttoxeter, of seeing in operation on his own estate the latest improvements in the application of steam power to the drainage of clay soils. He has just obtained from Messrs. Fowler & Co., of Leeds, a set of double engine tackle for ploughing, cultivating, and draining. The engines are of 14-horse nominal power, fitted with a large drum underneath the boiler, on which the steel rope which draws the implement is wound. For draining, double power is obtained by the wire passing over a pulley mounted on the frame of the draining plough, the opposite end being secured to the wheel of the engine, so that the rope travels at twice the speed of the plough. A draining plough made by Messrs. Howard, of Bedford, at work at Swansmoor, near Weston, is similar, except that the steel rope, instead of being drawn round a snatch-block in front passes round a large pulley on the frame. The plough on the first day of trial, says our authority, the *Staffordshire Advertiser*, did its work admirably. The mould which forms the drain is 4 in. in diameter, pointed in front, and is connected with the frame of the plough by a flat bar of steel, which cuts its way through the ground, the small orifice being closed again by rolling. The field in which the draining was first performed had been previously drained by pipes in the furrows, and the steam draining plough was used to run drains along the ridges. One advantage attending the use of the implement is that the land on each side the drain is slightly raised for a considerable distance, which admits of the aeration of the soil, a very important matter in heavy land. The drains were cut through in several places, and in each case the opening was

found to be perfect, and the inside firm and smooth. The drains are run at a depth varying from 2 ft. 3 in. to 3 ft., and the work will be done in the neighbourhood of 11 an acre, the drains being 16 ft. apart. We understand that in parts of Essex, where Mr. John Fowler conducted his first experiments fifteen years ago, the drains then formed in this way are as perfect as on the day they were made. It is hardly necessary to say that this mode is only applicable where the drain passes through a retentive stratum of clay. The cost of a pair of these engines, with all the tackle for ploughing, cultivating, and draining, is 1,600l. They require five persons to attend to them, and will drain from eight to ten acres per day, at the depth and distance apart stated above. The tackle was drawn by its own power from Uttoxeter to Smallwood Manor, along a road which has several steep hills, with perfect ease.

From 10s. to 18s. an acre was charged for ploughing or cultivating, going once over the ground, and from 16s. to 30s. for going over twice the depth, the nature of the soil and other circumstances determining the price. Mr. M. T. Bass, M.P., at the suggestion of Mr. Webb, joined the enterprise a few years ago. Two sets of their apparatus are stationed at Sleighford, in the northern part of Lincolnshire. Not only have the partners thus increased their plant, but many others in the district have been induced by their success to purchase the apparatus, and about thirty sets of Messrs. Fowler's double engine tackle are at work in Lincolnshire and Nottinghamshire. As the farmers become convinced of the value of the implement, and can reckon with confidence on getting their land worked by it, they are able to dispense with a large number of horses, and to effect a considerable saving, as well as to secure more efficient cultivation. It is the perfection to which the draining plough has been brought that has induced Mr. Webb to make another effort to try whether the apparatus cannot be profitably employed in the grazing district in which he resides.

The men employed by the firm of Fowler & Co. have from time to time clubbed their savings, and bought a set of tackle. The largest proprietor has gone out with it to a promising place, and hired it out, dividing the profits after receiving wages for himself. In this way no less than twenty sets of tackle have been purchased, and are now at work. A plan of introducing steam cultivation has been proposed, and is shortly to be put into operation, based on the following principles:—A steady, industrious man, of good sense and good character, is to be put in charge of a machine, receiving moderate wages, and after paying interest on the cost, the profits are to be equally divided, half to go to the purchaser and half placed to the credit of the man until the amount will repay the cost, when the apparatus will become his property. In this way his interest would be strongly enlisted in the work, whilst the purchaser has the security of possession for the original cost, interest on the outlay, and a share of the profits. No particular mechanical ability, it seems, is necessary.

It is a matter of surprise that so promising an investment as that offered by steam cultivation should be so little regarded, and it can only be explained by the early failures, and by the want of proper care in the selection of apparatus, and of prudent management in recent attempts to introduce it.

THE TRADES MOVEMENT.

Liverpool.—A correspondent writes: "It may interest you to know that the masons have determined to resist payment by the hour in this town and district, and that in consequence a general strike (called by them a lock-out) will take place here on Saturday next. The works affected will be very few in number, and the stoppage of little consequence. Trade was never known to be so bad in Liverpool in the memory of man."

Sheffield.—At a meeting of the associated masters in the building trades it was stated that an advertisement for men, which had been inserted by the masters in the local and other papers, was being freely answered. It was likewise stated that no difficulty had as yet been experienced by the masters who were in favour of the hour system, as they had sufficient men in all classes of the building trades to enable them to carry on the work which they

had at present in hand. In order, however, to guard against the possibility of their being in want of men, a deputation had been sent that morning to London, to arrange with Colonel Maude, of the Free Labour Society, for the sending down a number of men who were willing to work according to the system which the associated masters are desirous of introducing.

Stockport.—The dispute between the joiners and builders of this town, we are glad to say, is likely to terminate satisfactorily to all parties, the operatives being disposed to accept their employers' proposition of being paid by the hour. The only point waiting for arrangement now is the rate of wages for over-hours and the unprotected work in the winter season, which, there is reason to believe, will be amicably settled.

St. Helen's.—Mr. Harnett, general secretary of the Operative Stonemasons' Association, reports that the dispute at St. Helen's has been arranged, and that eighteen men out there had returned to work on the old terms.

Holland.—Strikes are beginning to be prevalent in Holland as well as Belgium. One is reported at Amsterdam. The ship-carpenters declined to continue work unless the masters would increase their wages from 1·80 fl. to 2 fl. a day, the working hours to be hencforth from six in the morning till six in the evening. The masters, however, refused these proposals, and the workmen have left the yards. Eight hundred men are now out of employment. The turf-cutters at Beets (Friesland) have also struck for higher wages. Here serious disorders have taken place, and some lives have been lost. The Dutch workmen want to expel the Belgians, who work for lower wages. The Dutch printers are organizing a league to obtain higher pay.

Berlin.—A Berlin letter says,—"The house-carpenters here are still out on strike, or at least a great many of them. A large public meeting of working-men was held here on Sunday week. Upwards of 3,000 persons attended it, and the speakers, who were of all trades, encouraged the carpenters to hold out. Two resolutions were passed, of which the first was to the effect that it was the duty of every working-man to help his fellow-workmen in their struggle with capital; and the second, that as the North German Parliament consisted of Conservatives and Capitalists, the working-men could not hope for any aid from them, and must therefore endeavour at the next election to secure the return of their own representatives."

Manchester and Salford Building Trades Institute.—The annual meeting of the members of this Institute for Technical Education has been held. There was a very numerous attendance, and the chair was occupied by Mr. Isaac Holden. Suitable addresses were delivered by the chairman and other gentlemen present. The report was read by Mr. John McLean, the secretary. The committee, in presenting their first annual report, state that, at the commencement of the movement, the objects of the institute were confined to the trades of carpenters and joiners, but it had been afterwards resolved to connect the building trades. The number of members for the past year had averaged 62 per quarter—58 carpenters and joiners, and of whom twenty were apprentices, three masons, and one a bricklayer. The students had generally shown their appreciation of the instruction furnished, by their regular attendance and diligence throughout the season. The committee, however, could not withhold expressing their opinion that the number of students for the first year had been very few compared with the number of members, and the importance of the building trade, in this locality. The total amount of subscriptions for the past year had been 25l. 5s. 0½d.; the expenses, including hire of rooms and teachers' salary, with other items, 41l. 3s. 6d.; leaving a deficit of 15l. 9s. 0½d.

Co-operation at Deptford.—A committee of workmen recently discharged on the closing of Deptford Dockyard has been formed to draw up the rules of a Co-operative Association, or partnership of industry, to carry on the trades of shipbuilding, ship-repairing, and ship-breaking in the unoccupied yard. The co-operation of several influential tradesmen in the locality, besides members of Parliament and others (among the latter being Mr. T. Hughes, M.P.), has been promised. The Government have expressed a willingness to treat with the men for the occupation of the yard on liberal terms, and the Admiralty have now a memorial from the latter before them, asking that the old and useless ships of the navy be sent to Deptford for breaking up.

RAILWAY MATTERS.

The Sheffield station of the Midland Railway is progressing rapidly towards completion. The whole of the station, both on the up and down line, will be covered in, and the span of the roof will be something more than 115 ft. On the down side of the line, which is the side nearest the town, the station will be 426 ft. in length, and the platform will be about 150 ft. longer at either end. The centre of the building will be set apart as hooking-offices. On either side there are large waiting-rooms for the three classes of passengers, and a first- and a second-class refreshment-room. The station on the up-side will not be so long as the other, but it will contain a refreshment-room, hooking-offices, and waiting-rooms. Both the up and the down platforms will be about 30 ft. wide. It is not intended to erect a goods station, as the one at present in existence will still be used, and most of the goods traffic will run over the old line to Mashborough and thence to Sheffield. The building on the down-line is nearly completed, and workmen are now engaged in fixing iron girders for the support of the roof, and in erecting the platform walls. The station on the up-side is not so far advanced. The site of the station is between Granville-street and Pond-street. The whole of one side of Granville-street has been pulled down to meet the requirements of the company; whilst on the Pond-street side, rows of cottage property have disappeared to make room for the entrances. The station will have a large open space in front, so as to accommodate cabs and other vehicles. That side of Granville-street which has been pulled down to make way for the line is supported by a wall stretching from the mouth of the tunnel nearly up to the top of Broad-street. Most of the station itself stands upon arches. The buildings are entirely of stone, and what architectural features they have about them are in the Italian style. There will be two chief approaches to the station, the most important being that which will commence in the Old Haymarket, near to the site of the new Post-office, which will occupy the eastern side of the approach. This approach will be 60 ft. wide, and will have an easy gradient to the station.

Much light is thrown on the interesting question whether railway travelling is injurious to health, by the statistical investigations of Dr. Wiegand, of Halle. His inquiries are based on the reports of thirty-eight companies, and the results for 1868 are as follow:—Of 11,125 engine-drivers, stokers, and other officials travelling with the train, 119, or 1.072 per cent., died; while of the 43,853 other officials employed only 408, or 0.931 per cent., died in the same period. It will be seen that the rate of mortality is somewhat higher in the first than in the second class, but the difference is not great enough to lead us to suppose that the occupation is more than usually dangerous or unhealthy.

MALTHUS AND THE POPULATION QUESTION.

The National Association for the Promotion of Social Science met last week in the room of the Society of Arts, Mr. Newman in the chair, when Mr. W. B. Hodgson, LL.D., read a lecture on "Population."

Dr. Hodgson said that it was to be regretted that the ideas of Malthus were always applied to on this question. Distress and destitution were not by any means to be found on the increase in proportion to the density of population. On the contrary, in many thinly-populated and fertile countries distress was much greater than in others which were as fertile, yet more densely peopled. Destitution was almost universal in thinly-peopled countries, even where the influences of climate and soil were favourable, while abundance might exist in countries densely peopled even without a fertile soil. No doubt the number of the rich and of the poor would be in proportion to the paucity and the density of the population. The application of the abstract theories of Malthus was, in fact, practically senseless at the present time, for the world was yet a long way from being under cultivation either to the extent or the degree which might be reached, and it was therefore unnecessary to reason on the results of an over-population which might never exist, and which, in any case, could only be anticipated in a very remote future. The present distress and scarcity were not due to over-population, but to over-specula-

tion. In Canada the want of population was preventing the development of the resources of the country. At the same time Dr. Hodgson admitted that it was the duty of parents to exercise due consideration, and to act with a due sense of their responsibilities, and not marry without some provision; for it was clearly wrong to bring up large families of paupers to be burdens on the community. The only remedy, however, which was possible seemed to be the diffusion of correct views on the question of individual responsibility, to which it must be left.

A discussion followed, in which the speakers seemed to be about equally divided, and a vote of thanks was unanimously given to Dr. Hodgson, who, in thanking the meeting, said he was of opinion that Malthus and his theories should be put aside altogether. The surface of the earth was not infinite, but it was not exhausted, nor all cultivated as yet, and it was unnecessary to speculate on a condition of things which might never arise. A large portion of the earth was now ready for cultivation, and general over-production was impossible. A large portion of the population grew up without being able to render any aid to society, and these must be taught the necessity of adding to the wealth of society instead of diminishing it. If we could qualify the mass of society, and make them all producers, we should not only make them all useful, but comfortable.

THE ARCHITECTURAL MUSEUM.

The honorary secretary writes,—"I should be glad to know those who are interested in the museum know, through your columns, that we are now busily engaged in arranging our collection. The task of sorting and finding suitable hanging-space for the various objects in so large a collection occupies, it is found, a longer time than was at first anticipated. Hence a slight delay has arisen, for which I should be glad to explain the cause to the public; and here I would remark that it is felt by those who are carrying on this work, that considering the advantages gained by architects for an annual guinea, and the very disinterested way in which art amateurs have come forward, we may fairly look for more general help from the profession.

STAGE NOTES.

The General Theatrical Fund Dinner.—The twenty-fourth anniversary festival of this excellent charity was held on Thursday evening, the 13th, at the Freemasons' Tavern, under the presidency of Mr. Angiolo R. Slous. Few recent anniversaries of this or similar institutions have passed off with more éclat, or have been more satisfactory in every respect. Mr. Slous made several admirable addresses, especially, of course, that in advocacy of the fund. To this, Mr. Buckstone responded in an amusing address, ending with the suggestive remark,—"When the stewards wait on you with their subscription-papers, write your names plainly, and let your figures be large." In reply to the toast, "The English Drama," Dr. Doran responded in an eloquent speech, a mixture of amusement and information, wit and pathos. Mr. Cullingford, the secretary, announced the subscriptions as 400l. The presidency of Mr. Slous will be remembered.

Princess's Theatre.—One of the most charming landscape scenes that has been exhibited for some time has been produced by Mr. F. Lloyds, for the new drama, "Presumptive Evidence," in which Madame Celeste is now playing at this house. The scene represents a cornfield in bright sun-light, a river, with bridge and other accessories, running near. It is as good as one of Vicat Cole's best works magnified.

Fluvial Realism.—A real river is to be introduced into the Munich Theatre in Wagner's "Rheingold." One of the scenes represents the Rhine (real water) flowing through a luxuriant country. Suddenly a nymph plunges into the water, and swims across the river to a rock. Mdlle. Mallinger, who is to perform this feat, is now taking lessons in swimming!

Another Theatre Burnt.—The Flora Theatre at Cologne has been totally destroyed by a fire which broke out just after the performance had been concluded. The catastrophe is supposed to be the work of an incendiary, and the more so that the Grand Theatre was burnt to the ground a few months back under similar circumstances.

The New Opera House at Vienna.—This build-

ing, although not yet completely fitted up, has just been inaugurated in presence of the imperial family, the ex-King of Hanover, Counts de Beust and Hohenlohe, the Duke de Gramont, and nearly all the foreign ambassadors. The house is lighted by an illuminated roof, as in some of the theatres of Paris.

CAMPANOLOGY: PEALS OF TWELVE BELLS IN ENGLAND.

The following list of twelve-bells peals is fuller than that published in "N. & Q." 3rd S. iv. 96. I give the date, the weight, and note of the tenor, also the founders. The earliest ring was at York Cathedral, dated 1631.

Date.	Churches.	Founders.	Weight. Cwt. lb.
1631.	York Cathedral Church.	Ancient.	63 0 0
	Melted down to a peal of ten, 1765, by Lester & Packe, of Whitechapel. Destroyed by fire 1899, after which a new ring was cast by Mears in		
1844.	St. John's, Cirencester.	Budhall.	C. 53 3 9
1719.	St. Bride's, Fleet-street.	Ditto.	D. 23 0 0
1724.	St. Nicholas's, Liverpool.	Dobson.	C. 41 0 0
1723.	St. Martin-in-the-Fields.	Rudhall.	D. 23 0 0
1729.	St. Michael's, Cornhill.	Whitechapel.	C. 41 0 0
1731.	St. Mary's, Finsbury.	Rudhall.	D. 23 0 0
	(Two trebles added in 1821.)		
1735.	St. Saviour's, Southwark.	Knight.	B. 52 0 0
1739.	St. Leonard's, Shorehithe.	Whitechapel.	D. 30 0 0
	(Two trebles added in 1823. Tenor cracked by cloaking, February 27th, 1860.)		
1770.	St. Mary's, Cambridge.	Whitechapel.	D. 30 0 0
1771.	St. Martin's, Birmingham.	Ditto.	D. 35 1 24
1775.	St. Peter's Mancroft, Norwich.	Ditto.	C. 41 0 0
1787.	St. John's, Halifax (13 bells).	Ditto.	E. 25 0 0
1787.	St. Giles's, Cripplegate.	Ditto.	D. 30 0 0
1798.	St. Chad's, Shrewsbury.	Ditto.	C. 41 1 0
1828.	Quee Park, Isle of Thanet.	Ditto.	E. 15 0 0
1830.	St. Mary's, Oldham.	Ditto.	C. 30 0 0
1841.	St. Peter's, Leeds (13 bells).	Ditto.	C. 30 0 0
1847.	West Bromwich (13 bells).	Ditto.	E. 25 0 0
1867.	St. Mary le Tower, Ipswich.	Warners, Chesham	30 2 0
1868.	St. Peter's, St. Alban's, augmented by Warners.	E.	23 0 0
1890.	Worcester Cathedral Church.	Taylor.	D. 40 0 0
	(In the moulds.)		

The advantage of an extra bell, as at Halifax, Leeds, &c., is, that the key may be occasionally altered from a *major* to a *minor*, when less than the full number of twelve are rung. The grand ring of ten at Exeter Cathedral is most remarkable for this clever arrangement. It is to be observed that a ring of bells was the old phrase for a set of bells, and not a peal; this latter word being applied to the performance of ringing, whether one bell or more; and among change-ringers it means the performance of the full number of changes which may be rung on a given number of bells; a less number of changes is called a *touch*. H. T. ELLACOMBE, M.A.

HAND-PAINTED TILES FOR SURFACE DECORATION.

In the Paris Exhibition of 1867 there were exhibited by the French Imperial Manufactory at Sèvres two ceramic pictures, painted by the well-known artist Yvon, each composed of several pieces of earthenware, each piece having been painted and fired separately, and afterwards combined into one large slab; with a mosaic system of joints, similar to that ordinarily employed for stained glass, so arranged as not to interfere with the leading forms of the composition. These pictures, which have been purchased by our Government, and which are now in the South Kensington Museum, suggested to Messrs. Simpson & Sons the idea of applying a similar method of vitreous painting to the tiles manufactured by Messrs. Maw & Co., such as are in ordinary use, as a means of general decoration at once artistic, perfectly durable, and suitable alike for interior and exterior use.

They have now succeeded in perfecting the process, and have issued lithographs of the designs they have prepared. Some of their specimens are highly glazed, while in others the surface is perfectly free from gloss, and resembles fresco-painting. The range of colours available for this description of work is very extensive; and as it is applicable for designs in all styles, it should be largely employed.

Its cost, they say, would approximate to that of ordinary mural painting of a like character, with the expense of the tiles and burning in of the painting superadded. This is vague; the expense of mural painting is regulated by the terms of the artist employed; and so with these wall tiles, as the Messrs. Simpson lay themselves out to execute the designs of architects and

others who may desire their co-operation. Using designs already in hand, 11. per foot is spoken of; and if ordinary encaustic or other cheaper tiles be used in conjunction with the hand-painted tiles, in the shape of borders and filling-in, the cost per foot of covering any given surface will, of course, be lessened.

The great point, however, is to obtain good art: it is not desirable to make a bad design permanent; and a pound a foot, unless it furnish something charming to look at, would be all too dear.

We quite agree with Messrs. Simpson in believing that ceramic painting will hold an important place in decoration hereafter; recurrent is setting that way; and we heartily wish them success in their praiseworthy endeavours to forward its introduction.

ON THE IMPORTANCE OF AQUEOUS VAPOUR IN WARMING AND VENTILATING DWELLING-HOUSES.

MR. CHARLES M. WETHERILL, PH. D., M.D., professor of Chemistry in the Lehigh University, of the United States, has written a paper on this subject, in the Journal of the Franklin Institute, in which he offers the following suggestions to practical men for an improvement in furnaces:—

1. Cease improvements of the stove, making it more complicated and expensive, and saving both coal and the trouble of charging it, until a good water supply capable of being regulated is obtained. This would not prevent the supply of moisture to any such complex furnaces if they be preferred.

2. Save the coal, as is done, by dampers in the fire flue and register, in the ash-pit and stove-door. Also, by attention to the quantity of air passing through the hot-air chamber governing it by dampers in the hot-air ducts near the stove, and in the cold-air ducts; paying also great attention to the air leaving the apartments, and regulating it as much as possible.

3. Seek some method of adding steam by the action of the fire, and in regulated quantities under control, to the hot-air chamber. Perhaps the water-trump for obtaining a blast by the fall of water or the stonizer may be made available. Perhaps some means for the evaporation or atomization of water in the apartment may render assistance in maintaining the proper relative humidity.

The admission of steam to the hot-air chamber does not rest upon theory only; it has been carried out in practice by Professor Henry at his dwelling in the Smithsonian Institution. An iron tube connected with the water vessel in the hot-air chamber, was inserted through the side of the furnace into the midst of the burning fuel; this device kept the water in the vessel in a state of rapid ebullition, raised the relative humidity of his apartments, and a quality of softness and salubrity were imparted not before perceived in the air.

The paper is accompanied with sketches representing a vertical and a horizontal section of a furnace improved for hydration. The supply tank, with half-cock, the author remarks, may be placed inside of the air chamber, providing for an overflow through the wall. The water hack should not be in the fuel, and devices should be present to prevent unpleasant results from derangement of the water apparatus. The water must boil at the rate of a gallon, or more, per hour, according to the ventilation, for a moderate dwelling.

Taking 100 as the saturating point, the atmosphere, he calculates, should be hydrated to a standard, ranging between 50 and 75, or to a mean of 67.5.

With respect to the rate of the renewal of the air, he says, "it has been found necessary in the halls of Congress to change it every eight minutes, i.e., seven times and a half each hour. This rate would not be required for an ordinary dwelling-house, nor could it be effected without powerful means; it would need the evaporation of nearly eight gallons of water per hour."

THE SUPPLEMENTARY EXHIBITION OF PICTURES OF 1869.

A COMMITTEE has been formed to arrange the proposed exhibition of a selection of the pictures returned by the Royal Academy, including the following names:—

Messrs. Samuel Solly, F.R.S.; George Chester; the Very Rev. D. Rock, D.D.; Dutton Cook, Mark Lemon, Captain J. W. Clayton, E. A. Foley, G. A. Sala, Frederick Chester, T. J. Golluck, T. Stuart Smith, G. J. Dampie, Alfred Thompson, Walter Thornbury, Alexander W. Macdonnell, J. A. Sterry, J. W. Benson, John Hollingshead, A. Harvey Moore, Walter Severn, A. Baccani, R. Sayers, Charles Prater, Edwin A. Pettit, Charles Drury Fortnum, Frederick Smallfield, A. C. Stannus, Henry Weekes, &c.

The works of art, it seems, will be received at the Old Bond-street Gallery, from Wednesday, 19th, to Saturday, 29th instant, inclusive. It is proposed that the exhibition shall open early in June, and remain open until the 31st of August.

PARLIAMENTARY ART-PHOBIA.

Sir,—May I be permitted to continue the subject so forcibly commenced in your number for May last, by selecting a short extract from those voluminous reports of the Irish Church debates, in which a topic of much interest to architects might possibly remain buried out of sight from some of your readers? It appears that Mr. Gladstone had proposed to set aside funds for the maintenance of some important monumental churches, not to exceed twelve in number; but in consequence of the general taste and judgment of a British House of Commons, had consented to forego that purpose. On May 13th Mr. Vance proposed and Mr. Scourfield seconded a clause of similar tendency to the omitted clause, whereupon I quote the newspapers of last Friday, the Attorney-general for Ireland said that the proposal of the hon. member for Armagh could not be maintained for a moment. The negative had already been decided in one of the fullest Houses of the session. Mr. B. Hope supported the amendment, which was negatived without a division. G. M.

REGISTRATION OFFICE FOR WORKMEN.

Sir,—I was much pleased at seeing a letter from "A Builder" on the above, and am sorry that so little notice has been taken of it. More so as it is generally acknowledged that the mode of engaging workmen in the building trade is clumsy and unsatisfactory. I have heard very often lament because there was not an office similar to that proposed by "A Builder" in London. I have looked for men, and they agree as to the necessity of some better method for communication between masters and men. It was not known that work in the building trade is uncertain, and that but few are kept as regular hands. Every one month, slack the next, and for that reason a large number are always seeking employment. A registration office would be a great gain, and save both parties much valuable time.

The associated workmen and the frequenters of public-houses have an advantage in hearing of jobs over those who are not members of the list, and who do not attend to the others. My employer being slack, I have to look for work; and I agree with "A Builder" that nothing is more disheartening than looking for work in London. I think it would be easy to form an office, and if supported by employers, I feel sure that a large number of men would try to make it a success. JACK PLANN.

CO-RELATIVE STRENGTH OF BUILDING MATERIALS.

I SEND an extract from the Times of the 7th inst., which may have escaped the notice of those who are unaccustomed to read the result of the experiments tried with guns at Woolwich, but which are always interesting, and in this instance instructive to builders and architects. The test was to try the powers of endurance of 30 in. wrought-iron gun, with a bursting charge of 240 lb. of powder, 1,114 rounds being fired; with the maximum penetration, as laid down by the Committee on Fortifications, as follows:—"Into earth, 40 ft.; into concrete, 12 ft.; brick-work and concrete on an equal level, 12 ft.; massive granite, 2 ft. (but with a fracturing and disintegrating effect to a much greater depth and over a considerable area); into iron plating, 11 in."

This is doubtless the severest test to which the relative strength of such materials can be subjected; and whilst giving a large pre-eminence in favour of iron, places brick-work and concrete on an equal level. The result certainly most favourable to those who advocate the use of the latter, both on the score of efficiency and economy. J. S. W.

ROTHERHAM HOSPITAL AND INFIRMARY.

NINETY-TWO designs were sent in, and the votes were 17 to 3 in favour of the design hearing the motto "Esculapius," by Messrs. Mallinson & Bakewell, architects, Leeds and Dewsbury, which was therefore selected. According to our correspondent,—

"The plan is so arranged that each department is separate and complete in itself, and yet at the same time in contiguity with the various offices and departments, each having a distinct entrance.

The hospital's entrance on the west side, with the porter's room, leads immediately to the waiting room, bathroom for cleansing, and examination of patients before admission to the wards, to the operating theatre and accident ward for patients that may have to be operated on, upon their immediate entrance.

The dispensary entrance is on the north side of the administrative department, with its lobby. The large hall for the patients to wait communicates immediately with the physicians' room, and with the surgeons' rooms, for the economy of time, the dispensary adjoining for prescriptions, medicine, &c., with hutchway or window into the hall, and one is also provided for the lobby."

SMOKY CHIMNEYS.

Sir,—Can any of your correspondents advise us what to do under the following circumstances:—About two years ago we built a village school-room 40 ft. by 20 ft. It has a high-pitched roof; the chimney is on the north side, and is carried up higher than the roof, but in spite of all we can do it will not draw when the wind is in the north or east. We have tried chimney pots and cowls of various kinds; we have also closed up the open fire, and replaced it by a Gill stove; still the wind rumbles down, carrying the smoke and flame into the room; we have also tried various kinds of openings in the chimney, but without any advantage. There is no doubt the chimney is too large, being 14 in. or 15 in. square, and being on the north side, the fire has not power to warm it. We had some thoughts of trying to introduce an iron pipe to form an inner flue, as this could be more easily warmed if the fire could get to it; but of this there appears no chance, as the down draught is so strong, the fire cannot reverse it. We have already spent many pounds about it, and any practical advice would be most thankfully received. ONE OF THE COMMITTEE.

COMPETITIONS.

THE design of Mr. Thomas Oliver, of New-onstlo-upon-Tyne, has been selected for the proposed New Congregational Church, Tosteth Park, Liverpool.

Bygone Sea Defences.—The Bognor Local Board, Sussex, recently advertised in this paper for designs for sea defences, offering a premium of 50l. for design selected. Forty-two designs were submitted to the Board, principally by engineers. The Board obtained the assistance of Mr. J. W. Grover, C.E., of Victoria-chambers, Westminster, to examine the designs, and report thereon. Mr. Grover reported that the best design, taken as a whole, was that bearing the motto "Canute defying the Waves," submitted by Mr. Green, of Lewes and Hertford (to whom the premium has been awarded). Mr. Grover also reported that the design "Experience," by Mr. F. A. Klein, of Cannon-street, London, was a good proposal, and deserved the consideration and commendation of the Board; as also the designs "Nil sine Labore," "Vis Consilii expers mole trivl sua," and "Zero," submitted respectively by Mr. T. I. Evans, of Gosport; Mr. Palmer Smythe, of Belize Park, London; and Mr. W. G. Bennett, of South Villa, Hampstead.

House Architecture in Carlsruhe.—The premium of 20l. offered by the corporation of Carlsruhe for designs of elevations of houses proposed to be erected in Alfred-street and South Portland-square, in this city, has attracted sixteen sets of plans, which are now being exhibited to the public in the town-hall. Many of them have of a very unsuitable kind and have evidently been the work of "prontice hands"; but there are a few designs evincing both architectural skill and practical knowledge of building. A set, for example, bearing the motto, "Design with beauty, build with truth," seems to attract favour. Two or three others might be named. The committee have not yet arrived at a final decision.

KIDDERMINSTER INFIRMARY COMPETITION.

Sir,—As the author of another of the rejected designs, I was waiting for a few minutes leisure to send you my murmurs upon this despicable job. I am glad to see your number of last week that the subject has been taken up by a brother competitor. During a long practice, though happily very little experienced in competitions, except in noting in the pages of the Builder the many enormities to which they give rise, nothing more iniquitous than the management of this one has ever come under my observation.

In the interests of my fellow sufferers and myself, I will, with your kind permission, challenge the committee to answer the following straightforward questions:—

- 1. Did Mr. Bland, the author of the accepted design, deliver his drawings a day later than the date named in the conditions, viz., on the 10th of February instead of the 9th?
- 2. Had not Mr. Bland access to the room in which the designs were exhibited during the time certain members of the committee were inspecting and discussing such designs?
- 3. Did not the estimate for carrying out Mr. Bland's design amount to more than 5,000l. instead of 4,000l. (the limit fixed by the conditions)?
- 4. Is not the personal friend and architect of the honorary secretary to the committee?

REJECTED.

ACTION FOR COLOURS SUPPLIED.

On Tuesday judgment was given at the Bloomsbury County Court, by Mr. G. Lake Russell, judge, in the case of J. Detenre v. Graham. Plaintiff, who resides at 29, Paradise-terrace, Islington, called, with his daughter, in July last, upon Messrs. Jackson & Graham, and submitted several samples of various colours to the firm; they were referred to Mr. Pugh, the surveyor to the firm, and he selected about thirty colours, and directed the plaintiff to send samples of each colour for the purpose of being tested as to quality, at the same time informing the plaintiff that the colours must be of the best possible quality, as none other were used by the firm. Plaintiff denied that anything was said about quality, and he said the goods were ordered for use and not as samples to be tested. He sent in thirty small boxes of colours, and received a bill payable at three months, signed by Mr. Pugh for the goods, but when it became due, Messrs. Jackson & Graham repudiated it.

Mr. Goddard, barrister, who appeared for the defence, contended that the action was a deliberate attempt to defraud Messrs. Jackson & Graham, and he called Mr. Edgar Graham and Mr. Pugh, who positively swore that they were not to be sent in as samples on approval; that they were tested, and were found to be worthless for the use of the firm, and they were returned. Plaintiff was informed that all colours must be of the best quality, and as regards the bill for payment at three months, Mr. Pugh signed it, believing it to be the usual delivery paper accompanying the articles. He had no authority to give promissory notes, and, in fact, the firm never paid in that way.

Mr. Clark, foreman of painters to Messrs. Jackson & Graham, stated that he examined the colours in question, and they were perfectly worthless to the firm. Mr. J. W. Grover, C.E., examined the witnesses for the plaintiff, to show that the colours were supplied at a low price, and that it could not be supposed that colours of the best quality were to be supplied, but the witnesses stated that the colours were bad at any price, and

Another Bridge across the Mersey.—Messrs. William Low and George Thomas, civil engineers, have submitted to the Mersey Dock and Harbour Board a letter and plans, illustrating their scheme of crossing the Mersey by means of a railway suspension-bridge between Liverpool and Birkenhead. It will consist of three spans, the centre one 1,800 ft. in length, and the others 960 ft. each, and will be 140 ft. above high-water mark. The bridge would unite the various railway lines in Lancashire and Cheshire. It will be under two miles long, and the total cost is estimated at 1,750,000*l.* This would be the sort of thing to try our engineering mettle before we venture to bridge the Irish and the British Channels.

British Archaeological Society of Rome. This society has wound up its proceedings for the season. The weekly lectures and excursions were continued as long as there were any English or American people remaining in Rome to attend them. Mr. Parker concluded with an account of the most recent excavations up to the present time, and announced that they would not be continued during the summer from want of funds. The latest discovery is the Remains of the Thermæ of Severus and Commodus, on the opposite side of the Via Appia to those of Antoninus (Caracalla). The "Lectures on the Ancient Streets of Rome and the Roads in the immediate neighbourhood" has been printed for the use of members, with an engraving to show the nature of the foss-ways or hollow-ways.

Ancient Remains in Jersey.—In a field near St. Helier's a tomb constructed of sixteen or eighteen huge stones roofed by three others, and closed at each end, the floor consisting of detritus and sand, has been discovered. There were eleven urns inside, some of them broken and imperfect, but others intact. They approach each other in size, and, standing from 6 in. to 8 in. high, are 9 in. or 10 in. in extreme width. Outside they are symmetrically shaped, and inside they are filled with earth.

City of London Museum.—The Chairman of the City Library Committee writes:—The Museum of the City of London is attached to the library at Guildhall, and consists of a very interesting collection of Roman antiquities, including several rare specimens of *fibelle, stili, crepide, fibula, strigiles*, lamps, knives, and many articles of personal adornment in bronze and bone; the glass includes lacrymatories and parts of vessels of various descriptions, shapes, and colours. The Samian ware is particularly fine, consisting of howls, vases, &c., highly ornamented with emblems of war and the chase. It also possesses many varieties of tessellated pavements, and other building materials of the same date. Among the more important monuments may be mentioned the group described by Roach Smith, of the *Dea Matres*, found in Orntched Friars; and, of still higher value, a Roman hexagonal column, found at Ludgate, erected by Aneudetus Provincialis and his wife Martina; also a very beautifully sculptured-fluted marble sarcophagus, of the fourth century, recently dug up at Clapton. The Medieval department is far from despicable, and includes the finest collection known of the leaden *signacula* or pilgrims' signs.

Over-papered Walls.—Our readers will recollect mention of a disgusting smell which drove so many officers from their quarters in Knightsbridge Barracks, and threatened the whole establishment with fever. Great pains had been taken by the engineers to remedy the evil. Drains were examined, and floors were taken up, but nothing was found. Since then ventilators have been inserted in every room, and the space beneath the floors has also been ventilated. The *Lancet* now mentions that the cause has been discovered. It was found that there were in one case, at least, fourteen layers of paper, some of them of a most expensive kind. Between these layers of paper stinking paste, fungi, and even maggots had accumulated; whilst the wall being hollow, the stench spread through the passages behind, and seriously increased the evil. "It is somewhat curious, that although the true cause was suggested by an officer of engineers some months ago, no real attempt seems to have been made to verify his suggestion until the arrival of the present regiment." Warnings against the injurious effects resulting from the practice of leaving successive coats of paper on the walls, will be found in the *Builder*, and on more than one page.

Monumental.—The statue of Mr. Mayer, of Liverpool, which the Corporation intend to place in St. George's Hall, as a memorial of Mr. Mayer's munificent donation, to the local museum, of antiquities, which cost over 50,000*l.* and half his lifetime in the collection, is now completed at Chelsea, by Signor Fontana, the sculptor named by Mr. Mayer, at the Corporation's request, to execute the statue. The figure is a portrait of Mr. Mayer as he appears in ordinary daily life. The proportions are of heroic dimensions, and the material is Carrara marble, of remarkable purity. It is said to be a good likeness. The pedestal of the statue of the Marquis of Westminster at Chester is now complete, and has just received the statue, which has been forwarded from Mr. Thornycroft's studio. The plinth, or base, consists of four blocks, and is, like the rest of the pedestal and capping, of a polished grey granite. The local *Chronicle* says of the inscription, which is in gilt letters, "The only objection to which this is open is the abbreviation of 'second Marquis.' We cannot understand why '2nd' should not have been used, which would have been far preferable to 2d, as the latter is liable to a funny ambiguity which will at once suggest itself."—An immense crowd assembled at Sydney, on the 28th March, to witness the laying of the foundation-stone of the statue in memory of Captain Cook, by his Royal Highness the Duke of Edinburgh.

Westmoreland Granite.—A new branch of industry has recently been established on Shop Fells. Some time ago Mr. Curtis, a gentleman connected with the Dalbattie Quarry Works and now residing at Penrith, directed his attention to a huge granite formation on a fell known as Wastdale Crag, about four miles from Shop railway-station and about two miles from Shop Wells. He obtained a lease of the property from the Earl of Lonsdale, and in the middle of July last began operations, and, in spite of many difficulties, by the aid of costly machinery has now made considerable progress. Wastdale Crag is the only granite ridge between Scotland and London, with the exception of minor deposits in Leicestershire, so that the cost of transmission from all parts of England and Wales will, it is expected, enable the lessees to compete successfully with the Scottish quarries in this respect. From its extent, too, the supply will be comparatively inexhaustible. The yield is 90 per cent. upon the workings, whereas in more than 50 per cent. The blocks are of immense size. One block was computed at 2,700 tons of pure granite, and blocks of from 20 to 100 tons in the solid are frequently blasted. The granite has three shades; one a light grey, another a dark red, and an intermediate colour, variegated and ornamental. It is harder than the Dalbattie granite. Lately 1,000 ft. of curh were finished and sent to London, the lessees having contracted with one of the metropolitan districts, and they have contracts for work in connexion with the New Town-hall at Manchester, and the Midland Railway hotel, in the New-road, London.

The Brighton Drainage.—The residents in Brighton are naturally anxious as to the result of draining it into the sea in front of the town, and unfavourable to the scheme. They have, therefore, had a public meeting, and have resolved:—

"That in the state of public opinion in reference to the system of drainage in Brighton, and in view of the injury caused by the existing prejudice against it, the town council be requested to confer with the neighbouring authorities and to receive a deputation from this meeting, with a view to instituting further inquiry into the practicability and expediency of removing the drainage away from the town."

That the Londoners and others who visit Brighton as a watering-place will acquire a prejudice against it on account of the fact that its drainage is disembogued in front of the town, and whether there be sufficient reason or not, as regards the relative purity of the water, seems to be but too probable. The case, as the chairman of the meeting, Dr. Carter, put it, resembles that of an aristocratic dining in a hotel at a table on which was a cloth which had been in use before. The cloth might be as wholesome as ever; but still the aristocratic visitor would not come again. It was something the same with the water in front of Brighton. Visitors would not believe it was fit to bathe in so long as the sewage was drained into it. Moreover, we would earnestly urge the adoption at once of more complete measures to secure an effective and unobjectionable system of drainage for the town.

Mr. Peter Cunningham.—We mention with extreme regret the death of Mr. Peter Cunningham, the author of the "Handbook of London," and other works, which took place on the 18th instant at St. Alban's. He had just completed his 53rd year, having been born on the 16th of April, 1816.

Newcastle-on-Tyne: New Slaughter-houses.—New slaughter-houses have been commenced in this town, on the principle of the abattoirs of France. Mr. Thomas Oliver is the architect. The contracts for erecting a large drill-shed have been let to Mr. Kennedy, of Jarrow. The building will be 130 ft. by 50 ft., and rooms for dressing, smoking, &c. are attached.

TENDERS.

For Congregational Chapel and School, Godalming. Mr. W. F. Poulton, architect:—

Loe	£3,318 0 0
Alford & Donlon	3,200 0 0
Ballett	3,600 0 0
Moon	2,595 0 0
Carter & Sons (accepted)	2,450 0 0

For alterations to Trinity Chapel, Reading. Mr. W. F. Poulton, architect:—

Wheeler Brothers	£390 0 0
Sheppard	355 0 0
Mathews	334 0 0
Barnicoat (accepted)	315 0 0

For alterations, &c., at No. 126, Newington-causeway, for Mr. J. F. Smith:—

Cunning & Mullins	£322 10 0
Falkner	321 0 0
Goodes & Clarke (accepted)	3 7 16 8

For new Wesleyan Chapel and School, Church Coppenhall, Cheshire. Mr. George B. Ford, architect:—

Cotterill	£512 0 0
Hodgkinson	81 0 0
Elson	738 10 0
Williamson (accepted)	670 4 4

For alterations to premises, South Andley-street, for Messrs. Wilson Brothers. Mr. J. W. Morris, architect:—

Shedfield	£532 0 0
Wicks & Bangs	352 0 0
Stevens	343 0 0
Abrahams (accepted)	338 0 0

For a house and farm buildings at the homestead known as Lower Cromer Hyde Farm, Lenford Mills, Herts, for Viscountess Palmerston. Mr. W. Wilds, architect. Quantities supplied:—

Castle	£1,607 0 0
Birt & Son	1,650 0 0
Raves & Blow	1,668 0 0
Lawrence	1,414 0 0
Wells	1,435 0 0
Elkins	1,298 0 0

For the restoration of Kimoote Church, Leicestershire. Mr. William Smith, architect:—

Law (accepted)	£1,065 0 0
----------------------	------------

For the re-building Boyton Church, Suffolk. Mr. William Smith, architect:—

Toley	£1,510 0 0
Last	1,433 10 0
Cullingford	1,432 10 0
Hewitt	1,432 0 0
Carter	1,232 0 0
Cannold	996 0 0

For the erection of a residence, St. Godwald's, Finsall, near Bromsgrove, for the Rev. J. H. Bainbridge. Messrs. Payne & Talbot, architects:—

Wilson & Son	£1,780 0 0
Surman	1,667 0 0
Partridge	1,600 0 0
Jeffery & Pritchard	1,550 0 0
Matthews (accepted)	1,605 19 0

For additions to a private residence, Blackheath. Mr. J. H. Rowley, architect:—

Brass	£558 0 0
Homann	490 0 0
Snowden	378 0 0
Sharrington & Cole	379 0 0
Shepherd	365 0 0
Crabb & Vaughan	364 0 0
Beeton (accepted)	325 0 0

For the erection of two pairs of semi-detached residences at Red Hill, for Mr. Joseph Perron. Messrs. Holden & Triha, architects. Quantities supplied:—

Holdswordth	£2,636 14 0
Marstrand & Sons	2,460 0 0
Futland & Holt	2,457 12 8
Gage	2,410 10 0
Regis, sen.	2,310 0 0
Room	2,283 0 0
Cook	2,255 18 0
Hooper	2,160 0 0
Grumant (accepted)	1,720 0 0

For taking down and rebuilding the parish church of Bishampton, Worcestershire. Mr. Frederick Freedy, architect:—

Wood & Sons	£1,877 0 0
Bennett	1,784 0 0
Warner	1,688 5 0
Inwood	1,684 0 0
Hearn	1,601 0 0
Collins & Collins	1,541 0 0
Griffiths (accepted)	1,509 10 0

The Builder.

VOL. XXVII.—No. 1373.

The Northern English Cathedrals.

N two triplets Mr. Murray has arranged the northern cathedrals to form two volumes corresponding in size and appearance with the rest of his cathedral handbooks. York, Ripon, and Carlisle make the first triplet; Durham, Chester, and Manchester the second.*

There are two modes of proceeding open to the handbook historian or archaeologist, as well as to the writer of history on a larger scale. He may either take up his subject from the most remote period of its existence, and trace its course downwards to our own time; or he may start with it from the present day, and wind it upwards to its earliest antiquity.

Both courses have been pursued by historians and genealogists, and have had their partisans. Mr. King, the compiler of

the Handbook before us, has chosen the former method in his treatment of the six cathedrals under notice. The dissimilitude in the aspect of the several buildings he has described, however, would impart startling differences to the impressions they produced on those who looked upon them, even if the facts in their histories were identical, instead of the mere manner of relating them being methodically the same. Looking at the first triplet, it is impossible not to be struck with the marked distinctions in the character of the three buildings. A glance at the illustrations we are enabled to reproduce will explain this.* First, there is York, laden as richly with ornamentation as an Oriental poem with metaphor; languid almost with wealth, luring with sumptuousness. Then there is Ripon, bold, bald, severe; conceived, those who looked upon it for the first time might exclaim, in the brain of an ascetic. Portions in each building, doubtless, could be picked out to neutralise this generalisation; such as the north and south transepts at York, which are as early as the west front at Ripon, or the two easternmost bays of Ripon choir, which are as choicely enfilong as some parts of Carlisle; but these are their leading characteristics. Thus, it comes to us, there is more Perpendicular work at York than in the other structures; most Transitional and Early English at Ripon; and that we are most struck with the Decorated work at Carlisle. Nevertheless, York is as ancient as Ripon, both retaining fragments of Saxon work; both are of older foundation than Carlisle, where, however, there is plenty of Norman work. Again, there is as great a distinction in the general aspect of the other three northern cathedrals, Durham, Chester, and Manchester. Durham, a bleached grey in tone, with black and green streaks and weather-stains upon it in damp, shady corner-places, is massy, sturdy, yet precious with stern enrichment; an exaltation of Norman art-power. Chester is more lightsome; reddish, neither hard, nor finical, nor coarse; but inviting, reassuring, refreshing; albeit, it is scarcely to

be seen otherwise than in snatches, from the crowding of houses around it; and Manchester is but a ripe, pliant Perpendicular church that is only a cathedral by architectural courtesy. Hence, there can be but little chance of a charge of sameness being brought against the narrator of the chief facts in the histories of these buildings, let the order in which he marshals them be ever so alike; and the facilities for contrast and reference which an identical arrangement confers are not to be overlooked.

Without finding any fault, therefore, with the manner of the Handbook, we will proceed to notice a few points respecting portions of the various fabrics that are open to question. We will begin with Ripon crypt. It would have been well if the position of this with reference to the rest of the building had been shown upon the plan. There is a plan of the crypt, and the entrance to it is marked on the plan of the cathedral; but its position beneath the upper structure is left to guess-work. If this had been shown, the point we are about to discuss would probably have struck others besides ourselves. Now, this hidden, hoary, priceless relic of Christian architecture in Saxon times, corresponds in age and general characteristics with that at Hexham; and the two taken together should yield us a clear and certain evidence of the ordering of the rite or ceremonies performed in them. At Hexham, it is plain that in rebuilding the Abbey Church the new fabric was planned with special regard to the position of the ancient crypt in relation to it. A more scrutinising reference to the plan of Hexham, mentioned by the writer, as consulted by him, published in Mr. Walbran's account of the fabric, in Raine's *Priory of Hexham*, edited for the Surtees Society, which plan was the result of a special survey made by Mr. F. R. Wilson, would have shown that the crypt stands due east and west in the centre of the commencement of the extreme eastern end of the nave; and that there are three sets of steps and passages to it; one on the south side, for the private use of the priest, to descend from the transept directly into the martyrium below; a second

* See p. 46.

CHESTER CATHEDRAL: CHOIR.

* Handbook to the Cathedrals of England. Northern Division. Part I. York, Ripon, Carlisle. Part II. Durham, Chester, Manchester. With illustrations. London: John Murray, Albemarle-street. 1869.

exactly in the centre of the nave, for the descent of the faithful, who, when at the base of the steps found themselves immediately in front of the door of entrance, whence they could view the relics without being permitted to enter the chapel; and a third, on the north side, for their ascent, without confusion, into the north transept. When dealing with Ripon, this arrangement is lost sight of; only two sets of steps are shown; and although the site of the third staircase is, doubtless, discoverable, no search has been made for it. The writers, however, quoted by Mr. King, have also failed to see the connexion between this relic and the old order in which it was visited, and its relation to the rest of the building. In any future edition we recommend the insertion, if only by dotted lines, of the plan of the crypt upon that of the cathedral, to show its exact position. It would add much to the interest of these crypts if we could learn particulars of the relics that were placed in them by Wilfred, or preserved in them afterwards, the sanctity of which, doubtless, led to the conservation of these rude places, mere oells,—that at Hexham being only 13 ft. 4 in. by 8 ft., and that at Ripon, 11 ft. 3 in. by 7 ft. 9 in.—in the face of the sumptuous rebuilding of the fabrics above them. Mr. Walbran, referring to the statement, in Prior Richard's "History of Hexham," that Wilfred constructed crypts, underground oratories, and winding passages below his edifice at that place, thinks it likely that at a future day the crypt which has been already discovered will be found to communicate with another. We do not follow him in this expectation; for we consider Hexham crypt complete in itself, and that its position in relation to the edifice above, with that of the flights of steps with which it is provided, explains to us with curious exactness the ordering of the manner in which it was served by the priest and frequented by the people. The crypt at Ripon was, most likely, served and visited in the same manner; but of this there would be no doubt if we found that there was a third flight of steps leading down to it from the centre of the eastern end of the nave to face the west end, as at Hexham.

Then we cannot agree with the writer and his authorities, who affirm that the Galilee at Durham was intended for a lady-chapel. This could never have been the case. We quote our author:—

"Bishop Hugh de Poitot (1153-1165) commenced (how soon after his elevation to the see we are not told) a 'new work,' probably intended for a lady-chapel, at the east end of the cathedral. Marble columns and bases were brought from beyond sea; but the walls had scarcely begun to rise when ruinous fissures appeared in them, a manifest sign that the work was not acceptable to God, or to His servant Gathbert." The cause was no doubt the same defective foundation which, in the course of the next century, produced the subsidence of the walls of the choir aisle, and the 'impending ruin' of its vault. Abandoning his first intention, therefore, Bishop Hugh (no doubt using the materials collected for his eastern chapel) began another 'work' at the west end, 'into which women might lawfully enter,' so that, although they could not be allowed personally to approach the more holy places, they might derive some comfort from the distant contemplation of them. This work was the existing Galilee, so called from a reference to 'Galilee of the Gentiles,' as somewhat less sacred than the rest of the cathedral. But it was specially intended that it should serve as a lady-chapel."

It is impossible that a portion of the edifice, "less sacred than the rest," could have been intended for a lady-chapel, then deemed the very centre or core of sanctity. There are foreign examples of parent monasteries in the same position that tell us precisely its use; and the intercourse with Continental ecclesiastical establishments was too intimate and constant for us to refuse to accept their solution of the question. Abbatial churches of the order of Cluny possessed ante-churches, or closed porches, exactly like this Galilee. At Cluny, Tournus, and Vézelay are corresponding examples. And in the ancient pontifical of Chalonsur-Saône their purpose is thus described:—*In quibusdam ecclesiis sacerdos in aliquo altari foribus proximiori celebrat missam, jussu episcopi, pontificalibus ante fores ecclesie constitutis.* In the earliest Christian ages we know converts were baptised in or near the porch, as not worthy to enter the sacred edifice till that rite was performed. But as the new faith prevailed over the face of the land, and only infants required baptism, these less sacred places then received penitents and pilgrims. In the abbey churches of the order of Cluny they were dedicated to the Archangel St. Michael. That at Tournus, divided, as at Durham, into a nave with two aisles, and opening into the main building in precisely the same manner, is of eleventh-century work; that at Vézelay,

on a still grander scale, with galleries, dates from the middle of the twelfth century; that at the mother church, Cluny, was built by the twentieth abbot, Roland I., in 1220. This last has a triforium. The Cistercians also provided *ant-eglises* to some of their churches, but the peculiar severity of their order prevented them from aiming at the luxury of the *Clunienses*, and their porches accordingly were less spacious, low, and simple. Any one familiar with French architecture and archaeology would see at a glance that the same currents of events and feeling in matters of ecclesiastical usage and discipline that prompted the renewal and erection of these vast vestibles, or *ant-eglises*, in the one country, must have been the occasion of their construction in the other, in the rare instances when the necessary funds admitted of the outlay. Those to whom the subject is yet unknown we would refer to M. Viollet-le-Duc's elaborate illustrated article on *Porches fermés, Ant-eglises, ou Narthex*, in his *Dictionnaire Raisonné*. The Durham Galilee may have been eventually used for a lady-chapel, but could not have been built for one. And whilst we are recalling the magnificence of Durham, the grandeur of its spaciousness, and majesty of its vistas, we must add a word of entreaty. The writer says:—

"And although the eye is now drawn up the long vista to the alter-screen, and beyond it to the windows of the nave altar, it is much to be desired that a screen between the nave and choir, such as that at Hereford or at Lincoln, should replace the heavier erection of Bishop Cosin, removed in 1848. Such a screen, whilst it would add to the beauty and intricacy of this great view, would neither interfere in reality with its extent, nor in any way prevent the use of the nave for congregational purposes."

We would urge, should a screen be ever determined upon, that those who sit at the council should see that it be light and low, if they are not able to overrule the proposal altogether.

Looking over the plan of the conventual buildings, which, with that of the cathedral adjoining, is a reduction from Mr. Gordon Hill's plan in the Journal of the Archaeological Association, we perceive that we can scarcely endorse the assignment made of several parts of the edifice. A room between the south transept and the chapter-house, said by Mr. Hills to be the ancient sacristy in the great parent establishments in France, is occupied as a small library, sometimes, as at Clairvaux, having a portion partitioned off, in which the monks could deposit their books; and a room south of the chapter-house, stated by Mr. Hills to be, with two others adjoining it, "of uncertain appropriation," is generally used abroad as the monks' parlour. Where, too, could the calefactorium be if not in one of these rooms of uncertain appropriation? Again, the spacious double-aisled vaulted apartment forming the south side of the cloister, Mr. Hills calls cellars which had refectories over them. In foreign ancient examples this is the position of the refectories, which have dormitories over them; and we submit this noble apartment is the refectory. Still we fully admit Mr. Hills's knowledge of these matters.

The feature of a catalogue in the Handbook of the chief relics in the sacristies and libraries of the cathedrals is a good one; for it makes it into a popular terrier, and will surely be useful as a cure for negligence and a preventive to abstractions. The days when nursemaids were allowed to cut out the illuminations from the choicest manuscripts in the Durham library, to amuse Dr. Dobson's children, are past; but it is not so long ago since some of the ancient pinnacles at York Cathedral were taken down and made into a grotto, poor spectral things being put in their place; nor have many seasons come round since the jellied effect of the ancient stained glass at York was utterly altered in the interior, and altogether withdrawn and effaced on the exterior, by the glazing in of an outer layer of coarse sea-green glass, whereby, too, the richness formerly produced by the depth of the millions is also lost. The figures in the niches on the different stages of the tower at Durham are not to be compared, we may say here, with the ancient ones they have recently replaced.

The plans of these six northern cathedrals are all drawn to one scale, 100 ft. to 1 in. By this arrangement it is easy for anyone to see at a glance that York is the largest of them all; Durham following its dimensions very closely when the Galilee is included in the measurement. Then Chester takes its place, Ripon follows, and Carlisle takes precedence of Manchester, narrowly, in length. The different periods of the various portions of the structures are all clearly indicated, with a key of reference on all the plans;

and we must say of the illustrations generally that they are admirably executed. Care, too, has been taken that the specialities of each building should be impressed upon the possessors of the Handbook, that they may not fail to see, exactly what they will be asked whether they have seen, on their return from their visit of inspection. At York they are reminded of the ancient Early English stained glass filling the five Sisters; that of the Perpendicular period in the eastern aisle of the south transept; the fourteenth-century Decorated glass in the nave, the great west window, filled with glass at the expense of Archbishop Melton, 1338; the glass in the vestibule of the chapter-house,—"*Ut Rosa flos florum sic est domus ista domorum*;"—and that of the great east window, second only to that at Gloucester in the world. The Gloucester window is not so high, but it is wider, the respective dimensions being, Gloucester 72 ft. by 36 ft., York 78 ft. by 53 ft. At York, too, they are reminded that the earliest brass of an ecclesiastic, save that of Richard de Hakeborne in the chapel at Merton College, Oxford, is to be seen. The fragment of Saxon work in the crypt is duly pointed out, as also are the treasures of the record-room, vestry, and treasury. In the vestry are the Horn of Ulphus, made of an elephant's tusk, and carved with beaked and winged beasts, and others with foliated tails after the manner of the early Apulian sculptor, which was lost in the civil war, but restored by the Lords Fairfax; a carved oak chest of early fifteenth-century work; a silver pastoral staff; the mazer bowl, of dark-brown wood, with a silver rim and silver feet of cherubs' heads, on which is written "*Recharde archo beschope Soroce grantis on to alle tho that drinkis of this cope x dayis to pardune*; Robert Gubsune Beschope musin grantis in same forme afore saide x dayis to pardone, Robert Strensall;" three silver chalice, with patens; three rings taken from the tombs of Archbishops Greenfield, Sewall, and Bowet; and an ancient installation chair,—an interesting collection, but one of absurd poverty compared with the possessions of the treasury in the days of old.

At Ripon people used to be shown the crypt beneath the chapter-house, full of bones, arranged almost in a fancy-work pattern. These have been buried; but there are still some curiosities to be seen. "In the pinnacle of the south-east buttress is a remarkable place of concealment, or perhaps of imprisonment. (Every religious house had its '*Internis*,' or prison, for refractory members. Sometimes, as at Fontaines, there were several, of different degrees of severity.) On getting to the head of the stairs, which wind up the buttress, no opening is seen; but when what appears to be the roof is pushed against, a trap-door opens, through which the prisoner might be thrust into his narrow quarters. By the side of the staircase turret, is a garde-robe seat, inserted within the battlement of the roof of the "Lady-loft." At Ripon there is more ancient woodwork to be seen than glass, though there are some roundels containing heads of saints preserved in the library, that were once in the east window, and since then in the westernmost window of the south aisle. The chief of the ancient woodwork is in the choir. There is a quantity of tabernacle work. The carved subellia of the stalls bear the dates 1489 and 1491, and the finials are remarkable. "In front of the bishop's stall is an elephant, with a 'castle' on his back, in which are fighting men,—one throwing a stone, another behind with a horn. The finial of the opposite stall, on the north side, has a very grotesque monkey. The subellia are good and well carved. The spires with grapes; Sampson with the gates of Gaza; a fox preching to geese; and a griffin among rabbits, one of which has been seized, whilst the rest are escaping into their holes, are especially noticeable," says the Handbook. The two easternmost stalls have pierced quatrefoils with sliding covers, which, when opened, afford a view of the high altar. At Carlisle, over and above the general interest in the exquisite architecture, and the special interest in the Decorated east window, one of the most beautiful in the kingdom, we find the leading distinctive characteristic to be provision for turning the church into a border fortress, it being, as has been said of Durham,—

"Half house of God, half castle 'gainst the Scot."

Speaking of the south transept, Mr. King mentions,— "In the wall between the aisle and the chapel is a pointed doorway, formerly opening on a wall, which was closed during the late

restorations. The water was raised by a windlass, and the arch was protected by a door, with a massive bar. A similar well, regularly formed, and with sides of squared stone, exists in the north transept, but has long been covered. Besides supplying water for the use of the church, such wells may have been of especial service in border churches, which, like this of Carlisle, served as places of refuge for the inhabitants in case of sudden alarm or foray." On the capitals of the eastern arch over the Norman piers of the tower, are carved the badges of the dominant family in the north, the Percy crescent and fetterlock, probably from the circumstance of Hotspur having been Governor of Carlisle and Warden of the Marches at the time of the repair of the fabric; and on the west side of the tower are badges of two other families, scarcely less famous, the Dacres and Nevilles. The nave of this cathedral is made into a parish church, in which, as the Handbook reminds us, the great romancer of the North, Sir Walter Scott, was married to Margaret Charlotte Carpenter, December 24th, 1797.

Durham, in the account of which, we have reason to know, special care has been taken with special result,—the coaly city being a nest of antiquaries, and the chiefs among them, the Rev. W. Greenwell and Mr. W. H. D. Longstaffe, having been consulted, is remarkable, first, for its site. Only Lincoln and Ely are equally fortunate in this particular. Another extraneous source of interest beyond the power-frught architecture are the robes and relics taken from the coffin of St. Cuthbert. A Saxon stole and mantle of flat gold thread, wrought with figures with coloured silks, are identified as the gifts of Athelstan, in 934, when he visited the shrine of the saint at Chester-le-Street. They are about 2½ in. wide, and at the ends are the words *Alfred Rex Westsax, Pio Episcopo Frithstano*. The stole, now in five pieces, had a central quarterfil, including a lamb, with the inscription *Agnus Dei*, with full-length figures of prophets on either side of it; and the mantle, in the centre, has an outstretched hand protruding from a cloud, with the inscription *Dextera Dei* and figures of saints on either side. Part of a girdle and two bracelets are of a similar age. It is somewhat curious that accurate drawings have never been made of these relics of the early English embroidery that once enjoyed so extensive a fame. The gold cross, of Saxon workmanship, with twelve garnets down each arm, one at each angle, and a large central one, that lay on the breast of the saint, is also among these relics. The manuscripts in this library descended from the monastery to the chapter, and are still both numerous and important, notwithstanding the ravages of carelessness and destructiveness. Anglo-Irish and Anglo-Saxon Gospels are among them, and one copy of the Gospels, in majuscule letters, tradition says is the handwriting of Bede.

At Chester may be seen in the cloisters, at the south end of the west walk, a few of the carrels in which the monks studied. These small inclosures were common to all or most cloisters, but have disappeared in too many instances. But there are examples yet standing at Gloucester and at Worcester. An alms-house, containing the hooks in most frequent use, was placed against the cloister wall at Durham, opposite the carrels. At Clairvaux, an apartment between the south transept and chapter-house was provided for the deposit of the hooks most in use, divided from the small library behind it. The stone pulpit, with its arched staircase in the thickness of the wall, in the refectory at Chester, is also not to be passed over, though not belonging to the cathedral itself. Only the pulpit in the refectory at Beaulieu, Hampshire, is to be compared to this. The stained glass here is of different degrees of merit, and all modern. In the vestry, however, is some beautiful early ironwork.

At Manchester, there is some good perpendicular woodwork in the choir, tabernacled, hench-ends, finials, stall-arms, and misericords, with small figures of angels, and others of apes and foxes. The opening into the Late Perpendicular lady-chapel—now called the Cuthbert Chapel, because Humphrey Cuthbert, a Tudor Manchester manufacturer and warrior, lies buried there—is of a much earlier character, suggesting that the remains of some previous building may have been used in its formation. And here, too, occurs one of those trifles of old times that we occasionally meet with in ancient buildings, a monumental rebus. The first warden of the

college was John Huntingdon, who built the choir, 1422—1458. On either side of the arch opening into this chapel is a rebus upon his name, copied from shields in the spandrels of the choir-roofs,—a hunter, with a stag and horned ram, and a man drawing liquor from a tun.

Mr. Murray has materially assisted a popular and rightful appreciation of our cathedrals by his Handbooks, and, consequently, has helped, in a corresponding degree, the great work of conservatism that should be the order of the day. And he has done more; for he has placed in the hands of the archaeologist and architectural student a work of easy reference that may generally be depended upon for its facts.

ROYAL ACADEMY EXHIBITION.

WITH no intention of giving a full and correct account of all the many capital pictures that this year's show at the Royal Academy includes, we resume noting some of the most noticeable. A clever and singular production tells that Mr. J. E. Hodgson has travelled far for his subject, and very forcibly shows that he is not likely to become a mannerist farther than his admirably honest method of depiction will gain for him the title. An "Arab Storyteller" (15) amusing a very attentive audience, grouped in semicircular line, with some narrative of absorbing interest, has afforded him an opportunity of recording how closely he has studied the people, their habits, customs, and costumes, outside or inside the gate of Tangiers: a testimony to his observation is provided in the variety of character and expression he has been able to impart to so many dusky faces; and some proof of the scene being a faithful transcript from fact exists in its unexaggerated yet peculiar naturalness.

A similar style of straightforward manipulation belongs to Mr. D. W. Wynfield. No executive dash is added to the charms of "The Rich Widow," who can boast of a sufficiency already, for she is "young, beautiful, and a great fortune," and beset by such admirers as her several attractions would allure (86); some as good-looking as herself and nearly as young, others older, and one very old, whose great advantage it is to wear royalty-conferred decoration. Fine painting is the chief recommendation of this work; for it means no more in subject than a clustering of bees would round a honey-jar. A second example by the same artist is still more convincing of the great worth a knowledge of the resources of colour arrangement bestows: "My Lady's Boudoir" (14) is resplendent with its tastefully expended wealth. The fair occupant of this gorgeous retreat is pouring water into a china vase, preparing it for the reception of flowers; draped in white she looks the pearl of a woman who doubtless is, with a gold setting from a Japanese screen against which she stands; a tablecloth, rich in its dyes, and a velvet chair, assist in this chromatic success, simple enough in its constituent materials, but extraordinary in their combination. Mr. J. H. Archer's children are, at least, a hundred years older than they used to be; and instead of playing at cards, they are playing at soldiers. A Royalist family are being drilled by the eldest boy of them, and are marching on in steady determination "Against Cromwell" (77). This, like all Mr. Archer's pictures of child-life, is very agreeable in its simplicity of treatment, and an excellent painting. Technical merit—more especially with regard to the landscape that is the scene of the tragic occurrence—distinguishes Mr. Archer's principal contribution that illustrates the ballad of "Fair Helen of Kirkconnel," who died in shielding her lover from the shot of his rival (129); though the figures are rather too tame and common in aspect and action to give full dramatic interest to so romantic an incident, it is a fine picture.

Mr. Pool's version of "The Prodigal Son," denotes his contrition (240), with some want of academic proficiency on the part of this able artist to make the figurative lesson as strong as the circumstantial—for the landscape is the fine portion of his rendering of the parable. Mr. Poynter's shows his Return and affectionate Forgiveness (100), with the father and son well represented so far as good drawing and sound painting are concerned; and Mr. Galt's his joyous Welcome celebrated by Feasting and Merrymaking (899), very carefully and perceptively told.

* See pp. 357, 381, 307, ante.

Mr. W. B. Richmond is a new aspirant for such high honours as few are competent to snatch, as few are earnest and patient enough to wait for. There is evidence of rare gifts and advance in their cultivation to justify a belief that the classic composition, entitled "A Procession in Honour of Bacchus at the Time of the Vintage" (277), is the precursor of such productions as will help to dignify the English School of Art. Greek art, that in its perfection of form is the acme of what can be attained in comprehending all that is to be imitated in dead stone of breathing human nature, may safely be accepted as the best exemplar of that form that wears a likeness to Him that made it. The older man becomes, the farther removed from origin he is. We honour Mr. W. B. Richmond for his high aspirations, and bid him God's speed in his efforts to achieve. "A Disputed Boundary" (319) is an excellent illustration, furnished by Mr. E. Nicol, of man's disposition to quarrel over an inch, perhaps, of questioned right; he has never painted anything better than the two Irish tenants at loggerheads about a hedge and a ditch grievance.

Mr. Pettie paints, from Shakespeare's description, "The Disgrace of Cardinal Wolsey," or rather the cardinal's conviction of his own fall (130). The likeness of Wolsey does not tally with that by which he is most readily recognised; no trace is left of the indomitable will and unbounded arrogance of the man,—

"Ever ranking
Himself with princes; one that by suggestion
Tied all the kingdom!"

but he is here, too soon represented as "an old man, broken with the storms of state." His mild, unadorned appearance, however, is in favourable contrast with the more exaggerated action of the Duke of Norfolk, who is making sarcastic obeisance as he takes his leave. "The Gambler's Victim" (44)—too sleepy and tired now that the excitement of play is over, and too much overcome by the fumes of the wine that has assisted it, to be conscious of or to care much for what the game has cost him—is very cleverly represented by Mr. Pettie in a smaller picture, wherein the plucked pigeon is making his uncertain way along a wing-wall from the downier birds that are feathered at his expense.

With crowds about to suggest the appalling nature of such an event, Mr. L. J. Pott's exciting representation of a "Fire at a Theatre" (2), cannot come under the category of "pleasing pictures," although it is always pleasant to note heroism, and there could never have been a louder or better-merited outburst of applause to greet the clown's "Here we are," than when, half-choked with the smoke, and more than well warmed to his work after many a tumble, he restores to its anxious mother a baby it was not in his part to sit upon. The catastrophe has happened behind the scenes: it is to be hoped that the actors, to whom "All the world's a stage," found their safe exits as surely as their entrances; but it is such a catastrophe as the whole seven ages may become dreadfully interested in; for children in arms are not inadmissible everywhere, and from Exeter Hall to a "penny gaff" the chances are, death against life at very long odds.

It is a relief to find well-imitated water so close to its adversary, such as runs "Under the Walls of Maestricht," and floats a canal-boat, that Mr. C. N. Henry depicts so really (4). Mr. G. A. Storey is more perfectly satisfactory in his portrait-compositions of "Sister" (7) and two little well-behaved brothers "Going to School" (27), than in apostrophizing Sterne's lesson on the value of flattery that "The Old Soldier" had learned to such good purpose as a means of levying black mail from fair females by defending their own opinions against the invasion of dark doubts. But his "fair charitable" looks too truly good and humane; her eye far too sweetly bright to leave her at all a likely subject to be affected favourably by such gratuitous and gratitude-seeking acknowledgment. She is very pretty and innocent as she stands in the bright morning sunshine, helping very much, with the help of a well-painted background, to make "the old soldier" an agreeable as well as a humorous picture (62).

Mr. F. Sandys has shown how nearly he can approach the desideratum of making a portrait a valuable work of art, and apart from such worth, its close resemblance to the portrayed must have the effect of securing for it a very general appreciation. As a thorough example of the painter's chief excellence, the perfection of

zinta finish in his adopted view of copyism,—his "Portrait of an Elderly Lady" (714) may challenge comparison with the more astonishing display of it in "Medea" (99); for there has been less latitude for forcing into excessive brilliancy everything coloured to a gem-like lustre. The lady's mourning habiliments of vividly-white and jet-black crape have failed to detract from the purity of complexion and life-likeness of the face, but have made it necessary to emphasize colour, even in this case, to an unnatural brightness.

Unless to reach the extreme of possible finish, and in *no plus ultra* intensity, be but one and not the only aim, there may be some doubt whether any other end is attained than to create wonder at workmanship; and more doubt if excessive elaboration be not the means sometimes of destroying the propriety of appearances rather than assisting it. There is nothing at all mysterious in the presentation of the sorceress "Medea" engaged in mixing a spell-broth from the most innocuous of ingredients, so far as may be visibly suggested: there are lovely tints, so bright and beautiful in a clean delicacy that ugliness and venom can never be associated with wearing jewels not only in their heads but all over them; choice chemical compounds in pretty and curious shells; precious little images, such as the beighted heathen make gods of, and often fetch high prices at Christie's & Manson's; and the lady herself, exquisitely handsome and with remarkable hands, does not really deserve to be thought capable of much more harm than others as fatally gifted with beauty as herself—which all the world must know is harm enough—though the light reflected from her nefarious occupation is not a favourable one to regard her in. This is a very beautiful production, however, and only raises the question of how far Medea may be realized clear of the haze of mystery. Mr. Poynter's idea of "Proserpine" gathering daffodils in a classic vale and veil, will serve as an ideal to those who can form no conception of how lovely and winning she must have been (396); it is one of its most perfect and covetable of the smaller items in the present collection; delightful in its originality of treatment as well as for the grace of it.

Mr. Wallis has given "Marsyas" (442) a bath of golden sunshine to fine effect, but is more true to Nature and himself when he paints, from possible observation, "A January Morning" (745), with its chill of snow and fog to intimate the self-denial of true charity. A young lady has been attracted by the poverty-stricken appearance of a wretched mother waiting admission to the workhouse for herself and child; prompted by compassion, she leaves her companions to wrap her own covering round the neck of the poor little shivering creature, and in her own quiet way shows at once her commiseration and contempt for a sore throat.

But there is no poverty so hard to be borne as that which is of new and unexpected experience; of such, for instance, as "The Old Gate" suggests, which, thanks to Mr. Walker, will lead to the building of several stories (485). This is a picture that will talk for ages unless the artist tells its intention, and no longer leaves it to the canvas for canvas: the want of elucidation necessary to give it special significance rather adds to its interest than lessens it, for it invites conjecture to supply that want, taking such hold of the attention as good acting in a strange language might do. How the house was built; how its former tenants prospered and perished, and why its last should have to leave so sorrowfully attended, are some of the questions that occur. Ideas of fresh and fresh growth may crop up from the trodden foreground, and every step give a different footing in the tale that leads to the fallen old house: the old gate may typify the old gait that causes such effects, and effects such causes as ruin in its mazes of carelessness, trouble, circumstances, and sin, finds a centre in sooner gaid than got out of. Does she who looks so sad in her deep mourning, that she may have lost father, mother, husband, children, and all, see in the mock structure of a paper-built house the metaphor of her own fragile fortune; or does she envy the mother of the snarling, ruddy urchins who are the builders even of such weak promise; or does she behold in the labourer on his way to his work a type of what destiny will make of her in the need that will oblige her to become a labourer too? Or did Mr. Walker find "the old gate," just as he has represented it, before some disipated old mansion that was all the more indicative as an

emblem of decay when seen in bright spring-time, and introducing such figures as in historical instinct he would select for a novel illustration of "The Past and the Future," paint a fine picture—as he could scarcely fail to do—that preaches in the eloquence of rare expressive power and poetic feeling a long sermon from a short text?

THE LATE MR. PETER CUNNINGHAM.

The death of Mr. Peter Cunningham, which took place at his residence in St. Alban's, Hertfordshire, in the evening of the 18th inst., was briefly mentioned in our last. He was born in Pimlico on the 7th of April (not the 16th, as elsewhere stated), 1816, and had therefore just completed his fifty-third year, and was the third son of Allan Cunningham, the well-known poet and assistant of Chantry, and who died on the 29th of October, 1842. The subject of this brief notice was educated at Christ's Hospital, and in 1835 was appointed by the late Sir Robert Peel, as a mark of esteem for the talents of his father, to a clerkship in the office of the Commissioners for Auditing the Public Accounts. In 1854 he became chief clerk of that department, and retired, on the 4th of February, 1859, with a small pension. On the 14th of September, 1842, he had married Zenobia, second daughter of the late John Martin, the painter. Mr. Cunningham was a most industrious contributor to critical and historical literature, and produced a number of books, besides writing constantly for periodicals such as *Fraser's Magazine*, the *Athenaeum*, and the *Illustrated London News*, wherein his weekly column of "Town and Table Talk" was for some years an attractive feature. He will probably be longest known by his remarkable "Handbook of London, Past and Present," written for Mr. Murray, and first published in two volumes, 8vo., in 1849. This work, which displays a great amount of reading, especially of our earlier dramatists and anecdotists, was seven years in hand, written and re-written:—

"It has not only engrossed all my leisure" (the author says in the preface), "and cost me much thought and anxiety, but has imposed upon me a very painful amount of minute research amongst unsorted papers, often very difficult of access, and never very clear or legible, for the chance of opening up new sources of intelligence."

The second edition of it was published as one volume.

He edited the "Poems of Drummond of Hawthornden," 1 vol., 8vo., as early as 1833; "Songs of England and Scotland," 2 vols., 8vo., 1835; the second edition of "Campbell's Specimens of the British Poets," with additions, 8vo., 1841; and "Campbell's Essay on English Poetry, and Lives of the Poets," 12mo., 1848. The "Handbook to Westminster Abbey," 12mo., was published 1842; "Life of Inigo Jones," 8vo., for the Shakespeare Society, 1848; "Handbook of London, Past and Present," already mentioned, 1849; "Modern London," 12mo., 1851; "The Story of Nell Gwynn," 8vo., 1852. He edited the Works of Oliver Goldsmith, 4 vols., 8vo., in 1854; "Lives of the Poets," by Johnson, 3 vols., 8vo., 1854; "Letters of Horace Walpole," chronologically arranged, 9 vols., 8vo., 1857, 1858. Rewrote Jesse's "Handbook to Hampton Court," 12mo., 1842; "Handbook to Windsor and Eton," 12mo., 1843; edited an edition of Allan Cunningham's "Life of David Wilkie"; an edition of "Boswell" (in conjunction with Mr. J. W. Croker); an edition of Pope's works; wrote "Revels at Court;" and a prefatory life of T. M. W. Turner, the painter. After his retirement to St. Alban's, with failing health, his literary contributions were chiefly confined to the *Builder*, wherein will be found a large amount of curious and valuable matter, mostly in the shape of artistic biography, with his name attached.

Somewhere about 1846 and in the following years Mr. Cunningham acted as joint honorary secretary (with the writer of these lines) of a committee formed to present a testimonial to the late John Britton, the antiquary. What was called the "Britton Club" grew out of this committee, and at one of the genial meetings of that little society, the veteran, William Jerdan, sketching in hasty verses its various members, thus characterized the subject of our note:—

"And Peter Cunningham, of antique lore,
A hand-book and a head-book, both so pat,
Whose converse shows you it is not a bore
To mix the ancient speech with modern chat."

His social qualities at the best period of his life were eminent; he found friends on all sides, and went largely into society. For some years he was a Fellow of this Society of Antiquaries,

and a member of several social clubs. With the brilliant little circle which at that time provided London with *Punch* he was much connected, and at the head of the preface—dedicatory to a volume of that most admirable serial (one of the great things of our era), stands, if we remember rightly, "Petrus Cunninghamus."

His life fully written would not be without a moral and a warning; but this is not the moment or the place to point to weaknesses. Let us recollect only the good things and the useful work he did. He was buried at St. Alban's on the 24th, by the side of his daughter Nora, who preceded him on the 19th of May, 1863. The mourners were his only son, Walter, his two brothers, General Alexander Cunningham, and Colonel Frank Cunningham, and his brother-in-law and old companion, Mr. Leopold Charles Martin.

May we add an earnest word for one left behind him? Mr. Cunningham's pension ceased with his life, and his widow is unprovided for. A pension on the Civil List, on the ground of the contributions to British literature by her husband and his father, supplying the place of the pension that has dropped, would be a good and graceful act on the part of the Prime Minister.

EFFECTS OF DRAINAGE AND WATER SUPPLY.

The inestimable advantages which spring from an abundant supply of pure water, and a well-devised system of sewerage, are every day becoming more appreciated, and in proportion as these benefits are valued, so will the scientific works of the engineer be acknowledged. The Registrar-General has just issued his quarterly returns of the rate of mortality, in which he specially alludes to forty-six of the principal towns of the United Kingdom. There is one town quoted in the list which probably more than any other shows the beneficial effects of drainage and water supply. The town to which we now particularly refer, is Swansea, Glamorganshire, a town which in itself contains elements for a high death-rate, but which is now quoted by the Registrar-General as the third healthiest of the forty-six towns enumerated. This town now contains a population of 65,000 inhabitants, and it is well known is the seat of the largest copper smelting works in the kingdom, something like two-thirds of the whole of the copper ores of the county being smelted in the immediate vicinity. Thus it has gigantic iron works, tinplate works, arsenic works, and other manufactories, which emit dense volumes of smoke, so much so, indeed, that the inhabitants may be said always to live in smoke, and the adjacent hills and districts are entirely denuded of vegetation. At one time high medical opinions were quoted, to show that the atmosphere, impregnated with the deleterious vapours and smokes from the works, must have a prejudicial effect upon health and life, and certainly the then rate of mortality seemed to bear out the opinion of the medical faculty. The inhabitants, however, and their representatives felt that if they lived in smoke they also lived upon or by smoke; that is, that the stability of their trade and commerce depended upon the prosperity of their large works. Impressed with this opinion, they did not make a crusade upon the proprietors of these works, compelling them to put the provisions of the "Smoke Nuisances Act" into operation; on the contrary, the whole town, in public meeting assembled, determined to reject the Act, for which we give them no praise, but the contrary. They will see their error presently. It was, however, felt, upon the other hand, that the rate of mortality was higher than should be reasonably expected, notwithstanding the adverse circumstances to be contended with. It was determined, after much controversy in the Local Board of Health, that a perfect system of drainage should be carried out, and that an abundant supply of pure water should be obtained, at whatever cost. Some ten years since, therefore, the sewerage works were planned, and have since been carried out under the personal supervision of Mr. Edward Cousins, the present surveyor of the Local Board; and up to the present time upwards of forty miles of brick and pipe sewers, varying in size from 3 ft. 9 in. by 2 ft. 6 in. to 2 ft. 3 in. by 1 ft. 6 in. (egg-shape), and pipes varying in size from 18 in. diameter to 6 in. diameter, have been laid. The house-drainage is in process of being carried out, about 4,000 houses having been connected

out of a total of about 8,000 houses in the borough; and this drainage has been carried out at a cost of about 40,000*l.*, in round numbers.

During the progress of the work the most remarkable results have been noticed and carefully recorded by Mr. Ebenezer Davies, the Officer of Health. In the event of any outbreak of fever or epidemic of any kind, those parts of the town through which the main drainage had not been carried were invariably its hotbeds, and in some instances fever proved fearfully fatal where no drainage existed, whilst in the same locality, but where the drainage had been carried, there was a happy immunity.

But not only was drainage resorted to with such beneficial effects, the corporation, or rather Local Board of Health, determined upon seeing a most abundant supply of water, not only for domestic, but for trade and flushing purposes; and at an outlay of somewhere about 100,000*l.*, they have succeeded in constructing a splendid reservoir at the Liliw, capable of storing no less than three hundred millions of gallons, or a supply to the town of no less than four months, without any rainfall whatever. This water, according to scientific analysis of Mr. F. Crace Calvert, of Manchester, is exceedingly pure, containing only 2 degrees of hardness, whilst the London water generally contains about 12 degrees. The Swansea water is the nearest to that of the celebrated Loch Kathrine, Scotland. The water of the Liliw has been conducted through eight miles of graduating conduit, and about twenty-five miles of distributive mains have been laid. These works were designed by Mr. R. Rawlinson, C.E.

The distributive mains have been superintended by Mr. Cousins, the borough surveyor. At present about 7,000 houses in the borough are supplied with water from the reservoir, and there can be no doubt but that in a few more years the works will yield a very handsome revenue, far more than paying the interest upon the outlay made. The receipts from the water works now amount to about 6,000*l.* per annum. The combined effect of these two important works has had the most satisfactory, and we may say extraordinary, result upon the public health, and has enabled the Registrar-General to place Swansea in its present position of the third healthiest of the forty-six towns he has enumerated. Prior to the carrying out of the drainage and water supply, the rate of mortality in Swansea was about 26 per 1,000. The last return of the Registrar-General now shows it 18.37 per 1,000, and one month it was as low as 12.35 per 1,000, whilst the tables of sickness kept by the large clubs of workmen show that the general health of the borough has most materially improved. We can scarcely be wrong in attributing much of this good result to the improved sewerage and abundant water supply provided for the town.

AN AMERICAN SCHOOL OF ART.

It is an old saying that three shops make a market. We have never seen it attested how many artists are required to constitute a school.

To found a school, indeed, in painting, or in any other branch of art, the genius of one man may suffice. We are in possession of works attributed to "the school of Michelangelo." The expression cannot be taken to intimate that the immortal Florentine had any rival professors of his wonderful mastery over marble.

We are, therefore, it seems to us, fully justified in speaking of the establishment, in our day, if not in our country, of a new school of painting. The New World once more has provided a surprise for the Old World. Two works by American artists, are now exhibiting in London, on the walls of the Royal Academy, and one on the show-rooms of Mr. MacLean, in the Haymarket, which are such as to justify the claim to be considered as examples of a new order of landscape painting. We refer to Mr. Bierstadt's picture, called "Among the Sierra Nevada Mountains, California," which is No. 309 in the catalogue of the exhibition of the Royal Academy, and to Mr. Church's view of "Damasens."

Of this latter picture we can only speak, to some extent, from knowledge acquired from the study of the former. When we see how far the results attained by a painter of one of the most famous scenes of Oriental landscape, agree with those scored by a penetrator of the Californian deserts, we feel justified in assuming the adoption of a similar method by the two New World painters.

The main excellence of this pictorial school

may be said to consist in such a representation of nature as results from a very patient and careful study of details, which are afterwards combined in an imaginative *ensemble*. The aptest illustration of our meaning may be taken from the art of the orator. A subject may be very carefully mastered—a speech, or speeches, may be written and re-written on the theme,—and then, at the moment of delivery, something entirely original is thrown out by the excitement of the occasion, in which, however, the golden fruit of the past toil is apparent.

Thus numerous sketches of every romantic incident of a landscape, from distinct points of view, and under all varying conditions of incidental light, fill the portfolios of Mr. Bierstadt. With a wise appreciation of that confusion which creeps over a sketch from the shifting of the shadow, which is caused by the diurnal motion of the earth, this artist has bound himself by the admirable rule never to occupy more than twenty minutes in making a water-colour sketch. Thus his notes, so to call them, of detail and of incident, are characterized by unusual vigour and truth. In colouring they are bold to the verge, but not beyond the verge, of exaggeration; and the promptitude with which the sharp outline of light and shadow has been seized and stamped upon the paper, gives the force of actuality to the scene, however rough be the handling.

A wide landscape, thus studied and recorded in detail, becomes the mental property of the artist. He can choose at leisure whether to represent it in storm or in sunshine, by morning or by evening light. He has but to map the outline of the salient features, from the point of view which he may ultimately select, and he will then find in his portfolio all that he may wish to transfer to his easel. Nature has been his teacher, and has instructed him, as it were, *visu voce*. It is true that, if he is not within him that which responds to her teaching, the lesson will be in vain. But few would seek to listen to the utterances of Nature who were not, more or less fully, fitted to become her pupils. And Mr. Bierstadt is not one of such a group.

To perfect mystery of truth of detail, and imaginative grasp of the *ensemble* of landscape, this new school adds another rare element of excellence, that of *proportionate precision*. In accuracy of study the painter is hy turns a geologist, a botanist, and a portrayer of animal life. He gives a flower in the foreground with all the fidelity of a flower-painter. He draws a deer, or an eagle, or a red Indian, as if he had no eyes except for animal forms. But when these elements take their place in his landscape, it is as subordinate features. He does not give you a portrait of a buffalo or a stag, with a background of landscape. It is his aim, and we are bound to say his successful aim, to subdue the individuality of figure and of form. He equally avoids that vague ignorance, or carelessness, of specific forms which shallow people call generalizing, and that precise, monotonous, equal-handed, reproduction of image, which makes what is termed *peinture à l'huile* treatment so closely resemble mosaic. His deer are neither more nor less striking on his canvas than they are on the landscape itself. At the first glance they only want motion; but if you bring the glass to hear on their forms, they will certainly not look like live deer, viewed through the telescope. Nor is it proper that they should do so. When an object is focussed by optical means, it becomes, for the time, the main centre of vision. But if a precision of this kind be attempted on canvas, we lose entirely that subordination of the parts to the whole without which there can be no such thing as pictorial unity. It is not that the artist should not be perfectly familiar with the anatomy and detailed outline of the wild animal. This he must know, but he must also know something more; he must know how the creature appears at a given distance, how its outline will melt into shade against foliage, or soften when relieved against rock or water; he must know what it is, and be able to draw what it appears to be.

Three very large landscapes, taken from Californian scenery, have been brought by Mr. Bierstadt to this country. We are happy to have been able to trace a distinct and visible increase in artistic power, as the artist has advanced; and we have no hesitation in qualifying the picture now at the Royal Academy as the finest of the series. We hope, indeed, again to have an opportunity of seeing the midnight view of Vesuvius in eruption, which was in

London last year. It is a subject as to the absolute fidelity of which to nature many more persons can hear witness than in the case of the great American lakes. There are few visitors to the Royal Academy who have seen a cataract of 4,000 *ft.* in sheer columnar fall, parting as it descends into a cloud of mist, and finally flowing like a wreath across the face of the unveiled precipice. But there are very many who have scorched their boots at the infernal fires of the lava, and cut them to pieces on the scoria of Vesuvius; who have beheld the cloudy cap of the volcano red with the pulsing and reflected glare, and who can therefore admire, with instructed taste, the faithful rendering of Mr. Bierstadt.

The "Storm in the Andes," one of the earlier of these large pictures, has been reproduced as a chromo-lithograph. The prints have been long in course of preparation; which is not to be wondered at, for they are said to have required the use of nearly forty stones. The effect is very brilliant, and the diminution of the same appears to have been very correctly effected. But a question of no small importance here arises. It is one which affects not only the representation of Mr. Bierstadt's landscapes, but the very principles on which such reproductions should be attempted.

In reducing a picture to a smaller scale, the proportionate area occupied by each tone and shade of colour will be unaffected. A reduction of this kind takes place in the retina, so that, in point of fact, it may be said that we never actually see anything but a reduced picture.

But, though the relative area occupied by each colour is unaltered, the relative proximity of tint is very materially altered. A bright light and a dark shade will contrast very differently at a distance of 6 *ft.* or of 6 *in.*; and however minutely the intermediate grades of line may be simulated, the element of distance is materially altered. Therefore, if we look at a landscape, or at a large painting, and then look at a reduction, or miniature representation, of the same, in which the same scale of colour is employed, we at once become sensible of a very different impression on the vision.

This contrast becomes extremely palpable in the present case. From the large size of the original painting, and from the number of colours introduced, the task of the lithographer has been one of no ordinary hardship. A brilliant picture has been produced; but a certain want of repose, as compared with the original, is distinctly perceptible.

In the present state of optical and chemical science, the production of chromatic effect by photography appears to be hopeless. We can, therefore, hardly hesitate to form the opinion that a chromo-lithographic reduction of a painting can only be a true representation of the original when taken from a copy reduced by the painter himself, or by some equally competent hand. Of course, the expense and trouble of such a procedure would be very great. There are, however, instances in which it would be worth while to incur them. Every artist is instinctively aware that a miniature must not be painted with the exact tints of a full-size portrait. In painting, and even in sculpture, the eye instinctively teaches the hand to work to scale. But this is something extremely different from matching a tint. We think that not the least of the recommendations of the print now in course of publication by Mr. MacLean may be the illustration which it affords of the importance of studying the scale and subordination of colouring. It is probably from this very cause that many chromo-lithographs are so harsh and untruthful.

We have said little of Mr. Church's view of "Damasens." It is a very beautiful picture. The limestone rocks are lighted up with the fierce, but quickly shifting ray which falls in those southern latitudes, with far more intense force than when it glints on our Westmoreland, or Scottish, or Welch, or Irish mountains. Far off, the ancient city—the pride and glory of the East, the metropolis of the nightingale,—is basking in the glorious light. The wealth of water of the noble rivers—the owner of the Rob Roy canoe would tell us which was Ahana and which Pharpar,—adds a sense of plenty to the beauty of the scene. We confess to a hesitation as to the foliage, which fills the greater part of the space between the foreground and the distant capital. The trees look knotty and stunted—almost like a cabbage garden. But we are far from mentioning this as a fault attributable to Mr. Church. So have we seen trees to look under similar circum-

stances. We are inclined to hold that this rather ignoble bit of detail is quite true to nature. The artist is not responsible for the flora of the country he visits, nor for the planting of its park-like scenery. No doubt, Mr. Church would have filled his canvas with weeping birches, and spiry cypresses, and storied, branching cedars, and lighted it up by the snowy lustre of the catalpa or the magnolia. But we incline to think that he has shown us the Vale of Damascus as it appeared to his own penetrating vision under that very sun-gleam which he has imprisoned on his canvas, and we thank him for his picture.

It is with true pleasure that we welcome this artistic success of the United States. In the hurry and jostle of the active life of our busy neighbours across the Atlantic, we have become accustomed to think that the art element has been neglected. When wealth has flowed in, in boundless and fabulous streams, we have thought it to be habitually applied rather in the pursuit of luxury, or of splendour, than in the cultivation of taste. We hail so effectively a protest against this view, whether as entertained by ourselves, or by the richer citizens of the United States. It must be remembered that an American artist, unless it be within his power to visit freely the Old World, labours under many disadvantages as compared with his European brethren. The great names of the past are less familiarly household words with him; or, at all events, the works that made those names great are less accessible to his study. The very pride of his young citizenship,—young in the life of nations,—may act as a bar to his progress. The names of the rivers of Damascus recall a memorable expression of this form of national pride. "Are not the lakes of the Sierra Nevada," the American artist may exclaim, "worth all the shores of the Adriatic? Who is Claude, or who is Titian, that I should learn the study of Nature, to sit at his feet?" But none the less it is true that this expression of self-reliance is the language only of ignorance. The human wit is not yet so bright that the best of us can afford to neglect the conquests of our predecessors. To know how the masters of the palmy times of art encountered those problems which ever recur to the artist, is an essential element of his education. To see how they succeeded, is at once an encouragement and an aid,—to see how they failed, may be, rightly viewed, of even greater value. Not that the study of Nature is to be neglected, even for that of the works of her most favoured children. But the road to excellence in art is proverbially long. Many are the byways, tempting enough in their aspect, that lead to the damp meadows brooded over by the mist of evening and the frowning towers of the giant. The lesson of those who have wandered from the path is not to be slighted without shame.

Nor must it be forgotten that landscape painting, charming as its results may be, is by no means the highest triumph of the painter's art. And when we ascend to portraiture or to historic composition, an intimate acquaintance, not only with the great masters of Italian painting, but with the works of Roman and of Grecian sculptors, is an absolute essential to any degree of excellence. Let an artist try to form his style on contemporary life; let him haunt the public assemblies of the day, the tribunals, the chambers of the Legislature; let him learn all that nature in her conventionalised garb there teaches, what will be his highest attainment?—a portrait limned with the fidelity of a photograph, with the same wearying and uninteresting result. Two requisites go to make a noble portrait,—a fit subject and a fit artist. Mere reproduction of feature, which is all to which the painter who has not drunk deep at the fountain of old art can hope to attain, taxes the mechanical skill of the draughtsman. It is one of the humblest exercises of the genius of the artist.

Dangerous State of a Wooden Viaduct near Huddersfield.—The town council of Huddersfield have unanimously passed a resolution drawing the attention of the Lancashire and Yorkshire Railway Company to the rotten and dangerous state of the Donley Dale Viaduct on their line, and threatening, unless one of stone be substituted, to complain to the Board of Trade on the subject. The traffic along this viaduct is very great, and it forms part of the highway between the Huddersfield district and the south, generally towards London.

THE (ALBERT) MUSEUM, SOUTH KENSINGTON.

BEFORE continuing my "Notes," I may as well state, for the satisfaction of lovers of art generally, and of "One of the Public" in particular—in case your correspondent should not have paid a subsequent visit to the Museum—that the strong remonstrance in the *Builder* of April 24 has been effective, and the objectionable panel on the wall of the beautiful staircase to the "Ceramic Gallery" has disappeared.

In my last notice of the loan exhibition I particularized various most interesting objects in the East aisle, or Oriental department of the South Court: I will resume my account in the same locality.

An extensive collection of Japanese objects, sufficient to fill two glass cases, is lent by Lady Boxer. The various items were gathered together by Captain C. R. Boxer, R.N. Among them are:—Two small bronze tea-kettles, each on a tripod, ornamented with dragons in high relief, very rich-looking; two similar, of still smaller size, and a hexagonal teapot, the sides chased with scrolls and floriated work; two bronze bowls in form of a lotus leaf, ornamented with buds, half-opened flowers and rolled-up leaves, the stalks forming the support to the bowls; two large teapots ornamented with dragons, and having serpent handles; two large bronze vases, inlaid with pattern of foliage in silver, with two handles, and a Greek fret border top and bottom; a small bronze vase and cover, damascened with silver, and having wing handles and a kylin—or dragon,—on the top; a singular "pricket" candlestick, the base of which is somewhat of a bell-shape, but is like a cage formed of strips of metal in imitation of plaited string, bound together by scrolls or tendrils; two graceful candlesticks, each in the shape of a crane, whose bent-down head holds in its beak the curving stalk of a lotus plant, the open flower being formed into the candle-socket: these are also of bronze, damascened with scroll pattern; six large shells called Venus's Ear (*Halotis*) set in lacquered wood with the bark on, and thus forming a series of dishes; a coral lac box, about 2½ in. square by 4 in. high, in four compartments, beautifully carved with foliage and flowers; an ivory vase formed of a piece of tusk in its natural shape, pierced with carving of birds and foliage, mounted on stand of gilt lacquer, studded with insects in their natural colours; and a larger vase, with landscape in gilded lacquer, on stand, inlaid with birds and foliage in mother-of-pearl; four small square trays in black lacquer, with bamboo basket-rims; two fine bowls of red and white porcelain, ornamented with foliage, and having a landscape in centre, inside; two bottles of the same red and white porcelain, with "interior" scenes, and one double handle on each; a plate of the same, with a garden scene; and a number of exquisite egg-shell cups, covers, and saucers, in varied sizes, that make one break the tenth commandment desperately; some pins for the hair, inlaid with the beautiful blue feathers that imitate enamel so well; a pair of very handsome large bronze vases, on stands ornamented with castings in high relief, admirably executed, of birds and foliage; a bowl of Chinese porcelain in Imperial yellow, with green dragons on it, and another of blue Chinese porcelain of rich deep colour; a green jado circular plaque, with a hole in the centre, carved with dragons in relief; an exquisite cup of Chinese egg-shell porcelain, with delicate deep blue ornamentation of sparse flowers and birds; two others of somewhat uncommon concave shape; and many more, greatly interesting objects, that must be passed over for want of time. Lady Boxer likewise lends two very fine incense-burners of bronze in form of a bowl, ornamented with multiplex Greek fret,—it is curious to see how partial the Japanese are, or have been, to this Classic enrichment,—and supported on bronze rockwork, with sea-dragons in high relief.

Not far off is the grand incense-burner lent by Mr. T. Hanbury. It is of turquoise-blue cloisonné enamel, with a landscape around the body containing swans, storks, lilies, foliage, and water. The burner is supported on the backs of three storks of white cloisonné enamel relieved by black and a little red; around the rim runs a blue border of hexagons, each enclosing a six-pointed star of red on white ground. The body of the vase has two handles of gilt dragons, each holding an open-work circle of enamel that looks like an inscription. The cover

is very bold, of flattened bell-shape, in equal parts of perforated gilt-metal scrollwork and cloisonné enamel, and is surmounted by an elongated knob of open-work gilt metal.

In the same glass case that contains this incense-burner stands an elegant work-table of carved sandal-wood, lent by Mrs. Hayllar: it has an elongated hexagonal top, supported by two bracket legs, which stand on a similar, but smaller, base, that rests on four kylin heads. This table is of modern Ahmedabad work, and is very carefully and delicately executed. Mrs. Hayllar also lends six plaques—which are to be found in the tall glass cases under the windows—and six cups and saucers of agate and other materials, of various sizes, all being modern Hindoo work, and very beautiful as specimens; four miniatures on ivory, and glazed,—a view of the Taj Mahal at Agra, modern Agra work; a view of the Khotab Minar, Delhi (a large tower or minaret); the Residency, Lucknow, after the siege during the late Indian mutiny; and the Cashmere Gate, Delhi, also after the siege. Was not this the gate before which Home and Salkeid performed their valorous and daring act of carrying up bags of powder, under fire of the mutineers, and laying them before the gate; by which powder it was blown open, and access thus gained to the city, which till then seemed hopeless of attainment? These three last-named paintings are all modern Delhi work, are extremely interesting, and are very minutely and carefully executed. There are, likewise belonging to the same lady, a large work-box of the well-known sandal-wood carving, modern Ahmedabad manufacture; and a good eight-fluted tray, of tortoiseshell and gold lac, modern Japanese work.

Some fine specimens of ancient Chinese cloisonné enamel are lent by Lieut.-col. H. Hope Crealock; they consist of a pair of large vases and covers, of the usual turquoise-blue, supported on three elephants' heads of gilt metal; a square coffer, with gilt metal mounts; a large deep salver, ornamented with a dragon and birds, fluted on the inside, and the rim to correspond; a pair of perfume-burners, Chinese enamel, turquoise ground, and the well-known designs in bright colours; they are like old-fashioned high candlesticks (but with a hollow ball at the top instead of a socket), and are surmounted by a perforated cover of gilt metal; a magnificent vase, about 2 ft. 6 in. high, of the same costly material; a large circular platter; a pair of pricket candlesticks; an incense-burner, of the ordinary type; and two vases, with covers and handles.

Two very large incense-burners and covers, with gilt perforated panels, elephant-head supports and carved wood stands, are lent by Mr. W. Hogg; and an octagonal cistern, or font, was bought by the museum for 39l.

In the glass cases against the north wall of this Oriental department, are collected numerous curious and extremely interesting objects; of these I must only mention a few, namely, a book formed of twelve leaves of thin wood, covered with lacquer, the writing black, the ground gold, with red filiated ornaments and figures of gods, the leaves inclosed in outer boards painted red, with gilt ornaments; it is 2½ in. long by 3½ in. wide, and has a wrapper of coloured cotton fabric, stiffened with interwoven strips of bamboo, and a cotton bandage 12 ft. 4 in. long, into which is woven an inscription in the same characters as the book. It is Burmese work, and was bequeathed by the late Mrs. Boyd Miller. A book of fourteen leaves of thin wood, coated with lacquer, the lettering black, on red and gold ground, inclosed between outer boards, ornamented with birds and sun in gold lacquer on red ground, 21½ in. by 3½ in., and given by Lady Campbell, with another of sixteen leaves; a book formed of nine sheets of thin copper, coated with lacquer, lettering black on red ground, ornamented with gold lacquer, 22½ in. by 4½ in., Burmese work; and another of two sheets of thin copper, 22 in. long by 4½ in. wide, both likewise given by Lady Campbell. A sword, worn by one of the three Delhi princes who were shot when that city was taken, during the mutiny, is lent by Lieut.-col. Maizey.

In the same cases are some law-books of the Burmese, written in white on blackened paste-board; also some of their sacred books, written on palm-leaves. There is, in a smaller case adjoining, a little model in crystal of a tope, or spheerical mound, found within a tomb near Bhalis, Central India; this model is presumed, from various circumstances, to have contained a relic of Buddha himself, and to hear date from

about the Christian era. There are also two caskets of steatite containing relics of two leading disciples of Buddha, found in a sepulchral mound near Bhilsa; the assumed date of these is between the third and sixth century B.C.; but why the disciples' relics should have been entombed so many hundred years prior to that of their master is a mystery. It is strange that the earliest and latest epoch ascribed for the death of Buddha should differ as much as 1877 years, the former placing it in the year 2120, and the latter in the year 543 B.C. A recent writer says, that "the Tibetan and Mongol account, which fixes his birth in either 1022 or 1027 B.C., and his death in 912 or 947, may come very near the truth. Buddha was the son of Suddhōdana, King of Magadha, in South Behar; his name was Sarvāthasiddha, and the title of Buddha, or 'the sage,' was not given to him until he had attained eminent sanctity as a teacher of religion. Soon after his birth he was presented before the image of a deity, in accordance with the custom of the country, when the image inclined its head towards him as a presage of his future greatness. He early developed mental faculties of the first order, and was also remarkable for his great personal beauty." At the age of twenty, he married a noble virgin called Yasōdharā Dēvi, by whom he had two children, a son and a daughter, and he died in his eightieth year.

To return to the Museum and the models of sepulchral urns from which Buddha's history has drawn me away. In the before-mentioned glass case, and in addition to the urns already noticed, are one of Steatite, containing wood and bone ashes, found likewise in a sepulchral mound near Bhilsa, assumed date between 500 and 200 years B.C.; and a smaller urn, or casket, of black steatite found inside the last-named urn.

In the corresponding aisle across the South Court, and on the site where Elkington's beautiful Victoria Trophy stood when I commenced these "Notes," is now to be seen a glass case containing a collection of bronze statuettes by the late Baron Marochetti, and lent by the Baroness. Of these, I much like the well-known "Emmanuel Philibert," a spirited equestrian figure, fully armed, and with the right arm raised in the act of returning his sword into the scabbard. He was that hero-ancestor of Victor Emmanuel who did good service to Venice three hundred years ago, and through whom—as a modern poet sings in "Venice Free"—the present king of Italy claims rank among her nobles,—

"As heir to that good duke of Savoy's race,
Emmanuel Philbert, to whom the grace
Was granted, for himself and heirs, to be
Nobles of this fair city of the sea."

The statuette of a man seated, and holding a large tablet, on which is inscribed, "Il Statuto," has a very fine head. Close by, in a table glass case, is a frame containing fifteen unfinished miniatures by Samuel Cooper, together with the pocket-book, in which they have been preserved. They are lent by Mr. E. H. Lawrence, of Hampstead, and are very interesting to see. There are, too, a Bible, London, 1682, in the English binding of the time, tooled in gold and colours, lent by Mr. R. H. Drewett; the Diploma of the Order of St. Hermangilda of Spain, dated 1816, written and illuminated on vellum, the page where opened being very carefully painted. It is lent by Mr. Beresford Hope, as is the "Horse," Dutch MS., and of sixteenth century, with illuminations, those where the book is opened representing the Annunciation—large; and the small one the temptation of Eve, wherein Satan is depicted, with a human head and neck, but horned; the body of a bird, the legs and tail of a dragon, and with brown arms to match. There is a grand modern Russian Bible, bound in red velvet, which is covered with a sheet of silver gilt, enriched with five medallions of enamel, containing a figure of the Saviour and the Four Evangelists, set round with large diamonds, either real or imitation, and the central plaque surrounded by rays of glory in diamonds. It is lent by Colonel Campbell, R.A. Proceeding up the large double staircase in the west corner of the north court,—and which bears on its walls some of the cartoons that were sent in, in answer to the Government invitation, as designs for the decoration of the new Houses of Parliament, and were exhibited in Westminster Hall in 1843,—to the new "Ceramic Gallery," which already wears a noble aspect, and will be nobler still when its large columns shall be each encased in its intended shell of maiolica. Each column seems destined to be dedicated to one world-famed potter. On those

already completed we read the names of Luca della Robbia, Palissy, and others, and where they appear, the cases contiguous contain the work of their hands and of their time. It is impossible to pass through the gallery, however hurried one may be, without being compelled continually to stop and gaze; for instance, at the terra-cotta bust of Flaxman, by himself, dated 1778, bought for 10*l.* 1*1*/₂; the Wedgwood black basalt vase, with two square handles, cover, and pedestal (the base bears, in relief, a concert of Cupids, date about 1770); a statuette of the Farnese Flora, at Naples, Bow porcelain, ascribed to John Bacon, R.A., late eighteenth century; a female head, bundle to cane, middle of eighteenth century; a vase and cover, of Italian Faenza, height 24 in., cover formed by six trefoiled arches, date about 1480, bought at the sale of the Soulgés collection for 80*l.*; a plaque of the Resurrection, with six guards, instead of the conventional four, Christ bearing a banner, and his feet supported by three cherubim, date about 1600 to 1610, very carefully drawn and coloured, price 12*l.*; a jug, with girl's face projecting in front, so realistic as to be quite startling, date about 1480, price 12*l.*; a plaque, Virgin and Child, under a slightly Gothic arch, dated 1489, price 14*l.*; a plate from the Bernal collection,—on it St. George standing with his shield, after Donatello's statue, 6*l.*; a fine plate, bought from the Soulgés collection for 50*l.*; a procession of six warriors bearing banners; it is dated 1520. The manner in which this and other plates are exhibited, so as to show both back and front, is very thoughtful and ingenious too. It is interesting to see the real signatures of the various masters in their craft; indeed, I might say the "various signatures." One plate close by is signed "Ma. Go. de Ugubio," and dated 1526; another, "da gubio," 1526 also. Of the Sgraffiato, or incised ware, there are several specimens ranging from 1470 to 1694.

Next comes the small case of Henri-deux ware, only five pieces, but still a grand collection, and which cost the Museum the modest sum of 1,820*l.* This peculiar ware is likewise called "Faience d'Oiron," from Oiron, near Thouars, where it was made. The pieces consist of a noble high candlestick, price 750*l.*, date 1541; a large plate, 140*l.*, date 1535; a pedestal salt-cellar, 300*l.*; tazza and cover, 450*l.*, date 1535; and a tazza inlaid with black, 18*l.* In lustré maiolica there is a plate, with a pretty girl on it, from the Soulgés collection, which cost 100*l.*; the bust is in natural colours on blue ground powdered with gold stars, and bears an inscription, "Amato chi me amato." A very early specimen of dated lustré ware is a plaque bearing a bas-relief of St. Sebastian, in a Renaissance niche, and below it "ADI 14 DELVGLIO 1501."

A plate with fluted border, date about 1540, bears a representation of the Laocoon; it is seen as three separate figures, not bound together by the snakes, as the group now is; a restoration of modern times; thus helping to confirm the opinion that it was not so intended by its classic sculptor. A very fine plate of maiolica from the Soulgés collection, and which cost 200*l.*, bears a bust inscribed "P. Perugino." The green border has on it medallions of birds charmingly painted in their natural colours; and on another plate is represented a maiolica painter in his *al-fresco* studio painting, in the presence of two persons of distinction, on a plate he holds in his hand. On a low stool are ranged his colours and brushes, and a curtain of deep blue forms the background. It is thought to be Caffaggiolo manufacture, and the date about 1515. The price was 150*l.* An earthenware plate of lustré maiolica, dated 1537, which was bought for 2*l.*, has an interlaced Arabic pattern in white, heightened with lustre tints on black ground, and is also by Maestro Giorgio.

Ere we leave the gallery we must just glance at the specimens of oil-painting on earthenware, which was an Italian fancy of the seventeenth century; and at the very fine collection of Oriental porcelain.

Descending the handsome maiolica staircase and turning to the left, we come into the court of metal-work, and here, placed somewhat high up, but in a prominent position, hangs the noble mirror in frame of silver *épousés*, lent by her Majesty. It is of large size, and is ornamented with festoons of fruits and flowers; at the top is a shield bearing the cipher of King Charles II. It is English work, date about 1670, and is a right regal mirror.

Retracing our steps, we pass through the "food department" into the library corridor, in which are placed the plaster busts of noteworthy men; here and elsewhere about the Museum these busts, so far as I have been able to number them, amount to seventeen or eighteen; they are inscribed with the name, date of birth, and death of their subject, and are very interesting and instructive so far as they go; but there was a much more extensive collection at Sydenham in the olden days of the Crystal Palace, and I would venture to suggest to the authorities at South Kensington, that it would be a little money well spent to get *replicas* of all the known and credited busts, there and elsewhere, of men and women worthy to be had in honour and held in remembrance. To those who cannot see these worthies in the flesh, it is most desirable and advantageous to be able to gaze upon their counterfeit presentment. And now, having arrived at the entrance of the Museum, it must prove an *exit* to me; for I must, with great regret, discontinue my "Notes" at South Kensington. In doing so, I beg leave respectfully but earnestly again to bring before the notice of the authorities the name I have suggested for our beautiful Museum. Since I have made bold to use it now for a period of five months, no better name has been proposed, and therefore I venture to think no more appropriate—and I am sure no *better* name—than the Albert Museum can be found, and so I commend it once more to their august consideration.

ART-LOVER.

THE STYLE OF THE PROPOSED LAW COURTS.

Sir,—In passing through Paris on my return from Rome, I have just taken up a number of *Galignani's Messenger*, and I there see it stated that "It has been announced in Parliament from authority that the style of architecture to be adopted for the new Law Courts is the Venetian Gothic." Is it too late to stop this instruction from being acted upon, or modified, or explained? Has Parliament no power to prevent another example of, or repetition of, Lord Palmerston's folly in St. James's Park, the laughing-stock of all educated people all over Europe. Is not one such piece of folly enough for one generation? Must we always go on advertising the ignorance of our statesmen of a subject which they ought to understand? The architecture of every nation is a part of its history. The English nation is a great nation and has long been so. It has a grand and magnificent style of architecture of its own which grew with its growth, was developed along with its civilization, of which it is a part and a standing proof. It shows that the English nation was in advance of other nations at the time when the most genuine, the most real, and the finest style of architecture that the world has ever seen, was developed among us. If it was not actually brought to perfection within the British Islands (as I believe it was), it clearly was within the dominions of the Crown, or of the King of England. At that period one-third of what is now France was under the dominion of our kings, Henry II. and Richard I., whose dominions by inheritance included the whole of the west of France and a great part of the south, the old Roman province of Aquitaine. The eastern part of what is now France was then part of the German Empire, as it remained for centuries after that period; and that part was so much behind the rest in civilization, that it is out of the question to look there for any advance. The *Domäne Royale* of the king of France was more advanced than other parts of Gaul, but not ahead of the English; it trod close upon our heels, but we always kept the lead.

The choir of Lincoln Cathedral, built in A.D. 1192—1200, is the earliest building in the world in which our national style was fully developed in all its purity, and this was the style of the great diocese of Lincoln at that period. It was not an isolated example; but the earliest to be brought to perfection. Other buildings in that diocese approached it very closely. The French had no building equally advanced in style for more than twenty years afterwards.

But what is meant by the "Venetian Gothic style?" I suppose it is the style of the palaces of the Venetian merchant princes on the Grand Canal, the admiration of the Russian court. They are very pretty toys, a series of *shams*,—merely fronts, and nothing else!

There is nothing behind the front wall to correspond with it in any degree, and they were

erected for the Venetian merchants of the time of our Elizabeth and James I., in imitation of the English style of the thirteenth and fourteenth centuries,—imitations at second or third hand. Very pretty things in their way, because any tolerable imitation of the English style of that period must always be pretty; but what folly it seems to send our English architect to Venice to study their petty imitations of our own national style, instead of sending them to the originals, to Lincoln and York, and Salisbury and Wells, or even to Oxford and Cambridge, for the later examples.

The colleges of Wadham and Jesus in Oxford, and several of the Elizabethan and Jacobean colleges in Oxford or Cambridge, are of a better style of architecture than the Venetian palaces, because more genuine and real, and are more suited to our wants and our climate.

The architecture of Italy ever since the year 1000 has always been a century behind that of the Western nations. The Italian architecture is the worst in Europe, and difference of climate must always make it unsuitable for England. What is good for the one cannot be good for the other. Strictly speaking, the Italians had no style of their own. The Romans copied the Greek buildings, and the Mediæval Italians copied the Roman works of the Empire, and used up the materials, until they were at last exhausted; and then at a very late period they imitated the style of the Western nations.

I have drawings of the architectural details of the Venetian palaces, with the dates upon them, made for me on the spot years ago. Most of the dates are taken from inscriptions on the buildings themselves, so that there is no disputing them, and they are all of the sixteenth or seventeenth century.

Unfortunately, the leading facts of the history of architecture are unknown to the greater part of our educated classes; well informed as they are on most subjects they have never given their attention to this. They have travelled much, but with their eyes shut in this matter for want of a little preliminary information. Our schoolmasters are entirely ignorant of the subject, and they cannot teach what they do not know. The words of Professor Goldwin Smith should be dinned into the ears of every schoolmaster in England. "The buildings of every nation are an important part of the history of that nation, and a part that has been entirely neglected by all historians, because the historians themselves have been entirely ignorant of the subject." Why are they ignorant of it? Because the subject has never formed part of the English school education, as it ought to do. Happily a change has begun, but it makes slow progress at present; it has begun in the first-class ladies' schools, and it is now a good test whether a young lady has been educated in a first-class school or not to see whether she knows anything of the history of architecture or not.

Our young men will soon be ashamed of giving their whole time to gymnastics, taking care of their bodies and neglecting their minds altogether, and will not like to find their wives and sisters better informed than themselves on a subject which they discover they ought to know. It unfortunately happens that although our higher classes travel more than those of any other nation, and ought, therefore, to be better informed, they trust implicitly in this matter to "Murray's Red Books," called on the Continent the "Englishman's Bible," and their trust is misplaced in this matter. The *archæology* of the whole series of handbooks belongs to the time of George III. and Napoleon I., the date of the books from which the handbooks were originally compiled; and this part has never been corrected since, because the venerable editor was himself educated in the days of George III., and cannot shake off the ignorant prejudices of his youth. English travellers are lamentably misled in this manner. For instance, they are taught to believe that the buildings of the Pisan style of architecture, a very remarkable, original, and beautiful style, are contemporary with our Anglo-Saxon belfry towers of the eleventh century, instead of what they really are, contemporary with our Salisbury, and York, and Lincoln, our glorious English style of the thirteenth century. Take the cathedral of Pisa itself as an instance of the usual sort of blunder, the date of the original building is given as that of the existing structure. This is not exactly false, but it entirely misleads beginners in the study; the original building *does exist* in the middle of the existing fabric, but it has been added to in all directions, in length, in width, in

height, so that it is difficult to make out the original part. All that is visible is of a much later period. The nave has been lengthened one half, and the beautiful little light arcades and colonnettes at the end of it, all belong to the late work, the thirteenth century. All that people understand by the Pisan style is of that period.

It is possible that the Doge's palace is intended to be taken as a type of the Venetian Gothic style. If so, I have a word to say on that subject also. The only good and valuable part of that building is the arcade, which forms the substructure; this is assigned by Murray to the fourteenth century, and is in the style that would be of that period in England. Possibly it was begun at the end of that century, but the greater part of it is certainly of the fifteenth, as is shown by the costumes of the figures carved in the capitals, and at best, the celebrated arcade is a copy of similar arcades in England a century earlier. The whole of the upper part of the palace is of the seventeenth century, or the end of the sixteenth, rebuilt after the Great Fire on a totally different plan from the original building, as I showed years ago by engravings of the two for comparison. The original design had much merit, great boldness, and variety of outline, and the arcade supported only a fine balcony in front of the building, the wall being at the back of it. After the fire, the wall was brought out to the front of the arcade, and was built up as flat as a sheet of cardboard, with holes cut out of it for windows, at intervals varying in distance, according to convenience. The front is decorated with an imitation of the brickwork so much in fashion in the seventeenth century in Italy, the beautiful terra-cotta of Lombardy, which might well be copied in London. Singularly enough, it is imitated in Venice in pink marble, the whole front of the Doge's palace being veneered with a thin coat of pink marble, cut into the form of bricks, but rather larger.

Possibly our authorities intend our architects and builders to introduce really fine terra-cotta into London; if so, they may do an excellent thing; and if they propose that the surface of the wall of the great public building shall be veneered with glazed tiles of the Milton fabric, well cemented into a wall of concrete, after the fashion of the Roman emperors, that may be also a good and convenient mode of building in London; and if the cement is good, that is, if the lime is quite fresh, or has always been kept in air-tight vessels until required for use, and then used the same hour that it is opened, such walls are everlasting: they are as solid as natural rocks, and are impervious to sound, which is another great advantage. Possibly, also, what is intended in the way of taste is to copy the beautiful wavy lines adopted at Venice, chiefly of the form technically called the *ogee*. This agrees with Hogarth's line of beauty, and so far is an excellent recommendation.

Perhaps the authorities will condescend to explain that this is what they really do mean. If so our architects need not go to the sunny South to study these beautiful forms; we have scores of examples remaining in England of the originals, not copies only. If the construction of the Roman Empire is recommended to be followed (as I should recommend), we have plenty of walls of the Roman Empire remaining in England, without going to Italy for them. The construction of the Venetian palaces is by no means good, not nearly so good as that of the great hospital at Milan of the same period, and not better than that of our own Elizabethan buildings. Our young architects should be set to walk all over England, Scotland, and Ireland, and may thus learn every variety of construction and of style, from the rudest and most barbarous to the best, without any need to cross the Channel. Buildings which have grown up by instinct in our own climate are in general much better suited to that climate than those of any other climate, and the taste and skill of the English architects of the thirteenth, fourteenth, and fifteenth centuries have never been exceeded by those of any other country. On the contrary, those of other countries have all learned from us,—first the French, and from the French other nations, but after a long interval.

It is probable that our authorities received their own educations in Oxford, before the Oxford Society for the Study of Gothic Architecture was established, and before the great revival of taste began. We now see the results of that revival in our churches. Let any one com-

pare the churches in England of the present time, or in the last few years, with those of thirty years ago, and he cannot deny the immense improvement in every way. But the public have not yet learned that the same genuine old English style of building is just as applicable to public buildings of all kinds, or even to private houses, as to churches. The purpose for which a building is erected necessarily governs the plan, but not the style of ornament, nor this mode of construction. The windows of the hall of the Bishop's Palace, at Wells, built about A.D. 1200, are as fine windows as any at Venice; those of many of our Mediæval castles are equally good, without any reference to the chapels, or the churches connected with them, and the construction of many of these buildings is as good as it can be. For types and models for buildings of any kind, we have still abundance of examples remaining. The city of Wells alone affords a series. We have there, in addition to the fine cathedral, with its remarkable sculptures (the finest of their period in the world), its chapter-house, its cloister, with the library over it: the houses of the bishop of the thirteenth century, the archdeacon of the fourteenth, the dean of the fifteenth, the canons, the preceptor, the organist, the singing men, and vicars choral, all of the fourteenth or fifteenth century, and all sufficiently perfect to be made out by an architect, though sadly mutilated by the ignorance of the persons who reside in them, and much of this mutilation is daily going on. At Lincoln, at Salisbury, at York, at Ely, and Worcester, and Gloucester, and many other places, we have the houses of the members of the cathedral chapter, and their halls, more or less perfect, all sufficiently so for study. Here is the field to which our young architects should be sent to study, and to find buildings suitable for our wants and for our climate.

JOHN HENRY PARKER, Hon. M.A., Oxon.

THE ROMAN PAVEMENT NEAR THE MANSION HOUSE.

DR. SAUNDERS writes that 33,000 persons visited the Roman pavement at the back of the Poultry on Thursday, Friday, and Saturday last. Thanks to the arrangements made by Mr. Bart, the contractor, all were able to see this interesting relic in safety and comfort. By letting the visitors enter at one door, pass round the excavation, and out at another, all confusion was avoided. The pavement seems to be about 16 ft. below the present general level of the surface, and is wonderfully fresh in appearance. It is of a bold type of geometrical pattern, scrolls, circles, and interlaced squares; no animals or figures of any kind; the tesserae are of five colours,—black, white, yellow, red, and grey. It rests on concrete. The shape of the pavement is a parallelogram with a circular end, and it would seem to have been always under cover. Adjoining is a well, formed with square blocks of chalk. The pavement, we are told, will be carefully removed to the City Museum, where it will always be visible. Viewed in the excavation, the making of which led to its discovery, the interest it excites is great. Looking down into the hole, there it lies fresh and bright as when it was first put down, perhaps in the vestibule of a house occupied by some Roman official. What a story it tells, what reflections it excites, trite but none the less striking. At least 1,500 years have passed away since it was placed there: what were the habits and manners of the people who passed over it? It speaks of fires, more than one; of the fires of the Danes probably, and the fire of 1666, which serve to explain the rise in the general level: and it affords a text on which might be hung the whole history of London. It is to be hoped that some pains will be taken to trace, if possible, the remaining walls of the building to which this speaking pavement belonged.

The Northumberland Vase.—Among the many valuable articles either spoiled or destroyed at the fire in Northumberland House in October last, when the roof of the grand ball-room fell in, the Sèvres Vase, presented by Charles X., upon the occasion of his Majesty's coronation, to Hugh, Duke of Northumberland, then ambassador extraordinary from Great Britain to France, was shattered into fragments. Mr. Daniell, of New Bond-street, has now effected its complete restoration, so that the eye can scarcely detect the slightest trace of injury.

CORNISH HILL-CASTLES.

IN the present paper, I shall confine my remarks exclusively to the hill-castles in the Land's End district, Cornwall, reserving for a future opportunity an examination of those in the central and eastern divisions of the county.

This district, of small extent, is bounded on the east by an imaginary line drawn from Lelant Church southwards to Cuddan Point, on the eastern confines of Monn's Bay, and in other directions by the sea. Within the peninsula thus defined, of about twelve miles in breadth from east to west, there are no less than seven hills crowned with British fortifications, all of which, however, have more or less suffered from the ravages of time.

Without doubt the fortress of Chûn, on the summit of a hill overlooking the Atlantic and the mining operations at Bosallack, is in better preservation than the other hill-castles in the neighbourhood, if not in the entire county; and it is consequently an object of very great interest to the archaeologist. In the face of this, it is sad to see the continual deprecations now being made on its ruined walls merely for the sake of the smaller stones, which are generally used for building hedges, barns, and out-houses on adjacent estates. So much has Chûn Castle fallen a victim to these spoliations within the last century, that some of its most striking peculiarities that were easily recognised in Borlase's time, cannot now be traced, and would probably have been entirely unknown had it not been for the labours of that indefatigable antiquary.

The plan of the castle may be thus described. First a ditch, 20 ft. in width, extends round the fortress. Then two concentric walls—the space between them forming another ditch, 30 ft. wide, which is now partially covered in with loose stones from the walls—enclose a central area approximately circular, although in reality a slight ellipse, the major axis measuring from east to west 125 ft., and the minor axis, from north to south, 110 ft. These walls are formed of dry-stone masonry, *i.e.*, a collection of loose granite stones heaped together with some attempt at order, but without the aid of cement. This class of work is found in many of the hill-castles and other primitive Celtic dwellings. Some good specimens of its general appearance when in a perfect condition may be seen near the outer entrance on the external face of the wall. The height of the outer wall is now on the average only about 7 ft., whereas Borlase considered it to have been at least 10 ft., and the inner one 15 ft., high. This decrease in height can be easily explained by the deprecations alluded to above. In thickness, the outer wall is 6 ft., and the inner one 12 ft. The continuity of the second ditch was broken by three transverse walls dividing the circular space into equal portions. Two of these cannot now be easily traced, although probably almost perfect in Borlase's time.

In the interior of the castle, according to the description of Borlase, was a third concentric wall of less strength, about 30 ft. from the inner wall. This space was subdivided into compartments by lines radiating from the centre of the interior area; and, although there is uncertainty as to whether these enclosures were originally roofed or not, they are supposed to have served as the habitations of those whose duty it was to reside within the fortress. Within the present century the principal traces of these compartments have unfortunately disappeared. On the north side of the central area within one of these enclosures was a well, but this seems to have become choked up, and hidden from view. At any rate, I was unable, on my visit last year, to discover its exact whereabouts; but I find that Mr. Halliwell was more fortunate in 1861, for in his work detailing his Cornish experiences, he says that the well was then visible, although the steps noticed by Borlase as leading down into it had fallen in.

The entrance to the interior of Chûn castle affords a remarkable instance of the military ingenuity of the old Britons. The opening through the outer wall faces the W. S. W., and on both sides is bounded by immense slabs of unworked granite. Thence, turning to the left, a passage nearly 40 ft. in length conducts us to the opening through the inner wall, where two jambs, each about 5 ft. high, still remain on the innermost side. This second entrance has a fine west aspect, and measures in its widest part 16 ft., and in its narrowest 6 ft., spaying outwardly. For further protection, another wall was built from the right-hand side of the outer

entrance to within 3 ft. of the inner wall, where it turned at right angles towards the inner entrance. Besides this, one of the three transverse walls before mentioned was so adjusted as to extend from the left-hand side of the inner entrance to the outer wall. It has been truly remarked by Borlase that "the whole of this work, the neatness and regularity of the walls, providing such security for their entrance, flanking and dividing their fosse, shows a military knowledge superior to that of any other works of this kind which I have seen in Cornwall."

The next fortress I shall describe is that called Castle-an-dinas, on the summit of a hill in the parish of Ludgvan,* 735 ft. above the sea-level, and, with the exception of Carminis Hill, north-west of Towednaek, the highest spot of elevated ground in the district. The hill on which Castle-an-dinas stands is easily recognised from others by a modern building on its summit, in the Gothic style, generally known as Rogers's Tower. This watch-tower, or "folly," was erected many years ago by one of the ancestors of the present proprietor, Mr. Rogers, of Penrose, apparently of stones taken from the encampment; but from want of repair the entire fabric is now in a very dilapidated condition, and will probably before many years hence be in utter ruins. The description that Borlase has left us of Castle-an-dinas is full of interest. He says:—

"It consisted of two stone walls, built one within the other, in a circular form, surrounding the area of the hill. The ruins are now fallen on each side of the walls, and show the work to have been of great height and thickness. There was also a third and outermost wall, built more than 100 ft. from the innermost wall, and within the walls are many little enclosures of a circular form, about 7 yards diameter, with little walls round them, of 2 ft. or 3 ft. high. They appeared to me to have been so many huts erected for the shelter of the garrison. The diameter of the whole fort, from east to west, is 400 ft., and the principal ditch 60 ft. wide. Towards the south the sides of this mountain are marked by two large green paths, about 10 ft. wide, which were visibly cleared by art of their natural roughness for the more convenient approach to this garrison. Near the middle of the area is a well, almost choked with its own rungs; and, at a little distance a narrow pit, its sides walled round."

All traces of this well have now disappeared, besides the circular enclosures mentioned in the foregoing extract. The outer wall is now about 12 ft. in thickness, and 5 ft. high; while of the inner wall scarcely a vestige remains, save its foundations, which are 12 ft. thick. The central area, bounded by the inner wall, has a diameter of about 180 ft.

About 1780 some relics were found within the inner circle of Castle-an-dinas. Among these were two granite blocks shaped like weights, with holes near the top of each, through which probably a rope was passed. One weighed 17½ lb., and the other 3 lb. 1 oz. They both bear a striking resemblance to weights dug up in 1756, at Bossens, in the neighbouring parish of St. Erth, which are engraved by Borlase in his *Antiquities of Cornwall*, plate xxviii., and in the *Phil. Trans.*, 1759, part I.

The castles of Caer Bran and Bartinney are on adjacent hill-tops west of Sancreed church-town. The former consists of an outer vallum of earth, and an inner wall of stone. The outer vallum sometimes attains the height of 15 ft., and is protected on each side by a ditch, so that there is an interval of 20 yards between the inner wall and the outer ditch. This wall formerly had a general thickness of about 12 ft., and enclosed a level area of about 70 yards in diameter. Near the centre of the encampment are the ruins of a circular enclosure possibly of a later date than the rest of the work. Only portions of the inner or stone wall now remain, the principal part having been destroyed within the last century for the sake of the stones. According to Borlase, the wall extended round the summit of the hill, and was in a perfect condition about the middle of the last century.

Bartinney Castle consists of a single vallum, but what now remains of it is almost entirely overgrown with furze. The circular enclosures in the interior, however, can still be traced; one has a diameter of nine yards, the other two only seven. This fort is 689 ft. above the sea, and is remarkable as being the only spot in England where the sun can be seen to rise and set in the sea on the same day, December 21st.

Treobhen Hill, between Castle-an-Dinas and Lelant Church, and Castles Horneck and Pencudjack, in the immediate vicinity of Lescance, were also the sites of British encampments. That on Treobhen Hill is in a fair state of pre-

servation, of an irregular plan, and occupies the entire summit.

It seems probable that these and similar hill-castles in Cornwall are the work of the aboriginal inhabitants, who thus sought to defend themselves from the attacks of their foreign foes. Although this is now the general belief of those who have paid particular attention to the subject, yet some of the antiquaries of the last century ascribed these works on the hills to foreign invaders rather than to the native Celts. Thus Polwhele, the historian of Devon and Cornwall, attributed them to the Irish; while Borlase thought them to be of Danish construction. Carew (about 1600) had adopted the latter idea when he wrote "And divers round holds on the tops of hills; some single, some donhls, and trehle trenched, which are termed *Castellan Denis* or *Danis*, as rayed by the Danes when they were destyned to become our scourge." But such a statement as this only shows how careful we should be before placing much faith in conclusions founded on the mere similarity of names, for it has since been shown that the word *denis* or *dinas* in Cornish signifies a bulwark or fortress; thus confirming the supposed original purpose of these so-called castles on the Cornish hill-tops, but destroying the theory that the Danes ever had a hand in constructing them.

E. H. W. D.

MEDALS AND PRIZES: INSTITUTE OF BRITISH ARCHITECTS.

The silver medal of the Institute is to be awarded to the author of the best essay on the following subject:—"On the best Principles of Arrangement for a Town Church, having reference to the usual Difficulties of Lighting." The Same medallion will be awarded for the best design, well illustrated by a sufficient number of drawings, for "A Metropolitan Railway Station of the dimensions of that at Charing Cross, showing the architectural treatment of the façade towards the Thames Embankment, and of the interior of the terminus shed, where the roof is required to be in one span."

Mr. Tite, M.P., president, offers a prize of fifty guineas to the author of the best set of architectural drawings, illustrating "A Design for the Treatment of the River Front and existing Terrace of Somerset House by any Alterations or Additions to the same, not destructive of the general character of the building, and connected with the Embankment-road now in course of formation, so as to produce the best architectural effect when seen from the Embankment-road and the river."

A list of other medals and premiums offered, with the conditions, is published, and may be obtained at the rooms of the Institute.

A FOUNTAIN FOR STOCKHOLM.

At the Stockholm Exhibition of 1866 M. Molin, who is a professor at the Swedish Royal Academy of Painting and Sculpture, exhibited the model of a design for a fountain which attracted some attention. This is now about to be executed in bronze (we should prefer it in marble) for erection in Stockholm, and we have engraved a view of it taken from the model. It is only fair to say that the sculptor contemplates revising and working on it some time before it is cast. The height of the fountain is 30 ft., the width 20 ft. The figures which form the pedestal and give the work its distinctive character illustrate a portion of the Northern mythology. The youth playing on the harp, and seen in the view, is the god of floods, lakes, and other inland waters, known as Næcken. Behind, and not seen in the engraving, is Agir, the terrible god of the ocean, with his wife, so to call her, the deceitful goddess Ran, who has a veil for her face. The other female figures represent their more or less gracious daughters, characterizing different waves. The belief is that, approaching for the purpose of carrying away the Næcken, as the Naiads, according to the Greek mythology, served Hylas, they, hearing his song, became enchanted and unable to execute their intention.

The figures, for the most part, are admirably modelled, and display considerable fitness and beauty.

Architectural Association. — On Friday evening, the 14th, Mr. G. H. Birch read a paper "On London, from the Sixteenth to the Commencement of the Eighteenth Century."

* Not to be confounded with a fort of the same name in the parish of St. Columb Major, in Eastern Cornwall.—E. H. W. D.

YORK CATHEDRAL: SOUTH-EAST VIEW.

RIPON CATHEDRAL: SOUTH-EAST VIEW.

FOUNTAIN FOR STOCKHOLM.—M. J. P. MOLIN, SCULPTOR.

HYDE PARK-CORNER FLORAL DISPLAY
AND KNIGHTSBRIDGE BARRACKS.

ALTHOUGH the hortalan decorations, extending from Apsley House to the Serpentine by Albert Gate, meet the approval and excite the admiration of the public, some murmurings have been uttered about the obstruction of view caused by plantation of flowering shrubs behind a mean range of houses in Knightsbridge.

A waste and squalid margin of about 80 ft. wide, extending 320 yards to Albert Gate, alongside the Drive, backed by a dingy wall and nineteen antiquated shops, has been decorated with varied mounds of pure verdure, and furnished with a gorgeous bloom of flowering shrubs; the opposing park border, and the hitherto waste dell at the Serpentine falls, have been adorned also with flowers, shrubs, and rockwork, in a style that reflects credit on the hortalan taste of the park managers; and yet five of the occupants of the park tenements, which are a blot upon the park surroundings, complain that their view of the promenade is obstructed by flowers! One householder and shopkeeper on the opposite side of Knightsbridge-road also joins in the outcry, and, with a deputation, waited upon the Chief Commissioner, who promised to consider their statement.

Now, as this selavage of waste, extending to Knightsbridge Barracks, was always a nuisance and a disgrace to the park, and especially as it has now become the most fashionable resort for promenaders along the Ladies' Mile, its reclamation and adornment have realized a great public benefit; and, in fact, the total exclusion by forest plantation of the Knightsbridge row would be a mercy to the frequenters of the walks, as well as to the crazy old tenements. It is true that there are two structures of more than ordinary pretensions on the line,—the mansion of the French embassy and a chapel of ease; but these do not complain, as, being of lofty proportions, they are rather benefited by a landscape garden, whilst the humble sheds (two of them only 10 ft. wide and 8 ft. high) are somewhat screened and protected from contempt. Indeed, this whole range, which is church property, and, like it in most cases, is in a ruinous, neglected, and disgraceful condition, ought to be wholly cleared away, together with Knightsbridge Barracks, and give place to buildings of better character, and more suitable to a site which ought to be the most valuable in London, but which is now in a disgraceful state, with its gin-shops and tenements that would have been a discredit to old St. Giles's.

There is abundant room for cavalry barracks close to the new Foot Guards at Chelsea; and mounted squadrons might surely make those quarters as easily as infantry. The accommodations at Knightsbridge are notably bad, as evidenced before in the *Builder*; and that district, which from position is the best in the metropolis, stands in the very worst repute, on account of the numerous public-houses, casinos, and other questionable refuges; but still, there are good dining-halls and reception-rooms for the Horse Guard officers, which command the richest views of park and gardens, and these, of course, will not be easily relinquished; for domestic and figurative soldiers require more of urban pretence and solace than campaigners of the line.

A great and invaluable public advantage would be completed by the transformation of all these park borders, and the high officials of our time who regard these concerns with a more national view will most probably persevere in improvements so earnestly begun. T. H. H.

EXHIBITIONS.

The South Staffordshire Exhibition at Wolverhampton.—The removal of the platform upon which the ceremonial of the opening took place, and the re-arrangement have added to the attractions of the interior of the main building. How the colouring and lighting add to the effect of the general arrangement of all the parts of the building are best seen in and from the gallery, which forms a good place for pictures. The success which attended the inauguration was considerably augmented by the large number of respectably clad artisans, who, with their wives, availed themselves of the privilege of visiting the Exhibition, after four o'clock on the opening day, at the charge of one shilling each. The day was observed by the majority of the tradesmen, and by many of the large employers of labour as a general

holiday. The receipts in money taken after the hour named, amounted to upwards of 30*l.*, representing a total of more than six hundred visitors. Since the opening day, however, the attendance has not been so large as the promoters were justified in anticipating, but it was the week before Whitantide, when both masters and men were busy at work preparing for the annual holiday. Notwithstanding these and other drawbacks the Exhibition has been well patronised, and many hundred artisans have found there a means of recreation and instruction. As an additional attraction the committee have arranged that a series of concerts and musical performances shall take place daily in the main building, and also in the grounds outside. The first of the series has taken place, and has proved a success.

The Industrial Exhibition at Charlwood.—This exhibition has been opened. The working men, women, girls, and boys in the following parishes and districts have contributed to it, namely,—Burstow, Charlwood, Crawley, Crawley Down, Horley, Ifield, Leigh, Ruspur, Newdigate, Sidlow, and Worth. The collection is multifarious, including works in straw, baskets, rustic seats, models, works in wood, drawings and paintings, stuffed birds, all descriptions of needlework, turnery, sticks for tying flowers, &c. &c. As an additional attraction, articles have been added in gifts by tradespeople and wealthy residents in the neighbourhood. On the opening day half a crown was charged for admission, and most of the *élite* of the neighbourhood visited the exhibition. There are altogether about 500 exhibitors, and 1,000 different articles exhibited, and three classes contrihuted to the exhibition,—first, the working classes, who sell for themselves; secondly, those who are exhibitors only; and thirdly, the upper classes, who exhibit and sell for the benefit of the exhibition.

THE TRADES MOVEMENT.

Bristol.—At a general meeting of the masons "for the purpose of hearing the opinions of the employers of masons, expressed by them individually, in respect of the changes required by a portion of them forming the Bristol Branch of the Associated Masters," the resolution passed by the masters at their meeting of the evening before was read and discussed, and the following resolution was unanimously adopted:—"That, the masters having closed all further negotiations and thrown down the gauntlet, and determined to enforce their original notice at the expiration of the month's adjournment, we accept the challenge, and resist to the uttermost all and every infringement of the existing working rules of our city."

Sheffield.—A meeting of the master builders has been held, at which, after some discussion, they came to a determination that it was necessary to draw public attention to a letter which had appeared in that morning's *Independent* from Mr. C. Cornish, in which letter several employers were mentioned as having commenced work under the old rules. In answer to this letter, the masters desired the public to be informed that, with the exception of Mr. Milner, they had been compelled to recommence work, in consequence of the pressure which had been put upon them by those for whom they were building. They did not wish it to be understood that they countenanced the old system.

Bolton.—The questions in dispute between the employers and operative joiners and carpenters were laid before Mr. Pope, recorder of the borough, for arbitration. Six employers and six operatives represented the respective sides of the case. The following are the terms of the settlement agreed to:—The men are to work 5½ hours per week at 30*s.*, the time to be reckoned as follows: 20th Oct. to 20th Nov., 6.30 to 5.30, 7*d.* per hour; 20th Nov. to 20th Jan., 7.30 to 5.0, 7*d.* per hour; 20th Jan. to 20th Feb., 6.30 to 5.0, 7*d.* per hour; 20th Feb. to 20th Oct., 6.0 to 5.30, 6*d.* per hour.

The Colliers on Strike.—The novel sight of men being escorted to and from their work by bodies of police is extending itself, and is to be witnessed not only in Yorkshire, but also in Lancashire. The men employed by the Tyldesley Company at their collieries near Manchester have been on strike for some weeks against a reduction of wages, and a number of colliers have been brought from Staffordshire to take their places. On their arrival they were vigorously attacked by the men on strike, and a large force of police has to be kept at the collieries to protect them.

The Trade-Unions Bill.—The various trade societies have determined to hold an aggregate meeting of trade unionists of London and the provinces in Exeter Hall, on the 23rd of June next. Mr. Samuel Morley, M.P., has consented to preside on the occasion, and Mr. Mundella, M.P., Mr. Harrison, and others will be present. The subject of the Bill has been warmly taken up by the various trade societies in the provinces, and at Carlisle, Warrington, Leeds, Burton-on-Trent, Northampton, Cheltenham, the Potteries, and, in fact, in most of the leading towns meetings have been held, at which it has been resolved to use every means to support the Bill now before Parliament, which has been introduced by Mr. T. Hughes and Mr. Mundella. In Birmingham, so desirous are the working men to give all the aid in their power to the measure, that the second annual Congress of Trades Councils and Societies, which had been announced for the 21st of June, has been postponed until the 23rd of August. In Glasgow and Greenock the same feeling prevails and has been expressed by the working men. In Dublin the strongest approbation of the Bill has been expressed, and at a public meeting held there, it was resolved to send deputations to wait upon the twenty or more members of Parliament resident in that city and neighbourhood to urge them to support the Bill. A large number of delegates from all parts of the country are expected to be present at the large meeting in Exeter Hall, which is to be held under the direction of the London Conference of Amalgamated Trades.

COMPETITIONS.

Bedford Public Baths Company.—We understand that the directors of this company have selected the plans furnished by Mr. Walter Robinson, of Furnival's inn, Holborn. There were twelve competitors.

The Proposed New Town-hall and Corn Exchange, Wareham.—Two architects competed for this building, Mr. C. R. Crickmay, Weymouth, and Mr. J. T. Lacey, London. Mr. Crickmay's design has been chosen. The plan provides a room for a corn exchange on the ground floor 40 ft. by 35 ft., lighted on two sides, with an entrance lobby and staircase. There will be on the upper floor a town-hall, 21 ft. by 35 ft.; a reading-room, 28 ft. by 16 ft.; a magistrates' room, 14 ft. by 13 ft.; with offices. The corn exchange-room will be 18 ft. in height. The cost of adopting this plan will be 1,500*l.* Mr. Crickmay has been appointed the architect of the proposed new building, and a building committee has been named and authorised to confer with him on the matter.

MONUMENTAL.

Monument to the late Duke of Athole.—A mural monument has just been erected by the Dowager Duchess of Athole to the memory of the late duke, in the aisle of the old Kirk of Blair, over the vault in which his remains are laid. The design, which is stated to have been suggested by the duchess herself, is allegorical, inasmuch as the principal figure in it is the trunk of a stricken oak, which is intended to represent the duke cut off, as it were, in the prime of life. At the point where the tree has been broken through, a branch of the ivy which entwined it has been loosened, and droops towards the ground. On one side of the tree a vigorous offshoot or branch (representing the present duke) remains in full blossom, and upon it hangs the plaid or mantle of the deceased. At the other side of the tree is the figure of one of the duke's retainers—a stalwart Highland Volunteer—leaning on the top of his reversed rifle, and lamenting the loss of his chieftain. On the base of the tablet, beneath the sculpture, is the inscription. The tablet is of the finest statuary Carrara marble. It is placed upon an architectural base, the whole rising to a height of about 9 ft., the breadth being about 5 ft.

Inauguration of the Stowell School Memorial.—A monument erected in Christ-Church-yard, Acton-square, Salford, by the teachers and scholars of Christ-Church Schools, to the memory of their late pastor, Canon Stowell, has been inaugurated. The monument is in the Early English style of architecture, and is erected a few yards to the left of the entrance to Christ-Church from the Crescent. The structure, of which Mr. W. B. Sanders, of Epperstone, Notts, is the architect, is octagonal in shape at

the base, and rises to a height of 20 ft. The whole is constructed of Hollington stone, relieved at intervals with red Mansfield pillars. At the lower portion of the monument are panels, one of which contains the inscription.

Inauguration of the Oastler Monument at Bradford.—The monument of the late Mr. Richard Oastler, the "Factory King," erected in the open space in front of the Midland Station, in Well-street, at Bradford, has been unveiled by the Earl of Shaftesbury. The monument consists of a colossal figure in bronze of the late Mr. Oastler, and two factory children, surmounting a lofty pedestal of granite. The artist was Mr. J. Birnie Philip, of London. The entire cost of the work is 1,500*l.*, and has been contributed by the friends of the "Ten Hours' Bill" in Yorkshire and Lancashire. Large numbers of people came from all the factory districts of the two counties. Not fewer than a hundred thousand persons filled the streets, and a procession of some 30,000 persons preceded the ceremony.

PICTURES BOUGHT FOR THE ART-UNION OF LONDON.

The following works have been already purchased by prizeholders of 1869. Many others, including the chief prize, have yet to be selected—

From the Royal Academy.—The old Priory Farm, G. Chester, 100*l.*; Dutch Landscape, A. Burke, 100*l.*; Moonlight, Capri, T. White, 50*l.*; The Close of Day, T. W. Hulme, 70*l.*; Evening, Canoe, E. Hayes, 60*l.*; "By the Waters of Babylon," W. E. Frost, A.R.A., 60*l.*; Spring Time, W. Luker, 50*l.*; Mending the Sleeping Sickness, J. Richardson, 40*l.*; The River Neath at Penbont, Mr. E. Gill, 40*l.*; Where the Trout lie, C. Smith, 35*l.*; Market Morning, A. DeBylandt, 35*l.*; Evening on the Veign, W. Williams, 30*l.*; Shades of Evening, G. S. Walters, 30*l.*; Detained, A. E. Emble, 20*l.*; Out of the Current at Rusewarp, B. S. Howard, 15*l.*

From the Royal Scotch Academy.—Loch Ness, A. Perigal, 20*l.*

From the Society of British Artists.—Left in Charge, J. Gow, 100*l.*; The Day of Rest, Marshall Clarton, 100*l.*; A Passing Storm, E. N. Downard, 75*l.*; The Way Across, E. Holmes, 60*l.*; The Wreath of Wild Flowers, E. J. Cobbett, 50*l.*; Pilot Boats, and other Crafts, E. Hayes, 50*l.*; The Front Stream, E. Holmes, 45*l.*; Low Tide on the Yorkshire Coast, J. W. McIntyre, 40*l.*; Mod. Sibald, Jas. Peel, 40*l.*; A Ghost Story, T. Roberts, 40*l.*; Senecite us da, E. Y. Hurlstone, 35*l.*; "There's but one Shirt," &c., A. Ludovic, 30*l.*; Plymouth Sound, H. K. Taylor, 25*l.*; Pensive Notes, M. Bancroft, 20*l.*; On the Ledge, G. Fringle, 15*l.*; In the Market, Miss E. Valentini, 15*l.*; Sappho, J. Physick, 15*l.*; Falls on the Llugwy, W. H. Foster, 15*l.*; My Neighbor Opposite, Miss Hunter, 10*l.*; Tattered and Torn, Mrs. Bach-house, 10*l.*; At Staplehurst, J. J. Wilson, 10*l.*; On Hayes Common, W. H. Foster, 10*l.*

From the Society of Painters in Water-Colours.—The Uri Rottebock, C. Davidson, 75*l.*; The Waltman at Sunrise, Collingwood Smith, 35*l.*

From the Institute of Painters in Water-Colours.—The Valentine, J. Sierra, 20*l.*; The Itinerary, W. Ke. Keeling, 15*l.*; Moel Sibald, J. C. Reed, 15*l.*; "Hail, Smiling Morn," &c., H. Mapleton, 10*l.*

From the Dudley Gallery.—The First Scent, Jas. Hardy, jun., 30*l.*; Lunch Time, Jas. Hardy, jun., 30*l.*; The Sunny Hours of a Hard Life, J. Carlisle, 15*l.*

CLERKS OF WORKS.

SIR,—At the discussion at the Society of Arts, lately held, Mr. Jones asked Mr. Smith what amount of consideration would secure honesty in a clerk of works. Mr. Nash said that there were some good ones, as well as a good many bad ones; and by being drawn from the ranks of the workmen it could not be expected that they would always be all that was desired. Mr. Smith stated that no sum of money would purchase honesty in such functionaries; but he appeared to know how to select a good one. I was bred in the trade, and I have had considerable practical experience as a working man, as a builder's foreman, and as a clerk of works, and I have had a very good opportunity of knowing the difference between a good and a bad clerk of works, and how many have been made clerks of works. There can be no doubt that the very best clerk of works must have seen some years' service as a builder's foreman, and is rarely worth being called a clerk of works until about forty years of age, when, whoever secures his services *must* pay for them, as it is not so much his ambition to be a clerk of works as it is to have a little less labour to perform for the same amount of pay. Honesty and integrity have grown into such a man, and his rule will be strict without being offensive either to his employer or the contractor under him. A bad clerk of works will be found in this style:—"I wanted, by a thoroughly practical man (carpenter and joiner), a situation as clerk of works. Aged 26. Salary moderate." This means two guineas per week. Another can at any time be found in an architect's office, who is pleased to get out at

any price, who knows nothing of the practical part of any one of the branches or of the quality of the materials being used, but by some means contrives to know enough to keep the architect and the contractor in constant hot water during the progress of the works. A good clerk of works can always be found if a proper salary is offered him; but it must not be expected that he will take the responsibility of a job upon his shoulders for the same pay, or in some instances less, than is paid to a journeyman carpenter.

AN OLD CLERK OF WORKS.

NEW BUILDINGS, CEYLON.

The Bishop of Colombo has recently consecrated a new church at Wellevatte, and laid the foundation-stone of another at Cottachincha. Also, on the 7th of April, the foundation-stone of a new church at Haputala was laid by Major-General Hodgson. The designs for the above churches were furnished by Mr. James G. Smith, of Colombo, architect.

ARCHITECTURAL PUBLICATION SOCIETY.

The annual general meeting of the subscribers will be held at the house in Conduit-street, on the 31st inst., at two p.m. precisely, to receive the report of another committee, and to receive the balance-sheets, and for the transaction of other business. The chair will be taken by Mr. William Tite, M.P. An important proposal will then be submitted requiring careful consideration. The report says:—

"If each of the present subscribers would at once personally enter himself and obtain the adhesion or guarantee the subscription of a new member, it would be possible for the committee to arrange for the completion of the 'Dictionary' without any further demand on the subscribers; the cost of the complete work (text and illustrations) would then be fixed at fifteen guineas. For a work undertaken without any capital and dependent solely upon funds derived from annual subscriptions, and assisted by unpaid aid for the management and production, and with but a limited circulation, this must be deemed exceedingly moderate."

Guarantees have already been received, and a large exertion on the part of the members will insure success. Something, at any rate, *must* be done.

KINGSTON-ON-THAMES: QUEEN ELIZABETH'S SCHOOLS.

COMPETITION DESIGNS.

ABOUT thirty different sets of plans have been received by the committee, and placed for examination in the Crown Court, by permission of the mayor.

The site of the new building is opposite to the present school, which has for many years been held in the fine old Gothic chapel, the sole remains of the once extensive scholastic group of buildings. Many of the architects ignore the existence of this chapel, most likely from not having visited the site, by showing on their plans arrangement for a new one, in connexion with the rest of their designs. Only 5,000*l.* are allowed for the cost of the new schools. Few plans, more especially those of a straggling character, are likely to comply with this important condition. As the committee intend to call in professional assistance, there is little danger of these "catch" designs bringing the committee into pecuniary difficulties. We are surprised that the title of the school did not suggest to more of the competitors the adoption of Elizabethan architecture, which is very suitable for such a building.

It is proposed to throw open the collection of designs for public inspection in a few days.

A BUILDER'S COMPLAINT.

SIR,—The builder's letter which appeared in the edition of the 15th inst. he complains of "building material" merchants employing others than builders at the same price.

I think it very difficult at the present time to tell what constitutes a builder; for instance, a common brick carpenter or paltry packing-ess maker binds into business by hook or by crook, and at once styles himself a builder, and by impudence and an immense amount of cheek procures jobs embracing many branches, all of which he is quite ignorant of, with the exception of his own bit of bodging. He employs other masters in their several lines, and cuts them to the lowest, puts on an immense profit for himself, but, when the work is done, which only increases the expense, and swells the job to such an alarming amount, that gentlemen, once bitten in this way, are compelled to have recourse to other means for the future.

I am not a builder; but, finding so many cobblers taking building work, I intend trying it myself.

R. P.

SOUTHWARK PARK.

SIR,—The announcement that this park would be opened to the public last week was unfortunately not correct: judging from appearances, it will be many weeks before it can be opened. I went on the day fixed to the extremely ugly main entrance, and had a peep through the closed enclosure-gate, and no one else was visible inside the park. Outside, in the swamp of the miserable roads, parties of three and four were to be seen, workmen with their wives and children, who had evidently come to see the park that day. One respectable-looking working woman was in a fury; it appeared that she and her little ones were going somewhere else to spend their annual holiday, but having been informed that Southwark Park would be opened that day they had changed the venue and had come to the park instead, and so lost the day entirely. No wonder on a race-course who had promised to pay, and at the time promised refused, could he more mercifully handled than were the names of some of the members of the Board of Works.

I thought of the Whitechapel improvement, and how long that has been in hand. Since the Act for that improvement was passed, the well-abused Metropolitan District Railway has made and opened four miles of line, mostly through house property!

ABSQUE LABORE NIHI.

THE BELLS OF ST. NICHOLAS'S CHURCH, LIVERPOOL.

SIR,—In the last number of the *Builder*, the Rev. H. T. Ellicombe gives a list of peals of twelve bells, among which he has St. Nicholas's, Liverpool, and the date, 1721. Allow me to correct this, for the information of those who take an interest in such matters. The date should be 1815, as the present tower was finished the 4th of August in that year. In 1725—not 1724—a new peal of six was put up, but the tower fell down on Sunday, February 11, 610, and when the present tower was completed, the peal of twelve was put up. A READER.

THE SECRETARYSHIP OF THE INSTITUTE.

SIR,—As Mr. Robert Kerr is sending round for signatures to a requisition to Mr. Charles Fowler to allow himself to be proposed for the vacant secretaryship of the Royal Institute of British Architects, you will perhaps be good as to allow me to say that our late secretary, Mr. J. P. Seddon, will be proposed for re-election at the meeting on Monday next.

GEORGE EDMUND STREET.

FROM IRELAND.

The church of St. Philip and James, Holywood, county Down, to which a nave, chancel, and north aisle have just been added at a cost of 5,000*l.*, has been consecrated by the Bishop of Down. The church, which is built of Scrabo stone, is in the Early English style. The edifice is built to accommodate about 720 people, and consists of a nave and two aisles, a portion of the old church serving as the northern aisle; but the south aisle is new. The nave measures 75 ft. in length by 30 ft. in breadth, while the dimensions of the chancel are 33 ft. 6 in. by 25 ft. 6 in. The total length of the church is 111 ft. 6 in., and the total width 72 ft. 6 in. The arches flanking the nave on either side are of redstone. From them spring the arches supporting the north and south walls, which are pierced by a row of windows on each side, overlooking the roofs of the aisles. The height from the floor to the springing of the rafters measures 36 ft., and the height from the floor to the ridge 53 ft. On the outside two porches are constructed, one on each side of the west gable, and at this end the old tower remains, the top of the spire standing 71 ft. above the base. The church has been designed by Messrs. Lanyon, Lynn, & Lanyon, of Belfast, architects; and its erection has been carried out by Messrs. Lowry & Son, builders, Great George-street, Belfast.

DECORATIONS AT ALNWICK.

A NOTICEABLE event occurred in the North on Wednesday, the 19th instant. Earl Percy took his bride to Alnwick Castle, and was received with every demonstration of welcome and congratulation by the Percy tenantry and inhabitants of the town. A triumphal arch of an architectural character was erected at the end of the winding street that skirts part of the castle walls, and opens into the wide space before the barbican, close upon the site of one of the gates into the town in the olden time, when it was surrounded with a wall. This was an ample four-centred arch, surmounted by an entablature constructed in wood, but painted with a clever imitation of the stone-work of the part of the walling of the castle that it adjoined. Upon the centre of the parapet was placed the Percy lion, with a reproduction of the effect of that, so well-known to Londoners, on Northum-

berland House. The spandrels were filled with the crest of the Campbell family; and just below the embattlement, between two string courses, was a wide fascia on which was inscribed, "Welcome to the bride;" which spandrels and fascia being transparencies, which were lighted up at night. Flags and young trees—the last placed in the angles as though they had grown there—kept up a constant flutter. The ancient gateway, still standing at the entrance to the town from the south, which was built by the son of Hotspur, and bears his crest upon a panel over the arched way through it, was decorated with heraldic devices and overgreens; and a third arch, made entirely of overgreens, was erected in the course of the approach to the town from Bilton.

The mounted tonantry, riding three and four abreast, forming a cavalcade as long as a "quiet street," met the Earl and Countess at the station at this place, distant about four miles from Alnwick, and conducted them to the town, at the approach to which they were met by the Percy Artillery Volunteers, and a very striking procession. The spectacle was altogether out of the common order of things. A display of fireworks, on the north terrace of the far-famed stronghold, was the last act of it.

CHURCH-BUILDING NEWS.

Herston (Swanage).—The chief stone of a chapel-of-ease has been laid here. The structure is to be built of local stone, roofed with stone, and will consist of a nave, chancel, side aisle, with vestry and turret. The design was drawn by the late Mr. J. Hicks, of Dorchester, architect; and the work will be carried out by Mr. Crickmay, of Weymouth, who has undertaken to complete the works of the deceased gentleman. The building contract has been taken by Mr. F. G. Fooks, of Herston, assisted as clerk and manager by Mr. Linnington, of Swanage. Whilst excavating for the foundation of the church, Mr. Fooks discovered that there was a store of stone called "burr," which he got at to be used in the building, thereby saving considerable expense. Already 200 tons have been quarried, and its worth is estimated at 1l. a ton. The stone is being worked for windows, plinths, and other parts of the structure.

Burley.—It has been determined by the vicar, the churchwardens, and inhabitants of Burley, to make some improvements in their church. The chancel is to be extended, an organ gallery is to be erected, and a portion of the gallery is to come down. A new organ is to supply the place of the old one, a new warming apparatus is to be inserted, and the church is to be re-seated with open benches. Other changes are also to be made, including the insertion of a new east window. A subscription list was opened some time ago. The different contracts have already been entered upon, and the entire cost is estimated at about 3,000l.

Windsor.—The Queen has signified her intention to give a donation of 400l. to the funds for the improvement of Windsor Parish Church,—200l. towards the alteration of the interior, and other 200l. should the building committee feel at any time that they have sufficient funds to justify their commencing the exterior work, which her Majesty considers to be very desirable. The designs from which the renovating is to be made are those of Mr. Tenison. The cost of erecting a chancel and replacing the old-fashioned pews with open seats is estimated at 9,500l., and the ornamentation of the exterior at about 3,700l. It has been decided to alter and pay for the interior work before anything is done with the plain exterior of the church.

Driffield.—A new church is being erected on the Sledmere estate, in the village of Firbank, on the Wolds, at the sole expense of Sir Tatton Sykes. The site will be that of the old church at the upper end of the village. The cost will be between 3,000l. and 4,000l. The length of the edifice will be 70 ft.; width, 20 ft. The walls will be of dressed Whitby stone; the chancel screen of Whitby stone, and the floor of Minton tiles. The general style will be Gothic. The tower will be pointed, and will rise to the height of 60 ft. The architect is Mr. Street, of London, and the builder Mr. Cliphams, of Norwell, Newark. The old church, just razed, and apparently stood two hundred years, was a very small unecclesiastical-looking building, and had evidently been built from the material of a much larger and more ancient one. Portions of

columns of the style of the twelfth century were found in the church just pulled down, as in other ancient buildings in the village.

Weardale.—The new church of St. Andrew, at Westgate, in Weardale, being finished, has been opened for Divine worship. It consists of a nave and chancel, with a porch at the south-west, a spirelet or bell-turret at the west end of the nave, a vestry on the north side of the chancel, and is of the Early English style of architecture. The flooring of the entrance-porch, alley, choir, and chancel, is of particular tiles, arranged with design, and the semi-transparent glass. The nave and choir are fitted up with wood seats, simply varnished, as is also a lectern of antique design and a communion table, the gift of the architect, Mr. Withers. The pulpit, situated in the north-east corner of the nave, is of Bath and Prudham stone, and the font is of the same material. Messrs. MacAdam & Son were the contractors.

Hellingley.—The restoration of the parish church is now in the hands of Messrs. Aris & Roe, of St. Leonards, under the superintendence and according to the plans and specifications of Mr. E. Christian, architect. It is intended to repair the whole of the external masonry, to remove the tiling of the roof, and relay it on new lathing. In the interior new seating is to be provided throughout, and various other alterations will be made.

Little Marcle (Herefordshire).—The chief stone of the new church has been laid by the Countess of Somers. The style will be decorated, and the church is to consist of nave and chancel, with organ chamber, vestry, and porch (the latter on the north side). The walls will be of native red sand (from Pixley), given by Earl Somers (besides 200l.), with Bath stone dressings; the framework for the windows will also be of Bath stone. There is to be an octagonal bell turret, in which will hereafter be placed two bells; and the building will be roofed with Broseley tiles in patterns. The internal fittings will be, for the most part, of red deal, varnished, the seats being open, and there will be an open timbered roof, ceiled between the rafters. The chancel and aisles are to be paved with Godwin's encaustic tiles. The nave will be divided from the chancel by a moulded arch, springing from circular columns having carved capitals. The contract has been taken for 900l., by Messrs. Wall & Hook, of Brimscombe. Mr. J. W. Huggall, of Oxford, is the architect.

Hallow (Worcestershire).—The new churob of Hallow has been consecrated. The old one has been retained as a mortuary chapel. The new site is in a field, near the entrance of the village from Worcester. Mr. Hopkins, consulting architect to the Diocesan Society, furnished the plans, but the necessary funds were not forthcoming, and the consequence was the abandonment of the tower and spire. The tower arch at the west end of the building is, therefore, bricked up. The building is in the Decorated style, and has a chancel, nave, aisles, vestry, and organ-chamber north of chancel, chapel on the south for the school children, and stone porch on the south side of the nave. The total length of the chancel and nave is 95 ft.; breadth, 45 ft.; the roofs are lofty, with open timbers, those of the chancel being ornamental; and the east window elevated. The chief constructional feature is the stone arch ribs of the nave roof, which are continued externally as flying buttresses, carrying the thrust of the roof into the masonry of the outer walls. Four pointed arches, resting on circular columns, divide each aisle from the nave; and the clearstory windows are circular. The east window is a three-light one, and there are two-light windows with head tracery in the aisles. A reredos has been presented by Earl Beauchamp. It was executed by Mr. Boulton, of Cheltenham, and is of stone-work, having for its central subject the Crucifixion *in alto-relievo*, with the walls of Jerusalem in the background, surmounted by a canopy which consists of three arches, cusped, each having a pediment inlaid with marbles, &c. Upon the pediments, which are crocketed, and upon the intermediate columns of serpentine, stand seven sculptured figures of angels, representing the Seven Churches, all of alabaster, bearing cardinals in their hands. The reredos, from its height, hides a large proportion of the east window. The church contains about 450 sittings, and the seats are open. The gables of the roof are decorated with floriated crosses, or rather, that over the nave is not a cross, but a trefoil in the centre of foliations.

The stone for the church was got from Ombersley, and the builder was Mr. Inwood, of Malvern. The entire cost of the building, including the hot-water apparatus (about 900l.) will have been about 4,000l. The church is dedicated to St. Philip and St. James.

Staines.—It is said that a non-resident landowner of this town has presented the parish with an acre of land for the purpose of building a church. The land in question is situate in the Station-road, nearly opposite the Wesleyan Chapel. A subscription will be opened to receive contributions to the building fund, and a new church, which will be free in every part, will be erected.

Ashbourn.—The newly-erected chancel of Clifton Church has been consecrated by the Bishop of Lichfield. The new chancel has been entirely built by subscription.

Little Ellingham.—The parish church has been restored and re-opened for divine service. On Advent Sunday, 1867, after restoration, it was totally destroyed by fire, except a small portion of the chancel, caused by the over-heating of the flue, which was constructed in too close proximity with the timbers of the roof. The walls of the nave, as left by the fire, were considered unsafe; it was therefore found necessary to pull them down and to re-build them from the foundations, in the re-construction of which rubble stone and concrete have been used. The chancel, although not entirely destroyed by the fire, was very much injured, especially the roof, the scorched portions of which have been cleaned, and the charred parts restored, re-decorated, and varnished. The walls within the sacrum and the reredos have also been re-gilt, and received additional decorations in stencil work. This part of the work has been carried out by Mr. W. Nichols, of Watton, painter. The chancel stalls, which were fortunately saved from the fire, have been replaced, and fitted up for the use of the choir. The repairs and refitting of the chancel stalls, pulpit, &c., have been carried out by Mr. Clark, of Hingham, builder. The nave is covered with an open timber roof, stained and varnished. The nave has been re-seated throughout with oak benches, and the floor relaid with coloured Staffordshire tiles. All the windows of the nave are filled with "roller-tinted Cathedral glass." New stone parapets have been placed upon the tower, and which has also received other repairs. It is intended to relead the steeple and to place a new weather-vane upon the top. The floor of the tower is relaid with coloured Staffordshire tiles. The whole of the work of restoration has been carried out by and under the personal superintendence of the contractor, Mr. J. Frost, wood-carver and builder, Watton. The seats are so arranged that the church will accommodate about 230. Messrs. T. H. & F. Healey, of Bradford, are the architects.

Hastings.—The honorary secretary to the committee for restoring All Saints' Church states that, at a recent meeting, Mr. Butterfield, the architect, exhibited to the committee drawings which showed what will be the effect of the restoration when completed. The work is estimated to occupy nearly a year. The committee appeal for additional subscriptions.

Bromham.—The church here has been re-dedicated after restoration. The nave and its north aisle, connected by three arches of the early Decorated period, have been cleared of incumbrances; the western arch thrown open, displaying a window in the tower; the font, set upon a new base and furnished with a raised oak cover, the gift of Lady Dynevor; the oak seats refitted throughout, superseding the inclosures which formerly blocked up a considerable portion of the area; the floor paved with red and black tiles; the windows re-glazed; these works, with the addition of an oak pulpit, made by Messrs. Rattee & Kett, of Cambridge, and an oak lectern, presented by the Hon. Miss Rice Trevor, comprise the chief improvements in the church itself. The former dilapidated chancel has been replaced (with the exception of a small portion of wall on either side, inclosing the leper windows, which have been retained *in situ*) by a new one of the same proportions raised upon the old foundations and opening from the church by an arch designed after those which separate the north aisle from the nave. The roof, covered with old tiles, is of open timber, the spaces between the rafters being plastered, as also are the panels into which the two bays above the sanctuary are divided. The stalls are of oak, their ends surmounted with poppy-heads designed after two which remain from the old work. The east window is a reproduction of its predecessor, and is to be filled

with stained glass by Lady Dynevor. The head of the leper window on the south side has been filled with fragments of early glass collected from other windows of the church, and the lights with quarries imitated by Messrs. Lavers & Barrand from a few old examples found in the course of the restoration. The recrodes is of white stone inlaid with red from Babicomb quarry, St. Mary Church, Devon. Upon the chancel floor, which is laid with Minton's tiles, is replaced the brass engraved by Lysous, originally intended to perpetuate the memory of Thomas Wideville and his two wives, about 1435, and re-appropriated by a descendant, Sir John Dyve, who died in 1535, his mother and wife. The contract for the whole of these and other works amounting to about 1,400*l.*, was taken and has been executed by Mr. Osborn, of St. Neots; the masonry being done by his brother-in-law, Mr. Whitehead, of Royston. Mr. Butterfield was the architect.

Mansfield.—The plans of Mr. William Smith, architect, for the restoration of St. Peter's Church, have been accepted, subject to any minor modifications deemed desirable by the restoration committee, and he is appointed architect for the restoration. The interior restoration of the woodwork will be of oak. The galleries will be dispensed with, and the pews in the body of the church will be open ones instead of the present pews. Promises have been given for sums amounting to 1,050*l.*

Books Received.

"ROADS, RAILWAYS, and Canals for India. By T. Logan, C.E., F.R.S.E. London: Spon." This is a reprint of two pamphlets by Mr. Logan, which were printed for private circulation about two years since. The author is executive engineer of the seventh division Grand Trunk Canal, and was formerly superintendent of the northern division of the Ganges Canal. As Indian subjects are beginning to be of more general interest than heretofore, the information here given will aid in the formation of a just appreciation of the relative value of roads, railways, and canals, in developing the resources of India, and also be of practical value to young engineers in India, and to those interested, especially in Assam, Cachar, and the eastern districts. The author urges the formation of a passable embanked road parallel to the hills passing through Northern Bengal, and extending on to the Brahmaputra, in order to promote a supply of labour in Assam.—"Tenth Annual Report of the Society for Promoting the Employment of Women in connexion with the Social Science Association. Office: 23, Great Marlborough-street, Regent-street." It appears from this report that the society has obtained permanent situations for 48 persons during the past year, and temporary employment for 46. During the year 2,061 visits have been made by applicants, 389 names registered, 1,087 letters received, and 2,106 written, &c. The indirect influence exerted by this useful society seems also to be considerable.—"The Journal of the Historical and Archaeological Association of Ireland, vol. i., third series: October, 1868: No. 4. Dublin: McGlashan & Gill." Besides a report of proceedings, this number contains interesting papers on Ogham Readings, by Mr. R. R. Brash; on the Contents of a Sepulchre of the Bronze Period, by Mr. T. O'Gorman; and on a book entitled "Beware of the Cat." There is also a list of the names and addresses of the many members of the society. The paper on the obscure subject of Oghams is an important one. The author is of opinion that the deductions to be drawn from the facts which have been accumulating for the last half-dozen years are quite sufficient to invalidate the opinions adopted by a section of our antiquaries, namely, that Ogham inscriptions were 'tricks of the middle ages,' and the invention of Medieval monks." Mr. Brash endeavours to elucidate the meaning of what is really engraven on the Ogham stones.

"County Military Training Schools. By W. Cave Thomas, Strangeways & Walden, Leicester-square." This pamphlet contains suggestions for improving the recruiting system meriting most careful consideration. It is a copy of a lecture delivered at the Royal United Service Institution, in March last, and relates to industrial training as well as military, and to general and scientific education. In concluding the exposition of his scheme, Mr. Thomas gives a summary of its salient points, from

which we may give a somewhat condensed quotation:—

"The County Military Training Schools are the basis of the system; the primary schools keeping up, according to the calculation adopted, and independently of any other source, 25,500 men in the reserve, and 25,500 men in the army. These men would, moreover, be skilled handicraftsmen in those special industries calculated to render an army independent. Then there would be the Middle School, supplying the Engineer, Ordnance, and other not-commissioned officers, whose numbers are not included in the estimated 25,500. Then there would be the High School, preparing men for commissions in all branches of the service, for the army, the reserve, the militia, and the volunteers, and not only designed to the military, but civil service; for it is important, with such extensive colonies and comparatively so small an army, that men holding civil appointments should have that amount of military education which would enable them, in any case of rebellion, to organize the countrymen and the available resources of the nation for defence to the best advantage. The high schools should, in fact, be seminaries where men should be prepared for important posts. The school system, too, provides for the promotion of talent from the primary to the high departments. The scheme also suggests the association, the identifying a regiment with a particular military district and its training-schools, the depot of that regiment being near to the military schools of the district and the head-quarters of the Reserve, as well as the recruiting staff and depot battalion. This is looked forward to as eminently calculated to promote recruiting in the district, and to develop an esprit de corps not likely to be so well fostered by other means. It also presents advantages superadd that of an army of thoroughly trained soldiers scattered through the land in civil employments, on account of the moderate term of service who would stand the country in good stead in case of invasion, and who might not be proof against a good bounty in other cases of need. There is also the proposed extension of the system of military schools to the colonies. It also proposed, under certain contingencies, that the boys from the primary schools shall be passed annually to the reserve, and from the reserve to the army, so as to rapidly increase the strength of the latter, and from this source allow to 100,000 men. Finally, I have to mention that branch of the reserve which would be open to working men for a limited period of home service; the conditions would be similar to those of the militia, but the drill days distributed over the year, so as not to interfere with their industrial occupations. The institution of this branch of the reserve, would, I think, offer a more acceptable form of service to the artisan than that of volunteering or the militia. To this branch the pensioners of the school system would be returned, and from it many recruits would doubtless be sent up to the army."

"The Smoke Nuisance, and its Remedy by Means of Water; with Remarks on Liquid Fuel. By C. J. Richardson, architect. Atchley & Co., Great Russell-street." Mr. Richardson published his plan for remedying the smoke nuisance, by washing it with a spray of water, in our columns a good many years ago. He here gives it in detail, with diagrams; and he remarks that though it certainly is not possible to disturb the whole of the chimneys of London, the worst of them might be operated on, such as the chief kitchen flues of the great establishments which are continually sending out black inky smoke. If it were possible, as he observes, to cut into all the chimneys of London and apply the remedy, the whole of the soot which at present escapes into the atmosphere might be caught and passed into the drains: it would there deodorize them, and the sewage, when it arrived at the Abbey Mills, would be rendered doubly valuable as manure, and be largely increased in quantity. This would certainly be the best mode of remedying not only the smoke nuisance, but the sewage emanations also, because so long as the air is contaminated with these, the smoke is at least useful in the air as a deodorizer of them, however injurious to human lungs in itself, or unsightly in its effects on buildings. In the pamphlet under notice, Mr. Richardson gives the results of his important experiments with liquid fuel. The substitution of petroleum for bulky coal in steamers would be an immense improvement, both in our mercantile and our naval shipping. Mr. Richardson says that "any boiler having water space below grate can be fitted to burn oil, so as to obtain a result from 2½ to 3 times above that given by the best coal; 5 times, probably, of that given by common coal: no alteration will be required, only some additional plates in lieu of fire-bars."—"Our Mother Tongue and its Congeners. By J. A. Pictou, F.S.A." This is a paper read before the Liverpool Literary and Philosophical Society. It is full of interesting and curious matter, as our readers will know that anything on philological science by Mr. Pictou must be. At the close of his present paper, the author, speaking of the relative importance of the English language, says,—"Before many generations are past, our language will be the mother tongue of 200,000,000 millions of people. For this consummation the language has long been in a course of preparation by Providence. It is the language of freedom, of progress, of civilization, of vigorous life and action; and, may I not add, of religion also? How important it is that the literature of a language which such prospects before it should be pure and wholesome!"

Miscellaneous.

Metropolitan Board of Works.—At a recent meeting the Board received tenders for the completion of the low-level sewer of the main drainage scheme. For that portion extending from Tower-hill to New Earl-street, Blackfriars, 4,400 ft. in length, the tender of Mr. W. Webster, at the sum of 67,000*l.*, was accepted; for that portion of the sewer extending from the Westminster steamboat pier to near the Grosvenor Canal Basin, Chelsea, 9,710 ft. in length, the tender of Messrs. Hiscox & Williams, at 72,700*l.*, was accepted. For the deepening and improving a main sewer in Kennington Park-road, 2,200 ft. in length, the tender of Mr. W. Crockett, at the sum of 3,700*l.*, was accepted. Mr. Bazalgette reported the finding of the tessellated pavement at the back of the Poultry, and a letter was received from the City Corporation, asking that it might be handed over to them for the purpose of being placed in the City Museum, which was complied with.

Wells Cathedral.—A meeting in aid of the proposed restoration of the west front and chapter-house of this cathedral has been held in the chapter-house, under the presidency of the Earl of Cork. The Dean of Wells explained what had already been done, and said that prior to the meeting 3,500*l.* were promised, and now they had 1,500*l.* more, so that he considered the success of the undertaking certain. Mr. Ferrey has estimated the cost at 5,000*l.* The question now was how the work was to be done, and by whom. It was proposed to restore the canopies in certain instances, and in others to repair them. There were 4,700 ft. of column in the west front, and each foot cost 6*s.*, so that it was a question whether they should be restored in blue liais or marble. Lord Taunton moved that it was generally desirable to carry out the restoration of the west front according to the plan recommended. He remarked that it had been proposed to have coloured glass in the chapter-house, but he thought it better to have no coloured windows than to have paltry ones. Prebendary Scarth seconded the resolution, and hoped they would get the work accomplished before they were disendowed and disestablished. Mr. E. A. Freeman opposed the present scheme, as he thought it was their duty to place the cathedral in its position as the great motherchurch of the diocese. They ought, as at Lichfield and other cathedrals, to improve and clean the interior, and after that to talk of the purely ornamental things; not, however, to leave the latter undone. He wished them to take the advice of Professor Willis on the restoration. The resolution having been adopted, Sir E. Strachey moved that the chapter-house be restored to its original simple beauty. Prebendary Horner seconded the resolution, which was carried. A committee was then nominated.

Injuries to Buildings by Subterranean Movements.—Considerable interest has been raised in Halifax regarding upheavings of the earth which have occurred at Folly Hall, a cluster of houses on the face of Beacon Hill, lying a short distance below the New Southwam-road. This road, which commences in New-bank, will be about a mile long. At the commencement of the road at the New-bank side, a dry retaining wall, 15 ft. thick, strengthened by a center foot 9 ft. thick, placed in Crossley's brick-yard, is being built "to keep off the hill," as it is termed. Near this place several cracks of considerable length have appeared in the hill, which "is known to have been moving for years." Cottage walls are cracked, and threaten to fall, and a wooden floor has been lifted from its position, and now assumes the appearance of a mound, the centre of which is upwards of 1 ft. above its natural level. Flags below have been thrown upward, and some even overturned, and placed in many singular positions. Some authorities state that the phenomenon is caused by an accumulation of water in the hill; and the contractors for the Southwam-road are laying 2 in. earthenware pipes into it above Folly Hall, to carry off any water into the drain.

Discoveries at Herculaneum.—The *Giornale di Napoli* mentions the discovery of a large room, which must have served for a kitchen. In it was a wooden clothes-press, entirely carbonized; also fourteen vases, a candelabrum and a lamp, all in bronze, several vessels in glass and terra-cotta; a small marble statue of a Faun, and two broken tables, one in marble and the other in slate.

The Proposed Abolition of the Patent Laws.—A deputation of the members of the Inventors' Institute, the Delegates' Invention-right Committee, and other gentlemen representing numerous industrial associations, waited on the Attorney-General, as one of Her Majesty's acting Commissioners of Patents for Inventions, to solicit his attention to Mr. Machie's proposed motion in the House of Commons for the Abolition of Patent Rights for Inventions. The members of the deputation impressed upon the Attorney-General that the interests of the working-classes and the status of the country in regard to the mechanical and chemical arts would be greatly injured by the abolition of the Patent Laws, although they unanimously required that those laws should be simplified and rendered more efficient.

The Poetry of the Fine Arts.—A lecture on this subject was delivered by Mr. Henry Macmanus, R.H.A., professor of painting, in the theatre of the Royal Dublin Society. The lecturer having given a lucid definition of poetry, fancy, and imagination, of all the fine arts, he said, literature was the youngest. Eloquence, music, and acting were born at a more remote period, since which their lives had undergone certain vicissitudes. Music, in her maiden loveliness, was all melody, but in process of time was wedded to harmony, resulting in the numerous offspring, secular and sacred. Eloquence was united with oratory and rhetoric; and acting was wedded to the drama. Either of these arts was sufficient to entertain the most cultivated intellect, but the mind could obtain glimpses of all of them when the appreciative faculty was thoroughly brought out. After pointing out the special sphere of each of these arts, and showing how poetry in its widest sense was connected with all, Mr. Macmanus urged how important painting and sculpture were: in many cases they conveyed the ideas expressed by language.

Suicide of an Architect.—Mr. Day, an architect, residing in Worcester with his wife and niece, arrived at Pentrich Vicarage, near Ripley, Derbyshire, last week but one, with the intention of staying a short time with the clergyman doing duty there. Mr. Day had for a length of time been in a depressed state of mind. On Tuesday night deceased's wife accompanied him to his bedroom door, when he requested her to leave him alone for a short time. On returning she found the door locked, and asked him to open it, which he did, when she found that he had attempted self-destruction. Medical assistance was obtained, but deceased died on Thursday night. An inquest on the body took place, when the jury returned a verdict that the deceased had caused his death by cutting his throat while in an unsound state of mind.

Society for the Encouragement of the Fine Arts.—On Thursday, the 20th inst., Mr. Montgomerie Ranking gave a lecture "On the Renaissance Influence, as traced in the works of the Elizabethan Dramatists"—Mr. Cave Thomas in the chair. After a brief sketch of the various epochs that preceded the revival of the arts, with especial reference to the Greek and Gothic periods, the lecturer traced with considerable success the spirit of the renaissance from its earliest dawn down to the time of Marlowe, Ford, Massinger, and Webster, illustrating his subject with passages from "The Duchess of Malis," "The Broken Heart," and "Doctor Faustus," in which the passions of love and fear were powerfully depicted. Mr. Cave Thomas, Dr. Heinecann, Mr. Tacey, and Mr. Temple addressed the meeting.

The Projecting Entrance at Burlington House.—Attention having been called in our pages to this matter, it was ultimately brought before the Board of Works, who directed that a communication be addressed to the vestry of St. James's, Westminster, on the subject. The vestry, on receiving the communication, referred the matter to the Works Committee, and that committee has recommended that no steps be taken at present in reference to the porch and projection, which recommendation the vestry has approved. So long as the hoarding remains up for the new works, the porch may as well be where it is as not.

The Priory Church, Dunstable.—The work of restoring this edifice has been recommended. It is to be hoped that no suspension will be necessitated by want of funds.

The Royal Academy Floors.—Messrs. Arowsmith & Co. are not satisfied that we should speak of the new floors in the galleries of the Royal Academy as being of "Marqueterie." If they had remembered the descriptive particulars we gave of the rooms with plans in a previous number, wherein we said "the floors are covered with Arowsmith's solid parquet work of wainscot and walnut wood," they would probably have thought it unnecessary to write to us. Like every one else, they take no notice whatever of the statement that answers their purpose, but they consider we do them a scandalous amount of injury when we omit to repeat it.

Ornaments on Dinner-tables.—Following an early lead of ours against the error of placing large obstructive ornaments on dinner-tables, a writer in the *Cornhill Magazine* says:—

"One of the foremost political men of our time gave a great dinner party. I was honoured by an invitation. I must say that the guests had been most skillfully chosen. There were not only great political personages, but people who were eminent in science, in literature, in art. Nevertheless, the wheels of conversation drove heavily. The next day I met, in the street, one of the guests. I said to him, 'It was not a lively dinner yesterday; and with such a host and such guests it ought to have been more lively.' 'No,' he replied, 'it was not lively; but do you know the reason why? Our host is a man who has the keenest appreciation of works of art, and exhibited so many that we could not see one another. That explains everything.' I think it did explain everything, and I went away feeling I had gained what is called a 'wrinkle' in the art of dinner giving."

All ornaments on a dinner-table should be quite low, so as not to intercept either sight or sound, or if the head of the house must have something more lofty in the centre let it be elevated on a long thin stem, so as to admit of free sight beneath.

Archaeological Institute.—On May 7th, the Earl of Dufferin (in the chair) directed attention to a fine specimen of early Irish art, exhibited by him. It was a large two-handled chalice, the body of which was composed of a white metal, formed of an alloy of silver and lead, which seemed to be peculiar to Ireland. It was ornamented with bands of gold, or gilt bronze, in various parts very highly enriched, and with numerous enamels and precious stones. It had been found last autumn in a "rath" or fort at Ardagh, county Limerick, by a man digging potatoes. The chalice is inscribed with the names of the Apostles in letters of the early Anglo-Saxon form, such as prevailed from the seventh to the tenth centuries. Numerous other objects were exhibited. The Hon. W. O. Stanley read a memoir on further explorations of ancient dwellings and vestiges on Holyhead Mountain, with supposed remains of early metal-workings. This memoir was illustrated by a large collection of implements of stone and ancient relics, pottery, &c., found in the course of the excavations. Ground-plans of some of the dwellings were also shown.

Exeter Meeting of British Association. The local committee have addressed circulars to all who are likely to attend the congress, affording every information as to the best and most economical means of travelling to Devonshire, and of finding accommodation when they arrive. Arrangements are made with the railway companies for special facilities to visitors. The local committee issue cards which will entitle those who hold them to tourists' tickets at reduced rates. The manager of the new Exmouth Imperial Hotel intends to give free railway passes between Exeter and Exmouth for the week to all British Association visitors who may take up their quarters in that building. The new Victoria Hall, for the accommodation of an audience of 2,000, will be finished in time for the meeting. The scaffolding has been removed from the south wing of the Albert Memorial Museum, and the completion of the front adds to the general effect of the architecture. The mayor, Mr. Henry S. Ellis, is exerting himself greatly to ensure a successful meeting.

Fall of Masonry at the Abbey Church, Shrewsbury.—One of the large ornamental stones over the northern doorway of this church gave way recently, and fell at the side of the walk with great force, bringing down with it a portion of the wall, but doing no very great amount of damage. This is the side next the sewerage works, but, as the foundation of the church is said to be as secure as ever, it is thought that the mischief was occasioned by the loosening of the stones of the wall on which the piece of masonry rested.

Workshop Regulation Act.—In Dr. Whitmore's monthly report on the health of Marylebone, he says:—"Since my appointment by the vestry in November last to carry out the provisions of the above Act in this parish, I have caused inspection to be made of 37 workshops, some of which were visited in consequence of complaints having been made to me of an infringement of the said Act. The result of these inspections shows that in 26 houses of business the provisions of the Act were complied with, whilst in the remaining 11 they had been more or less disregarded. With regard to the latter, working over-hours constituted the only offence. The ventilation was usually found to be very good, the apartments clean, and the cubic space ample."

The Works at Sandringham.—Immediately after the last visit of the Prince and Princess of Wales to Sandringham the building of the new wing to the house was commenced, but the walls of the old house having been found to be rotten, it was resolved to rebuild the whole of it, and this work is now being carried on. The new lake, picturesquely provided with islands and grove work, &c., has been completed, and adds to the general charm of the grounds. The Prince has lately visited the works in progress.

Fatal Fall of a Bridge at Montreal.—An awful calamity has happened at Granby, a village about thirty miles from Montreal. While several prominent citizens were looking at a flood, from the principal bridge in the place, the masonry at one end, which had become undermined by the water, flood wood, &c., gave way, letting the end of the bridge fall about 30 ft., precipitating twelve persons into the water, which was running with a very swift current. A boy was saved, but the rest, eleven in number, were drowned.

Drying the Crops in Wet Seasons.—Mr. W. A. Gibbs, of Gilwell Park, Woodford, Essex, has lately, it is said, introduced improvements in the construction of his air-stove, so that without a steam-engine the desiccating process can be easily carried on by help of common horse-works driving a fan. Grass can be converted into hay without sunshine, by his desiccator, which dries corn in the sheaf and desiccates beet and mangold.

Poplar Board of Works.—The "inscription stone" of the new board-room and offices, at the corner of High-street and Woodstock-road, was laid on the 20th inst., by Mr. Edward Coleman, in the presence of a large assembly of the members of the Board and the ratepayers of the district. The contract has been undertaken by Messrs. Baker & Constable, builders, at 7,300l. The building is from the joint designs of Messrs. Hills & Fletcher and Messrs. A. & C. Harston, architects.

Civil and Mechanical Engineers' Society. On the 22nd inst., at an ordinary meeting of this Society, held at their Rooms, Whittington Club, the president, Mr. B. Haughton, in the chair, the first part of a paper "On Water Supply to Towns and Villages," was read by Mr. George W. Usill. The reading of the paper was followed by a discussion. The president gave notice, that at the next meeting of the Society, June 2nd, a paper would be read upon "The Building Stone used in the Metropolis," by Mr. A. F. Pain.

The Manchester Alexandra Park.—A number of estimates were sent in by contractors for the levelling, sewerage, road making, &c., of the Alexandra Park, Hulme. The committee selected six out of the number for consideration, and they ultimately decided upon accepting Mr. T. Worthington's tender, which was the lowest. The tender of Mr. Lowe, of Salford, was the next lowest, and between his and the third there was a difference of over 1,000l.

Institution of Civil Engineers.—The annual *conversations* of this institution took place on Tuesday evening in Great George-street, Westminster, when the president, Mr. Charles Hutton Gregory, received a large number of noblemen and gentlemen, the majority of whom are well known for their connexion with, or their patronage of, matters pertaining to literature, art, and science.

The Idiot Asylum, Earlswood.—The Prince of Wales will lay the first stone of the enlargement of the Earlswood Asylum for Idiots, Redhill, Surrey, on Monday, the 28th of June, and the annual fête and summer entertainment will take place the same day.

The Wellington Monument, St. Paul's.—A vote of 2,800, on account of the Wellington Monument is to be proposed to the House of Commons this session. The original estimate for the monument was 14,000l.—10,266l. had been expended upon it up to the end of 1868, leaving 3,734l. to be still voted. Considering that the work is not yet finished in plaster, it is evident that some further financial arrangements will be required before the marble monument will be found in the cathedral.

An Antique Bell.—A bell of the twelfth or thirteenth century has been found amongst the ruins of Croxden Abbey. A number of letters of the form peculiar to the period mentioned are stamped round it. No local person has been enabled to make out their intention, but they were supposed to comprise some legend in contracted monkish Latin. Those who understand the form of ancient characters, however, will know that if some of them are reversed they stand for other letters—E becomes B, and C is transformed into D, and so on with many of the other letters of the alphabet. The letters on the bell are as follows:—AEOC. KWNOI. AEOC. EFTHI. EFTHIK. Mr. Redfern has received a communication from the Secretary to the Society of Antiquaries, who consider the bell to be of very great interest, and are decidedly of opinion that many of the letters are stamped wrong side up, and when viewed as they ought to be are neither more nor less than an alphabet, as here:—ABCD. LMNOP. ABCD. EFGHIK. EFGHIK. Mr. Redfern has suggested whether they may not have been intended for a peal on bells, which the repetition of letters might seem to corroborate. There is also a cross, or mark of the founder, on the body of the bell.

The Kind-Chaudron Shaft-sinking Apparatus.—The principle involved in this system is that of sinking a large shaft on the Chinese plan of sinking artesian wells; that is to say, a tool suspended at the end of a rope is raised up, turned a little round, and allowed to drop. In another form the same principle is carried out in the practice of "churn-jumping" holes for blasting, adopted in certain quarries. The application of this principle to holes 7 ft. or 8 ft. diameter, however, required a total change in the details of the apparatus and the method of operation. The Engineer, by means of diagrams, gives the details of this method. It comprises a system of cast-iron tubing, consisting of super-imposed rings, and a peculiar stuffing-box of moss to establish a water-tight joint between the base of the tubing and the rock. Nearly all the operations are performed from the surface. A small central boring is first made with a small tool having a number of chisels all along its under surface. After this the boring is enlarged by means of larger and heavier tools having a number of chisels at each end, and a projection in the middle, which passes into the central boring previously formed by the smaller tool, and which serves as a guide. The boring with the tools of the smaller diameter is always kept so much in advance of the larger boring, that the debris from the latter shall always fall into the former, and for this purpose the teeth of the enlarging tools are arranged on an incline so as to produce a boring, connected to the smaller boring by an inverted cone. In the smaller boring may be suspended a metal receptacle, into which the debris falls, and which is withdrawn when full, or a metal cylinder, with valves at bottom, opening inwards, receives the debris and raises it, by working, down and up.

Local Taxation.—According to the annual returns, the total amount of property assessed in England and Wales in 1865 was, upon gross estimated rental, 118,394,081l.; and upon rateable value, 100,612,734l. The total amount of the local taxation borne by the country in this year (1868) was 16,660,469l. This amount was made up as follows:—Amount levied for poor-rate, 11,061,502l. Amount levied for the following separate rates, which in some cases are not paid out of poor-rate—viz., county-rate, hundred-rate, borough-rate, and police-rate, 307,232l.; church-rates, 217,063l.; lighting and watching rate, 76,978l.; improvement commissioners, 44,431l.; general district rates under Public Health Acts, 1,736,247l.; rates under Courts of Commissioners of Sewers, including drainage and embankment rates, 695,810l.; rates of other kinds, 1,203,397l. This total includes a sum of 981,140l. for general and lighting rates levied in the metropolitan district.

The Diameter of Trees.—In a paper addressed to the Academy of Toulouse, M. Musset states that all the large healthy trees of the woods of Ville-d'Avray and St. Cloud are, in the immense majority of cases, thicker in the direction from east to west than in the contrary one. The same circumstance has been noticed elsewhere by other observers.

Associated Arts' Institute.—At a meeting held on the 15th inst., the question discussed was,—"Was the Renaissance Movement of any real benefit to Art?" It was opened in the affirmative by Mr. Woolbridge, and decided in the negative by S to 3.

TENDERS.

For roads and sewers, Sheerness, Kent:—

The Builder.

VOL. XXVII.—No. 1374.

Parisian Parks and Squares, with a view to the Improvement of our own.

URING the last ten years, while London has been but gradually improving in its parks and public places, Paris has been developing into Arcadia, and has left us far behind. Elysian fields, as one of the Parisian promenades is called, is not too extravagant a term to apply to most of them. Large sums have been spent on their improvement, and are annually expended on their maintenance; and, for a wonder, there are but few people who will not allow that they are worth the money. The French parks, promenades, gardens, and squares are all kept better than ours, though it is understood that it was our parks and squares that first induced the French Emperor with a desire to increase their number in Paris. The author of "Earnings from French Gardens" has recently enlarged the sphere of his observations; and has presented to our consideration a description of the Parisian parks, promenades, gardens, squares, churchyard-spaces, and boulevards, and a statement of the manner of their maintenance and their cost, with a view to our adoption of some of their best points.* One of his leading ideas under the present system we are spending too much upon a few parks, instead of increasing their number. Another is that our parks should be improved scientifically; that they, their special aspect and soil should be adapted to bear upon the kind of trees and plants most suited for them. Instead of every park having a hedge of privet and horders of yew, with a few trees all of a similar kind in the arrangement and contents of each should be entirely different. One square might exhibit the vegetation of the South Sea Islands; another a meadow and hill flora of cold and temperate countries; others, he urges, might be tasteful with grass, hardy shrubs, and flowers, and then people would have an object for which they would induce them to take this exercise more frequently than they are presently inclined to do, for want of one. In the manner our parks should be treated as naturally as possible: one might be bright flowers, the only beauty being that necessitating shelter and set them off; and another with the forest trees of northern and central Europe. Want of variety is one of the most horticultural misfortunes; and the preparation for an annual display over permanent plantings is one of the mistakes of our Commissioners of Woods and Forests. These ideas are the result of his Parisian surroundings to that we will now turn.

There are four parks in Paris, eleven squares, the Champs Elysées, the gardens of the Louvre, the Tuileries, the Promenades, and Gardens of Paris, and considered in relation to the Wants of our cities and of public and private Gardens. By W. Robinson, F.R.S. With upwards of four hundred illustrations. London: John Murray. 1868.

the Tuileries and the Luxembourg; the Jardin des Plantes, the Garden of Acclimatisation, several church gardens, and cemeteries; many long lines of boulevards, besides public nurseries, and great tracts of market gardens. All these open cultivated spaces, some of them occupying the site of narrow streets and filthy houses, cannot be without their beneficial influence upon the sanitary condition of the inhabitants, and we can see for ourselves the fresh effect, as of a newly-watered garden, they give to the city. Beginning at the west end with the Bois de Boulogne (of which we have spoken recently), we find 2,000 acres of land laid out as a combination of forest and pleasure garden, one half being wood, a quarter grass, an eighth roads, and some 70 acres being dug out into lakes. Some part of this park is cultivated with more than the finish of our own; the rest is left covered with scrubby woods and wild flowers; and further diversity is attained by water-falls, an enclosure for the deer; bold rock-work, attractive with conifers, rock-shrubs, and magnolias; a zoological garden; the race-course, known as Hippodrome de Longchamps; a large cascade near this, with the rocks about it, planted with ivy and rock-shrubs; and in the lakes are little islands of cypresses, bamboos, pampas grass, and other forms of pleasing vegetation, artistically arranged. Near the centre of the Bois and the lower lake is an enclosed space, called the Pré Catalan, where there is a cow-house, with eighty milk cows in it; some refreshment-rooms, and an open-air theatre; not forced, however, upon every one's observation, but sheltered, and carrying an ornamental aspect. The milk-house is frequented by the general company, but most especially by the horsemen who ride out early for exercise. And here, too, every August is held a gardeners' fête, with dancing, games, and fireworks. A curious system of removing the rain-water is adopted in this park, to which we referred in our recent notice of the Bois.* A number of tanks capable of holding from ten to twenty cubic metres of water, are placed under the foot-paths and in side alleys, to which the rains are conveyed by 4-in. drain-pipes, the first joint of which is imbedded in a monthpiece of Portland cement. Some of the tanks are circular in plan, and terminate in truncated cones; others are rectangular. Mr. Robinson describes the rectangular cisterns as measuring from 4 to 6 metres in length, between 1 and 2 metres in width, and 2 and 3 metres in depth, arched at the top, and being provided with trapped holes, by means of which they can be cleansed, and with harbicans in the footwalls for the escape of the water. The system of tanks was adopted as less expensive than the construction of sewers, which was estimated as being likely to cost 160,000*l.* The actual expenditure for the tanks is not given. The zoological garden mentioned as being within this park is the Garden of Acclimatisation, and is not to be confused with the famous Jardin des Plantes, where there are more zoological specimens. Its 200 varieties of vines removed from the Luxembourg, its oyster-beds and ostriches, Russian dogs and foreign ducks, and other curiosities of creation, are of scientific interest. There is a plan of the Bois given, and a dozen views of its streams, lakes, cascades, rocks, restaurants, and islands.

At the east end of the city is another noble park, the Bois de Vincennes, with a plain in it of 755 acres, where there are a drill-ground, 40 acres of water, 700 or 800 acres of forest, 110 of shrubberies, and as many of roads. Lakes, with islands and margins choicely planted, a fruit-garden belonging to the municipality, and a city nursery for herbaceous plants, rustic bridges crossing the waters, restaurants in the likeness

of Swiss chalets, and a plantation of Wellingtonias, are some of the chief features here; but everywhere turf, trees, and flowers are in refreshing contrast and freshness. The deep fresh green of the Parisian parks and gardens, as compared with the hay colour of the grass in London parks, varied with brown patches where it has been trodden away, as it often is in summer, is one of the most striking effects. This freshness is maintained by the system of watering. Even the race-course at Longchamps is watered. Long lengths of metal hose, made in joints about 6 ft. long, with junctions of strong leathern hose, each length of pipe being supported on two pairs of little wheels, are the means by which the process is effected, as we have before now mentioned in these columns. At a distance of about 3 ft. are perforations through which jets out a sprinkling fountain of water, not dense enough to convert everything into mud, yet of sufficient force to do the work required of it. Mr. Robinson has inquired, and finds that a man can water 1,500 square metres per hour, by the use of an apparatus 30 metres long, and that he need move the hose but three times. More than a mile of this kind of hose may be seen at work with hundreds of jets playing. For watering the streets the same kind of hose, running on little low wheels is used, only there is but one jet, which is at the end, that the man in charge can accommodate its use to the convenience of the traffic. One man does the work of ten when a garden is treated in this same manner. For roads and pathways a deliquescent salt is being tried. This is obtained from the residue of the manufacture of carbonate of soda. It is sprinkled over the roads by hand. Where there is traffic the salt requires renewal frequently, hence the cost runs up to twice that of water; but in places less frequented it is found to be much cheaper, because there is no cost incurred for pipes and hydrants.

The Parc Monceau stands the next on the list. It is more beautified than the others, though not so extensive. It was laid out, in the first instance, as an "English garden" for Philippe Egalité in 1778. Here may be seen the system of placing handsome plants singly upon grass, or in groups, to form one mass distinct and isolated, round which people can move without injuring them. The entrance avenue is of plane trees, with lines of roses of different colours on each side of the pathway, and in every direction are masses of foliage-flowers in superb contrast. There are not more than twenty-two acres in this park, which was improved at a cost of 48,000*l.* in 1861. The Parc des Buttes Chaumont is in quite a different style,—a Parisian Primrose-hill, with a bit of Hampstead-heath, thrown in, taken in hand and beautified without stint. The site was formerly a scene of desolation, abandoned clay mounds, and excavations. There was a quarry in it: this is retained as a cliff, 164 ft. high; and one of its bays is made into a stalactite cave, about 60 ft. high, into which water trickles through a gorge over ivy and other suitable plants. We give a view of it from Mr. Robinson's book.* At the base of the cliff there is a lake. Winding about on the grass are little streams, with Alpine plants placed here and there. One of the hutes, or high mounds, is planted with deciduous, which Mr. Robinson considers a mistake, as it is better to choose deciduous trees wherever possible in cities, evergreens being less likely to flourish. Another feature is artificial rockwork that is to be covered with plants. The approach to this park is only temporary, and is not satisfactory, though it is likely to be as magnificent as the rest when finished. The author was much impressed, in the course of his survey, with the extreme rapidity with which such works of improvement are carried on in Paris:—

* See p. 277, ante.

* See p. 446.

"I have seen acres of land removed to a depth of several yards without any fuss, and in a few weeks; miles of trees planted in the course of a single week; old suburbs blown up by hundreds of mines a day, and levelled into commanding terraces fit for princely mansions. One June day, bright, dry, and very warm, they were planting trees in this park, and large ones too,—trees that required great machines to lift them,—while they were marking the ground for fresh plantings. "Do you plant after this date?" I asked. "Every day in the year!"

The cost of turning this wilderness of plaster workings into a picturesque promenade, green with turf, glittering with water, and fragrant with floral triumphs, was about 140,000*l.* Of this sum 120,000*l.* were expended upon the bridges, roads, and gardens; and 20,000*l.* upon three restaurants, one double and eight single park-keepers' lodges, a rotunda, and the railings.

The gardens of the Luxembourg, concerning which such a tempest was raised a few months ago, are more concentrated than they used to be. Close to the palace is a basin flanked by balustraded terraces, above which are marble stairs and chestnut groves. The banks that rise to the terraces are planted with dwarf rose-bushes, and the borders of the squares of grass are full of a succession of occupants all the year round. In the borders, among the flowers, are lilac bushes, roses, and low bushes of honeysuckle—surely a treat to the people, whose road to their work may take them that way. The fountain, with its group representing Polyphemus discovering Acis and Galatea, and its long basin of water bordered with plane-trees, that make a green archway over it, and adorned with festoons of ivy and Virginian creepers stretching from tree to tree, is illustrated. M. Riviere, the superintendent at this place, gives free lectures, made very instructive with references to the examples he has at command, which are numerously attended. He appears to be especially clever in the cultivation of Woodwardia, which are seen to great perfection under his management, in the gardens in summer, and in the conservatories in winter.

To enable those who do not know Paris to picture the Place de la Concorde and the avenue of the Champs Elysées, the author bids them think of a wide pleasure-ground at the lower end of Regent-street, and to add to it a grand chestnut-tree-bordered avenue stretching through it and stalking on and on to the highest point of the broad walk in Regent's Park, and then to add to that the largest triumphal arch in the world. On the left side is the garden laid out in 1860, sprinkled with little sheds for the sale of cigars and gingerbreads, and dotted here and there with restaurants, concert-stands, and *cafés*; yet still sumptuous with belts of shrubs ringed round with flowers, the greenest of grassy carpets, great clumps of rhododendrons, weeping willows, banks and beds of azaleas and hollies, isolated specimens of rare plants, pampas grass, Wellingtonias, and weeping sophoras. The unobjectionable effect of these refreshment-stalls and chalets leads the writer to inquire why people cannot have similar accommodation, dropped down in the same quiet way, among the flowers and foliage of Kew. The two gardens in the Place Napoleon III., the enclosure formed by the new buildings at the Louvre, are quoted as being valuable lessons in inexpensive city gardening, and charming relief to the buildings and sculpture around. They are octagonal, small, and surrounded by railings with gilt spears, and contain only a circle of grass with an edging of ivy. Mr. Robinson's theory is that plenty of these simple squares, giving breathing-room in dense quarters of the town, are to be preferred to one or two large parks which can only be used by the comparatively small section of the community that lives conveniently near. The rows of orange-trees in tubs to be seen in the Tuileries, the Luxembourg, and at Versailles among other places, find little favour in his eyes. He calculates that each tree has cost as much as it takes to educate a surgeon or barrister, and when this unworthy expenditure has been made upon it, it never comes to anything more than a large tuft of not very healthy green leaves at the top of a tall stem. The orange-tree tub business comes in, therefore, for blame. And in many other instances the author shows he can see French mistakes as well as British shortcomings. Nevertheless, he brings up a large balance in favour of Gallic gardening for cities.

The first square on Mr. Robinson's list is that of St. Jacques, an open space in which once stood a church, of which only the very fine tower is standing. This, we need scarcely repeat, has been restored, and forms the leading feature of the square. Here, on one of the lawns, is a

specimen of the great Abyssinian *musa*, 12 ft. high, with leaves 8 ft. long, each having a red mid-rib tapering from the base to the point; backed with trees of our own latitudes, and in the foreground, is a mass of the edible *caladium* springing from a bed of mignonette, edged with guaphalium; and so on, in other nooks; a brilliant contrast to the clammy, slimy, dark places round some city church towers we might name, and, indeed, to its own former dilapidated and cheerless condition. This transformation was effected at a cost of 6,000*l.* Unlike the London squares, which are kept locked up, and rarely visited save involuntarily by the nurse-maids in charge of the children of nervous residents afraid to trust them out of their sight, the gates of the Paris squares stand open, invitingly, from six in the morning till ten at night; and they are furnished with seats. It is rather curious that while we are apt to think the populace of other countries less likely to injure public property, either trees, antiquities, buildings, or works of art, than our own, the French rightly impute to our people a similar propensity of behaviour. At one time, when the subject of planting these squares and places in Paris was discussed, a decided opinion was expressed that though such proceedings were practicable in London, they would never answer there, where the revolutionary tendencies of the people would be sure to assert themselves in the destruction of the plants and flowers. Rarely, however, is any damage done.

The Square des Batignolles, once an open space before a church, has a streamlet for its leading feature, instead of an old tower like St. Jacques. It resembles a charming vale, in which meanders a streamlet ending in a lakelet:—

"The margins of this streamlet are variously embellished with suitable plants; the rich grassy sides slope up till they end in dense plantations of the choicest shrubs, so well planted and watered that they look as fresh as if growing twenty miles from a large city. Let us walk round—the margin of the shallow, grassy vale to our right, the boundary shrubberies and the railing to our left. The walk expands from the breadth of ten or a dozen feet to forty, on the first corner of the square, so that the children find little playgrounds without going on the vividly green grass."

Where the gravel walks widen there are seats, and chestnut-trees to give shade, so that those in charge of the children can seat themselves while they play, and the general public can rest and enjoy the scene. Honeysuckles climbing up the stems of the trees, groups of tall maize springing out of dwarf phloxes, beds of variegated flowers, clumps of shrubs edged with flowers, groups of poplars and cedars, isolated specimens of the castor-oil plant, and bananas springing out of the turf, meet at the eye on all sides. The only fence used is a very low, light, open-work iron edging. The streamlet takes its source from a rockery covered with ivy and creepers, and shaded with trees. This little landscape extends only over three acres, was finished the year after it was commenced (1862), and cost 60,000*l.*

The Square de Montrouge is in an inaccessible locality, and is not so large as Leicestershire-square, but is full of "glistening, deep, and refreshing verdure," in the form of little lawns belted with low trees and shrubs. A group in bronze adorns one grass plot. The plants, too, are of the choicest; tropical grasses falling from tall stems like fountains, plants with huge leaves 3 ft. long standing in a broad mass not more than 4 ft. or 5 ft. high, and other contrasts and varieties.

In the Square du Temple there is more water, with water-plants, rock-work, and weeping willows, one specimen of which is considered to be 400 years old. There is a tall chimney of a manufactory in full view, and it has other every-day surroundings; but there are great masses of white and crimson and other hues among its deep green settings, that make it, nevertheless, very enjoyable. There are but 8,000 square yards in it. The cost of laying it out was 6,000*l.*

The Square des Arts et Métiers is one of the most frequented of the new improvements. Sometimes, indeed, of an afternoon, it is difficult to get across it, for the number of people taking the air in it. Here we part company with the idea of iron-railings, hitherto inseparable from squares. The inclosure is effected instead with a low balustraded wall, upon which are vases, at intervals, with aloe and similar plants in them. There is more gravel here than in most of the squares, because it was intended to serve as much as possible for a playground. In the centre is a Crimean monument; and besides

this there are two ornamental fountains, with oblong basins of water. This is considerably smaller than the Temple-square, for it covers but 5,000 square yards. The cost of it was, however, considerably more, 12,500*l.*

In the Place Royale we find another large open gravelled space, with an equestrian stat in the centre, shaded with a group of chestnut trees. In each angle of the square is a spouting fountain, the basin of which is bordered with grass, and then belted with flowers, and the grassy margin first mentioned are isolated specimens of the dark-leaved *Canna*. Mr. Robinson reminds us that Richelieu, Delorme, a Victor Hugo lived in the houses of this antique square. The garden of the Palais Royal is specimen of what a French square used to be before the taste for "English gardening" was set by the Emperor. It is a gravelled space with lines of clipped trees.

The Square des Innocents is another new one. In the centre of this stands the celebrated Fontaine des Nymphes, built by Pierre Les in 1550. This was made, in 1860, into a flower-shady, green, cool piece of pleasure-ground, the inhabitants of a busy neighbourhood at cost of 8,000*l.*

A nearly similar expenditure has made ground around the chapel that contains the mausoleum of Louis XVI. and Marie Antoinette in another square. This work was effected in 1856, the exact cost not exceeding 7,500*l.* The Square de Belleville is an example of a small inexpensive square made in a poor neighbourhood, to its great improvement. The site was that on which the fûtes of Belleville were formerly held, which was planted with lime-trees trained in the form of an arbour. It has now been planted with flowers and shrubs, and converted into a beautiful pleasing spot, at a cost of 800*l.* Like it is the Square Vintimille, a pretty fresh green spot, in the centre of an old *place* for less than 100*l.* The Square Montholon is, again, more ambitious. Here there is a grass plot sunk in the centre below the level; and there is also a running stream issuing from a rock into a miniature lake. The 5,000 square yards here embellished cost 7,500*l.*

We will give the author's description of another:—

"The Square Louvois is formed on the site of the Théâtre de l'Opera, which stood there until 1820, the assassination of the Duc de Berry, which took place in the February of that year, the theatre was pulled down, and a Chapelle Expiatoire was built on the spot. The building, however, was hardly completed when the revolution of 1830 burst forth. The chapel was pulled down, the ground was turned into a public square, and planted with trees. Later on, a beautiful fountain, from the design of Visconti, the architect, was built in the middle of the spot. The square consists principally of a grass which surrounds the fountain, and of two rows of trees, and a few simple ornaments; but notwithstanding the plain way—designed so as to form low pyramids, the place being planted. Usually, it is embellished with few ornamental exotics in summer, and is at all times a graceful spot."

In this way the author shows us the vigorous effort that has been made in Paris to open up and let in the sunshine and fresh air in all directions, especially in those that most needed. There is yet another square of which he speaks particularly; and as this is one connected with a museum, and consequently of a different character, we also mention it. It is that of the Hôtel Cluny and Palais des Thermes. The ruins standing in it, it will be remembered, and many of the objects of antiquity that were intended for the adornment of the exterior buildings are here displayed, and the plants and flowers beautify their surroundings, withstanding the site adjoins a busy boulevard.

The fruit, flower, and vegetable markets of Paris form another department in this volume, and we are again impressed with the advantage the Parisians enjoy in this matter. The Central Market, their improvement upon Covent Garden, covers five acres of ground. There are streets of stalls in it with passages wide enough for purchasers to transact business conveniently, and the stalls are airy, and sufficiently large. We reproduce of Mr. Robinson's views of it, and append a description.

"It is constructed so as to be a protection against extremes of weather at all seasons: it is cool and shady in summer; the system of cellars underneath roomy and good, and many useful arrangements for storing away provisions, both live and dead. The roof is zinc, the flooring partly asphaltic, partly wood, and, like every new building, or avenue, or

attract in Paris, trees adorn the margin of the wide footways around it, shading the scene of almost ceaseless animation beneath."

We shall return to Mr. Robinson's very useful volume, and refer to some of the many suggestions it contains.

THE CHROMATIC HARMONY OF THE INTERIOR OF WESTMINSTER ABBEY.

THE bold experiment to which, without any previous announcement, the tomb of the mother of King Henry VII. has recently been subjected, has called forth a series of explosions and counter-explosions, which many persons have read with amusement, and a few—the wiser few—with pain.

When we remember the position which, according to statistical comparison, England holds among educating or semi-educating nations, and especially when we reflect upon the very recent and limited development which art-education has experienced in our island, we shall hardly be surprised at the rarity, not to say the poverty, of writers in the English tongue who even attempt the *métier* of art-criticism. Whether we may put the effect for the cause is doubtful, but it is not possible to disconnect the fact that educated men are not ashamed to confess their entire ignorance of art, with the tone that is so frequently assumed by some of the few writers who have the field so much to themselves. On no point do men speak with such hesitating, unblushing, intolerant, dogmatism as on a question of taste. On any scientific difficulty some patient and long-unknown student may be expected to emerge from obscurity, and if he cannot at once throw the full light of explanation on the subject, he will yet place at the common disposal of scientific men the result of his investigations, and indicate the path by which he expects that the final triumph may be attained. Reasons may exist, indeed, of a commercial or of a nobler nature, that induce the scientific man to keep his own counsel for a longer or for a shorter time. But when he does speak, he does so clearly. He endeavours to tell others what he knows himself. He does not make use of a cramped and arbitrary phraseology calculated to veil his dogmas in so much obscurity as to preserve them from ready attack. He states what he knows, and how he has come to know it; what he expects, and what reason he has to expect it. He will use—and if he is a highly educated man probably plentifully use—technical terms. But he will only do so for the sake of precision, and he will be careful to explain the meanings of those terms with such lucid distinctness that no attentive hearer can misunderstand him. Such, we hope, is at least the method aimed at by our men of science. Such, beyond doubt, was the method of Faraday.

If we contrast this endeavour to carry the listener intelligently along with the speaker, or the writer, with that into which so many men seem, perhaps unawares, to fall when they speak of art, we shall gain a clearer insight into the cause of two not very brilliant phenomena, namely, why so few persons, even in their own estimation, know anything about art; and why there is such extreme, irremediable, and even undecided conflict about matters of taste. The writer on art, with the rarest exceptions, never explains a term. He seems, on the contrary, rather to lug himself on the facility with which he can throw the dust of a few hard words into the eyes of his admirers, or his opponents. With some men this may arise from natural infelicity of expression, or from the modest assurance that those whom they address know at least as much about art, its canons and its language, as they do themselves. At other times—we do not wish to be disrespectful to any one who can make use of the pen—we are put in mind of a poodle attempting to guard the entrance of the studio by shouldering a manstick.

Now, in the presence of a question of such extreme importance as the preservation or the neglect, the repair or the destruction, of some of the finest Christian monuments in the world, it is surely fit that the subject should be approached in the spirit of modest inquiry as to the best course to pursue, and of candid respect for all knowledge, or well-founded advice, that may be forthcoming. We might perhaps be accused of exaggeration if we were to say that, three hundred years hence, the destruction of such a monument as that which yet remains so perfect of the *chère reine* of the great King Edward I. would be considered as serious a

national misfortune as the loss of a great battle. One thing, however, is clear,—it would be more irreparable.

It is not then by sharp incisive letters, more fitted to raise a laugh than to carry conviction, that the thinking public will be enlightened on the subject. "We have had a most perfect success," says one gentleman. "What—touch the tombs!" replies another; "it is sacrilege."

"It is a housemaid's question," sneers a third. "Do you like to sit down in dust half an inch deep?" "A housemaid!" retorts a fourth; "do you wish to scrub up the old bronzes with ashes like a copper kettle?" Even this, if non-convincing, may be rational; but when one man lays down, in lofty language, his *ipse dixit*, on either side, not as an opinion, but as an oracle, why does not he see that he instantly prompts a hundred to contradict him by the mere anarchy of his tone. He may be right, but people will not believe him, unless he tells them in plain language why he holds his opinion, as well as what his opinion is. It convinces no one to call dirt "patina." It satisfies no one to say "the chimney-sweeper gives the tint which is respected by the preceding writer."

The first important question with reference to the condition of the grand bronze monuments of Westminster is the chemical one. It is a matter to be approached with some degree of delicacy when we consider what sort of workmanship we have produced in this material, in the full scientific blaze of the nineteenth century. When we compare our grimy Peela and Wellingtons or our serofulons lions with the purer metal cast by Bacon, even so short a time back as the reign of George III., to say nothing of the cannon taken from Russia, or of one or two of the elder bronze statues in the metropolis, we may well admit that dealing with the alloys of copper is not to present our *fortis*; and when we compare what has been done so recently and rapidly by man with what has been effected by the lapse of nearly six centuries, we may well take counsel to look before we leap.

After the question of the preservation of the monuments themselves follows the question, more properly architectural than sculptural, as to the harmonious aspect of the Abbey. Concerning this, we have a word to say with reference to the present appearance of the tomb *sub lite*, but we wish first to call the attention of our readers to another part of the Abbey, where an innovation bears the date of 1869, which may guide us in forming an opinion on this very serious question.

At the north end of the organ screen, during the alterations in the choir, a new end, of plain but not clumsy oak, has been added to the organ loft, which has not, even yet, assumed that mellowness of tone, the absence of which, when the woodwork of our churches is renewed, for a time grates upon the feeling. Under this gallery is the tomb of the last representative of one branch of the Carteret family—Sir Charles, who died in 1715. The tomb is a sarcophagus of marble, either built into the wall, or so executed as to represent such a position. To the right of the spectator a stout cherub leans on a diagonally disposed narrow slab of marble, which there is some reason to suppose to be intended to represent a sunbeam. The resemblance, however, is not clear. It is a plank, so to speak, of marble, placed at an angle of 45 degrees from the floor, and on it are inscribed the names of several of the family. In fact, it is of the date when the taste for allegorical sculpture was still prevalent, but when the artist hands which emblemed some of the early coconets were cold and stiff.

Above this quaint and ugly tomb, the whole space between the soffit of the organ-loft, the door giving access to the stairs, and the end of the same, is occupied by a new, bright, chromatic decoration. The space thus filled is some 9 ft. square. It is divided, by a light scroll work, into four compartments, each containing the coat of arms of a peer or peeress, with supporters, coronet, and motto. A border surrounds the whole, of the same dispersed or rather latticed pattern as the division between the quarters of the tablet, with gilded margins, and the initial letter C, and twelve shields of arms, brightly blazoned and illuminated.

The colours appear to have been chosen with care. The first effect of the memorial, new as it is, is rather glaring. But it can hardly be doubted that a comparatively short period will subdue the freshness of the tinctures, so far as to enable any judge of colour to form a correct opinion as to the effect of this mode of restoring

the ancient polychrome style of adornment. That the effect on the general repose and harmony of the Abbey will be far less disturbing than is that of the incongruous and rampant originality of many of the marble memorials which afflict our walls, we think there is a fair promise.

The ground of this memorial is a pale creamy white. The gold in the decoration is of a pale natural tint, neither reddened by copper nor whitened by silver. The red and blue of the illuminator, the gules and azure of the herald, are of that subdued tone which characterizes the coloured reliefs of many of the Egyptian tombs. The argent of the armorial bearings, and even the pearls on the coronets, are not tinged with silver or with the more drablike substitute, tin, but are merely indicated by outline on the self-coloured ground. The sable of the bearings, and the lettering of the inscriptions, are of a pale brown, and nothing so much detracts from the offensive glare of a perfectly new work as this undertaking of the inscription.

The arms will be valuable to the heralds of 2269 A.D., if arms and if heralds are extant at that date. It so happens that the supporters, which form the most prominent features of the memorial, are both brilliant and diversified in their colour. The first escutcheon, on the upper corner to the left, is that of Grace, Countess Granville, who died in 1744. It is not correctly blazoned, according to the best heraldic rules, as the field is not displayed as a lozenge. Uniformity is preserved by the use of four shields (of the heater shape), but as the memorials are divided, two to either sex, the appropriate form of field might have been adhered to with advantage in each instance.

The Countess of Granville's escutcheon, under an earl's coronet, is supported by a red-winged antelope to the dexter, and by a gold griffin to the sinister, with the grand motto beneath,—*"Loyal devoir."* The arms of John, Earl of Granville, who died in 1763, occupy the right-hand compartment on the same level, supported by two winged antelopes, gules. Those of Martha, Viscountess Lansdown, who died in 1689, are supported by the two brilliant winged monsters above named—the golden griffins; and those of Frances, first wife of the above-named Earl John, under the coronet of her husband, have supporters similar to those of her husband. A short inscription of the name, distinctions, and date of the birth and of the death of each of the above nobles, is clearly and distinctly painted, in Gothicized letters, beneath each blazon. Under and along the whole length of the tablet runs the following legend:—"All the above lie buried in the vault of their relative, General George Monk, Duke of Alhmarle, K.G.; and this record is inscribed by order of their descendant and inheritor, the sub-dean of this collegiate church. A.D. 1869." The sub-dean is Lord John Thynne.

We think his lordship is to be congratulated on the performance of this family duty. The thought that has been given to the subject has evidently been considerable.

Looking to the operation in the north aisle of the chapel of King Henry VII., we expected, judging from the announcement made, to see the effigy restored to something like the condition in which it left the hands of the sculptor. We do not think that such is the case. A gleam of golden yellow draws the eye at once to the spot. We cannot say that, in itself, this is objectionable. Yet, as the monument now exists, we fear that it must be so considered. The robes of the effigy, on which the greater part of the chemical cleaning has been bestowed, are not as they were once, brightly gilded over, but streaked and stained of copper, where fingers have constantly passed, and disfigure the restored gold. Different parts of the statue are in different conditions. Some parts, which have been gilded, are still black. The face and hands, by far the finest part of the effigy, appear to have been untouched. If they have undergone any cleaning the utmost credit is due to the operator. Although showing signs of age, they are in good preservation. But then, dark bronze contrasts too harshly with the gold of the robe, and the contrast is rendered more unpleasant by the rents and tears in the gilded sheath. The escutcheons beneath the tomb, let into foliate wreaths in the marble of which it consists, have a somewhat brassy appearance.

We fear that either too much or too little has been done to this tomb. We desire to speak with all modesty on the subject. We cannot doubt that the Very Reverend historian of the

Abbey has taken almost a paternal interest in the experiment. We think it possible that something more than mere washing and careful dry-rubbing may be advisable as to some of the monuments. We feel sure that a simple and safe process of removing actual dirt is loudly called for. But it would be with the utmost reluctance and hesitation that we should be disposed to lend a hand to anything more. And, although the memorial tablet erected by Lord John Thynne seems to show that the idea of gold and well-chosen colour being incongruous with the tone of the interior is erroneous, yet we cannot hold that the result of the operations on the tomb of the great-grandmother of the Non-heated Elizabeth is highly encouraging.

We suppose that we are correct in holding that the entire responsibility as to the preservation of these invaluable monuments devolves on the Dean of Westminster. From no one can we expect more loving and reverent care for so great a charge. We have been happy to echo the words of Dean Stanley when telling us what memorials are treasured in the Abbey. May we not be heard in our turn, when we say, although no advocates of either dirt or neglect, that the chemistry of bronze effigies may not be made a subject of experiment. One unlucky week may do mischief which five hundred years have been powerless to effect. Let us feel our way in a matter of so much national importance.

THE DICTIONARY OF THE ARCHITECTURAL PUBLICATION SOCIETY.

The early completion of this important work is so desirable that we give at some length a report of the proceedings at the annual general meeting of the subscribers held at the House in Conduit-street, on the 31st ult. Mr. William Tite, M.P., presided, and the report, to which we have already alluded, was laid before the meeting. The balance-sheet showed that the amount in hand available to pay the cost of production of the parts of illustrations and text then on the table and for future issues was 346l. 11s. 2d.

Mr. Cates, the hon. secretary, explained that this amount would not suffice to defray the whole of the expenditure, but that the arrears due from subscribers, and now in course of collection would suffice for this purpose; and further showed that for some years past the society had not been solely dependent on the annual subscriptions. The actual number of subscribers was about 300. In 1860, the receipts from subscriptions amounted to 341l., while from miscellaneous sources and sale of parts 170l. were received, and the expenditure was 456l. In the next year the subscriptions were 331l., miscellaneous receipts 203l., expenditure 452l. In 1862, the subscriptions were 351l., miscellaneous receipts 159l., expenditure 547l.; in the next year the subscriptions amounted to 332l., miscellaneous receipts 245l., expenditure 550l. In 1866, the subscriptions were 288l., miscellaneous 143l., and expenditure 398l.

Mr. Charles Mayhew having remarked on the desirability of hastening the time of completion, suggested that the remainder of the subscription to the Dictionary should be paid in three yearly instalments of three guineas, so as to get the work completed in that time. If the publication was to be extended over nine years more, some of them would not see its completion.

Mr. C. C. Nelson expressed his willingness to pay nine guineas down in order to expedite the completion of the Dictionary.

The Chairman remarked that the great point was to get a sufficient number of additional subscribers; he should be glad to hear the hon. secretary's opinion on that.

Mr. Cates thereon reported the very satisfactory replies he had received, expressing approval of the scheme for completing the Dictionary, several gentlemen coupling their approval, with the guarantee of an additional subscriber, or sending the name of one, while others expressed their willingness to contribute a larger annual subscription to secure the completion of a work which, even in its incomplete state, they had found to be of essential service and assistance in the practice of their profession. He also remarked it was a startling fact, that in London they had only 140 subscribers. Just before the meeting, he had jotted down the names of some few persons, as they occurred to him, who, he thought should be subscribers in London

alone—men to whom in their various vocations the Dictionary would be a great advantage. He had made out a list of such persons, amounting in the aggregate to about 250, who he considered ought fairly to be subscribers to this work; and if each subscriber would suggest to his friends how desirable it was that they should possess it, no difficulty could be found in obtaining in London alone the 150 new subscribers whose accession would enable the committee to complete the work for the fixed sum of 15l. 15s. for the whole, and without any payment from the present subscribers. The fifteen guineas need not be paid down at once; it would be sufficient that new subscribers undertook to pay that sum. He had also prepared a similar list of persons in the provinces, many of whom he believed would subscribe to the Dictionary if the matter were properly represented to them. In reply to inquiries, he said that a new subscriber paying the fifteen guineas would receive a copy of the work as issued up to the present time, comprising the text of the Dictionary A to L, and a large series of illustrated plates. If five guineas were paid, five years' publication would be supplied.

In reply to other inquiries by Mr. Hansard, Mr. Newton, and others, the Hon. Secretary said, leaving the question of time out of consideration, the great point they had to attain was this: they had a certain stock of copies in hand, and that was so much capital to the credit of the society, and the object was to utilize that stock by getting new subscribers. They could then provide funds for the completion of the Dictionary within the shortest possible period compatible with maintaining the character of the work. If they could at once bring in only a hundred new subscribers he would undertake to say before the Dictionary was completed he would be able from various other sources to get rid of all the surplus copies which would then remain.

Mr. Seddon suggested it would be better to keep the stock, and for the subscribers to pay down what was necessary to complete the work as quickly as possible. He also suggested that the payments by instalments should not be less than three guineas per annum, with the option of payment in advance by those who might be inclined to do so for the sake of helping the thing on.

Mr. Newton said they must not lose sight of the difference in the cost of the work in having a paid and a gratuitous editor. If the continuous services of an editor were secured, he had no doubt the work might be completed in three years.

Mr. T. C. Clarke said, supposing the present subscribers paid three guineas per annum for three years, and the work was completed, they would then have 150 complete copies of the Dictionary in hand, from the sale of which payment to an editor could be made. If they paid their nine guineas each, there would be a large capital in hand when the work was completed.

Several subscribers expressed their readiness to pay up the remainder of the subscription at once in order to expedite the completion of the work.

The Chairman, having commented approvingly on the scheme submitted, read a series of resolutions which had been prepared, and in his opinion placed the whole proposal in a clear light. They were as follows:—

1. That it is desirable to secure the early completion of the 'Dictionary of Architecture.'

2. To attain this end this meeting authorizes the honorary secretary to take such measures as may be necessary to obtain the immediate accession of a sufficient number of new subscribers, and pledges himself and the society to actively aid in making the work as widely known as possible, and in procuring fresh members.

3. That in the event of success attending these exertions, the entire cost of the Dictionary is to be fixed: for old and new subscribers, at 15l. 15s.

4. The number of copies available being limited, this arrangement and the advantages attendant thereon shall apply:—

a. To those subscribers now on the list who may, before the close of the year, pay up all subscriptions due or outstanding on December 31st, 1868.

b. To new subscribers who may pay down the fifteen guineas in one sum.

c. To new members who elect to pay the fifteen guineas by instalments, in the order of frequency of payment."

The Chairman, having expressed his full concurrence with the propositions just read, and several members having also stated their approval and made further inquiries,—

The Hon. Secretary, in reply, said he should feel obliged by subscribers then present making a selection from the lists he had prepared of such gentlemen as they were personally acquainted with, and submitting this matter to

them. He had great faith in the country architects; they had been the main stay and support of this society. He had received many letters from the country, expressing the highest approbation of their Dictionary, and their gratification at having become subscribers to it; some acknowledging that they had joined the society somewhat unwillingly, but had derived so much advantage from the information to be obtained in the Dictionary, that they would spare no effort to secure its completion. It was not simply amongst architects that canvassing was desirable: the large contractors and builders would find the Dictionary a valuable addition to their technical libraries, as well as to those of public institutions, and of amateurs and art patrons.

The resolutions were then unanimously adopted.

With a view to afford an opportunity of acting upon the plan suggested, the following resolution was also adopted:—

"That this experiment be immediately made, and that the meeting adjourn for a month or six weeks, to receive a report from the hon. secretary on the subject; and that Mr. Wyatt Papworth obligingly explain to the same meeting the time that the completion of the work would probably take if sufficient funds are found."

We shall hope to hear at this meeting that the required number of new subscribers has been obtained.

SPIRITUAL PHOTOGRAPHY.

AFTER spirit photographs we wonder what next and next. The spiritual is the newest phase of the photographic art and its latest development. This, it seems scarcely necessary to say, is a Yankee notion. There is at least one New York photographer who "calls spirits from the vasty deep" for the modest consideration of ten dollars ahead. And they come too, or something comes, very like the popular idea of a ghost. This clever artist takes the portrait of any person who may be desirous to sit, and also gives on the same *carte de visite* the shadowy picture of some deceased friend—husband or wife, parent, lover, or child. Thousands of persons believe, or profess to believe, that these likenesses are obtained by some spiritual force, and their credulity has enabled the "original spiritual photographer" to amass a handsome fortune. On the other hand, it happens that there are a large number of persons who have had spirit photographs taken, but are decidedly not satisfied with the result. They not only consider that in paying the sum of 2l. for their effigy in the new style they have paid "too much for their whistle," but they look upon the thing as a regular swindle, and legal proceedings were taken against the person in question, a Mr. William H. Mumler, of 630, Broadway. The charge against him was that by means of what he calls spiritual photographs, he had cheated many credulous persons, leading them to believe it possible to photograph the immaterial forms of their departed friends. Mumler was charged, in fact, with obtaining money under false pretences. The case being without precedent in the annals of criminal jurisprudence has excited extraordinary interest in New York. The trial lasted about ten days, and much of the evidence was of a most remarkable character. Mumler, it would appear, was originally a jeweller's assistant, and took to photography about seven years ago in Boston. His pictures brought him at once into notoriety, though it is only now that proceedings have been taken against him, at the instance of the Mayor of New York. The particular charge on which the spirit photographer was more immediately arrested was this. One of the officials of the corporation was ordered to investigate the business, which he did by assuming a false name, and by getting his photograph taken by Mumler. When the sitting was over, the negative was shown to the visitor. A dim, indistinct outline of a ghostly face stared out of one corner of the plate. He was told that represented the spirit of his father-in-law. He, however, failed to recognise the worthy old gentleman, and emphatically declared that the picture represented neither his father-in-law nor any of his relations, nor yet any person whom he had ever seen or known. Among the witnesses examined for the prosecution were several practical photographers, who stated that pictures similar to those produced by Mumler might be obtained through other agencies than disembodied spirits. The counsel for the defence also brought forward a large number of witnesses, all of whom testified to the genuine-

ness of the spiritual photographs taken for them by Mumler. They swore that they recognised the forms of departed friends—some of whom had been a long time dead—on the same card with their own likenesses. One gentleman even declared that not only himself but his friends distinctly recognised the features of his deceased wife in a photograph taken for him in this way. We find a Judge bearing testimony still more astounding. Judge Edmonds, who is known to be one of the most prominent advocates of spiritualism in the States, had two photographs taken by Mumler. The spirit form in the one he thought he could recognise, he said, though not the one in the other. This Judge declared his belief that the camera can take a photograph of a spirit. "And I believe also," he went on to say, "that spirits have materiality; not that gross materiality that mortals possess, but still they are material enough to be visible to the human eye." For Judge Edmonds has seen them. "Only a few days since I was in a court in Brooklyn, when a suit against a life assurance company for the amount claimed to be due on a certain policy was being heard. Looking toward that part of the court-room occupied by the jury, I saw the spirit of the man whose death was the basis of the suit. The spirit told me the circumstances connected with the death; said that the suit was groundless, that the claimant was not entitled to recover from the company, and further that he (the man whose spirit was speaking) had committed suicide under certain circumstances. I drew a diagram of the place at which his death occurred, and on showing it to the counsel, was told that it was exact in every particular." Parenthetically, we may observe, that for our part we should prefer a Judge without the very remarkable and peculiar power possessed by Judge Edmonds. The facts and arguments of corporeal beings are, as a rule, more conclusive evidence in a Court of Justice, we should say, than the manifestations of spirits so-called. Well, the real point at issue is whether spirits can have their photographs taken or not. Another witness examined in the case was Mr. P. T. Barnum, the notorious showman and prince of humbugs, who had bought a number of Mumler's portraits, and hung them on the walls of his museum as examples of humbug. Being anxious, he said, to find out how the thing was done, Barnum called on another photographer, and asked him if he could make a spirit photograph, telling him he did not want any humbug about it. The artist said he could do it. The showman was permitted to examine the glass, witnessed the process of pouring over the liquids, and then saw the glass placed in the camera. He could discover nothing unusual; but when the plate was produced it had Barnum's likeness and the shadow of Abraham Lincoln. "I saw the ghost of Lincoln as soon as it was developed in the dark room. It was conspicuous of any spiritual presence." Still this case witness was as much in the dark as ever as to the *modus operandi*. But at a subsequent hearing of the case the material side of the question was presented. The counsel for the prosecution succeeded in showing "how ghosts are made." Mr. Bogardus, a practical photographer, said there were many ways of producing these so-called spirit photographs. He could produce the picture of an angel hovering over a man's head, or put a pair of horns on his head, without his knowing that anything unusual had been done. Of course it was a trick, and an acute photographer might find it out, but the witness had deceived some good ones. He could take an impression on a sensitive plate, put the plate aside, either in the bath or elsewhere, and afterwards bring it out and take a second picture on it. When the plate is developed, both pictures will be developed together. This method, however, sometimes does not cut up the desired spirits. For example, an artist once took the likeness of a person surrounded by the apparitions of Daniel Webster, Henry Clay, Calhoun, and Napoleon. But the sitter desired the disembodied presence of Washington, and this could not be evoked, the artist not having made the necessary preparation. As another witness on the same side put it, these photographs could be got by taking a negative, and making a positive from it, which was subsequently used to make a spirit picture. A small camera was produced in court, and the matter explained practically. In one of the processes the negative used was a piece of transparent mica having a figure upon it. The witness showed how, by manipulating this with dexterity, the impression

of the figure on it could be made on the sensitive plate, and you have your ghost. This exposition of the affair seems to have created much merriment in the court. The evidence was conclusive. But besides it was proved that the ghosts in some of Mumler's pictures, which were exhibited, could not have been in front of the camera at the same time with the sitter, because the lights and shadows of the one were opposed to those of the other. In front of the camera! of course not; whoever heard of a ghost paying a visit except in the dark! With reference to the alleged likeness of the spirits to deceased friends, it was proved beyond a doubt that persons had been deceived by their imaginations, the same spirit having appeared on different plates, and been recognized as that of different departed ones! The dimness of the portraits aided the deception, and occasionally an extraordinary likeness to some deceased person happened to exist, or to be imagined. In this manner, from his long experience in the business, had become extremely expert and successful at it. We have seen several portraits taken by him. They were of the ordinary *carte de visite* size, and there was in addition to the likeness of the sitter, the shadowy outline of a male or female head, more or less indistinct, or a half-length figure of a female done in the regular white sheeted apparition style. The pictures were clever enough, and might readily deceive the credulous and unsuspecting,—as, indeed, they have done; but now that the trick has been detected, and the swindle publicly exposed, notwithstanding that no verdict against him was obtained, Mr. Mumler is not very likely to dispose of any more spirits at ten dollars per head. That he has managed to carry on so successful a trade in the disembodied for so long, only shows that the gullibility of mankind is very great.

THE ARCHITECTURAL ALLIANCE.

The association so called, which for understandable reasons does not include the principal body of English architects, held a meeting in London on the 12th ult., including four delegates from the London Architectural Association, two from the Birmingham Architectural Society, two from the Glasgow Architectural Society, one from the Liverpool Architectural Society, and one from the Nottingham Architectural Association. They declined to admit reporters, and have since issued printed "Minutes of Proceedings," the noticeable feature of which is a series of short reports received from societies on the question of Architectural Education, and which are thus summarised by Mr. Rickman, honorary secretary:—

"The five reports which have been received from the allied societies in London, Birmingham, Glasgow, Liverpool, and Manchester, may be summarised as follows; but it would be unfair to any of them to consider such an epitome as this complete report, for each of the reports contains carefully condensed information, and views deserving of the most serious attention. I can, therefore, only call attention to the salient points on which information was requested, and to the suggestions as to a course to be pursued which are contained in these reports, with a view to assisting us in our deliberations respecting our future course of action.

1. The age at which architectural pupils usually leave school?—In London, seventeen; Birmingham and Liverpool, fifteen or sixteen; Glasgow, fourteen to sixteen; Manchester, fifteen.
2. The usual term of articles?—London and Manchester, three to five years; Birmingham and Liverpool, five; Glasgow, four or five.
3. What proportion of those who enter the architectural profession are articled to an architect?—London, 75 per cent.; Birmingham, all architects proper; Glasgow, no articles, but a course of service partly remunerated; Liverpool, one-third of practicing architects, but all the present rising generation of architects.
4. What proportion of those who enter an architect's office have passed through a school of art?—London, 5 per cent. have passed through a school of art; Glasgow, 80 per cent. attend a school of design; Liverpool, perhaps one-half, including those attending a school of design.
5. The steps usually taken during the term of articles for the improvement of the pupil?—In London seldom more than office routine and the suggested attendance on architectural societies and classes; in Birmingham, beyond office routine, perhaps left pretty much to themselves; Liverpool, very little; Manchester, insignificant, with a few honourable exceptions.
6. What facilities exist in your district for improvement to the pupils?—What schools of art, public or private? What lectures, casual or regular?—In London, very numerous lectures and classes at several institutions; Birmingham, the Government School of Art; Glasgow, the school of art and a public library; Liverpool, lectures and classes at two institutions, the Government School of Art, library and papers; Manchester, School of Art and Mechanics' Institute.
7. What means your society takes for the improvement of those who have not yet passed through their pupillage?—London, papers and classes, and prizes; Birmingham, none; Glasgow, free use of rooms and library; Liverpool, papers and prizes; Manchester, papers and classes.
8. To what extent is the practice of study and sketching from existing buildings carried, and how far is it encouraged by the principals?—London, encouragement of

the practice is neglected, and few facilities given; Birmingham, it is not done so much as it ought; in Manchester there is a sketching class.

9. How far could the existing facilities for instruction be modified or added to to increase the extent of architectural education? The gist of this question is: what, in the opinion of the societies, is to be done?

The London Architectural Association says, and in this all the other societies agree, students use only to a small extent the facilities afforded to them.

The London Architectural Association also says that this is caused by the want of a recognised system, and suggests that time should be taken from the masters in the daytime for attendance on lectures, &c., by the students.

They urge examination as the proper ultimate admission to practice, voluntary for the present, compulsory for the future.

The Birmingham Society have to suggest increased library and museum accommodation.

The Glasgow Society say that action for the pupil has proved itself useless, and that the necessary examination before entering their architectural institute is expected to produce more activity from pupils than kind advice can do.

The Liverpool Society urge increased library accommodation, and that architects should pay more attention to their pupils, but that a compulsory examination would afford the strongest inducement to architectural education.

The report of the London Architectural Association is supplemented by this resolution:—And this Association, feeling strongly the desirability of obtaining a system of compulsory education and examination, in order that the profession of architecture may be established on a similar footing to other professions, would appeal to the societies throughout the country, through the delegates to the Alliance, to join with the Association in petitioning the Institute to take such steps as they may deem necessary to enforce a proper system of architectural education and examination, with the ultimate view of petitioning Parliament to make such examinations compulsory.

We have then before us the following considerations:—The importance of enlisting the architect's aid in the advance of the pupils' education.

The desirability of increasing in each town facility for self-help.

The necessity of a system pressed upon the pupils for self-education.

The absurdity of a profession like that of architecture being without systematic examination for entrance, and the course to be pursued to render such examination locally necessary before an architect can practice.

I have to suggest then, that whatever course of action is taken by the Alliance, should be systematically directed to the above objects *seriatim*.

The following resolution was passed:—

"That, in order that the profession of architecture may be established on a similar footing to other professions, the societies throughout the country be invited, through the Alliance, to join with the Association in requesting the Institute to initiate such steps as they may deem necessary to enforce a proper system of architectural education and examination, with the ultimate view of petitioning Parliament to give a legal recognition to such examination."

Further, it was resolved that the report should be printed and distributed to the allied societies, "so as to obtain their views as to the necessary steps for obtaining the objects required."

Previously, the meeting discussed "the propriety of making the bills of quantities a part of the contract;" and ultimately appointed "their office-bearers as a committee to hear the representations of the General Builders' Association, and, in conjunction with any other bodies who may be interested, to endeavour to come to some agreement on the subjects submitted for consideration, and to report to the Alliance at its next meeting, or to the constituent societies at an earlier period."

THE TRADES MOVEMENT.

Liverpool.—The differences between the Liverpool builders and the operative masons concerning the introduction of the system of payment by the hour insisted upon by the former, has ended in the retirement of between 400 and 500 operative masons from their work. They refuse on various grounds to accept the plan of payment by the hour, and also object to a proposal of the masters for arbitration in all disputes, at least so far as to meet it with the proposal of a court of conciliation, composed half of masters and half of men. There are some 200 non-unionist masons still at work, and the masters will of course attempt to increase the number. A similar dispute in Manchester was, it will be remembered, settled in the space of a few hours by arbitration. There is every appearance here, it is said, however, of a continued strike here. Both masters and operatives have issued circulars stating the terms upon which they will resume work, and these differ materially. Building operations have come to a standstill at some of the principal works in the district, including the church that is being built at Belmont-road, the new church at Kirby, the Lime-street railway station, the Exchange buildings, and the new offices in Prince's-street. A number of the non-unionists are employed in the construction of the new foundry, near the Great Float, Birkenhead, and at the works at the Sefton and Stanley Parks. The following

figures have been published by the secretary of the trade society:—List of the towns still on strike, with the number of masons out thereat:—Birmingham, 30; Cheltenham, 3; Liverpool, 18; Manchester, Hulme, and Salford, 294; Oxford, 2; Sunderland, 8; total, 355. The following are the numbers said to be locked out:—Bolton, 18; Coventry, 6; Liverpool, 334; Leeds, 105; Lynn, 4; Old Swan, 12; Wakefield, 9; Wolverhampton, 10; total, 525. The committee of the Liverpool society, in a letter to a contemporary, remarks on the 8th and last rule, viz., arbitration:—

"That this rule has neither been pressed nor opposed by either party, and it may be as well that attention should be drawn to it at once, as the primary and greatest point at issue, seeing that the acceptance of this rule by the operatives would be equal to discovering them from the only mode of protection to which they belong—viz., the union, there being no necessity for self-protection if the decision of all disputes is to be left to the arbitration of a disinterested person. They feel that they must still resort to strikes to obtain equitable terms."

Sheffield.—The dispute between the Master Joiners' Association and that of the operatives as to the adoption of the hour system, which has now extended over a month, remains unsettled. Each side appears determined not to give way, the one endeavouring to obtain men from a distance, and the other to induce them not to accept employment in Sheffield under the hour system. We are informed that there are now between fifty and sixty men on strike.

Manchester.—It is stated, on the authority of the master masons, that they have now 130 men at work, and that without any effort on the part of the masters the non-unionists are "coming in" at the rate of ten every day. The employers have resolved to take active measures with a view of securing the services of men not connected with the union. The strike promises, it is said, to become general in the building trades. The bricklayers' labourers a short time ago received notice of some sweeping changes in the existing regulations which have hitherto ruled their relations with the masters, and they resolved to resist the adoption of the masters' proposals. A special general meeting of operative bricklayers was held to receive a communication from the Master Bricklayers' Association with reference to the matters in dispute. The chief complaint of the men was that the masters wished "to thrust payment by the hour down their throats," the mode of payment in favour of them being by the day. It was moved that they should adhere to the practice of payment by the day, and an amendment to accept the proposition of the masters was received with cries of "Turn him out," and great uproar. The motion was carried by a large majority. In consequence of the opposition of the men to the hour system, the strike and lock-out have since commenced.

Leeds.—A meeting of the operative joiners and carpenters has been held for the purpose of discussing what they declared to be a "flagrant violation" of the decision given by Mr. Rupert Kettle, in the arbitration of the dispute with their employers last year. That decision was to the effect that men of fair average skill should be paid 6½d. per hour, and that this rate should be in force for two years. The men say that out of 600 or 700 joiners in the town, there are only about seventy receiving 6½d., and they therefore contend that the agreement has not been carried out. A resolution was passed by the meeting, deputed the chairman to request Mr. Jovitt, the umpire appointed at the arbitration, to call together the Board of Conciliation, and instructing the representatives of the joiners to demand a fulfilment of the agreement on the part of the employers, or the dissolution of the Board of Arbitration.

Wigan.—A conference was held at Wigan between the representatives of the master builders and the operative joiners, relative to some points in dispute, Mr. John Cross, alderman, attending as arbitrator at the request of both sides. The main point had reference to the demand of the men for an advance of wages. That fifty-five hours shall constitute the week's work was agreed upon. The masters were prepared to pay 6½d. per hour, which amounts to 11. 8s. 7½d. a week; while the men asked 6½d. per hour, which is equal to an advance of 2s. a week. At the conference, Mr. James Scott, in behalf of the men, cited the cases of Bolton, 55 hours, and wages 11. 10s.; St. Helen's, 55 and 11. 10s.; Oldham, 52 and 11. 9s.; Rochdale, 54½ and 11. 10s.; Southport, 55 and 11. 11s.; Manchester, 54½ and 11. 12s.; Leeds, 55 and 11. 10s. 4d.; and Warrington, 55½ and 11. 10s.; and he did

so to show that the wages paid in Wigan were lower than in any of those towns. He also dwelt upon the comparative dearth of provisions and the high rents in Wigan. Mr. Wilson, on behalf of the employers, referred to the depressed state of trade, and said that, unlike most of the towns named by Mr. Scott, Wigan had more regular and more constant work for builders. This dispute has been settled, the result being that, on the award of Mr. Cross, the joiners are allowed an advance of wages equal to 1s. 9½d. per week, while their rule as to the limitation of the number of apprentices is abolished.

EXHIBITIONS.

Worcester and the Workmen's International Exhibition.—Meetings of the Worcester manufacturers and employers of labour have been held to consider the desirability of holding a local working men's exhibition, from which specimens could be selected for exhibition in the Workmen's International Exhibition, proposed to be held in London in 1870. It was resolved that the working men of the various trades in the city be invited to a public meeting for the purpose of considering the desirability of taking part in the Workmen's International Exhibition, and that circulars containing the requisite information should be posted in the various establishments of the city for the information of the working men.

York.—A scheme for holding an Art Exhibition and Fancy Fair on behalf of the funds of the York Institute, has been set agoing. It will take place in November. A guarantee fund has been commenced.

The Great Industrial Exhibition at Altona.—We understand that Mr. J. H. Sillcoe, of the Trinity Works, Salford, has been appointed agent for Great Britain for the Schleswig-Holstein Industrial Exhibition, to be opened at Altona on the 27th of August.

PICTURES.

The Seven Churches of Asia.—Some time ago we mentioned a series of photographs of the seven churches of Asia,—Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea,—taken by M. Svoboda during travels in Asia. The same artist is now exhibiting in the German Gallery, Bond-street, a number of large oil paintings made by himself of the same remarkable places. Without offering great claims as works of art, they are cleverly executed, and are evidently strictly truthful. The views of Pergamos and Laodicea are more particularly satisfactory. This exhibition ought to be interesting to a large number of persons.

The late Robert Martineau.—An interesting collection of works by the late R. B. Martineau, the painter of "The Last Day in the Old Home," is now on view at the Cosmopolitan Club, 30, Charles-street, Berkeley-square. The sketches and studies made for a still unfinished picture, "Christians and Christians," show the careful way in which he proceeded to build up a picture. "**Brighton in 1869.**"—Mr. James Webb has painted a very charming picture of Brighton, as seen from the new pier, a part of which, filled with gaily-dressed visitors, forms the foreground. The view embraced extends from "the Bedford," on the left, to the chain pier on the right, and the characteristics of the town are well preserved. The water and the sky are admirably painted, and constitute the chief charm of the painting. A fine engraving of this picture of our City by the Sea can scarcely fail to have a wide circulation. It is on view in the St. James's Gallery.

COMPETITIONS.

City of Carlisle.—The premium of 20l. offered by the corporation of Carlisle for designs for elevations of houses proposed to be erected in Portland-square; Alfred-street, in that city, has been awarded to the design bearing the motto, "Design with beauty, build with truth." The design is by Mr. F. W. Hagen, of Hull. There were sixteen competitors.

Intended New Town-hall at Bradford.—A short time ago the Bradford Town Council adopted a site of 2,000 yards of ground (acquired in dealing with street improvements) in New Market-street, as a very central point for the purpose of a town-hall. The council has just now issued printed instructions to architects as to the character of the building required on the site,

and giving a schedule of particulars as to the extent of accommodation to be provided for the several departments of the corporation. The cost of the building is not to exceed 40,000l. The architect whose design is selected as the best will be entrusted with the execution of the work, receiving in payment a commission of 5 per cent. on the actual outlay. The architect whose design is the second best will be paid 200l., and the architect whose design is third best will be paid 100l. The designs are to be delivered to the corporation not later than the 1st of September next.

THE VIENNA OPERA HOUSE.

The New Opera-House in Vienna, which has been in course of construction for seven or eight years (it was half-way up when we saw it in 1862), has at last been opened. The *Times* correspondent gives an interesting account of its part of which we condense. The outside of the theatre built of a yellowish sandstone, is of that fanciful nondescript style which has its home in Imperial Paris. A product of study rather than of inspiration, it helps itself liberally wherever it can find something to suit its wants, regardless of any little incongruity which might arise from a mixture of Italian renaissance, Norman scroll-work, slender Saracenic columns, bastard rose windows, and a high French chateau-like roofing. Still the general effect is not displeasing, because the general proportions are fair enough, and the great difficulty of harmonizing the necessary height of the central part, the house proper, with the four wings which enclose it has been more successfully overcome than in the new Grand Opera-house in Paris.

The entrance-hall, and the grand staircase, which stands in another lofty hall reaching up to the third tier of boxes, are perhaps the most successful part in the building, and undoubtedly the finest thing of the kind in existence. The idea seems taken from San Carlo at Naples, but the original has been far surpassed in every respect. The walls are covered with gray marble-like stucco, and the ceilings are painted everywhere with frescoes, rather pale, but perhaps just on that account more in harmony with the general soberness of ornamentation, in white and gold. From the gallery which runs round the hall on the first floor a pretty *foyer* occupies the side towards the street, and opens out on a wide balcony supported by columns.

After the lofty hall the passages seem very low, which is owing to there being four tiers of boxes; for the same reason the boxes themselves are very low, although wide enough to contain three persons in a row. As in the late Opera House in the Haymarket, people in the boxes look as if they were pictures in a frame. The monotony of so many small boxes running side by side is relieved by the large Imperial State box in the centre of the house, which ramps up to the fourth floor, and the large Imperial boxes in the proscenium, which architecturally are perhaps the most successful feature of the inside of the house, the lowest being on the same level as the ground-floor tier, the middle one extending over two tiers, and the upper one being on a level with the boxes on the fourth tier. The lines which connect the horseshoe-shaped house with the stage are anything but graceful, and present moreover the incongruity of pointed arches, which clash with the rest.

As for the ornamentation, it is exquisite down to its minutest details. Especially the balustrades of the boxes, painted a pale drab and relieved by gold ornaments, are charming. All the draperies and curtains are in dark crimson, which harmonizes admirably with the general tone of colour. All round the grand tier, which, however, is of the same size as the others, medallions of renowned singers are placed as part of the ornamentation. All along the ceiling every large surface is painted with allegorical pictures, while over the stage are medallions with *Venus* and *Amourettes* in white stucco relief.

The Ladies' Sanitary Association.—The annual meeting is fixed to take place at 44, Berkeley-square, on Tuesday, the 8th inst. Lord Shaftesbury will preside, and several gentlemen well known in connexion with sanitary matters will take part in the proceedings.

ON ART AS APPLIED TO MANUFACTURES.

I HAVE BEEN asked to address to you a few words about Art; and I have great pleasure in complying, being sure that the subject interests greatly all those who are here met together.

What is art? It is the representation of the beautiful; the holding the mirror up to nature, impressing its loveliness, adopting its forms, borrowing its colouring.

How beneficent are its influences, how humanizing, how pleasurable, how valuable! It is a mine of intellectual wealth to those who study it, and a most important source of material wealth to the country where it flourishes. By art the sculptor chisels from the block of marble a form thrilling the heart with admiration of its beauty. By art the painter records the noblest acts of our country's history, or inspires the keenest sympathy by his able portrayal of a domestic story. By art things the most ordinary are made objects of admiration and of real value; and it is this application of art to common things which is of such importance to the manufactures of a country, and it is upon this branch of art that I propose to speak to you to-night. The practice of art, to be of real value, should ever be regulated by sound taste. The great French minister, Colbert, has said that "*Le goût est le plus adroit de tous les commerces*,"—a good truth which may thus be rendered,—"Taste is the most subtle and powerful of all the elements of commerce." But what is taste?—a question difficult to explain. It is a word that has many meanings; most people pretend to have taste; none like to think they have had taste. I often hear the expression "That is my taste;" and how tastes differ,—

"Talk what you will of taste, my friend, you'll find Two of a face, as soon as of a mind."

So says Pope. A countryman has a taste for fat dumplings, and some ladies have a taste for chignons. The word "taste" is often, I think, misapplied, and the word "liking" might generally be substituted for it.

Taste, applied to art, I should express as a keen perception of the beautiful, regulated by experience and careful cultivation. Art, guided by taste, is never more satisfactorily employed than in adorning objects of utility, for utility and beauty should always be associated. I say art guided by taste, and not, as it often is, sadly misapplied. There is a hook by a very able man, an honour to his country, Mr. Owen Jones, called "The Grammar of Ornament;" the book is, I hope, familiar to all of you,—it contains a multitude of examples of every period of art, all well classified, from Nineveh downwards: this is a valuable boon to all thoughtful art-workers, but it is distressing often to see how these examples are misapplied by ignorant designers, and ornaments of various periods and diverse styles commingled together. By true art, then, things the most ordinary are not only made objects of real beauty, but become specimens of real value.

The magnificent collection of terra-cotta vases in the British Museum shows how the art-workers of Etruria gave beauty to the most refined character to his vase of burnt clay. In those vases are combined purity of form, elegance of ornamentation, and exquisite design and finish in the outlined figures: that is more than can be said of the costly productions of the Imperial Porcelain Manufactory of Sèvres, at the present day.

Side by side, however, with those Etruscan vases may be placed the productions of our noble-hearted countryman Wedgwood, aided by the genius of our English Flaxman; glorious examples of what the unaided energies of one man can accomplish, when warmed by the true spirit of devotion to his art. Think of old Bernard Palissy too; think of his struggles through poverty, almost through starvation, to the realisation of his discovery. He made nature serve him for models of his work. He modelled in clay snakes, lizards, fishes, frogs, insects, all like life itself, enamelled in their natural colours by the process invented by this admirable enthusiast. Nor must I forget the lovely terra-cotta work of Luca della Robbia, whose productions, as far as I am aware, are not known in any other material. At the South Kensington Museum are valuable specimens of his work in bas-reliefs, of Madonnas, children, figures, &c., teeming with gentle beauty and natural sweetness.

I think that in our modern productions of earthenware and porcelain, we are not sufficiently

careful in the arrangement of the design: greater simplicity and greater purity are to be desired, especially in the ornamentation of common objects; for if the designs on these are in simple good taste, it would be an effective mode of diffusing the feeling for art among many. I allow that progress has been made within the last twenty years, but there is a dreadful mistaken opinion in the minds of many manufacturers, that in making for the million they must employ vulgar, shabby patterns, as suits the prevailing taste. In this I think they are entirely in error. They have no occasion to descend into dull colouring and meagre ornament; that does not constitute purity or beauty: a design may be simple, of good drawing, in fresh and harmonious colours, and cost no more than dull or gaudy patterns.

The firms of Messrs. Minton and Messrs. Copeland have worthily supported the character of this country for excellence in porcelain and earthenware, both for ornamental objects and for common things in daily use.

In the manufacture of metal-work immense progress has been made of late years, and instead of heavy, clumsy works cast in moulds of outrageously incongruous design, beaten work is often substituted, and thus the skill of the clever artificer can be impressed on the object. In metal-work of Medieval design our art-workmen of the present day are pre-eminent, in my opinion. I saw none superior to it at Paris in 1867. In mechanical work also, such as in steam-engines and locomotives, the harmony and general outline of the parts, as well as the finish of the work, are the best in the world. But in bronze cast-work, and in the art-quality of general objects, our art-workmen are far inferior to the French; in fact, English bronze-workers are few in number. In the British Museum will be found many specimens of bronze working, which should be carefully studied by English artisans, and at the Museum in Naples is an immense collection of bronze implements of all kinds found in profusion in the ruins of Pompeii; that City of the Dead which has reproduced to us the homes, the works of art, the objects of every-day life of a people existing 1,800 years ago. There you may see the forum, the theatre, the great amphitheatre, the soldiers' barracks, the houses of the patricians, the houses of humble shopkeepers—all roofless indeed, but the walls still glowing with their beautiful colouring, the elegant tessellated pavements fresh as last trodden by the owner, the garden enclosure painted in perspective, the fountains, the grottoes, the tracks of the chariot-wheels indented on the paved streets; all the details of domestic life, and the end of all things, their tombs. The excavations still proceed; they are not difficult, for the filling-in is partly of mud, partly small pieces, which is easily shovelled out, and in almost every house are found objects most interesting and instructive to the tasteful student.

All this great mass of discovered objects is collected in the great museum at Naples, the most interesting for this class of work in the world. There are arranged, properly classified, all the various objects of domestic use. I do not speak now of the specimens of high art, which are magnificent; there are the various culinary utensils, lamps, tripods, stately, surgical instruments, jewelry, toilet requisites, even to the rouge in the pot, for the fine Roman lady of her day;—everything, even of the commonest kind, stamped with a touch of elegance and tasteful thought. It seems as if the metal-worker in those days was not content in fashioning a simple stewing-pan, unless he gave it a touch of art, either in the form of the handle, or by an engraved outline pattern of tasteful ornament,—all simple and quiet, however; nothing overloaded or disproportioned. Their goldsmith's work, too, was most elegant, showing great skill as well as refinement of taste in those art-workmen of Pompeii.

Descending to our own times, most of you must have noticed in the Exhibition of 1862, in the Indian collection, metal bottles of elegant form, and inlaid with silver in ornamental patterns of great beauty; and in Paris, in 1867, I remarked some exquisite specimens of metal-work, of chased work, bordered in parts with inlaid silver ornament, made by an Italian artist for Mr. Layard.

I must not let my fancy, however, wander from my subject in descriptions of fine art, but confine myself to urging on the workmen of common things to study art, so as to throw into objects of ordinary use a pleasing form and a

touch of beauty; above all, avoid the evil, too common in our day, of overloading a work with inappropriate and redundant ornament. That is nauseous.

Let me next say a few words on textile or woven fabrics. These are of various tissues, and made for various purposes, but all are influenced more or less by this leading principle—that the fabric itself should, as far as possible, be the fundamental element of the design. In grass matting, for instance, the nature of the material and the kind of work oblige a certain simplicity of lines or of geometrical angular pattern. In the ancient tombs of Egypt figures are shown mat-making, exactly in the same way as I have seen them worked at Cadix and Seville at the present day. In the various kinds of carpets it is especially desirable that the design should be adapted to the nature of the material and its uses. In all it is essential that the design should be flat, and none of the objects represented with cast shadows. To walk upon ornaments in relief is as perplexing and disagreeable to the eye as it is objectionable in taste. The colouring of the carpets should not blaze away in bright contrasts of all the colours; a certain sobriety and harmony is particularly desirable in a floor-covering on which furniture is to be placed, and in a room on the walls of which are probably works of art. Not that I object to bright colours in carpets, for if they are properly brought together, a very quiet harmony may be produced. Take, for instance, the Persian carpets, which are always cheerful and bright, and never gaudy; the so-called Masulipatan carpets, made in India, are also excellent examples of most harmonious colouring, elegant and appropriate design, and good fabric. These are worthy of very particular study to the artist designer; he will find in them symmetrical arrangement and pleasing forms exactly adapted to the nature of the fabric. I think the designs for carpets are much improved of late in this country. I have a vivid remembrance of the chamber of horrors at Marlborough House about twenty years ago, and I think the errors of those days are better understood now; but still the manufacturers cling too much to the notion that in making for the million the products must be vulgar and gaudy. I think they are wrong, and that the million have better taste than they give them credit for.

The manufacture of lace by machinery has opened a wide field for a beautiful fabric, especially as applied to window-curtains; it is a very important manufacture, nevertheless it is exceedingly difficult to obtain appropriate and good designs in it. Plumes of feathers, large spreading ferns, or gigantic flowers are pressed by manufacturers to suit popular taste; they seem to ignore altogether beautiful existing patterns of guipure, or point, or other styles of lace, which have, however, been well imitated of late by some French manufacturers. I should weary you were I to go too distinctly into the various branches of woven fabrics; in all of them this principle should be observed, "That the design should be appropriate to the material."

I will now allude to cabinet furniture; it is a most important manufacture, in the superior branches of which art is a most material aid. I think the fundamental principle should be "truth in construction;" that this construction should be as simple as possible, and be evident,—afterwards ornament if you please, but let the ornament be appropriate in style and not redundant, let the carving be from the surface as far as possible, and avoid *appliqué* or stuck-on ornament. In the cheap, commonly-made furniture of the present day, the proportions are often faulty, the mouldings too strong, and, above all, they are overlaid with coarse, ill-executed carving, a hodge-podge of a bit of scroll, a bit of shell, and a bit of foliage, all grossly abused. But in most of the better class manufactories of cabinet furniture, I think, the taste is very good, fully equal to that of the French in the more ordinary objects; and by no means open to the sententious criticisms of some modern authors, who, to corroborate their peculiar arguments, appear to have studiously avoided the more respectable houses, and taken their standard of the prevailing taste from the cheaply-made rubbish to which I have alluded; then they exercise their taste, and compare it, as the best existing furniture, with their own designs, which they have the modesty to describe as quite the proper thing.

However, I will say no more on this subject, but return to the principles which should guide us in carrying out good cabinet work. We know

that good work must be costly, because it takes more time and care than common work: the great aim, then, should be to obtain a good effect at as reasonable a price as possible, by adopting good form in the readiest way, and giving just sufficient ornament to have a pleasing effect, and no more. I think we have not hitherto paid all the attention it deserves to the Etruscan style of ornament for general purposes. It is a style which associates well with simple forms, and may be carried out with sufficient plainness not to be expensive; but the more simple the outline the more perfect must be the drawing; every contour must be well proportioned and graceful, and the workman who executes the work must have a feeling for it. The features of each particular style should be carefully attended to, not only in the general design, but in the details, especially in the mouldings, both carved and plain. A careful study of early Italian work will show that the mouldings are very delicately wrought, and great beauty and finish may be given by attending to this. In the form of chairs the outlines should be simple and adapted to the curves necessary to give comfort; much carving is not desirable, and it should never project beyond the surface.

There is probably no manufacture which may be made more easily available for diffusing taste among the people, than paper-hangings. They are now so cheap that the home of the mechanic can be made to look tasteful and cleanly at small expense. About five-and-twenty years ago there was no manufacture in which good taste was so outraged, but the style has gradually much improved, and now neat, pretty papers can be had for one penny per yard. In paper-hanging great effect may be given by good borders of correct, quiet design and harmonious colour. There is a deficiency in borders of this class.

I have thus rapidly brought before your notice some of the manufactures which are directly influenced by the application of art, and have, I hope, shown how important it is that this great aid to manufacture be properly understood by the designer who composes each work. But the greatest assistance is given to this art-designer when his work is carried out by intelligent and capable workmen, who can appreciate the art-work, have taste for it, and above all if they can draw themselves. Therefore I say to every man around me, learn to draw. Every man can draw: how he will draw must depend upon the thought and labour he bestows upon it. Examples for his study are not difficult to find: the common thistle, the wild flowers, the foliage of trees, the hop with its elegant and drooping foliage clustering around the pole; Nature, in all its forms and colourings, afford a never-ending series of studies: once the first difficulties conquered, it is a most pleasing as well as profitable employment; and, as I have already said, a workman who can draw understands art-work with better feeling. It is by such aid that the natural taste and talent of a man are developed; from the simple workman he may rise to be the art-worker of fine things himself—of those productions that live from age to age, and are valued and loved by those who possess them; for, in the words of a true poet,—

"A thing of beauty is a joy for ever;
Its loveliness increases; it will never
Pass into nothingness."

JOHN G. CRACE.*

STEEL BRIDGES FOR STREET CROSSINGS.

IN 1863 plans were submitted to the Commissioners of Sewers of the City of London, by Mr. Williams, for bridges over, and by Mr. Newton for subways beneath, the crossings of the main thoroughfares of the City, for the accommodation of foot passengers. Similar projects have been frequently under discussion in the Court of Common Council, and elsewhere, before and since that time, but no fair trial has ever been given to either one or other of these descriptions of crossing. The alarming number, and constant increase in the number, of fatal and serious accidents from contact with vehicles in the streets, has never allowed the important problem to slumber of the best means of abating the perils of the streets to foot passengers. For years past the number of persons killed by

horses or vehicles in the streets of London has been more than ten for one of all the passengers by railway killed while travelling, or at stations, by accidents beyond their own control, upon all the railways in the United Kingdom. Of late the weekly returns of the Registrar-General have repeatedly shown that six, seven, and eight persons, or about one daily, have been killed in the streets of London by being, to quote a weekly return for the current month, "run over by a wagon," "run over by a water-cart," "run over by a Hansom cab," "run over by a horse and cart," "run over by an omnibus," &c.

The urgent necessity, becoming daily more urgent, of providing, at any cost of money to the public, and of time to foot passengers, means by which it will be, to say the least, possible for aged, infirm, and timid persons, to cross crowded thoroughfares with absolute immunity from the danger of being knocked down, trampled upon, run over, and killed, from contact with horses and vehicles in the carriage-way, has forced this subject once more upon the attention of the Court of Common Council, and the designs of Mr. T. P. Ivison, C.E., for steel bridges for street crossings, are now before the police committee of the court, by whom Mr. Ivison has been instructed to prepare a model for a crossing for the intersection of Ludgate-hill and Fleet-street with Bridge-street, Blackfriars, and Farringdon-street; the model to be accompanied by an estimate of the cost of the proposed bridge. The model is in course of preparation, and will be ready for exhibition in a few days. In the form of the model the completion of the intended crescent at the intersection referred to will be anticipated, and the contemplated altered disposition of the foot-paths, rather than their present form, will be provided for. The bridge proper will be near, and run in the direction of, the centre line of Bridge-street and Farringdon-street. There will be eight stairs, one from each *traverse*, which will curve inwards in the direction of the centre line of Fleet-street and Ludgate-hill, to each of which the side view will be presented. All passengers between Farringdon-street and Bridge-street, and from one side of Fleet-street and Ludgate-hill to the other side of the same line of thoroughfare, will require to pass the centre of the bridge, but passengers desiring to keep to the same side of that line will not require to do so. The curves of the stairs will be so arranged as to afford a cover that will make the use of them unobjectionable to ladies.

Mr. Ivison's design, which is applicable to the intersections of the widest thoroughfares in London, admits of various modifications in form and construction. In its principal features, the structure may be described in general terms as consisting of arched trough girders of wrought iron or steel, crossing the streets diagonally, and which are joined in the centre, and at the ends abut upon the stairs, which rise from the outer edge of the footway and, in part, over the gutter, which is covered in front of the stair, and is carried under it. The stairs are of easy ascent, and rise 11 ft., with one intermediate landing. The remainder of the ascent is by steps and inclines to the centre, where the bridge will be 18 ft. clear above the carriage-way. The merits and advantages claimed as embodied in the design are, compactness, convenience, and strength, and also elegance in appearance. Eminent professional men, who have examined the design, have readily admitted its claim to the possession of these advantages.

The principal objection to the proposed street crossings, and it is a serious one if well founded, is that the people would not use them, and could not be compelled to do so. The last part of the statement is indisputable, but it may be worth while to try whether the first is true. Passengers are not compelled to use the foot pavement, but, finding it to their comfort and safety, they do use it wherever it is possible; and no one who has noticed the anxious groups waiting at the corners of intersecting thoroughfares, until the time comes for them to make the plunges, and attempt the perilous exploit of rushing from the one foot-walk to the refuge, and from the refuge to the opposite pavement, can reasonably doubt that many of them would gladly undergo, for safety and comfort's sake, a degree of bodily toil little greater than the ascent and descent between the ground and first floors of an ordinary dwelling-house.

The idea of this crossing thoroughfares on foot is only simple, but a skilful embodiment of the idea in an actual structure is surely worth the experiment. In proportion to the extent to

which such crossings might be used important advantages would be secured. The present level crossings would be left undisturbed; the refuges, useful to a certain extent, but obstructions at those precise points where the carriage-way should be widest, might possibly be dispensed with; the carriage-ways would be further relieved by the diminution in the number of foot-passengers; fewer policemen would suffice to regulate the traffic; such means of passage would save the old, infirm, timid, and feeble from danger and apprehension; would save precious time wasted in waiting during the busiest hours of the day; would make city life easier and less harassing, by giving increased protection and facility of action.

NEW BANK, BURY, LANCASHIRE.

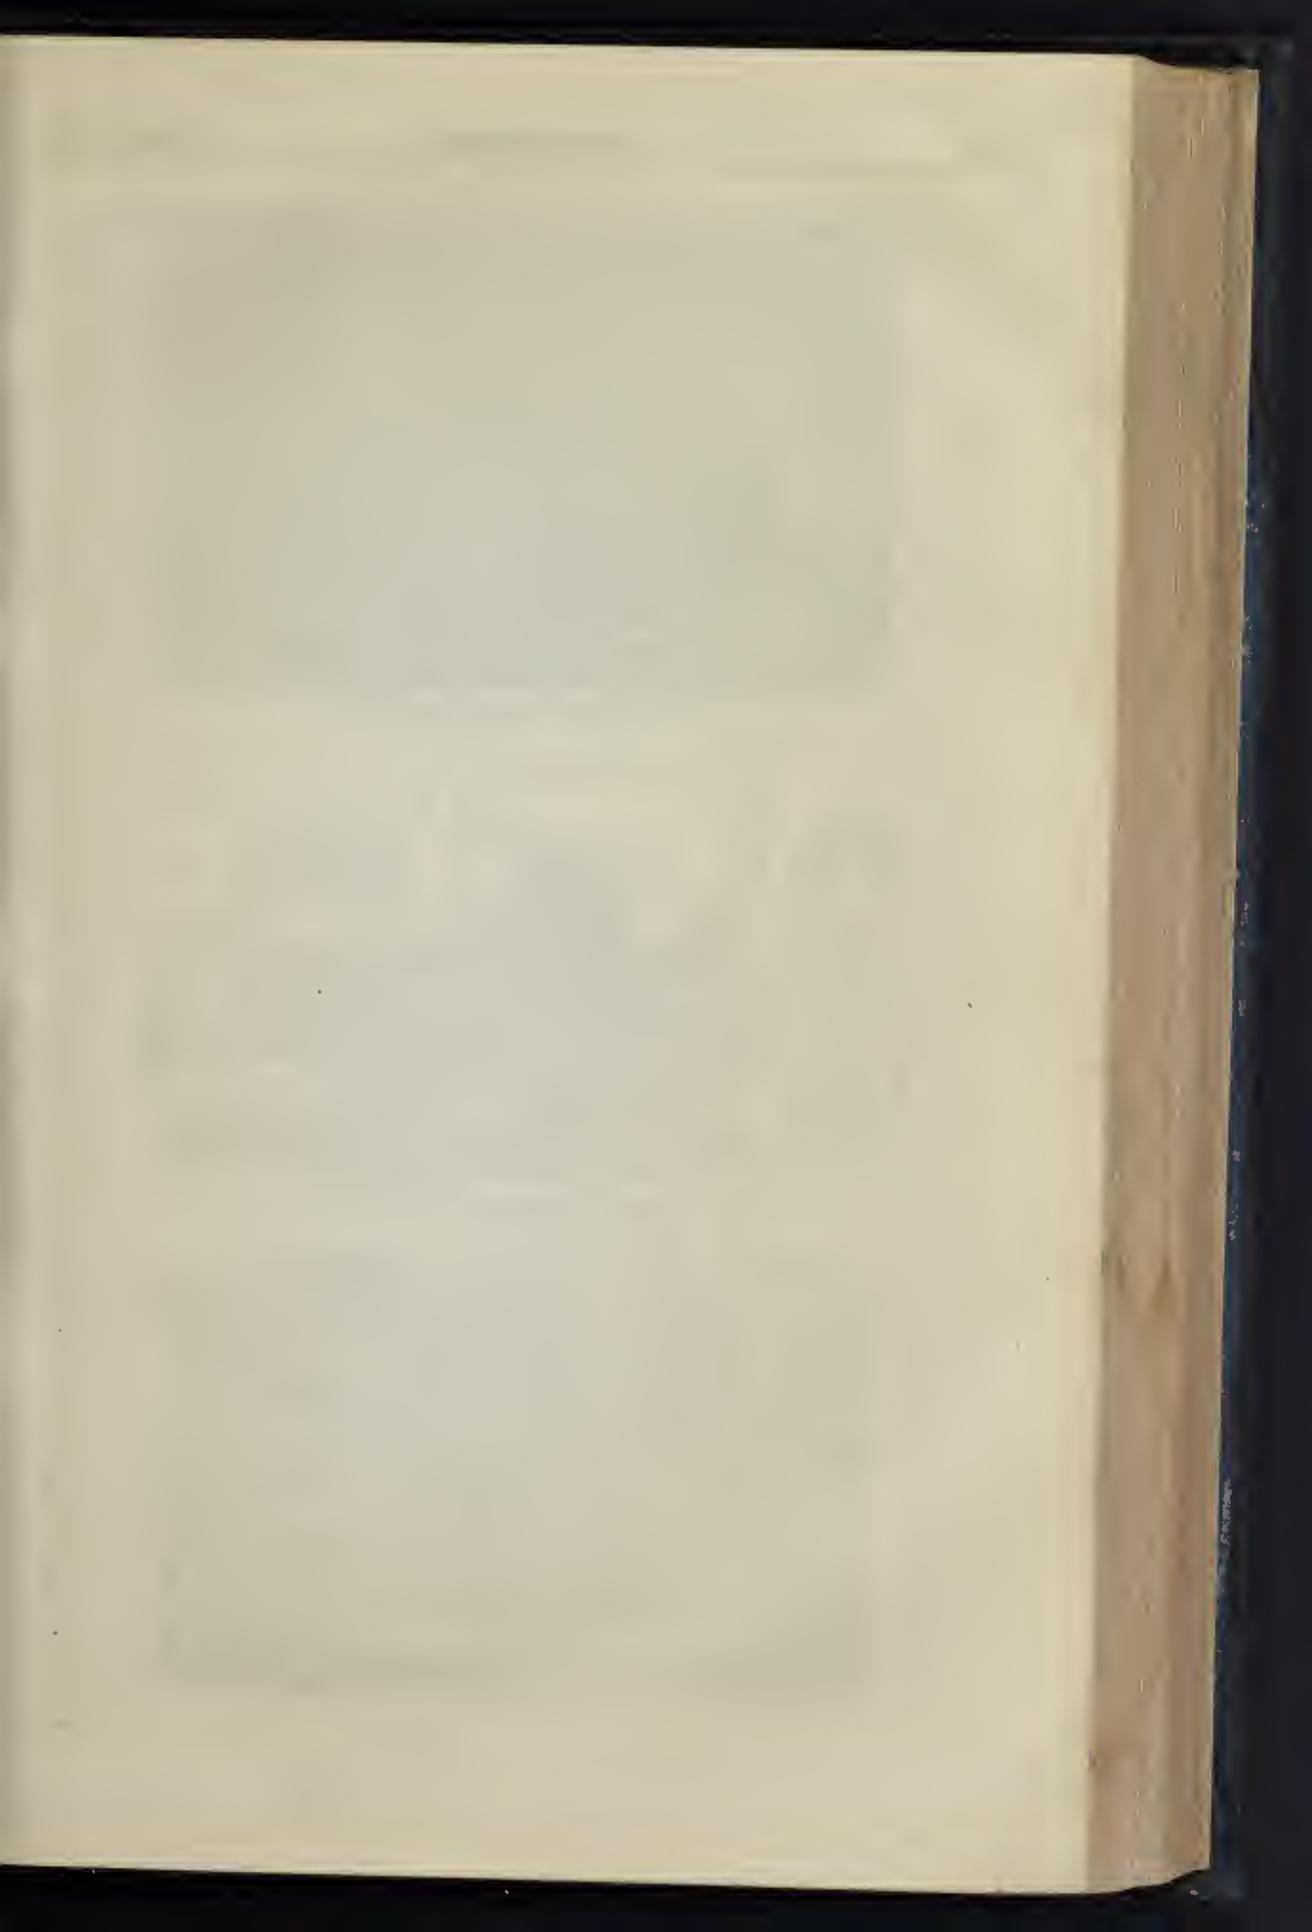

The Bury Banking Company was established in 1836, and some years ago erected banking premises in Silver-street, where its business was conducted until recently, when increased accommodation became necessary and the old buildings were pulled down, and the new buildings, which form the subject of our present illustration, were erected on the same site, and were opened for business in the autumn of 1863.

They provide the following accommodation for the company's own business operations:—Banking-room, 46 ft. by 28 ft.; manager's room, 24 ft. by 22 ft.; entrance-hall, waiting-room, clerks' room, and residence for bank porter; three strong rooms in addition to the one containing the bullion-safe, which latter is worked on the hydraulic principle. The whole of the first floor and a portion of the ground-floor are appropriated to offices (the entrance to which is in Bank-street), and these offices are let in suites to tenants as required. All the floors are of fire-proof construction on Phillips's principle. That over the banking-room may be taken as an example, and consists of three rolled iron girders, with laminated flanges supporting rolled iron joists 2, on which are laid small iron bars 1 for the support of concrete 4 in. thick. The concrete forms an excellent ground for the plaster ceiling, without any intermediate battens or laths.

The banking-room is 21 ft. in height, and has a ceiling divided into four compartments, in each of which are circular and other panels, and also three centre flowers. There are double windows to the rooms on the ground-floor: those to the outside are of iron, and those to the inside of oak, and they are all enclosed with Clark & Co's patent steel shutters. The wainscoting, doors, and all other woodwork of the principal rooms, and also all the bank counters, desks, and screens, are of Dantzic oak, with pillars, mouldings, &c., of ebouisé oak. Haden's warm-air principle has been adopted for the warming of the banking-room, safes, &c., and ventilation has been secured by lateral flues formed in the curved ceilings communicating with two vertical shafts carried up above the balustrade, and having each a small gas-stove therein for occasional use. All the safes and the fire-proof and burglar-proof doors have been manufactured by Chatwood's Patent Lock and Safe Company. The first story of the building is faced with Fletcher Bank stone (millstone grit), and has a string-course of hacked grey granite at the level of the window-sills; and the upper story is faced with Darley Dale stone, and has polished red granite plasters over the principal entrance. The arms of the several directors are carved in the capitals of the angle pilasters, and the pediment over the principal entrance is filled with a sculptured group of figures, typifying the various operations in banking. The iron gates and all the gasfittings were specially manufactured by Messrs. Joseph Ratcliff & Sons, of Birmingham; and the stone-carving was done by Mr. Joseph Bonhill, of Manchester. The general contractors were Messrs. Henry Southern & Son, of Salford. Mr. James Catterall officiated as clerk of works. Messrs. Blackwell, Son, & Booth, of Manchester and Bury, were the architects.

The Lighting of Coasts.—England has a light for every 1½ miles of coast, Scotland one for every 30½ miles, Ireland one for every 3¼ miles, while France exhibits one for every 12.3 miles. The light-houses in France are more than three times as numerous as in Scotland, compared with the amount of coast, and nearly three times as numerous as in Ireland.

NEW BANK, BURY, LANCASHIRE.—MESSRS. BLACKWELL, SON, & BOOTH, ARCHITECTS.

ARCHITECTURE IN MADRAS.

At a meeting of the Senate of the University of Madras last month the establishment of professorships was discussed. Amongst other subjects named for professorship,

Mr. Chisholm proposed that "Architecture" should be added to the list of subjects. In the course of an address he observed:—It has been said that architecture is a branch of civil engineering. I would most respectfully protest against architecture being considered in any way a branch of civil engineering; indeed, were a lecturer to lecture on both subjects, he would teach you to forget in the one a great deal that he taught you to remember in the other. In his capacity of an architect, he would teach you perhaps to imitate the buttresses and pinnacles, the props and counterpoises, of the thirteenth century; he would point with admiration to the clustered shafts and groined roofs of a Gothic cathedral; he would grow eloquent on the curves and proportions of a Grecian portico. In his capacity of a civil engineer, on the other hand, he would remorselessly scarp down the buttress, dismantle the pinnacle, and show how an inch-and-a-half iron tie-rod would replace these counterpoises; he would sweep the cathedral of its clustered columns, and point in triumph to a lattice girder spread from wall to wall. He would smile at the marble shafts of the Parthenon as he placed in your hands Hodgkinson's formula for cast-iron columns.

In the race of construction the artist has unfortunately been left behind the man of science; he has been left behind to contemplate and reproduce the works of hy-gone ages; but, let us hope, to dream of some glorious future when a Britannia Bridge will not be erected without the requirement of a Grecian portico,—when the works of a complicated engine will express as much art-thought as an elaborate tracery window. I would advocate the endowment of a professorial chair of architecture on several grounds, and, as I cannot possibly fill that chair myself, I have no hesitation in advocating its endowment. I would advocate a chair of architecture, in the first place, because I conceive it to be a duty we owe to the natives of this country. All the art with which this country has teemed still lies dormant among the people; it is scattered, perhaps, but recognisable in the carved wood lintel or plaster temple in villages remote from civilisation; but have not we, the conquerors, scattered it? Have we not, like all conquering nations, robbed the people of the architectural art they once possessed; but have we, like all conquering nations, given them anything in exchange? Have we engrafted any art on to theirs? There is hardly a work in the country which expresses the least sympathy between the conquerors and the conquered,—scarcely a structure which will enable future ethnologists to place us in the scale of civilisation above the level of barbarians. It is true we labour under great disadvantages. We cannot bring Gothic to this country,—it becomes parched and shrivelled; but we can teach its principles. The principles of all true art we can teach: the arrangement of parts; the symmetry of halves, but to arrange buildings appropriate and convenient; and when all has been arranged, with the least possible sacrifice of convenience, we can take him outside and teach him to ornament his structure,—not with the so-called five orders of architecture, but with the 500 orders to be found in the columns of his own temples, with the ornamentation of his own country, with the ornaments most grateful to his eye.

I would take a still higher view of the advantages likely to follow a more cultivated taste among the natives of this country. I allude to the morality of art. The science of aesthetics, although but of a century's growth, has already taken its place as one of the favourite themes of the polite literature of the day, and no branch of philosophical or semiphilosophical literature (I quote from a recent article in the *Westminster Review*) has occupied so many writers, and interested so large a public, as the literature of the fine arts. Hence, then, we have a subject which is not only of a practical nature, and from the study of which the most important practical results are likely to follow, but which opens up a new branch of philosophy, a branch of philosophy into which almost any branch of knowledge may be pressed for service; and it is in our power to bestow this on the natives of this country.

I would advocate the endowment of a chair of architecture on still graver grounds. We have

arrived at a most important period in the history of architecture in this country, and it will be decided in the course of the next five or ten years whether we are to have a style suited to the requirements of this country, or whether we are to have the mere copyists of every bullock which breaks on the surface of European art, and import our architecture, with our beer and our hats, by every mail-steam which leaves the shores of England. I have stated that the orders of the Romans have defaced every modern structure in this country, but we are threatened now with an invasion fifty times worse and more destructive to the cause of art than if every had imitation of a Greek temple throughout the world had been re-copied in plaster in this country. I allude to the invasion of Gothic. I trust I may not be misunderstood; I am almost a worshipper of Gothic in its right place; I acknowledge its principles to be the only true principle of architecture for all countries; but I object to the introduction of mere familiar forms and details, without the life, the soul, the vigour of the art; the mere copying of details, without the acquisition of the inventive faculties of the originators. The endowment of a chair of architecture would do much to stem the current of this invasion.

In advocating the endowment of a chair of architecture, I would give it as my opinion that the chair should be filled neither by the Principal of the Civil Engineering College nor the Consulting Architect to the Government. It should be filled by the very best man you could induce to leave England for India, a man combining the qualities of a fearless critic, an able lecturer, a well-read archaeologist; and he should possess a knowledge of construction at least equal to that displayed in the best modern works on architecture; and if you can get your man, no salary you could give him would be too large, and no dignity this university could afford too great. Apart from his professorial duties the amount which such a man could save Government annually by judicious criticism would be enormous. And in this way he would become a public benefactor; for if he who makes two blades of grass grow where one grew before is a public benefactor, surely he who makes one brick suffice where two or three were laid before may have claims to that title!

After some discussion, the Vice-Chancellor put Mr. Chisholm's amendment to the meeting, when it was lost, not a single hand being raised in its defence.

MR. THOMAS COOLEY, ARCHITECT.

SOME captious critics in the literary, architectural, political, and even in the comic world, have been employing their pens latterly prospectively and retrospectively, on the building of Blackfriars Bridge. There seems no reason why I should not fall into the same vein, and have my say for what it is worth. It must be stated, however, for the information of all whom it may concern, that I am unable to say when the present structure will be finished. So while awaiting that wished-for consummation, let me say something of it in the past, and of the career of those whose genius took root at its original arches. The architect of the original bridge, which the present is intended to replace, was Mr. Robert Mylne, and serving under him as an assistant was one Thomas Cooley, whose name afterwards in the sister kingdom, Ireland, rose to fame. Thomas Cooley served his apprenticeship as a carpenter to a Mr. Reynolds, of London, and subsequently, by his aptitude and ability, became a clerk to Mr. Grenell, a carpenter of the Board of Works. Like the late Peter Nicholson, Cooley gave up all his spare time to the study of architecture, and became in course of time a respectable draughtsman. When a Society for the Encouragement of Arts and Manufactures existed in the last century, they gave premiums to aspirants under twenty years of age. Thomas Cooley became a candidate, and furnished a design for a Temple of Victory. He did not obtain the first prize, though in such competition he was generally a successful competitor. In the year 1769 a committee of Dublin merchants offered premiums for designs for a Royal Exchange. Mr. Mylne, the architect of Blackfriars, recommended Tom Cooley most powerfully, and though Cooley's plan was inferior in architectural beauty and utility to that of James Gandon, another Englishman, but who shortly afterwards became the Irish architect *par excellence*, yet the design of Cooley was accepted; the interest of Mr. Mylne secured the job for his

assistant. Thomas Cooley passed over to Dublin, and while arranging for the carrying out of his design he had the opportunity offered to him of examining the several designs of others, which enabled him to make many alterations and improvements in his own. The design of the Exchange, as carried out afterwards, was a wonderful improvement on the original, and as a finished piece of architecture externally, notwithstanding the nature of the ground, which rendered a flight of steps and a balustrade necessary to its north or main front. The form of the Royal Exchange is nearly a square. It has three fronts of Portland stone, in the Corinthian order. A dome crowns the building. Its north front is the most imposing and beautiful. A range of six columns, with their corresponding pilasters and entablatures, are here presented. The pediment is a noble one, and is highly decorated. At each side in the Lano range are two pilasters. The balustrade in the front, which rendered a flight of steps necessary from the incline of Cork-hill, is a drawback. In this front, between the columns, are three entrances with iron gates hung to Ionic pilasters. Immediately over the gates are three windows, between the columns, that assist in lighting what was once the coffee-room. On each side of these windows are two others richly ornamented with architraves. The west front varies somewhat from the north front; it has no pediment. The interior of the Exchange would need too much description, as it presents a somewhat curious arrangement. Some changes have also been made since its first construction. The dome, as seen from the inside, is lofty, and is supported by twelve Composite fluted columns. The entablature over the columns is ornamented in an enriched manner, above which are twelve elegant circular windows. The ceiling of the dome is richly decorated with superior stucco ornaments in Masonic taste, divided into hexagonal compartments. A large window in the centre illuminates the building. Such is the *chef-d'œuvre* of Thomas Cooley. I must say, however, there is a lack of taste and judgment displayed in the ornamentation in the inside, and by its minuteness there is a confusion created. Much of what is to be seen would be effective in the drawing-room of a mansion, but in a large public building its effect is altogether lost. Alas for Dublin! the extinction of a separate legislature rendered the objects for which this noble building was designed no longer sought after. Of late years, the building has been converted into a Town Hall, where the Corporation hold their meetings, and other civic business is transacted.

Thomas Cooley also contributed other designs for buildings of public utility in Dublin;—the building known as Newgate, the Record Office on Inns Quay, the Marine School, and a small church in the Park; the Primate of Armagh employed him for his different buildings and improvements; and while our architect was in Ireland he did a large private business.

The craftsman architect of London, whose career began on the cradling of Old Blackfriars Bridge, on the Thames, laid him down to rest on the banks of the Liffey, in the city whose architectural taste he elevated, along with Gandon. His memory is still respected and his name spoken of with pride in Dublin, thousands of whose citizens still claim him and Gandon as Irish architects. Irish architects, so far as the professional fame and practice were concerned, they undoubtedly were, but they were Englishmen by birth.

Thomas Cooley died in Angelsea-street, Dublin, in the 44th year of his age. He was a widower for some time previous, and he left behind him a son and a daughter. Perchance this brief record, which I have hung on to the history of Old Blackfriars Bridge, will possess some little interest for others besides those who are interested in the completion of the New. If so, this little bit of neglected architectural biography will not have been written in vain. C. C. H.

Ventilation of the Metropolitan Railway.—Regretting with others the evil condition of parts of this line, Mr. W. Benson addressed a communication to the directors, pointing out how the ventilation might be improved by means of shafts at various positions. Since then we find the company have, with great advantage, removed the copolas which covered the two shafts at the Portland-road station. Something more, however, in the same direction must still be done.

THE BELLS OF OXFORD CATHEDRAL, AND OF OTHER EDIFICES.

The tower of Christ Church Cathedral is now furnished with a peal of ten bells in the key of C, rather sharp; the reputed weight of the largest, or tenor, being about 42 cwt. There is also a small one called the Latin bell, which, it is presumed, was formerly the Sanctus bell.

The bells forming the peal are severally inscribed as below:—

1. Abra. Rudhall, Glouc., Bellfounder. 1698.
2. God prosper the Church of England. A.R. 1693. A.R. 1757.
3. Prosperity to all our benefactors. A.R.
- [1.] 4. The Grace of our Lord. 1640.
- [2.] 5. This bell was made 1611. W + Y.
- [3.] 7. + In multis annis tunc campana Johannis. [This bell bears a shield charged with a chevron between three trefoils.]
- [4.] 8. Stella maris maris surunt pissina nells. [Two shields, one like that on the 7th; and the other charged with a chevron between three lave-cups or ewers.]
- [5.] 9. Prosperity to this College. A.R.
- [6.] 10. + Sanctus sacra fat hinc campana trita. W.L.M.H. [Rose and crown between two griffins, as supporters.] A. 1589.

The inscriptions are copied from the Rev. W. C. Lukis's "Account of Church Bells," 8vo., 1857.

The figures which I have placed between brackets indicate the old bells which came from Osney Abbey, and of which Dean Aldrich sings in his famous *Round*,—

"Hark! the bonny Christ Church bells, 1, 2, 3, 4, 5, 6."

The fifth of that peal was, however, recast at the celebrated Gloucester foundry by Abraham Rudhall, who in 1698 added four new bells, the third of which was subsequently recast by his son Abel.

W + Y, on the [2.] 6 bell, stand for William Yare, of Reading. He made the bell now used at the Bodleian Library in the same year, 1611.

The old Sanctus, now called the Latin bell, has no inscription or mark of any kind. Its diameter at the mouth is 1 ft. 8½ in.; height, 1 ft. 5½ in. This is the bell referred to by the dean when he says,—

"Tinkle, tinkle, ting, goes the small bell at nine."

The "mighty Tom," of which he also speaks, is suspended in the tower over the college gateway, as most people know, and is now tolled at about 9½ p.m. A few words on this bell may be given on some future occasion.

I may here remark that formerly the "small bell" rang at nine, by the cathedral time, for five minutes, to call the members of the college to evening prayer. This consisted of a short Latin service, lasting for about fifteen minutes. The Latin service was, however, I believe, abolished by the present dean a few years ago, and an English service at 5:40 p.m. substituted in its stead. The small bell therefore no longer rings at 9 p.m., but at about 5:40. It also rings for prayers at 7 a.m. in summer, and at 8 a.m. in winter. These services are strictly collegiate, and partake of the nature of family prayer. They consist of the morning and evening services of the church, with the omission of the greater part, if not the whole, of the Exhortation and the "Lessons." The "first and second bells" mentioned in the *Round* are sounded for cathedral service—i.e., a service open to all comers, at 10 a.m. and at 4 p.m.

The cathedral clock is kept five minutes in advance of common clocks, and all college arrangements are regulated by this cathedral time. For much valuable information relating to the services and the bells, I have long been indebted to a well-known member of the Cathedral Establishment whose name I am not for the present at liberty to mention.

The foregoing notes may be interesting to some campanologists, if not to other readers; while the account of the old bells from Osney Abbey will, it is hoped, be acceptable as a reply to one of Mr. J. D. Parry's queries in the *Builder* of the 15th ult.

As to the "Bolshoi Kolokol," or Great Bell, in the tower of Ivan Velikii, Moscow, it is considerably heavier than the weight given by Mr. Parry. It was cast from an old bell, with additional metal, in 1817, by Bogdanof and Zibialof, elevated to its place in 1819, and it weighs, according to Lyall (p. 211), 144,000 English pounds.

The statement respecting the bells at Cologne Cathedral is also partly erroneous. The great bell alone weighs upwards of 220 cwt. It is therefore evident that Mr. Parry has been misled

in the instances under notice, by the mistakes of other writers.

With reference to our bells in England, Mr. Parry asks if I can "give any cause for five being much the most accustomed (unless for small churches) or 'orthodox' number before the Reformation?"

Now, in ancient times scarcely any of our churches had more than two or three bells. But at length peals of five were introduced, and the bells were generally heavier than at present. "We know of no regular peal being hung in England," says the Rev. Dr. Alfred Gaitly, "before the year 1456, when Pope Calixtus III. sent a peal of five to King's College, Cambridge, where they hung for about three hundred years, and were considered for some time the largest peal in the kingdom: the tenor weighed 57 cwt." These bells, I may note in passing, were hung in a temporary wooden tower standing near the western door; and when this building fell into decay they were removed into the ante-chapel, where they incumbered the ground till they were sold, about the middle of the last century. In the course of time, however, the interest in the subject of ringing increased, and peals of six and eight were put up in various places; and at last we find ten and twelve, the latter being the largest number of bells that it is possible to ring in a peal. My answer, then, to Mr. Parry's last query is:—The music of five good bells tuned diatonically, and descending from the dominant to the tonic, or key note, is more satisfactory to the ear than that of any smaller number.

THOMAS WALESLEY.

THE SOCIAL POSITION OF THE ARCHITECT.

SIR,—Your recent article on "The Position of the Architectural Profession in the Provinces," and the letters it has evoked, seem to me to leave the subject incomplete until reference is made to certain other causes which prevent architects from attaining social position or public recognition as *professional men*.

Provincial practitioners are painfully aware of the number of untrained pretenders pursuing the calling of an architect, and depriving them of their due emoluments. Unsuccessful joiners, hinders' clerks, plasterers, landscap-gardeners, clerks of works, bankrupt hindlers, who have graduated in the colonies or on the Continent, house-painters, even tailors and drapers, crowd into the motley ranks of persons calling themselves "architects," until we are in danger of occupying the position assigned to the school-master in the old saying; that, namely, "When a man is fit for nothing else, he may turn architect! And the analogy is more complete than is at first sight expected; for as ignorant parents cannot select an efficient teacher for their children, so an uninformed public cannot distinguish an architect from a builder.

We need hardly wonder that, in the face of this fact, the real professional man, duly educated and highly refined as he often is, is looked down upon, and cold-shouldered, by the *real* professions and by educated people in general. The prevalent condition of things works towards such a result in many ways: of these two or three may be here alluded to. This unwholy army of interlopers, whose qualifications frequently consist only of prolix copies of architect's drawings and specifications, and such information as they can pick up, united in most cases with practical knowledge of some particular branch of the building trade, having succeeded in obtaining works to execute, which they do to an astonishing extent, naturally produce results which bring contempt on the profession whose name they have adopted, and that contempt spreads its baneful influence on the other hearers of that name. The consequences are clear; dissatisfaction in the client's mind and a natural repudiation of the utility of any architect.

Again, there is indeed by these worthies a most unfair competition. Being themselves originally little more than working men, entirely devoid of any approach to a liberal education, and capable only of a little (usually very bad) writing, and some unreliable "drawing" with tee square, &c., the usual fees of architects form an enormous increase in revenue in comparison with those to be derived from their usual avocations. Having no capital sunk in education, no long years of toil and study to be remunerated for, they are enabled to "work low"—very! The position of a *quasi* professional man offers them every temptation; for they have only to

maintain the mechanic's rank. Accordingly, they rush in; and although their work is generally dear at any money, they manage to "pull through," profiting mainly by the ignorance of their clients, and dependent partly upon the advice of hindlers. If they carry competition too far for their own purposes, abundant opportunities occur, by the old-fashioned process of a "tip," of remedying the defect—a remedy against which neither education nor the *esprit de corps* forms a safeguard for them when their individual consciences do not interpose a defence. Whence there comes more contempt, and some obloquy, on the name of an architect.

It would hardly be credited that architects themselves frequently help this vulgar and ignorant herd to attain the honours and emoluments of their own profession; but it is so, and many of them repent of it afterwards. Actuated by desire of momentary gain, they are occasionally induced to take persons of this class into their offices, thereby saving, perhaps, a junior clerk's salary after a while. I speak from actual experience; knowing instances where utterly ignorant, rude, coarse young men, who have been brought up in trade, have been received at their own request into offices, generally without premiums, and placed amongst clerks who have been brought up respectfully, and amongst pupils who have paid the usual *honoraria*. Such proceedings I consider to be as unfair as they are impolitic,—unfair towards the persons thus thrown together; and impolitic as producing that degradation of the profession in the provinces which tends to drive every qualified architect who respects his calling, into London, or to adopt some other vocation.

There is still one more cause which in some of its phases has been already touched upon, both by yourself and by your correspondents—and that is the want of thorough technical education in the profession. I would not add one word to weaken the force of what has already been said on this point; but it has come within my own observation that architects do not easily find assistants capable of giving them real assistance as juniors. Experienced assistants are to be had, but the employers shrink from engaging them, excepting on emergencies. Finding that they have to teach the junior assistants, they logically conclude that they may as well teach pupils, pocket the premiums, and get their work done (we will not say *how*) without paying salaries, excepting to a managing clerk. They therefore take in (rather too liberally, in a Pockingtonian sense) large numbers of pupils. Some of these find their way to learn and work; others, who have joined the profession as an item of their own respectability, pursue their architectural studies during the intervals between dress occasions and pleasure parties, and in combination with billiards, shirt-collars, and the "right thing" in boots and trousers. They are all turned out, however, with redundant testimonials as to everything but knowledge, ability, or industry, to annoy any brother practitioner who may be so unwise as to employ them. Yet they "must live" (that final appeal of vitality overrides all economics); and if their friends be influential or fortune favours them, their ignorance and their vagaries contribute to the sum of contempt heaped upon "architects."

For the industrious and studious amongst pupils and juniors, the prospect is cheerless enough. They present themselves to our view as well-educated gentlemen, qualified for the better grades of society, well-informed, often highly accomplished apart from their profession. The mob of interlopers renders the chance of private practice unnecessarily remote, unless the individual have influential friends; and the crowds of pupils (I should think no architect in decent practice has less than two) in various stages of development (from the chrysalis, which is the premium, to the testimonial, which is the full feather) shut him out from salubrious employment, excepting at a rate of remuneration inconsistent with his education and antecedents. If he fall back upon competitions, he must be very lucky as well as very industrious before he obtains the desired recognition of his abilities; and yet no other means appear to be available to raise him.

As regards the question of dignity and social precedence, an architect loses nothing by being excluded from society incapable of distinguishing real power; and however rarely he may meet with people who can so distinguish, let the young architect be content to enjoy that rare boon, and let his cultivation, his study be his own exquisite reward.

EXPERIENTIA.

NEW LAW COURTS.

The site and structure of the projected courts and offices have now become a question of interest to the whole population, and to every frequenter of the metropolis. Long since, the project had been decided on, the location fixed, competitive plans submitted to public inspection, and the assent of a parliamentary commission, together with the approval of the judges, and of the legal profession in general, was expressed in favour of the central position, as chosen, between Carey-street and the Strand; that site, then covered with a comparatively valueless mass of mean and antiquated buildings, was purchased, and cleared in the course of three years, and is now ready for the realisation of what is vitally needed for the accommodation of the metropolis public, and of the whole nation. It is a fine position and elevated, the lower side being 50 ft. above the Embankment, and open to the widest portion of the Strand; occupying the most central and convenient position for professionals and the public. It could be easily made accessible from the short gorges of the two Turnstiles; but, above all, it rests upon a solid and dry foundation.

A sufficient space for the erection of all the Law Courts having been thus acquired, and paid for, and whilst only some considerations of style and construction remained for discussion, a sudden light burst in upon officials in high position, revealing visions of rival, though unrivalled magnificence on the Thames Embankment; and—will it be credited?—economy in outlay forms the assigned motive for transferring the location to a site 50 ft. lower, insufficient in scope, trebly expensive in regard of purchase value, and, above all, or rather below all, needing excavation and solid concrete foundation to a depth of 20 ft. or even of 30 ft. beneath the range of high-water mark; and superimposed thereupon a substructure of 30 ft., in at least two stories, up to the floor range of the Courts of Justice!

Well, the plot recommended as more economical extends from "a street called Howard-street" to the Embankment causeway, between Surrey-street (24 ft. wide), and Arundel-street (25 ft. wide), Howard-street being 33 ft., and Norfolk-street, which bisects the block, 48 ft.

The extreme width from east to west, inclusive of Norfolk-street, is only 290 ft., and the depth from the north to the Embankment on the south is but 196 ft. in the mean; to which might be added of reclaimed slime, a margin up to and clear of the 100 ft. drift way—at the end of Surrey-street—of 60 ft., and at the end of Arundel-street of 80 ft. As the range of these streets does not quadrate with the new quay-wall and causeway, no fine structural facade could be erected to square with that block of ground. The Somerset House front, which has a river range of about 650 ft., on the west angle next Waterloo-bridge impinges some 12 ft. upon the rival causeway, but at the other extreme it is distant about 10 ft., and so the reclaimed space increases up to a width of about 200 ft. near Essex-street.

No building ought to advance beyond the line of a curve drawn equally with the line of Embankment wall, and from the south-east angle of Somerset House, and every frontage should have a central tangent to that curve.

It will be seen, therefore, that the proposed block is only 290 ft. by 256 ft., and if any further space is needed it must be obtained by purchase of the whole Strand frontage, and the other two blocks between Surrey and Arundel streets; for, in point of fact, the courts would be there stowed away in concealment and seclusion, but too much assimilated to the approaches already existing to the Chancery and Rolls Courts, as also to the Temple and other Inns.

There might certainly be an extension of the Embankment site in the direction of the Temple, by the purchase and clearance of Gwynne's extensive engineering premises and offices, besides numerous other large and small warehouses, stables, and premises, filling up the interval to the Temple Gardens; in which latter case the foundations must be all upon the alluvial river-bank, requiring structural outlay, which might be fairly estimated in three parts, viz.—the superstructure or ornate courts, the substructure of two stories to the Embankment level, and under these massive foundation walls to the London clay.

Now, as to the economical part of the question, it needs no argument to show that the cost of every house on the Norfolk estate would be treble that of each house cleared off on the

Carey-street site, while the Strand frontage, if bought, must be of tenfold value.

In addition, as to approaches to Mr. Layard's contemplated law centre, surely the lateral streets cannot be allowed to remain of only 24 ft. and 25 ft. width; or, would it be possible to withdraw the court frontages 20 ft. on all sides, thus reducing his Howard-street front to 250 ft.? But, in fact, it would be wholly ridiculous to select the proposed location, unless the grand facade were placed on the Strand; and even in that case, as along the course of Holywell-street the width of the Strand is only about 30 ft., an additional work of demolition and enlargement should be here carried out, at an expense that would be difficult to estimate.

It is easy to say that 1,600,000£ shall not be exceeded, and for that sum, no doubt, plain structures or refuges might be erected. The ground must, however, be paid for, and the expenditure must altogether depend on the sites selected, and the character of architecture adopted; but the Clement's Danos site being already cleared, two years might be gained by its adoption, on the outset of the works; and, perhaps, as much more by securing a good foundation instead of the river side, which, as at Somerset House, would require more of the solid structure below than above the court floor level.

Placed in this position on the principal leading thoroughfare, the courts would be ornamental to the metropolis and more easy of access. In that street, or at least 60 ft. in width must be formed in continuation of the Strand, from Lincoln's-inn to the Strand; and this will make that plot a speculation, dependent upon building leases. How, therefore, the Government is to be repaid for their outlay is matter of doubt.

On the grand consummation of the building, there will be, perhaps, in five or six years, the old deserted courts for disposal or conversion into offices for other departments, now hired at annual rentals; those at Westminster Hall being of inestimable value. All this may turn out profitable, but must be left for future contingencies.

T. H. H.

A TOWN-HALL FOR LEICESTER.

SIR,—The town of Leicester is one of the most flourishing in the Midland Counties, from its vast staple trade of elastic web, worsted hosiery, and shoe manufactures, and its something like one hundred thousand inhabitants, costly buildings for the conduct of the trade, as well as the high erected many centuries ago; the largest room will hold about 400 people. In this our petty and quarter sessions are held. At the farthest end of it is the magistral bench, at the back of this, on the other side, the wall, and adjoining is a public-house stable; and it is to be assumed of course that we have them on the one side and the horses on the other. The police-station is a part of this old dilapidated building, and is under 8 ft. in height. The cells are quite close to the sergeant's office, and the prisoners can hear nearly all that is going on. There is frequently a stench so unbearable, that the prisoners have to be taken out of their cells into a small yard attached, to obtain fresh air, and this is allowed to continue. Even more, the town council have been driven from their deliberations into the yard for the same purpose. These are no exaggerations; I refer you to our mayor, Mr. J. Baines (should the fact be doubted) as to the correctness of this statement. The sergeants that officiate in this department find it injurious to their health, and some of them are looking very unwell in consequence.

The whole town has been talking continually for upwards of twenty-five years about the necessity for having a new town-hall. The town council have frequently had the subject before them. At a special meeting a few weeks back, both aldermen and councillors were compelled to beat a retreat into the yard, as the stench was beyond description. About twelve years back, one of her Majesty's Judges compared the building to "an old boat, kept up-wards." This I consider to be a very good comparison, and I only hope his lordship saw that his appropriate remark has reached the columns of your well-known paper. For a number of years the judges upon circuit have refused to hold the borough assizes there, it being such an inconceivable abominable hole, as well as disagree to the town.

The assizes have been held (upon a surerance) in a court belonging to the county. The grand jury, after being sworn, have to turn out, as no room could be found for them there, the county grand jury requiring their own room.

Several times have been on the borough grand jury, and we have had to turn out, marshalled by our worthy town serjeant, Mr. Hodson, carrying his rod of office, and parade through the street to the town-hall (which is little better than a stable). Before leaving the Castle we have been desired to let them have each bit as soon as ready. When the first bill has been ready, I, with one or two others of the jury, have walked down with it, and on our return we have found some of the jury absent seeking to moisten their lips, and on our second return others had wandered away to lunch with one of the members. I made remarks of this to some of the jury at the time, feeling assured that the judges were aware of what really takes place, instead of paying a high compliment to the jury, he would ensure them severely, and the town also for not furnishing the required accommodation.

And this, Mr. Editor, is how things are done in this our industrious, wealthy, and prosperous town of Leicester.

During twenty-five years that the discussion has lasted as to the erection of a new town-hall, many of our noblest men have risen from the ranks, and built for themselves princely mansions, in addition to mighty factories, warehouses, and other great and costly buildings.

The committee of the whole council for selecting a site for the new town-hall, held on the 8th instant, the Friar-lane site was carried by a majority of three votes.

The meeting was then resolved into a special town council meeting, and the Friar-lane site was again carried by a majority of twenty-six. The reason for so great a difference between the numbers is, that the minority (a clique) were so astounded and crestfallen, that gloves, hats, and umbrellas were seized with the greatest avidity, and they all rushed out pell-mell, as though they should be too late for train without that great effort. The clique are again shuffling the cards, in order to obtain another postponement of the erection to an indefinite period.

The minority are very stubborn about the matter, and will not even admit that they are beaten. If a majority is not to rule, and the minority bow to their decision, then all law and order are lost, and the disordered minority, in the eyes of all honest, fair-thinking men, are nothing better than tyrants.

One of her Majesty's judges, who was for many years recorder for this borough, some few years ago complimented the grand jury on the propriety of their town, and stated that on his way from the railway station that morning he beheld a magnificent building, and on his inquiring what it was for, was informed for a shoe warehouse; and, in continuation of his address, said—"Surely, gentlemen, if private individuals can erect such noble edifices as the one I have seen, this town ought to have better accommodation for her Majesty's judges to hold their courts in."

A meeting was convened by requisition, the object of which was the postponement of the building of Assize and Sessions Courts; it having been agreed upon by the town council that the erection of a large hall should be for a future generation, the speakers declaring the town too poor to furnish the requisite accommodation for her Majesty's judges. There is plenty of proof that the requisition contained names obtained by misrepresentation, as also the names of young men in shops, at a very meeting it was proposed, seconded, and carried, that the whole of the rate-payers be polled before anything further be done in the matter. Nothing could be more preposterous. How many rate-payers will vote for an increased taxation? If this be done, we may wait a long time before we have a new town-hall.

CLEMENT PERITY.

MAY MEETINGS AND MAY PARTINGS.

SIR,—If the life of the poetical author of the "Seasons" had extended down to our time, it is possible that his description of the publications which occur during the month of May would have included at least two things which were unknown in his time—namely, May meetings and May partings. With May meetings I do not at present propose to interfere, but on May partings I wish, with your permission, say a few words.

And first let me explain what partings I mean. I mean that separation or divorce which occurs with capital, which now takes place periodically, and if at no other time, yet always in the spring. Instead of the circumstances being that "Now is the winter of our discontent—made glorious summer," it seems that the feeling of discontent is most intense on the eve of "glorious summer," that these words become of no avail; and men who have all along complained that they were by their employment unable to satisfy their wants, and that the system that object by the very Quixote method of refusing any employment at all. But it may be urged that conditions might be imposed upon the workmen which would make his employment uncertain, and, without seeming to decrease his remuneration. Let us examine this statement in connexion with the present strike (or lock-out, as they will have it) among the masons in Liverpool and its neighbourhood. Up to the 22nd May just past, the unit of time upon which their labour has been calculated, was a quarter of a day. If this unit had been a first quantity, change to a shorter period, such as a day, would have been necessary, as it is usually found that, among good and honourable men, long engagements are least. But this quarter of a day was not a fixed quantity, being subject to three variations. As work did not commence on Monday till 7 a.m., the length of that day was nine hours only; consequently a quarter of that day would be a quarter of an hour shorter than a quarter of any one of the four succeeding days, which were of ten hours each. On Saturday work ceased at half-past twelve, which gave six hours' work only for that day, and as the quarter of any other day so nearly corresponded to the half of this day, it was usual to work from each half. The whole of the middle quarters of the first five days of the week were again subject to additions and deductions on account of the hour for dinner not dividing the day into two equal parts, so that in making up the account of labour done, it was necessary to know not only the number of days and quarters, but also what days and what quarters of those days, as each variation in time had its separate value. A bookkeeper who could calculate all this without mistakes, would be a clever fellow. To put an end to this anomalous state of things, the master builders determined to adopt the system which has been found to work so satisfactorily to all parties in London and elsewhere, and as they untidily gave the usual six months' notice that after the 21st of May they should pay by the hour. At the same time they intimated that any dispute which might arise upon this or any other question, ought to be settled by arbitration without resorting to the old barbarous plan of striking. To both these propositions the men refused to agree, and alleged as a reason for declining to allow arbitration that no one man can be found who, in their opinion, fulfils the necessary conditions. It seems strange, at least, that the trade of a mason should be so peculiar, and the relations of the masters and men such, that the very plan, and indeed the very men who have by their influence and efforts during the last few weeks brought about a satisfactory arrangement in not a few places, should be unable to find the qualifications to do the same thing among the masons. The allegation is untrue, and will be as damaging to their side as the strike will prove damaging to their.

With regard to the payment by the hour, the reasons given for rejecting the proposal are either absurd or invalid, and would apply with equal force to the late arrange-

ment. There is one reason for accepting it which ought to have great weight with the men, and that is the much greater ease with which an advance of wages may be obtained.

As an instance, a change from a day payment to the hour system has just taken place among the joiners at Bolton, and they are to receive 7½d. per hour. What an easy thing it would be to get the 3-16ths necessary to make up the farthing, and have paltry a thing it appears to the public who have it to pay; yet it would make 10d. a week additional wage to the workman. Again, by the hour system, a workman having, say, overstepped the time to work in the morning, may commence at the next half-hour, while by the quarter-day plan he must lose a quarter, which was often the prelude to a lost day or more.

The change, then, it appears to me would be most favourable to the men, and would simplify bookkeeping by the masters; but the men say they will not adopt it till they are beaten.

In Manchester 400 men are on strike for a reduction of the hours of labour to nine, with the pay of ten hours. It is impossible at this time that they should succeed, and even if they should, what would be the result. Stone will be superseded by brick, and other materials. Artificial stone and iron are taking its place. An order for plate tracery in href has recently been given in Manchester, which, but for the strike, would have been in stone; and a Liverpool architect pointed out recently in a local paper that it was intended to erect a large building in which, if the strike took place, not a stone would be used.

When will my countrymen be more sensible? E. G.

SCHOOLS IN GLASGOW.

The schools at the corner of Renfield and Renfrew streets for St. Stephen's parish, in Glasgow, have just been completed. They are two stories in height, and consist of one school-room, 30 ft. by 27 ft.; two class-rooms, 20 ft. by 13 ft. 6 in.; hall and stairs, 11 ft. wide; lavatory, &c. for teachers, and three shops to Renfield street, on the upper floor,—one room, 50 ft. by 27 ft.; another, 45 ft. by 23 ft. (ceilings 18 ft. 6 in. high), with master's room over hall. The boys and girls have separate yards, with drinking-fountains, &c., in each. All the inside walls are lined to the height of 5 ft. with yellow pine lining in narrow widths, and the whole woodwork is stained and varnished. The total cost, including fittings, is 2,250l. The architects are Messrs. Cowan & Smith, under whose superintendence the works were carried out.

THE RECORD OF HISTORICAL TOMBS AND MONUMENTS.

SOME little time ago the First Commissioner of her Majesty's Works, Mr. Layard, invited the council of the Society of Antiquaries to furnish him with a list of such regal and other historical monuments and tombs existing in cathedrals and other buildings as in their opinion it would be desirable to place under the protection and supervision of Government, with a view to their proper custody and preservation. The council accepted the invitation, and appointed a special committee, called "The Sepulchral Monuments Committee," who have met and laid down certain regulations. They have limited the date to which the inquiry shall be conducted to the year 1760. The monuments are to be tabulated by counties from county histories (not from general books), in a form agreed on, various members of the committee and others each undertaking a separate county or counties.

SCHOOLS OF ART AND SCIENCE.

The Croydon School of Art.—This school, which is conducted by Mr. Wiggall, is said to be progressing well. The results of the examination have been announced by the Department. It appears that out of sixty who were examined, forty-seven passed. There are two degrees of proficiency attainable, viz., passed and excellent; a fair share of the pupils have gained the latter, and out of the forty-seven members who have passed, a great many were artisans.

Proposed School of Art for Burslem and Tunstall. A meeting of manufacturers and other principal inhabitants of Burslem and Tunstall has been held at the Wedgwood Institute to deliberate on the formation of a school of art in connexion with that institute. The attendance was select and influential. Mr. H. T. Davenport presided, and in opening the meeting pointed out the advantages already enjoyed by Hanley and Stoke, where schools of art are in vigorous operation, and said there was no reason why the manufacturers, workmen, and general public of Burslem and Tunstall should not enjoy similar advantages. After some discussion, a treasurer and committee for Burslem were appointed, and a meeting is to be held at Tunstall to elect a committee for that town. An annual subscription-list was also opened.

Education in Science and Art at Millers-brough.—Under the auspices of the Middlebrough Mechanics' Institute, a public meeting has been held in the Town-hall, to promote education in science and art. The chairman explained that it was intended to establish science and art classes at the Mechanics' Institute. The committee had decided to raise their building in Durham-street a story higher, and build suitable rooms. This would involve considerable outlay, and he trusted the public would lend a helping hand. Mr. Buckmaster, of South Kensington, explained the assistance the Government would give to such classes. Other gentlemen also addressed the meeting.

DECISIONS UNDER METROPOLITAN BUILDING ACT.

A RAILWAY A PUBLIC HIGHWAY.

At Greenwich Police-court Mr. Charles Brown, of the Railway Tavern, near Nunhead Cemetery, appeared before Mr. Maude, on an adjourned summons charging him, at the instance of Mr. Snooke, the district surveyor, with an infringement of the Metropolitan Building Act.

Mr. Liley, barrister, attended for the defence. Defendant has seventeen acres of land, which he uses as a cricket-ground and for pigeon shooting. On one side it is bounded by the London, Chatham, and Dover Railway, and on that side there are three sheds. Such buildings, within a specified distance of a "public highway," must be built of incombustible materials. The question was whether the railroad was a "public highway" within the meaning of the Act. Without the sheds the land would be useless, and they had been erected at a considerable cost.

Mr. Maude said that the fact of the land being bounded on one side by a cemetery, and on the other by a railway, it might have been imagined that the Metropolitan Building Act would not have applied to anything placed upon it in the shape of a building. The owner of the land, however, might eventually let it out for building purposes, and if the present structures were allowed to remain, there would be danger, as the Metropolitan Board of Works had stated it, from the sparks of engines passing along a line of railway, such railway being deemed a public highway. The Metropolitan Board of Works having refused its sanction to the buildings remaining, he had no alternative but to put the Act in force, and to order that the buildings be demolished within a month, with payment of 23s. costs.

PROPOSED ALBERT INSTITUTE, WINDSOR.

PROFESSIONAL ETIQUETTE.

Srs.—It will be within the recollection of some of your readers that about three years ago our designs for the proposed "Albert Institute," Windsor, were selected, in a limited competition.

Our drawings have been ever since with the committee, and several sums of money have been received towards the erection of our design; but the subscription has fallen short of the sum which would warrant a commencement of the work, and nothing has, therefore, as yet been done.

One of the unsuccessful competitors, a resident in Windsor, now seeks to set aside the selection of the committee by offering to advance one half the estimated cost of the work—securing it by a mortgage on the property—on condition that the committee to prepare the "plans and drawings" be given to him.

Of course the committee cannot accede to this ingenious suggestion, which, however, is so far useful in that it sets the whole competition system before us in a new light.

In order that you may have complete information on the subject, we beg to hand you a copy of the *Windsor and Eton Express* of the 20th ult., containing the curious proposal. BACON & BELL, Architects.

THE ATTEMPT TO ROB INVENTORS.

THE Patent-laws are bad enough, certainly, as regards the interests of inventors; but the fact that inventors suffer from their defective action is no right reason why the property of inventors should be left without any protection whatever. Inventions, the fruits of the labour and ability of inventors, are quite as much their property as the money which they seldom have in their pockets; and it is about as reasonable to deprive them of the protection of law to prevent selfish and greedy manufacturers or others from appropriating their inventions, as it would be to deprive them of the protection of law to prevent thieves from appropriating the money in their pockets. Were it now proposed to repeal the law of copyright, the gentleman who thrust his paw into such a bee-hive, to steal the honey, would meet with the reception he richly merited. Inventors, however, are not celebrated for the power of the pen, nor for their ability to defend themselves; so that he who has a greedy eye upon their property and their rights may pretty safely, so far as regards punishment, try his hand against them. Such has just been the case in the House of Commons, where, "in the interest of trade and commerce" ostensibly, but by no means in the interest of inventors, Mr.

Macfie moved that the granting of patents for inventions should be discontinued. Sir R. Palmer seconded the motion, and expressed himself in favour of the total abolition of all rewards for inventions. The discussion was continued by Lord Stanley, who was in favour of the motion. Mr. J. Howard, Mr. Mundella, Mr. Stapleton, and Lord Eloho opposed it. The Attorney-General said he believed that the *Patent-law should be amended rather than abolished*, and that it had done much more good than harm. The motion was ultimately withdrawn,—but, let inventors depend upon it, not for the last time. It is to be hoped, however, that no further delay will be allowed in urging the Legislature, with a will, to amend the law, so as to deprive its opponents of all excuse for attempting to get rid of it in order to get at the profitable exertions of inventors without paying for them.

THE SECRETARYSHIP OF THE INSTITUTE OF ARCHITECTS.

ON Monday evening last a special general meeting of this Institute was held for the election of an honorary secretary for home duties, when, after some discussion on the subject, Mr. J. P. Saddon, late honorary secretary, was unanimously re-elected to that office.

Srs.—In recognition of Mr. Street's "proclamation" in your last number, I feel bound to remark that I see no need for it having been made. The proper course was to resort to a party whip privately; and this was done, and with all success. At any rate, Mr. Street has been restored to that authority which some of us had hoped he would have been persuaded had lasted long enough. Under his management the yearly transactions appear now to have dwindled down to about seven papers (good, bad, and indifferent), two biographical memoirs, and six inconsiderable notices. So be it: as he himself very frankly tells us, he holds the secretaryship on altogether different ground. "*I hold it for the purpose of my party, and so long as my party keep me in, so long I will remain.*" The operation of keeping in such an official, against the wishes of an uncontested although indignant majority, is well known to be easy enough to such as are actuated by no higher motives; but I venture to think the scandal has now reached a head. ROBERT KEAR.

PAYMENT FOR TAKING OUT QUANTITIES.

At Wolverhampton County Court, on the 23rd ult., before Mr. A. M. Skinner, Q.C., judge, and a jury, Mr. Samuel Johnson, surveyor, of that town, sought to recover from Messrs. Trow, of Wednesbury, builders, the sum of 20l. for taking out the quantities for a house proposed to be erected at the Wergs, according to plans prepared by the late Mr. Banks, architect, for Mr. H. H. Fowler, solicitor. It appeared that the plans and specifications having been prepared by Mr. Banks, four builders, viz., Mr. Cockerill, Messrs. Higham and Mr. Horsman, of Wolverhampton, and Messrs. Trow, of Wednesbury, were invited to compete for the execution of the work, Mr. Fowler not hindering himself to accept any one of the tenders. The builders arranged that the "quantities" should be taken out by Mr. Johnson, who was to be paid (at the rate of 1¼ per cent. on the lowest estimate) by the lowest or successful tenderer, who, however, by custom, includes the cost of the quantities in his estimate. Copies of the "quantities" were supplied to each of the builders, and Mr. Johnson was to be called upon to guarantee their correctness, but it appeared that, in consequence of the estimates exceeding the amount which Mr. Fowler had resolved to spend upon his house, and also of the death of Mr. Banks, the first plans were abandoned, and Mr. Bidlake, architect, who succeeded to Mr. Banks's business, prepared fresh designs. The estimate of Messrs. Trow was the lowest, and in consequence they alone were applied to for a tender for carrying out Mr. Bidlake's plans, with the intimation that if the tender was satisfactory they would be entrusted with the work. They accordingly sent in a tender (the quantities being taken out by Mr. Bidlake, for which he received about 70l.), and the house was erected by them. Mr. Johnson consented to accept 20l. in discharge of his claim. The matter remaining unsettled, Mr. Johnson's solicitor wrote to Messrs. Trow, claiming the amount, and he received a reply stating that they never employed Mr. Johnson. They, however, paid 5l. into court. For the defence, Mr. Young contended that, because his clients were successful upon a totally distinct design from that of the late Mr. Banks, it was inconsistent with custom or equity to call upon them to hear more than a proportionate share of the quantities prepared upon plans that were abandoned. His

Honour having in the course of the case expressed his astonishment at the letter of the defendants, denying the employment of the plaintiff, Mr. Young said it was written upon the understanding that the arrangement with Mr. Johnson was made by Mr. Cockerill on behalf of the four builders, and not with the desire to escape from their part of the responsibility. The jury gave a verdict for the defendants. The judge said he quite agreed with the verdict, but, after the letter to which he had alluded, he should allow no costs against the plaintiff. He considered that Mr. Johnson had behaved very handsomely in reducing his claim as he had done, and that, therefore, the builders ought to have behaved more liberally towards him.

MONUMENTAL.

At a recent meeting of the Court of Common Council it was announced that a private gentleman having undertaken, at his own cost, to erect a memorial of the late Prince Consort, in the form of an equestrian statue, provided the Corporation would grant a suitable site, and would construct the pedestal, which they had agreed to do, the engineer of the committee had indicated as a singularly desirable site the circus at the western end of the new viaduct, where he said such a memorial would be visible, in some instances at a distance of from 500 yards and upwards, from every one of the thoroughfares converging upon that point. The statue is to be entrusted to Mr. Bacon, the sculptor, subject to the approval by the Corporation of a model to be prepared by him.—A long-talked-of monument at Paisley to Wilson, poet and ornithologist, is likely soon to be set up. Mr. Mossman, the sculptor in Glasgow, some time ago was commissioned by the committee to execute a bronze statue; and he has submitted to these gentlemen a model in clay. The statue is a colossal figure of Wilson, representing him in an American herd, looking earnestly at a Jay, his favourite bird, which he is supposed just to have shot; while his portfolio lies at his feet.—A monument is about to be erected in the grounds of the English Cathedral, Montreal, to the memory of the late Bishop Fulford, first metropolitan of Canada. The fund required, viz., 5,000 dollars, has been subscribed by a number of the principal residents.

THE YORKSHIRE ARCHITECTURAL SOCIETY.

An excursion of this society took place on Tuesday before last, the district visited being Easby Abbey, Richmond, and the Valley of the Swale. The party left York with aspects, so far as the weather was concerned, of anything but a cheering nature. At Easby the excursionists at once made their way to the church, which had been recently restored under the direction of Mr. Gilbert Scott. Here they were received by the Rev. J. Thompson, the vicar, who read a paper explanatory of the antique wall paintings illustrative of Scripture history, which were brought to light on the removal of the whitewash during the process of restoration. The party next proceeded to the ruins of the Abbey of Easby, which they minutely examined. The Rev. G. Rowe, one of the honorary secretaries, here read a paper on the "Early History and Present Aspect of the Abbey," which the late Dr. Raine had told them was founded by Rold of Barton, the constable of Richmond Castle, in the year 1152. On leaving the ruins the party proceeded by the footpath along the banks of the river to Richmond. The parish church, which has also been recently repaired under the auspices of Mr. Scott, was visited, as well as the castle and ruins of the Friary. Then, by the invitation of the Mayor of Richmond, who, along with Mr. E. Wood, the vicar of the party, had met and received them at Easby, the members were invited to the town-hall, where a luncheon was provided by his worship. The rain having shortly after partially cleared up, the excursion to the Valley of Swale was persevered with, and consequently a number of open coaches were at once placed at the disposal of the visitors, and a delightful ride of some six miles through some of the most beautiful scenery in England amply compensated them for the inconvenience which they had sustained during the early portion of the day. At five o'clock upwards of fifty of the members of the society and their friends dined in the Assembly-room of the King's-head Hotel. The Lord

Mayor of York, Mr. A. E. Hargrove, was in the chair, and he had on his right and left the Mayor and Mayoress of Richmond. The vice-chair was occupied by the Rev. George Rowe. The party left Richmond soon after six o'clock, and reached York by nine.

FROM SCOTLAND.

Edinburgh.—The restoration of the ancient cross of the city is now almost complete. The shaft, supported on a new pedestal, was erected a few months ago within the railings on the north side of St. Giles's Cathedral, not as representing the original position of it, but with the view of preserving it as a valuable relic, close to the ancient site, and where it would be comparatively safe, and cause no obstruction. Upon the erection of the shaft a want of effect was perceived, and it occurred to Dr. David Laing that a unicorn, as a crowning ornament, would not only give the desired effect, but help to give a more complete representation of the cross as it existed in its original form. This suggestion has now been carried out. The addition of the large stone basin which formed part of the original cross, and which is now at Abbotsford, would have rendered the restoration still more perfect, as the *Sootsman* remarks; and it must be regretted that an endeavour was not made to obtain this portion of the relic. This is the basin "fra the quihilk," in holiday times, "the wyne ran out at the spoutis in greit abundance," when "their wes the noyis of pepill casting the glassis with wyne." The drawings for the unicorn were presented by Mr. James Drummond, R.S.A., and from these Mr. John Rhind, sculptor, has executed the work.—A new mission church and school are being built in Canongate. The edifice, which is from designs by Mr. Robert Paterson, architect, is half completed. The style is Early Pointed, and the front of the building is plain, with a moulded central doorway, flanked by small triplet windows, which light the vestries. Over these are a central and two side windows. The school occupies a sunk floor, partly beneath, and extending backward beyond the body of the church. Provision is made for a gallery, which, however, is not to be erected in the meantime. Including the gallery, there will be about 600 sittings. Messrs. Berry are the contractors for the mason-work, and Messrs. Smith & Son for the carpenter-work. The cost will be about 2,000l.—During the last few years a considerable number of houses for workmen have been built at Fountainbridge, in the south-western suburbs of the city, where several extensive industrial establishments are situated. At Dalry, a large space of ground has recently been laid off in fens for houses of the class referred to, and building operations have been in progress for some months. Mr. McEwen has built a large brewery, and there are to be four blocks of houses, from designs by Mr. John Paterson, architect. In the meantime, only the south frontage of two blocks on the south side of the ground is being proceeded with; but that will embrace about 463 separate dwellings, arranged in four stories. The elevations are in the Scotch style of architecture, the chief features being stepped gables and corbelled chimney-stalks. There are railed flower-pots along the front. Nearly 100 of the houses will be occupied this month: these have been built by Mr. Mackenzie and Mr. Rutherford.

CHURCH-BUILDING NEWS.

Holloway.—The foundation-stone of a new church has been laid in Poole's-park. Seven Sisters-road. The building will contain accommodation for 1,053 persons, and one half of the sittings are to be free. The amount paid for the site was 1,000l.; the builder's charge will be 3,500l.; and the internal finishings will cost 1,500l.; making a total expenditure of 6,000l. Towards this outlay there has been granted from the Bishop of London's Fund 1,000l. for the site, and 1,000l. for the building; a sum of 100l. has been received from the Diocesan Church Building Society; and 1,350l. have been promised by private donors; so that the total receipts hitherto amount to 3,350l., and leave 2,550l. to be still furnished for the completion of the edifice. The church will meet the wants of a locality which is rapidly becoming so populous that it has been found necessary to form a new district out of St. Mark's, Tollington-park. The materials will be partly stone and partly brick. The nave will be 93½ ft. by 29 ft., and will be

separated from the aisles (86 ft. by 16 ft.) by a range of circular shafts supporting six arches, above which will be a clearstory. The chancel will be 27½ ft. by 18 ft.; the organ chamber 11 ft. by 8½ ft., and the vestry of similar dimensions. The tower will occupy the south-west angle of the structure. The architect is Mr. A. D. Gough, and the style will be Lombardic. It is proposed to convert the present iron building, when the new church is consecrated, into a school-room for the use of the Sunday and day schools, thus affording accommodation for 350 children, while the present day-school cannot conveniently receive 100.

Shanklin (Isle of Wight).—The church of St. Saviour has been consecrated. The parish church has been repeatedly enlarged in order to meet the requirements of this growing town, but it has barely sittings for 280. A new church is now in progress of erection. It is being built from designs by Mr. Thomas Hellyer, of Ryde, in the Early Decorated style. It will consist of a nave, 78 ft. by 25 ft., and a chancel 30 ft. by 19 ft., with two side aisles 11 ft. 6 in. wide, under lean-to roofs, and a tower and spire at the west end of the south aisle 115 ft. in height. The nave is 25 ft. high, and the roof is 20 ft. in addition. The chancel is approached from the nave by a single step, and is separated from it by an arch with moulded corbels. The foundation-stone was laid on the 28th of June, 1867, and the length of time which has been occupied in its erection is attributable to the bankruptcy of the builder who took the contract. The committee themselves took the management of the work, employing Mr. Jolliffe, of Ryde, as clerk of the works, and under his superintendence the erection of the nave and chancel has been completed.

Salford.—The Stowell Memorial Church, Regent-road, Salford, has been consecrated by the Bishop of Manchester. The foundation-stone of the edifice was laid on the 19th of October, 1867, by the bishop, the church being erected to commemorate the life and labours of the Rev. Canon Stowell. The site had formerly been a pit, and was found to be filled up to many feet with material of a far from solid description, so that in some parts the walling is as deep below ground as it is high above it. The steeple is so placed that on entering the Regent-road from Water-street it is at once seen in the distance, and appears from that point of view as if in the centre of the street, with the rows of houses on either side. The church is of stone, designed in the Geometrical Decorated style. It consists of a broad nave, flanked by comparatively narrow aisles, and lofty. On the north side of the chancel, almost detached in appearance, and entirely so in reality, from the main building, stands the steeple, about 150 ft. high. The western wall of the nave is pierced by an arcade of three arches. The outer, and are respectively to north and south porch, and are provided with double doors. There is another principal door to the tower porch, so that by three wide doors the congregation may quickly disperse. The whole of the floors of the porches and passages are laid with red and black tiles in patterns, and that of the chancel with Maw's ornamental tiles. The chancel stalls and communion rail are all of oak, moulded and carved. The seats in the nave and aisles are all alike, and are of simple form. The three-light baptistery window is filled with ornamental glazing made by Messrs. Edmundson & Co. The great west window is divided into six compartments, and is ornamented with tracery in the upper part. The chancel window is about 25 ft. by 13 ft. It is of five lights, and the head is filled with a central rose and other tracery. There are five equal arches on each side of the nave. The clearstory windows are in pairs, alternating in design. The aisle windows are also all traceried, and are all of different designs. The gasfittings have been made by Messrs. Thomason, of Birmingham. The chancel lights are brackets bearing a sort of crown of gas jets. In the nave, a little above the capitals of the columns, are other somewhat similar but simpler brackets. There are also brackets in the aisles and elsewhere. The bell and its fittings, Haden's heating apparatus, and everything else to render the church complete for service, have been included in the contract. The church will seat 700 adults. The contract was taken by Mr. Mark Foggat, at something under 7,000l. Messrs. Medland Taylor & Henry Taylor, of Manchester, were the architects.

Wootton Bassett.—The trustees of Sir H. Menz have offered to restore the parish church, at a cost of between 4,000l. and 5,000l. The re-

ations comprise a new nave, the reparation of the chancel, a new vestry, raising the tower, and some new screens. The old galleries will be done away with. The architect is Mr. Street. The offer has been accepted.

Haygrave.—The small parish church of Haygrave has lately undergone considerable renovation and enlargement. The principal feature of the recent works is a material enlargement of the church, which has been effected by the removal of the old vestry on the north side, and the erection in its place of an aisle about 30 ft. long by 15 ft. wide, accommodation being thus afforded for about ninety additional persons. The new aisle is connected with the nave by three arches and circular columns of Ancaster stone, the latter having moulded caps and bases. The roof is boarded with unstained pine, and slated, and the aisle is lighted by three two-light Early English windows, also of Ancaster stone. The walls are built of Dalham stone, faced with flint, and with stone coirns, &c. A gallery at the west end was pulled down about a year and a half ago, but the tower still remains partially blocked by a smaller gallery, which affords accommodation for the school children. The pews which covered the floor have for the most part given place to benches of unstained pine. The architect employed was Mr. Ralph Chamberlain, of London. Mr. James Drake, of Osuden, was engaged as builder. The stonework was done by Mr. Hopson, of Bury. The total outlay was something in excess of 3000l., and was raised by voluntary subscriptions.

SIX YEARS' SANITARY LABOUR AT LIVERPOOL.

MR. NEWLANDS, the Liverpool borough engineer, has just submitted to the health committee of the town council a report which embraces the work in his department for the last six years. From this report it appears that since the 31st of December, 1862, there have been constructed within the borough 24 miles 490 yards of sewerage, at a total cost of 86,114l., or a small fraction over 2l. per yard. Since December 31st, 1862, the great work of converting privies into water-closets has been going on, and the engineer records 13,229 such conversions, and the cost of the drainage connected therewith was 37,719l.: 162 slate urinals, and 35 of iron, with in all 447 compartments, have been erected. Not less than 26 miles 1,153 yards of streets have been paved during the same period.

Everton takes the lion's share in both of the departments. During the period 10,007 new dwelling-houses were erected, of which 48 per cent. were in Everton and Kirkdale, 23 per cent. in West Derby, and 26 per cent. for the Toxteths, leaving only 3 per cent. for the parish. The report embraces a great variety of other matters. On the subject of the utilization of sewage, the reporter states that the works of Messrs. John Noble & Co., under the Liverpool Sewage Utilization Act, are nearly completed at Sandhills outlet sewer, where the company mean to set to work as a preliminary test. The steam-roller purchased in 1866 cost 1,069l., weighs 30 tons, and has been worked five days in the week at a cost of 301l. for sixty-one weeks. It rolls macadam roads at a cost of 1d. per yard. Nothing is said as to its doing any injury to gas or water pipes sewers, &c.

Books Received.

A Few Remarks on the Crystal Palace and People's Park. By FRANCIS FULLER. Boot, 8, Eastcheap, 1869.

In this pamphlet Mr. Francis Fuller paints in strong colours the miserable condition into which the Crystal Palace, according to his view, is falling,—the gradual disappearance of everything elevating, and the exaltation of eating and drinking. He urges that the character of the institution has been disgracefully lowered; that it is most important it should be raised for the advantage of the public; and to this end that it "must either be rescued from the hands of the present Direction, or the Direction must be revised and strengthened, and made capable of performing new duties with vigour," that the debt must be paid off, and new capital raised; the institution be worked solely for the original objects; and the building and park ultimately become the property of the nation."

VARIORUM.

"Military Work by Military Labour, with a few Remarks on Mr. Hanbury Tracy's Motion before Parliament, by an Officer of Royal Engineers" (Buck, Paternoster-row), contains, besides the preface, an extract from "Hansard's Debates," vol. xciv., the debate on the introduction of the measure by Mr. Tracy; together with reviews of the press extracted from the *Times* and other daily papers, the *United Service Gazette*, *Saturday Review*, *Builder*, &c.; and abstract of a return to Parliament on the subject of soldier labour on repairs of barracks, and on new works. In the preface the author (O. E. W.) says of Mr. Tracy's plan for causing regiments to do their own repairs and other work:—

"There is as little interference as possible by any other department in the arrangements for carrying on the work. In a short time after a uniform system had been adopted, the standard of the quality of the work required would become known. Regiments would be found to emulise one another in the neatness and perfection of execution;—and any neglect or carelessness could be easily checked by a deduction from the payments, which in time might be left to the regiment itself to decide.

This work on repairs will afford constant occupation to a certain number of men, probably about 2 per cent. It will therefore rest entirely with the commanding officer to arrange his work, so that every deserving and competent artificer will have the opportunity of earning a small weekly wage. Casual special services, on which soldiers have generally hitherto been employed, need then only be carried out by their labour, when there is a surplus employed on repairs. The economy will be greatly to be gained quite wrong to suppose that the greatest saving can be effected on new works, any one with practical experience knowing that the contractor's profit is much less on the latter than on repairs."

"It is believed, from experience gained in making incidental repairs under the Royal Engineers by the troops at Portsmouth, that the required number of artificers could exist in the ranks. If an officer and four or five such men from every regiment at home were placed under the Royal Engineers for six months—say at our camps, four in number—they would acquire the necessary knowledge for carrying on a very simple system of work. A trifling permanent increase of pay would give the men on qualification the status of master tradesmen, and the seed would be sown for future development in proportion to the maintenance given by commanding officers. Probably before long we should find in some regiments that all utensils would be returned into store in a good state of repair."

—Mr. Meiklejohn's "River or Equator System of marking London or any large City with a River, or other main dividing Line, for Postal Purposes, Directions, Cab Routes, and general Guidance (Stanford, Charing-cross)." The title of this pamphlet explains its purposes. London would by this plan be marked off into small squares of a quarter of a mile each, with numbers running north and south from the river or median line, in connexion with alphabetical letters running from west to east. Thus the exact position of a quarter of a mile, with reference to all the others, could readily be known, and directions, cab fares, &c., facilitated. A letter, for example or direction, to "Mr. John Smith, 24, Clarendon-terrace, Sussex-square, Alina-road, Kentish-town, London, N.W.," would simply be to "Mr. John Smith, 24, Clarendon-terrace, K 6;" and, after all, gain and not lose in definiteness and precision.

"Letter to the Chairman and Members of the Mersey Dock and Harbour Board, on Proposed Liverpool and Birkenhead Railway. By William Low, C.E., and George Thomas, C.E. (Advertiser Office, Wrexham). Our readers who may wish to know more as to the proposed new hedge across the Mersey, spoken of in our issue for the 22nd May, will find it in the pamphlet under notice.—*Cassell's Magazine*, the *Quiver*, the *World of Wonders*, the *Popular Educator*, all from the same firm, contain monthly full value for the money they cost. The writing, besides being amusing, has usually a good purpose. We take a paragraph from the current number of *Cassell's Magazine* on "Nobdy's Children" :—

"Half-sentimental synonyms, whatever may have been their original strength and adaptability to a certain purpose, are like other epigrams. They cannot continue to be applied without being taken for expressions of truth where they are only indications of truth; they falsely assume the appearance of the inevitable, and ultimately help to undo the work for which they were at first intended, by seeming to relieve us from a responsibility which they once usefully reminded us. Already we have changed our synonym for the homeless children of the streets from 'Street Arabs' to 'Young Ravens,' and even to 'Gutter Children' and there is no telling how many notes of this sentimentally descriptive gamut may be sounded to very little purpose in reference to the general harmony, while we persuade ourselves that those on whom we bestow the pitifully evasive epithets are 'Nobdy's Children.' The truth is, that these forlorn boys and girls—these street Arabs—whom we are so ready to relegate to the great London desert as a race apart from ourselves, are of our own heritage, and we have no business that does not also belong to them, inasmuch as they are indivisibly connected with us for future good or future evil. They will be the men and women of the future time to come—the bread and butter, the help and the children, of the little ones who now sit round our tables, and who belong to us by the ties of close and loving relationship."

—A Treatise on Dwellings for the Labouring Classes. By Captain E. R. Read. Layman,

Covent-garden." The author of this pamphlet here propounds a somewhat Utopian plan which is to provide improved dwellings for the working classes, under national or Government auspices, and on a basis so profitable that a large surplus revenue is reckoned upon, available for a variety of purposes, including a sick fund, an educational fund, and a fund for the reduction of national taxation. At the same time it is considered that pauperism will be reduced within the narrowest possible limits. The organisation of this State scheme would resemble that of the present Poor-law, with a central board and local authorities. No doubt, proper education, decent dwellings, and a well-managed sick fund, would greatly benefit the working classes and render them less dependent on the ratepayers; but whether in ten years the system either can or will be brought into full operation at a cost of 20,000,000l. annually; or in twenty years at an annual cost of 10,000,000l., as Captain Read says it could, is quite another question.

Miscellaneous.

Scientific Slanging.—An owner, who has made a rock-work, planted with ferns, in the front of his house, near Winchester, has set up the following notice, and finds it efficient:—"Beggars beware! Scolopendriums and Poly-podiums are set here." This will remind some readers of O'Connell's famous passage of tongues with a fishwoman, when he replied to all her epithets with scientific terms, and ultimately shut her up by calling her an hypobutene.

Society for the Encouragement of the Fine Arts.—On Thursday, 27th ult., there was an exhibition of the series of designs by Mr. H. C. Solons, illustrative of Mr. C. Kingsley's story of "Hereward the Wake," and which obtained the premium offered by the Art Union of London in 1867, together with an equal number of partially shaded drawings—the best of the unsuccessful series—illustrative of Lord Byron's "Lara," by Mr. C. B. Birch, the sculptor. Mr. Godwin, F.R.S., presided. Mr. T. R. S. Temple, in a short paper on the subject, after noticing the slow growth of art societies in England, their importance in raising the standard of art, and their utility as well to the veteran as to the youthful artist, gave a rapid sketch of the rise and progress of the Royal Academy of Painting, of the Society of Arts, of the British Institution, and of the Royal Academy of Music; and more especially congratulated the Art Union on being the only society at the present day that professedly encouraged historical composition, one of the highest branches of art yet strangely neglected in England. He next drew attention to Mr. Solons's designs, remarking on the judicious choice of subject, and on the freedom and elegance of his pencil, and regretting that a country which had such a noble history should have so few great historical painters. Mr. Solons felt highly gratified at the notice taken of his designs, and, whilst wishing they had been better, said it was an arduous task to go through so many; each design, as far as the idea is concerned, requiring as much thought as a finished picture. The chairman addressed the meeting. Mr. H. Tidy, Mr. Mapleson, Mr. Gilks, Dr. Heinemann, and other gentlemen spoke, and the proceedings terminated with votes of thanks.

Ely Local Board of Health.—At the last meeting of the Board the chairman (the Rev. G. Hall) said: The Board and the town at large had every reason to be proud of the very healthy state of affairs detailed. These benefits could not be accomplished without the aid of excellent officers, and the town had every reason to be proud of the manner in which the duties were performed. The statement made by Mr. Marshall was so plain that every one could understand it. The great reduction in their expenses might be fairly ascribed to Mr. Mather, who performed his duties admirably, and with a sharp eye to economy.

The Small-pox and Fever Hospitals at Romerton.—A correspondent says:—At a meeting of contractors held at the Westminster Palace Hotel, on Monday last, Mr. R. Trolope, in the chair, Messrs. Richardson & Waghorn were appointed the surveyors to compute the quantities of the proposed works on behalf of the builders, in conjunction with the surveyor appointed by the Asylum Board. The other surveyors who were nominated at the meeting, were Messrs. Arding & Bond, Messrs. Franklin & Andrews, and Mr. Jas. Barnett.

Mr. James Shepherd, of Rome.—The death of our countryman, Mr. James Shepherd, long a resident in Rome, will be heard of with great regret by a large number of persons. Mr. Shepherd was well known, both in Rome and England, for his energy, probity, and social qualities, and is looked on as a public benefactor in Rome, since it is owing to his untiring exertions and able direction that the city is lighted by gas, and that by the end of this year the most pure and copious of all the streams formerly brought to the capital by the ancient Romans, the Marcian water, will be again introduced by means of an ample aqueduct, and restored to the use and comfort of the public and the salubrity and ornament of the city. Not only will every one interested in the Anglo-Roman Gas Company and the Marcian Water Company deeply deplore the demise of their director, but a large number of friends will lament his exit from their social circle, and offer the sincerest tribute of condolence to his bereaved widow. Mr. Shepherd had been indisposed for several days in consequence of a fall resulting from momentary suffocation caused by swallowing an orange-pip. This accelerated heart-disease, from which he died. His funeral was attended by a large body of the English residents.

Co-operative Congress.—A co-operative congress of representative working men and others is being held in the large room of the Society of Arts. There was a large attendance at the opening proceedings. Among those present were Mr. T. Hughes, M.P. (who was called upon to preside), the Comte de Paris, M. Morier (Chargé d'Affaires at Darmstadt), Mr. W. Morrison, M.P., Mr. Mandella, M.P., Sir J. Bowring, Mr. Hodgson Pratt, Mr. G. Potter, Mr. G. Holyoake, Mr. J. Plummer, Mr. Lloyd Jones, Dr. Travers, &c. Among the subjects to be discussed were:—What further steps can be taken to give effect to the resolution of the Trades Congress held in Manchester in June, 1868—"To utilize the organization of the trade-unions for co-operative purposes"; the best means of making co-operative societies mutually helpful; in partnerships of industry, what division of profits, as between capital and labour, is the most likely to produce perfectly harmonious action, and therefore the argest measure of success; and the best practical means of promoting a knowledge of co-operation among the people. During the sitting of the congress an exhibition of specimens of production by co-operative societies and partnerships of industry was on view.

Builders' Benevolent Institution.—Last week a general meeting of the subscribers to the Builders' Benevolent Institution was held at Willis's-rooms, King-street, St. James's, for the purpose of electing two pensioners—one male and one female—on the funds of the institution. There were fourteen candidates. Mr. G. F. Trollope (president) occupied the chair. Since the foundation there have been 104 male and female recipients of the fund,—the men receiving 244 and the women 207 per annum. The moneys are invested in the Three per Cent. Consols,—11,706l. 9s. 8d. being for the relief fund, and 2,951l. 12s. 7d. for the building fund. The chairman, in opening the proceedings, said their duty was a very simple one, having only to elect two candidates out of a list of fourteen. They all knew that the present number of pensioners was forty-six—twenty-three males and twenty-three females. The society had hoped to increase the number of pensioners, but he was sorry to say their wishes could not be carried out, as the funds would not permit it. He, however, trusted that they would in future obtain a greater number of subscribers, so that they might obtain their desired wish, viz., the relief of those who were in need. The poll was then declared open.

Metropolitan Police Returns, 1868.—The usual criminal returns have been printed. From these it appears that in 1868, 45,848 males and 21,022 females were taken into custody; 24,943 males and 9,784 females summarily disposed of, or held to bail; and 2,623 males and 661 females tried and convicted. Of those taken into custody, 9,756 males and 5,506 females could neither read nor write; 33,475 males and 15,950 females could read only, or read and write imperfectly; 2,535 males and 164 females could read and write well; and 82 males and two females had had superior instruction. Of those tried and convicted, 560 males and 177 females were of the first class, 1,889 males and 47 females of the second; 174 males and 13 females of the third class; and 6 males and no females of the last class.

The History of Alnwick.—Mr. G. Tate having completed his "History of the Borough, Castle, and Barony of Alnwick," a number of his fellow-townsmen and friends from other parts entertained him at dinner on the 21st of May, under the presidency of Dr. Collingwood Bruce, and presented him with a testimonial, in the shape of a silver tea-service, a purse of money, and an address. The service was handsome, and bore the following inscription on the coffee-pot:—

"Presented to George Tate, Esq., F.G.S. (together with one hundred guineas and an illuminated address), at a public dinner held in the Town-hall, Alnwick, on the 19th day of May, 1869, as a token of esteem for his private worth, and admiration of his eminent literary and scientific attainments."

The address bore in the corners small paintings of Alnwick and Hulme Abbeys, and the Barbican and Abbot's Tower of the Castle. Alnwick is entitled to our warm commendation for showing its appreciation of a townsman's labours.

The Kent and Canterbury Hospital, Canterbury.—At a special general board of governors held to receive and consider a report of the Board of Management relative to the proposed alterations and improvements in the hospital buildings, Dr. Lochee stated that it was found that the existing water-closets and tanks for patients, situated as they are inside the building, are calculated to give rise to disagreeable consequences; that the ventilation in all the wards is inefficient; that, from the impossibility of getting a temperature anything up to the required degree in winter, efforts to treat successfully lung diseases were rendered almost futile; and that the accommodation to out-patients and casualties needed to be much more extended. The faults of the building had not been exaggerated, and they could only be rectified by adopting and carrying out such plans as would be submitted to them. He did not hold out any hope that they would have a model hospital, or one that would even suit the ideas of modern constructors of such edifices; but serious inconveniences would be removed. The architect (Mr. Thomas Henry Watson, of London) then read a report of the proposed alterations and submitted plans of the work. He said he estimated the cost to be 3,800l., or, allowing for extras, 4,000l. It was finally resolved that the plans produced be adopted, and that an appeal be made to the governors and the public for a building fund.

Sanitary Condition of Salford.—The ninth annual report of the medical officer of health for Salford, Mr. E. J. Syson, has been printed. From this report it appears that the death-rate of the borough for 1868 was 30.53 per 1,000 per annum, or 1 in 32. Of the total deaths, in a population of 118,213, 1,893, or 52.43 per cent., were children under five years of age. The chief causes of death were scarlatina, by which 404 deaths were caused, the most fatal period being between the ages of 2 and 5; next follow bronchitis and diarrhoea; then phthisis. From convulsions, 193 died; from typhus, 117; from typhoid fever, 125; from old age, 128. There was an increase in 1868 of 33 deaths from typhus, and 72 from typhoid fever, compared with 1867.

Incorporated Church-building Society.—At the annual meeting of this society, the secretary read the report, which stated that from jubilee services the society received 8,000l. There was a large increase in the amount of funds held by the society in trust for the repairs of churches, the total being now 48,865l.; in March, 1868, it was 42,249l. During the past year the number of applications had been greater than in any former year; the grants made were 170 in number, and 8,475l. in amount. The accounts, as audited by Messrs. Johnstone, Cooper, Wintle, & Evans, showed a total income from all sources amounting to 13,757l. 17s. 10d. Some very considerable reforms are needed in this society.

The Park-lane Improvement Bill.—At the meeting of the Metropolitan Board of Works, Mr. Newton, in answer to a question, said the select committee of the House of Commons had refused to insert special clauses in the bill to remunerate persons for making the thoroughfare through Hamilton-place whose property would not be required, and in consequence of that refusal Mr. Gore, the Commissioner of Woods and Forests, had told the committee that he should consult the Lords of the Treasury as to whether they would consent to the third reading of the bill. It has, however, been read a third time.

New Park at Hampstead.—We understand that a plan has been set on foot by which, if carried into effect, the inhabitants of Marylebone, Kilburn, Beisize, Camden Town, Haverstock-hill, and St. John's Wood, will be greatly benefited. It was proposed in a vestry meeting at Hampstead the other day, to take on lease, at a moderate rental, with option of purchase, an area of between fifty and sixty acres in the neighbourhood of Finchley-road. It is expected that the new lord of the manor, Sir John Maryon Wilson, will not be indisposed to meet the wishes of the inhabitants of Hampstead thus far, especially if, as is very probable, the parish of Marylebone should unite with that of Hampstead, and both with the Metropolitan Board of Works, in forwarding the success of the scheme.

Paper Houses.—We have in former notices referred to the numerous uses to which paper is now being put, especially in America, where hats, buckets, and many other useful articles have for some time been made of it. The *Chicago Journal of Commerce* now informs us that houses are being built of paper, and that they are warmer, and cost one-third less than houses built of wood and plaster after the usual fashion.

The Sheffield New Post-office.—The contract for the new post-office has been let to Messrs. Robert Neill & Sons, of Manchester. The surveyor representing the post-office authorities in London and one of the contractors were in Sheffield on Thursday, staking out the building, and the works will be immediately proceeded with. The contractors are the same that are engaged in the erection of the new South Yorkshire Asylum at Wadley Park.

Lead Poisoning.—At an inquest held at Poplar respecting the death of Mrs. Elizabeth Christopher, a beershop-keeper in the Commercial-road, the doctor who attended the deceased said that her death was caused by drinking beer which had been drawn from new lead pipes in the bar of the beershop. The jury returned a verdict of "Accidental death from lead-poisoning." Dr. Schwarz, of Breslau, suggests a simple method of protecting lead pipes from the action of water, by forming on the inside surface of the pipes an insoluble sulphide of lead. The operation consists in filling the pipes with a warm and concentrated solution of sulphide of potassium, or sodium, which is left in contact with the lead for a quarter of an hour.

Important to Patentees.—The Lord Chancellor has decided a point of interest to the registrars of patents. An intending patentee had lodged a provisional specification, when another inventor filed one of a similar description, and procured his patent to be first sealed. The former complained of this, and argued that under the circumstances the Attorney-General should not have allowed the second person to file his patent. The Lord Chancellor, however, pointed out that there was no law to compel a person who had filed a provisional specification to proceed with his invention, and if the applications of other parties were to be uniformly rejected, the country might be deprived of the fruits of the ingenuity of many minds which were working in the same direction.

Completion of the Great Pacific Railway.—As the public by this time know, the Atlantic and Pacific Railroad is completed, and America, big in everything else, can now boast of the longest single iron highway in the world. At Promontory Point, in the State of Utah, where the last rail was fixed, the telegraph was kept actively at work, communicating with every important city in the States, and messages in rapid succession exchanged details of each step in the process of completion, with responsive congratulations sent by distant sympathisers. Of every incident as it happened all Americans were informed at the instant. It was really a grand event; and, as the London *Telegraph* remarks, "few will think the monster processions and rejoicings, or the special religious services, at all out of place in celebrating one of the greatest steps in the march of civilisation that the century has witnessed." As an appendage, we may add, Brigham Young, the Mormonite head of a hundred wives and children (all told), has broken the first ground for the Utah Central Railroad, below Ogden. The road is to connect Salt Lake City with the Pacific Railroad, and it is said will probably be finished in October.

Great Northern Railway Church at Peterborough.—On Friday, 27th ult., the Bishop of Peterborough consecrated this church, which has been built for the locomotive establishment of the Great Northern Railway Company at New England, about a mile north of the Peterborough station. Mr. Teale, of Doncaster, is the architect. The church is 104 ft. long and 48 ft. wide, and has a low central tower, but no transepts, a pyramidal roof covered with the stone slates of the country, and a semi-circular apse.

Overcrowding in the Borough.—In the course of an inquiry before the coroner for East Surrey, into the cause of the death of a child two months old, it came out that in a small room a man and his wife, with deceased, and a grown-up son and daughter, all lived and slept. There was nothing put up to part the two beds in the room. The coroner said it was most disgraceful that such a thing should exist. Overcrowding could not continue if a thorough house-to-house visitation took place, and the landlords were severely dealt with if they infringed the law. The child appears to have been suffocated while in bed.

A Big Blast.—At Shap Granite Works last week, a huge blast took place. With 75 lbs. of powder, a solid block of granite, measuring 40 ft. by 30 ft. by 15 ft., and weighing 1,500 tons, was blown from the monster deposit of Wastdale Crag. Probably such an immense mass, in one block, has never been blasted before.

The Sewage Question.—The Eton Local Board of Health have determined to adopt the report and plan of Messrs. Ripley & Simonds, civil engineers, for the drainage of Eton College and town. The system adopted is the separate one, with the purchase of land for sewage utilisation and irrigation. The cost is estimated at £8,000.

TENDERS.

For Kidsgrove sewerage. Messrs. R. Scrivenor & Son, architect. Quantities supplied:—
Pain £1,600 0 0
Taylor 1,340 0 0
Rowson 1,250 0 0
Lunn & Heynes 1,170 0 0
Pearee 1,031 17 7
J. & S. Smith (accepted) 1,020 11 0

For the erection of shop and premises, Gun-lane, Limon-house. Mr. T. C. Clarke, architect:—
Kilby £886 0 0
Abraham 684 0 0
King & Sons 668 0 0
Hoskins 620 0 0
Fletcher 574 0 0
Hopewell 553 0 0

For additions to the Lock Hospital, Harrow-road, Mr. F. W. Porter, architect:—
Hill & Keddell £3,114 0 0
Patman & Fotheringham 2,875 0 0
Dove, Brothers 2,775 0 0
Mansfield & Price 2,768 0 0
Abby & Sons 2,743 0 0
P'Anson 2,675 0 0
Ebb & Sons 2,544 0 0
Conder 2,508 0 0
Macey 2,413 0 0
Henshaw 2,375 0 0
King & Sons 2,294 0 0
Browne & Robinson 2,227 0 0
Longmire & Barge 2,117 0 0

For various works, St. Paul's Church, Mill-hill, Hendon, Mr. Parkinson, architect:—
Patman & Co. £3,164 0 0
Adams & Sons 3,160 0 0
Foster 3,080 0 0
Cooper & Cullum 2,950 0 0
Wheeler 2,873 0 0
King & Sons 2,858 0 0
Crab & Vaughan 2,736 0 0
Deards 2,554 0 0

For the erection of three houses and shops, at Ventnor, Isle of Wight, for Mr. Gibson. Mr. Francis Newman, architect. Quantities supplied:—
New Buildings. Old Materials.
Wickens £1,884 10 0 £38 10 0
Ingram & Son 1,897 0 0 38 10 0
Newham 1,893 6 0 37 1 8
Moses & Wallder (acc'd.) 1,749 0 0 100 0 0

For plumber's, glazier's, and painter's work, to eight houses, at West-hill, Hastings. Mr. Alfred Cross, architect:—
Nave £197 2 3
Pickwell 480 0 0
Jarret 385 17 4
Vidler 382 0 0
Brown (accepted) 397 5 6

For new house, Adelaide-road, South Hampton, for Mr. Gale, nurseryman. Quantities by Mr. W. Todd:—
Simpson & Son £585 0 0
Ehls & Sons 816 0 0
Thomas 789 19 0
Hackworth 777 5 0
Longmire & Barge 777 0 0

For Walton-on-the-Hill sewerage works. Contract No. 1. Mr. George W. Goodson (Reade & Goodson), engineer:—
Anderson & Co. £13,900 0 0
Hunking 12,819 12 2
Thomas 12,154 13 1
Lee 11,035 0 0
Dixon & Sleigh 11,464 13 0
Martin, jun. 11,238 0 0
Hartley & Co. 10,689 2 3
Mitchell 9,998 9 8
Fawkes & Mansel 9,867 15 9
Herdacre 9,868 0 0
Moore 9,628 0 0
Winnard, jun. 9,500 0 0
Thane (accepted) 8,324 1 6
Ford 8,225 0 0
Messrs. Smith 7,150 0 0

For house, Duke-street, for Mr. A. M. M'Dougal, Mr. Charles E. Davies, architect. Quantities supplied:—
Wood £8,500 0 0
Hill 5,347 0 0
Shurmut 5,144 0 0
Johnstone 4,620 0 0
Thomas & Son 4,300 0 0
Morgan & Lovell 4,283 0 0
Nightingale 4,140 0 0
Nixon & Son 4,120 0 0
Rudkin 4,000 0 0
Carter & Son 3,973 0 0
Myers & Sons 3,984 0 0
Blackmore & Morley 3,840 0 0
Hill & Sons 3,790 0 0
Conder (accepted) 3,673 0 0
Wigmore 3,675 0 0

For schools at Watford. Mr. Thos. Pearson, architect. Quantities supplied:—
Taylor £1,764 0 0
Hubbard 1,650 0 0
Stans & Son 1,696 0 0
Hamphrey 1,683 0 0
Nightingale 1,633 0 0
Waterman 1,498 0 0
Raper 1,480 0 0
Foss & Co. 1,477 0 0
Snowden 1,468 0 0
Cooper & Cullum 1,436 0 0

For rebuilding 40 and 41, Haymarket, for Mr. A. Binnie. Mr. H. Lauderjone, architect. Quantities supplied:—
Greig £2,926 0 0
Nightingale 2,917 0 0
Patman & Co. 2,810 0 0
Myers & Sons 2,687 0 0
Mitchell 2,570 0 0
Scrivenor & White 2,468 0 0

For the supply and delivery of about 214 tons of 24-in. cast-iron pipes, in 9-ft. lengths, and 8 tons ditto, in 3-ft. lengths, for outfall sewers, for the Ryde Local Board. Mr. Francis Newman, C.E., borough surveyor:—

Table with 3 columns: 9-ft. lengths, Per Ton, 3-ft. lengths. Includes entries for Starvel Iron and Coal Co., Woolstebulmies & Rye, Garrett & Co., Sharpe, Coker, Spittle, Boland & Co., Laurie & Co., Fry, Laddaw & Son, White, Clarke, Newton, Chambers & Co., Claridge, North, & Co., Christie & Co., Begg, Deace, Bolekew, Vaughan, & Co.

For the erection of eight houses, at West-hill, Hastings. Mr. Alfred Cross, architect:—
Longhurst £3,452 0 0
Jones 3,330 0 0
Vidler 3,245 0 0
Hughes 3,108 0 0
Roddie 3,093 0 0
Howell 3,069 0 0
Bourne 3,049 0 0
Farka (accepted) 2,787 0 0

For re-construction of old premises, No. 3, Cherry-tree-court, Aldersgate-street, for Mr. T. H. Ellis. Mr. William Smith, architect:—
Kilby £1,190 0 0
Selsby 1,184 0 0
Henshaw 1,130 0 0
Fletcher & Caughay 1,128 0 0
Crab & Vaughan 1,109 0 0
Blackmore & Morley 1,058 0 0

For alterations, &c., to Elm Villas, Leytonstone, for Mr. D. T. Leroni. Mr. William Smith, architect:—
Henshaw £3,690 0 0
Blackmore & Morley 325 0 0
Arber 297 0 0

For finishings to the Clarence Hotel, Hastings. Mr. Alfred Cross, architect:—
Howell £728 10 0
Parks 724 0 0
Vidler 714 0 0
Bourne 695 0 0
Hughes 655 0 0
Longhurst 618 0 0
Roddie 609 10 0
Russell 450 0 0

For a house in High-street, Saffron Walden, for Mr. G. B. Gibson. Mr. Frederick H. Johnson, architect:—
Wright £1,419 0 0
Bell & Sons (accepted) 1,380 0 0

For the new Barnsbury Railway Station, North London Railway Company:—

Table with 3 columns: Estimate A., Estimate B., Estimate C. Includes entries for Hill, Sharnam, Hill & Sons, Mill & Co., Goodman, Bennett, Hill, Keddell, & Waldron, Wood, Wenship, Merritt & Ashby, Keeble, Crab & Vaughan, King & Sons, Mansfield, Price, & Co., Axford & Co., Watts, Hedges, Webb & Sons, Sawyer, Wickes, Bangs, & Co.

For alterations and additions, St. Paul's Church, Mill-hill. Mr. R. Parkinson, architect. Quantities by Mr. George Lansdown:—

Table with 3 columns: Estimate A., Estimate B., Estimate C. Includes entries for Patman & Fotheringham, Adams & Sons, Foster, Cooper & Cullum, Wheeler, King & Son, Crab & Vaughan, Deards.

For reseating, &c., the parish church, Mitcham, Surrey. Mr. Edwin Chart, architect. Quantities supplied:—

Table with 3 columns: If in Deal, If in Chestnut, If in Wainscot. Includes entries for Lawrence & Sons, Dove, Brothers, Mills & Son, Lawrence, Chapman, Jackson & Blaw, Gulland, Myers & Sons.

TO CORRESPONDENTS.

E. C. - J. G. R. - F. N. - G. H. G. - R. & H. A. C. - B. - E. R. N. - T. H. K. - C. E. - W. - S. - G. - P. - S. & S. - A. - W. - T. W. - H. A. B. - A. J. S. - C. P. - R. C. M. - R. - E. Constant Reader (the architect, usual recs. ty. has been considered responsible for his clerk of the works. Now that committees and other bodies appoint their own clerk of the works, the position is altered) - Kidnapper's lottery (next week) - West-India Sewage (next week) - W. C. B. (in type) - M. U. (in type) - several papers and communications are unavoidably postponed.

We are compelled to decline printing out books and giving addresses. All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note: - The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stable, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Chmroh and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales. Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

PROFESSOR PEPPER'S LECTURE ON THE GREAT LIGHTNING INDUSTRY, as delivered before their Royal Highnesses the Princess Louise and Bedford, "Robin Hood" and "Assault," musically treated by George Mackenzie, esq., the "Astronomer," "Wendy," "Felic-Robert," "John Bull," "The Duke of Devonshire," "Stakes at Henry" - at the ROYAL POLYTECHNIC - One Shilling.

"THE BUILDER" - WANTED, to PURCHASE, the Numbers of 1854, 1855, and 1856 (Vol. 22, 23, and 24) - Address, stating price and this particular, to Mr. PARADISE, at the Office, 1, Abchurch-lane, Southwark, W.C.

Just published, in limited oblong form, Price One Guinea THE PRINCIPLES OF PERSPECTIVE. Illustrated in a Series of Examples, by HENRY D. HUGHES. LONDON: CHARLES KNIGHT & CO., 15, Abchurch-lane, Finsbury. CHELSEA: BARNY DAVIES, and all Bookellers.

THE SURPRISING ADVENTURES OF PHILIP QUABLL, the English Hermit, lately re-edited and illustrated. LONDON: WILLIAM TEGG, Fancourt-lane, Chancery.

ARABIAN NIGHTS (the) ENTERTAINING - A new and highly interesting and valuable work, which has not only been prohibited in the latter empire, the present edition is intended as a valuable book for all, and a valuable present to the youngest members of society. LONDON: WILLIAM TEGG, Fancourt-lane, Chancery.

The Builder.

VOL. XXVII.—No. 1375.

The Improvement of our Gardens and Open Places.

ANY useful hints may be obtained from Mr. Robinson's book on the Paris Parks and Gardens, spoken of in our last,* and we therefore return to it.

The spaces in front of several of the Parisian churches are very agreeably adorned in much the same manner as the squares, even to the fountains, little cascades, and statues. The church of the Trinité is a case in point. Here the garden extends in front of the church to about three times its width. It is in form of an oval, surrounded with a white stone balustrade, outside of which is a carriage-way up to the church doors. "From the garden to the church ascent is gained by two flights of steps, and between these steps three curvilinear cascades fall from three groups of statues, the waters uniting in one semicircular basin," says Mr. Robinson, adding, that the effect is quite sparkling, even for Paris. St. Clothilde has another garden approach,—not a stiff, straight gravel-walk through a church-yard, but a bright green sweep of grass and foliage, margined with the low iron edging that seems to be in general favour now in Paris, and which is only an interlacement of semicircles, in imitation of the rustic edgings, probably, formed with bent twigs. Fresh from a contemplation of this care and its happy effect Mr. Robinson thinks of the recent attempts at church-yard gardening in London. Speaking of the churchwardens who have already set to work, he says—

"Evergreens are to be substituted for headstones, and lamentable bits of Cockney gardening for the memorials of the dead. The most notable instance of this kind with which I am acquainted is around the church in Bishopsgate-street. Tombs and headstones appear to have been cleared out of the way, and all obstructions removed, so that a level surface might be obtained on which to set a few hundred evergreens, which have little more chance of flourishing in Bishopsgate-street than if planted in the Salt Lake."

And to churchwardens who have not yet taken any fatal steps, he says,—

"It would be a great advantage if the churchwarden mind could get rid of the idea that before making a garden in a graveyard it is necessary to level the space and make it like any commonplace bit of ground. Instead of pursuing such a course they should procure a few pounds' worth of advice from a respectable landscape gardener acquainted with the subject, and say to him, 'finabellish the spot without destroying its memorials or associations.' If you want it levelled, mutilated, and planted with a few formal beds and shrubberies, confide its execution to an intelligent navvy."

We should have been glad if the author had been as clear as this upon every point. On this same page we notice, he says, "Evergreen shrubs are proverbially fond of London smut," and points out their luxuriance in front of Tattersall's. While on page 161, when advocating the superiority of deciduous trees for cities on account of the ravages of the "black," he calls attention to the same spot as a witness on the other side. "The once handsome and healthy araucarias, planted in front of Tattersall's, at

Knightsbridge, and now draped with filth and soot," he describes as being, with the young pines and evergreens in the Regent's Park, and elsewhere, victims to the violence of the atmosphere. However, he makes amends for this contradiction by giving a long list of trees that will grow in London, headed by the plane, which gives such vivacious green to Berkeley-square. The last on the list, we may add, before we return to the Parisian improvements, is the lime. This is planted in large numbers in our suburban gardens, where the early withering and fall of its leaves make us fear the winter is approaching before the summer is half over. Every lime-tree in every small garden, says Mr. Robinson, ruthlessly, should be cut down. And Irish ivy should be trained up the railing to keep the dust out, and give a fresh green aspect.

Returning to Paris, we will take to the spacious streets and approaches, to see what municipal effort has done in this department. We find, in truth,—

"The city swims in verdure, beautiful As Venice on the waters, the sea-swan."

Around, across, and through the city stretch the wide, open, tree-bordered streets called *houlevards*, from the circumstance of the most ancient of them having been built upon the site of the *bulwarks* of old Paris. And not content with this, others, with footways on each side of them, it must be borne in mind, as wide as some of the old streets, pierce it in every direction, radiating from circular open *places*. Hence, not only is overcrowding an impossibility, as far as it relates to houses, in the present day, but it will be one for several generations. We inserted a view, in our previous notice, on the *Boulevards* near the *Château d'Eau*, as an example of their spaciousness, lightness, and attractiveness. The *Boulevard Richard Lenoir* differs somewhat from the ordinary type, for it is built to a large extent over a canal, and has eighteen pairs of ventilating and lighting shafts in the course of its 2,000 yards run, which features are made almost ornamental on as many little *parterres*, with central fountains, and flowers and grass in each. And on both sides of these *parterres* are wide footways, rows of plane-trees, and good roads. Then there are besides the *houlevards* that every visitor sees stretching from the *Madeleine* to the *Bastille*, those of *St. Jacques*, *d'Italie*, *d'Enfer*,—where there is a new name wanted, surely,—*du Mont Parnasse*, and the *Avenue de Breteuil*, on the left bank of the *Seine*; and as many on the right, among which we may count over the *Boulevards Pereire*, *des Batignolles*, *Clichy*, *Rochechouart*, *de la Chapelle*, and *de Belleville*. And again, treated in the same way are many *avenues*, of which the *Avenue de l'Impératrice* is the most gardenesque, according to our author's taste. The suns spent upon these works must have exceeded those *Cæsar*s laid out in the rich presents he made to the temple of *Delphi*; but when we consider the magnet that the magnificence of the city is to strangers, and the beneficial sanitary result, it will be seen they are, for the most part, wisely invested. The *avenue* mentioned was formed to make a wide, direct, and good approach to the *Bois de Boulogne*; 20,000l. was the amount of the first cost, to which the sum of 4,000l. was added for the enlargement of the *Auteuil Railway-bridge*, drainage, plantations, and flower-beds, and the length does not exceed 1,300 yards. The *Avenue de l'Empereur* cost 82,000l. Large excavations in some portions of its length, and embankments at others, account for the largeness of this charge. One portion runs along the *Seine*, and will form a terrace. The construction here is thus described:—

"The method which seemed to promise the greatest amount of safety combined with economy was to spread the pressure of the vast mass over a large extent of sur-

face. For this purpose a wide area was formed of concrete, on which was erected a wall nearly of the same size. This wall was hollowed out on each side by large spaces forming on the front turned towards the observer a series of vaults supporting a row of shrubs, which allowed the eye to wander through them into the neighbouring gardens. On the other side, where the embankment had been formed there were two rows of vaults, in order that the weight of earth resting on them might be added to that of the arcade itself, so as to counterbalance the effect of the tendency of the embankment to throw the wall outwards."

At any cost, with all care, and with every contrivance requisite, has Paris, in such matters, gone through an Augustan change. The pavements to the new streets and boulevards are of asphalt, and in a few narrow streets the paving-stones forming the once noisy roads have been taken up and laid with asphalt; while, on the other hand, in some of the widest streets where there is much traffic, there is a border of these paving-stones on either side of the macadamized centre, that this may not be cut up by wagons. It does not do to think of such places as the old *New-road* and *Leicester-square* after recalling Parisian improvements.

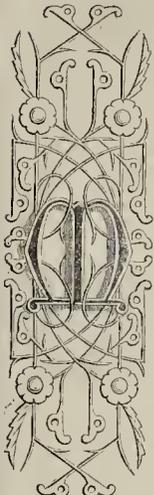

The public nursery gardens of Paris are one of the wonders of the place. The thousands of trees and hundreds of thousands of plants required for the public ways and places recently improved or formed by the city are all reared in the civic nursery gardens. Each of the gardens of the state rears its own stock, as our parks do. The *Jardin Fleurié*, where all the tender plants are raised, is in the neighbourhood of the *Bois de Boulogne*. It is nearly covered with glass houses, of which Mr. Robinson gives plans and sections, on account of their economy of space. He also gives a view of the wonderful caves under this garden for the storage of tender plants in winter. The establishment is a sort of horticultural college. Students over eighteen years of age, who have spent some time in the practice of horticulture, are admitted to improve themselves; and, we may record, half the hooks in the library arranged for their use, and that of the officers, are English. Then the nursery for the trees for the *Boulevards*, some forty-five acres in extent, is at *Petit Bry*, near *Nogent-snr-Marne*. That for shrubs is near the race-course in the *Bois de Boulogne*; and that for pines and rhododendrons in the same park, near *Anteuil*. A fifth establishment, for herbaceous plants, is in the *Bois de Vincennes*, where five or six acres of *chrysanthemums* may be seen, and other providings on the same wholesale scale for the city gardens. Mr. Robinson gives a figure of the machine used for transplanting trees of a large size, which is considered to be an improvement upon that in use with us. M. André, known to us for his work at *Sefton Park*, *Liverpool*, thus describes the mode of operation, taking for his specimen tree one of thirty years old, having a stem circumference of 3 ft. at a height of 3 ft. from the ground, and a total weight, with its earth-ball about the roots, of nearly two tons:—

"The operation is commenced by staking out, round the stem, the circumference of the earth-ball, which will be, on an average about 4 ft. in diameter for most spaces, and larger according to the size of the trees to be removed. A second concentric circle is then made about 2 ft. outside the first, the space between which will be the place for the trench to be dug for preparing the tree. The soil is then removed from this trench to the depth of 8 ft., and the small delicate roots are drawn out of the earth, left hanging, and carefully preserved. The earth-ball is then undermined, to prevent the roots from adhering to the subsoil; two thick planks 11 ft. wide, and a little longer than the ball, are placed underneath, parallel with the width of the cart, so that they sustain the weight of the earth when the tree is lifted. Pricket stems are now placed vertically close together all round the earth-ball, tied at the top and bottom with ropes, so as to prevent the earth from crumbling away, and also to protect the small roots from the inclemencies of the weather.

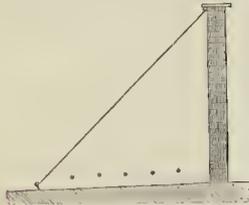

The removal of the tree is then commenced in the following manner:—Two stout thick planks strong enough to support the cart with the tree slung in it, and a little longer than the entire excavation, end having iron plates about 2 in. higher than the surface, bolted on each side so as to prevent the wheels from slipping off, are placed parallel to each other across the excavation, with the exact width existing between the wheels. The moveable bars are then put in their place again so as to strengthen the back of the wheels, which do not run on an axle, but are fitted in wrought-iron frames."

Passing the chains attached to the rollers beneath the planks below the earth ball, four men wind it up to the necessary height, when

* See p. 437, ante.

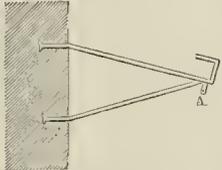

horses are placed to the cart, and away it goes to its destination. The trunks of some of the large trees newly planted in Paris are protected with a coating of moss enveloped in canvas; and round their base are discs of iron gratings, so that the earth may not get trodden down too hard. The cordon system of fruit-growing is worth more attention than it has yet received in England. It must not be confounded with the ordinary spur system. The word "cordon" applies exclusively to a tree consisting of a single branch bearing fruit-spurs only, and never allowed to ramify. One of the illustrations we reproduce shows the cordon on the front wall of a plant-house, in which position all the finer apples may be grown to perfection. The most popular form of cordon is the little line of apple-trees acting as an edging to the quarters in the kitchen and fruit garden. A border may be cropped with trees trained on this principle, and protected when necessary.

Peach Wall and Border, with Five Lines of Cordons, the whole protected in Spring.

Here is a galvanized iron bracket, more than 2 ft. wide, for supporting a temporary coping of bituminized felt. A wire passes through at A to support curtains where these are necessary:—

The large cheap bell-glass, called a Cloche, used in every French garden, gives great facility in the production of winter and spring salads. Acres of them may be seen round Paris; they are about 16 in. high, and the same in diameter at the base, and cost in France about a franc each. They are useful for many purposes, and every garden should be furnished with a few of them.

The Cloche, as used in Winter Lettuce Culture.

All the appliances and contrivances used by the best Parisian gardeners are illustrated by the author. We give one more modern invention,—the light iron trellis-work now in general use in the most advanced fruit-cultivation.* He goes minutely into the question of how we are to improve our fruit-culture, both in quantity and quality; advocates the use of many of the sunny banks of our railway embankments; and, indeed, says all there is to be said upon the subject. Instead of following him through this now somewhat beaten track,—beaten, though, by his own efforts as much as by those of others,—we will turn to a more novel branch of culture, from which we may and should take a lesson.

We allude to the cave culture of the mushroom. Picture a wheat-field on the south side of the city, with a deep well or shaft gaping among the waving corn, furnished with a pole pierced with sticks just large enough to afford footing and holding. Then descend this primitive ladder for 60 ft. At the bottom you find yourself, not in a coal-pit, but in a quarry, from which the stone has been picked out just as in our coal-seams, leaving long alleys of

workings propped up by pillars of the stone left here and there for the purpose, as pillars of the coal are left in our pits. And these workings are laid with low ridges of suitable soil, and turned into mushroom beds. In these long subterranean galleries, so low that you must stoop every now and then, and occasionally widening out from a narrow passage into a space wide enough to admit of several rows of beds, but everywhere dark and still, a crop of nearly 400 lb. weight of mushrooms is gathered daily. And there are many other mushroom caves around Paris. Mr. Robinson describes one that he visited, about an hour's ride from the city, that gave him the idea of a gloomy subterranean cathedral. In this one 3,000 lb. of mushrooms were gathered per diem, from beds measuring twenty-one miles in length. Another large cave mentioned has sixteen miles of beds. Mushrooms are curious things as well as delicious. They have their legends, and whims, and peculiarities, like more important objects. One tale told of them is, that they will not grow after being seen by mortals. This imputed blight is disproved every day; but the origin of the statement is clear. They soon exhaust their powers of growth in one place, and every now and then they cease to thrive, and the quarries have to be cleaned out and left to rest. It is believed, too, they will not grow in coal-pits, nor where there is any iron, even the neighbourhood of a rusty nail they will not endure; but experiments might be made before this need be taken for granted. Of course, it is not the interest of champignonists to assert they will grow anywhere; but it will be our own fault if some of the hundreds of miles of subterranean workings in this country are not utilized. A reference to Mr. Robinson's work will reveal the process of the culture. We give a view of the mushroom cave first mentioned, where it widens out into a large chamber.†

Our author has taken the trouble to sketch and compile particulars of the gardens of Versailles, Fontainebleau, St. Cloud, and Mondon, and we will accompany him to the first, called by the French the queen of geometrical gardens. There are in his book ten views, besides a plan of this palace and garden; consequently a very clear idea may be obtained of its beauties by those who have not visited it. And those who have walked on its Tapis Vert, trodden its labyrinth of gravel walks, heard the splash and sprinkle of its fountains, and admired its etaines and orange-trees, its clipped hedges, long canals, and peaked groves, will learn more by a glance at the plan than they could in an afternoon's ramble. We insert a view that includes the palace and a portion of the garden. The author does not, however, hold this place up for admiration. Its stiffness and formality are defects in his eyes, for which only the natural treatment of the gardens of the Petit Trianon compensates. In this there are "quiet and refreshingly voidant glades, a tiny streamlet, picturequely meandering through them; a well-designed piece of water, a little Swiss village, dairy, and so on, erected by Marie Antoinette;" and to pass into it, after expending some time in the Versailles gardens, or in those of the Grand Trianon, he says, is like being suddenly transferred from some gigantic cottonopolis to a green and sunny Piedmontese valley. A garden should appear in city eyes like unto a bit of the country, beautified by cultivation and taste. Those who have catered for the Parisians in this department, have borne this truth well in mind. We trust that the example they have set us in improving both the artistic appearance and sanitary condition of their city, will not be lost on those who have grand opportunities to do as much for London and the Londoners.

FREE PUBLIC LIBRARIES AND MUSEUMS.

ALTHOUGH a number of admirably conducted and highly useful institutions have been established in various parts of the country under Mr. Ewart's Public Libraries and Museums Act of 1850, and the several amended Acts passed subsequently, it can scarcely be disputed that the full capabilities of these measures, as stepping-stones to important educational agencies, have not been as yet, and are not now in process of being, worthily developed. It is a quarter of a century since Mr. Ewart commenced his public labours in connexion with this question,

and the first-fruit, so far as legislation is concerned, was the Museums Act of 1845, which enabled local authorities, with the consent of the ratepayers, to establish public museums, and to maintain them by local rates. Only two museums were established under that Act—the Royal Museum of Salford, and the smaller yet useful and creditable collection at Warrington. The first Act to promote the establishment and extension of Public Libraries, in addition to, or in conjunction with, Public Museums of Art and Science, was passed in 1850, and has since then been superseded by the more complete and practical Act of 1855, which has again been amended, and has had its provisions, extended by other Acts, in which Scotland and Ireland, as well as England and Wales, have been embraced.

The results of this enlightened policy have scarcely been satisfactory. The city and borough constituencies of England and Wales send 301 members to Parliament; the Scottish cities, burghs, and groups of burghs, send 24; the Irish cities and towns send 39. It would not be more surely than the constituents need, to keep them *au courant* with the literature, art, and science of their day, for them to have at least one well-appointed public free library, reading-room, and museum, for every city and borough member sent to the Commons House of Parliament. The number established falls, however, very far short of this. Prior to 1850 three museums were established, Salford and Warrington, already referred to, under the Act of 1845; and Winchester, in 1847, upon the voluntary principle, which failed as a support, and led the inhabitants, in 1851, to adopt Mr. Ewart's Act of 1850. In addition to these three museums, the total result up to the present time has been the adoption of the Free Libraries and Museums Acts in 34 other places, 28 in England and Wales, and three each in Scotland and Ireland. In many instances the inhabitants owe the benefits brought within their reach by the establishment of free libraries and museums to exceptional and accidental circumstances, rather than to their own appreciation of such advantages, or their desire to possess and profit by them. Liverpool owes its splendid free libraries and museums to the munificence, to a large extent, of Sir William Brown. Manchester, in a like manner, is mainly indebted to the personal liberality and energetic and persevering action of Sir John Potter, for the establishment of its original free library, which now has grown so great in its central reference department, and its five lending libraries, each with a museum attached. So it has been in Scotland also, with such places as Dundee with its Baxter, and Paisley with its Coats, men whose beneficent liberality has rendered it impossible for the rate-payers to reject the bounty of such donors, and nullify the benefits of the Act. In other cases, again, the proposal to establish free libraries has been carried by the tact, persistency, and ability of enlightened and collective agitators; in some cases by "management;" more clever, perhaps, than scrupulous, in packing the room in which the vote had to be taken with the supporters of the proposal to the exclusion of the opponents.

The comparative supineness of communities to avail themselves of the facilities the legislature has provided for the establishment of free public libraries and museums should not be a cause of surprise. Hitherto their introduction would have been, in many instances, as an inversion of natural order. General and efficient elementary instruction and training take precedence of the higher culture such institutions are fitted to impart. A certain degree of preparation is necessary before the books accessible in a public free library, or elsewhere, can be objects of desire, and sources of solace, delight, refinement, or strength. To the untaught and untrained visitor the objects presented in museums are mere images reflected upon the retina of the eye, which may excite a momentary ignorant wonder, but which, failing the equipment of the eye with intelligent messengers to the seat of thought, pass away like the picture reflected in a mirror, leaving no trace behind,—suggesting no reflection or comparison,—exciting to no attempt to understand the relations, correspondences, adaptations, or purposes of objects and combinations. Decided progress has happily been made, in the lifetime of the present generation, in popular instruction, and a more thorough system, with much larger results, may confidently be expected in the immediate future; this consideration invests the subject of free

* See p. 468.

† See p. 468.

libraries and museums for the people with greatly augmented importance.

Among the social as well as artistic and scientific subjects that occupy from time to time the attention of the Society of Arts, it is gratifying to know that this problem,—“How the Society may aid in promoting the establishment of Free Libraries and Museums of Science and Art,” is at present engaging their attention. A committee of the Society has been appointed to consider and report upon the subject. The committee met on Monday afternoon last at the Society's rooms, and may be said to have fairly commenced business. Mr. Henry Cole, C.B., presided, and there was a numerous attendance of the other members, including Sir Daniel Cooper, bart.; General Eardley Wilmo, R.A.; Messrs. Sannol Rodgrave, Seymour Teulon, George Godwin, J. T. Ware, Hyde Clarke, J. F. Isehn, James Hole, &c.

Mr. Cole opened the business in an appropriate succinct review of the important subject, and properly urged that either the Society, or some other authority or organization, should take action to stimulate public feeling on this important question. He also suggested the propriety of the committee being strengthened by the addition of a number of their own members who were also members of Parliament.

After a conversational informal discussion of the motion, and of other points involved in the general question, it was resolved, on the motion of Mr. Godwin, seconded by Gen. E. Wilmo:—

“That Dr. Lyon Playfair, Mr. Albert Pell, Lord F. Cavendish, Mr. E. A. Bouverie, Mr. Chas. Bunton, Colonel Akroyd, Mr. Thos. Bazley, Mr. G. C. Hentrick, Sir Frank Crossley, Mr. W. H. Gregory, Mr. A. J. Beresford Hope, Colonel Jervis, Mr. Walter Morrison, Mr. Edmund Potter, Mr. B. Samuelson, Mr. Wm. Tite, Mr. Muscicella, Mr. Ed. Baines, Mr. Geo. Dixon, Mr. I. Melly, Mr. Archibon Herbert, and other members of Parliament, members of the Society of Arts, should be added to the Committee.”

Also, on the motion of Sir Daniel Cooper, seconded by Mr. Seymour Teulon:—

“That the small number of the places which (as is shown by the following list) have adopted the system of rates for the support of free libraries and museums is a proof that the present system of proceeding is insufficient to secure the intended object.”

The following is the list of free libraries and museums, established by means of rates authorised by existing Acts of Parliament, referred to in the resolution:—

- Ashton-under-Lyne—Public Library.
- Birmingham—Public Reference Library, Reading-room, and Galleries of Art, Schools of Art and Science.*
- Blackburn—Public Library and Museum, and School of Art.
- Bolton—Public Library and Museum, and School of Art.
- Cardiff—Museum and Library.
- Coverham—Library, School of Art.
- Dover—Public Museum.
- Exeter—School of Art.
- Hertford—Public Library.
- Ipswich—Museum, School of Art.
- Kidderminster—School of Art, Public Library.
- Leeds—Act adopted, but not yet in force.
- Leamington—Act adopted.
- Leicester—Museum.
- Lichfield—Public Library, Reading-room, and Museum.
- Liverpool—Public Library and Museum, two Schools of Art.
- Malton—Public Library and Museum.
- Manchester—Reference Library, District Libraries, and Museum.
- Northampton—Museum.
- Norwich—Public Library, School of Art, and Museum.
- Nottingham—Public Library and Museum, and School of Art.
- Oxford—Public Library and School of Art.
- Salford—Public Library and Museum.
- Sheffield—Public Library, School of Art.
- Stockport—Museum.
- Sunderland—Public Library and Museum.
- Walesl—Public Library and Reading-room.
- Warrington—Public Library and Museum, Schools of Science and Art.
- Warwick—Public Library and Reading-room.
- Westminster (St. Margaret's and St. John's).—Public Library and Reading-room (also a branch Institute).
- Winchester—Library and Museum.
- Aldridge—Public Library, under Act of 1850.
- Dunfermlie—Public Library (Museum in progress).
- Foley—School of Art, Public Library and Museum.
- Cork—School of Art.
- Dundalk—Public Library and Science Classes.
- Embs—Public Library (unfinished).

The important topics to be discussed in future meetings are indicated, in part at least, by the following notices of motion that were given:—

By Mr. Cole,—

* That free libraries and museums should be regarded as part of a system of national education, and assisted by funds voted by Parliament, in addition to local rates.

† In some instances Schools of Art are maintained by their own separate and independent resources, although they are conducted in premises connected with Free Libraries.

‡ 8 and 9 Vic. c. 43. § Special Act.

§ 14 Vic. c. 65. || 13 and 14 Vic. c. 65.

And by Mr. Hyde Clarke,—

“That various old public libraries, as that of Archbishop Tenison, having been dispersed, it is expedient that legal provisions be made for the security, as national property, of all libraries and museums which are appropriated to the public use.”

The contemplated State assistance in the establishment of free libraries and museums may be taken to refer mainly to building grants. The local rate of from a halfpenny to a penny would, in many instances, suffice for the reasonable augmentation, from time to time, of public free libraries, and to maintain them in an efficient state; but the capital sum needed for a home for the institution is often an insuperable difficulty in the way of its establishment, which Government might remove with great public advantage.

It is much to be desired that this committee may fully accomplish the objects for which it has been appointed, and prove instrumental in securing the greatest possible “university reform,” by providing universities for the great body of the people. “The place where we are to get knowledge,” says Thomas Carlyle, “over-theoretic knowledge, is the books themselves! It depends on what we read, after all manner of professors have done their best for us. The true university of these days is a collection of books.”

THEATRICAL SURROUNDINGS.

THERE seems always to have been a kind of whiff of brimstone, a suspicion of sulphur, hanging about the stage, and whatsoever appertains to it, in the judgment even of many respectable persons, who are by no means included unconditionally under the number of the “elect.” Among those who have duly renounced the pomps and vanities of this wicked world, there are many who go with good courage to a concert, put a bold face upon a ball, but aver that there is to be a line drawn somewhere; and that line they draw just in front of the foot-lights. The theatre is to them a place of a doubtful reputation, which will not bear looking into; a haunt of dissipated sinners, where stage oaths are occasionally vented which would be shocking in a drawing-room, and where there is an indecorous exhibition of moral and physical semi-nudity, or nudity without the *sems*. And on this last head, perhaps, our scrupulous friends have just now a fair excuse for their grumble, though the matter may not be so bad as they make it out, and though we have by no means attained to the anti-drapery prejudices of our neighbours across the Channel. But waving the prevalent taste for the exhibition of—angles, and other illegitimate sources of effect, and looking only to that class of theatrical performances which approach to what is currently called “legitimate” drama, those who sit in the seat of the soorners are perhaps not wholly without excuse. It can scarcely be denied that there is a certain something, not very easily describable, about the air of the theatre, which renders it possible to divine why people of refined feeling, especially sensitive women, often give a very half-hearted and reluctant support to it; why some careful parents do not encourage their children to acquire theatrical tastes early in life. The fact is, that we retain about our theatres, in minor matters, a considerable relish of the taste and appreciation of a former generation. We have indeed purified the house in essentials; the theatre is no longer, as a rule, a place for disreputable assignations, more than any other place of public amusement; *procul hinc, procul inde puellas* of a certain description, has been long the verdict alike of the magistracy and of the public. But in the accessory attractions which, even in a good theatre, cluster round the principal piece of the evening, there is often something of the twang of the old school remaining, agreeable perhaps to veteran enthusiasts, but not welcome to the more fastidious of the present generation. The decorations have a faded gin-palace air about them; a gaudiness and want of solid and permanent character which we do not find in other respectable places of amusement, and which suggests the idea that the principle of sham that necessarily reigns behind the curtain has taken possession of the front of the house also. Even in recent theatres, where more artistic care has been given to the decorations; in such houses as the Gaiety, for instance, where we have the further attraction of Mr. Marks's clever, but rather unsatisfactory paintings, there is still perceptible something of the same over-gaudiness, which seems to be a

tradition with the theatrical decorator; as if anything sober and quiet were out of place here. And then the music,—is not theatrical music (bar the opera, of course,) proverbial? Thackeray, indeed, professed to enjoy it; nay, pitied the individual who “could not appreciate a pantomime overture;” and, of course, the great novelist was welcome to his taste. But is there not something entirely *per se* in the crazy tinnny sound of a theatre band, with its cracked cornet-piston, its three violins, and one “bass,” flourishing away at some threadbare waltz, in order that afterfamilias Popkins and family may not get too wearied during the necessary intervals between the acts? Does any one except Popkins ever listen to it? And would not most of us prefer a quiet talk, un-interrupted by the noise? There has been a little more attention attempted lately to this part of the entertainment in some quarters; music is to have a soul to be saved, and we are informed in the playbill that the band, “under the direction of Herr Von —,” will perform the following pieces, &c., and wretched stuff it is, generally. Have any of our readers happened to hear the *entr'acte* music written by one Schinbert for a certain German play, “Rosamunde”? If so, they may form an idea of what might be made of musical illustration in this way. But our heaviest charge is against the minor performances on the stage itself—the “first pieces,” so to call them. Why, if we go to see such a play as Lord Lytton's “Money,” recently so fairly put on the stage by Mr. Sullivan, must we, if we chance to arrive a little too soon, be edified by such a piece of indecorous twaddle as the “Mistress of the Mill”? Why, if we go to admire Mr. Alfred Wigan's fine acting at the Gaiety, are we to be bored by such preposterous rubbish as the “Two Harlequins” or the “Eligible Villa”? Why, if we take children to the pantomime at Drury Lane, must we be insulted with an objectionable farce such as was played there last Christmas and the Christmas before? The managers would consult their own interests, as well as the interests of dramatic art in general, by breaking through some of these time-honoured but utterly unnecessary observances, which really furnish ground for a great deal of the stigma so perseveringly thrown upon the theatre by a certain class of religionists. The theory, no doubt, is that it is the policy of a manager to consult all tastes, if he would fill his house. We much doubt the policy of attempting to consult all tastes in the same house. The “rip” who comes to grin at the indecorous farce is bored by the play; and those who are attracted by the latter, if it be really good, would be thankful not to be put in the way of having more vulgar associations thrust upon them. And we are convinced that many of the best and most educated class of English men and women, who at present almost entirely eschew the theatre, would give their cordial support to it, could they find a house where for certain *their* taste alone would be consulted, where the accessories and surroundings of the play would be pervaded by the same artistic spirit, and where they could give their tribute of tears or laughter to the Tragic or Comio Muse, without fear of being annoyed by tawdry decoration, contemptible music, and vulgar or (possibly) indecent farces.

THE PROPOSED LAW COURTS.

BLOCK plans for new courts on the proposed site between Howard-street and the Thames Embankment, and for new courts on the site already purchased between the Strand and Carey-street, without the purchase of any additional land, prepared by Mr. Street, together with a report addressed to the First Commissioner of Works, have been issued, and are before us. It would be waste of space, however, in the present unsettled position of affairs, to publish them. Suffice it at present to say that Mr. Street has given up the views he expressed so strongly to the Society of Arts Committee in favour of the Strand site, and has arrived at the conclusion “that the Embankment site affords by far the best opportunity for a great work now that the reduced scale of the building is accepted by the opponents” to the scheme:—

“In the case of both sites I may observe that as the area to be covered with building is so much smaller than was originally proposed, it will be necessary to omit many departments which were included in my former plans. On neither site would there be any possibility of finding space for all the offices of the Probate and Divorce department; and probably the Appellate Court, the Bankruptcy department, the Admiralty offices, the Land

Registry and Middlesex Registry, or some of them, might also have to be omitted. It does not come within my province to suggest which of these departments should be included and which omitted, but they would be about the same on either side. I propose also to reduce the number of courts to sixteen in all, with the addition, if required, of a large spare court. The Court of Appeal would then have to remain in Downing-street, and there would be no provision for a Bankruptcy Court."

We regret that we are unable to find any sufficient reason for the change of opinion in the report. Our own views remain unchanged, and we sincerely hope that the House of Commons will yet prevent the wilful waste of public money and public convenience that the new site would involve.

The building, as planned for the Embankment, would project about 75 ft. before the front of Somerset House, at the south-east angle of that building.

Mr. G. Pownall has surveyed the property required to be purchased in order to carry out Mr. Street's design for building the New Courts on the Thames Embankment site, as recommended by Mr. Lowe. Mr. Pownall estimates the cost of acquiring all interests in this property, after allowing for the re-sale of surplus land, at \$12,415L.,—212,415L. more than the estimate of Mr. Layard. Mr. Pownall has also surveyed the Carey-street site already purchased by the Government, and is of opinion that the utmost that could be obtained for the property, if used for ordinary building purposes, is 364,320L. If this be correct, the proposed substitution of sites involves a loss at the outset of 448,095L., without considering the cost of continuing Essex-street to the north, as shown on Mr. Street's plan, or any compensation which the Metropolitan Board of Works might claim in the name of the ratepayers of London for the embankment proposed to be taken. The Carey-street site cost 765,440L.; the difference of 401,120L. between this sum and its present estimated value arises chiefly from trade compensations.

ON THE CAM.

THE University of Cambridge may indeed claim justly the character of elegance. Noble benefactors have not forgotten it: princely revenues it still possesses, and many, very many, specimens of the arts. A truly Gothic town: like everything characteristic of our country, it has been the creature of necessity and utility rather than that of theory and art. Its walks and gardens, as scenes for retirement and study, are nowhere surpassed, and we are sorry to notice the noble avenue of lime-trees belonging to Trinity in so sad a state of decay. Age and close planting are surely doing their work, and the beauty of this famous drive will soon, we fear, be numbered with things of the past, and live but in pictures and the memories of the aged.

But it is not with the "backs" our duty and our pleasure lie to-day.

The nineteenth century, feeble and vulgar as some would fain deem it, will nevertheless leave to its successors works of art unexcelled even by any gone before; and for beauty and elegance, combined with thorough scientific construction, few will surpass the noble chapel just erected and consecrated for the College of St. John. The art of fault-finding, though doubtless most useful, brings but little pleasure to its acquirer; and were it not for the demands of professional duty, praise alone should employ our pen at this time. Old friends and kindly greetings are chery influences, and the vast amount of excellent design in St. John's new chapel ought alone to possess pleasure enough to counteract what little of error we may be able to find therein. And we do not fear incurring the charge of presumption in pointing out the but one or two faults, as we deem them, in Mr. Scott's latest and by no means least successful work.

The extreme height of the gables and roof being upwards of 80 ft., and the immense solidity of the tower when seen from below, create an almost general impression that it has not proportionate height enough; and this is perhaps the more striking from a distance where the four pinnacles belonging to the chapel of Kings, resembling an inverted table, still show the most prominently amid the trees. The tower is seemingly of a good proportion, 42 ft. square and 140 ft. in height, till we reflect that the general view will not be from the west, as depicted in the excellent illustration given in the *Builder* of May 15, but from the sides and eastward—

coming from the "Union," for instance, where the immense roof and the gables detract considerably from its apparent height.

The external pilarel niches, too, seem somewhat too light and finical to assimilate well with the rest of this really fine structure, and we fear are never destined to be filled.

A good general description has already been given in these pages in the number alluded to, so that a repetition of the details and figures there given is unnecessary.

We would we less seldom met a building deserving as little censure as this; and at such a time especially, when the bright May sun lights up the exquisite tracery of the windows, and the noble organ, with its more than half a hundred stops, sends its pealing tones rolling down the chapel as the choristers practise their gloriou anthems, and the rich full tones, both of music and colour, delight and impress the soul. With the tracery of the windows, Mr. Scott is peculiarly happy, and the donors of the stained glass must indeed be gratified with the framework in which their gifts are set.

The five windows of the apse have this inscription running beneath them:—

"*In majorem Dei Gloriam et in honorem Divi Johannis Evangelista fenestras hujus apsidis vitreis ornari curavit Edwardus Jacobus Comes de Porle, LL. D., Sannus Academicus Seneschallus, A.S. 1868.*"

and represent the following subjects (the windows proceed round the apse in order, beginning on the north side):—

- | | |
|--|-------------------------------------|
| I. Christ the Light of the World. | |
| 1. Patriarchsacontemplating the Saviour. | 1. Kings contemplating the Saviour. |
| 2. Our Lord washing the Disciples' Feet. | 2. Agony. |
| 3. St. Mary Magdalene washing the Feet of Jesus. | 3. Betrayal. |

- | | |
|--|---|
| II. Christ the True Manna. | |
| 1. Prophets contemplating the Saviour. | 1. Priests of the Old Dispensation contemplating the Saviour. |
| 2. Jesus before Caiaphas. | 2. Behold your King! |
| 3. Jesus captive. | 3. Jesus scourged. |

- | | |
|--|---|
| III. Christ the Spottless Lamb. | |
| 1. Apostles contemplating the Saviour. | 1. Apostolic Men contemplating the Saviour. |
| 2. Crucifixion. | 2. Descent from the Cross. |
| 3. Bearing the Cross. | 3. St. John leading away the Blessed Virgin Mary. |

- | | |
|---|---|
| IV. Christ in the Apocalyptic Vision. | |
| 1. Martyrs (men) contemplating the Saviour. | 1. Martyrs (women) contemplating the Saviour. |
| 2. Faith. | 2. Entombment. |
| 3. St. Joseph begging the Body of Christ. | 3. Nicodemus bearing Spices. |

- | | |
|---|---|
| V. Christ the Good Shepherd. | |
| 1. Bishops and Doctors contemplating the Saviour. | 1. Priests and Deacons contemplating the Saviour. |
| 2. Resurrection. | 2. <i>Noli me tangere.</i> |
| 3. St. Peter and St. John at the Sepulchre. | 3. St. Mary Magdalene looking into the Sepulchre and seeing the two Angels. |

The principal donors of the side windows are the friends of the late Rev. A. V. Halley, Fellow and Tutor; the exhibitors of Sir Ralph Hare; Mr. C. Bamford, M.A.; Mr. F. S. Powell, late M.P. for the borough of Cambridge; the Rev. A. C. Haviland; the Rev. S. Parkinson, D.D.; and the widow and family of Professor Blunt.

The fine coved ceiling will, we trust, undimmed by the gas, long maintain its beauty and long convey its historical associations to the mind of the spectator. Here we find nineteen heads richly decorated with full-length portraits of remarkable men who have flourished in each of the nineteen Christian centuries, with the inestimable advantage of having each his proper name depicted underneath. Here we find in the first bay Our Lord in Majesty, who most properly represents alone the first grand century of the Christian era. The next is lightened up by St. Ignatius, St. Polycarp, and St. Cypryan, whose doctrinal teachings still survive.

The fourth century is represented by St. Athanasius, patriarch of Alexandria, and St. Ambrose, bishop of Milan. Next we notice St. Chrysostom, or the golden mouth, and St. Augustine, bishop of Hippo, in Africa.

The sixth century glories in many celebrities, five of whom we find noticed in this richly decorated bay:—St. Gregory the Great; St. Ethelbert, king of the garden of England; St. Columba; St. Benedict; and St. Augustine of Canterbury.

Would that space permitted of a detailed account of the whole of this glorious roof. As a work of art it is fine, but as a piece of consecutive history it is invaluable. The curious we refer to the *Cambridge University Gazette* of the 19th of May for particulars too full to be noticed here.

We are constrained to mention the illustration of the fourteenth century, however, which may be not inaptly termed the founder's bay, as the loved name heads the list, the pious William of Wykeham, founder of the two noble colleges of St. Mary of Winton, at Winchester, and New College, Oxford. Another founder of an Oxford college—Oriel—faces the Bishop Wykeham, King Edward II., the first English Prince of Wales. Maria de Valence, Countess of Pembroke, the foundress of the ancient college in this university, which bears her name, separates him from Bateman, bishop of Norwich, founder of Trinity Hall. The only one in this bay who may not claim the position of a founder is Bradwardine, the "profound" prelate of Canterbury. There is another founder, however, close by as the leader of the figures of the fifteenth century—Archbishop Chichele, who founded All Souls' College, Oxford, and who, when Henry VI., husband of Margaret of Anjou (whose figure comes next in order), was about to turn his attention to the spoliation of church property, urged him into a war with France, in order to save him from the sin of sacrilege, doubtless hoping that the end would fully justify the means.

Wednesday, the 12th of May, will long be remembered by all members of St. John's College as a red-letter day. The consecration service which took place on that day was most impressive. Assisted by the Duke of Devonshire, the vice-chancellor, Dr. Atkinson, and many heads of their respective houses, the bishops of Oxford, Rochester, Lichfield, Hereford, and Gloucester, the Bishop of Ely commenced the service.

The Rev. E. B. Sparks read the sentence of consecration, the bishop signed it, and Mr. H. R. Evans, the registrar, took possession of and duly registered it. Professor Bennett composed an exceedingly fine anthem for the occasion, which was sung immediately following the sermon; Dr. Garrett's execution on the organ being here, as throughout, perfect. The offertory, amounting to more than 500L., will be devoted to the further decoration of the chapel.

Quick to follow so good a lead, several of the colleges have already begun dabbling in bricks and mortar, stone, and cement.

New keeping-rooms to King's are nearly finished, under the hands of Messrs. Trollope, and in general effect will be extremely good. Pembroke talks of erecting a new court, and sundry minor additions are already rumoured. Downing-street Chapel, too, formerly under the pastorate of Mr. A. Norris, is spoken of as about to leap to the corner of the street, and to be rebuilt anew. The architect is as yet in the dark, though that same all-wise bird, "Rumour," points to Kingston as his probable professional birth-place; and we hear that at last Mr. Woolner has been intrusted to execute for the master and fellows of Trinity a monument to Dr. Whewell, which is to be placed in the ante-chapel of the college. May it be as great an ornament and addition to the works of art as he was during his whole career to the University of Cambridge.

The heat and work of the day are over. Let us once again stroll down to the river side and enjoy with unabated zest the May boat-racing. Now is a universal holiday, and the whole town and county world, his wife and little ones, are assembled on each side the sluggish stream. Grassy is full, and not a few bright dresses and fair faces gleam amid the darker masses of non-rowing men. The towing-path is full from the Gut to the railway bridge, and a goodly number who mean running are already far down at the Loch, with their respective club crews.

Here, too, are we unfortunately bound to find fault. The river being too narrow to admit ordinary racing, humping races are the only possible form of testing power and endurance. The old distance start given to the boats might perhaps have been somewhat too short; but the present one, two boat-lengths and a half, is absurdly long. The whole distance is but one mile and a quarter; so that, unless the pursuing boat be mightily superior, it has no chance of catching up this excessive distance. Fewer humps and more rows over have been known this year than in any previous one, and much of the interest is thereby lost.

How contagious is excitement! As the last gun fires, and every oar is dipped into the water, the cheers are taken up from point to point, and with waving handkerchiefs and deafening cries, "Well rowed! well rowed!" the spectators on each side testify their pleasure. Trinity Hall

one night made an especially fine race, steadily gaining upon their leader, surely and surely gaining; with measured strokes and a wonderfully steady crew they are skilfully "coxed" round Grassy. The Longreach is before them. Rowing well indeed,—gaining, gaining faster. Now put it on; half a length!—a quarter!—a yard!—a foot!—the bump surely! but no, with one of the many proverbial "slips" an oar smashes with sheer pulling, and No. 5, we think, with the pithy sentence, "Go on, you fellows," plunged out of the ship into mid-stream. No easy feat to perform when the boat is going full speed, closely pursued by half a score of racing eights; a clever dive beneath the oars, and a few strong strokes, fortunately bring the hero safely to land; and, strange to tell, the boat, though of course missing to make the bump, yet in consequence of the plucky lightning of the ship by the loss of what would have been but a dead weight, pulled over the course, with her seven oars in a most gallant manner, and saved her place for another night.

Though we fear the spectators will lose somewhat of pleasure by the removal of the "Grassy" corner, nothing will rejoice us more than to report the progress and completion of the Cam improvement works. We are truly pleased to be able to state that the funds for the purpose are steadily rising; and we trust that no half measures will be adopted, but that the authorities will do all in their power to encourage the manly and healthful exercise of boating.

The cool walk home in the evening is not the least enjoyable part of this bright May-day, and the clean bright appearance of the running stream through the streets of the town set us thinking how few who daily traverse them know even the name or origin of their benefactor, the founder. Hobson, the founder of the conduit, a celebrated jockey, gave rise by his conduct to that commonplace expression of "Hobson's choice, that or none;" for in letting out his horses he strictly followed that rotation which gave each one his equal share of work, and refused, it is said, to let any other than that which stood next.

These, too, made us ask ourselves the question, why not arrange and carry out a new and complete system of drainage? In a town so full of fine buildings and inhabited by so many respectable and learned people, a town so rapidly improving and increasing, a town so rich and prosperous, should not health be one of its first considerations? We cannot but fail to be struck with the present impartial state of the drainage works, and we feel sure that if properly pointed out to the authorities, some system might be devised that would enable a not unmanageable and picturesque river to be made and kept wholesome and bright.

The warning is surely needless that thousands spent merely in dredging the Cam will lessen the evils for a time. Sewage with years will roll on, and the same expense must again be entailed. In the mean time how much will be suffered! Let us remind them of an old motto, peculiarly applicable in the case of drainage and sanitary works:—

"That which is worth doing,
Is worth doing well."

S. S.

THE LATE ORLANDO JEWITT.

The works of Orlando Jewitt, architectural wood-engraver, have been before the public for nearly half a century, and at his death, which took place on Sunday, 30th May, the last of the old school of wood-engravers passed away. We believe we are correct in stating that he was virtually a self-taught man; and that his work did not attract much attention till he left Derby, many years ago, to live at Headington, near Oxford. Here he was busily engaged in the production of the illustrations for the "Glossary of Architecture" and other books, for Mr. Parker, the archaeologist and publisher, of Oxford. The whole of the drawings on wood for the "Glossary" were made by Mr. Jewitt's own hand, as well as many of the original sketches from which the drawings were taken.

About 1857 he left Headington for London, on the promise of having the whole of the wood-engraving placed in his hands of a weekly paper then about to be illustrated for the first time.

His earlier works were not equal in value to his latter, and some old engravings of landscapes and trees we have seen do not foreshadow the extreme beauty and accuracy of his later productions. For the last eight or nine years

he has been at work on "Murray's Guide-books to the English Cathedrals," many specimens of which have been published in the *Builder*,—some only a fortnight ago. Amongst his later works are the illustrations to Mr. Scott's "Memorials of Westminster Abbey," and Mr. Street's books on Venice and Spain. The majority of the drawings in the latter books were made on wood (as well as engraved) by Mr. Jewitt himself, or by artists in his employ; but the best of all elaborate and highly-finished illustrations for a forthcoming work on "Ancient Rome," by Mr. Parker. These illustrations have never been exceeded for beauty and minute accuracy of detail, and will remain a lasting monument of Mr. Jewitt's excellence as an artist and wood-engraver.

He was thoroughly well acquainted with architecture and perspective, was equally at home with the pencil and the graver, and was accurate to a degree, as his works well testify. As may be imagined, a man with his amount of business could not possibly get through it all with his own hands, so he was willing to obtain assistance in drawing and engraving wherever he could find it; but this was no easy matter, for the ordinary work of artists and engravers he regarded with contempt. Amongst many others who lie under a deep obligation to him, for hints in perspective drawing and engraving, we may mention Mr. P. H. Delamotte, professor of drawing at King's College; the late Mr. I. S. Heaviside, who engraved for the *Builder* for a long time; and Mr. W. G. Smith, all of whom were his assistants for many years.

Mr. Jewitt was a great lover of nature and an accomplished botanist. He illustrated one of the editions of Professor Harvey's "Seaweeds," executed the drawings and engravings of the living animals for Mr. Reeve's "Land and Fresh-water Mollusks," and many of the engravings for Bentham's "British Flora." He was a practical naturalist, as well as a student, and might often be seen in Oxford or London, not in hand, in the pursuit of moths and flies, or dredging in pools for plants and animals. Nearly all the living slugs and snails were procured by himself or his assistants for Mr. Reeve's book. At all times and places he was on the alert,—sometimes at the cleaning out of a reservoir, sometimes on a roof or in a cellar; for all places produced him something.

Although seventy years of age he worked at his business to the end of his life. On the Thursday before his death he was about to begin drawing when his arm fell powerless by his side, his head fell forward on his work, and he never spoke again. During the last few weeks he had been suffering under a severe domestic affliction, which probably hastened his end.

Mr. Jewitt will long be remembered by those who had the privilege of knowing him as one of the most kind-hearted and admirable of men.

ON THE BUILDING STONES USED IN THE METROPOLIS.

At a meeting of the Civil and Mechanical Engineers' Society, held on the 2nd of June, a paper was read by Mr. Arthur C. Pain, "On the principal Building Stones used in the Metropolis." The author confined the subject of his paper to the building stones proper, excluding paving stones and granites. It was illustrated by a map of England and Wales, showing the position and distance of the various quarries, and their means of communication with the metropolis by railway or sea; also a table giving the name of each quarry in the county, name of owner, and agent in London; also the mineral and geological designation, component parts of stone, weight, chemical analysis, number of feet to the ton, average size of blocks, suitability for various purposes, the cost of working, colour, mode of working, price at quarry and at the various termini in London, as well as a few of the principal buildings in the metropolis and country constructed of each stone, with remarks on the beds, &c. He then described chronologically as they came into use, Kentish rag, Gattos fire-stone, Caen, Purbeck, Portland, Bath, Painswick, Bramley Fall, Mansfield, Chilmark, Ancaster, and Douling. Specimens of each bed were exhibited from the quarries of Messrs. W. H. Bensted & Sons, of Maidstone; Mr. W. Carruthers, of Gattos; Mr. E. Foucaud, of London and Caen; Mr. W. H. P. Weston, and the Portland Stone Company, both of Portland; Messrs. Randell & Saunders, of Corsham; Messrs. Pictor & Sons, of Box; Messrs. Husler

& Co., of Headingley; Mr. Robert Lindley, and Messrs. S. Fisher & Sons, both of Mansfield; the Wardour, Chilmark, and Tisbury Stone Co., limited, of Tisbury and London; the Ancaster Stone Quarries Co., of Ancaster; and Mr. C. Trask, of Douling, all of which have been used extensively in London. He also brought before the notice of the society and exhibited specimens of the Hollington, Little Casterton, Forest of Dean, and Minera. The decay of stone, its cause and prevention, having particular reference to London, was next considered. The decay, he believed, was caused by bad selection; as a proof of this, he drew the attention of the meeting to the fact that nearly all the principal buildings in the immediate neighbourhood of each quarry were in an excellent state of preservation, while buildings in London of the same stone, which had been comparatively recently built, were more or less in a state of decay. He attributed this, first, to the fact that the masons who worked the stone for the local buildings understood the material, and knew which quarries and beds were good, and rejected the bad, while the masons who worked the stone for the London buildings knew very often nothing about it, and put in good and bad without proper selection; or, secondly, the architect or engineer in his multifarious duties could not afford the time to study each class of stone at the quarries, so that the specifications were very often loosely worded, which was constantly taken advantage of. He did not wish to throw blame on them, as there was no place where detail or reliable information could be obtained. The author then gave as a proof of the difficulty of obtaining information that he had devoted all his spare time for over six months in getting the results which he had laid before the society that evening, notwithstanding that the respective quarry-owners, and the officers of the Geological Museum and Mining Record Office, had afforded him every facility. He then pointed out to the meeting how much this country was behind France in these matters, for M. Michelot, chief engineer of roads and bridges, had recently made a report by the direction of the French Government, on the building materials of that country, giving very detailed information, while the only works we have on the subject were the Commissioners' report, 1839, which treated generally, and not in sufficient detail, a few of the principal freestone quarries, leaving out hundreds of important quarries, notwithstanding which, to prove how much work of this kind is wanted, the report, originally published in 6d., is now worth from 10s. to 1l. The specimens of building stones at the Geological Museum was a step in the right direction, but the information concerning them was meagre in most cases, and in some nil; besides which it was easier to judge of the quality of a stone if the specimen was a rough lump than if squared and faced up. The Mineral Statistics, part 2, for 1855, published by the Mining Record Office, was a very valuable work, but it did not go deeply enough into the subject to be of great use to professional men. In conclusion, the author considered that until the heads of the professions of architecture, civil engineering, and the trades connected with the same, took the question up, and appointed an architect, engineer, chemist, geologist, builder, and practical stonemason, and an appointment of the same by the Government as royal commissioners, to report fully, and collect specimens from all the principal quarries in the United Kingdom, to be put in the public museums in every large town, we should still see the stonework of our public and private buildings decaying away.

THE LATE MR. J. SHEPHERD, OF ROME.

An esteemed correspondent writes:—In reference to this gentleman, whose lamented decease you notice in your last number, a curious and authentic anecdote is related. On one occasion he found himself short of coals for his gas-works, in consequence of the non-arrival of three vessels at Civita Vecchia. In this emergency, to avoid a great public inconvenience by cutting off the supply from the gas-lights in the streets of Rome, he wrote to the governor, stating the fact, and asking his permission to request the inhabitants not to use gas for their private purposes for a few days. Monsignore immediately wrote to a very eminent official countryman of ours in Rome, requesting him to call, without, however, stating the object. Our countryman forthwith attended the summons,

* This only applies partially.—Ed.

and Monsignore immediately entered into conversation with him on various topics. At length, by chance, he asked the character of Mr. Shepherd, and whether his word was to be relied on, and so forth. To this most satisfactory reply was given, and the frankest testimony borne to the honourable principles and undoubted truthfulness of Mr. S., who could be trusted in whatever he undertook. After the interview, while our countryman was pondering during his return home as to the purpose of his visit, he met one of his many Roman acquaintances, who said to him, "So you have been to the governor's. Do you know what for? Ah, we know all about it, and Marfioro will tell you more to-morrow on the subject." The next day the following pasquinade appeared:—"The Holy Father is in a fright, that Mr. S. should have a key by which he could throw all Rome into darkness at once; for he does not like any one but himself to have the power to keep his loving subjects in the dark."

THE VENTILATION AND TRAPPING OF DRAINS.

AFTER a paper on this subject read recently by Mr. James Lovegrove at the Society of Arts, a discussion was opened by the Chairman, Earl Ducie, which has not had sufficient publicity. The Earl said the subject was of vital importance, and none the less so that a great deal more attention was generally paid by engineers and others to the treatment of sewage itself than to the gases to which it gave rise. Mr. Lovegrove, however, had treated of air, which might be either man's best friend or one of his most dangerous foes, and had shown that it was not exempt from one of the conditions of humanity, inasmuch as it was exceedingly liable to be contaminated by evil communications. It had been shown that there were many schemes—of, he might almost say, diabolical ingenuity—for admitting to houses, under the guise of fresh air, that which really came from the immediate neighbourhood of the most corrupt materials, and that many of the sanitary improvements of recent times had led to evils before unknown. Great trouble and expense had been gone into in London in connexion with a system of main drainage, which was the most magnificent, probably, in the world; but it must be borne in mind that the strength of a chain was only that of its weakest part, and while the main sewers were so grand a scale, the system of house-drainage was often radically defective. The appliances, which had been described by Mr. Lovegrove, for remedying these defects, were particularly valuable, if, as seemed to be the case, they were efficient. He thought that in the discussion the distinction should be borne in mind between the ventilation of the sewers and that of house-drains. It was to the latter that Mr. Lovegrove's paper principally referred.

Dr. Alfred Carpenter, who had paid particular attention to the subject of the ventilation of drains for many years, could not agree with all the principles laid down by Mr. Lovegrove, because they seemed to go to the end of endeavours to keep in drains that which wanted to get out of them. The true principle of ventilating sewers was to let out everything, and abolish all traps in connexion with houses, except those communicating with the water-closets, which were necessary. His attention had been drawn to this subject through observing, as a medical man, the enormous amount of evil arising from the introduction of foul air into houses, and ultimately, he believed, he had been able to show how proper ventilation of sewers might take place, so as to leave the houses and drains perfectly safe, without any of the ingenious contrivances which had been displayed. Looking to nature as a guide, they found that in a tree or in an animal there were innumerable openings by which the foul gases which were generated were thrown out of the system. The true principle was to prevent the production in the sewers of the foul atmosphere, which was to be accomplished by keeping a continual current of fresh air running through them; and in this way, and this only, would they be safe; because, however perfect might be a system of traps, valves, as they knew, were always liable to get out of order, especially when they came in contact with the materials that passed through drains, and then there was an efflux of foul air. The principle he contended for was the prevention of foul air being formed in the sewers, by providing abundant openings for the admission of fresh air, by which the foul air would be oxidised or neutralised as

soon as formed. There should be no communication between the house and the drain, except in the water-closet, and the soil pipe should be carried up as straight as possible above the roof; there would then be no pressure on the water-valve, nor any entry of foul air into the house. This principle had been carried out by a local board of health with which he was connected, within the last few years, and with the most perfect success. The openings from the sewers should, of course, be provided with charcoal to neutralise the foul air without any danger to the inhabitants in the neighbourhood. These openings might be placed at intervals of 50 or 100 yards, and by this means all stagnation of air in sewers would be prevented. The same principle was applicable to mines, where it was found necessary to keep up a constant current of air.

Dr. John Tripe said there could be no doubt that the best system of ventilating sewers so as to prevent injury to the public health was to let in as much fresh air as possible, and change it rapidly. Nothing would be better than the system proposed by Dr. Alfred Carpenter, if it could be carried out; but unfortunately this was not the case, and they must deal with matters as they actually were. Most persons would agree that if they were going to reconstruct the whole drainage system, there should be no direct communication between the sewers and the houses except the water-closets; in fact, the surface-drainage should be altogether separated from the closet-drainage, and by this means small pipes would do instead of the enormous sewers now constructed; but this was not their position. Those who, like himself, were constantly engaged in sanitary work, and had to investigate the cause of the presence of foul air in dwellings, must be aware that, in a great majority of cases, the evil arose from some defect in the traps, such as had been described in the paper; and there was no doubt that a vast improvement would be effected by the introduction of the syphon-trap or something similar in house-drains, particularly at the sink. When he took the house in which he now lived he was told that it was thoroughly trapped, but in a few days the sink was abominable, and, on examination, it was found that there was no syphon to the trap underneath the sink: one was put there, and the smell ceased immediately. This defect was very common in kitchens, and was the cause of an immense deal of mischief. He quite agreed that, if it were possible, all sink drainages should be carried off to an open yard, thus avoiding direct communication with the sewers; but this was impossible in the vast majority of houses in London and elsewhere, where the kitchens were below the ground level, and therefore it was necessary to adopt the best system of traps which could be devised. He had not seen anything to equal some of the plans which had been described that evening; and he could speak from his own practical experience that they answered the purpose for which they were intended.

Mr. Botly said he was not so conversant with the subject as to be able to judge of the superiority of one plan over another; but, from his own experience, he could illustrate the great importance of the question. Some years ago he was for some time honorary governor to a hospital in the West of England, in which there were four wards. One of those wards had been for many years subject to skin diseases and erysipelas, and at length a committee was appointed to investigate the matter. It was then found that the closet-drains from nearly the whole building went along the wall of that particular ward; this was altered by the introduction of some such arrangement as had been described to them, and there was scarcely a case of erysipelas or cutaneous disease afterwards. It was often found to be the case that skin diseases were very prevalent in houses where the drainage was defective, and, therefore, too much attention could hardly be paid to the subject.

Mr. Baldwin Latham remarked that the paper which they had heard was rather on appliances by which drains were trapped than on their ventilation. There could be no doubt that the secret of success of the water-closet system of town sewerage depended on the ventilation of drains and sewers; but much more mystery was made of this subject than necessary, many persons conceiving that it could not be carried out without some special appliances for furnishing fresh air, or exhausting the sewers of foul air, but no greater mistake could be made. From the very nature of sewage action there was a constant fluctuation in the supply and flow of

matter through the sewers, which might be running at one period of the day three-quarters full, and at another only one quarter; and this fluctuation might be made the means by which perfect ventilation could be secured. Of course, the augmentation of the flow caused a displacement of the air, for which an escape must be found somewhere, and, as the flow declined, fresh air would come in to supply its place; so that if this were only encouraged by making a sufficient number of openings, which must be supplied with ventilators for oxidising or deodorising the foul gases, a perfect system of ventilation would be secured. The general plan, on the contrary, had been to trap every possible opening into the sewer, and to lead the sewer to a point below the water-line of the river; this was just like draining into a bottle. If at one period of the day the sewer was nearly dry, and at another half full, the result would be a quantity of foul gas condensed to the extent of one atmosphere, which must find an outlet somewhere, and all the traps in the world would not prevent it. Mr. Lovegrove had shown one method by which the ordinary bell-trap would discharge itself; but there are several others. If, for instance, the housemaid poured a whole bucketful of water down the sink at once it would act as a syphon of itself, and every drop of water would be drained off; and, again, it was a very common thing, if there were matters in the sink which would not readily pass away, to pull out the bell-trap altogether, and then there was a free communication with the drain at once. It had occurred to him, as the simplest method of guarding against these evils, that as the sink was generally placed against the external wall, the pipe might be carried through and allowed to discharge itself outside over an open grating fixed in the area, and then, if there were any escape of gas from the sewer, it would be outside the house, and not within. Stand-pipes for the admission of fresh air had been recommended, but, as he had already stated, no forced supply was required; the air must enter the sewer without pressure. Wherever a valve was used there must be a certain amount of pressure before the air would take that direction, and he could not conceive of what use it would be during certain periods of the day, when the current would be outwards from the sewers, and any valve arranged merely for the admission of air would be simply inoperative. With regard to general principles, in laying down a correct system of drainage, they must begin at one beginning; when the water was flowing in one direction the gas would be flowing in another, and, therefore, the arrangement described by which the gas was to be made to go in the same direction as the water when there was a flush appeared contrary to natural laws. Any system of sewers ought to be broken up into short lengths, which should be disconnected as much as possible, so that the foul gas from one portion could not pass to another. Before a town was drained the low-lying parts were always the most unhealthy; but after a system of sewers was constructed this condition of things was frequently reversed, and the higher parts became centres of disease, showing that by the system of impervious drainage, which was often adopted, the foul gases containing spores of disease were carried from one district to another. The ventilating openings in the middle of the streets had been much objected to, but they were not so injurious as the system recommended by Mr. Verley for carrying off the gas in close proximity to a chimney; for it often happened that there would be down-currents in chimneys, which would thus draw in the foul air into the house. Foul air was rendered innocuous in two ways, by dilution, and by oxidation or destruction. The former took place when the gas escaped in the centre of the road, becoming, of course, more dilute every foot from the opening until it ceased to have any power for evil. The other plan, oxidation, when successful, was more complete and far preferable. Mr. Latham then exhibited a diagram, showing a new construction of charcoal basket for this purpose. Around the charcoal chamber was a deep receptacle for the rain or falling water, communicating with the sewer by an overflow outlet below the level of the charcoal, which was thus kept constantly dry; in the centre, under the charcoal, and communicating with it, was a spiral chamber, up which the gas ascended. He might mention, in conclusion, with regard to the town of Croydon, to which Dr. Alfred Carpenter had alluded, that when the sewerage system was first constructed, a few ventilating holes which were made

were soon stopped up because of the stink which arose from them; but the result was that the town at particular periods became subject to attacks of low fever, which did not, however, appear in the low, but in the high-lying districts. It occurred to him that this was due to a lack of sewer ventilation, and in order to test it, when one of these epidemics was rife, he took a long line of road, and instead of beginning to ventilate at the upper end, as he should have done, if his object had been to do the work quickly, he began at the lower end and worked upwards. The result was, that as ventilation went on in that road, there was not a single fresh case of fever, and the patients began to improve rapidly; above the point of ventilation there were still fresh cases, and so it went on until the whole road was ventilated, and then the fever disappeared.

Mr. Glass did not consider trapping necessary, if drains were properly ventilated. If there were no traps there would be a constant influx of fresh air into the drains, and thence into the sewers, and there would be no nuisance, whatever, provided there were a sufficient number of ventilating shafts to the sewers. The plan of carrying pipes up the sides of houses was never really effectual; the proper method was to have special shafts with disinfecting agents.

Mr. Edward R. Cook said the discussion seemed to have wandered from the ventilation of drains to that of sewers, both being highly important; but the paper had dealt rather with the former. One important point which Mr. Lovegrove had seized seemed to be this, that, whenever there was a current of water down the feed-pipe of a house-drain, there would be a draught of air back again from the drain; and, therefore, it was necessary to provide against the water which lay in syphon or bell-traps being accidentally drawn off. He could not help thinking that the plan which had been shown for carrying the foul air through the drain by the rush of water was, at any rate, a step in the right direction. He could not agree with all that had been said as to the free ventilation of drains. If nothing were requisite but free access of fresh air, then an open ditch would be the best drain they could have, and was evidently not the case. If an open ditch were offensive, so, and much more so, must be a brick sewer, which at one time would have in it 3 ft. of sewage and at another only 1 ft. There were there present the three essentials to putrefaction, damp, heat, and air, and the generation of impure gas must consequently go on very rapidly. He hoped that by the attention of scientific men being called to the matter some means might be devised for preventing the generation of these gases, or for neutralizing them before they reached the atmosphere, for he could not think that their mere dilution by admixture with a large quantity of air was the proper method of treating them.

Mr. James Marr said the question before them was one of immense importance, for the returns of the Registrar-General showed that a large proportion of the deaths in London, especially those in crowded courts and alleys, arose from the constant breathing of impure air coming from ill-ventilated sewers. The Board of Works, the local boards, and vestries, all had most extensive powers, which were generally very properly exercised; no one could build a house, lay out a street, or construct a sewer, without their approbation; and one of their powers was to stop up or cover over any offensive drain, water-course, or pond, and to require the removal of all offensive matters. The 71st section of the Metropolitan Local Management Act was to this effect:—"Every district board or vestry shall, by providing proper traps or other coverings, or by ventilators, or by such other means as shall be practicable for that purpose, prevent the effluvia of sewers from exhaling through the gullyholes, gratings, or other openings of the sewers in any of the streets or other places within their district or parish." Now, the way in which sewers were commonly ventilated was by having openings in the middle of the streets, and by allowing the man-holes in various places to remain open for several hours at a time, and also by means of untrapped gullyholes, which ought to be hermetically sealed. In his opinion, the Board of Works should compel every builder to construct a ventilating shaft, direct from the drain leading from each large house, or, in the case of small houses, one to every ten or twelve. This shaft might be carried up inside the wall of the house close to the flues, and taken to the height of some feet above the chimneys. This

would only apply to new houses, but those already built might be treated in much the same way, only the pipe would have to be carried up externally. He could not condemn the system of trapping, because in many instances it was found to do its work well, but he at the same time agreed with Dr. Alfred Carpenter that a thorough system of ventilation would obviate the necessity for such appliances.

Mr. Ford regretted that the question had been limited to the ventilation of drains, as he considered the ventilation of sewers was the first and most important consideration; but he could not let the discussion close without bearing his testimony to the evils of the traps system, which had been so well pointed out by Mr. Lovegrove. He recently, in company with a sanitary inspector, visited sixty houses in one parish, in forty-nine of which the traps were uncovered. This was the great evil, that the tenants would constantly uncover them, and consequently they were of no service at all. It would be much better, therefore, in his opinion, to abolish bell-traps, and go back to the old-fashioned plan of a deep trap, because when that got choked with silt, the water would not run off, and it was obliged to be cleared out.

Mr. Lovegrove, in reply, said that the proposal of Dr. Alfred Carpenter to abolish all traps would, in the present state of things, be, in his opinion, a most suicidal policy; they were everywhere in use, which was a sufficient proof that they had their work to do, and it was, therefore, important to see that they did it properly. The next speaker rather supported the same view, but as his own experience showed the evil consequences of badly-trapped drains, he need not enlarge further on the result of abolishing such appliances. Mr. Latham had made some valuable observations on the subject of ventilating sewers, which, no doubt, was one of the most important questions of the day. It was quite a distinct matter from that of the ventilation of the drains which connected the house with the sewers, and this latter was, in reality, the more important, since the total length of drains in London was probably equal to ten times that of the sewers, and they were in immediate connexion with the houses. He could not conceive of such a state of things as would admit of doing without traps at all. He had heard it suggested that such a fall might be given to the drain that all sewage matter would pass off so rapidly that no smell would arise, but still there would be a large surface which would soon become coated with slimy matter, which would contaminate the air. There were two systems recommended for ventilating house drains, one being an outlet trap with a water curtain, which had been stigmatised by Mr. Latham as opposed to natural laws. He could only say that notwithstanding these supposed natural laws, he had found the air escape that way, having tested it over and over again, both by the anemometer and by the flame of a candle, and he had found the current of air as frequently passing in a contrary direction to the stream of water as with it. He believed the stream had nothing to do with the direction of the air currents. The fluctuation in the flow of sewage was, no doubt, a most important element of power in the ventilation of sewers, as he had suggested some sixteen years ago to the Commissioners of Sewers. The same thing might also be utilised in the ventilation of house drains, which were but small sewers. The other system was to have outlets for the foul air at a considerable elevation. He saw no reason why both methods should not be adopted. With regard to the ventilation of sewers, he had had it under his attention for a long time, and now had a considerable length under experiment upon the principles shadowed forth in the paper he had read, the results of which, at some future time, he hoped to be able to communicate.

Value of a London Mansion.—The freehold family mansion of the late Earl of Wicklow, No. 2, Cavendish-square, with a garden in the rear, leading to a range of stables and coach-houses, was disposed of by Mr. Phillips, at his rooms in New Bond-street, by direction of the trustees of the will of the late earl. The sale excited considerable interest, and was very largely attended. After a long competition the property was adjudged to Mr. Samuel Leo Schuster, of Queen's Gate, Hyde Park, at the price of 20,800*l.*, being nearly double what was paid for the property by the late owner some twenty-five years ago.

THE WORCESTER MODEL DWELLINGS ASSOCIATION.

VICE-ADMIRAL HASTINGS, of Burbourne House, near Worcester, who died on the 21st of May last, was the Chairman of the Worcester Association for Building Dwellings for the Labouring Classes, and had given much time and thought to the work of the society. The governors of the association, at a meeting held at the Town-hall of Worcester, on Tuesday last, passed the following resolution:—

"That this meeting desires to express to Sir Thomas Hastings, and to the other members of the Hastings family, the sincere regret felt by all the governors of the association at the death of the late lamented Vice-Admiral Hastings, who for so many years was an active and zealous member of the committee, and for the last few years fulfilled the duties of chairman with so much ability and such advantage to the association."

At the same meeting, Mr. G. W. Hastings was elected chairman in the place of his late relative. He is the third of the family who has filled the office, the late Sir Charles Hastings having been the first.

ACCIDENTS.

Oldham.—The coping-stones of the Albion Hotel, in this town, fell into the street below, and killed a police-officer and his child, who were passing at the time. Another person was so seriously injured that his leg had to be amputated. At the inquest on the dead bodies, Mr. Robert Lynam, the borough surgeon, produced a sketch of that portion of the premises which had given way. He said that so far as he could ascertain, the upper part of the wall was faced with stone without any fixings. The stonework was 6 in. thick, and the brickwork behind it 18 in., but the veneering was not tied to the brickwork. On the top of the veneering there was a cornice of heavy stones, each weighing from 13 cwt. to 15 cwt.; and on the top of the cornice a row of upright stones stood, weighing from 5 cwt. to 6 cwt. each. He found one of these stones lying on the foot-path before the hotel, and it was the one which had fallen upon the deceased. The cornice projected beyond the facing 12 in. towards the street, and 7 in. on the top of the wall behind the veneering. The height of the cornice from the street was 35 ft. The shop-fronts adjoining the hotel projected from the building, and his idea was that a part of the veneering, in consequence of the settling of the building when the shop-fronts were brought out, had thrown upon it a greater weight than it was able to sustain. There was not a perpendicular wall in the building, as they had all curved inward at the middle. The settling of the building had taken place, in his opinion, since the putting in of the shop-fronts. The wall of the building was then supported above the shops by wooden beams without pillars, and the settling had taken place over the whole building if the beams were properly attended to and made good. One of the beams was very rotten, and had it been allowed to remain much longer the whole of the fabric would have come down. Mr. George Healy, builder, stated that he had examined the building, and found the lower part of it quite safe. The facing underneath the cornice had not sufficient base to support the weight of the cornice, unless there had been cramps to fix it to the brick wall. The brick wall was itself of sufficient thickness to support itself, independent of the stone. His opinion was that the beams over the shop had given way a little in the middle, and the settling of the building had caused the cornice to get over-balanced. After some other witnesses had been examined, the jury returned a verdict of accidental death, accompanied by a recommendation to the corporation to appoint a competent person to examine the building, and see to its being immediately put into a proper and safe condition.

Bursting of a Canal Embankment.—An alarming accident has occurred on the Grand Junction Canal, between Cheswardine and Little Souldley, near Market Drayton. The embankment burst in two places, on opposite sides, and the water dashed across the adjoining fields. Sad havoc has been made with the gardens and fields in the neighbourhood, and two cottages were flooded.

Fall of a Cross in Bedfordbury.—Part of the large cross which surmounts the mission-house in Bedfordbury has fallen. The fragments struck several persons, but killed none.

Petersfield.—At that portion of the town adjoining the London and Portsmouth-road, a shop 40 ft. in length, brick-built and slated, in the occupation of Mr. J. Capton, wheelwright and builder, adjoining College-street, has fallen inwards. Six men were employed in excavating a pit alongside, but had left shortly before. The premises were about being converted into a steam brewery and malthouse; and old store buildings having been removed, and a great part of the ground excavated at considerable depth for cellars, &c., a portion of which ran alongside of the building in question, and, as it seems, too near for its stability, the foundation gave way, and the whole pile, with the exception of the front wall, fell.

Nenagh.—At the slate-quarries near Nenagh, three men were at work under a projection of stone several tons in weight. The constant strokes of the hammers while they were preparing a rock for blasting seem to have shaken the immense stone overhead, which came down like a thunderbolt, breaking one man's legs and arms into splinters, and crushing the body and head in a frightful manner. The other men were more or less severely injured.

Brighton.—While workmen were engaged in putting on the roof timbers of three or four houses just being built at the top of Southover-street, the party-wall of the corner house and next adjoining suddenly bulged and gave way on the ground-floor, bringing with it the wall above, the roof timbers, and scaffolding, precipitating the workmen to the ground, injuring two of them,—one especially receiving a fracture of the ribs,—and necessitating their removal to the hospital. An eye-witness ascribes to the accident to evident haste in construction, the materials of the party-wall on the ground-floor being composed of three parts mortar and rubbish; and while in a green state the wall above was carried thereon all in bricks, causing too sudden a weight before the work had sufficiently set.

Bolton.—A serious fire has occurred in the Bolton Market Hall, a fine structure, 294 ft. in length, and 215 ft. in breadth, and costing upwards of 50,000*l.* The fire originated in one of the lock-up shops underneath the gallery, occupied by a provision dealer. The ornamental ironwork of the doors had to be smashed in. By that time the shop was one mass of flames, and the fire had also communicated to adjoining shops, as well as to the canvas covering of shops in the gallery, which were filled with drapery goods. There being a plentiful supply of water the fire was speedily arrested. The damage is estimated at 500*l.* or 600*l.*, partly covered by insurance.

PHILOSOPHICAL HISTORY OF ARCHITECTURE.

In a recent letter to Professor Donaldson, M. Cesar Daly (of the *Revue Générale de l'Architecture*), who had been running after him on the Nile without success, makes some observations which have a general interest. M. Daly says,—

"The Viceroy has named me Commander of the Medjidie. I have collected a considerable amount of data on the Egyptian monuments of all periods (old Egyptian and Arabian). I will forward to you shortly the most important document written by me since I held a pen. Now, our writers, without an exception, to my knowledge, have written volumes on the different styles of architecture, without ever giving a really scientific definition of what constitutes a style, and consequently nobody has undertaken to show scientifically in what genealogical, rational, and æsthetic relations the styles stand to one another. The consequence is the utmost confusion in the language, and a thorough want of philosophy in the expoundings of the history of our art. It is certainly, to all first appearances, rather bold to speak in this apparently hard manner; but I think that I am fully justified in doing so, and the more so because I have attempted the two things myself, and written what I might call a syncretical and philosophical sketch of the history of our art, from the oldest historical times until the present day. I have attempted even a step more: I have tried to discriminate, in the midst of modern confusion, the elements which are destined to combine together and to constitute the basis of a future style of architecture. Of course, in a labour like this, a great deal will be contested; but as these opinions, or rather strong reasoned convictions, have governed my architectural judgments since thirty years, it is

just that I should make them known. I have hesitated a long time about it, being fully aware of the prejudice existing among all artists against the immixture of science in the department of art. The prejudice is not without a cause, and a strong and good one even; nevertheless it is hind to a certain degree, like all prejudices, and acts sometimes against the interest of art itself. Excuse this apparent boasting, but the pamphlet is already in print, and I only wait to read over the proof-sheets on my return to Paris, before giving *le bon à tirer*; you will receive it, consequently, in all probability, in the month of August next—of July, perhaps. If the matter excites any interest among the English confraternity, I will perhaps go over to give explanation *vis-à-vis*. From Jerusalem I go to Beyrout, Damascus, Balbeck, Cyprus, Rhodes, Smyrna, Ephesus, Constantinople, Athens (a point or centre of several excursions), and I will come back to Paris, traversing Naples and Rome, giving a fortnight to them. I calculate that with all this I shall still be in Paris in the middle of June. I shall thus have seen, in a sort of moving panorama, the antique world, and have compared occidental and eastern art, and I have new data and new conclusions to produce on that subject: you will see shortly. In the meantime, I am sorry not to have met you somewhere abroad."

SEWERAGE AND SEWAGE.

Horne Bay.—Mr. Bazalgette, the engineer of the Thames Embankment and London Main Drainage, has visited the Bay at the invitation of the committee. He inspected the present imperfect outfalls, and will shortly submit a plan to the committee. He expresses a strong opinion that the authority ought not to be content with having a scheme for the Old Town only; but that this opportunity should be taken of having one scheme of drainage for the Old and New Town, by which the sewage of the latter should also be conveyed away to the eastward, instead of being sent out opposite the middle of the town to defile the foreshore, and gradually create a nuisance.

Gainford.—Mr. Lamb, surveying clerk to Mr. Ross, architect, Darlington, has been employed by the Sanitary Committee to prepare plans and estimates for the works required for the sewerage. He considers that a sum of 750*l.* will be required for drainage purposes, exclusive of any cost of water supply.

Purification of Sewage.—A paper has been read at the French Academy of Science, by MM. Mille and Durand-Claye, civil engineers, on the chemical analysis of the liquid matter of sewers. Their experiments were conducted at the expense of the city of Paris, and under the direction of a special commission. It was ascertained that the waters of the sewers of the capital could easily be purified by means of sulphate of alumina, at a cost of one centime per cubic metre of liquid. The 190,000 cubic metres of the latter, which are daily allowed to run to waste, contain a quantity of useful matter the value of which amounts in the course of the year to about 250,000*l.* The operation of purifying the waters divides the fertilizing substances as follows:—The phosphates remain in the sediment; the potash is in dissolution in the liquid; one third of the nitrogen is absorbed by the water, the two other thirds by the sediment.

Lills Gonerby Local Board.—Upon the recommendation of the drainage committee, this Board has determined to adopt and carry out the plan and report of their surveyor, Mr. Jas. Marsh, C.E., for improving the drainage of the district. The first part of the work will be commenced shortly.

"**A Bishop among Architects.**"—A late bishop being desirous of enlarging his palace, caused an architect to prepare plans of the proposed alterations; but when he came to know the estimated cost of the works, he declined to proceed. "What excuse shall I draw for your fees, sir?" said the bishop to the architect; who told him that, as the plans were abandoned, his charge would be a hundred guineas. "A hundred guineas! Why, sir, many of my carriages do not get so much in the course of a year." "Possibly," said the other; "but your lordship must remember that I am a bishop among architects."—*Church Review.*

THE NEW ISLINGTON WORKHOUSE.

We illustrate this week the new workhouse for the parish of St. Mary, Islington, now in course of erection in Upper Holloway. The foundation-stone was laid in July last by the chairman of the board of guardians. The site of the new workhouse (which contains about seven acres and three quarters of land) is in the St. John's-road, and very near the Alexandra Orphanage. Being on the "Hornsey Rise," the ground is very much higher in the rear than it is in front, a circumstance which has been turned to advantage by introducing a lower or basement story under the main building, for stores, permitting further of the formation of a wide double terrace its entire length, which, as a platform for the building, enhances its general appearance. The fall of the ground towards the front has facilitated the drainage, and a thorough system is being constructed with the view of rendering every part of the building and yard perfectly dry. Underground vaults for coal have been provided.

The buildings externally are all of bright yellow stocks, relieved by bands and arches of red and white brick; Portland stone being sparingly introduced where other material would soon perish owing to the elevated and exposed situation.

The general arrangement of the several buildings will be seen on reference to the plan, and is as follows:—

- A. Casual wards.
- B. Porters' rooms and receiving wards.
- C. Board-room and offices.
- D. Outdoor relief offices.
- E. Main house.
- F. Dining-hall and chapel over.
- GG. Refractory wards.
- II. Stores.
- I. Kitchen building.
- KKKK. Infirmary wards.
- L. Administrative block.
- M. Separation wards.
- N. Doctor's residence and dispensary.
- O. Laundry.
- P. Storeyard and shed.
- Q. Yard closets and sheds.
- R. Dead-house, stable, &c.

The main building possesses a frontage of about 420 ft., and a corridor 8 ft. in width extends its entire length on every story, communicating on either side with wards about 18 ft. 6 in. wide. It is proposed to obtain a proper classification of the inmates by means of iron gates and separate staircases at certain intervals.

The entrance is in the centre, with a vestibule conducting to a principal staircase, behind which is placed the dining-hall, with the chapel over. The ground story of the main house will be 13 ft. 3 in. high in the clear, and the one and two-pair stories 12 ft. each.

The dining-hall is 70 ft. by 45 ft., and 16 ft. high, and the chapel will be finished internally in coloured brick, with an open-timbered roof.

The infirmary, which is placed centrally in the rear, is on the pavilion principle, and will consist of wards 96 ft. long by 24 ft. wide, those on the ground floor being 13 ft. high in the clear, and those on the one and two-pair stories 12 ft. high. They are lighted by windows on both sides extending to within 1 ft. of the ceiling, constructed in three heights, the two lower being double hung, the upper hung to hinges opening inwards for ventilation. It is intended to warm the wards by the "Galton" stove placed in the centre, two to each ward, by means of which pure warmed air will be introduced; the side walls will consequently permit of the uniform arrangement of the windows and beds. At the further end is a large window, which will contribute much to the cheerfulness of the wards, and at the same time assist the ventilation in connexion with louvres or fanlight over the door, which is at the opposite end.

A nurse's room, with inspection window, and separate scullery, fitted with a small cooking-stove and washing sink, will be provided to each ward. Each ward will contain 32 beds, affording consequently between 850 and 900 cubic feet to each occupant. Two large day or convalescent rooms are provided, communicating with spacious airing grounds.

The administrative block is placed centrally, and will consist of kitchen and scullery, apartments for the superintending matron, stores, and bedrooms in the upper part for the nurses.

The "separation" wards form a detached building, consisting of ground and one-pair stories, similar in its general arrangement to the infirmary, but providing 1,200 cubic feet per inmate, and reached by means of an enclosed corridor from the infirmary.

Access to all parts is provided by means of cartways up the two sides of the site, and enclosed corridors afford communication to every portion of the building under cover. Lifts will be provided in the several buildings. The right-hand front-wing building contains the board-room, with clerks' offices over, tradesmen's waiting-room, also a large waiting-room, 70 ft. by 45 ft., and three offices for out-door relief. The corresponding building on the left hand contains porter's lodge and rooms in connexion, two large receiving or probationary wards, each

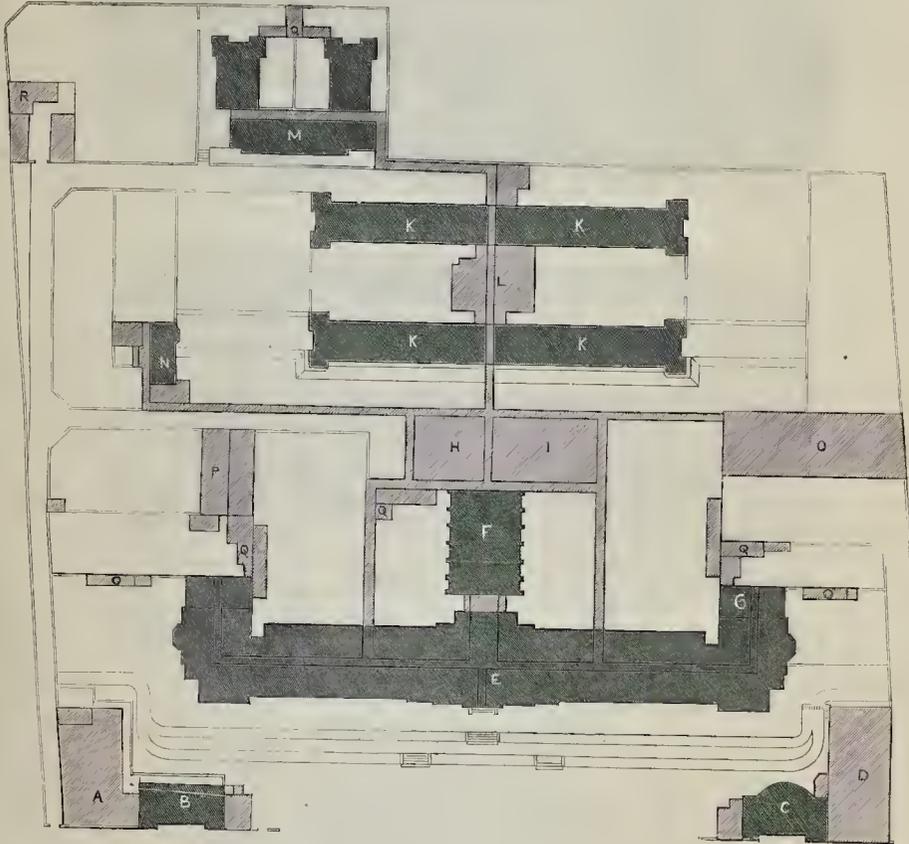

25 ft. by 16 ft. and 12 ft. high, with attendants' room adjoining; also the casual wards, one of which is 50 ft. by 20 ft., and the other 55 ft. by 18 ft. 6 in.; they are 14 ft. 6 in. high to the springing of the roof, and 21 ft. to the apex of the roof-light. The beds for the casual wards will be after a design by the architect, and so arranged as to turn up bodily against the wall when not in use, leaving the floor clear for the purpose of cleaning. They are also very inexpensive as to cost.

The buildings will be supplied throughout with

hot and cold water, and warmed by ventilating grates and stoves in all wards and rooms, and by hot water in the corridors.

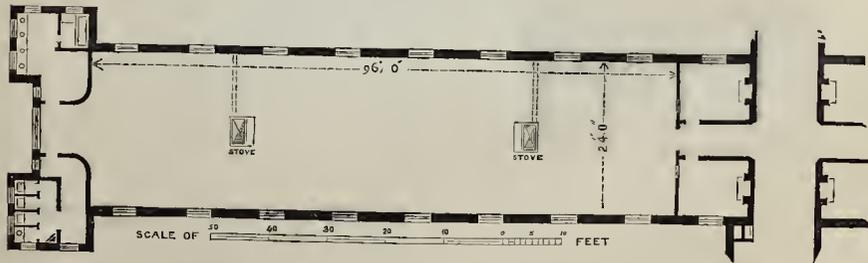

Mr. R. H. Burden is the architect. The contractors are Messrs. Nutt & Co., the contract amount being 63,300l. The engineer's work is being executed by Messrs. James & Co. The gasfitting by Messrs. Faraday & Son. The baths are from Messrs. Rufford & Finch. The bells will be on the electric principle. Mr. Barrett's fireproof flooring has been used for the main corridors. Mr. Lewis is the clerk of works.

ISLINGTON WORKHOUSE.

Block Plan.

Scale, one inch to 100 ft.

Plan of One of the Infirmary Wards.

ISLINGTON WORKHOUSE, UPPER HOLLOWAY — MR. R. H. BURNEN, ARCHITECT.

TO MEASURE HEIGHTS.

Mr. STANLEY, of Holborn, is now making a very compact and useful instrument, called the Apomeometer, that can be carried in the waistcoat pocket, for ascertaining the vertical heights of towers, spires, and other buildings. It cannot be better explained than by quoting the description given by Mr. Millar, the inventor. "The Apomeometer is constructed in accordance with the principles which govern the sextant, viz.—As the angles of incidence and reflection are always equal, the rays of an object being thrown on the plane of one mirror are from that reflected to the plane of another mirror, thereby making both extremes of the vertical height coincide exactly at the same point on the horizon glass; so that, by measuring the base line, we obtain a result equal to the altitude." The instrument we have tried, testing several heights up to 50 ft., worked very accurately. We consider it to be a valuable acquisition for the architect, traveller, and sketcher. A small hinged handle might be added with advantage.

HERTFORD.

Rebuilding of St. Andrew's Church.—The chief stone of the new Church of St. Andrew has been laid by Earl Cowper. Mr. J. Johnson is the architect, and Messrs. Dove, Brothers, are the builders.

The New Workhouse.—The local *Mercury* says of this building:—"The new workhouse, in the Ware-road, will be one of the architectural attractions of Hertford. There are some things which might have been different, with advantage to the general effect, but the building is nevertheless an agreeable object, and we prefer it greatly to the barrack-looking structures which usually serve as workhouses. We hope that the rooms are sufficiently large and lofty, and the ventilation good; and it is not too much to expect that space will be found somewhere for the leather and other materials used in the house, elsewhere than under the men's dinner-table. The policy of making the arrangements of a workhouse attractive may be questioned; but there can be no doubt that it is as much with a view to the benefit of the ratepayers as of the poor that the Legislature and the Poor-law Board require that they shall be of such a kind as to conduce to the health of the inmates. The *Villa Residence Company's Estate at Bengoe.*—Two of the houses erected by the *Villa Residence Company* on the site which it acquired on its formation, have been let for the purpose of a preparatory school for Hailybury and the other public schools. A residence for the minister of the new church in Port Vale has been erected on the same estate, on the brow of the Warren-hill, overlooking the valley of the Lee.

COMPETITIONS.

Cirencester Cemetery.—During the past week, on the walls of the Corn Hall, have been suspended a large number of designs, for the proposed obelisk and lodge at the Cemetery. Nearly seventy architects competed. The Board eventually accepted, we are informed, the designs of Messrs. Medland & Son, of Gloucester.

Bishop's Sea Defences.—The design selected for commendation, as second, was marked "Experience," and not "Experience" written upon a flag, as at first stated. It was the work of Mr. Joseph J. Bennett.

THE SEWERAGE OF WEST DERBY, LIVERPOOL.

THE West Derby Local Board, having applied to the Secretary of State for powers to borrow 22,000l. for the construction of an outlet sewer to the sea at Rimmel Bridge, an inquiry was held by Mr. Arnold Taylor, of the Home Office, at the Public Offices, West Derby village, on Saturday, the 15th of May, and on the following Monday and Tuesday, when evidence was given in favour of the proposition of the Board, as also in opposition and in favour of a rival scheme prepared some time since by Messrs. Reade & Goodison, the engineers to the Walton Local Board.

It appears that the townships of West Derby and Walton lie on the same watershed, and that several hitherto ineffectual attempts have been made to attain joint action by both boards in the construction of a main outfall. The West

Derby Board is desirous of carrying the sewage direct to the sea, and wasting it in the estuary of the Mersey; while Walton, desiring to utilize its sewage by irrigation, and having ineffectually attempted to persuade West Derby to join in an irrigation scheme, has already obtained borrowing powers for a separate system, which is now on the point of being carried out. In addition to this complication, a memorial, signed by some of the leading men in the township of West Derby, opposed to the course taken by the Board, was presented to the Home Office, praying for a thorough investigation: hence the inquiry.

Mr. G. F. Lyster, engineer to the Mersey Docks and Harbour Board; Mr. James Newlands, borough engineer of Liverpool; Mr. Orridge, engineer to the West Derby Local Board; and Mr. Lea, C.E., gave evidence in favour of the sea-outlet; while the memorialists were supported by Mr. M. O. Tarbotton, engineer to the corporation of Nottingham; and Messrs. Reade & Goodison, the originators of the utilisation scheme. A printed report in favour of the utilisation of the West Derby sewage, by Mr. Chalmers Morton, of the Rivers Commission, was also circulated at the inquiry, but could not be received as evidence, in consequence of that gentleman's non-attendance.

Mr. Lyster's evidence was to the effect, that the proposed outlet would not be injurious, nor prove a nuisance to Tenforth and Waterloo, the sewage being swept away seawards by the tidal current, and also that the Dock Board were willing to enlarge the Rimrose culvert sufficiently to take the proposed influx of sewage at the expense of the West Derby Board. He emphatically disclaimed any intention of appearing against utilisation.

Mr. Newlands supported the views of the Board, considering the proposed culvert a safety-valve to take storm water, and stating that the scheme was almost identical with one he proposed some years ago. He considered that the river Alt could not be used to take the effluent waters from irrigated lands, as it was a dammed-up and sluggish stream, and that the effluent water would ferment and prove a nuisance. It was also his opinion that the water would be worse as it flowed off the land, than when it went on in the state of sewage. He considered that the Liverpool outlets do not pollute the Mersey, as they are carried down to low-water mark, and all offensive matter is swept away by the tidal current, and when fermentation sets in, must be somewhere near the Isle of Man.

Mr. Orridge gave evidence of a somewhat similar nature; and Mr. Lea, that the sewage would not foul the Mersey and the shores at Waterloo. None of the witnesses could give an opinion on the opposition scheme, not being familiar with its details, and, in fact, avoided it altogether.

Mr. Tarbotton had studied both the plans of the Board and the utilization scheme, and had inspected the ground, his views being embodied in a printed report. He had also examined the estimates and the relative cost of the two schemes. The adoption of the inland route, combined with irrigation, would, he contended, save the Board 20,000l., as the outlet at present proposed only provided for the western sewage and the eastern main it was intended to connect with the outlet at an expense of 10,000l., making 32,000l. in all for outlet works; while the proportion to be paid by the West Derby Board, if they joined with Walton in irrigating, would, for engineering works for both mains, be only 12,000l. He considered the river Alt, which discharged 20,000,000 gallons per day in dry weather, with a velocity of 60 ft. per minute, a perpetual safety-valve, and by the provision of storm inlets into it, the sewers could be reduced in diameter. Was decidedly of opinion that the sea outlet would damage the shore at Waterloo. Considered Reade & Goodison's scheme simple, efficacious, and economical, and correct in principle.

Mr. Goodison unfolded all the details of the utilization scheme, and produced the detailed estimates, stating that the prices were bigger than those of the accepted tender for the Walton works. The Walton sewage would be disposed of by gravitation, and by enlarging the outlet they were about to construct, the whole of the western sewage of West Derby could be disposed of by it in a similar manner. The eastern sewage could be readily dealt with by pumping. Knew the Waterloo shore well, and considered it was already suffering by the sewage of Liverpool. Mr. Reade confirmed the facts and details spoken to by his partner. Tide-locked sewers

he thought, should always be avoided where possible, as the gases were bottled up and driven back by every recurring tide. Pointed out that the extension of the dock works northwards, which had increased the tidal current, had damaged the Waterloo shore, whereas, if the theories of Mr. Lyster and Mr. Newlands were correct, they should have improved it.

The Waterloo Board opposed the construction of the sewer, and brought witnesses to prove that their property would be materially damaged if it were carried out. The inquiry then terminated with a eulogium on Mr. Taylor for his impartial mode of conducting it.

THE SECRETARYSHIP OF THE INSTITUTE OF ARCHITECTS.

Sir,—It hardly appears consistent with the courtesy which binds society together, or with the generous fairness to which Professor Kerr doubtless lays claim, that he should avail himself of a public opportunity to recall a hasty (and doubtless indiscreet) expression used by Mr. Seddon long ago in a private house and on a private occasion. The Professor forgets to add that Mr. Seddon at once explained that he did not intend it to convey the meaning of his intention to use his official position for party purposes; and Professor Kerr, having withdrawn his opposition to Mr. Seddon, ought not to have let this Partisan arrow at the adversary he had sought unsuccessfully to offend.

Yours, &c., D. G. WATSON.

"We have received two letters commencing caustically on the unfortunate expression referred to; but we decline printing them: let bygones be bygones. There should be only one "party" in the Institute.

CLERKS OF WORKS.

Sir,—The securing of honesty in clerks of works being of very great importance, I was glad to see the subject taken up in your paper by "An Old Clerk of Works;" but, while believing that the class of men he points out to be men in whom honesty and integrity have "grown," I think it just to add that there is another class not drawn from the ranks of workmen, or from an office, who can claim to be honest, able clerks of works, though under forty,—viz., those trained for the work.

It was indeed I should be a Joiner; only about four months before I attained the age of fourteen I was taken by a permanent clerk of works to assist him in any way I was able, with the promise of being "put forward;" so that at an early age I could make a working drawing (such as could be worked to) for ordinary work. I remained with him a number of years, and obtained step by step, under his tuition, on churches, schools, warehouses, and residences—in fact, buildings of almost every description and style,—such a practical knowledge of the nature and cost of work and materials employed in every branch of the trade, as can be obtained only on the actual work properly explained at the time. Add to this, the just firmness that a like training must—or ought to—produce, and I have no doubt your readers will acknowledge the above claim on behalf of a small class of clerks of works to be just and worth consideration. A YOUNG CLERK OF WORKS.

FIXTURES IN SCOTLAND.

An important case as to fixtures has been decided in the Sheriff Court, Westwickshire. Mr. David Barr Lindsay occupied the mansion-house of Oxendale, on the estate of Dunso Castle, with the garden, offices, and certain parks, as a yearly tenant, since 1861. He had erected at his own expense a vinery, greenhouse, peach-house, and forcing-house. Mr. Lindsay received a legal warning to remove from the premises at the present term of Whitsunday. The proprietors, the trustees of Mr. William Hay, of Duns, claimed the glass-houses, and interdicted the sale of them by auction for Mr. Lindsay. After examining the premises, along with Messrs. Duns & Dods, holders, the Sheriff-Substitute issued an interdictor, in which he finds that the respondent, Mr. Lindsay, has been occupying the house and premises at Oxendale as a yearly tenant, and without a lease; that the greenhouse and other glass houses in the garden there have been erected by the said respondent at his own sole and considerable expense; that their removal will occasion no damage to petitioners' property; that the respondent is ready and willing to restore the garden forthwith to the condition in which it was before the said structures were erected; that, in these circumstances, and under these conditions, the respondent is entitled to remove the said greenhouse and other glass houses and appurtenances; that the respondent is not entitled to remove any of the trees or shrubs growing in the soil; therefore, continues and confirms the interdict as regards the said trees and shrubs; and *quoad ultra* recalls the interdict, refuses the prayer of the petition, finds the petitioners liable in expenses, &c.

THE KIDDERMINSTER INFIRMARY COMPETITION.

Sir,—I noticed too late in the week to reply in your following issue, a letter from "Rejected" relative to the Kidderminster Infirmary Competition. Other letters I have seen, but scarcely thought it worth while to reply to them, as they appeared to be written by disappointed men smarting under defeat. "Rejected's" letter is, however, so gross in its expressions, as well as false in its insinuations, that I cannot let it pass. Now, supposing that each of the four questions asked by "Rejected" were necessarily answered in the affirmative, it must be evident to your readers that no man in his proper senses would think of applying the terms "despicable job" and "iniquitous management" on such slender grounds; because it does not necessarily follow that there should have been any unfairness or partiality. But what becomes of the insinuation conveyed in the questions of "Rejected," when those questions are answered, I leave your readers to decide, and as briefly as possible to do so.

Mr. Bland's plans were forwarded on the evening of the 9th, and delivered with a number of others at nine o'clock on the morning of the 10th. He had access, on one occasion, to the room in which the designs were exhibited, by right as a subscriber, many others being present; but he did not discuss the merits or demerits of any of the designs with any member of the committee, some two or three being present, but not in their official capacity, as the exhibition was for the inspection of the designs by the subscribers.

As to cost, it was the belief of amongst parties well able to judge that none of the designs which gave the stipulated accommodation could be executed for the sum named, although some of the competitors, I believe, intimated as usual in their reports to the contrary.

Lastly, Mr. Bland was not at that time the architect of the honorary secretary, neither could he be called his personal friend, as up to the time of the competition his acquaintance with the honorary secretary was of the slightest description.

In conclusion, I beg to call the attention of "Rejected" to the fact that the committee having selected from the 19 designs exhibited, two of those which they considered best met their requirements, they called in an entirely disinterested architect to report upon the merits, demerits, and probable cost of the two designs; and he having strongly reported in my favour on all the counts, the committee decided on accepting my design.

JOHN GEO. BLAND.

BAKERS' OVENS.

Sir,—Will some of your numerous readers oblige me with particulars of a well-tried smoke-consuming furnace for bakers' ovens? I have no doubt that in most London bakerhouses some such apparatus is used; my wish, however, is to secure a thoroughly well-known and effectual smoke-consuming furnace.

B. A.

METROPOLITAN BOARD OF WORKS.

LAW COURTS' SITE.—DISTRICT RAILWAY.

At the usual weekly meeting of the Metropolitan Board of Works, Mr. Phillips, the representative of the Strand district, complained of the great delay in proceeding with the New Law Courts Site Bill, and said the uncertainty was most ruinous to the inhabitants.

The Chairman said the delay did not rest with the board, but with the Government.

Mr. Shaw asked the engineer, with reference to section 6 of the Metropolitan Railway Act, 32 and 33 Vic., whether, in his opinion, the works of the Metropolitan District Railway Company were proceeding at such a rate as to render it probable that that portion of the railway which is connected with the works authorised by the Metropolitan Improvement Act 1863, and also the remainder of the railway from Westminster-bridge to Cannon-street, would be completed and opened to the public by Jan. 1, 1870.

Mr. Bazillette replied that he did not think the works would be opened by the date named, but the company had applied for a Bill to raise funds to complete their works.

The engineer was requested to report weekly to the board on the progress of the works.

A report was read stating that the Thames Embankment works were proceeding satisfactorily.

THE DANGER OF DISINFECTANTS.

Sir,—A short time ago suggestions appeared in a medical paper, and were reprinted in a leading journal, with reference to the use of "green coppers" as a disinfectant. The idea of the writer was that the germs of fever-poison penetrate into the wells from the drains, and contaminate the water. Now it may be worth while asking whether there is not danger in the plan proposed. Is the disinfectant that is recommended a poison? If so, the remedy would be as bad as the evil that is sought to be cured, unless it can be proved that the two poisons act and re-act upon each other, and are both thus rendered innocuous.

This seems to me a question suitable for discussion in your columns, and you will oblige me by inserting these brief remarks.

SANITARY.
* Sulphate of copper is blue; sulphate of iron green; and as sulphate of copper has been called blue coppers, sulphate of iron has sometimes, stupidly, been called green coppers. If, therefore, by green coppers he meant protosulphate of iron, that cannot be regarded as a poison, used in the way indicated.

INTERNAL ADORNMENT OF BUILDINGS.

At the meeting of the London Artisans' Club, when Mr. Crace's paper, printed in our issue (p. 443), was read, Mr. Layard, M.P., said there was nothing, in his opinion, more calculated to raise taste in this country, and to create a high intellectual and moral feeling, than the internal adornment of public buildings. This country he considered almost entirely ignorant of what constituted internal decoration, and the kind of impression it produced on the mind of the beholder. A great deal had been done in outward decoration, but very little in internal. Very few public buildings were decorated in a manner worthy of the nation. The National Gallery, of which he was almost ashamed to say he was a trustee, had a very fine collection of pictures; but in respect to internal decoration little better—indeed, he might truthfully say it was a little worse—than auction-rooms. The case was very different on the continent. There the internal decorations of public buildings had done very much towards elevating the popular taste. Some few years ago it was said of the English people that they

had no ear for music. The reason why they had not was that music was not placed within their reach. Now, he believed the English were the most musical people on the face of the earth, not excepting Germans and Italians; and he believed it would be the same with the arts. He observed in Paris, in all matters of detail where the skill of the working-man was exhibited, we were very much behind the French,—in such matters, for instance, as area-railings, street-lamps, garden-enclosures. Our lamps in London were a perfect disgrace. Search the world over, and you could find nothing more ugly. Our area-railings were mean in the extreme.

REOPENING OF THE CHARLES MUSEUM, MAIDSTONE.

THE new wing of the Charles Museum, Maidstone, has been opened to the public for the first time, on which occasion the mayor invited a large number of the working-classes to a *conversazione*. The idea proved successful, nearly the whole of the possessors of tickets, numbering several hundreds, being present. The archaeological, geological, and fine art specimens are collected in Chillington House. The nucleus was got together by the late Dr. Charles. It is through the liberality of Mr. Alexander Randall that the institution has at last been placed in an efficient state, and its contents displayed in a manner which make them accessible to all. About a year ago Mr. Randall made the purchase of one of the wings at the side of the building, which at that time was in a dilapidated condition, and was used as a coal-shed. He then presented it to the town on condition that it should be restored. The town council have accordingly restored the building, with regard for the architecture: the whole of the old oaken beams, which were quite sound, and other materials having been used. The architect employed was Mr. Habert Benstead. The new wing has added two rooms to the building, one of which has been devoted to the library of works of reference which the town possesses, and the other to a picture-gallery. This has enabled Mr. Lightfoot to make a new disposal of his materials. The Brencley collection from the islands of the South Sea has been brought to light for the first time, and the building itself has had windows opened up, and oak wainscoting cleaned.

SUPPLEMENTARY EXHIBITION OF PICTURES.

A SELECTION of pictures and other works of art, partly from those which had been submitted to the Royal Academy and returned, is now on view in Bond-street, nearly opposite the end of Burlington-gardens. It consists of 524 paintings and drawings, 23 pieces of sculpture, and 5 miniatures. Fear of seeming to oppose the Academy, dislike to proclaim a grievance or even to let the fact of rejection be known, and various other reasons, have doubtless led many artists to refrain from submitting their works to the committee who have arranged this exhibition. About two-thirds of the whole, it is stated, were rejections of the present year. The collection includes a number of excellent pictures, and deserves a visit from all who are interested in art-matters or fond of pictures. We shall take an opportunity to return to it.

The catalogue, which is very dear at a shilling, and so shows no step forward, should contain a list of the exhibitors and their addresses.

CHURCH-BUILDING NEWS.

PRESSURE of matter, and the very large number of new churches and church restorations we have always to record, leave us somewhat in arrears for the present.

Rotherhithe.—All Saints' Church, Rotherhithe, has been re-opened, after having undergone a restoration and decoration, under the superintendence of Mr. G. Legg, of London, architect. The former small chancel has been taken down, and a new one constructed in its place. It is paved with encaustic tiles, and fitted with carved benches of pitch pine. A painted east window, by Messrs. Powell & Co., has been fixed, and the whole of the glass of the nave has been replaced with coloured glass. The organ has been removed from the gallery, and placed in a new organ-room, constructed on the north side of the chancel. The pews and free seats have been

replaced in the church by open benches, with carved ends. The roof has been remodelled. New pulpit, carved in pitch pine, and standing on a stone base, has been erected on the south side of the chancel, but in the body of the church. New fronts have been made to the children's galleries, and the galleries round the church have been decorated with architectural designs. The whole of the works have been carried out by Messrs. Harrison & Edwards, Rotherhithe.

Tattenhall.—The church is about to undergo rebuilding and restoration. The contractors are Mr. George Woolmans, builder, Tattenhall; and Mr. S. Dutton, stonemason, Burwardsley. The estimate for the whole restoration is 2,600*l.*

Watford.—It is intended to have the parish church restored, more or less thoroughly according to the subscriptions. Mr. Scott is spoken of as the architect to be employed.

Lewisham.—The foundation-stone of a new church, to be dedicated to St. Mark the Evangelist, has been laid by the Earl of Dartmouth. The church, in the Decorated style, will be divided into nave, north and south aisles, chancel, and organ chapel, with vestries for clergy and choir, and a narthex and tower with ashlar spire rising to a height of about 100 ft. at the western front. The dimensions of the edifice are,—Nave and aisles 80 ft. by 60 ft., chancel 28 ft. by 39 ft. The walls will be of Kentish rag with Bath dressings. The church will seat 750 persons, and owing to the nature of the site (from its inclination eastward) schools may be formed under the chancel. The present contract, about 7,000*l.*, embraces a portion only of the building, the contractors being Messrs. Carter & Sons. The architect is Mr. Wm. C. Banks, of London.

Wisebech.—The new church of St. Augustine has been consecrated by the Bishop of Ely. It consists of a nave 61 ft. in length and 24 ft. 6 in. in width, with four arches on each side, opening into north and south aisles 11 ft. wide, and a chancel 32 ft. by 22 ft. The seats are plain open benches, those in the chancel made in oak, and the whole will accommodate 500 persons. The pulpit, prayer-desks, and lectern were a special gift, and are therefore of a rich character. The pulpit is a stone one, with alabaster top, and red marble columns. The walls of the church are built of brick, with stone for piers, windows, doorways, &c. The whole of the works have been carried out by Messrs. Law, of Lutterworth, from the designs of the architect, Mr. William Smith, of London, at a cost of over 3,000*l.*, raised by subscriptions.

Hereford.—The new district church of St. James has been consecrated by the Bishop of the diocese. The church is cruciform in plan, and consists of nave, north and south aisles, transepts, chancel, sacristy, and south porch. The aisles are continued eastward of the transepts, and form an organ-chamber on one side, and an additional space for seats on the other. The nave is 72 ft. long internally, and is divided from the aisles and transepts by arcades of four arches on each side. The width of the nave and aisles in the clear is 44 ft., and the width across the transepts is 68 ft. The nave from the floor to the ridge is 42 ft. high. The chancel is 35 ft. long and 20 ft. wide, and 40 ft. high to the ridge. The south porch is constructed as the substructure of the future tower and spire, and contains the first few steps of the cork-screw staircase to the ringing-loft and belfry. The style adopted is Early Geometrical. The west front is pierced with three windows, one of three lights and two others of two lights each; the chancel by a three-light window at the east end, and by two two-light windows at the side; the transepts by four-light windows, and the sides of the aisles by seven two-light windows. The clearstory is pierced by light sexfoiled circular windows. All the windows contain foliated tracery in the heads. The building has been constructed with Three Elms quarry stone, with Box-ground Bath stone dressings; the interior throughout being ashlar with random-ranged Bath stone, axed on the face, and set in wide joints, and relieved with bands and voussoirs of blue stone. The roofs are framed with pitch pine, boarded and felted, and covered with Whitland Abbey slates. The timbers and boarding are left their natural colour. The sittings are also of pitch pine varnished over. The aisles and chancel are tiled, Godwin's ornamented encaustic tiles being used throughout the latter. The works have been carried out by Mr. Gough, builder, Bishop's Castle, from the designs and under the superintendence of Mr. T. Nicholson, of this city, the diocesan architect.

Vesthoughton (near Bolton).—The corner of the new church of St. Bartholomew has been laid. The contemplated structure will be the third built upon the same site, the first being erected in the fifteenth century, and the second in 1731. It is to be of stone, and the design is Early Gothic, with a tower at east end. The cost will be from 5,000l. to 7,000l., which is borne by Mr. J. Seddon.

Beple Morden (Cants).—The church here has been reopened. The first thing which attracts observation on entering the village is the new tower and spire, the base of which is of Bath stone and forms a porch for the north aisle, the spire being covered with oak shingle, capped with a vane. The wall of the north aisle of the church has been refaced, and the west gable rebuilt. The wall on the north side has also been restored, and a parapet formed on the top. About 200 years ago, it is believed, the tower of the church gave way, destroying in full the chancel, which up to the present day had not been replaced; but the patrons of the living having offered 400l. for its rebuilding, work has been carried out, and has added no less than 16 ft. to the length of the edifice. A lancet arch now appears in the Perpendicular style. The architecture of the church is Early English, although there is a mixture here and there of a later style. An entirely new roof has been put on, and the windows (several of which are fresh) are filled with the green tint cathedral glass. The walls of the nave and north aisle have been plastered; that of the south being refaced with clunch. The new seats are of deal (stained and varnished), those of the chancel being of oak, with carved heads. The flooring of the chancel is composed of Staffordshire tiling, whilst that of the chancel is laid with Collis's (Westminster) encaustic tiles. The improvements have been carried out by Mr. J. W. Lacy, of Norwich; the architects being Messrs. Elmslie & Francy, of London. The cost of the restoration amounts to about 2,500l.

Louth.—The works in connexion with the restoration of the parish church are progressing. Workmen are now engaged in fixing an alabaster pediment. A new stained-glass memorial window has been placed at the west end of the south aisle by Mr. L. K. Lucas, and another one, we learn, is to be placed at the west end of the north aisle. The interior of the nave will soon be ready for the reception of the seats, and the pews are being laid with tiles.

Eling.—Mr. Frederick Hobson has laid the memorial stone of a church, which he and his father are about to erect on a portion of their estate at Homington, not far from the Hamlet of the Inn. The designs of the church and paragon house are by Mr. Benjamin Farrey. The foundations of the structure are laid, and the walls built up about 1 ft. throughout. The edifice will be in the Early Decorated style of architecture, and consist of a nave, chancel, and apse, having a bell-turret at one end, about 20 ft. high, shingled with oak. Flint is to be the material used, with Bath stone dressings; the roof will be open, and the seating stained deal benches. The builders are Messrs. Goddard & Co., of Farnham, who have just carried out an extensive work at Mr. Ibbotson's mansion at Eling, and a schoolhouse and dwelling near Mr. Ingrove's residence, at the foot of the hill leading to Hunter's Inn, all from designs by the same architect, and at the expense of the same lady and gentleman.

Newcastle-upon-Tyne.—In the new parish of St. Philip, Newcastle, it is proposed to erect a plain and suitable church, at a probable cost of 5,000l., to contain 700 sittings, all of which shall be for ever free. It is also proposed that the church shall be built to the memory of the late Archbishop Longley. The site has not yet been decided upon, but it is not improbable that the Archbishop Longley Church will be erected on a plot of ground, situated at the end of Pitt-street, near to the old quarry.

Bradley.—Recently the rector, the Rev. E. R. Hampden, restored the chancel of the parish church at his own expense, when the walls were decayed, and the work was done in the Decorated style, under the direction of Mr. Scott. Following the example of the rector, the neighbouring parishes, parishioners, and friends resolved to take the matter in hand. The walls of that part of the building are in a very bad and dangerous state, especially on the south side, which is out of the perpendicular and rapidly decaying. This wall will be rebuilt of the old material as far as possible, and its Decorated windows reinserted; the wall on the north side will be pierced for six

arches, in order to add an aisle on that side. These arches will be supported by Decorated pillars, the caps of which will be moulded, as also the arches. In the new north wall of the aisle the old Decorated windows removed from the old north wall will be inserted. There will now be sittings for about 400 people. The removal of the gallery will open the tower to the church, and bring into view a little Perpendicular window in its western wall, as also the late Norman arch of the tower, underneath which will be a screen of open work. A roof of timber will be placed on the nave—a tie-beam roof on the Decorated principle. A new porch is also to be added to the north side; it will be of stone, and connected with the hot-air chamber (which is partly underground) for warming the church. It is likewise contemplated as soon as possible to restore the tower. The upper part is much dilapidated, having been badly repaired from time to time. Sandstone from Ombersley is to be used in the restoration of the nave. Mr. Perkins, architect to the Dean and Chapter of Worcester, has prepared the plans and drawings for the work.

Meole Brace (near Shrewsbury).—The new church was consecrated on the 19th inst. It consists of a wide nave, with north and south aisles, south porch, chancel (the width and height of the nave, terminating in a three-sided apse), north and south chancel aisles (one of which is used as an organ-chamber), and vestry. There will also be a massive tower at the west end of the north aisle. The seats and stalls are of oak, and provision is made for 500 persons. The pulpit, of stone, inlaid with coloured marbles, stands at the north-east angle of the nave. The font has also alternate panels of marbles and carving. The chancel pavements are from Messrs. Maw & Co. A rearedos of marbles, with central cross of white statuary, is provided. The arcade caps are alternately moulded and carved. Messrs. Morris & Co. have filled the altar-window with stained glass. In the centre light is the Crucifixion, with the Virgin and Child underneath; the two side lights contain double figures, in three rows, representing angels, apostles, martyrs, prophets, and kings; and in the head is our Lord in glory, surrounded by angels. Another window for the apse, by the same artist, is in progress. The carving is by Mr. Boulton, of Cheltenham. The style of the church is Early Decorated. Red Hill stone has been used for the walling; Shelvocke for dressings; and for the shafts to arcades and chancel arch, Bedfordwood stone and blue Pennant. The interior is ashlined with Shelvocke stone. Mr. E. Haycock, jun., of Shrewsbury, is the architect. The contractors are Messrs. Bowdler & Darlington; and the cost has been about 4,500l. This sum does not include the pulpit, font, east window, and rearedos, which are separate gifts.

Chipping Sodbury.—The parish church of St. John the Baptist, Sodbury, has been re-opened for divine service, after having undergone a restoration. The roughtcast that formerly covered the exterior has been removed, and the stone-work exposed to view. The bell-stage stone lounes have been taken out, and the spaces filled in with tracery. The west window of the tower has been restored. The tower was separated from the church by a wall, which was built up between the tower-arch piers, but it is now thrown into the church. The old ringer's wood floor has been taken out, and the groining which was commenced when the tower was built has been finished. The south porch has been entirely rebuilt from the foundation, after the style of the original. The canopies and figures have been executed by Mr. Earp, of London. A new vestry has been erected. The walls, arches, and columns of the church have been freed from whitewash. The old high pews have been taken away, and bench seats, with traced and ried panels of varied design in the fronts and backs, substituted. The number of sittings has been increased by about 130, or to 415. The chancel with its screens, filled with tracery, to part off its aisles, and also the clergy and choir stalls, have been executed in oak. The tiling in the floors is of varied design and colour, from Mr. Godwin's works at Lugwardine. The rearedos, which is of alabaster, is by Mr. Earp. The side panels are of Caen stone. The east window is of stained glass, and is the work of Messrs. Clayton & Bell, of London. The church has been refitted with a new organ, by Mr. Fowles, of Bristol. The roof of the church has been replaced by a new one of Baltic fir. The restoration has been carried out from the designs of Mr. G. E. Street, of London. The contractors

were Messrs. Wall & Hook, of Brimscombe, near Stroud, and Mr. Reddin was clerk of the works. The restoration has cost about 4,000l.

Shrew, near Oldham.—The old Church of Holy Trinity, at Shaw, near Oldham, having become somewhat dilapidated, it has been resolved to build a new one near the same site. The new church, which has been designed by Mr. Drew, of London, is to be in the Early Decorated style. It will have a nave with aisles, and chancel with aisles, and a central tower of two stories, and 90 ft. in height, rising over the chancel. There will be a large east window of five lights; and at the west end there will be three large windows of two lights each. The building is estimated to cost from 7,000l. to 8,000l.

DISSENTING CHURCH-BUILDING NEWS.

Clerkenwell.—A new chapel, belonging to the Baptist denomination of Spencer-place, has been opened in Charles-street, Goswell-road. The entire cost of chapel, schools, and land, according to the *Clerkenwell News*, is 5,000l., 3,400l. of which yet remain to be raised. The chapel is constructed to seat 800 persons. The edifice has been commenced and completed in the course of eight months.

Leicester.—The memorial stone of a church for the United Presbyterians has been laid here. The new edifice is being erected on the London-road, in close proximity to St. Paul's Chapel. It is planned to seat nearly 800 persons, and will be galleried on three sides. A minister's vestry and a session-room are provided, at the north-east angle of the site. The style is Early English. The building generally will be faced with rock-faced Bulwell stone, which has been preferred to the granite rubble of the locality, as being in itself equally durable, and forming sounder masonry. The dressings will be of Bath stone. The tower and spire occupy the south-west angle of the site, at the junction of London-road and Station-street. The total height of the spire will be 120 ft. The north front of the building will be brick-faced, and finished in a temporary manner, it being intended shortly to erect a lecture and school room on this side of the church, and closely adjoining it. The contract for the building has been taken by Messrs. Osborne Brothers, of this city, builders, for 2,741l.; and the cost of heating, lighting, and other charges, will bring the total expenditure to about 3,200l., exclusive of the cost of the land. The architect is Mr. Tait, of Leicester. The walls of the church are already several yards high, and the stone was laid inside the building, at the further end of the church; and when the works are completed, the front of the stone bearing the name of the gentleman by whom laid and the date of the ceremony, will be seen. The church will accommodate about 750 persons. The building is well advanced.

Leigh.—The corner stone of a new chapel and schools for the Primitive Methodists has been laid at Leigh. The building will be of a semi-Gothic style of architecture, having its principal front towards Bradshaw-gate. It will be constructed of brick, having Eidge Fold stone and blue and white bricks for door and window dressings, and a pressed-brick front on north elevation. The means of ingress to the chapel are by two porches, one on either side of the principal front. The principal window to the north elevation will be of large dimensions. The building will stand partly on the site of the old chapel, and cover an area of about 2,700 superficial feet, the ground-floor having school-room, minister's vestry, three class-rooms, and boiler-house. There will be separate entrances to the schools for boys and girls. The chapel will be amphitheatre form, and will be above the school, classrooms, &c. It will occupy the entire space above them, having open pewing, and will accommodate from 400 to 500 persons. The architect is Mr. Edward Pritchard, C.E., of Leigh, and the builder Mr. Thomas Bathell, of Earlestown. The building is estimated to cost 1,512l.

Derby.—The memorial stone of a new Congregational Church now in course of erection in Derwent-street was laid on the 1st inst. The new church, as arranged at present, is to accommodate 350 persons, but the accommodation can be increased to 500. The style of architecture is thirteenth century Gothic. The contract has been taken by Mr. Stoddard, of Derby, at 1,258l. The architect is Mr. Tait, of Leicester. The United Presbyterian Church has been opened. The building occupies a site at the junction of Green lane and Gower-street.

The plan is arranged to accommodate about 500, with minister's vestry and session-room, heating chambers, and other offices in the rear of the church. The style is English Gothic of the thirteenth century, and the material for the walling externally is white Coxbench stone, the window tracery being of Hollington stone. The principal front towards Green-lane has a high-pitched gable, containing a five-light window, with tracery geometrical in design, and is flanked on either side by the entrance-porches. The doorways to these have moulded arches supported on shafts with moulded caps and bases. Between the centre gable and the north porch an ornamental spire rises to a height of 70 ft. The front next Gower-street is divided into five bays, the easternmost bay projecting as a transept, and containing a two-light traceried window. Each bay in the body of the church contains a couplet of cusped-headed lancet windows. Internally the church is divided into nave and side aisles by two rows of light iron columns supporting the arched ribs of the roof. The ceiling of the roof is divided into panels by timber ribs stained and varnished. The contract for the building was taken by Messrs. T. & H. Herbert, of Leicester, at the sum of 2,150l. The architect was Mr. J. Tait, of Leicester.

Sunderland.—The foundation-stone of a new United Presbyterian Church at Sunderland has been laid. It is in the Gothic style of architecture, and will be built entirely of stone. Accommodation is provided for 800 persons; and the total cost will be about 3,500l. Mr. Thomas Oliver, of Newcastle-on-Tyne, is the architect.

Salford.—The foundation-stone of the new lecture-hall and schools connected with the Richmond Congregational Chapel has been laid. The new buildings are in the Gothic style; and comprise on the ground-floor a lecture-hall, 59 ft. by 35 ft., and 45 ft. 6 in. to the ridge, with vestibule and entrance giving access to eight class-rooms. The infants' school will be 42 ft. by 28 ft. 6 in., with separate entrances. Each school has lavatories, &c. The external walls will be faced with stock bricks, relieved with blue bricks to the arches of the doors and windows, and moulded bricks to the string-courses, with stone dressings to the doors and windows. The principal elevation will comprise two entrances; the gable pierced with large window of five lights with elaborate tracery. All the roofs are of high pitch, with open-framed principals and covered with Welsh slates, with ornamental ridge tiles and iron cresting. The buildings will be warmed and ventilated by Messrs. Haden, of Trowbridge. The cost will be about 3,500l. Mr. W. Southern is the contractor for the whole of the works, under the superintendence of the architect, Mr. John Lowe, of Manchester.

Ashburn.—The Countess of Huntingdon's Church has been reopened, after restoration. The entire outlay will be between 800l. and 900l. The works comprise the erection of a new orchestra and vestry, the introduction of new windows, glazed with tinted glass, and an alteration of the arrangement of the window openings throughout, which have received stone arches and imposts, in lieu of the old brick arches removed, and plaster arches and imposts interiorly, and stone dressings have been suitably introduced in other parts of the building. A new portico has been erected. The roof has been restored and re-slatted. The old horizontal ceiling has been removed, and the roof timbers, now exposed, have been wrought or cased, and the appearance further improved by the introduction of carved braces, cantilevers, and pendants. The internal alterations comprise entirely re-seating the body of the church with open benches. The organ has been removed from the gallery to the new orchestra, and the gallery rearranged, re-seated, and re-fronted; new stair-cases have also been put to the gallery. Through neglect to provide for any ventilation of the ground-floor the timbers were so decayed as to render necessary a new floor, which has been laid 18 in. below the level of the old floor, and the approaches improved. The woodwork throughout is stained and varnished, and the building warmed by the apparatus of Messrs. Haden & Son, of Trowbridge. The contractors were Messrs. Stonier Brothers, of Rochester, near Ashburn. Mr. W. Sngden, of Leek, was the architect.

Brighton.—The new Wesleyan Chapel, Norfolk-road, the foundation-stone of which was laid on the 24th of June last, from the designs of Mr. C. O. Ellison, of Liverpool, architect, is now completed. A stone spire rises over the south

porch to a height of nearly 120 feet. The style of the building throughout is Early Gothic. Light to the chancel is obtained by a large of ornamental window filled in with stained glass a geometric pattern, by Messrs. Forrest & Co., of Liverpool. The gas lighting is from coronas, with white glass halls round the columns of the galleries, and by brackets beneath. There is an organ-chamber at the south-east side and a minister's vestry at the north-west side. School, class, and examination rooms are provided below the chapel; and the whole is supplied with two rows of iron heating pipes. This part of the work was done by Messrs. Smith & Son, Brighton. The ornamental wrought iron-work was executed by Mr. Smith, of Birmingham; and the gas arrangements by Messrs. Banfield & Reed. The chapel will accommodate 1,200 persons. Mr. Chappell, of Skyming, was the contractor; and the personal supervision of the works, in the absence of the architect, being given by Mr. A. Loader.

Books Received.

"PAINTED WINDOWS: a Lecture by the Rev. Frederick Burn Harvey, M.A., on the New West Window in Berkhamsted Church." Longmans. This lecture was delivered in the Town-hall, Berkhamsted, and has been published by request. The introduction treats of painted windows generally, and from various sources, including our own pages. The rev. author has also made good use of Mrs. Jameson's volumes, and has altogether formed an interesting and excellent lecture. The west window in Berkhamsted church was presented by the late Mr. Thomas Whately, and has quite recently been erected.—"Tables of Roman Law. By M. A. Fauton, Docteur en droit: Translated and Edited by C. W. Law, Barrister. London: Wynn & Sons, Lincoln's-inn-fields." Here, in 15

Tables, we have the four books of the Institutes of Justinian, as to the ancient Roman law regarding persons, things, and actions. The first book gives some general notions respecting the meaning of the words *Justitia* and *Jus*, and treats of persons. The second, relating to things, treats of the means of acquiring particular objects, of successions to deceased persons, legacies, and trusts. The third deals with inheritances and obligations. The fourth treats of obligations and actions. The tables seem to be well translated and clearly arranged.—"A Course of Six Lectures on the Chemical Changes of Carbon. By William Odling, M.B., F.R.S., Fullerian Professor of Chemistry, Royal Institution. London: Longmans & Co." This course of lectures, by Professor Faraday's able successor, was delivered before a juvenile auditory at the Royal Institution during the Christmas holidays of 1868-69, and has been reprinted from the *Chemical News*, with notes, by Mr. Crookes, F.R.S. Carbon, as the basis of organic chemistry, is a highly-important subject, and it is here treated of in a way that renders it intelligible to non-chemical readers; for the meaning of every chemical term used is defined as it occurs, and the real definition is supplemented by a clear and decisive experimental illustration. Carbon is treated of in the lectures not only as the basis of all vegetable and animal tissues, but also in its mineral relationships. The first lecture treats of marble, lime, and carbonic gas, and there is one on graphite and diamond, solid and liquid carbonic acid gas, &c.—"Casell's Primary Series: Our Bodies." By Ellis A. Davidson. "An Elementary History of Britain." By the Rev. W. E. Littlewood, M.A. London: Casell, Petter, & Galpin. These are two very good little treatises for little people. That on Our Bodies, especially, forms a useful elementary text-book of human physiology, with 100 questions for examination; and, of course, the subject of health is not overlooked: the lessons are digests of lectures given in the City of London Middle-class Schools.—"Abstracts of Two Papers on the Geography of Disease. By Alfred Haviland. The important papers on the geographical distribution of heart-disease and dropsy, and of cancer, in England and Wales, already familiar to the readers of the *Builder*, are here made accessible to the public in a separate form. The author is turning his attention to the intimate relation between the prevalence of rheumatism and excess of heart-disease in certain parts of England; and to the remarkable prevalence of cancer in tertiary and post-tertiary districts subject to inundations.

Miscellanea.

Money for Public Buildings.—In the present financial year the outlay from the public purse for new buildings, sites for new buildings, alterations and maintenance of buildings, and construction of harbours, is not very likely to be less than 900,000l. The item of purchase of sites will include 55,000l. for space for enlarging the National Gallery northwards, and 45,000l. for more room for the offices the centre of which is in Downing-street; to say nothing of 25,000l. for ground adjoining the Victoria Tower, and of possible payment in respect of the new Court of Justice. Among new buildings we have demands for nearly 65,000l. towards providing "accommodation for various learned bodies" in the court-yard of Burlington House; 32,000l. for proceeding with the new Home and Colonial Record Repository; 30,000l. towards a building for the London University; 29,000l. for erecting, improving, and maintaining sheriff court-houses in Scotland; 20,000l. towards new buildings for the University of Glasgow; 10,000l. towards the extension of the Industrial Museum at Edinburgh. The Post Office department requires this year 50,000l. towards the erection of new offices in St. Martin's-le-Grand; 21,850l. for purchase of a post-office site at Birmingham; and various other sums for new post-offices, alterations, repairs, and maintenance, amounting up to a total of 165,000l. Ireland must have 100,000l. for new works and alterations in public buildings and harbours, and for their maintenance. Embassy houses, as usual, make their appearance in the building programme of the year. To this must be added 135,000l. for alterations, repairs, and maintenance of palaces, public offices and buildings, and the Houses of Parliament.

The Glass of the Romans.—The Slade collection in the British Museum is exceedingly interesting, and contains a great variety of Roman glass. Mr. Franks has made a report on it, in the course of which he says:—"Of cut glass, an art which it was formerly denied that the Romans possessed, there are good examples; such, for instance, is a boat-shaped vase of deep emerald hue, and of the same make apparently as the Sacro Catino of Genoa; a bowl cut into facets, found near Merseburg in Germany; and a cup, similarly decorated, found near Cambridge. Two vases exhibit designs in intaglio; one of them a subject with figures; the other, a bowl found near Merseburg, exhibits the story of Diana and Actæon. Of vases decorated in cameo, fragments alone are to be found in the collection, but as only four entire vases are known, this is not surprising. One of the fragments seems to be part of a large panel which has represented buildings, &c., and has on it remains of a Greek inscription. One of the rarest specimens in the collection is a circular medallion of glass, on which is painted a gryphon; the colours appear to be burnt in, and it is therefore a genuine specimen of ancient painting on glass, of which but three other instances are known."

The Brighton Drainage Question.—It is satisfactory to be able to state that the town council have decided to carry the sewage to a distance (either east or west) from the town by an intercepting sewer; so obviating all objection to the disembowment of the sewage in front of the town. It was merely by the casting vote of the mayor, however, that the decision was come to, there being 21 for and against an amendment to the effect that the plan already adopted be persisted in. Immediate steps are to be taken to carry out the resolution of the council; and the General Purposes Committee have been empowered to employ a competent engineer to advise as to the best course under the circumstances.

Preservation of Ancient City Records.—At a special meeting of the Court of Common Council last week, Dr. Saunders brought up a report from the committee for establishing a library in the Guildhall of the City of London, stating that they had provided a fireproof receptacle in the library, and they had the pleasure to report that the valuable manuscripts, &c., in the keeping of the committee were deposited therein, and that the records of two parishes in the city, replete with valuable information as to the citizens of the seventeenth century, have already been confided to the custody of the librarian. The report was agreed to without discussion.

Pre-historic Remains in Northumberland.—The Rev. Canon Greenwell, of Durham, accompanied at different times by Sir William Armstrong, Captain Noble, R.A., Captain West, R.N., and Mr. J. Hancock, of Newcastle, has concluded for the present an interesting survey and examination of the ancient roads, camps, cairns, Druids' circles, and pit dwellings of Northumberland. The whole district abounds in remains of pre-historic times. Various implements of bronze and iron were found in cists along with urns and human remains. The whole of the northern slopes of the hills in the neighbourhood of the two camps of Tossen and Lordenshaw (and the same feature occurs at other places in the district) is furrowed by the most enigmatical road-like hollow ways, which run up to the crown of the hill, in some places cut at a considerable expense of labour through the ground. The roads, or whatever they are, remain an archaeological puzzle. Large stone cairns crown the ridges of the hills, most if not all of which have been opened to a greater or less extent, probably by shepherds in search of treasure. Close by the camp at Lordenshaw are several rocks with the cup and concentric ring markings so abundant in Northumberland, and also found in Dorset, Argyleshire, and Ireland. Two places of sepulture were examined on the North side of the Coquet upon Cartington Fell. One was a flat bowl-shaped cairn of large size, in the centre of which were a cist, and some human remains. About a hundred yards north of this cairn was a circle of large stones. The inner diameter of the circle was 14 ft. These stones were partly enclosed within a cairn 28 ft. diameter and 3½ ft. high, and it is probable that at one time the inner space of the circle had been filled with stones, since removed for walling purposes, and that the circle was within a cairn. At the centre was a hole, which contained the bones of a burnt body. Canon Greenwell and his friends have commenced a series of investigations on the Howardian Hills in Yorkshire.

Alexandra Orphanage.—A bazaar is being held in the Royal Horticultural Gardens, now in full health, in aid of the Alexandra Orphanage for Infants, Hornsey-rose, and will remain open until this Saturday evening. In our volume for 1868, we gave a view and plan of the buildings intended to be erected by the charity. In the space of four years freehold land has been purchased at the cost of 3,367. 17s. 3d. Eight cottages have been erected on it at the cost of (with the lodge), 5,100.; and the central building is completed, at the cost of 6,000.; besides which the committee have had to provide sewers, make their portion of the road, and otherwise do a great deal of ground work, rendered necessary by the orphanage being on the side of a hill. The schools have yet to be built. At the present time there are 100 infants under the care of the charity. It may be worth while one of these days to inquire if some cheaper course could not have been adopted.

The Brighton Sanitary Association.—The annual meeting of the friends and subscribers to this association has been held at the Royal Pavilion. The report stated that during the past year 90 courts and streets had been visited by the agent of the association, and that 133 tracts, 98 papers, 7 almanacs, and 18 bottles of disinfecting fluid distributed. A number of houses had been white-washed, and each month the increased list of brushes and syringes lent showed that the people were in some degree waking to the importance of cleanliness. The library of the association contained 114 books and pamphlets, useful works on sanitary subjects, and the committee, who appealed for increased help, hoped speedily to make arrangements for lending out these works. The balance-sheet showed the funds in hand to be 257. 7s. 2d. The report was adopted and ordered to be printed for circulation. In connexion with the association there is, in two rooms at the Pavilion, an interesting museum of inventions, &c., relating to sanitary science. There is also a collection of various articles of food, by which persons may be taught to discriminate between the adulterated and the unadulterated.

Archaeological Society of Norfolk.—An excursion has been made by the members of this society to several of the county churches. The attendance was pretty good. Yarham, Mattishill, North Tuddenham, Hockering, East Tuddenham, Brandon Parva, Barnham Broom, and Coston and Kimberley were visited.

Oxford Architectural Society.—On Wednesday, May 26th, a meeting of this society was held in the Taylor Building, by permission of the curators. Mr. James Parker offered some remarks on the churches of Shipton and Burford, and upon the early history of those places. Mr. E. A. Freeman gave a short account of the battle between the Mercians under Egelbald, and the West Saxons under Cuthred, which is recorded to have taken place at Burford. Mr. J. H. Parker spoke upon the question of the Fairford windows, arguing against the probability of their being the work of Albert Dürer. A few members of the society and their friends made an excursion to Fairford on Friday, May 28th. At Burford Church, by the courtesy of the vicar, they had full opportunities of examining all the parts of this most difficult and instructive building, important alterations seeming to have taken place every fifty years from the twelfth to the sixteenth century. At Fairford, they visited the church, and there, of course, much discussion ensued as to the windows; and the remains of the older church, which was not destroyed, but made use of in building the fifteenth-century one, called for considerable attention. The discussion on the glass seemed to show that it was not all of one period or of one country, much less the work of one artist. Some portions seemed to fit the windows better than others, as if in the one case the glass were made specially for the windows, but in the other cut out of larger pieces to the size of them.

Unveiling of the Palmerston Statue in Southampton.—The Southampton statue of Lord Palmerston has been placed on its pedestal and inaugurated. The height of the figure is 8 ft., and the pedestal rises about 9 ft. from the ground. The basement is of concrete, 10 ft. square, with three tiers of brickwork above it, each 6 in. thick; and these are surmounted by a granite plinth and a marble base. The statue is that which was exhibited at the Royal Academy last year, and was executed by Mr. Thomas Sharp, of London. Lord Carnarvon unveiled the statue, which bears the following inscription:—

PALMERSTON, K.G., G.C.B.,
BORN, 1784; DIED, 1865,
A BURGESS OF SOUTHAMPTON.
ERECTED BY PUBLIC SUBSCRIPTION.
FREDERICK PERKINS, MAYOR, A.D. 1869.

The leading noblemen and gentlemen present were "grouped" near the statue at the unveiling, to enable Mr. Sache, photographic artist, to take a picture, proofs of which are now on sale. On three hearty cheers being given in honour of the deceased, and of Lady Palmerston and her son, the Hon. W. F. Cowper, M.P., who was present, Mr. Cowper responded in an address of thanks, on Lady Palmerston's behalf and his own. Earl Fortescue, the mayor, Earl Carnarvon, and others also addressed the assemblage on the occasion.

Art Schools National Competition.—The following gentlemen have acted as the examiners of the works sent up in competition from the schools of art throughout the United Kingdom:—Sir Francis Grant, P.R.A., Sir M. Digby Wyatt, Messrs. J. C. Horsley, R.A., F. Pickersgill, R.A., R. Westmacott, R.A., and E. J. Poynter, A.R.A., assisted by Mr. Redgrave, R.A., and Mr. Bowler. Upwards of 61,000 works have been examined in this competition.

Newspaper Press Fund.—The sixth anniversary Dinner of this association took place on Saturday night at Willis's Rooms, Lord Honghton, the president, in the chair. The company present were about 200 in number. The musical programme was, as on former occasions, of an attractive character, and formed a leading feature of the anniversary. A departure from the usual order of proceedings on occasions of this nature took place in having the whole of the singing and instrumental music in the early part of the evening, and during the time when the usual loyal and patriotic boasts were given. The subscriptions announced in the course of the evening amounted to about 700l.

The Telegraph Transfer.—The Chancellor of the Exchequer has stated, in the Commons, in answer to Mr. Hunt, that as the arrangements for the purchase of the telegraph lines by Government were not yet completed, it would be premature to make any announcement regarding them.

Stratford-on-Avon.—Ann Hathaway's cottage and garden have been advertised for sale by private contract.

Roman Decoration.—The Roman correspondent of the *Morning Post* says a very interesting discovery with regard to the state of preservation of the decorative paintings now revealed, has just been made on the Palatine-hill. During the continuation of the excavations, under the direction of the Chevalier Rosa, two chambers have been brought to light, about 50 yards westward of the temple of Jupiter Victor, which, from the style of their construction, the elegance of their mosaic pavements, and the artistic colouring and design of their mural paintings, evidently belonged to a portion of the imperial palace, dating from the Augustan period. The preservation of these specimens of the interior decorations of a part, at any rate, of the vast fabric, inhabited for centuries by the rulers of the Roman world, is owing to the fact that these chambers, with probably several others which will gradually be cleared out in the same manner, served, after being filled up with rubble, as substructions to an edifice constructed at a posterior date, a portion of which—a foundation wall, indicating masonry of the fourth or fifth century, is still standing within the original area of the principal chamber, which it divides longitudinally, biding one side of the mural paintings; on the other, however, are several admirably-preserved specimens of Roman house painting, the most remarkable subject being the favourite fable in which Argus, Io, and Mercury are the protagonists.

Experimental Erection of Concrete Cottages.—Cottages being required in connexion with the newly-sunk colliery at Carberry, says the *Scotsman*, the experiment is being tried by the owner of the estate, Lord Elphinstone, of building them of concrete. A plan has been laid down for a village of 40 houses, with church and school-house, to occupy a space of about 5 acres, between the Inveresk railway station and the colliery. Twenty cottages are already in course of erection at Elphinstone, but these are being built of stone, the experiment with concrete not having been resolved upon at the time they were begun. A commencement has been made with the new village, the operations being in the meantime confined to one of the corner blocks. Mr. Tall, the patentee of the moulding apparatus for forming the walls, is down to give the work a proper start. The cost of the experiment cannot yet be ascertained, but it will be fairly tested by comparison with the cottages which are being built of stone on another part of the estate. The experiment of coal-dust is being tried as part of the material in this instance. Should it succeed, the name of Coaltown will probably be given to the place.

Improved Dwelling-houses for the Industrial Classes.—A meeting has been held in the Guildhall, Newcastle, for the purpose of promoting the formation of a company to be called "The Newcastle-upon-Tyne Improved Industrial Dwellings Company (Limited)." Mr. James Hall, the originator of the scheme, stated that the Corporation had kindly placed the professional services of Mr. Lamb, the property surveyor, at the disposal of the company, and from an estimate he had made, a building capable of containing 200 persons would cost 4,000l. Mr. Lamb estimated that such block would, basing his calculation upon the rate paid for inferior dwellings, yield a return of 5 per cent., allowing 25 per cent., for a reserve fund. To make this experiment it was proposed to form a small company, with a capital of 5,000l., in 500 shares at 10l. each. One-third of the amount had already been subscribed. Resolutions were unanimously passed in favour of the scheme.

Building for a Week.—Orders have been given at Ismailia for the construction of the palace to be occupied by the Empress of the French during her stay in M. Lesseps's newly-built city. Twenty contractors from Alexandria and Cairo sent in plans and tenders. The sum to be expended must not exceed 27,000l. It must be completed by the 1st of October. Twelve pounds per day is the fine if the palace be not completed in time, and 12l. premium for every day it be completed beforehand. The building will be 150 ft. by 120 ft.

Women's Wages.—The working women of Boston (America) have organized a league, among the objects of which are to educate women until their labour shall be as valuable as that of men, and to secure an equality of wages between the two sexes.

Suggested Memorials in Trafalgar-square.—Some suggestions have been made for the improvement of Trafalgar-square. Mr. Sang proposes to make use of the water-supply of the existing fountains and to substitute two of the existing fountains and to substitute two memorials, the one in commemoration of the deeds of the army and the other of the navy. Both are similar in outline, but differ in their mode of embellishment and detail just sufficiently to indicate the special attributes of the two services. The memorial consists of two large square fountains, the sides of the basements of which are moulded and rest on a triple plinth, all of Sicilian marble, enriched with panels, or square serpentine tablets, intended to receive the names of the officers and men who fell or distinguished themselves at the various actions in their country's service. Out of one fountain rises a block of white marble, with four high reliefs in bronze, representing the deeds of valor of British warriors. This pedestal is surmounted by a group of war-trophies, and with its candelabra-shaped base forms the footing and hold of a Venetian mast or standard-pole, of a great height. One of the suggestions in the treatment of the square is the substitution of terrace balustrades, with a flight of steps open along the width of the northern side of the square, immediately facing the National Gallery. We have not heard at whose instance these proposals are being made.

The Surbiton Sewage.—A memorial has been presented to the Home Secretary from the Surbiton Improvement Commissioners, setting forth the nature of the difficulty in which they are placed as to the disposal of their sewage. By the Thames Conservancy Act, 1867, they are forbidden from allowing the sewage to enter the Thames after September next; and the Commissioners are desirous of having the time postponed, in order that a combination of townships may be effected, with the view of carrying the common sewage between Staines and Richmond, inclusive, to Woking Heath, on the plan prepared by their surveyor, Mr. Herritage. Such a union, they state, can only be effected by Government intervention, as attempts to bring it about have already failed. The case of Surbiton is one of peculiar hardship, as a system of sewerage has already been carried out under the Surbiton Improvement Act, which ordered the sewage to be emptied into the Thames.

Proposed Local Workmen's Exhibition in Worcester.—A meeting of working men and their employers has been held in the Guild-hall, Worcester, to consider the desirability of holding a local working men's exhibition from which suitable specimens could be selected for exhibition in the Workmen's Industrial Exhibition, proposed to be held in London in 1870. The Mayor (Mr. F. Woodward) occupied the chair, and appropriate resolutions in favour of the object in view were unanimously carried. The local exhibition will be held next year, previously to the London Exhibition.

Wisbech Museum.—The Townshend collection at this museum has been opened with a *conversazione*. The donor of this collection was the Rev. Chaucey Hare Townshend, of Park-lane, London, and Langsme in Switzerland. The bequest was of so great an extent that the directors of the museum have had to incur an outlay of nearly 400*l.* to provide suitable cases, &c., for the reception of the valuable articles which it comprised. The porcelain and glass have been arranged by Mr. William Smith, of Wisbech.

New Docks for Fleetwood.—There have been great rejoicings at Fleetwood, the occasion being the cutting of the first sod for new docks. The docks will be 600 ft. long and 400 ft. wide. The excavations will be only 16 ft., by which 23 ft. of water will be obtained from the dock sill at high water with an ordinary spring tide. The engineer is Mr. Cox, of London; and the contractor, Mr. Chambers, also of London. Above where the docks will be formed, considerable improvements by embanking have been made.

Fortunate Discovery of Coal.—A vast coal-field, extending for 300 miles, has been discovered on the line of the Union Pacific Railway. As regards the "opening up" of the Far West, this coal deposit is of the greatest importance, but to the Pacific Railway Company it is of special value. Six mines have already been opened. One of these yielded 4,000 tons in three weeks.

Value of Land in London.—We hear that the Merchant Taylors' Company have paid 90,000*l.* to the governors of the Charter House for five acres and a half of the land lately occupied by the Charter House Schools, and intend to remove their school from Suffolk-lane to it. They have let a portion for building purposes, but they retain three acres and a half for the school and its playground.

Alleged Discovery in St. Gervais Church, Paris.—A discovery has, it is said, just been made in the old church of St. Gervais. Some persons who were repairing the woodwork at one of the sides of the nave discovered a secret door, giving access to a small chapel, hitherto not known, the walls of which are entirely covered with excellent paintings in the Renaissance style, in good preservation.

Exmouth Improvements.—The completion and opening of a new and commodious market, extensive docks, and a family hotel, are announced in the local *Journal*. The market is light in structure, and has an area of about 120 ft. in length, by 60 ft. in breadth. The docks will prove to be one of importance to the trade of Exeter, as well as of Exmouth.

New Post-office for Birmingham.—The miscellaneous estimates contain a vote of 21,550*l.* for the purchase of a site for a new post-office in Birmingham. The land selected, according to the local *Post*, is at the corner of Paradise-street and Hill-street, opposite the Town-hall, and close to the intended site of the corporate offices and assize court.

Works of Albrecht Durer and Lucas van Leyden.—The members of the Burlington Fine Arts Club have collected a number of the works of these artists in the rooms of the club, 177, Piccadilly, where they are now on view to members' friends and others.

Fires caused by the Heat of the Sun.—Two fires that occurred on Monday are reported to have been caused by the excessive heat of the sun. One was in Lambeth, the other at Millwall.

York City Surveyor.—Mr. George Syman, architect, has just been elected by the York corporation as city surveyor, successor to the late Mr. Pickersgill.

TENDERS.

For erecting a new wing and making alterations to No. 20, Mornington-road, for Mr. W. Brookes. Mr. Alex. J. C. Scoles, architect:—

Ransom	£900	0	0
James	875	0	0
Rigby	720	0	0

TO SUBSCRIBERS.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher." The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

MARBLE WORKS.

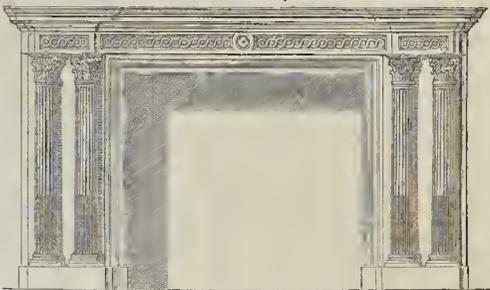

THE LARGEST AND

RICHEST ASSORTMENT OF MARBLE CHIMNEY-PIECES

IN GREAT BRITAIN,

Fitted with Marble Fenders and Tile Hearths complete, with Stoves suitable to the Design, is at

G. MITCHELL'S, MASON, 166, BROMPTON ROAD, LONDON,

IN THE FOLLOWING MARBLES:—

- | | | | | |
|----------|-----------------|------------------|------------|---------------|
| STATUARY | BRECHE | SIENNA | GREEN | BLACK |
| BLANC P. | ITALIAN GRIOTTE | ROSE DE CASTILLE | BARDILLA | ST. ANNE |
| VEIN | BROCATELLE | SARANOLIN | NAPOLEON | BLUE BELGE |
| SICILIAN | JAUNE LAMARTINE | LANGUEDOC | MALPLAQUET | ROUGE ROYAL |
| JASPER | JAUNE FLEURI | BLACK AND GOLD | COQUILLE | ROUGE GRIOTTE |

FOSSIL, BRECHE D'HERCULANEUM, VERT des ALPS, PORPHYRE, and various GERMAN MARBLES.

Also ALABASTER Inlaid in various Colours, DEVONSHIRE, and the various BRITISH and other choice MARBLES.

Over 1,000 in STOCK, averaging from £1. 5s. to £240.

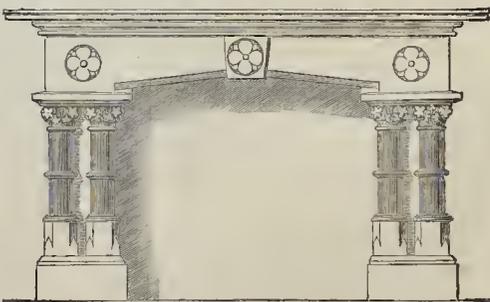

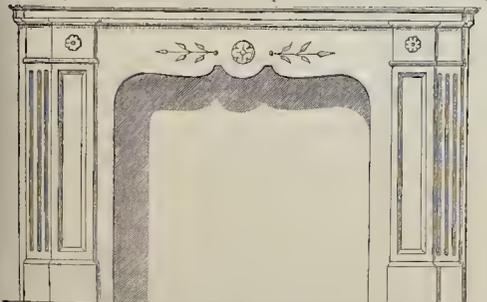

ARCHITECTS' DESIGNS CARRIED OUT WITH THE GREATEST ACCURACY AND PROMPTNESS.

COLUMNS, FONTS, HALL-FLOORS, STAIRCASES, OR ANY MARBLE WORK ESTIMATED FOR.

The greatest stimulus has been given by the above Firm to the Importation of Foreign Marble Work, which can be supplied at less than the cost of English labour. A number of OLD CHIMNEY-PIECES on View. Established nearly 20 years.

For the advantage of country Architects, Builders, and Merchants, by their giving a description of rooms for which Chimney-Pieces are required, stating about price, &c., Photographs and Particulars will be forwarded, together with Prices for same, and samples of the Marbles, if required; also a sheet of Designs of Chimney-Pieces and Monuments.

TWO MINUTES' WALK from KENSINGTON MUSEUM STATION, Metropolitan Railway. Omnibuses from Islington to the City pass every two minutes. A LIBERAL COMMISSION allowed to the TRADE and BUILDERS.

166, BROMPTON ROAD, LONDON, S.W.

The Builder.

VOL. XXVII.—No. 1376.

The Position of Labour and Capital.

THE *Builder* declares itself weekly to be a journal for the architect, engineer, operative, and artist; and weekly, we are naturally prepared to hold, does it justify its profession of purpose. Whether in advertisement pages or in the pages they envelope, we have reason to believe that the operative, no less than the classes he is associated with, habitually looks, and not in vain, for amusement, for instruction, for aid, and advantage. Employer and employed here find themselves, therefore, face to face, each in search of subjects of special interest,—side by side in search of matter of common interest; but what is the attitude in which they are confronted by our columns when the topics of the

day inevitably bring forward a conflict of interests?

For the publication itself, at least, there is then no position open or desirable but independence,—independence, not indifference; a position not so much out of the dust of the dispute as above it; from this position it will often, nay, we would boldly say, it will always when best taken advantage of appear that the conflict of interests does not in reality exist, or has only been superinduced by disarrangements and mistakes that either one or both parties ought to learn how to correct,—as purely the consequences of blind impulse or false reasoning as any of the errors in diet or medicine that are sufficient to put into opposition even the typical co-partnership of the belly and the members.

This is a principle, indeed, that should be held to be transcendental,—axiomatic, when large interests are considered largely,—when anything is in question beyond a personal struggle for a particular limited benefit that only one can enjoy, and that the defeated must be deprived of, and when consequences are regarded as affecting entire classes and extending broadly over space and futurity. Industry is an organization of which the healthiness depends on harmonious co-operation of all its parts; and this is so certain, that no proof of the bearings of a particular case can overturn it—can contravert the conviction that desperate mischief lurks in chronic quarrels and recurrent outbreaks, in unfair restraints or overbearing oppression, either on one side or the other.

This axiom we lay down in perfect confidence, not merely in its abstract philosophical truth, but as one of those maxims which any one who has to deal with mankind on a broad scale

should have ever in his mind, and will be made the best use of by those who are least likely to neglect the appreciation of the motives that have a really actuating force in the business of the world. By whatever clumsy compromise it may be necessary to patch up the dispute of the hour, the complete reduction of a difficulty can never be hoped for from an arrangement that does not announce itself as the best for both sides.

But if this be so, we can scarcely escape from the inference that many of those who speak and write most fluently on the claims and duties of labour and capital know but very little of the subject they are so diffuse upon. It is, indeed, comforting to be able to think so, however much hope of assistance in a difficult subject is forfeited in consequence.

Unionism—the principle of trade-unions as avowed and acted upon—is certainly one of the most definite expressions possible of conflict of interest between class and class. The union, by its own declaration, is in most definite antagonism to the employing capitalist on the one hand, on the other to the joint mass of labourers unassociated, whether the skilled in the craft who will not join the union, or the unskilled who would fain acquire the craft, but are excluded by union conditions. Now, having in view the axiom which has just been laid down, we enter upon the consideration of the position of an individual operative—of an operative in all the rights of an independent point of view—with the conviction that his most prudent and advantageous course, apart from the pinch of a casual dilemma, will be perfectly consistent with the best interest of employers, and of skilled and unskilled competitors.

The considerations involved in these questions have been recently put before the world with great fulness, and in a most readable form in Mr. Thornton's work,—“Labour: its Wrongful Claims and Rightful Dues; its Actual Present and Possible Future.” In a review of this work Mr. J. S. Mill has taken occasion to set his own position on the subject again before the world with certain corrections, without, however, as it seems to us, bringing much new light to the dark passages. In considering the relation of labourers and employers, he says,—“I agree with the author that conduct may be ‘grovelling and sordid’ without being morally culpable.”—p. 691; and so at once cuts through the sympathy with his argument of those with whom ‘grovelling and sordid’ are terms of moral imputation, and of nothing else whatever. The enunciation prepares for the strabismic distinction a few pages onward:—

“As between themselves and their employers, unionists are under no obligations but those of prudence. The employers are quite able to take care of themselves. Unionists are under no moral duty to their employers which the conditions they may seek to impose on them can possibly violate. But they owe moral duties to the remainder of the labouring classes, and moral duties to the community at large; and it behooves them to take care that the conditions they make for their own separate interest do not conflict with either of these obligations.”—p. 695.

This is to make sacrifice of a perfectly operative restraint,—the feeling of what is honourably due to the immediate party to a contract,—in reliance upon a vague world-wide reference to the influence which no mathematics could calculate upon an infinite outlying world, of which the immediate contact is scarcely perceptible at all.

The question at issue as regards all parties,—masters, men, and outsiders,—is in truth one of free trade, merging ultimately of necessity in the still higher questions of personal and political freedom. As regards fundamental legality there can be no dispute. Masters have an admitted right to agree together what terms they will offer; men have the same right to agree together what wages they will accept; Neither men nor masters can have a right to secure the effect of their agreement by means which

infringe the independent rights of any who may choose to be dissentient. Masters may combine if they can, and men may combine if they can; men to protect themselves against masters, masters to protect themselves against men; nay, masters and men may combine together, if they please and if they can, to protect themselves against the public, and the public in self-defence may have a counter combination if it is able.

If any of these rights are not sufficiently protected by law there can be little doubt that advantage will be taken of the flaw by the competitors interested, and it would be vain to hope to restrain them as a body from making the most of the opportunity by lectures on a moral duty owed to the community at large or to any section of it. But such an exposition may be fairly addressed to the arbiters of legislation and to the public opinion which in its process of development is not above the aid of moral considerations in groping its way to the prudential as identical with the just,—to a rule likely to be abiding as manifestly based on fair play.

When the rights of all—masters and men, unionists, non-unionists, and public—are duly guarded by law, all else may be left to the settlement of competition, the struggles of self-defence, the course of the market. When free trade has opened the accesses of the market so widely, we cannot fear lest free competition should not have fair scope. Competition is the sharpener of the wits and the spur of industry; and sorely as it may pinch individuals, its ultimate effect must usually be the enhancement of the gross produce divisible among the parties to its production. Every class will have food for discontent, no doubt. The discontent, however, of one class is the sign that another is not a hopeless victim. Industry is not gambling; it is not a juggling process for distribution of a value derived independently; it is no struggle of robbers over a booty; it involves what is equivalent to creation as well as distribution; it devours to reproduce, and forfeits its most characteristic quality and dignity when squabbles over proportionate shares of results destroy or even seriously impair the vitality on which the amount, not to say existence, of a result depends.

The first book of Mr. Thornton's work is introductory, and treats of Labour's causes of discontent. The exposition is truly serious enough to make a statesman serious, but is scarcely expanded to the completeness of other portions of the subject. The class below the lower class has itself several subdivisions; and how far the conditions of hardship in each of these may be directly alleviated or sweetened by gleam of hope is an inquiry that would lead us direct to the relations between them and the class above them—the class next above them, but separated by a chasm wider than separate commoners from the peerage.

Book II. treats of Labour and Capital in debate, from the most unregulated chaffering that leads to an agreement for wages, to the spirit of organization—the origin of traditions. Book III. treats at large of Labour and Capital in Antagonism, as exemplified in the operations of trade-unions for good and evil, and the writer asserts the good as enthusiastically as he frankly admits the evil. This book may be taken to present a picture of unionism in its present phase, which we cannot consistently with the axiom we started with be content to regard as its best, healthiest, or ultimate development. We pass, therefore, with interest to the last book,—Labour and Capital in Alliance; and here we have a review of the various attempts that have been made to accomplish a peaceful and mutually advantageous alliance between forces that are mutually indispensable, and never can be working to best advantage when not working in harmony. It is at this point that we may be well excused if we

are less confident than Mr. Thornton as to the subject being at present so fully elucidated as to enable a positive solution of all its difficulties to be yet obtainable; and, moreover, so far as good lights are at present provided—may, even—by the guidance of the very beacons that are provided in his own pages,—we turn our most hopeful looks towards a different haven from that in which we seek rest.

The first chapter treats of the attempts to reconcile labour and capital to hearty co-operation on the plan of industrial partnership.

On this system the employer nominally—for virtual case, to be out of the question—takes his workmen into partnership. The favourable example is a colliery in which the annual profit made in excess of a certain amount is divisible among the regular workmen rateably according to their respective earnings. The incentive to steadiness and industry is said to have been most effectual; and where the profit mainly depends on the steadiness and industry of the wage-earning workmen, no principle could be more legitimate; but the system violates all the rules of a trade-union. It is equivalent to pay for piecework, to encouragement to "chasing" and overtime. As administered with wisdom and fairness, the system has answered, but when the estimate of divisible profit rests with the capitalist, and the surplus is dependent on his arbitrary reckoning "of fair and usual reservation for redemption of capital and other legitimate allowances"—partnership is scarcely the word to use. From another instance cited, Mr. Thornton appears to be quite unaware of the extent to which the principle of a percentage on profits to the employed obtains throughout general business. In the form of premium upon amount of sales, or, at least, of sales of particular classes of goods, it is in operation in half the large establishments in London. To such establishments as those of the hilling trade, Mr. Thornton does not pretend that this scheme of conciliation of the claims of labour can be applicable; he has most confidence in co-operative societies, the subject of his third chapter.

The principle of co-operative societies is for the labourer to be a part owner; business is to be carried on by associations of capitalist workmen. It strikes one at once that this is very like a proposal to improve the condition of dock-labourers by making them skilled workmen. That a workman should have more or less capital—that is, a fund of savings—is, we have no doubt, the enthusiasm of very much of the misery that from time to time afflicts him and his belongings. We doubt not that every skilled workman may, by common prudence and self-restraint, get beforehand with the world in this way; but it is then a question very open to debate whether his most prudent course will be to make such an investment of it as is implied in his partnership in a co-operative society of whatever trade. There can be no doubt that by this path certain workmen, of unusual capacity and of thorough principle,—of tenacity of purpose and just confidence in each other,—may gain for themselves an improved position. This has been shown in the celebrated case of Rochdale; but with what result? Workmen who were capitalists have become capitalists who may or may not be workmen, and who employ others who are in no sense capitalists. So it is now branded as false to its principle, "the Iscariot of the tribe" (p. 403). Desertion on the one hand, and difficulties and failures on the other, make so much havoc with the examples adduced in favour of this panacea, to which we have ourselves a leaning, that it would be tedious to dissent upon it further. To obtain more cheering encouragement we must turn back to chapter ii, which we passed over, on Co-operative or Associative Stores. Into the details of these we have not space—it is, indeed, unnecessary—to enter. Their principle and working are well known. They are the very anchor of a workman's home, making easy to him the commencement of habits of economy by immediate reward of improved comfort, and inducting him into the faculty of association, of watchfulness against fraud, with frank reliance on the truly reliable. They secure genuine articles, just weight and measure, moderate price involving great economy,—freedom from debt. But the workman is bound to be far more beforehand with the world than will just enable him to qualify for participation in a co-operative store, by paying ready money for the current week. He has the contingencies of marriage, the emergencies of accidents, of sickness, of

funerals, of age, to provide against. Against all these his only safety lies in insurance, whether in a benefit society that will really insure what he bargains for, or in whatever other form. His own prudence must be the judge of the trustworthiness of the hands in which he places these hard-earned resources,—a trade-union or post-office savings-bank.

No man should be debarred from striking if he chooses for a grand advance in life, and if he knows his own capabilities—his own nature well—he may take his chance for opportunities; for if they do not occur, he will make them. But for the multitude of any class, the best policy will be to grasp firmly at the nearest rounds of the ladder. Those within reach of the workman are not to be despised. The long care for a remote future that over oppresses the capitalist he need not know. He may marry early; he may hope to see his children married early, providing for themselves; and thus the sweetest of all morsels on the board of nature is before him at an age when others higher up have not begun to allow themselves to dream of it. Intellectual pleasures are now well within his reach, and leisure of a purity unknown to other classes. But the basis of all must be not only industry, but forethought, and such bestowal of his surplus earnings as will secure with certainty comfort for himself and family.

ARCHITECTURAL REVIEW IN SCOTLAND.

EDINBURGH ARCHITECTURAL ASSOCIATION.

At the closing meeting on the 9th inst., Mr. Alexander Ballantine, the president, delivered a valedictory address, of which we give the pith.

In proceeding, first, to the consideration of ecclesiastical architecture, I find that at present none of the different religious persuasions possess any distinctive architectural character. For instance, who can, in passing through a town, say, that is a Roman Catholic church, and that an Episcopalian, or Presbyterian? A lettered tablet over the door may sometimes enlighten one, but I think that—externally, at any rate—any distinct expression does not exist, in the sense of a religious devotional feeling.

That such has always exercised some considerable influence upon the art of a country cannot for a moment be questioned. I do not say that it always exercised a beneficial effect; for sometimes it so jealously and mercilessly asserted its convictions, that art, strong only in the generous and gentle impulses of our nature, was ruthlessly trampled on and discouraged.

The patronage of the brilliant artists of the fifteenth and sixteenth centuries by the heads of the Church is pre-eminently honourable.

The work of restoration is active amongst the fine old cathedrals and abbey churches of England, and in Scotland we have the same movement afoot. The Scotch Church, however, is poor. There are no large diocesan revenues, and the sectarian interests are so numerous and scattered that comparatively insignificant buildings are erected. Nevertheless, the expenditure upon new churches during the last few years is by no means discreditable.

Our ecclesiastical art has had to contend with even a stronger enemy than poverty. I allude to that national prejudice against all admixture of places of worship. The rapidity with which that feeling has subsided is remarkable. Now, it is only heard of amongst a few old women, who are proverbial for retaining all the expiring prejudices of their representative generation. The kindly shelter of his native glen, or the heath and bracken of the trackless moor, were in beautiful though sad sympathy with the worship of the hunted covenanter; but, mean and affronting were those barns of whitewash and musty pews which people from choice erected as churches.

Happily, these are of the past, and our day is more auspicious. We need scarcely expect to see churches erected upon the grand scale of our old cathedrals; yet, largeness is by no means an essential of the beautiful. As we are passing to the more general adoption of the organ, and the cultivation of choral singing, corresponding features and accommodation will be required in the architecture; so that, no longer restricted to the limited area of a preacher's voice, we may have churches,—

"Where through the long-drawn aisle and fretted vault,
The pealing anthem swells the note of praise."

Still never for a moment let the great apostolic charge to preach the Gospel be undervalued. Is

it not the indispensable duty of a Christian place of worship to aid the minister in being distinctly heard by the congregation? "A moderate voice," says Sir Christopher Wren, "may be heard 50 ft. distant before the preacher, 30 ft. on each side, and 20 ft. behind the pulpit, and not this unless the pronunciation be distinct and equal." He does not give the conditions under which he came to these conclusions; but surely if the principles of acoustics are properly studied by the architect, and those of elocution by the minister, we might safely venture beyond such a circumscribed area. Indeed, we have statesmen who, by that power of presence, musical cadency of voice, compass of intellect, and felicity of expression, can so wrap the attention, that they are audible over a very much larger space; and why should not such faculties be more fully cultivated by the clergy?

With the increased difficulty of obtaining space in the midst of our large towns, the chances of removing those unsightly galleries will be lessened, and together with their advantage in seating a larger number of people within closer radius from the pulpit, I question if the architect may succeed in preventing their future use. We must bear in mind that the applied sciences and their effect upon building materials, give the present day great advantages, and architecture must brace up to overcome gracefully all requirements; and who knows but that some touch of genius, like the invention of the arch or the cupola, may alight upon a successful church gallery?

Having thus alluded to ecclesiastical, I now pass to civil architecture.

Comparisons have frequently been made between them, generally to the depreciation of the latter. High Church enthusiasts talk of it slightly, and place its aim and employment in a very subordinate light. . . .

In practice there may seldom be much thought expended upon the beauty of the duties which a building is meant to perform. Architects have requirements, site, cost, &c., to consider, and these may so occupy their attention that the mind will not readily wander over a vast range of thought, such as from purpose to destiny, in quest of some ideas rarer and better than those that are gathered by the passer-by. But in such reflections exist an unspeakable charm, and they originate the reverent humility and the lofty aspirations with which all great art ought to be imbued.

To be more practical, civil architecture is such an immense and rapidly-extending field that it demands great attention.

The changes effected by the growth of a city, and also their rapidity, may be seen from what has taken place in Edinburgh and Glasgow. Our new town was only projected a century ago, and so recently as 1848, Daniel Wilson, in his "Memorial of Edinburgh," speaks of Gabriel's-road, on the west side of the Register-office, where many of the venerable citizens then alive remembered having "wended their way between green hedges that skirted the pleasant meadows and cornfields of Wood's Farm, and which was in days of yore a favourite trysting-place for lovers, where they breathed out their tender tale of passion beneath the fragrant Hawthorn."

In Glasgow, the same enlargement of town towards suburbs, and suburbs to green fields, has taken place; for in 1807 many objected to the erection of St. George's Church in George-square, now the site of the most central railway station, because it was too much in the country.

Nor is this confined to these two cities. All are more or less extending. The population of Edinburgh and Leith, according to the 1861 census, had, since 1801, increased from 81,404 to 201,749, or about 2½ times. Glasgow within the same period—60 years—has increased from 77,058 to 391,864, or more than five times; and London, from 958,863 to 2,308,989, or nearly three times.

Although a considerable deduction may be made for the smaller neighbouring villages having gradually merged into these cities, and their population now included with them, still Great Britain—exclusive of Ireland, whose population is just about the same as 50 years ago, and not taking into account the emigration which during 1851 to 1861 amounted together to 2½ millions—had increased 2½ times, 10,764,591 in 1801; 23,522,321 in 1861. Thus, we learn, and learn but to wonder at the crowding.

The character of the streets and buildings of a town indicates at once the condition of the inhabitants. The dwellings must keep pace with the progress of the people. The older

buildings, originally the mansion-houses of the aristocracy, become gradually more and more deteriorated. Literally a standstill results in their degradation and ruin. By judicious change they may, for a time, retain their reputation amongst their new and popular neighbours; but ultimately comes the modern Cyclopean idea of scavengery, and says, "Your streets and closes are too narrow, steep, and crooked; your dwellings are unfit for pigs." It is in vain to plead that they are no worse than long ago, that the number of occupants might be more restricted, or that all that is wanted are cisterns and water-closets. You must change with the times, and away sweeps the broom of reform, obliterating alike the good and the bad of our architecture, the dark and the bright associations of our history. If this must be so, let us hope that some consideration will be given to preserve "the lines where beauty lingers;" and that the new work will be intrusted to architects who possess the veneration of the antiquary with the appreciation of the artist. They may meet modern demands, and yet linger a while in reverence over the old fabric, which may have associations worthy of recording and features of preserving or engraving upon the new.

Accompanying the power-loom, the burrowing, the blast furnace, and all large manufactories, are huge masses who must be housed in the very cheapest manner. The great extent of this renders complete architectural success impossible, and often in a great measure injures most praiseworthy embellishment.

For example, what church spire can appear to advantage amid masses of belching chimneys,—obelisk-shaped or ornamented,—and how often do octon-mill-like tenements jam public buildings? All the greater need, then, to multiply the beautiful. The responsibility of the welfare of the city rests with the citizen. In duty we must act, and in pity we must help, by introducing amongst the dense and poorer population as much as we can of the beneficial effects of good architecture.

In Edinburgh, however, we do not experience the same disadvantages as our so-called go-ahead cities. Our grandly picturesque position, spacious streets, garden squares, and our fine free-stone, are all eminently favourable to architectural progress. Public buildings, monuments, and statues, occupy the best positions. Churches, houses, banking and insurance companies, all vie with each other in the grandeur of their architecture. Private enterprise shows a liberal spirit; and the result is that our town is selected as a most attractive place of residence by people from all parts of the country and colonies.

Let architect and employer, therefore, bear in mind their city's reputation, and that even the subordinate parts of Edinburgh are no common places. The stingy speculator is about, and architects should beware of being identified with his shame. The profession may be their means of livelihood; but unless there is some higher incentive than fee, their art will be poor indeed. Remember the remark of Michelangelo, "I think that he will be a poor fellow so long as he shows such an extreme eagerness to become rich."

With the wider cultivation of matters of art and taste, we may hope to see the touch of an artistic hand really have a more appreciable value. Petty elaboration will never touch the sympathies of the people. In street architecture, we must have a certain economy; but in our greater works, if we could enlist the co-operation of our highest artists, then we would have the highest results.

Their influence would tell powerfully upon the people, and it would infuse a new life into the pallid conventionalities of both Classical and Medieval art. To those who think that incompatible with the production of easel pictures, I would point to Leonardo da Vinci's sketch-books, with a drawing of a new gun-carriage, hydraulic machine, or apparatus for lifting heavy stones, on one page, and a beautiful ideal female head upon the other; to Michelangelo, constructing the fortifications for the defence of Florence and painting the Sistine chapel, in addition to his grand works of architecture and sculpture. I might also instance Raffaele designing architecture,—and street architecture, too,—as seen in the well-known house in the Piazza of Florence. Then, Albert Dürer, Quintin Matsys, and very many others.

And in our own day, less versatile but still illustrative of the highest art being engaged upon architectural decoration, Paul de la Roche

painting the famous hemicycle in the *École des Beaux Arts*, in Paris; and Duprès, perhaps the most perfect modern sculptor of Italy, executing the tympanum of Santa Croce, in Florence.

I believe that when the public give the proper encouragement, some such helpers will come forward. Indeed, we have seen the lamented Dye's ability in that way, and we have no lack of able sculptors who would gladly more frequently be associated with the architect. I need not dwell further on this point. You must know how much nobler your art would thereby become.

The question of style will possess its influence, but it scarcely comes within the province of this address. I would, however, remark that in reviving, or I may now almost say practising the Medieval style, there may be rather too great a tendency to retain the old type, which, if persisted in, will be apt to produce a repetition of errors similar to those committed in the classical revival, such as importing temples to do duty as picture galleries, dwelling-houses, or shop-fronts. Architecture, whatever may be the style, must not rest satisfied with reproducing, but must go forth free, amid the freshness of nature, and the enterprise of the city, welcoming all progress of our fellow-men, and aiming at the bettering of humanity.

THE HEALTH OF BRIGHTON.

The town council of Brighton have at last decided to intercept the town sewage, and to carry it beyond the municipal limits, instead of emptying it at their own doors, to be thrown back upon them by each advancing tide. The council have at the same time been able to publish some facts relating to the health of the town during the first quarter of this year, which show that at all events during those three months the defects in the drainage, which, if maintained, would ere long have seriously affected the popularity of that favourite town, did not neutralise its natural healthiness.

The Registrar-General, in his quarterly returns for the first three months of this year, showed that 711 births and 490 deaths were registered in Brighton, which is estimated to contain at the middle of this year little short of 90,000 inhabitants. The annual birth-rate for the quarter was 32.2 per 1,000, and 5 per 1,000 lower than in the aggregate of forty-six large towns containing nearly three millions of population. The death-rate per 1,000 was only 18.2, and 6.4 below the average rate in those forty-six large towns. This difference in the death-rate is remarkable, and signifies that were it maintained for a year, more than 500 persons would survive in Brighton who would have died had the same death-rate ruled as that which prevailed in the aggregate of the forty-six towns.

We are often more sensitive as to the healthy repute of a town in which we intend to spend a holiday, than of the neighbourhood in which we live; the Brighton town council, therefore, acts wisely in wishing it to be generally known that the town has recently enjoyed such good health. Comparison has been made in the return before us with the death-rate at various ages, and from different causes, in London, for the same period, which, after making full allowance for situation and constitution of its inhabitants, which both tell unfavourably for the metropolis, serves a useful purpose in helping to show how and in what manner Brighton enjoys a lower death-rate than most other large towns.

The borough of Brighton includes an area of 2,320 acres, of which 340 are water; excluding these, the estimated population for the middle of this year shows a mean density of 45.1 persons per acre; while in London, within the limits of the bills of mortality, the density is 40.7. The natural increase in the population of the town during the first quarter of the year by excess of births over deaths was 311, against 191, 154, and 270 in the same quarters of the three years 1866-8. This may be taken as evidence that the Registrar-General's estimate of the present population is not over-stated, the probability of which might be suggested by the low birth-rate. It is shown, however, that in St. Peter's registration sub-district the birth-rate was 38.5, which somewhat exceeds the average town birth-rate; while in other parts of the town it was only 26.6 and 21.6. This difference is accounted for by the fact that St. Peter's contains most of the natural and resident town families, while in the

other sub-districts of Palace and Kemp Town the proportion of visitors and domestic servants is large. A low birth-rate is usually shown in Bath, Cheltenham, Leamington, and other pleasure towns, as well as in the fashionable suburbs of London, Manchester, Liverpool, and Birmingham.

In the first quarter of this year the death-rate in the whole of England and Wales was 24.8 per 1,000; and among the eleven largest English towns furnishing weekly returns, the lowest death-rate for the quarter was 20.7 in Birmingham. Brighton has, therefore, reason to be well satisfied with the rate of 18.2 per 1,000 for the same period. In the return before us, the rates of mortality in the different registration sub-districts of Brighton, calculated for the purpose of comparison, exclusive of deaths in institutions, are shown to have been 9.9 in Palace, 17.8 in St. Peter's, and 19.0 in Kemp Town. Each of these rates would be raised 12 per cent. if the deaths in institutions were ratably divided among the sub-districts; and as both the work-house and the hospital are situated in St. Peter's, it would be unfair to this part of the town to calculate the rates without this correction.

The 400 deaths in Brighton included 119 of children under five years of age, showing 29.7 per cent. of the deaths at all ages. Of the 20,088 deaths registered during the same three months in London, 7,894 were of children under this age, the proportion being here 39.3 per cent. of the total deaths. In Brighton 41.3 per cent. were of children and adults between 5 and 60 years of age, and 29.0 per cent. of persons aged 60 years and upwards. In London the proportion of deaths at these groups of ages was 38.1 per cent. between 5 and 60 years, and only 22.6 per cent. at 60 years and upwards. Principally through the much lighter infant mortality in Brighton, the mean age of death in that town during the first quarter of this year was very considerably higher than in London.

The death-rate from zymotic causes is one of the strictest tests of the sanitary condition of towns; and in this Brighton is not found wanting. The 400 deaths in the first three months of the year included only thirty-three which were referred to all diseases of a zymotic character, showing an annual rate of 1.5 per 1,000 persons living; whereas in London it was 4.9, in Liverpool 5.6, in Bradford (Yorkshire) 4.7, and in Exeter 2.6. Of these thirty-three deaths in Brighton, fifteen resulted from scarlatina, which epidemic disease can alone be said to have been at all prevalent, eight from different forms of fever, three from croup, two each from whooping-cough, diphtheria, and diarrhoea, and one from dysentery. Of the fifteen deaths from scarlatina, ten occurred in St. Peter's sub-district in the centre of the town. In examining town death-rates, the next class of diseases in order of importance as affording an index of the general health of the inhabitants, is that containing all affections of the respiratory organs, including phthisis. Unhealthiness of dwellings, from faulty construction, want of ventilation, and over-crowding, is sure to result in a high death-rate from these diseases. In Brighton, the 141 deaths referred to these causes during the first three months of this year showed an annual death rate of only 6.4 per 1,000; whereas it was 8.2 in Bradford, 9.0 in London, 10.9 in Exeter, and 12.0 in Liverpool. It is thus conclusively proved that the low death-rate in Brighton was principally due to three causes,—the comparatively low death-rate among infants, the small number of deaths referred to zymotic diseases, and the lighter mortality from inflammatory diseases of the respiratory organs.

Brighton, not being a manufacturing or a trading town, has many advantages in the constitution of its inhabitants, in addition to its natural advantages of situation and climate, and *ought*, therefore, to be healthy; it is, however, satisfactory to find that it has recently been so healthy, and now that the town council seem fully alive to the importance of appearing before the public with a clean bill of health, we shall hope to see in future returns a continuance of this low death-rate, and immunity from epidemic diseases. Not only the Brighton people, but the whole metropolitan population, have a strong interest in the health of this favourite sea-side resort.

The "Bermuda Dock."—Mr. John B. Day has published an interesting chromo-lithograph of the "Bermuda Dock," concerning which much has been lately said.

THE SELECT SUPPLEMENTARY EXHIBITION OF PICTURES.

WE return, as promised, to the collection of pictures in Bond-street, made under difficulties, and note some of the works that left the strongest impression after a visit.

Processional compositions are now of such frequent recurrence that there is need of more than an ordinary capability to secure attention and respect for them. Mr. J. S. Cuthbert has partly surmounted the many difficulties that beset an embodiment of allegory: his illustration from Spenser, "The Masks of Cupid" (5), is a notable work for the discrimination with which the several passions, vices, and frailties are shown in type, as well as for the technical merits that distinguish it. "The Evening after the St. Bartholomew" (26), by Mr. A. Baccani,—fugitive Huguenots,—wants but a little more decision and force to make it a fine and interesting picture; it has the advantage of quiet impressive treatment and appropriate effect. Mr. E. Hughes has found a good subject in "An Incident in the Life of Paganini" (51), that tells of the great musician's sympathy and benevolence. The story goes that, walking in the streets of Vienna one day, he saw a small brother of the how who scraped to support his mother, brothers, and sisters: compassionating the poor little itinerant, and after giving all the money he had about him, "Paganini took the boy's violin and commenced playing, gathered a crowd, and taking off his hat made a collection, which he gave to the lad amid the acclamation of the multitude." If more can be said of the matter than of the method of its elucidation—though there is very careful workmanship brought to bear upon it, and the monarch of a one-stringed melody deserved a more appreciative and numerous audience,—Mr. Hughes merits praise for leaving beaten tracks.

What a very clever picture Mr. J. Auld's is, of "The Death of Robert Greene, 1592" (66), but what a repulsive one. Lamartine's "History of the Girondists" has become a very favourite text-book for painters; and Mr. T. Davidson appears to have been inspired by a very pardonable admiration of Mr. E. M. Ward as much as by the words of his author. The "Condemnation to the Guillotine of M. and Mme. De Sartes, together with the Family of Mdms. De Sainte-Amaranthe, the counter-Revolutionists whom Robespierre had pretended to befriend" (72), shows some real executive power, though upright lines appear to be hard ones, and the head of Mme. De Sartes, which should have been the chief point, is the worst feature. The figure of the husband, firm in his convictions and ready to die for them, and that of the seated brother burying his face in his hands, are excellent.

Mr. R. Dowling's rendering of an incident from Clarendon's "History of the Rebellion" (75) wears an appearance of probability that condones to a great extent its shortcomings. Charles I. is receiving the answer to his summons for the Roundhead authorities to surrender the "good city of Gloucester;" the marked difference between Cavaliers and Commonwealth men leads to a very decided conclusion with regard to the artist's political opinions. "The Secret Message," by Mr. S. Sidley, has admirable qualities of workmanship, if least displayed in the heads of the lady and messenger (76).

Mr. F. Smallfield contributes a very clever representation of "Colonel Newcome at Gray Friars: Grace after Meat in Pensioners' Hall," wherein much of the pathos of Thackeray's description is realized (110). Mr. W. Hemsley's "Competitive Examination: the 'Clever Boy at Fault'" (129) is painted with the precise, clean finish that bespeaks its author; and Mr. C. Hunt's children in "Training the Fairies" for Christmas pantomime (200), if less comically expressive than on some former occasions, are earnestly engaged in their own and the artist's work. "Children of the Sea" (145), some naked urchins bathing from a boat, by Mr. F. Underhill; "An Unexpected Visitor," by Mr. H. Carter (166); "The Captive," a powerfully painted head by Mr. E. Sharpe (205) a lady ruminating sweet and bitter fancies relative to the loved one "Far Away" (215), by Mr. F. Wyburd; an old *bon vivant* who has loved to live, not wisely, but too well, and whose *gout* has brought gout to check it (222), by Mr. W. M. Wylie; "The Boar's Head, Eastcheap," when frequented by Prince Hal, fat John, and companions, by Mr. R. Farren (238); "The Present," by Mr. J. A. Fitzgerald (259); and "A Study" of a gray-

bearded elder, by Mr. V. Crome (316), are among those first to be noted.

A capatially painted composition of a horse helping yoked oxen with their load up a hill on "A Tough Bit of Road, Coast of Brittany: Storm passing off," by Mr. R. Beavis (20); and Mr. J. Brett's very truthful, to all appearance, but singular rose-hued sunset effect on a rippled sea, "Evening off the Menni Straits" (51); with Mr. L. W. Desanges's idealized portrait (187)—

"All honour to woman; to her it is given
To wreath the dull earth with the roses of heaven,"

lead their several departments, of which the last is first.

"Love's Messenger arrested" (24), though the angry papa who has caught the black Mercury by the ear is over-much demonstrative of his wrath, is cleverly represented by Mr. A. H. Weigall, telling an old story in a new way. In "Thwarted" (280), the lady is the detective party, and the story rather harder to be understood—nearly as hard as the painting, which, however, is forcible and brilliant, and by Mr. W. M. Egley.

There are force, colour, and character to recommend Mr. W. C. B. Browne's jovial anchorite, who expresses the adage "It is not the Cow that makes the Monk" (3); and careful nice painting in Mr. A. W. Cooper's arrangement of the three sixteenth-century personages interested in "The Broken Arrow" (7); and so there is, on a larger scale, in Mr. F. Chester's episode from Sir Walter Scott's never yet equalled historical romance—after "Kenilworth"—of "The Fortunes of Nigel"; the "Imprisonment of Margaret Ramsay and Nigel in the Tower" (10), when the hero is apostrophising her—"Poor child, the dew is yet wet on thy eyelashes, and thou hast fairly wept thyself asleep."

Mr. J. A. Vinter's boy indulging in a prolonged study of his father's picture as he rests his head and crossed arms on the table, is pretty and childlike in attitude, and more at ease in his opportunity of observation than most are at "A Private View" (33): the drawing of the head is not quite up to the mark of an Academy gold-medal winner, but it is a pleasant picture.

Mr. F. Weekes's small productions, such as "Troopers crossing a Morass" (37), and an elaborately finished armed "Trumpeter" (43), are attractions, in spite of their size. Mr. A. L. Herford's knickerbockered boy and naturally posed girl playing at "Jackstraws," or spell-cans (115); Mr. J. Payton's two fashionable ladies taking such steps in "Ascending and Descending" as he can best account for, as he has not made it quite clear how the portentous title applies to a daintily-executed picture of eighteenth-century modes (123); Mr. C. Lucy's "Shylock and Jessica" (183); Mr. E. L. Aldridge's noble wife consoling herself with her children in the recollection of what glory her husband is achieving whilst absent from her (193); Mr. R. Hillingford's depiction of James, one the second British king of that name, allowing his nationality to prevail "During the Battle of La Hogue," which induced an involuntary exclamation of "See my brave English Sailors"—very much to the surprise and, it may be supposed, the gratification of the French officers around him (310); and a very dark "Bivouac in the Crimea," in a rather dark corner of the room, by Mr. G. Regamey (325), are all sure to obtain their need of admiration.

Among the landscapes, Mr. J. Dochart's spring scene, "The Bursting of the Leaves, Cadezo Forest" (176); Mr. H. Weekes's "Hampstead Heath, looking towards Finchley," with some well-drawn sheep and donkeys to give more reality and vital interest to its representation (209); Mr. E. A. Pettitt's "Mont Bianco, from the Flégère" (1); "The Haunted House" (23), by Mr. H. Shirley; a clever classic-looking composition by Lord Ribblesdale (79); "A Glade by a River," by Mr. G. Mawley (92); "The Old Pump Well," by Mr. W. M. Taggart (251), are, with some others, noted in our catalogue; and the water-colour drawings and sculpture include a few excellent works.

There are clever portraits by Mr. A. Baccani, Mr. W. Crawford, A.R.S.A., Mr. T. J. Gnillic, Mr. J. E. Williams, and others; and Mr. J. R. Dicksee contributes some of his series of idealized and always graceful heroines, that may be termed portraits of familiar friends.

SIB.—With reference to your remark that the catalogue of the Supplementary Exhibition is dear at a shilling, and should contain a list of the exhibitors and their addresses, I shall feel much obliged if you will allow me to explain

that the words "price one shilling," originally printed on the wrapper, were a mere mistake of a clerk, which was rectified as soon as my attention was called to it, sixpence being returned to all persons who were known to have paid the higher price. I have only to add that a list of the exhibitors, with their addresses, has been appended to every catalogue except a few marked as "imperfect," which were compelled to issue, for want of perfect ones, on the morning of our opening day. Thanking you for your kind promise to return to the subject of the Supplementary Exhibition,

MOT THOMAS, Hon. Sec.

THE ARTISTIC TREATMENT OF PIERS, PILLARS, AND COLUMNS.*

Few subjects have received less attention from architects than the artistic treatment of piers and columns, although few will so well repay a careful study; and few hold so important a position in the great art of architecture. Numerous and valuable works have from time to time appeared on windows, mouldings, arches, doorways, &c., and yet so important a study as that of the decoration of so essential a feature in building has been neglected, or treated of only in works embracing many other subjects. And yet, scarcely any architectural member has employed so much artistic talent for its decoration, scarcely any have existed so long, or are so necessary to a building; and from the inexorable twin columns of the porch of Solomon's temple, to the equally mysterious pillars of a Pimlico portico, we find that they have themselves been employed through all changes in art, and in all countries, as decorative adjuncts to an edifice.

It is necessary before commencing any historical account of our subject, to inquire into the uses of the column, and to define exactly what were the necessary parts of which it consisted. This done, the lecture will consist solely of an account of the different modes of treatment employed in the purest styles arranged in chronological order, with such deductions therefrom as may be of use to us in our own practice.

Whatever might be the nature of the country in which the first builders commenced their work, it is evident they could not have advanced far before the necessity of constructed supports for their roofs was forced upon them. Where caves had been formed for dwellings or quarries, large masses of masonry were left to sustain the weight above; and in the fragile structures of the plains a wooden post was sufficient to carry the beams of the roof. In Egypt the two modes of construction may for a while have been carried on side by side, and we there see features peculiar to one of the styles obviously reflected in the other. When the habit of using the column had at last made it a decorative feature, and thus brought it in range of our subject, we find its most essential parts are the capital and the shaft, with the base, omitted as an ornamental member in one or two of the perfect styles, but generally present in some crude form. The capital, except only in a few quarried examples, is to be found universally, and must always be considered a member necessary to the completion of a perfect column.

The oldest columns which the world can show are perhaps those of the rock-tombs of Beni-Hassan, or the quarried tombs of the neighbourhood of the Pyramids, with which they are contemporary. The latter, like the majority of rock-cut examples, are simple, square, or oblong masses left to sustain the superincumbent weight, while those of Beni-Hassan are polygonal on plan. These were their natural outcome of the square pier which had first its angles worked off, making it octagonal, and then again reduced to a figure of sixteen sides. These, in this example, are further wrought by having the sides channelled, except in one case only, which has been left to receive painted hieroglyphic inscriptions. But this simple relief of fluting was not sufficient for Egyptian taste, accustomed to rich and gorgeous colouring, and too much interfered with their love of large flat spaces for pictorial decoration. Hence grew up another form of column more suited to their taste and requirements, while the simpler and severer form was left to inspire foreign artists, and be worked out by a people capable of appreciating its more refined beauties. The custom of painting the papyrus and lotus plants on the square sides of the piers soon suggested the rounding out into high relief of the stem and the bud. This, step by step advancing, ended in the background of the pier being cut quite away, and a pier, quarter-form on plan, resulting, as at first sight seems

* By Mr. J. Tasson Perry. Read before the Architectural Association, Friday, June 11.

most unlikely, from the square. To keep up the illusion of the new-formed pier representing four lotus-plants, bands tying the whole together beneath the buds were painted or sculptured round it. From this form, the change to the circular single shaft was very easy, and though it seems strange that a circular column should have been evolved, by apparently such roundabout means, from the square pier, a careful attention to the subject will show the correctness of the statement. In the earlier examples of the clustered shafts a slight entasis had been given to their outline; but when, of increased diameter to allow for the decrease in horizontal section, the plain circular shafts came into common use, they were made to diminish considerably at their lowest diameters to give them as far as possible a compensating appearance of lightness. The bands under the necking used in the clustered shafts were retained in the single ones, and give additional proof of their origin. Five was, according to Dr. Lepsius, the usual number employed, and five is the number of bands below the echinus of the Greek Doric order. The next change that they made was in the form of the capital, a memorable one in architecture, although the origin of the alteration goes far to prove that the Egyptians were in it more influenced by natural forms than constructive necessities. The conventional imitations of the bud alone suggested the idea; and the open flower, bell-shaped, the prototype of all the best forms of capitals in all future styles, suddenly appears in its full-blown perfection. That this was not the result of any rounding off of the angles of an abacus, or bringing out in graceful curves the lines of the shaft to meet it, is evident from a most cursory examination; for the same square block which served as an abacus in the bud capitals retains in this the same form and proportions, and is, for all practical purposes, as useless. The first abacus we find is in the examples already mentioned at Beni-Hassan; but it then, though in a rock-cut example, is a much more complete and useful member than when later employed in constructed columns.

It was usually of the same size across as the upper diameter of the shaft below, so that the spreading form of the bell-shaped capital, apparently so suitable for the fulfilment of all the requirements of a complete capital, had its utility destroyed by the interposition of this square and unmeaning feature. Thus, although we owe to these earliest builders the very first suggestions for the essential parts of a capital, and find in their examples the commencement of all the leading characteristics of later styles, we find the Egyptians themselves quite unable to understand the value of the discoveries they had made, or to apply them in such a manner as to render them other than mere ornamental accessories.

This direct study of nature not only produced these new and beautiful forms, but at the same time prevented the artists from making such blunders in the arrangement of the columns as might, perhaps, have happened among a people less mindful of its beauties. They were very particular when using together columns with the bud and bell-shaped capitals always to make the latter the higher, just as the full-blown flower is taller than the one only in bud. This is well seen in the great hall of Karnak, where the avenue of columns down the centre has open bell-shaped capitals, while the side ones, supporting only the lower roof, and of scarcely two-thirds the height, are arranged with capitals of the bud form. The great fault of this arrangement is, perhaps, the want of height this gives to the centre building, where, had the columns been of a similar character to the side ones, or had others been superimposed upon them, the eye would be better able to appreciate the increased height. The diameter of these columns is very great, and considerably detracts from their elevation, being almost half the total height of the story. But massiveness was so important a feature in the piers as in all other parts of the Egyptian style, and this is not to be wondered at, when we remember the small amount of skill possessed by the builders, and the enormous space they sought to cover with their roofs. The mode of decorating employed tended rather to increase than diminish the effect of massiveness. The carved flutings and painted papyrus-stalks early gave place to broad bands of hieroglyphs, or figure subjects ranged horizontally round the shaft, and bringing out its circular form in a happy and emphatic manner. The bell-shaped capitals were further decorated with perpendicular lines, and leaves

running from the shaft upwards, and producing a fine contrast with the lines of the shaft. The bright rich colouring of a group of these columns of the earlier dynasties was most brilliant and harmonious, and the majestic appearance of a single shaft was worthy of being compared with the finest example of Grecian or Medieval beauty.

It has been suggested that the different positions of the bud and full-blown capitals were arranged with a view of conforming better to the clearest mode of lighting usually employed; but if this be the case, it seems difficult to account for the peculiar case of the hall of Tothmes III., at Thebes. There, with the same mode of lighting, the bell-shaped capitals are employed, but inverted; so that, although they may be in a good position to catch the light, the effect could not possibly be seen from below.

In the later styles the bell-shaped capital superseded the other form, and the ornaments painted or carved thereon became much more intricate. The endless varieties of lotus-flowers, palm-leaves, &c., with which they were adorned, presented a most marked contrast to the simple painted decoration of the earlier times. But there was another feature, most distinctively Egyptian in its character, which at the same time became very common. This was the leaf-headed column. It appears to have been first employed as early as the eighteenth dynasty, but it scarcely came into ordinary use until the time of the Ptolemies. As a rule it was usually surmounted by a temple form in place of the square abacus-block, and in some cases it was united with the ordinary capital. The columns of the Temple of Denderah, which are the finest examples of this peculiar treatment, are among the best preserved, but the style can only be regarded as a mark of decline, and a sign of that sad falling off from the grand and simpler ideas of earlier times which so seriously affected the great epoch of building activity under the Greeks and Romans.

But while this grand and massive style of Egypt was passing through its various changes, on the plains of Shinar, a different race, with different wants and materials, was in a different manner working to the same result. The great cities of Assyria are perhaps more famous in history than those of Egypt, and the earliest records we have tell of the founding of Calah, Rezu, and Nineveh. In the means at their disposal these new builders were certainly not so fortunate as the others we have described; but with brick, and alabaster, and cedar, they raised gorgeous and ephemeral buildings, which, exciting the amazement of the ancient world, left scarcely a wreck behind to tell of their ancient beauty. With brick walls of enormous thickness, veneered with the richest sculpture, the great palaces were covered with roofs of timber, supported on wooden posts, which have in every case disappeared; but throughout all the heaps of ruin scattered through the country, no fragment remains to show how this important feature was treated. In Koyunjik Mr. Layard found something that appeared to him to be a pedestal, but from its peculiarly bulbous form, so un suited for bearing a weight, as well as for its want of similarity to the bases used in a later phase of the style, we should hardly be safe in concluding that his surmise is correct. On the other hand, it must be remarked that the Chinese form the bases for their wooden posts to this day in a manner not unlike this. A course or two of bricks, or a large tile with a deep stone rounded very much top and bottom, bearing a strong likeness to this Assyrian example. That columns were used by the Assyrians in their ordinary construction is certain, although no traces may remain in the buildings themselves. We know that Solomon, in building the House of the Forest of Lebanon, had a roof of cedar beams supported on three rows of cedar columns, with a porch of columns before it. And in the fine series of bas-reliefs brought over to the British Museum, are several instances of columns for the support of cornices, sometimes arranged as a temple in ante, and generally with the distinct Ionic volute and well-developed bases.

In the ruins of Susa, Persepolis, and Passargada, to which, after the destruction of Babylon and Nineveh, we must look for a continuation of the Assyrian styles, we are fortunately able to find considerable remains of columns to help us in our conjectures of the older style. But, far better situated than the earlier cities for materials, they substituted stone for wood where practicable, and though the roof was still formed of beams

of cedar, the columns were built of a material better adapted to support the superstructure and resist the action of fire, to which those eastern palaces so often fell a prey.

The columns of the hall of Xerxes at Persepolis are exceedingly graceful in form, being in some cases as much as eleven and a half diameters high, covered with flutings, and with capitals and bases complete. The contrast between these and the examples we have given from Egypt is very strong, and shows how much the materials and forms of the first efforts of the builders throw their influences forward over all succeeding phases of their particular style. The baseless, capless piers reflect unmistakably their simple stone-constructed models, while the more complete orders, with their perfect capitals and bases, prove as conclusively their wooden origin. The rough brick or stone base of the post would early be looked upon as means of decoration not to be neglected when stone was substituted for wood, and the boldly projecting capitals having their outgrowth from necessity and not the result of taste merely, could not but be continued as the artists advanced their work towards perfection. The form assumed by the capital was peculiar, and consisted doubtless at first of simply a short wooden template, such as those now constantly used in ordinary warehouse construction, to increase the bearing space of the top of the post, or allow of the great beams passing each other on a level. Compare this crude form with the perfected hull-headed Perseopolitan capital, and you will see at a glance how the latter, by constant use and artistic influence, has been evolved out of the former.

The changes, which in Egyptian work we find bringing about the circular shaft from the square pier, are missing here. The earliest examples we find of the style are already as perfect as they will be, for in all variations of treatment a material was used requiring no great difficulties to be overcome, and one in which the simplest form was round. But the flutings, with which the shafts were always relieved, it would be interesting to find in some less perfect state. Whether the result of direct imitation from Egyptian example, or whether the reflection of the simple mode of decoration employed in China of binding reeds and matting round their posts, it is now impossible to say. But it would be fortunate to discover the origin of a mode of decoration which so much influenced the later styles of Greece and Rome.

We shall find that the short time we have spent in dwelling on the peculiarities observed in the Egyptian and Assyrian modes of treating the column will help us considerably to understand the forms employed by the Greeks throughout the period of their art. In that art, which inherited all the beauties of the former styles, we find the chief characteristics of Egyptian and Assyrian architecture welded together, though never completely fused; so that to almost every feature and ornament can be assigned an origin in one or other of the earlier schools. But the imitations are never complete, but always adapted with that skill and taste so characteristic of the people, and the derived forms appear not seldom to be rather recollections of a model not present for actual copying.

It is an unfortunate thing that the links in the progress from the earlier examples of native art to the time when these new and unaccounted forms were first introduced into their architecture should be wanting. The Persian invasion and the rebuilding of more fortunate epochs have almost completely swept away all remains antecedent to the time when the Greek style reached its perfection, and it is nearly as difficult to trace it up from its beginnings as it would be to study the relations existing between our own Pointed styles and the works of Roman times, were all the remains of Romanesque architecture completely effaced.

The first example we find of the use of the column is rather as an ornamental accessory than for a practical purpose, namely, in the bas-reliefs over the entrance to the Treasury of Athens at Mycenae. It is interesting, as it contains one or two peculiarities, which the Greeks ignored through the heat periods of their art, and which do not reappear till a much later time. These are the base and plinth, which are here unmistakably present, and show that it was not for want of precedent that the Greeks omitted them in their Doric works. The capital seems like a rough copy of the Ionic order, more akin to those in the Assyrian bas-reliefs than to the finished examples of a later period. The carving of the whole seems to have more alliance

with the Romanesque work of Western art than the beautiful styles of the country in which it is found. The whole was the work of the Pelasgi, a people perhaps of Celtic origin, or more closely allied to those of Asia than the Dorians and other settlers who afterwards peopled Greece, and to whom, either pure or incorporating a large number of the Pelasgi, we owe the finest works now extant.

Wanting, as I have said, the steps that led up from this example to the more complete forms, we must turn at once to the study of the Doric column. The earliest specimen we can find is as perfect in all its parts as the latest, and there is no feature of any kind to be detected which gives the least hint at a connexion with our last example. But its Egyptian origin is undeniable. The Doric column as we find it at Corinth is stunted in its proportions, has no base, a fluted shaft, a square abacus, and below, the echinus moulding the great peculiarity of the Doric capital. The fluting differs from the Beni-Hassan examples, particularly in the number of the channels. And this point goes far to prove the imitation by unaccustomed hands of an exotic style, since in the Egyptian examples the flutings always number 4, 8, 16, or 32, as the natural outcome of the square, while in Greece the number is by no means certain; and this column at Corinth, with its twenty flutes, could not have been evolved therefrom by the ordinary process of cutting off the angles. At the same time, the absence of the flat fillet between the flutes tends to prove that this form of column was not the result of a channelled ornamentation applied to a circular shaft. Except in this particular, and in the presence of the peculiar echinus which here appears in architecture for the first time, the columns of Beni-Hassan were perfect prototypes of the Doric columns at Corinth. This new feature, however,—the echinus,—had its origin, too, on the banks of the Nile; and in its adaptation the Greeks showed that they were no servile imitators, but capable of appreciating the excellence of the style they sought to reproduce, and of separating from it its accidental defects. We have seen that the real constructive value of the capital was never understood by the Egyptians, and although they spread out and perfected this feature, yet the actual bearing surface was never increased. But the Greeks, no doubt already accustomed to value the capital for constructive as well as aesthetic purposes, could not so far stultify themselves as to adapt without modification a feature so useless. Taking, therefore, one of the best capitals, they cut off the upper and meaningless part above its broadest part, where often there was some definite line, as in the example at the British Museum, and sometimes possibly a joint. On this the square block abacus was flattened down to a size sufficient to cover the echinus, or one of the abaci from Beni-Hassan was bodily transferred. This origin of the echinus, first pointed out as possible by Sir Gardner Wilkinson, becomes most palpable to any one who will examine the example of a column of the eighteenth dynasty in the British Museum, the section through the lower part of which in effect, and allowing for difference of climate, is almost identical with the earlier Doric specimens of Greece.

The characteristics of the Doric order remain unchanged as long as the order is itself employed by the Greeks, although it goes through some considerable modification in its proportions. The column, as found at Corinth, was only 4½ diameters high, while those of the temple at Delos are seven. In this latter place the Temple of Apollo has some shafts, with the peculiar addition of a sheath, smooth and circular, covering up the flutings, with the exception, perhaps, of an inch top and bottom. The old entrance of the fine Sun Fire-office, in the City, by Mr. Cockrell, has two columns thus treated. In the portico of Philip, in the same place, and the Temple of Heronius, at Cori, are shafts fluted for two-thirds their height, the parts below being cut into twenty flat sides. But the Temple of Segeste, in Sicily, throws some light on this mode of treatment, and gives an example of the means employed in the construction of the order. The temple was never completed, having been in course of erection at the destruction of the city, and remains to this day only the bare shell of a building. The capitals are finished, except at the angles, where rough corners are left to be finished last to ensure sharp arrises. The shaft is inclosed in a sheath, as at Delos, but perhaps more strongly marked, the line of the shaft showing above and below. From this it would

appear that it was left, here and in the cases of Halicarnassus and Delos, for the flutings to be worked when the rest of the building was complete. There is also at Segeste a squared block forming a constructive base, but this would in all probability have been incorporated in the steps had the work been finished, and not made an ornamental feature, as later in the great Temple of Agrigentum. The small thin slab of stone left on the top of the abacus at Segeste, to prevent the risk of the edge flaying, is the beginning of the evil which later threw back the capital to its original uselessness by reducing the bearing surface to the size of the shaft below. Later examples of the use of this peculiar feature are found in the Tombeau de la Chrétienne, in Algeria, illustrated by Professor Lewis, and, strangely shaped, like the abacus of a Corinthian capital, in a capital figured in Flandrin & Costo's "Voyage on Perse."*

THE VELOCIPEDE MOVEMENT OF ENGLISH ORIGIN.

ALTHOUGH neither the English, the French, nor the Americans, have as yet come up to our idea, as regards either the utility, or the improvement of the velocipede,—or *traveller*, as bicycles, tricycles, and four-wheelers of the kind might all be called, and whether worked with the feet, the hands, or any other motive power;—we suppose it is not necessary that the *Builder*, the pioneer (as we shall now show) of the movement, should any longer chronicle its surprising progress.

It is the fate of pioneers sometimes to be so far ahead of their projected movement that, as Coleridge remarked of a higher class of pioneers, they look small in the perspective, and get out of sight altogether, occasionally, by the time the movement they originated reaches any point of vantage. So is it with the *Builder* in this instance. Overlooking, too, the progress made in the movement in England before it was ever heard of either in France or in America, our countrymen seem willing to give up their own prior claim to foreigners; who have now, however, certainly gone ahead of them. But that is no reason why the revival of the velocipede in England within the last ten or twelve years, and long ere it reached either America or France, should be ignored; and we shall accordingly devote a small space to what has really become a question of some little importance.

As we recently remarked, our purpose in originating this movement was chiefly utility, as was likewise the case with us in the beard or "moustache movement," as we named it, many years ago; and although our friends the French and the Americans, as we have said, seem to have gone crazy about the velocipede, and we in England are fast following their example; still they have not even yet, as to it, come up to the mark, which a few quotations from old volumes of the *Builder* will show that we have long and steadily held in view, and urged, over and anon, upon the public attention. To quote all we have said on this subject is far beyond our limits; but in giving a few examples, we shall also note the consequent result, in the gradual revival of the velocipede in this country, previously to its transfer to America and France.

On the 23rd of October, 1858, to go no further back, or upwards of ten years since, the following paragraph (and by no means the first of its kind) appeared in the *Builder* :—

"*Velocipedes and Self-moving Vehicles.*—The utility of such miniature "carriages" to metropolitan and other workmen, living at some distance from their employment, —to enable them, in fact, to live in healthful localities, though at a distance from their employment,—has frequently been suggested in the *Builder*. We feel pleasantly to observe that some little progress is being made in the suggested direction, as a workman, here and there [readers of the *Builder*, no doubt], may occasionally be seen on his way to work, mounted on such a vehicle. A postman has just been provided, by subscription, with one at Bangor, which greatly facilitates his labours along the country roads. Why does not some ingenious mechanic invent a self-moving vehicle of this sort, impelled by a powerful spring that could be wound up with a crank-handle, or by compressed air, indiarubber accumulators, or some such means, so as to save the perpetual movement of feet or hands? Some cheap form of self-moving miniature carriage, it is to be hoped, will ere long make its appearance, and it will then only require the exercise of a few strong-minded sensible workmen to overcome that repugnance which the least novelty is so apt to excite, in weaker minds, against the adoption of even the most manifest improvement in the present and prevalent mode of doing things."

* To be continued.

The application to velocipedes of india-rubber "accumulators" was suggested in 1856, by a correspondent of ours, and alluded to in the *Builder* of 5th April, 1856, in an article entitled "Self-moving Wheel-chairs, Gigs, Droskies, Cabs, &c.," in which we say, as we have often taken occasion to do in nearly similar words :—

"We have more than once urged the immense utility to the million of some simple, light vehicle, self-moving, or by means of some spring power easily wound up, whereby London workmen, tradesmen, clerks, &c., could go about their lawful calling, so as to be enabled to live in the suburbs, and to run along in all directions, independent of omnibuses, which, moreover, traverse only the main thoroughfares, and are, therefore, unsuitable in thousands of instances."

In this article, too, (of 1856) we note the circumstance of "seeing a workman bowling along on a small velocipede, with his tools in a box before him." In reference to "accumulators," we may here remark, by the way, that our correspondent, "Urgeo," stated that these instruments (suggested from seeing an African negro lift an enormous log of mahogany by help of the resilient force of tree branches, applied by means of wild vine withes), were at that time made of even 100-horse power. The precise form of "accumulator" suggested by him was that of a barrel fixed to the axle, and round which the "accumulator," or series of stretched india-rubber ropes, or bands, in fact, was to work.

Our correspondent concluded by suggesting that others should contribute their thoughts to the *Builder* on the subject.

Thus we see that the velocipede movement was begun, or revived rather, in England, at least as far back as 1856, or some years before it reached either America or France; and in that interval it had made pretty good advance, too, in England. Thus we find that journeymen such as those of the other day, from London to Brighton, and others, recently, were by no means unprecedented in England since the modern revival of the velocipede movement in this country. In the *Builder* of October 4th, 1862 (or nearly seven years since), a paragraph will be found titled "Velocipedal Progress," in which it is recorded that "Mr. Harris, landlord of the Fox and Crane, Bristol, had accompanied his brother in a journey by velocipede to London, on a visit to the International Exhibition." They went the 118 miles in twenty-one hours and a half, and returned comfortably eighteen hours. During the same interval, too, hundreds of French and American, as well as thousands and tens of thousands of English, visitors to the Crystal Palace at Sydenham, must have seen the staid velocipedes there, long before the new movement reached either France or America. The fact that the movement seems to have appeared or become popular in these two countries simultaneously, or nearly so, itself corroborates the idea that it extended to both of them from its one common source in this country.

Even Ransome's "Rantonee," a word which many Londoners must remember the walls being placarded with, before its meaning was ever hinted at, had assumed shape, as an improved velocipede, before either the French or the Americans adopted the movement; and for some time before they did so we took occasion, when correspondents asked us, as the known originator of the movement, where they could obtain velocipedes, to refer them to manufacturers of the article, at that time, in Cheapside and in Leicester-square. In country towns, too, such as Hull, velocipedes are said to have been getting common of late years.

In an amusing little volume on the velocipede,* recently published, the author states that it was in 1862 that the first American patent for an "automatic horse," or "cantering propeller," was taken out; but that it was not until the fall of 1865 that velocipedes appear to have excited much popular attention in America. By that time the movement was also in progress in Paris; for we find a paragraph in the *Builder* of 17th of August, 1867, in which, as usual, we were urging the improvement of the velocipede into a self-moving vehicle for behoof of those who cannot afford to "keep a gig," and especially of workmen, clerks, and others; and wherein we note that—

"In Paris the extension of the velocipede seems now to be taken up in earnest, and not like with us as a mere toy. . . . In America, too, the *Builder's* idea is taking root. A new style of carriage appeared in Boston recently. It was a light open buggy, carrying two men, and had no

* Velocipedes, Bicycles, and Tricycles; How to Make and How to Use Them; with a Sketch of their History, Invention, and Progress. By Velox. Routledge & Sons, London, 1869.

visible means of locomotion save a slight apparatus under the box . . . and was guided as easily as if a horse had been attached."

Now, does not this show that the movement in America was even specially connected, in its origin, with our idea of a self-moving velocipede? We observe, too, from an article on "Compressed Air for propelling Vehicles," in the *Builder* of November 23rd, 1863, in which we refer as usual to velocipedes, that compressed air, as we have shown that we had years before suggested, in connexion with this movement, had then been successfully applied at New Orleans to street-vehicles or cars. The air was compressed into light but very strong vessels, of a sort of paper mash, at a station, by means of steam power.

Of course, nothing we have said is to be held as calling into question the origin of the bicycle. That may have originated in France, in America, or in England itself, for all that we know. It seems to be doubtful, however, how or where the bicycle originated. The Americans have bicycles as well as the French; and the author of the little volume already noticed says that the claim of the American patent of 1862 "embraces all the essential points of the modern bicycle." Yet he somewhat incoherently, as well as quite mistakenly, expresses his opinion that "the re-creation [of the velocipede movement] is due to the *petits cravats* and *coquettes* of Paris;" although he also says that the French bicycle was "a thing of the future" "as far back as 1866" (only two or three years ago), when "the *Scientific American* recorded a patent for the two-wheel velocipede with treadles and guiding arms." One would think this author has himself pretty clearly proved that both the new velocipede movement and the bicycle were known in America sooner than in France, as they were in England sooner than in America. We have, at all events, shown that several years previously to 1866, and even to 1862, the movement had already been originated in England, and that the pioneer and originator of it was the *Builder*.

We may conclude these notes by recording a few circumstances as to recent "velocipedal" progress. Not only has the velocipede been adapted to locomotion on ice, but also on water; and a member of the Aeronautical Society, as reported in *Scientific Opinion*, suggests it as a basis for locomotion in the air!

An "Imperial Veloipede and Loco-Machine Institute" is being formed in London. Recently a conference was held at the Inns of Court Hotel, Holborn, for the purpose of explaining the objects of the proposed Institute.

Two great improvements, says the *New York Herald* of the 14th ult., will be perfected this week in velocipedes, and both are just the improvements that had far to make it a machine of every-day utility. The first is a means of doing away with the tarring sensation when riding over rough pavements, and the second is a device that triples the speed with less than the ordinary power and one-fourth the velocity of treadle movement.

When the novelty-hunters are quite done with the velocipede, as we have already said, we trust that one result of the movement may be that the vehicle will be improved out of mere velocipedism, in the way we wish, and made useful, as a *traverser*, to those who cannot afford to keep either horse or chaise; enabling them to live healthfully in out-of-the-way corners of the old skirts of London and of other large towns, while obliged to be daily in town on business.

THE TRADES MOVEMENT.

THE FEND BETWEEN masters and men, we regret to say, is believed to be getting more general than ever. Throughout the whole of Lancashire and Yorkshire the relation between them in nearly every trade is most unsettled. In Liverpool the master builders are said to be making strenuous efforts to bring the unfortunate difference which has arisen in the building trade to a close, while on the other hand the operative masons seemed equally determined not to come to the terms of the masters as embodied in the new rules. In consequence of the strike, the principal works in the town have been suspended; though it is said that sufficient masons have been obtained from other towns, chiefly London, to enable operations to be resumed. By our last account there were 65 masons working in Liverpool under the new rules, and 76 apprentices and "improvers." There were from 80 to

100 non-society men also at work. The Operative Masons' Society is an exceedingly strong one—it is said they have at least 27,000, in hand.

The strike on the part of the Manchester masons begins to show signs of feebleness in its funds. In another month, if men come in as rapidly as they have done since Whitsuntide, the masters, it is said, will have hands enough to carry on all works without any of the hands now on strike—some 600 or 700 of them.

At Leeds, a meeting of the masters has been held, and the following resolution unanimously adopted:—

"That this meeting, feeling the importance of the present struggle for the true principle in calculating time and arbitration in cases of dispute, fully resolves, along with the principal towns in England, to determinedly hold out, and rejoice in the fact that so many men have agreed to our terms, and commenced work in this and other towns."

At Blackburn a strike in the building trades is imminent. The secretary of the Masters' Association has received a letter from the operatives' union, intimating their intention of proceeding with their notices of a reduction of the working-hours from fifty-four to forty-nine per week. The masters are firm in their determination not to submit to the reduction, and the men will therefore go out on strike.

The joiners of Over Darwen on strike, in consequence of the refusal of the masters to comply with the request of the operatives for a reduction of the working hours, have refused to abate their demands. An attempt is being made to extend the strike to other towns in the neighbourhood.

At Wigan, where the fight has been about the hour system, the men have had an interview with the masters, but no arrangement was come to.

The masters have given in at Leamington. The builders acceded to the demand of the men for an advance of 6d. per day, and the men on strike were to resume work immediately at the new rate of 6s. per day.

A number of the operative painters of Worcester are on strike. They sent in a request to their employers in March, asking them to adopt the hour system, and to leave work at one o'clock on Saturdays—that being the custom in the other branches of the building trade in Worcester—and also asking a slight increase in their wages, to come into operation on June 1st. The men further requested their employers to meet them to discuss their request. The employers, with one or two exceptions, took no notice of this application. The men met on the 5th inst., and decided to be at the shop at one o'clock on the 12th inst., and demand payment by the hour. A circular was sent to the employers on Monday the 7th inst., informing them of this resolution. A number of the employers then met and resolved not to alter their time of working or payment. About six shops, however, paid upon the new system. The men struck at the other shops, but at one shop the men (numbering fourteen) have gone in again, after the principals had given an interview to a representative of the men. The men desired to submit their case to arbitration, a good opportunity being afforded by Mr. Rupert Kettle's presence in Worcester on the 6th instant, but the employers refused arbitration.

The bricklayers connected with the union in Leicester have turned out on strike. The rate of pay has been 6½d. per hour, for 58½ hours per week, and an advance of ¼d. per hour, and a reduction of the hours to 56 in the week, are asked for, which, owing to the badness of trade generally, the masters are unwilling to grant. A strike of the bricklayers' labourers for similar objects is anticipated.

The joiners in Glasgow and its vicinity have given their employers notice of their intention to shorten their present hours of labour to nine hours per day on and after the 1st of July, and have issued voting-papers to all the shops and squads,—the returns showing a majority of 6 to 1 in favour of the proposed change.

Mr. Richard Harnot, general secretary of the Operative Masons' Association, has issued the following report:—

"The only new feature, in connexion with the strikes and lock-outs this fortnight, is the appearance upon the walls of large towns of huge placards and counter-panels side by side, the one inviting to accept the employers' terms, and the other dissuading from accepting such terms. The strikes now pending, with the numbers on each respective strike-roll, are as follow:—Birmingham, 23; Birkenhead, 3; Bigglesy, 5; Manchester, 257; Sunderland, 7; total, 300. Partial lock-outs will exist in fourteen towns, viz.—Bolton, 3; Bristol, 95; Coventry, 6;

Didbury, 2; Fishford, 23; Halifax, 61; Liverpool, 235; Leeds, 69; Lymm, 3; Old Swan, 9; Sheffield, 25; Wakefield, 9; Wigan, 7; Wolverhampton, 9; total, 569—making, with those on strike, an aggregate of 839, showing a reduction of 21 members upon the funds since our last return. As the gross total of members of the society is 18,281, it will be seen that both strikes and lock-outs do not throw out of employ a twentieth of the actual members of the society."

Mr. Rupert Kettle, of Wolverhampton, who has already settled by his arbitration so many quarrels about wages between masters and men in the Northern Counties, has just effected another arrangement of the same kind among the cotton-spinners of Oldham. On this occasion *Punch* says:—"All our readers will remember the opening of a famous domestic quarrel in one of Dickens's Christmas Stories: 'Kettle begun it.' Let us hope henceforth all stories of trade-quarrels in the North will run 'Kettle ended it,' and that, encouraged by the success of this voluntary conciliation court, masters and men, instead of striking, will strike up the popular chorus, 'Polly put the Kettle on.' *Punch* begs leave to offer them a version of the song for such occasions;" and a very good song too: the refrain of it is:—

"Better put the Kettle on,
Better put the Kettle on,
Better put the Kettle on,
And let's agree!"

An American paper, in allusion to the progress of the "eight hours movement" in the States, says—"We have adopted the eight-hour system in this office. We commence work at eight o'clock in the morning and close at eight in the evening."

THE BRITISH MUSEUM.

You have recently devoted much space to interesting notes on the (Albert) Museum, South Kensington. How often do architects visit the British Museum? too often, or twice in their lives? Yet, beyond the old collection of undying interest, much which is new has lately been added. Many of your practical readers will be glad to know that there is in the Botanical Gallery an excellent collection of cabinet and coniferous woods, prepared and named by Mr. Edwards. The pines and firs are specially instructive to those who desire to acquire information touching the appearance of the several kinds, a matter in which, however elementary, much ignorance is sometimes manifested, productive alike of confusion to the young practitioner and of injury to his clients.

The art-student will be strikingly impressed by the haughty grandeur, specially in the pose and tournure of the lofty head, of a half-rummed colossal lion, from a Doric tomb on a promontory near Chidias, Asia Minor. Wandering here, in the Egyptian and Nimrod Galleries, and wending through the Greek and Roman Saloons, the contrast between the Kensington and British Museums is very remarkable. The former may be said to be characterised by sensationalism, the latter by solidity. Gigantic Egypt, mother of mysteries, lies silent as death, yet living before us,—massive, simple, sublime; the human heads starting in their calm repose, abstraction, and dignity, yet ever pleasing, almost smiling, and benevolent. Curiously interposed between Egypt and the standpoint of the Cnidias lion, almost as a veil, stands the solid symbolism of Assyria,—minute and elaborate, yet grand and overpowering; its cere-cloths cast aside, and risen, perfect almost as when hurried, from the sepulchre of ages. And ideal and heautoneus Greece, joyous yet tempered with her own pale cast of thought, with her faint and distant shadow, Rome,—they, too, speak here, oh, how eloquently beyond words! still with ever that wondrous appearance of unconsciousness of the spectator, and striking absence of any sign of mere self-exhibition, which defies the gods and ennobles the men. But, what! our ancient love, Clytie, is it she? Surely, yea. She, all know, pined away, and was metamorphosed into a flower; but on what poetic or prosaic authority can she be changed from of old into "an inexpressive of the Augustan period"? Another supposititious subject, "Caligula," arrests instant attention among the novelties; but whoever the airy and elegant figure portrays, there can be no mistake about the nobility of his steed.

The Parthenon marbles are now concentrated in the second Elgin Room, the frieze of the cells being protected with glass. In what was called the First Elgin Room are remains from the Mausoleum at Halicarnassus, erected in the

palmy period of Greek art, and which gave its name to subsequent memorials of the kind. The magnificent colossal horses seem to prance and curve; the lions are very characteristic studies; and not the least interesting statue is one presumed to be of Mausolus himself—a draped figure of great dignity, found broken into sixty-five fragments, at length reunited.

Externally, sheds still disfigure the colonnades, fantalizing with dreams of priceless treasures there and in cellars concealed from public gaze, and recalling the plaintive cry of "Antiques" in Count Platen's mournful verses:—

"Here have ye piled his together, and left us in cruel confusion;
Each one pressing his fellows, and each of us shading his brother;
None in a fitting abode, in the life-giving play of the sunshine.
Here in disorder we lie, like desolate bones in a charnel;
Waking, in all that can feel, deep sense of sorrowful yearning
For the magnificent days when, as all but alive, we were honoured!
Ye, too, have ye no temples, no pleached arcades in your gardens,
Where ye can take us, and plant us all near the un-perishing heavens,
After our own sweet went, to the joy of the pious beholder?"

The colossal pedestals will, it is to be feared, long continue without colossal statues; but cannot the accomplished architect to the Museum persuade the authorities to place a fountain in the centre of the grass-plot on either side of the portico? With two more respectful suggestions,—the labelling of hundreds of objects without any description, and the issue separately, with division of cost, of catalogues of the collections of natural history and antiquities, two diverse subjects conjoined in one pamphlet,—I may conclude this slight annotation on, incomparably, the most valuable collection existing in one edifice of natural, artistic, and literary productions. EDWARD L. TARBUCK.

RAILWAY MATTERS.

The New Liverpool and Manchester Railway.—Messrs. Benton & Woodriss, railway contractors, have entered into an engagement to complete the new railway within two years. The railway, which is undertaken by the Manchester and Sheffield Company, in conjunction with the Midland and Great Northern Companies, will have a spacious station in Ranelagh-street, Liverpool, and will join the Garston line about a quarter of a mile on the Liverpool side of that village, leaving Woolton to the left. It will then run through Farnworth and the heart of Warrington, taking, in its course to Manchester, the edge of Carrington Moss, Flixton, and other places, and will join the Manchester, South Junction, and Altrincham line near Old Trafford. There will be a fork from the line near Carrington to join the line at present constructed, leading through Stockport, and it will form a connexion with the Midland Company's new line running through Derbyshire and the neighbourhood of Woodley, and also with the Manchester, Sheffield, and Lincolnshire line at Godley, thereby forming a through route to London and all the places of importance on the eastern coast. The line from Liverpool to Manchester will be almost straight—32½ miles in length, and the introduction of the latest improvements in the construction of engines and carriages will, it is expected, enable passengers to traverse the distance in forty-five minutes. The line presents but few engineering difficulties, the chief erection being the bridge over the St. Helen's and Warrington Canal. The heaviest portion of the works at the Liverpool end of the line will be commenced very shortly in the neighbourhood of Halewood.

Rough and Ready.—A bridge on the Jeffersonville and Indianapolis railroad, 160 ft. long, was recently burned down, and rebuilt so that the trains passed over in eighteen hours.

A Scream of Triumph.—The completion of the Central Pacific railroad was celebrated characteristically at San Francisco. When the telegraph announced the last rail laid, the whistles of thirty locomotives, gaily decked, and drawn up in a line, screeched out in concert as an expression of joy, and the steam-whistles in the city joined in.

The proposed Bridge Across the Mersey.—At a recent meeting of the committee of works of the Mersey Docks and Harbour Board, Messrs. Low & Thomas, the projectors of the proposed Liverpool and Birkenhead railway, were present by invitation. The principal features of the scheme discussed by the Board were the two piers pro-

posed to be placed in the river, and the height of the bridge above high-water mark. One member of the committee considered that the height of 140 ft. above high-water mark was insufficient; and others were of opinion that objection would be raised to the piers in the river. Messrs. Low & Thomas were referred to the conservators of the river, and if it were found that no objection was raised by them, the committee of works thought that the Mersey Docks and Harbour Boards would not raise any difficulties.

THE SITE FOR THE LAW COURTS.

A FASHIONER of St. Clement Danes being asked for his consent to the Bill for acquiring the Embankment site, writes,—

"I dissent in reference thereto. Firstly—Because, from my knowledge of the site, my conviction is that the cost will go far beyond the amount provided in the Bill. Secondly—Because, owing to the quicksand on the Thames Embankment, it may be found necessary to have the foundations on the site of the streets, which would render the acquisition of the blocks of buildings up the Strand frontage necessary. Thirdly—Even if the Thames Embankment ground could be used for the foundation, from the cost to be paid for the Somerset House—some of the finest buildings in London—would be eclipsed in effect by Mr. Street's proposed façade to the river. Fourthly—Because, from the economical point of view, the Carey-street site would be found better adapted to the Law Courts. And, finally—Because the parish of St. Clement Strand has already been seriously injured by the removal of a large neighbourhood, and a second clearance in the parish of a large locality would cause a serious amount of ruin and inconvenience to the inhabitants, which no amount of compensation could repay."

The Royal Commission have appointed a committee to examine all the questions of measurement and cost.

Mr. E. M. Barry is justly urging that

"The printed correspondence, in answer to Mr. Benjick's motion on the appointment of the architect, is partial and incomplete." He says,—“It omits several letters from Mr. Street and myself, written when there was no difference of opinion between us, that the decision of the judges could not be departed from (as has since been done) without an intolerable breach of faith. It does not give, moreover, some further letters from me, in one of which, several months since, I asked for definite information on an important point without obtaining a reply. I hope Mr. Benjick or some other member will get his return completed, as it is most unfair to me that a portion of my correspondence should be printed with the omission of context and sequel.”

LINCOLN DIOCESAN ARCHITECTURAL ASSOCIATION.

The annual gathering of this association was held on Wednesday and Thursday, June 2nd and 3rd, at Southwell, under the presidency of Dr. Wordsworth, Bishop of Lincoln. Wednesday's proceedings commenced with service in the minister.

Mr. Fowler, architect to the dean and chapter of Durham Cathedral (formerly connected with Southwell Minster), afterwards read a paper descriptive of the architectural features of Southwell Collegiate Church. In the afternoon, after divine service, Mr. Fowler gave an account of the old palace to a company assembled in the grounds.

In the evening a meeting was held in the Assembly-rooms, presided over by the Bishop of Lincoln.

Mr. Bloxam read a paper on the effigy of Archbishop Sandys, and Mr. Dimock on "The Documentary History of Southwell."

On Thursday the members made an excursion to Rufford Abbey, the seat of Captain Saville; also calling on their way at the various churches between Southwell and Edwinstowe. A large party proceeded on the excursion, which included Halsam, Edingley, Parnsfield, Bilthorpe, Rufford Abbey, and Edwinstowe. About twenty conferences of various descriptions were occupied by the party, and the weather was fine. At Rufford Abbey they had luncheon. After visiting Edwinstowe they returned to Southwell. The annual dinner was held there in the Assembly-rooms. During the meeting of the Society a paper "On the Documentary History of Southwell," by the Rev. J. F. Dimock, of Bamborough, was read.

Archdeacon Trollope on Thursday evening read a paper "On the Norman and Early English Styles of Gothic Architecture;" and Mr. Poole another "On Ways and Means."

The Arundel Society.—The annual general meeting of this society was held on Monday last when the council gave a very favourable report of its condition and progress.

THE CLASSIFICATION OF STREETS.

Numerous propositions having been set forth with regard to dividing the metropolis into districts, one more proposal I venture to think will not muddle those who are now endeavoring to bring forth a great scheme. This additional idea is, divide the metropolis into twenty-four districts, and name each after the letters of our alphabet, A, B, C, and so on. In district A let all the names of the streets commence with A, Arbingler, Ales, Ach, Adara, &c., and down to Z district with the names of the streets commencing with Z, Zura, Zosland, &c. The alterations I give is, let the streets in each district be known by a number; thus, A, 1, A, 20, W, 4, Z, 10, and so on. This letter will be the most simple. The letters and numbers could be easily and inexpensively marked on all the lamps, and when it becomes known that No. 1 street in each district commenced nearest St. Paul's Cathedral, a child would have no difficulty in finding the direction required. Although streets in some parts of America are known by numbers (in letters, not numerals), there are no districts; and instead of writing one hundred and thirty-seven street, here it would be simply 137 A.

Objections may be raised as to doing away with familiar names; but, according to many late instances, familiar names end things have not stood in the way for supposed improvements. S.D.

PORTUGUESE ARCHITECTURE.*

M. SILVA, the architect of the King of Portugal, read an able paper on Portuguese architecture at the Congress of Architects at Paris held in Paris in 1867, which he has now published and illustrated with five photographs. It is written in French. The first photograph contains eight portraits of foreign architects who attended the congress, from Austria, Hungary, Prussia, America, Russia, and Portugal; the others represent buildings illustrative of different periods of Portuguese architecture. After a few preliminary remarks, M. Silva puts the clue to his thoughts about the architecture of his country in our hands. He states his conviction, like others, that the arts—especially architecture—are mirrors which reflect the moral and physical condition of the people who cultivate them; and that they become, in their turn, a powerful element in their civilization; and he then proceeds to show how Portuguese architecture exercised its influence in developing the civilization of the Portuguese, and to consider the mission of the architect to society. Four buildings are sufficient to illustrate his theme. These, he considers, characterise the principal phases of Portuguese architecture as well as of the life of the Portuguese people. They are the monasteries of Alcobaca, Batalha, Belem, and the Royal Palace of Mafra.

The monastery of Alcobaca was the work of Alphonse I., the founder of the Portuguese monarchy, in the middle of the twelfth century. Though it has been altered from time to time, it has maintained the proportions of its primitive construction, its simple portals, its high and thick walls, its three floors sustained by massive columns, destitute of ornaments; and these, M. Silva believes, exemplify the simple faith of the Portuguese of those days, their gross but pure and simple manners, their efforts for the foundation of the monarchy, and the consolidation of the national independence. The high walls, massive and sombre as the walls of a fortress, tell us that their founders were absorbed with religions and warlike ideas, and that the vitality of the nation was employed exclusively in the battle-field.

The Convent of Batalha, erected by Jean I., after his victory over the King of Castile, had placed him upon the throne of his natural brother, Ferdinand, marks another epoch in the sovereignty of the people, called by the author the most remarkable and glorious in the history of the country. Of all Portuguese monuments this is that which he considers presents the most admirable harmony in all its parts, the most taste, the best distribution of ornament, and the greatest excellence in execution. It also shows the beginning of a great impulse given to the national life, the glories acquired by the king and his son over the rival claimants of the throne in the field of battle, as well as the discovery of new lands and seas. Besides reflecting the development of a nation, architecture contributes to it in placing before the eyes of the mass beauties the contemplation of which has the effect of gradually softening their manners; and this building in an eminent degree fulfilled both missions.

The end of the fifteenth century saw another great change in the rate of Portuguese progress. The discovery of the route to the Indies by

* Dissertation Artistique sur l'Architecture en Portugal, depuis le XI^eème au XVII^eème Siècle, lue dans le Congrès International des Architectes à Paris dans la Séance de 29 Juillet, 1867. Par Chevalier J. N. De Silva, Architecte de S.M. le Roi de Portugal. Lisbon, 1868.

Vasco da Gama, gave a great impulse to the national life. Conquest, commerce, and navigation put the Portuguese in communication with foreign people, and furnished them much new information, which gave rise to new wants, and modified their habits. Riches gave birth to luxury. Austerity changed to softness, simplicity to gallantry. Adventure was the order of the day, and hymns of triumph a popular feature. This phase of Portuguese history Mr. Silva considers elaborately represented in the monastery of Belem, erected by King Emmanuel the Great, in memory of the discovery of the Indies and of Vasco da Gama. In this noble building he sees the greatness and heroic courage which presided at the foundation of the Portuguese dominion in the East, and that made Lisbon the commercial centre for all the provinces of Asia, as well as the splendour and glory of the national arms, and the poetry of the adventurous enterprises. The feeling that presided at its construction is an indication of the grand enthusiasm for the propagation of the faith, and the aggrandisement of the monarchy that animated the Portuguese at that period.

The fourth era in the national history illustrated by a building is that when Jean V. ceased to convene the three estates of the kingdom to his councils, and inaugurated a personal or absolute government. The sumptuous convent and palace of Matra was erected by this monarch. At this time the world was ringing with praises of the works of Bramanti, Peruzzi, Sangallo, Michelangelo, Vignola, and Palladio; consequently, it is not to be wondered at that the new palace was in the Renaissance style. Whilst taking the works of these artists into consideration, M. Silva declares that the architect of this palace did not blindly copy them; though he seized the feeling of the fashion they set, he gave a national tone to his building; told of the manners, hopes, and aspirations of the sovereign and the people; and in raising it created a type of national architecture, not bandsome, but regular, noble, and majestic—a type which serves as the chronicle and portrait of the long reign of Jean V. In the colossal proportions of the edifice, especially, and in the boldness of the superh cupola, he symbolised the elevation of the legislative ideas then being shown in the opening of canals, construction of roads and bridges, the introduction of new industries, the re-organisation of the navy, the foundation of an academy, and other works. Again, in the severity of the façades of the palace, and the strictness of their expression, might be traced the manner in which royal and monastic life were blended; thus the architecture showed the severe etiquette and ostentation of piety of the court of Jean V., and the *bristes* habits and monotonous manners of the people. Twenty thousand men worked at its foundation, therefore, M. Silva believes, was the inauguration of a new epoch of reform and splendour, for it encouraged the arts and created artists, who, by their talents and application to work, contributed to the progress of civilization.

After recounting that monuments constitute the best chronicles of the history of peoples, M. Silva sets before the architect what he concludes to be his double mission—firstly, to make the edifices entrusted to him to erect appropriate to the manners, customs, and tastes of the people among whom he dwells, when he thus becomes their historian; secondly, to make an effort to introduce into his country good taste, to establish harmony and system in the proportions of buildings, so that there may be transmitted insensibly into the national mind the harmony and order which give birth to generous thoughts and grand civilising enterprises; and, above all, to search carefully to ameliorate social conditions. Very suggestive, dignified, and thoughtful are many of M. Silva's remarks. Beauty, he continues, is an ideal very difficult to define, and which, in the vast realms of nature, takes very varied and capricious forms. Ask a rustic what are the attributes of beauty, and he will not know what to answer; but place before him a beautiful object, and you will see his ecstacy and astonishment. When a city is transformed so rapidly as Paris has been, little by little, by the systematic action of her architects, its inhabitants, accustomed to see on all sides the same principles of order, precepts of regularity, and laws of harmony, cannot fail to acquire good taste as a sort of possession transmitted from father to son. The most transcendental view of an architect's mission is obtained when we observe how he is called to assist at most of our social problems. When the re-

organization of punishment for criminal offences was before the Legislature, the architect stepped in with the penitentiary, in which building the criminal was precluded from evil communications, and every facility offered him to commence a new life; when the disasters of the old hospital systems were the burden of the day, the architect, with his new distribution of light and air, and infinity of sanitary contrivances, was the cure for them; and, in the great question of public amusement, the architect is again all in all in the theatre and other *salles de spectacle* public safety generally. And, without the national exhibitions are the most remarkable, would be impracticable. After dwelling in this manner upon the distinguished position of the architect *devant la société*, the influence he exercises in its illustration and upon its well-being, and the duty of Governments to second with all the means in their power the noble and very honourable mission which the progress of humanity has confided to him, M. Silva concludes with words of recognition of the grandeur of the great gathering together of all nations, which was the occasion of the congress, and of the affability of French hospitality and the generosity of French encouragement. It will be remembered that English architects were conspicuous by their absence from the congress. English architecture had not a single representative.

CREWE HALL, CHESHIRE.

CREWE HALL, one of the most interesting relics of English seventeenth century architecture, was destroyed by fire, as most of our readers are probably aware, in 1866. Since that time it has been in course of restoration (with additions), under Mr. Edward M. Barry, A.R.C.A., and is now nearly completed. Some years since, it was effectively restored by Mr. Biore, who, having withdrawn from active professional duties, was not willing to undertake the work a second time, though invited by Lord Crewe to do so. The main body of the house was entirely gutted by the fire (except portions of the dining-room), and has been almost wholly rebuilt according to its original design. The kitchen and offices were but slightly injured. The dining-room, the carved parlour, and the principal staircase, which were among the best specimens of Elizabethan architecture, have been carefully restored according to their original design, and the other parts of the house have been designed by the architect to correspond with them in style. As the accommodation for guests was very limited, new bedrooms and dressing-rooms have been added in a tower and private wing towards the garden, additional servants' offices have been constructed on the ground-floor, and advantage has been taken of the necessary reconstruction of the roof to form in it an attic story containing about twenty rooms for servants or others. The rooms for the men are divided from the women's rooms by a wall of separation. A new circular staircase leads from the ground-floor to the former, and the latter are approached by a distinct staircase.

New terraces have been built around the house, and the design for that given in our view has been taken from an oil painting in the possession of Lord Crewe, which shows Crewe Hall in the olden time, with terraces and a gateway, which have since disappeared. The principal piers of the balustrade are finished with supporters carved by Messrs. Farmer.

The chief alteration of the interior consists of the formation of the hall and principal staircase, with open galleries round it, to give access to the rooms on the mezzanine floor. Corridors on the one-pair floor for a similar purpose are built over the ceiling of the mezzanine corridors, leaving the centre of the court occupied by the skylight which lights the hall. These corridors occupy the four sides over the mezzanine corridors. They are arched with ornamental plaster ceilings of strapwork; at the four corners the corridors finish with four domes, with pendentives lighted through the eyes of the domes with ornamental glass.

An internal view of the hall was exhibited at the Royal Academy in 1868. It is entirely constructed of oak, with a hammer-beam roof, and principals filled in with perforated and carved Elizabethan fretwork. The hall is lighted from the top by squares of stained glass. The glass shows the heraldic devices of the Crewe family,

divided by moulded oak ribs, with carved bosses at the intersections. All the stained glass is by Messrs. Clayton & Bell. From the pendants to the hammer-beams wrought-iron gaseliers, by Messrs. Hardman, will light the hall at night.

The carved parlour has been restored according to its original design, except that the chimney-piece, which was formerly of stone, is now of alabaster and marble. The somewhat grotesque modelling of the figures in the bas-reliefs above the wall-framing has likewise been modified. The room is 14 ft. 6 in. in height, and the wall-framing is 9 ft. high, with plaster-work above, consisting of bas-reliefs in panels and foliated scroll-work.

The staircase communicates with the hall, and the landings are enlarged by being thrown open to it by triple openings on each landing. The openings on the one-pair floor (on which the drawing-rooms and picture-gallery are situated) lead to the corridors above described, and are of stone, forming an arcade of semicircular arches elaborately carved. A view of the hall is obtained from the corridors at each end, through openings level with the hammer-beams of the roof. A hot-water warming apparatus has been placed under the hall, and air-flues lead from it to conduct warm air to all the principal rooms. The latter are panelled with oak framing, and the drawing-rooms have dados and floor-borders of inlaid woods of different colours.

The chimney-pieces are of marble and alabaster, carved and inlaid. That for the picture-gallery is 15 ft. high and 10 ft. wide. It contains over the opening two oval niches, in which are placed marble busts of two ancestors of Lord Crewe, Bishop Crewe and Sir Randolph Crewe, executed by Mr. Weekes, R.A. The drawing-room chimney-piece contains, in a panel, a bas-relief by Mr. Armstead, representing a scene in the "Tempest." The design of these and some other chimney-pieces is very elaborate; and the modelling of them and of the work generally has been carried out by Mr. J. Mahey, of Princes-street, Westminster, who was engaged largely in the modelling for the Houses of Parliament, under the late Mr. Thomas. Mr. Mahey also executed the elaborately-enriched ceilings of the principal rooms.

The library is fitted up with walnut bookcases, over which are bas-reliefs in plaster of various scenes from English poets by Mr. Mahey, and the lower parts of the bookcases support statuettes in oak, about 18 in. high, of Elizabethan celebrities, by Mr. Philip. The chapel, which is consecrated, is on the ground-floor, with Lord Crewe's pew in a gallery at the west end, approached from the hall by the mezzanine corridor. The roof is oak, having arched principals, with plaster panels between them, and is being decorated by Messrs. Clayton & Bell. The other parts of the building are being decorated by Mr. Crace. The sacrum arch at the east end of the chapel is of alabaster and marble, with incised patterns; and the reredos under the window is of similar materials, with medallion heads of prophets and saints, by Mr. Philip. The east window is filled with stained glass. The entrance to the chapel is at the west end, under Lord Crewe's pew. The latter is carried on a screen of oak, with double arcades. The centre opening is closed by wrought-iron gates, by Messrs. Hardman.

The works have been carried out by Messrs. W. Cubitt & Co., as general contractors, and are expected to be completed during the present year. Lord Crewe has been very anxious, while retaining the characteristic style of his interesting house, to render the present works illustrative of the art of the present time; and Messrs. Weekes, Armstead, Philip, Crace, Clayton, Hardman, and all who have been engaged, have readily co-operated with the architect in carrying out his views.

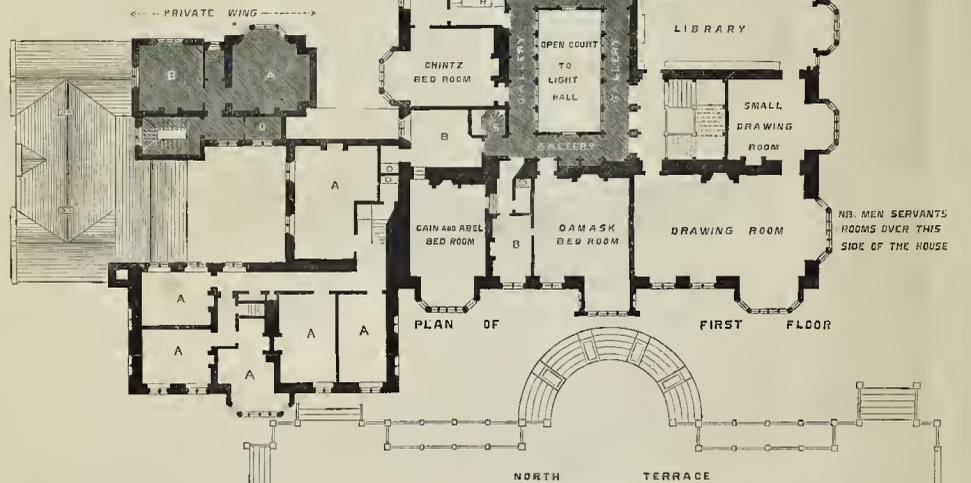

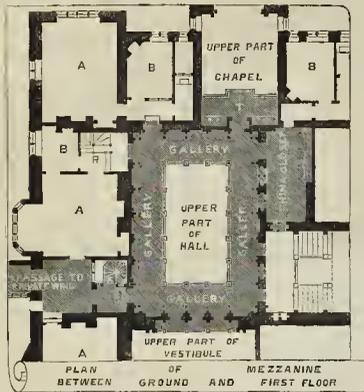

Mr. Barry tells us that as regards the parts of the building which have been restored according to their original design, he has derived much assistance from the drawings of Crewe Hall contained in Mr. Richardson's valuable work on Old English Mansions.

PLATE

BUILDINGS NEXT THE THAMES.

SIR,—Those who advocate the placing of our public buildings upon the embankments, have, perhaps, in their mind's eye the Seine and the view formed by the magnificent buildings lining its banks. The *tout ensemble* is worthy of imitation, and, as Englishmen and lovers of the beautiful, we wish London to possess as grand, as ennobling a scene. But London and Paris, the Thames and the Seine, are very different affairs, and must be treated differently.

The Thames, with its broad black bosom, seems to me inimical to architectural effect; it dwarfs the largest buildings, and by the similarity of its colour to our soot-stained, woe-hegone edifices, produces such a heavy sameness, as to destroy all poetry—all sublimity. The traffic of coal barges, the puffing of grimy steamers, the tackling of lighters, the stationary and helpless-looking dredgers, all combine, not only to stir up in heavy rolling volumes the mud and sediment of the bottom, but also the spectator's bile; whilst the occasional splash, splash, of the turbid waters upon landing steps, and the ceaseless snaking motion of the waves as they lazily rise and fall, are more suggestive of suicide than aesthetics.

What effect does the river front of the Houses of Parliament produce upon the *voyageur* as he passes it on his way up or down the river? Not one of awe for the size of the building, nor one of admiration for its beauty—rather indifference; but place that front in the position of another well-abused building, the National Gallery, and both awe and admiration would result.

The vast bridges which span the stream, and the heavy overpowering viaducts, all help to dwarf the finest buildings, and to militate against architectural effect. I am not arguing for the neglect of the embankments by the architect. I simply state that the embankment is not the fittest place in London to put a fine building, but one where it will have to contend against many killing effects.

Admitting, therefore, that the embankments, although unfit for the display of our finest buildings, whose size and importance should be enhanced rather than overpowered by contrast, I would plant thickly with trees more thickly than at present attempted, and devote the building sites to large shops, encouraging rather than depressing diversity of architecture; for this reason,—since grandeur is out of the question, I would invite the picturesque to assist me; by so doing the bridges would gain importance and grace—the green trees by day, and the brilliantly-lighted shops by night, would divert the river of some of its moody blackness, and give me the satisfaction of improving existing costly works, instead of the disappointment consequent upon the failure of a vast scheme met at all points by adverse forces.

The manner in which our neighbours would treat the subject would probably be as follows:—

"Here," they would say, "we have a wide river, we consider it too wide for architectural effect: so, for that reason and others, we will lay our foundation, running from London Bridge to Chelsea, and upon this will erect a grand row of houses facing north and south upon each side; we will have a broad roadway with double rows of trees; the river wall shall be massive and handsome, with corresponding steps and landing-places; we will remove all the mud from the channels separated by this long island; we will concrete or otherwise pave the bottom; and will then, without a blush on our cheek, invite both salmon and trout to disport themselves in our now silvery Thames. Do not think we have not dealt with the towns higher up with a strong hand; the strength of the current so augmented by the narrowing will prevent the accumulation of any deposit, and assist us in discovering weaknesses in such of the works crossing the river and lining its banks as shall have been already completed. This latter consideration, he assured, is looked upon by us as very weighty."

Mr. Lowe is quite welcome to this last idea: be work, he will instantly see, will more than pay for itself. He should therefore give it his best consideration and support, when started; otherwise, the best thing he can do is to leave the whole business alone: let the Courts be built upon the Strand site, where the architect will still him they ought to be placed.

In contemplating the manner in which the whole subject has been treated by our legislators, we are apt to look upon our countrymen as only cottagers in art. What a fuss and bother

have been kicked up about the three millions; ration and bankruptcy have been made to follow the expenditure of such an enormous sum—for a palace. Three millions! three millions! three millions! Notes of admiration fail to convey the terrible reality. Repetition, trumpet-tongued, still seems but the piping of a whistle, to those of our wise men who look upon gold as god and art as dress. Why, it is art, and art alone, that makes gold of any value. But these "cute" political economists cannot conceive a proposition so absurd. Where money is so quickly, quietly, and surely got rid of—where capital (political) is not to be made by retrenchment—we think nothing of throwing a million of money into the lap of Mr. Reed, and beseeching him to favour us with one of his monsters as a *quid pro quo*; and this monster after monster, million after million, come and go, and are likely to go on for ever; but when a million or two are required for art purposes, how very valuable money becomes! Verily, England is a great country, but it has much to learn yet as regards the fostering of the arts. Boasting, as we do, of being the wealthiest nation on the face of the globe, it is a pity we cannot boast of a higher civilization. Men with the sneers of some of our leading men at learning, their open flouting or neglect of fine art, the question naturally arises as to the good of doing anything but eating and drinking. The masses are by such teaching led to believe that such must be the fact. Let us hope, however, that the ventilation of this Law Court business, and its connexion with the expenditure of money for art purposes, will teach the nation that less so necessary for its true greatness.

M. U.

COMPETITIONS.

King's Norton Union.—The Guardians of King's Norton Union, Worcestershire, have selected the designs of Mr. E. Holmes, architect, for the new workhouse to be erected at Selly Oak. The estimated cost is about 15,000*l.* The plans have already been approved by the Poor-law Board, and tenders are to be at once advertised for. This is the ninth successive competition this architect has of late been engaged upon, in each of which (as we are informed) he has been more or less signally successful.

THE DRINKING FOUNTAIN IN BERKELEY SQUARE.

DESIGNERS of drinking-fountains may obtain a wrinkle by visiting the Lansdowne Fountain in Berkeley-square. The stream of water has a fall of about 3*ft.* from the lip of the urn into the basin, and nearly the same into the cup when held at the usual height. Result:—A small shower-bath to the thirsty wayfarer, refreshing or otherwise, according to individual opinion; also a wet and muddy condition of pavement generally prevalent around the fountain.

STYLE IN ARCHITECTURE.

SIR,—I observe in your last issue that the distinguished French editor, M. César Daly, complains of the absence of "a really scientific definition of what constitutes a style" in architecture. However this may be, there does not appear any insuperable difficulty in the matter. A style of architecture is simply that characteristic and collective material expression in which all the artists concerned in its production, working among a given people or in a given age, coincide. To be true, it must indicate the people's or age's collective type of character. This is an indispensable requisite; and to be good or great, it must indicate good or great things. But such good or great things are to be considered in reference to the people or age; for into what is abstractly, or absolutely, good or great, the subject does not require us to enter,—at least until we have, in some small degree, consolidated modern diverse theories into one consistent code.

"So our virtues lie in the interpretation of the time."

The above explanations will be found to apply rigorously to the Egyptian, Greek, Roman, Gothic, and other ancient styles; but now we have neither a true nor good, much less great style of architecture, reflecting our collective type of character; recent reproductions of effete styles (a *retrogression*, not *revival*, almost con-

fining to architecture and sculpture), mirroring, not modernism, but undue reverence for antiquity. It is clearly obvious that one man never did and never can invent a new style of architecture; this being consequent on the concurrence of many men, still leaving room for the exclusive peculiarities of individuals, constituting their separate manners or modes of expressing a concrete generality, or generic style. Of course, to develop the style, there must be a certain consentaneousness of sentiment, with harmony of conviction and aim, governing universality of expression of what is in, or common to, every mind; such oneness as there was of old, and is absent now in this unsettled time. But if architects, like our foremost *literati*, really thought for themselves, they would evolve results proportionately maintained by low optimistic retrogression, and more characteristic of the present age than of past periods of history.

E. L. T.

THE CHURCHYARD OF ST. MARGARET'S, WESTMINSTER.

SIR,—Will you allow me to suggest through your columns a small public improvement? The churchyard of St. Margaret's, Westminster, extending from the church for the full length of the Abbey, is now in this condition:—

It is bounded by an old and mean-looking palisade railing. It is traversed by footways that are paved with grave-stones, while its general surface is irregularly studded with grave-stones, the intervening spaces being covered with a coarse gravel. Owing to the constant traffic, the inscriptions on the grave-stones are mostly obliterated. The whole inclosure presents a slovenly and unsatisfactory appearance.

My suggestion is, to renew the palisade railing, say, with a similar railing to that near the statue of Canning; to take up all the grave-stones, and to range them regularly round the border of the churchyard, so as to form an inner margin, finishing this margin with a granite edging; to lay out and pave the requisite footpaths, finishing them with a like-granite edging; and to turf over all the residue.

I think if some such scheme as this were carried out under the eye of Mr. E. M. Barry, who has so much improved the adjacent open spaces, a satisfactory improvement might be effected without much cost.

Might I also suggest to the authorities in charge of the Abbey to have the grass that borders the building mowed occasionally, and not to permit rubbish to be deposited against the buttresses?

Z.

METROPOLITAN BUILDING ACT.

At the meeting of the Metropolitan Board of Works on Friday last, the Building Act Committee submitted a Bill to amend the Building Act, and recommended that it be at once introduced into the House of Commons, and that Mr. Tite, M.P., be requested to take charge of the same, which was approved by the Board. A letter was received from the Home Secretary, stating that the Parliamentary counsel had been requested to make the additions suggested by the Board to the schedule of the Bill for the transfer of the duties connected with dangerous structures to the Board.

CHARING-CROSS THEATRE.

ONE man in his time plays many parts, and so it is with some buildings. The Lowther dancing-rooms, on the north side of King William-street, Strand, were transformed some few years ago into a Roman Catholic Chapel, the original seat of the "Oratorians." When that body migrated to Brompton the chapel became a temple sacred, not to Wodin, but to Woodin, high the Poly-graphic Hall; and now, *présis*, pass! and we have in its stead a smart little theatre, with boxes, pit, and gallery, capable of holding some 1,200 persons, with stage, and underground green-room. There are also eight private boxes. Mr. Evers has acted as architect; Mr. Foster, builder; and the decorations have been executed by Mr. Bradwell, who is one of the proprietors. The ornamental work in relief, including the perforated dome, balcony-fronts, and proscenium, were designed and executed by Messrs. White & Co., in their carton pierre and papier mâché. The figures in the spandrels of the proscenium, on the ceiling, and in lunettes on each side over the private boxes, are tastefully painted by Mr. Ballard.

16 A PRIME NUMBER.

Sir,—In the preface which Mr. Fergusson has written to his "Architecture of Hindostan," I read with considerable surprise the following passage on the number 16 as a prime number:—

"Its importance will scarcely be felt by those who have not been in India, and who consequently cannot know how important the division of everything into 16 parts is, or some multiple or sub-multiple of that number. Not only is the money of the country so divided, and all the weights and measures, but all property is divided into annas (sixteenths), and in conversation it is the usual expressive of quantity. For all the ordinary purposes of life, it is certain that this mode of division is much superior to our heterogeneous system, and also to the French decimal division, for I fear it is too true that the greatest of all the mathematical misfortunes that ever happened to mankind was that of our forefathers counting their thumbs as fingers, and then going on to ten instead of stopping at eight, as they should have done. It is too late to remedy this now, but the Hindoos have done what was possible to correct this fatal error, and in doing so have invented a system which pervades their architecture, as it does everything else," &c.

Now, sir, this statement, unaccompanied as it is by any illustrations or explanations, is to me rather startling. While I am prepared to admit that our own Anglo-Saxon methods of computing money and weights and measures are not perfect, yet as a scientific student I have found the now nearly universal decimal system so appreciated, and withal so easy and successful in every department of human work to which it has been applied, that I am led to ask how it is that—admitting, as we do, that our present methods of computation are imperfect—we have so far adopted the decimal system as to make it legally optional, instead of the more perfect one which is enunciated above? E. G.

ARCHITECTURAL EDUCATION IN THE PROVINCES.

Sir,—I have read with some interest the report in your columns on architectural education. With your permission, I would offer one or two suggestions in connexion with the subject.

The committee appear to have left out of consideration, almost altogether, provincial architects and pupils, and I need not remind you that there is really a very considerable number of both.

To pupils in provincial towns, all the extraneous advantages for acquiring instruction in subjects connected with their profession, as announced in the report, are practically useless; and if the clause in that document, to the effect that the "artistic education of the architect, which is so much required, it is hoped will eventually be obtained in the London University," means anything at all, it means positive exclusion to the unfortunate provincial from any chance of acquiring the artistic education which, &c.

Of what possible utility can instruction in free-hand drawing at South Kensington, materials and construction at King's College, or even a lecture at the British Museum on "Athenian Sculpture, with the actual examples of the Parthenon frieze to illustrate the lecturer's remarks," be to a pupil at Newcastle, or Manchester, or Glasgow?

The suggested scheme must be extended and amplified, so as to be workable and useful, not only to that section of the profession who may have the good fortune to reside in London, but to the majority in the provinces also.

It appears to me that to this end the provincial societies or associations ought to be utilized. There should be appointed in every large town, and in connexion with each of these societies, a local board of examiners, properly qualified, to whom the examination papers prepared by the central board or committee in London should be entrusted, and the decisions of these local examiners should be as authoritative in their effect as those of the local marine examiners in seaport towns.

In connexion also with the provincial societies classes might be formed for instruction in elementary design (this is the case, I believe, in Liverpool), in the history of architecture, and in materials and construction.

The Government schools of art, which exist in the majority of large towns, would afford efficient instruction in free-hand drawing and perspective. And the fact of a pupil having passed successfully an examination in these subjects in such schools might be taken into account when he presented himself for examination before the local architectural board.

For instruction in mathematics, mensuration,

languages, &c., the provincial pupil would be driven to a great extent to private sources; for there need be no difficulty on that score, for there is no lack of competent teachers.

I think that the Committee on Architectural Education should add to obligations under which they have already placed the profession by their labours by drawing up a "Course of Study" for the use of beginners, to guide them in carrying on their studies systematically, and append to it a list of suitable and necessary books. And these books should be in duplicate at least in the library of every provincial society for the use of students.

It is to be hoped that all the societies, both in London and the provinces, will heartily unite in endeavouring to carry out this good work. It will do far more to raise the status of the profession, and to exclude incapables, than any amount of grumbling correspondence in professional papers. ROBERT LAMB.

CHURCH-BUILDING NEWS.

Ely.—For many years the western tower of the cathedral has been considered unsafe. Mr. Basevi, architect, who fell from the interior of this tower in 1845, and was killed, was at that time making an examination as to the strengthening of the walls of the tower; and after that gentleman's death his suggestions were in part carried out by the dean, Dr. Peacock. Recently, some internal scaffolding to the south-west turret of the tower has been fixed by order of the present dean, Dr. Goodwin, who has consulted Mr. G. G. Scott as to the firmness of the walls, and a considerable number of oak beams and iron bracing have been recommended to be fixed, to prevent the bulging of the walls, or, in fact, to prevent the falling of any part of the upper portions of the tower.

Doncaster.—The restoration of the parapets and pinnacles of the tower of the parish church, at an estimated cost of 500*l.*, is proposed. Mr. E. B. Denison, Q.C., has expressed his willingness to contribute half the requisite amount. The present appearance of the tower of the church is not creditable.

Peterborough.—The Great Northern Railway Church has been consecrated. It has been built for the locomotive establishment of the Great Northern Railway Company, at New England, about a mile north of the Peterborough Station. Mr. Edward Denison, the late chairman of the company, offered 1,000*l.*, and Mr. E. B. Denison, Q.C., 500*l.*, on condition that an adequate sum were subscribed for a plain church, to hold 500 persons, according to a design given by the latter gentleman. The shareholders subscribed about 1,500*l.*, which, together with some local subscriptions and grants from societies, leaves a deficiency of about 500*l.* still to be supplied. Mr. Teale, of Doncaster, is the architect. The church is 104 ft. long and 48 ft. wide, and has a low central tower, but no transepts, a pyramidal roof covered with the slates of the county, and a semicircular apse.

Yarmouth.—The foundation-stone of the new church of St. James has been laid. The new church is intended to displace the iron mission-room at the south end. The chancel will first be constructed, capable of containing 200 persons, and as funds are obtained the remainder of the edifice will be built, which, when completed, will afford accommodation for about 1,000 persons.

Llandulas.—The church of St. Cymbrid, Llandulas, erected at the expense of Mr. R. B. Heskeith, Gwyrch Castle, has been consecrated. The church, which will accommodate about 300 persons, and cost between 5,000*l.* and 6,000*l.*, is of Gothic architecture, from designs supplied by Mr. G. E. Street, of London; and the work has been carried out by Messrs. J. & J. Hughes, of Llandudno, builders. The edifice contains several stained-glass windows, and is furnished with a small organ, by Messrs. Hall & Sons, of London.

Thornton.—Arrangements have been made at Thornton that the erection of the new church, which has now been agitated for some time, may be proceeded with forthwith. A site has been given by Messrs. John Foster & Son, in an eligible position on the north side of the new road, and directly opposite the old church. The plans are now being prepared by the Messrs. Hasley, architects, Bradford.

Oldham.—The foundation-stone has been laid of a new church at Shaw, near Oldham. The edifice will occupy a site near that of the old

church of Holy Trinity, which is in a dilapidated condition, and is said to possess not one single architectural feature. The new building will cost from 7,000*l.* to 8,000*l.*, and is intended to be in the Early Decorated style.

Slingsby.—A new structure, replacing the ancient church of All Saints, has been opened for divine worship. This was one of the projects of the late Earl of Carlisle, but his death shortly after his retirement from the vice-royalty prevented its execution. The church, having become so dilapidated that its safety was imperilled, Earl Carlisle's brother, the Hon. Admiral Howard, resolved upon its complete restoration. The new church occupies the site of the old church, but is rather larger. The mixed architecture and the ancient monuments have been considered. The perpendicular window of the east end is filled with glass in memory of the late Earl of Carlisle, placed there by the Howard family. The Walker family have placed a two-light window in the south wall of the chancel, to the memory of the late rector, the Rev. W. Walker. The trustees of the Earl of Carlisle have fitted the three-light western window with stained glass, in memory of the illustrious Charles Hardwick, Archdeacon of Ely, a native of Slingsby, who was killed by falling over a precipice near Luchon, in the Pyrenees, on the 15th of August, 1859. These windows were all the work of Messrs. Clayton & Bell, of London. The tower, which is 55 ft. high, is set at the west end of the church. The sculpture in the edifice throughout is the work of Mr. Roddis, of Birmingham. The wood-stainer was Mr. Harker, of York. The new church will seat between 300 and 400 persons. Its dimensions are as follow:—Chancel 31 ft. by 18 ft., with south aisle 19 ft. by 8 ft., and north aisle 19 ft. by 11½ ft., having eastward of it (occupying N.E. angle) a vestry 11½ ft. by 10 ft., beneath which the heating apparatus is arranged, and from which the hot-air flues radiate. The nave is 39 ft. by 19 ft., the north aisle 39 ft. by 10½ ft., and the south aisle 39 ft. by 7 ft. The architect was Mr. Johnson, of Newcastle, and the cost has been about 5,000*l.*, almost the whole of which has been defrayed by the Hon. Admiral Howard. The general contractor was Mr. John Brown, of York; Mr. Bailey, of York, doing the mason's work; and Messrs. Hodgson, of York, the plumbers and glaziers' work.

Turpokey.—The parish church, after restoration and extension, has been reopened for Divine Service. The architect, Mr. J. S. Crowther, of Manchester, has extended the west end of the nave and north aisle, which now form two gables, surmounted by floriated crosses, the front elevation being in a line with the old tower. The west window consists of four lights, divided by mullions, the tracery, like that of the other windows in the western portion, being geometrical. The entrance, by means of a porch at the southern side, necessitated the removal of the lower part of the north and east walls of the tower. These have been replaced with two arches, through which the public enter to the south aisle and nave. Between these there is a pillar, from which a sloping buttress springs, defining the length of the old nave. While getting on the stone from the base of the tower the workmen came upon the lid of what had apparently been a child's stone coffin, on which a cross was rudely cut. The restored portion of the building embraces the nave and aisles up to the choir, for which the old stone was redressed and worked up again. The eastern part, including the chancel and choir, was rebuilt some time ago. The only portions of the old church now remaining are the tower and the chapel in the north aisle. Of the interior of the tower it may be said that the roof is of pitch pine varnished, the seats being of the same material. The latter are all free.

Trident-bridge.—St. Mark's Church has been consecrated. The edifice is built in the Early Decorated style, the material used being White Cressa bricks and Ancaster stone. The ground plan is a Latin cross, comprising chancel, sacristy, chantry chapel, nave, and south-west clock tower, to be provided with a spire. The site of the church, with the churchyard surrounding, is about half an acre in extent. Several painted windows have been introduced, and portions of others are the gifts of Captain Cating, Captain Aveling, Mr. S. T. Aveling, Mr. E. M. Smith (his own work), the incumbent, and members of his family. Another window has also been promised by Mr. James Aveling. The church is calculated to hold 300 persons.

and its total cost will be 2,500*l.*, including a sum of about 500*l.*, which is required to build the north-west tower. The architect was Mr. J. H. Owen, and the contractor Mr. C. Bennett, of Lynn; the stained windows were executed by Messrs. Heaton, Butler, & Bayne, of London, and Mr. E. M. Smith, of Wisbech.

Frampton-on-Severn.—Plans and specifications for the restoration and enlargement of the parish church have been executed by Mr. Henry Woodyer, of Guildford, architect. A new chancel is to be added, and the nave extended. Several large pillars will be done away with, and also the side galleries. A temporary vestry will be fitted up in the north aisle. The choir will occupy the chancel. The porch will be lowered, and the vestry, which is over the porch, will be removed. Several portions will be rebuilt, and others restored, so as to correspond with the original work. Some of the windows will be new, and others restored. Tenders will soon be had for the work.

Frosterley (near Stanhope-in-Weardale).—A new church here, dedicated to St. Michael, has been consecrated. The building is now nearly completed, the spire only remaining to be finished. The edifice, which is of the Early Decorated style, occupies a site on a slight eminence to the south of the village, and is built of Waskerley Hill stone, with some dressings. The flooring of the chancel is laid with encaustic tiles, and that of the aisles with variegated mosaic tiles. The interior of the walls is bare stone, similar to the exterior, and the edifice is lighted by day from about a dozen windows, and at night by paraffine lamps, there being no gas nearer than Stanhope or Wolsingham. The roof is open, and the spire will be at the extreme west end. The entrance is by a porch, on the west side, near the end. The seats are open, varnished, and free, and will accommodate about 270. The pulpit and reading-desk are of oak, and were made by Messrs. Richardson & Co., of Darlington; and the font, which is of Gatherley stone, is the work of Mr. D. Hurworth, of Darlington. The heating is obtained by Hayden's patent apparatus. The cost of the building is about 2,300*l.*; and, to complete the spire, about 200*l.* more will be required. The contractors for the work were Messrs. Lynes, of Darlington, and Mr. A. Kellott, of Crook. Mr. K. Hutchinson, of Durham, was clerk of the works; and the building is from the designs of Mr. Street.

Maisemore (near Gloucester).—The restoration and enlargement of the old parish church of Maisemore is in progress. The cost will be about 1,500*l.*. The walls are now ready to receive the roof. The new building is plain and simple. No trace of the old building remains save the chancel, the tower, and the porch. A new aisle takes the place of galleries, and open seats will be substituted for pews. The work is being done under the direction of Messrs. Fulljames & Waller, the architects.

Pensford.—The small parish church at Pensford has been reopened for Divine worship, after being closed for rebuilding. The tower is the only part that is now left of the first structure. Some two years ago it was found that the church was falling into a state of extreme dilapidation. It has, however, been rebuilt, at a cost of about 1,000*l.*. New open seats of stained deal have taken the place of pews. The architect was Mr. C. E. Giles, of Furnival's Inn, and the contractors were Messrs. Hayes & Son, of Bodminster.

DISSENTING CHURCH-BUILDING NEWS.

Bradford.—The church which has now for more than a year been in course of erection in Chapel-lane, for the Unitarian body, has been formally opened for religious service. The cost of the edifice has been 5,500*l.* The style of architecture which the architects, Messrs. Andrews, Son, & Pepper, have adopted is the French Gothic of the close of the thirteenth century. The street front, which extends nearly 100 ft. along Chapel-lane, is composed of a gable upwards of 75 ft. high, flanked by two large entrance porches. The gable is the feature of the external architecture. It is pierced with a moulded window, 40 ft. high and 24 ft. wide, with five lights, divided by clusters of shafts, surmounted by a large circle filled in with tracery of smaller circles. Over the window are three miniature porches, recessed, one of which is filled by a globe, while the gable is finished off with a cross-finish. The design includes the erection of a light spire, which may be added when desired. Internally the chapel is 83 ft. long by 55 ft. broad, and consists of a nave, with side aisles and a chancel. With

the view of giving the whole of the congregation an unobstructed view of the minister the aisles have been narrowed until they are merely broad and commodious passages, the congregation being all seated within the nave, on the centre of which runs a wide passage. On each side of the nave are five arches, springing from stone shafts with carved capitals, supporting the main side walls, and these walls, carried up to a considerable height, are strengthened by flying buttresses extending over the side aisles. Each bay has in the aisles two single-light windows, and in the upper part of the nave a large two-light window, having a circle above containing geometrical tracery. The ceiling, which rises upwards of 50 ft. above the level of the floor, is semicircular in form, divided by main and intermediate ribs, and is painted blue. At the south or chancel end of the chapel is an arch opening into an apse, which is paved with encaustic tiles and surrounded by an arcade of decorated arches and tracery, with four lancet windows above. At the sides are chambers for the organ and choir, with private entrance. The pulpit is at the south side of the aisle, and is of Caen stone with carved panels, containing in the centre discs of polished marbles, and a cornice enriched by foliated ornaments. The heating of the building will be effected by Hayden's system of hot air, and the artificial lighting by gas standards and brackets. Accommodation is afforded for 500 to 600 persons. As already stated, Messrs. Andrews, Son, & Pepper, of Bradford, are the architects, and the following the contractors for the respective trades:—Masons, Messrs. Barraclough & Co.; joiner, Wm. Crabtree; plumber, John Seafield; plasterer, Benjamin Dixon; slaters, Hill & Nelson; painter, H. Briggs; gasfitters, Messrs. Dooey & Co., Manchester; and carvers, Messrs. Maw & Ingle, of Leeds.

Cheadle Hulme.—The memorial-stone of the new Congregational Church at Cheadle Hulme, has been laid. The edifice consists of a nave with an apsidal end, semi-hexagonal in plan. The nave is in seven bays, with traceried windows on the sides, the two bays next the centre of the sides having three-light windows. The other windows are of two-lights each, and all have traceried heads under Gothic equilateral arches. The chief entrance is at the north-west angle by a porch beneath a tower, about 11 ft. square at its base. The tower is carried up square, with hipped angles for about 40 ft., when it slightly diminishes, by stone weathering courses, on which the tower assumes an octagonal form, with two-light windows on each face, the angles of the weatherings being surmounted by pinnacles about 12 ft. high from base to apex. The tower is to be roofed with timber, and covered with slates on green and blue bands. From the ground to the apex of the tower will be about 95 ft. At the north-east angle of the building is another porch, with a gabled roof. The roof of the chapel (open timber) is of one span, the principals of which spring from stone corbels about 8 ft. from the floor, and assume the form of a pointed arch. The windows of the apse end are a considerable height from the floor, so as to admit of an organ being placed beneath them. Preparations are being made for a gallery to be added at a future time, if required. Externally, in the south-west elevation, comprising the chief entrance and tower, each bay is marked by a buttress between the windows. The elevation to the north-east comprises the tower at the angle, the secondary porch at the opposite angle, and a broad gable divided into three bays of buttresses. The centre bay is filled with a five-light traceried window; the two others with similar windows, but of two lights only. The two other elevations are somewhat less ornate, though of a similar character. The chapel will be covered with blue slates, and the straight line of roof will be broken by dormers. The school building communicates with the chapel by means of the secondary porch, and comprises a room 40 ft. by 25 ft., and about 17 ft. high to the centre of the wagon-headed ceiling. Adjoining are two class-rooms. The cost of the building will probably be about 3,000*l.*, the site for which has been given by Mr. Storey. The architect is Mr. Henry Littler, Cheadle Hulme and Manchester. Mr. George Atkinson is the contractor, Mr. George Roy supplying the mason's work.

Thornston.—The Congregationalists of Thornston, near Bradford, are about to erect a new chapel in the village, and have sought designs for the proposed building. Messrs. Andrews, Son, & Pepper, of Bradford; Messrs. Pritchett

& Son, of Darlington; and other architects, competed, and the design by the first of these firms has been chosen. The chapel is to be erected in the main street of the village, the style selected being Gothic. The building will consist of a nave, aisles, and chancel, with minister's vestry on one side, and organ-chamber on the other, a screen dividing the chancel from the nave. Internally, the chapel will be 90 ft. long by 41 ft. wide, with a height of 45 ft. in the centre, and it will be fitted up with galleries. Entrance will be gained by three doors in the south front, facing the road, the gallery staircases branching off right and left. Externally, the building will be of stone; and at one side of the front a square tower and spire of the same shape will rise to the height of 110 ft., with convenient arrangement for a clock. The cost will be somewhere about 3,000*l.*

SCHOOL-BUILDING NEWS.

Kessingland.—Plans and specifications have been obtained for the erection of school-rooms. The Bishop of Norwich has laid the foundation stone. The cost of the schools will be about 900*l.* The building is to be in the Gothic style, designed by Mr. I. B. Pearce, of Norwich, and will be of red brick with white dressings. Mr. Samuel Hall, of Norwich, has taken the contract.

Great Horton.—New Congregational Schools have been opened here. They were designed by Messrs. Paull & Robinson, of Manchester, architects, and have been erected at a cost of nearly 6,000*l.*, the site on which they stand being rendered expensive on account of a public-house and other buildings which occupied it. The buildings consist of a large assembly-room, above which is a suite of small class-rooms. The ground-floor, underneath the assembly-room, is occupied by infants' class-rooms and the various offices connected with the buildings. The rooms are ventilated and warmed.

Leek.—The foundation-stone of new Sunday schools, for the Methodist New Connexion in Leek, and attached to the chapel erected a few years ago, was recently laid here. Mr. Sugden, of Leek, is the architect.

Gloucester.—The foundation-stone of St. Luke's Schools has been laid. They will consist of three large rooms placed side by side, and occupying in the aggregate a space larger than the Corn Exchange. The rooms are divided into departments for boys, girls, and infants, with separate entrances, and there will be cloak-rooms and lavatories. The master's house will adjoin the schools. A playground will be formed in the rear of the schools for each class. The elevations are designed wholly in brick and stone: varieties of the latter will be used. The contract has been taken by Mr. Moreland, of this city, for 2,542*l.* The architect is Mr. Maberly, of Gloucester and London, and the works will be erected under his supervision.

Middleham.—The foundation-stone of a school about to be erected in a memorial of the late rector of the parish, the Rev. Mr. Birch, has been laid here. The school will be erected by Mr. John Thorpe, stonemason, and Mr. John Clarkson, joiner, both of Middleham. The design is by Mr. John Topham, of this place. The plans and specifications have been prepared by Mr. Sturdy, of Middleham, architect.

Newmarket.—A national school for All Saints' parish is to be erected. The design has been prepared by Mr. J. F. Clark, of Newmarket, architect, and the plan includes a school-room, 60 ft. by 20 ft., with two class-rooms, each 16 ft. by 14 ft., the latter to be converted into reading-rooms, &c., during the winter months, whilst the former will be available for lectures and other entertainments. There will also be a master's house, and the total cost is estimated at 1,150*l.* The contract for the work included in the specifications has been taken by Messrs. Whitmore & Simpkin, of Newmarket, builders, at 1,119*l.* 16s. In addition to the erection of a national school, it is also proposed to enlarge the parish church, so as to double the present accommodation, which is only sufficient for about one-fourth of the population. The cost of the work now contemplated is estimated at 2,500*l.*

Bracebridge.—A school has been built here. The residence of the mistress is placed at the north extremity of the site. The school-room is placed immediately behind the residence, having play-grounds on the south side. The school-room is 31 ft. by 16 ft. inside, and 11 ft. 6 in. high to the square of the walls, the roof being open to the top of the side pieces, thus giving

the height of 17 ft. from the floor to the flat ceiling. Adjoining the school-room is a classroom, 12 ft. by 10 ft. 6 in., fitted up with infants' gallery. The building has been erected by Mr. Chambers, from designs by Mr. Watkin, of Lincoln, architect.

PROVINCIAL NEWS.

Lodden.—It is proposed to erect a building for public purposes in this place. Mr. Benet, of Norwich, architect, has provided the design, and guarantees that the total expense will not exceed 1,350*l.* A limited company is to be formed to raise the necessary funds. Shares to the amount of 860*l.* have been already taken.

Llanrhidian (Gower).—The foundation-stone of a new vicarage-house has been laid here. The architect is Mr. W. Richards, of Swansea.

Leicester.—The Wellington Hotel, which is about to be erected upon the site of the present "Wellington Castle" by Mr. Wm. Burley, from the design of Mr. R. J. Goodacre, architect, will have a frontage to Rutland-street of about 115 ft., and to Granby-street of 44 ft., and will be built in the modern Italian style, with white brick facing and stone dressings. The angle at the junction of the two streets will be made circular, and in it will be placed the principal entrance. The ground floor will consist of entrance-hall, staircase, bar, commercial and sample rooms, coffee-room, and waiting and private rooms. The first-floor will contain dining-room, 38 ft. long; billiard-room, and six private rooms. On the second and third floors there will be twenty-two bedrooms, bath-room, and store-rooms. The kitchen is to be a one-story building on the ground floor, adjoining the main corridor, and ventilated with Watson's patent syphon ventilator. A portion of the offices are to be constructed on the ground-floor, and the remainder in the basement. The whole area of the building is to be excavated and made available for storage. A lift will be introduced and communicate with the several floors for the transmission of luggage and other heavy articles. It is proposed to provide stabling for fifty or sixty horses.

Basingstoke.—The foundation-stone of the Mechanics' Institute has been laid here. The site of the new building is in New-street, and the ground has been purchased with a fund formed by the proceeds of a Loan Exhibition held some time since. The plans of Messrs. Messenger & Seymour, architects, London, were chosen by the committee, there being sixteen other competitors. The plans adopted were slightly modified, to meet the wishes of the committee, and, when finished, the building will consist of a large reading-room, library, and other offices on the ground floor, with club-room, class-rooms over, and the librarian's residence in the rear. The cost will be 875*l.*, and the contract has been accepted by Mr. W. Pistell, the ex-mayor.

Bournemouth.—The New Dispensary Buildings in Madeira Vale have been opened. They have been erected at a cost of more than 1,000*l.*, and were opened free of debt. They are built of brick, with stone dressings. There are seven rooms on the ground floor,—the accident ward, the consulting room, the waiting-room, the laboratory, the kitchen, the larder, and the scullery, 10 ft. square. Upstairs the rooms are four in number. Mr. Tuck acted gratuitously as the architect.

Poulton.—A parsonage-house for the Rev. John Rule, whom the bishop instituted as vicar, is just completed. Mr. Ewan Christian was the architect, and the style is Early English. The stone of the district, with Bath stone quoins and facings, was employed; and the tiles were also of native stone. The joiners' work throughout is stained and varnished, and the paint-brush is banished to the kitchen and servants' rooms. The chimney-pieces are of Bath stone, with borders of Minton's encaustic tiles, and frame and shelf being of pitch pine. The stabling is good, and the loose boxes are of stained deal. The estimated cost of the building was 2,046*l.*, and the work has been executed by Mr. William Hinton, of Cirencester, builder. One of the churchwardens has started a subscription towards the erection of a new church and schools, with the gift of 200*l.*, and all the stone required. As soon as a suitable site has been secured, it is hoped to set to work to build them. The new church is intended to be more centrally situated, the old church of St. Michael being declared to be at an inconvenient distance from the village, and past restoration.

FROM AUSTRALIA.

Melbourne (Victoria).—The trustees of the Melbourne Public Library have issued their prospectus of the proposed Fine Arts Exhibition, and preparations were to be made to open the Exhibition towards the end of March. The display will comprise works of art, art treasures, and specimens of ornamental and decorative art.

—At a meeting of the education committee of the Presbyterian Church of Victoria, held on the 1st of February, it was unanimously resolved:—"That the committee recommend the General Assembly not to sanction the transference of any more Presbyterian schools to the Board of Education, till it is ascertained what course the Legislature will take in the education question."

A sub-committee was also appointed to make arrangements for conferring with other denominations, with the view of conserving the religious element in any system of education that may be introduced by the Legislature.—The Presbyterian congregation of Richmond, Melbourne, who have since their formation in 1860 assembled for public worship in the wooden chapel in Lennox-street, opened on Sunday, February 14th, their new stone church, situated on the hill at the top of Lennox-street, close to the Bridge-road. The building is of blue stone, and is in the Gothic style. The part opened is calculated to contain 600 seats. When the whole building is finished, accommodation will be furnished for nearly 1,000 persons. The total length is to be 93 ft. 6 in., and the width 51 ft. The height of the church in the interior is 56 ft., and the outside walls are just on a level with the top of the spire of the Congregational Church in Collins-street—a circumstance showing the great elevation of the land on which the church is built.

The tower and spire, which it is proposed to erect at a future time, will be 160 ft. high from the ground. In the interior of the church the whole length of the floor rises as a slight inclined plane from the pulpit to the back of the church. The pulpit, pews, and fittings are of polished cedar, designed in keeping with the Gothic style of the church. The roof, which is arched, is of polished wood; and the windows, twelve in number, are filled with designed glass of various light-tinted colours. There are two rooms also erected at the end of the church: one for the minister, and the other for the committee. The amount expended on the portion now opened, reckoning the cost of the land, will be about 2,600*l.* or 2,700*l.*—The foundation-stone of a new Roman Catholic church, dedicated to St. Bridget, was laid on the 14th of February in the reserve at the corner of Nicholson-street and Reilly-street, Fitzroy. The church is to be in the Decorated style, and will consist of a single nave, 28 ft. wide by 60 ft. long, with an octagonal chancel. It is intended to afford accommodation for 450 persons, and will cost about 1,200*l.*—Mr. J. Flannagan, architect, who was some months ago prosecuted on an unfounded charge of perjury, which had subsequently been withdrawn by the officer of the Crown as untenable, was on 1st of February presented with an illuminated address, signed by many of the most influential mercantile and professional gentlemen of Melbourne, condoling with him in his sufferings while under the stigma of an unjust accusation, and expressing the entire belief of those whose signatures were appended to the document in the innocence and straightforwardness of Mr. Flannagan.—An omnibus company has been for some time in existence in Melbourne. They propose when in full working order to have about 50 omnibuses and 600 horses employed. The primitive and inconvenient street cars will thus be shortly replaced, it is hoped, by more commodious vehicles.

—A piece of gold weighing 10 dwts. was lately picked up in the roadway opposite Murphy's Hotel, Castlemaine. It was separated from a piece of quartz, which a cart-wheel had crushed in passing over. A few days afterwards a nugget was picked up in the roadway opposite the Criterion Hotel. It is well known that the Chewton-road, which is spread in some parts with quartz tailings, is sufficiently auriferous to induce the Chinese to sweep it at night, and it is said they are well repaid for the trouble. "Streets paved with gold! Such was the statement," says the *Castlemaine Daily News*, "that appeared in some of the English papers a few years ago in reference to Victoria; and far-fetched as the remark was, it may be seen that it was not altogether untrue."

It has long been known that the Western Australian eucalyptus, known as mahogany, or

Jarrah wood, possesses the valuable property of resisting the attacks of the white ant, which has destroyed all sleepers of native woods that have been laid down on the Indian lines of railway. To purchase and ship the wood to Calcutta has often suggested itself to Victorian speculators as a probably good operation. Late letters from India mention that a large contract has been taken in Calcutta for the supply of this wood, and that the contractor is on his way to Melbourne to make the necessary arrangements. A similar contract was made not long ago by Mr. Compton who is now understood to be in Perth fulfilling it, his great difficulty being the finding of ships. In connexion with the same subject, a singular circumstance has been mentioned. A large and formal-looking letter reached the Melbourne post-office by a recent mail, addressed to "The largest and most important timber merchant in Melbourne,—in the discretion of the postman;" and this was tendered to Mr. John Sharp, of Collins-street West. At first Mr. Sharp declined to receive it; but at length he opened the missive, when it proved to be an order from some one in Calcutta to send sample tenders of the various Australian woods. The order, it seems, is to be fulfilled, and it is possible that an important trade may arise out of this curiously opened correspondence.

FROM SCOTLAND.

Milnathort.—The new United Presbyterian Church has been opened for public worship. The building has a large class-room and vestry attached, and has accommodation for 700 sitters. It has a spire, 125 ft. in height, built of stone, the whole being completed under Mr. William Ingram, architect, Glasgow, at an expense of about 3,000*l.* The internal arrangements include a Gothic pulpit platform, the church being principally lighted at night by a star or sunlight of thirty burners, suspended from the centre, with ornamental scroll brackets under the galleries. It is heated by one of Clark's patent heaters. The windows are all filled with cathedral stained glass, having coloured borders, with centre stained rosettes.

Burns's Cottage.—Some alterations, according to the *Scotsman*, have recently been made in Burns's Cottage, Doonside, by the Corporation of Shoemakers of Ayr, who are in the possession of the interesting "biggin." The establishment of the place as an inn has proved a great convenience to the public; one of the two apartments has been fitted up for the exhibition and sale of Manchine woodwork and other objects of interest. The kitchen is still preserved in its original state. In the course of the alterations it was necessary to remove one of the old beams of the cottage, and from the little sound wood there remained in this the corporation have succeeded in getting a few ornamental articles made for distribution as mementos of the place. The alterations have been chiefly carried out under the superintendence of Convener Cowan.

Dumfries.—A meeting of the building committee in connexion with the new infirmary buildings has been held for the purpose of further considering the plan of Mr. Starford, architect, which had been selected for recommendation to the governors on condition that it was shown that it could be constructed for the stipulated sum of 10,000*l.* Mr. Starford's plan had originally exceeded that amount, and it was now produced in an amended form, an estimate based upon it amounting to 8,650*l.* 9s. 8d. Should the proceedings of the committee be confirmed, the building will be commenced forthwith.

Jedburgh.—The proposed restoration of the Abbey Church of Jedburgh, which has been before the public for a considerable time, seems now to be in a fair way of being carried into effect. At a meeting of the heritors of the parish, held on the 24th of February last, it was agreed, by a majority, to adopt the fifth recommendation of Mr. Bell, architect, Glasgow, for the restoration of the church, which plan restored the great west window and the St. Catherine's wheel in the west gable, the south aisle, and the clearstory, and would cost 4,200*l.* At the same meeting a committee was appointed to see the plan carried out. Against these resolutions several of the heritors protested, amongst whom was the Marquis of Lothian. Interdicts have now been served on all the acting members of committee, and the case is thus being brought before the law courts.

Kilmarnock.—A stained-glass window, prepared by the Messrs. W. & J. J. Kier, of Glasgow, has been erected in the High Church here, as a

memorial of the last earl of Kilmarnock. It is a three-light window, with figures illustrating the three injunctions of the Sermon on the Mount, "Ask, and it shall be given you," &c. At the base of the centre compartment is emblazoned the escutcheon of the Boyd family, and at right and left are the arms and names of some early benefactors of the church.

Books Received.

Transactions of the Architectural Institute of Scotland. Session 1867-68. Illustrations of Scottish Buildings.

The part last issued by the Architectural Institute of Scotland contains illustrations of the Font and Market Cross at Inverkeithing; the Monastic Church of Queensferry, and the Abbey Church of Drynburgh, drawn and lithographed (with evident knowledge of his subject) by Mr. E. C. Clarke. The remains of the church at Drynburgh, twelfth and thirteenth century in date, are amongst the most interesting ruins in Scotland. The domestic buildings at Dryburgh are in a more complete state than the church, and of these it is intended to give illustrations in the next issue of the Transactions.

The church of the Carmelite Monastery of Queensferry (founded about 1330) is at present thus profitably appropriated—the east end is used as a burial-place, the tower as a pigeon-house, and the nave as a receptacle for rabbits!

The writing to the various illustrations is, for 99 persons out of a 100, unreadable,—a sheer absurdity. If a little son, writing home to tell "dear papa" of the holidays, be forced to rule lines to keep his words straight, he always takes care to rub the lines out before despatching his epistle. Why should the public be worse treated than the parent?

Architectural Illustrations and Description of Kettering Church, Northamptonshire. By Mr. R. W. BILLINGS. Revised by the Author. May, 1869. Atchley & Co., Great Russell-street, W.C.

This work is so well known that it is unnecessary to do more than announce that a new edition, revised by the author, has been published. The manner in which these illustrations are given should be a lesson to the sketchers and scratchers of the present day. Kettering Church, as we suppose all our readers know, is a fine example of the Perpendicular period (mainly).

Cyclopaedic Science Simplified. By J. H. PEPPER. London: Warne & Co.

Though still an elementary work, this handsome volume is of a more advanced order than are the author's previous works. It contains a large mass of facts, with numerous illustrations, and is excellently well adapted to excite popular interest, from the author's great experience as a popular lecturer at the Royal Polytechnic Institution and elsewhere, which has specially prepared him for the production of just such a work. The author has also made good use of the valuable papers of such men of science as Faraday, Wheatstone, Brewster, Tyndall, Crookes, and others. The work treats fully of light, heat, electricity, magnetism, pneumatics, acoustics, and chemistry. It gives explanatory accounts of the curious experiments and exhibitions which so many thousands have witnessed at the Polytechnic.

VARIORUM.

"GOOD SOCIETY: a complete Manual of Manners," published by Routledge, is a valuable little volume. Ridicule has been attached to such books, but this is a mistake. A book on etiquette may, of course, be ridiculous, but it is not ridiculous simply because it is a book on etiquette. "Good Society," however, goes beyond etiquette; it contains much useful information, and is good in tone and feeling. There are very few persons, be their position what it may, who might not gain from its perusal. In the next edition the assertion on the title-page that it is "by the Right Hon. the Countess of" should be left out. The book is quite good enough to do without such nonsense as that.—The current number of *Fraser's Magazine* has a long and fairly-argued paper, headed "The Working Man and his Friends."—The title of *The Young Gentleman's Magazine* (Routledge)

explains its purpose, and this purpose is being fairly carried out.—"Cooling Cups and Dainty Drinks." By W. Terrington. Well! artists and antiquaries and builders want "cooling cups" as well as other people (so long as they are not heating cups no harm will be done), and there is no reason therefore why we should not mention that the little book thus headed, published by Messrs. Routledge, contains a number of useful recipes.—Mr. Tegg, amongst his reproductions, has issued a modernised edition of the "Surprising Adventures of Philip Quarll,"—always welcome to young folks.

Miscellaneous.

Poisoning by White Lead.—An inquiry has been held at the German Hospital, by Mr. Richards, into the circumstances attending the poisoning of a workman. Fortunately, only one of eight men so poisoned had died. Mr. Manthas Kurts said that the deceased was a walking-stick maker. He was employed by witness to varnish walking-sticks. On the 29th ult. deceased left his work, as he was too ill to continue it. Witness used white lead in his business for fastening on the tops of fancy sticks and also to whiten them. Dr. Julius Wibell said that the deceased was admitted into the hospital on the 29th of May, suffering from the effects of lead poisoning. He was in convulsions. Witness had told Mr. Kurts that it was dangerous to use white lead in his business, for it was a poison. The men were poisoned through not washing their hands at meal-times. The poison was not inhaled; it came from the hands while eating. The stomach was contracted, and a *post-mortem* examination proved that the deceased had died from the effects of lead poisoning. The other men have, under medical treatment, recovered. A juror said that white zinc would answer all the purposes for which white lead was used in the business, and that it would be harmless. The doctor said that if the men kept their hands washed, and the place was well ventilated, the effects would not be so injurious. The coroner said that it would be well to write to the officer of health to see that proper precautions were taken, and the jury returned a verdict "That the deceased expired from the mortal effects of lead poisoning."

Netherlands International Exhibition.—A meeting of the London committee has been held at the Mansion House, the Lord Mayor in the chair. The sub-committee reported that the portion of the building allotted to the United Kingdom would be well filled by nearly 200 exhibitors, and would include the most important British industries, all classes of these being more or less fully represented, and especially those of household necessaries, clothing, and food. Messrs. Gilbert Saunders, P. Le Neve Foster, Hodgson Pratt, Edmund Johnson, and P. L. Simmonds were nominated British jurors, having expressed their willingness to serve if approved by his Majesty the King of the Netherlands. The secretary was instructed to proceed, as soon as the preliminary details of allotment have been completed, to Amsterdam, to arrange the British section for the reception of the exhibits. Baron Mackay, president of the central committee at the Hague, stated that very complete arrangements had been made by a special reception committee for boarding and lodging 200 of our working classes during the exhibition, on the most economical scale; it would be necessary, however, to have the precise dates previously agreed upon.

Gibraltar Drainage and Water Supply. The sanitary state of Gibraltar is causing great anxiety. The new drainage system is nearly completed, but there is no provision of water to flush the sewers, and the emanations from the sinks and traps are very offensive. All the barracks are overcrowded, and this aggravates the evil. The rainfall, too, is below the average. Could not sea-water be lifted into a reservoir for the flushing of the sewers?

Technical Education.—Sir Roderick Murchison has kindly placed the theatre of the School of Mines, in Jermyn-street, at the disposal of the Workmen's Technical Education Committee, 150, Strand, to hold their first annual meeting on Thursday next, the 24th instant, at eight o'clock p.m. Lord Elcho, M.P., has consented to preside. Efforts to provide technical education for British workmen are well worthy the support of all classes.

Monumental.—Mr. Layard, in answer to Mr. N. Grenville, in the Commons, said the statue of Sir Robert Peel, lately removed from Palace-yard, is now in a Government store. As regards the question of its re-erection, he was now in communication with the committee under whose auspices it was made. There are two other statues warehoused in the Government stores, namely, those of Brunel and Stephenson. He had put these statues very carefully away till some arrangement can be made as to a site. It is proposed that they should be placed on the Thames Embankment, which would be an appropriate site for engineers. The original design was, that the statues of Peel and Palmerston should stand back to back on each side of the railing. The House has already decided against the statue being placed within the railing. A promise has been made that the Palmerston statue should stand on the outside; but, before this is carried out, it appeared to him advisable that Mr. Woolner should place on the site a model, both of the pedestal and the statue, so that members of Parliament may be enabled to judge whether the site is a proper one. The model is now up.—Mr. W. Thood, the sculptor, has just finished a statue of Lord Derby. It is a commission for St. George's Hall, Liverpool, where it will be formally inaugurated about the end of the present month or early in July. It is of heroic size, and represents the earl in his full-dress robes as a peer of Parliament, and with the insignia of the Garter: the figure stands in a somewhat haughty and almost defiant attitude. The material is a white marble, approaching closely to the appearance of alabaster. It is to be placed in a sculptured niche in the hall.

Prison Labour.—At the last meeting of the Howard Association (for the promotion of the most effectual methods of penal treatment and crime-prevention), Sir John Bowring in the chair, interesting statements in relation to the progress of the objects of the association were made by the chairman and committee, and the secretary, Mr. Tallack. Amongst other resolutions the following was unanimously agreed to:—"This meeting believes that very satisfactory results would follow the adoption (first as an experiment, and then as a rule) of a system of *Labour Sentences*, for certain classes of offenders, involving their confinement or restraint until they have, by the result of their labour, made total or partial *restitution* for their offences, or have at least defrayed the cost of their detention, either wholly or in good degree, according to their ability."

Artists and Tintagel Church.—As every one knows, Tintagel and the ruins of King Arthur's Castle have been much frequented by painters and *littérateurs*, and the artistic tastes of the vicar of the parish have led to much kindly intercourse between him and the visitors to the place. An effort on his part to restore his ancient church has called forth contributions from several artists, who have specially charged themselves with the care of the north,—or, as it will be henceforth named, the Painters'—Transept. Among the contributors are Mr. Poole, R.A., Mr. Samuel Palmer, and Mr. E. Duncan, of the Old Society; Mr. Thomas Danby, Mr. C. P. Knight, Mr. Naish, Mr. F. Dillon, &c. The works contributed arc now on sale at Messrs. Colnaghi's.

Artists' Benevolent Fund.—This fund, which was established in 1810, consists of two separate branches, the "Artists' Annuity Fund," and the "Artists' Benevolent Fund." The first is supported by the contributions of its members for their own relief in sickness or old age. The second has for its object the relief of the widows and orphans of the members of the artists' annuity fund, and is supported by the friends of the fine arts and artists, and the annual contributions of the members of the annuity fund. During the past year 48 widows and 4 orphans received annuities amounting in the whole to 975*l.* The dinner in aid of the fund is fixed to take place on Thursday, the 24th. Dr. William H. Russell will preside. Will not some of our readers assist to ensure a good gathering?

A New Town-hall for Liverpool.—A tempting offer has been made to the corporation for the purchase of the Town-hall; and the land adjoining the Public Offices has been surveyed, with a view to ascertain whether or not a new Town-hall could be erected thereon suitable to the high position Liverpool holds in the commercial world.

Gloucester Cathedral.—The work of restoration is being carried forward in this cathedral. Five months have elapsed since the restoration of the choir was begun, and much of it has now been executed. The thick layers of whitewash have been removed from one-half of the vaulting, from part of the triforium, and from a large portion of the side walls. Some faint traces of decoration have been found, but nothing of any value; and the anticipation that colour and gilding existed in the vaulting has been disappointed, no traces of decoration of any kind having been discovered. The stone tracery of the two eastern-most windows on the north side has been taken out and renewed, and the reglazing has been begun; the three remaining windows have to be restored. The exterior work in the south transept has been completed. The chapels dedicated to St. Andrew and St. Paul have been restored, the former at the expense of Mr. T. Marling and Mr. Gambier Parry, county magistrates; the latter by the Earl of Ellenborough. Mr. Marling has also promised a window for the south transept, at a cost of not less than 600*l*. The south porch is at present under restoration, the expense, estimated at 500*l*., being defrayed by Mr. W. P. Price, the senior member for the city. Some progress has been made in the restoration of the chapel of St. Philip, which is to form a memorial of the late Sir C. W. Codrington, M.P. The entire work of restoration will cost 40,000*l*.

Ancient Civilisation and History.—The fifth lecture of the series was recently given, at St. John's House, Winchester, by Mr. Reginald Stuart Poole, of the British Museum. On this occasion he traced the stages of Greek history from the Nomad, when the country was subject to the incursions of adventurers, the chief of whom were the Pelagian, Eolian, Achaian, and Ionian. The colonies of the latter were also found on the opposite shores of Asia Minor, and they were the commercial people of that early day. He pointed out that the cultivation of art was not necessarily favourable to a high morality; it depended upon the end for which any art was cultivated, whether its influence should ennoble or otherwise. Music, the least debasable of all arts, might be prostituted to vile purposes, though the art itself could not be rendered essentially bad. Greek sculpture was the finest ever produced; nothing has since been given to us, except perhaps by Raffaele, which could be considered its equal. The deductions the lecturer drew from his subject were—that philosophy is not religion; that it will never supply that which man wants; it takes the spoil, but it does not gain the battle over human nature; it affects to have discovered truths, whereas religion had done it before. And whether it be the Greek or any other nation, if it does not assign to woman as high a place as man, make her equal though diverse in her power, that nation will either fall or have to modify its own system. And no matter how high may be intellectual attainments in music, oratory, or architecture, they are all valuable rather as effects than as the causes of real good.

Laying Chief Stone of Water Tower for Tewkesbury.—Within the last two years Tewkesbury has been sewered, and now the Cheltenham Water Company has begun the necessary works for providing the inhabitants with water from the Severn. The company have purchased land at the foot of the Mythe Bridge, and the works have been designed by Mr. W. M'Landborough, C.E., formerly city surveyor at Gloucester. The water will be pumped into a subsiding tank, from which it will pass through three filtering-beds into a covered pure-water tank; and thence it will be pumped into the service reservoir. This reservoir is to be erected on the top of the Mythe-hill. The tower will be 30 ft. high; and, as the hill is 90 ft. above the level of the river, the water will flow to the top of the highest house in Tewkesbury. The base of the water-tower will be of red and black bricks, with moulded brick dressings; the tank, of cast-iron, will hold 85,000 gallons; and engine-power is provided to raise, in 8 hours, a sufficient daily supply for the town, allowing 20 gallons per inhabitant. The estimated cost of the works is about 8,000*l*. or 9,000*l*., and it is expected that they will be completed by Christmas. Messrs. J. M. Butt & Co., of the Kingsholm Foundry, are contractors for the ironwork. The foundation-stone of the water-tower was laid, with suitable ceremony, by the wife of the Mayor of Tewkesbury.

Proposed New Freemasons' Hall, at Wimborne.—The Lodge of "S. Cathberga" of Free and Accepted Masons have purchased the freehold of a large building here with the intention of converting it into a lodge-room. They have formed themselves into a company, and a committee has been appointed to carry out the arrangement and building. Mr. Walter Fleteber has been employed to prepare the design, &c. Liberal contributions have been promised.

The Post-office and the Telegraphs.—The United Kingdom Electric Telegraph Company, Limited, state that the Post-office have completed their arrangements, under the Telegraphs Act, with the whole of the telegraph companies for the purchase of their undertakings, and have nearly settled their arrangements with the railways. The amount of purchase-money required is now, therefore, so nearly ascertained that a reliable estimate may be arrived at of the probable financial result to the country. The money will be raised at from 3*1*/₂ to 3*3*/₄ per cent., and the revenue derived from the telegraphic business shows a return of between 5 and 6 per cent. upon the total sum required, and therefore a large net gain to the national revenue. The basis of twenty years' purchase of the net receipts of the companies, as fixed by Parliament under the Act, includes the plant as well as the goodwill of the business. The Act of 1844 prescribed 25 years' purchase of the net profits and of the prospective profits of the railways; so that the present arrangement is far more favourable to the country than existing precedents would have appeared to warrant. As an index to the sort of sums dealt with we may state that the directors of the British and Irish Magnetic Telegraph have just agreed to accept the sum of 1,243,526*l*. as a settlement in full.

The Channel Tunnel.—The chairman of the Channel Tunnel Committee, Lord Richard Grosvenor, M.P., and Mr. Thomas Brassey, jun., M.P., accompanied by the engineers, Messrs. J. Hawkshaw, J. Brunlees, and W. Low, having had an audience with the Emperor Napoleon, have obtained the report made by a special commission appointed by his Majesty to examine into the practicability of executing the proposed submarine tunnel between England and France. The report is of considerable length; all the members agree upon the practicability of the undertaking, as proposed by the English engineers, and the simplicity of ventilating during construction, by means of the double driftway. There are some differences of opinion as to whether the amount of probable traffic would be remunerative at first. They think it will take time to develop the traffic in opposition to established routes, but that other matters than traffic solely ought to be considered, "such as the advantage of strengthening the bonds which unite us to an industrious, conservative, and wise people, whose alliance with France constitutes a valuable pledge for the peace of the world." The French council of engineers of roads and bridges, and council of mining engineers, were unanimously of opinion that the driving of a submarine tunnel across the straits, in the manner proposed by the English engineers, presented no insurmountable difficulties. Copies of the report and other documents have been sent to the President of the Board of Trade.

A Gift to Westbury.—A newly-erected building, comprising lecture-room, reading-room, library, a residence for the porter and his wife, a ladies' cloak-room, and other offices, has been provided for the benefit of the increasing population of Westbury-on-Trym, by Mr. H. St. Vincent Ames, of Cote House, Westbury. The block is built of magnesian limestone from Clifton, with freestone dressings, and a porch of same material. The hall is capable of accommodating nearly 400 persons, and is lighted by means of large side windows and a window in the west end. It has an open timbered roof, stained and varnished, and the height from floor to ridge of roof is about 40 ft. The cost is over 2,000*l*. for the building, and to this must be added the cost of the land.

Rather Too Fast.—A three-story brick house, 18 ft. by 40 ft., and in the construction of which 42,350 bricks were used, was built in Lanoaster, Pennsylvania, last month, in nineteen hours and a half, and persons were living in it within three days from the time it was commenced.

"A Bishop among Architects."—Little anecdotes of this kind (quoted in your last) are always worth putting right. The *wot* in question is, I believe, one which attaches not to an architect, but to an acuary well known in the city of London. The bishop had long placed familiar confidence in Mr. A. in connexion with his official property, but could not help, on one occasion, harsarding in good humour the remark that his fee of a hundred guineas for a certain report was as much as many a hard-working cnrate received for a year's work. The witty reply was in effect as quoted,—"Your lordship will kindly remember that I am not a curate, but a bishop, in my profession"; and [so the affair was laughed off. I have heard this version of the story told in the presence of the gentleman I refer to, by way of a compliment to himself, which seems to be good proof of correctness. As for architects, it is well known that bishop and curate are paid by the self-same percentage.

R. K.

Congress of the Social Science Association.—An invitation from authorities to hold the next Congress of the Social Science Association in Bristol has been received, amongst others, and the executive committee have agreed to recommend the council to accept it.

TENDERS.

AS GENERAL FOREMAN or CHARGE of a JOB. An active and thoroughly competent Man. Total experience, aged 36.—Address, W. G. Gloucester-terrace, Malve Lane, Worcester-shire.

The Builder.

VOL. XXVII.—No. 1377.

The Use of Plaster in Decoration.

DEMANDS of modern luxury, in a northern climate especially, will probably always run counter, in a greater or less degree, to those of the highest architectural art. In the earlier days of simple and hardy existence, the most wealthy and self-indulgent owners of habitations were content to let the genuine building material of the walls show itself on the interior surface as openly as on the exterior, save where it might be concealed by hangings of "cloth of Arras," forming, however, no part of the wall-surface, and removable at pleasure with little cost or trouble. Then came, by slow

degrees, the days of wainscoting, rich, elaborate, and expensive in its best developments, and telling unmistakably of a time of settled aristocratic family succession, when a mansion was slowly and carefully built and decorated to serve, not merely for the short-lived enjoyment of its founder, but as an heirloom to his successors. And finally we merged into the plaster epoch, not merely covering the walls, for utilitarian purposes, but inventing cunning imitations in plaster of the stone-work of our ancestors, and discovering how Greek coffered ceilings and Gothic vaulted roofs could be thereby reproduced and multiplied, upon a fit cradling of lath and framework, to the great delectation of the beholders.

Whereupon a reaction; as there always is and will be a reaction, sooner or later, against whatever is mean and false, in art as in other matters. The prophet Pugin, seeing how architecture generally had been thus "dandied with untempered mortar," not only took up his song against it with an alarming energy, but (to use the language of Tate and Brady) "also practised what he knew;" building himself a house after his own heart, with bare stone walls, rather than enjoy the pleasures of plaster for a season. And though few of us have followed this heroic example, yet it must be admitted that the encrusting of a building with so base a material, —really a species of mud,—certainly deprives it of anything like a monumental or perennial expression, and goes far to vulgarise any design. We are tacitly conceding this in the efforts we are making in many quarters to dispense with plaster in our churches, and substitute the honest brick wall in the interior; though there are not wanting philosophical minds who boldly rail at this, and aver that we have as much right to expect comfort and luxury in our chnrb as in our drawing-room. Be this as it may, it seems probable that in our ordinary dwelling-houses we must for the present accept internal plastering as a necessary evil, until some better, more durable, and more architectural material is discovered wherewith to line our rooms without entailing an extravagant outlay. And the existence of plaster in our rooms being thus accepted and recognized, it is

natural enough that we should also wish that the material should be made to "pay its footing," so to speak, in the shape of decoration; and that as we have admitted it as useful we should also admit it as ornamental; the only proviso being that the ornament should be of a kind suitable to the nature, capabilities, and defects of the material.

The commonest and simplest method of employing plaster in a decorative manner is, of course, the agglomeration of a certain bulk of the material, greater or less (generally greater), at the angle formed by the meeting of the wall and ceiling, the collected mass being then "run" into the form of mouldings of any required section. Within certain limits, this is a legitimate and sensible way enough of employing plaster; it breaks the abrupt angle which would otherwise be formed in that position, and forms a frame to any decoration which may be attempted on the surface of the ceiling. But plaster has been much misused in this form; which is not to be wondered at, seeing that there is an idea current among those who "by this craft have their wealth," that the plaster cornice round the room represents the bracket which carries the floor above; at least, this was the theory of it which was gravely propounded to us not long ago by an excellent master of his trade. On this supposition, it is easy to understand how there has arisen the habit of "bracketing down" with concealed wooden brackets, in order to obtain a cornice heavier and deeper than could possibly be accomplished in plaster without such assistance, and which, if it were in reality what to the eye it is made to appear, a solid mass of plaster, would of course fall down at once. This is a process as absurd and disagreeable as it is wasteful of material. The only theory on which this source of ornament can be defended is simply the one we have hinted at—the desire to do away with the harsh effect of the plain rectangle at the junction of wall and ceiling; and this can only be done so as not to be offensive to the architectural eye, when the mass of plaster composing the cornice is so shallow as to be manifestly self-supporting, and to show itself in its true character. Besides this, it is a manifest error, except in the case of a disproportionately high room, to diminish the apparent height of the apartment, and consequently its dignified appearance, by bringing the material of the ceiling low down on to the wall, and thus losing 10 in. or 12 in. in height of wall. The plaster moulding, if it is desired to make it at all elaborate, should spread out, not upon the wall, but upon the ceiling, the (generally) bare expanse of which is thus reduced in extent; and the mouldings and general section should be kept so flat as to render it evident that the material can easily be retained in position by its own cohesive power. The section given in fig. 1 of our illustration represents the kind of form which such a cornice might take.* Here it will be seen that the mouldings are simple, not so small and crowded as to confuse the eye (which is often the case), and divided into groups by flat soffits, which serve to spread out the cornice over the ceiling without adding to its bulk. The small hollows introduced are a capital source of effect, giving a strong black line of shadow against the white material; and though the plasterer is sure to complain of the difficulty of miring them, he can do it, if he chooses, well enough. Such a cornice as this will be secure without any bracketing; and the large hollow in the angle, which is necessary in order to reduce the weight of material sufficiently, is also utilized, in order to form a dark shadow behind a perforated ornament, such as is shown at A.

This question of ornament, or, as it is more commonly called, "enrichment," in plaster cornices, is however a much more serious affair than

that of mere mouldings, and on this head the sina both of past and present generations have been grievous. In nearly all dwelling-houses erected by builders, and unhappily in not a few which have been under the supervision of architects, the visitor's impression, if he look up on entering a sitting-room, is that the products of the kitchen-garden are having a race round the ceiling. In proportion to the estimated rental of the house, there are to be seen one, two, or three rows of ragged, straggling plaster leafage inserted in the cornice—awkward attempts to imitate, in mis-shapen coarse casting, the delicate lines and surface markings of natural foliage, or the effect of wood or stone-carving, varied by an occasional gap where some badly-attached lump has fallen out; while in the centre of the ceiling is seen a strange excrescence, looking like a gigantic cauliflower squeezed flat, and fixed up there as a warning to its kind. Those of our readers who may have paid any attention to our observations in a former number as to the relation between design and material (see p. 3, ante), will the better enter into our view as to the style and degree of ornamental design permissible with good effect in plaster. Two things, as it appears to us, have to be borne in mind with regard to this, as to all vehicles of ornamental design—first, that the elaboration of the design, and the amount of thought bestowed upon it, should not be out of proportion to the durability of the material and the difficulty of working it; for to see a very highly elaborate and carefully-prepared design confided to a mean and perishable material, always conveys a sense of disproportion and of wasted labour. Secondly, that the manner in which the material is to be worked, and its texture and quality, must be taken into consideration in designing for it. Now plaster is a soft and by no means very durable material, forming, in its ornamental developments, no integral part of the building in which it is introduced; and all ornament which is executed in it is obtained by casting in a mould. These considerations will determine that in the first place such ornament should be of a comparatively simple character, since it is not worth while to expend the same amount of thought on the design as if it were to be executed in stone or wood, and consequently survive for many generations; that it should be highly conventionalized, since any attempt to imitate the delicacy of natural foliage in the manner which has sometimes been successfully accomplished in wood-carving, becomes simply offensive with the coarse lines and blunt angles which always characterize cast work; and that the effect should be obtained mainly by contrast of light and shadow, of flat surfaces with deep and decided sinking; for anything like surface manipulation, whilst it must necessarily, as we have observed, be very coarse in execution, becomes also offensive in so white a material, as the means of visibly harbouring dust and soot, which soon "relieve" the design in a manner scarcely calculated by its originator. On the other hand, this very quality of whiteness renders all shadow peculiarly valuable and marked, when employed as a contrast to a flat surface of plaster. For this reason such pierced designs as those shown at A, and figures 1 and 2 in our illustrations, are well suited for plaster ornament; with the deep hollow behind them, which, as we before observed, has a practical use in diminishing the weight of the cornice, the interlaced patterns in white plaster have quite a sparkling effect, whilst there is nothing on the surface which can hold dust. The moulds for these are best made by simply cutting them with a knife in a flat cake of plaster, without the intervention of clay at all; and by bevelling the sides of the pattern from back to front, the visible lines of the ornament can be rendered very thin and delicate to the spectator, while leaving sufficient material at the back to insure the required strength. The same

* See p. 500.

system can be mingled with surface decoration of a simple character, as in Fig. 7, where it is not necessary to have a perforation right through, as the employment of a deep sinking around the trefoil leaf will produce the desired effect. Our figures, up to No. 9, show some other examples of the style of ornament which appears to us suitable for cornice decorations in plaster. It will be seen that all these are simple and very conventional in character, depending on very few lines for their effect, and that the patterns are produced almost entirely by direct sinking, or by the contrast of surfaces in two different places. It will be observed also that all of them are designs of small extent, consisting merely of two small alternating members indefinitely repeated; these in general look better in execution than a more extended design, which often has a straggling appearance; and thus also one of the advantages of cast work is brought out, viz., the possibility of numerous repetitions of a small design without entailing a disproportionate degree of labour, or exercising the craftsman in a dreary mechanical carving of the same features *ad infinitum*. The effect of such repetition, however, when once executed, is exceedingly valuable, and was, as we all know, practised by the Greeks even in so hard a material as marble, in the execution of their "egg-and-tongue" moulding; one of the most beautiful and suggestive forms of ornament ever invented, and which may serve as a basis for endless modifications. In the present illustrations, we may observe, figures B, C, 3, 6, 7, 8, and 9, are only modifications of the same principle, the alternation of a shorter and rounder form with a thinner and more elongated one. But to leave the cornice and come to the consideration of the inevitable "cauliflower" which forms the centre piece; it seems quite consistent with propriety that a ceiling which is ornamented round the margin should have a central ornament also in the same style; but the centre "flowers" commonly kept in stock by plasterers and fixed up to order in the middle of the ceiling are the most absurd and offensive things, and violate every principle of architectural taste. They are for the most part great unwieldy lumps of so-called ornament, sometimes not without a certain elegance of conception, which makes the design look pleasing on paper or in a photograph, but in a florid style of surface-work and under-cutting which could only be accomplished with any effect in elaborate wood-carving. Even this is an exception, however, for in most cases the designs put up are simply, or rather elaborately, odious. Moreover, if those who eat dinners under the shade of these specimens of plaster vegetation were aware of their actual weight and the slight means by which they are often attached to the ceiling, they would be regarded in the same light as the sword of Damocles. Now the style of the centre ornament should have distinct references to the style and ornamentation of the angle cornice, and many of the remarks which we have made with regard to the latter apply equally to the former. Instead of looking like some huge elaborate specimen of vegetation stuck up above us, the centre ornament should be conventionalized and "architecturalized" into harmony with the cornice. We like best to see it take the form of a geometrical pattern in moulded lines, which might be "run" upon the ceiling just as the cornice lines are run, and then finished by the addition of some simple ornament in the interspaces. Or if the large number of mitres is an objection to running the lines, at least the whole thing should be kept flat and shallow, in the same style as our model cornice, and not be of such a shape and weight as to suggest the wonder how it ever could be kept in its place. Figures 10 and 11 are suggestive of the style of thing which might be inoffensively used; not imitative of any natural form, but simply an arrangement of ornament, for the most part flat or nearly so, in geometrical forms; the one with the orthodox circular outline, the other in the lozenge form, which might be tried as a variation, often, with good effect.

These two orthodox modes of placing plaster decoration, however, in ordinary houses, leave the principal expanse of the ceiling a plain white surface, as uninteresting and bald as can possibly be. Of course this is sometimes utilized for painting, which is, generally, however, if it is to be at all well done, an expensive process, and cannot be expected to become universal. But why, with an impressive material like plaster covering the ceiling, can no ornament be attained by diversity of surface anywhere, save at the

sides and in the centre? It is surely possible to devise means for impressing on the finishing coat of plaster, while still wet, such a small diaper ornament as might relieve the dreary monotony of surface, and serve to connect the centre ornament with the angle-cornices. This attempt is at least worth making, and a much better effect would be produced if some of the extravagances of cast ornament now lavished on the centres and sides of the ceilings of our drawing-rooms were retraced, and the ornament more equally distributed over the ceiling, which might thus also afford a ground for a simple decorative treatment of colour, by laying in the ground of the diaper-work in a flat tint, so as to bring out the principal lines of the patterns, or by a judicious touch of gilding appropriately placed. We give a suggestive sketch of a portion of a ceiling with the centre part treated in this manner; but even a simpler pattern than the one we have shown might be perfectly effective, and would be, at any rate, a vast improvement on the ordinary expanse of flat plaster which seems to be commonly accepted as a sufficient finish to our drawing-rooms above, in whatever richness of design and materials, in the shape of carpets and rugs, we may tread under our feet.

If we have confined our remarks and suggestions to what must be considered simple and every-day uses of plaster in decoration, and have not given any illustration of its use in more elaborate forms, it is because we feel that the least encouragement there is to the use of so unsatisfactory a material in large and important buildings, and in highly ornamental and elaborate decoration, the better will it be for art generally, and for architecture in particular. In ordinary dwelling-houses, where it is impossible to go to much expense in decorating, the (at present) necessary introduction of plaster as an interior lining, furnishes, as we observed, opportunity and means for a certain amount of decoration not altogether to be despised, if judiciously carried out, when we consider the cheapness and ease with which it can be produced. But with regard to all buildings of a high class, and even of large houses where expense is less an object, the rules with regard to the employment of plaster ought to coexist, like the Decalogue, chiefly of prohibitions, "thou shalt not" predominating over "thou shalt." Even with regard to the angle-cornice of a room, which seems so universally accepted as a proper situation for the decorative employment of plaster, we should prefer to see, where expense will admit of it, the employment of a moulded beam, whether decorated with colour or not, which would then really form that bracket for the flooring above which our plastering friends fondly suppose is represented by their agglomeration of run mouldings. And as to some other employments of plaster which are not infrequent, we hold that they should be altogether abolished. Tinted capitals, for instance, are most unfit subjects for execution in plaster, seeing that the very aspect of the material at once suggests weakness, where we know that, if a column is doing any real work at all, strength is specially required. Under the like category come all the devices so common, even with architects by no means to be despised in their profession, of bracketed plaster arches, bracketed drop mouldings and pendants, and all those devices which represent plaster as doing what it never can do, or endeavour to cheat you into the belief that it is another material. Plaster in a certain degree increases the comfort (though certainly not the cleanliness) of our houses, and is susceptible of being made ornamental up to a certain point with good effect, if treated as what it is, viz., a thin coating artificially laid on to the wall, and capable of being moulded or impressed in simple patterns. So treated, it may be called an architectural material, though of the lowest grade. Endeavour to go beyond this point with it, and it at once becomes a sham, repulsive to the architectural mind, and ranking no higher than so much confectionary pie-crust.

The Yorkshire Tumuli: Incised Stones.

The Rev. Canon Greenwell, of Durham, has resumed his researches among the British grave mounds, on the estates of Major Stapleton, Wasmoor, near Helmsley. Though unproductive in Moor, near Helmsley. Though unproductive in the usual accompaniments of grave mounds, the two of the barrows yielded incised stones bearing the "cup" markings, analogous to those of the sculptured rocks and cist covers which we before described.

FRENCH UTENSILS IN THE MIDDLE AGES.

AFTER an interval of ten years since the publication of his first volume on French furniture from the Carolingian period to that of the Renaissance, M. Viollet-le-Duc has now issued the first part of the second volume. He accounts for this long delay by saying the extreme favour with which the first was received frightened him a little. He felt that he must make his work worthy of its reception: in two expressive words, "*succès obligés*." This installment of the second volume relates to utensils, and will be followed by a part on goldsmiths' work. As now proposed, vestments and trinkets will be treated of in a third volume, and arms and tools in a fourth.

Foremost amongst the utensils described and illustrated are *aiguillères*, vessels for holding water, used both in ecclesiastical ceremonies and civil life. There are seven ancient examples figured, beginning with a specimen from a ninth-century MSS., which shows that a classical form was then still in use, and proceeding through succeeding centuries with the eccentricities they ran into. One *aiguillère* is in the form of a bust, with the spout inserted over the forehead; another is a strong-limbed horse, with a tap projecting from its broad chest.

The French equivalent for our word plate, *assiette*, was not used till the end of the fifteenth century: before then the term was still retain was employed—*plats*. And it was not till the twelfth century that a plate was apportioned to each guest at a banquet: previously one porringer served for two persons. In still earlier times people helped themselves out of the general dishes with their hands, in the Eastern fashion, and either threw the *débris* of their repast upon the floor or left it on the table. In the simple days of grilled meats, before mankind came to a knowledge of ragouts and crimes, a slice of bread laid before each person was sufficient accommodation. Upon this primitive plate the portion of each guest was laid, which he either cut with a knife or divided with his fingers into morsels. With every change of dish, or course, fresh slices of bread were provided. The custom still in use of serving small game upon slices of toasted bread is a lingering tradition of this ancient usage. M. Le Duc also tells us that the most ancient French plates were similar to those of the present day, only smaller; shallower, too, if intended for solids, and deeper if meant for *les mets liquides*. Earthenware plates were rare. The poor ate off wood; the middle class, off pewter; and the nobility, off silver. An illustration shows a fifteenth-century contrivance to send a dish hot to table. Instead of burning the attendants' hands with the hot pewter or silver, the circular dish was placed on the top of a cylindrical open copper ring, furnished with handles and feet, and thus transported easily to table while very hot. This contrivance, called a *doublure*, is perforated with an ornamental pattern.

Under the head of *Bassins*, we are told that basins for the accommodation of washing hands after a repast were either double or accompanied by one of the *aiguillères* we have mentioned. Egyptian paintings and sculptures show the use of basins with their proper vases for this purpose, as do those of ancient Greece. Vignettes of Greek MSS. of the early centuries of Christianity prove the continuity of the custom. A vignette in a psalter of the ninth century, in the Imperial Library, shows one of these basins, furnished with a long, straight, hollow handle, finished with a lion's head, through which the contents could be emptied. This is figured, as is the celebrated copper basin, decorated with enamels, found at Soisson, now in the same library. Sometimes basins for this purpose were made of silver and gold. In a woodcut M. Le Duc shows us, laid out in a sumptuous apartment, a Medieval repast, at which is seated a lady of rank, by the side of whom a page is kneeling and pouring scented water from one basin, furnished with an orifice for the purpose, over her hands into a larger basin he is holding with his left hand below them. Another illustration shows us a Medieval toilet-basin, with a girl washing in it. It is wide, round, and shallow, and placed on the floor; consequently the person using it had to kneel down beside it.

The exigencies of an alphabetical arrangement bring us, shortly after this, to a utensil of a less domestic character,—the barrow, *brunette*. Here M. Le Duc corrects an error that has prevailed

in France with regard to the invention of this little vehicle by Dupin, in 1669. He says he has found mention of them in thirteenth, fourteenth, and fifteenth century MSS., and gives an illustration from a vignette of a MS. of the thirteenth century, of a man propelling a wheelbarrow, the form of which differs but very slightly from that now in use.

Of the gold candlesticks mentioned with so much precision in the old catalogues of household gods, we are told not one example is left in France, and only a few silver ones; but of bronze chandeliers, with one or several branches, there is still an incredible variety. Of the dozen illustrations the most curious shows us a dragon, with a supplemental head where his tail ought to be, on which is seated a stunted personage, holding a large outspreading flower, in the cup of which is the spike for the candle to be fixed upon.

This candlestick is of the same dwarfish uncouth character as the twelfth-century sculptures in Apulian churches. The most beautiful example given is the gilded bronze upright candlestick which once belonged to Mans Cathedral, and before that was part of the treasure of Gloucester Cathedral, and is now again in England. It is of twelfth-century work, and covered from the three lobes at the top to the three feet at its base with a mass of human and animal figures fantastically linked and entwined, of which only the four evangelists can be identified. On the rim is written what has been supposed to be an explanation of the design:—

"Loci: ouis: virtutis: opus: doctrina: refulgens:
Prelucet: int: vicio: non: tenebretur: homo."

There is a second legend within the bowl at the top:—

"Hoc cenomanensis res ecclesie Pociensis: Thomas
Ditavit eum solannum."

And round the stem, over its encrustation of figures, is wreathed a scroll, on which is written:

"Abbatia: Petri: Gregis: et: Devotio: mitis:
me: Dedit: ecclesie: acti: petri: Gloucester."

In the Middle Ages every house had its *dragoir*, either upon a credence-table or on the *dressoir*, which, full of confections, sweetmeats, and spices, was offered to every visitor on his arrival, and also after a repast. They were of various forms, but generally stood on trays on which they could conveniently be handed about. M. Le Duc illustrates a handsome specimen of a bowl form, raised on a stem with an octagonal base ornamented with little griffins at each angle, which has a dome-shaped cover. It stands upon a platen, or narrow oblong tray, with two handles to it, leaving ample room for the spoons to be laid on one side of it and the cover upon the other. This last was laid on the tray on its crown, within which were the *serviettes* for wiping the fingers of those who helped themselves to the dainties of the *dragoir*. In the house of the Dukes of Burgundy, where luxury was carried to its greatest height, those objects were of extreme richness. M. Le Duc quotes an ancient writing relating to these princes, where mention is made of seven *dragoirs* set with precious stones as part of the utensils in use at their feasts.

Close to these elegancies we are shown a curious utensil, which is also a piece of furniture, belonging to the toilet of the ladies of the Middle Ages, called a *damoiselle à atourer*. It consists of a circular stand about the height of a table, out of which rises, to the height of a woman, a twisted stem furnished with arms. One arm holds a mirror, the other a dish of pins; on the top of the stem is what we should probably call a "dummy," but which the Medieval gallants designated a *damoiselle*, on which the lady's head-dress was placed till it was required for wear; and the stand below served for the deposit of combs, brushes, and cosmetics, during the progress of the toilet. M. Le Duc says, the adornment of ladies' heads during the period from the twelfth to the fifteenth centuries was very complicated, and to that of the fifteenth, especially, the *coiffures* of noble ladies required an infinite care, and a long time to arrange them properly and becomingly; and it was only likely that the *gardes-robis* would contain utensils and furniture specially adapted for them. He gives an illustration of a lady in the hands of the tire-woman seated, on a large ottoman, before one of these *damoiselles*.

Turning over a few more pages, we come to an arresting piece of iron-work, arresting because of its gracefulness. It is of a wheel form, the rays from the centre passing out of

the rim and finishing in flours-de-lis, and the spaces between each spoke being filled in with what we might almost call tracery. Details show that this handsome disc turns upon an axis fixed in a tripod furnished with a long handle, and we find it is nothing more than a griddle, made beautiful by the mind and hand of the smith who fashioned it. The use of the axis was to turn the grill round and round should an undue heat below threaten to burn the meat dressing upon it. The original is in the *Musée de Cluny*.

In the vast goblet called a *hanap* we find another word which was once common to both countries, but which one only has retained. Only in the title of an officer of state do we now use the term as *hanaper*. The author of this dictionary of relics of old French times takes up this subject from Saxon times, when politeness required that two persons should drink out of one hanap, the first to drink saying, according to French rendering in an ancient MS. called *li Romans de Brut*, *Wes hal*, and he who received the goblet to empty it saying *Drinkel*. But the hanap is often of a capacity to hold more than sufficient for two persons. Though generally of a goblet form, we hear of its approaching a punch-bowl character in the instance of that which belonged to Saint Louis, described as a *coupe* or *petit bacin*. Sometimes they were furnished with covers, and more occasionally with lock and keys. A fifteenth-century hanap figured consists of two spheroids of different sizes; the larger, furnished with a short stem and footed base, being the bowl; and the upper, or smaller one, the cover. This is surmounted by a crown, which, when it is turned upside down, becomes a second hanap. This cleverly-concocted goblet was, doubtless, carried on a platen to those to whom it was offered, and the taster sipped from the cover.

French Medieval lamps, again, as well as lanterns, are of many clever shapes. The earliest lamps were identical in form with those of the Greeks and Romans, and in material with those of Pompeii, of *terre cuite*. Then Oriental intercourse produced the cup form, suspended by chains or dropped into tripods. But as these gave but a feeble light, thirteenth-century invention set the wick free again in a bronze vessel, supported by a chain from above. In the fifteenth century the lamp consisted of either a round or square bowl, having a stem rising from one part of the rim and bending over it, the bend being furnished with a hook or loop, for facility in hanging. The stems were handsomely wrought into ornamental patterns, and round one of the bowls shown runs an inscription: *Servo e me Cosumo altvi*, accompanied with a device of a pair of hands joined, a heart, and a dog.

In the matter of mirrors we must not flatter ourselves we have progressed as far as outlines go. A Carolingian mirror did not swing, certainly, but it stood upright on a stem rising out of a fitting base, very gracefully. It was made of polished metal, not glass, framed sometimes in goldsmith's work, made more precious with enamel, gems, and pearls. In the thirteenth century an attempt was made to utilize glass for this purpose, but the process of quicksilvering being then unknown, the result was not sufficiently satisfactory to banish the steel mirror before the commencement of the sixteenth century. Ancient mirrors were not, however, to be compared with those of "the modern" for size. A large mirror was the size of a plate; and one of less pretensions might have been secreted by a hole in her pocket. M. Le Duc figures a circular mirror, the frame surrounded with small balls, and the stem rising out of a disc.

There is a beautiful example of a *nef*, which, from the heraldry upon it, must have belonged to a Duke of Orleans. At the hanquet the *nef* was placed before the *seigneur*. It was of goldsmith's or silversmith's work, in the form of a ship, furnished with crew, masts, sails, and rigging complete. It contained, under lock and key, the spoons, forks, napkins, cups, salts, and spoons required for a repast; just as our modern caddy is supposed to hold the tea and sugar in safe custody. The name *cadenas* was sometimes applied to them. The occasion of their use was the fear of poison. In those days of undeveloped medical science, doubtless many deaths attributed to poison may have occurred from natural causes not understood or discovered. On the other hand, it is to be feared that many persons were hurried out of the world by poisons administered in their food. A Duchess of Orleans,

quoted by M. Le Duc, states that half the people of the court of Louis XIV. died from poison. The *nef* of the Duke of Orleans before us is of silver, with enamel. On the side-planks of the ship, as well as on the stern, are large shields, which form the doors to the cupboards within. Six lions crouching beneath sustain it in position on a platen called an *entablement de maçonnerie*. On deck, and on an upper deck, are many armed men, whose shields are ranged to form parapets round them. Five large hammers are flying. Old inventories mention a prodigious number of these *nefs*, in silver and gold, decorated with enamel and precious stones. Charles V. owned four of gold and twenty-one of silver gilt. Sometimes the rigging and sails were of silk. Contemporary with them was the *baril*, an ornamental barrel made to stand upon the table or upon the *dressoir*, to hold wines, scented waters, and condiments. These were sometimes of silver, likewise; sometimes of ivory and wood. One figured is supported on the shoulders of two youths at a sufficient height to admit of the goblet being placed below the tap, and these stand on a trefoil tray, so that the wine should not be spilled upon the credence, *dressoir*, or table. In the sixteenth-century wine-ragons began to be put upon the table; before then persons of rank handed their goblets to the attendant pages to be filled.

In the salt-cellar we find a similar display of ornamentation at this early period. These, when large, were provided with wheels, so as to be easily passed down the table. When smaller, and there were numerous guests, they were placed at intervals as with us. Some like the *nefs* were in the form of ships. They were generally furnished with lids. Examples of the pre-Renaissance work are very rare. The author, however, gives a thirteenth century low flat-topped pewter salt-box, of a hexagon form. On each of the six sides of these is a little panel, with a figure on it; and on the lid is a representation of the Annunciation, on a diapered hack-ground, with an inscription:—"*Beatus me facit Ave gratia Plena, Dominus Tecum.*" On the under side of the lid, which when thrown open, would be in full view, is a representation of the Crucifixion, with a legend:—"*Cum sis in pensis primo de paupere pensa: cum pascis cum pascis amice Deum.*" Less severe than this, and of infinitely more costly material, is a second example, belonging to the fourteenth century, in silver, gilded. An agate vessel holds the salt, and is mounted in the manner of a chariot, on a framework furnished with four wheels. A miniature chateau on the top forms a rest for the golden lid when opened, and a snake's head serves as a clasp with which to make it secure when closed.

A Merovingian pail even was a picturesque object, not narrowed at the base, but of equal diameter throughout, with flat iron hoops, with an ornament on them, and a flat ornamental handle. These wooden pails have been frequently found in graves in the north of France and on the borders of the Rhine. A vessel of precisely similar character was used throughout the Middle Ages as almoners' pots, in which broken food was given to the poor. They were occasionally made of copper, lined with tin. Some inventories mention almoners' pots, or pails, of silver; and that of Charles V. enumerates a *pot à aumône* of gold.

Under the heading *seringue* we see the most primitive of fire-engines, the syringe. In 1663 a fire was extinguished in Troyes Cathedral with a syringe. In 1700 the same edifice possessed several of these engines. It was customary, formerly, to make a reservoir of rain-water under the roofs of great buildings, to which was supplemented a syringe. Sometimes a little water was sufficient to avert a great calamity, and the syringe was useful in directing it upon the portion of the structure on fire. Troyes Cathedral still possesses one of these relics, dating from the sixteenth century. It is figured. Between the last two rings hindering its long cylinder, are the arms of the chapter, and the initials S. P., for St. Peter, the patron.

Of all the trenchers that were once in use in France there is no example in any museum. They were made of crystal, silver, silver gilt, and gold, and all have alike vanished. Upon them the carver cut up the viands, and also arranged the slices of bread destined to receive the morsels selected by the guests. They are mentioned frequently in inventories, and the vignettes of MSS. show them over and over again, but there is no specimen known for M. Le Duc to figure.

The gold and silver vessels of the French kings and of the Dukes of Burgundy, it will be seen from our occasional reference to their inventories, were almost incredibly numerous. M. Le Duc epitomises the inventory of Charles V., and in this abbreviated form its richness is startling: 36 doz. silver plates, 33 doz ditto silver gilt, and 72 of pure gold, besides innumerable pots, hanaps, *drageoirs bassins*, *aiguïères*, *nefs*, salt-collars, one in the form of a *nef*, 6 doz. silver-gilt candlesticks, 14 gold ditto, &c. And then the inventory of gold vessels set with precious stones and pearls exceeds even this in magnificence of array. Some of these possessions were relics, such as the *coupe* of St. Louis, with its ewer, the *coupe* of King Dagobert, the *coupe* of Charlemagne set with sapphires, &c.

An account of glass vessels, *verrierie*, brings this portion of the work to a close. There is a graphic description of drinking-glasses from the days when they could not be set down unless they were empty, till the more moderate times when they were provided with stems. One of the five illustrations is shaped like a cone and ornamented with spiral stripes. This is assigned to the Merovingian period. We have but dipped into M. Le Duc's work sufficiently to give our readers a taste of its contents. It is like an ancient French *drageoir*—full of good things skilfully prepared.

SUCCESS OF MODEL DWELLINGS.

THE report presented by the directors at the annual meeting of the "Metropolitan Association for Improving the Dwellings of the Industrial Classes," possesses an interest which is far from being confined to the shareholders in that undertaking. There are two points in the report to which we would call the attention of all those interested in one of the most important social and sanitary questions of the day: first, the financial aspect of the undertaking, and the result produced in proportion to the capital employed; and, second, the sanitary condition of the inhabitants of these model dwellings, as shown by the death-rate which prevailed in those occupied during the past year.

The Metropolitan Association appears to have embarked a capital of rather more than 100,000*l.* in its endeavours to improve the dwellings of the industrial classes, and, notwithstanding the large amount of capital which was during the year unproductive pending the completion of the buildings upon which it was expended, the result, financially, of the year's transactions was a net profit of 4,236*l.* 1*s.* This sum was sufficient to declare a dividend of 4*l.* per cent., and to carry forward nearly 180*l.* to the guarantee fund, which was thus raised to 4,000*l.* It appears pretty evident that when the buildings are all fully occupied there will be no difficulty in earning a secure 5*l.* per cent. upon the capital employed, after making ample provision for deterioration of property. This should be considered quite satisfactory: here is an employment for capital, with undeniable security, and earning a certain 5*l.* per cent., with the important recommendation that a most invaluable social reform is being helped on its way. Moreover, the payment of the 5*l.* per cent. prevents the inhabitants of these dwellings from feeling that they are the recipients of charity, at the same time that the capitalist can have the satisfaction of being charitable in one of the most needed and most useful channels, and literally at no cost to himself.

The report further tells us that during the past year the property of the Metropolitan Association has housed an average population of 3,531 persons, and this with an outlay of only 100,000*l.*, a great part of which has been spent upon property untenanted during a great portion of the year. Probably the investment of this sum of money will, during the current year, house 4,000 persons, which is really an important section of the class for whose benefit the association was founded. In this population of 3,531 persons 62 deaths occurred during the year, 38 of which were of children under ten years of age. These deaths showed an annual death-rate rather under 18 per 1,000, while the death-rate of the whole metropolis during the same period exceeded 24 per 1,000. This sanitary result is eminently encouraging, and when the social and moral effect upon the inhabitants resulting from the radical improvement of their dwellings is further taken into consideration, it appears astonishing that this

and kindred companies should have to complain of their efforts being crippled through the want of additional capital. This surely will not long be the case when it is more generally known that 100,000*l.*, judiciously employed, will provide improved dwellings, with all their attendant blessings, for a population of about 4,000 persons; yet such is the truth, if the figures in the report alluded to are to be relied upon.

There is yet another class of our London and other large town populations, which appears at present to have been somewhat overlooked by the various societies and companies for improving the dwellings of the poor. We mean the very lowest class of labourers and others, who can only afford to pay 1*s.*, or at most 1*s.* 6*d.*, a week for their lodging. This class is, no doubt, a difficult one to cater for, but it is one of not inconsiderable number, and it is the class standing most in need of sanitary, social, and moral elevation. We earnestly hope, therefore, that some efforts will be made to afford to a lower stratum of society some of the benefits which are now being enjoyed, and fully appreciated, by the inhabitants of the numerous tenements erected by one or another of the associations established for this benevolent purpose.

THE ARTISTIC TREATMENT OF PIERS, PILLARS, AND COLUMNS.*

BEFORE the Doric order was lannoching itself into eccentricities, and was still in that perfection of beauty we see in the Parthenon, another more richly decorated, and in some respects more complete, style, was, while gradually throwing off the marks of its wooden origin, assuming an important position in Greek art. The Ionic order, although through all time it preserved in a strongly marked manner the signs of its eastern origin, gave more scope for the variety in its enrichment, and lent itself more freely to the changefulness and ornamentation which, at a later period, the Greek artists came to desire.

In one most essential matter it differed from the Doric, and could claim the superiority of completeness over it in having a base; and this no small insignificant member, as if an early attempt to soften off the sharp junction between the shaft and ground line, but as homely moulded and well developed as if directly copied from its Assyrian prototype. Through all the changes the form of the column afterwards underwent, this feature, once fairly introduced, was never lost; and, although in later phases of art it may not be so richly moulded, it is always regarded as an essential part of the column. In the capital, no less than in the base, is the Asiatic origin of the order manifested. The voluted encorchements which, in the Assyrian example, formed so marked a characteristic of the style are retained, but with that alteration which was natural to those by whom it was again employed. As with the *bn*d capital, the upper and useless part was cut away, but, in imposing thereon a square thin abacus that did not fit itself to the projections of the capital, the Greeks were scarcely as fortunate as in their adaptation of Egyptian forms. We can, of course, only speak here of the finished specimens of the order as now found; but doubtless there must have been many tentative examples, traces of which have now altogether disappeared, which would hetero have linked on the graceful pillars of the Erechtheion with the grand columns of Persepolis and Susa.

The capital of this order depended less on colour than on form for its beauty, differing perhaps therein from the Doric. But, to a limited extent, we know that coloured materials were employed to heighten the effect, and the graceful curves of the volute were emphasised by the insertion of glass or marble in the eye. The columns of the Assyrian porticoes were usually arranged in antis; hence the difficulty of dealing with a capital, the sides of which differed from the front, only first presented itself to the Greeks. Instead of boldly adopting some such expedient as might have been suggested by the *bn*s of the Doric order, they attempted to manipulate the volute in a manner so meaningless and with a result so contrary to good taste, that all the refinement and delicacy of their finish could never atone for, and which, more perhaps than anything else, led to the abandonment of the order or its absorption in another style. In the portfolio of the British Museum

example enough is seen of the bad effect of turning out the angle volute of the corner capital, and the attempt to make the front and side to correspond. In the Temple of Apollo at Bassæ, where the internal order employed is Ionic, its treatment is very peculiar. The shafts are set against square pilasters, of which they form a part, and the three faces of the capital show each a pair of volutes which mire at the angles, having thus become more ornamental accessories, with little or none of that appearance of encorchement which was the *motif* of the earliest examples.

In the treatment of the shaft the original model was exactly followed. The flutings, as at Persepolis, were evidently applied to a circular shaft, not evolved from a square pier, and were separated by distinct fillets following the curve of the column. The necking, which before had not been used in Doric, was now frequently employed, as in the Erechtheion, to inclose a band of raised ornament, as eastern in its character as the rest of the work. The use of the necking is not here, however, very great; but we shall see, when it becomes allied to the bell-shaped capitals of the Corinthian order, how useful an accessory it is.

We have not yet referred to the entasis which is given to these orders, and which in force is peculiar to each. The Doric, like its model, is most marked, but in Greek hands became much more refined, as suited their less massive piers, and with a curved outline so delicate that it requires the most exact measurements to detect its form. The entasis of the Ionic shaft, while perfectly apparent, is less marked, as is necessary for its greater height in proportion to its diameter and the number of flutings given to the shaft.

Before leaving this part of the subject, it would be as well to instance, as additional proof (if additional proof be required) of the strong influence of Assyrian upon Greek art, the bull-headed capitals of the island of Delos. Were it not that they were not only used in a temple of Apollo, of undoubted Greek work, but in some cases forming parts of some Doric piers, they might be taken for eastern work.

At Delphi was found a fragment of uncertain date, which shows a remarkable difference from what we have already seen, and supplies us, perhaps, with the first hint at a coming change. It is a graceful bell-shaped capital of palm-leaves, turning over boldly, springing directly from the shaft without a necking, and surmounted by a square unrounded abacus. It looks precisely as if one of the palm-leaved capitals of Egypt, refused a little in its outline, had had placed upon it a Doric abacus, and used without further adaptation. What may be the chronological position of this fragment it is now impossible to say; but one of the earliest examples we know of, in the Corinthian order, betrays, though not to so marked a degree, its Egyptian origin. In the Tower of the Winds at Athens is a series of columns, with square abaci and bell-shaped capitals set about closely with leaves of the acanthus and water-lily, while the shafts are fluted and hairless. In the Choragic monument of Lysicrates, a slight advancement is perceptible in the adaptation of the Ionic volute to the capital, modified and lessened so as not to be incongruous, as a means of relieving the crude junction between the circular bell and the square abacus. But in this case the abacus has itself also undergone a change. The sides have been hollowed out on plan, and the sharp angles which resulted therefrom, and which have so had an effect in the late example of Hadrian's Temple, are cut off. But this new arrangement, although it might give an appearance of lightness and more refined delicacy of form to the abacus, paved the way for a total disregard for the uses of the capital, and its declension once more to be as useless a member, practically, of architecture as ever were the beautiful models of Egyptian art from which the Corinthian order was initiated.

But, before we pass to the further notice of this order, which only reached the completion of the first stage of its history in the hands of the Romans, and its highest perfection and advancement in the Middle Ages, there are one or two points to be noticed concerning the general arrangement of columns employed by the Greeks. The first is the rule never to use more than one order in the erection of a building, except only in such positions as will prevent their being seen and compared with each other at the same time; and this rule applied to the works of the Egyptians and Greeks was in perfectly good taste, as the repetition of such

* By Mr. J. Tavenor Perry. See p. 493, *ante*.

forms as were used by the former were never monotonous, from the great variety given to them by the coloured decoration; and with the latter, the form being so simple in itself, that it could not be more objectionable than the repetition of similar parts in other edifices. But when this rule came to be applied to late buildings enriched with sculpture and all the decorations the Romans lavished on their capitals, the result was not only monotonous, but altogether disastrous to invention, and there is little wonder that it ended in a complete degradation of the refined lovely forms taken from the Greeks, and the general disgust one often feels for an order which contains in itself so many essential elements of beauty.

A startling exception to this rule is found in the Temple of Apollo at Baesæ, already mentioned, where, among capitals of the Ionic order, is introduced one of a Corinthian character. Particular historical reasons are adduced to account for this, though, except to students of that style of art to which too often a careful study of the Five Orders leads, the result would be sufficient excess.

Another point is the intercommunities. Though regulated by the rules of proportion, these rules were not among the Greeks of that class unbending nature found in the pages of Vitruvius; and I think it must be evident, from a study of the examples of the best periods, that their rules were not so much those of arithmetical precision, as of a careful and cultivated eye.

Before the Romans, by the adaptation and alterations of the Corinthian order, and by the multiplication of examples throughout their empire, made it rather a feature of their own than of the Greek styles, they had brought to some perfection a form of column indigenous to their own country. This was the Tuscan, which, insinuating or allying itself with the Greek models, became better known and commonly used as the Roman Doric. It commenced among a people of an origin closely allied to the Pelagis; and numerous examples remain, particularly in the pilasters of the tomb at Cervetri, showing the similarity between the modes of ornamentation employed by the kindred races. This, as showing to a great extent the influence of wooden construction on their works, will account for the addition to the Doric order of a base, a feature afterwards employed almost without exception in the buildings of Italy.

But the style the Roman artist peculiarly liked when his art reached its zenith was the Corinthian, which became the favourite order for buildings of the more ornate class throughout the empire; and the remains of its graceful capitals and highly enriched friezes are scattered over the whole region of Roman influence, from Tadmor in the Wilderness to the pillars of Heracles. Wherever it was found it exerted an overpowering influence on the works of after times; and though for a while its Doric rival seemed to monopolise the attention of our earlier artists, it was the bell-shaped capital that the Middle Ages made the one and only form known throughout the best periods of his art.

The Romans, in their treatment of the capital, followed at first, without much alteration, their Greek models, with one essential difference. As the Greeks first used the order complete, they only employed it for smaller monumental works, so that the peculiar form which it appeared when the Romans came to employ it for their largest edifices; and the full absurdity of the form only became apparent when—the hearing surface of the abacus being reduced to the minimum, and the projecting and useless angles reinforced by the addition of the large volutes of the Ionic—that beautiful solecism was perpetrated, the Composite order.

We have not time here to dwell at any length on the varieties of these orders to be found throughout the world. In their Roman dress they are so well known by modern reproductions, and so continually before us in architectural schools, that any reference to example is unnecessary. The Eastern influence, which gave to the later phases of the art so much richness of ornamentation, frittered away in meaningless forms the finer ideas of earlier times. The buildings of Baalbec and Palmyra, covered with all the wildest excess of carving, or the strange distorted columns of the ruins of Tivoli, alike show the degradation to which the art was brought; and it is fortunate for architecture that ere all true principles were utterly lost, that sweeping desolation came which scattered far and wide her memorials, to

inspire future generations to emulate her successes, while they avoided those errors which had led to her decline.

When, in the year 500, Theodoric visited Rome in his office of king of Italy, he found the city in a much more perfect state than might be expected from the frequent sieges and troubles it had passed through. Awed by the splendour of its buildings, and interested in a preservation of its glories, he ordered a careful conservation of its monuments, and devoted large sums of money to this purpose. Although it has been too common among the Gothic invaders to seem barbarians unable to appreciate the refinements of art and the beauties of architecture, this name of Theodoric is associated with one of the earliest examples, showing a taste for cultivating the neglected arts. The tomb of Theodoric is an example of no new style, with little but its rude mouldings to distinguish it from the works of much earlier ages, yet showing signs of that returning power and vigour, infused by the new races, which afterwards covered Italy—and not only Italy, but civilised Europe—with buildings rivaling the monuments of Rome for their grandeur, and of Greece for their beauty. The grant of money Theodoric made for the preservation of Roman works was well applied, and architecture, instead of being thrown back on altogether first principles, had preserved to it some of the finest edifices of former times, enabling the later builders, though halting, and doubtful of their first efforts, to carry on this same style until it reached its completeness in Mediaeval times.

The basilicas erected in Rome during the two or three centuries which elapsed after the decay of the Imperial power, were almost entirely formed out of fragments of other buildings existing in the city, so that few, if any, exhibit the smallest improvement on previous works, and it would seem as if the very abundance of material ready prepared to hand rendered all artistic effort useless.

But while art in the West is sleeping, we must turn to the East and see how there it is active and carrying on its work. The provinces of Asia, we have already noticed, were marked by that excessive richness and luxuriance of imagination which ever characterized the arts of the East. The gorgeous styles of Assyria and Persia—never wholly lost in their particular seats, and carried on unmodified by other styles across the Indus to still greater perfection, refined by Greek influence and reinvigorated by Roman enterprise—developed into new forms under the Sassanian dynasties. Among the ruins of Tephnan, Ctesiphon, Diabekr, and other cities of Persia, we find many relics of a form of art, resulting from the partial fusion of these various styles, and giving already signs of some of those new forms, which were afterwards to exert so marked an influence on all Eastern art. The peculiar convex form of capital, which became a feature in Byzantine works, is here most commonly found enriched with graceful and consistent forms of decoration unlike anything of previous times with which we are acquainted. In the small capitals from Warka, now in the British Museum, we find some examples of that form so peculiarly Assyrian, which the Greeks brought to perfection in their Ionic; but these forms are rare, and the convex form must be regarded as the representative one of the style. Whence this form was derived, so unlike any of the examples which had been common in Assyria in former periods of her prosperity, though not unlike the later phases of the style as found in India, we cannot say, unless it owe its origin to that rude imitation of Roman Doric by provincial masons, to which we shall presently have to trace the commencement of our own more short-lived, but scarcely less beautiful Romanesque forms. The decoration frequently employed consisted of scale ornaments in slight relief applied to the capital, richly carved neckings, and an arched or running pattern on the abacus. The richness, as well as the refinement of this work, was carried to a very high degree of excellence, but it could never relieve the coarse and ungraceful outline of the capital and the equariness of its parts. The shafts appear to have been generally unduted and round, while the haecs seem to have had little to distinguish them from the more usual Roman examples. Indeed, there is little in the style to merit more than a passing notice, except for the one particular of the capitals, and the influence they exercised on the style to which we now turn.

When Constantine founded his city on the Golden Horn, he found that the arts had well nigh died out, and he had to lament that while

he might have the ability to make his new city rival Rome or Alexandria for size and wealth, it was only by pilfering from every province in his empire that he could succeed at all in rivalling them in the beauties of sculpture or architecture. The number of churches, palaces, and other public buildings he erected, as well as the wondrous statues and carvings of Greeks and Asia he brought together, proved an incentive to the study of the forgotten arts; while the absence of large ancient buildings in the new city, with the ever-present influence of the Eastern nations around, caused his works to be freer from the servile imitation which might have marked them in the West. Beside this, the Greek city of Byzantium was incorporated in the new capital of the East, and Greek, not Roman, artists were employed in the erection of the edifices, so that we can scarcely wonder that signs of life and beauty once more appear in art.

The city was, however, hastily and unsuitably built, so that ere long it gave place to more lasting buildings, worthier, not only of the capital of the East, but the centre of art and luxury. The western empire, and nearly all the provinces of the mighty dominion were falling continually under alarms and invasions, while in the city of Constantine life passed much more quietly, sunned by the splendour of a court rivaling all the state and luxury of Asiatic despotism. The many changes of government which it survived invariably left the power resident in the city, and that power one, with very rare exceptions, patronizing art or display.

Among the earliest buildings we have remaining is the church of S. Johannes, built in 463, affording us a good idea of the state of art so long posterior to the building of the city. In the atrium we have a column of similar proportions to the Corinthian, but with an unduted shaft, and a capital of the form like that I have already instanced from Asia. The carving is of that sharply-cut, well-defined character, so indicative of the style and unarranged in such the same way as the ordinary Corinthian cap. The termination of the shaft is more distinctly marked, and projects considerably before the hollow of the abacus, which is unadorned, but enriched with a band of sunk ornament. The entablature is complete in all its parts, with carved frieze, modillions, and a richness of carving luxuriating over the whole, but destroying none of its classicality. Contrast all this with a capital from the interior, and here we see the change that has taken place in the form of the capital where the requirements are different. The example is taken from the arcade of the gallery. In pure Roman examples we should have had a capital surmounted with its complete scrap of entablature; but here the entablature has quite vanished, or has been reduced to such form and smallness as to confound it with the abacus. The decoration is still Roman, but the spirit is that of a new and more perfect style.

In the great representative church of the next century we find the change still more complete and marked. At Sta. Sofia's the capitals have almost entirely lost the earlier form, and the entablature has disappeared or become fused in a more useful abacus. The capitals take the outlines of the Sassanian examples; the abacus, like them, is unadorned, square, and enriched with sunk ornament, and although the little projecting volutes and other signs of classicality remain to show their origin, the result evinces that complete emancipation from old forms and adaptation to new requirements which had commenced with the introduction of the arch as an ornamental feature as well as a constructive necessity.

But whilst these changes in detail were making themselves apparent in the column, a new feature was developing itself and taking a position in architecture of which little had been known before. The arch had already altered the proportions and height of the column, separated from it the entablature to which it had for so long been bound, and now the introduction of the dome brought with it a feature of greater massiveness and very different proportions to the pillar, but fulfilling much the same requirements. With the arch itself, little more than the height of the column in relation to its diameter had been altered, for the same arrangement which had held good through former times of small intercolumniations was as possible, and indeed as necessary, as before. But when once the architects attempted to raise on the intersection of the nave a solid dome, the necessity was apparent for placing at the chief points of support massive piers, capable of bearing the concen-

trated weight of the roof. The Roman arcades had already prepared the way for this, in the grouping together of pilasters, as in the Colosseum; and in the basilica of Maxentius we have a perfect example in form of the pier. But here it is only one in appearance, being a column with its piece of entablature complete, stuck against a wall, which really carries all the weight of the vault, so that the proportions of the order have not had to be sacrificed to the necessities of the case. In the earlier instances of Byzantine treatment of the pier we find it little more than a mere strip of masonry left between the openings, to carry the superstructure, thus going back, as it were, to the very first principles of building. But with the domical forms of construction, the weight to be carried above was far too great to be trusted on the single slender shafts of the usual orders; so that having no precedent to guide them, they introduced the great masses of masonry necessary for the purpose, with but slight attempts, as a rule, to disguise their bulk. This is the case in the churches of SS. Sergius and Bacchus, Sta. Sofia, the Dome of the Rock, where, however panelled with marble or enriched with moldings, the awkwardness and rudeness of the mass is very apparent. As the feature, however, became more used, or the architects gained more experience, we find the pier broken up into smaller parts, and built with a regularity more akin to our own late and more perfect examples in Medieval times. In the Armenian churches of Dighour, Pitzonnda, &c., the piers have simple square pilaster faces on each side, which are carried through without break to form the arches under the dome. At Ani, a little later, the piers are still further divided, and distinct caps given to them at the springing of the arches. The angle shafts often introduced in the piers were carried up the whole height, and not only suggested different proportions for the single shafts, but gradually led the way for introducing the complete compound pier sometimes found in late Byzantine work. A good example of this is figured in Salzenburg, from the church of Pantokrator, which might almost pass for a Western example.

But as this new feature was thus being slowly worked out for the new requirements of the East, the want of skill, and poorness of materials, was also bringing about the same change in the West. The first ideas of the workmen—if not the result of absolute necessity—may have been given to them by the buildings erected at Ravenna and elsewhere, under direct Byzantine influence; but whatever their origin, the result was, that the pier came to take as important, or even a more important, place in Western than in Eastern art. But there was this essential difference between the two styles in their treatment of it, in the latter it rarely, if ever, was to be confounded with the pillar, except, perhaps, only in the very late Armenian works, and never once appeared to have forgotten its origin as a mere slip of wall; but with the Western it soon became mixed up with columns in every possible way, and to a great extent lost its original form in the clustered shafts, which are *par excellence* the mark of Medieval work. And this is not all; the habit of using the massive pier intermingled indiscriminately with the column, caused them to act and react on one another in a manner scarcely noticeable in the East.

It is not, however, to Italy that we must look for the chief results of the introduction of this new feature. There we have, as it were, the materials which our builders used; for although the Italians worked to a certain extent in the Pointed style, there was never that fusion capable of producing the results to be found in the architecture of France and England, or the countries influenced by them. Hence it is from them we must draw our examples, and in them we shall find quite enough to show the gradual change.*

Alleged Subterranean Passage under Richborough Castle.—A correspondent draws attention to the discovery under Richborough Castle of a subterranean passage, which he says has been cleared for a considerable distance. It is some 6 ft. high and 3 ft. broad, and some hundreds of yards in extent. There are also, he says, passages leading in other directions, but these have not yet been cleared of the earth. The walls and roof of the excavated portion are said to be lined with rough stones and flints. We shall be glad to hear something more of this if correct.

* To be continued.

THE TRADES MOVEMENT.

Bath.—The master and operative carpenters and joiners of this city have, in order to prevent strikes, established a Board of Arbitration and Conciliation, which consists of six members from each section. Mr. Edward J. B. Mercer has been chosen by the employers as their secretary, and the operatives have selected Mr. Thomas P. Chapman. The Recorder has consented to become umpire.

Leeds.—There was recently a meeting of the Joiners' Board of Arbitration, with Mr. Jowitt as umpire, to arrange a dispute that had arisen as to the rate of wages fixed by Mr. Rupert Kettle a year ago. At that time, amongst the rules agreed upon was one providing that men of fair average skill should be paid at the rate of 6½d. per hour. On the part of the masters it was stated their understanding was, that the increase was ½d. all round, and this they had paid. Further, they stated that trade being bad, men offered themselves at a lower rate than 6½d., and were employed by the non-associated masters, and the associated masters, being in a minority, if they paid the full rate, would not be able to compete with them. The men, however, pointed out that the wording of the rule was clear,—that 6½d. should be paid to fair workmen. The umpire stated that if the men were determined to abide by the letter of the law it must be carried out, and after a long discussion it was mutually agreed that a man might be engaged without stipulation as to the wage; and that, after two or three days, he should be paid according to his worth.

Worcester.—The painters' strike, it is said, may now be considered at an end.

CONCRETE IN BUILDINGS: SHEFFIELD.

MR. THOMAS PRIDEAUX, a gentleman who has patented and worked a smoke-consuming apparatus, and who has also patented in England and France a new kind of concrete walling for break-waters and sea-walls, has just completed a block of dwelling-houses in Havelock and Brunswick streets, Sheffield. It is called Havelock-square, and consists of nineteen houses, each containing ten rooms, water-closet, bath-room, wine and coal cellars. The houses form three sides of the square, and the fourth side is occupied by stabling for the use of the tenants, and a house for the residence of the stable-keeper. The buildings are of pressed brick, built in the Anglo-French style, with white string-courses. The appearance is improved by heightening the pitch of the roof, in doing which three bedrooms are formed in the place of two attics, which are generally to be found in buildings of this class; while above them is a large garret fitted up as a laundry. One of the features in connexion with the building of the houses is, that the plastering of the walls and ceilings has been accomplished without the use of hair in the mixing of the plaster. Instead of hair, Mr. Prideaux has employed the common hench-shavings, which, after being chopped into certain lengths by a chaff-cutting machine, are ground thoroughly with the plaster. The result obtained is said to prove that shavings are of a more tenacious character than hair, for, notwithstanding that the walls and ceilings have been plastered several months, not a single crack or flaw can be detected in any of the houses. Another feature is, instead of using stone, a peculiar concrete is employed in the making of fireplace hearths, footpaths, door-stones, &c. This concrete is prepared from the very waste of the Sheffield steel-refining furnaces, viz.,—the refuse crucibles which, having done service in the making of steel, and having been changed by metallic action, and the heat of furnaces from fire clay into a substance harder than stone though more brittle, are broken into pieces and cast into the mortar-mill, with proportionate parts of gas lime and water. These are well ground together, and while in a semi-liquid state, the compound is run into the place in which it is required, and after being worked or trodden for a time, is allowed partially to set. It is then "dressed," and when thoroughly dry, looks as well as stone. The patentee has tried several experiments with this compound, only employing the ordinary building lime, but he finds that the use of the gas lime produces a concrete far harder than that by the building lime. In the process of mixing nearly the whole of the small of the gas lime is evaporated, and by the time the compound is "set" not a trace of it can be detected. The fire-grates in the houses are peculiar in their construction. In appearance

they do not much differ from those generally in use, but on examination it is seen that at the back is an air-chamber fed by apertures in the back of the grate. The outlets of the air-chamber are at the back of the fireplace, through parallel openings. When heated, the air passes through these openings into the fire, and the result is that nearly the whole of the smoke made by the fire is consumed. No cinders are left in the grate, but simply a gray ash. By the construction of the flues of the chimneys smoky fireplaces are prevented. Mr. Prideaux has found extensive use for his concrete preparation in the erection of boundary walls in the yard and the stable-keeper's house, which latter is entirely built of it. For the building of the walls, &c., the concrete used is much coarser than that used within. It is run into its place in plank moulds to the thickness of about 9 in., then a layer of rubble or any kind of stone or pot rubbish is laid on the top of this, then another layer of concrete, then another of rubble, and so on until the required height is attained. The walls are then allowed to dry, and are afterwards dressed over with the finer concrete and jointed. These works show that the rubbish of Sheffield is of value in building, and that two things, hitherto considered almost useless, furnace-pots and gas lime, when properly combined, form one of the strongest of concretes. It is with this concrete that it is proposed to cover the whole of the yards of the houses, the footpaths at the front, and other places where formerly tar asphalt was used.

FREE LIBRARIES AND MUSEUMS.

The committee of the Society of Arts, appointed by the council to consider and report upon the best means to be employed for the promotion of free libraries and museums, to which we recently referred, met again, on Monday last, at the society's house in the Adelphi, for the further promotion of their object. Lord Henry G. Lennox, M.P., presided, and there were present in addition General Eardley Wilmot, Captain Donnelly, R.E., Captain Festing, R.E., Messrs. Wilbraham Egerton, M.P., Edward Denison, M.P., George Godwin, S. Redgrave, Seymour Teulon, Hyde Clarke, J. F. Iselin, and James Hole.

The following resolutions, of which notice had been given, were adopted, after a full and free conversational discussion:—

"That free libraries and museums, maintained under the Free Libraries and Museums Act, should be regarded as parts of a system of national education, and assisted by funds voted by Parliament, in addition to local rates. That various old public libraries, as that of Archbishop Tenison, having been dispersed, it is expedient that legal provision should be made for the security, as public property, of all libraries and museums which are appropriated to the public use."

In the discussion on the first resolution entire unanimity was expressed upon the point that a comparatively small sum voted by Parliament in encouraging the formation of free libraries and museums was calculated to yield an ample educational return. Aid was absolutely necessary, in many instances, in the first step; the provision of a building and a moderate principal sum granted for this purpose, would greatly stimulate local effort in the formation of libraries and museums, and afterwards in their augmentation and proper maintenance.

In relation to the second resolution, Mr. Hyde Clarke stated that he had urged Mr. Ewart to introduce a clause into his Bill for the protection, as public property in perpetuity, of books, pictures, and such other objects as had been once devoted to public use. Mr. Ewart entirely concurred in the recommendation, but was unwilling to encumber his Bill with clauses or provisions not absolutely necessary, or that were likely to hinder its adoption. In the United States public libraries are under the protection of the State Legislature; and, on the Continent, of the authorities of provinces, departments, communes, or municipalities: the consequence of which is that these collections accumulate and are preserved; whereas in this country, from the failure of institutions, and the absence of any protective provision, valuable collections of books, devoted to public use, are frequently dispersed.

Lord Henry Lennox, the chairman, referred to his intention of asking a question in the House of Commons, with a view to obtaining Government sanction and assistance in the distribution to local museums and libraries of duplicate and redundant works of science and art, books, and other objects, now in the possession of national

museums and galleries in the metropolis, but perfectly useless. At South Kensington there were three pictures, exactly like each other in all respects, painted by the same artist; and there were many valuable drawings and works of art, by Turner and others, stowed away, out of sight, at the National Gallery, that ought to be, and should be, put to a far more worthy use.

There cannot be a doubt that a comparatively small public grant in aid of free libraries and museums, and the distribution of duplicate unexhibited works of art, and of unused hooks, would serve two important purposes (1), in directly stimulating important educational agencies, and (2) in abating the feeling of jealousy with which votes in aid of the great national museums and galleries of the metropolis are regarded in the provinces.

COTTAGE PROPERTY IN LIVERPOOL.

A JURY was recently empanelled in the Sheriff's Court to assess the amount to be paid to Mr. James Nohlet for fourteen cottages situated in Norfolk-street and Watkinson-street, which are about to be taken and pulled down by the corporation in making a new road from Parliament-street to Park-lane. The property consisted of three houses in Norfolk-street, three in Watkinson-street, and eight in a court running between the two. The latter, it appeared, were occupied by eleven tenants, and in reality formed eleven tenements. The property was shown to the jury by Mr. Wylie, architect and surveyor, on the part of the claimant; and by Mr. Walter Scott, for the corporation. Mr. Gully, in stating the case for the claimant, said the property was leased by the corporation for seventy-five years from 1851. It was situated close to the docks, and in the very centre of that part of the town in which the working population required lodgings and houses. The gross rental of the premises was 235l. 6s. when fully occupied. Generally fifteen years' purchase was allowed in cases of this kind to arrive at the real value of the property; and, taking it in that way, and adding the usual 10 per cent. for compulsory sale, they arrived at a value varying from 3,070l. to about 3,270l. Mr. Lewis Hornblower, architect and surveyor, said he thought 15 per cent. for leakage on the property in Norfolk-street, 20 per cent. for that in Watkinson-street, and 25 per cent. for that in the court, were very liberal deductions to make. That would make the total net rental 186l. 3s. 2½d. Fifteen years' purchase would bring the sum up to 2,792l. 8s., to which he added 279l. 4s. for compulsory sale, which made the amount the claimant was entitled to, in his opinion, 3,071l. 12s. Mr. Wylie, architect and surveyor, considered claimant entitled to 3,264l. 10s. Mr. Wm. Henry Wordley, architect and surveyor, was of opinion that 3,150l. would be a fair sum to award the claimant. The jury awarded the claimant 2,500l. (The claim sent in to the corporation was for 3,500l.)

COMPETITION WORKS FROM THE SCHOOLS OF ART.

The prize works of the Schools of Art of the United Kingdom submitted in national competition are now open to the public in the galleries overlooking the Horticultural Gardens, for want of space in the South Kensington Museum. All kinds of art work peculiar to students enter into this competition—drawing and modelling from the antique; painting of still life from nature, in oil or water-colour; and architectural, surface, and plastic design. The prizes consist in all of ten gold medals, twenty silver, and fifty bronze ones, besides "additional prizes" in the shape of works of art and hooks. There are also drawings and models in reply to premiums offered by the Plasterers' Company: the former for ornamental work over a doorway are unsatisfactory; the latter, ornamental brackets, include several creditable works, such as those by John Brooks and James Rowley.

The gold medal has been given to E. Healey (Bradford School) for a design for a town-hall, meritorious in many respects. John Trego (Conventry) gets the silver medal, for an outline design for a metal chancel screen. For the most part, however, the architectural works are poor. B. Perks (Kidderminster) has the gold medal, for designs for the decoration of a room, and deserves it; designs by Andrew Brophy (South Kensington) for dining-room decorations, in colours and gold, are also very creditable. H. Archer (Shef-

field) is well entitled to the gold medal awarded him for a large metal dragon; and the same may he said in the case of A. S. Palmer (South Kensington), who sends a painting of a dead pigeon and accessories, and of Mary Anne Mansell (South Kensington), for some very graceful designs for the decoration of cups and saucers. Alice Donkin (Oxford), and Frances Seymour (Dahlin), who have both sent studies of heads, ought to be heard of again.

In the gallery of approach are some very meritorious large medallion heads in terra cotta, by George Tinworth (Lamheth), to whom the bronze medal has been awarded.

The collection shows a considerable advance as compared with those of previous years, and includes a number of designs for manufactures, which might be advantageously carried into execution. Manufacturers, indeed, ought to feel it to be their duty and their interest to take up young men and women who distinguish themselves in these competitions, and so to aid the efforts now making to advance the arts of design in this country.

PROPOSED COURTS OF LAW.

MR. GLADSTONE on Tuesday last moved for the appointment of a select committee to inquire into the site and charge of the new Courts of Law. Taking into consideration the advanced period of the session and the great pressure of public business on Parliament, he thought it would be impossible to devote the time absolutely necessary to a fair consideration of the rival plans. Under these circumstances, the Government being desirous to give complete satisfaction in the matter, wished to associate the House of Commons with themselves in arriving at a decision. He would therefore move for a select committee to inquire into the site and charge of the new Law Courts. Mr. Walter wished the first minister to state if he intended that the particular plans for the proposed buildings should be submitted to the committee. Mr. Gladstone said that the designs would not come under the consideration of the committee, but the plans would. The motion was then agreed to.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ARCHITECTURAL EDUCATION.

At the closing meeting of this Institute for the session 1868-69, Mr. W. Tite, M.P., president, in the chair, Mr. Seddon, hon. sec., announced that the report of the General Committee on Architectural Education had been considered by the Council, who had passed the following resolutions based on certain propositions contained in the report:—

1. That a text-book or pamphlet should be prepared setting out where and when (in addition to office instruction) courses of lectures specially pertaining to the profession can be attended, and giving a limited number of books in which the best information is to be had.

2. That a certificate be granted to all who pass the voluntary architectural examination established by the Institute.

3. That a preliminary examination be held at the Institute in elementary subjects, open to all students who have been at least one year in an architect's office, provided that it be not made compulsory on those who come up for the voluntary architectural examination.

4. That the Institute should assist the Architectural Association to carry out the drawing-school which it was proposed by that society to establish this session.

The Honorary Secretary also announced that Professor T. H. Lewis and Mr. A. Waterhouse had been requested to prepare the text-book referred to in Resolution No. 1, which, when approved by the council, would be submitted to members at a general meeting next session; that a form of certificate had been prepared, and would in future be given to those candidates who pass the voluntary architectural examination; that the preliminary examination mentioned in Resolution No. 3 would be (with the approval of the general body) henceforth established in connexion with the annual voluntary architectural examination; and that the council were prepared to assist the Architectural Association drawing-class in accordance with Resolution No. 4. It was further stated that in regard to the other suggestions made in the report of the general committee, the council desired to retain under the control of the Institute the architectural examinations above mentioned, but that they could not at present entertain the proposition that passing the examination should be made a condition of future membership.

The following papers were then read:—

"A Description of the Tomb of Vitellia (an ancient Roman architect) in the Villa Volusky at Rome, and of some Remains in Palestine," by Prof. Donaldson.

"On Abyssinian Church Architecture," by Mr. W. Simpson.

Before the meeting adjourned the President announced that in consequence of the engagements of many guests who had been invited on the 26th inst., the Council had reluctantly found it necessary to postpone the dinner, which was to have been given in the Crystal Palace on that day.

The Conversazione will be held in the rooms of the Institute, on Thursday, the 1st of July.

BUILDERS' ACTION FOR LIBEL.

MATHER AND REED V. HACKWORTH.

THIS was an action for libel in the Court of Queen's Bench, Westminster, before the Lord Chief Justice and a special jury.

Mr. Serjeant Parry and Mr. Pearce were counsel for the plaintiffs; Mr. Serjeant Ballantine and Mr. A. L. Smith were counsel for the defendant.

The plaintiffs were builders and contractors, carrying on business in Charles-street, Westminster, and the defendant was also a builder and contractor, in St. John's-wood. In June, 1867, the Board of Works advertised for tenders to build a fire-brigade station in Adelaide-road, St. John's-wood. The plaintiffs and defendant sent in tenders. The plaintiffs' tender was for 1,650l., and the defendant's for 2,000l., and consequently the former was accepted. Owing to a dispute with reference to the title to the land, the works were suspended until February, 1868. They were then commenced, and again finally stopped on the 31st of March. On the 21st of March a letter, signed "Fair Play," was published in the *Builder*, and elsewhere, headed, "Low Estimates and How Carried Out." The letter referred to the tenders for the erection of the fire-brigade station in the Adelaide-road, St. John's-wood, and charged the plaintiffs with having used "a little dirty pit ballast, with a great deal of unscrubbed burnt clay (or hallast, if you will)" instead of "clean-washed Thames ballast," required by the specification. The letter also contained this sentence,—

"I would, in conclusion, ask what inducement can there be for respectable builders to enter into competition jobs, with so little chance of success, against the 'cheap jacks' of the present day?"

The defendant, Mr. Hackworth, admitted the authorship of the letter.

The plaintiff, Mr. Mather, stated in evidence that the materials were changed with the consent of the Metropolitan Board of Works' surveyor; but in cross-examination, it was shown that he had sworn in November last, in reply to certain interrogatories, that "the concrete used was composed of fresh-burnt blue lias ground lime and clean-washed Thames ballast, in the proportion of one of lime to six of ballast." In explanation, plaintiff said the words "Thames ballast" had been used in the reply in mistake.

Mr. Serjeant Parry then elected to be non-suited. The plaintiffs were nonsuited accordingly.

MANUFACTURE OF TERRA COTTA.

SIR,—Terra cotta as a decoration for buildings has latterly become a subject of much discussion among architects, not though as to its applicability, as I believe most architects are agreed that ornamented clay is more in character with a building which is built of brick than stone dressings, from the fact that it is the same material in an artistic form, whereas stone is a foreign material in an artistic form. In one of your former impressions of the *Builder* (early in 1868) you gave an interesting account of a meeting of architects on this subject, at which the mode of manufacturing terra cotta was treated upon at some length, and a diversity of opinions was expressed, the principal objections to the use of terra cotta being the contraction and the liability to twist in the burning. I may say that I have been connected with the manufacture of terra cotta and fire-clay in their various forms in England and Scotland for some years, and my experience convinces me that plain and ornamental blocks of large dimensions can be made with the greatest accuracy without any twisting whatever, and can be produced as sharp and distinct in outline as stone. I will go further and state that terra cotta can be produced in a rich variety of colours at a cost which will favourably compare with stone. The first important point in the manufacture of terra cotta is to mix a body slightly vitreous, and ascertain

carefully the amount of contraction per inch in the burning, and allow accordingly in the clay state. The next point is to make the articles hollow, and allow them to dry when finished gradually without any heat, excepting a dry atmosphere, such as can be obtained in any building which is covered in. The only matter to be considered is the time required in drying, which is really of no importance if the work be commenced early. As regards the burning, which is an important consideration, a circular muffled kiln should be adopted, with a good number of fires in proportion to the size of the kiln (the circumference of the inner case of the kiln should never exceed 12 ft., by 11 ft. high, so that the heat can get a good "grip" of the whole interior). When the kiln is lighted it should be allowed to go on what is called "slow fire" for at least three days and three nights; that is to say, the months should be gradually filled up with coals until that time, after which the heat should be worked up to the pitch required. As regards the manufacture of terra cotta in colours, I have found the following plan to work well. Mix the various colours with a portion of the clay which forms the body of the material into a slip or liquid, and lay them on the moulds used with a camel-hair pencil, then fill up the mould with the clay (also made into a liquid), and allow the mould to absorb it until about half an inch thick, after which pour out the remainder. When the coating on the mould has become slightly hardened, take some clay (the same material as used in casting), and fill up to the thickness required. When sufficiently hard, strip the mould, and there will be produced an article, with a coloured surface, and of equal contraction with the main body. When it becomes what is termed "hard green," wash the surface over with a transparent glaze, and when burnt you have a glazed coloured surface, which is quite indestructible. The foregoing plan I have found to act well, and believe it might be adopted generally with great advantage in the decoration of buildings, as it would resist any atmosphere, would never require painting, and would wash perfectly clean with every shower of rain, thereby effecting a great saving, and what is of far greater importance, would be the legitimate decoration of a brick building.

ALPHA.

THE GRAND PUMP-ROOM HOTEL, BATH.

This new establishment has been formally opened. It occupies the site of the White Hart Hotel. The exterior corresponds with the Stall-street elevation of the Grand Pump-room and its colonnades. The baths are not yet completed. The public coffee-room is the largest apartment, occupying the whole of the northern wing, which is 54 ft. long and 21 ft. wide, exclusive of a recess 20 ft. long and 14 ft. wide. The grand staircase is of stone, with cast-iron balusters and mahogany rail. There is also a lift to the upper floors, which will admit of bath-chairs ascending and descending. The passages and chamber floors are covered with kamptulicon, and beneath the carpets with which the rooms are also covered. The works have been executed under the direction of Messrs. Wilson & Wilcox, architects; by Messrs. Bladwell, mason; Rideout, carpenter; Llewellyn & James (of Bristol), plumbers; Packer, slater, plasterer, painter, glazier, and paperhanger; and Phillips & Wilcox, smiths, gasfitters, and bellhangers. The hotel has been erected at the cost of a company. The town council have had permission from the Treasury to borrow 10,000*l.* to build the baths.

SURVEYORS.

Cockermouth.—The authorities here have dismissed their surveyor, Mr. Middlemiss, because, as it seems, he had given in his resignation, which would have expired in a month, and because he did not continue to present himself before "the Board," but had employed a "foreman" out of his enormous salary of 80*l.* per annum (for "carrying out the whole of the sanitary improvements in Cockermouth"), to act for him while he was in London. This, and such as this, was treating the Board "with the greatest contempt," so that they voted his "dismissal" by a majority of six to five,—a donkey-thing, which pleases them, and can do no harm, we should think, to their late surveyor.

Penzance.—The borough surveyor, Mr. John Matthews, has resigned his office on account of ill health. The reading of his letter of resigna-

tion in the town council, was followed by a spontaneous, warm, and general testimony to the worth of their surveyor, to his indefatigable labours, his ability and tact, and his strict integrity. Nearly every member present joined in this testimony, and many expressed their deep regret that illness should threaten to sever a connection of twenty-five years. Finally, it was left to the secretaries of the committees to consider what plan may be adopted to secure the advice of Mr. Matthews as a consulting engineer, to mark the council's sense of his invaluable services, and to appoint his successor.

St. Alban's.—The Local Highway Board have passed a resolution, increasing the salary of their surveyor, Mr. Wells, from 180*l.* to 225*l.* a year, and allowing him a gratuity of 20*l.* "for the efficiency of his past services."

COPYRIGHT OF ARCHITECTS' WORKS.

The President and Council of the Royal Institute of British Architects have addressed a petition to the Lords Spiritual and Temporal of the United Kingdom in Parliament assembled. It sheweth,—

"That architects are liable to considerable injury in the piracy of their designs and inventions, and that other parties can and do copy and appropriate to themselves such original ideas without any benefit or remuneration to the authors.

That it is therefore desirable to afford protection to architects for the copyright of their works by including works of architectural art under the definition of works of fine art in the Fine Arts Copyright Consolidation and Amendment Bill.

That such copyright should extend to their executed works or designs.

That the copyright of an architect in any work executed, or in a work proposed to be executed, should not pass to the employer, except under special agreement, but remain with the architect; and that the design in the drawings and specifications prepared for the purpose should still remain so far the property of the architect.

That copyright of architects' productions should extend to the same period as to authors of other works of fine art.

Your petitioners therefore most humbly pray your Lordships that, in the Bill introduced in your Lordships' House for consolidating and amending the law of copyright in works of fine art, provision to the above effect be made for the protection of architects in a manner similar to that for authors and inventors."

CLERKS OF WORKS.

Sir,—Your "Young Clerk of Works" in the *Builder* appears to think that he has some claim to be called a clerk of works through being what, according to his statement, I should call an apprentice to a clerk of works, which puts me in mind of the Irishman asking a learned judge to take his boy as an apprentice, and make him a judge "like your Honour's own self." And with your permission I will try to explain to him why I consider a man from the ranks ought to make the best clerk of works. I learned my trade with my father's men in the country, and having a desire to learn something more, I came to London and obtained employment with one of the best firms, where, after working for two years upon one job, I was sent out in charge of a small job as the working foreman, and at that time we used to work until we had satisfied ourselves that we had done a fair day's work. And here I would remind our young friend that until a man has worked himself, he has no right to be placed over others, as he cannot know when a man has done his duty at the various jobs to which he may be put. From this job I was sent to others, until I was placed upon the list as a recognised foreman. Now, with a good recommendation, I obtained an appointment as a walking foreman. This made me acquainted with the various merchants in the trade, and their prices, with an insight into the docks, and with the opportunity of knowing and inspecting the various descriptions of timber, which, though not being known by architects, had never been mentioned in a specification. Our works being extensive, and being carried out under five different architects; at one time I had the benefit of their experience through being in almost constant contact with them. At that time our works extended to a circle of about 12 miles round London, so that I had the chance of seeing how to manage the soapy sliding clay of

Norwood, and the solid bottom at Kensington. Since that I have carried out works in the Fens of Lincolnshire, also upon the Romney Marshes, and at many other places; and if our young friend had been with me through all this, he would have found out that there was something more than being able to make a working drawing required to make a clerk of works. I have picked up many of my workings from the sand in the road, sketched with an umbrella by more than one architect under whom I have served.

I will just hint to our young friend that he never can become a clerk of works at one place, but must travel a little.

AN OLD CLERK OF WORKS.

ALMSHOUSES AT SALISBURY COMPETITION.

Sir,—Last week a notice of a competition for some almshouses at Salisbury appeared in your paper, with a premium of 10*l.* offered for the best design. I have no doubt that many young architects eagerly embraced an opportunity of earning for themselves a small work like this. On inquiry, however, I found out that it is not intended that the successful competitor shall carry out the work, for the successful drawings are to be handed over to the surveyor.

This is at best a gross insult to the profession, and a systematic piece of jolliberry which it is the duty of architects to set themselves against. But, sir, the intentions of the committee were not made public till the following week; this has, of course, caused a great deal of valuable time and money to be wasted by men who can little spare either, and many who would never, simply on the chance of winning a paltry 10*l.*, have begun to prepare a set of drawings to supply the incompetency of a local surveyor. I trust you will give publicity to this in your valuable paper.

H. S.

DRAINAGE AND IRRIGATION; BROMLEY.

ON the 17th inst., a deputation from the Local Board of Bromley, in Kent, had an interview with the Secretary of State for the Home Department, with reference to the drainage and sewerage works in contemplation at that place.

The immediate object of the deputation was to obtain a further inquiry into the merits of the scheme proposed by the Board, under the advice of Mr. Arthur Jacob, C.E., who prepared the necessary plans and estimates. The inquiry was requested with a view of obtaining the sanction of a loan of 54,000*l.*, to assist in purchasing the land required for the purpose of irrigation and carrying out the necessary works.

The deputation comprised Mr. W. D. Starling, Dr. Farr, Mr. Holt, Mr. Hughes, Mr. West, Mr. Muddif, Mr. Chambers, Mr. Ryle (of Parliament-street), Mr. Latier, clerk to the Board, and Mr. Jacob, engineer for the proposed works.

The Right Honourable gentleman, in his reply, alluded to the fact that the proposed project had been most favourably reported upon by Mr. Morgan, Government inspector, who conducted a former inquiry on the subject. While admitting the soundness, validity, and engineering merits of the project, Mr. Bruce regretted that at present he was unable to give a decisive answer to the request of the deputation. He would, however, take it into consideration, and advise a further investigation of the whole question, with special reference to allegations put forward by the adjoining landowners in the matter of residential damage.

MASONS' MARKS FROM INDIA.

I HAVE read with great interest the extremely interesting lecture of Mr. G. Godwin, published in your No. 1,364,* on Masons' Marks in Various Countries, and as I have collected those of the North-West Provinces of India for some seven or eight years, and as these are not touched upon in the article in question, I think some illustrations of them might interest your readers.

From their nature I am of opinion, with Mr. Godwin, that many of them are ancestral. Some are undoubtedly the arbitrary signa adopted by a craftsman to mark his work, *e. g.*, a hatchet or nail.

In parts of large and ancient buildings I have often found as many as perhaps forty or fifty stones near to one another, marked in a similar manner. The same man probably dressed all these stones on five sides, leaving the rough side innermost, on which he set his mark.

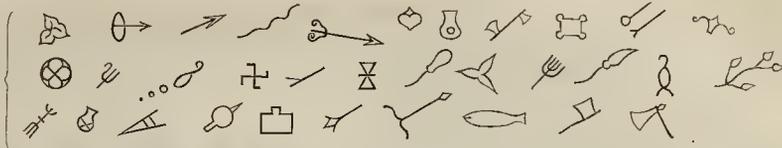

This mark would then be useful in computing the amount of work performed, which was often paid for by contract; and this is indeed the practice at the present day at the quarries near Allahabad, where the stone was obtained to build the abutments of the great Jam na railway-bridge.

Some men, it will be seen, used mere fanciful devices, as a bird, a scorpion, or a bow-and-arrow. Others, again, employed a letter, perhaps the first of their name.

On a black stone roof in small tower in south-west corner of Atallah Mosque.

FROM SUDDYN,
UPPER ASSAM,
J. A. S., p. 467, 1848.

Of course, the most common devices were crosses, circles, squares, triangles, or double triangles, the last being a Freemason's mark.

On many stones directions in Sanscrit characters, such as *right hand, bottom of pillar, upright &c.*, were cut; and these alone, from their character, are useful in assigning an age to the building, if found in the position in which they were originally placed.

Thus, in the remains of the Buddhist monasteries at Benares, found at Bukharya, Khind, and elsewhere, the characters in which these directions are cut are those which were in use during the much-disputed Gupta dynasty; and, hence, as we know that Fa Hian, in the fourth century A.D., found many such monasteries at Benares, we are confirmed in our views as to their age by the finding of these incised masons' directions.

The subject is, however, not of that importance which I was disposed to attribute to it when

I first took to the study of it, on account of the manner in which, especially in the East, the son copies from the father, and thus destroys the value of the type for fixing a date.

The same remark will, in a great measure, apply to ornamentation, and even to the clay figures and toys sold in the country fairs.

My friend, the late Mr. Henry Christy, whose beautiful collection in Victoria-street he bequeathed to the nation, pointed this out to me in the Mexican toys, whistles (clay), &c., which are simply reproductions of the most ancient forms.

In the plate all the varieties before alluded to are amply illustrated. Almost every figure explains itself; but I may mention that the characters of the instructions are those in use in the Gupta dynasty *circa* 300 B.C., and were translated for me by Bahi Rajendra Lalla Mitra, our first Bengali archaeologist.

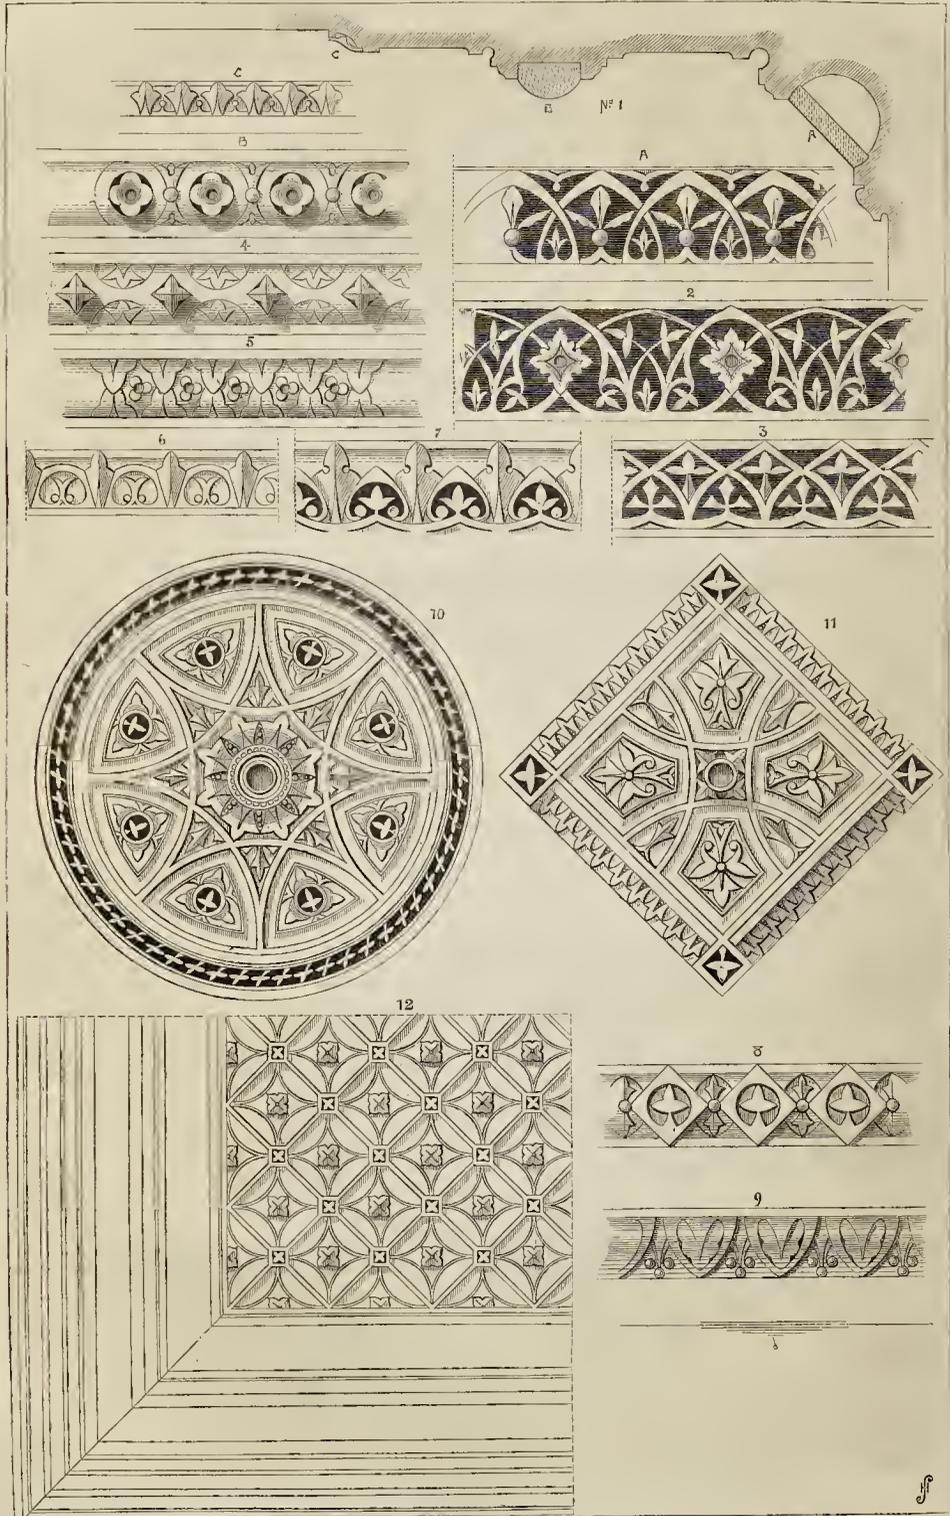

The figure of the cock is curious, and from its

position must have been incised on the stone when placed, which was probably during the Mahomedan occupation, A.D. 962.

I have added a line of masons' marks from Upper Assam merely to show how they correspond with those of India. Many of these marks are to be found in the caste-marks as recorded in King's "Gnostics."

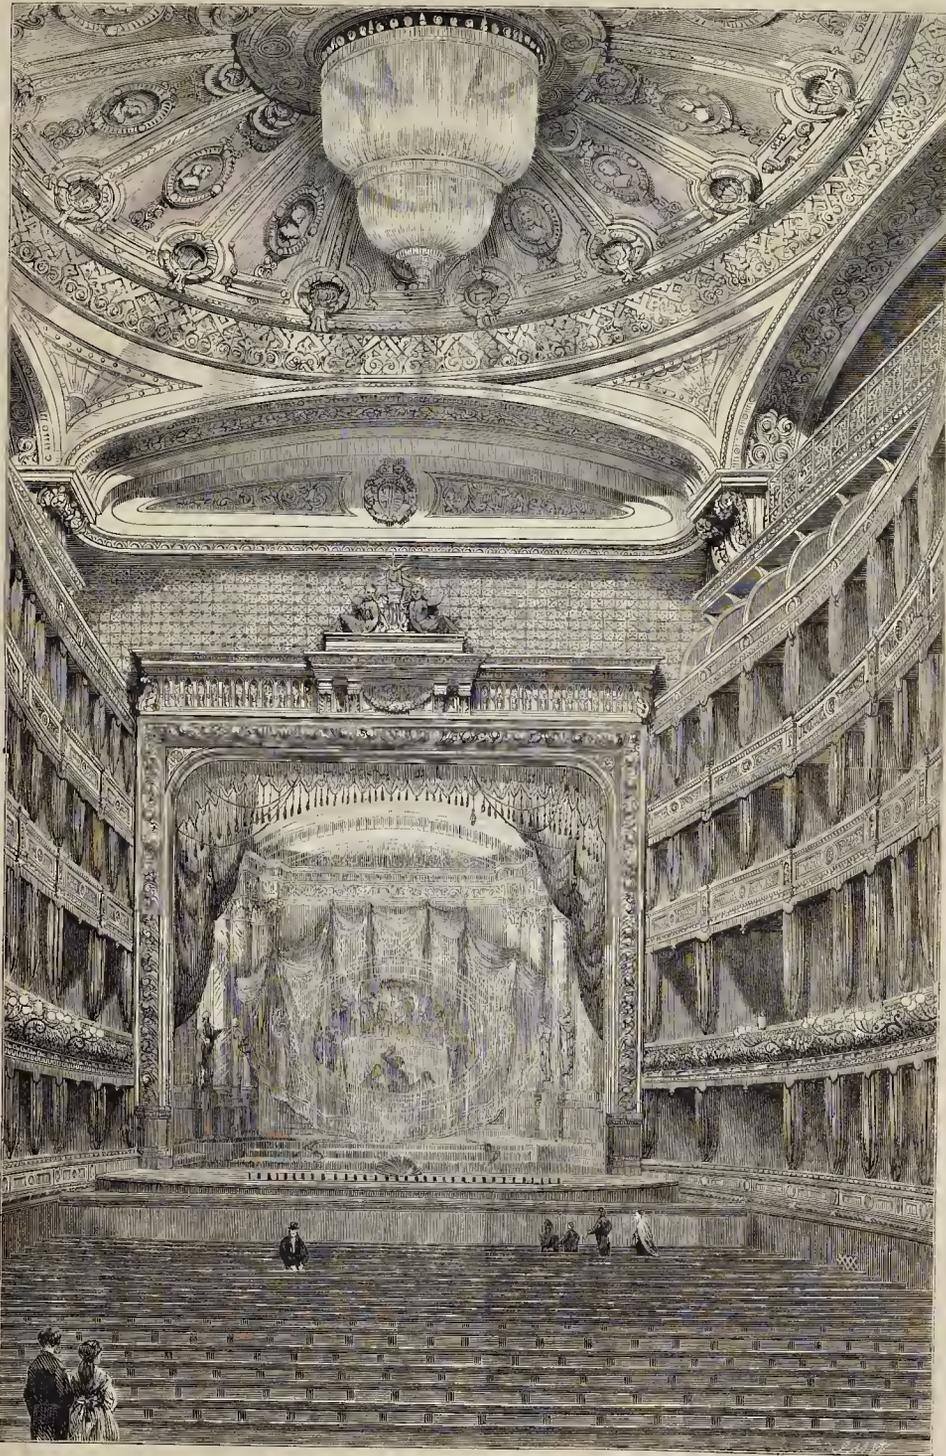

The swastika, or Hammer of Thor, as it is called in Mr. Godwin's paper, is well known as the Brahminical sacred mark, and it is common amongst Mediaeval and modern masons' marks. The hour-glass form is also common; whilst bows, arrows, tridents, together with simple and compound geometrical figures, are most general. I think that all masons' marks which may be found should be put on record; hence this note. A comparison of them may lead to a trace of how the holders of the old landmarks have been scattered, and prove of general interest.

SUGGESTIONS FOR THE USE OF PLASTER IN DECORATION.

[See ante.

HER MAJESTY'S THEATRE, HAYMARKET.—MESSRS. C. LEE, SONS, & PAIN, ARCHITECTS.

HER MAJESTY'S THEATRE, HAYMARKET.

We have on several occasions referred to the rebuilding of the burnt-down Opera-house, in the Haymarket, and in our last volume gave comparative plans of the old and the new house.* We now add a view of the Interior looking towards the stage, and will give a section in an early issue. From the illustrations, and our previous notices, all the dimensions are obtainable. It will be seen that there are now four tiers of boxes in front of the stage, and four tiers and an additional half-tier at either side. The space between the upper half-rows of boxes is thus gained for amphitheatre stalls, and a wide lofty amphitheatre behind them. Above these, again, is a back gallery, with the usual narrow side gallery running above the boxes. The boxes are larger than of old. They have about 6 ft. frontage, with heights according to the line of 7 ft. and 9 ft., with depths varying from 7 ft. to 12 ft. The Queen's box, seen in the view, has a private entrance and a public State entrance, both of stone stairs between walls. Behind the royal box are waiting-rooms. All the tiers of boxes are so built that there is no need of columns for the support of any part, and the partitions between them are so arranged that during the winter season they can be removed in the course of a day or so, and almost the whole of the curve formed into the unbroken balcony of a dress-cirque. Thus it will be seen, like Covent Garden, for winter performances. From the outer walls a series of wrought-iron brackets have been built out, radiating towards the centre. These midway from the wall are supported by a series of cast-iron columns, which extend from the basement to the roof. The broad passages between these iron columns and the walls are filled up on the inner theatre side with walls, and arched roofs overhead. Then there is a distinct fireproof passage round every tier of boxes from top to bottom. The weight of the boxes themselves is carried on that part of the cantilevers which projects beyond the columns.

A triumphed achievement in gilt carving, representing Apollo supported by Tragedy and Comedy, the work of M. Prolat, occupies the centre at the top of the proscenium. The ceiling, which is circular, is tinted in blue and gilt, and in each of its radial compartments is an oval panel, painted in imitation of a cameo, and containing the portrait of some famous composer. The names are,—Beethoven, Handel, Mozart, Rossini, Meyerbeer, Verdi, Bellini, Donizetti, Weber, Anber, and Cherubini. The prevailing line of the decoration is a pale salmon, picked out in cornices and panels with a variety of tints, and with enrichments of gold. The panels on the grand tier are divided by modelled trophies representing musical instruments, and other symbols have been executed in relief on the various tiers. The chandelier is 12 ft. in diameter and 18 ft. high.

Twelve feet below the stage is a mezzanine floor, and the total depth below the stage extends to nearly 30 ft., where the drums are placed for hoisting the scenery. It is not intended to have the usual sliding scenes on the stage. They are nearly all, if not entirely, to be what are technically called "cloths"—that is, scenes not painted on framework, but on loose canvas, with heavy rollers at the ends to keep them firm and stiff in their places when lowered. The advantage of this plan is, that it avoids the noise, and bustle, and labour of scene-shifting, the scene being merely raised up or lowered beneath the stage like an ordinary curtain. The side scenes, too, are not intended to be run in the ordinary wooden grooves, which constantly occasion embarrassment and delay. These scenes will simply be taken down 12 ft. below the stage into the mezzanine floor, and then run in grooves without requiring support from above. The house is built in a horse-shoe curve, 70 ft. deep from the curtain, by 56 ft. wide in the middle.

Mr. Drummond had charge of the stage arrangements. One of the principal improvements claimed is the increased facility with which almost any extent of the stage floor can be let down or raised as occasion may require. A space of as much as 46 ft. by 19 ft. can thus be raised or let down at once to the height or depth of 8 ft. The painting-room and carpenter's shop have been removed from their former position above the auditorium to one side of the part behind the scenes—to a space formerly occupied by the old Bijon Theatre—where the scenes are no longer painted in a horizontal but in a perpendicular position.

The footlights, as in some other recent theatres, instead of burning up, burn down into iron lines, under an artificial pressure of air, which also does duty in carrying off the smoke.

On a level with the grand tier of boxes is a chief saloon, answering to the foyer in a foreign opera-house. The size of this is 58 ft. by 20 ft. Each tier of boxes, as well as the amphitheatre stalls, has a ladies' saloon.

Mr. William Telbin, sen., has painted a very beautiful act-drop—an architectural composition of columns and white satin drapery, in the centre of which is an adaptation of Raffaele's "Mount Parnassus," in the *Stanzas* of the Vatican. The figures in this work have been painted by Mr. John Absolon, and the effect is very good. For the purpose of ventilation there are two of Gruney's stoves, an air-chamber of 25 ft. area, and an opening in the ceiling of 12 ft. diameter. The roof of the theatre over the auditorium is carried by four wrought-iron girders, 90 ft. in span; whilst the roof over the stage is supported by five wrought-iron girders, 56 ft. span. The number of persons Her Majesty's Theatre will accommodate is said to be about 1,800 for opera, and 2,500 for dramatic representations.

The architects are Messrs. Lee, Sons, & Pain. Messrs. Strode & Co. had charge of the gas-fittings. The whole of the work has been carried out under the superintendence of Messrs. Trollope, the contractors. The contract between the Messrs. Trollope and the Earl of Dudley was signed on the 28th of May, last year, and the house was completed in ten months, at a cost of about 50,000l.

How the theatre will be utilized remains to be seen. The lessee under the Crown, to whom the freehold belongs, is the Earl of Dudley, who has an unexpired term of, we believe, twenty-four years. Mr. Mapleson is the lessee in possession under the earl, with a very short term unexpired.

AIR-TIGHT COMPARTMENTS IN SHIPS.

As most first-class ships are already divided off into several compartments, each capable of being shut off water-tight from the rest of the vessel, there would not be any very great difficulty in rendering such compartments air-tight, by closing down the hatchways upon india-rubber padding, &c., which would ensure any part of the cargostored in such compartment from being destroyed by fire; and for two reasons:—

1st. If from any compartment in which goods were closely packed, a certain amount of air were extracted—say, reducing the atmospheric pressure some 2 lb.—without for a time (suppose a few minutes) letting in any more, a portion of heat and air would be withdrawn from the most internal part of any bale, and, in fact, from every nook or part of such compartment, no matter how closely packed. Then let in the fresh cool air, which would find its way thoroughly through the cargo. By from time to time continuing some such means, any amount of closely-packed goods could be ventilated, and hence kept cool and free from spontaneous combustion in either warehouses or holds of vessels.

2nd. If goods be on fire in a compartment capable of being made air-tight, air being extracted to the value of 2 lb. pressure from such compartment, and then only nitrogen or carbonic acid gas being let in to fill up the partial vacuum; continuing the operation, in a very short time a fire, which otherwise would be most unmanageable, would be readily influenced and extinguished by such atmosphere becoming entirely unfit for combustion.

Carbonic acid gas and nitrogen can be readily obtained anywhere by burning charcoal, or wood, &c., in any vessel or chamber, inverted, with its open or lower end immersed in water.

This operation has the advantage of not destroying property—at least, food and a few things excepted. Therefore, would it not be well for our assumed fire-proof warehouses and ships to be air-tight, or practically speaking so?

A SURVEYOR AND ENGINEER.

The Morley Water Works.—These works have been opened with some ceremonial. The fire apparatus was attached to the hydrants in various parts of the town, and the water was thrown over the buildings to the great delight of the inhabitants. In the evening Mr. Joseph Armitage Haigh, the chairman of the Local Board, was entertained to dinner at the Dartmouth's Arms.

THE WINDSOR ALBERT INSTITUTE.

Sir,—In your impression of the 5th inst. there appeared a letter signed "Bacon & Bell, Architects," which purports to be fair and legitimate comments on a letter of mine with respect to the proposed "Windsor Albert Institute." I have, hitherto, not had time to notice it; indeed, I hesitated whether I should do so at all, simply because there is not the slightest ground for the construction your correspondents have been pleased to put on the proposal made by me, and the motives which induced me to make it. As to the competition, which they seem anxious to remind your reader's took place three years ago, I think it would be as well, perhaps, if they were to let that little matter rest in peace. I have no desire to trouble you with a long letter in answer to their distorted statement, as the facts they have very ingeniously suppressed. Why did they not inform you that a public meeting had been held some time back of the members and those interested for the express purpose of considering the question of abandoning the scheme altogether, and after a warm discussion, the meeting was adjourned, and so stands until the early part of next month? Why did they not further state that it is pretty generally understood and believed by those who wish it well, that the said Institute will not come to anything under existing circumstances; and, moreover, that some of those who have given their subscriptions, talk of writing to have them returned, so that they may apply the money to some other charitable purpose?

Such are the facts, and it was under these circumstances I was induced to come forward and state what I was disposed to do, and that through the public press, so that it might stand clear of all parties, and not in the spirit or with the object which Messrs. Bacon & Bell invidiously impart to me. I simply wished, as the scheme was likely to fall through, to come to the rescue; but if it can be carried out, no one will be better pleased than myself. However, should the reverse be the case, perhaps those gentlemen will come forward and do what is proposed, and reap the benefits which they insinuate I wished to deprive them of; and of one thing they may rest assured, I shall not rush into print and impute to them other than the proper motives.

I may further be allowed, in conclusion, to say, that it would be rather an unreasonable thing to be expected of me to propose such aid to carry out the designs of more successful competitors.

W. SIB.
The unsuccessful Competitor referred to.

CHRIST CHURCH BELLS, OXFORD.

In my article on the Bells of Christ Church, &c. (vide *Builder*, 5th inst.), with a view mainly to explain certain allusions in Dean Aldrich's *Round*, I mentioned the different services held in the cathedral.

The information on this point was kindly supplied by a "well-known member of the cathedral establishment" in two letters dated respectively no longer ago than September 10th, and October 20th, 1868.

The same highly-esteemed clergyman has, however, just favoured me with two other letters, in which he says,— "With the exception of the words *in admoem*, instead of *behind*, which was manifestly a slip of the pen, the account of our cathedral services which I sent you in 1868 was at that time correct, but certain changes have been gradually made since."

I therefore feel bound to state in the columns of the *Builder* that the following are the present arrangements:—

- * Collegiate prayers at 8 a.m.
- Cathedral service at 10 a.m. and at 5 p.m.
- * * The cathedral clock is kept five minutes behind ordinary clocks.

The evening collegiate service, which, in Dean Aldrich's day, and for many years after, took place at 9, and subsequently at 6-4, has been abolished.

I give the name of the clergyman alluded to, but not for publication.

THOMAS WALSBY.

THE KIDDERMINSTER INFIRMARY COMPETITION.

In your issue of the 12th inst. Mr. Bland replies to my letter in your pages of the 22nd inst. and in that reply admits that upon two counts of the indictment he ought to have been out of court.

1st. He did not deliver his drawings in time.

2nd. He did largely exceed the stipulated outlay. Upon a third count he also admits that which, in my opinion, professional etiquette ought to have condemned, viz. that he staked himself of his right as a subscriber to visit the room in which the designs were exhibited. I should have waited until the committee had decided the fate of the competition.

Upon the fourth count Mr. Bland may be correct.

I am told that the designs of Mr. Bland and those of another competitor, having been selected by the committee, were submitted to a professional referee; the facts elicited by this correspondence should have formed part of his instructions, otherwise his adjudication must have been made in the absence of the most important evidence.

And, in conclusion, I leave it, sir, to you and your referee to judge whether the expressions used in my letter be applicable or not to the circumstances of the case,—whether, in short, they be such as a "man in his proper senses," to use Mr. Bland's phrase, would employ "upon such slender grounds." In my opinion, they are those which one "proper sense," that of honour and good faith, should justify.

RSACRSD.
* * The correspondences may end here.

DISINFECTANTS.

Sir,—In your impression for June 12 appears a letter signed "Sanitos" upon a question of disinfecting, and referring to a previous letter in a medical journal,—which letter I have not myself seen,—advocating the use of green copperas for the purposes of disinfection, particularly of drains, which are liable to contaminate domestic water supplies.

Proto-sulphate of iron possesses no advantage as a deodoriser—a disinfectant I do not take it to be. Its action for this purpose would be, in

presence of sewage, to combine with the hydro-sulphate of ammonia, and the sulphuric acid would combine with the ammonia or carbonate of ammonia, and thus non-volatile salts would be formed and the offensive odour cease.

The presence of iron in well-water would be objectionable for ordinary uses, and the only safe course to pursue, in the case of contamination by sewage, is to close the well and seek a purer source.

W. X.

CHURCH-BUILDING NEWS.

Newcastle-on-Tyne.—The foundation-stone of a new church at Eastington Lane, for the recently formed ecclesiastical district of Helton Lyons, has been laid. Mr. Swan, of Newcastle, is the architect, and the contractor is Mr. Harrison, of Houghton.

Brafield Church (near Bury St. Edmunds).—The church here has been re-opened after restoration. The roof was taken off, and it was then found that the chancel wall was in so dilapidated a condition, and had been so badly repaired by some former churchwardens, that it would have to be almost entirely rebuilt. This has been done in tile and flint, in imitation of the old style, and a three-light window with tracered head has been inserted, which will be filled with stained glass in memory of Arthur Young, the agriculturist. Between the nave and chancel there was scarcely anything to indicate where the one concluded or the other began, but in the aisle was a raised step, which was evidently where, in olden time, the altar stood. This has been continued across the church, and indicates the division between the two. The north wall of the church has also been repaired, and supported by buttresses, and a new two-light window inserted, filled with stained glass. The west wall of the nave has also been repaired, and a three-light window put in, all the windows in the nave and chancel being new. One of the three bells has been recast, by Moore, of London, as it was cracked. On the north wall of the church three oil paintings were found, one representing the encounter of St. George and the Dragon, the second the legend of St. Christopher fording the stream, while the third is supposed to have been a representation of heaven. To the aisle but little has been done. The west wall has, however, been repaired, a new window filled with stained glass put in, and the other wall raised. In the south wall also are two stained glass windows. In the east wall of the aisle is a large three-light window. The architect was Mr. Penrose, of London, and the work has been carried out by Mr. Cadgo, of Hartest, builder. The cost will be about 800*l.* or 900*l.*

Bracebridge (Lincolnshire).—A new chapel at the Lincolnshire County Asylum has been opened. In consequence of additions to the asylum, the original chapel became too small, and the committee of visitors were accordingly authorised to erect a detached chapel, capable of accommodating a congregation of 450, and to convert the old building into a recreation-hall, the cost altogether not to exceed 2,000*l.* The new chapel is 70 ft. 9 in. by 45 ft. There are separate entrances for the sexes, through porches 7 ft. 6 in. by 7 ft., between which are two retiring-rooms for epileptics, 10 ft. by 7 ft. 4 in. The roof is high pitched, all the timbers being exposed to view, and plastered between the rafters. The windows are glazed with cathedral glass, in lead lights. The woodwork exposed to view is stained and varnished. The stone for the walls and for lime was obtained upon the estate. The west gable is surmounted by a small bellcote. The original chapel has been altered so as to fit it for a recreation-hall. It is 45 ft. by 37 ft., with a raised stage 14 ft. by 6 ft., and a gallery 36 ft. by 7 ft. Both the new chapel and the recreation-hall are warmed by Gurney's stoves. The plans were prepared by the surveyor to the visitors (Mr. Young), according to instructions from Dr. Palmer, and the total cost has not exceeded the means placed at the disposal of the committee. The contract has been carried out by Messrs. Otter & Binne, of Lincoln, under the superintendence of Mr. Wm. Young, as clerk of works.

Cambridge.—The foundation-stone of St. Barnabas' Church, Mill-road, has been laid. The master and fellows of Gonville and Caius College have given the site for the church, and nearly 1,000*l.* have been already promised. When completed the church will consist of a nave and two aisles, 80 ft. by 22 ft., and is computed to accommodate 600 persons. It will be erected in the Early Decorated style of archi-

ture of a simple character, with a bell turret at the north-west angle, and a porch on the side fronting the road. It is to be built of brick and Bath stone, with a slated roof. At present, however, it is proposed to build only the chancel end (40 ft. by 22 ft., inside measurement), to accommodate about 200 persons. The seats are to be entirely free. The architect is Mr. Talbot Bury, of London; and the builders are Messrs. Quinsee & Attack, of Cambridge.

Maldstone.—St. Philip's Church, which has recently undergone extensive alterations, has been reopened by the Archbishop of Canterbury. The alterations and additions were designed to accommodate 220 additional persons, but as the work proceeded it was found that the boarding of the roof of the existing building was fast decaying, and other structural dilapidations were discovered, which rendered the outlay larger than was at first contemplated. The work done includes the pulling down of the north wall of the nave, and the erection of a north aisle (52 ft. by 16 ft.) and arcade. The old chancel arch and eastern gable of the nave have been pulled down and a new chancel arch and gable built. The whole of the internal ceiling and fittings have been re-arranged. The organ has been removed from the west end of the nave to the east end of the north aisle, and seats for the choristers are arranged in close proximity. The roof of the nave has been strengthened with iron, and the tiling has been stripped off and the roof re-tiled. Externally, the details of the side and end windows are of a more elaborate character than those of the old building, with stone-coped buttresses, carved stone crosses on the gables, base courses, &c. But to complete the work it is necessary to build the tower and spire 120 ft. high, and the apsidal chancel 30 ft. long, which forms part of the original design. The building is heated inside with hot water. The alterations have been carried out from the designs of Mr. E. W. Stephens, architect, Maldstone. The general contract work was executed by Mr. Vaughan, builder; Mr. Hylec doing the plumber's and decorator's work. The carving was by Messrs. Farmer & Brindley, of London; the metal work by Messrs. Hart & Son, of London; and the heating apparatus was supplied by Messrs. Perkins & Co., of London. An illumination on the organ has been worked out by a student at the local school of art, Mr. Frederick Elphick. A new chancel, with organ chamber, is estimated to cost 600*l.*, a west window 120*l.*, and a tower and spire 1,000*l.* Towards the latter, Messrs. Randall & Co. have promised 100*l.* The outlay up to the present time has been about 2,000*l.*

Lutterworth.—The parish church, known as Wycliffe's Church, at Lutterworth, has been reopened for divine worship, after having been closed upwards of three years for restoration. A contract was entered into for the nave and chancel. On the wall over the chancel arch a painting was found. The subject of it is the Judgment Day. This painting must have been done previously to Wycliffe's time. Another painting was discovered on the wall over the north door. This consists of two male figures wearing crowns, with the figure of a female between them. The foundations throughout have been taken out, and concrete, with brick and cement, substituted. The roof of the nave has been restored, and also the roof of the north and south aisles. There has been a new chapel or chancel aisle added to the east of the north aisle, with an arcade next the chancel, and an arch adjoining the north aisle. There is also a new vestry leading from the new aisle at the east, with a door at the north side. The north wall of the north aisle was found considerably out of the perpendicular. This has been placed upright without taking it down. The chancel has been restored, with a new oak roof, carved. The whole of the roofs are covered with lead, and the stonework throughout, except the tower, has been restored, and the old walls repointed. The new work is built to correspond with the old. The north and south arcades were in a dangerous state, the foundations having given way, and the stone crushed in such a manner that it was determined to take them all out, put in new foundations, and rebuild the columns. The old galleries had been cut into them, and the cap bases, &c., mutilated, all of which have been rebuilt. The old windows have been retained wherever practicable, new ones being put into the south. While carrying on the work, an early lancet window was found on the south side of the chancel, which has been restored and glazed. The church has had a new parapet added, with coping. The church

has been recoted throughout with oak seats, carved and moulded. The east window of the south aisle is a memorial window to the late Mr. Thos. Evans, of Lutterworth, being of stained glass, and the subject the Good Samaritan. The lancet window before mentioned is also of coloured glass, and has been restored. The subject is St. John the Evangelist. Another stained glass window at the east side of the south aisle is given by the executor of the late Mr. Charles Watte, formerly of Lutterworth, subject, the Three Marys. Mr. G. G. Scott is the architect; and Mr. Morgan clerk of the works. The contractors for the whole are Messrs. Law & Son, of Lutterworth; and their foreman is Mr. James King. The plumbing and glazing were done by Mr. H. Bawell; the pointing, &c., by Mr. Doe; the ironwork by Mr. Henly; the decorations to roof and nave, &c., by Mr. C. J. Lea, of Lutterworth; the gas-fittings by Mr. Skidmore, of Coventry; and the whole of the carving by Mr. Radcock, of London; the painting over the chancel arch, and the one over the north door, being restored by Messrs. Burinton & Grylls, of London, who also applied the stained glass windows. The estimated expense of the restoration was 7,700*l.* The tower and porch are not yet done, from want of funds.

Lincoln-cum-Colchester (near Ellesmere).—The foundation-stone of the memorial church of St. John the Evangelist has been laid here by Lady Marian Alfred. The church has been designed by Mr. Street, architect, and the plans are to be carried out by Messrs. Powell & Son, of Preece, the contractors. It will cost upwards of 2,000*l.*, and is the gift of Lady Marian Alfred, in memory of John late Earl Brownlow. It is to be built of Cefn freestone, in the Early Gothic style, and to seat 236 people. The walls are at present nearly 4 ft. high. Its form is to be a simple parallelogram, consisting of nave, chancel, and chancel aisle, with an open-timbered roof, and carved ribs. The bell-turret is to be between the nave and chancel, rising at the division in the roof between the chancel and nave, and it is to have two bells. In the body of the church there are to be five two-light windows, with tracered heads, and a three-light lancet-headed window comprised under one arch in the west gable. The chancel will terminate in a gable window of five lights, in tracery. The chancel-roof will be boarded internally, and divided into panels by moulds and ribs.

Melford.—The old church of Melford has been reopened with special services, after undergoing a restoration. The restorations include the removal of the old high pews, and replacing them with open benches in proper order and position, in oak; repairing, with Messrs. Minton & Co.'s red, black, and buff tiles, the tower, the chancel, and the passages in nave and aisles, those in the choir being laid with encaustic tiles; new tower arch and turret; restoration of arcades and clearatories on either side of nave and choir; restoring of oak tracery screen enclosing the choir and chancel, new seats in chancel aisle, and new moulded, tracery, and carved stalls in choir, all of oak; heating apparatus (warm air), by Porritt; lighting the church with gas. The present restoration is only a portion of the design prepared by the present architect, Mr. Henry Woodyer, of Grafham, near Guildford, which design contemplates the restoration of the east end, and consequent removal of the present carved and painted Grecian altar-piece, and the substitution of a Gothic retable, &c., and also the reformation of the tower, which was built in the commencement of the eighteenth century, the former one, with its spire, having been destroyed by lightning. The principal work was executed under the superintendence of the architect. The new benches are not his design, but are in a modified form a copy of those designed by Mr. Gilbert Scott for St. James' Church, Bury St. Edmunds. The stonework was executed by Messrs. Keogh, of Sudbury; half the benches by Mr. Fordham, of Melford, and the remainder by Mr. Leeks, of Melford, who undertook the carving, which was principally cut by Mr. Sprungr, Mr. Theobald, of Melford, did the bricklayers' work, &c. The total cost of the work, exclusive of the money spent on the chancel and private chapels, but including the organ (by Walker, which cost 500*l.*) amounts to 2,572*l.*

Gillingham.—The ancient church of Gillingham has been re-opened for divine service after the restoration which it has undergone, under

the direction of Mr. Arthur W. Blomfield, architect; the work having been executed by Mr. Alfred Stump, of Brompton. Without and within all is changed, except the greater part of the main fabric, which only required to be restored. The pews are gone. The seats are now all of the modern style, low and open. Part of the church has been rebuilt. The old architecture within and without has been so treated as to show to advantage. The church had been greatly maltreated in past ages. On the exterior all the repair and improvements originally recommended have now been included in the undertaking. Nearly the whole of the side walls of the chancel have been rebuilt; the roof is new, and at the east end there is a window displaying the old "Kentish oisping," one of the many contributions from Woodlands. Inside the church the columns and aisles are thrown up, and the roof seems raised to a greater height overhead. The arches and pillars had to be stripped of paint many coats thick. The nave roof was fortunately in the main in good condition, but required new raftering and ribs. The roofs of the chancel and both aisles are entirely new. A light gallery has been erected at the west end of the church for the organ and choir: this is the only gallery. The window above the reredos, the gift of Mr. John Lock, is large, carved, with Kentish oispe, and filled with stained glass. In the centre is the Saviour ascending. On the lower part are large figures of the four Evangelists. Above are kneeling angels with censers; and above these the symbols of the Evangelists; and the various openings are filled with illuminated glass. Besides this window, which was executed by Messrs. Heaton & Butler, there are three painted windows in Mr. Lock's chapel, and a memorial window to the Rev. Dr. Page, presented by Mrs. Page, executed by Messrs. Clayton & Bell; another to his first wife, Mary, presented by her daughters Mrs. Hay & Mrs. Jones, executed by Messrs. Heaton & Butler; a third to the memory of Mr. Stunt, presented by his sons, and the work of Mr. Hardman; and a fourth to the memory of the Marsh family, by Messrs. Lavers & Barrand. This window bears two fine figures—our Saviour with a lamb, and our Saviour knocking at the door.

DISSENTING CHURCH-BUILDING NEWS.

New Swindon.—For some time past the large building formerly known as the "Barracks," at New Swindon, has been undergoing a transformation into a chapel, to meet the requirements of the Wesleyan body. It is now completed, and opened. The building is of considerable extent, and besides the chapel proper, contains three class-rooms and two vestries. The school-rooms had long been felt a great desideratum. The builder's estimate was 2,363*l.*; and the site with building, 1,600*l.*

Thursall.—The new Wesleyan chapel at Alsager, erected from the plans of Mr. G. B. Ford, architect, Burslem, the foundation-stone of which was laid in June last year by Mr. A. Shaw, has now been opened. The building is in the Gothic style. Red pressed bricks, relieved by bands of black and white bricks, with stone dressings, have been used in the construction. There is a gallery over the entrance porch and vestibule. The orchestra, in which is placed a new organ, is at the back of the pulpit, underneath which is the minister's vestry, and at the rear a class-room. The roof of the chapel is celled half way up in a vaulted form, and is constructed with the view of preventing any reverberation of sound. The space between the ceiling and the roof will act as a ventilating chamber, into which the vitiated air will pass from the chapel by a simple mode of revolving shutters, and underneath these shutters are panels with ornamental wood. The internal woodwork is of red deal and pitch pine, stained and varnished. The windows are glazed with cathedral tinted glass, in leaded quarry lights, with a margin of coloured glass round each light. A warming apparatus has been fixed by Mr. William Boulton, of Burslem. The floor of the chapel is calculated to seat upwards of 400 persons. The total cost of the building, including the land and organ, is expected to be about 2,500*l.* The contract has been carried out by Mr. John Stringer, of Sandbach.

Bradford.—The chief stone of the works connected with the enlargement of Muff Field Wesleyan Reformers' Chapel in Old Bowling-lane, Bradford, has been laid. It is proposed to extend the present edifice on the southern side, making its dimensions 61 ft. by 39 ft.; it will

also be raised to a sufficient height to admit of the erection of galleries. The building stands on a site which inclines to the south, and two dwellings will be made on that side. The style of architecture approximates to the Corinthian. Mr. M. Brayshaw, of Bradford, is the architect, and the following are the contractors:—Mason, Mr. James Smith, Bradford; joiner, Mr. C. Wadsworth, Odsal; slater, Mr. James Smithies, Great Horton; plasterer, Mr. Jeremiah Bottomley, Bradford; plumber, Mr. John Radford, of the same place.

Nkley.—The new Congregational Church here has been opened for divine service. The buildings comprise a church, schools, and church-keeper's house, which are all designed in the Early Decorated style, and erected on a site, with frontages to Riddings-road and Green-lane, two of the principal new streets. The church is arranged with the gable in Riddings-road, looking towards the station, and has in the centre a doorway with recessed shafts, having moulded base and carved capitals, and surmounted by a crocketed gable. Over the doorway is a five-light window, with decorated tracery head, which rises into the gable, surmounted by a stone floriated cross. At the corner of the two roads stands a tower, which is to be surmounted by a spire, to finish 130 ft. from the ground. At the opposite corner to the tower is placed an octagonal turret, covered with a slated spire. The side of the church to Green-lane is designed in six bays, the first being occupied by the tower, the next four by windows containing tracery, and surmounted by gables which break the outline of the roof. Next the end of the nave comes the chancel of one bay, having an aisle containing the vestry and low clearstory pierced by trefoil windows. Beyond the chancel is the gable end of the school, which runs at right angles to the church. This gable has a wheel window above. Space is reserved for a minister's house near the church, and the whole site is to be surrounded by an open wrought iron railing on a low parapet wall. Internally the church is divided into nave and aisles approached by vestibules, and terminated by a moulded arch in the centre opening into the chancel or platform by an arcade, with the organ chamber on one side, and the doors into the vestries at the other side. The aisles are divided from the nave by light iron pillars, which are capitals decorated with foliage wrought in copper, and from these capitals spring moulded arches supporting the roof, which is wagon-headed in form. On corbels, half way up the pillars, rest narrow galleries, which run round three sides of the nave. All the seats in the church are open stalls. They are all made of grained pitch pine. The ceilings are coloured a sky-blue, powdered with white stars, and bordered round the timbers of the roof and ceilings with running ornaments in vermilion and blue. The walls are tinted stone-colour, with double lines indicating stonework, but conventionalised, and with a flower in the middle of each stone. Round all walls, surbasses, and cornices there is a running ornament in reddish-brown colour, and round the chancel arch is written in large ornamental letters this inspired admonition to all congregations,—“He that hath an ear to hear, let him hear what the Spirit saith unto the churches.” The pillars of the arcade are decorated with a diaper pattern, in chocolate and orange; the caps are picked out in green, blue, and crimson and gold, and the hauses are relieved in similar colours. Surrounding them the arches have ornaments running round the face and soffits, and the spandrels are decorated in a similar manner. All the windows are filled with painted glass, having coloured borders. On the floors of the vestibules and passages are laid mosaic tiles. The gas corones, brackets, balusters, and other metal-work, are all in keeping with the rest of the work. Accommodation is provided for about 650 adults in the church, and 200 scholars in the school. The whole of the works have been designed and superintended by Mr. J. P. Pritchett, of Darlington, architect, assisted by Mr. R. Law as clerk of the works, and the contracts have been executed by the following tradesmen:—Masons' work, Messrs. Y. & M. Freeman, Odsal; slating and plastering, Mr. John Tattersall, Bradford; joiners' work, Messrs. Ives & Son, Shipley; plumber's and glazier's work, Mr. L. Bannister, Leeds; painting and decoration, Mr. H. Mitchell, Huddersfield; constructive ironwork, Messrs. Walker & Son, Newcastle-on-Tyne; art metal work, Mr. Duvoy, Manchester; warming (which is achieved by means of heated air), Messrs. Haden & Son, Manchester.

Stockton-on-Tees.—A new Baptist chapel, situate in Wellington-street, top of St. John's-road, has been opened for divine worship. The plot of ground which the premises occupy measures 69 ft. by 68 ft. The structure is of Classical architecture, and built principally of brick, with stone facings. The chapel, in the interior, measures 60 ft. by 40 ft.; and the schoolroom, which is beneath the chapel, and approached from the back of the building, measures 40 ft. by 30 ft., and is 11½ ft. high. The pews are arranged with two aisles, with accommodation for 350 persons. There is no gallery at present, but the building is so constructed that one can be added. The church have decided to call the building the Long Memorial Chapel, in commemoration of the long services of their pastor. The architect was Mr. George Fletcher; and the contractor, Mr. John Craggs. The entire cost of the building will be about 1,650*l.*

SCHOOL-BUILDING NEWS.

Marlow.—New school-rooms have recently been completed and opened here. The new buildings, which have been erected at a cost of about 1,700*l.*, consist of a school-room, 50 ft. by 20 ft., and a class-room, providing accommodation for 120 infants, together with two residences for a master and two mistresses. The architect was Mr. L. Stride, of London.

Gloucester.—The foundation-stone of St. Luks's new National Schools has been laid. The new building will consist of three large rooms placed side by side. The rooms are divided into departments for boys, girls, and infants, with separate entrances, and there will be cloak rooms and lavatories. The master's house will adjoin the schools. A large playground will be formed in the rear of the schools for each class. The elevations are designed wholly in brick and stone; varieties of the latter will be used to vary the mass. The contract has been taken by Mr. Moreland, of this city, for 2,642*l.*, and it is expected that the works will be completed soon after Christmas. The architect is Mr. Maharity, of Gloucester and London, and the works will be erected under his supervision.

Sheffield.—The memorial stones of a Wesleyan Day and Sunday School have been laid at Sheffield Moor. A plan has been decided on which includes a ladies' room, to be erected on a line with the front elevation of the chapel; a chapel-keeper's house; a series of large school-rooms to accommodate 500 children, with lavatories and other conveniences; several class-rooms, and covered playgrounds; ministers' and stewards' vestries; and rooms with boilers and tea-making apparatus. The present rooms, when the new premises are completed, will be used as infant and ragged schools. The entire outlay is estimated at about 2,500*l.*, and 2,000*l.* have already been obtained. Mr. J. D. Webster is the architect. The mason work is being done by Mr. Thompson, the joinery by Mr. Robertson, the slating by Messrs. Harrison & Chadwick; the plastering by Mr. Taylor, and the plumbing and glazing by Mr. Columbine.

Wilmslow.—The new schools at Wilmslow have been opened. The design for these schools was passed by the committee of the Privy Council, and a grant was made by Government towards the building fund. The schools combine all that is needed for a national day-school, with facilities for parish or local meetings, lectures, &c. The boys' school-room is 42 ft. long by 20 ft. wide, and is separated from the girls' school-room, which is 34 ft. long by 20 ft. wide, by folding doors, thus making, when so required, one large "T"-shaped room, capable of holding 300 persons. Both of these rooms have class-rooms adjoining. The infant school is 35 ft. long by 30 ft. wide, and is entered by the same porch as the girls' school, on the north side of the building. The boys' porch is on the south side. At the east end of the building is the master's house. The schools are situated on a piece of glohe land, sloping towards the south, and near to the church. With this old Perpendicular building lately restored, the new schools have been designed to harmonise. They are built of grey brick, relieved by slight touches of red, in arches, bands, string-course, &c. The framework of the windows is of stone; the roofs are of slate, in two colours, arranged in patterns. The tracery of the windows has ornamental glazing, which has been done by Messrs. Edmundson & Co. The gasfittings, put in by Messrs. Thomson & Co., of Birmingham, are simple in design, and consist of pendants and brackets. There is

accommodation, according to Government regulations, for 120 boys, 100 girls, and 130 infants—350 in all. The architects are Messrs. Medland & Henry Taylor, of Manchester.

Coddington.—A new school-room for this little parish is now completed, and opened. It is built close to the church on a site looking across Herefordshire to the Welsh hills. The building is of red sandstone, the same as the church, with Bath-stone facings. The school-room is 25 ft. 6 in. by 16 ft. There is a house attached. The site was given by Major Heywood, of Hops End. The contractors were the same as rebuilt the church three years ago,—Messrs. Collins & Cullis, of Tewkesbury. The contract was for 560*l.*, but the well, pump, fencing, books, and maps with which the school is well furnished, make the total cost come up to 600*l.*

FROM SCOTLAND.

Edinburgh.—The local Review says,—

"While city improvements are in progress in the heart of the Old Town, at a cost which dispropor­tionably increases the local taxation, private enterprise has projected an improvement which will make Castle-terrace one of the finest streets in the city. We do not now refer to the very handsome range of dwelling-house tenements Mr. Gowans has raised and is still raising at this part of the city, but to the equally novel and attractive feature he is about to make of the park opposite his new houses. The stone dyke by which it is enclosed is to be removed, and a trottoir formed, 30 ft. wide, in the centre of which there will be a row of trees, hedges and elms alternately. The park itself will be surrounded with an ornamental iron railing, will be planted at intervals with shrubs, and laid out in walks. There will be an entrance to the garden opposite Cambridge-street, and another opposite the parallel new street further east called Cornwall-street. These walks will converge at a point on the lower part of the garden, where it is proposed to construct a light iron bridge connecting with West Princes-street-gardens, forming a more direct and pleasant route for the Princes-street people who have to pass in the Morningside direction."

Speaking of the houses on Castle-terrace from Mr. Gowans's designs, the same writer says,—

"Whether or not his theory is accepted of the application of geometric proportion to architectural design, the result is that we have a specimen of street architecture most harmonious in its composition and details, as well as striking from its novelty." There are sanitary improvements in the construction of these houses, he remarks, which might be introduced with advantage into the new houses which are rising on all sides of the city at present. The common stairs leading to the flats are exceptionally well lighted. At the end of the lobby in each flat there is a window which, besides serving the subsidiary purpose of providing a borrowed light for the part of a house which is often the gloomiest, opens into a wide ventilating-shaft, running up to the roof. The water-pipes, both those in connexion with the water company's main and those carrying soiled water to the sewers, are kept just within the back wall of the building, to prevent injury or accident from frost or other causes. To prevent contamination of the water in the cistern, the overflow-pipe communicates—not with the water-closet pipe, but with the bath. Pipes and shafts are also provided by which the foul air from the soil-pipes and sewers escapes on the top of the roof, instead of finding its way into the dwelling-houses.

FROM AUSTRALIA.

Adelaide (South Australia).—The chief stone of the Prince Alfred Sailors' Home has been laid by the Prince himself, on his second visit to Australia. The site has a frontage to St. Vincent-street of 150 ft., and a depth of 240 ft. It is near the Port Adelaide Railway Terminus, and is valued at about 600*l.* The subscriptions have reached a sum of 2,285*l.* Mr. R. G. Thomas, the Colonial Government architect, obtained permission of the Government to prepare plans for the proposed Home, which he has done, and his design has been approved by the committee. The plans include a large basement, which is not to be finished at present. On the ground floor there is an entrance-hall from St. Vincent-street, and a sailors' waiting-room leading to a shipping-office on one side, and an office belonging to the establishment on the other. There are also, for the use of the sailors, a large kitchen and scullery, a dining-room 40 ft. by 20 ft., a smoking-room 20 ft. by 20 ft., a library and reading-room 20 ft. by 20 ft., bath-rooms, a large verandah with balcony above, which will command a view of the shipping and the port. The upper floor accommodation is laid out almost entirely as dormitories for the sailors. There are forty

cabins and small bedrooms, and also lavatories and bath-rooms. There are also apartments on this floor for the manager. The upper floor will not be fitted up at present, and all the internal arrangements will be plain. The frontage to St. Vincent-street will be 100 ft., and the building will be arranged in three stories, besides the basement. The ground story will be 13 ft. high, and the other stories 10 ft. each, the total height of the building being 50 ft. The Home will be constructed of Dry Creek stone, with brick and freestone dressings. The design is plain Gothic in style. The total cost of the building will be about 8,000*l.*, but it is only proposed to build a part of it at present. Total accommodation will be afforded when the building is completed for 100 seamen.

Ballarat.—The peal of eight bells to commemorate the visit of the Duke of Edinburgh to Ballarat are in the key of E flat, the tenor weighing 23 cwt. The bells have just been cast by Messrs. Mears & Stainbank, of Whitechapel, agreeably with an order received from the "Alfred Memorial Bells Fund Committee," to be placed in the new tower at Ballarat, "to perpetuate the joy of its inhabitants at the failure of the murderers attempt on the life of H.R.H. the Duke of Edinburgh while on his memorable visit to these shores." Mr. Walsley sends us the inscription on the tenor bell, which is as follows:—

"IN MEMORIAM DEI OPTIMI MAXIMI GLORIAM.
QUI PRINCIPUM HONORABILISSIMUM ALFREDUM
KINGSBURGAE DUCEM
REGINAE ROSAE VICTORIAE FILIUM
SCIAM MANU GRAVITER VULNERATUM
EX MORTE TRIPUIT
CIVES BALLARATENSIS
GRATISSIME TANTAM REM MEMORIA PROSECUTI
HAS CAMPANAS FUNDI JUSSERUNT.
ANNO SALUTIS ROSAE
MDCCLXXIII."

Most of the principal inhabitants of Ballarat have subscribed to the fund for defraying the expense.

Books Received.

A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation. By the late J. R. McCulloch. With a biographical notice. New edition by HUGH G. REID. Longmans. 1869.

As every one knows, there is no work of this kind equal to McCulloch's standard Cyclopaedia of commercial lore. Mr. Reid was McCulloch's secretary from 1843 onwards, and eventually became his son-in-law. He has revised and corrected the whole work, and in doing so he has made use of materials which Mr. McCulloch, before he died, in 1864, had accumulated for a new edition. Mr. Reid has brought the work generally up to a recent date, as every such work requires; and has added new entries which the progress of science and commerce necessitated, such as on petroleum, acids and alkalis, telegraphs, transit, passports, &c. Nevertheless, the work was originally so based on great principles, that any necessity of completely remodeling it can scarcely arise. Much of the very small type has disappeared, although the book is still comprised within one pair of boards, the goodly bulk, however, extending to nearly 1,600 pages. The matter is now printed in double columns for facility of reference. On the whole, therefore, the Dictionary is edited in a very competent and efficient manner; and it only requires the insertion of separate and special articles on the commerce of our own chief towns,—not even London, Liverpool, or Glasgow, having any separate notice, although every great foreign port and city has,—in order to render it in all respects complete. No doubt it may be objected by the editor that the commerce of all our chief ports and cities is dealt with throughout the whole work, and that to have special articles on London, Liverpool, &c., would necessitate a repetition of all the information already embodied in the Dictionary; but surely a great work on the commerce of the world, such as this is, cannot be regarded as being complete, so long as it contains no separate articles on the commerce of the chief commercial centres of the greatest commercial country in the world. In whatever way it may be done, therefore, it is to be hoped that in the next edition this defect will be in some way remedied.

The present edition contains a biographical notice of McCulloch by the present editor, but no portrait, which is also to be regretted, especially as there are both portraits and busts of

him from which a good likeness might have been engraved. From the biographical sketch it appears that John Ramsay McCulloch was born in Whitburn, Wigtonshire, in Scotland, in 1789, and that he was, therefore, 76 years of age when he died in 1864, and was interred in Brompton Cemetery. His father was a small landed proprietor in the stewartry of Kirkcubright. McCulloch was bred as a lawyer, his education having chiefly been carried out at Edinburgh; but he disliked the law, and soon left it. He became a contributor to such periodicals as the *Edinburgh Review*, and was at one time editor of the *Scotsman* newspaper. Though a great politician and writer on political economy, he early devoted himself to the subject for which he afterwards became so celebrated. After spending nearly twenty years in collecting materials, he produced the first of the many editions of the "Commercial Dictionary," in 1832. The work has been republished in America, translated into several languages, and is referred to for the adjustment of mercantile disputes in all quarters of the globe. Since its first publication it has greatly increased in bulk, and is, in truth, a gigantic work; for if printed like ordinary books, it would make at least thirty volumes octavo. The author was naturally proud of its popularity and reputation; and an anecdote was told lately, at a public meeting, by a friend of his, Lord Neaves, a Scotch judge, which is worth repeating. His Lordship said, speaking of Mr. McCulloch, "He asked me once, 'Do you ever quote my "Commercial Dictionary"?' in court?" I said, with some emphasis, "Never; we never quote it, and we never mention it." Sometimes, I said, "a set of papers come upon us at night upon a mercantile question that we know nothing about, and we go up to our shelves and take down the "Commercial Dictionary," and find all we want there, and next morning we come out, to the astonishment of our clients, with better information upon the subject than they have themselves; but we never mention McCulloch's "Dictionary." And that pleased the old man, who had been rather chilled by my first observation, better than it was easily possible to please him."

In 1838 Mr. McCulloch was appointed, by Lord Melbourne, to the Comptrollership of the Stationery Office, a situation which he held till his death. In 1846 Sir Robert Peel testified his respect for Mr. McCulloch's services in preparing the way for those memorable commercial reforms which signalled his administration by conferring on him a well-merited pension of 200*l.* a year.

VARIORUM.

"Annual Report of the Committee of the Manchester and Salford Sanitary Association. Poulson, Printers, Manchester." This committee, in presenting the report, state their regret that the health of Manchester and Salford has been very unsatisfactory during the year 1868. They are of opinion that the great mortality of the city and borough is caused by the bad state of ash-pits and sewers, by the very faulty construction and arrangement of the houses of the working classes, by the dirty and intemperate habits of too many of the people, and in part by the want of accommodation for infectious diseases. The sanitary lectures delivered under the auspices of the Association continue to attract large and attentive audiences, it being not at all uncommon for working-men to travel three or four miles to hear them. The subjects treated of in these lectures and the names of the gentlemen who delivered them are appended to the report. They treat, of course, of sanitary subjects, such as the disposal of refuse, water-closets, death-rate, &c. The income of the Association for the year is 2,11*l.* 12*s.* 2*d.*, being less by 2*s.* 2*d.* than that for 1867. During 1868 the expenditure has again exceeded the income. The Association, say the committee, cannot continue its operations without a considerable increase in the annual subscriptions.—"Report on the Sanitary Condition of the Parish of St. George, Hanover-square. By C. J. B. Aldis, M.D., Medical Officer of Health." One of the chief features of this report relates to the Workshop Regulation Act. Dr. Aldis received fifty-eight complaints during the last year as to establishments in St. George's parish. These complaints were, as might be expected, mostly anonymous, but nearly all were true. In one case he says:—

"I found at a house in Lupus-street, six young women sitting in a scullery in the basement, where the chimney smoked so much that a fire could not be lighted in it, and the room being dark, they always worked by light. It contained a sink having a trap unsealed by water, with a water-closet adjoining. The cubic capacity insufficient for six persons, but nine usually worked there, rendering the room almost unbearable. On remonstrating with the proprietor, he acceded to my request, that he should provide a cheerful room upstairs, and lessen the hours of work. He provided the room; but as continued to employ the young women beyond the legal hours,—on one occasion, before the Alhambra hall, until 30 at night, and on another after 4 p.m. on Saturdays,—was compelled to take proceedings.

Steps already taken have greatly diminished the excessive hours of work in the parish for the present, and the reporter remarks that, no doubt, the result will conduce to the health and social welfare of the milliners. With regard to the moral aspect of the question, several of the employers have said that he will "drive the young women into Regent-street." On further inquiry, however, it did not appear that more than two or three employers paid any attention to the moral improvement of the girls; but probably they referred to the diminution of wages consequent on the shortening of day's work. In reference to the subject of the destruction of houses and erection of model dwellings, the reporter says:—

"In consequence of the destruction of King-street, 15 miles, Princes-row West,—a wretched locality—and of Queen-street, and of Ebury-street, about 127 miles, comprising 508 persons, have been displaced, the site immediately behind 'The Compasses' public house at the top of Ebury-street, will be partly occupied by five blocks of improved dwellings. The plan provides for ten good shops, and 120 first and second-class distinct premises for mechanics and others. The building has been delayed by some formal proceedings necessary for opening up an old street and forming a new one 40 ft. wide and 100 ft. deep.

New model dwellings are erected in Grosvenor-mews, Bond-street, and will shortly be completed. They are planned to contain 10 single-room and 10 double-room flats."

Report upon the Sewerage Works of some Towns in England. By R. R. Rowe, C.E., late Town Surveyor of Cambridge. Webb, Printer, Cambridge. This report was an extra-official one, presented to the Cambridge Improvement Commissioners. It treats briefly of what has been done, in regard to sewerage, at Stroud, Cheltenham, Weston-super-Mare, Leamington, Warwick, Banbury, Norwich, Bury, Bedford, and Croxford. The result is favourable to the utilization of sewage by irrigation, and against attempts otherwise to deodorise sewage. The reporter recommends the formation of a sewage farm at Cambridge, as suggested by Mr. Bazalgette.

Report of the Nottingham Highway Committee to the Town Council. Dnnn, Printer, Nottingham. It appears from this report that the average annual expenditure on public works at Nottingham has of late years been £7,291; but this average has been exceeded during the past year. The sewerage works have been more than usually extensive; 2 miles 432 yards having been executed during the year. The works referred to in the report have been carried out under the direction of Mr. M. O. T. Abbotson, C.E.—The Spiral Pump applied as a Force Pump, Suction Pump, and Mercury Pump. By Wilfrid Airey, J.E., London: Willis, Sotheman, & Co., Charing-cross. For bringing forward the subject of a machine so antiquated as the spiral pump (or Archimedes' screw), the apology of the author is that he in England, at least, the machine has never had a practical trial, and that when tried on the Continent it has always given satisfaction. The author treats of the theory of the machine, and gives formulae for calculation, &c.

Miscellaneous.

Public Audit.—A letter to the president of the Board of Trade, by Mr. E. E. Scott, public accountant, urges the necessity of appointing, by the Board of Trade, a body of certified and sworn auditors, from amongst whom every company should be bound by Act of Parliament to select an auditor, only removable upon petition and complaint to the Board of Trade. Auditors would thus be independent of directors on the one hand, and not likely, on the other, voluntarily to expose the affairs of the companies, though familiar with their working, and a safeguard and watchman for the general interest of the shareholders.

The Architectural Museum.—The evening of Wednesday, July 21, has been fixed for the opening of the new museum by a gathering of subscribers and friends.

Value of Building Ground in Carlisle.—A number of lots of building ground in Aglionby, Brunswick, Alfred, and other streets in Carlisle, the property of the corporation, were recently offered for sale, in the Town-hall, by auction. A number of fields on the Longtown-road, consisting of 12½ acres, and known as the Kingmoor Estate, were also announced to be sold at a minimum price of 950l., but at the conclusion of the sale of building-ground the auctioneer declared the sale to be postponed. There was a fair attendance of bidders. Sites in Cavendish-place and Alfred-street, lowest upset price 8s. per square yard; in North and South Portland-square, 10s. 6d. to 12s.; Brunswick-street and Aglionby-street, 7s.; Aglionby-street and Brunswick-street (corner lot), 5s. There was also offered some building-ground bounded by James-street, Rome-street, St. Stephen-street, and Lamplugh-street, called Mill-field, the minimum price of which was 5s. The bidding was very slow, and the only lots sold were the following:—Two sites in Portland-square to Mr. Jas. Graham, builder, at 10s. 6d. per square yard; a site in Aglionby-street South to Mr. Johnston, plasterer, at 7s. per square yard; seven sites in Mill-field to Mr. Metoife, builder, at 5s. per square yard.

Value of House Property in Sheffield.—An arbitration arising out of the requirements of the Corporation for the making of the new thoroughfare from the Haymarket into Norfolk-street is in progress. The claimant is a pawnbroker in Market-street, whose freehold house and shop, situated at the corner of Market-street and Baker's-hill, have to be removed, in order to make way for the intended improvements. The quantity of land proposed to be taken was 9½ square yards. A claim was made of 2,500l. for the building, and 5,000l. as compensation for loss and damage, besides payments of all costs. The claim had since been reduced to about 5,300l. There were two arbitrators—Mr. E. C. Cowley, Manchester, for the Corporation, and Mr. Thomas Haynes, surveyor, London, for the claimant; but at the outset it was agreed that the amount in dispute should be decided by Mr. George Pownall, of London, who had been appointed umpire. The claimant, it was shown, had hired a pawnbroker on the premises for twenty-three years. The value of the freehold was put at 50l. a year, with a twenty years' purchase, making a total of 1,600l. On behalf of the Corporation Mr. Holmes, the borough surveyor, put the rental of the house at 60l. a year, as it was in bad repair. Mr. T. J. Flockton, architect and surveyor, also considered 60l. a year would be a fair rent for it, taking it at twenty years' purchase. Mr. H. Jones, surveyor, London, also gave evidence; and Mr. Pownall said he would take time to consider his award.

Proposal for a Free Library for Derby. At a meeting of the committee of the Town and County Library and Museum, amongst other resolutions was passed the following:—"That a sub-committee be and is hereby appointed to confer with the committee of the Mechanics' Institution as to the amalgamation of this institution with the Mechanics' Institution, for the purpose of establishing the whole into a free library and museum, or otherwise." The Town and County Library and Museum has a library of from 9,000 to 10,000 volumes, many of them of value as books of reference. They have also a museum. The Mechanics' Institution has a library of about 6,000 to 7,000 volumes. They have also property in paintings, scientific apparatus, &c. They have also freehold property adapted for an extensive museum and library in the centre of the town. The lecture-hall of the Mechanics' Institution would be appropriated to the museum. The committee of the Mechanics' Institution has resolved that the suggestions be received and considered.

Sawbridgeworth.—Hyde Hall, a fine mansion, situated at Sawbridgeworth, Herts, has lately undergone renovation at the expense of its present occupant, Mr. H. L. Bischoffshelm, the hanker. Mr. A. Verlat, of Brussels, is the artist who was selected for the wall painting. The hall-room, with its monumental mantelpiece (of Brussels manufacture), and its lofty dome, has been painted *en grisaille*; and Mr. Vanden Bosch, Mr. Verlat's assistant, has ornamented the walls of the billiard-room with bunches of grapes and birds.

Carlisle.—It is proposed to erect a large public hall in this city. A committee has been appointed to arrange as to the project.

New Corporate Buildings for Birmingham.—A report of the Estate and Buildings Committee of the town-council on this subject was read at a recent meeting of the council. The committee gave extracts from the report and schedules of Mr. Waterhouse, to show the accommodation set out by him which would exist in the proposed buildings. 1st. The Corporate Buildings, comprising rooms and offices for the mayor and other officers of the corporation. 2nd. Assize Courts; one for the transaction of criminal business, with rooms and offices for the judges, the jury, witnesses, &c.; and another for the hearing of civil cases, with rooms for the judges, barristers, &c. 3rd. Judges' lodgings, containing all the necessary rooms and offices required for the judges' accommodation. "The cost of these erections, as nearly as can be estimated, would be, in Mr. Waterhouse's opinion, as follows, viz.—Corporate buildings, 37,000l.; Assize Courts, 76,000l.; Judges' Lodgings, 12,500l.; total, 125,500l. This expenditure would allow of the buildings being faced with stone, and erected in the most substantial and handsome manner. Built, however, in a more economical manner, at some sacrifice of appearance, both externally and internally, the cost need not, in his opinion, exceed the following; viz.—Corporate buildings, 31,000l.; Assize Courts, 63,000l.; Judges' lodgings, 10,500l.; total, 104,500l." The report having been received, the committee were authorised to advertise for plans for the new corporate buildings, and submit the same to the council for approval.

Monumental.—A public meeting has been held in the theatre of the Royal Institution for the purpose of considering the propriety of raising a public memorial of the late Professor Faraday. The Prince of Wales occupied the chair, and was supported by the president, members of the council, and fellows of the different learned and scientific societies, and deputations were also present from France, Italy, and Holland. It was resolved, "That it is desirable to raise a memorial to the late Professor Faraday," and that a public subscription be opened for the purpose. The proceedings concluded with a vote of thanks to his Royal Highness.—It is proposed to erect a tablet to the memory of the author of the "Christian Year" in the "Poet's Corner" of Westminster Abbey. The tablet has been designed by Mr. G. G. Scott, R.A., and will include a medallion likeness of Keble, to be executed by Mr. Woolner, sculptor.

St. Nicholas's Steeple, Newcastle-upon-Tyne.—Mr. George Robert Stephenson has written a letter to the Committee of Management of the St. Nicholas's Steeple Fund, in which he says:—"Although the firm I represent subscribed liberally towards the repairs in progress, and also paid the voluntary rate, I am willing, on my own account, and independently of my firm, to offer 500l. if any five gentlemen will come forward and guarantee 500l. each to carry out and complete the works required."

Society of Arts' Prizes.—The Council Prize (for Female Candidates)—The Council Prize (for Female Candidates) of ten guineas has been adjudged to Elizabeth Backhouse, aged 21, of the Birkbeck Literary and Scientific Institution (no occupation stated), who has obtained the following first-class certificates:—
1868. English History—First-class Certificate, with Second Prize, and the Prize for Female Candidates.
" Geography—First-class Certificate, with the Prize for Female Candidates.
1869. Domestic Economy—First-class Certificate, with the Prize for Female Candidates.
" English Literature—First-class Certificate.

A Building for the Indian Museum.—We understand that plans are being prepared for a building worthy to contain the collection of articles at present in the India Office, illustrative of the products, manufactures, and arts of India. It will stand on the vacant spot of ground south of the present India Office.

"Crews Hall."—We have to add to our notice of the restoration of this building, that Mr. John Leslie is the Clerk of Works. Mr. Leslie filled the same post at the building of Halifax town-hall.

Sheffield Architectural and Archaeological Society.—The third excursion of the members of this society for the present season took place on Wednesday last week. The places visited were Oughtibridge, Moor Hall, Broomhead Hall (where the excursionists were entertained by Mr. J. W. R. Wilson), Yewden Valley, Bradfield, &c.

Westminster Boulevard.—This scheme may now be said to have been launched before the public. The promoter, Mr. F. Lewis Margarin, adopted the successful expedient of issuing invitations to some 200 gentlemen interested in the undertaking to be present at the London Tavern, and hear the deeds read in public, and witness the appendature of the signatures thereto. A very large number of gentlemen assembled. The scheme is embodied in a Bill now before Parliament, to empower the company to acquire the land and houses (pulling down the latter) necessary for the purpose of constructing a boulevard extending in a straight line from the clock-tower at the Houses of Parliament for nearly a mile in the direction of Eaton-square. The scheme provides for the erection of model lodging-houses for the accommodation of the poor who will be displaced by the pulling down of their present wretched habitations. "No less than seven of the most eminent architects" have assisted in the preparation of the estimates, plans, designs, &c. The expenditure already incurred, as "preliminary or promotion expenses," amounts in round numbers to about 10,000*l*.

Extension of the Brighton Museum.—Mr. Twining, of Twickenham, having presented a collection of articles from the Twickenham Economic Museum to the Brighton Sanitary Association, together with a donation of twenty guineas, three unused rooms at the Pavilion, adjoining the Town Museum, were placed at the disposal of the Association, who, having formed an interesting collection "with a view to impart in a manner at once scientific and entertaining that knowledge of common things which is so necessary for securing health and comfort," have publicly opened their Museum and presented it to the Corporation. Henceforward it will form a part of the Brighton Museum, under the title of the Economic Department. The object of the founders of the department is to improve the manner in which people live,—to teach them how they can have more wholesome and non-nourishing food,—how they can live more economically,—and how they can enjoy greater comfort and better health. The Brighton Museum ought to be thrown open free to the public more frequently than once a month, as at present. Half the specimens in the general museum, moreover, according to our authority, the local *Herald*, are passed by almost unheeded and unnoticed, because they have no labels to inform the visitor of their character and history.

Southwark Park.—In the south-eastern district of the metropolis, a piece of land of about sixty-three acres, has been converted from market gardens into a new park by the Metropolitan Board of Works, and was opened, according to the newspapers, on Saturday last. It is situated near the Spa-road Railway Station, between Paradise-row, Rotherhithe, the Deptford Lower-road, and Rotherhithe New-road, about one mile from London Bridge, and within easy walking distance from the crowded parts of the parishes of Southwark, Horselydown, and Bermondsey. The land chiefly belonged to Field-Marshal Sir William Gumm, G.C.B. The expenditure for the land and other costs has been as follows:—For freehold and leasehold interests, 68,398*l*. 11*s*. 2*d*.; professional and other charges and wages, 5,330*l*. 18*s*. 5*d*.; incidentals, 722*l*. 19*s*. 2*d*.; contracts for works, for entrance lodges, gates, enclosure palings, formation of roads, &c., drainage of roads, and planting, 20,710*l*. 2*s*. 6*d*.; total to 25th of March, 1869, 95,162*l*. 11*s*. 5*d*. The cost of the freehold land was about 911*l*. per acre for sixty acres. There are sixteen acres reserved for building purposes to meet the expenditure of the metropolis in respect of the church.

Discovery in Bunbury Church.—A wall-painting has just been discovered on one side of the east window of Bunbury Church, corresponding to another which was found on the other side. It is the figure of an angel, with both wings represented. There was a legend on a scroll in old English characters, not however legible. The pictorial representation first discovered is that of a man with a child in his arms, and pointing to a cross of the ordinary shape, which, says the vicar, was also traversed by a St. Andrew's cross, and a wreath, perhaps of thorns, encircled them both. There was also the hammer and a pair of pincers, and a large nail in the lower part of the cross. This may have been meant to represent the child Jesus seeing, as in a vision, the future scene of his suffering.

The Fire near Drury-lane Theatre.—A panic was excited in the Strand and its neighbourhood on Saturday night last by the appearance of huge volumes of smoke and a report that Drury-lane Theatre was on fire. The "house" was not on fire, though the walls were scorched. The building in which the fire commenced and ended was that of the Messrs. Howard, builders, next door to the Albion Tavern, Russell-street, and immediately opposite one of the pit entrances to the theatre. This occurrence enforces two assertions we have often made,—namely, that theatres should be insulated, and that the yards of builders and timber merchants in towns should be under supervision.

Discoveries in Cheltenham Church.—The restoration of the chancel of this church, which has been effected at the expense of the Duke of Devonshire, has revealed some scroll paintings. On removing the plaster from the south wall, a painting from the beatitudes was discovered. The subject uncovered—"Blessed are the pure in heart, for they shall see God"—was written in Old English characters on a zigzag scroll or ribbon, the face of which had been white, the back gold, ornamented with red stars. The whole is twined round a stem, from which spring branches bearing leaves and red-berries, artistically drawn in a bold hand. Traces of a similar scroll are observable on the other side of the window, and it appears very likely that the whole of the walls were so decorated.

Floating Meadows.—In the Atlantic Ocean, a little to the west of the Azores, there exists, as is well known, a space seven times larger than all Germany, according to Humboldt, completely covered with a dense mass of marine vegetation. Monsieur Jules Lavinière has proposed to the Société d'Agriculture to make these floating meadows, as they are called, subservient to the purposes of agriculture. His suggestion is that the ships occupied during the summer in cod-fishing should in other seasons be employed in conveying this abundant manure to the Azores, where an entrepôt could be established, the weeds pressed and dried, and the mineral salts they contain extracted. Analysis has shown that these weeds possess the same fertilizing properties as those already employed as manure on the British and French coasts. Perhaps our own agriculturists may find it worth while to inquire whether an inexhaustible stock of cheap manure has not, like guano, been here overlooked for centuries.

New Children's Hospital, Southwark Bridge-road.—The Evelina Hospital, a new hospital for sick children, erected in the Southwark Bridge-road by Baron Ferdinand de Rothschild in memory of his wife, has been opened. It is capable of accommodating 100 beds, and will shortly be opened for thirty patients.

Bradford Town-hall Competition.—In reply to the invitation of the Bradford Corporation to architects to send in competitive designs for this proposed building, about 300 applications for particulars have already been received from architects in various parts of the three kingdoms.

New Post-office for Birmingham.—The miscellaneous estimates in the House of Commons contain an item of 21,850*l*. for the purchase of a site for a new Post-office in Birmingham.

The President of the Institute of Architects.—It is reported that Mr. Tite, M.P., will shortly receive the honour of knighthood.

TO ARCHITECTS, &c. A SENSIBLE (aged 20) requires an ENGAGEMENT. Neat draughtsman and writer. Thoroughly understood the usual routine of an office. Willing to give the best of his own merits to obtain a permanent engagement.—Address, L. G. care of Mr. Patis, 6, Spencer, High-street, Peckham.

The Builder.

VOL. XXVII.—No. 1378.

Odds and Ends.

BEFORE settling the date for an entertainment, it would seem easy for a public body to learn what other hodies were doing in that direction, and so to avoid clashing. Whether easy or otherwise, this is not done. On Thursday night in last week the Royal Academy and the Royal Horticultural Society opened their doors to guests, the dinner for the Artists' Benevolent Fund then also taking place, and, as a matter of course, with reduced numbers; and on Thursday night in this week the Society of Arts and the Royal Institute of British Ar-

chitects both held a *conversatione*, the former in the South Kensington Museum—a mighty crowd—and the latter at the House in Conduit-street. We note the occurrence in hope of preventing similar conflicts in another year. The Academy *soirée*, held earlier in the season than usual, with London full and new galleries to attract, was the most brilliant they have ever had. Music lent its aid, and the dresses of the ladies took the colour out of the pictures. This was also done by the gas, which seemed, so far as the paintings were concerned, to be a little in excess. Mr. Smirke's galleries, however, came out admirably, and the varied decoration was more observable, or at any rate more observed, than had hitherto been the case. The public will soon pay for the new building. We have heard, on tolerably good authority, that the "takings" at the door during the first month exceeded those of last year by 800*l.* a week; and that if the attendance continue to be as it has been, the total receipts for the season will probably be little less than 20,000*l.* We hear, too, that there will be no evening exhibition at a "reduced" charge, as heretofore; and hope, if this be true, that the Academy will compensate the less fortunate part of the public by reducing the entrance-fee, say for the last week. If they were to open the Exhibition *free* for a short time, it would increase their popularity.

Prince Teck at the Horticultural Society would have pleased the members better if, following the example of the Duke of Buccleuch on a similar occasion, he had personally received each visitor: the character of a "reception" is quite changed when visitors are not received.

At the Artists' dinner Dr. W. H. Russell discharged well the duties of chairman, and nearly 800*l.*, including a recent bequest, were the result. A wonderful career has been that of William Howard Russell, the "pen of the war," and very much his countrymen owe him. The Crimea, India, America, Russia, Egypt, have been scenes of his labour, and, as a writer under difficulties, he may claim amongst his characteristics wonderful truthfulness as well as brilliancy. In drinking "Prosperity to the Artists'

Benevolent Fund," he said that in asking their continued support to the institution he was not soliciting aid for a struggling fund in its infancy, but for a veteran of green old age, with, he hoped, the prospect of a long and active existence. It was solely in that conviction that he addressed them. The fund was not in the process of organisation,—a word which he confessed he had a horror of,—he was simply anxious to promote a system of recruiting, and thus ensure a continuance of that support which so useful an institution required and demanded. The fund was in a flourishing condition, but that condition might fall into a state of decay unless the same active powers now in operation were employed to maintain it. If his humble words could reach the world outside the room, and if he could successfully appeal to the sympathies of those whose walls were hung with the works of artists, he was quite sure he should be enabled to do something towards increasing the benefits of the fund. All the institution wanted was fuel to put into the boiler to enable it to go on as it had done.

This fuel must not be withheld. The fund specially helps those who help themselves. Every young artist should obtain an interest in the Annuity Fund. Only one R.A. was present on the occasion of which we are speaking, namely, Mr. O'Neill; partly because of the *conversatione* already referred to, and partly perhaps because of their attendance not long ago at the dinner for the Artists' General Benevolent Institution, an excellent society, but one that does not render the Artists' Fund unnecessary; in fact, as Mr. C. J. Dimond, the honorary secretary of the latter, said, if the Annuity Fund were rightly taken advantage of there would be little necessity for the General Benevolent Fund. The dinner was not well reported. It is an odd fact, by the way, that newspaper reporters of dinners, by whom half the speakers may not be mentioned, state, nine times out of ten, that Mr. This or Mr. That "was the toast-master;" though the doings of the majority of these officials, who request the company to "drink the herry with all the honors," are scarcely hearable.

Amongst other recent meetings we would mention that of the Society for Improving the Condition of the Working Classes, which was held on Friday in last week, the Hon. W. Cowper presiding, and the Rev. J. B. Owen, the Rev. A. W. Thorold, and several others, speaking earnestly in its favour. Mr. C. Payne, the active secretary, in the course of his report gave an epitome of the balance-sheet, thus:—Received from all sources in the year, 5,659*l.* 15*s.* 4*d.*; to which add balance in hand, 516*l.* 12*s.* 2*d.*; total, 6,176*l.* 7*s.* 6*d.* The current expenses of all the lodging-houses, including repairs, amount to 3,504*l.* 2*s.* 11*d.*; the interest on loans, &c., 898*l.* 5*s.* 9*d.*; printing publications, and lithography, 107*l.* 1*s.* 1*d.*; salaries, agency, rent of offices, advertisements, and all incidentals, 852*l.* 2*s.* 4*d.*; leaving to the credit of the society, 814*l.* 13*s.* 4*d.*; total, 6,176*l.* 7*s.* 6*d.* The real property, &c., belonging to the society (at cost), including balance at banker's, for the year ending December 31st, 1868, is 44,973*l.* 5*s.* 9*d.*; general liabilities, 20,987*l.* 3*s.* 3*d.*; leaving assets, 23,986*l.* 2*s.* 6*d.*

Some little regret was expressed by one speaker, and we think with justice, that, considering the large amount expended, the net profits of the year were so small. Mr. Owen had said in his speech, with respect to the rate of mortality in the houses of the society, it might be remarked that for the last ten years there had been a steady decrease in the average per 1,000. In 1859 the average was 20 per 1,000. In the year following it fell to 19 per 1,000. For the next five years it kept steadily to 16 per 1,000. In 1866, in consequence of an epidemic, it went back to 19 per 1,000. In 1867

it fell to 15 per 1,000, and from the causes stated in the report, clearly of a temporary and exceptional character, it had risen last year to 22 per 1,000. As the pioneers in this work they had to make and clear the way, and thus had to encounter greater difficulties than those who followed in the same course. The Limited Liability Act, which had been passed since the society commenced, had greatly facilitated the promotion of other companies for building improved dwellings for the working classes. They were delighted to see the spread and the success of these hodies, because they looked upon themselves as the parent society, and upon the others as their legitimate progeny. There was, however, and would continue, this difference between them, namely, that this society was in the main based on philanthropic principles, and a pecuniary dividend was a secondary consideration; while the others very properly based their operations on the commercial principle, and looked for a fair return upon the capital invested.

Fully admitting the position of the Society as a pioneer, we should be glad to see it returning a better percentage on the money spent, so that other bodies might find it their interest to invest in a similar direction. The chairman, in his closing address, said the society might undoubtedly have shown a larger balance in their favour, but that must have been done by charging higher rents, and this was not their object. It was, however, gratifying to know that in some cases a good, steady dividend of 4 per cent. had been realised by some of the companies; and if by the use of concrete walls or the Portland cement walls lately introduced the cost of cottages could be reduced from 130*l.* to 80*l.* and lower, they might hope not only to multiply these dwellings, but to reach a lower stratum of society. They might all be thankful that so far they had been engaged in a good work, and had achieved some success. The utility of the society was not confined to the buildings it had erected or modified and improved. It was in constant communication with persons on the Continent, and even in America, who sought advice, assistance, and plans, and in this special direction it was of very great service, and he thought they might look back with satisfaction on the past, and with hope to the future.

This is perfectly true, and ought to be taken fully into account when scanning the financial results. We may make another opportunity, however, to discuss this matter more fully.

At the dinner, a few weeks ago, of the Artists' General Benevolent Society, to which we alluded just now, the conductor of this journal ventured to call somewhat urgently for a reinstatement of the British Institution, or, at any rate, for the re-establishment of the annual exhibition of the works of the old masters, formerly held under its auspices, and thought that its capital—some 14,000*l.* or 15,000*l.*—ought not to be lost to art. The remarks found ready acceptance, and have since brought us a number of letters asking what should be done in order to secure the exhibition in question. It may be as well, therefore, that we should say, the Burlington Fine Arts Club, at present a small though influential association, are again moving with a view to bring this about. It appears that this club was founded to bring together on a friendly footing collectors, amateurs, and persons variously interested in matters of art, and to provide a centre for the exhibition and comparison, among its members, of objects of interest in their possession. Secondly, to utilise these exhibitions by making them, from time to time, subservient to the illustration of particular arts, or the art of a particular master or period, and to render them, under certain restrictions, accessible to a portion of the public. Thirdly, and especially, to identify the action of the club with the action, about to cease, of the British Institution, with a view to the revival and maintenance of periodical exhibi-

bitions in London of works of art by the great masters. With these objects the club opened in temporary premises, 177, Piccadilly, on the 1st of January, 1867, and has held there such special exhibitions as a limited space and light permitted; free access to these exhibitions being given to artists, men of letters, and other persons known to take a legitimate interest in art. It was soon found, however, that better accommodation was needed, and a sub-committee recommended the following as a course proper to be adopted, viz. :—

"To bring before the special general meeting, announced for the third Tuesday in May next, the desirability of extending the club to 500 members, either as a regular Dining Club (plus a certain art action), at 5s. per annum subscription; or as an Art Club (minus dining accommodation), at 5s. per annual subscription, as the meeting should, after discussion, determine. One of the objects of these propositions having been carried, the sub-committee consider that invitations should forthwith be addressed to persons likely to prove eligible members of the club, setting forth the details of the scheme, and undertaking that if, in reply to such invitations, the committee should receive before Michaelmas next assurances that a sufficient number of additional members would join the club as from the 1st day of January, 1870, then the committee would engage suitable premises into which they would remove from their present house, so that the new premises might be occupied, and the business of the extended club commence, as from the 1st day of January, 1870, from which date subscriptions of new members should run."

Touching the British Institution, and a continuance of the Exhibitions of Works by the Old Masters, a conference was held, whereas it was understood to be agreed that the directors of the British Institution would advance their capital of 14,500l. or 15,000l., free of interest, on a substantial security that the money would be laid out by the club in prosecuting the objects for which the British Institution had been incorporated; and endeavours were at once made to obtain a site available for the double purpose of an extended club and a gallery. It would appear, however, that no site suitable to the double purpose in view has as yet presented itself.

The club, we are told, has recently determined to adopt the recommendation to extend the number of members to 500, on the basis of its present constitution as an Art Club; and that for the purpose of providing adequate accommodation for the club so extended, and for affording increased facilities for carrying out the special art objects of the club, the committee are to hire on lease or otherwise such premises as they may deem eligible. Further, they are to communicate the proceedings to the council of the Royal Academy of Arts, and to the directors of the British Institution, and to suggest a conference of the three bodies, with a view to the settlement of the question, viz. :—“Is it desirable that Annual Exhibitions of Works of Art by Old Masters should be held in London; and if so, does it appear that by the action, collective or separate, of the three bodies above-named, this desideratum may be attained?”

What will come out of this we have yet to see. The difficulty in the way of obtaining a proper site is considerable. The Art-Union of London has a large sum of money in hand applicable to the provision of a gallery for the exhibition of works of art, and the Council of that body has made several endeavours to obtain land for it, but hitherto without success. If a union of these two funds could be usefully brought about, the difficulties might perhaps be lessened. This idea, which has occurred to us on the instant, has sufficient promise in it to prevent us from overlaying it with any further gossip. We commend it to the consideration of those who are concerned.

THE ARCHITECTURAL PUPIL.

WHATEVER may be thought of the value or importance of such meetings as those of what is called the “Architectural Alliance,” where a small number of delegates, by no means representing all the provincial or leading architectural societies, meet with closed doors to debate on the advancement of the profession, the recent printed reports of the last meeting furnish us at least with some new data as to the position of the architectural pupil, in the provinces especially, which are not without interest or significance. That much-neglected young man is at last to receive some tardy attention, his present position to be inquired into, and his future welfare and instruction are to be at least discussed, if not immediately or adequately provided for. We put a distinction between the question as referring to London and to the provinces, seeing that the facilities, for self-education at least, in London are so out of all proportion superior to those attainable in any

provincial town, that the direction in which improvement seems to be called for is quite different in the two cases. Taking the Report of the London Architectural Association, furnished in reply to a request from Mr. Rickman (hon. secretary to the Architectural Alliance), we find the main complaint of those who draw up the Report is that the students do not take advantage of the numerous opportunities for instruction open to them, including all the lectures at King’s and University Colleges, the Royal Academy, and the Royal Institute of Architects, the Schools of Art and Libraries at South Kensington, the Architectural Museum, the British Museum, &c., and, we may add on our own part, the advantage of living where buildings on a large scale are constantly being carried out, and can be inspected and studied in progress. The neglect of these golden means of improvement is not, however, charged by the report entirely, or even mainly, on the idleness or indifference of the pupils themselves, but on the fact that they are kept too close to their office-work, and are not allowed time enough by their principals to attend lectures, and to practice sketching and prosecute private study; the steps taken for the improvement of the pupil by his principal amounting in general, it is said, only to the ordinary routine of office-work, accompanied by “suggestions” as to the desirability of attending the evening lectures of the association, &c.,—a cheap way, certainly, of doing your duty to your pupil. Then the Association is also of opinion that a serious hinderance in the way of useful and exhaustive study lies in the fact that the great facilities for acquiring information in London have not been embodied by any one “in a definite or accepted system.” Still the facilities are there, *in posse*; and, given a desire for knowledge on the part of the student, and a reasonable liberality as to allowance of the requisite time on the part of the principal, it really seems impossible that any man of good ability should not be able to amass a quantity of valuable information in the course of a few years, although it might not be attained in the most systematic manner, or at least the pupil might have to systematise it for himself.

Turning from the report of the London Association to those furnished on the same occasion, and in answer to the same schedule of questions, by the Architectural Societies of Birmingham, Liverpool, Manchester, and Glasgow, the difference as to the available means of education existing in these large provincial towns, as compared with London, is remarkable. Scarcely any where do there seem to be regular lessons or courses of instruction in strictly architectural subjects, unless we include under that head the fortnightly papers, regularly read during the session of the Liverpool Architectural Society, some of which have appeared from time to time in our column; but these are often rather theoretical than practical, and of more value to advanced members of the profession than to students. It appears that in connexion with the Liverpool Institute, where *inter alia* are taught mechanical statics and dynamic, and drawing from casts, &c., there were also formerly special architectural and building classes, which have been discontinued “from want of attendance.” In Manchester, again, there is a school of art and a Mechanics’ Institute, “in both of which architectural drawing is taught; the latter is attended principally by artisans in the building trades, and nearly every architectural pupil has attended at one period or another the former; but as *neat draughtsmanship appears to be the sole object*, the constructional and practical branches of the profession are consequently neglected.” In Glasgow there is a school of design, but we learn nothing about its practical value, or the extent to which the pupils avail themselves of it. But one thing that especially strikes us in looking at these documents is their beautiful and touching candour. In place of making the most of the possible good intentions of the architects of each town as to instructing their pupils, all these reports are unanimous in representing that the duty of the architect to his pupil is systematically ignored. The Birmingham report says, “Articled pupils are left pretty much to themselves with regard to obtaining knowledge beyond the usual office work,” and adds with great *naïveté*, “Our society does not take any steps towards the improvement of art-students.” The Liverpool report states, that “in the majority of offices very little systematic instruction is given to pupils,—in some cases none;” and also that very little opportunity

is given to the students of visiting buildings in progress, and making practical acquaintance with the details of their profession; a very important point in architectural education. In Manchester “the steps usually taken during the term of articles for the advancement of the pupil are so very insignificant, that we may safely state them, with a very few honourable exceptions, as none whatever.” The Liverpool and Manchester Societies, however, unlike the Birmingham, have endeavoured to atone for the neglect of their pupils by individual architects, and the absence of means of self-instruction in their respective towns, by instituting classes in connexion with each society for instruction in matters connected with the profession. Thus, the Manchester Society has a class for design and construction on Monday evenings, a modelling-class on Wednesday evenings, and a figure and free-hand drawing class on Friday evenings; and on Saturday afternoons there is a class for water-colour drawing. The Liverpool Society, besides offering prizes for designs and sketches both in summer and winter, has a figure-drawing class meeting two nights in the week. The reports of both societies, however, complain of the want of attendance at the evening classes, though the Liverpool Society’s report states that the students’ prizes are actively competed for, and with results creditable to the competitors. As to the Glasgow Society, Mr. H. K. Bromhead, in his report on their behalf, disposes of all preliminary systematic education at one fell swoop. They do not trouble themselves with the pupil’s education; but they have an Institute incorporated by Act of Parliament, entrance into which is supposed to be the grand object of the pupil’s struggles; and as this entrance is not obtained but by passing an examination as to proficiency, it is supposed that here is efficient inducement for the pupil to educate himself as well as he can. So far as we understand the report, at least, the architects do not attempt to educate the pupil; only he cannot come into the Institute unless he is educated. But, then, the Glasgow architects do not take premiums, which Mr. Bromhead seems to think is their “weakest point;” on the contrary, the pupil is paid small sums during the latter years of his apprenticeship; and, on the whole, it is certainly better that architects should openly declare their intention of doing nothing for their pupils, and act accordingly, than that they should pocket a few cool hundred and pursue the same *laissez-faire* system after all, without acknowledging it. As to the means to be adopted for the future amelioration of architectural education, none of the provincial societies offer any express opinion, except the Liverpool one. The committee who drew up the report are of opinion that much must depend on “the recognition by individual architects of their responsibility towards their pupils;” but we must be allowed to observe that the fact that much does depend upon this, is just one of the evils of the present system; our architectural education ought to be independent of the caprice or conscientiousness of particular individuals. The Liverpool committee, however, further express their conviction that :—

“The strongest inducement to the improvement of architectural education would be the establishment of a compulsory examination for those who wish to enter the profession of architecture; such examinations being held in the provinces at conveniently situated central towns, if possible, but nevertheless in connexion with a governing body in London, such as the Royal Institute of British Architects; or in connexion with the English universities, if these latter should be brought to recognise the importance of art education, and provide for it in an adequate manner.”

“Much virtue in an *iff*” but this last “if” is one which we shall have to wait some time for. The committee also suggest the formation of a lending library, on an extensive scale, of architectural works; a project which has been mooted before, but never seems to have met with efficient support to induce any one to take it up, and become the *Mudie* of the architectural world.

The report of the general committee selected from the Royal Institute of Architects, the Royal Academy, the Architectural Museum, the Architectural Association, and the Architectural Exhibition Society, to examine into the defects and possible remedies of architectural education, goes (as might be expected) much more fully into the subject than any of the previously-mentioned documents. Their salient propositions are, first, “That a certificate be granted to all who pass the voluntary architectural examination;” that at some future period “the membership of the Institute be made dependent on the passing of the voluntary architectural ex-

amination in the class of proficiency; and "that a preliminary examination be held in elementary subjects, open to all students who have been at least one year in an architect's office." The object of the last is to encourage the student early to the habit of systematic study of the elementary knowledge connected with his profession, that he may more readily understand what he is working at, and lose less time. This would certainly be a good step, and would help to convince the pupil from the first that he was entering a profession requiring systematic study to master it: a conviction which we imagine is wanting to a good many of the young gentlemen who are at present knocking about in architects' offices. Then, taking into consideration the great facilities afforded in London for self-education, and the absence of anything like a systematic use of them, the committee suggest the preparation of a text-book or pamphlet, containing a complete curriculum of study for the architectural student, and especially pointing out when and where lectures especially pertaining to the profession can be heard, and giving a limited number of books in which the best information can be had in a condensed form. This the Institute have determined on providing.

That such a book, carefully drawn up, will be of the greatest use to students who have not the good fortune to be placed with a master willing or able regularly to educate them, there can be no doubt whatever. The committee urge the complaint, which is also made in the reports of one or two of the provincial societies, that the students make very little use of the opportunities now within their reach. There must be some reason for this. One cannot suppose that architectural pupils alone, of all students, are idle and good for nothing. The fact is, that there is no sufficient definite inducement to study hard, no assurance that without hard study the profession cannot be taken up and exercised. Young men intending to enter the professions of law and medicine know from the first there is a stiff examination awaiting them at the end of their period of study, which they must pass, or lose the whole time they have spent in study; but the architectural student sees that men constantly get good commissions through the interest of their friends, without possessing any remarkable natural talent, or spending any of the midnight oil in hard study, and he naturally hopes that he will be able to do even as these; and, in such case, it is difficult to entice him, as the good lady in the rhyme enticed her geese to "come and be killed" in a voluntary examination. He cannot be led—

"To scorn delights and live laborious days"

in the hope of passing, when he knows that Jones, who has wasted his time in sporting with Amaryllis in the shade, and snags his fingers at the examination, may, after all, get into just as good, or better, practice; for we all know that interest often goes a great way further than talent. The committee think, that one reason why the great number of lectures and other means of improvement attainable in London are not more used, is that principals do not allow the pupil time for them in the daytime (a complaint echoed by the Architectural Association), and they urge that subjects which are necessarily constituent parts of architectural education ought to be learned during office hours, in place of the pupil being compelled to spend his evening over them. Nothing more true; but then what is the advantage of the considerations to a pupil in the provinces, who is not within reach of all these lectures, and museums, and exhibitions? It may, of course, be said that he should come to London for his education; but are the London architects to be expected to find room in their offices for all the young men from the country who wish to study for the architectural profession? The more we go into the subject the more evident it becomes that the whole system requires altering. These kind of half-measures which provide first for placing a lad in an architect's office, and then for getting him out again at intervals to learn what he cannot learn, or is not likely to be assisted in learning while there, supply no really systematic course of education. It is a very uneconomical method of using the time during the period of study, to mingle up together office routine, and attendance upon lectures, and drawing-schools, in an irregular in-and-out way; it is not in such a manner that either the practical or the theoretical portion of the profession is likely to be thoroughly learned. What we want is the establishment of architectural schools or acad-

emies on the same system which has been long adopted on the Continent, where the principles of architectural design and construction, and the necessary supplementary branches of drawing, can be definitely and systematically taught by persons adequate to the task, where the student may apply himself to the acquirement, on a theoretical basis, of all the main branches of knowledge necessary to his professional success, without finding the regular and consecutive course of study disturbed and broken up by the details of office work. The knowledge of these latter can be acquired afterwards, and will be acquired in a much shorter time when the student comes to them with a previous knowledge of the general bearings and scope of his profession, than when (as at present) he is turned loose into an office to grope his way into the details of the work by degrees, and trust to finding out the general value of them afterwards.

We cannot just now go into the question, how such academies may be instituted, who is to institute them, and how they are to be supported; probably an appeal to Government would be necessary, and in that case we might hope that it would be the more easy to obtain governmental recognition also of the examination which should follow. Without saying that no one should be allowed to practise as an architect unless he has passed a prescribed examination, two things we wish to see done, without which no thorough reform can be accomplished; we wish to see the term "properly educated architect" legally defined by some qualifying adjective (say "certificated architect") which may distinguish the hearer of it from the jury-builder who writes up "architect" over his door; and we wish to see "the architectural pupil" altogether eliminated, and the architectural student taking his place.

COLOUR AND SOUND.

In examining the history of the physical sciences we cannot fail to be struck with the gradual tendency of their various laws towards unity.

The phenomena of each branch mutually illustrate each other, and the more they are studied and compared the more it becomes manifest that all are obedient to the same essential laws and governing principles, differing only in degree, and in the results the same operating forces produce.

In obedience to this principle, already we have striking analogies between light, heat, electricity, and sound, and we believe that the time will come when all the more common phenomena of nature will be found influenced by a few general laws common to each. Unfortunately for scientific education, phrases originally merely poetic becoming common, are apt to be so assimilated, as it were, that we fancy we understand their sense, without giving much attention to the absolute meaning of the words composing them. The harmony of colour will be spoken of, and apparently understood, by many to whom the true scientific explanation of the expression is entirely new.

That there is a similarity between the impressions produced by a painting and those produced by a musical composition, is a fact so long undoubted that an analogy between sound and colour has for some time occupied the attention of both painters and musicians; but with the exception of the remarkable results obtained with the prism and the monochord by Newton, no advance seems to have been made to the scientific application of musical harmony to the art of painting. It has remained for Dr. Macdonald* to bring forward a clear and probable theory. Just, then, as a note depends upon the number of vibrations of the string or other instrument causing it, so the colour of the light ray depends upon the number of its undulations. It has been found that the undulations of the colours of the iris increase in number and diminish in size as they ascend from the base red to the violet, just as happens in the musical scale in passing from the graver to the more acute sounds.

Can we not work out the precise relationships existing between the two scales, painting may be elevated to the status of a science, based, like music, upon mathematical principles.

Surely we may the more assume this step toward analogy to be correct from a knowledge

of the physical effect of beat—expansion; and we find that the heating power diminishes in the respective light-rays as they advance upon the scale.* Pointing out first the similarity between the seven notes in the musical scale, and the seven prismatic colours, Dr. Macdonald says that "the primitive colours, red, yellow, and blue, occurring respectively upon the first, third, and fifth intervals in truthful harmony, independent of coincidence or fortuity of any kind, may be said to compose the perfect chord of colour answerable to that in music, which all musicians admit to be the very groundwork and basis of harmony."

Again, we may fairly argue that pitch in sounds is equivalent to tint or hue in colours, determining their relations to each other. In confining his attention to the natural key in music, that commencing with the note C, Dr. Macdonald assumes red to be its analogue in the colorific scale, and for this assumption there are several favourable arguments.

As was before remarked, red is the least refrangible of the primitive, and its vibrations are longer and slower than those of any in its own series. This, too, is the case with the key-note with reference to the other intervals of its scale.

It would be difficult, in the small available space here, to give even the rudiments of harmony: we must be content with remarking that sounds in music are those whose respective undulations render it possible for them to act together, without interfering with or neutralizing each other,—without, in short, infringing the law of "interference."

Speaking technically, and quoting from the above-mentioned author,—

"From the study of their properties and offices the different intervals of the musical scale have received appropriate names; thus C is denominated the tonic; D, the super-tonic; E, the mediant; F, the sub-dominant; G, the dominant; A, the sub-mediante; and B, the sub-tonic. The word 'tonic' is always applied to the first or key note; the dominant to the fifth, from its predominance in harmony; and the mediant to the third, from the position it holds between the tonic and the dominant."

It will occur to every musician, either practical or scientific, that every note in the gamut may be supported by a fundamental bass note, with its third and fifth forming the common chord. There are but three chords required on the bass clef, the first founded on the tonic, C (red), E (yellow), and G (blue); the second on the sub-dominant, F (green), A (indigo), and C (red); and the third on the dominant, G (blue), B (violet), and D (orange). The painter is advised to choose first his key, and then to translate some good harmonic phrases into colours most heighting the nature of his subject; and to the determination of a key a clear perception of the fifth interval, the dominant colour, is essential.

"In giving an account of the complementary colours, it is usual to adduce the series resulting from the binary mixture of the primitives, forming a sort of colorific hexachord, like the old musical one in which the seventh interval, equivalent to violet, was wanting.

Had Guido, the monk, taken the prismatic scale for his guide, instead of its effect making a mechanical mixture of the three major constituents of the diatonic scale, he would have transmitted a still greater name to posterity."

Alternate colours produce common chords, red, yellow, and blue answering to C, E, and G, and orange, green, and purple to D, F, and A.

If we take one primitive, say red, the other two, yellow and blue, must exist, either separately or in its complementary, green; or, taking a compound colour, purple, composed of red and blue, its complementary will be found either in the opposite colour, yellow, or in the alternate compounds, green and orange, taken together.

We may here notice the analogy in effects of "interference," both in colour and in sound: yellow is said to be "indifferent" to green, red to orange, and violet to blue. Musically speaking, these intervals, being seconds, are positive discords; and, speaking of colour scientifically, we may notice that a green opposed to a strong yellow appears blue, a purple to a blue red, and an orange to a red appears yellow; the fact being that the undulations somewhat interfere with each other, and similar ones interfering with and nullifying each other, the solitary colour stands out with undue force. With reference to complementary sounds,—

"If a string sounding C be divided into four parts, 1-4th and 3-4ths will also produce C; but the complement of 1-4th are 3-4ths, yielding F, which is equivalent to green, the complementary colour to red. Divide the strings into five parts, 1-5th, 2-5ths, and 4-5ths will produce E, yellow; but the complement of 2-5ths are 3-5ths, yielding A, the equivalent of indigo or purple, which is the colour required."

* "Sound and Colour: their Relations, Analogies, and Harmonies." By T. D. Macdonald, M.D., F.R.S.

* See *Builder*, May 8th, "On Scientific Origin of Artistic Notions."

From these facts, the inference that complementary colours are, as it were, chromatic harmonies, is undeniable; and from these, too, we may account for the complementary impressions which arise on the retina when some particular colour long impinging upon it has been removed: it would appear that its surface, when long excited by the influence of a particular colour, is more susceptible of the vibrations of its complementary in white light.

Dr. Macdonald does not fail to show the scientific analogy between the structures of the human eye and ear, and the harmony between the sensations perceived by those organs. We must refer the reader to his little work for these interesting details. There has been a time when it was sufficient for the thinking man to give the world his thoughts, but with the present practical and somewhat hasty age, the cry is ever, *Cui bono?* Of what use can you make your discoveries? And to this inquiry the mind of genius at most times responds, feeling that to compass the greater good it must sacrifice somewhat to the less intellectual though more practical of its fellows.

Thus the ingenious gentleman we have quoted points out how many of the great masters were practical musicians as well as painters, and profited accordingly. "What is termed 'Gusto' in colouring is intuitive to the painter of genius, as musical taste is a natural gift to the born musician, who may compose and harmonise pleasingly, though ignorant of its rules."

We may remark Salvator Rosa, Carl Antonio, Guido Reni, Julio Romano, one of Raffaele's most excellent disciples, as instances of painters being at the same time musicians; and Dominichino, whose talent lay principally in the correctness of his style, and his power of expressing the emotions of the mind, was a thorough scholar in the theory of music.

But though natural taste has achieved great things in the graphic art, a scientific rule may be most advantageous to those not so highly favoured, and surprising results otherwise undreamt of may be developed. In a general sense, the lower the refrangibility of a colour the nearer it will appear to the eye; the more refrangible the greater will be the apparent distance. Thus, red being the least refrangible, will generally predominate in the foreground; yellow, green, and such intermediate colours in the middle distance; and blue, being the most so, with every variety of greys, will form the background of mountains, vapours, horizon, and sky.

A most striking effect has been accomplished by Paul Veronese, with much musical perception, in his picture of "The Marriage of Cana in Galilee":—

"The Redeemer, who is here the principal figure, is carried somewhat back in the picture, and the painter, who could not properly distinguish him by mere lights and shadows, clothed him in red; the least refrangible, and therefore the most approximating colour of the scale, so as effectually to conduct the eye to that figure."

Now, the first essential is the choice of a key. A definite key-note—say red—must first be fixed upon, and then the proper and dependent colours must be localised according to the painter's own taste and judgment. This note must necessarily hold the most central and prominent position in the picture, and the arrangement of the chords of the dominant (blue) and the sub-dominant (green) must be determined by it.

"The Taking Down from the Cross," by Rubens, is a peculiarly celebrated example of this arrangement. John is here the key-note, and the red drapery is in wonderful harmony with the colours in the immediate vicinity. "To the left we find the other components of the perfect chord, and to the right the common chord of the sub-dominant, the first interval of which is given in the green drapery of the female figure kneeling."

The three Marys are clothed in drapery answering to the third and fifth intervals; Joseph of Arimathea, a prominent character in the story, has colours corresponding to the tonic mediant and dominant. Two assistants are judiciously introduced, wearing also drapery in direct harmony, and in suitable places passing colours of limited extent are added, to promote the general effectiveness of the composition, as passing notes add grace and set off the agreements of a musical theme.

Donthless among the old masters very many pictures might be adduced as examples of pleasurable sensations being produced by arrangements which may be scientifically analysed and found in harmony with the foregoing rules; and doubtless, too, on the walls of the present Academy of Arts many works will stand the test

of severe musical criticism, and not be found wanting. For the encouragement of those who may fail to pass this searching examination, we may point out the picture of "Bacchus and Ariadne," justly reckoned a masterpiece of Titian. Dr. Macdonald says that it,—

"When translated into music, affords full harmonies, but there is an undue force in the dominant, as compared with the other intervals of the perfect chord. An excess of this kind is of course quite as possible in music as in painting. Were the notes one and three sounded together, and a fifth of inordinate strength then introduced, the latter would naturally counterbalance the other notes, and obtrude itself painfully on the ear."

"Musical rule would prescribe a reduction of the power of the fifth to equalise the harmony, and the same principles should be recognised in painting, viz., to preserve equality in breadth and strength of the components of all colorific chords."

"Trusting to the truth of musical analogy, we are in no fear of incurring the charge of presumption in thus noticing a slight defect in a noble picture so often, and so justly quoted by critics as a standard of art in colouring." He notices that the companion to this picture—however, Jupiter and Europa, in the Bourgeois collection, also by Titian, and painted in exactly the same key, has the common chord in perfection, the dominant being kept within due limits, and the harmony complete. Dr. Macdonald winds up his interesting pamphlet by deploring the tendency of modern paintings to lose their colour after the lapse of a few years. This he ascribes to an erroneous principle in the mode of colouring, involving too many processes, and to the chemical action arising from the mixture and intermixture of various tints.

Pictures painted by the old masters on the transparent principle 150 or 200 years ago seem but to be gaining in appearance, and improving in mellowness and beauty, while the portraits in the Dulwich Gallery are already faded.—Mrs. Tickle, Mrs. Sheridan, and the Moody family, presenting a sad and unhealthy aspect.

Pure linseed oil, both in a boiled and in a raw state, seems to have been the only vehicle for colour employed by the old masters, and we have no evidence to show that varnish of any kind was used with their paints.

Oil, as it were, insulates the molecules of the pigments, and preserves them from extraneous agencies, and even from chemical changes, with the atoms of other pigments commingled with them in tinting.

"It stands to reason that every absorbing surface, as in the bibulous grounding material of some kinds of prepared canvas, added to the want of binding and the evanescent nature of the vehicle itself, will sooner or later deprive the pigments of their protective matrix, exposing them to the action of new affinities, to the niter destruction of the pictorial effects they were intended to sustain. Soap and water would very soon undermine such colouring, whereas they may be fearlessly employed, if necessary, in the superficial cleansing of pictures painted with linseed oil."

Do not the foregoing remarks explain much that, in our sensations, has been incomprehensible? We have felt the effect surely when the sun has suddenly burst upon the landscape on a dull April day. Is it not the same when an accomplished organist suddenly introduces the "principal stop" into his "fugue," and on the swell organ chases it from the dull tones of the diapasons to the brighter and more striking ones of the "hantboy" and the "trumpet"? And in the endeavour to assimilate the foregoing rules, and to hear with the inner ear the melody both of pictorial art and of nature, are we not struck with the extraordinary musical crescendo and diminuendo effect of our English summer, when the swell organ of the sunlight affects the feelings with tenderness by its soft and fascinating impulses?

The light cheerful strain of spring upon the upper notes of the scale, and with but half-developed harmonies, the yellows and the greens, and the delicate lightly moving shadows, an air played, as it were, solely in the treble clef, gradually swelling upward, and slowly strengthening as the deeper notes of the summer tone the yellow into orange, and tint the green with a darker hue; while the high lights are brought forward, with great force, as the brilliant effect of the solar light, "the principal" mingles with and freshens up the whole.

Then, too, begins to appear more strongly the tonic, the key-note of the picture, and from sky and forest, the red light gleams in the middle distance, bringing it closer and into more familiar relations with our sympathies. Browns of every hue form an under-current of melody in the foreground, while infinite degrees of grey, and the cool upper tints of the scale, form a back-

ground of nonmountains, mists, clouds, and skies. Then the lessening energy and the diminished effects as the autumn dulness casts its shadows over, and, as softening melody appears to die away into distance, the foreground occupies the now prominent position, while the horizon vanishes, and the middle distance fades into the background. Then, as the fugue slowly descends the scale to the quiet resting-place of a deep bass note, some transient flash of old summer weather once again lights up the picture, the orange and the red reflecting back their colours over field and forest from a glorious sunset, the blue distance deepening to a violet, and every variety of rich and full chords boldly and brilliantly struck, while the "tenor" of the fallen leaves and the deep bass of the darkening shadows fill the soul with harmony, the true music of nature.

"And now the golden coves where autumn lingers
The never wearied hours have left behind;
Winter o'er all the hills with frosty fingers
Hath spread its pall of mist upon the pines."

And as the brighter high lights die away in the evening, and the darker masses of shadow creeping slowly up, throw the scenes far into the distance, the glorious pictorial anthem is left,—left to the last few notes on the mediants, to the repeated bass, and to the deep dark silence of winter.

S. S.

THE DECAY OF STONE.

I HAVE perused with interest in the *Builder* of the 12th ult. the abstract of a paper "On the Building Stones used in the Metropolis," and read before the Civil and Mechanical Engineers' Society by Mr. Arthur C. Pain.*

There are, however, one or two points upon the causes of decay in stone in which I must differ from the writer. The error into which he has fallen is, unfortunately, a very common one; but why it should be so, or why so remain, I can see no sufficient reason.

It is reported in this paper that the decay of stone was caused by *bad selection!* and proof is assumed that certain buildings erected in proximity to quarries from which the stone was obtained, are in good preservation; and that buildings erected in London of similar stone were more or less in a state of decay.

Unhappily, no specific reference is made to the kind of stone, nor the buildings in which it is used, whereby they may be identified. I do not pay much heed to the statement of local masons misunderstanding the stone better than their city brothers; indeed, most of the London masons are from the great stone-producing districts, and really the operators have virtually little option than to obey instructions.

No doubt, a proper selection in material, and the stone being fixed on a natural bed, have much to do with prevention of decay; but these are points well known.

Now, it is a fact, which has been already shown in this journal, that a stone eminently suitable for country districts may be altogether unsuited for the buildings in a town; a case in point being the Houses of Parliament.

The difference arises from atmospheric causes—chiefly gaseous contamination; and as the magnitude of a town and the importance of its manufactures increase, so it may be that a stone will be more and more unsuitable. The classes of building material to which I refer especially are those known as magnesian limestones—commonly and erroneously termed "Dolomites;" and also, though in a less degree, to all stone containing magnesia.

I may state that as the quantity of carbonate of this earth, as a constituent of any stone, becomes less,—the objection decreases.

The objection to material of this sort in certain localities arises from its component parts being more or less rapidly decomposable from the presence of acids of sulphur always existing in the atmosphere, particularly in populous districts, its source being primarily the oxidation of sulphur, during combustion of coal, a portion of which acid combines with ammonia, and no doubt, some remains as free acid.

From the affinity which exists between this earth,—magnesia,—and sulphuric acid, they readily combine; and, as the resulting sulphate of magnesia is very soluble in water, it is easily conveyed that any building material into which magnesia enters must quickly undergo what is termed decay; and, let me observe, that as the porosity of a stone and its power to absorb

* See p. 461, ante.

moisture increases, so does its liability to destruction, independently of disintegration by frost. Calcareous and sand stones frequently deteriorate in small patches, in holes or veins; that is, in stones which are sound when first prepared.

I have sometimes examined these defective and also the sounder portions, and generally found the first to contain a few per cents. of carbonate of magnesia, whilst the latter have been free or nearly so. I do not know if this has been before remarked by other observers. However, it should not be lost sight of,—it is important. Of course, when the coherency of a part is destroyed by removal of some of its particles the thing easily crumbles, and such is the case with these lime-stones.

It is somewhat singular that in the same number of the *Builder*, under the head of "Church-Building News," will be found an error somewhat like that of Mr. Pain's, but more significant. The words are few, and I will repeat them; they are worth the attention of observant students.

In describing the building of a Presbyterian Church at Leicester, your correspondent says: "The building generally will be faced with rock-faced Bulwall stone, which has been preferred to the granite rubble of the locality, as being in itself equally durable, and forming sounder masonry." (!) Let me observe, *en passant*, that the granite of this locality, although granitoid, is not granitic, but syenitic; a true granite I have not seen produced by the Leicestershire quarries. This is of no importance; yet I mention it because many of your readers are unaware of their not being granites. But to the point: My curiosity was somewhat incited to know what stone was equally durable with granite, and forming sounder masonry! I procured a few specimens, and confess a glance raised my suspicion of its goodness. Not a had-looking stone when seen in the work from a distance; but examination shows it as a very porous mineral,—somewhat as if air had been blown through a mass of crystals. The substance was evidently a lime, and may belong to any formation, geologically, above the "New Red." It is something pulverulent, especially when dry. Its crushing power must be low.

The result of analysis indicates that the stone as a building material is unsuited to urban atmospheres, for it contains upwards of 22 per cent. of carbonate of magnesia, which in Leicester, with its number of manufactories and great consumption of coal, must and will become converted into "Epsom salts," and the natural porosity of the stone will considerably tend to assist in its destruction, apart from the action of frost.

ANALYSIS OF BULWELL LIMESTONE.

Soluble in Acids.

Water.....	1.91
Alumina and protoxide of iron, with trace of manganese.....	19.98
Carbonate of lime.....	53.28
Carbonate of magnesia.....	22.56
Alkali.....	00.35

Insoluble in Acids.

Silica, alumina, peroxide of iron, and traces of lime, magnesia, and manganese.....	100.90
---	--------

The water absorbed is 9.27 per cent., or 1 part in 10.99.

In determining the aqueous absorption, a specimen was thoroughly dried in hot air for eleven hours, and subsequently immersed in water for seven hours,—not a very stringent test. The absorbing power of Portland and Bath stones, I believe, are respectively 1 in 16 and 1 in 13.

In conclusion, let me add my caution against the use of this stone in positions of atmospheric gaseous contaminations, &c., inseparable from a large manufacturing town, for I consider it inferior and inapposite.

Let me add one word, that it would be interesting to know upon what probable grounds the material in question was described and considered by your correspondent as "has been preferred to the granite rubble of the locality, being in itself equally durable, and forming sounder masonry." W. R.

Dumfries Infirmary.—With reference to a paragraph in a previous Number (p. 492, *ante*), Mr. Starforth says the original estimate for his design did not exceed 10,000*l.*, but on the contrary was 9,250*l.*, and the working plans now produced are not in an amended form, as they are strictly in accordance with the original designs. The highest tender was 10,875*l.* 19*s.* 7*d.* and the lowest 8,650*l.* 9*s.* 8*d.*

HOPE FOR THE MINERS.*

AGAIN from out the pit's black mouth arise
Appalling shrieks for help; heartrending cries
Of stifling miners, who, beyond the gloom,
Lie scorched and shrivelled in a fiery tomb!
Down the black shaft a hundred heroes go
With generous eager haste, though well they know
'Tis death to venture in the "fire-damp" wave
That laves their dying mates; so recklessly brave
They rush, in hopes to bring back one dear life,
To agonising mother, child, or wife,
Too of their noble self-forgetting zeal,
Bears them within the gulf, whose flames reveal
Its hellish work, and with their lives they pay
Peril for haste that will not brook delay;
And thus the fearful death-roll is prolonged,
And the pit's mouth with dead and dying thronged.

Is there no hope? Can nowhere help be found
To stop this wholesale slaughter underground?
What has experience done in all these years? . . .
Take for reply those harrowing shrieks, those tears
That thickly rain from widows' orphans' eyes,
As, one by one, from out the pit arise
The scorched and mangled forms they scarcely dare
To look upon, lest those they love he there!

But hark! a calm majestic voice I hear,
That checks the sob and stays the welling tear;
'Tis Science speaks: "Mortal, I give to thee
My fairest child, bright Electricity;
Let but her holy light for ever shine
Through the dim pathways of the fatal mine,
And free from danger, free from gasping dread,
Securely thou may'st walk whilst by her led." . . .
Can this be true? Is there, indeed, a charm
To guard the "venturous miner's life from harm?"
Up, then, ye pit-owners! Up, every one!
Ere yet another day its course has run,
Make,—at least, make,—a trial of the gift!
If it succeed or not, your efforts lift
From off your consciences a heavy load,
Which else had burden'd you along the road
To Heaven,—perchance proved an avenging rod
To drive you thence; and, looking up to God,
But watching, working still, we'll humbly pray
A blessing on the New Hope of to-day.

R. F. H.

THE TRADES MOVEMENT.

Liverpool.—A letter to the local *Journal*, from the Secretary to the Liverpool Master Builders' Association, dated South Crescent-chambers, 6, Lord-street, June 24, says:—

"I beg to enclose you a copy of the wages offered by the Master Builders' Association to competent masons, as an answer to the mistakements made at the trades meeting, held last night at the Oddfellows' Hall, in reference to reducing the wages of the masons in winter by the hour system."

The offer to masons is as follows:—
"There are 250 free-labour masons now at work in Liverpool, and there is constant work for 200 more. The masters invite all masons who wish to think and act for themselves to assist them in their endeavours to free the town of Liverpool from trade union tyranny and dictation (which have had the effect of injuring to a great extent both the trade and the best interests of the workmen), by accepting the employment offered. The wages offered are 7*d.* per hour, or 3*s.* 2*d.* per week in summer, and 7*d.* per hour, or not less than 30*s.* per week during the shortest days in winter, with constant employment. Masons, haster to accept these advantages, and you will find the masters to be your firm friends and supporters. Do not be misled by the emissaries from Liverpool, who make false statements to mislead you, that they may be enabled to live in luxury at the expense of their dupes. Apply to William Wood, secretary of the Liverpool Builders' Association, South Crescent-chambers, No. 6, Lord-street, Liverpool; or to any of the employers in Liverpool, who will enter into special engagements as to the payment of fares to Liverpool."

The offer is dated 21st June.
Manchester.—Strenuous efforts have been made by the master builders, during the last two or three weeks, to procure non-union workmen, and a number of men have been brought to the town; and a fortnight since there were already at work upwards of 300 masons and 150 bricklayers. During the following week, however, the brickmakers took up the quarrel, and refused to make or supply bricks to be set by non-union bricklayers. This is likely, we understand, to lead to the introduction of machinery into Manchester for the purpose of making bricks; and, seeing that there are about 70,000,000 made annually in this city and the immediate neighbourhood, it is rather surprising that it has not been done before. Man-

* Suggested by the proposition in the *Builder* by Mr. R. Taylor, an ingenious working-man, to employ sparks of electricity in coal-mines, to detect and consume dangerous gases as soon as evolved, which proposal was afterwards taken up in Paris, and made the subject of a paper.

chester is one of the very few large towns in England where bricks continue to be made exclusively by hand. Two or three companies and individuals have established brickmaking machinery, but the operative bricklayers have refused to set them, and the hand-brickmakers have refused to supply bricks to any master who attempted to use for any purpose bricks made by machinery. The consequence has been that all such efforts have had to be abandoned, and have resulted in loss, if not ruin; but in none of the previous efforts had the master-builders taken a part. They, it appears, went on in the old way, unwilling to encounter a strike as long as it could be avoided; but now, we are told, the matter is to be taken up by the trade. The masters have resolved, it seems, to establish, if possible, free trade in bricks as well as in labour.

The operative carpenters and joiners of North-woich and neighbourhood having given the masters notice of alterations involving a reduction of 2½ hours per week during the summer months and an advance of 1*d.* per hour throughout the year, an equal number of masters and workmen met to consider the subject. On the part of the masters it was contended that the trade of the locality, much less the general trade of the country, did not warrant any change having a tendency to increase the present price of labour. In proof of this the monthly state of the operatives' unions of this trade was quoted. In one report (that of the Amalgamated Society) there appeared only six towns, representing 140 members, where trade was good, against 105 towns where it was either slack, dull, or had, and nearly a similar number said to be only moderate, steady, or improving. Another association (the General) represented matters to be even worse. It was also contended that anything tending to make work in winter unnecessarily dearer than in summer was most suicidal to the interests of the greater portion of the workmen, and that the time worked and the wages at present paid in this locality compared favourably with many towns, in and out of the county, of much greater commercial importance than this. On the other hand, the operatives maintained this was otherwise in several neighbouring towns, such as Warrington, Altrincham, Runcorn, and Chester, where the wages were greater and the time worked less. The result of the meeting was an amicable readjustment of the present rules, chiefly as to phraseology and the number of weeks to constitute the winter months, the working hours and wages to remain as at present. The new rules were signed by Messrs. Bockett, Drinkwater, and Bostock, on behalf of the employers, and by three of the operatives.

It is understood that the dispute between the operative masons and master builders of Bristol has terminated, the masters finding themselves, owing to a want of union in their body, unable to continue the contest.

The masons' strike at Halifax has terminated. The men have returned to their work at the old terms.

The house-painters of Glasgow have resolved to close the strike, their belief being that if now adjourned, the advance of wages asked might be obtained without trouble at the beginning of next year. The men have been out since the 1st of May.

A large meeting of the joiners of Glasgow and the neighbourhood has been held in the Trades' Hall with regard to the nine hours movement. It was reported that eighteen employers were willing to concede the nine hours. Others had either not been waited on or had refused. It was finally resolved to defer the movement till the 1st of March, 1870.

A numerously attended public meeting, convened by the Mayor, in response to a requisition of the inhabitants, has been held at the Town-hall, Oldham,—

"To allow the working-classes an opportunity of expressing their opinions for or against the Bill now before Parliament, to amend the law relating to trade combinations and trade-unions."

The chair was occupied by the Mayor, who said he quite agreed with the spirit of the requisition, which set forth a belief that—

"Should the Bill become law, it would be the means of bringing about a better understanding between employers and employed, and consequently prevent to some extent those great evils, lock-outs and strikes."

He proceeded to remark that the amount of money that had been sacrificed by strikes in Oldham was something incalculable, and any measure that could obviate the necessity of such a mode of dealing with questions affecting

hour would be a step in the right direction. A resolution in favour of the Bill was carried unanimously, and it was afterwards agreed that a petition in its support should be signed by the Mayor on behalf of the meeting for presentation to the House of Commons by Mr. Hihbert, with a request that Mr. Platt, the other borough member, together with the representatives of this division of the county, would give it their support.

SMITHFIELD MARTYRS' MEMORIAL CHURCH.

On Tuesday last, being St. Peter's-day, the foundation-stone of the Smithfield Martyrs' Memorial Church, which is to be dedicated to St. Peter, was laid by the Earl of Shaftesbury. The site is in St. John-street-road.

It was originally intended to erect the Martyrs' Memorial Church in Smithfield, near to the scene of martyrdom, but this was impracticable. A tablet will, however, be placed there, recording the facts of history with regard to the martyrdom, and will, at the same time, direct to the memorial church, which will not be far from the spot. The edifice will in every respect be a "memorial," both outside and in, to the Smithfield martyrs. It is proposed to affix in some part of the building Chillingworth's motto, "The Bible, and the Bible alone, is the religion of Protestants." Beside this there are to be tablets to every martyr who suffered during the Marian persecution. As regards plan, the church will consist of a central nave, with north and south aisles, transepts, and a well-developed chancel, also with aisles, with a high tower occupying the north-west angle of the nave and north aisle. This tower will form a prominent object, reaching to a height of 120 ft. The lower story is to be an open porch, forming the chief entrance to the building. The western front of the nave will have a four-light window in the upper part, and two smaller two-light windows in the lower, the latter forming the lights of the baptistery. In the transepts there are to be rose windows above, and under the tower level a range of three lancets. Between the rose windows and the last-mentioned there will be, as respects the transepts, sculptured decoration in the shape of bas-reliefs, representing scenes from the Smithfield martyrdoms. The like bas-reliefs will also decorate the panelled spaces beneath the west windows of the nave and the west and north faces of the tower. The buttresses will terminate in canopied niches, containing statues, and the turret top and pinnacles of the tower will contain similar figures. The style of architecture is thirteenth century Gothic. The church is to seat 1,000 persons. The architect is Mr. E. L. Blackbourne. The contractors are Messrs. Dove, Brothers.

THE MISCELLANEOUS ESTIMATES.

On the vote of 17,000*l.*, to complete the sum of 25,000*l.* for the acquisition of land for the purpose of the New Palace at Westminster, and further embankment of the river Thames, Mr. Layard said that the original estimate amounted to 150,000*l.* It had been represented to him that if a fire occurred in those houses near the palace that building would be seriously endangered. The vote was agreed to.

A sum of 34,026*l.* was proposed to complete the amount required for the buildings of the Houses of Parliament. Mr. L. King inquired if divine service was to be regularly performed in the crypt. Mr. Layard said it would be for the House to decide. Mr. Kinnaird said anything more monstrous than the expenditure upon the crypt could not be conceived, and for no purpose whatever. Mr. Bentinck said some absurd statues were lately placed in the Queen's robing-room and other parts of the palace. One of these represented Henry VIII., the fattest man of his age, as a very slight personage; another made William III. a tall man, though it was well known that he was short and small. Mr. Morley suggested that rooms should be provided where members could have intercourse with their constituents. Mr. Miller called attention to the largeness of the amount required for the construction of the subway to the railway station, — 4,410*l.* Mr. Layard said he was glad aware of the want of accommodation in the interior of the building. The subway was constructed under a contract. Mr. White proposed to reduce the vote by 2,500*l.* for the purpose of preventing the proposed decoration of walls, to which, he said,

the First Commissioner of Works had ominously referred, and which might involve hereafter some extravagant expenditure. Lord J. Manners thought there ought to be some further explanation. He understood that the First Commissioner of Works confined his remark to the central hall. Was the House to commence the redecoration of the Houses of Parliament? He wished to know whether Mr. Barry was of opinion that the elevation of the roof of the central hall would be in conformity with the style of the building. Mr. Layard said that what he proposed to do was recommended by the report of the architect himself. The central hall was so dark during a great portion of the day that gas had to be used. He did not intend to go further in the way of decoration than he had mentioned. The amendment was negatived. Mr. L. King moved that the vote be reduced by 500*l.*, the sum required for the crypt of St. Stephen. Mr. Kinnaird disapproved of the ornamentations in the crypt, and hoped the amendment would be pressed. Mr. Onslow stated that the ornamentations of the crypt were much admired. Majority against the amendment, seventy-nine. The vote was then agreed to.

BRISTOL EXCHANGE.

Str.—At a meeting of the Bristol town council, on Tuesday last, it was decided, by a miserable majority of two votes, to utterly destroy Wood's fine old Classic Exchange, by putting over the open quadrangle a semi-elliptical roof of glass and iron, which was correctly described by Alderman Robinson as "the chump-end of a railway station," and by another gentleman as "a dish-cover." Having seen the model, I can state that a more unsuitable design for the purpose could scarcely be imagined; and I am quite sure that every professional man, and almost every citizen, who may see what is intended to be stuck up over the finest architectural work of the kind in the West of England, will be indignant that such an act of "Vandalism" is really intended to be perpetrated.

Pray, sir, lend your powerful aid to prevent this shameful act. W.

THE ROYAL COMMISSION ON WATER SUPPLY.

On the 24th of December, 1866, a Royal Commission was appointed to inquire fully into the water supply of the metropolis and other large towns. This Commission, consisting of the Duke of Richmond, Sir John Thwaites, Col. Harness, Alderman Sir Benjamin Phillips, Mr. Thomas E. Harrison, and Mr. Joseph Prestwich, was re-appointed early in April, 1867. The report of the Commissioners, bearing date the 9th of June, 1869, has just been presented to Parliament. The origin of the Commission, it will be remembered, was due in a great measure to the public interest which was excited, during the autumn of 1866, in all matters connected with the water supply, more especially of the metropolis, through the uncontroverted evidence of its direct influence upon the mortality from cholera, during the epidemic which then prevailed. The report in question, no doubt, contains a valuable contribution to what was already known upon the subject; but considering the vital importance of the inquiry, and the circumstances under which it was instituted, the delay in its publication appears somewhat unreasonable.

The principal points to which the attention of the Commission was directed were,—first, the present and growing insufficiency of the water supply in the metropolis and other large towns, and the consideration of different suggested sources for supplementing or substituting that supply; and, secondly, the pollution to which the rivers and open streams from which the water now supplied to the metropolis and other large towns is drawn, is continually exposed.

The inquiry naturally took two distinct channels, one relating to the present water supply of London and other large towns, and the other to the merits of the several rival schemes for supplying the metropolis from completely different sources from the one now used, namely, the Thames and its tributaries.

We can only now touch upon one or two of the conclusions and recommendations to which the Royal Commissioners have committed themselves, after this extended inquiry. They pronounce Mr. Bateman's scheme to be "in an engineering point of view, feasible and prac-

ticable," but recommend "great caution in judging of the sufficiency of a gravitation scheme of such magnitude." The quality of the water would be, they say, "satisfactory as regards purity," but in point of softness and colour they consider that it might prove "less suitable for the supply of the metropolis than the harder water at present used." The cost of this scheme would, according to the evidence produced, be at least 11,000,000*l.*; and, if it be taken for granted that this estimate would not be exceeded, we are told that the cost to the metropolis of obtaining water by this scheme would be much greater than under the present system. The scheme would probably be opposed strongly in Parliament by the interests connected with the River Severn, and great local anxiety would be felt as to the formation of immense artificial reservoirs at the head of the Severn Valley. The same general remarks and objections are said to apply, in the main, to Messrs. Hemans and Hassard's scheme for supplying the metropolis from the Lake district; indeed, the Commissioners, in leaving this branch of the subject, express grave doubts "whether it is desirable that the metropolis should be dependent on one source of supply so far removed, and which might be liable to accidental interruption."

Having thus pronounced against the various projects for deriving the water-supply of London from a distance, it is easy to imagine that their deliberations have led them, not hastily, to conclude that the Thames basin affords the most natural and desirable source for the supply of the metropolis. The Commissioners are of opinion,—“That the river Thames, supplemented if necessary, by works for storing the flood waters, together with the river Lee, and the water obtainable from the chalk to the south and south-east of London, as well probably as from the Lower Greensand, will furnish a supply sufficient for any probable increase to the metropolitan population.” These considerations have been arrived at by the evidence of the abundance, permanence, and regularity of the supply from this source, the supply streams of which are self-maintaining, and the collecting area of necessity much larger than any that could be made available on the gravitation system. As to the quality of the water supplied by the water companies, they pronounce that the weight of evidence is in favour of its generally good and wholesome character; that for drinking purposes it is quite unobjectionable, and in no way prejudicial to health, more especially as hard waters were in evidence declared to be more free from certain dangers inherent in soft waters, on account of their great solvent powers. The hardness, moreover, of the Thames water was said to be moderate in degree, and therefore not radically objectionable for cooking or washing purposes, while the proportion of the whole metropolitan supply need for manufacturing purposes was stated to be too small to render it necessary to go to a great distance for soft water. The Commissioners declare that perfect filtration is of the first importance to the good quality of the water supplied, and state that "this process is at present in many cases very imperfectly performed, and that more efficient means of enforcing the provisions of the law in this respect are required." They state, in conclusion, that "when efficient measures are adopted for excluding the sewage and other pollutions from the Thames, and the Lee, and their tributaries, and for ensuring perfect filtration, water taken from the present sources will be perfectly wholesome, and of suitable quality for the supply of the metropolis."

As to the quantity of water likely to be hereafter required for the supply of the metropolis, the Commissioners are of opinion that, even entertaining the possibility of an eventual increase of the population of London to between four and five millions, a supply equal to 200,000,000 gallons per day is the highest demand that need be reasonably provided for the metropolitan supply. It appears that the existing companies are prepared with only moderate additions to their present engineering means to supply a quantity little short of this amount.

The system of constant service is recommended for adoption to the farthest possible extent in the supply of the metropolis, and the Commissioners say that it "ought to be promptly introduced." Seeing that this cannot be effectually carried out "as long as the supply remains in the hands of private companies, to whom it would be inexpedient to confide the great powers

necessary for the purpose," the Commissioners are of opinion that "the future control of the water supply should be entrusted to a responsible public body, with powers conferred on them for the purchase and extension of the existing works, and for levying the rates," which would be necessary for the support of the system.

We hope on some future occasion to return to the discussion of one or two of the conclusions arrived at by the Royal Commissioners, which are in the main acceptable; but in concluding this brief notice of their report, we cannot refrain from expressing a regret that they have not declared an opinion as to the possibility of "excluding sewage and other pollutions from the Thames and the Lee, and their tributaries." It is on the very possibility of this supposition being carried into effect that the value of their conclusions and recommendations appears to us most essentially to depend.

THE ARTISTIC TREATMENT OF PIERS, PILLARS, AND COLUMNS.*

THROUGHOUT Gaul, the Roman colonies were very rich in buildings of public importance, with that amount of grandeur and decoration inseparable from such; but by far the greater part of them had vanished completely after the barbarian invasions to which the province fell a victim. Here and there, however, works remained to influence the new possessors of the soil when they at last turned their energies in this direction. But at best these Roman examples were rude, except, perhaps, in the extreme south, and taught little more than how to build well. In their details they displayed that ignorance of their models which betrayed their provincial origin, and it is well that thereby so much was left to the quick imagination of the new builders.

In their first attempts at building, the columns from the older edifices and ruins not being of sufficient strength to sustain the enormous weights which the hardness of the work and the thickness of the wall necessitated, they first need them rather as ornamental accessories in the angles of the piers, and from this came the habit of using the angle shaft, so long a feature of early work. One of the best examples of this method is seen in the Baptistery of St. Jean at Poitiers, where all the principal projecting angles of the interior have a complete shaft, capital, and base, the shafts having the usual entasis imitated from the ancient models, which fill below the necking forming part of the shaft. But as soon as this mode of decorating the angles of the square pier became common, a less expensive and difficult arrangement had to be adopted, and we find the angle shaft built up with the rest of the work in regular courses. This rendered the setting out of the regular diminution too difficult for the ordinary workman, and it was omitted altogether in such a position. Another mode of using the column was by placing it against the face of the pier, to carry one or more orders of arches, somewhat after the fashion of the piers and pilasters under the arcades of Roman work. A fine typical example of this treatment is found in the cloisters of Le Puy Cathedral, and it is seen in this how the proportions of the shaft and capital have undergone modification by the new manner of building. The habit of forming much more solid piers to carry arcades has tended to make the old canons of proportion neglected. In this case the shafts are only about six diameters high, the capitals massive, and the bases very pronounced. These alterations in the size of the capital have been the result of a fusion of some of the members of the entablature with the abacus, and the result has been a capital apparently much more capable of doing its work than the model from which it was taken.

If we analyse the parts we shall see how this has come to pass. In imitating the Roman cornice, or in constructing the broken fragments of a building of that style, we find that it was customary to omit the frieze altogether, putting the cornice itself directly on the abacus of the column. A good example of this is seen in the apse of the church of Alet, where all the parts are perfect, except the frieze, which is omitted. Throughout France and Germany numerous examples occur of this; and, as the cornice gradually became smaller, and more akin to a string marking the line of the arch-springing, the fusion became complete. But the

abacus, though thus overpowered by the additions above it, was never lost, through all the best and purest examples of Gothic work in all countries, and may be easily separated, even where the two are formed out of one stone; and it will be generally found that the face of the abacus is in the same plane as the wall above. But this alteration of the Roman mode involved another important change. The great piers of built masonry were strengthened by themselves, or strengthened by the addition, as at Le Puy, of shafts, were crowned only by this string, and not by a capital; and thus we see the origin of so peculiar and, at that time, so unprecedented a treatment of capitals, as the circular ones in the cathedral of Carcassonne. And this distinction between the piers and pillars is kept up through all the best periods of art, where the true capital is given only to the pillar, single or grouped.

Of the several orders employed by the Romans, only two came to be very distinctly imitated by the Romanesque builders; and although for a time each appeared likely to be the model on which all later examples would be founded, the more finished and lighter one gradually extinguished its rival. These two forms were the same, which, with different details, had for long been used side by side in each of the preceding styles, and which had in each played the same parts. They are best distinguished as the convex and the concave. With the Egyptians the early ind-shaped capital gave place to the full-blown flower; with the Greeks the Doric yielded to the Corinthian; and the rude, coarse Tuscan, under the Romans was soon displaced by the more finished and elegant Composite capital. And when the earlier builders in our own country and France commenced to work out for themselves that new style which was to contain the excellences of all the others, their first tentative efforts were directed to the enrichment of this form of capital, rather than to that other, which afterwards so well adapted itself to the more light and elegant details of the succeeding phases of the style. There is no doubt that when the revival in art first began there were numerous examples of Composite and Corinthian capitals found in the land for imitation; but they required more skill in the execution than the ruder forms of Roman Doric, especially as the details of that order were not nearly so finished as in Italian examples. In the Porta Nigra at Trèves, at Vienna, and other places, are specimens of the rough way in which it was worked, and which, although executed in the times of the Roman occupation, show most distinctly signs of the complete cushion capital.

Although, in many cases, it would seem that this form was roughly prepared in the stone and carved at later times, when the skill of the workman had increased, it was more common in the richest examples to trust solely to colour as a relief to the bald and ungainly shape. Examples of this still remain at Roshaim, Jamieges, Moscow, and other places, while cushion capitals carved afterwards are frequently met with in our own country and abroad. After the custom of using these capitals was established and Romanesque architecture had arrived at a considerable degree of perfection, the ornament with which they were covered was always of a flat nature, generally running up horizontally round the cap and not springing up from the necking, thus to a great extent betraying its origin in painted decoration. There is no doubt that this peculiar and heavy form of capital was admirably fitted for the part it played among the bold and massive details of Early Gothic, but that it was for this purpose specially invented, or evolved from the intersection of the cube and the hemisphere, is, I think, much less probable than the theory I have given. But that there may have been another cause is possible. It is not unlikely that many buildings had their capitals boasted out for the carving which there was not skill to execute, and these, left in the rough or eventually painted, might give the suggestion required. Eastern influence may have done more, especially in the south of France, where, not only the capitals, but so many other features, bear strong evidences of its presence. But, whatever the origin, whether an imitation of the coarse Roman models or a reflection of Sassanian art, or still more improbable, the natural outcome of the necessities of the work, it is certain that for long the convex form of capital was common throughout Christendom, and it was only when it came to be fairly compared with the other model that it gradually gave way to its superior elegance.

There is an curious example at Notre Dame du Port, Clermont, where one of these rude Doric caps is placed side by side in the same pier, with a quite as rude copy of the Composite; and although both are as coarse as well can be, the superiority of the latter to the former is most marked. But in some of the more refined examples the carving goes very far to redeem the shape, and not a few in South France are as richly and elegantly carved as the best of Byzantine work, the influence of which is very apparent in such cases as Le Puy, Issoire, Brionde, &c. There is a point that Mr. Ruskin notices particularly about these early capitals, namely, that the line of carving in the convex ones is always snuck back from the face, while in the hell-shaped it is invariably applied to the curve; so that in all the best examples you will find that the carving of a capital will be bounded between two lines, concave and convex, and anything thrown out beyond becomes very emphatic, as the crocket angles of later French work, but liable, if overdone, to be coarse and unsnappy.

In the imitation of Composite capitals there were few difficulties to get over beyond the mechanical one of the stone carving, and for awhile they contented themselves with copying anything they could get, until they had so far mastered the style as to have the confidence to make slight alterations in the arrangement of the foliage, and introduce fresh varieties. One of the earliest alterations was the simply dividing up the whole into leaves, placed as in their classic models, but omitting altogether the deep indentations and serrated outlines, giving a breadth of effect very telling when in close comparison, as is frequently the case, with capitals copied more exactly from the antique.

It is a noticeable feature in some of the great capitals of the simple cylindrical shafts, that where arranged round the apsidal end of a choir, their abaci were not unfrequently curved to follow the line of the processional path. This is very marked in the choir of S. Remi at Reims, and is seen in the bases of the piers of S. Bartholomew the Great, London.

The earlier forms of capital long survived another feature of classic origin, with which at first they were closely allied. The entasis early succumbed to the mechanical difficulties in the way of its construction, or the indifference of the builders, to a feature of such refinement. It was no easy matter for them to set out on the heads of stone the gradual decrease of the diameter, and thus the entasis came to be at first confined to the smaller monolithic shafts which could be easily turned in the lathe. Of these, good examples occur at S. Michel Le Puy and Gelnhausen and other parts of Germany. And when the habit of using the large circular piers without any bulge, became confirmed, the regard for the entasis died out, although the mechanical skill of the builders had much increased.

The decoration of the piers and columns was by no means confined to the capitals and bases in early work, and it is not unlikely that the habit of richly decorating their shafts tended to enhance the difficulty of using a diminishing column. Plenty of Roman examples remained to give the first idea for such work, and the simple channelled piers of La Charité sur Loire and Aunay, as well as the richly-ornamented shafts of Le Puy, show how readily they took to the idea. In England, a common and not ungraceful mode of decoration for the great Norman piers was by incised chevrons or interlaced work, the examples of which are so well known from Durham and Waltham Abbey. One or two examples remain of an opposite treatment, but the peculiar specimen from S. Lawrence, Pitlington, of a boldly projecting roll winding around the shaft is a warning that such decoration applied to a pier of any size would be most unfortunate.

The gradual disease of these forms of applied decoration resulted from two causes,—the breaking up of the great piers into smaller grouped shafts, and the introduction of marble. The latter was a material too hard and altogether unfit for such a style of treatment, and was, therefore, left to its unassisted natural beauties, possibly heightened by polish. But this is, I hope, doubtful, in spite of the remains of fragments found at Salisbury and elsewhere worked to a considerable degree of polish. There can be, I think, but one opinion that the substitution of the mere mechanical work of polishing for the more artistic modes of decoration previously employed was a step in the wrong direction. And this for no abstract principle involved, but simply because this introduction of a material so unlike the rest of the work, in a position of such

* By Mr. J. Tavenor Perry. See pp. 450 and 500, ante.

importance, tended to break up the mass to the extent of weakening the appearance of support, and detract from the very assurance of strength it was intended to inspire. The effect of a series of highly-polished dark marble shafts let in the angles of piers and windows is at first rather that of deep vacancies than supports, and much less happy than where the simple gray tint of unpolished marble harmonises with the rest of the building, as in Westminster Abbey. The love of breadth, or the absence of materials, preserved the great churches of France from suffering by these violent contrasts; but to this day our love for strong marbles is only equalled by our excessive admiration for plate glass and French polish.

A few cases remain where painted decoration has been happily employed on the columns. One of the best of these is in the north transept of the church of Our Lady of Charity, Faversham, where an octagonal Early English shaft has a series of figure-subjects ranged round it in bands, much in the same way as found in Egyptian temples and Russian churches.

The breaking up of the great piers into grouped shafts was brought about chiefly by the alterations and advancement made in the roofing great spaces, and thus still further concentrating the weight and thrust upon particular points, requiring their reinforcement by increase of bulk or compactness. The very common mode of covering the naves of the churches by wooden roof, carried on stone arches crossing at intervals, and dividing them into bays, caused the alternate piers to be much thicker, and necessitated the vaulting shaft carried up the whole height of the church, and resting on or grouped below with the piers of the nave arcade. This introduction of the vaulting-shaft in the nave led the way for that admirable arrangement of colonnettes which became so usual throughout all pure Gothic times, and which allotted to each rib of the vaulting or arch of the arcade its particular means of support, and grouped them around some main pier that carried a large proportion of the superincumbent weight.

The new arrangement caused many further modifications in the details. The capitals of these smaller shafts were, to a great extent, made independent of the capital of the larger pier. The super-abacus as a rule mitred round all alike, but the capital itself was generally made deeper in the large pier than to the small surrounding columns. Examples of this are to be found in many of the French cathedrals, as well as at Chichester, Salisbury, &c., in our own country. But at Chichester the mouldings of the super-abaci, as well as of the bases, are of different sections, and intersect in a manner less happy than peculiar. This difference in the heights of the capitals was not at first, perhaps, altogether the result of intentional regard for proportion, although in the result so fortunate. The upper bed of the stone which was of the depth of the smaller capitals, was generally of one stone, to form, with the super-abacus above, at once a tie to all the parts of the pier, and a means of evenly distributing the pressure over the whole. The horizontal joint which this necessitated across the carving of the great capital frequently suggested a charming treatment. A curious example of how important the Medievals regarded the distribution of the pressure over their grouped shafts, and the necessity for a medium capable of the task is seen at Salisbury, where is introduced an abacus made of bronze. This is in the centre of the west front, and it may have been thought that the great weight to be carried rendered an abacus so deeply undercut as are those of the Early English period liable to flake off in a material of less coherence.

The treatment of the abacus differed very materially in England and France. In the latter the much more common use of vaulting had the effect on the abacus of defining much more exactly its shape, which followed accurately the general outline of the mouldings or shafts placed upon it, and the arrangement of the foliage below was so regarded as to enhance the effect of strength given to the point on which there was the appearance of the greatest pressure. Add to this the depth given to it, and the simple bold mouldings formed on its edge, and we see that it is little wonder that it so favourably contrasts with the weak and lincy effect of our own Early English examples. With us, however, the form of the abacus, as a rule, followed that of the shaft beneath, whether in single or grouped examples, until the circular form of capital

became so established that piers, which are either square or octagonal in their arrangement, not unfrequently had above them circular abaci. Those of St. Hilda, Hartlepool, are good examples of this peculiarity, where the forms are very varied, being sometimes grouped shafts, and sometimes compound piers, but in all cases the abacus is simply a circular stone, fitting neither the square bold plan of the mouldings above nor the piers below. Compare to these the very similar piers from S. Etienne, Beauvais, and you will see how much the English example loses by its want of appropriateness in this respect. At the east end of Chichester are some similarly treated piers, where a circular abacus is placed in the same manner, over three shafts, standing wide apart, and only united at the cap and base. Numerous exceptions to this occur, as at Canterbury, Stamford, All Saints, Staughton Parva, &c., which it is impossible in a paper like this to particularize, although the examples are very interesting. In England a great alteration in the character of the foliage was the natural result of this change of the form of the abacus, as the antique mode would not readily adapt itself to the much altered circumstances. Here, too, we never had the numerous models of ancient sculpture for imitation, and our masons did not so early arrive at that perfection of carving which characterized the work of French artists. There were, thus, fewer trammels to hold us to that form which so peculiarly points to a classic origin; and this perhaps is scarcely a matter for regret, for although later in the field, and much more rarely called upon to produce works so grandly monumental, our sculptors attained a very high degree of excellence, and showed, in their treatment of the capital at least, more variety and imagination than their neighbours. The graceful and strange animal forms frequently introduced gave life and vigour to the whole, and made such works as those in the chapel of the Nine Altars, Durham, comparable with the best efforts of any age or country. On the other hand, the boldness of the crockets with which the French emphasised their angles and heavily weighted points, often became, from mere frequency of iteration, wanting in that piquancy which at first appears so striking, while the constant change and delicate beauty of the early English foliage are never monotonous or tiring.

Another new and important feature here first introduced to us is the band. While the whole mass of the pier was built in regular courses of masonry extending through the whole breadth, no other bond was required; but directly the smaller shafts, formed of different materials and of different density, were introduced, some tie capable of holding together the various parts became necessary. The plan already suggested by the treatment of the abaci gave sufficient suggestion, and like them the bands were usually nothing more than plates of stone, moulded on the edge, going throughout the pier or respond, holding the whole together or to the wall. In our own country we have one or two metal examples. At Salisbury they are simply hoops of bronze, with long hooked ties connected therewith, which were built up in the courses of the central shaft. The copper bands at Westminster are even better known. The stone bands across the wall shafts of Noyon and Laon cathedrals form remarkable features in these buildings, and are useful otherwise than for the construction, by marking more particularly the graceful proportions existing between the central and side shafts. At Noyon the bands are 7 in. deep, and occur every 4 ft. or 5 ft. At Chichester, where some of the wall shafts project a considerable distance from the wall, a long tie of Purbeck marble, well bonded into the wall and elaborately wrought with foliage at the sides, is worked into a moulded band on the face. The necessity of the bands is shown in some cases where they have been omitted. In that rather peculiar and beautiful Early English church at Hythe are several examples of Purbeck shafts, 4 in. or 5 in. thick, which have been bent from their own incapacity to bear the weight above without lateral support. This, too, may be seen in the porches of St. Alban's Abbey, where are several specimens of the peculiar way in which Purbeck shafts will sometimes yield and laminate if not put up headways. Where bands are used they are generally evenly spaced, as any irregularity is likely to give an appearance of distortion to the pier; but in some cases, where near the eye, and where the unequal spacing is too marked to appear anything but intentional, the effect is

good, as at S. Julian Brionde, where a hand is used at about a third the height of the shaft. The bands were not used only for the purpose of holding several shafts together, but were often placed in the centre of a single shaft, when that was built in two or more large stones, as at St. Peter's, Northampton, where there is a richly-ornamented deep hand introduced. As the style advanced and the separate shafts became gradually so united with the main piers as to allow of the whole being built up together in ordinary masonry, the absolute need for bands disappeared, and we find the great clustered shafts of Bourges and Le Mans rising their whole height without any break whatever; and it is a question, had they been cut up with bands as were the smaller piers at Noyon, if they would ever have had the grand and monumental effect they now present.

There is no feature connected with our subject of more variety and delicateness of execution than the base, and yet there is none in which the original model was so well preserved in all countries and through all ages. The Attic base from which the earlier Romanesque bases were copied, became in the hands of the Gothic builders more refined in its outline, with more deeply-cut hollows to throw out in strong relief the delicate fillets which bounded them, and which were set at such angles as would reflect the greatest light. The lower roll in the great bases became very pronounced, and, at times, the hollow was enriched with carved ornament. In Continental work the base was generally raised higher than in our own, and exhibits a much more carefully thought-out section than ours, although we have more members in a base of the same size. The bringing the base nearer the eye required that more attention should be devoted to its refinement and fitness than would be the case with other mouldings, and we find in them all the delicacy and finish of the finest Greek work mixed with that boldness of shadow and sharpness of outline so characteristic of Northern Gothic. Although our base differed from the French in none of its general arrangements, there was one matter of detail modified by slight differences of treatment. The hollow between the rolls being nearer the eye in the French example, the upper half of the shade in the hollow would be sufficiently seen to give the relief required, but with us the frequent absence of defined shadows, and the lower position of the base caused the hollow to be cut down to such a depth and in such a manner as to hold the water and moss.

The manner of raising the bases on high plinths, so common on the Continent, is very superior to the classic models suggesting the idea. The heavy mouldings which, in the antique examples, crown the plinth are here omitted, and the base mouldings form a graceful and gradual junction between the plinth—the true constructive base—and the shaft. The plinth, following the abacus, was generally angular in shape, and the expedients resorted to for hiding the exposed corners resulted in the introduction of the Claw. This is to be found in all Early Gothic work of most clever and appropriate designs, and it seems a pity that a feature so elegant should, by the rounding of the bases, and omitting the plinths, have gradually fallen into disuse in England. The plinths were frequently reduced to their smallest size possible with good construction, especially as the style progressed, and the lower roll of the base allowed to project considerably beyond the plinth. And this effect was often further enhanced by chamfering so much of the upper edge of the plinth as was left exposed, and stopping the chamfer square under the base, as in the choir of St. Hilda, Hartlepool, and commonly throughout France; while in S. Cyr, Nevers, they have gone to the extent of placing a small corbel under the projecting moulding, thus appearing to carry the weight.

Plinths came much more into use in the later styles of our own country, but rather on account of the introduction of benches into our churches than from any felt constructive necessity.

It will be unnecessary to pursue further our subject in the later periods of the Gothic and Revival, as I sought only, when commencing this paper, to trace the various features from their birth to their perfection; and, although instructive, it would be scarcely interesting to follow it, step by step, to its end and degradation. In the country, where, perhaps, the column was brought to its most perfect form and proportions, it was reduced to its most meaningless deformity. Side by side in Senlis Cathedral you may see columns rivaling the purest Doric for grandeur, and the

most delicate Corinthian for refinement, with those meaningless abortions so common in Flamboyant work, wanting in all the essentials of a column, and looking like nothing so much as petrified harley-sugar.

In briefly concluding this paper, I would just indicate one or two of the most important points to be learned from the subject. The complete column, as used in the best periods of art, was the natural outcome of the wants of the builders, and no detail or feature was suffered to be present merely for its æsthetic value. No ornament applied was in any way allowed to interfere with its constructive value, and weaken its apparent strength. But it too often happens now that a capital is only introduced as a means of showing off lacily copied carving, or to be, as defined by our chief Architectural Dictionary, merely an ornamental finish to the top of a column. The construction of the pier must depend entirely on the materials in reach, but it should always convey an idea of strength and ability to sustain the super-imposed load, and should therefore be one of the last members to receive decoration. But just now, unfortunately, there is a fashion of employing richly-veined shafts to support negligently capitals of twice their height, mere lumps of meretricious ornament introduced at the expense of solidity, or to cover a want of taste and proportion. Granite columns bearing cement entablatures and polished marble shafts corielled out to carry exaggerated dripstones, are features not uncommon in City forms of Victorian architecture; while, if a model at the South Kensington Museum is correct, it may yet be our fate to see grouped shafts "after the Gothic manner," with a regular entasis, looking like a stack of hop-poles trusting to one another for support, and as incapable of sustaining any weight. But a slight acquaintance with the best examples of the past would prevent the occurrence of such anomalies, and I have therefore presumed in so long a paper to give such an historical account of the whole matter as might clearly show the leading principles which guided architects in their treatment of this feature through all the best periods of our art.

WIRE TRAMWAYS.

ALTHOUGH the railway system is now in its fourth decade, we are still in the habit of drawing comparisons between its speed and comfort and the days when the performance of a coach journey between London and York was thought no common feat. Yet this very mode of transit was a sharer, to a large extent, in those obstacles which always present themselves to all new inventions—obstacles which, while distasteful to originators of new schemes, are not without conspicuous advantages, inasmuch as they serve to test, in a tolerably conclusive manner, the real merit of each new invention presented to the public.

No inventions are more likely to contribute to the welfare of mankind than those tending to promote and increase the facilities for inter-communication between different places, which adds to man's power to render himself *en rapport* with his fellow man or which enables him to transmit the produce of his land, whether vegetable or mineral, at a moderate expense to the point where a want for such produce exists. It is well known that one chief obstacle to the advancement of many, if not of all, our colonies, is the difficulty of transmitting the produce raised or manufactured by the settlers to a market at such a moderate expense as will admit of a profitable business being transacted alike by the buyer and the vendor. In numerous instances mines otherwise valuable at present remain useless to their owners, although in many cases but a moderate distance from a railway station, simply from the excessive expense of any arrangement hitherto available for transporting their produce, in consequence of the obstacles which present themselves to the construction of any roadway.

The present railway system has, however paradoxical the statement may seem, in one sense fought against itself. It is during the days of its infancy it has been decidedly an expensive system. The laws of physics were studied by early engineers to the neglect of those of commerce, the result being that while in certain districts we have unprecedented facilities for travelling or transmitting our goods, yet we find our railways are not profitable, nor is the system so generally applicable to all exigencies as to render it anything like generally available

for all purposes of transit. In a word, a railway, to realise even a moderate profit, can only be made where there is a large general traffic, and considerable natural facilities for its construction. Such a system as this is useless to transmit the produce of some quarry or mine of value, but which is surrounded by a rugged country abounding with ravines and precipices.

There is a mode of transit which has been practised in India and Australia by means of a rope stretched from point to point, but which as yet has been only what may be called a local arrangement used principally for bridging rivers or ravines. A scheme has lately been brought before the public which proposes an extension of this arrangement, and to apply it to the transmission of goods over long distances through countries where the ordinary railroad, from the reasons already stated, is inapplicable. The system known as the wire tramway is an attempt to convey goods over natural obstacles at so moderate an expense as to render it possible to profitably work collieries, mines, quarries, &c., situated in wild or mountainous places. The scheme is still comparatively in its infancy, and is capable of much development, but the essence of the plan is perfect, and a wire tramway—as it is called by the inventor—is already in actual practical operation, a line of three miles being successfully worked in Leicestershire at this moment. It runs from some granite quarries—the property of Messrs. Ellis & Everard—at Markfield to Bardonia, a station on a branch of the Midland Railway. The line is conveying stone from the quarries to a powerful crushing-machine at Bardonia, to be broken for road-metal. The line has been constructed to carry 100 tons a day, but has never as yet been worked to its full powers. It is actuated by a double-cylinder portable engine of sixteen-horse power, but which, like the tramway, is not nearly fully worked.

The nature of the scheme is simple, and has been already briefly described in these columns. It may not be needless, however, to recur to it. To suspend a weight from a rope supported by a post at either end would seem simple enough; to move the rope with such load would likewise appear easy to accomplish; but to cause the load to pass the post is another matter, but yet one that a little reflection will show can be managed without difficulty. The rope passes twice over the ground in one of the modes of arrangement, being, in fact, an endless belt passing at one end of the line round a Fowler's clip-drum, and at the other round a large pulley, or wheel, with a deep groove in the rim. The rope between the termini is supported on posts of any reasonable height, resting at these points on small wheels grooved in the rims, to prevent the rope slipping from them. On motion being communicated to the clip-drum, the rope moves also at the same speed as the periphery of the drum, of course. Any weight hung on the rope will move with it, and supposing the weight to be able to clear the posts it will move from end to end of the line, and were it not for the drums at the ends would move continuously; indeed, by proper arrangement and formation of the hooks, they would pass round these, and then the load would move continuously if required. The posts which support the rope are placed midway between the up and the down line of rope, and have at their upper extremities cross bars, at whose ends the grooved wheels are placed at such distance from the upright as to bring them in a line with the rope; these wheels act as friction rollers, and rotate as the rope moves.

The rolling stock, if we may call it so, consists of a number of boxes, each of which is provided with two iron hooks lined, where they rest on the rope, with wood; the shape of these hooks is the method whereby the boxes pass the posts. At the place where they hang on the rope they are simply hooks; a little below the rope, however, they spring back with a curve, similar to that of the bar which suspends the flat pan or plate used for weighing butter, &c., by cheese-mongers. This curve leads the hook or hanger clear of the wheel supporting the rope, and when quite below, it bends in horizontally, and supports the box which thus hangs below the wheel, its centre of gravity coinciding with the centre of the rope. When the rope moves the box moves, and the depth of the groove in the supporting wheel being but little in excess of the diameter of the rope, and the wood liners of the hooks being suitably curved, they pass gently up on the edge of the wheel and down the other side to the rope again, without perceptible jerk of any kind. From the foregoing it will be obvious that

so long as the supports and rope are of sufficient strength to sustain the load and the hauling power adequate, any given load may be transported from place to place without difficulty. The boxes will hang true, irrespective of the shape of the hangers connecting them with the rope, so long as the centre of gravity is kept in a proper line.

The question of curves may be dealt with in a variety of ways. The plan at present adopted at the Markfield and Bardonia line is a series of wheels set with their axes at an angle both with the horizon and also with each other, so that they would, if produced, meet in one common point, whose distance from the wheels would be proportionate to the rapidity of the curve. The number of wheels varies with the amount of alteration of the direction of the rope that is found necessary. The arrangement at the unloading end of the Bardonia line is simply a light angle iron, curved round the same centre as that of the clip drum, save that it is farther away from the latter, in the opposite direction to the line of rope. This angle runs parallel with rope for 2 ft. or 3 ft., and at the incoming side, curves gently up higher for a short distance, and then inclines all round to its other extremity, which is a little below the rope level. The hangers of the boxes are each fitted with a little grooved trunnion, and as each box comes to the angle iron, these trunnions pass on to it, and the impetus of the box causes it to run the trunnions up the angle iron, thereby lifting the hooks from the rope, and it then has the falling incline, down which it runs to an attendant, who unsets the box over a railway truck standing beneath, and when empty allows it to pursue its course along the angle iron till it rolls gently on to the rope, to pursue its way back to the quarry at Markfield, where a somewhat similar arrangement is provided, the boxes being there shunted by hand to be loaded. These arrangements are all capable of sundry modifications.

The general dimensions of the details of the Bardonia line are as follow:—The posts are from 10 ft. to 12 ft. high; the carrying wheels are 15 in. diameter on the bottom of the groove; the posts are about 150 ft. apart, with one exception, where it was found necessary to place them 600 ft. apart; the two supports here are about 40 ft. in height. The clip-drum is 4 ft. 6 in. diameter; the distance between the up and the down line being also 4 ft. 6 in. The rope is a wire one, 1 1/2 in. in circumference. The speed of the boxes is about four miles an hour, though this may be considerably exceeded. The boxes carry about 1 cwt. of stone, when loaded.

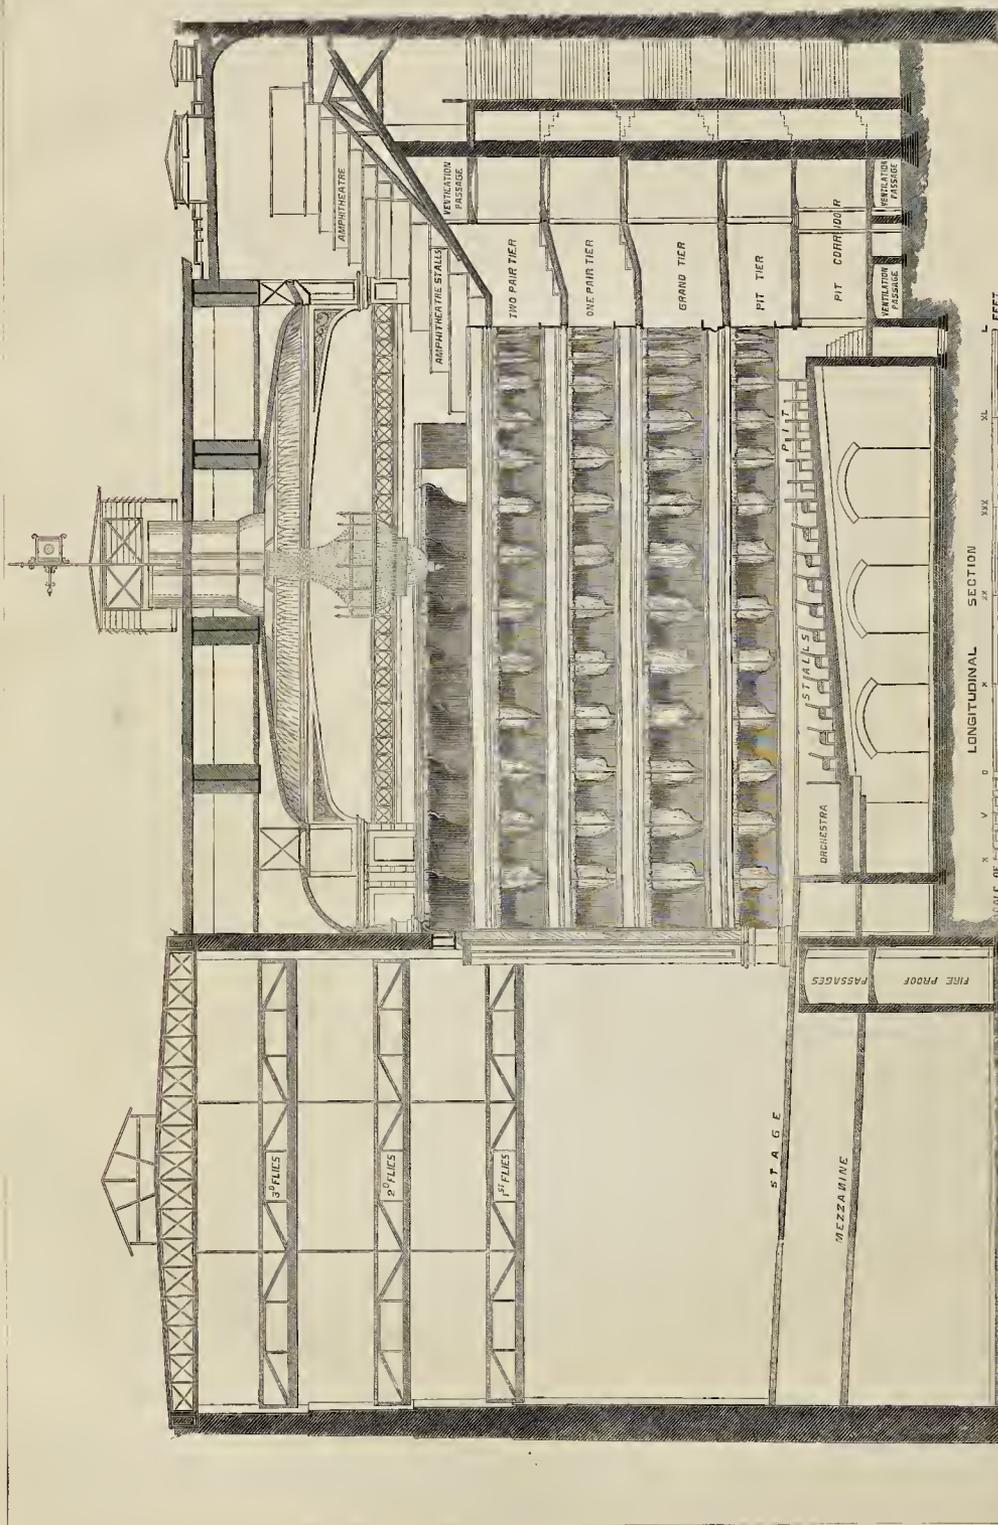

There is much reason to anticipate that the principle of moving loads, especially minerals, along a rope, will prove of much value to contractors or others engaged in erecting large buildings, from the facility with which a line can be constructed between quarries, brickfields, &c., and the scene of operations. Large structures, taking two or more years to complete, could have their lines put up at moderate cost, and on the completion of the work the line could be removed elsewhere. The contractor could have either his own post and rope, or hire so many thousand yards or so many miles of line, for such time as he required.

The employment of the system promises, too, the development of mines hitherto either unprofitable or altogether unworked for want of cheap transport. In a word, it promises to supply that which ordinary railways do not furnish, a line portable, cheap, and which may be any length from 100 yards to 100 miles. Some doubts have been expressed as to whether it could ever be worked on the system of a main line and branches, whereby more than one colliery or mine could be worked at the same time. There is no difficulty whatever in arranging such a system, the only requisite being suitable shunting arrangements and to have the main line a little stronger than the branches. Colliery proprietors and others possessing mineral property appear to entertain a sense of the probable value of the scheme from the inquiries they have hitherto been making into the matter.

HER MAJESTY'S THEATRE, LONDON.

In addition to the previous illustrations of the new theatre in the Haymarket, we give in our present number a Longitudinal Section of the building.*

MECHANICS' INSTITUTE AND SCHOOL OF SCIENCE AND ART, KEIGHLEY, YORKSHIRE.
MESSRS. LOCKWOOD & MAWSON, ARCHITECTS.

KEIGHLEY MECHANICS' INSTITUTE AND SCHOOL OF SCIENCE AND ART.

The erection of a large building for the joint accommodation of the Mechanics' Institute and School of Science and Art has just been commenced at Keighley, a rising town in Yorkshire. The Mechanics' Institute here was one of the first established in England, and a new building has been long wanted. This want will now be supplied.

On the ground or principal floor the Institute will have its more important rooms; consisting of reading-room, conversation-room, library, room for patents, and a large lecture-hall to accommodate 700 persons.

The first floor of the building will be devoted to the School of Science and Art, which will have a handsome suite of rooms adapted to its purpose. The painting-room will be lighted from the north; and the exhibition-room, for the drawings of the students, will be 48 ft. by 22 ft., with lantern light. Elementary drawing-room, modelling and casting rooms, master's rooms, and separate retiring-rooms and lavatories are arranged upon this floor.

The basement floor is occupied by class-rooms and curator's rooms; and from the nature of the site this story is clear of the ground on all sides. The entrances are so arranged that the mechanics' institute, the lecture-hall, and the school of art may each be in operation at the same time without interference with each other. All the rooms are lofty and well ventilated, and will be warmed by open fireplaces and by hot water.

Externally, the building will be Gothic in style, built entirely of stone, with ashlar quoins and dressings. It is placed at the angle formed by the Skipton-road and Cvsendish-street, and will be a conspicuous addition to the public buildings of the town. The funds for its erection have been raised by subscription, and the principal contributor is the Duke of Devonshire. The cost will be about 12,000*l*. The architects are Messrs. Lockwood & Mawson, of Bradford and London, who are also erecting large new baths and washhouses for the town in the immediate neighbourhood.

In addition to the accommodation afforded for the higher branches of science and art teaching there will also be rooms provided for the more primary and elementary education of working-men who have not had the advantage of attending school in youth. A too numerous class of such men still exists, and their delicacy of feeling is such that they cannot be persuaded in any numbers to attend the primary night classes usually monopolised by, and devoted to, the teaching of boys; and this accommodation is especially provided with separate rooms and entrances, &c., as an inducement to such persons.

There will be similar accommodation for female teaching, and it is expected that in both these branches advantage will be largely taken of it.

From this short description it will be seen that the Institution is designed as an industrial college for the Keighley district. The plan of operations under the consideration of the directors seems commendable. It is suggested that a school be established, upon the Bristol model, in the rooms allotted to the school of science, and that, in combination with the evening classes and the school of art, a complete system of instruction in science and art be organised. It needs not be pointed out how readily this scheme will be available for the whole of the district. At Bingley, Saltaire, Skipton, Wilden, and Cottingley ordinary evening science classes are either in operation or will be established prior to the ensuing autumn session. From these classes the most successful students can be passed on to the more advanced instruction that can be given at the Keighley institute, while the distance from the trade school is not great enough to prevent the daily attendance of lads whose parents desire for them a higher education than can be obtained in the day-schools of the respective townships. It is proposed to be done at Keighley by doing a every centre of industry, and English mechanics will have no right to complain of want of opportunities.

Waterproof Paper.—A patent has been obtained in America for the manufacture of a waterproof paper. It will be no uncommon thing, by and by, to carry a quart of milk home in a paper bag!

IRON BUILDINGS IN NEW YORK.*

In the city of New York there are a greater number of entire cast-iron building fronts in process of erection than ever before at any one period of time. Iron, indeed, has meritoriously secured for itself an almost universal adoption in this country for the first-story fronts of stores, on account of its durability, strength combined with lightness, and ready renovation; but its use for complete fronts, for a number of years immediately past, has, in comparison with marble and freestone, been small. When, some twenty years ago, iron fronts were introduced as a novelty, their low price secured a large adoption; but, incorporated with these early attempts were defects which in due time secured a general dislike to them. The introducing manufacturers and architects in iron, acting on the self-evident proposition that a multiplicity of ornament and decoration could be executed in iron at an expense not to be named in comparison with that of stone, literally covered their fronts with useless flagree work. Every column must be fluted or of some intricate pattern, every moulding enriched. Wherever a square foot of plain surface revealed itself, that was deemed a legitimate place for elaboration. The carvings high up in the air, on the fifth story, were the same as those low down on the first,—no bolder,—and in every case too flat and fine. Instead of seeking for beautiful outlines and proportions, and appropriately embellishing special features, to contrast with other portions of the edifice, purposely left plain and unpretending, with ironworkers' ornamentation was made the governing idea; and an elaboration, such as architects previously might have dreamed of, but did not dare represent in their plans, produced, with twistings and contortions of outline and crowding in of small columns and pilasters and dimming with so-called ornament, and planting on miles of reiterated and unmeaning rope mouldings,—all this was presented as embodying the beautiful, and as a thing which would greatly elevate the public taste. But the pretensions and vulgarity of these over-ornamented fronts, in due time, brought them into well-merited contempt, and sealed their condemnation by every person who had any knowledge at all of what is truthful and comely in architecture.

The fault of these fronts was not in the material employed, but in the false treatment. Mistakes occurred in the use of cast-iron from its unskillful disposal; and the material was judged more by the mistakes made by the unskillful, than by its capabilities for proper application.

For building purposes, cast-iron possesses unequalled advantages of strength, durability, economy, and adaptability to ornament and decoration. In resisting any kind of strain, it is vastly superior to granite, marble, freestone, or brick. Practically, cast-iron is crushing-proof, for a column must be ten miles in height before it will crush itself by its own weight. Unlike wrought-iron and steel, it is not subject to rapid oxidation and decay by exposure to the atmosphere, and whatever tendency it may have in that direction, can easily be prevented by a proper coating of paint. No other material is so valuable after it has served its original purposes, as it may be recast into new forms, and adapted to new uses.

In business quarters, where blocks of stores are built up solid, where each building measures about 100 ft. deep by 25 ft. wide, rear almost butting to rear, with window openings only at the front and back, light becomes one of the most important requirements. An airy edifice of iron may be safely substituted for the umbrous structures of other substances, and ample strength secured, without the exclusion of daylight. Iron, in this respect, presents peculiar fitness. It wants proper treatment, and asks not to be set up as a false jewel, coloured and sanded in imitation of stone, or made flashy with over-ornamentation. This material—emphatically an American building material—has peculiarities of its own, and will preserve its own individuality. If the ancient examples of cornices and capitals, and mouldings generally, which have stood the test of criticism and been judged correct, are deemed best for stone, then they are best for iron also, and an attempt to inaugurate new styles of architecture should bring a frown as quick when in iron as in stone. Whatever moulding is good in stone, or projection, or general outline, is also good in iron. And iron, with its greater daylight openings, and airiness of structure, will proudly speak for itself.

* By Wm. J. Fryer, Jr., Constructor in Iron.

But correct outlines must be faithfully followed; and can be in the hands of a skilful manufacturer. If error be committed by the unskillful, it no more condemns the material than will the thousands of ludicrous mistakes in wood and stone condemn those materials. The ancients worked in stone, and artistically produced outlines that perhaps never can be rivalled. Iron is the modern building material, dug from the bowels of the earth, smelted and purified by an advanced science, and ready to supplant stone, just as history relates stone supplanted mud in the construction of dwellings for men. Each tells of a growth in knowledge applying a better material.

In this country, where stone and brick are scarce and expensive, and where prejudices are less settled than in older countries, cast-iron building fronts have crept into public favour and confidence more rapidly than elsewhere. Much has been said against iron from misconception. It is exceedingly difficult in the minds of most writers who use sweeping denunciations and citations against iron, to separate wrought iron and cast iron in their respective endurance against weather. Wrought-iron rapidly oxidizes when exposed to the atmosphere, and goes to decay. Cast-iron, on the contrary, slowly oxidizes in damp situations; rust does not scale from it, and the oxidation, when formed, is of a much less dangerous kind than on wrought-iron. A coating of paint will counteract whatever tendency cast-iron has to rust when exposed.

A great deal has been written about the colour to paint iron work. Iron being a material which requires a coating of lead and oil, it is meet and proper to give it any colour that good taste may suggest. The colour will often be regulated by the character and hue of adjoining buildings or other surroundings. Because marble is white or sandstone brown, the painting of iron work in these colours must not be prohibited. What is to be condemned is the graining of iron in imitation of marble, and sanding in imitation of stone. Wherever practicable, iron work should be painted inside as well as out. Particular care in this respect should be given to window lintels and sills, so that if rain-water gets in behind and trickles down the face of the building, there will be no streaks of rust to tell of carelessness, or of the entire omission of an inside coating. All iron work put together in pieces, as cornices, trusses, &c., should have their joints well painted before being bolted or riveted together. In applying ornaments to iron, such as leaves of capitals, &c., not only should the ornaments themselves be first thoroughly painted, but the screws which fasten them to the main work should be dipped in white lead or paint.

After drilling a hole in iron the nuts around the hole should always be filed away. A lack of care in these little matters often causes the greatest annoyance. For the first coating of iron nothing is superior to oxide of iron mixed with oil, or what is known as metallic paint.

Long after a stone front has gone to decay and disappeared, the iron will be retained in its original fulness and sharpness in every line. Keep it painted; and, after a thousand years of exposure to wind and weather, an iron front will be as perfect as on the day of erection. To paint iron costs much less than to paint wood or other materials, on account of its non-absorbent surface. The interest on the difference in first cost between a stone and an iron front will easily pay for painting. More than that: allow the difference in cost to accumulate with legal interest, less the expense of two coats of paint every three years, and, by the time the stone is ruined, the iron will not only have cleared itself, and stand on the balance-sheet at a profit, but be in prime condition for continued service.

On any much-travelled street, a marble front soon becomes rusty and discoloured with dust and rain. An iron front, kept properly painted, appears periodically in a new dress, and is always clean and bright. Other things being equal, place two merchants respectively in a stone front and an iron front, store, side by side, and he in the clean, bright, attractive front will do the most business, and can afford to pay the largest rent. Just above Grace Church, on Broadway, there are two stores erecting, adjoining each other, and precisely alike in every detail, one front of iron and one of marble. These take a place in the history of building fronts.

A plain surface in iron, however, shows quite different from that of stone. The preserving coat of lead and oil gives to iron a glare and extreme smoothness of surface that is annoying and hurtful to the sight in reflecting the sun's

rays. Painting, too, reveals the unevenness and imperfections of the casting in a magnified degree, particularly when the sun's rays strike it at certain angles. On stone surfaces, after being made level and true with the chisel, there is still a grain and a slight but regular roughness of surface which prevents a glaring reflection. By a simple but very effectual process—that of casting the plain surfaces of iron with a fine cord running vertically—the shafts of columns, and arches, and lintels, &c., are given that charm of chiaroscuro which, by its delicate play of light and shadows, makes it soft and pleasant to the eye. This fine crimping destroys the effect of the usual and ordinarily unavoidable unevenness in the surface of castings, and in effect makes iron altogether more nearly to resemble stone.

When iron fronts were first introduced it was strenuously asserted by some, that expansion and contraction would dislocate the joints, and render a building unsafe. An examination of any of the numerous cast-iron structures, which, for a number of years, have been exposed to every change of atmospheric temperature without, and to the heat of steam-boilers, &c., within, will show everything unchanged. This proves that the temperature of our climate, throughout its utmost range, from the greatest cold to the greatest heat, exerts upon it no appreciable effect. Events have also proved, in the cases of the burning of store-houses, filled with combustible goods, that cast-iron fronts are absolutely fireproof, and will neither warp, nor crack, nor fall down. Only let it be remembered that, in addition to a high and intense heat, the use of a blast is required to reduce iron to a molten state, and the ability of iron fronts to withstand fire will be readily understood. They are also perfectly safe during thunder-storms. The metal, presenting so great a mass to the over-charged clouds, becomes a huge conductor in itself, and silently conveys all the electricity to the earth. In them, the intensity current is instantly diffused throughout the entire mass, and changed into a current of quantity, thus obviating all danger from disruptive discharges.

A front of iron can be previously prepared and fitted in the manufactory, and thence safely transported to the place of erection and put together with wonderful rapidity, and at all seasons of the year. It takes up less space than a stone front with brick backing, and so enlarges the interior of a building. When it becomes desirable to tear down the building itself, to make way for other improvements, the iron front may be taken to pieces, without injury to any of its parts, and be re-erected elsewhere, with the same perfection as at first. Instead of destruction, there would be removal only. In iron, as in other materials, must ever be observed those undeviating laws of proportion, and rules deduced from a refined analysis of what is suitable in the highest degree to the end proposed. There is not a structure erected anywhere, but adds its quantum to the good or bad impressions to be directly stamped upon the public mind. Thus every one who builds is unwittingly enhancing, or deteriorating, the taste of the masses; and the aggregate result of this is a thing not to be over-estimated. It behoves the general use and careful treatment of a material which allows greater architectural effect, in proportion to the outlay of money, than any other. In our new and growing country, the dollars saved on one building are required for the erection of another, or for use in railroad, or mining, or manufacturing enterprises. It is primarily a duty for every builder to do the most with his money and the most for art.

On the manufacturer depends the artistic appearance of an iron building as well as its durability. The material is capable of receiving the sharpest kind of lines. But to secure under-cuttings, and that certain crispness necessary to the proper effect, particularly of carved work, requires the experienced foundry-man in this class of castings. An architectural and a practical education are both essential to guide and direct a creditable execution. Between the iron fronts of to-day and those erected ten years ago, there is a perceptible improvement. The artistic working up of the material is better understood, and enlarged ideas of proportion and boldness are displayed. In capitals, for example: those first made were strictly in accordance with authorities given in architectural publications. These authorities gave stated heights of columns for their diameters. A 12-in. diameter column should be about ten

diameters high (10 ft.). Practically, 12-in. columns for building purposes were required about 15 ft. high. The capitals, however, were made without reference to the stretch in length of the column. By and by it was seen that these capitals were squatly in appearance, like a tall man wearing a low hat. The capitals were then lengthened, and in addition a greater projection given. This treatment was followed on bases, and cornices, &c., until now boldness in every part is carefully sought after.

The price of stone, in consequence of a continuous advance in labour, is doing wonders for iron. In New York there are under contract several entire blocks of dwelling-houses with iron ashlar fronts in place of stone. This iron ashlar is a mere shell in rasticated courses, bolted together and anchored to the brick wall, which latter is of the same thickness as in the case of brick backing to stone. The window openings have sills and lintels of a character similar to stone. This kind of treatment in iron costs less than one-half of the same in stone, and is cheaper than Philadelphia pressed brick, with moulded stone trimmings, for fronts of houses. For this innovation the eight-hour men in part have to answer, but even they cannot stay the progress of iron.

A system of building has been lately brought out which looks to the entire exclusion of brick-work. It consists of a series of hollow cast-iron box columns, placed about 18 ft. apart on a line with the depth of the building. On top of the columns rest wrought-iron cross girders, for sustaining the floor beams. Column over column, with girders, extend to the height of the structure. Between the columns are horizontal and vertical bars, on which are bolted cast-iron plates, of such a character as to receive and retain the plaster, which is spread directly upon them. These iron walls occupy far less space than brick, are economical in construction, incombustible, and able to resist an earthquake shock.

The use of iron in buildings has increased enormously within the past few years, and that it will increase in a greater ratio in the coming years, there can be no doubt. New ideas will push the work on in the march of improvement from its present stand-point. The uses and requirements and values of buildings are changing every day, and iron, in its architectural application, is to fulfil future requirements, such as in the past it has but limitedly supplied.

THE SOCIAL POSITION OF THE ARCHITECT. EDUCATION.

SIR.—There is much truth in the observations of your correspondent "Experientia" (p. 450, *ante*), but the remedy in a great measure rests with employers, who should satisfy themselves, before they commence a building, that the party whom they propose to employ is not only a well-educated man, but that he has also studied his profession thoroughly as a member of the Royal Institute of British Architects, and provisionally to commencing practice has passed a creditable examination before some of the members of that society, or others. For this purpose a certain routine, without being too intricate or difficult a course, should be laid down; commencing, perhaps, with a plain course of useful and classical learning, and then proceeding with a thorough course of good reading in the Institute or other professional library, of which there is less lack at the present day than was the case half a century since, when no other book was placed in the student's hands but Sir W. Chambers—and this never explained—and *no work on Gothic architecture for the student.*

Some years since, there was a most excellent synopsis published in the *Builder* of that day, pointing out and naming a very valuable course of books to study on every branch relating to the education of the architect. This might be revised, without rendering the course too intricate or laborious to the young student, who becomes shy in placing himself in contact with a professional man for examination. The course of study pursued in France and other countries in the education of youth for a profession is far different, and it is surprising in this country that the hint has not been taken, either by the Royal Academy or even other learned institutions. If a young man is intended to travel, before doing so it becomes essential that he should know how to observe, and avail himself of his travels, having a slight knowledge of French and Italian, combined with Latin. He

should also have a thorough knowledge of perspective, sketching, light and shade, with a facility of drawing the figure. It must be borne in mind that we are living in a different era to what we were some fifty years since. We have seen (thanks to the late enlightened Prince) what a boon was gained by the first International Exhibition, and we have since seen the progress and emulation it has excited in this country, in regard to manufactures and science; then why not to architecture? Let us have no bigoted feeling in regard to styles, but let each be well understood and well defined, and let us trust and hope that the day is not far distant that this country may have occasion to be proud of the talent of art, either in architecture, sculpture, or painting, in the form of a building or that of a royal palace. We have youth to encourage this, and a Prince who has travelled, and had every opportunity of witnessing how much better art is studied abroad than in this country. W.

TECHNICAL EDUCATION.

SIR.—At the conference held in the theatre of the School of Mines, in Jernyn-street, on the 24th of June, much regret was felt at the little interest evinced by the employers and artisans of London in the above important movement. Professor Huxley and Dr. Lyon Playfair told the working-men assembled that they must do something themselves if they wanted others to help them; and they further said that if industrial education did not advance, England must, as a necessary consequence, lose her high place among nations, and sink in the scale of civilization.

Papers were solicited to be read at the conference, but as that course was not followed, the conference was carried out orally, and, as is usual in such cases, much irrelevant matter was introduced. Although general education has made some advance, industrial and scientific education is no higher than it was before the Exhibition in 1851; and it is evident to all but those interested that the working men of this country must have facilities both in and out of the workshop for acquiring a thorough knowledge of the scientific principles whereon their special branches of industry depend. If their special employers are not yet aware of the fact that in scientific knowledge the masters and men of foreign countries are far in advance of us, and are fully alive to the necessity which exists for the higher development of industrial education. While the Government and great employers of labour in this country have been slumbering, they have been working, and are now reaping their reward by being able to compete successfully in the market of the world with the manufacturers of England. It is to be lamented that employers as a class take but little interest in what is going on around them. The technical conference held at the Society of Arts more than twelve months ago was not attended by a single employer; and up to the present not one employer has, I believe, taken the least notice of the efforts and objects of the technical education committee. The advantages which would result to all parties from establishing libraries of trade literature in connexion with their establishments is unappreciated, and apprentices and young workmen have less advantages now (in so far as learning their trade) than was to be had forty or fifty years ago. They are now left to pick up what they can, without supervision from employer or manager. Schools, lectures, and museums there are none; and the young, after their day's work, think of nothing but the last new star at the local music-hall, or what is out at the gait or minor theatre. Since the Great Exhibition of 1851, many warnings have been given to employers in this country, and yet not one technical library has been formed, or one school established, and to-day the general body of workmen are not one whit more advanced in systematic and scientific knowledge than they were before foreign competition became so close. What is wanted to remedy the present defective condition of things, and to stimulate the young workmen to higher efforts, is, in my opinion, closer supervision by the heads of establishments, and the formation of a system of rewards for the apprentices who attain the highest proficiency in their respective trades. Some plan ought to be provided whereby every apprentice or article workman should be informed as to the nature of the obligations he was going to undertake, with the benefits which

will eventually accrue to them, as workmen, from an attentive study of their trade, and in aiming to excel in all they undertake. If that honourable ambition could be formed in early life, it would be the means of preserving them from many snares, and in time would cleanse the workshops from that low moral state into which they have fallen; and, instead of taking a pride in obscene and immoral language, an emulation for the noble would be fostered, and the inertness which now prevails would be eradicated, and all engaged in the good work would reap a rich reward. It is well known that but few English workmen are scientifically taught; and if they have to deviate ever so little from the usual path they are lost. It is not at all unusual to find men engaged in watchmaking, engine-fitting, and machinery, who never read a work on mechanics and mechanism and who could not give an explanation of the simple mechanical powers—the lever, crank, and pulley; carpenters who can barely describe a circle, and to whom angles are a mystery entirely beyond their comprehension, and who are entirely lost if any one speaks to them of geometry; painters who cannot mix colours; opticians who know nothing of optics; mathematical instrument-makers who never studied mathematics. Illustrations of the above description might be adduced in connexion with every trade, and the evil of it is that they would in no case be exceptional. I have said that employers are apathetic as to what is doing in other countries, and the same may be said of the men. Their leaders are always harping on trade rights and the perfection of trade-unions. Advance of wages is of more interest to them than advance of knowledge, and they seem to suppose that the first can be maintained irrespective of all other considerations. If a look-out be not kept, the industry of the country will fall into the ditch.

Another point I wish to bring to the notice of the readers of the *Builder* and technical committee is the time of working of many trades in London, and which is one of the causes that retard the intellectual progress of those trades. In nearly all the London trades, except the builder's, it is the practice to begin work at 8 or 9 o'clock in the morning, and work up to the same hour in the evening; thus giving those engaged no time for improvement of any description. When it happens that I have been working in factories and shops where that mode of working is countenanced, I have invariably found the men dissatisfied with it. Many of the better sort have said that their time was passed in working, eating, and sleeping, as they often lay in bed till they had scarcely time to eat their breakfast; and that when they got home at night, washed, and had supper, it was time to go to bed. They have said they could alter the system of working if the men wished it, but lying in bed late had become a habit, and they had not the will and energy to emancipate themselves from it. It is evident to many that the custom is pernicious in every respect, and has an evil influence on the young, who have no time left for attending night-schools or any other instruction. I believe it will as a rule be found that the morals of such workshops are low, and as one bad habit begets another, the workman or boy who has no time for the culture of his mind, is in too many instances reckless and oblivious to improvement in trades or morals. The results of labour under such conditions are that anything is of more interest to them than the business they are working at; and I believe any one might be for an age in such places without hearing one high or lofty sentiment. Horse-racing, betting, gambling, is much of their theme; and one often feels that where there are many men and boys employed the place is something like a little hell, without one redeeming feature. One of the labours of the permanent technical education committee will be to rid the country of that evil custom, and give to those an opportunity of improving their minds. I know that the labour is almost Herculean, but it must be done; and let us hope that the "Society of Arts Free Library committee" will soon so agitate the country that there will be at least one free library in every town; and then there will be some hope that the young men, when released from labour, will become habituated to intellectual pursuits. The stigma that the English workmen are not readers or thinkers will be got rid of, and future generations will honour those who laboured to raise the workmen of this country to a high intellectual standard.

JACK PLANE.

LEICESTER TOWN-HALL.

SIR,—In your issue of the 5th ult. you were kind enough to insert a letter from me as to our beggarly town-hall and police accommodation, since which time there have been sundry sub-committee meetings of an equal number on each side of the disputing parties. A compromise was agreed to, which was considered equally honourable to both sides.

The advocates of the Friar-lane site gave way to their opponents by submitting to a diagonal street, and also the sale of about six or seven hundred yards of the ground, allowing them the privilege of erecting, at a future time, a large public hall on their favourite site; the police-station, court, and municipal offices to be erected upon the Friar-lane site. The mayor and ex-mayor, who are both of them worthily esteemed (although advocates for the Cattle-market site), very courteously agreed to the compromise, and to the erection of the buildings without further delay.

At the quarterly meeting, although matters had been so far settled, Mr. E. S. Ellis, one of the advocates of the Cattle-market site, and leader of the minority, strenuously opposed such compromise, and urged further delay. In consequence of this the matter again stands over, and probably will do so for some time to come, unless it be seen to through the Home Secretary, which would soon be done were he cognizant of the whole facts.

The urgent necessity for the building above named may be easily imagined, when I positively affirm that the materials of the old hall are not worth 10l.

We, unfortunately, have those amongst us who are always determined to lead, but never willing to follow.

CLEMENT PRETTY.

** We have taken some pains to inquire into the position of this question, and are satisfied that it would be greatly for the advantage of Leicester to have at once a fitting and handsome town-hall. Both parties should put their heads together for the common good, call in sound and impartial advice, and make up their minds to follow it. The present structure is quite discreditible, and we believe every one in Leicester who has thought about it feels that it is so. Money wisely used on such improvements increases the value of property in the town where it is spent, and raises the character of its inhabitants.

THEATRICAL.

The Haymarket.—The first part of Mr. Tom Taylor's new drama, "Mary Warner," reminds the playgoer of "Not Guilty," produced at the Queen's Theatre not long ago. This, however, is soon passed, and a fresh combination is made, which gives the principal character, played by Miss Bateman, some excellent situations, of which she makes good use, touching effectively the hearts of the audience. The part of the husband, *George Warner*, an inventive, practical engineer, suits the rough, heavy style of Mr. Howe. Mr. Kendal leaves his gentlemanly ways, and portrays effectively a tipsy, unprincipled vagabond, who is too well treated by the author; and Miss Caroline Hill and a little child give good aid. Without any great endeavours to render the scenery a striking feature, it is sufficiently interesting and realistic to convey fully the time and place. The machines in motion in the engineer's yard on the Lambeth side of the Thames; Plumtree-court, with its gaslights and lamp-lighter; and the interior of *George Warner's* house, in South Kensington, when he has risen in the world, are well contrived and executed. This piece is increasing in attractiveness, and the house is full every evening. The run, however, can be but short, as Mr. Buckstone's benefit is announced for the 10th, when he will doubtless, as usual, make one of his amusing addresses.

The Charing-cross Theatre.—The house now finished looks pleasant and bright; but parts of the interior must be altered. In the upper boxes, substituted for a gallery, only those sitting in the first and part of the second row can see the stage properly. The seats must be raised. It is a most singular thing that constructors of theatres do not in all cases make themselves certain on points of this sort before the house is opened to the public.

The new Opera-house in Vienna has proved a failure, we are told, in an acoustical point of view, and will require important alterations

inside. They should wait a little. Time seems to do something in this respect. We heard an eminent singer state recently that the Royal Italian Opera-house, Covent Garden, has improved so greatly as regards the transmission of sound, that it is now the most delightful place to sing in that an artist could desire.

WASTED ART-TREASURES.

ON Monday last a meeting of the Free Libraries and Museums Committee of the Society of Arts was held at the Society's house in the Adelphi, Mr. H. Cole, C.B., presiding. A number of Members of Parliament were present. The business related exclusively to the subject of the distribution and circulation, to the utmost extent, with reasonable expectation of public advantage, of the works of art, scientific objects, specimens of manufacture, and other objects, matters, and things, fitted to promote technical, scientific, and general culture, that are wasting in oblivion, utterly unproductive and valueless, in the store-rooms and lumber-rooms of some of our great metropolitan collections. There was entire unanimity in the decision arrived at, that strenuous efforts should be made, without delay, to remedy the evil indicated.

The result of the meeting was the adoption of the following resolution:—

"That Mr. Gladstone, the Premier, be requested to request a deputation from the Free Libraries and Museums Committee of the Society of Arts, appointed to promote the systematic circulation to local museums, libraries, and institutions of the United Kingdom, of the superfluous or neglected specimens of works of art, science, and literature in the national museums and galleries in the metropolis."

In this important matter there can happily be no party feeling, and it may be expected that a very powerful deputation will wait upon Mr. Gladstone, and press upon him the reasonable object they are organised to promote.

ARCHITECTS AND QUANTITIES.

SIR,—Knowing your strict impartiality, I am sure you will not deny me space for the few remarks I have to make on this subject. A contract being advertised, being a builder, I instinctively at this dull time made my way to the architect's office, whose name is attached to the advertisement, and obtained the bill of quantities for the work, and sat down for the purpose of pricing out and making up my offer for the work contained therein. Instead of that I address myself to you, Mr. Editor, being annoyed at the very outset by the three paragraphs that precede each section of the work; and as the same obnoxious lines often appear whenever an architect takes out the quantities for work he has in hand, I feel determined to commit this common cause of complaint to your judgment. The first paragraph on the bill is—

- 1st. The contractor whose tender is accepted will be at liberty to compare the following bill of quantities with the drawings and specifications before he signs the contract, and any errors therein pointed out will be corrected.
- 2nd. After accepting the bill of quantities as correct, no notice can be taken of any errors that may subsequently be discovered.
- 3rd. The contractor is to pay the architect 2 per cent. on the amount of complete tender for the bill of quantities, &c.

Now, Mr. Editor, I do not complain of the first and second paragraphs, if the third is left out; and I have not much to say about the third if the first and second are left out, but as a whole they are most unjust to contractors. Sir, I think you will easily see how these conditions work against the contractor.

"The contractor is to pay the architect 2 per cent. on the amount of complete tender for the bill of quantities; but he has to compare the bill with the drawings and specifications to ascertain if they are correct," thus redoing the work for which the architect receives 2 per cent. commission, and the contractor (for the same work) not a penny.

Now, Mr. Editor, I would ask those architects that adopt this system, why the contractor has to be at the expense of checking their quantities when they are well paid for ascertaining the correct amount of work to be done; and further, when any deficiency appears after signing the contract, the contractor has to forego all claim and any deficiency, simply because he has not found it sooner? In conclusion, I ask, are contractors fairly dealt with? Do they get justice and equity from the architect? I say, no. I think it only fair that a competent surveyor should be employed who guarantees the bill to be correct, as the person who takes out the quantities ought to be the only person responsible for any mistake arising therefrom. Or if the contractor is to have any responsibility in the matter, the architect should divide with him the commission, as the contractor has as much labour to perform in checking the bill as the architect originally has in making it out.

A CONTRACTOR.

SIR,—It appears that the quantities of Wolverhampton new town-hall were supplied by the architect, for which he will probably pocket a few hundreds for a few weeks' calculations; but to render the task safe, as well as profitable, he refuses to guarantee their correctness.

The builder already claims 10l. for works required by the plans and specification, but not in the quantities. The question I wish to ask is, what guarantee have the committee or the ratepayers that those quantities do not contain more work or more materials than what the builder, by the plan and specification, undertakes to perform; of this, should it be the case, we could not expect the builder to complain; and as the architect appears to have doubt about his accuracy in the matter, we ought to have none, but at once have them checked by a townsmen.

A RATEPAYER.

CASES UNDER THE METROPOLITAN BUILDING ACT.

ALTERATION OF WOODEN BUILDINGS.

Mr. R. SMITH, of Newington-holly, corner of Francis-street, appeared before Mr. Woodrych, Lambeth, to a summons which had been adjourned from Friday, the 19th June, in which it was complained by Mr. Long, the district surveyor, that he had erected or so altered a wooden shed in the rear of his premises as to be in contravention of the Building Act, by not having it constructed of incombustible materials.

Mr. Arnold, from the firm of Messrs. H. & F. Chesters, solicitors, of Newington, appeared for the defendant, and contended that the building existed long before the Building Act, having been erected upwards of thirty years; and also that, according to the 150th section, proceedings should have been taken within a month of the discovery of the alteration.

Mr. J. Carpenter and Mr. Z. Cohen, who had lived in and known the premises for upwards of thirty-five years, deposed that the shed had all the time remained in the same condition with the exception of a few necessary repairs.

It was, however, contended that a greater part of the shed as at present stood was new, and evidence was called to prove that the timber used in the alterations was enough to make more than one-half of the building "new."

An adjournment was agreed to for the purpose of enabling Mr. Woodrych to view the premises, which having been done, he said that certainly one-half was new, and that brought the case within the Act. He therefore decided that the alterations must be so made as to comply with the Building Act.

ALBERT INSTITUTE, WINDSOR.

Sir,—If any of your readers take sufficient interest in this matter, to turn to our letter in your impression of the 5th ult., they will see that Mr. Sim's letter in your last number confirms the justice of our complaint.

To his counter-charge that we suppressed the fact of a meeting having been called to consider the position of the scheme, and that certain subscribers had "talked of writing" to have their subscriptions cancelled, as there was so little promise of the work going on, we reply that the alleged facts had not come to our knowledge; and that if they had, they are entirely beside the question. We can, therefore, lay no claim to the "ingenuity" with which he credits us.

What he means by advising us to let the fact of our success in this competition "rest in peace," we do not know; nothing is, however, further from our intention.

Mr. Sim's statement that the meeting he advert to stands adjourned till next month, certainly does not improve his case; for it was scarcely decent that he should in the interim come forward with his plan for taking the commission out of our hands.

We should not have trespassed on your kindness in this matter, but that at the present moment much consideration is being given to measures for raising the status, and securing the dignity of the profession; and it is, at least, desirable that those who have in hand the cure of a disease should be made acquainted with its various manifestations. BACOS & BROS.

METROPOLITAN BOARD OF WORKS.

At the last weekly meeting of this Board, the first subject considered was a claim of 14,500*l.* against the Board.

The Works and General Purposes Committee brought up a report which recommended that the claim of Mr. Crook (14,500*l.*), in respect of loss which he alleges he has sustained under his contract for the engines at the Abbey Mills Pumping Station, by reason of the delay in starting them, be settled at the sum of 3,000*l.* Eventually the subject was agreed to be referred back to the committee for further investigation.

Southwark Park.—The thanks of the Board were given to the vestries who had provided the entertainment on the occasion of opening the Southwark Park, and a memorial from the inhabitants praying the Board not to let any part of the park for building purposes was referred to the Works and Improvements Committee.

Finsbury Park.—It was announced that Finsbury Park would be opened to the public early in the month of August.

SANITARY PROGRESS IN KIDDERMINSTER.

At a meeting of the town council to consider communications recently received from the Home Secretary with regard to a memorial of the guardians; to consider a resolution as to opening up, widening, and properly paving the streets of the town; and the appointment of a surveyor under the Local Government Act; the council resolved, on the first subject, by 11 votes to 2,—

"That, as the town has only just adopted the Local Government Act, and has not yet had a fair opportunity of properly carrying out and working the same, no steps be taken until sufficient time has elapsed to test whether or not such Local Government Act will provide all necessary requirements."

It was also resolved:—

"That the Council use the powers given to them as a Local Board to widen, improve, and open up streets where they found this necessary."

Mr. Corbet, in supporting this resolution, said, as an illustration of his argument, that there were many who, when a new market, at an expense of 2,000*l.*, was projected, said it would be a ruinous loss, whereas, they had now a handsome, well-arranged market, a credit to the town; and what had just happened? They had let it for 45*l.*, or 220*l.* more than the old one, and were thus getting 10*l.* per cent. for

their outlay. He referred to other towns where similar improvements had been effected, and concluded by saying the times required spirited although judicious legislation. The mayor then said, in reference to the appointment of a surveyor, that it was considered that the municipal offices—as the nuisance inspector, collector of rates, superintendent of the street repairs, and other offices—might be added in one person, to whom they could then afford to give a salary of about 180*l.*, but it was urged that he should give his whole time to the duties of his office; and at length the council resolved to advertise for a suitable person in the four papers having the greatest circulation in the district; viz., the *Daily Gazette*, *Daily Post*, *Brierley Hill Advertiser*, and *Kidderminster Times*; and also in the *Builder*.

ARRANGEMENTS FOR STREET TRAFFIC.

Sir,—Seeing a notice in your paper as to bridges across the streets for foot-passengers has determined me to ask your permission to propose a scheme which seems to me worthy of consideration. It is simply this,—in very crowded thoroughfares to construct a footway over the present path. May I now ask, through your paper, what the streets being connected by bridges. A large part of the present path could thus be thrown into the roadway, giving more room for vehicles, while foot-passengers would be completely freed from all danger. The inconvenience caused by the alteration to the householders would be compensated for by the additional value given to the house, since the first floor would be converted into a ground floor, and the second floor a first floor, while the present ground floor would be valuable for warehouses. Not being an engineer, I do not enter into the question of how it is to be done; but if it were necessary to carry iron girders across the streets to support the paths, it might in time lead to the formation of an intermediate roadway, which being used only for light traffic, would leave the lower one (then, as it were, subterranean) for the heavy wagons, which now render locomotion so difficult. S. ARTHUR SAWELL.

THE VELOCIPEDE.

Sir,—In a recent number of the *Builder* you quote paragraphs showing that years ago you suggested the use of self-propelling carriages to convey persons to their business, &c. May I now ask, through your paper, what we are to do with them when we get there? Everybody asks me this. Can we not have velocipede stables, where they could be kept during the day at a moderate charge? They do not occupy much room, do they?

AN ARCHITECT'S CLEEK AND VELOCIPEDE.

* * Not occupying much room, they might often be permitted to be taken into offices or other business premises; onto the back courts, &c., of coffee-houses, and other places, where dinner or tea is had. But, no doubt, special places will be opened, as in carriage depôts, stables, &c., at 1*d.* each, or so.

UNDERGROUND TEMPERATURE.

The temperature inside the earth has often been a matter of speculation. Mr. G. J. Symons, the well-known authority on rain and rainfall, has been investigating the subject. He has carried on his experiments at Hampstead. A well was sunk there many years ago into the chalk to the depth of between 500 ft. and 600 ft. for the water supply, and the demand exceeding the supply, an Artesian bore was made through the centre of the well to the depth of a quarter of a mile, in expectation of finding water in abundance in the lower green sand. The Waterworks Company, 1853, reached the depth of 1,302 ft., sunk nearly 8,000*l.* in two years, found no lower greensand, unfortunately, no water, and became ruined. The property passed eventually into the hands of the new River Company, who accorded to Mr. Symons the permission he sought to conduct a series of thermometric experiments on the abandoned site. Mr. Symons erected a hut over the well, and fitted up a little observing-house. At the British Association meeting at Dundee a committee was appointed to investigate the temperature of the earth at great depths. Mr. Symons is a member of that committee, also Sir W. Thomson, who moved for its appointment. Upon the solution hang certain matters of contention between Sir William and Professor Huxley as to how far underground temperature may be made to test the age of the world. Mr. Symons's experiments are not yet concluded. The results so far he regards as decisive. He has made gradual observations down to a depth of 1,100 ft., and has ascertained that the temperature there is 20 degrees higher than above ground; that is to say, the thermometer showed 70 degrees, whereas the mean temperature of London is 50 degrees. If this rate of increase continues, as there seems no reason to doubt would be the case, halving point (212 degrees) would be reached about a mile and a half down. At present, however, Mr. Symons is at a standstill; he has literally stuck in the mud. About 200 ft. of blue-black deposit

has accumulated at the bottom of the tube, and into this the thermometers cannot penetrate. Of course the learned society under whose auspices the work is being prosecuted will forbid such an ignominious termination of a valuable investigation, the like of which has never before been attempted.

INTERNAL DECORATION.

Your recent article on the "Use of Plaster in Decoration" is well worthy the study of every lover of art, as applied to the internal decoration of houses. It shows in a concise form the utter inability of the material as regards its durability, and as a means of support, and also as to its "tenacity" for adhering to all the dust which may arise to its surface. The question now presents itself, what is the legitimate material to use in the external decoration of a building? I have briefly explained in former letters that glazed surfaces of clay are the most durable and legitimate for the external decoration of a building. Now, if this system can be adopted where it is exposed to all kinds of weather, and to every variation of atmosphere (especially damp), to which the climate of Great Britain is subject, why, I would ask, could it not be employed internally? As regards the bracketing and enporring of angles, instead of having a "sham," which is supposed to support the corner of a room, you have a material which will have the strength of wood or stone, and which is more durable than either. If earthenware and china can be manufactured, and sold at such a cheap rate (and a manufacturer can afford to sell a white and gold china tea-service of twenty-eight pieces, for 8*s.* 6*d.* to a wholesale dealer), why could not a cornice, a bracket, or a centre flower be made and sold at an equally moderate price? You cannot purchase an ornamented cornice flower in plaster under 7*s.* 6*d.* or 10*s.*, and I am quite sure if twenty-eight pieces of china can be sold glazed and gilt, for 8*s.* 6*d.*, a centre flower of the same material could be produced for the same sum, with a good profit to the producer. I venture to assert that internal decorations could be sold at a considerably less sum than what I have quoted, as they could be made of a terra-cotta body, and washed over with a white glazed surface, which would be much cheaper than making the whole body of china or earthenware. This system would undoubtedly be a great advance on the present mode of internal decoration, and could be adopted by the "enrichment" decorators in plaster themselves, so that they could not complain of having their "trade" taken out of their hands, as they would be merely substituting another more durable and legitimate material for the one they are now using. ALPHA.

WHAT ABOUT THE OLD PAVING STONES?

Sir,—What becomes of the granite paving-blocks continually removed from our roadways by the contractors for the re-paving of them? Are they allowed for in the fresh contract?

I ask these questions, because, after watching the operation on many occasions, it has struck me, that by relaying the blocks bottom upwards, the same purpose would be answered, without the expense of new granite, as the wear and tear cannot have taken off above $\frac{1}{4}$ in. of stone, and for such a trifle it seems gross extravagance to purchase new blocks.

The old blocks, by a little labour bestowed upon them, must yield the contractors a very handsome return when chipped and relaid in other thoroughfares, under other contracts. Perhaps I may be mistaken, and these blocks may be broken into small pieces for macadamizing purposes. At all events, as an over-burdened rate-payer, I should like to get some reliable information on the subject. RACON EXU.

NUMBER OF BELLS IN OLD TIMES.

Sir,—I think I can answer Mr. Parry's question, in your issue of the 15th of May, ult., about the number of bells before the Reformation.

In small parishes, three was the usual number; each service of the day was to be marked by the tone of a different bell: so three bells would suit,—*Manc.*, *Meridie*, *Vespera*. For the first Vespers, the Ave Maria bell was rung, the angelical salutation being then said. (See Rappin, *Hist.*, vol. v., p. 403.)

At Osney Abbey they had six bells (afterwards transferred to Christ Church, Oxon), called *Douce*, *Clement*, *Austin*, *Hautester*, *Gabriel*, and *John*. In an old MS. relating to the religious offices performed in that abbey, it is said, *Officium Agnus Dei, collentur Douce, Clement, et Austin; et post missam, per non magnam spatium, pulsantur. Et notandum, quod semper*

post magnam missam, pulsetur Hæntectæ; ad completorium Gabriel vel Joha." (See "Hearne's Curious Discoveries," p. 305.)

On festival days, according to the ancient rituals, all the bells were to be rung, "et hauc planationem classicum vocant." (See "Bona, de Rehus Liturgicis," p. 173.)

"Enallor" means "to toll," "undo" "knell," and when more than one bell is so sounded, they make a *chime*. "Pulso" means "to ring."

H. T. ELLACOMBE, M.A.

CHURCH-BUILDING NEWS.

Holloway.—The foundation-stone of a new church, dedicated to St. Peter, has been laid in Kingsdown-road. The site was purchased out of the Bishop of London's Fund, which contributed 6,000l. The total amount besides, received before the laying of the stone, was 2,500l. Three sides of the edifice will face the Kingsdown, Shadwell, and Montpelier Roads respectively, and the principal entrance will be from the last of these roads. The structure will be in the Gothic style, and of simple character. The walls will be of brick, faced with yellow stocks, with Bath stone dressings. The nave, at the east end of which there will be a three-sided apse, will be 100 ft. long, 24 ft. wide, and 55 ft. high from the floor to the boarding of the roof. On either side will be aisles, each 80 ft. long, 13 ft. wide, and 20 ft. high. These will be separated from the nave by five pointed arches, supported on coupled columns of polished red granite. The church will be lighted by sixteen two-light clearstory windows, extending round the north, east, and south sides of the building, while at the west end there will be a large rose window over 6½ lancets. In addition to those of the clearstory there will be ten windows in the aisles, placed at such an elevation that the galleries which it is ultimately proposed to erect will not intercept the light from them. The number of sittings provided on the ground floor will be nearly 700. The galleries, which will not be erected at present, are designed to hold about 300 persons, so that the church will contain 1,000 sittings when completed. The contract for the erection of the edifice has been taken by Mr. Thompson, of Camberwell-green, for 4,880l. Messrs. Henry Jarvis & Son, of Southwark, are the architects.

Bury (Lancashire).—The Bury new cemetery has been formally opened. The site is a little over a mile from the centre of the town, and a little off the main road to Manchester. The grounds contain 33a. 1r. 27p. statute measure: 20 acres of which are intended to be devoted to the burial of the dead, and will contain 22,054 graves. The remaining 13a. 1r. 27p. are set aside for walks for the use of the inhabitants of the town. The drains are from 10 ft. to 14 ft. deep, and are constructed of dry rubble. They vary from 2 ft. 6 in. to 1 ft. 6 in. diameter; the total length of the main drains being 2,221 lineal yards. The whole site of the cemetery and walk is surrounded by a boundary wall of parapets hatched with rubble, having an average height of 4 ft. 6 in. This includes a stone and weathered coping 1 ft. 3 in., with 4-ft. piers at intervals. Between these piers and extending all round the grounds, is an ornamental railing of wrought-iron vertical bars, fitted in with cast-iron tracery from a special design. There are three entrances, viz.—one at the north-east corner, one at the south-east, and the principal at the south side. The carriage or main gateway is 12 ft. high, with piers at either side 4 ft. 9 in. square at the base, and 19 ft. 6 in. high, with buttresses and crocketed canopies. The Established Church is cruciform on plan, with a octagonal apse. Its extreme length is 52 ft., and the width across the transepts 34 ft. 6 in. There is a south porch facing the tower entrance, and between these is a vestibule screened off from the main body of the chapel with a glazed screen. The roof is open-timbered. The interior is fitted up with open seats having ornamental iron bench-ends. The floors are laid with ornamental tiles of a geometrical pattern. The tower and spire are 76 ft. high. The roof is covered with blue and green slates in patterns. The style is Decorated. The chancel of the Dissenters' Chapel consists of a porch, vestibule, small tower, nave, and vestry—the vestry occupying the place of the chancel. The vestry and vestibule are screened off from the nave, and glazed as in the former structure. The fittings are of red deal, with moulded caps to bench-ends, stop-chamfered. The south-west

angle-tower and spire are 54 ft. high, and in many points look hoiler than in the case of the church building. The tower, besides being a ventilating tower, adds to the general character of the structure. The roof is open-timbered, of steep pitch, stained and varnished. It is covered with purple and blue slates, with ornamental ridging. The plan of the Roman Catholic Chapel forms a nave, chancel, porch, and vestry. The roof is open-timbered. The chancel-arch is partly supported by carved caps and columns. The fittings are of red deal, stained and varnished. The floor is to be laid with ornamental tiles. The west end (exterior) is crowned by a bell-gable with canopy, underneath which is a colossal figure of a bishop, 6 ft. 6 in., supported on a carved cap, column, and pendant. The gable is pierced with two two-light traceried windows. The extreme length of the chapel is 44 ft., the width of the nave 37 ft. 9 in., and the width of the chancel 12 ft. The roof is covered with blue and green slates, arranged in alternate bands, and cut to pattern. The ridge is blue Staffordshire tile-cresting. The registrar's house is situated to the right of the main entrance. The gardener's lodge is one story high. At the back and near to this is a propagating house, 60 ft. by 15 ft., for the use of the grounds. The grounds and walks have been artistically arranged. The total length of roads and walks is 4,745 yards, or nearly three miles. The total number of trees and shrubs planted in the grounds is 41,662. The designs were by Mr. James Farrar, borough surveyor for Bury, and by Mr. Henry Styan, architect, Manchester. Mr. Thomas Vicar acted as clerk of the works. The carving was by Mr. Joseph Bonehill, Manchester, while the greatest portion of the stone-work was executed by the employes of the Burial Board. The joiner-work was by Mr. F. Dawson, contractor, Elton; the ironwork by Mr. Joseph Downham; the plumbers' work by Mr. T. Cornall; the painting and plastering by Messrs. Jacob Lomax & Sons, all of Bury; the slating by Mr. Kirkeley, of Manchester; the tiles being supplied by Messrs. Minton, of Stoke.

PROVINCIAL NEWS.

Great Wollaston.—The foundation stone of a new vicarage has been laid here. The ground for site, garden, and paddock is the gift of Mr. R. Gardner, of Sansaw; the estimated cost of land and building, 1,150l. A new church is to be built in a central part of the parish, money for the site and burying-ground having been left by a former incumbent. Messrs. Bowdler & Darlington, of Shrewsbury, are the contractors for the vicarage.

Osley.—The memorial stone of a new mechanics' hall has been laid here. The new building will be in the modern Italian style, and will include on the ground-floor a small lecture-room, which may be divided into two class-rooms, retiring or cloak rooms, reading-room, library, two class-rooms, lavatory, &c. On the basement will be a kitchen, scullery, chemical class-room, heating apparatus, coal and lumber closets, &c. The first-floor will comprise a large concert-room, with gallery, platform, orchestra, and organ. Over the class-rooms and under the orchestra will be a general and ladies' retiring-rooms, and a librarian's residence will be attached to the institution. The concert-room will accommodate about 900 persons, allowing to each a space of 2 ft. 6 in. by 1 ft. 6 in. The orchestra will contain sittings for about 120 singers, exclusive of platform room, and ample entrance and exit accommodation will be provided.

Burslem.—Mr. Edward Challinor, of Tunstall, has decided upon the erection of a new manufactory on the site of the old Oven House Works at Burslem, which are being pulled down. The new works will be of the most modern construction, and will include a mill for the grinding of materials and colour. The contract for the building has been undertaken by Mr. John Stringer, of Sandhaeb, and that for the engineer's work by Mr. William Boulton, of Burslem. The whole has been designed by Mr. George B. Ford, of Burslem, architect, and will be carried out under his superintendance.

Templesoverby (Carlisle).—The foundation stone of Ostenstands bridge has been laid. Ostenstands is a point on the River Eden, about a mile and a half south of the village of Templesoverby, and about a mile from that station on the Eden Valley Railway. The works have already made considerable progress. The plan of Mr. Bintley, of Kendal, was accepted; and

the contract for the work was let to Mr. Hepworth, of Kendal. The width of the river where the bridge will cross is about 150 ft. The bridge will be built of stone, and will consist of four arches; three of these will be 30 ft. span, and the fourth, a dry arch, will span 54 ft. The bridge is vested in trustees.

Blackburn.—New parsonage-houses are being erected as residences for the vicar of the parish of St. John, Blackburn, and also for the vicar of St. Mark's, at Witton. The former is to cost about 1,800l., and the latter about 1,100l., exclusive of laying out and ornamenting grounds, &c. The land in both cases has been a gift from Mr. Joseph Fielden, of Witton Park. Mr. Joseph Brierley, of Blackburn, is the architect.

STAINED GLASS.

Hanley Castle.—At a parish meeting held at Easter last, the following resolution was unanimously adopted:—"That some substantial memorial be erected by the parishioners of Hanley Castle, to the memory of the late Mrs. Lechmere, and for this purpose a subscription be entered into, and a committee appointed to carry out this object." In accordance with this resolution, the committee appointed at the meeting have decided upon filling the west window in Hanley Castle, with stained glass of the richest and best quality, the subject of the design to be "The Ascension," the cost to be defrayed by subscriptions raised in the parish. The amount required, about 190l., was collected in a few days; the sum was limited to that amount, and the subscription to the parish.

Trinity Church, Tewkesbury.—Mrs. Laing, of the Mythe, Tewkesbury, has just had an obituary window placed in this church, to the memory of a youthful son who died many years ago. It depicts the incident of Christ blessing little children, and forms an ornament to the chancel, which has lately been improved. It is the work of Messrs. Heaton & Co., of London. In addition to this, Mrs. Laing is also causing the other windows of the church, seven in number, which were of the usual common glass, to be refilled with thick tinted glass with colored borders.

Uffington Church.—A memorial window has just been placed in the parish church of Uffington. The window, executed by Mr. Gibbs, of London, consists of three lancet lights, and the subject is, in the centre the Crucifixion, and on either side a type of the Crucifixion: Moses lifting up the serpent in the wilderness on one side, and Abraham offering up his son Isaac on the other.

St. Michael and All Angels', Neepsend (Sheffield).—The east window of this church has just been filled with stained and painted glass. The style is of the Late Decorated period of architecture, of five principal openings, with geometrical tracery. In the centre light of the tracery is the figure of St. Michael, with the subdued dragon at his feet. The surrounding openings are filled in with ornamental lights of a mosaic design of deep colours. In the five lower openings is represented the scene of the crucifixion of our Saviour, and its attendant incidents, which extend over the entire breadth of the window. The figures are about 3 ft. in height. Each opening is surmounted with canopies of rich tabernacle work, with an arcade base across the window. Further colour is given to the design by a trefoil foliage border, enclosing each of the five lower openings. The window is the gift of the Rev. Thomas Wilkins. It was executed by Messrs. Baillie & Mayer, of London.

St. Bartholomew's, Dublin.—The three eastern windows of the chancel of this church have just been fitted with stained glass by Mr. O'Connor, of London. The subjects are "The Sermon on the Mount," "The Crucifixion," and "The Resurrection." The windows are a thank-offering from friends of the incumbent, for the providential escape from serious accident which the clergy and choir had when a pinnacle was blown down in the gale of December 27th, and fell into the chancel during Divine Service.

New Parish Church, Bolton.—A window in honour of Mr. Peter Ormrod, for his generosity in rebuilding the parish church, at a cost of over 30,000l., is to be put up in the new church. A design has been obtained from Messrs. Hartman & Co., of Birmingham, for a stained east window. The window is a seven-light one, 35 ft. high and 25 ft. wide. The artist shows a double series of groups of figures, the large ones on blue ground, and the smaller on a ruby. The subjects chosen

for the figures are from the life of St. Peter, owing to the church being dedicated to St. Peter, and also to the fact that the benefactor, Mr. Ormrod, bears that name. The cost is estimated at 800*l.*, to which there will be extras. The design has been commended, but the design of another artist who had been consulted not having been sent in, the decision on the matter has been deferred. A committee has been appointed to carry out the object.

Denton Church, near Manchester.—An easterly decorated window, consisting of three lights and tracery, has been filled with stained glass in this church. The three lights are occupied by life-size figures of our Saviour in the centre opening, and in the side lights Moses and Elias. These are surmounted by canopies and borders. The tracery is filled with sacred devices and monograms. Messrs. Edmundson & Son, of Manchester, were the artists.

Shipley Church, Yorkshire.—A painted window, consisting of three lights and tracery, has been placed in the nave of this church. The three lights are occupied by the Crucifixion, the Transfiguration, the Resurrection, and the Acts of Mercy, viz., feeding the hungry and clothing the naked, and the Good Samaritan. The upper portion of the window is filled with grisaille work, and the tracery contains angels and sacred emblems of a suitable character of design. These windows are from the establishment of Messrs. Edmundson & Son.

Books Received.

What is Matter? By an Inner Templar; author of "More Light: a Dream in Science." London: Wynman & Sons, Great Queen-street, Lincoln's Inn-fields, 1869.

Trotter somewhat eccentric and startling in certain of its enunciations, this is a thoughtful and suggestive treatise. First of all, a brief and rapid résumé of ancient and modern opinions on the subject in hand, down to Faraday, is well given, in remarkably few words. The author's own theory is eclectic, but in pretty close accordance with Faraday's, so far as Faraday has treated of centres of force as the more immediate basis or subject of physical phenomena. The author thus introduces his own response to the question, "What is Matter?"

"The universe is filled with centres of force; each centre the centre of a sphere; each sphere a compound of two spheres, having the same centre, one a sphere of attraction, the other a sphere of repulsion."

It is by the separation of these two spheres of attraction and repulsion, and therefore by the calling forth and exercise of their powers by each, that we have the different modifications of matter.

And again,—

"The Divine Mind caused a certain immense, but yet finite, portion of space to be marked off from his immediate presence as a centre—a great sphere—of space. This by some manifestation of His power and presence, was filled with centres of force, the seeds, as it were, of that which was to be known as matter, round each of which two forces, attraction and repulsion, were in abeyance."

This "abeyance," from balancement of attractive and repulsive force, appears to be the author's explanation of the ether stipulated for by various physical philosophers as a medium filling space, and which the Inner Templar accepts, in his own way, as the original or "prime matter." Professor Huxley's idea of "inert matter" in general is said to be that it consists of a balancement of attractive and repulsive forces. The words "attractive" and "attraction" imply an incomprehensible act, however, which is hypothetical, and which, Professor de Morgan jeannily predicts, will, by future theorists, be called "the pulley-haulay system."

In order to avoid all hypothesis on this subject, we have ourselves long used the words "concentrative" and "concentration" which are simply declarative of the universal fact or phenomenon, without involving either the "pulley-haulay system" or any other. And as the antithesis of concentrative, of course, we have preferred to use the word "radiative" rather than "repulsive." Using our own terms, then, we would suggest both to Professor Huxley and to the Inner Templar whether they ought not to modify their definitions of what matter is, by the consideration that, in ethereal or other "radiant matter," instead of the radiative and concentrative forces being in a state of balancement, the radiative is plus, the concentrative minus; while in more tangible and resistive forms of what is called gross matter, the concentrative is plus, the radiative minus. Thus, too,

the way out of matter into spirit may simply be the way out of concentrative into radiative states,—a possibility which involves the radiative infinity whence the grosser forms of matter proper may be said to have descended into concentrative unity. If concentrated matter can be infinitely radiated (as it may well be in the infinite, whence it emanated), what can matter radiated to a certain extent be but spirit? This we may more readily allow, since we find even sceptics ceasing to regard matter as that lifeless, dead, inert, and brute mass which it once was conceived to be. As a congeries of living and associated forces, concentrative and radiative, emanating together from central points of space, the "inert substratum," or, in truth, substratum merely, heretofore called "matter," on which all material forms, bodies, or superstructures, were supposed to be based, is knucked from beneath our feet, and all that remain are living forces, concentrative and radiative, emanating from central points, through which, as it were, we have a direct glimpse of the Unitive and Infinite meta-physical Power on which all physical creation is based, whence it all emanates, and by which it is all and ever sustained.

The Creator is a Sphere whose centre, said Coleridge, is everywhere and whose circumference is nowhere. Here we have a beautiful and true definition of that Unitive and Infinite Principle, who creates all centres of force, by whom all things subsist, and "in whom we live, move, and have our being." Though beyond all, He is in and through all, and perpetually sustains all. And as for the "infinitely divisible" matter, with which materialists used to dabble, it is easy to see that it is a bottomless pit where there is finally nothing to stand upon; and though, as they would insist, our forces must inhere in a subject, it is clear that they have in matter no such subject, no such basis; and therefore we must seek elsewhere for it; nor need we waste much time in the search; for concentrative force clearly emanates from and is based upon Unitive Power or Principle, and radiative force from and upon Infinite; so that the Unitive and Infinite Principle which transcends all physics—all creation, is the Substance or Basis of all, as well as the Creator and Disposer of all.

The accordance of the idea of Faraday, Huxley, or the Inner Templar,—that every body in existence is based upon forces emanating from (nitive) points or centres,—with the nature of the mind of man, which has been shown, in the *Builder* (of July 11th, 1863), to be an estimator of forces and their relations, and itself based on forces, affords an additional reason for looking with favour upon such an idea; but we cannot here enter further on this subject, and must therefore briefly wind up our notice of the Inner Templar's response to the question, "What is Matter?"

Basing it on his idea of matter, the author gives a version of the nebular theory, and also proposes a new theory of light, which we have not time at present to look into, but which seems to contain some rather curious and startling propositions, one of these involving the exact measurement of an atom or primitive sphere of force in various substances, such as air, water, and glass. On these and other points the author considers that he has "given the key which will unlock many mysteries in the world of philosophy and science;" and whatever the reader of his book may think on this point, he will find a good deal in it to ponder on, with nothing to weary the attention in the shape of prosey or prolix disquisition.

Miscellaneous.

The Tower Subway.—This work has now passed the nearest approach to the bed of the river, the top of the tunnel being 23 ft. below the bed, and the engineer, Mr. Peter W. Barlow, jun., reports that at the present rate of progress the tunnel will reach high-water mark on the Surrey side in ten weeks. The ground, it is said, is so dry that the New River Company's water laid on the works has to be taken from the shafts for the cement used in the tunnel. Air is supplied to the men by a steam-engine at the shafts. Communication between the men at the face of the works and the top of the shafts is effected by an electric telegraph.

* In connexion with the whole subject we may here refer to an article in the *Builder* of 1854, p. 580, titled, "What is Electricity?" and to a "Psychological Key," by J. E. Dove, in the *Builder* of July 11th, 1863.

Slate Quarrying in Wales.—Seventy-five years ago slate quarrying in Wales was confined to out-of-the-way corners, where a few slates and slabs were got by the owners of the ground for their own use. As far back as the last decade of the last century, however, the Penryn quarry began to be looked on as a profitable investment for capital, and the true value of slates as articles of commerce began to be felt. The want of roads or other efficient means of transport to the sea, greatly retarded the development of the new industry. All the slates and slabs were at first, perforce, carried six miles to port on the backs of ponies. Subsequently, a road was made, and carts and wagons were used; and at last came the tramway. Later on, the great Llanberis quarry was opened; and, later still, the quarries of Nantlle, Festiniog, and Corris. The fact that money was to be made by quarrying and selling slates soon attracted attention; and within the last half-century not fewer than 100 quarries have been opened in different parts of Wales, either by private enterprise or by public companies, but of these not half the number is now in operation, while the number of those worked to a profit is probably under twenty. Within an arc of six miles radius, described from Port Madoc as a centre, more than 250,000*l.* have been spent without the prospect of a return. Why this has been the case it is almost beyond our province to inquire. The incompetence of directors and managers has been one principal cause of the financial ruin of more than one company. The great error committed seems to have consisted in opening quarries in districts where the slate formation is naturally bad in a commercial sense. There are only three veins of absolutely pure, laminated, and lasting slate rock as yet known to exist in North Wales.—*The Engineer.*

Technical Education.—A conference on technical education has taken place in the theatre of the School of Mines, Jermyn-street, under the presidency of Lord Elcho. Several representative working men and others interested in the question were present. The chairman, in his opening address, said it was absolutely necessary that we should have something in the way of technical education, if our manufacturers and artisans were to hold their own in the face of foreign competition. Papers dealing with the question were read by Mr. Bookmaster and others, and several resolutions were subsequently introduced. The movers proposed, in effect, that the Workmen's Technical Education Committee should be a permanent organisation, under the name of "The Workmen's Technical School Union;" that the necessity for providing technical education for their workmen and apprentices should be urged upon the great employers of labour; that the trade societies be recommended to establish schools, night-classes, museums, and libraries for the apprentices in their respective industries; and that all corporate bodies, like the guilds of the City of London, be asked to apply a portion of their funds to a similar purpose; that the Government be urged to establish a certain number of superior schools of arts and trades, similar to those in France, for the education of foremen and other high-class workmen; that application be made for the establishment of chairs for instruction in the evening, precisely similar to that given in the daytime at the School of Mines, and that provision be made in the primary schools for instruction in the elements of science and art.

Palestine Exploration Fund.—The annual meeting of this Fund has been held in Willis's Rooms, the Archbishop of York in the chair. Among those present were Mr. Tito, M.P., Professor Owen, Mr. Magregor of the Rob Roy, and various other well-known persons. Mr. Grove, the hon. sec., read the report of the executive committee, and Mr. Morrison read the treasurer's report, from which it appears that the number of annual subscribers was doubled during the past year, which we are glad to think denotes increasing interest in the very important explorations at Jerusalem. We hope the list will again be doubled during the present year. A resolution was agreed to approving of the operations and desiring their continuance.

The French Duty on English Plate Glass.—A deputation of English plate-glass manufacturers has had an interview with Mr. Bright at the office of the Board of Trade, to present a memorial praying for a remission of the duty now imposed on English plate-glass by the French Government.

Enclosure of Commons.—The quantity of land which has been enclosed in England and Wales, or is in process of being enclosed, since the passing of the Enclosure Act of 1845, amounts to 614,804 acres; out of this quantity 1,742 acres were reserved for the purposes of exercise and recreation, and 2,223 acres reserved as allotments for the labouring poor. Wandsworth Common possessed over 800 acres of pasturage, which was used for common rights; but by the Enclosures Act nearly the whole of this has been taken for the erection of public institutions, the county prison, and railway cuttings, and the rights are reduced to within 100 acres. Now we are told that twenty acres more of the common are about to be taken by a parochial board for the erection of paper buildings.

Improved Cabs.—The Council of the Society of Arts have offered the following medals for improved hackney carriages specially suited to the metropolis:—The Society's Gold Medal for the best and most convenient open hackney carriage for two persons; the Society's Silver Medal for the second-best ditto; the Society's Gold Medal for the best and most convenient closed hackney carriage for two persons; the Society's Silver Medal for the second-best ditto; the Society's Gold Medal for the best and most convenient closed hackney carriage for four persons; the Society's Silver Medal for the second-best ditto. Lightness of construction, combined with adequate strength and durability, will be especially considered in making the awards.

Well-sinking in Algeria.—A curious circumstance is announced from Algeria. A well lately sunk at Ain Sala to the depth of forty-four metres, threw up not only a large body of water, but, to the surprise of the engineers, an innumerable quantity of small fish. These are described as being on an average half an inch long, and resembling whitebait both in appearance and taste. From the fact of the sand extracted from these wells being identical with that which forms the bed of the Nile, it is concluded that an underground communication must exist between them and that river.

Leicestershire Architectural and Archaeological Society.—The annual summer gathering of this society was held at Melton Mowbray, with an excursion to Botesford and several other places on the way. A day's diggings at Melton, upon ground where Anglo-Saxon relics have been found, preceded the excursions. A public meeting took place in the Corn Exchange, the vicar of Melton in the chair, when Mr. James Thompson read a paper on the objects of Architectural and Archaeological Societies, and the Rev. Assheton Pownall one on Early English Money. Mr. North also read a paper on the Ancient Schools of Melton. On the following day the excursion took place, when a party of about thirty proceeded in vehicles to visit the principal churches and objects of interest in a district extending to the extreme north-east of the county. Mr. M. H. Bloxam and Mr. T. North were amongst them.

The Workmen's International Exhibition, 1870.—A public meeting promotive of this exhibition has been held at the Pimlico Rooms, Winchester-street, Pimlico, when a deputation from the council explained the details and arrangements. The exhibition will be held in the Agricultural Hall, Islington. It is to serve, *inter alia*, as a school of technical education. All articles exhibited will be signed with the name of the workmen by whom they were made. Where division of labour prevails, workmen are invited to exhibit specimens of that particular part of the work in which they are severally engaged, such as in a piano or a watch, and to combine for the production of the completed article. Medals and certificates of merit will be given, and also, in special cases, money prizes. Articles may be sold, but not removed, during the exhibition.

Annual Poor-Rate Return.—The return for the year ending at Lady-day, 1868, shows that the gross estimated rental of the property in England and Wales assessed to the Poor-rate in the year was returned as 118,334,081*l.*, the rateable annual value 100,612,734*l.* The amount levied as poor-rates was 11,054,513*l.*, being 1*s.* 10*d.* in the pound on the gross estimated rental, 2*s.* 2*d.* on the net annual value. These ratios are larger than in the preceding year by 1*s.* 5*d.* and 1*d.* respectively. The total amount of local taxation was 16,660,459*l.*

Gas-Burners.—Too little attention has heretofore been paid to the subject of gas-burners, many of which are wasteful, while some others are far more economical. The referees appointed under the City of London Gas Act, 1868, in their report to the Board of Trade of the 3rd May, 1869, point attention to this subject, and state that they have found Leoni's standard Adams, Albert Crutch, and Economiser, to be far more economical than others they have tested. The referees think it a matter of urgent importance that such facts as those they state should be brought to the knowledge of the public.

The Proposed Building at Southwark Park.—An out-door meeting has been held in Southwark, to protest against the proposition to build on a part of the ground purchased with the view of making a park for Southwark. The Metropolitan Board purchased 63 acres, their purpose being to aid the ratepayers in defraying the cost by devoting 16 acres to building purposes, without which purpose, doubtless, no park would have been purchased at all; and the only fear, we should think, may be that the movement against the proposed arrangement may prevent the Board from purchasing open ground for parks in other parts of the metropolis. The meeting referred to resolved to send a deputation to the Board on the subject.

Farewell Breakfast to Artisan Emigrants.—At the Cannon-street Hotel, an interesting breakfast party has been held, to bid God-speed after the old Christian fashion to a party of fourteen British operatives, who, with wives and children, were about to leave this country for the United States of America, to be employed there on the new buildings of the Cornell University, at Ithaca, to which Mr. Goldwin Smith has been attached. These fourteen skilled workmen have been picked and chosen from the Associated Trades, through the agency, we believe, of Mr. George Howell, and under the auspices of the Hon. Anthon Herberth and Mr. Hodgson Pratt, by whom the invitations to this friendly little gathering were sent. Lord Houghton presided. After Lord Houghton, Mr. Applegarth, Dr. Watts (of Manchester), the Hon. G. Brodrick, Mr. George Howell, Mr. Hodgson Pratt, Lord Edward Fitzmaurice, Mr. Morier, and Mr. Cramer, were the speakers, as also was Mr. Sneath, a carpenter, one of the emigrants.

Electro Telegraphic Progress.—The French Atlantic cable which is being laid showed a slight defect in the electrical condition on Friday night. The gutta-serena resistance fell, and there was every indication of a fault which it was impossible to localise. On Saturday morning, however, the communication was again perfect, and telegrams between the ship and the shore were freely passed. The fault reported was considered to be evidently very minute, and in no way affecting the practical working of the cable. Since then a telegram has announced the cutting and hoisting of the cable, but whether in shoal water, or previous to reaching it, was not said; nor was any reason given.—It is stated that the sum agreed upon by the Electric Telegraph Company, as the price of their property, is 2,938,000*l.* The plant is valued at 1,000,000*l.*, and the net profits of 180,000*l.* will realise above 6 per cent. upon the sum the Government will pay.—In the House of Commons, in reply to questions, the Postmaster-General stated that the negotiations with the telegraph companies for the acquisition of the telegraphs were now completed, but those with the railway companies were not yet quite finished; these last, however, were in such a state as to enable the Government to ascertain very nearly the sum required for the acquisition of the whole of the telegraphs of the country, and a Bill would shortly be introduced for the purpose of raising the necessary funds. A clause would be introduced giving to the Government a monopoly of the transmission of telegraphic messages, in the same way that they have a monopoly of the transmission of letters.

British Museum.—A large and beautifully-ornamented vase (or, as the museum authorities prefer to label it, a "krater") found in the villa of Hadrian, Paestrina, has just been erected in the middle of the area of the entrance-hall. It is a very rich piece of ancient work, the bowl being supported on hold claw trusses with lions' heads. Round the upper part satyrs are carved, represented in the act of making wine. The whole erection stands about 10 ft. from the floor.

A Tribute to Mr. Applegarth.—A demonstration in honour of Mr. Robert Applegarth, secretary of the Amalgamated Society of Carpenters and Joiners, has been held at Chorlton-on-Medlock. Mr. Applegarth was presented with a book-case and 200 volumes of works, selected by Mr. Hughes, M.P., and other gentlemen, and towards which contributions were received from Mr. Rupert Kettle, Mr. Mandella, M.P., Mr. Vernon Lushington, Mr. Crompton, the late Mr. Ernest Jones, Professor Beesly, of the London University, Professor Jevons, of Owen's College, Mr. J. M. Ludlow, Mr. Lloyd Jones, and others. The testimonial was got up not merely as a reward for duty, but as a stamp of approval of Mr. Applegarth's public conduct.

Well-opening at Edlston and Wyaston. The inhabitants of Edlston and Wyaston have for generations suffered from the want of fresh water, particularly in the drought of 1868, but that necessity has been at length supplied by the liberality of Mrs. Alderson, of Wyaston Grove. A well has been sunk and a pump put down for the free use of the parishioners, over which has been erected a stone building. The presentation of the well took place on Wednesday, the 16th ult., when the inhabitants in gratitude made a public demonstration, and with the proceeds of a subscription from workmen's wives, presented Mrs. Alderson with a glass jug and two goliets.

The Royal Horticultural Society.—The president and fellows of this society have presented an interesting entertainment to a numerous and distinguished company. In addition to a *soirée*, several incidents occurred which are not generally included in the programme of this class of social gatherings. Prince Teck was present, and a long line of gasjets lighted up the bright combinations of colour effected by the movements of the company through the hall, and the statuary was thrown into bold relief by the sombre background of exotics. The members of the St. Cecilia Choral Society performed a selection of glees and part songs, all, except one, the compositions of English masters. Whippert's hand agreeably alternated with the singing, and the visitors continued to move through the conservatory and the avenues of promenade in its vicinity until nearly midnight.

Society of Arts.—The 115th annual meeting of the members of the Society for the Encouragement of Arts was held on Wednesday, at the offices of the society, Lord Henry Lennox in the chair. Mr. Le Nève Foster, the secretary, read a lengthy report detailing the operations of the society during the past year, which had been of the most varied description. The Albert Medal for rewarding distinguished merit in promoting art, manufactures, or commerce, had in this year been awarded to Baron Liebig. The Swiney Prize had been given to Dr. Guy. Prizes for art-workmanship to the amount of 95*l.* had been given. Three courses of Cantor lectures had been delivered by Mr. W. Perkins, Mr. S. Hart, and Mr. J. Henderson.

Addition to the Earlwood Asylum for Idiots.—The Prince of Wales has laid the foundation-stone of an addition to this asylum. The additions proposed comprise an extension of the dining-hall to nearly double its present length, with enlarged space for playing and recreation, new kitchen, scullery, bakehouse, wardrobes, workrooms, lavatories, baths, &c. The estimated cost of these is 12,000*l.*, but it is also intended to erect a detached infirmary whenever the Board shall find that they have sufficient funds in hand to justify the necessary outlay.

The New Fish Market, Swansea.—This much required accommodation, erected by the corporation at an expense of something like 500*l.*, has been opened. It is erected over the butchers' stalls on the south side of the market, near the Orange-street entrance. Means have been adopted to secure ventilation, and marble troughs have been erected for the display of fish; whilst there is an abundant supply of water.

Gas-pipes of Wood.—A firm in Oshkosh, Wisconsin (U. S.), has contracted to make 1,000,000 ft. of wooden tubes to lay down in that city for gas-pipes. They are to be made of timber 6 in. square, bored in the same way as pump-barrels. For the hackwoods of America wooden gas-pipes may be all very well; but where metals abound such pipes are not to be commended. The Chinese cane gas-pipes, even, would be better than these.

Value of a House in Cheapside.—The freehold premises in Cheapside occupied by Mr. John Bennett, the watch and clock maker, have been put up at auction. The auctioneer stated that the property covered an area of 1,750 square feet, which, if in possession, he should value at 15l. per square foot; but Mr. Bennett held a lease of the premises for about 11 years at 500l. per annum, for which he paid a large premium in addition to making considerable alterations; and if the premises were now in hand he should estimate them to be worth at least 1,000l. a year. The biddings commenced at 10,000l., and after competition the property was bought in, we believe, at 14,000l.

The New Law Courts.—A report has been issued by the committee appointed by the Courts of Justice Commission "to examine all the plans submitted to the Commission, with a view to ascertain the dimensions and measurements." The total area of office accommodation in the Parliament scheme is 256,821 superficial feet; the area provided in Mr. Street's Howard-street scheme is 180,423 ft.; that in Mr. Street's reduced scheme for Carey-street site, as just published by the Office of Works, 278,395 ft.; and under the scheme approved by the Commission reduced to the Carey-street site, 284,188 ft. This information is supplemented by the report from the surveyor of Her Majesty's Works and Public Buildings to the First Commissioner on the sites proposed for the courts and offices of law. It concludes in favour of the Embankment site.

Convalescent Hospital for Children.—The Mansion at Highgate known as Cromwell House, and believed to have been built by Cromwell for his daughter, and her husband, General Ireton, has been converted into a convalescent hospital for children by the managers of the children's hospital in Great Ormond-street. The rooms for dormitories and day-rooms are spacious and lofty, and there are an extensive playground and garden, with a large kitchen-garden. There are also bath-rooms, lavatories, and other modern appliances. When fully occupied, the house will receive about 100 patients. At the outset 50 children will be received. The works of alteration and adaptation have been carried out at an outlay of about 3,000l., by Messrs. Wagstaff & Son, under the direction of Mr. Arntz. The baths and hot-water apparatus, with all the fittings in the kitchen department, are the work of Messrs. Benham & Son. Other parts of the work have been carried out by Messrs. Jennings.

The South Kensington Museum.—In reply to Lord Eloho in the Commons, the Vice-President of the Committee of Council on Education said the reason why the brick and terra cotta buildings of the South Kensington Museum in Exhibition-road were not progressing for the last three months, was simply that it was thought necessary to reduce the building vote, which was 8,500l. for this year, and there were other works the completion of which was more urgently called for.

Working Men's Club and Institute Union.—On the 28th ult., a conference of persons interested in working men's clubs and institutes was held in the theatre of the Society of Arts, at eleven o'clock a.m. After the conference, the representatives of clubs in the country dined with members of the London institutions at the Artisans' Club in Newman-street. After the dinner a paper was read on "Art applied to Industry," by Mr. C. Lamport. On the following day (Tuesday), the 29th ult., the annual meeting of the union took place at Exeter Hall.

Public Parks (Ireland) Bill.—Viscount Lifford, in the House of Lords, said the object of this bill, which came up from the House of Commons, was to assimilate the law of Ireland with respect to the creation of public parks to that of England. The bill gave power to the commissioners of towns with a population of 10,000 or over, to levy rates for the purpose of forming local parks. The bill was read a second time.

Payment of Board of Health Surveyors. During a recent discussion concerning advertising for a new surveyor to the Local Board of Cockermonth, one of the members of the Board, Dr. Dodgson, said justly that it was a strange thing that they should give the engineman 2 1/2 a year and a free cottage to live in, while they were offering to a man who would have to look after the engineman the sum of 50l. per year.

The Value of Land in Brighton.—The surplus land which had been acquired by the corporation for improving the lower part of North-road, was recently submitted to public competition. Amongst the portions sold we may note Lot 6, at the corner of Jubilee-street, having a frontage of 18 ft. 6 in. to North-road, and of 35 ft. 8 in. to Jubilee-street, by Mr. A. Buckwell, for 295l.; Lot 7, to the west of this, having a frontage to North-road of 17 ft. 4 in., by Mr. W. Wilson, for 200l.; Lot 10, at the upper corner of Regent-street, to which it has a frontage of 45 ft. 4 in., and a frontage to North-road of 17 ft. 6 in., by Mr. Corney, for 310l.; Lot 11, to the west of this, a frontage to North-road, 16 ft., by Mr. W. Wilson, for 220l.; Lot 12, again to the west, a frontage of 20 ft., by Mr. H. Verrall, for 250l.; Lot 13, again to the west, a frontage of 16 ft., by Mr. H. Dash, for 260l.; and Lot 14, at the corner of Gardener-street, to which it has a frontage of 39 ft. 4 in., and to North-road of 16 ft. 6 in., by Mr. Oliver Weston, for 610l.

The Projected Channel Tunnel.—A deputation, consisting of Lord Richard Grosvenor, Admiral Elliot, Mr. Hawkshaw, C.E., and others, has had an interview with the Right Hon. J. Bright, at the office of the Board of Trade, on the subject of the proposed Channel tunnel from England to France.

Public Works in Greece.—An announcement of much interest was made in the King of Greece's speech at the opening of the new Chamber of Deputies. Amongst various other public works which will be speedily commenced, a canal is to be cut through the Isthmus of Corinth. This undertaking is at last to be realized, with the help, we believe, of M. de Lesseps. The famous Peloponnesus will then become an island.

Rats and Mice.—A recent writer says that cotton saturated with chloroform, and then stuffed in the holes of rats and mice, will prevent their re-appearance in a house. Tar is said to be a capital thing to pour into their holes, and might be largely used in conjunction with broken bottles and cement for filling up the places they have undermined and infest. In the bottles and cement alone not much faith is to be put.

Heat by Compression.—Every one knows that, if a certain volume of air be compressed, the temperature is raised in certain proportions. Acting on this fact, Mr. Bessemer has devised a plan for increasing immensely the heat of furnaces by condensing the gases.

Congress of the British Archaeological Association.—The congress of this association will this year be held in St. Alban's, commencing August 2nd, and ending on the 7th. Lord Lytton is the president, and the arrangements are making satisfactory progress.

Kent Archaeological Society.—It has been resolved that the general meeting of this society shall take place at West Malling on Thursday and Friday, the 5th and 6th of August.

Chelmsford.—The Chelmsford Highway Board, at their last meeting, passed a resolution increasing the clerk's salary 20l. A short time since they increased the salary of their district surveyor, Mr. Frank Whitmore, from 200l. to 250l. a year.

Royal Archaeological Institute.—The Royal Archaeological Institute of Great Britain and Ireland will visit Bury St. Edmunds on the 29th inst.

New Process for Preserving Wood.—A new process for preserving wood by means of borax is announced. The wood, it is said, can be made impermeable to water by dissolving some shellac in the solution of borax.

Schools of Art Works.—We are glad to hear that the large metal flagon, designed, modelled, and chased by Mr. H. Archer, and for which the gold medal was awarded, has been bought by an eminent firm in Sheffield.

For completing fire brigade station, Renfrew-road, Lower Kennington-lane, for the Metropolitan Board of Works:—

Clark & Green	£871 0 0
Ebb	844 0 0
Till	835 0 0
Crookell	795 0 0
Waterson	765 0 0
Blackmore & Morley	755 0 0
Shurmer	684 0 0
Ball	637 0 0
Winship	615 0 0

For St. Anne's Church, Brompton, Mr. A. Porter, architect. Quantities supplied:—

Coleman	£3,275 0 0
Dove, Brothers	3,255 0 0
Hart	3,250 0 0
Merritt & Ashby	3,241 0 0
Myers & Son	3,159 0 0
Kelly, Brothers	3,027 0 0
Nixon	2,996 0 0
Weeb & Sons	2,974 0 0
Browne & Robinson	2,850 0 0

For rebuilding house, Westminster, for Mr. Parks. Mr. H. W. Badd, architect:—

Hoare & Postlethwaite	£267 0 0
King & Son	565 0 0
Richards	610 0 0
Foster	610 0 0

For the erection of twelve cottages, at New Swindon, for Mr. William Road. Mr. T. S. Lansdown, architect:—

Harrison & Son	£2,432 0 0
Bridges	2,291 0 0
Nightingale (too late)	2,268 0 0
Kimberly	2,069 0 0
Newcomb	1,978 0 0
Lovett	1,969 0 0
Dover	1,900 0 0
Haynes	1,890 0 0
Forsshaw (accepted)	1,878 0 0
Briggs	1,794 14 0
Barrett (withdrawn)	1,770 10 0
Wilshire (withdrawn)	1,767 7 11

For school and class room and teacher's residence, Bredgar, Kent. Mr. G. Buck, architect. Quantities supplied:—

Gannon	£983 15 0
Sollitt	879 0 0
Harris	379 0 0
Anson	965 0 0
Tidy	855 0 0
Clements	835 0 0
Seywell	828 0 0
Wallis & Clements	883 0 0
Seager & Marley	859 0 0
Epps (accepted)	747 10 0

For building and dwelling-house, at Woolton Bassett, for Mr. S. Hart. Mr. T. S. Lansdown, architect:—

Hickling	£2,450 0 0
Kimberly	2,286 0 0
Newcombe	2,205 0 0
Wheat	1,827 0 0
Dover	2,115 0 0
Jones	2,100 0 0
Drew	2,014 0 0
Barrett	1,919 2 4
Dyer (accepted)	1,920 0 0

For reseating, refronting, &c. Congregational Chapel, in Fish-street, Hull. Mr. S. Musgrave, architect:—

<i>Bricklayer's and Plasterer's Work.</i>	
Musgrave	£400 0 0
<i>Carpenter's and Joiner's Work.</i>	
Sissons	£680 0 0
<i>Mason's Work.</i>	
Sweeting	£35 0 0
<i>Plumber's Work.</i>	
Richardson	£21 0 0
<i>Gasfitter's Work.</i>	
Stones	£36 0 0
<i>Slater's Work.</i>	
Wilde & Co.	£9 16 0
<i>Painter's Work.</i>	
Chapman	£30 0 0

For erecting Sandown townhall, Isle of Wight. Mr. T. Dowell, architect:—

Cooker	£1,800 0 0
Nesman	1,469 0 0
Parson & Co.	1,424 0 0
Low	1,418 0 0
Young	1,359 0 0
Hayden	1,327 10 0
Urey	1,327 0 0
Flue	1,287 0 0
Jellicoe	1,286 0 0
Thomas (accepted)	1,278 0 0

For alterations and enlargement of the Horse and Doners, Broad-street-hill, Cannon-street, for Mr. T. Brinn. Drawings prepared by Mr. F. Arthur:—

<i>Builder's Work.</i>	
Messrs. Michell	£396 0 0
<i>Plumber's Work.</i>	
Messrs. Clements	—
<i>Painter's and Decorator's Work.</i>	
McCarty	—

For rebuilding house and premises, No. 13, Elizabeth-street, Fimlico. Mr. J. M. Dance:—

Wilson	£561 0 0
Leggett	523 10 0
Whitick (accepted)	526 0 0

TENDERS.

For erecting warehouse, Speck's-fields, Mile-and New Town, for Mr. A. Bishop. Mr. J. Tamer, architect:—

Marr	2,256 0 0
Ashby & Sons	1,992 0 0
Eaton & Chapman	1,949 0 0
Turner & Sons	1,859 0 0
Ashby & Horner (accepted)	1,850 0 0

The Builder.

VOL. XXVII.—No. 1379.

A Note from Northampton.

WOULD any of our readers, having exhausted nearer quarries of antiquarian and artistic interest, be seeking a fresh working, they will find it in Northampton, which is about two hours from London by express train, and a centre whence numerous excursions may be made, instructive, fruitful, and delightful. The county, as every one probably knows, is full of historical

associations, dating from the time when the Romans constructed a chain of forts along the banks of the river Nen to the Warwickshire Avon, and further, up to the year 1675, when a large part of Northampton was burnt down. Hamtune, in Saxon times, or North Hamptone, as it was called soon after the Normans came, witnessed many important events. The Danes burnt it. Great councils were held here by Henry I., Stephen, Henry II., and others. Here the barons swore allegiance to John, in the year 1199; and afterwards, when they had made the king sign Magna Charta, Northampton Castle, amongst other castles, was given up to them as security for the fulfilment of the engagement. The last Parliament assembled in Northampton ordered the poll-tax which led to Wat Tyler's rebellion. One of the great battles between the Roses was fought in the fields close to the town, when the king, Henry VI., was taken prisoner. Burleigh reminds us of Queen Elizabeth, Fotheringay of Mary Queen of Scots, Tresham's triangular Lodge at Rushton, of the Gunpowder Plot; and Naseby, of the irretrievable defeat of Charles I. by Fairfax and Cromwell. Earthworks are not wanting, and architectural remains from the time of the Anglo-Saxons to that of the Tudors are plentiful. The works left by the former in England, indeed, cannot be fully studied without taking into consideration those to be found in the neighbourhood of Northampton. The churches of Brixworth, Barton, Barnack, and Brigstock,—all beginning with B, by the way,—are most important items in the group of works which remain to us, unquestionably dating from before the Norman conquest, and concerning which we will speak again hereafter. Northampton itself has one of the only four Round Churches in England, resulting from the Crusades, St. Sepulchre's; also a very beautiful specimen of Anglo-Norman work, St. Peter's Church, and the best remaining Eleanor cross. Eleanor, the half-sister of the king of Castile, and who, it will be remembered, accompanied her husband—when Prince Edward—to the Holy Land, and saved his life by sucking the wound made by a poisoned weapon, died at Harby, or Hardely, in Nottinghamshire, on the 28th of November, 1290. Crosses were erected, as every one knows, at the places where the body rested on its way to London, and some Expende Rolle, which have been preserved, mention one at Lincoln, at Northampton, Stoney Stratford, Woburn, Dunstable, and St. Alban's, all mainly the work of John de Bello, or of Battle. There were others at Harby, Geddington, Waltham, Chesham, and Charing.

Of the fifteen believed to have been originally erected, only three,—those at Northampton, Geddington, and Waltham,—remain. The statues of Eleanor for the Northampton Cross, as well as for others, were by William de Hibernia, or Ireland, but seem to have been copied from the statue executed by Master William Torell, goldsmith, for the tomb in Westminster Abbey. The four statues still remaining in the Northampton Cross (all of the Queen) are graceful and dignified.

The Northampton Cross, about a mile from the town, placed on a flight of steps that give it admirable firmness of aspect, is beautifully situated on rising ground at the side of the road: backed with trees, and with a charming view of the town in the distance on one side, it forms a picture that remains on the memory. The structure is in a fair state of repair, with the exception of the terminal, or fourth stage, but having been restored on various occasions, once at a period when less care was paid to the retention of old forms than is now the case, doubt is felt as to the correctness of some of the portions. We are disposed to think, however, that no considerable departure from the original was made.

It is noticeable that under each statue, on four of the eight faces of the first stage, is sculptured a small projecting desk with an open book on it, for the most part defaced, but still obvious.

It is sometimes said that these large crosses form a class of structures wholly peculiar to England; but this is not correct. The Schöne Brunnen in the market-place of Nuremberg is a remarkably fine work of the same kind, larger and more elaborate than those dedicated to the *Chère Reine*,—the beloved of all England, as Walsingham calls her. If we remember rightly, however, this particular example is of somewhat later date.

The Round Church, St. Sepulchre's, was built by Simon de Liz, the second Earl of Northampton, when he returned from the first Crusade, and is very rude and ugly. Round lofty columns form the annular aisle within, and are connected by pointed arches, which may or may not be original. At present the building is in a miserable condition, without interest of any sort except its age and origin. The later church, added to the Round in the thirteenth century, as at the Temple Church, London, has been lately restored, and, we believe, added to. Stones of two colours, call them white and brown, were originally used here somewhat indiscriminately. In the restoration and rebuilding, the colours have been varied with more regularity, and the result is a specimen of what has been wickedly termed the Holy Zebra style, at present somewhat wanting in repose. Time, however, the great harmonizer, will gradually lessen its garishness. The new work includes a considerable amount of carving, some of it very well executed.

The angular buttresses of the later tower here project so considerably at the bottom, and decrease so regularly, as to continue the lines of the spire down to the ground with agreeable effect.

St. Peter's is a remarkably interesting specimen of the Norman style; the variety in the capitals of the columns inside, and the beauty of some of them, are very striking. Britton, in his well-known 5th volume,* a most valuable hook, gives a sheet of these capitals, besides internal and external views of the church. Miss Baker, the sister of the historian of the county, spent a long time in removing from these carvings successive coats of whitewash, which had disfigured and preserved them. The tower, the greater part of which is Norman, is especially noticeable for its angular buttresses, each formed of a cluster of three columns, so to speak, decreasing in

size, story by story, and for a highly enriched Norman discharging arch on the west front of it. The effect of these buttresses, now that the earth is removed from the bases, and they are seen in their whole height, is very fine. The variety and beauty of the interlacings and floral patterns that adorn the face of the curious arch, alluded to, are also charming. These two features make the tower unique, so far as we know. To the other churches in the town we can but briefly allude. All Saints', the principal, which stands at the intersection of main streets, is a strange hybrid, completed in the reign of Queen Anne, but is not without interesting associations. St. Giles's Church is an ancient building, of various periods, and includes a handsome Norman doorway in the west face of the tower.*

It is worth noting that the calculations of the probable duration of life at certain ages known as the Northampton table, and on which, though it is now thought of little value, the present system of Life Assurance was almost founded, were made by Dr. Price from the account of burials in this town during a period of forty-five years,—1735 to 1780.

Of the new town-hall here our readers have heard before now. It is founded in general arrangement on the same type as the Manchester Assize Courts are, with central tower, under which is formed the main approach, and includes a considerable amount of descriptive sculpture in relief, and a range of figures under canopies along the whole front below the parapet. These canopies, awkwardly stuck on, are not quite satisfactory: nevertheless, the building, as a whole, is creditable to all concerned, and a great ornament to the town. A museum of local antiquities and other objects of interest will be found in one of its apartments, and is said to be worth a visit: we did not see it. Several of the inhabitants have a taste for collecting.

At "The George," for example, an inn of very ancient repute, though the present building is not old, the owner, Mr. Higgins, has gathered a number of pleasant pictures and many interesting odds and ends in the shape of china and old prints. This hotel is a comfortable, good place, and may be recommended. The sitting-rooms look up the principal street, and from them, on a Saturday, when a weekly market is held, a scene of great animation and hustle is visible, especially in the evening, when every stall has its light. During the whole day people stream through the street, and the amount of business done is very considerable.

We will make a couple of little excursions,—one that shall include Brixworth Church and Althorp House, the seat of Earl Spencer, with its fine library and paintings; the other to take in Earl's Barton Church, which will give us something to say on Anglo-Saxon work generally, and Castle Ashby, the house of the Marquis of Northampton. The name of this domain recalls to us forcibly the late marquis, Spencer Joshua Alwyne, whose memory is dear to the older fellows of the Royal Society. His *conversations* held annually, as president of that society, at his house in Piccadilly, not many doors from Apeley House, were the most agreeable evenings of the kind that can be remembered. Genial, hustling, thoughtful, the president brought people together, made them known to each other, and gave to these gatherings memories that remain. It was at these meetings that the late Prince Consort first made acquaintance with English men of science. We can remember distinctly the first at which the Prince appeared, when, passing round a table whereon were a number of

* It was the last anniversary of her Majesty the Queen's accession, and which fell on a Sunday, when we visited St. Alban's church, and on this occasion the Rev. Mr. Wright, the curate as we were told, preached a sermon full of loyalty and good teaching, so eloquent, and withal so simple and unstrained, that we shall expect to hear of him soon in a wider sphere.

* "Architectural Antiquities."

things, minerals, models, and such like, he made a pertinent remark on every one of them, ending with an observation on a machine for cutting out circular timbers for ship-building, which forced the inventor to say, "Well, sir, I must admit that what your Royal Highness objects to is its weak point."

At the same time that Lord Northampton was holding these meetings, the late Lord Londesborough, not then arrived at that title, was giving similar *conversations*, as president of the British Archaeological Association, in the adjoining house, as he afterwards did in Carlton Gardens, and Earl de Grey, as president of the Institute of Architects, was doing the same in St. James's-square. To all these gatherings men of any prominence in their several walks, or likely to become so, and, in the case of the latter two, ladies also, could find their way. The *conversations* now given by the various societies, mostly in their own rooms, agreeable and useful as they are, do not supply the place of those of which we are speaking. This, however, is a digression.

Starting for Althorp, we pass on the road, just outside the town, Becket's Well. It was to a council held in Northampton that King Henry II. summoned the imperious archbishop to hear charges made against him of perjury and contumacy. On the 18th of October, 1164, Becket appeared in great state in the hall of the castle, so offending Henry by his appearance and bearing as to lead the king to retire into an inner apartment. When the Earl of Leicester began to read to the Archbishop the sentence of the Court, commencing with the usual form, "*Oyez ci le jugement rendu contre vous*," Becket interrupted him, denied their jurisdiction, and reformed his quarrel to the Pope. At night, he secretly left the town, and tradition says he knelt to pray at the well that in consequence now bears his name. This trial of Becket has been pointed to as the earliest State trial of which we have any account. When our bellman cries "O yes! O yes!" he thinks he is talking English, not that he is carrying on the old Norman form of bidding people listen to a legal decree,—*Oyez ci le jugement rendu*.

Although we have started, it is too late now to go on to Althorp. To use the often quoted lines of the poet Cowper, who lived at Olney, not far off,—

—"The setting sun concludes the day,
And all the fair enchantment fades away;
The George receives us to the peaceful bed,
'Till morn new beauties o'er the landscape spread."

When the sun rises we will rise too and finish our Note from Northampton.

THE PROPOSED TRADE-UNION LEGISLATION.

AMID all the complicated struggles that vex the social system of modern Europe may be traced the action of two distinct and antagonistic principles. The influence which they exert is not novel, for their existence is coeval with human nature; or, at all events, with human society. But amid the rapid, although bloodless, revolution which is the offspring of the nineteenth century many of the ancient watchwords of party have been laid aside. Much that was once assumed to be unquestionably true is now not only exploded, but forgotten. That religious horror of innovation which, two thousand years ago, was considered to be a distinct effect and sign of the fear of God, has retired to its remotest strongholds, if it has not altogether ceased to be an element of moral activity. The evil of change, as change, is no longer held by any person to be an undeniable truth. In the face of the immense strides made by science, and especially by the practical science of the chemist and of the mechanic, the most timid conservative confines his aspirations to the desire, that change shall be well considered, well aimed, and well ordered. To remain *in statu quo* is no longer the expectation of any person who thinks at all.

For the mind that seeks to look beyond the immediate requirements of the hour, and to dispel that haze of conventionalism in which the language and the ideas of party spirit involve the great questions of the day, it is instructive to be brought face to face with the great principles to which we refer, displayed in their naked simplicity. On all questions of organisation, from above or from below, of hierarchical order, or of democratic delegation, of the rights of capital, the rights of labour, and the rights of man, the widest differences of opinion may, and

no doubt do, honestly obtain. But the oneness of the absolute and irrecolvable hostility that underlies every other form or pretext of conflict is the division which subsists between those who endeavour, with more or less wisdom, to draw and bind together all classes and elements of society for the common good, and those who endeavour to set interest against interest, class against class, or man against man, for the sake of individual advantage. The former seek to build, the latter to pull down. The former are willing, in so far as it is in their power, faithfully to serve the State. The latter postpone any thought for national or for general advantage, to the supply of their own need, or the gratification of their own vanity.

If we bear this unquestionable distinction clearly in mind, we may find that much of the mist and vague doubt that beset some of the great social questions of the day will disappear. More especially may we hope that this will be the case when we approach one of the most vital of them all—the subject of the organisation of labour.

The organisation of labour has two aspects. We cannot divide it, as might at first be expected, into the natural and the artificial, for such a division is, in fact, nothing more than another mode of describing the presence or the absence of organisation. But any attempt at organisation has to deal with the two primary elements of demand and of supply, of the employers and the producers of labour, of the customer and the manufacturer, the mouth and the hand.

Now the radical, essential evil of the form which the trade-union organisation has assumed within the last half-century lies in the fact that the men who have given movement to the masses have not regarded this primary division of the subject. They have overlooked the essential relation between demand and supply, and they have not overlooked, but endeavoured to destroy, the intimate interdependence that exists between the two productive agencies themselves. They have committed the fatal error of placing labour in opposition to the natural element of labour, which we call capital. They have taught the workman to regard his interest as permanently distinct from that of his employer, instead of being so intimately connected with it as to be, in the long run, identical. They have sought to place the man who works to-day, in opposition to the man who, having worked yesterday, has something which his successor wants, and which, by a common effort, each may help the other to acquire or to increase. They have drawn a line between employer and employed, instead of between producer and consumer; and they have drawn a barbed line at this false limit, than that which ought to be interposed at the proper point of division.

To speak at the present day of the trade organisation of workmen as a crime, an evil, or a matter to be compulsorily put down, is as unphilosophical as it is unpractical. In even the worst abuses of the union organisation may be detected the instinctive effort of the proprietor of labour to do for himself that which ought to have been done for him. He may, and too often does, mistake the way. Not only so, but he may often be found seeking for what he wants in the very opposite direction from that of the path which he ought to take. But the blame of this ignorance is not exclusively his own. Neither is it by negative teaching that the case is to be met, or that the powerful, though blind, craving for organisation is to be either satisfied or suppressed.

Labour at the present day is in the very crisis of emancipation from a long and painful servitude. The moralist is beginning to regard the toil of man, whether it be with the brain or with the muscles, as a blessing, and not as a curse. Men of thought are awakening to the fact that the great requisite of progress is the adequate distribution of labour. The wealth, that is to say, the well-being of society, demands that every member of every class shall take his or her appropriate share in the great total of human duty, and shall win the reward attendant on the faithful discharge of the same. Luxurious idleness for one, grinding and sordid toil for another, is a state of things evil for all alike. All men who can be said to think at all are agreed on this point. The tendency which is so fearfully prevalent at the present day to make the rich man richer, and the poor man poorer, is felt by all persons who have any pretension to have a voice in the matter, to be one of the chief, if not the chief, menace that clouds the future. Thus, in every grade and rank of society we see indica-

tions of a tendency towards that happy state of things in which England may find each man ready and willing to do his duty.

The idea that the theoretic perfection of society implies the complete distribution of labour, intellectual and physical, among its members, so that idleness and oppression shall be equally dreaded and avoided, may be regarded as the key to the great problem of the social bond. As this thought becomes concrete in action, so will the occupants of any degree of the social scale be more harmoniously bound to those both above and below them. And it is a principle which, while never yet distinctly put forward as the cry of a party or the symbol of a school, has got a far more energetic life, and a far wider influence, than we may at first be inclined to imagine.

The success that attends the exertions of any individual labourer, or of any class of labourers, in the great social hive, will be found to depend on the degree in which those exertions tend towards the realisation of this great object—the provident and efficient distribution of labour. As in every successful industry the distribution of the parts tends to the perfection of the whole, so is it in the great master industry of social life. And it is for this reason that all purely selfish attempts at organisation are mischievous. They are short-sighted in their aim; and, therefore, false in their results. They endeavour to give a factitious independence to a part, the welfare of which is impossible without the welfare of the whole.

No instance of the fatal results attendant on a neglect of this principle of social solidarity is more striking than that which is found in the case where labour is arrayed against capital. The true object of every special industry is the attainment of the industrial results by means of the *minimum* exertion of labour. For it is not labour, alone and by itself, that is a blessing, but productive labour. Thus, the punishment of the treadmill is said to be most grievous to those doomed to undergo it, from the sense of the absolute waste of time and of power, and the sheer inutilty of the toil. Let the prison labour fill reservoirs, or grind corn, or produce any tangible, useful, known result, and the toil of the prisoner will be lightened of its bitterest moral element. Then, the more productive each item of labour is made, the more room is left for further application. Waste of toil is thus as great a social evil as waste of time, or waste of the products of toil.

In this diminution of unnecessary labour the great part is played by what is unfortunately called capital. The relation between the capitalist and the craftsman is of the same nature as that which exists between the workman and his tools. The capitalist, normally considered, is a great tool-maker, seller, or warehouseman. He has provided, at the cost of past labour, the shelter of workshops and of manufactories, the steam-engines that drive, the pumps that clear the workings, the cupolas and steam-bleats that smelt the ore, the shafts that reach the mineral, the winding-gear that brings it to the surface. All this is the contribution of capital to its partnership with labour, and evil it is for all those who attempt to divide what God hath thus joined.

So far, then, as the general organisation of the trade-unions of this country tends to draw a line between the capitalist and the labourer, to set increase of wages against rate of profit, and to make the workman regard his interest as permanently apart from, or even opposed to, that of the master, the influence of these associations can only be regarded as hostile to the best interests of society.

But in so far as they tend to impress on the mind of the workman that he is a member of an order of society as indispensable to the common welfare as any other order, and one, moreover, that is clothed with its own most ancient dignity, that of productive energy and perseverance, the trade organisations may be regarded as the product of the instinctive efforts of those who live by labour to rise to the height of their duty and of their task. And even when we regard those features which all wise men must lament and all good men must blame, let us remember how far those above, too, have been negligent or unwise. Have the educated so bestirred themselves to help the workman, that they have the right to condemn his uneducated but honest effort to help to raise or to instruct himself?

It is a very hopeful sign for the future of our manufacturing industry to see, as we have done on a recent occasion, the chair of a public meet-

ing held by, or in behalf of trade-unions, taken by a master manufacturer. The sentiments expressed by Mr. Morley on the occasion to which we refer, merit the serious and grateful attention of every operative. It will be a public benefit to convince the great mass of working men that their employers, so far from being their enemies, are their best and truest friends. And nothing is more likely to tend to this desirable result than the proof which is afforded by meetings of this description, that the master manufacturers by no means desire the degradation of the operative class. They do not wish their work-people to remain a mere disorganised mob. What they do desire is, that the organisation should be based on natural principles, and directed to a practical end. In a word, it is to co-operative, not to mutually defiant, organisation, that employer as well as employed must look, if they wish to retain, or rather to regain, our command of the markets of the world, or even to keep the wolf from the door.

The more intelligent, the more able, the more comfortable the workman, the better for the employer. That which the latter has to dread is, not education, but imperfect and erroneous education; not elevation in the social scale, but inflation with a false notion of self-importance; not combination, but conspiracy. The educated operative is the best aid to the educated master. It is the half-educated man, whether employing or employed, who is the source of disturbance. The man who has enough intelligence to understand how the exertions of all conduce to the welfare of each, has attained to that position in the moral world that we desire to see generally occupied. The man who has learned just enough to see the evils of the present state of society, without justly appreciating the causes, is apt to look to violence as the remedy. And thus has that element of brute force been appealed to, which disturbs and complicates the social relations, which embitters class against class, and which tends to chase industry from its great centres, and comfort and content from our shores.

In looking at those steps which tend to draw together master and workman as partners and fellow-labourers, we wish to call attention to some of those institutions already existing among us, the full development of which is seriously to be desired. Perhaps the first of these beneficent fruits of incipient organisation is the sick fund. In this, as far as our own experience extends, the management has generally been retained, and that with some degree of jealousy, in the hands of the operatives. The one great point to regard is the safe-keeping, and the just application, of the subscriptions. The danger of waste, or of misapplication, is wont to increase with increasing prosperity. As the bulk of the money is collected in the form of a weekly deduction from wages, nothing can be more proper than that the distribution should be effected by the hands that earn, and that collect, the supply. But it is no less a duty incumbent on the employers of labour to contribute to this fund. Directly or indirectly, they must do so to some extent; and it is in all respects most desirable that the contribution of the employer should take a distinct monetary form. Nor is it so much for his interest, as for that of the ultimate objects of the fund, that a voice as to the care and proper application of the fund should be given to the capitalist in virtue of his appearance as a subscriber.

Next to the sick fund in the estimation of the sick—prime in importance in the view of the foregoing—is the industrial school. In this the initiation and guidance belong to the masters or employers, no less naturally than do those of the sick fund to the subscribers. But none the less is the concurrence of the operations of the utmost importance. The hope and promise of the future, the greater or less delay which must interpose before the proper dignity of labour is assumed, lie within the province of the school-master. No association of workmen, whether among themselves or in relation to their employers, has within itself the salt of durable success, if the schools for the young are neglected. As we sow, in this respect, shall we surely reap. The importance of the conveyance of this conviction to the minds of the operative classes, is of the first order.

Following the school is the Mechanics' Institute. All forms of adult education, improvement, and intelligent amusement, come under this head. Libraries, lectures, lessons in music, cottage flower-shows,—all those modes of employing the brief leisure of the workman, which afford a relief from the constant pressure of toil

on the one hand, and from the fatal allurements of the public-house on the other, come under this head. Amusement, within due limits, is the right of the workman. Within or without such limits, he is sure to crave for it, and pretty sure to have it. The care of his friends, whether they wear broad-cloth or fustian, should be to supply that quality of amusement which is suitable both to his taste and to his welfare. And, so far as this can be done by intellectual amusement,—by that which, while play to the well-taught mind, will fill the un instructed with wonder, as in the case of some of the marvels of demonstrative chemistry,—the gain is immense. No source of mischief is more active than *ennui*; and this intolerable scourge is by no means confined to the gentle or to the tenderly nurtured. There is the *ennui* of ignorant idleness; and no social evil is at times more to be dreaded. The cure for this disease is to be found in that class of occupations which may be grouped together under the general name of the Mechanics' Institute and Club.

An industrial community,—whether associated together under a single employer, as in the case of villages that cluster around some important manufactory, or whether formed of a congeries of such distinct groups, as in the case of our larger manufacturing towns,—in which masters and work-folk are bound together in a common interest by means of the sick fund, the school, and the mechanics' institute, is the best example of a true trade-union. But we have yet, in some cases, advanced a step or two further in the emancipation of labour, and at each such step we attain further advantages for each and for all.

The step to which we now refer is that which is due to co-operation. Viewed in its simplest form, co-operation is the necessary complement to the division of labour. Looked at as a question of policies proper, it is a means of enlisting human nature on the side of industry instead of on the side of idleness. It is a method by which the selfish instincts are made to tend to the welfare of society. We are far from wishing to suggest that every effort to apply the principle is economically wise, or that amateur associations can with nicotinate advantage replace the properly-trained tradesman, unless under exceptional circumstances.

But there are simple and effective methods by which the operative classes can be economically interested in that saving which they have the means of readily effecting. The stimulus to the means of avoiding waste, and to the exertion, at every point, of the utmost care and the most untiring skill, that is afforded by the existence of a pecuniary interest, however slight, in the results of the manufacture, it is not easy to exaggerate. In some instances the work-people have had their wages augmented by a percentage dependent on the profit of the work. They are thus associated in a direct partnership with the capitalist. Wages, and interest on capital, together with a proper allowance for depreciation of plant and machinery, being first paid, and all expenses, direct or contingent, allowed for, the resulting net profit is divided, in an ascertained ratio, between the head and the hands. The satisfactory result of this intimate alliance between the master and the man is said to be as striking as might be anticipated to be the case.

Another method in which the influence of the spirit of association tends to bind class to class is to be found displayed in the operation of building societies. The advantage of a wise development of this system is even greater than that of directly interesting the workman in the product of his toil. For, by the prudent capitalisation of his savings, by means of monthly or weekly subscriptions to the building fund, the workman becomes more closely linked, not only to his fellow-countrymen, but to his native land. He becomes, to an adequate extent, a landholder. The great question of the division, or even the opposition, between the landed and the industrial interests, thus receives a solution that is advantageous to us all; for, while a minutely-divided peasant proprietary is hostile to the due cultivation of land, and thus to the productive power of the country, an industrious manufacturing proprietary, whose savings, whether in the form of commercial returns or of domestic comfort, become tangibly augmented from year to year, form an invaluable element of the national wealth.

We trust that the attention which is directed to the Bill lately before the House of Commons will not be limited to the discussion of its clauses; but that all those who are interested in the welfare

of the operative classes will turn their thoughts to those tangible results of a real trade-union, which are within the reach of provident industry, and which are so important to the national welfare.

NORMAN HYDRAULIC ENGINEERING AT CANTERBURY.*

THE Kent Archaeological Society has added to the "Archæologia Cantiana" a careful and picturesque paper, written by Professor Willis, "On the Architectural History of the Conventual Buildings of the great Monastery of Christ Church, Canterbury," the outline of which was read by him to the Archaeological Institute in 1847, and subsequently to the Society of Antiquaries. The subject is one capable of much elaboration, and this has been bestowed upon it in the years that have elapsed since it was first undertaken; and several plans, and a large number of sketches taken by the Professor's skilful pencil, conduce highly to the interest of the mode of treatment. We would draw attention, however, chiefly to two Norman drawings showing the system of waterworks and drainage, reproduced in all their terse, spirited quaintness. One of them has not been published before; the other, mistaken for an architectural plan of the monastic buildings, was engraved in the "Vestisæ Monumenta," but not with the minute fidelity of the present specimen, for the contractions of the inscriptions were expanded, and the aspects of the names, which in the original follow the elevations of the buildings, were made uniform, so that they could be read without turning the plan about; and this engraving has been reduced for other works without collation with the original: hence these liberties have been perpetuated. Professor Willis has, however, now traced line for line, reserving all explanations of contractions for his letter-press description. The original drawings are preserved in the library of Trinity College, Cambridge, fastened, by stitching and paste in the one instance, and by paste only in the other, into a large folio illuminated MS. volume, containing the Psalter in Latin, Norman French, and Saxon, with other sacred writings, generally known as "Eadwin's Psalter." Two hundred and seventy-three pages of this folio are continuous, when there occurs a gap, as though some leaves had been torn out; and it is in this vacancy that the larger of the two Norman drawings is stitched through its middle crease into the binding bands of the book. Following the drawing is a portrait of Eadwin, and then two more leaves of the original volume, on which is written the latter part of the Nicene Creed, the missing portion, clearly, having been on one of the leaves torn out; and then, pasted to the vellum guard that is the return of the final page, is the smaller second drawing.

Professor Willis takes them both to be the work of the engineer Wibert, or of his assistants; and considers that, though incidentally they figure the convent buildings, they were made for the purpose of illustrating and explaining, for the information of those in charge of it, and of those who might come after them, the system of waterworks and drains they laid down. The larger drawing, he thinks, bears evidence on the face of it of having been made by a mechanist anxious to explain his contrivances, for which purpose he has delineated the monastic buildings and named them, so as to show the exact course of the pipes from one to the other, and the positions of the cisterns and standpipes in reference to them; and the smaller drawing has the appearance of being a disentanglement of the hydraulic system from the architectural plan, or a condensation, by the same hand, of the same information, so compressed, with a view only of making the hydraulic arrangements clear, that no other buildings than those actually supplied with water are indicated, and these only just sufficiently for identification, and with no inscriptions. Before noticing the Professor's explanation of the system thus illustrated, we should mention that these bird's-eye views of the Norman draughtsman are the earliest Mediæval example of this kind of perspective known. Instead of placing his buildings on the plan as though seen from one point of view up in the air, as we now do, he made a different

* The Architectural History of the Conventual Buildings of the Monastery of Christ Church in Canterbury, considered in relation to the Monastic Life and Rules, and drawn up from personal Surveys and original Documentary Research, by the Rev. Robert Willis, M.A., F.R.S. London: Printed for the Kent Archaeological Society, by Taylor & Co., Little Queen-street. 1869.

point of view for each building, so as to keep his elevations on the lines belonging to them on his plan. Thus angles and projections are not of much account in his eyes, and he places all gable-ends upon the same *hass* lines as the elevations.

When the drawings are spread out before us they show a number of stiff tiny buildings, most of which are roofed with scaly tiles, and all of which are irregularly strung together, though scattered over the sheets, by the thick line that represents the water-pipes from one to another. Here and there, too, there are circles which represent the various tanks. In the larger drawing, which is upon two sheets like the original, and where, as we have said, there are more buildings depicted than on the smaller, we can see the semicircular-headed arcades of the cloisters, and the rosette-formed basins of the lavatories in them; and that some of the largest roofs are ribbed as though covered with lead; and we can see the gutters intended to carry away the rain waters encompassing some of the courts and traversing others. Now and then the gables are surmounted with crosses, but more frequently with balls, and when there is neither of these, fantastic animals or birds either crouch or are perched upon them. The herbarium is quaintly distinguished by rows of plants as much like crooked pins as anything else; and the fish-pond by an enclosed and scalloped space, in the centre of which two fishes' heads are projecting in opposite directions from a circle. On some of the doors and posts there are indications of handsome iron-work. Everywhere the windows are long, deep black, single lights. Sometimes over the roof tops, sometimes on the façades and on the ground are written in Latin, very neatly, with many contractions, the following explanations, which we quote from the Professor's table of translations:—

Cistern in the Ladies' Cemetery.

Here the water flows into the fish-pond from the cistern in the outer or Ladies' Cemetery.

Here the water passes into the aisle of the infirmary hall.

And here comes out of that aisle and enters the fish-pond.

Here it quits the fish-pond, and passes to the Prior's cistern.

Cemetery-gate near the chapel.

Tub from which the water flows under the necessarium of the infirmary.

Kitchen of the infirmary.

Vestibule or treasury.

Door of the crypt.

Passage which leads from the great cloister to the infirmary.

Stand-pipe into which, when the waters of the source fail, water raised from the well may be poured, and it will be distributed to all the offices.

The system may be described as one of tanks or receptacles, supplied by a feed-pipe, and furnished with a waste-pipe, and from which the water was drawn by orifices near or at the bottom. After leaving the source, which is represented as a circular conduit-house, the pipe passed through a cornfield, vineyard, and orchard, all conventionally delineated, to five oblong settling tanks, one after another. The length of piping then crosses the city wall, close to one of the towers of the city wall, and, entering the precincts of the monastery, passes from tank to tank, each of which is at a lower elevation than the last. Water is distributed to some points, also, by short vertical pipes soldered to the main pipes underground; and from the occurrence of the representation of what appears to be a spigot or cock, we may conclude that the end intended for the delivery of the water was furnished with some such contrivance. We quote the description of the service by Professor Willis:—

"The whole of the water is poured into the first tank by the main-pipe from the springs, from which tank it issues through a waste-pipe, leaving in it a sufficient supply. This first waste-pipe descending to the ground is carried below the surface to the second tank, into which it rises, acting as its feed-pipe to that tank, and having its upper end at the same level as its other branch. Similarly, a second waste-pipe, parallel to the feed-pipe, but shorter, descends to the ground, and rises in the next tank of the series to act as its feed-pipe, and so on. The last tank of the series pours its waste water into the sewers of the convent. Thus each tank in the series is connected to the next by a horizontal pipe buried underground, with an upright branch at each end, one of which is its own waste-pipe, and the other end the feed-pipe of the next tank."

Before this system of distribution was adopted the water was raised from wells, which were not then covered over, but retained as additional sources of supply should this one go wrong. A column with a large capital, which served as a funnel, was placed near the well of the infirmary cloister upon a pipe which communicated with all the offices, and supplied them by stand-pipes; and, as we have read among the inscriptions, when the ordinary supply was deficient water could be obtained from the well, and poured down the column, whence it would run from any of the cocks of the stand-pipes communicating with it. And a second well in the outer cemetery was also retained side by side with a new cistern, which is depicted as furnished with a lever handle raised on a forked pole, and having a chain and bucket at one end and a balancing stone at the other. The new cistern by its side was not provided with a tap, but with a pedestal, on which the town's-people could stand and dip their pails into it, probably to prevent careless persons from leaving the tap running and the water wasting. A waste-pipe conveyed all superfluous water to the great fish-pond.

There were three layers, or lavatories, to be supplied. On entering the monastery the pipe made straight through the prior's gateway and under the infirmary kitchen to the first of these, in the infirmary cloister, which was used by the monks for their ablutions when they first issued from their dormitories in the morning. A second pipe proceeded westwards to the next layer, in front of the refectory, used for ablutions before meals; and here the small tank which received the water was elevated on a pillar, apparently to give it a sufficient head to enable it to pass to the other receptacles, the first of which was the third layer, in front of the infirmary. These layers appear to have been all furnished with taps, from which water could be carried away in pails; but they were, nevertheless, pyramidal roofed structures of a highly ornamental character. That near the refectory had a large low circular octafold basin, from the centre of which arose a pillar or stem carrying a smaller basin, the margin of which was formed of semicircles placed alternately with angular projections, which last served as lips from which the water poured down into the lower basin. Each foil of this lower basin appears to have been provided with one of the contrivances we have mentioned as being likely to mean a stop-cock or tap, so that each monk could wash at a separate spot without deluging the whole of the water. The Professor acutely notices that the draughtsman omitted to show what became of the waste water that flowed from the upper to the lower basin, and again from the taps when in use, and concludes there must have been a circular tank on the pavement to receive it.

The provision for carrying off the rain-water from the south side of the church and the roofs of the great cloister consisted of an open gutter round the outer border of the cloister garth, and a channel which crossed the garth from west to east. These channels conveyed the waters to a small cistern underground near a passage from the principal cloisters to those of the infirmary, and thence they were carried underground till they flowed into a channel proceeding from the prior's water-tub, and were conveyed across the Green-court into the town ditch. This plan was still in use in the fifteenth century, as may be seen in the list of the works executed in Prior Chillenden's time, which sets forth that he repaired and amended the gutter in question; and again in that which relates the works of Prior Goldston, 1495-1517, who constructed rain channels on the south and east sides of the church, and joined them to that which had been amended by Chillenden, as aforesaid. That they were not altogether sufficient we may conclude from the statement made by Prior Goldston, that before the construction of his subterranean aqueduct outside the church the rain-waters "were wont to inundate the whole crypt of the Virgin and the adjacent chapels, and greatly hinder the access of the pilgrims to the glorious Virgin."

The Norman engineers made an arrangement for flushing or purging the pipes. At the angle of every pipe where it turned vertically to feed a tank, they placed a short horizontal branch leading to the nearest drain gutter, and furnished with a stop-cock. These branches are marked on the drawing *Purgatorium*, and can have been intended for no other purpose than to purge the pipes from sediment; and they cleaned the fosse of the great *necessarium* by conducting their great sewer through it.

This Norman scheme of distribution of water and drainage was useless after the Reformation. The buildings in which were the principal layers and stand-pipes were taken down, and water was required in new positions, especially in the prebendal houses. Hence a new conduit-house was built in the centre of the Green-court, and from a large cistern on its upper floor the new requirements were met. This new house is shown on an unpublished plan, entitled "A Description of y^e Vanils, Pipes, Sestones, and Cutters belonging to the Church, as is herein shewed. Drane out and finished by James Wilkes, Waterman to y^e Deane and Chapter of Christ's Church, Canterbury, October the 27th, anno 1668."

The quaint Norman drawings bring to mind the care and skill the engineers displayed in their works; the corn-fields, vineyards, and orchards amidst which they worked; the monastic circle for whose needs they provided; and the constant going and coming of guests and pilgrims that made up so much of life in those old days. The new conduit-house that displaced their lavatories, and which a local antiquary has handed down, was "square and like a country pigeon-house," had no long reign, and was itself displaced at the beginning of the last century.

The archæology of engineering has made a gain in the hands of Professor Willis.

COVERING IN THE BRISTOL EXCHANGE.

The determination of the town council of Bristol, by a very narrow majority, to cover the quadrangle of the Exchange with a roof of iron and glass, according to a design furnished by Mr. Turner, of Dublin, has caused some excitement in that city, and led to numerous objections. We printed a letter on the subject in our last, and the Bristol papers have since published various other communications and editorial comments. It is very satisfactory to find so much interest manifested on such a subject. It was the privilege of the conductor of this journal, some years ago, by a report made professionally, to enforce the claims to admiration possessed by the Exchange, one of the best designs of Wood, of Bath; to prevent a proposed renewal of paint and whitewash on the stonework of it, and to lead to its being brought back to its original condition. We feel on that and other grounds more than ordinarily anxious to prevent any act that would tend to injure this building as an architectural monument, and we join urgently with those who are requesting the town-council to obtain the best possible advice before taking such a step as that contemplated. We do not say, by any means, that the quadrangle should not be covered in: there may be good reasons for taking such a step; but this may be done well or done badly, and the council will incur serious responsibility if they do not adopt the necessary precautions to insure the former. We have not seen the design, but the accounts of it that have reached us are far from satisfactory. We should be sorry to damage any individual, especially a manufacturer so creditably known as Mr. Turner; but the profession of this gentleman seems to us to have been a little misunderstood by those members of the council who put forward the fact that Mr. Turner erected the great Palm-house at Kew and the Botanic Winter Garden in the Regent's Park as a reason for accepting his design for covering in their Exchange. Both these works were designed by architects,—Mr. Smirke in one case, Mr. Decimus Burton in the other. We repeat that we have no wish to condemn the scheme; but we do urge most strenuously, in the interests of architecture and of the city of Bristol, that the town council should obtain the best possible artistic advice before they proceed to carry it out.

Opening of New Sunday and Day Schools at Farsley.—New Sunday and day schools have been erected at Farsley, near Leeds, by the friends of the United Methodist Free Church. The building is entirely of stone. The architects are Messrs. C. S. & A. J. Nelson, of Leeds. It is of two stories, the lower story being adapted as an infant school and a day school, being divided with a mid-partition, while the upper story, which is a fine room about 75 ft. in length and 36 ft. in width, will be exclusively used as a Sunday school. For this purpose four separate class-rooms for senior scholars will be available. It is estimated that the total cost when finished and furnished will be about 2,500*l.*

THE SOLWAY FRITH CROSSED BY A RAILWAY.

The public openings of new railways remarkable for important engineering works have become comparatively rare occurrences. The successful construction of a highway across a tidal estuary would be, at any time in the history of railway enterprises, specially worthy of note. This engineering feat has now been completely accomplished in connexion with the Solway Junction Railway, under the direction of Mr. James Brunles, the engineer who, about ten years since, conducted to a successful issue the works of the Ulverston and Lancaster line, which crosses the tidal estuaries of the rivers Kent and Lever, and the treacherous sands at the head of Morcombe bay. The works in the Solway Frith are in some respects of a similar character to those near Ulverston; the chief point of difference is probably in the "stair" which had to be pierced and the consequently altered mode of dealing with it. In Morcombe bay nothing but sand was met with in borings of 70 ft., and the cast-iron piles in the works there have disc bottoms. In the Solway a variable depth of sand overlies rough boulder gravel, and the piles of the viaduct there have chilled cast points.

The Solway Junction Railway, of about 22 miles in length, commences, at its southern end, at the Brayton Station on the Maryport and Carlisle line, and proceeds in a northerly direction to Kirtlebridge, about 17 miles north of Carlisle, where it joins the Caledonian line. It crosses the Solway Frith from Bowness point, just below Port Carlisle, to the Port of Annan, on the north, or Scotch side. The line is about 8 miles below the head of the Frith, or the point near Greta reached by the tide.

The distance between shores is about 2 miles wide at high water, and the hydraulic engineering works include two banks and an open iron viaduct. The south bank is 440 yards long, the Scotch bank, 154 yards long; they are each about 25 ft. high at the outer or waterway ends. The banks have cores of clay to their bases, and the slopes, 2 to 1, are puddled with clay about 1 ft. deep, upon which pitching stones are laid of from 15 in. to 18 in. deep.

The open viaduct, through which the tidal waters pass, is 1,960 yards long, divided into 30 ft. spans. The supporting piles are 12 in. diameter, 3/4 in. thick, and are cast in 9 ft. lengths, connected at each of the turned flange joints by eight 1 in. bolts. The rails are 34 ft. above the bed of the Solway. The mean rise of the tide is 20 ft. The girders are of wrought-iron, and 2 ft. 6 in. deep, with a 1/2 in. camber upon the length of each; they have expansion joints over the piers. The platform is formed of Mallet's buckle plates, riveted to the girders longitudinally, and to plates transversely. The longitudinals are stayed by ties and transoms 10 ft. apart. Every 16th range of the cast-iron columns is doubled. The piles were driven by Lisson & White's steam pile-driver; 12 to 15 blows per minute could be got from a 25 cwt. monkey, with a 5 ft. drop. The driving was tidal work, and usually required two tides for each pile. They are driven to 17 ft. and 18 ft.

No scaffolding was used for the work, which was for the greater part executed from barges specially constructed for the purpose. The upper portion of the work was finished outwards from the shores, and the successive girders swung into position by steam cranes. The weight of the cast-iron used is about 2,900 tons, and of wrought-iron 1,807 tons. The cost of the viaduct and sea embankment has been 100,000.

The only other remarkable work was the crossing of Bowness Moas, on the Camberland side, which has, in some places, a depth of 50 ft. of unstable sponge. By draining the portion of the Moss over which the line is carried was so much consolidated as to sink about 5 ft. A good road was obtained by long sleepers laid upon faggots, of which about 100,000 were used.

The chief traffic likely to be conducted upon the new line will be the conveyance of its mercantile iron ore from the Cumberland and Furness districts to the Scotch ironworks. Above 200,000 tons of mercantile ore are sent annually from these districts to Scotland, including above 30,000 tons carried by sea; a portion of which, at least, may be expected to be carried over the new line, to the avoidance and relief of the crowded station at Carlisle. The route by Solway Junction and Caledonian to Coatbridge—the centre of the Scottish iron trade—is much shorter than any other, as it is

also to numerous ironworks nearly north of Dumfries. An agreement has just been confirmed by Parliament under which the Caledonian Company will work the new line at 45 per cent. of the gross earnings, diminishing to 42 1/2 per cent. in three years, and to 40 per cent. in other three. The Solway Company to maintain the permanent way of their line. The North British and the Glasgow and South-Western Companies sought running powers over the Solway line from the committee of the House of Lords, but these powers were not granted. The Caledonian Company subscribed 60,000, to the Solway Company, but the other two companies are not contributors.

Colonel Yolland, from the Board of Trade, has been over the line, which will be opened immediately for traffic.

The works were laid out by Mr. James Brunles, C.E., engineer-in-chief, and executed, under the inspection of Mr. Alex. McKerron, resident engineer, to the entire satisfaction of the board of directors, by Messrs. Waring, Brothers, & Eckersley, contractors.

PARK-LANE IMPROVEMENT.

FOR several past sessions of Parliament, continuously, the Metropolitan Board of Works has promoted a bill for the urgently needed improvement of widening Park-lane at the Piccadilly end. The unconquerable opponent of the measure has always been His Royal Highness the Duke of Cambridge, the acquisition of whose mansion was thought indispensable to the improvement. Last session a special committee was appointed, and reported specially upon the subject to the House of Commons. His Royal Highness being determined not to part with his house if he had power to retain it, led the committee, if he may be supposed, to make the recommendation that the widening should be in Hamilton-place instead of at the narrow end of Park-lane, and that Hamilton-place should become a continuation of the main portion of Park-lane. This recommendation has been adopted, and the long-desired improvement will now be carried into effect, without touching the residence of the Duke of Cambridge. The most important properties scheduled in the Book of Reference as necessary for the improvement are, the mansion of Sir Edward Kerrison, at the junction of Hamilton-place with Piccadilly; the mansion in Hamilton-place of the Hon. Butler Johnstone, and portions of pleasure-gardens belonging to the Lord Chief Justice, Sir Alexander Cockburn, Earl Vane, and others. The remainder of the property scheduled consists of coach-houses, yards, and stables. The improvement will consist of the widening of Hamilton-place to its junction with Park-lane,—a distance of 400 ft.,—to the full width of the latter thoroughfare.

SEWER GAS AND VENTILATION.

At a recent meeting of the Social Science Association, Dr. Alfred Carpenter read a paper on the "Influence of Sewer Gas on the Public Health; and the Theory of Ventilation as required in Sewers."

After demonstrating the evil power of sewer gas and its results, he said this is neither the time nor place in which to detail cases which have come under my own observation; but I may be allowed to adduce the fact that, previously to the introduction of the plan now adopted in my own town, occasional outbreaks of fever used to puzzle us, notwithstanding the insertion of ventilating pipes, and the occasional use of the rain-water pipes for the same purpose.

On inquiry, and continual research, I found that these cases always occurred after dry weather, and shortly after a succeeding heavy rainfall;—that the cases occurred near to the dead ends of long lines of pipe sewers, that an extension of those sewers removed the fever higher up, and relieved the houses formerly affected;—that the fatal cases most often occurred in houses at the very end of a sewer, and farthest from the outfall;—that the inmates of those houses had been probably breathing the sewer gas for a long period in a less concentrated form, before its final outfall, and before the system became sufficiently charged to enable the change to arise in the blood, the total of which is called "typhoid fever." If the total is not reached, the disturbance may take on one of the disorders I have

already mentioned, or even merely produce a want of power. Chemists tell us what small amounts of material help to entirely change the form of bodies and alter their constituent particles; who shall say how much the ordinary chemical actions which take place in the nutrition or purification of the body may be interfered with by such gases? It seems certain that one effect is the decrease of red blood-corpuscles, but how brought about one is only able to conjecture.

When a smell is perceived at a particular spot, or in a particular house, orders are generally given to stop the place of issue, by trapping the offending opening, with the beneficial result of removing the smell, and staying the progress of disease in that particular house or place; but no means are taken to prevent its influence being felt elsewhere. The mischief is simply transferred in a selfish kind of way, and the public suffer for it. I have had much experience of this kind of thing in our district, and soon saw that trapping was not a proper remedy, unless it was accompanied by the provision of another exit. This has been clearly made out upon lines of ordinary sewers, but it has been even more manifest in detached sewers; that is, sewers not connected with any general system. The effects of trapping were very marked last year at the Warehousemen and Clerks' Schools, on Russell Hill. These schools accommodate some 160 children; they were opened nearly three years ago, and at first the children enjoyed unusually good health, but in the autumn of 1867 typhoid fever made its appearance. It appears that a smell, slight at first, but afterwards very intense, had been perceived in the laundry. The place of exit was trapped, and the smell prevented at that place; but as no other place of exit was provided for the sewer gas until it reached the interior of the building, it was conveyed from the cesspool by the pipe sewers into the lower part of the building, and then into the classrooms. Now, in cold, damp weather they do not so freely ventilate such buildings as much as might be. The rooms being warmed by hot-water pipes, have no open chimneys to produce draughts. The hot summer was followed by heavy rains, fires had not been commenced, and the rooms were not chilled by having the windows opened. The children would get up in the morning and go down to work in their classrooms before breakfast, and inhale the sewer gas when they were least able to resist its influence, and when it was most concentrated, viz., on cold, damp mornings, after heavy and warm rains had stirred up the deposits in the sewers and cesspools. The result of this action was that nearly 40 per cent. of the children suffered from mild typhoid fever.

The same result happened this spring at the Female Orphan Asylum at Beddington. No provision was made for the ventilation of the sewers in connexion with the building, but an accidental opening—accidental at least as far as ventilation was concerned—existed in the plug which acted as an overflow-pipe in the latrines. The latrines were in close communication with the classrooms, into which the children used to go in the early mornings. The classrooms were not provided with any efficient and certain means of ventilation like the Russell Hill Schools; they are warmed by hot-water pipes instead of open fireplaces. Foul air once in the room could not easily get out, and in a short time about 30 per cent. of the children suffered from the effects of sewer gas.

Similar results have happened in other schools, both public and private, within my own observation, but I need not multiply instances. I may, however, give one more illustration, that afforded by the book kept by our local Board for the registration of stoppages in sewers. Our engineer, Mr. Latham, says that before the introduction of the plan now adopted by our local Board, stoppage in the sewer was always coincident, in point of time, with illness in the houses affected by the stoppage. I have at times been able to draw attention to a defective sewer, simply from observing on that line of sewer rather more than the ordinary amount of illness of a slight kind, and it has always been found that that sewer had a defective ventilation, and by remedying that defect the illness on that line of sewer decreased.

The frequent recurrence of these cases led me to consult all the publications upon the subject that I could find, being convinced that a remedy existed. I found special assistance from the reports of Dr. Letheby and Mr. Hayward, which were published by the City Commission of

Sewers in 1858. But while they acknowledged the sufficiency of cause, they did not point out an effective or practical remedy; meanwhile openings were multiplied, as strongly recommended by Mr. Rawlinson, and eventually the Croydon Local Board determined, three years ago, to adopt the principle of opening the extremity of every sewer, and of every branch or house drain in connexion with the sewer, and make every house ventilate the house drain, whilst the Local Board had openings made into the sewers at 100 yards' interval, so as to allow of a constant and continuous current of air. By this means the effects of sewer gas have been entirely obviated, and the consequences removed in those portions of our district to which the law is made to apply in a most marked and decisive manner.

The early sanitarians reasoned in favour of small sewers, partly on the idea that they would keep perfectly clean, and that no decomposition could take place, and therefore that no gas products would be formed. Theory and practice do not, however, go together; sewers are never constructed in ordinary towns as the early sanitarians intended that they should be; they do not, as a rule, flush clean; they are often badly laid, and as a consequence deposit takes place in them, and decomposition, with the liberation of sewer gas, results. Now this sewer gas makes its way more easily out of the large sewers of London, with the many open gratings existing therein, so as to some extent to obviate the chance of pressure upon the traps, which exists much more forcibly in the pipe sewers of less extensive drainage areas. It will form at times very abundantly in the house drains, and these being, like gas receivers, open at the bottom only, the sewer products will make their way through the traps into the houses; and if the traps become, as is often the case, untrapped, especially in dry weather, there is a ready means for the entrance of the gas into the house, independently of the means afforded by the water in the trap itself, which is a ready conductor of the miasms—absorbing the agent on one side and giving it off on the other.

Theoretically, ventilation of sewers ought not to be necessary, for, theoretically, no deposit ought to exist in a sewer; but practically this is found at times an impossibility, and an efficient system of ventilation must be provided.

The experience obtained in extended drainage areas, as well as that from more isolated districts, has shown that trapping is only stopping the danger at one point and forcing it in another direction, quite as dangerous to those exposed to its influences. It follows, therefore, that the only satisfactory solution of the difficulty is the prevention of its intrusion into houses at all, and the prevention of its collection in sewers in that concentrated form which leads to mischief. Its formation cannot be prevented,—not at least until sewers are so constructed, as to their fall and their workmanship, that no deposit is likely to take place in them at all, and that no settlement shall change their level, whilst the character and the quantity of sewage continue the same. It is seen, therefore, that miasms will form; how, then, are their influences to be avoided?

The nature of this miasm has been well pointed out by various chemists and medical authorities; all concur in the belief that dilution destroys it; that if sufficiently diluted with air it becomes innocuous, and its sting is taken away; when it first escapes from a sewer it carries with it some condition which is injurious to life, tending to prevent some necessary change in the blood, or other vital tissues, either by its own power or by means of a property to which it simply bears the relation of carrier. If it be mixed with sufficient air, especially if that air be ozonised, the miasm becomes oxidised and comparatively harmless, or if not so oxidised its presence is not injurious to life. Just as a minute quantity of urea in the blood is not injurious, yet if the purifying influence of the circulation through the kidney be interfered with, or obstructed, a rapid change for the worse results. So again with carbonic acid; if the ventilation of lung structure is interfered with serious damage is suffered; even the ordinary ventilation through the pores of the skin must not be stopped, or some change takes place in the body which is not consistent with perfect health.

It is seen that the circulation of air, or of air-carrying fluids, is incessant in both plants and animals; that this incessant action is the result in a great measure of chemical and physical changes in the moving fluids; that the safety of

animal as well as of vegetable life depends upon this incessant movement; that if this movement can be produced and continued in sewers, no sewer gas could exist in a form sufficiently concentrated to be hurtful to human life.

Professor Graham and others have pointed out that nature has given to gases a law by which they have a tendency to diffuse themselves inversely as the square roots of their densities. This law certainly comes into play as soon as ever the gases are disengaged, at once tending to produce motion in the air. This motion will be assisted by the continuous changes of temperature following upon the quantity of hot water going into the sewer; it will also be encouraged by the presence of a flowing stream, varying in depth, and keeping up a varying circulation, causing an incessant motion of the air; as sewage rushes down, air must rush up to occupy the vacant places. Our problem, therefore, is how to render this circulation positively continuous, and to prevent its sinking into that dead calm which arises when the forces oppose one another, and which then allows the air to become saturated with sewer miasm. This has been effected most perfectly in our district, by compelling every new house to have ventilation for itself. The soil-pipe is continued upwards in a straight line above the level of the pan between the trap and the sewer, and it is made to terminate by an open extremity above the eaves of the house, away from a window, and not close to or level with a chimney. Every connexion with the sewer requiring the presence of a trap has that trap guarded from the consequences of pressure by a ventilator similar to the soil-pipe, the latter being placed as close to the trap as possible. It is found necessary to make these shafts ascend straight up, and not curve or turn at right angles, or their efficiency is interfered with. The result of making these innumerable openings at the higher points of the sewer has been to promote a rapid circulation through the sewer, by which all sewer gas is removed as quickly as formed by dilution and deoxidisation, and no concentration can take place. If any of the traps which may be considered absolutely necessary in the house should get out of order, then the introduced gas would be comparatively harmless because so diluted; but every communication with the sewer other than that of the W.C. is indirect only.

These innumerable openings act like the pores on the skin, or like the stomates upon the leaves of plants: they are themselves causes of motion, for the air in the sewer of a large town will always have a temperature and density different from that outside; it will always be warmer in cold weather, whilst in hot weather it will be much more loaded with moisture. Differences of temperature, density, and moisture, will always be sufficient to determine a circulation, provided entrances exist for fresh air, as well as exits for that which has passed through the sewer.

The ordinary manholes and gullies in the streets will provide these openings, and more often lead to a down-draught than to any upward current of foul air. I have often found this to be the case in the ventilating places which have been opened near the lower ends of our Croydon sewers; air enters instead of finding an exit. The principle to be observed is stagnation, whether of acid, of liquid, or gas,—deposit must not be allowed, fluid must always run off; let there be also innumerable openings near the tops of the houses, and it may be safely assumed that no stagnation will exist in the sewers themselves, for these openings will be the promoters of incessant movement. Let every water-closet have its movement promoter, its safety-valve, in the pipe I have mentioned; let every trap, which it is absolutely necessary to use for the protection of the inmates of a house in a similar manner protected; let every pipe, not actually conveying sewage, have an indirect communication with the sewer only. Let all openings in the streets be untrapped and everything done which will promote sewer circulation, and disease in every way will become, as it has been in Croydon, more tractable, and the effects of drain-poison almost unknown.

It may be argued that these recommendations apply only to pipe-sewers, and will not do for the large culverts now being constructed in London. This I deny; they can be ventilated as well as the Southwark subway, or the metropolitan railway tunnels. If they contain deposit they are badly constructed, and such had work ought to be remedied. It is becoming more and more certain, however, that more mischief arises in

the house drains, where stagnation can take place, than in the main sewers in which the main current is over flowing; it never stagnates sufficiently long to allow of decomposition taking place, except under the most exceptional circumstances, which would be fully guarded against by the precaution of having proper charcoal ventilators in the manholes of the streets, at those places at which an up-current might be established—as at the top of a sewer having a rapid fall towards one on dead level. These ventilators have been often lately perfected by our engineer, Mr. Latham, by means of which the chimney is protected from rain, and the air compelled to pass through a double sieve. Various other ways may be adopted for promoting rapid circulation in the large sewers better known to engineers than to myself, but the correct theory of sewer ventilation is undoubtedly motion. Motion is success, stagnation is destruction or defeat. I have not supported by figures the proposition I have submitted, because it has been found impossible to isolate the districts so as to place them under the same conditions, but I may simply state that the mortality for the parish of Croydon for the quarter ending March 30th, 1869, the quarter which generally has the highest rate of mortality, was 19.53; the deaths from fever in the same quarter were nil among nearly 60,000 people. The mortality for London in the same quarter was 25.0; that for all England, 24.84.

The idea of reading this paper arose from hearing at the Society of Arts a paper upon house-drains, which seemed only to urge traps as a remedy for smells. I say ventilate; do not trap.

In the course of discussion, the chairman, Mr. Edwin Chadwick, C.B., said:—

The theory of the paper states that theory and practice do not always go together, and that sewers are never so constructed in ordinary towns as the early sanitarians intended they should be. But it is not the mechanical theory, as he assumes, which is in default, but the administrative theory; the theory shanted for of local self-government, which has shant out instruction from an authority which is the best means of information, competent from undivided attention, and really responsible, for its advice and initiation; the theory gave sole initiation to an authority, unformed and extremely liable to be misinformed, misguided, and really irresponsible, for non-observance, for misfeasance, or for malfeasance. Hence the gross imperfection and waste in these works which have been maintained and extended. Hence such works as house-drains without properly adjusted supplies of water; large expenditures in sewers, made uselessly, even when on proper scales, which they rarely are—because they are made without the proper connexion with house-drains, and house-drains constructed, but connected with sewers of deposit, and forming the necks of the retort with the bulbs, contained in my report of 1862. Hence such works as, after all the sanitary work and all the expense, the people are no better off than before, and that sanitary works are only another means of nuisance,—as under such works as are frequently met in the metropolis, where house-drains and blocks of houses, possibly well drained, are joined on to immense sewers of deposit—extended cesspools. In the metropolis there are yet some thousand miles of sewers of deposit, retaining matter until a periodical cleansing, usually at a cost as high, by proper work, self-cleansing sewers might be made,—meanwhile giving off the noxious products of decomposition into the streets and houses. Why, even at this town of Croydon, it turned out that the first imperfectly constructed tubular drains and tubular sewers were connected with old sewers and drains of deposit—it not being then perceived that when so connected, they may be made the means of conveying the noxious products of decomposition into houses. The most important part of the paper read to-night is the reference to the fact that, classes of fever cases in the houses are almost invariably found to be connected with defective drains, or with the "dead ends" of sewers. Now it may be confidently asserted that these defective drains and "dead ends" mean only bad work, productive of decomposing deposit, and that the right course, instead of washing off the products of decomposition, is to prevent them by taking up the bad works, and laying down better. Instead of that, so common, so general are the drains and the sewers of deposit, that there is no common comprehension of any other, and the question arises, how to keep them down, how to deodorise them, how to neutralise them, how to trap them, how to keep them from how to wash them off by shafts, or send them amidst the crowd amongst other people; the last thing to be considered for lime to come being not yet conceived—namely, how not to produce them. I despair of the defect required. In the general prevalence of bad work, and of deposits and the products of decomposition, we have no perception of the wide distinction between the putrid sewage which produces it, and kills fish, and of the fresh sewage, which, when it is allowed to escape into rivers,—a waste that ought not to be,—feeds them.

We have sewer gas treated as a necessity. Now, for

people of more advanced perceptions and information, I will mention another test of bad work; that is, the "nose test," as I call it. You may test the work of the architect and the work of the sewer-engineer in the street, by the nose. The sewer, as I have said, is the nose. The drain small in the house, the sewer small in the streets, are infallible proofs that ought to be known and acted upon by the sanitary administration, by the local and mal-administration. You may infallibly test a local administration—the nose. All smells of decomposing animal or vegetable matter may be taken as meaning decomposition, and, if intense, immediate disease, as described in our earlier instructions. Where works are properly constructed, there is, I repeat, no deposit, no decomposition, and no smell of decomposition. Traps are only needed against accidental obstructions, which usually arise from defective inlets or from positive nuisance.

Mr. Hensle said that no doubt good ventilation and a quick current along sewers would do much, but still decomposition could not be altogether prevented. Much of what passed from houses, especially the products of cookery, was already in a state of decomposition. Moreover, the offensive products of trades, steam, and hot water passed freely into the sewers to the great disturbance of the contents. He went on to say that, in a state of decomposition, the most important improvement was also required—namely, the severing the communication between the interior of the house and the sewers. Nothing short of this would do, and it was the duty of the sanitary authorities to see that it could keep out the offence. The chimney draught, the heated air within houses, inevitably drew the foul current into the houses under houses at all. No water-closets should be entered into a house; however close it might be it should be necessary to go into the open air first. All stop-pugs to pass into the open and drop into a hole. Barrels, or small casks, or traps, should be outside, having no continuous communication with the interior. Small speculative builders and others were in the habit of running up anything, however defective, as a matter of convenience, and it was the duty of the sanitary and local authorities to be unable in any way to meet the case, although in the construction of minor matters. The wholesome views of the Commission were scarcely touched. The most important part, as regarded health, the laying down of sound efficient drains, was scarcely touched. He was sorry that the architects and builders, as a whole, were far more anxious to make a slightly and well-paying affair, than to give any real consideration to health and convenience, and yet these considerations of an importance impossible to be over-rated, are not in any respect incompatible with true taste.

Mr. Cook, as a member of the Metropolitan Board of Works, and one who had moved for a committee of the Board on the subject, said that there were great difficulties in the way of carrying out a perfect system of ventilation. The great embankment sewer, which had a fall of only one inch in a mile from Fulham down to Abbey Wood, admitted only of a very tardy flow of the sewage. In the still of night, there is a large discharge of offensive smell from the traps. This had been obviated to some extent by a new plan, consisting of a small opening at the top of the gully-holes. But in purifying the air as it escaped, it had the effect of stopping the ventilation so that it could not work in the sewers. At the East End of London this plan, also tried and tried at the Woolwich Arsenal a shaft with a strong draught had been erected, but this too was unsuccessful, inasmuch as the air, which could not extend but a comparatively short distance up the sewer, was not able to get to the top of the shaft, and a system complete. There was no doubt that the offensive gases in sewers should be got rid of, and he hoped that some day would suggest some chemical which might be introduced, and which would have the effect of deodorizing the liquid sewage. He concluded by inquiring whether dilution was destruction.

Mr. Arthur Jacob, Chief Engineer of the local authorities, has waterworks under their administration, as a rule, trap-inspectors are appointed to prevent the waste of water. This precaution was observed because waste of water is a nuisance, and it was important to him that the relative position of district and local boards with their constituents, the ratayers, for the adoption of the health of the town. But he less regard to be had for the health of the town than for their pecuniary interests; and if not, why were not trap-inspectors as well as trap-inspectors? Ordinary traps were exceedingly bad, and much in his opinion might be done by systematic inspection of them.

Dr. Aids was sorry to hear objections made to the trapping of gasses, for what else could be done when noxious gases escaped from them in every direction? At ventilators of sewers also gave rise to many complaints, and he believed that abats connected with the sewers, and carried up as high as the chimney-tops, would obviate much of the evil. He knew places in the east end of London where they had been erected, and produced the best results by preventing sickness in families. More experiments should be made upon the effects of sewer gases. It was true that the late Dr. Barker, of Bedford, had supposed a deficiency in this respect, but still further experiments were required. Dr. Aids believed that more evil was attracted to the houses by the gas accompanying the zymotic disease. An air-pipe, extending from the soil-pipe to the roofs of the houses, was frequently found in the older houses of St. George's, in the Strand square. He had tried the charcoal ventilator, which, besides obstructing the outlet of gas to some extent from the sewer, was filled up by boys with stones, and rendered perfectly useless.

Mr. Liddle remarked that it was a mere waste of time to discuss the question of the pernicious influence of sewer gas upon the public health. The fact of its pernicious influence was admitted, but the important question for consideration was how the sewer gases could be prevented from making their way into the houses and streets. Dr. Carpenter had been spoken of as a remedy for the evil, but in his (Mr. Liddle's) opinion the best, and in the end the cheapest, way was to reconstruct a large portion of the sewerage of the metropolis. The sewerage of St. George's, in the Strand square, was several outlets in the river, and hence, most of them had not sufficient inclination; so that instead of their being conduits of filth, they were deposits of filth, which became continually increased, and the offensive smell was so much complained of. It was the duty, in Mr. Liddle's opinion, of the Metropolitan Board, when commencing the sewerage for draining the metropolis, to so reconstruct the whole of the existing sewers to suit the new outfall at Barking and at Crossness, as that they should cease

to be mere deposits of filth. At present the sewers of London were under the jurisdiction of the several local Boards, all acting independently of each other, and the Metropolitan Board. This was a bad arrangement, for in his opinion the whole sewerage of the metropolis should be placed under one jurisdiction, who should appoint proper officers to see that the sewers were always in perfect working order, who should inspect all the house-drains communicating with the sewers, and who should have power to compel the owners of houses to have the house-drains so constructed that the emanations from them should not be able to find their way into the houses. In a short, the whole of the sanitary arrangements of a house should be submitted to a competent authority before the house was suffered to be built.

Other gentlemen having spoken, the Chairman said:—I cannot conclude this evening's proceedings without observing upon what you have heard from the member of the Metropolitan Board of Works who has taken part in the discussion. You have heard him describe the very poor fall that the engineering skill selected by that Board appears to have considered available for an important main line sewer, as well as the consequence of the sluggish flow obtainable with that fall, deposit, and, of course, noxious decomposition. Now, I can assure you, and it ought to be made known, that steam power, which raises water to heights for distribution at a working expense of a shilling only for every 70,000 gallons lifted 100 ft., can also at the same rate practically give fall to any extent needed by lifting it from depths. It might even lift the subsoil drainage water, as well as the surface water, from uncovered spaces, that is, as I conceive, improperly carried into the sewers. What might have been done may be proved to what has been done elsewhere—that is, that every court, alley, and street, of 1,500 miles of street in the metropolis might have been provided, to its immense relief, with complete self-cleaning sewers, outfalls and all, or less than the former system, and which, under the direction of that Board, have been expended on the great intercepting sewers it has directed, and such equally as one of its members has described to you. It is really most deplorable that such works can have been done, and that so imperfect is the knowledge current on the subject that they should pass unchallenged as being ill-done.

THE PROPOSED LAW COURTS.

The Committee met for the first time on Monday last, Lord Stanley in the chair. Almost all the members attended. The first witness was Mr. E. W. Field, secretary of the Courts of Justice Commission, who was examined respecting the certificate given by the Commission as to the total cost of the scheme not exceeding 1,500,000L. Mr. Layard then put questions to show the insufficiency of the public accesses to the Strand or Carey-street site. The witness denied this, and said that the chief question was the convenience of access for lawyers, and that for this purpose the present accesses to the Carey-street site were sufficient. In answer to Mr. Tite, he said that in the reduced plan of the Commission, the Probate Department (though not the Probate Court) had been omitted. The map of the Incorporated Law Society was said by Mr. Field to be inaccurate only in minor details, but perfectly correct in principle. The Commission thought it was possible to erect all the most important courts and offices on the Carey-street site. There would be more light and air by the side of the river, but the Howard-street site was otherwise so objectionable as to outweigh all such advantages. He deprecated strongly different buildings for the Courts of Law and Equity as a hindrance to the fusion of the two branches of the law. In his opinion, the Commission had nothing to do with any site but Carey-street, and he would as soon think of building the Courts at Kensington as in Howard-street. Great delay and inconvenience occurred daily from the present scattered state of the legal buildings. It was of vital importance that the chambers of counsel and offices of solicitors should adjoin the new courts. The present dispersion caused not only slow work, but bad work, and was very injurious to suitors.

The letters unaccountably omitted in the return of correspondence with the two architects recommended by the Judges of Design, already printed, have now been published, by order of the House of Lords. They are very material to a right understanding of Mr. E. M. Barry's position, and show the justice of Mr. Barry's complaint of the omission.

We reprint a portion of the letter from Mr. Street to the Earl of Derby, dated Jan. 20th, 1868, a letter quite honourable to that gentleman.

"I gather, from the minutes of the Courts of Justice Commission, that on the 30th of July, 1867, after six months' deliberation, the Judges of Design made an award which recommended the employment of Mr. E. M. Barry and myself as joint architects to the building. Four months later they repeated their decision, which was then sent to the Commission, who agreed, on December 13th, 1867, that we might be asked to undertake the work, suggesting only that the opinion of the Attorney-General should be taken as to whether the decision of the judges should be recognized."

It is now more than a year since the plans for this great work were sent in, and nearly a year since the award was made; and though I cannot doubt the eventual acceptance of their award, I feel that I ought not any

longer to delay saying to your lordship that the present uncertainty is not only a great hardship to me, personally, but also at the same time in some degree a hindrance to the proper execution of the work, if it is finally entrusted to me. For, first, very many persons, assuming that I am to be one of the architects, refuse, naturally enough, to put smaller works into my hands, supposing that my time is already almost exclusively occupied on this great work; and, secondly, I am myself at present unwilling to refuse much work, which, if this question were settled in my favour, I should undoubtedly refuse, in order to be able to devote sufficient time to the most important architectural work of the day. For, though the architects were not at all bound by the conditions of competition to refuse any fresh work, it is certain that in any case they would at once be obliged, and ought, to refuse a good deal.

In common with the other nine competitors, I entered upon this competition, as I thought, with a most distinct understanding that the award of the Judges of Design was to be final. This opinion was founded on the Treasury minute of December 23rd, 1865, "that the notice or invitations to compete be issued by the Committee of Judges, and that their award should be final." This minute was communicated to me by the Commission."

"I do not suppose that the award of the judges being made in favour of two architects can be less an award than it would have been if it had been made in favour of one only. It is true that the instructions did not expressly indicate the possibility of such an award, but at the same time they nowhere prohibited it, either really or by inference; and indeed the minutes of the Commission, at page 73, speak of negotiations having 'passed between the architects and the Treasury as to the terms on which the successful competitors should be engaged.'"

And, as regards the advantage or the contrary, of the employment of two architects on such a work, it may not be improper to observe that, impressed probably by the enormous extent of the work to be done, the Commission originally proposed to obtain, first of all, floor plans from one architect, and afterwards to obtain architectural elevations by competition from another; that the same course of employing two architects of that which has lately been proposed by the *Times*; and that among the competitors for this work two at any rate were in partnership with other architects, and in the event of the selection of either of them, there would in fact have been the same employment of two men.

The opinion which I hold as to the finality of the award is shared by other of the competitors."

ATKINSON MORLEY'S CONVALESCENT HOSPITAL, WIMBLEDON.

The hospital, founded by the late Mr. Atkinson Morley, for the reception of patients from St. George's Hospital, will be opened for the reception of patients on Wednesday next, July 14th, the anniversary of Mr. Morley's death. The governors of St. George's Hospital, to whom the funds have been entrusted by the founder, do not feel that they would be justified in spending any money upon "a ceremony" usual upon such occasions; but any governors or subscribers to St. George's Hospital, or other persons, will be admitted after four o'clock on that day, to the grounds of the hospital at Wimbledon, on presenting their cards. The Institution includes two day-rooms, one for men, one for women, 49 ft. 8 in. long, 14 ft. 10 in. wide; 12 ft. high. Four dormitories, two for men, two for women, for twenty beds each, 79 ft. 10 in. long, 24 ft. 10 in. wide; 15 ft. high. One ward for five beds, 49 ft. 10 in. long, 15 ft. wide, and 15 ft. high. One ward for twelve children, same size. Ten wards for single beds for serious cases, 15 ft. 10 in. long, 12 ft. wide, and 15 ft. high—each. There are warm baths, lavatories, and W.C. on each floor; chapel, superintendent's apartments, besides laundry, coach-house, and stables.

TECHNICAL EDUCATION.

The council of the Union of Lancashire and Cheshire Institutes, in conjunction with the Society of Arts, have resolved to urge upon the attention of Parliament the subject of the extension and improvement of technical education. A petition has been forwarded by the council for presentation by their president, Mr. Bazley, M.P.; showing that science classes exist in connexion with ninety-two institutes of the union; that the petitioners also promote annual exhibitions in connexion with the Society of Arts; that great difficulty arises from the insufficiency of primary instruction received by the students; that much greater facilities for securing scientific knowledge and discipline exist on the Continent than are provided for that purpose in Great Britain; and that the industry of this country must seriously suffer if this defect be not remedied. The petitioners believe that the only proper course of procedure to effect the desired object is to establish a national system of primary instruction; to re-organise and improve the character and methods of secondary schools; and to constitute science colleges, fitted to receive the best pupils from the secondary schools and science classes. The petitioners, therefore, urge upon Parliament to adopt such measures as may be best adapted to meet the case.

BRICKMAKING IN WESTERN INDIA.*

ENGLISH brickmaking has been unsuccessful in Bombay, and the want of success is always attributed, it seems, to a wrong cause. The author of the pamphlet under notice, states that he has "succeeded not only in making good bricks from Bombay clays, but also in finding out the causes of previous failure, and in clearly defining by what means brickmaking in Western India becomes a certainty instead of a hazard." Want of suitable clay was blamed, but Mr. Walsh has found plenty of good clay. The ignorance of the native brickmakers has been often expatiated upon, but he learnt that first-rate bricks had been made in Western India; and if the modern native bricks were comparatively rubbishy, still they were good enough for the purposes to which they were put. Want of the ancient fuel (wood), appears to account for modern deterioration; and the import of coal from England is very costly. Mr. Walsh finds that the fuel used by the native brickmakers is the most available. He says, on this subject, —

"The sweepings of the streets in Indian towns, &c., consist, in great part, of a heterogeneous mass of valuable matter, &c., which, on account of there being eight months in the year of fine weather, instead of being converted into manure, exists as dry combustible matter, which receives the name of *cutchra*. The amount of *cutchra* which is constantly accumulating in a large town is considerable. The accumulations in Bombay alone are enormous, and a large staff is constantly employed to keep it cleared away."

"The native brickmakers use *cutchra*, &c., as the fuel for burning their bricks, but their method of using it does not admit of the bricks being burnt to an English standard. It occurred to me that if *cutchra* could be burnt in a kiln instead of in a clamp, the proper burning of the bricks would be effected. Some experiments which I made entirely confirmed my anticipations. The Government of India granted me a patent for this use of *cutchra*, &c. I also designed a kiln which I considered suitable for the purpose. The form of kiln was also secured to me by patent."

The author concludes his pamphlet, by stating some of the conditions which must be observed in order to be enabled to produce really good bricks from Indian clays. These are, "1st, in the preparation of clay to be careful not to disturb the balance of constituents which is observable in true brick earth; 2nd, not to interfere in any way with the attraction of cohesion within the bricks; 3rd, to so arrange the bricks in kiln, and so apply the fuel, as to prevent the bricks from becoming scorificaceous; 4th, to so construct the kiln that the proper economy of fuel will be effected."

THE TRADE-UNION BILL.

A NUMEROUSLY attended deputation from the trades' societies of the metropolis, appointed at the recent meeting of the trades at Exeter Hall, waited upon Mr. Bruce, the Home Secretary, for the purpose of urging upon the Government the propriety of giving their support to the Trade-Union Bill before Parliament. Nearly the whole of the leading trades were represented. The deputation was accompanied by Messrs. T. Hughes, M.P., A. J. Mundella, M.P., and several other members of Parliament. Mr. Hughes introduced the deputation, and explained the objects of the Bill. Several members of the deputation then spoke at some length. Mr. Bruce, in replying, said that the pressure of business on the Government had been the only reason why the question had not been taken up by it this session. He had examined the reports of the commissions and the Bill in question, and there were some points in it with which he agreed. He thought the Bill dealt with a most important question, which could only be dealt with by the Government in its official capacity; and he should advise the deputation not to press the Bill this session, but to wait, and allow the Government to deal with the whole question in the next session, when there would be more time for consideration. The deputation said their constituents would not feel satisfied without the second reading of the Bill was pressed to a division, that they might see which members falsified or fulfilled their pledges at the hustings. The discussion lasted about two hours. The deputation afterwards held a meeting, when a resolution was unanimously adopted, "That the promoters of the Bill are hereby respectfully requested to press the second reading of the Trade-Union Bill, on Wednesday next, to a division, no matter from what quarter any opposition may proceed." The second reading

* Chemical and Geological Observations relating to Brickmaking in Western India. By M. Walsh, London: Spott.

of the Trade-Union Bill was moved, on Wednesday, by Mr. Thomas Hughes. He denied that trade-unions, when strikes could be avoided, were favourable to them; or that these operations had the effect of driving trade out of the country. He declined to enter at length into the clauses, as the Bill is not to be pressed further in the present session. These societies, he submitted, deserved well of the country, in consequence of the money expended by them for benevolent purposes. The motion for second reading was seconded by Mr. Mundella. Mr. Brassey considered that the result of trade combinations had been more favourable to the employer than to the labouring classes, far greater advantages having been conferred on those classes by the natural operation of the laws of supply and demand. He supported the second reading, and thought there should be concurrent legislation in reference to threats. The Bill was read a second time, and the House shortly afterwards adjourned.

THE WORKING MEN'S CLUBS AND INSTITUTES UNION.

At the seventh annual meeting of this union, held at Exeter Hall, the Hon. George Brodrick, in the chair, the report that was read stated that the aggregate number of working men's clubs had risen from 312 to 355 during the past year, 23 of which were established with the aid of this society. Fifty-six institutions had affiliated themselves with the union, and thus raised the number to double the former amount. The Marquis of Westminster had offered a site and a donation of 1,000*l.* towards the erection of a Workmen's club in Piccadilly. Five new clubs had been established in London during the past year, and three had been closed. The council had not neglected to do their best to help all these institutions to fulfil the important functions for which they were established. The London Artisan Club was spoken of as a model institution, and had been highly successful. The failures were such as might be traced to remediable causes.

Endeavours are being made to provide the members of workmen's clubs and institutes throughout England with the means of access to the best works of our principal writers, and especially to afford them the means of perusing new works of interest and importance. A circulating library has, therefore, been established at the main office, for the purpose of supplying to institutions in union with this society thirty volumes every quarter, for an annual subscription of 5*s.* As there are upwards of 350 workmen's clubs and institutes with a constituency of about 60,000 members, it will be seen that this library affords the means of putting into the hands of a very intelligent and numerous body of men, books which it is really of national importance that such men should become acquainted with, but which, without this agency, they would probably have no opportunity of seeing. The council appeal to all persons interested in this condition of the working classes, to promote this important work by contributions to the library, either in money or books. We echo their appeal.

THE NEW MARKET-HOUSE, HEMEL HEMPSTEAD.

THE opening of a new church for this town has been followed by the completion of a new market-house. The town buildings now comprise a town-hall and magistrates' room erected in 1851, the Corn Exchange, constructed in 1857, and the new Market-house erected in 1868-9, under the auspices of a committee formed of the principal inhabitants of the town.

The new building adjoins the Town-hall, being built on the site of the old market-house. It contains market-place, 50 *ft.* long, and 25 *ft.* wide, protected from the weather, the back and side being enclosed with glazed openings, and the front archways fitted with iron revolving shutters. There are large lofts over, with a hydraulic lift for raising the grain. The building has a turret 70 *ft.* high, in which the market and fire bell is placed. This turret is the principal feature in the front, and through its base there is a passage to the churchyard, and the ancient Norman church. The other entrance to the churchyard is by a principal archway under the magistrates' room. There is a porch in the centre of the front of the market-house, extending over the pathway, and supported by two polished granite shafts with carved capitals.

The floor of this market-house is formed of iron huckle plates, and supported by wrought-iron girders. A large cellarge has been constructed under the market-house. At the south end a small portion of the premises is occupied by the London and County Bank. The buildings, as now complete, extend 180 *ft.* along the High-street. The structure is designed in the style prevalent in the reign of James I. The materials used are brick and stone throughout. The principal and return fronts are built of red brick.

The whole of the buildings have been designed by Mr. George Low, architect, London, and erected under his superintendence. The contract for erecting the market-house was carried out by Mr. Thomas Cook, of Berkhamstead, builder. The amount of the contract was 2,140*l.*; but the total cost is in excess of this sum.

ART-UNION OF LONDON PRIZES.

We give a second list of works selected by prize-holders:—

From the Royal Academy.—Winter Shooting, R. Ansell, A.R.A., 35*l.*; Boatside, E.M. Ward, R.A.—The Castle and Town of Samur, G. C. Stanfield, 100*l.*; By the Waters of Babylon, W. E. Frost, 63*l.*; Early Training, P. Jaclman, 50*l.*; Evening, Causal, E. Hayes, 53*l.*; We too, We too, must Fall, F. The Solo, G. Pope, 45*l.*; The Torrent Brook, Dolgely, P. Deakin, 40*l.*; Faggot Stacking, A. Fraser, 40*l.*; In the Wood, near Miner's Bridge, R. S. Rowley, 55*l.*; Bright Weather after a Gale, H. Moore, 50*l.*; The Puddle, E. Eagles, 23*l.* 10*s.*; Puck, W. E. Frost, A.R.A., 21*l.*; The First Lesson in Straw-plaiting, G. W. Brownlow, 25*l.*; Near the Market-house, Ross, W. Callow, 20*l.*; The Berkshire Coast, H. Jutsum, 20*l.*

From the Society of British Artists.—A Mountain Stream, W. S. Ross, 25*l.*; Grazing, H. King, 25*l.*; Going Home, W. Bromley, 25*l.*; Reminding the old cabinet, T. J. Watson, 40*l.*; Duckings, J. A. Vinter, 20*l.*; Morning, J. Peel, 25*l.*; View in Glen Neagh, J. C. Ward, 25*l.*; Evening Shadows, E. M. Wimperis, 25*l.*; Dort on the Meuse, J. J. Wilson, 20*l.*; Where the Painted Leaves are strewn along the Winding Ways, W. Luker, 42*l.*; Algerine Pirates, J. Danby, 50*l.*; It won't come straight, T. Heaphy, 30*l.*; Waiting for Somebody, J. T. Peel, 25*l.*; No Throughfare, P. Mizen, 25*l.*; Evening, G. L. Copard, 40*l.*; The Faith Mawr, T. Pyno, 30*l.*; The Kivrol, C. Smith, 30*l.*; Mountain Road in Dolgely, J. C. Ward, 35*l.*; Mountain Scene, R. Harwood, 35*l.*; Scene near Elstead, Jno. Tennant, 40*l.*; An English Farmyard, J. S. Herring, 40*l.*

From the Institute of Painters in Water Colours.—On the Beach, Eastbourne, E. Roberts, 52*l.* 10*s.*; Coniston Water, Cumberland, J. E. Hay, 25*l.*

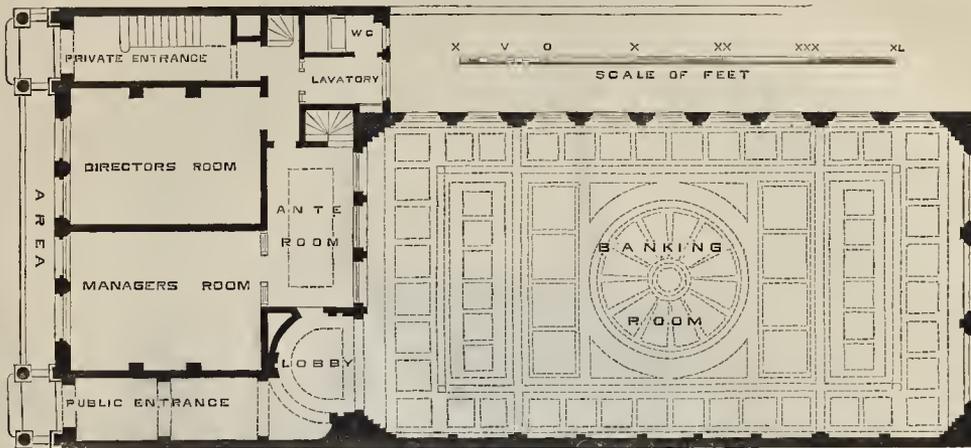

From the Society of Painters in Water Colours.—Interior of Portland Hall, Joseph Nash, 25*l.*; The Hobe Goll Berchtersgaden, Colledgewood Smith, 20*l.*

From the Cornhill Gallery.—Parable of Our Lord, P. Priolo, 70*l.*; The Willing Captive, W. M. Egley, 21*l.*

THE NEW MOVABLE BRIDGE AT SKELTON.

IN the course of last month a new bridge, which has been constructed over the Ouse, between the Skelton and the Hook side of the river, was to be opened for use. The bridge in question crosses the river at a point where the stream is fully 800 *ft.* in width, and is so constructed as to admit of two lines of rails, which will shortly be put in use by the North-Eastern Railway Company, who have constructed what is known as the Hull and Doncaster Railway, and which joins the Hull and Selby line with the South Yorkshire branch near to Doncaster, and opens up a new route from Hull to London. The difficulties attending the bridging of the river for so great a distance was rendered all the more difficult by the engineer having to provide an opening through which vessels could pass. This was got over by a swivel bridge being fitted in the centre, which is 250 *ft.* in length, and which turns upon a centre pier of 50 *ft.* in diameter. The bridge itself is made up of seven spans, which are composed of solid webbed fish-lashed girders, which rest on cast-iron pillars of great strength. There are three piles in each pier, which have been sunk through various estuarine and fluvial deposits to a distance of about 60 *ft.*, and then screwed into Kimmeridge clay. The opening in the bridge is placed over the deepest part of the stream, and has been so constructed as to give 100 *ft.* of headway for vessels. The bridge is moved by hydraulic power, by engines invented by Sir W. G. Armstrong & Co., who are the contractors for the movable part of the bridge, which can be opened and closed in the short space of half a minute. The signals are constructed on the "lock system," and are regulated by the movements of the bridge. It is intended to light the bridge with gas. Mr. Pitt, plumber, of Goolle, has obtained the contract for lighting the bridge, which, viewed from a distance, has a good appearance. The contractors for the fixed parts of the structure are Messrs. Butler & Pitt, of Stanningley, near Leeds.

BIRMINGHAM TOWN AND DISTRICT BANK.

Plan.

RICHARD CASTLES, ARCHITECT.

ANOTHER little bit of neglected biography of another overlooked architect will not, I think, be out of place in the pages of the *Builder*. Unremembered now, yet celebrated in his day, our subject was one of those professional architects whose birth and training belonged to one country, while the practice of his art was confined exclusively to another. Few even of the citizens of Civita Eblana, who are justly proud of their public buildings, are aware that it was to the subject of this short sketch that they owe the design of Leinster House (now the Royal Dublin Society), and also the design of the Dublin Lying-in Hospital, beside which stands the historic Rotunda.

Richard Castles was a native of Germany, being born in Cassel, and he was brought over to Ireland by Sir Gustavus Hume, of Hume Castle, in the county Fermangh, in the last century. I have not been able to discover any record of designs for works by him in this country during our architect's residence in Ireland, but it is quite possible and probable that, owing to his extensive practice, extending over many years, he designed some works in England.

Castles was a clever but very eccentric architect, and many curious stories are related of his professional career in Ireland. The following enumeration of the principal of his public and private works will show that he had no small share of patronage in Ireland during his career:—The Lying-in Hospital, Leinster House, the Printing-house in Trinity College, the Cupola of the College Chapel, which was pulled down towards the close of the last century. The design for the finishing of the Parliament House was also his. Of baronial or palatial mansions in the capital and country, he designed Powerscourt House, county Wicklow; Hazelwood, in the county Sligo; a mansion at Summerhill, county Meath; Cartown, county Kildare, for the Duke of Leinster; Ballyhays, a residence vaulted over with stone for Colonel Newburgh, county Cavan; a house for the Marquis of Waterford, in Marlborough, afterwards occupied by the Board of Education; two houses in Kildare-place for Lord Masserene, and for Sir Skeffington Smyth; two or three large residences in Sackville-street, Dublin; one for Lord Bective in Smithfield, Dublin; one for the Lady Dowager of Kildare in Kildare-street; one for the Protestant Bishop of Clogher; and several others of minor note.

From the above list it may be seen that Castles had a good practice. He also erected the first stone lock in Ireland—that of the Newry Canal, county Antrim. Like some other clever professional men, he had one great failing; he was addicted to intemperance, and in consequence was improvident. A great portion of Castles's time was spent in the tavern overnight, and one

of his principal companions was no less a personage than the celebrated and justly-esteemed Dr. Bartholomew Mosse, the founder of that very humane institution, the first in the kingdom, the Dublin Lying-in Hospital. Mosse bequeathed his fortune for the purpose.

Richard Castles was extremely odd and whimsical in his manner and habits; he had a decided aversion against shaving himself, and was over-cautious and most particular about those whom he employed on his works. The art of stucco plastering was carried to a high perfection in Dublin in the last century, as many of the residences of the nobility still testify. A Mr. Simpson enjoyed a great reputation in that line, and was employed by Castles, who liked his performance so well that he ever afterwards kept him on his works, and when not requiring him recommended him to others. Castles was a good draughtsman, and was most clear in his directions to workmen. Whenever he came to view his buildings and wished to give any special direction he would summon all the workmen together, and they were obliged to follow over the works in a long train, while he pointed out to each what he required to be altered or done. He was very changeable, and he frequently had many of his buildings half pulled down when he did not like the appearance presented.

Castles married an Irish lady, a native of Lisburn, in the county of Antrim, but he had no issue by her, and her death preceded his by some years. He continued a widower ever afterwards.

While engaged at the Duke of Leinster's, at Cartown, county Kildare, Castles's death took place. Retiring after dinner one day to write some directions for the carpenter, he was suddenly seized with a fit, and was found dead in his chair. Long addicted to drink and late hours, he was subject to attacks of the gout, which weakened his constitution. Richard Castles was between fifty and sixty at the period of his death.

For the information of the craft and his countrymen, we are able to state that the ashes of this clever and eccentric architect rest in the Church of Maynooth, Kildare. Independently of his failings, our subject was a man of strict integrity in all his professional and personal engagements. His extensive practice gave him opportunities of amassing wealth, but he neglected to avail himself of them, and the result was that he was often distressed for means. Yet he was highly esteemed as a professional man. His company was much sought, he being a most agreeable companion. The Irish capital is indebted to Richard Castles more than it is aware, for he was the pioneer of the fine architecture in public buildings in that city which culminated afterwards so grandly under the sway of Thomas Cooley and James Gandon.

C. C. H.

LONDON ORPHAN ASYLUM.

THEIR Royal Highnesses the Prince and Princess of Wales have signified their intention of laying the foundation-stone of the proposed new asylum at Watford, on Monday, the 12th inst.

The annual report of this valuable institution for the past year has been published. In their appeal to the public, the managers notice the fact of their having contracted for the erection of the new building at Watford, from Mr. H. Dawson's design, for 450 orphans, for 63,088*l.*

The Grocers' Company have, in a spirit worthy of their ancient liberality, voluntarily bestowed the sum of 3,000*l.* for building a house for the reception of fifty orphans, to be designated "The Gift of the Grocers' Company." Eight such houses are designed for the accommodation of 400 boys; and the Board are not without hope that some other public body or individual may generously emulate the noble example of the "Worshipful Company of Grocers." The contract price for erecting the structure, of which we give illustrations, is rather under 3,000*l.*

Another gift has afforded the managers great satisfaction, and we do not wonder. Four years ago the Head Mistress, much esteemed, married the late Mr. George Peckett, who had done good service to the institution. Having lately lost her husband, Mrs. Peckett has announced her intention of building the chapel (of which we give a view), at her own cost (about 5,000*l.*), to serve at once as a memorial of him, and of her own regard for an institution with which she was long connected,—an occurrence as honorable to the managers as it is to the lady.

Donations to the building fund, and for annual subscriptions, are pressing called for. Some statistical tables appended to the report show how considerable a difference on the whole expenditure is sometimes made by a small increase of cost on each individual for provisions, &c. Thus in 1863, the cost per head of each orphan was 10*l.* 1*s.* 1*d.*, and the cost for the entire establishment was hence 4,343*l.* 19*s.* 7*d.*; while in 1868 the cost of each child was 12*l.* 1*s.* 5*d.*, and the total cost was hence increased to 5,230*l.* 1*s.* 3*d.* The average number of children in 1863 was 432, and in 1868 it was 431.

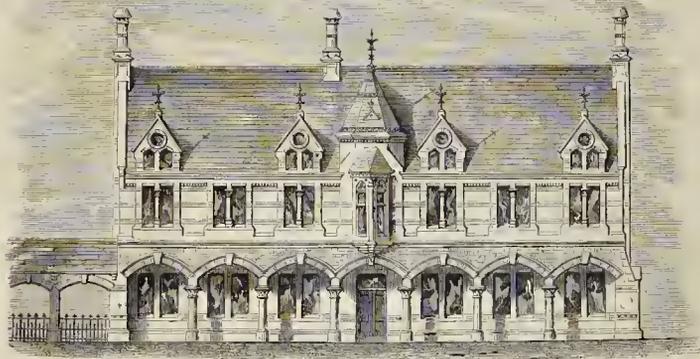

The objects of this institution are most admirable, and we fully endorse words lately uttered by the Rev. J. W. Gleadow, while pleading the cause of the asylum:—

"This Institution is distinguished from a great many of the other establishments of benevolence, which, like gems in a monarch's diadem, adorn and dignify our land. Whilst others direct their attention to mitigate the different evils that result from poverty, disease, old age, and accident, thus furnishing a refuge for the broken remnant of human life, this, on the other hand, contemplates its objects in the first years of their existence. It takes them from the position of danger in which, by no act of their own—by no vice or folly of their own—they have been placed. It rescues them from the associations and from influences which might make utter shipwreck of their hopes and their happiness. It saves them from such a fate, and with all the anxiety of a parent, guards their early years and trains them to religion, to virtue, and to usefulness."

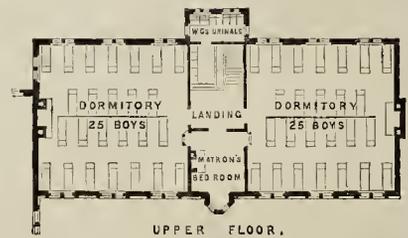

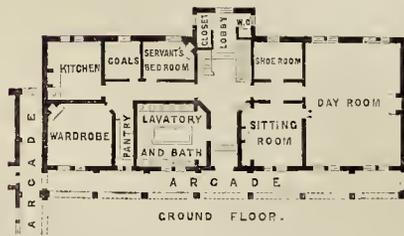

LONDON ORPHAN ASYLUM, WATFORD.

View of Chapel.

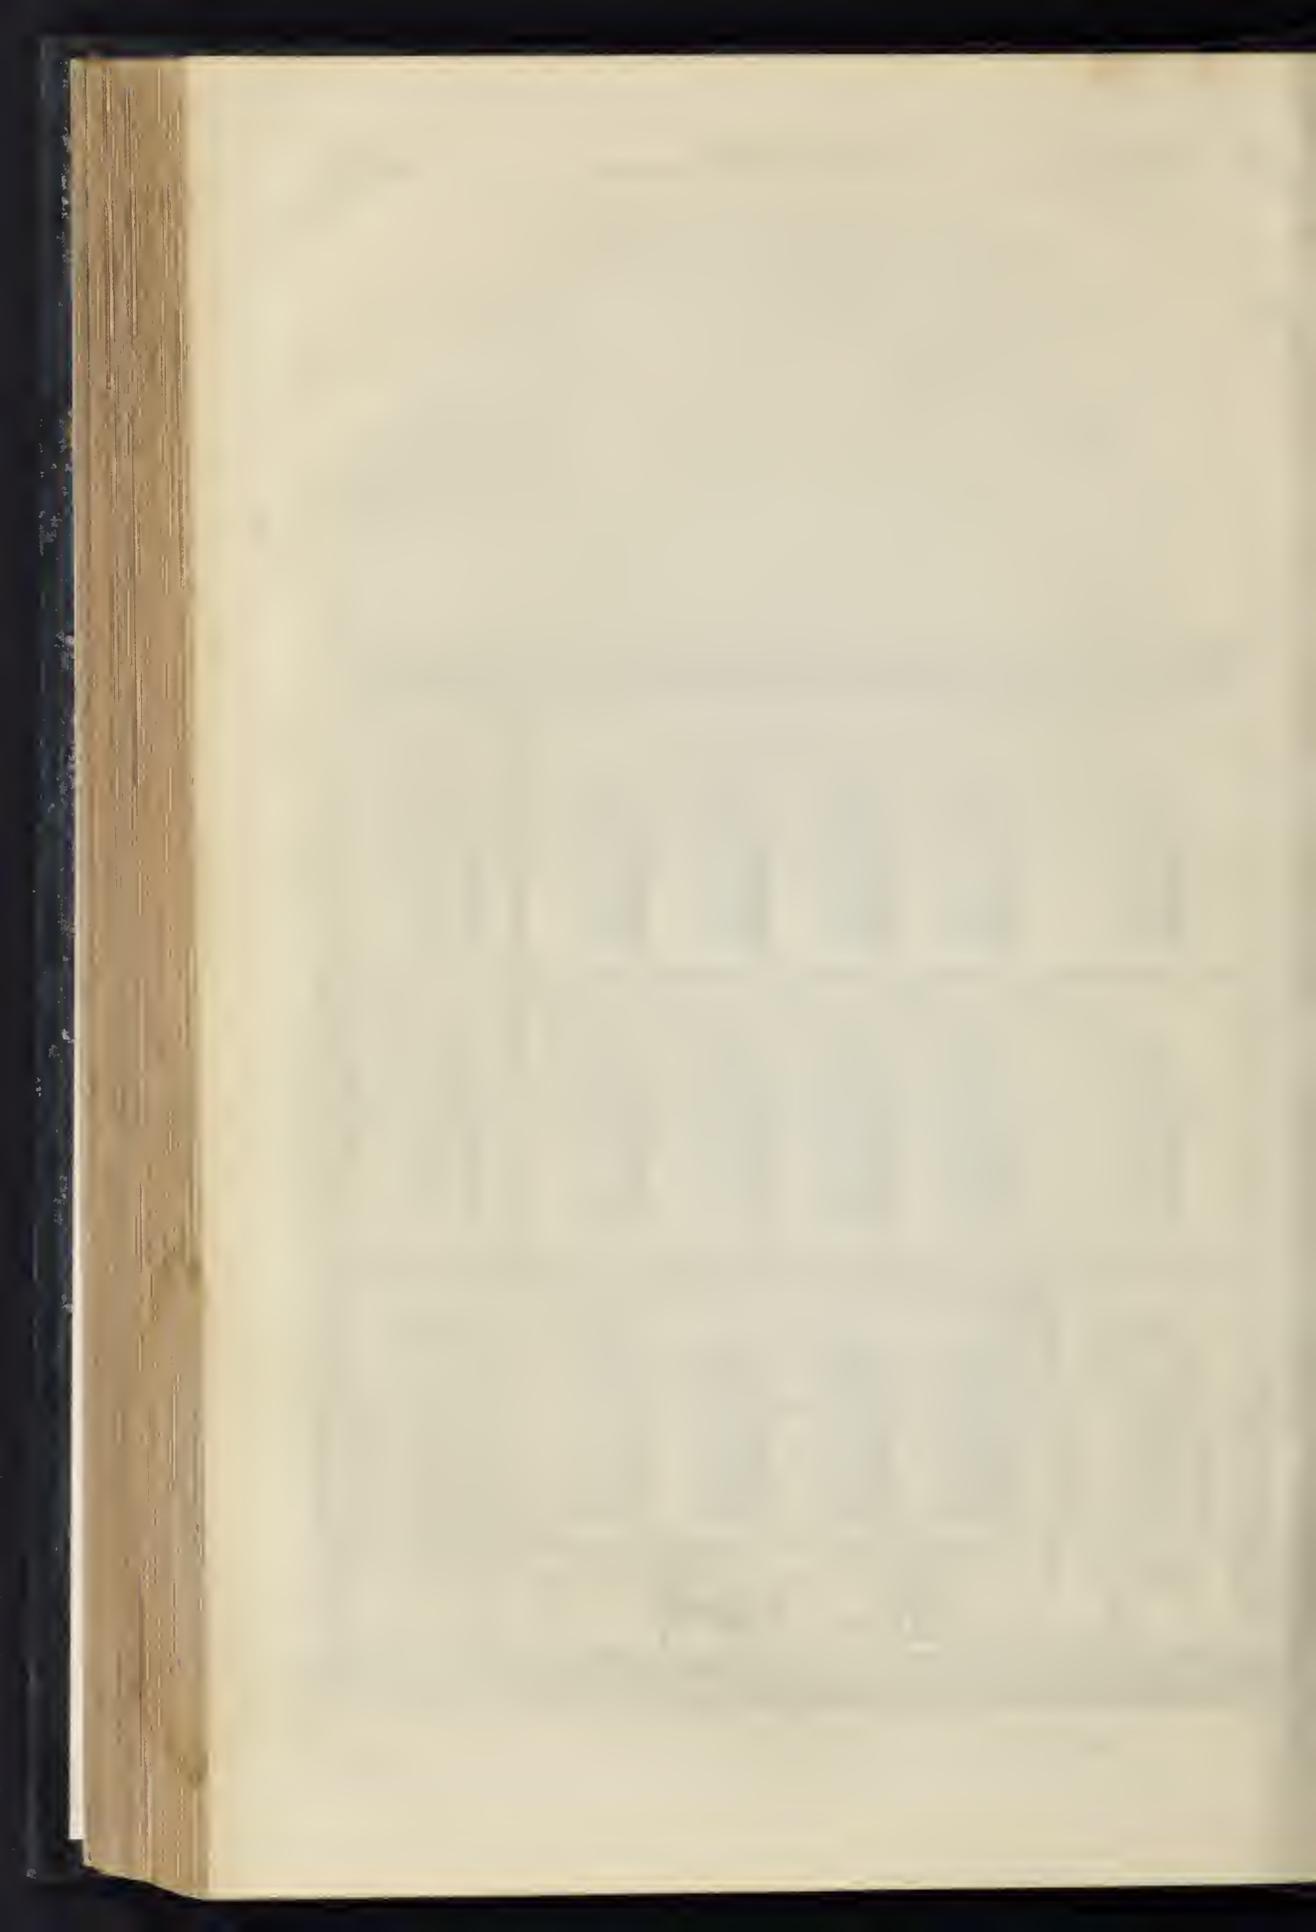

Boys' House.

BIRMINGHAM TOWN AND DISTRICT BANK.—MR. YEOVILLE THOMASON, ARCHITECT.

surveyor, it was to be out of the first instalment, which was, of course, the employer's money, and the item was very properly to be provided for by the builder at the foot of the estimate. The tenders ranged from 9,000*l.* to 7,500*l.*, or thereabouts; or, after allowing for 500*l.* worth of old materials, showed 5,000*l.* to be the lowest value to be put on the work. At the foot of all the builders' estimates the item of "Surveyor's fees, 15 per cent." was added, being included in the amount of the tender. The lowest tender was that of the old-established and respectable firm of Daniel Crowe & Sons. A deed of contract was prepared by Mr. Moore's solicitor, submitted to Messrs. Crowe's solicitors, and approved, and everything appeared in fair train for proceeding with the work, when it was found that Mr. Crowe, sen., was in too infirm a state of health to execute the contract, and some delay took place. Eventually Messrs. Crowe, jun., offered to carry on the work, giving the names of three first-rate merchants of the city of Dublin as securities. This, however, defendant did not choose to accept, and soon after, without informing either the architect, the surveyor, or the builders, changed his mind, and advertised the site for sale. None of the work had been carried out, and as the surveyor had no bill to pay him in the ordinary way, and as provided for by the "conditions of tender," he looked to the defendant to pay him, as having first employed him through his architect, and as being the only party who received any benefit. It would also be proved that defendant fully understood and approved of the plaintiff's being employed on the usual terms.

After evidence had been led for the plaintiff, Mr. Macdonough stated the case for the defendant. In course of which the Chief Justice said—Really, Mr. Macdonough, do you have any defence to this? We had a case—Taylor v. Hill—so like this before that it seems needless to waste further time on it. The only doubt then was, whether the employer or the builder was the party liable, as some work had been done; but here there can be no doubt on that subject. The custom of the trade was then proved by half a dozen witnesses. You would be better employed in another court.

Several jurors also said it was really only wasting time to continue the trial. Mr. Macdonough here conferred with defendant, and announced that his client pressed him to go on, as he had never seen the plaintiff or authorised his employment, and conceived he had a good defence to the action. Defendant addressed the Court to the same effect.

The Chief Justice said that, of course, he would try the case on, if the parties were determined on it. At the close of the evidence for the defendant, the Chief Justice briefly charged the jury. The evidence, he said, was, to some extent, contradictory; the defendant asserting that under no circumstances he was to pay the plaintiff, and that he instructed the architect to that effect. The latter, on the contrary, asserted that the surveyor was employed under the usual arrangement, as set forth in the documents, without any such special stipulation as that stated by defendant. If they believed the former, they should find for the defendant; if they believed the latter they should find for the plaintiff, as undoubtedly the work had been abandoned; and on the authority of the case cited, as well as the usage proved, the employer became liable under these circumstances.

While the jury retired, Dr. Boyd submitted to his lordship that even supposing Mr. Fogarty had been instructed, as stated by defendant, that was no answer to the plaintiff, unless it could be proved that he was aware of and had acquiesced in the alleged arrangement. (The Chief Justice took a note of the exception.)

The jury, after a brief deliberation, returned a verdict for the plaintiff for 12*l.*, 1*s.*, and costs.

THE REFORM OF HOTEL CHARGES.

THE erection of limited company hotels, and the employment of capital in them, has been generally a failure in England, as I know to my cost, having been so unlucky as to take shares in several of them. Does not this want of success arise from their scale of charges as compared to the prices at the German watering-places, the proprietors of which, with a short season of about four months, almost all make fortunes, besides benefiting by their custom the towns in which they reside? It seems impossible in our country to get the old idea "of sticking it into a few customers at the old approved rates" out of the heads of our innkeepers, whether of the old sort, or the new modern limited style.

I noticed a paragraph in one of the daily papers last month suggesting a speculation in chambers or buildings suitable for the middle classes, in the style of the Grosvenor Buildings, with sets of rooms to be rented, say, at from 50*l.* to 100*l.* per annum, with a restaurant attached, from which the residents could be supplied at a fixed tariff, and thus avoid to a certain extent the expense and trouble of servants. The idea is a good one, and worth the attention of some of your enterprising readers.

On reference to the dividends of several hotel companies, I have not been able to account for the poor returns obtained, and cannot see why an undertaking of this kind, in a thickly-populated, rich, and active country, should not yield large profits if conducted upon such principles as to secure constant employment and use of the accommodation offered to the public.

As my profession has led me to travel for many years past on the Continent, and much in England, and having been compelled by my own health and that of my family to wander about the world and reside in hotels, lodgings, and furnished houses, my attention has been frequently drawn to the matter of hotel accommo-

dation in England, and its inferiority to that on the Continent, notwithstanding that most articles of consumption are cheaper with us; and my experience has led me to ascribe this entirely to the high charges persisted in by our countrymen in face of the poor results obtained by them. To succeed, they must tap the pockets of the millions, be content with a small profit from each, and leave the old system of the yellow and blue rooms, with their dozen occupants, and their port and sherry at 8*s.* a bottle, claret at 10*s.*, to the npper ten thousand, the *parvenus* rich and others of that sort, and send the old Boniface traditions of the road to the limbo of forgotten things.

In this view I beg to submit an estimate of the returns for an establishment built to accommodate 100 guests, in the style of the German hotels, and let at an average of 2*s.* per day, and kept full by a low tariff:—

	Per Day.	Per Year.
Rent—To pay for house, furniture, &c., 100 at 2 <i>s.</i>	£10 0 0	... £3,650 0 0
Profit on food, &c.:—		
On breakfast and tea; cost, 6 <i>d.</i> , each person, charged 1 <i>s.</i>	2 10 0	... 912 10 0
On dinner; cost 9 <i>d.</i> , charged 1 <i>s.</i> 6 <i>d.</i> , 10 <i>s.</i>	3 15 0	... 1,368 15 0
On wines, say 6 <i>d.</i> , each person	2 10 0	... 912 10 0
Servants, charged at 3 <i>d.</i> , each per day	—	456 5 0

The cost here is calculated from the actual retail prices of plain breakfasts, consisting of tea, coffee, or cocoa, bread, fresh butter, and eggs or fish; dinners of plain joints of beef, mutton, or veal, with vegetables, bread and cheese, and farinaceous puddings, supplied to a family of four persons, where meat is 1*d.* per pound dearer than in London, and bread, butter, and groceries also rather higher in price, except tea, which I have taken at 2*s.* 6*d.* per pound.

Possibly some of your readers would be surprised at this estimate,—and so was I when it came out on paper. Now, here is the lowest charge at which I have ever been able to get myself and family applied in England, at hotels professing the most reasonable charges:—

4 persons—Breakfast, plain, at 6 <i>d.</i>	£0 6 0
Tea ditto 1 <i>s.</i>	0 4 0
Dinner ditto 1 <i>s.</i> 6 <i>d.</i>	0 7 0
Servants, at 6 <i>d.</i> (but generally 1 <i>s.</i>)	0 2 0
	£0 19 0

against actual cost, 5*s.* Is it any wonder, therefore, that people in my class of life, with incomes from 250*l.* to 600*l.* per annum, carefully avoid hotels and take lodgings in England, and spend the holidays in Germany or elsewhere on the Continent?

The charge of 1*s.* 6*d.* per day for each person generally made at railway hotels in England is most unreasonable, and of itself prevents many persons from frequenting them. It is the knowledge of these charges in England that has put the Germans up to imitating them to the English in a moderate ratio. It may be objected to this statement, that these figures assume that all the 100 rooms are let. So they will be at my scale of charges. Many families and other persons would reside altogether in such establishments, as they do in America. The restaurant would supply people outside of the house in the neighbourhood, and there would be other profits on wines, hire of carriages, &c., provided always that the proprietors will content themselves with moderate profits in a large turn-over. Remember that the trade is all ready-money; and surely 100 per cent. ought to satisfy an innkeeper. I know few other trades but chemists who would not be well pleased with half that rate.

As I find my pocket will not stand, this summer, the English charges, I am off to Germany next week, for a couple of months, and shall be glad if this statement will enable you to throw out any hints in your valuable paper to remedy this state of things, and enable me next year to spend my money in old England.

A RETIRED BUILDER.

Concrete Houses.—Travellers by railway and others visiting Cleckheaton, will have noticed two houses which are in course of erection there by Mr. James Cockroft, upon the concrete principle. These houses are now fast approaching towards completion. They are semi-detached, with bay windows to the front, and comprise on the ground floor four rooms each, with five bed rooms, bath-room, and closet above. The wood-work throughout will be of pitch pine varnished.

SUBURBAN VILLAGE AND GENERAL DWELLING COMPANY.

THE annual general meeting of this company has been held. The report of the directors was read, in which they revert to the difficulties they had to contend with, but are enabled to speak with satisfaction as to the present position and future prospects of the company. The estate at Longborough Park had been obtained on terms that admitted of no doubt, they thought, that, when covered, a substantial return for capital invested would be secured. The retiring directors and auditors were re-elected. The chairman said that the directors had hitherto given their services gratuitously, and should ask for no fees until the company was in a more prosperous condition.

THE ROYAL ARCHITECTURAL MUSEUM.

WE mention with great satisfaction an intimation from Sir Thos. Biddulph that her Majesty the Queen graciously consents to become the patron of the Royal Architectural Museum, and gives 50*l.* We have already mentioned that the new building, near Dean's-yard, Westminster, will be opened on the evening of July 21st. The council are understood to wish the meeting to have something of the character of the well-remembered gatherings in the old "cock-lofts" of Canon-row, whereat artists-workmen formed part of the audience, and short addresses were delivered by friends of the Institution.

THE PROPOSED MOSAICS FOR THE HOUSES OF PARLIAMENT.

WE hear that an attempt is to be made to rescind the vote enabling Mr. Lyard to fill some of the spandrels in the Central Hall with mosaics. We trust, however, it will not prove successful. That our artists have not at present produced any thoroughly satisfactory works in mosaics is no sufficient reason for stopping endeavours in that direction, but the reverse. Excellence is not to be attained by a jump: it must be perseveringly striven for.

MARTYRS' MEMORIAL.

SIR,—On reading in the *Builder* your notice of the Smithfield Martyrs' Memorial Church, it struck me as especially necessary to repeat your advice elsewhere given, that the mottoes and inscriptions should be written in the current characters of the present day, whether on stone or glass. I hope no Mediaeval notions will prevent this being done. I do not trouble you with reasons; I think they will readily occur to your readers. REFORMER.

SANITARY STATISTICS IN PARIS.

PARIS now publishes weekly returns of mortality, and furnishes to our Registrar-General the number of deaths each week, with certain information relating to the causes of death, in time for simultaneous publication in the official weekly return of births and deaths in London and thirteen other large towns of the United Kingdom. This marked sign of progress toward a complete system of International Sanitary Statistics is important beyond the mere value of the facts thus rendered available. So long as Paris neglected to publish this weekly information, which in time of epidemics is of great international interest, other large continental cities felt justified in showing the same apathy; the example now set by Paris will probably ere long be followed elsewhere. Berlin has for some time, and Vienna for a still longer period, enabled the Registrar-General to publish weekly statistics of those cities; but the value of the return received for the first time this week from Paris is greatly enhanced by its referring to the same week as the return for London, which has not hitherto been the case with either Berlin or Vienna.

According to the return received from Paris, the present population of that city is estimated at 1,883,842. In this population 840 deaths were registered during the week ending Saturday, 3rd July, which showed an annual death-rate in the week of 23 per 1,000 persons estimated to be living. In London, during the same week, the death-rate did not exceed 20 per 1,000; but in Berlin, in the seven days ending Thursday, 1st July, the death-rate was so high as 34 per 1,000.

A comparison of the relative mortality from a few diseases during last week will be interesting, although its value will be far enhanced when the comparison can be extended over a series of weeks. The numbers for Paris have for this purpose been raised in proportion to the difference of population, and are not the actual numbers registered. Small-pox would have caused 27 deaths in Paris last week (were Paris as large as London) against 4 in London. Scarlatina, on the contrary, caused only 5 deaths in Paris, against 75 in London; measles 15 against 22; and diarrhoea, 15 against 20. The fatal cases of diphtheria were as 10 in Paris to 4 in London. Inflammatory diseases of the respiratory organs, bronchitis, and pneumonia, caused 169 deaths in the week in Paris in proportion to 146 in London. The deaths resulting in childbirth were as 13 in Paris to 8 in London.

The return from Paris does not yet contain information relating to the temperature or rainfall, or to the number of births registered; but what we have is a most valuable instalment, and it will doubtless be rendered more complete ere long.

NEW STREET PAVING.

A PART of Threadneedle-street has been paved with a new material, so far as England is concerned; viz., compressed rock asphalt. This kind of paving has been used in the continent, and in Paris and other cities, and is extensively used in Paris and is being gradually repaved with it. The advantages of this material laid in the manner adopted in Paris, of which the part of Threadneedle-street is a specimen, include the absence of noise, mud, and dirt, and its durability (some of the streets in Paris having been laid fifteen or sixteen years without renewal).

The work has been executed by French workmen, under the superintendence of Messrs. Callender & Amos, who hold the right for Great Britain from the proprietors of the mines from which this rock asphalt is obtained.

LADDERS.

SIR,—I have the honour to suggest that ladders for use especially in the metropolis and large towns, could most conveniently be made of iron, folding by jointed lengths; and that these iron arms be attached to the ladders at each joint, on both sides of the ladder, for the purpose of being hooked into rivets or staples, to be placed in the walls of buildings that ladders are erected against. Such ladders would be easy to move about, and be safest when erected, and could be put up almost at any place, where otherwise ladders cannot, by reason of the difficulty of getting them set up. Modern erections could at suitable distances in their walls have iron rods run through them, with the staple end of the iron rod projecting slightly on the outside wall, and be securely fastened on the inside by a crossed pin or bar. If you name the matter, it may be carried out advantageously by some of your readers perhaps, and safety to life and limbs be obtained at very little cost or trouble.

H. H.

GLAZING.

SIR,—Can any of your correspondents give me the benefit of experience as to the use of hair felt in the place of putty, partially or otherwise, for the purpose of having glass of large size on iron skylight-bars?

CLERK OF WORKS.

DECORATION OF SURFACES.

SIR,—In reading over the article, "The Use of Plaster in Decoration" in the *Builder*, June 26th, I find the following:—"It is surely possible to devise means for impressing on the finishing coat of plaster, while still wet, such a small diaper ornament as might relieve the dreary monotony of surface."

I have been thinking of the same thing for some time. This is what I propose. Have a polished metal roller about 9 in. diameter, and from 12 in. to 18 in. long, and $\frac{1}{4}$ in. thick; die-sink the pattern on the polished surface, and roll it on the wall or ceiling while the plaster is still wet. A brush may be fixed on the frame to keep the surface moistened with oil. I have an idea for a rotary paint-brush to paint large surfaces cheaply.

The axle is a tin cylinder to hold the colour, with brushes fixed on the outside. The brushes are supplied with colour from the cylinder or root of the brushes through perforations in the cylinder. A friction wheel at each end will give motion to the brush when rolled on the wall or ceiling.

For the decoration of walls and ceilings, I propose to have a rotary stencil plate, that is, a perforated cylinder of paper or metal, with a brush inside revolving in a contrary direction.

The motion to the brush can be given by friction rollers and straps. Could not the same thing be used for plans? I think it would be cleaner and more expeditious. Instead of liquid colour, have a stiff brush and a solid cake or pad.

THOS. LEWIS JOWETT.

CHURCH-BUILDING NEWS.

Blayton.—The improvements which have for a considerable time past been carried out in St. Cuthbert's Church, are now approaching completion. The tower, which, at the building of the church, was left in an unfinished state, now begins to form a feature of the edifice as seen from a distance. Two stained-glass memorials have been inserted in the easternmost windows of the north and south aisles. The north aisle window consists of two figures, the one taken from Joh xix. 25, 26, depicting the patriarch uttering the passage:—"For I know that my Redeemer liveth, and that He shall stand at the latter day upon the earth; and though after my skin worms destroy this body, yet in my flesh shall I see God." The other figure, from 2 Timothy iv. 6-8 represents St. Paul as he expresses the words:—"For I am now ready to be offered, and the time of my departure is at hand. I have kept the faith: henceforth there is laid up for me a crown of righteousness, which the Lord, the righteous judge, shall give me at that day; and not to me only, but unto all them also that love His appearing." This window has been placed as a memorial of the late Mr. Charles Armstrong, of Newcastle. The other window, situated in the south aisle, has been erected at the sole expense of his partners, in memory of the late Mr. Henry Poole, of the firm of Poole, Austin, & Co., Blaydon Bottle Works, and consists of a coloured design, of a geometrical and grisaille character, with medallion emblems, sacred and Masonic. The great east window, which was filled with painted glass some time ago, at the cost of the present incumbent, as a memorial to his deceased relatives, has recently had the old over-glazing taken out for the purpose of better adjusting the iron bars that crossed the faces of some of the figures, and marred their effect. It has now been overglazed with patent rough plate, so arranged as to leave the figure subjects clear. These windows, as well as other three stained ornamental windows in this church, are all from the works of Mr. Henry M. Barnett, of Newcastle. There is, it is understood, a project on foot for the purpose of procuring a new organ, to be placed at the western end of the nave, immediately under the tower.

Whittington.—The chief stone of the chantry and north aisle of Elford Church has been laid. The design is by Mr. Street, and the work is in the hands of Mr. Clarkson, Tamworth. The whole expense will be defrayed by the Hon. Mrs. Howard, the patroness of the living.

Douling.—The ancient church of Douling, near Shepton Mallet, is about to be restored. It was built about 600 years ago, on the site of a former church, begun in 960, at the instigation of St. Dunstan, who visited Douling in that year, and persuaded the people to replace the old wooden church by one of stone, to be dedicated to St. Aldhelm, Bishop of Sherborne, Abbot of Malmesbury, and first Bishop of Salisbury, who died where Douling Church now stands. The total cost of the work will be about 4,000l., and it will occupy about two years.

Brindle, near Preston.—The old chancel and the Cavendish Chapel of Brindle Church are being rebuilt, and the nave also will be considerably remodelled and improved, and new bench seating provided throughout the church. The ancient church was altered, and to a great extent rebuilt, about forty years ago, in the then prevailing style of Gothic. The work is being carried out by local contributions, assisted by subscriptions from the Duke of Devonshire, patron of the living, Lord Chesham, and others. Messrs. Brade & Smales, of Kendal, are the architects; and Mr. Robert Pickup, of Chorley, is the contractor for the work.

Hartley Wintney.—The foundation-stone of a new church has been laid here. The design is decorated, and the plan comprises nave and two side aisles, transepts, chancel, baptistery, organ-chamber, vestry, &c. The materials are Bath stone and brick. The architect (Mr. Lansdowns), was selected by open competition, and the contractor is Mr. Hibbard.

Farndon (Cheshire).—The church of St. Chad, Farndon, has been re-opened. The gallery has

been taken down at the west end, thus affording once again the use of an entrance under the tower, and exposing the west window to view.

The pier arches have been cleaned of colouring, and the character of the stonework disclosed; and the font, placed at the west end, near the tower, is likewise restored. In the roof, little of the old timber remained. This has been cleaned, and moulded ribs added of pitch pine, coloured to match, and so panels have been formed, the spaces of which are plastered. In the chancel, screens and new oak seats have been added to correspond with the work done when the chancel was partially restored some years ago; while the seats throughout the body and aisles, which are all free and open, are of pitch pine, stained and varnished. The aisle floors have been laid with tiles, red, white, and buff, supplied by Messrs. Boote, of Barslem. The windows have been re-glazed throughout. With the exception of the windows in the chancel and the tower, a semi-transparent glass has been used, with blue and ruby-coloured borders. The others are tinted, and the whole of this work was attended to by Messrs. Lavers, Barrand, & Westlake. The heating will be by means of hot air from a Porritt stove, under a grating at the entrance from the north porch. In the south aisle a mural monument has been erected to the memory of Dr. W. H. Clarke, a judge in the Recorder's Court at Rangoon, who was born at Farndon, and died at sea. The inscription is on white marble under a crocketed canopy of Caen stone, supported by dark green marble shafts. The chapel of the Barnston family has been entirely rebuilt or re-aced. The old roof and ceiling were removed, and the underside of the new roof is panelled, with moulded ribs and cornice, which are slightly decorated in colour. A new window of four lights has been put in. This chapel has cost about 200l., the architect being Mr. Douglas, of Chester; and the builder, Mr. Harrison. Externally, the repairs of the church have been confined to the roof, and repointing the walls, where the mortar had fallen away. The total cost of the work is nearly 800l., but this does not include the cost of the chapel, which is borne entirely by Major Barnston. The work of restoration has been carried out by Mr. Edwin Huxley, of Holt, the foreman for Mr. J. Harrison, of Chester, upon the plans of the architects, Messrs. Kelly & Edwards, of Chester.

Hemel Hempstead.—St. Paul's Church here has been consecrated. The new edifice has been erected in the Early English style of thirteenth century. The church consists of a nave with north and south aisles, a chancel, and a transept on the north side; a vestry on the north side of the chancel, and an organ-chamber on the south side. There is a bell-turret about 60 ft. in height, which is placed on the north-west angle of the nave, with a vane at the top. The nave is divided from the aisles on each side by arcades of five bays, with shafts alternately octagonal and cylindrical, with moulded bases and caps, and pointed arches. The windows in the clearstory are circular, of four, five, and six foil, and the aisles have pointed windows arranged in triplets. The large east and west windows, and the windows of the transept and clearstory, are filled with geometrical tracery, and the east window (four-light with tracery head) is filled with stained glass by Messrs. Lavers, Barrand, & Westlake. There are three entrances to the church, viz., the north porch, which forms the principal entrance, and faces Queen-street; a large western door; and a door within the porch at the end of the north aisle. The nave and aisles have open roofs of stained deal, plastered between the rafters, and with pierced quatrefoil panels. The chancel is divided from the body of the church by a chancel arch springing from moulded corbels, and the roof of the chancel is close boarded and divided by moulded ribs into panels. The chancel is paved with glazed tiles, and the space within the Communion-rails with Minton's tiles in patterns, the passages in the nave being laid with blue and red Staffordshire tiles. The sittings in the church consist of open benches of stained deal, and there are stalls in the chancel with prayer-desks and a lectern. The pulpit, font, and reredos have been executed from the architects' designs, the two latter by Mr. Earp, of London. The walls of the church are constructed of flints, dug on the site, with quoins and dressings of Box Ground Bath stone for the outside; the pillars, arches, and dressings of the inside being of Combe Down Bath stone, with the general surfaces plastered. The interior dimensions of the church are 105 ft. 9 in. in length, by 54 ft. 4 in. in width. The height of

the nave is 24 ft. to the plat, and 17 ft. 6 in. from plate to ridge. The church affords accommodation for about 570 persons, and 300 sittings will be free. The architects were Messrs. Drury & Lovejoy, of London; the contractor, Messrs. Gibson, Brothers, of Southall. The Clerk of the Works was Mr. Richard Slanagher. The amount of the original contract was 2,800*l.*, but we are informed that the entire cost of the building will much exceed that sum.

Birkenhead.—St. James's Church has been consecrated by the Bishop of Chester. The church is situated in an area at the northern part of the town, where no less than eight streets converge. The building is in the Early English style. It was designed by Mr. Charles Evans Lang, and Messrs. J. & W. Walker, of Birkenhead, were the builders. The church consists of a nave and aisles, a clearstory, a chancel, 40 ft. in length, and north and south transepts, in the latter of which are galleries. The aisles are divided from the nave by a range of columns, and from these spring the arches which carry the clearstory and roof. At the junction of the nave and chancel is an arch which springs from reeded columns and rises some 40 ft. in height. The chancel is lighted at the east end by a triplet window, and by three coupled lancets at each of the sides. An uninterrupted view of the church is afforded from east to west, owing to the nave and aisles being unbroken and unintruded upon, except by the pews and organ, the latter being placed in the western bay of the north aisle. The western window is of considerable magnitude, and consists of three lofty lancets, which, together with the intervening arches and a triangular window above, occupy the entire west end of the nave. The church is slated to accommodate 800 adults, and is 140 ft. long by 50 ft. wide. The transepts from north to south are 86 ft. long. The tower and spire are placed at the west end of the north aisle, and rise 130 ft. high. On the south side is a porch, and at the east end are two entrances with convenient vestries. The roof has no tie-beams, but externally there are flying buttresses. Extensive schools have been built in connexion with this church. These afford accommodation for about 500 children, and there are also houses for the teachers adjoining.

Dinnington.—This small village, situate twelve miles east of Sheffield, and six miles north-west of Worksop, has been recently improved by the erection of a church, built at the sole expense of Mr. J. C. Athorpe, the lord of the manor. The new church is a small edifice dedicated to St. Nicholas. It is in the Early English style, and built by Mr. Cawthorne, of Retford. It consists of nave, chancel, and north and south transepts. The benches are open. On each side of the chancel is a stained-glass window. In the south transept is a painted memorial window, representing the resurrection of Christ. In the tracery over the window are the four evangelists, hieroglyphically represented—St. Matthew by a lust, St. Mark by the head of a lion, St. Luke by that of a bull, St. John by the head of an eagle. The west window is filled with stained glass. There are four cartoons, representing—“Christ blessing little children,” “Baptism of St. John,” “Joseph and Mary, with the Infant Child Jesus in Bethlehem,” and “Christ among the Doctors in the Temple.” The whole of the painted windows are from Munich; a wheel window is placed over them.

Hertford.—At a recent meeting of the building committee of St. Andrew's Church, the architect and clerk of the works were in attendance, and Mr. Johnson produced the names of five companies, who had sent him prospectuses for warming the church. It was resolved unanimously that the committee, on the suggestion of the architect, recommend Gurney's stoves to the consideration of the parishioners, provided the whole work of warming the church, brick-work included, be done at a cost not exceeding 100*l.* Mr. Cousine was appointed clerk of the works from the 3rd of May last, at 2*l.* 2s. per week, payable at the end of every four weeks. A rate to increase the funds was also recommended.

Jarrow.—The question of a new cemetery for Jarrow has been under consideration. The burial board have been authorised to purchase the piece of land called the — Close, situated at Shipton, in the occupation of Miss Carr, from Col. Townley, for the purpose of forming it into a cemetery, according to Mr. Thompson's plan; the whole cost not to exceed 2,600*l.*

Avington.—The Church of St. Helen's is about to be restored. The old pews are to be swept away, open seats put in their place,

and other alterations made as a commencement; and afterwards, as funds come in, the whole structure will be restored. The architect is Mr. Woodyer, of Guildford.

Books Received.

“RAILWAY Travelling in the Nineteenth Century, with Plan of Proposed Improvement, by George Lansdown. London: printed by Pettitt & Co., Frith-street, Soho.” The plan which we have urged for many years as a *sine qua non* for efficiency and safety in passenger and guard communication,—namely, a means of free transit along the train for guard or passenger,—is insisted on by the author of this pamphlet, who has patented a communication between carriages by adjustable platforms. He shows clearly that the objection of cost in altering carriages, loss of seats, &c., is all a bugbear, and that there would be gain rather than loss on the change, by comparison with the fitting up of electric or other signalling. But even that is a very secondary consideration by comparison with the public safety, which can in no other way be insured by the trim of trains in transit. The system is already in operation both in America and on the Continent, and nothing but the stolidity of our countrymen prevents its adoption here. The plans of Mr. Lansdown would accomplish the desired alteration in perhaps an unobjectionable way as possible.—“Railways and the Public. By Raphael Brandon, F.R.S.E. Second edition. Bell & Daldy.” We are glad to see that Mr. Brandon's project seems to be meeting with favour, as we agree with its principle, whatever be the merits of the precise fares fixed upon. In his preface Mr. Brandon says that, according to the returns for 1857, if his system had been in operation, the annual income would have exceeded the actual receipts by 48,000,000*l.* sterling; and that this suggests the possibility of still further reducing the fares, from 1*l.* first-class, 6*l.* second, and 3*l.* third, as he proposed in the first edition of his pamphlet to 6*l.* first-class, 2*l.* second, and 1*l.* third-class, “all the way”; even were it from the Land's End to John o' Groat's House. Perhaps Mr. Brandon only means to add strength to his first proposal, however; and certainly the public would be satisfied with that, whatever the shareholders—if any—might be. Meantime, a “National Railway Association,” with a good long list of members, has been established for the purpose of carrying out Mr. Brandon's scheme, with Mr. Brandon himself as hon. sec. A prospectus and list of members accompany the second edition of his pamphlet.—“The Paying and Non-paying Wights pulled by the Locomotive Engine in 1857, considered in connexion with existing Charges for Passengers and Goods. By B. Haughton, of the London and North-Western Railway. McCordale & Co., printers, Gardington-street, London.” This is a very different sort of pamphlet from Mr. Brandon's. The author is on the engineering staff of the North Western, and his paper on this subject was read before the Civil and Mechanical Engineers' Society, of which he is president. Mr. Haughton states that the Board of Trade and other returns on which his calculations are based

“disclose the strange facts that the average British passenger weighs 2 tons with train accessories; and that the ton of goods, &c., weighs 3*l.* tons; and by no known processes can these enormous multiplications of original net weights be reduced, consistent with affording that amount of personal security, and comfort, and accommodation now enjoyed. Let them in their future deliberations on this subject [he says] relinquish the idea which has so long clung to them, and which has been so ingeniously and persistently placed before them, that a railway passenger is a feather weight—a letter or a newspaper as it were—and that he may be treated accordingly; let them try to realize the facts as stated, as to the actual total of paying and non-paying weights pulled, and the enormous energy developed in order to produce the effect expressed in the figures as before given, viz.,—25,312,656,458, horse-miles tons.”

These, combined with the figures representing the wear and tear of material, and the labour expended in the maintenance of the system, will perhaps convince them of what an exhausting, devouring, and insatiable monster it is that they have called upon to minister to their lately-born wants, and will go far to reconcile them to the existing tariffs of fares and rates.

—“Notes on Joint-Stock Companies.” By Robt. A. Ward, Solicitor. London: Effingham Wilson, and Simpkin, Marshall, & Co. Mr. Ward is the author of a work on “Investments,” which we favourably noticed in 1852. The pamphlet under notice is one that cannot but be useful to

all intending to have anything to do with Joint Stock Companies. Take the following as an specimen:—

“Before taking shares in a company the following questions should be put to the secretary or promoters:— 1. Who are the promoters of the company? 2. How many shares have been *bona fide* subscribed for, and by whom? State in your reply the number applied for by each person. 3. Are paid-up shares to be given to any director or other person?—if so, state particulars and reasons. 4. Is any guarantee given to any subscriber against loss or liability? 5. Are any paid-up shares, and if so, how many, to be allotted to the promoters of the company; and are they to receive any, and if any, what other advantages? 6. Is any remuneration, and if so, what, fixed for the services of the directors, manager, and officers of the company? 7. Are the whole amount of the shares to be allotted if applied for? 8. Are the allotments to be made in the order in which the applications are received, or at the caprice of the directors? 9. How are the directors, manager, and other officers removable? 10. Is it proposed to place any restriction upon the transfer of shares? 11. What is the qualification of a director?”

A case of winding up is quoted, which shows that where a company is on the verge of bankruptcy, a shareholder may, nevertheless, shift a great part of his responsibility. The case was one in which a person held 250 shares in a company, for which he had paid 1,750*l.*: these he sold to a clerk of his for 1*l.*, and so escaped liability, as the court decided, on the ground that it was an absolute and bona fide transfer, out and out, without any trust or reservation. On the subject of investments, the author *inter alia* says,—

“Land companies are as yet in their infancy. My impression is, that purchasing land with judgment, and reselling it in lots with a registered title, is a very desirable mode of investment for a company or an individual, and it contains the element of speculation in a small degree only, as the land cannot be lost.”

—“The Quarterly Journal of Science. July, 1869. Longmans & Co. This number contains an interesting paper on “The Prohibitive Antiquities of and around Lough Gur,” in Ireland, by Professor Harkness, F.R.S.; illustrated by a sketch map and wood engravings. There is also one by Dr. E. Lankester, F.R.S., on the “Teaching of Natural Science in Schools;” another by F. Hall, F.R.S., on “A Ternary Geological Classification;” and various others, besides the usual Chronicles of Science and Notices of Scientific Works.—“A Letter on Clubs and Institutes for Trade Societies. Published for the Working-men's Club and Institute Union, 150, Strand.” In this little circular trade societies are very properly recommended to establish clubs, where the members may meet for the transaction of business, instead of resorting to public-houses. Some communications approving of the suggestion, from the Rev. H. Solly, Mr. Lloyd Jones, Mr. Applegarth, Mr. G. Potter, and others, are appended.—“Report on the Pollution of Rivers and Streams in Lancashire. By Councillor Joseph Brierley, C.E. *Blackburn Times* office.” This report was presented to the Royal Commissioners on Rivers Pollution, on their official visit to Blackburn; and has been reprinted from the local *Times*. The author has been for many years surveyor to the Burnley Improvement Commissioner, and engineer to the Blackburn Corporation. In this report he offers various suggestions for the consideration of the Commissioners, as remedial measures; such as that each river basin be placed under the conservancy of a proper officer; and that there be a central or controlling board, with officers under the control of the central board only; that a survey be made of all rivers and streams, and their pollution with solid matters be at once prohibited under penalties; and, as to other offensive matters, such as sewage, trade waste, &c., that two years be allowed for otherwise disposing of it; and so on.

Miscellaneous.

Blasting Rocks under the Sea.—The granite rocks which have so long impeded the navigation of the arm of the sea between New York and Long Island, are now being blasted. Apparatus is erected for working a drill under water by steam. The drill bar at its cutting end is 1*l.* in diameter, and has nineteen diamonds embedded in its face. When in motion it makes from 300 to 500 rotations a minute, and in that time, such is the cutting effect of the diamonds, the hole is sunk 1*l.* in. A number of holes, consequently, can be drilled in a day. A diver then descends and charges them with nitro-glycerine, which is exploded in the usual way.

The Society of Engineers.—On Friday, in last week, the members and associates of the Society of Engineers made their second excursion of the present season, when they visited the Chatham Dockyard Extension Works, by permission of the Lords Commissioners of the Admiralty. A steamer was chartered for the occasion, in which the members and their friends, to the number of about 100, made a pleasant run down the Thames and up the Medway, luncheon being served on the way. The band of the Grenadier Guards was on board, and added to the pleasure of the day by performing an excellent selection of music. Amongst the members present were Messrs. F. W. Bryant (president of the society), W. Adams (vice-president), Alfred Williams (honorary secretary), Perry F. Nursey (auditor), G. W. Harris (secretary), Baldwin Latham, G. Waller, A. E. Stephenson, &c. The docks, which are very extensive, are fast rising upon a large tract of marsh, formerly known as St. Mary's Island, which covers an area of about 320 acres, and lies to the north-east of the present yard. The works, when completed, will consist of four graving docks, each of which will be 510 ft. long, 80 ft. wide at the coping, and 41 ft. 6 in. from floor to coping level. They will have 28 ft. 6 in. depth of water at the highest level of the neap tides. There are also three large basins, the combined area of which will be 74 acres, and the depth of water in each 30 ft. at high-water neap tides. The works are progressing satisfactorily, and the contractor, Mr. A. Gabrieli, expects to complete them by Christmas, 1870, the time allotted in the contract.

The New Assize Courts at Durham.—These courts have been re-opened. The whole of the architectural features in the vestibule, corridor, hall, and courts have been carried out to correspond with the original design of the exterior of the building. The fittings of the interior of the courts are in Dantzic oak and American ash, with red and yellow pine linings, the woodwork of the old courts having been used as the framing or heart to the new, the whole being stained and varnished. We postpone a description of the buildings, as we shall probably illustrate them. The cost of all the works will be about 5,000l. Mr. C. Turnbull has been the clerk of the works, and has carried out the masonwork, which was principally alterations, with daily workmen, and the following tradesmen have been contractors for their different departments of the work:—Joiner and carpenter, G. Gradon, Durham; slater, R. Rule & Son, Durham; plasterer and for cement and tile flooring, W. B. Wilkinson, Newcastle-on-Tyne; painter and glazier, W. Hodgson, Durham; plumber and gasfitter, James Laidler, Durham; for heating and ventilation, Haden & Sons, Trowbridge and Manchester; furnishing, W. Robson, Durham. The whole has been executed under the superintendence of Mr. William Crosier, the county surveyor and architect.

Sanitary Report on Islington, 1868.—The report on the sanitary condition of the parish of St. Mary, Islington, for 1868, by Dr. Ballard, the medical officer of health, has been printed. In respect to the Workshops' Regulation Act, Dr. Ballard states that although he thinks it highly desirable that the Act should be put into action, the difficulties met with have entirely prevented any enforcement of its provisions. Unwholesome crowding, uncleanness, and want of ventilation, however, have been interdicted, and a good many amendments in these respects made. Under the Artisans' and Labourers' Dwellings Act three series of premises have been reported to the vestry; namely, Parocella-court, in the High-street; certain houses and shanties in Broad-street, Holloway; and certain houses in Albert-square. The last have already been closed. In the other cases the premises have been reported as being dangerous to health.

An Imperial Inventor.—Some years ago the Emperor of the French was astonished at the great space occupied by flour when packed in sacks in the usual manner, and imagined that it might be compressed into a much smaller bulk, and be thus rendered of easier transport. He at once authorised some experiments to be made on the subject, which resulted in the flour being submitted to powerful hydraulic pressure, and served to the various regiments in the cases, not only occupying a very small bulk, but protecting the flour from the damp of the atmosphere, and so preventing it from becoming mouldy.

Coroner's Report for Central Middlesex.—The sixth annual report of Dr. E. Lankester, F.R.S., is printed in the weekly sessional proceedings of the Social Science Association for 1st July. It contains much important information and suggestion on such subjects as infantile deaths and infanticide, deaths from accident, suicide, sudden deaths, &c. In six cases of death from small-pox on which inquests were held, none of the deceased had been vaccinated. Dr. Lankester calls attention to "the existence of a sect of fanatics, who, regardless of the overwhelming evidence in favour of the beneficent effects of vaccination, and in defiance of the laws of the country, recommend that children should not be vaccinated. These persons [he adds] recommend that parents should not have the births of their children registered, so that the inspectors of vaccination may not be thus enabled to discover the residences of unvaccinated children." We believe that in such cases an opinion is entertained that though vaccination diminishes deaths from small-pox it produces other diseases, but we have not yet seen anything like clear evidence that this is other than a mere fancy. Sudden death from disease of the heart, Dr. Lankester says, although it is almost a natural cause of death amongst old people, also frequently occurs amongst persons under sixty years of age, mostly from the effects of alcoholic drinks, preventing the due oxidation of the tissues.

The Prince Consort's Windsor Association.—The annual meeting of this Association has been held in Windsor Home Park. Princess Christian of Schleswig-Holstein and Princess Louise presided, and presented the prizes to the successful candidates. In a large marquee separating a smaller division, where the royal dais was erected, from that used more particularly by the general public, was a collection of exotics and fruit. Other tents in the larger half of the enclosure contained an exhibition of vegetables and fruit, and a display of cottage handicraft. There were models of locomotives, a church, lathe, electric telegraph, &c., and specimens of needlework. About 250 exhibitors dined in a large marquee. The vicar of Windsor presided. After the dinner Lieutenant-General Seymour read the report of the Committee, and the exhibitors were addressed by the vicar of Egham. The prizeholders, about 200 in number, were afterwards marshalled up to the royal dais one by one by the Committee; and as their names were called over by General Seymour, the prizes were delivered by the princesses. The prizes varied in amount from 3s. downwards, while the successful candidates in six of the classes also received framed and glazed certificates, surmounted by a medallion of the Prince Consort. The certificates were signed by her Majesty.

A Lost Opportunity.—When the Viceroy of Egypt inspected the fire brigade in the gardens of Buckingham Palace, we learn that, in order to illustrate the utility of fire-escapes, certain firemen went through the form of rescue from the roof of the palace. They assumed, we are told, a helpless state, and were carried down on the backs of their comrades, some being lowered by means of ropes. We almost wish, says the *Pall Mall Gazette*, that at the same time his Highness could have been favoured with other scenes illustrative of our habits which could not have failed to interest him, and would have been useful as warnings, if not as examples. For instance, a few hack cabs might have been driven to the palace gardens, a select number of police constables assuming a helpless condition while the vehicles were allowed to loiter leisurely through the grounds. The entrance to the palace might have been upheaved by one of our gas companies, then carefully relaid and repaved; upheaved again by a waterworks company, again carefully relaid, and then dug up once more by an underground railway company,—everybody present assuming "the helpless condition." The Viceroy would then have left the palace with a fair idea of the "working of our systems."

The late Mr. Robert Grace, Architect. We regret having to record the death of Mr. Robert Grace, architect (late of Derby), at his residence, Newton-road, Burton-upon-Trent. Mr. Grace held the office of town commissioner for several years, and during that time discharged the duties devolving upon him to the great satisfaction of all the ratepayers. His loss will be felt by a large circle of friends.

St. Alban's Congress of the British Archaeological Association.—The proceedings of the Congress will include—*Monday, Aug. 2.* Opening Meeting at the Town-hall.—Address of the President.—*Déjeuner* at the Town-hall.—Examination of the Alby Church and Monastery.—*Dinner* at the Town-hall. *Tuesday,* Excursion to Redburne, Kensworth, and Markyate Cella, and Dunstable.—Lunch at Dunstable.—Inspection of the Kneilday Way. *Wednesday,* Visit to Verulam, and the special excavations.—Luncheon.—Examination of the churches and town, and Sopwell Nunnery. *Thursday,* Excursion to Hatfield.—Examination of Hatfield House.—Visit to Knechtworth.—Reception by the President, Lord Lytton, and *Déjeuner.* *Friday,* Excursion to Hemel Hempstead and Berkhamstead.—Lunch at Berkhamstead.—Examination of the Church and Castle, and of Penley Manor House. *And Saturday,* Excursion to Abbot's Langley, King's Langley, and Cheries.—Lunch at Cheries. A number of good papers have been promised.

Holborn Board of Works has come into collision with the corporate authorities of the City. At the meeting on Monday evening last the Clerk reported that, acting under the direction of the Board, and by the advice of counsel, he had taken proceedings against Messrs. Boit, the contractors for the City Corporation. The proceedings have reference to certain works executed at the intersection of Cow Cross-street and St. John-street. An indictment has been presented at the Middlesex Sessions, and a true bill has been found, but the case has been removed by the City under a writ of *certiorari* to the Court of Queen's Bench, where it will not be heard until next November. It is a pity there should have arisen this necessity for litigation between two bodies so closely interested in each other's welfare.

The Wright Testimonial.—A painting, in commemoration of the labours of Thomas Wright, the prison philanthropist, has been presented to the Corporation of London in the Guildhall. There was a numerous assemblage of ladies and gentlemen in the body of the hall. This is one of three pictures to be presented,—one to London, one to Manchester, and one to Salford. The picture entitled "The Condemned Cell," and of which we have before spoken, painted by Mr. Charles Mercier, contains a life-size portrait of the philanthropic workman in the act of ministering to a convict supposed to be under sentence of death. The deputation from the committee was accompanied by Mr. Wright. Lord Shaftesbury presented the picture to the corporation.

New Mode of Cheapening Pig Iron.—Mr. Richard Brown, of the Shotts Iron Company, Glasgow, has provisionally protected an expedient for cheapening the production of pig-iron, which has been well received by the Scottish ironmasters. Ironstone, after being calcined, according to the usual custom, is allowed to cool down, and in many instances is permitted to lie in heaps till the grass grows over the mound, while all the time the char is absorbing moisture from the atmosphere of from 10 to 20 per cent. What Mr. Brown proposes is to remove the ore in as hot a condition as possible, and, at all events, before it reaches the temperature of the atmosphere. If removed in an incandescent state to the blast-furnace, it enters on its further stages as a protoxide instead of as a peroxide of iron, is much lighter in weight, and a consequent saving is effected in the lordship, and also in its transmission by railway. Less fuel will also be required to convert ore so removed into pig-iron. There are other improvements, and the saving from all sources is estimated at from 3s. to 5s. a ton.

The Competition for the new Market at Bradford.—A considerable number of designs are lodged at the Town Clerk's office, but they will be kept strictly private until the award has been made by the committee of the council delegated with that duty. The ground proposed to be covered is the site bounded by Godwin-street, Darley-street, Kirkgate, and Kirkgate Chapel, and the competition is confined to local architects.

Inverted Siphon.—An iron pipe, 11 in. in diameter and 8,800 ft. (a mile and two-thirds) long, has been laid in Tuolumne county, California. It runs down a mountain, under a creek, and up the ascent on the opposite side, under a perpendicular pressure at the lowest point of 684 ft.

Wholesale Destruction of Bricks.—During Sunday night in last week, a large amount of mischief was done at the brickfield of Mr. George Bradbury, Bury New-road, Manchester. Some 21,000 bricks had been stacked in walls 3 ft. or 4 ft. high, and about 80 yards long, as a final preparation for the kiln. On Monday morning the whole of these walls of bricks were found to have been thrown down, and the damage is attributed to the fact that Mr. Bradbury and his men are at variance. The great point of contention is the resolution of masters to pay by the hour. Mr. Bradbury resisted a peremptory notice he received three weeks before to cease supplying bricks to the hour men. He expresses his determination to persevere, and his yard is now every night in charge of the police. The majority of the masters, it appears, have been induced to side with the men, and the result is that some sixty or seventy firms refuse to supply bricks to those master bricklayers who enforce the hour system. On the other hand, some ten or a dozen refuse to cut off the supply, and Mr. Bradbury is one of them. Their yards have been stopped for about three weeks, the men, it is alleged, refusing to make up the bricks unless the masters promise not to supply the bricklayers who have joined the hour system. The conspiracy, therefore, as in so many other instances, is that of workmen against workmen, rather than against employers, who, in this case, are scarcely entitled to be called masters.

Public Museums and Libraries.—In the Commons, Lord H. Lennox asked the First Lord of the Treasury whether he would authorize the necessary steps being taken to effect the systematic circulation to local museums, libraries, and institutions of the United Kingdom of the superfluous and unexhibited specimens of art, science, and literature now deposited in the national museums and galleries in the metropolis. In reply, Mr. Gladstone said her Majesty's Government were very favourable to the object contemplated in the question. Some things had been done in this direction, especially at the South Kensington Museum, the powers of whose directory were not adequate to enable them to effect everything desirable. Within the past month the Treasury had had a letter from the trustees of the National Gallery to the effect that they had made collections of drawings intended to be deposited on loan at centres remote from London. Government would consider the whole subject in the interest of the public.

The Iron-gate Improvement, Derby.—The foundation-stone of the projected buildings has been laid by Mr. Councillor John Smith, who purchased the hock at the top of Amen-alley, which he has demolished, and upon the site of which he intends to erect shops, from designs furnished by Mr. B. Wilson, architect. Mr. Smith being a member of the Provincial Grand Lodge of Derbyshire Freemasons, the officers of the Ardetum Lodge and other friends were present on the occasion, and assisted in laying the stone according to Masonic order. At the commencement of the proceedings, the architect, in presenting a silver trowel to Mr. Smith, thanked him for the opportunity it had given him of showing what the Iron-gate improvement would have been if his original plan and designs had been carried out. On the conclusion of the ceremony Mr. Smith invited the company present to a dinner at the Lamh Inn.

London Association of Foremen Engineers.—The thirty-fourth half-yearly meeting was held on Saturday at the City Terminus Hotel. It was well attended, and the auditors' report and balance-sheet were presented and unanimously accepted. From these documents it appears that the institution now numbers 210 members, that the general fund amounts to 481l. 6s. the superannuation fund to 1,014l., and the widows' and orphans' fund to 15l. 10s.

Monumental.—The statue of Mr. Joseph Mayer, by Signor Giovanni Fontana, has at length been placed in St. George's Hall, Liverpool. It was by Mr. Mayer's advice that Signor Fontana, a pupil of Thorwaldsen, was selected to execute the work. The figure, we hear, is executed with vigour and feeling.—The statue of the Marquis of Westminster has been inaugurated. The defect in the inscription, to which we lately referred, has been altered from "2d Marquis of Westminster" to "Second Marquis of Westminster." The inauguration was not of a public character.

Michael Faraday.—In reply to Mr. Lyon Playfair, in the Commons, the Chancellor of the Exchequer said he deduced from facts the general rule that the practice of the country has not been to give parliamentary grants for the purpose of erecting statues to private citizens, however illustrious. There have lived Shakspeare, Milton, Newton, Locke, none of whom have had public statues erected to them. "Therefore," he said, "I think that we may well be content to pass over Faraday in such company, and I say this without any disrespect to Faraday."—We may here remark that Faraday is to be honoured in Paris. Three new streets about to be opened beyond the Arc de Triomphe at the end of the Champs Elysées, are to be named after Lebon, Torricelli, and Faraday.

Llandaf Cathedral.—The last great portions of the work of restoration before the reopening have been the rebuilding of the south-western tower,—now surmounted by a spire that makes the cathedral visible to all the country round,—and the giving again to the northern tower its crown of battlements. The cost of these works has been more than 8,000l. There are many minor details (of no little cost, however, in the aggregate) which still remain to be accomplished, such as the completion of the *flèche*, the extension of the choir, the carving of seats and corbels, and parapet, the arceding over the great west window, the provision of additional seats and a peal of bells, &c.; but all these will probably be undertaken separately, and finished year by year as resources can be found.

The Metropolitan District Railway.—At a meeting of the Metropolitan Board of Works, the engineer (Mr. Bazalgette) reported that about eighty men were employed on the Metropolitan District Railway works on the Thames Embankment, and said that unless the works were carried on more vigorously it would be some years before they were completed. Mr. Freeman withdrew a motion he had made that a mandamus be applied for, and the question was postponed until this week.

The Isle of Dogs.—There are at the present time, according to an official statement, nearly 700 houses unoccupied in the Isle of Dogs. In most instances the doors and shutters have been carried away, and every square of glass is broken. Many of the tenements are falling rapidly into decay. The total number receiving out-door relief in Poplar is 5,018, last year 6,976.

Wimbleton Sewerage.—The Local Board have had a system of drainage laid out by their surveyor, Mr. Bird, to convey the sewage from New Wimbleton, in the valley of the Wandale, and from the village of Wimbleton, to the lowest part of the common, where they propose to irrigate the land by the sewage. Mr. Grantham was called in to report upon the proposed scheme.

Luton Waterworks.—Mr. T. F. Middlemiss, who in April last resigned the surveyorship of Cockermonth, was on the 18th of June appointed engineer, manager, and secretary to this company, vice Mr. Wm. Wood, gas works, Cambridge. The works are now being constructed, and expected to be completed in a few months.

Sewage Utilisation.—The Hon. Henry Petre writes that his farm (Lodge Farm, Barking) has for the last two years been cultivated with London sewage alone as a manure. There are now upwards of 100 acres bearing corn, root, and other crops, produced solely by sewage, and Mr. Petre has no hesitation in saying that sewage can be profitably and economically used in the cultivation of all the ordinary farm crops of this country.

The Company of Armourers and Brasiers.—The office of surveyor to this company becoming vacant, an election to fill it took place on Thursday, the 1st inst. There were three candidates, Mr. Graham, Mr. Taylor, and Mr. Iebh; Mr. Graham was elected.

Destruction by Relic-hunters.—The *Dumfriesshire Courier* calls attention to the partial destruction, by some relic-hunters, of the tombstone erected by Sir W. Scott over the grave of Helen Walker, the prototype of the imaginary Jennie Deans.

Royal Academy.—At a general assembly of the Royal Academy, on the 30th ult., Mr. E. M. Barry, associate, was elected a Royal Academician.

Lynn Dock.—The Prince and Princess of Wales opened the Lynn new dock on Wednesday. Their royal highnesses were presented with an address at the Town-hall.

TENDERS.

For repairs, painting, &c., Iaverness-terrace, Hyde Park. Mr. N. S. Joseph, architect:—
Verral £373 0 0
King & Sons 282 0 0
Heeps 278 0 0

For new show-room and other works to premises, 128, Leadenhall-street. Mr. F. J. Lepard, architect:—
Gammon & Sons £1,719 0 0
Browne & Robinson 1,688 0 0
Coleman 1,660 0 0
Abraham 1,680 0 0
Newman & Mann 1,555 0 0
King & Sons 1,400 0 0
Woodward 1,450 0 0

For St. Ann's Church, Bermondsey. Mr. A. Porter, architect:—
Coleman £3,275 0 0
Dove, Brothers 3,255 10 0
Hart & Son 3,250 0 0
Meritt & Ashby 3,200 0 0
Myers 3,150 0 0
Kelly, Brothers 3,047 0 0
Nixon & Son 2,968 0 0
Webb & Son 2,974 0 0
Browne & Robinson 2,890 0 0

For Congregational chapel and school, Crewe. Mr. W. F. Poulton, architect:—
Longson £2,352 0 0
Cobb 2,060 0 0
Bowker 1,860 0 0
Bamber 1,887 0 0
Pollitt 1,860 0 0
Gohard 1,768 0 0
Parrell 1,750 0 0
Atkinson 1,668 16 0
Cottrell (accepted) 1,644 0 0

For villa residence at Caterham, for Mr. A. Nicholson. Messrs. T. & W. Stone, architects:—
Roberts £1,933 0 0
Turner & Son 1,897 0 0
Meritt & Ashby 1,777 0 0
Ward 1,751 0 0
Bill, Kaddell, & Waldram 1,725 0 0

For alterations to the Gospel Oak Tavern, Gospel Oak-fields, for Mr. T. H. Carman. Mr. F. Tyreman, architect:—
R. & T. Wilson (accepted) £385 0 0

For Saltaire Institute and School of Art, near Bradford, Yorkshire. Messrs. Lockwood & Mawson, architects:—
Hillegarth & Son £22,241 0 0
Ives & Son 2,375 0 0
Ives 19,660 0 0
Whitley 19,300 0 0
Gibson & Mansel 18,399 0 0
Barry (accepted) 18,364 0 0

For the erection of St. Saviour's Church, Battersea Park. Mr. E. C. Robins, architect:—
Forrest £5,180 0 0
Kirk 4,930 0 0
Brass 5,200 0 0
Fritchard 4,150 0 0
Newman & Mann 4,078 0 0
Dove, Brothers 4,075 0 0
Scrivener & White 4,035 0 0
Lathey, Brothers 3,896 0 0
Myers & Sons 3,729 0 0

For building the Queen Victoria, Blue Anchor-road, Bermondsey. Mr. F. Harger, architect:—
Smith £1,301 19 4
Shirley & Home 1,180 0 0
Shurran 1,144 0 0
Maeers 1,140 0 0
Davies 1,109 0 0
Whitaker 1,085 0 0
Luzford & Co. 1,030 0 0
Saunders 1,022 0 0
Schiffeld 1,009 0 0
Stone 876 0 0
For labour only.
Lancaster 549 0 0
Smith 522 4 0

For alterations and additions to the Industrial Schools, Brentwood, for the Guardians of the parish of St. Leonard, Shore-ditch. Mr. Wm. Lee, architect. Quantities supplied by Messrs. Linsdell & Gillard:—
Turner £21,000 0 0
Deacon 19,300 0 0
Henshaw 19,319 0 0
Kirk 18,889 0 0
Fish 18,341 0 0
Whitaker 17,908 0 0
Wood 17,883 0 0
Newman 17,565 0 0
Perry 17,489 0 0
Bill, Kaddell, & Waldram* 17,390 0 0
Nightingale 17,063 0 0
Winship 16,990 0 0
Blackmore 16,910 0 0
* Accepted.

For sewers, gullies, and junctions on the Leabonon Estate, Wandsworth, for Mr. J. Nickinson. Mr. D. Haylock, surveyor:—
Parsons £242 0 0
Hobson 218 0 0
Cooper 210 0 0
Blackmore 179 10 0
Chappel (accepted) 161 10 0

TO BUILDERS, UPHOLSTERS, &c. WANTED, by an ARTIST - Interior Decorator, Designer, &c. - AN ENGAGEMENT to Superintend ornament. Good references. Thoroughly acquainted with every style of Art. Apply by letter, to J. A. J. Canterbury Terrace, Canterbury-road, N.

TO ARCHITECTS AND OTHERS. WANTED, by an Architect and Surveyor, who is giving up residing from want of connection, a SITUATION as MANAGER in an Office, or on a Building Estate. Has the most practical knowledge of building operations and office work generally. - Address, 411, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as GENERAL or SHOP FOREMAN of JOINERS. Well experienced in high class works by eminent architects, church, dwellings, &c. Capable of taking entire charge of any class of building work. TO IRON AND COAL MASTERS. THE Advertiser, who for the last twenty years has had the superintendance of the Counting-house Department of a large Iron and Coal Work near Glasgow, is open for an ENGAGEMENT. - Apply by letter, addressed X. Y. Z. care of Messrs. Kingsbury & Co. 12, Clement's-lane, Lombard-street, E.C.

GILDER WANTS a JOB, house decorations or picture frames. Good references. - C. T. W. 149, Whitefield-street, Tottenham-Court-road.

TO GASETTERS, BELLHANGERS, AND HOT WATER EMPLOYMENT WANTED, as above, by a Young Man. Town or country. - Address, C. E. 46, Upper East-street, Mary-bone.

TO ARCHITECTS. A THOROUGHLY practical CLERK of WORKS, who has had several years' experience on first-class works, is desirous of an ENGAGEMENT. - Address, C. M. T. Office of "The Builder."

A GOOD PLUMBER is in want of a SITUATION. Thoroughly experienced in new work or jobbing, or a three-branch hand. - Address, PLUMBER, 29, Albert-street, Knightsbridge, London.

A QUANTITY of excellent GRAVEL, lying at the Strand Hill, to BE SOLD, in quantities, or in bulk, only at Mr. DONNELLY'S Office, 10, St. Mary's-buildings, Wych-street.

TO BUILDERS AND CARPENTERS. A STEADY Young Man, aged 21, WANTS EMPLOYMENT as CARPENTER and JOINER. Is well up in all kinds of work, and has some knowledge of Stone. Moderate wages. References if required. Town or country. - Address, H. C. 49, Bridge-street, Southwark, London.

TO BUILDERS, WRITERS, AND THE TRADE. A STEADY Young Man requires a SITUATION. Is a good writer; can do graining if required; and can make himself useful in any branch of the trade. Wages not so much an object as a permanent situation. - Address, CHACKNELL, 23, Vauxhall-bridge-road, Finsbury, S.W.

A WORKING FOREMAN of BRICK-Cutting, Laying, Plastering, Labour only. Town or country. High-as testimonials. - Address, M. 1, Longborough Cottages, Longborough-hack, Bricktop.

TO ARCHITECTS. A CLERK of WORKS of experience, well recommended, a Joiner by trade, seeks a SITUATION. - Address, A. 46, Clarendon-street, Clarendon-square, N.W.

A Young Man (aged 22) seeks an ENGAGEMENT with either an ARCHITECT, BUILDER, or SURVEYOR. If just completed his articles with an Architect and Surveyor. Satisfactory references. - Address, 419, Office of "The Builder."

A CLERK of WORKS, of considerable experience, desires a RE-ENGAGEMENT in town or country. Has excellent recommendations from last and previous employers. Can prepare working drawings, measure up jobs, and estimate. - Address, "The Builder."

A GENERAL TURNER, ROOF and OVAL, wishes a constant SITUATION. Conversant with all kinds of work, and can take charge of an engine. - Address, A. Z. 2, North-street, Finsbury, N.W.

TO ARCHITECTS, &c. A GOOD DRAUGHTSMAN, having had upwards of seven years' experience in the whole routine of office work, can 's to take charge of an ENGAGEMENT. Good references given. - Address, residing terms, 2, Park-office, Wexham-street, E.C.

A GENERAL FOREMAN or CHARGE of a JOB. An active and thoroughly competent Man. A total stranger. - Address, W. 5, Gloucester-street, Malvern Link, Worcester-shire.

TO ARCHITECTS AND SURVEYORS. A GOOD GENERAL ASSISTANT. A requires an immediate ENGAGEMENT (temporary or otherwise). - Good references and terms address, CLAUDIUS, 10, Great Trench-street, W.

BUILDERS CLERK, who has had considerable experience in estimating, measuring, making out bills and orders, and building accounts generally, is desirous of meeting with an ENGAGEMENT. He is well practised in office routine, in a good draughtsman, and understands the management of an office. - Address, SUKVEYOR, 145, Stanhope-street, Hampden-road.

TO ARCHITECTS AND SURVEYORS. A 25 is open to a RE-ENGAGEMENT. Neat and quick at work, willing to do detail. Good references. - Address, X. 1, care of Mr. BAKER, 12, Parliament-street, Westminster.

TO ARCHITECTS AND SURVEYORS. A GOOD GENERAL ASSISTANT requires a RE-ENGAGEMENT. Neat and quick at work. - High testimonials from London Architects. - Address, F. 12, Brompton.

A BUILDER and CONTRACTOR of great experience, doing good business, WANTS a PAINTER with a small capital, who would take an active part in the business. - LEE & GRAHAM, Accountants, St. George's Chambers, Albert-square, Manchester.

TO HOUSE PAINTERS, &c. A YOUNG Man wants a JOB as IMPROVER. Terms moderate. Town or country. - Address, B. D. 37, Victoria-terrace, St. John's-road.

The Builder.

VOL. XXVII.—No. 1380.

A Note
from Northampton.

LIDTHORPE, or, as it is now called, Althorp, mentioned in the first part of our note,* is about five miles from Northampton. The House has little to recommend it from an architectural point of view, but contains a library of world-wide fame, and some 400 pictures, including fine specimens of the work of Titian, Vandycck, Janssens, Holbein, Sir Antonio More, Pourbus, Snyder, Kneller, Lely, Sir Joshua Reynolds, and Gainsborough. The number of the books here is estimated by

Mr. Baker to be 33,000, and there is a further portion of the library in the town residence, Spencer House, St. James's. It is a treat at Althorp to look even at the backs of them. What real use is permitted of them we cannot say. It would be interesting, and not valueless, to learn what amount of actual benefit has been conferred on society, say during the last fifty years, by this wonderful collection of the results of man's learning and labour? The excuse made by "Charles Surface" for having sold the family library,—“For my part, I was always of a communicative disposition, so I thought it a shame to keep so much knowledge to myself.”—was really sounder than he thought it was. Of course we should be sorry to see such collections as this at Althorp dispersed, but glad enough to find them turned to greater account.

We have no intention to give a list of the pictures, or even to point out the best of them. The main thing to say is, that they well repay a journey. William, first Duke of Bedford, and George Digby, second Earl of Bristol, in one frame, is a very fine specimen of Vandycck's skill. His better known picture here of Dædalus and Icarus is to our mind less satisfactory. A powerful full-length, by Pourbus the younger, of one of the Dukes de Guise; Sarah, Duchess of Marlborough, by Kneller; Rubens, by Vandycck, a capital sketch by Rubens, representing David presenting a thank-offering to Jehovah on the return of the Ark of the Covenant; a portrait of Sir Antonio More, by himself; Sir Kenelm Digby, by Janssens; and a number of elegant female portraits by Sir Joshua Reynolds, are sure to be noticed by those who pass through the rooms. The younger Cornaro, by Titian, is another striking work.

There is a mystery, a pathos, in the colouring of Titian which is more often felt than understood. A very recent writer, whose book has scarcely left the binder's,† traces Titian's appreciation of the grandeur of Nature and the poetry of labour, his knowledge of those moments in Nature when her splendour is soul-shudding, to his early home amongst the Dolomite mountains

of Cadore:—"Even the revels of a Bacchanal were rebuked by the tones of earth and sky; and it was as in the pensive twilight of some great day that princes, senators, and soldiers, were rendered to posterity."

How well Titian was known to appreciate nature is shown in one of Aretino's letters to him, wherein he describes himself as attracted by the splendours of a sunset while looking out of window at a boat-race. "There appeared in certain places a green azure, in others an azure green, composed according to the caprice of the Master of masters—Nature; so that," says he, "I called out two or three times 'O Titian, where art thou?'" Do we not find in such scenes the true source of Venetian art, so glowing and yet so subdued? A great master was *il Gran Tizian*. The circumstances of his death were sadly in contrast with his life. The centre of a delightful circle, including rank, beauty, and genius; the entertainer of a king, and pointed to by Michelangelo as the man alone worthy to be called a painter, he died at 99, in the midst of plague-stricken Venice, 1576, abandoned and alone,—his plate and pictures carried off before his eyes by ruffians. A law had been passed that during the visitation no person should be buried in the churches; but an exception was made in favour of Titian, and the church of the Frari has, in consequence, become a place to be visited by all lovers and students of art. We are rambling, however, from Althorp. A view of the Green Park in 1760, by Hogarth, should be looked at. It shows Spencer House, and the piece of water next Piccadilly, since got rid of. There was a report the other day, by the way, that Hogarth's house at Chiswick was to be pulled down. Fortunately this was erroneous; there is no such intention, we believe, just now. Something should be done to ensure its preservation.

Judging from the richness of the dress, the admirable picture of an old lady, now called "Rembrandt's Mother," by Rembrandt, more probably represents one of his wealthy sisters; and others have thought so before us. Amongst the earlier works is an admirably-painted triptych, or rather an altar-piece with doors; the centre part of which, popularly but erroneously called "St. Jerome studying Theology," shows the saint with an open book, and pointing to a skull, with the motto on a portion of the apartment, *Respice finem*. We have seen a duplicate of the picture elsewhere. Waagen, in his usual dogmatic style, attributes it to Bartholomew de Bruyn. A piece of encaustic painting found near Beneventum, and cut out in the presence of Georgiana Countess Dowager Spencer, by permission of Ferdinand, fourth King of Naples, in the year 1793, should not be passed over. There is a small picture attributed to Claude, which is much darker than the great majority of his works. It possesses considerable beauty. After all is said by adverse critics, Claude must still retain the character of a great landscape painter. "I remember," says Sir George Beaumont, in a letter now accidentally before us, "receiving a reprimand from Wilson, the painter, for finding fault with Claude, though I qualified my observation by saying what I really thought at the time, that Wilson was a much better painter himself. 'I'll tell you what,' said Wilson, 'all I know of the matter I learnt from Claude and Cuy, the only people who ever could paint fine weather and Italian skies; and if you will study Claude well, and get acquainted with him, you will be of the same opinion. There is one picture of his (and I think he named the Doria Claude, with the Temple), which makes my heart ache. I shall never paint such a picture as that were I to live a thousand years.'" A very piquant portrait of the author of the "Fæerie Queen" (what the author called "a continued allegory, or dark conceit") reminds the visitor of the probable connexion of the poet

with the noble family of the Spencers; and if he inquire he will find little reason to doubt it. In dedications of some of his poems to three of the daughters of Sir John Spencer the relationship is referred to, and in another poem, in which various ladies are engiosed, he says:—

"No lesse praiseworthy are the sisters three,
The honor of the noble familie;
Of which I meaneast boast myself to be,
And most that unto them I am so nie."

Why in modern times his name has been spelt with *s* instead of *c* is not obvious. On the poet's monument in Westminster Abbey (for though he died "from lack of bread," he has a stone there) his name is written like that of the owner of Althorp,—SPENCER. His epitaph (we have just now looked at it to be certain) reads thus:—"Hæare lyes (expecting the second coming of our Saviour Christ Iesus) the body of Edmond Spencer the prince of poets in his tyme whose divine spirit needs noe othir witness then the works which he left behinde him."

When leaving the House and its rich contents, a piece of modern sculpture in the hall, a floating Sailor about to sink, attracts attention. If we mistake not, it is by one of our countrymen, now practising an adopted art in Florence, Captain Fuller. The expression of the face is remarkably good.

Brixworth, anciently Briolesworde and Brikelswerth, is about three miles farther on, from Northampton. Its characteristic feature, semicircular arches in the present outer walls of the nave formed by two concentric rings of so-called Roman bricks, with a flat course over each ring, will be remembered by all who have looked at illustrations of early architecture in England. They may also remember that it has a square tower at the west end, and a large staircase-turret built against the tower, with a rounded end westward. All these three features would seem to be of different dates, and all anterior to the Conquest. Good antiquaries have considered the nave to be actually Roman work, and may be right. Other good antiquaries deny this, viewing it as early Saxon work, the material being obtained from Roman buildings in the neighbourhood, and they may be right. Those who know the basilicas of Italy, those who believe that the pharos and church on Dover heights are of Roman work, will see no reason to deny at once the Roman parentage of the church at Brixworth, especially if seen now; for some of these arches have been rebuilt during the recent restoration, and look more Roman than ever, the bricks having been made to radiate truthfully, while in the original no attention had been paid to this, and the radii were all manner of ways. This is one of the misfortunes that attend restoration, however conscientiously conducted. We make no great complaint against those who conducted the work here; ancient parts are left exposed, and there seems to have been an anxious desire to do right. Modern exigencies must be met; but the question arises whether in the case of buildings of such age and national interest with respect to art-history as Brixworth, they should not be left alone, except to the extent of maintaining them, and other structures provided to fulfil their purpose.

The plan of Brixworth Church is Basilican. The nave is of two squares, and is 60 ft. long by 30 ft. wide. The chancel is one square, 30 ft. both ways. On each side of the nave, north and south, beyond the arches in question, was, not a continuous aisle, but a series of small apartments, or *cubicula*, five on each side, as excavations have shown, besides one on each side of the tower. In an upper story of the tower a three-light balustrade window, with the arches formed of bricks, altogether of the type we call Saxon, has been formed in the wall next the nave, displacing part of an arch of bricks similar to those at the sides. The turret, again, built against the tower, is also pre-Norman; so that

* See p. 537, ante. † Cadore, by Josiah Gilbert.

the extreme age of the nave is undoubted. Even if the nave were not built in the time of the Roman domination, it is work in the Roman manner carried on by the Britons or the Saxons. We have more, however, to say on this point, especially as illustrated by the tower of Earl's Barton Church, than we can get into the tail of an article, and so must break off again for a time.

THE GREAT COAL SUPPLY QUESTION.

It appears that we are to have a reprieve. Not in our days, nor even in the days of our sons, or our sons' sons, is the evil of exhausted coal fields to come upon our country. A famine, to which the cotton famine would be as nothing—a dearth of our chief source of light, of heat, and of motive power, so far as those prime elements of civilization are now artificially produced—is declared, by the best authorities, to be far from imminent. Our annual consumption of 100,000,000 of tons of coal may continue, and may augment, for more years than we need care to reckon. The wolf which was declared to be at our door is now stated to be a very distant, if not an altogether mythical, beast of prey.

Our readers may remember the glance which we afforded them, now nearly two years ago, at the coal fields of the future. The very important question of the extent of our own sources of supply, and the probable duration of their enormous and increasing yield, has, since that time, been investigated with a minute care not unworthy of the occasion. We are not yet in possession of the report of the Commission. In fact, a sort of appeal has been made to our forbearance on this score; and it is urged that the Commissioners ought not, by any public expression of impatience, to be hurried into a premature and incomplete publication of the result of their labour.

We are happy to think that the matter is not so urgent as to call for the rejection of this plea. No practical evil is likely to result from the delay of a few weeks, more or less, in the completion of the inquiry. On the other hand, it is of extreme importance that the work of the Commission should be exhaustive of the subject; and that the report should present us, not with the vagaries of individual opinion, but with the undeniable result of all that is, or that can be, known on the subject at present. So practical an object would be such a welcome novelty among the reports of the Royal Commissions that have had to deal with any great engineering questions, that we should be loth to do anything to cause miscarriage, or to impede the happy and timely delivery. To have the great question of coal supply removed from the province of opinion to that of scientific certitude, will be an achievement worthy of the best efforts of the miners, geologists, and statisticians, of our day.

The inquiry is divided into five several branches, respectively carried on by as many distinct sub-committees. The first of these relates to the limit which is placed on the productive value of our present coal-fields, by the mere condition of depth from the surface. In this respect the result of the present investigation can only be regarded as negative, or at least as provisional. The actual limit may be stated with more or less precision. The future limit can never be less remote. It may, on the contrary, be greatly extended. All improvements in our mechanical and chemical knowledge have a tendency to roll that limit further back, and to endow us with the power of penetrating yet deeper into the bowels of the earth. We may expect to learn from the report of, and from the evidence taken by, the Commission, how far increasing heat is a function of increasing depth below the level of the sea; and how far such an increase may be regarded as dependent on a general geognostic law, or how far it may be influenced by local conditions. We may also expect precise information as to the best and most reliable method of ventilation; and as to the effect of good ventilation in checking or eliminating the noxious heat of deep subterranean workings. But as to the result of methods of ventilation yet untried,—of the artificial production of a low temperature, or rather of a chemical means of absorbing heat;—or as to improvements in the mechanical mode of extracting the rich mineral wealth of the coal-fields with the minimum amount of human labour,—the Report will have but little to tell us. Under this head, therefore, we may confidently hold that the facts will be better than the anticipations, and the future more satisfactory than the present.

It will be highly desirable that, in considering this important part of the theory of our coal supply, the investigation should not be limited to the question of temperature. Human safety is no less an economic element, as regards the cost of coal, than human comfort. When we are inquiring how far a deep seam may be accessible, the high temperature which obtains in its galleries being the great obstacle to its free working, let us not forget that liability to explosion increases, both with pressure and with temperature. The Commission cannot, with justice to this object, fail to glance at the causes, and the methods of prevention, of those terrible calamities with which, since the appointment of this national inquest, our mining districts have been more than ordinarily afflicted. In speaking of the ventilation that will reduce temperature, the investigators ought to define and to recommend the system that will prevent explosions. The two objects, if not identical, are, at all events, very nearly allied, and, to some extent, are to be pursued by similar means.

The waste of consumption, the second point of inquiry, is in itself a wide and comprehensive subject. It is one that has been often dwelt upon in the pages of the *Builder*. Considered in its full extent, it is a matter of architecture and of social habit, rather than an incident of mining. It is a question in relation to which our friends, the political economists, are signally at fault. Neither the terror of the coal merchant's bill, nor the more constant aggravation of smoky chimneys and smoke-laden skies, has induced us, as a nation, to take any serious steps towards the economical, clearly, and perfect combustion of fuel for domestic purposes. A few bricks interposed behind the kitchen range, as a feeble barrier against the combusive fury of the cook (that great ally of the coal dealer), and a more general flattening of the grates of our sitting-rooms, constitute the main improvements which the past half-century has witnessed in our household coal burning. And the waste in the coal districts themselves, the consumption of slack at the mouth of the pit (nearly or quite obviated as it is by the application of all forms of coal-dust to the fabrication of artificial fuel), is but trifling in comparison to the thriftless and gigantic waste of our careless open fires.

The waste in production, which must chiefly depend on the more or less thorough exhaustion of every seam, by the removal of pillars and similar measures, is a point on which we may fairly expect that the report of the Commissioners will be full and conclusive. It is eminently a coal-owners' or coal-miners' question, and all concerned in the production of coal will look with interest to this portion of the evidence taken by the Commission, and probably to the expression of the opinion of the Commissioners on the subject.

The geological part of the question, or the statement of what we may call the *geological expectation* of the discovery of further supplies of coal beneath more recent strata, is understood to be that part of the subject on which the labours of the Commission are most forward. It is, indeed, almost enough that the honoured name of Sir Roderick Murchison is associated with this part of the investigation, to insure that this should be the case. The result of this part of the inquiry is, we are told, most encouraging. No doubt very much and very valuable information will be here forthcoming. Not so much that we can expect anything absolutely new, at all events to the geologist, as that we may expect to have all that is known to science, in its present phase, clearly and distinctly placed beneath the eye in a synoptic form. In this alone, even if no other result is to be anticipated, we may fully expect to find a justification for the appointment, and for the cost, of the Commission.

It is, however, evident that the practical value of this part of the labours of the Commissioners must depend, to a very considerable extent, on the results attained by the first sub-committee. Interesting as it may be to know under what surface soils, and at what estimated depths rich stores of the precious mineral may be fairly pre-empted to exist, the economic value of those stores will be dependent on the success of our system of deepworking. Nor will the necessity, and the very serious cost, of *verifying*, by actual sinking, any prediction ventured on from merely geological premises and induction, fail to interpose a wholesome check on the activity of the imagination, or on the energy of the scientific faith, of those who seek to burrow beneath

districts now innocent of coal, for the hurried and long unsuspected coal measures that may, or that *ought to*, lie beneath them.

The labours of the Commission would not be complete without a glance at the poetry of the subject. For we can hardly speak of the endeavours of Mr. Robert Hunt, of the Mining Record Office, to determine the coal consumption of the future, otherwise than as an exercise of the powers of imagination, in a field which that celestial faculty has, for the moment, all to itself. All that statistics has to say on this subject can be said in a few lines. The quantity of coal which we have, or which the four sub-committees agree that we ought to have, in an economically accessible condition, will come out in an approximate statement of millions of tons. At our present rate of consumption, this will last for so many years—tens, hundreds, or thousands, as the figures may show. Thus, if we take the rate of increase of consumption (whether we go back rather more than half a century to the commencement of the era of peaceful industry that succeeded the collapse of the Gallic empire, or whether we run back to the earlier epoch, of which we now celebrate the centenary, of the hinding of the genius of steam to the chariot of human civilization), we shall find a certain annual rate of increase in production and in consumption of mineral fuel to have obtained. Applying either one or the other of these two ratios of augmentation to the future, we shall again arrive at a numeric result—an *Annus Domini* considerably nearer to 1869 than that previously indicated. Any more elaborate attempt at prediction we think likely to be little more than waste of time. The rougher method is likely to be really the truer. As to certain branches or items of consumption, much is known, and, no doubt, by patient investigation, a pretty fair guess may be made as to the future. But other elements are altogether in embryo. New, and entirely unexpected, demands on the light-producing, heat-producing, motion-producing force of coal, are certain to spring up. On the other hand, the discovery of new sources of supply of light, heat, and motive power may be none the less confidently anticipated. Let us set the unknown against the unknown, and save the time that would be consumed to no purpose in the minute dissection of certain details of a great subject, the entire comprehension of which is far beyond our grasp.

In this, as in almost every engineering, mechanical, or chemical question, the ultimate arbiter is the ledger. People speak of discovering, or of inventing, other sources of light and heat than those of which we now familiarly make use. Mechanical men know that there is no difficulty in so doing. Electricity has been mentioned. We know something, as yet but a very little, of what we may expect from electricity. But the knot of the question lies in the pen-table. So long as, by the combustion of a pound of coal, we can produce a greater dynamic effect than by any method which does not cost more than the price of a pound of coal—coal will be king, or, at least, coal will be employed. When, either by the increased cost of winning coal, or by the decreased cost of the application of any other source, or reservoir, of power, this pre-eminence falls to be enjoyed by the black diamond, it is to such other sources that we shall turn. Nor are we altogether without expectation that the employment of such cheaper force may diminish, or, at all events, very seriously modify the character of, the demand for the employment of coal long before we approach any indication of the proximate exhaustion of our coal fields.

Our readers will receive this remark with the more interest from the fact that an intimation which we formerly threw out as to the great source of supply of a large proportion of the mechanical power of the future, has become invested with the character of experiment in America. The papers inform us that a patent has been taken out for economizing the tidal force. How far this appropriation of one of the most stupendous elements of mechanical agency to the inflation of an individual purse may be possible, we cannot, of course, tell. Con- veniences of detail may, of course, be protected by patent; but the idea of a tide-mill is as old as that of any form of water-mill. To propel the floats of a paddle-wheel by a rush of water, whether by a stream always gravitating in one direction, or by a reciprocating current, the inward and outward flow of which are due to the same universal force, is the same thing in principle; nor is there room for any very striking

novely in the application of the force of a current. But there are two considerations which make the question one of unusual interest to ourselves. The first is that of the great tidal rise that occurs around the greater portion of our coasts. We may reckon this at from 15 ft. to 20 ft. on an average. In some places—as in the Yarmouth Roads—the general change in tidal level is not more than 4 ft. or 5 ft. At Choptow, on the other hand, the extreme rise of the highest springs is stated to amount to no less than 70 ft., and on the occasion of the floating of the tube for the railway bridge it considerably exceeded 50 ft. Thus the power of elevation and depression which is exerted on our coasts, twice within twenty-four hours, and of which little or no mechanical use is at present made, is so enormous as to be practically limitless. A mechanical equivalent far exceeding the whole effect produced by our annual consumption of coal is now entirely neglected. We cannot suppose that this will always be the case, and that the tremendous power of the tide will be allowed to expend itself for ever on the disintegration of our cliffs, or in the scouring out (or, indeed, in the silting up) of our harbours. The other consideration is, that no country in the world is so favourably situated for the economical use of the tidal power. When we compare the extent of coast-line in the United Kingdom with the acreage of the island, we must be struck with the ready accessibility of the greater part of the country. In other cases, such as in Greece, Italy, and the Archipelago, where the ratio of coast-line to area is equal, or superior, to that which obtains with ourselves, the tidal power is feeble. But in England, Scotland, and, though less remarkably, in Ireland, the broad fringe of coast, swept by a three-fathom tide, bears a very high proportion to the gross surface of the island, and is accessible in a very unusual degree. Nor must we consider that the force of current is the only mode in which the great lifting power of the tide can be exerted. Tidal basins, with influx and eflux mechanically utilised, may be constructed with signal advantage on many portions of our coast, especially in the Principality and in the western parts of the island. But the hydraulic power is limited by the area we may enclose; that is to say, by the size of the tidal basins. As to the hydrostatic power, the only limit would seem to be that of the number of machines that may be invented or constructed. The lift of the body of water that surrounds our coasts,—say to the height of six fathoms every twenty-four hours,—amounts to a mechanical force more easy to state in figures than to realise in the mind; and any application, either of the hydraulic or of the hydrostatic energy, which may be possible in the great Western hemisphere, will always, from our geographical position, be so much more available to the inhabitants of this country, that we may afford to contemplate with considerable sang froid the mechanical outcome of the future.

Our coal-mines, indeed, we have now learned to regard a stored-up result of the action of what we may call *celestial chemistry*. The force exerted by the heat of the sun, and utilised, and, as it were, condensed by the vegetative process, lies there ready for our use. It is but going a step further to contemplate the utilization of the forces of *celestial mechanics*. Such, in its simple fact, is the tidal energy. Historically speaking, the chemical application has been first made by mankind. We burnt coal in ignorance of what combustion was. No thought of chemical science inspired the earliest experimenter, who, applying light to the black substance on which he stumbled, said,—“Aha, I am warm; I have seen the fire.” The economic value of heat is a matter at the knowledge of which we have arrived empirically. If we had never needed to cook, or to warm ourselves, we should never have invented the steam-engine. But, having gone thus far on a path which we took in entire ignorance of whither it would lead us, we are in a position to look round at the wide and noble prospect that opens before us. And, regarding the question analytically, it is evident that it is simpler to produce a mechanical result by a mechanical, than by a “chemical,” process. Had man been obliged to “evolve” his mechanical power “from his inner consciousness,” instead of having arrived at his present condition by a happy sequence of accident and of consequent experiment, he would certainly have sought the aid of the tidal force before he had thought of harnessing the submerged forests of the coal measures. That which, as a matter of history, is the last application of the

powers of nature, would, if philosophically anticipated, have been the first. Whether, therefore, our own time may witness the economical application of the tidal process or not, we cannot doubt that, if the abode of mankind is to be prolonged on this planet to a future at all commensurate with the past, we shall draw from this inexhaustible source much of our artificial supply of heat and of motion.

GEOLOGY AND BUILDING STONES.

AMIDST the many and radical changes which all professions and trades have undergone within the last twenty years, none is so important as the necessity that now exists of acquiring the knowledge of collateral sciences, many of which ranked in former days under the head of “Ologies,” to be taken up or not at the fancy of the student. They are no fancy studies now, however, but such as every man engaged in practical work must sooner or later make himself acquainted with, if he hopes to get on. Be he farmer, builder, ironmaster, brewer, or what not, there are subjects to be mastered of which his forefathers dreamt not, and of these chemistry and geology are probably the most useful; the latter, indeed, is not essential to so many trades as the former; but it is not the less useful, and especially in the provinces of architecture and building. All the same, it is a science utterly neglected by both architect and builder; and although at first it may be difficult to see the connexion between fossils and houses, there are branches of geology which are of the utmost importance to the building trade—such as lithological, which treats of the composition and character of the rocks and stones; stratigraphical, useful in all questions concerning situation, foundation, drainage, &c. And in the same way that a farmer ought to be intimately acquainted with the geologic constituents of the soil, the builder ought to have a thorough knowledge of building stones. Every holder will naturally be acquainted with the stones of his own neighbourhood or county; but taking the subject in its widest sense, there is considerable ignorance as to the geological position, durability, and capabilities of the various building stones in England, especially as difficulties are often interposed by the confusion of names, by which the same rocks are identified in different parts of the country. Even in coalfields, where one would have thought that each seam was known throughout its whole course, an interval of five or ten miles is often sufficient to give it an entirely different name, and cause the impression to be manifested that it is a new and different vein.

We propose to offer a few remarks from a geological point of view on some of the strata from which we draw our supplies, in the hope that they may not be uninteresting or devoid of some practical utility to the readers of the *Builder*. But, at the same time, we say the subject is of such importance that it would be worth while to appoint a commission, consisting of practical geologists, builders, and engineers, which should systematically report on the qualities of every known stone-bed in England. Take, for instance, the freestones of the oolite, and it will be allowed, that while recognising the economic value of the really good ones, an immense amount of rubbish called Bath or Portland stone, is sent out, which is quite incapable of resisting the action of the weather, and chips away at the first frost. It would be well if every gentleman who determines on building a house, or every committee which has to superintend the erection of a public monument, would, before putting themselves into the hands of the builder, go to the trouble and expense (which would be often saved over and over again) of having an analysis or report of the stone to be used. By so doing, the builder would often save his credit, and the employer his money.

There are but few districts in Great Britain in which the buildings do not attest, more or less, the geological character of the neighbourhood; and as an educated farmer ought to be able to prognosticate the formation by the adaptability to certain crops, so an architect ought to give a good guess at the same from a passing glance at the outside of a cottage, the building differences being frequently as sharply defined as those of geology.

In Gloucestershire, for instance, there is no mistaking the substantial look and the comfortable yellow glow of the farmhouses and churches on the top of the Cotswold oolite hills, and all

the way thence into Oxfordshire and Wilts; but at the bottom of the same line of hills, where the lias plains of the Severn Valley appear, we find a totally different kind of country building, in which timber and plaster have played the most important parts. This shows, that the formation of lias, marls, and clays is one which is not rich in quarries; for, as a general rule, the old builders used the materials that were nearest at hand, and I have no doubt that this was partly the reason why so many of the old houses of England were built of timber and plaster. They will, in most cases, be found in districts which were well wooded, and on formations which were not prolific in building quarries, such as the lias marls of Worcester and Gloucester, or the new red sandstone marls of Cheshire and Shropshire. Carriage was an important item in those days, and country gentlemen were content to build their houses and cottages from off their own estates. They did not send fabulous distances for a particular kind of stone, like the Earl of Belmore, who built his splendid mansion near Euniskillen, of Portland stone, while he had much more beautiful, and quite as durable marble on his own grounds; or like Sir Francis Willoughby, who in 1550 built Wollaston Hall, near Nottingham, of stone from Ancaster, in Lincolnshire. He said that he got the stone cheap, because he freighted the horses back again with coal from his estate; but old Camden, who was of a disbelieving nature, declared that he did it “out of ostentation to show his riches.”

Although the oolite formation is to be found running in a regular band throughout nine-tenths of the length of England, there are only a few localities in which the stone has got a world-wide celebrity, such as Portland, Bath, Cheltenham, &c. These places have become centres of production, partly on account of the superior quality, partly from their situation as regards carriage, and partly from fashion; but there can be no doubt that there are vast stores of equally good stone to be extracted at other spots.

The oolite zone, which is on an average 80 miles in breadth, extends with great regularity from Portland to Scarborough, but comprises a considerable number of divisions, in which the rocks vary extremely in their composition and value. Geologists divide the series generally into Upper, Middle, and Lower, the Upper being subdivided into Purbeck beds, Portland stone, and Kimmeridge clay; the Middle into Coral Rag and Oxford limestones; the Lower into Cornbrash, forest marble, great oolite, fuller’s earth, and inferior oolite. For practical purposes, these subdivisions are sufficient, although both geologists and quarrymen (but especially the former), have a fondness for minutiae which is puzzling to beginners. The geologist subdivides according to a particular band of fossils, by which he can identify the rock and carry out his horizon into another part of the country; but the quarryman is not so scientific in his subdivisions, which are merely founded on differences which notoriously affect the character of the rock, or the manner of working. But as a general rule, although a quarryman’s diagnosis as to character may be worth having, a geologist’s is the only one to be depended upon as to identity of beds.

The Purbeck beds are best seen in Dorsetshire, between Weymouth and Swanage, and in the neighbourhood of Wareham, almost the only localities, indeed, where they are sufficiently developed to be worked, although they are seen in a slight degree in other counties, such as Oxfordshire and Bucks. Geologically speaking, all three divisions of the Purbeck are exceedingly interesting, because they are mostly of fresh-water origin, instead of marine. One of the beds of the middle division is known as the “Cinder Bed” and is almost wholly made up of shells of a peculiar kind of fossil oyster (*Ostrea distorta*), and near the base of the Lower Purbeck is a bed called by the quarrymen the “dirt bed,” or “black dirt,” which was once an old vegetable soil, and contains trunks of fossil trees.

The Upper Purbeck beds from Swanage have furnished the stone called Purbeck marble for the shafts and columns in the Temple Church, in Westminster Abbey, for the tomb of William Rufus in Winchester Cathedral, Salisbury Cathedral, and many others. It is said that the Purbeck stone used in the older churches was not of very good quality, and weathered badly. The Purbeck beds from Wareham supplied the stone for the lighthouse at Margate and the prison at Winchester. There is a marble known as Sussex marble, which is of the Wealden age—

a fresh-water formation just prior to the Purbeck beds. This is often mistaken for Purbeck stone; but the difference may be detected by the size of the fossil shells, which are larger in the Sussex stone.

TELEICONOGRAPHY.

TELEICONOGRAPHY is a long new word, which we owe to the ingenuity of our French neighbours. It means, as those of our readers who are familiar with Greek will see at a glance, the drawing of distant objects. The French have a right to coin the word, inasmuch as it indicates a new and admirable method, discovered by a French artist, by which a faithful delineation of objects so distant as to require the use of the telescope to distinguish their details, may be readily and correctly effected.

M. Revoil, an architect well known in France, from having had charge of the restoration of the Roman remains at Montpellier, Toulon, and Nîmes, has recently been engaged in a special study of the early architecture of the southern provinces of the ancient kingdom. In the course of his attempts to arrive at exactitude of definition, by the aid at one time of the camera lucida, and at another of the telescope, he has been induced to make experiments as to the combination of the principles of the two instruments. The result of this effort M. Revoil has called the *Teleiconographie*.

The principle of this instrument is that of allowing the image transmitted by the object-glass of a telescope to pass through a prism connected with the eye-piece. The rays of light that would in the ordinary use of the telescope be transmitted direct to the eye, are refracted by this prism, and thrown down upon a table placed below the eye-piece. The distance between the prism and the table determines the size of the image projected on the latter, and it is easy for the observer to trace, on a paper placed on this sketching-table, the actual outlines indicated by the refracted light.

The idea once grasped, it is easy to work out the details. The telescope is fixed on a stand with screws and clamps, allowing of both horizontal and vertical motion, as it may often be necessary to give traverse to the instrument, in order to make a connected drawing of a larger area than can be included in the object-glass at one view. In fact, an entire panorama can be traced, if the relative positions of the axis of the telescope and the surface of the sketching-table are undisturbed.

We see no reason to doubt that M. Revoil's eyepiece might be adapted to the ordinary theodolite, so that any person who possesses one of these instruments may, at a small expense, obtain a good sketching apparatus.

The advantage possessed by the Teleiconograph over the camera lucida is manifest. The size of the image may be determined at will by the person who uses the former, without any diminution of accuracy. We have before us a lithograph of the summit of one of the towers of Notre Dame de Paris. The "croquis" was taken, by means of the instrument of M. Revoil, at the distance of about 300 metres. It is 12 in. long. A sketch taken by the aid of a camera lucida is drawn alongside, and is only 1 in. in length, or one-twelfth part of the linear measure of the bold outline of the Teleiconogram (as we suppose the new likeness will be called). Two mountain peaks, in Provence, sketched by aid of the same apparatus, show how admirably it can be applied to the sketching of country. For the purposes of military surveying, its services promise to be of the utmost value.

The Teleiconograph insures certitude in drawing, but it does not draw. It is an aid to the artist, not a self-acting substitute for his eye and hand. The sharp, bold touch of a master of the art of drawing will be as distinct from the feeble peddling of an inferior workman, when the refracting prism is used, as when free-hand sketching is resorted to. The division of attention between the object and the copy, which is often so painful, will be entirely avoided by the use of this instrument. In the hands of a true artist the result will be every way admirable,—exact as a photograph, without the distortion of all those parts of the field which are distant from the centre, and at the same time marked by all the peculiarity of touch proper to the master. The camera lucida, from its greater portability, will still hold its own, but we shall hope to see M. Revoil's instrument brought into familiar use in this country, to meet circumstances for which it is peculiarly adapted.

THE EVIDENCE AS TO THE PROPOSED LAW COURTS.

AT the committee meeting on the 9th inst. Mr. Field said that Messrs. Abraham, Waterhouse, and H. A. Hunt were the witnesses on whose evidence the Commission signed the certificate that the whole scheme (including the purchase of the site) could be carried out for a million and a half. The lowest estimate for opening Turnstile was 91,000*l.* As regards light and air on the Embankment site, he had omitted to refer to the river fogs as a great and special objection to it.

Mr. Burnet, architectural clerk of the Commission, had made the map for the Incorporated Law Society. Admitted certain inaccuracies in the details of the map, which was taken from an old Parliamentary paper showing a plan of Sir Charles Barry's for a design then recommended by him in 1845. Prepared for the Commission a reduced scheme for erecting the building on the site already purchased. The bridges of connexion with the Temple over the Strand were omitted in this scheme. The plan of the Incorporated Law Society was only incorrect in details not affecting its principle. Thought Carey-street ought not to be much less than 50 ft. wide. Had shown a street 60 ft. wide at the west side of the building. Could not speak as to the probable selling value of the Carey-street site. Some of Mr. Street's criticisms on his plans were not quite accurate. The inaccuracies complained of in the Law Society's map were unduly favourable rather than otherwise to the Howard-street site, as many new offices had arisen on the north side of Carey-street, which did not appear in the map of 1845. He prepared the reduced scheme not in any way to interfere with Mr. Street, but as a suggestion to show how much of his scheme could be carried out on the land already purchased. His descriptions of the various plans were drawn up without communication with Mr. Street. The Probate offices, Royal Commission-rooms, and a few others are omitted from the reduced scheme, as also the Probate, Admiralty, and Bankruptcy Courts. The same omissions occur in the Howard-street scheme.

Mr. Street said his first great plan provided everything originally asked for by the Royal Commission, and, with the streets round it, would cover upwards of 7½ acres. The courts were in a central block, with an internal street round it for light and air, bridges of communication around the internal street giving access to the offices beyond on the outside edge of the site. Had proposed certain additional accesses to the site from the north and west, an opening to New-square by the purchase of the houses at the north side of Carey-street; and an opening to Chancery-lane in the centre of the east front of the new building. The Commission adopted almost the whole of these suggestions, with some further additions of their own. Additional accesses to the Carey-street site appeared to him to be indispensable. At the Howard-street site he proposed to take the north as well as the south side of the street, so as to secure the erection of suitable buildings opposite the new buildings. The site gives an acreage of nearly five acres, available for building purposes. This included internal courts for light and air. Thought it an extremely good site. The accesses are good, and facilities for providing light and air, and securing quiet, are very great. Would excel the Carey-street site in those respects. The accesses to the Howard-street site are singularly good,—by the Strand, the Embankment, the railway, the river, and the bridges. The access from the north side needed most explanation. Would utilise the terrace of Somerset House as a carriage approach from Wellington-street. Had arranged with Mr. Fowler a modification of the proposed railway station. Though it was no doubt a difficulty, this would greatly reduce it, and it was no longer a serious objection to the scheme. A tunnel and arcade over it from Howard-street to the north side of the Strand could be constructed. The widening of the upper end of Essex-street would be almost necessary. The site offered great advantages in an architectural sense. A broken front would be a great advantage, and almost called for by the Embankment line being covered. A contrast with the unbroken front of Somerset House is also desirable. Could not admire the river front of Somerset House. His design projected 50 ft. beyond this front, but would hardly hide any portion of it in consequence of the considerable curve of the Embankment. There was

no reason for iron rules of uniformity of frontage. Breaks were often advantageous, and good architecture always assists itself. Looking down on the building from the Strand would not be a serious objection, as many buildings looked very well under similar circumstances. The view from Waterloo Bridge would be extremely good. Anticipated no great difficulties with the foundations, which should be about 25 ft. below the level of the roadway, with a bed of concrete 25 ft. thick. The Embankment offered great advantages for building as to access of materials, &c. This advantage might be stated as an economy of 5 per cent. on the total cost of the building. The rails of the railway are to be 17 ft. below the roadway. It might possibly be necessary to go deeper than 25 ft. for foundations in some parts. Three courts and several offices are omitted in the Howard-street scheme. The general arrangement of the plan was entirely different from that proposed for Carey-street,—not quite so good in some respects, but better in others. The rough estimate of the building is 900,000*l.*, inclusive of foundations. The scheme prepared for a smaller scheme on the ground already purchased in Carey-street had the same disadvantages of plan as the Howard-street plan, the shape of the land being very unfavourable and irregular on the western side. Is very inferior for light, air, and quiet. Additional accesses would also be indispensable, and very little could be saved in this respect by the reduced plan. The cost of the reduced plan in Carey-street would be about the same as in Howard-street. On the whole, he preferred the latter. Mr. Burnet, in adapting Mr. Street's plan to the reduced site, had spoilt it.

On Tuesday last, the examination of Mr. Street was continued, and various questions were put to him respecting the aesthetic disadvantages of the Howard-street site; Mr. Beresford Hope asking if St. Paul's would be improved by bringing it down to its present eminence, and placing it on low ground near the river.

Mr. H. A. Hunt was then examined. He was strongly in favour of the Embankment site, as the best for light, air, accesses, and surroundings. He considered that the further expenditure of a million of money would not make Carey-street a good site; and rather than do so, he would prefer to spend such a sum in buying the property between Howard-street and the Strand, and have it an open Court-yard in front of the new Courts, like that in front of the Charing Cross Station. This, however, was not in any way necessary, as he maintained the Government plan provided everything really requisite.

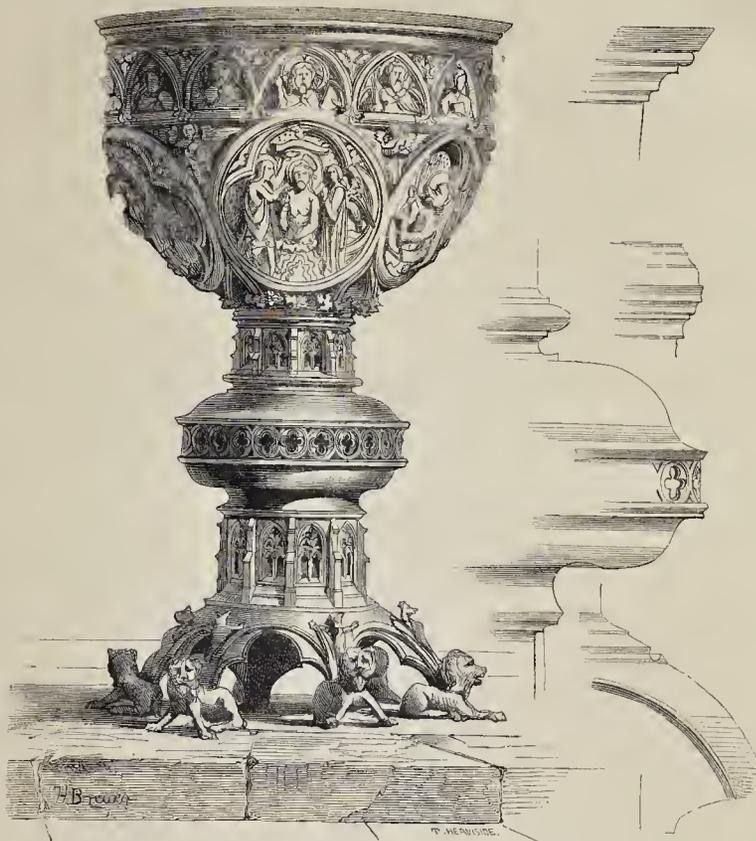

REPORT OF AMALGAMATED ENGINEERS.

THE eighteenth annual report of the Amalgamated Society of Engineers, Machinists, &c. for last year, has been printed for circulation amongst the members. It consists, as usual, chiefly of statistical and arithmetical details relating to the numerous local branches of the association. In his few preliminary remarks, the General Secretary, Mr. Allan, says:—

"In issuing this the eighteenth annual report of our society, ending December, 1868, I deeply regret that I am not in a position to announce a more prosperous state of affairs, so far as our funds are concerned. As in the previous year, it is my painful duty to report a large diminution in our accumulated fund, amounting to 26,564*l.* 0*s.* 5*d.* This is attributable to a lengthened depression in trade such as we have never before experienced; and, in this respect, we have only shared the same fate as other similar societies, the depression having extended to all branches of industry, not only in the United Kingdom, but to the whole of the continent of Europe, as well as America. This state of things has, no doubt, in a great measure (if not entirely) arisen from over-speculation and ruinous competition, which for years has existed, and which still continues to exist. However, it is to be hoped that the experience gained in the past will be the means of remedying and preventing such disastrous results in the future."

This adverse state of affairs, however, is only relative; for the society has not only been able to meet all its heavy liabilities, but possesses a balance of no less than 98,699*l.*, or nearly 100,000*l.* to meet future obligations. During the year, 109,803*l.* were expended. Of this sum, by far the largest amount was in donations, or for out of work benefit, namely, 64,979*l.*; the amount so expended in 1867 having been 58,243*l.* The sick-benefit expenditure was 16,992*l.*; accidents, 1,000*l.*; funerals, 5,043*l.*

Valuation of Property (Metropolis) Bill.—The House in committee on this Bill, have agreed to the clauses with some minor amendments.

FONT OF ST. MARY'S CHURCH, MÜNSTER.

FONT OF ST. MARY'S CHURCH, MÜNSTER.

The font of which we give an illustration is a fine specimen of Mediaeval church furniture. The material of which it is composed is bronze. Immediately below the rim are representations of our Lord and the Apostles (eleven only). Lower down are five great circles, which cover the bowl of the font, and these contain the Evangelistic symbols, and the baptism of our Lord by St. John. At the foot are six lions, and standing on their backs are six bats. The workmanship of the whole is very sharp. It appears to have been first cast, and then cleaned up with some sharp tool. The probable date is about 1350.

The following are the dimensions:—height, 3 ft. 10 in.; height of bowl, 1 ft. 6 in.; width of bowl, 2 ft. 4 in.; width of knob, 1 ft. 5 in.

DESIGNS FOR THE CORN EXCHANGE, ROCHESTER.

The corporation of the city of Rochester having decided that the erection of a New Corn Exchange would be desirable, and, judging by the appearance of the very small and dingy apartment which now bears that name, not before it was necessary, requested several architects to furnish designs, and six have responded to the invitation.

The site for the proposed Exchange is very confined, being surrounded by existing buildings except on the eastern side, where it abuts on a narrow street known as Pump-lane; the southern side is bounded by the present Corn Exchange

and other buildings, nearly excluding any chance of light from thence; and on the north and west the light would be partially built out, so that top lights, or very elevated windows, only could be of service.

The corporation in their list of requirements, which are very multifarious, desire,—“A large room to be used as a corn exchange, assembly-room, or concert-room, as occasions may require; the room is to be so arranged as that the present Corn Exchange may be used at the same time if necessary.” The lower portion of the building is also required to contain a kitchen for the purposes of corporation dinners, a library, &c., and an entrance is to be provided from Pump-lane, as well as through the present Corn Exchange. The cost of the whole is not to exceed 5,000l.

The drawings have been exhibited in the present Corn Exchange, and were very well hung. “Che sarà sarà” explains his design by six drawings to scale, a showy perspective view of a room full of elegantly dressed ladies and gentlemen, amid a tremendous array of columns, and a descriptive specification, which, if it lacks grammar, is certainly not wanting in confidence. The plan of the hall is a rectangle, 47 ft. by 85 ft. in the clear, covering nearly the whole area at command. The longer sides are divided into bays by coupled Corinthian columns, detached from the wall, standing on rather lofty pedestals, and carrying an entablature breaking forwards over each group of pillars. The whole design is very elaborate and very flashy. The ceiling is formed of two coves, one above the other, the lower grained for lunettes, and the centre is covered by three flatish glazed domes, which would appear to be very bad acoustically; although

the specification informs us that the ceiling is curved to “an acoustic cove,” and all deep coffers and skylights are avoided. How the specification and drawings are to be reconciled to one another it is hard to say.

A vast amount of space is lost by the columns, which project 4 ft. into the room, and evidently to no purpose structurally, for, on referring to the plan of the ground floor, it will be found that the wall below the level of the hall is only about 2 ft. thick, and the columns stand forward above, with nothing to carry them. They are intended to be of “Marezzo marble, with plaster caps and bases gilt.” So much for genuine materials and true principles. There is no accommodation for an orchestra, or separate staircase for performers. For dining purposes, arrangements are made for a lift and serving-room, and a little cranny is shown behind the marble columns for a refreshment-bar; but there are no apparent means of supplying it, except through the hall itself.

The principal approach through the present Exchange is pretty good. The stairs from Pump-lane are scarcely 3 ft. wide, rendering it out of the question to use this approach to the hall alone. On the ground-floor a considerable space is reserved in all the plans at the western end of the site for the yard of a public-house, over which the hall is carried in various ways in the different designs, some of which do not seem very secure. The library is badly lighted from the north; the kitchen is absurdly small, and not well supplied with larders or other appliances.

“Perseveranda” exhibits four sheets of drawings, and a perspective of a less pretentious

nature than the first we have noticed. In this case the hall is a rectangle, 42 ft. in width by 92 ft. in length, the sides being divided into six bays, as is the case in most of the designs, by single engaged Corinthian columns, projecting into the hall about 2 ft., and standing on plain block pedestals, but with very little support from below. The entablature, which is cut through by the windows, carries a deep cove, into which the semicircular heads of the windows are groined. The ceiling is commonplace, but the effect of the lighting from windows very high up would be decidedly agreeable. The hall occupies the whole area at disposal more completely than is the case with any other of the designs, but the necessary accommodation for concerts or public dinners, in fact for any purpose other than that of a mere corn exchange, is entirely ignored; and on the lower floor the kitchen is without gentry or larder, and the library, which is well lighted from Pump-lane, has no accommodation for a librarian. The approaches are very good, and two separate doors are obtained from the present Exchange, besides a good passage and staircase from Pump-lane.

There are two competitors who exhibit under the motto of "Ceres," the one showing a Gothic and the other a florid Renaissance design. The Gothic design is explained by eight sheets of general drawings and two perspectives, and shows the various requirements of the corporation more completely considered than is the case with other of the competitors, there being three plans of the great hall, showing its adaptability to the purposes of a corn exchange, a concert-room, or a dining-hall. The hall is a rectangle, 73 ft. by 45 ft., free from any sham columns or other projections. The general effect much resembles one of the large dining-halls at the universities.

The hall is divided into six bays, the lower portion of the walls lined with woodwork, and the upper part to a height of about 16 ft. from the floor divided into panels, one to each bay; and shown in the perspective as painted with subjects, intended, no doubt, to illustrate local events. Above these are lofty pointed windows groining into the lower portion of the roof, which is of a flatish hammer-beam construction, boarded on the under side of the ribs, and with square skylights along the ridge, which have not a good effect, and the perspective is so darkly coloured that the upper portion of the roof appears to be in a fog, and the whole effect is much more sombre than might be thought. The Pump-lane approach is good, and has convenient rooms beside it. The orchestra is of a rather unpleasant form, but has a separate staircase and retiring-room for performers close at hand. The principal staircase is so ingenious in plan that it is not easily comprehensible; some portions seem to suggest mounting four or five steps merely to come down again.

"Ceres, No. 2" displays four sheets of neatly-drawn plans and elevations, and seems, with the exception of his namesake, to have entered more fully into the necessities of the case than any other of the competitors. The hall, which is shown in a very attractive perspective, is different in plan from any of the others. It may best be described as a rectangle, 50 ft. by 76 ft., with the corners rounded off, and deep recesses at the ends, containing respectively the orchestra and a very theatrical-looking gallery. The total length of the hall is 94 ft. The walls are decorated with Corinthian pilasters, with round-headed windows between, and the curved corners are formed by similar windows, which have a painful effect. Above is a deep cove, glazed, and a richly ornamented flat ceiling.

The general form of the room would be probably good for musical purposes, but the glazed cove is a dangerous experiment. There are two staircases, and a capital entrance from Pump-lane, and the principal staircase is pretty designed in a square hall domed. The library is badly lighted, and kitchen dark. Taking the designs as a whole, they are nearly all of a most commonplace character, and the stipulated 5,000l. will apparently be exceeded by most of the competitors.

The National Portrait Gallery has become so large that it is necessary to find a new habitation for it until the National Gallery has been made big enough to receive it. In the meantime it is intended to transfer it to the gallery at Kensington, where the Portrait Exhibitions of the last three years were held. The transfer will be completed by the end of the year.

ARCHITECTS IN GOVERNMENT EMPLOYMENT.

On the vote of 18,222l. to complete the sum of 34,222l. for the salaries and expenses of the officers of the Commissioners of her Majesty's Works and Public Buildings being moved in Committee of Supply,—

Mr. Layard (in answer to Mr. S. Booth) explained that certain changes had taken place in the officials of the office, resulting in the appointment of Mr. Fergusson as secretary of works and buildings, the gross amount of salaries to be paid by the department to remain the same. It was found impossible to retain in that position the services of another gentleman who was an architect, who admitted that he could not give an opinion upon the estimates, plans, or elevations of another architect. He thought the committee would be of opinion that a salary of 750l. was not too much for such a functionary, and at the same time a reduction of 200l. was made in the salary of the assistant secretary. Other salaries had also been reduced.

Mr. Hunt suggested that the vote should be withdrawn for the present, and hoped the Government would not decline to do so, in order that the House might see the correspondence.

Mr. Ayrton said that there were two questions, that of the permanent arrangement, and that of the temporary. The former architect and surveyor was in this delicate position, that he was the consulting architect of the department, and yet had the power of undertaking buildings for the Government, on which he was paid by a percentage, as in his private practice. It was thought better, therefore, to have an officer under the title already mentioned, to give advice on all the operations of the department. A special arrangement was made for Mr. Pennefather completing the works he had in hand. He trusted the committee would not think it necessary to have the vote postponed.

Sir W. Galloway did not believe that a more able or more disinterested person existed than Mr. Pennefather, who was also an old servant of the Government. He wished to know if that gentleman was to leave the service without any retiring pension or allowance.

Mr. McLaren wished to ask whether it was not the fact that all estimates and plans for buildings in Scotland were made out by one gentleman, at a salary of 925l.

Mr. Layard said there was no intention to lay the slightest blame on Mr. Pennefather, and the only object had been to release him from a disagreeable position. Mr. Fergusson was not a practical architect, and could give an independent opinion on all matters connected with architecture. He could state that during the three or four months Mr. Fergusson had been in office his services had saved many thousands of pounds to the public. With regard to the Scottish business, the salary of 925l. did not include travelling expenses. As soon as Mr. Pennefather had finished the works in hand he would receive his pension, and he was perfectly satisfied with the arrangements made.

The vote as originally prepared was agreed to.

THE REBUILDING OF CARLISLE GAOL.

THE alteration of the county gaol at Carlisle, to meet the requirements of the Prisons Act, is now rapidly approaching completion. The alterations have rendered necessary the entire remodelling of the interior of the gaol. With the exception of two wards which have been converted into bath-houses; of the governor's old house, which has been used for warders' rooms, offices, and chapel; and of the store-rooms, cells, and kitchen on each side of the entrance-gate, the whole of the old buildings, according to our authority, the local journal, have been pulled down, and the materials of which they were composed have been made use of in building the new prison. The male and female wards are now in one large block four stories high, with the governor's old house contiguous to the division wall between the two, so that communication may be had from it to both wards. There are 112 cells for male prisoners, and 56 for females. The total average number of prisoners is about 100. The alterations have been rendered necessary by the determination of Parliament to adopt the separate system, so that the casual criminal may not become contaminated by communication with habitual thieves. Every prisoner has a separate cell

allotted to him; each cell being 13 ft. in length by 7 ft. in breadth, and 9 ft. in height, with an arched roof of masonry, a flagged floor, and a strong wrought-iron door. The furniture is very simple, but one thing seems exceedingly objectionable. Each cell contains what is called a *mattum in parvo*, comprising an earth-closet, convertible into a food-table, as well as cupboard and washstand.

An old building has been converted into a convenient laundry, where the female prisoners wash the prison clothes, and mangle and iron them.

A new tread-wheel is being erected by Messrs. Blaylock & Pratchitt, and by its machinery water will be supplied to the gaol from a well which has been sunk 280 ft. for that purpose, the solid rock having been bored 256 ft. of that depth. The "mill" will be enclosed in a glazed shed, and within it will be placed the mat-looms, so that all the hard labour may be going on at one time under the surveillance of the same officers.

In utilizing the governor's old house an opportunity has been afforded of enlarging the chapel. The whole of one floor of the old house has now been devoted to the chapel and vestry. The chapel is divided into two by a wooden partition, so that the males and females may be completely separated.

The cost of the alterations will be between 15,000l. and 16,000l. Mr. T. Milburn is the builder; and Mr. Gory, the county surveyor, is the architect.

PIER, HARBOUR WORKS, AND NEW HOUSE OF ASSEMBLY, ISLE OF MAN.

THE first column of the new iron pier running out from the foot of Broadway, Douglas, was driven on the 17th of March last, and the last column on the 29th of June. The pier has now been carried out about 1,000 ft. from the shore, including the platform at the outer end, which is 90 ft. in length and 40 ft. in width. The railings alongside the pier are being put up, and the houses are in course of construction. It is expected that the pier, which will add to the attractiveness of Douglas as a watering-place, will be ready for opening by the end of the present month.

At the sittings of the Legislature of the Isle the plans for the extensive harbour works at Douglas have been brought under consideration. It was resolved that a sum of 10,000l. should be granted for a further extension of the new low-water landing-place there. The members then proceeded to consider the general question of harbour works, and, after a long debate, a resolution was arrived at rescinding a former resolution of the Legislature by which it had been decided that the sum of 122,000l. should be expended upon a large work of concrete extending straight across the bay, and in its stead it was resolved that a built work running out in a north-easterly direction from Douglas Head should be substituted. The last work is estimated to cost 52,000l. for the first 550 ft., and when it is extended to that distance, the members will be asked to decide how much further and in what direction the work is to be extended, and what the cost is to be. The governor, in answer to inquiry, said that the engineer-in-chief, Mr. Goode, would receive 600l. a year during the construction of the work for his services, and for the use of his London office. Mr. Powell, who would be in immediate charge of the Douglas works, as well as the works at Ramsey and Peel, would receive 1,000l. a year salary, and 200l. a year travelling expenses.

Extensive plans of harbour works at Ramsey were then brought under the consideration of the court. There are two plans of harbour works proposed for Ramsey; a built work by Mr. Coode, estimated to cost 50,000l.; and an iron work by Mr. Dixon, the contractor for the new pier at Douglas, to cost 35,000l. A committee of the court was appointed to inquire into a report on the merits of the two plans.

The plans for the new House of Assembly at Douglas were then taken into consideration. Eight architects had been invited to send in plans and estimates of this building, which is to include law courts and public offices; but only five responded to the invitation. A prize of 150l. was offered for the best plan, and 75l. for the second best. There were only four plans sent in, two of the architects, Mr. Henry Christian and Mr. Frederick Fothergill, of London, having combined. Their design was for an ornamental building in the style of the thirteenth century, and was estimated to cost 13,000l. Mr. G. W. Hamilton, of Liverpool,

whose design was awarded the second prize, estimated the building planned by him to cost 14,000*l.* The architect in his report, said that "he had endeavoured in the design to produce a building characteristic of its intended purpose, and had avoided costly arched openings and ornamentation." The first prize was awarded to the design sent in by Mr. Burnett, of Glasgow, which was in the Tudor style, and was estimated to cost 17,000*l.* Mr. P. Ellison, of Liverpool, proposed two plans, one in the English castellated or baronial style, to cost 13,663*l.*, and the other an adaptation of the Continental Gothic, and estimated to cost 16,100*l.* The members of the court adopted the recommendation of the committee, and agreed to purchase a site for the building in an advantageous position, at a cost of 2,000*l.*, and after several hours' debate, adjourned the final consideration of the plans.

NEW MODE OF LAYING AND JOINTING PIPES.

A PATENT joint has been invented by Mr. William Williams, an active member of the Water Committee of the Town Council of Liverpool. It consists simply in the direct contact or union of a cylindrical socketed with a spherical butt-ended pipe, without the intervention or use of lead or packing of any kind. The socket end of each cast-iron pipe is made of thickness uniform with the pipe itself, and strengthened by an external hoop of wrought iron. It is then correctly bored so as to form a true section of a cylinder. Upon the butt-end of the pipe is cast a projecting boss or ring, the surface of which is turned truly so as to form the zone of a sphere, of external diameter equal and duly proportioned to the internal diameter of the cylinder. The union of the two metal surfaces is thus designed to be perfectly maintained throughout a circular ring or line of contact which within the cylinder is fixed, but varies on the spherical zone according to the angle of direction at which the pipes are united, while the tightness of the joint is unimpaired by change of position. It is therefore a movable joint, so that, within certain limits, the line of direction of the pipes may be changed, and in case of disturbance or subsidence of the ground in which they are laid, the line of pipes is self-adjusting, and the distortion is unaccompanied by fracture or leakage. It is proposed to use these pipes within the Hilton House Tunnel of the Rivington Pipe Line, where settlement is apprehended from the working of the seams of coal beneath, and a saving of 30,000*l.* is expected to result. The invention has been tested in presence of the mayor and corporation, and various architects, engineers, and others interested.

THE EXTENSION OF WORCESTER PRISON.

THE amalgamation of the city and county prisons rendered necessary an extension of the accommodation previously furnished by the county gaol. For the purposes of this extension it was decided to purchase certain property upon the west side of the old prison, and to erect on the site thus obtained an additional wing, at the cost of the city, sufficient to meet all requirements. Plans were accordingly prepared by Mr. H. Rowe, the city architect, and tenders advertised for, the one sent in by Messrs. Wood & Son, of this city, being ultimately accepted. The work was begun in September last.

The new wing is just ready for the roof. It comprises, upon the basement, capacious stores for the goods manufactured in the prison, with every facility for loading the same. There are also baths and washing-places, where the prisoners on their arrival after receiving sentence, are required to perform the most thorough ablutions before taking up their residence in the scrupulously clean and healthful apartments assigned to them. Here, too, is the apparatus for the heating and ventilation of the prison, which is upon Haden's principle. The whole is arched over with brickwork, and above, in two stories or tiers, are the cells of the prisoners, forty-eight in number. They will be well lighted, warmed, and ventilated, each cell having a separate flue communicating with the central ventilating shaft. The pure air is admitted at the top of the cell, and the impure forced through an outlet in the lower part of the cell wall. This, says our authority, the local *Herald*, is

found in practice to work much better than the reverse principle commonly adopted, as the dust from the prisoners' work is thus carried downwards, and prevented mingling with the air which he is compelled to breathe. The entire atmosphere of the cell is changed once in every seven minutes. Very few rooms of private houses, says the *Herald*, would bear comparison with these cells in the matter of pure atmosphere. Each cell, moreover, has its separate and ample water supply.

The new block or wing of the prison measures about 70 ft. by 44 ft., the external walls of which are of great thickness and very strongly built, whilst along every other course of bricks are two rows of strong iron bonding, which will prove particularly troublesome to any adventurous captive who may endeavour to pick his way through the walls. Surrounding this new wing is a spacious exercise-yard for the prisoners, enclosed by a lofty boundary wall 21 ft. high. This wall on the inner side is perfectly perpendicular, without buttresses or breaks of any kind. The heavy coping-stones have been placed upon two courses of loose bricks, and though regarded as being safe and firm enough if undisturbed, will immediately yield to the force of a man's weight, as every prisoner will doubtless be duly informed. On the outside the wall is built in steps, being thickest at the base, which, however, does not seem to manifest the same sort of consideration for confederates which the perpendicular interior and the coping-stones show for prisoners.

The new gateway has been constructed in this portion of the prison. It is a double one, so that after the ponderous outer doors have been passed by the prison-van there are still massive iron gates which bar further progress. The van will thus pass into the intervening space, and the doors on the one side will be securely closed before the gates on the opposite side are opened.

BUILDING AT THE CAMP.

A VERY rapid piece of building was done at the Wimbledon Camp for Messrs. Spiers & Pond, in the shape of a *Restaurant*, which covers an acre and a quarter of ground, and contains some 9,000 superficial feet of framed and glazed work on the façade, 400 squares of flooring, besides roofing, and all the internal fittings; a bar 200 ft. long, offices, stores, cellars, kitchen, cooking-apparatus, and all internal fittings. The building, which was designed by Mr. Penrice, is put together in lengths of 5 ft., fastened with bolts and nuts, making the whole portable, and variable as to size. This building, together with the temporary erections in troop-stables, forage and commissariat stores, entrance buildings, post and police offices, canteens, and about four miles of fencing, was put up in three weeks and two days by Messrs. W. Bracher & Sons.

The trussed gutters are a little too slight, and should be strengthened next time. The supporting posts are made hollow, and serve as down-pipes in connexion with an elaborate system of drain-pipes. The kitchen was fitted up by Mr. Dray, and all the bread used was baked in three ovens put up by Mr. Batley, of Bermondsey, at the small total cost of 75*l.* The cost of the building, without the fittings, was something over 2,500*l.* The necessity for complete arrangements is shown by the fact, that more than once from 25,000 to 30,000 persons were served in a day.

THE NEW PUBLIC OFFICES.

ON the motion for going into Committee of Supply, Mr. Goldney called attention to the sum granted for the purchase of the site for the new Public Offices, and to the proposed expenditure for the new Home and Colonial Offices, and asked the First Commissioner of Works if he had any objection to lay on the table of the House a plan of the land already purchased, and of the land intended to be acquired, with an explanatory statement, showing what portion of the land was intended to be built upon, the amount of money already laid out, and when and for what purpose it was expended. He also desired to know if a plan and estimate for the new Home Office had been prepared; and if so, the amount of the estimate, and where plans could be seen.

Mr. Leyard replied that the only objection was that the information had been already laid before the House. One portion of the plan had already received the assent of the House, and

had to a great extent been proceeded with, and a Bill was before one of the Committees upstairs relating to the acquisition of additional land, and the completion of the remainder of the buildings. As soon as that Bill was considered by the Committee, and decided upon, full opportunity would be given to the House to discuss its details. The cause of the delay in the carrying out of the scheme of buildings was, that when he came into office he found it advisable to have Mr. Scott's plans reconsidered. That had since been done, and the result had been some additional buildings, which he believed would be found of much use.

In reply to Mr. Kinnaird and Mr. Candlish, Mr. Ayrton stated that the sum expended up to the present time was 706,223*l.*, and that the total estimated cost was 1,181,000*l.* Of this sum the India Office would refund 87,000*l.*, so that the actual expenditure would be 1,094,000*l.* This latter sum, however, was subject to a further reduction of 50,000*l.* on account of exchange of property, but that was a matter still under consideration.

BRADFORD MARKETS COMPETITION.

SIR,—Amongst the numerous improvements now being effected, or proposed to be effected, in the Borough of Bradford, perhaps none is so desirable, none so urgently required, as a covered market. The indescribable place at present used for market purposes is situated near the Manor Hall, and has until within a few years been the property of the ladies of the manor. By a recent Act of Parliament, however, the Corporation have obtained possession of the property as lessees for 999 years. Since the passing of this Act, various propositions have been made with a view to the improvement of the markets accommodation of the town, but without any practical result at present.

In March last, advertisements were issued inviting the architects of Bradford to furnish designs in competition for a new covered market to be erected on the present site. The immediate object of the restriction (which, however, it is rumoured, has been violated) is not easy to perceive; but probably the committee felt that the peculiar circumstances of the site rendered necessary something more than an ordinary survey; but, if this did not constitute the motive, probably it was the *amour propre* of the townsmen, and a prophetic pity for strangers who might possibly be induced to enter the lists, that prompted them. The instructions issued to competitors contained the usual conditions, and appended thereto were three plans showing certain lines "determined upon by the council." In addition to the market itself, the competition was to include designs for exterior buildings, as shops, &c., with which it was proposed to surround *three* sides of the site.

The drawings were delivered on Thursday, the 1st July inst., and on Friday, the 9th, eight days afterwards, the Markets Committee met, and in two brief hours made their choice.

The amount proposed to be expended on the market alone is 20,000*l.*; the surrounding buildings are estimated by one of the competitors to cost 12,000*l.* The "job," therefore, is an important one, and eleven competitors have expended their time in endeavouring to meet the views of the committee. Twelve sets of drawings have been sent in, varying in number from four to thirteen; it may, therefore, safely be presumed that the committee had really an arduous task to perform in the time which they devoted to it, especially as each competitor furnishes a report with his drawings. Reading the reports alone would probably consume the whole of that time, leaving the members no opportunity to compare the merits of the various plans, or to decide upon the correctness of the descriptions given by their authors, or to ascertain whether they had conformed to the instructions or wisely altered them; or, indeed, to investigate any of the numerous questions of utility and appearance which a conscientious consideration of the subject demanded.

As Bradford offers to architects another opportunity of competing for her public buildings, it is desirable that architects should be informed how "they manage these things in Bradford;" and if those to whom the interests and welfare of the town are committed are bent upon sacrificing their public duties to their private proclivities, it will be well for architects to know how to avoid any attempt to confer the benefits of their art and learning upon them.

It will be easy to enquire what kind of decision this is which has been arrived at. Caught by the usual attractions of gorgoons, but not over-strict perspective, and high colour, both the conditions of the competition and the requirements of the public, in some cases, have been overlooked. The first selected design, *Experientia docet*, said to be by Messrs. Lockwood & Mawson, is shown in a beautifully-executed set of drawings. The perspectives, which are highly coloured, are brilliant in effect, and really beautiful as works of art. In considering the plan, however, there seems to be some loss of space in the otherwise picturesque octagonal pavilions which are placed near the two principal entrances. Some of the competitors have, we think wisely, for economical reasons, adopted galleries; these are not shown in the drawings under notice, but it is stated that they might be added; whence an effect is obtained which could not be realised consistently with an advantageous investment of the public money. The character of the interior is not in the least degree that of a market, but partakes rather of the nature of an arcade for fashionable shops; a lounge for dandies, rather than the market-place of a working man. The interior, apart from this paltry consideration of utility, is very pleasing; the enclosing walls being admirably arranged, and the light obtained from the north. The limitation of price, however, has not restrained the designer.

The design placed second in order of merit, "Northern Light" (imputed to Messrs. Andrews, Son, & Pepper), is less ingenious in plan, and relies on the arrangement of the light for its intrinsic merits. The roofs seem admirably designed for the retention of snow; and it is questionable whether the arrangements proposed, which give a glazed surface towards the north, and open upwards towards the south, would be at all effective in excluding heat. The preceding competitor is at least more successful in his arrangements in this respect. The entrances are bold, pretentious, sensational; but the remaining portions of the design are effective and well-proportioned.

The third premium is awarded to a set of drawings signed "Municipal," reported to be the work of Mr. Hargreaves. The plan is highly elaborate, the classification of the trades having been worked out. Objection might be taken to many of these arrangements; but it seems to me that all fish should be excluded from a general market; and the position of the conveniences is most deplorable. The roof is complicated and expensive, without attaining much effect. The style of the exterior findings shows some ability; but the author loses good proportions whilst seeking after novelty of form.

The whole exhibition forms an interesting collection of drawings; but some of the competitors will feel that they have placed themselves in the position of a captive slave in the triumphal procession of a Roman general, devoting themselves to the public amusement without prospect of adequate reward. But since the decision above alluded to is merely the recommendation of a committee to the town council, and will not take effect until ratified by the latter, there is yet time to hope that other means may be adopted to arrive at a right decision on merits whereof drawing is not the greatest. Some of the other competitors seem to have carefully restrained their architectural fancies within the limits of the purse committed to them; and it seems unjust both to the ratepayers of the borough and to the twelve firms who compete, that the decision should be left to a body of a dozen gentlemen, with no special qualifications for the undertaking. Had these been a dozen architects, they would have known more than would have allowed them to decide in so short a time; and it is not reasonable to expect that, being what they are (doubtless highly respectable and worthy) tradesmen, namely, they could perform such an astounding feat as to fully apprehend and pronounce justifiable judgment on so many drawings with such despatch. It is highly desirable, in order that the best man may be placed first, that professional advice should be placed in.

INTEGER.

From Ireland.—The Roman Catholic Church of Ballybophil, county Dublin, has been recently altered and remodelled internally, and a new tower, with helix and spire surmounting the same, added at south-east angle. Mr. J. J. Lyons is the architect; Mr. Wm. Conolly, the builder.

INAUGURATION OF KING'S LYNN DOCK.

We have mentioned that the new dock at Lynn was inaugurated by the Prince and Princess of Wales. The water area of the dock basin is 6½ acres. The form is that of an irregular quadrangle, the southern side being 780 ft. in length, and the northern side 590 ft. The width from north to south between the edges of the quays is about 440 ft. At the water surface the width is 420 ft., and the average depth of the dock is 31 ft. The dock is not surrounded with perpendicular quay walls, but has banks with an inclination of 1½ horizontal to 1 perpendicular, the slopes being faced or paved with solid blocks of concrete. Small craft can get up pretty close to the quays, and to accommodate vessels of considerable draught seven timber jetties have been constructed—four on the south side and three on the north side. Each jetty is 16 ft. wide and 32 ft. long, and the floors are furnished with rails leading to the lines round the dock, which are brought into easy communication with the Great Eastern system. The concrete blocks used in facing the dock basin are 4 ft. square and 15 in. thick, and they are composed of Portland cement sand, and shingle. Of these blocks 5,000 were used; they are placed on a layer of concrete and jointed with cement. The foot of the sloping wall or pavement thus formed rests on a foundation of church stone, bedded with concrete, carried down from 2 ft. to 4 ft. below the bottom of the dock. The lock-gates were put together on the spot, the ironwork being applied by Messrs. Tod & Son, of Edinburgh. The contractor is Mr. Lawrence. The plans were prepared by Mr. Brance, C.E. The dock belongs to the King's Lynn Dock Company, who were incorporated with an authorised capital of 88,000l.

SURVEYORSHIPS.

STR.—You would confer a very great favour upon many of your subscribers by giving the results of elections for surveyorships, with the name of the successful candidate; as in too many cases the election is only a farce, candidates being selected and requested to attend (at great expense) from long distances, while all the time some favoured individual is picked out for election.

J. B.

* * * We do so on all occasions when the names reach us.

SUBTERRANEAN ROME.*

ALTHOUGH most educated people have a tolerably well-defined impression of the nature and appearance of the subterranean primitive Christian cemeteries of Rome, there are yet many facts concerning them of which they must necessarily be in ignorance, because as time goes on fresh discoveries are made which furnish new information. Most people, for instance, will be surprised to hear that the extent of galleries now found, would, if drawn out in a straight line, stretch from the northernmost part of Italy to its southernmost shores. In many particulars, too, the newest information requires us to throw away opinions that were supposed to be founded on facts. Thus it is now ascertained, and demonstrated too, that the subterranean galleries and chambers are not adaptations of old sandpits or *arenaria*, but were originally made by the early Christians for the purpose to which they put them. It need be looked upon as certain that the *pozzolana* so largely used in building operations in Rome was found here, and that the workings, when abandoned because exhausted, were thus utilised. Ordinary English visitors to the dim, narrow labyrinthine passages, and the crypts opening out of them, looked into their "Murray," as that publisher's handbook is familiarly called, and read, "The origin of these subterranean cemeteries was evidently for the purpose of extracting that peculiar species of volcanic ashes called *pozzolana*, so extensively used by the ancient and modern inhabitants in their constructions. Nearly all the catacombs can be traced to no other cause. Originally *arenaria*, the classical designation of these sandpits, they were arranged

by the primitive Christians for their new destinations of dwellings, places of worship, and retirement;" and having read, they believed. More earnest students consulted hulkier volumes, but found the same opinion expressed. Looked at from an artistic point of view, too, the paintings with which they are decorated were formerly described as poor, meagre, and feeble. To entertain these opinions to-day, however, is to have fallen out of the ranks in the grand march of progress, to be behind the time, and of the old school. Murray's chapter on the catacombs was newly written for 1868, renouncing these views, and substituting for them the newly-observed fact that the catacombs were excavated out of the *trufa granularis*, which material was useless for any other purpose, showing that it must have been selected by the early Christians as suitable for graves, and not adapted by them because it was already hollowed out ready to their hand. Again, the language of the old criticism of the worth and date of the art-work no longer applies. Specimens that were inaccessible and scarcely to be made out have in these latter days been opened out; many others have been found, and a certain degradation from simplicity and excellence to be noted in those examples that are clearly the first steps of Mediæval effort, points out that many works of much richness, freedom, and variety must be of earlier date than those of this stiff and meagre type. And when this poorer style of art is known to belong to the end of the third century, it follows that the earlier specimens must have been painted in days that were close upon those we term Apostolic.

Who is it that makes these discoveries, and comes to these conclusions? As is well known, a Commission of Sacred Archaeology has been directing excavations for some years, and among the members of this Commission were the late Padre Marchi, who published an important work upon the monuments of the primitive Christians, and in other ways gave great impulse to the interest felt about them; and the Commendatore de Rossi, who has given nearly thirty years of his life to a minute examination and classification of the same relics of early Christian art. For the last few years all eyes in Rome have been directed to the appearance of a renowned work by this last-mentioned authority, which was expected not only to recount the proceedings of the society, or the results of them, but to give to the world a narrative of surpassing interest, which his discoveries would enable him to relate. Padre Marchi's work was published in 1841. The twenty-eight years that have elapsed since that date have proved more fruitful than the two centuries that preceded it; and De Rossi's industry has been rewarded with the discovery of six or seven historical monuments of great interest, to the position of which, owing to his intimate acquaintance with all the old records, and, specially, two ancient itineraries, he was able to point beforehand with sufficient precision to lead to a successful search. The Commendatore's work, profusely illustrated, and entitled "Roma Sotterranea," has now appeared, and has been received, in Italian archaeological circles, with much cordiality as well as profound respect. And now Messrs. Longmans & Co. have placed it in the power of the English reader to make himself conversant with the nature of the recent discoveries on sites so indissolubly connected with the fortunes of those who first embraced the new faith the apostles preached, by publishing an admirable condensation of it, with his consent, in the English tongue. They have committed this task of compilation to Dr. Northcote and the Rev. W. R. Brownlow, who have executed it with much fidelity, appreciation, and some, if not quite sufficient, circumspection.

To study these ancient catacombs, where not "cooked," is to take up the history of Christianity from the time and place where the New Testament breaks off the wondrous thread. Immediately we approach them we are transported back to those old times when the bodies of St. Peter and St. Paul were not newly buried; and when many who had listened to their stirring words entranced, were still living. De Rossi speaks positively on this head:—"Precisely in those cemeteries to which history or tradition assigns apostolic origin, I see, in the light of the most searching archaeological criticism, the oracle of Christian art and Christian inscriptions; there I find memorials of persons who appear to belong to the times of the Flavii and of Trajan; and finally, I discover precise dates of those times." There is one inscription known bearing date the third year of Vespasian,

* Roma Sotterranea; or, Some Account of the Roman Catacombs, especially of the Cemetery of San Callisto, Compiled from the Works of Commendatore de Rossi, with the consent of the Author, by Rev. J. Spencer Northcote, D.D., President of St. Mary's College, Oscott; and Rev. W. R. Brownlow, M.A., Trinity College, Cambridge, London: Longmans, Green, Reader, & Dyer, 1869.

i.e. A.D. 72, but no record has been kept of the sites on which it was found. In the catacomb of St. Lucina, however, scratched on the mortar of one of the *loculi*, was found by Boldetti a record of the time of the Consulate of *Sura et Senecio*, which marks the year A.D. 107; and another on marble in the same place recording *Piso et Bolano*, Consuls, A.D. 110; as well as a third inscription which De Rossi considers marks the burial of a Christian within forty years of the time that the body of St. Paul was deposited in the same place. This interesting record runs thus:—

“DORMITIONI
T. PLA. ETVY
CHIO. QVI. VI
XII. ANN. XVIIIII
MES. XI. D. III
HYNO. LOCVM
MORAVIT. M.
ORRIVS. HELI
YS. AMLOVS
KARISSIMVS
KAIRES. BALE.”

“As a resting-place for Titus Flavius Eutyrius, who lived nineteen years, eleven months, three days, his dearest friend, Marcus Orbes, gave this spot. Etwelw, beloved.”

The cemetery of Saint Priscilla, on the Via Salaria Nova, always said to have been dug on the property of the family of Pndens, converted by the Apostles, also presents evidences that confirm the statement of this antiquity. The catacomb of St. Agnes is supposed to be no other than the cemetery of Ostriarius, described by Paurinus, the Augustinian friar, as the oldest of all, “because it was in use when St. Peter preached the faith of the Romans;” and, again, the sepulchre at Tor Marancia is now identified as that cemetery which was formerly called by the name of St. Domitilla, or by that of her chamberlains, Saints Nereus and Achilles, for two inscriptions found there clearly state that the ground formerly belonged to this member of the imperial family. After glancing in succession at the principal catacombs supposed to be of apostolic antiquity, the authors of this summary of De Rossi’s work, thus draw up the facts of the position:—

“The local traditions of ancient Christian Rome have come down to us, partly embodied in the acts of the martyrs; partly in the stories that were told to foreigners visiting the city in the seventh and eighth centuries, and by them committed to writing in itineraries; partly in the ‘Books of Indulgences,’ and in the ‘Book of the Wonders of Rome,’ compiled both for the use of strangers and of citizens; partly also, but more sparingly, in the scattered notices of a few Medieval writers. From a diligent comparison of all these various authorities, it is gathered that some five or six of the subterranean cemeteries of Rome were believed to have had their origin in apostolic times; and in every one of these instances, so far as we have an opportunity of examining them, something peculiar has been either noted by our predecessors, or seen by ourselves, which gives countenance to the tradition. When these peculiarities are brought together, they are found to be in perfect harmony, not only with one another, but also with what we should naturally expect from a careful consideration of the period to which they are supposed to belong. The peculiarities are such as these:—Paintings in the most classical style, and scarcely inferior in execution to the best specimens of contemporary Egyptian art; a system of ornamentation, in fine stucco, such as has not yet been found in any Christian subterranean work later than the second century; crypts of considerable dimension, not hewn out of the living rock, but carefully, and even elegantly, built with pilasters and cornices of bricks or terra-cotta; no narrow galleries, with shell-like graves thickly placed in the walls, but spacious *ambulatoria* with painted walls, and recesses provided only for the reception of sarcophagi; whole families of inscriptions, with classical names, and without any distinctly Christian forms of speech; and, lastly, actual dates of the first or second century. It is impossible that such a marvellous uniformity of phenomena, collected with most patient accuracy from distant and distant cemeteries on all sides of the city, and from authors writing at so many different periods, should be the result of accident or of pre-conceived opinion.”

Two of the itineraries mentioned as having conveyed useful information to the archaeologist were discovered only about a hundred years ago in the library of Salzburg, and were therefore unknown to Bosio and other writers on the Christian remains after their discovery in A.D. 1578. One of these important guides was written between the years 625 and 638, and the other within a few years of the same date. The first starts from the centre of Rome, passing out through the Flaminian Gate, and passes to the principal roads from one to the other by paths, some of which can be still pointed out; the other follows a similar plan, but is second to it in interest, because the writer does not seem to have actually made the survey himself, but rather to have compressed the descriptions he gives from some larger work; but both of them are useful in containing mention of topographical details concerning the cemeteries before the great work of emptying them of their choicest contents was commenced. A third document that has been useful in pointing out the locality of particular tombs is a list of relics collected

by Abbot John from the various shrines in the catacombs, in the days of St. Gregory the Great, for Theolinda, Queen of the Lombards, which list is written on papyrus, and preserved with some of the relics in the cathedral of Monza. But the chief clue to the success of De Rossi’s labours was the tact which enabled him, instead of rejecting these authorities as worthless, to accept their help. He saw that where St. Damasus and other early popes had been at the trouble to build spacious staircases down to particular spots in the catacombs, would be found the tombs of martyrs that were once visited by pilgrims, for whose accommodation these means of access had been made. Whereas, Padre Marchi avoided such places as bore evidence of having been tampered with in later times, and was always on the look-out for chambers and galleries in their primitive condition as when first hewn out of the rock, De Rossi judged that where the crypts had been changed into sanctuaries, *luminaria* opened out for light, and air-galleries widened, and any other structural arrangements made for the accommodation of numbers, then he stood upon a side of the utmost value. Pope Damasus, too, must not be overlooked for the large share he has borne in handing down a true history of the contents of the catacombs in his custom of renewing old inscriptions, and placing others to mark important sites. His assistance, rendered 1,500 years ago, has been invaluable. The beginning of the fifth century, when Rome was sacked by the Goths, ended the history of the catacombs as cemeteries; and for the next 400 years they were used only as shrines and places of pilgrimage, except in rare instances, when they have been chosen as places of refuge, as when Boniface I. concealed himself for a time in the cemetery of St. Felicitas. The popes during these centuries kept the tombs of the martyrs heightened and repaired, as we may see from entries in the *Liber Pontificalis*. Even after Totila had desolated Rome these were restored, and the services renewed, John III. ordering that oblations, ornate, and candles should be sent from the Lateran Palace for the ceremonies every Sunday. But after the siege by the Lombards, under Astolphus, when some of the graves were broken open and the bodies carried off, Paul I. resolved to remove “the bodies of the martyrs, and confessors, and virgins of Christ” into Rome, and place them in a church he built to receive them, dedicated to SS. Stephen and Sylvester, on the site of the house in which he was born and bred, and which he had then inherited. On this occasion more than a hundred saints were removed, and their names duly chronicled in a list still extant. The succeeding popes endeavoured, however, to rehabilitate the ancient cemeteries with their ancient glories, but without much popular support; for, in consequence of the crypts of the martyrs being destroyed and abandoned, Paschal I. translated 2,300 bodies in July, 817; and this new feature in the history of early Christian relics remained in great favour for some time, the succeeding popes not only translating more, but re-translating those already deposited in Rome. Thus rifled, ruined, and abandoned, the cemeteries that were not near monasteries were one by one forgotten. In those that were so fortunately situated lamps were kept burning as late as the eleventh and twelfth centuries. A pilgrim of the eleventh century noticed the cemetery of St. Valentine, on the Via Flaminia, and another writer mentioned it again in the twelfth century. In the fourteenth century, a statistical account of Roman churches mentions only three that were attached to cemeteries; and by the fifteenth there was only one cemetery that was left open and frequented by pilgrims, which was that beneath the Church of St. Sebastian, called in old documents, *Cemeterium ad Catacumbas*. This title, applying only to the part of the Campagna in which the church was built, just as the circus built in the same neighbourhood by Maxentius, was called the *Circus ad Catacumbas*, has since been indiscriminately given to all subterranean cemeteries over the globe. Except as belonging to that of St. Sebastian, the term is not mentioned in old times, the names in use being *hypogaeum*, *cometerium*, *martyrium*, or *confessio*.

A set of terms, new, yet very old, has to be mastered by those who would understand anything of these ancient burial-places. The little chambers opening out of the narrow passages are known as *cubicula*. An ordinary grave,—that is, a flat oblong compartment large enough to receive a body, hollowed in the sides of the

passages, generally in tiers one above another,—is called a *locus* or *loculus*. When a grave was made large enough to contain two, three, or four persons, it was called *bisomum*, *trinomum*, or *quadrisomum*, accordingly. There are to be seen in many of the *cubicula* graves of a more ornamental type. These consist of a semicircular arch recessed in the wall, below the straight base line of which is sunk the space for the body; they are called *arcosolia*, *solum* being the term in use among the pagans for their funeral urns. Sometimes the recess is found square-headed instead of semicircular: when De Rossi, for the sake of distinction, calls it *sepulcro a mensa*. Burial was called *depositio*, and those who dug the graves, *fossores*, in old writings. We quote the authors’ description of the uses, beyond burial, made of the tombs in the subterranean cemeteries:—

“Those of the *arcosolia*, which were also the tombs of martyrs, were used on the anniversaries of their deaths (*anniversarii*, or birthdays) as altars whereon the holy mysteries were celebrated; hence, whilst some of the *cubicula* were only family vaults, others were chapels, or places of public assembly. It is probable that the holy mysteries were celebrated also in the private vaults, on the anniversaries of the deaths of their occupants; and each one was sufficiently large in itself for use on these private occasions; but in order that as many as possible might assist at the public celebrations, two, three, or even four of the *cubicula* were often made close together, all receiving light and ventilation through one shaft or air-lole (*luminare*), pierced through the superincumbent soil up to the open air. In this way as many as a hundred persons might be collected in some parts of the catacomb to assist at the same act of public worship; whilst a still larger number might have been dispersed in the *cubicula* of neighbouring galleries, and received there the bread of life, brought to them by the assistant priests and deacons. Indications of this arrangement are not only to be found in ancient ecclesiastical writings; they may still be seen in the very walls of the catacombs themselves, episcopal chairs, chairs for the presiding deacon or deaconess, and benches for the faithful, having formed part of the original design when the chambers were hewn out of the living rock, and still remaining where they were first made.”

We are enabled to reproduce from the book three views in the catacombs, and the plan of a portion which serves to show the way in which the galleries ramify.

Prominence is given in the work before us to the cemetery of St. Callistus. This, it will be remembered, is that which De Rossi discovered on the Via Appia, after having seen only a fragment of a marble slab, bearing part of the letter R and the syllables NELLVS MARTYR, in the cellar of a vineyard, in 1849. He induced Pope Pius IX. to purchase this and the adjoining vineyard, and in the course of subsequent excavations found the other portion of this slab, with the missing piece of the letter R and the letters CO upon it, which showed him that the conjecture he formed that the tomb of Cornelius, pope and martyr in the middle of the third century, was before him was correct. This tomb he knew from the old writings was close to the cemetery of St. Callistus, in which there was a chapel more famous than most others, as the bodies of the popes in the third and fourth centuries were deposited in it, to which adjoining another chapel in which St. Cecilia was laid. The author of the earliest itinerary we have mentioned, specially mentioned this cemetery as containing “an innumerable multitude of martyrs; first, Sixtus, pope and martyr; Dionysius, pope and martyr; Julian, pope and martyr; Flavianus, martyr; St. Cecilia, virgin and martyr. Eighty martyrs rest here below.” Further excavations were made, in the course of which 121 fragments of one of the Latin inscriptions Pope Damasus put up were found. When put together, and a few missing letters or syllables supplied by the context, this inscription read as follows:—

“Here, if you would know, lie together a whole crowd of holy ones.

These honoured sepulchres enclose the bodies of the saints;

Their noble souls the palace of heaven has taken to itself.

Here lie the companions of Xystus, who bear away the trophies from the enemy;

Here, a number of elders, who guard the altars of Christ;

Here is buried the priest, who long lived in peace;

Here, the holy confessors whom Greece sent us;

Here lie youths and boys, old men, and their chaste offspring;

Who chose, as the better part, to keep their virgin chastity.

Here I, Damasus, confess I wished to lay my bones,

But I feared to disturb the holy ashes of the saints.”

This decided De Rossi that he was in the Papal vault mentioned, ruined indeed, with its approaches blocked up, probably to preserve it from depredators, but still containing fragments among its *debris* of monuments of great interest. In one corner of this crypt, to which access was at first obtained, it appears, down the *luminare*, though one of the ancient staircases has now been restored, is a narrow doorway, cut irregularly in the rock, which opens into a large chamber about 20 ft. square, furnished with a wide lumi-

nare, which enables it to be well seen now. When first found it was filled with earth, which had to be removed, as in other instances, to the surface through this *luminare* or shaft from above. As this work proceeded, and the *luminare*, also full of earth, was emptied, the figure of a woman in the attitude of prayer was deciphered on the wall, below this a Latin cross between two sheep; and below this again, though still in the *luminare*, the figures of three saints. On the wall of the chamber, close to the entrance-way from the burial-place of the popes, was found a painting of a woman, "richly attired, and ornamented with bracelets and necklaces such as might be looked for in a high-born and wealthy Roman bride, and might well be intended to represent St. Cecilia." But this painting, which appeared of seventh-century date, was found to be executed on the surface of ruined mosaic-work; and a niche close by, decorated with a Byzantine head of our Lord, was also noticed to have been previously encased with marble, indicating there had been a renewal of ornamentation, marking a site of high religious interest. This fact, taken in connexion with the circumstance that close to these paintings was a recess large enough to

hold a sarcophagus, and which left but an inch of rock between it and the back of a similar recess in the Papal crypt, and compared with the statements in the documents we have mentioned, led De Rossi to the conclusion that it was in this chamber that the beautiful Christian bride of the martyr Valerius was laid, after three strokes of the executioner had left her to bleed slowly to death on the pavement of her own palace. The legend is related at length in the volume before us. We must pass on to notice two new matters relating to this cemetery, or these cemeteries; for, we should explain, in this neighbourhood there were several Christian burial-places, each complete in itself, and following the outlines of the space of ground above, given for the purpose, but which in course of time have been connected with one another by long passages, so as to make one vast subterranean area. One of these points is a new method of mapping subterranean galleries, invented by Michele De Rossi, the brother of the archaeologist. The writers speak of "a most ingenious instrument" he has devised, by means of which maps of Roma Sotterranea will be as complete as those of any modern city. We shall return to this volume on another occasion.

CANOPIED STATUE OF HER MAJESTY THE QUEEN, FOR BOMBAY.

Our engraving represents a monument which has been executed in this country, and is about to be sent out to India. It is a present from the King of Baroda to the Victoria Gardens, Bombay, where it will be set up, and is the design of Mr. Noble, of Bruton-street. The figure was executed by him, and the architectural part by Mr. Earp, of the Kennington-road. The figure of the Queen is of colossal proportions, being more than 8 ft. in height, seated. Her Majesty is in her full robes of State, with the sceptre and orb—emblems of her dignity,—and is seated on her throne. The figure has a very dignified appearance. The material of which it is made is white marble. The canopy, which is 42 ft. high to the top of the finial, is of white Sicilian marble. It is of Gothic type, and well executed. The background of the interior is slightly relieved with a pale Sienna-tinted marble, enriched with a diaper incised, and an inscribed garter. The pillars on each side of the front are also of pale Sienna marble, richly chiselled. The base is composed of steps, the lowest of which is 18 ft. wide, and 22 ft. deep from front to back.

CANOPIED STATUE OF HER MAJESTY THE QUEEN: VICTORIA GARDENS, BOMBAY.
MR. NOBLE, SCULPTOR.

WELLCLOSE-SQUARE.

Sir,—The reason given by the Metropolitan Board of Works for its late decision in the matter of the proposed Wellclose-square Free Recreation Ground is so curious (if the reports which I have seen of it are accurate), as to require some notice. "The Board cannot recommend any steps to be taken in the matter, as the centre of the square has been sold for building on." This is the decision of London's only guardian of open spaces, the Metropolitan Board, respecting a suggested open space not now built upon, in a quarter of London where the people are so thick that if all London were as populous, the metropolis would contain 14,000,000 souls, and where the people are so poor that they cannot afford to waste the time in walking through the miserable streets to the nearest free recreation-ground, two miles off, for that walk would "cost a meal!"

The noble book of Mr. Robinson on the "Parks, Promenades, and Gardens of Paris," to a review of which book you lately gave such worthy prominence in your ever-gracious columns, had better be burned at once by the common hangman if the reason given for this decision of the Board for the Protection of Open Spaces in London is sound!

W.

THE ANGLO-ROMANO GAS COMPANY.

At a meeting of the directors of this company, held in Rome at the end of last month, to elect a new *gerente* in place of the late Mr. James Shepherd, Mr. Charles Poncinchi, who had been with him as engineer for several years, and was expressly pointed to by Mr. Shepherd to succeed him, was unanimously elected. The following address to Mrs. Shepherd, determined on at the same meeting, serves to show the high consideration in which the late *gerente* was held:—

"Noble Signora.—The greatest consolation, under the loss of our dear one, is the esteem and consideration in which they were held by all who chanced to approach them. You may, in the very heavy affliction that troubles you, comfort yourself with the thought that to very few is it given during life to attain to the admiration and esteem that our much-loved Mr. Shepherd deservedly acquired for himself in the minds of all.

Our colleagues, who assembled on the 23rd of last June to consider their loss, charged me to express the feelings of lively grief which they all most sincerely share with you.

The demonstration, therefore, of the moving esteem and regret that they so deeply feel for his beloved memory suggests the erection of a monument in the place where, through him, our business sprang up and flourished.

The fear of preventing the afflicted family from honouring its head as it thinks best, withholds the partners themselves from directing any memorial to be erected in the place where his mortal remains repose.

Will you (noble madam, graciously receive these sincere expressions both of grief and regret, which, through me, the whole company of shareholders desire to show me to remain, madam,

Your humble and obedient servant,

President of the Council of Surveillance.
Rome, July 1st, 1869."

TREES IN KENSINGTON GARDENS.

The treatment of trees in this now invaluable park, has lately attracted much attention. In the *Times*, a letter complains that "a wanton riot was perpetrated in cutting down several of the finest trees (Scotch firs), just as they had reached their prime;" and again in Parliament the question was asked wherefore such spoliation had been done?

Any one used to plantations, or conversant in landscape gardening, and the effect of fine timber trees, would, on viewing the state of Kensington Gardens, say that the full-grown trees are too thick, being in many cases 12 ft., 10 ft., 8 ft., or even only 6 ft. apart; thus grown to the height of 50 ft. or more, without freedom for expansion, the stems are bare, or the branches interlaced, and the natural grace of arborage entirely destroyed thereby. In some parts it is a forest of deformed poles, with branches and foliage mostly on the top; many of them being decayed, and falling each other, from too close proximity. The spaces afforded portions of the gardens are little frequented, as there is in reality nothing picturesque in their aspect; and, in fact, throughout the whole range, great improvement might be assured by cutting away one full fourth part of the deformed timber. This would give room for the survivors to spread their branches, and create a shade, and redeem from desertion the groves of stately poles, so that an agræic wanderer might recline and luxuriate there like *Ulysses*, "sub tegmine fagi."

Now there are in these plantations very few Scotch firs, which are confined to only about one

small acre in extent; where the five decaying trees were cut down, and where there yet remain 28 more of similar growth. This group is anything but ornamental, the stems being bare to the top, which has but little garniture. It may, however, by its hungry aspect, lead attraction to other competing groves, and it is certainly more open than the forested portions.

Many of the trees, being from 100 to 200 years growth, are nearly defunct, some actually so, and many more are partially decayed at the top. The dead trunks ought to be cleared away, and the decayed branches lopped; and, for the sake of improvement, and free growth of the survivors, a selection should be made of the least ornamental of the compacted centenarians for their removal, so as to give place to the free growth and development of this our urban forest.

By such treatment this range of 200 acres of timber trees might be rendered more accessible, agreeable, and certainly more graceful; but some competent landscape gardener ought to have control in the arrangement of all park plantations, if only to insure good taste in the selection of trees, so that places of public resort may not be deformed, as along the Cromwell-road, &c., by rows of poplars, which are the most formal and least graceful.

It is clear that some damage has been done by drainage in several places. A finely-expanded beech tree, which shaded a traverse of nearly 100 ft. near the S.E. angle, is withered; so also others of ornamental growth near to the fountains. Some of these drains were made in compliance with remonstrances from vicinal residents who crossed the ground daily, and complained of the plashy surface beneath the groves. Other deeper drains were made for the Serpentine Waterworks. Now the clearance of unsightly trunks of chestnuts from 200 to 300 years old would give more open air, more freedom of growth, and improved scenery; besides that these now intramural woodlands would be more passable and enjoyable.

T. H. H.

BELLS FOR DISSENTING CHURCHES.

In a former communication published in the *Builder*, of the 17th of April last, I endeavoured to show that churches of every denomination had a full right to use bells. At the same time it was intimated that those bells might be made use of in such a manner as to create a nuisance.

Now, it is known that many Roman Catholic churches in England have each one or more tower bells, while some of them possess a peal of five, six, or eight.

The following statement may, however, be news to most persons. Since the communication referred to appeared, Messrs. Mears & Stainback, have informed me that they have cast bells for three Dissenting places of worship, namely:—

- Trinity (Independent) Chapel, Poplar.—a bell weighing 102 cwt., A.D. 1842.
- Independent Chapel, Hatherlow, Cheshire.—a bell weighing 74 cwt., A.D. 1853.
- Unitarian Church, Totmorden, Lancashire.—a peal of eight bells in the key of F, the weight of the tenor being 14 cwt., A.D. 1868.

I may add that this last is a new stone Gothic structure, at the west end of which is a tower surmounted by an octagonal spire, standing out conspicuously on the hill side. The cost of the building was about 12,000*l.*, the whole of which, it is said, has been paid by Messrs. Fielden, Brothers, who have also defrayed the expenses of the bells and other furniture.

THOMAS WALESBY.

THE THAMES TUNNEL.

The Thames Tunnel, which was opened on August 2, 1843, will be closed on Wednesday next, having thus been a public footway for a period of twenty-six years, less thirteen days. It has been purchased for 200,000*l.* (one-third of its cost) by the East London Railway Company, which line will be completed as far as Wapping in a short time. The new Thames Subway from Tower-hill to Bermondsey (Mr. Barlow's scheme) commenced on February 16th of the present year, is proceeding very rapidly, and, if all goes well, will be opened for traffic in three months' time. Its cost will be under 20,000*l.* The works of the old Thames Tunnel were commenced in 1825. Physical and financial difficulties delayed the opening for eighteen years.

W.

LOW CLASS COMPETITIONS.

Sir,—Allow me to call the attention of your readers to the terms of a competition now pending at a Wesleyan chapel and schools at Doncaster. The requirements are a chapel to seat 1,000, schools for 500 children, many vestries, &c., for 4,500*l.* In the instructions are the following articles:—

"The building committee for the chapel and buildings will pay to the architect producing the design most approved by them the sum of 50*l.*, and for the second best in like manner the sum of 25*l.*, and such designs will become the absolute property of the committee, who may at their option employ either of such architects to carry out the designs, or otherwise."

"If the architect be so employed his remuneration will hereafter be agreed upon, and will include the premium approved design."

"The successful competitor will not be entitled to any prize or payment unless substantial contractors undertake to execute the work at a cost of not more than 10 per cent. above his estimate of the cost, which estimate must be sent in with the plans."

Unfortunately such conditions as these are not unusual in Dissenting chapel competitions, which fact goes far to account for the ugliness of the buildings produced; for it is quite certain that no established architect would compete unless he knew beforehand that it was arranged that the work should be given to him whether successful or not; for, in the first place, the committee will not approve of any design which can be built for the 4,500*l.* in presence of many others much more showy and ornamented that cannot be carried out in their integrity for the money, made by persons who have no established character to lose.

Secondly, it is highly probable, even if the committee should choose a design capable of being carried out for the money, that the superintendence of the building would be given to some local architect (the committee have the power to do so by one of their conditions quoted above), who would thereby get the credit and remuneration justly due to the producer of the design.

Thirdly, if they employed the successful architect, by the second condition quoted above it is evident that they mean to haggle with him for his remuneration, or they would simply say the usual 5 per cent. would be given, about which there ought not to be any question.

The only architects likely to compete on these terms are article pupils or clerks out of work, to whom 25*l.* for six or seven weeks' labour would be a great object for the best way of surely gaining in this competition is to send in a showy design, which could not be executed for the money, with the object of getting the second premium, as the cost of the second design will not be severely questioned.

My attention was called to these conditions by a pupil who intends competing for the sake of practice; and for young fellows in his position the chances are favourable. The wonder is, that committees cannot see that by such conditions as these they appeal to the very lowest members of the profession, who have neither means nor powers for making good designs, nor character nor position which would render it advantageous to themselves for them to "do" their clients in any possible way.

M. M. G.

A SCHEME FOR THE CHANNEL RAILWAY.

The following is a scheme for the Channel Railway, so that all the traffic is above water. To form a line of rails in the sea, from England to France. These rails are to be laid on arches, embankments, or some other suitable structure. The rails are to be laid far under water, that ships may pass without interfering with them. A skeleton framework of iron on wheels is to traverse these rails; this framework is to reach out of the water, so that the deck or platform on it is free of the ordinary tides. On this is accommodation for passengers, cattle, goods, &c.

The steam-engines to be placed on the deck and motion conveyed to the axes of the wheels by a vertical shaft. The screw-paddle wheels or hydraulic force may be also applied for propulsion.

T. T. L.

TECHNICAL EDUCATION.

Sir,—Will you allow me a small space in your valuable, impartial journal, to make a few remarks, in answer to "Jack Plaster's," on the late conference on the above subject. That much regret was felt that so little interest was taken in that important movement, I have no doubt. The gentlemen who introduced the scheme were trying to do good, but I fear they began at the wrong end. I will give a few reasons why: the first is, the masters in this age require men that can "work,"—not men with learning and skill; as I heard one master say to his men, "that he did not pay them for thinking; they must work, he would think." The second is, that men that spend the whole of their leisure time in study, naturally look for elevation from their present rank; and if you will only look in the advertising columns, you will see the field is overflowing already with (what they term themselves) competent and skilled men, and as there is not one out of every twenty learners in the country that has a foreman; if he has one, it is either a relation or a man that has no more money for it than the man that works; and some masters remark that they have "managed" before without, and they can still. The third is, the artisans are not likely to spend their time in learning, as there are a great many in the building trades (in London especially) that have not served one hour's apprenticeship. The way it is done is this; they reach about the age of twenty (a porter, perhaps, previously); they get a few shillings' worth of tools, and get a job in some building (they never go to a shop for a day), and "they do as others do." Then they do what they call "squaring" the foreman; that is, they give him 2*s.* or 3*s.*, and sometimes even 5*s.*, to stop on the job; and if there are too many on the job, it is these men that stop, as the dishonesty of the foreman keeps them in preference to others (however good workmen they may be), because, you know, it elevates his wages a great deal if there are five or six of this class of men, and that is a consideration to him. The fourth is, the masters have "managed" before without technical education, so they do not trouble themselves about it.

Indeed, I could give a great many more reasons, but I have almost taken too much space already; but I wish to suggest a scheme to which I hope you will give a helping hand. Skilled workmen ought to go through an examination from the same as some professions; and if a building were hired or erected, and workmen go to work there under a honest and competent person or persons, and a certificate

we got a sort of an anachronism, at the best, it discourages persistently shams of materials workmanship, and which has in this way an immense amount of good to art generally, and to architecture in particular. But since we prefer to see our church walls in order divested of plaster, and our woodwork of it, we must not, I think, reject or eliminate the materials altogether as useless shaminations. There has been an abuse of those materials in making them represent other materials, this must be looked upon as a misapplication of the properties and capabilities of plaster paint, and not as a reason for their being rejected shams or "abominations" in themselves.

A great mistake, as the writer of the article states, is in making plaster, for instance, do twice as a durable material, and in this light depending on it the design and artistic labour of plaster stone or wood. In the matter of external cornices and internal decoration generally a mistaken conception of the qualities and uses of plaster must be apparent. Running, or simple casting are the only methods ultimately sanctionable in using this material ornamentally. The first is perhaps the simplest mode of applying plaster to the upper angles of cornices, and if the members are artistically rounded with ample resists or plain surfaces for a relief of the eye, "run" cornices are as effective as those cradled down and blocked or dilapidated. The introduction of modillions and blocks is certainly indefensible, because it gives a cornice a constructional importance which a plaster cornice cannot possess, and it gives to plaster itself an assumption of cohesive strength which is false. The method suggested in this article on this material is one that must ultimately take the place of the flimsy and meaningless "agglomerations" of plaster, and enrichments that now find admittance even in first-class residences and public buildings erected from architects' designs. The plan suggested I have never thought of,—in fact, I do not see why the inserted ornament in the angle hollow of cornices could not be made of perforated wood out of the design intended, which should be always more or less conventional.

The dispersing suggested to the surface of things would vastly relieve the monotony of whitened plainness that now usually prevails in ordinary houses and buildings. Till a material end yielding and tenacious than plaster be used, we must accept that as a vehicle for finishing our walls and ceilings, and as a fire-proof and non-conductive medium of some value. We might extend the same argument to paint as preservative material, though it is a question whether it should be employed representatively in architecture at all, but rather conventionally as a decorative sense.

G. HUSKISSON GULLAUME.

PROPOSED DOCK IMPROVEMENTS FOR GLOUCESTER.

Two schemes of great importance as regards the trade of Gloucester, the Bristol Channel, Dean Forest, and South Wales, are now engaging attention. A plan of improvement has been proposed by Mr. Clegram, the resident engineer, and endorsed by Mr. T. E. Harrison, a London engineer, for an extension of the Gloucester and Berkeley Canal, from a point one mile above the present outlet to Holy Hazle Pill, three-quarters of a mile below. By an outlay of 150,000*l.*, according to our authority, the Gloucester Chronicle, a new entrance can be provided, with a tidal basin 700 ft. long and 300 ft. wide; inside this, a dock 2,000 ft. long and 355 ft. wide; and an extension to the existing canal 700 ft. in length, 150 ft. in width at the top, and with a depth of water of 19 ft. Thus accommodation would be given for the largest ships that can navigate the estuary of the Severn from King's Head to Sharpness. This scheme is regarded as offering the greatest improvement of which the port of Gloucester can at any time be capable. The Board of Trade has been consulted, and it is understood that the president, Mr. Bright, approves the plan. As the site is only some four or five miles from the trunk line of the Midland Railway, the docks and the line might easily be brought into communication.

The other, and somewhat kindred, project is the connection of the existing railways, east and west of the Severn, by a direct line, instead of having to go all round by way of Gloucester. A plan has been suggested for making a subway from the Severn and Wye Railway to a point

near the proposed docks at Holy Hazle Pill. This, it is said, could be done without interference with the traffic on the river, and it would materially lessen the distance between the metropolitan and the Dean Forest and South Wales coal-fields, while the result of a recent survey is said to be the calculation that by the construction of the new docks and of the subway, the Government mineral and woodland property in Dean Forest, 25,000 acres in extent, would be improved to the value of 40*l.* an acre, or in all 1,000,000*l.* sterling. The cost of the subway is set down at 250,000*l.*, not more than a third of the cost of the gigantic bridge at Oldbury, and not greater than that of the Newnham bridge. It would connect the South Wales and Midland systems, and would afford a constant export trade in coal and iron from the contemplated docks at Holy Hazle Pill. If the docks are constructed and the subway is made, ships will be enabled to load at Holy Hazle Pill, and the consequent improvement in the value of the Forest of Dean coal-field will be enormous. It is, therefore, stated that the Office of Woods and Forests is willing to recommend a loan for the construction of the subway.

The Gloucester and Berkeley Canal Company, it is said, will shortly decide whether they will apply to Parliament for powers to carry out so much of this great work as they are immediately interested in.

CHURCH-BUILDING NEWS.

Hertford.—Christ Church, Port Vale, Bengo's has been consecrated. The style is Geometric Decorated. The church consists of nave, chancel, south aisle, north and south transepts, organ chapel, and vestry. The plan is cruciform, and is arranged to admit of lateral extension by the addition of an aisle on the north side, and the elongation of the north transept. There are two entrances, viz., one through a porch on the south side, and the other through a moulded doorway near the vestry on the same side, which also forms the entrance to the vestry. At the north-west corner of the nave a bell-turret of characteristic design rises out of the buttresses, which are carried up of greater width and projection than the other buttresses to form a base for the superstructure. The lower part is carried on disengaged circular shafts placed in the angles formed by the junction of the buttresses. These shafts have moulded bases, hands and carved caps from the top of which the turret begins to rise, the eaved sides being gradually enlarged by corbelling out until the turret forms an octagon on plan. Above the gable of the nave roof, the bell-story is formed by a light arcade composed of stone shafts, with moulded bases, and carved caps over which are trefoil-headed openings on each of the eight sides surmounted with carved gables, and a stone spire with an ornamental cone at the apex. The south window is a combination of two two-light windows under a single arched head filled in with tracery: the panels and caps of shafts are carved. The chancel has an apsidal end divided into bays, with single light windows. The roof is formed with moulded arched ribs, stained and varnished, springing from stone shafted corbels, and the intermediate spaces, or panels, are carved or coloured blue. The chancel arch is of large span, and lofty in proportion; the jambs have banded shafts in the angles, with carved caps, carrying a moulded arch. The nave and other roofs are open timbered, and are formed with principal rafters, and carved, moulded ribs springing from stone corbels. All the timbers are wrought, and covered with boarding and felt laid horizontally, the whole being stained and varnished. The seats are low, open benches, with cut bench ends, stained and varnished. The aisles are paved with black and red tiles laid in patterns diagonally. The windows generally are glazed with green cathedral glass, and chancel windows with rough plate-glass, with *flow-de-lis* pattern or quarries. The whole of the stone carving has been executed from natural examples. The architect was Mr. Thomas Smith of Hertford, and the works have been carried out under his superintendence by Mr. Harris, the contractor.

Barcheston.—The ancient Church of St. Martin, at Barcheston, is now in course of restoration, from plans furnished by Mr. Ewan Christian, of London. In the work of restoration as much of the old work as possible will be retained. New roofs to the chancel, nave, and two aisles will be provided, and new seats throughout. The work will be done by Mr. Alfred Groves, of Milton, near Chipping-Norton.

Avon Dassett.—The new parish church has been consecrated by the Bishop of Worcester. The new building consists of a nave, 44 ft. long by 17 ft. in width; north aisle, 44 ft. by 10 ft.; entrance porch to the south side, western tower, and chancel, 34 ft. by 16 ft. On the north side of the chancel are the organ chamber and vestry. The style is Early English. The chancel, which is on the site of the old one, is laid with Godwin's tiles. The chancel stalls and seats are of carved oak, most of which was given by the late Rev. W. C. Risley, of Deddington. The recesses of the church is a restoration of the old arcade, which was of the transitional date between the Norman and the Early English. The old church was in a very ruinous state, and very little of it was worth retaining; but that which was of any consideration has been replaced in the new church. Among the things retained is the tomb of an ecclesiastic of the thirteenth century, which, under a fourteenth century canopy, has been replaced in the chancel. The west window of the tower, too, is one of the retentions. The tower and spire rise to the height of 125 ft. The principal entrance to the church is by a porch, which is about 25 ft. above the level of the road, and reached by a flight of temporary steps. It is intended to erect oak gates, in keeping with the style of the church, at the entrance to the churchyard. The church is roofed with brown Staffordshire tiles. The seats are low-set benches of varnished deal, which can be moved about at pleasure. The roof internally is of plain tile, while that of the nave and aisle is of Baltic timber, neither stained nor varnished. The body of the building is laid with red 6-in. Staffordshire tiles. The font is of Purbeck marble. The warming of the church is accomplished on Mitobell's warm-air principle; that is, small fire-pits are placed at intervals under the floor, connected with a flue, which has been carried out by Mr. Hudson, of Leamington. Through the instrumentality of the Rev. W. C. Holbeck, who, besides, has contributed a great portion of the stone for the building, a peal of five bells has been obtained. They were furnished by Mr. Blews, of Birmingham, who also presented the altar candlesticks, which were designed by the architect. Towards the entire cost 2,400*l.* have been subscribed.

St. Michael's, Radnorshire.—The parish church of St. Michael's has been restored and reopened. The fabric had been condemned as dangerous some nine or ten months since, and had consequently been shut up, and when the work of restoration was commenced, so neglected had it become, that ferns and lichens were growing in almost their native wildness in many a crevice within. The building itself is one of those little "mountain churches" one is accustomed to stumble across on our hill sides. It is in the Early Pointed style of architecture of the thirteenth century, and consists of nave, chancel, south porch, and tower, the latter a massive structure with walls thick enough for a "donjon keep," or for the confinement of a state prisoner. Its restoration is now completed. The architect has copied as far as practicable the original structure in all its details. The outside coating of whitewash has disappeared, the joints of the stones have been repointed, a new roof with ornamental ridge tiles and iron finials has been put on, and a new porch has been erected. Inside the building has been treated in the same manner. The walls have been scraped and cleaned, new windows (Early Decorated) have been inserted. The roof of the chancel has two depressions, the second, or lowermost, over the sanctuary being canopied like Brilley Church, close by. The chancel originally possessed a double screen, and the roofs were celled; they are now opened out, and the old wood-work has been allowed to remain wherever practicable; the rafters of the nave were all pretty sound, but in the chancel nearly all the woodwork is new, stained dark to match old as nearly as possible; the whole, including the screen, has been newly varnished. The old "ramshackle" pews have been swept away, and seats of varnished pine placed in their stead, free and unappropriated. There is a new pulpit wrought in Farleydown stone, and pierced and fitted with an oaken reading-stand. The font is a plain, solid specimen of hollowed stone. The architect has given a small east window of stained glass.

Huttoft.—The parish church at Huttoft, which was in a very dilapidated state, has, through the exertions of the vicar, the Rev. G. Bryan, been restored, and it is now reopened for divine service. The fabric was in a sad state, involving

many years of neglect. The upper portion of the chancel arch was hocked up with masonry, and a ceiling thrown across the chancel; and two or three windows were likewise blocked up, and the stone mullions of others had given way to the domestic lead and iron work of modern times. The roof steps had been hidden with mortar. The north wall was in a dangerous condition. The mullions in the six oct windows were replaced with wood casements. The floor was partly common brick and partly hardened mud; and the gallery, though useful, had an unseemly appearance. The exterior of the building had a somewhat motley appearance by the decayed stonework being in various places repaired with bricks, and the roof of the porch was covered with red tiles, &c. There has been, however, a restoration in all of these particulars, and the entire restoration fund was about 600*l*.

Whaddon, Cambs.—The parish church of Whaddon has been reopened. With the exception of the tower, the edifice, which is in the Gothic style, has been completely restored: the outer walls have been refaced with pebbles, edged with stone, and new windows and a porch added; the walls of the interior are replastered, and the stone pillars renovated; the roof of the nave has been restored, those in the north and south aisles being new, as also that of the chancel. The floor is paved with red and black encaustic tiles, worked in large squares. A new lectern, reading desk, and carved oak pulpit have also been supplied; and the seats are for the present temporary, in consequence of the want of funds, which is also the cause, we understand, of the tower not being restored in correspondence with the remainder of the building. The lead on the roof has been roost and laid afresh. What has been done in the chancel will be defrayed by the Ecclesiastical Commissioners, who are the patrons of the living; that part of the edifice has had new oak choir-seats placed in it, a new altar-rail, &c. The communion-table was covered with a purple velvet cloth, with gold fringe; and the reredos was adorned with crimson cloth, above which appeared a three-light stained glass window, the gift of a gentleman in the parish. Beneath the new organ-chamber is the furnace for the hot-water apparatus, which is to warm the church when necessary by means of pipes traversing the various walls; the pipes are $1\frac{1}{4}$ in. diameter. Two coils of pipes, covered with iron pedestals, are placed at the tower end, and in the chancel the pipes are covered with iron trellis work. This portion of the work has been executed by J. L. Bacon & Co., of London. "The poor man's window" was contributed by the poor of the parish; it is in stained glass. The cost of the restoration is estimated at about 2,300*l*. The builder employed was Mr. Brown, of King's Lynn, and the architect Mr. Ewan Christian, of London.

Manston.—The chancel of the parish church has been restored and heated at the expense of the rector, the Rev. E. Anderson.

Milborne Port.—The parish church has been re-opened for public worship, after having undergone considerable alteration and enlargement. The building had been allowed to fall into a crumbling dilapidated condition in many parts, in addition to which there was scarcely adequate accommodation for the parishioners who attended divine service. The cost of the work done amounts to about 4,000*l*. Mr. Alfred Reynolds of this place, was the builder employed. The work has all been carried out in accordance with designs prepared by Mr. Henry Hall, of London, architect. The nave has been extended 28 ft., with two additional bays, whilst an aisle has been constructed on the north side, where an unsightly excrescence only before existed. Added to these improvements is a new roof, whilst the stained windows and ornamentation of the interior throughout give to the place quite a different appearance from heretofore. The foundations of the structure are of forest marble, which was brought from Toomer-hill, near Milborne Port, and above the string-course the building is of local stone, with portions of the old material worked in, and the dressings are of Ham-hill stone. Two perpendicular windows have lately been inserted in the chancel aisle, with buttresses unmounted by foliated pinnacles. The buttresses are as yet unfinished, the blocks left being no doubt intended to receive ornamentation. A window has been inserted in the east end of the chancel, beside which is a small lancet-headed window of Early English character. The south transept was rebuilt a few years ago, and only a partial restoration has now been found necessary. The large square tower stands

on four late Norman tiers, and is hatted, with pinnacles at the angles. The roof of the nave is covered with slabs of local stone, with a cresting of Ham-hill.

Hull.—The foundation stone of the new church of St. Silas has been laid, in the parish of St. Paul. The site of the building is in Barnston-street, on an open space of ground in front of the Kingston Cotton Mills. The church will comprise a nave, with north and south aisles, chancel, vestry, organ chapel, and tower. The nave will be divided into five bays by circular columns of Bath stone, with wrought moulded caps and bases, and having brick arches set in pattern. The chancel will be 26 ft., by 23 ft., terminated octagonally, and will have three two-light windows. The altar will be under the centre window, and be raised five steps above the nave. The exterior of the church will be of brick, with stone dressings. The tower will be opposite the end of Lincoln-street, and form a principal feature in the design, and is intended to be surmounted with a elate spire, bearing wood Lucerne lights, of ornamental design. The building is designed in the first period of Gothic architecture, and is to be carried out under the superintendence of Mr. Samuel Musgrave, architect. The contractors are—for brickwork and plastering, Mr. Muegrave; carpentry and joinery, Mr. Sissons; stonemasonry, Mr. Sweeting. The Clerk of the Works is Mr. Hull. The estimated cost of the building is upwards of 3,000*l*.

Battle.—St. Mary's Church has been restored and opened for divine service. The architect was Mr. W. Butterfield, of London, and the work has been carried out by Messrs. Gaskin & Godden, of Canterbury, at a cost of about 4,000*l*. The work has not yet been thoroughly completed; the tower is as yet untouched, and it is estimated that about 1,000*l*. are needed to complete the work. The Lady Chapel has been entirely restored, and the eastern portion screened off to form a vestry. The east window has been removed, and replaced by three lancets. The roof is for the most part new, and the exterior walls have been completely restored, excepting those of the tower. In the interior various changes and improvements have been effected. The old gallery has been removed, and the western arch thrown open. The floor of the church has also been lowered throughout, rendering the interior more imposing in its height. The old-fashioned pews have been replaced by modern seats, composed of oak, and the interior has been fitted up with apparatus for heating by hot water. Seats are to be appropriated in all parts of the church, but every third bench is to be for the free use of the parishioners. The sanctuary and chancel are paved with Minton tiles, and the tiles of the nave are by Peake. The carving of the foliage around the pulpit is by Mr. Barp, of London. Two new bells have been provided by extra subscription among the parishioners, and a new organ has been built by Messrs. Bovington & Son.

SCHOOL-BUILDING NEWS.

Walsall.—The memorial stone of a new Baptist school, which is to be erected near the corner of Stafford-street, in this town, has been laid. Want of accommodation in the chapel and the school, it seems, has been felt for years; and last year it was resolved to erect new school-rooms to accommodate 700 children, and to renovate and enlarge the chapel so as to seat 250 more persons, or in all to seat 750 people. The estimated cost of the whole, when finished, is over 1,600*l*. During the time the buildings are in progress Divine service will be held in the Temperance Hall, Freer-street. The designs of the new schools have been prepared by Mr. Ingall, of Birmingham, architect; and the building will be erected by Messrs. Trow & Sons, of Wednesbury, builders. The schools will be of a very plain character, and are to be built of brick, with stone dressings, and very little ornamentation of any kind.

Stoke.—The corner-stone of a new Sunday School building attached to the Baptist Chapel at Stoke-upon-Trent has been laid. The new building will accommodate about 400, with rooms for infants, senior children, and adult classes. The plans had been prepared by Mr. E. Penn. Mr. Natban Barlow, of Stoke, is the contractor. The entire cost of the school, including heating-apparatus, gasfittings, and furnishing, will be about 600*l*., which, with alterations necessary to be made in the chapel, will amount to 660*l*.

Sandy (Bedford).—The new national school, which have been just erected at Sandy, through the exertions of the rector, the Rev. J. Richardson, have been opened with some ceremony. The school building is situated on the outskirts of the town, and within easy distance of the church. The halls, of which there are two, are at right angles, and severally measure internally 56 ft. by 20 ft., being calculated to accommodate 150 pupils each. The main block is flanked on either side by residences, one for the master, and the other for the mistress, the whole of the premises occupying a site of about half an acre, inclusive, however, of an area in front, which is to be devoted to the purpose of a play-ground. The estimated cost of the entire erection, independently of the site, which has been given by the rector, amounts to 1,700*l*. The architects were Messrs. Haherston & Pite, of London; the builder, Mr. Field, of Sandy. The style participates of the Gothic character.

Stroud.—A school, with service-room, has been built at a cost of 500*l*. The architect was the Rev. W. H. Lowder, whose quaint designs have been carried out by the contractor, Mr. Restall, of Biele. The dimensions of the building are—length, 61 ft.; breadth, 18 ft.; height of walls, 11 ft.; class-room, 16 ft. square, and of the same height. The whole cost of the building, and also of a teacher's residence adjoining the school, was defrayed by Mrs. Kehle, of Biele.

PROVINCIAL NEWS.

South Shields.—The Post-office authorities have decided upon taking premises in Dean-street, adjoining Messrs. Wright's new buildings, for the purposes of a post-office, and the necessary arrangements will at once be made for effecting the required alterations. It is intended to pull the old building down, and upon its site rear a new erection, with all requisite accommodation for carrying on the postal business.

Epworth.—During the last two or three years the market town of Epworth has greatly improved in appearance. Many unsightly and inconvenient houses have been pulled down, and new habitations erected in their places. The boundary wall around the New Connexion Chapel and the new Temperance Hall, in High-street, have improved the appearance of the street, which a short time ago was considerably widened. A double row of flags is being laid on a part of the footpath, and the channel has been relaid. The Gas Company are carrying their main pipes along the whole length of the town, and the town will be lighted during the ensuing year, not partially, as heretofore. The town will be brought under the Lighting and Paving Act, and not be dependent on voluntary contributions, or a voluntary rate. Other improvements have been effected; and what is now most required is a new and commodious market-house. As soon as a suitable site can be secured, the building will be erected. Epworth being essentially the capital of the Isle of Axholme, a market-hall is necessary for the accommodation of those attending it. Amongst other improvements is the renovating and repairing the parish church, and others are in contemplation.

FROM SCOTLAND.

Glasgow.—The erection of the new university at Gilmorehill is steadily proceeding. Outside the building, the ground fronting the eastern elevation is being brought into order and neatness. It is now about two years and a half since the erection of the new university was commenced, but it is not expected that the halls will be ready for occupation before autumn next year. The eastern front, which is to be used as class-rooms, is the furthest advanced portion of the buildings. It has been under roof for several months, and the internal work is now being carried out. The octagon laboratory, at the south corner of the eastern front, is in the same forward state. The south front, forming a continuation of the students' class-rooms, has also been roofed, with the exception of the wings, between which is the central tower. These wings are, however, nearly ready for being covered over. In the north front, set apart for the library and museum, &c., the angle towers have been roofed, with the exception of the north-west one, which is not yet so far advanced. The library is externally complete, and the erection of the museum and reading-room has been carried to the commencement of the second floor. The founda-

plans for the great hall, which is to connect the northern and southern divisions, and to form the central space into two quadrangles, are nearly completed, as are also the foundations for the carriage-drive entering the great hall from the north. The erection of the dwelling-houses for the professors, to the west of the university, is also making progress. There are here a range of seven houses, three stories in height, and in addition, there are four in the north front, and two houses, including one for the principal, at the south end of the west block. Provision is being made for the heating and ventilation of the various halls and class-rooms.

Books Received.

Wrought-Iron Bridges and Roofs. By W. Cavertorne Uwin, B.Sc., O.E. London: Spottiswoode, 1869.

This volume contains a series of lectures delivered at the Royal Engineer Establishment, Chatham, to the officers of the Royal Engineers under instruction there; and they were afterwards printed at the press of that establishment for private circulation. That they were useful to those for whom they were originally intended we have no doubt, and they are now offered in a revised and rearranged form to a wider circle of readers. The author assisted Mr. William Fairbairn in some of his many researches, and the work is dedicated to him. It is illustrated with examples of the calculation of stress in girders and roof trusses by graphic and algebraic methods. The author has restricted the use of symbolical expressions as much as possible; and the work holds an intermediate place between practical and theoretical treatises.

VARIORUM.

“CHANNEL TUNNEL: Statement and Reports. Savill & Co., Printers, Chandos-street.” In the form of a pamphlet we have here a statement of the executive committee, with engineer’s report, and diagram; also address presented by the committee to the Emperor of the French, at an audience on June 17th, 1869; and report of the special commission appointed by the Emperor to examine the project.—“On the Supply of Animal Food to Britain, and the Means proposed for Increasing it, by Wentworth L. Scott, F.R.S., &c. London: Sampson Low & Co., Fleet-street.” This is a reprint of a paper read before the Society of Arts in February of last year, and noticed by us at the time.—“The Duties of a Royal Engineer Officer in Time of Peace, for the Organisation of the Staff of an Army. Book, Paternoster-row.” A wide range of details is comprised in this pamphlet. It deals *inter alia* with the position and duties of surveyors and clerks of works, in relation to the officers of the Royal Engineers, and suggests various reforms. It deserves to be read.

Miscellaneous.

Compensation.—An arbitration has been held before Mr. George Pownall to assess the compensation due by the Midland Railway Company to the Duke of Norfolk, for land required to be purchased from his Grace between Heeley and the junction with the Sheffield and Rotherham Railway. The claim was divided into freehold land not on lease, severance, re-versions of land, and compulsory sale. These items the advisers calculated at 76,215*l.* altogether. The witnesses summoned on behalf of the company made the amount 41,371*l.* The award of Mr. Pownall has now been made, and it amounts to 47,333*l.*

Compensation Gate and Door Closer.—An invention has been patented by Messrs. P. P. & J. Nimmo, of Edinburgh, for closing either the heavy doors of banks, public buildings, churches, &c., or the interior doors of dwelling-houses, as well as garden and other gates. The power by which it acts is obtained from balanced weights. As with most other door-closers and springs, when fitted, it is placed under the heel of the door, and forms the lower hinge, on which it turns. As the door moves on its hinges in opening, a pinion, fixed on a vertical stand or spindle, engages with a curved rack or lever, and lifts a balance-weight. On the door being released, this weight falls, and brings back the door by the same means.

New Masonic Hall, Sunderland.—The foundation stone of a new Masonic Hall has been laid in Park-terrace, Sunderland. The total estimated cost of the building is a little over 1,500*l.*, which will be provided by the Sunderland Masonic Hall Company (Limited).—The design of the front elevation shows a white brick building, with stone dressings, in harmony with the remainder of the buildings in the row, which faces the new Park. The front will be pedimented with three tiers of three light windows. Above the second, or ground-floor window, is a projecting balcony opening out from the club-room on the upper story. The principal entrance is at the side. Ascending by a flight of seven steps, there is an Ionic portico, with columns on each side, and from the portico three steps lead to the entrance-hall. From the entrance-hall is a descent by a flight of steps to the basement floor, in which is situate a kitchen 24*ft.* by 13*ft.*, and 13*ft.* in height, in which will be a large cooking apparatus, capable of providing for 150 people. Immediately behind the kitchen is the refreshment-room for the use of the brethren, 25*ft.* by 42*ft.*, and 17*ft.* in height. Here the Masonic dinners will be held, and this room can be let for meetings of Free Gardeners, Foresters, Oddfellows, and other kindred societies. It will hold comfortably 150 people. On the ground-floor, in the front of the building, is a waiting-room of the same size as, and immediately above, the kitchen, and 12*ft.* in height; this will be subdivided into lodge nights for Masonic purposes. Two double doors, one on each side of the fireplace, open from this waiting-room to the lodge-room immediately behind. The dimensions of this room are 25*ft.* by 42*ft.*, with a height of 21*ft.* It will be ornamented with Corinthian pilasters and tall Corinthian columns. At the east end will be a raised semicircular dais, ascended by three steps, and ranged round the semicircle will be placed seven chairs in the form of stalls. The room will be lighted with gas, and ventilated by the patent ventilating sun-lights, and it will not be used for any other than Masonic purposes. Above the waiting-room is the club-room of the same dimensions as the one beneath. The building has been designed by Mr. John Tillman, architect, and will be carried out by Messrs. T. & A. Cooke, contractors for masonry; Mr. Thomas Armstrong, for joiners and carpenters’ work; Mr. Thomas Atkinson, for plumbers and smiths’ work; Mr. Danber, for slating; and Mr. Thos. Goddardson, for painting.

Improved Action in Pianofortes.—It is surprising that the piano should still be defective in its action, but such is the fact, and therefore improvements in it are of interest to every household. The space allotted at the South Kensington Museum for the exhibition of musical instruments, in which are combined the latest improvements, is at the present time crowded with many specimens. Prominent amongst these is a piano fitted with a new check-repeating action. The improvement consists in a particular position and action of a spring and loop, and in forming the “bopper” with an incline at the top, so that it may press on the front of the notch after escapement has taken place. The results obtained by these means are considered to be good, being a light and elastic touch, and instant repetition. The inventor, Mr. John Brinsmead, has patented this improvement throughout Europe and America.

Fire from the Sun’s Heat.—On Sunday afternoon a fire was observed in the upper part of a dwelling-house, occupied by Lieutenant Sutcliffe, in Park-road, Manningham, near Bradford. A few buckets of water extinguished the fire, which was almost confined to the wooden spouting running under the eaves. The heat sent out for a short time was so intense that a considerable portion of a leaden conductor was melted down. The fire was found to have been caused by the ignition, under the sun’s rays, of a couple of sparrow’s nests, which were just beneath the Welsh slates.

The National Cottage Hospital for Consumption.—On the 28th instant the Princess Louise will lay, in her Majesty’s name, the foundation-stone of the second pair of buildings of the National Cottage Hospital for Consumption and Diseases of the Chest, at Ventnor, Undercliff, Isle of Wight. Nearly 100 noblemen and influential gentlemen interested in the institution are announced as stewards for the ceremony and the luncheon, at which the governor of the Isle of Wight, and president of the hospital, is to preside.

West Derby and Walton Sewerage.

The Home Secretary has at last decided not to sanction the West Derby Board’s scheme for discharging their sewage into the river Mersey. He recommends the West Derby and Walton Boards to join and carry out a scheme for utilising the joint sewage, under the provisions of the 1867 Sewage Utilisation Act, “on the broad grounds that sewage should, if possible, be utilised, and that the pollution of even so considerable a stream as the Mersey by the discharge of sewage should be avoided as far as possible.” The proposed junction was recommended in the report to the Walton Board by Messrs. Reada & Goodison, on the disposal of the sewage of both townships, nearly eighteen months ago. Both Walton and West Derby are moving in the matter, but West Derby rather unwillingly. It appears from the proceedings of the West Derby authorities that, in consequence of the defective sewerage, Carr-lane has been in a most unsanitary condition for the last twelve months, and there has been fever there. The local health committee are of opinion that the easiest and best plan of remedying the evil, without hardship to the owners, would be to drain in a natural line at the back of the houses in a ditch. The district of the Dog and Gun abounds with nuisances of all sorts. The washing of the clothes of many of the Liverpool people is done in that locality, and fever has thereby been imported into Liverpool. The water is also contaminated, and well adjoining some wet middens is being sunk deeper, and more poison thereby obtained.

Opening of the Stratford Town-hall.

The new town-hall just completed for the use of the local board and parochial and general officers has been inaugurated by the Lord-Lieutenant of the county, Sir Thomas Western, bart., amid great rejoicings. The building is in the Broadway, the principal thoroughfare. It is Italian in style, freely treated, with statuary surrounding the principal entrance, representing Justice, Mercy, Art, Commerce, Fortitude, and Temperance. Two cupolas rise from the centre of the building, the vane reaching 100*ft.* from the ground. The lower portion of the building is rusticated. The entrance-hall is decorated. Over the entrance to the vestibule is a balcony, with red granite pillars. The vestibule is paved with Milton’s tessellated pavement, and from the vestibule a wide staircase leads to the upper rooms. The rooms in the basement are devoted to the Local Board of Health, parochial and local purposes, the board-room being decorated. The assembly-room, which can be used for public meetings, entertainments, or vestry meetings, is 50*ft.* wide by 75*ft.* long, and 30*ft.* high, with an orchestra at one end, and an alcove at the other. The decorations were carried out by Mr. Boobinder, in carton pierre. The building contains about 30 rooms, and has been erected from designs supplied by Mr. Lewis Angell, surveyor to the Local Board, and Mr. John Giles, of London. Mr. Ennor is the builder.

Congress of Trade-unions at Birmingham.

The list of papers to be read at the approaching congress of trade societies is being rapidly filled up. The Dublin Association of Trades will contribute a paper on “The Justification of Unionism.” The Manchester Trades Council has promised two papers—one on “The Hours of Labour,” and another on the question, “How far will Co-operative Production and Industrial Partnerships assist in settling the conflicting interests of Capital and Labour.” Mr. Heath, of the Amalgamated Glass cutters’ Society, will treat on “The Limitation of Apprentices.” Mr. A. Walton, Brecon, who represents a large trade association in South Wales, will handle the subject of “The Direct Representation of Labour in the House of Commons.” Glasgow, Sheffield, Leeds, and Newcastle will also be represented. The conference will open on the 23rd of next month.

New Church at Highbury.

The foundation-stone of the permanent church of St. Augustin, Highbury New Park, has been laid in the presence of a large assembly, by the vicar of the parish of St. Mary, Islington. The church, which is to be in the Gothic style, will cost 10,000*l.*, and be capable of seating from 1,100 to 1,200 persons. It is being built for the Rev. Gordon Calthrop, who has been labouring for the past five years in a temporary iron church close by the present building. The site on which the building is being erected was given by Mr. Henry Rydon.

Discovery of British Skeletons, Pottery, and Implements, under a Church.—About a month ago it was announced that Sir Tatton Sykes, bart., had razed the old Norman church at Fimber, to erect another in its stead, and that from under the western tower, and from beneath the floor of an earlier church (which seems to have been burnt down) were taken two urns, a flint axe, various flints, animals' bones, &c., leading to the conclusion that both churches had stood upon a tumulus. A day or two ago further finds confirmed this conclusion. At 35 ft. to the east of the urns named was a British skeleton, which the men destroyed. On hearing of this Messrs. Mortimer took up the work, and soon discovered a deeper burnt burial, part of which had also been removed. There were no relics. In going down through the forced clay (previously supposed to be in a natural position, but now found to be full of handstruck flints), Messrs. Mortimer first found in the rubble chalk beneath the clay the butt-end of a large and finely-formed leaf-shaped arrow-head of black flint. At a depth of 3 ft. into the rock the bottom of an oval grave was reached, on which lay the skeleton of a medium-sized adult in the contracted British fashion, the head being to the north-west. Under the body was a pavement of flat stones. Before the face of the skeleton was a very elegant "food vessel," and above the head were three small flint flakes. The urn is covered by alternate lines of hold uniform and herring-bone impresseions, which delicate lines of herring-bone work cover the whole interior of the lip. The tumulus being made of clay suggests an origin for the curionemeres which yet exist in an undusted capping of purple clay in Fimber village.

Chatham Dockyard.—At the recent visit of the Society of Engineers to the Chatham Dockyard Extension Works, it was seen that the docks, which are very extensive, are fast rising upon a large tract of marsh, formerly known as St. Mary's Island, which covers an area of about 320 acres, and lies to the north-east of the present yard. The works, when completed, will consist of four graving docks, each of which will be 510 ft. long, 80 ft. wide at the coping, and 41 ft. 6 in. from floor to coping level. They will have 28 ft. 6 in. depth of water at the highest level of the neap tides. There are also three large basins, the combined area of which will be seventy-four acres, and the depth of water in each 30 ft. at high water neap tides. The works are progressing; and the contractor, Mr. A. Gabrielli, expects to complete them by Christmas, 1870, in the time stipulated in the contract. In the first dock, the granite flooring is laid, and the sides are built up to half their intended height. The main culvert, in connexion with a pumping-engine, by which the docks will be emptied, is finished. In the second dock, the floor has been laid, and the entrance begun; the third and fourth docks have not yet been commenced. In the first basin, which is called the repairing basin, the walls are in an advanced state, and the river entrance is being made. The entrance from this basin to the second, or factory basin, is also being made, and the walls of the latter basin are being built. The chief object of interest in the yard was the plate-bending furnace, which is heated by liquid fuel on the Dorsett principle. A generator, in which creosote is distilled, is placed near the furnace, and the gaseous product is conveyed by pipes to the furnace, where it is burned in jets.

Petersburg Exhibition.—M. Fontana, architect to the Czar's Ministry of the Household, is charged to construct, on the model of the London Crystal Palace, the building for the exhibition which is to take place at St. Petersburg next year. A sum of 27,000*l.* is allowed for this structure, which is to be completed externally by the 1st of September next, and entirely by the 1st of May, 1870.

Royal Gallery of Illustration.—"No Cards" and "Cox and Box," after 100 representations, are as popular as ever. The present season is drawing to a close, and those who seek refinement with honour, and the enjoyment of delightful music, should not let the opportunity slip by of visiting one of the best entertainments Mr. and Mrs. German Reed have had for many years.

A New Lubricator of Machinery.—Black lead, with which certain parts of pianofortes are lubricated, is now extensively used in Paris as an emollient for oil in the lubrication of machinery. It is said to answer exceedingly well.

Slate Statistics.—The produce of the numerous slate quarries of North Wales is estimated at the present time to be not far from 350,000 tons annually, representing, in money value, about 865,000*l.*, or an average of nearly 2*l.* 10*s.* per ton. The produce is made up as follows:—Pestiniog and surrounding veins, 95,000 tons; Penrhyn and surrounding veins, 109,000 tons; Llanharris vein, 75,000 tons; Nantlle veins, 40,000 tons; Corrie veins, 20,000 tons; making a total of 342,000 tons. The number of hands dependent on quarrying is estimated at 9,400. Of this total the Pestiniog veins employ 2,900, Penrhyn 2,500, Llanharris 2,000, Nantlle 1,300, and Corrie 700.

The Velocipede Movement.—*Le Constitutionnel* announces the production by the combined ingenuity of M. de Cabriere, an enterprising gentleman, and M. Doirier, an intelligent workman, of a novel description of velocipede. The new vehicle has two wheels in front and one behind. It is worked by the feet and the hands simultaneously, or by either at will. The apparatus is said to be so cleverly constructed, and so perfectly under control, that the new traverser—we can scarcely call it velocipede in this instance—moves with great ease in every direction and stops instantly at will. It is by no means fatiguing to work. The rider is provided with a saddle or little seat, and is not embarrassed with the task of preserving his equilibrium as on a bicycle. We observe, from proceeding in a court of law at Birmingham, that a self-moving traverser has been invented there. This shows the direction that the movement is taking in England.

The Strike at Manchester.—A resolution, hearing upon this strike, has just been come to by representatives of the London and Manchester Bricklayers' Societies, at a meeting held in Sheffield. These representatives, eight in number, were in negotiation, with the view of removing some difficulties between their respective societies, and were assisted by Messrs. W. Allan, D. Guile, and George Odger, of the London Trades' Council, who acted as arbitrators. After disposing of the differences of the two societies, the meeting adopted unanimously the following resolution:—

"That in the interests of both employers and workmen, this meeting recommends that the dispute existing in the bricklaying trade of Manchester should be settled by the following mode:—That a Board of Conciliation be appointed, of an equal number of employers and men, and that a chairman be selected who shall be acceptable to both parties; and that the decision of the Board shall be binding upon both employers and men."

This resolution has given much satisfaction, not only because it affords a prospect of settling an injurious dispute, but also as a recognition generally of arbitration as the best means of adjusting trade disputes.

Unhealthy Dwellings in Newcastle.—At an inquest on the body of a woman who had committed suicide while in a low and dependent state of mind, the coroner remarked that the room and the house in Cox's Entry, where the deceased and other persons reside, were a disgrace to the owners, and never in the course of his experience had he witnessed such unhealthy dwellings; he was astonished how human beings could exist at all in such places. The jury also expressed themselves in strong terms about the unhealthy state of the dwellings. The verdict returned by the jury was "That the deceased had committed suicide while in an unsound state of mind."

The Market Question.—We hear the Statistical Society proposes, among other more active measures, to engage in the investigation of the markets question in the metropolis; and, at the last meeting, named a deputation, consisting of Mr. Newmarsh and two others, to confer with the record committee of the Society of Arts.

New Hospital at Hanwell.—A new hospital at Hanwell, founded by the Baroness Weld, was solemnly opened by Archbishop Manning last week. The hospital is 49 ft. long by 27 ft. wide. The architect is Mr. Welby Pugin. There were present on the occasion a large number of priests.

Art and Science at the Mansion House. The Right Hon. the Lord Mayor (Jae. C. Lawrence, M.P.) and the Lady Mayores will entertain the council of the Royal Society, and the members of the Royal Academy, at dinner on Wednesday, the 21st inst., and have invited a large party to meet them.

A Phenomenon in Peru connected with last year's Earthquake.—On the Locumba road, about twenty-two leagues from Tacna, there exist what is termed a *dry arroyo*, the bed of a former river, into which, from time immemorial, no water has been known to pass. During the earthquake which destroyed Arica and partly Tacna, the shocks were strongest in the neighbourhood of Locumba and the Arrieros. A mule-driver reported that one of the mountains near the *arroyo* had been split open, and a small stream of ferid water was oozing out of a mountain into the *arroyo*. No attention was at first paid to the fact, nor to the mortality among the animals that visited the neighbourhood. It was only when the people began to leave Tacna, and flee from the scourge of the yellow fever, which was devastating the cities of the Vallec of Locumba, that they became aware of the fatal effect upon their animals, at a distance of as much as eight and ten miles from the *arroyo*:—

"The stretch," says an informant, "I can compare to nothing else than old bilge water, of the smell of which you become painfully conscious. Within twelve miles from its source my horse dropped down water nos, and in five minutes he was dead. He vomited three or four times a thick black substance, similar in consistency and appearance to the black vomit. I was thus left to walk fifteen miles to the nearest house, two-thirds of which I may call a mules' graveyard, so thickly was the old road covered with them. The cause of this singular freak of nature is unknown; but it seems that the gases which have impregnated the atmosphere produce the vomit and death of the animals that inhale it. What these gases are composed of science alone can solve."

A commission has been ordered by the Peruvian Government to examine into this extraordinary matter and report upon it.

Exhibitions of Bavarian and Foreign Art.—The Munich season promises to be exceptionally brilliant this year; for, in addition to the interesting collections of works of art, there will be three large exhibitions open from the middle of the present month till October—namely, the General International Exhibition of Art in the Crystal Palace, and in connexion with it in the same building the Local Industrial Exhibition; and, thirdly, in the old building for the exhibition of works of art, an exhibition of painting of the old masters, the property of private persons. The arrangements made by the railway companies to issue circular tickets for thirty days will afford tourists ample time to visit Munich. The National Gallery has been re-arranged by Director Foltz. The large gallery at Schleissheim is also to be re-arranged.

The Pimlico Carpenters and Joiners Classes for Technical Education.—The balance-sheet for the first session, from June 17th, 1868, to May 14th, 1869, just issued, shows, on the side of income, 48*l.* 1*s.* 9*d.*; and on that of expenditure, 45*l.* 4*s.* 10*d.*; giving a balance in hand of 2*l.* 16*s.* 11*d.*

The New Atlantic Telegraph.—The *Great Eastern* has successfully accomplished her task. The cable was cut in order that communication might be made with St. Pierre. The reef of the work was done by the consort ships carrying the shorter lengths of cable. This insulation is said to be "eplendid." A message has been telegraphed from the American side to the Emperor, congratulating him on the completion of the work.

Funds of Trade-Unions.—Leave was given to Mr. Bruce to bring in a Bill to protect the funds of trade-unions from embezzlement and misappropriation. The Bill was read a first time, and the second reading fixed for last Thursday.

Staindrop.—The following tendere for the work to be done at the new Wesleyan chapel have been accepted, viz.:—Messrs. Ahdale & Stephen, Darlington, mason, plasterer, and slater's work; Mr. J. D. Martin, Darlington, joiner's work; and Mr. George Simpson, Staindrop, plumber, glazier, and painter's work. The chapel will be 41 ft. by 30 ft. inside, and accommodate 218 persons, with provision for enlargement. The architect is Mr. John Rose, of Darlington. The style is Romanesque.

Tudhoe.—The foundation stone of a new church and presbytery, to be called the Church of St. Charles, has been laid at Tudhoe, by the Roman Catholic Bishop of Hexham and Newcastle. The site selected is situated near the village of Tudhoe, and Mr. C. Salvin, of Burn Hall, has contributed 1,000*l.* The contemplated orphanage is for the purpose of gathering together from the entire district the destitute orphan children, and placing them under the direct instruction and supervision of the Roman Catholic community!

The Builder.

VOL. XXVII.—No. 1381.

A Note from Northampton.

THE Vicar of Brixworth, the Rev. Charles Frederick Watkins, is not quite satisfied with the observations, in a former part of our Note, on the restoration of his most interesting and important church.*

Mr. Watkins writes to us,—“There has been no ‘rebuiding of arches,’ as you suppose; reparations only have taken place, and either with remaining original fragments, or the thin stone of the neighbourhood, so as to maintain a clear distinction between the old and new work. Neither were there any ‘cubicula,’ as you report. You have mistaken foot buttresses upon which the side arches of the aisles rested, or locked into the piers of the nave-arcade, for sectional divisions.” And afterwards he says, “Not a brick or stone of the Saxon work has been displaced. It has been a restoration in the true sense of the word, as bringing out, the original, as far as it exists, to the eye of every beholder, and in a sound condition.”

We really found no fault with the restoration; but to say that “not a brick or stone of the Saxon work has been displaced,” is simple nonsense, and is contradicted not alone by eye-sight, but by the vicar’s own statement, that original fragments or the thin stone of the neighbourhood has been used in the new parts so as to prevent them from being confounded with the old. Mr. Watkins says he knew we should fall into error, and warned us we should, if we attempted to give an account of Brixworth Church from personal observation alone. The fact is, we have fallen into no error at all. Mr. Watkins is a little too dogmatical;—has it all his own way, probably, at Brixworth;—but he really has done so much good service that we will not find fault with him. All that is known of Brixworth is as clear before us as if we had had the thirty years of constant residence on the spot of which he speaks. We are not writing a history of Brixworth Church, or even giving an account of it,—simply writing a note, which has grown upon us, to show, amongst other things, what a wonderfully interesting building this is. As to the *cubicula*, we had before us a plan published in the Journal of the British Archaeological Society,† illustrating an interesting paper on the church, by Mr. Edward Roberts, wherein the *cubicula* are shown, the writer saying,—“Recent excavations have shown that these cubicula were five on each side, exclusive of those on each side of the tower.” We must leave the Association to defend its own plan. Mr. Watkins mentions that he discovered within the square tower (the lowest story of which is possibly of the same date as the nave) “the bases of circular columns which formed the propyleum to the Roman temple, or

early Christian church.” He also discovered in one of the piers a Roman eagle of the Assyrian type built in “and evidently taken from an earlier building.”

Putting aside the possibility of actual Roman work, we have, at any rate, in Brixworth Church a most interesting example of work in the Roman manner carried on in Saxon times. We ought to speak of the eastern apse, with its ambulatory, rebuilt on the wall of the crypt, it is asserted, which has been left entire; but we may not now give greater space to the subject.

It will be remarked by any visitor to Brixworth who knows anything of the matter, that the leading characteristics of the set of buildings we are contented to call Saxon are not present,—“long and short work,” as it is termed, and long pilaster-like slips of stone connected either by semicircular arches or corresponding slips diagonally placed. In the tower of Earl’s Barton Church, to which, after returning to Northampton, we now proceed, these are seen in full force, as well as balustrade windows, another characteristic feature. This tower terminates at the present time with an embattled parapet, comparatively modern. Originally it was probably finished with a four-gabled roof, like the tower of Sompotting Church, Sussex.

We have before our eyes fine towns,—say in the fourth century,—at Silchester, Wroxeter, St. Alban’s, and numerous other places; we know that the Britons were incited by Agricola to erect halls, basilicas, and forums, and to ornament them with porticoes: Tacitus says so distinctly: we know that the Saxons built thousands of churches and monasteries; and yet some modern writers would almost have us believe that all the buildings erected between the time of, say, Silchester and the coming of Norman William, have been clean swept away. It has been urged often that the common use of timber in building is indicated by the Saxon verb *getymbrian*, to build, apparently formed from the name of the material commonly used. But if we learn from Bede that King Edwin, in the year 626 ordered a church to be built of timber, at York, for his own baptism, the same chronicler tells us that the king afterwards directed that it should be rebuilt of stone. The evidence afforded by old writers, illuminations, and existing remains that both the Britons and the Saxons erected stone buildings is not to be controverted, and these were executed, as might be expected, in the manner of the Romans,—*Mure Romano vel Romanorum*. They built of timber at times when it was more convenient, as we do now, but stone and brick were mainly used. Working on this *getymbrian* theory, the tower of Earl’s Barton Church, and other towers wherein the same sort of construction prevails, have been pointed to as suggesting the execution of a carpenter, or person accustomed to use timber, rather than that of a stonemason. The disposition of the large thin stones is adduced as resembling the framework or quartering of common partition walls, or those of half-timber houses where upright and diagonal pieces of wood constitute a sort of framing, and in which brick-nogging or lat-and-plaster is employed to fill up the spaces.

Even Mr. Fergusson sees no reason to dissent from this theory. “The Saxon,” he says, “in its ornamentation showed a tendency to wooden forms which we do not find in others. In Lycia, in India, and Egypt, we are able to trace a wooden architecture gradually developing itself out of one of stone; but here we can almost certainly detect a stone architecture becoming wooden from the two materials being constantly employed in juxtaposition, the meaner being generally predominant.” This is plausible; and is generally received: but is it true that this mode of construction resulted from the circumstance that the builders, or rather designers, of these churches had been used to deal only with

timber? We think not, and never could think so. The triangular-headed opening, the slender pilasters of stone, the alternate use of long and short blocks, with the interspaces filled with rubble, small balustrade-like columns, are all to be found in works of the late periods of the Roman empire. Sir Gardner Wilkinson, in a paper on “Long and Short Work,” read some years ago at a meeting of a county Archaeological Society (the too cautious honorary secretary of which refused to allow it to be printed, at the author’s request, in our pages, so that it might be confined to their own Transactions and remain unknown), took this same view, and pointed to a number of instances he had met with, notably during a tour through the Regency of Tunis in 1844. He there found whole towns, apparently of the time of Justinian and the subsequent emperors, the houses of which were built in this manner, whose walls consisted of upright shafts of long and short blocks, with the intervals filled up with small stones and mortar. The same style of building is met with in other places, and we have no doubt that this mode of construction was borrowed from the Romans by Saxon builders in this country. However, we must get on to see a building of more recent date, first adding that the Norman parts of Earl’s Barton Church are interesting, and that the whole structure is in a very bad condition.

Our ramble included the seat of the noble family of the Douglas-Comptons, Castle Ashby, which was bought by Henry VIII.’s Sir William Compton, from the third earl of Kent. It may be taken, always remembering that there are special times when the owner allows the House to be seen, in the same round with Earl’s Barton Church.

There are many places in England called Ashby: the term (written in Domesday book, *Ascehi*) is thought to be compounded of the Saxon for an ash-tree, and *by*, a dwelling; an addition being made, as at Canons Ashby, Ashby Ledgers, and so on, to distinguish one such locality from another.

The House at Castle Ashby stands in the midst of a finely wooded estate, with an artificial lake, formed by “Capability Brown.” The building was commenced by Henry Lord Compton in the fourteenth year of Queen Elizabeth’s reign, A.D. 1572, but was not finished till 1635, which date will be found in one of the parapets. The parapets, by the way, are formed of inscriptions, or texts, as was not unusual in buildings erected about this time.

Inigo Jones designed the part of the building last erected, without any great addition to his reputation in consequence.

The staircase is quaint, but less grand than some of a little more recent date. The carved uprights are apparently interpolations. The extent of the house is very considerable, the rooms and galleries are varied in size and height. Amongst the quite recent alterations, and, we may say, improvements, is a large and lofty built-up chimney-piece, of carved wood, in the drawing-room, the greater part of which would seem to have been obtained from abroad, and worked into a whole on the spot.

Some one has said, and many feel, that a home is no home unless it contain food and fire for the mind as well as for the body. So those have thought who, century after century, have gathered together the collection of works that furnish Castle Ashby. There is an admirable and extensive library, and the walls show many charming pictures.

The collection has this distinguishing feature, and the owners of other historic houses, ancestral homes, may usefully note it,—that the present marquis has added a large number of specimens of modern industrial art-work, both foreign and English, maiolica ware, and so forth, which are even now interesting, and a hundred years hence will be invaluable.

* See pp. 537, 538, ante.

† For December 31, 1863.

Two new lodge-entrances are in course of completion, one Gothic in style, by Mr. Street, the other of the mixed character of the House, only more so, by the architect of the Northampton town-hall. The upper part of the latter displays a large amount of heraldry, showing the various arms, crests, and mottoes belonging to the family, such as a fired beacon on a mound, inscribed *Nisi Dominus, for Compton*; a bear sticking between two oaks of an oak-tree, with a chain and lock holding them, and marked *Locksicher*, for Douglas; a considerable sprinkling of helmets; and the great Coat and emporters, with the motto,—

Se ne scerch; que ung.

The two elaborate sets of iron gates and terra cotta piers, of one of which we gave a view in our last year's volume,* stand within the grounds in front of the Mansion, and are to be regarded, perhaps, as a triumphal way or entrance of honour. Unless so considered, they seem wanting in purpose, the more so as the lofty and somewhat formidable-looking gates and piers have on each side of them a quite low railing over which entry would not be difficult. Sir Digby Wyatt, under whose able direction Mr. Blashfield produced these piers in terra cotta, has also co-operated with that manufacturer in forming a series of terraces, with parapets, pedestals, bastions, and fountains of the same material, a very extensive and important experiment. The parapets following the character of those on the Honco consist of letters forming inscriptions. The work is sharp, and for the most part seems to stand well. Here and there every now and then a failure takes place, probably through insufficient burning, or some accidental fault in the constitution of the material; but when time has found out such weak spots as there may be, and these have been reinstated, there seems little reason to doubt that the whole will long endure.

The gardens, some time neglected, are being brought into excellent condition. We would gladly talk of the contents of some of the glass houses, and the hundred or two varieties of roses outside, but may not give the space the comments would occupy. Some new houses have been built, and are now occupied, the outside of which is to be cased with terra-cotta, while, inside, the wooden uprights between the lights are lined with mosaic, orchids, and other flowering plants, with a charming effect resulting.

Some parts of the grounds are admirably laid out, and show the hand of a master in the art. There is something peculiarly pleasing in English landscape gardening. The wild charm and waywardness which in other countries Nature shows only when far away from the residence of man are here brought to his very door, and made to conduce to his most cultivated home delights.

We have made our Note from Northampton somewhat longer than we intended, and here it must end, without half exhausting the subject.

THE MILITARY ARCHITECTURE OF THE FUTURE.

THE amount of money which it is proposed to expend, within a short time, on various civil and military works under the direction of the Government, is so considerable as to give occasion for very serious reflection. A daily contemporary estimates the cost of six items, of a civil description, at from 10,000,000 to 12,000,000 sterling, a sum which is probably considerably within the mark. These are:—1. The New Law Courts. 2. The New Public Office, three times the size of the block already built. 3. The New National Gallery. 4. The New Natural History Museum. 5. The remodelling of the Admiralty and adjacent buildings. 6. The completion of Burlington House, of the Record Office in Foster-lane, and of the South Kensington Museum. To these distinct items has to be added an indefinite margin of approaches and thoroughfares.

Concurrently with these metropolitan demands on the service of the builder, we have to consider the demands made on the public purse for the completion of the national defences. Portsmouth, Plymouth, Pembroke, Chatham, Sheerness, each and all have to be considered. With the increase in range of ordnance, the cost of structural defence increases in almost equal ratio; nor does it seem as if the sense of security

was to be purchased at a lower price than that which is demanded for the governmental, artistic, and educational requirements of the metropolis. The provision for the poor,—casual, criminal, diseased, and lunatic,—again threatens to swell an expenditure, local and national, to a sum bearing an appreciable relation to the National Debt. And if we may hope to be so happy as to write off the amounts thus claimed from the results of an increasing and elastic revenue, still the total, representing so much taxation which might otherwise have been remitted, will be the equivalent of a national outlay of some three-quarters of a million sterling per annum for ever.

In the face of so large an outlay it becomes more important to consider the fact that we are on the threshold of a great revolution in military architecture. We are preparing, as we propose to show, a system of defence that will go far to obviate the necessity of very much of the costly structure of fortifications. Knowing, as we do, what great changes have occurred in this respect, both before and since the time of Vauban, we think it only ordinary discretion to arrest the progress of expensive forts, at least until we see with more certainty what will be the result of the nullification of the process of recoil in placing artillery in position, and in withdrawing it from exposure except at the actual moment of firing. Let us glance, for a moment, at some of the great secular changes which mark, or rather which constitute, the history of architecture.

Architecture, historically regarded, has been chiefly indebted for its progress to the impulse given by three patrons, or rather orders of patronage—the soldier, the priest, and the king. It is true that these distinct functions have been not unfrequently exercised by the same individuals. The great pile-up of fortifications have often been warlike sovereigns. The most perfect temples of pre-Grecian times were also royal mansions. Temples, as well as palaces, have been turned into strongholds, or even originally constructed with a view to military defence. But by whatever hands, or under whatever political conditions, these several orders of structure have been raised, they yet assert their distinct individuality. When we ascend above these humble efforts of the builders' art which merely aim at the provision of a shelter for the family, it is long before we find any trace of what we now call public buildings. Halls for popular assembly, debating-rooms, music-halls, mechanics' institutes, are creations of the present day. Theatres are some two thousand years older, but still do not date from an antiquity more remote than that which is commemorated by Horace; when rude carts served at once to convey the actors and their very slender "properties," and to form the stage: this locomotive theatre being, itself, an advance on the original trestles, mounted by the lee-stained actors. Amphitheatres, if built for the people, were yet the works of monarchs, or of those wealthy and powerful Roman senators, triumvirs, imperators, or incipient tyrants of whatever name, who ranked above barbaric kings. In a word, public buildings cannot be regarded as more ancient than the "public" itself. And the antiquity of our present idea of "the people" can hardly be pushed back to a more early origin than the literature which preceded the great French Revolution.

Apart, then, from that class of buildings which is daily assuming more importance in the present day, but which is, in its origin no less than in its adoption, essentially modern, the chief architectural works of the world have been either military fortifications and citadels; religious temples, tombs, and monuments; or royal palaces and seignoral *châteaux*. With the advance, or at all events, the change of man, of human civilisation, the change of manners and of creed has been faithfully reflected by these architectural mirrors. The general tone of social life may be gathered from an investigation of the work of the architect. At times, indeed, the result of his labours is so different from that which is sought by his successor at the present day, that we are yet in doubt as to the veritable purport of some of the most enormous, as well as the most ancient, buildings in the world.

The climate and the sands of Egypt have preserved structures reared four or five thousand years ago from the decay which, in other and less favourable circumstances, would have led to total destruction in less than a tenth of the time.

The earthquakes which so frequently shatter the northern shores of the Mediterranean, and the rapid and luxuriant vegetation of Central America, are agencies which, had they prevailed in Egypt, would have left little or nothing extant that was reared before the days of the Ptolemies, if even the pseudo-Egyptian works of that last of thirty-three dynasties had lasted to our day. Year by year the sands yield to those who attack them their long-buried records, preserved fresh and uncorrupted under their friendly veil; and long-forgotten history promises to assume not only a definite, but an unquestionable, shape.

But with all our knowledge of the kings and of the temples of Egypt, the Pyramids still remain almost as mysterious an enigma as the Sphinx herself. They seem to mock human curiosity. They partake of the nature of unfulfilled prophecy, inasmuch that they seem to afflict with madness, or at least with monomania, those who devote themselves to their study. No doubt can be entertained by any candid student of their monumental, ephemerical, character. That their builders had attained a not contemptible knowledge of the rudiments of astronomy, as well as of those of geometry, and a considerable skill in the builder's art, is undeniable; but the enormous disproportion between the solid and the hollow contents of their vast structures is altogether anomalous in the history of architecture. The existence of the small internal chambers and of the inclined and portcullised passages, as the only perforations left in these stupendous artificial mountains, is an arrangement so entirely unparalleled as to be barely intelligible. The preservation of the royal mummy, during a lapse of time equal to that of the great year mentioned by Plato, in a structure that should defy alike elemental and political change, is the only practical aim that we can now attribute to these great monuments of unstinted human labour. The point most interesting to the philosophic inquirer of the present day is, the extreme antiquity of the evidence afforded by the pyramids and sepulchres of Egypt as to the doctrine of the immortality of the soul, and of its return to its former body—the earliest known idea of the resurrection. It should be noted that, with all the toil and skill that was expended to make both the sepulchres and sarcophagi secure, there appears to be combined arrangements as if we would admit of their being opened, without violence, when the time which their preservation contemplated should arrive.

With this evidence of the early existence of a doctrine which has never ceased to exert a mighty social influence, is mingled the trace of another portion of the ancient creed of mankind, which is very contrary to most modern schools of thought. The divine character of the monarch was a distinct dogma of ancient sovereignty. As the cuneiform inscriptions of either the Persian, the Medo, or the Assyrian kings, enter their long-silenced messages, they all tell us the same tale. In Nemroud, as well as in Diopsolie and in Memphis, the temple and the palace constituted one building. The living king dwelt among the shadows of his departed ancestors, those tutelary guardians of the land and of the race, of whom he was only the terrestrial representative,—the link between the gods of the past and the fathers of the future. In these ancient structures, the architect, in toiling for the king, toiled also for the priest; and in proportion to the awe which attended the regal dignity, and the sacerdotal function, the strict requisite of military defence dwindles and disappears.

Defence, however, was the aim of the most ancient structures. To all that is Egyptian, it seems probable that we shall, by and by, be able to attach definite and positive date, although the chronology which is being slowly unveiled reaches back to a period which many persons are utterly unprepared to accept. But no dates has as yet been assigned to the early Cyclopean structures. From the absence of evidence of the tool of the mason, in the ruder forms of Cyclopean masonry, we have reason to attribute them to a period antecedent to the use of iron or of bronze implements, and we are thus carried back to an era far antecedent to that of the fine granite-masons of the Pyramids. As yet, therefore, the soldier is the oldest builder who has left his architectural trace on earth.

The architectural history of the religious and the political state of mankind, as evinced by the remains of the structures reared by the king and by the priest, present, in one respect, a remarkable contrast to the military history delineated

* Vol. xxvi., pp. 44, 45.

by the buildings of the soldier. The reason may probably be found in the intensely practical character of the art of war. The soldier deals with facts,—he grapples with actual resistance, whether that of the human arm alone, or that of the human arm aided by structural defences. He does not seek merely to awe the mind, or to symbolise or shadow forth irresistible power; he displays all the power which he is able to command. Therefore his architecture follows hard upon the progress of science,—he cannot afford to be conservative, in the sense of abhorring innovation. Surprise is his most irresistible weapon. The commander who makes it a rule *stare super antiquas vias*, is apt to be convinced of his mistake by rude and summary lessons. If he is not awake to what is going on in the world he is liable to be roughly awakened. For these reasons military architecture is, for the most part, a faithful expression of the most advanced scientific knowledge of the date which it fears, and accordingly the remains of ancient fortifications show a steady and uninterrupted advance in the practice of the art of war.

With religions and palatial structures an opposite law prevails. Without saying that the functions of the priest are less important, in a social sense, than those of the soldier, it is yet evident that they contemplate an entirely different order of ideas. The object of the priest is the moral government of mankind. Not that he seeks to affect the imagination. Not that he less demands the service of the whole man than does the soldier. On the contrary, he demands more. He requires not only obedience but assent. He strives to found his dominion on a deeper and more imperishable basis than that of military discipline. He would make the soldier himself his minister, servant, and executioner.

The aim, therefore, of temple architecture, has been to impress the imagination: while the soldier sought that which was strong, the priest sought that which was sublime. But in this effort to subjugate the imagination, two elements came into play; and it is the alternating force with which one or other of these two distinct orders of ideas have from time to time been developed, that has stamped sacerdotal and ecclesiastical architecture with such varying and contrasted features. The contrast is a mark of race, no less than of time. Although the two ideas to which we refer are presented to our minds as instances of the sharpest contrast, it is yet easy to trace them to the same origin. The main subject of sacerdotal dogma has been invisible power. The object of sacerdotal architecture has been to impress upon the mind the actual reality, and the sensible proximity, of the source of this invisible power. This effort has been made in two opposite directions.

The Tonic tribes of the time of Tacitus, the builders of the earlier pyramids, and the masons of the stone circles of the prehistoric times, appear to have all regarded the invisible with that genuine awe which precluded any attempt at its representation. They were not iconoclasts, because they had not yet degraded the object of their worship by iconography. The forests were their most sacred temples, and the vast, solemn, heaven-pointing, durable structures which they raised were but artificial sacred groves.

Symbolism, however, is a mental action of spontaneous growth. In childhood it is the natural language of the mind. In the infancy of creeds or of natures it is no less simple and self-sprung. The most awful mystery may be denoted, and very naturally comes to be denoted, by a symbol. The veneration which it is sought thus more persistently to impress on the mind, tends unavoidably in the course of time to clothe the symbol itself with a portion of its sanctity. Thus symbols grow into idols. They did so in Egypt five thousand years ago. They do so in London to-day.

In the relics of ecclesiastical architecture we can trace the introduction and the growth of symbolism, until it assumes the forms of the grossest and most incredible idolatry. The extreme of splendour, combined, for the most part, with a very debased taste, marks this culmination of the effort to represent the invisible. Then comes a period of conquest or of reaction. Cambyses, or Constantine, or Omar, or Luther, strikes at the stone which had become defiled. The temples are decreased; the basilica replaces the Naos, again, it may be, in its turn to become adorned with images of celestial protectors; or to witness, as in the church of Santa Chiara, and in the chapel of Saint Jannarius, at Naples,

the paltry simulation of those rites which once were as real as they were universal.

While ecclesiastical structure has thus reflected the course of struggle between two opposite tendencies, military building has maintained a steady course, and has thus presented a truthful mirror of the science of the day. The state of the art of offence is faithfully recorded by the character of contemporary fortifications. When the battering-ram had been so far improved as to form an engine that would overthrow walls formerly impregnable, great builders, such as the magnificent Herod, erected towers with solid, megalithic bases, against which the ram would dash itself to pieces with no more effect than that produced by the waves on the promontory of *Misenum*. As the feathered artillery of the archer became more precise and deadly, walls and towers were crenellated and loop-holed for the service and the defence of the bowman. Solid square towers (as in the fortifications of Sorrento) projected from the curtain of a lofty wall at such distances from one another as to allow of the sweeping of the wall by the flight of the shafts. As explosive artillery gradually crept into use, this method of defence became antiquated, because cannon-balls fired along such a curtain would batter the opposite tower. Then came Vauban, to remodel the art of defence. The next great step was that of the increased range and precision of the artillery of our day. With every fresh increase of this power some ancient virgin fortress lost its proud distinction. Hills, once too distant to be regarded as military points, were found to dominate spots long considered impregnable, as at Gaeta. The introduction of heavy floating batteries has changed the value of maritime defences, and has led military men to reconsider the value of such stations as Gibraltar and Dover. Gaeta, indeed, though attacked from one commanding point by the *Cavalotti* guns, yielded to a sea attack. With the increased efficiency both of direct and of vertical fire, the lofty walls of ancient fortresses became but so many targets. Casemates sunk in live rock, trenches, batteries *à fleur d'eau*, *kaponier* defences, and iron or steel shields, are the chief features of modern fortification.

Military architecture, then, having descended from the heights on which it was wont to isolate itself in feudal times, having dismantled the towers of such strongholds as Rochester Castle, or the Papal Palaces at Avignon, the walls of Amiens, or even the lines of Chatham, has arrived at a point at which it seems about to obliterate itself altogether. Sunk fences and earthen banks can hardly be termed portions of military architecture, but they are becoming daily more essential characteristics of fortification. And the greatest step which has been taken in the art of war since the invention of gunpowder,—the utilisation of the recoil for the purpose of raising or depressing a gun, so that, after firing, it may sink into convenient obscurity, and present no mark for hostile aim,—is almost certain to render military architecture, strictly so called, a thing of the past.

It is worthy of attentive remark that, while the great perfection to which the artillery of the day has been brought has stimulated our engineers to attempt the defence of their costly and ponderous engines, first, by shields of iron and of steel (whether in land or in sea batteries), and then by concealing their position until the very moment of their discharge, the defence has become submarine as well as subterranean. Long lines of ditch, with a strongly-laid and well-protected railway at the bottom, for the traverse of the Moncrief Gun carriage, will replace certain walls in the fortifications of the future. Simultaneously with the inauguration of this revolution in the art of the military builder, the chemist assures us that he has perfected the torpedo, on which we may thus rely for the defence of our ports and harbours. These submarine infernal machines were had recourse to by the Russians for the defence of Sebastopol. The arrangements then made proved to be imperfect and unsuccessful. In 1859, and again in 1866, the Austrians adopted the same method for the protection of Venice. Their engineering was not, however, subjected to the test of actual attack. The War Department of this country has directed the attention of its able chemist—we disclaim any play on the word—Mr. Ahel, to the subject, and his researches have been attended with eminent success. He is now in a position to construct, and to lay, a nest of torpedoes, connected with a submarine wire, by means of which they can be rendered sensitive or not at will. Thus our own vessels might pass

over them in safety, while, if it seemed advisable for our fleet to withdraw, and to leave the coast apparently clear, the slightest graze of a hostile keel would cause an explosion that would blow out the bottom of the intruder.

The engineer and the chemist are thus removing the art of fortification from the province of the architect. We seem to witness the proximate close of a long and most instructive chapter in human history, a chapter every section of which will repay the careful perusal of the student. Palatial architecture is undergoing a change, ecclesiastical architecture is ramifying into branches as various as the divisions of sect and of school, but the great historic series of the building works of the soldier, regarded as picturesque elements of landscape, appears to be approaching its term.

THE ROYAL COMMISSION ON WATER SUPPLY.

ON THE PRACTICABILITY OF OBTAINING LARGE SUPPLIES OF WATER FROM THE MOUNTAINOUS DISTRICTS OF ENGLAND AND WALES.

FIVE engineering projects having this object in view, have been laid before the Commissioners. Four of these plans have for their object the supply of the metropolis.

They are proposed by the following engineers—

- 1st. Mr. John Frederic Bateman, F.R.S.
- 2nd. Messrs. Hemans and Haassard.
- 3rd. Mr. Hamilton Fulton.
- 4th. Mr. George Remington.

Mr. Bateman urges that the supply of water to London should be sought where it is purest, softest, and most abundant, and recommends mountains of hard and impermeable rocks where there is little land cultivation or manufacturing operations, and where reservoirs for storage could be easily provided at a sufficient elevation to give a supply of water to the greater part of London without pumping.

He considers the nearest high land fulfilling these requirements is to be found in Wales, and has selected the district supplying the head of the river Severn. The artificial conduit to bring the water to London would pass near the town of Stourbridge, Bromsgrove, Henley-in-Arden, Warwick, Banbury, Buckingham, Aylesbury, Tring, Berkhamstead, and Watford, and would end in a reservoir on the high land near Stanmore, ten miles north-west of London, capable of containing twenty days' supply at the present rate of consumption. 230 million gallons a day is the quantity proposed to be brought to London. The length of the conduit would be a little more than 180 miles. It would be chiefly an open channel, lined with masonry, but would be tunnelled where necessary through the hills, and formed by syphon pipes across the deep valleys. It would have a fall of about a foot in a mile, and would deliver the water at Stanmore at a height of 270 ft. above the mean sea level.

Mr. Bateman would make use of the present means of distribution, revising them, and adapting them to the constant supply system.

The aqueduct would pass within ten miles of the centre of the populous manufacturing districts of Birmingham, Wolverhampton, Dudley, and Walsall, and these places might be supplied on the way, for they are the most difficult towns to supply with water of any in England.

Mr. Bateman proposes to appropriate 204 square miles of drainage area. The rainfall has not been registered in the district, but Mr. Bateman assumes it to resemble that of other districts of similar conformation where the rainfall has been registered, and thinks it ought to be as great as the Highlands of Scotland, and of the Lake districts. In this way it is estimated that the average rainfall is 75 in. per annum; but as it does not do to lay out waterworks on the average, he takes two or three of the driest consecutive years, and puts down 60 in. as the fall to be reckoned upon. The loss by evaporation and absorption in such districts has been found to vary from 9 in. to 16 in. per annum, and 12 in. are taken as a safe estimate for this district, leaving 48 in. available, but for greater security Mr. Bateman again diminishes this to 36 in., and bases his calculations on that.

Compensation is the next question, not in this case, to mills, as is usual in the manufacturing districts of Yorkshire and Lancashire, but to rivers, in dry weather; for in dry weather probably all the water would be impounded in the reservoirs, and leave the rivers dry, except for this compensation. To compensate mills,

one-third of the available supply is usually given out; but merely for rivers having no millie requiring power, one-fourth is thought to be sufficient.

The Royal Commissioners examined Mr. Hawksley on this question of quantity, and he considers that the average rainfall would not exceed 45 in., but he says it is known to be impossible by any system of reservoirs that can be constructed to deal with more than the average of three consecutive years of minimum fall. The minimum year has about one-third less than the general average, and in the three consecutive driest years the average fall is one-sixth less. Therefore 45 in., less one-sixth, leaves 37½ in. as the quantity due to the three minimum years. Mr. Hawksley also, besides reducing Mr. Bateman's quantity, increases the estimated loss by evaporation and absorption, which he puts at 13½ in., leaving but 24 in. available instead of 36 in., as estimated by Mr. Bateman.

Mr. G. J. Symons, author of a work entitled "British Rainfall," has very good means of judging correctly on this question; and he tells the Commissioners that the mean fall in three successive dry years would probably be 44 in. or 45 in.

The Commissioners consider the storage proposed by Mr. Bateman a matter of great importance. There being no natural lakes, it is proposed to make reservoirs of a total capacity of 6,709 millions of cubic feet, which would provide from 120 to 140 days' supply. Here again Mr. Hawksley differs from Mr. Bateman, and considers that 170 days' supply should be provided for the three driest years.

As to the quality of the water, the Commissioners made an independent investigation, and intrusted the selection of the sites where samples were taken, so as to afford a fair average of the whole, to Mr. W. Fole, F.R.S. Fourteen samples were submitted to Dr. Frankland, F.R.S., and Dr. Odling, F.R.S. The ground selected by Mr. Bateman consists chiefly of the slates of the Silurian series of rocks, and its features are favourable to the purity of water flowing from it. The analysis of these waters bears out the favourable opinion that might be formed of them from the nature of the ground, and shows that there are only about 2½ to 4½ grains of solid matter in the gallon, and their hardness, by Dr. Clark's test, is only from 1 to 2 degrees. This organic matter is also small. Of five principal objections raised to this water there are but two that seem to be well founded,—the one that considerable tracts of peat exist within the gathering-ground, which give colour to the water, and that this colour would hardly be removed before it reached London, and if so it would not give satisfaction to the people. Mr. Hawksley says "it would not be tolerated." Water that comes from high lands is usually coloured by peat; but in manufacturing towns this is tolerated for the sake of its softness, which is so necessary for manufacturing purposes; while in London, "the white water," says Mr. Hawksley, would be much preferred. It appears to be admitted that the exposure of peaty water to the atmosphere in large reservoirs tends to clear it of colour. Filtration through sand in the ordinary way will not remove the colour. Dr. Angus Smith and Dr. Miller say that peaty water would not be injurious to health, and the chief objections to it are its bitter taste and its appearance. The other objection is, that the water, being soft, will act freely upon lead, and, while the doctors differ in their opinions on this subject, the Commissioners say that the evidence does not show that any injurious effects in this respect have resulted from the use of soft water in Whitehaven or Manchester and other towns.

Mr. Bateman proposes to make the outlay gradual by dividing the full quantity of 230 million gallons a day into four stages, viz.:

1st. 130 million gallons, to cost	£8,685,008
2nd. 170 " " " " " " " " " " " "	10,371,615
3rd. 200 " " " " " " " " " " " "	10,822,474
4th. 230 " " " " " " " " " " " "	11,400,023

These sums do not include the purchase of existing works or interests. On the other hand, certain property of the companies, to the amount of 1,000,000L., might be sold when the gravitation system has been adopted, and Mr. Bateman states that each of the above sums ought to be reduced by that amount.

However large this outlay may seem, it is not more in proportion to population than has been incurred in Glasgow, Manchester, Liverpool, and other places, and is far below the cost incurred in many other places.

Mr. Bateman proposes to levy rates in the

metropolis, on account of the water supply, in the same manner as is done in the three towns named—first, a public rate, levied in consequence of the protection against fire which a constant supply and high pressure necessarily confer, and in consideration, also, of the great advantage which all property is supposed to derive from a full supply of water; and, secondly, a domestic rate, in respect of the water supplied for domestic purposes. The rates so levied are—

	Public Rate.	Domestic Rate.
In Glasgow	3d.	1s.
In Manchester	3d.	9d.
In Liverpool	6d.	4½d.

To carry out this financial plan, the water supply would require to be vested in a public body, with power to levy rates and purchase the interests of the several existing companies, and to introduce the new supply.

The Commissioners' "remarks on Mr. Bateman's plan" recognise it to be practicable in an engineering point of view, but doubt the sufficiency of the estimates, without, however, giving any reasons for that, beyond a vague surmise that the works would be subject to contingencies, and that it is impossible to arrive at any reliable estimate of the cost, without detailed surveys and sections, which they think would probably cost 10,000L., and imply by that, apparently, that therefore Mr. Bateman could not have been expected to furnish a reliable estimate. But detailed surveys are never made in similar cases, and one would have thought Mr. Bateman's reputation sufficient to warrant the Commissioners in relying on whatever estimate he might give, unless they had made a detailed estimate of their own, which they do not say they have done, nor is it likely that they have.
