A limestone which is obtained from the north of England is a very good building stone, and is worked in a similar manner to granite, with small picks and axes. One or two churches were erected from this stone in Preston some thirty years since, and are still in good preservation. It is quite essential that all building stones, of whatever description, should be fixed on their bed or joint bedded, as we have seen the ill effects produced by stones being fixed otherwise. I have not gone into the various ingredients of which these stones are composed, but merely mention those that will and those that will not decay. In conclusion, I hope the time is not far distant when we shall see granite introduced in London for bases, plinths, columns, &c. The light-colored granite when left from the axe would match well with our Portland stone, and the expense of this granite is not so much in contrast with other stones as might be expected.

WILLIAM CROSS,
Manager of the Prince Consort Memorial,
Hyde Park.

TELEGRAPHIC PROGRESS.

ALTHOUGH the telegraphs are not formally to become the property of the Government until the 1st of January next, an arrangement has been come to between the Postmaster-General and the companies, that the system should pass under the control of the Government staff next month, in order that the latter may have practical experience of the working before their own responsibility commences. The present scale of charges will, however, be maintained, and the receipts will be paid over to the companies every week.

On and after the 1st of January, the instruments of the various companies will be collected at the principal Money-order Office in Cannon-street, which will be the telegraphic head-quarters. The present office in the Exchange will be retained as a receiving-office, and the messages will be transmitted thence to Cannon-street by the pneumatic tube. Branches will be established at all, or nearly all, the money-order offices in town, and the messages from these branches will be sent by wires to

Cannon-street, where they will be checked, and despatched to their destination. The present staffs will, for the most part, be retained in the service of the Government. Individuals who are not required will be pensioned, if they have been five years in receipt of quarterly salaries, or seven years on weekly wages, from the companies. With regard to the messages, the Government will start with a uniform rate of 1s. for messages of twenty words (exclusive of the addresses) to any place in the United Kingdom. A considerable increase of business is expected. Reduction of rates, extension of business, and increased efficiency will be kept in view as objects to be attained whenever practicable.

A man who owes a bill in London, says a New York paper, can now pay it in four hours by simply going to Wall-street and purchasing a document known as a "cable transfer," a device born of the great Atlantic telegraph enterprise, whereby the equivalent of the money which he gives in New York will be immediately delivered to his creditors in London.

The *Times* anticipates a grand development of speculative rascality during the next few years in telegraphy. "The public," he says, "will be invited from time to time to construct some specific line at a heavy cost, on glowing representations from the experts in these matters as to probable results, and so soon as the required subscriptions shall have been paid they will find some rival line projected by the very same parties, who will then in the 'rapid progress of electrical science' have discovered that the new one can be laid in a much more speedy and efficient manner at 20 or 30 per cent. less expense."

The messages by the French cable the week before last were 478, yielding 1,088*l.* In the previous week they were 448, yielding 1,040*l.*

THE PRUDHOE CONVALESCENT HOME.

THE Prudhoe Memorial Convalescent Home at Whitley, in Northumberland, has been inaugurated by the Dowager Duchess of Northumberland, in the presence of the Duke and of Earl Percy, Lord Alington Percy, Sir William Armstrong, the Mayor of Newcastle, and a numerous assemblage besides. The institution has been erected as a monument to the memory of Alington Percy, fourth Duke of Northumberland, K.G., and is situated on Whitley Links. It is conveniently placed for sea-bathing purposes, and commands an extensive prospect of the surrounding country, with a fine sea-view. The foundation-stone was laid with much ceremony, on the 14th of June, 1857, by the Hon. Henry George Lord Warkworth (now Earl Percy). It is intended as a place of resort for invalids from all parts of Northumberland and Durham. It will be an auxiliary to the Newcastle Infirmary, of which the Duke was a chief supporter.

The building is designed partly on the pavilion plan. It consists of a central block containing the "administrative," or house department, with a central corridor, running at right angles with this, out of which the various rooms project, both back and front, with open spaces between for ventilation and for light and sunshine. The front of the building faces the sea, and the whole of the apartments have a sea-view. The length of the frontage is 230 ft., and the various offices extend to a depth of 190 ft. backwards. The structure is built entirely of stone, and the style of architecture adopted is Gothic, of a simple and plain character, adapted to the purposes of the building, except the central portion, in which some architectural embellishment is displayed, in recognition of the magnificence of the late Duke of Northumberland. The line of frontage towards the road is enclosed by ornamental iron railing, in the centre portion of which is the entrance to the gateway, with gatekeeper's lodge, partially recessed in a segmental curve. The building, which is raised several feet above the level of the roadway, is approached by means of an elevated terrace with steps in the centre, and by inclined roadways on each side. On reaching the building, the vestibule, which is open, is approached by several steps. This entrance consists of a triple arch supported on polished red granite columns, with encaustic tile flooring and stone walls in particular. On either side are the porter's and matron's sitting-rooms; behind is the surgeons' room, and adjoining are the grand hall and stone staircase. The grand corridor, 8 ft. wide, intersects at this point,

and on the one side are the day-rooms and dormitories for the men, and on the other the same for the women. Behind the hall are salt-water and fresh-water baths for both sexes, and beyond these is the dining-hall, approached on either side by the respective occupants. The kitchen and cooking department, with several out-offices, including wash-houses, laundry, pantries, &c., are in the extreme rear. Accommodation is provided for between fifty and sixty patients, but the building is designed to accommodate ultimately 100 inmates. The latrines are so arranged that they cannot affect the atmosphere of the house—being separated from the day-rooms and dormitories, and ventilated on the "through and through" principle. The dormitories are also arranged on this plan, each bed being placed against the wall, with a window on each side of it, and also with corresponding windows exactly opposite, for purposes of light and air. The whole structure is fire-proof, the several staircases being of stone, and the corridors arched and covered with encaustic tiles. The floors are of pitch-pine, and are polished, and the walls are coated with Parian cement, which can be washed when required. The ventilation and warming are in harmony with the new principles adopted throughout the construction of the building, everything being as natural as possible under the circumstances. That portion of the building which the architect has selected to express more especially the memorial character of the structure is the centre block, and here he has thrown the whole of the ornament and the architectural expression. There is a central tower, about the middle of which is proposed to be erected on a projecting pedestal and under a carved canopy, a statue of the late duke.

Mr. Thomas Oliver is the architect under whose superintendence, with the assistance of Mr. John Adams as clerk of the works, the building has been carried out. Mr. Joseph Keyll was the contractor for the whole of the works, and Messrs. Walker & Emley undertook the engineering department. The total cost has been about 20,000l.

SOMERSET ARCHAEOLOGICAL SOCIETY.

ALTHOUGH we briefly noticed the trip of this society to Cheddar and Rodney Stoke on the first day of their meeting, the excursions did not really commence until Wednesday. The first halt was made at the village of Rowberrow, which lies in a secluded hollow of the Mendips, and is the centre of the mining district. Of the parish church Mr. Parker gave some account. Having heard that the old mansion of Langford Court was worth a visit, some of the party went there for the purpose of noticing the principal features of the house, over which they were shown by Mr. T. B. Collings. After leaving Langford Court the Ancient British Camp of Dolbury was visited. The ascent was a trying one, especially to the stouter members of the party. Passing through the grounds of Mendip Lodge the next place reached was Burrington Church, which was described by Mr. Freeman. They then proceeded to explore Barrington Combe. On reaching the cavern known as Aveline's Hole, as many of the company as could descended into it, and Mr. Boyd Dawkins gave a brief account of it. A short cut across the fields led to a Roman Amphitheatre, the plan of which was pointed out by the Rev. Prebendary Scarril. A few yards further on the President called attention to some hut circles as indicative of former occupation. The party then dropped down to Charterhouse, where they partook of luncheon in the schoolroom.

While the horses were resting and their drivers dining, a party set off across the fields on a visit to the works of the Mendip Mining Company, who find it more profitable to work up the slag on the surface, which was cast aside by the Romans as useless, than to dig up the ore from the bowels of the earth. It was stated that this slag contained about 25 per cent. of lead. A visit to Cox's stalactite cavern closed the day's proceedings, and the party returned to Axbridge about eight o'clock.

Wincobme was the first place visited by the archaeologists on Thursday. Though not so numerous as on the previous day, the party filled several conveyances. Leaving Wincobme, and journeying for four or five miles under the shadow of the Mendips, the next stoppage was made at Loxton, a small village romantically situated under Crook's Peak. Here was seen a curious

little church quite different in character from those larger, later, and finer churches which the archaeologists had been visiting.

Christian, a small parish, situated in the gap between Crook's Peak and Bledon Hill, only a few minutes' ride from Loxton, was the place next visited. The inspection of the church being completed, the journey was continued to Banwell Caves. The explorers then proceeded to Banwell, and on arriving at the village, they found the business nearly at an end. Sir Stafford Carey read a paper on "Year Books," and Mr. W. A. Sandford was to have read one on "The Rodentia of Somersetshire Caves," but time pressing, it was taken as read, and the company agreed to visit Banwell Church. Mr. Freeman was again the guide. The concluding meeting was held in the schoolroom, Banwell, where luncheon had been provided by the liberality of gentlemen in the neighbourhood.

SOCIAL SCIENCE CONGRESS, BRISTOL.

THE Congress in Bristol promises to be satisfactory. The order of proceedings stands thus: On Wednesday, 29th September, there will be, at 3 p.m., special service at the Cathedral; sermon by the Right Rev. the Lord Bishop of Gloucester and Bristol; and, in the evening, the inaugural address by the President, Sir Stafford H. Northcote, bart., M.P., in the Victoria Rooms. On Thursday, at 10 a.m., address by Mr. G. W. Hastings, president of the department of Jurisprudence and Amendment of the Law, in the Victoria Rooms. At 11 a.m. the departments will meet in their respective rooms; and at 8 p.m. the Mayor will hold a reception at the Colston Hall. On Friday, at 10 a.m., address by the Rev. Canon Kingsley, president of the Education Department, in the Victoria Rooms. At 11 a.m., the departments will meet; and, at 8 p.m., working men's meeting in the Colston Hall, Sir Stafford H. Northcote in the chair. On Saturday, at 10 a.m., address by the Right Hon. Stephen Cave, M.P., president of the Economy and Trade Department; at 11 a.m., the departments will meet; excursions to Cheddar, and to the Bristol training-ship at mouth of the Avon. On Monday, 4th October, at 10 a.m., address by Dr. John A. Symonds, president of the Health Department; at 11 a.m., the departments will meet; and, at 8 p.m., soirée at the Victoria Rooms; address by Miss Carpenter, on Female Education in India. On Tuesday and Wednesday there will be meetings, and on Thursday an excursion to Chepstow Castle and Tintern Abbey. The ladies' conference will be commenced on Wednesday, September 29th.

THE TRADES MOVEMENT.

THE masons at Sheffield have, at a meeting presided over by the mayor, for the purpose of bringing about an amicable settlement of the dispute between masters and men in the building trade, deliberately adopted a resolution in which they decline to submit the question to arbitration. They alleged as a reason that by so doing they should isolate themselves from the 290 lodges forming their National Association, by none of which has arbitration ever been adopted.

The operative stonemasons' strike at Manchester having lasted about twenty-two weeks, and there being no prospect of an immediate settlement, the masons made the following overture to the employers:—"That we, the operative masons of Manchester, Salford, and Hulme, do hereby agree to accept 30s. and 48½ hours per week." The reply of the masters was:—"That no men be engaged hut on the terms that have been adopted during the last few months." The men, it is said, are determined to make no more concessions, and will not submit to the hour system and arbitration.

At the adjourned meeting of the London carpenters, in support of the Blackburn joiners, on strike for the nine hours, it was resolved—

"That this meeting bears with satisfaction that a conference has taken place between the employers and workmen of Blackburn, with the object of settling the existing dispute, and is of opinion the offer made by the men is one that should be accepted by the employers; and that we continue our pecuniary support to the Blackburn men until the strike is settled."

The Blackburn strike has now terminated on the masters' terms,—hour work in place of nine hours' day work.

In the course of the discussion of the London carpenters, the necessity of inaugurating a

nine-hours movement in London was strongly advocated. It was stated that, while hundreds of joiners were walking idly about the streets, several firms were working their men twelve and thirteen hours per day. It was also stated that at Messrs. Trollope's firm the men for some time past had been working from six o'clock in the morning until eight at night, and that last week an order had been issued that they were to go on working until nine o'clock. Some of the men who remonstrated against these long hours had been discharged in consequence.

The twenty-first anniversary dinner of the Paddington Operative Bricklayers' Society has been held at the King Alfred, Lisson-grove; Mr. George Howell in the chair. The chief business of the evening was to receive from Mr. Howell, who had been delegated by the trade to attend the recent trade congress at Birmingham, a report upon the proceedings as affecting the labour question. Referring to the question of shortening the hours of labour, he stated that the prevailing opinion expressed at the congress was in favour of an eight-hour day's work. Although the congress had decided in favour of the limitation of apprenticeships, he did not agree with that decision. It was a principle which never could be enforced in their own (bricklayers') trade, and if enforced, it would have the effect of driving young lads into trades which were already overstocked. As to the protection of trades-union funds, the Government had passed a temporary measure which would effect that object, and it was not likely that Government would recede from the position they had taken up. The congress had unanimously condemned the combination laws. Co-operation and industrial partnerships had been approved of by the congress, and he looked upon the scheme as likely to be one which would solve the labour problem by giving men a direct interest in their own labour. Arbitration had been warmly approved of by the congress.

SEWAGE MATTERS.

Sewage Culture at Aldershot.—The Aldershot sewage farm contains 130 acres, 77 of which have been under irrigation, some of it for several years. When the sewage was first applied there was no vegetable soil, properly so called, on the common. The surface consisted of reddish and yellow Bagshot sand, with layers, more or less dense, of iron-sand, locally termed "pan" which required to be broken up before the ground could be prepared for crop. This ground contained 95 per cent. of silica, 3 per cent. of protoxide of iron, and a trace of vegetable matter. The surface, to a depth of 4 in. to 6 in. was in many places nearly as hard as concrete. Perhaps the very worst possible soil has in this experiment been brought under successful irrigation and culture. It is remarked, in the report of the Army Medical Department, that all the elements of the question have been dealt with, and the result has been that the offensive harrack and South camp latrines have been abolished, the station drained, all the refuse water rendered innocuous by irrigation, and the fertilizing matter removed out of it and applied to the production of food on ground which had previously yielded nothing in the form of useful vegetable produce. Mr. Blackburn, the lessee of the Aldershot Farm, has given some interesting information regarding the method of cultivation adopted. The whole sewage of the South Camp and barracks was not turned on to the farm until 1856, scarcely three years ago, and the following have been the results, as regards produce raised per annum on each acre:—Potatoes, 4 to 5 tons; swedes, 12 tons; mangolds, 13 tons; garden turnips, 300 bushels; cabbages, 16,000 plants. There is, besides, a large area under Italian ryegrass cultivation, which is cut five or six times a year for cows, and four times a year for horses. The lowest cutting averages six tons per acre, the highest fourteen tons per acre. The maximum produce is forty tons of ryegrass per acre per annum. As the culture advances, the number of articles is increased. The usual cropping of the farm is as follows:—Potatoes, 23 acres; Italian ryegrass for food, 29 acres; Italian ryegrass for hay, 15½ acres; green crops, 6½ acres; total, 77 acres. This absorbs the whole summer sewage of the camp and barracks. The crops to be raised this year will be Italian ryegrass, potatoes, mangolds, swedes, turnips, cabbages, tares, onions, carrots, and haricot beans. There has been no smell from the farm; the earth

deodorizes the sewage as soon as it touches it. There are no complaints of nuisance from the irrigated land, nor of injury to health. All the plants grown are healthy-looking and wholesome for consumption. At first there was some prejudice against the produce, but that has been entirely removed.

Sewage Utilisation and Reconstruction of Sewers at Liverpool.—The Liverpool Sewage Utilisation Company has commenced operations on a small farm at Ince Blundell, and the directors speak hopefully of the project. The undertaking, however, would appear to have been beset with difficulties. In the first place, the negotiations with Major Blundell for land at Blundell-sands fell through, and it became necessary to carry the pipes three miles further than was originally contemplated. This, of course, was attended with increased expense; and to make matters worse, several of the warmest friends of the scheme were unable, owing to the commercial pressure, to give the monetary support which they had promised. Then the Earl of Derby and Lord Selous insisted upon a deposit of £10,000, in hard cash as a guarantee against any damage that may arise to their property from the undertaking; and the result is that the company finds itself in a deficiency of about £3,500. The affair is practically at a standstill for want of funds, and an appeal to the shareholders and the public is to be made.—The reconstruction of the sewers in Nesham Park, which, on examination, were found to be defective, has been completed. Some months ago the West Derby Local Board, in whose district Nesham Park is situated, and who ultimately will have charge of the whole of the sewers in the park, refused to incur the responsibility of taking them over until they had been examined, and their construction certified as perfect. This refusal resulted in the borough engineer being requested to make a careful inspection; and on this being done it was discovered that in many places the levels of the sewers had been miscalculated; and it was also found that at several points the brick-work had fallen in, and that the sewers had literally collapsed. A considerable portion of the main sewers running through the park was thus condemned and taken up. The sewers are now, on an average, 11 ft. in depth, being about 4 ft. deeper than those which were condemned as ineffective. As the contractor alleges that the original sewers were executed under the superintendence of the corporate surveying officials at the town-hall, it is, we believe, a matter of uncertainty on whom the cost will fall.

Leamington.—An agreement has been arranged between the Earl of Warwick and the Leamington Local Board for the latter to pump the town sewage upon his lordship's estate for thirty years, for £50l. a year. The rise is over 100 ft., and the distance about two miles. It is estimated that the necessary works will cost the Board 12,000l., and that the annual expenses will be 700l. The Earl will take all responsibility as to injunctions. The A B C process of Messrs. Siller & Wigner is in operation at Leamington for this year.

The New Sewage Works at Halifax.—In reply to remarks made by Mr. Bristolow, before the Master of the Rolls, that the contractors for these works were unable to find the necessary sureties, the *Halifax Guardian* has been requested by Messrs. Dovenor & Helm to state that they were not unable to find sureties, but that they declined to enter into the severe bond imposed upon them by the Vice-Chancellor's chief clerk.

The Drainage of Brighton.—Mr. Hawkshaw, the engineer called in by the town council to advise it on the point of carrying the sewage to a distance from the town, has made his report. Three "practicable modes" of doing the work are considered by Mr. Hawkshaw; namely, 1st, by an extension of the present system of deep-sea drainage, the cost of which would be about 66,500l.; 2nd, by an intercepting sewer to the westward, to which there are such "insuperable difficulties" that Mr. Hawkshaw cannot advise its adoption; and 3rd, by an intercepting sewer to the eastward, which Mr. Hawkshaw recommends as "the most perfect and efficient" plan. The cost of this latter plan Mr. Hawkshaw estimates at 80,000l. It would include both the Cliftonville and the Brunswick-square districts. Mr. Hawkshaw concurs with Mr. Hawksley and Dr. Letheby that sewage delivered into the ocean from 1,500 to 2,000 ft. from the shore is not likely to be productive of disease or objectionable to health; nor, he adds, "do I believe that any smell arising therefrom can be detected by persons on the shore." But, he says, its

discharge is plainly visible from the road facing the sea; to those who go out in boats, and who chance to come near the point of discharge, the effluvia is unpleasantly evident; and "those who bathe from boats cannot escape occasionally finding themselves floating in a bath of what must necessarily be far from agreeable." The mouth of the sewer, however, Mr. Hawkshaw points out, might be taken more than double its present distance out to sea—to 4,000 ft.; and he shows how the discoloration of the sea by storm-water might be dealt with in this way. The expense would be 66,500l. According to Mr. Hawkshaw, the most perfect plan is to construct an intercepting sewer from Cliftonville to Portobello (four miles eastward of the Brighton boundary),—a distance of seven miles and 160 yards,—with a fall of 3 ft. per mile, and with, at intervals, ventilating shafts,—"which," adds Mr. Hawkshaw, "could be so arranged as to be unobjectionable."

THE STUDY OF ARCHITECTURE ABROAD.

M. PILLET, an architect in Paris, formerly of the *Ponts et Chaussées*, announces that he is about to open a preparatory *atelier* for such as desire to enter the "Ecole des Beaux Arts," and where complete instruction will be given. The studies are to be organised so that the students may not only acquire the knowledge necessary for admission, but be enabled to go at once to the second class, and be so practised in drawing as to have no occasion to take further lessons in it. He points out in his announcement that in existing *ateliers* the candidates for admission to the school only obtain instruction in architecture, and are obliged to have recourse to other professors for mathematics, descriptive geometry, history, drawing, and water-colour painting, which expensives studies being pursued separately, and without general control, do not always produce such a result as could be desired. If it be remembered, however, continues M. Pillet, how important these branches of instruction are, not simply to enable the student to pass the examination for admission, but for definitive education in architecture, the advantage of pursuing them under one direction will be obvious.

Architectural students in this country, and those who have the management of them, may learn something from this announcement if they consider it properly; and it is with that object in view that we refer to it. They may see something of what is necessary if English students would keep abreast with the architects of the future abroad, and fit themselves to aid in advancing the artistic character of their country.

RETROSPECTIVE EXPOSITION AT BEAUVAIS.

BEAUVAIS, famous in old times as the see of one of the six spiritual peers of France, has inscribed its name on the records of the present year as the scene of what is called a Retrospective Exposition. The term, when once explained, is not to be condemned. The exhibition itself has been one of more than mere local interest; and the idea, hinted by the title, of illustrating the history of the past, down to our own time, rather than of endeavouring to whet the edge of the manufacturing rivalry of the day, is one worthy of very full development.

Two gentlemen of local distinction, the Baron de Selliers, of the Château de Mello, and M. Delabarthe, of Beauvais, appear to have been the principal instigators of, and contributors to, this interesting exhibition. The objects displayed were divided, chronologically, into two categories, that of those anterior to the eighteenth century, and that of those of the eighteenth and nineteenth centuries. Two saloons, adjoining the great hall of the Industrial Exposition, were occupied by the articles contributed. Objects of stone and of bronze, Gallo-Roman and Merovingian relics, coins, medals, enamels, portraits, works in iron and in earthenware, old MSS., chests, and furniture, formed the contents of the ancient division.

Ancient arms, contributed by M. Barrand, are described as being those of a race of men who lived as far back as the Glacial era! What, ever doubt may be thrown on this determination of date, we come nearer to historic times in regarding the next relic, a magnificent Gaulish sword, of bronze, the alloy being of the same proportions that are found in early Grecian

weapons. In a leaden sarcophagus, together with some jewels and ornaments of female attire, was found an ivory bas relief of Bacchus, surrounded by fauns. A similar plaque is said to have been found near Rheims. A Roman *pilum*, of a form altogether unusual, with a quadrangular point more than 2 ft. long, is another relic of early Roman date. Later, but still telling of the victories of Rome (if with the keys rather than with the sword), is the copper-gilt cover of a reliquary, and a diptych, of German work, dated in 1495. Mention must also be made of two portraits, in *Limoges* enamel, one of King Francis I., and one of his queen, Claude of France, bearing the signature L. Limousin. A sketch of a *chasse*, designed in 1459, for the cathedral of Noyon, by Gravat, a bourgeois of Amiens, and a fifteenth-century manuscript of the customs of Normandy, are also among the chief objects of interest in this portion of the collection; which further contains a fine piece of tapestry work, representing the vision of Constantine, which was commenced by the orders of the famous Fouquet, intendant of finances, and completed at the *Gobelins* manufactory, by the order of Louis XIV.

The division adopted, being according to date, and not according to the character of the object, is such as to render unnecessary a summary of the jewels, stiffs, *jaïences*, and other articles exhibited in the second, or modern saloon.

"ORNAMENTAL PYROGRAPHIC WOODWORK."

BURNED patterns on woodwork are of old date, and some few years ago an establishment was opened for supplying them on a large scale, of which our readers were told at the time. Some fresh works have now been opened in Glasshouse-street. In the ordinary samples, the designs are burnt into veneers of sycamore or maple, and are supplied wholesale to builders, cabinet-makers, and others, ready for laying in the ordinary manner; but, if preferred, the designs can be applied to the solid work, to impart greater durability. By the use of wood so ornamented all necessity for painting is, of course, avoided. It is inexpensive and worth looking to.

HOUSE BUILDING AT CHISWICK.

Sir,—In an article in your issue of Sept. 11th, under the head of "House Building at Chiswick," mention is made of "One Gothic mansion in the district, with a river frontage, and two peaked round towers," stating that it suffers from "being cellared, and at high tides has some 3 ft. or 4 ft. of water standing in the bottom, which, of course, saturates the greater portion of the house, and keeps it in a damp condition for an indefinite time after each flood."

As there is but one house in the district to which the first part of this statement can allude, one that I erected about twelve years ago for J. Pullman, esq., I beg to give an unqualified denial to the second part, viz., that it suffers from being cellared, &c.

The house is built as substantially as possible, none of the estate being more, if indeed so, solidly constructed; and when I tell you that Messrs. Holland & Hannen were the contractors who carried out the collapse in question under my personal superintendence, I think it will be a sufficient guarantee that the work was well done. Since reading the article from which I have quoted, I have seen the proprietor who has inhabited the house since its erection, and he will fully endorse my statement. Your insertion of this letter will greatly oblige

RHAELE BRANDON.

LOW RENTS.

Sir,—I have just seen the letter of Mr. W. S. Truman in your esteemed publication of the 11th inst. He is a bold man. May his liberality and example be followed not only by owners of house property, but also by those who supply our daily bread and other necessities, and you may be assured we shall hear less of strikes and discontent; and the public-house and crowded lodging will be superseded by a respectable home for every man.

ONE OF THE BEES.

WELLS AND MINES.

Sir,—Having so frequently read of accidents and deaths occurring in wells and mines for want of some speedy means of rescue for the sufferers, it has occurred to me that some sort of "safety-cradle" or frame-work of either iron or basket-work might be so constructed as to be kept constantly at hand at the bottom of wells or of the shafts in mines, and so secured by an extra length of chain or rope as not to interfere with the ordinary work of the workmen, but ready to be brought up with its human freight when necessary by a little extra working of it. Thus, if in repairing a well a workman were overcome by the unhealthy inhalation of deleterious gas, he would fall into the very receptacle ready for his rescue, instead of into the jaws of death—as the foul vapours at the bottom or deep water might prove; and if even not drawn up in time to prevent so serious a catastrophe, no other life need be risked to bring him up. When for use at the bottom of a shaft,—for instance, where ready accommodation might be required for many people,—the cradle might be made in tiers or stages, and formed so as to collapse (like the

head of a shaft) when not required, and the chains or ropes might be of sufficient length to admit of its being allowed to stand aside when not required, so as not to interfere with the ordinary means of egress; and a bell being at hand to communicate the alarm to a watcher above-ground, a little extra work would soon bring a few more at least up to bank than could be rescued in the ordinary manner without unnecessary delay.

M. A. H.

AN IMPRACTICABLE CONTRACT.

An arbitration case, between Messrs. Cutler and the Radhill Gas Company, has just been decided by Mr. T. G. Barlow, gas engineer, as arbitrator. Messrs. Cutler, in October, 1868, entered into an agreement with the Radhill Gas Company to construct on the company's premises a cast-iron tank and gas-holder. The contractors also agreed to construct the foundation; but on making the excavation they discovered that the subsoil was boggy and totally incapable of bearing the weight of the structure it would have to support. They reported this fact to the company, and requested them to provide another site for the gasholder. The company at first refused to do this, but on Messrs. Cutler stating their inability to carry out the contract on that site with credit to themselves, some negotiations ensued between the parties, which resulted in the abandonment of the contract, so far as the foundation was concerned, the contractors allowing a certain sum from the original contract price. The company then, failing to procure another site, decided upon making a foundation on the boggy site themselves. For this purpose they employed the very man who had been Messrs. Cutler's sub-contractor for the foundation, and at last a resting-place was made for the tank and gasholder. The Messrs. Cutler then commenced building; but they discovered that as the structure increased in weight, the foundation began to subside unequally. This subsidence caused a very unequal strain to be exerted upon the side of the tank, which was constructed of plates of iron bolted together, the unequal strain causing the plates to fracture. The fractured plates were taken out and fresh ones substituted for them; but the contractors discovered that the subsidence caused the tank to be out of the perpendicular, and also out of the circular. They state that they did all in their power to remedy these defects by cutting the plates to a different shape, and by altering the joints; but they found their efforts were of no avail, and therefore applied to the company for payment of the work done. The company refused to make this payment, on the ground that the works had not been done in a proper manner, and that it was absolutely impossible for the gasholder to work in the tank as constructed by the contractors; whereupon the latter contended that as the badness of their work had been caused by the subsidence of the foundation constructed by the company, they were not liable to make their work good, and they gave notice of their intention to refer the matter to arbitration. Four days were employed in hearing evidence and speeches on both sides; and the arbitrator has decided that the Messrs. Cutler shall be paid the amount of their claim, less only a few deductions for the goods supplied by them, to the company without written authority for them to do so. The latter part of the award condemns each party to pay their own costs, which, in all probability, amount to between 400*l.* and 500*l.*

THE PUBLIC CLOCK THAT STRUCK THIRTEEN AT MIDNIGHT.

Most people have heard something about the tradition, that a soldier, whilst on guard at Windsor Castle, during the reign of William III., declared that he heard the clock of St. Paul's Cathedral strike thirteen at midnight.

Here is the original story — not generally known — which I take from *The Public Advertiser* of Friday, June 22, 1770, now before me: —

“Mr. John Hatfield, who died last Monday at his house in Glasshouse-yard, Aldersgate, aged 102, was a soldier in the reign of William and Mary, and the person who was tried and condemned by a court-martial for falling asleep on his duty upon the Terrace at Windsor. He absolutely denied the charge against him, and solemnly declared that he heard St. Paul's clock strike thirteen, the truth of which was much doubted by the Court, because of the great distance. But, whilst he was under sentence of death, affidavit was made by several persons that the clock actually did strike thirteen instead of twelve; whereupon he received his Majesty's pardon. The above his friends caused to be engraved on his plate, to satisfy the world of the truth of a story which had been much doubted, though he had often confirmed it to many gentlemen, and, a few days before his death, told it to several of his neighbours. He enjoyed his sight and memory to the day of his death.”

But, as I stated in the *Builder* of December 14, 1867 — when I gave my first account of the Great Bell — the sentinel must have spoken of the clock that struck upon “Great Tom at Westminster,” for St. Paul's Cathedral had not then any public clock.

Your esteemed correspondent, “J. D. P.,” having reopened the subject in your last number, I have thus attempted once more to set the question at rest. THOMAS WALESBY.

Chemical Professorship at Anderson's University, Glasgow. — Mr. James Young, well known in connexion with the paraffine industry, has presented 10,000 guineas to Anderson's University, for the purpose of founding a chair of technical chemistry, and establishing bursaries, scholarships, &c. The *Society of Arts' Journal* says Mr. W. H. Perkin, F.R.S., who, it will be remembered, delivered a course of Cantor lectures before the members of the Society of Arts during the last session, has been appointed the first professor.

NATIONAL EDUCATION LEAGUE.

A GENERAL meeting of the members of the National Education League is to be held at the Exchange Assembly-rooms, Birmingham, on Tuesday and Wednesday, the 12th and 13th of October. On Tuesday, after the election of officers, and the report of the Provisional Committee has been read, the following motion will be submitted to the meeting: — “Resolved, that a Bill, embodying the principles of the League, be prepared for introduction into Parliament early next Session.” In the afternoon papers will be read and discussions taken on the best system for National Schools, based upon local rates and Government grants. In the evening there will be a *soirée* in the Town-hall, given by the Mayor of Birmingham. On Wednesday papers will be read and discussed on Compulsory Attendance, and on the best means of enforcing it; and on Unsectarian and Free Schools. In the evening a public meeting will be held in the Town-hall; the Mayor in the chair. Mr. F. Adams, 47, Ann-street, Birmingham, is the secretary.

The object of the League is the establishment of a system which shall secure the education of every child in England and Wales. The means proposed are —

1. Local authorities shall be compelled by law to see that sufficient school accommodation is provided for every child in their district.
2. The cost of founding and maintaining such schools as may be required shall be provided out of local rates supplemented by Government grants.
3. All schools aided by local rates shall be under the management of local authorities and subject to Government inspection.
4. All schools aided by local rates shall be unsectarian.
5. To all schools aided by local rates admission shall be free.
6. School accommodation being provided, the State or the local authorities shall have power to compel the attendance of children of suitable age not otherwise receiving education.”

NEW ZEALAND.

The *Illustrated Australian News*, of Melbourne, gives a view and some particulars as to Princes-street, Dunedin. This street is the main thoroughfare of Dunedin, skirting the bay at the foot of the hills, on which the larger portion of the town is situated. The ground occupied by Princes-street has been levelled within the last few years, and now presents a very different appearance from what it did eight years ago, before the influx of a Victorian population. At that time it ran over two outlying spurs of the main range and crossed two swamps, one at the foot of Rattray-street, and the other further east, where the Octagon is now built. The view given is from the top of Jetty-street, and the first building on the right is the Provincial Chambers. The Provincial Government invited competitive designs for the Provincial buildings, and about eight sets of drawings were submitted. Those prepared by Messrs. Mason & Clayton were selected. The building is nearly square, having about 150 ft. frontage to both Princes and Water streets. The approach to the Provincial offices is from Princes-street. The offices surround a large central hall, which is approached from the main entrance in Princes-street; it is about 80 ft. by 40 ft., and both stories are lighted by a lantern from the top. This hall accommodates the public on the plan of a large bank, where easy access to each department may be had. The frontage to Bond-street has three stories on the ground floor, having two magistrates' courts, each 40 ft. by 25 ft., with the necessary offices conveniently arranged. Over these courts the Provincial Council Hall is situated (80 ft. by 34 ft. and 24 ft. high) fitted up for Mr. Speaker, members, reporters, and the public, with polished cedar.

The building is Italian, being faced with red pressed bricks, with Oamaru stone dressings. Next is the post-office. This building was commenced at the time when the demand for postal accommodation was very great, consequent upon the discovery of gold. Now that the great rushes are over it is found too large for postal purposes, and an arrangement has been entered into between the General and Provincial Governments by which the former hand the building over to the latter, on the condition that the Provincial Government provide funds sufficient to erect a smaller building suited to the requirements of post-office, telegraph, and registrar's departments. The principal front is towards Princes-street, about 150 ft., having a deeply recessed arcade on each side of a large central tower abutting at each end on wings, which were

intended to have been offices for money orders, savings-bank, and private letter-boxes. The sorting-room, 60 ft. by 40 ft., is in the centre of the building, and off it are rooms for the letter carriers, inland and foreign despatch, delivery and receiving of letters; the sorting-room being lighted from the roof. The upper floor, which extends completely round the sorting-room, was planned to accommodate the chief postmaster, chief clerk, auditor, &c., but is now appropriated to the museum and municipal corporation offices. The building is faced with Oamaru stone, and otherwise built of brick. It is Italian in design, of rather an ornate character. The lower story is composite, with rusticated pilasters between dwarf Doric columns, supporting moulded arches, with enriched spandrels and richly carved frieze and cornice over. The upper story is Corinthian, the entablature, with the usual dentils and modillions, being supported by full columns, coupled with relieved windows between each pair of columns. The building was designed and carried out under the superintendence of Messrs. Mason & Clayton, at a total cost of about 28,000*l.* Beyond is the Bank of New Zealand. The spire in the central distance is the monument erected to the memory of Captain Cargill, the pioneer of the settlement built in the centre of the Octagon.

THE NEW STREET FROM BLACKFRIARS BRIDGE TO THE MANSION HOUSE.

SIR. — This street is only partly open. On the 9th of April last, the Metropolitan Board of Works let the contract for paving, sewerage, sub-way, &c., the Mansion House end of the street, a portion 450 yards in length, to Messrs. J. Mowlem & Co., for the sum of 19,750*l.*, and these gentlemen will probably finish their work during the ensuing month, October.

The Blackfriars Bridge end of the street (Blackfriars Bridge to near Cannon-street) must be at least a year before it is opened. Very little structural work has been done at this end.

The contract for the portion of the low-level sewer from New Earl-street to the Tower, about 1,480 yards in length, was let on May 14th, to Mr. Webster for 67,500*l.* This is the work which may be seen going on in New Earl-street, and in Cannon-street. The time to be occupied in this contract I have not heard.

The contract for that portion of the Northern Embankment which reaches eastward from the Temple Gardens, was let in May, 1868, to Mr. Webster, for 126,500*l.* It was commenced on June 30, 1868, and was to have been finished by June 30, 1869, that is, in twelve months from commencement, but some delay to the contractor was caused first by the whole land necessary not being placed at his disposal; and, secondly, by his dam breaking in. The progress up to June 1st this year was 48,490*l.*, of which the sum of 7,490*l.* was for progress during the month of May. The average progress, according to contract, was to have been 10,000*l.* a month. On the 24th of September the Board will meet again, and on the 1st of October we shall have another report of progress.

JASPER.

MONUMENTAL.

The equestrian statue of the Queen, for Liverpool, now being completed by Mr. Thornycroft, is not likely to be placed in its position in front of St. George's Hall during the present majority. It will probably be about the Christmas or New Year holidays ere it is ready to be publicly unveiled.

A marble cenotaph, to the memory of the late distinguished astronomer, the Earl of Rosse, has just been erected in the church at Parsonstown, Ireland.

A new reredos, the gift of Lady Mildred and Mr. Beresford Hope, in memory of a daughter, and as a thank-offering for the recovery from a dangerous illness of another daughter, has been erected in Kildonnan Church. It was carved by Mr. Redfern, under the general architectural superintendence of Mr. Slater, and was erected by the authority of a faculty from the Archbishop of Canterbury. The material is Painswick stone, relieved with colour and gilding. The shape is that of an oblong panel of the same length as the altar, and of such a height as not to interfere with the east window. The centre is occupied with the Crucifixion, angels appearing in attendance on our Lord.

The Humboldt centenary was celebrated throughout America. Some alarm seems to

have been excited lest the statue of the great traveller, which had been cast in Germany, should not arrive in time to be duly inaugurated. We learn, however, that it reached New York some days before the celebration.

THICK TRACING-PAPER.

Sir,—I require to make a number of tracings on thick tracing-paper, and shall be glad if any of your subscribers will inform me if there is any method by which the tracing-paper can be made more transparent, so that the ink lines can be plainly seen through the paper.

SUBSCRIBER.

* * A recipe for making thick paper transparent was quoted in our pages a few weeks ago.

DISFIGURING ADVERTISEMENTS.

Do you not think that the advertising portion of the community should be required to confine the exhibition of its talent within reasonable limits, and not be permitted to disfigure such portions of the metropolis as have been beautified at great public expense?

Not content with the innumerable spaces and contrivances already under their control, the advertisers must bedaub with their announcements every new piece of foot pavement, and completely spoil the appearance of new and well-finished work. The Thames Embankment is already disfigured in this way. The new street from the Mansion-house to Blackfriars has been in like manner visited by advertising transgressors; and, unless prevented, we shall be having the new Blackfriars Bridge and the Holborn Viaduct tattooed with fantastic advertising designs, much to the annoyance of every lover of order.

Why spend thousands of pounds upon stone carving and decorative ironwork, and then allow the effects to be counteracted by such unsightly additions as I have referred to? F. W. M.

Another correspondent writing on the want in the metropolis, still insufficiently met, of "stopping places" and the disfigurement of those there, says:—

"I should like to draw the attention of the several vestries of London to a very effectual remedy adopted by that of St. Marylebone to prevent the places I have been writing about being made so unsightly by quack medical advertisements. I do not know the precise Act of Parliament quoted, but it is to this effect:—By a certain Act of Parliament named, any one disfiguring any lamp-post, or erection, or building in the parish, renders himself liable to a penalty not exceeding, &c., or an alternative imprisonment."

CHURCH-BUILDING NEWS.

Shute (Devon).—The church at Shute has been reopened, after considerable works of restoration. The central tower has had a new roof, parapets, and gargoyles; and a new roof of red deal to the north aisle. The arched ceilings have been improved by ribs and bosses. The church has been reset with red deal. A new entry has been erected at the end of the north transept. The south transept arch has been raised and restored. Tracery and appropriate glass have been supplied to the west and east transept windows. The east window is in stained glass by Messrs. Powell. There are new pulpits and reredos, of Caen stone, in Ogwell marble shafts by Messrs. Mitchell & Son. Minton's tiles are laid in the chancel.

The contractors were Messrs. Langford & Co. The stone carving was executed by Messrs. Hens; the wood carving by Mr. Lindell & Mr. Harding, Exeter. The architect was Mr. Edward Ashworth, of Exeter.

Blackton.—The new church of St. James's, Blackton, near Wakefield, has been consecrated by the Bishop of Ripon. The foundation-stone of the new church was laid in 1867. Built in the Second Pointed style of architecture, the church contains nave, north aisle, chancel, south aisle, and south porch. It is seated to accommodate 450 persons, and the pews, which will free, are of heavy pitch pine. Exterially the church is built of stone, and the inside walls of pressed bricks, which, with the open-roofed roof and complete absence of ornamental masonry, give the building a very plain unpretentious appearance. At the east end there is a stained-glass window, the gift of the patron of the late Lady Matilda Lister Kaye, Lady Grange, and the workmanship of Mr.

Bagaley, of Newcastle-on-Tyne. The subjects of the first light are the Nativity, and Christ blessing little children; second light—Christ being made known in the breaking of Bread; centre light—the Crucifixion; fourth light—the Burial of Christ, and His Commission to His Apostles, the Resurrection, and the Martyrdom of St. James, to whom the church has been dedicated. In the tracery are represented the Ascension, and the Kingdom of Glory with the Angels. The nave is separated from the north aisle by four pointed arches of red brick, springing from circular stone pillars, with moulded capitals. The chancel is divided from the nave, with which it corresponds in width, by an arch of similar construction. On the west side of the church is a four-light tracery window, of plain glass, with stone mullions. At this end of the church a bell-turret has been erected, but there is no nearer approach to a tower, the church being exteriorly as plain as it appears inside. In the chancel aisle, which is separated from the church by a red-brick arch, is placed the organ which belonged to the old church. The building is entered by a porch at its south-west corner, with moulded doorway, and faced internally with white brick. The stone font, which is placed opposite the entrance, has likewise been removed from the old church. The chancel is paved with encaustic tiles, which are further carried up to the Communion-table. The church is built from the designs of Mr. W. H. Crossland, of Leeds and London, and is built on land bequeathed for the purpose by the late Rev. H. Torre, rector of Thornhill, who has also furnished the burial-ground adjoining. The cost of erection will be about 2,600*l.*; of this amount 2,000*l.* have already been subscribed.

Carlton.—The church of Carlton, Saxmundham, has been restored. The restoration just finished has been entirely confined to the interior of the building, which has undergone a complete transformation. Formerly the nave was filled with high pews, the chancel was on the same level as the nave, and the carved oak pulpit was stuck upon a kind of platform in the south-east corner of the nave. Now the floor of the nave has been re-laid, the passage paved, and in the place of the old pews are stained deal benches with carved poppy-heads, the oak panelling round the walls being allowed to remain. The vestry under the tower has been re-arranged and improved, and the pulpit removed from the south to the north side of the nave, and placed upon a base designed by Mr. T. Thurlow, of Saxmundham (by whom the restoration of the chancel has been carried out, and who has had the general superintendence of the whole), and where necessary it has been retouched. The chancel arch remains as it was before, but the floor of the chancel has been raised a step above that of the nave, and a plain stone screen put up with new reading-desk and lectern. The carved oak benches in the chancel have been repaired and re-arranged by Mr. Thurlow, and its floor is now paved with Staffordshire tiles, the space within the communion-rails being paved with Minton's encaustic tiles. Mr. Carter, of Saxmundham, has carried out the carpenter's work. The restoration of the chancel has been at the expense of the rector, the cost of that of the nave being defrayed by subscriptions.

Longhope.—The spire and tower of the parish church having been for some time past in a dangerous and dilapidated condition, it has been determined to take down the spire and part of the tower, and to rebuild the latter in a more substantial manner. The tower will have pinnacles at the angles, and the bells, so long silent, will be rehung and made available for ringing. The contract has been let to Mr. Organ, of Mitheldean, builder; and the work will be carried on under the direction and superintendence of Mr. Alfred W. Maberly, of Gloucester, architect.

Winsthill, near Burton.—St. Mark's Church, Winsthill, near Burton-upon-Trent, has been consecrated. Mr. Holmes was the architect. The church is in the Geometrical Early Decorated style of architecture, and comprises nave, 72 ft. long by 24 ft. wide within the columns; north and south aisle, each 12 ft. wide—the tower occupying the west end bay of the south aisle; the chancel, 30 ft. long by 21 ft. wide, and a vestry and organ-chamber on the north side of the chancel. On the north, an arcading of four bays, and one on the south of three bays, connect the aisles with the body of the church. The arches are of Hollington stone, with red Mansfield stone voussoirs, and have an inner

ring of Bath stone, chamfered. They are supported by square shafts, diagonal in plan to the line of arcading, with a red Mansfield stone column on each face, and connected together with richly-carved caps and moulded strings and bases. Alabaster is employed in the ornamentation of these columns. The entrances to the church are situated west and south, the latter occupying the lower stage of the tower, and the former entering through a porch, with stone roof and ceiling. The doorways are relieved by red Mansfield stone shafts, with moulded bases and carved caps, and the arches are moulded. The height from the floor to the ridge of the nave roof is 52 ft., and from the floor to the top of the wall-plate 22 ft. The nave and aisle roofs are open-timbered, and plastered between the rafters; that of the nave is carried by framed principals, with king-posts and tie-beams moulded and carved, and supported on stone corbels. The chancel roof is carried by framed principals with curved trusses, supported by Devonshire marble corbelled shafts, with carved caps and corbels. This roof is boarded on the under side of the rafters, the upper portion taking the form of the cross-braces of the principals. The tower is 45 ft. high, and the spire 75 ft. to the top of the cap-stone, the total height to the top of the nave being 150 ft. The tower contains a peal of six bells, from the foundry of Mr. John Taylor, of Loughborough. The bell-framing, which is of oak, is carried by stone corbels built into the tower walls. The diameter of the tower bell across the mouth is 47 in. The walls of the building are of brick, plastered internally, and faced externally with Hollington stone, the external dressings are moulded and carved work being of picked Hollington stone, rubbed. The internal dressings are of Bath stone. Red Mansfield stone has been used in the bands and voussoirs of the arches. The roofs are covered with tiles of two colours, arranged in patterns, and having an ornamented ridge cresting. The interior of the chancel is lined with Bath stone. The opening to the chancel is 20 ft. wide between the piers, and the height from the floor of the nave to the apex of the arch is 32 ft. Four Devonshire marble shafts, with moulded bases and carved hands and caps, support the arch, the inner rim of which is of Derbyshire alabaster. The building is lighted by a wheel-window at the west end, and by several three-light windows with traceried heads in the aisles. The chancel is lighted by two single-light windows on the south side, and one on the north side, and a beautiful seven-light east window, the latter being filled with stained glass, representing various incidents in the life of the Saviour. It will seat about 550 persons. The reredos (of Caen stone) extends across the whole width of the chancel, and consists of an arcading of seven divisions, the centre being considerably larger than the others. The arches, which are moulded and cusped, are carried by dwarf alabaster shafts, with moulded bases and carved caps. Over the arches are gables with carved crockets and finials, the space forming the tympanum being filled in with sunk tracery. In the spandrel spaces between each gable are figures of angels, supported by carved corbels, and covered by carved canopies; the seven compartments are filled in with polished white marble, that in the centre having the sacred monogram in brass, whilst the other compartments contain the Commandments, Belief, and Lord's Prayer, and selected text. The lower part of the reredos has the surface carved in diaper. The nave and aisle benches are of deal, stained and varnished. The chancel stalls are worked in oak, having open-framed arcaded fronts, the spandrels of trefoil heads, and other portions being carved. The chancel floor is laid with Minton's encaustic tiles, while the aisles and passages in the nave are laid with Hopton Wood stone. The church is warmed by means of hot water. At the entrance to the churchyard are folding gates to the carriage-road, with foot-gates on either side hung to stone piers. The gates are framed and cross-traced with oak, and fitted in with ornamental metal work. This, and the metal work in the chancel and pulpits, was the work of Messrs. C. Smith & Son, of Birmingham. The stone work has been executed by Mr. William Clarke, of Burton-upon-Trent, and the joiner's work by Mr. George Lilley, of Ashby-de-la-Zouch; the carving throughout has been cut by Mr. Thompson, of Nottingham.

Bungay.—The alterations and improvements in the interior of St. Mary's Church being sufficiently completed, a special opening has

taken place. Among the improvements in the church we may notice the erection of a stone reredos, consisting of traceried base, Gothic arches with carved spandrels and surmounted with carved cresting; an oak altar-table, carved; new oak altar-rails on metal standards, &c. Within the altar-rails the floor is laid with Minton's encaustic tiles. The reredos was executed by Mr. Henry Narsey, and the altar-table and reading-desk by Mr. J. D. Botwright, both of this town.

SCHOOL-BUILDING NEWS.

Percy (Tynemouth).—The foundation-stone of new schools for the parish of Percy, in the township of Tynemouth, has been laid by his Grace the Duke of Northumberland, who has also given the site. The schools are intended for the accommodation of 129 boys and 96 girls; a house containing five rooms being also provided for the schoolmaster. The cost of the building will be 1,050*l.*, exclusive of the value of a large quantity of materials which have been supplied by the neighbouring proprietors. The building will be erected from the designs of Messrs. Green & Gibson, architects, Newcastle-on-Tyne.

Kidderminster.—New Wesleyan schools have been erected and opened here. Mr. Bland, of Birmingham, prepared the plans, and the building has been erected by Mr. Hodgkiss, of Wolverley, the cost being about 1,150*l.*, exclusive of fittings. The new schools consist of one large room, another room for infants, and four classrooms.

Books Received.

Architectural and Decorative Designs, for the Use of those engaged in Architecture, Sculpture, Working in Metals, &c. Drawn by Enrico Salandri. Incorporated with "Page's Decorator." London: Atchley & Co. 1869.

We have here sixty-five quarto plates of parts of buildings, ornaments, and details well drawn and neatly engraved, for a price little more than nominal,—12s. 6d. They are, for the most part, from works of the Renaissance period, not a few Rococo, and the plates have done duty before; nevertheless we venture to say there are few persons engaged in designing who would not find the volume a good investment.

Miscellaneous.

The Carlisle Memorial.—A column in memory of the late Earl of Carlisle, erected on the summit of Balmer-hill, Castle Howard, Yorkshire, was last week opened to view. The design by Mr. F. P. Cookerell was selected, our readers may remember, in competition. The work has been executed by Mr. Bailey, of York, under the honorary clerkship of Mr. John Clieck, of Whitwell, the agent for the Lechnere estates. The monument bears a surrounding inscription, as follows:—"In memory of George Wm. Frederick VIIIth Earl of Carlisle, Viscount Morpeth, K.G." Upon the Castle Howard face of the pedestal is the inscription, "He to whom this monument was raised, A.D. MDCCCLXIX., in private life was loved by all who knew him. By his public conduct he won the respect of his country, and left the bright example of a true patriot and earnest Christian." On the York face is the following:—"He to whom this monument was raised by public subscription, during XII. years represented in the House of Commons firstly Yorkshire, secondly the West Riding, and during VIII. years was Viceroy of Ireland." The cost is estimated at over 2,000*l.* The monument is visible to the whole vale of York, the greater part of the vale of Derwent, the West Riding hills, the Yorkshire wolds, and a large part of the North Riding.

Government Educational Inquiry in Manchester.—In preparation for the bill for the improvement of the education of the people, which is to be submitted next session to Parliament, the Government is making an inquiry into the present supply and quality of such education within the municipal boroughs of Manchester and Liverpool. The commissioner, Mr. D. R. Fearon, who is appointed to conduct the inquiry in these two boroughs, will commence his operations in Manchester about the 20th of November, and in the meantime receive information or suggestions from persons interested in the subject.

Railway Progress in Russia.—The table of Russian railway statistics for 1870 has just issued from the press. The railways already in operation make up an aggregate of 5,490 English miles, all of which, with the exception of the Moscow, Tearskoe-Celo, Riga, Danaburg, and Warsaw-Vienna lines, have been constructed within the last eight years. The lines to be opened in 1870 are the Kharkov-Taganrog, 350 miles; the St. Petersburg-Viborg, 240 miles; the Moscow-Smolensk, 260 miles; the Ribinsk-Bologoe, 172 miles; the Lazovo-Sevastopol, 214 miles; and the Ostashkovo-Torjokovsk, 214 miles. To be opened in 1871, the Poti-Tiflis, 190 miles; the Kharkov-Kremenchug, 165 miles; the Voronej-Grushevsk, 353 miles; the Liban, 196 miles; the Ivanovo-Kineshansk, 248 miles; and the Skopinak-Risjak, 29 miles. To be opened in 1872, the Baltic-Port and St. Petersburg, 254 miles; the Tambov-Saratov, 225 miles; and the Borisoglebsk-Tsaritzin, 232 miles; the whole forming a total of 3,335 miles of railway to be completed and set in operation within the next three years. The programme of the "outer list" contains the lines surveyed during the past year, and now about to be commenced. These reach the enormous aggregate of 10,000 English miles, and run thus:—Southern and Western lines:—1. From Smolensk to Brest-Litovsk; 2. From Rostov (on the Don) to the central Caucasus; 3. From Livna to Orel. Eastern lines:—1. From Tiflis (the chief town of the Caucasus) to Baku, on the Caspian Sea; 2. From Nijni-Novgorod (via Kazan) to Ekaterinburg, the frontier town of Siberia; 3. From Morshansk (via Penza and Samara-super-Volga) to Orenburg, the frontier town of Tartary. Northern lines:—1. From Yaroslavl or Ribinsk to Vologda; 2. From Viatka (a town about 300 miles to the north-east of Nijni-Novgorod) to Archangelsk.

The Artisans' and Labourers' Dwellings Act.—Two of the parochial bodies of the metropolis have at last begun to act up to the spirit and letter of Mr. Torrens's Act. At a recent meeting of the Hackney District Board of Works, Mr. Runtz moved that the houses in Lawrence-buildings, West Hackney, numbered 1 to 6, and 8 to 11 inclusive, be closed. He remarked that the Board had tried every means of bringing the premises into a habitable condition, but without effect. Fever, he said, was continually in the place, and to close up the houses was the only practical remedy to be adopted. Mr. Beck said he had known the place for the last twenty-five years as a hot-bed of disease. Mr. Gowland hoped this case might act as a caution to other landlords as to the state of repair in which they kept their houses. The motion was carried, as was also another for the demolition of a number of cottages in Sanford-lane, West Hackney. At the last meeting of the vestry of St. George the Martyr, Southwark, it was decided that the necessary proceedings should be taken in the case of certain houses in Little Surrey-street, which had been reported by the medical officer as unfit for human habitation and dangerous to health.

To Render Timber Incombustible.—In the *Neues Jahrbuch für Pharmacie*, Herr Reinach states that, having been requested to report to a fire insurance company about the best means of preventing timber bursting into flame, he experimented with various salts, and at last came to the conclusion, as the result of his experiments, that impregnating timber with a concentrated solution of rock-salt is as good, if not better, a preservative against its bursting into flame as water-glass (silicate of soda), while the price of the former salt is, of course, only a mere trifle; moreover, rock-salt thus applied to timber is a preservative against dry rot and noxious insects. The author recommends the use of salt water, that is to say, a solution of rock-salt of moderate strength for the use of fire-engines during a fire as by far more effective than water; but in order that the salt should not injure the working parts of the engines, they will immediately afterwards have to be played with fresh water again.

Architecture, University College.—We desire to draw attention to the commencement of the annual course of lectures at University College by Professor Hayer Lewis. The first lecture will be given on Tuesday, October 5th. There will be thirty lectures on architecture as a fine art, and thirty on construction. Students will do well to avail themselves of the means of obtaining information thus afforded. The lectures are delivered in the evening.

Experiment for Supplying a City with Hot Air.—Experiments, it seems, are being made by a gentleman who has worked for many years in the United States armory, for supplying a city with heated air. He proposes to force air rapidly through a coil or series of iron pipes heated in a furnace, and then to a greater length of pipe outside, made of fire-clay, which is claimed to be about the best non-conductor that can be had. The first trial will be a pump of 8 in. diameter and 8 in. stroke, and the clay pipes, now being made in New York, will be 300 ft. in length and of a 4 in. bore, with a thermometer at each end, which will indicate 60 degrees. The projector expects to heat the air in the iron pipe to that temperature and force it to the further end with little loss. If the pipes are laid in the streets it will be necessary to have them enclosed in a brick arch, lined with mortar made of fire-clay. It is contended, if the thing works according to the expectation of the projector, that but a small portion of the coal now used will be necessary for all heating and cooking purposes.

A Sanitary Inspector Wanted.—Any one walking through the pleasant green fields between Highgate and Fortis-green will have his nostrils assailed by the most abominable odour, arising from an open ditch, passing beneath the high road and Great Northern Railway, and winding towards Finchley. On tracing this open drain to its source, we found it in a field through which a public footpath runs at the back of Hampstead-lane, and close to a crescent of new and, at present, unoccupied villas, in which the odour was distinctly perceptible. Here the open mouth of a large earthenware drain empties its contents, which are said to be only the overflow of some large cesspools receiving the drainage of the houses on the north-west side of Highgate. However this may be, it is certain that the new houses in the crescent, at the back of the playing fields of the Cholmeley School, have lately been drained into this open ditch, and that its stench is abominable. The drains of many of the houses of Fortis-green also run into this ditch, and no attempt has been made to cover it in.—*Lancet*.

Grange-over-Sands, North Lancashire. The Blawith Estate, advertised in our present issue for sale on the 14th of October, is in a peculiarly beautiful, though not very well known part of the country. Grange overlooks Morecambe Bay, and, knowing the site well, we quit a Grange with a contemporary, who says:—"Excursionists in want of a new pleasure,—they who have done Europe, and are shy of Ireland, no caring to be shot by the merest mistake in the south, or stoned for being too blue, or too orange, or too green, in the north,—will do well to take tickets for Grange, and explore the magnificent district. Beauty of nature, interest of history, quaintness of social life, and many other pleasant things, combine to make the place attractive. The estate includes a good mansion, and a very productive farm. An hotel has been built, and the railway station adjoins the grounds, and gives ready communication with Furness Abbey, Lake Coniston, and Barrow."

Nicknames of Italian Painters.—Ado Stahr, in his "Winter in Rome" (*Ein Winter in Rom*, von Ado Stahr und Fauny Lewald, Berlin, 1869), writes:—

"Together with Guercino's name I remember that too, it is a nickname, Guercino meaning 'the little squint' his original family name was Barberi. Such like *toponi* which, originally given by boon companions, stuck the artist, and took the place of the true name of the same, are many in the history of Italian art, and they at the same time characteristic as regards the social form of that time. Thus the painter Robusti was, and is still called 'Tintoretto' (the little dyer); Barbarelli we know almost only as 'Giorgione' (his George); Conradi 'Ghirlandajo' (the garland-maker); Ribera as 'the little Spaniard' (Spagnoletto); Andrea Vanucci is much better known by his nickname Andrea del Sarto (Tello Andrea), his father being a tailor. Which name is behind Luca della Robbia ('Madder-Luke'), and Massacio ('Dirt-Thomas'), I cannot call to mind just now."

Kenilworth Castle.—A considerable portion of the ruins of this once magnificent pile having shown signs of falling, Earl Clarendon, the owner, is now repairing and strengthening the great hall, Leicester's buildings, and parts of the external walls on either side. His lordship also restoring some of the doorways, windows and fireplaces. In the course of the repairs excavations have been made, and underground apartments, cells, and passages revealed which had been hid for centuries. The great hall, 90 ft. by 45 ft., still retains several of its Gothic windows, and some of the towers yet rise 70 ft. high.

Royal Military College, Sandhurst.—A memorial window to the late gentleman cadet George Ayscough Booth, son of the vicar of Clondown, Bath, has recently been erected in the east end of the College Chapel. The stonework, of the fifteenth century, was designed by Mr. Backeridge, of London. It is a cusped four-light window with tracery. The two side-light windows bear a series of subjects in stained glass, commemoratively displaying, under the form of allegory, the virtues of Bravery, Piety, Brotherly Love, and Resignation; while the Redemption, Resurrection, Ascension, and Judgment are embraced in the centre compartments. Faith, Hope and Charity, Humility, Forgiving Spirit, and Repentance are also allegorically displayed in the tracery, and two ascending angels bearing texts, complete the figurative arrangement. The entire work is finished by a canopy-work surmounting each group. The window was executed by Messrs. R. B. Edmundson & Son, Manchester.

A Mushroom Town.—The headlong manner in which things are done at the West is shown by the progress of the town of Duluth, upon the projected route of the Northern Pacific Railroad, and which metropolis is now fully three months old. Within the period which has elapsed since its birth, 75 houses have been built, plank sidewalks laid down, a large hotel commenced, which will be completed in September, and two churches are under way. Four months ago the land upon which Duluth is to be built was worth from 1 dol. 25 c. to 2 dol. 50 c. per acre; now town lots in the city are worth 1,000 dol. each. From about five persons—the population of Duluth on the 1st of April—the residents of the town have swelled to 1,500.—*Philadelphia Commercial.*

Leith School of Art.—At a meeting held in the Council Chambers, Leith,—the Provost in the chair,—it was resolved to establish in Leith a School of Art, in connexion with the Government Department of Science and Art, for giving instruction in freehand, geometrical, mechanical, and architectural drawing, designing for manufactures, modelling, and painting. Over 500 had already subscribed, and some further sums promised, to meet the expenses incurred in commencing the school. An influential local committee was formed, with the Provost as chairman, and Mr. Robert L. Bain, late artist-master at Inverness, was appointed master of the school.

An "Unsuitable" Tombstone.—At a recent meeting of the Wednesday Local Board, attention was called to a tombstone to the memory of a man named Mincher, lately erected at the cemetery, with Watts's verse inscribed upon it:—

"Whatever brawl disturb the street,
There would be peace at home;
Where sisters dwell, and brothers meet,
Quarrels should never come."

The verse was held to be unsuitable. The clerk said the verse was attached without the knowledge of the Board, and it could be removed. The chairman was not inclined to order the absolute removal of the stone, but merely to point out the objectionable verse to the friends, and to them to alter it. The widow's defence was that at the deceased often repeated the verse. The suggestion of the chairman was adopted, and it was resolved that in future all inscriptions should be submitted to the Board.

Breaking of a Bridge in Prussia.—At Königsberg, during a *fitte* in honour of the King and Crown Prince of Prussia, the Princess of Wales, and other royal personages present at Königsberg, a wooden bridge which was illuminated seems to have caught fire, and a panic ensued, the people who were on it witnessing fireworks which were going on; the railing of the bridge gave way, and some hundred persons were precipitated into the Schloss teich or lake below. Forty-three corpses had been recovered from recent accounts. The *fitte* was brought to a sudden close.

A Railway Bridge on Fire.—Early on Monday morning, Cotton railway bridge, about three miles from Preston, was discovered to be on fire on the up-line side of the bridge. The fire on that line was at once stopped, and the trains were made to extinguish the fire, which fortunately were successful, and preparations were made to renew the burnt part of the bridge with fresh timber. The bridge is a wooden one, and it is supposed the fire was caused by lighted cinders falling from an engine in passing over.

Will of an Italian Architect.—Signor Poletti has left his whole fortune, now found to amount to 400,000 francs, to his native place, Modena. The syndic of that city, however, has just been apprised that the executor will not part with the property until Modena is placed in a position of independence, and that, in default of this—that is, the restoration of the old duchy of Modena—the bequest will be diverted to the city of Rome.

Park-lane: a Large Offer.—At the meeting of the Metropolitan Board of Works this Friday, a letter from Mr. Dunster is to be read, stating that one of his clients is willing, on the Board obtaining a repeal of the Act for opening up Hamilton-place, and obtaining an Act for the widening of Park-lane, to contribute the sum of 50,000, towards such improvement.

Velasquez.—We hear that in one of the public libraries of Spain several letters and receipts in Velasquez's own handwriting have been found. One was a receipt for 1,100 reales, or nearly eleven pounds sterling, for his famous picture of "The Drunkards." Prices have changed.

The Builders' Benevolent Institution.—The annual dinner in aid of the funds of this charity is fixed to take place on Thursday, the 28th of October. Mr. J. M. Macey is the president for the year, and the list of stewards is now being made up.

Discovery in Rome.—In digging for the foundations of a large palace to be constructed for a savings-bank on the Piazza Sciarra in the Corso the workmen, it is said, lately discovered the basement of the triumphal arch erected by the Senate to the Emperor Claudius.

Dumfries.—The foundation-stone of a new infirmary for Dumfriesshire and New Galloway has been laid, with Masonic honours, by Mr. Landerdale Maitland, Provincial Grand Master for Dumfries. The building is expected to cost about 13,000.

The Gale.—During the recent high winds an old beech tree, nearly 4 ft. in diameter, was suddenly blown down at Croydon. The tree was borne by the gale across St. Peter's-road on to the roof of a house, which it greatly damaged.

Blackfriars Bridge.—This bridge was commenced in the year 1760, not 1710, as, by a typographical slip, was stated in a recent notice of Metropolitan bridges in our pages.

Eton College.—A new music-hall is being erected in connexion with Eton College. A residence is also being built for Doctor Hayne, the professor of music.

TENDERS.

For stabling at Holloway, for the London General Omnibus Company (Limited). Mr. A. G. Church, general manager. Mr. Scerry, architect. Quantities supplied:—

Fawcett	£14,355 0 0
Fletcher & Cughey	14,181 0 0

For alterations to the Clock-house at Potter's Bar, the list of tenders for which was published last week:—
Shirley & Horne (accepted)..... £388 0 0

The Builder.

VOL. XXVII.—No. 1391.

Concrete Buildings.

SOME time ago we alluded to the erection of a large and lofty warehouse wholly of concrete, in Great Guildford-street, Southwark. We have recently visited it, and find it standing remarkably well. It was built by the owner, Mr. H. Goodwin, Mr. E. T'Anson being the architect. Mr. Goodwin, who is laying himself out to execute other buildings in this material, gives us some particulars of the work, which we use usefully printed:—

At your request I will as briefly as possible give you an account of the concrete warehouse in Great Guildford-street, built by me. In the place, the concrete is composed of one part best Portland cement to seven parts of mal consisting of clean Thames gravel, crushed and clinkers from furnaces, crushed bricks, shippings, oyster-shells, pottery, hard core dust-yards, and any other hard and incom-ible material I could get. After waiting six months for the Metropolitan Board of Works to consider whether or not Portland concrete was applicable to building purposes, I at last got consent to proceed with the work. We built upon an average day about 12 in. all round the walls, being in with sand and cement at every fresh- of concrete. We also put in hoop-iron at each floor. We could have built 18 in. away, which is the depth of the apparatus, but considered 12 in. quite fast enough for a build- to high; though at other smaller jobs I have built 3 ft. per day. The building is 70 ft. 0 in. high, and 60 ft. high. It consists of basement five floors, each floor supported by twelve columns. The roof is of concrete 3 in. thick, between tes-iron 3 ft. 6 in. apart, covered with asphalt. The thickness of walls is to brick rule; those 70 ft., two floors 27 in., two 22 in., and two floors 18 in.; the 50-ft. are, two floors 22 in., and four floors 18 in. The cost of the walls, considering I had a great deal of the material for nothing, amounts under 6l. per rod; or, take the whole building as a cube, the cost was about 10s. per foot. It is very strongly built, and stands as one of the warehouse class can- it is now loaded with goods, every floor and has never shown the slightest crack or movement. It is harder than most kinds of concrete used for building purposes, and is of one mass from beginning to end. While in the course of construction I was honoured by visits from many members of Parliament, most of the members of the building profession, and many gentlemen, who took great interest in this experiment and experiment in building, as well as in myself. Thanks for your good remarks in the Builder at that time.

With Mr. Tall's patent apparatus (with which it was built) a perfect surface is obtained without, it requires only a thin coat of plaster and sand to finish the walls perfectly straight and true. I quite agree with Mr. T'Anson

in his opinion "that the success of such work depends on the entire honesty of the man who does it."

I have learnt so much of concrete with this and other contracts I have taken since, that I find the greatest care must be used in choosing the material. I have made specimens of all kinds. Many persons, and amongst them builders, think if they have gravel, by adding the cement they have all that is required to make concrete. So much depends upon the gravel, that if it is not the right sort the work will cost as much as brickwork, and then never be sound. Every bit of loamy matter and dirt must be washed out thoroughly; then you must replace with clean sharp sand, about one-fourth.

Those who wish to build of concrete should only do so where the material is on the spot or very near. Clean river ballast, with a good proportion of sand, is as good a thing as we can have for Portland cement concrete. If some crushed slag or furnace clinkers can be mixed, so much the better; it is also lighter, which is a good thing in wall construction. Burnt clay is also a very good material, provided it is well burnt. Great care should be taken to sift with a fine sieve all crushed material; for, let it be what it may, dust, loamy matter, or fine sand, if it is finer than the cement itself it will dilute and kill it. I have made specimens of concrete with gravel that have become as hard as the best stock brick, and I have made others, with the same proportion of cement, that you may crush and crumble in your hands. There is much gravel in some parts of Surrey, all small round stones free from lean, but containing a very fine sharp sand. Many would think it good for concrete; but use it, and take whatever care you please, the concrete will be little better than if you had only mixed it with water; the reason is, the sand being finer than the cement, kills it.

The concrete chapel I have just completed at Snarebrook, in Essex, is built of the refuse of the brick-fields, mixed with sharp sand got from a good depth, there being a sewer in course of construction close by. The concrete is composed of one part cement to seven parts of material. The prime cost of the walls, including the working apparatus, was 7l. per rod. Many of the statements that have appeared in print upon concrete are not correct. It has to be borne in mind a yard of concrete mixed dry, when wetted and put into the apparatus, falls considerably short of a yard,—at least 15 per cent. Neither does the cement make bulk, but disappears in measure, as does the water. If lumps of stone can be got, or brick burrs, or old bricks, to pack into the wall, it makes better work and cheaper. The more the cement can be displaced the better for the work and the less the cost. Great care should be taken the cement is not too fresh, or it will cause the work to crack. It should be at least a month old before using.

The concrete villa at Addiscombe-road, Croydon, is now completed and occupied; it gives great satisfaction, and, it is said, will be the only house the rain will not penetrate in that neighbourhood. The lower floors are all of concrete, and perfectly smooth and warm; there is no channel for a mouse or any creeping thing in that house, unless it take up its abode with the family. I forgot to remark, the porch in front of the chapel at Snarebrook is built of white brick, by desire: the whole of the other work to the walls around, some 130 ft. long, 5 ft. high, 6 in. thick, without a pier, are all of concrete. Some of the walls near by are 12 ft. high, and 9 in. thick.

In the course of these particulars, Mr. Goodwin makes an observation on which we may usefully enlarge. He says:—"It has to be borne in mind a yard of concrete mixed dry, when wetted and put into the apparatus, falls con-

siderably short of a yard,—at least 15 per cent. Neither does the cement make bulk, but disappears in measuring, as does the water." In the prize Essay on Concrete, by the Conductor of this journal, published in the first volume of the Transactions of the Institute of British Architects, this loss of bulk in making is pointed out, and experiments are referred to which show a diminution in those particular cases of about one-fifth.

In the year 1857 Mr., now Professor, Lewis read a paper at the Institute of Architects with the view of showing that this asserted loss did not take place. The writer says:—

"The general idea with respect to this material is—1st, that there is a sensible loss in bulk of the ballast, independently of that of the lime; and, 2nd, that the materials, on being mixed together, expand considerably. So much is this idea prevalent, that a respectable builder—one, I am sure, quite above stating anything that he did not believe to be true—required, in calculating the price of the concrete, that I should allow him one-seventh more ballast than the concrete cubed to, he depending on the published statements of the loss of ballast being thus great. It was this demand that first led me to experiment. The following trials were all made in the same manner, and, with one exception, I was present at the whole process from beginning to end. Several of the committees of the Architectural Publication Society also attended at the trials. A wooden box was made, holding exactly one cubic yard. This was filled with a fair sample of the ordinary Thames ballast, and such as is used for concrete in London. To this was added ground Medway grey stone lime, in the proportion of one of lime to six of ballast. The whole was then turned out and mixed together in the ordinary way, the cubic yard taking about forty gallons of water. The whole bulk would thus stand as follows:—

Ballast	27 feet cubic.
Lime.....	10½ do.
Water	5
Total	37½ do.

The concrete, thus mixed, was thrown into the box from the level of the ground, so that the lower part would have a fall of about 4 ft., and the upper part of 1 ft. The experiment was also made of throwing it in from a platform, 10 ft. above the ground. In each case the result was the same, viz., the whole mass, made into concrete, occupied precisely the same space as the dry ballast, viz., one cubic yard, all the bulk of the lime and water, being about two-fifths of that of the ballast, being lost, but none of the ballast itself. The surface was carefully levelled, and thin boards tacked over, so as to ascertain if there were any expansion in the setting, but none could be perceived."

We needed no inquiry to assure ourselves that as a rule, whatever might have occurred on the occasion described by Mr. Lewis, the original statement as to a loss in bulk was correct. In order, however, to obtain the experience of others on the point, we made numerous fresh inquiries, and found the answers so unanimous in confirming our views, that it seemed unnecessary to notice the contradiction. The statement, however, that there is no loss in bulk of the ballast having been adopted in consequence in more than one book of reference, and loss having accrued to individuals in several cases through faith in it, it is desirable that the truth should be established.

The Messrs. Lucas wrote:—
"We have the pleasure to forward you, as promised, the following particulars of experiments made with concrete. They were made at the new Italian Opera House, Covent Garden.

A deal measure, 3 ft. by 3 ft. and 3 ft. deep, carefully made for the purpose, was placed upon a wood floor, and filled with ballast thrown in from a shovel, and made quite level on the top. The ballast was then taken out and mixed in the usual manner (upon the wood floor), with three bushels of ground stone lime, and thrown again with shovels into the measure whilst hot; the concrete, when first put in, exactly filling the measure, as did the ballast before being mixed with the lime.

A deal measure was used in order to ascertain if any expansion took place, but as it retained its shape, none occurred horizontally, nor did any appear vertically.

The experiments were made with 'gravel taken from the excavations, well screened, and with unscreened Thames ballast,' the same quantity of lime being used to each, and the operation performed alike in both cases. When set, the concrete formed with the screened gravel, had diminished in height about 1½ in., or

1.24th, and that formed of Thames ballast unscreened, about 2½ in., or 1.16th. We think, however, that had the concrete been thrown in from a stage, the subsidence would have been greater, most probably 1.12th, and should not think it safe in making an estimate to calculate the subsidence, as less than 1.12th."

Mr. Edward Druce, the resident engineer at the Dover pier works:—

"I have found that with the materials such as we have, 22 parts of the materials when mixed together and measured dry make about 17½ parts of liquid concrete."

Mr. Plucknett (W. Chitt & Co.) said:—

"We have found from actual experiment that 5,722 cubic yards of Thames ballast made 4,891 cubic yards of concrete. It was thrown from a height of 10 ft. This quantity of concrete consumed 544 yards of ground stone lime."

The result of some experiments made by Mr. Buckwell at his Phoenix Stone Works, East Greenwich, was, that "a cubic yard of cement concrete contained 34 cubic feet of ballast and 5 cubic feet of cement."

Mr. G. Robertson, the resident engineer at Leith Docks, wrote more fully, and thus:—

"When the ballast was moderately dry, 12 cubic yards of ballast and 2 cubic yards of fresh ground lias lime made 11 cubic yards of concrete mixed and deposited, the waste from the dry materials being then 22 per cent."

But, if the ballast was very dry, the same quantity might only make 10 cubic yards, and *vice versa*. The first quantity is the average, however, of thousands of yards, and may be depended upon as accurate in practice, with the above proportion of lime."

A cubic yard of concrete requires on the average 38 gallons of water of mixture, of which 8 gallons are required chemically to form hydrate of lime, and 30 gallons remain free in the concrete.

The expansion in setting varied from an extreme of 1.30th in hot summer weather to 1.48th in winter during cold weather. This is the expansion for a cubic foot enclosed in a box; on the large scale it is not so great, as the weight of a mass above aids in keeping it down. With lias lime, which slakes slowly, there is expansion going on for perhaps a month. More particulars about the lias lime will be found in a paper I read before the Institution of Civil Engineers in 1858."

The use of concrete will probably extend, and it is of importance that all the circumstances attending it should be rightly understood.

ARCHITECTURAL DECORATION IN THE EIGHTEENTH AND FIRST CENTURIES.

An accurate and minute representation of the details of the domestic architecture of a given period seems to bring before the imagination, with striking force and startling reality, the very tone and movement of the social life of the people. The glimpse into daily habit, in the Augustan times, which is afforded by a visit to the unveiled *atria* of Pompeii has more power in stimulating the imagination to realise the Roman life, during the decadence of the first Christian century, than the whole library of classical literature. We look, indeed, to pictures for the same class of information, but it is not often that we find faithful pictorial records of manners far removed from those of our own time. We are apt to think the clustering wigs, the ponderous garments, and the stage-ethnical attitudes represented by portraits and statues of the eighteenth century exaggerated and unnatural. We do injustice to the artists. They did but represent what they actually beheld, and reflected the pseudo-classical charlatanism which was the fashion of the hour. Yet we fail to realise the truthfulness of the powdered effigies. The graphic portrayal speaks in a more dead language to our sympathy than do the records, the letters, the memoirs of the persons portrayed. The intellectual, political, passionate life of the day more closely resembled our own than did the dress, the country, or the general appearance of the men and women. The former seems to appeal more directly to our common human nature than does the latter. But, if we can, as it were, peep into a room, one, five, nineteen, centuries old, from which it might be thought that the occupants had only just stepped out, we come face to face with the life of the period in a very striking and instructive manner.

Such a treat for the student of the morals,

and the art of the eighteenth century is now offered to the visitors to the South Kensington Museum. What the Crystal Palace, in its palmy days, effected by way of reproduction of Roman, of Moorish, or of Medieval architecture, is excelled by this representation—it is a reality, not an imitation—of the hodoir of a lady of the Court of Paris in the days of Louis Seize.

This piece of decorative architecture, painted on panel, has been erected in a corner of the eastern arcade of the south-eastern court of the Art Museum. The legend attaching to its history, as stated by the officers of the Museum, is as follows:—M. Serilly, one of the paymasters of the army of Louis XVI., who lived in the old Rue St. Louis, in the Marais (now the Rue de Turone), married one of the favourite maids of honour of Queen Marie Antoinette. During a temporary absence of M. Serilly from Paris, his wife, with the assistance of the Queen, caused this hodoir to be fitted up, as a surprise to him on his return.

From the Serilly family the house passed to M. St. Anbin, by whom, through M. Achille Juvenal (the well-known antiquary and writer on tapestry and similar subjects), it was sold to M. Recapps, and so came into the possession of the Museum.

We are thus invited to enter the actual apartment which, eighty years ago, was finished with all the graceful taste of the period, for the delight of the chosen darlings of wealth and of courtly favour. The lesson which it offers is as intelligible as it is impressive. The luxury of Imperial Rome had been transplanted to the banks of the Seine. The erotic legend of a poetic mythology, illustrated by the ablest artists of Europe, was represented on the walls. The worship of pleasure, if, as became the climate, in a guise somewhat less unveiled than in a *veneream* at Pompeii, yet no less distinctly and exclusively followed out, is brought home not only to the imagination, but to the senses. The little apartment (13 ft. square, 14 ft. 6 in. high to the level of the top of the projecting cornice, and 16 ft. to the centre of the coved ceiling) has two sides occupied each by a window, one by the fireplace, and one by a door. The great proportionate height, while it diminishes the apparent size, and somewhat lessens the English notion of the comfort or *snugginess* of the apartment, is well calculated to promote the feeling of enjoyment, a fact of which those who have passed from the occupation of lofty rooms to that of apartments with lower ceilings are made very practically aware. The panelling is of a delicate white, tastefully painted, and inlaid with gilt mouldings and arabesques. In the centre of the ceiling is represented Jupiter,—not a very noble figure, by the way,—resting by his Eagle. Large bronze shells occupy each corner of the coved roof, the lower part of the decoration of which is hidden by the bold projection of a rich cornice. Below this, a scroll pattern, traced in gold and flowers, runs round the room. Scutcheons, or shield-shaped ornaments, range below; and under these, again, are painted circular medallions, with a row of oblong medallions beneath. Under these last are inlaid metal figures, in low relief, bearing vessels on the head. A band of scroll pattern, in gold and flowers, as in the upper part of the decoration, follows; and the base is occupied by Cupids supporting vases.

In four lunettes under the cornice are the largest and most highly painted figures that ornament the apartment:—Vulcan, girt with a leopard-skin, and armed with a ponderous hammer—not the swarthy god of the industrial forge, but the emblem of skill made the slave of luxury; Pomona, with a cornucopia laden with fruit, telling of that horticulture which waited only on the service of the *château*; Juno, imperious and scornful, half asleep beside her characteristic peacock; and a stern river god, the only figure who seems to have preserved somewhat of his natural vigour, unflattened by the enchantments of the scene. Geres and Bacchus, Vulcan and Vesta, appear in medallions on the ceiling.

The grey Italian marble slab of the chimney-piece, with its ornamental figures, is upheld by two finely-carved, bearded, terminal figures,—works, not of a mere decorator, but of a sculptor. The interior, or lining of the fire-place (in which silver dogs no doubt held the fuel), is the only part of the room which reminds us of later progress in the application of fine art to the service of architectural luxury; the embossed cast-iron back and sides being inferior in sharpness of execution to the work we should now

produce. Even this inferiority, however, is a point of keeping, when we consider the purpose which this old ironwork is applied.

In the panels on either side of the window on the east of the room, and in the corresponding decorations of the door which is opposite, the painter seems to have given rein to the warm luxuriance of his fancy. In the former, delicately tinted Venus, girt with but the slightest apology for a *cestus*, stands caressing a dove on her bosom, while its mate flutters above her head, and beneath the feet of the golden are painted a dove and a goat. *Vis-à-vis* to the Queen of Beauty advances Mars, no longer the God of Battle. A dove broods on the summit of his helmet; and he holds out a wreath of flowers in his hand. Above him a cock corresponds to the dove of Venus; and below, a fox, peering out as if for grapes, reminds one of the famous fall of *Æsop*. The pendant panels by the doorway are painted with figures of Diana and Endymion, and with hunting dogs and groups of game.

It is true that there is yet much wanting to the reproduction of the full effect of this elegant apartment. It is still far from finished. Very much, in all French rooms, depends on the effect of the hangings, the *parqueterie*, and the furniture, all which have yet to be supplied. That antique and correct taste, at the result of which, in producing true luxury of furniture contrast to mere display, the *Memoirs* of d'Abraham give such an instructive glance could alone be intrusted the appropriate furnishing of such a hodoir. It is true that in the immediate vicinity there are to be seen rare and choice specimens of the articles of luxury of the period,—inlaid and painted tables, embroidered chaises painted and gilded china; but it is impossible to look at the restored apartment without feeling that, in order to do it full justice, the architect who designed should also have furnished it. It is so harmonious, all is so utterly Pagan (with one glimpse of the sterner redeeming feature of the Pagan life), that the step back into ball reared for the æsthetic education a delight, not of a choice and dainty *noblesse*, but of the teeming population of the largest city of the nineteenth century, seems a practical anachronism. It has been, indeed, a deluge that has intervened between the Paris of which we have here a specimen, and the Paris of London of to-day!

The value to the architect or the decorator of such a specimen of the fine art of a luxurious period, applied to domestic architecture, is very considerable. A lesson of more serious import may be drawn from a study of the scene we have attempted to describe. With the revival of learning, and of that taste of classical literature which yet illustrates the memory of the period of Leo X., commenced an attempt, on the part of those who directed the course of fashion, to re-establish some of the worst evils of decaying Roman civilisation. With classic taste was introduced the fashion of classic morals, or rather of that laxity in certain respects which was so fatal to the over-romantic civilisation, first of Italy, and later of Gaul. It is a stern retribution hefel those who renounced in a great part, only its darker vices. Women and women thought only to repeat the story of Lucretia, or to imitate the luxury of senators or of the emperors of tottering Rome, those who were ground to the very dust to support a heartless idleness in which they had no share, went yet a step further back. They drank yet deeper at the fountain of classical history. They learned how the pride of Tarquinius sharpened the sword of Brutus. They recalled the great word which was older than empire among the Romans. From the mock classical drapery of the court of Louis XVI. emerged a grand spectre of the Republic. The people were taught to look backwards with admiration. They did so, at last, with a vengeance!

It is highly instructive to compare the revived pagan taste of the period to which we have referred with those actual relics of Roman times which are yet continually being brought to light in Campania. But the courts, and frescoes, and mosaics of Pompeii are, if not familiar, yet least, as to their representation and description, readily accessible to our readers. The literature of the subject is ample. It is more suitable for our purpose to refer to the latest progress of discovery, and to compare with the lady's hodoir of the decrepit French monarchy, the proportions and adornment of the imposing Italian villa which is even now in course of exploration at Palermo.

In sinking holes for the fixing of some of

which are used for the displays of the fireworks in which the Southern Italians take so much delight, in the month of December, in the Piazza Vittoria, at Palermo—opposite the archiepiscopal palace—some remains of ancient buildings were brought to light. Professor Cavaliere, and a committee interested in the promotion of the fine arts and discovery of antiquities in Sicily, directed attention to the subject, and were rewarded by the discovery of the foundations of a large edifice, some 100 ft. in length, at a depth of about 4 ft. below the level of the soil. A porch, or vestibule, with two carved door-jambs, on which it appeared that hinges had turned, gave entrance into a hall, nearly 80 ft. long, entirely paved with mosaic work. A doorway, graced by two Corinthian columns, led thence into a long gallery, also floored with mosaic, which again opens into a square apartment, leading into other chambers.

An external gallery, the floor of which is 6 in. higher than that of the rooms included, runs round part of the house; the whole of which had not been uncovered at the time when the description was taken.

In one of these apartments Orpheus, dressed as a shepherd, with a lyre and an iron instrument in his hand, is represented in mosaic of a very correct style; and is admirable in attitude and expression. The work, however, is nowhere equal to that of the great hall, which, for beauty of design and freedom of execution, is said to be one of the finest specimens of Classic art that has yet been discovered. In the vestibule is represented a life-size nude figure, which is in a good state of preservation. The floor of the hall itself is divided into five longitudinal and thirteen transverse compartments, adorned with geometrically-drawn polygons, stars, and frets. A large medallion in the centre is supported by four nude figures. Half-clothed females, wearing diadems, are in other compartments, one seated in a flying griffin, one on a sea-monster, one on a horse with the tail of a dolphin, and one on an eagle. A superb head of Neptune, armed with his trident, is a pendant to one of a radiant Apollo. Two horned heads, one representing a youth, and one bearded, Ieda and Jupiter, and a faun chasing a nymph, form the principal subjects of this superb composition.

Three compartments have been injured, and barbarously restored. The head of the female on the sea-monster is wanting, but, notwithstanding these imperfections, the grandeur and beauty of this splendid mosaic are such as to have produced an extraordinary impression on all those competent to judge of such works, by whom it has been seen. The complete uncovering, and accurate delineation, of the entire ground plan of this important villa will be awaited with mutual interest.

In the comparison thus afforded between the decorative art of classic, and of pseudo classic times, we cannot fail to be struck with the greater power of the earlier people. Where the light taste of the Parisian courtier adorned, with a decoration as perishable as it was elegant, the walls of a single apartment,—a floor which, it may be, had a shop below and a garret above,—the Roman designed in stone, and produced pictures which even the earthquake could not obliterate. In fact, it is to the most terrible forces with which we are acquainted, the fury of warlike storm, or the energy of elemental disturbances, that we owe, almost exclusively, the relics of ancient decorative architecture. The ashes of Vesuvius have preserved the frescos and mosaics of Pompeii, which look, at the moment of their discovery, as fresh as when they were buried in that black and blinding snow. Violence and fire have thrown those monuments over the ruins of the palaces of the Assyrian kings, from beneath which their injured sculptures are now disinterred. In cases where cities never cease to be inhabited none but the most massive architectural features can escape the transformation due to repair. It is only where the destruction has been overwhelming that what has been preserved has been preserved unchanged.

But the painted panels of the Lomis XVI. Palaces would have become entirely obliterated by such an overthrow as has preserved the noble mosaics of Palermo. Climate, no doubt, goes for much, and the distinctive action which the sun exercises on wood has taught the Italian Builder to make use, whenever it is practicable, of stone or of cement. But however we can account for it, the difference remains. If we compare the work of the two periods of decadence, of the corrupt Roman life which was

swept away by the sword of the Goths, and of the corrupt French life which, if but for a moment, was swept away by the Terror and the guillotine, we find the former to be that of men who wrought for all time; the latter, that of men who wrought but for the moment.

Another, and a not unimportant difference, may be traced between the art of the empire and that of the *ancien régime*, between the decorators by oil and the decorators by mosaic. It is that of the superior truth that distinguishes the earlier. Representations of Jupiter and Mars, of Venus and Diana, in the halls of the most Christian king or of his courtiers, were nothing but a sham. In those of the Roman senator they indicated a reality. Without supposing that the Roman gentleman of the time of Cicero or his readers were altogether possessed with faith in a mythology such as is to be found in the pages of Lempriere, there is yet no room to doubt that their forms of thought and modes of speech referred at least as distinctly to the immortal gods of Rome as do those of the Italian of the present day to St. Joseph or St. Jannarius,—to the Madonna or to St. Anne. As in the painted or modelled nook that is to be found in almost every Italian court or garden,—where a daily offering of flowers, or a half-hunt taper, represents the homage paid, in former days, to the Lares, or to Pomona,—there is an indication of the presence of an actual power or force, for good or for evil, ever operative on the popular mind,—so was it with the representation of gods and heroes in the times of our earlier paganism. Nor did the worshipper invoke their aid in mockery. In many aspects of what we now call morality, especially in all that regards the relation of the sexes, the code of Roman manners was far looser than that of Romish prescription. But the manners were not at variance with the code. The emperor had no lurking scruple that he ought to absent himself from the sacrifices because of his devotion to any Roman Madame de Montespan. For a monarch to live in the open disregard of the laws of a religion in defence of which he devastated whole provinces because their inhabitants would not kneel at his altars, was an anomaly unknown even to those who earned the terrible title of foes to the human race. And accordingly, much and repeatedly as Rome suffered from her captors, never was she wetted by her own children with so fierce a baptism of blood as the St. Bartholomew, or its *contre-coup*, the Revolution. The gods of Rome, faintly painted on the walls of salons of Paris, told of an unreality in the morals of the day, which was to meet with a very stern rebuke. Viewed in this light is there not much that we ourselves may lay to heart, in the reflections suggested by a visit to the boudoir of Madame de Serilly?

SOCIAL SCIENCE CONGRESS IN BRISTOL.

AFTER a meeting of the Council of the Association on Wednesday morning, the Bishop of Bristol preached a sermon in the cathedral, which was well attended. In the evening, Sir Stafford Northcote, bart., M.P., as president of the Congress, delivered the opening address in the Victoria-rooms, in the course of which he commented on the various subjects in the programme. We confine ourselves to what the speaker said on sanitary matters, and a portion of his remarks on the education of the labourer:—

Sanitary Questions.

I hope that in what I have been saying I have not led you for a moment to suppose that I undervalue the immense power for good which resides in the State, and which can only be exercised by the State; or that I am of opinion that what the State now does for the advancement of important social objects is anything like sufficient. On the contrary, I believe that there never was a time when State assistance, of the right kind, was more needed for the advancement of these objects than at present. The State is, or ought to be, in the possession of much more perfect information than any private body; its command of the machinery of administration is greater in almost every department of life; and it holds a position of independence and authority, which gives it advantages to which no private individual or corporation can make any pretensions. It is, therefore, most reasonable that in examining social questions we should give great prominence to the inquiry, how far the State can properly

and usefully interfere to promote social improvements. This inquiry we very naturally make in connexion with the third of the great departments of this Association,—the Department of Health. Public health, as has well been said, is public wealth; and it is a description of wealth, which, it is to be feared, we do not husband so well as we ought to do. Now, no amount of individual care, or of individual skill, can do what is wanted in this matter. Combined action is necessary to secure to the great masses of our population the first conditions of a sound sanitary state, to check the propagation of infectious disorders, to prevent overcrowding in dwelling-houses, to provide an adequate supply of pure and wholesome water, and otherwise to bring all the forces of civilisation into play in order to counteract the evils which civilisation brings in its train. For these are not inconsiderable.

It is not quite without reason that the ancients feigned that the introduction of the arts of life by Prometheus was followed by the introduction of a host of new and unknown diseases, especially when they added that mankind had by their own carelessness forfeited the gift of perpetual youth with which the gods had, in the first instance, crowned the measure of their blessings. The progress of population, consequent upon the increase of wealth, and the ever-encreasing exigencies of competition, tend very obviously and directly to the introduction of new dangers to health and to life. But the antidote accompanies the poison, if only we have the skill and the sense to use it; and it seems to be a legitimate function of the State to take care that, while private enterprise is basting after the acquisition of wealth, and is applying all the resources of science to its production, recourse should also be had to science for the protection against the evils which the wasteful, because selfish, spirit of private enterprise might otherwise engender. It is much to be regretted that we have not as yet a thoroughly well-organised department of the Government charged with the duty of superintending our sanitary system.

There is, I am convinced, abundance of work for a Minister of Health, and I believe that such an officer would be able amply to justify the expense which the department would occasion by the services he would render. We must remember that there is the broadest distinction between Government interference with private enterprise and Government support of private enterprise; and we must not confound the creation of public offices for the promotion of important objects with the absorption of all dealings with regard to those objects by the State. The time is probably at hand when three new Ministries must be created: a Ministry of Health, a Ministry of Education, and perhaps (though on this point I speak with diffidence) a Ministry of Justice. The present day, however, is the day of Royal Commissions; that of Ministries is yet to come. More than one such commission is now inquiring into questions affecting the public health. The most important is that presided over by Sir Charles Adderley, which is considering the consolidation of our very complicated sanitary laws, and the completion of our system of sanitary organisation. Those who are in the habit of paying attention to the connexion between the growth of national habits and the growth of national language, will not have failed to notice the recent introduction among us of the phrase State medicine, a phrase absolutely new to many of us, and perhaps still imperfectly understood by the general public. Let me, by way of giving an idea of what it is, quote the list of subjects which, as a committee of the General Medical Council inform us, have been suggested as proper for the examination of candidates desiring to take out a diploma in State medicine, and to enter the Public Medical Civil Service. They are: forensic medicine, toxicology, morbid anatomy, psychological medicine, laws of evidence, preventive medicine, vital and sanitary statistics, medical topography, and certain portions of engineering science and practice. State medicine, in short, as a member of the committee well expresses it, consists in the application of medical knowledge and skill to the benefit of communities, which is obviously a very different thing from their application to the benefit of individuals in private or curative medicine. We are all of us aware that medical men are continually being called on to perform public duties which lie wholly beyond the range of their private practice. They are called on to give evidence in courts of justice as to the nature of injuries, the causes of deaths, the sanity or insanity of in-

dividuals, the presence or absence of poisons, the wholesomeness or unwholesomeness of articles of food, of water, of the vapours occasioned by particular kinds of manufacture, and so on. They are or may be called on to act as coroners, as inspectors of the sanitary condition of workhouses, of prisons, of ships, of barracks, and of various public buildings. Their advice is required in relation to the purification of rivers, the drainage of towns, the regulation of burials, the repression of contagious and infectious diseases both among men and among animals, quarantine, vaccination, and numerous cognate questions. In fact, it is difficult to assign a limit to the demands which the State might with advantage make upon the time and intelligence of a well-organised Medical Civil Service. These remarks naturally suggest two reflections. In the first place, we seem to want a body of men able to withdraw themselves without inconvenience from the engrossing demands of private practice, and to devote themselves to the especial study of the public questions which require medical attention. To a certain extent, of course, it is desirable that all medical men should study those questions; and upon some of them it is necessary that they should be prepared to give opinions as cases arise. But the physical powers, even of medical men, are limited; and it is impossible that a doctor in large private practice, with all the anxieties which such practice necessarily entails upon him, should give to questions of a public character the time and consideration which their importance demands. In the second place, when we have got our Medical Civil Service, how are we to turn it to the best account? This is undoubtedly a question of great difficulty, and one which must lead us into other fields of inquiry, for it connects itself very directly with the whole question of local organisation, and of the relations between the central and the municipal authorities of the country. If we are to have an organised medical staff spread over the face of the land, some kind of local organisation will be required for it; the machinery cannot be wholly worked from London. The solution of this problem will, I hope, be materially assisted by the labours of the Royal Commission now sitting under the presidency of Sir C. Adderley; and should it be solved satisfactorily, the result may be important in more ways than one; for a good system of local organisation for one purpose will greatly facilitate the establishment of a good system for other purposes. Few greater advantages could be conferred on England than a well-considered framework of local self-government, charged with the administration of most of those matters of which this Association takes cognisance,—of justice, of health, of education, of charitable trusts, and so forth,—subject to due control by the supreme central power.

I should have been glad, had the time permitted, to make some remarks upon the sanitary questions which have been raised in British India, and upon the measures which have been taken for the improvement of the public health there. But I should be tempted into too wide a field; and though I am well aware of the great interest which the members of this Association feel in all that relates to the social condition of our Eastern Empire, and of the personal labours there of one whose name I need not mention in the present assembly, for I am sure it is in all our hearts, I must exclude India altogether from the field of my observations.

The Agricultural Labourer.

I pass on, then, to the fourth head of your labours,—the department of Economy and Trade. And here I find that you propose for special discussion the questions of the administration of the Poor-law, of assisted emigration, and of the condition of the agricultural labourer. . . . Now for the improvement of the agricultural labourer you want two things—you want to raise the standard by which he measures himself, to teach him to aim on behalf of his children, if not on his own behalf, at something higher than he has hitherto been content with; and to place within his reach the education and training necessary to enable him to reach that standard if fair play be given him. That is one thing which you want; the other is that he should have fair play; that his work should be paid for in such a manner as to make it his interest to do his best; that he should be encouraged to form habits of diligence and of independence, and should be made to feel that his destiny in life is to a great extent

under his own control. You want, in fact, to operate upon the individual, and to make him work out his own improvement. This is a task not only distinct from that which the advocates of artificial systems for the wholesale elevation of the labouring class propose to themselves, but one which in practice will often be found antagonistic to them. Those who are interesting themselves in the improvement of the condition of the labourer may, I think, be divided into two schools. The one is animated by the spirit of the trade-union, the other by the spirit of piece-work. The one would work through the class, the other through the individual. I take my side with the believers in piece-work. Not that I dispute or doubt the reasonableness of such an organisation of labour as is sufficient to protect the individual labourer against the possible exactions of the capitalist; if trade-unions or labour-unions could be confined to that object, they would be deserving of respect and of sympathy. But when they go further and demand of their own members that they should limit their individual exertions so as not to produce more or to earn more than their fellows, they introduce a principle at once unjust and dangerous. There is no saying what injury they may not thus inflict upon their neighbours; there is no saying even what injury they may not inflict upon their country, by restricting the development of its industry, and possibly driving out of it branches of business essential to its prosperity. The theory of co-operation is indeed a beautiful one; but it seems better suited to the republic of Plato than to the atmosphere of this work-a-day world. It will, no doubt, commend itself to those who abhor what they call privileges, who prefer equality to liberty, and who look to the State to exercise the evils of the inequality which nature has unhappily inflicted on the human race. This is the theory which finds its latest expressions in the proposal of one of the societies represented at the late National Labour Congress at Philadelphia, "that when an employer refused to make an advance in wages or a reduction in the hours of labour, the State should employ such workmen." I presume that in such case the workmen would both fix the amount of wages they would like to receive, and name the amount of work they would like to do in return, leaving the taxpayers to make up the difference between the two sides of the account. It is a theory which may well find advocates; but to many of us—I hope to the majority of us—individual freedom and fair competition are the very breath of our nostrils, and long may it be ere we are deprived of them. What I have said of the artificial system of trade-unions applies, I think, at least in a degree, to the artificial system of assisted emigration directed to the diminution of the supply of labour. I do not believe that in this country there is a real surplusage of labour. Population advances very much less rapidly than does the accumulation of capital; and were it not for the very rapid increase of machinery our labour supply would now be extremely deficient. It might very easily happen that by the injudicious encouragement of wholesale emigration we might drain the country of its strength and drive away employment to other lands, just as we might do by an injudicious attempt to force up the rate of wages beyond the natural level. England holds a very high position in the industrial world, but it is one which rests upon a somewhat narrow basis; it is one which it would be comparatively easy for her to lose, but exceedingly difficult, if not impossible for her, if she once lost it, to regain. I look, then, for the improvement of the condition of our labourers generally, and of that of the agricultural labourers among them, to the free play of individual competition under favourable circumstances, rather than to any artificial remedy. But do those favourable circumstances exist? Has the agricultural labourer really fair play. Has he the opportunity for raising himself? Has he the inducements to exert himself? I fear we cannot give a wholly satisfactory answer to these questions. I cannot doubt that the system of the Poor-law, taken as a whole, has exercised and still exercises a deadening influence upon our labourers, or that it tends greatly to neutralise the wholesome spirit of competition and self-reliance which it is so important to arouse. It is a system which could not be summarily set aside without serious hardship and injustice; but it is a system from which it should be our endeavour as far as possible to teach our labourers to emancipate themselves. Nor is such emancipation visionary. The machinery of

the law must of course be retained; there is always be plenty of cases of unavoidable snuffer to be relieved by it. But if the labourer be trained in his youth to recognise the duty of laying his provision for his old age,—if he be early taught prudence, and foresight, and self-denial, and at the same time the means be provided him investing his savings with perfect security which he has now great difficulty in doing, great step might be taken in advance; and his employers be brought to see the wisdom so regulating his wages as to enable him additional labour to earn additional remuneration, and so encourage him to increased industry, the heavy weight of pauperism would no longer oppress the energies of our people, but to a very great extent be shaken off.

Earl Ducie, the Dean of Bristol, and the Mayor of Bristol also took part in the proceedings.

PARIS.

The grille of the Palais de Justice, which dates from the last century, is about to be restored and rebuilt. The principal gateway, the only one in *reposé* iron-work,—the Gate of Honour,—far from being in the same state of ornamentation as it was when first put up, besides wanting the entablature and the globe crown and fleur-de-lis. All the royal insignia were removed in 1793; the accompanying attributes were also removed; but the L L remain. They signify, as it is said, *Law and Liberty*, but curious that the letters, placed back to back, that the two significations march in opposite directions. One thing is certain, viz. that the rusted grille should have been restored, from state in which we saw it a few days ago, with the rest of the building was being renewed. The repairs of the iron will cost 400l.

The rear face of the church of St. Vincent Paul is about to receive a monumental annex in the form of a rotunda, with crypt, in order to increase the accommodation; it will be a construction similar to that of Notre Dame Lorette, on the side facing the Breda quarter, of much larger proportions.

For a long time past the immense building the *Magasins réunis*, in the Place du Château d'Eau, has been shut up, owing to the failure of the company. Various rumours have gone forth with regard to the future destiny of the pile; a hotel, a monster restaurant, a post-office, all have been hinted in turn. The company who own it propose now, it is said, to found a permanent and universal exhibition, to be called the Galleries of the Château d'Eau. By plan, to which most of the manufacturing firms have adhered, the consumers will be able to purchase necessary objects of household use directly from the manufacturer, and economise for himself the profits of the retailer, which are often in England, enormous.

M. Say, the great refiner, of the Boulevard de la Gare, had given orders to M. Saint-J Drn, successor of M. Mlot, to sink an artesian well in his vast establishment in the *Ph. d'Italie*. It was attended with complete success the trepan reached, at a depth of 1,844 ft., a column of water which rose up in a column, with temperature of 82°, furnishing 1,540 gallons a minute. With tubing, the water will rise 60 ft. or 100 ft. above the ground. The operation only required four years, the total expense not having exceeded 12,000l. Two other artesian wells, as we have before stated, are being bored for the municipality of Paris: one at Lachapelle Saint-Denis, near the road-point, under orders of M. Degoussé; the other at the summit of the Butte-aux-Cailles, at the southern extremity of Paris, the works being confided to M. Saint-Just-Drn, who bored the well for Say.

The black wooden tower which formerly stood over the Passy well no longer exists: a shaft about 4 ft. high stands in the middle of a natural fountain-basin. Through a hole in the rock, 1 in diameter, gushes forth the streaming torrent into the basin. There is no engine, nor building, nor sign of one near, so that the phenomenon is studied in all their wonderful aspects. The height of the jet is not great, as the diameter of the bottom of the well is less than that of the top; but the quantity astonishes any one who has never seen an artesian well exposed. As the temperature, on a cold day the steam may be seen at a considerable distance.

The French Transatlantic Cable is working well. The number of messages for the week end of the 4th of September was 448, producing 1,000

The works of the new Opera-house have made a regular spurt lately; the inside work is well in hand. It is said that superior orders have been given to the contractors to have the theatre ready by the 15th of August, 1870. Scaffolding are being erected for hoisting the bronze Pegasus, now exhibited in front of the Palais des Champs-Elysées, the work of M. Ondry, of Autenil; it will be placed on the summit of the theatre. A splendid *tampadaire* of vast dimensions is being put in place; so, after all, the opera will be ready before the Hôtel-Dieu; at least, so it seems. Carpeaux's group has been cleaned, as we stated; but a letter has been addressed to the Paris papers intimating that a few persons have sworn to destroy the work if it be not removed.

AN ARCHITECTURAL COMPETITION ONE HUNDRED YEARS AGO, WITH SOME NOTICE OF THE ARCHITECTS.

SOME account of an architectural competition one hundred years ago, with a list of the architects' names, supplemented by a few notes relative to the life and subsequent career of a few of these, cannot but be interesting to the readers of the *Builder*. The list is that of the architects, English and Irish, who sent in their several plans for the building of the Royal Exchange, Dublin, in the February of the year 1769:—

1. William Ivory, Norwich.
2. James Gandon, † London.
3. Stephen Riou, Canterbury.
4. T. M. T., Dublin.
5. John and Samuel Hope, Liverpool.
6. J. Jenkins, London.
7. — Everard, London.
8. Timothy Lightoler, Chester.
9. Robert Mack, Dublin.
10. N. J., Dublin.
11. Thomas Rawlins, Norwich.
12. W., Ireland.
13. J. Jours, London.
14. John Fellow, Southwark.
15. J. T., London.
16. James Workman, Cava.
17. Mr. Ivory, two designs, Dublin.
18. —
19. Messrs. Myers & Sproule, Dublin.
20. —
21. William Barbor, two designs, Dublin.
22. Præter Laudem Nullins Avarus, Hibernicus et Amator Patriæ.
23. Architectos B.
24. —
25. Oliver Grace, two designs, Dublin.
26. Hibernicus et Amator Patriæ.
27. Francis Sandys, Dublin.
28. —
29. J. C., Dublin.
30. —
31. Thomas Jarat, three designs, Dublin.
32. —
33. J. W. L., † London.
34. Peter de la Roche, London.
35. F. S., London.
36. Thomas Cooley, † London.
37. R. Edwin, London.
38. Edward Stevens, London.
39. Thomas Cranston, London.
40. William Donn, † London.
41. James Lovel, London.
42. Thomas Wiggins, London.
43. O. B., London.
44. O. A., London.
45. Thomas Sandby, † London.
46. George Richardson, London.
47. William Blackburn, London.
48. John Whiscard, London.
49. Anthony Chearnly, London.
50. Richard Louch, London.
51. Arthur Blackhall, London.
52. †, London.
53. William Elgby Naylor, two designs, London.
54. William Newton, London.
55. John Byrne, Dublin.
56. Roland Omer, Dublin.
57. Michael Priestly, Londonderry.
58. Edward Johnston, Londonderry.
59. Vitrings, Dublin.
60. William Beauford, Dublin.
61. Lodge, No. 158., Dublin.

In the above list those marked † were considered the best designs by the Trustees. It will be seen by a reference to the list, that London contested stonily with Dublin for the prize, and succeeded in winning it. Thomas Cooley was adjudged the first premium of 100l.; James Gandon received 60l., and Thomas Sandby, 40l. In looking down the list, we incidentally find a few names whom the pall of oblivion has not hidden; and by a little painstaking ruminating in the neglected corner of our architectural history, we are enabled to restore and fix two or three more whom the mists of a century were fast hiding from our sight.

Of Thomas Cooley and his *chef d'œuvre*, the Royal Exchange, of Dublin, we gave some particulars a short time since.* James Gandon, soon after the competition, passed over to Dublin, became a resident, and rose to fame.

In fact, he became the first architect, *par excellence*, as we remarked before. Gandon, although he failed to obtain the first prize for his design in the competition under notice, yet shortly afterwards distanced all competitors. In the Dublin Custom House, the Four Courts, and the Corinthian portico to the Irish House of Lords (now the Bank of Ireland), James Gandon's architectural services may be seen. Gandon designed several works in the capital, and throughout Ireland; he became the associate of the most eminent public men in Ireland and England; was elected member of the Royal Irish Academy; and during his professional career in Ireland he contributed some articles to the foremost publications on the rise and progress of architecture in Ireland. Gandon was a hoosem friend of Captain Grose, the famous antiquary, and though dying many years subsequent to him, he was buried with him in the same grave in the village churchyard of Drumcondra, near Dublin. The Mr. Ivory who exhibited the two designs 17 and 18 was a native of Cork, and, like Thomas Cooley, was originally a carpenter. He was a skillful workman, and for some time followed gun-stock making for the chief gun-maker for the Ordnance in Dublin. Ivory imbibed a taste for architecture, and by close study and a determination to succeed, made a rapid progress in the knowledge necessary to the pursuit of the profession. He learned drawing under a master named Bell Mires, but he soon eclipsed his tutor, and was shortly afterwards appointed drawing-master in the Dublin Society School of Art. Ivory became also a surveyor to the Revenue buildings, and he held this office to the time of his death, which took place in 1786, in the fifty-fourth year of his age. Ivory's designs for the Royal Exchange, though they missed the premium, were rewarded with a piece of plate, along with some others. The exhibition of the designs for the Royal Exchange led to the improvement of Ivory's style of drawing. The Blue-Coat Hospital, Dublin, and the Bridge of Lismore were among his public works. It is said he furnished designs for the Courts of Law and for Newgate. Newcomen's Bank, in the Irish capital, was also designed by Ivory, along with several private dwellings throughout the country. Ivory was much given to redundant ornamentation and embellishment, as may still be seen on his works, and this, in the opinion of some detractors from the external appearance of more than one of his successful buildings. Whether William Ivory, of Norwich, whose design is marked J, was any relation of the Dublin architect, we know not at this lapse of time. The latter's Christian name was Thomas.

The name of Peter de la Roche, the inventor of a new "Sixth Order of Architecture," appears at 33 in the list. Some account of this notable personage will be found in the standard architectural works of this century. William Beauford, M.A., No. 60, was the principal of a classical academy in Cork, as late as the close of the last century. He was very ingenious in mathematical problems, and was the writer of some papers "On the Theory of Walls for Roofed Buildings." He compiled tables also for showing the thickness of cut stone on a brick wall at the top, for the support of all the different angular roofs commonly used in Ireland—of Gothic and common pitch, or of pediment, or whether covered with pantiles, slates, or lead. Some of Beauford's mathematical and scientific theories were published in the "Anthologia Hibernica," 1795-6.

William Beauford was also author of an interesting paper on "The Theory of Columns." His problems were comprised in the following:—To find the strength of an insulated column of any of the five regular orders. Second.—Having the power of any force necessary to throw down a column when applied at the top, and acting perpendicular to the axis of the column, to find the power of the same force when applied down the side, and parallel to the axis. Third.—To find the strength of a column having part of its diameter sunk into the wall. Fourth.—Having the contents of a buttress necessary to support a wall, to find how many columns and pilasters shall be equal in power to the buttress.

He calculated a table which expressed the strength of the columns, and their parts, and also diminished pilasters, the strength of their respective circumscribing cylinders and parallelepipeds, being equal to unity.

In concluding his paper on "The Theory of Columns," Beauford remarks, "Such an inquiry, however, may be of service to architects in

enabling them to place their ornaments with judgment both in respect to taste and utility, and not entirely to depend on the caprice of fashion."

The academy over which Beauford presided in Cork, was a commercial and military one. He was previously (1799) at the head of one, or somewhat similarly engaged, in the town of Athy, county Kildare. Strictly speaking, although Beauford sent in a design for the Royal Exchange, he was not, so far as we understand, a practising or professional architect. His mathematical writings, however, were most useful and valuable, and he was proved in the field in the interest of architecture and the building art at a time when the strength of materials received little attention either from builders or their workmen, and when a piece of wood or iron, or any other material, was more judged by its size and weight for obtaining the desired end, than the principles of judicious application, and consequent economy.

Of Edward Johnston, No. 58, of Londonderry, at this moment we know nothing. There was a William Johnston of Armagh, who lived about that time, or a little later; but the only architect of eminence of that name whom we know of belonging to the sister kingdom was Francis Johnston, the founder of the Royal Hibernian Academy, and architect of many public works in Ireland. Whether he descended from either of the other two Johnstons aforementioned, we are not at present able to say. There were other architects of repute in England and Ireland in 1769, but they do not figure in the list unless some of the *noms de plume* hide their names.

Perhaps some of the many readers of the *Builder* will be able to identify other names among this rare and interesting catalogue which we publish to-day, and furnish whatever "waif and stray" they can in making our knowledge more perfect of those architects who played a not unimportant part in our architectural competitions of ONE HUNDRED YEARS AGO.

C. C. H.

THE SANITARY STATE OF TRURO AND FALMOUTH.

THE remarks in our pages "Concerning certain Cornish Towns" (p. 720, ante) have produced considerable stir in those towns, and have brought us a dozen letters, some confirming, others denying their correctness. At a special meeting of the Truro Improvement Commissioners, the mayor called the letter in our pages "unfounded and unjust," and then individual commissioners proceeded to point out how much improvement was needed in the town, and how many nuisances were permitted to exist. We have no desire to injure or annoy any person; our object is the general good, and we advise the authorities to take our observations in good part, and to set themselves to remedy the existing defects. We have submitted to the writer of the comments "Concerning certain Cornish Towns," the various letters we have received, especially one signed "An Improvement Commissioner," which has also been printed in the *West Briton*, and we subjoin a part of his reply:—

Truro is a tramp in a dirty condition: he is to be cleaned by a Commission: they stand by as they see his hands and his face washed; the fellow's neck and ears are not touched; his hair is a tangled mat; his body is left in the state it was; yet these Commissioners all the man clean. Clean! ay, a marvel of cleanness, for as the soap is shining on the fellow's face, they exclaim, "By George, you wouldn't know him, would you?"

Now I, "Pro," declare boldly, he is not clean, and that men like "Improvement Commissioner" by their obstinacy and ignorance, have done more to retard the progress of sanitary measures than any number of those who, like at Falmouth, say regarding their own tramp, "Yes, he is dirty, but soap costs money, and we ought not to pay for all of it; there are those two parishes adjoining that ought to help us." Men like "Improvement Commissioner" have done more to keep preventible diseases in stock in England than any other class of men; and they have done more to retard improvement.

I affirm the sewerage of Truro is bad. Years ago, when the cholera raged fearfully in the town, the Improvement Commissioners got afraid, and they made a great many sewers, and I believe the most part of the sewerage may date from that time. They were all built rectangular in section, of common dry stonework, covered with large flat stones (called coverers), as they came from the quarry; the ground was excavated, and

* See p. 419, ante.

the walls of these sewers were built on the rock: no invert or arch was turned.

These drains, of course, in time fell in from the superincumbent weight of earth, and from the decomposition of the stone used in their make; and it was that the walls, having to be repaired, were repaired with brick, but neither invert nor arch was turned; the walls still rest on the rock, and are still covered in with flagstones! These are the drains the "Improvement Commissioner" says have been "constructed of brick."

As for the assertion that there are "seven or eight miles of public drains carried to the utmost limits of the town;" seven or eight hundred, if they were hadly made, would not show the sewerage in a better light.

But if it is true that there are seven or eight miles of public drains, and also true that no "less than 20,000 ft." of glazed pipes have been lately used in drains, I would point out that not much less than four miles, or more than half of all the drains in the town, have been either made or repaired by means of glazed pipes alone; and then there is the remaining length of new brick sewers to be added; say, not to be too extravagant with "Improvement Commissioner's" statement, one mile more, or, on the whole, 5-7ths or 5-8ths of the whole of the town sewerage have been recently repaired or made—an assertion which is just one of those wild ones "Improvement Commissioner" might be expected to make, and manifestly untrue to all who know Truro. If a statement be provided, showing where and when these pipes were used, I will thoroughly investigate the matter. I earnestly ask for such statement.

The cesspits were made, as the sewers, of common dry stonework, having a wood cover, set in a wood frame; the openings in and out were untrapped. They, too, have begun to fall in, and some of them have been repaired in the same way as the drains, the stone decomposing under the influence of the sewage matter; and brick walls are built, leaving the bottom on the rock, and, instead of a wooden, a cast-iron cover provided, set in granite. Such a one is the one I particularly spoke of in Mitchell-hill,—please observe I name places,—though I understood it was through possessing a cast-iron cover, built of dry stone walls.

My friend was visiting a poor sick woman living a few yards from this cesspit, and the stench was so bad that it caused a slight attack of diarrhoea.

Now Mitchell-hill is not in "the outskirts of the town," neither is Fairmante-street, Carelew-street, Charles-street, Union-street, Pydar-street, Goodwives'-lane.

"There are now but a few more untrapped cesspits." Are there? I am glad to hear so much work has been done in the last three weeks. But should cesspits exist at all? And moreover, should excreta and garbage be permitted to lie in their openings, poisoning all the air around? My statements relative to the mode of cleansing these cesspits remain unchallenged, and also my statement as to the foul smells caused by their cleaning out. If they will have cesspits, why not use disinfectants? If it were pure "road detritus," would it smell? and would it be black or putrid? or has Truro a peculiar strong-smelling "road detritus"?

I was told of the stench-traps that had been inserted, but I was wishful to avoid mention of them, for I felt I might be misunderstood, sewerage being in such an infantile condition in Truro. Let me now point out that the sewers being badly made, trapping all their openings will aggravate the evil, and the houses in the streets will be invaded by noxious smells. Truro may so far be thankful that all the openings into its sewers are not trapped, nor anything like it; in one street I noticed some openings were trapped, but a cess-pit in the middle of the length of the street was untrapped, and a cess-pit at the lower end of the street was untrapped. Thorough trapping is good if the sewers are good, but then the gases generated in sewers are so powerful and penetrating that even if the sewers are good, care must then be taken to ventilate them. That I am again correct in another item is obvious from the "Improvement Commissioner's" letter:—"About 100 large cast-iron traps have been laid over the many inlets to the common sewers." Bearing in mind that there are "seven or eight miles of public sewers carried in every direction, &c." a stranger can readily judge how thoroughly the sewers in Truro are trapped.

Again, by inference, I am correct. "Im-

provement Commissioner" can see no good in waterworks if they have wells; for was it not found that the "worst specimen of their water three years ago had considerable advantages (sic) over a sample from a neighbouring waterworks"? Some few years ago water taken from three or four wells was tested, and it was found full of impurity; the well in the High Cross, and that by some inn—I forget the name, but I think it was the Dolphin—was found particularly bad. I am told, too, that the pumps are continually under repair. Now, by *under repair* is meant the absolute stoppage of water supply to a particular district for an indefinite number of not hours only, but days, and the supply of dirty water for a time longer.

Because a "neighbouring waterworks" (Query, Was that the Falmouth Waterworks?) has a bad sample of water, is that any reason why Truro should be supplied for the most part with water that is not tasteless?

I am aware that in two or three of the main streets are granite gutters, along which flows water, and I am indeed glad to see it there; but "Improvement Commissioner" goes too far in praise of it. It comes from the leats, on which, just before the water enters King-street, is a public privy, the matter from it falling into the water; higher up are another privy, a dye-house, and a wool-stapler's. I am not sure, but I believe Castle-street and another street connect on drain into it. The back of the street leading to the railway station drains into a branch of it that goes under River-street, and nearly if not all, the houses bordering the leats have privies disgorging their contents into it. I saw that from the public walk called the Leats. But if properly kept, those streams are beyond value; if they were well kept, I should not have seen *excreta* rolling down the gutter in Duke-street, and a housemaid emptying her slop-pail into it near King-street. Why, however, should those streets I have named as particularly bad have open guttering? Good guttering is wanted there; at least, as much as in the main streets: it was that of which I spoke.

I was not told there were in every direction in the lower parts of the town brick-built tanks holding many hundred gallons (is hundred a misprint for thousands?). May I ask where they are, and their exact cubical contents? And if they are only in the lower parts of the town, may I ask, of what service they are to the higher portions of the town for either flushing or in case of fire? And have the upper portions of the town anything in the world to depend on in case of fire, but the pumps so sparsely scattered about? And what flushes the sewerage in the higher portions of the town? I mean that portion the more respectably inhabited, as well as that particularly occupied by workmen. What have those streets I have named to depend on for flushing or in case of fire?

I wrote of the pitching of the streets, not the pavement: it is in a state only to be recommended by coach-builders.

If Truro has a low death-rate, of which I am not aware, it may be ascribed to the position of the town in and on the sides of a valley, a position that man with all his inanity cannot entirely spoil. If the present health of the town is good, it must be ascribed to God's mercy, not to the efforts put forth by the authorities of the town.

As to Falmouth,—is it true, or is it not, that Falmouth was recently, on the solicitation of some of the inhabitants, visited by a Government inspector (I believe, Mr. Rawlinson)? Is it true that, in consequence of his representations, Mr. Bush was employed to give plans for the drainage of the district? And is it true that, while the town authorities were haggling with the parish authorities of Falmouth and Budeock, Mr. Bush died? and but little more has been said of the matter since, except to grumble at Mr. Bush's bill? Pro.

Utilisation of Blast-Furnace Slag.—The following method is now adopted in several iron-works in Belgium:—The slag is allowed to run direct from the furnace, into pits about 8 ft. or 9 ft. in diameter at the top, with sides sloping inwards towards the centre, where they are about 3 ft. deep. The mass is left for eight or nine days to cool, when a hard, compact, crystalline stone is obtained, which is quarried and used for building purposes, but chiefly for paving-stones. They appear to wear exceedingly well, being quite equal to the grits and sandstones already so much used.

POUNDS.

Sir,—As you have given space to Mr. Topper's lament over impounded cattle, it may be as well to comfort your readers by the information that pounds are fast going out of use and being removed. As owner of a manor and a pound, I took some trouble lately to find out why cattle never were impounded now as they used to be in my father's day. I found, that in consequence of Highway Acts passed since his time, the police took it on themselves to manage straying cattle, and did not allow my "parish Pinder" to interfere. The pound has had no inmates for at least a dozen years, and therefore I shall *certainly not* erect a comfortable cat-hed-shed therein. What a pity so much amiable sentiment should have come into the world too late. Even when pounds were in their glory cattle rarely remained many hours unclaimed.

A LORD OF THE MANOR.

*** The following letter from the *Bedford Times* (to give no other proofs), shows that "A Lord of the Manor" is still ill-informed on the subject of which he writes:—

"In your last issue I saw a paragraph from the *Builder*, in which Mr. Martin F. Tupper appeals on behalf of the unfortunate animals that are so often starved in pounds for want of forage and water. A few days ago I saw a curious illustration reported from Newport Pagnell. The writer says:—"It is a small stone-walled enclosure, the bottom well lined with bricks and glass, the upper part of the wall studded with broken glass bottles deeply embedded in mortar. Three horses were confined in this place of torture; two were speedily liberated from their cruel bondage; the other, a very valuable horse, was allowed to remain, and was constantly plunging and lacerating its chest against the glass, disfiguring and maiming itself for life, while the inquisitor, policeman, stood guarding his poor captive. If this be the kindness shown to dumb animals by our vigilant police, surely the tender mercies of the wicked are cruel."*

ALNWICK CASTLE: ITS MILITARY ARCHITECTURE.

The castle of Alnwick stands upon a moderate eminence on the south bank of, and about 150 yards distant from, the river Alne, which was thus its immediate defence against the Scot. It is in distance about five miles from, and about 200 ft. above, the sea at Alnmouth. Towards the east and south the castle is cut off from the town of Alnwick by a deep ravine or combe, once the bed of the Bow Burn. This has been trimmed and scarped by art, and its upper part towards the town has been nearly obliterated by modern front of the castle, and separated from it by upfilling.

To the west is a nearly level platform in a ditch, wholly artificial, and in part filled up and covered by the stables and other similar buildings. This ditch was formerly produced along the south front, and communicated with the Bow Burn ravine. A bank of earth of modern date conceals the town from the castle on this the south-western quarter.

The walls of Alnwick town were embattled, and probably built under a licence to Henry Percy in 1434, when he constructed the Bond Gate, now standing. It is uncertain whether the town wall was independent of the castle, as at Okeston, or abutted against its outer wall, as at Carlisle. The main entrance to the castle and its principal postern were both outside the town. The former was approached from it by a town gate, the position of which is remembered, and its name preserved, in the way called "Narrow Gate." The castle postern opens towards the river. The Lion gateway in the south wall, leading to the town and the railway station, is altogether a modern structure, but may represent a by-gate communicating with the town.

In plan the castle is irregular, and many-sided, but on the whole it approaches to a right-angled triangle, the clock-tower being the right angle; the west and south sides, terminating, the one in the Abbot's Tower, and the other in the Eastern or Ravine Tower, are 125 yards and 213 yards long; and the side towards the river, and contained between these two towers, is 226 yards. The area within the walls is nearly 3 acres; that included by the ditch is reputed at nearly 7 acres.

There is no single keep-tower. The keep is in plan an irregular polygon, set round with clustered towers, and containing a central court. This is placed nearly in the middle of the general inclosure, with which it was connected at three points: one, on the south, by a hold and lofty gallery replacing an original curtain, and which

projects 35 yards from the keep to a gate-house, which divides the eastern and western wards, and is known as the Middle Gate. The other annexions, on the north side, are two curtain walls, of which one reached from the keep 33 yards to the Falconer's Tower, now rebuilt and shifted, and had upon it the Armerner's Tower, now destroyed; and the other was a curtain, now removed, which extended 20 yards from the keep to the Postern Tower.

By these arrangements the area was subdivided into an outer or western, an inner or eastern ward, and a central open keep. There remained, however, on the north front a three-sided space, bounded by the keep and the two curtains, and flanked by the Falconer's and Postern towers. This space, open towards the river, is at present protected on that side by a low retaining terrace-wall and bastions, of very modern date. A survey of 1567 shows this side open, and no doubt it was so originally; this river, its steep bank, the keep, and the flanking towers and curtains being regarded as a sufficient defence. This disposition is, however, singular and very curious, and looks as though the engineer wished to attract the enemy to this, the strongest and most completely flanked part, by a show of weakness by the absence of an outer *enceinte*. Economy of construction could not have been the motive, for the cross curtains, in length, would go some way towards completing the broken *enceinte*.

It would seem, from existing fragments and traces of foundations, that the lines of the present *enceinte* and keep are those of the old Norman fortress. The outline is governed very much by the disposition of the ground, and the shell keep was the approved Norman way of occupying such a knoll, whether natural, as at Darham, or artificial, as at Windsor, or as here, probably a very slight addition to a natural knoll. A distinct ditch, now filled up, as at Cardiff, encircled the keep, and protected it from its containing wards. Towards the river this ditch seems to have worked out into a steep scarp.

The keep is at this time an open court surrounded by towers. To the south-east, the gatehouse, about 40 ft. deep and 20 ft. wide, has a grand external and internal round-headed Norman arch, of 9 ft. 2 in. span, the vault between being segmental and crossed by plain chamfered ribs. The exterior arch has a double band of hold chevron mouldings within a circle of double-banded work. The inner arch has a single chevron band, and above it a band of which the voussours have alternate patterns of sunk nail-heads and the heraldic "lozenge." This is the work of Estace de Vesoi, who died 1157, and may be dated 1150, though possibly a part of this "manisissimum castellum," which, according to Mr. Tate, was existing in 1135. This Norman gateway is imbedded within a complete gatehouse of Henry de Percy in 1350, of which the main features are two lofty towers, which, as half octagons, flank the entrance from the eastern ward. Original shields of arms, in the Northumbrian fashion, are carved below the parapets; and upon the merlons, which are looped, are some original figures, as at Bothal and Chestow. The archway is porticulated. The parapets are not unshiculated. The vaulting of the interior of these towers is very good, and they contain in the basement the original dungeons, which are described as vaults 10 ft. square, aired by loops, while below these are oubliettes, 8 ft. by 9 ft., and reached only by trap-doors in the floor above. Over the gateway is the private dining-room.

Entering the court, the open part of which is about twenty-four yards across, on the right, in the wall, is the very curious well. Within a pointed panel are three deep recesses, also pointed, of which the centre contains the mouth of the well, the shaft of which descends in the thickness of the wall. A wooden axle crosses above it, and is fitted, in the lateral niches, with two wheels, set round with pegs, for winding up the water-buckets by hand. Above, within the panel, in a small niche, is a figure of St. James blessing the source. This curious and probably singular well was the work of the first Henry de Percy, in 1312-15; but the figure of the saint is thought to be an insertion of the last century. There is a similar arrangement over the great gate of Goderich Castle, for working the porticullis.

Behind the well is the rear wall of the Great Hall, built by the same Percy, refitted by the first duke, and rebuilt in 1863. The vaults below, with their segmental ribbing, are original, as is part of the rear and north wall and of the

bow, whence the cross curtain ran to the Postern Tower. This is still the state dining-room, 60 ft. by 24 ft., and the vaults fulfil their original destination as ocellars. At this point is placed a cloister supporting a corridor, by which a bye access is given to the suite of state-rooms. This is modern, but is a manifest improvement, and in full keeping with the building. The original entrance to the hall was six open steps from the court.

Next beyond the hall, pointing to the north-east, is a tower, once the kitchen and soullery, but rebuilt for the second time in 1856, and now the drawing-room, 45 ft. by 22 ft. Beyond this, along the north-east front, are the saloon, 42 ft. by 22 ft., and an ante-room, 22 ft. by 22 ft., built 1750-86, but newly fitted up. Next to these, and forming the north-west angle of the keep, is the Prudhoe Tower, the principal tower in the fortress, upon which the flag is hoisted. This contains the library, 55 ft. by 24 ft., and presents two grand bays to the east and west, with a deep re-entrating angle between them. This also is modern.

Next, on the west front, follows the chapel, built in 1856, a rectangular tower of bold projection, one principal floor, and a high-pitched roof. The two angles are cut off, so as to form a polygonal apex. This conventional east end points, however, south-west.

Then, facing to the south-west, follow two half-round towers, rebuilt 1750-86, containing state bedrooms, and connected by a short curtain, within which is a dressing-room. Finally, between these and the gatehouse, completing the circuit of the keep, and projecting due south, is the gallery, having on the first-floor a breadth of one line of five rooms and a corridor, and below, the middle gateway. The rooms are the private apartments of the duke and duchess, and there is a communication with the kitchens. The gateway, which has a porticulis, is of the date of 1309-15, and built into the south curtain, from the outside of which it projects as a mural tower. The gallery replaced a curtain about 1760, and was rebuilt 1856. The battlements of the gatehouse were probably added about 1407-55.

The entrance to the state apartments is in the central court, beneath the arched vestibule, at the north-west corner. From this a grand flight of steps ascends to an interior vestibule, and thence, by a second flight, to the guard-chamber, which opens into the state-rooms. These are all on the first floor, the basement being occupied by servants' rooms.

Although the greater part of the keep has been rebuilt in the last and the present century, it still is composed of the saxon towers of the early Percies, shown in the plan of 1567, and much, especially of the basement, is old; and what is new is arranged with a close general regard to the older, and, indeed, in many parts Norman, plan. The exterior ditch of the keep is partially filled up, and of course the draw-bridge of the inner gate has been removed. A porticulis remains.

Of the general and exterior *enceinte*, the most complete and striking portion is the western gateway, a very fine and unaltered example of a gate and barbican of the Edwardian period, 1312-15, in its simplest form. The barbican, about 55 ft. long by 32 ft. wide, is entered by a large round-headed arch, between a pair of square flanking buttresses, corbelled out above into two turrets, also square. Over the entrance in a sunk panel is a large Percy lion, with their motto, "Espérance." The arch leads into a passage, 55 ft. long by 10 ft. wide, for the first 20 ft. vaulted, but afterwards open to the sky. This lies between very lofty side walls, embayed to each way. On the left, a small side-door led to the counterscarp of the ditch; on the right, another door opens into a mural stair ascending to the battlements. In front is the portal of the gatehouse. This barbican crosses the ditch, now filled up. Besides an outer drawbridge, over a loop of the main ditch, it had an inner bridge between its lateral walls, dropping from the gatehouse. This is mentioned in the survey of 1538, and was filled up in 1567. The parapets are without machicolations, and the embrasures have no mouldings. The merlons are not looped, and the figures placed upon them date only from 1750-86. Probably in advance of the ditch of this barbican was a harrier or palisade of timber, and the level space in front, commanded by the walls of both town and castle, is what was usually employed for jousting matches or military duels. The adjacent river was a sufficient security against surprise.

The gatehouse, of which the barbican is the

covering, is a rectangle 40 ft. deep by 45 ft. broad, of slight projecting and bold external projection, and presenting to the field two half octagonal towers. The passage is vaulted, and has the usual defences of a porticulis and gates. The portals are round-headed. There are lateral lodges, entered one from the passage and one from the court.

Entering the court, the curtain on the left, of considerable height, has Norman foundations, 1150, and an Edwardian superstructure, 1350. Outside a strong course marks the base of the parapet, and the embrasures have a decorated moulding carried all round. The wall extends to the Abbot's Tower, but upon it is a small rectangular mural tower, called the Avenor's Tower, 1309-15. The Abbot's Tower, of the same date, caps the north-west angle. It is rectangular, and of three stages, the lowest being vaulted, and ribbed with segmental arches, as in the Constable's Tower, and below the Great Hall. The third stage rises clear of this wall, and is reached by a well stair, which occupies the north-east angle.

From this a short curtain of mixed date, 1150 and 1350, with a low salient, extends to the Falconer's Tower, also rectangular, rebuilt, though not exactly in the old site, in 1856, and from which a modern curtain wall runs up to the Prudhoe Tower of the keep. Upon this wall stood the Armerner's Tower, also rectangular, destroyed in 1856, to improve the view from the library. The removal of this and the Falconer's Tower are said to have been the only intentional subtractions made from the original military works of the castle.

Returning to the west gate, the curtain on its right extends, past the west Garst Tower, to the Clock Tower, all rebuilt 1750-86. The latter is circular, with a flat gorge and keel-shaped salient, and caps the south-west angle. Outside the last-named curtain, and reached through it by a gateway, are the stable courts, riding-school, and guest-hall, 135 ft. by 35 ft., by 25 ft. to the spring of the open timber roof, a very noble structure. These buildings are of modern date, 1856.

From the clock-tower the south curtain supports, on its outside, the estate offices. Part of this curtain is 1750-86; part 1309-15. This latter part includes the Auditor's Tower, 1770, of which the square rear projects into the court, and the half-round front outside. Beyond this is a bit of Norman curtain, 1150, against which, on the outside, is built the modern kitchen, and above which a modern corridor communicates between the duke's room and the record-room in the Auditor's Tower. The treatment of this part of the structure by Mr. Salvin deserves especial notice, from the happy combination of the features of the Edwardian age with the appliances of the present day. The kitchen, with much to remind the visitor of Darham and Avignon, is as a whole superior to either, and is, besides, a model of culinary arrangement. These offices, originally within the keep at the east end of the hall, were placed here by the first dukes, but were recast and rebuilt by Duke Algernon.

Formerly there stood in the west ward the exchequer and the stables. The exchequer was a large rectangular building, applied to the north limb of the west gatehouse, and like it embattled. The two ranges of stabling stood a little within and parallel to the curtains next the clock-tower. These buildings, shown in the survey of 1650, were removed probably about 1755.

Traversing the middle gate, in front is the eastern or inner ward, and on the left the inner or gatehouse of the keep. On the right, outside the curtain, is the steward's room, and beyond it the Warder's Tower, mentioned in 1567, but altogether remodelled and rebuilt in 1860 upon a work of 1770. It now contains the lion gateway, leading to the gardens. Below the gatehouse is an ale-cellar, and above, one side of it, attached to the offices, the confectionary.

Beyond the line of the curtain is irregular. About the salient it is Norman, 1150, and a very good example of the rough walling of the age. Upon it is the east garret, 1309-15, and it ends in the Ravine tower, the most eastern work of the castle, and capping an acute angle of the *enceinte*. This is a good-sized round tower, with a well stair at its junction with the curtain. It has been much repaired since its foundation in 1309-15. It is defended by the ravine, whence it derives its name.

From hence the curtain trends to the north-west, being in great part Norman, but repaired

at what is called the "Bloody Gap." Beyond this is a garret bartizan, called Hotspur's Chair. It was the gorge of a half-round tower, now removed, but shown in the plan of 1650. Beyond this the curtain is again mixed Norman and Decorated of 1312-15 to the Constable's Tower. This is a strong half-round tower, capping a flattish salient to the north-east. It has an exterior entrance by stairs to each of its three floors. From this a short curtain, 1150, leads to the Postern Tower, 1312-15, rectangular, pierced below by the vaulted and porticulated passage of the postern, and vaulted also on the first floor. This tower is a fine example of a Northumbrian military building of the Decorated period. The arches are round-headed or segmental, and it has in its rear wall a remarkable two-light window, with a transom, and in the head a foliated circle. There is also a very perfect garderobe with external shoot. From this tower, a curtain, now removed, ran upwards to the bow of the hall tower of the keep, and thus completed the defences of this ward. The original postern passage is filled up, or nearly so, with earth, but by the side of the tower a way leads to a terrace walk between the keep and the river, and extending to Falconer's Tower.

The eastern ward contained the castle chapel and the conduit, supplied with water by lead pipes from an exterior spring called Howling Well. The chapel, a considerable building, stood detached near the Bloody Gap, and was removed in 1755. The ecclesiastical establishment seems to have been on a respectable scale, and included chantry for the performance of the obits of the family. In this quarter also stood the brew, bake, and slaughter houses, for the use of the garrison.

Alnwick Castle is probably the finest extant example of a Norman castle of this type, having an open keep and a complete *enceinte*; for although most of the present buildings are either of the fourteenth or the nineteenth century, the plan is certainly Norman, and certain detached portions of the construction. It seems also that the keep was never a mere shell, like Cardiff or Arundel, but was always set about with towers and provided with a handsome gatehouse. A remarkable feature is the use of the round-headed and the segmental arch in the Decorated period. This is a local peculiarity, and found in other works of the same age and neighbourhood. The very free use of stone warriors upon the parapets, carried to an absurd extent in the repairs of the last century, is also remarkable. They are seen at Bothal, and in Edwardian works, both at Caermarvon and Chepstow, but by no means so freely distributed as here. They were obviously intended for ornament only, and of all the figures that of the eagle at Caermarvon is the most appropriate. No archer would or could have stood on the crest of the parapet. Most of the later figures were very properly removed by Mr. Salvin.

There is found upon the battlements of both walls and towers, in various parts of the castle, a convenient arrangement for slinging a movable wooden shutter in the embrasures, so as to defend the warders from a Scottish shaft, and from the scarcely less keen edge of the bleak winds of the Border. The shutter hung horizontally, like a port-lid, but from the trunnions, of which one rested in a round hole in one masonry, and the other in a similar hole, terminating in a groove in the other, so that the shutter hung freely, and could be lifted in and out if necessary. The arrangement is precisely that applied to the roller of a round towel. Traces of this arrangement remain in various parts of the castle. A perfect example is seen on the barbacan. It may also be seen on the east wall of Gederich.

The officers forming the staff of this castle, as a civil residence, in 1567, were the constable or governor; the porter of the outer gate; the greive, or executive officer, or halliff; the receiver, or auditor; the feodary, who looked up the services and tenures; the steward, learned in the law, who administered justice; the clerk of the courts, who engrossed the rolls and kept the records; and the foreign or outer bailiff, who collected the castle-guard and cornage money, and summoned the tenants and suitors. The annual payment to the whole was 53*l.* 18*s.*

Looking to the character of the country, so charged with traces of early military earthworks, and to the strong and well-defined natural position of Alnwick, it seems probable that it was occupied as a camp by some of the tribes who, from a very remote period, made this border their battlefield, and whose defences are

still visible in eleven distinct earthworks within a very short distance of the town. If so, they would necessarily have placed their defences to the north and east, upon the lines of the present castle. The interior eminence would certainly have been their citadel, and the trench, completing their scourity, would most conveniently have been carried along the general direction of the western front, so as to connect the head of the Bow Burn with the Alne, and thus complete the seclusion of the peninsula. Such a site, so defended, was not uncommonly constructed or adopted by the Northmen and Saxons when they became settled, and they would have placed the timber and palisaded mansion of their thane upon the central entrenched knoll.

Probably the Norman Gilbert Tysen, of cloudy memory, who is the reputed pioneer of the Conquest in these wild regions, found and contented himself with some early kind of timber fortress, for the earliest traces of masonry that remain *in situ* or have been extracted from the walls, though Norman, are of late character, and attributable to Eustace Fitzjohn, who married Beatrix, daughter and heir of Ivo de Vespi, who is thought to have married Tysen's daughter. Eustace, called De Vespi, flourished under Henry I. and Stephen, and died in 1157. He was a likely man to have constructed a great castle, being a baron of considerable power, sheriff of Northumberland, and founder of the abbey of Alnwick and, in Yorkshire, of Malton. Also he must have felt the want of a strong place, for, in his days, in 1135, Alnwick Castle was taken by David I., of Scotland, in the interest of the Empress Maud.

Eustace no doubt built, in the first half of the twelfth century, a polygonal clustered keep upon the knoll, gave it the gateway we still see, and placed his residence within. Traces of his walls are said by Mr. Tate to have been discovered when the last rebuilding was being executed. No doubt also he dug or cleared out the moat round the keep. To him also must be attributed the general wall of the *enceinte*, and possibly the ditch outside it; and this would have been strengthened by mural towers, many of which must have stood where their successors are now placed. De Vespi's work is indicated by the stones being mostly square blocks of moderate size, laid in courses, but in beds more or less wavy, as though the mason used neither line nor level. The joints are open. Beyond question De Vespi constructed a castle in keeping with his wealth, and worthy of the chief baron of the Border.

In July, 1174, William the Lion, on his way back from an invasion of Cumberland, found himself, to his surprise, before Alnwick. William, son of Eustace de Vespi, attacked him. He was unhorsed, captured, and sent into England, and beyond sea, to prison. Eustace, son of William, succeeded in 1190, and was visited by King John, 12th February, 1201, and 24th April, 1209, when the king received at the castle the homage of Alexander, king of Scotland. Four years later, May 14th, John, ordered Philip de Ulcote to demolish the castle of Alnwick—a mandate which could scarcely have been obeyed, seeing the king himself was there 28th January, 1213, and 11th January, 1216, no doubt unwelcome visits, for Eustace was a Magna Charta baron. He met his death from an arrow before Barnard Castle in the last year of King John. Henry III. visited Alnwick 23rd September, 1256, and Edward I. was the guest of John de Vespi there 30th April and 1st May, and 16th and 17th August, 1291, and 16th August and 13th and 18th December, 1292; and again 22nd, 23rd, 24th, 25th, 26th, and 27th September, 1296; and 26th and 29th June, 1298.

The Barons de Vespi became extinct in 1297, by the death of William, seventh Baron, when the castle and harony were acquired, it is said, to the fraudulent exclusion of the natural son, by Antony Beo, the warlike Bishop of Durham, by whom, in 1309, 3 Edward II., they were sold to Henry de Percy, the representative of a warlike family, whose advent forms an important era in the history of the Border. Percy, as the leader of the Northern barons, made Alnwick his residence, and although in possession only for five years, seems to have rebuilt much of the fabric, the rest being completed by his son of the same name.

The Percy Castle, laid out nearly upon the Norman lines, presented very nearly the appearance of the present structure. The authorship of the inner gatehouse is established by the escutcheon of Clifford on its walls, the second Henry de Percy having married a lady of that

house. To the first half of this fourteenth century may be attributed, as has already been pointed out in detail, nearly all the leading features of the castle, as it stood at the incoming of the first Duke. The Percies, though they maintained the reputation of Alnwick as the great Border fortress during nearly four centuries, do not appear to have materially altered the fabric of the two earliest lords. They received here Edward II. in 1311 and 1332, and Edward III. in 1335, but the later earls were much at Petworth, and in Yorkshire; and upon the death of the 8th earl, in 1537, and the attainder of his brother, the family ceased to reside at Alnwick, and the castle was neglected. The Percy line ended in Elizabeth, daughter of Jocelyn, the 11th earl, who, 30th May, 1682, married Charles, Duke of Somerset. Of their children, two had issue, Algernon and Catherine, who married Sir Wm. Wyndham, and eventually conveyed to that family the Percy estates at Petworth, Egremont, and Leonfield.

Algernon Seymour, Duke of Somerset, and by creation Earl of Northumberland, left one child, Elizabeth Seymour, who inherited Alnwick, and married Sir Hugh Smithson, created Duke of Northumberland, and ancestor of the present family.

A survey of Alnwick in 1567 shows the decay then to have been very considerable, and as the Seymour lords preferred their paternal residence, Alnwick became almost a ruin. From this it was redeemed by the first Duke, who, under the advice of Adam, restored, and in part rebuilt the keep; and although he fitted up the interior with plaster and frippery, made the exterior sound and good, and, on the whole, in keeping with the character of the place, and with what remained of the ancient buildings.

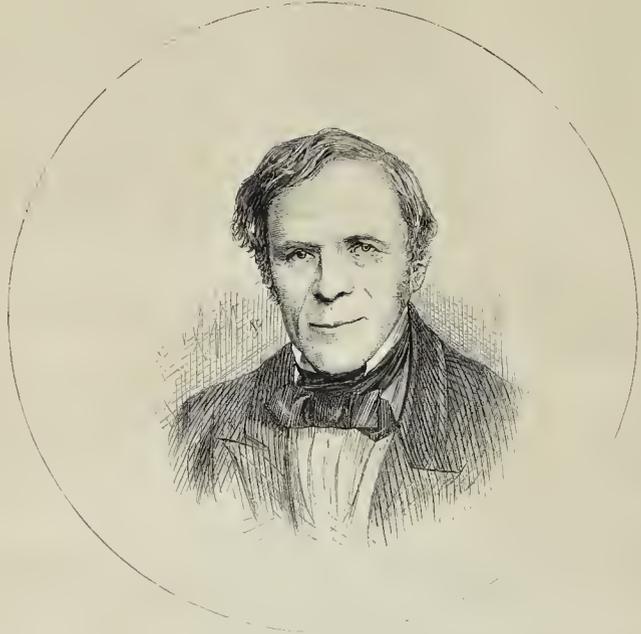

Matters so remained until the accession of Duke Algernon, better known as Lord Prudhoe, a naval officer, and a good man of business, who had travelled much, and possessed a cultivated taste, and was of a truly noble and magnificent disposition. While foremost in works of public usefulness connected with his estates, county, and profession, and careful to drain his lands, rebuild the cottages of his labourers, restore the local churches, and provide life-boats for his dangerous coast, he, under the sound advice of Mr. Salvin, almost rebuilt the castle, preserving with scrupulous care all that admitted of preservation, and adapting his new work to the period of the first and second Percy, the founders of the later castle. Having thus restored the great fortress of the Border, with strict regard to the rules of military architecture, he proceeded, under the advice of Canina, to fit up the interior in the style of an Italian palace. The contrast afforded is certainly extreme, and the attempt, on so costly a scale, was hardly; but the adaptation of the fittings to the irregular plan of the rooms is so well conceived, the materials employed are so rich, and the execution of the details is so skilful, that it is difficult to regard even so great an incongruity as other than a distinguished success.

Much attention has of late years been paid, and by very competent persons, to the history of this castle. Grose gives some particulars, now very valuable; but this and the castles of Warkworth and Prudhoe have been illustrated by the late Mr. Hartshorne, and are treated of also by him with great success in the Northumberland volume of the Archeological Institute. More recently Mr. Tate has handled the subject of Alnwick castle with both skill and accuracy, in his admirable history of the barony of Alnwick, now just completed. In the above sketch free use has, to some extent, been made of the above materials; but the object of the writer has been to treat solely of the fabric of the castle, and that from a military point of view.

MR. SYDNEY SMIRKE, R.A., F.S.A.

Architect of the New Galleries for the Royal Academy, Burlington House, London.

PLAN OF ALNWICK CASTLE.

STREET ARCHITECTURE, BRISTOL: SHOPS IN HIGH STREET.
MESSRS. PONTON & GOUGH, ARCHITECTS.

STREET ARCHITECTURE: BRISTOL.

SHOPS IN HIGH-STREET.

The amount of building that has been done in Bristol and Clifton within the last ten years is very surprising, as well in the shape of banks, insurance offices, hotels, and new shops in the city, as of countless detached and semi-detached residences in its beautiful suburb. Members of the Social Science Association now holding congress there, and whose knowledge of Bristol may be of early date, can scarcely fail to be impressed with the remarkable change apparent. Alterations, too, in the thoroughfares now about to be made, and of which our readers have heard, will still further alter and improve the aspect of the city. As a natural result, one that always follows public improvements, individuals go to work in the same direction, and endeavour to improve their separate holdings. The two shop-fronts in High-street, of which we give a view in our present Number, afford instances of the extent to which the desire to ornament is carried. These were designed by Messrs. Ponton & Gough. The intention of the architects was to show the constructional means used for the support of the building above the shops, and to introduce as little masonry as possible, before the windows of the upper rooms.

The rooms above the shop are about 24 ft. in depth from the façade, and notwithstanding the deep recessing of the glass line, ample light is admitted. The front is of Bath stone, with shafts, bonds, and voussours of red Mansfield and yellow magnesian limestone; sulphur inlay of various colours being introduced between the hoods on the lower story.

The window-heads on the first floor include a series of inscribed heads of ancient healers, which, like the rest of the carving, are very well executed. The parapet, with its range of sitting lions and shields, is the least satisfactory part of the composition.

OXIDATION OF IRON IN BUILDINGS.

The question of the mode in which iron suffers from oxidation, when included in masonry, appears likely to attract fresh attention. It is a subject on which those persons who are familiar with the repairs, or even with the demolition of old buildings, are not altogether without experience. But especial value attaches to the discoveries made on the recent occasion of the examination and repair of the tomb of King Henry VII., in Westminster Abbey, from the fact that both the date of erection, and the subsequent history of the monument, are so distinctly ascertained.

After the cleansing of the statue of the Countess of Richmond, to which so much public attention was directed in last May, the ornators of the tomb proceeded to examine the central monument of the Abbey, that of King Henry VII. and his queen, standing, as is well known, in the chapel founded by that sovereign, under the protection of a richly-wrought grille.

Not only did the effigies appear to be coated and partially corroded in consequence of long neglect, but the altar-tomb itself gave symptoms of dilapidation and decay. Joints yawned, and cracks menaced, and the general appearance was such as is often produced, in similar structures, by subsidence of the foundations. The effigies were therefore carefully removed, and carried into the Eastern apse, or smaller chapel, where they were cleaned, and that with great science. The altar-tomb itself was reverently taken to pieces, with a view to its replacement in its original integrity. It soon appeared that no subsidence had occurred. On the contrary, the tomb had been built on the finished pavement of the chapel, and the portion of this pavement which had thus been protected from wear was in a condition of great and original splendour, being enriched with a diapered pattern, partly polished, and partly pounced or frosted.

The actual cause of the dilapidation of the tomb then appeared. It was nothing but the oxidation of the only pieces of iron which had been employed by the builders. All the fittings were of copper, with one exception. At each corner of the tomb, as many of our readers will remember, sits a boy angel, in gilded copper. To keep these figures in their place copper bolts were employed, which passed through the upper portion of the ornamental work, and were secured by attachment to four plates of iron, which were built into the tomb itself, under the slab on which the effigies rested. These four

iron plates, notwithstanding their protection, first by the work of the tomb itself, and secondly by the building which sheltered the tomb from the chief vicissitudes of atmospheric temperature, had developed, on either side of each, solid plates of rust, of from three to four times the thickness of the original iron. The slow formation of this oxide had acted as an irresistible wedge, riving the fabric asunder, and threatening in course of time the entire overthrow of this noble monument.

Specimens of these plates of oxide, as well as one of the original iron plates, were exhibited at the meeting of the Royal Archaeological Institute, on the 2nd of July last. The dangerous metal has now been replaced by plates of copper; and the tomb has been restored to its original beauty. But the lesson as to the conduct of iron when included in masonry or in mortar, even under circumstances which might be presumed to be more than ordinarily favourable, is not one of which any prudent architect or engineer will lose sight.

THE POPULATION OF LONDON.

ACCORDING to the census of 1861, the population of London (which was 2,803,034), was nearly equal to all the towns and cities of Great Britain, containing more than 100,000 inhabitants (fifteen in all), as is shown by the following table:—

	Population.
Birmingham	286,076
Bradford	106,218
Bristol	154,093
Leeds	207,165
Liverpool	448,068
Manchester	338,722
Newcastle-on-Tyne	108,108
Salford	102,449
Sheffield	158,472
Stoke-upon-Trent	101,207
Edinburg	168,121
Glasgow	394,834
Dublin	285,904
Belfast	119,718
Total	3,428,815

The entire population of Scotland was but 3,062,964.

The remark of a celebrated Frenchman was very apt:—" *London n'est plus une ville: c'est une province couverte de maisons*." for it contains as many people as the three largest capitals in Europe together, viz.,—Paris, Constantinople, and St. Petersburg, and more inhabitants than either of the kingdoms of Denmark, Saxony, Hanover, or Norway. J. B. W.

A WORKMAN ON THE TRADE-UNIONS CONGRESS.

SIR,—An unprejudiced reader of the report of the late trade-unions congress could not but notice how entirely the delegates were disinterested from the outside world. They moved and passed resolutions which, if put into practice, would affect the whole community, and yet forgot that the public lived outside their meeting-place, and whose interests were, as a rule, opposed to their conclusions; in fact, the delegates appeared to be in the position of the man who had a memory so bad that he could not leave his home for a short distance without forgetting who he was and where he resided. It is evident that as soon as the delegates separated they would have different interests, as each one represented a different trade; and for the supply of their daily wants they would, as a natural course, buy in the cheapest and best market that which their families required for their daily consumption.

The question of a reduction of the hours of labour received great prominence, and is one of the cherished ideas of the leading unionists. The subject, like many others, looks well on paper. I suppose there are not many workmen who would object to work eight hours per day instead of ten, and therefore to the superficialist and unthinking it is an captivating scheme, more so as the leaders try to persuade the workmen they are doing a charitable action by relieving their fellow workmen's burden and creating employment for them at others' expense. The authors of the papers were not so selfish as some people would suppose, and had no wish to do all the great work by themselves, as they appeal to employers "to abolish the present system of competition, as it is fraught with the most disastrous consequences to society." It seems the congress would fashion society after some plan of their own, and so regulate trade and manufactures as to equally divide what they thought was sufficient

among employers, and limit production so that everybody should have a little of the results of labour; only it must be a very little, as it would entail a little exertion and labour upon the labourers, and under the new plan, that could not be thought of.

In the socialist agitation, the founder of the rational or new system of sociology established Harmony Hall and Harmony Farm. All the approaches to it were laid with rare wisdom. The roads and paths were excellent, and of great beauty. Nevertheless, the delegates who met at Harmony were not harmonious. The result of so much wisdom was defaced, as the delegates could not agree to proportions. And I am afraid, that when the trade-unionist scheme is fully developed, and the scales are evenly balanced, the rank and file will not agree to proportions, as the talkers would, of course, want more than the producers; and, like the national workshops in France, and Harmony Hall in England, the schemes will fall because in theory and on paper they look sweetly pretty, but in practice they are entirely wanting.

It is said there never was a time in the history of this country when trade was more depressed, or employment more slack. And one of the rare gems of the congress was the proposal of the delegates to raise the price of labour 20 per cent., without inquiry as to what its effect would be upon the income of the country. In examining the report of the census for 1861, I find there were 177,969 carpenters and joiners in England and Wales. Professor L. Levi, in his estimate of the income of the working classes, states the average income of the workmen is 22s. 6d. per week. The average income of carpenters and joiners would amount to at least 26s. or 27s. per week. For the sake of enumeration, 5jd. per hour, may be taken as not an excessive estimate, and ten hours per week as the reduction of working time for each man. This would raise the price of joiners' work, 2,004,793l. 5s. per annum. And, further, there are 287,485 mechanics in other branches of the building trade, and, at the same rate of wages as the carpenters receive, it would add for operatives' wages alone 5,528,367l. 11s. for the cost of building in England. The labourers, of whom there are a large number, although not specially stated in the report, would add at least another million; and when employers' profits on the extra capital are accounted for, with the increased cost of material, it would add not far short of nine millions per year to the present cost of building operations. What the building trade had done others would imitate; and a rise of 2s. per week in the rate of remuneration would add 37,200,000l. per annum to the cost of production, and would give the finishing stroke to the prosperity and industry of England.

The trades' delegates seem to have learnt nothing from the experience of the past; they want to take society back to a period when it was the rule to fix and regulate by law the hours of labour and the rate of wages. It is related in the history of industry that guilds and corporations proved the ruin of trades in the corporate towns; "and industry took refuge in the then obscure hamlets of Manchester, Birmingham, Sheffield, and other unprivileged places." The moral of which it would be well for the bulk of workmen to understand; and, I am sure, if they did they would to a man repudiate the false and pernicious blindness of the leaders of trade-unionists. Supposing the reduction of the hours of labour could be carried to a successful issue, and that the moderate computation of 57,000,000l. were added to the yearly cost of production, and trade-unionists met at the Crystal Palace to raise a song of triumph for their victory, their success in the end would prove more lamentable than a defeat, as they could not force the foreigners who buy our goods to receive them at the enhanced price, nor could they force the public of this country to find them employment. Some trades have already found to their cost that there is no royal road to employment. The engineers and ironworkers, for instance, have seen their accumulated fund yearly wasting, in spite of the extra levies and contributions; and they live in hopes that something may turn up to revive a failing trade. The self-made leaders of the working classes at Birmingham complained about the employers wishing to grow rich in a few years. But they ought to have known that in trades which are continually agitated by strikes, and where the employer is not certain for a month at a time that his business will not be disturbed by a strike, he is desirous of making the most profit

in a short time. And if the strike for the reduction of the hours of labour be successful in several towns, it is the inauguration of a general agitation, and will in the end result in the total removal of many industries from this country.

Working men have for a long time been pursuing a suicidal policy, as they have acted as if capital were a patient that would bear continual bleeding, and no wound so deep that it would not heal; and before the patient was recovered, the knife was again in preparation to inflict another sore deeper than the one before. Trade-unionist leaders, with their peculiar political economy, are, it appears, still ignorant of the real cause of the higher remuneration of English artisans. It is not because England possesses more gold than other nations, but that she has hitherto possessed greater powers of production, in the excellence of her machinery and tools, and labour has been more energetic and more skilfully applied than in any other country. The statistical abstract for the United Kingdom shows that this superiority is yearly diminishing, and continual agitation is hastening it on. I intended to review the question of limiting apprentices, but must leave that and other points for another letter.

JACK PLANE.

THE BUILDING TRADE AT SCARBOROUGH.

LIKE many other places which furnish a home for those in pursuit of pleasure and health, Scarborough, there can be no doubt, has been overbuilt, and as a result the building trade is not at the present time in a very flourishing state. There can, however, be no disputing the fact that the builder and the architect have left some good marks of their handy work in times past, as well as at no very distant period. We need only mention the erections at New Scarborough, the Cliffe Hotel, with its 300 bedrooms, thirty private sitting-rooms, together with all the other necessary rooms and conveniences, or point to the bridge, which is 41.4 ft. in length, and 75 ft. in height, to call to remembrance a few of the works which have been completed in the town. At the present time there does not, however, seem to be much doing in the building trade. A few new erections are rising up, amongst which is a structure that has been built on an eminence overlooking the north sands, which will henceforth be known by the name of Cromwell House. The builders have been Mr. Harrison, of Scarborough, and Mr. Grey, of York. The structure, which has a flat roof, is of brick, and has a pleasant appearance. Another erection, similar to the one just named, but not in the same style, is in the course of erection in the same locality.

AMSTERDAM EXHIBITION.

ACCORDING to Mr. P. L. Simmonds, the British Commissioner at Amsterdam, out of 210 British exhibitors 150 have received rewards, including 15 diplomas of honour, 10 gold medals, 36 silver medals, 23 bronze medals, and 12 honourable mentions. Besides these, exhibitors not coming properly within the scope of the Exhibition (owing to their goods being of a different or expensive character, and therefore not strictly suited to the working classes), received 17 diplomas of excellence and 3 extraordinary mentions. The list includes,—

Class I.—Houses and Fittings, &c.

D. Anderson & Sons, Belfast—Roofing felt—Honourable mention.
Engert & Rolf, London—Asphalted roofing felt—Bronze medal.
T. H. Phillips, London—Gas cooking-stove—Bronze medal.
Partridge & Co., Birmingham—Gas brackets—Bronze medal.
Jas. Harding, London—Roofing felt—Silver medal.
Doulton & Co., London—Drain-pipes—Mention extraordinary.
Galliehan & Co., London—Drain-pipes—Mention extraordinary.
W. S. Adams & Co., London—Cooking-stove—Mention extraordinary.
Walker & Slingman, London—Washing boiler—Honourable mention.
C. J. Philp, Birmingham—Chandeliers—Silver medal.
Moule's Patent Earth Closet Co., London—Earth closets—Bronze medal.

J. E. Watson, Newcastle—Plans of workmen's dwellings—Bronze medal.
J. Cliff & Son, Wortley, near Leeds—Drain-pipes—Diplome d'excellence.
Daley & Co., Northampton—Kitchener—Mention extraordinaire.
G. Glover & Co., London—Gasmeters—Diplome d'excellence.
W. Blews & Sons, Birmingham—Gasfittings—Diplome d'excellence.
John Brogden & Sons, Bridgend, Glamorgan—Iron—Gold medal.
Maw & Co., Brossely—Mosaic tiles—Diplome d'excellence.
Society for Improving the Condition of the Labouring Classes, London—Drawings of cottages—Diplome d'honneur.
Central Cottage Improvement Society, London—Drawings of cottages—Diplome d'honneur.

Class VII.—Societies, &c., for Promoting the Well-being of the Working Classes.

Henry Briggs, Son, & Co., Whitwood—Gold medal.
Postmaster-General, London—Diplome d'honneur.
Central Co-operative Society, Rochdale—Diplome d'honneur.
Society of Equitable Pioneers, Rochdale—Diplome d'honneur.
Thomas Twining, Twickenham, London—Diplome d'honneur.
Working Men's Club and Institute, London—Gold medal.
Working Men's College, London—Gold medal.
Working Women's College, London—Gold medal.
Rochdale Co-operative Corn-mills Society—Bronze medal.
J. Bracciant, London—Bronze medal.
Gustav Meinhardt, Birmingham—Bronze medal.

UNITED PRESBYTERIAN CHURCH, DALKEITH.

THIS church was the subject of a limited competition, when the design of Mr. R. Thornton Shiells was chosen by the Committee.

Accommodation is provided for a congregation of 700. There is a gallery at one end of the church opposite the pulpit, and in the rear is placed a session-house and vestry, the former of which serves also as a Sabbath school. The interior is fitted up with deal benches, and has an open timber roof. The pulpit is in the form of a platform of deal stained and varnished, and the whole of the fittings are of a plain and unassuming nature.

The cost of the building, exclusive of the spire (135 ft. in height), is about 3,000*l.*; but it is expected that funds will be forthcoming to complete the design, as the building occupies a prominent site in the town which already possesses two fine spires.

RAILWAY MATTERS.

TRAINS are often placed in situations of danger where the break-power at the command of the guard and driver is insufficient to meet the emergency. It is obvious that the difficulty would be overcome if the break-power could be applied equally to every carriage composing the train. This, Mr. John Clark, of the firm of Messrs. Wilken & Clark, of London, is said to have succeeded in accomplishing. He has invented an apparatus by which a continuous break, self-applied, is attached to every carriage of the train, so that in case of any portion of the train breaking away on an incline, the break is at once brought into operation by the accident alone, and the carriages brought to a standstill. This power is obtained by passing a small chain from the break-van beneath the bottom of the carriages the whole length of the train, and this chain is attached to the breaks. While the train is running the chain is kept tight by the guard. To apply the break throughout the train all that is necessary is to slacken the chain; and the same result follows if an accident should snap the chain at any part, independently of any action on the part of those in charge. When the break is applied no jolt follows, and, unlike most other breaks, the power of this new apparatus increases from the moment it is applied. A train of Midland carriages has been fitted up by the inventor with his apparatus, and an experimental trip was made a few days ago on a heavy portion of the line near Buxton. Amongst other measures resorted to for testing

the value of the invention, the driver was ordered to run down hill at full speed, and, after attaining a speed of 55 miles per hour, he slipped the coupling and left the train uncontrolled by the engine. The snapping of the connecting chain at once applied the break, and we understand with such success that in 27 seconds the train was brought to a standstill after running 330 yards. The maximum power of the break was also tested on a similar descent. The engine set off at full speed, with all steam on, when the break being applied, engine and train were brought to a standstill in 1,000 yards. The trials are said to have given satisfaction to the officials of the company, who were present to watch them. This experimental train has been running between Leeds and Bradford, and is so completely under control that the loss of time by stoppages at stations has been materially lessened. The Leeds Mercury is of opinion that still more satisfactory results would be attained if the break power were placed in the hands of the driver, so that he could time its application with the shutting off of the steam when about to stop.

LONG-LANE, WEST SMITHFIELD.

MORE than 100 silver coins, consisting of crowns, half-crowns, and shillings, of Elizabeth, James I., Charles I., and Charles II., were found in an earthen pot, on Monday last, in excavating for the new houses about to be built for Mr. Hayne, on the north side of this street. The coins were quite black, and had been burnt, probably in the Great Fire of 1666, which consumed the old Griffin Inn, then standing on this spot, portions of whose foundation walls, consisting of the peculiar thin red-bricks in use three and four centuries ago, have been exposed. The pot containing the coins was found amid the ancient foundations referred to. The frontage of the new houses will be set back 12 ft., so as to be in line with the south front of the New Meat Market. Long-lane will thus be widened; the City Corporation having determined, by taking advantage of the rebuilding of the houses, to begin this much called-for improvement.

SCARLET FEVER.

THERE appears to be a complete epidemic of scarlet fever, not only over all the metropolises, but throughout the country. As regards London, it has more especially prevailed in Brompton, Whitechapel, and the Holborn district. In the week ending 25th ult., there were 191 deaths from the fever in the metropolis, which implies a great deal more illness. The Registrar-General says it is "more fatal than ever;" the weekly deaths had been 170, 179, 178, and 191. Doubtless the dryness of great part of the summer, and the consequent deficiency in the natural process of washing away all sorts of filth and decomposing organic matter which rain effects, have tended to cause this fever to spread. It only behaves us, however, all the more strictly to aid nature in such a strain.

The medical officers attached to the various boards of works of the metropolis have, at several meetings which have been recently held, drawn attention to the alarming prevalence and spread of the fever. Particular attention was directed in the Holborn district, to its existence in Eagle-street, Red Lion-street, where several deaths had resulted from it. Mr. Hutchinson, one of the members, said more deaths had occurred in Eagle-street from scarlet and typhus fevers than in any other part of the district. He attributed this fact to the presence of effluvia which came from a slaughter-house in Yorkshire Grey-yard, as on one occasion when he visited the place he found 2 ft. of water and putrid matter, which came from the slaughter-house, extending from a gully into the yard. The smell was most offensive, and likely to breed any fever. The blood from the slaughter-house ran into the gully, instead of directly into the sewer, and it got congealed. He proposed that the occupant of the slaughter-house be forthwith required to drain directly into the sewer. The dunghill, also, which was in the yard, should be cleared away more frequently. The proposition was seconded by Mr. Padman, and Dr. Complin said the houses should be thoroughly washed with lime, and fumigated. Dr. Gibson thought carbolic acid would destroy the infection. Mr. Walker stated that scarlet fever was raging to a fearful extent throughout the metropolis. It behoved them to adopt all requi-

ente steps for the obviation of the spread of the disease as much as possible. Dr. Gibson reported that during the five weeks of the recess seventeen deaths were recorded from scarlet fever. The general mortality had been in excess of the average for the corresponding weeks of the past ten years.

The medical officer for Bermondsey reports eighteen deaths from scarlet fever during the fortnight ending September 11. On being asked in what particular part of the parish the fever prevailed, the medical officer said it was all over the country; and, in reply to other questions, said that nothing could be done by the vestry to prevent its spread. He gave advice to the persons who had families where the disease prevailed. The reason, in his opinion, the fever was so prevalent arose from the fact that parents would not take sufficient care to keep their children away from those who were affected.

EXTENSION OF THE NEWCASTLE WATER WORKS.

The first sod has been cut in connexion with a great new reservoir at Hallington, among the wild hills of South Northumberland, for the Newcastle and Gateshead Water Company. The proposed receptacle is intended to be used for the storing of the clear and pure water which ripples through the water-courses of the district, in order that, in seasons of great drought, the residents along the banks of the Tyne may have a pure reserve for the periods of their necessity. Mr. Bateman, the engineer, was instructed to search for a site for the new undertaking, and, as the company had for long been draining an area of 17,500 acres near Hallington by means of a large open aqueduct, a natural heath in the locality was ultimately chosen as possessing the greatest number of advantages. The reservoir, or the Hallington Lake as it is termed in the Act of Parliament, will cover 160 acres of land, and contain the enormous quantity of 630,000,000 gallons of water. This is 70,000,000 gallons more than the whole of the existing supply combined, and should be sufficient, even if the operations of the company are extended to Tynemouth, to meet all the legitimate requirements of the present and next generation.

The greatest length of ground to be submerged is about a mile and a half, and the only embankment required for confining the water in this space will be three in number. The principal or central embankment—through which the water will be drawn into the existing aqueduct—will constitute the most formidable obstacle in the way of the contractor, Mr. J. B. McGinire, of Manchester; but by means of a puddle trench or wall, and a good water-tight foundation, this experienced gentleman expects to surmount any difficulties that may arise from the marshy character of the land to be worked upon. The puddling wall will be 16 ft. wide at the bottom, tapering to 8 ft. at the surface, and will be supported by the bulk of the soil removed from the interior of the workings; while, as an additional precaution against the angry dashing of the waters in stormy weather, the interior slopes will be faced with an impenetrable coat of rubble pitching. The embankments contain altogether from 200,000 to 300,000 yards of earthwork, and these, as well as the interior, are intended to be ready for use in two years.

THE ENGINEERING TRADES OF MANCHESTER.

The inaugural meeting of the Engineering Employers, Foremen, and Draughtsmen's Society, for the session 1869-70, has been held at the Mechanics' Institution, David-street. Mr. William Mather occupied the chair, and there was a numerous attendance. Mr. J. Nasmyth said the society was formed in 1856. It then numbered forty-five members. Its object was to discuss scientific and practical questions connected with mechanical trades. The members had also to contribute monthly or quarterly subscriptions, which went to form a fund to aid members who, when their active period of life was past, needed such assistance. In 1858 the members had increased to fifty-four, and the society had steadily progressed since. The chairman in the course of his address said the Government had never made the slightest effort to provide institutions for the encouragement of trades, and for increasing the knowledge of

those engaged in them. Everything that had been done was attained through voluntary effort. The time had arrived when they must gravely consider their position. If Englishmen had accomplished so much under great disadvantages, what might they not accomplish by study and education and the aid of scientific knowledge? As an employer, deeply interested in keeping the trade of the country, he had not the slightest fear of the competition of foreign nations. They must regard themselves in the future more as citizens of the world. They ought to rejoice that other nations were advancing, and, instead of feeling discouraged, they should be urged by that circumstance to go on a little faster. He thought, as intelligent men, and enjoying a position in the engineering trade, which was happily free from the disputes that affected some other trades, they might exercise an influence which would bring about a better understanding between the interests of capital and labour. Mr. Hamilton Woods and Mr. R. Rawlinson afterwards addressed the meeting, the latter stating that the society now numbered 140 members, and that the money in hand amounted to 1,100*l*.

THE PUBLIC MORTUARY QUESTION.

The sanitary committee of the Clerkenwell vestry have reported to the vestry with reference to the state of the Clerkenwell mortuary, which has recently attracted much public attention, consequent upon the remarks of the deputy-coroner for Central Middlesex as to the want of ventilation in the building, and therefore danger of injury to the health of those whose business brings them into the place. It was also stated that the bodies of the dead could be plainly seen by the occupants of the houses opposite to the mortuary, and that therefore in front of the entrance a screen should be erected. The committee in their report state that the construction of the mortuary, which was built in 1866, had met the approval of the Government inspector, and that any faults found with it since had arisen from the fact that it was not kept in proper order.

The committee recommended that three air-bricks, with charcoal filters, be placed in the walls at each side of the mortuary; that a screen be put up outside the door; and that the surveyor be instructed to attend to the internal condition of the building.

The vestry has approved the report of the committee, and it is considered that its adoption will prevent the outrages to decency and danger to health heretofore observable at the Clerkenwell mortuary.

NEW BATHING ESTABLISHMENT AT FOLKESTONE.

The desirability of erecting a bathing establishment at Folkestone had been frequently mooted, but nothing was practically effected in the matter until Mr. Gardiner, a local architect, in conjunction with Mr. Harrison, of the firm of Brocksman & Harrison, took it in hand. Mr. Gardiner visited the principal bathing establishments in France prior to preparing the plans which he subsequently submitted, and which were ultimately adopted. It was suggested that a company should be formed, and a capital of 10,000*l*. raised in 100*l*. shares. This suggestion was acted on, and several of the leading residents of Folkestone, with Mr. Gambrill, the then mayor, at their head, formed themselves into a limited liability company, of which Mr. Gambrill became chairman. The plans prepared by Mr. Gardiner were approved of, and the contract for the erection of the building was taken by Mr. France for the engineering work, and by Messrs. Holdom & Powell for the building. The shares, with the exception of twenty-five, were at once taken in the locality, and have been paid up in full. The foundation-stone of the building was laid by the mayor, Mr. Gambrill, in September, 1868, in the presence of a number of gentlemen interested in the prosperity of the town. The visitors on the occasion included Baron M. de Rothschild, M.P.; the Lord Chief Baron (Sir Fitzroy Kelly); Dr. Alderson, president of the College of Physicians; and others. The building is now open to the public. It is in the Italian style, freely treated, and occupies a frontage of 117 ft. by a depth of 48 ft. On the lower tier is a large swimming and plunge bath, and also every description of medicated and "invalid" baths. The first-floor is devoted to a series of

warm and cold baths,—at one side for ladies, and the other for gentlemen. The baths are so constructed that the bather can indulge in sea or fresh water at pleasure. The upper tier has an entrance from the cliff, the house being built on the slope of the hill; and here are situated subscription and assembly rooms, reading, billiard, and refreshment rooms, which are reserved for subscribers to the baths. The assembly-room is frequently used as a hall-room. One of the features of the establishment is a spacious balcony running the entire breadth of the grand saloon, from which an extensive sea view is obtained.

NEW INFIRMARY FOR POPLAR AND STEPNEY.

An order was issued by the Poor Law Board a short time since, combining Poplar and Stepney Unions into a sick asylum district, with a view to the better classification of sick workhouse inmates. At the same time the Poor Law Board notified their intention to sanction the erection of an infirmary for the use and at the joint expense of the two unions.

The scheme was entered into with some spirit by the Guardians of the places concerned, and very soon a site was secured. It is situated at Bromley, Middlesex, adjoining on the Tilbury and Southend Railway. At the last meeting of the Board of Management tenders were opened for the erection, as follows:—

Hunt	£34,308	0	0
Sheffield	34,252	0	0
Kilby	33,755	0	0
Henshaw	33,545	0	0
Emor	33,142	0	0
Pearson	32,749	0	0
Perry & Co.	32,739	0	0
Webb & Son	31,200	0	0
Turner	30,900	0	0
Hill, Keddall, & Walsram	30,745	0	0
Nutt	30,103	0	0
Mann	29,532	0	0

Mr. Mann's tender was unanimously accepted. Messrs. Hareton & Harston, of East India Dock-road, Poplar, are the architects.

ERECTION OF NEW HOUSES: NOTICES TO SURVEYORS.

At a recent meeting of the Camberwell vestry, as reported in the *Clerkenwell News*, the local sewers committee reported that they had requested the inspectors of nuisances to make a weekly report of all new houses in course of erection, with the view of discovering whether proper notice has been given to the surveyor of the same.

Mr. E. D. Rogers said it was unfortunately the fact, that there were builders who forgot, in the midst of their business, to give notice to their surveyor of their intention to erect buildings; and, in consequence, he could not examine them and see that they were properly drained; but this was a matter of such great importance that it should be attended to.

ACCIDENTS.

Salford.—An accident of an alarming nature has occurred in a dwelling-house in Bow-street, off Arlington-street, Adelphi, Salford. The house is one of a kind known as single houses, consisting only of a ground-floor, with a large cellar underneath, and an upper apartment. The ground-floor had sixteen or seventeen persons assembled in it for the purpose of "waking" a dead body. The people had not been long in the house when the floor, which consisted of stone flags, supported by timber couplings, suddenly gave way and fell into the cellar underneath, a distance of at least 7 ft. or 8 ft. The corpse and the people assembled, with the furniture, were precipitated to the bottom of the cellar. A great portion of the furniture was destroyed, but, fortunately, no bodily injuries were sustained. It is stated that the accident occurred in consequence of the joists which supported the floor having been rotten, and many of the floors of the houses in the neighborhood are reported to be in a very dangerous condition from the same cause.

Peterchurch.—A terrific gale of wind recently made great havoc at the parish church of Peterchurch. This old Norman fabric has been under repair since October last, and the double chancel and apse have been restored. About a month ago the work at the nave was begun, and

the south wall having binfold, and being very much out of the perpendicular, it was necessary to take it down and rebuild it (one-half of this wall had been rebuilt), the roof stripped of its tiles being strongly shored up. This roof was a massive one, consisting of twenty-three continuous oaken rafters. The wind swept every one of these from the wall plates, and whirled them into a heap of ruin into the body of the church. Most providentially the accident occurred at a very early hour in the morning, before the men went to their work. The curious old font was encircled by the huge beams, but uninjured, and the new walling and windows also escaped; but the roof of the new heating vault was smashed in, and some scaffolding and ladders broken to pieces. The bishop immediately headed a list of subscriptions for the further restoration of this ancient and interesting church with 20*l.*, an example which it is to be hoped will be followed throughout the county. About 300*l.* more are required to complete the proposed restoration. Mr. P. E. Williams, of Westminster, is the architect, and the builders are Messrs. Lewis & Day, of Hereford.

Newcastle-upon-Tyne.—A frightful accident has happened at the North-Eastern Company's new goods station, in course of erection at the Forth Banks, Newcastle, by which a man was killed on the spot, and another received such injuries that his death ensued within half an hour afterwards. Two glaziers were at work in the station. They were engaged in putting glass into the roof of the building, and for that purpose were on a scaffold close to the roof. While so employed one of the planks composing the scaffold broke, and the unfortunate men were precipitated to the ground—a very considerable distance.

THE CLOCK THAT STRUCK THIRTEEN.

After reading my accustomed weekly periodical, about which I will not say anything, as words would be idle in praise of its excellent papers, I beg again to refer to the "Clock that struck Thirteen at Midnight."

Before the time of the present St. Paul's, and as long ago as the reign of Henry VII., there is on record a well-attested story of a young girl, who, going to confess, was importuned by the monk then on his turn there for the purpose of confession in the building; and, quickly escaping from him up the stairs of the Great Clock Tower, raised the clapper or hammer of the bell of the clock just as it had finished striking twelve, and, by means of the roof, eluded her assailant and got away.

On accusing him as soon as she reached her friends and home, she called attention to the fact of the clock having struck thirteen that time; and on those in the immediate neighborhood of the cathedral being asked if so unusual a thing had been heard, they said it was so.

This proved the story, and the ecclesiastic was degraded.
J. N.

METROPOLITAN BOARD OF WORKS.

PARK-LANE: DANGEROUS STRUCTURES: GAS FROM SEWAGE.

The first weekly meeting of the members of this Board after the summer recess was held on Friday in last week, at the offices, Spring-gardens. Sir John Thwaites, chairman of the Board, presided, and the members present were—Sir W. Tite, M.P., Messrs. Thompson, Collinson, P. Taylor, Savage, Richardson, Hall, Rogers, L. Breton, Runtz, S. Taylor, Biggott, Meaden, Freeman, Phillips, Nicholas, Hows, Fowler, Brooker, Barker, Brushfield, R. Taylor, Dalton, Legg, and Saunders.

Amongst other business which was transacted, the letter, of which we gave notice last week, from Mr. Dunster, stating that a lady, residing in the vicinity of Park-lane, was anxious to preserve Hamilton Gardens from encroachment, and was prepared, on the Board obtaining a repeal of the Act for opening up Hamilton-place, and obtaining an Act for the widening of Park-lane, by the removal of Gloucester House, to contribute the sum of 50,000*l.* towards such improvement, was read to the Board.

It was ordered that the clerk do write to Mr. Dunster, to say that the Board could not accede to the request of his client.

A report was read from the Building Act Committee, recommending that for the present the several district surveyors be requested to carry out the provisions of the Metropolitan Building (Dangerous Structures) Act, 1863, at the same scale of fees as already settled by the Board, and that it be referred to the Building Act Committee to consider and report as to any further arrangements which they may deem necessary for the proper carrying out of the provisions of this Act. Mr. Biggott moved the adoption of the report, and the motion was agreed to.

Sir John Thwaites alluded to a paragraph

which had appeared in several newspapers, to the effect that gas was being manufactured in India from sewage, and leading to the inference that the same results might be obtained from metropolitan sewage. The writer, as Sir John remarked, appeared to have ignored the fact that Indian sewage consisted principally of solid matter, whilst London sewage contained 94 or 95 per cent. of fluid matter, which would render the cost of extraction too heavy to be of any practical utility. At the same time, on the part of the Board, he wished to state that they would give every facility to persons who desired to experiment with a view of arriving at any results not hitherto attained.

CHURCH-BUILDING NEWS.

Walton.—The new parish church here has been consecrated. The church, which has been erected from the designs and plans furnished by Messrs. Paley & Anstis, is built of the red sandstone of the district. The style of the architecture of the new building is English Gothic, some portions of its details modelled upon the old priory at Lanercost, to which the living once belonged. At the north-west end there is a square tower, surmounted by pyramidal slate roof. In the tower is the entrance porch, its arched doorway being modelled upon Lanercost architecture. Passing through the porch (which occupies the whole area of the tower), and entering the body of the church, we find a nave about 45 ft. long by 22 ft. broad, with an aisle, divided from the nave by pointed arches resting upon piers; and at the east end is a large chancel, the entrance to which is spanned by another Gothic arch. The capital of one of the piers is composed of a plain moulding, relieved by a band of "dog-tooth;" and the capital of the other is a floral wreath. The chisel marks are left on the piers and the arch-stones. The aisle occupies the breadth of one side of the tower, and has a curved open timber roof. The roof of the rest of the building is also of open woodwork, but there is no varnish or polish upon any of the beams or timbers. The same remark applies to the seats throughout the church. The chancel fittings are of oak, and the sittings in the body of the church are of pitch-pine. There is a six-foil window with three lancet windows beneath it, at the west end; along the south side of the nave there are three single lancet windows, and one couplet with a quatrefoil above it; in the nave there are small lancet windows with inner arches, after the style of Lanercost Priory; and in the east end there is a triplet window filled with stained glass (by Mr. Wales, of Newcastle), and there are also side lights. The windows are all splayed, and the rough-hewn stone is shown, the joints only being chiselled. The walls are plastered. The history of the stained-glass window was this. The site of the old church not being sufficiently large for the new building, and there being no other way of enlarging it except by building over the family vault of the Walton House family, it was arranged that the graves of the Johnsons should be enclosed in the chancel of the new church, with brass tablets to mark them, and the east window was filled with stained glass as a family memorial. The pulpit is of wood, carved; the lectern is plain. The vestry is at the north-east, cut off by a wooden screen; and within the communion rails there are sedilia for the officiating minister. The mason work was done by Messrs. James Ferguson & Sons, of Great Orton; and Mr. Rutherford, of Brampton, did the carpenter's work. The cost has been about 2,000*l.*

Carmarthen.—The new church in Lammastreet, Carmarthen, has been consecrated by the Bishop of St. David's. The church is intended as a chapel of ease to St. David's. The new building was commenced in June, 1867, upon plans drawn up by Mr. R. K. Penson, of Ludlow, architect. The building work was tendered for, and the tender of Mr. D. M. Williams, of Carmarthen, was accepted, the amount of his contract being 3,028*l.*, the total cost 3,600*l.* The ceremony of laying the foundation stone was performed on the 3rd of September, 1867, by the Worshipful Master of the local Masonic Club. The architecture of the church is mixed, the Gothic, however, predominating. It consists of a nave, south aisle, north transept, chancel, and a tower over the chancel. The dimensions are:—nave, 78 ft. by 27 ft. 6 in.; south aisle, 78 ft. by 22 ft. 6 in.; chancel, 41 ft. 6 in. by 25 ft. The height to the top of the wall plate, is 22 ft., and to the ridge of the roof 43 ft. The tower is 34 ft. high, and

has a sharp pointed roof with ornamented iron crest, surmounted by three crosses. The chief material used is hammer-dressed local stone, with facings of Bath stone. The windows, nineteen in number, are filled with cathedral tinted glass. The roof is an open one, laid with ornamental slates, the inside being of pine, stained and varnished. All the fittings of the interior are of stained and varnished pine. The pews are open, without doors. The nave, aisle, and transept are laid with Broseley ornamental tiles, and the chancel with encaustic tiles. The gas-fittings will consist of brass corona round the columns. The number of sittings is 630. The ground around the church is to be laid out and planted; and when the funds permit the temporary wall now enclosing the ground will be dispersed by ornamental railings. The sum required for the whole work is 3,600*l.*, of which 3,000*l.* have been subscribed.

Books Received.

The "Transactions of the Manchester Statistical Society," 1868-69, just now published, include some interesting papers, especially one "On Vagrants and Tramps," by Mr. T. Barwick Baker. Mr. Baker thus sums up his remarks,—

"If, then, I am asked how to make vagrancy cease as a trade, I should say,—1st. Give sufficient food to all who apply; let there be no dirt, no bullying, nothing that can be alleged as a grievance. 2nd. Make it known to the public that such is the case, and beg them not to give. 3rd. Use the ticket system; not as a magical spell, but as a means of relieving from task work those who travel fairly in order, that you may finally enforce a harder task on such as are not travelling straight at their best pace. 4. Urge the transference of vagrants from the Poor Law and workhouse to the police and County rate, so as to get a thoroughly uniform action. 5th. Then build vagrant wards at the police stations, with separate rooms—I should rather prefer the Winesy plans to those at Oswestry, as less expensive. And 6th. When you have made the vagrant wards decent, with sufficient food, punish sharply all beggars."

—The *Illustrated Midland News*, published in Birmingham, has begun very fairly. The difficulty will be to preserve the characteristic on which it is founded, and to prevent it from becoming simply an imitation of the *London Illustrated News*.

Miscellanea.

Minerals and Metals.—There will shortly be published an account of the geological survey of Great Britain and the mineral statistics of the United Kingdom for 1868, which has been prepared by Mr. Robert Hunt, the keeper of the mining records. In a preliminary notice, signed by Sir Roderick Murchison, it is stated that there has been a falling-off in the quantity of coal produced, arising, doubtless, from the long-continued commercial depression, and in regard to the carriage of coal the tonnage has diminished. The production of ores from the British mines does not exhibit any material variation. The following is the quantity of minerals raised in 1868.—Coal, 103,141,157 tons; iron ore, 10,169,231; tin ore, 13,953; copper ore, 157,395; lead ore, 95,236; zinc ore, 12,781; iron pyrites (sulphur ores), 76,484; gold quartz, 1,191; arsenic, 3,300; gossans and ochres, 6,692; wolfram, 9; fluor spar, 60; manganese, 1,700; barytes, 14,235; coprolites, 37,500; salt, 1,513,840; clays, fine and fire, 1,012,479. The total value is 33,837,858*l.* The quantity of metals obtained from the ores enumerated is,—Iron (pig), 4,970,206 tons; tin, 9,300; copper, 9,817; lead, 71,017; zinc, 3,713; silver, 835,542 ounces; gold, 1,012. The money value is 15,736,416*l.*

The Canterbury Water Supply.—A report from Mr. S. C. Homersham, the engineer to the local waterworks, as to the new works at Wincheap, has been printed, together with the report of an analysis of the water by Mr. D. Campbell, analytical chemist to the Brompton Hospital. The water is got from the chalk hills at Wincheap, through a bore hole sunk for the purpose. It is hard when pumped up from the subterranean springs, but, subjected to the lime process of Mr. Clark, of Aberdeen, it becomes soft almost as rain-water, and is perfectly pure and free from organic taint. It is to be conducted through pipes in the ground to covered reservoirs, whence a constant supply will be given to the town without need for cisterns. The works are nearly completed.

Halfpenny Card Postage.—The authorities at the General Post-office have recently had brought under their notice a system of card postage, which has been tried, it is believed successfully, in Germany. At first sight, a penny-postage seems cheap enough, and the trouble of folding up a letter and putting it into an envelope may be looked upon as infinitesimal. But those who conduct large businesses can tell a very different tale. On the other hand, so far from decreasing the receipts from Post-office traffic, it would tend rather to increase them, while diminishing materially the bulk and weight of the mails. The system would be simply this:—Cards would be provided of a standard size by the Post-office, having, in one corner, as an integral part of the card, a triangular stamp. These cards would be sold by the Post-office in packets, just as stamped envelopes are sold now, at the rate of one halfpenny for each stamp. A trifling addition might be made to the charge, to meet the expense of providing the card itself; but probably this would be unnecessary. One side of these cards would be appropriated to the note or writing to be sent, and the other side to the address, and these cards would pass through the post-office and be delivered in the ordinary way.

Albert Park, Middlesbrough.—The fountain which has for some time past been in course of construction in the centre of this park is just completed, and arrangements are being made for its inauguration. It stands on the central plot of ground at the junction of the two main walks. The basin is 90 ft. in circumference, being enclosed in a circle of grey granite, and lined at the bottom in whitewash and cement. The foundation of the fountain is masked by large blocks of freestone, dispersed so as to give a natural effect. The fountain rises in four stages, including the single pinnacle at the top, so that the water will have four distinct falls into and from these intercepting shelves of increasing size into the basin below. These circular shelves are ornamented, especially the lower one, which shows a fringe of lilies resting on the leaves, all painted in imitation of nature. Four cranes and four swans in colours support the two upper shelves respectively. It is questionable whether such ornamentation will stand the weather, coupled with the effect of Tees water conveyed in iron pipes.

The New Workhouse, Westbury-on-Severn.—The guardians of this union, having for some time past found the accommodation afforded by their house wholly inadequate for the increasing population of the various parishes comprised within their district (which includes a portion of the Forest of Dean), lately determined to erect what in fact amounts to an entirely new workhouse. With this view they consulted Mr. Alfred W. Maberly, of Gloucester and London, architect, and his plans having been approved by the Poor-law Board, the contract was let to Messrs. James Coleman & Son, of Chaxhill, builders, who are proceeding rapidly with the work. The new buildings comprise a large dining-hall, with chapel over, ascended by staircases, day-rooms and dormitories for the aged and infirm and able-bodied of both sexes, and for boys and girls, with schoolrooms, lavatories, &c. Attached are work-rooms, wash-houses, laundries, sheds for out-door labour, with all other necessary rooms required in a building of the kind. The old workhouse will be converted into an infirmary, wards for infectious diseases, &c. It is expected that the new house will be ready for occupation during the coming year.

The Wolf Rock Lighthouse and the Storms.—The masonry of the lighthouse being complete, a staff of eight men were placed on the rock to fit up the doors, windows, and lantern. The door, as already noticed in our columns, is of brass, and weighs 13 cwt., yet it opens and shuts with ease, and fits so as to exclude every drop of water: the framework of the windows and of the lantern is proportionately strong and requires to be nicely fitted. On Wednesday, the 8th, the men were all well, and had an ample stock of provisions, enough to withstand a blockade of several weeks. On the 10th and 11th the sea rose, and soon broke clean over this exposed rock, so that the top of the lighthouse had to be securely battened over, and the door and windows closed. The eight men had to make themselves close prisoners. Gales and tremendous seas have since unavailingly assailed the lighthouse.

Fall of a House, Clifton.—On Monday morning last, soon after half-past seven o'clock, an accident of a very alarming character, attended by severe injuries to six workmen, occurred at the Queen's-road, Clifton. A series of dwelling-houses and shops, called the "Royal Promenade," are in course of erection between the points at present occupied by the Riffe Drill-hall and the Queen's Hotel. The disaster occurred by the sudden collapse and tumbling down of a considerable portion of the side wall of one of the unfinished houses nearest Clifton. The wall was of considerable thickness, and, falling outwards, buried six of the workmen who were on the spot. It is feared that one will not survive, and that probably another case will prove fatal. The workmen at the place assign the accident to two causes. According to some of them the wall had been raised too rapidly, portions being set upon other portions before there had been sufficient time for the parts to dry. Others considered that the mortar used was not sufficiently good.

Inauguration of Statues at St. George's Hall, Liverpool.—A statue of Lord Derby, executed in Carrara marble, by Mr. Theed, of London, has been publicly inaugurated in the large hall of St. George's Hall, Liverpool. The statue has been provided by the Liverpool corporation, at an expense of 1,000*l.*, in consideration of Lord Derby's gift to the town of the Derby Museum, his eminent qualities as a statesman, orator, and scholar, and his connexion with the county. The statue is of the heroic size, and has occupied the artist two years in its execution. It represents Lord Derby in the robes of a Knight of the Garter. On the same occasion there was also inaugurated the statue, in Carrara marble, by Fontana, of Mr. Joseph Mayer, of Liverpool, who is well known in the scientific world, and who recently bequeathed to the town his museum of historical art, valued at 60,000*l.*, and comprising the Fansett collection of Anglo-Saxon antiquities, the Palsky collection of ivory and other gems, and a large variety of Egyptian remains. This statue is also of the heroic size.

Machine-made Bricks.—Until the present time a rule has been in force, owing, we believe, to an understanding between the trade societies of bricklayers and brickmakers, by which none but hand-made bricks were admitted into Manchester. The prohibition also extended to bricks which had been manufactured beyond a certain distance from the city. The existing strike has been the means of inaugurating a new state of things. A company known as the Fairy-lane (Bury New-road) Brick Company has been established for the manufacture of machine-made bricks; and on Tuesday morning the master builders celebrated their triumph in this matter by a demonstration. A hundred carts, laden with bricks from Fairy-lane, and owned by different contractors now engaged upon works in the city, passed in procession to Albert Square, where they halted for a few minutes. They were afterwards taken to the various buildings on which they were to be employed. A considerable proportion of the bricks manufactured by the company will be used in the erection of the new Town-hall.—*Manchester Guardian.*

Opening of the York Institute Art Exhibition and Fancy Fair.—An art exhibition has been opened in the lecture-hall of the York Institute, with the view of popularizing the institute and clearing it from debt, as well as improving the taste of the working classes and the citizens generally. The exhibition, which it is proposed shall remain open for at least one month, comprises, in numerous sections, a collection of paintings by old masters and modern artists, water-colour drawings, engravings, chromolithographs and photographs, busts, statuary, articles of *verre*, literary and historical autographs, ancient costumes and armour, old china and earthenware, coins, metal and leather work, wood carvings and various models, artificial flowers, ornaments, stuffed birds and animals, scientific apparatus, geological specimens, &c.

Presentation.—Some difficult alterations having been completed at Thgmortons-chambers, the successful termination of the work was celebrated by a dinner, on which occasion the architect (Mr. C. N. McIntyre North) was presented by his client with a timepiece, as a mark of approval. The contractors were Messrs. Newman & Mann, of Peter's-hill; and Mr. Waller, of Fish-street-hill.

The Proposed Wet Dock at Whitehaven.—At a special meeting of Whitehaven Town and Harbour Trustees, Mr. Stiven, the harbour engineer, laid before the trustees a plan for the construction of a wet dock in the harbour of Whitehaven. The situation of the proposed dock is thus described in Mr. Stiven's report:—One of the dock walls will run parallel with Tangier-street. The length of this wall will be 570 ft. The wall at the west end of the dock will be 330 ft. long, and intersects the bulwark. The front wall across the north harbour will be 560 ft. in length, and 70 ft. in width. Through this wall, and adjoining the present north wall, will be placed the dock entrance-gate, 50 ft. in width. The wall at the east end of the dock will be 360 ft. long. The area of water space will be nearly four acres and a half. The meeting received the report, and resolved that it be printed and circulated, and that Mr. Stiven prepare an estimate of the cost and the probable time that would be required to carry out his plan.

An Arminian Church in England.—A religious service of a very unusual character was performed at Chorlton-on-Medlock on Friday week—the laying of the foundation stone of the first Arminian Church in England. The officiating priest wore a magnificent blue cope, richly trimmed with gold fringe. The foundation stones, sixteen in number, were blessed on the previous Sunday. Each stone is dedicated to one of the apostles and fathers of the Church, and has its special place assigned according to the Arminian rubric, in the foundations. During the ceremony the priest held in his hand a gold cross, and read from a richly-bound missal the psalms and other prayers arranged for the service. An acolyte carried the stones, which are about 2 in. long, in a bag, each one folded in a white linen cloth, with the saint's name inscribed upon it. Small holes were cut in the foundation to receive the stones, which were deposited at each corner.

Restoration of St. David's Cathedral.—The building committee held a meeting at Carmarthen a few days ago, the Lord Bishop in the chair, when a financial report was read. It appears that, including 10,000*l.* given by the Ecclesiastical Commissioners, about 21,000*l.* are available; and that about 18,000*l.* have been already spent. Mr. Gilbert Scott, the architect, reported upon the works already executed by Messrs. Wood & Sons, and made a rough estimate of what it would cost to repair and restore thoroughly the remaining portion of the interior, the roofs, and external walls—viz., about 11,000*l.* Mr. Scott is to report to a future meeting, and an appeal for further subscriptions is to be made.

Earthquakes in France and Elsewhere.—On September 11th, at 5.5 a.m., a violent shock of earthquake took place at Bagueres-de-Bigorre, spreading in the direction of Bourges, Luz, and Saint Sauveur. The noise was similar to the rolling of distant thunder, and was terminated by an explosion such as would be caused by the falling in of some cavern. At Bagueres several persons thought that their houses were falling down, and got out of bed to rush abroad. At Saint Sauveur, a lady passenger in the diligence between Luz and Bourges felt the ground undulate under her feet at the same time; the earthquake roll was, as usual, like a cart rolling over a paved street. There have also been earthquakes at the Isle of St. Thomas and in South America.

The Baronetries of Mr. Whitworth and Mr. Fairbairn.—It is stated that Mr. Whitworth and Mr. William Fairbairn have accepted the baronetcies which have been offered to them by Mr. Gladstone. Mr. Whitworth's name will, perhaps, be remembered more by the improvements which he has made in the construction of tools than by the rifle which bears his name; and Mr. Fairbairn's discoveries in metallurgy, adding, as they have done, to the material wealth of the country, abundantly entitle him to such honour as the Government has to bestow. Both of the new baronets have risen from the workman's bench.

Working Men's College.—The sixteenth session of this college will commence on Monday, October 25, when the principal, the Rev. F. D. Manrice, M.A., Professor of Moral Philosophy at Cambridge, will deliver the inaugural address. Six new class-rooms are now in course of erection, at an estimated cost of about 2,000*l.*; of this sum about 400*l.* are still required.

Banbury Church Plans.—The adjourned meeting, with the view of applying for a faculty to carry on the plans that had been submitted for a new chancel, was held last week, and as the proposers, very unwisely, as it seems to us, would make no concession whatever as to the seven steps up to the communion-table, the opposition shown continued to be so strong that the vicar and his friends withdrew the plans. All the opposition said was, do without two or three of the steps: surely a small concession to make. Salvation does not depend on such steps as these.

Lamplighting by Electricity.—Mr. Hart, an experienced electrician, has pronounced a scheme for lighting up all the street lamps in Edinburgh at once from an electric battery. The saving of gas alone, without taking the other savings on ladders and lamp-lighters into account, is said to show a figure beyond the expenses of the simple lighting power. The proposal to light lamps by electricity is not a new one, as old volumes of the *Builder* can testify.

Shoreditch New Town-hall.—The ventilating tubes of the sun-burners were placed so near to the woodwork, notwithstanding the provisions of the Building Act, that an accident was feared. The suggestions of several practical men have been taken on the matter, and the vestry resolved to accept the tender of Messrs. Stucle & Co., who undertake to construct additional shafts of ventilation and other improvements for the sum of 46l.

The Female Art Gallery.—A hazard is being got up for the sale of works of art executed by female artists, the proceeds of which will be devoted to the Female Art Gallery, in Great Russell-street, Bloomsbury-square. The hazard is to be opened for five days, and close on Christmas Eve. Those who desire to encourage female art can become subscribers to this gallery.

The Proposed New College at Rotherham.—We are glad (says the *Sheffield Independent*) to be able to announce that a site has at length been obtained for the College, which is intended to supersede the present one at Rotherham. The committee have succeeded in purchasing 5½ acres of land at Moorgate, near the residence of Mr. Jubb.

Preliminary Opening of the Suez Canal. M. de Lesseps, it is reported by telegram, has passed through the whole length of the Suez Canal in fifteen hours, by steamer, the barriers which obstructed the passage of the water into the Bitter Lakes having been removed.

Bequest for Chapels and Schools.—Mrs. Burton, who died recently at Roundhay, near Leeds, has left some large bequests for charitable purposes. The total amount of her benefactions exceeds 30,000l., of which 15,000l. are to be devoted to the erection of Wesleyan chapels and schools in Cumberland and Scotland.

The Expected High Tides.—Consequent on the report of the high tides expected next month large numbers of persons residing in houses on the banks of the Thames are taking measures to prevent the water entering their dwellings.

Great Fire in Bordeaux Harbour.—Between twenty and thirty large vessels have been destroyed by fire in Bordeaux harbour. The fire originated in a lighter loaded with petroleum.

TENDERS.

For building a warehouse, 23, St. Mary Axe, E.C. Mr. H. H. Collins, architect:—
 Abrahams £936 0 0
 Ebbs & Sons 788 0 0
 Sale 798 0 0
 Cohen (accepted) 760 0 0

For building warehouse, 29, St. Mary Axe. Mr. H. H. Collins, architect:—
 Abrahams £343 0 0
 Sale 605 0 0
 Ebbs & Son 602 0 0
 Cohen 511 0 0

For building stables, Stratford-mews, Oxford-street. Mr. H. H. Collins, architect:—
 Ebbs & Son (accepted) £435 0 0

For alterations and additions to stables, Wimpole-street, Cavendish-square. Mr. H. H. Collins, architect:—
 Ebbs & Son £345 0 0
 Cohen 320 0 0
 Sale (accepted) 297 0 0

For building Mortuary Hall, Lodge, and enclosing walls for Hebrew Congregation, Witton, Birmingham. Mr. H. H. Collins, architect. Quantities supplied by Messrs. Batstone & Hart:—
 Webb £3,014 0 0
 Waden & Sons 2,958 0 0
 Matthews 2,890 0 0
 Partridge 2,810 0 0
 Creswell & Sons 2,596 0 0
 Barnley 2,493 0 0

For the erection of a villa residence, in the King's-road, Buckhurst Hill, for Mr. S. P. Willamant. Messrs. Hills & Fletcher, architects:—
 Alexander £735 0 0
 Wiehs & Bangs 739 0 0
 Sheffield 693 0 0
 Stevens 688 0 0
 Egan 650 0 0
 Grover 618 0 0

For a bridge at Ruislip, Middlesex. Mr. G. Eves' architect:—
 White £207 2 0
 Henson 206 10 0
 Cox (accepted) 82 0 0

For erecting show-rooms and offices for the City of London Real Property Company, Limited, at 25, Mincing-lane, City. Mr. Edwin A. B. Crockett, architect:—
 Gammon & Sons £2,890 0 0
 Myers & Son 2,636 0 0
 Clemens 2,320 0 0
 Newman & Nunn 2,335 0 0
 Patman & Fotheringham 2,230 0 0
 Maesy 2,189 0 0
 Abby & Son 1,440 0 0
 Brass 2,014 0 0
 Conder 1,695 0 0

For works at Philip-street, Kingsland. Mr. W. Mundy, architect:—
 F & F. J. Wood £350 0 0
 King & Sons 349 0 0
 Marr 338 0 0
 Blackmore & Morley (accepted) 239 0 0

For works at 337, Goswell-road. Mr. W. Mundy, architect:—
 Peters £163 0 0
 Higgs 147 0 0
 Marr 140 0 0
 Langmaid 139 0 0
 Blackmore & Morley 128 10 0
 Bewles 112 10 0

For works at "Old Blue East," Curtain-road, Shoreditch, for Messrs. Truman, Hanbury, & Buxton. Mr. W. E. Williams, architect:—
 Anley £220 0 0
 Fairhall & Weekes 750 0 0
 Marr (accepted) 725 0 0

For construction of sewage tank and engine-house, for the Epsom Local Board of Health. Mr. W. Scarlett Trebarne, architect:—
 Colker £290 0 0
 Walton 789 0 0
 Clarke 774 0 0
 Chuter 754 0 0
 Doggett 667 0 0
 Farley 715 0 0
 Paice 700 0 0
 Spearing & Moy 677 0 0
 Crab & Vaughan 667 0 0
 Appleby 657 0 0
 Colker (accepted) 633 10 0

For the erection of St. Luke's Church, Halliwell, Lancashire. Mead & Henry Taylor, architects:—
 Middleburn £5,200 0 0
 Clark 4,998 0 0
 Ellis & Hinchliffe 4,332 0 0
 Fogant 4,314 0 0
 Robinson & Son (accepted) 4,232 0 0

For new Cattle Market, Melton Mowbray. Mr. R. W. Johnson, architect:—

No. 1 Contract, for Excavators, Roadmakers, and Builders' Work.
 Lee & Alderson £4,250 0 0

 Fast 1,690 0 0

For alteration to factory at Kettering, North Hants. Mr. R. W. Johnson, architect:—
 Sharrman £473 0 0
 Margdale 469 0 0
 Wilson 490 0 0
 Hawthorn 407 0 0
 Barlow & Melton 381 0 0

For alterations and additions to Craven Lodge, Melton Mowbray. Mr. R. W. Johnson, architect:—

At House and Offices.
 Neale & Sons £775 0 0
 Herbert 760 0 0
 East 732 10 0

At Stables.
 Herbert 985 0 0
 Neale & Sons 950 0 0
 East 946 0 0

For house in Mansion House-street, Hammersmith, for Mr. C. Bawn. Mr. W. L. Gumme, architect:—
 Sprinks £462 0 0
 Braithwaite 479 0 0
 Coombe 389 0 0
 Chamberlin Brothers (accepted) 359 0 0
 Richardson 348 0 0

For two houses in Regent-street, Bow, for Mr. Hayes. Mr. W. L. Gumme, architect:—
 Sprinks (accepted) £359 0 0

For villa residence at Dresden, for Mr. W. Copstake. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Newbon £758 0 0
 Collis & Hudson 718 0 0
 Harvey (accepted) 709 0 0
 Hedma 682 0 0

For villa, Shelton Hall Estate, Hanley, for Mr. J. Mountford. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Brindley & Critchlow £250 0 0
 Bennett & Cooke 846 0 0
 Woodbridge (accepted) 825 0 0
 Bowden 724 0 0
 Baslow 793 0 0

For shop and premises, Stafford-street, Hanley, for Mr. Boul. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Brindley & Critchlow £280 0 0
 Matthews 559 0 0
 Barlow 586 0 0
 Bowden (accepted) 553 10 0

For limekiln, Hanley, for Mr. J. C. Daniel. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Hedern Brothers £359 0 0

For three cottages, Tinkerslough, for Mr. Frost. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Bryant £384 0 0
 R. Hammersley (accepted) 330 0 0

For fixtures, Queen's Hotel, Hanley. Messrs. Scrivener & Son, architects. Quantities supplied:—
 J. Hemmerley £350 0 0
 R. Hammersley (accepted) 345 0 0

For additions to brewery, Burslem, for Mr. H. Parker. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Walley £745 0 0
 Vachin 715 0 0
 Barlow (accepted) 687 0 0
 Bennett & Cooke 660 0 0

For Ironwork for the above.
 Warner £131 19 6

Over 1,000 in STOCK, varying from £1. 5s. to £240 each.

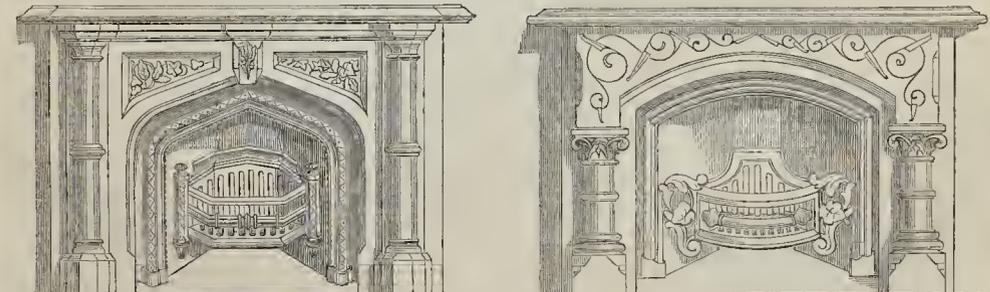

ARCHITECTS' DESIGNS CARRIED OUT WITH THE GREATEST ACCURACY AND PROMPTNESS.

COLUMNS, FONTS, HALL-FLOORS, STAIRCASES, OR ANY MARBLE WORK ESTIMATED FOR.

The greatest stimulus has been given by the above Firm to the Importation of Foreign Marble Work, which can be supplied at less than the cost of English labour. A number of OLD CHIMNEY-PIECES on View. Established nearly 20 years.

For the advantage of country Architects, Builders, and Merchants, by their giving a description of rooms for which Chimney-Pieces are required, stating about price, &c., Photographs and Particulars will be forwarded, together with Prices for same, and Samples of the Marbles, if required; also a Sheet of Designs of Chimney-Pieces and Monuments.

ESTIMATES will be FORWARDED for any kind of STONE, in Blocks, Slabs, Landings, or Scantlings, or Worked ready for Fixing, by Ship or Rail.

TWO MINUTES' WALK from KENSINGTON MUSEUM STATION, Metropolitan Railway. OMNIBUSES from ISLINGTON and the CITY every TWO MINUTES.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and not to the "Publisher."

BUENOS AYRES GOVERNMENT CERTIFICATE.—TRANSLATION.—"We, the undersigned, at the request of Messrs. J. C. Thompson & Co. certify that the IRON SAFES of Messrs. CHUBB & SON, London, of which these gentlemen are Agents, were exposed for several hours to the fire that took place in the offices of the National Government on the evening of the 26th instant; that in our presence they were easily opened with their respective keys; that the moneys and important documents they contained were found in perfect order; and that these Safes are now in use in the National Treasury Office.—Buenos Ayres, July 31st, 1867.

(Signed) J. M. DRAGO, Treasurer of the National Government. JOSE TOMAS ROYO, JUAN M. ALVAREZ. A true copy.—A. M. BELL." A large assortment of these Safes may be inspected, and lists of prices obtained, at CHUBB & SON'S, 57, St. Paul's Churchyard, London; 68, Cross-street, Manchester; 28, Lord-street, Liverpool; and Horseley-fields, Wolverhampton.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stable, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Commisstees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Church and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales, Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

Just published, price 7s. HARGREAVES & CRAVEN'S NEW PATTERN BOOK OF ENCAUSTIC AND GEOMETRICAL TILES, as manufactured by them from Designs by A. Waterhouse, F.R.S.A. John Gibbs, George Gullie, J. F. Bentley, R. P. Sydes, T. H. Watson, and others.

Just published, price 7s. KELLY'S PRACTICAL BUILDERS' PRACTICE-BOOK; or, Safe Guide to the Valuation of all kinds of Architects Work; with the Modern Practice of Measuring, and an Abstract of the New Building Act for Regulating the Construction of Buildings. Revised and Corrected by New Calculations upon the present Value of Materials and Labour. Arranged by an Architect of eminence, assisted by several experienced Measuring Surveyors. Illustrated and exemplified by Steel Engravings and numerous Woodcuts. Royal 8vo, price 7s. newly bound. London: Published by K. KELLY, Paternoster-row; SIMPKIN & MARSH, 11, New-street; and all the principal Booksellers.

Of whom may be had, new Editions in Quarto, of the following Practical Architects' Works:—

- 1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET MAKING. Revised by TREDGOLD: being a new and complete System of Lines, for the Use of Workmen, founded on Geometry and the Principles of the Art. Two Parts at 3s. or in boards, 3s.; containing upwards of 120 plates. Two Parts at 3s. or in boards, 3s.; containing upwards of 120 plates. Two Parts at 3s. or in boards, 3s.; containing upwards of 120 plates. Two Parts at 3s. or in boards, 3s.; containing upwards of 120 plates.

2. PETER NICHOLSON'S PRACTICAL MASONSRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD) both plain and ornamental; containing a new and complete System of Lines for Stone-cutting, for the Use of Workmen; the Formation of Mortar, Cement, and Plaster, to which is added a variety of new Designs for Marble Buildings. Arranged by an Architect of eminence, and a Description of the various Materials employed. Ten Parts at 3s. or in boards, 3s.; containing upwards of 120 plates, and numerous Woodcuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS OF ARCHITECTURE; containing plain and simple Rules for Drawing and Executing them in the present Style, including an Historical Description of Gothic Architecture. Illustrated by upwards of One Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams, &c. Twelve Parts at 3s. or in boards, 3s.

4. DESIGNS FOR COTTAGE and VILLA ARCHITECTURE, containing Plans, Elevations, Sections, Perspectives Views, and Details, for the Erection of Cottages and Villas, by S. H. BROOKS, Architect. Beautifully engraved on steel, with Directions for Building, and the estimated cost of each edifice. Twelve Parts at 3s. or in boards, 3s.

5. DESIGNS FOR PUBLIC BUILDINGS, containing Plans, Elevations, Sections, Perspectives Views, and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other Buildings for public purposes. By S. H. BROOKS, Architect. Beautifully engraved on steel. Ten Parts at 3s. or in boards, 3s.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE, containing a Series of Designs for Decorating Apartments with Gilding, and suited to the various Styles of Architecture. By H. W. and A. ARROWSMITH, House Decorators to Her Majesty. Ten Parts at 3s. or in boards, 3s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION, containing a complete Treatise on the Art of House Painting, Ornamenting, and Gilding, including the Origin of Colour, the Laws of Harmony, and the Discovery of recently made Inventions, Oil, Vermilion, &c. By W. M. HARRIS, Esq. Accompanied by actual Specimens of Hand-painting Gilding and Marbling. Ten Parts at 3s. or in boards, 3s.

8. THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA: a new and enlarged Edition, comprehending Practical Illustrations of the Machinery and Processes employed in every Description of Manufacture of the British Empire. Illustrated by upwards of 800 Wood Engravings. By RICKMAN, Civil Engineer, &c. The rapid progress of the Mechanical Science has developed many of the important facts since the first publication, in 1825, of the Encyclopaedia. The inventors and discoverers recently made have engaged the diligent attention of the Editor; for, as the value of each was tested by experiments, a description was accordingly prepared. By the inclusion of new articles, and care in the revision of old ones, this edition has now become especially valuable; so that it may be received as fully and satisfactorily expressing "the existing state of Engineering and Mechanism, adapted to the wants of Practical Men." In two large 8vo. vols. cloth, lettered, price 30s.

SCHOOL FITTINGS.—MESSRS. BANKS & CO.'S PATENT REVISED ILLUSTRATED PRICED SHEET of every article required in a well-furnished School, sent for three copies to—FARGOANE WORKS, ALBERT STREET, MANCHESTER.

Practical DIRECTIONS for COMBATING INFECTION, and Preventing the Spread of the "Catching" Diseases, such as Scarlet Fever, Measles, Small Pox, Typhus, &c. embodying the recommendations of Dr. Budd, Dr. Hardwick, and others. Recently designed for Distribution by Guards, Health Officers, Inspectors, Poor-Law Surgeons, Medical Men, Clergymen, &c. ROBERT HARDWICKE, 152, Piccadilly, London.

UNIONISM: with Remarks on the Report of the Commissioners on Trade-unions. By JAMES STELLING, Author of "Letters from the Slave States." Glasgow: JAMES MACLEHOSE. London: HAMILTON, ADAMS, & CO.

THE EDINBURGH REVIEW, No. 266, will be published on SATURDAY, the 15th inst. ADVERTISERS intended for insertion cannot be received by the Publishers later than SATURDAY NEXT, OCTOBER 30th. London: LONGMANS & CO. 39, Paternoster-row, E.C.

TO ENGINEERS and SURVEYORS.—PRIVATE BILLS, new Standing Order for the meeting Session, Lettering Books, Tracing Paper, and every article for the use of Engineers and Surveyors, in the preparation of plans for deposit. Plans, &c. lithographed with the greatest expedition.—WATERLOW & SONS, 40, Parliament-street, and 60, London-street, London.

HOUSES OF LORDS and COMMONS. SESSION 1870.—The new Standing Orders relative to Private Bills, are now ready and will be delivered post free. Price 5s.—WATERLOW & SONS, 40, Parliament-street, Westminster.

COLOURED SUPPLEMENT TO THE ENGINEER, OCTOBER 1st, 1868.—FIRST and SECOND CLASSES CARTRIDGES MONTHLY LITHOGRAPHED BY W. Adams, Esq. Engineer.—Four-page sheet, dimensioned, full coloured.

THE ENGINEER OF FRIDAY, OCT. 1st. 1.—Festling Railway, No. 2 (illustrated). 2.—The Iron and Steel Institute. 3.—Post-mortem on the (illustrated). 4.—Shand and Mason's New Steam Fire Engine (illustrated). 5.—The Holland North Sea (illustrated). 6.—Pneumatic Ore Stacks (illustrated). 7.—The Sewage Question. 8.—The Highway of Nations. 9.—Literature. 10.—The Engineering and Scientific News of the Week. Full Lists of Patents. THE ENGINEER, price 6d.; by post 7d.—Office, 113, Strand, and at all Newsagents and Railway Stations.

The Builder.

VOL. XXVII.—No. 1392.

Social Science in Bristol.

Our last we referred to the opening of the Congress of the Social Science Association in Bristol, and the address of the President, Sir Stafford Northcote. It is now closed, and so far as regards the real object of the Association must be considered as very successful. In a financial point of view it is to be feared there will not be so large a balance for the year's work of the Association as has been the case on some former occasions. The addresses of the Presidents of Departments were very good; many important papers that will influence future legislation have been read, and many valuable observations were communicated in the course of the discus-

prescribed by the supreme authority of the community; how to secure the least evil with the greatest good; how to reconcile the largest liberty of the individual with the least damage to the public need; how, in fact, to adjust the machine of society to the inexorable necessities of its existence,—that was the great problem to be solved by the science of law; and on the correctness of the adjustment, on the wisdom of the solution, depended the weal or woe of every people.

The address delivered by Canon Charles Kingsley, as head of the Education department, was truly admirable, alike in matter and manner. Implying a full discussion of certain moot questions, he bade society remember the broad, ugly, dangerous, disgraceful fact, that there are now—according to the computation of those who ought to know—about one million two hundred and eighty thousand children in this kingdom who ought to be attending some elementary school or other, but who are not; one million two hundred and eighty thousand children growing up in ignorance, in a country which calls itself civilised, but which will be called by a very different epithet some 200 years hence, unless she mend her ways right speedily. Turning then to a subject of equal importance, and one which is exciting increased interest among thoughtful women and men, the better education of girls, he said rightly, something must be done, and done on a large and generous scale, in this direction. While devising plans for educating and civilising the so-called dangerous classes, we must not forget that the most dangerous class of all—far more dangerous than street Arabs or thieves, is composed, alas! of women. And that the causes which keep that class continually recruited are not so much poverty as emptiness of brain and heart. Want of education, whether intellectual or moral, which leaves too many a fair savage, as he termed them (and too many not only of our lowest, but of our lower middle class, are nothing else), with no rational or profitable occupation, no sense of duty or responsibility, no intellectual exercise (if she can read), save the perusal of illicit and exciting novels; and no ideal life, save one which will give fullest scope to vanity, luxury, and passion. They must be taught that there are higher objects in life than finery and amusement; that they are responsible to themselves, to the State, and to God for the precious gift of womanhood. In concluding his address, Mr. Kingsley said he trusted that a system of public education for girls of the middle and upper class would organically develop itself in due time. "Some such organisation must arise, and arise soon. For a people like our own, so rapidly increasing in mere material wealth, and, let me say it, brute prosperity, can only be preserved from ostentatious frivolity and mere tinsel barbarism, by instilling a true and lofty civilisation in its sisters, wives, and mothers of every class. One word more, and I have done. Whatever we do for primary or secondary schools, or for our advanced ancient universities themselves, let us see that our primary education, and still more our advanced education, includes some better teaching of nature and of fact. Let us see that the children of these realms are taught, if not the principles of physical science, at least some of those habits of careful observation and sound induction which alone make physical science—indeed, which alone make health and wealth upon this planet—possible. No one is more deeply convinced than I am of the need of sound religious teaching. But no one is more deeply convinced than I am that even the best religious teaching, especially in these days, will bear but stunted and shrivelled fruit unless accompanied by physical teaching; and thus supported (as all human thought should be), humanized in the minds of teachers and of children alike on a

substructure of truth, reason, and common sense." Remarkable enthusiasm was excited by his observations.

The Right Hon. Stephen Cave, in his address to the Economy and Trade Section, referred thus to

The Position of British Workmen.

"We have seen that the trading industry of England dates chiefly from the immigration of skilled workmen from the Continent, who not only practised their various handicrafts, but taught them to the English. We find that their pupils were apt, and made rapid progress, especially in the southern and eastern counties. Consequently, although the earliest immigrants were welcomed, as conferring benefits in return for shelter, yet when in after years they arrived in larger numbers, flying first from the tyranny of Spain in the Low Countries, and afterwards from France, after the revocation of the Edict of Nantes, they came to be regarded not so much in the light of instructors as of rivals. The English workmen complained that they could not compete with the superior industry or greater frugality of the foreigners; and when we read that these foreigners made soup of ox-tails, which were thrown away, just as the dory was within the memory of man, we cannot wonder that they managed to live well upon what the proud islanders despised. It was said that Massena kept his army before the lines of Torres Vedras seventeen days longer than English troops could have existed, and that during the last year of the siege of Sebastopol, French soldiers made savoury meat of what was flung out as refuse from our hutchers' tents. A story need to be told of a noble Polish exile who lived at wonderfully small cost in London on cats' meat, of the composition and ordinary use of which he was wholly unware. But without going so far as this, there can be no doubt that ignorance, recklessness, and prejudice still cause the waste and refusal of excellent food among our operatives, and necessarily increase their cost of living. To return: great jealousy sprang up against the foreign workmen, resulting frequently in violent outbreaks. We have all heard of the 'evil May-day' in Henry VIII.'s time, and the order in the previous reign that hats should only be made in a city or borough, levelled at the Flemings, who had established a manufactory outside Norwich, which, together with other disabilities, had the natural effect of driving sundry manufactures back to Holland, and ruining the Norfolk capital. I think we have heard of similar rules made by the stonemasons' union about working stones in a quarry. These disputes and jealousies, and tyrannical edicts, at the time of which I speak, chiefly affected different classes and races in the same country. Incessant wars of bigotry and ambition so desolated the Continent that trade continued to flourish in England in spite of every obstacle; and the working of coal, and invention of machinery, together with the markets furnished by our colonies when the Continent was closed by war, completed the commercial prosperity of England. But the restoration of peace to Europe and America has produced its natural consequences. Coal, iron, and copper have been discovered in many districts, and the industry and frugality of the Continental workman, now on his own soil, again forces matter for complaint. The managers of the trade-unions, while loudly denying that their peculiar rules have rendered this competition more formidable, give a practical refutation of their own arguments by their anxiety to extend those rules to foreign countries. Others, again, propose to handicap their foreign competitors by the re-imposition of import duties on manufactured articles. But how can it be more just to impose a tax on manufactured goods, for the protection of manufacturers or artisans, on the plea that such articles are made much cheaper abroad, than on corn, for the sake of increasing the profit of the agriculturist and wages of the labourer, on the ground of unfair competition with virgin soils and less uncertain climates?"

"Though I have said that we cannot expect to retain our high commercial position unless we preserve our character for energy and integrity, yet I must be understood to feel much apprehension on this score. Transactions have, no doubt, too often taken place not wholly consistent with the stainless faith of the British merchant; but that this faith still stands high is proved by the fraudulent devices of foreign traders for the purpose of passing off their wares as British manufacture. Foreign goods with false trade-marks

sions that followed. A certain amount of these is preserved by the labours of the press, but much of the information thus orally communicated is altogether thrown away and lost. The public, looking on casually at the proceedings of such a Congress, do not realize the number of earnest and disinterested labourers such a meeting includes, or the extent of their labours. There are men in England who spend half their lives in working for the public good without fee or reward, or any desire for it,—men who are more often sneered at than applauded, and who will be scarcely alluded to when they die, though the nation may be then enjoying advantages resulting from their labours.

Mr. G. W. Hastings, as President of the Jurisprudence and Amendment of the Law Department, made his opening address interesting as well as instructive, no easy matter on such a subject. The practical work of Social Sciences, he said, was to adjust the machinery of society so that it might move in harmony with the great necessities that impelled its progress, with the wants and aspirations of the people; and that adjustment could be effected only by the instrumentality of law. The whole material universe, so far as they could observe, was self-regulated. But when they came to man they found a change—a moral element had supervened, and the free-will, which was the grandest heritage of the race, had opened the flood-gates of evil as well as the infinite possibilities of good. Therefore those manifold evils that grew so persistently with the good fruits of man's companionship had to be repressed, where that was possible, or regulated if they could not be repressed, by the strong arm of the law. The question how best to frame the rules to regulate, repress, and reform

are shipped to England, merely to be sent out again with the clearance of the British Custom-house. And it is said that in Hamburg there is a manufactory fully employed in forging the labels of one great English firm." The right hon. gentleman went on at some length to explain the error, in considering questions of political economy, of generalising from too few instances, remarking on the mistake of those who laid all the blame of the late crisis on the principle of limited liability. He proceeded—"We are entitled to ask whether fewer companies would have been formed under the old law, and whether their collapse was owing to the new system, when we find how few were the instances in which the arrears of calls were paid up, and that in such cases, therefore, it was of no practical consequence whether the liability was limited or not. Surely it is an arbitrary interference with the freedom of action, to say that a man shall not be at liberty to stake as much or as little as he pleases on a commercial venture. Moreover, it has been proved by bitter experience that reputed wealth is a broken reed, and the frequent failure of various banks and other mercantile firms might have shaken the trust of the most confiding in unlimited liability."

The Health Department was under the admirable presidency of Dr. Symonds. We take two paragraphs from his address:—

Health Machinery.

"Dr. Rumsey, with a masterly hand, chalked out lines and parallels for the future extension of sanitary legislation, while Dr. Stewart presented strong statistics and vivid pictures of the good that must accrue to mankind when even the present very imperfect machinery of hygienic improvement has had fair play. But all of these writers afford abundant proof that if we wish to bring out the life and strength of this great people, and to

'Cleanse its foul bosom of that perilous stuff,
That weighs about its heart,'

we must have efficient machinery and a greater number of workers. They must be men accomplished in the sciences that belong to this department, and also men who have had thoroughly practical training. Their occupation must be the care of the public health, and of that only. They must be above the control, and independent of the appointment, of local boards, for there must be neither favour nor fear in their relations with local authorities and with local possessors of property. If they are thought to strain their power, and to encroach too much on public finances, that is, on local rates and taxes, let them be amenable to censure and restraint from the hands of the national administration. It is extremely difficult for locally-appointed inspectors and local boards to do their duty when they have to deal with the dwellings of the poor. They come into conflict with individual interests, often with the interests of persons powerfully influential in the locality. But there are a vast number of subjects that would fall under the care and control of such State officers, who would have no other duties to perform than those which belong to their special office. There would be no struggle between the claims of public work, ill paid, and those of private engagements, which are the main dependence of the officer for subsistence. The interests of the public would not be subject to the fortunate accident of alighting or not on an able and assiduous agent like Mr. Davies, of this city, who has zeal and activity enough to combine successfully both public and private duties. The work of such an officer as we have indicated would comprehend not merely the inspection of the dwellings and lodging-houses of the labouring classes, and streets and thoroughfares, but rivers and watercourses, also workshops, factories, and mines, would come under his survey. Again, he would have to watch the public market-places, the stall of the seller of fruit and vegetables, the shambles of the butcher, the shops of the vendors of possibly adulterated food and adulterated drugs; in fact, all places where refuse may accumulate and noxious products arise, and whence deleterious substances may be disseminated. The registration of births and deaths might or might not fall to his lot, or to that of some other medico-legal functionary; but certainly it would be his duty to watch the progress of sickness in the population, not merely as measured by death-rates. His work, like that of this Association, would be to prevent or reduce the deadly records of the public registrar, and with a view not only to save life, but also to make life happier and more useful.

Suitable Amusements.

"The great misery of the world is not dying, but dragging on a maimed, mutilated existence, in which labour is suffering, and pleasure is a burden and disappointment, a state without spring, and without light or colour, or at best a dull, monotonous *chiaroscuro*, which, if not distressing, is utterly joyless. Yet to vast multitudes life is nothing better, because in the districts inhabited the fountains of life are inadequate, or are adulterated and poisoned. We cannot very much wonder that the artisan, dulled and half stupified by the close air and ill odours of the workshop and the lodging, or by the fumes of the factory, should reel into the cheerful beerhouse or the glittering gin-shop, craving for some temporary relief to his weariness and depression. I need scarcely remark, *en passant*, that one of the most crying wants of the community, with regard to public health, is provision for unobjectionable amusement. In supplying his needs it is not enough to give him oxygen in plenty, and pure water and wholesome food: he has to be entertained as well as fed. Recreation and play are as necessary to mankind as are food and raiment. And if there are not sources of rational and innocuous amusement, then there will inevitably be riot and debauchery. An enlightened and refined community will some day provide for these things. It will not, as of old, be left to self-seeking, ambitious consuls and emperors to corrupt the people with '*panem et circenses*;' but Governments will keep a paternal eye over the sports and amusements, as well as over the health and the toil of the great mass of the community. Here, however, we are encroaching on other departments. But indeed it cannot be otherwise than that the departments should occasionally overlap each other. The mind and the body, the body and the mind; the laws that bind and the laws that loose; the knowledge that strengthens and enlivens; and the economy that provides and husband the resources of life and strength; all of these in their several requirements and operations are perpetually crossing and interpenetrating each other as the unavoidable result of the compositeness of man's constitution, and of its correlative wants."

Of the proceedings of the various departments we can say but little for want of space. We must confine ourselves to subjects particularly within our province.

Government and the Public Health.

Dr. W. Budd opened the subject put down for discussion, "Can Government further beneficially interfere in the prevention of infectious diseases. He said,—

"He would set out by taking up two leading positions: first, that the vast and multitudinous brood of infectious, or, as he preferred calling them, self-propagating diseases, were the great field of preventive medicine; and more emphatically that those diseases presented prevention with its great opportunity. Alluding to a chart which he had prepared of the deaths from all causes, in London, in the years 1863 and 1866, he showed that in the former deaths from all causes amounted to 69,853, and of this number 10,949 resulted from infectious diseases; and in the latter deaths from all causes amounted to 81,308, and of this number 19,625 resulted from infectious diseases. When the diseases which really were self-propagating were put in their right place, they would be nearly one-third of the total number of deaths, and nearly one-half of the total sickness; but he did not wish them to take that for more than his own opinion, which he dared say many of them would regard as somewhat exaggerated in that matter. The figures showed that of all the legions that made up the great army of death, that of the infectious diseases was at once the most active and the most deadly. They had as yet counted only the slain, and if they multiplied them by some ten or twelve, those who were wounded and amid great pain struggled through, they would have some idea of the loss of human power, and the amount of human misery which those diseases entailed upon them. He believed on the principle *Salus populi suprema lex* the means of destroying infectious diseases was the State medicine. Men would set on the enactments of the State when their herds were endangered; but why were they so slow in putting in force enactments when they themselves were threatened with disease? 16,000 men perished annually by typhoid fever, and no measure had yet been taken to destroy the poison by which that vast mortality was kept up, and thus day by day the dragon's teeth were sown throughout the land, which were to spring up armed men. To that number they must add 147,000 more, which annually passed through the protracted misery of the disease. The action of the Privy Council was excellent as far as it went; but it did not go far enough. What he would urge was, that, first, they should have a thoroughly efficient administrative department of Government presided over by a minister of public health for the superintendence of all sanitary matters, and to enforce the law on all necessary public officers; secondly, a compulsory appointment of medical officers responsible to the central department, and with salaries adequately sufficient to command the undivided services of able men, not only in large towns, but in rural districts; thirdly, the institution of fever hospitals in towns and cottage hospitals in the country; fourthly, the issue of codes of prevention, to be drawn up under the authority of central boards; fifthly, the establishment of depots for disinfectants, &c., in every union; sixthly, instruction in all public schools for the

higher and lower classes of the laws by which infectious diseases spread, and the principles to be acted on to prevent their spreading; and lastly, the institution in all medical schools of special courses of instruction in preventive medicine."

Dr. Trenoh (Liverpool) alluded to the Act of 1866, which he maintained was sufficient for public purposes, without further legislation.

Mr. D. Davies (medical officer of the Bristol Local Board) thought the Act of 1866 might be sufficient if municipal bodies would take advantage of it, and make by-laws; but they would not do so in many instances. He believed they might stamp out typhus in Bristol, but they had it brought there from Liverpool, Manchester, Glasgow, and Ireland. There was one case which was brought from Glasgow by rail, and how many were poisoned on the way no one knew. The case went to the Infirmary, and was sent thence to St. Peter's Hospital. The advantage of a central authority was that action could be brought to bear on the country generally, for with respect to Bristol at present, the only parish of St. George was always full of typhoid fever.

Dr. Pearce denied the advisability of Parliament taking further action in respect to infectious diseases.

Mr. Godwin said they would do more harm in letting the opinion go from this department that there was not any need of Government interference in the matter of health than all the other departments would do good. He would move the following resolution:—"That this meeting is of opinion that not merely can Government beneficially interfere in the prevention of infectious disease and the general promotion of sanitary reform, but that it is imperatively called on, after sufficient inquiry and after the receipt of the report of the Royal Commission, to move at once and effectively, to arrange and simplify existing statutes, to make sanitary legislation compulsory, and to assist in obtaining for the people pure air, pure water, and pure food." A great deal had been done in Bristol; there appeared to be a good Local Board of Health there, and the death-rate was improved; but it was not yet what it might be. He had seen in Bristol some most frightful places, where a good state of health was certainly not possible. Parts near the cathedral might be instanced, and near the gas-works; the Quarry, where men, and women and children were huddled together in small low rooms, without back windows, so that there was no possibility of air, and if any epidemic broke out there such was the state of health that it would carry off large numbers of them.

After long discussion, the motion was carried by a large majority; together with one moved by—

Mr. Michael, "That in order to secure the efficient action of sanitary law, it is desirable that a special department of the public State should be created for the supervision and regulation of the public health."

The Sewage Question.

At another meeting of the department, Mr. J. V. N. Bazalgette read a paper "On the Sewage Evil, its Cause and Effects, with Suggestions for its Remedy." He said pamphlets, blue books, reports, and newspaper correspondence had already accumulated a mass of contending opinions before which local boards and other authorities entrusted with the care of public health stood appalled, and whilst all were unanimous in the opinion that "something must be done," all were equally irresolute as to what particular mode was the best, and seemed waiting for "something to turn up." That irresolution and consequent most injurious delay in disposing of the sewage of towns arose in a great measure from the desire of individuals to stereotype some one particular method as the only efficient means to be adopted in every case, regardless of locality and of the varying conditions which existed in every town. As Dr. Sangrado insisted upon his celebrated specific to the manifest advantage of the undertakers, so the irrigationists, regardless of climate or locality, insisted upon flooding the neighbourhood of all towns with the crude contents of the sewers, as though marvellous crops of a rank herbage were the only desideratum, and the certain immediate precursor of the millennium. There were, doubtless, instances in which irrigation would be found to be not only the most efficient, but, perhaps, even the most economical mode; but from all he had yet seen, he was unwilling to admit any system could be considered advisable which did not commence its operations by deodorising the sewage, and thus retaining many of its most valuable con-

situations which now were wasted by evaporation and exhalation, to the manifest annoyance and injury of the neighbourhood when the operation was carried on, and long before vegetation had been afforded the opportunity of absorbing them as it gradually did, when its powers were allowed to act. It must always, moreover, be borne in mind that irrigation required large tracts of ground which could only be obtained at a distance from towns; that that required costly works to carry the sewage, with annual expense for maintenance; and he might there be allowed to quote the case of Leamington, which, with a population of 17,454, had undertaken at an estimated cost of 12,000*l.*, and entailing an annual expenditure of 700*l.*, irrespective of the interest on the original outlay, to convey their sewage two miles and a half from the town, the only receipt to set off against the expense being 430*l.*, paid by the individual who had the sewage. Referring to the various systems adopted for disposing of town sewage, he said that the one at Stroud was the best that he had seen.

Mr. W. Hoop read a paper "On Town Sewage," in which he urged that funds should be forthcoming to have the best system of sewage for large communities tested, so that the health of the public might not suffer, and the valuable matter now often wasted preserved for agricultural purposes.

Mr. S. Sneade Brown read a paper "On the Ventilation of the Sewers of Clifton." He said Clifton now extended from Clifton-road, Clifton-down, over what were until lately green fields, as far as Fodland and Whiteladies'-road, and was at the present time undergoing a still more rapid extension, and spreading itself over the intervening spaces. Taking 311 ft., the elevation given in the map for the Observatory (so called), the height of the highest part of Upper Clifton, adjoining the Durham-down, could not now be less than 300 ft. above the bed of the river, and the upper part of Redland stood still higher. The Clifton sewerage system was distinct from that of Bristol. It comprehended ten branches, uniting in a main sewer which discharged down a steep incline about 240 ft. above the bed of the river into the Avon, at the foot of Clifton-down, where it mixed with the contents of the great Bristol sewer, received from the outfall into the river higher up. The *Journal of Science* for October, 1866, animadverted on the commingling of the tides of sewage in the bed of the Avon so near the town as an engineering mistake, and a breach of hygienic laws. The writer described peculiarities of the sewers at Clifton, and said what he had discovered respecting them induced a reasonable doubt whether the official statement, "that the Clifton sewers do not require ventilation or flushing, as there is no deposit in it and never any accumulation of foul gases," would bear the test of inquiry. He touched on the defective ventilation in the houses about Redland-quarry, and said the sewer air diffused among some of them constituted a grievous blot on the sanitary map of Bristol and its neighbourhood, in spite of a fair supply throughout of drinking-water and the natural advantages of its elevated position. He eulogised the doings of the local board and their officer, Mr. Davies; but he believed that public representations on matters hearing directly on the public health were of essential service to every public body; and that the most dangerous condition for any community to be placed in was to have "peace, peace," cried, when there was no peace.

The *Bristol Times*, discussing the subject since, says,—"No one engaged in the work had any doubt that it would have been much better to take the entire sewage of Bristol and Clifton in a common and capacious culvert, to be carried down along the river side to its mouth; but the cost was the question: and as the plan, so far as it went, was safe, because it could be supplemented and prolonged Channel-ward at any time, the local authorities were content, for the present, to limit the system to a river outlet." We are convinced, however, with the writer, that by the cost ever so considerable, they cannot long defer a further and more finished effort. For as

"Heaps of dead
Will slay their slayers by the pest they spread,"

the sewage discharge does to some extent return by tide and through locks to prejudicially affect the salubrity of at least the ancient city, which, comparatively good as its health is, might be still healthier but for this cause. We must cease to pour the sewage of 170,000 people into

a narrow river. There is no use trying to ignore an inevitable necessity. As it must be done, the present, we should say, is the next most favourable time to do it; since we have allowed a still more favourable time to slip by."

Houses for the Poor.

In the Economy and Trade Department, a paper by Mr. F. Wedmore was read. The writer began by remarking that the problem of how to provide the City poor with healthy homes at moderate rents had been rendered more difficult by the failure of successive experiments. The erection of blocks of buildings in the neighbouring country, and the institution of cheap workmen's trains, had been of little avail, as the disadvantages of living in the country seemed to the poor as great as the advantages. Mr. Peabody's model lodging-houses were too much tenanted by those who, though they might need help, certainly did not need it the most; and this observation applied still more strongly to the "Improved Dwellings" at Notting-hill, in one of which there lived a barrister. It had been thought that by giving to model lodging-houses something of the character of public works, their devotion to the legitimate object would be secured. But Acts of Parliament had done very little. Mr. Torrens's Act, introduced in 1856, was almost a dead letter. There was little use in giving to local authorities—vestries and metropolitan "Boards"—power to spend the ratepayers' money. They would not avail themselves of it. Vestries meet neither the larger view of Imperial Government, nor the feelings (personal and passionate), which were the stimulants to individual work among the poor at London. Some day the State might do much, when people had ceased to fear a "Paternal Government" that boldly took the initiative; but till then Mr. Wedmore saw no remedy but personal supervision, which, it should be remembered, could be indefinitely extended as volunteers increased. Cottage property in London was very remunerative. The writer described the atrocious state of some houses he had visited which were paying 20 per cent.

At the Ladies' Conference, Miss Octavia Hill spoke as to what she had been doing in London for the dwellings of the poor. The efforts made, she said, were directed towards raising the condition of the poor with their dwellings, rather than raise their dwellings for them. The landlords of the poor in London were almost always a low class of people; their power over their tenants was intense, for good or evil, happiness or misery. The great want, therefore, seemed to be that persons of an upper class should become their landlords, and exercise a better influence. She was speaking of this to Mr. Ruskin, and he took the matter up, and gave her money, with which houses in two poor courts in Marylebone, which bore a bad character, had been purchased. Some stables had been pulled down, and a playground made, but otherwise the houses were not altered in the main, and most of the existing tenants were retained; the one condition being, that they must strictly pay their weekly rents. In this she was inexorable, but found, so great is the power of personal influence, that she scarcely ever had any difficulties, though there were now forty families under her. Miss Hill went on to speak of the want of innocent and healthy amusement among the poor, young and old, saying that if those who had money would turn their attention to this, instead of giving indiscriminate alms, they will do good instead of the harm which they now do.

Knowledge of the Laws of Health.

A paper by Dr. Lankester, F.R.S., on "The Teaching of Physiology as a Branch of General Education" was read. He observed that children must be taught to read, and when they read it was quite as easy to teach them to read a book on the structure of their own bodies as it was to read anything else. The Universities should insist upon a physiological examination. If boys were not trained in the rudiments of physiology, surely the girls ought to be. To them as assistants of their mothers in poor men's families, and as nursemaids in the home, a knowledge of the laws of life was essential. If they were ignorant of the structures and functions of a child's body, they made mistakes which were constantly leading to the destruction of infant life. He had no hesitation in expressing his conviction that the large mortality of children under five years of age was not due to vice or

crime, but to ignorance. At least 2,000 children were suffocated annually in bed with their parents or nurses in England and Wales, and not five per cent. of those cases could be traced to vice or crime. The cause of death was the ignorance of the mother or nurse of the necessity of procuring for the children a due supply of fresh air. One of the great causes of the prevalence of preventable diseases and death all over the land was the utter and entire ignorance of the majority of women of the laws which governed health and life. The amount of suffering and wealth that might be saved by a knowledge of the laws of disease was incalculable.

The Workmen's Meeting, always a feature at these congresses, was held in the new Colston Hall, of which we gave a view a short time ago. The meeting included some 3,000 earnest and attentive listeners, and was a fine sight. Concerning what was said there, and other matters, we may find an opportunity to speak. We would simply add here, that Mr. Edwin Peers and other officers of the association exerted themselves, together with some of the members of the local committee, successfully in carrying out the arrangements of the week. Such meetings do not manage themselves.

THE ART LIBRARY AT SOUTH KENSINGTON.

So many are the facilities which are offered to the students of art, of architecture, and of engineering, military, civil, and mechanical, by the various educational collections that are grouped together under the general title of the South Kensington Museum, that a long list of novelties may be frequently described under that comprehensive heading. One branch of this institution, to which we are sure that many persons will be grateful for having their attention directed with some precision, is the Art Library.

It is well to state, in the first instance, that the full advantages which this valuable collection of books and engravings offers to the public are as yet, to no small extent, counteracted by the inadequate accommodation at the disposal of the librarian. Four rooms, squeezed out from the North Court, imperfectly supplied with borrowed light, and confined to an area which, measured on the published ground-plan of the Guide Book, does not exceed four hundred superficial yards, form the present most insufficient lodging of the Art Library, together with the reading-room, which latter only affords an available table space of less than 2 ft. to each person. It is but fair to say that no one can more distinctly perceive, and more perseveringly deprecate, this orphaning parsimony of space than does the learned and courteous librarian himself. "The arrangements for readers," he reported last year, "can scarcely be called accommodation." "Additional room," he again complains in his last report, "is more urgently required than ever." The space which was insufficient for the requirements of readers four years ago, has become wholly inadequate for a number nearly double that of those who attended in 1864 or 1865. "The necessity of having space for the exhibition of the collection of drawings, prints, and photographs, of architecture, ornament, &c., becomes more pressing as the collection increases in extent and value, and the requirements of students seeking aid in the library, not from books only, but from its store of art illustrations, become more varied."

The want of proper accommodation is compensated, it is proper to add, as far as is at all practicable, by the intelligence, patience, and courtesy of the librarian and his assistants. Students who have become accustomed to the manipulation of the illegible temporary catalogues of the British Museum, and to the loss of from 20 to 90 minutes incurred during the process of fetching from the shelves any volume of which the would-be reader has succeeded in discovering the press mark, indicating its exact position in the library, experience a pleasant surprise on their first occasion of consulting the Art Library at Kensington.

The readers there do not appear to be considered in the light of intruders, of public enemies, or of ignoramuses, shamefully ignorant of the one criterion of education—knowledge of a MS. catalogue which forms in itself an unindexed library. If the object of research be indicated, the officers of the library take an interest in aiding the pursuit. They seem to have not only a personal acquaintance, but an

intimate friendship, with the authors whose works are on the shelves, and to take positive pleasure in affording such an introduction as the student may be blindly attempting to obtain. On any subject in illustrations of which the Art Library is rich, and the student, wishing to be exhaustive in his search, is not previously acquainted with the literature, more information can be garnered at South Kensington in a day than at Bloomsbury in a week or more. The South Kensington staff, in a word, are not attendants, but assistants.

The total number of volumes and pamphlets in the library is now 25,334, being an increase of 6,267, over that of the preceding year. The total number of drawings and prints is not mentioned in Mr. Soden Smith's report, but 5,133 have been acquired during the past year. 7,878 additional photographs have raised the number of these works of art to 32,273. A copious index to the collection has been printed, which forms, taken with the photographs themselves, an iconographic dictionary of objects relating to art more comprehensive than has been hitherto attempted.

It is calculated that there exist upwards of 30,000 old books of a strictly art character, all of which it is wished to include in the library. Some of these are scarcely attainable from their rarity, but the great majority can be purchased. The acquisition, however, of all important old works becomes daily more difficult; prices are rapidly rising; and the competition of private collectors, and of the agents of public libraries, especially those of the United States, is constantly becoming keener. Sir R. Colt Hoare's "History of Wiltshire," Hasted's "History of Kent," and Bridge's "Northamptonshire," have been among the most valuable purchases of the past year.

Librarians and purchasers of books, no less than literary students, will look forward with great interest to the completion of the "Universal Catalogue of Works on Art," on which the editor of catalogues, Mr. J. H. Pollen, has been engaged since 1867.

The contents of an art library, although far from miscellaneous, will yet be found to rank under very distinct categories. Of these the first may be regarded as that of descriptive technical work, such, for example, as the valuable illustrated manuscript of Cavaliere Cipriano Piccolpassi, written in 1545, entitled, "I tre Libri dell'Arte del Vasajo." Descriptions, such as this unique volume contains, of the processes of foreign or of ancient art manufacturers, are of the highest value and importance to the student, and it is the aim and object of the directors of the art library to acquire every existing work of this description. After MSS. from foreign works, rank translations, such as that made by M. Stanislas Julien from the original Chinese, and published under the title, "Histoire et Fabrication de la Porcelaine Chinoise." Those ancient volumes are supplemented by the literature of the day, as in the case of Bronziart's "Traité des Arts Céramiques," the "Description Méthodique du Musée Céramique de la Manufacture royale de Porcelaine de Sèvres," and the last edition of Joseph Marryat's "History of Pottery and Porcelain, Mediaeval and Modern."

After works of technical description may rank those of illustration, properly so called. Such, for instance, are the numerous and noble folios containing engravings of the principal European galleries and collections, as the Gallery of the Florentine Academy, the "Description du Musée Royal des Antiques du Louvre," by M. Le Comte de Clarac; that of the "Real Museo Borbonico," at Naples; the "Musée des Monuments Français," by Alex. Lenoir; "Il Vaticano descritto ed illustrato," by Pistolesi, and numerous catalogues, handbooks, and descriptions, of various collections.

Works that are incidentally illustrated, and prints and engravings which, if of no great intrinsic excellence, are of value in illustrating the history and progress of graphic art, form again separate portions of the library. The bequest of the Reverend Channcy Hare Townsend to the Art Library included "all books in his library containing engravings." It is evident that if such a wide limit as this be fixed for the contents of the library, its future extension must be so enormous as, to a considerable extent, to interfere with its present most valuable characteristic, that of the instant accessibility of its contents.

A catalogue of "the Library of the Division of Art, at Marlborough House," was printed in 1855. This work, although referring only to some 5,000 volumes, may be regarded as a sort

of programme for the future catalogue of the Art Museum, and in that capacity is worthy of consideration.

The classification of this catalogue is imperfect, the arrangement being partly alphabetical, partly according to subjects, and partly according to the names of authors. The essential principle of all sound cataloguing—the double arrangement of index of subject and index of author—is lost sight of. The volumes included in the library are recounted, under the names of the authors when known, and under the title of the subject when anonymous, in the series which are thus arranged:—A. Alphabets, Writing, &c. B. Anatomy, Physiology, &c. C. Antiquities, Ancient and Mediaeval, D. Architecture, E. Art: 1. General; 2. Practice; 3. Taste, Theory, &c.; 4. History; E. Biography. And so on to Z. Trades. Under the respective heads the same disorder prevails. Thus, "Architecture" is followed by "Art, the Pictorial Gallery of, Useful and Ornamental," "Assisi, San Francesco d'," "Description of the Church of," "Auber, M. l'Abbé, Histoire de la Cathédrale de Poitiers, &c." In a small list of 5,000 volumes it is possible to find what is required, even when thus loosely arranged, by turning over page after page. For a catalogue of a large library, such a system of entry is of little use.

If we take, without farther criticism, the twenty-eight heads into which the Art Library is thus prospectively divided, we shall see that they are such as to admit of a systematic distribution, as the bases of a very available method of classification.

1. Thus, commencing with the literature of the subject, we should group together under the first division the several heads of:—1. Alphabets, Writing, &c.; 2. Biography of Artists; 3. Dictionaries, Glossaries, &c.; 4. Systems of Drawing and Graphical Instruction; 5. Geometry and Perspective; 6. Periodical Literature.

II. Descriptive works would follow in the second division, ranked under the heads:—1. Topography; 2. Antiquities, Archaic and Mediaeval; 3. Monuments; 4. Architecture; 5. Engineering, Building, &c.; 6. Heraldry; and 7. Costume and Habits.

III. Natural history claims a division to itself, including anatomy and physiology, together with descriptive natural history.

IV. Artistic works, strictly so called, rank under the heads of:—1. General Art; 2. Sculpture; 3. Painting; 4. Glass; 5. Decorative Art; and 6. Galleries, Museums, &c.

V. Manufactures, trades, and miscellaneous works complete the distribution of the heads already designated into an orderly and intelligible series. The works catalogued under each head should be arranged in the alphabetical order of the principal subject treated of or set forth in such title. A nominal index, or list arranged in the alphabetical order of the writers' names, should accompany such classified catalogue; the whole contents of the library being ultimately referred to in a general nominal index, which might be reprinted at intervals, say of ten years.

If on the reception of each book its title were immediately copied out and printed on a slip of paper, the subject chosen for insertion in the classified catalogue and the surname of the authors being printed in large black letters, so as to be legible at a glance, a book containing a series of these slips would form the day-book, or credit waste-book, of the library. The arrangement of the slips themselves in the draft catalogues might thus take place, *de die in diem*, with the very smallest amount of labor. Catalogue and index could be carried on at the same time; and no good reason could be given why every work, before it had been seven days in the hands of the librarian, should not be thus recorded in the three distinct entries of register, catalogue, and index. To call a mere nominal index a "catalogue" is a perversion of terms.

In the case of anonymous works, no insertion would be made in the index. Works attributed to any author would be entered under the supposed name; an addition, or note, being printed on the title slip, stating the grounds of the attribution. Works signed by initials would be indexed under the last letter of such initials.

The system of cross references, which is carried to such an intolerable extent in the British Museum catalogue, would be greatly simplified by the use of printed slips. In most cases it would be sufficient to paste a portion of the slip only in that part of the catalogue from which, under the ordinary arrangement, the cross reference is usually made. The words in

the title which are distinguished by capitals, and which may be considered as forming a subsidiary title, are those which would thus appear in the catalogue. Thus, if we take an example at random from the catalogue to which we have referred, we find a title of six lines, commencing, "AUBER, M. l'Abbé. Histoire de la Cathédrale de POITIERS." In the register this title would be inserted in full and designated by a serial number, which would denote the date of its acquisition; it would also be found in full in the index under A, and in the catalogue under P; a single line would be found under C in the list of cathedrals, the black letters being sufficient to lead the reader to turn to P for fuller information.

There is a class of books, now assuming extreme importance, which is not to be found under either of the above heads. We refer to *éditions de luxe*, or illustrated books proper, such as the Bible and the "Idylls of the King," illustrated by Doré. Objects of elegant refinement, rather than of educational art, such works will in time form a library in themselves, and, in the mean time, should be classed in a distinct catalogue.

The means of consulting foreign periodical literature which is afforded by the Art Reading-room at South Kensington are ample and valuable. French, German, Italian, and Spanish serials lie on the tables, beside English journals. It is highly instructive, if not highly satisfactory, to compare the styles of illustrations adopted by ourselves with those of the Continent. The general superiority of the French artists in this respect can hardly be contested. As far, however, as we can form an opinion, the main element of superiority is to be found in the care given to the actual operation of printing.

The Art Library at Kensington, small, but rapidly increasing in size, and miserably cramped for space, yet offers to the student such facilities as he will find in no other establishment in this country. Hardly any subject of study, in any way connected with art, is unrepresented.

The facility of consulting, at the modest expense of 6d. per week, the rarest and most costly volumes, is as yet far from being realised by the public. It is a matter for great satisfaction that this facility has hitherto been so little abused; a liberal and generous treatment seeming to produce a corresponding return. Such a work as that on the "Antiquities of the Russian Empire," produced under the direction of an Imperial Commission, with 4to text, and six volumes folio of plates,—a present from the Emperor of Russia,—may be cited as one of the treasures of the library. "L'Histoire des Arts Industriels, par Jules Labarte" the great work by Franz Book, containing representations of the regalia of the Holy Roman Empire; the work now in course of publication, under the auspices of the French Government, by M. Prisse d'Avennes, under the title, "Histoire de l'Art Egyptienne, d'après les Monuments les plus recueillis, jusqu'à la Domination Romaine," are productions of the same princely splendour. The privilege of access to such volumes can hardly be too highly rated.

The treasures of high art that lie *perdu* on the shelves of the Art Library are no less precious than the literary stores. Rare old engravings, photographs of the original sketches of the greatest artists, illustrated descriptions of the principal European galleries and museums, supplemented, as they are, by the publications of the Arundel Society, tempt the man of taste to linger within the walls. Nor are original MSS., or original drawings, excluded. Perhaps the chief artistic gem of the library is the Italian note-book of Flaxman, an oblong book, of stout drawing-paper, on which the objects that chiefly attracted the attention of that artist in a tour through the Italian peninsula are drawn with bold, careful, vigorous touch. It is highly noticeable, as illustrative of the peculiar bent of Flaxman's genius, that it is on the relics of Roman antiquity that his attention was mainly fixed, to the exclusion of the no less picturesque, and far more vividly instructive, features of the Italian life of the present day,—a life which, as dependent on an unchanged climate, is an exponent of the habits and customs of ancient Rome, as valuable and instructive as either tombs, or busts, decorated friezes, or crumbling mosaics.

We are by no means certain that the authorities of the South Kensington Museum will be disposed to thank us for directing, so far as our voice can reach, the attention of the public to a portion of their establishment which,

though rich and tempting, is as yet so inadequately housed. But we write in the interest of the public, and with the conviction that it is only requisite that the actual contents and ready accessibility of the Art Library should be known, to produce such an influx of readers as to render delay in the erection of a proper library impossible. We have just heard it stated, in very loud and very unanswerable tones, that it is not the more educated class who criticise, admire, and stay away, that renders any adequate support to those who endeavour at once to please and benefit the public. As the drama finds its chief patron in the multitude, so must an institution like South Kensington, whether we regard the schools and educational collections, the Art Museum, or the Art Library, find its chief supporters and most numerous frequenters, not among those who are satisfied with the present state of their education in matters of taste, of art, or of science, but among those who are eager for instruction. Let those who consider their education finished stay away.

But for those who would reverently regard the wonders of the past, who would watch the footsteps of the great masters of ancient or of Mediaeval art, who would take counsel with the careful writers, and learn from the patient draughtsmen and engravers, of countries and of times more artistic than our own, we have but one word to say. In no spot in the world, be it where it may, will they find so readily accessible, so much to educate, to delight, and to ennoble at once the taste and the intelligence as in the Art Library and Museums of South Kensington.

THE CITY HIGHWAYS.

We are glad to see that some suggestions which appeared in our columns in reference to the present condition of the eastern portions of the metropolis are shared in by Mr. Haywood, the engineer to the City Corporation, and are not unlikely to form the basis of important improvements which are now held in contemplation by that body. We made allusion in a late impression to the expediency of an addition to the present number of bridges over the Thames, more effectually uniting the opposite shores of the river below London Bridge, and we observe that the apprehension which we expressed upon the occasion as to the inadequate accommodation which would be likely to be afforded by the construction of subways under the river is more widely entertained than we had supposed. It is acknowledged that superior facilities would be acquired by bridge accommodation and the construction of subsidiary railways towards the relief of the compression of the City traffic.

Mr. Haywood is in accord with us as to the hesitation which would be likely to be declared with reference to the usage of subways, and has proposed the erection of a bridge nearly in the line of direction, which is occupied by the present tunnel from the Tower to Brompton. Those localities unquestionably possess urgent claims in regard to the accommodation which would be extended to them by such a structure; nor do we imagine from the circumstances of the case that in the immediate adoption of this proposal, any consequences of such a character as might, at first sight, appear calculated to ensue need be apprehended with reference to the underground tunnel. Viewing that work for a moment simply as a proprietary work, in the execution of which a large amount of proprietary capital has been already expended, we believe, that it cannot fail to be remunerative. It is obvious that with a capacity restricted within certain limits, as that of the subway professedly is, it could not hold out anything like the amount of accommodation that is demanded between the localities which it joins.

From the preponderance of traffic at these parts, the tunnel is likely to meet with employment up to the fullest extent of which it is capable. Tolls for a few days on London Bridge would defray the total cost of the erection of the subway. So singular, indeed, is this structure in its general features, and the cheapness with which it has been contrived, that the gratification of the novelty which it embodies would almost liquidate the expenditures which has been incurred. We wish to be understood as stating this far from disparagingly. The illustration here afforded by Mr. Barlow as to the possibility of conveying heavy weights from space to space will yet assert important claims to attention, and be wisely adopted. It is the nearest

approach to a material telegram without a battery, advancing in the teeth of pneumatic resistance itself, and the principal objection which may be alleged with reference to it is, perhaps, that it is not a highway. There are numerous circumstances under which its employment would not be exposed to such objections as may now attend it. Many of the suggestions which are embodied in the compendious report as made by Mr. Haywood, and now issued,* from the magnitude of the difficulties with which he has to deal, are necessarily extensive in themselves.

They for the most part intimately concern the welfare and interest of the community at large, and no doubt in some cases are pronounced with the view of eliciting public approval or concurrence, if not with the express object of inviting an attentive criticism. We are induced to recur to the subject of the present commercial limitation of the metropolis, not simply on account of finding our former views so largely shared by the Engineer to the City Corporation with reference to the necessity of the erection of bridges below bridge, subsidiary branches of railway in the eastern portions of the metropolis, and with regard to the minor utility of tubular driftways or tunnels under the river, but from the masterly scope which Mr. Haywood has given to the inquiry.

The variety of means comprised in his recommendations has led to a reconsideration of the impressions which we entertained as to those means which would most effectually, in our view, operate towards the accomplishment of some of the desired objects. The present extent of the city area appears to us an element in the case which has not yet perhaps been sufficiently weighed. The municipal area is but 631 acres, and how far we may be justified in opening up readier means of access to within those constricted lines is a subject which of itself is fairly entitled to some consideration as the case stands. Within these limits it is calculated that nearly one million persons congregate daily. Following, with some timidity, the figures upon which Mr. Haywood proceeds, we are led to the supposition that within thirty or forty years two millions of persons will insist upon finding accommodation within the same area. A communal police, an ingredient which few would regard favourably as a necessary constituent of traffic reform upon which the City Engineer seems somewhat disposed to rely for assistance, might, under the circumstances, discover a wide employment, but not exclusively in that harmless direction which is assigned to them. A comprehensive arrangement we believe would not involve the manifestation on their part of a greater amount of concern for our personal safety than they now display.

We are indisposed to draw largely upon the figures contained in, and suggested by, this report; but inasmuch as we have already alluded to the inequalities which may be perceived in reference to the distribution of the inhabitants over the metropolitan area, we would advert to the results which have been obtained in this direction by Mr. Haywood.

A line continued in a straight course with London Bridge to the extremities of the inhabited areas of London, at both sides, would represent, with regard to the population, a state of things to which many of the difficulties of the present situation may be referred, and which has hitherto engaged but little attention. Mr. Haywood appears to have arrived at the supposition that in a short time the population at either side of such a line would nearly balance, and tends to preponderate eastwards. As we have before remarked, at one side there may be discovered numerous means of intercommunication across the river, while on the other side not a solitary instance of the kind attracts attention, or exists to the sight. We are inclined to regard this circumstance as the chief cause of what is now not only intolerable, but grave and threatening in its growing aspect. Mr. Haywood remarks that "it would be interesting to ascertain the distance needlessly traversed annually by vehicles and pedestrians, owing to the want of a bridge lower down the river than London Bridge, and no calculation yet made upon such subjects would show anything approaching the immense loss of time, loss of labour, and loss of money which the absence of another bridge imposes

* "General Improvement of the City. Report to the Court of Common Council from the Improvement Committee, with Report from W. Haywood, esq., C.E., Engineer to the Commissioners of Sewers, in relation to the Traffic of the City."

upon the traffic and population of the north-east and south-east of London."

It is not, however, in our opinion, one bridge only or two bridges which would substantially effect a relief of all the increasing exigencies of the position, but three or four, or even a greater number, would appear not far from being demanded and desirable. The City alone is not the only precinct of London susceptible of considerable amelioration. The further development of Sporeditch, in anything like the time extending over the report, represents both a psychological and physical problem. There are many other places which would be embraced and included in a comprehensive rectification of frontiers, to adapt a French expression, of the City and the improvement of its approaches. This task now devolves upon the Corporation, and, if done, could be done once for all.

The numerous railway stations already terminating in localities within or adjacent to the City boundaries, are regarded as being likely to contribute a novel element of mischief. This we do not consider to be a consequence fairly to be apprehended.

The railway branches now entering the City principally facilitate an earlier arrival and later departure to and from the City offices than was formerly practicable; and, in our opinion, add but little to the normal insufficiency of that accommodation which is now experienced. As a means in any degree operating towards the reduction of vehicular traffic, which we are inclined to view as a radical source of the existing confusion, they are comparatively valueless; but they exercise some effect in marking off those periods when foot traffic and vehicular traffic combined reach their maximum points of danger.

Any means which could be devised to diminish the vehicular traffic would operate more successfully than endeavours to accommodate it. The difficulties of the case do not appear in so far a way of being met by providing a further accommodation for the traffic already existing as in getting rid of some portions of it and preventing its access.

The short extract which we have quoted from Mr. Haywood's report with reference to bridges below bridge we think supplies a key to the whole difficulty. The traffic which approaches in converging lines, along both the Eastern inlands from the river towards the nearest accessible bridge, would be subdivided, at points where such traffic pertains, by the erection of more local accommodation than that which London Bridge affords. As a parallel case, let it be supposed that all the bridges west of London Bridge were translated eastwards, and that the traffic now conducted between the two shores were compelled in the direction of London Bridge. The contrast is far from comprising such an exaggeration of the circumstances as might readily be entertained.

As an important feature amongst the improvements recommended for adoption by Mr. Haywood, the establishment of steam-ferry services at points along the river below the Tower would take a principal rank. Those who have witnessed the convenience which is afforded by the steam ferries plying across the Mersey will regard this proposal as possessing many claims to consideration. Ordinary steam-boats, such as those now navigating the Thames, would, however, be inadequate for such a service, and a number of new vessels would necessarily have to be designed and constructed in order to be of any avail in the interchange of produce and merchandise over the river.

While such an amount of maritime traffic as that which is now localised in the direction of London Bridge is continued it would be hazardous to look forward to the successful working of a steam-ferry system, however well contrived. The interception of such traffic at points further below bridge seems to be an essential element in any project to extend or reform the condition of the City.

An alternative proposal is submitted in the construction of bridges with central draw-spans; but here again unquestionable inconveniences would arise in the adoption of a bridge such as is suggested, containing a central moveable opening to admit of the passage of masted vessels. It would convey but little of that accommodation which is expected from bridges in ordinary; nor do we imagine that restrictions or regulations as to its intermittent employment within stated times, for naval and other traffic, would be found to work advantageously. The central span presents insurmountable difficulties.

It would require to be large in proportion to the length of the bridge, and the severance and reunion of the platform would be attended by many vexations and cost. A very fine example of the class of structure herein indicated was, some time since, designed by Mr. Pogo for erection over the river Hooghly, at Calcutta, consisting of four spans of 400 ft. each, and a central draw-span of 80 ft.

It is remarked in Mr. Haywood's report, that the removal of Middle-row, Holborn, in union with the large undertakings in course of completion under the Corporation's auspices, will in no degree sensibly alleviate the existing congestion of the City area, an intimation which we are readily prepared to accept. These improvements have been accompanied by the extension of the terminal stations of some of the main lines of railway into the centre of the metropolis, which would go far towards diminishing any relief which might originally have been expected from these measures. The union of the main lines with the Metropolitan system is not yet complete, and the proximate extension of the Great Eastern Railway, with this object, is daily encroaching upon various properties in the busiest and most capacious parts of the East Central district. An important range of buildings, including the premises forming Miles's Builders' Materials Entrepôt, are now being cleared, with the object of bringing the Great Eastern line into more effectual operation, and numerous habitations are in this direction threatened with removal. These points all tend in favour of an unrestricted and far-reaching scheme on behalf of the City, rather than a mere extension of the existing thoroughfares and the construction of new streets.

The increase of the population within the metropolitan area, based upon calculations which extend over nearly seventy years, gives a population to begin with in the year 1800, a period which many now living will witness of 6,000,000 of inhabitants, or about six times the magnitude of the population as it stood at the commencement of the present century. A more wonderful exposition of the phenomena of human life it would be difficult to submit. Never before assuredly in the history of the world have so many singular features united towards the foundation of such a state and condition of human existence as that represented at the present day.

Nineveh, one of the most notable cities of antiquity, was but 14 miles long, by 8 miles in breadth, inclosed by a wall 100 ft. high, 46 miles round, and thick enough for three chariots abreast. Babylon was 50 miles within its walls, which were 75 ft. thick, and 100 ft. high, and pierced with 100 brazen gates.

The walls of Rome were but 13 miles round, and the city was estimated to have arrived at a maximum population of rather more than four millions of inhabitants. The first census which was taken of Rome occurred 566 years before the birth of Christ, and after an interval had elapsed of nearly four centuries from the presumed date of the foundation of that city, according to the historian Varro. The frequency with which the increase of its population was noted and recorded up to the time of the rebuilding of the Capitol demands the most serious attention of civilised communities. When the Pantheon was erected, under the reign of Augustus, the population is computed to have reached four millions, and it so remained during the lifetime of our Lord, whose birth occurred about this time. The city of London was founded by the Romans in the fiftieth year of the Christian era, Caractacus at that time being taken prisoner to Rome. Since that period we possess access to historical records sufficiently authentic to establish an unbroken and continuous succession of events down to the discovery of yesterday of the Roman pavement in Bucklersbury.

The city of Cordova, under the dominion of the Saracens in Spain, possessed more than 200,000 houses, and more than a million of inhabitants. After sunset, it is said, one might walk through that city in a straight line by the light of the public lamps for a distance of ten miles, while seven hundred years after this time there was not so much as one public lamp in London. The streets were solidly paved, while in Persia, centuries subsequently, whoever stepped over his threshold on a rainy day stepped ankle-deep in mud. "The Spanish Mahometans had brought with them all the luxuries of Asia. Their residences stood forth against the clear blue sky, or were embosomed in woods. They had polished marble balconies

overhanging orange gardens; courts with cascades of water; retiring-rooms vaulted with stained glass, speckled with gold; and the floors and walls were of exquisite mosaics. Here a fountain of quicksilver shot up in glistening spray, the glittering particles falling with a tranquil sound like fairy bells. There were apartments into which cool air was drawn in summer from flower gardens. Clusters of frail marble columns, surprised the beholder with the vast weights they bore. In the boudoirs of the sultanas they were sometimes of verd antique, and encrusted with lapis lazuli. Through pipes of metal water, both warm and cold, to suit the season of the year, ran into baths of marble. In niches where the current of air could be artificially directed, hung dripping alcarazas. There were whispering galleries for the amusement of the women, labyrinth and marble play-courts for the children; for the master himself grand libraries;" and at this brilliant scene, it is said that barbarian Europe lighted its lamp of civilisation. If such were the case, we must confess that its lamp has yet been scarcely sufficiently well trimmed to discover some of its more important needs. The baths and aqueducts of Rome are still conspicuous by their absence, and the lavatories and marble play-courts of Cordova would be taken to reflect upon the sanity of a Briton. The hurry of life and money-making is so great with many, that a meditation upon the wider and more lasting foundations of life appears impracticable in the main. But we have gutter children and coroners' inquests, and poverty lies quietly down amongst us, to perish upon thresholds of gold. In some points we have omitted to reproduce those common adjuncts of decency by which only an improvement in the manners of a civilised people could be detected.

To revert, however, to the question of the prospective increase of the metropolitan population to the extent and within the time predicted, we have to take objection to the necessity of still further condensing any portion of that population within the prescribed boundaries of the area of the City. If out of the population that is to be one million and a half will find their occupation in the direction of Threadneedle-street, why not at Clapham or Wimbledon, Hampstead or Crayesend? There is as much intercourse, and profitable intercourse, carried on between London and Liverpool, as was formerly possible between London Bridge and Chelsea. There are at this moment nearly 13,000 miles of railway open and in operation in the United Kingdom, finding a common centre within the heart of London. Had Rome possessed such facilities as these, it is possible that some method would have been devised to increase the extent of its commercial centre, at least beyond the dimensions of 631 acres, and might even have taken into consideration the asphyxiating system of bodily refreshment which, as far as the rising generation is concerned, is enacted there. The scheme of the Metropolitan Railway is not only capable of conferring the means of speedier access to and from the City, but would effectually govern new centres of industry and trade. It is now a laocoon struggling with the stream of human life. Viewing the wholesale remodelling of streets and thoroughfares suggested by Mr. Haywood's report, the magnitude of approaching highways asserts some claim to reference.

Foremost amongst these in the southern side must be reckoned the Clapham-road, which, meeting with a slight diversion at the Elephant and Castle at Newington, hursts into architectural fireworks at Clerkenwell-green. The Old Kent-road and Walworth-road unite at a point in advance of London Bridge, and expand inconspicuously immediately they cross over that narrow path, the main direction of the united roads continuing from the other side of the bridge as far as Stoke Newington and Stamford-hill.

The road originating at Blackheath runs continuously until it disappears in the vicinity of Buckingham Palace. When we have named the Wandsworth-road, which itself terminates in the Clapham-road, we have exhausted the cardinal highways of the southern portion of the metropolis. In magnitude they are surpassed by the vast thoroughfares which span the boundaries of London at the Middlesex side. There is one continuous road from Hammer-smith to Stratford with a parallel inside road terminating in Lincoln's-inn-fields by Great Queen-street. From Marylebone to Victoria Park, and Hyde Park to Edgware, would about enumerate the main arteries of Metropolitan Middlesex.

Within the limits thus roughly sketched there are computed to be no less than 500,000 human habitations, affording accommodation to a fixed population of one seventh of the entire inhabitants of the United Kingdom. Nearly one-half of the adult portion of this population at some time daily enter the City, and we are glad at length that some steps have been resolved upon to provide that accommodation which has been so long demanded. This, in our opinion, cannot satisfactorily be arrived at by any means which would encourage further traffic citywards, but by the subdivision of the existing traffic along the course of the Thames eastwards by means of several bridges and the discharge of maritime traffic further down the river.

SHAKESPEARE ILLUSTRATED.

A FEW weeks since we devoted some little space to remarks, descriptive and critical, with reference to the redecoration of the Prince's Theatre, at Manchester. We have now to bestow a passing word on the very carefully and artistically got up representation of the "Winter's Tale," which has been produced at the same theatre, on the model of what was done by the late Mr. Charles Kean at the Princess's Theatre, London. Mr. Calvert, the manager, in the preface to his acting edition of the play, combats the idea that there is anything inimical to the highest exercise of the actor's art in the addition of elaborate scenic illustration. As scenery and costume of some kind are indispensable, to contend that their correctness and effectiveness are a matter of indifference, is to "acknowledge the wrong thing better than the right, and own that to be inappropriate is better than to be appropriate;" and, as a close student of the art of acting, he asserts that "not only is the audience the more impressed by the realism of the *mise en scène*, but that the actors themselves undoubtedly derive an impulse from it." Following out this principle, not only has the play been brought out with the best scenic effects that could be obtained, but the whole of the ornaments, costumes, dances, and other adjuncts have been made subjects of study, and antiquarian authorities consulted in reproducing them. The architecture of the various interior scenes has been designed under the supervision of a professional architect, and the scenes were painted by some of the most accomplished artists in this branch of painting. Particularly good are the second scene, act i., a summer apartment in the Palace of Leontes, and an apartment in the Palace of Polixenes (act iv., scene 3); the latter, which is a "front scene," is an excellent piece of illusory perspective. The only defect we should notice in the architectural portion of the scenery is in the front of the temple at Syracuse (act iii., scene 1), where the columns are too tall and thin in proportion, especially for what must be supposed to be Sicilian Doric.

The hand is a far better one than is found in some of the London theatres, and the whole of the music has been arranged with special reference to the scenes and situations it illustrates, and thus becomes an addition to the total effect, instead of a mere excrescence. Our limits do not permit us to enlarge upon the quality of the acting generally; but we must allude to Mr. Calvert's impersonation of *Leontes* as a carefully studied and artistic effort, especially notable for that careful attention to minutiae which is always the mark of a really finished actor, and which is sometimes neglected and its absence supposed to be atoned for by some noteworthy point in one scene, to which everything else is sacrificed.

The principle before urged in this journal, of bringing true artistic skill to bear upon all the accessories of a theatrical representation, has been carried out here with a degree of care and intelligence which deserves wider recognition than that of a provincial town.

The Armenian Church, Manchester.

A paragraph, on p. 793 in our last issue, gives an account of the erection of an Armenian Church in Manchester; this should be Armenian, if, as we suppose from our correspondent's description, it is the national church of Armenia that is meant. We have Armenian Churches in abundance,—that is, for those who, like the Wesleyans, adopt the doctrines of the Dutch divine, James Arminius, on free grace. Wesley called the magazine he established *The Arminian Magazine* (now the *Wesleyan Methodist Magazine*).

THE DRAINAGE OF BRIGHTON.

The General Purposes Committee has passed, by 7 to 5, a resolution approving of Mr. Hawkshaw's plan for the drainage of Brighton by an intercepting sewer from Cliftonville to Portobello, and recommending the council to give the necessary Parliamentary notices for obtaining an Act in the next session giving the necessary powers. An amendment was proposed:—

"That, as Mr. Hawkshaw agreed with Mr. Hawley and Dr. Letheby that the present system of drainage was not injurious to the health of the inhabitants,—in which they were borne out by the Registrar-General's report;—as the proposed alteration of the system involved an expenditure of not less than 80,000*l.*; and as the council was equally divided in their opinion as to the necessity of such alteration, it was not advisable to give the Parliamentary notices now asked for until the effects of the alteration of the central and western outfalls had been tested, the co-operation of the adjoining districts obtained, and the opinion of the inhabitants of Brighton as to the proposed plan ascertained."

This amendment was negatived by the same division; and the committee's resolution of approval was to be submitted to the town council at their next meeting.

In addition to the report already published, Mr. Hawkshaw has since, in a supplementary note, furnished some details in explanation of his plan. The local *Herald* says, in allusion to these details, "How far these tend to meet the objections that have been raised to a sewer seven miles long, and to the danger of thus creating a nuisance far greater than any we have hitherto endured, we are unable to say. We hear, however, that Mr. Hawkshaw's mode of ventilating this sewer is by gratings at every 200 or 300 yards; and we confess that the prospect of this line of gratings running along the front of our promenades is by no means reassuring. If, instead of discharging the foul air of our sewers into the depths of the sea, we bring them beneath the very noses of our visitors, where is the gain?"

FEN AND MARSHLAND CHURCHES.

On a railway journey from one commercial or manufacturing city to another,—between London and Manchester, for example,—what quiet rural districts are hurried through, what charming shady nooks open out for a moment and then are gone, and how gladly sometimes would the traveller stop, if he could, to admire, to examine, or to rest. But stopping is out of the question, and in spite of his regret and in spite of all attractions, he is carried on perhaps to a more smoky atmosphere than the one from which he began his journey.

The thorough pursuit of any profession, especially of any of those to which this journal is devoted, drives a man along in a fixed track almost as inexorably as a locomotive draws a train. Many things come under his notice and invite his attention, to which he would gladly give careful study and quiet thought, if he could only stop to do it. But each day's practice brings duties which cannot be postponed, though these are not always of the kind which would enchant the fancy or engage the heart. You would occupy your mind with the highest artistic criticism perhaps, when you are obliged to break off the chain of your thoughts to consider the position of a dust-bin or the diameter of a drain! Architects can rarely select the subjects to which they have to give time and thought, still less can they leave out what is unattractive, and only notice what is choice when the selection has been made. But amateurs can do this; and the architectural profession is greatly indebted to them for much intelligent labour and criticism.

A valuable addition to work of this class has just been made by the publication of a book bearing the title which heads this notice, and containing careful and artistic photographs of twenty-six churches in the eastern counties.* These churches have been selected for illustration on account of their architectural rather than for their antiquarian interest: they are not merely old, but intrinsically beautiful. And as each set of photographs is accompanied by a short sketch of the history, alterations, and individuality of the building, a very useful and inter-

esting hook of reference is the result. These descriptive notices, which display research and study as well as a sincere affection for the venerable buildings described, are written for the most part by the clergy of the several churches, headed by the Dean of Chester, who contributes a notice of Wisbech Church, which was the former scene of his labours.

Two volumes of this hook have just been brought out, and a third is promised shortly. It is to be hoped that their publication will be attended with such success as to encourage similar work in other districts. How many beautiful churches are falling into decay, or into the hands of the injudicious restorer, leaving little trace to future time of the feeling of their builders, or of the dignity which time has stamped upon their work.

The photographs are extremely good, the interiors being particularly free from the gloom so often observable in photographs of this kind. The points from which the views are taken are well selected, and both the general effect and the clearness of detail are well preserved. Architects who cannot spare the time or the money to make a tour among the Fen and Marshland Churches, may here obtain a considerable acquaintance with their artistic merits, as well as with their structural peculiarities. The cover is the least satisfactory part of the hook.

INFIRMARY FOR WANTAGE, BERKS.

The guardians of the poor of the Wantage Union, having determined to follow the example of the Boards throughout the country who have provided improved accommodation for the sick poor, have matured a scheme for pulling down certain old buildings at the back of the workhouse, and erecting an entirely new infirmary on the site. The new building will include ordinary and special sick-wards and day-rooms for both sexes, and lying-in ward. Lavatories, bath-rooms, and other conveniences will be provided for all classes, and the building will contain most of the latest improvements of its kind.

More accommodation for the pauper poor has long been needed in this union, which consists of thirty-four parishes, and embraces a large district. The outlay will be about 2,000*l.* Plans have been prepared by Mr. J. P. Spencer, architect, of Wantage; and, the Poor-law Board having already approved of them, tenders will be advertised for forthwith.

THE SMOKE NUISANCE.

At Newcastle-upon-Tyne the authorities have resolved to put down the smoke nuisance which is very bad there still. Mr. R. H. Simpson, confectioner, New Bridge-street, has been summoned before the magistrates, at the instance of Mr. Curry, inspector of nuisances, for not abating the nuisance. Mr. Curry stated that on the 24th ult. he had watched defendant's bakehouse chimney for fifteen minutes, and during that time he saw dense black smoke issue from it. Mr. Simpson said he had a smoke-consuming apparatus, but at present it was out of repair. A new one was in course of construction. Fined 40*s.* and costs.

A Civil Engineer, lately on a tour of inspection in the North, says:—"I have examined every class of furnace, and the kind of fuel used, with the various systems of furnace management, but I have seen no furnace, whether in iron, chemical, or any other works, that might not easily be made to consume its own smoke, as required by the Smoke Act. There are in London over twelve thousand furnaces of various classes, in a large number of which nothing but common dust coal is now used. You may take your stand upon London Bridge, or ascend the Monument, from where you can soon for a distance of twelve miles, it would be difficult to trace one smoky chimney. The best of appliances are in use, but they were inefficient for a long period, until the stokers were made to understand that they must give proper attention to their furnaces, or they would be subjected to a fine or a month's imprisonment. If it could be clearly proved by the smoke inspector before a magistrate that the furnace is fitted so that it is capable of consuming its smoke, the prosecution then falls on the stoker for misusage. Mention has been made about 'machine stokers': perhaps there is no place where they have had so true a trial as in London. Jukes's is the only apparatus which may be said to have mastered the difficulty, and before Mr. Jukes died he

proved it to be practicable to apply self-feeding apparatus to certain furnaces; but the difficulty in keeping these machines in order, to say nothing of the first cost, operated against them, so that few of them are now in use. A machine stoker means augmentation of boiler power, boilers of a suitable form for their application, a large annual outlay for repairs, also spare apparatus if it is desired to keep daily in operation, and then, without proper care and attention, they will make as much smoke as any common furnace. It is a common thing for those employing them in London to be fined for smoke. Newcastle, like London, will not get quit of smoke if the stokers are not made to answer for mismanagement and neglect. As for the Tyne, no river can equal it for smoke, and it is a disgrace which could easily be prevented, as on the Thames; but if the law is not enforced, this will continue. We want no committees in London to search for the best mode of consuming smoke. A few sharp smoke inspectors, who will show no favour nor affection to any one, keeping a good look-out for the offenders, would soon cause Newcastle to be as free from smoke as London is."

COMPENSATIONS.

The Metropolitan Board of Works, in their report this year, give an account of the claims made and the compensation actually paid for property taken for metropolitan improvements. The claims settled up to the end of March last in respect of property required for the Southern Embankment amounted to 998,861*l.*, and they were settled for 629,519*l.*, or two-thirds of the sums asked. The chief abatement was in the claims, not for freehold property, but for lesser interests. In fifty-nine freeholds and copyholds the claims were 336,024*l.*, and the settlements 264,574*l.*; seventy-eight leaseholds, claims 584,145*l.*, settlements, 355,265*l.*; thirty-three yearly tenants, claims, 18,650*l.*; settlements, 9,638*l.* For the new street from the Mansion House to Blackfriars, up to the end of March, claims amounting to 2,604,290*l.* were settled for 1,984,711*l.*; and here again the leaseholders had to abate most largely. Claims were made for 1,305,616*l.* for 170 freeholds, and the settlements were for 1,143,867*l.*; the claims for 264 leaseholds were for 1,259,317*l.*, and the settlements 818,969*l.*; for 111 yearly tenants at will, claims, 38,959*l.*; settlements, 21,704*l.* For the property on the Embankment by which the street is continued westward from Blackfriars claims for 327,107*l.* were settled for 221,309*l.*; and again the difference between the two sums was not so large in respect of the freeholds as of the lesser interests. In the Kensington improvement,—widening part of the High-street, and forming a new street from Young-street to King-street,—claims for 216,704*l.* were settled for 160,469*l.*; freeholds, claims, 129,875*l.*; settlements, 102,820*l.*; leaseholds, claims, 78,183*l.*; settlements, 53,247*l.*; yearly tenants, claims, 7,953*l.*; settlements, 4,230*l.* In the Whitechapel improvement,—the new street from Church-lane to Leman-street,—the last account shows claims, 252,795*l.*, settled for 193,757*l.*; freeholds and copyholds, claims, 129,860*l.*; settlements, 108,293*l.*; leaseholds, claims, 114,301*l.*; settlements, 79,907*l.*; yearly tenancies, claims, 8,599*l.*; settlements, 4,610*l.* The Stingo-lane improvement comprises a new street from Marylebone-road to Upper York-street; the settlements up to the date of the report amounted to 8,020*l.*, the claims being 11,986*l.* The claims for freeholds were 5,570*l.*; the settlements, 4,300*l.*; for leaseholds, claims, 6,416*l.*; settlements, 3,720*l.*

"ARCHITECTURAL COMPETITION ONE HUNDRED YEARS AGO."

REMINISCENCES of those who have gone before us in the world of art and architecture are always interesting. The distance of a hundred years is not so great as to prevent its traditional connexion with the present time. I can furnish a few traces of two of the names mentioned in the list given in your last number.*

No. 5 on the list, John and Samuel Hope, were architects in Liverpool. Samuel died early, but John continued in practice nearly half a century. Amongst other works he built, about 1790, Trinity Church, Wavertree, a neat Italian design, with a west-end tower and lantern,

* See p. 781, ante.

* * * The Fen and Marshland Churches, with Historical and Architectural Descriptive Notes." This series of photographs includes the churches of Walsoken, Walton, Emmeth, Wisbech, Walpole, Terrington, Tiney, Leverington, Elm, Ely Cathedral (six views), St. Margaret, Lynn; St. Nicholas, Lynn; Upwell, Outwell, Terrington; St. John, Thorney, and Whittelsey. Paraphrase illustrations by E. Johnson, London: Simpkin, Marshall, & Co.; Wisbech: Leach & Son, 1869.

crowned with a cupola. He also built, in 1799, a large Wesleyan Chapel in Leeds-street, Liverpool, since pulled down.

The business established by him was continued down to a recent period. He was succeeded by Mr. William Byrom, who married his daughter. The Unitarian Chapel in Renshaw-street, Liverpool, was designed by him about 1809.

Mr. Byrom was succeeded by his nephew, Mr. Samuel Rowland, who carried on a large practice for many years, and accumulated a handsome fortune. He built St. Bride's Church, a classical building, with an Ionic portico; a large pile of buildings in Dale-street for the unfortunate Royal Bank, now the Queen Insurance Buildings, &c. He died childless about 1850, without a successor.

No. 8 on the list, Timothy Lightboller, was rather celebrated at the period in question in Cheshire and Lancashire. He was the architect of St. Paul's Church, Liverpool (opened 1769). The design is not common, and possesses considerable merit. The plan is quadrangular, nearly square, with a projecting portico on each front, the columns carried up in one order. The building is crowned with a large dome, supported by a circle of columns inside. The dome was originally open to the church, but the acoustics were so bad that a lower internal ceiling had to be constructed.

Lightboller also erected (1776) St. John's Church, near St. George's Hall, a veritable specimen of the Batty Langley style of pseudo-Gothic.

J. A. PICTON.

BRADFORD TOWNHALL COMPETITION.

The council have selected as the first best of the designs for the new townhall, those bearing the motto, "Let Bradford Flourish" (Medieval); as the second best, those bearing the motto, "Justitia," and as the third best, those bearing the motto, "Gaiety."

The authors of the first designs, who will have the erection of the building entrusted to them, are Messrs. Lockwood & Mawson; the second designs, which gain a premium of 200l., are by Messrs. Milnes & France; and the third, to which a sum of 100l. is allotted, are by Mr. S. Jackson, all Bradford architects.

That the authors of all the selected designs should be all Bradford architects has already led to comment.

The first design has a central clock-tower, based in design upon the campanile of the Palazzo Vecchio, in Florence. The principal contents of the building as designed are called 475,258 ft., and the architects are confident that the work may be executed within the limit of cost,—40,000l.—prescribed by the council.

The plans of Messrs. Milnes & France show the accommodation in the building distributed in the same manner as in the successful design. The style is Venetian-Italian. The Market-street front is about 90 yards in length, and in its centre is the principal entrance, the chief approach to which is formed by a noble portico, two stories in height. The building is surmounted by a large cupola, with clock, bell-turret, and dome. The architects calculate the cost at 34,650l., leaving 5,350l. for extraneous ornamentation, as towers, cupolas, and other architectural features.

Mr. Jackson estimates the cost of carrying out his design at 45,000l.

ARTISANS' AND LABOURERS' DWELLING ACT.

I BEG to inform you of the fact that the vestry of St. George the Martyr, Southwark, commenced to carry out the "Artisans and Labourers' Dwelling Act" on the 18th September, 1868. About seven weeks after the passing of the said Act, the Medical Officer of Health certified the houses Nos. 1, 2, and 3, Charles-court, Charles-street, to be in a condition dangerous to health, so as to be unfit for human habitation. The certificates were referred to a surveyor, and copies of the report served upon the owner, with time and place appointed for the consideration thereof. When the owner appeared with legal adviser, and raised objections, which the vestry overruled, it was arranged that the houses should be closed, and not again be let for human habitation, which houses are at present closed. This case I believe to be the first under that Act. I am desirous that credit should be given where due.

JOHN EDWARDS, Inspector.

MURAL RECORDS.

You have more than once, Mr. Builder, suggested that there should be inserted into the wall of the house that had been occupied by any person of literary, scientific, or artistic eminence, a stone bearing a short inscription, little more than the date of birth and death, such as are found in various cities on the Continent, much in the style of such records in Rome, as in the case of Pausanias and Salvator Rosa.

I take the liberty of calling your attention to this subject at this present moment, because there has passed from among us a man of extraordinary learning, known by his habitual urbanity and kindness to all the frequenters of the reading-room of the British Museum,—I mean Mr. Thomas Watts. Surely a stone in the wall of the British Museum might be made to speak a word of recognition and approval of such rare public services. Of course, it would be for the trustees and the architect to determine where such records might be appropriately placed.

B.

ARCHITECTURE AS A POPULAR STUDY.*

ARCHITECTURE is too much overlooked by us as a study. There is no science which is forced so much upon our attention; no science which pleases us so much, even although we do not understand it; no science of which it is easier to learn something; no science which carries us further back in the world's history, and presents such a vivid picture of the manners and customs of nations, that would otherwise have been hurried out of sight and remembrance; and yet as an accomplishment it is the least chosen of any. All the arts and sciences are useful in civilising and enlightening a nation, but we question whether any is more useful than architecture. We can fancy a nation having wonderful architectural structures (like Great Britain in the thirteenth century), with little knowledge of poetry, philosophy, or astronomy; but we could not imagine a nation learned in all the sciences living in huts and wigwags. It is necessary for the well-being of the other arts and sciences. It is also useful in being the best means by which a nation can record its greatness, and hand it down to future generations and ages. As Ruskin says, "How cold is all history, how lifeless is all imagery to that which a living nation writes and uncorrupted marble bears! how many pages of doubtful record might we not spare for a few stones left one upon another!" One of the deepest feelings implanted in man is that of wishing his name to be remembered after he is passed away. Akin to that is a patriotic feeling, desiring that his country may long be preserved, and its name, actions, and acquirements remembered to the world's end. What, then, is to accomplish this latter desire? Is it the poetry, the philosophy, or the manufacturing skill of a nation that is to do it? No! Let us wander down the banks of the sacred Nile to the interesting land of the Pharaohs, and whom do we find there as representative of the greatest nation in old-world history? A few wandering Arabs living in tents, and surrounded by cattle, with no architecture, no literature, no art, no science, and who expect to reach heaven through the narrow gates of Mecca. Let us ask them for the language, the religion, and the literature of the ancient possessors of the soil, and the only answer we obtain is a movement of their finger towards some colossal ruins in the neighbourhood, signifying that the architecture of the Egyptians alone is left a witness to their greatness. Yet it is sufficient. Go into the Hypostyle Hall of Karnac at Thebes, and wander among its groves of massive and gigantic pillars, sculptured with figures and hieroglyphics from top to bottom, along whose innumerable vistas we gaze in wonder and awe, till the gradually-receding columns are lost in a gloomy obscurity. The number and magnitude of the buildings show us the Egyptians' power and wealth; the images and bas-reliefs of their religion and ceremonies; the carvings and details of their culture and taste; the precision with which each joint is fitted, of their skill and workmanship; and in the great size of the materials, and the strong and almost imperishable manner in which they are put together, we perceive that they, more than any other nation that ever existed, were possessed of the desire to live for ever in history.

* From a paper by Mr. A. Dewar, read before the Halifax Literary Society, Nova Scotia. We print it as agreeably indicative of advancing taste in the colony.

so that all nations of the earth might behold and reverence their greatness and power.

We read in Spanish history how Cortez invaded Central America, and destroyed many great cities and magnificent buildings occupied by a highly-civilised and intelligent people; but the present degraded Indians of that country, living in huts, often tell us nothing of their ancestors, nor do they preserve any books or traditions regarding them. It is only by examining their ruinous and forest-bidden cities, discovered only a few years ago, that we can prove the truth of the Spanish historians, and only by reading these stone books of the nation that we can determine their position in the scale of civilisation, their knowledge, their power, and their religion.

A few years ago a traveller was threading his way through an almost impenetrable and uninhabitable jungle in Camhodia, Siam, when, through an opening in the trees, there burst upon his astonished vision the massive wall of an old deserted city. Entering therein, he discovered, among other buildings, a magnificent temple, rich in ornament, beautiful in style, and grand in design. Long shady corridors ran round the outside, constructed better than modern works of a similar nature. The pillars were ornamented with the most exquisite mouldings and carvings, and the walls were enriched with the most graceful bas-reliefs, depicting the people in one long procession, the ladies in magnificent attire, and the men carrying swords and spears of apparently beautiful workmanship, or driving in wheeled carriages of elegant design, the whole demonstrating to the astonished gaze of the traveller, that a powerful, wealthy, and highly-accomplished nation, whom Europeans had never heard of before, once occupied these ruins; that about those streets people hustled in ahney stream of life, where now all was solitude and desolation; and in that temple, where the voices of thousands joined in a universal song of praise, the serpent and the tiger now made their shod. Thus do we find, and in many more instances besides those we have mentioned, when a nation has been swept off the earth, or sunk into barbarism, when its descendants possess no traces of their ancient history, and no traditions of their ancient glory, when their books have been destroyed, and all the other knowledge and skill that they possessed have failed to witness to their greatness, that architecture, like a faithful sentinel, has stood by it in its centuries of neglect and danger, brought it out of the mist and obscurity with which it had long been veiled, and placed it in its proper rank among the nations of the earth.

Architecture is the one language which every nation can read and understand. People point to literature, and say that there is an influence which reaches from the highest to the lowest, but its universal influence is cramped by languages; to painting, but by its scarcity it influences only the wealthy and the educated; to individual religions, but their influence passes away with the nations that adopt them. Books may be written, yet we are not forced to read them; pictures may be painted, yet we are not forced to look at them; sermons may be preached, yet we are not forced to hear them; but architectural buildings cannot be erected in our midst without our regarding their appearance and meaning, and there they will stand, coloured by hoary age, exerting an ever-present influence over future generations when the name of the builder has been lost in oblivion. People may, without thinking, deny the intellectual influence of architecture, but what a man sees every day has as much influence on his mind and feelings as the meat he daily eats has over his body.

Architecture has as ennobling and refreshing an influence on our minds as the advance of spring and summer has on our bodies, accomplished also in as gradual and imperceptible a manner. For whatever suggests thought and causes research, and is accordingly a most beneficial and powerful instrument for improvement. The nobler the feelings also that are aroused the greater is the pleasure.

In travelling, a knowledge of architecture is invaluable. In visiting a foreign country, and entering their cities, every one takes most interest in that which illustrates or teaches him more regarding his special study or hobby. The student ransacks the libraries for ancient classical lore. The artist lives in the picture galleries, admiring and studying their contents. The antiquary frequents the museum, and patiently threads his way through narrow, dirty

streets, seeking for old buildings. The geologist, like Hugh Miller, wanders to the churchyard, and there discovering a fossil in a stone, passes away hours in looking at it, investigating the causes of its appearance there, musing over the story that it tells, and noting the lessons that it teaches. The merchant examines the shops and stores. The man of pleasure frequents the restaurants, the billiard-rooms, and the theatres. But one and all make a point of examining the principal churches and public buildings. Yet though they see the structures they do not understand them, nor can they comprehend their full meaning. They are as much understood as a starry sky is by one who does not know astronomy, or a collection of wild flowers by one who is ignorant of botany.

THE EDINBURGH POOR-HOUSE.

A NEW poor-house for the city of Edinburgh has been erected at Craiglockhart. The site is within a very short distance of the city, and yet the scene is as quiet and as thoroughly secluded as if it were miles away. The principal approach to the building is from the Morningside-road, about a quarter of a mile to the south of the Morningside toll-bar.

The new poor-house faces the south, and will ultimately consist of three groups of distinct buildings, viz., the main poor-house in the centre, the infirmary to the east, and the lunatic asylum to the west. At present only the poor-house and infirmary have been erected, though the site of the lunatic asylum has been partly excavated and levelled.

The style of the buildings is Scotch. The whole is treated in a plain and simple way, without expensive or ornamental details. The architectural effect is chiefly obtained from the mass and extent of the building, and by the arrangement of the plan in breaking it up into a number of separate blocks. At the centre of the main poor-house a corbelled tower, octagonal in form, rises to the height of 105 ft., and a picturesque and varied outline is given to the long fronts by numerous projections, crowned with crenelated gables. The classes are entirely isolated from one another in separate blocks of buildings, each complete within itself, and every class has a spacious airing-court allotted to its own use. Those for the doubtful classes are surrounded by the poor-house buildings and offices, while the better-behaved have airing-courts facing the south, tastefully laid out with walks and plots in which flowers and shrubs will be cultivated. The separation of the building into a number of detached blocks, joined only at one point by a connecting corridor, is a peculiarity of the Craiglockhart Poorhouse. The separate block system adopted gives facilities for ventilation and for obtaining sunlight and fresh air for the inmates. A second peculiarity of the building are the special facilities afforded for efficient administration, and for the smooth working of the establishment with a small staff of officials. The poor-house consists of an administrative block in the centre—two blocks in line with it to the west for the male paupers, and two blocks in line with it to the east for the female paupers. As the females are considerably more numerous than the males, a third block is provided for them to the north of the other two, and facing eastward. The buildings are three stories in height, except the east wing block, which is only two stories high. The central corridor of communication, which connects the various blocks on each floor, is in one unbroken line from end to end, without any steps or difference of level; and from it the officials can, both by day and by night, keep a constant supervision over the various classes without requiring even to enter the wards. The corridor is 6 ft. 4 in. wide, and is thoroughly well lighted, and ventilated directly from the external air between each block. In the administrative block at the centre, and separating the male and female portions of the building, are the offices of the governor and matron, and the other official apartments. Immediately behind is the dining-hall, and beyond it the kitchen department and stores. The stores are concentrated in a two-story block immediately facing the back entrance, so that all goods on their delivery are at once carried into them. They are in the immediate neighbourhood of the kitchen, where so many of the articles are to be used, and have also separate serving-rooms attached for males and females, where articles not used in the

kitchen are distributed to the parties coming for them from the wards. The kitchen, which stands between the stores and the dining-hall, has also serving-rooms attached to it communicating both with the dining-hall and the wards. From the special arrangements adopted, none of the paupers, except those regularly employed in the kitchen and stores, can ever be there without immediate detection, and thus pilfering and many other evils are avoided. From the concentration which has been effected, not only can the governor and matron keep a constant supervision over these important departments, but also a much smaller staff of paid officials will be able to do the work than could otherwise have accomplished it.

We come next to notice the sanitary arrangements. Each class is provided with separate water-closets, lavatories, and baths, upon every floor, to which they have ready access both by night and by day. The closets are placed in projections opposite the staircase at the centre of each block, and are entirely cut off from the wards by doors and intermediate lobbies, having thorough cross ventilation. The two walls of the central corridor are built hollow, and a series of chambers about 3 ft. 6 in. are formed along the whole extent of the wall on both sides of the corridor. These chambers are made use of for extracting the foul air and supplying the fresh-heated air. In every block two hot chambers are provided, in which fresh cold air brought from the outside of the buildings is heated by powerful coils of steam pipes, and is covered by the hollow chambers to the various floors. For ventilation a central foul-air trunk is provided in the roof of every block, and each ward has several of the chambers in the hollow walls, acting as extracting flues, and leading the foul air up to the central trunk. At the middle of each block a hot chamber is formed, where the foul air is rarified by the heat from a hot-water cistern, and a current being thus produced, the foul air escapes through a large ventilator into the open atmosphere. Each ward is also provided with Sheringham's patent ventilators in the external walls for the supply of fresh cold air, so that a constant circulation is maintained during the night, and at other times, when the windows are all closed. The day-rooms and dormitories for the various classes of paupers are all large and spacious apartments. They are 35 ft. long by 18 ft. wide, and have 12-ft. ceilings, giving in the dormitories a cubic air-space on the average of nearly 500 ft. per bed. The wards are heated at each end by large open fireplaces, with an iron grate and mantel-piece of new design, projecting boldly out into the apartment, and having fire-brick back and sides, so as to radiate the heat in all directions. The fireplaces openings have circular heads, and the spandrels on each side are ornamented with foliage, having the poor-house monogram and the date in low relief. The walls of the wards and passages have been all lined to the height of 4 ft. 6 in. from the floor. The plaster-work of all the bath-rooms, lavatories, and water-closets is painted in oil, and the woodwork varnished.

The dining-hall is 74 ft. by 48 ft., with accommodation for dining 600 paupers. It is divided by iron columns into a centre and two side compartments, and the ceiling is panelled in squares, with ornamental main couples, brackets, and pendants. There is a platform at one end, suitable for addresses, concerts, &c.; and as the dining-hall is at present to be used as the church for the poor-house, the pulpit will be in the mean time placed here. The seating is all open, supported on iron standards, so arranged that the seats can be folded up for cleaning out the hall daily.

The kitchen is 30 ft. square by 19 ft. high, and is thoroughly lighted and cross ventilated by large clearestory windows on each side, going right up to the ceiling, so that all steam or vitiated air can be swept away. The kitchen and the scullery adjoining are fitted up with a most powerful steam cooking apparatus. In the kitchen there are six steam-cooking vessels, several of them 5 ft. in diameter; and in the scullery there are two large steamers for vegetables, which are prepared by steam in open wire trays much quicker and better than they could be hoiled in water.

At the back of the internal female airing-courts is situated the washing department, and the enclosed drying and bleaching greens.

At the back of the internal male courts are the workshops for the smiths, carpenters, plumbers, tin-smiths, painters, tailors, shoe-

makers, bookbinders, &c., and adjoining these are extensive farm offices.

The infirmary is designed upon the pavilion system, now universally adopted in all new hospitals. There are four pavilions arranged in pairs for ordinary cases, and a fifth pavilion at the back, entirely detached, to be used exclusively as a fever hospital. At the centre of the corridor which connects the pavilions is placed the administrative block, which contains the officials' apartments, the dispensary, store-rooms, and kitchen accommodation. The pavilions are two stories in height, and contain one ward on each floor.

The governor of the poor-house is accommodated in a detached villa erected on the ground to the west of the main building, and the other officials have apartments within the house.

As the Edinburgh Water Company's Act did not embrace the poor-house within the area of supply, it became necessary to obtain a Bill to extend the area so as to include the poor-house. This was passed during the last session of Parliament, but the necessary works authorised in connexion with the Bill have not been begun yet.

The total number of pauper inmates for whom accommodation is at present provided is 1,000,—viz., 740 in the main poor-house, and 260 in the infirmary. The lunatic asylum, which, as we have said, is not yet begun, will accommodate 160 additional.

The contracts for the poor-house, infirmary, and governor's house at present erected amount to about 45,000*l.*, exclusive of roads; and we understand that there is every prospect that the whole expenditure will not exceed the sum originally contemplated—viz., 50,000*l.*

Messrs. George Beattie & Son, Grove-street, are the architects of the building. The contractors are Mr. Robert Hutchison for the mason work; Messrs. Kemp, Murray, & Nicholson for the joiner work; Mr. William McCalman for the plumber work; Mr. William Anderson for the slater work; Messrs. Ross & McLean for the plaster work; Messrs. J. Young & Co. for the ironwork; Mr. Andrew Cunningham for the glazier work; Mr. John Meiklejohn for the heating; Messrs. John Brydon & Sons for the bells; Messrs. Andrew Muirhead and G. H. Potts for the painting; and Mr. John Mellon for the roads, &c. The clock and bell have been supplied by Messrs. Robert Bryson & Son; and the iron cistern and tanks by Messrs. John Whitelaw & Son, Dunfermline. Mr. Andrew Wood is the clerk of works.

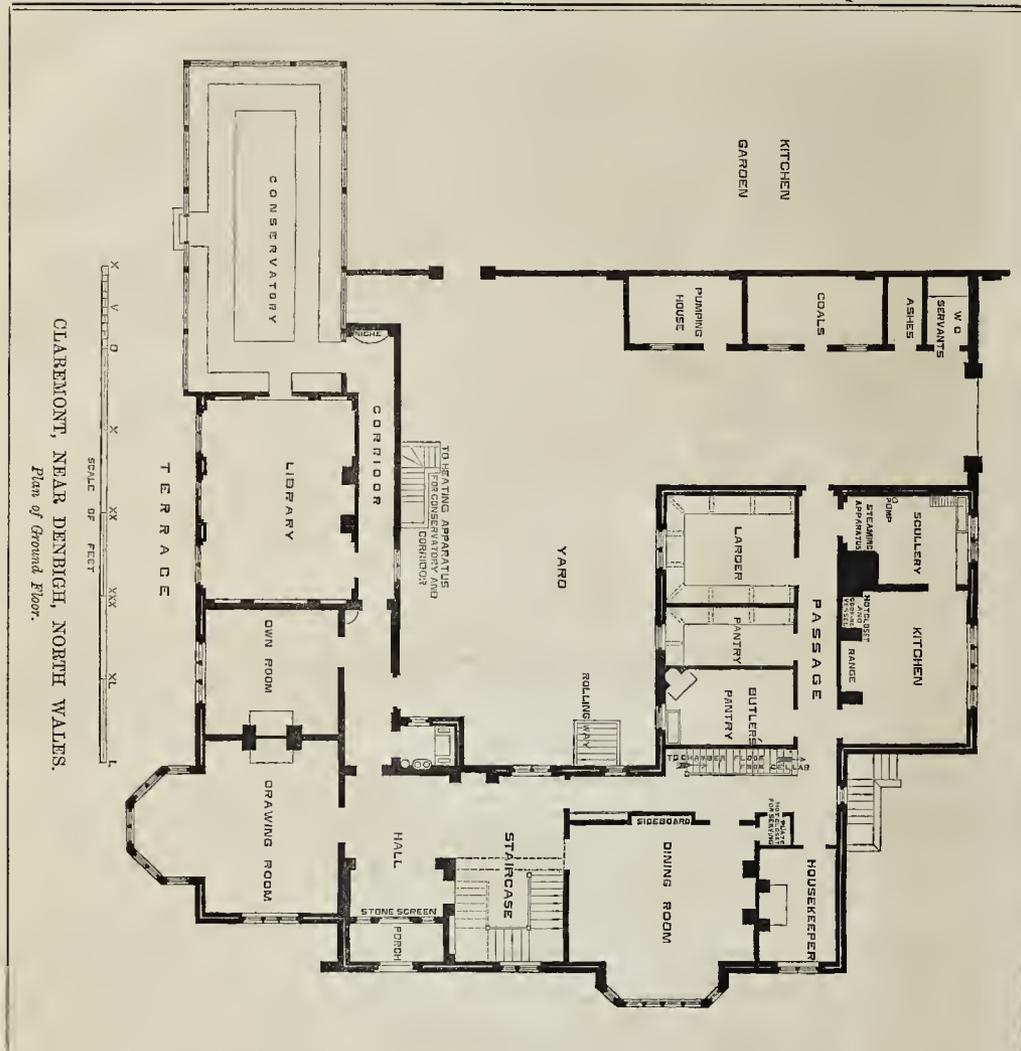

CLAREMONT, IN THE VALE OF CLWYD.

THE works at Claremont, in the vale of Clwyd, North Wales, the country residence of Mr. John Taber, of London, have just been completed. All the out-buildings, stabling, garden walls and sheds, lodge and park walls, terraces, and gardens, have been carried on simultaneously. The house itself is Domestic Gothic in style, the principal material for the walls being red brick from the brick-yards at Birmingham belonging to the builders, there being at the time of commencement no bricks in the locality. The whole of the window and door dressings, bay and oriel windows, parapets, &c., are of Cefn freestone, one of the best building-stones used. The outside woodwork is red deal, all the joinery being of pitch pine, five or six times varnished, the different coatings being rubbed down so as to get a fine surface.

The house on plan consists of entrance-lobby, paved with encaustic tiles, hall, and staircase-hall laid with parquet; the ceilings here being open timber-work, with moulded beams. The chimney-piece is of freestones, designed in character with the rest of the house; it has marble shafts and bases, carved caps, stone fender, and tile hearth. The staircase is of stone, with wrought-iron continuous balusters. Dining-room, with large bay-window and parquet border; drawing-room, with octagonal projection; library, own room, and conservatory. There are the usual servants' offices, and arched cellars under the main portion of the building.

In connexion with the private or own room is a W.C. and lavatory, with hot and cold water supply. An entrance is provided to the yard, so that fishing or shooting parties need not enter either the front door or servants' offices; the owner being also able to see his out-door servants without the necessity of their having to pass any portion of the house.

The dining-room has a serving-closet within, so that the doors need not be opened during dinner.

The whole of the water is pumped from the well to the tower, and thence conveyed to the different parts of the house, gardens, and vineries.

The position of the drawing-room has been so arranged that fine views are obtained of the whole of the vale of Clwyd. Standing in the octagonal portion, to the right is seen Denbigh, crowned with its castle; beyond is Rhyddlan Castle; and farther on, the sea. In front are picturesque ranges of hills, small valleys running up from the larger vale. To the left is Ruthin, with its picturesque town, where the church-spire and the castle are conspicuous, peeping over dense masses of foliage; views south, east, and west, embracing Ruthin, Moelfamma, and the opposite mountains, are obtained. At the bottom of the grounds, to the west, runs the River Clwyd, which gives much beauty to the surrounding magnificent scenery. Owing to the tremendous force of the wind as it rushes up the valley from the north-west, and direct from the sea, care has been taken with the view of keeping out the weather. All outside walls are built hollow; the casements of the windows have copper weather-bars top and bottom; the siles are strengthened with strong copper flanges, one portion of which, shutting into the frame, may prevent the heating in of wind or rain. Brass bolts, the entire height of the casements, with clips top and bottom, force the window to,

the handle as it is turned acting as a lever. All sills are weathered by a moulding worked on them, the ends having carved stops.

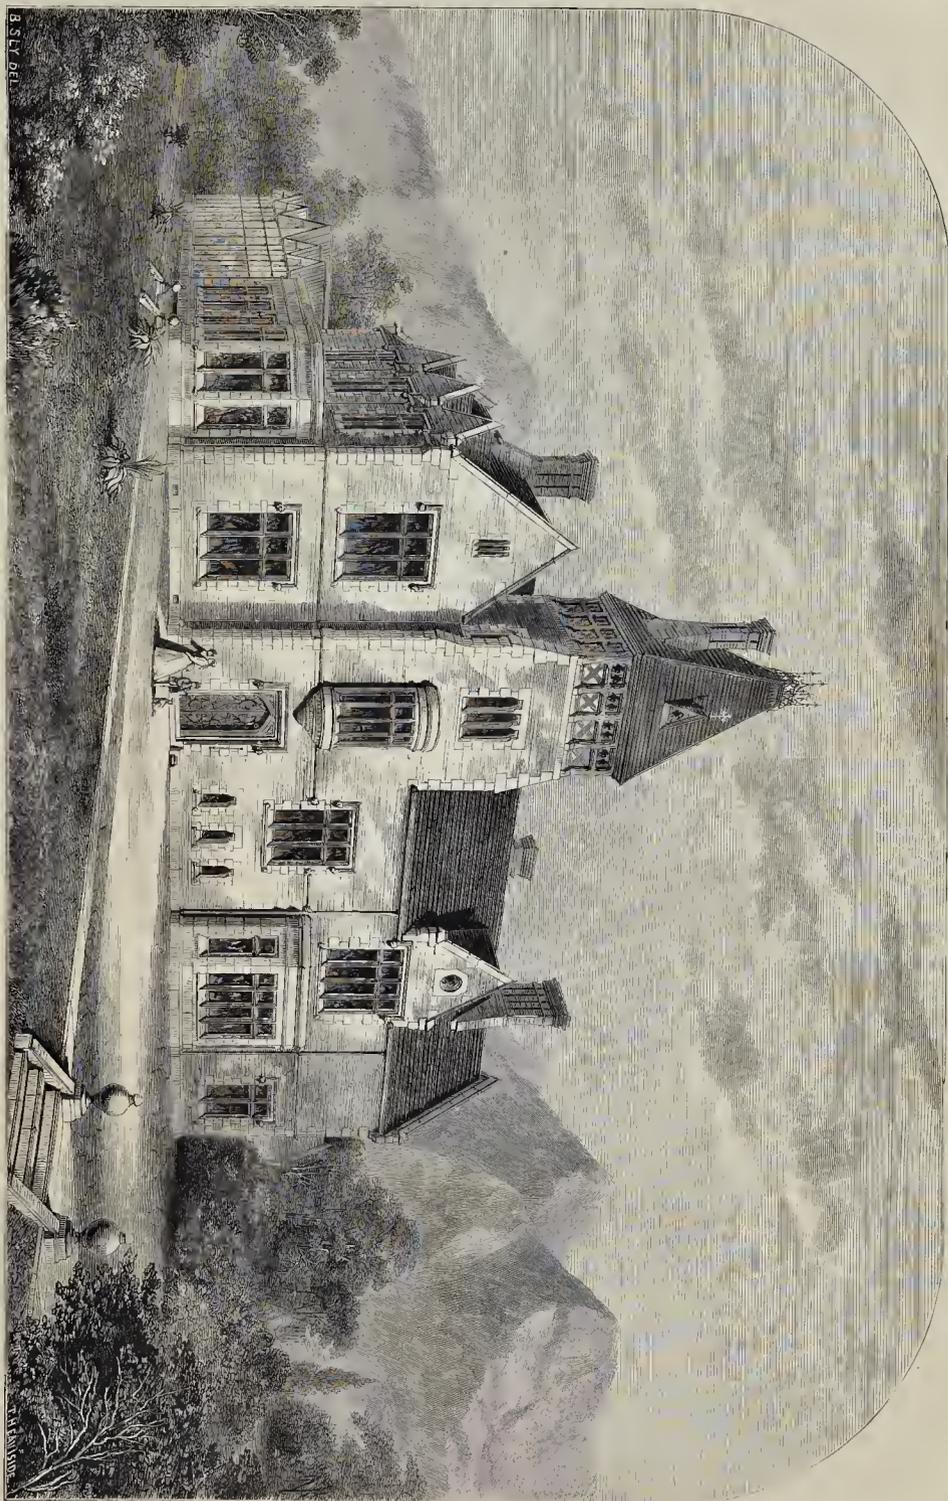

The carving throughout, by Mr. Griffiths, of Chester, is good. The same carver modelled all the enriched ornaments for the plaster cornices.

The library, which can be used as a music-room, opens into the conservatory, which is 40 ft. by 21 ft. The library has been specially designed for decoration; in its length it is divided by piers into three bays of uniform size, the ends having three, the central one being wider than the others. The fireplace is specially designed, and has a marble fender and encaustic tile hearth. The cornice has a large and enriched cove, somewhat more freely treated than the other cornices. The garden wall is built hollow for strength and protection from cold.

The river, which runs so near, is in a prolonged drought, such as we had last summer, almost dry. A well has therefore been sunk, and as quicksand was found, iron cylinders had to be used. In case the water here should fail, pipes are connected with a large rainwater tank, 12 ft. deep, and 12 ft. in diameter. Tanks of similar construction are provided for the lodge and stabling. The water supply for the range of vineries and forcing-houses, besides being supplied from the tower, is supplemented by large slate cisterns.

The whole of the works, with the exception of the woodwork for the vineries, has been satisfactorily carried out by Messrs. Barnsley & Sons, of Birmingham and London. Mr. Ewing, of Chester, laid out the grounds, and designed the woodwork for vineries; the architects undertaking the conservatory, which, adjoining the house, had to be in character with it. Messrs. Haden heated the conservatory, and designed and supplied the cooking apparatus. Mr. Tilley, of London, sank the well, and supplied the cylinders. Messrs. Maw supplied the tiles for lobby, conservatory corridor, and conservatory. Messrs. Arrowsmith the parquet floors; Mr. Crace the decorations, with the exception of the wrought-iron balusters, which were done under the architect's direction before Mr. Crace came, so as to prevent the "monzing" of wrought-iron work, had an inferior decorator been employed. The balusters were creditably done by a local blacksmith, Mr. Thomas, of Denbigh.

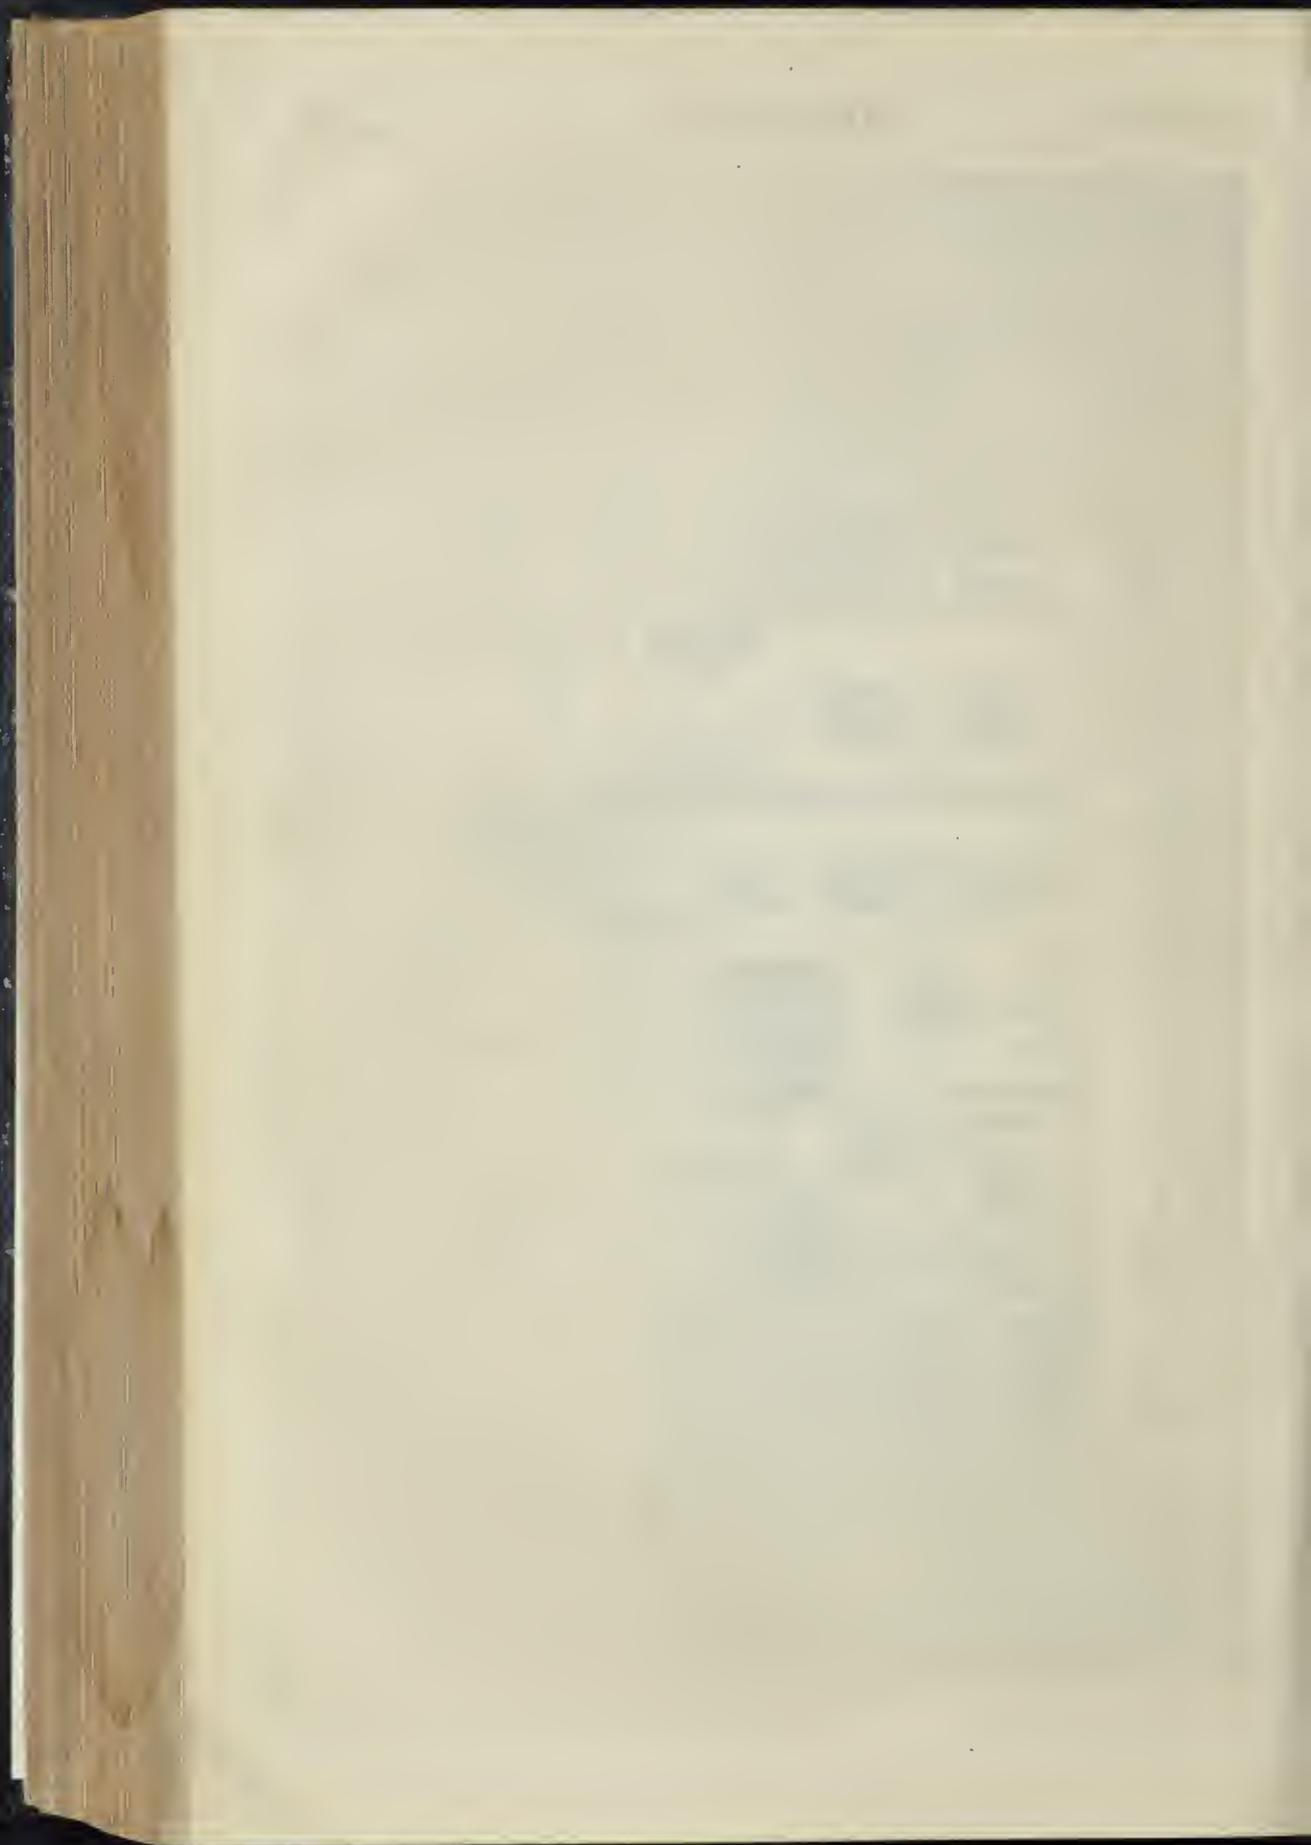

The architects were Messrs. Lloyd Williams & Underwood, of Denbigh; Mr. King, of London, filling the place of clerk of works efficiently. The contract for the house, exclusive of the conservatory and room adjoining, was 4,250l.; the cost of conservatory and adjoining room, 1,400l.; the garden walls, stabling, lodge, vineries and potting sheds, park walls, gates and piers, terrace steps, &c., raising the amount to between 10,000l. and 11,000l.

CLAREMONT, IN THE VALE OF GLWYD, NEAR DENBIGH.—MESSRS. LORD WILLIAMS & UNDERWOOD, ARCHITECTS.

B. S. L. DEL.

H. F. WOOD

DRAINAGE AND POLLUTION OF
STREAMS.

Liability of Drainage Commissioners for "Negligence."—The case of Collins v. The Middle Level Commissioners was held by an Act of Parliament certain drainage commissioners were to make and maintain an embanked cut to carry off their drainage water through lands on a lower level, and not within their jurisdiction, to the river Ouse; and also to make and maintain a culvert under the cut, to carry the drainage of those lands from the east to the west side of the cut. Owing to their negligence the bank of the cut burst, and the water flooded the land on the west side of it. The plaintiff, who occupied land on the east side of the cut, stopped up the culvert to prevent the water coming up it; but the occupiers on the west side broke down the obstruction, and consequently his land was flooded also. It was held by the Court of Common Pleas that he was entitled to recover from the Commissioners for the damage done.

Pollution of Streams.—The Corporation of Halifax had erected certain works so that the sewage of the town flowed into an ancient brook, which passed the mill of a manufactory, and thereby the brook or stream was so far polluted as to affect the health of the workmen and others in the manufactory residing in the neighbourhood of the stream, and also affected the property of the manufacturers. The balance of the scientific evidence proving that what had been done by the Corporation caused a nuisance and was injurious to the public health, it was held by Vice-Chancellor James, in the case of the Attorney-General v. The Corporation of Halifax, that the relators were entitled to an immediate injunction to restrain any further extension of the works by which the pollution of the stream had been caused, and a further injunction (to commence on the 1st of June, 1870, to allow time to the Corporation to apply to Parliament for additional powers if so advised), against causing the sewage to pass by or through the present outfalls.

The Beccles Drainage.—At a special meeting of the Town Council the Mayor read a report of Mr. Bruff, on the drainage of the town, which, after a long discussion, was adopted, by nine out of thirteen members present voting for it. The town-clerk was instructed to ascertain the expense already incurred; and also whether any and what further expense will be incurred to put the Council in possession of plans, sections, and information which may be necessary to carry out an improved system of drainage by degrees, as the requirements of the town and the state of the borough fund may warrant.

CHIPSTABLE CHURCH, NEAR
WIVELSCOMBE, SOMERSET.

In the early part of the year 1858, the body of this church, being in a dilapidated and unsafe condition, was taken down. The work of rebuilding was then commenced, from the designs of Mr. Ferrey, F.S.A. The new edifice consists of nave and chancel, and south aisle with porch. The eastern portion of the aisle is separated by an ornamental wood screen to form the vestry. The massive Perpendicular tower, which had been substantially repaired some few years since, has not been interfered with, except by the removal of the modern screen which blocked up the arch opening into the nave. The old body of the church appeared to have been rebuilt, or at any rate considerably altered (in the last century most probably).

The arcade dividing the nave and aisle was of the Perpendicular period, and possessed some curious caps composed of figures of angels bearing shields, &c. Several of the bench ends to the nave were of the late Tudor style, of an elaborate and beautiful character, and profusely carved.

The old roofs to the chancel and aisle were of the Somersetshire type, barrel shaped, formed of arched and longitudinal ribs, with paterae at the intersections; there were carved figures at the springing of the ribs; the panels were filled in with plaster.

The whole of the features thus described, whenever they were not too much decayed to be used, have been reintroduced into the new church. The roofs are of similar character to the old ones. The new nave benches and ends found requisite are designed in harmony with the ancient, though somewhat more simple workmanship. The new building, generally speaking, follows the form and dimensions of the previous

church, but is slightly larger. The new pulpit is of stone, with carved panels of the four Evangelists; and, no old font remaining, a new one has been designed. The chancel benches are of wainscot, with shaped ends and sunk carved panels. The local stone (the gift of the Rev. W. Nicholls, the rector, and Mrs. Nicholls) has been employed as the material for the walls, with Ham Hill stone for the dressings. The roofs are covered with Bridgewater tiles. The chancel is separated from the nave by a bold arch of discontinuous character, so that little or no interruption is presented, and the entire church and aisle are well open to the chancel. The altar-cloth, lectern, and kneeling-mats were given by relations of Mrs. W. Nicholls; two carved Glastonbury chairs by a relation of the rector; and two carved alms-boxes by the builder.

The total cost of the work has been upwards of 1,500*l.*, and it was carried out by Mr. Henry Davis, of Taunton, builder.

THE POULTRY: UGLY BIRDS.

SIR,—Can you afford a corner in your usefully-filled journal to protest against allowing such a hideous block of houses as those on the south side of the Poultry to occupy one of the most valuable sites of the richest city in the world?

I never have the pleasure of sitting at any of the western windows of the Mansion House; but if I had, I should fancy that, although the demolition of "Charlotte-row" had increased the range, it had by no means improved the beauty of the view.

Our architects of the present day are wisely and successfully combining beauty and utility; give them such a site as the above to deal with, and we may feel assured that the result would be such a transformation as would, at the same time, afford a more agreeable picture, develop the resources of the situation, add to the wealth of the City at large, and provide greater accommodation for the traffic.

USEFUL AND ORNAMENTAL.

TELEGRAPHIC PROGRESS IN AMERICA.

The purchase by our Government of the telegraphs appears to be exciting a desire in the States to go and do likewise. The *New York Herald* of the 1st ult. understands there is a new and remarkable invention, an automatic system of self-telegraphing power, which will multiply eight or ten times the facilities of telegraphic communication over the present system. There is reason, he thinks, to believe this is one of the most astonishing inventions of the age, and destined to produce a great revolution in the commerce, financial affairs, intercourse, and social condition of the world. The United States Government will be asked, it is said, to test this invention, and to take control of and use it for the public good. "Congress, we hope," says the *Herald*, "will not hesitate to investigate the matter and to make the necessary appropriation,—first, to try the new system between Washington and New York, and then, if successful, to obtain the patent and give the whole country the benefit of it under Government control. Congress should pass at once, on reassembling, Mr. Washbourne's Bill appropriating 30,000 dollars for an experimental postal telegraph line between New York and Washington, with an addition of any other sum, if necessary, to test on such line the new automatic system. It is known that the object of Mr. Washbourne and those who act with him in proposing an experimental postal telegraph line is, if that should prove successful, to place the whole telegraph system of the country under Government control. This is the secret of the determined and powerful hostility of the existing telegraph monopoly to his measure. The time has come when the telegraph should no longer be in the hands of private companies or individuals. The British Government has had the sagacity to see this; has purchased the lines in England, and on the 1st of January next will take entire control, in connexion with the post-office department, of all telegraphic communications. The great nations have moved slowly in this matter, and have followed what the lesser ones—such as Belgium and Switzerland—had done before. All will have to come to it in time. There is no other way of preserving the secrecy of communications, of preventing monopolies from using the telegraph to the injury of the public, and of cheapening the transmission of messages."

THE PLYMOUTH MEMORIAL, MASSA-
CHUSETTS.

MANY memorial monuments have been raised in various places throughout the United States, to commemorate the deeds of the Northern army during the late war, and one has just been erected at the seaport of Plymouth.

It is a column of the Doric order, composed of fine Hallowell granite. The mound on which it is placed is 60 ft. in diameter, and nearly 4 ft. high. On this mound are three steps of Rockport granite. The base of the monument is 9 ft. 6 in. square, with a sub-base 6 ft. square supporting the disc—a single block of stone—on which are placed the four tablets. The base of the column is round, with heavy mouldings, as are column and capital. The capital is ornamented with a sculptured laurel wreath, and is surmounted by an eagle standing erect, and having underneath its feet a crushed serpent and a broken chain. The total height of the structure is about 40 ft. The inscription on the front tablet bears in deep-out letters the following:—

"MEMORIA

IN

ETERNA.

THE SOLDIERS AND SAILORS OF PLYMOUTH WHO
GAVE THEIR LIVES FOR THEIR COUNTRY
IN THE WAR OF 1861."

The remaining tablets contain the names of seventy-two who perished in the war. The builder was Mr. Peter Blessington, of Boston. A similar monument for Derby is now being exhibited at the builder's works in Cambridge-street.

BUILDING LAWS.

SIR,—I am glad to see you taking an interest in the fallaciousness of trade. I sincerely hope you will continue to attack the subject, and not let it rest until the Government take stringent measures for its suppression.

You mention houses that will just stand, locks that will scarcely last a week. The class who are to blame are those who style themselves manufacturers, whereas they are only factors. It is that class by whom the capitalist who is willing to pay a fair price for a good article, and the good workman who will produce a good article at a fair price, are defrauded. I repeat my conviction that it is high time for the British to adopt the plan of Napoleon I. with regard to the laws affecting the building trade. On his accession to the throne of France he found the laws of France to be most defective. He chose a number of young men and set them to make a code of simple, just laws, and fastidiously into their minds that the simpler the laws they framed aimed for the administration of justice, the greater would be their reward: he locked up the old laws and issued the Code Napoleon which those young men of integrity framed, under which the building trade of France is prospering. Therefore they are able to build a city worthy of a great nation, and to make great advancements in the march of arts, commerce, and manufactures.

ALEXANDER KAY.

CONCRETE BUILDING.

SIR,—In your leading article of October 2nd you particularly call attention to the fact that ballast sensibly diminishes in bulk when made into concrete. Of this I am perfectly convinced; and, after making several accurate measurements, and building within these last six months over a thousand cubic yards of concrete walling, I find that 6 cubic yards of river ballast or clean gravel are required to build 5 cubic yards of finished walling.

Now I find Mr. Tall, in his pamphlet, page 3, gives—to use his own words—"the proportion of materials employed in the construction of houses now in progress opposite Perry-street, Gravesend, as follows:—7 yards of burrs from brickfields; 7 yards of gravel stone; 1 yard of Portland cement (16 bushels to the cubic yard)". This will do 15 cubic yards of concrete walling. He therefore not only allows nothing for diminution in bulk of the ballast and burrs, but measures the Portland cement as well. Any one tendering for the building of concrete walling on the basis of these figures would be sadly wrong. Moreover, these works are copied, word for word, into current price-books. Another error, I find, is given credit to, and which I have not seen contradicted,—"The walls being of one solid

mass, sound is completely deadened." This is quite wrong: a gentle tap on the hard cement angle of the chimney-breast of the adjoining room is heard so distinctly where I am writing this, although a 9-in. wall intervenes, that one unconsciously looks round to discover whence it proceeds.

That concrete walls have many advantages is an undeniable fact; they are cheaper and stronger, and in country places where bricklayers are difficult to be procured, agricultural labourers are only too glad to obtain 6d. a day more wages than they usually earn; and farmers—except at hay-cutting and harvest—are glad for some other employment for a portion of their hands. Living in a very exposed situation, I find that 9-in. concrete walls give not the least evidence of the "sweating" so usual to see on the plastered walls of newly-built brick houses in damp weather.

For tanks for storing rain-water, undoubtedly concrete is "the" material. I find it requires somewhat more cement in proportion—about one part in six. I use a wooden circular drum or core, 6 ft. in diameter and 3 ft. in height, and made in four quarters, to facilitate moving and refixing; I dome the top with concrete, leaving a manhole in the usual manner. These tanks do not require plastering or facing with Portland cement. Nor does the water waste,—a sufficient evidence of the imperviousness to water of concrete. The cost is less than half that of brick tanks, as the latter always requires plastering with Portland cement, unless glazed bricks are used.

It is not uncommon for the circular walls of brick tanks to be filled up behind with pieces of brick or other rubbish: with concrete it is one solid mass. W. W.

THE POINTING OF FIRE-BRICKS.

Six.—Will some of your practical readers inform me what is the best material to use for the pointing of fire-bricks in open stoves? I find that where fire-bricks are set in ordinary fire-clay, the joints soon burn out for a depth of about half an inch, which gives the fireplace an untidy appearance. W. G. L.

ASPHALTE.

I SHOULD feel much obliged to any of your readers who would tell me how to lay down asphalt; what substances to mix with it, in what proportions, so as to form the hardest and toughest composition; I am building a small yacht, and wish to fill up the space between the floor-timbers, so as to make the bottom water-tight, and to form a waterway. S.

QUANTITY SURVEYORS.

Six.—In the *Builder* of the week before last there is a list of tenders for "building houses, Church-street, Blackfriars," the quantities by Mr. Shrubsole. My client (Mr. Cohen), whose tender was accepted, has requested me to say that he knows nothing whatever of Mr. Shrubsole, and that he did not receive any quantities from him. I shall feel obliged by your giving this publicity. J. C. TRAVIS.

* * We have received letters to the same effect from other builders who tenders, and feel it necessary to say that the statement objected to came to us from Mr. Shrubsole himself.

COMPETITIONS.

Manchester Reform Club.—In this competition the design by Mr. E. Salomons has been selected.

The Proposed Church on the Beaconsfield Estate.—In reply to the protest from competing architects (see p. 733, ante), the committee, by the Rev. J. Thompson, said,—“That, agreeing neither in the justness nor charity of its several allegations, they adhere to the decision of their previous meeting.” Mr. George Fowler Jones, whose name was accidentally omitted in our copy of the protest, in the course of a rejoinder, says,—

“As some of the committee, on being told of the facts, admitted that the proceedings were wrong, and as it was quite clear to the public, from the exhibition of the designs, that the choice was not according to the instructions, the stigma of injustice must remain with the committee, not with the allegations of the competitors, who have only required what was personally promised to at least two of them, and which all had a right to demand—a fair and impartial decision in fulfilment of their agreement.”

“It may be satisfactory to those of the committee who think their sense of justice and good faith has been called in question, to see nothing of their inability to appreciate the time and skill required in preparing a set of architectural drawings, to know that they have needlessly put four professional men to the expense, in the aggregate, of 200*l.*, for which they, in their justice and charity, consider 20*l.* sufficient remuneration!”

I have purposely avoided making this a personal matter, as I might have done. Considering all four competitors have been equally kindly treated, even the one chosen by the committee has no credit in being the selected one; and with the hope that a little good may come out of a grievous wrong, I wish, in all charity, the new church success.”

VENTNOR CEMETERY COMPETITION.

A GENTLEMAN at Ventnor, named Saunders, considering himself aggrieved by a note under this heading in a recent number (p. 750, ante), requested the name of the author of it. We have submitted the request to the writer of the note, and append his reply:—

Sir,—I decline to consent to my name, as the writer of a letter on Ventnor Cemetery Competition, being disclosed. I can only say that in writing that *jeu d'esprit* I had not the remotest idea of hurting any one, my only object being to fairly criticise the questionable proceedings of a public body, and I hold that all such criticism should be anonymous.

The gentleman who has written to you complaining of the letter may be consoled when I state that it was not his name, but quite another name, that was given to me, when I made inquiries about the competition, as the name of the person whom the Bursal Board had looked out for their work.

You are at liberty to send a copy of this to Mr. Saunders, and to publish it if he wishes. VERB. SAT. PAP.

ACCIDENTS.

London.—Whilst two men were repairing a gas meter at Mr. Dieder's photographic rooms, in Hanover-square, the gas became ignited, and an alarming explosion took place. Both were injured, and one of them is in a dangerous state.

Liverpool.—The greater portion of the dwelling-house in No. 5 Court, Stockdale-street, has fallen down. The house, which was an old one, and belongs to the corporation, was unoccupied, and fortunately no one in the court was hurt. Notice was sent to the borough engineer's office, and some men were sent to take down the remainder of the building, which was considered in a dangerous state.—During a heavy fall of rain and thunderstorm two boys were asleep in the garret of a house in St. Domingo-road, Everton, a slate fell in off the roof, and the rain poured down upon the bed. The boys had not been many minutes removed to an adjoining apartment before that portion of the roof over the bed on which they had been sleeping fell in upon the spot, carrying with it the ceiling, which lay upon the floor in a large mass where the bedstead had stood only a short time previously.

Birmingham.—An immense mass of scaffolding in front of the Odd Fellows Hall, Temple-street, has given way, falling forward upon the houses on the opposite side of the street. The men at work on it were precipitated to the ground, and hurried among the debris. With great difficulty five of the workmen were extricated, and conveyed to the Queen's Hospital, one of them not being expected to recover. A number of other persons, including three ladies, were hurt by the accident. One lady and two other persons have since died.

Dudley.—On Saturday, Mr. Hipkins, lessee of a pit at A'ridale, near Dudley, was engaged with some workmen in certain operations for stifling a fire which had broken out in the mine. One of the men having descended to a scaffold in the shaft, and not answering when called for, Mr. Hipkins himself went down to look for him. Subsequently some water was thrown down to disperse the gases supposed to have accumulated, and then a party of men descended, and discovered the dead bodies of Mr. Hipkins and the miner Bradley at the bottom of the pit.

South Shields.—A lad employed as a labourer recently fell from the top of a chimney in course of erection in Claypath-lane, 114 ft. high. The lad was assisting the mason erecting the chimney, and while standing on a temporary platform at the top, some planks gave way, and he was precipitated down the chimney. Upon being picked up it was a matter of surprise that he remained alive.

SCHOOLS OF ART.

Proposed School for Rotherham.—An influential meeting of manufacturers has been held at Mr. Barra's office, Howard-street, Rotherham, for the purpose of considering the desirability of establishing a local school of art. It was admitted on all hands that the district needed an institution such as the one proposed, which would be a benefit to the town, both commercially and morally. Mr. Barra described an interview which he had had with Mr. Buckmaster, of the Science and Art Department, on the subject, stating that that gentleman had expressed his readiness to render what assistance he could, should the matter be taken up by the townspeople. After the question had been discussed at some length, and various suggestions made, it was decided to invite Mr. Buckmaster to Rother-

ham some time in November next, when the subject will probably be brought before the inhabitants by means of an address from that gentleman. Considering the important connexion there is between the art of designing and the local manufacturers, there is reason for believing that the proposal will be carried out in the form either of a branch school in connexion with Sheffield, or an independent institution.

The Hanley School.—The desirability has been suggested of calling the attention of the inhabitants of Hanley to the effect which the opening of the Burslem and Tunstall School of Art is likely to have on their own school. Since the collapse, ten or twelve years since, of the Burslem School of Design, says the *Staffordshire Advertiser*, a substantial proportion of the students of the Hanley School of Art have been residents in the former town, and it is calculated that on the opening of the new school, the arrangements for which are approaching completion, between twenty and thirty of the present students of the Hanley school will draft themselves off to Burslem. Now, although the opening of another school of Art in the Potteries under the management of an intelligent and influential committee is a subject for unqualified satisfaction, it is of course undesirable that this should be done to the detriment of a neighbouring institution, which has been for a considerable number of years the *alma mater* of many a young artist and modeller. If the manufacturers of the Staffordshire potteries expect to redress themselves from the imputation of "having very little real appreciation of true art," they must do something more than subscribe their two or three guineas a year to the local art schools, or applaud well-worn platitudes at the annual meetings. It is a fact that at the present time several of the largest and most influential manufacturers of Hanley do not send a single pupil to the school of art; some eight or ten firms have upon the books one each, and only one house appears to recognise to the full its obligations in this particular. The exception is a singularly honourable one, and is the case of Messrs. Brown-Westhead & Co., who send twenty-five of their apprentices to the afternoon classes, and pay the fees.

The Yarnmouth School.—The annual distribution of prizes in connexion with this school took place at the town-hall. The mayor (Mr. S. Nightingale), presided. The report of the committee stated that the past year had been one of progress. The attendance had improved—especially in the artisan class—and the results obtained at the annual examination had been highly satisfactory, under the able tuition of Mr. Dornay. At the same time, the more advanced students were not so numerous in proportion to the rest as was desirable. The number of prizes given in the third grade was seven; a Queen's prize was gained by Walter Platt, for a design on wall-paper. The number of prizes awarded in the second grade was eleven. The total who passed in connexion with the central school was 41; hospital, 112; charity, 28. The attendance at the central school for the year was—ladies' special class, 16; general day, 26; artisan evening, 59; total, 101. Attendance of scholars—hospital, 270; charity, 60; grammar, 100; Mr. Tomkins's, 120; total, 550. As to the School of Navigation and Mathematics, the committee presented a more favourable report than that of last year. The committee's report was adopted, and the prizes were then distributed.

The Nottingham School.—A first-class exhibition of the works of modern artists, both in oil and water-colours, has been opened at the large room in the school of art. The pictures are on sale. Many local artists are exhibitors. The prices of pictures marked in the catalogue vary from two guineas upwards to 750*l.*

Caversham Bridge.—This new structure is completed. It is of cast-iron, supported by iron columns, embedded in the river. The bridge is 30 ft. in width, 20 ft. being the carriage-way, and 5 ft. on each side being appropriated to foot passengers. This width of carriage-way exceeds by 2 feet that of Henley Bridge, and also Magdalen Bridge and Polly Bridge in Oxford, and that of Dorchester Bridge. The cost of the new fabric will be between 6,000*l.* and 7,000*l.*; one half of which will be paid by the borough of Reading, and the other half mostly by the county of Oxford.

CHURCH-BUILDING NEWS.

Islington.—St. Thomas's Church, Hemingford-road, has been recently re-opened, after having been closed for a time, for the purpose of cleaning, carving, and completing the interior of the edifice. The church was first opened for divine service in 1860. Much still remained to be done towards the completion of the edifice, as also a debt of 1,900l. remained to be cleared off. Having succeeded not only in liquidating the debt on the church, but likewise in purchasing an organ, at a cost of more than 800l., the pressing want of school accommodation forced itself upon the committee and congregation. This was completed in less than two years. About 4,500l. were forthcoming for this work. Until this had been accomplished, the church question had been permitted to remain *in statu quo*. Since then, strenuous efforts have been made to secure its completion. A lightning conductor has been placed; an improved system of lighting has been introduced, fitted by Mr. A. Fernhead, Caledonian-road; the whole of the interior has been cleaned; and the rade blocks have been carved by Mr. Bromfield, of Kennington-road. Mr. W. G. Caldwell, architect, from whose designs the schools were built (a member of the congregation), consented to superintend the whole of the work, of which Messrs. Williams & Son were contractors. Towards the expense of all the improvements already made, a sum of about 70l. is still needed to make good the deficiency of funds. Other improvements are in contemplation, viz., the erection of a reredos, carving of pulpit, &c., to defray the expenses of which, a committee of ladies has been formed.

South Kilworth.—The parish church here has been re-opened, after undergoing a restoration. The old structure was in a dilapidated condition and inconvenient for public worship. It was of the Romanesque style, and would appear to have consisted of a nave and chancel, with a narrow aisle to the former on the north side. At the end of the fourteenth century the church was enlarged by the addition of a tower and south aisle, and the edifice was probably increased in length. In comparatively modern times the church lost the fourteenth century aisle. The original narrow Norman aisle had been replaced by a broad one, with brick walls, and was of very poor character and construction. The chancel had been rebuilt with thinner walls, and its length curtailed. Its old square east end had been replaced by an apse of miserable design and character. The pitch of the roof had been considerably lowered, and the whole of the ancient windows, the old roof, and other parts had been destroyed. Indeed, almost the entire edifice, the tower excepted, had been built in a mean and inconspicuous manner. The roof was not of a kind meant to be exposed to view, and the fittings were of an uneccelesiastical character. The restoration of the building was entrusted to Mr. C. F. Bodley, of London, architect. The tower and spire were in a good state of repair. The south aisle, the architect recommended, should be built in character with the tower. The slope of the lean-to roof is shown in the east face of the tower. The new work is planned to harmonise with the fourteenth century work of the tower and spire. The north aisle, which was of a narrow width, has been rebuilt, with stone walls. The only other feature of interest, and that chiefly from its antiquity, is the arcade of three arches on the north. Though of no great beauty they have been preserved, unaltered in character. The interior has had to be entirely re-modelled—the work, in fact, being one, not of restoration, but reconstruction. The opening out of the tower arches has been effected. The stonework of the arches has also been restored, and two new arches now divide the new aisle from the nave. The fittings have been re-arranged throughout, and the chancel rebuilt with a place for the organ and vestry on the north side. The whole of the floor has been concreted to keep the building dry, and open seats of oak have been constructed. To carry out these works the outlay has been about 2,000l.

Chipstable.—The parish church of Chipstable has been re-opened for divine service. The old church had become very dilapidated, and its condition almost dangerous. It possessed no features of architectural interest, except some good carved seat-ends of late Tudor character. These have been preserved, and form the ends of some of the seats in the new church. The building is designed in the Second Pointed style, and consists of a nave, chancel and south aisle,

porch and vestry. The walls are built of a local stone, having Hamdon Hill dressings. The roofs are covered with Bridgewater tiles. The chancel is separated from the nave by a bold arch of discontinuous character, so that little or no interruption is presented, so that the entire church and aisle are well opened to the chancel. The ceilings are formed in a parallel arrangement, the ribs at the intersections having carved bosses. The floor is paved with red and black tiles, the chancel having encaustic tiles of a better kind. The new seats are of deal, varnished, all the old seat-ends being used again. There are a stone pulpit and font, and appropriate chancel-seats. The whole of the work has been carried out by Mr. Davis, of Taunton, from the designs of Mr. B. Ferrey, of London, architect, at an expenditure of about 1,500l. The old tower was restored some few years since, and has not been interfered with, except the lower part, which has been thrown open to the church by the removal of a modern wood screen. The arches of the old arcade have also been preserved.

Huntingdon.—St. Mary's Church has now been closed for several months, but is about to be re-opened. At the outset it was merely proposed to erect a new organ, and stalls in the chancel. For the former a new chamber was built. Since then the old ceiling has been removed, the roof opened up, and hoarded. The large gallery at the west end has been demolished, and a lofty arch thrown out at the western entrance. The columns have been cleaned and restored, and many other minor alterations and additions have been effected. The organ is being built by Messrs. Foster & Andrews, of Hull.

Llanvannan, Monmouthshire.—The very old church here has been re-opened for divine service, having undergone restoration. Before the alteration it had a most comfortless and neglected appearance. Traces of decay were visible on its damp walls and floor, and the pews were heavy and old-fashioned. The pews have been now, however, superseded by new and open sittings, the gallery over the western entrance has been removed, and the choir now occupies a place in the chancel. The alterations are devoid of any approach to ornamentation. A new window has been put in the chancel. During the progress of the works, several stone arches, separating the nave from chancel, and chancel from mortuary chapel, and covered with white-wash, were exposed to view. The architect for this work was Mr. E. A. Lansdowne, of Newport and Bristol.

Beaconsfield.—The parish church of St. Mary and All Saints, which has been under restoration and alteration, has been consecrated and re-opened. The cost of the alterations has been 4,800l., of which 600l. have yet to be provided. The wooden galleries that disfigured the building have been removed, with one exception. Mr. Woodyer has been the architect, under whose superintendence the works have been carried out, and the builders have been Messrs. Gibson Bros., of Southall. There are about 500 sittings in the church. The reredos is a specimen of stone carving; the centre panel represents the Crucifixion, and in the panels on each side are groups of angels worshipping. The screen, presented by the architect, is surmounted by a large gilt cross, on which is a shield containing the initials "I. H. S." Both the pulpit and font have been presented, the former by Mr. George Charley and family, and the latter by Mr. E. Waller.

Longtown.—The church here has been re-opened. The township of Longtown is one of four, comprising the parish of Clodock, the other townships being Llanvaynor, Craswell, and Newtown.

The township of Newtown alone now possesses an independent incumbency, Longtown and the others being but chapels-of-ease to the mother church of Clodock. Longtown Church, to quote the words of the pastor, had "long lain in a most sad and fearful state." It consisted of nave and chancel only, and, previous to its restoration, a portion of the west end of the nave was partitioned off to serve the purpose of a school-house. There was no flooring of any kind save the earth, and no seats or benches; the only accommodation in this way being some low, rough forms, which were transferred from school to service, and from service to school, as occasion might require. In addition to all this, the walls and roof were in a deplorable state, the weather having found its way through to such an extent as to render the building more uncomfortable even than many a well-kept barn could possibly be. The little chapel being

situated on the side of an eminence is in that position that the earth on the north side is some 5 ft. higher than its floor level, whilst on the south side the porch is entered by a flight of steps of some ten or a dozen. The church, which is an Early English structure, has undergone an entire restoration, under the supervision of the diocesan architect, Mr. T. Nicholson. The walls, externally, have been pointed, and internally have been treated to a coating of plaster. The roof is new, the old timbers only being used as far as was practicable, the ridge ends being completed with ornamental iron finials. A new bell-gable, containing two small bells, which were formerly in the roof, has been added, the bells having been recast and toned. A new stone porch has been erected on the south side of the church, which, we may remark, has a somewhat unusual acquisition in the shape of a stone seat running along it from the porch to the buttress at the south-east angle; probably only a utilitarian of the extra thickness of the foundation on this the sloping side of the church. The seat has been restored to its original state, and the buttresses have been rebuilt. New windows have been inserted, with the exception of the west window, and one window has been added both on the north, where formerly was none, and on the west end, where used to be the fireplace of the school. A new schoolroom has been built at a short distance from the church, on a site the gift of the Earl of Abergarnny, the lord of the manor. Flooring has been laid down, and the nave provided with benches. A new octagonal pulpit of Caen stone with pierced panels, in the Early Decorated style, and provided with an oak book-rest, has been erected. The chancel arch, too, is new, and a new font has been added. The old flat ceiling has been removed, and the timbered roof opened out; the timber being in a wretchedly disfigured condition has been the source of a great deal of trouble to the workmen. The fabric has been supplied with a system of drainage, and with new spouts, neither having existed before. The work has been carried out by Mr. Pritchard, a local builder, at a cost—the schools and church combined—of 1,060l.

Stenton Wynville.—The church here has been re-opened for Divine service. There is but the nave to the church, besides the chancel. The nave has been rebuilt, the whole of the old stone preserved, and used again in the work. A new south porch has been made with a plain arch. In taking out the ground for the porch foundation, a stone coffin was found, containing bones, which were reburied. On the outside of the church is a memorial stone inserted, which no doubt occupied the same position before; on it is the following inscription:—"Here lieth buried William Brundell, gent., aged 88 years. Died 30 October, 1636." There has been inserted a chancel arch, the screen having been removed, and now there is a view of the chancel and the east window. The east window is of three lights, filled with stained glass. The centre and principal one is a representation of the Crucifixion, and bears the following inscription:—"To the glory of God, and in thankful remembrance of many mercies. J. W. 1863." The other two lights have been filled in with stained glass in accordance with the wishes of the giver of the centre light, Mr. J. White, of the Inner Temple. On the left side is Jesus speaking with Mary. At the bottom the text "Jesus said unto her, Mary. She turned herself and said, 'Rabboni.'" The other light represents Jesus appearing to his disciples, and the text, "Then came Jesus, the door being shut, and stood in the midst, and said, 'Peace be unto you.'" In the centre of the head of the window is the patron saint, St. Dennis, and on either side are angels with scrolls. On either side of the window are the Commandments, and beneath the window, in a scroll, containing the vine leaf and fruit, and ears of wheat, is the text, "My flesh is meat indeed, and my blood is drink indeed." A border surrounds the whole. This work has been done at the cost of Mrs. Burnaby, the mother of the rector, from the proceeds of sale of work which she has made for the purpose. On the south side is a memorial window of two lights, in remembrance of a brother of the rector. The subject is Christ walking on the sea. The pulpit is the gift of the rector's sisters, and has been made by Mr. John Wilson, of Kibworth. It is an octagonal one of English oak, supported by shafts of polished ebony, with carved capitals and annulet mouldings. The termination of each shaft above the panelling, and down upon a base of Ketton stone, is by a foliated boss. The panels are

circular, and carved, and to the moldings of the framework is added the relieved early dog-tooth ornament. There are open deal seats in the church: the floor is of Whetstone's tiles. The church is heated by a flue with open grating, by Messrs. Johnson, of Leicester. Mr. Haycock, of Rothwell, was the contractor; and Mr. Drewry has done the decorations. The architect was Mr. J. Goddard, of Leicester.

Compton.—The parish church has been reopened for public worship. The building has for some time past been undergoing alterations, which have improved the appearance of the interior. The coating of lath and plaster, which formerly hid from sight the oak beams and the roof of the nave and north and south aisles, has been removed, and in many instances the time-worn timbers have been replaced. For the windows in the roof others have been substituted more in conformity with the character of the building, a third having been inserted on the south side, while that on the north has been filled up. Among the alterations one is the addition of a painted glass window, erected to the memory of Mr. George Smallpiece, of Field Place, and his widow. The subjects are St. Peter raising Tabitha to life, and the Good Samaritan. The work of restoration has been carried out by Mr. Mitchell, of Shalford, at a cost of about 500*l.*, raised by subscription. Mr. Woodyer, of Grafham, was the architect. The peculiarity of the church, which is chiefly Norman, its arches and columns constituting specimens of that style, is the chancel. This is of Norman architecture. The roof is extremely low, and above it, open to the church, is an apartment, anciently a chantry chapel, now the Losely pew. It is fronted by an ancient wooden balustrade, covered with white-wash.

NEWS FROM IRELAND.

The dedication of St. Peter's Roman Catholic Church, Dungourney, took place on the 19th ult. The R. C. Bishop of Cloyne officiated. The present structure has been so much restored that it may be virtually called a new edifice: 18 ft. have been added to its length, so it is now 108 ft. in the clear. Its height has also been increased, the walls partly rebuilt, and the church newly roofed. The spire is the principal addition. It opens into the body of the church through a lofty Gothic arch of 22 ft. span; and the chief feature of the edifice here is a three-light stained-glass window over the high altar. Two smaller stained-glass windows adjoin the side altars dedicated to the Virgin and St. Patrick. Ten lancet windows pierce the side walls of the church, filled with coloured glass; and a Gothic window of large size lights the other end of the building. A gallery is provided over the principal entrance. The roof is open timbered, stained, and rests on corbels; the intervals between the rafters being ceiled. The church is 30 ft. in breadth. In addition to the porch which forms the main entrance, a Gothic doorway opens in the western wall of the structure. Vestry-rooms occupy the angle formed by the apse and the body of the church; and in the chapel-yard a residence for the curate is provided. The edifice will afford accommodation for about 1,400 or 1,500 persons. The architect is Mr. Richard R. Brash; and the builder Mr. Barry, of Middleton. The church stands on elevated ground, surrounded by trees, and on the banks of a small river which takes its name from the locality. The village is a neat one, and besides the church a large and conspicuous school-house adds to its appearance.

The consecration of the altars of St. Ronan's Church, Roscrea, has taken place. The columns are of green Galway marble, highly polished, with carved capitals fluted. The central panel of the high altar is enriched with a half-height figure of the Redeemer. The throne is of Caen stone, carved. The canopy is supported by red marble shafts, polished. A figure of the angel is fixed on the apex of the pinnacle. The altar steps and predella are of Portland stone, and the space between the lower step and the first pace at the back of the altar, is laid with Portland flags. The screen is composed of Corsham Down stone. It is well carved. The columns that carry the tracery are of polished Cork marble, and the capitals and cornice are carved. On the top of the cornice are six angel figures, the wings carved in wood and gilt. The table of the altar is of black polished marble. The side altars, which are in keeping, are also of Corsham Down stone. They are enriched with figures of the Virgin and St. Joseph, mea-

suring 4 ft. 9 in. high. The retables is of ashlar, capped with a cornice. The steps are of Portland stone. The Communion-rail is of stone and marble, polished, with simple capitals, a marble slab, 10 in. wide, 1 in. thick, with rounded moulding in the front, &c. The gates are of wrought iron and brass. The altars have been built by Messrs. Barley & Powell, of Dublin, from the designs of Mr. J. J. McCarthy.

In Waterford several improvements have of late taken place in the matter of widening streets, flagging, lighting, and improving the park. A public market is spoken of, and a safe bathing-place for the people. The present Mayor of Waterford has exerted himself very creditably for the improvement of the city; and under his suggestions and advice much has been effected. The old historical ruin of the city has also been pinned up and protected from decay, and the town-hall is to be provided with a portrait of O'Connell, in recognition of his services in aid of civil and religious liberty, and the reforming of the municipal corporations of Ireland.

The Ennis and Athenry Railway has been opened; but the public of the south-west do not appear to reap much advantage from the circumstance.

There is a strike of masons and bricklayers employed in the construction of the Dundalk and Greenore Railway. They demand a rise of 2*s.* a week. Their present wages are 2*s.* They also ask a decrease in the hours of labour.

The Town Commissioners of Galway, who not long since laid out 1,000*l.* in connection with waterworks, will not be moved to give a farthing towards keeping the town cloak from going into delirium tremens. It is a disgrace to the old historical town of Galway, *alias* "The City of the Tribes." A ten-pound note would remove a stigma from the town.

The building trade is rather dull in every part of Ireland.

Books Received.

The Scenery of England and Wales; its Character and Origin. By D. MACKINTOSH, F.G.S. London: Longmans, Green, & Co., 1869.

This is an attempt to trace the nature of the geological causes, especially denudation, by which the physical features of the country have been produced. It is said to be founded on the results of many years' personal observations, and is illustrated by many woodcuts. The author had previously written papers on Denudation, which appeared in geological and other journals.

The influence of rain, rivers, frost, glaciers, icebergs, waves, and ocean currents, as well as earthquakes and other physical convulsions, are all brought under consideration; and on such subjects there are great diversities of opinion amongst geologists. Doubtless all have had a share, smaller or greater, in cutting out the present features of the country, but the question is, have any of these causes had a paramount influence, and if so, which of them, one or more?

A powerful influence is here, rightly we think, attributed to icebergs and glaciers, but not to the probable extent to which, after the great elevating and depressing forces, the modern features of the land are due to ice and flood conjoined. As for those geologists who do not realise to themselves the tremendous power of these conjoint agencies, Mr. Mackintosh utters a mild protest against their view in terms such as these:—

"*Alleged Dormancy of the Sea during the Glacial Submergence.*—Some writers, and amongst them Professor Jukes, are of opinion that during the glacial submergence, the sea did next to nothing in the way of denudation. But have we any reason for supposing that the 'calm of desolation' then 'brooded over the face of the deep?' Were the winds then stagnant, and were the billows miraculously enchained? . . . Was there no ground-swell, and were there no rapid currents at the time when the Welsh and Cumbrian hills were islands and their passes straits? Is it not more reasonable to suppose that the Atlantic breakers were then more furious, the Atlantic ground-swell more incessant, the Atlantic currents more impetuous than now?"

The truth is, that geologists seem, in not a few instances, to have imagined the glacial or arctic era, over now temperate climates, to have been an era of stagnant and perpetual wintry ice, in which everything was bound up for centuries, without anything like intervening summers, or summer-floods, with moving glaciers and icebergs; whereas, if the winters were extreme in coldness, so, in all probability, were the summers extreme in heat; since such is the present law of winter and summer, in the arctic region, from the operation of causes still in operation.

The glacial era was just an extension of the arctic region, farther south in the northern hemisphere than now, and farther north in the southern hemisphere. And as the icy and snowy winters were produced by the sun passing farther away to the south in the northern winters, and farther to the north in the southern winters, the summers were extreme in heat as the winters in cold; and the commotion which modern arctic summers produce amongst the glaciers and icebergs in the far north was as nothing to what it must have been over England and the Continent in the glacial era. It was then that the tremendous ploughs and harrows of nature were brought into full operation, to pulverise and prepare the soil for the human race; and it was then that valleys were ploughed out and mountains denuded, and that the main features of England and other countries were carved out of the rough block which the great elevating and depressing agents provided for their more special carvings, and for the finishing touches of rainfall and rivers, frost, &c.

Geologists have allowed themselves to be more or less restricted and deprived of resort to natural agencies of vast power, by the dogmatic dicta of astronomers, who, as such, know nothing of the necessities, and the geological evidences, of the case. But, however positive astronomers may be as to the impossibility of certain cognate secular changes, regarding which their data are admittedly very limited and uncertain, the conclusion is irresistible—and they must be instructed by geological facts—that the arctic region itself—the cause which makes it arctic being known, and still in operation,—in truth extended, during the glacial era, or rather the era of ice and flood, far farther south than it now does in the northern hemisphere; and probably also far farther north than it now does in the southern.

The alternations of summer and winter, and of ice and flood, in the arctic regions, as we have already indicated, are astronomically ruled by the obliquity of the ecliptic, or the oscillation or pendulation (figuratively or popularly speaking) of the sun into and out of either hemisphere; so producing summer and winter. And astronomers not only admit the fact that the obliquity of the ecliptic was at one time greater than it is now, but that it is still on the decrease; so that the plane of the ecliptic is, and from time immemorial has been, on the way at least towards a coincidence with the plane of the equator. The extent and limits of this diminution constitute the only question with astronomers. They insist that the limits can only be very small; while it would appear, from the geological facts, that these limits must be very considerable; and it would be easy to show (as indeed the writer of this has, to a certain extent, already done, in the *Scotsman* newspaper, of January 5th, 1842), that the "great uncertainty" in which candid astronomers admit this question to be involved, is still farther increased, and to an extent which drives them entirely out of the field, by virtue of weapons supplied by themselves.

It will, we hope, be seen, from what has been said, that we need not resort to the hard hypothesis of a change in the amount of solar emission, or in the temperature of space traversed by our system, for an explanation of the era of ice and drift; because we have shown how it is explicable, to the fullest extent, by simple and natural causes, in one sense still in actual operation.

It is not the first time we have urged this (see, for example, the *Builder* of October 4, 1862, on "The Alps in the Glacial Era"), but it well merits repetition, till geologists snatch the subject out of the hands of the astronomers, who have much less to do with it than geologists have.

The hook before us is both suggestive and interesting, however far short we may conceive it to be of duly proportioning the causes which have given England its modern outlines.

Laxton's Builders' and Contractors' Tables, for the Use of Engineers, Architects, Surveyors, Builders, Contractors, Lend Agents, and Others. By HENRY LAXTON, C.E. London: E. & F. N. Spon.

UNDER this title Mr. Laxton is preparing a series of tables likely to be very useful to many. He has now issued the first instalment, appertaining to the bricklayer, which contains twenty-two tables, with nearly 30,000 calculations. The headings of four of the tables will serve to show their character:—"Value of any number

The Sanitary State of Stafford.—A correspondent of the *Staffordshire Advertiser* says:—In the principal thoroughfare, and within a stone's throw of my bedroom window, are two places for the boiling of offal, and another for the manufacture of tallow candles. The foul and sickening fumes from these places penetrate every house in the neighbourhood and "murder sleep." Then the two channels which flow the entire length of the picturesque Greengate-street are neither more nor less than open sewers, and their condition, especially at night, would be a disgrace to Cologne itself, the city of a thousand stinks. As a people we plume ourselves upon being more cleanly than our Continental neighbours; but I protest with all my might against the people of Stafford sharing this credit. Verily they are heathens (begging the pardon of the constructors of the *cloaca maxima*). They worship Beelzebub, the god of filth, and of that from which flies spring, as saith the prophet Carlyle.

Cambodia, Cochín-China.—The ruins which have been discovered in Cambodia, says the *Revue Coloniale et Maritime*, prove that the inhabitants must at one time have been as highly civilized as they are now debased. Remains of sculpture have been discovered rivaling those produced in Greece in its best days. Well-built bridges have been discovered in many parts, and the expedition conducted by M. de Lagree found remains of the same and other constructions as far as the 15th degree of north latitude. So extensive and numerous are these remains that they are considered to prove beyond dispute that at the time when they were built the country must have been densely populated by people rich and prosperous to a very high degree; indeed, there is positive evidence of the fact in the writings of a Chinese traveller, who speaks with warm admiration of the lavish manner in which gold was employed in the decorations of their monuments.

The Suez Canal.—The working rules for the transit of ships through this canal have been issued in a printed form by M. De Lesseps, as president of "the Suez Universal Maritime Canal Company." The navigation of the canal is to be "opened to all vessels without distinction of nationality, provided they do not draw more than seven metres fifty centimetres (7 m. 50 c.), equal to 24 ft. 7 in. English; the canal being eight metres (8 m.) in depth, equal to 26 ft. English. Steam vessels will be allowed to navigate through the canal using their own propellers; sailing vessels, about 50 tons, will have to be towed with the service established by the company." There were two Suez Canals, one a preliminary or temporary canal, and the other the permanent one. On a previous occasion the Suez Canal was announced to be opened, but it turned out to be only the smaller one: in this case, of course, the public understand it to be the permanent and great canal which is about to be opened.

The Bath City Water Supply.—Mr. Bateman, C.E., has prepared his report for the Bath City Council. "The gist of it," says the local *Chronicle*, "if we mistake not, will be found substantially identical with that of our own city engineer, Mr. Mitchell, prepared and presented in 1864. He declares emphatically for resorting for water to St. Catherine's Valley, as the only certain, sufficient, and satisfactory source of supply, and attaches little if any value to other localities that have been named. He confirms, in fact, the conclusions on which the Bill of 1866 was framed, so that we are come, after three years' delay and three years' inconvenience, to the precise situation in which we were in the autumn of 1865, with all the work of preparation and negotiation to do over again." The entire cost of the measure, adds our authority, will probably be more than covered by a sum of 80,000l.; while any outlay which may be made for the purchase of the Bathwick and other private springs will yield an ample return in the income already derived therefrom.

The Anti-drink Movement.—An experiment is about to be tried at Bradford, in the way of providing a substitute for the public-house. It is proposed to erect a large building, in which all sorts of amusements will be provided, together with library and reading-room. No intoxicating drinks will be allowed on the premises. The capital required is 1,000l. 800l. of this sum have been taken up by working men themselves.

The Iron and Steel Institute.—The first provincial meeting of this Institute has been held at Middlesbrough, in the Odd Fellows' Hall, under the presidency of the Duke of Devonshire. About 180 of the members of the Institute gave notice of their intention to attend the meeting, and about seventy more gentlemen were candidates for membership. There was a very large attendance, all the principal ironmasters of the district being present, and also many distinguished strangers. Besides the president's address, various papers were read; Mr. Isaac L. Bell, of Newcastle, one on "The Development of Heat, and its Appropriation in Blast Furnaces of different Dimensions;" Mr. Josiah T. Smith, of Barrow-in-Furness, one on "Siemens's Regenerative Furnace, and its Application to Reheating Furnaces connected with Rolling-mills;" Mr. E. Williams, of Middlesbrough, one on "The Manufacture of Rails," Mr. R. Howson, of Middlesbrough, one on "The Siemens-Martin Process of manufacturing Steel," and Mr. J. P. Budd, one on "The new Process of removing Silicon from Pig-iron."

Lincolnshire Sea-side Convalescent Home.—The total amount of subscriptions now promised is 2,100l., exclusive of the site, nearly two acres, which has been presented free of cost. The committee appointed at the general meeting having requested Mr. Fowler, of Louth, to prepare plans for a building, these plans were submitted to Miss Nightingale, and met with her approval. On the 3rd of September, the following tenders were sent in:—Mr. Clark, Louth, 3,530l.; Mr. Pattinson, Ruskington, 3,190l.; Messrs. White & Wood, Alford, 3,179l. 10s. The last tender was accepted. Mr. Fowler has promised to return one-half the usual architect's charges for plans, &c. All the living-rooms will be lined inside with Portland and Parian cement, as at Netley Military Hospital. The building will be 180 ft. long, providing for twenty men and twenty women. There is at present a deficiency of 800l. in the funds. The Hon. A. L. Melville, the treasurer of the fund, receives subscriptions at the bank, Lincoln.

Hoist Apparatus.—An invention, said to be new, is being introduced into the mining and manufacturing districts, under the name of Calow's patent safety hoist apparatus, for preventing accidents in hoists of mines, works, hotels, &c. By this arrangement the mechanism is not brought into play by the mere slackening of the rope, but when the rope breaks only; the rope not being in any way connected with the apparatus. The cage has to gravitate before the machine is acted upon. As described to us, "a bar has on it a lever weighted; this weight keeps a spiral spring compressed; when the cage becomes a falling body (i.e., falls at 16 ft. in the first second), the support for the spring ceases to exist, and it becomes of a greater length, thrusting the eccentric jaws or grips into the slides, and effectually preventing the cage descending."

The Metropolitan District Railway.—At the last weekly meeting of the Metropolitan Board of Works, Sir William Tite, M.P., pursuant to notice, presented a memorial from certain bankers, merchants, &c., of the city of London, calling attention to the proposition of the Metropolitan District Railway Company to continue their railway to the Mansion House, and to form a covered way to the Royal Exchange; and expressing their conviction of the great public convenience that would result from such arrangement. The memorial was referred to the Works and General Purposes Committee for consideration in connexion with the reference already made to them on the subject. In course of the proceedings, Mr. Lowman Taylor objected to have a railway station opposite the magnificent Royal Exchange. Where else, he asked, could they get an outlet?

Science Instruction for Women.—We are very glad to hear of an important experiment which is about to be tried at the South Kensington Museum, to promote the instruction of women in science. By permission of the Lord President, Professors Huxley, Guthrie, and Oliver are about to commence a course of lectures on Natural Science, beginning in November. The fees will not exceed a shilling a lecture, with voluntary examinations, and the terms will even be lower to schools and governesses. Some distinguished ladies have expressed their willingness to assist this experiment. The Hon. and Rev. F. Byng, of Onslow Gardens, London, S.W., is the treasurer and secretary.

New Forge Works at Fontypool-road, Monmouthshire.—The formation of new forge works is in course of completion. The ground occupied will be about 2½ acres. A capacious reservoir has been formed adjoining the river to supply the works with water. Messrs. Neville, of Llanelly, are the contractors for the engines and machinery, a great portion of which is now on the ground. The contract for the iron roof work was undertaken by Messrs. Steel & Rake, of Newport. The roof is arranged in two spans of 44 ft. each and 120 ft. in length, supported on three rows of lattice girders, which latter are carried by cast-iron columns in the usual way. The works will be styled the Panteg Forge.

Paper Carpets.—An American paper suggests the following piece of domestic economy:—Save all your newspapers, and when you get enough for the purpose, make a paste as for putting on the wall, and lay them down one by one, pasting them till your floor is covered, then let it dry; then lay another in the same way. When again dry, get some wall-paper of a suitable colour, and paste all over it. When dry, go over it again with a good coat of varnish, and you have a nice covering for your floor, which will wear as long as a carpet [will it?], and look as well as oil-cloth. This is a cheap method of covering bedrooms which are not much used.

Dock Work Expenditure at Liverpool and Birkenhead.—Mr. Lyster, the engineer to the Mersey Dock Board, on Thursday presented his annual report of the expenditure on dock works at Liverpool and Birkenhead from June, 1868, to June, 1869. The figures were as follow:—New works at Liverpool under the Acts of 1858, 1859, and 1863, 55,995l. 11s. 7d.; repairs and maintenance, 80,664l. 15s. 5d.; proportion of official charges, 4,640l. 0s. 7d.—total expenditure for Liverpool, 140,900l. 7s. 7d. New works at Birkenhead under the Acts of 1858 and 1866, 71,289l. 9s. 8d.; repairs and maintenance, 22,254l. 11s. 11d.; proportion of official charges, 3,185l. 8s. 6d.; total expenditure for Birkenhead, 96,729l. 10s. 1d.; conservancy expenses, 1,383l. 5s. 10d.; grand total of expenditure for the year, 239,013l. 3s. 6d.

Opening of an Industrial Exhibition at Jarrow.—An exhibition of works of art and mechanical skill, curiosities, articles of vertu, &c., has been opened in the Mechanics' Institute, Jarrow. Mr. C. M. Palmer, who has been designated the maker of this sort of ship-building enterprise, did the honours on the occasion. The object of the promoters of the exhibition is to wipe off a debt which encumbers the Institute. The hall is decorated permanently, and in the recesses are painted in bright colours a variety of mottoes suggestive of the aims of the Institute. The apartment is 80 ft. long and 40 ft. wide.

The Liverpool Tramways Company.—At an extraordinary general meeting of this company, held in London, the contractors, Messrs. Fisher & Parrish, reported that the line from the Adelphi Hotel to the borough boundary is finished; and that the centre line, running from the Adelphi Hotel, down Lime-street and St. John's-place, along Dale-street, Castle-street, Lord-street, and Church-street, and up Elliot-street, back to the Adelphi Hotel, will be completed this week. The contractors expect to have the road ready for public traffic within a month from the present time.

Surveyor for Margate.—A special sitting of the watch committee was held last week for the purpose of receiving the five gentlemen whom they had selected among the forty applicants for the office of town surveyor, from whom they intended to make their final choice. The committee and the five gentlemen selected were present—viz., Mr. P. Coghlan, of Liverpool, who required a salary of 200l.; Mr. G. J. Stead, of Liverpool, 150l.; Mr. Rumbell, Maida-hill, London, 200l.; Mr. Watson, of Crewe, 200l.; and Mr. Perry, of Stoke Newington, 250l. After consideration of the testimonials of these gentlemen the committee's choice fell upon Mr. Coghlan, and he was duly informed of his success.

The Pigs in Fulham.—The Fulham Board of Works is determined upon a war of extermination against the disgusting pig-breeding nuisance. The medical officer reports an instance of eighty of them kept in two narrow sheds, surrounded by human habitations.

The "Tentostelling" of Amsterdam. Professor Pepper has visited the International Exhibition of Amsterdam, and is now giving visitors to the Polytechnic Institution in Regent-street a most agreeable and instructive account of it, with particulars of Holland, and the habits and manners of the people. It is done in Mr. Pepper's best manner, good at all times, with excellent taste and conciseness, and is illustrated from beginning to end by a series of dioramic pictures. The building is a permanent one, and of considerable pretensions.

Drinking Fountain for Keighley.—A drinking-fountain has been erected in the Church-green, opposite to the parish church gates, Keighley, at the expense of Miss Butterfield, of Cliff Hall. It is formed of grey Scotch granite, highly polished, from the works of Messrs. D. H. & J. Newall, Dalbeattie, Scotland. On the west side of the fountain is the following inscription:—"This fountain was erected by Miss Butterfield, of Cliff Hall, 25th September, 1869. 'Let him that is athirst come.'"

A New Church for Southwark.—The foundation-stone of the new district church of St. Anne, Bernadysay, has been laid by Mr. Alderman and Sheriff Cotton. The building is to be in Gothic composite style, and is to accommodate 800 persons. The builders are Messrs. Browne & Robinson; and the architect is Mr. Porter.

Epitaph on an Architect.—A writer in *Notes and Queries* says,—On a monument in Walton Church (the original parish of Liverpool) is the following epigram epitaph on an architect, A. H. H., d. 1655:—
"Thy mortal tenement, immortal germ,
Hath sunk to dust, while all thy works stand firm.
O may'st thou at the rising of the just
Thyself stand firm, when all thy works are dust."

Steam Omnibuses in Scotland.—The authorities of Glasgow have granted permission for omnibuses drawn by patent road steamers with india-rubber tires, built by Mr. R. W. Thomson, C.E., Edinburgh, to be run experimentally through the streets of their city.

Haulbowline.—The Lord-Lieutenant of Ireland has laid the foundation-stone of the naval dockyard about to be constructed at Haulbowline. His Excellency's visit to Cork was marred by very inclement weather.

The Wolverhampton Free Library.—The free library and reading-rooms at Wolverhampton have been opened in a building which has been rented by the corporation for the purpose.

Carisbrooke Church.—According to the *Illustrated Standard*, her Majesty has forwarded a donation of 25l. to the organ fund of Carisbrooke Church, a place of historical interest.

King's College: Arts of Construction.—The lectures of Professor Kerr commenced on Thursday, October 7th, and will be continued on every Tuesday and Thursday, at half-past three.

TENDERS.

For rebuilding the Rose and Crown, and dwelling-house adjoining, in Chapel-street, Guildford, for Messrs. Crooke, Mr. Henry Peak, architect:—

	Gross Estimate.	Deduct for Old Materials.	
Burdett	£1,147 10 0	£73 15 0	
Dickinson	1,144 0 0	59 0 0	
Stroudwick	1,148 0 0	72 0 0	
Mason	1,108 0 0	72 0 0	
Mason	1,108 0 0	61 0 0	
Pollard & Son	1,083 2 4	60 0 0	
Loe	1,073 0 0	150 0 0	
Garnett	1,065 0 0	106 10 0	
Beagley (accepted)	974 0 0		

For alterations and additions to two cottages at Farmcombe, Surrey, Mr. Henry Peak, architect:—

Goddard & Son	£384 0 0
Moon & Son	335 0 0
Aitfield (accepted)	245 0 0

For house and offices at Hidenborough, near Tunbridge, Mr. W. G. Bower, Jan., architect. Quantities supplied:—

	With Wainscot Fittings in Dining-room.	With Deal Fittings in Dining-room.
Pennett	£3,685 0 0	3,431 0 0
Wheatley	3,143 7 0	3,001 13 0
Dove	2,862 0 0	2,915 0 0
Wiltshire (accepted)	2,859 0 0	2,818 0 0

For house and three cottages at Rochampton, for Mr. Bevilacqua, Messrs. Beeson, Son, & Bereton, architects. Quantities supplied by Mr. Burnett:—

Dawson	£2,612 0 0
Myers	2,843 0 0
Easton, Brothers	2,838 0 0
Avias & Co. (accepted)	2,299 0 0

Accepted for supplying a new boiler, also for works required to be done in setting the same, and for an additional coal-cellar, for the Waterchapel Union:—

For Boiler.

Hodge & Son	£109 0 0
For Setting, Boiler, and Coal Celler.	
Wood, Brothers	538 0 0

For villa residence in St. Alban's, Mr. Frank E. Thicke, architect. Quantities supplied by Messrs. Pain & Clark:—

Arnold	£1,150 0 0
Snell	1,100 1 10
Haley	1,094 0 0
Savage	1,090 0 0

For oil-mill, grain warehouse, engine-house, chimney, &c., at Boston, for Mr. J. C. Simonds. Plans and quantities by Mr. W. H. Wheeler:—

Patinson	£7,400 0 0
Baker	7,200 0 0
Sherwin	6,880 0 0
Otter & Elsey	6,800 0 0
Garnet & Wright	6,862 0 0
Huddleston (accepted)	6,208 0 0

For the erection of a building on the site of Nos. 23 and 23, Change-alley, Cornhill, for the "Estates Company, Limited and Reduced," Mr. E. A. Gruning, architect:—

Ansion	£3,890 0 0
Mansfield & Price	3,875 0 0
Ashby & Sons	3,859 0 0
Coleman	3,848 0 0
Trollope & Sons	3,788 0 0
Newman & Mann (accepted)	3,685 0 0

For the excavation and construction of a double basement on the site of Nos. 11 to 15, Fotheringhay-street, Lambury, for the "Estates Company, Limited and Reduced," Mr. E. A. Gruning, architect:—

Hill, Reddell, & Waldram	£3,619 0 0
Sharman & Co.	3,339 0 0
Newman & Mann	3,276 0 0
Trollope & Sons	3,100 0 0

For the erection of two houses and offices upon the Conservators Land Society's estate at North End, Fulham:—

Kinifff	£564 0 0
Sharman	536 0 0
Taylor & Pilets (accepted)	510 0 0
Brown	500 0 0

For new gallery and repairs to John Knox's Church, Stepney, Mr. Barker, architect. Quantities not supplied:

Johnstone	£1,250 0 0
Stevens	873 0 0
Carey & Son	770 0 0
Girling	735 0 0
Mackert & Co.	710 0 0
Brady	510 0 0

For rebuilding two warehouses, Wood-street, City, Mr. Herbert Ford, architect:—

Moutrie	£5,720 0 0
Henshaw	5,693 0 0
Wardell	5,273 0 0
Gammou	4,960 0 0
Pritchard	4,906 0 0
Lawrence	4,865 0 0
Myers	4,877 0 0
Killy	4,855 0 0
Ashby & Horner	4,790 0 0
Craib & Vaughan	4,723 0 0
Brown & Robinson	4,463 0 0
Brass	4,381 0 0
Couder (accepted)	4,248 0 0

For erecting three villas in Greengate-street, Plaistow, Essex, Mr. Chas. R. Peters, architect:—

Langmaid (accepted)	£700 0 0
---------------------------	----------

TO CORRESPONDENTS.

Consent for Concrete.—Messrs. Hilton, Anderson, & Co. ask us to state that they made and supplied the cement used in the concrete warehouses & other buildings described in our last. We are sorry to hear that J. J. H. (in the press of other country cannot) influence the decision of the commissioners as to a railway across the Straits. It must be of little consequence to proprietors what the press says.—P. The Building Act as it makes owner and contractor liable for default surveyor's fees.—Ketter (the metal) his in question are obtainable in Birmingham, but we do not give addresses.—B. P. (4 inches).—J. W. Louth (brick and stone buildings have been named in Chicago, but we do not know exactly).—J. A. (see paper by the late Prince Comar, in *Society of Arts Journal*).—A. J. A.—E. We are compelled to decline printing out books and giving addresses. All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. Noz.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TO SUBSCRIBERS.

The Publisher cannot be responsible for Original Testimonials left at the Office in reply to Advertisements, and strongly recommends that Copies only should be sent.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

BENOS AYRES GOVERNMENT CERTIFICATE.—TRANSLATION.—"We, the undersigned, at the request of Messrs. J. C. Thompson & Co. certify that the IRON SAFES of Messrs. CHUBB & SON, London, of which these gentlemen are Agents, were exposed for several hours to the fire that took place in the offices of the National Government on the evening of the 26th instant; that in our presence they were easily opened with their respective keys; that the money and important documents they contained were found in perfect order; and that these Safes are now in use in the National Treasury Office.—Benos Ayres, July 31st, 1867.

(Signed) J. M. DRAGO, Treasurer of the National Government. JOSE M. ALVAREZ.

A true copy.—A. M. BELL." A large assortment of these Safes may be inspected, and lists of prices obtained, at CHUBB & SON'S, 57, St. Paul's Churchyard, London; 63, Cross-street, Manchester; 28, Lord-street, Liverpool; and Horseley-fields, Wolverhampton.

IMPROVED MACHINERY. combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stable, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Chrono and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales. Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

SCHOOL FITTINGS.—MESSRS. BANKS

A CO'S PATENT REVISED ILLUSTRATED PRICED SHEET of every article required in a well-furnished school, sent free three stamps.—FABRICIANSE WORKS, ALBION STREET, MANCHESTER. **DIAPHRAGMATIC DIRECTIONS FOR COMBATING** "Catarrh" Diseases, such as Scatiff, Fever, Measles, small Pox, Typhoid, &c. embodying the recommendations of Dr. HALL, Mr. HACK WICK, and others, specially designed for Distribution by Guardians, Managers, Inspectors, Poor-Law Surgeons, Medical Men, Clergymen, &c. ROBERT HARDWICK, 102, Piccadilly, London.

TO ENGINEERS AND SURVEYORS.

PRIVATE BILLS, new Standing Orders for the enabling Scales, Lettering Books, Tracing Paper, Drawing Paper, and every requisite for the use of Engineers, &c. engaged in the preparation of plans for deposit. Plans, &c. lithographed with the greatest expedition.—WATERLOW & SONS, 49, Parliament-street, and 60, Lombard-street, London.

THE LIFE OF CHARLES THE FIFTH,

EMPEROR OF GERMANY, BY WILLIAM ROBERTSON, D.D. F.R.S.E. Late Principal of the University of Edinburgh. With some Account of the Life and Writings of the Author, condensed from that written by David H. Stewart, Esq. S. S. London: WILLIAM TEGG, Paternoster-Row, Chesops.

THE VALUATION (METROPOLIS) ACT,

1859, with Introduction, Opinions, Notes, and Index; and an APPENDIX, containing 30 & 7 Wm IV. c. 101, an Act to Amend the Law relating to Parochial Assessments; (25 & 26 Vict. c. 10) an Act to Amend the Law relating to Parochial Assessments in England; (27 & 28 Vict. c. 80) an Act to Amend the Town Assessment Act, 1852. By DANBY E. FRY, Esq. of Lincoln's Inn, Barrister at Law, and of the Portico Buildings, Strand, London: KNIGHT & CO., 30, Fleet-street.

THE POOR-LAW ASSESSMENT and COLLECTION ACT, 1859,

with Introduction, Opinions, Notes, and Index; and an APPENDIX, containing 30 & 7 Wm IV. c. 101, an Act to Amend the Law relating to Parochial Assessments in England; (27 & 28 Vict. c. 80) an Act to Amend the Town Assessment Act, 1852. By DANBY E. FRY, Esq. of Lincoln's Inn, Barrister at Law, and of the Portico Buildings, Strand, London: KNIGHT & CO., 30, Fleet-street.

WORKING MEN and IMPROVED

HOUSES. The new and illustrated edition of "The Dwellings of the Labouring Classes," by HENRY ROBERTS, Esq., M.P., and "The Physical Condition of the Labouring Classes," will be found a summary of the efforts at home and abroad to improve the "Healthy Homes" for working men and women. "A most valuable handbook"—*The Builder*. To be had at the Store and Stationery Office of the Labouring Classes, 21, Beater Hall, Strand, Price 7s. Also Designs for Cottages, numbered on sheet, with Specifications, &c.

TO ADVERTISERS.—The "ILLUSTRATED MIDLAND NEWS," a first-class pictorial paper, published at Birmingham, is sought as a medium for advertisements of a permanent character. It has a circulation of upwards of 30,000 amongst the leading localities of the Midlands, in addition to a current sale in all parts of the United Kingdom, France, Belgium, and the colonies. The best will contribute to its pages, and the best will be arranged upon its literary staff. Advertisements may be sent direct to the Office, 125, New Street, or through the Editor and Publisher, Agents and Printers, published weekly, 6d. a line; after 25 lines, 9d.; after 50 lines, 1s. Quotations and other acceptable advertisements send to "The Illustrated Midland News," is certainly a fair newspaper.

Sale by order of the Secretary of State for War.
MR. SPILLMAN WILL SELL BY PUBLIC AUCTION, at the ROYAL ARSENAL, Woolwich, on MONDAY, 16th OCTOBER, 1869, at ELEVEN o'clock in the forenoon precisely, the following STORES:—
 Nine Steam Boilers, Files, Founders and Lead Ashes, Scrap Iron, 73 & 8c, Silver, Buckets, Hubs, Wagon and Linen Bags, Iron Casks, &c. &c. Officers' Mess Furniture, Lifting Jacks, &c. &c.
 May be viewed from Ten to One o'clock, and from Two to Five o'clock, on the three working days previous to and morning of the Sale; and Catalogues may be obtained of Mr. G. O. Palmer, at the Tower; and Military Store Department, Royal Arsenal, Woolwich.

WIMBLEDON FARE.—The valuable Building Materials of a new & well-ventilated Res. des. des.
MESSRS. GLASIER & SONS are instructed to SELL by AUCTION, on the PREMISES, Lake House, Albert-road, Wimbeldon Park, on WEDNESDAY, OCTOBER 20, at ONE o'clock precisely, the whole will be first put up in one lot, and not disposed of till the whole has been sold; the valuable MATERIALS of the above-mentioned residence, which has only been erected about five years; comprising plate glass and other sashes and frames, sash and window and other doors, marble chimneys and register stoves, handsome carved alabaster drawing-room chimney-piece, carved S. R. Busts, by Phillips & Co.; S. K. Cottage, zinc bath and fittings, capital mould and timber floors, rafter, plate, brickwork, stone paving and coping, lead, and the usual fixtures and fittings, and two days' cart, and cartages had at the Green Man, Purney Heath; on the Premises; and of the Auctioneers, 41, Charing Cross.

Waltham Common Estate Improvements.—Second Partion.—To Build a House and Other Buildings.
MESSRS. C. STUART BARKER & SON are bound with instructions from the Guardians of St. Mary, Newington, in SELL by AUCTION, on the PREMISES, on MONDAY, OCTOBER 11, at TWELVE o'clock precisely, the whole of the valuable BUILDING MATERIALS of upwards of 60 Houses, 5 or 6 Rooms, in the streets of Waltham, in the Red Lion's street, Milk street, Pen-street, Chalk-street, and Bourne street, Waltham Common, comprising about a million of sound bricks, large quantities of tiles, slates, roof and floor timbers, stone, water, sash, doors, and sashes, lead, sash iron pipe, railing, paving, and other materials.—Catalogues sent upon application may be had of the Auctioneers, 37, King William street, City, E.C. and 144, Waltham-road, S.E.

PARTNERSHIP.—To FIRMS requiring CAPITAL.—Mr. J. LIDWALL has Three or Four eligible Clients with £1000 to £2000, each (one with a large trade), in search of a Good Mercantile Concern. Interview by appointment. (Communications confidential).—14, Walbrook, E.C.

PARTNERSHIP.—An ARCHITECT in the West-end, of considerable experience, desires a PARTNERSHIP with a Member of the Profession, who wishes to relieve himself of the office work; or with a young gentleman of means, with a good connection.—Address, 85, Office of "The Builder."

QUANTITIES MADE EASY.—A quick and accurate method of taking quantities from Plans or Builders' Estimates, with a list of the principal ones, sent free by post for 30 stamps.—Address, A. G. S., Northbrook-terrace, Burslem, Stoke-on-Trent, S.E.

GILDERS, thoroughly experienced in House Work, Decorative Furnishing, and Glazing in all its branches, may be OBTAINED at the House of Col. Marlborough inn, Bishopsgate-street, Oxford-street. Work done by the day, hour, or job. Materials found if required.—Address to the Secretary.

BUILDER'S CLERK WANTED, who can trace plans, &c. Keep a set of books, and superintend repairs. Salary commensurate.—Apply, by letter, to Mr. J. G. G. G., sitting age and experience, to LEVELL, care of Mr. Patterson, Stationer, Custom street, E.C.

COUNTY SURVEYORSHIPS.—An open competition for TWO COUNTY SURVEYORSHIPS, with maximum salaries of £500 and £400, a Year respectively, will be held in DUBLIN in NOVEMBER next. The Examinations will consist of: the four days commencing with NOVEMBER 2nd, and the five days commencing with NOVEMBER 16th; and will be in the following subjects, of which Candidates are at liberty to take up all or any, subject to a disallowance of marks for superfluous knowledge:—

PART I.	Maximum of Marks.
Mathematics, including Geometry, Trigonometry, Algebra, Differential and Integral Calculus, and Geometrical Optics.	100
Mechanical Philosophy, including Statics, Dynamics, Hydrostatics and Hydraulics, Pneumatics, and Heat regarded as a Source of Power.	100
Experimental Science, including Inorganic Chemistry, Heat, Electricity, and Magnetism.	100
Geology and Mineralogy.	100
PART II.	
Strength and other Properties of Materials, and the Calculation of Strains.	100
A. Railway and Canal Engineering.	140
B. Marine Engineering, including Harbour, Dock, Sea, and Reclamation Works.	140
C. Hydraulic Engineering, including Water Supply, Sewer, and Irrigation.	140
D. Country Works, including Architecture, Roads, Drainage, and River Works.	140

* Each of the groups lettered A, B, C, D, to include Designs, Estimates, Specifications, and the Mechanical contrivances connected with it; and Candidates will be required to show that they have been engaged in the practice of the profession in a systematic way for a sufficient time, or have had in some other way satisfactory opportunities of becoming acquainted with the practice of their profession in some one of the branches thus indicated. Persons wishing to compete should forward, not later than OCTOBER 26, evidence of their age (which must be between 20 and 40), and of their professional training, to "The Secretary, Civil Service Commission, Cannon Row, London, E.C." Such further inquiries as may be necessary will be made by the Civil Service Commissioner, with regard to the age of Candidates, and also as to their health and character. Dublin Castle, 2d October, 1869.

WANTED, by an ARCHITECT, an ASSISTANT.—Apply, by letter, stating qualifications, age, and salary, to A. B. C. Advertiser Office, Oswestry.

WANTED, a BUILDER'S CLERK, in an Office where no other is kept. Must be able to keep prime cost, and do a moderate amount of ordinary drafting in the Office. A young man, well educated, stating age, references, and salary expected, to No. 99, Office of "The Builder."

WANTED, a thoroughly practical WORKING FOREMAN OF JOINERS, in a small firm. Must be capable of doing all the work of the trade, and have references, to A. B. C. Water-lane, Manby Park, Stratford, E.

WANTED, a SHOP FOREMAN OF JOINERS. Must be fitted a similar situation before. Well up in drawing, the management of men, and converting timber.—Apply, with references, stating wages, to EVER & NEWMAN, Brighton.

TO SMITHS AND RANGOR PITTERS.
WANTED, a WORKING FOREMAN for a SMITH'S SHOP. One that understands shoe, range, and hot water work, and is prepared to do EVERY & NEWMAN, Brighton.

WANTED, in an Architect and Surveyor's Office, a well-educated YOUTH, as Out-door CLERK. One having been in an office a short time preferred. No premium required.—Address, X. Y. Z. Post-office, Newport, Monmouthshire.

WANTED, an active Man TO TAKE CHARGE of a 35-horse power Engine and Boiler. Must be thoroughly understood his business and be prepared to give satisfactory references.—Apply, by letter only, stating salary, &c. required, ENGINEER, 3, Clifton-road, Clifton Park.

TO WORKING FOREMEN OF CARPENTERS.
WANTED, a WORKING FOREMAN OF CARPENTERS. One who has had the superintendence of brickwork preferred, for the erection of houses at Lower Clifton. Must be able to do all the work of the trade, and have references.—Address, R. M. C. C. 22, Norton Folgate, N.E.

TO RITE DESIGNS, SPECULATORS, PLUMBERS, AND OTHERS.
WANTED, by a PLUMBER, well experienced in every description of new and old work, a JOB or SITUATION, in town or country. If of a permanent nature, would do all time at other branches if required, or would take a job piece-work. Age 32.—Address, PLUMBER, care of Mr. Whately, 4, Harcourt-place, Derry-street, E.C.

TO MASTER BUILDERS.
WANTED, by a practical Man, a SITUATION as OUT-DOOR FOREMAN. Has had good experience in superintending the erection and preparing the joiners' work for good jobs. A Carpenter by trade, 31, Good reference.—Address, J. E. 25, Glyn-street, Vanhook Gardens.

WANTED, by the Advertiser (aged 32.) Married, in ENGAGEMENT, Good practical surveyor, draughtsman, and estimator. Understands land surveying and leveling. Accustomed to dilapidations.—Address, J. M. H. care of Mr. Chilton, Crouch-end, N.

O BUILDERS AND OTHERS.
WANTED, by the Advertiser, aged 23, the MANAGEMENT of a small BUSINESS, or to assist Principals in the supervision of Buildings. Can take off estimates, measure up work, and is a fair draughtsman. Used to the supervision of buildings and book keeping. Good references. Send to any reasonable amount. E. B. M. past experience, Two years in town.—Address, E. B. B. Mr. Brackett, Stationer, High-street, Colchester.

TO JOINERS.
WANTED, an ENGAGEMENT as IMPROVER. Aged 19. Can keep books, if required. London preferred.—Address, C. W. J. 15, Edin-street, Norton Folgate.

TO TINDER MERCHANTS.
WANTED, by a practical Man, a SITUATION as FOREMAN. Long experience in buying in, thoroughly understood the construction of English and foreign timber, and is an excellent estimator.—Address, G. Post-office, Derby.

WANTED, an immediate RE-ENGAGEMENT by an efficient GENERAL ASSISTANT. Well up in Gothic and Italian Gothic, detail, perspective, leveling, &c. Has had the experience of good London and provincial offices. Highly commensurable testimonials. Address, ALFRED, Post-office, Waltham-street, W.

TO BUILDERS.
WANTED, a SITUATION as CLERK or ASSISTANT, by a Young Man of practical experience. A good acquaintance with a fair knowledge of mensuration and quantities. Willing to fill up odd time at home.—Address, 15, Athelstan-terrace, Holloway.

TO ARCHITECTS.
WANTED, a SITUATION as CLERK, by a Young Man of practical experience. Is a fair draughtsman, with a knowledge of mensuring and quantities. References good. Salary moderate.—Address, Z. 10, Athelstan-terrace, Strand, Holloway.

TO BUILDERS, CONTRACTORS, AND OTHERS.
WANTED, a RE-ENGAGEMENT, by a Young Man, well up in the duties of the Office. First-class references. Salary moderate.—Address, H. C. R. 11, Ascott-village, Green-end East, Dalston.

TO CIVIL ENGINEERS AND SURVEYORS.
WANTED, by an experienced Draughtsman, an ENGAGEMENT to assist in PREPARING PLANS, &c. for Parliamentary Deposit. Testimonials.—Address, C. Post-office, Turbott-street, W.

TO SAWMILL PROPRIETORS AND BUILDERS.
WANTED, by a steady active Young Man, aged 34, a SITUATION. Can chop on saw, work a frame or circular saw bench, or take the management of a saw-mill. No objection to Town or country.—Address, J. W. No. 19, Gunpowder-street, Stamford-street, Lambeth, S.E.

TO BUILDERS.
WANTED, a RE-ENGAGEMENT as FOREMAN, or to take Brickwork by the Rod. Good references.—Address, T. C. No. 2, Vine-street, Waterloo-road, S.

TO ARCHITECTS.
WANTED, by a good DRAUGHTSMAN, a RE-ENGAGEMENT. Accustomed to town and country offices. Salary moderate. First-class references.—Address, R. Baxter, two Longwood-street, E.C.

WANTED, a SITUATION as Plumbers' or Painters' LABOURER. Can do jobbing plumbing and putting, or good plain painting.—Address, 902, Office of "The Builder."

WANTED HANDRAILS, STAIRS, or GENERAL JOINERS' WORK, by a practical Man (labourer only). Town or country.—Address, R. 24, Tavistock-terrace, Portobello-road, Notting-hill, London, W.

TO ARCHITECTS AND SURVEYORS.
WANTED, a RE-ENGAGEMENT, by an ASSISTANT, aged 22. Good draughtsman and penman, perspective, &c.—Address, 905, Office of "The Builder."

TO CIVIL ENGINEERS, SURVEYORS, AND OTHERS.
WANTED, a RE-ENGAGEMENT as ASSISTANT ENGINEER or SURVEYOR, &c. Has had the entire charge of extensive public and other works. Thoroughly conversant with the drainage and water supply of towns. Is a competent draughtsman.—Address, A. Z. Post-office, Brompton, Bath.

TO ARCHITECTS AND BUILDERS.
WANTED, an ENGAGEMENT by an ASSISTANT, who is a thorough practical draughtsman, an experienced quantity surveyor, measurer, and estimator. Temporary or permanent.—Address, Y. Z. 3, College-street, Vias street, York-road, Lambeth, S.

WANTED, by a thoroughly practical BRICKLAYER, or a RE-ENGAGEMENT. Carpenter by trade. Good reference.—Address, A. B. 24, Myrtle-street, Queen's-road, Dalston.

TO BRICKMAKERS.
WANTED, a SITUATION as CLERK, by a young Man. Aged 22.—Address, H. J. E. Post-office, Hounslow.

TO BUILDERS AND OTHERS.
WANTED, by a young Man, a SITUATION as BUILDERS' FOREMAN or CLERK of WORKS. Thoroughly conversant in every branch of the trade.—Address, A. B. care of Mr. C. Clarke, 6, Silver-street, Golden-square, W.

WANTED, by a Young Man, aged 33, with good references, a SITUATION as HAND CARPENTER, PAINTER, and GLAZIER. Can undertake the charge of a job. Can do jobbing plumbing and putting.—Address, A. B. 15, Little Canada-street, Golden-square, W.

TO BUILDERS.
WANTED, by a thorough practical OUT-DOOR FOREMAN, a RE-ENGAGEMENT. Carpenter by trade. Good references.—Address, A. B. care of Mr. G. Matlock, 25, Trinity-street, Finsbury, E.C.

TO ARCHITECTS.
WANTED, by an ASSISTANT, a RE-ENGAGEMENT. Can prepare detailed working, and detail drawings, and is well up in the general routine of an office. Understands perspective.—Address, 316, Office of "The Builder."

WANTED, by a thoroughly practical Carpenter and Joiner, who has had for several years the head of first class work in one of the largest shops in London, a SITUATION as SHOP FOREMAN, or Charge of a Job.—Address, A. B. 13, Thornhill-street, Finsbury, E.C.

TO ARCHITECTS AND SURVEYORS.
WANTED, by an experienced ASSISTANT, an ENGAGEMENT. Is well acquainted with the various styles, constructional, detail, and general routine of the office. First-class draughtsman and designer. Land surveying and leveling. Address, L. B. 3, Chancery-lane, 12, Bell-yard, Temple-lane.

WANTED, by a practical experienced BRICKLAYER, a SITUATION as FOREMAN, or Foreman by the Piece preferred. First-class references.—Address, W. R. 5, Cleveland-street, Mile-end-road, E.

WANTED, a RE-ENGAGEMENT as GENERAL FOREMAN, or Charge of Job. Carpenter by trade. All 35. Good references. Present and past employer.—Address, W. T. Post-office, Bow-road, E.

TO PAINTERS, PLUMBERS, &c.
WANTED, by an experienced Man, a SITUATION as THREE BRANCH HAND. Good references if required.—Address, G. G. 39, Ravenor-street, Finsbury.

TO HOUSE DECORATORS, BUILDERS, &c.
WANTED, a SITUATION as JOBBY, by a steady respectable Man, a good Plumber, Zincworker, Glazier, and first-class Painter D. decorator, and Paperhanger. Twelve years' experience in all the above branches. References to most moderate. Good references.—Address, D. DAVIS, 5, Old Fish-street, City.

TO BUILDERS AND PLUMBERS.
WANTED, by an experienced PLUMBER, a SITUATION as FOREMAN, or other.—Address, A. D. 16, Alder-road, Kensington Park.

TO BUILDERS, CONTRACTORS, AND OTHERS.
WANTED, a RE-ENGAGEMENT, by a good JOINER. Sashes and frames, boxing shutters, &c. Fine work. Can take charge of a reference from London, or in London. Town or country.—Address, 235, Office of "The Builder."

TO BUILDERS, PLUMBERS, AND OTHERS.
WANTED, by a respectable Young Man, a SITUATION as PLUMBER. Good references.—Address, J. F. B. 9, Canning-street, Pentonville-hill.

TO BUILDERS, PLUMBERS, AND OTHERS.
WANTED, a SITUATION as SHOP FOREMAN, or to take Charge of a Job. A thoroughly practical carpenter and joiner by trade. A five years' and three years' experience.—Address, G. R. 20, Clarendon-square, Seymour-street, N.W.

TO BUILDERS AND OTHERS.
WANTED, by a respectable Man, aged 36, a SITUATION as IRONMONGER, or any capacity where trust is required. No objection to the country. Good references.—Address, G. C. 41, Weston-terrace, West-end, Kent, Kenton-road, W.

TO BUILDERS.
WANTED, by an Ironmonger's Assistant, a SITUATION as STORE-KEEPER, or Clerk in a Builder's Office. Will make himself generally useful. First-class reference.—Address, F. 15, Bittern-street, E.C.

TO ARCHITECTS.
WANTED, a RE-ENGAGEMENT as CLERK of WORKS. Has a good thoroughly practical knowledge of all branches in the building trade. Good testimonials and references.—Address, L. B. 13, Goldford-street East, Waltham-square, Clerkenwell.

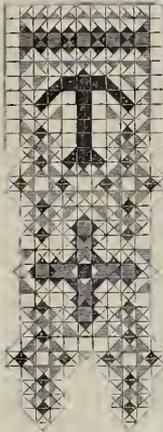

WANTED, by the Advertiser, a RE-ENGAGEMENT as GENERAL FOREMAN, or to take the entire Charge of a Job, either in town or country. Is a Carpenter and Joiner by trade, and has exceptional references as to character, ability, &c.—Add. W. A. 15, Upper Clifton-street, Finsbury, E.C.

TO BUILDERS.
WANTED, to JOIN the Advertiser, in a valuable building contract. The Builder, who can find 3000 or 3500, or would be treated with for transfer of agreement of mutual advantage.—Address, 935, Office of "The Builder."

TO ARCHITECTS AND SURVEYORS.
WANTED, a RE-ENGAGEMENT, as WORKING or GENERAL FOREMAN of JOINTERS, to conduct full equipment of saw-mills.—Address, T. T. Britannia Iron Works, Water-works, City-road.

The Builder.

VOL. XXVII.—No. 1393.

Technical Education in France.*

THE Imperial School of Arts and Trades was founded to train educated workmen and overseers in the industrial arts. It owes its origin to the following circumstances. In the year 11 of the Republic, Napoleon, then First Consul, paid a visit to the Government College at Compiègne, and asked some of the pupils what they intended to do when they left college. The answers he received he considered very unsatisfactory. Said the

subtle Corsican, "The Government pays large sums to educate these young men, and when their studies are ended none of them, save those who join the army, are of any use to their country. Nearly all of them remain at home, a burden to their families, which they ought to aid. This must be put an end to. I have visited the great manufacturing establishments in the North and the larger workshops of Paris; I everywhere found foremen clever in the manual labour of their trades, but scarcely one among them able to draw the outlines or make the most simple calculations of a machine, or to convey his ideas by a sketch or a written description. This is a great defect, and I will provide the remedy for it. There must be no more Latin here, that will be learned elsewhere, but the study of trades, with so much theory as is necessary for their progress. By this course we shall obtain well-taught foremen for our manufactories."

In this speech the great Napoleon gave the *raison d'être* for these well-organised institutions. We may observe that some of his remarks as to the deficiencies in technical instruction as it existed in France in his time, apply with considerable force to certain shortcomings of our own at the present day.

After acquiring an elementary education elsewhere, the pupils passed to the School of Arts and Trades, where, according to the occupations they intended to pursue, they were distributed among the different workshops, as,—1. Smiths, filers, fitters, turners in metal; 2. Founders; 3. Carpenters, joiners for furniture, building, and machines; 4. Turners in wood; 5. Wheelwrights. In these shops the pupils worked eight hours a day. There were half a dozen classes, according to the proficiency and aptitude of the pupils. Out of the eight hours only two were given to study and to theory, including geometry, descriptive geometry applied to the arts, and drawing and shading of plans and machines. Pupils were admitted without regard to age, and the number was fixed at 500.

Many improvements were introduced in the course of the subsequent years; but the chronicle of these changes would be too long to be inserted in this place. It will be preferable to give a

brief sketch of the organisation of the school at the present time.

As we have seen, the studies are both theoretical and practical. The pupils are admitted, after an examination, only once a year, on the 1st of October. The instruction extends over three years and a half, and there are no vacations, not even a half-holiday. Sunday is the sole day of rest. By this system no time is lost, and the pupil learns to grow accustomed to the six days of unceasing labour, which are his lot in life. Twelve hours and a half of work have to be got through daily. Five hours and a half are given to theoretical studies, and seven hours to practical work.

The theoretical study is divided into two parts,—four hours and a quarter in the morning, and one hour and a quarter in the evening. The morning, as being the time when the head is clear and the ideas fresh, is chosen for mathematics and questions, also drawing. The workshop duties are divided into two equal portions,—from ten till half-past two, and from half-past three till seven. The interval is devoted to dinner, and playtime after it. This interruption of manual toil rests the body, as the work itself rests the mind for the evening studies. The pupils rise at a quarter-past five and make their own beds.

The school is classified in three divisions, or years of study, each having its own professor of mechanics, or mathematics, and of drawing. There is also a professor of grammar, and during the first two years a professor of writing. The chaplain gives every week a lecture in religious and moral instruction.

During the first year the professor rapidly passes through the programme of admission, his object being to systematise the knowledge acquired elsewhere, before proceeding with his own teaching. In the subsequent two years he teaches them,—arithmetic, algebra as far as and inclusive of quadratic equations, elementary geometry, comprising curves of the second degree demonstrated geometrically, plane trigonometry, the elements of descriptive geometry, and of the construction of geometrical machines. In the third year a professor teaches industrial mechanics, including hydraulic machines and steam-engines; the principal elements of physics; lastly, the rudiments of chemistry, its nomenclature, and its applications to materials. The pupils are interrogated whilst at their studies by the professors and by the foremen of the workshop.

A very simple method of teaching drawing is practised. During the first year the pupils acquire a free use of the hand by making designs with a drawing-pen of curves, &c., which at a later period they will require when drawing machines. Most of these designs are taken from architecture, of which the scholars are taught the rudiments. For this portion only the drawings are copied from models. The first year's drawing studies are completed by making drawings of joints in carpentry and joinery, exercises tinted with Indian ink, and two drawings of plans.

During the second year, first the elements of machine drawing; next follow, in the hours of study, working drawings of descriptive geometry, which require the most rigorous accuracy. On attaining this point, the pupils, having acquired neatness, clearness, accuracy, and precision, should be able to draw well. They immediately apply their skill to the geometrical drawings of machines, gearing, &c. In this second year they make sketches in the workshops of tools and various machines to scale, with dimensions given. In the third year they make drawings of machines, and illustrations of the lectures on mechanics. They also calculate the principal parts of the machines, and conclude with making drawings of machinery in black and white.

We have thus given in detail this simple and

natural gradation of studies in drawing, it having been found to afford the most successful results. The complete three years' course comprises upwards of a hundred designs or working drawings. The projects and details of the machines to be made in the workshops are executed by the professors in the office of the engineer of the works. It now remains to describe the practical instruction. The pupils are classified in this way. One-third of them are distributed in the preparatory workshops, that is from twenty-five to thirty-five in each of the three: the pattern-shop, the foundry, and the smithy. The remaining two-thirds (about 200) are sent to work in the fitting-shop.

In the pattern-shop the pupils commence with making simple patterns with boards; next they learn to execute all the different joints used by carpenters and joiners; next come patterns for foundries, proceeding from the simplest to the most difficult and most complicated; straight or bevelled gearing, with and without mortising, cylinders and framework for steam-engines, and so on. By way of practice in cutting and manipulation of wood, the pupils also make articles of furniture, pulpits, and woodwork for churches, and other things more or less ornamented.

In the smithy the students commence with welding scraps of old iron into masses, and making tongs and other tools used in forging. They next forge small articles for exercise in filing and fitting, and afterwards make parts of machines. In the third year they are taught the use of the steam-hammer.

In the foundry they commence with plain castings of medallions, balustrades, and palisades, as well as the simpler parts of machines. They next make hubs and statuettes on a small scale, before proceeding to execute in large dimensions. By degrees they come to the framework of machines, and the casting of large wheels, either with cogs or with mortise holes, to receive wooden ones. Lastly, they proceed to the casting of small cylinders.

By way of showing how successfully these things are taught in the Imperial School of Arts and Trades, we may mention, that in 1861 this school turned out a fine casting in bronze, upwards of 9 ft. high—a statue of the Duke de la Rochefoucauld, which was set up in the public square of Liancourt. As a rule, however, these castings are in iron. All the processes of the workshop are performed by the pupils themselves, as making the moulds, charging the furnace, casting, paring, and trimming.

In the fitting-shop the pupils begin with simple pieces of regular forms, requiring considerable attention to symmetry and precision, and for that reason very instructive. For example, they first of all make two small iron straight edges, perfectly true in every way; then two squares accurate in every respect; next they make a regular quadrangular prism, and from it an octagonal prism. Subsequently they execute various kinds of compasses, hand and claw-vices, keys for screws, ratchets, bow-lathes, and bench-vices, and, finally, machine tools, steam-engines, and parts of machines, according to the orders in hand.

In carrying out these multifarious practical operations, their work is regulated by certain general principles. In accordance with these principles the pupils, as a rule, make only one piece of the same kind, in order to learn how to execute the greatest possible number. All their work is done, as far as is practicable, by hand, and with the simplest tools.

The intention of this training is to teach the pupil to make all kinds of things, so that he may be able to turn his hand to any branch of his trade where he may find an opening, and to fit him for entering any workshop, large or small. It is stated by the Government reporter, that after a year's work, in any spe-

* See p. 787, ante.

cialty, a clever pupil will acquire all the rapidity of execution characteristic of good workmen.

Until the pupils can work well with the hand, they are never allowed to use the machine tools, or the mortising, planing, or filing machines; but the less skillful always have the advantage of seeing these machines in use; and having been compelled to make drawings of them, they must be well acquainted with their principles. Each pupil has a vice to himself, and at each bench the more advanced pupils teach the juniors. There are also in each shop one or two workmen as examples for the lads.

The pupils are classed, according to merit, at the close of the year, at which time the most deserving are rewarded with prizes. These prizes consist of silver medals bearing the words, "School of Arts and Trades—Reward," for the pupils who are about to leave the school, and who constitute the first division. In the second and third divisions, the rewards consist of hooks on science or the industrial arts. Sometimes a successful pupil is fortunate enough to obtain the award of a sum of money to help his start in life, but this money is never paid till the following year, and then only on condition of the claimant's producing certificates that he has been working at his trade for the past twelve months.

Among the prizes may be mentioned those of M. Xavier Jourdain, founded in 1863, as a testimonial of gratitude for the education he received in the school, to which he attributes most of his success in life. The first prize is a gold medal worth 300 francs (12*l.*), and a sum of money, 1,000 francs (40*l.*); the second prize is a similar medal and 500 francs; the third prize is a silver medal and 400 francs.

The average annual number of pupils during the last four years has been 312; but at least six times that number presented themselves as candidates.

The question will naturally arise, do the pupils on leaving the schools readily find employment, and at remunerative wages? A return shows that from the very entrance of those pupils upon active life they have obtained employment in factories, workshops, and in railway and other establishments. Out of 465 pupils who left the establishment during two years, two only were returned as being out of employment. All these young men seem to have obtained fair wages. Every department of France has the right of sending three exhibitors;—one without any charge, the second to pay one-fourth of the charges, and the third one-half.

How such an establishment would work in this country it is no part of our plan to dilate upon. Our intention in this article is to give facts, which may be accepted as trustworthy, being founded upon official documents. We have no theories to advance, we wish simply to give an account of certain things as they exist.

Let us now turn our attention to some other institutions for technical instruction in France. Among the most important of the minor establishments may be named the Polytechnic and Philotechnic Associations. These two associations have in Paris no less than 150 professors, who perform their functions gratuitously. The instruction consists of courses of arithmetic (first and second years), geometry (first and second years), descriptive geometry, physics, chemistry, machines, drawing of the figure and of ornament, geometrical drawing, book-keeping, geography, natural history, elementary astronomy, grammar, hygienics, singing. The Philotechnic Association has also established courses of English and German, which are not given by the sister establishment.

This association has been rightly called the Working Men's College, as the Conservatory of Arts and Trades has earned the title of the Manufacturers' College. Admission to all the courses is not only gratuitous, but the pupils are also received without any conditions as to their previous education.

Various objections have been raised against courses of teaching for adults, which the director answers. Among other objections it has been urged that the artisan, after a hard day's work, must be, as a general rule, little disposed for intellectual effort. Again, the workman being obliged sometimes to work over-hours in the evening, cannot be regular in his attendance. The first objection, says the director, is unfounded. Intellectual effort after bodily labour is a recreation rather than a fatigue. Energetic workmen who know the value of instruction find a pleasure in attending classes, if not every day, at least once or twice a week. To the second

objection, which the head of the establishment admits to be more serious, he remarks that in certain establishments over-hours are rare, and that, when the men miss lessons, they may easily learn what has taken place in their absence from the notes of their comrades.

We now come to the important establishment founded at La Ciotat by the Company of the Messageries Impériales, for supplying its workmen with the means of acquiring or extending their technical education. There is an infant school and a primary boys' school at La Ciotat; but these do not fall into our plan.

In 1863 evening classes for instruction were opened for workmen and apprentices. Three times a week there is a drawing class from eight till ten in the evening; three lessons per week in the English language are given; and there are courses of orthography, grammar, &c.

At the Graffenstaden Factory, in the Department of the Lower Rhine, there is a school for technical instruction. The term of apprenticeship in this factory ranges from four to six years, during which the lads are bound to attend the school. Experience having shown that the school to be successful must not be altogether gratuitous, each pupil has to pay a tenth of his earnings into the school fund. These boys are taught calligraphy, French and German grammar, dictations and compositions in French and German, free-hand and geometrical drawing, drawing of machines, arithmetic, elementary geometry, physics, and mechanics.

The classes are held every morning from six till eight o'clock (including Sundays), and every evening from five till seven, except Wednesdays and Sundays. Firm discipline is maintained. The schoolmaster presents to the director of the factory a daily report respecting absent pupils, or other facts. The punishments to which the pupils are liable, according to the character of their faults, are a reprimand from the director, a pecuniary fine, or expulsion from the factory. There are monthly and yearly examinations, on which occasions prizes consisting of useful hooks are awarded. The efforts of these lads at self-improvement are aided by an excellent library provided by the factory, containing the best scientific and technological works which have appeared in the French, German, and English languages.

The Imperial manufactory of arms at Tulle provides classes for the instruction of its workmen. Attendance at these classes is compulsory on all the workmen proposed for promotion, either in the manufactory of arms, or as head armourers in the different army corps. They are optional for all the other workmen; but none are placed on the lists for promotion who have not attended them to good purpose.

In founding these classes the objects in view were,—1. To give the heads of workshops and factories the instruction necessary to enable them without the aid of others to keep the daily accounts of the workmen under their orders. 2. To give the men destined to become controllers of arms or chief armourers to corps of troops, a sufficient knowledge of elementary geometry and linear drawing to enable them, if called upon, to take the direction of workshops for the manufacture or repairs of arms, or to superintend the working of machines in factories, and to keep the same in repair. These classes are held three times a week, and are taught by three Government officials, one for arithmetic and elementary geometry, another for drawing, and a third for the manufacture of arms. All these courses are attended by workmen employed by the Government.

The Upper Commercial School is another representative institution. It was founded in the year 1820 as a scientific institution of a kind then unknown. Its curriculum requires three years of study by the pupils, and no pupil passes from one class to the next without undergoing an examination.

Though in some manner elementary, the first class admits only such pupils as have received a good primary education, and are pretty well versed in French grammar, arithmetic, and geography. It is devoted to improving their handwriting; to the study of arithmetic, geography, and history; to an elementary course on the usages of trade and the rudiments of accounts; to natural philosophy and chemistry; and to the knowledge of raw materials, of which the school possesses samples. In this class the pupils begin the study of languages: the foreigners learn French; and the French pupils make a more profound study of the rules of their native idiom. The second class does

not receive pupils under sixteen: it carries on some of the preceding studies, adding book-keeping, the theory of accounts, in all parts, the application of arithmetic to all the operations of trade and banking, a course of correspondence, essays intended to accustom pupils to express their thoughts rapidly with precision and clearness, linear drawing, geometry, the elements of algebra, commercial geography, and the study of the code of the commerce of France.

The third year is devoted to the higher branches of learning, and to practical exercises. It includes the study of the exchanges, and of arbitration, as to transactions with foreign Governments; application of accounts to commerce, manufactures, and agriculture; analytical chemistry and chemical manipulations applied to the study of merchandise, and to the discovery of adulterations; technology of the principal manufactures; the requirements of trading ports, railways, and docks; mercantile and marine law, and political economy. The pupils are divided into groups, or commercial firms, which are from time to time renewed, buy and sell goods, keep hanks, charter vessels, assure, commission, correspond, and perform, under the guidance of an able and experienced professor, all the most difficult and most varied operations of commerce. The pupils rise at half-past five all the year round, and at six commence the business of the day. The hours of every day are thus employed:—Five hours' lessons, six hours' study, and four hours' recreation.

We have now noticed at some length all the representative establishments for technical education which exist in France. Throughout the length and breadth of that country there are scores of similar establishments,—trade schools, farming schools, drawing schools, and schools of architecture and engineering.

By way of conclusion, we may give a *proleptic* of the views enunciated by General Morin, the Government reporter, on technical education with respect to the very important question of the education of apprentices.

With regard to apprenticeship, and its connexion with education, three principal solutions have been put forth. The first is, that the workshop alone can attain the object of all apprenticeship, properly so called, namely, training the artisan, and giving him the requisite manual dexterity. To combine with a real apprenticeship to the future trade the degree of instruction that all workmen ought to possess, two principal means have been successfully employed. One consists in placing the school in the workshop or factory, and in compelling, either by law or internal regulations, the daily attendance of the apprentices for a certain number of hours. Of this kind are the important factory-schools at Mulhouse, Graffenstaden, Wesserling, Le Creusot, La Ciotat, &c. The second solution is that which has been organised by certain municipalities, and private firms and societies of patrons, which take the apprentice under their protection, and watch over his interests until he has served his time. The third manner of preparing youths for the practice of the different trades, consists in establishing a workshop in the school itself, and dividing the pupil's time between study and manual labour.

Such, in a condensed form, are some of the opinions and reports of the authorities charged by the French Government with the duty of examining the real condition of technical education in France.

ARCHITECTS AND ENGINEERS.

The generalising tendencies of the present day, the result mainly of the broader analysis of modern science, concur to draw together and assimilate, in many points, pursuits and professions formerly separated by an easily-recognised line of demarcation. As we draw nearer in our researches to first principles in science and art, we come almost insensibly to find things which we had been accustomed to regard as essentially diverse in their nature, resting, in fact, very much upon a common basis; we discover that knowledge and information which have been supposed to hear specially upon one particular occupation, come in usefully also, or even indispensably, in the practice of other pursuits more or less analogous. The primary effect of such discovery is, as we have hinted, to unsettle and confuse the nominal boundaries of professions, a process which is still more accelerated by the rapidity of modern life and the comparatively short time in which everything

nowadays is expected and demanded to be done. "That is best which lieth nearest" is the principle adopted by the practical man as well as the artist. The client goes to whomever he thinks will supply him most readily and quickly with what he wants. But the secondary effect of this state of things must necessarily be in the end to narrow the circle of individual practice in any art or profession, to promote the principle of the division of labour, and to break up large and ever widening spheres of labour into smaller sub-divisions, so that each practitioner may be able to grasp fully what he professes to do, and to render efficient aid and co-operation towards the grand result to be attained.

It is under such general influences as above indicated, that the two professions named at the head of this article have, at present, got themselves a good deal confounded together in the public mind; which confusion has been, if not initiated, at least encouraged and stimulated by sundry members of the engineering profession, individually or through their recognised journalistic representatives, on the principle, assumed if not stated, that "an architect and an engineer are very much alike,—especially an engineer." The distinction between the two professions was formerly sufficiently recognised by every one, and might in broad terms be expressed thus: that the engineer was concerned in providing for transit from one place to another, the architect in erecting buildings *in situ* at the various termini of locomotion. The older engineers made their fame by their canals, their bridges, their roads over impossible places; the architects by their mansions, their town-halls, and public buildings generally. But the advent of that great democratising agent, steam, for a time very much modified all this. In the first place, the discovery of so new and valuable an agent in locomotion naturally drew everybody's attention, much more than formerly, to the constructions required in connexion with locomotion, rather than to those needed for habitation or display. Railways became an end rather than a means, so that in some cases the natural order of things was reversed; and instead of the railway being used as a means of communication between two towns, unimportant towns were made the excuse for a railway, projected and surveyed, if not completed. In such a state of things the engineering profession of course got a long pull, and a strong pull, and a pull altogether, alike upon the purse and the confidence of the public; giving, let it be said, good and strenuous labour in return. Then there were, in connexion with railways, such things as terminal and roadside stations to be built; things bearing the semblance of being strictly architectural work, but which, nevertheless, fell largely into the hands of the engineers, as many direful structures up and down the country can and do abundantly testify. Then also, since the time saved in travelling has led inevitably to our much faster rate of living generally, and the demand for the execution of edifices of all kinds on much shorter notice than was once deemed necessary, it has been discovered in some important instances that the engineer, from his constant grappling with tough constructional problems under adverse circumstances, is a readier man in an emergency than the architect; and so there has passed into his hands the superintendence of sundry erections, from time to time, which, if there be anything at all in the architectural profession, certainly ought not to have been built without, at least, the co-operation of an architectural designer. However, the mischief is done now; and that which has in some instances come to pass in practice, has been justified in theory, in certain quarters, with a persistence and an ability which have not been without their effect on the public, who will believe anything if they only hear it often enough, and many of whom are already quite prepared to accept the engineers' own account of themselves, as the persons best qualified to superintend the contriving of all such structures as might, could, or should be erected upon the surface of the earth. This view of the matter is partial and incorrect in itself, disconcerting to the student of architecture, and exceedingly pernicious to the student of engineering.

Of course, as we all know, every design must have a structural basis, and therefore knowledge of construction is necessary to the architect, whatever he is engaged upon. It is only when the constructive necessities of a building, or of a structure of any kind, completely override in importance its artistic necessities, or

when the constructive problem is so difficult and complicated as to be itself an object of special study, and of the application of abstruse scientific and mechanical principles, directed by a judgment resulting from long practical experience, that the aid of the engineer is really necessary. There are classes of works which belong purely and absolutely to the engineer, and wherein there can scarcely be said to be any scope for architectural embellishment; there are again works, such as ordinary houses, churches, &c., where the only problems really requiring thought and intellect are those of design (including plan) and ornamentation; and there are again works belonging by custom and in their initial form to the engineer, which would yet be susceptible of much embellishment from the hand of the architect; and, conversely, works of which the main object is beauty, but which are erected under structural conditions which demand special engineering skill and science to grapple with them successfully.

And this latter class of works, of what we may term the mixed kind, is much more numerous in the present day than ever it has been hitherto, and is not perhaps likely to become less so. It might seem natural and right that the mere channels of locomotion, of access from one centre to another, should fall solely under the hand of the engineer, as works purely of necessity and for use. And in the old road and osal-making days this was of course the case. But now that the railway system has necessitated so many stopping-places on the road, apart from ordinary towns and villages, where erections of great size are required for the daily use and under the daily sight of many thousands of people (not to speak also of the multitude of roadside stations, importantly, their number and frequency, if not by their size), it is surely desirable that some special attention should be paid to the aesthetic beauty of such structures, in addition to their mere constructive strength and fitness. In some cases this has been done, but chiefly in the matter of small roadside stations; the large termini being still left, for the most part, under the sole care of persons whose very education tends to draw their minds completely from considerations of beauty and expressiveness in an edifice, and to develop their faculties on the practical and calculating side only. On the other hand, the demand for the production of very large buildings on very short notice, and sometimes under peculiarly difficult conditions, which has arisen under modern civilisation, tends to put the architect in a very different position with regard to the practical requirements of his profession. A Gothic cathedral was a thing elaborated slowly and deliberately, and may have been the result of many accurate scientific theories than of practical experience attained by men who were constantly engaged on their work, thinking of little else, and who had time to deliberate and experimentalize. Now, everything is wanted to be turned out of hand by a certain date, and its constructive security must be guaranteed, or the insurance companies will have nothing to say to it. And all this seems to lead us to what we have called the secondary but inevitable result of the conditions of modern life, viz., the carrying out to a greater extent the principle of the division of each profession within closer limits. In other words, we think that not so much a fusion of the professions of engineer and architect is called for, as a co-operation of the members of those professions each in his own strictly-defined sphere.

It may be said that we should rather attempt to educate our engineers better in design, our architects more thoroughly in construction, and so dispense with the inconvenience of having two professions to do, as it sometimes seems, the same thing. Our system of education would have to be very much methodised and improved before any such result could be obtained. But we believe the idea is chimerical, except with regard to peculiarly gifted and exceptional individuals. Architectural design, in a high form, rests, as we have frequently urged, upon very subtle and refined principles, not apprehended without considerable study, even by those who have a special gift that way; and the very quality of mind which predisposes a man for this class of study is that which has most antipathy to, sometimes even absolute inability for, mathematical and mechanical studies. "Ah! sir," said William Blake, on being shown some mechanical engravings, "these things we artists hate." On the other hand, it cannot be doubted, not only

that the highest engineering talent is very often found totally unaccompanied by what we may term aesthetic perception, but that, as before remarked, the very course of an engineer's education tends to draw his mind solely to the consideration of the mechanical properties of material, without any reference to their capability for beauty of form or finish. And the very rapidity of demand in the present day intensifies the importance of this distinction. Were there more time allowed for maturing the design and carrying out the construction of a large building, there might be more chance that one man would be able to provide at once for its constructive and artistic requirements. As it is, except in cases where one of these two classes of requirements is at a minimum, it is next to impossible for one mind to attend properly to things so diverse, and calling into play such a different class of faculties. Where the constructive and the artistic problems are equally balanced, and are each important in themselves, a fully satisfactory result can scarcely be obtained but by co-operation.

We should probably not have much difficulty in recommending such an idea to the consideration, at least, of members of the architectural profession. In some instances within our knowledge the calling in of an engineer as consulting constructor has been adopted by an architect, and that voluntarily. And there are probably many cases where, in carrying out very large works especially, an architect who was solicitous for his future fame as a designer, would be really glad to be relieved of the onus and responsibility of the thousand and one practical difficulties and dangers to be provided for or guarded against, and have his mind left free to bestow all its faculties on the great end of all architecture, rendering a building a delight instead of a nuisance. We are sorry that we can feel no such confidence, or half-confidence, in the converse case. The attitude taken by the engineers towards their architectural brethren has too much savoured of an antagonistic, or, at least, a kind of "we-can-do-without-you" feeling. When Professor Kerr, some years ago, in a paper read at the Institute, and printed in full in these columns, ventured to advocate something like the same system of co-operation which we have been hinting at, he was answered in an indignant and injured tone by an engineer correspondent, who assured him that engineers "would not put themselves into architectural harness." No one ever asked them to do anything which ought to be so defined. Those who take this tone, no doubt, think that they evince their superiority by so doing; that they speak from a superior standpoint to that occupied by those half-taught people the architects. They are quite mistaken. Their arrogance is that, not of knowledge, but of ignorance. But the mischief is that, from the nature of the case, it is often impossible to convince them of this. Mathematical and mechanical knowledge is a thing that can be defined; and if an architect is deficient in this, his deficiency can easily be proved to him, though he is, of course, open to say, if he choose, that he thinks it of no consequence to him. But if a man is insensible to the difference between beauty and ugliness, between an artistic and expressive, and an inertistic and meaningless structure, what can we say? He is insensible, and there is an end. You cannot demonstrate to him, logically, that he has erected a monstrosity upon the earth; for all that he can see, it looks all right, and he does not know what more you can wish for. The absurdity is, that with all this ignorance and indifference to what constitutes the aesthetic in building, the engineers still seem to have a kind of lurking conception that something called architecture is needed to give the finishing touch to their constructions; and this they set about supplying by the light of nature; that is to say, instead of letting the real construction of their work appear, they mask it behind something, which resembles something else which has been done somewhere else by somebody else at some other period, ancient or modern, and which has no conceivable relation to the matter in hand, and then complacently think they have done the architect's work in addition to their own. All that they have really done is to deprive their work of all the solid and satisfactory expression which it might have had as a piece of unadorned construction, and to make it, externally, a meaningless and often hideous sham. Pure constructive provisions, when made on a large scale, will often produce a fine general effect in spite of the engineer. We remember on one occasion being struck by

the fine bold outline of a machicolated water-tower seen in the distance from the streets of a provincial town. The machicolations were used for the practical purpose of obtaining a wider area for the tank at the top. We took an opportunity of making a closer inspection of the edifice, and scarcely know how to express the effect it produced upon us. An attempt had been made at what might be called "lunar Gothic," and every detail in the tower, and the surrounding buildings, was so moonish, so inconceivably hideous and barbaric, that we stood lost in wonder how any man could possibly have invented such ugliness. Yet this was the work of an engineer eminent in his profession, and who, as we incidentally learnt afterwards, prided himself particularly on the appearance of this very building.* He is dead now, and we trust his iniquities are forgiven.

The real remedy for this engineering intrusiveness of barbarism upon us lies with the public. And if the directors of railways and water companies, and such-like concerns, could be got to insist upon the introduction of artistic as well as constructive excellence in the great works which their business requires, we might be spared some very painful sights, and even gain some very fine ones, with little or no extra expense. Consider what a fine thing might be made of such a large railway station as that of Crewe, for instance, with its long perspective, if treated with architectural breadth of effect in the general arrangement, and fitness and elegance in details. We see no reason why the engineers should feel inattentive at such a proposition. We believe the architects are quite willing to recognise the importance of engineering experience and knowledge, and to avail themselves of it where it is really desirable. They may surely ask in return that their art should be recognised, and that engineers should be willing to consult the judgment of persons who have studied the art of beauty and expression in building, which they themselves have paid no attention to. One piece of advice we give the engineers in the meantime. If they still wish to keep clear of the architects altogether, they had better be contented with naked construction, and avoid dabbling in architectural design themselves. They could do nothing which would illustrate more emphatically their need of the architects' assistance.

A FEW WORDS TO SOME WORKMEN.

WE adopt, as we naturally should, the observations made by the third speaker (Mr. Codwin) at the Working Men's meeting held in Bristol during the recent Social Science Congress. At that remarkable gathering no fewer than 3,500 persons attended, of whom at least 3,000 were of the wage-paid class. The Health Department of the Association considers the various questions relating to the Public Health, discusses improvements in house construction, drainage, ventilation, the functions of government in relation to public health, and the machinery expedient for its preservation. The Council always desire that this part of their programme should be brought prominently before the meeting of workmen invariably held during their congresses; and very properly so, for it concerns no part of society more, if so much: health is the workman's stock-in-trade; without it, he is nowhere; knowledge of the laws which regulate it is of the utmost consequence to him, and should be systematically taught: every item of such knowledge that he can obtain will be of value to him. Much has been done in Bristol within the last dozen years to improve its condition. Clark's report shows what it was in 1850. A board of health and an anxious medical inspector have since been at work, and have lessened the death-rate; but they must not rest on their oars: the removal of the sewage will demand their most serious consideration; hundreds of houses are still unfit for human habitation, and smoke is still allowed to disfigure the city, to interfere with health and to prevent cleanliness, although the Act of 1866 would enable them to remedy the evil. Walpole called Bristol "the dirtiest great shop I ever saw;" and inattention to the smoke nuisance

* In another place, we have seen a large reservoir built on the top of a hill, in a pretty country, which might have been made a striking object. It was built in the form of the smallest and most simple of cottages, under a single roof, the tower at one end taking the usual aspect and position of an outside chimney upon the centre of the gable! The effect was, literally, to dwarf the scale of the whole landscape round.

leaves it, to a certain extent, still open to a similar remark. Smoke interferes with the spirits, makes life less buoyant, and lessens happiness. Surely it should be fought with; surely it should be conquered. It is too late in the day for objectors to express any doubt as to the value of good sanitary arrangements. What has been effected by improvements in this direction in Salisbury, Ely, Croydon, and Bristol itself, as well as many other places, affords sufficient proof of their value. The great test, is the death-rate. What lessening the death-rate of a town means is not fully felt by all. Take a practical illustration of it. The population of Bristol is called 172,000, and the death-rate in 1863, if correctly given, was 23 in 1,000;—for every thousand persons living 23 died in the year; 3,956 in all. Now the death-rate in Manchester for that year was 32; and if it had been the same in Bristol, 1,548 persons alive at the end of the year would have been dead. This is a serious matter, and worth comprehending.

It must be remembered, too, that for every death there are seven or eight cases of illness that do not so end. Besides the 1,548 additional deaths, there would, therefore, have been eleven or twelve thousand additional cases of illness, with their consequent pain, poverty, pauperism, degradation, and misery. To lessen the death-rate of Bristol one per annum, is to save 172 lives yearly, and some 1,200 cases of illness. Are not all concerned in striving to effect this? The consideration of the importance of sanitary improvements should surely make us less impatient of the taxation they might lead to. What is wanted, we say again, is knowledge. If the Board of Health were fully supported out of doors, they would probably soon apply themselves to enforce the improvement of some of the dwellings, for example, lying between the cathedral and the gasworks,—dwellings wherein, as at present occupied, health and virtue are scarcely possible. At the place called the Quarry, also, great changes are called for. Here habitations are planted against the sides of the excavation, so that proper ventilation is out of the question. The effects of overcrowding should be inquired into, and the value of air understood. How is it that so many children still die before they are five years old? The number comparatively is enormous and damnable. With adults, badly-constructed houses and overcrowded rooms produce a low state of health in the whole population, and dispose it to receive readily any infection, physical or moral. The bad food they get, and the habits some of them indulge in, increase this disposition to the bad. Nor is the latter evil confined to their class. Each class has its bad habits. What might not be done if we all gave up some of our indulgences with a view to the general improvement—say, for example, that less was drunk. Some 50 millions a year are spent in intoxicating liquors, with a crowd of fatal consequences to boot. Suppose we gave up half our drinking,—not to be too good all at once,—the 25 millions sterling so saved could be made to save 25 millions more. It is not alone the working-classes that need to be taught temperance. All classes require the lesson: there should be temperance in other things besides drink. Education is a more profitable investment than beer, and has a money value. Artistic skill, the result of education, has given foreign nations a great advantage over us. If our workmen will not go to the School of Art themselves, if they are too firmly fixed to get out of their regular groove, at any rate let them send their children: the hope of the nation is in its children. A knowledge of drawing not merely brings delight but profit, and its acquirement in youth is as easy as that of writing: it gives a new sense, a new power. Connected with these subjects,—the public health and the education of the masses,—are the adornment of cities and the spread of taste for works of art and knowledge of art. One of the speakers at the same meeting, commenting on this observation had filled the people's bellies with nonsense. Such a remark is worse than nonsense a vast deal. Are we to wait until all the bellies are filled before we talk to any of the value and delights of art? If so, depend on it there will be less and less power in the country to afford that material aid. The ignorance in respect of art amongst all classes is sorrowfully great. Our public bodies should attach more value to art, and spend more money on it. We want large pictures in our meeting-places open to all, teaching, elevating, purifying; we want more sympathy

between masters and men, between men and men; we want universal education, and the spread of knowledge. Knowledge is not merely power, knowledge is health; and without health there can be little happiness or progress.

THE LATE MR. THOMAS WATTS, OF THE BRITISH MUSEUM.

The following observations by Mr. Henry Stevens (of Vermont), long and honorably known in this country in connexion with books, will be found interesting:—

Mr. Watts need to say that his first position in the library was the very humble one of supernumerary assistant for arranging and cataloguing the accumulations of Chinese, Russian, and other books of the kind, which no officer or assistant felt disposed to take hold of.

In 1838 Mr. Panizzi, then keeper of the printed books, detecting and appreciating his uncommon abilities, nominated him as second officer on his staff, Mr. Jones being the first. One of Mr. Watts's chief recommendations to the appointing powers was his practical and working knowledge of twenty-five languages. For nearly twenty years it was part of Mr. Watts's duty to examine, classify, and place all authors as they came crowding into the library. Thus every hook, from whatever part of the world it came, passed under his eye, affording a rare opportunity for a man of his linguistic powers. Many a time has he been noticed beside his loaded attendant stood yawning. He gave great attention to the bibliography of the literature of the north of Europe, including the Icelandic, the Swedish, and other Scandinavian languages, nor was he less mindful of the Russian and Solovay languages generally, especially the Hungarian. Mr. Panizzi, and afterwards Mr. Jones, with commendable zeal, purchased all the books in these languages recommended by Mr. Watts, in so much that the museum is now probably richer in books of each of these languages than any library in Europe, not excepting perhaps the best collection of each language in its own country.

Soon after 1843, when Mr. Panizzi, aided by Mr. Jones and Mr. Watts, drew up his famous report on the deficiencies of the British Museum in the literature of the several countries of the world, it was found that though every English book might in time be acquired, yet the books wanted from all parts of the world, in all languages, would soon outnumber and dwarf the English department. It was, therefore, thought desirable to give especial attention to the collection of American books, as if they were English; that is, to procure them all. A parliamentary grant of 10,000*l.* a year was asked and obtained for the purchase of books alone, the binding and all other expenses to be provided for by other funds. That sum is still the annual grant. In 1843, a few American books were purchased, but probably at that time the whole collection of American books in the library did not exceed 1,000 volumes, nor was there at that time any just idea of the vast amount of books that had even then been produced in the United States. In 1845, a young man from Vermont dined at the Museum, introduced by Mr. Sparks. He had taken a degree from Yale, had heard Story lecture, and was a good deal interested in American literature and history. Mr. Panizzi, Mr. Jones, and Mr. Watts, soon drew from him a report on American books, comprising a list of some 10,000 volumes not in the library. Measures were at once taken for purchasing the entire list, and from that day to this the American department has been filling up so rapidly that now there are probably not less than 100,000 volumes of American books and hooks relating to our country in the British Museum, including especially all the more bulky and costly works, and not excluding pamphlets and the unconsidered trifles of the day. This noble work, begun by Mr. Panizzi, and steadily carried on by Mr. Jones for nearly ten years, has been pressed on by Mr. Watts during his brief administration of about three years. In 1856, the trustee sanctioned the printing of the catalogue of the American department, which when completed will go far towards a history of American literature.

Mr. Watts possessed a most remarkable memory. He could instantly point out the press and shelf of probably more than 100,000 works. He liked to meet Americans, and always prided himself on knowing something of the personal

history of every prominent one who came to see him. The writer well remembers two attempts to test this faculty. One day, without any notice, he took a friend into Mr. Watts's recess, and said abruptly, "Mr. Watts, let me introduce to you Professor Silliman, of Yale College." "Oh," said the rising, and cordially extending his hand, "how very fortunate here of all places in the world, just fifty years since your first visit, when in your 'Travels' you wrote a most interesting account of our library. Come, let me go and see your rare little book, and at the same time I will show you the library, and afford you the opportunity of writing another account, showing our half-century's progress,"—and he walked off the professor to a remote part of the library, and laid his hand on the volume, as if it had been one for his daily reading. A similar readiness delighted and astonished the Hon. George P. Marsh with respect to his little privately printed Icelandic grammar.

Among all his pressing duties (and when 10,000 a year are spent, and an average of 30,000 volumes acquired, duties are pressing) which he never neglected, he found time to do a good deal of literary work, one of his earliest productions being "A Letter to Mr. Panizzi on the History of Early English Newspapers," showing, to the regret of antiquaries, that several of the earliest and most interesting respecting the destruction of the Spanish Armada were forgeries. He contributed largely to the cyclopedias and magazines on biographical, bibliographical, and philological subjects. His "History and Description of the British Museum" in the English Cyclopaedia is an exhaustive production, and his "Essay on the Hungarian Language" made him a member of the Hungarian Academy.

Mr. Watts was the first superintendent of the new Reading-room,—a living, breathing, and answer-giving index to the vast library of 1,000,000 volumes within. He had seen the library grow from 250,000; and, as he had placed most of the authors as they arrived, none knew so well as he who they were, and where they were to be found. He held this post for nearly ten years, when, on the retirement of Mr. Panizzi in 1866, Mr. Jones succeeded to the office of principal librarian and secretary to the trustees, and Mr. Watts was soon after promoted to be the keeper of printed books.

HOW BRISTOL WAS RETARDED, AND IS PROGRESSING.

DURING the recent congress of the Social Science Association,

Mr. Charles Nash, timber merchant, of Bristol, read an interesting paper on "Some Causes which have tended to retard the Commercial Progress of Bristol." After general remarks on the interest attaching to the study of the causes of the advance or decline of great cities, an extract from Seyer was read in proof of the importance of Bristol in early times, showing that in the thirteenth century the citizens carried out a great improvement in their harbour. In the next century, when Edward III. fitted out an expedition against France, London contributed 25 ships and 662 sailors, and Bristol 22 ships and 608 sailors. The prevalent idea that Bristol was now a declining place was then combated. Its population, wealth, and commerce are all greater than ever, and are rapidly increasing, although the rate of progress has not been equal to that of Liverpool, Glasgow, and one or two other towns. The question was then asked—Why has a city, with almost unrivalled natural advantages, with a safe channel only a few miles distant, surrounded by mineral wealth, and with all the prestige of historic greatness, lost its place of second city in the kingdom? The first reason given was the difficulty experienced in the last century from the want of floating accommodation for the shipping frequenting the port. Every tide the vessels were left on the ground, and thus damage often occurred.

From 1765 to the end of the century, one plan after another was proposed and laid aside, until, in the year 1802, Jessop's was adopted with some modifications, and the existing floating-harbour was commenced. The estimate was 200,000l., but the cost was 600,000l., and from this circumstance arose the next cause of retarded progress. Oppressively high charges were imposed to eke out a dividend, and thus the advantages of the improvement were partially neutralised. The trade increased so slowly that

in the third decade of the new works the dock receipts were only one-third greater than in the first, while heavy town-dues and other charges increased the pressure. It was stated that since 1848 the foreign trade of Bristol has increased threefold. The next cause named was the want of accommodation for large ocean steamers, which are now conveying the most valuable part of the trade of the country. Bristol proved Dr. Lardner to be wrong, and when the *Great Western* had triumphed, nothing was wanted here to secure the West Indian and North American mails but suitable accommodation. The opportunity was lost, and Liverpool and Southampton obtained the prize. The *Great Britain* was built only to leave us for ever, and even the *Great Western* was soon afterwards withdrawn. After many schemes for supplying this want had failed, the Channel Dock Company was formed, and is now actively engaged in constructing a dock of fifteen acres at Avonmouth, with an entrance wide enough for any ship but the *Great Eastern*.

Another more recent cause was then noticed as some length—the want of agreement among the commercial men of Bristol: divided counsels have hindered many onward movements. As instances of this pulling in different directions, the defeat of the Bristol and Clifton Railway Bill by two or three influential individuals, and the Parliamentary contest of 1863 as to the great river deepening scheme, and the construction of docks at Avonmouth, were noticed. A truce ensued, by the terms of which the river improvements are going on, but on a reduced scale, although still perhaps too large and costly for the results to be obtained; and the Channel Docks are also being constructed. The fact of these large works, as well as the Porthead Pier, the Harbour Junction Railway, and extensive street improvements all going on together, was noticed as a proof of the life now stirring in Bristol. Most of the causes enumerated may be classed under four heads:—Deficient water communication; faulty railway arrangements; high charges, and divided counsels. They are enough to have stopped altogether the growth of a place less favourably situated than Bristol. The paper concluded thus:—"And now that many of these causes are removed, or are in course of removal, a second youth has developed itself in Bristol. The suburbs are extending in every direction; new public buildings, warehouses, and manufactories are rising in our midst; and the foreign trade is increasing more rapidly than at any former period."

NEW WORKSHOPS FOR BLIND PERSONS IN LIVERPOOL.

THE foundation-stone of new workshops for blind persons able to work has been laid in Cornwall-street by the Archbishop of York. The site, containing about 1,000 yards of ground, has been granted by the corporation. The building, according to the local *Journal*, is to be of a horse-shoe shape or plan, having its closed end to Cornwall-street, and will cover, with the yard at the back, 962 square yards. It will have a frontage to the street of thirty-six yards. The centre portion of the front will contain upon the ground floor a vestibule, show-room, manager's office, and principal staircase leading to the two upper floors of the central block. There will be on the first floor a committee-room, library, and lady-visitor's workroom, lavatories for lady-visitors, and for workwomen, adjoining their workroom in the left-hand wing. Along the back of these rooms there will be a corridor from the landing of the stairs, leading to the women's workroom and to a large room in connexion with it in the left wing, to be used for the holding of classes, women's dining, and general gatherings. Upon the top floor of the central portion is arranged house accommodation of four rooms, with scullery, pantries, &c., for resident officers. The wings right and left of the centre, with the exception of the floor on the left-hand, are devoted to class-room, &c., and will be occupied by the several trades carried on in the institution, viz., basket-making, mat and brush making, &c. The basement of the wings will be used for stores and the preparation of the willow rods, &c., for the basket-makers, and under the central portion will be a dining-room and lavatory for the workmen. Provision will be made in the gateway and porch for sheltering the children or others who guide the workpeople to and from their work. The staircases will all be of stone,

providing easy access to the several workshops and safe egress from them in case of fire or accident. The whole of the floors, except those of the horse part, will be carried upon wrought-iron girders, and the principal part of the floor will be of fire-proof material. The whole of the workshops, corridors, and staircases, class-room, and dining-room, will be warmed and ventilated with constantly changed hot air. Externally, the building will be faced with cream-coloured bricks and red-stone dressings; and the style of its architecture is to be Pointed Gothic of the simplest character. The architect is Mr. G. T. Redmayne; and the builders are Messrs. Haigh.

MORE ABOUT FLYING.

IT is one fortunate privilege of the humble undersigned to have "many adversaries." He may not possess the pleasure of their acquaintance, neither need they in the minutest measure know him; but he can nevertheless afford to thank his foes for their constant and notorious zoilistic kindness. Every smallest imputation of that happy but persecuted individual, whether it be poetic or prosaic, or both or neither,—whether breaking a lance for Byron or taking a fly with Dædalus,—is through them forthwith by common consent fiercely assailed and thereby advertised, and soon made famous by their ridicule and censure; by reason and means whereof the light shuttlecock of reputation is kept well in the air (unintentionally, doubtless, because to a certain person's benefit) through the blessed and inexorable hattle-dorres of spleen. Long may such useful slanderers flourish; and so let them help to keep a man at peace in the midst of notoriety, and of a good English courage winal, in spite of the skeleton of those healthy horses.

But to my brief text after this just personal exordium: "More about Flying." Well, that exordium has some small warrant even as to our present aerial hobbyhorse of human flight; for my short paucity on the virtues of flapping has been perverted at length, even in a full London leading article, into total denial of the expediency of levitation. No one ever said this,—or meant to infer that comparative lightness would be no advantage to the flying human. By every means give us elevating power through a lighter gas, if any can. Some sort of "fame gunpowder," or woven gun-cotton to be leisurely exploded in detachments on a regulated-cracker system, or some exhalation of extraordinary buoyancy yet to be discovered by the chemists,—these, stored in a vertebral tunnel, with lateral tubular appendages, might well be imagined as helps to our heavy manhood (or, perhaps, better as lifters of the machine in which he sits), before and beside the potent flapping mechanism, which must ever constitute the main motive-power for flight. We may reasonably recollect that no bird has anything analogous to hallowing for its elevation; feathers may be the lightest clothing, and hollow bones the least ponderous of skeletons; but anyhow, so far as we can discover, there is not only no lighter gas in them by way of lifter, but actually all accessories, even to the downiest of pinions, are heavier than common air. It is possible to buy a pound of feathers. If, then, we men may avail to help our weighty material by carburated hydrogen or some new gas lighter, and shall add to this levitation a tireless and unlimited flapping power by clever mechanism, we ought manifestly to be able to heat the birds; and it only requires the shrewd inventor to arise—no he soon will—to enable us to do so. Where is the Faraday to levitate our grossness by that lighter gas? Even dining tables float up to the ceiling nowadays; sometimes not without (so seers and believers have testified) spiritualized men-mediums upon them! If there be some natural secret here (and who shall say there is not?) it behoves our Royal Society physicists to find it out. And when this is "found and made a note on," where is the ingenious mechanician to fabricate steel muscles for our breasts and shoulders, and to give us the strong but light and delicate tissue whereof we may float on wings? Such things remain to be discovered; and in these stirring days of energy and competition will probably be caught by their predestined inventor, before the nineteenth century is ten years older. Wealth and well-earned honours await any such inventor; and the *Builder* is the inventors' organ, for which cause we drop our word in here. If Whitworth and Fairbairn, as consummate earthly artisans, are worthy of the "bloody hand of Uster," what glory short of straw-

berry-leaves should crown the head of the coming discoverer of the heavenly art of flying? Ambition of every kind, from Censols to the peerage, herein may find fulfilment,—in that near but future day; but just now no doubt we are practically hounds at fault, hereby scenting, and not finding: the present cover-heater has but little help to offer, beyond throwing out a suggestion, giving an idea to the winds, and hiding any one catch and keep it as his shrewdness best can. For human flight we must imitate birds rather than hubbles, and get all help from chemistry for a lighter gas to levitate our flesh and bones, as well as from mechanism, to supply us with stronger muscles.

MARTIN F. TUPPER.

THE NEW CITY AND COUNTY BANK, KIDDERMINSTER.

The new bank is now nearly completed at the corner forming the angle of High-street and Vicar-street. It is on the site of premises heretofore occupied by the same establishment (the Worcester City and County Banking Company), but which premises were ill calculated for banking purposes, whether as regards arrangement or substantiality. At present the business of the bank is conducted in other premises near at hand, rented temporarily while the new bank is being raised, and the opening of which will probably take place in the course of a few weeks.

The building was designed by Messrs. H. & E. A. Day, of Worcester, and completed under the supervision of the junior partner of that firm, Mr. Ernest A. Day.

Owing to the irregular shape of the site, and the small depth of frontage in High-street, great difficulty was experienced in providing the necessary requirements of the establishment. This was to some extent, and with regard to appearance, overcome by the introduction of a portico at the angle formed by the two streets. Mr. R. Thompson, of Kidderminster, is the builder. Mr. Gooling was the clerk of the works. The contract for the building was 3,550l.

The frontage to Vicar-street is 69 ft. 9 in. long, exclusive of the portico. White brick, with freestone dressings, are the materials used in the face-work, and the structure consists of two stories, divided on the outer wall by an enriched stone string-course. At the base is a plinth of freestone, moulded and sunk. On the ground floor is a series of segmental-headed windows, and on the chamber floor there are semicircular-headed ones, the arches springing from pilasters having carved caps, and the key-stones with moulded capping: there is a stone balustrade to each window. The entrance to the manager's house is by a doorway near the centre of the Vicar-street façade, while the bank entrance is by the portico before named. The slated roof rests on a cornice, which has a panelled scuff, moulded and cut cantilevers, and stone frieze; and the brick chimney stacks have stone panelled and bracketed caps.

Entering by the portico or colonnade we observe four Ionic columns, supporting an entablature and balustrade. We then pass into a lobby underneath a semicircular arch, having on its carved key-stone a shield bearing the City and County Bank arms; and next into the principal banking-room for public business. This apartment is 27 ft. 8 in. by 23 ft. 5 in., and is 20 ft. high. There are four columns of Bath stone standing on moulded and panelled pedestals, and having capitals sculptured after the model of the Temple of Jupiter Stator, supporting an entablature, from which springs a panelled coffered ceiling, and in the centre of the ceiling is a circular wheel light, sufficient for the requirements of the banking-room. From the great bank-room doorways lead to the strong-room, the bank parlour, lavatories, and closets. The strong-room is fire-proof, being lined with glazed brick, and having a semicircular vaulted roof, an iron door, and thick stone slab pavement. The floor of the public bank-room is of oak, but encaustic tiles are laid down in the entrances, lobbies, halls, staircases, lavatories, &c. Fine oak, panelled and varnished mahogany, and red deal have been used for the doors and internal woodwork generally, the doorways in the principal apartments having moulded architraves, with cushion frieze and moulded heads. The manager's entrance-door has a fan-light with segmental head, moulded spandrels, and square top. A half-glass screen separates the lobby

from the entrance-hall; then, passing under a semicircular arch resting on pilasters having carved caps and moulded archivolts, we arrive at the principal staircase, which is lighted by a lantern 30 ft. above the ground-floor level, with a coffered ceiling and ornamental panels. The staircase is fitted up with close carved face-strings, moulded wall-strings, turned balusters, moulded hand-rails, and turned and carved newels. There is a drawing-room 20 ft. by 17 ft., a dining-room 24 ft. by 17 ft., eight bed-rooms, bath-room, closets, store-room, cellaring, servants' staircase, kitchen, scullery, china-closet, cook's pantry, coach-house, stable, and all other usual offices. The bank is heated by a hot-water apparatus, supplied by Messrs. Rimington & Son, of Skipton, Yorkshire; Mr. Whetstone, near Leicester, laid the tiled floors; and Mr. Forsyth, of Worcester, did the carving. At the rear of the premises is a small garden, which will probably be enclosed by a wall having an ornamental balustrade, and a gateway with panelled doors and pillars with ornamental caps.

OPENING OF SHREWSBURY MARKET HALL.

The new General Market and Corn Exchange at Shrewsbury is so far completed that it has been formally opened for use. The building is in a mixed style of architecture, and is built of blue, red, and white brick, with Gainsborough dressings. Its total length is 313 ft., and its greatest breadth 150 ft. On the basement are fifteen vaults, for the storage of goods, with inclined roads leading thereto. At the entrance the cart-way is 10 ft. wide, and in the centre 24 ft., so as to permit of a wagon going to the entrance of the vaults, and of turning, previous to coming out. This approach to the vaults is from Claremont-street. On this floor are also a number of shops, the fish-market, and the ice-house; and here, also, it is intended that the heating apparatus shall be fixed.

The ground floor consists chiefly of the general market, the vegetable market, the arcade, the butchers' market, and a number of shops. The general market is well lighted and ventilated, and so, indeed, is the whole of the building. There are six entrances to this portion of the building (the general market), the principal one being from Mardol, by means of an arcade 16 ft. wide. In Claremont-street a covered cartway is being erected for the loading and unloading of goods in wet weather. The roof of the cartway will be of glass. The windows and doorways are all circular-headed, and the majority of the doors are made to slide, in preference to having hinges. The height of the Corn Exchange is 88 ft., and of the tower, which rises near it, 151 ft. The latter is surmounted by an ornamental iron vane. The tower is square, and has a large circular opening on each side for the clock dials, which will be four in number, and upwards of 8 ft. each in diameter. The clock will be supplied by Mr. Joyce, of Whitechurch; the bells will be supplied by Messrs. Mears, of London.

An improvement effected by the erection of the new building is the widening of the streets in the vicinity. Formerly, Shoplatch and Claremont-street were narrow and dangerous thoroughfares. At present Shoplatch is a street 40 ft. wide, while Claremont-street is 30 ft. At Mardol Head the width is 28 ft., and in Bellstone 30 ft.; and the whole have been re-metalled, curbed, the footpaths flagged, and in some cases the levels have been altered.

On the Shoplatch end of the Corn Exchange is a piece of carved work, in stone, representing, in figures of colossal dimensions, the allegorical characters, Peace and Plenty. The figures are 11 ft. 6 in. high, the shield 13 ft., and the length of the whole is nearly 25 ft. The figures project 2 ft. 6 in. The design was provided by the architect of the building, and the work has been carried out by Mr. C. Landucci, sculptor, Shrewsbury. The side of the market in Claremont-street very much resembles that in Shoplatch. The estimated cost of the building was about 41,000l., but of this 3,250l. were furnished by the Corn Exchange Company for the erection of the Exchange.

Immediately on entering the market from the doorway in Mardol, is an arcade with a row of pillars on either side. This space, it was originally intended, should be formed into shops; but as it was doubtful whether the general market would accommodate the whole of the market people, it has been left vacant till that

question is solved. At the end of the arcade, and below the tower, are closets and other conveniences; and, immediately beyond, is the fruit and vegetable market. It has an entrance from Shoplatch, and one from Claremont-street, and communicates also with the general market and the arcade. It contains forty-eight stalls. Of these twenty-eight are arranged in rows down the centre; and the remainder are fixed around the walls. Along the centre of the general market are two rows of wooden stalls, the main "thoroughfare" of the hall running between them. They are thirty-six in number, and are so constructed that the salesman stands within, and has a counter in front and on one side. On the Shoplatch side are thirteen rooms, well-lighted shops. Behind the stalls, in the general market, are the benches for the market-people proper. The accommodation consists of long rows of tables for holding the commodities offered for sale, with seats on either side.

There are, at present, fifty-four tables, and it is calculated that each will accommodate eight persons, making a total of 432. The butchers' department is at the north-west corner of the building. It contains five shops and thirty-four stalls. Along the whole of the Shoplatch side of the general market runs a gallery, which is approached by a stone staircase at the Bellstone end, and one of iron at the opposite end. It contains six shops. The fish-market is situated at the Bellstone end of the building. It is somewhat below the street. Adjoining is a large ice-house, capable of holding about 200 loads of ice.

The vaults extend beneath the whole of the general market, and have a wagon entrance from Claremont-street, with additional incline communication with Mardol Head and Shoplatch. In the Claremont-street section are seven vaults, and on the Shoplatch-street side six. They vary in dimensions, but all are lofty, drained, and ventilated. The whole of the market proper has been fitted with gas. The general market will be lighted by twenty-two star-lights, with twelve burners in each, and the gallery and vegetable-market by bracket-lights. During the daytime the general market is lighted by a large lantern light. The corn exchange may be approached either from Shoplatch or from Claremont-street. It is 90 ft. long by 45 ft. wide, and at the ends it takes the form of an arc. It is lighted by a large lantern light, running the whole length of the room, by three bull's-eyes on one side, and large windows at each end. At night it will be lighted up by four star-lights, with forty-eight burners in each. In the ceiling, which is 52 ft. from the floor, there are eighteen large apertures for ventilation, and the room will be heated by hot air. Over the doorway is a small gallery. Adjoining the exchange is a sitting-room, 17 ft. by 11 ft., and 22 ft. high.

The whole of the work in connexion with the market and exchange has been carried out under the superintendence of Mr. Price, as clerk of the works, from the designs of the architect Mr. Griffiths, of Stafford.

The *Shrewsbury Chronicle*, to which we are indebted for these particulars, gives a view of the new edifice.

OPENING OF BRECON COLLEGE.

The new Congregational College at Brecon has been opened. The site of the building is just above the station of the Brecon and Merthyr Railway, on the Camden-road, the ground for the purpose having been bought from the Marquis of Camden. The elevation of the ground adds to the appearance presented by the college, besides the advantages derived in a sanitary point of view. The college consists of a centre building with a wing on each side, leaving a considerable area between. The length in front is 152 ft., and the depth is nearly 100 ft. A tower, 100 ft. in height and 10 ft. square, projects 7 ft. from the line of the front. The design is Gothic, and the material employed is native stone, with dressings of Bath stone. The basement floor consists of a kitchen, 30 ft. by 17 ft., and 10 ft. high; scullery, 20 ft. by 16 ft.; wash-house, 30 ft. by 17 ft.; lavatory, 20 ft. by 16 ft.; and an arched munition-room, fire-proof, 12 ft. by 12 ft.; large pantry under the tower; corridor, lumber-room, 16 ft. by 12 ft.; coal-house, &c. There are on the ground floor a dining-room, 35 ft. by 21 ft.; library, 35 ft. by 21 ft.; in the tower two wide flights of stairs leading into the entrance-hall; corridor, 6 ft. in width, extending the whole length of

the front; chief staircase, 16 ft. by 12 ft.; lavatory; four studies, each 11 ft. by 9 ft.; matron's room, 12 ft. by 12 ft.; store-room, 12 ft. by 6 ft.; staircase, &c. The height of the rooms on this floor is 13 ft. 6 in. On the first floor are two class-rooms, each 25 ft. by 16 ft., and 11 ft. high; 16 studies, 9 ft. by 12 ft., 11 ft. in height; a hospital; two servants' bedrooms, and large landing and passage. There are on the second-floor six studies, twenty-two bedrooms, each 12 ft. by 9 ft.; bath-room, and staircase leading to the tower. The bedrooms are 9 ft. 6 in. high. There is a yard for the use of the students 90 ft. by 80 ft. At each end of the college is a tutor's residence. There are two large oriel windows in the front of the college projecting 7 ft. outwards, and serving for the three lower stories, which are also lighted by square windows with mullions and transoms, the bedrooms on the top story having dormer windows. The roof is pointed with coping and parapets of Bath stone. There are square buttresses projecting from the tower, and going to a height of several feet above the eaves of the building, and a good deal of stone dressing of an ornamental character. The studies and bedrooms are all fitted with ventilators, the former with fireplaces also. In part of the building there is a terrace 18 ft. long, and 56 ft. in width, with a road leading to the back. The college is well fitted in every way for the convenience and comfort of the students. The contractors are Messrs. Watkins & Jenkins, of Swansea; the amount of their contract is \$2500; the extras will probably amount to 2000, or 2500. The plans were drawn by the Rev. Thomas Thomas, of Landore.

A FALL IN BELFAST, IRELAND.

A STRANGE occurrence is reported by the local *Newletter*. The inhabitants of Byron-street, Belfast, and that neighbourhood, were alarmed the other night in their beds by a sudden report resembling thunder, or the discharge of a battery of artillery, under their windows. In the morning it was found that the cause of the night's alarm was the total demolition of a whole street of new houses, fortunately as yet not occupied, which came down with a sudden crash. Doors, windows, bricks, &c., all lay in one heap of ruin. Where, the previous night, a row of partly-completed dwelling-houses stood, there was now a pile of rubbish and debris. The mystery was cleared by the production at the police-court of a man named Clarke, who, with a number of others, was found by two constables, immediately after the fall of the building, concealed in the vicinity. A subsequent search about the premises led to the finding of a number of strong ropes, like ships' hawsers, which leads to the supposition that the mischief was done by passing the ropes round the narrow wall between the lower windows underneath, and pulling down the buildings by sheer force. Eleven houses in one row have been completely demolished, and it was also found that in another line of buildings behind the interior walls had likewise been pulled down.

BUILDING TRADES' MEN IN THE ARMY.

His Royal Highness the Commander-in-Chief is not disposed to let the subject of the civil employment of the soldier fall to the ground. The Duke of Cambridge has sent a circular respecting the employment of soldiers in trades to Chatham, in which the attention of commanding officers is called to the approval given by the Secretary of State to such employment. Returns are now called for of all soldiers who have been educated in any of the building trades, — as carpenters, plumbers, painters, glaziers, bricklayers, and gasfitters. So far from there being any attempt to impose on those soldiers extra and uncompensated labour, it is proposed that the privilege of obtaining employment as a civil workman shall only be accorded to tradesmen-soldiers who have been in the service for two years, and who bear good characters.

The gist of the scheme lies, as we have more than once insisted, in the rendering useful employment acceptable to the soldier. The elevation in the social scale which he will acquire by the occupation of time that would otherwise be wasted, or worse, in the practice of a craft, cannot be acquired *volens volens*. It must be *volens* alone. That a judicious management may make this supplementary service

highly popular, we think there is no room to doubt. In the appropriate employment of the hands and muscles of a picked part of the population in useful works, lies an element, not at all to be neglected, of national wealth. The case should not be regarded from the miserable standpoint of trade competition. The burden imposed on the country for military defence forms no inconsiderable portion of our entire annual outlay. No very brilliant prospect is open as to the means of permanently reducing that outlay. The distinct tendency of the advance of science is to increase it. The right direction in which to look for the alleviation of the pressure is that of making, as far as may be, the service of our defence self-supporting.

TILE PAVEMENTS.

At the cost of the Freemasons of Bristol, Mr. William Powell, acting on their behalf, a very handsome pavement has been laid in the Lady Chapel of Redcliff Church. It is composed of varied combinations of rough encaustic tiles, with rich glazes of yellow, green, and black, being partly reproductions, and partly imitations of ancient examples. These tiles are especially made with a roughness in the body, which produces depth and richness of tone in the colours, and prevents the patterns from being too mechanical and true, giving them the spirit of the ancient work.

The tiles are of Messrs. Maw & Co.'s manufacture, and the pavement was executed, under the general directions of Mr. Godwin, by their London agents, Messrs. W. B. Simpson & Sons, who have lately given special attention to the introduction of this class of work.

A pavement lately executed by the same firm, under the direction of Mr. G. G. Scott, at St. Asaph Cathedral, is also a good specimen of tile work, the special characteristic in this case being the introduction of incised tiles of a coarse body, floated over with a richly-coloured glaze, in imitation of some ancient tiles recently found in the cathedral.

These rough tiles seem to us worthy of the notice of architects, as they are suitable for ecclesiastical purposes, especially in cases of restoration.

A mosaic chancel pavement has just been completed in Blackley Church, in memory of the Rev. Andrew Doria, who for seven years was curate of the parish, and who died at the age of 34, two years ago, at Lindow, the school church of which village he took the sole charge of on leaving Blackley. He was a lineal descendant of the Genoese branch of the Doria family, celebrated in Italian history as warriors, statesmen, and patrons of art. The pavement was designed and laid down by Messrs. Dale & Sons, Manchester.

THE THEATRE.

The Princess.—The most noticeable point in the new drama here, "Escaped from Portland" (an adaptation of "Le Mangeur de Fer," which may be freely rendered The Bracelet Breaker), is the completeness of the disguises assumed by Mr. Chas. Mathews (*Gentleman Jack*), five in number. These even do what stage disguises seldom effect, deceive the spectators. Mr. Vining, too, plays several parts with much vigour. Mrs. Chas. Mathews is charmingly tender as *Lisa Tyrell*; and we must say a word for the intelligence displayed by a new young lady, Miss Carlisle. The scenery is bright and appropriate. A view of Putney Bridge, by Mr. Lloyds, makes the bridge much too low; the excitement caused by the fall from it, too, would be greater if the bridge were higher.

The Olympic.—This theatre has been very elegantly decorated, in the manner adopted at the Princess's, and by the same decorator, Mr. James Macintosh. Scroll ornaments are applied to both tiers of boxes, and to parts of the ceiling, and are richly gilded. The proscenium is wholly gilt. The curtains are of a dark cerise satin, and the backs and ceilings of the boxes are kept of the same dark colour. The effect of the whole is rich and comfortable. The *carton pierre* decorations were executed by White & Co. The house, now under the direction of Mr. W. H. Lippin, has been opened with a version of "David Copperfield," titled "Little Em'ly," which is so good, and for the most part so remarkably well acted, that we may take an opportunity to refer to it more fully.

THE LONDON HOUSE PAINTERS.

At a meeting last week, at the Artisans' Club, in Newman-street, of members of different societies of house-painters and decorators, having for its object the formation of an association of workmen, for the purpose of technical education and improvement of the execution of work in painting and decoration, a statement was made by Mr. G. Shipton, general secretary of the Amalgamated Society of House Decorators and Painters, of the views of the executive council of that society. The statement was to the effect that employment in the trade might be greatly extended, to the advantage alike of the community and of the workmen and their employers, by directing public attention to the educational advantages and cultivated pleasure derivable from buildings decorated in harmonious colouring, and characterised by refinement of taste,—points about which great want of apprehension prevailed. By general improvement in the execution of work there would be a sufficiency of work at all times in the hands of employers of the better class, to the exclusion of those who are regardless alike of the interest of their customers and of demoralising efforts on their workmen. The operatives would be more steadily, regularly, and pleasingly employed; the community, by systems of economised labour, and by cultivation on the part of the men and masters, would get better and more pleasing returns with less original cost. To effect practically such objects, the proposal was to establish a school or system of class instruction for education in matters technical, or otherwise, related to the special industry, the instruction being confined first to what would be most useful in daily work. This instruction was proposed to be given indifferently to society or non-society men, whilst backed up, and perhaps in the first instance set going, by the trades' societies, whose organisation could not but be valuable for such a movement. Several members spoke to the same effect. There was a slight difference of opinion about the extent to which the association should supply qualifications to those men who had never passed the training of an apprenticeship; but ultimately resolutions were passed affirming the want of such a society, appointing a committee, and arranging for a second meeting.

A STRANGER ON THE THAMES EMBANKMENT.

Sir,—On Saturday morning, the 9th instant, curiosity led me to take a morning walk along the Thames Embankment. The morning was beautiful and fine, but, without any more novelistic preliminary, I shall come to the subject of my remarks. As I expected, from the description which I have read in the *Builder* and the London daily press, the river wall, as a work of tidal engineering and the building art, is all that might well be desired; but here my encomium must finish. Now for the footway or roadway between Westminster Bridge and the Temple: it is open to the gravest criticism and censure, for a variety of reasons. The flagging of the footway is one of the most unworkmanlike pieces of work I have met with for some time. In the first place, the flags are badly laid, and worse jointed, and there is hardly any attempt to obtain a uniformity of level. I do not mean to say that a level could be carried out, strictly speaking, between Westminster Bridge and the Temple, but I do mean to assert that the unsightly up-and-down appearance, so painfully and palpably apparent, could have been avoided. In following the direction of the river there is nothing more easy to obtain than a certain uniformity in the rise and fall of the roadway; but from almost every perch in some parts of the Embankment a wave-like undulation can be seen.

I have said that the flags are badly jointed, the outer half of the footway being wretchedly so. I looked again and again to convince myself, and I almost came to the conclusion of believing that one-half of the footway had only been temporarily laid, for hundreds of the flags lap at their joints one above another $\frac{1}{2}$ in. and in some cases $\frac{3}{4}$ in. None of the open gratings which protect the trees, and which are let in in quarter divisions, in the flagging, preserve their level, but are quite unsightly in appearance, being up and down, although the work is but quite recent. In fact, one half of the Thames footway is taking its good-bye from the other half, and exhibits all the features as if the shock of an earthquake warned it that its hour of settlement had come.

Another very grave complaint I have also to make. The entire length of the footway of the Embankment is very filthy, particularly along the angles between the flagging and the bottom of the river wall. Dirt has accumulated in many places to the depth of 2 in. or 3 in., and I regret to observe offensive nuisances are allowed to remain unmoved in the "set-offs" and break along the wall. Surely a dastard or two, with hand-cart, might be told off every morning for keeping this, what might be a beautiful promenade, clean. Notice should also be put up; and where any infraction of the rules of decency is committed, the delinquents, when discovered, should be summarily and rigidly punished. I have also noticed that in the ebb and flow of the tide much mud is drifted up on the stone stairs and landings. This, on the fall of the tide, should be at once swept down, as, besides being dangerous, its appearance is anything but a pleasurable sight.

The Thames Embankment requires at once a Conservancy appointed as well as the river Thames itself; and if something approaching to this power be not vested either in the police authorities or in a separate body, our river-side roadway and esplanade, instead of becoming a blessing and an improvement to this mighty city, will become an eyesore and a questionable advantage to the citizens of London.

Some remarks have already appeared in the daily press concerning the invasion made by the wild boys and tomboys of the streets of this favourite lounge, and the unlimited licence enjoyed by this wanton and unenlightened stratum of the town. I would not debar one of God's humblest creatures from the participation of an enjoyment, no matter what its garb might be; but at the same time I would have order and decorum enforced, and all riotous behaviour put down with a strong arm. These are the views, whatever they are worth, of

A STRANGER ON THE THAMES EMBANKMENT.

SCHOOLS OF ART AND SCIENCE.

The Reading School.—The annual distribution of prizes to the successful students of this school took place at the town-hall. There was a very good attendance. The hall was hung round with numerous specimens of the work of the students. The chair was taken by the president of the society, Mr. D. Higford Burr, of Aldermaston Court. The annual report stated that—

"With regard to the present year, although numerically the school is no stronger than it was, the committee believe that in the various departments its efficiency has been considerably increased. Drawings executed by forty-seven students during the year were transmitted to South Kensington in March last, in accordance with the regulations of the department. Of these, three were awarded prizes, whilst forty-four received marks showing that the pupils by whom they were submitted had received sound instruction. At the local examination held at the school on the 9th and 10th of March last, eighty pupils attended. Of these twenty-seven were pronounced good, and six excellent. The latter received prizes, the former cards of merit. A communication has been lately received from the Department in which the establishment of science classes is recommended in connexion with schools of art. In deference to this recommendation, and believing that the instruction thus afforded will be valuable to many, it is proposed next term to form classes for teaching the following subjects, viz. 1. Practical plane and solid geometry; 2. Machine construction and drawing; 3. Building construction."

Mr. Havell, the master, read the list of prize winners, who received their prizes from Mr. Burr. The meeting was afterwards addressed by Dr. Wells and other gentlemen, and a vote of thanks was given to the master by acclamation.

The Oxford School.—A large and deeply interested meeting, comprising a great number of artisans and mechanics, was held at the Town-hall to hear the report of the proceedings of the science classes which have been in operation during the past year in Oxford, the success of which is said to have been alike creditable to the students and to the teachers. The Rev. J. E. Thorold Rogers occupied the chair. After the report of the committee was read, Mr. Buckmaster addressed the meeting. At the close of the proceedings, it was unanimously resolved,—"That the amalgamation of the science committee with the art school is desirable for the purpose of forming a combined School of Science and Art." The Oxford school of art was established four years ago.

A Watford School.—A class in connexion with the Science and Art Department of the South Kensington Museum has been formed at Watford, and several gentlemen have consented to act as a committee of management, with Mr.

A. T. Brett as chairman. Mr. J. B. Fairman is the teacher of the class, which meets on Thursday evenings in the room under the Literary Institute. The payment by the members is merely nominal (9d. per month), and is only intended to meet the incidental expenses. The science now engaging the attention of the class is "Animal Physiology," and the lessons are illustrated by diagrams, dissections of animals, and the microscope. Mr. Buckmaster has given a lecture (Mr. Brett in the chair), at the Literary Institute, in reference to the Government scheme for promoting a knowledge of the principles of science and art.

THE NEW OFFICES FOR THE POPLAR DISTRICT BOARD OF WORKS.

SINCE the issue in which we announced the discontinuance of these works, the differences of opinion between the builders and the architects have been discussed at several meetings of the Board. An earnest desire has been expressed at these meetings that Messrs. Baker & Constable, the contractors, should complete the erection, and, by order of the Board, they have been formally called upon to proceed with the carrying out of the contract. Messrs. Baker & Constable, however, declined to do so; and have placed the matter in the hands of Messrs. Noon & Davies, solicitors, who, on the part of their clients, have served a writ upon the Board for non-compliance with the provisions of the contract, in refusing payment for work actually done. On the other hand, the architects, Messrs. Hills & Fletcher, and Messrs. Harston, stoutly refuse to certify for the amount demanded by the builders, and state their conviction that they are perfectly justified in withholding the certificate, inasmuch as timber had been supplied which was not in accordance with the contract, and that under the circumstances it was competent for them to require that the timber to be henceforth used in the building should be deposited on the premises before certifying for further payment. The members of the Board appear to be greatly annoyed at the phase the affair has assumed, and at their last meeting decided to make a stand against the action taken by the contractors. It was agreed that as the builders preferred litigation rather than to proceed with the contract, the Board had no other course open to them but to invite, by public advertisement, tenders for the completion of the building; and it was resolved to institute the necessary proceedings against Messrs. Baker & Constable's securities for the recovery of any loss which the Board might sustain in consequence of the non-fulfilment of the conditions of the contract.

ACCIDENTS.

A "STEEPLE JACK," Thomas Butterton, of Every-street, Manchester, has met with his death while repairing a tall chimney at Mr. Farmer's chemical works, West Gorton. The rope by which he was holding on broke, and he fell from a height of twenty-three yards.

A fire has occurred at the Crystal Palace High Level Station of the London, Chatham, and Dover Railway. The firemen of the palace and those of the metropolitan brigade quickly attended, when it was found that about 8 ft. of the staircases had become ignited, but by the use of hatchets and water the fire was soon extinguished. It was caused by the overheating of a flue.

NEW VOLUNTEER QUARTERS, LIVERPOOL.

THE First Lancashire Volunteer Regiment of Rifles having found that the storehouse now occupied by them in St. Anne-street, Liverpool, does not afford that accommodation which the rapidly-increasing strength of the regiment demands, have, at the cost of two of the commanding officers, been enabled to purchase a site for a new drill-shed, the erection of which will be proceeded with forthwith.

The new quarters, which will be situated at the corner of Low Hill and Gloucester-place, will consist of the drill-shed proper; length, 220 ft. by average width 72 ft., and the usual storehouse, armoury, magazine, officers' quarters, &c.

The local architects selected to design and carry out the work are Mr. C. Sherlock and Mr. T. B. Troughton, jun., of the firm of Troughton & Prescott, of this town.

THE LIONS AT SALTAIRE.

SCULPTURED representations of the lion are to grace the open spaces in front of the Mechanics' Institute and the schools at Saltaire. These lions were designed by the sculptor, Mr. Thomas Milnes, of London, for the base of the Nelson Column in Trafalgar-square; but, after he had completed the models and made preparations for proceeding with the work, the commission was taken out of his hands and given to Sir Edwin Landseer. In the meantime the models remained in Mr. Milnes's studio, where they attracted the notice of Sir Titus Salt. Mr. Milnes is the sculptor who executed the bust of Sir Titus, which was presented to him a few years ago by his workpeople, and is now at his seat, Crow Nest. Sir Titus was desirous of having the lions at Saltaire, and after a consultation with Mr. Lockwood, his architect, it was decided to place them in front of the buildings named, two on each side of the road. The lions are four in number. Two of them have just arrived, and one has been set up on its pedestal. They have all been modelled from animals in the Zoological Gardens. The figures are each 8 ft. long, 3 ft. wide, and 5 ft. high. They have been sculptured in Pateley Bridge stone, and the weight of each is nearly 3 tons.

ANCIENT FOUNTAIN IN FREIBURG.

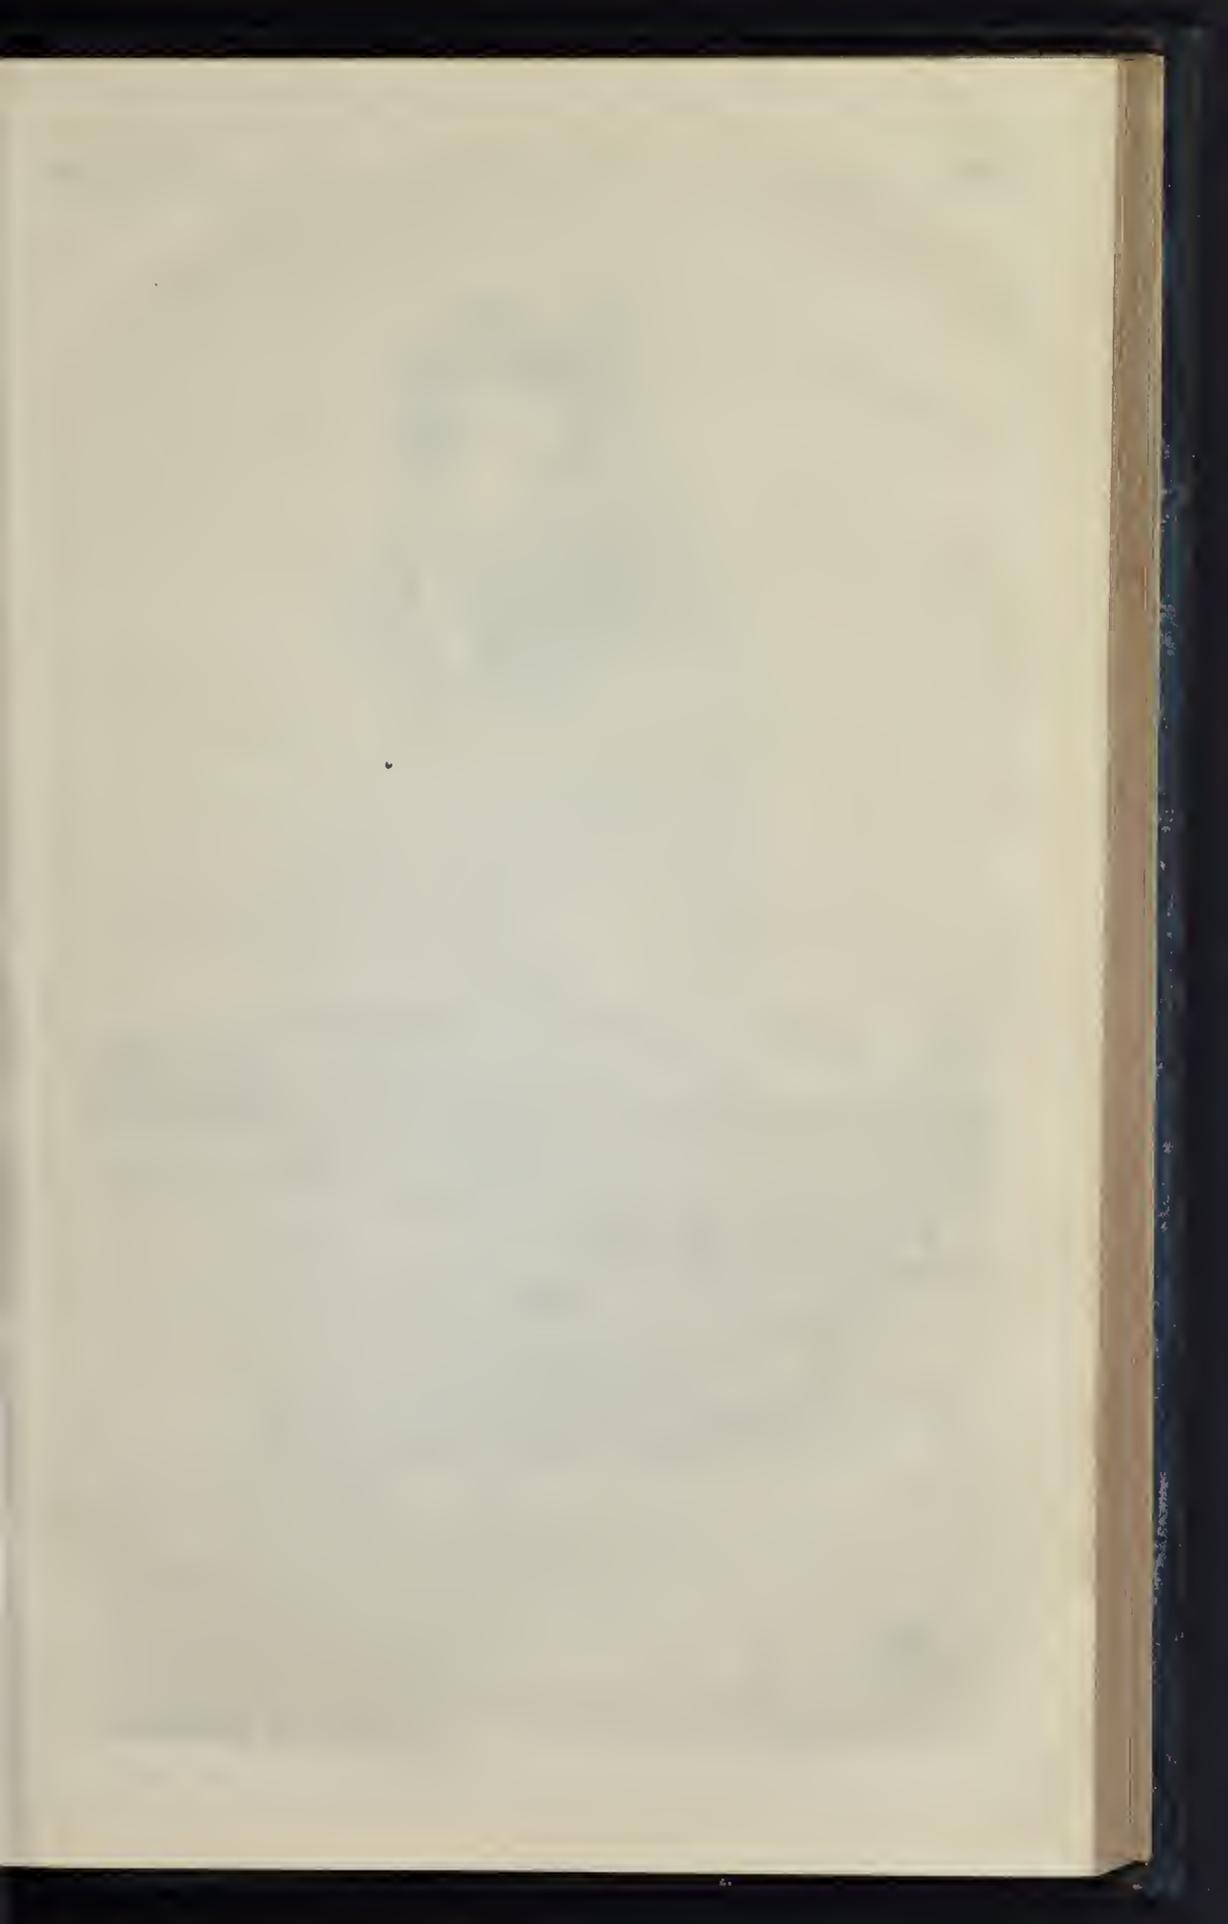

THE town of Freiburg-in-Breisgau is justly celebrated for its magnificent minster. Few more interesting churches exist in Europe, and it would be difficult to find one which offers a more beautiful subject, or collection of subjects, to the pencil of the artist. No engraving can give an idea of the great beauty of this cathedral, as one of its greatest charms is the exquisite colour of every portion of the building. The stone of which it is built is of a delicate crimson tint, and is overgrown with lichen of the richest orange. Nor is the interior less remarkable for its picturesque beauty, as nearly all the windows are filled with old stained glass of the most brilliant description; and most of the altars are ancient, some of them adorned with pictures of great merit. The high-altar pictures are the works of Hans Balding Grien, and were painted at the beginning of the sixteenth century. Over an altar in one of the side aisles of the choir is a painting by Holbein; and over another, a large silver crucifix of very early Romanesque work. The pulpit, which is ornamented with statuettes in bronze, is said to have been carved by an artist of the name of Hauser in the year 1561; but from its appearance, and the entire absence of Italianism in its details, it might date from fifty or sixty years earlier.

The other churches in Freiburg are not very remarkable.

The Protestant church is noteworthy from the fact that it originally stood at Thennenbach, and was removed here "stone by stone" (?). Probably it was, in its original condition and position, a fine and interesting abbey church; but its "removal" and "reconstruction" have robbed it of all interest, and as it now stands it is a dry, hard, lifeless Romanesque building. The doorways, however, which are probably the only portions of the building that have been really "reconstructed," are good examples of the style. The interior consists of plain whitewashed walls, entirely devoid of ornament, and painted deal galleries and benches,—a precious "reconstruction" of an ancient abbey church!

The Minorite church has been a good fourteenth-century building, but has suffered from modernisations perpetrated during the last century. It contains a good set of stalls, and a curious cloister.

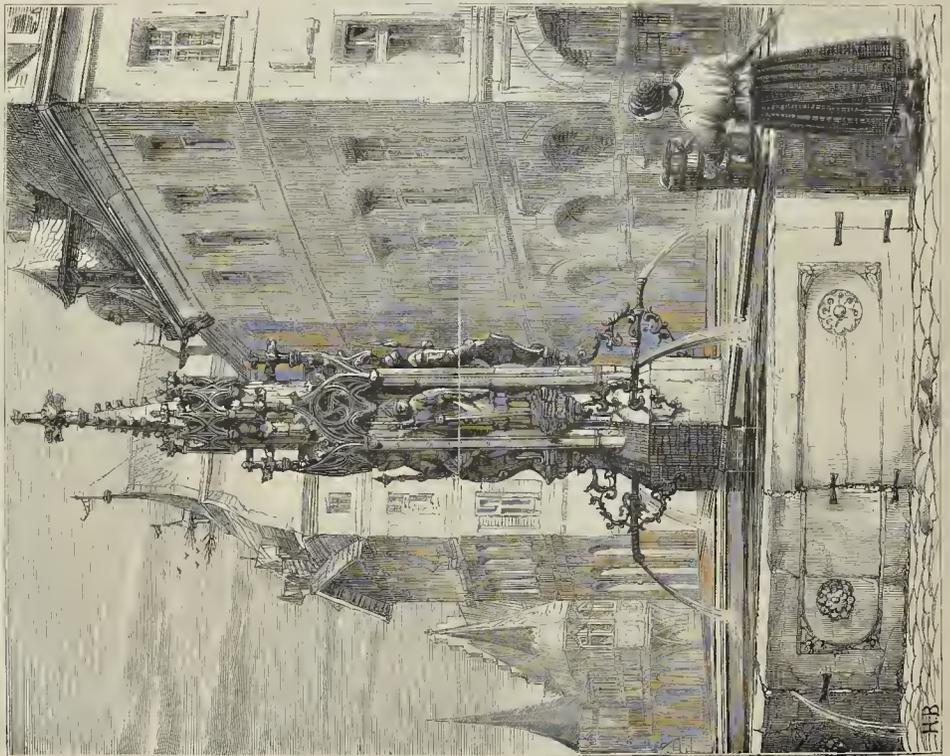

The Kaufhaus, opposite the cathedral, is a charming little Gothic building, built upon an arcade of four segmental arches, with how windows at each corner, and the font decorated with rich niches, containing statues of the German electors. The roof of this building is shown in our engraving to the extreme left. Not far from the Kaufhaus is the beautiful little fountain of which we give an illustration. It is built of red stone, with white stone figures. Its probable date is about the year 1480. It is ornamented with four large statues, two representing bishops of Freiburg, and two of them knights in full armour, probably intended to represent counts of Zähringen, the original possessors of the town. Opposite the cathedral is another ancient fountain, which had the misfortune to be "restored" about thirty years ago, and has been quite destroyed in the process.

MR. ALFRED WATERHOUSE,

Architect of the Manchester Assize Courts and Manchester Town-Hall.

ANCIENT FOUNTAIN IN FREIBURG, GERMANY. — CIRCA A. D. 1480.

H.B.

CHESTER TOWN-HALL.—MESSRS. LANYON, LYNN, & LANYON, ARCHITECTS.

CHESTER NEW TOWN-HALL.

For the last ten years or more the subject of town-halls has been prominently before the public; and we doubt much if there be a town-councillor living, however small and insignificant the corporation to which he belongs, whose attention has not been, at some time or other, officially directed to the question.

An alderman of the present day is not content, as were his predecessors, to spend the time that he is called upon to devote to municipal affairs in the small, dingy, and often unhealthy rooms that collectively were dignified with the title of town-hall. He seems to think, and justly too, that if he gives his time and labours gratuitously to promote the welfare of his fellow-townsmen, the least that they should do for him in return is to provide a suitable building in which all the offices connected with his duties may be brought into convenient proximity in order to make the necessary calls upon his time in visiting them as small as possible. Many men with large businesses to attend to willingly devote part of their day to public matters, when they know that every opportunity is seized of lessening useless waste of time, and so obtaining the greatest result for the amount of labour bestowed, who would not consent to the old system of trotting from one corner of a town to another whenever a fresh department had to be visited.

That the new building erected upon this principle of concentration and saving of time and labour should be handsome, and an ornament to their town, is only a natural result of the wide-spreading influence that our art publications and instructors have produced on the mind of the general public during the last quarter of a century. Whether the public hall of one town is finer or more costly than another, is a subject that the citizens of rival communities will now very warmly argue.

A glance over our past numbers for the last decade will show a long list of new town-halls; and add to these the number that are nearly finished, or for which designs have been submitted in competition, and the sum total is really imposing. The influence for good that some of these exert on the minds of the population is invaluable.

The corporation of Chester at length, tired of plodding on in the old style of conducting their municipal business, determined to have a new town-hall; and in the spring of 1864 issued their instructions, and invited architects to submit designs in compliance with them. Their call was very numerously responded to, and a fine array of architectural essays was the result. The local professionals, to a man, we believe, came to the scratch, and the picked men of London, Manchester, Liverpool, and Dublin entered the lists. Upon the receipt of these designs the corporation, with a due and praiseworthy sense of their responsibility that it would be well for other municipal bodies under similar circumstances to imitate, retained the services of Sir Matthew Digby Wyatt, to examine and report upon the plans. After a lengthened scrutiny, he sent in his award, in which he stated "the design sent in under the motto, 'Love's Labour' is by far the best;" and "I would therefore respectfully recommend that the premium of 100l. should be awarded to the author." "No one else has succeeded in the combination of so many good points." "There is an air of quiet dignity in the well-balanced proportions and elegant forms of the design under consideration, which is, to my eye, wanting in anything like the same degree in any of the other designs." On the matter of the estimate, the report goes on to say, "that while 'Love's Labour' is the best design, it is far from being the most costly;" and then compares it favourably with a design, the quantities of which had been taken out by a surveyor, and an estimate obtained upon them under the amount suggested by the instructions.

In the face of the above, however, strenuous efforts were made by some members of the council to have "Love's Labour" rejected; but the majority had the grace to abide by the award of their professional adviser. On opening the sealed envelopes containing the mottoes, "Love's Labour" was found to be the work of Messrs. Lanyon, Lynn, & Lanyon, of Belfast and Dublin.

We lately gave a plan and view of the first prize design for the New Houses of Parliament, "Sidney," submitted in that international competition by Mr. W. H. Lynn, a member of this firm.

The new town-hall contains on the lowest or

ground-floor the ball-keeper's rooms. The police department has a separate entrance in Princess-street, and includes the prisoners' cells, which are placed under the Quarter Sessions Court. Direct communication by staircases is provided from these cells to the docks of this and the police-court. The kitchen and its offices are on this floor, and it is connected with the council-chamber by a lift and turret stairs for the use of servants. The entrance for the public to the courts is also on this floor, at the back corner of Princess-street, from which steps ascend to the level of the public corridor. The principal entrance is approached from the road by a double flight of broad steps, with pierced parapet in front, and steps in the porch under the central tower. The porch has a double-arched entrance and groined ceiling. The tympani of arches round the sides of this porch, and the principal doors to the same, have figure-subjects carved in stone, by Messrs. Williams, of Manchester, from models designed by Mr. S. F. Chesser, sculptor, late pupil of Mr. Foley, and gold medallist, illustrating events in the history of Chester.

On the principal floor, as well as on the one above, the front portion is devoted to the use of the town-hall proper; and the rear part to the courts and their offices. The principal entrance leads into the grand staircase-hall, from which corridors branching right and left lead to the municipal offices. By passing directly under the first landing of the principal stairs, the public hall is reached. It is placed between the courts, that on the left being the quarter sessions, and the one on the right the police-court. In connexion with these are judges', justices', lawyers', and witnesses' rooms, &c.

The upper or council-chamber floor is gained by the grand central staircase. The mid-landing of this stair is open to the public hall, with three arches. The ceiling over is hoarded and stained and varnished, forming a semicircular space;—an arrangement which considerably enhances the effect of these apartments. From this landing a separate flight of steps turning to the right, over the justices' passage, behind the police-court, leads to the lower end of the council-chamber, by which means the general public may have access to the chamber, without necessarily passing through the lobby, or near the rooms in immediate connexion with the council-chamber. The mayor's parlour is placed in the centre, under the tower, and between it and the council-chamber on the Princess-street side is an ante-room, and, on the opposite, are two committee-rooms. All these rooms are *en suite*, for the convenience of receptions and public banquets, &c., and the walls panelled for about 4 ft. in height; the ceiling being treated with diagonal hoarding arranged in patterns.

The opposition party in the council that tried to turn out the design originally, not content with the failure of their first efforts, have continued their labours, and in every possible manner attempted, and in many cases with a fatal result, to thwart the intention of the more liberal party that was anxious to have the work well and handsomely finished. We learn, that it was by the councils of the former that the grand staircase-hall is lined with red brick, instead of ashlar, an accident that has very much detracted from the finished appearance of this composition.

The first contract was for 21,600l., and included heating, plumbing (internal) carving, grates and chimney-pieces, fireproof flooring, &c. The estimate for the tower was subsequently entered into for 1,980l., and both by Messrs. Clarke & Son.

A strike occurred on the subject, we believe, of the clerk of works, and long delay in the progress of the building followed; during which time the contract changed hands, Mr. Thomas Hughes, of Aldford, eventually completing the works.

The building is executed in white sandstone, relieved by bands of red Runcorn stone, and shafts of slate, with the exception of those to the principal entrance, which are of polished Aberdeen granite.

The external doors are of oak, and the interior woodwork, generally, is of red pine.

Messrs. Edmundson have applied two circular stained-glass windows, one of which is placed in the public hall, and one in the waiting-hall.

The gasfittings, and ironwork generally, have been supplied by Skidmore, of Coventry. The roofs are covered with green slates. Mr. Hughes, the contractor, delivered up the keys of the building to the town council on September 30th.

Mr. J. Pearce was the clerk of the works, under

whose superintendence the town-hall has been completed, and the preparation for the opening carried out.

The building is situated between Princess-street and the new markets, and can be very fairly viewed from the west front of the cathedral, which it faces.

H.R.H. the Prince of Wales was to open the town-hall in state on the 15th of October; arriving in Chester on the previous evening, and remaining during Thursday night at the Grosvenor Hotel, which was taken for him and his suite by the Earl of Grosvenor. Hoarding was set up at the ends of all the streets past which the royal *cortège* would pass, to prevent crush, and stands were erected in front of the town-hall to accommodate about 3,000 persons.

"THE COCK MAY CRAW, THE DAY MAY DAW," &c.

SIR.—The writer of the article, "News from Ireland" in the *Builder* of last week cannot be an Irishman, else he would not express any surprise at the Calway town commissioners laying out 1,000l. "in connexion with the water-works," and refusing to grant a farthing for the repair of the town clock. Had he been a native of the land of good whiskey, he would have been at no loss to perceive a logical connexion between the two courses of conduct of the commissioners. How on earth can whiskey punch be made unless you have plenty of hot water? And as for the time—hang the time!—who cares to know what o'clock it is while there is abundance of the raw materials for the "flowing bowl?"

POTTEEN.

ARCHITECT FOR RAMSCATE BURIAL BOARD.

The Burial Board (elected by the town) appointed Mr. Scott, jun., to be their architect, and the appointment was reported to a vestry meeting, and accepted. A meeting of ratepayers has since been held to protest against the appointment, on the ground that there are competent architects in the town, and we are invited to express an opinion on the subject. We are bound to confess that the impression given to us by the reports of proceedings is that the meeting in question was an indecorous affair.

THE SOANE MEDAL OF THE INSTITUTE.

SIR.—Will you kindly allow me to reply to a competitor who asks me to do so through your journal, that the number of drawings deemed sufficient is,—two plans (*viz.*, of the platform and roof), two elevations, one section, one perspective view, and one sheet of details; in all, seven drawings.

It may be presumed that so much of the side elevation as can be contained in the length of a double sheet of elephant drawing-paper will suffice.

JOHN P. SEDDON, Hon. Sec. R.I.B.A.

OPENING OF NEW (CONCRETE) SCHOOLS AT CATTISTOCK, DORSET.

The new national school-house at Cattistock which was commenced in April last, and which, says the *Dorset Chronicle*, from whose report we quote, is regarded as a great acquisition to this pretty little village, has been formally opened amidst general rejoicings. The building is constructed of concrete. The design, a Gothic one, was furnished by the late Mr. J. Hicks, of Dorchester; but it has been modified to the plainest form possible. The concrete walls are faced to a comparatively smooth surface, and the quoins, which are cast in separate blocks, are neatly lined out. The building measures from end to end 50 ft. by 52 ft. in width, and comprises a school-room 50 ft. by 18 ft. in the clear, classroom 16 ft. by 14 ft., and a schoolmaster's house containing six rooms, with offices and appurtenances complete. It stands on a pleasant site near the parish church and rectory, the north side of the school-room facing the road. There are entrances by wooden porches at the ends, and a verandah runs around to the schoolmaster's house-door, which is on the south side. The roofs are of slate, with numerous gables over the windows and the pointing ends, and on the centre of the main roof is a small bell-turret surmounted by a gilt vase. The school-room is of a height measuring upwards of 20 ft. from

floor-line to ridge; and is well lighted by four square-headed windows in the north side and a larger four-light window at each end. The open-roof timbers are painted a chocolate colour relieved with blue, the iron ties being also blue; which, with a variety of lamps depending, give an air of simple decoration to the interior. The pure white of the ceilings also contrasts with the sombre grey of the walls, the thickness of which is 12 in. in the school-room and 9 in. in the dwelling. The work has been performed by local contractors,—Messrs. Jones & Wightman, under the superintendance of Mr. Brooking as clerk of the works. The edifice is not yet quite finished. The foundation-stone was laid, on Easter Monday last, by Mrs. Digby, of Chalmington.

The site, which provides for play-grounds adjoining the house, is the gift of the lord of the manor, Mr. G. D. Digby, of Sherborne Castle, who also contributes 350l. towards the cost of the building. The total cost of the work, it is said, will be about 1,100l. or 1,200l. The old building in which the school has hitherto been carried on is pulled down.

NORTH AND SOUTH LONDON.

SIR,—In the discussion of the subject of the proposed new bridge east of London Bridge, I do not see the "East London Railway" alluded to. This will doubtless relieve the traffic, and arrangements might perhaps be made for carts, &c., to be conveyed in the trains through the tunnel. Allow me to take this opportunity of suggesting that the moveable platforms used for access from the river piers on the Thames Embankment to the steamboats should be made double, so as to allow people to go on and off at the same time. A.

MARGATE.

SIR,—The sanitary committee should forthwith procure a return of the number and depth of cess-pools contaminating the soil; the number and extent of the wells; the distance between the former and the latter; the number of undrained houses in the town; and the necessity of the drainage being carried say to a midpoint between Birchington and Margate, where it could be employed on the marsh lands.

A LONDON SURVEYOR.

DECAY OF INTERNAL STONEMWORK.

Sir,—Will any of your correspondents advise me on the following?—
The best plan of preventing the decay of the internal walls of a church from which the plaster and whitewash of many years have been removed. A large quantity of mouldering stone in the form of dust keeps continually falling, and I should be glad to know of the best mode of preventing it without resorting to plaster.

W. D. SKELTON.

* In such a situation, Ransome's process would probably answer the purpose.

QUANTITY SURVEYORS.

HOUSES, BLACKFRIARS ROAD.

SIR,—In consequence of a remark made in your edition of last week, I feel called upon for a reply, and beg to state that I consider it was perfectly justifiable in this instance to say, "Quantities supplied by Mr. Shrubsole," inasmuch as I did prepare the quantities at my own office, from the drawings handed to me from the architect for that purpose, and the following contractors were furnished with and based their estimates upon my quantities:—

Merritt & Ashby	£1,471 0 0
Taylor & Pitt	1,480 0 0
Werne	1,575 0 0
Crabb & Vangh	1,370 0 0
W. Smith	1,355 0 0
Gore	1,340 0 0
Nightingale	1,297 0 0
Pitcher	1,253 0 0
Soden	1,228 0 0
Cooke & Green	1,227 0 0
Till	1,205 0 0
A. Smith	1,178 0 0
Hutchinson	1,150 0 0
Shirley & Horne	1,110 0 0
Stone	1,110 0 0
Turner	1,085 0 0
Brown	1,047 0 0

Of course I could not prevent Mr. Cohen, or any other contractor, from tendering without my quantities; and, in my opinion, it was more courteous on my part to furnish you with a complete list of competitors than to have omitted the names of one or two contractors simply because they were not supplied with my quantities. S. SHRUBSOLE.

* We do not consider that any person has a right to claim having "supplied the quantities" unless this has been done by direction of the architect, or, with his concurrence, by the joint action of all the contractors. We threatened some time ago to set forth the proceedings of some of the "quantity surveyors," which were very irregular, and postponed the intention simply from unwillingness to damage individuals.

WORK IN THE CITY.

SIR,—A new era has dawned on the City; innovation, in the shape of the Metropolitan Board of Works, has invaded the sacred place, and its ancient authorities have taught a lesson. Any of your readers who pass the end of the new Mansion House-street cannot help seeing the strong contrast between the work recently done there by the Metropolitan Board of Works and the old rough and ugly style of the Corporation. It is most striking. See where the new work terminates and the old work adjoins. The first with neat arries and close joints to the curb, the paving well squared and neatly finished; the second, rough and ugly, no arries, joints you could lay your finger in, both in the curb and also in the paving. Nor is this confined to the old paving work. Go to the new Viaduct, and I think you will agree with me that a good piece of work is spoiled by the rough and ugly footpaths. Surely the City can pay for having its work well done. Is it that the Corporation, through its officers, still adheres to cobble-stone for its footpaths, although it has banished them from the carriage-way? T.

HOW MUCH IS A BUSHEL?

SIR,—Perhaps some intelligent reader of the *Builder* would explain a puzzling difference that occurs in some of our ordinary measures of quantity. The bushel, according to "W. W." letter in last week's number of the *Builder* (concrete proportions), is the 18th part of a cubic yard. A bushel (per table of standard measures) contains 221.992 cubic inches, and requires twenty-eight such measures to make a cubic yard; 21 bushels = 1 cubic yard, according to "Laxton's Price-book."

In an old number of Weale's "Engineer's and Architect's Pocket-Book" I find a table of "measures for various purposes," containing among others, the following:—

A load of lime, 32 bushels,

and, 36
This table is probably retained in this year's issue of "Weale's," but I have not one.

I humbly submit that it would be most useful to men who have to buy cement to have the bushel and merchants' accounts, &c., to have measures of capacity determined. I dare say you have had similar applications from persons placed as I am at present; your calling attention to the matter will be productive of good in drawing forth perhaps an explanation from those most conversed with such materials. A BUILDING MAN.

IMPORTANT TO BUILDERS' CARMEN.

HELEY v. HILL & OTHERS.

THE defendants, Messrs. Hill, Keddell, & Wadram, well-known builders, were summoned at the Shoreditch County Court on the 11th inst. by the plaintiff, one of their carmen, for a debt of 16s. 3d., alleged to be due from the defendants to the plaintiff for wages. The plaintiff said that he had been employed by the defendants as carman, and as a weekly servant at a salary of 41 per week, and that he was discharged from their service on the first day of the week without notice, and was, consequently, entitled to a week's wages, less 3s. 3d., which they had paid him for one day's work. The defendants, on the other hand, maintained that the plaintiff was not a weekly servant. They reserved to themselves the right to discharge any of their carmen at any time on payment of a day's wages. At the same time, however, they made it a rule not to do so except in a case like the present, where the plaintiff was discharged for insolence to one of their foremen, and refusing to obey orders. The judge immediately decided in favour of the defendants.

MONUMENTAL.

THE Birmingham town council have resolved to erect a statue of Mr. Josiah Mason, the founder of the Erdington Asylum, either in the Orphanage or elsewhere in the borough; and have requested the mayor to ask Mr. Mason's consent to give to the sculptor who may be selected the requisite sittings for the model. It was also resolved that the mayor be requested to lay before the General Purposes Committee Mr. Mason's answer; and, in the event of his consenting to sit for the statue, the committee be instructed to select the artist, and commission him to execute the work in such a way as they may think desirable, and that the committee be instructed to report to the council their opinion as to the best site for the statue and the proper mode for a public inauguration. Some of the members expressed their regret that the working classes would thus be shut out from doing honour to Mr. Mason by subscribing for his statue.

In the Liverpool Town Council Mr. Gladstone recently mentioned that it was proposed to have the following inscription on the statue of the Queen to be erected in front of St. George's Hall:—"Erected in honour of her Majesty Queen Victoria, and as a companion to the memorial statue of the lamented Prince Consort, by the Corporation of Liverpool, 1869. Long live the Queen." The finance committee, he said, had thought it right to take the sense of her Majesty as to what should be inscribed on the pedestal, and it had received her special sanction and approval. He thought it right to observe that cutting and carving granite was an expensive process, but, under the circumstances, it was quite unavoidable; and although the words were more in number than might be

desirable, yet they must agree to what was suggested.

The Derby and Mayer statues in St. George's Hall, Liverpool, have been unveiled. They occupy adjoining niches on the east side of the hall. That of Lord Derby is by Theed, and was voted by the corporation in recognition of his lordship's distinguished talent as a statesman, an orator, and a scholar, of his connexion with the county of Lancaster, and of his gift to the town of the collection of natural history known as the Derby Museum. The statue of Mr. Joseph Mayor is by Fontana, and was also voted by the corporation in recognition of a splendid gift to the town, comprising the Fausset Collection of Anglo-Saxon Antiquities, the Palsky Collection of Ivories, and a fine collection of Egyptian gems, curiosities, &c. Both of the statues are of heroic size, and the cost of each has been about 1,000l. The ceremony of unveiling was witnessed by a large concourse of spectators. Mr. Best presided at the grand organ, and during the interval which preceded the entrance of his worship performed a selection of music.

The recumbent effigy of the late Countess of Devon, in Eyedorcham Church, near Exeter, Mr. E. B. Stephens, sculptor, which was shown during last season at the Exhibition of the Royal Academy, is now fixed in the church, as a monument to the memory of the deceased lady. The figure is placed upon a raised stone table in the Contrean Chapel, on the south side of the chancel. The work and its surroundings, the flooring, the wall-painting, the lighting, the whole setting, so to speak, of this monument is of a costly character. The figure, which is of full length and life-size, is sculptured in pure white Italian marble. It represents her ladyship as she lay in death, awaiting burial. The head is partly covered with lace, imitated by the chisel of the sculptor, and on the shoulders and upon the wrists are shown a collar and wristbands of the same material. The hands lie across each other on the breast, resting upon a cross decorated with flowers. A voluminous white ermine covers the form from the waist to the feet. The tasselled pillow and beaded mattress, like the effigy, are carved in marble. The chapel in which this monument is placed is over the old Courtenay vault (the late Countess was buried in the new vault in the chancel). Everything in this chapel is new, or restored and beautified for the reception of the tombstone, except one of the two coloured memorial windows, which is "in memory of Thomas Pergrine Courtenay, born 1752, died 1841." The window in the south wall is just erected, in memory of the lady upon whose mantle effigy the tinted figures fall. It is, like the older one, in the Perpendicular style. The chapel is a study in ecclesiastical decorative painting. The flowers and figures are cheerful, while solemnity and fitness are preserved. On the hand under the spring of the roof, quite round the chapel, appear, in large size, the different family arms. In the roof the ribs and the spaces between are specially painted to correspond with the walls, while the large bosses at the intersection of the timbers are gilded. The floor of the chapel is a costly example of artistic paving. Next the skirt of the wall, and round the foot of the monument, run lines of dark Devonshire marble. Then comes a string of white Italian marble. Between these the floor is a mosaic, formed partly of encaustic tiles and partly of Devonshire marbles of various kinds. A line of slabs, however, of ordinary stone runs along the north side of the chapel, on which the ancient inscriptions belonging to the vault are restored. In addition to the effigy and tombstone, Mr. E. B. Stephens laid the floor of this chapel; while the decorations and the new window were done by Messrs. Clayton & Bell, of London. The style of the tomb is of the fourteenth century, and the general decorations are adapted to the same period.

The ship *Queen*, of Swansea, was wrecked in Gull Island, Newfoundland, in December, 1867. The owners, Messrs. Richards & Power, have, as a mark of their sympathy for those who perished, instructed Mr. Philip Rogers, of Swansea, to design and execute an obelisk monument, for the purpose of marking the last resting-place in that desolate island. The obelisk stands 8 ft. high, and is cut out of the forest of Dean stone. The following is the inscription:—"On the front view:—"To the memory of the crew and passengers of the ship *Queen*, of Swansea, who were wrecked on Gull Island, December 12, 1867, and there perished. This monument is erected by

the owners of the *Queen*, Messrs. Richards, Power, & Co., of Swansea, Great Britain." Right view:—"Passengers—Felix Dowsley, William Hoskins, Patrick Duggan, Thomas Power, William Kennedy, Grinelda Hopkins, and Caroline Stitson." Left view:—"John Owen, master; Thomas Morgans, mate; and six seamen, names unknown." The block will be shipped shortly for Newfoundland, the place of its destination.

CHURCH-BUILDING NEWS.

Croydon.—The restoration of St. John's Church is now nearly complete. After the destruction of the edifice by fire in 1867, a contract was entered into for rebuilding the church at a cost of 22,000*l.* Mr. Gilbert Scott was the architect, and Messrs. Dove were the builders, by whom the work was undertaken. It was commenced in the latter end of 1867, and the contributions to meet the expense have been most liberal while for pulpit, altar-rail, font, and other matters, subscriptions have been raised without the slightest difficulty. The building is in the Perpendicular style of architecture. The total length of the nave is 97 ft., and the width is 36 ft. The chancel is 56 ft. 6 in. long, and 30 ft. wide. The tower is 28 ft. square, so that the total length of the church is 123 ft. 6 in., and the total width is 80 ft. 10 in. The height to the ridge from the nave floor is 55 ft., and the western tower is 120 ft. high. The tower is battlemented, and at each angle rises a small embattled octagon tower, surmounted by a crocketed pinnacle. The chancel is divided from the north and south aisles by an arcading of two bays. The detached pillar is in rich polished Devonshire marble. The roof of the chancel is oak panelled, having carved bosses, and the chancel is divided into three bays, the trusses coming down the walls into carved corbels, the intermediate trusses having angels with musical instruments in their hands. The nave is in six bays, with an oak roof. The roofs of the aisles are of deal, all the timbers of which are shown, the trusses coming down into corbels having angels carved upon them in attitudes of devotion. On the trusses under the nave roof are angels holding shields. The church is lined throughout with Godstone stone and blue Corsham intermixed, and the pillars of the arcading are of Ancaster, and the arches of Little Casterton stone. The seating of the church is all oak. A window in the south aisle of the chancel is memorial in character, given by Mr. Blake, and there is another given by Mr. Robinson, both being by Messrs. Lavers, Barrand, & Westlake. The western window is the gift of Mr. R. A. Heath, and it is executed by French artists. The organ is a large and powerful instrument, placed at the end of the north aisle of chancel. It was built by Messrs. Hill & Son. The gas fittings are of brass of a costly character. The pulpit will be of oak on a stone base, but it is not yet erected. The reredos behind the altar is executed by Messrs. Farmer & Binsley, of Lambeth. It is of alabaster, and in three divisions, the subject on the first being the Nativity, the Crucifixion in the centre, and on the other division is the Ascension. The font is of alabaster, of octagonal shape, having on the four cardinal faces carvings representing the Baptism of Our Lord, the Blessing of Little Children, the Baptism of the Centurion, and of the Centurion. The other faces are filled in with shields and monograms. This font has been subscribed for by ladies. The work has been carried on under Mr. Dove, general foreman for the contractors, while the architect has been represented by Mr. W. Prosser. A movement has been set on foot for having the sittings in the church free.

Eye (Suffolk).—The parish church here has been restored and re-opened. Entering by the west door, we find the heavy old outer doors replaced by gates of open work. From the roof of the west entrance the successive coats of paint and whitewash have been cleared away, and the groining which they formerly hid revealed. The entrance is paved with Pease's tiles. The inner door is new, and of oak. The nave is 74 ft. long and 24 ft. wide, while the north and south aisles are about 14 ft. in width, giving a total width of upwards of 50 ft., broken by the plain octagonal columns of the nave. The height of the nave is in proportion to the other dimensions, and the oak roof has been restored, and relaid with new lead. The roof of the nave is a hammer-beam roof, with curved ribs richly moulded. The original design has been preserved in its entirety, the old woodwork

being retained, except where it had become decayed. The carved work about the roof, of which there is a profusion, has all been renewed, care being taken that they should be in accordance with those portions of the old work which were remaining. The principal ribs in the nave roof were for the most part sound, but the carving had suffered greatly. In the north aisle a similar plan has been pursued, new oak being substituted for that which was decayed, and all the carving which was deficient replaced, and the roof of the south aisle, which was in a very dilapidated state, has been entirely renewed, the new one being a counterpart of the original. The easternmost bay of the nave roof differs from the rest of the roof in that it is panelled. It was originally painted, and this ornamentation has been reproduced by Mr. Short, of Eye. In the centre of each panel is the sacred monogram in red letters upon a white ground, surrounded by the crown of thorns in green, there being borders of blue and other colours. Upon the wall above the chancel arch being freed from the whitewash with which it was covered, the remains of a painting of the Doom, some portions of which gave evidence that it was the work of a vigorous hand, were discovered, and Mr. Short made a copy of those portions which remained. In the clearstory of the nave are five three-light windows on each side, all of which have been restored and glazed with cathedral glass, and the tracery of the five windows in the north aisle, and the four in the south, has been renewed where necessary, the west window of the north aisle glazed with cathedral glass, the whole of the stonework cleaned from disfiguring paint and whitewash, and the plain portions of the wall replastered. A gallery in which the organ was placed formerly blocked up the tower arch and concealed the west window, which has four lights; but of this a clean sweep has been made, and the organ, which is still in the hands of the organ builders, will, when finished, be placed in the north chancel aisle. The tower arch is now open, and the west window has been restored. The chamber, which was formerly that in which the ringers stood, has by the opening of the tower arch become open to the church, and, a light stone screen being placed in front, is available as a gallery, the ringers being promoted to a floor above. At present the gallery is approached by a staircase which opens in the church, but it is proposed to make a new staircase in the thickness of the north wall of the tower. For the old pews open benches of uniform character throughout the nave and aisles have been substituted. They are made of wainscot oak, and the ends of the benches have elbow rests carved in a variety of designs, all from nature,—such as ivy leaves and berries, the hazel with its nuts, sea-weed and shells, the hawthorn, ferns, the water avens, and many others. These were designed by the architect, Mr. Colling; and the carving has been executed by Mr. Groom, of Ipswich, by whom also the remainder of the wood end much of the stone carving has been done. Many of the seats are free, and rich and poor are mingled together. The whole expense of the chancel, which has been restored from the designs of Mr. Colling, in a similar manner to the nave, has been borne by Sir Edward Kerrison, and the total cost of the work in this part of the church must have amounted to about 1,000*l.* The clearstory windows of the chancel have been filled with cathedral glass, the work being done by Mr. Neale; and the stonework restored where necessary, and the side arches of the chancel, which were formerly of brick, have been renewed throughout with stone. Various other restorations and improvements have been made. Mr. James K. Colling, of London, was the architect. That gentleman estimated the cost of repairing the roofs at 759*l.*, and that of the general restoration and re-seating the nave and aisles at 1,183*l.*, but the total cost of the works ultimately determined upon by the committee, irrespective of the chancel, has reached 3,000*l.*

Bramham.—The parish church of Bramham, which has undergone a restoration, has been re-opened. The work has been at the expense of the rector, the Rev. S. R. Carter, the only assistance of any moment that the rev. gentleman has received being from Mr. W. Gurdon, of Bramham Court, who undertook to defray the cost of the new seats. Mr. J. H. Hakewill is the architect. The total expense incurred approaches 3,000*l.* Before the restoration the walls were plastered, the roofs bad, the windows out of repair, the aisle had been pulled down by the parishioners about sixty years before in order that money might be raised by the sale of the

lead of the roof and the building presented anything but an attractive appearance. The rubble walls have been dressed with Bath stone. There formerly was about 8 ft. of height above the string course of the tower, below the belfry windows; this part of the tower was pulled down and it was rebuilt to a height of about 14 ft., and new belfry windows have been put in, and the tower finished with a parapet with circular tracery of Bath stone filled with black flints, while the moulded string-course immediately below the parapet is ornamented with ball flowers, and two new carved gargoyles are placed on the west side. The mullions and tracery of the two-light west windows, as well as the stonework of the outer windows in the tower, have been repaired. The walls of the nave, chancel, aisle, and porch are similar in character to those of the tower, and the roofs, which are entirely new, are of plain tiles. The only old wall to be seen from the outside is the south wall of the nave, in which are three windows, one three-light and the others two-light, the stonework of which has been renewed where necessary. The chancel is entirely new, is considerably larger than that which formerly existed, and is lighted by the east window, and by three windows on the north and one on the south side, all of which have tracery. The aisle is new, and does not cover quite so much space as that pulled down some years ago, the foundations of which were discovered in the course of the work. The relieving arches over the windows have been faced with alternate squares of white Bath stone and black flints, the monotony of the rubble walls being by this means broken, and further relief is given, as far as the aisle is concerned, by the formation of what may be called cross-shaped panels by the stonework of the buttresses, these panels being filled with flint. The nave would appear to have been originally much narrower than it now is, probably hardly wider than the tower itself, but, at some subsequent period, several feet in width were added to the south side, no corresponding addition being made to the north, and the consequence is that the chancel and west arches being in line, the chancel is all on one side of the nave. The roof of the nave is an open wagon-roof, with moulded tie-beams supporting king-posts, these king-posts being, with the exception of the wall-plate, the only portions of the old roof which have been made use of. The columns and arches of the north side are the old ones, which were bricked up in the wall when the former north aisle was destroyed. The architect was not aware of their existence, but when the mean wooden windows which had been put in were taken out, and the brick wall began to be pulled about, the old arches were found, and Mr. Hakewill had them repaired where necessary, and made use of. The benches are of English oak, with wide seats, but the backs are not sloped. The nave, porch, and aisle are paved with Staffordshire tiles; the chancel, which is raised three steps above the level of the nave, with Minton's tiles. On the wall at the back of the font is a painting by Constable—the first public work, it is said, of that artist—representing our Lord rebuking his disciples when they would have prevented children being taken to him. This painting formerly hung over the communion-table. The west window is filled with stained glass, and in one light the subject is the baptism of our Lord, that of the other being John the Baptist in the Wilderness. All the windows in the chancel are filled with stained glass. The east window has five lights. In the centre compartment is the figure of our Saviour, those at the sides being filled with angels, the legend being, "Angels, archangels, all the company of heaven laud and magnify Thy glorious name." The subjects of the south window are the angel meeting the two Marys at the grave of Jesus, and the angel at the Ascension. The subjects of the windows in the north wall are, "Out of Egypt have I called my Son;" "They shall call his name Emmanuel;" the angel appearing to St. Paul; the angel and Cornelius; and St. Philip—"Arise and go toward the south."

Lincoln.—The foundation stone of a new church for the united parishes of St. Peter-in-Eastgate and St. Margaret, has been laid, with Masonic honours, by Major Smyth, D.F.G.M. of Lincolnshire, in the presence of the Bishop of Lincoln, and a large concourse of people. It was determined, under the advice of the architect, Mr. Arthur W. Blomfield, to pull down the old church, and build another and larger church more in the centre of the ground. The new

church will be seated for nearly 500 persons, and will consist of a nave and north aisle, chancel and large vestry, and south and west porches. There will be no tower, but a bell-turret in the west gable. The dimensions are:—length of nave and aisle, 82 ft. 9 in.; ditto chancel, 29 ft.; width of church, 40 ft. 10 in.; ditto chancel, 22 ft.; height from floor to wall-plate, 22 ft.; ditto to ridge of roof, 42 ft. The style of the church is First Pointed, of simple character. The material used for the walling is Lincoln stone rock-faced with dressings of Bath stone, the ashlar of the old church being employed as far as it will go. Bands of red Mansfield stone are introduced at intervals. Internally the walls will be plastered, Bath stone being used for all quoins and arches. The roofs and sittings will be of stained deal. The church will be heated with hot water, an apparatus room being provided beneath the vestry. The contractors are Messrs. Oter & Binns, of Lincoln. The contract for the church, exclusive of one or two items, such as the pulpit and stained glass for the east window, which will be private gifts, is about 2,500*l.* (the amount of the architect's estimate).

Worcester.—The work of restoration in connexion with St. Andrew's Church will, it is calculated, cost about 2,000*l.* Of this sum over 1,100*l.* has been subscribed. It is proposed that the sittings shall be free and unappropriated. A contract has been entered into with Mr. Warner, of Malvern, builder, and he has commenced work.

Kilworth.—The parish church of South Kilworth, Leicestershire, having been almost rebuilt, with the exception of the tower, by Mr. G. F. Bodley, at a cost of about 2,000*l.*, has been re-opened.

St. Bees, near Whitehaven.—The parish church of St. Bees has been re-opened, after various restorations. The communion chancel has been restored by Mr. James Lumb; other gentlemen have restored other portions of the edifice; and a number of memorial windows have been inserted by Messrs. James Lumb; William Lumb; Spedding, of Summergrove; Benn, of Greenbank; Fox and Rigg, of St. Bees; and Harrison, of Linthwaite. The whole of the windows on the north side of the church were put in at the cost of Mr. Benn. At the western end there is a memorial window of the late Captain Sharpe, of the Cumberland Militia, which has been inserted by the officers of that regiment as a tribute of respect to his memory. The roof is in a very bad condition, and it is to be hoped that ere long the necessary funds will be raised to complete the restorations, which have been going on occasionally for some years.

DISSENTING CHURCH-BUILDING NEWS.

Driston.—The new Wesleyan chapel, which occupies a prominent site in the Mootyn-road, has been opened for public worship. It is built in the style of Gothic architecture prevalent in the early part of the fourteenth century. It has in the front three entrances, giving access to the ground floor and galleries staircase. At the north-west angle are a tower and spire, the total height being 160 ft. The interior arrangements consist of a nave and aisle, divided by clear-story arches of moulded Bath stone, supported by columns of cast iron, with enriched capitals. There is sculptured foliage distributed over the external surface. The building is adapted to hold 1,100 persons. At present only the chapel is finished, but it is intended to build extensive schoolrooms adjoining the apex end of the present structure. The architects of the building are Messrs. Tarring & Son; contractors, Messrs. Myers & Son; heating arrangements by Mr. Boulton; lighting by Mr. Rothwell; and the decorations by Mr. Sansom.

Ashford (Kent).—The new Primitive Methodist chapel here is nearly completed, and has been recently opened. Owing to the adjoining property, the light is obtained from the back and front principally by large wheel windows in the gables. The building may be said to be in a Single Pointed style, with medium pitched roof. The architect was Mr. John R. Collett, and the builder Mr. James Clifford.

Stoke-upon-Trent.—The Baptist chapel in the London-road has been re-opened for public worship, after having undergone a renovation and improvement. The old square pews have been removed, and modern open benches have been substituted in their places. The new Sunday schools, class and lecture-rooms adjoining,

which have been erected during the past four months, about to be opened, are built of red and blue bricks, with moulded brick dressings. The whole of the chapel and school works have been carried out by Mr. Nathan Barlow, contractor, from the designs and under the superintendence of Mr. Edwin Penn, architect, at a cost of 650*l.*

Swansea.—The memorial stone of a new Baptist chapel at Morriston has been laid. The new chapel is to be one of the largest in the Principality. It measures 74 ft. long, by 49 ft. 6 in. wide, and will contain sittings for 1,250 people. The edifice is to be built in the Tuscan style of architecture. The architect is the Rev. H. Thomas, Ystradgynlais. The contractors are Messrs. Jones, Evans, & Jones, Clydach. The estimated cost of the chapel is 2,140*l.*; and when it will be opened the old chapel will be converted into three vestry-rooms, &c., at the cost of about 500*l.* It is estimated that the new buildings altogether, when completed, will cost 2,800*l.*

Leighton Buzzard.—The chief stone of a new Primitive Methodist Chapel has been laid here. The edifice, which is being erected on the site of the old one by Mr. Dawson, of Leighton, is to accommodate about 800 persons, and its dimensions will be 60 ft. by 40 ft., with a height in the interior of 25 ft. The external design is to be Italian, the front elevation being plastered with Roman cement; there will be four pilasters in front, and two on each side—of cement. Two schoolrooms, over each other, will also be built for "the children of the industrial classes." The total cost of the buildings will be about 750*l.*

Nottingham.—The memorial stone of a new Presbyterian Church of St. Andrew, of Belgrave-square, Goldsmith-street, has been laid. The edifice, when completed, will comprise a nave, 50 ft. by 30 ft., with circular bays or aisles on either side, and a gallery at one end, extending over a vestibule in connexion with north and south porches, in which are stone staircases communicating with the gallery. Over the south porch are carried the tower and spire, 120 ft. high. The style of architecture adopted is Early Decorated; and the walls will be built of Bwlwell stone, with dressings and window tracery of Ancaster stone. The interior of the church will be generally of a plain and unpretending character, and the open benches so placed that every one can see the minister, each bench being slightly raised above the one in front, and fixed circular on plan. The pulpit and fittings connected therewith will be placed against the western wall. The nave will have a wagon-headed boarded roof, supported by carved principals. There will be seat accommodations for upwards of 600 adults. On the western portion of the site will be a lecture-room, 48 ft. by 25 ft., with sessions-room or vestry, and other offices, communicating with Vickers-street, all in character with the church they adjoin. The architect is Mr. Robert Evans, of Nottingham; contractors, Messrs. R. Bennett & Co.; clerk of the works, Mr. Robert Speed. The cost will be about 4,000*l.*

Yardley Hastings (Northampton).—The Congregational Chapel at Yardley Hastings has been reopened for Divine worship, after a restoration and renovation. With the exception of the galleries, the whole inside of the chapel has been taken out, a new floor has been laid down, new pews of deal, varnished, have been put in, with a large pulpit, of the same material. The chapel is lighted with paraffine-lamps, placed on pillars. The work has been carried out by Mr. John Watkin, of Northampton, from the plans, and under the superintendence of Mr. Sharman, of Wellingborough, architect. The cost is about 400*l.*, the greater part of which has been raised. Schools are attached to the chapel. The chapel has been painted throughout, the walls, ceiling, and pillars being of a French grey colour, relieved with white cornices, and some bright colouring.

Fenton.—The memorial-stone of the new Mount Tabor (Methodist New Connexion) Chapel, the erection of which has recently been commenced at Fenton, has been laid. The new edifice will occupy the site of the old chapel, with the addition of ground at the rear, from which some old houses have been removed. It will be in the Gothic style of architecture, according to examples in France and Germany of the thirteenth and fourteenth centuries. The total length, exclusive of the entrance, will be 55 ft. 6 in., the width 40 ft. 3 in.; the height from ground line to ridge 51 ft. The front gable, facing Market-street, will contain the

principal entrance, and will have three wide doorways with moulded arches, and stone labels with carved terminals, supported by circular stone shafts, with circular moulded bases, bands, and curved caps, the whole surmounted by a large five-light stone window with tracery in the head. The gable will be covered with stone, having moulded corbels, crockets, and finial. To the right and left of the entrance are to be staircases leading to the galleries and orchestra, the right staircase being surmounted with a tall, slated, spire roof, and the left staircase surmounted by a tower with buttressed angles and spire, the total height of which is to be 110 ft. to the top of the metal finial with which it is to be crowned. There will be two-light windows on each face, the angles being surmounted by pinnacles 10 ft. high from the base to the apex. The minister's vestry will be near the entrance, and the other vestries at the further end of the chapel, with the heating-chamber below. The walls are of brick, plastered internally; and the front faced, externally, with stocks, relieved with Hollington stone dressings, moulded, carved, and traceried work. The bays are to be marked in the side walls, by buttresses, between the windows. The roofs are to be open, carried by framed principals with curved trusses filled in with cut and perforated boarding, supported by moulded stone corbels, and to be stained and varnished. The opening to the orchestra from the chapel is to be 15 ft. between the piers, and the height from the floor to the apex of the arch 43 ft.; the arch being supported by moulded stone corbels, and finished round with plastered archivolts. There will be a gallery round two sides and one end, with a circular enriched and moulded front. The chapel will be lighted at the sides by two-light pointed and curved windows, and at the end by a five-light stone traceried window, the latter being filled with coloured glass. The entrance floor will be laid with tiles to a pattern. The benches and fittings throughout are to be of deal, stained and varnished. The buildings will be warmed by means of hot air. At the entrance to the chapel from Market-street will be sliding wrought-iron ornamental gates, and the space in front will be enclosed by a wall surmounted by stone and metal work. The school, which is to be at the further end of the chapel, will be two stories high, the entrances to which are from Park-street. The total length is 56 ft. 6 in., and the width 35 ft. 6 in. The rooms are to be divided into departments for boys and girls, with separate entrances, in which are to be a number of class-rooms. The room may be used as a lecture-hall, or for public meetings. The chapel, it is calculated, will accommodate between 800 and 900, and the schools will be sufficiently large for nearly that number of children. The estimated cost of the building is 2,440*l.*, exclusive of the old materials. The architect is Mr. H. Finchbeck, of Manchester, under whose supervision the work will be carried out; and the contractors are Messrs. Wade, Brothers, also of Manchester.

Stowport.—The memorial-stone of a new Congregational Chapel has been laid here. The architect is Mr. Bidlake, of Wolverhampton; and the builder Mr. Nelson, of Dudley. The total cost is estimated at about 1,400*l.*, towards which some 700*l.* or 800*l.* have been promised.

SCHOOL-BUILDING NEWS.

Elmley Castle.—New schools, which have been erected in this village, through the generosity of Lady Pakington, have been opened by the bishop of the diocese, the ceremony being combined with the harvest-home celebration for the parish. The school which has hitherto existed afforded accommodation for only thirty or forty scholars, and was in many ways inconvenient. The new building will accommodate about eighty scholars, and will be used as a day and Sunday school. The cost will be about 500*l.*, and would have been about 70*l.* more had not the farmers of the village undertaken the carting of the material free of charge.

Middlesbrough.—The National Schools for the parish of St. Hilda, Middlesbrough, which have been erected by Mr. Bolekow, M.P., on ground granted by Messrs. Hopkins, Gilkes, & Co., situated in West-street, have been opened by the Duke of Devonshire. The new schools cost 6,000*l.*, exclusive of the land, and will accommodate 900 boys, girls, and infants.

Abingdon.—New National Schools have been opened here. The building is of brick, and has

More Complaints as to the Metropolitan Underground Railway.—The *Kensington News* writes a leading article complaining of the great want of accommodation for third-class passengers on the Metropolitan and District railways:—

"For two hours at evening daily," he remarks, "saving Sunday and Saturday, and on the latter day for five hours, may be witnessed a scene that is without parallel in the civilised world. . . . The company does not recognise any rights but its own. The tenure of a seat for the journey is not, in the company's view, rented or purchased by the traveller. The company wants money, and to get it breaks the law, and breaks faith too, by allowing sixteen, twenty, and even in one instance twenty-six persons to occupy the space of ten. The extreme case we heard complained of by workmen themselves, who protested afterwards that they could not breathe the hot, fetid, deadly air in the compartment."

Correspondents of our own make other complaints as to the way things are managed on the Metropolitan. One, who went from King's Cross Station to South Kensington, not knowing the price of a third-class return-ticket, which is sixpence, laid down two sixpences at the wicket, which betrayed his ignorance to the check-giver, and received threepence change, which, as he afterwards discovered, was thievery to the extent of threepence. Another asked for a ticket for Chelsea at the Portland-road station of the Metropolitan, which has only one station in Chelsea, namely, the station at Sloane-square. On reaching their Chelsea station, full fare was re-demanded from him, on the ground that the ticket was not given for the Chelsea station of the Metropolitan, which issued the ticket, but of another company, a mile or more away from the Chelsea station of the Metropolitan. Passengers, to escape such thimble-rigging jugglery, and prevent the Metropolitan Company from thus reaping double fares, must take care not to say to the ticket-clerk of the Metropolitan that they want a ticket on their line for Chelsea, but for Sloane-square, where their only Chelsea station happens to be!

The Brighton Drainage.—The Town Council, by a vote of 22 to 20, have rejected the recommendation of the General Purposes Committee to cause immediate steps to be taken for obtaining an Act of Parliament to carry out Mr. Hawkshaw's plan for the construction of an intercepting sewer from Cliftonville to Portobello. An element of doubt is as to the ventilation of the seven-mile sewer. In his original report, Mr. Hawkshaw spoke of "ventilating shafts, which could be so arranged as to be unobjectionable," but did not specify the character of them. In a subsequent interview with the General Purposes Committee, he seems to have been questioned on this point, and it was then ascertained, as we have already stated, that his plan for ventilating this seven-mile sewer, with a fall of 3 ft. per mile, was by a line of gratings, running at intervals of 200 or 300 yards in front of the marine promenades. Mr. Hawkshaw was, it seems, requested by the Committee to put his views upon this matter of ventilating in writing, and this he has done in a supplementary report, made public on Monday in last week, in which the plan of ventilation by gratings "along the margin of the sea" (to adopt Mr. Hawkshaw's own expression), was strongly urged, "because," says Mr. Hawkshaw, "in my opinion, no more serious mistake can be made, and none more likely to be attended with bad results, than to neglect such precaution."

New Process of Refining Iron.—Mr. Palmer Budd's new process of refining iron was shown, in the works of Messrs. Bolckow & Vaughan, to the members of the National Iron and Steel Institute, after their meeting at Middlesbrough. It appears that the patent has been taken out by Mr. Budd for the invention of such "improvements in the manufacture of iron and steel" as shall henceforth render the process of puddling much quicker and easier. This valuable result is said to be accomplished by the subjecting of molten cast-iron to the action of soda and soft hematite iron ore—or other oxide of iron—previous to its being subjected to the puddling process. It was alleged by the patentee that the puddlers much prefer the iron in this condition, as it lessens and helps their work, and also that it will tend materially to cheapen the process of manufacture. In his opinion, the money value of the invention to the iron trade will be enormous; greater, perhaps, than that arising from the use of blast-furnace gases, said to be 1,000,000*l.* a year, and which Mr. Budd first introduced into this country, and made known to the iron trade at the meeting of the British Association held at Swansea in 1849.

Workhouse Bakehouses.—The Poor-law Guardians of the hamlet of Mile-end Old Town, have recently been engaged in frequent discussions as to the advisability of establishing a bakery in connexion with their workhouse, in Bancroft-road, for supplying the in- and out-door poor with bread. A committee of the Board was appointed to privately discuss the benefit likely to result from the adoption of the scheme, and at a meeting of the Board, held on the 7th inst., a report was presented by the committee, recommending that the proposal be adopted, and stating that "we have obtained from Mr. W. Dobson, architect, a plan showing the proposed alteration, and the cost of the same. The erection of the bakehouse, oven, flour-store, and chimney-shaft, were estimated by Mr. Dobson to cost 460*l.*; and the erection of two 12-bushel ovens, to cost about 120*l.*, making a total of 580*l.* Should the Board decide on adopting this our recommendation, we further recommend that one of Stevens's hand-power bread-baking machines be obtained, at a cost of from 25*l.* to 50*l.*" Some opposition was offered, on the ground that the adoption of the scheme would seriously injure the tradesmen of the hamlet, but eventually the report was carried, and advertisements ordered to be issued, inviting tenders for carrying out the works.

The Bath Water-Supply.—The insufficiency of the present water-supply was well illustrated by Mr. Bright, in a recent debate in the town council, reported in the local *Chronicle*. The past few weeks have not been remarkably dry, yet it would seem that during that time certain of the inhabitants of Southgate-street have been on such short commons of water, that they have had only two days' supply each week, and Mr. Bright, who stated this, added that had it not been for a pump in the Fall Moon-yard, to which they were allowed to resort, they would often have been absolutely without any water. Mr. Lewis capped the statement with the remark that the pump, which thus supplied their pressing wants, stands in a stable yard, near the river. Mr. Bateman's report fully bears out all that has been said on the insufficiency of the existing water-supply. He lays it down that an adequate provision of water would give from 25 to 30 gallons a head per day to the population, and remarks that the corporation can afford no more than 14½ gallons, while the smaller private companies do out something less than 2 gallons daily per head to their customers. It would seem that the corporation are deriving an income of 2,300*l.* less the interest of 4,000*l.* (say 200*l.*), from their water-works, or something like 9 per cent.

A New Opening for Labour.—There is a good opening for any capitalist or philanthropist who would endow London with street porters after the pattern of the German *diensmann*. The commissionaires are efficient, but they are scarcely numerous enough; and, besides, they do not perform one of the chief functions of the *diensmann*, which is to carry large parcels, boxes, or portmanteaus. For many years Edinburgh has been provided with such porters, who stand (or at least used to stand) at street corners or other stations, with belts or ropes over their shoulder, ready to carry trunks, &c., as well as parcels, or to run messages or carry letters, at any one's orders. It is one of the petty discomforts of London, on the contrary, that when a person wants to have a tolerably-sized box carried he does not know by whom to send it. If a brigade of street porters, with belts, as at Edinburgh, or light barrows, as at Margate, were established, having stations scattered about the different parts of London like cab-stands, as the *Pall Mall Gazette* suggests, it would render a real service, and there is no doubt it could be made to pay.

Acidulated Non-inflammable Wood.—In a letter to us, signed "R. Taylor," sulphurous acid is suggested as a means of rendering wood inflammable. A small splinter of fir wood was inclosed, which we find ceases to flame the moment it is taken out of a gaslight, although it materially increases the volume of the gas flame while burning, as it does, in it. The acid, our correspondent says, is diluted with ten parts of water before steeping the wood in it, and floor-planks, he adds, require but a few minutes' immersion.

The Surveyor of St. Luke's.—The salary of Mr. Nihlett has been increased from 250*l.* to 300*l.* by the vestry. An amendment that a gratuity of 50*l.* be voted instead was rejected.

Wolverhampton Free Library and Reading Room.—The inauguration of this new Free Library has just taken place. It has been started and will be carried on under the Free Libraries Act, which was adopted at a unanimous public meeting held some months ago. The building in which the institution is located was formerly and for many years used as a Mechanics' Institution and Athenaeum, in Queen-street. It has been cleaned, repainted inside and out, and refitted. There is an upper room which will be used for the library, and a lower room which has been furnished for readers. There are also smaller rooms that may be used, if necessary, for reading or writing, and out-offices. The Athenaeum committee have transferred to the new institution upwards of 2,000 volumes of books to form the nucleus of a library: some effects, and a number of shares in the building, and gifts of books had also been received.

The Penzance Borough Surveyorship.—There were 78 applicants from all parts of England for this office, and the special committee recommended that the following four gentlemen be invited to attend, receiving 5*l.* each for travelling expenses:—Alfred Morris, aged 27, surveyor to Rusholme Local Board of Health; Clement Clitheroe, 25, assistant-surveyor to Local Board, Kingston-upon-Hull; George Livingstone, 26, assistant-surveyor of Preston; and John Hume, 27, assistant-surveyor to Derby Corporation and Local Board. To this an amendment was proposed that the name of Mr. Thomas Carne, builder, of Penzance, be added to the list; but, on a division, it was opposed the eight who supported the amendment, and it was lost. The duties of the new surveyor were then defined in writing and agreed to; and at an adjourned meeting of the town council and local board, Mr. Alfred Morris was elected as borough surveyor, the services of Mr. John Matthews being retained as consulting engineer.

Big Ben's Inscription.—A writer in *Notes and Queries* points out an objection to the inscription under the face of the great clock of the Houses of Parliament. It is as follows:—"Domine salvam fac regiam nostram Victorianam primam." He says, the glaring absurdity of *primam* will perhaps more clearly appear when I tell you that a near relation of my own was once acute enough to discover (as a solicitor) that a deed had been forged by its beginning, "This Indenture made the . . . day of . . . in the . . . year of our sovereign lord King Charles the First," &c. Until there has been a second Queen Victoria the error of calling her Majesty Victoria the First has been pointed out. Who knows but that she may be Victoria the first, or the only Victoria of her class?

"Drunken Blackburn."—The vicar of Blackburn, in the course of a speech made the other day in that town, after showing that Blackburn stands A 1 as a drunken town, made a suggestion, according to the *Rock*, which is worth repeating. "If people will drink," said he, "it is far better for them to go and drink together, than that the rest of the town should suffer. There ought to be a Drunkards' Quarter; if there ought to be any drunkards at all. You have often heard and seen in towns—in most large towns—that there are shambles where the butchers' meat is to be sold—the do not allow it to be sold in other parts of the town;—and in Blackburn it would be far better if we had a kind of Drunkard's Shambles, say at the top of Brandy House Brook, a very proper locality in which to drink; let them go up to the top of the hill to drink."

A Covered Market for York.—The question of a covered market for York, which has for some time past excited great interest, has been brought before the corporation for discussion. A special committee, appointed some months ago, had reported in favour of what called the Davygate site, the cost of which was estimated at about 30,000*l.* A number of petitions, signed by 3,097 of the ratepayers, against the scheme, were presented, and only one petition in its favour. The adoption of the report was moved, and an amendment to refer it back to the committee was rejected by a majority 22 to 17. The original motion was therefore carried. The town clerk was authorised to take the requisite steps for applying to Parliament for an Act to empower the council to erect the market.

TO LIME-BURNERS, WHITING AND CEMENT MANUFACTURERS—TO BE SOLD, in consequence of the death of the late owner, in NOVEMBER next, by PUBLIC AUCTION, under previously approved of a FREEHOLD PROPERTY of 32 Acres, containing open pits of grey and white chalk, sand, and brick earth. The property is situated at Amberley, Bucks, on the River Avon (having water communication with London and Portsmouth), and abuts on the Amberley Station of the London, Brighton and South Coast Railway. The most productive has been used for the following Purposes.—Apply to Messrs RICHARD & GEORGE HOLMES, Solicitors, Ainstock.

EALING—The Castle-hill-park Estate. A very attractive and valuable Building Property, Freehold, within seven miles of Hyde-park corner, containing 66 acres of ornamentally-landscaped and public park land, well laid out with new roads and sewers partly complete, and ready for immediate building operations. The land admits the new line on the Great Western Railway for the metropolitan traffic, and is called the Drayton Green Station.

MESSRS. DRIVER have received instructions to sell by AUCTION, at the MART, Tottenham-park, Tottenham, on TUESDAY, OCTOBER 19th, at 2 o'clock precisely, in one or more lots (unless previously otherwise ordered by private contract), the above very valuable PROPERTY, situate within one mile of the Ealing Station, and close to the proposed Drayton Green Station on the Great Western Railway (main line), from Ealing, and via Kensington from Victoria. It comprises about 66 acres of ornamentally-landscaped, park-like land, the most desirable portion of the Ealing-hill-park Estate. It is elevated, commands extensive views, and has a southern aspect. There are a valuable gravel and brick earth, or pit, roads, with sewers partly made, and gas and water laid on to two sides of the estate. A temporary church has been erected. This property is fit for immediate occupation, and especially recommends itself to building speculators and capitalists. Also a superior detached Residence, fronting the Ealing Station, containing rooms with ample accommodation. Particulars may be had of Messrs TRAVES, SMITH, & CO., Solicitors, 27, Abchurch-lane, London, E.C. 4, or of Messrs DRIVER, Surveyors, Land Agents, and Auctioneers, 4, Whitehall.

TABLES showing the WEIGHT of DIFFERENT LENGTHS of Round, Square, Flat, Bar, and Cast IRON, STEEL, BRASS, COPPER, LEAD, and TIN, BY SAMUEL FENN.

In consequence of the death of Mr. CHARLES FOX, the above Table will in future be published by JAMES HOGGIE, 67, Finsbury-row.

Published at St. 5s. offered for 3l. 10s.

OWEN JONES'S GRAMMAR OF ORNAMENT.

Impr. 4to. 112 superb Plates in gold and colors, with Letter-press descriptions, extra cloth, 45s. 6d.

BERNARD QUARITCH, PICCADILLY, LONDON.

SCHOOL FITTINGS.—MESSRS. BANKS & CO'S PATENT REVISED ILLUSTRATED PICTURE SHEETS for every article required in a well-furnished school, sent free by stamps. PARSONAGE WORKS, ALBERT-STREET, MANCHESTER.

Imperial 8vo. cloth, extra, price 8s. 6d.

THE LIFE OF CHARLES the FIFTH, EMPEROR OF GERMANY.

By WILLIAM ROBERTSON, D.D. F.R.S.E. late Principal of the University of Edinburgh.

With some Account of the Life and Writings of the Author, condensed from that written by Thomas St. Paul, F.R.S. Edited by James Blair, LL.D. Wm. Blackie & Co., Northumberland-street, London.

Imperial 8vo. cloth, extra, price 8s. 6d.

QUANTITIES MADE EASY.

A quick and accurate method of taking out quantities from plans of buildings, with or without a specification. Sent free by post for 50 stamps.—Address, A. C. G. Northbrook House, Brompton Ashlar, Lew. Kent, E.C.

CONTRACT, WORKING, and DETAIL DRAWINGS of every description; also Perspectives and Compositions.—Address, C. 47, London-wall, E.C.

COMPETITION, PERSPECTIVE ARCHITECTURAL, and ENGINEERING DRAWINGS prepared from rough sketches.—ADDRESS, "LA PALMETTE," 14, Argyll-street, Kings Cross, W. G.

COUNTY SURVEYORSHIP.—An opportunity is offered for the TWO COUNTY SURVEYORSHIP, with minimum salaries of 500l. and 400l. a year respectively, will be held in DUBLIN in NOVEMBER next.

The Examinations will extend over the four days commencing with NOVEMBER 2nd, and the five days commencing with NOVEMBER 16th, and will be in the morning subjects of which Candidates are at liberty to take up all or any, subject to a disallowance of marks for superfluous knowledge.—

Mathematics, including Geometry, Trigonometry, Algebra, Differential and Integral Calculus, and Geometrical Optics.	100
Mechanical Philosophy, including Statics, Dynamics, Hydrostatics and Hydraulics, Pneumatics, and Heat treated as a Branch of Power.	100
Experimental Science, including Inorganic Chemistry, Heat, Electricity, and Magnetism.	100
Geology and Mineralogy.	40

PART II.

Strength and other Properties of Materials, and the Calculation of Strains.	100
A. Railway and Canal Engineering.	140
F. Marine Engineering, including Harbour, Dock, Sea, and River Works.	140
C. Hydraulic Engineering, including Water Supply, Sewage, and Irrigation.	140
D. County Works, including Architecture, Roads, Drainage, and River Works.	140

Each of the groups lettered A, B, C, D, to include Diagrams, Engravings, Specifications, and the Mechanical notations connected with them; and Candidates who take up more than one of these have to engage in the practice of their profession on adequate works for a sufficient time, or have had in some other way satisfactory practical experience, and to submit specimens of their profession in some one of the branches thus indicated. Returns showing to whom candidates are desired forward, and later than OCTOBER 25, evidence of their age (which must be between 25 and 40 years), and of their professional training, to "The Secretary, Civil Engineers' Examination Board, London, S.W."

Further inquiries as may be necessary will be made by the Civil Service Commissioners, with regard to the age of Candidates, and also as to their health and character.

Dublin Castle, 2nd Oct., 1899.

TO BUILDERS, DECORATORS, &c.

CHILDREN, thoroughly experienced in House Work, Domestic Purposes, and holding in all its branches, may be OBTAINED at the House of 11, Marlborough-street, Bathing-place, Oxford-street. Work done by the day, hour, or job. Materials found if required.—Address, to the Proprietor.

TO ARCHITECTS &c.

GOOD WORKMEN can find long EMPLOYMENT at the New Asylum Works, Hereford.—Apply at the Office on the Works.

HALSTED LOCAL BOARD OF HEALTH—WANTED, a competent person to undertake the duties of SURVEYOR, INSPECTOR, and COLLECTOR, under this Board, at a salary of £100 per annum, to be in whole time to the duties of his office, and preference will be given to a person who has had experience in such duties. Applications to be made, and testimonials sent in to me, on or before the 30th of NOVEMBER next.

G. F. ARDEN, Clerk to the Board.

Halstead, Essex, 13th October, 1899.

TO BUILDERS.

WANTED, a Young and experienced BUILDER having from 2000 to 3000, at command, to join another in developing a well-wooded Estate on 1200 acres, with liberal advances will be made by the settler, and good houses are much needed.—Address, giving name, &c. to No. 1, 17, Office of "The Builder."

WANTED, an active and energetic Man as MILL FOREMAN and SALESMAN at a Timber Yard and Saw Mill in the country. All applications must be in own hand, writing, and give full particulars of former employment, age, salary required, and references.—Address, R. P. Mott, Luton, Beds.

WANTED, a FOREMAN, that has had great experience in Building Contracts Railing Walls.—Apply to the Jersey Railway Company, 81, Old Broad-street, London.

WANTED, a thorough, experienced PLUMBER. The situation is constant. The references as to ability, &c. may be undertaken by the settler. Some others need apply.—Address, stating wages, No. 003, Office of "The Builder."

TO POTTERY FOREMEN.

WANTED, Man, to TAKE CHARGE of an old-established POTTERY near London.—Apply, by letter only, stating terms, &c. to C. C. No. 25, Buckingham-street, Strand, W.C.

TO ARCHITECTS ASSISTANTS.

WANTED, immediately, a thorough competent ASSISTANT, well up in Gothic detail, and a good perspective draughtsman. Terms and full particulars to 50, Office of "The Builder."

TO DRAUGHTSMEN.

WANTED, immediately, for a few months, a Young Man accustomed to PLOT DETAILED TOWN SURVEY. Must be rapid and accurate plotter, and one able to ink in and point well preferred.—Address, stating salary (which must be in excess of 100) with copy of testimonials, and specimen, to EDWARD BROWN, C.E.S., Hampden-place, Halifax.

TO WORKING FOREMEN OF CARPENTERS.

WANTED, a good practical WORKING FOREMAN to take charge of the Carriage of a Large Job. He must well understand drawings, and be in every respect thoroughly efficient.—Apply, stating age, references, and salary required, to G. Fox, office of "The Builder."

TO PATENTS, GUARDIANS, and OTHERS.

WANTED, by the Borough Surveyor of Kidderminster, a PUPIL. Premium required.

WANTED, a thoroughly practical FORE-MAN of Millinery, who can make himself generally useful. Address, in confidence, giving age, salary required, and name of present or last employer, 59, Office of "The Builder."

WANTED, a SITUATION by a young Man who is thoroughly competent at the Machine of chain- or Chalk-line man. Will make himself generally useful if required.—Address, H. 35, Barbican.

TO ORNAMENTAL METAL MAKERS.

WANTED, WORK, for an ORNAMENTAL METAL WORKER in-charge, a MANAGER capable to undertake the best class of Millinery and Ornamental Work. A liberal salary will be given, but high qualifications required. Application to be made by letter, stating position, age, present occupation, &c. need not be made, but when called.—Address, H. V. 154, South Lambeth-road, London, S.W.

TO BUILDERS and DECORATORS.

WANTED, by a steady Young Man, a SITUATION, as a steady YOUNG MAN, or as a steady GRAINER. Is a good worker and has no objection to fill up time at painting; or would like the general home decorating complete by estimate. W. CRACKNELL, 257, Vauxhall Bridge-road, Finsbury, S.W.

BRIDGE, EMPLOYMENT by a respectable Young Man, aged 30, as GENERAL HANDY MAN, in Plumbing, Painting, Glazing, and Zinc Work. Well up in all the various jobs of the trade. Wages very moderate.—Address, S. S. 25, Glastonbury, Manchester-square, W.

TO BUILDERS and CONTRACTORS.

WANTED, by a young Man, 29 years of age, a SITUATION as CLERK or ASSISTANT to the above. Can prepare drawings, measure, and estimate. Is also a good scrivener. Would undertake the entire supervision of a small building.—Address, J. S. 7, College-street, Bond-street, Chelsea, S.W.

TO ARCHITECTS and SURVEYORS.

WANTED, by the Advertiser, a RE-ENGAGEMENT in an Office of the above. Age 25. Terms moderate.—FERGUSON, 76, Victoria Park-road, South 14th Square.

TO BUILDERS, &c.

WANTED, by a well-educated, active, and efficient Man, a SITUATION to take charge of the Machine of work being made in or out of kind of wood cutting machinery, such as lathe, &c. Day or piece. Could sit at the bench if required.—Address, MACHINIST, 5, Fetterick-place, Lower-road, Charlton, S.E.

TO BUILDERS and CONTRACTORS.

WANTED, a RE-ENGAGEMENT, as FOREMAN of WORKS or CONTRACTORS MANAGER. Has been employed in the above position for the last 17 years. Seven years experience in City Works. Age 37. Good references.—Address, H. T. 45, St. George's-road, Southwark.

TO BUILDERS.

WANTED, a RE-ENGAGEMENT, as WORKING FOREMAN (ex-paner and joiner by trade). Can prepare designs, working and detail drawings, and estimate. Has had extensive references to London builders and architects.—Address, L. F. 63, Long-lea-road, Peckham Rye.

TO BUILDERS, CONTRACTORS, and OTHERS.

WANTED, by a Man who has had the management of a very large job in London. Well acquainted with all the branches in the building trade, and thoroughly up to date in all its details. Has had extensive references to London builders and architects.—Address, L. F. 63, Long-lea-road, Peckham Rye.

TO ARCHITECTS and SURVEYORS.

WANTED, by an ARCHITECT and SUR-VEYOR, RE-ENGAGEMENT, temporary or otherwise. Eight years' experience. Terms 80l. per annum.—Address, No. 953, Office of "The Builder."

WANTED, by a Young Man, an EN-AGEMENT as IMPROVER in a Carpenter's Shop, in town or country.—Address, C. R. 37, Lilford-street, Finsbury, E.C.

TO ARCHITECTS and SURVEYORS.

WANTED, by a good DRAUGHTSMAN, a RE-ENGAGEMENT as ASSISTANT, in town or country. Accustomed to design, perspective, detail drawings, surveys, &c. Ex-est references. Good penman. Salary moderate. Age 32.—Address, 68, Office of "The Builder."

TO BUILDERS and SURVEYORS.

WANTED, by a thoroughly efficient MEASURING and QUANTITY CLERK, an EN-GAGEMENT either for the whole or part of the time. Is a practical man.—Address, Mr. Lambert, 62, Beak-street, E.C.

TO BUILDERS, &c.

WANTED, a SITUATION, by a good GRAINER and MARBLER, CHISSEL, and GENERAL DECORATOR. Willing to fill up time with any other branch of the trade, or take charge of work, if required. If required, give references. Wages moderate.—Address, L. E. A. 8, Cheek-street, Battersea, London.

TO BUILDERS and CONTRACTORS.

WANTED, a RE-ENGAGEMENT as TIME-KEEPER, or TIME and STORE KEEPER. Town or country. Good references.—Address, R. M. E. 13, Ranshaw-grove, Eltham Bridge, S.W.

TO IRONMONGERS and BUILDERS.

WANTED, by a first-class Hand, a SITU-ATION, at SMITH, BELLA-HOGS, GAS and HOT WATER FITTER. Age 35. Good references. Town or country.—Address, J. W. 32, Wellington-street, St. James's-park, H. A. W.

TO BUILDERS, PLUMBERS, and OTHERS.

WANTED, a SITUATION, by a first class PLUMBER and GASFITTER in all its branches, on iron light gilding. No objection to fill up time in painting, &c. Age 33. Wages moderate. Good references can be given.—Address, F. R. D. care of Mr. Appleton, 29, South Molton-street, Oxford-street, London.

WANTED, by a thorough practical Man, a RE-ENGAGEMENT as SHOP FOREMAN of JOINERS, who has had several years' experience. Willing to fill up time with any other branch of the trade, or take charge of work, if required. If required, give references. Wages moderate.—Address, R. W. 5, Clinger-street, St. John's-road, Hoxton.

BRIDGE, EMPLOYMENT by a CAPABLE and JOINER. Used to dilapidated. Has a good knowledge of plans, specifications, and accounts. Also jobbing generally.—Address, No. 125, at 10, Little Wimpoll-street, W.C.

WANTED to PLACE a BOY, aged 10 in the house of a PLUMBER and DECORATOR. Has knowledge of the trade. Town or country.—Address, J. S. 25, Glastonbury, Manchester-square, W.

TO BUILDERS and PLUMBERS.

WANTED, by a good PLUMBER, a JO-BER or Piece-work. Well experienced both in new and old work. Can do plain gas and zinc work. Understands pump work. Town or country.—Address, A. B. C. 2, Thomas-street South, Chancery-lane.

TO BUILDERS, PLUMBERS, &c.

WANTED, by a sober, steady Married Man, aged 31, a constant SITUATION as JOB, as a thorough practical PLUMBER, GASFITTER, and ZINC-WORKER. Willing to fill up time with any other branch of the trade, or take charge of work, if required. If required, give references. Wages moderate.—Address, J. W. 5, Clinger-street, St. John's-road, Hoxton.

TO BUILDERS and CONTRACTORS.

WANTED, by the Advertiser, a SITU-ATION with the above. Has had eight years' experience, and has a good practical and theoretical knowledge of the trade. Will apply to G. H. 35, Vauxhall-bridge-road, S.W.

The Builder.

VOL. XXVII.—No. 1394.

Notes on Church Organs.

CERTAINLY the most proper and advantageous method of placing in a church so large and important a piece of furniture (if it may not be rather called an erection) as the organ, so that the different desiderata of safety to the instrument, adequate dispersion of the sound, and satisfactory architectural effect, may be equally provided for and attained, is, or ought to be, an important point for the consideration of church architects. Unfortunately the architect's difficulty by simply erecting too often gets over it alone. He knows that there is to be an organ placed in the church which he is designing (unless it be for one of those sects who hold "all such as handle the harp and the organ" in reprobation), but he contents himself with marking off a certain space on the plan as "organ-chamber," or "organ-gallery," as the case may be, without any inquiry as to the space required for the instrument, or the conditions under which it will sound most effectively; and it is generally not till the church is completed that the unhappy organ-builder, who may have been commissioned to place a large and valuable instrument in it, discovers that he is restricted to a space quite inadequate for the convenient arrangement of his mechanism, and a position where the finest effects of his instrument will be muffled or distorted, and where even the safety of its delicate mechanism may be seriously endangered. And considering that a good organ costs a large sum of money, and when put up is expected to last a long time (according to the German builders, a first-class organ, under proper care, should last four hundred years), it would be well if architects would give a little more consideration to the subject.

With regard to the best acoustic conditions for an organ, the most important are that the pipes should not be too much crowded together internally, and that the organ should have as much free space all round and over it as possible. If, for economy of space, the pipes are densely packed, the sound of those at the back has to struggle onward through a formidable barrier, besides that there is danger of the pipes interfering with one another's sound, "sympathising," as the organ-builders term it. And if the organ is hoisted up in a confined recess, the effect will be not only to muffle and obstruct the sound, but to destroy the balance and proportion of the different parts. This will be particularly felt with the louder stops, those pipes which happen to be near the front will be heard harshly, and with undue prominence, while others at the back of the recess will be comparatively lost. It is only when an organ has a large space round it, plenty of breathing-room, that a really grand effect can be obtained from it; and the reason nearly all cathedral organs sound fine is, not that they are a very superior class of instru-

ments (in some cases they are much the reverse), but that the sounds have space to develop and blend together into a total effect, in which any little roughnesses and inequalities of individual pipes are lost and submerged. But the fashionable method, which seems to be adopted by architects with one consent, and as a regular custom, of placing the organ in a sort of recess adjoining the chancel, called the "organ-chamber," is positively the very worst plan that could be adopted. There is generally a roof close over the top of the pipes, so that all the sound is driven down again the moment it is produced; and the tones of the louder stops, especially of the "reed" class, which are intended to be heard at a due distance, homard the ears of those near them in a most disagreeable manner, while from those further off the whole effect is deadened by the interposition of a wall or a massive pier; and as the organ-chamber is always put close to the choir seats, the organist has only a choice of evils: he must either play so loud as to be very distressing to the ears of his choristers, in order to be heard in the church; or, if he "aggravates his voice" so as not to incommode them, his accompaniment will probably be inaudible to the congregation. On acoustic grounds, the old west-end gallery, when not placed too high up, was far better than the organ-chamber in vogue at present. Then this chamber is almost always made too small for the convenient arrangement of a large organ; consequently, not only are the pipes crowded together in the detrimental manner before mentioned, but the mechanism has also to be fitted in so closely that scarcely any room can be left for the ready inspection of every part of it, which is absolutely necessary if the organ is to be kept in proper order, but is in the case of many church-organs next to an impossibility, in consequence of the close packing which has been resorted to in order to fit them into the meagre space allotted. Proper tuning is also rendered much more difficult, as very often some of the pipes cannot be got at without displacing others, which should never be the case; for, in addition to the loss of time, it is very bad for the instrument that the pipes should be handled and pulled about in this fashion.

The one advantage of the "chamber" system over the gallery is that it brings the organ near the floor, which is always a gain to its effect, as the sound travels very much upwards, and the larger pipes, too, gain great additional sonority when in contact with the floor of the building, which then becomes to them very much what the body of a violoncello is to the strings. Those who have to place an organ in an organ-chamber already built will find it an advantage to excavate as low as may be done with safety, cementing the bottom and sides below the ground line; the bellows will then go into the space thus formed, and the pipes above can stand proportionately lower, and thus have a better chance of speaking out. The best position for the organ, both acoustically and architecturally, would, in fact, be on the floor at the west end, where it could be designed, if necessary, in two towers at each side of the west window, the lower portion in the centre under the window. In a church where the singing was intended to be entirely congregational, this would be the best position on all grounds. But where there is a choir it seems imperative that they should be at the east end in sight of those whom they are to lead, and equally imperative that the organ should not be far from them. In this case we would place the organ in the transept, if not a very deep one; or, if there be no transept, against the south wall of the nave, on the floor if possible; or, if seat-room be valuable, in a hanging gallery against the wall, placed no higher than is just necessary to keep it out of the way of the congregation. In neither case would it be so far from the

choir as a cathedral organ commonly is, and being between choir and congregation would be equally audible to both. It is best, however, not to place it close against an outside wall; still less, as is often done, between two, or even three, outside walls. Every change of temperature affects both the tuning and the mechanism of an organ. In heated air the pipes sound sharp; in a colder air flat; consequently no large gas corona should be placed near the organ, unless it be so high above it as not to affect the air immediately around the pipes, otherwise the result will be that the organ may be in perfectly good tune at the morning service, and out of tune at the evening service, when the gas is lighted; the larger pipes which rise into the stratum of heated air of course feeling its effect in a different ratio from the smaller ones. Every precaution should be taken to prevent damp from getting to the instrument, and to neutralise as much as possible the effect of atmospheric changes, which is sometimes disastrous. The internal mechanism is of a more delicate description than most persons who have not had to do with organs are at all aware. It consists mainly of carefully-finished woodwork; and the connexion between the keys and the valves or "pallets" which admit the wind to each pipe is effected by long strips of wood called "trackers," of a section of about $\frac{3}{4}$ in. by $\frac{1}{2}$ in. Under the influence of cold, of course, these, when of any length, contract, as many an unfortunate organist knows who comes to his church on a frosty morning and finds half a dozen notes "ciphering" (i.e., speaking without being asked), the pallets having been pulled open by the shrinking of the trackers. As to damp, a very little of that will throw the whole mechanism out of working order, the swelling of the wood causing the action to bind in various places. These hints will sufficiently indicate the necessity of providing for the safety of the instrument against damp and barometrical change. If necessarily placed against outside walls, these should be built with a cavity. The organ should not be near an outer door, and any window that may be in close contiguity to it should be double glazed. Provision should also be made for a small gas-stove, either close to the organ, or, what is better, inside it, by which the temperature can be regulated and adjusted, and which will also serve to counteract the effects of a damp atmosphere in rainy weather.

As to the architectural design of the organ, people will follow their own predilections; but it may be observed that the design of the organ may be made to harmonise with the general design and plan of the building to a far greater extent than is usually the case, if the subject be made a matter of forethought instead of afterthought. Indeed, if the precise contents of the organ can be determined on beforehand, it may even be made to appear as an integral part of the edifice, standing on a surbase of stone or marble, or stone with marble shafts or dressings. It has become customary to use the larger diapason pipes as the principal constituent of the "front," and this is certainly the cheapest way of producing an effective appearance; but it is not altogether without its drawbacks, as the pipes in this case, instead of standing in their natural position on the soundboard, have to be "conveyanced off," as it is termed, the wind being taken to them by supplementary tubes called "conveyances,"—a plan which naturally renders the pipe less prompt in speaking, and increases the chance of leakage of the wind before reaching the pipe. Whenever the pipes are so used, the larger ones should be placed at the sides, and the smaller ones in the centre, as they are thus nearer their "wind," and require shorter conveyances; for the system of arranging pipes on the soundboard is always (except in very small organs) to place the large pipes at either end alternately, the

low C standing at the extreme left, the "C sharp" at the extreme right, D on the left, "E flat" on the right, and so on, the smallest being in the centre. Were the pipes arranged on the sound-board in the order in which they sound, all the large pipes forming the bass placed at one end, the effect would be to suck away all the wind from the little pipes at the other end. At the same time care must be taken, in arranging the front pipes, not to bring the smaller centre ones too close over the head of the player, as the wind, passing over the lip of the pipe, produces a whistling and hooting, when in close proximity to the ear, which becomes an intolerable nuisance in pipes from about 4 ft. length downwards, besides preventing the player, when he is using those pipes, from hearing the other portions of his instrument, and knowing properly what he is doing. We have known cases in which it has been found necessary, after the organ was built, to put up a very unsightly projecting screen over the head of the organist, in order to shut out from him the noise of the diapason pipes in front. Besides the large metal pipes which are commonly made use of ornamentally, the architect may avail himself of the large square wooden pedal pipes, which are generally placed at the extreme opposite sides of the instrument, and may, if panelled, painted, or otherwise decorated, form an appropriate side finish to the case. In the great organ at St. George's Hall, Liverpool, the late Mr. Cocke-rill availed himself of these wooden pipes in a striking manner, placing the largest of them, with ornamental heads, in a semicircle round the back of the instrument, where they form the best feature in a design otherwise a good deal wanting in unity and simplicity. We are decisively of the opinion, too, that where the pipes are need in the front design, some kind of decorative finish should crown them and conceal their tops: the prevalent fashion of leaving them to stand nakedly up, a row of cylinders truncated at different lengths, is simply a barbarism; and so also is the habit of splashing them over with all manner of colours like a display of fireworks. Indeed, if the diapason pipes are made with a good proportion of tin, they will often have the best effect if left unpainted, and with merely a little well-considered decoration round the mouth of each pipe.

The complacent manner in which the "organ-chamber" arrangement has been accepted is due perhaps partly to the fact that a large proportion of church organs are now turned out in a sort of wholesale fashion, of no great size, and of such similar arrangement and make that a chamber that will do for one of these regulation organs will do for any of them; indeed, one very large firm has been accused of making its smaller church organs in lengths of 300 ft. at a time, and cutting off as much as is wanted by each customer; and country churches, too, have been overrun with things called "Scudamore" organs, consisting of one keyboard and three or four sets of whistles,—things which are the abomination of desolation, standing where they ought not. It should be remembered that an organ is really nothing unless it attains a considerable size, and that every properly-laid out large organ will have, or should have, its own individuality, and its own peculiar characteristics, which require to be duly provided for. In the case of an organ standing free against a west end or transept wall, it is well not to spread the instrument out laterally to too great an extent, as the two sides will be unequally heard by those in its vicinity. It is possible, at a little extra expense, to place the keyboard so that the organist may sit with his back to the instrument and facing the choir; the "tracker" movement being carried under his feet. The mechanism requires a little extra care, but the advantage of the player being able to see those whose singing he is accompanying and supporting, is obvious. All certains and staff hangings near the instrument are disadvantageous, they tend to absorb the sound. On the other hand, in a large edifice, curtains and such things dispersed about the building have a beneficial effect in densening and reducing the echo; the dresses of the congregation conduce to the same effect. It is an absurd superstition with those who do not know much about the matter, that the effect of an organ is improved by an echo in the building. On the contrary, there is no instrument to which the absence of any marked echo is so important. The sound of an elaborate piece of music played on an organ in a place with a redundant echo, is rather like the effect of a pen-and-ink drawing made on

blotting-paper; all the outlines are blurred and confused. The position of the instrument should be calculated for a perfectly clear definition of all the sounds that issue from it.

THE SLADE ENGRAVINGS AT THE BRITISH MUSEUM.

The British Museum, on re-opening, after its very brief and well-earned "close time," presents its visitors with three important additions to its visible treasure. Of these, the most imposing, at all events in point of magnitude, is the collection of antique marbles;—alas! for the most part fragmentary, from the famous mausoleum, or sepulchral monument of Mausolus, in Caria, which is now being arranged in the hall adjoining that occupied by the Elgin marbles. The second is the very rich collection of Arabic and Venetian glass, lamps, pottery, gems, and cognate objects, forming part of the bequest of the late Felix Slade, which is to be found near the cases containing the objects collected by Sir William Temple, in the Vase and adjoining rooms. The third, to which we propose to introduce our readers, is the small but highly valuable collection of engravings, also bequeathed by Mr. Slade, which are admirably exposed to public view on a dozen screens, in the King's Library.

The historic progress of the art of engraving is represented by the prints here grouped together in a very striking and instructive manner. The catalogue is not yet prepared, and the great defect of most public exhibitions,—the absence of well-digested and really instructive labels,—is a sad drawback on the value of this exhibition to the public in general. We trust that the catalogue will be so drawn up as to give the fullest reliable information with regard to each engraving (which may be done in but few lines), and that extracts from this document may be affixed, in the form of printed labels, in each instance. There are rather more than 350 engravings, of the Italian, Dutch, German, and English schools, commencing with proofs from some of those early *nielli* which appear to have been the grandfathers of all modern incision on metal with a view to reproduction on paper. Such, indeed, was not the object of the workers in *niello*, who in fact did little more than transfer to the more appropriate medium of metal the method of pictorial representation, by a mixture of incision and colouring, which is as old as the Theban tombs, and which had been gradually brought to so high a state of perfection by the Etrurian, the Magna-Grecian, and the Grecian potters. But the admirable sharpness and beauty of the proof that can be "pulled" on paper from a fine *niello* is evident from an examination of some of the specimens in the first case. In one, a female figure is seated in a chair, and heet by a rabble rout of satyrs and dancing figures, recalling the description given by Milton of the Lady in "Comus." Another is an Arabesque design, including masks, satyrs, and griffins, of extreme delicacy and freedom of touch.

Italian art is but poorly represented in the collection. The name of Baldo Baldini is one of the earliest that occurs. There is a group attributed to Andrea Mantegna,—a portion of the triumphal procession on the Arch of Titus, commemorating the capture of Jerusalem,—which, though somewhat rough and hurried in drawing, and especially in shading, has all the characteristic dignity and life of the master in question. Of Marc Antonio Raimondi we have a noble design of David, with his sling in his hand, and the head of the fallen Goliath. A pendant to this fine engraving may be selected from the classical subjects of the same artist, in a graceful standing figure of Apollo with his lyre. There is a very careful and, apparently, truthful portrait, in profile, of Michelangelo, by Giulio Bonasone, in which the dilapidated bridge of the great sculptor's nose (the *fon* handiwork, according to Benvenuto Cellini, of that same Torregiano who executed the monument of King Henry VII. at Westminster) is disastrously apparent. An extremely spirited battle-piece, by Marco Dente da Ravenna, is another admirable product of the Italian school of engravers.

German artists, working either in their own country or in England, have contributed more copiously to the collection, and it can hardly be disputed that the finest, as well as the most numerous, specimens bequeathed by Mr. Slade are thus of German origin. Among these the

attention of the student will be arrested by a group by Martin Schongauer, hearing the monogram M + S, representing Christ and the Virgin, each wearing a lofty and overshadowing crown, with a sort of window interposed between them, filled by a glory of angels. The death of the Virgin, a quaintly crowded, but very boldly designed picture, is also marked by the same signature. The Madonna lies on a large bed,—a four-post bed, it ought to have been, but two of the posts are omitted,—and one of the curtains at the foot is looped up to the tester, in order to leave room for the twelve apostles, who crowd around the moribund figure. The Virgin's face is, in accordance with the Romish tradition as to her actual age, far more youthful than is generally represented to be the case at so late a period, comparatively speaking, in her life. St. John the Divine is placing a taper of formidable dimensions in her hands. Another large taper is fixed on a pricket candlestick near the foot of the bed. The apostles are all barefooted, and clad in the monastic garb. One holds a tremendous processional or pastoral cross. Two are reading, prayers out of an illuminated missal. One is coming in to the apartment with a bronze *scara*, or hocket, in his hand, the attachment of the handle of which is adorned with a goat's head and horns in relief. The expression of grief and reverence on the face of one of the apostles, probably intended for Peter, which is turned towards the spectator, to the left of the picture, is wonderfully real and impressive. Near this crowded scene should be observed a single figure of a crowned female with an open book in her hand, adorned with floating hair, of extremely delicate execution. A companion to this engraving may be found in that of a female bearing a scatheon, on which is blazoned a salient horse. There is also a descent into Egypt, hearing the monogram M + S, in which five little angels are clinging to the shoots of a palm tree, in order to weigh down the clusters of dates and bring them within the grasp of Joseph.

A most extraordinary mixture of piety and of heraldry, or rather an attempt to bring before the mind the incidents of the Passion under the disguise of the science of hiszory, bears the monogram C. S., and is attributed to "the master, of 1466." An esontheon, bearing the instruments of the passion, is borne up by supporters of no less dignity than the Saviour and the Virgin, aided, after a manner not altogether unfamiliar to the French heralds, by the four Evangelic beasts. The Paschal Lamb and the sacramental chalice are depicted below, in the place occupied in English hiszory by the scroll for the motto. The eagle and the winged bull and winged lion below them. The vined helmet (in Continental heraldry it is not ordinarily placed full face, as in English representations of the crown of a sovereign) is encrowned by the crown of thorns, and bears, as a crest, a dextrocheir, or arm with the thumb and first two fingers extended, in the form peculiar to the act of giving the sacerdotal benediction. The wafer, charged with a cross, is behind this open hand. It may be remarked, *en passant*, as not generally known, that the badge of the Jewish priests, or what Christian heraldry would call the crest of the family of Cohen, is a pair of hands joined as if in prayer or in benediction.

Two figures in clouds to the right and left, in the corners above the group, are altogether non-heraldic. The shield is made to assume the appearance of some of those crowded and paltry Italian coats of arms on which the severe taste of French heraldry works with so much contempt. The cross, occupying the centre, quarters the field. On the dexter are to be seen the spear, the ladder, the kerchief of St. Veronica, with the miraculous portrait and the scourges. On the sinister, are the hammer, the nails, the pillar, the rods, the reed and sponge, a bucket or *scara*, and three heads in profile, one surrounded by a nimbus.

A remarkable plate, by Israel von Meilman, represents the delivery to Judas by the High Priest of the thirty pieces of silver, the price of blood. The scene appears to be laid in the Temple, but the artist commits the strange outrage on a well-known peculiarity of Jewish custom of making the traitor uncover his head before the priests. He is removing his cap with a sort of cringing, clumsy, bow. A pricket candlestick does duty in the sanctuary, and a tabernacle or ark, something similar to that made use of in Jewish synagogues, is inscribed in front, with some very orthodox-looking letters,

which, however, on inspection, turn out to be neither the square Hebrew character familiar to the Oriental scholar, nor the Phœnician, still to be found at Nabona. In the distance is represented the scene in the garden.

Near this quaint but striking engraving, is an entombment, by Albrecht Glockenton, in which seven figures take part, one of whom, with his back partly turned towards the spectator, has a pair of pincers stuck in his girdle. The expression of grief in the countenance of one of the Maries is very truthful and touching. In the extreme distance, on a low, bleak hill, a cross, with a ladder reared against it, stands out from the misty horizon.

The grand name of Albrecht Dürer is illustrated by twenty-eight engravings, including some of the most famous and well-known of the productions of this vigorous artist. Among these are the celebrated pair of satyrs, one displaying a lion, with a cock for the crest, which does all but crow, and the other, adorned by a skull, and held by a richly-draped female, to whom a weird and goblin old man, with a shock of twisting and curling hair that is a picture in itself, is offering very pressing attentions, not, it would seem, altogether *invita Minerva*. A little group of three boys, playing on musical instruments, almost recalls the *amorini* of Il Fiamingo. The extraordinary design, now well known by its multiplication by photography, of the mounted Knight and Death (the origin of the tale of "Tristram"), is represented by a very fine impression. A Temptation, and the appearance to St. Hubert of the miraculous stag, are among the most beautiful specimens of this valuable series. A little frieze of *amorini*, marked with the monogram J. B., should be compared with the three little musical lovelets of the German master.

Wenceslaus Hollar has executed a Dance of Death, the delicacy of the execution of which may be advantageously compared with the hold, firm touch of Kaulbach. From the arabesque framework which surrounds each scene the little series appears to have been designed to illustrate a book. The first plate represents the Temptation. In the next, which is the Expulsion from Eden, one skeleton is making an unwelcome companion, running side by side with Adam and Eve, while a second, brimfull of delight at the prospect of a rich harvest for the sycote of Death, is at the same time dancing before the group, and playing merrily on the fiddle,—appropriate music for that wild march! In the third plate the same rueful visitor takes a part in the tilling of the earth by the sweat of the brow of man, while Eve sits by, tending her hounding children, and industrious in the use of distaff and spindle. Then follows, with the motto "*Moriatur Sacerdos magnus Josue*," the approach of Death to a throned figure, wearing the triple Papal crown. Cardinal Death, duly hated, stands near among other ecclesiastics. "*Percediam pastorem*" applies to the visit of Death to a bishop. "Woe to him who justifies the wicked for a reward" is illustrated in a method for which the Congregation of the index would have shown master Hollar small consideration, had he given them the chance, by a cardinal selling a pardon. "*Principes induitur merces*" is the motto to the message of Death to Hezekiah. "Woe to those who walk in pride," and to the "women who are at ease," are two other examples of the unwelcome intrusion of the grisly visitor. The plumed head of a figure on the last plate of the series is as imposing as that of the King in the *Cotes Drolatiques*.

With the grim satire, and delicate workmanship of Hollar, may be compared the figures of a not altogether dissimilar series, that of the Seven Deadly Sins, by Jacques Callot. It is painful to be compelled to add that most of these highly improper personifications are made to look rather attractive than otherwise. *Invidia*, indeed, with a snake in her holy grasp, and a filthy dog at her feet, and a microscopic devil in the air tugging at her hair, is disgusting. *Avaritia*, with a hoisted toad and a money-bag, is not much better. *Ira*, with sword and shield, and a lion for attribute, is spirited enough. *Gula*, attended by a gluttonous hog, bearing a hotted case in wicker, and a cup, is attended, like her sisters, by a flying little devil. *Pigrity*, is reposing on an ass, which is also reposing, and is attended by a seated demon. *Superbia* has a mirror and a peacock, with a flying minister of Evil; and *Luxuria* is a beautiful female, scantily draped, with a sparrow on her fist, a goat by her side, and a familiar imp gently combing one of her long and floating locks.

From this homily of Callot we pass to the sordid and vulgar life which David Teniers and Adrian van Ostade have rendered immortal. Twenty-eight engravings illustrate the works of Rembrandt. There is the well-known appearance of the angels to the shepherds, and the flight of the terrified rascals from the "glohe of circular light." Then follows the honour paid to Mordecai, by a grotesque and disconsolate Haman. A fine engraving of a man giving a sheaf of arrows to a youth recalls the story of David and Jonathan. Next is the hospitality of Abraham, in which the low Dutch character given to the glorious angel guests, one of whom is positively bald, can only be termed disgusting. The same expression must be applied to a scene in which Barabbas is made the central figure, a low vulgar ruffian, standing in relief against the dark shadow of a doorway, with Pilate attired in a voluminous and spirally-formed turban, and hearing a long rod, on the one hand, and HIM, to whom the people preferred Barabbas, on the other.

Pilate's wife is visible at a window. The figures and faces of some of the rabble are very characteristic. It is impossible to look at this, and indeed at many other of Rembrandt's groups, without coming to the conclusion that this great colourist came to grief in his drawing in a manner not uncommon in the case of children when first using the pencil—namely, making the head, and upper part of the figure, so much too large for the space there is to occupy, that the legs have a large parenthesis cut out of their dimensions, and the figures are squinted not as Dutchmen are equal, but with the impossible proportions of ill-designed dolls. A youth hearing the ewer of water to wash the hands of Pilate, and several other figures, require holes to be sunk in the pavement of the *person* to accommodate their feet—if they are to be supposed to have feet at all.

Again, we have the engraving of Philip and the Eunuch, one of the same grotesque illustrations of sacred story. An engraving of a solitary tree, shown dark against a light background, gives the wonderful *Chiaroscuro*, in which Rembrandt was altogether unrivalled, without the countervailing coat of proportion that characterises most of his figures. There is an admirable scene of a man giving alms to two beggars and a child, a fine impression of the Alchemist, and by far the finest work of the series, a portrait of the artist himself, at a period of life intermediate between those which date the two portraits in the National Gallery.

The names of Van de Velde, Antony Waterloo, Theodors Stoop, Nicolaas Berchem, Joannes Brengel, are all illustrated by fine specimens of the art of the engraver. Antony Vandyk, among some superb etchings, or half-printed engravings, which are by far the most noticeable works in the collection, has a curious portrait of Titian and a Lady, illustrated by an Italian verse, which it will better suit English decorum to leave untranslated. We have passed by the names of Lucas van Leyden, of Ieronimus Wieser, and of Heinrich Goltzius, the latter of whom has executed a very fine head of King Henry IV. of France; and the second, one of that great king's evil genius, Henrietta de Balzac d'Autringes.

Among the engravings of Wenceslaus Hollar are two which possess unusual interest for our readers. One of them is a view of London in 1644, with the Gothic nave and tower of St. Paul's Cathedral, here of its eighty-fathom spire, rising proudly over the City, the bridge laden with horses, and furnished with two draw-bridge openings, and forty-four other churches, palaces, and buildings of importance indicated by numerical references. The designer of the view, which is one of great historic interest, addresses his purchasers in verse, concluding,—

"London, the glory of Great Britain's Ile,
Behold her Landskep here, and tru Pourraile."

The companion print is one of the interior of the Royal Exchange, which is filled by a disproportionately numerous crowd.

We must not omit to mention a pair of engravings by the same artist, hearing the date 1651, in one of which is represented King Richard II., meekly kneeling on his knees, while to his left stand St. Edmund, with an arrow in his hand, Edward the Confessor, holding a ring, and John the Baptist, whose raiment of camel's hair contrasts with the royal robes of his brother saints. In the pendant is represented the Madonna, accepting the prayers of the king; the most noticeable feature in the design being the dense and lofty palisade which is formed in

the background by the pointed wings of the attendant angels.

From the school of Rembrandt we pass to a screen containing twelve engravings, which even when seen together with so many specimens of unusual excellence in the art, assert an unquestioned superiority in certain details of execution. In the whole collection there are no prints which so much resemble paintings,—which have so much the effect of actual colour,—as those of Johan Georg Wille. Most of those here displayed are too familiar to all amateurs of engraving to need description. "The Satin Gown," "The Boy blowing Bubbles," "The Tricoteuse," "The Boors Smoking," "The Girl Scrubbing a Porringer," "The Singing Party," "The Fiddler," "The Madonna with the Bambino," "The Girl with a Sparrow," "The Schoolmaster," and "The Old Woman with a Tulip," are here,—no one of them representing a truly noble or beautiful subject, and yet each unsurpassable in its method of rendering the subject unfortunately chosen by the artist.

The name of Thomas Cecil is annexed to a fine portrait of the Black Prince, which has every appearance of being an accurate likeness. It bears a strong resemblance to the more generally known features of the martial Edward III. We are told that the impressions "are to be held by Roger Daniel at ye Angel in Lombard Street," and informed further that—

"The terror of his fights the Black Prince won
The name of Black, not his complexion.
This to his deathless memory be erected,
And to famous archery too much neglected."

Five English portraits, by Simon, Crispyn, and Willelm van der Passe, occupy the next screen. One, by the second of these artists, of Queen Elizabeth, with the motto, *Posui Deum adiutorem meum*, and the legend, giving the date of her death in the artificial form, *mortua anno MISERICORDIE* (the large letters signifying the year), should be compared with a finer and younger portrait, by an anonymous artist. A portrait of James I., dated 1621, with Prince Charles standing by, by Willelm van der Passe, is very noteworthy, and gives an admirable physiognomical study of the vain and cruel pedant, with signs of hope and promise in his ill-fated face. Robert White has engraved George, Earl of Cumberland, K.G., with his armour, and even the handle of his lance, powdered with gold stars. W. Hole has produced a fine figure of a knight holding a rod or pole, as if about to strike at a mark. The large folio-sized portrait of George Villiers, Duke of Buckingham, with flowing hair, and profusely-strung collar of pearls, by Willelm Jacob Delf, is positively superb.

The eleven engravings by W. Hogarth do not include the best productions of that artist. Among them are the well-known portraits of Wilks and of Lord Lovat, High Life, the Times (in 1762), and the four plates of the Election. There is a fine portrait of Bishop Hoadley, by Bernard Baron, and we then come to the admirable mezzo-tinto engravings of the most celebrated portraits by Sir Joshua Reynolds, which are for the most part the work of John Raphael Smith. Among these are the Honourable Mrs. Stanhope, Lady Catherine Pelham Clinton (a child feeding fowls), and the Banished Love. Roxalana is engraved by Dankarton; the Strawberry Girl, and Barbara, Countess of Coventry, by Thomas Watson.

King Charles II., Fairfax (spelt Farfax), Sir William Paston and Lady Paston, are fine portraits, engraved by William Fairbairn, cir. 1659. The last case contains vignettes by Bartolozzi.

It will be seen that the collection is one of great artistic and historic value. It should be added that one great characteristic of the series is the rare excellence of almost every print. None but good copies appear to have been purchased. The mounting, in simple cardboard mounts, with the engraver's name alone distinctly printed, is worthy of the engraving, and the plain locked case allowed to each engraving leaves nothing to desire in the way of preservation and accessibility. The Museum is to be congratulated on this great acquisition; and so is the public.

Holborn Viaduct.—The New Viaduct is now open for foot passengers. It will be formally opened by her Majesty on the 6th of November, together with Blackfriars Bridge.

BRADFORD TOWNHALL COMPETITION.

The authorities in Bradford have at length been seized with the townhall mania that has raged with such virulence of late years, in this part of England especially. They made a stonemason's resistance against the malady approaching a crisis, but it at length got the mastery, and, as we now see, has broken out in an architectural rash, that will lead to a heavy doctor's account, and, we hope, a good condition of things afterwards. The patients seem anxious to stipulate as to the amount of the medicine bill, but we fear that, as is often the case in such architectural eruptions or surface diseases, they will be liable for something more than they propose to pay. It is quite true, too, that the corporation got through this "liability of youth," for the longer it is delayed the more dangerous, that is, expensive, it becomes. Her sisters, Leeds, Halifax, Rochdale, Chester, &c., have pulled through with comparative ease; while Manchester, who waited so long, has had to pay dearly now that her time has come. It is the more surprising, too, that Bradford has resisted the "soft impeachment," until the present moment, as so much good architectural work has already been done in and around her, and so much more is promised for the future. Considering the close affinity that exists between the Scotch and Yorkshire characters in their love for "filthy lucre," and intimate knowledge of its full value, a stranger arriving for the first time in Bradford is unexpectedly gratified to find the streets so well stocked with good specimens of architecture.

Sidney Smith's remark respecting Scotchmen and humour may be very aptly applied to Yorkshiremen and art,—something approaching the severe character of a surgical operation being requisite in both cases, with this difference, however, that after the surgeon has done his duty on the Yorkshireman, the result will be lasting and perfect.

Either the honour of his town, the desire to be considered liberal and wealthy, which in America induces so many to submit to double taxation by returning their income at twice its real amount, or the advantage they expect from a stately building serving as an advertisement, by causing them to be generally talked about, may be the motive; but the result is the same, and beneficial both to the town and the profession; it should not therefore be too closely examined, but the fact itself "received with thanks."

The intentions of the Bradford Corporation to build a Town-hall were made public in May last. About 400 applications for instructions were received by the town clerk from architects in all parts. These rules and requirements were found to be so unsatisfactory in many respects that letters of inquiry and explanation passed in great numbers, until at last the different points of the instructions were so modified that the competitors were virtually told that they might do just as they liked. This was enough to raise suspicions in the minds of many, and it was further increased by a letter asking architects what amount of space they required for the hanging of their drawings, having a number attached to the form to be filled up and returned, thereby affording a clue to the ownership of each design, all being required to appear under motto only. The result of all this was that of the 400 applicants only about thirty were trapped, and we shall see below how effectually their wings were afterwards clipped. "In vain is the trap set in the sight of any bird," this has been very markedly illustrated in the present competition, as nearly half of the competitors come from London, and others from a still greater distance, Leeds and Liverpool being slightly represented, but Manchester and Halifax being "conspicuous by their absence." Putting out of the calculation the local men, the numbers of the competitors increase according to the inverse ratio of their proximity to Bradford. The reason being that the further they were removed the less they knew of the "family feeling" of the Bradford "good folks." There was an old rule that if any thing good chanced it was to be kept in the family. What a "happy family" must this one be when all the plums are given to its own children irrespective of good behaviour. This seems still to be in force in the case of architectural competitions, although in cases such as Government examinations the value of patronage has been greatly lessened.

It is a remarkable fact that such a small percentage of the applicants submitted designs, as in the case of Manchester, Bolton, Chester, and

even for the small hospital at Rotherham, a quarter, or even a third, of the number put in an appearance. The cause of their "backwardness in coming forward" is not to be found in the amount of work that is at present inflicting the profession, for whatever may be the case as to a few of the great guns, the "minor cannons" have scarcely a "shot in their locker."

The corporation having received the designs, stowed them away in three rooms, one over the other, in an empty building near the intended site, known as Gath's warehouse. The mode of arranging the designs, especially those that were intended for the prizes, was very good, being similar to that adopted at Lincoln's Inn for the "Law Courts" designs. There was an attempt at placing these plans according to their supposed quality, as the curator informed us that those in the top room were scarcely worth looking at; but in this we certainly cannot agree with him. The councillors next proceeded to go through the ceremony of selection, which they had in all probability done some days or weeks previous to the receipt of the plans, and straightway voted the first prize, or the execution of the building, to Messrs. Lockwood & Mawson; the second, or 200*l.*, to Messrs. Milnes & France; and the third, or 100*l.*, to Mr. Samuel Jackson, all of Bradford. There was a very pretty bit of innocent hy-play at the opening of the sealed envelopes after the announcement of the awards, calculated, however, to deceive few, for when the mottoes and names of the first two had been declared, the third design, marked "Gablet," was said to have no known author.

The first premiated design, by Messrs. Lockwood & Mawson, under the motto, "Let Bradford flourish," is the most elaborately set forth of any in the collection, and is illustrated by six beautifully drawn exterior and interior views, coloured in sepia with great artistic feeling, and one external view cleverly worked in pen-and-ink. The elevations and section, only one longitudinal, are executed in brown ink; the sectional portions, corresponding with the plans, are filled in with black, a contrast to the brown lines that is too severe and crude.

Fortune has treated Bradford much better than might have happened, for the plan that accident has thrown in her way, *bon gré mal gré*, is one of the best in the collection, both in arrangement and architecture; but the fickle lady has taken her revenge in the character of the second and third designs, which appear to be selected on the principles of extremes meeting. The nature of the proposed site, as to the advisability of adopting which so much has been advanced *pro et con*, in the local journals, is very peculiar. As to its general position and character, it seems suitable on the whole. In shape it resembles the sole of a hoot of the late fashion, the rounded end or heel facing Leeds-road, and the toe, across which a new street will run, Great Horton-road, the north side Market-street, and the south side Chapel-lane and Norfolk-street.

In addition to the principal plan, which is completely worked out to fit the Gothic design, an alternative for the first floor, showing a different position for the borough court, but not nearly so good as the original, is submitted, arranged to suit the Classic design, which is as inferior to the Gothic as are their respective plans, along with some minor "revisions of separate parts, such as prisoners' cells, &c. We will, however, content ourselves with describing and commenting on the original plan only.

The basement, although required for little more than cellars, is well lighted and convenient, with the exception of the entrances, which, though forbidden in Market-street, might with advantage be more numerous in the remaining streets. We may here remark a defect in the preparation of the drawings, viz., in the colouring of the floors, they being all of one tint, instead of having the rooms belonging to each department tinted differently from those of another, a method that would have greatly assisted in reading the arrangement of parts. As to the ground floor, the police entrance is placed in the centre of the Leeds-road end, or heel of the building, semicircular on plan. From a spacious hall open chief clerks, detectives, and district surveyors and other offices, as well as the parade room for police, placed under the borough court, and connected with it by a staircase leading into the prisoners' dock. From this hall a large staircase rises, for the use of lawyers, witnesses, and others having business in the borough court on first floor. Next to these, proceeding along Market-street front, we find the curator's house, messengers' and porters' rooms either

side of the main vestibule, with central staircase leading to the principal floor, and also stairs descending to the basement. On the opposite side of the central doorway lie the market superintendent, superintendent of fire brigades, scavenging nuisance, and hackney-coach offices, there terminating the Market-street front.

Proceeding along the toe of the hoot, facing New-street, towards Chapel-lane, we find in the centre the entrance to the municipal offices, which leads into a spacious hall, on the opposite side of which, facing the entrance, is a handsome circular staircase, with columns in front, around which the groined ceiling of the main corridors sweep. On this stair access may be gained either to the municipal offices on principal floor, or to the basement below. Further on, proceeding in the same direction, are placed the inspector of weights and measures; beyond him, at the corner, and turning down Chapel-lane, is the fire brigade department, and room for engines. The remainder of this front is devoted to police cells and day-rooms for men. The whole of this floor is well arranged, with no unnecessary loss of space. The areas, or open courts, are spacious, and the corridors well lighted and ventilated.

First or Principal Floor.—The main approach to this level is by two easy flights of steps, in a spacious vestibule, placed in the centre of the Market-street front. Through this an entrance-hall is gained, one side of which is occupied by the principal staircase, placed under the central tower, that rises to the second floor by a single flight of steps, which branch right and left from the first landing. The base of this tower has the same fault that is said to have lessened the chance of Mr. Charlesworth's design for the Manchester Town-hall, viz., the walls are not sufficiently thick adequately to support a superstructure some 200 ft. high. On the left of this staircase-hall a corridor leads to the borough court, and between it and Market-street is placed the mayor's reception-room, and beyond it, in the direction of Leeds-road, the rooms for magistrates and their clerks. The space lying between these latter and the Norfolk-street and Chapel-lane angle of the site is occupied by the borough court (the police parade area being underneath, as before described), bounded on the right by a groined corridor, lighted from a large internal open area, which gives access to the court from the municipal end of the building. The extremity of the borough court, opposite to the magistrates' bench, which is next to their rooms before mentioned, is semicircular on plan, and behind it, in the angle of the site, comes the public staircase leading to the gallery, over this end of the court. In the semicircular end of the site, facing Leeds-road, are placed the jury-room, waiting-hall, gained by steps starting from the police entrance-hall, on the ground-floor; also, lawyers', witnesses', and police-officers' rooms. From the above it will be seen that the arrangement of this borough court is admirable, the magistrates, public, and those having business in the court, are all and each kept separate and isolated, and unable to interfere or tamper with each other,—an important point that has been very little attended to by most of the competitors.

Returning to the principal staircase hall, and thence proceeding westward in the direction of Great Horton-road, or to the toe of the hoot, we find the town-clerk's and borough surveyor's offices with the upper flight of the circular staircase before mentioned. From this end, stretching down Chapel-lane, are the water and rate offices, with the remainder of this front taken up by committee-rooms.

In the centre of the building adjoining the back of the circular staircase, and lighted from a large internal court, are the offices of the borough accountant,—a judicious position in which to deposit a man whose attention should not be distracted from his work.

We may here remark that we see no necessity for planning off the square all the rooms looking on to Chapel-lane, with the exception of those influenced by the walls of the council-chamber, and these even could have easily been altered.

Second Floor.—Over the principal entrance in Market-street is placed the room for receptions and assembly of councillors. Three doors lead from this into the staircase vestibule, from the centre of which a bridge crosses the principal staircase to the council-chamber door. Immediately behind the screen masking this door is the mayor's chair, and in front of it, arranged in a semicircle with prolonged ends, are the seats of the aldermen, and behind and above them those for

councillors. Reporters are provided with a couple of tables at the back of the benches and facing the mayor; and the opposite end of the chamber, which looks into Chapel-lane, and is segmental on plan, is occupied by a gallery; and on either side of this are other galleries opening into the chamber, and approached from the back corridors. The gallery for the public, over the semicircular end of the borough court, is gained from this level. Two balconies project into the court on either side, one in the centre of each wall, and connected with the passages. The library, grand jury-room, recorder's room, with those for witnesses and lawyers, occupy the space from the centre of Market-street front of the building to the Leeds-road end of it. The offices for coroner, guardians of the poor, and end of the Chapel-lane front. The mayor's private rooms and some minor offices do the same for the remaining portion of the Market-street and New-street elevations.

The third floor contains little more than unappropriated rooms. Having given our readers a pretty clear view of the interior of the building, we expect that they will be thereby all the better prepared to understand our remarks upon the exterior or architectural portions of it.

The style of the design may be described as Early French, with a spice of Northern Italy of the same period in it.

The beautiful and artistic manner in which the drawings are got up would make nearly any style "go down"; it is fortunate, therefore, that the one selected is so good as it happens to be.

The principal elevation in Market-street is made up of a central and two side-gables springing from the level of the main cornice, and bounded at the angles by octagonal and engaged turrets terminating above in arched pinnacles; the whole united by façades, composed of six bays each. The central feature of this elevation presents a wide pointed doorway, with jambs of three orders, having attached columns. The arch over is moulded, the outer order being enriched with radiating diapers. On each side of this door are massive pilasters supporting canopies containing statues. Above the door, and under a shallow crocketed gable, are three trofiled arches with figures; and higher up a decorated band or frieze.

The windows of the square portion of this gable correspond with those of the main façade, with the exception of those to the first-floor, which are narrower, and contained under gable moulds. A projecting oriel window, of good design, is shown by the perspective view in the central pavilion, over the doorway, but omitted in the elevations. The gable proper is filled up with three pointed and traceried windows, the centre one having two lights, with three of their miniatures in the apex.

The proportions of this gable are unpleasant; it is too wide even in the elevations, and would appear much more so in execution. The angle turrets might with advantage be drawn some 3 ft. closer together, or the springing of the gable raised considerably.

The ground-floor line of the main façades is treated in a plain and massive style, with square-headed and shafted coupled windows. Above them runs a band of oblong panels containing shields. Upon this band rest the main floor windows, which are composed of coupled and shafted pointed lights, deeply recessed under a flat-pointed arch, with broad soffit, springing from a broad carved impost or string the depth of the foliated caps, under which is a circle with a cinquefoil-cusped opening and diaper work. The spandrels of the main arches are in like manner filled in with square horizontal diapering, having a circle and medallion in the centre. Again, another bepanneled band, and then come the second-floor windows, which are rather plain and small, running in couples, divided by recesses of similar outline, and containing figures, the whole forming a continuous arcade round the entire building,—a convenient arrangement by which a window that will not "work in" may be changed for a figure that must. Where this arcade meets the angle turrets, figures are made to cluster round them, one on each of the faces. The usual Gothic cornice, with arched parapet over it, completes the whole, allowing for an occasional dormer window of two lights, or a first-floor window of tondies, under a gable of its own.

The semicircular end facing Leeds road is like the main façade, curved to the required shape by hydraulic pressure, and suffers from the process; for the great span of the main arches

planned on such a short radius throws their crowns very much in advance of the hanches. The construction is had, and presents the appearance of a very corpulent man suffering from repletion. The dormer that occupies the centre of this curve is twice the size of the others, and suffers in the same way as the portion below, for the line of its gable coping has an unpleasant twist in it. It is desirable to avoid placing arches in a curve, especially those of considerable span.

The doors in the centre of both the ends of this design are poor, and the portions we have before alluded to, require reconsideration. The central clock tower rises from over the principal staircase. Its design is meagre, however much its original may be admired. It shoots up like a rocket, with a variegated tail, and when the "pop" comes, a heavy macciolated cornice with swallow-tailed battlements appears, and the "hang" produces a large open belfry with pyramidal roof. A small clock is crammed in somewhere amongst the swallow-tailed battlements. It is wonderful, judging from the designs before us, what hazy notions architects have as to the proper diameter of a clock for a given altitude, scarcely any being satisfactory on this point. Probably it is a good rule to make a clock face 1 ft. across for every 10 ft. it is raised above the ground. Many of those we speak of would require a telescope to read them, and appear more like a watch than a clock.

We must reserve further notes.

PLYMOUTH GUILDHALL COMPETITION.

THE Town Council very properly took professional advice in the selection of designs entitled to the offered premiums: Mr. Alfred Waterhouse was the architect who so assisted them, and the first premium has been awarded to "Fiat Justitia, ruat Caelum" (Messrs. Alfred Norman & Jas. Hine), the second to "Ich dien" (Mr. Charles Foster Hayward), and the third to "Nina," name unknown.

We give the referee's report on the selected three:—

"The first, 'Fiat Justitia, ruat Caelum,' proclaims the master. A nobly grouped and most picturesque exterior expresses the magnificent purposes of the buildings. Guildhall and Courts all assert themselves. The design is at once solid and inexpensive; the richness being confined to the parts requiring it. The public entrances to the galleries of the courts are well arranged. They lead direct to them, and to them only, and thus keep those who come to be amused merely, distinct from those who have business to transact. There is, also, a commendable absence of long corridors in the Assize Courts' end of the building, which, however, would have been better 1 ft. or 2 ft. wider.

The hall, 42 ft. by 80 ft., exclusive of its apical end, would make an admirable *salle des pas perdus*. It is covered by a roof of somewhat novel construction, but which I think would be successful, both aesthetically and architecturally, all the more so, however, if it were kept somewhat lower. The courts, 48 ft. by 36 ft. and 40 ft. by 36 ft., seem to me of about the right size, but would surely be improved if, with the hall, they were reduced in height. I think, also, a passage under the Bench in each case would be desirable, and that the gallery for the grand jury in the Crown Court should be lowered in height. The municipal offices, as exactly in the line of Union-street, placed so that both the council-chamber and the various offices, which are drawn 22 ft. wide, could well afford a reduction of, say 3 ft. from front to back, thus giving more space to the central square, and reducing the cost of the building. It would be well, also, if the public had not to come to the front of their gallery in the council-chamber in order to reach their seats at the back.

Consider this not only one of the very best, but also one of the cheapest designs in the room. In all probability it could be erected in its entirety for a sum but little exceeding the higher figure named in the instructions. The tower, though a striking feature, and from its entirely different character, hardly interfering with the church, might be omitted without taking so much from the composition as would be the case with the towers in some of the other designs. The Assize Courts, also, might for a time remain unbuild, without preventing the erection of the Guildhall and Police courts.

"Nina" is a good design as embodied in a most artistic and admirable design. The author, unlike the author of 'Fiat Justitia,' who follows the arrangement set forth in the lithographic plan furnished to competitors, places his principal block of buildings towards Westwell-street, with a tower of great beauty in the centre, so placed as to come not only opposite the tower of St. Andrew's church, but exactly in the line of Union-street, designed so that an approach from Devonport the main thoroughfare would seem to have been made to lead up to what would be the most striking architectural ornament of the town. On the one side of the tower are grouped the municipal buildings, and on the other the Guildhall. Passing through the tower, you enter a fine open space, 130 ft. square, with St. Andrew's tower, as before stated, opposite; the courts on the right, and on the left, a space for future extension. From this side the exterior is, if anything, more attractive than from the other, and, as a general scheme the plan seems to me preferable to that of 'Fiat Justitia.' If the arcade to the east were dispensed with, more light would be secured to the rooms at the back of it, and some expense saved. The stores at the back of it, in this design, kept so entirely to themselves as in the design already described, and I think some re-arrangement would be needed in the municipal offices. The great hall could be made lower by omitting the aisle-rooms, if the mayor's gallery could be dispensed

with, and would average 120 ft. by 60 ft. The cost of this scheme would far exceed the sum suggested; indeed, the author himself, to a certain extent, admits it.

"The design 'Ich dien,' though not equal to others in artistic ability, has the merit of being far less expensive than 'Nina,' yet still, in my opinion, likely to cost considerably more than 'Fiat Justitia'—than which, however, it contains more extra accommodation. It is a design of two modest, but effective groups, rather late in style, leading up to St. Andrew's tower, as their common centre, to the effect of which this design is, perhaps, more subservient than any other. The plan was generally excellent in its arrangement. The public hall is of good size, and likely to be successful acoustically. The arrangement for judges (except as to their fireplace), and for the grand and petty juries are unexceptionable. There should be a way under the bench of the Crown Court to allow the bar ready access to the Civil Court. The bench, however, should not be so far above the floor as shown (7 ft. 6 in.), and the galleries in this design generally have not sufficient slope to enable those occupying the back seats to look over those in front. There is no way into the enclosed spaces behind the single turret and central gables. The author's calculation as to cost may be taken as very reliable. After the three designs thus reviewed, I am at some difficulty to continue my selection, and several claims of several seem to be nearly equal. Of this class, bearing the mottoes 'Nota Bene,' 'Medio Tutissimus,' the figure 13 in a circle, 'Unus Civium Decor Urbium,' and the designs with the device of a resolute man with a black circle, deserve special mention. The author of 'Nota Bene' has allowed the Leeds town-hall to guide him both as to his plan, and, partially so, to his elevation. Still it is not a sorry copy. The exterior possesses a simple dignity, and the arrangements of the interior are to be commended. A few points in the design appeared to me to be open to criticism; for instance, there would be a deficiency of light in the great hall, if such a design. This, however, might be obviated by lightening the windows on the north side. The means of communicating between the hall itself (a noble room of 157 ft. by 60 ft.) and the surrounding corridors are insufficient. This also might have been easily obviated, as at St. George's Hall, Liverpool. The mayor and magistrates would suffer from this room being placed behind the screen for the Westwell-street portion. The cost of executing this design will probably exceed the sum named."

Considerable opposition to the proposed erection is manifested by a portion of the ratepayers, but they can scarcely shut their eyes to the fact that a new Guildhall is necessary, and ought to be provided as speedily as practicable.

Srs.—It seems superfluous to write judgment comments upon the many flagrant instances of jobbery under the present system of competition, but this instance at Plymouth presents so entirely a new feature, that it seems worthy of a special notice. Professional advice was obtained, and then I should say the competitors breathed freely, thinking that all the conditions would be thoroughly considered, and an impartial selection made. The instructions were not to exceed 25,000 l.; but, as usual, showy perspectives,—prepared regardless of cost,—were submitted. To my great surprise, Mr. Waterhouse (the adviser) recommended in his report three of the most expensive of the designs, viz., 'Fiat Justitia,' 'Nina,' and 'Ich dien,' and, although recognizing his own error, entered in his report a pretty little piece of special pleading as an attempt at justifying his peculiar recommendation.

He then says,—"I would venture to remark that the clauses in the conditions referring to the cost were not such as would be interpreted by architects to the them down strictly to the sum specified."

In answer, I need only quote the instructions to the architects, which are now before me. "It is intended that the outlay on the foregoing buildings shall not exceed from 20,000 l. to 25,000 l." I think most of us in business would understand that sentence to mean what it says, and it certainly says enough to put such designs as would cost 60,000 l. out of court altogether. I would ask Mr. Waterhouse if he could not make a more judicious selection than he can for 25,000 l.? And I hold that it is the duty, and most sacred duty, of a professional adviser to a committee who select him for their guidance, to set aside all those designs so evidently prepared without regard to cost, violating, as they do, the first and most important condition of the competition, and take into consideration only those which can be carried out for about the sum stipulated.

As a rule, one is not surprised at building committees (when we remember the class of humanity of which they are generally composed) being caught with bats in the shape of prettily-prepared perspectives with the chimneys omitted, "because they are no ornament;" but when it comes to this, and professional men in the position of Mr. Waterhouse overlook those who design with beauty and build with truth, to recommend those who lack the first requisite of an architect, which, in Mr. Ruskin's opinion, is "to do fine work economically," we may indeed say, where will this injustice end? AGENTS.

ON THE APPLICATION OF SEWAGE.

Waste not—want not. Words applicable to states as well as to individuals, while the amount of paperman is so great, and the means of increasing the food-producing powers of the country is allowed to run to waste, polluting our rivers and coasts; while it is possible to see ships laden with manures from distant lands, heating against a flood of loathsome matter containing the same elements of productiveness as they are burdened with.

In England produce is consumed from every part of the world. To increase the fertility of the soil not only are manures imported, but the stores of it accumulated in past ages are now ransacked, by which posterity is being impoverished both here and abroad, since the

debris arising from their consumption is thrown into the sea, and other lands are unable to manure their soils, as the means of doing so are sent away to us.

Although in towns of limited population other means may be found of removing *debris* without the aid of water, it is a settled point that in all large towns it is impossible to alter the present system of drainage; therefore my remarks are confined to the disposal of sewage as it is now obtainable, so as to return to the earth that which has been taken out of it.

As yet no method sufficiently economical to be practical has been discovered of entirely separating sewage so as to render its water pure; all methods yet tried having failed to fix the salts; the inability to do so causing the substance obtained to be of inferior value, and the water is not rendered innocuous.

The only agent found capable of accomplishing the result is the earth. As rain falling in one place finds its exit many miles distant, so let sewage be applied, when it will be found the earth has deprived it of its noxious qualities, and the water will have drained away into the water-shed of the country.

From the experiments of a few years, it is demonstrated that sewage contains extraordinary fertilising powers; but it is an important question, if the lands on which the experiments have been tried are those of a suitable character, since low-lying lands have not a porous subsoil whereby an amount of moisture is retained which renders them unfit for general cultivation.

For the profitable and successful application of sewage, it is absolutely necessary the land should have a subsoil affording *natural drainage*, which is only to be obtained by taking it on to high lands. I am prepared to hear the cost of pumping, &c., would be enormous: that thought would have deterred me from venturing on such a proposition, were it not that the expenditure of twenty millions for the construction of a tunnel to connect England and France for the accommodation of a few passengers who dislike the effects of an hour's rough sea, is thought worthy the consideration of our ablest engineers. It is to be hoped, therefore, that a subject bearing on the present and future welfare of England is as worthy an object of their attention, though perhaps, from the well-known bias of the craft, who are never so pleased as when there is a work to be accomplished that is nearly impracticable—a scheme involving but money will not meet with approbation. To reach lands of the foregoing description the sewage must be raised to such a height as to command the greater part of the line of country through which it would have to be taken, and to avoid heavy works the natural configuration of the country could be followed to its outlet.

As an example, take the case of the sewage on the south side of London. From Plumstead raise it into an aqueduct leading to the high land of Belvedere; raise it as necessary, having regard to the convenience of crossing rivers, until the chalk downs and waste lands of the southern coast are reached: by this means it would flow over a large area, and would be kept near the surface. To distribute it still further, branches could be led off.

The next point for consideration is the method of applying it to the land. That practised in India for irrigation should be adopted, with this difference, that whereas there water is applied to growing crops, here the sewage would be poured on to fallow lands. The land would have to be terraced to allow the fields to be laid out level, on to which the sewage would be conducted by pipes, and allowed to flow over them until they were well flooded, then the supply stopped, and allowed to drain away, which, with a subsoil of chalk or gravel, it would soon do, leaving the soil highly manured, and in a fit condition for any crop.

The great objection to a scheme which is mooted, *viz.*, that of embanking the Maplin Sands, and conducting the sewage from Plaistow on them, is—they are low-lying, and would have to be kept drained by artificial means; also, in consequence of the thinness of what would be called dry land, the sewage would pour out, through the drains, as fast as it went in, giving no time for the salts (the valuable ingredient) to be eliminated.

MIRROS.

Royal Institute of Architects.—The first ordinary meeting of the session will be held on Monday evening, the 1st of November.

THE PRESBYTERIAN MISSION HOUSE, SEACOMBE, CHESHIRE.

This building, which has just been completed, from the designs of Mr. H. H. Vale, Liverpool, consists of a large central hall, with triplet windows at each end, and clearstory lights on the sides below the eaves, with two transepts, divided from the hall by coupled arches, pillars, and moveable screens. The hall is flanked by two wing buildings, forming smaller gables on the front elevation, the roofs being relieved by rows of dormer lights. These wing or aisle buildings contain two stories. The lower one is used for class-rooms, reading and smoking rooms; and the upper one for keeper's residence, Bible-woman's house, class-room, store-room, &c. In the rear of the hall there is an infants' school, with cloak-rooms, lavatory, waiting-room, and other offices and outbuildings. The materials used in the construction generally are grey brick with red bands, quoins and arches, stone, and terra-cotta. The interior of the hall and transepts is lined with white bricks, having red brick bands, arches, and quoins. The roof is open-timbered, and counter-voiled between the rafters. The whole of the exposed timbers are stained and varnished. The gable factables are of fire-clay, made by the Roughdales Company from the architect's drawings, and while being less porous than the local stone, present an appearance equal to masonry. The chimney-stacks are formed of the same material. The group of buildings is crowned by a bell-turret, serving also as a ventilator: it is supported upon the centre of the ridge upon a pair of coupled principals. The wrought metal-work has been supplied by the Midland Architectural Metal-workers' Company, the cast iron by Messrs. Weber & Co., of Liverpool. Messrs. J. & T. Mason, of Egremont, were the sole contractors; Mr. Reddy was the sub-contractor for the carpentry and joiner's work; Messrs. Cherry & Lawlor, for the plumbing; and Messrs. Forrest & Co., of Liverpool, for the glazing. The cost of the whole undertaking, exclusive of the land, is about 2,000l. The hall and transepts will accommodate, need as a church, 400 people; and the infants' school, 100 children.

THE DECLINE OF SHIPBUILDING ON THE THAMES.

MR. JOHN GLOVER, in discussing the cause of this, gives a table, which shows "the daily rate of wages, on the Thames, Wear, and Clyde, of carpenters, joiners, platers, caulkers, riveters, painters, riggers, sailmakers, boiler-makers, engineers, turners, and pattern-workers. The cost of one day's labour from these combined crafts is, on the Thames, 72s.; on the Clyde, 58s. 8d.; on the Wear, 55s. 8d. The Thames price is 22-73 per cent. higher than the Clyde, and 29-34 per cent. higher than the Wear. I submit that this single fact is an explanation of the decline of shipbuilding on the Thames so conclusive as rather to suggest a demand for another explanation, *viz.*, how the trade was carried on until recent time with such a disadvantage. The answer is simple. It was not a profitable trade. One after another the builders failed, and some more than once, and their estates usually yielded very small dividends. Moreover, it was what I may call a hot-house trade. The buyers were not individuals spending their own money, looking for the cheapest market, and taking the benefit of competition therein; but, on the contrary, they were chiefly Governments (British and foreign) and large companies, often highly subsidised and rich, with whom price, and an adequate return to be earned thereon, were not primary considerations. While the Thames workmanship was, or was thought to be, unrivalled, the buyers I have described contracted almost exclusively with Thames builders, who obtained high prices in the absence of competition from other rivers. But Thames workmanship can now be equalled both on the Clyde and Mersey, on the Tyne and West; our own and other Governments and the large companies no longer restrict their contracts to the Thames; in such competition the lowest price wins. The Thames has lost—lost inevitably—with its labour rate 22-73 per cent. above the Clyde, and 29-34 per cent. above the Wear. There is good reason for believing, moreover, that this difference in the rate of wages is aggravated by the extent to which work is done by the 'piece' in the northern yards. Ironwork on the Clyde is nearly all so done, and I am informed that on the Wear nine-tenths of it is so done."

"Some further disadvantage to this industry on the Thames has accrued through the comparative disuse of wood in the construction of ships. Formerly all vessels were built of wood. Coal and iron, and the cost thereof, were not then very important items in their construction. Now, a steamer built of wood is a rarity, and nearly all large sailing vessels are built either entirely of iron, or of iron in the interior with a wooden skin. These last are called 'composite' vessels. It is apparent how the disuse of wood, and the greatly increased use of iron, favours the rivers in close proximity to the banks of which iron is manufactured, and where coal—so important an item in all work with iron—is also found proximate, and therefore cheap."

"With regard to the chief reason, it is most natural to ask why Thames wages did not fall with the decline of trade until such a level had been reached as would have enabled Thames masters to compete successfully with other rivers. The 'Union' seems to have decreed otherwise. They fixed a limit below which wages ought not, in their opinion, to fall. They succeeded thus far. Wages remain nominally high. But there is no work: trade is destroyed. It is perhaps an extreme illustration of what happens when the men become masters."

SCHOOLS OF ART AND SCIENCE.

Crystal Palace School of Art, Science, and Literature.—To what extent the Crystal Palace, in a passive sense, has been instrumental, if not in directly promoting education, at any rate in improving the tastes of the masses, it is impossible accurately to determine; but that it has had a great influence for good there can be no possible doubt. It was, in the first instance, with a view to utilise its valuable resources for educational purposes that the directors, some ten years ago, established the school, and success has year by year attended it. Its operations are confined to female education, and comprise lessons and lectures by eminent professors and teachers on all subjects embraced in a liberal education, and the courts and collections of the Palace are made available by way of examples and illustrations. The new session (1869-70) commenced on the 18th inst. According to the prospectus, which is already issued, there are many privileges accorded to registered pupils, such as the free use of a good reading-room and library, and an opportunity of purchasing a season ticket to the Crystal Palace at half-price.

Technical School, Chelsea.—The opening meeting of a new school has taken place in College-street, under the auspices of the Rev. Gerald Blunt, Rector of Chelsea, and an influential committee. Mr. Buckmaster delivered the inaugural address, in which he urged the necessity of such schools for the instruction of the boys of the better class of artisans, apprentices, and young men. Mr. Bickerton, the teacher, also addressed the meeting on the industrial and educational objects of the school, which promises to be successful. A good number of mechanics and young men were present, who appeared much interested in the proceedings.

Bristol School of Science.—A scientific *conversonione* has taken place in the lecture-hall of the Athenæum, Corn-street, in connexion with this school, which is in union with the Department of Science. A number of etchings, engravings, photographs from Besaëlie's cartoons, diagrams, anatomical drawings, &c., were exhibited on the walls of the hall. There was a large attendance, mostly of young people of both sexes. The chair was taken by Canon Girdlestone, and Mr. Buckmaster delivered an address on "The Value of Scientific Instruction, and the Aid Government affords for its Promotion." Referring to the Bristol Trade School, he said it had now outlived all its difficulties, he was glad to say, and made itself a name and reputation, not only in Bristol, but throughout every part of the country, sufficient to ensure its continuance even if the Parliamentary grant were entirely withdrawn. An address on "Inorganic Chemistry," by Mr. F. T. Ewens, followed, and was illustrated by numerous experiments. During the evening, several selections of music and songs were given.

School of Art for Leicester.—A meeting to consider the desirability of establishing a School of Art and Design in Leicester, was held in the Town-hall, on Thursday evening before last. The Mayor presided. Appropriate resolutions in favour of the object in view were unanimously

passed, and a committee appointed to draw up rules for the management of the school, &c.

The Maidstone School of Art.—The distribution of prizes to those students of this school who have successfully passed the Government examination has taken place. The concert-room of the Corn Exchange was well filled with a fashionable assemblage. Mr. James Whatman, M.P., took the chair. The report stated that the school continues to be well attended by students. From the commencement of this year, which is the second since its commencement, 73 middle-class students and 30 artisans have been under instruction, making a total of 103. This is a slight falling off in the numbers from the first year, and, in the case of a new institution, is what might be expected. The number of prizes obtained for drawing sent up is seven. The school continues self-supporting.

The Lincoln School of Art.—Through the efforts of Archdeacon Mackenzie and Mrs. Mackenzie, classes for the study of drawing, painting, and design are about to be established in Collingham, as a branch of the Lincoln School of Art, under the direction of Mr. Taylor. Already a sufficient number have joined to make a good beginning. Some of the works done by the Lincoln students, and other paintings, have been exhibited at the Farmers' Club room, and an address has been delivered by Mr. Taylor, headmaster of the Lincoln School of Art, showing the value of art to all classes, and explaining the course of study. There was a good attendance. The archdeacon presided, and in opening the proceedings delivered a short address.

BRIDGE ACCOMMODATION FOR LONDON.

In connexion with this subject it may be useful to put on record the pith of a report by the Bridge-horse Committee laid before the Court of Common Council on the 13th inst.:

"The committee stated that they proceeded in the references made to them, and were attended by the Lord Mayor and Mr. James Medwin, the respective movers thereof, and also by a deputation of the petitioners, who were severally heard upon the subject; and his lordship having suggested the propriety of inquiry being made to ascertain whether it would be possible to obtain for the benefit of the public the use of the footways adjoining Cannon-street Railway-bridge, they directed the City Engineer to draw the footways of the bridge to the attention of the committee, and the committee were informed by the architect stated that, with the present means of access thereto, the footways, if opened, would be beneficially used, and of very little benefit to the public, and the committee were informed by the controller that the Act of Parliament authorising the construction of the railway-bridge did not contain any provision for compelling the company to close the footways of the bridge to the use of the public. They had considered a report presented to them by Mr. Henry Carr upon the general question of communication between the north and south sides of the Thames, which stated that increased accommodation might be given on London Bridge by widening the structure without affecting the stability or adding to the weight of the foundations, and without changing the general elevation of the bridge; but he added that in his opinion the question as regarded London Bridge could not be dealt with irrespective of Southwark-bridge, and of its proposed improvement. Mr. Carr attended before the committee, and submitted a model, showing the manner in which he proposed the bridge should be altered, whereby the footways on each side might be increased 2 ft. 6 in. in width, at an expense of about 18,700*l.*, or half that amount if the footway on one side only was widened. Mr. Carr also submitted a plan for increasing the width of Southwark Bridge, and improving the steep gradients thereof, at an expense of 100,000*l.* to 110,000*l.*, together with a plan showing the northern and southern approaches of both London and Southwark Bridges. The committee had also considered a design submitted to them by Messrs. Happle & Stockman for increasing the width of London Bridge by throwing both the present footways into the carriage-way, and constructing additional footways 12 ft. 6 in. wide on each side of the bridge, the cost of which alterations was estimated at 27,000*l.*; also a plan submitted by Mr. Hamilton H. Fulton for widening the bridge by throwing the existing footways into the carriage-way and constructing additional footways of a width of 12 ft. on each side on wrought-iron cantilevers, the probable cost of which Mr. Fulton estimated at 100,000*l.* The alterations contemplated by Mr. E. W. Bryant, who submitted a model showing the manner in which he proposed to afford increased facilities for the foot traffic on London Bridge by the addition of a footway 6 ft. wide to be connected on wrought-iron cantilevers outside the parapet on the eastern side of the bridge; and Mr. Bryant stated that by the removal of the present parapet an additional width of 1 ft. 3 in. might also be allowed, thus increasing the footway from its present width of 9 ft. to 17 ft. 3 in., the cost thereof he estimated at 9,820*l.*, which amount included the cost of a temporary footway to provide for the existing footways during the progress of the works. Mr. Bryant further stated that the carrying out of his plan would not affect the stability of the bridge. Mr. Frederick Binsley also submitted a plan showing the footway 5 ft. 6 in. on the eastern side in a similar way, at an estimated cost of 6,000*l.* At the request of the committee, the City Commissioners of Police caused returns to be made, from which it appears that the average number of foot passengers crossing London Bridge during six days in December, 1867, was 110,519, whilst the number on the 17th of March last was 105,350, showing a diminution between the two periods of 5,191; but, taking the largest number of foot-passengers that crossed the bridge during one of the six days in December, 1867, and comparing it with the number that passed over the bridge on the 17th March last, it would appear that a diminution had taken place to the extent of 17,302. The committee had presented them a further report from the City Architect and Mr. S. W. Leach, relative to the gradients and approaches to Southwark Bridge, and in conclusion they stated that, having given the whole subject their consideration, and having regard to the diminution that had already taken place in the traffic over London Bridge, they were of opinion that the further consideration of the question as to improving the communication between the north and south sides of the Thames, and that of providing increased accommodation for the foot traffic over London Bridge, should be postponed until the committee had had an opportunity of ascertaining the effect on the public traffic that may be produced by the opening of the new bridge at Blackfriars, the new street to the Mansion House, and the Tower Subway now in course of construction, and until the traffic over Southwark Bridge and Cannon-street Bridge shall have been more fully developed; and they therefore recommended that the references made to them on the above subjects should be discharged.

The report was agreed to. At the meeting, it was stated that after the opening of Blackfriars Bridge, London Bridge would be closed twelve working days, in order that it might be repaired, as had been agreed upon at a former court. It would, however, be closed only to vehicular traffic, and not to foot-passengers.

THE TELEICONOGRAPH.

The account we gave of M. Revoll's invention for facilitating the drawing of distant objects has been reprinted far and wide, not least so in America: the result has been claims on the part of more than one gentleman of having long previously devised and used the same arrangement. Mr. Sharpe, in our pages, showed that he had done so, and mentioned an improved arrangement, with the same object in view, exhibited by the late Mr. Varley, at the Great Exhibition of 1851.

An American gentleman, Mr. Edgerton, of Fort Wayne, Ind., now writes thus to the *American Gas-light Journal*:

"In your issue of the 16th inst. I observe an article, copied from the *London Builder*, describing a new instrument called a 'Teleicograph,' devised by one M. Revoll, a Frenchman.

I have a transit theodolite made for me to order, by Messrs. Troughton & Simmes of London, December, 1852, and among other appliances devised and attached to the same, is M. Revoll's 'Teleicograph.' I never thought the idea of sufficient importance to give it a Greek name, or describe it in the journals, although I have used it to great advantage for seven years. At the time I devised this apparatus, I supposed the idea was one that might have occurred to many; but since it has come in for a Greek name, and found place in the *London Builder*, I write to claim a share in the device. Messrs. Troughton & Simmes will well remember constructing the apparatus, and I have it here now to substantiate my assertion. Without knowing it I have practised 'Teleicography' for seven years! and it may be never had before constructed one, as I had to make a sketch of the device."

HOW TO BUILD.

We read that the builders of ancient Rome were obliged to warrant their private buildings for ten years, and their public ones for fifteen. Moreover, every accident arising from bad construction during these periods, was to be made good by them or their heirs. If they were unable to make the necessary repairs, they were whipped, amanded, and banished. Some such law like this, if it could be enforced in the nineteenth century, within the bills of mortality of this great city of London, would work a salutary and lasting reform. It is not "how to build," but how not to build, consequently structures are very often, in fact are daily, being erected, whose best recommendation is that they are certain to kill off some portion of every family which may have the misfortune to live in them.

In the first stage of their existence, they effect this by dampness, want of ventilation, and the absence of any proper system of drainage.

In the second stage of existence of these houses, they kill off their inmates by the presence of too much ventilation. Doors, windows, and roofs exhibit the effects of employing green or unseasoned timber; aching pains begin to trouble the joints and shoulders; and, like the human body, the framing body of joinery creaks with a chronic asthma. In the house where there was insufficient ventilation first, there is any quantity of wind and weather now, for tenon and mortise part company, and paper, lath, and plaster follow suit, with a groan for the internal genii.

The third stage in the life of those model structures is this,—that they suddenly drop to the earth with an epileptic spasm, without the

least external warning; and in annihilating themselves they bury several families in the one general crash.

Need we add the sequel? Scarcely. We will simply note an "inquest,"—verdict, "accidental death."

Not a word of censure on the "jerry builder" or sham contractor, who made a nice thing out of speculating in the blood of his fellow-beings. Not a word of reproach on the man that "did not want any of your confounded architects." Not one word on the jack-of-all-trades who was surveyor, engineer, architect, and all. No, not a word. He, like other "lucky dogs," caught up the "tip" of the day, and his trade is to build to sell, and not to build to last.

Oh, would that the old Roman law were still in force, or that a vigilance committee were embodied so that the building ghouls of London could be "whipped, shamed, and banished" from the country!

AMERICA.

A Roman Catholic Church, dedicated to St. Paul, has been built in Worcester, Massachusetts. The length is 171 ft.; the width, 91 ft.; the height of basement, 16 ft.; height of walls above audience-room floor, 24 ft.; height of clearstorey walls, 12 ft.; height of tower from pavement to top of cross, 212 ft. The material for exterior walls and tower, including spire and cross, is to be granite; colour for the body of the work, white; for the trimmings, dark. The porch in the front is to be supported on red granite columns, polished. The trimmings are fine hammered, and the body of the work laid in square ashlar-work.

The church is being built for a new society under the direction of the Rev. John G. Power. The architects are Messrs. E. Boyden & Son, of Worcester, who also superintend the work. At present there are no persons following the business of what is called in England "the clerk of the works;" but the architect's reference to the erection of their own designs, except in some few very large and extensive buildings requiring constant oversight.

ARCHITECTURAL SOCIETY OF NORTHAMPTON.

At the annual meeting of this society, held on the 13th inst., Lord Alwyne Compton presiding, the Rev. N. F. Lightfoot read the report, which referred to various restorations under the auspices of the society. In reference to Earl's Barton Church, it was stated that there was an opinion that the tower was not secure, and subscriptions were invited for obtaining the necessary fund. References were also made to restorations at Peterborough Cathedral, Loxwick (which was re-opened on Tuesday, by the lord bishop of the diocese), Deene, Cransley, Sirixton, Bozatt, and Abthorpe.

The Rev. G. Ayliffe Poole then read a lively paper "On Ways and Means." Mr. Poole referred to the enormous amount of church work done immediately after the coming of the Normans into this country; and having given some amusing and serious instances of the steady perseverance of the early church-builders and their modes of obtaining ways and means, he gave a vivid description of the characteristics of modern begging, and of bazaars, which he said were, of all methods of raising ways and means, the most extravagant. He gave some humorous evidence of this in the nature of a debtor and creditor account, of the cost of raising 500*l.*, which he made to appear to be 1,232*l.* Some conversation followed on various points in the paper, in the course of which Mr. Smyth said that one of the difficulties of raising funds in modern times was that it was necessary that the work should be done at a heat.

Sir Henry Dryden said that he thought it was clear that a great deal of the work in Medieval times was done by amateurs. Wages, too, were lower, as was the case in France at this day, where a wonderful amount of church work was doing, and how the funds were raised he never could ascertain.

Lord Alwyne Compton said, that one reason why church building was so popular in the twelfth century, was that there had been a general belief that the world would come to an end in the tenth century; and when that was found to have been a fallacy, the Normans set to work to repair the neglect that had so long prevailed.

The Rev. F. H. Sutton then read a paper "On Painted Ceilings," and the Rev. W. D. Sweeting one "On the Application of Medieval Wills to Archaeology."

At the excursion previously the society retraced much of their old ground, visiting Earl's Barton and Brixworth.

COMPOSITE METALLIC BEAMS.

In a letter addressed to the editor of *Scientific Opinion*, Mr. Thomas Stevenson, C.E., of Edinburgh, says:—The combination of wrought and cast iron has been long in use for trussed girders; but for bolted or riveted beams the problem which seems hitherto to have engaged the attention of engineers, and which has been successfully solved, is the proper distribution of the material. What I have now to propose is the employment of composite metallic beams, composed of metals possessing different qualities, the pieces of which those girders or tubes are composed being bolted or riveted together in the usual way. Such pieces should consist of metals or combinations of metals which possess powers of resistance to compression and to extension, varying as nearly proportionally as possible to the varying crushing and tensile stresses in the beam or structure. In the event of its being cheaper to limit the application of this principle the stronger and more expensive material might be used for the upper portions only where the compressing force has to be resisted.

For example, in the case of a flanged girder of malleable iron there would be bolted or riveted to the upper flange plates of cast iron or steel, or some other material possessing greater powers of resisting a crushing force than malleable iron. There might also be bolted or riveted to the lower flanges plates of steel, or some material possessing greater power of resisting extension than malleable iron. In the case of lattice bridges and similar structures, the metals possessing greater resistance would, of course, be in like manner employed for the upper and lower beams.

In some cases, as, for example, when the load which has to be supported is fixed and constant in amount, as in buildings where a girder is employed to support a mass of superincumbent masonry, it would economise the cost if the same principle as has just been described for the depth were also applied to the length of the girder. Here, then, the top plates of steel would be placed only in the middle, while the rest of the top plates might be of cast iron. In like manner, with the bottom flange, the steel plates would be reserved for the middle, while those near the abutments might be of wrought iron.

By adopting this principle of applying metals of different strength to different parts of the section, bridges of larger span than have hitherto been attempted might, I think, be made without materially increasing the cost of construction.

I may mention that in some experiments lately made with two bars, one of which was composite and the other homogeneous, there was, with a load of 5½ tons, a decided superiority in the rigidity of the composite beam, which consisted of cast iron, malleable iron, and steel. I am making further experiments on the subject, with the view of getting formulae for composite beams; but, in the mean time, the above account may prove interesting to your readers.

MONUMENTAL.

Dean Davies's Memorial, Hereford Cathedral.—The memorial of the late Dean of Hereford has arrived at the cathedral. It consists of an altar tomb, in white marble, having a recumbent figure of the late Dean on the upper portion. The statue is represented in full canonicals, and is in a recumbent position, with the hands gently pressed together, as if in deep and silent meditation. The face, in which the character of the original has been successfully preserved, is treated in keeping with the hands, and, indeed, with the whole figure, so as to embody as completely as possible the idea of deep and inward prayer, just as it may be imagined would be assumed before the spirit leaves its earthly tenement for ever. On the borders of the pillow upon which the head rests the following texts from the sacred volume are inscribed:—"The morning cometh and also the night." "Thy will be done." "In Thee is my trust." The whole rests on a tomb, which is the work of Messrs. Farmer & Brindley, of London, and is wrought

on the sides and ends in Staffordshire alabaster, either angle being supported by shafts of verd antique, with foliated capitals and bases. The entire work will cost between 800l. and 1,000l. The tomb is placed in the north-east transept. The work has been designed by Mr. Scott. Mr. Noble was the sculptor of the effigy. Mr. Noble contends strongly for the tomb being placed north and south in the position it is to occupy, on account of the much better effect produced in the toning of light and shade on the countenance of the effigy. But the authorities are unwilling to depart from the conventional rule of "due east and west."

Adam Smith's Statue.—A committee was recently formed to purchase M. Gasser's statue of the great political economist, to present to Oxford University as a memorial of one of the most illustrious persons who have received their education at the University. 700l. are required to purchase the statue, which is now for public view in the University Randolph Gallery. The committee consists of Lord Taunton, Lord Justice-General Inglis, Mr. Gladstone, the Dean of Christ Church, the Master of Balliol College, and Professor Rogers. Upwards of 400l. have already been subscribed.

THE LEIGH HUNT MEMORIAL.

Some year or so ago, at a meeting of the little social and antiquarian club, the Noviomagians, Mr. S. C. Hall urged the desirability of putting up a fitting memorial of Leigh Hunt at the place of his burial, Kensal Green. The guineas of those present were at once promised. A small committee was afterwards formed, which had the advantage of the active co-operation of Mr. Townshend Mayer as treasurer, and Mr. E. Ollier as honorary secretary, and a few circulars soon obtained the modest sum that had been determined on as the extent of the outlay. Mr. Joseph Durham, A.R.A., undertook the preparation of the memorial, a marble bust on a pedestal, inscribed, "James Henry Leigh Hunt. Born October 18, 1784. Died August 28, 1859. Write me as one that loves his fellow-men;" and on Tuesday last Lord Houghton, in the name of the subscribers, presented the monument to the public. Lord Houghton's address was eloquent and felicitous, and was delivered with much feeling and the best possible taste. Mr. Durham has produced a good likeness and something more. The thanks of every lover of letters is due to Mr. Hall for the successful accomplishment of this good work.

THE THEATRES.

St. James's.—An objection has been raised by one of our correspondents to the advertised description of the new drop-scene here, King Charles II. leaving St. James's Palace to go to the play, on the ground that the king never lived there. If the writer had seen the playbill, he would have found that the king is supposed to have been dining at the palace with the Duke of York, and going thence to the new theatre in Dorset Gardens. The drop is an interesting work. Mr. O'Connor has given a capital view of the gateway and adjacent buildings, with a view eastward of the Pall Mall of that time, 1678; while Mr. White (with Mr. Planohé for his good authority) has depicted the king in his coach, officials and attendants, Rochester, Popsy, and a group of the ladies of the time. For the comedy with which the house opened, "The Stoops to Conquer," some capital scenery of its kind has been prepared. The scene for the last two acts, Mr. Hardcastle's Drawing-room, by O'Connor, is too elegant and fresh, not mistakable for an inn; but it is such a charming room *per se*, so elaborately built up and fitted up, that we are content to admire without questioning. Mr. Lloyds also provides some capital work. The acting is even and good, Miss Herbert, Miss Henrade, and Mr. Shore being always safe; but the play affords no opportunity for a display of their special powers. The bright spot in the picture is the *Tony Lumpkin* of Mr. Lionel Brongh, whose remarkable display of boisterous vigour in two or three of the situations renews the audience to enthusiasm. We are disposed to think the management, in seeking to revive some of our standard comedies, have not made the best possible choice, if a long run he looked for; however, we shall see: the intentions are evidently good. We doubt, too, the wisdom of abolishing the pit. The house

has been gaily decorated. The prevailing colours are light blue and rose pink, not particularly harmonious, although "a French association."

The Gaiety Restaurant.—A lofty and costly building of stone, Gothic in style, has been erected, adjoining the Gaiety Theatre, Strand, and at the corner of Catherine-street, to be used as a restaurant, in accordance with the programme the proprietors of the Gaiety Theatre put forth at the opening of the house. All the upper apartments communicate by short lobbies with the tiers of boxes. The idea entertained by the proprietors is that a great convenience will be afforded to the public if they have the opportunity of partaking of dinner, either singly or in parties, previously to witnessing the entertainment provided for them in the theatre, or of supper afterwards. The principal dining-room of the restaurant, which faces both Catherine-street and the Strand, is a handsome room, measuring 60 ft. by 35 ft., richly decorated and furnished. Smoking-rooms, cabinets, a large circular luncheon-bar, wine-counters, and other extensive arrangements for the refreshment of the public, form part of the restaurant, which communicates with the theatre on the balcony floor. Mr. Phipps was the architect. We are free to confess that we have no great admiration for the arrangement which seems intended to approximate the theatre to the music-hall. We see no necessary connexion between eating and drinking and the stage, and trust that other theatres will not be led by the example to connect themselves with a tavern.

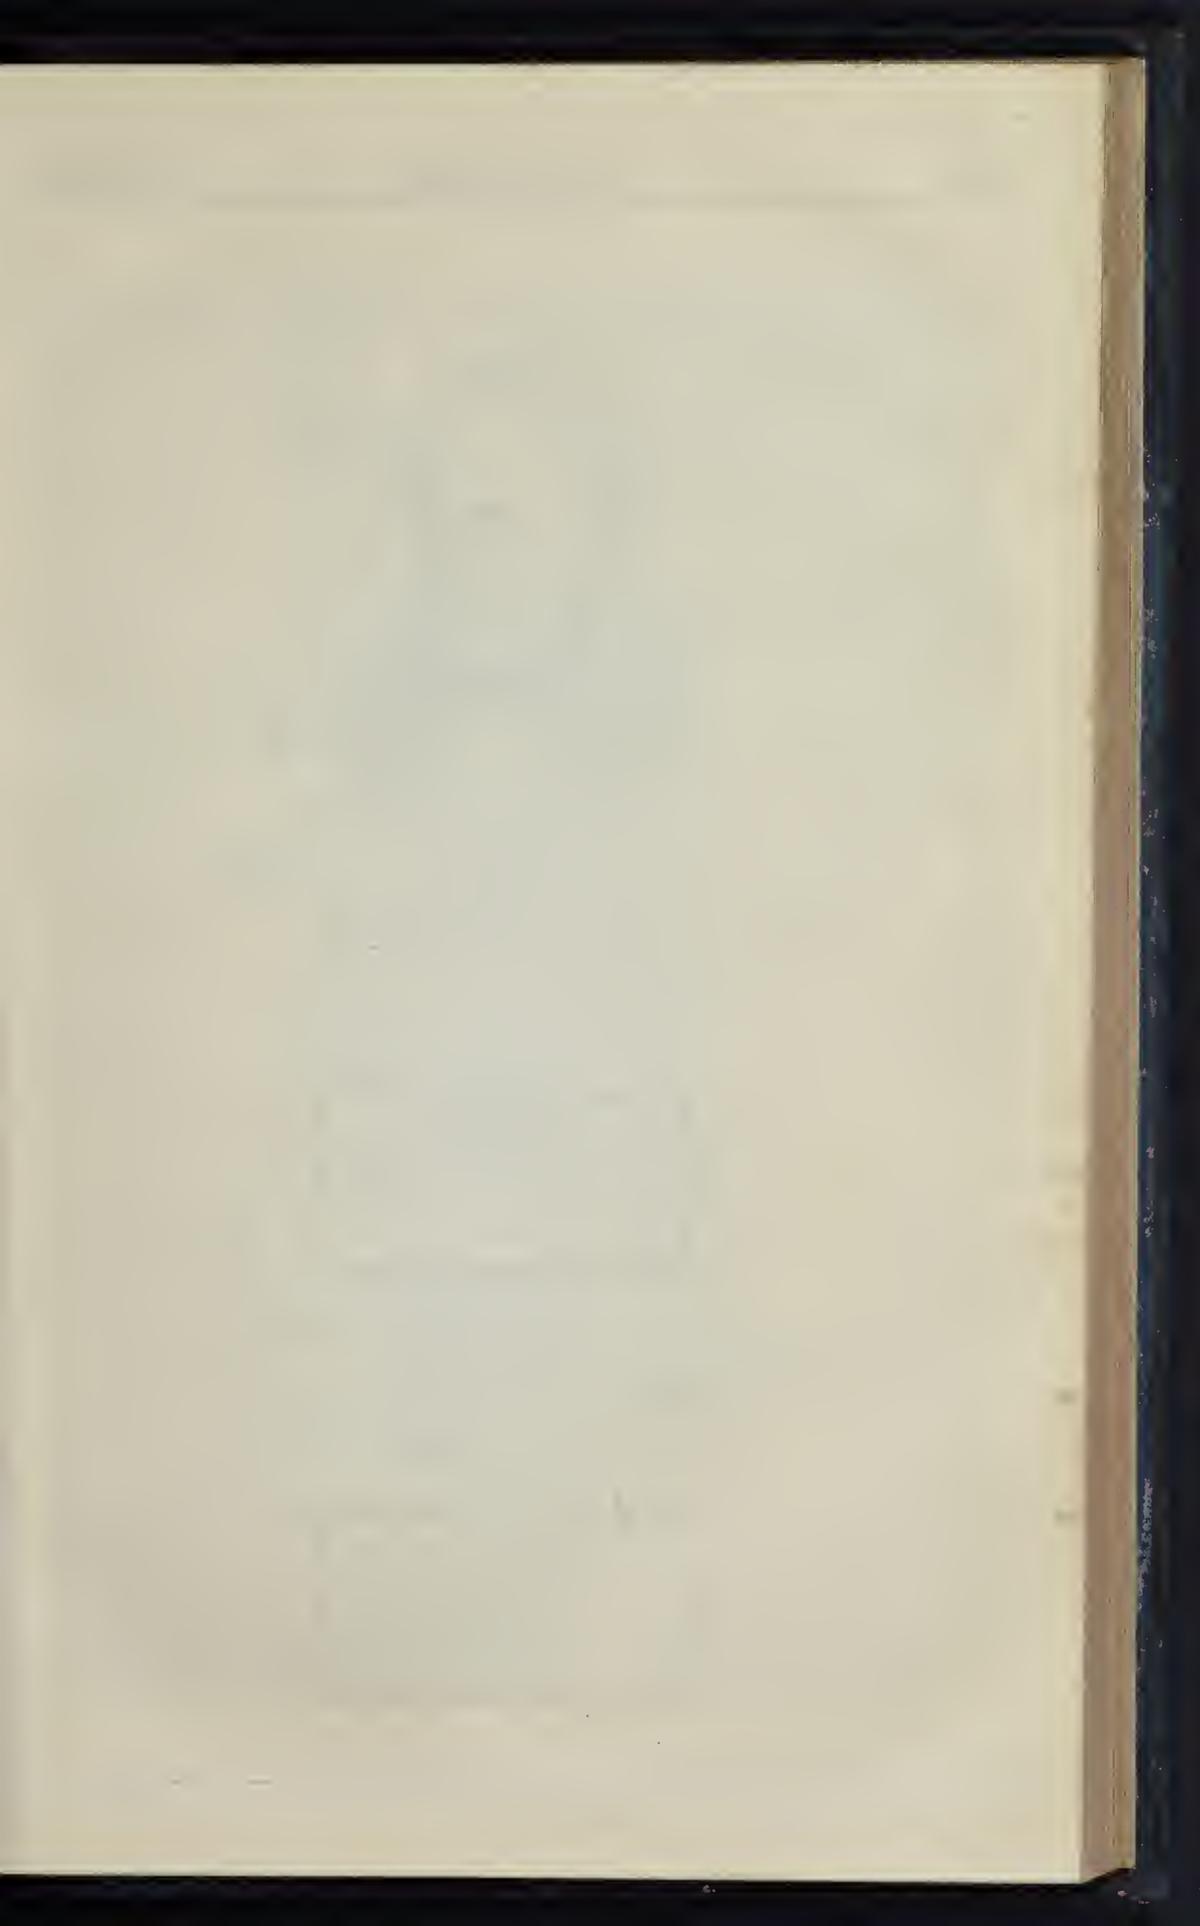

THE SEWAGE QUESTION.

Nuneaton.—The following letter, from Mr. R. Rawlinson, Government Engineer, has been received by the Clerk to the Local Board, in reply to a communication recently addressed to him:—

"Sir,—In reply to your note of the 25th ult., I beg to say that I cannot attend your Board to advise as an engineer privately. With respect to the sewage difficulty, if the Local Board can obtain land on which to use the sewage in irrigation, this will be both best and cheapest. Some 80 or 100 acres will be sufficient. Let the sewage be properly applied, as at Bedford, Banbury, Rugby, Crofton, &c., and the ratepayers will be at the least cost, if at any. Disinfectants, or chemical treatment in any form known to me, do not remove the causes of mischief from sewage, and cannot be remunerative. John Lawson, esq., C.E., of No. 3, Westminster Chambers, or Baldwin Lubham, esq., C.E., of No. 4, Westminster Chambers, will, on application, safely advise you what to do. But there are also other engineers, whose names do not so readily occur, equally able to advise.—Yours truly, ROBERT RAWLINSON."

Banbury.—The Board of Health at Banbury collects the sewage of 11,000 people in tanks (covered), whence it is pumped by means of a steam-engine about a mile to a farm of 137 acres, which it irrigates. The rent is £l. 10s. an acre. Thirty-five acres have been under Italian rye grass for the last three years, and the whole of the farm, with the exception of twelve acres, has been irrigated. Immense crops of rye grass, and natural or mowing grass, have been obtained during the last two seasons. The sales of the produce by public auction realised in 1868 1,800l. During the present season, up to this time, the amount obtained has been 1,160l., and there are further sales to come off. Fourteen acres of mangolds were grown this summer, says the *Field*, and two acres of the same field were devoted to cabbages, carrots, parsnips, and onions. The wireworm thinned the mangold plants in the spring, but the crop in those parts where there was abundance of roots was splendid. The land was flooded with sewage last winter, and the crops had limited applications of it during their growth. The effluent water from the farm has no smell, and scarcely any taste, as it enters the Cherwell.

Mechanics' Institute, Huddersfield.—At this Institution, which has become one of the largest educational establishments in the country for working men, having about 1,200 members, there is a large elementary class studying architectural drawing. It consists mainly of young men, masons, carpenters, wood carvers, &c.; and the committee, rightly considering it of great importance, do all they can to further the views of the students. The fresh drawing classes here have been well attended for some time past; when our informant last looked in there were seventy-nine pupils hard at work. We cannot too strongly advise the members to avail themselves of these classes.

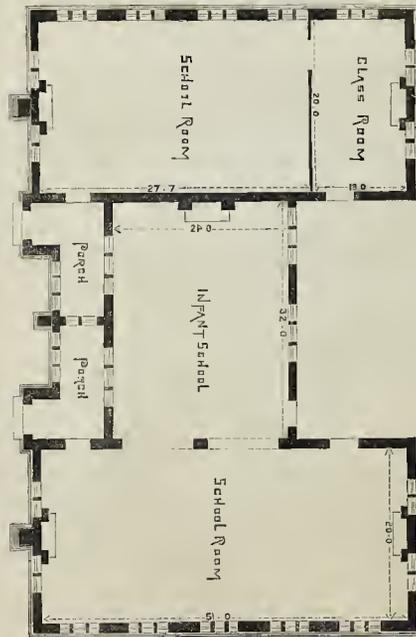

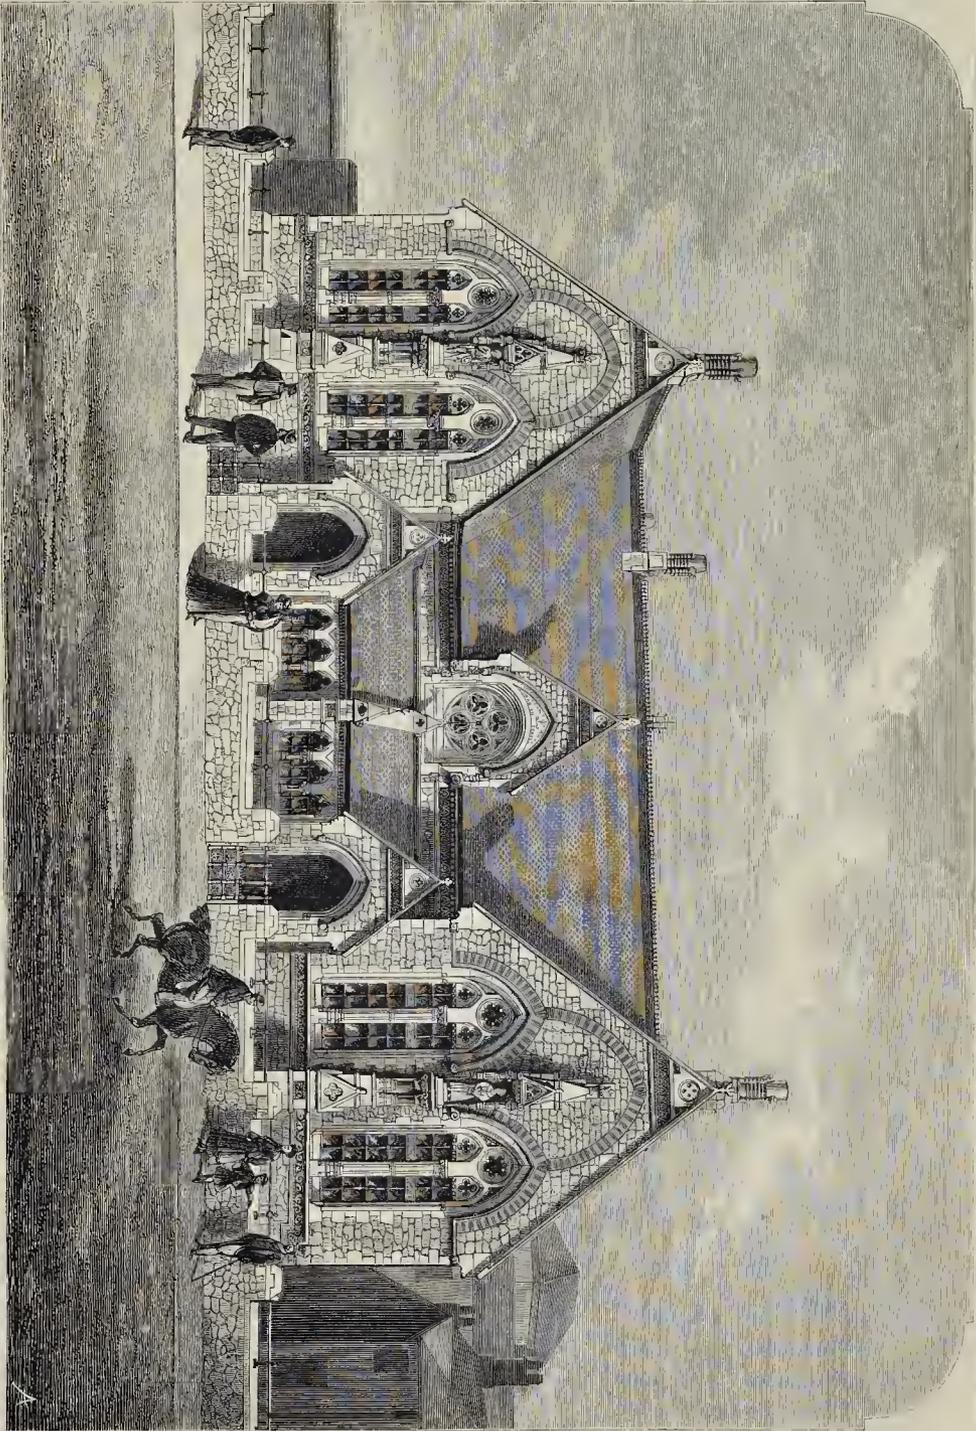

MR. ROBERT KERR,

Professor of the Arts of Construction in King's College, London.

ST. MARY'S PARISH SCHOOLS, LEICESTER.
Plan.

ST. MARY'S PARISH SCHOOLS, LEICESTER.—MR. JOSEPH GODDARD, ARCHITECT.

ST. MARY'S PARISH SCHOOLS,
LEICESTER.

The buildings of which the accompanying engraving is a representation have lately been erected on the site of the old schools, which were in such a dilapidated condition as to necessitate urgent measures being taken for raising sufficient subscriptions for the erection of new schools on a more extended scale. The preparation of plans and designs was placed in the hands of Mr. Joseph Goddard, of Leicester, architect, and the handsome buildings have been erected by Mr. John Firm, the successful competitor for the contract.

The material of the walls is Enderby granite, with Bath stone and red brick dressings, lined with brick. The roofs are open-timbered, of good design, stained and varnished, and covered in with Newcastle tiles, of two patterns. The window-openings are filled with iron lights and casements. The cost of the whole of the buildings, fence-walls, &c., but exclusive of land, amounted to 1,950*l*.

The two very good terra-cotta figures (boy and girl) in the niches were in common brick and stucco recesses on the old building, covered above a quarter of an inch thick with whitewash. They have been carefully cleaned and reinstated, as shown in the engraving.

KIRKE WHITE'S MONUMENT, AND ALL
SAINTS' CHURCH, CAMBRIDGE.

Sir,—The above subject having just "turned up" through the demolishing of a new church at some distance, of *All Saints' Church, Cambridge*, and the inscription being probably much less known than fifty years ago, whilst I trust probably equally worthy now to strangers,—that at least may be worth reproducing. And a few words on the Church, of which, however advisably, its place will know it no more, may interest some formerly acquainted.

The Tablet (by Chantrey) is large and hold, of the best "statuary," with "medallion" of the unfortunate young poet. This inscription is by the amiable Professor Smyth. Besides any vivid touches of character, it seems to have not been noticed that the abrupt introduction of name strongly resembled (very likely unintentionally) what Johnson pronounced very felicitous in one of *Pope's* epitaphs:—

"Frught with fond hope, and learning's sacred flame,
To Granta's bowers the youthful student came.
Unconquer'd powers th' immortal Mind display'd;
But, worn with anxious thought, the flame decay'd,
Pale o'er his lamp, and in his cell retired,
The Martyr Student faded and expired.
O! Genius, Taste, and Piety sincere!
Too early lost, must studies too severe!
Foremost to mourn was generous *Southey* seen;
He told the tale, and show'd what *WHITE* had been;
Nor told in vain. Far o'er th' Atlantic wave
A Stranger came and sought the Poet's grave:
On yon low stone he saw the humble name,
And traced the fond memorial to his fame."

Of the honourable "United States" visitant I have forgotten the name; but it, of course, can be identified. He, at least, paid a kind tribute to the "old country."

"Fortes creantur fortibus et honis."

A proposal to remove the monument now to the opposite (new) chapel of *St. John's* (the poet's college), seems certainly the best possible.

The Church, anciently sometimes styled "All-hallows," with "Fulbourne" added (which is now obsolete), was, though small, if not mediocre, not wholly uninteresting. Its chancel had been rebuilt, or else eased, with brick, and barbarised, as also the window of the body. On each side of the latter were three obtuse arches, with good clustered columns; the rising panelled ceiling was also effective. The old organ, given from the chapel of *Jesus College*, situated (as three more) in the parish, was considered grand in tone for the size. Shortly before the close, near death, of the popular ministry—at least to undergraduates—of *Dr. E. D. Clarke*, the interior was handsomely repaired, with new organ-loft, oak pulpit, &c., and a small copy by *a* *Downman*, *Harding*, of *Carlo Dolce's* "Last supper" (at Berlin, as *Dr. C.* informed me), provisionally to which the pews, according to

* Of this amiable, and accomplished, and active man, distinguished traveller and mineralogist, a "sketch" appeared, with the writer's name, in the *Literary Gazette*, (1822), which at least obtained a flattering, spontaneous (unmerited) approval from a lady, justly considered of elegant taste, the then Duchess of Bedford.

some inexplicable fashion popular above 100 years ago in some churches, and even colleges,—as *Islington*, *Little St. Mary's*, *Cambridge*, and *All Souls' Chapel, Oxford* (1817),—had been painted of a dark green colour. At the west end was a tower far from imposing, containing three poor bells. When an opening was cut through this, which narrowed the pavement (1820), it was discovered that, as in reported foresight of *Sir C. Wren* at *St. Magnus, L.B.* (which was not open at first), an arch had been "built" south and north within the walls. *J. D. FARR.*

TYRANNY.

Sir,—There is an old saying often used in the West of England, when a person is describing something strange and unaccountable, "If I hadn't a seed it, I wouldn't a believed it." It is with much the feeling of such a speaker that I send you the following:—

A master plasterer of Liverpool has, among other contracts, a job a few miles from Chester, which is now nearly completed, and there remain two or three plasterers and one labourer to finish it. More labourers have been working there, but they have been drawn off to other jobs. The man is a native of the place where the work lies, and was engaged on it, and is paid the same rate of wages as the others who were sent away. There is a Labourers' Trade Society in Liverpool, and this society went out of its way to near Chester, to call upon this labourer to join their society. This the labourer refused to do. They then applied to his employer to discharge him, and gave a short notice that unless he was dismissed the whole of the labourers employed on the various jobs would be withdrawn. The threat was carried out on Monday, the 11th inst., and the men left their work. Finding this had no effect on the employer's resolution, the Labourers' Society have legned with the Plasterers' Society, and they too have given the contractor notice that unless the matter is settled amicably (which, of course, means according to their demands), the whole of his plasterers will be withdrawn, the burden of their support to fall on the Labourers' Society. This is how matters stood on the 18th inst. The sage advice recently given here to trade-unionists appears to be quite lost upon these people, and it seems that, as far as they were concerned, *Lord Stanley* might as well have stopped at home. *E. G.*

RE-OPENING OF COGENHOE CHURCH,
NORTHANTS.

The parish church of Cogenhoe has been reopened for Divine service, after undergoing a complete restoration.

The church, which is familiar to all lovers of architecture in the district, is an interesting specimen of Early English work, and dates back to the first part of the thirteenth century. The following notice of it occurs in the "History and Antiquities of Northamptonshire," by *John Bridges* and the *Rev. Peter Whalley*:—"The church, dedicated to *St. Peter*, consists of a body, north and south aisle, chancel, and south porch, leaved. At the west end is an embattled tower, in which are three bells. The church and chancel are 65 ft. 10 in. in length; the body and aisle are 45 ft. in breadth. The length of the tower is 12 ft., and the breadth of it 10 ft. 6 in. In the north-east corner of the porch is a receptacle for holy water. The register begins in 1558. . . . Under the upper window of the south aisle lies the figure of a Knight Templar upon a tomb, completely armed, with a dog at his feet, and having on his left arm a shield, whereon are these arms:—a fess between three martlets. This is said to be the tomb of *Sir Nicholas de Cogenho*, lord of this manor in the time of *Edward I.*, and reported to have been the founder of the church. The like arms are cut upon the pillars which support the nave. Against the upper pillar of the chancel, on the western side, is a sinister bond. In this church was a chantry founded by *William de Cogenho*, for one priest to sing for ever at *Our Lady's* altar; and endowed with lands and tencements, which, in 1555, 26 *Henry VIII.*, were rated at 67*s.* 4*d.*; but in the second of *Edward VI.* amounted only to the yearly value of 50*s.* 9*d.* oh. This chantry seems to have been situated on the north side of the chancel, as there are marks of a large arch, now filled up, through which was probably the entrance into the chantry-chapel."

The edifice, having, through lapse of years, fallen into decay, and being likewise found very ill-adapted for Divine service, a parish meeting was convened by the rector and churchwardens in the early part of last year, when it was resolved that an endeavour should be made to effect its promised restoration. Liberal donations were promised, and the patron of the living, *Mr. George Burnham*, of *Wollaston*, undertook to restore the chancel at his own cost, and the rector to rebuild the ancient "Chantry Chapel" referred to in *Bridges' History*. The parishioners, moreover, came forward with offerings, and under those auspices the work was commenced in the autumn of last year, by *Mr. John Watkin*, of *Northampton*, under the supervision of *Mr. C. Buckridge*, of *London* and *Oxford*, architect.

The aisles and chancel have been re-roofed with pitch pine. Open seats of oak have taken the place of the old square pews and other seats, many of which were in a most dilapidated condition. The west window and the heltry arch, which were blocked up, have been re-opened. The tracery has been re-inserted in the windows, the arches have been relieved of their many coatings of plaster, and the stonework throughout has been pointed and renewed. A two-light Early English window on the north side of the chancel, which had been for years blocked up, has been opened out and filled with stained glass in memory of the late rector (the *Rev. Edward Watkin*), by his widow, the subject being the two figures of *St. Peter* and *St. Paul*. The window is by *Messrs. Clayton & Bell*, of *London*.

THE PRESERVATION OF STONE.

Sir,—In reference to the letter of your correspondent, asking for a method of preserving stone in the interior of a building, I would ask him to try a solution of oxalic acid, so as to obtain a surface of the oxalate of lime in place of one of friable carbonate. I have not had many opportunities of trying experiments upon the subject, but as far as I have gone with pieces of Bath stone, the result is most satisfactory, the surface of the stone showing under the microscope a brilliant coat of crystallized oxalate which is nearly insoluble, as I have soaked it in water for twelve or fourteen hours, and then find it is not acted upon by moderately strong hydrochloric acid. The process seems so cheap and simple that I should like to see it tried on the interior of some new building, as it would altogether prevent the destruction of the stone by the sulphurous and other acids formed during the combustion of ordinary coal gas. I think it would also at all times allow the carved work to be cleaned either with a common dusting-brush or even to be washed with water.

I should much like to see the process tried, but as I have not the pleasure of knowing any good stone carver or architect, I have not had an opportunity of seeing it carried out.

ROBERT PALMER.

ACCIDENTS.

The fatal accident from the fall of a scaffolding in *Temple-street*, *Birmingham*, to which we have already alluded, was a cornice accident. The *Odd Fellows' Hall*, has been undergoing repairs, both interiorly and exteriorly. The work has been carried on by *Mr. Matthews*, builder, who contracted for the work, and he was assisted by *Mr. Holmes*, plasterer, who acted as a sub-contractor to *Mr. Matthews*. Both *Mr. Matthews* and *Mr. Holmes* had men employed under them, and a large scaffold was erected outside the building for them to work upon. That part of the work performed by *Mr. Matthews* was the raising of the building a story higher, or from three stories (its original height) to four stories; the scaffolding, therefore, extended along the entire length of the premises (about 40 ft.), and was also carried round the opening on the lower side of the hall to some extent. It was constructed in the usual way, and consisted of long poles and deal planks, fastened together by ropes, and connected with the building by pulleys, driven through the wall. The bricklayers' work was finished, and plasterers were engaged upon the scaffold, when the cornice at the top of the building gave way, and fell on to the scaffold. The consequence of the sudden heavy fall of bricks, stones, and mortar upon the boards was that the pulleys gave way, and the planks and boards, deprived of their support, came crashing down to the ground. At the time of the acci-

dent there were five men engaged upon the scaffold or beneath it, and these and other persons who were passing were more or less seriously injured, and some of those hurt afterwards died. The scaffolding appeared to having given way first on the upper side of the hall, as it was seen that it was still fast at the lower end.

THE DICTIONARY OF ARCHITECTURE.

We are glad to be informed by Mr. Sydney Smirke that considerable success has attended the endeavour to obtain a sufficient number of new subscribers to ensure the completion of the "Dictionary of Architecture" without any further call on the present members of the society. This success has, however, been the result chiefly of the exertions of a few energetic friends; and further vigorous exertions are absolutely necessary in order to justify the committee in proceeding with the scheme. Still more new subscribers are wanted, and we hope that some of our readers will use their best endeavours to bring in friends. The new list of subscribers comprises persons of all classes of society, from noblemen of the very highest rank, and great public bodies, down to the huddlers in country towns and clerks of the works. If the apathy and indifference of the subscribers and of the profession allow the Dictionary to remain incomplete, and permit a proposal so eminently favourable to fall to the ground, it will be a great disappointment, and a discredit to the profession. This contingency must not, however, be allowed to occur. Each school of art throughout the country should be provided with a copy of the Dictionary.

The committee have just now issued two parts of the work, one consisting of twelve plates to illustrate L and M, the other comprising 112 pages of text, "Lead" to "Lytus." This includes a vast amount of information under the heads it contains, greatly increased in value by innumerable references to works that treat of them more at length.

OUR GOOD THINGS DONE BEFORE US.

Sir,—I have just finished reading the *Builder* for September 18th (for I was abroad at that time, and so missed seeing it). A patent seems to have been taken out by a Mr. Steel for the improvement of water-closets. He proposes to place them one over another, setting each of the upper closets back a little, so that a clear space down to the ground will be left from each. It is somewhat amusing to find a patent being taken out for this in the nineteenth century, when precisely the same arrangement was adopted by the builders of the old castle of Raglan, in Monmouthshire, hundreds of years ago.*

I wonder, sir, if they took out a patent for it, and whether the patent has yet expired; or whether, if they were alive now, they would say that Mr. Steel had stolen their ideas!

F. B.

FROM MELBOURNE, VICTORIA.

The Exhibition has been closed with a grand concert, attended by 1,000 persons. The Governor was present, and was thanked by Sir Edmund Barry, on the part of the trustees, for his patronage of the undertaking. The results of the exhibition are interesting. The exhibits of oil-paintings, said Sir Edmund, amounted to 756, a fact which demonstrated most undeniably and most cheerfully the love of art largely existing in so young a country. All these were contributed at a very short notice and in response to the trustees' solicitation, within a radius of five miles from Melbourne. He was happy to inform his Excellency that the trustees, like Chancellors of the Exchequer, found themselves inconvenienced by a balance to their credit. They proposed to devote the first portion of the funds to institutions which were the pride of the city,—the one for the relief of the sick and suffering, the other for the support of the aged and infirm. The hospital and the benevolent asylum deserved their first care; and, secondly, the object announced in the programme, namely, the endowment of a scholarship for the best pupils of the year in the School of Design. That school had been struggling on for years, yet still it had not been burthen of

* In rough stone, of course, but the same principle. I saw it about four years ago.

fruit. The pictures on the walls, exhibited by several of the pupils, were entitled to considerable commendation. The pupils now numbered over fifty, and, under a proper tutor, their latent ability would be developed.

The Victorian Permanent Building Society's New Offices will stand on an allotment of land in the best part of Collins-street east. The front building will be three stories in height, with a warehouse and store in the rear, and a large cellar underneath. The society will occupy a suite of offices on the ground-floor, the other parts of the premises being let for various purposes. The façade is to be in the Italian style of architecture, and will occupy the full frontage. The lower portion of the building will be ornamented with rusticated piers, and is to have two pair of circular-headed folding-doors (enriched with elegant ironwork), the one leading direct to the company's offices, and the other opening into a broad passage leading to the upper offices and the warehouse. The windows on the first story will be circular-headed, embellished with Ionic pilasters, entablatures, and cornices, while those of the next story will be pedimented, ornamented with moulded trusses, Corinthian pilasters, enriched friezes and cornices. The building will be surmounted with an appropriate balustrade, having a centre panel bearing the name of the society. The architects are Messrs. W. H. Ellerker & Co., of Elizabeth-street. The contractor is Mr. H. Lockington; and the total cost, including land, will be about 11,000l.

The rate of wages in the colony is still maintained at former rates, skilled labour and domestic servants being in great demand. The following are among the rates of wages:—Stonemasons and brickmakers, 10s. per day; carpenters, 9s. ditto; builders' labourers, 7s. ditto; country labourers, 12s. 6d. to 16s. a week.

An Australian Diamond Mine Company has been established at Melbourne. Extensive discoveries of gold, diamonds, sapphires, and other gems have been made near Mudgee, and it is said that the miners have been in the habit of throwing away small dust diamonds, though worth about 600l. an ounce.

A large number of builders and contractors have met for the purpose of receiving rules prepared by a committee. The rules, with a few amendments, were adopted; and after the enrolment of several new members it was resolved that the association should be named the Builders' and Contractors' Association of Victoria, and that its business be conducted by a president, vice-president, secretary, treasurer, and committee of seven. The following gentlemen were nominated and elected:—Cr. Amess, president; Cr. O'Grady, vice-president; Mr. William Ireland, secretary; Mr. William Cain, treasurer; and Messrs. Cunningham, Young, Mitchell, Cooper, Leitch, Pigdon, and Martin for committee. It was resolved to forward a copy of the rules to the Board of Land and Works, and to all the engineers and architects in Melbourne, as it was felt desirable, for the success of the association, that it should have the support of these gentlemen.

A meeting of master brickmakers has been held to consider rules agreed upon by the master brickmakers of Brunswick. Mr. John Glew occupied the chair. The rules were submitted *seriatim*, and were passed with a few trifling amendments. The object of the association is to guard against unprincipled and fraudulent persons in the building trade, who have neither means nor intention of paying for bricks or other material supplied them. The association is divided into five divisions, viz., Brunswick, Hawthorn, Richmond, Collingwood, and Prahran. A large number of members were enrolled, and arrangements were made for a future meeting to elect office-bearers.

THE FOOTPATH OF THE THAMES EMBANKMENT.

Sir,—In your impression of Saturday last appears a letter from "A Stranger on the Thames Embankment," in which the writer complains of the state of the footpath between Westminster Bridge and the Temple. Will you, sir, permit me,—as the contractor for the footpath, in justice to myself,—to say that the cause arises from the fact that the larger part of the paving, viz., that next the river front, is laid over the subway on solid concrete, while the bed for the outer portion is composed of ordinary rubbish filled in to a depth of 30 ft., which had not had time to become solid at the time the work was done, although the Metropolitan Board of Works pumped many thousand tons of water upon the filling-up up to the time of the paving being laid down.

Of course, a subsidence would necessarily take place under such circumstances, and hence its paring company.

JAMES KENTON.

CHURCH-BUILDING NEWS.

Ashbourn.—Mr. Francis Wright, of Osmaston Manor, near Ashbourn, has for some time past contemplated erecting a second church at Ashbourn. About two months ago an advertisement appeared inviting tenders for the construction of the new church. The new edifice is to be built on the north-east side of the town, immediately adjoining the cattle-market, and fronting to the Buxton-road. The contractors for the erection of the building are Messrs. Critchlow & Ward, of Uttoxeter, whose contract, we believe, amounts to 4,500l., but this sum does not include plumbing, glazing, or iron-work. The nave will be 75 ft. in length, and 42 ft. in breadth, with centre and side aisles. The chancel, a circular apse, has a radius of 15 ft., and will contain an oval communion-table. The vestry on the north side will be 12 ft. long, and 9 ft. wide. The tower, which stands at the west end, will be 22 ft. square, and 61 ft. in height from the floor line, and will be without a spire. The height of the building to the ridge is 38 ft. The chief entrance will be on the west side, immediately underneath the tower. The exterior walls will be Mayfield stone, caed inside with bricks. The interior is laid out to accommodate 500 persons, and will be heated by an improved hot-water apparatus. The contractors have already entered upon the work, the foundations have been cut, and the walls of the building are rising above the surface of the ground.

Heworth.—The new church at Heworth, near York, has been consecrated and opened by the Archbishop of York, under the designation of Holy Trinity. It is situated at the corner of the road leading to Tang Hall. It has been erected in remembrance of the Rev. J. Willey, by his widow, who has recently been deprived by death of her second husband, Sir Trevor Wheeler, bart., of Leamington, Warwickshire. The building consists of a nave and chancel, with side aisles for children, a tower at the north-east angle of the nave, and a porch at the north-west end of the nave. The vestry and porch for children are on the south side of the chancel. The nave, which is of one span, is 35 ft. wide by 73 ft. long, and 47 ft. high to the apex of the open roof, the walls being 25 ft. high. There is a centre and also two side passages, with two rows of seats, to accommodate 280 adults. The north and south aisles are seated for 134 children, and are each separated from the nave. Two arches spring from corbels and a centre shaft of red Mansfield stone. The chancel is seated for sixteen adults on the south side, and children of the choir in seats on the north, in front of the organ-chamber, in the tower. There are 300 free and 150 appropriated seats in the church. The chancel measures 33 ft. by 22 ft., is 38 ft. high, and is paved with Messrs. Maw & Co.'s encaustic tiles. There are three entrance porches: one by the tower, the second by the vestry, and the third, or principal entrance is at the north-west. The walls internally are plastered. The dressings are of stone, the corbels and capitals being all carved. Round the chancel there is a frieze of majolica tiles, and under the east window is a series of majolica and painted tiles. The centre window is filled with stained glass, the gift of Mrs. Bell, of Heworth, in memory of her late husband, the subject being a single figure of the Ascension of our Lord. The glass in the cinquefoil window over it was given by Mr. J. Keswick, the builder of the church. The three windows at the east end are deeply recessed, and the moulded arches inclosing them spring from carved capitals resting on detached shafts of red Mansfield stone. Similar shafts, &c., divide the side walls into compartments, and support the principals of the roof, which are all slightly stained and varnished, and the panels boarded. The side walls throughout the church up to the stone string-course under the window-sills are coloured green, finishing with a coloured border of a conventional pattern. The roofs are all open-timbered, with framed bammer-beam, principals, purlins, &c., and boarded in panels under the rafters. The wheel window in the west gable, of five trefoiled openings, is filled with stained glass, of geometrically-arranged foliage, the gift of Mr. Jones, the architect; and the quatrefoils and vesicas of the eastern windows, and that over the front, are filled with glass, given by Mr. George Harrison, the clerk of the works. The church will be lighted by gas, from rows of jets along the sides, on a level with the window-sills, and the building warmed by three hot-air stoves under the floors of the passages, the flues being taken through the

vestry fire. The walls of the church outside are faced with Bradford walling stones, on brickwork, and all the dressings are of Ancaster stone. The tower is square, without buttresses, and 20 ft. at the base, diminishing into an octagon of 18 ft., with ornamented angle brackets, gabled parapet, and pinnacles at the angles, and terminated with a spire, which, with the iron vano, gives a height of 129 ft. The roofs are covered with dark Westmoreland slates, with stone girding and Staffordshire tile cresting. The ground round the two sides of the church is inclosed with a sunk fence wall of stone. The entrance-gate pillars are of stone, with some architectural character, and the gates are open-framed, with ironwork in the panels. The architecture is all of the Early Decorated period, but of simple character, from drawings and designs, and carried out under the personal superintendence, of Mr. G. Fowler Jones, of York. The organ, presented by Mr. W. Gray, was built by Mr. Hopkins, organist of the church of St. Olave, Marygate, York. The cost of the church and parsonage-house attached will, it is said, exceed 10,000*l*. The masonry and brickwork have been carried out by Mr. J. Keswick, builder; the carpentry and joinery by Mr. J. Holmes; the plastering by Mr. Rawlings; the slating by Messrs. Wood & Son; the plumbing and glazing by Mr. R. Walker; the ironwork by Messrs. Fryer & Son, Mr. Ayers, and Messrs. Dent; the painting by Mr. R. Gowland; the stone carving by Mr. C. Cole, and that of the woodwork by Mr. James Jones; Mr. W. Knowles having supplied the stained glass and the painted tiles of the reredos, and the decoration of the organ case and pipes. The whole of the tradesmen thus employed reside in York. Mr. George Harrison acted as the clerk of the works.

Flamborough.—St. Oswald's Church has been re-opened after restoration and rebuilding. It is five years since the work of restoration began: it commenced with taking down the old turret and new roofing and repairing the chancel; but as the work proceeded the other parts of the church were found to be in such a state of decay that it became necessary to extend the works to the entire rebuilding of the chancel, and to effect other improvements and alterations. These works have, however, been protracted by several unavoidable causes. The south walls of the nave have been nearly rebuilt. The nave has been new roofed; the timbers are stained and open, and slated. Six windows, three on each side, and two more in the south clearstory, have been restored. All the windows have been glazed with cathedral glass, with the exception of one in the south aisle, which is of stained glass, and was the gift of Mr. C. H. Childers of Flamborough. The walls have been replastered, and the pillars and arches, which were previously coated with whitewash, have been cleaned. The pillars are of a yellowish chalk. All the old high-backed pews have been swept away, and replaced with stalls of pitch pine and varnished. The aisles have been new flagged, and a heating apparatus introduced. One of the arches in the north aisle has been opened out and restored, and an arch on each side of the chancel arch, and dividing the aisles from the chancel, has been erected. The old arch formerly leading into the belfry has been hared. The chancel has been rebuilt, except the interior gallery and arches, at the cost of Mr. Walter Strickland. The roof is open and of stained timber, corresponding with that of the nave. Instead of the old square windows in the clearstory, new circular ones, intersected with crosses and other decorative ones, have been substituted. In the east end a large five-light perpendicular window, and a smaller one at the end of each aisle have been introduced. The old Norman arch between the nave and the chancel has been restored, the floor new flagged, and other restorations carried out. The architect was Mr. R. G. Smith, of Hull, and the contractors were Mr. J. Bennett, of Bridlington Quay, and Mr. A. Hall, of Flamborough, for the masonry; Mr. J. Harrison, of Flamborough, for the wood work; and Mr. R. Redhead for the glazing.

Peckleton (Leicestershire).—Works of restoration are now being carried out at the church here. The stucco is to be removed from the exterior of the walls, and the perished stonework of walls and windows renewed. The new roofs will be raised to the original pitch, and the chancel rebuilt. This church was originally erected in the fourteenth century. The works here being carried out by Mr. John Firm, of Leicester; the architect is Mr. Osborn.

Leicester.—A new church is to be commenced immediately, in Belgrave-gate. The edifice is to be dedicated to St. Mark, and will be built (at the sole expense of Mr. W. Perry Herrick, of Beammanor, and his sister) from the designs and under the superintendence of Mr. Ewan Christian, of London. The building is to be erected by Mr. John Firm, of Leicester.

Attenborough.—The parish church of Attenborough has been re-opened. The restoration of the edifice has recently undergone (under the direction of Mr. R. C. Sutton, architect), has involved a new seating, and a restoration of the interior walls, which previously had upon them a thick coating of yellow-wash. The restoration also includes the taking down of the gallery at the west end, the throwing open of the belfry arch, and the erection of a new door.

Baconsthorpe.—The church of Baconsthorpe has been re-opened for divine service after a restoration by Mr. Chapman, by whom the execution of the work has been carried out from the designs of Mr. Teulon.

Addiscombe, Croydon.—St. Paul's Church, built for the Rev. M. B. Ollie, by Messrs. Wright, Brothers, of Croydon, from the designs of the late Mr. E. B. Lamb, at the sole cost of Mr. R. Parnell, has been opened for divine service. The stonework of the exterior and interior is carved in natural foliage. This, with the internal fittings, consisting of pulpit, desk, and font of Caen stone and various marbles, brass altar-rail, pulpit-rail, font-rail and lectern, oak sedilia, chancel seats, &c., is the work of Messrs. Cox & Son, of London.

Armley (near Leeds).—The foundation stone of Christ Church, Upper Armley, has been laid. The site was selected and promised by the late Mr. Gott, who also gave a large subscription in aid of the building fund. The church, when finished, will have a square tower, and will form a conspicuous object. The architects are Messrs. Adams & Kelly, of Leeds. The style adopted is Early English, and the plan comprises a nave, with north and south aisles. Inside the church will have a total length of 145 ft., and a breadth of 65 ft. 6 in. At the west end of the nave will be the tower, 26 ft. square at the base, and rising to a height of 107 ft. There will be a ringing-chamber and belfry stages, and provision will also be made for a clock having four faces. The entrance will be by a porch in the westernmost bay of the south aisle, and by a doorway in the south wall of the chancel. By the vestry there will also be a separate entrance. An arch in three orders will open the tower into the nave. Sandstone from the Horsforth Quarries is being used in the building, and effect is given by introducing double hammer-dressed facing and finely-tooled dressings. The church will seat 650 adults, but increased accommodation may be obtained without enlarging the edifice. The contractors are Mr. Thomas Whiteley, mason and carpenter; Messrs. Watson & Wormald, slaters; Mr. Geo. Wilson, plumber and glazier; Messrs. Heaps & Robinson, ironfounders; Mr. William Dewhurst, plasterer; and Mr. W. Switbank, painter. The contract estimate for the work is 6,407*l*.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Newcastle-upon-Tyne.—The foundation stone of a new church, which is to be erected at the Red Barns, situated at the head of Elwick's lane, in the eastern district of Newcastle, has been laid. The site is on an open space of ground, in the midst of a large portion of the working population of the town. The edifice is dedicated to the patron saint of the order of monks located in Newcastle, who have undertaken to raise the funds for the erection of the edifice, viz. St. Dominic. The entire cost of the church itself is estimated, will be about 8,000*l*, of which upwards of 4,000*l* have already been subscribed, principally by the people of the parish of St. Andrews, in which the monastery of the Dominicans is situated. It is also intended to erect a new monastery on the site after the church is completed, which will require a further large sum of money. The church is of the Romanesque style of architecture, and has been designed by Mr. Archibald M. Dunn, of Newcastle, architect. It will be chiefly remarkable for its great simplicity and large size, the number of sittings being over 1,400. The dimensions are as follows:—Nave, 112 ft. long, 30 ft. wide; chancel, 48 ft. long, 30 ft. wide; aisles, each, 134 ft. long and 18 ft. in width. The total length of the

church, including the narthex at the west end, is 180 ft.; and the height of the nave roof, 75 ft. The plan is cruciform. The exterior of the church will be built of stone, and the interior will be lined with a cream-coloured brick (as a substitute for plaster), mixed sparingly with bands of red brick. These are manufactured by Messrs. Robson, of Wideopen. The present contract, which extends only to the foundation, is let to Mr. William Gibson.

Bloxwich.—The new church which has been erected at Bloxwich has been solemnly dedicated to St. Peter, in the presence of a large and influential congregation. The edifice is built after the French Medieval style of architecture, and consists of nave and aisles, the chancel being a continuation of the central nave, which terminates in an apse. The cost of the structure, with the adjoining presbytery, or priest's residence, is about 1,900*l*, and the greater portion of that amount has already been raised in the way of subscriptions and voluntary donations. The designs for the building were prepared by Messrs. Bucknall & Donovan, of Birmingham, architects, and the work of erection was carried out by Mr. Hemming, of Redditch, builder. There is very little ornament of any kind; and the decorations of the interior—which were done by Mr. Stensell, of Tannton—are not at all of a costly character. It is calculated that the church will accommodate about 400 persons. The walls are of brick, with Bath stone dressings, and the benches and boarded roof are of stained deal. The only part of the interior on which any degree of ornamentation may be said to have been applied is that inside the apse, the roof in that part being painted green, relieved with gilt stars and borders. The dimensions of the edifice are 75 ft. by 35 ft., and attached to the chancel is a small sacristy. The organ at the west end of the church was constructed by Mr. Nicholson, of Walsall, and some parts of the instrument that was used at the old chapel have been worked up into it.

STAINED GLASS.

Holy Trinity Church, Bordesley.—The old stained glass in the east window has been replaced by new glass. It is a large rose, with sixteen principal openings, surrounded by a circle of quatrefoils, and themselves surrounding a geometrical centre. The principal openings are filled with figures of the twelve apostles, and four evangelists, the antipodean effect avoided by locating the evangelists two on each side, in a recumbent position, and ranging the apostles, six above and six below, in a position as nearly perpendicular as circumstances will allow. The centre and outer ring of quatrefoils are filled with floriated ornaments on a ruby ground, the figures themselves being on a blue ground. The designer and executor of the window was Mr. Swaine Bourne, a young artist.

St. Saviour's, Nottingham.—A stained window has recently been placed in this church. The window is on the south side, at that end of the aisle nearest the chancel, and has been erected in memory of Mr. Gilbert Gaunt, of West Bridgford, and his wife, by their two daughters. One of the two principal compartments of which the window consists is filled with a representation of the Resurrection; and the other depicts Christ bearing His Cross. Messrs. Cox, of London, were the artists. The top compartment represents the "Agus Dei," or the Lamb. The window is the first of a series. The church certainly requires a few more of these windows. We may here mention that a new reredos has been placed in the chancel.

Horncliffe Church.—A window in memory of the late vicar, Rev. W. H. Milner, Prebendary of Lincoln Cathedral, has been unveiled. The work has been done by Messrs. Heaton, Butler, & Bayne, of London. There are five lights, and tracery above, in which are placed the following subjects, commencing at the top on the left hand:—1. "The Annunciation;" 2. "The Birth;" 3. "The Adoration of the Magi;" 4. "The Flight into Egypt;" 5. "The Crucifixion;" 6. "The Entombment;" 7. "The Holy Women at the Tomb;" 8. "The Charge to St. Peter;" 9. "The Ascension;" 10. "The Descent of the Holy Ghost." In the tracery pieces are various emblems of the Passion, *i.e.*, a cock, hammer and pincers, ladder, scourge, reed and hyssop, crown of thorns, spear, scarlet robe, coat for which lots were cast, &c., and above are angels with censers, and an "Agus Dei." The

surrounding stonework is of the fourteenth century, and, therefore, the glass is treated so as to match, the subjects being in panels, under short decorated canopies, and the details being copied from old glass of the fourteenth century.

St. Michael's, Handsworth.—A memorial window has been put up at the west end of this edifice, in memory of the late vicar, the Rev. Walter Thursty. The commission for the memorial has been executed by Mr. Bourne, of King Edward's-road, in this town. The window is in the Second Pointed style, and contains four main lights, in each of which is represented an archangel, with the conventional emblems which it has been customary to associate with him from the earliest times, namely,—Michael; in armour, resting his left hand upon a shield, and trampling upon Satan, whose head he pierces with a spear; Gabriel, with shield and sceptre, a lily growing beside him; Raphael, hearing a fish in his right hand and a pilgrim's staff in the left; and Uriel, clasping a sword across his breast. These severally rest upon a floriated base, and are surrounded by an elaborate canopy, the background being blue and the ornamental enrichments ruby. In the geometrical tracery above are other figures with musical instruments, to typify the heavenly host.

Butler's Marston.—Two painted windows have recently been placed in this church, to the memory of the late Rev. George Fuller Thomas, for twenty-two years vicar of the parish. The subjects selected are "The Good Shepherd," and "The Good Samaritan." The work was designed and executed by Messrs. Clayton & Bell, of London. The one light window in the church is an offering from the widow and relatives of the late vicar. The subject is "Our Saviour breaking bread with the two disciples at Emmaus." The church was restored by the Rev. George Fuller Thomas shortly before his death.

FROM SCOTLAND.

Edinburgh.—A site for the public fountain presented to the city by Mr. Ross, of Rockville, has at last been secured in West Princes'-street Gardens, and the city will in a short time be embellished by the erection of what the Scotsman styles "one of the most elaborate and ornate structures of its class in Europe." The fountain, which was designed by Durenne, of Paris, has just arrived from France in 122 pieces. It cost Mr. Ross upwards of 2,000*l.* It will be erected on the middle walk in the lower part of the gardens, between Castle-street and Frederick-street. Being visible from Princes'-street, it will form a great ornament to that thoroughfare, while it will, at the same time, afford an interesting feature in the landscape as viewed from the Mound. It is proposed that on the days when the fountain plays, the public shall have free admission to the gardens. It devolves on the public to defray the expense of its erection on the chosen site. Already 100*l.* have been received; but between 400*l.* and 500*l.* more will be required.—A discovery of some interest has been made in connexion with the street improvements at present being carried on in the Grass-market. For years past, a St. Andrew cross within a circle has been pointed out as indicating what was supposed to have been the ancient place of common execution. The street is in course of being relaid, and while doing so the workmen uncovered near the spot what turned out to be the socket of the old gallows. It was at a considerable depth below the present street level. It had a lining of wood, and was about 18 in. in depth by 9 in. square. The contractor, Mr. McIntosh, replaced the cross immediately over the site as now accurately ascertained.

—The directors of the North British Railway have resolved to proceed immediately with the new station at Waverley Bridge. The first step taken will be the erection of a New Waverley bridge. The present structure will be removed, and a bridge, after a design similar to that at Westminster Bridge, London, will be erected in its stead. It will be higher than the present bridge, and more on a level with Princes'-street. It is also intended to remove the goods traffic to the old market.—The directors of the Bank of Scotland having got their new offices in Bank-street nearly completed, are making arrangements, according to the Scotsman, for turning to account the large space of ground lying at the south-west corner of the bank. A portion of this ground was until a few years ago occupied by a tall land of houses, and it was when these houses were removed as

being unsafe that the directors of the bank acquired possession of the site, which adjoined a space formerly owned by them. Various proposals have been made from time to time as to the purpose to which the ground should be devoted, and it was one of the sites named as being peculiarly suitable for a town-hall. Now the proprietors have determined to construct a new street upon it, and to carry out other works which will improve the surroundings of their edifice. Mr. David Bryce, R.S.A., the architect of the bank, has prepared plans for the contemplated works, and already some preliminary operations are in progress. The plans embrace an extension of Bank-street eastward for a distance of fifty yards, the formation of a new street, southwards from that extension to the High-street, and the erection of a broad stair giving access to Market-street. Owing to the situation of the ground on the slope of the High-street ridge, it is necessary, in extending Bank-street, to put in a strong retaining wall, founded on the rock 70 ft. below the street level. The construction of this wall is now being proceeded with. The wall will run in a line with the front of the bank, and will be surmounted by a railing. The street between the wall and the houses on the other side will be 50 ft. in width. The elevations prepared by Mr. Bryce show that the houses will be in the Baronial style, and that some of them will have four stories, and others five stories and attics. In all cases, the street floor will be let for shops or offices, with saloons behind. The east side of the new street will have a frontage of 212 ft., and the west side a frontage of about 160 ft. Including the new space in Bank-street, there will be a total frontage of about 500 ft. At its junction with the High-street, the new street will be 38 ft. wide, but about midway down it will expand to 45 ft. The gradient will be 1 in 40. From near the north-east corner block a wide stone stair will lead down to Market-street, and afford a convenient access to the railway station. The fens are being rapidly taken up.

PATENTS CONNECTED WITH BUILDING.

BRICKS AND TILES. *J. & W. Adams.* Dated 29th October, 1868.—This consists in treating or preparing clay, loam, or brickearth, by adding thereto and mixing therewith street-slop, or drift, ash, and sand, or waste from stone sawing, commonly known as stone sand, or stone crushed for the manufacture of bricks and tiles, whereby we are enabled to dispense with ashes, also at the same time improve the texture, colour, and quality of the said articles, and produce superior bricks and tiles from inferior clay. The number and quantities of the mixing materials above mentioned must be varied according to the colour required and the quality of the materials. The drift and sand or waste and other similar matter, the drift and chalk, or the whole of the materials being mixed together and added to the clay or loam, as the case may require.

ROOFING.—*W. D. Young.* Dated 27th October, 1868.—All the edges of the tiles or plates are bent over in the form of a hook, so that when laid in place they overlap, catch, or interlock into each other. The joints of the tiles or plates, by being so interlocked, form an effectual protection against rain or wind passing through. The tiles or plates may be fixed to the beams or frame by hooks or clips, firmly secured to the beams or frame, the hook portion passing into and bearing upon the overturned or bent edges of the tiles or plates.

WINDOW FRAMES.—*J. Johnson.* Dated 27th October, 1868.—The barrels or drums are caused to rotate by cords, hands, or lines, running through suitable guides and passing down the window frames in the manner of ordinary roller-blind cords, such cords, hands, or lines being secured to and passing around large pulleys or wheels attached to the barrels or drums for giving a certain amount of leverage, so that by pulling the cords at the sides of the frames and thereby causing the large pulleys, and with them the barrels or drums to rotate, the cords attached to the sashes or shutters will be wound around the barrels or drums, and the sashes or shutters consequently raised while on the barrels or drums being caused to rotate in a contrary direction so as to unwind the cords, ropes, bands, or chains, the sashes or shutters being released, will descend by reason of their own preponderance over the sash weights, which latter are for this purpose made so as only partially to counteract the

descending tendency of the sashes or shutters. The cords, hands, or lines, by which the barrels or drums are actuated, may be kept lightly drawn down the sides or linings of the window frames by adjustable pulleys or hantons held in position by spring catches capable of being slightly raised or depressed when requisite, so as to somewhat slacken the cords, bands, or lines, and thus permit the sashes or shutters to descend by their own weight, or to be raised by the pulleys or hantons are again released, when the action of the spring catches will cause the cords, bands, or lines, to be again drawn tight, and thus to instantly arrest the downward progress of the sashes or shutters.

VENETIAN BLIND TAPES.—*James Carr.* Dated 25th January, 1869.—The inventor uses a Jacquard loom, and furnishes it with four sets of warps, or warps which may be divided, as is well known, so as to form sheds for more than one web of cloth, and to supply these warps with weft he employs a rising box loom, and prefers that it should be furnished with four shuttles, one for each of the two tapes, and one for each of the short strips, although a smaller or larger number may be used, and the arrangement of loom the inventor employs is that which is known as the Marionette. The machinery, however, may be of any arrangement used for similar purposes, and the order of making the sheds varied.

WINDOW SASHES.—*Edward Ruston & W. W. Mills.* Dated 26th January, 1869.—In connexion with an ordinary sash, on either of its sides, and projecting slightly from the edge thereof, the inventors place a toothed wheel turning in a frame fixed to the said sash. The teeth of these toothed wheels are inclined to their axes, the said wheels somewhat resembling ordinary worm wheels. The teeth of the wheels may, however, be parallel with their axes. Working in slots in the sash are spring checks or catches, which prevent the rotation. On either side of the sash frame, and in the line of the motion of the sash, strips or ribs of vulcanised india-rubber or other similar elastic material are fixed; they make these elastic strips or ribs by preference of a nearly semi-circular figure in cross section, the convex side of the strip or rib being situated outwards, and being presented to the projecting parts of the toothed wheels fixed on either side of the sash. When the sash provided with the toothed wheels described is in its place in the window frame, the toothed wheels compress and flatten the india-rubber strips or ribs. By the elasticity of the strips or ribs such an amount of resistance is offered to the toothed wheels as to support the said sash in any position in which it is placed. In order to raise or lower the sash the spring catches described are lifted from the toothed wheels so as to permit them to rotate. They prefer to arrange the handles of the catches so that the disengaging of the catches and the lifting or depressing of the sash are effected at one operation. Or the catches may be geared together in any convenient way so that pressure at one part of the sash may simultaneously release both catches.

TREATING TIMBER.—*John Pickering.* Dated January 26th, 1869.—This consists in applying to the surfaces of the timber to be finished rapidly moving surfaces of grinding or polishing material, such as sandstone, grindstone, emery, in combination with other substances or other suitable abrading materials. The finishing surfaces of the abrading and polishing substances are circular and made to revolve at a high velocity against or upon the surfaces of the timber requiring to be treated by them, the effect of the treatment being that heat is generated by the friction of the abrading surfaces upon the wood, so that the surface of the wood becomes covered to the required extent, besides being rendered very smooth and polished in a rapid manner.

VENTILATORS AND CHIMNEY-POTS.—*G. Hawksley.* Dated January 29th, 1869.—These ventilators or pots are formed from a long metal band, say of hoop-iron, which the inventor turns into a coil by extending it on one edge more than on the other. He does this by passing the hoop-iron between rollers which are set so as to form a taper nip, and the rollers may be so formed as simultaneously to give to the iron a curved face; or in place of expanding the outer edge of the hoop-iron, a similar result may be obtained by corrugating its inner edge. He then takes a cylindrical mandril of the size of the interior of the ventilator or pot which it is desired to produce, and having in it a number of longitudinal

radial grooves equidistant the one from the other. In these grooves other flat pieces of hoop-iron are placed, having inclined notches in them at equal distance apart from end to end of each piece.

Books Received.

"THOMAS Civil Engineering College, Roorkee; Annual Examination, August, 1869: Report at Close of Session 1868-9, &c. Roorkee: Printed at the Thomason Civil Engineering College Press, 1869." These papers show the nature and extent of the examinations which Royal Engineers and others undergo in the Government College of Civil Engineering at Roorkee, in India; and we have no hesitation in saying that the student who successfully passes a fair examination on the many practical and theoretical questions here put cannot but be in a fair way to become a competent engineer, overseer, &c.; and he must do so before he can receive a certificate of qualification for one or another of the several grades of the Public Works Department. The senior and first departments of the college are composed of officers and civilians who are candidates for the engineering grade; the second department, of soldiers (chiefly) who are candidates for the overseer grade; the third department, of natives, who are candidates for the sub-overseer grade, and whose examination is conducted in Oordoo. There are papers which must be taken up by all; and voluntary papers for college honours only. There are also monthly examinations in mathematics, civil engineering, and physical science, and other tests as the education proceeds.

Miscellaneous.

Halifax Waterworks Extension.—The Hebdon extension of the Halifax Waterworks has been formally inaugurated by the cutting of the first sod of the Castle Carr tunnel, by which the waters of Hebdon and Liddenden valleys will be connected. The scheme is a gigantic one, and will cost nearly 200,000*l.* The Widdop reservoir embankment alone will be over 89 ft. high, and 245 yards long. The depth, at the foot of the embankment, will be 71 ft. 3 in., and in the centre 56 ft., and then it shallows to the head, forming a winding lake nearly a mile in length, and a quarter of a mile wide at its broadest part. In the Washaw Dean valley will be three reservoirs. The upper one will have an embankment 233 yards long, and 71 ft. 10 in. deep, the water being 64 ft. at the greatest depth. The middle reservoir is to be about half a mile long. The embankment will be 313 yards long, 74 ft. high, and the depth of water 68 ft. The lower reservoir will be smaller, having an embankment 6 ft. high, and a depth of water of about 66 ft. The water from the Widdop and Washaw Dean reservoirs will be connected and conveyed by aqueduct and tunnel to near Castle Carr, where will be the junction with the Liddenden scheme. The Castle Carr tunnel will be 2,500 yards long, and have a fall of about 5 ft. to the mile. It will be 8 ft. 9 in. wide, by 4 ft. 6 in. high, having a flagged bottom the whole length. The contractor for its construction has been let to Mr. Parkinson, of Halifax, who has also constructed the Fly Leats, Upper and Lower Dean Head, and the Castle Carr reservoirs. At the cutting of the first sod by the mayor, it was stated by Mr. Hill, M.P., representative of Mr. Bateman, that the cost of construction of the tunnel would be 70,000*l.* There would be three shafts. The one where they stood would be 392 ft. deep. No. 2 would have a depth of 476 ft., and No. 3 would be 331 ft. deep. The time given to the contractor for the completion of the work was four years.

Birkbeck Literary and Scientific Institution, Chancery-lane.—At this Institution, which is in connexion with the Science and Art Department, Mr. W. J. Wilson (Prince Consort's Prize-man, &c.) is to deliver a course of thirty cheap lectures on Electricity and Magnetism, on Friday evenings, at nine o'clock, commencing October 22.

Lake Dwellings.—Traces of lacustrine dwellings have been discovered in Llangorse lake, a lonely lake on the western side of the Black Mountains, and the island in its centre is said to be evidently artificial, and constructed partly of piles and wattling.

Heating Railway Carriages.—We are now familiar with gaslight in railway carriages. Why should we not have steam-pipes to heat them? In the first-class carriages we can generally in cold weather get a tin containing hot water for the feet; but this is a luxury for-bidden, we believe, to second and third-class passengers, and even first-class passengers have at times had to tip the porters before they could obtain the boon. Experiments, according to the *Daily News*, have been made with steam warming on the Brunswick Railway, on the Prussian Eastern, on the Hanoverian, and on the Lower Silesian. The Hanoverian Government Railway runs daily two mail trains with steam heating apparatus between Cologne and Berlin. The steam comes from a tubular boiler in the luggage-car. In the Brunswick Railway it comes directly from the locomotive. In either case the temperature of the carriages is raised from 20 to 30 degrees Fahrenheit. Is it too much to hope that our engineers will one day allow us this comfort? A little less of the extravagant and worse than needless waste of steam in the perpetual screeching of the mammoth-pig-stop whistle (which seems to indicate that signalmen are usually asleep at their posts) would help to make up for the loss of steam by heating the carriages.

Opening of Truro Public Rooms.—These rooms have been opened with ceremonial and festivities befitting the occasion. The rooms occupy a central site, near Boscawen-bridge, on the north side of the Green. The edifice consists of a central block, with two small wings. The walls are of stone from Mylor, the greenish drab of which is relieved by the cream-coloured Bath stone dressings. There is an oriel in the green front. The accommodation provided comprises a large concert or assembly room, with adjuncts; provision for the Cornwall library and the Truro Institution; billiard and club rooms in the main block; a Masonic hall in the east wing; and in the western wing apartments for the theological library left to the county by the late Bishop of Exeter, and the depository of the Society for Promoting Christian Knowledge. The hall is 85 ft. long, 38 ft. wide, and 34 ft. high, and has, not including the gallery, five entrances, three direct from the staircases and passages, and two through the supper-room. It is calculated to seat about 800, the gallery holding 100, and the orchestra, at the other end of the room, being capable of accommodating about 130. The roof is half open-timbered, in six bays, quatrefoils being introduced in the spandrels and shields, which will hereafter be decorated. The windows—six in number—open on the Green. Artificial light is supplied by a number of gas pendants hanging from the roof. An organ, built by Messrs. Hill & Son, has been erected in the orchestra.

The "Iron Blacksmith."—A Stenbenville mechanic named Wm. Kenyon, says the *Sharon Times*, an American paper, has invented, and has now in operation in that place, a very marvellous piece of mechanism, which he styles the "Iron Blacksmith." It occupies the space of an ordinary-sized cask, is very compact, is driven by an engine of herculean strength, and the machine itself is of almost incalculable power. It is at present constructed for the manufacture of wrenches used by machinists—gasfitters more particularly. These wrenches are produced from solid steel, at the rate of one every three seconds, doing the work in three seconds which would require the swiftest and most expert workman a whole day to do, besides executing the work much better. When the "Iron Blacksmith" is "fully armed and equipped," it will produce, as if by magic, any description of tool or implement; also, chains, horse-shoes, fingers for mowers and reapers, all with the same facility and exactness; in fact, almost every article which now comes from the stalwart blows from the arm, and directed by the mental skill and ingenuity of the intelligent smith. This machine, which is the result of many years of thought and labour, besides an expenditure of many thousands of dollars, is destined, our authority thinks, to revolutionise the smithing trade.

Working Men's Club and Institute, Holloway.—In the course of the present month, according to the *North Londoner*, this new hall will be completed, and opened with a *soirée*. It is situated in a good position in the Holloway-road, and consists of a lecture-hall, class, reading, committee, club, and conversation rooms, and gymnasium ground.

Model Cottages for Farm Labourers.—There have been recently erected by Lord Vernon, at Sudbury, near Dorby, several model cottages for farm labourers. Each cottage contains a living-room, three bedrooms, entrance porch, scullery, pantry, fuel store, piggery, privy, cesspit, and asphalt. Each cottage is provided with a washing-copper, sink, and a fireclay baking oven. The living-rooms are fitted with dwarf cupboards, each side of fire-place, with cottage ranges, and the bedroom fire-places have small cottage stoves. The rainwater from the tops is conveyed to tanks for domestic use, having a pump to each cottage fixed over the sink in scullery. The cottages have been built with local bricks made on the estate; the external walls being hollow for dryness, relieved with hands of dark blue Staffordshire bricks. The roofs are covered with blue and brindle tiles, having ornamental ridge cresting. The entrance porches have projecting eaves and gables, with barge-boards and brackets. The works have been carried out by Mr. S. Deville, of Burton-on-Trent, from the designs, and under the direction of Mr. John Birch, of London, who gained the Society of Arts' premium and medal for such designs.

Reopening of Bunhill Fields.—Considering the efforts made in past years by the *Builder* to induce the authorities to set the Bunhill burial ground in order, it is gratifying to be able to state, as we now do, that this ancient burying place has been reopened to the public; not as a repository for the dead, but as a pleasant place of recreation, having been planted with trees, and converted into an additional park for the metropolis. Being part of the Great Fishery estate, Bunhill Fields lapsed a few years since to the Ecclesiastical Commissioners, who resisted the temptation to convert the place into a building site, and decided that it should be made conducive to the health and recreation of the inhabitants of the surrounding district. Bunhill Fields, as is well known to our readers, contained the remains of John Bunyan, Defoe, Dr. Watts, and many other of England's worthies, and it is satisfactory to know that the corporation have taken care to preserve the monuments and tombstones which marked the places where the illustrious dead repose.

"Going, Gone!"—The sale of stock at a farm called Methlem, twenty miles beyond Pwllheli, brought a large gathering of the leading farmers of Anglesey and Carnarvonshire together. Whilst the auctioneer was selling off some articles of furniture in a room above the dairy, the bidders, to the number of about 150 persons, proved too great a weight for the floor, which gave way just as Mr. Owen was giving his final "Going, going, gone," to a piece of furniture, and the whole party was precipitated to the dairy below. An ex-mayor of the borough of Pwllheli was thrown into a pail of cream, and was slightly injured, whilst a solicitor found himself sunk in a ten-gallon cask of hutter-milk. A corpulent farmer, weighing a little over 16 stone, was precipitated on a pot of butter, which broke and besmeared him sadly. The bidders, after the accident, would not follow the auctioneer to other rooms up-stairs, and the articles of furniture that remained unsold had to be taken down-stairs. Accidents of this kind are not unprecedented. Some consideration should be given to the state and strength of floors, under such circumstances, beforehand.

How Disease is generated.—The following extract from the report of the medical officer of health of St. Olave's, Southwark, which has been presented to the Local Board of that district, reveals one of the risks to which poor people in over-crowded courts and alleys are subject. Dr. Vinen says:—

"In the yard of No. 1, Cow-alley, is a large water butt for the supply of that house and two others in Goat-street. In consequence of the butt not being provided with a lid, the water is exposed to the influence of air and light, encouraging the development of animal and vegetable life, as certain effects of water being thus exposed. I exhibited some specimens of conferva and other vegetable productions found growing in very considerable quantities on the sides of the butt, and also a sample of the water, in which were plainly to be seen freshwater shrimps, blood-worms, snails, and more minute creatures—the water-leas, cyclops, &c. Small as the water-leas is, its appearance in water implies the presence of other creatures, still more minute than itself, upon which it feeds. This water, in the condition I here describe, so utterly unfit for any domestic purpose, has been constantly used, the larger animal growths being first strained off."

It is satisfactory to know that the Board issued an order directing the erection of cisterns with covers and the necessary appliances.

Workmen's International Exhibition, 1870.—Very considerable progress has been made, not only in this country, but in foreign countries. Side by side with the contributions of our own country will be the productions of the French artisan, of the thoughtful German, of the artistic Italian, of the persevering Dane, and of our American cousins. To meet the very energetic efforts made in foreign countries, seventy local committees have been formed in the United Kingdom. It is hoped that the artisans of this country will make a most determined effort, so that the Workmen's International Exhibition of 1870, in the Agricultural Hall, at Islington, will not only be a display of the best foreign workmanship, but an exposition of the talent, industry, and manipulative skill of the British workman.

Opening of the Industrial Exhibition, Basingstoke.—The new Mechanics' Institute has been opened with an Industrial Exhibition, similar to those recently held in some of the principal towns of England. The collection included works in wood, models, needlework, paintings, photographs, drawings, illuminations, stuffed animals, works in straw, rush, and other materials, &c. The rooms were classified as follows:—On the basement, works in wood and metal, and miscellaneous articles. On the first-floor, loan department, needlework, and natural history,—a separate room for each. Two rooms at the rear of the building were furnished as refreshment-rooms. The entrance was fitted up with flags, and an iron hammered gate made by Mr. J. B. Soper. There were nearly 600 exhibitors.

Antwerp.—Antwerp is utilising its fortifications. The *Precurseur* of Antwerp says:—"The sale of the Southern Citadel is now an accomplished fact, the contract having been signed at Brussels between Dr. Stronberg, of Berlin, on the one hand, and M. Frère-Orban, Belgian Minister of Finance, on the other. The price is 14,000,000 of francs. The State reserves ten hectares (two acres and a half each) of land, to be employed for a new passenger and goods station; Dr. Stronberg engaging by his contract to establish large docks, warehouses, &c., at his own cost."

The Maclesfield Town-hall.—A record has come to light here, after the lapse of nearly half a century. The extension and improvement of the Town-hall premises have necessitated the taking down of a portion of the old building; and, during the progress of this part of the undertaking, the workmen found the foundation-stone of the hall, which was laid in 1823, lying at the south-west corner. A brass plate, bearing an inscription recording the event, and eight coins and three medals were found.

Bursting of a Steam Boiler.—Nineteen persons have been killed and nearly a hundred injured by the explosion of a boiler at the State Fair, Indianapolis, in the United States. The boiler was attached to a saw-mill, and had just been fired up for test with another machine, arrangements having been made to take it up as soon as the trial was over. Many of the bodies were horribly mutilated and burned, and in some cases it would be impossible for friends to recognise them.

The Architectural Association.—The annual *conversazione*, with which the business of the session commences, will be held at Conduit-street, on Friday evening, the 29th inst. This is the right time for new members to join. Architectural students, and those interested in cognate arts, cannot take a better first step than by enrolling themselves members of the Architectural Association, and availing themselves heartily of the advantages it affords.

Relics of Roman Winchester.—Extensive excavations have uncovered a variety of interesting articles in connexion with the Roman occupation of Winchester. There are several cinerary urns, all more or less broken, and in one calcined bones were found. There were also a couple of urns, with one handle each, of fine earthenware

The New Townhall, Chester.—Sir: In your notice you say, "the gas fittings and ironwork generally have been supplied by Skidmore, of Coventry." I beg to say that I supplied the wrought-iron work for the exterior, which was made from the designs of the architect.—ALFRED WEBB.

TENDERS.

For the United Methodist Free Church, Fishbury, Messrs. Woodhouse & Potts, architects. Quantities supplied by C. N. McIntyre North:—

A. & J. Smith	6,231 0 0
Brown & Robinson	6,231 0 0
Dove	6,196 0 0

Just published, **QUANTITIES MADE EASY.** A quick and accurate method of taking out quantities from all buildings, with or without a specification. Sent for by post for 30 stamps.—Address, A. C. S., Northbrook-terrace, Barnet, Antislane, Lea, Kent, S.E.

J. L. BACON & CO.'S IMPROVED HOT-WATER APPARATUS,

FOR WARMING AND VENTILATING
Private Houses, Churches, Schools, Hospitals,
Manufactories, Greenhouses, &c.

HAVING had a large experience for many years in heating Houses, Churches, Schools, and other Buildings, both public and private, we are prepared to offer a Hot-Water Apparatus surpassing all others in economy and efficiency. The small size of the pipes enables us to introduce them with facility in buildings already erected. The pipes can be placed in any position, either along the skirting, or under the windows, or coiled up in pedestals, or sunk beneath the floor, in all cases being covered with iron trelliswork, of either plain or ornamental design, to suit the architectural decorations of the buildings. Buildings warmed on this system are more thoroughly under control than when large pipes are used; the tubes, from their small size, containing but little water, are quickly heated, causing great rapidity of circulation and economy of fuel.

The average cost of warming a house of ten rooms (exclusive of kitchen offices) having a cubic content of 20,000 feet, would be about 80*l.*, or 4*l.* per 1,000 cubic feet warmed. For churches the cost would vary from 10*l.* per 1,000 cubic feet to 25*l.*; the cost of a church of ordinary size being about 16*l.* per 1,000 cubic feet. Schools and factories, about 2*l.* per 1,000 cubic feet.

An Apparatus is on exhibition at our office, where the public are invited to call and examine it, and we are prepared to prove to every one that this Apparatus stands unrivalled for simplicity, economy, safety, and durability; and, moreover, that it warms without vitiating the atmosphere.

Estimates will be given for any plans sent to our office, or on application being made for a personal inspection; and we guarantee every apparatus which we erect.

Testimonials,

SELECTED FROM MANY WHICH WE HAVE RECEIVED.

ALFONA RAILWAY STATION.
In the newly erected large railway-station, an architect of the name, has had all the rooms, without exception, heated by Mr. J. L. Bacon. I bear testimony to Mr. Bacon that this heating has been in full use six winters, and has during this time given full satisfaction to the public in general, as well as to the officials of the railway; whilst the consumption of fuel, an equal and agreeable temperature was produced, even in the coldest weather. The trials and pedicasts, which are necessary in the heated rooms, do not in any way disturb the rest of the decoration, but even in the least finely-furnished saloons; on the contrary, they are quite in harmony with the rest of the furniture.
In finishing, allow me to add, that the business intercourse with Mr. Bacon or his representative was always most agreeable, and that during the sitting of the apparatus, which cost 11,12*l.* I never experienced any hindrance in my building. It gives me pleasure to be able to testify the truth to others, and thereby contribute my experience to recommend Mr. Bacon.
Altona, 19th April, 1863. MANFRED SEMPER, Architect.

CITY SCHOOL OF ZEPHAR.
At the request of Messrs. J. L. Bacon & Co. of Berlin, we, the undersigned Commissioners of Buildings, pronounced favourably on the Hot-Water Apparatus erected in the New City School. Messrs. J. L. Bacon & Co. have entirely fulfilled the obligations of their contract, and have furnished the new school with a Heating Apparatus which leaves nothing to be desired. Not only the Apparatus properly proportioned to the different rooms to be heated, but the construction, taken in its whole, is as exact as any could desire. The saving in fuel is great in comparison with other modes of heating. We have to warm forty-five large rooms, 31 feet long by 24 feet wide; two large lecture rooms, the corridors, and four staircases; making altogether a cubic space of 672,760 feet. We are able to obtain the heat of an hour and a half of dry, Faber, whatever the external temperature may be, and we easily keep the rooms at this temperature. During hard frost we burn daily four bushels of coal for each furnace; this cost, at about 5*l.* per bushel. Expenses has taught us that the daily consumption is on the average three bushels per furnace. We have to feed five furnaces, consequently the heating of the whole of our large building costs us 6*l.* 3*s.* per day. It would be impossible to warm our large rooms comfortably with ordinary hot-air stoves, however perfectly they might be constructed, and the consumption of fuel would be at least three times as great. The advantages of this method of heating are as follows:—The equal distribution of heat; the cleanliness which it results; no fuel being carried into the rooms; the cheap cost of maintaining the apparatus in three years we have had no expense for repair; the saving in fuel and situation; and lastly, the whole house has perfectly and uniformly, provided the necessary amount of work to admit pure air, and allow the vitiated air to escape. We are perfectly satisfied with the apparatus, and we are about to give Messrs. J. L. Bacon & Co. some more very large orders.
The Commissioners of Towns Buildings,
E. TRUMMELER,
Director of Buildings.
Zittau, 5th March, 1863.

LUNATIC ASYLUM AT HAMBURG.
The undersigned, at Mr. J. L. Bacon's request, hereby certify that he has erected for us numerous Hot-Water Apparatus, in private dwelling, office, schools, and public buildings, and that the work which he has executed has entirely fulfilled its purpose everywhere. Amongst the public buildings, we mention especially the heating of the cells of the Lunatic Asylum, Friedrichsberg (near Hamburg); in this building the principle of insensible ventilation has been brought into use, and executed, in connection with high-pressure heating. The air is warmed in the heating chamber by passing over the surface of the pipes, and is driven to the most remote parts of the building, by the means of a small steam fan, through horizontal flues, and reaches the cells at a distance of 200 feet, with sufficient force to give, in winter, the required warmth of 66 degrees Fahrenheit, entering through small openings near the ceiling into the cells, as required by the physicians.
The large day-rooms in the main building of the Lunatic Asylum are warmed by Hot Water Pipes, placed behind the skirting boards, and covered with iron trelliswork, which equally fulfil their purpose.
We like to state, finally, that we have always been highly satisfied with the execution and the work of Mr. J. L. Bacon's High Pressure Hot-Water Apparatus.
CHR. TIMMERMAN & CO.
Civil Engineers and Architects.
Hamburg, May 1, 1867.

GERMAN AND FRENCH REFORMED CHURCH, COBLENHAGEN.
We, the undersigned elders of the German and French Reformed Church of this City, do hereby, at the request of Mr. J. L. Bacon, certify that the Hot-Water Apparatus, erected by him in the above mentioned church, has, during the whole of last winter, notwithstanding severe frost, worked perfectly well, and at all times, been able to give sufficient heat.
S. C. SCHWARZ,
C. K. DE CONINCK.
Coblenhagen, 20th May, 1860.

PRIVATE HOUSE, TUFNELL PARK.
Gentlemen,—In answer to your inquiry, I beg to state that the Hot-Water Apparatus you fitted in my residence answers admirably, maintaining an equal temperature throughout the house, and being capable of adaptation to the varying circumstances of the weather.
I am, Gentlemen, yours, &c.
J. E. SCOTTE.
To Messrs. J. L. Bacon & Co.

"COURT OF JUSTICE, BERLIN.
I certify that Messrs. J. L. Bacon & Co. have erected in the Court of Justice of this town a Hot-Water Apparatus to my entire satisfaction. This Apparatus gives a permanent heat of 63 degrees Fahrenheit, even with an external temperature of 14 degrees Fahrenheit.
Royal Bau Inspector,
Berlin, 9th March, 1858. HESSE.

LA SAINTE UNION, HIGHGATE.
We have much pleasure in being able to testify to the perfect efficiency of Messrs. J. L. Bacon & Co.'s warming Apparatus, which has been applied under our direction to a large institution at Highgate.
One of its chief recommendations is the small consumption of fuel, taking into consideration the results gained.
D. Kensington square, 11th October, 1852.

PRIVATE HOUSES AND PUBLIC BUILDINGS IN ENGLAND.

OFFICE and SHOW-ROOMS:—FARRINGTON ROAD, LONDON, E.C.
ONE DOOR FROM RAY STREET.

The Builder.

VOL. XXVII.—No. 1395.

The High Court, Calcutta.

Public Works of India.

ATTERS architectural and constructional do not go on quite satisfactorily in India. With every disposition to listen to both sides, we cannot resist the impression that the Department of Public Works requires great reform. It is composed chiefly of a military element; everything smacks and smells military; and the assertion that reaches us from all quarters is that "The few civil engineers are snubbed and made to eat humble pie to military chief engineers, who really do nothing but sit at office and write minutes and reports, and carry out a system of scarlet tape unknown even in red-tape England."

We are disposed to think there should be a separate architectural division in the Public Works Department, as there is for railways and for irrigation works.

The building we illustrate in our present number is the new Calcutta High Court, designed by Mr. Walter L. Granville, late architect to the Government of Bengal, and which is now nearly ready for the roof.* It is on the site of the old Supreme Court, facing the Eden Gardens, and promises to be a handsome addition to the public buildings of the city. In plan it is a rectangular parallelogram, whose sides measure, respectively, 420 ft. by 290 ft. It therefore covers nearly three acres of ground. The building has three stories, and is 88 ft. high from the road to the parapet. The large central tower is 36 ft. square, and 230 feet in height. The interior quadrangle measures 235 ft. by 145 ft., and has vaulted cloisters or corridors all round on the two lower stories; whilst, on the third, the corridors are on two sides only. There are six large carriage entrances, vaulted and lined with stone, to the interior quadrangle; these form the chief entrances for the public. The building, however, may be entered through the large lower, and through six doorways placed in the south verandahs. There are also two doorways to the north and two private entrances, with separate staircases, for the judges. Carriages will not be permitted to remain in the courtyard, but will proceed to shelter under carriage-sheds, to be built in the avenues and gardens it is proposed to lay out on the maidan. The rooms on the ground floor are set apart for clerks' offices, principally natives, and the heavy records of the courts. The tower above the ground floor will be used as the depository for wills and other valuable records.

On the first floor there are in all seven courts of law, with retiring-rooms for the judges, a judges' library, a bar-library, with consultation-

room and retiring-rooms, attorneys' rooms, native pleaders' rooms, petty jury-rooms, a private office for the registrar, and a room for the Chief Justice's clerk, with a number of bath-rooms and other subsidiary conveniences. The corridor at the south front is for the private use of the judges, who will thus be able to communicate with one another without mixing with the public.

Of the two largest courts, one will be used for cases on the original jurisdiction side, the other for cases on the appellate side. They are each 82 ft. long, 72 ft. wide, and 50 ft. in height, and contain 200,000 cubic feet of air, being thus much larger than our Houses of Lords and Commons.

Ventilation by the natural process has been attended to in these courts by means of the following expedient. At a height of 30 ft. from the floor, runs a clearstory all round the court. This clearstory will permit the upper part of the court to be left open to the outside air, except during violent storms, when the openings can be closed. This system of top lighting and ventilating by means of a verandah or clearstory half-way up the room was first introduced by Mr. Granville, at the large waiting-hall of the Eastern Bengal Railway Station at Sealdah, Calcutta. In addition to this natural mode of ventilation, a high-pitched roof is added, plated with iron, over the ceiling of the court, under the impression that as the iron plates become heated by the sun, the interior of the roof will act as a furnace, and will draw up the heated air from the court below, through orifices made in the ceiling, and that this heated air will then escape outside.

The smaller courts, libraries, and other rooms, on this floor, are all nearly 30 ft. high. On the third story, chambers facing the south are provided for barristers. This will be a source of revenue to the court.

A few words on the construction of the building will probably be acceptable. The walls are of bricks obtained from the Government brick-works at Acra; they are of good quality, and the work is strong and sound. The walls on the lower story are faced on three sides, viz., south, east, and west, with a sandstone quarried from Barakur. Stone is used as a facing to the lower story in preference to the cheaper method of sand-plastering, on account of the rapid disintegration of all brick and plaster work situated in the lower strata of the Calcutta atmosphere. It is well known that, at almost all seasons of the year in Calcutta, there is more or less a certain saline nitrogenous miasma rising, chiefly at night, about 16 ft. or 20 ft. above the ground, which affects most injuriously every building in the town. By the use of stone, expensive periodical repairs are avoided. On the first floor stone is used up to the springing of the windows, also in the arches and quoins. The plinths, arches, string-courses, and corbels of the quadrangle are of stone. Inside, a very small quantity of stone is used, which is to be regretted; but economy apparently demanded a sacrifice, owing to the great rise of prices: so plaster is being substituted for stone in many places where it should not be. We will only add that the whole area upon which the building now rests was excavated to a uniform depth of 6 ft. (except in certain parts), and then filled in with good concrete, which was strengthened very greatly by two tiers of stout hoop-iron interlaced, the meshes being 18 in. square. This concrete mass formed a solid plateau upon which the brick footings were easily and neatly laid. Trenches and piling were thus avoided, and evenness of settlement was more likely to be secured.* The foundations of the tower were taken down 15 ft., and the operation of getting in the concrete was very tedious, as pumping had to be resorted to night

* A layer of asphalt, $\frac{1}{2}$ in. thick, was laid over the whole horizontal surface of the walls, at a level of 3 ft. from the ground, to prevent the damp rising.

and day. The concrete, however, was eventually put in on the top of a blue clay stratum of considerable thickness and tenacity, and was then paved with large flagstones, upon which the solid mass of brick foundations was commenced. At a higher level near the ground, the foundations were again paved with stone, so that the tower might be set out with great accuracy. We have already stated that the height of the tower, as designed, is 230 ft., its total weight is estimated at 600 tons, and its pressure on the earth is about $1\frac{1}{2}$ ton to the superficial foot.

The high-pitched roofs are all of iron, with strong cast-iron plates, on the same principle as in the roofs of the Houses of Parliament. The estimate for the building was originally 18 lacs, but it was ordered to be reduced to 16 lacs, or 160,000*l.*

Mr. Granville's five years' engagement with the Government, during which time he has designed and superintended a large number of public buildings, terminated last year, and was not renewed, though this and other edifices remain unfinished. The works at the High Court are being carried on under the superintendence of Mr. Barnfather, the executive engineer of the Second Presidency Division. This really seems neither fair nor wise. The architect-designer has almost a prescriptive right to superintend the execution of his own designs. At any rate, it is scarcely likely that the Department of Public Works, to whom the buildings are now confided, will be able to carry out the designs in their true spirit of integrity or with sufficient architectural ability, as their officers are all ordinary engineers, and not one of them, it is asserted, has any knowledge of architecture, save as an amateur.

Leaving this particular case, we would refer to some letters touching the Public Works Department brought to us by the last mail. Works of great cost, such as State railways and canals, are about to be commenced, and great concern is manifested lest the direction of these should not be confided to proper hands. In view of these works the Department, it is asserted, has prevailed on the Home Government to send out a batch of sixty Royal Engineers, and are industriously representing that civil engineers are not to be trusted with the expenditure of public money, unless military men are set over them to watch them. However this may be, it is certain they have published the following notification in the *Gazette* :—

"Whereas the Governor-General in Council is given to understand that in the *Civil Engineering profession* in England, it is a *recognized practice* for civil engineers employed by public companies and otherwise, to receive, in addition to the salaries paid them by their employers, commission on contracts given out, or stores and materials ordered or inspected by them, and other like pecuniary considerations for services done, or intended to be done, which are considered *legitimate sources of emolument*; and whereas a considerable number of civil engineers, who have practised in England, have lately been employed by the Government of India, and the number of such engineers is likely to increase; it is hereby notified for general information that every person in the service of the Government in the Public Works Department in any part of British India, whether civil or military, must consider his salary or pay, as regulated by the rules of the Department for the time being, or defined in any agreement with the Secretary of State for India, in Council, and whether it is drawn wholly or in part in the Public Works Department, or the Military Department, to be his sole legal remuneration; and that the receipt of commission, or any other consideration whatever, directly or indirectly, on account of any business or transaction in which he shall be concerned in behalf of the Government, whether in India or elsewhere, is prohibited."

This has caused great anger. One correspondent writes :—"We are fairly staggered by the audacity of this aggression, when we remember that before the mutiny, at a time when the Department was officered almost exclusively by military men, it was notoriously corrupt from top to bottom; and that sundry officers of Bengal Engineers would look very foolish if certain old scandals about their accounts were raked up. Why, sir, it was the introduction of civil engineers, with their high notions of professional honour, that has mainly rescued the Department from its former ill odour in this respect."

* See pp. 866, 867.

"In former days military men were not supposed to be particular about accepting a tip from a contractor. I do not mean to say that the Bengal engineers of the present day do this, but if they succeed in thwarting the wishes of the Home Government, and driving the whole body of civil engineers to resign in disgust, as they appear to desire, what has been before may be again."

"The Home Government will, doubtless, not allow the Bengal engineers to go quite to this length, but the latter may possibly succeed in their alternative object, which is to secure all the chief posts on the State works, with a body of civil engineers under them, who will do all the professional work, and supply that practical knowledge which they are conscious they do not possess, while they themselves appropriate all the praise and the pudding. The extent to which this system has been worked already is very well known behind the scenes in India."

"But I think both the Government and the Bengal Engineers are reckoning without their host in one very important particular. They talk very glibly of raising five or six millions a year in the London money-market, to be spent under military direction; but what think the capitalists? They have the means of forming a pretty good notion of what would follow, from the experience of the Indian railways. Ask such men as Mr. Turnbull and Mr. Puser to relate the many things they have suffered from many consulting engineers; or read the Blue Book on the delay in constructing Indian railways, and ponder over the skill copiously illustrated therein; or ask any civil engineer who has been in India, what he thinks of the Public Works Department, and whether he would like to invest his savings in railways and canals made by its military officials."

"The best test, however, of the efficiency of the military engineers is to ask what they have done already, and how they have done it? Mr. Kimnaird's committee on public works in India should take up this question, and ask about each of the great works which have been executed by the Public Works Department,—how long has it been in progress? what is its present state? what was the original estimate? and what has it actually cost, including not merely the money spent on works, but the loss of interest on capital, cost of establishments, and loss of revenue by unnecessary delay in completion? A searching investigation of this kind applied to three or four large undertakings, such as the Ganges Canal, the Lahore and Peshawar road, and the works on the Godavery, would bring to light such waste of time and money and professional incapacity that I feel sure no man in his senses would contribute money to be squandered under such auspices; for the sums to be expended are so enormous, that if these public works are badly constructed, or if their cost is doubled by the delay arising out of the inefficiency of the Department, which in its present condition will inevitably be the case, they cannot possibly pay the interest on the capital. The revenues of India are already strained to the uttermost to cover ordinary expenditure, and a failure in the returns from these works means an imperial bankruptcy. Fail they will, if entrusted to those who for twenty years have muddled and mismanaged the Public Works Department, until it has become a by-word."

Without endorsing all these remarks, there is sufficient evidence before us to justify fully the demand for inquiry and improvement. An Indian newspaper says:—

"Is there nothing, we would ask, to be told concerning the Great Northern (State) Railway, or is the Government ashamed of the disgraces and mismanagement which for so long has kept up a staff of engineers doing nothing, wasting the energies which they brought to their work, and at the outset being so disheartened with the impotence and vacillation of Government that they despair of ever accomplishing what at first seemed an easy enough task, and is indeed rendered difficult only by the gross ignorance and thick-headedness of officials who can work only by a system of pre-arranged budgets such as would ruin any contractor in Christendom. Is there nothing to relate concerning all the canals contemplated, and so beautifully drawn out on paper, but of which not a dot of soil has been turned, and which have been named and fully officered merely to deceive an ignorant and most limited home public, to whom distance lends enchantment and flattery seems like truth. Is there still no attempt to divulge of an imperial system of roads, which by opening up communications generally will defy the recurrence of famines by their constant recurrence are becoming a disgrace to our administration? Famines which arise from no other cause than want of communication, and which would become impossible by an organised network of roads possible throughout the year."

The latest specimen of failure sent to us is an account of the Jubbalpore Church, in course of

erection under a military engineer, which half-up is found to be unsafe and is condemned. "I have learnt," says our informant, "that orders have been received for the building to be dismantled; but as it will cost more than the materials are worth, to take the structure down brick by brick, it has been suggested to use run-powder in effecting the work of dismantling."

Again: from Nusserebad, we hear that a court of inquiry is about to be assembled at that station, to report upon the barracks there, that have lately been built at an average cost of 50,000 rupees each. One of these edifices fell the other day with a terrific crash. Providentially, warning was given by the cracking of the roof, and the men were able to move out in time, else we should have had to deplore as great a loss to the gallant Royals as that which happened some years ago to the old 50th at Loodianah, where suddenly, in the dead of night, a crash was heard: the roof of one barrack fell in. "Beneath that mass were the heroes who had escaped the carnage of the battle-fields in which three to one of the regiment had died! 51 men, 18 women, and 29 children were killed by the fall of those barracks; 126 men, 39 women, and 34 children were badly wounded—many maimed and disfigured for life!"

In the case of the new barracks at Nusserebad, which have cost on an average 50,000 rupees each, we trust that a searching inquiry will be instituted.

Enormous sums have been spent in India on public works, and are about to be so spent. Of the past it is of little use speaking; but we should keep a watchful eye over the future. The *Times* correspondent said in a recent letter:—

"This was what was spent on public works and railways in India in the year ending March, 1868, according to the official list:—

By officers of the Public Works Department	27,034,332
By civil officers from local funds	741,091
From feudatory funds	230,082
Expenditure on all works other than railways	8,006,115
Advances in India to guaranteed railway companies	3,150,932
Advances in England to ditto	4,282,303
	£15,419,860

Eight millions on ordinary public works, of which seven must be set against the land revenue; seven and a half millions on railways, the interest on which we guarantee! It is magnificent, but it is dear at the price of deficits. The sum assigned for last year was 161 millions, and that estimated for the current year is 161 millions, of which a proportion is from loans. Apart from deficit and the unsolved taxation in question, the mere fact that we are to spend 150 millions sterling before the end of the century on State railways and canals out of the loans should warn England to send as one of her most curious financiers."

We must go further and say, it should warn England to see that these works are executed under the best possible direction. We have no wish to curtail outlay on the public works contemplated, provided the money be wisely spent,—not wasted. Such works economically executed will produce a good return. But it is the duty of the Government who control them to see that they are executed in the best possible manner and at the least possible cost.

BRADFORD TOWN-HALL COMPETITION.*

"*Justitia*," by Messrs. Milnes & France, Bradford, has carried off the second prize of 200*l*.

On obtaining the first glance of this design from a short distance, the impression is gained that a vast hotel has got into the collection by mistake. The general mass would be rather imposing were it not for the questionable proportions and shape of the main features. From above the centre of the main block of the building, which is occupied by any number of windows squeezed in between small columns (the design is Italian), rises a low pointed, curved dome, with plain slating, crowned by a smaller one; the whole looking like a huge wire-gauze meat-cover. At each end of the main façade is an octagonal tower terminating in a cone-shaped roof. The perspective of these, as well as of the dome and apsidal end of the building is not quite correct. The principal entrance in the middle of the front elevation under the dome is protected by a gigantic portico. The impost of its piers is continuous with the minor cornice under the first-floor windows. From this springs a wide semicircular arch with cornice and parapet over, the former having the same relation to the second-floor windows as the

impost has to the first floor. The colouring of the principal view has gone far to redeem the picture as a work of art, and to it and the massive gilt frame the authors probably owe much.

As to "*Gabiet*," by Mr. S. Jackson, of Bradford, the motto is, we imagine, the abbreviated form of "*Gabiet on the Brain*" which would aptly express the state of mind that the author was in during the composition of this design. If we could count one we could add about a hundred more gabiets to it. The "house with seven gablets" is a mere cottage to this fanciful building. The central feature of the main front is made up of a wide doorway under a gable. Above rise the tower and spire, which start with three lanky lancet windows, of course under three gables, next a string, and then another dose of lancets and gablets. Above these a minute arcade, with a gable over containing a clock-dial, the angles being occupied with gabletted pinnacles. On the slope of the spire are gablets. The design of the end pavilions is poor. In the whole there seems to be scarcely a square yard of plain honest masonry for the wearied eye to rest upon.

The plan occupies more space than that of the two former designs, and is straggling, and without any claim to praise.

These designs are proposed to be executed for 40,000*l*. each.

The reports accompanying the several designs had been removed before we entered the exhibition, which we regret, being curious to know the estimates attached to some, as well as a few other interesting particulars that the drawings alone could not supply.

We now turn from the consideration of the second and third premiated designs to those of the unfortunate.

"*Non quo sed quomodo*," This, we fear, is not the principle adopted by the Bradford corporation. This design is all parts and no whole. The main features are some hundred spikes, no end of gables, and an emaciated and cranky-looking spire of the ecclesiastical persuasion. Had the elevations, which are prepared with the finest lines, been bolder drawn, the author would have had a much better chance of steering clear of frippery. The plan is simple and good, but there is evidently some patent way of lighting corridors adopted which is not shown on the drawings.

"*Lycurgus*," Messrs. Mallinson & Bakewell, Leeds, is in the Flemish style of a late period, and is really very beautiful in parts, and would well bear execution. The spire portion of the main tower, however, is meagre, and the roofs of the angle towers facing the Leeds-road should be considerably elevated. The two pen-and-ink views are quite treats in their way; they are done with great feeling, and show a true appreciation of the picturesque. The plan, unfortunately, is very straggling, to some extent consequent upon the style adopted. Too much space is devoted to corridors. The two interior views of the borough court and council-chamber are nicely got up, but the inner hood arches to the windows are out of drawing.

"*Non Sibi*," Messrs. Connell & Adams, Birkenhead. This is a very original and fine composition, but very ill represented. It is eminently picturesque, and indeed one of the few in the collection we should like to see carried out. In this case the London "*Law Courts*" have been put under contributions for the circular angle towers; but then good use has been made of them. The roof of the central tower is out of perspective. It is very annoying to see so many elaborate and sometimes good drawings spoiled by inattention to the rules of perspective. If young architects could only be persuaded to sketch more from old or existing buildings, these specimens of professional deficiency would be much less numerous. The plan is good and compact, but greatly confused by the style of printing adopted.

"*Libra*," Mr. T. Harris must mean this title as a joke; for his design is conspicuous for the total absence of balance in it. The tower is too heavy; but the rest of the composition is bold, and the different portions of the building are well expressed. With a little more consideration, this would be an excellent design.

"*Fiat Justitia*," Mr. Mitchell has obtained his request. This is of the old English Classical type; a central pediment on eight columns, with projecting pavilions at the end of the façade, and a tower like that of the London Royal Exchange, at the Leeds-road end.

"*Vile Dulce*," Mr. G. Hall, London, is a quiet Italian group, looking better in the eleva-

* See p. 849, ante.

tions than in the view: the lines of the tower are very good. The arrangement of plan is satisfactory, with a few exceptions.

Quatrefoil in Circle, Messrs. Walford & Evill, is well worth looking at. It borders on the extra massive style, but has many charming hits, and makes a good group. The main entrance is composed of a bold and wide archway, from the haunches of which octagonal engaged turrets, decorated on the level of the second floor with canopies and figures, terminate in graceful pinnacles. Over this door and between the turrets are windows for the different floors, and these are surmounted by a gable. The central tower, which rises from the back of this gable, is quite plain until the arches are reached which contain the clock dials. Below the clock-faces in the recess of the arches are subjects in bas-relief. From the feet of the gables, over the clocks, project well-shaped octagonal spirelets, and between them runs a small arcade, from which the central lofty slated roof ascends. The main facade is very massive on the ground-floor, the light to the cells, &c., being admitted by small oblong openings. The windows of the first floor are contained in wide and deeply-recessed arches, with circles in the spandrels, from which project corbels holding sitting figures. The second floor has a continuous arcade of simple pointed windows. The dormer windows are not so successful. The chimneys are good. The main facade is terminated by graceful gables, with bay windows to the lower floors. The spiral slated tower at the Leeds-road end of the building is a fine composition. The plan is simple, and calculated to work well. The oriel turret to the Chapel-lane front is a great success. The authors have wisely, in their view, raised the central tower above what is shown in the elevation, but the dormer windows have suffered by the change made in them. We must give Messrs. Walford & Evill hearty commendation.

The design next in position, but not in quality, falls under the sign of the "Boar's Head." The character of being important has not apparently assisted the author of this anonymous plan, although he has sent in two designs, Classic and Gothic, embodied in fifteen drawings. The tower of the Classic design is an original and fair composition, but the rest of it is tame. The circular tower of the Gothic design has something novel and good about it; but the portion over the dome is inferior to the rest. The plan is straggling, and, with some good, has several weak points in it. The exterior views are beautifully coloured.

"*Meum*," by T. Turner, Bedford-row, London, which the councillors have not wished to deprive him of, is evidently got up in a hurried manner, which is the greater pity, as the plan is the most compact and one of the best in the collection. The main tower is bold and well put together; but there is in the whole a want of that finish which the author has shown himself well capable of imparting; as, for instance, in the "Lancashire Insurance Buildings," in another chester. We should imagine this to be the cheapest design in the collection.

"*Honour*," by Mr. Ralph Nevill, shows signs of youthfulness and want of time. More care would have been of service.

In "*Honesty*" the tower is rather good and original, being apparently the last and best effort of the author.

Mr. Fairbank's design is well grouped and good in outline, and the tower is original. The details are too small and cut up; the plan, however, is quite up to the average.

The author of "*Spes est Solatum*," J. N. Crofts, Liverpool, is the most fortunate of the unfortunates, as he may be said by his motto to have created for himself a fourth prize, not mentioned in the conditions. He can with a safe conscience now inform his friends and admirers that his is a premiated design; and it is well for him that such is the case, for otherwise he never had even the ghost of a chance of reward.

Mr. J. P. Seddon, of London, has submitted a fine composition. The grouping is excellent, and there is great invention shown in the central tower, as well as elegance in other parts. The wings and end towards Leeds-road are agreeable, and the plan is good, although, perhaps, occupying more ground than any of the others. The colouring of the sky, in his principal view, interferes greatly with the design.

Messrs. Driver & Co., of London, must rue the day that ever they competed for this townhall. Their design is very fair, but the plan is not equal to it.

The remainder of the designs do not call for notice.

The effect that the examination of these designs has produced upon us is one of sadness; and for several reasons. First, that so much good work has been done, for nothing; secondly, that inferior work has received prizes; thirdly, that so much bad work should be executed; and, lastly, because of the immoral effect that such competitions have upon the profession. Architects are led to be untrue to each other. Some court of honour is required to restrain them, and the public in connexion with them, similar to that established in Austria for the control of the army.

THE IMPROVEMENT OF THE CITY AND THE PASSAGE OF THE THAMES.

THE human heart, we are told by anatomists, is divided into distinct chambers, destined for the reception, and for the discharge, of the full tide of life, through the pulmonary and the systemic circulations. It is not our purpose here to trace the gradual simplification of auricle and ventricle in the structure of the reptile and of the fish. We refer to the subject as an illustration of the operation of that great diaphragm which divides into two separate systems the circulation of the heart of the British Empire; or, in other words, of the obstruction caused by the Thames to the street traffic of London.

The functions of the river, indeed, are complex. While on the one hand it impedes, on the other hand it serves, the purposes of intercommunication. When London was only a city, and Westminster was another city, and no man had dreamed of the rise of a vast province over-spread with buildings, the Thames was the main highway, at once of commerce, of state, and of pleasure. The great natural harbour formed by its estuary was the cradle of the commerce, and thus of the liberties, of London. When Saxon kings held festival at Westminster, and when Tudor sovereigns sent their traitors to the Tower, the river bore their state, and formed their military line of communication. When Whittington sent out his simple, or desperate, venture, tradition says, his famous cat took ship at a wharf on the Thames. But, from times so remote as almost to pass historic memory, or, at least, to allow us to realise the state of bridgeless London, the sea-borne traffic of the great port has been kept eastward of the central part of the City, where the street frequented by the Lombard merchants ran into the line of retail shops called Cheapside, by the time-honoured barrier of London Bridge.

Since the first piles were driven on the spot that was then a ferry, a compromise has been carried out between the land-borne and the water-horne traffic of the city and port of London. A rude wooden structure,—first a fortified entrance; then a street lined with quaint overhanging shops, and peopled by frugal tradesmen, who lived, and thrived, and reared their children, over the rushing tides of the Thames; last of all a bridge, and nothing else,—London Bridge has in each case been the western limit of the seaborne traffic of the river. The unwieldy, shapeless troughs, which we might call peculiar to the Thames if we did not remember the *chalandes* of the Seine, seem to owe their origin to the necessity of passing through the low, narrow, apertures that were left between the clumsy piers and hissing dolphins of the ancient bridge. No mast, worthy of the name, could pass the barrier, after the plan of opening a swing bridge was once abandoned. The trade, the commerce, and that which did duty for the architecture, of London grew up on this principle. The Custom House stood hard below the bridge. The Tower, until its military importance gradually dwindled to its present nullity, kept watch over the thick of the shipping. And, to this hour, vessels, propelled by the power that is so rapidly revolutionising the world, from the ports of France, of Belgium, of Holland, and elsewhere, discharge their passengers on the wharf between the Bridge and the Custom House.

So far has it been taken as an accepted fact that the position of London Bridge was a physical feature of the country, as much to be respected as the cliffs of Dover, and as incapable of alteration as the hours of the tide, that a large province, covered with buildings, and containing nearly a million inhabitants, has grown up, on either bank of the Thames, below the bridge, without making any attempt to have a

bridge of its own. The time, and labour, and trouble, which the inhabitants of this district experience, when they wish to transmit their persons or their goods from the northern to the southern bank of the river, it is not easy to estimate. The waste is enormous. It has been submitted to almost as if it were a law of nature. One great passage, not over, but under the stream, was long the pride and the wonder of the engineering works of this country. But that the population never took altogether kindly to the use of the Thames Tunnel is evident from the fact, that it is at this moment being converted from a highway into a railway crossing. The small passenger tunnel from Tower-hill, to which we have repeatedly had occasion to refer, is as yet untried as to its receipt of public favour.

With the annual increase of the population and commerce of London comes an annual increase of the inconvenience experienced by the inhabitants of the eastern district. As they, to a very great extent, consist of the humbler classes, of course this is not a subject to excite much interest in amateur legislators or hungry speculators. For the shipwright, or the mason, or the small artisan or tradesman, not only is his time his money, but it may be called his bread and cheese. Make him devote half or three-quarters of an hour daily to an extra walk, in order to get over an out-of-the-way bridge, and he will weigh so much the less at the end of the week. Not only will he be, to some extent, reduced by the unnecessary exercise (which people who only walk when they choose may recommend as an excellent sanitary process), but he will have so much time the less for earning, or for sleep. We apologise for mentioning so humble a topic. To persons so impatient of the waste of five minutes, as are most of those to whom the rest of the twenty-four hours is spent in the effort to kill time, it must seem a very miserable matter to talk of a bridge for the poor people at the East end. Why cannot they stay on that part of the river on which they happened to be born? Why were they born at all?

But the shoe pinches in another place. It pinches us. We, City magnates and merchants, west-end speculators seeking our brokers, suburban residents on the Brighton line of railway, we all have need of London Bridge. And, to our intense disgust, we find that we are often hindered in crossing it. The immense flood of down-river traffic that is forced up to cross the Thames at this lowest available point, jostles with that natural to the locality. From Goldsmiths' Hall to Westminster Abbey we have a bridge every quarter of a mile. But to the quarter of a mile since of London normally appropriate to London Bridge, has to be added a width of six times the dimension for the Eastern district.

Not that, even now, London Bridge can be said to be altogether inadequate to the traffic which comes upon it. Year by year the difficulty becomes greater; but at this moment, it is rather a question of police than of engineering, and, still more emphatically, is rather a question of approach than of bridge.

The City officer, who has given much and well-directed attention to the thoroughfares of the metropolis (though he has added little or nothing to the statistical information collected so far back as the year 1868), both expresses an opinion coincident with our own, and furnishes us with the means of verifying those opinions. Looking at the London day as being nine hours long, we find that 19,000 vehicles pass in a day over London Bridge, as compared with 5,000 over its nearest neighbour, Southwark Bridge. This is not a traffic to choke a bridge which affords room for four uninterrupted lines of vehicles to pass at the same time, two in each direction. If we allow the vehicles to pass in equal numbers both ways, and consider the entire traffic to be carried on during nine out of the twenty-four hours, we arrive at 2,111 vehicles per hour in all, or at 1,055 passing either in or out of the City. If we further estimate that two-thirds of these vehicles use the quick line, and one-third the slow line (into which the traffic is now directed by the aid of the police), and allow a rate, over the bridge itself, of five miles per hour for the former, and two miles per hour for the latter, we shall arrive at the distance which would separate one vehicle from another, if they followed in one evenly-distributed string. Of course, they do not present this exact average, being closer at certain hours than at others. Still, the inquiry is by no means illusory. The swiftly-passing vehicles would

ollow at intervals of 12½ yards, and the slow ones at intervals of 10 yards.

We invite Mr. Haywood, on whom very much of the responsibility for a due provision to meet the public wants will probably devolve, to apply to the elucidation of the question of the hinderance to the City traffic that occurs on London Bridge and its approaches, a little more of that care to collect statistical information, by means of which he has taught us the relative duty performed by the principal street crossings. It is requisite to know, in order to deal exactly with the matter, the exact volume of each of the distinct streams of traffic that unite, cross, or separate, within the Y-formed belt of road north of the bridge. Each of the seven converging thoroughfares conveys distinct systems of traffic. The divisions of up and down, and of light and heavy, are obvious, though the latter is not distinguished in the details of Mr. Haywood's report. But it is necessary further to know what goes over the bridge from each feeder, what runs from feeder to feeder, and what runs straight across the main line of communication.

For instance, Cannon-street brings down a certain number of vehicles that turn to the right and cross the bridge. It brings down a smaller number that turn to the left, and go towards the Bank. But it brings down a third series, and we suspect that it is the largest of the three, that go up into Gracechurch-street. Now the first and the second groups are easily dealt with,—but every one of the third causes, or is liable to cause, a pulsation in the entire line of concentrated over-bridge traffic.

The same line of reasoning applies to Arthur-street, east and west, to Gracechurch-street, in short, to each of the converging lines of highway. We want to know, in the first place, exactly what the traffic is, not merely in block, but in detail; and then we shall be able to state with great precision what any local improvement will, or will not, effect.

It is clear that one of the main objects to be kept in view, is the relief of London Bridge, by the increased use of its nearest neighbour, Southwark. It is probable that all, or, at all events, the greater part of, the traffic which now comes along Cannon-street to cross London Bridge, is traffic properly belonging to Southwark Bridge; but which is diverted from its proper course by two serious obstacles. Of these one is the steepness of the incline over not only the approaches, but the bridge itself. On the northern side the gradients are actually as steep as 1 in 18, making the horses lift nearly one-fifth of the load which they ought to draw. On the Surrey side they are 1 in 24. The other obstacle is one of plan. When the narrowness of the northern part of Queen-street is also considered, it is clear that, as far as the City side is concerned, Southwark Bridge has not a fair chance, especially as regards heavy traffic. On the Surrey side, again, the approaches lead nowhere. The noble new avenue of Southwark-street, which as yet has not attracted its due share of traffic, curves northward as it approaches London Bridge, so as to be as unfavourable as possible for diverting any of the traffic coming from the south, which might, on a better plan, naturally follow the Southwark Bridge route.

The consideration of the gradients of Southwark Bridge, with a view to their being brought more into accordance with the requirements of heavy traffic, and the rearrangement of the approaches, so that they should invite, instead of repelling, traffic, are matters incumbent on those who are responsible for the improvements of the metropolis.

With regard to the east and west traffic, which causes so serious an inconvenience to the course of the more active intercourse from north to south, two methods may be pointed out for obviating the evil. The adoption of one or the other will, sooner or later, prove imperative. The aid of police arrangements would be requisite for the accomplishment of each, as well as certain enlargements and alterations in the existing streets. The great facility to traffic which is afforded by the unobtrusive action of the two policemen who now act as sieves on London Bridge, sifting the light from the heavy conveyances, is, however, such as to reassure the most strenuous advocates of British freedom, and to convince them of the fact that, in crowded thoroughfares, the policeman is a true and useful adjunct of the surveyor, and that the exercise of his preventive functions will, if neglected, be replaced by that of his more costly function when evil has actually occurred.

The two methods in question are these. First,

to divert all the east and west traffic when, or a little before, it strikes the line of the London Bridge approaches, and to cause it to pass under a land arch at a lower level. The objection to this plan is, not so much the outlay necessary for adopting the existing passages to this new service, as the addition to the labour of the heavy vehicles in descending and reascending from the level of Cannon-street to that of Thames-street.

The second method would involve a partial widening of King William-street, as well as the removal to a more convenient spot of the statue which is at present, as a question of interference with traffic, so extremely ill placed. The plan by no means applies to London Bridge alone. It might be applied to all the great cross knots of the metropolitan traffic. It is based on the fact, that while a direct cross traffic causes a double and formidable interruption to both streams, it would be quite possible to *dam* the same amount of vehicles in between one another with very small inconvenience. To effect this, two dolphins, or islands, or points of resistance, must be taken, at equal distances above and below the intersection of the cross-roads. Let us suppose, for the sake of illustration, the statue of King William to be removed to the point opposite the intersection of Arthur-street, and a similar pillar to be set up in King William-street (which for that distance must be widened), at an equal distance to the northward of the fork of the Y. Every carriage coming from Cannon-street with the object of passing into Gracechurch-street, should be compelled to turn to the left on entering King William-street,—to fall into the file of northward-moving vehicles on the western side of that street, and to *dam* its way through this file to the centre of the road. Arrived at the dolphin, the vehicle would have to turn round the island, which could be done without any arrest of the proper traffic of the street, to make its way into the southward-bent line of vehicles, and to edge out of this at the corner giving access to Gracechurch-street. For west-bound traffic a corresponding route would be taken; the lower dolphin, opposite Arthur-street, being in this case the turning point.

By this method, at the cost of two turns, and of a few additional hundreds of feet of traction, the hinderance caused by the crossing of the two lines of traffic at right angles would be greatly lessened. The difficulty would be "turned," not met full in the face. The plan, as a novelty, may seem complex upon paper, but, with the experience of the London drivers, and the almost insensible aid of the police, a very few days would suffice to admit of its introduction, to the great saving of delay, and avoidance of foul language, so only that sufficient width of roadway were accorded for the purpose.

Supposing all this to be effected, there still remains the unquestionable fact, that the means of passage across the river are urgently demanded by the great metropolitan district east of London Bridge. East of a straight line drawn five miles to the north, and five miles to the south of London Bridge, are no less than thirty-seven metropolitan districts. Of these the twenty-five to the north of the Thames, in 1861, had a population of 667,000. The nine to the south of the river at the same date included 282,000 souls. A total of 949,000 inhabitants cries out for an over or under river bridge. It does not require the gift of prophesy to predict that, before many years, we shall see the approaches to the existing bridges arranged on the principles of common sense (civil engineering is only common sense reduced to form), and a new bridge constructed for East London either under or over the Thames.

REVUE GÉNÉRALE DE L'ARCHITECTURE.*

OUR much-esteemed contemporary, the *Revue Générale de l'Architecture et des Travaux Publics*, often noticed in these columns, has now attained the thirtieth year of its issue under the auspices of M. César Daly, its founder; and we cannot but say again a few words in praise of the high character it has maintained, and the good service it has performed up to the present day. The last half-dozen numbers are now before us, and they appear in every respect to come up to the

* *Revue Générale de l'Architecture et des Travaux Publics*, publié sous la Direction de M. César Daly. Numéros 11, 12, 1868; 1, 2, 3, 4, 1869. Paris: A. Morel, Rue Bonaparte.

lofty standard it has set up for itself. It will give, perhaps, some of our readers information concerning the manner in which an art journal is conducted in France if we state that it appears in single or double, and sometimes triple and quadruple numbers at irregular intervals, but with sufficient method to insure the issue of twelve numbers in the course of a year. The price of the folio volume thus composed of a dozen parts is forty francs in Paris, and forty-five francs in the departments. Although new buildings are described and illustrated, as well as ancient monuments, building-news forms no part of the scheme; but the death of architecta of every country is recorded, and accounts are given, when possible, of their works. Current competitions are briefly mentioned; and a short chronicle is drawn up of any distinctions conferred upon architects. The volume for 1868, which we take as a fair sample, concludes in the numbers before us with a bibliographical list of works, published within the year, relating to architecture. Six books, only, appear in this catalogue. The illustrations consist of about sixty steel engravings, executed, for the most part, with a painstaking finish that may be taken as a explanation of the irregularity in the publication of the numbers. Besides these there are, occasionally, chromo-lithographs and woodcuts.

The volume for 1868 is brought to a close with notices and illustrations of several more than ordinarily interesting buildings;—notably a plan and sections of the French Exhibition of 1867, with those of some of the principal foreign pavilions erected around it. These have not now the attraction of novelty, but they have the value of exactness in the matter of details. The Indian pavilion and the Chinese kiosk or the constructions shown in the last numbers for 1868; and the Tyrolese houses, with all its details and practical peculiarities, and the magnificent palace of the Bey of Tunis, follow up the subject in the volume for the present year. But before parting with the old year's work, we must notice two other buildings illustrated in it,—*habitations d'artistes*, or two houses, the one designed especially for a painter by M. Amoudru, the other for a sculptor, by M. Uchard, and both built in Paris. Many an English student, doubtless, casting about in his mind for a suitable subject for designs for exhibition, has thought of residences specially adapted for a poet, painter, sculptor, and musician, as opportunities to show power of arrangement and contrivance, but ultimately abandoned the scheme. In Paris, however, there are many realisations of this wandering thought, some of which have been illustrated, and here we have mansions for a painter and a sculptor. The first is shown in a section only; the latter by plans of the four floors, including basement, in which easy access to the different *ateliers*, and contrivances for the removal of large pieces of sculpture, are the most noticeable features. There is, too, a sheet of plans of workmen's dwellings that we should not pass unnoticed. On this we have six types of houses erected for foreign working people, which have, naturally enough, a strong family likeness to those provided by large firms for our own artisans. There are the houses built by Messrs. Japy, Brothers, & Co., at Beaucourt, Haut-Rhin; those by the Baron de Behr, in Pomerania; Messrs. Honget and Teston, at Verriers, Belgium; and those erected by the Auzin Company in the department *du Nord*, France; some built back-to-back; some with what the French call *caves*, but which we term cellars; some with three and some with four rooms. Cramped and bare, as some of them are, the entrance-door opening at once into the room, all are an advance upon the four low walls that formerly formed the homes of the great mass of the working population all over the world; showing that if we have by no means reached perfection in this department of the necessities of life, we are, at all events, making progress. We are informed that the Société Verrièreux has commenced building a new type of house, that was not represented at the Exhibition of 1867, in which further improvements have been made.

In the fifth and concluding article upon the antiquities of Eleusis, we note that the author, M. Lemonnier, quarrels with the English antiquaries who have published views of the restoration of the *Anactoron*, for having done so with but a partial examination of the remains. Three quarters of their restoration, he says, are composed of conjectures without foundations.

The volume of the *Revue* for the present year opens well with a varied collection of subjects.

Foremost is a description and illustration of a very curious and handsome casement in a free-stone building known as the house of the Three Nurses, in Narbonne, dated 1558. Rabelais is said to have loitered here in the course of one of his journeys to Rome, and to have received some inspiration from his inspection of the caryatides with which the casement is decorated. There are five figures in it, two of a large size upholding a frieze over the window, and three exactly corresponding with them, except that they are on a smaller scale, which do duty as mullions. Below the frieze are eight lions' heads, from whose mouths an ornamental chain is festooned across the width of the casement. The glass is in small panes arranged as hexagons inclosed in octagons. This architectural curiosity is followed by details from that part of the Petit Luxembourg, Paris, that was formerly the convent of *Les Filles du Calvaire*. The chapel of this fabric, it will be remembered, has been demolished, but the cloisters are utilized as a winter garden.

To these details, which are chiefly portal, succeeds an elaborate essay, entitled "De l'Architecture de l'Avenir à propos de la Renaissance Française," by M. Daly, in which architectural effort is traced from the primitive cone of the tumulus and pyramid to its highest achievements. This is accompanied by a table of styles-types, in which the various styles are referred to systems of social ideas. The first style, or that of the straight line, practised by the Egyptians in the first degree, all their evolutions being rectilinear, is associated with a political system described as *Unité puissante, Liberté nulle*. This same rectilinear style, expressed, in a second degree, by the Greeks, is attributed to a state of things exactly the reverse of this: *Liberté puissante, Unité nulle*. The Roman mixture of rectangular with curvilinear lines is supposed to be the result of a mixed political system. The styles of the Middle Ages represent order produced by authority, *L'Ordre par l'Autorité compressive*; that of modern times, from the Renaissance to the present day, is the growth of a mixture of political ideas and sympathies; that of the future, which is to be founded on the ellipse, is to be the result of order maintained by liberty, *L'Ordre par la Liberté*. A second table traces the influence of French society upon modern architecture, through the mazes of Renaissance, eclecticism, and rationalism, pointing again to the ellipse as the basis for an expression of the distinctive aims of the present day, and of the future into which we are immediately drifting. This essay, to which its author attaches much importance, may demand examination hereafter.

Following this review of the past, present, and future of architecture, is a description and illustration of the *tribunes* newly devised for the Parisian race-course, in the Bois de Boulogne. Paris. These are ornamental seats, arranged in groups, as in our "grand stands." The stand, which is almost as ornamental as the Tyrolean cottage illustrated, is divided into accommodation for three ranks of spectators: an imperial pavilion in the centre; private boxes on each side of this; and the public seats to which anybody can have access who likes to pay the sum charged for the privilege; and each class is furnished with a separate entrance. It is built of three stages, that on the actual ground-line being of no avail for seats; these are principally on the first or raised floor, but a second point of vantage is gained on the flat top thrown out over them, which serves as protection also from the weather to those below.

Another is provided in a light campanile, with which the attractive structure is furnished. The baths and public lavatories at Caen, by M. Auvray, are shown in two sheets of plans and elevations. A practical paper on retaining walls, with a sheet of profiles, by Lieut.-Col. Michon, is followed by a descriptive sketch of the church of St. Augustine, by M. Bouchet; and then comes a notice of the current competitions. The first of these last-mentioned *concours publics* is for a theatre in Constantine, Algeria, for the best designs for which three prizes are offered respectively, 3,000, 2,000, and 1,000 francs; an uninviting competition for a church at Arras follows, which the editor thinks can be scarcely intended seriously; a *concours* for a statue of Boerhaave, for Leyden, in the Low Countries, is mentioned as open; and one for a monument to the memory of Rossini, is noticed as having been decided in favour of M. A. Dillon. Austria has two competitions on the list, one for a grand hôtel-de-ville in Vienna, and the other

for a fish-market at Trieste. The prizes offered by various societies are also catalogued. A bookcase, by the brothers Gueret, and a collection of halsters of the seventeenth and eighteenth centuries, are among the smaller objects illustrated. Preceding the list of archaeological works, which, as we have stated, concludes the instalment of the *Revue* before us, is a summary of European items bearing upon the fortunes of architects and prospects of architecture, such as word of the distinctions awarded to architects in different countries, in the form of medals and orders, the honours recorded in this part of the work being the decoration of the order of the Medjidie, from the Sultan, upon the proposition of the Viceroy of Egypt, to M. Daly, and the gold medal of the British Institute to M. Lepsius; notice of the French archaeological congress at Loche, and the international exhibition at Munich; the names of the competitors from the School of the Beaux Arts for the great prize at Rome; and word of the formation, in Paris, of a new society for the building of cheap dwellings, under the title of *L'Épargne immobilière*. We wish our contemporary a strong tide and a fair wind, and should be glad to hear he had many subscribers in England. At the same time, we remind our readers, for their advantage, that this work, and those of other countries of a similar character, will be found in the library of the South Kensington Museum.

THE DUDLEY GALLERY, PICCADILLY.

THE third Winter Exhibition of Pictures in Oil, under the management of the committee of the Dudley Gallery, Egyptian Hall, now open, consists of 212 paintings and 3 terra-cotta figures. It makes no very high claim for critical admiration, but includes, nevertheless, a number of excellent and interesting works. We may especially point to those by Mr. G. D. Leslie, Miss Rebecca Solomon, Mr. F. W. Hulme, and Mr. George Mawley. The principal work of the last-named artist, "In the Borghese Gardens" (81), is a landscape of great completeness and beauty. Mr. Leslie's No. 134, marked,—

"Be patient, and count,
While the church clock struck,
In measured numbers the appointed hour,"—
is full of grace and tenderness. "At the Fountain, Rome" (169), is as well painted as anything Miss Solomon has yet exhibited. "The Mouth of May" (16), by A. B. Donalson,—

"Mater amabile, ora pro nobis,"—

is brighter and cleaner than previous works, by this thoughtful and clever artist. 34, "Wandering Thoughts," by Miss Starr, a forcible head, serves to keep alive the good expectations entertained respecting her. 60, "A Train-bearer," Briton Riviere; 84, "Water Lilies,—on the Tiber," Talford; 110, "Whistle and I'll come to you, my lad," Kesley Halsewell; "Devouring," a favourite Author" (138), C. Goldie; and "Italian Gossips" (144), Frank W. W. Topham, are all works of merit, and are entitled to praise. Mr. Smythe should be mentioned for his 151, "A thick Night of the Goodwins," which tells a story forcibly; and Mr. Claude Calthrop has made considerable advance in his art, and bids fair to take a good place.

THE IMPROVEMENT OF OUR PUBLIC STATUES.

I WAS requested some time since to consider the subject of our public statues, and to offer some hints thereon. The accompanying memoranda occurred to me, which, if well considered and amended by the suggestion of others, might form a good basis of a scheme of action for securing satisfactory statues and memorials in the public places of the metropolis.

PROPOSAL FOR A COMMITTEE ON PUBLIC STATUES.

To consist of the Chief Commissioner and the other Commissioners of her Majesty's Works and Public Buildings; of the architect of that Commission; of the President and one other Fellow of the Royal Institute of British Architects; of the President and two other members (an architect and sculptor) of the Royal Academy.

It is suggested that on all occasions, when it is proposed to put up a statue or memorial of any distinguished public man, in some conspicuous place in the metropolis or its neighbourhood, the same should be done under the sanction of the said committee.

That a model or drawings of the entire memorial, comprehending any pedestal, steps, &c., must be submitted, with a description specifying—1. The intended size; 2. Materials of which it is to be composed; 3. The name of the artist employed; 4. The contemplated expense of the total cost; 5. Intended period of erection; 6. The expected site.

N.B.—It is expedient that the design or model should be submitted to the said Committee before the execution of the statue or memorial is actually begun.

When the full-sized figure is completed, and cast in plaster, it should be put up with an extemporised pedestal, or other accompaniments on the spot it is intended ultimately to occupy; and the committee should inspect it, so that, ere it be too late, a just appreciation can be had of its appropriateness, whether in size, proportion, or general composition, and any defect in these respects can be remedied before the execution is commenced.

That plans should be prepared in the office of Her Majesty's Commissioners, showing the sites of any public areas or buildings calculated to receive statues and memorials, and with elevations and dimensions of any pedestals already erected, and calculated to receive sculpture. *Et, gr.*, the pedestals at both ends of London Bridge and other bridges; along the line of the new quays of the embankment of the Thames; the four pedestals in front of the British Museum, and scrolls of the pediment, and of the pediments of the Royal Exchange, Mansion House, and Royal Palace, &c.; the entrances to the parks, especially the archways to Hyde Park, and completion of upper part of the Marble Arch, &c.

That a plan should be prepared, showing the present distribution of Trafalgar-square and Waterloo-place, St. Margaret's-square, Westminster, and other open public spaces and areas, with a scheme for the mode in which any future statues or memorials should be permitted, so as to harmonise with the present ones, in arrangement, altitude, area, and other particulars.

Such data being prepared will afford the committee the opportunity of knowing fitting positions for such memorials, and lead to their being able to advise with the promoters, and decide upon their nature and size.

That such committee should have the power of submitting to the Government propositions for completing the architectural and sculptural effect of various public buildings, which in London (with a few notable exceptions) are generally deficient in sculptural embellishment. That this is necessary, in order to give full effect, may be seen in the buildings of France and Italy, and is most obviously apparent in our Gothic edifices, all which are generally rich in external sculpture. This would also give encouragement to our sculptors, and advance the art,—objects which it was the aim of the late lamented Prince Consort to promote in the completion of the new Houses of Parliament.

In order to avoid as much as possible the disastrous effect of metal statues, which in a few years become black and heavy in tone, and to diminish the liability to destruction hereafter from the value of the material; and having in view the corroding effect of our atmosphere upon marble, it is desirable to promote the execution of statues, as much as possible, in grey granite unpolished, like the statue of King William IV. near London Bridge. Grey granite is not affected as marble or stone, and preserves its clear bright tone. That statue proves that all the essential parts can be finished with great precision (as among the Egyptians), and that sufficient accuracy of detail can be given to the minor parts of the sculpture exposed in out-of-door positions, and where they must necessarily be of sufficient scale to height them for the locality.

It is desirable to avoid placing bronze statues in places where trees or foliage would be heaved them, as they never come clearly out in relief from a dark background.

THOS. L. DONALDSON.

The Metropolitan District Railway Extension.—It has been resolved by the Metropolitan Board of Works, "That the Metropolitan District Railway Company be informed that the Board will strenuously oppose any project which will prevent the railway from being carried to Tower-hill, and the Inner Circle from being completed by them according to the original scheme."

WEST BROMWICH DISTRICT HOSPITAL.

Two memorial stones of a new hospital to be erected at West Bromwich have been laid by the Countess of Dartmouth, in the presence of a large and influential assemblage of the nobility, clergy, gentry, and various public bodies of this portion of South Staffordshire.

Situated in the midst of a wide and densely populated district,—surrounded on every hand by collieries, furnaces, and large works of various kinds peculiar to the Black Country, where the toiling thousands earn their daily bread, exposed to all the dangers of mining on the one hand, and accidents by machinery on the other,—injury to life and limb there are matters of continual occurrence. For the relief of the unfortunate sufferers, the only institutions where they can be accommodated and properly treated are the two hospitals, at Birmingham on the one side, and the South Staffordshire Hospital, at Wolverhampton, on the other, the distance to either from this neighbourhood being between five and six miles. It is with a view to meet the want thus so urgently felt that the new hospital at West Bromwich has been projected.

A committee for carrying out the details of the scheme was appointed in September last year, and the following facts are gleaned from their report, presented at a subsequent meeting. After stating that the committee had visited several of the principal hospitals in the adjoining towns for the purpose of collecting information both as to the construction and management of hospitals, the report proceeded as follows:—

"The committee gained important information from their visit to the Birmingham General Hospital, which embodied all the modern improvements so far as they could be adopted. There were two general principles upon which hospitals were built, viz.—the 'corridor' and 'pavilion' principles. The 'corridor' plan was that in which the wards and rooms abutted, and were parallel with a main central passage or corridor of the building, which rendered it impossible to have windows on one side. The 'pavilion' plan was that in which each ward was detached from all other parts of the building, excepting by a connecting passage, thus enabling windows to be placed on each side, and, if desirable, also at one end, in this manner securing three aspects, and an abundance of light and ventilation. The committee decided on the 'pavilion' principle of construction, with a minimum of cubical space per bed of 1,500 ft., and an abundance of light and ventilation. The hospital would contain forty-two beds, with administrative offices, but wards for only twenty-two beds would be erected at present, leaving the entire fulfilment of the design till the institution has, by its operations and usefulness, made the necessity for its completion to be fully recognised. The designs of Messrs. Martin & Chamberlain, of Birmingham, architects of the Birmingham General Hospital, had been adopted; and a site on the Lodge Estate, fronting Edwars-street, at right angles with Lombard-street, and containing an area of 6,000 yards. The present outlay will involve a cost of about 9,000*l.*, including the cost of 6,000 yards of land, 'Lodge Estate,' and the completion and furnishing of the building as an hospital."

The subscriptions already amount to about 7,000*l.* The following is a description of the building, as it will be when erected:—

The hospital will consist of a central building with two wings. The central building will contain the out-patient department and the administrative department. The wings form the hospital department, and will each contain two wards for patients. It is intended at first to erect one only of these wings.

The entrance doorway of the centre group of buildings opens into the waiting-hall for patients. This hall is 23 ft. long by 15 ft. 6 in. wide. It has on one side the surgery for general purposes, and on the other side the dispensary, each of these rooms being 16 ft. 3 in. by 14 ft. A door opens from the waiting-hall into the physicians' and surgeons' consulting-room. Next to this room there is a committee-room, and on the other side the central hall are the living-rooms for the resident surgeon.

Beyond this block of buildings, and running at right angles to it, is the corridor connecting the wings with the main building.

Each wing will contain two wards, each ward being 40 ft. long by 25 ft. wide, and 15 ft. high; and so each ward will accommodate ten beds, each bed will have a superficial area of 100 ft., and 1,500 cubical feet of space. The fireplaces will be built in the centre of the wards, and will be used both for warming and ventilation. The wards will be well lighted, having windows on three sides, and will be thoroughly well ventilated by a system of flues, to be used both for warming and ventilation. Adjoining each ward is a semi-detached block of buildings containing bath-rooms, sculleries, and water-closets.

There is also a room attached to each ward, which will be used as a sitting-room by the patients when their health is sufficiently improved.

The nurses' rooms will be placed adjoining the wards, and commanding a full view of them.

Each wing will have a separate stone staircase, and a mezzanine floor will be formed, leading off the staircase, which will contain linen-chests and stores for clothes.

The kitchen buildings will be opened at the back of the corridor connecting the wings with the main building. This group will consist of a kitchen, 18 ft. square; a scullery at the back, 18 ft. by 12 ft.; and a large larder and pantry. The apparatus-room for the heating of the building will be placed under the scullery.

A detached building will be erected at some distance from the general building, and will contain the wash-house, laundry, and drying-closets, and a dead-house and post-mortem room.

The buildings will be all of brick, with Pillough stone dressings. They will be faced with pressed bricks. The floors to the wards will be of oak, and the walls will all be finished in Parian cement.

The style of the building is Gothic, but, of course, not Ecclesiastical Gothic. There is very little ornament of any kind, and in fact none that is not directly obtained from the constructional necessities of the building. It is intended that both the workmanship and the materials of the building shall be of the best quality possible.

The total cost of the building, calculating on one wing only being erected at first, will be about 6,000*l.*

The architects are Messrs. Martin & Chamberlain, of Birmingham; and Messrs. Trow & Son, of Wednesbury, are the builders.

ENGINEERING AND ARCHITECTURE.

I READ with much pleasure the observations in your number of October 16th, headed "Architects and Engineers." I am only surprised architects and the public have not previously noticed the grievous blots made on the metropolis by the huge and ugly constructions which could have been made ornaments to our city in the hands of men educated in architecture. I will now especially allude to the Cannon-street arrival-shed, that hides from view in passing over London Bridge St. Paul's beautiful dome and its campaniles, as also the spires of the churches of Bow, in Cheapside, and St. Bride's, with many others of rare beauty; indeed, the thing is so monstrous and ugly, that it dwarfs all other buildings from that point of view. I used to hope that the business premises and warehouses on the banks of the north shore were very much improving, and becoming quite architectural. The brewery when Calvert's, now the City Brewery Co., began to have a classical appearance; and had it remained in the hands that commenced the river front improvement, would have had a most pleasing effect, and I suppose equally well adapted to its purpose as if it had been built only for use regardless of beauty. This is so effectually crushed, that it is unobserved by the side of its ugly neighbour, the said arrival-shed. Indeed, the monstrous City Boiler, far surpassing those of Kensington notoriety, I am afraid is likely to last in its place for many long years to come, and that we have no hopes of seeing it replaced by a beautiful building on its site, as we are at Kensington, where ugliness previously reigned supreme. I will also refer to the railway-bridge and its accessories on the Borough side of the bridge, once the most beautiful approach to a great commercial city; now, alas! a conglomeration of stunning noise overhead, equally annoying to the ears as the sight. All this could have been obviated, and the rail passed under the bridge approach at much less expense; but then the engineers would not have had the glorification of spanning an enormous thoroughfare with a scientific construction in iron; and it is this vanity of producing something wonderful in span, strength, height, or tunnelling, that has caused millions of money to be spent, and ugliness realised instead of beauty. I once asked a young man in an engineer's office (he being a drawing clerk, and knowing something of architecture) how it was that he could not introduce some of his architectural knowledge in his designs; his reply was that he had attempted it, and was told to bring none of his art there; it was not wanted.

Now, I can remember when the engineers' college was established at Putney, that there was a professor of architecture on the establishment, and that I received from Dr. Corie a note requesting the favour of the said professor and

his pupils to look at the progress, and take sketches and make notes of the works of a large house I was building for myself near Roehampton, and to which I gave a good deal of study, and which he was pleased to say was the most perfect of the style he knew of. This was some thirty years since: I still preserve his note. How greatly have the profession changed their views since the days of Dr. Corie! but the establishment did not flourish, and I suppose they threw the twin beauty overboard, and kept the young giant that has grown into a wonderfully powerful but ugly-featured monster.

This is the first time in my life that I have presumed to put pen to paper to an editor of a periodical that I esteem the pioneer of good taste, and which I have read from the first number to the present, and always with pleasure. W. H.

WASTE LABOUR TO WASTE LANDS.

At the Bristol Congress, Mr. F. Fuller read a paper "On the Increase of Wealth and Pauperism, Poverty and Crime, in this Country," in which, after pointing out, as we have often done, the cost to the country of ignorance and crime, and the growing numbers of uncared for children, he said,—

I may now be asked, Where are the means of doing all that you propose,—of maintaining, educating, and training these hundreds of thousands of pauper children, and these still more numerous ones who are growing up without any apparent prospect but that of vagrancy, mendicancy, vice, and crime? How keep our adult paupers and our prisoners at useful and profitable employment? how qualify them for such employment? and how find it for the latter when at large, without intruding on the already over-crowded market of the honest workman, who in all branches of industry experiences an increasing difficulty, an insuperable impossibility to obtain employment? Want of employment for the people, you say, is the principal source of other formidable evils. The labour-market is overstocked; there is not nearly work enough for those who are willing to do it, nor is there any tangible prospect of a diminution of the difficulty. Will you not increase this difficulty twofold by making our young paupers and vagrants, our adult paupers and criminals, competitors with our normal working population for a share of that which is already so inadequate to the demand for it?

I say emphatically, No. I would not narrow the field of employment for any,—I would expand it, in its several channels, for all, and prominently for the honest and untainted, now pining for want of it, by utilising inexhaustible sources of work, wealth, and general prosperity.

Briefly, then, I would apply "waste labour to waste land." In this principle lie the hope and certainty of natural safety and social regeneration. From a return presented to Parliament it appears that there are 31,861,040 acres of waste or uncultivated land in the United Kingdom. Of these it may be roughly estimated that an area of, say, 10,861,040 acres is unfit for cultivation, though, as is observed in the second report of the Industrial Employment Association, "the Chinese would probably cultivate most of these." It is further estimated in the same inquiry (which was not drawn up without due inquiry and consideration), "That other 10,000,000 acres would be adapted only to the growth of plantations of various kinds, such as timber, nursery stock, &c., but that the remaining 10,000,000 acres could be made as good for food-growing purposes as many thousands of acres of land now under cultivation, and that the annual value of such produce would be from 10*l.* to 20*l.* per acre." This calculation is justified by results obtained in innumerable instances, amongst others by Mr. Blackburn, at Aldershot, upon land formerly barren sand; and again by the Honourable Mr. Petre, at the Lodge Farm, Barking, where values varying from a maximum of 75*l.* to a minimum of 30*l.* per acre, according to the different descriptions of articles cultivated, have been produced. But taking the average produce of the new lands brought under cultivation at 5*l.* per acre, here we have the enormous aggregate of 50,000,000*l.* sterling added annually to the wealth, produce, and wages fund of the country, whilst the process of obtaining it would, as has been cogently remarked in some of the letters and articles which have appeared in the public journals, solve the whole labour difficulty by opening employment literally for millions of the people, not alone in agricul-

trual operations, but collaterally in all departments of manufacturing and productive enterprise, to which such an immense increase of the wealth created would impart a wholesome, solid, and permanent impulse.

The estimate of 5l. per acre may be challenged as too high, considering that the average product per acre of all the cultivated land in this country is under 4l.* But the kind of cultivation contemplated under the proposed plan is the thorough development, and at the same time the nutrition and sustentation, of all the resources and powers of the soil. Bearing this in mind, it will be seen that my calculation does not go above, but below, what could be accomplished.

It will be perceived from the tenor of my remarks that in the training of the young especially I regard employment in agricultural pursuits and the numerous vocations connected with them as the main resource on which we have to depend. My own long experience, confirmed by the unanimous testimony of all with whom I have been from time to time in correspondence, confirms the accuracy of this view. Twenty-seven years ago, when the school now at Redhill was located at St. George's Fields, and the boys were chiefly engaged at indoor, sedentary work, such as tailoring, shoe-making, mat-making, and so on (in all of which, let me remark, the labour-market is peculiarly glutted), they were greatly annoyed and troubled by the large proportion of desertions and relapses occurring amongst them, and by the restlessness and discontent of even the best disposed of them: not more than 30 per cent. of the whole were reclaimed. I beg you now to mark the difference when the scene and the occupations were changed. From the first report of the committee of the Industrial Employment Association, it appears that "when the school was removed to Redhill, and in addition to the above trades, the boys were employed at farming, gardening, brick-making, baking, laundrywork, and instruction in the duties of shepherd, cowherd, dairyman, the poultry-yard, blacksmith, butcher, &c., no less than 87 per cent. were reclaimed, and many of them became first-rate colonists, earning from 5s. to 10s. a day. A very large proportion of them are in regular correspondence with the chaplain of the establishment, and some of them have themselves become employers of labour." The fact is that active, varied, and cheering out-door exercise of the fields and gardens keeps up the boys' spirits, engrosses their attention, and also produces moderate and wholesome bodily fatigue, so that they sleep soundly, and there is no nightly planning and plotting for escape.

EXCURSION OF THE LONDON ASSOCIATION OF FOREMEN ENGINEERS.

On the 16th inst., the members and friends of this institution, more than 150 in number, paid a visit of inspection to the Abbey Mills Pumping Station of the great Main Drainage Works, West Ham.

At the entrance-gate of the high and middle level sewers, which cross the Stratford-road immediately beyond Stratford Bridge, the Associated Foremen, headed by their president, Mr. J. Newton, Royal Mint; and accompanied by Mr. Richard Moreland, Mr. W. Todd, and several other engineering employers, were met by Mr. G. Usher, resident superintendent engineer of the Abbey Mills Station. Passing along the grass-covered embankment through which the sewage tunnels at this point are conducted, an excellent view was obtained of the magnificent engine-house and its appurtenances which are on the south-west side of the embankment. The two chimney shafts, each 209 ft. in height, and standing isolated on either side of the building, appeared like sentinels constantly on guard. These large columns are externally octagonal in form, and are capped by ornamental iron roofs, pierced for the egress of smoke. The engine and boiler houses form one building. The decorations, which are very elaborate, consist of coloured bricks, encaustic tiles, and stone dressings, floriated carving being introduced at the caps of piers, columns, and pilasters. A cupola or dome of a highly ornamental character surrounds the engine-house, its topmost point being 110 ft. above the floor line. Right and left of the vestibule, and reached by descending

stairs of iron, are the stoking floors, in front of the boilers, of which there are in all sixteen, in two series of eight each. On ascending, the party was introduced into the engine-house, where the scene was striking in the extreme. The height of the building, the elaboration of all its details, its cruciform shape, and the gorgeously fitted-up engines within it, tended to convey the idea that it was a temple consecrated to the genius of science rather than an ordinary place of shelter for steam-engines.

The engines are eight in number, and are each of 112-horse power. They are disposed in pairs, and in such a manner that the eight steam cylinders stand round the centre of the edifice under the dome, from which the engines themselves are lighted. By this plan the visitor has an opportunity of surveying the peculiarities of the motors, which are the work of Messrs. Rothwell & Co., of Bolton, Lancashire. On the occasion of the foreman's visit, the whole of the engines were put to work simultaneously. Two hours were spent in unravelling the mysteries of the Abbey Mills Station, the gigantic pumps of which place lift the sewage of districts covering an area of 25 square miles a height of 36 ft., and whence it flows to the outfall at Barking.

At the termination of the visit some 70 of the visitors adjourned to the Royal Hotel in the Bow-road, where a collation was provided for them.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the second meeting of this society for the current session, on the 20th October (Mr. F. Horner, president, in the chair), a letter was read from the town clerk of Liverpool, requesting the society to consider a proposed amendment of the Liverpool Building Act, and to offer suggestions thereupon. It was stated that the council of the society had referred the matter to a sub-committee, who were going carefully into the subject, and that their report would shortly be forwarded to the town clerk. The Liverpool Builders' Association and the House-owners' Association, it was understood, had also been requested to co-operate in offering suggestions for the amelioration of the present Building Act, and for carrying before Parliament a draft of a more efficient and consistent Act.

Mr. G. A. Andley read the second part of a paper entitled "Notes of a Tour to Florence and Back," illustrated by numerous photographs of the cathedrals and churches of North Italy, dwelling especially upon the buildings at Verona and Padua. Among other buildings, he alluded to Giotto's Chapel at Padua, and strongly condemned the style of decoration employed there, especially the painted mouldings and cornices on the internal walls. He considered that Giotto's example in these respects had a very bad influence upon some of his contemporaries and immediate successors. The church of San Antonio, at Padua, in spite of its remarkable and picturesque outline, had, he thought, failed to solve the problem of the adaptation of the dome to Gothic architecture.

MOVING HEAVY BUILDINGS.

NOTICES of various feats of house-moving in America will be found in our volumes. Lately we have been pressed by correspondents to give further particulars of such doings, and finding the following account in the current number of *The Architectural Review and American Builders' Journal*,* we transfer it to our pages:—

"We had the pleasure of seeing lately an astonishing specimen of mechanical power and skill in Boston, which rivals the famous house-elevating process of the Chicago engineers. Tremont-street has to be widened from the corner of the Common out to the beginning of the new avenue. To do this it was necessary either to pull down the Pelham House, a fine new structure at the corner of Tremont and Boylston streets, or to move it bodily, sideways, about 20 ft., towards the Public Library. The house is 75 ft. wide by 100 ft. deep, five stories high, with a Mansard attic and a basement story, and is supported on square granite piers, with heavy partition walls of brick. These piers were first clasped with vertically-set timbers, and the whole house then jacked up a few inches from its foundations. Parallel foundation walls, about 2 ft. wide, were then built in the cellar floor in the direction of the intended

movement. Into the top surface of each of these low walls were embedded, side by side, five or six long strips of strap-iron. Under each pier or other support of the house were placed about twenty pieces of round rod iron, cut to an equal length of about 24 ft., and something over an inch thick. Each group of these short rollers, set crosswise of the strap iron ways, formed a square, upon which the bottom of the pier was allowed to descend and rest. Between all the rollers were interposed square rods of wood to moderate the motion. Of course, as the house moved forward on the ways, the hind rollers and their separating attics dropped out, and were re-inserted in front. The motive force was got by means of 60 or 70 huge wooden screws, with their heads against the first floor and their heels against the paving at the curbstone, the intermediate ground having been excavated. The building is said to weigh 50,000 tons; as it is a hotel arranged in the French mode, giving each occupant a complete apartment or suite of rooms on one floor, and is not only furnished but inhabited by all its boarders during the movement. It began to travel at eight o'clock in the morning of August 21, fourteen of the workmen being detailed to work the screws, and turning together at the sound of a whistle. The rate of movement was about 14 in. per hour. There seems to be no good reason for doubting that the Pyramid of Cheops, or St. Peter's at Rome, could be moved endwise or sidewise at pleasure, any required distance, by this same process."

What feats of this kind have been performed in England?

THE VICTORIA DEBATING SOCIETY.

SANITARY INSTRUCTION OF WOMEN.

The first meeting for the season of the members of this society—which appears to be an offshoot from the Victoria Institute, and the object of which is the discussion of all questions relating to women,—was held last week at the ladies' class-room of the Victoria Debating Society, 74, Newman-street, Oxford-street,—Dr. Hodgson in the chair.

Dr. Lankester delivered an address upon the necessity of Physiological Instruction for Women. One of the deficiencies, he said, in education in the present day was a want of the knowledge of the laws of life which regulated the existence of our bodies. It was well known to all who studied the statistics of the Registrar-general that a large proportion of the deaths which occurred from week to week were preventible. Since 1857 returns had been made of the mortality of 13 large cities and towns in Great Britain, and it was seen that sometimes the mortality of those towns was as large as 40 in the 1,000, while sometimes it sank as low as 17 in the 1,000. The difference did not arise from any dispensation of Providence; it arose from a neglect of an observance of the laws by which life was regulated. The Government had seen this, and had interfered so as in many cases to reduce the rate of mortality by the enforcement of sanitary laws—such as an improvement of drainage or the removal of vegetable matter. He asked his hearers to remember that the means which were effectual to save a life, saved at least thirty or forty illnesses as well. If harpurs were going at large and committing depredations, there would be a cry of "What are the police about?" But a murderer was at large—one who, in the form of typhus fever, was slaying its thousands—of the arrest of which they heard very little indeed. And yet the result of the exertions made in some parishes—such as St. James's, Westminster,—to stamp it out, showed that many of the lives now lost day after day might be saved. It was worth their studying how they were to gain the knowledge of the laws of the science of physiology, by which so much disease might be prevented. For his part, he believed that it would be better to teach children how to avoid disease, how they might live to old age, than to teach them to read and write. What he alluded to was to teach them—and particularly girls—the knowledge of simple things, such as the necessity of the proper performance of the functions of the brain, of the eye, and the other functions of the body; of the introduction of more air into the rooms in which we live by day and in which we sleep by night; and the use of pure and the avoidance of impure water. The learned lecturer urged the desirability of female servants being taught the deadly effects of bad drains,

* Mr. Mechi states that the present produce of all the cultivated land in the country is 170,000,000l. sterling, and that it ought to be 364,000,000l.

and the injurious results of burning an undue quantity of gas; teaching them that one gas jet consumed as much oxygen as four or five human beings. If the simple laws of life were more widely taught—and more particularly to those who ruled over and carried on the business of the household—the germ of disease would be destroyed, many thousands of valuable lives would be saved, much sickness would be averted, and great enjoyment of life promoted and secured.

NEW WARDS, MARYLEBONE WORKHOUSE.

THE St. Marylebone, like most other old work-houses, has been found quite incapable of accommodating the continually augmented demands upon its space arising from the increase of population and other causes. Moreover, the greater part of the building is fast decaying, and must of necessity be sooner or later entirely rebuilt. Some portions, past repair, have been taken down, as in the case of the old bakehouse, laundry, and kitchen. Other similar offices have been erected on more convenient sites, and the ground made available by their removal has been utilised in the erection of a building to accommodate the aged and infirm women.

The whole building now contains nine wards, each 40 ft. wide, 60 ft. long, 13 ft. high, and gives 780 cubic feet of air space to each of the 340 inmates. The cost of the buildings, including architect's commission and other contingencies, will be about 271. per bed.

The skirting at the back of the beds forms a box 9 in. square, with a perforated zinc front; below these boxes are channels containing hot-water pipes; at the ends of these channels and in the front and back walls are large openings, through which the external air is admitted. By this means the fresh air, being first warmed by passing over the hot-water pipes, will rise upwards and be emitted through the perforated front of the skirting boxes into the wards immediately under the beds. The foul air is carried off through wide channels in the ceilings, which communicate with large flues running up the side walls, and terminating just above the level of the eaves of the roof.

The upper wards are somewhat differently constructed from the lower wards, inasmuch as the ceilings follow the line of the sloping sides of the roof, which are supported at intervals on semi-elliptic cast-iron ribs. The emission of foul air in these wards is provided for by a channel in the apex of the ceiling, running the whole length of the room, and having zinc flues at intervals open to the air.

The architect was Mr. H. Saxon Smell; Messrs. Crabb & Vaughan were the builders; Messrs. Potter & Sons executed the heating, ventilating, and sanitary works.

A MISTAKE IN FARRINGTON-ROAD.

I AM in time to draw attention to, and I hope that I am in time to induce others to put a stop to, a piece of work which is now going on in Farringdon-road, not far from the Holborn Viaduct, and which appears to me to amount to a mistake. If you look over the north side of the viaduct bridge, you will see that the road immediately beneath your eye is broad and handsome, and so continues up to as far as new Charterhouse-street. But at Charterhouse-street it suddenly jerks to narrowness and misery. At the corner of Charterhouse-street and Farringdon-road, a building, said to be for a public-house, is being erected (it has already nearly reached to its first floor), and this building spoils the noble road by projecting into it and narrowing it. This is the only building at present commenced on that side Farringdon-road till you get some distance further on,—to Hatton-wall, I believe, but am not sure, for they do not condescend to put names up to streets in this quarter;—and at the corner of Hatton-wall stands another public-house called the "Metropolitan." Now the road should be continued wide up to at least as far as this,—that is, to about opposite the Clerkenwell Sessions House. I do hope that some leading member or members of the Common Council will at once take a walk, and look over the north side of the new viaduct bridge, and then see if something cannot be done to stop that which, if allowed to be continued to completion, will be an eyesore and a nuisance for ages. The vaults built under the pavement are nothing; they do not reach up the

road nearly so far as to the "Metropolitan" public-house. It should be remembered that the Pentonville end of Farringdon-road (or whatever the track is called in that part) will not always remain as it is, but that some day we must have a great improvement there, probably a cut from about Clerkenwell workhouse straight to the Angel at Islington, to admit North Londoners to have now and then a peep at the Thames Embankment and New Blackfriars Bridge, and to go down what might, if the foot-pavement were better, be one of the finest roads in the metropolis—Blackfriars-road.

SURVEYOR.

P.S.—A friend tells me that the part of Farringdon-road in question is not in the City, but in the district which is under the jurisdiction of the Holborn Board of Works. If that be so, I hope the proper authorities will see to it.

THE ARTISANS' AND LABOURERS' DWELLING ACT.

THE Marylebone vestry have heard and determined the appeal of Lord Portman and the lessees of the disgraceful house property in York-court, Paddington-street, against the condemnation of seven houses, Nos. 15 to 22, under the provisions of the Act, as wholly unfit for human habitation. Mr. Wilde, for Lord Portman, said that his lordship would make no appeal against the decision of the vestry. For the lessees and owners of the houses it was argued that the property was still capable of being put in repair, so as to render the dwellings tenable, if the vestry would again consent to forego its powers. At the conclusion of the investigation it was decided that the vestry clerk should forthwith serve the necessary notices and orders for the demolition of the premises.

A most disagreeable locality is about to be improved, under the operation of the Artisans' and Labourers' Dwellings Act, by the demolition of the buildings which lie between Bit-alley and Fryingpan-alley, Turmill-street, Clerkenwell, close to the Sessions-house. The buildings in question have long been known as the abodes of the worst and lowest class, and so close are the opposite houses both in Fryingpan and Bit alleys that two persons can hardly walk abreast through them. Recently the houses were reported to the Clerkenwell Vestry to be in a condition dangerous to health and unfit for human habitation; and the sanitary committee of the vestry recommended their demolition. Some doubts having arisen as to the power of the vestry to order the houses to be pulled down, that body submitted a case to Mr. H. B. Poland, who has stated his opinion that the vestry may require the whole if necessary, or a sufficient number, of the houses, to be pulled down, although there is no express enactment authorising houses to be pulled down merely on account of the narrowness of the street or court in which they are situated. The vestry have now adopted the report of the sanitary committee, and directed the demolition of the houses in question.

CHURCH DECORATION IN SCOTLAND.

THE church of St. James-the-Less, at Leith, has just been re-opened, after being painted throughout, from designs by Mr. E. Francis Clarke, architect, of London. The church, which was designed by Professor Scott, R.A., is now additionally interesting, as one of the few churches in Scotland which have as yet been treated with colour, and it is likely that many churches will follow the example which has been set at Leith. The chancel, which is finely arcaded in stone, contains richly-foliated niches, in which are figures of SS. James-the-Less, Andrew, Paul, Luke, Mark, Peter, and also of Ninian, Columba, and Margaret, of Scotland. Each figure is richly coloured, with a gold nimbus. The lower part of the chancel is treated with the conventional certain pattern, upon which are crested spaces with emblems. The organ-case displays figures of angels with instruments of music, and the organ pipes are decorated in gold and colour. The upper portions of the nave and transepts are diapered with the "ashlar" pattern, with foliated scrolls at the constructional parts, and at the west end is an ornate stencilled arcade. The nave and transepts below the string-course are painted in dark reddish brown, with diaper. The prevailing colour in the church is a warm cream-colour inclining to red, and the scrolls, &c., are principally in dull red, with light blue sparingly

used. The constructional parts of the chancel arcade are sparingly embellished, with light blue and gold, and the principal arches throughout the church are enriched with scrolls and diapers. The work has been carefully carried out by Messrs. Ballantine & Son, of Edinburgh.

CATHEDRALS.

St. Asaph Cathedral.—The chancel of this cathedral has been restored by Mr. Scott; also the crossing, groined with oak, which contains the stalls, throne, and choir seats. The original style, the Decorated, has been kept in view in the restorations, which comprised, in detail, six chancel windows, one of which is appropriated to a memorial in stained glass of Mrs. Hemans. The stalls have been cleaned and replaced, and a new pavement of Minton's tiles laid down.

Worcester Cathedral.—A screen is in course of erection on the north side of the sacristy or chancel of this cathedral. It is the gift of Mr. J. D. Allcroft, and will probably cost upwards of 600*l.* Messrs. Barher & Brindley, of London, who executed the reredos for the dean, are also constructing the screen, which consists of open arcade work in Early English style, decorated with carved foliage, finials, &c., and standing on a haemate, the face of which is covered with diaper work. The material employed is Caen stone, with Purbeck marble for the shafts. Mr. Scott designed the screen, which is intended to harmonise with the reredos, and the architecture of the east end generally.

St. David's, Pembroke-shire.—Further works are to be executed in this Cathedral, in addition to those which have been already carried on. The new outlay will, it is stated, amount not less than 11,000*l.* 18,000*l.* have already been spent on this cathedral. Mr. G. G. Scott is the architect.

COL. CHARLES VALLANCEY, ENGINEER AND ANTIQUARY.

IT is surprising what a number of remarkable Englishmen, whom the eighteenth and nineteenth centuries produced in every branch of the literary profession, either forsaking their country, or leaving it from accidental causes, cast their lot in Ireland; and, in achieving fame, conferred a lasting honour on the sister kingdom by their labours. In the architectural world we have already, in the pages of the *Builder*, rubbed the rust off a few worthy names, who deserve to be restored to popular favour. On this occasion it is our province to lift up from the shade a remarkable man, whose name is now rarely alluded to in this kingdom without a sneer, but who in his day was thought worthy of the fullest recognition.

Charles Vallancey, LL.D., F.R.S., F.S.A., &c., was a native of England, and was born about the year 1720. The family is of French descent. Vallancey received a liberal but not a collegiate education; and, while a comparatively young man, entered the army. He was quartered in Gibraltar for some years, of which celebrated rock he made a sketch, which was afterwards engraved by an Irish artist of the name of Ashford. Vallancey's regiment, after some time, was ordered to Ireland. Shortly after, our young captain of the 12th regiment entered the corps of Royal Engineers, and gradually rose to the position of colonel. His commission bears the date of 1782. Vallancey was not long in Ireland when his literary taste began to develop itself. He published the *Field Engineer*, a treatise on Stone-cutting, and one on Tanning, and other subjects. Next succeeded a military survey of Ireland, which not only received the approbation of George III., but also was rewarded with pecuniary favour.

In 1774 began that work with which Vallancey's name is more intimately connected, entitled "Collectanea de Rebus Hibernicis." This work was continued occasionally, and extended over a number of years. Fourteen numbers of this publication appeared, forming about five octavo volumes. In 1772 or 1773 Vallancey published an "Irish Grammar of the Ibero-Celtic Language." This work was reprinted in 1782, with additional matter. This grammar is very imperfect, but Vallancey had no mean difficulties to contend against in its compilation. There was at this time scarcely an available printed grammar of the language, excepting O'Malley's of 1677; and so an Englishman taking to the study of that difficult subject from a taste for it, it is surprising that our author acquitted himself so well. In 1772 he contri-

buted an essay on the "Antiquity of the Celtic Language." Vallancey's "Treatise on Stone-Cutting" was translated from the French of M. le Chevalier de Clair, to which were added remarks upon "Saxo's New System of Fortification proposed in his (Saxo's) Reveries or Memoirs of the Art of War."

In the minutes of the Society of Antiquaries, 1773, is a correspondence of Major Vallancey with Governor Pownall, on the subject of the monument at New Grange, near Drogheda; contending for its being an arch-Druid's tomb, the three cells three altars, and the characters the name of Aongus, the arch-Druid. In that year he was the active secretary of a society which had been formed in Dublin under the patronage of Sir Lucius O'Brien, bart., for the illustration of the antiquities of Ireland; "but so little," says Mr. Gough, "does this taste prevail in that nation (which, if we may believe Mr. O'Halloran, is one of the oldest in the world), that Major Vallancey, the secretary of this new society, may be considered as the society itself. In the year 1773 he prevailed on the Dublin Society to form themselves into a committee, which might have been serviceable to the kingdom in general. The plan of that committee may be collected from the queries they published. In four years' time they obtained only forty answers to 4,000 queries, many of them perfectly trifling. The committee is therefore dropped, and with it all Mr. Vallancey's hopes of ever being useful to Ireland in the great scale they hoped to work on. He is now engaged in taking surveys of Ireland for Government. [Letter to Mr. Gough, Dublin, April 28, 1778.] He had resolved to publish whatever antiquities had fallen in his way in some periodical work, and had actually begun in the *Hibernian Magazine*; but the proprietor executed the plates so miserably that he desisted, and met with no encouragement to print his discoveries in England; so that his 'Irish Grammar,' a 'Short Correspondence with Governor Pownall, on the Subject of the Drogheda Barrow,' and his 'Collectanea de Rebus Hibernicis,' are all we have of this onerous antiquary."

In a letter to Mr. Gough, Oct. 3, 1783, Mr. Vallancey says, "I am glad to hear you are about a new edition of Camden. Much information of the ancient state of Ireland may be had from Mr. O'Connor's letter to me in the twelfth number of my *Collectanea*; and in my former numbers no man could give you more help than Mr. O'Connor. I have prevailed on him to write a history of ancient Ireland; but I am much afraid his age and infirmities will not permit him to finish it. I am now proceeding with the next number, in which I shall give ten plates of the antiquities of Ireland. Some of these monuments are evidently prior to Christianity. Such is the *Jordan Morain* of the Irish, or *בְּרֵית מִיָּדוֹן* or breast-plate of judgment of the Chaldeans; and such the *Cloch Mashaic* of the Irish, or the *אֶבֶן מוֹשֶׁה* forbidden by Moses in Lev. xxvi. 1. For the confused accounts of this stone I refer you to the learned Spencer, 'De Legibus Hebraeorum,' and to the more learned Millius, 'Disertationes selectae variae S. Litterarum,' yet all their conjectures, and those of the rabbis, must have still passed for such, had not these monuments been preserved in this wonderful country. These are now in my possession. I have ordered some impressions to be struck off, and shall forward them to you in a few posts. These plates cost me (a poor man, with 15s. a day and 15 children) about 60 guineas; they are at your service for Camden on these terms:—Send to White as many copies as will produce £30L, and you may also insert my descriptions most of my next number. I can also give you an account of the Anglo settlement in the reign of Henry II., under Strongbow, and a map of their country surveyed by myself. They are seated in the county of Wexford, in the spot they first settled in,* speak the language of that day, and never marry out of the barony, or permit an Irishman to live in it. I have collected a short vocabulary of their language, and a long song on some game of ball. These are at your service to insert also. I found Strongbow's entrenched camp very perfect. This country, like language, monuments, and history, are subjects of great importance to antiquaries, in the studies of their bards. Thera was truth dispersed, but the living monuments of the day no man can be deceived in. I wish I could recover

my drawing of what is called Cormac's Chapel. I have lost it; it is the work of Etruscans: their monuments declare they sent colonies to Ogygia, and the Irish records declare they received some from Croton, the country of Tarasus."

Mr. Gough having thankfully accepted the offer of the plates, on the condition of being allowed to pay at least some part of their expense, Mr. Vallancey replies, Feb. 13, 1784:—"In my last, I meant to say that if it was agreeable to you to embellish Camden with the fourteen plates of Irish antiquities contained in that number, you should have the plates for half the sum they should cost me. The estimate was made at about 60 Irish pounds; but, by lessening the scale, and throwing many objects into one plate, they have been executed for 33 guineas. I should be proud to dispose of them to you, for your edition of Camden, and offer them to you for 15 guineas. As there were but 500 run off from each plate, they are not worn. My labours, I believe, have hitherto been little known in England. It is but of late I could convince my countrymen that the early history of this country was connected with Britain. I have good reason to believe they are now convinced that the inhabitants of the Britanno Isles, before the Welsh, were one and the same stock; and that many of the monuments of antiquity found in England are falsely attributed to the Romans." The plates were the embellishments of Mr. Gough's edition of Camden. In 1784, Vallancey was elected a Fellow of the Royal Society of London; and in 1786 he published "An Essay towards Illustrating the Ancient History of the Britanno Isles," 8vo., intended as a preface to a vindication of the ancient history of Ireland; and (by establishing the authority of the ancient Irish MSS., and exploring the sources of the language) to ascertain the origin of the people. This was followed by "A Vindication of the Ancient History of Ireland," wherein is shown:—1. The descent of its old inhabitants from the Phæno-Scythians of the East. 2. The early skill of the Phæno-Scythians in navigation, arts, and letters. 3. Several accounts of the ancient Irish bards authenticated from parallel history, sacred and profane, &c. The whole illustrated by notes and remarks, and remarks on each chapter, by Colonel Charles Vallancey, LL.D., F.R.S., and of the Societies of Antiquaries of London, Edinburgh, and Perth; member of the Royal Irish Academy, and of the Philosophical Society of Philadelphia, &c.; Dublin, 1786, 8vo. (being the fourteenth number of "Collectanea de Rebus Hibernicis"), of which see a very ample account by Mr. Gough in the *Gentleman's Magazine*, vol. lvii., p. 252, and the spontaneous effusions of Mr. Burke in p. 253. In 1797, he published "The Ancient History of Ireland, proved from the Sanscrit Books of the Brahmins of India; dedicated to the President and Members of the Royal Academy, in the Oriental Emigration of the Hibernian Druids," with all the inventive imagination of Stenkeley applied to the Indians (see vol. lxxiv., p. 1,036). In the "Archæologia," vol. vii., p. 276, are his "Observations on the Alphabet of the Pagan Irish, and of the Age in which Finn and Ossian lived," 1784; and in vol. viii., p. 302, his "Observations on the American Inscription," 1786. In the preface to his "Collectanea Hibernicis," p. 4, speaking of Sir James Ware, "the Camden of Ireland," he observes that considering his ignorance of the Irish language he did much: his works are the outlines and materials of a great plan, which he enjoyed neither life nor abilities to finish; and it is much to be lamented that he had not the good fortune to meet with so experienced and intelligent an amanuensis as Mac Ferbas sooner. "Sir James Ware," Mr. Gough informs us, "collected and preserved the scattered monuments and antiquities of his native country. His pursuit of these studies began after he left the university, by the encouragement of Bishop Usher. When he was just turned of thirty, he published "Lives of the Archbishops of Cashel and Tuam, and of the Bishops of Dublin," about twelve years after (1639), "An Account of the Irish Writers," &c.; and 1654, when he was sixty-five, "Disquisitions on the Antiquities of Ireland;" and a second edition augmented in 1658, both in 8vo., together with "Annals of Ireland under Henry VII.," which were antecedent by several historical and other pieces. Many of these came out in different volumes, and translated from the original Latin by his son Robert and others, 1705. A completer and far better edition of all Ware's works,

except "The Annals of Ireland," was published at different times by Walter Harris, esq., in three volumes (fol.). The first contains "The Ecclesiastical Affairs of this Kingdom," adorned with prints of the cathedrals, seals, &c., Dublin, 1739. The second is a "Translation of his Disquisitions," with eight additional chapters, and other improvements from his own and other papers, distinguished from the rest of the work; with prints of antiquities, coins, and religious orders, Dublin, 1745. The third volume comprehends "The Irish Writers," with the addition of nearly 400 new articles, many from a copy interleaved by the author; these were reprinted in two volumes, folio, Dublin, 1764. Sir James found time for these studies, notwithstanding his engagements as Auditor-General at the Council Board, and in the Parliament for the university, and the negotiations he conducted for Charles I. with the Irish Catholics. When the Parliament were masters of Ireland, he retired first to France, and then to England, till the restoration reinstated him in these and other public charges. He died 1666, aged 73. His MS. collections relative to Ireland were purchased of his heir by Lord Clarendon when Lieutenant, 1686; and after his death by the late Duke of Chandos, whom the public-spirited dean of St. Patrick's in vain solicited to deposit them in the public library at Dublin; these underwent a second dispersion by public auction. Dr. Millos, dean of Exeter, whose uncle had large property in that kingdom, purchased a large part, and deposited them in the British Museum; Dr. Rawlinson others, and bequeathed them to the library of St. John's College, Oxford. Some part fell into the hands of Lord Newport, late Chancellor of Ireland.

Colonel Vallancey, in the memorable year 1798 in Ireland, occupied the post of Lieutenant-General in the Engineer Department, and in 1803 he became a general. He was also, in recognition of his literary and antiquarian labours, elected vice-president of the Dublin Society, to which society he devoted many years of zealous attention. In fact, the Royal Dublin Society owes to him much of its subsequent success and fame. It might with truth be said of Vallancey, as is said of the Norman who came to Ireland for conquest, that he afterwards became more Celtic than the Celts themselves.

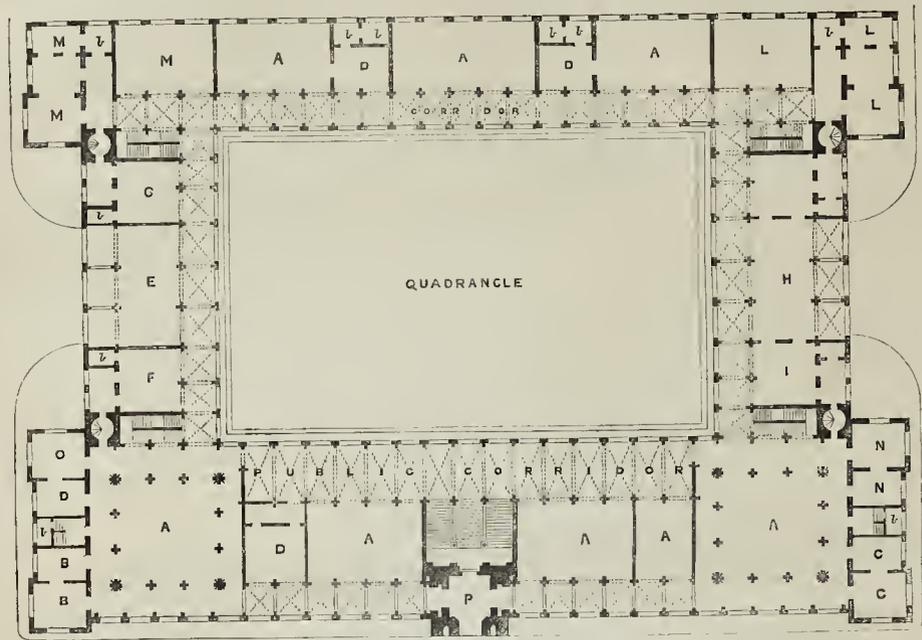

Vallancey made Irish antiquities his particular study, and his love never lessened for the subject until his death. He was much attached to Ireland, and his many works are a proof of this. The School of Antiquarianism which he helped to found and consolidate has now fallen into disfavour, yet the result of his studies and researches was a valuable contribution. He gave impulse to the study of Irish history and Irish antiquities; and had it not been from the remarkable sight of an Englishman in Ireland devoting such time and attention to the elucidation of the Irish language and the Irish race, many notably clever men who afterwards contributed their quota to the subject would not have studied the question at all. Vallancey's industry and perseverance forced the matter upon them, and stimulated such archeological philologists and antiquaries to bestir themselves in their own fields of inquiry.

Charles Vallancey died in Dublin, on the 8th of August, 1812, at the advanced age of ninety-two, much regretted. He left some rare MSS. behind him, which were doubtless taken possession of by his relatives. Whether any of these fell into the hands of the Royal Irish Academy, or British Museum, or Trinity College Library, Dublin, we know not, nor are we able to say at present, though we have made some inquiries, if any surviving members of his family are in this country. The writer made a search through the metropolitan Directories of the three kingdoms, but failed to meet with the name. The nearest approach to it is the name of Vallance. Of this name there are a few in Great Britain and Ireland. Strange if his fifteen children and their descendants (supposing these were married) had all died out. Perhaps in the Army List or in France some of the Vallancey parent stock, or English or Anglo-Irish descendants, may be found.

We are indebted for some of the particulars of this imperfect sketch to the pages of the *Gentleman's Magazine* for 1812, and to the "Anthologia Hibernica," 1793. Vallancey enjoyed the friendship and held correspondence with the most notable of the literary English, Irish, and Scotch celebrities of his day, and as an engineer and antiquary his name should not be wholly forgotten.

THE TOWN OF SHERBORNE AND THE DIGBY HOTEL.

THE completion of this large hotel is an instalment of the works to be ultimately carried out in improving this old town, centuries ago a cathedral town and an important one in the West of England. The chief glory of Sherborne and of Dorset is the grand church of St. Mary the Virgin, restored by Mr. Carpenter and Mr. Slater, by the liberality of the late Earl Digby and Mr. Wingfield Digby, of Sherborne Castle. The town, through the decay of its manufactures, lost much of its former attractions. Many churches were altogether pulled down, and its ancient buildings were converted into dwelling and store houses. Its principal streets are now not much better than winding lanes, and the main road to Dorchester and to the castle is crossed by the Exeter Railway on a level.

Plans have therefore been prepared by Messrs. Slater & Carpenter, at Mr. Digby's request, for extensive alterations on the south side of the town, between the Abbey Church and the railway; and following these plans a new street has been made, leading up in a direct line to the south transept of the abbey. This street will be continued over the railway and River Yevo by a fine three-arched bridge of stone, and will then branch off to the castle and to Dorchester; thus forming the chief entrance to the town, and opening up the hitherto crowded church and buildings. At the northern end of this street are proposed to be built the market-house and town-hall, facing the south side of the abbey, with the other necessary market buildings.

The Digby Hotel is built on the west side of the street, and its gardens and pleasure-grounds (laid out by Mr. Thomas) extend down to the railway, thus leaving open the charming views of the country and park to the three fronts. It

is erected not only for a general and commercial business, but for hunting men, and also as a "half-way house" for tourists on their way to Exeter and the far west. The fact of there being three packs of hounds very near, and especially the Blackmoor Vale hounds, make Sherborne headquarters for hunters and a West of England Market Harborough or Melton. For the use of these gentlemen suites of rooms are arranged in the hotel, and the lunting stables are built in separate blocks, so that each may keep separately his four horses and servants.

The building has a square court in the centre, round which run corridors on all the floors. It is three stories high besides the basement, and built of local stone, with dressings of Ham-hill stone. The style adopted follows out the style of the fifteenth and sixteenth century domestic buildings in the town and locality. The windows are all square-headed, with transoms; and all the upper ones have small gable roofs over them. There is a great dining-room provided, 40 ft. by 20 ft., a coffee-room, 27 ft. by 20 ft., and a commercial room of about the same size, besides many private sitting-rooms both on the ground floor and on the upper floor, *en suite* with bed-rooms. The offices are extensive, and are fitted up with appliances for cooking, heating, ventilation, and with lifts to each floor, bath-rooms, and lavatories. A billiard-room is at once to be built on the terrace in the grounds, and connected with the main block by a covered way.

The hotel stables are built round a large court to the north of the hunting stables, and are fitted up with boxes and stalls for seventeen horses, with coach-houses for twenty carriages, sick-horse boxes, singeing-room, lotts, grooms' rooms, &c., and a tap in connexion with the hotel.

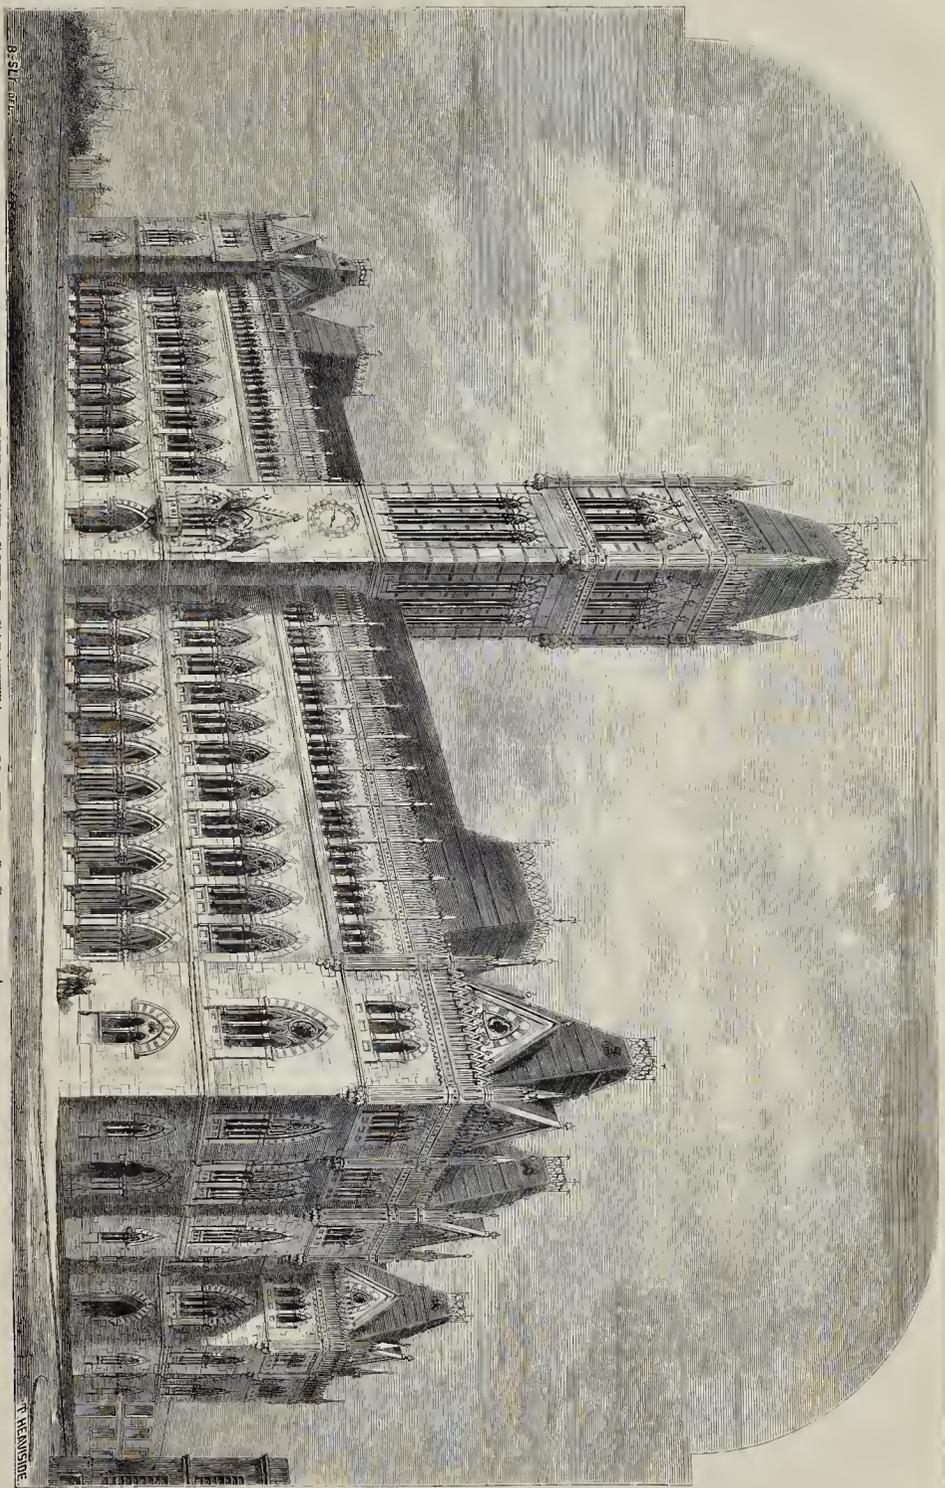

The works have been about two years in hand, by Mr. Estcorn, of Gloucester, under Mr. Thompson, the architects' clerk of works.

On the western side of the churchyard is the ancient Hospital of St. John, founded by Bishop Neville, of Salisbury, in the fifteenth century, with its curious chapel opening into the two stories of the main building, the upper being used as a women's gallery, and the lower for the men. Extensive additions have been made by the same architects to this institution; new board-rooms and dormitories for the pensioners have been built, and form a part of the group of buildings which, when completed, by the new town-hall and market-place, will form the entrance to the street from the close.

We may also mention the famous "King's School," the school of West England, expanded now far beyond the thought of its royal founder. The ancient Edwardian and Jacobean buildings were quite of inadequate size, and some years ago the ancient domestic buildings of the abbey were converted by Mr. Carpenter into school-rooms, chapels, and studios, and later still extensive ranges of buildings were raised northwards of the abbey, for dormitories, class-rooms, master's house, &c. A new department for "science and art" is about to be commenced, and a great school-room is contemplated.

All these buildings are designed by the architects in the local type of Gothic, so as to gain an effect of unity in the mass of new and old buildings grouped around the abbey church and its close.

The new Yeatman Hospital, on the hill above, is designed to harmonise with the ancient *abbot's* lodging, which remains singularly perfect, and overlooking the old monk's fish-ponds, at some little distance from the other monastic buildings. The grand ruins of the old Norman castle, and the later Elizabethan castle, built when all the church property had passed over to Sir Walter Raleigh and other lay proprietors, are too well known to need any words.

THE HIGH COURT, CALCUTTA.—MR. WALTER L. GRANVILLE, ARCHITECT.

T. HEANSIDE
[See p. 857, ante.]

A WORKMAN ON THE TRADE-UNION CONGRESS.

RESTRICTION OF APPRENTICES.

Sir,—It seems the question of the limitation of apprentices is one on which the leading unionists slightly differ. Among the strange things said at Birmingham, none surpassed the papers and discussions on the restriction of apprentices; and certainly not any of the proposed schemes, if put in operation, would more affect the position and well-being of society. The resolution proposed and carried was,—“That this congress is in favour of a fair proportion being allowed in keeping with the demand, a limitation is justifiable; a fair proportion being allowed in keeping with the number of men allowed to teach them.” The first paper on the question was read by the secretary of the Glass-cutters' Association, and was in perfect keeping with the occasion and the trade.

The glass trade is, without doubt, one of the most unfortunate trades in this country, and has had more difficulties to contend with than any other. For a long series of years it was loaded with excessive duties and excise regulations, which prevented its development and progress. And since the duties have been repealed, it has been cramped and impeded by strikes and restrictions of the workmen. I suppose it is generally known that the production of glass, excepting in the higher work, is exceedingly simple, and easily acquired. And yet in opposition to all economic laws, the restrictionists would have the public pay a higher price for adult labour, when it is only a boy's trade, and all its details can be carried out with little learning and experience. Although the glass trade in this country has for a long time been entirely free, it has not progressed in the same ratio as in other countries. The number of glass-workers in France, at the last return was upwards of 35,000, and the trade was then in a most flourishing condition, while the whole number engaged in this country is but 15,046. In looking over the statistics of exports and imports, the results are still more striking, and I have often wondered whether the leaders of the glass-makers' protected union ever took the trouble to examine the returns. If they had they would have found that the great portion of the English glass exported was common glass bottles, whilst the foreign imports, are the higher and more expensive glass. The first mention of imported glass in the statistical abstract is for the year 1854, when 54,040 cwt. of all sorts, except common, were imported, and the quantity has continued to advance. The latest returns for 1867 give 422,574 cwt. as the total imports of all sorts, except bottles of green or common glass, into this country, valued at 791,832. As a set-off to that, there were exported from England 165,070 cwt. of flint and window glass, and 703,132 cwt. of common glass bottles.

With such figures as the above, it must be evident to the most obtuse mind that something must be wrong in the glass-making machinery, and that restriction of apprentices is not the remedy. The delegate representing the trade at Birmingham informed his brother delegates, with great unctiousness, that his trade had restricted the number of apprentices, and had regulated the supply to the demand; and yet the foreign glass manufacturers had found, to their advantage, that there were over and above the balanced supply, 257,504 cwt. of the best glass wanted in this country. It seems the glass-makers and the majority of trade-unionists believe the public wants are a fixed quantity, and some scheme was to be invented whereby the supply could be gauged to a shaving of the demand. The fallacy might, with a slight inquiry, have been discovered; and it was a great pity the glass-cutter, in drawing up his paper, did not examine a little into the history of his trade. I have specially alluded to the glass trade, because that, of all trades, shows most clearly the illusion of the members of a trade trying, by coercion and restriction, to limit the supply, and keep up the price of an article, to some fanciful idea of what the public will pay, and to what is its demand.

In turning to the resolution and the contents of the papers, I find the restrictionists "would allow apprentices when the state of the trade justified it;" or, in other words, when all the adult workmen were fully employed. I suppose there never was a time in the history of any trade where that condition was fulfilled. And to carry out the objects of the resolution, many trades would have to be entirely annihilated, as

there are many sources of supply independent of the workmen of this country; and where they do such artificial stratagems to raise prices to such a height that the public would not buy home-manufactured goods, the workmen of other countries would supply the public wants, and the last state of the home workmen would be worse than the first. As the members of some trades have proclaimed the dogma of a limitation of apprentices, and have called a council to ratify it, nothing can be fairer than to call upon them to carry out their principles to their legitimate conclusion, and keep their offspring within the prescribed limits of their own trade; for instance, the glass-cutter's child cannot have any claim outside his father's trade. And then the next step must be a restriction on marriage. As there are many unemployed in every trade, it is in perfect keeping with the objects of trade-unionists, that no increase of population for at least one generation should take place; for if the young are not allowed the opportunity to gain a living because some of the older happen to be unemployed, and as the workmen call upon the State to protect them from an influx of young workmen, it is certainly only in accordance with the foregoing that the State should require the restrictionists to keep from multiplying until all the conditions they wish to enforce are fulfilled. But supposing the law relating to restriction of apprentices were in force, and the machinery to regulate the number of apprentices were provided and in motion, and all the conditions as to the requirements of the nation,—for the productions of the glass-makers, or any other body of workmen,—were settled; and when it was decided that an additional carpenter, or tailor, or shoemaker was required, and there were ten candidates for admission, how would the favoured one be chosen? Would the employer or the workmen have to choose the fortunate candidate, or would it be by competitive examination or by ballot? Something ought to have been said about that part of the question when the wise heads of trade-unionism affirmed by resolution that a limitation of apprentices was necessary for the welfare of those who have by some means been fortunate enough to acquire a trade. They ought to have settled all the preliminaries, and not left the outside world in the dark as to their future operations. It appears the Birmingham delegates would, in their anxiety to relieve trade-unionists, add still further tyranny to their already unwise laws; and I think, in all consistency, the next time they meet they ought to add the following as an addendum to the resolution,—“That, in the opinion of this congress, a stern restriction on marriage is required by the state of trade, and that all marriages are totally prohibited until all the workmen are permanently employed. Yours, fraternally,—Peter Simple, President; John Clever, Secretary.”

JACK PLANE.

MONUMENT TO NICCOLO ALUNNO, AT FOLIGNO.

DURING a recent sojourn at Foligno, I had occasion to see and admire a colossal statue by a young sculptor of that city, named Ottaviano Ottaviani, destined for a monument to a great artist, a native of the same Umbric city, Niccolò Liberatore, better known as "Alunno," whose works were produced between the years 1458-1492, and who may certainly rank among the greatest painters of this devotional class, and as first of the Umbric school before Perugino, in the fifteenth century. Little is known of this truly great artist beyond the limits of Umbric; and it is therefore the more gratifying to find that his fellow-citizens have resolved to erect a worthy monument to one so gifted, at his birthplace. The original idea, however, as well as the execution of this work, pertain to the young sculptor who had the spirit to undertake a task so happily suggested before receiving the commission which the civic authorities have since given to him. He has availed himself of a supposed (not certain) portrait of Alunno introduced among the accessory figures of one of his finest pictures, "The Martyrdom of St. Bartholomew," at St. Bartolomeo, a church near Foligno. He represents the painter, in the costume of the fifteenth century, with an ample cloak thrown over his other clothes, a close-fitting cap on the head, brush and pallet in his hands, and in act of contemplating (as apparent) some picture which we may suppose him bent upon finishing or altering. The figure is about 3 metres in height, and is characterized by much individuality, by

a strongly-marked earnestness. I understand that it will be ready for erection in the ensuing spring, and that the site chosen will be either the principal piazza of Foligno or a planted esplanade between the city and the railway station. Assuredly such a project deserves to be noticed, and encouragement may well be bestowed upon such talent as is recognisable in the work of Signor Ottaviani. C. J. H.

THE PLYMOUTH GUILDHALL COM-PETITION.

Your correspondent, "Argus," in his letter to you last week, makes several admirable remarks as to the conduct of competitions in general, with which I entirely agree. In making their award, it is indeed the first duty of a committee, or of its professional adviser, to stand by the instructions issued to the competitors. It is because I feel so strongly on this point, and because I think "Argus" has overlooked, or, perhaps, not been aware of all the facts of the case, that I venture to ask your insertion of this letter.

On reading over the instructions to architects for the first time, after my appointment as referee, the impression produced on my mind was that a great deal of accommodation was asked for the money intended to be expended. On seeing the various designs, I discovered that the competitors had found it so. There was, I believe, hardly a design among the 25 which could have been erected in a creditable manner, at ordinary building prices, for the intended limit of "from 20,000l. to 25,000l." This I found had arisen, first, from the large number of requirements specified in the instructions; and, secondly, from the clause immediately following this enumeration. "The above particulars are not intended to exclude the provision of such additional accommodation, appropriate to the several uses of the intended building, as may appear to any of the competing architects to be desirable, and as the arrangements of the buildings will admit." Of this clause almost every competitor appeared to have, more or less, availed himself; some of them, as "Ich dien," acknowledging in their estimates that the cost of their schemes had been thus increased.

I concluded, therefore, that the hard and fast line as to cost could not, in this case, be drawn; but that so far as that one question was concerned, the merit of a design ought to be considered in inverse ratio to its costliness.

"Fiat Justitia, ratum Cælum," and "Ich dien," considering the amount of extra accommodation provided, instead of being, as your correspondent says, among the most expensive, were among the least expensive designs sent in.

I, for one, should rejoice to see the day when the Institute, as our representative body, would take upon itself the duty of calling attention at the right time (that is, before competitors commence their labours) to what may appear to be defects in any conditions drawn up for the guidance of competing architects. It would save the latter much unnecessary labour, the referee some perplexity, and the critic some expenditure of righteous indignation.

ALFRED WATERHOUSE.

THE PRESERVATION OF STONE.

PERMIT me to suggest to your correspondent of October 16th, a method of preserving and hardening internal stonework, which will prove more effective and more permanent than the application of oxalic acid. It is true that a solution of this acid, or better still, of oxalate of alumina, will give for a time a certain amount of coherence to the particles of an oolitic limestone; but this substance has its drawbacks, with which I have become only too well acquainted through the experience of the last ten years. There is no better plan of hardening and preserving friable, absorbent, and decaying stones of all kinds, than the application of a process known as the "combined process," which I may, perhaps, be allowed briefly to describe. Three solutions are employed in succession, they are applied with a brush as easily as whitewash. These solutions are, 1st, soluble phosphate of lime; 2nd, caustic hydrate; and, 3rd, a special preparation of silica, not ordinary water-glass. The process in its earlier form involved the use of the two first of these solutions, and was employed with considerable success in several public buildings. In its complete and perfected condition the method

has received the sanction of Mr. Gilbert Scott, and other authorities. It has been adopted with the stone of the St. Pancras Midland Terminus, and elsewhere. Caen or even Corsham stone thus treated ceases to absorb water (carved work in the rain in consequence becomes no darker), and though its colour is unchanged, its surface acquires a finish, which greatly improves its appearance. A piece of black cloth is not whitened when rubbed against Bath stone thus prepared, so that the mechanical abrasion of the surface is arrested. The materials cannot cause either dampness or efflorescence on the stone; the process, moreover, is cheap. The patent process is now the property of the Ransome's Concrete Stone Company, and is carried out by their licensees, Messrs. Hockin & Wilson, of Duke-street, Manchester-square, W., who have worked it under my direction for several years.

A. H. CHURCH, M.A., Professor of Chemistry, Royal Agricultural College.

P.S. Where the "combined process" is inapplicable from the pulverulent nature of the surface, a warm solution of solid paraffine in benzole or in mineral turpentine, answers admirably. For decayed internal carved work I prefer occasionally to mix white copal varnish with the solution of paraffine. These solutions or those of the combined process may be paid on to the surface with a syringe, or with *la bouffée*. I have employed them successfully for years. For preserving iron, bone, ivory, and many other materials (tessellæ of Roman pavements, for example), I sometimes use solid paraffine, driven in by the aid of heat.

A. H. C.

THE REFORM CLUB.

THE Reform Club, in Pall-mall, one of the late Sir Charles Barry's best works, has been painted and gilt inside, by Mr. Crossley, of Newark, and looks very bright and comfortable. With the exception of the coarse treatment of the Elgin frieze, in the morning-room, there seems nothing to complain of. We might even have gone further, and praised some of the combinations, but for the pretentious accounts which have appeared in other quarters. From these it might be supposed that the whole of the real decorations of the various apartments had just now been executed, instead of being simply tinted, and cut in with a certain amount of discretion. What possible occasion there was to send all the way to Newark in order to have this done, with Mr. Craze, Mr. Collmann, Mr. Sang, and two or three others living close by, it passes our comprehension to divine.

M. REVOILL'S TELEICONOGRAPHE.

I SEE that another inventor puts forward his claim for priority of conception of the instrument for facilitating the drawing of distant objects on an enlarged scale; in fact, an improvement upon the old camera lucida. In the present instance, the claimant is an American. We had already Mr. E. Sharpe's notice; and I believe that our able painter, E. W. Cooke, R.A., had also conceived years since a like instrument, and possibly many others. But, sir, M. Revouill's merit consists not only in this, that he has made the discovery and perfected it in execution, but that he has made it generally known and available to all the world, by its being procurable at any respectable instrument-maker's at Paris; and has sent over one to the Royal Institute of British Architects, in the library of which institution it is put up complete, and may be consulted by all. The great benefactor is not merely he who makes a discovery, but he who also puts it within reach of application, and for use by all the world.

M. I. B. A.

MONUMENTAL.

ON the 14th inst., a tomb in the form of a small Gothic chapel was uncovered at Kensal Green. It is built of stone, with marble shafts and tablets, stained-glass windows, gate, and iron enclosure for flowers. It is fully covered with carving, which, with the stonework, has been executed by Mr. L. T. Carter. The stained glass windows, with the mosaic over the door, has been executed by Bell & Almond. The iron-work by W. Pedlar. The tomb is erected to the memory of Marian Susan, the wife of Mr. George Ernest Augustus Ross, of Lavender Hill, from designs of Mr. Walter Blackett, architect.

ARCHITECTURAL ASSOCIATION.

THE syllabus of papers and discussions for the current session stands thus:—

- October 29th, Opening Conversations.
- November 5th, Annual meeting, and Address by the President.
- November 19th, Natural Science, as applied to Architecture. Mr. C. W. Quin, F.R.S.
- December 3rd, On the Limits of Variety in Architectural Design. Mr. W. Seagrill.
- December 17th, Art applied to Industry in France, as promoted by the new Association of Art Manufactures in Paris. Mr. Blanchard Jerrold.
- December 31st, On the Study of Architectural History. Mr. Spiers.
- January 14th, 1870, Timber Buildings of the Middle Ages. Mr. C. Baily.
- January 28th, The Churches of the Deaneries of Freebridge Lynn and Freebridge Marshland, Norfolk. Rev. R. C. Nelson, M.A.
- February 11th, The Bed of the Tiber. Mr. G. A. Sala.
- February 25th, Members' Soirée.
- March 11th, Domestic Architecture during the Reign of Queen Anne. Mr. R. Almond.
- March 25th, Recent Improvements in Building Appliances. Mr. J. D. Mathews.
- April 8th, London Brickwork in the Sixteenth and Seventeenth Centuries. Rev. J. H. Houli.
- April 22nd, The Progress and Development of Church Architecture, and Arrangement in England since 1830. Mr. F. T. Dollman.
- May 6th, General Business Meeting. A Discussion:—Subject—Was the Renaissance Style productive of any real Benefit to Architecture? Inroduced by C. Aldridge.
- May 20th, Some further Remarks upon Monumental Sculpture. Mr. T. H. Watson.
- June 3rd, A Paper on Papers. Mr. T. Blashill.
- June 17th, Nomination of Officers. Remarks on Rhenish Romanesque Architecture. Mr. C. Heesom, jun.
- July 1st, Election of Officers. An historical Description of an ancient Building in the Neighbourhood of the Metropolis. Mr. G. H. Birch.

Three courses of lectures on Heat and Ventilation; the Chemistry of Building Stones; and the History of Architecture (a small fee being payable for each course) have been arranged for.

The business at the *conversations* this (Friday) evening will consist of a short address by the President, the distribution of prizes, nomination of new members, and any remarks that may be made by gentlemen present.

STAMPED TENDERS.

SIR,—Please allow me a small space in your columns, so as to open the subject of stamped tenders. The question is, do tenders, or offers for the execution of contracts, require to be stamped? Perhaps some of your readers will give some information on the subject. A short time ago I had a county-court trial, with a party to recover a balance of account due for a contract finished. *I was non-suited, because my tender was not stamped.* If this is the law, I never knew it before, and I am afraid many more are in the ignorant of it.

I shall be glad to see any correspondence on this head, as it is a matter of much importance to the building trade.

* * * Our correspondent must surely have misunderstood the judgment. A tender *per se* requires no stamp.

TYRANNY.

SIR,—Since writing my former letter on the strike of labourers and threatened strike of plasterers, Liverpool, the man has been discharged, and the labourers have returned to their work. Comment would be superfluous.

E. G.

IMPROVED COMPETITIONS.

SIR,—Doubtless the profession have been much exercised in their minds by the result of some recent competitions, and by reason of the voluminous correspondence thereby engendered, editorial patience must have been taxed greatly. I have, however, a suggestion to offer which I am sanguine enough to believe would, if adopted, place the subject of competitions on a satisfactory basis.

I have to suggest that, for the future, competitions should be settled in the same way as vacant appointments, and instead of committees advertising for designs, that they should simply request architects to send in their applications, accompanied with testimonials, lists of charges, and so on.

In this case, such architects as were not troubled with foolish prejudices on the score of dignity, professional etiquette, self-respect, &c., would submit their applications and immediately commence a vigorous canvass of the committee. Entertainingly having to decide on matters the opportunity of underselling their professional brethren, trusting to recoup themselves by means of bills of quantities, and surreptitious donations from grateful tradesmen.

The advantages of this plan are obvious. Architects would be saved all the trouble and expense of preparing gorgeous competition drawings, and committees the annoyance and perplexity of having to decide on matters that they know positively nothing about, besides escaping the obloquy heaped on their heads by irate and unsuccessful competitors. Society would be spared the painful spectacle of a profession divided against itself, and the vexed question of competitions would disappear from the face of the architectural world.

The only parties to snicker from such an arrangement would be,—1st, the public, and they don't seem to care; and, 2nd, high-minded, conscientious, and talented men, and who cares for them?

R. LAMB.

GLASS PAINT FOR STOVES.

MAXTON has been made in our paper of a German glass-paint used for stoves and fireplaces instead of blacklead. Inquiries have been made as to where it can be obtained. We shall be glad to receive address.

INTENDED NEW BOARD-ROOM AND RELIEF OFFICE FOR HACKNEY UNION.

THE guardians of Hackney Union recently decided to erect a new board-room and relief offices. Plans have since been prepared by Mr. Lee, architect, according to which the board-room would be 40 ft. long and 20 ft. wide (sufficiently large to accommodate twice the number of guardians returned by the union), at one end of which a bay window was to be placed. The waiting-room attached to the relief offices was to be 43 ft. by 50 ft., capable of holding 250 persons. The plans were forwarded to the Poor-law Board for approval, and a reply has been received, stating that "the Poor-law Board approved of the site and general arrangement of the building, but considered that the dimensions of the various rooms, &c., it was to contain were greatly in excess of what was required, and therefore the work would cost more than necessary." The Board objected to the expense of placing a bay window in the board-room, and also the size of the waiting-room, and "returned the plans, &c., for the reconsideration of the guardians."

A somewhat warm discussion ensued, at the termination of which the subject was referred to the building committee and architect for consideration and report.

WHAT IS AN ACRE?

SIR,—In the *Builder* of the 16th Oct. a correspondent asks a question, "How much is a bushel?" which reminds me of a similar one put in March, 1866,—"What is an acre?" Not having observed any notice of it in the *Builder*, although a regular reader, I consider there can be no harm in again bringing it under your notice. You give as an example that the Scottish acre contains 5760 square yards, which is not so,—it contains 6104-12750 square yards. The error is in making the fall, or pole as you call it, contain 36 square yards instead of ells: the Scottish ell measuring 37-0588 in., 1 square acre is = 1261183 imperial acres. The above is taken from Buchanan's Tables, authorised by the Lords Commissioners of her Majesty's Treasury.

A. BLACK.

MORTUARY FOR CITY OF LONDON.

AT the last meeting of the City Commission of Sewers, the Sewers Committee reported that they had secured a site for the mortuary in Golden-lane, at an expense of 5,000*l.*, and recommended that a chamber should there be constructed for the reception of 12, and afterwards 24, dead bodies, for the holding of *post mortem* examinations, for keeping the sick carriages and hearses, and for the disinfection of clothing. The total cost, including the site, would be about 13,000*l.* The report was carried, and referred back for execution.

THE WHITECHAPEL IMPROVEMENTS.

A REPORT to the Metropolitan Board of Works was brought up last week from their Works and General Purposes Committee upon the present condition of the works for the improvements at Whitechapel, stating that they had made but slow progress, and also that inferior articles had been used. They therefore recommended:—

"That the contractors for the works, Messrs. Marshall & Maxwell, be forthwith called upon to take out and remove all the upper rings of the vaults which have been constructed with inferior and broken bricks and bats, and in strict accordance with the terms and conditions of the specification; and that no more mortar be permitted to be used which is not properly mixed and tempered in a mill.

That the contractors be also forthwith called upon to take up all the so-called concrete laid over the vaults and roadway, and to fill in the same with concrete composed of good materials, with the proper proportions of lime as described in the 37th section of the specification.

That the contractors be further called upon, prior to reinstating the works, to at once remove the whole of the inferior bricks and earth sittings, and rubbish found upon the ground.

That the further services of William Fortescue, the clerk of works employed upon this contract, be dispensed with."

The first three were agreed to, and after some discussion of the fourth the subject was referred back to the committee for further consideration. Mr. Fortescue sent in a letter of resignation to the meeting.

CO-OPERATIVE ARCHITECTS IN ITALY.

THE co-operative principle meets with much favour in Southern Italy. The *Times* correspondent from Naples says a novel instance of the application of the principle is announced as having been made, not by workmen, but by masters—that is, by the architects of Caserta, with whom those of the neighbouring town of Maddaloni have united themselves. "Under the title of the 'Association of Architects of the City of Caserta' they undertake, in their common interest, any commission connected with their profession, and to resolve all questions of art in meetings of the society. While, therefore, not paying more than would be demanded by a single engineer, it is pointed out as one of the great advantages offered by the association that any person entering on a building or engineering enterprise would here have the benefit of the united study, intelligence, and activity of many. I do not say a word as to the merits or prospects of success of these associations, but report them merely as an indication of that awakening of the public Italian mind which in many directions and forms is so evident."

A HALL FOR THE "FORESTERS."

THE London United District of the Ancient Order of Foresters, comprising about 600 knights, and having an invested capital of upwards of 63,000*l.*, has at length seen the propriety of erecting its own place of business and hall in which to conduct its delegate meetings. A plot of ground forming part of the Charter House Estate, adjoining Wilderness-row, has been secured as the site of the proposed building, for which competition designs and plans (advertised for in this journal) were invited.

On Thursday, the 14th inst., the Committee submitted, from the eight sent in in response to the invitation, two designs, signed "Stability" and "I aim at the Mark," to the general meeting, on which a long discussion ensued. It was unanimously resolved, that the design "Stability" be received as first, "I aim at the Mark" second. Upon opening the letters of explanation, the second design was found to be from Mr. Walker, of King's Arms Yard, Coleman-street, City; and that marked "Stability" by Mr. W. L. Gomme, architect, Hammer-smith, who was unanimously elected architect to the Society to carry out the works.

A FUNNY THING IN COMPETITIONS.

Sir,—The committee of the London United District of the Ancient Order of Foresters having invited designs for the erection of a Foresters' Hall in Wilderness-row, received eight sets of drawings from as many competitors. The committee, on the reception of the designs, immediately proceeded to select two for the premiums they had offered, and, after a short deliberation, they unanimously selected the plans of Mr. W. L. Gomme, of Hammer-smith, the chairman of their own body, as being the best. This is intelligible, as far as it goes, for there is no reason why the chairman's plans should not be as good, if not better, than those of any other person. In proceeding to select the second best set of designs, the committee seem to have had a toss for it. They ultimately selected the plans of Mr. Walker, of King's-Arms-yard, Moorgate-street, on the ground that the design could not be erected for 6,000*l.* (the required amount being 4,000*l.*), and because, in the opinion of the committee, the design could not be carried out according to the Metropolitan Building Act! This part of the committee's decision seems quite unintelligible, but probably they can explain it.

Soleo.

DERBYSHIRE BUILDING STONES.

Sir,—I have been asked to give my opinion upon the qualities of the Derbyshire stones. I have great pleasure in doing so, for I cannot overrate them too highly; they only require to be known in order to be more extensively used than they have been hitherto. There is in Derbyshire an abundance of marbles, limestones, and sandstones. The sandstones are in great variety; from the coarse-grained Bramley Fall grit to the fine-grained, hard, compact, Darley Dale stone. There is also every variety of colour as well as texture. The hard stones are costly, and expensive to work, but there are others of a milder nature that "fret" well under the tool. Most of them possess good weather qualities, and are well adapted for public buildings, especially in our large towns, as they will withstand atmospheric changes. It has been a matter of surprise to me that they have not been more largely introduced into the London market. Several of them have been tried with success in Derby, Birmingham, Manchester, Liverpool, and other places. I may have an opportunity of giving a fuller description of some of them.

Of limestones, in the first rank stands Hopton Wood; and of the sandstones, I may name Coxenoh, Duffield Bank, Cromford, Crich, Mattock, Darley Dale, Stanton Moor, Stanton Park, Wingerworth, and Pillingham.

SAMUEL TUCKETT.

CHURCH-BUILDING NEWS.

Rickmansworth.—A new church is about to be erected at St. Peter, Chalfont, Bucks. Mr. John Harris, of St. Alban's, is the architect. The following were the tenders received:—Mr. J. Honnor, Tring, 1,082*l.*; Mr. F. Taylor, Uxbridge, 980*l.*; Mr. D. Osborn, Tring, 939*l.*; Messrs. Savage, St. Alban's, 909*l.* 10s. 6d. (accepted).

Shrewsbury.—St. George's Church, erected in 1832, has been re-opened after undergoing considerable alterations. The high pews have been removed, and new and uniform seats are now provided, with stalls for the choir. The organ has also been repaired, and removed from the west gallery to the south side of the chancel. The pulpit, altar-rails, &c., are new; and an improved system of warming has been adopted. There are now wide central passages in nave and transepts. The work has been carried out by Messrs. Nevett, of Ironbridge, from the designs of Mr. E. Haycock, jun., architect, Shrewsbury.

Chesterfield.—The chief-stone of Christ Church has been laid at Stonegravel, near Chesterfield. The church will be in the fourteenth century style, and built of stone, and is intended to accommodate about 180 persons. The nave and chancel will be under a continued roof, with apsidal end, porch, and bell-turret, with open timber roof, porch, vestry, and heating vault underneath. The cost of the building will be 500*l.* The architect is Mr. S. Rollinson, Chesterfield, and the builder Mr. R. Maw.

Stanton Brudenell.—The parish church of Stanton Brudenell has been re-opened for divine service. The church is dedicated to St. Dennis, and consists of a nave, chancel, and porch. Formerly it had also a south aisle, chantry, and tower with four bells, the latter having been removed to the tower of Corby Church. During the works at this church an early British grave was found, in the shape of a kist-van, with the bones of an adult enclosed, mixed with a large quantity of ashes and charcoal. The restoration of Stanton Brudenell Church has completed the whole of the churches upon the Brudenell estates in Leicestershire. The Countess of Cardigan, notwithstanding an outlay of many thousand pounds at Deene Church (to be shortly opened), lent a helping hand towards the restoration of Stanton Brudenell Church, and personally attended at the re-opening.

Barnsley.—A new church has been consecrated at Bierley. The erection of the new edifice is mainly due to Mr. Fojambe, M.P., and other resident landowners and gentry. The building has been erected from plans and specifications furnished by Mr. John Wade, of Barnsley, under whose superintendance the works have been carried out. It is built entirely of stone, the inside being faced with tooled ashlar. The seats are open ones, with ornamental bench ends. A western gallery has been fixed for the organ and choir. The roof of the nave consists of three arched ribs, springing from carved corbels. The east window is filled with stained glass, the centre lights representing our Lord's resurrection. The two side lights portray His agony and represent Him bearing the cross. The western tower window is filled with stained glass in geometrical figures. A school-room, with class-room, as well as a residence for the mistress, is also erected close at hand. The contractors have been Messrs. John & Thomas Ridal. The entire cost is set down at 3,000*l.* The church is to be dedicated to St. Paul. It is situate in the parish of Felkirk.

Bradford.—St. Andrew's Church has just been enlarged and re-opened. The church has been enlarged by the addition of 170 sittings. The nave of the edifice has been extended for a distance of ten yards, and the porch removed to the west end. The expenditure is 1,200*l.*, nearly the whole of which has been defrayed by subscriptions.

Boston.—The new church at Boston, dedicated to St. Mary, has been formally consecrated. The land upon which the church is erected was given by the daughters of Mr. Samuel Brooks. The church has been built, licensed, and the services conducted for some ten months, but owing to difficulties that have arisen the consecration has been so far delayed. The edifice,

which is seated to accommodate 450 persons—210 appropriated seats and 240 free—is built in the Early Gothic style of architecture, and consists of nave, 66 ft., by 37 ft.; apsidal chancel, 24 ft. 6 in., by 16 ft.; organ chapel, and vestry on the south side. There are two entrances at the west end, with inner porches, separated from the church by a glazed tracered screen. The font, situated at the west end, between the two entrances, is of Caen stone, consisting of a circular bowl, with inscription round the edge, and supported by a red Mansfield shaft, with foliated capital of lilies. The pulpit, situated at the north-east angle of the chancel, is also of Caen stone, supported similarly to the font. There are seats provided in the chancel for the choristers. The chancel is raised two steps above the level of the church, and the part appropriated to the communion one, and both are laid with Shaw's tiles. The lighting is effected by standards in the chancel, and corbels on each side of the nave. The gas-fittings are by Messrs. Skidmore. Externally the building is of red brick, with blue brick bands, and the dressings to the windows and doors, which are of stone, are set in brick reveals. The west gable is surmounted by a simple little bell-turret. The roof is open timbered, and plastered between the rafters. The architects were Messrs. Horton & Bridgford, Manchester, and the contractors, Messrs. Bowden & Edwards, also of Manchester. The cost, including heating, lighting, extra foundations, fittings, and boundary walling, has been 2,600*l.*

Jarrow.—The church recently erected at Jarrow Grange, Jarrow, has been consecrated. The edifice is in the Early Pointed style of the beginning of the thirteenth century, and consists of a chancel, nave, 71 ft. by 24 ft. 6 in., with north and south aisles, and vestry, organ-chamber, and south porch. It is built of natural bedded parpoints from Tow Law, with ashlar stone dressings from Hebburn. The churchyard is surrounded by a dwarf wall and wrought-iron palisading. Mr. Henry Hudspeth was the contractor for the masonry and plastering.

Swinton.—The new church at Swinton, dedicated to St. Peter, has been consecrated. The edifice, which is seated to accommodate 900, is built in the Decorated Gothic style of architecture, and is situate immediately adjacent to the old church. The latter will shortly be removed. Although the new building is not yet completed,—a tower, for which a sum of 1,200*l.* is yet required, being wanted,—the building itself is sufficiently far advanced to permit of service being now held. The cost of the building will be about 15,000*l.*, of which amount 800*l.* are required for the church, and 12,000*l.* for the tower. The church consists of nave, north and south aisles, chancel and chancel aisles, organ-chamber on the south, and vestries for clergy and choir on the north side. The total length of the building is 144 ft. by 66 ft. There are two porches at the west end and one at the north, immediately adjoining the entry to the vestries. The exterior work is of Durnford parpoints, with Longridge dressings, and the interior of Hollington stone. The wood fittings are of varnished pitch-pine. The chancel is 38 ft. long and 23 ft. wide, whilst the north and south chancel aisles are 26 ft. by 15 ft. 6 in. The fittings of the chancel are of oak, and the reredos and arcades of carved Mansfield stone. The floors of the aisles and chancel are inlaid with Godwin's tiles. The chancel is raised two steps, and the altar is ascended by four. The chancel is lighted by a large corona, of 180 lights, with two brackets; each of the aisles is similarly lighted. The roof of the nave, which is supported by six clustered columns and four responds, is open-timbered. The chancel is lighted by a large five-light tracery window; the north chancel aisle by a three-light tracery window; the south chancel aisle, by two three-light tracery windows; all with carved bosses outside. The pulpit, of Mansfield stone, with marble columns and panels, has been presented by Mr. James Bowers. It is proposed to build the tower to a height of 105 ft., and in the turret provision will be made for the reception of eight bells. One-half of the seats are appropriated, and the remainder free. The architect is Mr. G. E. Street; the contractor, Mr. Horsman, Wolverhampton.

Brighton.—The trustees of Trinity Chapel, taking advantage of great improvements which have been, and are still being, effected in Duke-street by the municipal authorities, have made an addition to that place of worship. In widening Duke-street, the corporation took away the vestry and choristers' room of the chapel, which were situated on the southern side of the

building and to the west of premises which also belonged to the trustees of the chapel and formed the junction of Duke-street with Ship-street. In exchange for these premises, the corporation gave to the trustees a portion of the property which they acquired from other parties on the west of the chapel; and on this site a chancel, vestry, chorister's room, and other offices have been erected. This alteration gives room for additional seats at the west end of the chapel, occupying the place where the communion-table and pulpit formerly stood; and the entire body of the building has been re-seated, modern open benches having been substituted for the old-fashioned pews. To some extent this alteration has been carried out in the galleries. The chapel has now a light appearance, the new chancel, which is Norman Gothic in style, being open and airy. The chancel is about 21 ft. square, and 30 ft. to the ceiling, which is of stained wood. The whole of the alterations have been designed and carried out by Messrs. G. Lynn & Sons, builders, of this town. The reteros is composed of coloured glazed tiles, the most prominent features in it being the cross (Maltese) and the emblems of the Trinity and Eternity; the latter consisting of triangles in a circle and the fleur-de-lis. This portion of the work was executed by Messrs. Maw, of Broseley, Salop. Above the reteros, on the south, is the mural tablet to the memory of the late Rev. Robert Anderson, which formerly occupied a position at the side of the communion-table. On the north side are three small memorial windows of stained glass; but the most prominent feature here is the large window on the west, erected to the memory of the late Rev. F. W. Robertson. This window, which contains above 100 ft. of stained glass, set in Bath stone, has been erected by Messrs. Powell & Son, of London. There are three lights, the centre containing three medallions, and the other two a cartoon each, illustrative of the leading incidents in the life of our Lord and His disciples, and suggested by the most remarkable of Mr. Robertson's sermons. The designs of these medallions and cartoons, which form a Greek cross, are by Mr. Holiday, of London, and were selected by the committee. In the centre light is "Our Lord as a Child among the Doctors in the Temple," taken from Holman Hunt's picture. Immediately beneath this is "The Crucifixion." The bottom picture of this group is the "Doubt of Thomas." On the left of the centre of these three is "St. John preaching in the Wilderness," and on the right of the centre, "St. Paul preaching at Athens," taken from one of Raffaele's cartoons. The standards for the altar-rail, brackets, &c., are all emblematical of the Trinity, and have been supplied by Messrs. Cox & Co., of London. At the north-east corner of the chancel is a new pulpit of carved oak, and in the centre of the chancel arch is a carved oak eagle lectern.

Buxton.—The foundation-stone of a new church has been laid here by the Duke of Devonshire. The Duke gave the site, and subscribed 1,000l. towards the cost of the building. A total of 2,700l. has been received towards an expenditure which is estimated at 5,000l. The new church, which is to be dedicated to St. James, is situated near the end of the Broad Walk, and will accommodate 700 persons.

Monks Kirby.—The church here has been restored and re-opened. The restoration, which has been designed by Mr. Street, has cost, we believe, about 7,000l. The architect has introduced stone screens and screens of carved oak; also a reteros and ornamental pavement. There is a painted window by Messrs. Hardman, Hughes, & Ward, and Lavers & Barrand, and one of Walker's organs. Those of the windows which are not of painted glass have been prepared under the direction of the architect, with the view of giving a suitable tone to the church. The pillars are of a warm-coloured stone. The village of Monks Kirby is two miles from Stretton Station and five or six miles from Rugby. It is the parish church of the family of the Earl of Denhig, and contains old family monuments, which have been restored. The chancel was restored by Trinity College, Cambridge, the patrons of the living.

Ellesmere Port, Cheshire.—A new church has been opened here by licence from the Bishop of the diocese. The consecration had been delayed for the completion of the conveyance of site. On plan the nave is 63 ft. by 33 ft., north and south transepts, 14 ft. 6 in. by 10 ft. 6 in.; chancel, 21 ft. by 26 ft., with organ chamber on

north side, and vestry and bell-turret on south side, north and south entrance porches and priest's door. The roofs are open, all the timbers being stained and varnished, with plaster ceiling formed between the rafters. The sittings, choir seats in the chancel, pulpit, prayer and litany desks, altar-rail and table, &c., are of pitch pine varnished without any staining. The chancel floor is laid with encaustic tiles by Maw & Co. The passages of nave and transepts, &c., being laid with black and red tiles in patterns. The architecture is of the Early Decorated Gothic style. Messrs. Penson & Ritohy, of Chester, were the architects, and Mr. John Roberts, of Chester, the builder. The sittings provide for 363 persons. The cost has been about 2,500l., independent of churchyard enclosure, &c., of which 1,500l., together with a site forming an addition to the existing churchyard, have been supplied by the Marquis of Westminster. The church is built principally of Runcorn stone, the inside arches of transepts and chancel, organ chamber, &c., being of that material. The warming is effected by hot-water pipes upon the high-pressure system.

Wettenhall.—The foundation-stone of the new church of Wettenhall has been laid. The old church was cramped and inconvenient, holding at most but sixty or seventy persons, while there are near 300 in the district who require accommodation. The old building was pulled down, and a contract for a new fabric taken at about 700l. Good progress has been made. The architects are Mr. J. Redford, of Manchester, and Mr. J. A. Daveport, of Over-lane, near Winsford. The contractor is Mr. P. Hodgkinson, of Sandach.

Linfield.—The old parish church has undergone a restoration, by having its exterior roof pointed, and the whole of the walls of the interior coloured, &c. The work has been carried out by Mr. Keasterton.

Newnigh.—The chancel of Frettenham Church, which has been entirely rebuilt at the sole cost of the rector, the Rev. J. Shirley, has been reopened. The chancel has been rebuilt from plans by Mr. Phipson, and the work has been carried out by Mr. Cornish, of North Walsham. The benches and altar-rails are of oak, carved. The floor is paved throughout with encaustic tiles.

Liverpool.—St. Saviour's Church, Breckfield-road North, has been consecrated. The new church is built in the style of the early part of the thirteenth century, and is of unusual size in all its parts, the span of the arches of the principal arcade being over 20 ft. The pillars have been carried to a height sufficient to permit of the chancel arch springing from the same level with the other arches of the arcades. The clearstory is planned to have something of the effect of a lantern; the arcade of the same being continued over the last chancel arch. The pillars are constructed of Cefn stone, with attached shafts of red Mansfield. The main walls of the church are of local red sandstone, relieved with white Stourton. The roof, which is lofty, is of Baltic fir throughout, the whole of the fittings of the building being of varnished pitch pine. The architect was Mr. Gordon N. Hills; and the builder Mr. Tomkinson. It is intended at some future day to crown the edifice with a tower.

Birstall.—The church of Birstall has been reopened for divine service. Works of restoration have been for some time in progress at this church. The restoration and enlargement have consisted of the removal of the erection which divided the aisles, as well as the gallery, plaster ceiling and fittings, and the substitution of a stone arcade of three bays between the nave and north aisle, carrying open timber roof, and the insertion of new windows in the nave and aisle wall. On the north side of the chancel has been added an aisle, in which is placed the vestry and organ chamber, the vestry being enclosed by an oak screen. The chancel has been repaired, and all the architectural features restored. On removing the modern plaster from the walls, some interesting discoveries were made of ancient work. In the south wall were traces of early windows and a priest's door, and in the north wall was discovered a circular-headed lancet window in a perfect state. The body of the church has been fitted with open deal benches, and the chancel with oak stalls. The pulpit is of Caen stone. The cost of the restoration will amount to about 1,550l. The work has been carried out by Messrs. Halliday & Cain, builders, Greatham, Oakham, from the designs of Mr. G. G. Scott, architect.

Oxford.—St. Barnabas's Church, Jericho, has been consecrated. The style of architecture is a departure from the conventional type of church building. The church will accommodate 1,000 persons. There are no pews, chairs occupying the whole of the floor devoted to the congregation. Owing to the peculiar mode of construction, the cost will not be much beyond half the sum required for churches of similar dimensions. The plan, as described by the local *Herald*, is a Basilica, and consists of a simple parallelogram 100 ft. long by 60 ft. wide, divided into nave and aisles by two ranges of circular arches; at the east end is a lofty apse, ceiled with a half dome; at the opposite end is a smaller apse, in connexion with the porches. The lower portion of a campanile stands detached at the south-east corner, the ground floor of which contains the vestry. The internal arrangements, with such modifications as are deemed necessary by the Anglican ritual, are similar to those of the Early Christian Churches of this type. A choir is raised in front of the altar, and forms a kind of elevated platform, which is reached by three steps. It is separated from the nave by a low screen or septum of stone, on which is a railing of metal-work entirely surrounding it, having iron gates at the west end and on the north and south sides, and at the east end of the stalls. When the choir was filled with the choristers and the officiating clergymen, it presented a novel appearance. The altar is a conspicuous object on entering the church. It is raised nine steps above the nave floor, causing it to appear much higher than the choir. A lofty baldachin or pointed canopy of wood supported on four slender pillars, highly gilt and decorated with colour, forms a prominent object under which stands the communion-table, bearing two lofty brass candlesticks, each holding a large wax candle. At the back is a shining cross. Over the entrance to the choir is a floreated metal cross suspended from the roof, and conspicuous at the entrance. The nave is separated from the aisles by columns supporting semicircular arches, above which is a range of simple round-headed clerestory windows, with a large circular window, without stonework or tracery, at the upper part of the west end. The aisles are lighted by small square windows. The glass of the windows is slightly tinted with green, yellow, or blue, and floreated forms given to the lead holding the glass. The cheapest possible materials have been used, and methods of construction harmonising with the style, strength, and durability. No wrought stone has been used except for the columns supporting the nave arches, and on the base of which at the corners of the pedestals are conventional ornaments. The walls are 2 ft. 8 in. thick, built in rubble of local stone, in blue lias mortar. Brick has been used for arches, bands to level up the work at intervals, and at the groins. In various parts the brick is allowed to show, except where fresco decoration is contemplated. The outside walls are plastered with rough Portland cement to protect the stone, and on the inside rough stuccoed to receive decoration. Where hard stone is usually employed, Portland cement has been used. The floor of the church is of the same material set in concrete, and the floor of the choir is tiled. The nave has a king-post roof of low pitch, which with the aisle roofs are framed with all timber and boarding nawnrough. The roof is picked out in panels, and the whole decorated with colour, in which a warm tint prevails. There are no mouldings throughout the building, and the carvings are confined to the capitals of the nave arcade. Although there is little carving in the body of the church, there are some examples of carving by Messrs. Knowles, stonemasons, carvers, and builders, of Oxford. At the tops of the pilasters in the baptistery the heads of the founder and the bishop are carved. The heads, also, of the incumbent, and the vicar of St. Paul's, are carved in stone. The contemplated decorations have as yet only been carried out in the roof of the baptistery and the eastern apse. The dome of this apse is coloured a pale blue, with stars of various sizes. In the centre is a colossal figure of Our Saviour enthroned, the head surrounded by a nimbus, containing a cross. Below the cornice, in a series of arches, are the figures of the Apostles, two and two, SS. Paul and Barnabas occupying the centre. Below the figures the wall is panelled with a spreading vine springing from the centre of each panel. The base is a dado of Indian red. The building has been executed by Messrs. Castle & Co., under the direction of Mr. A. W. Blomfield, architect.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Weston.—The new church at Weston, Warwickshire, dedicated to "Our Lady of the Sacred Heart," has been consecrated by Dr. Ullathorne, Roman Catholic Bishop of Birmingham. The church is a simple structure, consisting of nave, chancel, and side chapel. The materials are brick, with dressings of local stone. The font and altar were executed by Mr. Jaquet, of London. Mr. Bromwich, of Rugby, was the builder. Mr. Gualbert Saunders, of London, was the architect.

West Drayton.—The new church at West Drayton has been opened for divine service. The edifice is dedicated to St. Catherine the Martyr, and will accommodate about 500 persons. It is built of brick, with stone dressings, and is in the Early Decorated style. There are a nave, two aisles, a baptistery, a sacristy, a chancel, and a small side-chapel near the chancel, dedicated to the Blessed Sacrament. The chancel is lighted by means of a carved stone oriel window, and is paved with Minton's encaustic tiles, with the initials of "Ave Maria," and with plain tiles. The nave and aisles are laid with blue and red Staffordshire sile tiles. The building is 80 ft. long and 40 ft. wide, the height to the ridge of the roof being 45 ft. The cost of the portion completed has been 2,500*l.*, and when a proposed tower has been erected, the total cost will have been 3,000*l.* The architects are Messrs. Wilson & Nicoll, of London; and the builders Messrs. Fassnidge & Son, of Uxbridge. Mr. Dale has been clerk of the works. A painting, by Spagnoletti, of the preparation for the Crucifixion of our Lord, has been presented as an altar-piece by Mr. Swift, of London, who has also been a donor to the building fund. The school-room is 40 ft. long and 20 ft. broad, and will contain about 250 children. This has been built by Messrs. Fassnidge & Son.

Cleator.—The foundation-stone of a new church, dedicated to the Virgin, by the title of "Our Lady of the Sacred Heart," has been laid at Cleator by the Roman Catholic Bishop of Hexham. The church is after the design of Mr. Welby Pugin, architect. The edifice has been for some time in the course of construction, and the builder is Mr. Henry F. Edwards, of Whitehaven. The foundations were completed on the 18th of August last. The masons then commenced operations, and the walls are now about 9 ft. above the ground. The design is cruciform, and the building will accommodate about 1,000 persons. Its dimensions inside are 130 ft. by 50 ft., and 75 ft. across the transepts, and its height is about 65 ft. The cost of the structure will, it is expected, be 4,000*l.* According to the design, in the centre of the aisle bays, spaces are left for the stations of the cross, and on either side there are placed lancet windows of peculiar form; externally a vesica, containing the emblem and number of the station, corresponds to the internal group. The chancel is lighted by an eastern rose-window, and by side windows of simple tracery; and the chancel arch is supported on clustered columns, crowned with carved capitals. Eastward of the transepts are two small chapels; and an organ-gallery is provided at the west end over the main door. The clearstory is composed of small coupled lancets, which admit a subdued light into the body of the church. A font in the north aisle, and a pulpit on the Gospel side of the nave, will be provided. The sides at the west end are flanked by buttresses, which, rising from the aisles and the walls of the projecting porch, form a spreading base to the bell-turret, which, with moulded corbels, and wrought-iron gilded cross, surmounts the gable. Immediately above the slope of the roof of the porch are three lancet windows, which are held in balance by two similar windows in the ends of the aisles. In the group of the east end, the transepts break the line of the main roof, and the transept chapels cluster round the chancel. The church is being built of Cleator red and Cockermonth yellow stone, and the foundations have been put in entirely of concrete from the iron furnaces at Cleator Moor.

The Smoke Nuisance.—The Leeds Town Council rightly are still carrying out various smoke prosecutions. A case against Messrs. Gantt, of Broad-lane, Bromley, woollen manufacturers, and their engineman, John Marsden, has been dismissed on payment of costs, the defendants having now put in an efficient smoke-burner.

FROM SCOTLAND.

Edinburgh.—Mr. Syma has urged the advantages and conveniences of one large block erection for the new Royal Infirmary; and Sir James Simpson, on the other side, has denounced the palatial mode of building, and advocated that of a village, or, in fact, the pavilion system elaborated so often and early advocated in the *Builder*.—The foundation stone of a church for the Free Methodists of this city has been laid. The site is in Park-place, at the east end of the University Music-hall, and the plans were prepared by Mr. Macrae, architect. The church will be 60 ft. in length, and 40 ft. in breadth, and will be seated for between 450 and 500 persons. About 150 of these will be accommodated in a gallery which it is intended to erect at the north end of the building. The church will have a northern frontage. It has been estimated to cost from 1,000*l.* to 1,200*l.*

Perth.—Arrangements have been completed for the erection of the new Free West Church in Tay-street. The site is about halfway between High-street and the County Buildings, on the line of Tay-street. The building has been designed by Mr. John Honeyman, junior, architect, Glasgow, in the style of architecture which prevailed about the middle of the thirteenth century. The extreme length of the building, exclusive of vestry, &c., will be 114 ft., and the width 63 ft. The principal entrance will be in the base of the tower at the end of the building next Tay-street, the lower part of the tower forming a spacious porch. The tower will measure 30 ft. over the buttresses, and the height from the pavement to the top of the steeple will be 212 ft. It will form a very conspicuous feature in every view of the city. The church will be divided into three aisles by iron columns supporting the side galleries and the roof. The ceilings will be all plastered, but the principal couples, which are ornamental, and the purlins, will be exposed to view. The height of the central aisle from floor to ceiling will be 43 ft. Provision will be made for ventilating the church by drawing the vitiated air into the tower. The pews will be 33 in. wide, and there will be accommodation for fully 1,000 persons, allowing 20 in. for each sitting. The contractors for the work are,—Messrs. C. McCarrach & Sons, masons; Mr. C. S. Whitte, wright; Mr. J. Peebles, plasterer; Mr. J. MacLeish, plumber; Mr. P. Reid, slater; and Messrs. J. Bruce & Son, glaziers, all of Perth. We understand that the total cost, exclusive of the site, the gift of the late Mr. Turnbull, will be about 8,000*l.*

Dunkeld.—The memorial which is to be erected in Dunkeld Cathedral, to the memory of the officers and men of the 42nd Highlanders,—the "Black Watch,"—who fell during the Crimean war, is now completed, by Mr. Steell, the sculptor, and is expected to be shortly removed to Dunkeld. Miss Burdett Coutts, the Countess of Rotbes, and the Hon. Waldegrave Leslie, were present in the studio during a recent visit of the Highlanders, to see the memorial. It is in the form of a large Gothic mural tablet, the upper part of which contains a sculptured group in high relief, representing a scene on a battlefield. The sculpture is in pure white marble, and will be surrounded by a deeply moulded border of sandstone.

Dundee.—The proposal to construct a railway bridge over the Tay at Dundee has been revived by the North British Railway Company. In the event of the work being now proceeded with, the plans and specifications will be nearly similar to those prepared in 1866. The present Tay Bridge scheme embraces, first, a branch from the main line at Leuchars to a point a little to the east of Wormit Bay, about a mile and a half above Newport; second, the viaduct; third, a station at each end of the town of Dundee; and fourth, a tunnel connecting the two stations. The branch from Leuchars to Wormit Bay will be five miles in length. In its construction, no heavy works will be required; and it will reach the shore at a convenient elevation for the bridge. The bridge, which will be constructed on the lattice-girder principle, will rest upon stone piers. The structure will be upwards of two miles in length, and will consist of 73 spans, of which 10 will have a width of 60 ft. each, 45 of 120 ft., and 18 of 200 ft. The latter will extend over the deepest part of the river, and beneath them all shipping will pass. In accordance with the Admiralty requirements, the central part of the bridge will be of great height, so as not to impede the passage of vessels. From the surface of the water at full tide to the under side of the girder,

the height will be 100 ft. A careful survey of the proposed line of the bridge has shown that foundations of solid rock for all the piers may be got at an average depth of 14 ft. below the bed of the river. Over the 18 great central arches the line will be level, and thence it will descend to the southern end with a gradient of 1 in 150, and to the northern end with a gradient of 1 in 60. The superstructure of the bridge will consist of girders of lattice-work, divided into three sections, one of which extends over the navigation channel, and the others thence to either shore. In order to make the structure as low as possible consistent with maintaining in the central spans the required height above the high-water-line, the rails will be laid on the top of the side sections of the girder; while in the central section they will be laid inside, on the floor of the lattice-work tube. The girder has a width throughout of 16 ft., and the central section is 25 ft. in depth. The side sections diminish in depth towards either shore.—Logie burying-ground, at the west end of the town, having been closed, in consequence of its greatly overcrowded state, a committee of the town council have been on the outlook for ground for a new cemetery. An arrangement was made by which not only a new cemetery but a large public park will be secured for the west end of Dundee and for Leocha. The arrangement is to feu 60 acres of the hill of Balgay, 20 to the westward to be used for a cemetery, and 40 to the east for the public park. The rate of feu is to be 12*l.* per acre, or 720*l.* for the whole. At a meeting of the town council as a Burial Board, the arrangement has been approved so far as the portion to be used for a cemetery is concerned; and as the police commission, which has the power of providing pleasure parks, is composed of the same persons, there is no doubt it will be approved of by it also. When the hill is laid out, it will form, it is said, one of the finest public parks in Scotland. At the east end Dundee already possesses the Baxter Park, of nearly the same size, so that both in the east and west there will be large public parks.

FROM AUSTRALIA.

Melbourne.—The foundation-stone of the Carlton Wesleyan Church, Palmerston-street, which is about to be erected on ground adjoining the school-house, wherein the congregation worship at present, was laid on the 27th of July by Mr. S. Grey King. The cost of that portion of the church which will be first erected will be 2,100*l.*; and towards this the congregation have 650*l.* in hand. The architects are Messrs. Reed & Barnes, who have produced a good design, and the contractor is Mr. J. Pignon.

Fitzroy.—The new Roman Catholic Church of St. Bridget is now rising in the reserve at the corner of Nicholson-street and Reilly-street, Fitzroy. The foundation-stone was laid by the Right Rev. Dr. Goold with the customary ceremonial. The church is to be erected in the Decorative Gothic style of architecture, and will consist of a single nave, 28 ft. wide by 60 ft. long, with an octagonal chancel. It is intended to afford accommodation for 450 persons, and will cost about 1,200*l.* The material will be bluestone rubble, with pressed cement dressings to the windows and doors. Mr. T. A. Kelly is the architect.

Ballarat.—The Fine Arts Exhibition here was formally opened on the 21st of July, by the Governor of the colony. There was a grand banquet on the occasion, in the annex to the Alfred Hall. The Exhibition is in connexion with the Mechanics' Institute. It was lately asked what becomes of all the pictures. Here is what has become, or what is likely to become, of one old acquaintance, which, last time we saw it, graced the walls of the Pantheon in Oxford-street. The trustees of the Ballarat Mechanics' Institute are desirous of obtaining Haydon's picture, "The Banishment of Aristides," and they endeavoured to negotiate its purchase from the present possessor, Mr. Twentyman. Mr. Twentyman, however, is about to form a private picture gallery, and in replying to the overtures from Ballarat, he expresses himself in very strong terms respecting the authorities of the public library, to whom he had previously offered the picture.

Geelong.—At a meeting of the shareholders of the Geelong Gas Company, the directors recommended a dividend of 8 per cent., but this was overruled by a majority of votes that the usual 10 per cent. be given. Considerable dis-

cussion took place with reference to rate charged to the public, many shareholders urging a reduction to 15s. per 1,000.

Sydney.—As the gold fever subsides, the diamond fever supervenes. A reputed marvel of gems, "the Armidale diamond," has arrived in Sydney, and has at once been placed in the hands of the Rev. W. B. M. Clarke, geologist, for examination and report. Great excitement exists pending his inspection. In the mean time a gentleman, just arrived from Sydney, states that for some years past the finder of this precious stone has been engaged searching for diamonds, and that success has wonderfully attended his efforts, several jewels found by him having been already sent to England. This last one (if it be a diamond at all, which seems to be as yet an undecided question) is about the size of a turkey's egg, and weighs 7 oz. 14 dwt. The Bank of New South Wales, at Armidale, advanced 700l. after testing it. It is said that even should it prove to be a colourless topaz, the value is enormous. People in Sydney talk about its being worth a million and a half of money, but that will depend upon its purity. In the Brazilian diamond mines a stone weighing 1,680 carats, or 14 oz., was first valued at 224 millions, then 56 millions, then three millions and a half, but its true value (not being very brilliant) was 400,000l. It would seem that this Armidale "diamond" was picked up from the surface of the ground on a station, and not at the Armidale diggings. It was rumoured in Sydney that the proprietor of the station intended to test the ownership with the finder.

SCHOOL-BUILDING NEWS.

Wigston.—The old schools having been found quite inadequate to the requirements of the village, a movement was set on foot to obtain new ones, and the requisite funds having been gained to make a start, the superintendence of the building was undertaken by Mr. W. Barber, architect, London, and son of the Vicar of St. John's, Leicester. The mans placed at his disposal were too limited to admit of anything in the way of ornamental detail. The schools are of red brick, and covered with Switthland slates, and are in the Early Pointed style. They comprise boys', girls', and infants' rooms. The boys' and girls' rooms can be used as a mixed school, and for village meetings. They can be separated by a moveable partition, so as to form distinct rooms if necessary. The new buildings are designed to accommodate 250 children, 150 boys and girls, and the remainder infants, and are set back some distance from the village street, the space between the street and the building forming a spacious play-ground. Yards and offices are provided at the back of the schools, and behind the yards is a large garden, which it has been proposed to utilise as a work-ground for the children, and as a means of teaching them something of horticulture. The contract was taken by Messrs. John Sharpe & Son, of Wigston, builders, at a cost of 969l. The schools have been opened by the Bishop of the diocese.

STAINED GLASS.

St. John's Chapel, Cirencester Church.—This chapel has been enriched by the setting up of two windows, representing a portion of the history of St. John. The story begins in the upper division of the western window, on the right-hand side, in which the angel is foretelling to Zacharias the nativity of St. John. Underneath is the Vision of Zacharias in the Temple. The upper division, on the left compartment of the window, represents the Nativity of St. John; and that underneath, the Visitation of Mary to Elizabeth. In the eastern window, the upper compartment on the right hand represents the Circumcision of St. John; and underneath, Zacharias writes, "His name is John." The lower compartment, adjoining, exhibits St. John in the presence of the Virgin Mary and the infant Saviour; and the compartment above, the Mission of St. John. These windows, we understand, have been set up to the memory of the late Mr. Lawrence and his wife, residents in this town. They were designed and executed by Messrs. Hardman & Co., of Birmingham.

Abbey Church, Cambridge.—Three more windows have been inserted in this church. The south side chancel window is filled with the figure of Charity, under an ornamental canopy; the one on the north side is a memorial window,

erected by the children of the late Sarah Preston, the subject being the Raising of Jairus's Daughter, with an inscription, "She is not dead, but sleepeth." The window opposite contains medallions of the four acts of Mercy, surrounded by ornamental groundwork. The tracing is occupied by an angel. The whole of these windows were designed and executed by Mr. W. H. Constable, of Cambridge, the same artist who filled the chancel window last year for Mr. T. Preston.

Knaresborough Church.—Messrs. Clayton & Bell have supplied a design for the intended window in memory of the late Sir Charles Slingsby. The subjects are taken from the lessons for the day (February 4th) on which he was drowned. There are two from the Old Testament—The Deliverance of Israel, and Healing the Bitter Waters of Marah; two from the New Testament—Jesus asleep in the Storm, and Jesus rebuking the Wind and the Sea. The design has been seen and approved by the bishop of the diocese and by Captain and Mrs. Slingsby, and has been placed in the shop of Mr. Hannam, bookseller, Knaresborough, for inspection.

PROVINCIAL NEWS.

Dury.—A plot of land, in Henhill, about 247 ft. frontage, and running 111 ft. back, was secured for the erection of new premises, for Messrs. Ashworth, hat manufacturers; and extensive buildings have just been erected on it, capable of making 3,000 hats per week. The front is 154 ft. long, and about 33 ft. wide, and runs down one side the whole length of the plot, viz., 111 ft., and the remainder of the land will shortly be occupied by dwellings for the workpeople. The premises themselves are so arranged that they can be converted into dwellings at any time, with very little additional expense. The principal portion of the ground floor is flagged with 4-in. Rosendale flags, and the whole of the upper floor is double boarded. All bearing timber and joiners' timber is best Savannah pitch-pine. The main front is built of Platt's best stock brick, and the remainder of selected seconds brick, with stone heads to windows, and stone quoins to angles, with stone cornice corbelled out. The masons' work has been executed by Messrs. Edward Hill & Brothers; plastering, Mr. Scholes; plumbing and glazing, Mr. Robt. Caton; slating, Mr. John Kay; and the carpenters' and joiners' work, by Messrs. Ashworth themselves. The cost of the building is about 3,000l., and it has been erected from the designs and plans of Mr. James Hart, of Southport, architect.

PATENTS CONNECTED WITH BUILDING.

STEEL PILES.—*J. H. Johnson.* A communication, dated 29th January, 1869.—This consists in the forming of iron or steel into piles, faggots, or billets, preparatory to rolling, by pressing the metal into forms of the required shape, also in forming iron or steel into hollow piles or billets preparatory to rolling into other articles, such as pipes or columns; various combinations or arrangements of machinery may be employed in manufacturing pressed and moulded piles or faggots, as above described, but that which the inventor has found to give the best results consists of a hydraulic or other powerful press, the ram of which carries a plunger which accurately fits inside a strong metal case or mould, of any desired size and transverse section, the sides of such mould being capable of opening on hinges, in order to release the compressed and finished pile. The blooms having been placed in the mould, and the sides closed down and secured, the plunger is caused to enter through one end of the mould, which is left open for that purpose, and to forcibly compress, by the action of the hydraulic press, the metal contained inside the mould, thereby not only expelling the impurities which may be in the bloom, and which escape through the joints in the mould, but causing the metal to be thoroughly consolidated, and to take the exact form of the mould.

PAINT.—*F. Joy.* Dated January 29th, 1869.—The inventor proposes to use any or all the ingredients now used in the manufacture of paints, but the peculiarity of his invention consists in utilising or using together with such ingredients the common resin of commerce in combination with oxide of zinc. This combination has not heretofore been employed in the manufacture of paint, applicable to the various purposes for which ordinary paint is used.

FIREPLACE SCREENS.—*C. Hoult.* Dated February 2nd, 1869.—This consists in making the use of sheets of glass, transparent, semi-transparent, or opaque screens, some of which are highly ornamented on the surface by cutting or being pressed, or moulded, or silvered at the back, to serve as mirrors, or in any other convenient way. It is preferred, however, to use one or more sheets of plain glass, and to apply to the surface intended to be the back thereof any desired ornamental design in gold, silver, or colours, or imitation jewels, or any combination thereof, or to place behind such sheet or sheets of glass any painting in oil or water (photograph, plain or coloured), or otherwise, into a frame of metal or other material, by preference stamped out of sheet metal, iron, or tinned iron; or they may be cast in copper, brass, or steel, or other material, or varnished, in such a way that they are themselves of an ornamental character.

ARTIFICIAL STONE.—*C. D. Abel.* A Communication, dated February 3rd, 1869.—The principal components of this hydraulic cement are lime, silica, and alumina, the two latter being by preference extracted from refractory clays. In order to bring about the formation of the double silicate of alumina and lime, sulphuric and boric acid are added in small quantities to the compound.

CHIMNEY GUARDS.—*W. Blundell.* Dated 5th February, 1869.—The guard or casing, which is to be placed on the chimney-top in the usual manner, is made rectangular in cross section and covered at its top by a suitable cap. The sides at their upper parts are formed with openings, the combined total area of the openings at each side of the guard or casing being equal to the cross sectional area of the guard or casing itself. Each opening is provided with a flap or louvre-piece, working horizontally on pivots or centres in such manner that the upper part of the flap or louvre-piece when it is closed shall slightly overlap the inner edge of the upper part of its opening, while the lower part of the flap or louvre-piece in the same position in like manner overlaps the outer part of the lower edge of the opening. Each flap or louvre-piece is so balanced by a weight, or by other suitable means, as to stand at an angle when at rest, thus leaving its opening clear for the escape of smoke or vitiated air, but so, nevertheless, that the slightest current of air from without shall have the effect of causing it to close its opening.

ROOFING TILES.—*L. A. St. Paul de Limay.* Dated 9th February, 1869.—The inventor provides the tiles with lateral flanges, by which they are connected together, and also with ears for securing the tiles to the framing of the roof. The ears are fixed at one corner of the tiles, while the ears are made to hook on to the flanges, and are also secured by nailing to the rafters. The number of these ears vary according to the size of the tiles; by making the tiles of small dimensions the inventor is enabled to use much thinner and cheaper metal than is the case when tiles are made of considerable size.

MASON'S TOOLS.—*A. Munro and W. B. Adamson.* Dated 15th February, 1869.—This consists in the construction of conical tubular tools. The tools under the first modification constitute a hollow truncated cone or short conical tube. The tools are fixed in the holders of the machine for cutting stone, slate, marble, rock, or other substances, preferably by means of a bolt, which passes into or through the hollow or tubular part of the tool, on or in the other end of which a nut, spring, or collar is placed, or the bolt may be made to tightly fill the hole in the socket, in which case the nut, spring, or collar is dispensed with. The bolt, on being tightened, draws the tool firmly into the recess formed in the socket or holder to contain it. Under a second modification the tool is made hollow for a certain length only, the after part forming a solid shaft or bar, which passes into a correspondingly formed hole in the socket or holder, and by which it is held therein. The tools constructed under the first modification are to be formed of chilled iron steel, forged or pressed into the requisite shape, or of chilled or forged compounds or alloys of iron or steel. The tools constructed under the second modification are to be made of chilled iron or of chilled compounds or alloys of iron or steel.

BRICK PRESS.—*J. A. Wade and J. Cherry.* Dated 18th February, 1869.—A suitable frame mounted on wheels or otherwise, carries the fixed die or mould (for forming the sides of the brick, tile, or other article) to which is hinged

the movable upper die or lid. The lower die or loose bottom, which works vertically inside the fixed die or mould, and by which the pressure is given, is supported upon two eccentrics keyed upon a shaft, capable of revolving in bearings fixed to the frame, and having a hand lever keyed at one end thereof. The hinged upper die or lid when closed is held down by a catch, but when released by a cam on the eccentric shaft, or a pin on the lever is thrown back by means of a spring.

SLIDING WINDOWS.—A. Bartholomew. Dated 15th February, 1869.—The inventor applies a plate or plates, or surface or surfaces, to the side or sides of the upper sash, with holes tapped to receive a screw with a square or other head adapted to receive a loose key, by which such screw is placed in position, and when in position, by acting on the upper part of the lower sash, to prevent the one from being raised and the other from being lowered beyond a suitable distance, which may be varied by the position of the screw in the upper sash.

BRICK-MAKING MACHINERY.—F. Vandenberg. A communication. Dated February 3rd, 1869.—This consists of a pug-mill of the ordinary construction mounted above a series of moulds, which are placed in a circular or rectangular framing. The clay or other material is forced down to the lower part of the pug-mill, where it enters moulds carried upon a circular table, which has a rotary motion communicated to it in any suitable manner. Beneath the table a wheel or drum is placed, upon which the bottoms of the moulds are brought to bear in their rotation. This wheel causes the moulds to rise, so as to bring the upper surface against the underside of a fixed table or plank; in this operation the clay becomes compressed within the mould. The moulds, with the material within them, then pass on towards a second wheel or drum, by which the bottom of the mould is lifted, so as to cause the moulded article to project beyond the top of its mould. It can then be removed to a drying stack; or, if the clay is sufficiently free from moisture, it can be attacked or otherwise treated for burning.

SPRING HINGES.—J. Reap and W. H. Michelmore. Dated 26th February, 1869.—The pin or vertical axis of the hinge is mounted in bearings, so that it can freely turn through rather more than a quarter of a revolution either way. The upper part of this pin is squared so as to receive a lever or shoe which is affixed to the lower angle of the door, which thus turns on and with this pin as an axis. On the pin are mounted two rollers, so as to turn on vertical discs, which are at some distance from the axis of the pin itself. Two curved jaws are mounted on vertical axes, one on each side of the hinge-pin, and are acted on by a spring, so as to make them close tightly together towards the hinge-pin, and these jaws are geared together, so that when either one of them is caused to move from the hinge-pin the other also moves from the hinge-pin. The rollers already described bear on the inner surfaces of these jaws, one upon each, and each of these faces is made of such curvature that when, by moving the door, the hinge-pin with its roller is turned, the roller running on either face causes the jaws to expand against the force of the spring, and, consequently, when the door is left free the force of the spring tending to make the jaws close together causes the rollers to be passed towards the middle position, and so closes the door.

SUBSTITUTE FOR FIRE-BRICK.—J. Cliff. Dated 1st March, 1869.—Instead of using fire-bricks, lumps, stones, tiles, or other forms of materials or compounds in construction, burnt or unburnt, the inventor uses powdered or reduced ganister, stone, quartz, sand, mica, sandstone, or other silicious material, plumbago, lime, baryte, steatite, and magnesia, alone or separately, or in varied proportions with fire-clays, or with each other, or with silicious or other solutions mixed or not with hair, fibre, sawdust, shavings, or pulverised coke, or with other analogous materials.

Convalescent Home, Manchester.—At a meeting of the trustees of the Manchester Infirmary, held on Monday evening, it was stated that Mr. Robert Barnes, late cotton manufacturer, had made the handsome gift of 10,000*l.* to the institution, with the intention of its being applied in support of a new convalescent hospital established at Cheshire. It was agreed that the new institution should be named "The Barnes Convalescent Home," in honour of the donor.

Books Received.

The Indian Economist (Street, Cornhill) is the title of a new monthly journal published in Calcutta, and devoted to Economic and Statistical inquiries concerning India. Judging from the two numbers before us, this is not a superficial scissors-and-paste affair, but the work of well-informed men, in earnest, and is likely to be found of much service.—*The Statistical Reporter*, also a monthly publication, gives valuable returns and other information concerning India.—"Cassell's Household Guide" is intended to supply information in a cheap form on the various departments of household management. Part I. contains much useful matter.—The astronomical illustration in De la Rue's Red Letter Diary and the Pocket-Book, of course, refers to the luminous prominences from the sun, concerning which so much has been discovered during the year. Mr. Warren De la Rue shows in the article accompanying the illustration how early he contributed important information on the subject.—*The Quarterly Review* for October (Murray) contains several papers of special interest. One is on the Water Supply of London; another on the Byron Mystery; a third on Islam, by the author of the remarkable paper in the *Quarterly* on the Talmud. There are also papers on Isaac Barrow; on Higher and Lower Animals; and others on political and ecclesiastical subjects. The paper on the Water Supply of London is a *bona fide* review of the Report of the Royal Commission on Water Supply, and other reports and returns. The reviewer draws particular attention to the Thames Basin as a source of supply treated of by the Commissioners; and to the desirability of transferring the water supplies to the metropolitan or municipal authorities, so as to have the consolidated water-supply under public control.—A notice of some ancient tombs, at Movilla, County Down. By W. H. Patterson, Belfast, printer. This is the substance of a paper read before the Belfast Naturalists' Field Club. It relates to certain ancient slabs in the churchyard of Movilla, of an ordinary shape, with sculptured crosses on them, of various designs.—Bakerian Lecture. On the Continuity of the Gaseous and Liquid States of Matter. By Thos. Andrews, M.D., F.R.S. From this abstract from the proceedings of the Royal Society, it appears that Dr. Andrews has discovered that carbonic acid gas can be made to pass without breach of continuity, from the gaseous to the liquid state, and

"As a direct result of his experiments, he concludes that the gaseous and liquid states are only widely-separated forms of the same condition of matter, and may be made to pass into one another by a series of gradations so gentle that the passage shall nowhere present any interruption or breach of continuity. From carbonic acid as a perfect gas, to carbonic acid as a perfect liquid, the transition may be accomplished by a continuous process, and the gas and liquid are only distant stages of a long series of continuous physical changes. Under certain conditions of temperature and pressure, carbonic acid fluids itself, it is true, in a state of instability, and suddenly passes, without change of pressure or temperature, but with the evolution of heat, to the condition which, by the continuous process, can only be reached by a long and circuitous route."

—*The Shipwrecked Mariner: a Quarterly Maritime Magazine*. No. lxxv, vol. 16. October, 1869. Morrish, Paternoster-row. This sixpenny quarterly is interesting to all connected with the sea, and interested in the extension of the lifeboat system. The number before us contains a report of the thirteenth anniversary of the Shipwrecked Fishermen and Mariners' Royal Benevolent Society; tables of sums given for relief to fishermen and mariners, their widows and orphans, &c., by the society referred to; and to shipwrecked crews, &c. It also contains various narratives and other interesting matter; and is usually purchased for distribution amongst fishermen and other seafaring people.

Miscellaneous.

Illustrations of Roman London.—The Common Council have agreed, at the suggestion of the Library Committee, that a detailed description of Roman remains found in the city of London be obtained, and the drawings of the pavement recently found chromo-lithographed at an expense not exceeding 135*l.*, and a copy sent to every member of the court, and to the members of various learned societies and the Metropolitan Board of Works.

The Yorkshire Tumuli.—The Rev. Canon Greenwell, of Durham, has resumed his investigations in the British tumuli of the Malton district, with a view of completing his researches (so far as the North Wold range is concerned), there being no barrows left, except those which have been rifled years ago by the curiosity-hunter and treasure-seeker. The feature of one barrow was the finding of a sandstone slab having "cup" markings on both sides. Another barrow (which yielded no interment) abounded in these "cup"-marked stones. There were scores of them, in fact. The stone varied in shape and size; some had but one "cup," while others had a row of several "cups," some on both sides and some on the edges; six or eight being together at times, and often connected by a groove out in the stone. These cup-shaped hollows were perfectly fresh, and showed no sign of wear; in fact, the tool marks remained quite as sharp as the day when made. In this discovery there was not one single instance which showed any sign of use. Most of the striking examples will be engraved. The stones in which the "cup" markings are found are of a soft nature, and might easily have been worked by a flint chisel. Most of the marked stones will go to Durham. Nothing is said of any concentric circles, with which the cup-shaped markings are usually but not always accompanied on the rocks in Northumberland. Other barrows were opened; but these were the most interesting.

National Education League.—The vitally important subject of education, now being fully agitated, for the establishment of a public opinion on the subject, has our best wishes so far as regards the education of every child in the country. The first general meeting of the members of the National Education League has been held at Birmingham, with a large attendance both of ladies and gentlemen, the latter including many of the most forward promoters of the educational movement in all parts of the country. A deputation from the Society of Arts, consisting of Mr. Edwin Chadwick, C.B., Member of the Council, and Mr. Le Neve Foster, Secretary, attended. Mr. George Dixon was called to the chair. Various papers were read and discussed on successive days; and it was finally resolved—"That, in the opinion of this meeting, the scheme of the National Education League is the one best adapted to secure the education of every child in the country; and "That the executive committee of the League be requested to prepare a Bill, based upon the principles of the League, for introduction into the House of Commons during the next session of Parliament."

The New Workhouse, Islington.—At the last meeting of the Islington Guardians the clerk read a letter from Mr. Burden, the architect at the new workhouse, Upper Holloway, in which he stated that being informed that the Board had passed a resolution with reference to the appointment of a surveyor, it remained for him to state that it was necessary that one duly qualified party should be appointed to act as the surveyor on behalf of the guardians as against any party the contractors might employ on their side. The necessity for one party was occasioned by the fact that the duties to be performed involved responsibility. That the clerk of works would be in attendance when required was, of course, assumed. It was inevitable that accounts must under the contract be the result of measurements, and nothing short of the greatest confusion could be anticipated in the event of the measurement of the deviations being left, in the first instance, entirely in the hands of the contractors. He reiterated his opinion that it was most advisable that the surveyor appointed be one acquainted with the works. Should it be the pleasure of the Board to constitute the clerk of works the surveyor in question (a mode of procedure for a work of such importance most unusual), it must be obvious that his time would thus be very largely if not entirely absorbed, to the abandonment of his present very important duties, unless the whole matter be deferred until the completion of the works, which, for manifold reasons, would be quite at variance with the advice he had given to the Board as their architect.

A Railway Station Burnt.—The railway goods station at Heckmondwike, Dewsbury, accidentally caught fire on Tuesday night last, and was completely gutted. The damage amounts to nearly 20,000*l.* The east wall fell, and two men were severely hurt.

Value of Property in Bristol.—Stoke House, formerly the residence of Sir Henry Lippincott, with the adjoining park, in all about ninety acres, has been sold by auction in Bristol for the Birmingham Financial Company, who, having not long since purchased the property, divided it into forty-four lots, as a building-ground speculation. The house and grounds were knocked down to Mr. W. H. Budgett, of Redland, who also bought the greater portion of the land. The prices ranged from 350*l.* to nearly 1,000*l.* per acre, and it is said that the Birmingham Financial Company have realised a profit of over 22,000*l.*, the property having been purchased only a few months since for 30,000*l.*

New Masonic Hall at Stockton-on-Tees. The foundation-stone of a new Freemasons' Hall, for the Lodges of Philanthropy, has been laid on the north side of Wellington-street, with befitting ceremonies. The site is on the west side of the town, in a street recently laid out. The designs, which have been furnished by Mr. J. C. Adams, architect, comprise a building 72 ft. in length, with a height of 50 ft., constructed chiefly of red brick. On the centre of the front elevation will be a stone façade, projecting from 1 ft. to 2 ft. in advance of the rest of the building. In the interior there will be an entrance-hall, lodge-room, banquet-hall, kitchens, &c. The lodge-room will be lighted from the roof, which will be slated and of a moderate pitch. The estimated cost, with the land, is 1,400*l.*, and the entire contract has been let to Mr. T. Bowron, builder, Stockton.

A Welsh Railway on a New Principle.—The Portmadoc and Festiniog Railway is attracting attention among scientific men. It is now used as a regular goods and passenger line. The gauge is only 2 ft. broad. Hence, though the line runs through a very difficult country, the expenses of construction and working are so small that the traffic yields the enormous revenue of 30 per cent. The proportion between the dead weight and paying weight is much less than upon other railways. The engine and tender upon this line weigh about 10 tons, against 40 tons upon the wider gauge of other lines. Instead of a first-class carriage weighing 7½ tons, to carry thirty-two passengers, and representing nearly 5 cwt. of dead weight for each passenger, the carriages on the Festiniog weigh only 30 cwt. for twelve passengers, or 2½ cwt. for each person carried.

St. Pancras Schools, Leavesden, Watford.—At a recent meeting of the St. Pancras Board of Guardians, the School Committee presented a report stating that they had inspected the progress of the works in connexion with the erection of their schools, and found that the buildings are rapidly approaching completion; but that with respect to the progress of the drainage works, it appeared that Mr. Mann, the contractor for the erection of the schools, is of opinion these drainage works will interfere with the due performance of his contract, and that unless they are at once stopped, he will apply to the Court of Chancery for an injunction. Mr. North, the chairman of the committee, stated that the object of Mr. Mann appeared to be to get an extension of time and money from the guardians.

Granville Hall, near Ramsgate.—Mr. and Mrs. German Reed, who have been travelling through the provinces with great success, inaugurated, at St. Lawrence-on-the-Sea, near Ramsgate, the Granville Hall, a new building, which is capable of holding a very large audience. The hall is built in the Gothic style, and is lighted by windows fitted with coloured glass. In the centre stands the fireplace, with ruged-royal columns, with Carrara marble bases and caps, representing the hop, vine, and various fruits. Over the arch is a free translation of the "*Lignum super joco*," &c., of Horace, and the whole is surmounted by the arms and supporters of the Granville family, with their motto, "*Frangas, non flectes*." Over the main entrance is the inscription, "Through these wide gates none come too early or depart too late." Mr. Pugin was the architect.

Chief Commissioner of Works.—Her Majesty the Queen has been pleased, by Warrant under the Royal Sign Manual, to appoint Mr. Acton Smee Ayrton to be First Commissioner of her Majesty's Works and Public Buildings in place of Mr. Lazard, who has been appointed Minister Plenipotentiary at Madrid.

Progress of the Channel Docks, Bristol. The dock, lock, and tidal harbour at Avonmouth cover an area of 25 acres. The dock itself will cover 16 acres of ground. It is 1,400 ft. long, by 500 ft. wide. The lock will take up 3 acres, and will be 450 ft. in length, by 85 ft. in width. The tidal harbour outside will occupy the remaining 6 acres. Sufficient progress has been made in the excavations to enable the visitor to understand without difficulty, the exact outline and size of the new dock, lock, and approaches. The average depth of the excavations is a little over four yards; in some places it is as much as six yards. A very large proportion of the soil excavated has been used in the construction of the dam which is made to keep back the tidal water whilst the lock is in course of construction, and the completion of this portion of the work (the dam) was one of the chief causes of a visit of the shareholders, which has recently taken place.

Trade Unionists in Manchester.—On Saturday a deputation from ten trade-union associations, including the building trades, engineers, spinners, and tailors, waited upon the Mayor of Manchester (Alderman Graves), at the Town-hall, for the purpose of "calling the attention of the City Council to the unnecessarily slow progress of the public works of the city, and the consequent privation entailed upon a large proportion of working men and their families, whose means of subsistence are entirely dependent upon the proceeds of their daily toil or on parochial relief." The Mayor suggested that the deputation should present their memorial to the council through the medium of a member, and then have the subject fully discussed. In his position as mayor he had no power to decide the question.

The Village Hospital Movement.—The Rev. Henry W. Majendie, the vicar of Spess, Berks, has just erected in that parish a village hospital for the reception of poor persons suffering from disease or accident. It is built of brick, and stands in an open and pleasant part of the village. Six or seven beds will be made up to commence with. A nurse experienced in the London hospitals will superintend; and the medical practitioners of Newbury will attend the patients. The building has been formally opened. A contemporary mentions, as "a most singular coincidence, that within a few hours after the opening ceremony, the founder of the hospital (Mr. Majendie) slipped down while conversing with a friend, and broke his arm."

Mark Masonry in Cornwall.—This is comparatively a new Masonic degree in Cornwall, or at least it has been revived during the last few years, and is making considerable progress under the auspices of its first Cornish Grand Master, who was installed G.M. about two years since at Truro. This degree is separate and distinct in its government from the Craft Masonry, of which Mr. Augustus Smith, of Scilly, is the Provincial Grand Master for Cornwall, and has its own charitable funds, schools, annuities, &c. Although every candidate for admission must previously have been a Craft Mason, they have no other connexion, and hold separate lodges. It is termed the Fourth Degree in Freemasonry.

Rome.—Galignani says,—"The Chevalier Pietro Rosa, director of the excavations in the part of the Palatine Hill that has become the property of the Emperor Napoleon III., admitted the public lately to visit the archaeological discoveries recently made by the side of the baths of Livia. This interesting discovery consists of a swimming-school, with a series of chambers constructed with reticular walls, coated with stucco, and adorned with fine encaustic paintings; these last covered with a preservative chemical varnish. They represent various mythological subjects, surrounded by some very delicate drawings, executed with great skill and in very brilliant colours."

Proposed New County Prison.—At a meeting of the Middlesex magistrates a committee reported the result of their inquiries in reference to a site upon which to erect a new county prison. The result of advertising was that offers of forty-six sites had been made, and of these the most desirable was considered to be one at Highbury Vale, between 12 and 13 acres in extent. The purchase of this at a cost not exceeding 12,250*l.* was recommended by the committee, and after considerable discussion it was agreed to. Considerable opposition is manifested to the proposition.

Metropolitan Tramways.—The Metropolitan Tramway (North) Company have given official notice to the Poplar District Board of Works that works for constructing the line of tramway between Whitechapel Church and Stratford will be commenced within fourteen days from the date of notice. The companies are bound under their Act not to break up more than 100 yards of the road at one time, and to leave a quarter of a mile between any openings they may make. It is understood that the works, when commenced, will be pushed rapidly forward, and that the carriages for the line have been ordered, some being already complete, while others are in course of construction.

Engineers and the India Office.—Since our leading article was in type, we have been informed that the Duke of Argyll received at the India Office, on Wednesday, the 27th inst., a deputation of the council of the Institution of Civil Engineers, on the subject of a notification lately issued by the Public Works Department of the Government of India. The deputation consisted of Mr. C. Hutton Gregory, president; Mr. Bidder, Mr. Fowler, Mr. Cubitt, Mr. Hawksley, Mr. Abernethy, Mr. Bramwell, Mr. Hsmanly, Mr. Murray, and Mr. Stephenson; Mr. Manly, honorary secretary; and Mr. Forrest, the secretary.

Mosaic Picture for Southgate Church.—Messrs. Salvati & Co. have just now produced in mosaic a "Last Supper," intended for the new reredos in Southgate Church, designed by Mr. G. G. Scott. The mosaic is of considerable size, and has cost 210*l.* To the workmanship as a mosaic we have no objection to make; it is an excellent specimen of the art. As a picture, it is somewhat monotonous, and wants force. The colours, however, blend harmoniously, and the general effect is agreeable. Some of the heads are exceedingly good.

Working Men's College.—The inaugural address on the opening of the sixteenth session was delivered on Monday night at the College, Great Ormond-street, by the principal, the Rev. F. D. Maurice, M.A. The Rev. Mr. Brewer (vice-principal), Mr. S. Amos (Professor of Jurisprudence at University College), Mr. W. H. Flower, and Mr. T. Hughes, M.P., also spoke. Mr. Hughes thought they should feel proud of the gold medal conferred on the College at the last Exhibition at the Hague, as a token of its usefulness among the working classes.

Altona Exhibition Awards.—Considering the small proportion of British exhibitors, it was not to be expected that any large number of awards would be made to this country. The official lists show 60 *diplomes d'honneur*, of which the Singer Manufacturing Company has one. There are 100 gold medals, among which figure Shand & Mason, Marshalls, of Geinsborough, and McCormick; also W. A. Wood, the "Grover & Baker," and "Elias Howe" sewing machines. Out of 34 silver medals the United Kingdom receives 15.

Home Bay.—The sea between this and the Reculvers is making rapid inroads, and no steps appear to be taken to check its advance. The distance is between three and four miles, and if a sea-wall were built, a very easy matter, the ground reclaimed would alone be a considerable boon. A concrete wall, in which the shingle would play a part, would effectually protect the land from destruction, and this applies more or less to the whole "coast line" of the Trinity.—S.

Harrogate Pump-Room.—It is intended to erect, in the Royal Pump-room, Harrogate, three stained-glass windows, for a two-fold object, namely, in memory of Captain William Slingsby, the discoverer of the Harrogate waters, and as a tribute to the memory of the late Sir Charles Slingsby, bart. To assist in this work the directors of the Royal Chalybeate Spa-rooms have just given a successful concert in aid of the memorial fund.

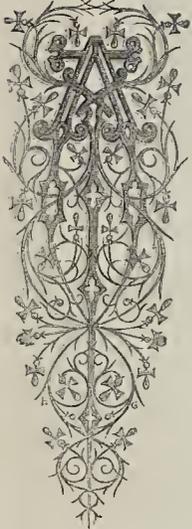

Buildings in the City.—The City architect has reported to the Court of Common Council that his estimate of the expense of the necessary repairs to the public buildings belonging to the Corporation for the half-year ending Lady-day next is 7,950*l.*, as follows:—The Mansion House, 1,000*l.*; prisons, 250*l.*; Guildhall, &c., 200*l.*; markets, 500*l.*; other public buildings, 6,000*l.*

The New Offices for Poplar.—The Board have terminated the contract with Messrs. Baker & Constable, and determined on obtaining fresh tenders for the work.

The Builder.

VOL. XXVII.—No. 1396.

Leeds Castle, Kent.

FEW miles from Maidstone, in Kent, rising out of a broad sheet of water, and casting embattled shadows into it, stands a large castle, that was once the residence and property of the good Queen Eleanor. When it came into her possession it was either a Norman building, or else a Saxon fortress with Norman extensions; but her gallant husband made several additions to it, some of which are still standing, and give the fabric an Edwardian character. In antiquarian circles

the old place is a familiar and appreciated object; but to the general public Leeds Castle is almost unknown. Yet not only was it once the residence of the brave and loving lady, whose womanly deed in Palestine will be told to every generation that has yet to come, but after her death it was successively the property of many illustrious persons, and otherwise associated with people of whom we are never tired of hearing. It first passed into the hands of her successor, Margaret, the second queen of Edward I., and was afterwards settled on Isabella, the wife of Edward II. By-and-by, we find the castle in the hands of no less a celebrity than William of Wykeham. Froissart, too, visited Leeds Castle, in company with Sir Thomas Percy and Sir William de Lisle, and placed on record an account of his stay at the "beautiful palace," and his kind reception by King Richard II. Then we find Henry VIII. there, pulling the old place about, and building more accommodation for one of his eight wives and her maids of honour; and, after a few more strokes of Time's scythe, it is in the possession of the famous Lord Colepepper, the friend of Charles II., and Evelyn is there directing a few repairs, and making other arrangements for the due keeping and accommodation of some 600 Dutch prisoners entrusted to his care; then it passed into the possession of the Fairfax family, not, however, until the famous commander-in-chief of the Parliamentary forces had departed this life; and, finally, George III. and Queen Charlotte paid a visit to the member of that family resident there in their days, his Majesty graciously recording the event with his own royal hand in the family Bible. Beyond, however, its associations with those and other celebrities, Leeds Castle has attractions of its own which we will endeavour to describe.

It stands on two islands in a sheet of water, about fifteen acres in extent; these islands being sufficiently close to one another to admit of being connected by a double drawbridge. It consists,

therefore, of two large piles of buildings, which, with a strong gatehouse and barbican, form four distinct forts or divisions, capable of separate defence after either fell into the hands of an enemy; and the water was so managed as to pass between these several buildings in three places. Thus it will be seen the Edwardian architect cleverly developed the natural strength of the position, if, indeed, he did not find this arrangement ready to his hand as left by the Norman *ingénieurs* who preceded him. Three causeways approached the castle: one of them was opposed by the barbican, which was composed of two parts, with a drawbridge between them; and when the barrier was successfully passed, those who were endeavouring to gain admittance found themselves exactly in the same position as those who approached by either of the other causeways, in front only of the bridge that spanned the moat, before the strong gatehouse protecting the fortress on the first island. Supposing, for convenience sake, that we have passed this second drawbridge in our path, we find ourselves standing outside the gates of the main entrance into the group of buildings occupying the whole of the area of the larger of the two islands. Passing this interior gatehouse, with the buildings adjoining it, we are admitted to an inner bailey, across which, at the opposite end, extends the large building, called the New Castle, in which are situated the principal apartments required for a modern dwelling. In the rear of this portion of the fabric, which has been modernised both in Elizabethan and Georgian times, as well as in our own, is the smaller island on which stands the old castle, often spoken of, too, in old writings as the *Gloriette*. Between the two structures were two drawbridges: thus communication could be cut off from either side. The position of the two islands with reference to their approach from the shore being thus indicated, we will observe the buildings upon them more narrowly.

We must premise that the particulars we are about to give are obtained from a valuable descriptive and historical work just completed by Mr. C. Wykeham Martin, the present representative of the families of Colepepper and Fairfax, and consequently the owner of the fabric.* We may add, as we know the fact will interest many of our readers, that Mr. Martin also comes of the same stock as the family of which William of Wykeham was so celebrated a member. The feeling for architecture shown so forcibly by the famous Chancellor is exhibited in a striking degree by him; and this appreciation of the subject, combined with a knowledge of other branches of antiquity, has resulted in the production of a very accurate and pleasant book. It is illustrated with a number of good photographs, which show the different periods of the masonry admirably; by a good plan; and several woodcuts; a few of which we are enabled to produce.† Under this escort, then, we will set out on our round.

The first outwork, approaching the castle from the Maidstone road, which is spoken of as a barbican, composed of two parts, contained the mill. After passing this and an outer ditch, we are confronted by the second defence, called the Inner Barbican. These two, taken together, the guide whom we are following points out, were designed with much ingenuity, for they not only formed the dam which kept the water in the moat, but they were strengthened with a ditch round the inner barbican, over and above the wide moat which yawned between this outwork and the entrance to the castle. At the end of the bridge giving access to the main portion of the fortress, still stands the gate-house, which is attributed to the reign of Henry III., on the

face of which are the stone corbels, inserted subsequently, for the support of a brattice; and on either side are guard-rooms, from which the entrance could be also defended. On one side of this entrance it is probable the stables were situated, and on the other the cellars for the reception of the vast stores of salt meat, beer, and other requisites for a garrison, and a kitchen; and on an upper floor, over these, were the guard-rooms for the private soldiers and yeomen of the guard, and a constable's room between them, having in front of it, exactly over the entrance, a portcullis-room. Every passage and staircase was of the narrowest dimensions, so that only one man could pass at a time, giving every opportunity for a hand-to-hand fight for every inch of ground. But there was not always fighting going on; and many an idle hour was spent within these chambers, as an inscription, incised on the chimney-piece, in the constable's room, proves. Some young gallant, in the fifteenth century, to while away his time, took the trouble to cut the following sentence upon the stone:—"Whyle that ye may my ladye please not sors of travayle they werke, quoth Oracius;" and as in very similar characters the word *Nefereit* is cut upon the arch of the outer gate, our guide thinks it likely the gallant may have borne that name. These rooms were enlarged by Edward I., who also gave additional windows to them. Beyond this key to the island the area was divided into an outer and inner bailey, the one encompassing the other. The massive wall of the inner *enceinte* has disappeared, but the foundations remain, and show its position; the outer bailey was surrounded by a lower wall, strengthened with bastions and towers, believed to be the work of Edward I. There are traces of several ancient buildings, besides the residence of the lord of the place on this island, but the only one standing within the inner bailey is the Maidens' Tower, to which we will presently direct our steps. We must first examine one of the towers of the outer bailey, built of Edwardian masonry, which was intended by the royal builder to contain a swimming-bath. Until recently this was always looked upon as a boat-house or water-tower, but the expense rolls of the executors of Queen Eleanor speak of a bath, "*Balnea Domini Regis apud Ledes*," with details of the expense, that indicate that this was the fabric. Mr. Wykeham Martin thus states the case of this interesting relic:—

"In the first place, this water-tower or boat-house had a very costly pavement, far beyond the requirements of a place intended for such a purpose only. The stones were about 2 feet square, faced on the upper side, and as carefully jointed as they would be for a modern dwelling. The pavement is now gone, but the impressions of the stones remain in the mortar, which has become so hard that I thought they remained *in situ* till I baled out the water to examine and clean the bath. For it appears from the extracts above, quoted from the expense rolls of the executors of Queen Eleanor (1391-3), that Reigate stone was purchased by Edward I. in the first of those years for the pavement of his bath. But the quantity bought was a 'centena,' or hundred of stones. Now this, if it means 100 ones, is precisely the quantity required for this floor, which measures 22 ft. by 16 ft. If this 100 meant 108, 112, or 120 stones, as a centena of iron is described by Du Cange as 120 stones of 8 lb. each, there would be a few left for other uses. In the next place, the lead that was purchased at the same time was precisely the quantity required for the roof of such a building. If we take the quantity specified to me by my plumber and carpenter, allowing 10 lb. a foot for the weight, and allowing for the waste occasioned by the check rolls and the flashing let into the wall, the building being 30 ft. by 27 ft., it would come within less than a hundredweight of the quantity purchased *pro balneo Domini Regis, viz., 'cvi clareyrou' of lead.*"

As we have said, beyond the residence of the lord, which is represented in the modern dwelling on its site, there is only the Maidens' Tower standing of all the buildings that must have once greeted the eye on emerging from the gate-house. The names of several, however, are preserved in various surveys and records. Thus we bear of a *vetus capella*, which also implies a new one; the "*granaria australis*"; the constable's stable; a Longhous; an Annessehouas, "le long stablyl," a "*magna coquina*," "le grete larder," &c. In 1367 it was recorded that the "*pons glorietta*" had been repaired, and the pipe of the aqueduct mended "*et in castro et in parco*," showing that

* The History and Description of Leeds Castle, Kent, by Charles Wykeham Martin, esq., M.P., F.S.A. Westminster: Nichols & Son, 1869.

† See p. 868.

the conduit-pipe existed before that time, and was, the author thinks, probably laid down by Edward I. Seeing, however, the ingenious system of waterworks constructed at Canterbury by Norman engineers, as recently described in these columns, there is no reason why this should not be of equal antiquity. Tiles are mentioned as covering some of the honsos, and lead as being furnished for others, showing that where not required to form a flat roof for fighting men to conduct their operations upon, the latter was spared on account of its expense. The "*magna coquina*" mentioned above, was recognised in the alterations made in 1822. Described as "*juxta pedem pontis gloriolæ*," and an oven also mentioned in connexion with the same bridge, there was no difficulty in identifying a kitchen found exactly on that spot, with a very ancient oven, part of which was thrown out beyond the wall on a corbel, as that in question. A woodcut shows this kitchen, with the *pons gloriolæ* and clock-tower adjoining. Crossing this bridge, now covered in, so as to form a long passage or corridor over it, with rooms above, we are on the smaller island, or in the old castle. Here our guide makes one little slip, though not upon the oak floor without a osiling in the place of the old drawbridge; but on clearing this way, to turn an arch in stone, a portion of a circle, or quadrant, was found in the stone-work in which the heel of the drawbridge must have worked when it was raised or lowered; and on the upper or bed-room floor there were indications of a similar arrangement to that at Cumnor Place, mentioned by Sir Walter Scott, "when Leicester treacherously calls Amy Robsart to him with the bridge drawn up between them." The great novelist imagined a far more sly piece of villainy; for he made Varney imitate Leicester's call to entice his victim out of her apartment across the trap-door which was to give way with her tread. But let this pass: it does not affect Leeds Castle. The entrance-tower, called in old records the tower of the Gloriette, has a curious old bell, with the Virgin and Child, St. George and the Dragon, and the Crucifixion depicted upon it, which is used as a carillon that custom having been maintained from the days of the Grevecoeurs, the owners of the castle before it became the property of Queen Eleanor. And there is also a very ancient clock which strikes upon this bell, supposed, on the authority of Mr. Octavian Morgan, to be of the same age. Turning to the left, on passing through the flat-headed trefoiled archway of this tower, we come upon the chapel built or improved by Edward I. It has been very much pulled about, one of Henry VIII.'s staircases having passed through it, and the site of the altar having been turned into a dark closet under the staircase; but still the owner can make out the original form, and, if we understand him aright, intends to restore it. He says:—

"It is easy, however, to trace the original arrangement, as, though one side wall and one of the end walls have been replaced, one side wall and the other end wall are in their original state, with the exception of one window, which lost its tracery when it was built up for the purpose of constructing the staircase of Henry VIII. There were two windows of a similar pattern, one of which remains, and the other is that which has just been described as having lost its tracery, which consisted of external arches of the Early English period, with handsome shafts, of which the bases and the bell-shafts are in good order; but in place of the original tracery some of a more recent character has been inserted. This is of a pattern which never prevailed beyond the county of Kent and a limited portion of Sussex, and is therefore called 'Kentish tracery.' In 1314 it is recorded, in Edward II.'s survey, that a violent hurricane had damaged the glass windows at Leeds Castle to such an extent that it would require Cr. shillings to restate them. Whether the tracery was also damaged is not stated; but, at all events, it seems that new tracery was put in at that time, as well as new glass. The level at which the bases of the shafts of the windows are fixed shows the steps leading to the altar and the original position of the floor. At the farther end there was a pew or gallery for the use of the lord's family."

Most of the rest of the work forming the old castle, save the outer shell, was the work of Henry VIII., and consisted of timber and plaster, with large oak or chestnut windows and handsome cornices. But the prisoners whom Evelyn lodged here, either accidentally or intentionally, set fire to this part of the fabric, and left a scene of destruction as a memorial of their detention. Lord Fairfax rebuilt some of the injured parts, especially the banqueting-hall, leaving the original doorway, fireplace, with the Royal arms and supporters of the house of York on the spandrels, and windows. And in restorations made in the time of the present owner, as many as possible of the old cornices and windows have

been re-used; specially the fire-place, thus preserved by Lord Fairfax, has been re-inserted in a billiard-room above the hall. The banqueting-hall is now a kitchen. Alterations as still proceeding here to gain the accommodation afforded by the chapel, before it can be restored to its original purpose. In the kitchen in which the dinner for the banqueting-hall was prepared when King Harry banqueted in it, there is a fireplace with its chimney divided into two flues with a window between them, an arrangement, from the character of this light, that appears to have been made by him. There were also a buttery and pantry, besides accommodation for the storage of provisions in the event of a garrison occupying it during a siege. There was a sally-port, too, opening on to the moat from the foot of a novel staircase, which is still there, with its flight of steps descending below the present level of the water. But the drawbridge with which the author believes it was furnished as a means of reaching a little inlet in front of the doorway, which, he thinks, was the centre of a bridge that was placed there for convenience in times of peace, and removed when danger was apprehended, has disappeared. On the way down the novel staircase is a chamber now used as a dairy, which is supposed also to have answered that purpose in old times, as the water from the conduit was turned through it as though for the purpose of keeping it cool. Beyond it are a few inferior offices; and then we come to a handsome room, the opposite end of which adjoins the tower of the Gloriette, at which we entered. This room is noticeable for having a Tudor fireplace, with the arms of Guldeford, quartered or impaled with Halden, in the spandrel, a circumstance Mr. Wykeham Martin accounts for by the fact that Sir Henry Guldeford was employed by Henry VIII. to build an upper story to this building. Ascending now to the upper floor of the Gloriette, which we can reach either by the staircase built by Henry VIII. in Edward I.'s chapel, or by the passage occupying the position of the old upper pair of drawbridges over the deep, glassy waters, lapping between the new castle and the old, we land in a large lobby lighted by a window with oak or chestnut mullions. This was occupied by some of the Dutch prisoners before referred to; and traces of their confinement were to be seen in rough chess or draught boards on the floor, as well as in a large glazed sentry-box at the head of the staircase. The author's sister, Mrs. Simcox, gives a drawing of this scene of old sights. The queen's drawing-room was approached from it; also another apartment which the author conjectures may have been the queen's "wardrobe," from the fact that the royal arms are in the spandrels of the fireplace, but no supporters. This room, he says, was in a state of great decay; the ceiling was perished, and the floor so rotten as to fall with the weight of four men upon it, as soon as it was touched for the purpose of being renewed. A bedroom beyond this slipped into the moat in the lifetime of the Robert, Lord Fairfax, who received King George, and Queen Charlotte, weakened, doubtless, by the fire kindled by the Dutch prisoners, which left a gap at this point. On the other side of the lobby, after a small room with a Tudor fireplace in it, extending over the banqueting-hall below, were two rooms and a lobby, which had the appearance of once having formed the queen's withdrawing-room, which would thus have been of the same size as the hall. In the spandrels of the fireplace of this apartment we learn, from the arms of the house of Lancaster on one side, and the castle of Castille and the pomegranate of Arragon on the other, that it was built before Katharine of Arragon had ceased to charm the royal Blackbeard. This fireplace has, of course, been re-used, as, indeed, have the numerous door-heads, with the royal arms, fleurs-de-lis, or Tudor badges upon them, found in this part of the building; for not only have these rooms been restored, but the gap made by the Dutch prisoners has been filled up. A wardrobe was found in this locality, which had been inaccessible for two centuries; thus it was disclosed in its original rudeness, "a mere chimney, so to speak, with a low wall in front, capped by a stout piece of oak." One of the Tudor firebricks is delineated.

We have now to sketch the features of the main building on the larger island, known as the New Castle. In Elizabeth's reign Leeds Castle was the property of the Smith family, ancestors of the present Lord Strangford; and on the site of the principal residence in older times they built a handsome Elizabethan house.

When the place came into the possession of Lord Fairfax, he took out the stone millions of their fine windows, and inserted sashes; and then he placed boards before them cut to a point, to look like Gothic openings, and stuccoed the old mansion over to give it the appearance fashionable at that time called rustic work. The author says a village churchwarden never made a more hideous disfigurement. Even Walpole looked down upon it and wrote of it,—"*The Fairfaxes had fitted up a port, bad apartment on the fore-part of the castle. . . . They had a gleam of Gothic in their eyes, but it soon passed off into some modern windows, and some that never were ancient.*" No wonder, then, that when the author's late father came into possession of it with an understanding that he would put it into repair, this spurious work was condemned and pulled down. As this house was built against the exterior wall of the castle, a part of the ancient work thus perished with it; but, with that exception, Mr. Wykeham Martin regrets only the old Elizabethan drawing-room, of which both walls and ceiling were panelled in oak; and of this the oak chimney-piece has been preserved and re-used. The old building was smaller than that now standing on its site by 9 ft. in length and 7 ft. in width. The new one is quadrangular, and two storied, with the entrance in the centre of the principal front between two octagonal turrets of 12 ft. diameter carried up the full height; and there are turrets at each angle to correspond with these. The walls are embattled, and rising above them are Hampton Court chimneys. The assistance of Mr. William Twopenny in the design is recorded by the author.

The Maidens' Tower, which we have left to the last, because its owner has done so,—although from its position it is, perhaps, entitled to an earlier description,—is shown in a woodcut with the bath of Edward I., near to which it stands.* It is built upon the wall of the outer bailey near the bath, and thence projects into the inner bailey. It is a large quadrangular three-storied tower finished with battlements that are evidently modern; but a drawing of it on an old plan of the estate shows that the roof was once gabled. The ground floor contains the brew-house, in which is a very wide chimney, which the author thinks can only have been required for the heating of many large cauldrons of water at a time, pointing to a period before the introduction of coppers with flues. There appear to have been two staircases and two sets of rooms above; and two wardrobes still exist, from which circumstance it is concluded it was occupied by several persons, probably guests, though not necessarily the maids of honour, with whom tradition has associated it. Mr. Wykeham Martin thinks, if Henry VIII. built it, enlargements were made to it, subsequently, by the Smiths.

In his inquiry into the date of various parts of the fabric, the author raises the question whether the Gloriette was not in the first instance a Norman shell castle on the site of a Saxon mound fort. Tradition affirms that the chief councillor of Ethelbert II., Led, Ledan, or Ledian, built a castle on this site, which was destroyed by the Danes; and the same authority sets forth that Robert de Grevecoeur began Leeds Castle on the site of an old Saxon fort. The Gloriette presents a strong resemblance in the mind of the antiquary, Mr. Clark, to what we might expect to find from such a sequence of events. It has a splayed base for 17 ft. above water, and as many at least below; and, arguing in favour of the supposition, we are told,—

"If, then, we suppose that the stream ran round the old castle, and was deepened and widened into a small moat, we should have a nearly rectangular shell of considerable size, the lower story of which, battering as it rose, attained a height of quite 35 ft. before the ground floor was reached, and the would foundation a very respectable work for defence. In addition to this, there are two loopholes of the same soft sandstone with the adjacent window, to which some persons, as noticed before, assign the date of Edward I., and somewhat of Edward II., and which it is possible may be somewhat older, in an adjoining semicircular projection; and under each loophole is the bottom of a still older loophole of Caen stone, giving a greater antiquity to the foundation of the semicircular projection than that of the superstructure. And this, with the adjoining wall, is clearly a portion of the work of Edward I. This would seem to indicate that Edward did not build the old castle from its foundation, but merely altered and improved an existing building, thus confirming Mr. Clark's conjecture, at least to a certain extent, in addition to the strong internal evidence supplied by the shape and appearance of the building, and the very peculiar nature of the mound on which it stands."

When discussing the date of the drawbridges, the author refers to M. Viollet-le-Duc's state-

* See p. 880.

ment respecting the period in which these ingenious contrivances came into use, and points out two instances in which they were mentioned at an earlier date than that he assigns to them. He says they were attached to the gates of towns about 1350. The regulations drawn up by Stephen de Pencestre for the ordering of Dover Castle, in the reign of Henry III., set forth that the bridge should be drawn at sunset. And in the twenty-third year of that monarch's reign, according to the Liberate Roll, he ordered a breausche and drawbridge to be constructed at Winchester, this being as much as a hundred and twelve years earlier than allowed by M. Le Duc. Generally, the author finds this installment of the work left by our Medieval ancestors indicates an early and higher order of culture than the term "dark ages" suggests. The masons especially were equal to those of the present day, and the same must be said of several of the other trades. A Russia, "destitute, indeed, of many of those improvements and appliances which have been invented in recent times, but still containing a wealthy, powerful, and luxurious aristocracy, surrounded by a rude, barbarous, and unenlightened serf population," is perhaps the nearest realisation we can approach to those old times which gave us our incomparable cathedrals and left us such cleverly-contrived fortresses as Leeds Castle. In some particulars we have made no progress, or rather broken off the thread. Vine-growing is a case in point. The Norman engineers, mapping out their waterworks at Canterbury, showed vineyards round that abbey, and there were vineyards attached to Leeds Castle in the days of Queen Eleanor, and wine made from them. The expense-rolls of that lady's executors mention various sums paid to Arnold le Vinern, who could have been nothing but a vine-dresser. No vines are now grown for wines. But at the cottages, however, in the locality there are still to be seen vines of a peculiar kind, growing in very short, thick clusters, which the author thinks are descendants of those with which Queen Eleanor made wine in 1230. The expense-rolls quoted above afford a great deal of very interesting information, for which we have scarcely left ourselves space. Thus a visitor was expected, Eleanor's son-in-law, the Count de Barr, and straightway many purchases were made for his proper reception. Bread, fish, ginger, mustard, sugar, "powder to make pimento," eggs, flour, "galentin poudre," or spice for galantines, saffron, and almonds are amongst the provisions laid in for his entertainment, whilst large quantities of wax and firewood were also bought; and 8 ells of canvas and 8 ells of cloth are entered as having been purchased for napery and "coverture of the dresser." The same rolls show that on the anniversary of the queen's death a sum equal to between 300*l.* and 400*l.* of our money was spent in memorial ceremonies at this castle.

William of Wykeham's connexion with the fabric was in virtue of his office of surveyor of the castles of Windsor, Leeds, Dover, and Hallow, to which he was appointed in 1369. He appointed a deputy in 1363. Mr. Twopenny looks upon one window as the work of the reign of Richard II., but the author contends that it is not likely the chancellor would have interested himself about such a small matter, and forbears to claim any part of the castle as his work. There are accounts which show, however, that he deputed the Prior of Leeds to put the palings of the park into good repair.

From the many historical facts noted by the author, which pass pageant-like over his pages, we must content ourselves with singling out the siege in 1321. Although Leeds Castle was settled on his wife, Isabella, it appears that Edward II. had exchanged it for a seat in Shropshire belonging to Lord Badlesmere. Perhaps to try her right to it, the queen appeared before its gates when his family was in the occupation of it and demanded lodging for herself and train, then on pilgrimage to Canterbury. Lord Badlesmere's castellan refused her admittance, when she attempted to enter by force without avail, several of her retinue being slain. When the king was informed of the occurrence he determined to resent it, and accordingly summoned a large force to meet him in front of the castle. Every man between the ages of sixteen and sixty from the counties of Essex, Hampshire, Surrey, and Sussex, was to repair there, and the whole *posse comitatus* of Kent was to be in readiness on the same spot three days previously to their arrival, which was to take place on October 20th. Accompanied by men from London and the

Cinque Ports, and his two brothers and four earls, the king appeared in person before the walls, and conducted the besieging tactics. Meanwhile, Lord Badlesmere, who was from home at the time of the repulse of the queen, but fully concurred in it, supported by other noblemen, drew near with the view of rendering his garrison assistance. They took up a position at Kingston, whence the Archbishop of Canterbury headed a deputation requesting the king to raise the siege and refer the dispute to Parliament. This he refused to do, and afraid of opposing so considerable a force Lord Badlesmere was obliged to leave his castle to its fate. On the 1st of November it capitulated, and twelve or thirteen of the defenders paid for their prowess with their lives. In cleaning out the moat in 1822, the author says a very large and ancient key was found, which, he thinks, is likely to have been the key of the castle thrown into it by the castellan after he locked the gates in the face of the queen and her train, that nothing might induce him to alter his resolve. The desperate, defiant castellan, the Amosonian queen on her palfrey, her little circle of retainers making ready to try their strength as the autumn evening was closing in, the bill mist rising off the still waters of the lakelet, the lights flitting to and fro in the dusky castle, the way-guards passing like shadows behind the embattlements, are all before us as we close the book. Mr. Wykeham Martin has presented us, in this way, with many a pretty picture besides those provided by the photographer's pen. He may be nearly as proud of his work as he is of his castle.

THE KNOT OF THE RAILWAY DIFFICULTY.

PUBLIC attention, if we may trust the usual barometric indication furnished by the columns of the daily press, has of late been fixed, with unusual intensity, on two distinct subjects, the intimate connexion between which has not hitherto been pointed out. We refer to the unprecedented rapidity with which the whitewash of a coroner's verdict has been passed over all parties concerned in the production of a grievous railway collision; and to the accounts given of the performance of Mr. Fairlie's "Bogie Engine" at Hatching. To stimulate the interest already excited, comes the report of a fresh collision near Manchester, an "accident" of which, *per se*, as nobody was killed, and only six or seven persons were wounded, no one but the sufferers themselves would have been likely, in ordinary times, to take notice.

The connexion, however, between the two subjects, of railway collision, and of possible improvement in, not only the details, but, to a great extent, the principles, of railway locomotion, is intimate and essential. The natural and every way important completion of the railway system has been checked by inattention. Railways, as a rule, do not pay; at least, the exceptions to their economical success are so numerous that no one will risk the money required to carry out the secondary lines, and to extend the ramifications of the true circulation of our traffic to the extremities of the country. This is, unfortunately, an old story. What is new, and what is a good omen, is the fact that for the first time, after so many years, men competent to the investigation are turning their minds to the solution of the question, "Why do not railways pay?"

Want of traffic is not the cause. For many of the lines are absolutely choked with traffic. Were this deficiency the root of the matter, the lines which are over-fed would earn such enormous dividends as to cover the shortcomings of their less active neighbours. The over-work of the lines finds a grim exponent in the list of collisions, often fatal, always costly.

That these collisions are not, properly speaking, accidental, we think will be made out. But beyond this immediate question of police, lies the further difficulty. "How is it, that with a traffic requiring such precaution from its frequency, dividends are so small?"

Now the ray of hope,—and it is a very bright one,—that is freshly turned on this point, is this. We have made a great mechanical mistake. We have directed our attention the wrong way. We have so constructed our running stock as to inflict great and altogether unnecessary damage both on itself and on the permanent way. And we have apportioned so enormous an amount of dead weight to the freight of our trains, especially of our passenger trains, as at the same time to choke our tracks and to starve our pockets.

Let us first regard the question of the preventability of collision.

"Give my tenantry distinctly to understand," wrote an Irish absentee landlord to his resident steward, "that no threats to shoot you will have any effect on me."

The perfect *travaux* of the remark, or rather the evidence which it affords of a mode of regarding matters from an exclusively personal standpoint, is such as would be highly appropriate to many of those easy-going gentlemen who have assumed the responsible functions of railway directors, with so little appreciation of the weight of the responsibility which they have thus incurred. It is not enough that the shareholder bears daily witness to the monstrous evils attendant on amateur management. It is not enough that the report of the directors of one of our large railways coolly dilates upon the fact, that the Board of which the reporters are the present constituent members has spent eight millions of money without earning a single halfpenny by the outlay. It is not enough that, when some terrible disaster wags a convoy in flames, or hurls train against train, a terrified engine-driver, or an overworked pointman, is put upon his trial for manslaughter. None of these threats touch the Boards. Therefore the Boards, as a rule, are content to leave things as they are. Penalties, no doubt, must follow on the occurrence of those breaches of the rules, alike of common sense and common prudence, which are the fruitful sources of what are ironically termed "railway accidents." But these penalties chiefly affect the purse. And the purse in question is not that of the directors, but that of the shareholders. When the case is so flagrant that public indignation cries out, "Who is to blame?" there is always some unfortunate official ready to be offered up as an altogether involuntary sacrifice.

This pleasant state of things—pleasant, that is to say, for the directors; decidedly unpleasant for the rest of the world,—for officials, passengers, and shareholders alike—appears to have attained the stability of an institution. Of what use is it to complain? No threats to shoot the steward stir the fears of the master. No diminution of dividend by heavy compensation, no ruin of the family of an industrious servant by the results of a prosecution, toncubes the exalted repose of the Board-room; nor, so long as this is the case, will any amount of public indignation prevent the recurrence and the increase in number of these terrible and fatal railway collisions, the season for which has this year set in with early and unusual severity.

We do not go the length of saying that accident, properly so called, is impossible on a properly-regulated railway; but, in point of fact, real accidents are extremely rare. They hardly ever occur. To call a case of gross neglect an accident is a perversion of language,—an unjustifiable and dangerous perversion. The verdict of "Accidentally killed" which was returned by the jury in the inquest on the bodies of the persons killed in the recent railway collision near Nottingham, was, we cannot hesitate to say, altogether unjustifiable. Till coroners and coroners' juries have rather more definite ideas as to what is and what is not accident, they are likely to have ample occupation.

Murder, by the English law, does not necessarily imply malice towards the murdered person on the part of the murderer. If A, intending grievously to harm B, kills C unintentionally, it is murder. If in pure covetousness, or neglect, or in the performance of an unlawful act, one man unintentionally kills another, it is murder. And if we look at the legal decisions on the point, we shall find that the neglect of any necessary precaution in circumstances of known danger involves, to say the least of it, a very serious responsibility.

Now there can be no doubt that all collisions of the character of that to which we now refer arise in consequence of the neglect of a well-known precaution, the adoption of which would render such occurrences impossible. The electric telegraph places in the hands of the controllers of railway traffic the means of absolute prevention of collisions. To allow a train to rush over a given portion of railway, in utter ignorance whether that portion is or is not clear from obstruction, although with the means of acquiring that knowledge at the fingers' ends, is a neglect of due precaution which, when death ensues, would have a very ugly name given to it by an impartial judge.

It must be borne in mind that the adoption of the positive safeguard of what has been called

the block system is a matter for which the directors of a railway are responsible. Let them be held so. Let the jury who sit on the bodies of the next hatch of sufferers give a little attention to this part of the case. In an accident, no doubt, no one may be to blame. But a collision, which would have been prevented by the use of a known measure of precaution, is *not* an accident, and the guilt of aggravated manslaughter lies at the door of those who neglect to prescribe the adoption of such a precautionary code of rules.

We are not about to enter into the details of the block system, or to insist upon its absolute perfection. On every line, according to the distance of its stations apart, the density of its traffic, the nature of its gradients, and other differences of detail, the *modus* of the working code may be special and peculiar. But the broad idea of dividing the entire line of railway into a series of districts, of magnitude proportioned to the traffic and the other details of the case, and of never allowing a train to enter one of these districts, at any considerable speed, until it is known by telegraphic information that the preceding train has left it, is one the adoption of which would render collision impossible. Some extra expense might attend the introduction of the rule. Some interference with the punctuality of trains (if it is allowable to use such an expression, merely for the sake of argument, and without at all intending to intimate that such a thing exists) might ensue. But human life and limb would be perfectly safe. Great cost of repairs and compensations would be avoided. And, in committing his body to the custody of the conductors of the traffic of the country, the traveller would have the comfort of knowing that it was no longer a mere question of minutes whether his train should, or should not, come in collision with any other train.

Let the absentee landlord be made to understand that his head, and not that of his agent, will be made the next running target. Let directors learn, by the large text of a verdict of manslaughter, that it is for them to enforce the adoption of a rule which is essential to the safety of the passengers. Let those who influence the public mind aid in putting the saddle on the right horse. It is only necessary to do this to put a stop to railway manslaughter.

No country in the world possesses a more deserving, industrious, careful, intelligent, body of public servants than are the men who constitute the great mass of those employed on our railways. Often overworked, often underpaid, they are now laden with a responsibility which is not duly their own. The stress and strain thrown, in many instances, on an officer who is in no adequate way compensated for the tremendous anxiety to which he is exposed, are altogether disproportionate. To avoid collision, as a general rule, railway directors depend almost entirely on the prudence and activity of their servants. They exact, from their conscientious care, that security which ought to be independent of any thing but the most ordinary adherence to routine. First, the lines ought to be so constructed as to allow of the circulation of the different systems of traffic without mutual interference. Secondly, the code of working regulations should be so drawn up as to render collision impossible. The first requisite would, no doubt, involve considerable expense, if it were now rendered compulsory. It is carried out, to a very considerable extent, in the system of lines converging at Victoria-station. It is disregarded and despised, in a very unnecessary manner, in the system of lines crossing and recrossing one another between London Bridge, Cannon-street, and Charing-cross. Re-arrangement of these lines is loudly demanded by public safety, no less than by public convenience. But, apart from this provision, which sooner or later must be carried out, such a modification of the block system as will prevent collision, as a normal rule and not as a happy chance, ought to be rendered imperative. Legislation, in the mere interest of the public, is of course not to be expected. But the public have the matter in their own hands. A sharp and sure remedy lies within the province of the coroner's jury. A single verdict of manslaughter, not against the over-wrought officials, but against the negligent chairman and directors, would in all probability settle the matter. No second case would be likely to occur, for, at the next weekly meeting, every railway board in the kingdom would take the steps proper for preventing collisions.

At the same time that the density of that unremunerative traffic, with which the result of

the last twenty years of railway management has encumbered most of our main trunk lines, is calling so imperatively for absolute regulation by telegraph, the attention of the public is directed towards a proposed reform, from which consequences of the most brilliant nature are anticipated as likely to arise. We are not about now to commit ourselves to an absolute approval of Mr. Fairlie's system, or to urge that he, or any other engineer, has attained the *ne plus ultra* of economical mechanism. But we do say, and that without hesitation or qualification, that the inventors and advocates of light railways, and of corresponding light engines and plant, are looking in the right direction.

The internal communications of this country, having received such a stimulus as is unknown in the entire preceding history of the world, have been arrested in their due development by a check of corresponding severity. It is all very well to lay the blame on the greediness of promoters, the selfish anxiety of great contractors, or the ingenuity of civil engineers in the creation of occupation. All this is, no doubt true; but there is something more fatal behind. It is well known that the continued paralysis of public enterprise has been such as to disappoint even the least sanguine of those who have looked forward to an improvement in industrial enterprise as a question of bread-and-cheese. For over-speculation, over-haste, over-railway production, we have paid, God knows, an ample penalty of starvation. But the main, unprecedented, intolerable feature of the present long stagnation has been its apparent permanence. Not only have our burnt dogs carried on an unusually prolonged dread of the fire, but it has appeared as if fire would never again be kindled, at which they or their successors could singe their tails. In a word, the depression attendant on a period of over-work and over-speculation has been so profound, so enduring, and so hopeless, that a politician who looks beneath the surface is driven to the conclusion that some cause, hitherto undiscovered, must be his work to aggravate our present gloom. In 1845 the fury and vigour of the railway mania was far wilder than it has been at any subsequent period. Great and permanent evil was inflicted on the industry of Great Britain by that mania of 1845. But, though for a time crippled, the industry survived, and again sprang into active life. Money was wasted, dividends were thrown to the winds, resources were devoted to the production of unused lines of communication, to the utter loss of the subscribers. But the railway system,—regarded not only as a mode of carrying traffic, but as a net of lines requiring great extension and increase, survived the shock. Since the recovery from the depression of 1846 and 1847 there has been no difficulty in raising millions when required, or, unfortunately, when not required. What is the reason of the difference?

It is not because the railway system, as a method of intercommunication, has arrived at its natural maximum of extension. Main trunks, indeed, have been run in almost every available direction. But the entire system of secondary lines, the natural feeders of the 14,000 miles now at work, has to be completed. And the trunk lines are, often, so choked and loaded with traffic, that the rails are continually occupied by successive trains, running at each other's heels with intervals far less wide apart than public safety demands.

At last,—a long last,—the *tertium datus* is pilloried before the public. No doubt, there are many who do, and who will to the last possible moment, deny that such is the case; but we shall be mistaken if the public hold with them. Respect for the authority of great men is an admirable thing. But it is carried too far if it fetters the course of improvement. All honour to George Stephenson! His name will rank ever high among the benefactors of mankind. None the less true is it, that, in creating a new department of practical mechanics, he made, and led his followers to make, a grievous mistake. Our railway engineers have overlooked one of the chief elements of the problem to which they have addressed themselves. They have effected locomotive transport by means which have disregarded the necessary economy of the case. They have whirled across the country such disproportionate loads of dead weight that the entire railway system has well nigh collapsed beneath the burthen.

The cause, then, of the non-prosecution of the necessary works of completion for our system of internal traction is not financial, but economical. The difference is essential. Finance, checked

to-day, springs and reveals to-morrow. Economic returns, when absent, cannot be galvanised into existence, and economic failure, in the present case, results from mechanical reasons. So long as these prevail economic death will remain as our normal state.

Let us regard the question in a light which will admit of no hesitation. Our ordinary railway traffic is conducted at an average speed which is less than double the maximum speed of the more rapid coach traffic, on the best lines of route which it has displaced. On the other hand, the strain and shock to which a carriage running over a smooth continuous surface of iron rail is exposed, were expected to be, and *ought to be*, very much less than the half of those to which one is subject on an ordinary road. The same vehicle drawn along a turnpike road at the rate of sixteen miles per hour (the rate of some of the fast Shrewsbury coaches), and along a much less severely graded railway at the rate of thirty miles per hour, would suffer far more strain in the former than in the latter case. At all events, as of the two forces which oppose motion, gravity and friction, no human wit has found the method of obviating the action of the former, it is clear that in the diminution of friction lies the great economic saving which railways were designed to effect.

How comes it to pass, then, that for the vehicles which have to run with the minimum of friction, we have introduced a ponderous mode of construction far more in excess of the requirements of the case than was ever employed for the vehicles subjected to the larger amount of strain and of shock? What is the difference between the power of a galloping team of four good horses, and the resistance of a macadamised road, measured by the tendency to pull a mail-coach asunder, and that of the tug of a locomotive over a pair of rails? The question is one that answers itself.

Again, in our road engineering (which we may compare with that of the *diligences* of France, the ponderous but well-knit carriages of Italy, the marvellous chairs, suspended over a long perch, used in Portugal, or the ready-made shift of an Irish car), what has been the rule? For increased speed we have diminished the weight of the vehicle. Where hundred weights, or at all events quarters, were in question for Pickford's vans, or for the broad-wheeled wagons which recall the memory of Whittington, pounds were looked after in the hull of the Quicksilver Mail. In our ponderous vehicles, and yet more ponderous engines, for our express trains, we have retrograded, positively retrograded, in mechanical science.

We have not space at our command here to enter into the canons which have led to the enormous overweight of our railway plant. We can now only bear our share in calling the attention of all those interested in the matter to the subject. It is certain that the hammering, oscillating, grinding motion which now accompanies railway travelling may be, to a great extent if not altogether, avoided. It is certain that, to resist, or rather to *produce*, this destructive action,—destructive alike to carriages, to permanent way, to the nerves of the traveller, and to the dividend of the shareholder,—we have, for a quarter of a century and more, been proceeding in the wrong direction. While the London omnibuses carry a ton of passengers to a ton of dead weight, we are told, on authority which ought to be good, that our railways carry nineteen tons of dead weight to a ton of passengers! A man need not be an engineer to understand that this is radically wrong. If the *débris* of the Stephenson school of engineers will not address themselves to the subject, it is tolerably clear that they will be superseded by a set of men,—self-taught, it may be,—who will. On our existing lines of iron road, let us convey passengers with as much attention to the exigencies of mechanical law as that which has been brought to bear on road vehicles, by the owners of the London omnibuses. To carry a dozen passengers from London to Liverpool at a velocity of thirty miles an hour, does not, as a mechanical necessity, require a greater proportion of dead weight for passengers (exclusive of the propulsive power in either case), than was necessary to convey the same load down the declivity now spanned by the Holborn Viaduct. Let the subject be faithfully and honestly wrought out. Let the ill-constructed vehicles be superseded, first by experimental trials, then by special trains; by degrees by the introduction of a more mechanically perfect working plant than that which at present grinds

us in the dust,—and dividends will swell, like the olive harvest in a prolific year; shareholders will fatten upon something more substantial than hope; and then we, engineers, builders, labourers whose name is legion, may smile at the good time coming, when we shall again pull off our coats, hurn our nightcaps, and turn the lines of deserted parish roads into the likeness of the entrance to a beehive. Let us correct our mechanical blunder, and our railway economy will right itself.

WINTER EXHIBITIONS: THE FRENCH GALLERY, PALM MALL, AND THE OLD BOND STREET GALLERY.

WER weather was no preventive last Saturday to the assemblage of many visitors in the Old Bond-street Gallery, nor to others who availed themselves of Mr. Wallis's invitation to the French Gallery, to see privately how well he has catered for the aesthetic taste of the British public, and how pleasantly he has combined home with foreign produce in what he sets before them. With no novelty to introduce he has, at all events, contrived very ably to renew confidence in his judgment, and acknowledgment of the energy with which he proceeds in his self-imposed task; a task it must be, with so many opportunities offered the painter for a double picture season. November may claim some affinity with genial May, with only the difference of a *suntlight* and a *sunshade* between them. November, with its mire and muck, its foggy veil that is never half thick enough to hide any of its ugliness but only adds to it, as in some other plain cases; the month of all months that most people have disagreeable reason for seeing none that it should ever be forgotten, with its associative reminiscences of asthma, bronchitis, catarrh, and a whole alphabet of ills ranging from large to small type, has now some claim to a welcome in virtue of what art can do to improve Nature.

The collection of pictures exhibited at the French Gallery comprises many admirably executed. It was to be expected that M. G. De Jonghe would repeat his assertion of mastery over the difficulty of making brilliant yellow preponderance subservient to a harmonious result; and this time with no lack to control in its management. The fair patient who was "Recovering" last spring, and receiving the congratulations of a lady friend, is again represented still in bed, but so much better apparently,—and nearly as well actually,—as to allow of her eldest child's presence: she is amusing this morsel of four or five years' human experiences by explaining to him "The Picture Book" (65), that gives the picture's title. As an example of very skillful workmanship, this is scarcely less remarkable than its predecessor, the memorable combination of black, white, and vivid yellow. Mr. W. Q. Orchardson is not often more successful as a colourist than he has proved himself to be when confined to a similarly limited chromatic scale: black, white, and yellow have been tamed into very softer harmony in his depiction of a fond mamma, regarding her dot of a daughter, "The Idol" of her affection (87), to the effect of conveying the sombre suggestion that she is her only idol now. Somewhat slight and sketchy this is very dexterously painted; as are Mr. Pettie's two contributions, "A Hard Fight," seen before (98); or it may be a second edition of the educational primer published more than a year ago, at the Royal Academy, revised and corrected. The vicissitudes of poor governesses have afforded endless themes for both pen and pencil description; but, thanks to civilisation, emigration, and sewing-machines, the subject is bereft of much of its romantic interest now, though Mr. Pettie's clever characterisation and clever manipulation are none the less attractive on that account. The same praise for dexterity is due to his rendering of "Romeo and the Apothecary" (126), even if style of execution, in this instance, borders too closely on the careless indelicacy of a first sketch only.

M. G. Koller's first method makes all such deficiency the more apparent. For clean, solid, luminous depiction, and the attainment of finish without loss to breadth of effect, his Mediceval interior, wherein the presiding mistress of the household is receiving a visit from a female friend (120), is exemplary, with more show of labour—of the means by which the end has been gained. M. J. Devrind's similar performance (140), "Going to Mass," will exact a similar acknowledgment. They are excellent specimens of completeness. Breadth and freedom in execu-

tion are the most remarkable attributes of an important work by M. S. Liezenmayer (130), "Maria Theresa of Austria nursing the poor Woman's Child," a fascinating picture for its beautiful colour and graceful treatment, though it is a treatment that intimates the adaptation of nature rather than its direct copyism. M. J. Portails has selected a very dangerous phase and face of "Jealousy" (74). Moody and morose, his victim seems to gloat on the sense of her wrong and the sense of her right to avenge it; however, M. J. Bouthoune assists to relieve apprehension in his emodiment of females' extremes: like all other extremes, they meet. "Friends for Life" (71) is but a day's intention, and "Enemies until Death" (80) scarcely an hour's, it is to be hoped, since the ladies who are supposed to be actuated by these diverse emotions are obviously too well brought up and highly connected not to be above such common human influences; and if they were, not to take very great care to hide their failings and feelings.

Mr. T. Ead is represented by one of his very estimable correspondents, who are always "his very truly." On this occasion her epistolary composition is costing her more trouble than it did the artist to record the fact of her being "In doubt" (55); but she need be in none with regard to a capability of expressing herself comprehensively, for that has been done for her—most easily and most admirably by the consummate skill of the painter.

Mr. J. B. Burgess shows an accession of power in his portrait of "A Little Spanish Lady" (40), who is a great deal Spanish, and a great deal of a lady, to the credit of him who has made her look so. "The Padre's Visit" (135), though but an ordinary incident, has served to the purpose of exhibiting great proficiency in technical attainments, and is a pleasant companionable picture. Mr. Burgess always paints conscientiously, and leaves never a trace of hurry or neglect in his works.

Mr. E. Long, with a more ambitious design, is less distinct in elucidation of the story he wishes to convey. Has "Liberty of Creel—Andalusia" any reference to turning the Jesuits out of Spain? One would suppose not, but that it was rather "taking liberties" with a creed, and very properly perhaps (176). The composition—a large one—embraces a variety of Spanish characters who seem to differ from the opinions of two priests, one gesticulating as if in pious horror of the indignities offered to the Church, whilst the other appeals for some show of the respect due to its representatives from too stolidly indifferent an audience to pay much attention to any such demand. Method here is superior to matter, for good workmanship and picturesque costume go a great way towards exciting inquisitiveness and a wish that some further description in the catalogue were there to satisfy it. The "Forbidden Fruit" (184) is a plant, *nicotiana*, "put by people in their mouths and noses, or smoked;" the fruit of the forbidden is the smoking, and the fruit of the disobedience is—sure to follow; at all events, M. C. Schlosser leads expectation up to this point, for his smokers are a herd of school-boys, whose idea of the niceness of the act exists but in the knowledge of its naughtiness, and they evidently are beginning to be sorry for their transgression already, and to feel that they have reason to be, or very soon will have. Even he, who in assumed ease of attitude leans against the usher's desk, and with head thrown back watches the curling cloud issue from his wide month, will presently wish he had been a better boy: *sic transit gloria fumi*,—if you commence too early,—and you cannot begin too soon, for then, perhaps, you will never do it again.

Mr. B. W. Leader's splendid sunset picture, "Head of Derwentwater" (22), is a Leader in a double sense of the word, for it is an exquisite performance, and would take a prominent position anywhere; and Mr. Vicat Cole's "View on the Arun, near Arundel" (196), though not so comprehensive, and of lesser pretensions with regard to size, is scarcely less beautiful.

Two sea-pieces (9), "Calm off the Coast of Holland," by M. P. J. Clays; and a lifeboat "Going to the Rescue" (64) through such a sea and to such a wreck as few could represent so well as M. Th. Weber, are likewise exceptionally fine performances.

To return to the figure-pictures, Mr. Folingsby's dead throuadour (12), "The Song is finished," M. L. Goupil's lady (17), "Arranging the Flower Vase;" Mr. E. Nicol's pair of comic impersonations (28), "The Tenant's Letter," and "The

Steward's Letter" (15); M. C. Beyachlas's highly-finished episode, "Grandmother's Birthday" (35); Mr. J. Archer's admirably painted young knight in armour of the fifteenth or sixteenth century, certainly misnamed as "Sir Lancelot," of King Arthur's time (41); Mr. T. F. Dicksee's charming and highly elaborated "Kate and Bianca," from "Taming of the Shrew" (70); Mr. G. B. O'Neill's physician comforting an anxious daughter or wife,—or one who but lately thought she should never become a wife,—with the gladdening intelligence that the precious life was now "Out of Danger" (79); and "A Wallachian Team," by M. A. Schreyer, with some human figures to manage it (106)—these, with Mrs. M. E. Freer's veteran, who, *minus* an arm, is still impregnated with the martial greed for glory, and regrets that he should be "Left Behind" by his comrades, who, on the march, are passing his window (109); M. C. Blanc's fortunate and unfortunate young Italian heggars, the one "Counting his riches," and the other lamenting that she should have but a solitary coin for her "Hard Day's Earning" (127 and 137); "All Anxiety," by M. T. Rosiere (150); "Christmas Charities," by Mr. G. Pope (157); and Madame de Thullier's little imp of an intruder regarding with curious interest a mask or some mysterious trifle of a lady's wardrobe, wondering "What can it be?" (180),—have all some special claim for consideration.

Just as tastes may differ, choice,—where no great right of precedence really exists,—would vary so much that it is best to leave it to its various elections of leading works amongst the whole number that a judicious selection has restricted already to the category of chosen: a system, by the way, that might with advantage be more commonly followed, if the institution of winter exhibitions is not to outgrow its strength, and its production become but a very pale offshoot from the real stem of cultivated art as it now flourishes, poorly indicating its real health and strength.

Mr. G. H. Boughton may be taxed with anachronism in his application of "Indifference" as he illustrates it (4): at the period that the costume of the two would-he enslavers betoken it to be,—the regency or reign of George IV.,—the gentleman would have been considered singular indeed who sang,—

"When my hair is grey,
Then I shall be wise;
Then, thank Heaven, I shall not care
For bronze brows eyes"

(which are called "coffee-coloured" now); for most likely he would have worn a wig and thought more of his eyes than ever, had any desire to be considered at all fashionable. However, it is a very agreeable little picture, original in its treatment, and very truthful in general effect. Mr. H. Le Jenne's peasants making "Preparations for Dinner" (10) form a pretty group of highly-coloured rustic properties, as carefully and admirably painted, and as conducive to "Happy Thoughts" (16) as any of the speculations of Mr. G. Smith's visionary, in the present evidence they show in common of quiet content and academic skill in their representation: the infant in the cradle, the cyonism of its mother's mind's eye in its minute's contemplation of a ten years' progress, is a beautiful study to more than her who is most of that opinion.

There are works by Mr. T. S. Cooper, Mr. T. Creswick, Mr. J. C. Thom; by MM. H. and H. P. Koekkoek, M. J. Bertrand, Mr. J. C. Horsley, M. E. Portielje, Mr. F. Goodall, M. C. Champ, Mr. E. W. Hulme, and others, that to notice as they deserve would extend our say of this exhibition very considerably. As it is, further notes on winter exhibitions must be postponed until next week.

Utilizing the Tides.—A proposal to utilize the power of the tides on the Thames at Westminster, was made some time ago in the *Builder*. This idea, we observe, has been taken up by a Frenchman of Italian origin, one Ferdinand Tommasi, who claims to have discovered a valuable mode of employing the force of rising and falling tides as a motive power. M. Tommasi, who is an engineer, and who has patented his invention both in France and abroad, says that the force of tides can be employed on his system at no matter what distance from the sea. A pamphlet on the subject, bearing the title of "Le Flux Moteur," and accompanied with numerous pictures and diagrams, will shortly make its appearance.

OPENING MEETING
OF THE ROYAL INSTITUTE OF BRITISH
ARCHITECTS.

THE opening meeting of the session took place on Monday evening, Sir W. Tite, M.P., president, in the chair.

The decesses during the recess of Mr. E. B. Lamb and Mr. Charles Freeman, Fellows, and Il Commendatore Luigi Poletti, of Rome, hon. foreign member, was announced. A large number of donations to the library and collections of the Institute were also announced, including donations to the amount of 42l. to the library fund. Mr. E. A. Gruning, of Gresham House, and Mr. E. W. C. F. Schmidt, of Great George-street, were elected, the latter as Fellow, and the former as an Associate.

The President then proceeded to deliver his opening address in the presence of a very crowded meeting. He commenced by congratulating the Institute upon the success it had attained. The number of persons connected with it in the various classes of fellows, associates, honorary fellows, honorary foreign corresponding members, students, &c., amounted at the present time to 675. The funds and finances of the Institute were in a flourishing condition, and, after payment of all current charges, a considerable sum had been carried to a reserve fund. These were incidents gratifying to them as men of business as well as artists; and he congratulated them, with all sincerity, on the present position of the Institute. The few remarks he would trouble the meeting with he could arrange under three heads, viz.: first, the position of the Institute during the past year, and what it had done during that year; secondly, some slight notice of what is at present doing in London; and thirdly, some general considerations referring to the present position and the possibility of the increased future usefulness of the Institute.

Having enumerated the papers read during the last session by Sir Digby Wyatt, Mr. A. H. Layard, the Rev. R. Burgess, Professor Lewis, Professor Donaldson, and others, which were distinguished for their ability and the interest which they excited, the president passed a high encomium upon the late Mr. Arthur Ashpitel and Mr. George Smith; and then referred in terms of satisfaction to the award of the Royal gold medal of the last year to Professor Lepsius, the eminent archaeologist of Berlin; also to the election of Emilio de Fabris and Il Cavaliere Professor Giuseppe Poggi, of Florence; and Il Conte Francesco Augusto Vespignani, and Il Commendatore Luigi Poletti, of Rome (the latter recently deceased), as honorary foreign members. The president then mentioned the fact (already known to our readers) that the grand prize of 100,000 francs given by the Emperor of the French to the most distinguished architect, sculptor, or painter, during the preceding five years, had been awarded to M. Duc, of Paris, architect, honorary and corresponding member of the Institute, who, he said, had appropriated 25,000 francs for the foundation of a scholarship in architecture. On the second head of his remarks, the president observed that it was impossible for a contemporary architect to give an opinion, unless it were a kind and friendly one, of the works of his contemporaries, but it would be expected that he should say a word upon some of the remarkable works that had been carried on in London during the past year, and he was sure his remarks would be received in the spirit in which they were dictated, viz., of good nature, good temper, and, he hoped, of kindness. The first work he would notice was that of Mr. James Pennethorne (London University, Burlington Gardens), and on that he had not a word to say except to the exceeding success of that building, which, he thought, was in every way worthy of the time, the architect, and the purposes to which it was devoted. He was quite sure all present would agree with him in regarding that building, the latest of Mr. Pennethorne's works, as one of the most successful he had ever executed. He now came to the new rooms of the Royal Academy. Were not these again a great success? He thought in this work of Mr. Sydney Smirke's every thing they saw demanded their approval. He thought the architect had done all that could be expected. The rooms were elegant, convenient, extremely well ventilated, and were all that the public could require in a building for such a purpose. No doubt there would eventually be a better access to it by the assistance of Mr. Charles Barry, whose firm had the charge of the front buildings, and

he thought, when completed, it would be a most eminent success. They as architects had been a little annoyed,—perhaps the fault was their own; but he had felt that architecture had hardly had justice done to it in the Academy exhibition. The room originally appropriated to it was perhaps well enough in itself. It might be that the drawings sent were not of sufficient interest or merit, and that had been suggested by some persons as a reason why the exhibition last year was not a successful or satisfactory one; but he hoped some amongst them, especially the younger members of the profession, would be found to do something to redeem the lost position at these exhibitions which, either from the want of a proper place, or want of purpose, or from some other cause, they had experienced. The next work to which he referred was the great hospital now in course of erection by his friend Mr. Curry, on the banks of the Thames, opposite the Houses of Parliament. It would be folly for him as a governor of that institution to say that they gave the architect power to spend as much money as he pleased upon decorations. They wanted a hospital and usefulness; they also wanted great economy; and he thought, when finished, it would be a building in every sense of the word worthy of its uses, and no inelegant decoration of the metropolis itself,—useful to the suffering public, as well as creditable to the governors who had directed its construction. He now came to the two great incidents of the day, Blackfriars Bridge and the Holborn Viaduct. The latter work had been constructed by Mr. Haywood, who styled himself architect and engineer, but he (the President) had long known him as an architect, and he thought all they had said and felt with regard to the viaduct was to that gentleman's credit. Perhaps he might make this criticism in all good nature, that he thought the decoration a little overdone. The Romans and Greeks built for antiquity and apparently for eternity. He was not sure that could be said of the buildings of the present day. We had grown to be fond of ornament, of gilding, and other characteristics which we did not see in the remains of Greece and Rome, and which he thought in a certain sense might be a little spared in our modern works. With regard to the new bridge it was in the whole a most successful work in regard to usefulness in every sense of the word. He had on other occasions given his opinion upon the architecture. He recollected the one which Mr. Mylne built, and he confessed he admired that more than the one he now saw. He thought it, like the viaduct, was overdone in decoration; but in both cases, he was bound, as a man of considerable experience, to say he wondered at the enormous success that had been achieved in the working of the materials. The hardest qualities of granite were worked with a dexterity and ability which commanded their highest praise. In parts of the viaduct the granite was almost wrought like joiners' work, and that no doubt would be as perpetual as they desired anything of that character to be; and in the case of the bridge, though he could not say he admired the cornices, the workmanship was beyond all praise, and, together with the polishing of the granite columns, was in every way creditable to the executors of it. Passing on to the third part of his subject, the President remarked that they were called upon in connexion with their position in the State to perform certain duties in their corporate capacity, and he ventured to think that those duties had been carefully and anxiously performed. One of those duties was the examination of candidates for the office of district surveyors under the Metropolitan Board of Works. That was now becoming a matter of exceeding importance. The Board of Works could, if they pleased, place these examinations in other hands; but they had been satisfied with the pains hitherto taken, and that part of their duty, he hoped and believed, had been well performed. During the past year a proposition had been made by that board to bring a Bill into Parliament to repeal the existing Building Act. The subject was referred to a committee of this Institute, and much time was occupied in the consideration of the subject; but on the whole it was thought better to leave well alone. Some changes, no doubt, were required in that Act; but, on the whole, they thought it would work well, and that it was not desirable to make any great alterations in the legal provisions which the present Building Act supplied. They had had during the year an application from the Builders'

Association, who had brought under their notice the very grave question of the relations between builders and architects, and had urged upon them a great many changes. His own experience supplied him with the fact that engineers never allowed any interference between themselves and their contractors or builders, but kept the whole of the affairs in their own hands, as well as the settlement of questions of payment. For his own part, he would say it had always been his own practice that he would not be interfered with as architect. If the work was ill done he interposed; or if the materials were bad he sent them away. But he had never in any of his buildings interfered with questions of payment to builders, and they would accept that as the experience of a somewhat long professional life. It appeared to him, when a man had done his work, if any question arose out of the contract, he had the greatest right in the world to represent himself, or to be represented, in the matter, upon a reference to indifferent parties. He was glad to find this Institute, after going into the question, had come to the same conclusion as he had himself, viz., that the architect should be the sole dictator in matters of architecture and building, without interfering with the agreement between the employer and the builder as to the amount to be paid for the work. The next topic he would touch upon was a very grave and important one. The point was this,—that their object and end must be, and always ought to be, to promote architectural education; to make their members wiser, more learned, and more able men. He thought that was not to be done by those advanced in life urging on one another, because their duty was for the most part done, and their work ended; but they wanted to encourage and teach the young and rising architects: therefore this had been a subject of great anxiety on the part of the council, and they would see presently what had been done to encourage the rising architect to cultivate his genius and talents. The whole direction of architectural education, he felt persuaded, must be in that way, and in that way the regulations proposed by the council would, he hoped, be firmly and finally carried out. [Mr. Seddon here read the resolutions based on the suggestions of a general committee of the Institute on architectural education, which have appeared in this journal.] The president having publicly testified to the kindness of Professor Lewis and Mr. Waterhouse, in having undertaken the task of preparing the text-book, which he felt confident would be of the greatest benefit to students, remarked that he had only one more topic to notice, and that was, that during the past month there had been two letters addressed to him personally, in print, which had appealed to him on two distinct subjects. He thought all he could say on the matter was pretty well condensed in what he had just remarked in regard to their being able in some way to assist the young architect,—not those who, like himself, were advanced in life, who must be content with the position that had been formed for them. The writer to whom he alluded appeared to think that when a person aimed to become a Fellow of this Institute, he should be subjected to an examination. He would say he never knew of such a course being taken in any other professional society, nor could he conceive it would be submitted to in this. A man, before he obtained the rank of Fellow, attained a position in his profession, which his skill, age, and experience warranted. It appeared to him that the title of Fellow of this Institute was valued by those who bore it, because he found it need in all directions, appended to their names, and he did not believe that anything more could be done in that direction. The other point brought forward was this,—that Fellows should measure for builders. Well, perhaps that might be quite right; but at the same time he thought they, as architects, ought to hold themselves as much as possible distinct from interests of that character. A man of honour and a gentleman could be a man of honour and a gentleman anywhere. A distinct regulation was established at the foundation of the Institute, that Fellows should not measure for builders. It was there still, and he did not himself feel inclined to disturb it. It was a very distinct practical question, which every man of business could understand; but it was not a subject which they could discuss at that large meeting. The president concluded his address by repeating the expression of his gratification at the progress which the Institute had made, and its growing success, and said he should

be happy in the thought if by any means he had been instrumental in promoting that success.

Professor Donaldson, in moving a vote of thanks to the President, remarked that the address was practical and useful, and dealt with topics interesting to all present. He had not led them into wide fields of fancy, but had confined himself to practical points connected with their art. In reference to the magnificent prize which had been awarded to their honorary and corresponding member, M. Dno, the Professor remarked that it was a matter of pride to them as professional men that it had been bestowed upon an architect. Amongst the more striking works lately executed in London he considered the new building of the Bible Society in the City, by Mr. T. L'Anson, worthy of notice. It was, he said, a noble structure, and did honour to the architect, the society, and the art of the present period. He expressed his concurrence with what had fallen from the President as to the undesirability of interfering with the more material enactments of the Building Act. On the subject of the title of "fellow" of the Institute, the Professor remarked that it was to be regarded as a guarantee to the public that the bearer was worthy of the confidence of his employers; if not he would not continue to be a member.

The motion was seconded with great cordiality by Professor G. G. Scott, R.A., who suggested that no greater boon could be conferred upon the profession at large than the publication by the President of the results of his long experience on the numerous practical, as well as artistic, questions which had come before him, and he hoped his hon. friend would find an opportunity of gratifying them in that respect. The resolution of thanks having been passed by acclamation, the President briefly acknowledged the compliment paid to him, and said the suggestion should have consideration.

FINSBURY MIDDLE-CLASS SCHOOL.

A good work is being done in the city of London by the Middle-Class School Corporation, recently established, and whose purpose is to give the means of a sound every-day life education to the children of the middle and lower middle classes, at small charge. The first of their intended buildings has been erected in Cowper-street, not far from Finsbury-square, and is now occupied. It is intended to accommodate 1,000 boys, and has been built by Messrs. Brass, under the superintendance of Mr. E. N. Clifton, architect, at the cost of about 16,000*l.* The site, nearly 2 acres in extent, cost 29,000*l.*, but this included some house property, which will bring a small rental to the school. English, French, arithmetic, mathematics, drawing, and French, form the general course, under the direction of the Rev. W. Jowitt, with some twenty assistant masters. The Rev. Mr. Rogers, it is but fair to say, has been the mainspring of the undertaking. For the advantages offered, the charge to each pupil is one guinea per quarter. The buildings being provided by the subscribers,—*domus*, as at the universities, being free,—this small payment will, it is considered, defray the cost of instruction and maintenance of the building. Drill is attended to by a sergeant, and greatly improves the hearing of the pupils. There are now 900 boys in the school, and by Christmas the full number, it is believed, will be there. Visiting the building last week in the afternoon, we saw the boys dismissed, and a very agreeable sight it was. They marched out to the playground, round which with military precision they arrange themselves in double file. The head-master makes this the opportunity for a general review and a few words of the right sort here and there, according to circumstances. A certain number of the musical class have by this time mustered in the centre, the National Anthem is played, all saluting, and then, forming fours, they march to the gates, and break up, to take their several ways. The brass band would be larger but for the want of instruments, funds for which are not at present available.

The boys having left, we can look at the building. It has no architectural pretensions; it is plain to bareness: still, externally it has a sort of dignity. It is of four stories, including the basement (which contains the dining-hall), and is wholly of brick. A sufficiently-wide corridor runs through it longitudinally, with a large well-staircase at each end, so as to empty the building rapidly. The stairs are caged in with iron bars (side and top), the aspect of which is disagreeable. Given, however, a well stair-

case, and such a precaution is absolutely necessary. Without it an accident might have been expected within a week. On first thoughts, a square staircase, with a wall between the flights, would seem best adapted to meet the circumstances. Considerations, however, as to ventilation and light have to be weighed, and though these wants might be met in another way, they afford very good reasons for adopting the present arrangement. The dining-hall to which we alluded will seat 500 at a time. The charge for dinner to each boy who takes it is 6*d.* Many bring their own "nosebags," but all sit down to acquire habits of order and propriety. The other floors consist of class-rooms and lecture-rooms, with good lavatories and closets. In the upper story additional light is obtained from the top. A small room on one floor will be fitted up as a laboratory, in aid of which a grant of 100*l.* has been obtained from the trustees of the Gilchrist Educational Fund.

The walls of the rooms are lined with boarding to a certain height, the brickwork itself, whitened, showing above. Everything appears well and soundly done, but no trace of colour or ornamentation of any sort appears. Of course, the first great requisite is to provide apartments in which the business of the school can be conveniently carried on, and to this exclusively the funds have hitherto been devoted. We trust, however, no long time will elapse before Art be brought in to do its silent teaching.

The value of the Association that has resulted in the establishment of such a school as we find here, and which is prepared to carry on the work in other districts, cannot be over estimated; nor can we praise too highly those individuals by whose efforts it has been brought about.

ANTIQUITIES OF ROME.

We have received the third part of "A Catalogue of 1,500 Photographs illustrative of the Archeology of Rome," prepared under the direction of Mr. John Henry Parker, F.S.A. Printed for private circulation. We are not surprised that Mr. Parker does not think it expedient to publish this in its present imperfect state: it is natural that he should wish to make it complete before it is published; but, considering what a great undertaking it is, and that he has been already five years about it; remembering also the uncertainty of human life, and that he may never live to finish it; we are glad that he gives as much publicity as he can to what he has already done. He bids fair to produce the same sort of revolution in the archeology of Rome that Rickman produced fifty years ago in England, to put the subject into a new groove which others will soon follow, and the next generation will derive the full benefit of what he has set going. It is the application of this system, the close examination of detail and comparison of one with another, of less perfect remains on one spot with more perfect remains of the same kind and of the same period in another place, which forms the basis of modern archeology. Mr. Parker has also sent us proof sheets of his chronological table of buildings in Rome from the foundation to the time of Constantine, with the authorities for the dates. These two things ought to go together, and to be published together.

He has marked in the table all the buildings of the remains of which he has photographs, so that a scholar or an archeologist can now, with the help of a good magnifying glass, judge for himself whether the dates Mr. Parker boldly puts upon them can be relied upon; he has given the means of correcting them if he is in error. We observe that he lays great stress on the primitive earthworks as having governed the plan of the city, and dictated the sites of the principal buildings, and often the plan of a building also. We suspect that the same will be found to be the case with many other ancient cities and castles. This is a new subject for investigation, which has hitherto been overlooked. We are sorry to see that he states that his funds are exhausted, and that he cannot carry on the work he had undertaken in Rome without assistance. He has not called on others to help him until he had done the utmost that his own means allowed, and we trust the example he has set will be followed. We have heard it whispered that he received as much as 10,000*l.* (all now expended on archeological objects) from the estate of the late Robert Stephenson, the engineer, which, though legally at his own disposal, he chose to consider as trust money only for archeological

purposes, and, therefore, devoted a moiety to this object in Rome, believing that such would have been the wish of Stephenson could he have been consulted. We gather from the end of the catalogue that persons desirous of assisting in this work can do so by paying donations to the Roman Exploration Fund, at Messrs. Coutts's, of which Mr. Parker is treasurer.

SCHOOLS OF SCIENCE AND ART.

Technical Education in Clerkenwell.—A school for the instruction of apprentices and workmen has been opened at 44, Clerkenwell-green. The Hon. Anson Herbert occupied the chair. He referred to the progress of education in North Germany, especially in those subjects which make the apprentices and workmen more skilful and perfect. Accept, said he, the assistance which the Government offers, and make the best of it, although it is not all we think they ought to give. A working man in the meeting said the working men had never made any effort to secure a better education, or taken any trouble to impress the Government that they desired it. The chairman said it was quite true the working classes had not as yet felt the importance of the subject. We are progressing, said he, towards a great organisation of labour, in which the co-operative system will prevail, in which there will be a brotherhood of workers directing their own industry. He believed such a co-operative system was the only means of providing employment for the population; but it required a high state of intelligence to reap the full benefit of such a system. We must also endeavor to give working men more taste. Some of the best designs in former days were made by men engaged in the industries in which the designs had to be executed. We have a great arrear of ignorance to wipe off. We want more light. We must decide on what we want from the Education Office. Mr. Buckmaster then addressed the meeting with great earnestness, urging the importance of a better education for all classes of society, masters as well as workmen. Mr. Young, a picture-frame maker, said he felt the importance of a school in the district like the one proposed. Mr. Donati said he was a wood-carver, but he had never been taught drawing. He feared, up to the present time, the instruction had been too expensive for working men. Mr. Lucas said he feared the employers of labour were quite as indifferent to scientific instruction as the men. So long as the men could do their work and make a profit for the master, it was, in most cases, all that was cared for. There was an entire absence of all opportunities for improving the art education of the working classes in this district. There was nothing to be seen but bricks and mortar. A man could not walk in Paris without seeing something beautiful at almost every step, but there was nothing to be seen in our streets but wretched, dreary-looking objects,—nothing to improve the taste. Mr. Sollas and Mr. Coles, salaried teachers, then addressed the meeting, and explained the course of instruction which they proposed to give. The school, it appears, promises to be successful.

The Oxford Schools of Art and Science.—A meeting of the friends and students of the School of Art has been held in the Town-hall. There was a large and highly respectable attendance. The walls of the hall were decorated with the drawings of the pupils. There were present on the platform the Dean of Christ Church in the chair, Dr. Adlard, Professor Rogers, Mr. Burchett, head-master of South Kensington Museum School, and various others. The report stated that the committee had a much more satisfactory account to give of the institution than last year. The receipts for the last year have been more than sufficient for the expenses, &c. It appears that 350 pupils have attended the schools during the past year; being an increase of 142 over the numbers last year. Of these 96 were in the artisan class, and of their works 436 have been sent to South Kensington for approval, preparatory to the claim for a money grant from Government. It is satisfactory to observe that in each year since the establishment of the school the annual grant has regularly increased; partly on account of the more liberal arrangements of the Department, but principally owing to the increased quantity of works executed, for which claims may be made. The chairman announced to the meeting that the Art and Science Departments in Oxford would henceforth be under one management. They were under

one management at South Kensington, and he hoped their union in Oxford would be attended with advantageous results. He hoped the gentlemen of the Oxford Science School would, as far as possible, induce their pupils to avail themselves of the opportunity of attending the Art School. Professor Rogers, one of the chief founders of the Oxford Science School, explained the origin of that school by gentlemen who were interested in the spread of industrial and economical education. The chairman reminded those present that the School of Art had yet to clear itself of a very large debt. The plant was worth much more, but the School was at present chiefly maintained by fees; and they required subscriptions. He thought it was only fair that the managers of the Art School should, on joining the Science School, make an appeal to the University to contribute some small sums towards the assistance of the joint concerns. He should be very glad to give something himself.

A School of Art for Lewes.—The formation of a School of Art in Lewes has been a success, so much so, that it has been decided to erect a building for the purpose as soon as a suitable site can be secured. The Government will grant 300l. or 400l. of the money required for the purpose.

The Gloucester School of Science.—The Science Classes, under the Science and Art Department, successfully started by Mr. Jeffery, at the Free Library, in 1867, and continued last year under the management of Dr. Davis, of Cheltenham are about to be recommenced under the united management of these teachers. It is hoped that they will be able to establish a permanent Science School in this city, in connexion with the Government department, so that young men here may have the opportunity of obtaining the diplomas in science now granted by the Committee of Council. A preliminary meeting has been held in the class-rooms, 10, Eastgate-street, to announce the plans for the winter months, and to enrol students. There was a good attendance, and twenty-five members joined. The prizes obtained for successes in the examinations in May last, and the certificates of success from the Committee on Education, were distributed to the pupils.

Classes for Technical Education in Liskeard.—Mr. Buckmaster recently delivered a public lecture in the Temperance Hall, Liskeard, under the auspices of the Mechanics' Institution. Mr. Sandey, J.P., occupied the chair. After the lecture a discussion took place, in which Mr. Buckmaster's science was questioned by a practical builder as to the forces acting upon an arch; he also stated that the mechanics of Liskeard were much better acquainted with science and drawing than had been credited by the lecturer. After Mr. Buckmaster's reply, a number of persons of both sexes gave in their names for classes, probably in physical geography, and on experimental science. The drawing is already provided for by a branch school of art, which has been successful, although the number of artisans in the school is very small.

The Birkenhead School of Science and Art.—The prizes awarded by the Science and Art Department to the students of this school have been publicly distributed in the Music Hall, Clangton-road. Mr. John Laird, M.P., presided. Various works executed by the students of the school were submitted for inspection. Mr. Laird said he had ascertained that the following was the number of working men, apprentices, and others, who had attended during the five years ending December 1867:—Workers in iron, 259; workers in wood, 109; bricklayers, masons, and plasterers, 77; house painters and plumbers, 44; architects, surveyors, and apprentices, 24; schoolmasters and governesses, 52; sundry trades, 41; and schoolboys and girls, 53; total, 659. Therefore no one could doubt that the school had been eminently useful for the class for which it was intended. During the past year 20 students sent up 75 drawings in the advanced sections. The works of 12 were commended, and prizes were awarded to two of them. The works of seven were selected for national competition, in which one was successful, and five studentships were awarded to three others. The total number of drawings sent up was 630. It was only due to those attending the school that the people of Birkenhead should support it liberally; and what was required to make the school more generally useful was a larger building. If there was a larger building, the number of pupils could be increased, and the school made of much higher

standing, and this could be done at a very small expense. The proposed building would cost from 2,800l. to 3,000l.; the Government pay was about 1,000l., there had already been subscribed 850l.; and only 1,000l. or 1,200l. were wanted to complete the work. There were surely 100 men in Birkenhead and the neighbourhood who could give 10s. each, in order that the school might be gone on with. Under Mr. Bentley's charge the school had taken a high position in the country. Some appropriate resolutions were unanimously agreed to.

THE THEATRE.

Haymarket.—Three particularly good scenes, Library at Cleve Abbey, Croquet Lawn in the ruins of Clove Abbey, and Drawing-room at Beaumanoir Park, have been provided by Mr. O'Connor for Messrs. Tom Taylor and Dubourg's comedy, "New Men and Old Acres," described as an original work, and, at any rate, a very interesting and effective piece. The first interior in the house of the old county family, with its stamped leather wall-hangings, old pictures, furniture, and plate, is cleverly contrasted with the drawing-room at Beaumanoir Park, where everything is gorgeous and now. The croquet lawns within the ruins is a charming picture, and the architectural portions show commendable care. The piece is very well acted by Mr. Buckstone, Mr. Howe, Mrs. Chippendale, Mrs. E. Fitzwilliam, and others; but the honours are fairly carried off by Miss Madge Robertson, who, as the daughter of the house (*Lilian Favaour*), talks gentle slang in the first instance and affectionate good sense in the second, with a vivacity, discretion, and power of pathos that hold her audience in smiles and tears from first to last.

Crystal Palace.—A handsome new theatre has been formed here, but is at present wanting in some main qualifications of a good house for operatic representations. As defects will, doubtless, be early remedied, we shall take another opportunity to visit it before making any comments.

An Offer to Unread Dramatists.—The editor of the *Gaiety Gazette* makes the following offer to the "nacted and unread":—

"Any gentleman—or lady—who has a play and a guinea on hand, may forward them both to this office, with the name of some gentleman in the published list of contributors to the *Gaiety Gazette*, to whom he would like his production to be submitted. The gentleman of their choice shall be invited by me to read the piece, taking the guinea for his trouble. Should he decline to look at it, the writer shall be so informed, and in that event there shall be no second choice—either the play and the guinea must be taken back, or the selection of a critic amongst the staff of the *Gaiety Gazette* shall be left at my discretion. And in no case shall any one be expected to answer the complaints of the rejected. I am not to be held responsible, nor is any one else connected with this paper, for the loss or injury of any MSS. All that is guaranteed by the *Gaiety Gazette* is this,—that the plays shall be fairly read by persons entirely competent to criticise them, and not, unless it be wished, by those gentlemen who are suspected of monopolising the stage."

The second part of this amusing proposition is:—

"The editor of the *Gaiety Gazette* has received a formal intimation from Mr. John Hollingshead, that if the above programme be carried out, he, for his part, will put the *Gaiety Theatre*, with its company and its properties, at the disposal of any author whose piece shall be approved by the critics of the *Gaiety Gazette* for one morning performance—of which the author shall take all profits—on the simple condition that he pay all expenses, and make his own arrangements, by letter, with the artistes whom he wishes to include in his cast; so that, in no event, shall the cost of their salaries fall upon the theatre. The manager shall not be asked to receive any strange actors, nor shall the author demand an introduction to Mr. Hollingshead, or to myself, or to the critic of his piece, nor accept any, unless by invitation."

WOLVERHAMPTON CORPORATION NEW BUILDINGS.

The foundation stone of the new town-hall, sessions-court, police-court, barracks, and cells, for Wolverhampton, has been laid. The site is the ground which was occupied by the old town-hall, facing North-street, but enlarged and improved. The proposed premises may be considered in two divisions, the first fronting towards North-street, which will be devoted to corporate purposes more particularly, and the second, fronting Red Lion-street, for the police.

The Italian style of architecture has been adopted, and the front of the structure will be executed in stone, and the rear in red brick, relieved with blue bands. The estimated cost of construction, which Mr. Ernest Bates, of Manchester, the architect, arrived at, was 17,000l.; but some alterations and additions have been made

to the plan in the provision of cellaring, from which a revenue of 80l. a year is likely to be derivable, so that the contract has been let to Mr. Philip Horman for 17,300l.

The ground-floor of the building will be approached by a flight of steps from North-street, and the public hall, measuring 39 ft. square, will have a dome-shaped ceiling with a lantern light. The offices for the town-clerk and the rate-collector will occupy a prominent position in the front of the premises, and on the floor above will be a chamber for the mayor, rooms, for committees, for the recorder, for robing, and for cloaks. On the right and left of the hall, on the ground floor, will be the council-chamber and sessions court, respectively 49 ft. by 38 ft. 6 in. in dimensions, and not far off a court for the magistrates, all approached by wide corridors. There will also be a host of minor apartments, for counsel, witnesses, officials, &c. In the police department there will be provision made for every requirement, including seventeen cells for male and fifteen for female offenders, averaging in size 15 ft. by 6 ft., well warmed and ventilated by a suitable apparatus; barracks, including twenty-one bedrooms, and apartments for baths and for the sick. The front of the town-hall will be of bold design. The centre portion of the facade will project, having double Corinthian pilasters at the angles, and a dome-shaped roof, with ornamental iron cresting. The two wings will also slightly project, and be supported by single Corinthian pilasters at the angles, and be in keeping with the rest of the edifice. There will be a large balcony for use on important occasions, and a public clock may be introduced conspicuously.

THE SAXON CHURCH IN WORTH, SUSSEX.

The following communication from "A Sussex Correspondent," demands immediate attention:—

"I have just now returned from visiting Worth Church—that was; Worth ruin that is! I found the chancel had vanished clean away; and six or seven rough men were picking away, with large picks, at the strong plaster over the rubble work of the Saxon walls! Their heavy blows resounded like screechle all about the venerable pile. In my sorrow I called out to the head workman,—'What are you doing, picking off that plaster! You'll have to put it all on again; and you can't make anything half so good as that!' 'Oh, no, we shan't put any more on,' said he; 'we shall point down the stones.' 'Point them down!' I exclaimed; that rough work was never meant to be shown; it was always plastered over.' It was afterwards mentioned to me that more than one of the Saxon pilasters was out of the upright, and would have to be taken down and rebuilt! Pray do what you can to prevent further damage. This curious and interesting churob does not belong to Worth only, but to the whole country, and ought to be preserved intact with the greatest care."

We fully agree with our correspondent in this opinion, and earnestly implore those who are concerned in the work, to pause before they knock down another stone. They will have to justify themselves for what they have already done.

CONVERSAZIONE OF THE ARCHITECTURAL ASSOCIATION. EDUCATION.

The Architectural Association's session of 1869-70 was opened on Friday (the 29th ult.), at the House, in Conduit-street, with a *conversazione*. The attendance was numerous, and included many ladies. The chair was occupied by the president, Mr. Lacy W. Ridge.

The report of the judges awarding the Association prizes was read by Mr. T. R. Smith. The President said,—I think a few words are necessary to mark the connexion of this meeting with the Architectural Association, and to distinguish it from similar meetings which other societies might hold in these rooms. Secondly, we have on these occasions hitherto been favoured with words of wisdom which have fallen from some of the professional elders who have come among us. With their words of wisdom we are not willing to dispense now. It would, however, be impossible to ask such gentlemen to speak unless first something were said on the part of the Association itself. But there are, I believe, still deeper reasons why these mixed gatherings

should not be allowed to fall into a state of absolute silence. To develop one such reason will be the object of the few thoughts I hope to put before you this evening. The fine-art architecture may be shortly defined as the art of spreading beauty to that which is useful. Man needs a building that therein some special object may be performed. Art-architecture enables him to make it beautiful. In the Middle Ages, a bishop wanted a building where men might meet in crowds to do honour to their God. The architect proportioned the parts thereof that it might be beautiful. He vaulted the roof, moulded the arches, carved the capitals. He made windows for light, and gave them beautiful forms. He glazed them as a protection from the weather, but he painted the glass for beauty. He wanted more colour; so his painter brought his art, and there he told his wondrous tales. There were doors, which the sculptor beautified. There were towers for bells, and these the architect grouped in lovely outlines; and a cathedral was built. Now, as in the building itself, so in each detail, we find first a requirement supplied, and then beauty incorporated in the work by the art of the architect; and this operation of combining utility with beauty is not confined to buildings, or even to the details thereof, but finds a field for its exercise in every kind of manufacture. The constant presence of wants to be supplied, while it is the groundwork of all true styles of architecture, and the great hinderance of all styles that are false, is the very reason for the existence of all industrial manufactures. A constant view to utility and a true love of beauty are the requisites alike of the architect and the designer of manufactures. Their art is identical; it is, in fact, the one great art-architecture that governs the whole. It is important to establish this, because many who enshrine architecture in the academic circle of the fine arts—with painting and sculpture—are surprised when asked to regard some common thing of daily life as a work of fine art. The furniture, the tapestry, the pottery, the glass, the dress of everyday life, are as capable of receiving art-treatment as buildings themselves. When in times past building has flourished, the art in these things has flourished too; and when architecture declined, first one manufacture and then another fell under an artless tradition. Think not that in thus claiming an extended sway for architects I am anxious to increase the province of architects. Speaking generally, it might be said that when art most flourished we heard least of architects. It is as with the saints of ancient times—when the world was most wicked then they most abounded, and their deeds stood out in high relief, whereas in the general decency or appearance of more modern days the character is unknown, or at least unrecognised. In some respects the existence of architects is abnormal, for surely each man should be the best designer in the branch of art in which he works. In buildings, however, where so many arts are brought together, a chief is indispensable; and at this period, when all the subsidiary arts have fallen into a state of decadence, in which each is inconsistent with the others, some race of men who will study abstract design may well be tolerated. My object, therefore, in setting forth the close connexion, or rather the identity, of art in buildings and art in manufactures, has rather been to remind us of the Architectural Association, on the one hand, that the result of our studies must be to establish principles for an art which shall be applicable not in buildings alone, but in all manufactures, and to claim on the other hand that the true principles of architectural art shall govern all works of industry. If this is to be so, it is manifestly useless for architects to stop short at "the five orders," or the forms of this or that century. With these things art in industry has nothing to do. We find, however, common ground at once when we turn our attention to beauty of outline, grace of proportion, harmony of colour, and the laws, now constantly neglected in manufactures, which make ornament artistic. A constant view to utility is, however, the greatest bond of all. By it, character or style is imparted to an object (be it building or manufacture) in such a way that the very expression of use becomes a great source of beauty. I will illustrate what I mean; and first, negatively, from a building. Let me remark that I give no opinion on the building, which, in fact, I have not seen; I only use it as an illustration. During the past year a market has been erected, with extreme magnificence on the part of the donor, at the east end of London. You may possibly remember

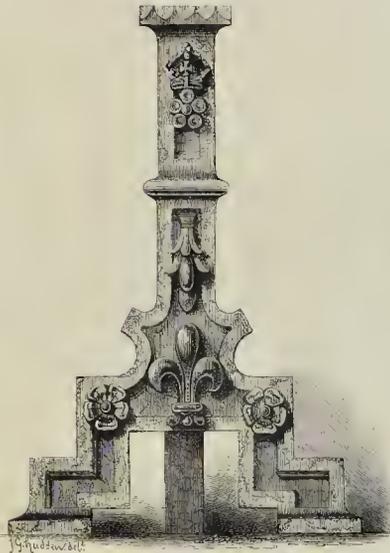

that in the descriptions of Columbia Market which appeared in the daily newspapers at the time of the opening, certain decorations and parts of the building were spoken of as "ecclesiastical." Now, the character of the artistic criticism which appears in non-professional journals is such that it is quite possible this word may have been used to express the forms of a style of architecture which was just as applicable, and just as much used in civil and military buildings, as in churches; and, if so, all may be well. If, however, any features or decorations did really suggest to intelligent minds that they would be more appropriate in a church than a market, then such features and decorations were worse than useless; they tended to destroy the character of the building,—they made it less fit for a market, and were sins against the laws of artistic utility. Now, let us turn to a common article of manufacture; and I must ask you to excuse its extreme familiarity, because it adds to its value as an illustration. Take an ordinary table-knife. It is simple enough, and, at first sight, you will say useful enough. Now, you will remember that it has constantly to undergo things laid down on a plate, and that one part only of the blade, a part near the end, is ordinarily brought into play. That may be seen at once by looking at knives that entered the head of the designer of the knife, or, at any rate, be disregarded. Take next an old-fashioned table-knife, such as still lingers among the inhabitants of old country-houses. First, we find a long sweep given to the point, at which the cutting ordinarily takes place, to lengthen the point on which the work comes. Then we find the point strengthened with additional metal; we find a place provided for the forefinger, and a knife produced which, while it is quite as useful for such purposes as cutting bread as any other knife, is characteristically and essentially a table-knife. It is far more utilitarian than the other, for it will far longer endure the special work for which it is designed; and it is a work of art, for it displays thought, and has given its designer the opportunity of introducing, graceful curves and outlines. In the first case we have a work which satisfies a simply utilitarian age; in the second place, we have more utility, with character and expressed quality—this derivation of the art from the use—because in this rests the only hope of associating the practical utilitarianism of the age with art. By this only can we hope to persuade the commercial man of "per cent." to entwine art with his manufactures. By this only can we hope to arouse a lethargic public, and to persuade them that architects are something more than antiquarian pedants, and architecture something more than an obsolete amusement. Now, if our art of architecture may be thus legitimately extended into every manufacture,—if it should constantly intertwine itself with everything that is useful around us,—have not all of you, even those who have least connexion with the architectural profession, some share in the matter? and have we not been justified in asking you to listen for a few minutes? We ask you to share with us our position as artists, and in the common things of daily use to be patrons of art. Think not you can even see those arts which you may consider (and perhaps to some extent rightly) the nobler arts of painting and sculpture in perfection, if art be wanting in minor things. This is impossible; for both public taste and the minds of the artists will be perverted by the ugliness of their ordinary surroundings. It would not be difficult to show that at the present moment painting suffers under a fearful incubus, while sculpture has been brought to the verge of annihilation, from the want of artistic character, and from the intrinsic ugliness of the costume worn by the men of this generation. We ask, therefore, the sympathy of all in promoting the welfare of our art. That it is a good work for you to help in, we doubt not; the Government of the country says that it is a good work, for it establishes museums and schools for instruction in art. We believe art to be a blessing, because it can soften the too stern realities of life; because it can shed one bright beam over the daily toil of the workman; and because it can make both the worker in art and him that appreciates it advance one small step towards the nature of the Great Creator, who, in the simple allegory of the earliest of prophets, is represented as reviewing all that he had made, and "Behold, it was very good."

Professor Kerr, in response to an invitation from the chair, said he should like at the outset to enter a very faint protest against being regarded as one of those whom this president had designated "the elders of the profession," and he certainly did not lay claim to the high merit of always speaking "words of wisdom." A little wisdom, no doubt, went a long way; but on such occasions as the present he thought that a little amusement was perhaps as much in request. Leaving, therefore, the wise part of the business for the meeting to be held in due time upstairs, he would now address himself to the present meeting upon its own ground. He thought he had reason to congratulate the Architectural Association upon having on this occasion returned to the original principle of the presidency of the Association, in electing to that office a gentleman who (if he would excuse him saying so) was one of the juniors of the profession. It was only last year that the principle was departed from, and it was departed from then for what was regarded as a very excellent reason,—with which, however, in general practice, he could not agree. What they had to do in this matter was to put forward their best men, that was all that was asked for; and he would undertake to say that there were a good many best men in store before the supply could be considered fairly exhausted. Following up the remarks of the chairman, he proceeded to refer to the subject of the education of the architectural profession—a subject in which, of all others, the young members of the association were deeply concerned. There were one or two questions a good deal agitated at the present moment which were not very clearly understood. First, it was said, "You have only to go across the Channel, and there you will find professional architects in France, every one of whom is educated regularly by order of the Government, while those who have shown proficiency at the close of their curriculum become by that fact entitled to preference." Now there was something highly attractive about that system of education in France as compared with the system practised in our own country. And what was the reason of this difference in the practice of the two countries? It was not that the architects of England were inferior to the architects of France. It was not that this profession of architecture in England was less noble in the estimation of the public. It was owing to what he might call that accidental difference of constitution which prevailed, not in this only, but in a thousand other things of no less importance, and by reason of which the narrow channel which separated the two countries seemed to divide two peoples who never could be brought into any uniformity of practice on any question whatever. The principle which had always prevailed in France, whether under a despotic monarchy, a republic, or otherwise, was the principle of centralization. That principle had lain at the root of everything in France, whereas in our own country the ruling principle was one of anti-centralization. Which of the two systems was the best he would leave it to his audience to judge. While differing in their opinions on the subject of professional education, architects were agreed to this extent at least, that practical education should be supplemented by theoretical education—by the establishment of a sort of curriculum, not compulsory, but in some authorised form, by means of which the young architect might be enabled to supplement his practical training by what theoretical instruction might be thought necessary or desirable in the exercise of his profession. There was the question, of a cognate kind, of what was known by the name of the diploma system. Those young men who were training for the profession, when they were willing to pass an examination demanded that when they had done so they should have some recognition of the fact. At the end of one of Bulwer-Lytton's plays, it was remarked that in this world, in addition to the possession of intellectual requisites, there must be what was called "a little humbug." Now, there was no cause why these young architects should not desire a little of this very reasonable kind of humbug, in the shape of some acknowledgment of the fact that they had passed their examination. The Society ought not to be chary of its honours, and the Institute should not be chary of its compliments, but gladly welcome the students of the profession, and amply accord to them every reasonable recognition of success. Nor should this be done merely as a matter of formality, but it should be thrust upon them in the character

AT LEEDS CASTLE, KENT.

The Kitchen, the Bridge adjoining, and the Clock Tower.

Fire Dogs, which formerly belonged to King Henry VIII., found at Leeds Castle.

The Water Tower and the Maidens' Tower.

[See p. 877, ante.]

of a merited honour and distinction. If the diploma system were settled upon that principle, there would be a great deal of good done, and there would be an end to a great deal of misunderstanding. If, for instance, every person who passed the ordinary examination were thereby entitled to admission as an associate, that in itself would be one practical recognition; and if every person who passed with distinction were entitled to become a fellow after five years' standing, that would be a further practical recognition of excellence, which would certainly be appreciated by those examined. There might be other contrivances by which those who submitted themselves to examination, and passed, might receive recognition of their success. He would urge upon the Association to do their part earnestly and loyally, and meet the invitation of

the Institute of Architects, believing, as he did, that in a few years these examinations would be a source of great encouragement to the students of the profession. He congratulated the Association upon the prospects, which he believed were very bright, for the coming session. He remembered when that Association was first established, he had seen it in its early struggles, and had watched its gradual progress till now, when it certainly possessed a membership which entitled it to be regarded as one of the established institutions of the country.

Professor Lewis also added a few words of congratulation to the meeting, and, referring in the course of his remarks to the subject of examinations, which he had himself much at heart, said that although he had been somewhat disappointed at the results, he had no doubt whatever

as to the importance of the examinations themselves, on which, indeed, very much depended the success and distinctive character of the architectural profession. He could not approve, however, of making the examinations compulsory.

The prizes for measured drawings were awarded to Frederick H. Read (*Spere*), J. Hinton Bryan (*Sprances*), and Charles Hanbury (G. E. R.); and for the essay, to Keith D. Young (*Assin*).

In the class of design the judges awarded the prizes as follows:—
“The first to R. F. Deal, whose ‘Landing Stage’ and ‘Warehouse’ are highly commended. The second prize to R. A. Came, whose ‘Warehouse’ is of very great merit. Mr. Henman is honourably mentioned for a careful set of studies.”

In the figure-drawing class the carefully-elaborated studies by J. E. Fogarty entitle him to the prize. S. F. Clarkson and R. M. Marnock show great industry.”

THE CENTRAL SYNAGOGUE, GREAT PORTLAND STREET, LONDON. — MR. N. S. JOSEPH, ARCHITECT.

THE CENTRAL SYNAGOGUE, GREAT PORTLAND STREET, LONDON.

UNLESS we view wrongly the Jews of the times, there is a party among the Jews who feel that the mass of their co-religionists are growing lax, not alone in religious observances, but in the acquirement of knowledge and the pursuit of those arts in which so many of their persuasion in all countries have superlatively excelled; and they are seeking to awaken attention to this fact and to encourage such endeavours as may be made to lead the rising generation into the right way. We hear of literary clubs and other similar associations. The *Jewish Record*, an intelligent journal, draws attention, too, to the careless manner in which the services are performed in many of the synagogues, and the want of other synagogues of proper character. Abroad, in Germany and France, some handsome synagogues have been recently erected. In our present number we give a view of a new synagogue now approaching completion in Great Portland-street, Portland-place, one entrance being in that street, and another in Charlotte-street. It is being built by Messrs. J. Perry & Co., from the designs of Mr. N. S. Joseph, architect; and the amount of the contract, including two houses for ministers and a building containing a vestry-room, is over 24,000*l*. Externally it is of brick and stone, in a style that may be called Moresque. The entrance-doors and other parts display a considerable amount of carving, executed by Mr. Sansom. The synagogue proper is 94 ft. one way, and 60 ft. the other; and it is 49 ft. in height to the crown of the vaulted ceiling. Below it are cellars. The roof and galleries are carried on cast-iron columns, which are turned in a lathe to give a good face for painting. The mouldings of the ceiling and arches are of plaster. At the northern end there are two galleries, approached by flights of stone steps. The iron work is supplied by Messrs. Shaw, Head, & Co. Mr. Stanley is the contractor's foreman.

The building, which is being erected under the presidency of Sir Anthony Rothschild, hart, is intended to be a branch of the ancient place of worship known as the "Great Synagogue," in Duke's-place, City, and is to supersede a smaller edifice in the same street, which has been found insufficient for the accommodation of the Jewish residents in that district. Like all synagogues (where, in accordance with the customs of the ancient race, the sexes pray apart from one another), the galleries are for the female congregants, the whole of the ground-floor being intended for the men.

The perspective view shows at the south-east end, elevated above the general level, the *echol*, or sanctuary, a domed recess, within which is the *arón-hakkodesh*, or sacred receptacle for the scrolls of the Pentateuch. In the centre of the building is the *almemar*, a raised platform whence the preacher, surrounded by the chorists, conducts the service. The seats, both on the ground-floor and in the galleries, are placed longitudinally, and raised tier above tier. All the internal fittings, the *almemar*, seats, and the bulk of the joinery, will be of oak.

HOLBORN VIADUCT.

On this Saturday (Nov. 6th), this important and costly improvement will be formally opened to the public, and, as we sincerely hope, by her Majesty the Queen. It may be useful to state that in our number for April 24th of the present volume* particulars of the viaduct will be found, with sections showing its construction, and a plan of part of it. The works, it will be remembered, have been performed by Messrs. Hill, Keddell, & Waldram, under the direction of Mr. William Haywood. We mentioned that the iron-work of the Farringdon Bridge had been supplied by Messrs. Cochrane & Groves. We have to add that certain portions of the structure were made by Messrs. Andrew Handyside & Co, namely, the iron bridge and parapet over Shoe-lane; the iron subway bridges and parapet over the London, Chatham, and Dover Railway; the ornamental gates at the four entrances to the subways in the Farringdon-road; the bronze foliage on the capitals of the polished granite columns supporting Farringdon-road Bridge, and the ornamental lamp pillars on the viaduct and approaches (not the large centre ones). With reference to the lamp-posts, it may be interesting to note that

each one is so arranged as to contain at the base a meter, and half-way up the post a disc plate is fixed inside to prevent any gas that may have escaped from the pipes in the subway ascending to the lighted lamps, and so causing an explosion. Under the disc, the pillars are pierced with ventilating holes to allow free egress to the open air of the leakage gas. It is well to mention that what is called the Patent Enamel Paint is used on the Farringdon Bridge, so that its behavior in the course of time may be noted.

The houses on the skew at the four corners of the bridge, to which we referred in our last account, are now nearly completed, and challenge criticism, as do various statues and other adornments. We prefer, however, to postpone our observations till a quieter moment in the history of this laborious undertaking.

BLACKFRIARS BRIDGE.

THE new bridge at Blackfriars, like the Holborn Viaduct, will be opened to the public this day, Saturday, November 6th, as nearly as may be 100 years after the opening of the first bridge, which took place November 18th, 1769. We only think it necessary just now to say that a view of the new bridge will be found in our volume for 1862,* as well as a view of its defacing neighbour, the iron bridge for the London, Chatham, and Dover Railway. Descriptive notices have been given on various occasions, the last in our present volume, p. 163, *ante*. Mr. Joseph Cahitt and Mr. Henry Carr were joint engineers; the clerk of the works was Mr. Pickett; Messrs. Thorn & Co. were the contractors; and their agent was Mr. F. Bryant.

ACCIDENTS.

Ipswich.—Mr. Seagar, builder, of Foundation-street, in this town, was walking on a scaffolding of a house which he is building in North-hill-road, Woodbridge-road, when he caught hold of some stonework on one of the windows. The stones having only recently been laid, the mortar was not set, and his weight caused them to fall, knocking him down. He fell on to some bricks below, injuring his ribs. Fortunately the falling stones did not touch him in their descent.

Woodchester.—The carelessness of a workman has been very nearly causing the burning down of Woodchester Church, erected only six years ago. Gas was being laid on, and a hole was bored through a beam over the chancel-arch, to put a pipe in. The hole was not large enough, and the clever workman actually burnt it larger with a heated rod! Directly after, the beam was in a blaze, but the fire was immediately seen and suppressed. The alarm brought half the village to the rescue, with their entire stock of huckets.

Swansea.—A few nights ago a serious gas explosion took place in the new Congregational Chapel, Walter-street, Frymore, which was opened about two months since. About the time stated the chapel-keeper, having turned on the gas at the meter, went into the left-hand lower to light the gallery preparatory to the service. In the tower he struck a match, and instantly a fearful explosion took place. He was knocked down and somewhat seriously hurt and bruised. The tower was considerably damaged. On examination it was found that the gasfitter, who had been at work during the day, had carelessly left an 1½ in. pipe unplugged, and the gas, when turned on at the meter, instantly filled the tower.

Glasgow.—An accident, resulting in instant death to one man, and fatal injury to three others, has occurred at the New College Buildings, Gilmore-hill. A number of masons and labourers were engaged on a scaffold at what may be called the clearstory of the library, when, from some cause or other, one of the main supports, or ledgers, on which the cross needles of the scaffold rest, broke, precipitating four or five of the workmen into the space below—a fall of upwards of 50 ft. There were five or six others upon the scaffold at the time, but those, finding their footing giving way, clung to the uprights, and so saved themselves from going down along with the scaffold and its load. It was found that an Irish labourer was killed, and that three of the other workmen were severely injured. Two of them died in the Royal Infirmary. The cause of the breaking of the ledger appears to have been a sudden jerk, occasioned by the emptying of a

harrow of stones. The men had not been working on the scaffold for some time previously to the occurrence of the accident, and had just resumed the use of it. When the stones were laid down, a crack of timber was heard, and when one of the men, who carried a hod of mortar, joined his companions, the structure gave way.

Leamington.—On Sunday night the Rev. John Craig, vicar of Leamington, narrowly escaped being seriously injured. Just before he entered the pulpit of the parish church, a piece of the moulding of one of the central arches, about the size of a brick, fell from a height of 40 ft. into the pulpit. The occurrence caused considerable alarm, and several persons prepared to leave the church; but the vicar quietly entered the pulpit and preached as usual. The church has recently been renovated at a great cost, and was only opened about a month ago.

COMPETITIONS.

Infirmary at Wigan.—A limited competition for designs for a new infirmary at Wigan has taken place. The competitors are four:—Mr. Grayson, Liverpool; Mr. Cooke, Liverpool; Mr. Worthington, Manchester; and Mr. Lynam, Stoke-npon-Trent. Mr. Hanson has been called in to advise the committee.

Plymouth Guildhall.—We have received another letter from "Argus" as to the selection in this case, made by an architect, but do not think it necessary to print it. The writer says in the course of it,—

"The time seems now come for action to be taken,—for something to be done. Mr. Waterhouse writes that he for one should rejoice to see the architects defended, and their efforts for advancement of themselves and their art protected. It is he, and men like him, that must make the reformation, if it is made. Let him exert himself in the cause of the Institute, and rescue the profession from the hands of ignorant meddlers."

Doncaster.—The successful competitors for the New Wesleyan Chapel and Schools at Doncaster are—First premium, 50*l*, design under motto "Don," by Mr. William Watson, of Wakefield; and second premium, 25*l*, design marked "Spes," by Mr. G. B. Ford, of Burslem. Mr. Watson is instructed to carry out the works.

THE MIDLAND COUNTIES IDIOT ASYLUM COMPETITION.

WHILST so many complaints are afloat of the duplicity and unfairness of committees in the matter of competitions, it may not be amiss to call your attention and that of your readers to the accompanying invitation issued by the committee for the proposed Midland Counties Idiot Asylum, by which you will see that the adjudication is left in the hands of a professional referee appointed, not by the committee, but by the votes of the competing architects. It appears to me that this plan satisfies every scruple, and removes all fear of trickery, nepotism, and backstairs influence:—

"In the event of your deciding to send in plans for the above, the committee desire that you will send to them, by the 1st day of December, the names of three experienced architects.

In electing their consulting architect, the committee will choose the gentleman nominated by the largest number of the competitors, and who shall be willing to advise them concerning the plans, for a fee of twenty-five guineas."

NOT A COMPETITOR.

THE HOLLOWAY WORKING MEN'S CLUB AND INSTITUTE.

This institution was opened under the presidency of Alderman Lusk, M.P., on the evening of Thursday, the 28th ult., the occasion being celebrated by an inaugural *soirée*, attended by a considerable number of the members of the club and their visitors, as also by a fair representation of those gentlemen by whose special exertions the present buildings have been called into existence.

The secretary gave a description of the position of the building fund, whence it appeared that the total cost of the works would be about 1,100*l*, inclusive of furniture, of which sum about 500*l* had been already subscribed, leaving a balance of 500*l* to be still discharged; the above sum also included about 350*l* spent on the adjoining premises, which were held on a building lease by the club with their own, and were now re-let at such a rent as left the club free.

Alderman Lusk then, in a short and appropriate speech, had all welcome to their new domicile, and declared the building opened,

* See pp. 321, 323.

* Vol. xx., p. 733.

calling upon the Rev. Mr. Tucker, the Rev. Mr. Mackenzie, the Rev. Mr. McCall, Mr. Levett, and Mr. Startin, who severally addressed the meeting. Mr. Startin dwelt on the educational advantages offered by the library and constitution of the club. For some little time afterwards the company promenade the rooms and inspected the various collections of art lent for the occasion, and there laid out. A selection of music concluding the evening.

Considering that the whole area occupied by the club premises is over 3,600 ft. superficial, and that the cost has little exceeded 650*l.*, it will at once be seen that no great amount of ornamentation has anywhere been displayed; the only decoration, indeed, being the colours of the distempers in which the walls are tinted. The rooms are all lofty, with skylights over them admitting ventilation and light, and three of them are capable of being united into a large assembly-room, by folding back the partitions.

The work has been done by Messrs. Fletcher & Ganthey, under the direction of Messrs. John Turner & Son, architects.

ROUND ABOUT THE MANSION-HOUSE.

The new street just opened to the public from Cannon-street to Charlotte-row, terminated there by the extensive west façade of the Mansion-house (scarcely ever before seen), has, besides, thrown open along its line several most picturesque architectural vistas; but none more so than those looking eastward, whether it be that towards the Poultry end of the Mansion-house, looking up Cornhill, or that at the southern end of the same building, looking to the picturesque tower and dome of St. Stephen's, Walbrook. The former may be considered unrivalled, embracing, as it does, so many interesting and imposing buildings. The beauty of the scene may, however, be greatly shorn of its interest should the triangular piece of ground on the west side of Charlotte-row, be again covered with buildings, which would in that case entirely spoil the now handsome effect.

Having most enthusiastically enjoyed the architectural scenes opened to view, I may be excused for suggesting something more which, to my mind, would further add to the perfection; i.e., that besides keeping open the triangular space alluded to, the portico and entrance at the Poultry end of the Mansion House should be removed therefrom to the western side of that building, and have proper approaches made thereto. The chief entrance could then at all times be attained with ease and comfort, the architectural effect of that side would be greatly improved, and the portico shown by the light of the sun in all its beauty. By such an alteration the Poultry could also be further widened.

Should you concur in the idea herein initiated, and deem this communication worthy of insertion in your paper, possibly, as in the case of the open space at the east end of St. Paul's which you so ably advocated, the open space here named may, at least, be preserved.

JOHN TURNER.

BUILDERS' BENEVOLENT INSTITUTION.

The twenty-second anniversary festival in aid of the funds of the Builders' Benevolent Institution was celebrated on Thursday evening (28th ult.), at Willis's Rooms, King-street, St. James's; Mr. J. M. Macey, president, in the chair. There was a numerous attendance of the leading members of the metropolitan building trade.

The Chairman, in proposing the usual loyal toasts, referred to the health of her Majesty, which had unfortunately prevented her from appearing among her people so frequently as she otherwise would have done; also to the anticipated pleasure of her attendance, with the view of opening to the public those great constructions, the Holborn Valley Viaduct and Blackfriars Bridge. With respect to H. R. H. the Prince of Wales, he was sure the people of England felt it a source of great satisfaction his being connected with the leading learned and scientific institutions, together with his desire to promote perfect unity and concord between the colonies and the mother country.

Captain Stodal, of the Bloomsbury Corps (Rifles), briefly replied to the toast of "The Army, Navy, and Volunteers."

The Chairman, in proposing the toast of the evening,—"The Builders' Benevolent Institution," said it was not one of a complimentary character, but a business matter. He found, on reference, that during the twenty-two years' existence of the Institution, the sum of upwards of 14,000*l.* had been funded; 11,000*l.* being appropriated to the relief fund, and 3,000*l.* to the building fund. At the present

time, they were not going to consider the advisability of building almshouses or not, but to consider the desirability of the relief fund had done its work very well. At the present time they had forty-six pensioners on the funds,—twenty-three men and twenty-three women,—and from that fact, if they were to draw upon the funds, at the present time of the establishment of the Institution, it must be seen what an amount of benefit had been rendered to those who stood in need. If there were any trade liable to failures or adversity from unforeseen causes, it was the building trade; and under those circumstances he hoped that energy would be used, with the view of increasing the funds, so as to afford further means to assist those who were then waiting to become recipients. Out of the forty-six pensioners then on the funds, he found that thirty-three of that number were living with their friends,—one of these having reached the age of ninety-one,—and four others were in the Bricklayers' and Tilers' Almshouses. He mentioned this merely because he thought that, when persons became advanced in age, it would be better they should be with their friends than live away in almshouses. He, however, did not wish to stop the subscriptions to the building fund, but would leave the objects of the Institution open, viz., the giving relief to desamp members of every branch of the building trade, and their widows, and concluded by thanking them for their kind contributions.

Mr. Charles Lucas next proposed "The health of the Chairman and President," which was suitably responded to.

"The Patrons, Vice-Presidents, and Trustees" was next duly accepted.

The Chairman proposed "The health of the Treasurer" in a highly complimentary speech.

Mr. Geo. Plucknett acknowledged the compliment, and expressed his adherence to the Institution, of which he had the pleasure of being the treasurer.

The toast of "The Architects and Surveyors" having been briefly replied to,

The Chairman gave that of "The Directors and Stewards," accompanying it with the name of Mr. Nicholson.

Mr. W. Nicholson in reply expressed his regret that owing to the want of funds he could not have another election this year. The directors had sent out 1,500 circulars appealing for subscriptions, and the result was only six annual subscribers and four donations. This was to be accounted for in the depression of the trade, but perhaps never worse than at the present time. He, however, hoped that by-and-by, when trade would permit, many would come forward to their aid.

Mr. Harris, the Secy., announced the evening's subscriptions and donations amounting to 350*l.*

GLASS PAINT FOR STOVES.

We find we have already stated that the German glass paint for stoves may be obtained from Messrs. Kellau & Gumm, Nussdorf, Vienna.

The "Glass Paint for Stoves" can be obtained from Messrs. James Price & Co., Varnish and Colour Manufacturers, Edmonston, M.

ANGLE CHIMNEY.

Sir,—I am about to build a moderate-sized country house, which I am anxious to have as compact, convenient, and comfortable as possible. Can any of your readers tell me from experience whether there is any disadvantage in placing the fireplace in the inner corner of a room, provided that the doors and windows are all as far removed from it as possible? Such an arrangement would give more wall room, and would, as it seems to me, after careful consideration of the subject, make any room of fair size more snug and comfortable than having the fireplace in the ordinary position. A. H.

"TEMPLE BAR."

Sir,—In the pages of the *Builder* and the newspaper press, from time to time, several queries have been put respecting the retention or removal of that ancient and dilapidated bit of City architecture, Temple Bar. Although not invited by anybody, I want to have my say upon it. On what ground should it be retained? I see none, except the plea that it is an historical relic of the past. Surely it does not conjure up very delightful associations, nor does it teach very noble lessons for study or reflection. It is marked by deeds of bloodshed and watered with tears. I am not speaking unkindly of poor old Temple Bar; I look upon it as a dangerous block that ought to be removed elsewhere as soon as possible. If it can be preserved, when removed, by any anti-dry-rot solution from decay, so well so good; but as it stands at present it is an incongruity and an impediment to metropolitan progress and improvement, and its future retention cannot be compensated for by any inherent virtue it retains. I am no Vandal, but the reverse, for I love antiquities; but I love handsome houses, wide streets, and unpimped thoroughfares more. I would wish that some retired merchant or accountant, with a genius for calculation, would give the public some figures of the loss of money through loss of time that this same old arch has caused. The work-day world of team and wagon, hansom and cab and other vehicles, makes streets of locomotion, has often heartily vented its curses, no doubt, upon this old arched *gibber* of the past.

Do, Mr. *Builder*, help us. You have already bridged some of our social swamps, and undermined some of our criminal bridges. Help us, pray, in carrying away the old gate, and packing up the old stone effigies.

Let the ultimatum of London go forth. There are poison and plague in our back streets and alleys. The hearts of the ferrid young are throbbing,—father and mother and child are choking for want of air. God's light is hidden out from the homes of our workpeople; there is darkness upon the City tines and pavements; let them hup their hands! All who are not? The "ays" have it. Temple Bar comes down at last,—A. D. 1870.

PO BOX PANICO.

* * * The removal of Temple Bar is included in the scheme for building the new Courts of Law.

THE FORESTERS' HALL.

Sir,—Will you permit me to offer a few remarks in reply to a letter in your issue of the 30th ult., signed "Solo." The committee on the selection of the plan sent in had no idea who were the authors until announced at the general meeting, and those that signed "Solo" were from its merits of design and perfectness of interior arrangements which the others failed to possess; and which your correspondent does not seem to question, only that Mr. Gosme was our chairman. Allow me to give this a flat denial, as his office expired at our October meeting, and in no way directly or indirectly interfered with our selection.

"Solo" seems to jump at conclusions in reference to the second design. The committee trusted to the honesty of the architects sending in their designs as to the estimated cost of the building, as also to the capabilities of its being in accordance with the Building Act. It was not their opinion, but was raised in discussion at the general meeting, which prompted this doubt expressed by your correspondent. It is plain "Solo" cannot know much about it when the committee deliberated some two days, and the general meeting some two days more, before it was finally decided, which he calls "short," although I am free to confess some of the plans did not require two minutes' consideration to consign them to obscurity. I am deeply impressed with your remarks, on page 858 of this week's *Builder*, relating to some competitors for the Bradford Town-hall, "The coloring of the principal view has gone far to redeem the picture as a work of art, and to the massive gilt frame the author probably owes much." I am free to confess these qualities did much for the success of the design at the general meeting, and were influenced by far weightier reasons. If architects would honestly show their designs naturally, and with the necessary chimneys and roofings, which he demands their consideration, it would be better, as men would not choose the picture in lieu of the straightforward elevation of a possible structure. GEO. DAYEY.

TRADE-UNIONS IN EARLY DAYS.

Sir,—Upon turning over some old papers, I found the accompanying circular, concerning Trade-unions, from Sheffield, addressed to my father, in the year 1814. It appears to have been printed by Montgomery the poet, who for some years was the editor and printer of a Sheffield newspaper.* JOHN CHUBB.

"GENERAL CIRCULAR."

Sheffield, March 28, 1814.

Sir,—For several years past the manufacturers of this place, it is well known, have been progressively advancing in price, chiefly in consequence of the extensive combinations of the workmen to raise their wages. This evil has now made a progress so alarming as to threaten the most dangerous consequences to the trade. Advances, immoderate beyond all precedent, have been demanded by these men, and means equally violent and illegal employed to enforce them. On the part of the merchants and manufacturers, it has at length been found necessary to counteract these proceedings by the most vigorous and comprehensive measures, of which one of the first has been a general suspension of their purchase, and stoppage of their manufactures. In order to facilitate the attainment of this object, they most earnestly and respectfully solicit all houses concerned in the purchase of Sheffield manufactures, both in the United Kingdom and abroad, not to purchase or present just now the execution of their orders, but wait until the powerful efforts now employed have restored the commerce of this town to its usual regularity. By a general co-operation of this nature, it may be confidently believed that the workmen will shortly be induced to recede from their unreasonable pretensions, the prices of goods properly regulated and fixed, and the whole trade secured from further interruption, by a judicious and permanent arrangement.

Signed on behalf of 'The General Committee of the Sheffield Mercantile and Manufacturing Union,' PETER BLOWWELL, Chairman.

ADVERTISING UPON HOARDINGS.

At a recent meeting of the St. George's, Hanover-square Committee of Works, the surveyor reported that in accordance with instructions of the committee, he had written to those gentlemen having boardings within the parish upon which were advertisements, and informed them that the license for these boardings would not be continued if the advertisements were allowed to remain.

Mr. Thorn said he thought this to be a serious matter. An accident occurred only on Sunday last, when the hoarding in Down-street, Etonally fell in. Had it occurred when the men were at work, in all probability there would have been a loss of life. He considered it high time that some steps were taken in the matter, for the more leniently treated, the builders, the worse the committee were treated. The hoardings were overloaded and were dangerous.

The law upon the subject was explained by the clerk, which was to the effect that any person erecting a hoarding without a license from the vestry or District Board of Works, or continuing to allow a hoarding to remain longer than the time stipulated in the license, was liable to a penalty of 5*l.*, and 4*s.* for each day the hoarding was allowed to remain. The vestry had the power to pull such erections down, and deposit the goods in any place they thought proper, and the charge for pulling down and removing the same were paid; and if it were not paid within eight days, they could sell the goods and hand over the surplus to the owners; but if the money raised were not sufficient, they could compel the owner to pay the deficiency.

An instance was mentioned by Mr. Thorn, where the owner of a hoarding received 1*l.* per annum for advertisement. He thought it was not so remunerative, the vestry should have a boarding of their own, for the money would be acceptable. He moved that the vestry be recommended to enforce the penalties against the owners, and that Mr. Smith be instructed to write to them informing them of the fact.

This, after some further discussion, was unanimously agreed to.

* The Iris.

THE GOVERNMENT ATTACK ON ENGINEERS IN INDIA.

WITH REFERENCE to the subject of the leading article in our last Number, the president of the Institution of Civil Engineers has addressed a letter to the Secretary of State for India, which reads thus:—

"Having reference to the interview your Grace was this day pleased to accord to the deputation of the Institution of Civil Engineers, I am desired by the Council of the Institution to state in writing for your Grace's more specific information:—

1. That the profession does not recognise the acceptance by civil engineers of commissions, or other payments, except openly and directly from their immediate employers.

2. That the profession distinctly disapproves, reprobates, and condemns the practice implied in the Notification No. 212, recently issued by the Public Works Department of the Government of India.

3. That it is a rule of the Institution not to receive into membership any person tainted, or believed to be tainted, by any of the improper and corrupt practices alleged in such Notification.

4. That if it be possible to cite instances of misconduct by persons calling themselves civil engineers, yet that any such instances are entirely exceptional, and amount to flagrant departures from the well-understood and well-recognised practice of the profession, and therefore cannot justify the broad accusation contained in the Notification in question."

FOUNTAIN IN THE JEPHSON GARDENS, ROYAL LEAMINGTON SPA.

A SHORT TIME ago, in a notice of the rise and progress of Royal Leamington Spa, we mentioned that a memorial was about to be raised in the Jephson Gardens to the late Mr. John Hitchman, who took an active part in all that pertained to the prosperity of that town. We have now to record the completion and dedication of the memorial, which has taken the form of an ornamental fountain. It is situated in the gardens near to the chief entrance, and may be said to be of Italian Gothic, with a tinge of Romanesque. The design was selected from 40 drawings, which were submitted to the committee. The design chosen was the work of Mr. Candale, of Leamington, and may be briefly described as consisting of a lower basin of quatrefoil shape, which rests upon two steps, which form the haesement. From the basement a shaft of red granite, polished, which bears an appropriate inscription. This is also supported by archoutants and counterforts, which also spring out of the basin. The granite shaft again supports a richly carved corbel stage, which, in its turn, carries a quatrefoil basin, which is of black marble, upon which are four jets of water, which issue from bronze grotesques. Another jet supports a group of other marble basins, and surmounting the whole is a pinnacled carved and gabled. The steps and lower basins are made from Derbyshire stone, whilst the stones used in the other parts are chiefly from Yorkshire. The cost is about 300l.

CHURCH-BUILDING NEWS.

Toucester.—Kilsby Church has been re-opened by the Bishop of Peterborough. Previously to the recent restoration it was in a very dilapidated state. In addition to what has already been done, we were informed that Mr. Cowley is about to restore the chapel. The work of restoration has been carried out by Mr. Gee, of Daventry, and Mr. Watts, of Knapton, from the designs and under the superintendence of Mr. E. Christian, of London, architect. The old lead has been taken off the roof and re-cast, and the church has been re-roofed. The old clearstory windows, which were blocked up, have been re-opened. The pillars and walls, which were covered with whitewash, have been cleaned and stuccoed. A new organ gallery has been taken away, and the chancel arch, which was blocked up with a large tablet, has been exposed. The windows on both sides of the church, which had been deprived of their tracery, have been renewed, and a flat lead roof over the porch has been replaced by a high-pitched roof. A portion of the north arcade and the chancel arch have been taken down and rebuilt, and the chancel roof is entirely new. The south arch in the chancel, which was blocked up, has been opened. The chancel is paved with Milton's tiles, and a new chancel rail has been erected. There are new stalls for the choir. The cost of the works is something over 1,000l.

Malsmore.—The parish church of Malsmore has been re-opened for divine service, after restoration. The architects who were consulted by the committee were Messrs. Fulljames & Waller. They recommended that all the existing pews should be swept away, so as to throw open the space from the chancel window to the western

window of the tower; the erection of a suitable chancel arch; the substitution of an open-timber roof for the decayed timbers and plastered ceiling; the pulling down of galleries; the building of an arcade on the line of the north wall; and the adding of a north aisle, 14 ft. wide, the full length of the church; the providing of organ-chamber and warming apparatus; and the entire refitting of the church with low open seats. There were sittings for 200 people. Mr. Fulljames proposed to provide seats for 200 adults and 50 children. The work, he estimated, would cost some 1,500l. The improvements have been carried out on this recommendation.

Thoroton (Notts).—This church has been re-opened, after a restoration from designs by Mr. Hakewill. A new chancel, new porch, and new north aisle have been opened.

Stanton Prior.—The church of St. Lawrence, Stanton Prior, has been re-opened, after having been closed for four months, during which time it has been restored. The work has been carried out under the supervision of Mr. C. E. Davies, by Messrs. R. Mann, Hunt, & Gregory. The church is fitted with open sittings for 90 persons. The chancel is paved with encaustic tiles, which form also the characteristic feature of the reredos. The five windows of the chancel are filled with stained glass by Messrs. Lavers & Barrand, that at the east end representing the Agony, Crucifixion, and Burial of our Lord. The west window has been restored in memory of the late rector by members of his family, and will shortly be filled with stained glass by Messrs. Hardman.

Cavendish.—The parish church is being restored under the supervision of Mr. William White, architect. The chancel required to be almost rebuilt, and a vestry has been erected on some ancient foundations on the north side, and the north aisle extended, so as to form a chancel aisle on that side. Additional accommodation is thus gained. Various other improvements are being carried out. The nave has also been renovated. No architect was employed on this and other parts of the work. Messrs. Green & Mason, of Haverhill, are the contractors.

Wilsford.—The church here has been re-opened after restoration, under the professional advice of Mr. Weaver, the county surveyor. The old roof has been removed, and replaced with an open frame roof of the original pitch, with ornate and moulded braces springing from the ancient stone corbels, and the whole is close boarded, stained and varnished, and slated externally. The south porch and buttress have been rebuilt, and are nearly reproductions of the originals. The floors and fittings have been removed and replaced by new floors on oak sleepers, and new seats with panelled and traceried ends. All the fittings are of pitch pine, oiled (not stained) and varnished; and the gangways and open part of the chancel floor have all been raised with concrete, and laid with Minton's tiles (black and red); and the soil has been lowered, and drainage provided round the external walls. The whole has been executed by Mr. Mullings.

Litchfield.—The church of St. James, at Ogley Hay, has been re-opened for divine service, after having been closed for several months for alterations. The alterations and improvements consist of an organ-chamber and vestry, with new painted windows, and the re-decoration of the whole of the interior. The east window is the production of Messrs. Edmundson, of Manchester, and has cost 85l. In the centre is represented a full-sized figure of St. James, to whom the church is dedicated, on either side being depicted four incidents in the Apostle's life, viz., his call, the raising of Jairus's daughter, the Transfiguration, and the three apostles in the Garden of Gethsemane. The other windows are the work of Messrs. Camm, of Smethwick. The painting and colouring have been done by Mr. Holmes, of Walsall, and the stonework by Messrs. Longmore & Brown, of the same place. Messrs. Paull & Robinson, of Manchester, were the architects. The total expenditure is estimated at 600l.

Ashfordby.—The parish church here has been restored and re-opened for divine service. The edifice has been restored by Mr. Scott, the builder being Mr. J. J. East, of Melton Mowbray. The work has extended over a considerable time, having been first commenced in 1866. The church was then in a most dilapidated state. Three years ago the chancel was restored, and a new vestry built. The east windows were fitted with painted glass, by Clayton & Bell, and also the window on the south. More recently, oak stalls

have been placed in the chancel. Last year the restoration of the body of the church was commenced. A sum has been expended amounting to about 1,300l. A large part of this sum has been devoted to underpinning the church, and making good the foundations. 500l. were spent upon the roofs alone, in which there was a great quantity of decayed wood. All the pews have been cleared away, and the church is now seated with chairs placed upon a boarded floor. The ancient screen of the time of Henry VII. has been restored; and a new oak pulpit on a stone base, a lectern, and a reading-desk have been set up. The western portion of the church has been thrown entirely open, and the west door has been restored for use as the principal entrance. Outside the church an improvement has been made in the churchyard by removing the soil round the church to a lower part of the ground; new entrance-gates on the western side have been made, and flagged paths laid down.

Kington.—The church here has been restored, at the cost of 370l., of which 300l. were raised by subscription. The architect was Mr. William Thompson, of Grantham; and the builders, Messrs. Rudd & Cooling.

Reigate.—The foundation stone of a new church has been laid at South Park, where within the last few years a considerable population has sprung up. The committee have determined on the erection of a simple church, capable of accommodating 250 people, at a cost of about 2,000l., and a considerable portion of this sum has already been subscribed. Much of the furniture of the church will be provided by special gifts.

Wolverhampton.—Some time ago it was found that dry rot had taken such extensive hold of the flooring of St. John's Church that it must be refloored; and it was resolved at the same time to replace the old narrow high-backed pews with those of more modern construction, re-colour the walls, repair the organ, and make other alterations. This (the organ repair excepted) has been done by Messrs. Higham, of this town, from the designs of Sir M. D. Wyatt, architect, and the church has been re-opened. The re-arrangement and re-construction of the pews are effective, and the result has been heightened by the addition of a kind of pseudo-chancel, on a platform raised about 1 in. from the nave, and provided with choir seats. A new oak pulpit has been erected, on a stone base; encaustic tiles have been laid down; the heating and lighting system remodelled; and gas-burners of ancient design, from Skidmore's, at Coventry, replace the former gaseliers. Lack of funds prevented the carrying out of designs for ornamenting the walls and ceiling. The organ has been repaired, at a cost of 200l. The total cost of all the repairs and improvements is about 1,600l.

Barnborough.—The parish church of St. Peter, at Barnborough, after undergoing a restoration, has been re-opened for divine service by the Bishop of Lincoln. It was thought there should be a new concrete floor placed underneath the whole structure in order to prevent the dampness, which had been complained of. This has been carried out. The old high-backed seats have given place to stalls of pitch pine, varnished. A new pulpit and lectern have also been erected, likewise a reredos, the gift of the Rev. H. Jubb. All the interior walls have been cleaned, and, where necessary, repaired. An ancient oak screen, carved, which divides a small chantry from the other parts of the church, has been washed, the paint removed, and renovated. The chancel end has been altered. Six new windows have been placed in the clearstory on the north, and two on the south side of the church. A new patent stove has also been introduced, by which the whole structure is heated during cold weather. All the sittings, of which there are about 200, are free. The total cost of the restoration is fixed at about 700l. The architect engaged in the work was Mr. C. H. Fowler, of Durham; the joiner's work was done by Mr. Smith, of Hemmingfield; and the masonry by Mr. Blackham, of Jump.

Snarden.—Snarden Church, popularly known as the "Barn of Kent," after an extensive restoration, was re-opened on the 28th ult., when there was a special service.

Lowick.—The parish church of Lowick, a village picturesquely situated about two miles and a half from the Thrapston Station of the Peterborough branch of the London and North-Western line, has been re-opened for divine worship after a restoration, from the plans and under the direction of Messrs. W. Slater & R. H.

Carpenter, of London, architects. The cost of the restoration has been about 1,400*l*. The original seats in the church have been copied for the new ones, and portions of the old roof have been retained. The church has been re-roofed, re-floored, and re-seated with seats of carved oak. It is heated by means of an apparatus supplied by Mr. Johnson, of Leicester. The work has been carried out by Mr. Allen, builder, Irthlingborough; the plumbing and glazing having been done by Mr. Alfred Downing, of Finedon.

Deens (near Oundle).—The parish church of this village has been re-opened after restoration, of which it was greatly in need. The tower and spire have not been touched, but the modern vestry has been removed. The nave of the church has been enlarged by one bay, the chancel has been extended, and two chapels have been added. The old high pews, which were painted white, with black cappings, have been replaced with wainscot oak open seats. The west arch was blocked up with a solid brick wall, and before this was a large family pew. The pew has been removed, a low-sided pew having been erected in the south aisle. The brick wall has been taken down, a new arch has been built, and a new west lancet-light has been substituted for a perpendicular one. The clearstory has been taken down and rebuilt, and the old elliptical-headed windows have been replaced by new windows, with label mouldings round the arches. The roof of the nave has been replaced with a high-pitched hammer-beamed roof, of deal, stained and varnished, with pierced tracery in the spandrels, with carved wall-pieces, resting on stone corbels. A new window in the north aisle was rendered necessary in consequence of the extension of the bay; and, in taking down the chancel wall, a window, in character with the other windows in the aisle, was found built up in it, and has been made use of. The pulpit is of alabaster, with a base of Portland and Kern stone. The church is heated with Haden's apparatus, the heating vault being under the priest's vestry. The chancel is paved with Maw's tiles, and has a new stained-glass east window, representing twelve scenes in the life of our Lord, by Lavers, Barrand, & Westlake, of London. This is a memorial window to the late Earl of Cardigan. The old stained-glass window has been re-erected in the south recess of the Brudenell chapel. In the chancel aisle, on the south side of the chancel, is a triple sedilia, with a piscina; and on the north side is a credence-table. The chancel is divided from the nave by a dwarf stone wall, with iron rails. The altar cross is of brass, and is set with crystals. The work of restoration has been carried out by Messrs. Holland & Hansen, of London, from the plans and under the direction of Mr. T. H. Wyatt, of London, the principal management of the work having been undertaken by Mr. George Vials, jun., formerly of Northampton, a pupil of Mr. E. F. Law. Mr. Fowles was foreman to the builders. The wrought-iron screens, and other metal-work, were furnished by Hart, Son, Peard, & Co., who also executed the altar cross, from Mr. Viall's design. The tile pavements in the chancel and Brudenell chapel were laid by Simpson & Sons, Maw & Co.'s London agents. The carving was done by Mr. Earp.

DISSENTING CHURCH-BUILDING NEWS.

Halifax.—The memorial stone of a new Independent Chapel has been laid here, at Belle Vue, Hopwood-lane. The architects are Messrs. Roger Ives & Son, of this town. The style of architecture adopted for the church is the Early Geometrical. It will be built with Northwrayn pitch-faced wall stones and freestone dressings. The edifice will be 113 ft. 6 in. long by 53 ft. wide, and 53 ft. high externally, exclusive of the minister's and other vestries at the back. It will be divided into nave and side aisles by cast-iron pillars supporting the galleries and roof, and five bays in length, the end bay next the organ recess being much wider than the others, so as to allow of the church being enlarged at some future time by the addition of transepts, which will be prepared for in the erection of the new church. At the north end of the building will be an octagonal recess for the organ, 22 ft. wide and 6 ft. 6 in. deep, divided from the nave by a deeply-moulded deal and enriched arch, springing from granite columns with carved freestone capitals. Over the pillars dividing the bays will be moulded arches in brickwork and cement, between which and in the centre over each pillar

will be granite columns, and with carved capitals and moulded bases, supported upon carved corbels, upon which the roof principals will rest. The internal woodwork, where exposed, will be of pitch pine. The pews will be 2 ft. 10 in. wide, and allowing 20 in. for each person, will accommodate 568 persons on the ground floor, and 364 in the galleries, making a total of 932 sittings. In the south front to Hopwood-lane will be the entrances, vestibules, and staircases; at the south-westerly angle a tower and spirelet 120 ft. in height. The principal entrance will be in the centre of the front, through a moulded doorway, with moulded windows on each side, over which there will be a large five-light traciced window. On each side of principal entrance in the same front will be entrances to the galleries. On the side elevations in each bay of building, the windows under the galleries will be arranged in couplets, over which will be three-light traciced windows to light the galleries, with gables and ornamental finials over each. In the transept gables will be large four-light traciced windows, with coloured mullions and carved capitals. All the windows will be glazed with tinted glass in quarries, and with ornamental borders. The grounds will be enclosed with a low wall, and ornamented wrought-iron railings and gates. The various works have been let to the following contractors, viz.:—Masons' work, to Messrs. Michael Firth & Co.; carpenters' and joiners', to Messrs. John Dyson & Son; slating and plastering, to Messrs. Joseph Bancroft & Son; plumbing and glazing, Mr. George Walsh; ironfounders' work, Mr. Jas. Farrar; and painters' work, to Messrs. W. Leo & Son. The works are now being carried out under the direction of the architects. Mr. Powell is the clerk of works. On November 14, 1866, estimates for carrying out the above plans were received and adopted, amounting to 6,638*l*. 2*s*. 5*d*. In the estimates no provision is made for boundary rails, pulpit, and the heating and lighting of the chapel. These, with the cost of the land, will probably make a total outlay of 8,500*l*, exclusive of the cost of schools, which it is proposed to erect at some future time.

Bledlow.—The dedication of a new Wesleyan chapel has been celebrated at Bledlow. The entrance is by a double door in front, opening into a lobby with a door on each side. Over the door is a double-light window, divided by a stone column. It has a gallery at the end nearest the entrance. The light inside is subdued by rough plate glass. The pews are of picked yellow deal, and the seats and backs are slightly inclined. The pulpit is ascended by five steps, and is made with all the modern improvements, being low, shallow, and broad. The communion is in front of the pulpit, raised 6 in. or 7 in. from the floor, and inclosed by a rail, done in green, with white and stained capping. The chapel is made to seat, when required, about 290 persons, and a number of the sittings are free. The design of the chapel was furnished by Mr. E. Pierce, High Wycombe, who also superintended its erection. It is in the Italian style. The walls are faced with red bricks, and white string courses, with dressings of Bath stone.

Bradford.—The foundation-stone of a new chapel to replace the old Methodist New Connexion chapel at Adwalton, has been laid. The new edifice, a plain structure on the site of the old one, will be built from the designs of Messrs. Sheard & Hanstock, of Batley. The chapel fronts the Bradford and Wakefield-road, and 300 extra sittings will be provided.

Sturminster Newton.—The Wesleyan chapel here having been enlarged, beautified, and rendered more convenient, has been re-opened. The building is of brick, with stone dressings, and is enlarged in length 15 ft., being now capable of accommodating 350 persons. The interior has an end gallery of stained wood, of which material the roof is composed, the centre parts being of slightly tinted rose colour. The entrance to the chapel is by a vestibule, and the building is lighted by windows of cathedral glass. At the back of the chapel school-rooms are in course of erection. The architect was Mr. Stent, of Warminster, and the builder Mr. R. Edwards, of Fontmell Magna. The cost of the enlargement and the school buildings is estimated at from 600*l*. to 700*l*., of which about half has been collected or promised.

Norwich.—The French Church, formerly the parish church of St. Mary-the-Less, has been re-opened for divine service, after undergoing much alteration, and having been to a considerable extent restored. From its situation with regard to the Cathedral Church, to which it was appro-

riated, it was called in former days St. Mary's at the Monastery Gate. In 1637 it was granted to the congregation of the French Protestants, called the Walloon Company, who fitted it up for divine worship. This congregation became extinct about forty years ago, since which time it has been occupied by the Swedenborgians. But from them, too, it has passed into the hands of the congregation of the Catholic Apostolic Church. The nave and chancel have been cleared of pews. The latter has been raised, and for the present is fitted with chairs. The sanctuary is raised two steps higher than the rest of the chancel, with rails across, and the altar is raised on a footpace. Sedilia have been formed in the sill of the chancel windows, and a new piscina has been inserted. Another piscina was found in the nave, and restored. The nave has been fitted with open seats of deal. The western gallery has been removed, and the tower arch opened and restored. The parvise, or porch chamber, has been restored, and a new staircase constructed for it. Six consecration crosses, found in the nave and chancel, have also been restored. The woodwork was executed by Mr. Spencer, of Trowse; the carving and restoration of the stonework by Mr. Barrett; and the gasfitting by Mr. Bishop, of Elm Hill.

SCHOOL-BUILDING NEWS.

Earl Stotham.—The new school buildings, erected in memory of Mr. George Reeve, a farmer who many years ago left a considerable sum of money for the endowment of the schools of the parish, have been opened. The architects were Messrs. Corry & Fergusson, of Carlisle. The facings of the exterior are of white brick, with red brick arches, strings, and gables, and stone lintels, the spandrels of the arches being filled with herring-bone work. The windows at the ends of the buildings are of a more ornamental character than the others, the heads of these Gothic, with eye lights. The principal room in the interior is 43 ft. in length by 18 ft. in breadth, the height from the floor to the wall-plate being 11 ft. 6 in., and the roof is open as far as the collars. Light is obtained from twelve windows set in pairs. Besides the school-room are a class-room, lavatory, lobbies, and offices. The inside walls have white strings and dressings. Mr. W. G. Cannold, of Ipswich, was the contractor. The building stands upon land which was given for the purpose by Pembroke College, Cambridge, the patrons of the living. The farmers of the parish carried the materials for the building.

Wigston Magna.—The old National School building being much too small, the vicar resolved to undertake the erection of more roomy and convenient schools. The architect selected by the committee was Mr. E. W. Barber, the son of the incumbent of St. John's, Leicester, whose plans were approved; and the contractors were Messrs. John Sharp & Son, builders, Wigston. The building, which is in the Early Pointed style, consists of two main portions, which open into one room, to be used as the mixed school for children above six years of age, with two separate porches for entrance, and a large infant-room at the extreme end, quite separate from the main room. The schools are placed back from the street about thirty-five yards, and the front space forms a playground for the boys; the girls' playground, with the necessary premises and offices for both schools, being placed in the rear of the building.

PROVINCIAL NEWS.

Birmingham.—The chief stone of the new workhouse for the Aston Union has been laid. The entrance building, with a frontage of 300 ft., has a hold archway in the centre; to the left (or male side) of which is a corridor leading to the clerks' offices, waiting-room, and a board-room, 34 ft. by 18 ft.; and beyond are the rooms for the male probationers and tramps, with all the requisite closets and lavatories. There are spacious airing-grounds in the rear, leading to the engine-house and such other places as will give useful occupation to the able-bodied men. On the right of the entrance archway are the wards and dormitories for the females of various classes, clothes-stores, dining-rooms, and other conveniences. In the rear of these entrance buildings are large airing-grounds, divided by a central avenue leading to the main building, of three stories in height, the centre carried somewhat higher than the other portions. The principal material used in the elevations is red brick, with

blue brick strings, and stone dressings introduced where appropriate. On each side of the entrance are the rooms for the master and matron, communicating with a large central hall, and corridors extending the whole length of the building. These corridors lead to the day-rooms and dormitories, for able, aged, infirm, and imbecile men and women, with store-rooms, lavatories, &c. There are two staircases of stone in each division of the building, and in the central hall a grand staircase in three divisions, lighted by a lantern tower, which forms the principal feature in the elevation. In the rear of this are various domestic offices, including a spacious cooking kitchen and bakery, and connected with the different wards are airing-grounds for the respective classes. On the male side there are workshops and a mill; on the female side a washhouse, laundry, and other appliances. The first floor has a large dining-hall, approached by the central staircase,—length, 68 ft., width, 35 ft.; and well lighted on each side. The front centre is, as well below, appropriated to the master and matron, and on either side are the dormitories for the men and women, of different classes, with a corridor the entire length of the building, as described for the ground floor. On the second floor there is the same general arrangement of corridor and staircases, and a like division of the sexes on either side of the centre buildings; and on this floor some provision has been made for the future, as there are several spare dormitories. A small portion of the basement has been set apart for cellars, larder, boiler-room, and such other accommodation as could be properly provided underground; but otherwise the building is well above the ground level, and it stands in an elevated position. In the fitting-up of lifts, cooking and warming apparatus, &c., every well-proved invention of the best engineers will be used, under the direction of Mr. Yeoville Thomason, the architect. The infirmary will be a separate block of buildings. The builders of the whole are Messrs. Jeffery & Pritchard. The estimated cost of workhouse and infirmary is about 35,000l.

FROM SCOTLAND.

Edinburgh.—The new church built by the congregation of Free St. George's, in place of the edifice removed in the course of the progress of the improvements being made on the Caledonian Railway Station, has been opened for public worship. The site is at the corner of Shandwick-street, and Stafford-street. It measures 78 ft. from east to west, and 125 ft. from north to south, and has been all built upon. The style adopted is the Palladian. The principal front is towards Shandwick-street; and the west front is also elaborately finished. The main entrance is flanked by coupled Ionic columns, surmounted by a broken pediment. Above is a range of arched windows, with projecting keystones, to be carved. On either side is a slightly projecting wing, with a three-light square-headed window on the ground floor, and an arched window in the upper story. Corinthian attached columns rise from the basement story to the porch-arch, which, with the dentilled cornice, overhangs over them. This portion of the facade is finished with a balustrade, having pedestals to carry vases. At the south-west corner a tower is to be erected, but it has not been carried further in the meantime than the basement stage. The western elevation consists of a centre, in which are two ranges of rusticated windows, flanked by wings having attached Corinthian columns, surmounted by triangular pediments, the outer mouldings of which are broken off at some distance from the apex. The church will be entered through a vestibule and corridor. Over the vestibule and corridor there is a large hall, which is to be employed for congregational purposes. The church proper is divided into centre and aisles by iron Corinthian columns supporting a series of arches. The central portion of the ceiling is elliptical in form, and is divided into square panels, with bosses at the intersections, while the ceilings of the aisles consist of a series of small domes. Galleries have been erected in the aisles and in the south end opposite the pulpit. The seats are in the modern style, with low backs, and open at the ends. The pulpit has been dispensed with, and instead a platform erected in the apex at the north end of the building. The roof of the apex is a semicome. It is supported by six pillars of polished Breckinridge granite. Several feet lower than the preacher's platform there is a second platform

for the use of the office-bearers of the church, the whole being surrounded by a halustrade. The platform is in oak, and the pews, as well as the front of the galleries, are of pine. The church is lighted by windows on three sides, which have been filled with obscured glass, marked out with stars. At night, light will be supplied by means of central sunlights, and pendants from the roof of the aisles, and from under the galleries. The church is seated for a congregation of about 1,250. Mr. David Bryce was the architect; and the contractors were Messrs. Watherston & Son, builders; Mr. Anuan, plasterer; Mr. Beattie, plumber; and Messrs. Purdie, Bonar, & Carfrae, painters. Mr. McPhail was clerk of works. The building, including 13,600l. for the site, was estimated to cost about 31,000l.

STAINED GLASS.

Gloucester Cathedral.—The eighth or easternmost window in the south aisle of this cathedral, according to the local *Chronicle*, has been filled with stained glass in memory of the late Lieut.-Col. Sir Harry Darell, bart. The window was originally of the same design as the others in the south aisle, but was altered and enlarged—probably about the beginning of the fifteenth century—as a memorial to persons commemorated by the tomb beneath. Four or five years ago it was proposed to restore the tracery to the original pattern, and a window for it, to the memory of the Niblett family, was executed in Munich under the direction of Mr. J. D. T. Niblett. The architect of the cathedral, however, determined to retain the present tracery, and the window was, therefore, given to the Rev. Sir Lionel Darell, of Frerethur Court. The glass contains two rows of figures, with tracery over. The tracery is filled with figures of angels. In the upper lights are the four Evangelists, with their symbols. In the lower tier are the figures of St. Stephen, Cornelius, the Centurion, and St. Peter. Mr. Rogers, of Worcester, was the artist.

Shrawardine Church.—A stained glass window has been placed in the east side of the church to the memory of the late Mr. Pryce William Bowen, of Shrawardine Castle, by some of his neighbours and friends. It is a Gothic window, of Gristhill stone, divided into four compartments with the following subjects:—"Naked and ye clothed me," "Sick and ye visited me," "Hungry and ye gave me meat," and "A stranger and ye took me in." Beneath the window is a marble tablet bearing the inscription. Both the glass and stone work were executed by Messrs. William Evans, Everall, & Dodson.

Miscellaneous.

Establishment of Tramway Omnibuses at Liverpool.—An unusual stir and excitement have prevailed in Liverpool, in consequence of the inauguration by the Liverpool Tramway Company of their new system of omnibuses, which are of great size, and built upon the American plan. They are formed of American ash, and each omnibus is about 16 ft. long, 7 ft. in interior height, and constructed to hold twenty-two passengers inside and twenty-four outside. They are tastefully fitted and finished, and the outside well protected by rails. There has been quite a rush upon the new vehicles, much to the disgust of the old-fashioned omnibus drivers, who, by "nursing" their rivals, do all in their power to worry and annoy them. The public generally, however, appear highly to appreciate the advantages which from increased size, readiness of ingress and egress, comfortable and safe outside seats, and the absence of jarring and jolting, are afforded by the new system. Each tramway omnibus is drawn by three horses, and furnished with breaks of great power. The fares are 3d. inside and 2d. outside.

Oswestry Cottage Hospital.—The foundation stone of the Oswestry and Ellesmere Cottage Hospital and Nursing Institution was laid on Monday last, November the 1st, with Masonic honours, by the Right Worshipful Provincial Grand Master of North Wales and Shropshire, Sir W. W. Wynn, bart., M.P., by request of the brethren of the Saint Oswald Lodge, No. 1124. The building is designed to accommodate twelve beds. Mr. W. H. Spanll, of Oswestry, is the architect; and Messrs. Trow & Sons, of Wednesbury, are the contractors.

The New Uxbridge-road Station, at Notting-hill.—The new station at Uxbridge-road, near the Royal-crescent, is now finished. Though small in size, it has some architectural pretensions. The *Kensington News* says, on the whole there are no less than five doorways in front, which is in great contrast to the Metropolitan Extension stations, which have but one doorway for egress and ingress, a circumstance which often occasions crowding and inconvenience. The projecting eaves give the building, above all, an ornate appearance, being supported on pairs of terra-cotta brackets. The apex of the roof consists of a large skylight and ventilator. The interior is thus amply lighted. In front of the station is a verandah formed by a triple ridge and furrow roof, glazed above, and supported by iron brackets, built into the walls, in lieu of columns, which latter are sometimes found to be an inconvenience and obstruction. On the platforms below are separate waiting-rooms and offices, the up and down platforms being uniform. Only about one-fourth of the length of the platform is roofed over at present, a plan which may soon call for rectification, as in wet weather it will compel the passengers to herd together under the roof, instead of ranging themselves opposite the respective classes of carriages, and immediately entering the same, as on the Metropolitan. It is stated to have been built for the London and North-Western Company, by Mr. Richard Danckley, of Blisworth, and to have cost 5,000l. or 6,000l.

Late Discoveries in the Peninsula of Sinai.—The vice-chancellor of Cambridge University has published to the senate a very interesting report from Mr. J. H. Palmer, fellow of St. John's College, a distinguished Oriental scholar, who was sent by the university to accompany the Ordnance survey in the peninsula of Sinai. The funds were supplied from the foundation of Mr. Worts, formerly devoted to travelling bachelors. Mr. Palmer has collected a great body of information on the nomenclature, the traditions, and the inscriptions of the country. He says,—In the course of our explorations we found many interesting remains, almost identical with the primeval dwellings and tombs found in various parts of the United Kingdom. These discoveries drew my attention to another fact, which I think may prove important to British antiquaries, as suggesting an analogous explanation of the curiously-marked stones of Scotland. It appears to have been a custom from time immemorial for the rude inhabitants of the desert to mark out their holders with large stones, on which each tribe cut or scratched its own peculiar symbol. This custom prevails to the present day, and it is a noteworthy circumstance that the marks now in use among some of the Arab tribes closely correspond in pattern and appearance with the stone-markings of North Britain. I have brought back a collection of these marks and symbols.

Whitworth Metal.—The quiet intimation given last spring about a new metal is now something to be talked about, says *Chambers's Journal*, for Sir Joseph Whitworth, after a long course of experiment, has succeeded in producing iron and steel, which, as he states, will resist any amount of shock or strain that may be put upon them. This "Whitworth metal," as it is called, is, while in a molten state, subjected to enormous pressure, by which all the air-bubbles—those sources of weakness—are got rid of, and the metal is rendered perfectly homogeneous. If Sir J. Whitworth be right in his conclusions, our iron trade is about to undergo another revolution. Besides guns of the largest size, which will send their bolts through anything and everything, and never burst, we shall have wheels for railway-carriages that will never crack, hoilers that will never blow up, and wire for submarine cables that will not break in the laying.

The Smoke Nuisance at Gateshead-on-Tyne.—Mr. William Wharton Bardon, Low Teame, Gateshead, on the Tyne, at Newcastle, was summoned before the Gateshead magistrates, on the charge of allowing an illegal amount of smoke to issue from his works—twenty minutes of dense black smoke, and nine minutes of light, out of a period of sixty-eight minutes. It was stated on behalf of the defendant, who did not deny the offence, that hitherto he had tried every means in his power to prevent the emission of smoke, and finding his efforts as yet ineffectual, he was about to adopt fresh measures. A fine of 40s. and costs was inflicted.

Interesting Discoveries in America.—A party of explorers in the district to the south and south-west of the Mormon settlement, at Salt Lake, report the discovery of the remains of an ancient city now almost buried in the sand of the desert. The ruins consist of a collection of rocks, mounds, and pillars, covering several acres in extent. Remnants of what had once been arches, with keystones, are still perfect. There also remain a number of small stone pillars, constructed with a peculiar kind of red mortar or cement, set upright about 20 ft. apart, as if they had been used to support an aqueduct from a large stream half a mile distant. In some places, the report states, the lines of streets were made distinctly visible by the regularity of the stones, and seemed to run at right angles to each other. Some of the stones, it is added, had evidently been cut into squares with hard tools, although their original forms were scarcely perceptible. That the people of this long-lost city had attained a considerable degree of civilisation is further evidenced by the remains of ancient salt-works in the vicinity. Many traders have noticed similar ruins in other sections of the country between the Rocky Mountains and the Sierra Nevada chain.

Associated Arts Institute.—The first *conversations* was held last Saturday night at the Rooms, in Conduit-street. The object of the institute is "to deliver addresses and hold debates on questions connected with the fine arts, to exhibit sketches, and generally to promote intercourse amongst artists, and those interested in art." An inaugural address was delivered by Mr. R. Westmacott, R.A., the chairman. The members (140 in number) are chiefly young artists. Meetings are held on Saturdays during the session (October to May), papers are read, and debates follow. The great point of interest, however, is the competitive production of sketches by members. The committee name a subject, the members treat it according to their own notions, the sketches are brought together at a given meeting, and their merits are decided by the votes of all present. The winning sketch is then photographed, and preserved in the album of the institute.

The New Mansion-House Street.—At the last weekly meeting of the Metropolitan Board of Works, a memorial was presented from the inhabitants of the Mansion House, praying that the open space upon the west side of the Mansion House, between Bucklersbury and Charlotte-row might be left intact; and it desired also that the new Mansion-House Street might be terminated by an uncovered space capable of being appropriately ornamented, and in which case the ground beneath the surface might be used as vaults. The erection of a triangular building on the vacant ground would seriously interfere with the proposed public improvement. Sir John Thwaites said the purchase of that piece of ground would cost over 200,000*l.* The question was eventually referred to the Works Committee.

Opening of the New Cemetery for Rochester.—The new cemetery which has just been completed for this town has been opened and consecrated. It is situate about a mile from the town, and adjoins the road leading to Maidstone. The quantity of land acquired by the board of health was twenty acres. Only twelve acres of the land, however, will, for the present, be brought into use. The whole cost of the land and buildings is 8,000*l.* The chapels for both episcopalians and nonconformists are of brick, and plain. Adjoining the entrance-gates is the residence of the gardener and keeper of the grounds. The architect was Mr. J. Young, of this town. The building and boundary walls were erected by the executors of the late Mr. J. Stump, the contractor.

The Swansea Gaslight Company.—At the 17th half-yearly meeting of this company, the chairman stated that notwithstanding the reduction in price during the last half-year to 3s. 6d., and the large outlay for extension of works and mains, the full parliamentary dividend would be divided. During the last seven years the demand for gas had increased 105 per cent. They required additional capital for still further erections. The gas had been reported by the local medical officer of health to have the illuminating power of 15.5 to 16 sperm candles, or 33 per cent. beyond the requirement of their Act, and was free from all impurities. A noble suite of offices had been lately erected from the design of their engineer, and under his superintendence.

St. Mary's Church, Sandwich.—Archæologists may be interested to learn that the situation of the tower (which fell in 1667, and destroyed much of the interior of the church) has been ascertained, by means of excavations recently made within the building. The bases of the Norman columns were found in good preservation at some depth below the present floor, and are left exposed for the inspection of visitors. From their position they clearly show that the tower stood at the western extremity of the nave, but was internal to the church, occupying a position over the present font.

A Lock-out at the New Opera House, Paris.—On Monday, in last week, M. Viollet, the builder of the new Opera House, expelled all the men from the place, in consequence of a quarrel with his sub-contractors. After endeavouring in vain to persuade the journey-men to work for him at reduced wages, he sent for the police, and drove them out forcibly. It has now been summarily decided that M. Viollet was bound by the engagements of the sub-contractors, and a commissary of police, an attorney, and a huisier formally reinstated the men in the building.

Netherlands Exhibition.—The awards to the successful exhibitors—very few English, however, being present—were distributed by Prince Alexander in the name of the King. The Ministers of State and the representatives of the various countries interested took part in the ceremony, and a report was read by Baron Mackay, the president of the Central Jury, as to the results of the exhibition. A large company assembled at a banquet given in the evening. Illuminations and a display of fireworks brought the exhibition to a close.

Doncaster Church.—A subscription list, headed by the late vicar, lies at the bank, for the restoration of the pinnacles of St. George's Church, which, from original construction and fracture by storms, are in such a state that complete rebuilding of the parapet is requisite to make it safe. Mr. Teale estimates the cost at 400*l.* Mr. E. B. Denison, Q.C., has offered to pay half the cost, provided a contract is made to his satisfaction before next May.

Swansea New Hospital.—The formal opening of this institution has taken place. About 14,000*l.* have been expended in the erection and furnishing of the building; and it was opened free of debt. It was erected by Messrs. Thomas, Watkins, & Jenkins, of Swansea, builders. The original plan, as stated in the architect's description, comprised a north wing. This has not yet been built. There are, therefore, only fifty beds, instead of 100, the number originally fixed upon.

Cafes in Paris.—A journal publishes some curious statistics relative to the *cafes* in Paris, and states that the French capital possesses 4,730 of those establishments, in addition to sixty-four *cafes* concert. They give employment to from 8,000 to 10,000 persons, and the business done by them amounts to 120 millions of francs annually.

Proposed New Public Hall for Tunbridge Wells.—A public company is being established to erect a public hall for Tunbridge Wells; and out of 2,600 shares all have been disposed of, except about 400; and less than 2,000*l.* remain to be subscribed for. At a recent public meeting an appropriate resolution in support of the object in view was passed.

Macclesfield Town-hall Extension.—The new corner-stone of this extension has been laid. The addition is intended to give a more prominent aspect to that part of the exterior fronting to the market-place. Mr. James Stevens, of Macclesfield, is the architect; and Messrs. R. Neill & Sons, of Manchester, are the builders.

The Late Mr. John Bruce.—The sudden death, in the street, of this estimable and accomplished man will distress most those who knew him best. He was one of the most admirable of our literary antiquaries, and has left many solid and useful contributions to biographical and historical knowledge.

Opening of a New Market-house at Accrington.—On Saturday last the new Market Hall recently erected in this town was publicly opened by Mr. Samuel Dugdale, chairman of the local board. It will hold 10,000 or 12,000 persons.

Rome.—The foundation stone of the monumental column on the Janiculum, in commemoration of the (Ecumenical Council, was placed with due solemnity on Thursday, October 14th, by Cardinal Berardi.

Institution of Surveyors.—The next ordinary general meeting of this Institution will be held on Monday, November 8th, when the president, Mr. John Clutton, will open the session with an address.

Social Science Association.—It has been determined that the next Congress of this Association shall be held in Newcastle.

TENDERS.

For Girls' and Infants' School, New Malden, Surrey.—Turner (accepted) £305 0 0

For additions and alterations, 78, Cannon-street, City, Mr. Frederic Sparrow, architect:—
Hill & Son £818 0 0

N.B.—REMOVED from 36, Parliament-street, to 81, St. Martin's Lane, London, W.C.

The Builder.

VOL. XXVII.—No. 1397.

Architecture v. Archæology.

HE state of feeling which induces men to spend much of their best time and energies in studying, collecting, and preserving the records, literary or artistic, of a past age; which causes them to worship with a blind indiscriminate reverence everything that was done or said at some former period; the spirit, in short, of *Antiquarianism* holds, like other peculiar tendencies, its "movable feasts." There are always to be found, certainly, isolated individuals who rejoice to indulge this taste beyond ordinary limits; whose delight is in old songs, old manuscripts, old bottles, or old wine; the Oldbucks and Captain Groses who furnish

food for the satirical novelist or rhymist. Such persons are regarded as harmless triflers, whose whims are of no serious consequence, and have no worse effect than to make themselves a little noticeable. But there are occasional periods when whole societies are possessed by the same kind of antiquarian predilection, to such an extent as to colour the whole history of the thoughts, manners, and habits of two or three generations. And it so happens that two of the most important antiquarian epochs of which we know much have been largely connected with architecture and architectural taste. The Renaissance, indeed, was in its initiation a literary movement; how far inspired by the sight of the ruined marbles of ancient Rome constantly before the eye may be matter of conjecture; but its first developments were literary, and it was only after the admiration for the treasures of ancient classic literature had led men to the conviction that the only thing left for them was to imitate the style and adopt the language of antique poetry, that the same impulse was communicated to the art of architecture, and led to the now much-ahmed revival. But the more recent Mediæval antiquarian revival may be said, if not to have been actually born of architecture, at least to have shown its earliest marked development in the quasi-Mediævalising of enthusiastic architectural students. In very truth, the causes of the movement lay deeper than this, and the modern Gothic architects have had the good fortune to float into prosperity on the fall tide of a popular feeling which would have shown itself and run its course independently of their assistance; but it is likely that they have very much accelerated and assisted the movement by which they have been so much the gainers, in putting the worship of Mediævalism into so tangible a form, in the shape of new buildings and hooks illustrative of old ones; and that, as Pugin said, naively enough, in one of his letters, that when a certain very admirable new chapel was finished, he "thought he should

secede," so the public generally have been much encouraged and stimulated to a decisive declaration of Mediæval sympathies, on seeing the multitude of Gothic churches rising up around them in place of the old he-pewed and he-galleried structures in which their fathers and grand-fathers had slumbered.

Now, in the reverence commonly felt for things which are old there is much which is to be admired, even when the feeling passes the strict bounds of what is rational and logical. There is always a certain relief to the mind when at all over-wearied with the struggles of everyday life, in turning aside to contemplate the monuments and literature of a long-past age. There is a serenity about them which falls pleasantly upon the mind; whatever strifes they have witnessed or been connected with have passed away and are forgotten, and their records come to us—

"cool, and calm,
And shadowy, through the mist of passed years."

And there is also reason in such respect for that which has stood the test of time, and has remained for our contemplation to-day; for, as a general rule, whether in art or literature, that which is best remains, that which is worse is gradually forgotten; and one explanation of the fact that antique art and literature really do seem so far beyond that of our own day is this, that we commonly see only the best of them; whereas among modern productions we have to cull the best with difficulty from amid heaps of mediocrities and puerilities. So far, then, a certain amount of antiquarianism is not simply pardonable, but healthy, and minds which are without it must be called one-sided. But when this archæological sympathy comes to assume an unreasonable importance, and to develop itself in the practical imitation of forms of art which are long since dead, and are no longer the expression of the real inmost feelings or most pressing wants of humanity, it becomes a real and serious evil, to be combated by all who are alive to the value of human thought and labour, and are desirous that things so precious should not be thrown away in carrying out, with mistaken energy, work which will not in reality advance humanity, or have a lasting interest or value.

Not that we by any means ignore the importance of pleasing the present and existing taste, whatever it may happen to be, to some extent. It is a small consolation to a man who may happen to derive a maximum of pleasure from a certain form of art, to be told that another form, to which he is indifferent, will please his descendants better. Mr. Trollope, in one of his novels, sets up a plea in favour of mullioned casement windows, on the ground that, say what we will as to their inconvenience and practical inefficiency in some respects, no other form of window has produced so great an aggregate of happiness. Granting (as we are inclined to do) the truth of the premiss, the claim is a strong one. And on the same principle it may be urged that the Gothic revival, mere imitation as much of it has been and is, has nevertheless been the source of a great pleasure to thousands of people of a certain constitution of mind: to architects and their clients, lay and clerical; to numbers of young ladies who have taken a sentimental delight in it; to wealthy amateurs, and clever art-workmen, and honest masons who have taken a pride in carrying out well what they were set to do, with no provoking doubts as to the *cut bono* of the whole thing. And this would be all very well, and there could be nothing to grumble about in connexion with it, did we build for ourselves alone. No one can find fault with the enthusiastic misanthropic antiquaries (generally clergymen) who got up choral societies for the sole practice of Mediæval music, and concerts where Palestrina takes the place of Beethoven, and where nothing more recent

than the sixteenth century is admissible. The thing is interesting in its way as illustrating a certain phase of art, and when it is over it is over, and the recollection of it stands in nobody's way. But architecture, even in so far as it is purely an art, is too expensive and permanent an art to be played with in this way. A building is not like a concert or a picture, which we may go to hear or see, or not, as we please. Whether we like it or not, there it is in our way, and, if it is properly constructed, in the way of our descendants too, for many generations to come. And on these grounds it behoves those who employ their talents in designing or (may we not sometimes say) *compiling* buildings after the Gothic fashion prevalent at present, to consider whether their work really will have the value for posterity which would justify the expenditure of so much time and money in its erection. And all analogy seems to show that resuscitations of the form and spirit of the art of a past time have never anything beyond an ephemeral interest. The quasi-classic Latin and Italian poetry of the *Cinque-cento* revival never took a permanent place in literature, notwithstanding the talent, probably even genius, often employed upon it. The first followers of Stuart & Revett in England were as enthusiastic and industrious, as certain that they were in the right course, as are the slashing young Gothic men of the ultra-modern school, who now deride them and their works. The first developments of the Gothic revival even are passing into the limbo of contempt; and some works, counted once as the great successes of this said revival, are viewed with a kind of melancholy toleration by numbers of well-educated people both within and without the pale of the architectural profession. And if, as it appears, the large and costly building for the Courts of Law is again to be an antiquarianism, with ornamental niches and shrines for saints eminent in the history of the Bar, and so forth, it is not unlikely that the reaction, inevitable as it is, against this exaggerated Mediævalism, may assert itself to a degree unpleasant to the feelings of the architect even before his building is completed. No one can intelligently study the course which mental progress is taking at present in Europe, and especially the writings and deliverances of that highest class of intellects who in the end lead public opinion, without seeing that the temporary return to the ecclesiastical theory of life, which has formed the stage for the revival of Mediæval art, cannot finally commend itself to the wants and feelings of modern civilisation. And from such a point of view, the vast expenditure already incurred, and further proposed to be incurred on buildings which may seem to our immediate descendants anomalous, or even absurd in regard to artistic design, or providing for fancied requirements whose necessity may not be recognised beyond the present century at furthest, becomes a matter for very serious consideration indeed.

We cannot, in fact, afford to practise sentimentalism in architecture, except in special cases and on a comparatively small scale. There are certain classes of buildings (such as monumental and memorial erections) where fancies as to reproduction of old styles or of the effect of particular buildings of antiquity, may without impropriety be indulged in if desired. But on a larger and more extended scale the game is not worth the candle; it is too expensive an amusement. It is highly important for the best interests of the country that the great amount of potential talent and energy represented by the numbers of persons who look to make their living through the erection of buildings should be so directed as to produce results of the greatest possible permanent value to the country. And it must not be forgotten that architecture is a pursuit based on utility. No reader of this journal will suppose that we mean for a moment to ignore its claim to rank among the arts; but

we cannot leave out of sight the original force of the good old Saxon word "build," as it is defined in the quotation which has long stood as a motto on our annual title-page. It is this forgetfulness of the utilitarian basis of architecture which has led to much of the recent distastefulness in the style of other periods and climates. It has been forgotten that the real object of architecture is to render healthy, fitting, and beautiful those erections which are among the necessary conditions of civilised and refined life upon the earth. In the pre-sanitary Mediæval period the cathedrals really were the expression of what was deemed most necessary upon earth. The Church was everything; and if the every-day life of men was to use the words of a thoughtful if not orthodox writer, "poor, solitary, nasty, brutish, and short," it was sufficient if they had the Church, spiritual and material, as a refuge on occasion from the meanness and discomfort which oppressed soul and body respectively. But the social theory of life now predominates over the ecclesiastical (we do not say the religious). And the business that our architects really have before them in the future is to solve the problem, how to make the vast collections of dwellings continually increasing around our great towns places where human life may be carried on with comfort, with decency, with pleasure. Seeing that wherever men congregate they are obliged to cover the surface of the earth with more or less thickly-packed habitations, how may we devise these so that they may be a pleasure instead of a nuisance; so that they may give us something in return for the green trees and fields which are laid waste to make way for them; so that the surroundings of our town life, in all its branches, may be made as enlivening, as cheerful, say even as beautiful, as possible?

We noticed that during the Chureh Congress recently held at Liverpool, when, of course, there was an abnormal excitement of ecclesiastical feeling, Mr. Boreford Hope strongly urged the building of a cathedral in Liverpool, and it was stated that there were persons there ready to expend fifty thousand pounds down to commence such a work, and "as much more as might be wanted." Looking to the information supplied by the reports of the officer of health and other sources, we might almost venture to say that all this money might be better spent than in providing what might prove merely an expensive failure. Some are getting minded to think that the town itself, the laying out of streets and houses in the best and most effective manner, both as to salubrity and architectural effect, and the clearing away and rebuilding of bad, densely-packed, fever-breeding districts, sufficient places for worship existing, may be at present of even more importance, and has certainly been unduly neglected.

We recommend our rising architects to look more to the future, less to the past.* And we believe this advice to hold good on artistic as well as on practical grounds. Much of the battle of the styles, and the failure of many expensive buildings, and the confusion as to architectural style, has, we verily believe, and as we have again and again in years gone by expressed, arisen simply from beginning at the wrong end; from the habit of assuming that a new building must take a certain outward form or "style," instead of considering first, what are the requirements and purposes of the building, and what plan will best fulfil them; and, secondly, how may we suitably decorate that plan so as to make of it a pleasing and expressive building. Originality of style and expression in a building would be far more likely to grow up in this manner, in natural sequence, than they will be galvanised into existence either by Mediæval diletantism or by constant straining after novelty for its own sake. And if more time were spent in considering what are the real building problems peculiar to modern times, and how to deal with them, less time in acquiring merely an archaeological knowledge of former buildings, we should probably build to more purpose, and to the more permanent use and enjoyment of those who will succeed us. We do not expect this view to meet with any sympathy from the rather numerous class of persons who are only anxious to get as many jobs in hand, and turn out as many pretty drawings in the

* Lately, at a dinner where there were present a number of architects, a clerical speaker claimed affinity of feeling between the clergy and the architects on the ground that each found, in the course of their studies, that the further they went back the more admirable they found everything. The sentiment was loudly applauded; but, to be sure, allowance must be made for an after-dinner audience.

popular style, as possible in a given time. We appeal rather to that smaller class, to be found, we trust, in all professions, who wish so to carry on this pursuit that their labours may be of some permanent value to the world, and to whom the making of money is a secondary consideration.

METROPOLITAN FIRES.

THE tranquillity of the public mind has been disturbed, and the sense of public security rudely shocked by two recent disastrous fires which have occurred in the metropolis.

They were attended, in each instance, by a far greater sacrifice of human life than happily accompanies such outbreaks generally; but as to the circumstances and conditions under which both of these fires originated, there was little to call for exceptional remark.

The occupants of the respective premises may have unhappily considered themselves as fairly within range of protection as the inhabitants of most houses at this moment believe themselves to be; yet eleven persons out of twelve perished. It is in view of the alarming and precarious situation which these truly lamentable instances bring suddenly home to the door of every one that we are led to place under examination those provisions upon which, in the face of such emergencies, we are accustomed to rely for assistance and preservation. So perverse and intractable an element enters into many of our legislative arrangements in similar matters, that it can be characterised as nothing short of a fixed and natural law of irregularity, which, do what we will, cannot be satisfactorily brought under subjection.

The most precise calculations of the engineer may not prevent the possible falling in of a roof or bridge, involving, perchance, a loss of life and property. The most careful organisation of which railway management seems capable, can scarcely assure us of the impossibility of another Abercrombie accident, and even the precise and mathematical formula upon which the system of life insurance is projected, may not guard such institutions from failure, and those associated with them from disappointment and probable ruin.

In ordinary domestic households, however, where it might be supposed that more than usual precaution and watchfulness would be exercised in reference to the preservation of human life,—leaving the question of property for the moment altogether out of consideration,—from destruction by fire, we are actually brought nearer to this remorseless danger of which we complain in its more threatening forms. There is a never ending series of outbreaks of fire in this metropolis, occasionally arriving at such proportions as to threaten to engulf the entire city. At times throughout its interminable course this phenomenon assumes the features of a startling conflagration, calculated to spread dismay and apprehension in all directions. A very curious and painful reflection is suggested by official statistics in reference to the subject of metropolitan fires. Any one who may happen to wish for some opportunity of studying the incidents usually attending street fires in London might, by calling at any hour,—it might almost be said, at any moment,—at Watling-street, where the headquarters of the Fire Brigade are located, be put in possession of intelligence which would lead to some locality where a fire would be raging. How this wonderful continuity is kept up, it would be bootless to inquire. It is comprised at length within some such fortuitous doctrine of averages as that relating to the destruction of human life in street thoroughfares and elsewhere, and we could only wish that we could be assured that they were equally reliable.

Unfortunately there is not wanting towards the maintenance of fire averages, the too painful proofs that in many cases such outbreaks may be traced to the malignant wilfulness of human nature itself.

There are instances on record of the deliberate destruction of entire cities by fire, as in the case of Moscow upon the invasion of the French army only some fifty years since, where the inhabitants silently deserted the capital that they had themselves skillfully doomed, and devoted to destruction by this means.

It was by the light of the flames of the Kremlin that Napoleon sat down to forecast the closing of his great career, and never throughout that career did any incident arise capable of awakening an equal degree of consternation in his mind. It was a subject to which he would

allude as one of the most awful spectacles which he had ever witnessed, and the mere recollection of it used to end in rendering him for a short time completely insensible in after years. Troy, Antioch, Corinth, Jerusalem, and Imperial Rome have all been visited by dreadful conflagrations, and what more immediately concerns us is, that London itself has not escaped from being more than once almost annihilated by similar catastrophes.

The ravages of fire, when once that element obtains the mastery, are more fell and speedy than the exterminating sword, or the devastations of a pestilence. To leave, however, the domain of historical evidence, as well as the review of calamities which have long past occurred, let us revert to the case of those ordinary fires and conflagrations which are in course of continual occurrence daily and nightly in our midst, destroying numerous habitations, and to the manifest danger of surrounding property and life.

Up to within the past few years, and in keeping with that national instinct of oblivion in which other matters of equal importance yet remain shrouded,—sewage, water-supply, child-education, and poor-law relief,—we were in possession of no properly-organised system whatever to limit the extent to which any outbreak of fire might have happened to have arrived.

A promiscuous and voluntary aid towards the suppression of fire was brought into play by the Fire Assurance companies some years ago; but it was, of course, obvious that the remedy which was thus afforded could only have been expected to be employed in cases more particularly where the interests of such companies were involved. No such associations, unless founded upon gratuitous or benevolent principles, could undertake so wide and important a mission. The management of insurance establishments being professedly of a different scope, or not limited to such objects, it followed that fires which proved to be attended by certain losses pointed clearly, more clearly than anything else could have done, to the expediency upon which those associations were based. Far be it from us to seek to impute blame in any quarter upon such grave issues as those relating to this question. It was at length seen more evidently that where there was no fire there was no risk, and where there was no risk there was but little incentive to make provision for prospective losses by the payment of large annual premiums by way of insurance.

In occasional outbreaks of fire happily it may have been unattended by any loss of life, the necessity or prudence at least of providing against the loss which might have been sustained appeared undeniable. So far we think we may be permitted to put the case without being ourselves exposed to liability or danger of mis-construction.

It is the obvious policy upon which alone the business of any insurance society could be satisfactorily conducted, and far from misapprehending the important advantages which such associations confer, we would say that as things are, it would be more prudent and necessary than ever that their operation should be supported by public concurrence, and more widely extended and understood.

The consideration of this element of the subject may be momentarily deferred. The inconsistencies to which the situation gave rise at length led to the establishment of a Metropolitan Fire Brigade, which was ostensibly placed under the direction of the Metropolitan Board of Works; but some recent statements have been put forward with the view of relieving the public mind from any impression which it may have entertained as to the responsibility that would devolve in the direction of that body. We are thus brought face to face with an entirely new phase of the question which appeals to and demands a prompt and universal recognition on the part of the public.

Within the past few weeks it has been established by legal inquiry, that in two of the more insignificant class of fires with which we are mostly familiar, no less than eleven human beings have perished. One of these fires occurred at a small shop in Baywater, in which seven persons were sacrificed, and the other took place in somewhat similar premises at Newington, in which four, and very nearly five, lives were lost. The practical issue which usually arises out of such calamities, and more especially in view of their possible recurrence, is necessarily as to the direction in which we should be justified in looking for more effectual assistance. It is not so much the discovery as

to who may be to blame, if any there be to blame, for what has recently happened, that would prove of more practical avail; but more in a prospective than a retrospective view that we would approach the subject. An appendix was made to the verdict which was given by the coroner's jury in reference to the Bayswater disaster, recommending that arrangements should be made by the Metropolitan Board of Works to enable the fire-engine at the station in Queen's-mews to get to fires more quickly than it did in this case. This recommendation on the part of the jury has in its results afforded to the chief officer of the Metropolitan Fire Brigade an opportunity of apprising the public that he more particularly should be held responsible for any miscarriage in this direction, and by interposing between the public, as represented at the coroner's inquest, and the Metropolitan Board of Works, Captain Shaw has revealed some features of the fire-brigade system, as at present conducted, with which the public formerly were not so familiar.

In a letter to a contemporary upon the fatal fire at Bayswater, Captain Shaw has availed himself of the privilege which has been accorded to him of communicating to a large section of the community that "all the inhabitants of the district who take an interest in their local affairs must be aware that the Metropolitan Board of Works has been actively engaged for upwards of two years endeavouring to find a more suitable place for the men and engine." As we have no reason to suppose that this statement is put forward in all seriousness, those who, as Captain Shaw remarks, must be aware of the circumstance, may discover some slight difficulty in deriving any new consolation from the assertion to that which they have enjoyed all along through the period named. But it may become a matter of congratulation that the circumstance is now likely to engage a wider share of public recognition. We can only hope that we do not lose the full intent and scope of the observation, and in that case proceeding from the source to which it is attributed, it may be regarded by some as a display of activity beyond all praise. The letter goes on to say that the suggestion of the coroner's jury was that it would be advisable to make arrangements to get the Bayswater engine to fires more rapidly than on the occasion in question, which simply meant—and at this point we are precluded from following Captain Shaw's construction so clearly—which simply meant,—the gallant captain continues, that it would be an advantage to have all our men living in the station, and thus save the time now lost in sending a distance of 111 yards for them. The greater comparative efficiency which it is apprehended would attend the accomplishment of this object has operated towards so liberal a view of the jury's report that its identity with the form in which it has come now to be presented may not be so generally perceptible. We are not so sure that the jury would itself recognize the original meaning or adhere to the construction with which it has been officially invested. The distance in question would, we believe, cause a difference of nearly one minute either way in the equipment of a fire brigade corps, presuming that no other obstacle than that of distance intervened: 330 ft. are, after all, only about one-third of the distance across one of the Thames bridges, and from one extremity to the other would practically be found within speaking limit. It is the distance only that in Captain Shaw's communication appears to be more especially observed.

In seeking to divert any possible blame from the Metropolitan Board of Works, and encouraging it rather towards himself, it may have so happened that too wide an interpretation may have been placed by Captain Shaw upon the jury's report, to the gratuitous detriment of, or at all events without contributing to enhance the reputation of, the Fire Brigade. We are rather inclined to shelve by a literal acceptance of the terms of the recommendation which the jury desired should be notified to the authorities, which were intended, and believe that, however complicated it may have appeared in other directions, or whatever task might have been involved in reducing its meaning to a more simple form, that the jury meant exactly what they stated in this instance, and no more. The inferences which may be drawn by the inhabitants of Bayswater from the singular construction which in some quarters has been placed upon the jury's recommendation may lead to more desirable arrangements in that locality. What we have more to consider are those circumstances arising out of

the unhappy occasion which concern the general public. Since the direction of the Fire Brigade system has been confided to the Metropolitan Board of Works, a sum of 70,000*l.* per annum has been expended in its management. There may not be a great many probably likely to entertain the opinion, that recent occurrences would demand the display of any unusual amount of congratulation as to the results which have attended such an expenditure. It is neither with the expenditure, however, nor the system that we have now to deal; for it is our conviction, notwithstanding the public complaints that are now likely to arise, that with such an expenditure and such a system, all that could be done has been done.

The undoubted courage displayed by the members of the Fire Brigade Corps upon occasions where they have arrived at seats of actual danger, has become proverbial, and we would be the last to withhold an acknowledgment of the bravery and succour which they have in so many instances rendered. But the risks which we now have to meet in occasional outbreaks of fire are disproportionate altogether to any available means towards their being effectually encountered at immediate command. An efficient and comprehensive remedy may no longer be expected from the Metropolitan Fire Brigade, or from the Metropolitan Board of Works, with the present resources which they are possessed of for this purpose.

It is possible to conceive of a fire of such magnitude, that in view of all London being burned down, the State itself might be moved to seek to provide some remedy.

The chief officer of the Metropolitan Fire Brigade remarks, "I have much pleasure in adding that we are now perfectly able to deal satisfactorily with any emergencies that may be expected to arise." While far from wishing to detract in any way from the value that such an assertion would be necessarily promoted to convey, its supercilious recognition would retrospectively condemn the marked negligence with which the system has recently been visited. Any organization which could so suddenly be brought up to now satisfactorily meet all possible requirements, and which was lamentably deficient of such perfection but a few days past, could not fail to provoke equivocal reflections.

The occurrences which are now fresh in the public mind were certainly, in their general features, of no unusual kind or emergency. We would incline towards an invitation to release the Fire Brigade and the Metropolitan Board of Works from the necessity of insisting upon pretensions which may so speedily be proved to be groundless. The emergencies that may be expected to arise out of any outbreak of fire present so wide a margin of contingencies that great discretion would be demanded in providing adequately for them all. It is not so long since Sycemham was destroyed by fire, involving a loss to nearly the extent of a quarter of a million sterling. Only a year or two since, a church at Croydon was destroyed, and owing to the weather, and state of the roads at the time, the means for extinguishing the fire actually could not be brought to the spot where it was raging, although the spectators were close and numerous. The combustion of fatty or volatile bodies on the surface of water would seriously menace the shipping of our great cities, and it is but a short time, comparatively, since all London was fairly startled by the great fire in Tooley-street. This is without regarding the more exposed and unprotected state of suburban property. If some of those emergencies which we have indicated, and to which we are liable at any moment, presented themselves again, we are not enlightened by the statement of Captain Shaw as to how they might more happily be met. A perfunctory assumption on the part of any one as to the transition from powerlessness to that complete efficiency which is within so short a time claimed on behalf of the Fire Brigade, would not only be calculated to engender erroneous ideas, but would invite criticism as to the causes by which it may have been delayed. It is to be hoped that there may be reasons for the supposition beyond any with which we are acquainted, and that any indication of increased efficiency in the management of the fire brigade system in the future may condone its possible shortcomings of late.

We observe that as an element of the present protective system, the Fire Insurance companies are called upon to contribute a sum of 10,000*l.* annually towards the necessary expenditure. It

may be thought unfair to employ the funds of such associations in the general suppression of fires, unless it so happened that the whole of the property in the metropolis be insured, which is far from being the case. This element may occasionally contribute towards some derangement of the present system.

The annual average loss of British property by fire is computed to reach ten millions sterling. The average annual home loss exceeds two millions, and indeed any casual outbreak of fire in Tooley-street would threaten to involve a sum as large as this.

The amount of property insured in England from destruction by fire now exceeds probably fifteen hundred millions. Some years since the value of insured property in France was computed at two thousand millions, while the value of insured property in England was at that time reckoned at twelve hundred millions.

The premiums which are paid on policies of insurance with respect to insured property in England exceed five millions sterling annually. Out of this the insurance companies return to the public the sum of one million, which represents the yearly value of insured property destroyed by fire in this country. There remains, therefore, to complete the two millions representing the total destruction of insured and uninsured property combined which takes place every year in England, a sum of one million which is in no way provided for, and which is, consequently, altogether lost and irreparable. The margin which has been claimed by insurance companies with reference to the tariffs upon which their operations are conducted has resulted in rendering them the net recipients of four millions annually out of the public industry, and it is within that margin that we believe the whole and only hope of future public safety resides.

The accumulated funds of the insurance companies, which may be said to be held in trust for some portions of the public, if applied to a protective rather than a restorative system, would render the country comparatively proof against fire.

This large annual gift to the insurance companies, if devoted only for one or two years towards the remodelling or reconstruction of household property in the metropolis, would tend to save countless lives and disasters, as well as enriching the nation by the substitution of improved habitations. It would be almost impossible for a dangerous fire to break out in the buildings lately erected in Victoria-street, and we could conceive nothing more to be deprecated than the application of modern methods of fire extinction against those ranges of dwellings should a fire actually arise.

The improvements which have been for some few years past gradually gaining favour in the practice of building and architecture by the more extended employment of fire-proof materials, tend more effectually to limit the ravages and destruction of fire, and also to abridge the labours of fire-engines and brigades. No one knows better than those concerned in the direction of fire-brigades, that their utmost efforts must necessarily be limited to arriving at the seat of any outbreak of fire at the earliest possible moment after discovery, and then seeking to suppress the spread of the flames by copious and immediate saturation. After the salvation of human life has been effected, that in cases where that object may have been happily secured, it becomes a matter of comparative indifference whether the destruction of property is continued by means of water or fire, and rarely is anything according to the generality of published reports preserved. The elements of unnecessary terror and destruction which fire-engines sometimes carry in their wake, the fury and onslaught of their attacks occasionally, and the puerile and inundating streams with which surrounding property is at times promiscuously flooded, has created a disposition on the part of many to resist the nature of the succour that is customarily rendered. It is questionable whether a greater degree of protection could be secured, however, by the expenditure of 70,000*l.* per annum in any other way than that by which it is at present expended, and which would at the same time comprise an equitable arrangement with the insurance companies as to the proportion of the expenses which might continue to be contributed by them.

Science, which may justly boast of so many triumphs in other directions, although the question of fire and fire suppression is so pre-eminently a scientific subject, yet curiously

leaves us to the contrivance of more or less perfect mechanical expedients for projecting deluging streams of water into the midst of burning materials. It is obvious that in many cases the water may not possibly reach the seat of fire, and consequently very little impression is produced, while any combustible materials may remain unconsumed. The persistence with which streams of water are projected into the body of conflagrations is incredulous. It must necessarily burst into steam, or be carried upwards by the force of ascending flames. When the flames subside, then only is water more applicable in being directed upon the incandescent remains. But there is a still greater danger than this, for at certain stages of combustion water will actually burst into sheets of flame.

To the occurrence of this phenomenon upon a small scale may be attributed the succession of explosions which mostly attend fires of magnitude in the metropolis.

It may be studied and observed to greater advantage in some of the London Gas Works upon the drawing of a bed of retorts, where volumes of water thrown from hand-pails upon the mass of red-hot coke explode with the lightning and concussion of artillery. A cubic foot of water may be resolved into 30,000 cubic feet of flame, and it is well known that water has been actually employed in the production of gases for ordinary illumination. As an instance very clearly indicating the laws and processes of combustion from a want of a more general knowledge of which, we believe, many erroneous opinions are entertained to the prejudice of life and property, we would revert to an occurrence which shows that a room enclosed in the ordinary way, if left alone, cannot burn beyond a certain quantity of materials save by some adventitious aid.

A gentleman sealing a letter dropped some flaming wax into a waste-paper basket, which blazed up and set fire to a woollen table cloth. He ran out of the room and shut the door, and, having sent for assistance, with the servants he watched the progress of the fire through a window from the lawn. Even after several minutes the paper-basket was still burning. An oil lamp on the table had burst, and the oil was running down one side of the table-cover, burning with a flame a yard high. The room was soon clouded so thickly that the actual flame could scarcely be seen; but at intervals a lambent flame passed about the room like a fire-cloud, and then subsided. The muslin curtains, in fact, wasted away by the effect of the heat, but could not burn for want of air. The window-glass cracked, but did not break out, and, after a few minutes, only a few smouldering embers were visible in the darkness of night. Scarcely anything was consumed, but everything in the room was destroyed. We are far from quoting this as an example to be imitated in all cases, but with the intention of showing in what way fire may be propagated, and that its propagation does not necessarily depend upon the successive ignition of contiguous bodies, but rather on a general increase of temperature affecting more or less volatile bodies, or bodies more or less disposed from their character to enter into a state of combustion without the actual contact of flame. A very important scope is afforded for a scientific investigation as to a more effectual method of fire prevention. Should the public not yet be sufficiently awakened to deduce out of the insurance system a means of lessening the general risk, the Metropolitan Board of Works might be induced to set some such inquiry in motion.

What the public are most concerned in bearing in mind at this moment is, that notwithstanding that it contributes five millions yearly to the insurance companies, and that a sum of 70,000*l.* is annually expended under the auspices of the Metropolitan Board of Works, with the view of limiting disasters incident to fires in the metropolis, as much human life has been sacrificed within the past few weeks at outbreaks of fire of the most ordinary description as would attend a railway collision or a colliery explosion, and that the chief officer of the Metropolitan Fire Brigade asserts that all that could be done in such cases by that body was done.

South Kensington Museum.—Professor Huxley gave, on Tuesday, at the South Kensington Museum, the first lecture of the course, on the elements of physical science, which is intended for the instruction of women. The course will consist of three parts.

DISASTER AT THE HOLBORN VIADUCT.

We have to mention, and we do it with extreme regret, that a number of the granite columns that carry the iron bridge over Farringdon-street are seriously fractured. If we followed our own inclination, we should say nothing on the subject till the engineer and contractors had told their own story. But the matter has already been made public, and it would be thought that we had neglected our duty if we omitted giving at once such information on the subject as we have. Entering from Fleet-street, the second shaft on the east side is split on five of its six faces, three of the splits being apparently about 1 ft. long. On one of these faces there are several fractures. The third shaft has a crack in its centre block that looks to be about 2 ft. long. In addition to this, three of the faces of the bottom course of this shaft are split in a very unmistakable manner.

For the sake of understanding it clearer, we may say here that the granite shaft of each of the twelve columns supporting the bridge girders is composed of three pieces, a lower one resting on the pedestal, which we may call the bedding-piece; then a middle piece taking up about two-thirds the entire length of the shaft, and which is surmounted by a third block of small dimensions.

One of the cracks of the third column is very wide. The fourth column has three fractures, one of them being the largest of any of the fractures to be found. Two of these splits look very unpromising. The top block is split on one of the faces. The fifth column is apparently not fractured; but its bearing inclines so much inwardly towards the road, as to have crushed a portion of the edges of the joint on that side, whilst the opposite side of the joint is open to the extent of the eighth of an inch.

On passing to the western row of columns we find that the second one shows a bad fracture. It consists of a split on two adjacent faces, starting from the middle of each face, and converging downwards to meet in a common point at the base. This is a heading-block fracture; and if it is as serious as it seems, the injured piece may at any moment be forced out from the block. The top course of this shaft is also cracked. The sixth column on this side has two cracks on opposite faces of the top course; they do not look very assuring. The second abutment column on the same side has two lengthy cracks upon one of its faces; one being about 22 in., and the other 14 in. long. The blue granite plinths are all right.

The fractures in the shafts have increased in extent since we first examined them, and we can scarcely resist the conviction that the disaster is very serious, and that some of the shafts, at any rate, if not all, must be taken out and reinstated. It will give us great pleasure to find, when Mr. Haywood has made a careful survey, that we are wrong. If, however, it turn out as we fear, we should be disposed to advise the substitution of iron, rather than of other shafts of granite of a size that would suit the present ornamental capitals. The red granite used ("Ross of Mull") is obviously less strong than the grey granites employed here. But the weight above is so considerable, and the traffic so enormous, that iron seems to us the only material for the position, if present sizes are to be adhered to.

This is not a moment for us to ask questions with a view to attribute blame, though it will have to be done, with reference, for example, to the way in which the blocks are bedded, and as to the experiments that were made on the power of resistance to crushing weights possessed by this granite. It is to be feared that the facilities afforded by Mr. David Kirkaldy's works, in Southwark, for ascertaining such facts with certainty, are not taken advantage of to the extent that public safety demands.

We must not, in our anxiety to avoid giving pain, conceal the belief we have that two, if not three, of the shafts may yield at any moment, if the traffic above be continued without the adoption of precautions below.

A CORRESPONDENT WRITES.—On Wednesday, at dusk, a further inspection showed that the fifth column on the western side, had cracked across on the bottom course of the shaft. The split is very sharp and clean, as if it had been cut. The centre length of the sixth column on the same side has also shown unmistakable signs of yielding. Hitherto these were thought to be flaws only, but they have developed themselves

into absolute fractures. Crowds of people, mostly building artisans, arrive all day, in one continuous stream, and the observations are numerous.

Some say that the foundations are defective; but they go down into the London clay 36 ft. below the old level of Farringdon-street. Then a bed of concrete 6 ft. deep was laid in two long trenches, one to each row of columns, 12 ft. in width. Upon this were built brick piers of the same superficial dimensions, nearly up to the ground surface; and finally the pedestals of grey Cornish granite,—hexagonal in form,—upon which the shafts were fixed. Another story is that the frost of three weeks ago produced a contraction in the main rib-girders of 1½ in.; and that such contraction, not being sufficiently allowed for, pulled the columns towards the centre and produced all the mischief,—mischief which the vibration of the great traffic overhead has brought to a climax.

STYLUS.

On the eve of going to press, we have received the following official communication:—

At a special meeting of the Improvement Committee held this (Thursday) afternoon, Mr. Haywood, the engineer for the Holborn Valley Works, reported that having this day made an examination of the bridge, he is of opinion that it is perfectly safe for public traffic; and at his suggestion the committee directed that three eminent engineers,—viz., Mr. Bidder, Mr. Edwin Clark, and Mr. T. Elliot Harrison,—be requested to examine and report forth with upon the condition of the bridge.

WINTER EXHIBITIONS: OLD BOND STREET GALLERY.

If the number of pictures, drawings, and works of slight and slighter pretensions to either denomination now being exhibited at the Old Bond-street Gallery were lessened by one-half, with a view of bringing more closely together the best of them, the collection would stand a fairer chance of being well regarded as an adjunct to the several winter exhibitions already established.

Amongst the best must be recognised Mr. E. C. Barnes's "Prawn Seller" (6), with a special note of the admirable breadth of painting displayed in the heap of prawns; Mr. P. Jackman's clever interior introducing "The Net Mender," or menders, for there are two of them (12), indicating great executive power and a rare apprehension of colour and effect; Mr. T. Davidson's drawing-room is painted, likewise, brilliantly and forcibly, with its occupants,—an elder sister singing "The Old Song" to the younger, who listens to her fellow-mourner for those who so often listened with her formerly (80); Mr. F. H. Potter's contemplative lady adumbrates some cognate sentiment of herewith, temporary or for ever (33),—she recalls "The golden days in which she saw him first."

Mr. C. Lucy offers an antidote for thoughts of life's and death's shadows in his bright and well reasoned and seasoned reminder that the world is very beautiful, that happiness is as natural to it as grief. "Sunny Hours of Childhood," the pleasant alluring preface to—sometimes—a horrid story, if it promises "to be continued in monthly parts and annual volumes." Mr. Lucy's well-described children (61) imply their wisdom by basking in the warm light of present days, and blinking at the future; for the morrow is divided by a long bed-time,—the darkest hours they know as yet, the only hours they hate to think of, unless, like "The Sick Child" (57), alluded to by Mr. A. B. Houghton, they are forced to take physio three times a day; but this is a disagreeable episode. "The Grandfather" (18), by Mr. J. A. Fitzgerald, is another phase of childhood. "As the Twig is bent," &c. (20), is a clever sketch by Mr. V. W. Bromley, of an old reiner teaching the scion of a fighting family—for the costume betokens feudal times—how to cross swords, and learn by might to hold as right all you may feel disposed to appropriate, which is very wrong both in precept and practice; but it is astonishing how long some old customs and habits prevail. "An Attack," by some other geese of a different sort on common ground, but who are likely to get more than they want from the peasants they are assailing (59), is a very natural-looking picture by Mr. J. W. Bottomley. "Against the Jack" (62), by Mr. J. Emms, reminds one—and a great many—of the Jack that frightened Mr. Briggs, by barking like a dog. "On Guard" (71), a

sentinel of Elizabethan period, is a clever sketch, by Mr. W. Small, and capital in style for a sketch. "The gentle Music of a bygone Day,"—*The Barkly Favers*, V. M. Morris, and of Mr. J. R. S. Stanhope, too, with those whom he imitates; quite in tune with "A bygone Day" also (194); "A Chilly Morning" (205), by Mr. G. Earl, much more direct in observation of nature; "The impending Storm," not a landscape, but a trooper about to withstand stormers, somewhat mildly represented (217), by Mr. J. S. Lucas, "Doesn't he like his Bath!" the rivets of which rivet the attention, though the little Triton by no means denies the imputation that he shares in the love of a "cold tub" in common with all Britishers, and will climb the Alps with the best of them, presently, so far as Mr. J. S. Outbert has made him expressive (219), "Bless the Babies, how they abound!"—these, with Mr. J. J. Hill's Welsh peasants on "The Walk" (243); two studies of Irish cabins (244 and 265), by Mr. A. C. Stannus; and "The Harpsichord" (257), by Mr. C. Rossiter, are a very fair example of the most noticeable figure-subjects in the collection.

There are some clever landscape representations: for instance, "Autumn Woods" (17), by Mr. J. Knight; "September," a combination of landscape and figures, by Mr. E. B. Barwell (30); "Evening on the Arise," by Mr. G. Chester (85); "Where the Ferns grow" (123), by Mr. E. Holmes; "The Burial-place of Hogarth, Chiswick, on the Thames," with a late evening effect, by Mr. G. F. Tennisswood (191); "The Redlands, near Leith-hill" (210), by Mr. G. W. Mote; and some others also well deserving of attention.

The water-colour drawings include many pleasing and deftly manipulated, as well as highly finished, performances. They are numerous, and will repay a patient examination.

OUTRAGE AT WORTH CHURCH.

SOME of our readers are unwilling to believe the statement made by one of our correspondents last week, that the chancel of the Saxon church in Worth "had vanished clean away." With grief and shame, we have to assure them that the statement is perfectly correct. We visited the place on Tuesday, though with no doubt as to the accuracy of our informant's report, and found that the very foundations had been rooted out, the trench lowered, and that the new walling was being proceeded with. The work is in the hands of Mr. Dancy, a local builder, and the architect under whose direction this outrage has been committed is said to be, though we can scarcely believe it, Mr. Salvin. It is no answer to reply that it was desired to remove the large buttresses which had been built up at the east end by previous more reverent hands, and that the chancel would then have fallen. The wall might have been shored, and other and more sightly buttresses substituted with ease. When it is remembered that Worth was perhaps the only Saxon church we had presenting the original plan throughout, and that the chancel was probably the oldest part, the indignation with which this destruction will be heard of will be increased.

The removal of the plaster has shown the existence of various arched openings in the walls, afterwards blocked up, especially two pairs of coupled semi-circular-headed windows on each side of the nave above the string-course, and an opening on the west side of the south transept, the circular head of which is cut out of a stone lintel.

As to this removal of the plaster from the external face of the walls, less can be said, because opinions differ as to the mode in which walls of the Saxon period were treated. In this particular case, however, where the walls for the most part are of the roughest of rubble, we have not the slightest doubt that they were intended to be plastered, and were so from the first. Here and there, where the walling is of a somewhat better character, a stone may be seen with moss upon it, but it is not the moss of a thousand years ago. Be this as it may, we will make no complaint on that head. Our regret and our anger are for the destroyed chancel, and our fear is for the chancel arch, a most interesting example, and for the characteristic long and short work all over the remainder of the building. Some blame surely attaches to the Sussex Archaeological Society, so busy with its excursions and its dinners! Did they do nothing to try and save the building, the most precious in respect of its antiquities in the whole county. Where are

the Rev. W. Powell and Mr. F. Barchard, the bona secretaries? Have they heard nothing of these doings, or, worse still, have they heard and yet not dared? We drew attention to the contemplated works here many months ago, and the Royal Institute of British Architects, at a meeting specially convened, passed resolutions declaratory of the great historical value of the chancel, and urging the necessity for the most careful conservation. The warning, however, was needless. A third of the church has been ruthlessly destroyed, and those who have been concerned in the work have earned for themselves lasting obloquy.

THE INSTITUTION OF SURVEYORS.

THE opening meeting of the present session of the Institution of Surveyors was held on Monday, the 8th inst., at the Rooms, No. 12, Great George-street. There was a good attendance of members, and the president, Mr. John Clifton, commenced the proceedings by delivering an address. In the course of it Mr. Clifton said,—

"It appears that 117 public Acts, and 159 private and local Acts, were passed during the last session; and, although so much time was occupied in discussion about the Irish Church, that several Bills which were of interest to us were put on one side for the present, others were passed which, more or less, directly concern us. "The Irish Church Act, 1869," incidentally promotes the interest of our profession, and promises to give employment for some years to architects, surveyors, and actuaries, whom the Commissioners are empowered to engage, and to pay out of moneys in their hands, on a scale approved by the Commissioners of the Treasury. Nearly all the directions for the partition, sale, or retention, of the Church property, are based on the present estimated annual value; and property directed to be sold is, in most cases, to be first offered to the parties in possession, at prices fixed by the Commissioners. Provision is also made for arbitrations, which are to be conducted in accordance with the directions of the Lands Clauses Consolidation Acts.

"The Valuation of Property (Metropolis) Act" is of considerable importance, not only as regards its immediate effects, but viewed as an experiment in the direction of an equalization of assessment, and probably of rating, throughout the country. Every one must admit the absurdity—many have experienced the annoyance—of the assessment of their houses by two or three Committees or Boards at different amounts, for various rates or taxes, each independent of the other. Oftentimes the assessment is raised by some zealous Surveyor, of Taxes simply by way of experiment, to see how much it can be increased before the occupier will submit to the annoyance of an appeal. This Act then, which applies only to those parishes which are wholly or for the greater part in value under the jurisdiction of the Metropolitan Board of Works, provides that copies of the valuation lists, as made out by the overseers under the Union Assessment Committee Acts, shall be sent to the Surveyor of Assessed Taxes, and to the various authorities concerned with the county rate, sewer, and other local or general rates, who have powers of appeal, both against the total and the particular assessments of any parish, to Courts of special and general Assessment Sessions to be held by the justices. Each valuation list, when finally approved, is to be in force five years, subject to such alterations as may be necessary. Every fifth year a new list is to be made out and formally approved as before. This list is to be evidence of the gross and rateable value of the hereditaments included therein. The poor-rate, the county-rate, sewer-rate, and all local rates, are to be made on the rateable value, and the house and property tax on the gross value, as set forth in the lists. An attempt has also been made in this Act to define more clearly the terms 'gross and rateable value.' In the Bill as originally drawn, it was proposed to have a 'General Valuation Board,' chosen from the assessment committees of the several unions, who were to settle and approve the valuation lists, with appeal to a Poor Law Commissioner, who was to hold a court at certain times. The whole of this arrangement was struck out on discussion in the House, and the assessment sessions by the justices substituted. It was also proposed that the gross value should not be fixed at any less sum than the rent actually paid. This obvious injustice, and contravention of

acknowledged principles of fair assessment, was also struck out."

A vote of thanks to the president for his address, was moved by Mr. H. A. Hunt, and seconded by Mr. J. H. Lloyd, and carried unanimously. Mr. Menzies and others then addressed the meeting, which was afterwards adjourned to Monday, November 22nd, when Mr. W. Hope, vice-chairman, will read a paper in continuation of that of last session, on the "Distribution and Agricultural Use of Town Sewage."

THE PUBLIC HEALTH IN THE PAST SUMMER.

IT appears inevitable that until sanitary intelligence becomes more generally diffused, and until the people are better educated in the rudiments of physiology, we shall continue the victims of our climate. Each summer and winter the periodical returns of the Registrar-General show with what regularity our death-rate moves in sympathy with the mercury in our thermometers. In summer a few degrees, more or less, of heat are a matter of life or death to thousands of our infant population through diarrhoea. In winter the mortality from diseases of the respiratory organs is directly governed by the temperature, and a week's frost will often double the number of deaths from these diseases at all ages. It is impossible, therefore, satisfactorily to review the death-rates in any summer or winter quarter without fully taking into consideration its meteorological conditions.

Although the past summer was far cooler than that of 1863, its temperature was nearly two degrees above the average of the same quarter in ninety-eight years, according to the calculations of Mr. Glasher, of the Royal Observatory, Greenwich. Throughout July, except the first few days, the weather was warm, and above the average. In August the temperature was below its seasonable average, except during one very hot week between the 21st and 29th. September was generally warm, and the temperature showed a considerable excess throughout the month. Very little rain fell during July or August, and although the fall in September showed a slight excess, the amount measured in the quarter was 24 in. below the average of fifty-four years. The mean temperature of the air in the quarter was 61.4° Fahr., and 2.5° below the mean of the corresponding quarter of 1863.

In England and Wales during last quarter the Registrar-General tells us that the natural increase to the population by excess of births over deaths was 75,478, or more by 13,513 than in the corresponding quarter of 1863. This increase was, however, very materially reduced by emigration, as it appears that during the quarter 70,734 emigrants left the various ports of the United Kingdom. These numbers, we are told, do not include those who sailed from ports where Government emigration agents are not stationed. An increase of 18,109 emigrants was shown upon the return for the same quarter of 1863, the largest part of which increase was of English and Scotch, whose destination was principally to the United States and British North America. The increase of Irish emigrants was only 3,171. The births in England and Wales during last quarter were below the numbers in the summer quarters of either 1867 or 1863, but showed an annual rate of 31.5 per 1,000 against an average of 34.0 in the ten previous corresponding quarters. In the eleven largest cities and boroughs of England, including London, the birth-rate was 35.1, and in forty-six other large English and Welsh towns, 34.3 per 1,000; the town birth-rate therefore was not, generally speaking, much in excess of that in the rural districts.

The deaths registered in England and Wales last quarter showed a decline of 15,848 upon those returned in the summer quarter of 1863, and were 2,000 lower than in the same period of 1866, when cholera was somewhat epidemic; but with those two exceptions the deaths showed a considerable excess upon each of the corresponding quarter, as far back as 1853. The death-rate, however, which is calculated upon the estimated population of each year, was only 20.8 last quarter, against 23.9 in 1865, and an average of 20.6 in the third quarters of the ten years 1853-68. In the third quarters of the ten years 1853-68, the rural districts, including, of course, the small towns and villages. This difference of six per 1,000 in the mortality of the two sections of the population, may almost be taken to

represent the waste of human life which is due to the habitual disregard in towns of the most obvious sanitary laws. Theoretically towns should be quite as healthy, if not healthier, than rural districts, and we may fairly expect to see in the future these relative death-rates practically more nearly assimilated.

In the eleven large English towns furnishing weekly returns, including London, the death-rate last quarter averaged 25.2 per 1,000, which was nearly 2 per 1,000 in excess of the general town death-rate, and so much as 7.8 above the rate in country districts. These towns are estimated to contain a population of about five millions and a half. In forty-six other large English and Welsh towns ranking next in size, the death-rate last quarter averaged only 21.2 per 1,000, which was more than 2 per 1,000 below the general town death-rate. These forty-six towns are estimated to contain a population of nearly three millions. We shall presently have to allude to one or two of these forty-six towns, which form an exception to the generally low death-rate; but as it is evident that the principal excess of deaths last quarter occurred among the eleven largest towns before mentioned, we will first consider severally the rates in those towns.

London, which contains nearly half of the entire population of these eleven towns, showed last quarter a death-rate of 24.3 per 1,000, or 1 per 1,000 above the general town death-rate, which was almost as high as the rate that prevailed during the remarkably hot summer of 1868, and nearly 4 per 1,000 above the rate in 1867. Among the other towns, Birmingham and Bristol enjoyed rates so low as 21.4 and 21.7 respectively; the rates were 23.7 in Newcastle, 24.6 in Bradford, 25.2 in Hull, 25.6 in Sheffield, 25.9 in Salford, 27.2 in Leeds, 29.3 in Manchester, and highest, 30.5, in Liverpool. Newcastle, Manchester, and Leeds showed a satisfactory improvement upon the average of previous corresponding quarters, although, as regards the two latter, much remains still to be done ere they will permanently take higher places in these periodical lists. In all the towns except London and Bristol the rates for the quarter showed a large decline upon the summer quarter of 1868, principally due to a decrease in the deaths from diarrhoea.

Among the forty-six towns in the second list, nine towns showed death-rates exceeding 25 per 1,000, among which Exeter, Leicester, Halifax, and Tynemouth may be especially pointed out as exhibiting in their returns evidence of unsatisfactory conditions. In Exeter the rate has now been excessive for some quarters, and a severe epidemic of measles swelled the returns during the past summer. Leicester has again suffered from infantile diarrhoea, in excess of most other towns. In Tynemouth and Halifax, diarrhoea and scarlatina combined to produce a very high rate of infant mortality.

Considering the far more moderate heat of the past summer, compared with that of 1868, the fatality from diarrhoea in the third quarter of this year was very remarkable. In London, during the quarter the deaths from diarrhoea showed a decline of but 18 per cent. upon the same period of 1868, while in Liverpool it was only 13 per cent. In most of the other towns the decline was much greater; but according to a special return made to the Registrar-General, during the last nine weeks of the quarter, the annual death-rate from the disease averaged in the eleven towns more than 4 per 1,000, and ranged from 2.5, 3.2, and 3.4, the lowest in Bristol, Newcastle, and London, to 5.8 in Leeds, 6.4 in Birmingham, and 6.6 in both Manchester and Liverpool. In Leicester, the death-rate from diarrhoea for the whole quarter was 8.9 per 1,000. The mortality from diarrhoea was greatest during the last week in July, and the first fortnight in August, after which it steadily declined, and, at all events in London and Liverpool, appeared to be scarcely influenced by the remarkably hot week at the end of the latter month. Above 80 per cent. of this mortality from diarrhoea occurs among infants, and it is impossible to tell how large a proportion of these may be directly traced to actual neglect, without taking into consideration the habitual and ignorant disregard of precautions of diet and cleanliness which indirectly help to produce this annual waste of life, varying only with the summer temperature.

In addition to this excessive death-rate from diarrhoea, the country was affording during the latter part of the quarter from what it is fashionable now to call a "wave" of scarlet fever, which has increased in intensity in the month that has

elapsed since the end of the quarter. In London, Liverpool, Hull, Leeds, and Sheffield, the epidemic still rages severely. During last quarter, in addition to these towns, Reading, Shrewsbury, West Bromwich, Dudley, Epsford, Oldham, Rochdale, Haslingden, Blackburn, Scarborough, Durham, Chester-le-Street, Tynemouth, and Monmouth, were all visited by this epidemic with more or less severity. Such visitations are the warnings that town populations from time to time receive of their unsatisfactory sanitary condition. The tendency of the present day is fortunately to pay more attention to these warnings than was usual even in the earlier part of the present century.

RAMSGATE RETOUCHEE.

No reminiscence, historical or topographical, polemical or political,—nothing of the kind. Our purpose is rather suggestive of an architectural, sanitary, or social future, than a memorial past. We went to Ramsgate, not as a fashionable visitor would go to it or its seaside neighbour Margate; we went on business, and in availing ourselves of the occasion we have done a little additional duty, we hope, in opening our eyes and looking right and left. Ramsgate has improved a little of late years on both sides of the town. On the East and West Cliffs the march is observable, but much remains to be accomplished before we can write with truth that its improvements are of a very remarkable or attractive character. The approach to the town from the London, Chatham, and Dover station, is most unsightly, and far behind the time. To use a trite but true expression, you enter the town by a system of "shooting round corners" and angles, to the danger of a break-neck by a personal or vehicular collision. Leaving the gateway of the railway station, you wind round to the left by the pier gates and enter Harbour-street, a dangerous and narrow defile or gut. If you subtract the footways from the street here, you have only the breadth of one carriage-way, and this breadth of roadway continues, with but slight difference as far as convenience is taken into account, for about two hundred yards or more. Correctly speaking, this narrow passage continues the entire length of that part of the street between the upper and lower pier gates. Through this narrow wind-pipe of Harbour-street the traffic between the railway station and the town has to be forced through. To make matters worse a pile of obstructive buildings, called the Harbour-master's Offices and Dock Stores, are back point blank against the roadway, casting a pall of darkness on the row of dwellings and shops opposite, and injuring the trade of those whose fate it is to be located in this spot. As we are improvers and not Vandals, we must perforce, after due inspection, condemn this pile of harbour buildings, which project out into the roadway, and vote at once for their speedy removal. As the young local board is beginning to look alive in general, and as an agitation is at present rife in the town, having for its object the transfer of the powers vested in the Harbour Board itself, we deem it the more opportune to have our say.

From inquiry and examination of the matter in dispute, it strikes us that the harbour interests could be managed better by the local board of the town than by the present body. The obvious improvements required in the Ramsgate harbour of refuge could be carried out simultaneously with the town improvements.

Connected with the harbour management there is one great evil,—the dues levied off small craft or vessels driven in by stress of weather, are altogether too exorbitant for the freight of many of these vessels. Numerous vessels are obliged through necessity to seek the harbour of Ramsgate as a place of safety in times of storm, to escape certain shipwreck and destruction on the Godwin Sands. A new scale of dues, according to the tonnage of the vessels obliged to enter, should be struck; for certain we are that many of the poorer or smaller and weaker craft lie out at sea at the risk of life, from inability to pay the dues at present demanded of them. It is the intention of the local board, we believe, to carry out an accommodating scale of dues suited to all classes of vessels as soon as the powers now possessed by the Harbour Board are vested in other hands. We believe the Board of Trade are in favour of the transfer as soon as certain requirements are proved and conditions agreed to.

Proceeding along the quay, or street facing

the inner basin of the harbour, the traffic is obliged to make a circuit, owing to the circular sweep of the basin that bounds it. Now, on mature consideration, we would go in boldly for cutting off this segment of the harbour simultaneously with the removal of the present harbour-master's offices, thereby widening the whole length of the thoroughfare from the entrance to Harbour-street to the approaches of the West Cliff, or even further. Filling in this cut-off slice of the inner basin and making it into a roadway would not cause the slightest inconvenience, and it would be a very unappreciable loss to the harbour interests compared with the vast benefit that would be conferred on the town, and the inhabitants and shopkeepers along the quay. A glance by those who live upon the spot must convince them that a wonderful improvement to the roadway by which the central portion of the town is reached would be effected. At present the small coaling craft that unload on the quay are in too close proximity to the line of houses and shops that flank the opposite side of the roadway, and in summer time the nuisance of the drifting coal dust obliges the hotel-keepers opposite to shut down their windows to escape the injurious effects on their rooms.

On the East Cliff some easy and ready approach from the town is required, as at present there is no carriage-way except from the more elevated part of the town. The sands are reached from the East Cliff by a long stone stair; but vehicular traffic, or parliamentary locomotion even, exists not from this point. Plans, we believe, have been suggested and discussed, but what they have been like we know not; but this we do know, that we cannot discover any terrible engineering difficulty in the way of creating a tolerably easy approach by a roadway, beginning near the pier-gates and gradually rising to the level of the cliff head at Augusta Stairs. The house property perched up there, and now gradually extending onwards to and beyond St. Lawrence-on-the-Sea, will never become payable or eligible property until an easy line of communication is effected from the lower part of the town direct. The new roadway might commence, as we said, springing from opposite the entrance to the pier-gates, and sweeping up the cliff inside the railway station. If nothing but a solid roadway was intended, the cut away chalk and flinty shingle of the cliff would help in the formation, and would tend to lighten the cost of construction; but if the London, Chatham, and Dover Railway Company, as they evidently would, enter into this desired improvement, which would be to their benefit, a double purpose could be obtained by the outlay of a little more capital. Then, instead of a solid roadway, the structure might be arched, thereby forming underneath a requirement which the present railway company is without,—good stores, or series of stores. We have indicated enough on this point by way of suggestion; and if the matter be taken up with spirit the difficulty of a ready approach from the lower part of the town to the East Cliff will vanish.

On the East Cliff a terrace of new houses of Gothic character was recently built, from the designs of Mr. E. W. Pugin. Four of the houses have been thrown into each other and converted into a hotel, which is called the Granville. The terrace is not yet finished. The buildings are attractive in appearance, and the intention will no doubt be in part realised in the summer months, during the flock of visitors to the seaside. The Granville and the Granville Hall will doubtless get a fair share of patronage. The site chosen is a good one, and it is presumed that the fare and conduct of the establishment will be on a scale commensurate with the respectability it aims at. Some new buildings are and have been erected lately at the head of the town, on the West Cliff side, and some neat and handsome villa residences are to be soon also.

Ramsgate wants a proper market; the present niche in the wall is an ugly patch upon the eye of Ramsgate. This little less than "cobler's stall" ought to disappear, and a proper and commodious market take its place. A few public fountains would be an improvement in the summer time; and if Ramsgate has any pride or commendable ambition, perhaps she can remember some celebrity of Kent or the Isle of Thanet worth erecting a statue to. There are many other things that Ramsgate might do for itself; but we hesitate to lend it back by increasing its burden. Public parks, we suppose, are in the distance, and museums, public

libraries, and workmen's institutes. A great deal of money is expended in Ramsgate by visitors during the summer months. We should like to see a portion of this money practically utilised in the improvement of the town; and if those who reap the richest harvest were to consult with those who desire to improve the town, a greater yearly influx of capital would be the result. Money spent in adorning and improving the town would bring good interest.

In taking our leave at present of Ramsgate, we must note that we have omitted to speak of a few other matters that will "keep" afloat, and dredging machines, ship building and repairs; the mud bank in the harbour, and how to obviate it.

To Ramsgate we bid once more adieu. On the score of health command us to it. While its white cliffs are visible, and the ocean winds and waves sweep across the Godwin sands, there will be hope and health for the town, even though no social or sanitary inspector be visible to the naked eye.

ART IN THE NORTH.

On Thursday, the 4th, a *conversazione* was held by the members of the Alnwick Mechanics' Institution, in the Corn Exchange of that town, when the Duke of Northumberland presided, and presented the prizes and certificates of the successful students of the science and art classes recently established in connexion with it. Mr. Adam Robertson, secretary, read the annual report; and the co-secretary, Mr. Heatley, announced the names of the students who had distinguished themselves by winning honours. The Duke addressed the large audience on the advantages of a scientific and artistic education, and also gave a few words of encouragement to each pupil on handing him his prize.

There was an exhibition at the same time of objects of Local, European, and Oriental art and interest, all loans from residents. In the course of the evening four short lectures were delivered, the first being on Palæontology, by Mr. George Tate; the second, on Galvanism and the Electric Telegraph, by Mr. W. J. Carr; the third, on Art, by Mr. F. R. Wilson; and the fourth, on the Chemistry of Respiration, by Dr. MacVail. We subjoin some of Mr. Wilson's remarks on art:—

Overlaying all the surroundings and conditions of our everyday life is a beautiful presence, for which we all feel more or less appreciation. The more cultivated or refined our minds, the more enjoyment comes to us out of this beautiful presence, and the more indispensable it is to us. I need not say, as you have the programme before you, that I allude to art, that mixture of fancy and skill, expressed in graceful forms and harmonious colours, which can make a bare wall as beautiful as a woman's song, a bit of iron-work like a poem, a bit of wood-work like a psalm, a common mug or dish worth a king's ransom. The wall, and the iron, and the wood, and the clay are all good in themselves; but this overlaying with fancy and skill,—in very much the same way as we read the chapters of the Ark of the Covenant were overlaid with silver and the pillars with gold,—makes them infinitely more precious. I must preface the few remarks I am going to make concerning local illustrations of this captivating, elevating, enchanting Art.

Whatever we do for art in the way of cultivation, art does for us tenfold, nay, a hundredfold. It is true man has lived upon earth without art, but only in a dumb and blind kind of way in holes and caves,—a kind of way that we should look upon now as insufferable squalor, not to be thought of after dark without a shudder. Directly he emerged from his cave and resolved upon a better habitation, art came to him, and has shined with him ever since, brightening his days, beautifying his home, decking out the companion of his life, woman, and in nearly every conceivable particular putting a new and pleasant face upon things. Under the auspices of art, the rude weapon of the successors of the cave-dwellers was perfected in form and ornamented; the rude clay urn that was to be buried in the grave of the warrior's child, or wife, or in his own, became graceful and rich in fanciful markings; and step by step, and in the course of one generation after another, the gear of humanity put on an aspect of loveliness. In our own district, to which I wish especially to confine myself, we have remains of this first impulse to art in the sculptured rock-markings which Mr.

Langlands first observed on the Berwick hills, and concerning which Mr. Tate has subsequently told us so much and so well. We have, too, remains of very early habitations, mere circular stone huts, grouped together, sometimes, within circular ramparts; and occasionally we come across stone cists, or places of sepulchre of these ancient people, as, recently, at Forest-gate and on the banks of the Cawlish Burn; indeed, it would be difficult to pick out a district possessing more remains of this period. As century after century left these primitive days farther and farther in the past, nearly everything man took into his hand became a vehicle for the expression of artistic feeling; and at last we find him, in different countries, huddling palaces and filling them with sculpture, paintings, mosaic work, carvings, superb furniture, vessels of silver and gold enriched with enamels and precious stones, and utensils, even when destined for the commonest purposes, treated artistically. I include the meanest utensils of common life in this category advisedly, for there are, at the present day, in the museum of the Hôtel Cluny, in Paris, many examples of the most delicate taste lavished on humble objects. I may mention, as an instance in point, a gridiron of French Medieval workmanship preserved there, which is every bit as dainty and elegant in its design, relatively to its purpose, as a piece of point lace. Goblets, basins, plates and dishes, all the splendid array of vessels that stood upon the dresoir or upon the banquet-table, we might expect would exhibit artistic beauty, as, indeed, they did; but this instance of art adding grace to usefulness is a convincing homely proof, I think, of my assertion that art will do a hundredfold more for us than we can do for it.

In the comparatively early days of humanity, art seems to have lingered long with the slant-faced Egyptians on the banks of the Nile, helping them to adorn their slant-faced temples and tombs; and thence to have passed to the banks of the Euphrates. Traces of palace after palace rising terrace upon terrace, and temples and tombs of a colossal size, give us a grand idea of the people who could compass them. Then we find art tarrying on the banks of the Tigris, and on those of the Ganges, receiving a distinctive treatment on each, and ultimately thriving in Europe. The Greeks, Etruscians, and Romans, all courted its bright presence, developed its adaptability, and basked in the beauty they enjoyed under its auspices. In the course of the many centuries in the various lands I have thus lightly touched upon, there were vicissitudes in the fortunes of that portion of mankind that inhabited them, that ever and anon were felt by art,—seasons of depression, "dark ages," if you will; dynasties decayed, desolation ensued; faith and even clime endured some changes; but through good and ill fortune art stood forth or stood by as occasion required, ready at all times to be taken up where it was put down, and to be the same solace and incentive to our race that it was from the beginning. In what we call the middle ages many noble, generous, exalted inspirations were expressed in mosaic work, ivory carvings, wood carvings, goldsmith's work, stained glass miniatures, illuminated missals, enamels, and in ceramic wares, as well as in the grandest of all the arts, architecture, and its most sumptuous decorations, painting and sculpture. Thousands of brains were at work in these various departments; some in the convent cell or cloister, as in the case of Fra Angelico, the sweetest, purest, and most pathetic of Italian painters; some in palaces, as in the case of the Duke de Medici, who spent ten years in perfecting ceramic treasures; others in ordinary studios or ateliers; and others, again, like the indomitable Bernard Palissy, with scarcely a roof over their rough workshops. And in the present day we have this mass of brain-work to look back upon. It is our heritage: left us by those who have gone before, for our guidance, consolation, emulation, and intellectual delight.

Having thus outlined the commencement and progress of art,—having seen how the ancient Egyptians gave one aspect to it, the heeded Assyrians another, the Persians, Hindus, Greeks, Etruscians, Romans, others, all distinctly marked by national characteristics,—we will turn our attention to the existing examples of ancient and modern art in this locality. Just as the annual overflowing of the Nile, Euphrates, Tigris, and Ganges influenced those who lived on their banks, and caused them to build protecting dykes and embankments, and form canals, so the situation of Northumberland, on the borders

of a hostile country, called into requisition buildings that were necessary for the protection of the inhabitants. The great Roman wall was the earliest comprehensive work to effect this object. This great stone barrier stretching right across England from sea to sea, with towers at intervals sufficiently close to admit of easy communication, and garrisoned stations here and there along the line, was as great a work in its way as we need wish to see. It answered its purpose when it was made, and there are fragments still standing, climbing over steep hills and dipping down into narrow dells, to teach us what may be done by courage and determination even in the teeth of hostilities. The Saxons availed themselves of its protection, consequently had no occasion for a similar defensive work; but we have remains of their architecture in this neighbourhood, as in the tower of Whittingham Church, and the chancel arch of Bolam Church, from which we may assure ourselves that art was not lying by in their days. And when we come to the gallant Norman and Edwardian castles, and the stately, I might almost say plucky, pele towers, or stone sentinels, scarcely anywhere across the border country more than three miles distant from each other, and the great grave-looking bastle-houses, we find the necessity for defence from powerful aggressors again giving a distinctive character to the country-side. Just as much as the poem of Chevy Chase stands apart in all literature, and its wailing notes in all minstrelsy, do the buildings of this tract of country stand apart in all architecture. Many of the churches belonging to this old time, as will occur to most of you, partake of this same stately, self-reliant, defensive character, their towers being either veritable pele towers, as at Ancofort, or capable of fortification, as at Warkworth, Egingham, and Long Houghton. Our own old parish church, St. Michael's, you will, doubtless, call to mind before I can do so, has a peculiar turret at the south-east end, for some defensive purpose, that places it at once apart from the open unassuming edifices of more midland counties. Norman window openings were small everywhere, but here they were smaller still, those in the church at Rock, measuring only a few inches in width. In Plantagenet times the same care, scrupulous, expectation, and preparation, were practised and made evident. In the days of the house of Lancaster, we may see by our grand, stern, rugged gateway into the town, Bondgate tower, every precaution against surprise and assault, was still taken; but in Tudor times, we may read on the old sunney, mullioned, stone stone of houses frequently built in the form of a wing to some of the older peles, the need for constant alertness was passing away. Thus the art of the district tells us its history.

Coming now in my rapid survey to examples of modern art in the district, we approach the great centre of order life, Alnwick Castle. The admirable Duke Algernon, in turning the great fortress into a treasure-house of art, and founding a temporary school of art within its precincts, planted the germ, as it were, of an extended appreciation of the fine arts in this locality, the first fruits of which have called us together this evening. Within the walls of Alnwick Castle, workers in nearly every department of art may now see specimens of their work, executed with a skill and fancy, that will make them impatient of less excellence in themselves, and so spur them on to greater efforts. The paintings,—I am now speaking of the frieze and other decorations, not the pictures,—the sculptured chimney-pieces, the carved ceilings, doors, and window panels, the inlaid dados, the Venetian mosaic pavement of the so-called guard-chamber, the opus Alexandrinum in the chapel, the ivory inlaid fire-place in one of the chief chambers, the smith's work, too, can be either examined usefully as lessons in different branches of art, or studied together as most sumptuous groupings of colour and forms. Those who look upon the interior of Alnwick Castle from a pictorial point of view will be reminded of the brilliant colouring of Titian, and of the soft blending of the delicate hues of his rival, Giorgione; and those whose artistic experience does not enable them to form such associations of ideas cannot but be impressed with its richness, hearty, and harmony. It will be, as I have said, a spur to others, an incentive to some, a consolation to more, and a repression to those who need repressing. Indeed, we can scarcely place a limit to the influence for good of such examples. Even the most simple-minded matron, whose

mind has never considered a question more artistic than the creation of an apple-dumpling or a roley-poley, will go home to her kitchen or parlour, after she has been permitted the privilege of seeing the art-treasures of the castle, less content with her four bare walls, and more ready to welcome the first approach of art. The flatirons and lucifer match-box will no longer appear suitable decorations for her chimney-piece; and she will be brought to think, "Wor Geordie might larn worse things than a bit draing."

SCHOOLS OF SCIENCE AND ART.

Technical Education for London.—A meeting of "Masters, Wardens, and Clerks of the Livery Companies of the City," has been held at the Mansion-house, under the presidency of the Lord Mayor, to discuss the best means of diffusing technical education among the working classes of the metropolis. His lordship stated that he thought their course should be, first, to adopt a resolution declaring the necessity and importance of technical teaching, and then for each company to discuss in its court the money assistance it would be prepared to give. Their grants might spread over three years, and at the end of that time they might severally and collectively review results. Mr. Buckmaster, from the Technical School at Kensington was present, and would give them some practical hints as to the best course to be pursued. It was indispensable that something should be speedily done, as manufacture after manufacture was leaving this country, and being taken up in foreign countries. Mr. Campin corroborated the Lord Mayor as to the rapid improvement which was perceptible in foreign work, but feared that no Government interference would be sufficient to educate the British workman up to the Continental level. It was for the Livery Companies to show themselves fit for their position, by taking the lead in such a movement. He suggested that the day's work should be to appoint a committee to draw up a plan. Mr. Sheriff Vallentin proposed a formal resolution, declaring it expedient that the Livery Companies should forward and prosecute the object of technical education. The proposition was carried unanimously. Mr. Buckmaster said that the proper system of technical education would be to teach theory in the schools, and to have practical application to the workshops. He exhorted the Livery Companies to undertake the good work, promising them that they need fear no injurious rivalry from South Kensington. The real danger to British work lay in the desire to produce it cheap, and the Livery Companies should seek to make it good. Their great object should be to obtain good teachers, and for that purpose examinations should be held and premiums should be given, as was at present done by the School of Science and Art. The proceedings terminated with the appointment of a committee, and a cordial vote of thanks to the Lord Mayor, now Sir J. C. Lawrence, bart., M.P.

The Coventry School of Art.—The annual meeting of this school has been held in St. Mary's Hall, under the presidency of Lord Leigh. There was a large attendance, which included a great number of ladies. The committee report that they are again enabled to show evidence of satisfactory progress,—an equal number of medals, one additional Queen's prize, a larger number of successful candidates in the examinations, a similar recognition of the merit of the master, and a higher general position for the school. An increased number of students have attended, the numbers being 189, against 165 last year. The awards of the Department of Science and Art are about the same as in 1868. The number of students who passed the March examinations in freehand, model, geometrical, perspective, and mechanical drawing was 48, against 35 last year; and the successful papers were 66, against 50 last year. The funds are now in a sufficiently satisfactory condition to allow an expenditure for paving the passages to the school-yard. Among the drawings of the year much good and careful work was pointed to in the report. The ribbon designs are in better taste, and better adapted to the manufacturers' purposes than formerly. The designs for watch-cases were fully up to those of former years.

Scientific Education in Newcastle.—A public meeting, convened by the committee of the Newcastle Mechanics' Institution, has been held in the lecture-hall of the Institute—under the presidency of the mayor—for the purpose of

considering the position of Newcastle with respect to technical education, and the propriety of further developing the Government scheme for scientific teaching, through the means of evening classes, for artisans.

It was unanimously resolved,—

"That the state of general, and more especially scientific, education among our working classes is behind the requirements of the times, which, in order to make progress therein, demand theoretical knowledge as well as manipulative skill."

"That in the opinion of this meeting the Government scheme for scientific education among the artisan class population is well adapted to promote that end."

The Abingdon School of Science.—The third annual public meeting of this school has been held in the County-hall. The attendance was very good, especially in the reserved seats. The mayor occupied the chair. He said it was with great pleasure that he saw the advance science had made in Abingdon. It had been very rapid, and in a short time he hoped to see greater results achieved by the members of the classes.

The third Annual Report of the Abingdon Science Classes" was read. It stated that while the success attained by the students has not been so high a standard as compared with the results of the two previous examinations, still there has been no diminution in the number of pupils, and their labours have been rewarded with a fair share of success, so that the progress has upon the whole been satisfactory. The school commenced its session of instruction in November last, having three classes, viz., animal physiology, inorganic chemistry, and physical geography. No less than fifty students entered their names to study in these subjects, and of those forty-four presented themselves for examination in May last; of this number twenty-six passed, viz., twenty males and six females—but of these only one was entitled to take a Queen's Prize. Twenty passed in animal physiology, five in inorganic chemistry, and one in physical geography.

The Keighley School of Art.—The annual meeting of this school has been held. Advantage was taken of the meeting to present to the students the prizes. A public tea meeting was held in the school-room, at which the pupils and their friends, upwards of 100 in number, were present. After tea, a meeting was held in the Mechanics' Institute, which was presided over, in the unavoidable absence of Mr. Isaac Holden, by Mr. J. Kitson, jun., of Leeds. During the year the school has made considerable advances in every direction in spite of the disadvantage under which it labours, for want of more commodious premises. Some new members have been received, the attendance has been better, and some higher class work has been executed. Mr. A. Stevenson, of Leeds, the master of the Keighley School, read the report of the Keighley Art Night Class for the year to March, 1869. The report spoke of the continued success of the school. There has been a great increase in the number of pupils who had entered the class, and never before had the nightly attendance been so good as during the twelve months since last annual meeting. I find, said the reporter, from the school registers, that 76 pupils entered during the year 1864, 92 in 1865, 67 in 1866, 72 in 1867, and 96 in 1868. The success of the students in the annual examinations has had the effect of popularising the class, and I am glad to state that the great proportion of the new entries consists of young men. The following table is given in the report, showing the successes in the various grades of examination for the last four years:—

	1866.	1867.	1868.	1869.
National awards (exceptional).....	1	1	0	1
Prizes for drawing (3rd grade).....	6	0	6	8
Drawings, "satisfactory" (3rd grade) 10	18	15	14	
2nd grade prizes.....	8	11	12	9
2nd grade passes.....	10	11	15	34
2nd grade "full certificates".....	1	6	5	5
Totals.....	38	60	53	71

"I will now conclude this report," said the master, "by drawing a parallel between what we are and what we confidently hope to be. We are at present a night class, divided possession of little better than a large collar, with no convenience whatever for puruating the higher branches of art instruction. . . . If we can do so much as a night class with such inadequate premises, what may we not do when, in a new and commodious building, with every requisite apparatus and sole possession, we rejoice in the name and advantages of a school art? That that position is awaiting us, we are happy to know. It has been pleasant during the last year to watch the slow and certain ascent of the walls of that building which is to be the future seat of our operations, and I do not think I am trenching on prophetic ground when I say that our next annual meeting will be held within the walls of that fine building. A few weeks ago I went over the building with Mr. Swire Smith, and was highly gratified with my inspection. The school of art portion, in which we are more immediately interested, is admirably adapted for its purposes, it having been the care of the Building Committee that every part of the structure should be exactly

suited for its peculiar uses. The school consists of three large class-rooms and an exhibition-room or picture-gallery, and will accommodate 150 students at one time. It is proposed to fit up these class-rooms with every appliance necessary for art study, so that when finished it will be a model school of art, and will want nothing but an influx of good students into its rooms to make it a successful school of art."

Northampton School of Science and Art.—The public distribution of prizes awarded by the Science and Art Department to the successful students of the science and art classes in connexion with the Northampton Museum has taken place at the town-hall. The certificates awarded to the students by the Society of Arts were also distributed. Sir Henry L. Dryden, bart., presided, and distributed the prizes and certificates. There was a very large attendance of the public. The report of Mr. C. Loes, science teacher, stated that—

"The subjects studied during the past winter were acoustics, light, heat, magnetism, and electricity. The classes were well attended, and the following successes were attained:—

First-class certificates.....	16
Second-class certificates.....	40
Third-class certificates.....	33

In the elementary and advanced papers in acoustics, light, and heat, the average monthly attendance was 45, and in electricity there were two failures in all, out of 70 who sat for examination.

In the elementary paper on magnetism and electricity the number of failures was large. It was a paper of exceptional difficulty, one that required good reasoning power; and this opinion, I have good reason to believe, is shared in by teachers and students of all other classes in that subject in the United Kingdom.

Classes are already formed for the ensuing winter in—Magnetism and Electricity; Acoustics, Light, and Heat; Animal Physiology; Inorganic Chemistry; and Physical Geography.

130 names are enrolled on the registers."

The report of the Art Classes stated that

"During the past year 67 students have joined the class—50 males and 17 females, their ages varying from 12 to 16. The average monthly attendance is 42. The greatest number attending during one month was 49 in November last, and the smallest number in one month was 20 in September of the same year. The average attendance for each evening during which the class has been open is 12 males and 10 females, making a total average of 22. The actual number of students who attend at the present time is 45. The favourable progress of the class is attested by the results of the examination held, under the direction of the Science and Art Department, on the 9th and 10th of March last. . . . There is no lack of power or of inclination on the part of the students; but the inconvenience of the present class-rooms, in which a concentration of light, which is essential to the lighting of a cast, cannot be obtained, is a serious prohibition."

The chairman urged attention to the subject of new rooms for the classes, as well as for the museum.

The Sheffield School of Art.—The annual meeting of the subscribers to this school has been held; Mr. F. Thorpe Mappin in the chair. The reports and treasurer's accounts having been read and adopted, a vote of thanks was given to Mr. Soumes, the head master, for the efficient manner in which he had conducted the school. The report of the council stated that the school, both with regard to numbers and proficiency, shows an improvement upon the last year. The statement of assets and liabilities showed a balance of 186l. 1s. 6d. in the hands of the treasurer.

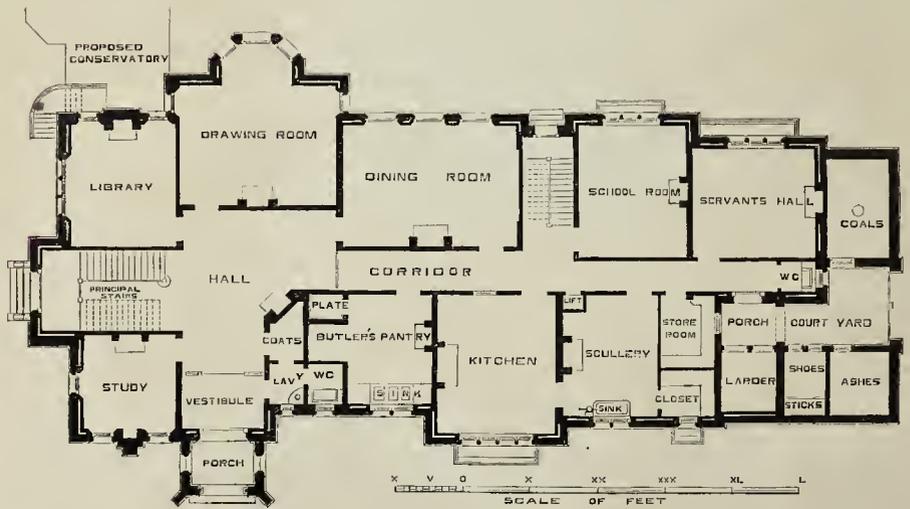

The Cirencester School of Art.—The committee of this institution have just associated with themselves new members to fill up vacancies which had occurred in their number. The school continues to be self-supporting, commencing a new year at Midsummer last with a balance of 2l. 12s. in hand, against 1l. 8s. 6d. brought forward. Some popular lectures in connexion with the school will be given through the aid of Professor Church in the course of the next two months. It appears that the public fails fully to appreciate the advantages offered by the school; and the young artisans are not so alive as they ought to be to their own interests in availing themselves of the benefits to be obtained there at the very small charge of something under 2d. a lesson.

Sea Water in London.—Various schemes have been proposed for supplying London with pure sea water. A company has just been formed, which has for its object to supply the metropolis with pure sea water at so low a rate as to bring it within the reach of all. It is proposed to draw the water from the sea daily by means of a steam-pump; then to filter it, and remove sand and other mechanical impurities. The company undertake to deliver daily, Sundays excepted, one gallon of water, at the rate of 1s. per week, and five gallons for 4s. 6d. For the present the delivery is limited to the western parts of London.

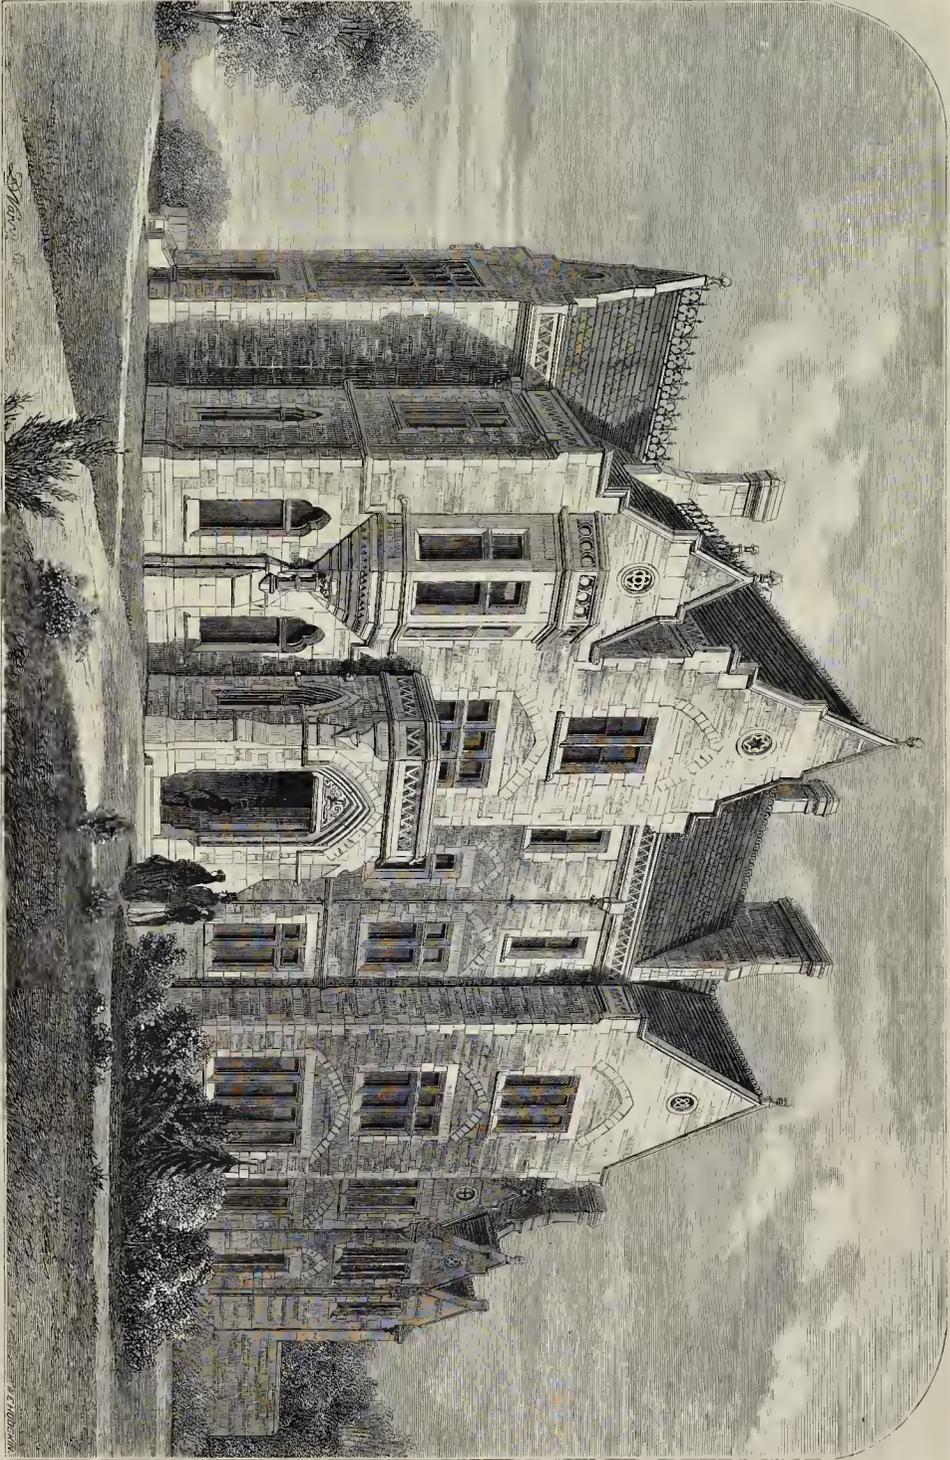

SIR M. DIGBY WYATT,
Architect of the India Office Court, Whitehall.

WOODBURN, NEAR DARLINGTON.
Plan of Ground Floor.

WOODBURN, NEAR DARRINGTON.—MR. G. GORDON HOSENN'S, ARCHITECT.

WOODBURN, NEAR DARLINGTON.

WOODBURN, the residence of Mr. Theodore Fry, is situated close to the town of Darlington. Commenced about two years since, it has just been completed, from the designs of Mr. Geo. Gordon Hoskins, architect. The building occupies a most picturesque site, surrounded by pleasure-grounds of moderate extent, and commanding an excellent view of a beautiful wooded valley banking the river Tees, with the Cleveland Hills in the distance. The external walls and dressings are of stone from the Dannhoushe quarries, near Staindrop, Yorkshire, the former being faced with coursed and gauged pitched blockers, with played beds and vertical joints, and backed with rubble-work to the width of 15 in.; then occurs a cavity of 2½ in., and a half-brick lining walled in cement, the lining being tied into the stonework by means of wrought-iron ties. The shaft to the oriel window is of red polished Aberdeen granite; the slating is of Bangor slates, with every alternate four courses cut to pattern, and it is furnished with iron cresting. The principal corridors and offices on the ground floor are laid in somewhat of the English baronial style, and has a good effect from the entrance-hall. The joiners' work is of wainscot, oak, St. John's pine, and red deal, the latter being stained and varnished.

The contractors for the various works are as follows:—Masonry and brickwork, Mr. Thomas Robson, Darlington; carpenters and joiners' work, Mr. John Windale, Darlington; slating, Messrs. Wharton, Darlington; plastering, Mr. R. M. Ormrod, Carlisle; plumbing and glazing, Messrs. W. Russell & Sons, Darlington; painting, &c., the late Mr. W. Garthwaite, Darlington; carving, Messrs. Farmer & Brindley, of London. The cost may be considered as between 2,000l. and 10,000l.

THE MARQUIS OF BUTE ON ART.

THE Marquis of Bute presented the prizes at the Cardiff art and science classes, and in the course of his speech observed,—"There is an immense quantity of early-woven tapestry, the plunder of private houses at the time of the revolution, to be had in France,—so much so, that, being at Lyons the other day, on the occasion of a great public festival, I found the streets in many places hung all along with old tapestry, sheets, and flowers. This woven tapestry came in about the time of the Renaissance, to fill the place of the embroidered hangings of the Middle Ages, and later we find the place of the simple hangings supplied by stretching stuff, generally silk damask, tight over the walls, as is common in large London houses at the present day. This has a richer effect than paper, but besides the great cost, which must forbid it, as well as woven tapestry, to many, it shares with woven tapestry the great defect of losing the grace and elegance of the older hangings. It is to the old practice of hanging the wall with stuff rather than painting or papering it that I would particularly direct your attention. Pictures can very well be hung upon it. Paper, however, is now come to be the most ordinary covering for our walls. A person whose taste will make careful choice of a paper whose pattern does not offend, as many do; and in this matter Pugin lays down the same rule as regards carpets, viz. the avoidance of anything like an attempt at the representation of shade or perspective. In accordance with this, we shall find that the best patterns are those after the manner of diaper-work, both for effect and for propriety, and a little care will select those whose colours and patterns are most suitable, considering the use to which the room is to be turned, and the colour and kind of the rest of the furniture. Concerning ceilings, the rule of adhering to the useful only, and not of forming structures specially for the purpose of ornament, is fatal to many flat plaster ceilings, which are simple screens to hide the construction. The plainest good ceiling is of wood, and, as in panelling, the natural advantages of the wood should be carefully utilised. The effect of an open wooden ceiling thus produced is very pleasing. If further ornament be required, the wood should be painted in an effective manner, which ought to be light and more brilliant than the objects below. We find that the decoration of old wooden ceilings was frequently, as in nature, a powdering of stars; and heraldic decorations are very well adapted, by their brightness, to occupy this position. In large roofs, where carving has

been added, the effect has been splendid in the extreme. Where convenience has made it desirable to have a flat roof, this has been made the object of some beautiful decoration. I think I am not mistaken in saying that a magnificent specimen of this treatment remains in Peterborough. I am altogether innocent of an extraordinary scheme which has recently been attributed to me for filling the windows of a certain cathedral with plate glass, to be further disfigured by having coats of arms cut on them, like the so-called decorations of some decanters and wine-glasses."

HUNGERFORD BRIDGE AND WELLINGTON-STREET VIADUCT.

THE select committee on this proposed undertaking have issued their second report. In it they say they have come to the following resolutions, which they have agreed to report to the House:—1. That no general control over works and buildings in the metropolis constructed under parliamentary sanction, is at present vested in any government or public officer or department, other than that now exercised by departments of Government over the buildings that are under their superintendence. 2. That the design and execution of unsightly works, such as the Charing Cross Railway Station, and the railway bridges across the streets and roadways of the metropolis, as well as the juxta-position of the London, Chatham, and Dover Railway Bridge, and the New Blackfriars Bridge, across the Thames, may be reasonably attributed to the fact that railway, gas, water, and other public companies, or corporate or chartered bodies, have not been hitherto required to deposit any designs, elevations, or models of projected works or buildings when applying for Parliamentary powers. 3. That having regard to the improvement of the metropolis, and as a security against its further disfigurement, it is desirable that whenever any public company or corporate body applies for Parliamentary powers to enable it to execute any works, or erect any buildings in the metropolis, or to raise money for the execution or erection of such works or buildings, it should, before coming to Parliament, deposit at the office of the Commissioners of her Majesty's Works and Public Buildings plans and elevations, designs or models, in like manner as railway companies are now obliged to deposit plans and sections at the Board of Trade; and the committee recommend that the standing orders be amended, so as to effect this object. 4. That the First Commissioner of Works should report to Parliament on such plans and elevations, designs or models, and that such reports should be referred to the committees on private Bills in the same manner as the reports from the Board of Trade and Admiralty are now referred.

JOHN HOPE, ARCHITECT.

At a meeting of the Liverpool Architectural Society,

Mr. Parslow read the following notes relative to John Hope, an architect formerly practising in Liverpool:—

In a recent copy of the *Builder** the names of the architects are given who competed for the Dublin Exchange, one hundred years ago. Comments are made upon a few of these names, and it is added, some knowledge of others may be possessed by readers of the *Builder*. I possess information with reference to the Liverpool firm whose name appears fifth on the list; my authority is my brother-in-law, who is the great-grandson of Mr. John Hope, the senior member of this firm.

John and Samuel Hope were sons of John Hope, architect and builder, of Millington, Cheshire. John was born in the year 1734, and Samuel in 1737. The father was architect to the Earl of Stamford and Warrington, at his seats, Dunham Massey and Enville; he was also the architect of Knutsford, Cheshire, and of several residences in that county. His sons succeeded to his business, and came to Liverpool about the year 1763. Samuel died shortly after engaging in the competition referred to. John's books, still in existence, which were most elaborately kept, show that he was engaged frequently by the Corporation of Liverpool. He prepared plans for the rebuilding of St. Nicholas' Church, for which he was paid, but there is no record of

his continuing the work. He was also engaged as architect in the erection of St. Paul's Church, though there is no record of his preparing plans for it; some interesting particulars, however, appear. For attending Parliament and conferring upon the Churoh Bill he charges the Corporation one guinea per day for forty-five days. He also charges an annual salary of 52l. 10s. for his services for several years in building the church. The name of Timothy Lightholler, who prepared the accepted design for this church, is often mentioned by John Hope in his books. He was further engaged in making additions to St. Domingo House, the residence, for a short period, of one of the royal dukes. Among other clients appears the name of her Grace the Dowager Duchess of Athol; also the Leigh family, of High Leigh Hall, Cheshire; the Humdells, of Ince; and the Earles, Stanley, and Booths, of Liverpool. Wavertree Church was also built by him. A most complete diary still exists of his private and business matters, which he kept every day for twenty-eight years. An entry is made in his day-book relative to sending off his drawings for the Dublin Exchange; but his diary does not commence until the year following. A note worth mentioning also appears of an agreement to pay Mr. Byrom, his draughtsman, 40l. per annum for three years. This Mr. Byrom subsequently married his daughter, and succeeded to his business at the beginning of this century. The last entry in his diary was made fourteen days before his death, which took place in his seventy-third year, 1808.

In his diary are notes showing that he was an interested observer of political events, which subjects are also introduced into his business letters from the Earl of Stamford and Warrington; and a poem, expressing gratitude to God for Mr. Hope's recovery from a serious illness, written by one of three orphans whom he took under his care, represents him as remarkably benevolent and kind to the poor.

THE BRIGHTON BOARD RECOVERS ITS REASON.

IT is with unusual satisfaction that we greet the official promise that the directors of the Brighton Railway "have determined upon carrying out a revised and reduced scale of fares, together with increased facilities for season tickets on and from the 1st of January next."

We have had, our readers will remember, repeated occasions to contend against the suicidal policy which is thus happily abandoned. The question is one which finds its place in our columns as a thoroughly building matter; in as much as it has directly affected the residential value of the property along the course of the line, and has led, not only to the discontinuance of building, but to the vacating of many residences actually let. The residential effect of a given line of policy, or even of a given system of management (or mismanagement), is a subject eminently interesting to our readers; and it is highly important to remark that it is precisely this aspect of the subject which, as we have ventured to anticipate, has at length proved decisive.

Week after week have those who studied the returns of railway traffic found them to give the same unmistakable indications. Increase of returns have been normal with all the lines running to London termini, with the significant exception of the London and Brighton railway. The opening of the new Midland line, indeed, has caused a division of the northern traffic, which would, without reference to this fact, present an anomaly; but the explanation, in this case, is fully adequate, and no such circumstance has occurred in the South-Eastern district.

We can well believe that the decision of the Board comes not one hour too soon. We do not mean too soon for the dividend to be carried in the first half-year of 1870, but for the sake of those residentially interested. A suburban region, in every respect equal in its local advantages to the Sydenham and Norwood district, has long been left comparatively virgin, for want of that communication which is now one of the first requisites of civilised life. The swelling and wooded hills to the north of London, the line of eminences outward of our English Montmartres, have only very recently been approached by railway communication. The Great Northern and the Midland Railways are now aiding, or emulating, one another in supplying this missing link. The basin of the Brent, the country about

* See p. 781, ante.

Hornsey, Crouch End, Hendon, Edgware, Stanmore, is the best peopled and most rural district within an equal distance from town. There can be no doubt that, as in all previous cases, the builder will wait upon the engineer, and that the best energies of the Brighton Board, if directed to the encouragement rather than to the destruction of a residential traffic, will not do more than enable the south-eastern suburban district to keep pace with the growth of its diametrically opposite neighbour.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the meeting of this Society on November 3rd, the prize offered by Mr. Pictou for the best sketch-book made by students during the summer, was awarded to Mr. Oakley, a pupil of Mr. H. H. Vale. It was stated by the secretary that Mr. C. E. Smith, of Liverpool, sculptor, had volunteered his assistance for the present in giving instruction to the figure-drawing class in connexion with the Society, and that the class would shortly re-open. Mr. J. A. Pictou exhibited a great number of sketches taken during a recent tour in France, Italy, Switzerland, and Germany, and gave some account of the progress of architecture in the various localities he had visited.

At a special meeting of the Society, held on the 5th ult., a report of the sub-committee appointed to consider a proposed amendment of the Liverpool Building Act was read, and formally sanctioned by the meeting, and ordered to be forwarded to the town authorities. The main object of the report, which dealt only with a portion of the subject, was to recommend the appointment of a competent tribunal, or jury of experts, who should have power to adjudicate upon, and sanction a deviation from, the letter of the Act, as to construction of buildings, whenever such deviation could be shown to be desirable and advantageous to the public.

THE WHITECHAPEL SCANDAL.

SIR.—The newspapers have recently given prominence to the doings of the Metropolitan Board of Works and some of their officers with reference to the new street now being constructed by that Board from the end of the Commercial-road into Whitechapel; and at the meeting of the Metropolitan Board of Works on Friday, the 5th inst., the committee, to whom the inquiry was delegated with reference to the construction of the coal-vaults and sewer (being portions of the contract for the formation of the new street in question), brought up their report. The substance of this report is, "That the concrete over the coal-vaults, although it had been made two months, was not yet hard. That the third ring of brickwork over the same vaults was not built with whole bricks." This is the sum of their fault-finding. Now for their recommendation, which recommendation was adopted by the Board.—"That Mr. Cooper (the assistant engineer) is censurable for having neglected his duties in permitting a portion of the works to be carried out in the defective manner which an examination has disclosed."

Now, sir, I feel certain that the public are not aware that this gentleman, whom the committee have thought fit to thus hold up to public condemnation, is the same Mr. Cooper who carried out the construction of the new road leading to Victoria Park, called the Burdett-road; the Northern High-level sewer, extending from Old Ford, Bow, to Hampstead, nine miles in length; the Northern Outfall sewers extending from Old Ford, Bow, to the Thames, at Barking Creek, and 5½ miles in length, over a difficult district, and nearly 20 ft. above the level of the marshes over which it passes; the Northern reservoirs in the marshes, covering an area of 10 acres, the whole vaulted and groined; the Northern Low-level sewer, from Abbey Mills, Stratford, to Tower-hill; the Abbey Mills Pumping Station and engines, the largest work of the kind in the world; the Isle of Dogs branch of the Northern Low-level sewer, a portion of which is laid in the bed of the Thames, 35 ft. below high water; and the Thames Embankment, between Waterloo Bridge and the Temple Gardens, the cost of the whole of which is over two millions of money, and have been constructed without failure or settlement of any kind.

I fear the enumeration of all these works may be tedious, but as I believe it to be only an act of justice to a badly-treated public servant, I

must ask you to allow me to state the works which were under Mr. Cooper's supervision at the time this so-called neglect of duty is charged to have taken place.—Isle of Dogs and Blackwall sewer in connexion with the Millwall Dock (case of arbitration); construction of siphon under entrance to London Dock; construction of Low-level sewer from Tower-hill to Blackfriars Bridge; new street from the Mansion House to Earl-street; Thames Embankment from the Temple to Blackfriars Bridge; also all the work under contract over the district (the whole of East London), of which he has the general supervision. These works, I am told, when finished will cost over a quarter of a million of money. As I have the above facts from a member of the Board, I think I am justified, with your permission, in laying them before your readers. The moral of the matter is this, that although you, as a public servant, may have for years discharged most important duties in the best possible manner, you may at any moment be held up to public censure over a paltry and contemptible work, such as the construction of an ordinary coal-vault, at the instigation of men who have no scientific or practical knowledge. Should men's reputation be thus frittered away?

T.

COTTAGE HOSPITALS.

Dean Forest.—Lady Danraven has added another institution to the village of Clerwell. She has provided schools for the instruction of its children, a reading-room for its young men, and a church; and now she has erected a cottage hospital. It is completely furnished, and replete with all proper appliances, while it is even architecturally an addition to the appearance of the village. Mr. J. Middleton, of Cheltenham, was the architect. The hospital has been opened by Lady Danraven, in a quiet manner.

Oswestry and Ellesmere.—The chief stone of a cottage hospital has been laid, with Freemasonic ceremonial, at Oswestry. The new building is situated in the Welsh Walls, about 150 yards from Willow-street. It is being erected from the designs of Mr. W. H. Spaul, architect, Oswestry. It is to be built of red bricks relieved by white Ruabon bricks. The windowsills, heads, and other stonework are from the Cefn Quarries Company. The roof overhangs at the eaves and gables, the latter having ornamental large boards. The whole design is of a Gothic character; but from the smallness of the amount to be expended on the building there will of necessity be very little ornament. The internal arrangements comprise, on the ground floor, general dining-room, 21 ft. by 13 ft. 6 in., nurses' sitting-room, surgery, bath-room, kitchen, larder, scullery, wash-house, coal-house, wood-house, ashes-cellar, &c., as also two wards, one to accommodate four beds, and the other two, allowing about 1,400 cubic feet of air to each bed. To these there is a nurses' kitchen attached. The first floor, which is approached by a wide staircase, has the same ward accommodation as the ground floor, a sitting and bed room for the matron, as also a bedroom for the head nurse, and store-rooms. On the upper floor are four large bedrooms for the nurses. Messrs. W. Trow & Sons, of Wednesbury, are the contractors for the whole building.

Melksham.—The Cottage Hospital here having now been in existence for more than a twelve-month, the committee have issued their first report, which is of a gratifying and encouraging character. The hospital is a small house, fitted up with the necessary beds, baths, and appliances. The expenses of fitting up the house and furnishing it, amounted to 621. 17s. 3d., which amount was raised by donations. The year's expenditure has been 841. 18s. 10d., and the number of patients who have benefited by the outlay has been thirty, of whom twenty-two have been discharged cured, four have been relieved, two discharged as incurable, and two remain under treatment.

Mr. W. T. M. Torrens, M.P., lately delivered a lecture on "The Relief of the Sick in the Hospital and the Home," in which he pronounced strongly against hospitals, and in favour of home treatment. The *North Londoner*, in commenting on this, asks how a case of typhus or amputation progresses under a busy wife and rascally children, or in a house packed with inmates from attics to basement? Mr. Torrens, however, also advocated "cottage hospitals" where the sick could be seen by their friends, and

which could be cleaned and disinfected with ease, and closed when unnecessary. The movement to set up such hospitals ought to be more generally encouraged than it is.

THE GREAT AROID.

THE *Builder* was one of the first to record, some six months ago, the discovery of a new and gigantic plant in the Chontales Mountains of Central America. As was then surmised, the plant has proved to be new to science, and in the words of Dr. Berthold Seemann, its discoverer, it is "the largest Aroid, both in leaf and flower, of which we have any knowledge." A few weeks after the paragraph appeared in this journal, two living roots were received in this country, and in a couple of months one of them shot up a leaf-stalk 7 ft. high, and 9 in. in circumference; the plant grows with great rapidity—several inches during a single night. Your readers will remember that it produces but a single leaf; this leaf, however, measures, including the stalk, some 14 ft. in length, with a corresponding spread. After this solitary, gigantic leaf has died down, the single flower (which is 2 ft. in length) appears. A living plant in the possession of a London plant-merchant was recently exhibited at one of the meetings of the Royal Horticultural Society, and was awarded an honorary distinction, and the critical parts of the flower are preserved in spirits at the British Museum. Referring to the leaf-stalk, Dr. Seemann writes, "It looks like a huge snake (beautifully mottled) standing bolt upright at the command of some Eastern charmer."

Dr. Seemann has, in the last number of the *Journal of Botany*, dedicated this giant Aroid to the conductor of this journal, under the name of *Godwinia gigas*, for several reasons which he is polite enough to print, but mainly because of early active support of window gardening in the metropolis, which "has spread amongst even the humbler classes that taste and love for plants without which, after all, the race of botanists would soon become extinct."

How strong this love of flowers now is amongst some of our working classes is well shown by Mr. Turner, the great nurseryman of Slough, who, in recently speaking of potted and carnations (to the growth of which there is very little encouragement given about London), said, he could not supply the demand there is for them, "especially amongst the colliers of Merthyr Tydfil and similar places." W. G. S.

WOODEN RAILWAY VIADUCTS IN YORKSHIRE.

ON some of the early Lancashire and Yorkshire lines of railway the bridges and viaducts are composed of wood, and the company now seem to be in a fair way of knowing the results attending such a state of things. The Huddersfield town council are just now taking an active and determined part, trying to compel the Lancashire and Yorkshire Company to reconstruct or render safe the viaduct on the Huddersfield and Penistone Railway, which was erected in 1848. The structure, which is composed of wood, crosses a deep valley at Denby Dale at a point where it is about 400 yards in length and 109 ft. in height. The timbers of which it is composed are crossed and bolted together, but it is held to be insecure. Several representations have been made to the company and to other parties, and at the last meeting a communication was read from Captain Tyler, who stated that a total weight of 167 tons 17 cwt. had passed over it, and had caused such vibrations as was usual at such a height, and he was of opinion that the speed of trains passing over the structure ought, as a matter of precaution, to be reduced considerably, as he understood that trains passed over it at a rate of from forty to fifty miles per hour. He suggested that a masonry viaduct should be erected, but as this would take between two and three years, he suggested that the utmost attention should be paid in the meantime to the timber-work. The company have just made another great improvement on another part of one of their busy lines where the chief of the bridges were of wood, and had become rickety with use. The North Dean Branch Railway, from Halifax, which was constructed in 1844, has been redoubled, and was opened a fortnight ago. The whole of the wooden bridges which spanned the Calder,

the canal, and the roads along its route, have given place to stone and iron erections. We may also mention the fact that the wooden bridge which crossed the river near Horbury, between Barnsley and Wakefield, has been replaced by a permanent erection.

PROPOSED NEW STREET FROM CHARING CROSS TO TOTTENHAM-COURT ROAD.

At a meeting of the vestry of the parish of St. Anne, Westminster, held on Thursday, the 4th inst., a plan for a proposed new street from Charing-cross to Tottenham-court-road, which had been proposed by Mr. Henry Bilgoad, the St. James's representative of the Metropolitan Board of Works, was taken into consideration, and the vestry unanimously resolved to support the proposed improvement by every means in its power. The suggested improvement would go through an inferior class of property, and would include in its length the roadways on the east side of Leicester-square and the west sides of the New National Gallery and Trafalgar-square, and would be the greatest possible convenience to the inhabitants of the metropolis. The estimate of the cost was stated to be about half a million. We have before now pointed out the necessity there is for a street precisely in this direction.

MEMORIAL TABLETS.

I LATELY observed in your columns a proposal to place tablets, with inscriptions thereon, on the buildings in towns with which some interesting event, or the residence of some celebrated person, or historical suggestiveness is associated. At a late meeting of the Local Board of Health in Leicester, the question was discussed, and by common consent, a small sub-committee was appointed to report thereon. It has occurred to me to ask whether you or any of your readers would inform me what kind of tablet it is desirable to select for the purpose had in view. Should it be of iron, wood, or stone? Should the letters stand in relief, and be painted, or how preserved? What kind of letter should be selected? Any hints on these heads would be acceptable.

MEMORABILIA.

* * * The Society of Arts decided on using terra-cotta tablets; but, up to this time, we have reason to believe a very successful result has not been arrived at by the makers. The question is well worth discussion.

ST. ANDREW'S CHURCH, STEYNING, SUSSEX.

This church, a magnificent fragment of a rich Norman church, has lately received some considerable improvements in parts where modern work had made it bare and out of keeping with the ancient work. The Norman part of the church, of which many illustrations have been published in "Rickman," "Britton," Parker's "Glossary," &c., is the nave of four bays with its aisles, and with the transverse arches at the end of the nave eastward. Originally the Norman nave must have been three or four bays longer westward; but after the suppression of the Alien Priories, of which this was one, early in the fifteenth century, the nave was shortened and closed up at its present length by a wall of Perpendicular architecture, with a large central window of that style, and a two-light window in the end of each aisle. The transverse arches already spoken of at the east end of the nave and aisles originally opened into the transepts, the church being cruciform. This form, however, it lost in the reign of Queen Elizabeth, when the old chancel, transepts, and central tower being pulled down, a small chancel and aisles were built where the central part of the cross had been, and the old material also furnished means to construct a very massive tower at the west end of the nave. This Elizabethan chancel was particularly bare and rude in its architecture, and within a few years much has been done to redeem its incongruous appearance. A fine east window of three lancets, with masonry of good character and internal marble shafts, was inserted about six years ago, and filled with stained glass from Messrs. Hardman. Now, at a cost of near £500., an arcade, also in the Early English style, has been added across the east end under the window, and returning along the sides of the chancel. This work has shafts of polished Ippelen marble carrying arches of Bath stone, the backs of the

panels lined with alabaster. The three central arches at the east end form a reredos, and their panels are filled with painting on tile by Messrs. Simpson, of London, with borders of gold mosaic. The alabaster panels are relieved by incised ornaments and lines, and the whole of this work, with the marble and masonry, has been executed by Mr. Houghton, of Great Portland-street, from the designs of Mr. Gordon M. Hills, architect.

WORKMEN'S INTERNATIONAL EXHIBITION, 1870.

A PUBLIC meeting has been held in the New Quebec Clubhouse, to promote the objects of this Exhibition. The chair was taken by Archbishop Manning. A deputation from the council of the exhibition attended. Letters were read from the Duke of Norfolk, Lord Petre, Hon. A. Herbert, and others, expressing their inability to attend, and their high appreciation of the objects of the Exhibition. The first resolution, "That this meeting approves of the objects of the Workmen's International Exhibition, 1870, and will support the council in carrying them into effect," was proposed by the Rev. W. H. Freemantle, seconded by Mr. Daniel Grant, and carried unanimously. The second resolution was moved by Mr. Paterson, and seconded by Mr. Bullock, "That this meeting considers it of great importance to the success of the Workmen's International Exhibition, 1870, that new inventions exhibited should be protected from piracy, and that all operations under the patent laws should be more simple and less expensive, and this meeting authorises the chairman to sign a petition to Parliament, prepared for the purpose, on behalf of the meeting." This resolution was carried by acclamation.

THE FORTHCOMING INTERNATIONAL EXHIBITION.

The following tenders were sent in for the execution of the works to be erected by her Majesty's Commissioners for the Exhibition of 1851 at South Kensington, for the forthcoming Annual International Exhibitions.

For the main building:—

Cubitt & Co.....	£72,200 0 0
Holland & Hansen	71,800 0 0
Mansfield, Price, & Co.....	70,900 0 0
Smith & Co.....	68,407 0 0
Lucas Brothers	68,335 0 0

For the conservatories over the arcades:—

Holland & Hansen	£5,940 0 0
Smith & Co.....	5,896 0 0
Mansfield, Price, & Co.....	5,550 0 0
Cubitt & Co.....	5,750 0 0
Lucas Brothers	5,698 0 0

Messrs. Lucas's tenders were accepted.

The tenders for the terra-cotta decorations were as follow:—

Pulham	£3,867 0 0
Gibbs & Camling	3,748 0 0
Wilson & Co.....	3,700 0 0
Blanchard, Sons, & Co.....	2,860 0 0

Messrs. Blashfield, Cliff & Son, Lindsay & Anderson, and the Coalbrookdale Company sent in tenders for portions of the terra-cotta. The Messrs. Blanchard will execute the work.

ENGINEERS AND COMMISSIONS.

SIR,—There is a great outcry from the engineers against the insinuations of dishonesty contained in the Governor-General of India's order; and, perhaps, with some reason; though, as I think, the protestations are overdone.

No one doubts that such men as Mr. Hawkshaw and Mr. Gregory are the very soul of honour, and that there are not a few members of the profession worthy to be ranked with them; men of spotless integrity, who would scorn to stoop to the meanness of accepting fee or bribe in any form, and who would resent the offer as the greatest insult that could be done them.

May their tribe increase! But are all engineers, because they are engineers, immaculate? And is there any better ground for believing there are no dishonest engineers, than there is for believing all merchants honourable, all contractors scrupulous, all lawyers disinterested, or all grocers innocent of adulteration? Will Mr. Hawkshaw throw his weight over the entire brotherhood? Unless common talk and rumour be entirely groundless, gifts of money, of pianos, of carriage and pair, of gold watches, and other valuables from contractors to engineers are not

unknown transactions. Matters like these are of all things the most difficult of proof, as it is the interest of both sides to preserve absolute secrecy. I should like utterly to disbelieve such rumours, and believe every man with whom I dealt as engineer or architect to be impregnable to such approaches, or even to *undis personal influence*, and as impartial and upright as those ought to be "whose decision is to be final and binding on all parties." One excuse for contractors, perhaps, is that while the engineer or architect is thus supposed to be a disinterested party and sole arbiter, he is employed or retained by *one only*, and may be supposed to favour that one, except there be some counterbalancing influence.

Every honest man must wish all conditions and customs modified, or done away with, that hinder perfect equity for all parties. "A fair field and no favour" is our motto. Further, engineers should not issue specifications unless all conditions are meant to be insisted on. The reverse is very frequent, and is a great evil, but I cannot now enter into particulars.

IRON-WORREER.

THE INDIAN GOVERNMENT AND THE ENGINEERS.

At the first ordinary general meeting of the Institution of Civil Engineers, held on Tuesday, the 9th inst., Mr. Gregory, the president, on taking the chair, set forth the steps with reference to this matter that had been taken by the council, and with which our readers are acquainted. At the close of his remarks he said:—

"If in the engineering profession, as in others, there may be instances of secret dishonesty, such acts are not recognised as legitimate. The profession has not sought to parade its purity before the world, but the members of this Institution know how carefully any one believed to be unworthy of it has been excluded from this representative body of the profession; and although happily such instances have been very rare, and such practices are from their nature most difficult of detection, yet steps have before now been taken, which have issued in some persons charged with misconduct ceasing to belong to the Institution."

THE FIRST VACCINATOR.

RECENTLY, in company with some friends, I drove from Swanage to the village of Worth (Dorsetshire), to look at the old quaint church which has lately been restored; and, in walking through the churchyard, read the following, which, at this particular time, when vaccination is so much talked of, I thought would not be amiss in your columns:—

"Benjamin Jesty, of Downshay, died April 18th, 1816, aged 78. He was born at Yetminster, in this county, and was an upright, honest man, particularly noted for having been the first person known that introduced the cow-pox by inoculation, and who for his great strength of mind made the experiment from the cow on the wife and two sons in the year 1774."

F. A. B.

CASES UNDER THE METROPOLITAN BUILDING ACT.

HOT-WATER PIPES.

A SUMMONS under the Building Act, issued at the instance of Mr. Edward Power, District Surveyor of the southern division of the city of London, against Mr. H. Watts, of 1, Water-street, Blackfriars, hot-water apparatus manufacturer, was heard at the Guildhall Justice-room before Sir Benjamin Phillips, on the 26th of October.

The infringement of the Act complained of was that the defendant had fixed a system of hot-water pipes at the premises of Messrs. Welch, 44, Gutter-lane, Cheapside, without having given the district surveyor notice of his intention to commence the works, as required by the 38th section of the Act.

The facts of the case were as follow:—

Messrs. Welch employed a builder, Mr. W. Brass, to make certain considerable additions to their warehouse, and the legal notice was given by him before commencing the works. This notice, however, gave no intimation that hot-water apparatus was to be put up in the new additions, nor was Mr. Brass employed to execute the works. Mr. Power surveyed the additions made by Mr. Brass, from time to time, during their progress, and on the last occasion of his visiting the premises he discovered the hot-water apparatus complained of, which was then completed, and consisted of pipes for conveying hot water laid on to or within 4 in. of the wooden flooring, and connected with a system of pipes which warmed the old premises. This work being contrary to the statute, which enacts section 27, rule 4, that "no pipe for conveying hot water shall be placed nearer than 3 in. to any combustible materials," the District Surveyor gave notice to the defendants to amend within forty-eight hours, which he neglected to do.

The District Surveyor proved that but for the accident of his visiting the premises after the completion of Mr. Brass's contract, he would never have known of the pipes having been fixed.

Mr. C. H. Clarke appeared for the District Surveyor, and Mr. Luxmoore, instructed by Messrs. J. & C. Robinson, appeared for the defendant. On behalf of the defendant it was contended, first, that the notice given by Mr. Brass, as it had the effect of making the District Surveyor aware of the fact of the hot-water pipes having been fixed, was a sufficient compliance with the Act; and, secondly, that Mr. Power having served the defendant with a notice to amend, was a waiver of his right to summons for neglect to give notice.

The Alderman, after consulting with Mr. Martin, the chief clerk, decided that the notice given by Mr. Brass was not sufficient, and that the District Surveyor was entitled to a notice from the defendant; and that the notice to amend, served by the District Surveyor upon the defendant did not preclude him from summoning under the 38th section, and fined the defendant 40s. and the costs of the summons.

ARCHITECTS AND CONTRACTORS.

SIR,—Sir W. Tite, M.P., in his opening address at the Royal Institute of British Architects, is reported by you to have said:—

'The Builders' Association had brought under their notice the very grave question of the relations between builder and architect, and had referred upon them a great many changes. His own experience supplied him with the fact that engineers never allowed any interference between themselves and their contractors or builders, but kept the whole of the affairs in their own hands, *as well as the settlement of questions of payment.* For his own part, he would say it had always been his own practice that he would not be interfered with *as architect.* If the work was ill done he interposed, or if the materials were bad he sent them away. But he had never, in any of his buildings, interfered with questions of payment to builders, and they would accept of him as the expression of a somewhat long professional life. It appeared to him, when a man had done his work, if any question arose out of the contract, he had the greatest right in the world to represent himself or to be represented in the matter upon a reference to indifferent parties. He was glad to find the Institute had come to the same conclusion, viz., that the architect should be the sole dictator in matters of architecture and building, *without interfering with the agreement between the employer and the builder as to the amount to be paid for the work.*'

This, I, as a contractor, think to be a very important step in the right direction, viz., of emancipating contractors from the oftentimes tyrannical and generally one-sided conditions of contract, which in recent years have become so usual as to leave contractors only Hobson's choice,—work on those conditions or not at all.

All trade transactions ought to be conducted on equal terms as mutual benefits, with no greater obligation on the one side than on the other, and all the degrading, rigorous, and unreasonable conditions with which contractors have been too often shackled done away with. I am convinced better work would be done under a régime where credit and honour were the stimulants than is done under the *in terrorem* system now in vogue, which puts a premium on cunning and craftiness, and discourages conscientious work for honour and credit's sake.

A CONTRACTOR.

COMPETITIONS—ONCE MORE.

So long as there are two cats in Kilkenny, so long will there be feline war. So long as there are two living architects, there will be competition. Disappointment, therefore may fret and fume and complain. The pages of the *Builder* may be, and will be occasionally, the vehicle of their groanings over disappointed hopes; but still they will compete again and again, led on by the *ignis fatuus* Chance, and under the old and tattered banner whose inscription is *divinopro spero.* It is only when the *spero* is extinguished with the *ignis* that they will give in. We have seen the fluttering moth,—poor foolish thing, say we,—again and again since his wings at the alluring flame, forgetting that to him the flame is not all brightness and dazzling joy.

What feature of competitions is there which has not been a hundred times decied? Unfairness, meanness, paltry favoritism, unjust weighing of merits, clever chicanery, juggling of picture lore, false estimates, local influence,—what more? Have not these been exposed enough? Yes, verily; and yet, if a gas balloon of competition be sent up, a score of gaping eyes are soon upon it, a couple of scores of eager runners set off in pursuit, whilst all the while the guiding genius who holds the silver strings will drop it down just where he will. The burned child dreads the fire, but the disappointed, wronged competitor is not so warned; and if he be what matter? there are a hundred others willing to try, to them, new experiment, as to whether they really can, Salemadder-like, play with fire and not be burned.

Practically, honourable men of position in the professions by and by will only enter limited competitions; they will mutually agree that the conditions of the race be fair and honourable before they run; it will be considered as vain to be joined in general throng, and they will rebuts with "all comers." Thus, in time it will be found that open competitions exclude acknowledged and experienced worth, and those who desire to have the labours of others for nothing will find that they hardly get the money's worth. I would suggest that it be matter for thought, and thereafter organization, that men of acknowledged standing do not compete, except on the "limited" principle; that the lowest premium shall be adequate to cover the actual cost of the labour performed; and the second shall be a sort of medium reward of merit; and the first shall in every case entitle the winner to the execution of the work on the usual professional terms. If the premium

is to be merged into the commission, be it so; we will not quarrel about this. I wish these men "all comers" were less so; and I am not a disappointed competitor. Only once have I competed, and I came in first; therefore I am free to mumble, but I have read so much, and heard so much, that I subscribe myself undeviatingly as one who heretofore will only enter a

LIMITED COMPETITION.

THE THAMES EMBANKMENT FOOTWAY.

LAST month a correspondent, through your pages, drew attention to the bad condition of the flagging of the footway of the Thames Embankment. The contractor acknowledged the justness of the remarks, and offered some reasons for the faults complained of. Since then, the footway has got worse and worse, the outer portion, as was pointed out, becoming frightfully broken up by settlement. The Metropolitan Board has been obliged at last to send men to lift and relay the flagging. Last week and this I visited the Embankment, and saw for myself the "cause and effect." The flagging on that part of the roadway next the river wall is laid on solid foundation, being over the arched subway; but the other half, being laid on a foundation of loose filled-up matter, composed of hard mud, rubbish, and river sewage, has gradually sunk from the commencement.

Added to this, the circumstances of the railway cutting in progress beside is another cause of the breakings and flagging. An inspection convinced me that the work of repair and relaying on the present substratum, is little better than labour in vain. In one month it will be quite as bad as before. Indeed, portions of the repaired work, which were only repaired the day before, had sunk again. The labourers employed, on being asked to acknowledge this, said joined in the opinion that what they were doing would have to be done over again. The circular-rim railings that protect the trees here in every instance sunk, and this lower connecting curb, which should stand up 6 in. over the grating, is supposed to be level with the flagging (but which in no instance is) in many cases resting on the said grating, having sunk in the general settlement.

It occurs to me that more labouring men, with picks and shovels, are not the class of skilful hands that are required for lifting and relaying the flagging. I should prefer to see a somewhat more masonic touch about the work.

KEEN'S CEMENT AND PAINT.

SIR,—I want some of your readers to tell me what I had better do under the following circumstances:—I have painted one side of a newly-made wall, and the other with Keen's cement. The paint was mixed,—red lead, turp, and gold size; it peels off. I should be glad to know how to prevent it.

A PAINTER.

LOOSE SLATES.

I EXERCISE in the *Builder* that a new patent tile is introduced. Time there was an improvement; the old irregular tiles are without fastenings save the mortar; say, save the mortar! Many come to grief by wind and rain; it is surprising that they last so long as they do. When they slip it often gives us the benefit of a glorious rain. Slates are secured by nailing, but the oxide, slip, slide off, and away. A gentleman told me that he had narrowly escaped from being killed by a slate falling off a high house; it grazed his nose and cut partly through the toe of his boot. A short earthenware screw and a little white lead instead of nails would be a lasting improvement. At present our roofs are insecure; the very pigeons can peck holes in our water-tights. R. T.

HOW MUCH IS A BUSHEL?

SIR,—Replying to a building-man's letter in the *Builder*, twenty-one bushels undoubtedly make a cubic yard; but a load of lime is not necessarily a cubic yard. Lime is sold in London by the yard, but in many parts of the country by the chaldron, which is thirty-six bushels. I never before heard of any specific quantity of lime being called a load, as is the case with timber.

The statement that sixteen bushels of cement make a cubic yard was, as I said in my letter, a copy from Mr. Tall's pamphlet of the proportions of materials to be used in concrete walls; in fact, I find it takes on an average twenty-three bushels (so called) of cement to make a cubic yard, the two-bushel sacks containing from half a gallon to half a bushel less than the pressed quantity. This I have tried repeatedly, and with cement from various manufacturers.

Does cement compress when in sacks with being loaded into carts or railway trucks? if so, what is the essential correct proportion of cement should be used, would there be no diminution of strength as there is of bulk?

The clearing up of this doubt would possibly be of service to others as well as myself. W. W.

ALLEGED INFRINGEMENT OF COPYRIGHT.

At the Westminster Police Court last week, Messrs. Holbrook, of the Manor Ironworks, Chelsea, were summoned for infringement of the Copyright Act in casting some fancy iron panels for staircases from the registered design of Messrs. Bates, Hayward, & Co., of London, and Rotherham. Mr. Newman, solicitor for the defendants, pleaded guilty, but said the firm had acted in perfect ignorance of going wrong. The model of the panel, then referred to, was sent to them from Messrs. Trollope's for casting, and had it been marked plainly "R. D." with the letter and number of the design," as required by law, the firm might have represented would never have been placed in this unprofitable position. Instead of this there was a mark so obscure that it escaped attention altogether, and not knowing it was registered, the firm made a copy of the design. When it was discovered an offer was tendered to make the fullest apology and pay costs. Mr. G. H. Hayward produced the registered design of an ornamental panel, to show that the work was properly marked, and Newman also produced the casting stated to have been

sent by Messrs. Trollope to defendants, and did not deny that they had the design in their possession, and were not aware they were registered.—Mr. Arnold, after inspecting both, said that although the statue imposing the penalties for violation of the registered design of a notice was the words "willfully" or "knowingly," they must be implied, as he could not punish a man for an infringement of something he was ignorant of. The mark on the casting produced by Mr. Newman was so obscure as to require a very close examination to distinguish it. He therefore did not consider this a case for any penalty, and should only require defendants to enter into their recognisances to appear for judgment to be called upon. If the casting and sale of the copies of the design were discontinued, they would hear no more of the matter.

THE LAMPS IN PALACE YARD.

SIR,—May I be allowed, in your columns, to set the attention of Mr. Barry to a point which has been remarked upon not only by myself? I allude to the unnecessary accumulation of lamps in the neighbourhood of New Palace Yard. Whether seen under the light of the sun, or in reflection from so many glass globes is extremely unpleasant, or by night, when the glories of old Vauxhall (with its thousand additional lights) are recalled, the present arrangement detracts very much from the dignity of the building. Is there any insuperable objection to the whole of the clustered lamps being lighted every night, and so dispensing with at least every other single lamp upon the railing round New Palace Yard, to its great architectural improvement, and to the removal of almost all the lamp-posts here, and about the other enclosures? A. P.

COMPENSATION CASES AT LIVERPOOL.

MR. J. J. ASTON, assessor, and a jury, in the sheriff and jury's room, St. George's Hall, have decided the amount of compensation to be given by the corporation, who seek to acquire some freehold property belonging to Mrs. Ann Pickles, Field-street, Everton. Mr. G. Goffey appeared for the claimant, and Mr. Rayner, town-clerk, for the corporation. The property in question is required by the corporation for improvement purposes, and consists of Nos. 25, 27, 29, and 31, Cazneau-street, being at present occupied as a public-house, a baker's shop, and private dwellings. For the claimant Messrs. Joseph Prattan, Birkenhead, and Messrs. Thomas, Wylie, and Kilpin, Liverpool, all experienced surveyors and valuers, were called, who estimated the value of the property at about 2,355l. Mr. W. H. Weightman and Mr. William Cuswagh, for the corporation, valued the property at 1,417l. 12s. 10d. respectively, after deducting what they considered the corporation were entitled to as credit for a vestment for 1,500l. Another case of compensation for compulsory sale of property for town improvement purposes has been settled. The property belonged to Elizabeth Haughton and others, and is in the same line of improvement as Nos. 73 and 75A, Rose-place, and No. 1, Cazneau-street. The amount claimed as compensation for the portion of the ground actually required by the corporation was, we understand, 1,500l.; but the claimants are said to have been content with a sum rather more than half of that amount.

"COMMISSION."

SIR,—The public press appear to have taken the cue from the Government authorities in India in denouncing the engineering profession as corrupt. It will readily be conceded by members of my profession that the system of bribery prevails to some extent in our ranks, and that engineers who are engaged in business relations with contractors, are exposed to strong temptation, and unfortunately sometimes prove frail.

I do not justify the evil complained of on any ground, nor do I say that corruption can be justified by showing that the system of commission, bribery, or whatever it may be called, prevails largely in the transaction of every kind of business. The world knows, however, that certain members of Parliament have abused the trust reposed in them; and how a Governor General of India that shall be nameless, came to grief for making an improper use of his position. We need only look into the transactions of the commissariat department, and of other departments of the army, to rest satisfied that corruption is not a disease peculiar to engineers.

Fronting that some few engineers are dishonest, it may fairly be asked why Government and the press should display such ignorance as they do in assuming that dishonesty is recognised by the profession, and that it is general. Both statements are grossly false, and have been rightly resented.

I will say that engineers are sometimes subjected to very strong temptation by their intercourse with contractors and the manufacturers of building materials. I have held office as engineer to a Local Board of Health, and have over and over again been offered what agents call *commission* on such orders as I might issue in this way. This is an evil that can only be remedied by engineers themselves, who should refuse to entertain any proposal whatever from firms who do their business in this way. The subtle and pernicious agent used by those people who have their hands in bribery is, that the local engineer is inadequately paid for his services; and thus being generally true, the weakest point in a man's conscience is assailed, and it is not much to be wondered at if he sometimes yields to the attack. A. J.

DISFIGUREMENT OF THE THAMES.

SIR,—Blackfriars Bridge is opened,—a fine work for generations to admire. Some few yards westward is the antiquated and still beautiful and venerated Temple, in remembrance of the civility of past ages. Between the Temple and the bridge is a vast reeking gaswork. How our modern Tempers allowed them to squat there is a wonder. Its proximity does not throw additional light on the ancient construction of the Red Cross Knights.

Perhaps it was to prove that they were assiduous to, and would not flinch from a *reform*, however foul. Cannot the Coke Company be asked away? There is a probability of making gas from water. A.

ABOUT TOWN CLOCKS.

A CORRESPONDENT in a recent impression, who signs himself "Pothecary," has the amusing reason why the Galway Town Commissioners will not vote a farthing to put the town clock of "the City of the Tribes" in repair. It may be, as he states, that they do not want to know what it is. Why not know and mend (mend), not time, are two of the undeveloped resources of Galway, and it has not the least doubt but public spirit would run high enough in the councils of Galway-to-morrow to vote a statue to the man who would succeed in re-establishing a Transatlantic packet station there, although there is not much corporate spirit alive among the members of the town council as would prompt a majority of them to vote even 5s. to put their wheezy and asthmatic town clock in repair. Galway, however, is not the only city in Great Britain that is careless about its town clock. A pretty extensive acquaintance with the principal towns and cities of the three kingdoms convinces me that there exists the same general reluctance on the part of town councils everywhere to keep their town clocks in repair. Whether the notices of important motions to be moved on a particular day, or the "motion for adjournment," as the clock strikes a certain hour on a Board day, has anything to do with the disarrangement of the time, or whether there is any occult manipulation practised by the finger of "a ghost in the bell" on the clapper for some wise and, I know not, yet I have often noticed that the sundial on the notices of many of our churches casts its shadows wider askance, and gave a far different tangent than the hands of the town clock did on its circle.

From the history of town clocks is written, there will be much valuable information imparted to the public. Many a barefaced lie will be revealed, many a broken promise will be heard of; many a specious resolution and unattainable amendment dissipated from the faded crypts of "the murdered innocents" struggled before and after their time, victims of abortion and miscarriage: each will tell its own tale, and the historian will be enabled to be particular as to dates, and the world shall understand.

I claim no intuitive perception or prophetic foresight in what I am about to state, but I will state my existence that the town clock in Ireland will be kept in repair in proper repair, as long as they are under the control of town councils.

Corporations, whether aldermen, town councillors, or mayors, presumptive or de facto (without any disclaimer I say it), are too much interested with the question of the spoils of office to bother their heads about what is merely a matter of time.

What customs and pastimes are there not yet in our midst! The clock is stopped on the wall in Ireland while the peasant corpse is waking; law and order are supposed to rule in our streets.

"While the watchman's loud snore breaks the peace that he keeps,
And the Lord Mayor (like the nightmare) on a full belly sleeps."

This is the age of brass and charitable donations: there could not think be a more commendable object than to have a subscription opened to defray the expense of repairing our town-hall clocks throughout the kingdom. It would surely be a work of charity and kindness to relieve our sorely distressed civic magistrates and provincial grand oracles from the great burden they bear on behalf of saucy, undertaxed, and well-to-do bodies of ratepayers.

"Those that think should govern those that toll."

The poet was right, by Jingo, and he would have made the picture complete if he had added that the toiler should be permitted to give the whole of his time on tick, for the purpose of reducing the rates, and keeping the town clocks in repair.

TINKERER.

Milroy, for "Description of Apparatus for Excavating under Water, and for Sinking Cylinders." 11. A Telford premium, in books, to Samuel Foster Bidder, jun., for paper "On Machines employed in Working and Breaking-down Coal, so as to avoid the use of Gunpowder." 12. A Telford premium, in books, to Charles John Chubb, for paper "Coal-getting Machinery as a substitute for the use of Gunpowder." 13. The Manly premium, in books, to David Marr Henderson, for paper "On Lighthouse Apparatus and Lanterns."

RAILWAY MATTERS.

The New City Railway.—Cannon-street, Broad-street, Moorgate-street, Fenchurch-street, Ludgate-hill, and Smithfield, are all well provided for. The Tower is the very district now most in need of a station on the London railways, and the Metropolitan District line was projected as much for the accommodation of the Tower district as any other in the course of its route. Wanting the continuation from Queen-street to the Tower, remarks the *City Press*, the new line is in competition with half a dozen others that have termini in the City. But carry it to its proper destination, and it supplies the last needful link of the inner circle, not only opening the way from west to east, but from north to south also, east of London Bridge. The afterthought of the directors suggests to us that they know nothing of the new Thames Tunnel, or of the Fenchurch-street Station, or of the probable future of the Great Eastern, or of the success of the Metropolitan and North London lines. Public opinion must determine the matter.

The Trim of Trains in Transit.—We are glad to note that the daily press is at last beginning to see the truth of what we have always insisted on, that no system of ropes, wires, or electric or other telegraphing apparatus from one end of a train to the other would ever suffice fully to secure the safety of passengers, and that nothing but a guard's bent along the whole train would do. The *Pall Mall Gazette* says on this subject:—

"A train is a moving street, and it needs a policeman on constant duty. The ridiculous contrivances of which passengers are invited to avail themselves when they want assistance are worthy of a board from Bedlam. What should we say to a municipality which should tell us that if, when we were walking in the streets, we want sudden protection from robbers, all we have to do is to break the window of a house, and pull a handle inside, and then somebody will telegraph to the station to send assistance? Or what should we say of the coffee-room of an inn, in which, if we wanted the waiter, we had to throw open the window, thrust the body half out, and catch hold of a cord stretched along the wall overhead, and then keep signalling till the waiter saw which window he was wanted at, after which he would tell the landlord, and he would speak to the cook, and then the waiter would come to us? The arrangements sanctioned by the Board of Trade as sufficient for railway passengers are no whit more sensible. You are locked up for an hour with unknown strangers; if a lunatic or a robber stuns you with a life-preserver or strangles you with his knuckles, you are requested to break a pane and turn a handle or to open the window and clutch at a cord. If, as in America, or Switzerland, or Austria, the guard could walk down the centre of the train, his functions as a policeman would come into play, and misadventure would be deterred because they could not tell when he might show himself."

ACCIDENTS.

Welbeck.—The roof of a temporary workshop has fallen in at the new works at Welbeck, whereby a joiner was severely crushed, and several others slightly injured.

Brentwood.—An accident has occurred at a new walling in course of erection near the railway station by Mr. Shurmer, builder, London. Two men were at work under an archway, when the brickwork fell, severely injuring a carpenter. It is believed the frost succeeding the previous rains caused the building to give way.

Cirencester.—The Corn Hall has narrowly escaped destruction by fire. For several weeks past plumbers have been engaged in laying down lead on the roof, in the endeavour to prevent rain from coming through. Their work was not far from completion, and, as on previous days, they had a brazier containing fire on the roof. The men left for dinner, and soon after it was discovered that the roof was on fire. A flame of fire a yard long ascended from the top of the building. Water was speedily carried up on to the roof, and the fire extinguished. The fire had melted the solder round the bottom of one of the ventilators, and on it thus becoming loosened at the socket, the ventilator rolled down the roof and fell among the crowd. The origin of the fire may be attributed to the incautious laying of a heated tool, but more probably from the falling of a coal from the fire in the brazier drifted by the wind.

Darlington.—A strong hurricane has blown down a house recently erected in Cobden-street. The building was scarcely completed.

Newcastle-upon-Tyne.—For some time past a church, in the Decorated style, has been in the course of erection for the Primitive Methodist body on the north side of Cambridge-street, and at the junction of that thoroughfare with Maple-street. A strong north-west wind had been blowing all night, and about 10 ft. of the west gable fell with a sudden crash into the interior of the building, carrying away a portion of the joists and a large Derrick crane. At this time, two masons were in the act of getting their tools in the cellars, and they were buried in the falling debris. A few minutes later fifteen joiners or so would have been in the interior of the building engaged in raising the roof timbers. One of those buried was found to be dead, but the other was alive, though severely injured, and has since died. The size of the chapel is 48 ft. by 42 ft., and the height of the ceiling, 42 ft. 6 in. It is calculated to accommodate nearly 700, while the total cost of the erection will be something over 2,000l. Mr. Matthew Thompson, Newcastle, is the architect; and Mr. T. Hodgson, Gateshead, is the contractor for the mason work.

THE PHYSICAL COMMOTIONS THROUGHOUT THE GLOBE.

THESE commotions still continue; but the crisis would appear to have passed, if the diminished force of the various manifestations is to be trusted. There have, however, been recent earthquakes in Germany, as well as in Italy and France, and in Russia and India, as well as in Australia, and South and North America,—in short, over all the globe. Professor J. Phillips, of Oxford, in his recent book on Vesuvius, gives it as his opinion, which accords with our own previously expressed idea, that the earth is now passing through one of its periods of volcanic activity. How long that period may last no one can say. Of late the theory has been advanced that earthquakes are caused by the influence of the sun and moon on the internal waters of the molten sphere. A Mr. Rudolf Falb has lately written in defence of this hypothesis. Our own, as our readers know, is that there is a continued pressure of rotation upon the crust, from the molten mass of the interior, which molten mass we still believe in, with many geologists, notwithstanding recent opinions to the contrary. This pressure from within has crises, during which its centrifugal tendency to expansion rends the crust, and so relieves itself, while the rents are healed, as it were, by intruding molten matter, which solidifies and re-cements the crust. The rendings are greatest in the more equatorial regions, and just because it is there that the centrifugal power of the rotation is greatest; but by reaction of the pressure, earthquakes and volcanic belchings from the interior occur even in such circum-polar regions as Iceland, and in intermediate districts such as Italy.

It was the opinion of Mr. Hopkins, of Cambridge, or rather his demonstrated conclusion from elaborate geological and mathematical investigations, that the power which has produced all the great rendings of the earth's crust must have been a power operative upwards from within; and this conclusion supports our idea that they arise from the rotary pressure of the molten and more mobile interior upon the less mobile or less yielding crust of the sphere. If the power of the rotation tends to increase with the known diminution of the obliquity of the ecliptic, the circumference of the sphere must be expanding; or, in fact, the molten and encrusted sphere must be growing in dimensions; and how far this may go, or what may be its limits in the course of ages, it may be hard to say. We have already spoken of the instructive light which the state of the other planets, as to coincident rapidity of rotation, size, and levity, sheds on this question.

The tidal wave predicted by Lieut. Saxby, as a consequence of the co-ordinate position of both sun and moon, did not occur with us to the anticipated extent, at the time predicted, but there have been tides since 5 ft. higher than the dreaded one, and which have done much damage on the banks of the Thames from not being looked for. The Americans say that the tidal wave on their shores rolled in as big as 18 ft. at Newcastle, New Hampshire, where it ran 125 ft. beyond high-water mark; and elsewhere, as at the Bay of Fundy, there has been an enormous tide, with destructive floodings. If the angle of the ecliptic was ever of much greater extent than it is, the most tremendous tides of waves of later ages must have been nothing

PREMIUMS OFFERED BY THE INSTITUTION OF CIVIL ENGINEERS.

The council of the Institution of Civil Engineers invite communications on various subjects, such as, first, authentic details of the progress of any work in civil engineering, as far as absolutely executed (Smeaton's account of the Eddystone Light-house may be taken as an example); second, descriptions of engines and machines of various kinds; or third, practical essays on subjects connected with engineering, as, for instance, metallurgy. For approved original communications, the council will be prepared to award the premiums arising out of special funds devoted for the purpose, and they have published a list of subjects on which they specially invite communication. This, we believe, may be obtained at the Institution. The council have awarded the following premiums:—

1. A Telford medal, and a Telford premium, in books, to M. Jules Gaudard, C.E., Lausanne, for paper "On the Present State of Knowledge as to the Strength and Resistance of Materials." 2. A Telford medal, and a Telford premium, in books, to William Sherriff, for paper "On the Outfall of the River Humber." 3. A Watt medal, and a Telford premium, in books, to Zerah Colburn, for paper "The American Locomotives and Rolling Stock." 4. A Telford medal, and a Telford premium, in books, to Thomas Nesham Kirkham, for paper "On Experiments on the Standards of Comparison employed for Testing the Force of Steam." 5. A Telford medal, and a Telford premium, in books, to John Elliott, for "Description of the Low-water Basin at Birkenhead." 6. A Telford medal, and a Telford premium, in books, to Professor Ansted, for paper "On the Lagoon and Marshes of certain parts of the Shores of the Mediterranean." 7. A Telford premium, in books, to William Henry Wheeler, for "Description of the River Witham and its Estuary, and of the various Works carried out in connexion therewith, for the Drainage of the Fens, and the Improvement of the Navigation." 8. A Telford premium, in books, to James Robert Moor, for paper "On the Mauritius Railways." 9. A Telford premium, in books, to Iurine Bell, for paper "On Sinking Wells for the Foundations of the Piers of the Bridge over the River Junna." 10. A Telford premium, in books, to John

to what probably once occurred, when the world may have "stood out of the water and in the water, so that the world that then was, being overflowed with water, perished," as St. Peter so mysteriously tells us, in regard to the scriptural deluge.

CHURCH-BUILDING NEWS.

Ruswarp.—St. Bartholomew's Church has been consecrated and opened. From the slope of the ground a considerable elevation had to be given to the east end. This point the architect has met by carrying his plain wall up to the sill of the apse windows. The church comprises nave, apsidal chancel, organ-chapel, children's aisle, vestry under tower, and south-west porch. The period of architecture on which the design is framed is the Early Decorated. As the whole of the church has been designed by the architect with the idea of receiving colour decoration, the roofs of both nave and chancel have been boarded to the curves of the principal timbers. The eastern wall of the apse has been painted by Mr. T. H. Rendman, from a design applied by the architect. The carving has been executed from natural types by Mr. Rusby, of Sheffield, though sparingly applied, on the score of expense. The whole cost of the church will be about 2,000l. Amongst the donations are a clustered column, the gift of Mr. Charles Saunders; a font, presented by Mrs. Belchar; and a stained-glass window for the apse, given by Mr. John Corner, the manufacturers of which, Messrs. Mayer & Co., of Munich, could not complete it in time for the consecration. Mr. R. Robinson, of Whitby, has carried out the whole of the works, from the designs and under the superintendence of Mr. C. Noel Armfield, of Whitby, architect. Mr. Deana, of Leeds, was clerk of the works.

Kimcote.—The village church here, after being restored, has been re-opened for Divine service. The work has been executed by Messrs. Law & Sons, builders, Lutetworth, under the direction of Mr. W. Smith, of London, architect. In the works just completed, the old staircase to a roof-loft was discovered in the south portion of the chancel arch, an early piscina in the south wall of the chancel, and a recess in the north wall, which probably contained an early ambrisey. A very small low side window was found in the usual position. The whole of the sixteenth century roof of the nave has been repaired, the western gallery which blocked up the tower removed, and a new roof placed on the chancel and aisle. The side walls of the chancel have been rebuilt, and the old four-light window restored and re-fixed. The south porch has been rebuilt on the old foundations; also the arch in the western end has been opened, showing a fourteenth-century window filled with stained glass. New seats have been provided for a part of the church, but there still remains much to be done, and the tower, which was in a very bad condition, requires rebuilding. A font, pulpit, and other fittings will be supplied as soon as the necessary funds are forthcoming. The cost of the present restoration is about 1,100l.

Shipton-on-Cherwell.—The parish church has been re-opened; the flat whitewashed ceiling having been removed, and the roof cased with timber, the chancel paved with encaustic tiles, and the whole building re-seated, together with other repairs and improvements, under the superintendence of Mr. Buckeridge (the builder being Mr. Selby, of Oxford), at an expense of upwards of 500l., including a small organ by Mr. Bevington, and an east window by Messrs. Heaton, Butler, & Bayne.

Stourbridge.—The memorial stone of a new church has been laid for the accommodation of the district of Stammer Mill, near Stourbridge. The plans were prepared by Mr. Thomas Smith, of Stourbridge, architect, for a church to accommodate 400 people. The cost of the actual building, it is said, will be under 5l. a sitting, but there are many extras, such as leveling the site, building retaining and boundary walls, warming and lighting, &c., which will make the total cost of the undertaking amount to 2,700l. The edifice will be Gothic, of the Early Decorated period. It will be built of brick, with stone dressings. The plan comprises nave and side aisles, chancel, and chapel, organ apparatus, and vestry, with crypt, for warming apparatus. A western and north porch will be the entrances. The chancel will terminate octagonally, and will be lighted by three two-light tracied windows. The nave will have five bays, and will have two trefoil-headed windows in each

bay. There will be one four-light tracied window in the west gable, a single-light trefoil-headed window in the end of each aisle, and four cinquefoil lights in each bay and clearstory. A bell turret will be framed in the roof over the east end of the nave. The aisles, passages, north porch, and chancel, are to be laid with black and red quarries, having ornamental tile borders. The seats, roof, and woodwork generally will be of red deal, varnished. The roofs will be covered with slates, and plastered between the rafters, except the chancel and west end of the nave, which will be boarded to groin ribs. The builder is Mr. Horton, of Brierley Hill. The contract for the church is 1,840l.; but 200l. had to be spent in purchasing a cottage in the middle of the site; the retaining walls will cost 340l.; warming apparatus, 120l.; and other items will bring the total outlay to the 2,700l. mentioned.

Dereham.—The portion of the new cemetery which belongs to the Established Church has been consecrated by the Bishop of Norwich. The site is contiguous to the town, and the chapel is visible from the adjacent highway, or from the railroad. The plans for the chapel and lodge were prepared by Mr. Brown, of Norwich, architect; and the contractor was Mr. W. Hubbard, of Dereham.

Criccieth (North Wales).—The parish church here has been re-opened for divine worship. The church is situated in a quiet and secluded spot in this rising watering-place, with its castle, sea views, and interesting neighbourhood. Those who recollect the unsightly low square pillars which divided the church in the centre, the irregular and inconvenient arrangement of the interior, and the prevailing damp, will feel that the rector did not take the good work of restoration and repair prematurely in hand. He had the professional advice of Messrs. Kennedy & O'Donoghue, of Bangor and London, architects. The church consists of a nave, the east end of which is portioned off for a chancel, these sections measuring 51 ft. from east to west and 17 ft. from north to south, and are separated from the north aisle by a colonnade of four bays, having moulded and segmental arches, and carved corbels, caps, and bases, and slender shafted columns. The stone used is from the neighbourhood of Knahon. The old oak roofs have been divested of their coating of plaster, and oiled. The slating has been partially renewed, and the centre lead of the gutter entirely renewed. There are two windows in the east gable, the one in the chancel partaking of the Decorated, and that in the north aisle of the late Perpendicular style. Seven windows in the north and south walls are to be replaced by others when funds enough are collected. The external appearance of the building is suitable to a rural district. These gables are crowned on the west gable of the nave by a bell-turret, with cross, and on the three others by terminals of various designs. The internal arrangements are now adapted for the accommodation of 350 people, in open seats, made of yellow pine, stained and lightly varnished. The oak altarpieces are adapted from the old church, and the reredos formed of old oak panelling partly carved, from the former fittings. The cost of the work has been nearly 500l. The works have been executed by Mr. Richard Lewis, of Criccieth, builder.

PROVINCIAL NEWS.

Falmouth.—The block of buildings situated on Bowling Green-hill, Falmouth, known as "Earle's Retreat," has been formally opened. The founder of the Retreat, Mr. Geo. Earle, of Philadelphia, in the United States, is a native of Falmouth, and, having realised a large fortune in America, has caused to be built, at his sole expense, a block of buildings, to serve as an asylum for the aged and deserving poor of the town of Falmouth. The site is one of the finest in the town, and commands extensive views. The Retreat, as described by the *Cornish Telegraph*, is in the Gothic style of architecture, and contains 32 rooms, 20 of which are occupied by two persons each, and the remaining 12 are single rooms, so that altogether accommodation is afforded for 52 persons, but it is contemplated, in case of emergency, to make the single rooms answer for two persons. The rooms are ventilated, and in each there is a fireplace, with imitation marble mantelpiece. The large rooms contain one large iron bedstead each, and the smaller ones one small iron bedstead each, and there are cupboards and other conveniences. The principal feature of the Retreat is the chapel, which is in the same

style as the other portions of the Retreat. There is accommodation in it for about 150 persons. The window facing the entrance is of stained glass, in the Geometric style. The Retreat is surrounded by a low wall and railings, between which and the buildings there are grass plots. The object of the Retreat is that a home, free of rent, shall be provided for deserving poor of Falmouth in their declining years, and it is entirely of an unsectarian character. At the present time 32 inmates have been chosen for the Retreat, varying in age from 57 to 84 years.

Gateshead.—The new town-hall is almost finished. The large room will be opened on the 23rd. There are seatings for nearly 1,000 people.

Miscellaneous.

The Derby Volunteer Drill Hall.—This new hall, in Newland-street, Derby, has been formally opened. The site of the building is about half an acre of ground at the corner of Becket-street and Newland-street, with the longest frontage to the latter. Accommodation is provided for a large drill hall, 150 ft. by 75 ft. in the clear. The principal approach to it is under an archway leading from Becket-street to the centre of one end of the hall, over which there is an orchestra; there are also two entrances from Newland-street. Along the sides of the hall recesses are formed for the arms of arms. The roof is constructed under one span with wrought-iron circular ribs carrying boarding and slates, and is about 35 ft. in height to the centre from the floor. The entrance-hall to the headquarters and buildings generally is from Newland-street, to the right of which and adjoining the drill hall is the reading-room, 30 ft. by 20 ft.; to the left, the orderly room; and facing the entrance a stone staircase leads to the sergeants' and officers' rooms, to the band practice and committee-rooms, and to store-rooms over. On the ground floor, to the left of the archway leading to the drill hall, are lavatories, armorer's-room, and kitchen. Within the site area also provided quarters for two sergeants, stables, and barrack yard. The buildings are constructed of red brick, relieved externally by stone dressings and a few coloured bricks and tiles. The outline is broken by a flag tower rising from the centre. The cost is about 5,000l.; Mr. Bridgford, of Derby, was the builder.

A New Velocipede.—Visitors to the Crystal Palace during the last few days have been struck by something novel at last, among the many velocipedes which the present demand has brought forth. For some time past the want of a machine combining speed with comfort, safety with easy recreation, has been felt, and velocipedes have been denied to the invalid and the aged. In this new machine (patented by Messrs. Farrall & Turnor, of Dublin), the old system of working with the feet is dispensed with; the weight of the body, thrown alternately on the saddle and on the footboard, as in horse riding, becomes the moving power, and the machine glides forward with ease, and according to the skill of the rider, with rapidity. Ladies, it is said, can ride on it with the same ease as on horseback.

A Project for Uniting Liverpool and Birkenhead.—Mr. J. F. Smith, of Leicester, has laid before the works committee of the Liverpool Dock Board a plan which he has devised for uniting the two sides of the Mersey. Mr. Smith's plan consists of a wrought-iron tube to be laid in the water, at a depth of 25 ft. below the surface, at a cost of 500,000l. for a mile. The works committee, we understand, while they would not pledge themselves to carry out the scheme, intimated that they would offer no opposition to it as long as the navigation of the river was not interfered with.

Condition of St. Pancras Infirmary.—Some painful disclosures illustrative of the manner in which the poor are housed in the St. Pancras Infirmary were made at an inquest before Dr. Lankester. A man 32 years of age, who had been placed in one of the wards, died from consumption, and the evidence showed that the atmosphere was of the most vitiated nature. The jury found that the man's death had been accelerated by the want of fresh air, and expressed a hope that the guardians would direct their attention to the state of the infirmary.

Clays and China Stone.—The returns stating the production of the more important clays and china stone in this country in the year 1868 show that Cornwall produced 100,000 tons of porcelain clay, of the value of 91,666l.; 29,000 tons of china stone of the value of 23,200l.; and 1,479 tons of fire-clay, of the value of 554l. The first two items show smaller quantities than in 1867. Devonshire produced in 1868, 12,000 tons of porcelain clay, of the value of 9,600l., and 45,000 tons of Teignmouth clay, of the value of 20,250l. The last item shows not quite so large a quantity as in 1867. In Dorsetshire, 150,000 tons of pottery and other clays, of the value of 3,750l., were obtained in 1868. There were also produced in Staffordshire, Yorkshire, Derbyshire, &c., 675,000 tons of fire-clays, of the value of 168,750l. These items amount to 1,012,479 tons of fine and fire-clays, of the value of 317,770l. This is not so large a return as that of 1867. A list of porcelain and other clay works working in 1868, compiled by Mr. Robert Hunt, the keeper of mining records, shows ninety in Cornwall in Devonshire, five producing porcelain clay, and four Teignmouth clay; and there were also eleven producing Poole clay, and sixteen in Staffordshire producing Stourbridge clay.

Well-Digging under Difficulties.—The want of water in Western India beyond reach of the river is the grand impediment to cultivation and civilization; it is accordingly a religious duty to supply it. One evening, says a paper in the *Cornhill Magazine*, a troop of the irregular force on march stopped at a few solitary huts; but they could find no inhabitants, and the well was dry. Seeing a hole with a heap of earth beside it, however, the officer looked down into the darkness, and a little old weak voice called out from the bottom, praying him, for the love of God, to draw up a basketful of the soil to the surface of the earth. He did as he was asked, and then the old man, still out of the depths of the hole, explained how he had vowed to dig a well; that for many years he had spent nearly all of every day picking away the earth with his little scoop; depending upon any passer-by whom he could get to help him for removing the "soil" by spoonfuls as it were, with a string and a basket, which he was too weak to do himself; he went up and down by some wretched bits of stick and cord; he had dug 40 ft. or more, and was expecting to reach water quickly. No hermit was ever more solitary.

The Manchester Free Libraries.—The seventeenth annual report to the City Council for 1868-9 has been printed. From this report it appears that the aggregate annual issues have increased from 807,961 to 893,648; consisting of 477,544 volumes issued to borrowers; 97,511 volumes issued in the news-rooms; 126,243 volumes issued in the reference library; and 192,350 specifications of patents. These issues do not include the periodicals and books which lie on the stands and tables, and are constantly in use, so that by taking into account a minimum rate of one perusal of only a single paper for each reader in the news-rooms, the ultimate account of actual circulation cannot be represented by a less number than 2,501,286! All the reading-rooms together can accommodate 791 persons. The number of readers actually present at one time has very often in the evening exceeded that limit, and amounted to 1,031; being 240 in excess of the number that can be conveniently accommodated.

The Granite of New Blackfriars Bridge. It is fair to mention that the granite used in this work was supplied by Charles Goodyear, the quarrier of the De Lank Quarries, near Bodmin, Cornwall. About 150,000 cubic feet were delivered in blocks of very large size. Upwards of 80 of these stones have been of the enormous weight of from 12 to 20 tons each, and about 200 from 6 to 12 tons, all of the grey granite, and of even colour. Twenty of the largest sizes, of from 12 to 20 tons each, were split out of a single block, detached from the general mass by means of blasting, and machinery on the spot.

Southern Vauxhall Waterworks Company.—The large reservoirs now in course of construction at Battersea are in a fair way of being opened about June next. Two hasins are being made, having an inlet into each other, to contain 24,000,000 gallons of water. The workmen are actively engaged in laying a concrete bottom. Messrs. Aird & Sons are the contractors for these works.

Zinc.—The returns obtained from the zinc mines of the United Kingdom show a production in the year 1868, of 12,782 tons of zinc ores, principally sulphide of zinc (black jack), the value being estimated at about 39,192l. The number of mines was 35,—18 in England, 15 in Wales, 1 in Ireland, 1 in the Isle of Man, 1 in England and Wales the chief production was from three countries—3,350 tons from Denbighshire, 2,858 tons from Flintshire, 2,061 tons from Cornwall; 3,278 tons were produced in the Isle of Man. The production of metallic zinc was about 3,713 tons, of the value of 75,436l. All these figures are lower than those for the preceding year, 1867. Prices were lower in 1868 than in 1867 in the London market, the mean price of spelter falling from 21l. 6s., in 1867, to 20l. 6s. 4d. in 1868, and the mean price of zinc (in sheets) from 27l. 7s. 6d. to 25l. 13s. 4d. per ton.

Telegraphic.—The injured cable of the Anglo-American Telegraph Company has been successfully raised. The defect was about forty miles from the coast of Ireland.—A new line of telegraphic communication with Europe, *via* Russia, was recently opened, and other lines being for awhile interrupted, a good many messages have been sent by it. The *Hambury Gazette* gives the following among other examples:—"London, 17th.—Alderman salomon tins salt haroms crawfords refused corranaly another agrilian assassination ireland careoton bnatry catholic archbishop Armac." "22nd.—letter popp Rummig Kunning contat all up non.—Catholics autr encomendial Concil for discussion from already contend abitary generally chained hoals ford times braves snppes deserued with drawtoc to presented spot his government saying excepted instructions and Washington government disavowes proedirm, &c., &c."

The Fireproofing of Furniture.—Every now and then, says a writer in *Cassell's Magazine*, loud noisings are heard about the importance of rendering the dresses of ballet-girls incombustible, but why should we not make our house incombustible and our furniture fireproof? It can be easily done, or rather it could be, if there were some sort of compulsion put upon builders and upholsterers. Timber is the material that needs the preservative, and it may be prevented from firing by simply impregnating it with a concentrated solution of rock salt. The fact has just been announced by a German chemist, who was commissioned to solve the question by a fire insurance company. Water-glass will act as well, but it is expensive. The salt renders the wood proof against dry-rot and the ravages of insects. A solution of it pumped out of a fire-engine upon burning matter would be vastly more effective than plain water.

The Open Space Question.—A meeting, presided over by Mr. M'Ullagh Torrens, M.P., has been held in the dining-hall of the Holborn Union Workhouse, to consider the means by which an "open space" of three acres in the Gray's-inn-road may be thrown open to the public. The "space" in question is the old burial-ground at Trinity Church, in the thoroughfare named, but beyond the boundaries of St. Andrew's, Holborn, and which is now surrounded by a high wall, which shuts out all view of this comparatively large piece of land. A resolution to the effect that it would be a great advantage to the people at large if the St. Andrew's burial-ground in the Gray's-inn-road were thrown open to the public, was carried unanimously, and also one to co-operate with other authorities in carrying out the purpose of the meeting.

A New Movement.—A petition to the Queen is in course of signature, praying her Majesty to see that measures are taken without delay to enable the large number of persons at present out of employ, and willing to work, to go to those portions of her Majesty's dominions where their labour is required, and where they may prosper and increase the prosperity of the whole empire. So says the *Beehive*. The petitioners also declare that they have heard "with alarm and indignation" that her Majesty has been advised to consent to give up the colonies, "containing millions of acres of unoccupied land, which might be employed profitably both to the colonies and ourselves as a field for emigration." The petitioners ask her Majesty to assemble her Parliament without delay, that they may inquire into the causes of the present distress, and seek a remedy.

Monument to the Late Robert Scott-Lauder, R.S.A.—The students who had attended the classes of the late Robert Scott-Lauder in the Trustees' Academy and in the National Gallery, have resolved, with the sanction of the family, to erect a monument over his grave in the Warriston Cemetery. The monument will be in the form of a slab of grey Sicilian marble, with an alto-relievo head of white marble in medallion, and an appropriate inscription underneath. The subscribers have intrusted the commission to their fellow-student, Mr. John Hutchinson, R.S.A., the sculptor of the bust at present in the library of the Royal Scottish Academy. The influence of Scott-Lauder's teaching seems to have been remarkably favourable on artists, as may be seen by the positions already attained by so many of his pupils, amongst whom may be specially mentioned Herdman, Pettie, Orchardson, Hutchinson, Cameron, Peter Graham, M'Whirter, M'Taggart, Chalmers, the Burrs, and others.

Rattening in Paris.—Forty shopmen belonging to the great hardware establishment of M. Hallex, Rue St. Martin, Paris, struck their work and left. But on reflection fifteen of them returned, whilst the others got employment in the Belle-Mengere, the remainder persisting in the strike. These latter have recruited other malcontents presented themselves, to the number of about forty, at the shop of M. Hallex, and wanted to compel the men there to follow their example. But resistance was made, an altercation ensued, and at last a personal struggle took place. Heaps of merchandise, frying pans, cans, and various culinary utensils were overturned, and some of the shopmen, and even M. Hallex himself, were bruised. In the end the assailants were repulsed. Six persons were arrested, and have been sent to the prefecture.

Sanitary Registration of Cottages.—Professor Acland, of Oxford, has had published, by Parker & Co., of Oxford, a specimen copy of "Forms for Registering the Sanitary Condition of Cottages of Labourers and Artisans for the use of Landowners, Officers of Health, Guardians, and Others." These forms have already been used in some districts ever since 1861; and extended knowledge, says Dr. Acland, has made me more than ever desirous to see the use of such forms more general. The form is composed on a single leaf: it is simple and easily filled up. In connexion with the state of drainage of the surrounding ground, we would suggest that the condition of pavement in yard, if any, should be noted.

Suez Canal.—We learn from the new journal *Nature*, that the President of the Royal Society, Sir R. Sabine, being unable, through pressure of official duty, to accept the Khedive's invitation to be present at the opening of the Suez Canal, was allowed to nominate a gentleman to represent the Royal Society on the memorable occasion. The President's choice, which has been approved by the Council, fell on Mr. J. F. Bateman, C.E. This selection will perhaps gratify the civil engineers as well as the Royal Society; for Mr. Bateman, who is now on his way to Egypt, has made himself known on the Mediterranean, by his land reclamations in Majorca and at the mouth of the Ebro.

Resignation of Assistant-Surveyor, St. Pancras.—Mr. E. Cunningham, assistant-surveyor to the vestry of St. Pancras, has sent in his resignation to the Committee of Works, on account of the state of his health and declining years, and asking for a recognition of his services. Mr. Cunningham has been in the service of the parish for a period of 34 years, and was formerly surveyor to the Southampton Estate Paving Board, and is entitled to a pension of 20l. a year on that account, which will come to him on his ceasing to hold the office of assistant-surveyor.

Proposed Improvement of Euxton.—The Duke of Devonshire says, if the people of that town will form a public company to carry out a number of required improvements, with a capital of 10,000l., he will take half the shares, and give in addition eight or nine acres of land at a nominal rent of 6s. per annum. A committee has been appointed to canvass the town and take other steps. It was stated at a meeting held on Friday that the land offered by the duke was worth 9,000l.; this, with the 5,000l. of capital he offers to provide, making his grace's contribution to the scheme 14,000l.

City Expenditure.—The amount raised by the Corporation in the course of the last few years approaches three millions and three-quarters, distributed in about the following proportions:—The new Meat and Poultry Market, its site and approaches, 1,000,000; purchase of Southwark Bridge, 265,000; rebuilding Blackfriars Bridge, 350,000; and the Holborn-valley Viaduct and approaches, 2,100,000.—In all 3,715,000. Not only has this amount been raised without difficulty during a period of general distrust, which has almost suspended railway enterprise, but it has been so readily obtained that none of the great works have been delayed a single hour for want of funds.

State of Truro.—The correctness of our correspondent "Pro," in his observations on this subject, has been made manifest in various quarters. The *West Briton* of last week says:—

"We regret that we continue to receive repeated complaints of the state of the Truro river, which no longer ought to be neglected as it has been by the Truro Town Council, considering what a large portion of its revenues is derived therefrom. A correspondent writes:—The state of Truro river at and about Quay head is really scandalous. Only a few weeks since the Truro Shipping Company's vessel, the *Mary*, was benesped when close to the Quay head by a bar of ground and mud allowed to accumulate there. The channel is all silted up; it is not so wide as resolved on by the council, and consequently vessels cannot swing as they used to do."

The Corn Exchange, Bristol.—At a meeting of the Bristol town council, on Tuesday last, it was resolved, after long discussion, "That this council, admitting the necessity of protecting the traders and others attending the exchange by a covering, refer the subject back to a committee to be appointed, to take the opinion of one or more skilled architects as to the best mode of accomplishing that object. The committee was appointed as follows:—The mayor, Aldermen Porter, Baker, Adams, Ford, Abbot; Messrs. T. Pethick, Warren, Mills, G. Wills, and Weston.

Royal Italian Opera.—Lovers of music are thankful for the operatic entertainment now going on at Covent Garden Theatre. The company is a good one, including Mdle. Ilma di Murska, Signor Mongini, Signor Cotogni, Signor Gardoni, Mr. Santley, and Mdle. Titiens. The "Flauto Magico" will be given this (Saturday) night with an admirable cast; and on Tuesday next "Hamlet." Signor Arditi retains his position as conductor. We hear of an English nobleman ready to spend 150,000l. in building another opera house if a proper site can be obtained!

Great Fire in Siberia.—A St. Petersburg correspondent says:—Full particulars have now arrived of the terrible fire at Yeniseisk. A tremendous storm was raging at the time, and as the town consisted mostly of wooden houses, nearly the whole of it perished in the flames. Several hundreds of persons perished either by suffocation in the burning houses or by drowning in the river. The number of houses destroyed was upwards of 1,300, besides four churches, two monasteries, the Government offices, with all the official documents and the principal stores-houses.

Public Baths for Brighton.—At the last council meeting, the Baths and Washhouses Committee presented the following resolution:— "That sixteen public baths be constructed in that part of the building known as the Infantry Barracks, coloured blue on the ground plan submitted. That the surveyor do prepare a specification of the works as shown on the drawings also submitted, and that an advertisement be issued for tenders for the performance of the works by special contract."

The motion was carried without opposition.

The Free Library Movement.—A Free Library was opened by the mayor of Tynemouth at North Shields on Thursday. It is the first that has been started in the Tyneside towns, and consists of a circulating library of over 13,000 volumes, a large reading-room, reference-library, museum, and science and art classes. A rate of 1d. in the pound per annum has been levied on the town by the corporation for the maintenance of the institution. All the speakers connected with trade strongly advocated the compulsory education of children as means to that end.

Social Science Association.—The opening meeting of the session will take place on Monday evening next, the 16th inst., when, by the request of the committee, an introductory address on the business of the session will be delivered by Mr. Edwin Chadwick, C.B.

Randell, Saunders, & Co.—The business of these well-known Bath stone merchants will be conducted henceforth as a Limited Company. The objects they have in view, they state, are to give greater facility for the extension of their business in the Bath stone trade, and to incorporate with it the quarrying and selling of other building stones, and to associate with them in the business some of their staff who have for many years assisted them.

Opening of the Session.—The first meeting of the Royal Society will be held on Thursday, the 18th inst. The Society of Antiquaries also meet for the first time on the 18th. On the previous evening, 17th, the Society of Arts will commence the new session, and an opening address will be delivered by Lord Henry Lennox, M.P., chairman of the Council.

Society of Engineers.—At the next ordinary meeting of the society, to be held on the 15th inst., a paper will be read "On the Need for further Experiments on Strength of Materials," by Mr. Charles J. Light. The annual dinner of the society will take place at the Westminster Palace hotel, on Friday, the 17th of December.

Cemetery at Rochester.—We are informed that the new cemetery mentioned in a paragraph last week, is for the adjoining town, Chatham, and not for Rochester. The sum mentioned, 8,000l., was borrowed, but not wholly expended. The land cost some 2,000l., and the buildings, in round numbers, 3,600l. The architect was Mr. J. Young, of London.

Portraits.—We have pleasure in mentioning that the engraved portrait in our present number was made from an excellent photograph by Mr. John Watkins, of Parliament street. The portrait of Professor Kerr was from a photograph by the same gentleman.

TENDERS.

For the erection of villa residence on the Redlands Estate, Reading, for Mr. Thomas Chancellor. Messrs. Wm. & J. T. Brown, architect. Quantities supplied:—

For new workhouse for Chorley Union, Chorley, Lancashire (foundations already in). Mr. T. T. Bradshaw, architect. Quantities supplied:—

Dawson	£22,288 0 0	£85 0 0
Higham	21,141 8 3	127 18 0
Coope Bros.	20,445 5 0	82 7 0
Thompson	19,884 0 0	—
Richter	19,810 0 0	68 0 0
Bayer	19,770 0 0	174 per yd.
Farrington	18,963 0 0	58 0 0
Collins & Son	18,513 0 0	56 8 0
Warburton Bros.	18,370 0 0	53 0 0
Sud	18,234 19 2	48 17 3
Brown	18,210 0 0	87 0 0
Nightingale	18,323 4 6	—
Saville	17,950 0 0	68 0 0
Wade Bros.	17,705 4 9	124 0 0
Pecton (accepted)	18,761 0 0	35 0 0
Gillett	16,685 19 8	18 5 0

For completion of works at vestry-hall, Poplar, for the Poplar Board of Works:—

Capps & Hitchie	£6,807 0 0
Shedfield	6,233 0 0
Hearle	5,630 0 0
Nightingale	5,824 0 0
Crabb & Vaughan	5,159 0 0

Accepted for Ware Water Works. Messrs. Russ & Minns, engineers:—

Contract No. 1.—Engines, Boilers, Pumps, &c.	£2,839 0 0
Contract No. 2.—Cast-iron Mains.	1,466 0 0
Contract No. 3.—Buildings, Reservoirs, Well, &c.	2,500 0 0

For the erection of villa residence, exclusive of grates, chimneys, water-closet apparatus, and other items, Victoria-road, Harborne, near Birmingham, for Mr. Wm. Fitcher:—

Stokes	£798 0 0
Newey	759 0 0
Pugh	753 0 0
Briley (accepted)	700 0 0

For finishing a concrete villa at Wimbledon, fr Mr. William Parsy:—

Gris	£1,004 0 0
Harvey	910 0 0
Mullett & Wimp	879 10 0
Crouch	650 0 0

For cottage hospital at Royston. Mr. Edward Nash, architect:—

Savell	£975 0 0
Gronson	818 0 0
Gibbons (accepted)	813 0 0

For cottages at Grove Ferry, Kent. Messrs. W. G. Habershon & Fite, architects. Quantities supplied:—

Harrison	£890 0 0
Smith & Swain	26,200 0 0
Pearce Brothers	655 0 0
Haywood	630 0 0
Featherstone	623 0 0
Davis	615 0 0
Wilson	600 0 0
Spencer & Haywood	597 0 0
Hatten	586 0 0

Accepted for building a house at Rottingdean, for Mr. Troubridge. Mr. Pike, architect. Quantities supplied by Mr. G. Tuppen:—

Turner	£151 0 0
Burgess	183 0 0
Welfare	40 0 0

For finishing three houses, Nos. 14, 15, and 16, Vauxhall-road, High-street, York-road, Battersea, for the London and Westminster Building Society. Messrs. Berriman & Son, architects:—

Tarrant	£233 0 0
Perkins	200 0 0
Cooke & Son	165 0 0
Gibbs & Son	162 0 0
Fisher & Sons	149 0 0

The Builder.

VOL. XXVII.—No. 1398.

The State of Art Education, in Great Britain and on the Continent.

HERE is a class of writing which, partaking of the two distinct qualities of current and of standard literature, appears but rarely to attract the attention due to either, although frequently possessing the merits of both. It is to be found in the large and annually increasing library of "Blue books," in which the results of the most exhaustive research, directed, at times, by the highest literary skill, are to be found side by side with returns of very partial interest, or reports of very moderate excellence. The origin of a volume of this series may be either a royal command, a party vote, an honest desire to bring full information before the world, or the attempt to manufacture

a peg on which to hang a speech, or to frame a motion. The blue cover, then, giving no assurance of the value of the contents of the volume, it not infrequently happens that a work of the highest value issues stillborn from the press of Messrs. George Eyre & William Spottiswoode, and that a brief paragraph of abstract, in the columns of the daily press, forms the only introduction of its contents to the great mass of even the reading public.

Very often, indeed, a subject is overlaid by the actual amount of detail under which it is produced. Thus, although the information which may be derived, as to the actual state of art industry and art education in Great Britain, as compared with that prevalent in foreign countries, from the Reports on the Paris Exhibition of 1867, which have been presented to both Houses of Parliament, by command of her Majesty, and have already been mentioned by us, is of great and readily available value, but few purchasers are likely to be found for the six compact octavos, to the contents of the second of which,—containing 620 pages, and published at the moderate price of 3s. 3d.,—we now bespeak a few moments of attention.

These twenty-eight reports, indeed, exhibit the same absence of unity of conception, and consequent uniformity of treatment, which impart a somewhat hitty and scrappy character to the whole Blue-book library. Side by side with one or two masterly papers, in which the authors, writing not only from clear heads but from sympathetic hearts, raise the discussion of questions of art to the level of philosophical discourse, are mere extracts from catalogues *raisonnés*, of little or no interest to any but the writers, after the collections of which they treat are dispersed; even if they could have served, in the first instance, as a guide to the instructive observation of the classes of articles in question.

The reports of Mr. Redgrave and Professor

Westmacott, with which may be classed those of Sir Digby Wyatt, are productions of a very different order from that of a mere criticism on a given class of exhibits, whether artistic or only personal. Addressing themselves directly to the vital question of art education, these papers afford the basis of a most instructive comparison between what is done and what is attempted, by the exertions of the Science and Art Department in this country, and the state and outlook of the same branches of national culture in the more educating portions of the Continent. They yield glimpses behind the scenes, and show us the views which regulate the course of study which is favoured by the managers of the museums and library at South Kensington. And, rising above the practical questions of educational detail (important as these are), they confront the yet more fundamental problem of the distinction between high art and art which is essentially decorative or ornamental. They indicate the true locality of the most famous schools existing, or that have existed, in either province; and they afford us the basis for something more than a mere guess at the probable and proximate future of each department of artistic culture.

One of the questionable features, in our judgment, of the educational scheme elaborated by the South Kensington School, is that subservience of art proper to decorative purposes which underlies the entire system. That in a national school, supported by public funds, and looking not so much to the elevation of the public taste, as to the encouragement and perfection of manufacture, this tendency may be to a certain extent unavoidable, we are not about to deny. But the need of providing, as far as possible, a counterpoise to a tendency which has always marked the corruption produced by wealth, and the decline of an over-wrought civilisation, becomes all the more urgent. If the ultimate aim of acquiring facility in figure drawing be the decoration of a tea-cup, the result, sooner or later, will be rather the degradation of artistic taste, than the elevation of the tea service into an æsthetic machinery.

It is with a view to this necessity of ennobling the pursuit of art, viewed as a decorative aid to manufacture, by the pursuit of art, viewed as a worthy exponent of noble thought, that the report of Mr. Westmacott possesses unusual value. He speaks with the true ring of the sculptor's tone,—the language of the severest and most lofty style of art. He regards design from the most elevated stand-point. He admits no real beauty that does not to some extent involve the presence of that which is pure and noble in idea. He refuses, as any man who is fired by the true artistic inspiration must do, to acknowledge the possibility of the erection of a realistic school of art as a rival and a counterpart of that which is ideal. Realism is only a part, and by no means the highest part, of the imitative art, whether in sculpture, or painting, or in literature. Realistic truth is one of the requisite qualifications of the artist. It is a gift to be acquired by education and by skill. It is absent from the hieroglyphics of the obid, or of the artist working during the childhood of the race. It is commanded by such masters of the pencil as Titian and Vandyke; but it is only one of their elements of power. To speak of realism in art as a novelty, or as a principle calculated to serve as the basis of a school, is to evince equal ignorance of the history and of the elements of art.

"It is sometimes asserted," says Mr. Westmacott, "that which pleases is beautiful to the person pleased, and that every one has the right to exercise his own fancy in determining what is or what is not beautiful. This is a fallacy. The abstract right to derive pleasure or gratification from any object, or, it may be, work of art, may be conceded; but no amount of satisfaction it may possibly afford, can endow a work with beauty if it has it not. Nor is every one capable of judging, off hand, whether or not this quality is present. In art it is not, as many suppose, merely a question of individual feeling. Certain

qualifications are required to form a sound judgment on so subtle a problem. This is especially the case in estimating what constitutes beauty in the human figure, so full of variety in all the conditions of sex, age, strength, and character. There must be, in the first place, some knowledge of the construction of the figure, and the laws of action; the power to discriminate between various classes of form; and, by practice, and careful education of the eye, to know how to compare Art with Nature, in her best aspects, in living models; and thus to determine what it is that artists and poets mean by *fiéal beauty*."

The highest class of sculpture, we fully agree with Mr. Westmacott, is calculated to interest and excite the loftier feelings by representing sublime and noble subjects under the most perfect forms. The influences which are unfavourable to the development of this severe and elevating form of art in our own country are two-fold,—those which are permanent, as arising, in the main, from those social habits which depend on temperature and on climate; and those which are secular or peculiar to our own time. The noblest subjects for sculpture, since Praxiteles first dared to represent the female form entirely unveiled, are heroic, or nude, and that for two reasons. The first of these is that there is no natural object which is at once more beautiful in form, and more calculated to appeal to the human imagination, than the human figure itself, under its three widely different types of manly, feminine, and infantine grace. The second is, that by this treatment alone are the impressions produced by that change in the character of attire, which we call fashion, and which exert a disturbing influence on the judgment by means of association of ideas, altogether banished. But heroic sculpture is not native to a northern climate. Where the human figure is never seen, as a rule, unclothed, there is a degree of incongruity involved by representing it as nude. It is possible that a sort of barbaric prudery regulates our ordinary views on this subject; but even this is less hostile to the worthy pursuit of art than is the diametrically opposite tendency of French taste, intensified as it is by the action of the rulers of the empire. Where neither the recurrence of public games, nor the irresistible power of a torrid summer, allows the eye to obtain familiarity with the undraped form, its representation will always convey, to the unaccustomed mind, not the true, artistic, idea of the nude, but the very different one of the undressed. Even in the models copied by the artist this sense will be continually present; and the more faithful is the representation of living form, however beautiful, the more fully will the influence of the feeling of shame, which is far from being the feeling of modesty, betray itself in the unconscious language of the entire shrinking physiognomy.

Debarred, then, partly by the drapéd habits of society, and partly by the ridicule which would attach to the representation of a modern king or captain in heroic nudity, from the congenial pursuit of the highest branch of the art of the sculptor, we are beset by a difficulty of no slight importance when we attempt the draped figure. Not only does a sort of commonplace vulgarity attach to the imitation, in marble or in bronze, of the ordinary articles of attire with which we are familiar, but the attire itself has become more mean, ugly, and inartistic than at, perhaps any preceding period of history. We refer not only to the unpicturesque, we might say inhuman, adornments of female attire, but, even more decidedly, to the contempt shown in the male dress for any considerations of what is becoming, or even of what is comfortable, and suitable at once to the habits of life and to the exigencies of climate. A species of archæological value may attach, centuries hence, to the faithful delineation of the English men and women of the present day. But it will be in an archæological sense alone. A period when neither dignity, gravity, nor military simplicity is in any way studied by the constructors of male attire, and when the graceful and winning charm of modesty is as much disregarded in that of the

softer sex, as are any principles of æsthetic harmony or fitness, is not one in which realistic imitation can produce anything worthy of the name of sculpture.

The exertions of the sculptors' art are, therefore, very much confined either to portraiture, chiefly in bust, or to allegorical and conventional representations. There is, indeed, the third category of historic sculpture; but eminence in this branch of the art, which demands, in addition to the other qualifications of a good sculptor, a thorough acquaintance with the history and the details of costume, is not to be acquired at a bound. In the absence of some more distinct encouragement nothing but a rare combination of genius and of circumstance can produce a good historic sculptor in England.

Considerations of a very similar character apply to the English school of painting in oil. "While the English pictures of poetical, episodical, historical, domestic, *genre*, and landscape subjects are," in the opinion of Mr. Cope, R.A., "conspicuous for excellence and variety in aim and treatment, there are no pictures of national importance." "England has no national collection of oil pictures, for the Sheepshanks and Vernon Galleries mostly consist of cabinet gems suited to the dimensions of drawing-rooms, and were collected by private gentlemen, and afterwards bequeathed to the nation." Fresco painting, the noblest branch of the art, is forbidden by the English climate. For oil painting, on the scale familiar to the great masters of Continental art, England has neither school nor encouragement. Thus, while it can no longer be said that there is no English school of art, it must be admitted that but a limited field is open for the highest exertions of the English artist.

In France the case is totally different. The encouragement, and the direction of the course of study, of the student, are there considered a matter of national importance, not undeserving of the systematic care of the Government of the country. From the very commencement of his career, the French student is at once stimulated to exertion, and kept within certain wide and well-understood limits, by the wholesome influence of competition. He does not find the high places of his profession filled up by men whose chief pride seems to be taken in keeping down their juniors. Such an offence against justice—we may almost say against decency,—as the three-repeated refusal of a few square inches of wall-room, in an annual exhibition which is called national, to such a remarkable painting as the "Medea" of Mr. Sandys would have been impossible in France. The student competes for a place in the Academy. Admitted there, he competes for the *Prix de Rome*. He afterwards produces works for exhibition at the annual *Salon*, which may procure the distinction of medals of the first, second, or third classes. Further success in his profession will be acknowledged by the bestowal of the much-prized decoration of the *Legion d'honneur*, that of the simple chevalier, of the officer, or of the commander. The State will purchase any very successful work, and deposit it in galleries or museums, in Paris or in the Provinces. The most distinguished artists are continually commissioned to illustrate the chief events of the day by the exercise of their art; and the thirst for national fame, so characteristic of the French people, thus leads to a constant encouragement of the artist, not by the uncongenial condescension of the patron, but by the open-handed rendering to Art of that which is her due.

Under these circumstances high art in France has a life and a future, even if they are not those of the very noblest stamp. The attempt made by the school of David (as by Flaxman in our own country), to naturalise a sham classicism, in subject, in attire, or in treatment, is almost entirely abandoned. The present movement of art in France is in the direction of the picturesque. The laws of light and shade, harmony of tone, careful completion of the entire picture, are combined with a freedom of touch which would be in danger of degenerating into what is slovenly and vague, but for the correction supplied by the incessant study and reproduction of the *modèle*.

It thus comes to pass, not only that French art commands an unrivalled position on the Continent, but that, whether avowedly or insensibly, it is influencing, not to say devouring, all other national schools. The manner of the Belgian artists is more French than Flemish, "possessing little of the juicy touch and transparent colour of the old school." The works of the Dutch painters "have a greater affinity with the

broad generality of treatment and solid painting of the French school, than with the refined delicacy of execution and rich richness of colour so characteristic of the old Dutchmen." "The productions of Prussia mostly emanate from the school at Dusseldorf. They possess no very special character to distinguish them from French art, to which they are gradually more and more tending." The modern Bavarian school, like most of its Continental contemporaries, "seems founded upon that of France, both in its style of work, its perception of nature and in the subjects it most affects." "The art of Austria is in no way remarkable for any distinct national traits." "The influence of France on the art of Spain is evident." The school of Sweden and Norway, "generally, is in close relationship with that of Dusseldorf, at which place most of the principal painters reside, so that it may be almost considered as a branch of that school." The visitor "looks in vain for anything nationally characteristic of Russian art." Even Muscovite or Finland subjects "are treated in the modern French manner, and seem rather French than Russian." The modern art of Italy "seems to be an offshoot from that of France, and has no distinctive character of its own." Even Greece contributed to the exhibition which furnished the subjects of the report from which we quote, a moonlight picture of Antigone, in the style of the French school; and Turkey "attempts at still life, in the French manner."

While this missionary and conquering influence of French art is so fully asserted by the reporter commissioned by this country, it is painful to read the very judicious remarks of Mr. Horsley on the decadence of that English school of water-colour drawing which attained its highest excellence in the works of Turner, Cox, Dawkins, Hunt, Copley Fielding, and others. This admirable school was properly and exclusively English. Its essential principle was that of making use of the lovely quality of transparency possessed by colour ground in water, when employed on paper, without any opaque mixture. It is, therefore, a serious subject for consideration that scarcely one pure water-colour drawing, unpolluted by opaque colour, is now produced.

In condemnation of this hybrid and makeshift style of what is now called painting in water-colours, Mr. Horsley cites the unquestionable authority of Turner, who not only strongly reprobated the use of opaque colours in water-colour drawing, at the time of its first introduction, but asserted emphatically that, if persisted in, it would "prove the ruin of water-colour drawing." The temptation to produce drawings with rapidly has been the chief cause of the general adoption of this pernicious practice. It is interesting to note Mr. Horsley's remark, that not only is the purity and limpidity of the true water-colour style destroyed by the introduction of opaque dabs, patches, and smears, turning the sky, in some instances, into the resemblance of a stuccoed and whitewashed wall, but that the mongrel pictures are likely to be as short-lived as they are rapid in their production. For while pure water-colour drawings should always be protected from unnecessary exposure to light, opaque mixtures require the very opposite treatment. "Permanent white" becomes permanently black, and other opaque colours have a tendency to crack and peel off, when they are kept covered up, besides being injuriously affected by hygrometric changes in the atmosphere.

It is evident from the comparative view of English and of foreign art which the reports on the Universal Exhibition of 1867 supply, that the impulse which, originating in 1851, is maintained by the exertions of the Science and Art Department, has but a slight and incidental, if any, influence on the highest branches of art. For decorative purposes—for art industry, rather than art proper—we have, indeed, entered upon the Victorian *Renaissance*. It is still to be regretted that painting should be confined to the production of cabinet pictures; that sculpture should be allowed to sink into effigy-making; that water-colour drawing should disappear, in its purity, from our schools. Much as a careful and well-designed education in art-workmanship may effect, much as it has already effected, the best hopes of the originators of the movement will fail of fulfilment so long as a languid pursuit, or a misdirected activity of study of art in its highest branches, allows the energy of the workman to distance the skill of the artist.

LINCOLN AND ITS NEIGHBOURHOOD.

THERE are few more interesting cities in England for the archaeologist, architect, or mere lover of the picturesque, than Lincoln. The position of the more ancient portion of the city on the summit of a lofty ridge that traverses the county from north to south, crowned by the magnificent cathedral, is almost unrivalled, and the view from the valley below strikes the traveller as at once familiar and uncommon. The truth is, that the situation of the minster, and the disposition of the steep narrow streets straggling down into the valley, black with the smoke of many furnaces, and sonorous with the sounds of labour, are frequent enough in Continental towns, and thence the impression of familiarity, although the scene is not so common in England as it is abroad. One misses, however, the usual accompaniment of the foreign landscape, the clear crisp air, the fragrant smell of wood fires and *pôt-au-feu*, the ringing high-pitched voices of the women, and a sense of deeper colour and spaciousness which is never experienced in England.

The people of Lincoln are, as a rule, a handsome, well-developed race, and the women of the lower class are especially remarkable for their regular features, tall stature, and easy carriage. This portion of the country was largely peopled by immigrants from Celtic Gaul, who sought refuge here from the incursions of the Gothic tribes that overran the continent of Europe about 150 years before the Christian era, as well as by the Danes, who seized upon Lindsey Island, or Lindum, a Saxon province, which occupied the same extent of country as Lincolnshire, in the year 833, and again in 993. The inhabitants retain several characteristics of speech, manners, and feature, which may probably be traced to these remote ancestors; their intonation is remarkably pure; and there is an entire absence of the broad accent usual in the adjoining county of Yorkshire. The city is of very great antiquity; the site of the ancient British city having been, according to Ieland, somewhat to the north of the present site, beyond the Roman gateway called Newport, and some of the lines of fortification are still to be discerned. The outline of the Roman city is clearly traceable: the ancient Hermin-street traverses it from north to south; and there are besides the celebrated gateway on the north side several remains of the massive wall which defended the city on four sides, of unmistakable Roman work. The Roman city was remarkably small in extent, forming a parallelogram, about 1,300 feet one way by about 1,200 feet the other way, extending from the western wall of the castle on the west to the smaller transept of the minster on the east. The northern boundary is marked by Newport Gate; and there are some remains of a corresponding gateway on the south side in a wall in the street called Steep-hill. Under the Danish dominion, Lincoln rapidly increased in size and importance, and became one of those cities whose inhabitants intermarrying with the invaders were called *Fiehnburghs*, and were allowed considerable privileges. The erection of the castle and the cathedral under William the Norman still further extended the power and influence of the city, and from that time Lincoln played a prominent part in the history of the country. In the thirteenth century the city rose to a position of considerable eminence on account of its trade in wool, then the staple commodity of England. The river Witham was in the reign of Henry III. navigable for vessels of large burden from Boston to Lincoln. The city ranked as the fourth seaport in England,—London, Boston, and Southampton only ranking as superior. The embankment and proper protection of the river having been neglected, it at length became unnavigable; and in the reign of Charles II. the control of the Witham passed into the hands of a private company, and it is now leased to the Great Northern Railway Company. The principal trade in Lincoln is the manufacture of agricultural implements, which is carried on by a large number of eminent firms employing a considerable body of workmen. The minster is, as a matter of course, the great object of attraction. Very extensive works of restoration have been carried on of late years, and both the exterior and interior give evidence of a laudable desire on the part of the Dean and Chapter to discharge their duty in the preservation of that remarkable building. Into the question of the propriety of the restoration that has been effected, we do not care here to enter, but those who are interested in the subject will

find it discussed at some length in our pages in a former volume. Some of the flying buttresses of the chapter-house are now being reconstructed. The windows have been, with a few exceptions, filled with stained glass, of varying merit, by various donors. The best windows are those by two amateurs, the Rev. Augustus Sutton and Mr. Frederick Sutton, who have executed several of the windows in the east transept, as well as that at the west end. The east window, by Ward & Hughes, although very nicely drawn and well arranged, is unsatisfactory in colour, being cold and thin.

The new pulpit, from a design by Mr. G. G. Scott, is quite out of character with the building; the base is of the most nondescript character, and the wood carving, although very beautifully executed by Riddle, of Peterborough, does not correspond with the carved woodwork of the stalls.

The prebendal stalls and canopies are unequalled for simplicity of design and richness of effect, and are well worthy of study. The woodwork was unfortunately stained a dark brown colour in 1848, by which much of the grace and lightness of the original work has been destroyed. The stalls of the choir are now in course of reconstruction.

The entrance to the choir from the lesser transepts is closed by two wrought-iron screens of fourteenth-century work of good design, one of which, that on the north side, has been lately restored by Messrs. Hart, of London. The restoration cannot be pronounced satisfactory, and the cresting, which replaces some seventeenth century scrollwork, is extremely coarse in execution, and inappropriate in design. The brass railing enclosing the altar, erected a few years since by Messenger, of Birmingham, is also very defective in an artistic sense; but as the design was furnished by the donor, one of the clergy of the cathedral, it may be thought invidious to complain of the quality of the gift.

The minister suffered severely at the time of the Reformation, and again during the civil wars: the whole of the memorial brasses have been plundered, and the statues and other decorations of the tombs and chapels removed or defaced. On the south side of the presbytery or retrochoir near the altar, is the tomb of Katherine de Swinford, third wife of John Gaunt, Duke of Lancaster. The tomb is in a very neglected condition, and it has been lately suggested in a local paper that it would be a graceful act on the part of her Majesty to undertake the repair of the tomb, she being herself Duchess of Lancaster, and directly descended from Catherine de Swinford, as shown by the following table:—

- John of Gaunt—Catherine Swinford.
1. John Beaufort, Marquis of Somerset, &c.
 2. John Beaufort, Marquis of Somerset, &c.
 3. Margaret—Edmund Tudor.
 4. Henry VII.
 5. Margaret—James IV. of Scotland.
 6. James V. of Scotland.
 7. Mary, Queen of Scots.
 8. James I. of England.
 9. Princess Elizabeth—The Elector Palatine.
 10. Princess Sophia.
 11. King George I.
 12. King George II.
 13. Frederick Louis, Prince of Wales.
 14. King George III.
 15. Edward, Duke of Kent.
 16. Queen Victoria.

The verges informs the visitors, and the guide-books also assert, that Katherine was the sister of Chaucer the poet; but the fact is that Chaucer married Katherine's sister, which is a very different relationship.

After the minster the most noticeable objects in Lincoln are the curious pre-Norman towers attached to the churches of St. Mary-le-Wigford, near the railway station, and St. Peter-at-Gowts, in the High-street. These are very much alike in style, and resemble very closely in outline the campanili or bell-towers attached to several of the churches in Rome, and are probably of about the same date. These towers are square, and have what has been termed "long and short work" at the quoins. There is a circular-headed door on the west side next the street; the middle stage of the tower is unperched, and the upper stage has a two-light window, with semicircular arches and a balustrade column. St. Peter-at-Gowts has a bas-relief of St. Peter in good preservation. Pre-Norman remains are extremely rare in England, and it is satisfactory to be able to report that these interesting buildings are quite sound, and are in no need of rebuilding or restoration.

The building called the Jew's House at the foot of Steep-hill (a narrow and excessively difficult ascent from the lower part of the town to

the elevated ridge upon which the minster, castle, and principal part of the ancient town are situated) is a very good specimen of a twelfth-century dwelling of the upper class. It is engraved in Pugin's "Specimens," vol. i., p. 1, and there is a view of it in Knight's "Pictorial History of England," vol. i., p. 626, by which it will be seen that the house has undergone but little alteration, and that of a nonimportant character, since the year 1837, the date of the publication of the history. The corbels to the central doorway are, however, less distinct than they appear in the sketch, and the chevron ornament over the door has also suffered from the effect of time. The interior of the house was rebuilt some forty years since, and the only original part remaining is the front wall towards the street, which is very nearly 3 ft. in thickness.

The name "Jew's House" is said to have been derived from the house having been the residence of one Belesed de Wallingford, a Jewess hanged for coin-clipping in the reign of Edward I., but there is no foundation for the tradition. The expression "Jew's House" seems to have been vulgarly applied to houses built of stone. Stow in his "Survey" mentions a part of a large stone house adjoining the Royal Exchange standing in his time, the other part of which was taken down for enlarging the Royal Exchange. "This stone house," he says, "was said of some to have been a church, whereof it had no proportion; of others a Jew's house, as though" he shrewdly remarks,—

"None but Jews had dwelt in stone houses; but that opinion is without warrant, for beside the strong building of stone houses against the invasion of thieves in the night, when no watches were kept, in the first year of Richard I., to prevent the casualties of fire which often had happened in the city when the houses were built of timber, and covered with reed, Henry Fitz-Aldwin being mayor, it was decreed that no house for no man should build within the city but of stone, until a certain height, and to cover the same building with slates or burnt tiles; and this was the very cause of such buildings."—*Stow's Survey by Thomas, p. 73.*

Another remarkable building, of nearly the same date as that last referred to, is the building called "John of Gaunt's Stables," situate on the east side of the High-street, and near the southern extremity of the town. The front next the street is remarkably well preserved, the carving of the corbels and the mouldings of the handsome Norman archway being still fresh and clear as when first cut. The stone used is what is called the "ros stone," from the upper oolite bed of the Lincoln quarry, which is of a beautiful cream-colour, and is evidently very durable, and admirably adapted for carved work. The minster is partly built of this same stone, but there are also portions built with stone from some of the higher beds, which abound in shells and corals. As is the case with the Jew's House and some other buildings in Lincoln, John of Gaunt's Stables is a popular misnomer. It appears from Leland's description, that the building was a guild-hall, belonging, he says, to St. Ann's Church; but this is probably a mistake for St. Mary's Guild. The interior presents no features of any interest. It is now used as a mangle-house; and although the structure has not suffered any great injury of late years, with the exception of the addition of a floor, which shows below the entrance archway, it is too much to hope that it can long be used for its present purpose without incurring constant risk of deterioration, or the positive destruction of its architectural character. It is a pure and beautiful specimen of Norman work, and is worthy of being preserved as what is called in France a *monument historique*, at the expense of the state or municipality.

The house of John of Gaunt, the great Duke of Lancaster, stands on the opposite side of the street. It is now converted into two houses, and retains but few evidences of its former magnificence.

The high bridge over the Witham, 1330-1400, is a remarkably complete Medieval work; it is, nevertheless, alleged to be insufficient for the present navigation of the river, and it is suggested it should be rebuilt. Improvements, however, are effected but slowly in Lincoln, on account of the strong political feeling existing in the town. The townhall, which is in the Stone Bow, an archway across the High-street, is quite unworthy of the size and importance of the city, and a new townhall is much needed, public meetings of any importance being now held in the corn exchange. There is no system of drainage in Lincoln except by means of cesspools. The Local Management Act has, however, been adopted by the corporation, and the sanitary condition of the town is as good as can be ex-

pected under the present defective method. The effective sewerage of the low-lying portions of the town will be a matter of some difficulty, but there is no reason why the attempt should not be made.

It is proposed to lay out a plot of ground on the east of the city as a park or arboretum, which is much wanted. The ground, which consists of about 17 acres, and is advantageously situated, belongs to the freemen of the city, who have the right of pasture over it, and an arrangement has been initiated by the mayor and corporation to compensate the freemen by an annuity of 200l. a year, and to sell a portion of the ground for building, for the purpose of raising the funds for laying out and planting the park.

The church of St. Peter, in Eastgate-with-St.-Margaret, is now being rebuilt by Mr. Blomfield. The new church is to the north-east of the town, on the site of a former church, built in 1778. The new building is not sufficiently advanced to enable an opinion to be formed as to its design. The foundation stone was laid a few weeks back with Masonic honours.

A new church is also in progress in the lower part of the town, adjoining the Free School, for the parish of St. Swithin. The new church is built to the eastward of the present church on the Sheep-square, the site of a former market, which was purchased of the corporation at the nominal price of 500l. The style is Early Decorated, and, as far as the work is completed, it is of a satisfactory character, although rather safe than original. There are appearances that it is not intended to proceed with the tower and spire at present. The church will consist of a nave, north and south aisles, tower and spire at the west end, with a porch on the south side, and a vestry to the south-east. The dimensions are,—nave, 106 ft. long; chancel, 40 ft. total, 116 ft. Breadth across nave and aisles, 61 ft. The church will accommodate about 1,000 persons. The materials used are Branton stone for the exterior, and the interior is faced with ashlar of Ancaster stone. The contractor is Mr. Lovele, of Branton. The architect is Mr. Fowler, of Louth, who obtained the commission in competition with ten others.

The ancient church of St. Swithin, the predecessor of the present church (a mean, uninteresting building, dating only from 1801), was one of the finest in Lincoln. It was unhappily destroyed by an accident during the civil war between the King and the Parliament in the seventeenth century. In 1644 the Earl of Manchester,—the Parliamentary general,—attacked the city from the side of Canwick, and having taken the lower part of the town, was preparing to assault the upper part, when some combustible material intended for the attack took fire, and the burning flakes being carried by the wind, and alighting on St. Swithin's church, caused its destruction.

The church of St. Mary, at Swineshead, near Lincoln, memorable in history as the spot where John of England retired when mortified by the loss of his personal baggage and treasure in crossing the Wash, and where he contracted the illness that terminated in his death, has been restored, and the termination of the work was celebrated on the 14th ult. by a restoration festival, at which upwards of forty of the clergy assisted, with the bishop of the diocese at their head. The church, which is a conspicuous object from the Boston and Sleaford Railway which runs about a mile to the eastward, is Late Decorated, with some admixture of Perpendicular work, and consists of a nave and aisles, a spacious chancel with a chapel opening out of it, south porch, lower, and spire. The restoration included the lowering of the floor to its original level, new open benches, and pulpit and reading desk, the removal of the whitewash and plaster with which the walls were encrusted. The work of restoration has been executed by Mr. Pattinson, of Ruskington, and Mr. Franks, of Swineshead, under the superintendence of Mr. Kirk, of Dewsbury. The cost of the restoration will be about 1,800l., including the new organ by Brindley, of Sheffold, which was presented by Mr. Reddish, the churchwarden.

New Tramways in London.—Notices have been fixed to the lamps on Blackfriars Bridge and in the Blackfriars and Westminster Bridge roads, stating that an application will be made to Parliament in the ensuing session for powers to lay down tramways in these thoroughfares.

THE RAILWAY HOTEL, LIVERPOOL.

The large hotel in course of erection for the London and North Western Railway Company, at their terminus in Lime-street, Liverpool, from the designs of Mr. Waterhouse, and before now described in these pages, is rapidly approaching completion externally, half the roof being already on. The building is in the round-arched Gothic or Semigothic style, which its architect has recently adopted a good deal, and which has the merit of appearing sensible and purpose-like, besides exhibiting a certain novelty and individuality of treatment. A row of lofty round-arched windows, with quasi-classic archivolts, forms the principal feature in the ground-story front, marking the height of the coffee and reading-rooms which occupy the main portion of the front ground-floor: elsewhere the upper part of this story is treated as a mezzanine. Over the first-floor string-course corresponding piers are carried up through three stories; the first and second floors having square-headed windows between the piers, the third floor round-arched windows corresponding with the arcade which connects the main piers. Over all is an attic with rather heavy dormers, the space between the dormers being filled up by a square panel enclosing an inner panel, within which is worked a kind of circular shield, slightly convex in section, and surrounded by a row of small beads or knobs. Unless there is something symbolical in this device, it is difficult to account for it; as mere ornament it certainly is not a successful feature. The main plan of the building is very simple, and looks as if it would work well; a centre entrance hall opens from Lime-street, divided by a lofty arch, supported on groups of four granite columns, from the central staircase beyond, which is lighted from the roof. From this central hall and staircase longitudinal centre corridors run right and left the whole length of the building on every floor, lighted by a two-light window at each end, with a vista right through from end to end. These corridors are fire-proof, formed of Yorkshire landings carried on continuous brick corbels. The architectural effect of the central staircase cannot be judged of yet; but a small detail in the construction of some of the upper landings reminds us what very clumsy methods are sometimes tolerated by architects (or clerks of works) in effecting the joining of iron beams at right angles. In this case, a very large wrought-iron beam carries the main landing connecting the corridors, and a cross-landing is carried by a smaller beam, one end of which is supported by a small piece of T angle-iron riveted against the web of the large beam, and projecting horizontally 2 in. or 3 in. It is probably strong enough for its purpose, but has a very make-shift appearance; and in a similar position in another large hotel (built by an architectural firm in very large practice), we saw, not long since, a system of cast-iron beams of equal section, arranged at right angles, those carrying the cross-landings having their flanges cut short at the point of junction, and the web continued so as to rest on the flanges of the longitudinal beam, the cross-beams thus resting entirely on the end of their web. Considering how frequently the use of iron beams in such a position is called for in large staircases, it might surely be possible to foresee it, and provide a suitable bracket on the main beams to take the ends of the cross-beams, instead of leaving the junction to be effected by the rule of thumb.

The line of elevation at each end of the building is slightly advanced both in front and rear, the projection taking the form of what may be called an angle tower, the tower effect being chiefly produced by the inevitable Mansard roof, which rises far above the cornice. On the ground story of each tower is a large and heavily-moulded *porte-cochère* arch, the flank wall which connects the two towers at back and front having a similar boldly-treated archway, above which several tiers of small windows, with shafts and foliated capitals, have a very elegant effect, and contrast well with the expanse of almost entirely plain masonry on the flank of each tower. It is something nowadays to find any architect recognising the value of breadth of wall-space in an architectural design; and this portion of the building is really treated in a striking and effective manner. For the rest, we can scarcely say so much; and indeed, considering the size and cost of the building, and the splendid and commanding site it occupies, facing, but rather higher than, St. George's Hall, it is impossible not to sympathise with what seems to be the prevalent feeling in

Liverpool, that a very fine opportunity has not been made the most of. The appearance of the disproportionately high roofs at each extremity, with the long tall mass of chimney-stack at each side crowded upon and scarcely separable from the roof, is anything but satisfactory. Almost the only ornament on the principal front, with the exception of the questionable panels in the attic above alluded to, is in the shape of perforated ornamental panels in geometrical patterns, under the windows; those under the first-floor windows being projected slightly forward and forming balconies, the corbels supporting which, by the way, come rather awkwardly close down upon the archivolts of the ground-floor windows. While the general aspect of the building is that of solid durability without show, and while the vulgarity of extravagant ornamentation is entirely avoided, the impression left by it is unsatisfactory on the one hand from a want of real effectiveness and point in the general design (always excepting the end elevations aforesaid), and, on the other hand, from the want of repose in the sky-line formed by the aspiring roofs and chimneys; a defect emphasized by contrast with the well-known sober monumental horizontal lines of St. George's Hall opposite. The masonry, of Sturton stone, with Minera and Cefn stone dressings is, we should add, in every respect admirable.

AN ENGLISH THEORY OF THE ARTS.*

A work has just appeared, on the rise and progress of the arts, which may be considered, in some respects, as the English equivalent of the German work on the same subject by Dr. Lübke, Mr. Bennett's translation of which was reviewed in these columns.† In the latter, the contemplative German thought out his theory, and then applied it to the various nations of the civilised world, in a calm, meditative, though perhaps crotchety, kind of way; whereas in the work before us an English barrister has thought out another, and has smoothly, glibly, and diffusely applied it to the various arts, recognising all nations as only one humanity. The German doctor's leading ideas are that, first, the geographical features of a country, and then the political conditions and general mode of life of its inhabitants, originated its arts, cultivated, or repressed them, as the case might be. Mr. George Harris sets out with the conviction that the origin of art is due to the innate power the mind possesses of combining ideas. He says the faculties with which the soul is endowed are of two kinds, active and passive; and it is the former, or the power to receive ideas, reason upon them, separate and combine them, that gives birth to artistic productions; the latter faculty also taking part in the result, in so far as it renders the mind liable to be affected by sensations of different qualities when excited by the material senses. Last we should obscure the author's meaning by compressing his words, we quote his continuation of this explication. "As the faculties availed of in the pursuit of art are as obvious and as definable as those which are employed in the progress of reasoning, so are the principles of this study as sure and as well established as those of logic. The efforts of this power may be capricious or ill-regulated in some minds, but in all they are capable of being regulated by certain laws, and are controlled by well-established rules. The principles of taste are certain, because the same senses and the same intellectual faculties as regards their nature, although different in extent and quality, exist in every mind." Thus, though both authors write of the rise and progress of art, they look at their subject from points of view so far removed from each other that its identity is almost lost. Dr. Lübke writes of art as though it was a crystal stream flowing through various tracts of land, and that was spread out in one till it formed a broad smooth sheet, and contracted in another to a deep tearing river, and precipitated, cataract-fashion, over rocks in another, according to the geographical features of the district; while Mr. Harris, though he can see it in this light, too, leads us more to think of it as of water in a well to which every individual brings his own crane, gullet, or bowl, and quaffs his draught after his own fashion. But still the combination of brain-power and mechanical skill we call art is the

same thing all the world over, and in all time, whether men look at it *au dessus* or *au dessous*, from within or from without. We remind our readers of the German survey of the subject, only that they may compare it with the theory advanced in the work now before us.

Mr. Harris has made what he considers a new and correct classification of the arts. They are nine in number; and he ranks them in the following order:—Painting, sculpture, poetry, eloquence, music, architecture, dramatic acting, costume, and gardening. Seeing that architecture is generally conceded to be the grandest of all the arts, we admit the novelty of the scale without pledging ourselves to its correctness. We miss, too, in this catalogue many arts that should have found a place in a list making any pretence to completeness. Under which of these headings could we group the works of the Della Robbias or of Bernard Pailsey? Under which could we place those of Benvenuto Cellini? And where may we rank the works of illustrious goldsmiths, enamellers, and engravers? Ghiberti's famous gates are a work of art, yet can scarcely rank either as sculpture or any of the other arts here mentioned. The art of the *tapisserie* is of as much account as that of the *costurier*, yet it is overlooked. To be plain, notwithstanding a very noticeable inclination on the part of the author to leave not a stone unturned in connection with his labours, and, if possible, to fracture it and show us what was in the centre of it, he has in this particular given us very short measure. Without dwelling further, however, on what he has not said, we will follow him in some of his observations. He first commends art to mankind, and mankind to artists; and after minutely stating the claims of art, how different kinds were invented, their growth, their spheres, the points where they agree and where they separate, he proceeds to declare the leading principles that should regulate design in either of them. These, he avers, are all deducible from nature, yet it is not by a faithful portraiture of nature that success is ensured:—

"The consideration that the excitement of the mind, in an agreeable or gratifying manner, forms the origin and the foundation of each art, ought ever to be kept in view as a leading principle of design in art of either kind, so that every performance may be calculated to delight as well as to excite us. The principles of design, including those of delineation, are to be deduced in each of the arts, the greatest masters in them have pursued. The rules of art are to be drawn from the productions of art, and not the productions of art formed from the rules. Nature herself, as she is seen to exist, first supplied and taught the principles of art, and from her inexhaustible mine, the richest stores may be drawn. God gave these principles to nature, and nature gives them to man."

Thus it would seem rules are only to be ascertained by the study of great masters, which every student undertakes. Moreover, he lays down that they are chiefly negative, and principally of use to avoid defects, not to ensure perfection. No great poet has so frequently broken through rules as Shakespeare; yet none has attained equal perfection. Another rule he would inculcate is not to commence the execution of any design before it is clearly defined in the mind; but the chief one is to unite the freedom and absence of all affectation and formality of nature with grace, energy, and vigour. After this the rules dwindle down to elements of delineation, which are discussed in the following order:—1. Correctness. 2. Perspicuity. 3. Fitness. 4. Consistency. 5. Contrast. 6. Energy.

Mr. Harris applies, somewhat ingeniously, terms and turns of thought belonging to one art to another. Speaking of alliteration, for instance, in reference to poetry and eloquence, he points out its presence in architecture, costume, and gardening. In architecture the use of uniform ornamental terminations he looks upon as alliteration; in costume, corresponding ornaments; and in gardening, the formal arrangements in which each work and corner is but the counterpart of another that balances it, he speaks of as so much alliteration. This is a fanciful thought. Alliteration is not exactly a repetition, or even a balance. And when we come to include the distribution of colour, and the relation of masses of light and shade in painting, as alliteration, the agreement is still more difficult to discover. He would stretch the application to sculptural designs; and beyond these to music and acting, where, however, he confesses it is more faintly indicated and less direct. That he should have made the attempt is, to some extent, an index of his desire to treat every kind of art as one product of the mind, varying only in its fruit with the constitution of the individual who gives it birth. A poet, painter and sculptor, and musi-

* "The Theory of the Arts; or, Art in Relation to Nature, Civilization, and Man." By George Harris, F.S.A. In 2 vols. London: Trübner & Co. 1869.

† Vol. xxvi, p. 923.

oian are all producers of art, which, to him, is identical in kind, except in outward form; and conformable to the same rules, except those of mechanical execution. He even detects a "chemical affinity" in art, which term he explains in the tendency of representations of transactions which vividly and immediately affect the mind, to attach themselves at once to the heart. And, again, he requires of art that it should magnify and purify nature as well as reflect it. He sees, too, resemblances sooner than some people can see them. Gardening possesses, for instance, a close correspondence with painting in his eyes.

In his retrospect of this last-mentioned art, Mr. Harris scarcely goes so far back as he might; for he gives no account of the wonderful terraces upon the banks of a few north-country rivers in hilly districts, which are the remains of pre-historic gardens, when the low lands were too boggy, or wooded, for cultivation. In the valley of the Breanish, Northumberland, in the vale of the Tweed, and in Pembrokeshire, and elsewhere in Scotland, these terraces are distinctly marked, and are regarded with great interest by archaeologists as veritable fragments of ancient Britain. They lie high up on the hill sides, ridge over ridge. The gardens attached to early hermitages, too, are overlooked by him; and those attached to the abbeys, and other ecclesiastical institutions, are equally ignored, although their influences have not yet perished. In the neighbourhood of Jedburgh the monastic pears are still represented; and around Hulme Abbey, again, the monks' plums are now growing wild. His impression is that, though Fitzstephen records that the citizens of London had large gardens in the reign of Henry II., and Hollinshed's Chronicle infers choice gardening in the reign of Edward I., the wars of the white and red roses exterminated all but the roughest kitchen gardens and bare pleasure-grounds; and it was not till the reign of Elizabeth that gardening was treated artistically. He calls the celebrated poem of the Scottish king, James I., to witness that the garden at Windsor, in the reign of Henry V., was but a place thickly planted with trees, with alleys of hawthorn, and an arbour in each corner. The Northumberland Household-book of 1512, too, he quotes, to show, that out of an establishment of 150 persons there was but one gardener "who attended hourly in the garden for the setting of herbs, and clipping of knottes, and sweeping the same garden clean," tasks which are now distributed among something like thirty people. But in more modern times gardening has had advantages over both painting and sculpture, he considers, because ornamental grounds belonging to the wealthy, expense has not been spared in their cultivation, and persons of the highest taste and accomplishments have turned their attention to it.

Reviewing the British position among the arts further, Mr. Harris allows that the modern excels the ancients in landscape painting and in water-colours. He re-arranges, in a rapid fashion as he passes through the array of British painters, their respective ranks. He takes Turner by the shoulder and places him below Martin and West he beckons up to stand close to the great masters of old. There is a sect of artists who would, doubtless, close a book that contained such a passage as the following:—

"The true and fair position which I shall assign to Turner, and which a just and discerning and impartial posterity will, I believe, accord to him, is this. He is not, as has been asserted, the greatest landscape painter who ever lived, or even who has adorned this country; and he is far inferior generally, and in his highest qualities, to either Claude, Salvator Rosa, Wilson, or Gainsborough. To Martin he is superior in mechanical skill, although far his inferior in imagination and mental power generally, as also in perspective effect. Turner's merits consist really and solely in his power, of representing with wonderful truth and vigour certain prismatic results, the appearance of mist and spray, as also of water when agitated, the rays of the sun when it is declining, and the varied appearance of the sky. In many respects he was unrivalled here, especially as a painter of clouds. But beyond this he can only be allowed to rank with other artists."

We would advise the critics in question, though, as we would art-students generally, to read on, for the sake of the prospects of art in this country. He pleads for more patronage. Painting, so far, has scarcely been aided, except to gratify family vanity and affection; and sculpture has only been befriended by the dead in the form of memorials; though poetry has, comparatively speaking, flourished, and elegance has enjoyed a large patronage. Architecture has been still more firmly tied down, because no architect has the power of building a cathedral to show his skill. But given a little more

patronage,—national patronage,—and all will be well. A trichinal of taste is the only other requisite for our artistic prosperity. Nevertheless, he has a proposition to make, to the effect that more than one mind should be employed upon a work of art. A man might be able to conceive a grand subject in a practical manner, and yet be unable to put it upon canvas; for this secondary process he would employ another hand, cunning and well skilled; and to the works thus produced he would give the name,—*Grapho-pneumata*.

HISTORY OF ARCHITECTURE IN ROME. ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The ordinary general meeting of the Institute took place on Monday evening last, when Messrs. John Edward Cox and Herieth Williams (Associates) were elected Fellows, and Mr. H. Joseph, Williams an Associate.

A memorial to the Metropolitan Board of Works, urging the desirability of maintaining the open space by the side of the Mansion House, and forming the entrance to the new street thence to Blackfriars, was unanimously adopted by the meeting.

A conversation took place with reference to the works at Worth Church, which led to the inquiry whether the council were in a position to give any official information on the subject, to which the chairman replied, that the matter having been referred to the committee for the conservation of ancient monuments, they passed a resolution expressing a hope that this interesting monument of architecture would be preserved. The subject had been again brought before the notice of the council that evening, and they had decided to call the attention of Mr. Salvin, jun., the architect, to the letters on the subject which have appeared in this journal, and also to the resolution of the committee, at the same time expressing their confidence that that gentleman would do all in his power to carry out the views therein expressed.

Mr. J. H. Parker (honorary member) read a paper entitled "A Sketch of the Early History of Architecture in Rome, as connected with the recent Excavations." The first portion of the paper was devoted to a description of the early methods of fortification adopted in Italian cities and villages as border defences against the attacks of hostile tribes. These villages and towns were surrounded by a bank of earth, and a wide deep trench, out of which the earth for the bank had been taken. On the top of the bank a wall of wood with wooden towers was placed, or sometimes a palisade only. In process of time the summits of all the hills became fortified in this manner, and the narrow gorges between them were also placed in a state of defence. These ancient earthworks were on a gigantic scale, the whole population being employed upon them for mutual defence, and they were never destroyed. The bank may be removed in parts, and the trenches filled up in parts, but it was sure to leave plain traces behind. The tops of nearly all the hills in England and in Gaul were fortified in this manner. Sometimes these great earthworks were considered as natural formations; in other instances they were called Caesar's Camps, because they were afterwards occupied by the Romans, but they were often constructed by the natives to oppose the Roman invasion. Such ancient fortresses were found all over the world, in the East as well as in the West. In Palestine they are very remarkable, and Jerusalem itself is built on a strong earthwork.

The lecturer then proceeded to give a description of the ancient walls of Rome, pointing out on a map the directions in which they were carried, further illustrated by numerous photographs of great interest. He then went on to remark that we must not conclude that because the fortifications were faced with stone walls, principally tufa, the inhabitants of Rome in the time of the kings lived in stone houses. On the contrary, it is recorded that the house of Romulus was a wooden hut only. The only stone buildings within the walls were a few temples; the houses were entirely of wood, and most of the temples also. When a great deal of ornament was used in their buildings, the ornament was of wood or bronze, not of stone. In the Temple of Solomon, at Jerusalem, the earliest building of the kind of which we have any record, all the ornamentations were of cedar wood and bronze. The walls were of large

blocks of stone very similar to those of the walls of the kings at Rome, only larger. As a general rule, the older a wall is the larger the stones are, but this must, of course, depend on the building material. In the remains of other fortified cities of the early period, such as Fiesole and other Etruscan cities, we do not find any remains of houses; there are commonly one or two temples, and sometimes a fortified palace, but the houses were mere huts. It was, therefore, no great hardship for people in such a state of civilisation to be removed with their flocks and herds from one city to another, wherever safe fortifications for their families and pasture for their cattle were provided. This accounts for the rapid rise in the population of Rome. The Romans for several centuries adopted the plan of transferring the inhabitants of the conquered cities to Rome; their flocks and herds were added to those of the Romans, and increased the wealth of the city. Many of the original cities have never been inhabited since: the walls are nearly all that remains. Sometimes a Roman colony has been settled within the old walls, probably in part to defend them, and hinder an enemy from making use of them. It was not till after the introduction of lime mortar into general use that houses of stone began to be built, and then public buildings were erected before private houses. Lime mortar is supposed to be a Greek invention, but it was not brought into use in Rome until after the time of Camillus. It was either a Roman invention or was very soon introduced there and brought into use. Brick came into use in Rome very soon after lime mortar. The earliest walls with mortar are of rough stone only, with a profusion of mortar, but they soon began to face these rough walls, called concrete, with brick, to give them a smooth surface. They also at an early period used small blocks of tufa, cut into the shape of bricks, but usually of a rather larger size. We read of bricks at a much earlier period, both sun-dried and kiln-dried; but the bricks of Babylon and other earlier cities were cemented with bitumen only, or sometimes with slime or mud, where bitumen was not to be had. The earliest wall in Rome built with lime mortar is the high concrete wall at the north end of the Palatine supporting the cliff, near the middle of that end of the hill. This has been built of rough stones grouted in with fresh hot lime, and the outer face supported by a wooden frame, which has been suffered to remain until it decayed. The date of this early concrete wall is not recorded; the earliest dated building of this construction is the Emporium on the bank of the Tiber, about two centuries before the Christian era. The celebrated wall called the Murotoro, because it is distorted by the giving way of the foundations, and the Pantheon of Agrippa built a few years before the Christian era, have walls of enormous thickness, the mass of which is concrete faced with brick, and the brick is bound together and fixed to the concrete mass by a number of arches of construction. The buildings of the time of Julius Caesar are generally faced with large blocks of travertine, well out and fitted together, but quite plain. The buildings of the time of Augustus continued to be still frequently quite plain during the early part of his reign—that is, before the Christian era. Instances of this form of construction were given. During the long and peaceful reign of Augustus great progress was made in the fine arts, including architecture and the construction of walls. According to some authorities, the time that Christ was on earth was precisely the period when the arts were in the highest state of perfection in the Roman empire. This view is hardly borne out in strictness; but it is universally agreed that during the first century of the Christian era the arts were in a higher state of perfection than they had ever been before, or have been ever since, unless an exception is made for architecture in the thirteenth century, but that does not apply to Rome. Architecture is generally a guide to the other arts. For the construction of walls, Mr. Parker regarded the brickwork of the time of Nero as the finest in the world. The bricks with which the walls are faced are so thin that we can count ten to the foot, including mortar. In the second century there are eight to the foot; in the third century, six; and in the fourth century, four only, as in modern brick walls. This was regarded as a useful general guide to the age of a building in Rome.

Of the temples and other buildings before the time of Augustus, there are only such remains as serve for historical purposes, but not as models.

Such as remain sufficiently perfect to be considered as models are the Theatre of Marcellus, the Temple of Fortune, near the Tiber, and the Arch of Drusus. The remains in an imperfect state are numerous and important, and some of the buildings are nearly perfect. The beginning of the fourth century, the time of Maxentius, was a great building era, and there are many buildings of that period remaining; but after the accession of Constantine the Senate ordered that all these buildings should be called after his name, and the name of his predecessor obliterated. The removal of the seat of empire by Constantine was fatal to the prosperity of Rome as an imperial city. He gave all the imperial estates in the Campagna to the church, and as these estates had supplied the funds for the buildings of the city of Rome, this transfer completed its ruin. After that time the history of church architecture and of the Middle Ages begins.

On the subject of the durability of Roman walls and the cause of it, Mr. Parker remarked that, after the introduction of lime mortar, the lime in these walls was always used quite fresh and hot. It was pounded and mixed with a large proportion of gritty sand: full advantage was thus taken of the wonderful expansion and crystallisation of lime as it cools. The jagged edges of the crystals combine with the rough sand, or broken stone, or brick reduced to powder, and the mass thus formed is as hard and as durable as a natural concrete rock. English builders frequently have a prejudice against the use of lime quite fresh and hot; they say it bursts the walls, but this is because they do not pound it or grind it before they use it. A large lump of lime when water is poured upon it, will burst through anything, but in a powdered state there is no danger of this. The principle of our modern cements, both that called Roman cement and that called Portland cement, is the same. They consist of fresh lime pounded and mixed with rough sand or pounded stone, and kept in air-tight vessels until it is used. If this precaution is not attended to, lime absorbs moisture from the atmosphere so rapidly that all its binding power is gone before it is used. The more fresh it is the more strongly it will bind.

A few words on the construction of Medieval buildings in Rome might be interesting. It was rather difficult to say when the Middle Ages began. In the west of Europe, we generally mean by that term from the eleventh to the sixteenth century; but in Rome it was usual to begin them at a more early period, and to include what some call the "period of the Decadence," that is from the fourth century to the tenth. For that long space of time, about 600 years, we have scarcely any buildings remaining in England, and very few in France or Germany, because it was the habit of people to live in wooden houses, and to make even the churches and public buildings of wood also. The Anglo-Saxon word for "to build" is "timberen," and in Normandy M. de Caumont sought in vain for any masonry on the sites of the castles of the barons who came over to England with William the Conqueror. He found very fine earthworks, but no stone building of that period. The Norman keep was invented by Gundulph, at Malling, and rapidly adopted by the king in the White Tower of London, and by the Norman barons generally, as so admirably adapted to their wants at that period. A handful of brave men could defend themselves against any number till succour could be obtained from the neighbouring barons.

In Rome the fortifications are much earlier, and of quite a different type. The gateway fortresses consist of a circular wall surrounding the old gate, with inner and outer gates, so that when the fortress is complete three gates have to be passed through. The mass of the wall is generally concrete. The brick facing is quite different from that of the magnificent wall of Aurelianus in the third century. The wall of which there are large remains, was one of the wonders of the world. It was 13 miles long, 50 ft. high, and had a corridor for the sentinels inside the wall, with an open arcade within, and the solid wall without. All the early churches had been halls in houses, which came to be considered the natural form of a church, and the name of Basilica, which originally signified the King's Hall, was adopted as that of a church. That of the Holy Cross at Jerusalem is a curious instance of the adoption of an old hall for a church. The main structure is of the second century, and is oblong, with the original arches

for aisles. An apse at the altar end was added in the time of Constantine, which showed the idea that an apse had at that time come to be considered as necessary to make it a church; but in the fifth century round and polygonal churches were sometimes built, as at Ravenna and St. Stephen.

In conclusion, Mr. Parker remarked that the great abundance, including marble columns by the hundred, which remained in Rome from the time of the Empire, was in reality a misfortune to the Roman architects. In order to make use of these materials, they continued to build in the old forms, not only during the period before the year 1000, but in the thirteenth and fourteenth centuries also, long after the magnificent style, miscalled Gothic, had been brought into general use in the West. The so-called Gothic style scarcely came into use in Italy, until the fifteenth and sixteenth centuries. The arch is the real characteristic of Roman architecture; and from this everything else has been developed. In Medieval walls in Rome the surface is often faced with small stones of a peculiar character, called Opus Saracenicum, said to have been introduced into Italy by the Saracens; but it is really found occasionally in early Roman work, and was probably taken by the Saracens from Byzantium, and only brought back into Italy by them. Generally, perhaps, the buildings of the Renaissance in Rome are the finest that we have anywhere.

A conversation ensued principally with regard to the period when lime mortar was first used, when Professor Donaldson stated that on his first visit to Egypt he extracted a large fragment of mortar from one of the great pyramids, and these were anterior to the Roman remains spoken of by Mr. Parker.

On the motion of Sir M. Digby Wyatt, seconded by Professor Kerr, a vote of thanks was passed to Mr. Parker for his paper.

Descriptions were then given by the respective inventors of Mr. Miller's apocometer for measuring the height of spires, columns, &c.; and of a lock, invented by Mr. Hodgson, a harrister, called the Citadel Lock; and the proceedings terminated.

ON PAINTED ROOFS.*

The comparative lowness of our English churches seems to have called especial attention to the treatment of roofs in this country, and very great pains appear always to have been taken by English architects to produce the most magnificent effect possible in this particular department of their art.

Why it was fashionable to build churches, the roofs of which were not much more than two-thirds the height of those in France and elsewhere, we have no means of ascertaining. But that it was a mere fashion we may feel pretty certain. I think it is Mr. Ferguson who so justly remarks that an architect who could raise one of our great English churches could without difficulty have placed the vaulting at any elevation he thought desirable; indeed, as a matter of mere skill and beauty, our roofs in England (whether of wood or stone) far exceed anything that can be shown on the Continent. Of course, the great height of the cathedrals of Cologne, Amiens, and Metz, produces a most splendid effect, and gives them great dignity; still, our more sumptuous vaultings, by their intricacy and beauty, must have gone a long way towards rivaling, even if they did not excel in dignity, the ceilings of which I have been speaking, when in their glory. Again, the great distance from the eye at which the foreign roofs are placed made actual ornament a matter of secondary importance; and the consequence is that the roofs abroad are very often poor in design and execution, and that coloured decoration upon them is far more rare than it is with us. The well-known examples at Liège, with some others at Treves and elsewhere, afford excellent specimens, no doubt, of the method of treating roofs vaulted with stone, but they are of a late date. One of the most celebrated examples of a painted ceiling on the Continent is that at Hildesheim, which the late Mr. Le Strange took as the model upon which to arrange the remarkable roof-painting on the nave at Ely Cathedral. The barrel vault at St. Sauveur, near Poitiers, in France, is a remarkable, though little known, example, apparently of the same period as the painting at Hildesheim; at least, it seems to be what we

should call Late Norman or very Early English in this country. The entire vault of Alby Cathedral, in the south of France, is most magnificently painted by Italian artists of the sixteenth century; but as this work almost approaches high art, it scarcely comes within our present subject, though, if money were forthcoming for the entire fittings of our churches on the handsomest possible scale, it would be most unwise not to advocate the use of the highest decorative art, even upon roofs, distant as they are from the eye.

Still, as so great an amount of money can seldom be expended in decoration in these days, when mere church accommodation is so urgently needed, we ought to turn our attention to that which lies within the reach of almost every church builder or restorer,—I mean an effective method of roof decoration, produced by few colours, and at a small cost, but which has still some real thought and knowledge of the subject bestowed upon it; for it is impossible not to feel that a well-designed decoration, if it only consists of black and white, is more worth looking at than a far more elaborate painting, where the expenditure has not been guided by taste and skill. Every one would be inclined to allow, no doubt, that ceilings vaulted either in wood or stone add almost more than anything else to the dignified and minister-like appearance of churches; they have, however, one very great drawback,—they diminish the actual height of an interior very much. No one who has ever been between the roofs of Lincoln Minster (for instance) can fail to regret the enormous loss of height which the vaulting causes. Had this space been thrown into the church, it would have allowed the ceiling to have been raised to at least 100 ft. above the pavement, and so given that splendid building the only thing it seems to lack—proper elevation of the roof inside. This very fact, however, seems to be an additional argument in favour of roof colouring, as a carefully thought out scheme of decoration for such ceilings would go a long way towards finding a remedy for their only fault. It is a great pity that we have so few examples left us in a thoroughly trustworthy condition of the method in which these vaults were coloured. Both in England, however, and elsewhere, the ground colour seems most frequently to have been white, slightly tinted to take off its chilliness. Upon this pattern were traced sometimes radiating from the bosses, as at Wells Cathedral, or running alongside the ribs, as may be plainly traced in the transepts of Lincoln Minster; in this instance, additional richness is given by the introduction of an occasional medallion. In many instances, however, the bosses alone were richly coloured, together with a short piece of the rib in each direction from the boss itself, the rest of the roof being left of its natural stone colour: this has a very good effect. Examples of this treatment are to be met with in the cathedrals of Norwich, Ely, and Worcester; and in each case, I believe, the painting we see is an exact reproduction of the original colouring of the ceiling.

When the vault of the angel choir at Lincoln Minster was unfortunately stripped of its original plaster, a great quantity of painted ornament was discovered, and destroyed: thus depriving those who were interested in the subject of colour, as applied to church decoration, of a very valuable example, and, at the same time, doing a serious injury to the beauty of the interior of the church.

It is, perhaps, worth mentioning, that very possibly the painting on the roof of the choir of Westminster Abbey is only a clumsy eighteenth-century reproduction of the original decoration of that most graceful vault.

The wood vaulting of the choir of St. Alban's Abbey Church still retains its colouring in a remarkably good state of preservation. It consists of medallions and leaves boldly executed on a pale blue-green ground. The treatment of the ribs is also especially good.

It is impossible, however, in a short paper to go thoroughly into the various styles of roof-painting; so that the best plan, perhaps, will be to confine these remarks to one portion of the subject. The roofs which are most characteristic of our English phase of Gothic art are the astonishing series of timber roofs which are scattered over every part of the kingdom, displaying a most wonderful knowledge of the capabilities of the material with which the architects had to deal, and an amount of artistic variety of design and ornamentation which it is almost bewildering to think of.

* By the Rev. F. H. Sutton, M.A. Read at the last meeting of the Northamptonshire Architectural Society.

Different districts had, of course, their special types, the Norfolk and Suffolk roofs being (as a rule) entirely different from those of Northamptonshire, Leicestershire, and the Midland Counties; these varying from the Somersetshire, Gloucestershire, and West of England series, and these again giving place to a new style of coved and panelled ceilings in Devonshire and elsewhere. Still in each district, though its own peculiar form of roof is found, of course, most frequently, we are able to discover an extraordinary variety of treatment, execution, and design.

Now, as we have generally in our church restorations to deal with a wooden roof of one of these types, the best way will be to explain what would have been the usual treatment of such ceilings, when it was wished to colour them, and to illustrate the subject by a few specimens of roof-painting, such as we do not frequently find in our old churches. As a rule, as far as I can gather from looking carefully at a very large number of examples, it was not very usual to paint an entire ceiling elaborately. In many churches, indeed, the roofs seem to have been left the natural tint of the oak, with a little painting introduced in a hollow moulding, as at All Saints', Stamford; or with a pattern on the flat of a spandrel, or the more enriched design being reserved for the last bay of the nave eastward, over the screen, or for the panels immediately over a side chapel.

Instances of this arrangement are very common. A very good one occurs at Cransley Church, near Kettering, which I shall have to refer to again, and at Bury St. Edmunds, in St. Mary's Church.

Examples, however, of entire ceilings covered with paintings are to be found, and, when means permit, this plan ought to be adopted, if it is for no other reason than that of showing that the work of decorating our churches has not been undertaken in a niggardly spirit. But, of course, in most instances expense is an object, and where something has to be given up, that which, after all, is an architectural luxury, may well take a less expensive form, in order that the actual instruments of Divine service may be provided for on a more handsome and fitting scale. It is for this reason that the partially-coloured roofs to which I have been referring are so especially valuable, as they show us how much may be done in the way of decoration at a small cost.

An ordinary midland county roof is, as we all know, generally rather flat, and though frequently handsomely carved and moulded, perhaps more than any other kind of ceiling, seems to require the assistance of the decorator's art.

The church roof at North Luffenham, in Rutland, is one of the kind I have been speaking of, &c., it is a partially-coloured one, and is a fair specimen of the manner in which the old Gothic designers treated a plain roof. It may be taken very well as a type of such like simple decoration. It could be executed by any country painter, at a very small outlay beyond the ordinary cost of staining. The roof at North Luffenham has not been selected for illustration on account of its being in any way a remarkable specimen of painting, but to illustrate how small an amount of colour is required to produce a decidedly good effect. It is this which renders it a good model for imitation where a church restoration committee is in the usual chronic state of insolvency.

It will be seen that the principle upon which this roof is decorated is this: the woodwork, as a rule, is left its own natural colour, while the mouldings and bosses are painted in white, red, and black, the colours being everywhere counter-changed. The spandrels of the principals have a flower pattern stencilled on them in black and red; the chamfer is red, and the flat portion on the underside is white, to correspond with the other parts of the roof.

At All Saints', Stamford, if I remember right, much the same arrangement occurs, only in that instance small ornamental flowers are introduced in the hollow mouldings, to enrich the effect. The roof at Cransley Church, already alluded to, gives us some excellent hints to guide us in our roof decorations; the same colours are used as at Luffenham, the ornament being chiefly the usual barber's-pole pattern, as it is called—a twist of black and white. The aisle roofs, however, are more out of the common way, and the colouring of some of the spandrels in the south aisle is still pretty fresh. The pattern is drawn with a free hand on the plain uncoloured wood, in

white, with a red edge; it is dashed off apparently without any formal design being sketched, but it is very graceful, and fits the space remarkably well; in fact, it is not easy to suggest a more appropriate style of ornament for roof painting where time and money do not permit of a more elaborate treatment.

The roof over the nave at Brant Broughton, in Lincolnshire, retains its original colouring; the aisle roofs, however, have either never been painted, or have lost their colouring from being nearer the ground, and, therefore, more easily cleaned. This is a much richer specimen than those already mentioned. It is painted, however, on the same plan, and the same colours are used, with the addition of some gilding on the carved work. There is a very effective chevron pattern on the purlins of this roof. Altogether, this ceiling even now has a remarkably rich effect, and is well worth a visit.

The roof of Northwold Church, in Norfolk, is another fine specimen of one which has been painted entirely. It has been, unfortunately, rather coarsely re-coloured, but it still looks very well.

Perhaps the most beautiful bit of roof painting to be found anywhere is that over the eastern compartment of the south aisle at St. Mary's Church, Bury St. Edmunds. It formed the ceiling decoration over a side chapel. In this instance the roof has been hoarded to receive the painting. Like the others which I have described, the colours used are black and red upon a white ground, the mouldings, as well as the flat parts of the roof, being profusely ornamented with the twisted barber's-pole pattern in black and white, while the hollows are coloured red; the panel itself between the principals is divided diagonally with broad bands, containing inscriptions, which are separated from each other by a beautiful diaper pattern of ivy-leaves on an interwoven stalk, the intervening spaces being filled with the initials of the founder of the chapel, J. B., surrounded by a garb. At the intersections of this diaper little rays of metal gilt are tacked on, to conceal the junction of the stencils, with remarkably good effect; these, again, being connected by a flower, which formed the eye or centre of the gilded rays. The initial letters of the inscriptions are most delicately illuminated in gold, shaded with brown, in a style which is almost worthy of an M.S. The spandrels, too, are very good. This church also supplies us with an unusually good example of a panelled ceiling retaining its original painting. It is a very rich specimen, and more gorgeously coloured than most. In this case the ground of the panels is also white, and the carved ornaments, which are very rich and elaborate, are coloured red, black, and gold, a good deal of gilding being used to bring out the rich carving of the bosses, possibly owing to the darkness of the chancel, which it covers. The lower part of the roof, just above the wall-plate, is formed into oblong-coved panels, each containing an angel holding a scroll: this painting, I need hardly say, would be costly to imitate.

A very simple example of an original panelled roof, with its oil painting, occurs at Caston, in Norfolk. The panels themselves are left the natural colour of the oak, the ribs and bosses alone being painted. The rib is a simple roll moulding, with a hollow on each side; the roll is painted with a twist of black and white; the hollows are red, and the carved bosses at the intersections of the ribs are gilt. This roof looks remarkably well, and might be used with good effect anywhere.

It will be seen from those remarks that roof painting need not necessarily be an expensive undertaking, and I trust we shall see the experiment tried much more frequently than we have hitherto done. If it is, there can be no doubt that our churches will very soon assume a dignified beauty, which at present we can scarcely conceive possible.

Mr. Sutton, being asked by the Chairman, said he should be happy to assist any one who wished him with his advice on the subject of painted ceilings. In reply to Mr. E. F. Law, he recommended roofs being painted in water colours, as they could be done in a very little time. The roof of South Kilworth Church was done in ten days.

Mr. Law advocated roofs being painted in distemper. The colours became dark from absorbing the moisture, but there was no dripping. It would be much better, also, to have stencilling between the rafters: it was much more lively, and had a great advantage, besides which the difference of cost was great.

THAMES BRIDGES.

The traffic over London Bridge was stopped on Monday, and now there is not a single stone of the pavement laid down in 1865 left in its place. The inconvenience thereby occasioned is, of course, great. Southwark Bridge is notoriously an inconvenient one; and there is a disinclination, if not a dislike, on the part of drivers, to cross it. This has thrown the larger portion of the goods traffic between the northern and southern divisions of the metropolis upon the new bridge at Blackfriars. The City authorities, in anticipation of the advent of this pressure, have as yet refrained from taking down the old wooden temporary bridge, but have issued orders that all traffic passing southward should go over it, thus putting the less strain occasioned by the smaller traffic from south to north upon the new structure.

Some short time ago the *Spectator* wrote:—

"London Bridge is choked with traffic on it, and the City council has been considering and rejecting all manner of expensive proposals for widening it. Foot passengers especially suffer. They are often in danger, and, as Mr. M'George pointed out, the balustrades being solid, the bridge is a dust-trap in good weather and a ditch in bad. Will the *Baldler* tell us if there is any final reason why a bridge like London Bridge should not have a second story put on it,—a wooden bridge, like a railway crossing, supported on iron pillars let into the buttresses, and secured for pedestrians? No work in wood would be necessary for that, and cabs would gain the space now occupied by the *treitours*. Must such a second story be too ugly for human endurance?"

We will say nothing as to the obstruction to view and the ugliness that might thus be created: sufficient objection to the proposition may be grounded on the fact that the foundation is already as much loaded as it should be.

In a "Report on the Communication between the North and South Sides of the River Thames," by Mr. Henry Carr, G.E., recently published,* the writer shows that the pile and timber foundation of London Bridge is not equal to the work put upon it, and says the piles are, no doubt, either crushed or the piles are driven down.

"It is evident," he says, "that, although London Bridge stands well at present, it would not be desirable to put on additional weight, even if the additional weight were so small as probably to produce no appreciable effect; nevertheless, should additional weight be put on, and any settlement take place at any future time, the committee might regret having increased the load upon a foundation which certainly has no strength to spare."

The writer proposes to widen the footpaths of the bridge, from 9 ft. on each side, to 11 ft. 6 in., by removing the parapet to nearly the extent of the cornice which now projects beyond it. In the same report Mr. Carr proposes, with reference to Southwark Bridge, to lessen the steep incline which at present interferes so much with its usefulness, and to widen it from 42 ft. to 54 ft., without additions to the foundations. He would take down the existing cast-iron arches, and replace them with others of wrought-iron, lowering the soffit to the same level as at Blackfriars. The new street now in progress will give a good approach, and something should certainly be done to enable the bridge to take its fair share of work.

LECTURES ON ARCHITECTURE AT THE LONDON INSTITUTION.

PROFESSOR KERR delivered, on Thursday evening, the 11th instant, the first of "Four original Lectures descriptive of Architecture or the Fine Art of Building," dealing preliminarily with the primitive style of the Egyptians, and others before the Greeks. His object, said the lecturer, was to explain to an audience presumably uninitiated in architectural matters the grounds upon which controversy at present so much rested with reference to this art in what was called "the battle of the styles,"—a discussion now so frequently appearing in the press as to have rendered an otherwise recondite subject of professional study a matter of popular interest; one great class of society holding to Classicism, and another maintaining Medievalism,—and this frequently with considerable, not to say inexplicable, warmth. After defining the question of art and the sense of beauty, and giving an illustration of the way in which plain building becomes artistic by the use of proportion and ornament, the lecturer went on to explain the causes which produce style (given, said he, such and such conditions, the result will be necessarily so and so), and proceeded to examine the style of the Egyptian

* Waterlow & Sons, Parliament-street. 1869.

works, which he thought it convenient to trace to the excavated temples, so as to account for the extreme ponderousness of the columnar arrangements. He had previously, however, presented the following scheme of general artistic chronology in epochs of 500 years.

B.C.	2000 to 1500	... Egyptian, rising.
	1500 to 1000	... Egyptian, declining.
	1000 to 500	... Assyrian and Persian.
	500 to 1	... Greek.
A.D.	1 to 500	... Roman.
	500 to 1000	... Byzantine (the Dark Ages).
	1000 to 1800	... Western Ecclesiastical.
	1800 to 2000	... An antiquarian epoch, apparently now drawing towards a close, to be succeeded by a fresh line of effort.

After pointing out on drawings (most of which were courteously lent by Professors Donaldson and Hayter Lewis) the characteristics of the Egyptian manner of design, the lecturer dwelt upon those points which he considered had so far been accomplished as established architectural data. The cornice was one, but not the stylolate. Sculptural decoration of a mural character, and painting to correspond, and the use of colour decoration, were other points. The structresque had been accepted; proportion, also, as a purely architectresque element, had been fairly exhibited. Symmetry, not necessarily an axiomatic idea, had been established. The introduction of architectural ornament, treated in a perfectly architectresque manner, was accomplished; and symbolism, also, in its simple form of characteristic expressiveness.

The remainder of the lecture glanced at the character of Assyrian and Persian work, Indian and Chinese (ancient and modern alike), and thus stopped at the preparation for the Greek epoch.

THAMES EMBANKMENT, COURTS OF LAW, AND BRIDGES.

As the commencement of a new era for London, our riverine boulevard, although complete only in its quay wall and footway, excites admiration; but the opportunity opened by it for adorning the metropolitan centre, by the erection of ornamental buildings, and by the plantation of intervening spaces, at suitable intervals, whilst at the same time it affords views hitherto occulted except from steam-boats—this is its chief value.

The railway is advancing with great celerity, and is likely to be in action the ensuing spring. The works are continued night and day, so that recollecting the rapidity with which the line from Brompton to Kensington was carried out, together with the stations, we may calculate upon the promise of the contractor to throw it open by the 1st of May.

The opening of New Blackfriars Bridge and the Holborn Viaduct, while it confers wondrous benefits upon the traffic of London, will bring more palpably before the public the inexpediency of placing the Courts of Law upon the lie-by of the Embankment, or on any other site than upon the *central, solid, and elevated* position which was at first selected, purchased and cleared for them at St. Clement's Danes.

Granting that room could be found by making expensive clearances between Somerset House and the Temple, the site would be neither so convenient for the practitioners nor suitors in the Courts; besides that, it must be at increased cost, and would require two years longer in process of erection, leaving the Temple Bar centre a ruinous waste, to be hereafter disposed of after the fashion of Victoria and Farringdon Streets. The delay and indecision upon all our public works have hitherto been as discreditable as unprofitable.

The sites upon the river embankment are so valuable and beautiful that they will be eagerly sought and turned to good account. It would not contribute to the scenic effect to continue a series of lofty buildings from Somerset House to the Temple—the river would be overshadowed, and the views of monumental London curtailed off from the causeway. In such cases, as in Venice, all structural effect must be sought and studied from a gondola.

There are, however, other and more important considerations,—the first being the professional convenience and aptitude of the Clement's Danes site; the second, the waste and incalculable public loss of further clearances.

It is dismal to behold, in the busiest centre of the metropolis, a hoarding that shuts off for 300 yards all traffic and intercourse between the

Strand and Lincoln's-inn-fields; lawyers' offices, inns of court, and more humble ranges, all levelled in desolation—the population scattered; and that when, after due consideration, all this had been done, the crotchet of a high official should suffice to arrest and stultify so much thought, precaution, and outlay. Surely there must remain some power of action, if not with officials, at least with the recognised architectural authorities.

If the works are to be done, they ought to be carried out at once; there are just now some 40,000 skilled workmen and labourers out of employ, and yet public works are suffered to stagnate! The National Gallery, Piccadilly, the Galleries of Exhibition-road, South Kensington, the meditated bridge from Whitehall-place, with other public structures, have been long in abeyance, and Governmental works ought to be carried on at a season when work and wages are of such vital importance to the community.

The question of bridges across the river, connecting the north three-fourths of the metropolis with the south-east one-fourth, which has been recently treated in the *Builder*, now becomes of more importance, as other great thoroughfares are opened and improved; for the greater the facility of intercommunication, the greater the requirement for its extension. The opening of the toll-bridges by the Corporation is assuredly a step in the right direction; but the rapid growth of the great commercial city, a mile eastward of London Bridge, now absolutely necessitates the erection of another bridge, near the Tower and short of the docks, for the ease and intercourse of the great commercial and shipping centres, which embrace the import and export trade of this mighty city. St. Catherine's Wharf, a little over half a mile from London Bridge, and hereabouts, in the vicinage of the Tower, an open bridge would save an enormous annual outlay of time and money to 400,000 inhabitants of these hitherto disconnected limbs of the metropolis.

The outlay involved in the formation of such a bridge would be far exceeded by that expended on improvements in the busy centres to be benefited by its erection; whilst the anchorage of a constantly increasing mercantile marine lower down stream must essentially improve the further outlying river vicinages of Essex and Kent; and at this season of dearth amongst the working classes nothing could be more opportune than a speedy commencement of the project.

T. H. H.

ANOTHER GRAND HOTEL IN NEW YORK.

THE formal opening has taken place of a grand caravansera, corner of Thirty-first-street and Broadway. The Grand Hotel is built of Winchester marble, in the Romanesque style of architecture. Mr. E. S. Higgins, a successful merchant of New York, devoted 800,000 dollars to the undertaking. Each story of the eight has a distinctive architectural feature in the marble framing of the windows, one set being round, another segmentary, another semicircular, and so on. Each floor is distinguished by a colour. On this the carpets and upholstery are green, on that blue, on the next crimson, and so on through the seven primary shades. Some of the mirrors are superb; all are large and elegantly mounted. They cost 20,000 dollars.

In the principal corridor of each floor, close by the broad area into which the grand double staircase opens, a coil of hose, mounted by a brass pipe, hangs suspended on a hook. 200 ft. lie on each floor, as a provision against fire. A gnest may act the part of fireman, if anything like a conflagration breaks out in his neighbourhood, and he draws upon 10,000 gallons of water over his head in the reservoir top of the roof for assistance.

The elevator is not without its features of novelty. At every floor you approach, the doors of wire netting, by automatic arrangement, fly open, saving the boy a great deal of trouble, and the ascending traveller a trifle of time.

In the subterranean exploration—a matter of easy accomplishment, as there is an abundance of light—the laundry, the wine-cellar, the store-rooms, and the water-closets come successively under observation.

The gentlemen's *café*, on the first floor, is a sumptuous apartment, with heavy panelled ceiling, black walnut furniture, green drapery, and a dazzling glitter of silver ware proceeding from every table. The gentlemen's smoking-room is not yet quite finished, neither is the reading-

room, but both are under way to completion. A restaurant is attached to the hotel, where young men can live at a moderate rate. The whole cost of the furniture was 200,000 dollars.

SOCIAL SCIENCE ASSOCIATION.

THE opening meeting of the session has been held at the Society's rooms, Mr. E. Chadwick delivering the usual introductory lecture. He congratulated the members on the movements now making to press forward elementary education, and on the appearance of the National Education League of Birmingham and the National Education Union of Manchester, both having in view a complete system of national education, embracing the primary instruction of all children in reading, writing, and arithmetic, but seeking to accomplish the object by somewhat different means. The Social Science Association were in favour of an unsectarian system; and, remarking that there were large omissions in both programmes, suggested that the association might well apply to filling them up. He next pointed out the advantages of mind culture in improving not only the moral but the physical condition of the people, and increasing the power of mechanical, agricultural, and other industrial productions. This latter benefit he held fully justified the application of a national rate. The department of Economy and Trade would assemble under conditions of distress and demands for protection against hostile tariffs. He held that hostile tariffs were best met by free trade in its ultimate result; but by all means, he said, let those who demand inquiry be gratified. But to stimulate production and employment it was requisite to stimulate consumption, and to do that we must improve and cheapen art and science and manufacturing to enable us to keep pace with other nations. And how, he asked, was this to be done, but by improvements in primary education, leading to improvements in technical and art and science education? The lessening of the, at present, great loss of life and property by storms, the economising of the means of advancing sanitary science, the reduction of military expenditure by improvement in arms, he also connected indirectly with the spread of education. He touched upon railway reform, advocating the transference of the railways to Government, on the principle adopted in the case of the telegraph companies. The depressing conditions which were within the province of the department of Economy and Trade comprised causes which called for the serious exertions of the department of Jurisprudence, especially in regard to bubble companies, financing frauds, frauds on insurance companies, and analogous crimes; and, as a Commissioner of Police inquiry, he expressed his opinion in favour of a system of public prosecution, suggesting, however, that a great difficulty to overcome would be the opposition of the law officers of the Crown.

On the motion of Mr. G. Hastings, it was resolved that Mr. Chadwick's address be printed, for the use of the several departments.

OUR STATUES AND SCULPTORS.

PERUSAL of Professor Donaldson's observations in your pages as to London Statues* leads me to send you a few remarks written by me some time ago.

Our London statues are the constant butts of satirical authors, who, in novels, burlesques, and comic periodicals of the day, find no easier way of showing their wit than by ridiculing the unfortunate statues. Admitting that they are not satisfactory, I think a fair, impartial judgment would be that in many instances it is not the design and execution, but the material of which they are formed, that renders them so displeasing. On the Continent, even at a few miles' distance from our shores, if the design and execution be no better than in the London statues, the marble or bronze, retaining longer its original colour by the greater light, dryness of atmosphere, or the less consumption of coal, is more pleasing and inviting to the eye. The few white marble statues existing in London prove that, as a material, white marble will not suit, unless our fire brigade are employed with a liberal supply of soap to keep them respectable. The statue of the Queen at the Royal Exchange

* See p. 861, ante.

often requires cleaning, and an attempt is now being made on it to resist further decomposition. Monochromatic marbles of a sufficiently light hue are too few for the purpose, and all polychromatic or variegated marbles are unfit for sculpture or carving. Bronze in London, whatever may be its original colour, whether pale green, brassy yellow, or rich copper hue, soon loses its original agreeable tint, and becomes the most monotonous, melancholy, and disagreeable tone that it is possible to conceive; the statues constantly reminding us of swamps,—not a clear, transparent, lustrous black, like marble, but a dull, heavy hue that will not allow the light and shade, even in our brightest days, to be seen at a very short distance, and obscuring all the details and minor beauties which add so much to a work of art. I believe many persons have passed up Portland-place and round Park-crescent without noticing the statue of the Duke of Kent. There is a statue of the Duke of Cumberland, of Culloden celebrity, in Cavendish-square, that, if my memory does not deceive me, was formerly gilt. Not having remarked it for years, I fancied it had disappeared; but, on looking expressly, found it still there. After the first few months, when the original agreeable hue of the statues has changed to the permanent repulsive tone, few persons are to be noticed examining them; and if the charm of novelty is lost to us, it cannot be the case with provincials or foreigners. The statue of Achilles, copied from one on Monte Cavallo, Rome, in Hyde Park, and those of Marochetti, are equally neglected as those by our own sculptors. The statue of William IV., near London Bridge, erected about twenty years since, has retained its colour longer and better than any other about London; and if expense were not an object, would show that a light unvariegated (or very slightly so) granite would be a good material, and if polished it would better resist the atmosphere. Unfortunately, the material proved so costly that it rined the sculptor. Perhaps by this time cheaper ways can be found of working granite. No method has yet been discovered of using terra-cotta with sufficient accuracy on the scale required; and if that or any artificial stone could be made to resist time, it would be too brittle to stand the attacks of the London Arah, who seem to have a natural antipathy to Grecian or Roman noses. Marble will not, and it is doubtful if granite would if within reach of a stone. Sir Joshua Reynolds said that a painting should challenge attention by its general attractive appearance, or its other beauties would be liable to neglect. This remark is as applicable to sculpture as painting, and if sculptors wish their works to escape the present neglect, and ridicule, and desire greater encouragement, they must follow that advice Sir Joshua offers to painters, and not give the subject up in despair.

Though I am not a sculptor, I feel much interest in the subject; and, believing that no method can be found for preserving in London for any long period the original beautiful colour of bronze; also, that any change almost would be preferable to the dead, dull, chilling effect of the smoked statues,—I have tried experiments with other metals as far as my limited means would permit. If iron after it has acquired the warm tone of rust, could be preserved from further decomposition, its colour would be far more agreeable. The domes of the four courts at Dublin are covered with copper, and, I am told, have become of a beautiful sea-green tint; but it would not answer here. Gilding appears satisfactory on spires, towers, &c., but not near the ground. Sir Charles Barry had gold leaf prepared with very little alloy for the spires of the Palace at Westminster. I was able to obtain some of similar purity; but without alloy it is very difficult to work, and does not appear to succeed near the ground. Mr. Nash tried mosaic gold for the railings at Buckingham Palace, but it soon failed. I thought that the effect of the warmer-toned oxidised silver would be very superior to the dismal permanent bronze colour, and tried to produce it. Vulcanised iron soon became of a dirty hue, and would not be very durable; lead the same. Tin, which it is extremely difficult to get pure, has soon rusted. Nickel is of a too dark grey cold tint, and is very difficult to work. Aluminium, from which I expected much, became of a cold white tint, which I thought was a white frost deposited on it, but it has remained the same. Platina appears to me to promise the most satisfactory result. It remained throughout the winter of 1867 and 1868 exposed to the south-east in my

garden, at about 150 degrees above the Liverpool high-water mark, the datum of the Ordnance survey. It retained its brilliancy, with a slight improvement of warm tarnish. I showed it to an eminent sculptor, who objected to the brilliancy, while at the time he was having his electrolytised bronzed statues painted, those not having been exposed to the outdoor atmosphere, but had changed in his warm, sheltered studio. The platina has remained since in the same situation without, as it seems, any change. I think in London the dust and damp would soon dull it sufficiently. It appears to me to be worth the trial, and I wish I was wealthy enough to make it on a sufficiently large scale. Architects may find the metal worth consideration. Being anxious to obtain the metals as pure as possible, I procured them at Messrs. Johnson & Huntley's, assayists, and give the prices and gravity, for that must be considered in judging of the expense:—

	Per oz.	Water.
Gold.....	24 7s. 6d.	19 0
Aluminium.....	0 6 6	from 273 to 275 0
Platina.....	1 6 6	21 0

In the same number of the *Builder* I think I noticed that a French decorator was introducing painting on foil. In one of my rooms I was much annoyed by damp, which completely spoilt the paper, and the paperhanger in repairing the room introduced foil over the damper parts. It seems to have succeeded. Would it be worth trying for painting on instead of fresco? I imagine it must be a pure tin foil; for any lead in it would injure the colour, and that I found very difficult to procure. Zinc grounds were tried some years since, but failed entirely.

G. B. MOORE.

I HAVE read the admirable article in the *Builder* by Professor Donaldson, and my excuse for first speaking of myself is to show why I consider myself capable of appreciating the ideas. In early youth I worked as a granite mason, and being looked on as a handy lad, a great many quaint little jobs fell into my hands. I left that occupation, and came to London, and commenced modelling the figure. I gradually worked my way to be sculptor's assistant, and as such, I believe I have the good opinion of the best men of the day.

Working as I must, I generally get my living by finish; but I have always felt that for a public work to be effective it should depend on greater qualities, and it should be large enough to correspond with its surroundings. In points of pedestal, position, and size, the sculptor must defer to the architect. Boldness of outline, depth of shadow, and truth of general form are all that should be looked for in a work to be seen in the open air; and I am sure, from experience, that sufficient detail can be introduced to satisfy the artistic mind if necessary; and in speaking of detail, I do not for a moment refer to those glorious surfaces of some of our best examples,—every line, every half-tint of which assists in its beauty and its truth; but to the buttons, ribbons, and buckles, the pre-Raphaelite texture and touch so much thought of and so easy to do in marble.

I should not advocate granite as a material for work that can be placed in a position where steady shadows and delicate lights could have their full and proper effect; but for the open air, for large and effective work, it possesses the finest properties.

The statues of London and the way they are distributed are felt to be disgraceful and hopeless to us poor assistants. The fact of a man being able to design and model, and being therefore a sculptor, goes for nothing. The chances are that he will have to work for some business man, who will only have his name on the work. Several statues, lately erected to the memory of eminent men, are entirely the work of assistants, and one is by a man who never modelled a statue before. I speak from positive knowledge. Better work could be done at less cost if the men who do the best work had a chance of doing it for themselves, for they would be more interested in it as artists. I doubt that the statues of London will ever be improved under existing circumstances. Most of the commissions given of late have been the result of jobbery or forced popularity. I am not now writing for myself alone, but I am saying what all my class know and talk about. I beg, in conclusion, to submit one suggestion, which I trust may be thought practical, in order to guard against quackery.

Let six men, who have proved themselves accomplished assistants,—men of experience,—

be selected, and let each man be paid a small remuneration for a quarter-sized model, and let them compete, perhaps with any others who may choose to do so. These men can easily be found, and would be certain to be able to work out what they could design; but at the present time they know from experience that it would be waste of time to compete against names and capital.

I believe such great men as Chantrey and Flaxman would, were they living and young now, be scarcely able, by their talent alone, to prevail against the present corrupt system.

A SCULPTOR'S ASSISTANT.

THE NEW HOTEL, CAIRO, EGYPT.

As the opening of the Suez Canal is turning men's minds towards Egypt, our readers may be glad to know something of the Oriental Hotel Company's new hotel at Cairo, in Egypt, which has recently been opened for the convenience of travellers to the Nile, and by the overland route to India, as also for the reception and accommodation of the many invalids who find benefit from a winter residence in Cairo. We give a view of one front of it, and plans of two floors.

The hotel is beautifully situated, facing the gardens of the Ezbekish and the Rue de Boulaac, and commands a good view of the Pyramids. The foundation-stone was laid with great ceremony by his Excellency Nubar Pasha, Minister of Public Works, on the 18th of January, 1865, being the anniversary of the accession of his Excellency the Viceroy.

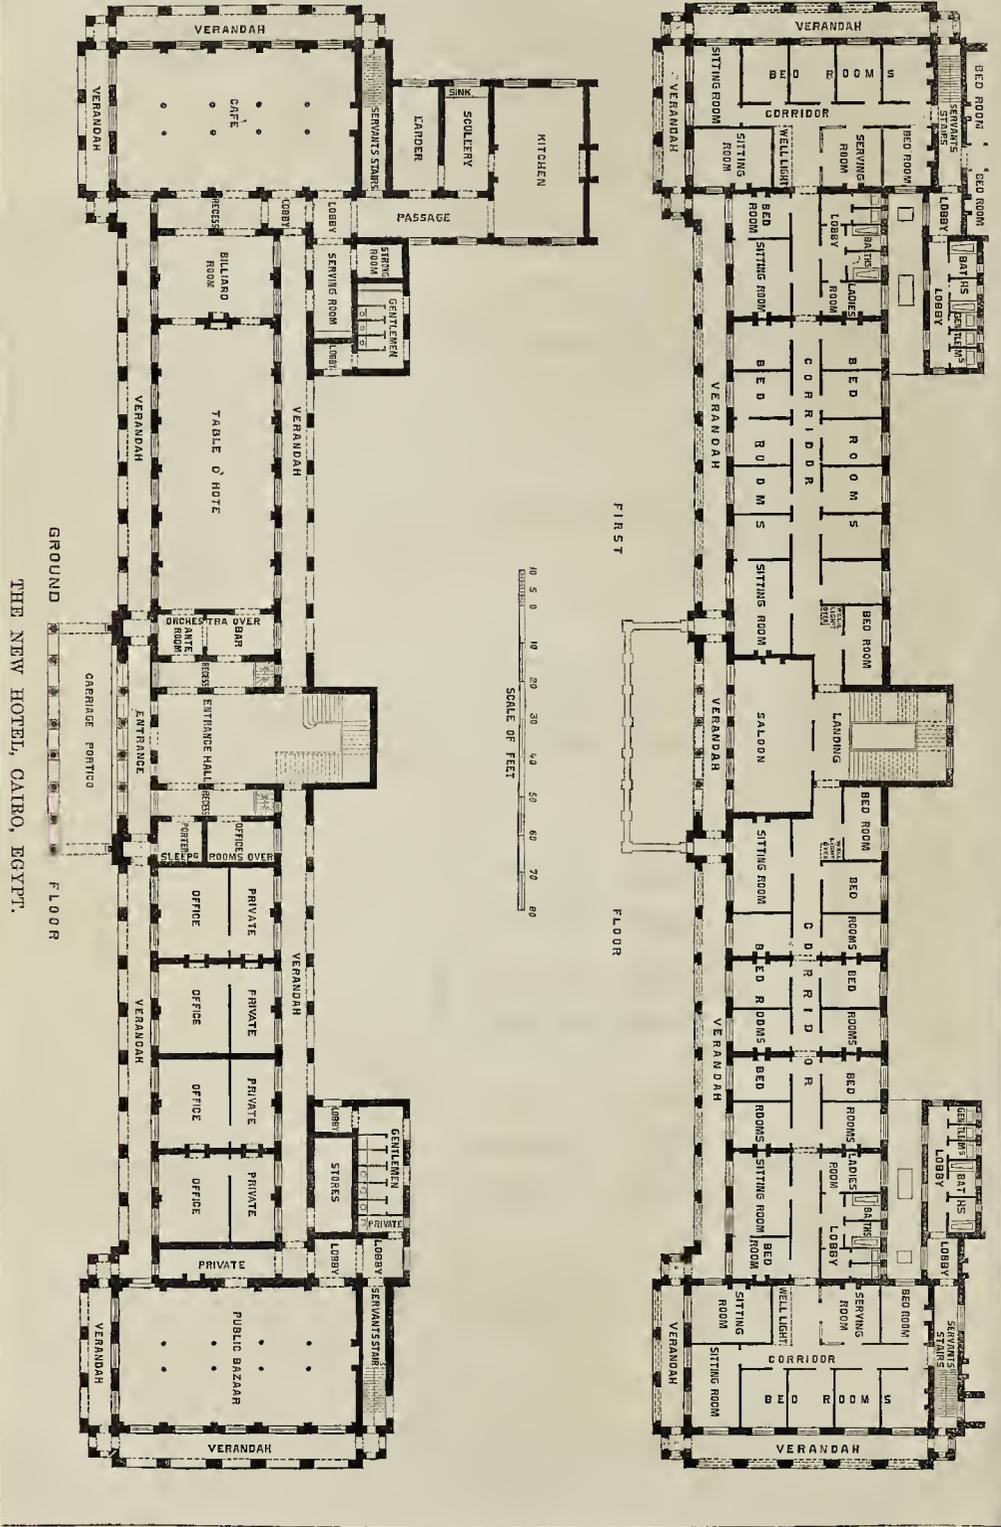

The hotel, when completed, is intended to form a quadrangle (with large open gardens in the centre), of which only the principal front, facing the Boulevard d'Ezbekiah, and a portion of the return fronts facing the Rue de Boulaac and the new street, have been as yet erected. The building is Franco-Italian in style, and has been erected from the designs and under the superintendence of Mr. Christopher G. Wray, of London, who, from a long residence in India as an officer of the Public Works Department, had knowledge that enabled him to arrange an hotel suitable to the requirements of the climate.

It is constructed with stone from the neighbouring quarries, with terra-cotta enrichments, which were sent from London, as also were all the woodwork and fittings. The portion at present built has a frontage towards the Boulevard d'Ezbekiah of about 400 ft. in length, and returns about 85 ft. towards the Rue de Boulaac, and about 140 ft. facing the new street, and it is about 70 ft. high. It contains upon the ground-floor a *café*, 61 ft. by 36 ft.; *table d'hôte* room, about 80 ft. by 30 ft.; *bar*, 61 ft. by 36 ft.; billiard-room and suites of public offices, all 21 ft. high; as also a grand staircase, 60 ft. by 23 ft.; and at the rear a kitchen department, serving-rooms, and other offices.

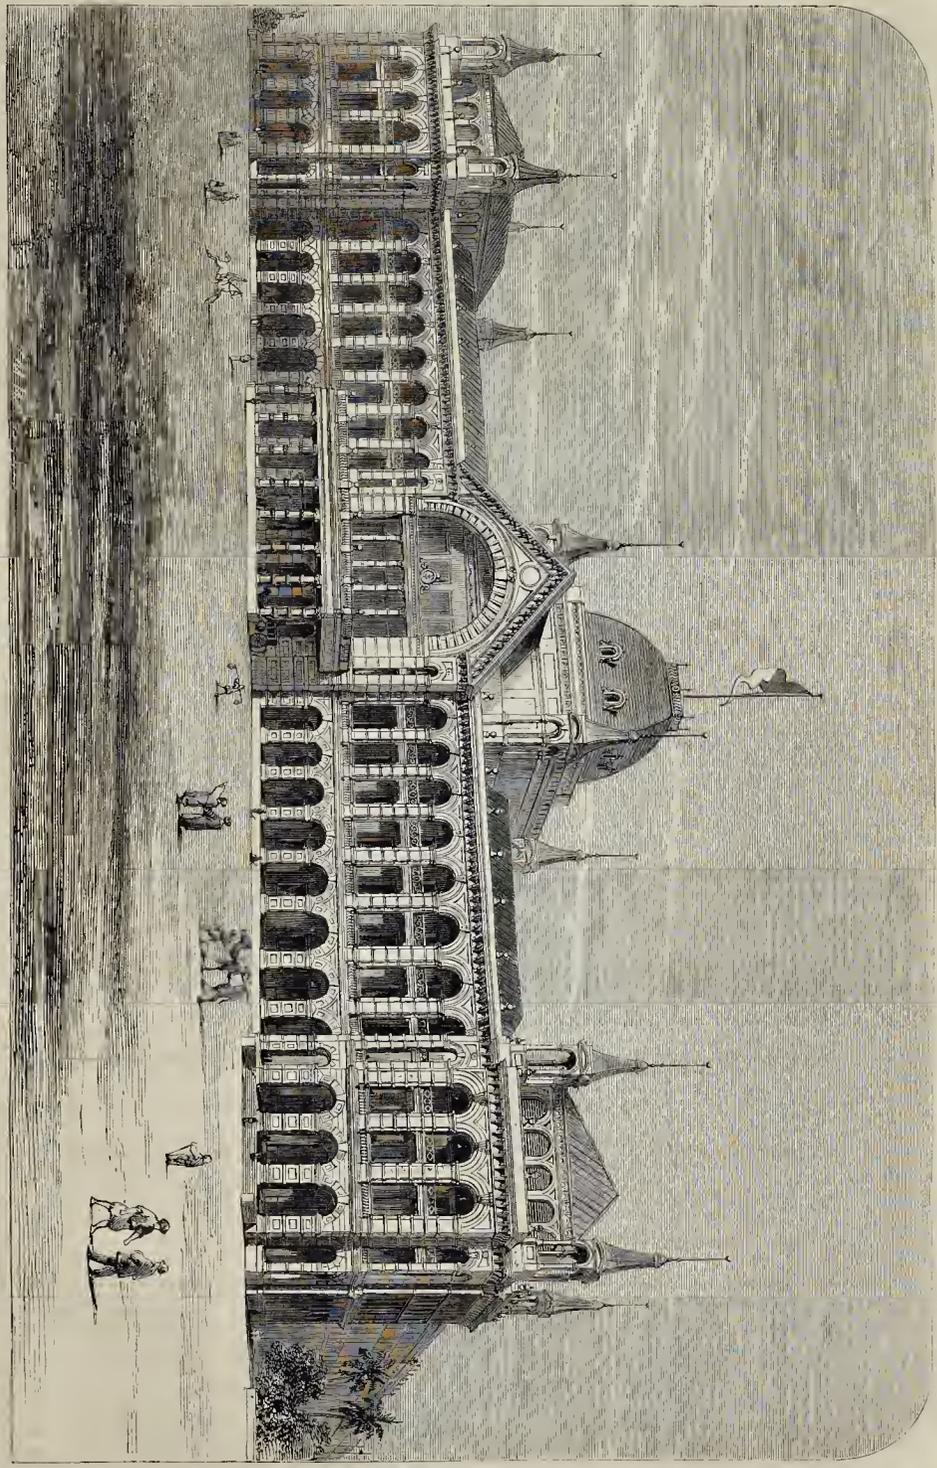

The hotel is surrounded on all sides by wide verandahs, affording a passageway around the building, and supplying a comfortable lounge. The *table d'hôte* room is supplied with an orchestra for evening entertainments, and is laid with parquetry, so as to afford a dancing floor.

Upon the first floor are a ladies' *salon*, 41 ft. by 21 ft., and 20 ft. high; nine private sitting-rooms, with bedrooms *en suite*; and forty-two bedrooms, besides various serving-rooms and W.C.s, which are numerous, and conveniently arranged, those for ladies being entirely separate, and approached through their own retiring-rooms. The bath-rooms are fitted with large baths, and shower-baths over all, supplied with hot and cold water, the whole of the apparatus and fittings being of the best London manufacture.

The second floor is somewhat similarly arranged, and contains fifty-nine bedrooms, besides ladies' rooms, serving-rooms, baths, &c., as on floor below, and all 15 ft. high. The floors are variously laid with parquetry, marble, and stone paving, bordered with Maw's encaustic tiles, which give a rich effect. The various apartments throughout are supplied with Bregnet's patent electric bells. The total cost of the portion of the building already erected has exceeded 100,000*l.* The whole of the very arduous contract was undertaken by Messrs. J. Perry & Co., of Broadway, Stratford, London, and has been completed in a very satisfactory manner by their agent upon the works, Mr. T. Sinton, and by the company's clerk of works, Mr. C. Tompson.

THE NEW HOTEL, CAIRO, EGYPT.

THE NEW HOTEL, CAIRO, EGYPT.—MR. CHRISTOPHER G. WYATT, ARCHITECT.

SOME RESULTS OF TRADE UNIONS.

SIR,—All conversant, during the last ten or fifteen years, with building matters are aware of the great increase of cost involved in them. In the provincial district I am most familiar with, an advance of from 60 to 100 per cent. has occurred, which cannot be accounted for by all or any of the changes that have taken place with regard to wages and hours of labour. The increase of wages is from 25 to 30 per cent., say the larger proportion; the reduction in the hours of labour may be taken at 15 per cent., making, with the 30 per cent. on wages, 45 per cent. This still leaves on the average some 35 per cent. to be accounted for. Now, how can this be done? The cost of materials will not explain it; for, notwithstanding occasional fluctuations in price, there is no very appreciable change under this head, since the increased value attending a greater demand from increase of population has been balanced by the greater facilities afforded for carriage, and the consequent equalizing of prices in the country at large.

The great use of machinery should tend to reduce cost of production; and though sometimes charged for at unduly high rates, it, for the most part, does conduce to cheapness.

Some have assumed that larger profits are absorbed by contractors than heretofore; but my own observation leads me to a directly contrary conclusion, and I feel obliged to look for an explanation from some other source.

This, I think, is to be found under two principal heads, both of which are referable to the influence of trade-unions among building workmen. The first cause I instance is the less amount of work performed (though at higher wages) in a given time. The second arises from charges levied on master tradesmen without any compensating profit. Let me illustrate this from facts. A builder put into the hands of a good workman a piece of work of which several exact repetitions were required in a building in hand, and the man completed his task in one day and a quarter. He was given another of the same piece of work, while a third was at the same time placed in the hands of a fellow workman; on these each of the men expended two days and a quarter. The builder asked the man who was first placed on the work how he came to be so much longer on it in the second case than the first. "Oh," said he, "I could have done the second in a day and a quarter, too, but I dared not work faster than the man beside me, and I should have been fined (naming a sum beyond a week's wages) by the 'union'!" Again, a master tradesman entered a nearly completed building where his men were at work, towards evening twilight, and while watching their progress saw a stranger enter, who evidently did not see him. "My lads," said the visitor (a "union" inspector), "you are getting on a little too fast here; you must make your jobs last out a bit better than this or it will never do; so mind what I say or you will hear of it again as you won't like." The master stepped forward to ask the fellow's business there, but he speedily got out of the way.

A freeman, a strong unionist, chosen and placed over some work by the proprietor, prolonged the work on various pretexts, the most usual being the want of masonry details from the architect, by which he accounted for a quantity of stone remaining for weeks unwrought on the site. It was discovered that he kept the details without using them as long as he thought fit, making this excuse for delay, and that he threatened to get one workman discharged for working too well, who was the only one in his branch of work too honest to be controlled by the plausible knave who was put over him.

As to the second head,—senseless cost. A contractor had two considerable buildings in hand in a large town, the distance between the two being some 350 yards. For convenience he arranged to pay the men employed on both works at the building nearest his place of business. The first pay-day after this arrangement the men who were asked to walk the distance named for their wages refused to do so, and, after sulking for an hour and finding that no one came to them, they went to the other building, but demanded a quarter of a day's additional wages on account of their own delay, threatening to strike if this were not acceded to—which it was!

Two buildings, separated by about the breadth of a road, a moderate distance from a large

suburb, were, for some reason, under different arrangements as to "walking time." The workmen left their homes together, walked the half or three-quarters of a mile in company, and then one set began their work while the others smoked their pipes for ten minutes or thereabouts, at the expense of their employers as to time, though I suppose not as to tobacco.

Such instances might be multiplied a hundred-fold, but cannot surely be within the knowledge of those who advocate trade-unions, as at present constituted, as conducing to independence and self-respect among workmen, and as having a wholesome influence on the relations between capital and labour. In the matter of self-respect, the standard of labour for a good workman is lowered, under penalty, to that of the worst or laziest he may be associated with, while the standard of pay for the worst is what can be claimed by the best! Higher wages paid to superior workmen, as out-door foremen, stone-setters, &c., have come in some places to be stigmatised as "blood-money," on the assertion that the remuneration is simply for "driving" the men working at ordinary wages. As to independence, lately passing a large country church in course of building, I saw only the clerk of works on the spot, where shortly before some thirty masons were busy. The "delegates" from the "Union" had been there, ordering the men to strike, not more than one-third of whom did so willingly, the others telling the clerk how they wished they could remain at work, but that they "dared not." A clever, industrious joiner, who had a lathe at home, and was good at cabinet work, not long ago begged the friends who gave him occasional evening employment of this kind to keep the fact private, or he should be fined for earning money out of shop hours.

This system is driving many of our best workmen out of the country, and its evils rarely in directions not always obvious; but in all it tends to diminish the real self-respect and independence of our handicraftsmen, as must be the case where a low maximum of work is combined with a high minimum of pay, which, moreover, one of the union speakers, at a large meeting in the North lately, declared to give a security against "inferior work!" The encouragement is in this country thus constantly decreasing for any man aiming to obtain a high character as a workman. A deputation of union men in the employ of a builder called on him to dismiss a foreman, an excellent and trustworthy man. In answer to the question, "Why?" the reply was, "That is our concern; we don't choose to work under him, and shall strike if he is further employed by you."

The man was dismissed, and has emigrated. One result of these false principles strikes me as bearing directly on a point of political economy, though I cannot remember ever to have found it so treated. It is, that a part of the great social system in Britain is claiming to proceed at a different rate from all the rest. It is often asserted that men generally do not work so hard as they used to do, but the fact is, that they do not generally work so long hours, but do more in a given time than before; but it is also true that many occasional instances occur in which men work much harder than they need. Take a civil engineer and his staff, preparing to bring schemes before Parliament, or a leading barrister with a seat in the House of Commons, and I think cases of hard work will be found which will tend to raise the average for at least the head-workers. But our trade-unionists claim practically to do less work in a given time for higher wages than of old; and as this runs counter to the existing system in all the upper classes of workers, viz., that of harder work in shorter hours, a serious drag is imposed on the great social machine; and I am convinced that much of the grievous derangement from which the trade of England is suffering might be traced to this obvious discrepancy in the relations between employer and employed.

The only sure remedy for the evils I have tried to point out seems to me to rest in stringent positive legislation, making it obligatory on all trade societies to submit their rules for approval, and to be publicly registered, denying such registry or licence to all societies seeking to establish rules in restraint of trade or of individual freedom of action, and finally making it penal to attempt enforcing rules of trade or of fines for their breach, other than such as have been legally sanctioned. Much would, I know, be said on such a proposition, as to interfering

with trade, and so forth; but legislation has in late years so closely touched trading interests, by limiting (and wisely) the hours of labour and the age of those labouring, &c., that it would surely not be unfair to put some such check as I speak of on the licence of labour itself. I have the disadvantage, if indeed it be one, of regarding this subject only as a spectator; were I in the position either of an employer or a workman I might perhaps find my views much modified, but could such modification reach the point of justifying, to any fair or logical apprehension, anomalies such as disgrace this much misunderstood system? QUERY.*

SCHOOLS OF ART AND OF SCIENCE.

St. Pancras.—A lecture on the advantages of Science Classes has been delivered by Mr. Buckmaster, at the School-rooms, Ossulston-street, in support of a new movement originated by Mr. Parton Parry, who almost single-handed, according to the *North Londoner*, is seeking to establish classes in St. Pancras. In a report of what took place at the meeting, the *North Londoner* says Mr. Parry thus explained the plan he proposed to work on.

"The instruction he intended giving would comprise practical, plain, and solid geometry. In commenting upon the ignorance of these subjects which prevailed among our workmen, he said that the man who made the models on the table—and they were excellently turned out—was quite unplaced when asked to make a cube. By dint of questioning, he discovered that the man had joined in a rattle; that he had been the fortunate recipient of a goose, and the instruments employed to determine the important event had been dice. After this illustration of a cube, he proceeded to make one. The number of students on his book was three from a thickly-populated district like Somers-town. The charge amounted to three pence per week. The prize consisted of books, medals, instruments, &c. The German workmen were coming over and taking Englishmen's places, because employers appreciated intelligent workmen."

Mr. Buckmaster said he could scarcely think that three persons represented the interest felt. In such a district there must be a large number of men ready to avail themselves of the advantages now presented. He wished working men would organise to express their feelings on such matters as readily as on political questions."

At the close of the meeting a number of pupils gave in their names. The class meets on Thursday evenings at the School-room, and we hope that, under the guidance of Mr. Parry, who has proved most successful elsewhere, much good may be effected.

The Macclesfield School of Art.—The annual meeting of the Useful Knowledge Society, with which this school is connected, has been held in the town-hall, and as usual attracted a numerous attendance. The platform was decorated with a large number of drawings and designs, the work of the pupils of the School of Art. In the course of the proceedings the meeting was told that, with one or two exceptions, all the designs for silk-weaving, which formed the most practical feature in the display, were applicable to the manufacture. Mr. W. G. Brocklehurst, M.P., occupied the chair. The report of the council of the School of Art stated that the present circumstances of the school are not satisfactory. Only a small amount of aid was still given by the inhabitants. The council stated that Mr. Cole, C.B., had come to give his advice and suggestions at this critical period of the school's history. If encouraged by the townspeople, the council would gladly arrange for the establishment of one or more science schools that might receive Government sanction and assistance. Other manufacturing towns possessed these schools, and the Government gave much encouragement to their establishment and support. The report of Mr. Ford, the master of the School of Art, stated that this year, in March last, 43 students were successful in 54 exercises, divided thus:—30 in freehand drawing, 6 in geometry, 2 in perspective, and 8 in model drawing; 15 being distinguished by the mark "excellent," gaining guinea boxes of colours, boxes of instruments, and scientific books, and the remaining 33 certificates of merit. Comparison of results for the last four years—1866, 16 successful and 3 prizes; 1867, 50 successful and 15 prizes; 1868, 70 successful and 20 prizes; 1869, 54 successful and 15 prizes. The difference between the success of the above examination of this year and last—a year without a parallel in the school—arose in a measure from his incapacity, through illness, either to instruct or lecture, two months previously to the examination. Mr. Ford complains that the designs for silk fabrics sent in for national competition did not meet with that practical consideration which they merited.

* The writer has sent his name and address as guarantee of the truth of the statements made in the communication.

"In April," he says, "the students' designs and other works were transmitted to the Department of Science and Art for national competition; but when in June the results arrived, great was the students' disappointment. Anticipating a success greater than in previous years from the practicability of the designs and the right application of art principles, the results showed that the impracticable works of former years were more successful. Although on each sheet the words 'original and practical designs for silk fabrics' were written, it would be invidious to inquire whether the honorary examiners of the departments,—Sir F. Grant, F.R.A., Daniel Maclise, R.A., J. C. Horsley, R.A., and others,—considered their specific application to manufacture. If the London examiners are practically acquainted with the subject, they must know that the designer for silk goods has resources, rules, and methods of execution, which, together with considerations of expense, of fashion, of commercial nobilities, and such like, must fetter him to great simplicity of production, but which is, unfortunately, antagonistic to the complication of line and multiplicity of colour required by the Department of Science and Art. It will be difficult for the school to serve a practical town and an impractical Government. It therefore remains for the committee to determine whether the school shall be made practically available in the preparation of useful patterns for fabrics of the loom, or direct its course to the production of an abstract kind of decoration adapted to no particular purpose. It appears to me the Government will pay for, and take cognizance of, the latter, but not the former."

At a recent meeting of the town council, Mr. Wright gave notice that at the next meeting he should call the attention of the council to the position of the Macclesfield School of Art. Alderman H. Brocklehurst said, whilst the town was experiencing some benefit from a revival in trade, the school of art continued to languish. He felt convinced that the interests of the silk trade were closely connected with the prosperity of that school, and hoped the views of gentlemen both in the council and out of it had changed since the public meeting held on the subject of the school's condition a few years ago.

UTILISATION OF SEWAGE AT LEICESTER.

At a recent meeting of the town council, Mr. Thompson said, he found that the town had been in possession of the sewage works for ten or eleven years, and during that period they had been the cause of an annual loss. In 1859, the loss was £26l.; in 1860, 1,114l.; in 1861, 1,209l.; in 1862, 1,398l.; in 1863, 1,170l.; in 1864, 926l.; in 1865, 1,264l.; in 1866, 1,028l.; in 1867, 1,200l.; in 1868, 1,412l.; and in the year just closed, 1,130l.; making a total loss of 12,482l. The prospect of avoiding the loss was almost a certainty, for during the last five years many towns had been paying attention to a question which was becoming of daily increasing importance, that of applying sewage, by the process of irrigation, to the adjoining land. This had been done with great success. He moved,—

"That in the opinion of this Council the time has arrived when measures should be taken to render useful to the land in this district, and profitable to the town, the sewage which is now useless, and that it is desirable to engage a competent sanitary engineer to visit the locality and prepare a report and preliminary survey on the subject, to be laid before the Council as early as may be after the conclusion of his inquiries; and that Mr. Baldwin Latham be the engineer appointed."

After some discussion, the motion was carried unanimously. A committee was then formed to carry out the previous resolution.

THE HISTORY OF THE HOLBORN VIADUCT COMPETITION.

SIR,—I was many miles away from London on the occasion of the opening of the Holborn Viaduct, and I did not see the report of the extraordinary statement made by Mr. Haywood at the dinner given by the late Lord Mayor at the Mansion House, on the 6th inst., until the middle of last week. Probably I should not again have reverted to the circumstances of the competition for the best plan for effecting that important improvement, for although I felt that I had been unfairly treated in that competition, I was willing to let bygones be bygones; but upon reading the report in the *Times* of the after-dinner speech of Mr. Haywood, I thought it was but right that the public, and particularly the profession, should know the real facts, and I trust that you will kindly insert the following account of that competition (as far as I was concerned in it) for the entire truth of which I will vouch.

No less than 105 designs were sent in by eighty-four gentlemen, and I was the author of three of those designs, one of them being the same that I had prepared at the instance of the Metropolitan Board of Works in 1859, and which had received considerable notice at the time. I had carefully revised the plan, and it was placed

in Class No. 8 in the report, "For high level streets or viaducts passing north of Holborn-hill and Skinner-street, which thoroughfares are to remain as at present, or hut with trifling modifications." The other two designs came under the definition of Class 1. "For constructing complete viaducts on high level roadways upon the line of Holborn-hill and Skinner-street, involving the entire removal of the present surface and the property on both sides." In the report presented to the Court of Common Council, on Friday, November 6th, 1863, three designs in Class 1 are specially referred to, "No. 4, by Mr. Frederick Marrable; No. 32, by Mr. Thomas Charles Sorby; and No. 68, by Mr. Richard Bell;" but no cognizance whatever is taken of a second design by me which had the No. 81 attached to it, and was, in fact, a revision, and very great improvement and simplification of the same general design as No. 4 (before referred to). My name stood the first, and I received the congratulations of several members of the Corporation, and Mr. Haywood himself told me that the first premium would be awarded to me. I was doomed, however, to disappointment, as the first premium was given to Mr. R. Bell, and the second to Mr. T. C. Sorby! Doubtless there existed some good reasons for throwing me out. The *Builder* of the 21st November, 1863, points out some "discrepancies" in both of these premiated designs; at any rate, they were, although premiated, not adopted, and Mr. Haywood was employed to prepare a plan for Parliamentary deposit for the ensuing session. In the report of the Improvement Committee to the Court of Common Council on November 6, 1863 (which is now before me, and from which I quote), it is stated,—"In the very important duty of examining the several designs, your Committee felt that it was most desirable to secure the assistance of a professional gentleman competent to place before us the varied points of detail necessarily involved in this great public work, and believing that Mr. W. Haywood, the engineer and surveyor to the Commission of Sewers, was peculiarly qualified for this duty, we invited him to undertake the same. Mr. Haywood thereupon, at our request, withdrew a design which, in common with other competitors, he had sent in, and at once acquiesced in the wishes of the Committee."

Whether Mr. Haywood brought out his design which had been withdrawn from the competition, or not, I cannot say, as I never saw it, that I am aware of; but he prepared a plan for Parliamentary deposit (for which he was very handsomely paid), and a bill was obtained during the next session of Parliament, and, strange to say, the plan that he so prepared as being the very best that he could produce, after he had had the advantage of all the other brains from which had emanated 105 designs, is so very like one of the three designs that I sent in for the competition, that it would require a very careful examination by a very professional eye to detect where the difference existed (this is the design bearing the number 81 in the competition, which was entirely set aside, or at least not noticed at all in the report).

Sir, I enclose for your inspection drawings correctly reduced (to a uniform scale for more easy comparison) from Mr. Haywood's deposited plan, and from my plan, No. 81, that was rejected, or rather passed over in the report, and not thought worthy even of a passing word, but which, after being adopted by Mr. Haywood, without the slightest acknowledgment, was thought worthy of being carried out under the sanction of his great name, and with such a flourish of self-blown trumpets as has seldom, if ever, been attempted by any architect or engineer.

If any of your readers or the public care to see the originals of these plans, Mr. Haywood's lithographed deposited plan, with his name and that of the then acting City Remembrancer attached, and the selfsame drawing that I submitted in the competition, and numbered 81, they may be inspected at my office, 21, Whitehall-place.

This is the true history of this competition, from which Mr. Haywood has derived a world-wide fame, and very substantial pecuniary benefit (although a salaried officer of the Corporation), while I stand out in the cold, without a word to throw at a dog. I memorialised the Corporation (before it was too late) for a reconsideration; but although I was invited to attend to support the prayer of my memorial, I was not heard, but was received with cries of "Do you come here to

accuse our officer?" &c., and I was obliged to retire without being able to say a word, and that was the last I had to do with this competition.

According to the report in the *Times* of Monday, the 8th of November, Mr. Haywood, in responding to the Lord Mayor's toast, "The Engineer," made this most extraordinary statement,—"That he was a competitor in a fair and honourable competition, with eighty other professional men, for the execution of the Viaduct, and he won it! He stated most distinctly that no person connected with the Corporation had the remotest idea that he was a competitor until after the award was made." This is at niter variance with the report of the Improvement Committee to the common council on the 6th of November, 1863, before quoted. Mr. Haywood can tell which is right; and if he thinks that "he won it" in a fair and honourable competition, then I have yet to learn the business of my profession over again, and to forget all that I have hitherto thought to be fair and honourable. I should not like to say more, however strongly I may feel, or I should perhaps say too much. Let the public and the profession form their own opinion—they will not form a wrong judgment.

FREDK. MARRABLE.

THE TALKED-OF NEW OPERA HOUSE.

THREE lines in our last number added incidentally to a short notice of Covent Garden Theatre, and stating that we had heard talk of an English nobleman being ready to spend 150,000l. in building another opera-house, if a proper site could be obtained, have brought us a shower of letters, with all sorts of offers, requests, and suggestions. One set of gentlemen say they have plans and estimates all ready; and another, that they contemplate utilizing the Colosseum, in the Regent's Park, as an opera-house, and, indeed, have all their plans ready too. All we desire to add at present is, that we have no doubt of the correctness of the rumour to which we gave currency, and that we will forward to the proper quarter such of the letters as seem to deserve attention. We believe the scheme, if carried out, would include the foundation of a national opera.

THE MYSTERY OF EASTER ISLAND.

ON the surface of this thickly-peopled world of ours there is not to be found a spot more desolate, forlorn, and thoroughly isolated than that known to Englishmen as Easter Island,—nor a spot more suggestive of the most curious and interesting questions relating to the antiquity of man, and a probably submerged continent. The recent arrival at the British Museum, of a gigantic statue from that rock in the Pacific, now to be seen by special application at the British Museum, gives us a good reason for a short discussion on this topic, which we hope may be attractive to many readers.

It is surely a marvel worth looking into as most difficult to explain, how it comes to pass that some of the most gigantic—if rude—statuary of human workmanship should be found on a small island in the middle of the Pacific Ocean, inhabited only by a few wretched savages, without so much as a tradition of the extinct people who must have raised these monuments; and in itself so desolate as to have no trees, no fresh water, no plants but the imported plantains, potatoes, and bananas, and no animals except the as certainly imported poultry and rats! But let us look at this forlorn place more closely.

In latitude about 27° S., and longitude 109° W., some 2,500 miles distant from the nearest continental neighbour, South American Chili, and even from the nearest and that a solitary brother islet, no less than 1,000, is the iron-bound coast known to mariners as Easter Island; because the old buccaneering explorer, Captain Davis, happened to discover it on that sacred day, in the year 1686. It was afterwards touched in 1722, by Admiral Roggewein; and is described as hilly and stony, and about eleven leagues in circuit, of a triangular shape, and a volcanic appearance, the heights being bare and rugged. We will, however, take our fullest description, especially as to the Rook-images, from Captain Cook's second voyage in 1773.

After some nautical details as to the locality and anchorage, the great explorer says:—

"We stretched in for the land, and by the help of a glass discovered people, and some of those colossal statues or idols mentioned in Roggewein's voyage. Near the place where we landed were some of those statues before men-

POOR INVENTORS; OR, RIGHT v. MIGHT.

Sir,—Permit me to plead on behalf of the above unfortunate. Promoters of the world, perceiving wants, they endeavour to supply them; but unless they jump to perfection at once, improvers trip them up, taking all the credit and cash. The man that has laid the foundation will get out; the reward is too often secured by one who crowns the edifice with the pots, or finds the paint. We are called poor fools, while the successful pilferer is esteemed. I can speak feelingly on the subject, being a sufferer—a consumer of many things lost,—a job for a painter, an esq., &c., out in the cold,—have been gazetted once, perhaps shall be again, in another column of hankrupts. Law is against the man that toils a whole lifetime, and then faints within sight of the goal. He is picked up by his plans by some kind improving creature, who rushes into the Patent Office, and the law protects him for fourteen years from any attack from the rightful owner. I have worked ten months, and walked over 300 miles, to perfect an article which is pronounced good, but no grist for me. We claim to be noblemen; Nature's noblemen, striving to do good, leaving the world better and more advanced than what we found it. A recent piece of legislation was attempted to *down with us*, but public sympathy was with the poor inventor. The fight is to be renewed next session. Aid us in the contest, for with the loud voice of indignant young men we shall prevail. R. T.

P.S.—Honesty begets! never expect grand results from an inventor's career; let the love of the gift prompt you, *pro bono publico* be your motto, and an old cost for your arms.

METROPOLITAN BOARD OF WORKS.

MANSHION HOUSE.—CONSTANT WATER SUPPLY.—DISTRICT RAILWAY, &c.

At the usual meeting a report was brought up from the Works and Improvements Committee, recommending that a communication be addressed to the Improvements Committee of the Corporation, informing them, that having regard to the great value as building land of the ground on the west side of the Mansion House, the Board feel it impossible to entertain the question of preserving it as an open space. The recommendation was put and agreed to.

A report was presented from the Works and General Purposes Committee, stating that they had considered the report of the Royal Commissioners, and it was the opinion of the committee that a constant water supply to the metropolis was most desirable; and they further recommended that the chairman be requested to seek an interview with the Home Secretary, inquiring if it is the intention of the Government to bring in a measure founded upon the report of the Royal Commission, and also to place before him the Board's general approval of the report. This report led to a brief discussion, but it being the general opinion, a day was fixed a fortnight hence to consider the subject.

A report was presented from the Works Committee, recommending that the approval of the Board be given to proposed variation in the construction of the Metropolitan District Railway works, so far as they pass through the Temple land, by the substitution of an arch for girders and arches, as shown on the plans approved by the Board. The recommendation was agreed to.

Mr. Silas Taylor moved that a committee be appointed, to consist of seven members, to be called an inspection committee, with power to view the works of the Board in progress, and report the result of their examinations when necessary. This motion led to a long discussion, in the course of which an amendment was moved, but eventually both motion and amendment were negatived.

RE ANGLE CHIMNEYS.

Sir,—In reply to your correspondent "A. H.," I beg to say that in my opinion an angle chimney is a very objectionable feature, except it be used from sheer expediency in some room where a chimney is necessary, and the form of the room and necessary disposition of doors and windows prevent it being placed, as is most usual, in one single end. In any room of ordinary shape it must be both unsightly and inconvenient, and will not yield many extra feet super, of either floor or wall space; no more than two persons can sit with any comfort by it; and it is the need for a wall space, by saving in materials and labour, a little examination will prove the gain to be the merest trifle. To have the chimneys all through a house always in the inner corner of the room would certainly be a novel feature, and one which, I think, would in no way repay the designer or his client, and certainly be no gain to the builder. A. B. C.

CIVIL ENGINEERS AND THE INDIAN GOVERNMENT.

THE Governor-General is a little startled by the indignation his attack on a whole profession evoked, and a circular has been issued from the Works Department, to explain what was meant. The circular says,—

"There is no question the civil engineers in England are at times remunerated by commission on work done or ordered to be done under their supervision, which is, as stated in the notification, regarded to be a part of their legitimate remuneration. No reference was made or implied to any illicit receipt of gratification."

And it ends thus:—

"The Government of India unreservedly declares its complete confidence in the body of civil engineers in its service. It has long been, and continues to be, the desire of the Government of India to recognise their merits and their claims as fully as those of any other class of its officers, and its appreciation of them is sufficiently proved by the large addition to the number of civil engineers employed under Government during the last few years. Further, so far from having at the present time any reason to depreciate the value of the service of the civil engineers, the Government of India has lately had before it proposals, which it is hoped will take early effect, for improving their position generally, and placing them, in respect to their emolument, on precisely the same footing as all other officers employed in the same duties."

BUILDINGS IN LONDON.

OUR attention has been directed to the circumstance that the President of the Institute of British Architects has added the following note to the official report of his address. We willingly print it:—

"I did not advert to the many elegant buildings of a private character in the metropolis; if I had I should have noticed with much satisfaction Mr. Lanson's Bible Society, and also the new clinic recently erected in Pall-mall, by our well-known Mr. Brandon, which is, I think, one of the finest edifices of its class in the metropolis."

BUILDING WOODS.

SIR,—I shall be glad to be informed by any of your correspondents how the various classes and descriptions of pine and fir timber, and deals, are known and distinguished from each other when sawn. E. M.

THE ARCHITECT FOR THE NEW POST OFFICE.

SIR,—I see in the public papers that a design for the "new General Post-office buildings" in St. Martin's-le-Grand has been made by "Mr. Williams, of her Majesty's Office of Works," and that a contract has been accepted for the work. Can you give me any information as to who is this Mr. Williams? I imagined it might be one of the five members of the Royal Institute of British Architects of that name; but such is not the case. Surely such an important edifice should have been entrusted to the care of Mr. Pennington or of Mr. Sydney Smirke, R.A., the architect of the Post-office, whose brother erected the present edifice. P. W.

CHURCH-BUILDING NEWS.

Chorley.—St. Peter's Church has, during the past month, undergone a restoration, the dry rot having been discovered under the pews of the nave. The pews have been lowered 2 in., and the doors removed, so that the chancel is now free and open. The inside walls of the nave are now embellished by a painted dado, surmounted by a stencilled pattern, of conventional design. The chancel, from floor to roof, is diapered. The whole has been carried out under the superintendence of Mr. Thomas H. Myres, of Preston, architect.

Hallinell.—Saint Luke's Church, the foundation stone of which has just been laid, has been in contemplation for some years. The site is by the side of the old road leading to Chorley from Bolton, on rising ground. The architects of the new church are Messrs. Medland & Henry Taylor, of Manchester, and the contractors are Messrs. J. Robinson & Son, of Hyde. The foundations, which had to be unusually deep, owing to the site proving to be a filled-up pit, were put in by Messrs. Isaac Pilling & Son. The ground slopes considerably from the west to the east, so that additional height is given thereby to the eastern end of the building. The church, as may be now seen from the work already executed, departs but little in outline from a simple parallelogram, terminating at the chancel end with three semicircular apses. This parallelogram is divided into three—longitudinally by two rows of arches (thirteen in all), and transversely by three arches. The north aisle is seen to be shortened by the tower porch, which is placed at its western end. The south aisle is lengthened so as to project beyond the nave, and the part thus projecting will contain the font. The building materials are mainly those of the district. The walls are to be of hard rubble stone, pointed, while the angles and window-frames, &c., are principally of red brick. There will be also dressed ashlar stonework in the tracery of the windows and elsewhere. The church will have seventy-six windows, none of them very small, and some of a large size. Internally, the church will be lofty and spacious. 800 persons can be seated without galleries. A bell, vestry fittings, heating apparatus, gas fittings, pulpit, and font, are all provided.

Llyncell (Breconshire, South Wales).—The parish church here has been restored and reopened for divine service by the Bishop of St. David's. The edifice is in the Perpendicular style. The whole of the dressings have been cleaned from lime-whitening with muriatic acid: none of the old dressings had been chiselled over. The stonework of the windows has been repaired, and they have been fitted in with new glass of two shades, put in promiscuously by Messrs. Burlison & Grylly, of London; that of the chancel has

been fitted with iron saddles and stanchion bars, and Winn & Co.'s patent glass ventilators have been used. The chancel arch stonework has been cleaned, and pointed in Roman cement, as well as the priest's doorway, nave doorway, two doorways in the roof-loft on the north side of the nave, doorway leading to the tower, &c. The wall above the doorway at the west end of the tower has been opened, and a stoop formed on the south side of the jamb; the jamb being bared, and corbels thrown above to receive walling, the stoop and corbels being in a perfect state of preservation. The roofs are all of oak, with longitudinal and transverse moulded ribs, which have been repaired with similar timber. The moulded ribs in the chancel are new, and have been left clean and varnished. All the doors, with the exception of that of the nave, are new, from designs prepared by the architect, and are made of native oak, hung with ornamental hinges, locks, and ironwork. The chancel stalls are of native oak. The whole of the nave sittings are of deal, varnished. The font is of Caen stone, with native stone base. The tower is formed for the use of a vestry, divided from the nave by an old oak screen, which has been restored for the purpose. The floor of the vestry and nave is of red deal. The aisle is of paving stone. The chancel floor is laid with encaustic tiles in patterns supplied by Mr. Godwin, of Hereford. The steps are of native stone, rubbed. The architect employed was Mr. G. G. Scott; and Messrs. Williams & Sons, of Brecon, were the builders.

Castlemorton.—The district in which a new chapel-of-ease has just been erected is part of the parish of Castlemorton, and is situated about five miles from Malvern Wells, and the boundary where meet the three dioceses of Worcester, Hereford, and Gloucester and Bristol. Miss Selwyn, of Glenberrow, the owner of some property in the locality, set herself to the task of raising subscriptions for the erection of a chapel of humble structure, which, according to the estimate of Mr. Preezy, of London, would cost 500*l.* On the project becoming known, a site of half an acre, situated in the centre of the district, and on the edge of a common, was given by the Ecclesiastical Commissioners as lords of the manor, while the London Incorporated Society gave 30*l.* towards the funds. Earl Somers gave the stone, and the farmers of the district their services in hauling it. The chapel is situated at the base of the "Holly Basin." Mr. Smart, of Malvern Wells, is the builder. The style is Early English; the plan a plain parallelogram, with bell-cot at the west end, a south-west porch, and an east window of three lights painted. There is sitting accommodation for ninety persons. The floor of the building is laid with encaustic tiles, and heated by means of hot-water pipes. The roof is of open woodwork stained. The principal portion of the east window is devoted to the illustration of three of the principal incidents of the life of our Lord:—The descent from the Cross, the appearing in the garden after the Resurrection, and the Ascension to Heaven.

Lexden (Colchester).—The newly-erected district church of St. Paul, Lexden, Colchester, has been opened and consecrated, with the burial-ground. The church is situated on a portion of the ground formerly belonging to the Freehold Land Society, a short distance from Essex Hall Asylum and the railway station. The style is Early English, and the edifice is built of stone rubble, with Bath stone dressings. It consists of a simple nave and chancel, with a view to further enlargement by the addition of a north and south aisle. The length of the nave is 55 ft. 6 in.; length of chancel, 25 ft.; and there is sitting accommodation for 214 persons. It is surmounted by a bell-turret at the west end. The bell was cast from the metal of the bells of a number of old Dutch clocks, purchased by the Rev. J. Papillon, rector of Lexden, from a Colchester clockmaker. There is a circular apse at the east end of the chancel. The roof is timbered, and covered with plain tiles. The roof of the nave rests upon two arcades, and are filled in between the arcades with red brick walls temporarily, to be removed when the chancel is enlarged. The gable at the east end of the nave is surmounted by a stone cross, and at the chancel by a wooden cross covered with lead. There is a vestry 10 ft. 6 in. by 11 ft. The church is lighted by tinted cathedral-glass windows, and by gas. The nave is supplied by corona burners suspended from the tie-beams, and the chancel by ornamental standard burners. It is heated by Musset's patent hot

water apparatus, without any furnace or fire, but by means of gas jets applied to small cast-iron boilers connected with the water-pipes. The pulpit is of stone, and there is a carved lectern on the stone wall between the nave and chancel. The font is of Bath stone, with marble columns, carved caps and bases. The aisles of the church are paved with red bricks, the passages of the nave and chancel with Minton's tiles, and inside the apse with Minton's 6-inch tiles, white mosaic tessera squares and border round. The floor under the seats is paved with oak blocks on concrete. The whole of the seats throughout is of pitch pine varnished. The architect was Mr. J. Clarke, of London, diocesan architect; the builder was Mr. Joseph Grimes, of Colchester. The total cost of the church is 2,000*l.*, of which about one-half is subscribed. A school is contemplated in connexion with the church.

Hastings and St. Leonard.—The foundation stone of a new church in St. Andrew's has been laid. Some time since, when the town was extended in this direction, and much land was sold for building purposes, a benevolent lady, Miss Maria Jane Sayer, of Hastings and Challey, set apart, in St. Andrew's-road, not far from the Gasworks, a site upon which, at a fitting time, a church and parochial schools could be erected. Miss Sayer, in addition to the site, gave 1,000*l.* A committee was formed, subscriptions were readily given, and Messrs. E. Habershon & Brook, of London, were instructed to prepare plans and conduct other necessary preliminaries. They produced a design, the carrying out of which was undertaken by Mr. J. Howell, of Hastings, who has contracted to execute the works for 3,235*l.*, of which, we understand, the larger portion has already been raised. The church is in the Early Gothic style, and will be built of local blue stone, with dressings of Bath stone. The building will consist of a nave, a side aisle, chancel ending in an octagonal apse, and a tower and spire at the south-east corner, 103 ft. high to the top of the vane. The church is to be 22 ft. long, and 43 ft. wide, and will accommodate 232 persons. All the windows will have tracery heads, and the capitals of the nave arcade will also be carved. Space has been reserved as a site for the erection of parochial schools at a future period. Mr. Colpoys is the clerk of the works. Several feet of the outward walls have already been raised.

Hadleigh.—The church here has been restored. The principal feature in the instalment of the work of restoration which has just been completed, is the restoration of the roof of the nave, the replastering of the walls, the renewal of the windows, and removal of the west gallery. The roof is a wagon-roof, and was formerly celled, but the plaster has now been removed, and a timber roof following the form of the original substituted. It consists of three segments of circles, the centre one being larger than those at the sides. Moulded rafters rise from the cornice, and meet these beams, and being continued, meet in the centre of the roof, the intersections being ornamented with carved bosses. To resist the lateral thrust there are eleven tie-beams, which have been cased so as to be uniform with the remainder of the woodwork of the roof, all of which is now, and from the tie-beams are braces which meet the extremity of the foil at an acute angle, so as to form with the side segments of circles supporting arches. The tie-beams are further supported by iron brackets, painted bright blue, picked out with gold. The windows of the clearstory and aisles were all filled with slightly tinted glass, with a narrow edging of clear glass, and the stone mullions and tracery have been reprinted and restored. The clearstory walls are supported by moulded perpendicular columns and arches. A stone arch across the centre of the nave which was deemed unnecessary for the purpose for which it was intended—to prevent the collapse of the walls—has been removed, and simply carved corbels from which it sprang remain. The removal of the large west gallery in which the organ was formerly placed, has left a large irregularly paved open space beyond the pews, at the centre of which stands the font. The removal of the organ gallery has opened the whole west wall to view; it is a blank space happily relieved by the doorway (which was formerly blocked up), and a small opening about half way up the wall. The organ, which has been 100 years in the church, has been removed to the north chancel aisle: it has been taken to pieces and re-erected, and two of the stops re-erected by Messrs. Godball, of Ipswich. The

chancel pews have disappeared, and oak benches, with carved poppyheads, and stalls substituted. The east window has been proposed to fill with stained glass, in memory of the late rector. In the lady-chapel window all the old painted glass which was found in the church has been utilized, and in the south chapel is a painted window, the gift of the late Mr. Knox. During the restoration of the roof of the nave, and the other alterations (which cost between 500*l.* and 600*l.*, and were executed by Mr. William Everett, builder, Hadleigh), the church has not been closed.

SCHOOL-BUILDING NEWS.

Manchester.—The Manchester Jews' School's new building in Derby-street, Cheetham Hill-road, has been inaugurated. The building, which is a plain structure, consists of two large rooms, one on the ground floor, and the other on the first floor. The former is to be occupied by the girls, and the latter by the boys. At the end of each of the large rooms there are class-rooms, and accommodation for the younger portion of the scholars. The building has been erected to accommodate 600 children; but in the event of the attendance increasing, that number can be increased to 800. A committee-room is situated on the upper floor. A covered play-ground is provided in the basement, occupying an area of 330 square yards, on which also is provided a care-taker's residence. Accommodation is provided for lavatories, and hat and cloak rooms. The entrances to the boys', girls', and infants' school-rooms, are quite distinct. Large play-grounds, with appliances for gymnastic exercises, are provided in the rear for boys and girls. The architect was Mr. E. Salomons, of Manchester, and the builders were Messrs. Cochrane, Parker, & Co. The whole of the fittings, together with the furniture for the committee-room, were supplied by Messrs. Sidebottom & Co., of Manchester. The cost, including the price of the land, has been about 7,000*l.*

Debenham.—A new building for a school and lecture-room has been raised here by the members of the Congregational Church. Adjoining the chapel is a new parsonage, and the whole (the above-named room being in the rear of the house) forms an addition to the church. The contract for the entire work was taken by Messrs. G. Scopes & Chapman, of Needham, for 410*l.*, but extra brought up the total outlay to about 450*l.* The room is 40 ft. long by 20 ft. wide. The roof is too low. The plans were prepared by Mr. A. Damant, of Debenham.

Books Received.

Notes on the Great Pyramid of Egypt, and the Cubits used in its Design. By COL. SIR HENRY JAMES, R.E., F.R.S., Director-General of the Ordnance Survey. Southampton: Gutch, printer, 1869.

FROM new measurements, of all the four sides of the base of the Great Pyramid, from socket to socket of the corner stones, taken at the suggestion of Sir Henry James, and at the cost of Miss Birdett Counts, by Mr. Inglis, a practical engineer, the conclusion to which Sir Henry has come, in reference to the length of the Egyptian cubit, is, that it was 18.2415 in. long, or the precise length of the ancient Greek cubit, according to Mr. Penrose; thus corroborating Herodotus, so far at least as regards the equal length of the Greek and the Egyptian cubit; and also verifying the conjecture of Sir Isaac Newton, that the base of the pyramid was made a round number of Egyptian cubits. The mean length of the sides obtained by Mr. Inglis was 9,110 in.; that of the Ordnance survey was 9,130 in. The mean of these two results is 9,120 in. One of Mr. Inglis's measures is exactly 9,120 in.; and of one of the Ordnance surveys, 9,121 in. "We may, therefore," says Sir Henry, "confidently regard 9,120 in., or 760 ft., as the true length of the side of the pyramid, when it stood perfect; but 9,120 in. is precisely equal to 500 Egyptian or Greek cubits of 18.2415 in. . . . The side of the base being 500 cubits, or 750 Egyptian feet, and its length 750 English feet, the length of the Egyptian and Greek foot was to the length of the English foot as 75 to 76, or as 1 to 1.013."

Sir Henry James suggests, ingeniously, that the angles of the descending and ascending passages being a little under the angle of rest or quiescence, or a little over 26°, trucks or stones could be made to slide down with great ease

under complete control; and that trucks might have been so counterpoised that a ready way of descent first, and then of re-ascend, through the grand gallery to the king's chamber, might have been arranged, whether for the conveyance of the dead body of the king, or for his convenience during his life; while, after deposit of the body, the stone "portcullis" or plug to the entrance at the bottom of the ascending gallery, might readily be lowered from within into its place by means of tackle, the workmen finally quitting the interior through the "well."

Purchasers of these notes for 1*s.* 6*d.*, have, in addition to the notes, four photo-zincographs, —two of the Great Pyramid and the Sphinx; one of the Sphinx and Second Pyramid; and one of the Nileometer at Cairo; besides diagrams illustrative of the pyramid and the Nileometer.

The Book of Manly Games for Boys. By Captain CRAWLEY. London: William Tegg.

COMMENCING with "Prisoners' Base" and other games without implements, games with tops and with hoops, cricket, tennis, and so forth, the writer proceeds to teach swimming as well as it can be taught out of the water, skating, riding, sailing, and so on, and goes on to chess and games of chance. Captain Crawley, as he chooses to call himself, writes for the most part of what he knows. Now and then he is not quite clear, but this is the exception. Thus, in his chapter on driving he says:—"If anything in front causes you to slacken your pace, raise your whip, so that the driver of the vehicle behind you may have notice also to go less rapidly. Avoid all sharp turnings, and remember the rule of the road,—*Keep to the right!*" The italics are the author's. Now the author must know, just as well as we do, that this is not correct. "The rule of the road is a paradox quite: as you go driving along, if you keep to the left you are sure to go right, and if to the right you are wrong." Nevertheless, this is a capital book for boys. We can cordially recommend it. The illustrations, by Mr. John Proctor and others, are not only spirited, but useful.

A Handy Book of Property Law, in a Series of Letters. By LORD ST. LEONARDS, W. Blackwood & Sons, Edinburgh and London. 1869.

WE have simply to mention that a new edition (the eighth) of Lord St. Leonard's very valuable Handy Book has been published. We learn from a postscript that the author has brought up the law to the present time; and, moreover, that, owing to the many alterations that have been made in the law during the time which has elapsed, he found it a much more laborious task than he anticipated.

A New Tile-Pattern Book.

MESSRS. HARGREAVES & CRAVEN have issued a Trade Book, which includes a number of designs for tile pavements by architects, especially by Mr. John Gibbs, who has exhibited considerable originality in most of his contributions to it. Mr. Goldie, Mr. Waterhouse, Mr. Bentley, and others have also assisted. Directions given for keeping the pavements clean may be usefully quoted:—

"Wash with cold water and soft soap, applied with a scrubbing-brush. This will improve the colours, and remove the saline scum arising from the cement the first few weeks after the tiles are laid. Stains or dirt, from neglect of cleaning, may be removed by dilute muriatic acid (spirit of salt), applied with a pumice stone. The acid must be carefully wiped off, and always, after washing the tiles should be wiped with a clean dry cloth. The water used should be perfectly clean."

VARIORUM.

"EVERYBODY'S YEAR BOOK: a Popular Annual for 1870." Wyman & Sons, Great Queen-street, W.C. This is the third annual issue of a very useful and popular annual, containing a large quantity of varied information of an entertaining as well as a useful order. Besides the usual almanac matter, there are remarks on the philosophy of furniture; on good cookery; on home ferneries; a handful of anecdotes; poetry of the affections; epitaphs; charades; information for everybody, &c. So large an amount of literary matter for 6*d.* has necessitated the reprinting of the two previous annual issues of this periodical. Mr. Tegg is doing good service by his reprints of standard English works, and we commend him especially for his last production,—Robertson's History of Charles V. This is a book which will never go out of fashion, and should never be out of print. There is no more interesting part of it than the exposition given of the traces of ancient wisdom and arts existing

in the East. The volume is well got up, and includes an account of the life and writings of the author condensed from that written by Dugald Stewart.—A pile of new books is before us, and will have notice in due time.

Miscellaneous.

Completion of the County Gaol at Carlisle.—This new prison has been completed and has been certified by the Government inspector. The old gaol has been transformed into one in which the "separate system" can be carried out in accordance with the requirements of the Prisons Act. The male ward was the first completed. The female ward has now been finished. It is almost a counterpart of that set apart for male prisoners; the chief difference being that there are 52 cells instead of 112. These cells are similarly constructed and furnished, except that the gas-light, instead of being enclosed in an aperture of the wall beyond the control of the prisoner, is an ordinary bracket, so placed as to be near the prisoner's work. Part of the alterations of the prison consisted of the erection of a new treadmill and system of waterworks. The greater part of the work thus performed by the men is utilised in supplying the gaol with water, for which the prison is now no longer dependent upon the city supply. The water is pumped, from an artesian well by a set of three-throw pumps, and then forced to a high cistern, whence it gravitates to all parts of the gaol. The old gaol, erected in 1824, cost 42,500*l.* (including 3,600*l.* for the site). The alterations, which have been carried out under the directions and superintendence of Mr. Cory, county surveyor, have cost 16,000*l.*, including the governor's house, the treadmill, and waterworks. The newly-arranged prison provides cells for 180 prisoners; in the old gaol there was only accommodation for 123.

The General Builders' Association, Birmingham.—The sixth annual dinner of the Birmingham branch of this Association has been held at the Great Western Hotel. There were about 100 members of the association present, and amongst the visitors were,—Councillors Perke, Harris, Davis, and Biggs; Messrs. A. B. Phipson (President of the Birmingham Architectural Association), Naden, Ferry, Proude, and Maut. After the repast and the loyal toasts, Mr. Clay, of Manchester, proposed "The General Builders' Association and the Birmingham Branch." The Chairman, in responding, said the Birmingham branch of the Association had done much not only for the benefit of the masters, but also for the benefit of the men, and amongst those systems which it had introduced was that of settling disputes by arbitration. He referred to the unwholesome and extreme competition among the builders, which he thought should not exist, and remarked that while during the past ten or twelve years the wages of the men had risen thirty per cent., the prices obtained by the builders had gone down. The next toast, "The Architects and Surveyors of Birmingham," was proposed by the Chairman, and responded to by Mr. Phipson. Mr. Bloore proposed "The Operatives connected with the Building Trade," and remarked that the earnest desire of the builders of Birmingham was to assist the workmen in every possible way in an endeavour to elevate themselves.

The New General Post-office.—On Tuesday the contract of Mr. W. Brass, of Old-street, St. Luke's, was accepted for building the new General Post-office. The site for the new building is the open space directly facing the present post-office in St. Martin's-le-Grand, and the edifice will be reared after the designs of Mr. Williams, of her Majesty's Office of Works. The facade will be 860 ft. in length, with an elevation of 89 ft. It will be of Classical design, and will present four architectural fronts, with interior arrangements of sufficient capacity to meet, in every particular, the increasing requirements of this important branch of the public service.

The South Shields' Town-hall Question. After obtaining designs and accepting a tender for the erection of a Town-hall, the council have decided, by fifteen for and sixteen against, not to proceed. An architect writes:—"So the competitors have been made fools of, and spent their time and money for nil. Surely they can compel the council to carry out some one design, or else claim compensation."

New Invention for Glass-making.—Mr. Hugh Percival, late of Darlington, the manager of Messrs. Anstin & Co.'s (formerly Messrs. Scott's) Glass Works, at Southwick, has, after years of experiments, brought to a successful issue a new mode of glass-making, which it is said will not only revolutionise the trade, but render unnecessary the erection of huge unsightly cones. Mr. Percival divides his tank into certain compartments. Into the first, or "founding" division, he places the raw material, which undergoes the process of smelting. Instead of having to wait until the contents are infused, and the top part skimmed, the mixture as it becomes molten flows by conduits into a series of other compartments, where the refining process is continued until it reaches the last one, from which the men "gather" and work the glass into bottles. The great advantage in the new plan is the continuance of the work; no skimming of the pots is required, for every scrap of material is melted, that requiring the greatest fusing, instead of having to be removed by the old process, being ultimately converted into glass.

Dowlais Steel Works.—Some few months since a 70-ton block for a steam hammer, by Mr. William Williams, of St. Helen's Works, Swansea, was successfully cast at the steel works now in operation at Landore. Mr. C. W. Siemens, the patentee of the process carried on at these works, is at present erecting similar works at Dowlais, for the Dowlais Iron Company. In addition to other castings a block of like weight to the one at Landore was required, the casting of which was again undertaken by the same firm, and this has been successfully carried out by them at Dowlais. The first charge of iron was tapped at about two a.m., and successive charges followed from two cupolas throughout the day, until three p.m., when the full weight of 70 tons had been poured into the mould, the metal keeping in a state of fusion for over twelve hours, and it would not be cold enough to transverse and fix into position for about twelve or fourteen days.

Roman Pavement in York.—Last week, the men engaged in the restoration of St. Mary's Church, Castlegate, in this city, discovered the remains of a tessellated pavement. It is situated where the south porch stood, and is about 2 ft. under the old floor. The dimensions, we are informed, are about 5 ft. by 2 ft., and are hut a portion of what has been a work of considerable dimensions. Unfortunately, the centre has been destroyed to make way for an interment. The outer portion consists of eight rows of red squares: within are eight rows of white squares, and then two of black. These form the border or outer part of the pavement. The interior is of white squares. In the corner is a diamond of black, with a flower of white, red, and black. There are some remains of a more elaborate combination in the centre, but it has been so much broken and defaced as to be beyond description. Mr. Burditt, the clerk of the works, has had the pavement washed and protected.

The Sheffield Archaeological Society and the London Court of Common Council.—At a special meeting of the Court of Common Council, at the Mansion House, on Friday week, for the despatch of urgent business, the Lord Mayor presiding, a letter was read by the town clerk from the Archaeological and Architectural Society of Sheffield, to the effect that they had arranged to hold a *conversations* in the School of Art in that town on the 1st of December next, and that they would be extremely indebted to the corporation if the ancient cutlery now in the possession of the library committee, and lodged in the City Museum, and a few other objects of antiquity, could be lent to them for exhibition on that occasion. They pledged themselves to take the greatest care of the curiosities, and to return them in perfect safety free of cost. The requisite permission was unanimously granted, and the Library Committee were instructed to carry it into execution.

The Boys' Home, Regent's Park.—A new wing has been added to the buildings of the Boys' Home, near Primrose-hill. The new wing, which is two stories in height, contains an additional school-room and workshops, and its erection will enable the Home to accommodate eighty boys, instead of the present number (fifty), if the necessary funds for their support are forthcoming. The Bishop of London has inaugurated the new addition to the building.

The Warming of Norwich Cathedral.—A hot-water apparatus for warming the cathedral has been fitted up by Messrs. Barard, Bishop, & Barnards, and brought into use. Four large tubular boilers are fixed in a building on the north side; and from these are taken the main pipes from transept to transept crossing the choir, from which branch between 8,000 ft. and 9,000 ft. of 4-inch pipe are laid beneath the floor, in the nave and choir, and a portion of pipe is also laid in the triforium of both nave and choir, being intended to heat the air in the upper part of the building to prevent cold currents descending. Coils of pipe next the walls are introduced in the transepts. The pipes, which are laid beneath the floor of the nave and choir, are covered with ornamental cast-iron grating of an ecclesiastical design. The temperature, when all the boilers are working, is found to be from 20 to 25 degrees beyond that of the external atmosphere. The heat can be moderated if desired.

A New Movement for the Unemployed.—On the 6th inst. a meeting was held at Liverpool (Mr. Rogers presiding), for the purpose of aiding a movement inaugurated by Mr. Johnson, the object of which is to give employment to the large number of labouring men who at various times are thrown out of work in Liverpool by the fluctuations of trade. The design is to engage these men upon work which will only yield a very moderate rate of wages, seldom exceeding 1*s.* per day, an amount which, it is calculated, will be sufficient to keep them above starvation point, but not large enough to attract impostors, or induce men to forsake their legitimate employment when it presents itself. A rate has been engaged by Mr. Johnson and a few of his friends, and an average of from forty to fifty men are at present being daily employed in making firelighters at the rate of 6*d.* per hundred. The scheme has hitherto been attended with a slight loss.

Co-operation at Dalston.—New co-operative stores at Dalston have been formally opened. The new building, which is the most prominent in the village, has a frontage of 30 ft. by 24 ft. deep, and consists of three stories, to be appropriated as follows, viz.:—The ground floor to the shop, the second to the warehouse, and the top known as the lecture-hall and reading-room. There is also a large wing adjoining the main building appropriated to warehouses, committee and ante rooms, also a hakehouse. The total cost is 600*l.*, viz., 270*l.*, the original cost of the premises, and 330*l.*, the amount of contracts for alterations, &c. Mr. John Bewley, builder, Dalston, had the contract for mason's work, plastering, and slating; Mr. H. Hope, the joiner's work; Messrs. Sles & Morgan, of Carlisle, the painting and glazing; Mr. Irving, the plumber's work; and Mr. Thomas Corbett, the ironmonger's work.

A New Experiment in Working Men's Clubs.—In the midland counties of England these clubs are being established on a broader basis, and, as their promoters believe, with increased chances of success. The Rev. H. Solly has been holding a series of meetings in the iron and coal district around Birmingham, and we are told that he has at length "yielded to the overwhelming evidence in favour of the clubs supplying their members with such articles of refreshment, including beer, wine, &c., as they may desire." The immediate result, it is said, has been to "interest the leading artisans especially the officers of the great friendly and trade societies" in the clubs, which they have heretofore rather shunned, deeming them unfitted to meet the wants of the great bulk of the working classes.

Steam Cultivation.—Step by step the movement goes on. The *Farmers' Chronicle* says:—"Mr. James Howard, M.P., has turned his attention to the question of drilling by steam power, and has had a drill, upon the Suffolk principle, constructed with a harrow in the rear. During the past week the machine has been regularly at work upon the farms of Messrs. Howard, Bedford, and upwards of 20 acres per day have been drilled and harrowed; 16 ft. are covered at a haul. A self-propelling engine is employed to haul the drill. The apparatus is moved from field to field without the aid of horses, and is ready for work within the short space of an hour. By a simple device the shock-rod, working on a pulley at either side, turns round the drill and harrows when the end of the field is reached."

Bury.—The Bury Co-operative Society have lately been going in rather heavily for building. Last year they completed the large new central stores in Knowlesy-street, from the designs of Mr. Simkin, besides erecting new branch stores at Moorgate, Pitsoth Moor, and Elton, all of which were built under the superintendance of Messrs. Maxwell & Juke, architects, of Bury. In addition to these stores, the society have built between thirty and forty cottages for their own members, and are now engaged in altering and adding to the old stores in Market-street, in which is now incorporated the Old Sun Inn.

An Art Sale.—Buyers of fine works of art may be glad to have their attention drawn to an advertisement in our present number of an approaching sale by Mr. Fred. Godwin. It includes the well-known life-size group of the "Fishing Girls," by R. Monti, shown at the Great Exhibition of 1851, and a fine work by (Marochesi, also in marble. The "Saviour in the Temple." Some pictures and decorative furniture are also out of the common way.

St. Pancras New Infirmary and Schools at Highgate.—The long-standing dispute between the Poor Law Board and the parish of St. Pancras respecting the proposed new infirmary and schools has at length been settled. (The terms of a compromise were agreed upon at a recent meeting of the guardians.

Colour in Signal Lamps.—It is asserted that railway managers have made about the worst selection they could in the colour of their signal-lights. Bright yellow is the colour most easily distinguished, and violet, red, and green are the least readily recognised. After yellow, blue is the most quickly seen.

North British Railway.—At a meeting in Edinburgh recently the chairman moved the approval of the Tay Bridge scheme, costing £50,000. An amendment was moved by Mr. Kirkcaldy to delay the work for twelve months, until the chairman's motion was carried by a large majority.

Society of Painters in Water Colours.—The winter exhibition of sketches and studies by the members of this society will be open to the public on the 29th inst. The private view will take place on the 27th.

Tramways.—The Tram-Railway Company of Great Britain (Limited) have now, it is said, before them twenty-eight applications for tramways in various parts of the kingdom, accompanied by offers of considerable local support.

Music Hall, Derby.—Messrs. Harris & Grant, formerly of Worcester, have just erected, in a Princess-street, a music-hall which will accommodate 2,200 persons.

For new stabling and cottage, &c., Friary-street, Guildford, for Messrs. Elkins & Son. Mr. H. Peak, architect.

Terra Cotta Decorations at South Kensington.—Sir: May I ask you to state that the tender supplied by Messrs. Lindsay & Anderson, for the terra cotta decorations for the new Exhibition buildings, was in amount £2,866, and included the whole of the work? An accidental omission was discovered in taking out the quantities, previous to the delivery of the tenders, which was corrected and included in the above-mentioned sum. JAMES ROBINSON.

Grove Ferry.—To list of tenders for cottages, at Grove Ferry, Kent, in our last, and:—Birley & Son, 61st.

All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Notes.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

TO SUBSCRIBERS.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Chrono, Turret, Stahle, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Chrono and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales. Steam Factory for Clocks and Watches, 69 and 60, Lodgegate-hill; Showrooms, 25, Old Bond-street, London.

ADVERTISEMENTS.

Just published, in post 8vo. cloth, with 5vs plates, price 4s. 6d. **A PRACTICAL TREATISE ON CONCRETE** and how to make it; with Observations on the Uses of Concrete, Limes, and Mortars. By HENRY BRID, C.E. London: E. & F. N. SPON, 45, Cannon-street.

Just published. **QUANTITIES MADE EASY.** A quick and accurate method of obtaining the quantities of every article required in a well-finished house, built free by post for 30 stamps.—Address: A. C. S. Northbrook-terrace, Brentford, Middlesex, W. Kent, &c.

TO ARCHITECTS.—The BAPTIST HANDBOOK: or the Annual of the Baptists.—The Baptist Union also an Advertisement containing the names of Baptists, or the list of Non-conformist or Episcopalian Churches or Chapels.—For terms, apply to JAMES & ALEXANDER, Printers, 7, Wynant's-lane, Chancery-lane.

SCHOOL FITTINGS.—MESSRS. BANKS & CO'S PATENT REVISED ILLUSTRATED PRICED LIST of every article required in a well-furnished school, sent free three stamps.—PARSONAGE WORKS, ALBERT-STREET, MANCHESTER.

Late published, in crown 8vo. price 10s. 6d. **ELEMENTARY INTRODUCTION to PRACTICAL MECHANICS,** illustrated by numerous Examples. Being the Third Edition of "Elementary Examples in Practical Mechanics." By the Rev. JOHN F. WHEEDEN, M.A. Professor of Mathematics in the Staff College. London: LONGMANS, GREEN, & CO. Paternoster-row.

In crown 8vo. with frontispiece, price 3s. 6d. **THE GERMAN WORKING MAN;** being an account of the Early Life, Amusements, and Habits for Culture and Material Progress, of the Artisans of North and South Germany and Switzerland. By JAMES SAMUELSON. Edited by the "Quarterly Journal of Science." London: LONGMANS, GREEN, & CO. Paternoster-row.

In vol. 8vo. 8rs. price 10s. 6d. cloth, or 14s. bound in calf. **MAUNDER'S LIBRARY OF REFERENCE; a Popular Compendium of General Knowledge,** including Ornamen, Dictionary, Gazetteer, Mythology, Cosmology, Forestry, &c. One hundred and fifteen thousand, thoroughly revised. MAUNDER'S BIOGRAPHICAL TREASURY, with about 1,000 additional Members, by W. L. B. GARDNER, Esq. MAUNDER'S SCIENTIFIC and LITERARY TREASURY, with upwards of 1,000 New Articles, by J. Y. JOHNSON, Esq.

TO BUILDERS and CONTRACTORS.
 A THOROUGHLY good PLUMBER wishes to be employed as a JOB or constantly. Well up in its routine. Can turn his hand to gas or zinc work if required. Unexceptional reference can be given. No objection to the country.—Address, R. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956

The Builder.

VOL. XXVII.—No. 1399.

Albert Dürer.

XTREMELY pleasant, very quaint, very quick, especially when there was dancing under the linden-trees, Nurnburg, or Nuremberg, must have been in the days of old, when it was a free imperial city. It is very quaint and pleasant still; for few places have endured less structural changes, though there is not so much life in it. But when Albrecht Dürer the elder, after turning his back upon the little Hungarian village in which he was born, and after travelling in Germany and

the Netherlands, in accordance with the custom of other skilled art-workers, at last came to Nurnburg, in 1454, on the day of Philip Pirkheimer's wedding, when there was a great dance under the trees, it must have been a charming place. We know Albrecht doffed his wallet, and we may conclude, since he handed down to his son an account of this festivity, that he donned his guest-garments, and was made welcome by the company. At all events, he travelled no farther, but took service with Joseph Haller, the goldsmith, there.

Probably Nurnburg would have had attractions for most of us if our lines had fallen upon those days; for there were several noble workers there filling the place with beauty. Adam Kraft, the sculptor, was living, busy, breathing life into stone; Peter Vischer, the smith, was working out the poetical thoughts that were in his soul into ironwork; Veit Stoss, the carver, was another producer of work of rare power; Wohlgeuth, the painter, was there; and Sebastian Lidenast, the worker in copper, was earning himself a name. There were mechanicians in the city, too, who were revolving in their minds, and from time to time making known, many inventions and improvements, the result of brainwork. When Albrecht Dürer the elder settled among these men and their fathers he must have been nearing thirty years of age. His master had a fair wife, Cunegund, and a little daughter, then two years old. The successive anniversaries of Philip Pirkheimer's wedding-day found the little maiden growing and prospering, and at last listening to the love-speeches of her father's craftsman; and before the thirteenth had come round Joseph Haller gave her in marriage to him. This child-wife, described by her illustrious son as "a fair and handy maiden of fifteen," bore her husband eighteen children. Most of these little ones simply came into the goldsmith's modest household to pass out of it again immediately. Three only lived to man's estate, Andrew, Hans, and the great painter and engraver, Albrecht.

Those who would know more of the surroundings and life of this gentle, genial artist, we must refer to a work just written by Mr. W. B.

Scott,* who seems to have set himself to his task as a goldsmith would apply himself to the execution of some choice *reliquaire*, bringing out his finest tools and his store of precious stones, with which to enrich it as it progressed under his hands. Twice or thrice he has taken up tools too blunt to produce lines corresponding with the rest of his treatment of the subject. But he seems to have seen his mistake in a moment, and thrown them aside directly. It is Mr. Scott's impression that the art of engraving for the purpose of printing was a German invention. He says, though Vasari has given Florence the credit of having been the first seat of the art, there are many engravings extant, as was first shown by Strutt, that bear dates anterior to the earliest practice of it in that city. Martin Schöner and Israel von Mechin were working at the period of Vasari's date; and their respective masters belong to a still earlier portion of the same century. Germany, at all events, speedily excelled in all kinds of engraving; and foremost among German engravers stands Albert Dürer, painter, carver, and architect. Of his various accomplishments, that of engraving seems to have been the most profitable, for from his earliest manhood to his death, and to his widow after his death, it was a source of income. But we must not be so inartificial as to forestall the story of his life in this abrupt manner.

Happily, Mr. Scott has for the core of his *reliquaire*, several pieces of Albert Dürer's own making. These are, first, an account of his family, which he compiled from his father's papers; secondly, a series of letters written by him, when at Venice, to his friend Pirkheimer, at Nurnburg; thirdly, the diary he kept during his long stay in Antwerp; and lastly, several pieces of rhyme which he appended to his prints. All these Mr. Scott has set in his book, so to speak. He has, furthermore, enriched it with other relics; notably, with six etchings of his own workmanship, which show us Dürer æ. 13, as in the drawing in the Albertine, Vienna; the Hungarian village of Eytas, where his forefathers "occupied themselves with horses and oxen," as given in his print called "The Great Fortune"; his portrait at 28, taken from his picture at Munich; his house at the Thiergartner-Thor, in Nurnburg; the view from one of its millioned windows; and his portrait, again, at 50, as painted by Tommaso Vincidoro during his visit to Antwerp.

Besides these, Mr. Scott gives four woodcuts, showing the statue by Rauch, erected to the painter's memory in the Dürer-platz, Nurnburg; a drawing-pen found in repairing his house; two shields, one charged with a panning device, and

* "Albert Dürer: his Life and Works." Including Auto-biographical Papers and complete Catalogues. By William B. Scott. With Six Etchings by the Author, and other Illustrations. London: Longmans, Green & Co. 1869.

the other with the arms appointed him by the Emperor; and his gravestone; lastly, the cover of the book is ornamented with one of Dürer's interlaced designs for embroidery.

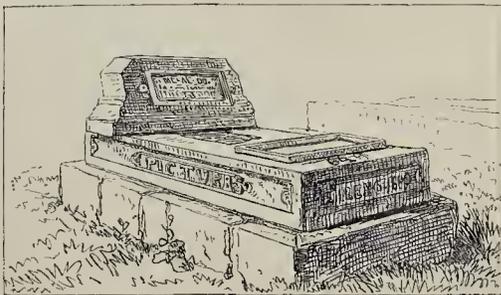

The first-mentioned piece of writing from Dürer's pen is touching, simple, and reverent. It begins:—

"I, Albrecht Dürer, the younger, have sought out from among my father's papers these particulars of him, where he came from, and how he lived and died holily. God rest his soul! Amen."

After describing his father's parentage, and ultimate settlement in Nurnburg, his father and mother's marriage, and transcribing from a book, probably the family Bible, a list of their eighteen children, with the day and hour of the several births (these were held of great importance in an astrological point of view in those days), and the names of their godfathers when sons, and godmothers when daughters, he continues:—

"My father's life was passed in great struggles, and in continuous hard work. With my dear mother bearing so many children he could never become rich, as he had nothing but what his hands brought him. He had thus many troubles, trials, and adverse circumstances. But yet from every one who knew him he received praise, because he led an honourable Christian life, and was patient, giving all men consideration, and thanking God. He indulged himself in few pleasures, spoke little, shunned society, and was in truth a God-fearing man."

Out of the supposed cause of his poverty and obscurity, his family of children, came, however, the source of his fame. We should never have heard of Albert Dürer the elder but for one of these apparently nawelcome little ones. Mr. Scott, momentarily taking up a rough-edged tool, says, "They must have kept his household wretched" forgetful of the benign Presence that said, in the faint days of yore, "of such are the kingdom of heaven." Albert the younger was to have been a goldsmith, like his father; but ultimately prevailed upon him to allow him to turn painter, and was, accordingly, apprenticed to Michael Wohlgeuth for three years. At the end of that time he set out upon the inevitable journey art-workmen spoke of as *wanderjahre*. He travelled for four years, when he was recalled by his father, who, during his absence, had arranged with a friend that he should marry his daughter Agnes, who had a dowry of 200 guldens. With this sum Dürer is thought likely to have purchased the commodious house in which he lived all the days of his life, and which has in our time been purchased to become public property. We would that Mr. Scott had sketched the painter's wife with a softer pencil. He does not allow her a single good quality, except the merit of having been young and handsome. Her piety he alliteratively links with peevishness; her frugality he calls parsimony. We reproduce his ungallant picture by way of warning. "Agnes had no children. She is represented as pious, peevish, urgent for industry, parsimony, and privacy. We seem to recognise her; a woman physically unloving, nonenjoying;

The Grave-stone of Albert Dürer.

such stuff as saints are made of." We do not know whether the saints or the *jung frau* Agnes have the most need to take offence at this piece of rough riding; but we will leave the scorn to their united clemency. It is true Dürer has left no record of her association in his work, as many of our most gifted contemporaries have done of their wives, but he took her with him in his visit, of two years' duration, to Antwerp, when he might have left her at home; coupled her name with his, when he put his money out to interest, which he was scarcely called upon to do, save from choice; and left her at his death well off in worldly circumstances, when one of his brothers, at all events, was living, and a fit recipient of his accumulations. Hence we may conclude, as, indeed, the author seems to think towards the close of his labours, that Agnes was not quite so bad as she has been painted. Pirkheimer is the chief authority from whom her character has been delineated; and in one of his letters to T'cherte, architect to Charles V., at Vienna, we can detect a mutual dislike. He tells of the death of Albert, who he says was the best friend he ever had in his life; and adds, he left many beautiful watches and things, one of which he should have liked to have had, but Agnes removed it out of his reach. Pirkheimer wrote the well-known epitaph upon his friend's grave. Let us hope Agnes relented, and sent him the coveted keepsake.

Albert Dürer was a very comely man to look upon. Mr. Scott says his face resembled the ideal attributed to the founder of Christianity; and in truth the portraits show us the very perfection of manly beauty. No wonder, then, that he found as many friends in Venice after a short stay as he did in Antwerp, and every where he went. His was not the hard task of proving he was better than he looked. At Venice he found welcoming outstretched hands on all sides. He wrote to his friend Pirkheimer, "There are many fine fellows among the painters who get more and more friendly with me; it holds one's heart up." Gian Bellini, who has praised me much before many gentlemen, wishes to have something from my hand. He has come himself to me, and asked me to do him something, and he will pay well for it. Several people have told me I am in great favour with him, and I understand he is a pious man; he is very old indeed, but yet the best among them." Titian and Giorgione were in Venice at this time, and were probably among the friendly painters. The Doge offered him 200 ducats a year to live in the city. Again, in the Low Countries the Flemish painters received him with the warmest welcome, inviting him to ceremonial banquets, sometimes including in their invitations his wife, and even Susannah, her maid. At Brussels, Cologne, and Aix-la-Chapelle, he was entertained for many days free of any cost, and the Council of Antwerp offered him 300 florins a year, and a fine mansion to live in if he would remain among them. We select one as a sample of numerous entries in his diary. It relates to the beginning of his stay in Antwerp, 1520:—

"On Sunday, the day of St. Oswald, the painters have invited me into their Guildhall, with my wife and her maid. We ate an excellent dinner on an entire service of silver. All the wives of the painters were there, and, when they conducted me to my place at the feast, the entire assembly, standing up, made a lens for me as if they entertained a great lord. There were at the banquet people of consideration in Antwerp who bowed to me, and made me many compliments, saying they all wished to do what might be agreeable to me. After I was seated, the messenger of the council of the city approached me with two livermen, and made me accept four measures of wine, saying that he did so on the part of the gentlemen to show me honour, and as a sign of esteem. I prayed him to spare it to the gentlemen my thanks, and I offered him my very humble services. After him came Master Peeter, who presented to me two other measures of wine with his respects. We passed a long time at table with very great pleasure, indeed a part of the night, and then they conducted me home with banners, and made a thousand demonstrations of friendship. I thanked them with fervour, and betook myself to bed."

On turning over the pages of this diary we are somewhat surprised Mr. Scott has not dwelt at greater length on Dürer's work as an architect, and upon his practice of the art of glass painting; especially upon this last, seeing the controversy evoked by Mr. Holt's assignment of the Fairford windows to him, and that the diary shows him to have been in communication with Flemish artists in stained glass. His principal object in going to Antwerp was to see the Lady Marguerite, the sister of his patron lately deceased, and obtain her influence in favour of his application to the new emperor, her nephew, that he might retain his appointment of painter

to the king. Owing to the delay of Charles in making his entry into that portion of his dominions, Dürer's stay was prolonged for two years, during which time he records incessant work, which is quite compatible, though some people do not think so, with the record, also, of incessant visiting, giving and receiving of presents, making of purchases, interviews with celebrated artists, such as Quentin Matsys, or scholars such as Erasmus, and excursions to other places of interest. Portraits seem to have been his principal occupation here, and copies of his engravings, his most frequent complimentary and propitiatory gifts; but here and there are signs of his interest in the class of work to which we refer:—

"I have given to the painter on glass, Honig, four little pieces on copper."
"Master Dietrich, the glass-painter, has given me some red colour, which is found in newly-baked bricks here in Antwerp."

"I have bought a shirt of red linen for thirty-one stivers; some of the red colour they get from newly-burnt bricks two stivers."

"I have offered to Dame Marguerite, sister to King Charles, an example of my engravings. I have also made for her two designs on parchment with the greatest care, which I estimated at thirty florins; and for her physician, the plan of a house he proposes to build; this plan I would not to under ten florins."
"I gave four stivers for kettle-brown [Here Mr. Scott says, in a note, this word is of some importance, as it goes far to connect Dürer with glass-painting. It means halt, a plant, a species of salale, or glasswort, the ashes of which are used in the making of glass]."

"I invite Tommaso Gerhard, his daughter and her husband, the glass-painter Honig Jobsten and his wife, and Felix, which costs me two florins."

"Give an Apocalypse to Master Dietrich, the glass-painter."

"I have made a sketch for Tommaso, partly coloured, after which he may have his house painted."

"Two [books] to the son of Honig, the glass-painter."
"To Master Art, the glass-painter, I give a 'Life of the Virgin.'"

Thus these entries show that the Flemish glass-painters gave him the material for the new red colour they prized, and that he subsequently bought more of it, as well as a stock of kali. His interchange of courtesies and gifts with four glass-painters suggests, too, further business arrangements. A little more research on Mr. Scott's part might have brought forward more conclusive testimony.

Collectors will specially value the *reliquaire* we must now lay aside for the comprehensive and descriptive catalogue it contains of the master's works; a hundred, at least, engravings on copper and etchings; more than two hundred wood engravings; a much larger number of paintings; nearly as many sketches and engravings; many carvings in wood and ivory; besides his literary works on fortification, geometry, and human proportion; his scarce architectural efforts and his models. It tells us all the old story; industry is the only road to excellence and success. But we would have our readers look into it themselves, and realise the fine old house at the Thiergärtner-Thor, with the atelier, in which most of this work was executed, occupying the ground floor, the agreeable, intellectual Nurnburg society, the guild that was so much associated with Dürer, the step gables and cunning dormers of some of the old, tall houses, the great churches with Peter Vischer's ironwork and Adam Kraft's sculptures in them, the fountains, and the linden trees where the great dance was held on Pirkheimer's wedding-day. They will see Mr. Scott has paid a fitting tribute to one of the greatest masters of his craft, in good coin.

POSSIBILITIES OF STREET ARCHITECTURE.

An architect has been defined as a man whose fate it is continually to be imagining great things and executing little ones. There is, it must be admitted, but too much truth in the definition, as many a hardworking man, drearily checking "extra" bills, and planning small and uninteresting houses, in an office hunched round with gorgeous architectural dreams in water-colour, could well testify. And there is, we fear, something deeply rooted in the English character, especially in that stratum thereof whence art-patronage most proceeds at present,—the wealthy middle-class, which peculiarly militates against the hopes indulged by young architects and artists, of being permitted the opportunity of realising their brightest æsthetic dreams. The "art-phobia," of which we noticed such a remarkable development not long ago in our legislative assembly, during the Law Courts discussion, exists more or less in the minds of the nation at large: there is a certain "smugness" and stolidity of taste prevalent among our

landed and moneyed, and not wholly absent from our titled, aristocracy, which connects any undue attempt at artistic effect in a residence with they know not what of vulgarity and show, and which finds the acme of respectability in a decent plainness. The best prospect of a modification in this way of thinking, probably lies in the increasing connexion and intercourse between the natives of this *ultima Thule* of ours, and some of their more artistically-minded continental neighbors. Awaiting the good time to come, when every educated and wealthy Englishman shall be as anxious to have his mansion truly artistic in design and detail as he now is to have it comfortable and commodious, let us consider whether there may not be some more ordinary and hitherto rather neglected fields on which to expend our talent in the meantime.

It is too much the habit, both with professional and non-professional men, to rank as "architecture" only the isolated buildings, such as churches, town-halls, and such other structures, which are built under exceptional conditions of size and costliness that render the attainment of a certain degree of architectural effect comparatively easy, or even inevitable; for a very large building strikes and impresses sometimes by its mass, independently of details. And when we speak of the architectural interest or beauty of any special town, we commonly look back mentally to a kind of panorama of the principal buildings, like that which Mr. Verdant Green was troubled with after lionising Oxford. But, in truth, it is not this importance of public buildings in giving architectural character to a town somewhat over-estimated? It is true that after visiting the majority of English towns, the only pleasing recollections as to their outward aspect (except it be with regard to site) have reference to a few isolated edifices, while the mass of the streets and buildings only remain in the mind as a kind of dingy background against which to relieve the real works of architecture, few and far between. But is it not in fact more important that what really constitutes the town itself should be pleasing, rather than that all architectural effect should be concentrated in, and confined to, certain favoured spots and individual buildings? These latter, whether sacred or secular, may be glorious ornaments to a town; but the finest cathedral or town-hall will not altogether compensate for miles of street laid out without plan or reason, and flanked by brick walls with rows of square windows of identical size and appearance. It is with the streets and the unavoidable rows of houses that flank them that the inhabitants of a town in their everyday occupations, come most immediately into contact; and the architectural character of the town should impress itself on the spectator through this medium, as well as through that of isolated buildings for special purposes. That this view of the subject should be so much ignored amongst us is partly due to the fact that for long past our town streets have been absolutely destitute of any architectural character or individuality whatever; and a slice of street from most parts of London, for instance, might just as well be a slice from Birmingham, Manchester, Liverpool, or any other large town the main features (if features they can be called), presenting an indistinguishable identity of ugliness. We have got used to this, and accept it as the natural state of things.

It is, however, by no means necessarily so; though it may be admitted that in large towns already built a long period must elapse before any appreciable improvement could be made, by dint of rebuilding, in the general aspect of things. The times are gone by now, in the European world at least, for the deliberate planning and building up at once of new towns, with all the parts duly laid out with relation to requirements of traffic and peculiarities of site. Most of our towns have grown up by degrees from small beginnings, and have (so to speak) laid themselves out, in curves and angles of picturesque but awkward variety; and one troublesome peculiarity of this natural growth is, that the central portion of a town generally, being the oldest, is built in narrower streets than the outlying portions laid out at a later period, when the prospective increase of traffic had become more apparent; consequently, the proper arrangement of the plan is mostly inverted, and the space is least just where the traffic is greatest and most concentrated. So great a nuisance has this crowding of the centre become in London, in addition to the tortuous character of some of the routes, that a well-known daily

contemporary recently expressed a wish for another "fire of London," if so we might have the chance of rebuilding it on a better and more commodious plan. On the other hand, it must be said that much of picturesque and of historical interest is to be found in the traces of the gradual growth of a town, and the old landmarks of property, which are preserved in the irregular line of its streets; and in the old names of streets, too, there is often a store of information and suggestion for the antiquarian, the name itself sometimes giving unmistakable record of the original character of the site on which it was built, or preserving the memory of some incident connected therewith. We cannot altogether be indifferent to associations of this kind; and most of our readers will think that there could scarcely be anything less interesting than to have all towns laid out like New York, in parallels and rectangles, distinguished by numerals in a regular series. The best, and perhaps the only method of dealing with our existing overcrowded and labyrinthine centres of habitation, is to embrace every opportunity of clearing through their dense masses straight lines of wide thoroughfare which will serve not only as conductors of traffic, but in some degree of air and ventilation to the narrow courts and lanes past which they may run; conductors, also, perhaps, it may be said, of civilisation, from the refined to the more heightened districts, which may thus be brought into better knowledge of each other, to the advantage (possibly) of both sides.

And in building such new streets, and in the constant pullings down and re-edifications that go on in old ones, what can we do to give them something of architectural expression and effect, to obviate their degeneration into so many furrows or miles of brick? There are involved in this question considerations of material, of design, and also what may be called the semi-legal question as to how far the owner of each strip of property is to have the option of doing exactly what is right in his own eyes, without regard to general effect or to the design of the contiguous front on each hand. This latter question, indeed, touches on the first principles which are at the ground of street architecture. Should a long array of houses be grouped into one design, or should we openly accept the fact that every man's house is his castle, the abode of his own peculiar Pecunia, and so let our streets appear simply as the agglomeration of a multitude of individual residences, having no connexion with each other except by accidental contiguity of site? The admirers of the wild disorderly picturesque of the gabled North German streets will stand up for the latter principle, as involving not only absolute truth of expression, but variety of sky-line. It is one thing, however, to admire the natural growth of this picturesque outline; it is quite another thing to set to work deliberately to be picturesque, "of malice aforethought." Moreover, this same skyline is not attained without a considerable waste of material and space in the roof, besides the loss of light and air which would certainly result were all our streets roofed in the fashion which has become prevalent in so many new buildings, especially of the hotel class. That which can truly be termed "architectural" effect is to be obtained rather by the regular sequence and balance of parts than by irregular huddling together of perhaps incongruous designs. Not that we would, on any account, recommend a system of formal unity of treatment along a whole line of street. This could not fail to be monotonous; but, when we have heard complaints made, as we sometimes have, of the odium of despotism told by the regularity and unity of some of the Parisian streets, it has seemed to us that a little enlightened despotism in such matters here might not be altogether amiss. The aspect even of our common streets is rendered worse than it might be by the independent manner in which owners go to work in rebuilding and painting or cementing; leaving us, here a strip of brick, there a strip of cement new and white, there another strip old and dirty, and another of a different tint, and so on; and in those streets where rebuilding goes on in more ornate and architectural forms, the singular and defiant opposition of character and design in adjoining fronts often seems almost the result of a deliberate feud between the respective architects or their clients. It might surely be possible, without tying yourself to follow the style of your neighbour's building altogether, at least to give some consideration to making the principal heights and lines of the fronts correspond in some degree, to effect something like an

artistic function between the designs of the two properties, instead of carrying over the face of your own elevation strongly-marked strings and cornices wherever there are none on the adjoining building, and emphasising the divisions between the properties by outlining the mouldings off square at the end. These remarks would of course apply mainly to streets of shops and other buildings which are diverse in their objects and require to a great variety of treatment. But between the Scylla of howidering variety and the Charybdis of dull monotonous uniformity there scarcely seems to be any middle course recognised, so far as street architecture is concerned. Some degree of judicious official supervision of the design, as well as the construction, of the buildings which line our streets, might perhaps avail to counteract the extreme of either evil, that of having no street architecture at all, or of having what may be called street architecture run wild. It might be possible to compel uniformity in the main features of buildings through a certain extent of street, without too despotically interfering in details; to demand continuity of main cornice lines, for instance, and a certain balance in the respective heights of buildings, so as to give something of the general appearance of design to a street, leaving such matters as ornamental detail, spacing of windows, &c., to individual taste. Conversely, the riles of builders at whose bidding spring up miles of brick screens pierced with square holes, without break or variation, might be compelled either to employ an architect to arrange their rows of dwellings with a little attention to grouping and variety of effect, or to submit to the attentions and directions on this head of an official supervising architect. We know, of course, how dangerous a thing is hueracratic intervention in matters of art generally; but it is clear that nothing can be worse, nothing more un-architectural, than the majority of our street buildings at present, and it is difficult to imagine any change in the present system which would not in all probability be a change for the better.

The question as to the degree of variation of design desirable in a row of street dwelling-houses, without going to the extent of producing a motley variety, has not been paid much attention to. Even when an architect takes the trouble to design a terrace, it seems to be practically admitted that each house should be a fac-simile of its neighbour; a slight variation, perhaps, being made in the end houses of the block. This is scarcely a necessary rule, however, and we fully think that a man should know his house by some other means than by merely remembering that it is No. 5 or No. 7 in the row; it should have an individuality, a character of its own. It is possible to attain this without sacrificing general uniformity of aspect. A few slight breaks in the line of frontage, a variation in the form of window-heads, or in the spacing of the windows, a diversity in small ornamental details, sufficient to be evident on close inspection, without appearing in violent contrast when viewed *en masse*; by such devices it may be quite possible to attain variety of expression in each residence without interfering with the combined architectural effect of the whole. A more difficult question, perhaps, is how to give anything that can be termed architectural effect to the more ordinary of our streets, flanked by houses of a necessarily low or moderate rental. It is possible, however, even here to give at least the expression of solidity and durability, in contradistinction to that miserable appearance of weakness and meanness which has been so grotesquely commented upon by Mr. Garbett in some parts of his little work on the "Principles of Design." The mere change from a 4½-in. to a 9-in. reveal in the windows would do a great deal; the abolition of such bastard construction as the flat arch in brickwork, the renouncing of sham Greek columns and architraves from before our front doors, and the substitution of even a plain brick opening with a little characteristic treatment in moulded brickwork, would do a good deal more. The abolition of parapet walls (constructive absurdities in theory and, on brick walls of ordinary thickness, worse than absurd in practice), and of the wretched pieces of cradling which are hung on to street houses and called "cornices," is a thing devoutly to be wished; and perhaps nothing would more tend to give something like a solid and satisfactory character to our street houses than the employment of a genuine, honest cornice either (if of stone) to form the eaves gutter, or of brick corbeling or oak to carry an iron gutter. There

is much to be done, too, with regard to the architectural treatment of shops: we have at present for the most part only arrived at making them stand on plate-glass; and it is to be feared that this flimsy system of building so as to make the greatest possible show of the goods on the ground story without providing any apparent foundation for the superstructure, is only too truthful and suitable an exponent of the spirit of show and plausible profession and competition which is so characteristic of modern trade. When shopkeepers come to think that it is more respectable and dignified to succeed by dint of thorough honesty and fair dealing, and by respectable connexion and reputation, than by outvying each other in dazzling shows behind plate-glass windows, and between multiplying mirrors, we may have a more honest and solid style of shop architecture, in which the ground story might be a remarkable and characteristic feature, capable of great variety of treatment in a thoroughly architectural manner, instead of being merely an expanse of plate-glass. In designing street buildings of a more ornamental and architectural character, the oversight seems to be constantly committed of not taking into consideration the width of the street in which they are to stand, and the consequent distance from which they are likely to be viewed. Designs are made sometimes with story upon story of ornamental features, crowned by a projecting cornice of 3 ft. or so, which look very well in a drawing, but which are usually to be built in some street so narrow that only the ground floor comes within the immediate notice of passers by, while the cornice shuts out a great deal of the scanty light from the windows below. A building to stand in a narrow street should be designed accordingly; the ornament should be mostly in the lower story, where it can be seen, not (as is sometimes the case) all crowded up near the cornice, for the benefit of an occasional workman repairing slates on the opposite roof; and projections should be reduced to a minimum. It may be said, indeed, that the consideration of the design of a building with reference to all the circumstances of its site, so as to render it as effective as possible in those circumstances, to avoid throwing away work which will not be seen, and to turn even what may at first sight seem disadvantages of site into a source or suggestion of novelty of treatment, is a matter more important than is commonly acknowledged in practice; the neglect of it being, perhaps, often fostered by the habit of getting up competition drawings, where the only object is to make as much show as possible, independent of all possibilities or impossibilities as to the realisation of the effect depicted. And we would have no architect, however gifted and successful, think it beneath him to give every consideration, when he has the opportunity, even to so commonplace a commission as one for ordinary street houses. Bits of pleasing effect in detail and general treatment may with care be realised even in very plain work, and make all the difference between an architect's treatment (however simple) of a street front and a builder's ill-treatment of the same. And street architecture is its richer and more ornate forms, when treated in large masses with true architectural feeling, has sources of effect in its long perspective which can hardly be realised otherwise. Were the buildings forming Regent's-quadrant, for instance, of a higher and more architectural class, and so treated as to make the most of the long curvilinear perspective, there might be few things in the shape of town architecture more effective or better worth seeing.

PUBLIC STATUTES.

SOME judicious remarks by Professor Donaldson, which appeared in the *Builder*, on Public Statutes and Sculpture, have excited much attention, and they seem to offer an opportunity for discussing a question of no small importance to art, and it should be, of no slight interest to the public. I would, therefore, ask permission to endeavour to improve the occasion opened by the letter of your intelligent correspondent, and, as shortly as possible, express my views as to what appear to be the prominent causes of the unsatisfactory state of things referred to in that paper. The question is a much larger one than at first appears, and deserves to be treated extensively. It is not my intention to do so now; it will only be convenient, at this time, to touch upon one or two points which have a special application to the subject.

It seems to be assumed, in the first place, that, with exceptions, "few and far between," our public statues are not works of art of which the country has much reason to be proud; and, secondly, that they are not, as a rule, the productions of sculptors who are believed to be the most competent, and, therefore, who would be the most likely to do any work intrusted to them satisfactorily. Here are two distinct propositions, yet they are by no means altogether unconnected in their relations to each other. It is not necessary that they should be discussed by themselves. It will be better to consider the subject generally than in its parts, and thus to avoid all reference to particular or individual merit.

In order to limit the present inquiry to an examination of the causes that affect the more satisfactory progress of art in this country, it may be useful to consider what is the class or character of sculpture which receives the greatest amount of support and patronage in England; and what are the means usually taken to procure works from artists. There can be no doubt that Portrait is the most popular exercise of the sculptor's art at the present time, and the class for which there is the most frequent demand among us; and, possibly, we may here find the whole secret of the inferior character of this art, which is, by some critics, said to prevail. An unprejudiced examination of the peculiar conditions attending this exercise of sculpture will supply abundant reasons for works of this class not being of a very high art-quality, even under the most favourable circumstances. But, practised as it is, ordinarily, in these days, it would not be difficult to show that the artist's best efforts never can rise to any very remarkable degree of excellence. We derive our knowledge of sculpture, as a fine art, from the traditions and examples that have reached us of the greatest masters of Greece; and subsequent sculptors have been content to follow these as the noblest guides in their own practice. Now, it may be permitted to remind the reader that the practice of the ancient Greek sculptors was founded on the study—broad and comprehensive—of the most perfect examples of form, the normal beauty of nature being the standard which the artist essayed to reach. The universal, not the individual, type was the aim of his imitative power. Portrait was unknown in the time of the nobler Greek schools; its introduction was comparatively late in the history of Greek sculpture; and, as its principle was to substitute the particular or exceptional for the general, to represent the individual and not the class, the innovation had an almost immediate deteriorating effect upon art; and, as a necessary consequence, its decline soon followed—a decline from which sculpture has never recovered. It followed, of course, that for a lower class of art a lower class of artists sufficed. A profound knowledge of the human form, the study of beauty as an essential element in fine art, nobility of expression, an acquaintance with the mechanism and capability of action of the human figure, may be almost wholly dispensed with when a sculptor is called to represent little more, of nature, than a face, and that individualized into a personal likeness. The consequences are not far to seek. There have been, since the Greeks, sculptors of exceptional excellence. So there may indeed be room, in a portrait, for character, and for skillful composition; and, no doubt, according to the degree of ability in the sculptors, these qualities may be found more or less in public portrait statues. But, as a rule, where this standard is not, and never has been, a high one, namely, the representation of the greatest perfection of form, we must be prepared, in these times especially, to accept a lower grade of art excellence. The inferiority is not denied, but it has been attempted to be shown how it may, in a great measure, be accounted for.

There is, however, another phase of the subject, which may very properly be adverted to, although it must be done in a very few concluding words. It is not altogether or entirely owing to any natural inferiority in the modern sculptor that he exercises his art inadequately. The artist in these days usually has to live by his profession; and to do this he must produce what will please those from whom he has to look for his reward. The public, then, and the self-constituted arbiters of taste, judges of designs, in committees and competitions, must bear their part in the reflections that are so readily made on works, he it remembered, of their choosing, and on the shortcomings of public monuments they have selected for execution. If an artist

who has had some teaching and practice, however deficient, fails, how shall those who have had no teaching, no education whatever in the principles of art, but who, notwithstanding, unhesitatingly pronounce upon it, succeed in deciding what is good or what is bad? *Quis custodiet ipsos custodes?* If the art that is produced is inferior, are not the ignorance and the want of taste in the public to bear some part of the responsibility? If the patrons of art, for want of refinement and of education in its principles, are incompetent to judge of better things, and are satisfied with commonplace, why should the artists, even if competent, be expected to provide what would neither be understood nor appreciated? The fact is, speaking generally, the art-tone of the country is a low one; and this, of course, in spite of some few exceptions, acts upon the producers of art.

But it is time to close. This is a part of the subject that requires delicate handling, and much more consideration than can now be given it.

RICH. WESTMACOTT.

THE DISTRIBUTION AND AGRICULTURAL USE OF TOWN SEWAGE.*

I HAVE been asked to re-open the adjourned discussion on the utilisation of town sewage, by furnishing a short account of some of our successes and some of our disappointments at Barking during the past season. And to this I will add such general observations as further experience has enabled me to make.

I will commence with my disappointments, or rather with a few of them, because, as they belong to the order of mischances termed by the Registrar-General "preventable," were I to finish with them I should leave an erroneous impression on your minds.

With regard, then, to the best known sewage crop, namely, Italian rye grass, I stated in the spring that, under proper cultivation, ten crops, averaging nine or ten tons each per acre, would always be obtained in one season by the application of a sufficient quantity of sewage, if the grass were sown at the right time of the year; namely, in the month of August. This statement I repeat now, and further experience has only confirmed me in this view; yet I am sorry to say that in actual production I can only bring you one ton nearer the promised hundred than before. On my own land I have, as yet, no rye grass under sewage, but on the Metropolitan Sewage Company's farm one piece of ground has been sown in the month which I had so frequently recommended, and I was in great hopes, even although it had been somewhat starved in the winter, yet that it would have been efficiently liberally dealt with during the growing season to have given a result approaching, at all events, to the standard of 100 tons. If you consider that it is now upwards of eight years since I first began to labour towards the utilisation of the sewage of London, you will better understand the disappointment that it was to me on finding that when there seemed at last to be a chance of a fair experiment, this chance should have been thrown away, and the desired result postponed until the end of the ninth or perhaps tenth year. I say, or perhaps tenth year, because, as I shall presently explain, it is now fortunately in my power to make reliable quantitative experiments, independently of the Metropolitan Sewage Company, who have for so long stopped the way. But as a full result can only be looked for from grass sown in the month of August, I cannot obtain that full result next year. I must wait for the year following, which will be the tenth of my labours. Let us hope that there may be something lucky and auspicious in that figure, and that the tenth crop of grass cut at the close of the tenth year of work will complete the last 10 tons required to make up the promised 100.

I have to record another disappointment, with regard to maize. I had, and still have, great hopes of this as the cereal pre-eminently adapted to utilise large quantities of sewage, and to yield maximum quantities of food per acre, whether for man or beast. I stated that so forcing was the effect of liquid food upon this crop, that I had every expectation that I should be able to ripen it in any year in the climate of Essex, because the growth of the plant in its early stages would be so hastened that it would

be able to avail itself, for ripening, of the heat which we always have in August and September. This expectation I still entertain, but with one modification, and that is, that to guard against the effect of a cold spring followed by a cold early summer, such as we had this year, it is absolutely essential that the seed should be sown in an open porous soil; so that when the sun does come, it may penetrate and warm the soil and roots of the plants in the shortest possible time. The soil in which I ripened the maize last year, and in which I have failed to ripen it this year, was a cold dense brick-earth, which was never thoroughly warmed this year at all. The 3 in. a day, or one-eighth of an inch an hour, as Mr. Bramwell forcibly put it, which the sewage enabled the Indian corn to grow last year for a month continuously, was never attained this year for a single day. No sooner had it struggled above the surface of the stiff earth than the cold north winds in June nipped it, and, in fact, it was frost-killed; so much so, that down to the middle of July it was completely white and blanched like celery or sea-kale, and appeared to be all but dead. However, having entire confidence in the stimulating powers of sewage, I then commenced applying it with an obstinacy in proportion to the strength of the previous north wind, and the result was that the colour rapidly reappeared; towards the end of July it began to grow; and, at last, in the middle of October, it attained the proportions you see in this plant, the cobs being about two-thirds formed.

Among the successes of the season, either at the Lodge Farm or on my own ground, may be mentioned the following:—

A crop of wheat on 4½ acres, the land being a poor gravel, and the crop being the third crop of wheat in succession, gave just under 4 quarters to the acre of grain, weighing 61 pounds to the bushel, from an application of about 700 tons of sewage per acre; however, in the judgment of Professor Voelcker as well as in my own, this crop was starved and mismanaged at a critical period of its growth.

Two acres of oats, following two successive white crops, with green catch crops in between, received, on a poor yellow gravel, some 600 tons of sewage per acre, and yielded 10½ quarters of grain to the acre, weighing 41 pounds to the bushel.

Six acres of barley, following two successive white crops, on a poor gravel, and said to have received rather more sewage, yielded 4 quarters and two-thirds to the acre, weighing 52 pounds to the bushel.

An acre of beans received 800 tons of sewage, and yielded 5 quarters of grain.

Four acres, one rood, and twelve poles of mangold received a more uncertain quantity of sewage, and produced altogether 201 tons of roots, or not far short of 50 tons per acre; but this was starved for many weeks together.

Three rods, ten poles of potatoes realised nearly 26l. in the Borough Market; the quantity of sewage uncertain.

An acre of carrots, which received about 1,000 tons of sewage, realised 36l. 10s.

An acre and three-quarters of onions, which received one light dressing and two heavy ones, sold for 80l. 12s. 11d., or about 46l. an acre.

An acre of sugar beetroot, grown experimentally according to the directions, as regards distance apart between the roots, of some eminent Belgian sugar manufacturers, yielded 22½ tons from the application of about 1,000 tons of sewage; but the seed was not very good, and the amount of top was enormous, and out of all proportion to the roots, partly, as Mr. Duncan believes, owing to the inferior seed, and partly, I have no doubt, owing to their being too close together.

For the future I shall be able to record accurate quantitative experiments in the application of town sewage. This is because I have recently taken a lease of another farm about three miles farther from London, together with a lease of the sewage of the town of Romford. I am informed that Romford contains a population of about 8,000, of whom 6,000 or 6,500 are believed to be "sewered," as the phrase is, at the present time. However, correct information will be obtained in the course of the coming year as to the actual amount of population drained by the sewers.

The farm consists of about 120 acres, of which the greater part is a light sandy and gravelly loam, admirably adapted for sewage irrigation; but, in itself, exceedingly poor land. For the land, with commodious buildings, I pay a rent of

* From a paper by Mr. William Hope, read at the ordinary general meeting of the Institution of Surveyors, 12, Great George-street, on November 22, 1869; Mr. John Clutton, president, in the chair.

300l. a year. For the sewage, delivered upon the farm, I pay a rent which is, I believe, the largest dead rent paid for the sewage of any town, no matter what the population, up to the present time, namely, 600l. a year. For instance, the Local Board of Croydon only gets about 300l. a year, or half of what I pay, for the sewage of a population nearly seven times as great as that at present drained by the Romford sewers. Nevertheless, I believe that I have got an exceedingly good bargain, as I have got the sewage for something like 2s. per head of the present population. It is my intention, so soon as I have got the land laid out, and ready for the proper distribution of the sewage, and so soon as I can procure a self-recording meter which will not become clogged with the dirt of the sewage, to commence a series of quantitative experiments, of which a correct and rigid account shall be kept for the benefit of the public.

I desire to state my very strong conviction that every surveyor or farmer laying out land for sewage irrigation, ought to stir the subsoil and break through the hard pan formed by centuries of shallow cultivation; in order, first, to prevent water stagnating and becoming sour and rotting the roots of the crops; and, secondly, to permit of the roots of rapidly growing plants penetrating as deeply into the soil and with as great facility as possible. The ordinary subsoil plough, or any variety of it, I look upon as very objectionable, because the long base or sledge grinds along on the lower subsoil, and hardens and polishes it, or puddles it, as the case may be, and moreover it makes one deep score or rut, and that is all. I have accordingly, during the past year, made several experiments in order to produce what I may term a subsoil stirrer; that is, an implement which should effectually break through the hard pan, and loosen and move the subsoil without turning it up, following the plough after the fashion of an ordinary subsoil plough; and my final pattern is, I think, as nearly perfect for the purpose as possible. It is exceedingly simple, very light, and very strong, being in the nature of a cultivator, or grubber, and not of a plough.

There is no sledge to produce the harmful effect upon the subsoil above described, but the "lines" or "fingers" tear the ground up and leave it loose and rough at the bottom. One of the difficulties to be encountered was the necessity to have, for any description of grubber following a plough, a wheel in front to regulate the depth of cultivation, and it was manifest that a wheel could not revolve in a loose furrow without becoming hopelessly clogged; so I devised the simple wheel that you see here, having no spokes, but a solid or flush side, with an axle protruding beyond the other edge, and having a shoulder upon the axle, which fits inside a sort of rectangular cup, which is then bolted to the inside of the other and solid side of the wheel. The wheel then goes in the furrow after the ordinary plough, and the flush side being turned next the perpendicular side of the furrow, prevents the earth, no matter how loose the top soil may be, from crumbling in and clogging up the wheel. With this implement, and three horses, following the ordinary plough, I can cultivate from 18 in. to 20 in. deep with the greatest ease, even where the subsoil is a hard pan of gravel resembling concrete; and I look upon this implement, or one of a similar character, as essential upon a sewage farm where steam power is not regularly employed. In my experiments with it, I was very ably and kindly assisted by Mr. Wedlake, of Hornchurch, who devoted an amount of personal attention to it which few manufacturers would have given to so small an affair.

For the distribution of the sewage over the farm, wherever to obtain a sufficient fall a height has to be given to the carrier of over 30 in., I am making use of the description of sheet-iron trough which I alluded to in my former Paper, with a slight improvement. In addition to the prolongation of the sides, to give vertical stiffness, and so to admit of a greater distance between the supports, the top of the sides will be turned over as a flange, to give lateral strength. The sides will further be tied together every 3 ft. by iron straps. The supports will be cut out of yellow deals, and will consist of a pair of uprights to take the sides of the trough, with a cross-piece to take the bottom of the trough. The uprights will spread slightly towards the base, and will be mortised into a sleeper placed about 1 ft. below the surface. There will be openings at every 30 ft., with a simple water-tight valve and down pipe, and a shutter in the

main trough, by which the further flow of the sewage can be regulated or stopped altogether at pleasure. The sectional area of the main trough will be equal to that of an 18-in. pipe; and the contract price of the trough with supports and shutters, with two coats of paint, fixed in position, ready for work, is 6s. 8d. per yard forward, with an extra 5s. for each opening with valve and down-pipe, making a total, including these openings, of 7s. 2d. per yard forward, which is a triumph of economy. The contractor is Mr. Edwin Maw, the well-known manufacturer of sugar and gas machinery. The simple water-tight valve to which I have alluded is his invention, and is so ingenious that a short description of it may be useful. A circular opening having been made in the side of the trough, a light iron casting is riveted to the edges. This casting is in the nature of a three-way piece, and in form resembles the little cistern at the head of a common rain-water down-pipe on the side of a house, except that from one side projects the third way, so to say, which is the part that is riveted to the edges of the opening in the side of the trough. The bottom of this casting fits and delivers into the down-pipe, and is slightly conical, and the water-tight valve is simply a wooden plug which jams into the conical part, a pin with bores at the top keeping it either partially or wholly open. These openings discharge 200 gallons a minute; and those who have had to deal with water, and know the difficulty and cost of making water-tight valves or sluices, will the better appreciate the ingenuity which has enabled Mr. Maw to produce so complete an opening, valve, and down-pipe, for the trifling sum of 5s.

My lease of the sewage of the town of Romford has given me some little insight into the general conditions in which the sewage of an ordinary country town is likely to be presented; and I find that the dilution is so much less than that of the sewage of London, that one of my first stipulations in treating for the sewage was, that the dilution should be largely increased; not because I believe that the strong black stuff which I saw on my first examination would have been too strong, chemically, for any crop to which it might have been applied, but because it deposited a black sediment, which, as it dried, formed a cake upon the surface of the ground, through which no seeds could have burst, and which must have greatly injured all young crops by stopping the healthy ventilation of the soil, and, possibly, even by mechanical pressure round the stems of the young plants. This pressure is an injurious action, which the sticky brick-earth of my experimental field at Parsloes exercised largely on my unfortunate young plants, struggling for existence in the cold north wind of June last. The wind dried up the surface, and formed a coating analogous to the black cake formed by the Romford sewage, and I observed many thousands of young plants, of all kinds, mechanically squeezed to death by this action. In fact, in sewage farming, where at least the supply of sewage is abundant, the only thing that has to be attended to is the physical condition of the soil. Its chemical condition may be totally disregarded, provided it does not contain matter actually poisonous to vegetation.

Having stated that I have endeavoured to tone down the Romford sewage to the same strength as that of London, I may mention one of the means that I have taken to do so, as it is a means that may often be in the powers of others to apply. It is simply draining all the upper part of the farm into the tank from which the sewage is pumped to the highest level. There, of course, is (or rather will be) the necessary arrangement for diverting the pure drainage water into the river, if and when it is not wanted, but, at other times, it will go back upon the land along with the fresh sewage coming down.

I should here remark that, from a farmer's point of view, the dilution of the sewage of a town should, if possible, be not less than twenty-five to thirty gallons of liquid per head of the population.

I am continually asked what I propose to do with so large a volume of liquid in the winter months. I answer there is no difficulty whatever in disposing of it. Winter is the time when the greater part of the farm-yard manure all over the country is applied, and instead of carting heavy loads of solid manure, with struggling horses, over muddy roads and sticky fields, it is simpler and cheaper to open a few sluices, and put in a few stops, and let the manure distribute itself. This necessitates good drainage, that is all.

BRISTOL THOROUGHFARES.

On Monday the Mayor of Bristol is to open one of the new roadways now being formed at great cost by the city. It is called the Deanery-road, and forms an easy route to Clifton, viz Jacob's Wells and Berkeley-place; also to the Howells, viz St. George's-road and Hotwell-road; thus avoiding the ascent or descent of Cow-street and Park-street.

The new road commences on the south side of College-green, at the west end, near the Norman archway leading to the Lower-green, and passes in nearly a direct line over the site of the old Deanery premises and garden, which circumstance has suggested the future name of the road. It is then carried on an embankment sustained by retaining walls to Lamb-street, which is spanned by a girder bridge; a short length of embankment then carries the road to College-street, which it crosses exactly at the intersection of that street with Brandon-street, the road being here carried by another, but much more extensive, girder bridge, and from thence to its junction with St. George's-road on an embankment 20 ft. high. The principal works in the roadway have been the construction of the two bridges, especially that spanning the intersection of College-street and Brandon-street, crossing each at an angle of 45 degrees, which the *Daily Post* describes as a novelty in engineering. The two outside girders are each upwards of 100 ft. in length, to which are riveted transverse girders carrying Mallett's patent buckled plates, which support the roadway; the footways on either side are carried on cast-iron cantilevers fastened to the main girders, and finished with ornamental cornice and balustrade.

The whole length of the new road is about 700 ft., and the width 50 ft., including footways 9 ft. wide on each side, and it is of an easy gradient throughout, the highest point being at Lamb-street Bridge. The carriage-way over the two bridges is composed of "rock asphalt" from the Val de Travers, in Switzerland, laid by Messrs. Callender & Amos, of London, the English agents for the Société des Asphaltes de Paris. This material has been extensively used in Paris for some years in the best thoroughfares, but this is only the second instance of its adaptation in this country, the first being in Threadneedle-street, London. We must express a hope that some improvement has been effected in the surface of it over that in London, which affords no foothold and is very dangerous.

The actual cost of the foregoing works of construction has been 6,700l., to which must be added the amount for the purchase of the several properties. The whole of the works have been executed in about fourteen months by the following contractors:—The masonry of the bridges and retaining walls by Mr. W. Baker, of Canon's-mare, Bristol; the wrought-iron work of the bridges by Messrs. Lloyd, Foster, & Co.; and the cast-iron work by Messrs. Trow & Sons, both of Wednesday.

The works have been carried out by order of the Streets Improvement Committee of the Local Board of Health, of which Mr. John Perry is chairman; Mr. Alderman Proctor, sheriff, vice-chairman; and Mr. J. G. Heaven, clerk. The several properties required have been purchased, at a cost of 13,703l., by Messrs. R. S. Pope, S. C. Frupp, and Josiah Thomas, district surveyors to the corporation. The engineering works of the roadway have been designed and carried out under the direction of Mr. Frederick Ashmead, engineer and surveyor to the Local Board; Mr. F. H. Yabbion, assistant engineer; and Mr. Henry Jones, clerk of the works.

Sheffield Architectural Society.—On Monday last the annual general meeting of this society was held in the School of Art. The Rev. J. Stacey, president, occupied the chair. Mr. Fawcett, one of the secretaries, read the report of the committee, which congratulated the members on the continued and increasing prosperity of the society. Mr. J. D. Leader, the treasurer, presented a statement of accounts, which showed that the society had funds in hand to meet all anticipated demands, although there were a number of subscriptions still in arrear. The *Conversation* of the society, which is to be held on the 1st of December, and for which the Corporation of London has granted the loan of its curious collection of ancient cutlery, promises to be a very interesting gathering.

THE DRAINAGE OF HITCHIN.

A LARGELY attended public meeting has been held in the Town-hall, Hitchin, to consider the question of the condition of the sewerage in the town of Hitchin, and to hear an address on the subject by Mr. J. Bailey Denton, of Stevenage, the well-known hydraulic engineer and surveyor. Mr. John Hawkins occupied the chair.

Mr. Bailey Denton commenced by tracing the history of the sewerage of the town during the last twenty years, giving the state of the health of Hitchin before and after the adoption of the Public Health Act, and quoting statistics to show what certainly is not the case in numerous other instances, that the number of deaths, having due regard to the increase of population, had not been decreased to any noticeable extent by the adoption of the present system of drainage.

The state of the sewers in the town at present it was commented on as not being satisfactory, and this may help to account for the statistics. Mr. Denton pointed out some of the parts of the town which were most affected by the inefficient state of the pipes. After expressing his surprise that the surveyor who managed the laying down of the pipes should have allowed them to pass under, and, in some places, just above the bed of the river (though doubtless he was led to place them so from reasons which he (Mr. Denton) did not know), the speaker proceeded to explain a special scheme for depositing and utilising the sewage in the soil instead of carrying it into the river. He mentioned a piece of ground lying between Hyde and Grove Mills, in the hamlet of Walsworth, which, he said, would be exactly suited for the purpose, though open to the objection of being within a mile of the town. By proper management of the pipes, Mr. Denton argued that 90 or 100 acres of land would not only act as a sufficient bed to take in the sewage, but would yield a large profit to the town, if so used. He quoted as instances the large number of towns in England in which, under the system he advocated, large pecuniary as well as other profit was obtained, and he reckoned that, in the case of Hitchin, if the townpeople acted as their own sewage farmers, a profit of 600*l.* a year might be made, if the ground were let to a sewage farmer for 300*l.* a year, and if they contracted with a private person who would pay them for the benefit of the sewage 150*l.* a year. He also advised the buying of Grove Mill, and using the water-power as a means of raising the sewage to the level of the land.

THE SAXON CHURCH IN WORTH, SUSSEX.

As my former letters on the "restoration" (?) of the above church appeared originally in the *Builder*, I think it only right to continue the discussion through the same channel, if you will allow me to do so.

By accident, I omitted seeing the following letter in the *Sussex Express* for November 13th until too late to reply to it in your current number:—

"Worth.—The Church Restoration.—We are glad to find that the letter in our last Tuesday's paper has elicited the following satisfactory reply:—

"Worth, Sussex, November 10th, 1869.
Sir,—Having in your last number expressly called the attention of your readers to some remarks of a Sussex correspondent on the subject of Worth Church Restoration, you will, I am sure, be glad to receive some intelligence from persons belonging to the parish, and more or less responsible for what is being done. I shall not attempt to go into the past history of our very ancient and venerable church,—it being sufficiently agreed on all hands, that it dates from the Anglo-Saxon period. Unmistakable proofs of this exist, in the form of the arches, in the massive rough-hewn shapes of the stones which form the capitals and impostes, in the singular structure of the long and short work (as it is technically called), in the bold rough footing to the walls all round, marking perfectly the original cruciform shape of the building. It would be well if we could say more. But past ideas of restoration, strange to say, seem altogether to have disregarded the principle of architectural uniformity, and to have been contented to bury under relentless heaps of plaster and whitewash some of the most interesting features of the original building; and, before the work of thorough restoration, which is now being attempted, was begun, not a window remained that was at all in character with the original design; while all proper lighting of the church, strange to say, from altogether to have disappeared the entire of one transept, to the exclusion of a large portion of the congregation; and was supported on timbers called "trees," because the walls themselves were never intended to support such an appendage. The interior was further defaced by the erection of a modern gallery, running the whole length of the nave on the north side of it; which, however suited to accommodate more persons

in the church, was a sad disfigurement to the ancient proportions of the building.

It became at last a question, not of "keeping the old church intact" (which would have been simply impossible, without undoing everything that had been recently done), but of keeping the old fabric from utter demolition and decay; and up to the present time, as the work of examination (chiefly by removing the comparatively modern coating of plaster) has proceeded, the dangerous condition of the walls has been more and more exhibited, and, to our great satisfaction, many of the ancient windows brought to light. We cannot but rejoice that the evil has been detected in time, and that without destroying the old walls we shall be able to point them afresh, and to restore to them something of the harmony of the original windows by which they were pierced. I think I may assure your correspondent, and all who take an interest in the subject, that the inhabitants of Worth parish cherish the old church far too deeply to countenance any scheme which, under the name of restoration, might have exposed it to "ruin."—I am, Sir, your obedient servant,
A MEMBER OF THE COMMITTEE FOR THE RESTORATION OF WORTH CHURCH."

It is a very calm, gentlemanly letter; but, as you see, does not venture to touch the main charge, that "the chancel has vanished clean away." If removing the supporting buttresses, which, as you said last week, "had been built up at the east end by more recent bands," and thus allowing the chancel to slip down, be called "keeping the old fabric from demolition," and "without destroying the old walls," words certainly must convey a very different meaning to the "Member of the Committee" than they do to myself. I beg your readers to peruse your notes, under date November 13th, headed "Outrage at Worth Church," and then ask themselves if the editor of the *Sussex Express* has any cause to say, "We are glad to find that the letter in our last Tuesday's paper has elicited the following satisfactory (?) reply."

A SUSSEX CORRESPONDENT.

** Our correspondent treats the writer of this letter with too much consideration: it may be "a very calm," but it certainly is not a "gentlemanly letter," because it is untruthful,—untruthful by suppression. A more jesuitical statement was never penned. Who could possibly suppose that "the bold rough footing to the walls all round" no longer marks "perfectly the original cruciform shape of the building;" that "the curious apex at the east end," to which he refers with an affectation of interest, had been ruthlessly swept away; that instead of keeping the old fabric from demolition and repairing "without destroying the old walls," they had positively cleared away the whole of the chancel! A more flagrant attempt to deceive was never made.

British Archaeological Association.—At the first ordinary meeting of the season, held November 24, the subject of the restoration of Worth Church, Sussex, was again under consideration. In January last the council had directed a protest against unnecessary interference with the structure, to be sent to the building committee; and their secretary, Mr. E. Roberts, reported the steps he had taken, down to the present time. It is to be lamented that an irreparable mischief has been done in the total destruction of the chancel, so that the church has now lost the characteristic it possessed of being a singularly perfect Anglo-Saxon structure. In the face of the contradictory reports which have appeared in the *Builder* on the one hand, and the local prints on the other, as to the extent of the mischief, it might have been hard to believe that so destructive an act had been committed; but the council were assured of the fact on the evidence of one of their body who had seen the chancel levelled to the ground, and its foundations uprooted. A letter in justification of the act, from the Rev. G. Banks, was read, which declared that the destruction was approved by Archbishop Otter, and under the complete sanction of the architect, Mr. Salvin. The attention of the council was called to a singular letter of justification, published on Saturday last, by "A Member of the Committee for the Restoration of Worth Church," in which the writer plainly relates his story of the doings of the committee, and misleads by entirely concealing the fact that the chancel has been destroyed. "We cannot but rejoice," he says, "that the evil has been detected in time, and that without destroying the old walls, we shall be able to point them afresh, and to restore to them something of the harmony of the original windows by which they were pierced." The council could only express their deep regret that their remonstrances, with those of the Society of Antiquaries, had been so ineffectual in this case. The Rev. Mr. Banks sent to Mr. Roberts a sketch of one of the early windows now just discovered in the nave of the church.

THE ROYAL THEATRE AND WINTER GARDEN, LEICESTER-SQUARE.

SOME incorrect allusions to this undertaking having appeared, our readers may be glad to know exactly what is the state of the case.

A company has been formed with the object of purchasing the freehold known as Saville House, situated on the north side of Leicester-square, with the houses in Lisle-street abutting on the same: which has been done. The property comprises about half an acre of land, and has a total frontage of 149 ft. in Leicester-square, Lisle-street, and Leicester-place. Upon this site a large theatre, winter garden, and restaurant will be erected. It is proposed to be carried out in a very complete manner, in accordance with the design of the architect, Mr. E. C. Robins, of Southampton-street, Strand.

The auditorium will enable about 6,000 people to see and hear dramatic and lyric performances and grand spectacular effects, which will be represented on a stage 10 ft. deeper than that of Drury Lane Theatre, and fitted with the most recent appliances.

Separate staircases will be provided for each of the four tiers, and numerous wide doors for free ingress and egress to them, and to the winter garden and promenade on the ground-floor, which will be stocked with plants and flowers, and adorned with fountains and statuary. The dress circles and private boxes are to be entered from Leicester-place.

Spacious saloons will be formed at the level of each tier, and recesses for bazaars and refreshment-stalls.

Towards Leicester-square there is to be a restaurant, and billiard and mercantile club-rooms; and an open piazza will extend along the front towards Leicester-square, affording shelter for several hundred people.

MATTERS THEATRICAL.

The proposed New Opera House.—The stir in the public mind on the subject of a new opera-house, made evident by our announcement that money was ready for such an undertaking in one particular quarter, has continued to manifest itself during the past week. We have received letters recommending sites, recommending a conductor, recommending a mode of obtaining singers for the English department, and from two architects recommending themselves as designers of the fabric. We do not know any reason why we should not at once say that Mr. Gruneisen represents the gentleman who has the object in question in view. Above, we have mentioned an authority what one set of gentlemen intend doing in Leicester-square. By another body it is proposed, as we have already mentioned, to convert the great building of the Royal Colosseum, in the Regent's Park, into a grand opera-house, "the most spacious and magnificent in Europe, where the representations—operatic, dramatic, scenic, and scientific—will be on a scale of excellence and variety unsurpassed." They urge that a circle one mile and a half in diameter, struck from the Colosseum as a centre, includes the richest districts in the west and north-west of London, and a two-mile radius includes Belgravia; that all the approaches to the building are spacious and free from heavy traffic, and it can thus be reached without interruption; that the arrangement for the entrances to the opera-house are such that five carriages can set down at one time, which will prevent delay and exposure to cold to the visitors; and that the corridors of the boxes will be sufficiently spacious for picture galleries and sculpture enjoyable during the promenade in the *entrées*, and profitable by an income from their exhibition and sale on a percentage. They hint that a branch line 330 yards in length would connect the premises with the Portland-road Station of the Metropolitan Railway, and that the opera-house would thus be connected with every railway running out of London; and see an element of success for their venture in the contiguity of the principal station hotels to the Colosseum; the Great Western, North Western, Great Northern, and Charing-cross hotels being within ten minutes' drive of the building, the Grosvenor within a quarter of an hour, and the Langham within five minutes' walk. In Paris four opera-houses have long been established, viz., the Grand Opéra, the Opéra Italien, the Opéra Comique, and the Théâtre Lyrique. As the population of London exceeds that of Paris by

more than a million, the proposed new opera-house, say they, will surely not be thought one too many. In this proposition, Mr. Thomas Page, the engineer, is the chief mover.

Royal Italian Opera House, Covent Garden.—An excellent performance of Meyerbeer's "Robert le Diable," was given last week; the *Robert* of Signor Mingini, and the *Isabella* of Mlle. Emma de Marska, being especially good. The activity of the management is extraordinary. The "Nozze di Figaro," the "Sonnamhala," the "Flauto Magico," and the "Huguenots," succeeding each other without pause.

The *Lyceum* has been taken for a period of some length by the Messrs. Maitland, gentlemen heretofore known only amongst amateur actors. They contemplate, we are told, the novel expedient of a double company, French and English.

The Gallery of Illustration.—Mr. and Mrs. German Reed produced on Monday night a new operetta, written by Mr. W. S. Gilbert, the music composed by Mr. Frederick Clay, in which they were well supported by Mr. Arthur Cecil, a very promising singing actor, Miss Fanny Holland, and Mr. E. Connell. It was completely successful, and with good reason: the little plot is ingenious, and the music very agreeable. The scene, a Tudor gallery, in which the pictures become animated, is cleverly contrived by Mr. J. O'Connor. Mrs. Reed's old Scotchwoman is an admirable piece of acting. The esteemed managers of this place of amusement, to whom the public owe so much innocent enjoyment, are fast changing the character of their entertainment, and are probably laying the foundation of an English Opera Comique. "Cox and Box," with Mr. Sullivan's most charming music, still keeps its place in their bill.

A Belgravia Theatre.—A paragraph in the daily papers, afterwards partially contradicted, to the effect that a theatre was in course of erection near Sloane-square, Chelsea, sent us there on a voyage of discovery, to learn if the mania for theatre-building had really spread so far south-west. We found it to be so. The Ranelagh Presbyterian Church, situated in Lower George-street, and close to the station of the Metropolitan District Railway, is being converted into a theatre for Mr. H. Grant. The works are far advanced. It is a small affair, but there will be dress-boxes, four private boxes, two omnibus boxes, and six others in the proscenium, stalls, pit, and gallery. The house is estimated to be capable of holding from 900 to 1,000 persons. There is no contract, but the works are superintended by Mr. Smithers, late of Drury-lane; Mr. R. Blackmore, we were informed, being the architect. The dimensions of the building in the clear are 80 ft. long by 40 ft. broad, but 6 ft. are to be added to the length, which will make the stage 31 ft. deep. The decoration of the proscenium and ceiling is commenced: we presume, if the management did the undertaking succeeds, that something better will be attempted hereafter. The house is to be opened at Christmas. There is a sun-light by Pottford, of Shoreditch. The works, such as they are, have now been in hand six months.

MURAL PAINTING, UNIVERSITY HALL, GORDON-SQUARE.

THE late Mr. Henry Crabb Robinson, largely known and well esteemed, was one of the founders and endowers of University Hall. In memory of him, Mr. Edward Armitage, A.R.A., has painted one end and part of each side of the dining-room there, above the dado, with representations of his dear and distinguished friends, thirty-four in number, as gathered together in a sort of *conversazione*; and a very remarkable assemblage it is. Over the door, in the centre of the end, is a seated figure of Mr. Crabb Robinson. At the extreme left, and on the side of the room, is seen Mrs. Barbanid in talk with Mr. Wakefield; Godwin, Hazlitt, Clarkson, and Walter Savage Landor stand by. Next come his German and French friends, including Wilhelm von Schlegel, M^{de}. de Stael, Herder, Goethe, and Schiller. On the other side of the door are Wordsworth, Southey, Blake, and Flaxman. There comes Edward Irving; beneath, Samuel Rogers has taken his seat. On a sofa are Mary and Charles Lamb; near at hand Lady Byron is listening to the Rev. F. W. Robertson. Dr. Arnold, Talfourd, Bunsen, and others, are near. The figures are somewhat over life-size, and are painted in monochrome, white being used for the high lights. The background represents tapestry against the wall. When we say that

there is a want of elevation about the picture, and that it is somewhat "dowdy," so to speak, we have no intention of disparaging it, but of showing the system that has been worked on. The amount raised by subscription was very small comparatively (some 300*l.*, we hear), and Mr. Armitage in return has given them a work of very great interest, which will long attract visitors to University Hall. We shall be glad to find the example followed.

HOLBORN VALLEY IMPROVEMENT.

SIR,—After six years' incubation, Mr. Marrable appears in print to accuse me of having stolen and executed his plans for the Holborn Valley Improvement.

The facts which he misrepresents are these:—In 1863, in reply to the advertisement of the Corporation, I sent in plans marked "Test me well," accompanied by a sealed envelope enclosing my name, on the outside of which was written "Not to be opened until the Committee's selection is made."

These plans included a complete viaduct, the eastern and western approach streets with gradients of 1 in 45, the widening and raising Farringdon-road to a gradient of 1 in 45, the improving the gradient of the street to the Meat Market from 1 in 33 to 1 in 45, and prolonging Shoe-lane beneath the viaduct. The plans of other competitors may have included one or other of these; but none comprehended them in one design as mine did.

What passed in committee it is not for me to say; but, after opening my envelope, they requested me to withdraw my design from the competition for premiums, and give them assistance in classifying the other plans.

It is now no secret that the committee had already considered the plans marked "Test me well," the best amongst the small number that really met the first indispensable condition of raising Holborn Valley.

The premiums were awarded to Mr. Bell and to Mr. Sorby; but on this part of the committee's duty I was not consulted, and had nothing whatever to do with it.

Mr. Marrable states that I told him he was to be premiated. If I had known it, and told him, I should have committed a gross breach of trust; but I never told him anything of the kind, and have already, some years since, contradicted this assertion to Mr. Marrable himself. Moreover, he has held an appointment cognate to my own, and must know that it would be impossible for me to predicate what a numerous committee would do in the way of selection.

But this is not the only example of Mr. Marrable's defective memory: he says he never saw my design. It hung for more than a year, in 1863-4, in my office, and I have shown it to him myself.

On the 21st of November, 1863, an account of this design was given in your journal from the particulars which accompanied it when it was sent in anonymously, which design you, Mr. Editor, to the best of my belief, had personally examined at my office.

In the same month, in answer to a letter from Mr. Marrable, dated the 24th of November, he had an interview with the Corporation, and protested against his own defeat, and the award of the prizes to Messrs. Bell and Sorby; neither on that occasion, nor in any other public manner, did he venture upon the charge against me which he now makes.

As to the mysterious third plan of his, No. 81, I never heard of it before, and there is no record of it in the Corporation documents; the plan No. 81 was of an entirely different character, and by another person.

Mr. Marrable's name certainly headed the first list of selected designs, for the simple reason that the arrangement of the plans (made by the Corporation officers, and not by me) was a numerical one, and Mr. Marrable's number being 4, came naturally before Nos. 32 and 68.

As to my speech, I am not a self-possessed speaker, and the dinner was after an exciting day, and a fortnight of intense labour and anxiety previously. It is absurd to suppose that speaking in the presence of a body, the larger number of whom must have known the facts as well as myself, I should state anything not substantially true; but as a matter of fact my designs were selected as the best before any member of the Corporation knew that they were mine; and that is what I call gaining the work in competition.

In conclusion, I say that I never borrowed a thought or an idea from Mr. Marrable; that my competition plans were sent in when his were, and that I could not, therefore, have stolen them from him; that my plans are intact, and shall be publicly shown at the Royal Institute of British Architects, and I invite Mr. Marrable, if his original plans are intact also, to exhibit them likewise. I say that the plans now being executed by the Corporation are the same as my competition plans (with an additional line of street only to Ludgate-hill, determined upon years afterwards); that I should never have had this work had I not entered into competition with the others; and this, I again repeat, is what I call gaining the work in competition, and, as I hope and believe, honourably.

WILLIAM HAYWOOD.

*** It may as well be mentioned that Mr. Marrable has brought this matter before the "Professional Practice Committee" of the Royal Institute of British Architects.

THE HISTORY OF THE HOLBORN VIADUCT COMPETITION.

SIR,—In your last issue Mr. Marrable comments upon Mr. Haywood's speech at the dinner given by the late Lord Mayor. I should not have taken notice of the matter had no public attention been thus called to circumstances in which I was also concerned.

Why Mr. Bell obtained a premium at all (and I do not see that any portion of his plan has been carried into execution), or why Mr. Marrable was left out in the cold, I never could quite understand; but, in asserting his claim to originality, Mr. Marrable must recollect that your columns, for months previous to November, last, sounded the rival claims of others still earlier in the field.

With regard to my share in the matter, I may state that the High Level road, as proposed in my plans, is, I believe, substantially the same as carried out, the new streets from Hatton-garden to the Meat Market, and from Saracen's Head-yard to Farringdon-road, are, I believe, as near as possible, as I proposed them.

My design contemplated spanning the Farringdon-road by a single arch of 90 ft., with a roadway of 27 ft. 6 in., and I entirely fail to see the advantage of the costly pier occupying most important space in the present roadway, utterly destroying the simplicity, dignity, and monumental character of the bridge, besides introducing a most needless element of difficult and uncertain construction.

I also provided, as executed, staircases at two corners of the bridge for communication between the high and low levels.

It is unfortunate that Mr. Haywood occupied the double position of competitor and adviser to the committee. I carefully examined Mr. Haywood's plan after the question was settled, and felt no doubt at the time that Mr. Haywood would have had a greater claim to the first or second premium than any other competitor, had his design not been withdrawn.

I set up no competitive claim for originality, but simply asserted, without fear of contradiction, that my plans (Mr. Haywood's being withdrawn) met the ascertained requirements of the case more completely than any other plans submitted.

THOS. CHAS. SOBRY.

THE HOLBORN VIADUCT.

SIR,—The architectural and engineering design of this viaduct is pleasing to every one that looks upon it; and, as we examine it, the more is one convinced of the thought, care, and pains that have been bestowed upon it by Mr. Haywood.

Permit me, Mr. Editor, to offer a few remarks upon granite columns in general. Perhaps some of those gentlemen who have passed their opinions upon the columns of the viaduct are not aware that most of the granite columns that are brought to London have a hole drilled through them from end to end. I cannot say if those at the viaduct are so or not. If they are, a great portion of the strength of the columns is withdrawn by this hole running through them. Columns in all cases should be solid in themselves. It will also be noticed in the columns that are brought to London, that the beds are generally rough and hollow. This should not be the case; they ought to be perfectly smooth and true, because, if the bed of each column is $\frac{1}{2}$ in. hollow, when the two are fixed together there will be $\frac{1}{2}$ in. space between them, and, as a natural consequence, the weight or pressure is at once withdrawn from the axis, and thrown to the outside of the column. In like manner, if the beds are rough, when the weight rests upon the column it will cut through the lead that is placed between the joints, and cause the two faces of granite to meet each other, and the pressure necessarily being greater on those points that are raised than on any other portion, it will burst or split the granite column,—and not only granite columns, but, in like manner, columns of any stone. For instance, some years ago, a large Portland column, 5 ft. diameter, was fixed at one of our public buildings; all the weight resting upon the centre portion of the beds or joints, they being round, caused it to split like a pane

of glass; and the same result would follow by the beds or joints being hollow, as mentioned above. The safe way, the proper way, and the only way, I will venture to say, in fixing granite columns, or any other columns that are required to support great weights, is to place between the joints, within 1½ in. from the outside of the column, a piece of lead, with the centre cut out, and to fill the whole of the inner portion with cement or fine mortar, so that when the upper portion of the column is lowered on to the bed, it will have an equal bearing throughout, provided the beds are worked true. The Ross of Mull granite is used for columns at the Prince Consort Memorial, which are fixed in the aforesaid manner, great care having been taken that the beds or joints were smooth and true (these columns were worked and polished on the ground). The pressure upon them is twenty-one tons on each superficial foot, thus bearing some thirteen tons more on the superficial foot than the columns at the Holborn Viaduct; and not one of these columns referred to shows any symptoms of splitting, notwithstanding the great weight they support. If all columns were fixed on this principle, we probably should be spared the pain of seeing such disastrous results as are too often witnessed. As regards the Ross of Mull granite, I will merely state that it may be classed among the finest in Europe; I have seen some of the beds running 20 ft. in height. It thus possesses advantages over most other granites by the mason generally being able to fix it on its natural bed.

WILLIAM CROSS.

SCHOOLS OF ART AND OF SCIENCE.

Thrapston Science Classes.—Thrapston has made a start in forming a science class. Several attempts have been made on former occasions to induce the young people of Thrapston to enter the lists of competition for the honours of the Science and Art Department, and Mr. Buckmaster came down to explain the action of the Department; but nothing but failure seems to have come of it. Now, however, a small beginning is made. A few schoolmasters of the East Midland Association have banded together, and these, with some of the more intelligent of the boys of the National School of Thrapston, form a fair class for a start. The subjects taught are Animal Physiology, Magnetism, and Electricity. They are all under the instruction of Mr. John J. Graves, of Landport, who has undertaken them at the invitation of the schoolmasters of the class; and the secretary of the committee is the Rev. J. P. Goodman, of Keystone, the Rev. J. Bagshaw being the chairman. These classes are open to any person, male or female, who may be disposed to join.

The Nottingham Mechanics' Institution Science Classes.—The prizes gained by the students in these classes have been distributed by the Rev. F. Morse, in the lecture-room of the Mechanics' Institution. There was not a very large attendance. Mr. Morse, on opening the meeting, observed that there seemed to be a progressive interest taken in the science classes in Nottingham. Last year the students of geology were 8, this year they were 13; last year the students of physical geography were 40, now they were 60; the students of physics last year were 30, this year they were 20, for they had lost a teacher to whom they were much attached. In magnetism last year there were 11 students, this year 25; in inorganic chemistry there were 38, and this year 30, making a total last year of 127, and this year of 148 students. With reference to the results, he found that in May, 1869, 61 students were examined in physiology; 5 passed in the advanced grade, and 11 in the elementary grade. Twenty students were examined in inorganic chemistry, three of whom passed in the advanced grade and four in the elementary; in physical geography 30 students were examined; 20 passed in the elementary stage, and Mr. Major, the teacher, took the first place in the examination in honours. In acoustics, light, and heat, three students were examined; three passed in the elementary stage. In magnetism and electricity 14 students were examined; three passed in the advanced and nine in the elementary grade. In geology 10 were examined; two passed in advanced and five in the elementary grade. Having referred to the advantage of a knowledge of scientific subjects, Mr. Morse went on to say that he thought many artisans had now sufficient time to study them. They did not leave work very late, and it must be interesting to attend a class. The prizes were then distributed.

Technical Education at Portsmouth.—An influentially-signed requisition was presented to the Mayor of Portsmouth, requesting him to convene a public meeting of the inhabitants, in the Guildhall, to hear an address from Mr. Buckmaster respecting the establishment of a school of science and art in the borough. The Mayor convened the meeting, and it was numerously and influentially attended. The Mayor presided, and on the platform were the Right Hon. W. Cowper, and other members of Parliament and other gentlemen. Mr. Buckmaster addressed the meeting at considerable length. After the address it was resolved:—"That it is desirable to establish a School of Science and Art for Portsmouth." Mr. Cowper, M.P., said it was a matter of astonishment and surprise that a town like Portsmouth, and a neighbouring town like Gosport, should have been so long without any school of the kind they proposed to establish. The large number of skilled workmen in the place made such a school a great industrial and educational necessity. Mr. Bonham Carter, M.P., and other gentlemen, having addressed the meeting, the hon. secretary (Mr. Holt) said a subscription-list had been opened, and amounts approaching to 100l. were promised in the room.

The Cardiff Science and Art Schools.—The report of Mr. James Bush, the headmaster of these schools, says:—

"The schools have been well attended during the year, especially during the winter months. The school of art still continues the source of chief attraction to pupils. Of course, with our present accommodation and large number of students, there are no vacancies for new pupils, though there are many applicants. . . . The number of prizes in the art school is less this year than last. Pupils generally join the class to learn freehand, model, crayon drawing, and similar subjects; and having passed in the first two, have no further examinations to undergo. Consequently they remain in the school, pursuing studies in which there are no examinations, and the number of prizes must, therefore, decrease each year until we have accommodation for new pupils, who will take the places of the old ones on the prize lists.

The condition of the science school is very satisfactory. There is an increase of three on the science prize list this year. The mathematical class is now well attended by pupils, who seem determined to master the subject."

The seventh annual report of the Cardiff Free Library Museum and Schools of Science and Art states that:—

"It is daily becoming more manifest that greater accommodation is absolutely necessary. This consideration led the honorary secretary to prepare and submit to the committee a scheme for a new building, and with a view to eliciting public opinion on the subject the plans and report were ordered to be printed and circulated. The committee has as yet taken no further step in this matter, being deterred by the consideration of the very great outlay which would be required adequately to meet the wants of the institution. They, however, strongly commend the question to the serious consideration of the council."

It is to be hoped the all-powerful Marquis of Bute will lend a hand in this emergency.

Instruction for Women in Natural Science at South Kensington.—An interesting scientific experiment, to which we have already alluded, in connexion with one of the educational developments of the day is now in progress at South Kensington, with the permission of the lord president of the council, in the Science and Art Department, and under eminent scientific and social conduct. It is a regular course of bi-weekly lectures for ladies, on the Elements of Physical Science, delivered in the lecture-theatre of the South Kensington Museum by Professor Huxley, assisted by Professors Guthrie and Oliver. The lectures are quite academic in the thoroughly scientific character of exposition and demonstration; and academic, too, in the length to which it is proposed to carry out this course of elementary instruction. The inaugural discourse was delivered by Professor Huxley. There are large attendances, and very close attention is given by the fair students, so that it is safe to predict a success for this interesting experiment in academic teaching.

BURLINGTON HOUSE, LONDON.

The works here, long inexhaustibly delayed, are now recommenced in earnest.

Burlington House was originally built for Lord Burlington, by Sir John Denham, surveyor of the works to Charles II., immediately before Wren. His lordship was asked, according to Horace Walpole, why he built so far out of town, and replied, "because he was determined to have no building beyond him." But according to Pepys's Diary, that wonderful seventeenth-century record of seventeenth-century customs and gossip, Clarendon House and Berkeley House were being built to the west of it at the very same time:—

"Feb. 20, 1664-5.—Next that (Lord Clarendon's) is my Lord Berkeley beginning another on one side, and Sir J. Denham on the other.

Sept. 23, 1668.—Thence to my Lord Burlington's house, the first time I ever was there, it being the house built by Sir John Denham, next to Clarendon House."

The site was previously occupied by a farmstead; a print by Kipp, shows the house in 1700, with its gardens, and beyond them where Regent-street, and Portland-place now are, was the country. At this time London contained only about half a million inhabitants, but it was seventeen and a half times greater than the second town in the kingdom. Chelsea was a quiet village, with 1,000 inhabitants. Sportsmen wandered with dogs and guns over the site of the boroughs of Marylebone, Finchbury, and the Tower Hamlets. A single crazy bridge spanned the Thames. The great merchants resided in the City, in rich mansions, richly decorated. Roger North tells us that Sir Dudley North expended 4,000l. (a large sum in those days) in the furniture of his reception-rooms, in Basinghall-street. Macaulay says that the fashionable spots of London then were the south and west of Lincoln's-inn-fields, the Piazza of Covent Garden, Bloomsbury-square (then Southampton-square), and Soho-square. Foreign princes were taken to see Bloomsbury-square as one of the wonders of England. A few great men still retained their hereditary hotels in the Strand. The area north of Holborn was renowned for snipes and peaches; and St. James's-square, near the court, had just been built. Where Regent-street now stands was a solitude, where a sportsman might get a shot at a woodcock. Old General Oglethorpe (who died in 1755), used to boast that he had shot them there in Queen Anne's reign. Where Conduit-street now stands was a meadow renowned for its spring, and on the east was the *pest field*, in which a pit was dug to bury the corpses at the time of the plague. This field is seen marked on maps as late as the end of the reign of George I. At the end of the seventeenth century Covent Garden was surrounded by the houses of the great, but a filthy and noisy market was held in front of them. We who are accustomed to gas may smile on hearing that about this time the lighting of London was so bad that Edward Heming obtained letters patent to place a light before every tenth door on moonless nights, from Michaelmas to Lady-day, from six o'clock to twelve. He was extolled as the greatest of all the benefactors of the city. We have digressed thus to give our readers an idea of the great metropolis at the time when Burlington House was built.

Richard Boyle, Earl of Burlington (born 1695, died 1753), put a new south front to the house and added the colonnade in 1718. He was the protector of Kent, the architect, and was himself much skilled in architecture. Walpole attributes the design to the Earl himself; but Colin Campbell, in the "Vitruvius Britannicus," claims the merit of the design, including the gateway. Horace Walpole was in Italy when these additions were made, and when he returned was invited to a hall at the mansion. He says:—"When I passed under the gate by night it could not strike me. At daybreak, looking out of the window to see the sun rise, I was surprised with the vision of the colonnade that fronted me. It seemed one of those edifices in fairy tales that are raised by geni in a night-time." This colonnade was borrowed from a palace, by Palladio, at Vicenza. Whether the Earl designed the gateway or not, it is certain that later in life he designed many architectural works. Pope, in his fourth "Moral Essay," addresses the Earl thus:—

"You, too, proceed! make falling arts your care;
Erect new wonders, and the old repair;
Jones and Palladio to themselves restore,
And be whate'er Vitruvius was before."

When his lordship was travelling in Italy he was shown by a nobleman a church which he greatly admired for the elegance of its structure, and requested that he might sketch it next day. The nobleman said there was no occasion for this, as the model from which it was taken was St. Stephen's, Walbrook, near the Royal Exchange. When his lordship arrived in London, he visited the church before he saw any of his friends, or returned to his own house. The church was built by Sir Christopher Wren, in 1762-79.

Mr. Gwilt says, "compared with any other church of nearly the same magnitude, Italy cannot exhibit its equal; elsewhere its rival is not to be found. Had its materials and volume been as

durable and extensive as those of St. Paul's Cathedral, Sir Christopher Wren had consumed (in St. Stephen's) a more efficient monument to his well-earned fame than that fabric affords." Peniston, the celebrated Vicar of Bray, subsequently became rector of St. Stephen's, Walbrook.

But, to return to Burlington House. The walls and ceilings were painted by Marco Ricci, and the whole was considered the finest mansion in London.* Gay, in his *Trivia*, observes:—

"—Burlington's fair palace still remains,
 Beauty within—without, proportion reigns;
 Beneath his eye declining art revives;
 The wall with animated pictures lives.
 There Handel strikes the strings, the melting strain
 Transports the soul, and thrills through every vein;
 There of I enter—but with clearer show,
 For Burlington's beloved by every Muse."

Hogarth, in a caricature dated 1731, called "The Man of Taste," gives us a view of Burlington-house, representing Kent on the summit as painter, sculptor, and architect (for he was all three), furnishing his palette and pencils over the heads of Michelangelo and Raffaello. Pope stands a little lower down whitewashing the front, and bestropping the Duke of Chandos in the street. Though the gate and colonnade looked to our more enlightened taste debased in style, Ralph refers to it as the most expensive wall in England; the height wonderfully proportioned to the length, and the decorations both simple and magnificent: the grand entrance elegant and beautiful; and by covering the house entirely from the eye, gives pleasure and surprise, at the opening of the whole front with the area before it at once. Handel lived three years in the house: it was the delight of the earl to assemble poets and philosophers within its walls.

Burlington House passed to the Duke of Devonshire in 1753, for in that year Lord Burlington died, and the title became extinct. Lord George Cavendish (son of William, fourth Duke of Devonshire) completed the earl's design for the façade, and Ware (author of a scientific volume on vaults and bridges, and architect to the alterations at Chatsworth, Northumberland House, and other places for the Dukes of Devonshire and Northumberland) made some alterations. In 1819, he built the Burlington Arcade on a narrow strip of ground on the west side of the house, which produced the Cavendish family 4,000*l.* a year, though sub-let for 8,000*l.*

The Duke of Portland, Prime Minister to George III., resided in the mansion, and died there in 1809. The Elgin Marbles, brought from the Parthenon at Athens by the Earl of Elgin, some the works of Phidias himself, were deposited here before being removed to the British Museum. White's Club, in 1814, gave a grand ball to the Allied Sovereigns then in England, which cost 9,849*l.*

Burlington House and Garden (area 143,000 square feet) was purchased by Government for 140,000*l.*; and the Royal, Geographical, Linnean, and Chemical Societies were allowed to hold their meetings there.

In the *Times*, May 29, 1866, Mr. Beresford Hope published the opinion of the Council of the Institute of British Architects, viz.—"That Burlington House, with its colonnades, possesses considerable merit, and that it would be a subject of regret if such building should be wantonly interfered with, or needlessly destroyed." But he suggested adding another story, altering the colonnades, and perforating the screen wall, thus entirely altering Lord Burlington's design, though he professed to care for it. In 1867, 20,000*l.* were voted for the alterations, and Government proposed to build apartments for the learned societies located in the wings of the mansion, to form the Piccadilly frontage. In the rear is the edifice for the London University; so that there will be three distinct buildings. Mr. Pennetborne is entrusted with the London University structure, and Messrs. Banks & Barry superintend the buildings for the learned societies. Mr. S. Smirke, R.A., has satisfactorily erected the rooms for the Royal Academy exhibitions. The sculptors-room is on the north side of the building, and communicates towards with the central octagonal hall. A great deal will doubtless be done by future Academicians as regards exterior embellishment. We will conclude this, in many respects imperfect, sketch of Burlington House, by quoting part of

* Sir William Chambers observes, "few in this vast city surpass, I believe, that behind an old brick wall in Piccadilly there is one of the finest pieces of architecture in Europe."

the speech of Sir Francis Grant, P.R.A., at the banquet held there on Saturday, May 1st:—

"The Royal Academy commenced its career under the auspices of a great king and a great painter—George III., and Sir Joshua Reynolds. For the first thirty years of its existence it occupied very humble apartments at Pall-mall, originally built for an auctioneer. Afterwards, when one constant friend and patron, George III., made over to the nation his own royal palace, Somerset House, he expressly reserved to himself the right of appropriating apartments in that building to the Royal Academy. Hence, after fifty-seven years of occupation, at the request of Government, the Royal Academy transferred its abode to Trafalgar-square; and now, in lieu of the accommodation provided for the Royal Academy by George III., the Government have granted to us a site eminently adapted for the purposes of a college of art, on which, from our own funds, we have erected those noble galleries and schools of art, where, with greater advantages, we hope gratuitously to maintain, as we have done for the last century, the chief art-education of this country. For we are proud to reflect that the Royal Academy can say what can be said by no other academy in Europe, that we have never applied for or received any grant of public money. On reviewing the efforts of the past century, although we might possibly have hoped to produce still greater results, I think, when we recall the names of those eminent artists who have been students at this Academy, who derived all their inspiration and knowledge of art within its walls, that it cannot be said we have failed altogether. Such names as Scolding, James Barry, Copy, Banks (the sculptor), Smirke, Stothard, Lawrence, Hopper, Flaxman, Joseph Mallard Turner—a name alone sufficient to glorify a century—Caird, Wilkie, McLeamy, Leslie, Eddy, Newton, Constable, are sufficient to quote. When I read to commemorate these illustrious pupils of the Royal Academy, who have brought glory and fame to their country, I feel we have no occasion to blush for the past or the present."

J. P.

DOBROYD CASTLE, TODMORDEN.

We have elsewhere mentioned this large residence, which has been erected for Mr. John Fielden, from the designs and under the direction of Mr. John Gibson, of Westminster.* It is situated on the Dobroyd heights, commands extensive views of the Halifax, Rochdale, and Burnley valleys, and forms a prominent feature in the landscape as seen from the Lancashire and Yorkshire railway and other points. In its construction the most durable materials, such as hard native stone and oak have been used, and in its internal decorations inlaid woods and marbles of various hues have been carefully wrought. The furniture has been made to match in all respects.

The plan and view show the general arrangement and character of the structure, but our readers will be glad to have a portion of the previous more detailed description repeated. As will be seen, it is in the castellated style of the Tudor period, with angle hattering turrets, surmounted by a main tower, having a flag-turret at the north-west angle. Besides the native stone, about 1,500,000 bricks, made of native clay, have also been used on the works. The height of the flag-tower from the floor line is 82 ft.; the top of the main tower is 27 ft. square. Entering at the tower (or principal entrance, we are in the vestibule. The walls of the vestibule are carried up in Bath stone, with oak-paneled ceiling; the floor is of red and white Mansfield stone, and the dado round is of Riga and Pollard oak. Passing forward we find ourselves in the saloon. The columns and pilasters are of Devonshire marble, the capitals of the columns being carved with representations of English national sports. The panels over the doorways are of Caen stone, with representations—(1st) Ploking Cotton; (2nd) Packing Cotton; (3rd) Arkwright, represented with a lathe, wheels, and mechanical instruments near him, in his father's harber's shop, apparently in deep thought upon some invention; (4th) Working the Cotton—girls in a mill. There are several carved shields in the saloon, each bearing the monogram of the founder and his wife, J. R. F. From the floor line to the top of the saloon is 34 ft.; the floor dimensions are 27 ft. by 44 ft.; the grand staircase rising from the saloon to the upper corridors. The billiard-room is to the right; it is fitted up with oak. The centre tower over the gaslight is emblematical, being composed of figures representing energy. All the chimney-pieces and fenders are of choice marble of different hues, the stoves all bearing the monogram of the founder and his lady. All the floors are of oak; there is no painted wood nor paper-hanging in the building; all the walls are painted. The principal windows are fitted with Clark's patent revolving shutters, and Meakin's self-acting sash-fastener, which is applied to 130 windows. The total number of rooms is 61.

The hot-water arrangements and stoves have been supplied by Mr. D. O. Boyd. The gas arrangements are by Strode & Co. The whole

of the plaster work is done in Parian cement. Every room in the castle is ventilated by a distinct ventilating-shaft, and all the rooms have pure air thrown into them. The grates are also so arranged that hot air is thrown into the rooms in winter, and cold in summer. The breakfast-room frieze is ornamented with rose enrichment. The whole of the woodwork in the drawing-room is inlaid in designs with the following kinds of wood—Walnut, with satin-wood, ambona, Hungarian ash, purple-wood, and ebony. The drawing-room is lighted from the sides by gaslights opposite to mirrors. The frieze is worked with passion-flower enrichment. The chimney-piece is of statuary marble, inlaid with onyx. Between the drawing and dining rooms is the entrance from the castle to the east terrace. The frieze in the dining-room and centre tower are emblematical of the room, with vine enrichment. In the staircase from the saloon to the corridors the banisters are gilt; the steps and landings are Spinkswell stone; the handrails is of Riga and pollard oak. Two Devonshire marble columns form the novel. The columns of the corridors are of Devonshire and Greek green marble, with carved capitals representing floral and animal life. The base of the saloon and the staircase is a square; it then forms into an octagon, and culminates in a circle. It is lighted by a glass lantern-light by day, and at night by two magnificent sun-lights, by Strode.

All the work here, inside, is carried up in Bath stone, and the top of the banisters round the corridor is covered with crimson velvet. In the sections between the columns, at the top of the staircase, are mirrors. In Mrs. Fielden's boudoir most of the woodwork is of Hungarian ash, the door is inlaid with purple-wood, birch, ambona, and ebony; the wardrobe adjoining is furnished with fittings of pencil-wood. The stables fitted up by Messrs. Magraw & Brothers, Belfast, have accommodation for seventeen horses, with coach-houses, harness-room, &c., and a dog-kennel large enough to hold a pack of hounds. The stables are floored with bricks inside the stalls, and with Loh quarry stone in the passage; the walls are done with Minton tiles, and oak. The stables, &c., are 100 ft. by 90 ft. The area of the greenhouses and vineries is 120 ft. square; the area of the walled-in kitchen garden, 150 ft. by 120 ft. Mr. W. Glover was clerk of the works. Mr. Kemp laid out the grounds.*

* At the dinner which Mr. Fielden, on taking possession of the building, gave the workmen who had been engaged there, a song written for the occasion by one of the joiners, Mr. Morgan, was sung by the whole company. We are tempted to print it less by its poetical merits than by the good feeling it displays:—

Tune—"The Lass o' Gowrie."

When gratitude commands the tongue,
 It may as well break forth in song;
 My happiness continue long
 With our sterling friend, JOHN FIELDEN.

At Dobroyd Castle, may he prove
 Through lengthen'd years the joys of love;
 Fare as angels from above,
 The love of Mrs. FIELDEN.

His splendid Castle, well design'd,
 Peerless, methinks, is of its kind—
 The product of the master mind
 Of the Architect, JOHN GIBSON.

To carry out a plan so vast
 Required a man of no mean cast;
 He has done it well from first to last,
 Respected WILLIAM GLOVER.

An honest British workman here,
 The Builder of this Castle fair,
 There is no man, nor far or near,
 Deserves success like DAVIS.

I feel a meed of praise is due
 To all good masons, stanch and true;
 Who, led by LONG, have brought to view
 This splendid Dobroyd Castle.

The carpenters and joiners too,
 We know their work will bear review;
 Led on by JENKINS, firm and true,
 They've finish'd Dobroyd Castle.

The carvers, too, have play'd their part:
 Theirs truly is a work of art,
 Almost enough to make you start,
 On viewing Dobroyd Castle.

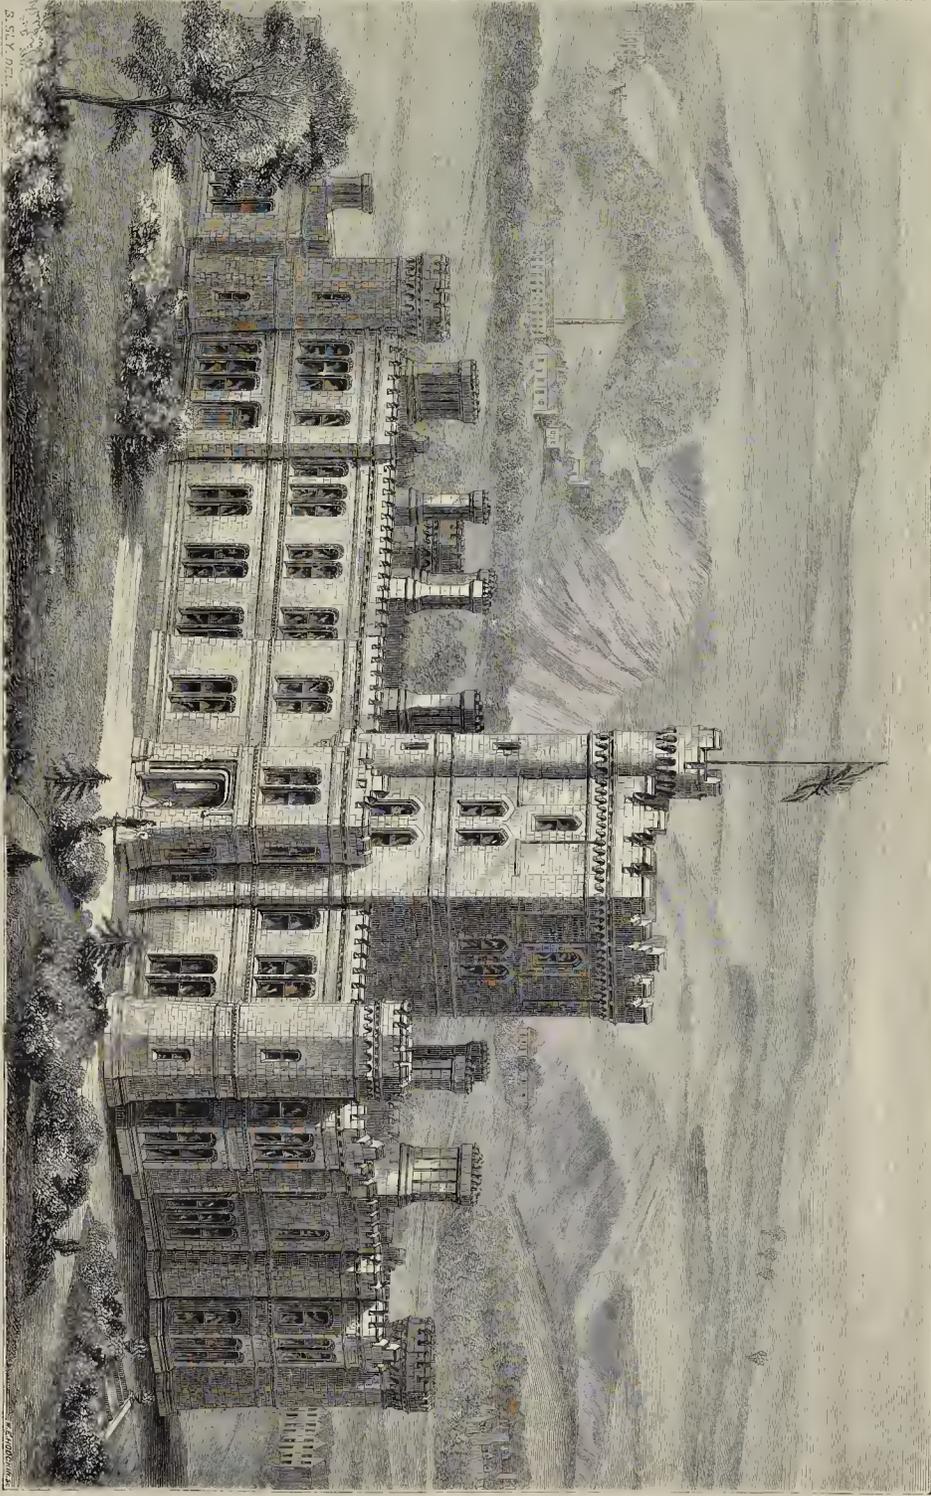

The decorations, rich and rare,—
 'Tis seldom seen a scene so fair
 As Burlington & Strode could show you there,
 Inside fair Dobroyd Castle.

The gardeners, too, a sturdy band,
 With KEMP's good taste and CRAIG's command,
 Have made it seem a fairy land,
 Around fair Dobroyd Castle.

With gladness did we hail the day,
 We saw JOHN FIELDEN wend his way,
 To take, possess, and make his stay
 At his fair Dobroyd Castle.

Now I must conclude my song,
 For I fear 'tis rather long,
 Wishing nothing bad or wrong
 May come near Dobroyd Castle.

* See p. 532, ante.

DOBEROYD CASTLE, TODMORDEN, LANCASHIRE.—MR. JOHN GIBSON, ARCHITECT.

S. SLY DEL.

W. GIBSON SCULPT.

THE SOCIETY OF ARTS' PROGRAMME.

THE address at the opening of the session of the Society of Arts was read by the chairman of the council, Lord Henry Gordon Lennox, M.P., late secretary to the Admiralty. His lordship enumerated the various committees appointed, and the purposes in view, or more or less accomplished. Among them were the food committee, and what it was doing in regard to the supply of meat, fish, poultry, milk, grain, &c., and the preservation of meat, as by ice; the committee on India, and the subjects of tea, silk, cotton, and other fibres, waste land, hill settlements and sanitarium, and trade with Tibet and Central Asia; the committee on mechanical inventions and the patent laws; the proceedings of the council as to education, &c.

The council propose to appoint committees to act in different localities, for the purpose of promoting the establishment of scientific and technical colleges, such as Owen's College, Manchester.

The committee on free libraries and museums throughout the kingdom will continue its labours, by collecting such information as may stimulate and aid the formation of these useful adjuncts to education.

For the present session, the society offers a large number of prizes for productions in most branches of art-workmanship, and additional prizes are offered for specimens of the applications to industry of prescribed art-processes.

A committee has been for some time sitting with the object of marking the houses in which the great and good of former days were born, lived, or died. For this purpose tablets were required, which, while they should not disfigure the buildings on which they were placed, should be easily affixed, and should be rendered, as far as possible, not only imperishable, but easily cleaned when grimed by the smoke and dirt of our great towns. With such an object, the leading makers of encaustic tiles were applied to. Some refused even to attempt so difficult a task, but, after very many failures, the council announced that Messrs. Minton, Hollins, & Co. have at length overcome all difficulties, and specimens on the wall were pointed to as the result of their skill and ingenuity.

Tablets have been already affixed to commemorate Lord Byron and the Emperor of the French; and leave has been obtained from the owners of the houses to commemorate in a similar manner Sir Joshua Reynolds and Benjamin Franklin. Tablets are also proposed to Flaxman, Barry, R.A., Handel, Garrick, Dryden, Goldsmith, Sir W. Blackstone, Sir Humphrey Davy, and Dr. Jenner, and other names will doubtless follow.

The committee on musical education is to be re-appointed. The cab question and the premiums offered for improved vehicles, the Channel passage and the projects for tunnels and bridges or viaducts, and other subjects were all brought under review; and the re-arrangement of the society's library, with new catalogue, librarian, and reading-room, was announced.

METROPOLITAN AND OTHER NEW SCHEMES.

MANY columns of the daily press are filled with advertisements as to new schemes affecting the several localities in which the papers are published. Those in the Metropolitan papers are mainly as to tramways. One advertisement alone fills nearly a whole page of small type with a mere enumeration of the routes of a multitude of tramways, north and south, east and west. There seems to be scarcely any great thoroughfare unconnected with them, and of course it is quite beyond our limits to attempt to describe them. Highgate and Islington, Pimlico, Peckham and Greenwich, Shoreditch and Paddington, Camden-road and Westminster-Bridge-road, Tottenham Court-road, Oxford-street, Holborn, are all to be connected with a network of tramways if we are to believe these voluminous advertisements; but doubtless a greedy appropriation of the whole ground is the first thing thought of; and there will be picking and choosing where and when to lay a few of the innumerable tramways, should the projectors succeed in obtaining their Acts of Parliament. Manchester and Birmingham are also to have their tramways. A Bill will be brought in for a Southwark and City subway, under the Thames from near St. George's Church, Southwark, to or near Arthur-street, in the city of London.

There is a Bill for the "extension of the limits of the county of the city of London to the limits of the metropolis, the area within such extended limits to be called the county of London, or by some other name; alteration and consolidation of the institutions within the metropolis, enlargement and alteration of the powers of the Corporation of London, exclusion of the borough of Southwark from the Corporation of London, and repeal, alteration, and extinguishment of certain powers, rights, and privileges within the borough of Southwark; incorporation of a governing body for the metropolis, dissolution or alteration of the constitution and name of existing public bodies; regulation of duties and appointment, superannuation, and displacement of officers; powers with reference to the appointment of justices and the administration of the law within the metropolis; rating powers, by-laws, amendment of Acts, and other purposes."

ST. DAVID'S CATHEDRAL.

MR. SCOTT has just given his second report on the fabric of this cathedral. In the spring of 1858 he made a report to the Dean and Chapter of St. David's, bringing forcibly before them its forlorn condition: roofs much decayed, the walls, pillars, and floors of the nave in a terrible state from damp; the bad condition of the tower, which presses heavily on the walls of the nave and transepts; and a frightful crack in the north and south sides of the tower. No attempt could be made to repair other parts of the cathedral until the foundations of the tower were restored to a state of security, and this one item could only be accomplished by the exercise of great skill, and at a heavy cost. Mr. Scott estimated the cost of the necessary repairs to the whole cathedral at from 27,500*l.* to 30,000*l.* This report seems to have frightened the Dean and Chapter, who felt the sum as quite beyond any fund they could command, and the subject seemed to have been laid aside until October, 1863, when the bishop presided at a public meeting at Carmarthen, and put down his name for 1,000*l.* towards the repairs, the Dean and Chapter adding another 1,000*l.*, Lord Dynevor 500*l.*, Lord Cawdor 200*l.*, Mr. Phillips, of Pictou, 200*l.*, some of the landed proprietors 100*l.* each, and other smaller sums. Afterwards the Ecclesiastical Commissioners gave 10,000*l.*, and since that time a great deal has been done towards the restoration of the cathedral. The tower, which was the most serious work, has been restored, and the foundations made secure. The other chief repairs were the completion of the choir with its fittings, and of the eastern arm with its aisles. The eastern chapel of the south transept, which was most ruined, has also been seen to, and a system of drainage has been carried out. There is still much to be done in the repair of the roofs of the nave, and of the two transepts, and with the repair of the porch this will require 5,750*l.* There are other repairs in windows and new flooring; and also the repair of the aisles, which, with the repair of the Chapter-house, parapet, and pinnacles, will require about 5,000*l.*, so that with warming, lighting, contingent expenses, and professional charges, the total amount required will be about 12,500*l.* As so much has been done, it is supposed that there will not be any difficulty in finding funds to finish the work.

THE BUILDINGS NEXT THE THAMES.

SIR,—A stranger in London is much struck with the grandeur of the Embankment, and the facilities it offers for effective ornamentation, but the neglected state of the old wharfs and warehouses still preserve, along the South Bank and between Blackfriars and London Bridge on the northern side, ample evidences of squalor and mean buildings. On the former we find only two objects worthy of the position,—the Lion Brewery and Alderman Humphreys's Store; on the latter, all remains to be accomplished, save only Somerset House and the Temple. The inquiry now is,—what is to be done with the large spaces saved by the Embankment from the river slime? To make public gardens of these spaces would be useless, beyond the adornment of the causeway on both sides by trees and shrubs. These reserves could be neither useful nor ornamental as places of recreation for the denizens of pent-up London courts. Closed in by lofty ranges, there could be no space for effect, and at two points of the line the gigantic

and hideous deformities of Charing-cross and Blackfriars Railway Stations give a death-blow to all taste of design, or consecutive architectural finish; these aisles towering to the height of 150 ft., with lateral ranges of heavy and overshadowing brick wall, would dwarf and overshadow the finest structural designs that could be devised by professional skill, and some of the modern performances of the profession of architecture fully evidence that taste and skill have not become enfeebled, at least in England: on all sides we meet with improved and even splendid architectural designs.

Now, sir, as one who rarely animadverts on structural deformities, will you allow me to ask, would it be possible to make some change in the elevation of the two fatal blemishes upon the noblest aspect of your beautifully placed city? Could not the two stations referred to be reduced in their lateral walls by about 15 ft. to 20 ft.; and then, by dividing the glazed roof, after the fashion of the Metropolitan Railway stations, and thus reducing the altitude of the semicircular single-span roof by as much more? Such a change would give light and animation to the line of embankment, and in some degree qualify an approach to continuity of design and effect.

It may not be out of place to observe that the portion of the footway on which the trees are planted (about 3 ft. wide), and which has sunk through the subsidence of the newly-made ground, might as well be left unflagged. The trees would grow better, and in fact the intervening spaces are useless as a thoroughfare, the remaining width of 17 ft. being quite sufficient; besides that on the other side north of the driftway, there will be also another flagged footway, and, it is to be hoped also, another, or perhaps a double range of trees.

I will conclude with one more observation as to the reasonable and unobstructive elevation of buildings, railway stations, or others. Can any man build his house as high as the Cross of St. Paul's? or has your district surveyor no power to prohibit an unsafe or obnoxious height of elevation? UN VOYAGEUR.

ANGLE CHIMNEYS.

SIR,—The following extract from the diary of the well-known John Evelyn, of Sayes Court, Deptford, on the above subject, may not be uninteresting to your readers:—

"1670—July 22nd.

So, passing through Newmarket, we alighted to see his Majesty's house there, now new-building: the arches of the cellars beneath are well turned by Mr. Sammel, the architect; the rest mean enough, and hardly fit for a hunting-house; many of the rooms above had the chimneys in the angles and corners, a mode now introduced by his Majesty, which I do at no band approve of. I predict it will spoil many noble houses and rooms, if followed. It does only well in very small and trifling rooms, but takes from the state of greater."—(Evelyn's Diary, by W. Bray. London: Colburn. 1850.)

E. A. C.

NEW BUILDINGS, EDMONION MARSH.

SOME large Varnish and Colour Works have been erected for Messrs. James, Price, & Co., between the Angel-road and Ponder's-station of the Great Eastern Railway. The works consist of five blocks of buildings. The factory, boiler-house, and coal-stores are covered with galvanized iron roofs. The engine, machine, and drying houses are covered with timber roofs and slates; the floors paved with York paving on concrete bed. The drying-houses are two stories in height, and are divided by wrought-iron floors and joists. The warehouses are also two stories in height, with deal floors and joists, and divided into sections by brick walls. The shaft is 100 ft. high, has a square pannelled base to about 3 ft. above the factory roof, and is continued its height circular with Portland stone moulded cap. The machinery consists of a powerful horizontal engine, and two rollers, and is connected with bright driving shafts and cranks, with the whole of the machinery, including drums, pumps, and cranes. The water-tank, which contains about 5,000 gallons, forms the roof of tank stand, under which are fixed the varnish tanks and drums, and is supported on cast columns and wrought girders, approached by an iron staircase. The drying-houses are heated by the boilers partially by direct communication, and partially by the exhaust steam.

At the entrance of the works are situated the counting-house, with clerk's office, lavatory, and W.C., fitted up with the necessary conveniences, adjacent to which is the engineer's residence. Upon the opposite side of the entrance are situated the stables and coach-houses.

The contractors for the buildings were Messrs. Eaton & Chapman, of Kingsland; and the engineer was Mr. Best, of Bermudaese. Mr. James Wesley Reed was the architect.

NEWGATE MARKET AND ITS OWNERS.

The following letter states what certainly seems a hard case:—

"I send you a circular we have issued. The City have treated us badly; they have not fulfilled their promises nor done what is just. Our market has been established thirty-eight years, and supplied a great public want. It has only averaged a fraction over 5 per cent. for rent, and now we have a loss of more than 20,000l. for money we have laid out on alterations and fittings for market purposes. These latter have been copied without acknowledgment in the new market quite closely, as any one may see. As many as 75,000 persons have passed through our market in a week, the greater part going to the City portion of Newgate Market. We have provided paved, lighted, and watched passages one-tenth of a mile in length for these passengers for thirty-eight years, at our own cost. The City stalls were only temporary shanties, while a great part of our market was made with every convenience for air and shade. The City market was leasehold, under the Dean and Chapter, and they only paid 4l. a year, and 2d. per foot superficial to their landlords, and let it out as high as 3l. per foot per annum; so that they paid the landlord 48l., and received 4,810l. clear themselves as profit. They never widened a thoroughfare or laid out anything on improvements for nearly 200 years. When they got an Act for dismarketing Newgate Market they took powers for widening the thoroughfares and improving the neighbourhood, but they have never spent a shilling on them, and propose to widen Long-lane and leave our neighbourhood in its present forlorn state.

ALFRED TYLOR."

THE ST. PANCRAS INFIRMARY QUESTION.

VERDICT after verdict of the coroner's inquests on deaths which are occurring in the infirmary of St. Pancras Workhouse leave little doubt about the unhealthfulness and overcrowding of the infirmary, and the imminent peril of death to poor persons placed within its walls.

There are gentlemen who, conscientiously, no doubt, desiring to uphold the sanitary merits of this workhouse infirmary, appear to imagine that they have discovered, for the first time, that cubic space is not the only or even the chief consideration as regards the healthfulness of sick-wards in an infirmary. Were they "constant readers" of the *Builder*, they would be well aware that this is no new question at all. Every sanitarian is well aware that even where the utmost requirements of cubic space are fulfilled, there may be still great unhealthfulness in the inclosed space, unless it be well ventilated. But ventilation is not everything itself, as such, any more than cubic space. Patients may be killed by "ventilation," no less than by want of cubic space. The utmost care and discretion are requisite in the ventilation of even the most spacious infirmary: otherwise the sick, who are, on account of their very want of healthful vigour, more susceptible and more liable than usual to the serious evils arising from draughts, may be killed by ventilation, no less than by want of ventilation. Where there is a want of adequate cubic space, moreover, ventilation becomes so urgently requisite that there is little or no chance of patients escaping the evils of draughts; and an aggravation of their disease may be just an accession of inflammation from too much ventilation, in too little space. It is even doubtful whether the best possible ventilation, in the best possible ward, be in itself sufficient, without artificial defecation and disinfection by proper chemical means,—by such means as will give oxygen, as the alkaline permanganates do, instead of taking it, as some accredited defecating or disinfecting agents are said to do.

It is all nonsense, then, to talk of cubic space being a myth, and ventilation everything: neither the one nor the other of these proposi-

tions or assertions is true. Both are of very great importance; but proper ventilation in very small cubic space is not possible; and it is they who maintain that all depends on ventilation that are mystified by their own "myth."

Under the circumstances, we are not surprised to find, not only that the Poor Law Board insist on the removal of the sick in the St. Pancras Infirmary to the new Infirmary at Highgate, which the St. Pancras guardians actually have already almost waiting for them, although they have hitherto tried to avoid using it; but that these heretofore obstructive guardians have at last, themselves, seen the necessity of adopting the Poor Law Board's decision, and of "cordially concurring" in the carrying of it out.

The Poor Law Board have also announced their determination to institute a public inquiry into the state of the wards of the old infirmary, and the charges preferred by the guardians against their medical officers. That the wards are not only ill-ventilated and far too small for the number of poor people crowded into them, but that the foul air is intensified by contributions from the sewers, would appear to be but too probable.

We are glad to hear it said that Miss Nightingale has offered her services in the nurse department at Highgate.

FOREIGN JOINERS' WORKS FOR ENGLAND.

A CORRESPONDENT wrote last week:—

"It was reported some time ago that the joiners' work at St. Thomas's Hospital was made in Sweden. Is this true? If so, they must have vastly improved in their style of finish. I should much like to know, as I am in the habit of having a large quantity of joinery made from home; and if they can compete, and be sufficiently below our British manufacturers to induce an English firm to put their work in foreign hands, and do the work as that is done, it seems to me to be worth looking after."

We find, on inquiry, that the statement that some of the wood-work for the hospital comes from Sweden, is quite correct. It is understood to be perfectly satisfactory to the architect, and we are able to add, without seeking to pry into the contractors' secrets, that it is obtained at less cost than they could produce it for at home.

LECTURES ON ARCHITECTURE, LONDON INSTITUTION.

PROFESSOR KEAR'S third lecture was delivered on Thursday, the 25th inst. We may give some particulars of it in our next number, and of that which preceded it. The concluding lecture, Thursday, December 2nd, will treat of the Modern Manner, and the Future; exhibiting the revivals of the Classical and Mediæval styles, together with the more original efforts of Modern European art: corresponding with a fourth epoch of Civilisation.

OPENING OF THE NIGHTINGALE WING OF THE DERBYSHIRE GENERAL INFIRMARY.

On the 11th instant the new wing of this infirmary, which derives its name from Miss Florence Nightingale, was opened before a large assemblage, by the president, Lord Vernon.

On the north side of the new wing has been built a chapel of some architectural pretensions. The dimensions are 40 ft. long, by 20 ft. wide. The new wards, situated on the south side, are reached by an open staircase, the wards for males being on the first floor, and those for females on the second. The wards themselves are large; 108 ft. long, by 26 ft. wide, and upwards of 16 ft. high; each contains 32 beds. A balcony is placed at the end, to enable the patient, when sufficiently recovered, to enjoy the benefit of fresh air. The head nurses' apartments are so situated as to command a view of the whole. Arrangements have been made for the reception of the many accident cases which occur in these districts. The patient is placed in an accident carriage, and taken to the receiving ward, where he is examined by the surgeons; he is then, without being removed from the carriage, raised in the hydraulic lift, which has been designed and erected by Mr. Alfred Davis, Old Jewry, London, and conveyed to the floor upon which the ward is situated. The accident carriage is

the gift of Messrs. Holmes, of Derby. The new kitchen, a lofty building, 30 ft. by 20 ft., is fitted with a range, and with copper heated by steam, supplied by Messrs. Rosser & Russel, London. The arrangements for warming, and for the supply of hot and cold water, are also by this firm. The food is passed from the kitchen into an hydraulic lift by the same engineer as the larger one, and so raised to any floor that may be required. This lift is also connected with the corridors, and is so arranged that it may be employed for other household purposes.

The carrying out of these important works, which have cost upwards of 17,000l., has been facilitated by the attention of Mr. Wright, of Osmaston Manor, who has devoted to them a large amount of time and pains, and whose name appears in the list of contributors for no less a sum than 3,500l.

The architects were Messrs. Stevens & Robinson, of Derby, and the contractor was Mr. Edwin Thompson, also of that town.

WAREHAM NEW TOWN HALL.

THE foundation-stone of this new town-hall has been laid. It is to be constructed on the site of the old one, which has been razed to the ground. Connected with it will be a corn exchange, which forms a prominent feature of the undertaking. The corn exchange is to be on the ground-floor, having a separate entrance from North-street. Its dimensions will be 39 ft. in length and 36 ft. wide. There will, of course, be the usual fittings required for the corn trade. In addition to the entrance from North-street there will be a door leading to the main entrance of the town-hall. The entrance to the town-hall proper will be from East-street. Here there will be double folding doors. A flight of stone steps will lead to the council-chamber, the magisterial-room, and the reading-room. The respective dimensions of these rooms will be 37 ft. by 22 ft., 16 ft. by 14 ft., and 19 ft. by 17 ft. The corn exchange will have four windows on the eastern side, and two on the western side. The town-hall will be lighted by five windows in the eastern wall and three in the western. There will be a large and ornamental fanlight in the main entrance. The style of architecture chosen is Gothic.

Messrs. Beer, Hobbs, & Best, of Wareham, have taken the contract, the precise figures being 1,332l. for the completion of the work according to the plans and specifications drawn up by the architect, Mr. G. R. Crickmay, of Weymouth. But there will be many extras, such as gas-fittings and commission, and altogether the cost of the building has been estimated at 1,700l. Towards this about 1,200l. have been raised.

ARCHITECTURAL UNION COMPANY.

THE annual meeting of this company will take place on the 1st of December to declare a dividend and transact the ordinary business of the company. The balance-sheet shows considerable arrears of rent due to the company, and the report contains this paragraph:—

"The unexpected and sudden death of Mr. Lamb, who was treasurer of the Architectural Exhibition Society, unfortunately rendered it impossible for that body to discharge the rent due from them to the company, before the accounts were audited, which causes the large arrear shown in the balance-sheet, and prevents the usual dividend being paid."

The directors recommend a dividend of 6s. 9d. a share, instead of the usual 10s.

SIR JAMES CLARKE LAWRENCE, BART.

THE admirable manner in which the late Lord Mayor discharged the duties of his office, and the applause which he has won from his condutors, must interest strongly so large a section of our readers, acquainted, if not connected, with the firm of Messrs. William Lawrence & Co., that we think it right to record in our pages the terms in which the Court of Common Council has expressed its appreciation of his services:—

"That the best thanks of this Court be presented to the Right Hon. James Clarke Lawrence, M.P., late Lord Mayor of this city, for the valuable services so efficiently rendered during his year of office. The Court has witnessed with the highest satisfaction the manner in which in the discharge of the important duties of his office his Lordship exercised those qualities by which the character and dignity of the position of Chief Magistrate of the city of London have been maintained. This Court especially recognises the judgment his Lordship displayed when presiding over its deliberations, and is of opinion that in com-

binning firmness with consideration he greatly contributed to the successful conduct of business, and advanced the important interests connected with the Corporation. This Court also desires to express its high approval of his great ability in the administration of the Masonic-house, for which in his able advocacy of works of general philanthropy; and would record his generous liberality in dispensing the hospitalities of the Masonic-house, for which in every respect he is entitled to the warm and sincere acknowledgments of this Court, hereby presented to him. While with pleasure recognizing the gracious act of her Majesty the Queen in visiting this city to open Blackfriars Bridge and the Hothorn Valley Viaduct, this Court sincerely congratulates the late Lord Mayor upon the intimation of her Majesty's intention to confer upon him the dignity of a baronet—an honour personal to himself, but fully appreciated by the Corporation of London."

OPENING OF THE SUEZ CANAL.

THE procession of ships headed by the French Imperial yacht, *Aigle*, with the Empress of the French, has successfully opened the Suez Canal, by passing through it from the Mediterranean to the Red Sea and back. Thus a long-talked-of work, of cosmical importance, has been at last so far accomplished by the cutting through of a narrow neck of land heretofore separating more than one-half of the whole habitable world into two parts, and dividing the ocean on either side of it, so that till now no ship could pass from the Mediterranean arm of the Atlantic ocean to the Red Sea arm of the Pacific ocean, without almost circumnavigating the world, whether via the Cape of Good Hope eastward, or Cape Horn westward. The only other engineering work likely ever to excel it in importance would be the cutting asunder of North and South America, just as Africa and the continental land of Asia and Europe have been by the Suez Canal. The canalisation of the Isthmus of Panama, however, would be, probably, a more difficult work than that of the Isthmus of Suez, although there might be less fear of the canal being silted up with sand, as Mr. Stephenson anticipated.

Whether the present shareholders of the Suez Canal will really benefit by the work is a secondary consideration altogether by comparison with the vast importance of the canal to the commerce of the world. The rates are believed to be as yet too high; but that is likely to rectify itself in the long run. A rush upon the canal all at once, perhaps, is not to be anticipated. And, indeed, whether the great ships usually called "East Indiamen" can traverse it we do not know; but, no doubt, ships will be adapted to the canal, as well as the canal to ships.

CONDITION OF THE THAMES EMBANKMENT.

At a meeting of the Metropolitan Board of Works, held on the 19th inst., Mr. John Grant, the assistant-engineer, made the following statement with respect to the Thames Embankment (North), between the Temple and Westminster Bridge:—

"As during the past week various paragraphs have appeared in the *Builder*, *Morning Advertiser*, and other papers, to the effect that recent symptoms of settlement and failure had shown themselves in this important work, it may be satisfactory to the public, though unnecessary for the board, to be informed that there is not the slightest ground for alarm as to the safety or soundness of the Embankment, which goes down about 14 ft. below low water, and would stand by itself, independently of any backing of earth or other material. Foreseeing that the works of the Metropolitan District Railway would inevitably disturb the recently laid pavement, the board will recollect that, by advice of their engineer and solicitor, an agreement was entered into between the board and the railway company that the latter should pay the board for all injury and damage of every description occasioned to the footpath by the railway operations. Inasmuch as these must necessarily cause disturbance of the adjoining ground during their progress, it would obviously be wasteful and unwise to do more than is absolutely necessary to the railway, now in rapid progress, completed. When the railway works are finished the paving will be relaid, and, in accordance with the agreement, charged to the company."

If Mr. John Grant had taken the trouble to refer to the *Builder*, he would not have made such an erroneous and improper statement as we find here. No single word has appeared in our pages impeaching for an instant "the safety or soundness of the Embankment." The letter we printed from "A Stranger" simply pointed out the very bad condition into which part of the pavement had fallen, the correctness of which was shown by the letter from the contractor, which we printed, setting forth his view of the cause of it, and by the fact that men were forthwith sent to repair and set right the pavement in question. With what may have been said in other papers we have no concern, and the least Mr. John Grant can do is to express

his regret that he had made so unfounded a statement. The fact is, that being anxious at all times to support men in authority (the tendency of the day is unfortunately quite the other way), we deal much too leniently with the shortcomings of officials—too often condone their failures and errors—so that they begin to think they may take what liberties they please. If we turn over a new leaf, which is more than likely, some of these gentlemen may have cause to regret that they were not a little more careful and precise.

WELLS CATHEDRAL.

SOME months since a report was made by Mr. Ferrey, the diocesan architect, to the Dean and Chapter of Wells, describing the dilapidated condition of the west front of the cathedral, and urging that some immediate steps should be taken for its conservation, on account of the fabric having sustained great injury during the last few winters. As the estimated cost of the work was considerably more than could be encountered by the cathedral authorities, the dean issued an appeal to the county, which, after being succeeded by a public meeting, met with a fair response, and a building committee was appointed to carry out the objects proposed.

The committee thinking it desirable to ask for a report also from Mr. Scott, that gentleman, together with Mr. Ferrey, made a careful examination of the cathedral last week. The result was an entire confirmation of Mr. Ferrey's previous report and the recommendations therein made by him.

The cost of the restorations is estimated at about 3,000*l.*; but the sum as yet subscribed is insufficient. As soon as the adequate amount is obtained, the requisite reparations of the west front, as also of the interior of the chapter-house, will be proceeded with.

EMBANKMENT OF THE COAST.

In this and the reclamation of waste lands, the improvement of the drainage and embankment of rivers, the surplus labour of this country might be most properly and beneficially employed for many years to come; there would be then no necessity of depriving this country of its skilled labour in the very questionable and expensive expedient of sending abroad one of its principal supports. Much of the depressed condition of matters generally is to be attributed to the excessive taxation consequent on the extravagant wars in which this country has been engaged,—in the case of the Russian war alone of upwards of a hundred millions—rates and taxes come now to nearly 50 per cent. of rental.

The attention of Government might be most beneficially given to the schemes enumerated.

R. L. S.

BUILDING WOODS.

In answer to "E. M.," it was almost impossible to become practically competent to distinguish one kind of deal from another without having had some experience: there are, however, four principal kinds known to builders, viz., "yellow deal," "white deal," "spruce," and "pine." It may be well, in the first place, to observe that the *yellow deal* is not necessarily more yellow in colour than the other kinds, but may be known by its knots being generally of a reddish yellow or brown colour, and firmly nuted to the boards, so that they cannot be forced out or through a board; and *yellow deal* is not so shining and silky in appearance as white, and does not, to the experienced eye, look so hard on the surface as the white; but it bears the appearance of containing much resin in its grain, and when cut crosswise, it will present a smoother and closer grain than the white, and its annular rings will not be nearly so strongly marked and prominent.

White deal may be known by its knots being much darker in colour than those of yellow, and very liable to come out, through being loose; and it frequently has much turpentine, which, though thick, will yet run over the newly-cut boards. When rough, but more especially when planed, it will present a beautifully glossy surface.

That called *spruce* differs from that commonly called "white," by its being harder, and its grain is likely to wear unevenly on the surface, the annular rings standing up

prominently on the surface, and presenting an unsightly appearance. Its knots are frequently very small, numerous, and dotted over its surface; its end also shows the annular rings with great distinctness.

Pine is neither so glossy as "white" deal, nor so reasonably dull as "yellow." Its knots, too, are generally more or less loose, which will form a criterion whereby to know it from yellow; and when cut across the grain, its end will be close and woody in appearance, not having the annular rings prominent as in "white" and "spruce," whereby it may also be known from those woods. It does not contain resin like "yellow," and consequently has not the strong resinous colour that yellow deal has; but it contains turpentine, which may be seen running over the boards, as in "white deal." Its surface, when nicely prepared, is very smooth, the grain not having much tendency to wear unevenly, and although not so glossy as "white," yet its grain presents a sparkling kind of appearance not seen in "yellow."

A fifth kind, called "timber," although of various kinds, generally is similar to "yellow," excepting that it is coarser, has larger knots, which seriously weaken it, and for which reason it is advisable to saw and reverse girders, &c., in order that knots or faulty places (not occurring in the centre of their length) may be distributed; its being coarse renders it difficult to execute good joiners' work with it, as it works so badly.

HENRY AMBROS.

SIR,—Your correspondent "E. M." in last week's *Builder* inquires how fir timber and dealers distinguished in their various classes when sawn; and, as an importer and proprietor of saw mills, I will give him as clear and brief an answer as the subject admits of.

Yellow and white deals from the various Russian ports are usually unmarked, whilst those from Sweden and Norway are generally painted or stencilled on the ends, according to the fancy of each shipper; but as these marks number some thousands it is impossible for any person not in the trade to remember a tenth of them. When these deals are sawn into boards the marks are rendered unintelligible, and no one either in or out of the trade can say from what port they have come, or whether they have originally been classed as first, second, or third quality.

J. A.

THE ARCHITECTURAL LIBRARY OF THE INSTITUTE.

THE Library of the Institute of British Architects is now of considerable extent and value. Several handsome donations in its aid have been lately made, but it is still far from complete, and the council have just now issued a list of publications, about 1,000 in number, which they consider wanting in such an Architectural Library of Reference as should be possessed by the Institute, with the view of obtaining them from the members and others. This is a very good step, and we shall be glad to find it attended by the desired results.

SIR,—The Library now embraces a collection of books of great value, and to some extent unique. It is to be feared that so valuable a collection should be placed in a *fire-proof* apartment?—that is, should not be liable to be reduced to ashes in a brief half-hour. The floors, walls, and roof might readily enough be constructed *fire-proof*—solid vaultings, brick arches, and ironwork; and iron fittings, shelves, &c., and slate desks. The rooms on the ground floor at Conduit-street, at present let off in a most incongruous occupation, would be best suited with the basement below for the library, or the galleries in the rear, if these were brought up to the proper ground level, in place of being in a species of cellar.

A PAVILION.

The present library would form a good tea and conversation room.

VALUE OF PROPERTY.

At Worcester part of the Brickfields Building Estate, containing 877 square yards, and freehold, with land tax redeemed, was sold for 1*l.* 2*s.* 6*d.* per yard, to Mr. Wainwright, for Mr. J. Booth. A piece of building land, with a plantation of trees growing thereon, situated at the south side of the entrance to St. George's-square, Worcester, having a frontage to the turnpike-road, has been sold. The land contained 1,330 square yards, and was the property of the late Vice-Admiral F. D. Hastings. It was sold to Mr. W. Johnson for 300*l.*—In Liverpool thirteen consecutive lots of property, situate in Everton, Edge-hill, and other parts of the town, were sold the other day. The following prices will convey an idea of the value of houses in the respective localities. The tenure of the property is freehold.—Lot 1. Twelve dwelling-houses in Adelaide-street, Everton, annual rental 148*l.* 4*s.*, realised 1,400*l.* Lot 2. Thirteen houses in Adelaide-street, rental 182*l.* 1*s.* 4*d.*, sold for 1,790*l.* Lot 3. Seven houses in Adelaide-street and St. Domingo-road, rental 158*l.* 16*s.* 4*d.*, brought 1,650*l.* Lot 4.

Two dwelling-houses in Adelaide-street, rental 24*l.* 1*s.*, sold for 360*l.* Lot 5. Eighteen houses in Jane-terrace, Kinglake-street, and Derby-place, Edge-hill, rental 240*l.* 9*s.*, sold for 2,490*l.* Lot 10. Ten Dwelling-houses in Canterbury-street, rental 195*l.*, sold for 2,310*l.* Lot 11. Eight houses in Canterbury-street, rental 156*l.*, sold for 1,830*l.* Lot 12. Thirty houses in Field-street, rental 429*l.*, sold for 4,070*l.*—*Hampstead, London.*—Mr. F. J. Clark, writing of the value of land at Hampstead, says last year a considerable area which had just been enfranchised was sold by auction at prices varying from 1,500*l.* to 2,500*l.*, and some frontage land, within a quarter of a mile of this property, at upwards of 4,000*l.* per acre.

SHELTER FOR CABBIE.

UNDER the title of "The Builder's Plea for Cabbie," in our volume for last year (p. 687), we urged the desirability of providing shelter for cabmen and their horses. It is therefore pleasing to us to note that the suggestion is being carried out at Edinburgh, so far as regards the cabmen themselves. Through the exertions of Mr. A. B. Fleming, a neat wooden building, designed by Mr. Pilkington, and provided by subscriptions from inhabitants in the neighbourhood and the cabmen themselves, has been erected at the stand at Randolph-crescent. Large side-windows are provided in it, by which a full view of the road in each direction can be commanded; and it is entered by a door from the street-side immediately facing the stand. A gas stove is to be provided for it, along with which there will be a small boiler for the supply of hot water.

The movement is, on the face of it, so admirable, remarks the *Medical Journal*, that we think there would be little difficulty in raising the funds necessary to provide similar shelter in London and other large towns. The nature of their employment exposes the cabmen to all the influences of cold and wet, and accordingly they are great sufferers from consumption and acute chronic rheumatism, but more especially from bronchitis; and they are rendered the more liable to these from their intemperate habits, which are, under the circumstances, easily understood, as they find that stimulants "keep out the cold" for the time. If shelter, such as has been provided in Edinburgh, were procured for the cabmen in every town, there would be less encouragement to intemperance, and their calling would be rendered in every respect a more healthy, profitable, and respectable one. If, in addition, these stands were each provided with a restaurant, where good food was sold cheap, the movement would prove a still greater boon to poor cabbie.

DONEGAL GRANITES.

At the last meeting of the Royal Geological Society of Ireland, Dr. Haughton called the attention of the meeting to specimens exhibited of polished granite from the county of Donegal. They were brought there by Mr. Harte, the county surveyor of Donegal, and he (Professor Haughton) had examined them attentively, and could bear testimony to their rich lustre and brilliancy of colour, which was of so much importance. At present they got their red granite from Peterhead, near Aberdeen, and where, in spite of the want of any natural advantage, the industry of the Scotch had created a large and thriving trade, upon a mere barren rock. He knew the locality where Mr. Harte got this granite, and had examined it for scientific purposes himself, and he had no hesitation whatever in saying that this fine granite would bear the most favourable comparison with that of Peterhead, commonly called Aberdeen granite; for the granite of Aberdeen itself was grey, like the Dublin granite. Why should they, then, go out of their own country to get granites, when they had such fine materials as these beautiful specimens now exhibited?

Mr. Harte said the largest specimen before them had received its polish in the marble mills of the Messrs. Sibthorpe, of Corkhill,—gentlemen who had already done much to develop the use of Irish marbles, and who, he had no doubt, would do the same as regards these granites. They had no granite in Scotland like this of Donegal. He had compared this granite with all the best Peterhead specimens he could get, and it was several shades higher and richer in colour than the latter; in fact, it was very brilliant, and took, as they could see, a beautiful polish. He

was glad to say that the matter was in a fair way to success, and he had every expectation would prove highly remunerative. He was now commencing to quarry this granite.

ROOF DECORATION.

IN the paper upon church roofs which appeared in your last issue, the author imperfectly describes the "star" decoration upon the roof at the east end of the south aisle of St. Mary's Church, Bury St. Edmunds. He says that it is of metal with gilded rays, and has a flower in the centre. During the restoration of the church nearly twenty-five years ago, I had an opportunity, as a pupil of the late Mr. Cottingham, the architect employed, of taking a cast of this unique ornament, and I send you a *fac-simile* drawing. The stars are of cast lead; the centre is not a flower, but the singular feature of a convex piece of glass blackened on the back-side, giving it the appearance of a mirror. From this eye, or centre, the star is surrounded by wavy clouds, which are silvered, and from these proceed from each of the four sides a group of seven straight rays of various lengths, which are gilded. The diameter of the mirror, representing the star, is 24 in.; the same across the clouds, 5 in.; and the total width from point to point of the gilded rays is 1 ft. I think this a very rare instance where looking-glass was employed in Medieval times as a decoration; and the appearance of these mirrored stars, several in number, on the church roof in question, must have been very singular when they were new and fresh.

F. R. WILSON.

PORTS OF THE BAL TIC.

SIR.—Can any of your readers inform me where I can purchase a work fully explaining the various timber ports in the Baltic, and their respective qualities of timber?
A SUBSCRIBER.

VENTNOR CEMETERY COMPETITION.

SIR.—Although loth to trouble you on the never-ending subject of dissemination implied in a "competition," I cannot refrain from writing a few words on the late competition at Ventnor. The sum to be spent mentioned in the particulars was 1,400*l.*, and the design chosen by the Burial Board would cost, on the authority of our architects of some standing, over 2,200*l.* This has not the appearance of justice; but, if I mistake not, these same drawings were sent in some years since for the Carisbrooke Cemetery, where the sum limited to be spent was 3,000*l.* I forgot to mention that the estimate of the author of the selected designs in this instance is under 1,400*l.*

HONESTY.

CAIRO HOTEL: TERRA COTTA.

WILL you be good enough to name in your next issue that the large columns, together with the whole of the terra-cotta embellishments to the Cairo Hotel, were executed by us for Messrs. J. Perry & Co., and under the immediate direction of Mr. C. H. Wray, the architect, and oblige
M. H. BLANCHARD & CO.

THE NEW WORKS AT THE POST OFFICE.

SIR.—A correspondent, "P. W.," in your last issue inquires, "Who is this Mr. Williams, of her Majesty's Office of Works?" I have the pleasure of knowing Mr. Williams personally, and being well acquainted with his works. He is the architect and surveyor to the Post-office. Many years of special experience and great activity have thoroughly qualified him for rising to the exigencies of the present case, and his executed works, such as those at Edinburgh, Cardiff, &c., testify to his ability to appear well before the public, and rightly administer the funds placed at his disposal.
T. S.

KEEN'S AND PARIAN CEMENTS.

SIR.—A "Clerk of Works," in your last number, wishes information respecting the painting of a wall newly plastered with Keen's cement, attributes the peeling off to dampness, and assumes that a similar result occurs with Parian. This is not so. The known characteristic of Parian is non-dilutescence. The loosening of paint from the surface of Keen's cement arises from other antagonistic causes than dampness.
FRANCIS & CO.

DRILL HALL AND GYMNASIUM IN NEWCASTLE.

LEUT.-COL. POTTER, of Heaton Hall, Newcastle, has, at his own cost, erected a large hall, in this town, to be used as a drill-hall and gymnasium. The building is in Locke-street. The site has been purchased from the corporation. The building, which is of brick, and of an unpretending architectural character, is about 130 ft. long. At the east end is a house, where the drill-sergeant will reside; and the house also contains board, orderly, dressing, smoking and secretary's rooms. The drill-hall and gymnasium, which is about 105 ft. long by 60 ft. wide, is open from the ground to the roof, and is divided into five bays by cast-iron pillars, which support the roof, and also to the timber work of the gymnasium. All the necessary apparatus for a gymnasium will be erected in the

hall. At the west end of the hall is a gunnery, in which will be kept the large guns; and over the gunnery is a gallery for the accommodation of spectators. On the north side of the building are an armory and store-room, and also the usual out-offices. There is an open courtyard, 70 ft. long by 25 ft. wide, at the west end of the building; and most probably at some future time a tennis court will be formed in this yard. The cost of the building, which will soon be completed, and the fitting up of the interior, will be about 2,000*l.*; and, besides this, there is the cost of the land, Mr. Thomas Oliver is the architect. The contract was let to Mr. Kennedy, of Jarrold; and the work has been superintended by Mr. Henry Andrews, clerk of the works.

DRAWING AND DESIGN IN THE SCIENCE AND THE ART SCHOOLS.

WITH your permission I will call attention to a few anomalies in the existing regulations of the Department of Science and Art, for the working of the schools, which are causing inconvenience in many localities, and bringing the two divisions (science and art) into apparent rivalry with each other, when, by some modification of those regulations, each might, without interfering with the other, be made to work more efficiently and in accordance with the altered circumstances of the present time.

Amongst the twenty-three subjects taught in the science classes are practical, plane, and solid geometry; machine construction and drawing; and building construction. Forming part of the twenty-three stages taught in art schools, are linear geometry, mechanical and machine drawing, and details of architecture. Although there is some apparent difference in these subjects, it is really only a distinction, and not a difference, as they are substantially the same. The effect of these subjects being thus separately taught by each division is that in towns where (as is mostly the case) separate science and art classes are in existence, the above subjects are taught in two places having no connexion or arrangement with each other. If a building artisan wishes to learn the branches of drawing bearing especially on his trade, he is in doubt whether to go to the Science or Art school, for each advertises that it teaches exactly what he wants.

In the science schools examinations are yearly held in the whole of the twenty-three subjects taught; but in the art schools examinations are only held in five subjects, viz., practical geometry, perspective, free-hand drawing from the flat-drawing from models, and mechanical drawing. It will thus be seen that in two out of the five subjects of examination it has a direct rival in the sister division. In another way the scale of payments on results is very disproportionate. In the science classes payments of from 1*l.* to 3*l.* are made on each satisfactory examination paper, whilst on a similar paper worked in an art school only 10*s.* are paid. I think it unnecessary to go through the whole list of inconveniences and discrepancies which arise from this state of things; for I think it must be apparent to every one that some modification of the existing arrangements is necessary. I should not enter upon this matter if I were not prepared to suggest a remedy, which is briefly as follows: To take away the geometry and mechanical drawing entirely from the art division and transfer it to the science; although at the first institution of art schools it was perhaps necessary to attach those subjects, though not exactly related to the objects for which the schools were founded, yet required as an additional support; but now that they are fulfilling their immediate object in a more marked degree, and science classes are instituted in most parts of the kingdom, it would be a decided advantage if the whole machinery were remodelled to suit the altered circumstances. But what must the art schools do when deprived of these supports? Instead of the second-grade examinations in geometry and mechanical drawing, examinations should be held in the principles of elementary design, historical analysis with reference to design, and historic ornament. I need scarcely enlarge on the advantages which would ensue if the general students of the schools were thus encouraged to acquire at least an elementary acquaintance with these subjects; if good textbooks were prepared for the guidance of the students, class lectures were given, and the instruction generally tended to a good grounding in the principles which lead to true taste in design and ornament; if examinations were then held annually to test the progress gained, I believe that the best results would be obtained. In the school to which I belong there is carried out at present a system of general instruction in

the above subjects, but I believe that in most schools, unless a student is intended to be a designer or art workman of some kind, he has no instruction of this kind, for the reason that it pays better to keep him to "drawing" pure and simple.

My apology for troubling you with these remarks must be that, while so many vague generalities have lately been indulged in a neglect of technical education, few practical details have been set forth for the improvement of the present means at our disposal. I am a believer in the Department of Science and Art as a means to the end, if the machinery be improved to suit the altered requirements of the time.

CHARLES J. FOX, Hon. Sec.,
School of Art, Halifax.

P.S.—Since the above was in type, the Department have issued some amended regulations, which bear on the subjects embraced in this letter. They are to the effect that "science drawing" may now be taught in schools of art, and examinations held as science classes. I will not criticise these alterations, but simply wish to notice that such alterations have been made.

C. J. F.

CHURCH-BUILDING NEWS.

Hellingly.—The completion of the restoration of the parish church has been celebrated by the performance of divine service. The restoration was commenced on the 1st of May, the alterations being effected by Messrs. Aris & Roe, builders, Hastings, from designs and plans prepared by Mr. E. Christian, of London. The whole of the tiling was at once removed, together with the plastering which formerly hid the timber roof, thus giving an additional height to the nave. The roof has been re-tiled and plastered; the whole of the timbers being now exposed to view. The old groined roof, with its carved bosses over the chapel, and the timbers over the aisles, were found to be in such a ruinous and dilapidated state as to be unsafe; they are, consequently, replaced by new work; the chapel roof has been considerably raised, in order that the whole of the window on the north side might be visible from the interior. On the removal of the pewing, it was found that the bases of the columns running along the aisle had been mutilated, and in some instances undermined to a dangerous extent. Nearly all of the bases had to be renewed in Godstone stone, as a substitute for the Eastbourne stone, of which a considerable portion of the edifice has been built. The old plastering on the north aisle was removed and replaced by new, disclosing on the north aisle a series of Norman dressed stones, in many instances showing the characteristic ornament of the Norman period, and being the remains of a building considerably more ornate than the present. Three fragments of a Norman font were found under the plate. They are now visible in the chapel, being built in the wall. The floor of the church has been raised 6 in., upon a foundation of concrete. The aisles are re-paved with black and red Poole tiles. The seating is of varnished deal. The two arches in the chapel, communicating with the church, and which were formerly blocked up, are now thrown open. The gallery being removed, the organ and choir are located here. New oak doors have replaced the old ones. The stonework in the exterior wall has been restored, and the north gable of the chapel re-built, care being taken to disturb the appearance of the building as little as possible. A new window was found to be absolutely necessary in the south aisle: it has accordingly been added.

Marston.—The parish church has been restored and re-opened for divine service. Early in the present year a restoration of the edifice was determined upon, and Lord Wenlock, the patron, and the Hon. R. Lawley and the Hon. and Rev. S. W. Lawley, his lordship's brother, contributed largely to the restoration fund. Mr. Scott was consulted, and under his direction Mr. H. Brumby, builder, was employed as the contractor for the work. The plastering on the outer walls was entirely removed, and the original surface exposed to view, such repairs as were required being made, and the whole pointed. Two old Norman windows, which had been filled up, were re-opened and glazed; and, with a view to give increased accommodation, a new transept was erected on the north side. In the interior the work has been extensive. The old roofs and flat-plastered ceilings were all taken down. New roofs were constructed, of high pitch, with open timbers, and varnished, and the

exterior covered with grey slates. The floors have been relaid with tiles, preserving the monumental slabs, some of which are very old. The chancel is paved with encaustic tiles by Mr. Godwin, of Hereford. New seats of pine have been erected throughout the nave, aisle, and transept. The chancel is fitted with oak stalls. The pulpit is of alabaster, carved. The east window is of three lights, and is filled in with stained glass by Hardman, of Birmingham. The subject is in connexion with All Saints, to which the church is dedicated; and the centre figure represents our Saviour in glory, surrounded by saints and angels. The window is the gift of Col. Akroyd, M.P. for Halifax, whose ancestor was a priest of Marston in the fifteenth century. The interior walls have been cleaned throughout, the arches and pillars forming the arcade have been restored and pointed, and the new transept is built in accordance with the style of the original fabric. The cost of the restoration may be stated at 1,500*l.*

Oshtam.—Hartley Westpall Church has lately been re-opened, after having been restored by Mr. G. G. Scott, jun. The church is a timber building of the latter part of the thirteenth century. The old oak roof, with its tie-beams and crossed rafters, has been preserved, the wooden pillars which support it being repaired and strengthened where necessary. The modern casing of brick has been taken away, and the walls rebuilt with flint and stone. The west end remains in its original condition of wood and rubble. The belfry, built many years after the nave, has been taken from the west end, and raised on flint walls the same height as the church, and placed on the north side of the chancel. The nave is newly seated with plain benches of elm, and an oak screen with decorated tracery separates the nave from the chancel, which has been restored, in memory of the late rector (the Rev. Dr. Keate) and Mrs. Keate, who rest in it, and an altar-tomb with a monumental brass has been raised to Dr. Keate's memory. The church contains several stained-glass windows by Buckson & Crylls. One on the south of the nave, with figures of Zachariah and Elizabeth, is placed by parishioners and others to the memory of Dr. and Mrs. Keate. There is also one on the north side in remembrance of Dr. Broughton, late Bishop of Sydney. Opposite it is a window, representing Faith, Hope, and Charity, in remembrance of a sister of the wife of the present rector.

Bleasby.—The parish church of Bleasby has been re-opened, after having undergone a restoration, and been made better adapted to the requirements of the parish. New high-pitched roofs have been erected for the nave and transepts; a new north aisle has been built; and four new arches constructed. The internal fittings of the church are all new. Five new windows have been opened. Mr. Christian, of London, was the architect, and Mr. Chipsham, of Norwell, the builder. The total cost of the improvements so far has been 800*l.*

Westwell (Oxon).—This parish church has lately been re-opened, after undergoing repairs and additions. It is a very small and simple building, consisting of nave, chancel, and south porch. The walls are probably of Norman or very Early English date throughout, with the exception of the porch, which is Decorated. The south door, which has a solid tympanum, is Norman, and has detached shafts to the jambs, a treatment which has been repeated in the chancel arch. The chancel, which was restored by a former rector, inclines more to the north than is usual. There are small lancet windows in the north and south walls; but the east window is circular, enclosing a cinquefoil. The modern ceiling of the nave has been removed, thus exposing to view an oak roof of good design. At the west end stood a rickety gallery, rising through which four posts supported a bell-cot. The works just completed consist chiefly of a slight extension of the nave westwards, it having been necessary to take down and rebuild the end wall. A few more sittings have thus been gained. The works have been executed by Mr. Alfred Grover, of Milton; and the seats supplied by Mr. Wm. Hollowell, of Burford; and an oak altar by Mr. Frank Smith, of London; under the direction of the architect, Mr. Edward J. Tarver.

Farmborough.—The parish church of the ancient village of Farmborough having been restored and considerably enlarged, was recently re-opened for divine service. The alterations were commenced in the spring of the present year, and although, from lack of funds, the

entire plan has not been carried out, the work that has been done is complete in itself. The north wall of the nave was taken down, and an arcade has been erected which separates it from the north aisle, nearly as wide as the nave itself. The galleries have been removed, and a small organ-chamber has been formed at the east end of the north aisle. The chancel is separated from the nave by a new screen with wrought iron gates, and the space within the altar-rails is paved with encaustic tiles. The pavement of the rest of the chancel sadly requires renewing. There is a stained-glass window by Mr. Wallis, but this, we were informed, was not new. The tower, which is a specimen of Somersetshire Perpendicular work, remains intact, but improvement has been made in the interior arrangements. The partition which formerly separated the tower from the nave has been entirely removed; the tower, which is thus thrown into the body of the church, is used as a belfry. The old pews have been supplanted by open benches, capable of seating nearly 300 persons, being an increase in the accommodation previously provided. In pulling down the walls a few remains of the original church were found, and these have been preserved by being let into the old wall.

Brimpton.—St. Peter's Church, Brimpton, which has been entirely rebuilt, has been re-opened for divine worship by the Bishop of Oxford. This is the second church erected by Mr. James Blyth, of Woolthampton House. Four polished granite pillars, the roof, and the stained glass windows are the principal features. The former church, except the tower, was razed to the ground and rebuilt on the same site. The new edifice comprises a nave, with north and south gabled aisles and porch of oak, chapel on the east end of the south aisle, and a transept at the east end of the north aisle, with a recess for the organ. The chancel is fitted up with stall fittings of carved oak, and is paved with encaustic tiles. All the other fittings in the church are of oak, chestnut, and walnut-wood, grown on the Woolthampton estate. The pulpit and stand are of Caen stone carved. The roofs are of Baltic timber varnished. The church internally is entirely faced with Bath stone, and all the capitals to the columns of the arcade on both sides are carved in imitation of foliage and flowers, the columns being of red granite polished. Externally the church is faced with flint, and Bath stone dressings. The old tower of red brick was cased over externally with flint and stone, with windows, doorways, and buttresses to correspond in style with the other portions of the church, which is of Pointed architecture of the fourteenth century. A timber-framed spire, covered with oak shingle surmounts the tower. The belfry contains a peal of four bells, which have been tuned and refixed by Messrs. Mears & Co., of Whitechapel, on new oak frames complete, and a clock has been added. The present height of the tower and spire to the top of the nave from the ground is 132 ft. The present church has accommodation for 205 adults and 55 children. The two west windows in the aisles, and the east and south windows in the chancel, are filled with stained glass by Messrs. Ward & Co., of London, in memory of departed members of Mr. Blyth's family. The carving of the stone and wood work was executed by Messrs. Farmer & Brindley, of London; the encaustic tiles in the chancel (by Maw) were provided and laid by Messrs. Simpson & Son, of London; and the heating apparatus by Messrs. Haden, of Trowbridge. The church was contracted for and built by Mr. W. Alloway, of Wokingham, builder, at a cost of 3,700*l.*, exclusive of stained glass, warming, and the timber supplied from the estate. The works were carried out under the superintendence of Mr. John Wheeler, clerk of the works, from the designs of the architect, Mr. John Johnson, of London.

Milgham.—The new parish church of St. Matthew, erected through the liberality of Mr. Benjamin Back Greene, of Milgham House (a near relative to Mr. Blyth), has been consecrated by the Bishop of Oxford. The site of the new edifice is as near as possible in the centre of the parish. It adjoins Mr. Greene's park, on the hill within a short distance of the Bath-road. The edifice is capable of accommodating a congregation of 250 persons. It consists of nave, south aisle, north chapel, chancel, and porch. The pillars of the arches dividing the nave from the aisle are of red Mill polished granite. All the walls are faced internally with Bath stone, and externally with Bath stone and flint. The whole of the sittings are of oak, also

the reading-desk. The pulpit and font are of Caen stone, carved. The roofs are of Baltic timber, varnished, hoarded, and covered with Staffordshire tiles. The chancel is paved with Maw's encaustic tiles to an ornamental pattern. All the corbels are carved, and Messrs. Farmer & Brindley, of London, executed the carving. The tower is at the south-west corner of the nave, and is finished with a stone spire, which rises to a height of 105 ft. from the ground. The windows generally of the church are glazed with cathedral glass. The east window is filled with painted glass, by Messrs. Hughes & Ward, of London, at the sole cost of Mr. Greena. The window consists of three lights, representing respectively the Birth, Crucifixion, and Ascension of our Lord. The lancet window in the south aisle of the chancel, representing the Parable of the Talents (by Messrs. Heaton & Butler, of London), was the gift of the parishioners. The church is heated by warm-air apparatus, supplied by Messrs. Haden, of Trowbridge. The architect was Mr. John Johnson, of London; Mr. Allaway was the contractor; Mr. Roberts was foreman; and Mr. Wheeler clerk of the works. The iron-work was executed by Messrs. Hart & Son. The old bells have been re-hung, with the addition of one cast by Messrs. Mears & Stainbank, of London.

Harston (Cambs).—The church here has been restored and re-opened. The edifice has been entirely re-seated with open deal benches. The roof has been repaired, stained, and varnished; the old oak pulpit removed from the west arch, and renovated and placed on the north side of the chancel arch. On the opposite side a new reading-desk has been fixed, with carved oak bench at the back. The windows have been reglazed with plain glass (for the most part), and the walls cleaned and fresh plastered; the stone work wherever prominent having been refaced where requisite. Repairs by way of new wheels, &c., have been executed in the bell chamber. New doors have also been placed on either side of the church. On the outer side of the south door there is a furnace for heating the edifice, the heat being conveyed by pipes a short distance in the cross aisle, when it is carried up the centre aisle to the chancel steps, passing out at the well staircase on the north. Coming to the chancel, we find a new carved oak rood screen, and then our attention is drawn to the reredos: it consists of the Ten Commandments, the Lord's Prayer, and the Apostles' Creed, executed in the Elizabethan character, with illuminated capitals; more immediately over the altar appearing (in the same style of execution) the following text: "Then Jesus said unto them, Verily, verily, I say unto you, except ye eat the flesh of the Son of Man, and drink his blood, ye have no life in you." This inscription is the work of Mrs. Durbin, the vicar's wife. The woodwork, carving, and general fitting up, were done by Mr. Joseph Stubblefield, of Newton; the stone work and glazing by Mr. Clayton, of Cambridge; and the plastering, heating apparatus, and other extra work by Mr. Jude, of Harston. The work has cost about 500l.,—roughly estimated.

Worsop.—St. John's Church, Worsop, was consecrated and opened for divine service several weeks past, but the scaffolding around the tower has only been partially removed, and the interior of the edifice is gradually approaching towards completion. The font is an irregular octagon, the sub-base is of red Mansfield stone, moulded with an inscription engraved around it. The upper base (and the other portion of the font) is of Caen stone, moulded with carved spurs. On this rest a column of polished granite, and four smaller ones of serpentine marble. These are furnished with carved capitals clustered, which support the bowl, on the lower sides of which are carved medallions representing the baptism of Christ.—"John the Baptist preaching in the Wilderness," "Christ blessing little Children," and "Christ's last Charge to his Disciples." The spandrels over each medallion are filled with polished bosses of Derbyshire spar; on the smaller sides are carved corbels springing out from immediately above the carved capitals. These support moulded bases with polished marble shafts and carved caps. The whole is surmounted with a moulded cornice enriched with scale pyramid ornaments. The font is from the design of Messrs. Hime & Son, architects, Nottingham, and the whole of the work has been carried out by Mr. J. M. Thompson, of Ollerton and Nottingham, by whom also the carving and sculpture have been executed.

Annsroft.—The foundation-stone of a new church has been laid at Annsroft, for the districts of Annsroft, Hookgate, Exford's Green, and Lyth Bank, all of which localities are within one mile of the site, which has been given by Mr. John Rutter, of Wolverhampton. The estimated cost of the church, parsonage-house (which it is also proposed to erect), and the endowment is about 3,000l. The plans for the new edifice have been prepared by Mr. Randal, of Shrewsbury. The work will be carried out by Messrs. Bowdler & Darlington, of Shrewsbury, the builders of the neighbouring church at Meole. The building will be a modification of the Early French style, and will consist of nave, north aisle, chancel, and narthex or western porch. The length, including the chancel, will be 75 ft. and the width 27 ft. The aisle will be 33 ft. long and 12 ft. wide. The roof will be an open one, of stained deal, covered with Staffordshire tiles. The seats will be constructed of deal and elm, stained and varnished. When complete the church will accommodate 220 persons, and all the seats will be free and unappropriated. At the west end of the nave will be a bell-turret, 50 ft. high: this will be of wood, covered with lead. In the chancel will be three lancet windows, and a circular window at the west end. The church will be built of Red-hill stone, with Shelvoka stone dressings. The estimated cost of the building itself is about 1,100l. At present only sufficient funds are in hand to guarantee the promoters in proceeding with the nave and north aisle, and it is intended to defer for a time the erection of the chancel and parsonage-house.

Brentwood.—The old church of Childeritch was pulled down in May last, and since that time a new edifice has been erected on its site, and was recently opened for divine service. The church has been built from designs furnished by Messrs. Nichols & Johnstone, architects, London, and under their superintendence the work has been executed by Mr. W. C. Middleton, of Gravesend. The style is late Early English, the material Kentish rag and Bath stone. The church consists of chancel and nave, surmounted by bell gable. Internally the only visible relic of the old church is the font, of the time of Henry VIII., as the old characteristic timber was found upon examination to be thoroughly decayed.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Southend.—A new Roman Catholic Church has been erected here, and opened by Archbishop Manning. The new church is situated in Cliff-town. It is in the Early English style. The material is brick and stone mixed, and there is some carving in the workmanship. It is 85 ft. long by about 30 ft. wide, and it is so arranged that the church can, if required, be enlarged. The architect was Mr. Goodman, of Southend.

Leadgate.—Dr. Chadwick, Roman Catholic Bishop of Hexham and Newcastle, has opened a new church, dedicated to "Our Lady and St. Joseph," at The Brooms, near Leadgate. This church, which commands a view of Lancaster valley, is built in the Gothic style of architecture. The architect was Mr. Welby Pugin. The nave is 79 ft. long by 32 ft. broad; the aisles on each side are 8 ft. each in addition; and the chancel is 32 ft. by 25 ft. inside, the form being octagonal. The height of the building is 68 ft. to the apex. There are to be a confessional and a font, which are not yet completed; and accommodation is afforded for 700 persons. The church, when completed, will cost between 4,000l. and 5,000l., a large portion of which has been subscribed by the workmen employed by the Consett Iron Company in the ironworks and at their collieries.

Harwich.—The newly-erected church of St. Mary of Mount Carmel, at Harwich, has been opened. Up to the present time the chapel of the Roman Catholics at Harwich has been at the house of the Rev. Thomas Parkinson, the official acting Roman Catholic chaplain to the troops stationed at Landguard and Harwich. The site closely adjoins the railway station. The church stands slightly recessed from the road leading to Dovercourt, and is an unpretentious little building of Suffolk brick, with a roof of Taylor's patent tiles. The design of the architect (Mr. Pugin, of Ramsgate) has not yet been entirely carried out, and it is contemplated that at some future time, should it be found necessary, the building should be extended to the westward, so as to be nearly double its pre-

sent length, and then a bell-turret will give a finish to the west end. The chancel consists of nave, with north and south aisles, sanctuary and vestry or sacristy. In both aisles are one two-light and two three-light windows, the south aisle also having at the east end a small circular window, and in the east wall of the sanctuary (between which and the nave is a plain arch) is a circular window with geometrical tracery; and there is also a three-light window of a somewhat more ornate character than those of the aisles in the south wall of the sanctuary. The roof of the nave is supported by timber uprights, from which spring the arches of the roof, which is open, and, as well as the remainder of the woodwork of the church, of stained deal. The roof of the sanctuary is a plain wagon-roof. The nave and aisles are 30 ft. in length, and the width of the building from wall to wall is also 30 ft., sitting accommodation being afforded for some 200 persons. The walls are double, to ensure warmth and dryness; and the work has been carried out by Mr. J. W. C. Butcher, of Harwich. The total cost was 730l.

Books Received.

The Architect and Monetarist: a Brief Memoir of Thomas Alexander Tefft; including his Labours in Europe to establish a Universal Currency. By EDWIN MARTIN STONE. Providence: State of Rhode Island, U.S.A., 1869.

This is a memoir of a promising young architect, of Providence city, who, as some of our professional readers will remember, spent some time in London perfecting his studies in his chosen profession. He cherished to the close of life appreciative memories of the many courtesies received from distinguished men of our metropolis, who highly rated his ability. A monument to the wife of Mr. Benjamin Moran, of the American Legation in London, from a design by Mr. Tefft, is standing in Norwood Cemetery, where it has attracted some notice. Perhaps the most important event in Mr. Tefft's life was the working out of a practicable plan for uniting the currencies of all nations,—a subject that engages special consideration with statesmen and scientists on both sides of the Atlantic. To this feature Mr. Stone gives special attention in the memoir. Mr. Tefft completed his architectural education under Mr. James T. Bucklin, of Providence, one of the leading architects of Rhode Island. Mr. Tefft was born about the year 1825, and died at Florence in 1869. The memoir is an interesting one.

The German Working Man: his Institutions for Self-culture, and his Unions for Material Progress. By JAMES SAMUELSON, Editor of *Quarterly Journal of Science, &c.* London: Longmans, Green, & Co.

THESE instructive particulars as to German workmen do not seem to have been written with the exclusive view of running down the British workman and running up the foreigner; but they show wherein our own workmen may well take a lesson from them, both by following and by avoiding their example. The author, however, who is the president of the Liverpool Operatives' Trades' Hall, has had mainly in view a description of a few of the combinations of German working men for self-help, education, and art-culture, as well as two co-operative associations for trade purposes; and to afford to our own operatives such information concerning their German fellow-workmen as appeared likely to be of service in the establishment of trade institutions of an improved kind in England.

We shall quote a passage from the summary to show the nature of the author's conclusions:—

"There was long an impression in England that Continental artisans are, on the whole, inferior to ours, and that idea was fostered by the fact that, where English machinery was sent abroad, it was considered necessary for one or more English mechanics to accompany and superintend its erection and use. Moreover, our own countrymen undeniably possess greater endurance, and their activity during working hours is greater than it is in foreigners, consequently it was not unusual in great engineering works to employ gangs of English navvies, and it is a not unfrequent matter of amusing comment, even now, that the German workman often performs half his duties with a long pipe in his mouth. But this is the superficial aspect of the case. What the German workman lacks physically is, on the whole, well compensated for by his superior intelligence and sobriety, and it is just there where our artisans have to fear his competition; there it is that they may find in him an example worthy of imitation. We have seen that during his whole life his mental powers are successfully cultivated, and he has been

bettering his condition by this means, whilst the English artisan has been employing physical force to the same end. Which would be the permanent gainer in the long run, if the same line of action should continue at home and abroad, it needs little foresight to discover.

I fear that few of our English artisans fully appreciate, even now, the value of a theoretical knowledge; that being, really, in a multitude of instances, the only advantage, and perhaps a very slight one in degree, which their employers possess over them.

That the mental training of adults abroad is not a system of yesterday is obvious from the length of time some of their 'Culture-Unions'—as, for example, that at Elberfeld—have been in existence; and these have not alone trained the working man himself, but, by showing him his own defects, have made him all the more anxious that his children should be early reared in useful knowledge."

The Art of Garnishing Churches at Christmas and other Festivals. By EDWARD YOUNG COX, Southampton-street, Strand. Second edition.

Mr. Cox has added a number of illustrations which increase the value of his book to those who need it. This sort of thing may be carried much too far,—in fact, is often carried much too far. Still, when it is done it may as well be done tastefully as not, and this book supplies many useful suggestions.

Cassell's Magazine, vol. iv.; **The Popular Educator**, vol. iv.; **Cassell's Book of Birds**.

The bound numbers for the year of *Cassell's Magazine* make a very entertaining and handsomely illustrated volume. It includes two complete novels, "For Her Sake," and "Baffled, or Michael Brand's Wrong." Part I. of the new series contains the opening chapters of a novel by Mr. Wilkie Collins, "Man and Wife," besides a considerable amount of other amusing reading. "The Book of Birds" just now commenced by the same publishers, is an adaptation from the German of Dr. Brehm, by Mr. T. Ryder Jones, F.R.S., and promises to be a complete work on ornithology. It is fully illustrated, and has good coloured plates.

The Timber Trades Price Book. By W. RICHARDSON, Accountant. London: Longmans. 1869.

The author of this volume is an experienced calculator, and has prepared other little works of a similar kind. The present one comprises eight useful tables, with a very few illustrations by way of explanation.

VARIORUM.

"The Parks, Open Spaces, and Thoroughfares of London." By Alexander M'Kenzie, Landscapist Gardener. London: Waterlow, printers, London-wall. The author, in the course of his remarks, points out various desirable improvements, such as we have ourselves occasionally brought under notice. To illustrate the wealth of London in open spaces, Mr. M'Kenzie thus shows their collective extent, as regards the parks and commons, also not forgetting the squares and gardens, disused burial-grounds, &c.

"The parks may be enumerated as follows:—

	Acres.
Hyde Park, containing.....	380
Kenington Gardens.....	290
St. James's Park.....	154
Green Park.....	453
Regent's Park.....	293
Victoria Park.....	336
Battersea Park.....	174
Greenwich Park.....	109
Stourhead Park.....	50
Total.....	2,061

[Then there are Bushey Park and the gardens of Hampton Court Palace, as well as the great extent of Richmond Park.]

Next to the parks, the commons in the suburbs of London require attention; and it is satisfactory to feel that the necessity of restoring these has been so strongly manifested, especially with reference to the threatened invasion of Wimbledon Common, that there is little reason to apprehend any serious interference with them. The principal of these are,—Clapham Common, Tooting Common, Wandsworth Common, Wimbledon Common, Barnes Common, Peckham Eye, Blackheath, Hampstead Heath, Hackney Common and Downs, London Fields, Epping Forest. If proper steps are taken to ensure the preservation of these for public use, a benefit will be conferred upon the future generation, which it would be difficult to over-estimate."

—"Five Hundred and Seven Mechanical Movements." By Henry T. Brown. London: Tribbner & Co., 1870. The author, of the curious and interesting volume is the editor of the "American Artisan." He shows, by engraved illustrations, and very brief descriptions, all those mechanical movements which are most important in dynamics, hydraulics, hydrostatics, pneumatics, steam engines, mill and

other gearing, presses, horology, and miscellaneous machinery. The examples are said to include many movements never before published, and several which have only recently come into use.—"Self-Government for London." By Charles Buxton, M.A., M.P. Published by the Metropolitan Municipal Association, 209, Piccadilly. Mr. Buxton here gives, in the form of a letter to the Home Secretary, the leading ideas on which he conceives a constitution for London should be based. He wishes to stimulate, so far as he can, the action of the Government in preparing, without needless delay, for the creation of a constitution for the metropolis; to enforce what he is persuaded are the two leading ideas upon which any such Constitution should be shaped, viz, that,—

"I. For the administration of all her great metropolitan affairs, the whole of London should be formed into a corporation, on the usual model, with a lord mayor at its head.

II. For all minor local purposes, the ten Parliamentary boroughs already existing should be raised to the condition of municipal boroughs, each of them with an organization of whatever kind may be thought most appropriate, but complete for the management of its separate affairs."

Miscellaneous.

The Inventors' Institute.—The first meeting of the eighth session of this society has been held at the rooms of the Institute in St. Martin's-place. In the absence of the president, Lord R. Grosvenor, M.P., the chair was taken by Mr. Hume Williams, who briefly opened the proceedings. The inaugural address was delivered by Mr. John Inray, C.E., and had special reference to the contemplated reform of the patent law, and the action to be taken by the Inventors' Institute with reference to the subject during the forthcoming session of Parliament. The paper opened with a review of the work which had been performed by the Institute during the last session. Mr. Inray did not for a moment attempt to deny that the existing patent laws are full of faults and injustices. The mission of the Institute he represented to be to promote a root-and-branch reform of those laws, and he maintained that the rights of invention ought to be as clearly defined and as firmly established as those of property, capital, or authorship. The council, he announced, has ready a Bill for the attainment of these objects; and unless their action is anticipated by the appointment of a committee of the House of Commons, they will present it to Parliament next year. At the close of his address Mr. Inray dwelt emphatically upon the importance of this question to the working classes, among whom were to be found many inventors; and the same topic was raised in the remarks with which the chairman opened the discussion which followed the reading of the inaugural address. Mr. F. W. Campion moved a resolution approving of the Bill prepared by the council, and requesting them to take steps to introduce it into Parliament next session. This was seconded by Sir W. Pothergill Cooke, and after some conversation was unanimously agreed to.

Destruction of a Cathedral by Fire.—On October 1, Christ Church Cathedral, Victoria, British Columbia, was totally destroyed by fire. The fire was discovered at the south-east corner, near the chancel, and the entire building was wrapped in flames in an incredibly short space of time. The font, iron safe (containing the church plate), and chancel furniture, were rescued. The organ was carried out in sections, and piled on the rocks, but the damage caused in this operation has made its value now but nominal. The whole of the interior of the edifice became a mass of seething flames, which soon burst through the roof. The bell, in falling, crashed through the building to the ground. Shortly after, the roof of the main building fell in, and that of the aisles soon followed. The walls next gave way. The construction of Christ Church was begun in 1856, and the building was completed in 1856. In February, 1861, a fire broke out in the roof, which was extinguished with slight loss. In 1862 and 1863 important additions were made to the building. No light had been used in the church for several days, and no fires had been lighted in the stoves since April last. Incendiarism is suspected. Unfortunately the insurance was only for 500l. It has been resolved to endeavour to build a permanent edifice, worthy of being the cathedral of one of the most promising of the British colonies.

Stoke Town-hall.—The assembly-room at the Town-hall, Stoke-upon-Trent, has been reopened, after undergoing a transformation. The expense amounted in all to about 150l. The decoration of the hall was done by Mr. Gee, of Stoke, and the alterations and enrichments were carried out under the superintendence of Mr. C. Lynam, architect. The entrance to the hall have been improved, a stage with footlights has been substituted for the former heavy orchestra, all draughts have been cut off, and a warming apparatus has been introduced. The style of the decorations is Neo-Grec, combining the severity of ancient Greek art, with the varied colouring and richer detail of the Renaissance. Round the room runs a coloured dado of a somewhat Pompeian character, forming a broad basal band, which unites the several portions of the architecture. The pilasters which support the cornice have their lower portions decorated with Greek ornament, whilst the upper are picked out in vermilion. The cornice bears upon its frieze diaper panels in gold. Above this is a deep Cove, whose concave surface carries the eye upward to the designs adopted for the ceiling. The principal staircase has been coloured, and the gaslights are supported by bronzed figures manufactured by the Coalbrookdale Company, whilst copies of Copeland's Parian busts of Juno and Adriaen have been introduced on the landing.

Leavesden Woodside.—The Poor-law Board propose to relieve the guardians of St. Pancras from the new school buildings and land at this place, to annex the parish of St. Pancras to the Central London School District, having its school at Hanwell, and to arrange with some other parish in want of school buildings to take the property. The guardians of St. Pancras have expressed their concurrence in this proposal. Mr. Mann, the contractor for the building, having bartered that part of the ground where the drainage works were to be executed, the guardians have directed Messrs. Killingback & Radley to suspend the execution of the drainage works for the present. Mr. Mann has offered to the guardians to allow the drainage works to be proceeded with on condition of their granting him an extension of time of three months to complete the buildings, and to indemnify him against any damage done to the building in the execution of the drainage works. The guardians have given Mr. Mann notice to complete the works by the 3rd of April next, according to the terms of the contract. The guardians have expressed their determination to push on the completion of the buildings with the utmost expedition.

The Oratory of St. Gwithian.—A word for the preservation of this very ancient relic is given by the *Cornish Telegraph*. It lies on the right side of the road leading from Gwithian to Codrevy, and about 200 yards in from the road. It seems, from the road, just like an ordinary mound of sand, overgrown by grass; but the four walls of this ancient building still exist. It stands east and west, and the form of the chancel is quite preserved. The walls of this ancient place, which carries us back, it is believed, to the fifth century after Christ (having been built by the British long before the conquest of this part of England by the Saxons), are constructed in the same way as those of St. Piran in the sands (Perranzabubo), with rough stones of all sorts and sizes, put together without mortar. The whole of the interior of the building was at one time excavated, showing the inside of the building, of course without roof. A recent visitor to the spot found one part of the northern wall fallen in, as he thought from the pressure of the sand from outside. He found the whole spot in a very unprotected and desecrated condition. If it were railed in it would be secured from cattle, &c. If something be not done soon it will be too late, and the loss, like that of Trewhella Crose and other old relics of Cornwall, may be regretted, but never replaced.

The National Education League.—A public meeting in favour of the National Education League was held in the hall of the Hartley Institution, at Southampton, on Friday, the 19th, when the following resolution was passed, viz.:—"That this meeting desire to express its hearty approval of the general objects of the National Education League and all the means by which it is proposed to attain them; and the friends of education here present hereby pledge themselves to use their best endeavours to promote the success of the League in this town and neighbourhood."

Mechanico-Chemical Ventilation of Hospitals, &c.—Can a circumscribed atmosphere, vitiated by the respiration of an animal confined in it, be rendered normally pure? Chemistry furnishes a certain reply—it can. That is to say, the generated carbonic acid being absorbed, and an amount of oxygen added proportionate to the quantity existing in the carbonic acid. The *Engineer*, in writing on this subject, says:—"We have no hope that the scheme of mechanico-chemical ventilation can, or at least will, be applied to ordinary dwellings. Not only would the cost be too great, but the necessary mechanical and chemical conditions would be wanting. We can see no reason, however, that should debar its application to hospitals and sanitariums, and possibly to barracks and prisons. [Surely workhouses would be as readily ventilated on this principle as prisons? Why should prisons be preferentially suggested?] To take an extreme case, let the proposition be to ventilate a fever ward, in a situation where fever is endemic, to ventilate it with pure normal air. Surely there should be no difficulty in pumping the necessary supply of air through cream of lime, to effect separation of carbonic acid, sulphurous acid, hydrochloric acid and aqueous vapour; then through oil of vitriol to effect separation of ammonia. The result would be air almost chemically pure, so far as the chemical agents specified are concerned; and probably the fever miasm would also have been eliminated. In certain cases, it might be thought desirable to medicate the injected air—to charge it with ozone, for example. This, again, could readily be done in a way we need not stop to particularise.

Proposed Bridge over the Ouse.—A public meeting has been held at Calwood to consider the projected bridge over the river Ouse, at this place. The chairman said Mr. Hodgson, the engineer, had surveyed the site of the proposed bridge, and had prepared an estimate of the probable expense, which was 6,339r. 8s. Messrs. Pease & Hutchinson, Darlington, had also furnished an estimate of the cost, which was below that of Mr. Hodgson's, but this did not include sundry expenses connected with the scheme, which were embraced in Mr. Hodgson's calculations. It was resolved that three gentlemen should be chosen as trustees. Mr. Noble explained that the 6,000l. capital was proposed to be raised by 600 shares of 10l. each; 1l. to be paid on allotment, and 2l. on the 1st of January next. It was arranged that the tolls should not exceed those charged at Selby Bridge. Upwards of 2,000l., representing 200 shares, were subscribed at the close of the meeting.

Relapsing, or Famine Fever.—At a meeting of the managers of the Metropolitan Asylums Board at Spring-gardens, on Saturday, November 20th, Dr. Brewer, M.P., in the chair. After the disposal of the ordinary business of committees, the especial attention of the managers was called by the chairman to a report from the special committee on the subject of the provisions to be made for the outbreak of relapsing fever in and around the metropolis. The result is that the recommendations of the report have been adopted; and the Fever Hospital authorities will accordingly erect a temporary hospital in their grounds, to be rented by the Asylums Board, and to be ready almost immediately for 60 patients. The rate at which the fever increases, however, forbade the managers to rest there, and a temporary hospital will be erected at Hampstead, which can be extended and fitted up for 60, 120, or 180 patients, if requisite. The Hampstead hospital can be erected in thirty days.

A Bridge Washed Away at Carlisle.—Recently a violent storm of wind and rain prevailed in the neighbourhood of Carlisle. This continued downfall of rain soon told on the rivers Eden and Caldew, and both rivers overflowed their banks, and hundreds of acres of land near both rivers were submerged to a great depth. At Cummersdale, a strong wooden bridge spans the Caldew, and during the night this bridge gave way under the force of the torrent, and was carried off bodily.

Social Science Association.—At a meeting of this Association, held at the Board-room, Adam-street, Adelphi, Mr. G. W. Hastings, president of the Jurisprudence Department, delivered an able address, in which he reviewed the discussion at the Bristol Congress "On the Relation between England and her Colonies." A discussion ensued, which was adjourned.

Plumbing for Calcutta.—The Justices of the Peace for the town of Calcutta are inviting the attention of manufacturers and others interested in the supply and erection of house-fittings for a supply of water on the constant-service system to the large field for the sale of which the Calcutta Water Works will afford at the commencement of next year, when the new water supply, under pressure, will come into practical operation throughout the whole town. The drainage works, in an important portion of the town, are also so far advanced as to admit of the introduction of water-closets and sinks in connexion with the new water supply. The justices' agent in England is Mr. Philip Wall, of Victoria-chambers, Westminster.

Paddington Almshouses.—It may be worth noting, for the use of future topographers, that these almshouses were commenced to be pulled down on July 4, 1869, to give place to five shops which are to be built on their site. They consisted of eighteen rooms, being intended originally for eighteen inhabitants. Latterly, however, each occupant had two rooms. On the front of these houses was a large stone with the following inscription on it:—"These Almshouses were built A.D. 1714, at the expense of the Inhabitants for the Poor of this Parish past their Labour. Robert Cromwell, George Clackie, Churchwardens."

Exhibition of Old Masters.—It is very satisfactory to know that the Royal Academy intends to hold an Exhibition of Ancient Masters, together with a selection of the works of Stanfield and C. B. Leslie, during the months of January and February; prompted by a feeling of the loss to art in consequence of the abandonment of the Exhibition of Ancient Art formerly held under the auspices of the British Institution. But this in no degree excuses the managers of the Institution for what must be considered little less than the betrayal of a public trust. What do they intend to do with the large sum of money they have in hand?

Proposed Mechanics' Institute and Public Rooms for Manningham.—At a recent local public meeting arrangements were made for the appropriation of the site of the building now in trustees' hands, and heretofore occupied by several religious bodies for places of worship and schools. The site and buildings will be sold to the promoters of a Mechanics' Institute, who propose erecting a large room for public meetings, religious services, &c., and a news-room, library, class and other rooms.

Westminster Abbey.—A correspondent says that some recent excavations at Westminster Abbey have revealed the ground-plan of an old building that formerly stood just within the angle formed by the junction of the north transept with the nave, externally. The outline of the stone walls thus laid bare runs due east and west for about 60 ft. There are steps leading apparently down to a vault, and smaller steps that led apparently up an octagonal stair-turret. Amongst other remains is a stone sarcophagus, with a leaden coffin within, which has not yet been opened.

Opening of the Southern Thames Embankment.—The southern portion of the Thames Embankment was formally opened on Wednesday last by the Metropolitan Board of Works. The members of the Board assembled at the office in Spring-gardens, and thence proceeded to the Surrey side of Westminster Bridge. They then passed along the embankment, headed by Sir John Thwaites, chairman of the Board, to Lambeth Church, where they were joined by the members of the Lambeth vestry.

Lime-street Hotel, Liverpool.—In our remarks last week on this building, wherein we state the masonry is in every respect admirable, we might have added (we are told) that Messrs. Roberts & Robertson were the builders, Messrs. Howarth & Clydesdale their foremen; and that it was done under the superintendence of Mr. C. Tate, clerk of works. This information had been already given, we believe, in our pages, but we will not object to repeat it.

Statues.—A statue of the late Mr. Peabody is to be erected at Baltimore at a cost of 150,000 dollars.—It is intended to place a statue of the late Earl of Derby in the Carlton Club.—Hiram Powers, the well-known American sculptor, has nearly finished an "Eve," which some connoisseurs think the best thing he has yet done.

Opening of New Music Hall, Derby.—The new music-hall, erected in Princess-street by Messrs. Harris & Cant, has been opened. At present the building is in an unfinished state, but when completed it will be capable of accommodating upwards of 2,000 persons. The foundations consist of brick and stone, carried upward by woodwork, and covered by a roof of corrugated iron. The entire length is 120 ft.; width, 66½ ft., and the height between 59 ft. and 60 ft. The stage is 46 ft. long by about 32 ft. wide, and is fitted with every requisite appliance, retiring and dressing rooms lying to the side. The proscenium is lofty; and the act drop and scenery were painted by Mr. D. Bosco Hughes, of Birmingham, and Mr. Thos. Cbinn, of Manchester.

Ship Ventilators.—A plan, invented by Mr. William Chambers, has been published, with illustrative diagrams, in *Scientific Opinion*. It is called a self-acting ventilator, and is said to be applicable in every case where a current of air exists or can be created; and the same effect is produced whether the air blows at the rate of twenty miles an hour into the mouth of the ventilator when it is standing still, or whether the ventilator passes, as the ship moves, through the still air at twenty miles an hour. The air enters the large mouth of a pipe, and can only escape through the small end with great force into a larger pipe; there it drives out the foul air escaping from the chamber, to be constantly filled from below, at a rate proportionate to the quantity of air received into the month.

Trade Fixtures.—The Court of Exchequer Chamber has affirmed the decision of the Court of Exchequer, in the case of *Climie v. Wood*, holding that trade fixtures annexed to the freehold for the more convenient use of them, and not to improve the inheritance, and capable of being removed without any appreciable damage to the freehold, pass under a mortgage of the freehold to the mortgagee. The decisions which establish that a tenant may remove trade fixtures are inapplicable as between mortgagor and mortgagee.

The German Gallery, Bond-street.—This gallery is at present occupied with 283 sketches in oil, by Mr. W. W. Warren, recently taken in Rome, Naples, Venice, Corsica, and elsewhere. They show great facility and much skill in seizing salient points so as to convey similitude, but they are over slight, as it seems to us, for public exhibition. The artist revels greatly in beds of flowers, which he represents with considerable effect.

Novelties in America.—A loom is now on exhibition in New York, which is capable of weaving cloth 6½ yards in width; also a centrifugal pump, which has the power of raising in one minute not less than 25,000 gallons of water. From the granite quarries of Mouson, in Massachusetts, there was recently taken a slab 350 ft. in length, 11 ft. wide, and 4 ft. thick, measuring altogether 15,440 cubic feet, and weighing 1,283½ tons.

Gloucester.—A new school in Milbrook-street, a remote part of the St. James's district, in the rapidly-growing neighbourhood of the new Wagon Works, has been opened. It is a brick building, internally whitewashed, and having a class-room above and one below, with all the usual offices, and capable of holding considerably more than a hundred children. The cost was 450l. Mr. Ashbee prepared the plans, and Mr. Mann was the builder.

Landowners' Progress.—It is stated that the late Earl of Derby has left behind a fortune of 190,000l. a year. When his lordship succeeded to the estates they were said to be worth 60,000l. a year; and the great increase is attributed to the wonderful extension of factories in Lancashire, and the consequent enormous increase of buildings.

TENDERS.

For additions to the Maidstone Union House, Mr. Martin Bulmer, architect. Quantities by Mr. G. Back—

The Builder.

VOL. XXVII.—No. 1400.

Researches upon the Strength of Materials employed in Modern Systems of Building.

Are in receipt of the second and concluding volume of Mr. Bindon Stoney's work on strains in girders and similar structures.* The publication of the first part of this treatise some three years since, it may be remembered by some of our readers, received at the time a passing notice in our columns.

The work in its complete form appears likely to prove so important a contribution towards the elucidation of the science and practice of construction that we are inclined to consider that the present volume, from the elements of which

it treats, puts forward claims to somewhat fuller notice.

Although so long an interval may be regarded by some to have elapsed before the appearance of the concluding portion of the work, when the wide range of authorities to which the author has had occasion to make reference is noted, and the nature of the inquiries incident to such a work is borne in mind, it will no doubt be admitted that time would be necessarily occupied in the production of such a volume as that which is now before us.

It appears at an opportune moment, as a want has long been asserting itself, not less on the part of the general public than in professional circles, with reference to the comparative safety and durability, as well as cost of modern engineering and architectural erections. More particularly may this, perhaps, be said to be the case in regard to compound structures in which iron and other materials may have been extensively employed.

A theory has sprung up of late years which has been by many considered favourable to the application of iron to building purposes largely in conjunction with the ordinary practices of architecture. Since the introduction of this system, however, the theory of construction itself would appear to have become so widened by successive changes in the manufacture and preparation of building materials, more especially of lately added elements, that former investigations into the strength and properties of materials, have in some instances become more or less valueless and inapplicable. Unlike a somewhat similar treatise to that which is now under consideration, which was issued by Mr. Clark, and founded upon the construction of the Conway and Britannia tubular bridges,

the conclusions which have been arrived at by the author of the present volumes are not alone based upon such features as might have been observable during the erection of any particular undertaking, but in addition embrace the opinions of many well-known authorities who have treated of some of the questions which are involved. The treatise upon the Anglesea and Carnarvon Bridges has long been regarded as an authority of rank, owing to the circumstance that many of the assertions which it embodies could be referred to actual experiments which were necessitated in carrying out the undertakings of which the work treats. The value of Mr. Stoney's work, independently considered, may be inferred, when it is remembered that in a single span of 460 ft. of the Tubular Girder Bridge, between Holyhead and Anglesea, no less a quantity than three thousand tons of material is employed, while in other structures which serve a like purpose the desired objects have been accomplished with less. Notably we would refer to the late Mr. Roebling's bridge over the Niagara Falls, in America, a structure which is, as well known, used for purposes of locomotive passenger and goods traffic, and yet comprises within a single span of 820 ft. only one thousand tons of materials, and of this quantity more than one half is timber. The scope which, by such a contrast alone, would seem to be afforded for a more economical adaptation of material than that which obtains in English practice, might be considered to justify the researches into which Mr. Stoney has been led in these volumes, and we would have been far from displeased to have observed a reference to the comparative cost, style, and weight of such undertakings as executed in England and elsewhere, notwithstanding the prejudicial reflections to which such an inquiry might be calculated to give rise.

The question of the weight of materials demanded in the erection of bridges was, we believe, first sought to be experimentally realised in this country by Mr. Peter Barlow, whose standard investigations upon the strength of materials are frequently referred to in the present volumes. Although, contrary to the predictions of the moment, considerable success has attended the erection of the Niagara Railway Suspension Bridge, the system upon which it is constructed would not appear to have largely recommended itself for adoption. Numerous cast-iron railway bridges have recently been erected over the river Thames, and in some instances the question of level has, at great additional cost, been seen to have been subordinated to the requirements of an arched structure. A more extensive application of the Niagara Bridge system has been lately employed in the designs of a grand bridge over one of the American rivers, and we believe that it has long been an object, on the part of Mr. Peter Barlow, to introduce a somewhat similar class of suspension bridge into the domain of engineering science in this country. It is well known that the present Lambeth Bridge embodies a most important series of investigations as to the cost and stability of bridge accommodation, and that Mr. Barlow made a special journey to inspect the Niagara structure before this experiment was attempted. The longitudinal stiffening of the Lambeth Bridge is of iron, while in Mr. Roebling's design it is of wood. The question as to the desired rigidity in such structures mainly resolves itself into the dependence which may be placed upon the nature of the materials to be employed. Prior to the application of iron in the form of wire cables in suspension structures, it is well known that English engineers regarded with much diffidence the continuity of certain qualities in iron throughout great lengths, either in the form of girders, suspension links, or laminated bands. This doubt yet largely prevails, and some important

evidence is adduced in reference to these points by Mr. Stoney, which is likely to engage considerable attention in the professions of engineering and architecture.

We are led to infer that the author is in accord in a certain measure with Mr. Barlow as to the magnitude of practicable spans upon the suspension principle, and that this object would be chiefly likely to be attained where the inherent defects attending the application of iron in ordinary forms may be avoided. So far, up to the present moment the economical appliances of iron in the erection of bridges of large span would appear to be discovered in cases where that material has been employed in the form of continuous twisted wire ropes. In view of the future erection of any large railway bridge, say for instance, over the Mersey, uniting Liverpool and Birkenhead, a project which has been long contemplated; or, in the event of the necessity arising for the maintenance of the connexion between Holyhead and Anglesea, should the existing means fail, the practicability of the suspension system as seen to be successfully carried out in America will necessarily claim further attention and research.

Mr. Stoney's references to the experiments of Mr. Kirkaldy, which are given in a valuable tabulated form in the body of the work, are in no way calculated to reassure us as to the advantages which would be likely to attend a too unguarded employment of iron and cognate materials in architecture. It has been demonstrated that regard must be paid to architectural requirements in cases where iron may be proposed to be employed as an auxiliary material, and many results tend to prove that in this respect the tentative science of engineering must be held subordinate to the better founded and established laws of architecture.

Mr. Stoney observes that when an imperfectly elastic material has received a permanent set from the application of any weight, which is subsequently removed, the material becomes more perfectly elastic than before within the range of strain which first produced the set, and its alteration of length per unit of strain is less than at first. For practical purposes the author asserts that the limits of elasticity in wrought-iron does not exceed twelve tons per square inch; and though higher strains than this may not in the least diminish its ultimate strength, yet they will take the stretch out of it, and this may render iron which was originally tough and ductile so hard and brittle as to be seriously injured for many purposes. It is, in our opinion, to the injudicious tests to which iron is occasionally subjected, that many cases of rupture may be attributed in that material, and possibly many instances of disastrous boiler explosion. The extreme facility with which the tensile strain and compressive resistance of iron may be regulated has almost rendered the employment of that material at length dangerous, especially in conjunction with materials of dissimilar properties.

Iron may be made to pass through so many grades of deterioration in its manufacture without readily indicating the processes to which it may have been subjected without actual strain or fracture, that the tendency of home and foreign competition, coupled with the facilities to which we have referred, has resulted in bringing the production of that article in England in some directions to a discreditable level. It would appear that the tensile properties of iron may be retained over a wider range of cheap contamination than some of its other properties, and many of the qualities of iron now usefully employed in building are imported from abroad.

We notice with interest that in connexion with the theory of strains in girders and similar structures the imperfections which are most commonly to be met with in the materials which are adverted to, are viewed with that importance

* The Theory of Strains in Girders and similar Structures; with Observations on the Application of Theory to Practice, and Tables of the Strength and other Properties of Materials. By Bindon B. Stoney, B.A., Member of the Institution of Civil Engineers, and Engineer to the Dublin Port and Docks Board. In Two Volumes, with Illustrations. London: Longmans, Green, & Co. 1869.

which this branch of the subject deserves. There could not, perhaps it may be said, be found in any publication extant a more masterly exposition of the general properties of iron than is to be met with in this volume. No review of a work of this kind could probably do full justice to its contents, for, being mainly intended for the instruction of engineering students, and for guidance in the varied elements of constructive science, it would be attended with difficulty to single out for especial remark any particular branch of which it treats. We do not remember, however, in any similar work which has come under our notice to have observed the question of connexions in iron so treated of as in some portions of the later volume, more particularly under the heading of appliances for connecting ironwork, pages 351 to 370. A perusal of the first 265 pages of vol. II. would well repay the attention of architects and builders, being composed more particularly of a treatise on compressive resistances in bodies of brickwork, stone, iron, and various classes of cements, as well as including the action of cements and binders' materials under tensile and lateral strains. This feature of the work, in view of the recent incident at the Holborn Valley Viaduct, is entitled to especial attention.

Quoting some experiments of Mr. Clark, in relation to the action of stone under compression, the author says that in the instance which he refers to, "the sandstones gave way very suddenly, and without any previous cracking or warning. After fracture, the upper portion generally retained the form of an inverted square pyramid, very symmetrical, the sides hulging away in pieces all round. The limestone formed perpendicular cracks and splinters a considerable time before they crumbled."

It will be borne in mind by many that this description represents nearly the order in which the fractures in the Farringdon-street columns would seem to have been generated. We hope, however, these are not so extensive in the mass as might be inferred from the external appearance of the columns. Continuing from this portion of the work, Mr. Rennie observes, "it is a curious fact, in the rupture of amorphous stones, that pyramids are formed, having for their base the upper side of the cube next the lever, the action of which displaces the sides of the cube precisely as if a wedge had operated between."

The features which have presented themselves in the visible lines of fracture upon the polished facets of the Holborn Viaduct columns, appear so to approximate to what might have been anticipated from the experiments which are described in this portion of Mr. Stoney's work on the theory of strains, that we view the occurrence with a regret which no assurance with which we have yet been inspired has diminished to the extent that could be wished.

The importance of such a treatise as that which Mr. Stoney has at length produced in the hands of the pupils of modern engineering and architectural establishments cannot well be overrated.

In concluding the observations which we have been led to make upon the perusal of the work, we would note the singular lucidity of the arrangement of the letter-press and the novelty of the illustrations which is displayed. As an example of the clearness and simplicity for immediate reference with which works of a similar character may be contrived, it may claim to possess several features well worthy of imitation.

In the absence of that special education which is supplied in engineering schools and colleges on the Continent, many of our apprenticed students are left to acquire the elements of their profession at *par-bazard*. It is impracticable that any engineer or architect of reputation could advance by personal instruction the number of pupils which may be found in the leading offices, and the progress of younger members of the profession is consequently narrowed, and mainly dependent upon such facilities of observation and imitation that they may chance to possess.

Mr. Stoney's work lends a ready key to the more abstruse elements and problems of constructive science; and it is sufficient to bear in mind the length of time over which the author's labours have extended in his prodigious reach to the conclusion that the work may have been written with other objects than those of pecuniary gain or contemporary praise.

It cannot fail to be regarded as a valuable accession to the literature of applied arts and sciences, and in its more especial direction should take a foremost rank.

THE LIGHTHOUSES OF THE BRITISH ISLES.

The Trinity Board.

SCATTERED notices have appeared from time to time, in the periodicals of the day, of some interesting particulars as to engineering and other works in connexion with our lighthouse system; but the topic is so peculiarly attractive to the "gentlemen of England who sit at home at ease," that we propose to lay before our readers a general sketch of the whole arrangements for the illumination, if we may so call it, of our British coasts.

The genius of the nation is prominently distinguished for its voluntary enterprise, as distinct from Government control: witness the Lifeboat Institution; up to the present time a private society supported by the liberality of the public. The lifeboat is the last hope of the wrecked sailor, when the winds and waves are doing their worst; and surely one of the sublimest forms of charity is that which saves our mariners from the last danger of the vasty deep.

With this, however, at the moment, we have not to do; our subject is what may be called the previous question. The lights that show the dangers of our rock-bound coasts are the most important agents in carrying out the wish that used to be expressed in homely terms upon our bills of lading, and so God send the good ship to her port in safety.

Who builds our lighthouses, and how are they maintained? Whence come the requisite funds? What is the construction of the lighthouses? and what are the lights themselves? are questions in which we, as the first maritime nation in the world, should, and do, feel the deepest interest.

Pharosology, the modern term for the science of lighthouse building and lighting, remained, up to the commencement of the present century, nearly in the same state as it had been left by the Romans a thousand years ago; but since then it has made rapid strides. The celebrated Cordouan tower in the Bay of Biscay, completed in 1611, may be called the first of modern lighthouses, as indeed modified by successive improvements it probably still remains.

The Eddystone, off Plymouth, familiar to us by Smeaton's celebrated work, was perhaps the next of note. It was completed in 1759.

The next great rock lighthouse of modern times was the Bell Rock, on the east coast of Scotland, built by Robert Stevenson in 1810, from which date improvement and development have been rapid and various, both in the erection of the towers and the method of lighting.

And first, as to the question of who builds our lighthouses, we answer, the Trinity Board of Deptford Strand; and a few words as to their constitution and functions may not be out of place. They are a chartered corporation, dating back from Medieval times, their various charters, of which we have record, having been granted successively by Henry VII., Henry VIII., Edward VI., Elizabeth, James I., and Charles II., and under these charters their powers were exercised, and their sphere of action developed, until, by the Mercantile Marine Act of 1854, a certain jurisdiction was given to the Board of Trade, and some important alterations took place in the financial arrangements.

The powers of the Board extend to buoys, beacons, and sea-marks, as well as lighthouses, though probably the last exceeds all their other functions in interest and importance. Charters, from Magna Charta downwards, have been granted by the Crown for various objects of public weight or private interest as long ago as any record has been kept in any archives; but probably this is the sole instance of a private chartered corporation, for that was its original character, still at the present moment discharging, and that efficiently, though subjected to the most searching investigation, the very duties for which it was originally constituted in the dark ages of our history.

One of the records of the early renewals of the charter, date of Charles I., contains a characteristic comment as to what may be called the popular element in its earlier constitution, in the following remark from the well-known pen of Pepys, of the "Diary," the first master of the corporation,—"That the number of younger brethren could not be too great, that mariners are the strength of the nation, that every one has a right to be a brother, and that if there were 4,000, it would be more for the king's service than 400."

Our City companies, chartered as they are, have now entirely lapsed from their original

vocations, and remain still noble institutions but confined in their daily work to social, charitable, and, in a minor and indirect way, political objects.

The greatest, probably, of chartered companies, the old East India Company, has only lately, as we may say, been absorbed into the Government of the country; but the Trinity Board, earlier in its institution than most of these, has survived them all, and is still doing its legitimate work, and doing it well.

In its present form the Board is self-selective, and pre-eminently nautical in its character. The younger brethren correspond to the livery of an ordinary company, and the elder brethren represent the court, consisting almost entirely of captains who have had the command of vessels for a number of years.

It will be readily seen that a vast mass of actual practical knowledge of the special requirements for lighting our coasts must be at the command of a body of men thus constituted.

The whole of the executive business is transacted by the elder brethren, subdivided into various committees, though certain special matters must be submitted to the approval of the whole body, e.g., the erection of a new lighthouse. Some few years ago, this particular point was made a subject of popular investigation, or, we might almost say, suffrage. The inhabitants of the district were carefully canvassed, and it was only on presentation of petitions, signed by what was deemed a competent and sufficient majority, that the erection of a lighthouse, and, of course, the imposition of the consequent dues, was determined upon. The predominant authority of the Board of Trade, however, has much modified this course during the last few years, and the matter now rests much more entirely with the central authority.

The Trinity Board are the authorities in England, subject to the Board of Trade. In Scotland, there is a separate Board, "The Commissioners of Northern Lighthouses," always to a certain extent in union with the Trinity Board, though not incorporated with it. The same duties are discharged in Ireland by the "Commissioners for Irish Lights."

Local and harbour lights are also under the particular superintendence of the authorities of the port or harbour where they are situated, under the general superintendence of the Trinity Board, and these different authorities throughout the United Kingdom exceed 150 in number.

As in the case of most original charters, a sort of monopoly was the foundation of the grant, i.e., a right granted by the crown to erect lighthouses, with power to charge upon the vessels using those lights a regulated toll. For many years this right was conceded to private individuals, as well as to the corporation; and there were many private lighthouses, each with its special radius and particular dues, thus erected,—much of the nature of a toll levied upon a road for improvement or otherwise.

In 1836, however, an Act of Parliament was passed, in view of concentrating and consolidating our lighthouse system, which gave the Board the power of buying up these lights for a compensation awarded by juries, in the way with which our late railway experience has made us familiar; and the sum thus expended by the Trinity Board was considerably over one million sterling. For the Smalls Lighthouse, at the entrance of the Bristol Channel, of which we shall give a further description, was paid the sum of 170,186l. 7s., and for the Skerries, 441,984l. 11s. 3d.

So time ran on; the lights originally granted, and subsequently purchased, were maintained by the Board, and the dues collected by tolls in the earlier portion of the period, and more lately by a carefully compiled and minutely subdivided table of tonnage, until in 1853—the last year under the old system—the outgoings of all descriptions, buildings, lights, repairs, maintenance, &c., were, in round numbers, 136,000l., and the income, 423,000l.; the enormous balance being expended partly in liquidation of the debt incurred in purchasing the lights, and partly in charitable purposes.

It was felt, when the general arrangements were revised, that the maritime community were being unfairly taxed for the benefit of the general public; and the result is, that the tonnage dues alluded to above have, within a period well within the memory of the present executive, been reduced by 50 per cent.; the object being to render the corporation self-supporting, without surplus or deficiency.

The Board has a good character. The Master (the Duke of Edinburgh) receives as nothing, and the fees of the elder brethren are little more than nominal, when their duties and responsibilities are fairly regarded.

The Lighthouses.

The total number of lighthouses in Great Britain and Ireland exceeds 400; of these, something less in number than one-half are under the direct control of the Trinity Board, the remainder being under the same general superintendence, but managed by district local authorities, under different Acts of Parliament. All the more important stations and great rock lighthouses are included in the former section; while they vary in dimensions from a simple column bearing a gas-lamp, to the famous erection of the Skerryvore, a granite tower 153 ft. in height.

The cost of three of these is as under:—

	Cost.	Height.
The Bishop Rock Lighthouse, near the Land's-end.....	36,000l.	145 ft.
The Bell Rock.....	61,000l.	117 ft.
The Skerryvore, on the west coast of Scotland.....	85,000l.	158 ft.

When a lighthouse has to be erected on an ordinary foundation, the common principles of building, of course, apply,—the weights to be carried, the height of the structure, and the accommodation to be provided, are mere matters of ordinary professional calculation. But the peculiar difficulty of constructing many of our lighthouses is derived from the fact that they are erected under circumstances of the most exceptional danger, and that the most powerful resources of engineering science have to be brought to bear to cope with unusual characteristics, either of the forces to which they are exposed or the character of the foundations upon which they are to be erected. And first, as to the forces to which they are exposed, taking the Great Rock Lighthouses as our example, the vanguards, as we may call them, of our shores, which have been gradually pushed further and further from land in the face of the enemy, the sea. The force of the impact possessed by the waves of the sea in a stormy weather is something terrific.

Mr. Thomas Stevenson constructed a self-registering instrument, which recorded the power of the waves that struck it, with the following result:—The average pressure at Skerryvore, for five of the summer months of 1843-4, was 111 lb. per square foot. The highest pressure registered during the height of winter storm was 6,683 lb. per square foot, and to this extreme power the lighthouse in question opposed a successful resistance. It may probably be regarded as the maximum pressure of the sweep of an Atlantic wave. In less exposed situations the pressure is much diminished. At the Bell Rock, in the North Sea, the highest registered pressure was 3,013 lb. per square foot.

The most exposed lighthouse in the world is probably the Bishop Rock. On the 30th January, 1860, the following incident occurred. We may say that there is a bell provided as a fog signal, which is hung more than 100 ft. above the sea-level. It weighed 3 cwt., and was hung with unusually strong iron fittings and gudgeons. On the date above named a storm wave actually wrenched the bell from its fixing; it was dashed to pieces on the rock, and a fragment was found some days afterwards firmly imbedded by the force of the storm in a crevice of the rocks.

Such are the forces that have to be overcome. We shall now proceed to give some further detail of the erections which are found efficient in resisting these influences from year to year, and their cost.

The ordinary land-towers throughout the United Kingdom generally approach 100 ft. in height, and cost from 10,000l. to 11,000l.; but there are many much less in size. The cost may be taken at an average of 8,000l.

There are forty-seven light-vessels under the control of the Board; their average cost, with the moorings complete, may be taken at 7,000l.; but their maintenance is very expensive, owing to the crew required. It may be taken at 1,100l. per annum, or about four times that of a first class fixed light. And here we may notice the introduction of pile lighthouses on shifting sands as substitutes for floating lights.

Proverbially the worst foundation for an erection is the sand. "The house that was built upon the sand" is the type of all unstable erections. How much more when that sand is a quicksand in a waterway covered at high water, and shifting with the currents.

The pile lighthouses have to be erected under

these difficult conditions, and we shall proceed to give a detail of one or more of the successful ones, as there have been instances in which they have had to be taken down, owing to the shifting or failure of the foundations. The first was erected upon the Maplin sand, off the Essex coast, from the design of Messrs. Walker & Burgess.

It is a curious fact that sand-banks, although so treacherous at their surface under the peculiar action of the water that they will gradually absorb and bury whatever solid matter is left exposed to the action of the tide, yet when the immediate surface is passed through they afford a sufficiently solid foundation for the erection of heavy structures upon piles. Indeed, of such a stubborn and solid nature is the interior of the bank that it is impossible to penetrate it with an iron har, although driven by a pile-engine beyond a certain depth; and it is in reliance upon this peculiarity that pile lighthouses are constructed.

The Maplin Lighthouse is erected upon nine piles of wrought iron, 6 in. in diameter, furnished with screws at the bottom 3 ft. across (ordinary screw pile) driven, or rather screwed, down into the sand; and this is the only foundation.

From these piles spring strong cross-braced timbers in cast-iron sockets, starting from about 2 ft. above high-water mark. The total height of the building is 36 ft. above the same level; and the upper portion consists of an octagon room 6 ft. high and 27 ft. in diameter, entirely framed in wood, tied together with iron, and encased with wood boarding; the lantern rises high above it in the centre.

The room is divided into two sleeping-berths, a dwelling-room, and store-room; and below the floor, in the angular space left by the intersection of the cross braces, are coal-cellars, water-tanks, and other necessary conveniences.

The cost of the whole was about 5,000l.; and we may here notice a peculiar instance of the action of the sea on quicksands.

When the lighthouse was built, a strong timber-framed raft was first laid upon the surface of the sand, upon which the men worked, and through openings in which the piles were driven. When the work was done, it was suggested that the raft should be left as it was, with the object of acting as a tie, and strengthening the foundation, but a curious result followed: the scour of the water lifting and dropping the raft with every wave, had precisely the same effect upon the raft as it has upon a vessel, and it gradually began to work its way down into the sand, slipping over the piles, but with this difference, however, that, being held fast in its place by the piles, the sand would not cover it, but was washed away from its upper surface. It thus gradually sank for some years, lower on the one side than on the other, until there was an open pit in the sand several feet deep, and the whole size of the foundation, raising grave apprehensions as to the security of the building.

Many hundreds of heavy faggots, with tons of chalk attached, were put in in the hope of filling the opening, but the next storm invariably swept them away.

This went on for some years, until one season the pit was so deep that a sufficient accumulation of sand gathered on the upper surface of the raft, to prevent its being again moved by the water. Once at rest, the same agent that had occasioned the damage repaired it: the wash of water filled up the pit with sand, and the top is now a level surface with the rest of the bank. The house was erected in 1840.

We must reserve the remainder of our statement for another number.

ON SOME OF THE DIFFERENCES OF STYLE IN OLD BUILDINGS.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of the Institute held on Monday evening last, Sir W. Tite, M.P., president, in the chair, Mr. G. E. Street, A.R.A., read a paper "On some of the Differences of Style in Old Buildings." Mr. Street commenced by remarking that he should confine himself on this occasion to bringing before his audience some considerations as to the causes which produced the differences of style observable in

Medieval buildings throughout Europe. It was, he said, the especial glory of our national architecture that its developments are so many, so various, and so true that no one who has both zeal and brains can avoid having his enthusiasm awakened in the course of his study. The differences in style in old buildings are very great, and the result of various causes. The work of old architects owed not a little of its vigour to its variety. Each man who had any inspiration did the best he was of, and of course produced his school of followers, and the fact that so many men did this showed how infinite is the life and variety of which Gothic architecture is susceptible, always in strict obedience to the true principles upon which it was founded. Among the causes of variety the following were mentioned:—

1st. The requirements of materials, which are obviously different in districts which allowed of the use of only stone, or brick, or timber.

2nd. The influence exercised in certain districts by exceptionally gifted architects.

3rd. The spread of art-knowledge by orders of men such as Freemasons, and religious orders whose habits gave them knowledge of countries other than those in which they were for the time working, and in the course of conquest or colonisation of one country by another; and, lastly, the employment (not at all uncommon in the Middle Ages) of foreign architects.

4th. Attempts in one age to copy work done in a previous age.

The requirements of the most available material certainly played no small part in the history of architectural development. We must remember that of old an architect was almost compelled to use the material nearest to his hand; water conveyance being the only chance he had of importing the material of one district into another, and of this ample use was made, but, of course, the opportunities were rare; but in thus working in the material nearest to hand, the architect dignified his art by proving that no material which God had provided was unworthy of it. Thus it was, in the Middle Ages, a good stone country produced good masons. The country about thus became proud of their work, and gave them plenty to do; and so from age to age they produced a succession of buildings, all worthy of our admiration. It was difficult to build badly with plenty of good stone to build with. The dignity of the material was a safeguard against utter badness of workmanship, and so the best art in England and elsewhere is found nearest to the best stone quarries. Wherever stone could not be procured in the neighbourhood, there the artists did their best at once to make the most of the other materials which were available. Throughout Europe, the early architecture was the work of stonemasons, and the carpenter and bricklayer were but little esteemed; but when in the Middle Ages other materials had to be used, there arose the first opening for a difference of style, caused by a change of material. Take the case of a granite country. Go to Guernsey, where granite was plentiful, and where there was no timber to be had, and we find buildings expressly contrived to meet this state of things; and this was especially noticeable in the churches. With all their rudeness of construction in an intractable material, these Guernsey churches are full of interest and character. Having cited other examples of this kind of construction, in this country and on the Continent, where it would seem the attempt was made to construct buildings which should be as imperishable as the materials of which they were built would allow, Mr. Street passed on to the use of flint in various parts of the kingdom, by which the style of design was also affected. In flint districts, stone was also wanted, and builders who had to import their stone from the quarries at Gaen, or from some far-off part of their own country, were obviously likely to be very economical in its use, and hence those buildings were erected with as few quoins as possible.

Those whom he addressed were all aware how much the use of brick had affected the art of design wherein it had been adopted. The great fields of brick architecture were the north of Italy, the north-east of Germany, the west of France, and various parts of Spain. The development of each was different, but they all agreed in the discovery of certain properties in bricks; but they, it seemed, all agreed, that if brickwork is to be strong, it must be built with an enormous quantity of mortar; and so, instead of specifying, as enlightened nineteenth-century architects do, that "no mortar joint is to be more

The following gentlemen were elected Associates, viz., D. Robert Dale, Archdeacon, E.C.; Thomas Hill, 14, Bedford-row, W.C.; Robert Lamb, Darlington; William Smith, 1, Moorgate-street; Alex. R. Stanning, 187, Fenchurch-street; and Frederick Strauts, Christchurch, New Zealand.

than $\frac{1}{2}$ in. thick," he thought, if we could find a Medieval specification, we should find it ran in this form,—"No mortar joint to be less than $\frac{1}{2}$ in. thick." Then it came to be found that bricks might be moulded, and that if the earth were well tempered and fine, any delicate pattern might be reproduced in a hard material, which would almost defy weather. The result of this was that in most brick districts we see moulded brick traceries used and repeated all over a building, not because they were very beautiful, or because they were required, but because they existed, and had to be used. Examples of these repetitions of tracery were found all over the transepts of St. Katharine, at Brandenburg; while it was a curious fact that in Italy, France, and in Germany the use of brick led to the erection of sham fronts in front of the roof gables, the main or only use of which was to show off the variety of moulded bricks. A close affinity in cause and principle would be seen between such fronts as those of the town-hall at Lunck, the gables of the churches in and near Toulouse, and the transepts of Cremona Cathedral, whilst each was entirely independent of the other in style; and evidently their architects knew nothing of each other's work. Having referred to the curious effect of this brickwork upon stonework in the same districts, which was particularly noticeable in the buildings of Venice, the author proceeded to comment upon the change which was effected in architectural design where wood only was available for building. In the districts of Hampshire, Worcestershire, Montgomeryshire, Cheshire, and Lancashire oak timber was wonderfully plentiful in the middle ages; but in all parts of the country wooden buildings were very common, and at the present day there are a vastly larger number of Medieval domestic buildings of this material than of stone. It was worthy of notice that where oak was very plentiful, it led to important developments of design, as was instanced in the magnificent roofs of Worcestershire and Montgomeryshire, where timber of enormous scantling was available, as compared with those of Sussex and Kent, where the timber seems to have been much smaller.

On the next head of the subject, viz., "The Influence exercised in certain Districts by exceptionally gifted Architects," the author remarked that of course in the Middle Ages, just as now, there was great difference of style, and great diversity of power, in the works of various architects. As a rule, each man's work will be found in one district. Sometimes it is the cathedral which sets an example to the diocese; sometimes it is the hand of an architect brought specially for the work from a distance; but a careful examination of various works will show such evidence of unity of design and similarity of system as would enable us to classify them with the same sort of ease as we are at this day able to detect the hand of all our better architects in their various works. In support of this position the author mentioned the instance of Westminster Abbey and a small parish church at Stone, near Dartford, as affording evidence in some of the details of the architecture that the architect was the same in both structures. The same observation applied to the churches of Merstham, Chipstead, Cliffe-at-Hoo, Brasted, and Merton. Another curious case is that of Bristol Cathedral and Yatton Church. The lecturer pointed out the evidences of similar origin in the cases he mentioned, to which many others in various parts of the country were added.

Having dwelt on these points at considerable length, the lecturer passed on to remark that there remained only one other head on which he would detain the meeting, and that was the influence on style which is caused by attempts to copy in one age what had been done in some previous time. The old Rhénish architects of the thirteenth century must have purposely slant their eyes to what was going on in the Domine Royale in the first half of that century, and would not, without a struggle, give up the main features of their churches. So in such a church as that noble one at Münster Maifeld, they deliberately relieved many of the characteristics of a Romanesque church along with parts and details which showed an acquaintance with thirteenth-century Gothic. In somewhat the same way architects in Spain were building completely Romanesque churches at the very same time that, at Leon, Burgos, and Toledo, French architects, brought there for the purpose, were building magnificent churches under their very eyes of the purest and most advanced Gothic.

Then there were many cases in which we find an architect of one period trying to conform his work to that of an earlier building to which he has to add. An instance of this, he said, was to be found at St. Eluc, on the Mediterranean, near Perpignan, where there existed a cloister which at first sight one would suppose to be purely Romanesque; but, upon inspection, it was quite clear that whilst the west and south sides are of the twelfth century, the east and north aisles are of thirteenth or early fourteenth century work, copied in general outline and design from the earlier work, though natural foliage is freely introduced in place of conventional. They all knew the case of Westminster Abbey, where, with what appeared to be excellent judgment, the noble design of the earlier church was continued in the fifteenth century with so much general similarity that uneducated eyes would not detect the difference. Worcester Cathedral affords another case of the same kind, for there evidently the architect of the nave tried to make his work harmonise entirely in its lines and general design with the thirteenth-century work of the choir. The results, both at Westminster and Worcester, were not encouraging; but both designs being really full of life, and fire, and poetry, the eye feels no pain at the extraordinary discrepancies of detail where all is beautiful. But there is, perhaps, in England no example of copying so well worth study as that of the grand old Devonshire church of Ottery St. Mary, which, though evidently built late in the fourteenth century, in imitation of the neighbouring cathedral of Exeter, was, nevertheless, designed with a clear intention to hark back to still earlier examples, and to imitate many of the features of the thirteenth century. The work is so well imitated as to give the impression, until their detail is examined, that it is really the work of the thirteenth century. Their detail, however, is so pronounced as to leave no doubt whatever as to the age of the work; and this led to the observation that had often been made before, that our forefathers never knew how to copy what they saw. Some men would tell us that because they knew not how to copy what they saw, we ought not to do so either; and that every one, giving reins to his imagination, should design just what liketh him best, without reference to antiquity or precedent; in a word, that we should all take courage by the example of that wonderful Strand Music-hall. He ventured to dispute any such suggestion most energetically. We saw enough of other men's works, and knew enough of other men's studies, to know that the most original and most admirable work is that of the man who studied old buildings the most thoroughly; and he was amused to see every now and then attacks made upon their originality and honesty as architects by men who told them their works were mere compilations, whilst if they saw any of the designs of those very men in what they were pleased to call the Gothic style, they would find that they were indeed simple leaves taken out of the vulgarest book of specimens, without the slightest power even of copying accurately the work before their eyes, and still less of assimilating or fusing together with any kind of harmony the various pages from which they got their designs. The more they studied old art [the less they would want to copy it; and the only way to escape from the necessity of simply copying was to devote themselves with enthusiasm to its accurate study.

At the close of the paper, a conversation took place on subjects mooted in it, in which Mr. Seddon, Sir Digby Wyatt, Mr. C. Fowler, Mr. C. F. Hayward, and Mr. P. Anson took part.

THE SOCIETY OF PAINTERS IN WATER COLOURS: WINTER EXHIBITION.

Last Saturday, the sketches and studies contributed by the several members of the Old Society of Painters in Water Colours were privately viewed, as is customary, before the public were invited to see the display. The present exhibition is the eighth and the least interesting of the series; for, any difference that may be observable to distinguish it at all, is of a somewhat unfavourable nature. Too constant a complacent reiteration of claims to be considered, even superlatively clever, becomes fatiguing at last, let them be ever so undonible. The weather was bad; just such as must have persuaded the poorest of us, that an omnibus was one of the cheapest and dearest of blessings, for it rained with cool, dogged determina-

tion to rain as disagreeably as possible, and as if to wash out all recollection of finer days. At such a season the ideas to be associated with those more delightful natural aspects likely to be selected for an artist's sketch or study are very welcome; and it is disappointing to find so often a revised edition, in lieu of a direct transcript, that conveys more of the reality than he who instinctively apprehended it at the time can ever afterwards imitate.

However, there are many very beautiful drawings, none more so than Mr. E. Duncan's (182) "Waterfall on the River Broom, Rossire," that in spite of its exquisite workmanship bears every appearance of having been "done on the spot," like the two studies of "Whitby Scarr," by Mr. G. Dodgson (190, 198), for it would appear to be difficult indeed to represent such truth from memory. The figure subjects are either fewer than usual, even compared with the landscapes, or much less attractive. There are no chalk drawings, by Mr. F. W. Burton, whose absence is much felt in viewing the collection. Mr. F. Taylor is not so conspicuous as on some former occasions, though his heroine on horseback, petting her dogs, "Favourites," a Study for a "Hawking Picture" (170), shows more symptoms of falling off than he himself does; the horse leans dangerously forward of the centre of gravity, as sometimes horses do; neither is Mr. Carl Haag, though his contributions are numerous and he is still one of the most important contributors. "The Sheikh" (177) is an admirable study of a head, brilliantly painted and life-like; and "The Temple of Jupiter at Athens" (131), with the Acropolis in the distance, is scarcely less emphatic for colour, perspective, and effect than "The Interior of the Odeon of Herodias Atticus at Athens" (103). Mr. John Gilbert is best to be identified with two of his smaller emanations, "William III. in Battle" (391), and another capital composition of martial men and horses doing duty as "Outpost" (398) that exhibit most forcibly his great command over colour and effect. Unlike these, Mr. Walker's drawing of "A Lady in a Garden, Perthshire" (336), derives its great value from subdued colouring and a breadth of effect that never interferes with an appearance of elaborate finish, but gives a charming completeness to it; this constitutes its worth, for the lady is a perfect lady and no story-teller. Mr. G. J. Pinwell evidently has great admiration for the qualities that distinguish Mr. Walker's interpretations of natural appearances, but he will lose himself with his outlines if he follows him blindly; similar amenity of colour belongs to the description of "The Last Load" (356), but making every allowance for the diffused and confusing twilight of a warm summer evening, the many figures melting into flatness with the background are more suggestive of a fading tinted photograph than of probable reality; and these many figures are rather rapid representations of a happy peasantry, and seem to share depression by common consent. The screens usually supply the index to what the voluminous works may promise; they are rather empty on this occasion.

Mr. A. D. Frupp loves sunshine evidently, for his fisher-folks are indicative of this. The "Finished Study for a larger Work" (14) is very careful and cleverly done. His study of Venetian buildings (91) revives old notions, for they are very gen-like in colour, as well as conscientiously drawn.

Mr. T. R. Lamont has two very pretty drawings finished with close reference to Nature: one of a delicate child talking to a gardener who has been mowing like old Time, and cutting down the daisies with the rank grass; "There are no Birds in last Year's Nest" (74), may be a premonition. "Green Corn and Poppies" (82) afford a more lively theme for conjecture. "Sacharissa" (95), and "A Youth carrying a Name on a Cherry-tree" (303), by Mr. E. K. Johnson, advance us yet another stage in finish—more ways than one; and "The Brook" (149) was chosen by the Poet Laureate for an illustration, as well as by Mr. J. D. Watson, who is mistaking blackness for power. A Paritan maiden "At Prayer" (202), and, with the same objection, a "Northumbrian Fisher Girl" (275), are the best of the ten items exhibited by him, excepting "A Study" (161) for a portrait, which should be the very first and best. Mr. F. W. Topham's "Flower Stall, Venice" (194), is delightful for colour. It is to be wished he had more liberally assisted the collection; for the landscapes predominate to such an extent as to leave figure representation for small consideration.

"Fruithoe Castle, from the Moat, Northhamerland" (10), by Mr. F. M. Richardson; "The Vale of Nant Gwynant" (62), by Mr. T. Danby; "The Rocky Valley, near Tintagel" (87), by Mr. S. P. Jackson, who has overcome his tendency to dingy neutral colours and cold greens, as "The Weir Pool" (92), will leave just a dim recollection of; "Going on the Thames" (138), by Mr. J. J. Jenkins, and "Skirting Knole Park" (148), as good as any of the nine that repeat the same name; "On the Hills, Loch Houra" (144), by Mr. Francis Powell; "Pangbourne" (174), by Mr. Birket Foster; "A Rough Sea" (187), by Mr. C. Davidson; "An Autumnal Evening" (242); and "Loch Cornishk" (368), by Mr. Alfred W. Hunt,—whose works all betoken a keen observation and an admirably honest method of recording it,—are but a few of the better works exhibited.

Mr. H. B. Willis has depictions of calves and cows that appear ignorant of all cattle diseases, so nice and clean and well combed are they.

We wish we could say more of the drawings, the works of the leading professors of water-colour painting; for with the shoals of such productions as are now in the flood of a mercantile prosperity it would be well to have some thought for the future and the medium. It may surely be prognosticated that such an issue of a manifold form of its minor application will lessen the value of its more important use, and all water-colour drawings he heretofore designated sketches and studies, with so little to distinguish them from finished performances as at present exists.

MISSION HOUSE, SEACOMBE.

We have already published particulars of the Mission House at Seacombe, a village on the Mersey, opposite Liverpool.* With this we give a small view of the building. The people hanging chiefly to the poorer and more neglected classes. "The state of education is very defective; home-training is had; drunkenness is common; a low moral tone prevails." For some years the Egremont congregation have been engaged in mission work in the village. An old Wesleyan chapel was first acquired on lease, and fitted up for the use of the mission; and, about a year after, an adjoining building was also taken, to meet the growing requirements of the work. But all the available accommodation in these buildings be-

* See p. 832, ante.

came too strait for the operations of the mission. It was therefore resolved to erect new premises, with suitable mission-house and class-rooms; and on the 20th of July last the new building was opened. The cost of the building, including the site, has been about 2,300*l.*; of which sum a balance of 750*l.* remains to be collected.

The first gathering in the old mission-house was the Sunday School, which still continues to prosper, and now numbers about 30 teachers and more than 300 scholars.

Among other agencies, a day-school was commenced in 1863. In the new rooms, and in the hands of the three teachers at present on the staff of mission workers, it is confidently hoped that this school will prove a great success. Working lads beginning to earn wages have also been cared for; and an endeavour has been made to fill up their evenings by the attractions of instrumental music, and the more profitable employments of the night-school and Bible classes. Beginning with one, there are now fifty workers, and not less than 800 persons are under direct and constant influence. The builders were Messrs. J. & T. Mason. Mr. H. H. Vale was the architect.

LECTURES ON ARCHITECTURE AT THE LONDON INSTITUTION.

In the second lecture of the course, Professor Kerr took up the subject of classical architecture. Starting at the point B.C. 500, he considered the position of Persia, which had overthrown the venerable empire of Egypt, and was now jealous of the rising importance of Greece, a new nationality founded, not on conquest or tradition, but on commerce, enterprise, and unprecedented intelligence, and destined before long to initiate a new civilisation. Accordingly, remembering the principle that architecture is history in stone, it would be certain that a novel system of the art was about to arise. Then tracing the order of origin of the arts, sculpture first, then poetry, then architecture, and a long way in the rear painting and music, and touching again upon the question of religious influence as a prime mover in all, and most notably in architecture, he rested at length upon the examination of the Doric Temple and the Parthenon. Explaining the theory of the timber-work type, he passed on to critical observations upon the new architectural features now established, such as the advanced design of the column, and of the entablature, the portico, the peristyle, the

stylobate, the cornice of ntility, the pediment the exquisite use of sculpture, the more defined arithmetical proportions (repudiating, for his own part, all geometrical theories, the conic-section mouldings, and the fastidious optical corrections); remarking also upon the effect of precision of workmanship, which, however refined and extreme, was always to the advantage of classical design, whereas in Gothic the effect of mastery and sometimes rude work was as essentially a vital element of success. The Ionic and the Corinthian columns being next considered, the lecturer pointed to the fact, almost more remarkable than all, that a complete system of columnar design, in three distinct and artistically perfect "orders," had now been accomplished; besides which an equally complete system of mouldings—the ovolo, the ogee, cyma, torus, head, hollow, and scotia, the fillet, and fascia—had been unalterably established. After a few words on polychromatic decoration, the transfer of the style to Rome was arrived at, and the career of the art pursued from the age of Augustus to that of Constantine. Although religious edifices still led the way, there was now a vastly expanded field of operation; embracing villas, baths, theatres, bridges, and aqueducts, triumphal columns, and archways, and notably basilicas. The same epoch of civilisation was still in progress, but the luxury, wealth, pomp, pride, and private patronage, of the Roman Empire were altogether peculiar in their influence upon the art. New features also were still coming into view. Such were the pedestal, the pilaster, the arch, the dome, and the use of storied orders. The application of the arch structurally was dwelt upon, and its limited use artistically. The altered system of mouldings was also described, crude circular curves being substituted for the refined elegance of the Greek contours. On the whole, concluded the lecturer, the philosophical and fastidious grace of the Greeks, to this day unequalled in the world, had given place to more grandeur and luxury under the Romans, which in course of time led the art more and more into decadence, to be with all other products of Classic intellect in the fulness of time entirely overwhelmed and lost, until a thousand years afterwards their remains, and even their ruins, should be searched for and exhumed to form the basis of modern civilisation.

In the third lecture, the subject was the Architecture of the Middle Ages, and the point of departure was A.D. 500. Nearly a century and a half ago, the Roman emperors had taken refuge from the barbarians in the new metropolis of Constantinople, established at the extreme east of Europe. Only a few years ago the ancient capital, Rome, had at length been captured by the Goths. A few years more and it was to be finally pillaged, and the remnants of ancient magnificence and taste swallowed up. Two great forces had been at work in this: the pressure of barbarism from the West, and that of Christianity from the East. If architecture were history in stone, here, again, must be the origin of an entirely new system. But, in the scheme of the Dark Ages there was to be another element. While Christianity was to govern East and West, a similar new religion was to possess a Southern field. The Western nations, seeking a hotter faith, and adapting the Christian principles to their own habits of thought, founded the Latin or Roman Church; the Eastern nations, in like manner, formed the Greek or Byzantine Church; and Mohammed, animated by the same purpose, but rejecting Christianity because of image-worship, established the creed of Islam. And, accordingly, there arose three corresponding modes of architectural art: the Romanesque of the Latin Church, the Byzantine of the Greek Church, and the Saracenic of the Moslems. Turning now to the Basilica, or Hall of Justice of the Romans, this was described as the type for future Christian churches; the plain rectangular house, with longitudinal ranges of columns supporting the roof, the entrance at one end generally, and the seat of justice in a recess at the other, obviously serving the precise purpose of the primitive Christians, whether of the Latin or of the Byzantine sect. The sixth century, however, did not accomplish much of permanent durability: it was notable only for the name of the Emperor Justinian, under whom, for the moment, many great public works were carried out. Amongst the rest, there were certain basilicas or churches; although the greatest of all, St. Sophia, at Constantinople, was an exceptional design scarcely to be dwelt upon. The seventh century being

MISSION-HOUSE AT SEACOMBE.

of little mark, the eighth brought the age of Charlemagne, under whom great exertions were made to advance learning and art, but again with little effect. Many churches, however, are dated from that period, still keeping more or less to the old basilican form. The Saracens, by the way, had by this time attained to considerable knowledge and taste, for Bagdad was now flourishing in the East, while Cordova was being built in the West.

The ninth century exhibited great disorder, consequent upon the disruption of the empire of Charlemagne. In architecture, St. Mark's, at Venice, almost alone seemed worthy of notice, although still an exceptional work. Arab art during this century continued at its best, as well as in the next; in the course of which, on the European continent at large, the nationalities were acquiring form and character, as exhibited in architecture by a variety of German and French churches of much antiquarian interest. But it was not until the ensuing eleventh century that we could be said to reach firm ground. Various cathedrals throughout Europe marked the age of the growing authority of the Popedom, the First Crusade, and our own Norman Conquest. In a word, the Romanesque in Western Europe had become, by the process called in science degradation, either Norman or its equivalent. The Byzantine in the mean time might be said to have passed eastward, following indeed its Oriental character, into the Saracenic and the style of the Russian Church. The critic would perceive up to this stage the following innovations. Whereas the Greek mode had established the colonnade, the entablature, the mouldings, and the portico, and pediment, with very little of "wall design," and the Roman mode had added arching, arcading in colonnade, pilastering, and a good deal of wall work, the Romanesque had established aisle plan, croiform, and round plan, arcading proper (not in colonnade), simple vaulting and domes, elaborated wall work (as at Pisa), roof design, gable design, tower design, and sky line. Attention being now confined to England, as furnishing a local history of Gothic architecture sufficiently illustrative of the whole field, the lecturer proceeded to explain from the drawings on the wall the well-known characteristics of Norman design, describing its details as being crude and its ornamentation clumsy, although picturesque enough in their way. But the following age of the thirteenth century, he said, brought out a very different state of the art, under new social influences. The Papacy was in its full ascendancy, and the clergy controlled society. The mendicant orders added their special local influence over the people at large. The building fraternity, no matter in what particular form, had acquired organization and knowledge. Finally, the introduction of the pointed arch afforded a specific basis for a complete revolution in architecture. Whatever difficulties of an archaeological kind might surround this last question, the structural solution was enough for architectural criticism. The art had accepted arcuation, pure and simple, with all its indefinite conditions to follow. Arcuation was the architecture of small stones (the Classic mode being that of large stones), and a little examination would satisfy any one that the pointed arch was at once a condition of complete arcuation, and that the first attempts at its use would be the most sharply pointed in character, as was the fact. The lecturer proceeded to explain the progress of design through the thirteenth, fourteenth, and fifteenth centuries, dwelling more emphatically upon the averse elegance of the earlier work, the graceful tracery and foliage of the middle period, and the fan-groining, carpentry, and flying buttresses of the later time. The exquisite development of plan he also described in warm terms, especially in Continental cathedrals. Metal work, colour decoration, proportion, and symbolism were also mentioned. Finally, the great critical merits of Gothic architecture were two,—arcuation carried to every possible limit, and articulation exhibited in most instances with a truthfulness or guilelessness which of itself was one of the most exquisite elements of art.

Working Men's Club, Great Quebec-street, Marylebone.—Classes for practical, plane, and descriptive geometry, mechanical and machine drawing and building construction, have been established at this club, under the direction of a certificated science teacher, thus affording to artisans an opportunity of acquiring a scientific training in connexion with the recreative advantages afforded by institutions of this nature.

NEW INFANTRY BARRACKS FOR GLASGOW.

OUR friends on the Clyde are in fortune's way just now, and may congratulate themselves accordingly. Not only has their new Court-house "presently," as they say, been opened, and many other improvements of various kinds projected, but a new infantry barracks has actually been begun. The old military quarters in the Gallowgate, in the very centre of this very populous town, were long ago condemned for various reasons, any one of which was sufficient for the purpose. First of all, they were very unsuitable, inadequate, and badly arranged, not only according to hygienic principles, but to the comfort and convenience which we deem necessary to the life and character of the improved soldier of the present day. Then, again, the numerous whiskey-shops, and their ever-attendant evil companionships, not only seriously interfered with the soldier's physical status, apart from his moral one, but, what is equally bad, are standing impediments to military discipline. It has been long lamented that, even under the most favourable circumstances, drunkenness is the gigantic standing crime in the army; whilst that other evil, which must not be mentioned to ears polite, is its standing disease. With respect to the first, nothing but improved quarters, both physical and educational, sufficiently far removed from towns,—especially garrison towns,—to render street temptation difficult, will answer.

Thirty acres of undulating ground have been purchased, situated about two miles and a half from the city of Glasgow, in a north-westerly direction, near Maryhill, and able to command communications by road, railway, and canal. The widely-known "Kelvin Grove,"—although grove no longer, but villa-terraces, and wealthy suburban nestlings,—rendered classic by the poetry of Burns, is in the immediate vicinity. The scenery is of the most lovely kind; and if the future regiments to be quartered there have but a corresponding happiness within, then, indeed, may they enjoy themselves, and sing aloud that "We are in a military paradise." The name of the particular locality is Garioch, and the immediate plot of ground upon which the buildings are to be erected is opposite Jeffrey's weaving factory, on the Glasgow and Maryhill road.

Of the whole quantity of land which has been purchased, about eight acres will be built upon, and otherwise appropriated to military purposes. The main entrance will be by iron gates in the Maryhill-road, with a second gate in the Garioch-road. On the right hand of the main entrance will be a guard-room and temporary lock-up cells; whilst on the left-hand side will be the regimental offices, orderly-room, court-martial room, prisoners' room, &c. Taking the main entrance to be approached from the east, away on the north side, having a southern aspect, will be the officers' quarters, in the rear of which will be all the necessary domestic offices, out-houses, &c., and stabling for seven horses. These quarters will front directly across the barrack-square, and face the men's block. The disposition of the officers' rooms will be in this way:—The commanding officer, as befits his position, will have separate accommodation to himself; not only that, but, on the well-founded conclusion that he will generally be a married man with a family. His servants will, also, be provided for, away from the servants of the other officers.

The next arrangement is for three field officers with two rooms each, and thirty-four officers with one room each; such room being so planned that there will be a recess sufficient for a bed and bed-screen, so as to enable the occupant to convert his "bungalow" into a snug sitting-room at pleasure. In addition to these rooms, there will be nineteen others adjoining for officers' servants. So much for the private portions, if they may be so termed. A second portion of these quarters will comprise a complete officers' mess establishment, including ante-rooms, billiard-rooms, smoking-rooms, and such similar accommodation as the social rank of gentlemen of whom officers are composed may require.

We now cross the parade-ground, or "barrack square," as the soldiers call it, and we come to the bones of the rank and file. The square will be the enclosed quadrangular space, formed by the three sides of the projected buildings, and the western section of the barrack boundary wall. This parade-ground will be 580 ft. by 486 ft. As the contour of the land is of a very

wavy nature, and as it will have to be made perfectly level, a good many hills will have to be placed in the bosom of a good deal of what in other words, there will be a good deal of what Scottish builders call "getting and filling." The men's quarters are in two divisions, each division being in parallel blocks behind one another, the dividing buildings being the school-chapel, gymnasium, &c., at right angles. The division on the left-hand side, from the barrack-gate will be exclusively for the married "department" of the regiment. The married private soldiers will have rooms to accommodate forty men, their wives, and children. In addition to these will be the necessary accompaniments of school, laundry, hot-air drying-closets, lavatories, &c. Away in the corner, to the rear right, will be the infant schools; so that the married people and their families will be entirely to themselves. On the same side of the square, but by themselves, there will be quarters for five staff-sergeants, having two rooms each; sixteen staff-sergeants, with one room each; twenty married sergeants, one room each; twelve single sergeants, one room each; and eight other non-commissioned officers' rooms.

There will, also, on a plan similar to that for the officers, be a complete sergeants' mess establishment, with mess-room, billiard-room, cooking house, stores, &c. The staff-sergeants and sergeants' quarters will be to the west of the single men's division, with ample space, isolating them, in accordance with their rank.

It will thus be seen that the non-commissioned officers of a regiment need never, if desirable, come in contact with the men when off duty for any purpose whatever. To the rear of the staff buildings will be the military provost's establishment, small, but very handy and compact. There will be quarters for the provost sergeant and assistants, an office for the counting-house, part of his unpleasant business, a detention-room, hard-labour yard, and twelve quiet, unobtrusive cells. In fact, from what we can learn of this part of the general plan, a year or so's "moonlight furlough" may be passed here very "comfortably" by the chastised and humbled penitent of the court-martial. Let us hope, however, in all seriousness, that there will be little or nothing to do for the iron-hearted "provo."

There will be four blocks for the single men; two of two stories high, and two of three stories. There will be 240 men in the two-story blocks, and 360 men in the three-story blocks. There will also be two cook-houses, each capable of cooking for more than 300 men; whilst a library and reading-room will supplement the culinary department by providing ample food for the mind. In order to have cleanliness made easy, there will be lavatories immediately adjoining each room; in addition to which there will be the inestimable benefit of a bath-house, and recreation facilities of every kind.

Having provided for cleanliness, the authorities show that they are not unmindful of the next and higher virtue in a manner that must be pleasing to many a heart that beats under a red coat. Hence, in the chapel-school the accommodation for divine worship will be enough, or more than enough for the English church portion of any regiment.

The chapel-school will seat 330 rank and file, 60 women and children, and 40 officers and ladies for divine service; whilst for educational purposes, there will be room for the instruction of 100 adults. The seats in the central part of the floor will be movable, so as to convert the chapel into the school, and vice versa. There will be both schoolmaster's and school-mistress's quarters attached in close proximity to the scene of their labours. The gymnasium will contain every appliance of the modern system, including bars, climbing poles, ropes, &c., and will comprise in addition a racquet-court, a five-court, and a skittle-alley.

Behind the single men's block will be the canteen, which, it has been said, will be under each personal supervision of the officers' committee as to prevent the adulteration of liquors on the one hand, and drunkenness on the other. The question of canteens has long been under the earnest consideration of competent military reformers, with the view of making the most of them for the soldier and the soldier's family. They have hitherto been too much left in the hands of the landlords or contractors, who have sold bad articles at dear prices. How to manage them efficiently for marching regiments has presented some difficulty, on account of the officers of such regiments having little knowledge of, and

less inclination towards, business matters. Besides, such officers are, comparatively, so short a time in each town that there can hardly be sufficient inducement for them to trouble their heads with canteen affairs. At Woolwich and Chatham the difficulty disappears, because there is always a staff long enough in the place to deal with canteen abuses if it has the will and the power. On the other hand, in the case of line regiments, who generally enter towns knowing as little what the day's pay will buy as if the men dropped from the clouds, it would be well and wisely done to have canteens and their doings placed under the supervision of the civil branch of the Royal Engineer staff of the district; or, should there be no civil branch, then the Engineer staff itself. In the building under notice, the canteen will virtually comprise a shop-store, where the soldier or his wife may purchase every article required in the sphere of their daily existence.

The canteen will be divided into two distinct portions—the family shop on one side and the public-house part on the other; each will have separate entrances away from one another.

Behind the staff-sergeants' quarters, on the southern side, there will be a new feature, namely, a pensioners' department. This will be very advantageous, because it will enable the pensioners to be mustered, instructed, or dealt with in a military atmosphere, and upon military ground. The regimental band, too, will have a specially adapted room for itself. A powder-magazine will be constructed in a part of the ground that may be deemed to be the best suited for the purpose; whilst a very convenient armoury is among the arrangements. Referring to the hospital for one moment, it has to be stated that there will be a suitable mortuary, with all the requisite appliances for surgical operations, *post-mortem* examinations, &c. The whole of the external walls of the buildings will be of stone; brickwork being used in the interior. Ventilation will be by both shaft and piercings, when necessary. The lighting will be by gas; the filthy room-fans will be superseded by night urns, kept at a temperature, so as not to chill the men frequenting them in winter, and open only during the night. Each floor, too, will have its own corridor in the rear, so that men may pass from one floor to another without being wet, or having to dress themselves, beyond barrack-room costume. There will be a supply of hot water for all purposes at all hours. In all the rooms for the single men the windows have been so planned that two beds will stand between each pair of windows. The whole of the buildings will be inclosed by a rubble stone wall, with rustic copings, 10 ft. high, and 20 in. thick. This wall has at the angles projecting turrets loopholed for musketry, so as to sweep the entire face of whatever line the fire may be directed upon. The particular style of walling has not, we believe, been determined on, but it is supposed that it will be either rubble or coursed work, with mullions and dressings.

The walling is to be of sandstone from the quarries of Stockenfield or Kelvindale, and the other stone used for dressings to quoins, windows, staircases, chimney-caps, &c., to be freestone from the Hunter's-hill or Gifnock quarries. In the draining of the ground, 2-in. agricultural pipes will be used, whilst for the buildings glazed stoneware pipes will be laid down. In the external walls, the ventilating inlets will be of terra-cotta air-bricks for the floors, and galvanized iron ventilators overhead. There will, also, be extracting flues for the foul air, of glazed stoneware piping, and air-ducts to supply the fire-grates.

The ground floors of the lower part will be laid with 3-in. Arbroath dressed flagging; but the corridor floors of the upper stories will be freestone landings 4 in. thick, supported on wrought-iron bearers and girders. The floors to the hospital wards, lavatories, mess-kitchens, &c., to be on Fox & Barrett's fire-proofing principle, resting on rolled iron joists. Asphalt, too, is to be used wherever it may be requisite to prevent damp and noise. Wherever it is practicable the chimney-flues will be constructed so as to be swept from the outside. The lavatories, closets, and urinals will be exclusively supplied from cisterns of their own, and no other pipe will be attached to them. The hospital will be warmed both by open fire-places and hot water. The heat will be delivered from a cylindrical wrought-iron boiler, 4 ft. by 2 ft., cased in fire-brick, with a recess-furnace front, and set in the hospital kitchen. The hot water will start through a

2-inch flow-pipe, passing under the roof of the covered way into the principal staircase. On the entrance to the wards the dimension is reduced to a 1½-in. pipe, with the requisite stop-cocks on the landings. The circulation will return to a galvanized wrought-iron cistern of 150 gallons capacity fixed in the centre of the building, and so back again to the boiler. From the hot-water cistern a 2-in. escape-pipe will pass through the roof, turning down towards the gutter. Gas will be laid on in every part of the establishment where gas can possibly be useful.

The Glasgow people have been long complaining that the vast property of the third great scaport of the empire should be left in so comparatively an unprotected state. It is now many years,—more than twenty,—since the cavalry were removed from the old barracks in Eglinton-street, and what is the result? Why, that on any emergency troopers must be sent for all the way to Hamilton, ten miles off! This was actually the case during the late Sunday Fionian demonstrations.

These barracks have been designed by the Civil Professional Branch of the War Department, under the direction of Lieut.-Col. Murray, R.E. The warming and ventilating arrangements were supervised by the Army Sanitary Committee. The designs have been submitted in detail to the Queen, and have received her Majesty's approval and signature. The contractor for the whole of the work is Mr. John Kirk, of Woolwich, who has just completed the fortifications of Newhaven. Although no special time has been fixed, it is expected that the barracks will be ready for occupation in the latter part of the autumn of 1872.

THE MANAGEMENT OF COMPETITIONS.

I venture to suggest, that the time has arrived when the Institute (with every advantage both to the public and our profession) might take up the general regulation of competitions. If it were once understood that we declined as a body to compete unless the conditions issued were those framed by the Institute, much of the existing evil would be removed.

I propose that a list of architects willing to act as competition judges be kept at the Institute. They would serve in rotation, or if business prevented one of them, the next on the list would be requested to attend.

Ample advertisement should suggest reference (by any promoters of competitions) to the Institute, and on application being made the first architect on the list should proceed to the site of the proposed work, there confer with the committee, and prepare the requisite conditions, signing the names of the intended judge or judges. The conditions would, of course, be carefully framed in "schedule" form, the details of which need not at present be discussed; but I foresee a great saving of labour from this source alone, as a mere glance at the schedule would suffice to show competitors the nature and extent of the work.

Everything should be done to insure absolute uniformity, in the scale, the sizes, and the colour of all drawings. The perspectives, perhaps, may be unrestricted (except as to size), as they will not mislead a professional adviser.

The memoranda issued to architects should be divided into "Instructions" and "Suggestions," the former to be absolutely binding, the latter not so; then if the cost were stated under the "Instructions," any palpable excess would absolutely exclude a competitor; but if it appeared as a "Suggestion," then the designs should range in their order of merit; the authors of the first and the second designs thus selected receiving a fee previously decided upon, but any other design which would come within the limits of cost, and was most in accordance with other requirements, ought to be chosen for execution.

Rules for measuring the work would be supplied, and the price be founded on the cubic contents of the building and the superficial area of external walls.

A printed form for the report to accompany each design would be issued for the competitors to fill up. This would greatly facilitate examination, whilst additional matter (to a limited extent) would be permitted.

Half the designs sent in should be numbered in their order of merit (unless utterly worthless), the numbers to be affixed and a list of the authors' names to be registered at the Institute and published.

All drawing should be exhibited to the public, unless individuals express a desire to the contrary with reference to their own. I have seen many instances of injustice which could scarcely have occurred had the public been admitted to see the drawings; and I think, moreover, that if we consent to exercise our hands, heads, and hearts in such work as this, we might at least allow our productions to do some little good to others. Our drawings would thus help to elevate the public taste and improve the daily increasing feeling for architecture. To us they are of little value; our time, labour, and materials have been well-nigh wasted.

I many years since elaborated a scheme, of which this is a bare outline, and I think the matter of such importance, of such absolute value to the profession, that if there be any difficulty at first in placing it before the public we should find it well worth our while to subscribe amongst ourselves, and form a fund to carry out the scheme.

I should be happy to say to confer with any of my brethren upon the subject, and to add my contribution. The time seems to have arrived when a little united action would carry us safely through the worst of the evils attending our unavoidable competition.

AUGUSTUS FREEE.

SCHOOLS OF SCIENCE AND ART.

The Wolverton Science and Art Institute.—The anniversary of the opening of the science classes in connexion with this institute has been celebrated by a public tea, to which between four and five hundred sat down. The tea was followed by a musical entertainment and the distribution of prizes to the successful students for the past year. Mr. J. B. Bickersteth, a director of the London and North-Western Railway Company, occupied the chair.

Technical Education in Bedford.—A lecture in connexion with the local class in technical science has been delivered at the Working Men's Institute, Harpur-street, by Mr. Buckmaster. The chair was taken by Mr. James Howard, M.P. Mr. Fry read the report, showing that out of fifteen who presented themselves for examination twelve had been successful. These had been classed as follows:—First class, three; second class, three; third class, six. Those who obtained certificates in Class 1 were entitled to Queen's prizes. The books were presented in course of the meeting.

The Torquay School of Science and Art.—The presentation of prizes to the students of this school who have successfully passed the recent examinations, has taken place at the school. The duty of presenting the prizes was undertaken by Lord Talbot de Malahide, in the absence of Lady Palk. The chair was taken by the president, Mr. E. Vivian; and the room was crowded with a large, interested, and sympathetic audience. Mr. Luxmoore, the hon. secretary, said, it was satisfactory to know that the school during the past year had done a great deal more than any school almost in England,—certainly better than any school in the West of England. The Art School had 85 evening pupils, and 75 day pupils; the former were mainly of the artisan class, to whom the Government gave most of the prizes now on the table. Of these 55, the majority went in for the examination in May last, and 31 took prizes; one pupil in particular, Mr. Eastbrook, gained the Queen's prize and bronze medal. Mr. S. Youlden was also specially mentioned. In the Science classes Torquay held a high position; during the past year 90 students went in for examination,—70 in electricity, and magnetism, of whom 54 passed successfully, 18 gaining first-class Queen's prizes; 18 second-class, and 13 third. Here, again, Mr. Eastbrook had come forward, and in magnetism and electricity he stood the highest of all the students in the kingdom; for this he should have received the gold medal, but, owing to a mistake in the regulations, he was debarred from taking it. He also stood third in physiology in the kingdom, and having gained those two prizes, he would now go to London, it was to be hoped, to win more. At present there was in the school a physiological class, with 20 students; a class for acoustics and heat, with 32; and a class for electricity and magnetism, with 70 students. There were also, on Saturday afternoons, classes for ladies and gentlemen, which had not long been started. The Chairman, in course of the meeting, called upon Mr. H. Bridgman, who was the means of bringing about the establishment of these schools,

to say a few words. Mr. H. Bridgman, who was very heartily applauded, made an interesting speech of considerable length. He alluded to the progress the school had made since the first preliminary meeting, held in a small room, in Lower Union-street, in 1866: it had gone on and prospered, and no doubt it would continue to do so, for, during the last two years, he found that no less than 180 pupils had passed their examinations.

Exeter Science Classes.—The annual meeting of the friends of the Exeter Science Classes, held at the Athenæum, was remarkably well attended. A lecture "On Technical Education" was delivered by the indefatigable Mr. Buckmaster. The Rev. W. David said the science classes could be made of great value to the citizens. He had been a member of one of the first classes that had been formed in Exeter, and had a very lively recollection of the pleasure and instruction he derived from the teaching of Mr. D'Urban in the geology class. Mr. D'Urban's pupils certainly were few. Beginning with convenient pupils they had dwindled down to three, but he hoped to see the classes well attended in the future. He regarded those schools as filling a present void in the course of education in England. On the proposal of Mr. Cotton, a vote of thanks was unanimously accorded to Mr. Buckmaster.

Carlisle School of Art.—The annual meeting of the subscribers to this school has been held in the school-room, in Finkle-street, the mayor (Mr. W. I. R. Crowder) presiding. A large number of pupils and their friends were also present. The secretary (Mr. T. H. Hannah) read the report, which stated that the duties of the school had been performed to the entire satisfaction of the committee by the master, Mr. Lees, and the pupil teacher, Mr. Parker. Owing to the examination of those subjects of the Science and Art Department which have been regularly taught in Schools of Art, such as mechanical and geometrical drawing, building, construction, &c., having been placed under the Science branch of the Department, the examination of those subjects, which was formerly held along with the art subjects proper in March, would now take place in May. At the examination of the school in March last, 43 students were successful, of whom 9 gained prizes. Last year the numbers were respectively 27 and 7. During the year 75 students had sent 316 drawings for examination in London. Of those Mr. Edward Parker, the pupil teacher, gained a silver medal in the national competition for a study from the antique; 3 obtained third grade prizes, and payments were made on the work of 61 others. Last year, 58 students presented 108 works for examination. The committee had great pleasure in stating that the master, Mr. Lees, had obtained one of the prizes offered by their lordship to the "head masters of those schools in which the result of instruction, as tested by the Department examination, was most satisfactory." Owing to the number of artisans in the evening class being so large that there was scarcely accommodation for them if they were all present, the committee had made arrangements with the committee of the Mechanics' Institute for occupying their large hall in Fisher-street. The financial statement showed that the income of the school during the past year, including a balance of 24*l.* 14*s.* 6*d.* by treasurer per last account, and after making certain reductions, had amounted to 90*l.* 5*s.* 6*d.*, of which sum 27*l.* 18*s.* 6*d.* were derived from annual subscription, and 64*l.* 17*s.* from school fees. The expenditure had amounted to 62*l.* 18*s.* 3*d.*, so that there remained a balance in the hands of the treasurer of 28*l.* 7*s.* 3*d.* Mr. Edmund Potter, M.P., distributed the special prizes, and addressed the meeting on the subject of art schools.

CROWN POINT, NEAR NORWICH.

The mansion that Sir Robert Harvey, bart., is erecting on his estate at Crown Point, near Norwich, is approaching completion. The new hall is situated on gently rising ground in the freshly-made park at the rear of old Crown Point House, and is visible from the Kirby and Bungay roads, the main approach being from the latter, from whence an open drive, skirted on each side by plantations, leads across the Kirby-road to the hall. There are two lodges, one at the Bungay-road entrance, and the other at the Kirby crossing, both in the style of Swiss architecture that characterises the water-side lodges, gamekeepers' cottages, and other minor buildings on the estate. The mansion is in the Elizabethan style, and the chief entrance is

covered by a portico of iron-work, with cupola roof. The ground floor comprises a saloon, separated from the hall by a screen; a dining-room and two drawing-rooms, *en suite*, with conservatory beyond, breakfast-room, library, billiard-room, &c. On the upper floor are bed-rooms, with double dressing-rooms, &c. These rooms have bay windows, from which view of the park and surrounding country are obtained, comprising the Lakenhem Viaduct, the Castle and Cathedral, Mcnsehold House (the seat of the late General Sir R. J. H. Harvey), Thorpe, &c. On the third floor are more bed-rooms, the total number in the mansion proper being twenty-four, and there are thirteen others over the servants' apartments and offices. The hall will be lighted with gas. At the rear are a range of stables, with carriage-yard and riding-school, the whole enclosed under a covered glass roof, 180 ft. long and 40 ft. wide. These will, in a year or two, be concealed from sight, by plantations of choice shrubs and evergreen trees, by which they have been flanked. The transformation of what but little more than a year ago was an open field into an ornamental park, has been accomplished with great success. A terrace walk will extend in front of the house, which faces the south. Beneath it will be a summer garden, and other gardens stretch away to the east, and are now in course of formation; a rosary, and some picturesque rockwork overhanging an artificial cave, from the mouth of which a lion is peeping (the work of Mr. Barrett, of Norwich), being the most recent work of Sir Robert's gardener. The mansion has been built from the designs of Messrs. Coe & Peake, of London, architects. The contract for the office was undertaken by Mr. D. Balls, of Norwich, and the work being divided into two contracts, Mr. J. W. Lacey was the successful competitor for the hall—at least, with the exception of the fittings and decorations of the lower rooms, which, being of an unusually elaborate and ornate character, will probably be confided to a London firm.

A NEW CHAPEL IN PLYMOUTH.

A LARGE Baptist Chapel, which has been in course of erection for the last sixteen months, upon Matley Plain, has just been opened. In style it is of the Palladian type, and the façade contains a considerable amount of ornamental as well as constructive detail. The chief feature is a central arch opening into a covered recess, and extending from the ground to the pediment. This is flanked on either side by towers, which rise to the height of 90 odd feet from the foundation. The main doorway is in the recess, and there are side entrances in each tower, which also afford access to the gallery. The sides of the recess are carried up by columns, which in the lower story are Doric, and in the upper Corinthian, surmounted by carved capitals. There is a three-light window, with Corinthian pilasters, over the chief entrance, and smaller windows over the others to accommodate the gallery stairs. The entablature, and the mouldings generally, are bold. The towers are surmounted by truncated pyramidal slated roofs, with crests of iron-work, painted and gilt. The material of the building throughout is of limestone, and the columns and dressings generally of Portland, while the steps are of granite. The pulpit is of wood, and octagonal. The seats are all open benches, and together with all the woodwork, of pitch pine. The chapel is lighted at night principally by two encaustic in the centre of the ceiling. There is a school-room in the basement, to accommodate 500 children. The building is close to the Matley tunnel of the South Devon Railway, and, including the site, has cost 8,000*l.* Mr. Ambrose, of Plymouth, was the architect employed, and Mr. J. Finch the general contractor. Mr. Harry Hiers, of Exeter, has executed the stone-carving; Messrs. Plimsaul put up the heating apparatus; and Messrs. Monk & Westlake the gas-fittings.

Olney Church.—This church, interesting from its association with Cowper and Newton, has for some time past been sadly in need of repairs, but we are glad to learn that an effort is now likely to be made to restore it to its proper condition. The lord of the manor (the Earl of Dartmouth) has undertaken the restoration of the chancel, according to the *Rock*, and it is to be hoped that other friends will be found to help the vicar in his greatly needed work.

ART IN COMMON LIFE.*

I MUST clear the way for what I have to say on art by limiting my subject. I shall not have time, and I have not the power, to speak at all of the so-called fine arts—of painting, of sculpture, or even of architecture. A picture, or a statue, or a fine building is indeed an ornament, in one sense of the word. It adorns a room, or a public building, or a town; but the principles which regulate the work of the successful painter, sculptor, or architect are far more complex than, though not really different in kind from, those which are concerned in making beautiful, adorning, decorating objects of daily or occasional use. In considering ornament, then, I confine myself to a study of the principles which should guide us in determining the true nature of ornament, and its proper employment. Moreover, I exclude painting and sculpture now, because, when good, they are and must be always costly, and therefore not within the general reach,—the painting, and etching, and carving, are often the treasures of the cabinet of an individual. Even if public taste were educated sufficiently to understand such works, they are usually inaccessible; and it should be added, that the real merit of works of fine art does not come out when they are small and apart from each. A large painting on a wall of a public building, boldly treated, illustrating some instance of bravery, charity, or devotion, and surrounded by proper architecture, of which it indeed forms an essential part, is not only of general instead of special use, but produces in the spectator a sense of the sublime, which a small picture that can be looked at by one person only at a time, which must be peered over in the hand, cannot ever achieve.

The question may be asked—Why ornament at all? We know that the earth itself is adorned, and that the so-called savage, half-civilised, and highly-civilised nations have invariably led them to colour their various war-clubs, paddles and canoes, and that the colours and curves of these Fijians, Sandwich Islanders, and others may be called ornamental. Instinct so called of man, savage and half-civilised, as well as most cultivated. In ancient pre-historic times the cave-dwellers scratched on bone or pottery rude outlines of the animals they slew or tamed; the palaces of Nineveh are lined with sculptured reliefs where palms and various forms of plants are drawn, with warriors, captives, and kings, and the spoils of battle; the seals and many ornamental objects of the Babylonians survive to our time, beautiful with minute and laboured devices. The architecture of Egypt has furnished models of excellent colour and of quaint form to our artists of the present day. The palm of the deserts and the water-lily and rush of the Nile were pressed into the service of decorating their temples by the ancient people. If we go further east we shall find in China and in India an excellent taste for colour, and some notions of form, handed down from age, the exact distance of which from our own day, though great, is not exactly known. Time would fail me were I to endeavour to allude even to the chief styles of ornament prevailing in Greece and subsequently in Rome; of the ware of Etruria; of the metal, stone, wood, and ivory work of the Middle Ages; of the early Irish illuminated missals before the tenth century of the Christian era; of the works in carved wood of early Norwegian carvers; of Medieval Arabic ivory; and of the period of the Renaissance or Revival of Classic Art. But the principles of true ornament may be deduced from nearly every kind of decoration, whether Greek, Italian, Egyptian, or Chinese. What these principles are I will endeavour to state.

An ornament as to its nature should be human; that is, should appeal to the eye, the thought, the affections of man. It must have a meaning, and the more meaning the better. Where possible it should possess as many as possible of the following properties or characteristics; it should be:—

1. (a) Local, (b) Historical, (c) Public, (d) Fixed, (e) Large.

It should also be:—

2. Informative and truthful. If it seems to represent anything it should represent it truthfully as far as it goes. More rich and beautiful the more extensive the knowledge which contrived it and the knowledge which it imparts. Study necessary both on the part of the artisan and the public.

* By Professor Church. Read at the Cirencester School of Art.

B. Ornament in its application should be appropriate.

(a) Adapted to the use of the object decorated.

(b) Adapted to the material to be decorated.

(c) Capable of sufficiently good execution by trained ordinary workmen.

A. Human character of true ornament.

1. Local, Historical, Public, Fixed, and Large.

2. Informative, Real, Ideal, Conventional, contrasted.

B. Appropriate,—as to material and colour; as to use; as to nature of the executant or artificer.

From these, the conditions of ornamentation, we may trace the origin and real character of conventionalism. The great colourist of Venice, the great sculptor of Greece would convey the greatest amount of truth, produce the best ornament. But we have to limit ourselves in various ways. Titian's colour and the statues of Phidias are not for every day's use. We lack the men—the genius—the skill for work like theirs, we also want to turn our ornamented objects to the purposes of common life. We cannot copy nature perfectly to begin with in her full spirit, her full variety, her force, her tenderness: we must learn what we can keep, what we must omit. Then we come to the second reason for conventionalism, the use of the objects to which ornament is to be applied. Ornament must never interfere with use: it ought not to hinder, but to aid the proper employment of any article of common employment, and it should be appropriate to the object. Do not put wreaths of May blossoms or gaudily-painted pictures or photographs under glass on your coal-stoves. A third limitation is imposed by the material. Bits of rich glass for a coloured window; of marble and stone for a pavement; a wavy line for the border of a dress; abstract forms of flowers and birds for paper on your walls; lumps and bosses and slings of molten glass on the tumbler and the vase; sharp, clean-cut patterns reminding you of material forms of beauty, cut out in brass or hammered out in iron, or engraved in silver.

But although all ornament must be suitable to the material and adapted to the use of the object decorated, and to the skill of the workman, the conditions thus imposed upon the direct copying of nature for purposes of ornament must not lead us to forget the first principle laid down: that ornament must be human, it must appeal to man. It must not be senseless,—meaningless. Let us study the several necessary conditions of deriving ornament from nature by a fair example.

Plants lend themselves readily to the decorator. Where nine workmen can carve some semblance of a flower, one only can represent anything like an animal form.

Ivy: its freedom, its variety, its curves.

Periwinkle. Bramble. Rose calyx. Clover.

A more severe treatment is required the less tractable your material.

But severe as the treatment may be, do not let it bind you down to a fixed bondage,—the bondage of the east-iron schools,—a bondage which brought Gothic early in the nineteenth century into disrepute. Bring the freedom and variety of nature into your work, but discipline your abundant resources. Do not let stiffness on the one hand, nor extravagant curves on the other, interfere with the *unity* of your decoration. Fourteenth-century windows, their details varied, on the same position influenced not by appearance primarily, but by use.

Some people may think or may say that my subject is a trivial one—not worthy of the attention of sensible men. There are some men who care nothing for a poem unless it conveys a satire or a jest, who do not care for any form of art, and I had almost said for nature itself, for nature is, as has been well said by an English writer, the *Art of God*. I ask you, then, consider whether or no my reasons for forcing ornamental art on your attention are good. We have our work in this world; we have power wherewith to perform it. Those powers must be trained if our work is to be well done. Are we to train all our powers, or only some?—put out some talents to weary; others lay up in a napkin, and bury in the earth? Shall we not work better in all directions if we add day by day fresh facts to our knowledge, accumulating power and the wisdom to it? Let the worker in iron learn first of all how to work the metal with skill and ease and certainty. Let him then learn how to make it into forms which shall, at least, not be ugly if not absolutely ornamental; but will it be of no service to him if he finds out in addition to all this how

the iron was got out of the earth, and out of its ores; what are its properties and its components, and so forth? And he may gain advantage beyond his special handicraft by getting knowledge and hints from other arts. A man comes to the School of Art because he wants to "letter;" he learns this in a few weeks, and goes away content; but might he not have learnt more, and improved himself greatly had he looked a little further? A plain letter may easily be painted; what if he had got to learn to illuminate and design, and become known as an artistic and tasteful as well as a skillful workman? Thus I appeal to come to you on grounds of personal advantage. But I may do more. I may urge upon you the importance of developing new industries for the populations of the country, and improving those that exist on national, or social, or patriotic grounds. Honest materials, honest work, manual skill, artistic taste, and that wide and varied cultivation of the mind and hand which, applied to one's daily work, leads to invention and discovery, and the advancement of the handicraft and the country of the workman.

Ornament and the study of its principles is a noble one; ornament may minister to a mere love of finery, unreasonable and indeed ridiculous, but this is merely one of the many ways in which anything excellent in itself may be abused. But the rich abundance and the curious variety of natural decoration at once provide us with material for our ornamental designs, and at the same time teach us the appropriateness of forms and colours to special offices. Dazzling sunlight and moonlight cold; the earth adorned with light, rolling on its course; the canopy of the sky variegated with stars and flashing with thousands of meteoric lights; the sunrise awakening the light of the world; the sunset, like the golden throne of the majesty of heaven, invested north and south by dark clouds like shadowing cherubim; the rooted mountains grand; the ocean, ceaseless in movement, varying in colour, lashed in fury of foaming wrath by the storms, or smiling with its innumerable ripples of light; the hiding of the loaf; the blossoming and tender or rich colouring of the flower; the pencilling of the insect's wing; the special glory of the nature and form made in the divine image,—all these may speak to us of beauty and ornament, if we will listen and will learn.

A PLAN FOR WIDENING THE STREETS.

Of all the questions occupying public attention at the present time with regard to the improvement and well-being of the metropolis, there is not one so much importance as that of making due provision for street traffic. The utter incompetency of the present width of street to the demands of public convenience has been long acknowledged, but little has been done to improve matters. The metropolitan railways, though they relieve the streets of a vast amount of passenger traffic, will never provide a remedy for the existing evil,—an evil which is daily increasing. The right thing to do is to widen the present thoroughfares; but the enormous cost of this, in the usual way of going to work, has been an almost insurmountable obstacle hitherto. A scheme, however, for doing this readily, conveniently, and economically, I now beg to submit to you, with diagrams.

In your Journal a few weeks back a suggestion was made to have an upper pathway in a line with the first floor of the house; but the trouble, danger, and difficulty entailed by this scheme would be very great. I have long thought over the subject, and think the proposition I am about to make must, on consideration, meet with general approval and acceptance. It is this. To set back the present line of shops on ground floor 8 ft. or 10 ft., making the space so gained the public pavement. The upper and outer line of houses being supported by columns or an arcade. The advantages of this plan would be that it is easy of execution and comparatively inexpensive. Instead of purchasing the property outright, with costly outlay for leases, compensations, &c., as heretofore, only a limited portion of the ground-floor would have to be bought at the first; and when the term of lease was expired the whole of the house should then be set back, and only a limited indemnification would be necessary. The colonnade might be removed or not as thought most advisable. The gain to the roadway by this means would in many cases of city streets double their capacity. Leadenhall-street at one part is

only 29 ft. 6 in. wide, including pavements, at present; but, on the realization of my plan, with pavements he, say 50 ft. In Fleet-street, Ludgate-hill, and the Poultry, there are parts respectively 44 ft., 41 ft., and 37 ft. 3 in. All these I would make 20 ft. wider. In Newgate-street, where the narrow parts almost prevent the benefit of the wider portions being felt, my system might readily be applied, and the full width of street be obtained in a few weeks. In some cases I should only propose to treat one side of the street in this way.

Certain it is the exigencies of the public service are so pressing that something should be done to effect a radical improvement on the present state of things, and it is to be hoped that the *levée* attending the opening of the new street and viaduct may result in the matter being taken actively and immediately in hand.

FRED. TAYLOR.

THE HOUSE OF NEWCOMEN, THE INVENTOR OF THE STEAM-ENGINE.

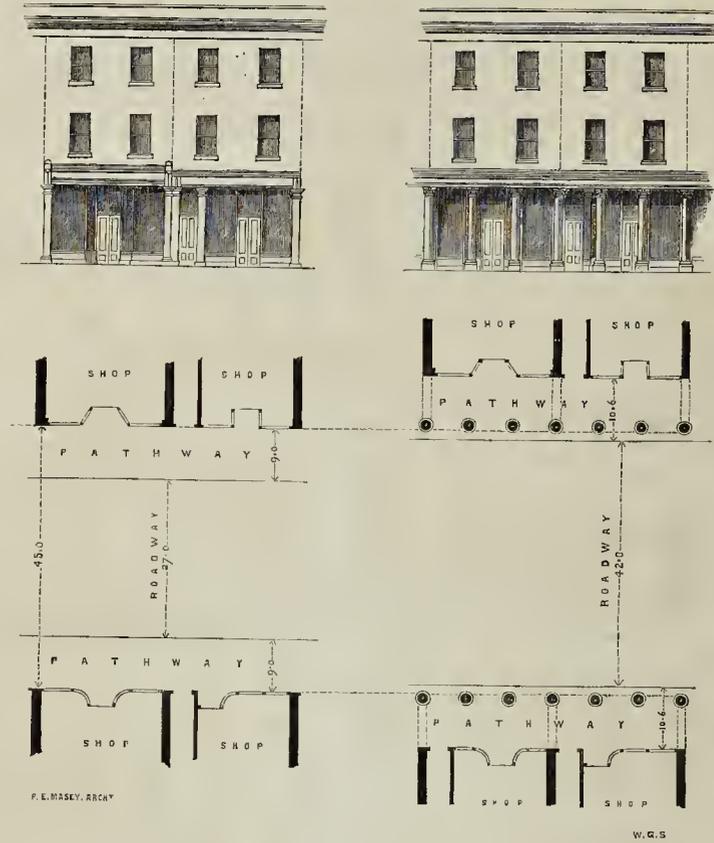

THOMAS NEWCOMEN, the locksmith, of Dartmouth, South Devonshire, first applied steam usefully as a motive power, and his was the chief hydraulic machine for about two-thirds of a century, and was found most valuable in the development of our mining system. Upon this Watt worked, and though Newcomen was thus superseded, his name should always be held in honour amongst us. The story since told of Watt, that he conceived the idea of the motive power to be obtained by steam by watching his tea-kettle, the cover of which would frequently rise and fall when boiling, has long been told in Dartmouth as relating to Newcomen.

The house in which Newcomen lived when he invented his engine was situated in Lower-street, in Dartmouth. In 1834 it was sold and taken down, by order of the local Board of Health, when Mr. Thomas Lidstone, one of a family of builders, of a hundred years' standing in that place, purchased the ancient carved and moulded woodwork of its street frontage and interior, which he rebuilt (1838) in Ridge-hill, in the parish of Towtall, in Dartmouth, carefully replacing in the sitting-room the clavel (*Devonian* for the wooden mantel) of the fireplace at which Newcomen, according to popular tradition, sat when he first noticed the action of the tea-kettle to which we have referred. With the view of preserving a knowledge of the old house, Mr. Lidstone has published a tract containing these particulars, with several illustrations drawn on the wood by himself,* especially a sketch of the house as it stood in Lower-street before it was demolished, and one of the building he erected to the remains,—“Newcomin Cottage,” as he calls it. The latter, as well for the cleverness as for the good feeling it shows, we reproduce. The grounds he has for altering the usual spelling of the name we do not know, and have therefore followed the ordinary mode, though we shall not be surprised to find him right. The cottage contains old woodwork and plaster-work saved from other houses and buildings in the neighbourhood during the last quarter of a century. In 1851 the author endeavoured to obtain funds to raise a monument to Newcomen, but did not succeed. It was a worthy attempt, and should be revived. Money so spent would bring back a good pecuniary return to the town, to say nothing of its moral effect.

OFFICES AND WAREHOUSES, MANCHESTER.

THIS building is situated at the corner of Brown and Marden streets, and was erected for Mr. M. Olive, of the firm of Olive & Spartali, Greek merchants, of Manchester, from designs, and under the superintendence of Messrs. Clegg & Knowles, of Manchester. It has four stories and basement, the front part consisting of suites of offices, and the back part and basement of warehouses; the front part to Brown-street being occupied by the British Imperial Insurance Corporation. It is executed externally in Darley Dale stone, with a liberal use of red and blue granite. The contractors are Messrs. Bowden & Edwards, the carving being done by Messrs. Williams & Mooney.

PLAN FOR WIDENING THE STREETS OF LONDON, BY MR. FREDERICK TAYLOR.

"NEWCOMIN COTTAGE," DARTMOUTH.

OFFICES AND WAREHOUSES, MANCHESTER.—MESSRS. CLEGG & KNOWLES, ARCHITECTS.

ARCHITECTS' ACTIONS.

PEACHEY V. GIRDLESTONE.

We adopt the *Times*' report of this action, tried November 29th, in the Court of Queen's Bench, Westminster, before the Lord Chief Justice. Some further explanation seems necessary, particularly as to the course taken by the Church Building Society—

This was an action by an architect against a clergyman and other gentlemen to recover compensation for plans and estimates for an intended church. The sum of 321s. 10s. was paid into court, and the question was as to the validity of the plaintiff's claim, which amounted to 432. 17s. 6d.

Mr. Digby Seymour and Mr. Row were for the plaintiff; the Solicitor-General and Mr. Macnamara were for the defendants.

The defendants were a committee appointed to raise funds for the building of a new church at Elye, and to superintend the building. They agreed by advertisement to pay 100*l.* for designs they selected, not engaging to employ the architect who was the author of them to superintend the erection of the church. The advertisement referred the architects competing to a paper of instructions containing this clause—“The total cost, including fittings, &c. must not exceed 5,000*l.* and that accompany the designs, and a responsible contractor must be named who will undertake to complete the works for that sum.”

The plaintiff was a competing architect, and the committee were disposed to accept his design, but he desired to show by estimates that his design could be carried out for the specified sum, although he named a firm of builders as proposed contractors. The committee, therefore, only accepted his design conditionally on his satisfying them that the church could be completed for 5,000*l.* They therefore wrote to him accordingly, desiring specific calculations, and he wrote accordingly, and they accepted his design, apologising for defective details. He met a sub-committee, and explained his designs, and, according to his statement, they suggested advertising for tenders. At all events, it was proposed that the committee should advertise for a building to public competition, provided it could be done for 5,000*l.*; and if that was found impracticable, they held themselves at liberty to decline the plaintiff's design. The general committee, however, did not agree to this proposed course, and overruled it. Upon this the plaintiff, nevertheless, proceeded to advertise for tenders, and to draw out a set of quantities and estimates, which he afterwards claimed to recover. The general committee, however, had immediately communicated their resolution to him, overruling the proposed course, and distinctly stating that they did not authorize him to take out the quantities, and make the detailed estimate, although they were still willing, if he could find a builder to do the work for the specified sum, to employ him. The builders he had mentioned had said that, looking at his drawings, the work could be done for that sum; but in the result they found that they could not do so, and that it would cost 11,000*l.*

The plaintiff thereupon wrote to the committee, in effect, complaining of them, and asking for further time. They answered that they were afraid of this result, and that the delay threw them into great difficulty, adding, “The delay has been the result of our agreement with you, and we must not allow us to go further in expense.” Here, plausibly, “I don't want the committee to be at the expense of my delay; but only to give me further time to obtain tenders.” Thereupon the committee agreed to these terms, and while they adhered to their former terms, they were willing to allow him a little further time, and also to let him have the plan of the church in the neighbourhood, in the hope that they might be able to take the work. In this way some further expense was incurred, and this formed another item of his present claim. Thirteen copies of the quantities and estimates were sent to one of them for 5,800*l.* The committee thereupon adopted his tender, on condition of his getting two surveys made accordingly obtained, and the plaintiff's design was then accepted, and it was concluded that he became entitled to the 100*l.*, which was therefore paid into court. The committee, however, had intended that the successful applicant should superintend the work, although, as they contended, they had not bound themselves to do so, and it was only on condition that the plans should be approved by the Incorporated Church Building Society; and this was the great matter in dispute. The plaintiff was silent about it in his examination in chief, but in cross-examination he was pressed as to whether he was not told that his employment was to depend upon his plans being approved by the Church Building Society; and though he said he “could not remember it,” he did not venture to deny it, and, on the other hand, there was the most positive evidence of it. Two gentlemen (Mr. Girdlestone one of them) distinctly swore that it appeared probable from the admitted facts that a grant was expected from the society, and that its approval of the designs was a condition. Moreover, the plans were to be laid before the Board, and submitted to their architect; and these gentlemen distinctly stated that the plaintiff was told of this. However, the society disapproved the designs, and the plaintiff was told of this, and that no contract could be signed until the designs were so altered as to be approved by the society. The committee applied to the society to put the designs in objection to the design and the details, and they replied that it was difficult to do so, as they were disapproved *in toto*, and Mr. Brandon, their architect, being now examined as a witness, so stated to the effect.

Thereupon the committee proposed to settle with the plaintiff, paying him his 100*l.* This he declined, but proposed to send in new designs and plans in a month, and that if they were not approved, he proposed to have another month to send in new designs. They declined that counter proposal, and hence the present action, in which the plaintiff claimed not only the 100*l.*, but all his expenses, and all the compensation for taking out quantities and making detailed estimates, and also compensation for loss of his commission on the work. He calculated that if the work had been superintended by him he would have gained 100*l.* on that account, but as he had not done so, however, in that event the 100*l.* for the designs. He, however, claimed only 3 per cent., as the matter had fallen through. But he charged his expenses in addition; not only the 100*l.* for the designs, but the 100*l.* which were allowed him, but the cost of advertisements. The total claim was 661*l.*, out of which 126*l.* 10s. was paid into court.

The case lasted two days. At the close of the first day, the Lord Chief Justice summed up the case to the jury at some length, and with manifest care. The great point in the case, he said, was, whether the employment of the plaintiff was to be subject to the approval of the plans by

the Incorporated Church Building Society. The evidence of it, he observed, was distinct and decisive, and it was not denied by the plaintiff. It appeared, moreover, he added, probable, as a grant was expected from the society, and their approval of the plans would be a condition, and if this condition was originally imposed upon the plaintiff, there was no hardship in enforcing it. The Church Society was not bound to grant money unless they were satisfied, and the committee were obliged to submit to their resolution. And if they imposed the condition on the plaintiff, he could not complain of it. The vital question in the case upon which it must turn was, whether that condition was imposed upon him. If it were so, then came the question whether an opportunity should have been allowed to him of altering his plans. The committee did the best they could for him, and applied to the society to point out their objections to the design. The reply was, that it was not easy to do so, but that the details were wrong. At all events, they declined to adopt the plans; and the committee were not bound to allow him the time they required for furnishing new plans again and again. The great point was the original proposal. The jury, after some consideration, retired to consider, and eventually found a verdict for the defendants.

THE BELLS AND QUARTER CHIMES OF GREAT ST. MARY'S, CAMBRIDGE.

The tower of the church of St. Mary the Great, Cambridge,—the church appropriated to the University,—has a fine peal of twelve bells in the key of D, the weight of the tenor, or largest bell, being 30 cwt. There is also a clock, and * one other bell, which is used to give notice of congregations and exercises.” This bell, it is said, was, prior to 1545, “placed in Benet's Church, which was the original church belonging to the University.”

It appears that a peal of ten bells was cast and hung in the tower by Richard Phelps, of Whitechapel, London, in 1724. But the tenor bell having at length been cracked, was re-cast in 1770, by Puck and Chapman, also of Whitechapel, who at the same time added two tenor bells, thus making a peal of twelve bells, which were opened by a hand of “Cambridge Youths” on Christmas-eve in the same year.

The eleventh bell was subsequently re-cast by William Dobson, of Downham, Norfolk.

Robert Southey tells us, that in the year 1793, the Society of Cambridge Youths rang at this church a true and complete peal of Bob Maxims in five hours and five minutes. This consisted of 6,000 changes, and for regularity of striking and harmony throughout the peal was allowed by competent judges to be a very masterly performance. In point of time the striking was to such a nicety, that in each thousand changes the time did not vary one-sixteenth of a minute, and the compass of the last thousand was exactly equal to the first.

And here let me observe that the present members of the Society of Cambridge Youths are also said to be excellent ringers.

I now come to the clock which chimes the quarters on the 3rd, 4th, 5th, and 8th bells,—counting from the treble downward,—thus:—

- First quarter } 3, 4, 5, 8.
- Second quarter } 5, 3, 4, 8; 5, 4, 3, 5.
- Third quarter } 3, 5, 4, 8; 4, 3, 5; 3, 4, 5, 8.
- Fourth quarter } 5, 3, 4, 8; 5, 4, 3, 5; 3, 5, 4, 8; 8, 4, 3, 5.

The hour being struck on the tenor, or largest bell.

These quarter chimes have been copied for some other public clocks, including the great clock of the New Palace at Westminster.

I may remark, by the way, that if you have a peal of ten, the 1st, 2nd, 3rd, and 6th bells must be used for these changes.

Permit me now to say, that I have in my possession a paper—repeated at Cambridge in 1838, the contents of which will, I think, be found interesting to change ringers in general. Here is a copy of it:—

“REGISTERS OF A SOCIETY DENOMINATED THE CAMBRIDGE YOUTHS, ESTABLISHED ON THE 3RD OF AUGUST, 1734.

This Register is extracted (so far as the entries could be obtained) from a regular series of Books still remaining in six compartments of a chest. The former records of the Old Society, which began in the reign of Queen Elizabeth, are not to be found; neither are there any memoranda of the original institution now remaining, except a few accidental occurrences in the mousing pages of a few local Manuscripts, by which it appears the Society then consisted chiefly of the *Youthful* Members of the University.

EXPERIENCE has, however, usually demonstrated the salutary advantages derived from the practice of Ringing, whilst Harmony, by her enrapturing powers, hath been allowed to exhilarate the mind, and even to captivate the gloomy aspect of melancholy. That the theory of Ringing hath been improved by the investigations of the most learned in figures, and that the moderate practice of it hath been beneficial to the constitution, have past ages abundantly proved in the course of the two last centuries. It may, consequently, be a surprise to many, that some account of the primeval state of this Society, with its discovery and improvements of Ringing, which is so innocent and

recreative an employ, should, for so long a series of years, have escaped the attention of its several ingenious members; but be it remembered, few of our ancestors were stimulated to preserve the transactions of their own times which frequently render historical relations involved in the remotest obscurity. But now, *temporantur*, every industrious friend to literature hath a propensity to record the events of his time for the instruction of posterity; in which view the following concise, yet authentic and accurate remains, which have casually escaped the wreck of time, are selected for those who may then be the spectators of this Society.

In the year 1777, the old church of St. Mary, containing six Bells, was taken down, and the first stone of the present structure, laid 19th May, 1778, and was finished in 1810; but the tower was not completed till 1808, which was 130 years after its foundation, and a peal of eight bells was hung therein by contribution, the tenor weighing 18 hundred and a half. A diligent and long attention to this sublime art rendered those who had a sagacity in discovering and judgment in admiring its beauties, at length proficient; but so far from satiating their desires, they became more and more ambitious of higher attainments; and in the year 1724, to satisfy their enlarged ideas, a new peal of ten Bells was completed by the ingenious Mr. Richard Phelps, who died 18th August, 1738. From that event originated a new system of laws, by which the society have since been governed; but, through the corrosive influence of time, no memorials are now extant of the original society, except the bare names of those who coincided with the laws respecting the new establishment, their records *tenna edax verum*, have long since been consigned to oblivion. In Sept. 1769 the tenor bell being accidentally broken, a laudable plan was immediately formed and successfully put in execution by Mr. Dax and Mr. Paris, who will be respectfully remembered by this society, not only for their indefatigable pains in procuring a new tenor of about 30 hundred weight (cast 14th Feb. 1770), but for their own contributions in a subscription which they, with great diligence raised, to purchase such additional trebles as, the completion of the present melodius peal of TWELVE.”

Here follow the names of 110 members and 8 “representatives.” Amongst the former I find:—

Charles Mason, D.D. Fellow of Trinity College,	1725
Robert Heath, Esq. of Christ College,	1726
Richard Dawes, M.A. of Emanuel College,	1731
Samuel Roe, M.A. Fellow of Trinity College,	1738
James Benett, Organist of St. Michael's Church	1738
James Gifford, Esq. Mayor of Cambridge in 1757	1738
Charles Day, Esq. Surveyor of Taxes	1750
John Paris, Esq. Bookbinder	1758
John Innesdale (although totally blind,	1767
markable for his extensive knowledge in the art of ringing, and other musical profession)	1767
William Robson, Organist of St. Neil's Church	1768
John Bostell, Bookbinder	1773
Humphrey Argent, Organ Builder	1777
Thomas Steere, an ingenious Mathematician	1787
Leonard Procter, Esq. B.A. of Trinity College	1835

I should mention that the last member in the above list, Mr. Leonard Procter, is still an able performer, and—like Messrs. Cattle, Denison, Ellicombe, Troyte, and many other country gentlemen—often joins in the manly and healthy recreation of scientific change ringing.

THOMAS WALESBY.

PREMISES v. PREMISSES.

SIR,—An alteration of orthography in a familiar word is gradually creeping into use, which alteration I strongly deprecate, on the ground of its being not sensibly correct. Technically correct it may be: that point I must leave to scholars to decide; as also the question of “root” and “derivation.” I can merely regard the matter from the stand-point of utility and common sense.

The alteration to which I allude is the substitution of the word “premisses” for “pre-mises.” No doubt, it is absurd to employ the one word “premisses” in two entirely different senses, as we now do. We say, speaking of our homestead, “on my premisses” and when referring to some prelatory proposition as to any matter under consideration, we say “judging from the premisses.”

Now, surely the word as it stands is more necessary in the latter case than in the former. What has been pre-missed make the pre-missed, and to double the s, and make the word pre-missses, seems palpably wrong; for then it reads as if the foregoing reasoning had all been pre-missses: former failures, in fact. Why should we not retain “premisses” with one s when used in the sense of prior statements? And, if necessary, let the word be pronounced pre-misss, to agree with the verb to *premiss*; and write “premisses” when applied to an estate. To double the s, or even to omit it, is a mistake, for the sound and sense would not be altered; and no particular meaning, so far as I know, attaches to the term that makes it, as now spelled, peculiarly applicable to one's house and grounds: one's premisses, in fact, or premisses, if you will.

I am aware there is a noun “premiss,” a pre-mise, or antecedent proposition; but this is

obsolete, and when I read the other day in a well-known publication "granting the truth of the premises, the claim is a strong one," the phrase struck me as being not only awkward, but also as opposed to common sense.

I therefore, for one, vote for "pre-mises," our prior explanations; and "premisses," or "pre-mises," our house and grounds. R.

BROADWAY ARCADE RAILWAY, NEW YORK.

THE New York papers are very much taken up with a new project, which they regard as preferable to the tunnel railways, such as our own Metropolitan, one of which it has been proposed to form in New York. The Arcade Railway would run along Broadway, the line of ordinary traffic above and the railway traffic beneath. The street would be sunk from the present level to a sufficient depth to form an arcade with groined roof of masonry supported by iron columns. The area space in front of the buildings would give light and air to the under roadway; but whether it is proposed to sink the level of that roadway lower than the foundations of the houses, or, if so, how that is to be done, does not appear to be clearly pointed out. The upper roadway would be substantially paved, and of course would need no lifting for gas, water, or other purposes, the subway providing for these. The surface water would descend through the columns. The groined roof would be made water-tight by means of asphalt. There would be footways at each side below, the same as above, and staircases to ascend and descend.

The high-level railroad projects, as well as the tunnel ones, have been cast altogether into the shade by the arcade plan. The time seems to have come when one or another of these projects must be adopted.

The New York traffic has immensely increased of late years. From the reports of the State Engineer, it appears that the number of passengers carried by horse-cars increased, within the nine years from 1859 to 1868, from 43 to 1 to 104 to 1, and it is now estimated at 115 to 1 by the city railroads alone; the number of passengers carried being set down at 118,000,000, by contrast with 32,889,080 in 1859.

GRANITE COLUMNS.

SIR,—I hope you will pardon my troubling you with a few observations in reference to your correspondent's remarks on this matter in your last impression. I am an old mason, and have carried out many heavy and important works, and cannot agree with him, that "most of the granite columns that are brought to London have a hole drilled through them from end to end." I beg to say that in all my practice I am not aware of such being the case, excepting where provision for gas-pipes is necessary; but all columns, caps, and bases, as well as heavy pilasters, have "Lewis-holes" in top of them, for the purpose of hoisting and fixing, which holes do not generally exceed 8 in. or 10 in. deep. Neither do I quite agree with your correspondent as regards the beds being "perfectly smooth." Most assuredly they should be perfectly straight and closely axed. In fixing steel-lead between the joints, it should not be less than 9 in. or 10 in. wide, and not within 1½ in. of the outer edge of the column, and of not less substance than six pounds weight to the superficial foot. J. S.

DOES IRRIGATION PAY?

THE area of land under irrigation in the north-west provinces of India during the Rubhee season of last year was as follows:—

	1869-9.
Ganges Canal	797,219 acres.
Eastern Jamma Canal	215,002 "
Doob Canal	10,494 "
Bareilly and Tersee Canals	37,290 "
Total	1,049,295 "

The importance of these works is strikingly exemplified in these figures, which are given by the *Indian Economist*, which concludes that but for these canals 1,050,000 acres of land under cultivation would have been barren through drought. Now an acre of irrigated land in the north-west, continues our authority, will produce from 1,200 to 1,900 lb. wheat, or the whole area irrigated an abundant supply of food for 3,000,000

persons for a whole year. The average price of wheat, moreover, throughout the provinces for some weeks past had been about 10 seers the rupee. Thus the irrigation of this million of acres has resulted in a crop of food of the money value of 8,000,000L. sterling:—

Acres. lb. wheat. lb.
 1,050,000 × 1,500 × 20 per rupee = Rs. 78,750,000

Now here, he adds, is a very simple sum in arithmetic, and yet how slow we all are to learn it. The total cost of the whole Gangetic system of irrigation has been, if we remember rightly, about 2,000,000L. sterling, and here it is recouped four times over in a single season of drought. In addition to this million of acres under irrigation for the rubber crop, there were 326,114 acres irrigated for the khareef harvest, a total area of 1,375,469 acres for the two crops. What proportion of this land would have been absolutely barren but for the canal works, we are not told. Let the State but retain its interest in the land, concludes the *Economist*, and the time will come when we may obtain 50,000,000L. a year from it, with as much ease as we now do 20,000,000L.—a very arithmetical sort of fact, which a troop of Indian statesmen find it impossible to master.

THE SANITARY CONDITION OF GOOD HOUSES.

SIR,—No apology is required for addressing the *Builder* on the question of sanitary improvement. You have so long been a general in the fight that I doubt not you will allow one of the rank and file, a full private, to fire a shot in the cause.

Beginning where things were at the worst, your labours were directed to the amelioration of the condition of the poor in the dark and confined alleys of this great metropolis; and for whatever improvement has been effected, you may fairly take a large share of credit.

I want you to help now to stir up an agitation in favour of a higher class, namely, the occupants of the terraces, places, and villas of the suburbs. So far as the sanitary condition of their dwellings is concerned, this class is at the mercy of the builder and landlord. Feeling strongly on the subject, I will not risk drawing on my imagination, but will describe the state of things actually existing in the house I occupy,—a house built within the last five years, and finished with all the "latest improvements."

Finding that there were unmistakable "sewer smells" both upstairs and down, I made a thorough examination, and discovered, to begin with, that the drain ran right under the house from front to back, and that not even ordinary precautions had been taken to make the pipe-joints tight. The waste-pipe to the sinkstone in the scullery was (supposed to be) protected at the top by an ordinary ball-trap, and its discharging end was passed just through the flags and delivered into an open 9-in. brick shaft, built above a square junction on the drain-pipe. To allow the gas to spread under all the basement floors, half bricks were left out of the sleeper walls and partitions at certain intervals. Two pipes ahead of the sink-stone branch, another junction received the overflow from the scullery cistern, the pipe being carried up without even an ordinary syphon bend. Together, these neat little arrangements fully accounted for the smells in the basement. On the ground floor, there is a water-closet; above it, on the first, a bath-room; and above that again, a cistern supplying both with water. The bath waste and overflow, and the cistern overflow, were connected with the head of the soil-pipe behind the closet trap. Here, then, was another direct flue ventilating the sewers into my bath-room, and accounting for the sickening odour there experienced. I had these things set right by taking all the waste and overflow pipes into a trap outside the house, so arranged as to cut off all connexion between the inside and the drains. The man whom my landlord sent to do the work assured me that many of the houses in the neighbourhood were similarly drained, as he himself had had the doing of them; and from further inquiry, I am satisfied that not only is this not an exceptional case, but an example of an almost universal rule. Could anything possibly be devised better calculated to bring our houses into the condition of the notorious infirmary wards of the St. Pancras workhouse?

With a cistern overflow on the same floor, in direct communication with the sewer, the air breathed in sleeping-chambers must of necessity become highly polluted during the night, and to this may doubtless be attributed hundreds of

cases of illness, preventible under better sanitary conditions. During the winter months, when every occupied sitting-room has its fire, and all means of ingress for external air are closed, a sort of exhausting action takes place, and the foul gas from under the basement floor and ill-ventilated connexions, is sucked up and passed through the rooms and the lungs of their occupants, to supply the place of the air ascending the chimneys. This is no fancy, but a unpleasant experience I have myself enjoyed.

Surely such a state of things only requires to be understood for householders to take steps to remedy it. It is of no use to trust to the respectability or position of your landlord. The class of houses I refer to are erected by speculating builders, whose only care is that the cost shall be kept down, and that the houses shall have an attractive appearance. Such unimportant details as drains are left to the tender mercies of some old navy, who takes them to do by the piece, and the connexions to a plumber, whose faith is built on a bell-trap. If cistern overflows are ostensibly protected by the orthodox syphon bend, it is a delusion, because the waterworks companies have the power to inflict a fine in case the ball-cock is so "set" that the water runs away by the overflow at the time it is coming in by the service, that though the syphon is there, the water is absent, and no trap is made. What is imperatively wanted, sir, is an amendment of our building by-laws, by which district surveyors shall have power to enforce the execution of house-drainage works in accordance with sound principles.

In these days of sanitary commissions and social science congresses, it is a disgrace that the dwellings of the middle and higher classes of London, should be the breeding-places of fever; and it is high time that all medical officers and inspectors of nuisances should deserve, by their exhibition of zeal, the epithet "Sanitary Mad," bestowed by a wise member of the St. Pancras Vestry on one of their officials. J. M.

SANITARY CONDITION OF GLASGOW AND BRISTOL.

LAST week a deputation from the Sanitary Committee of Glasgow, with Dr. McGill, one of their medical officers, and Mr. Ellison, their inspector of cleansing, visited Bristol, and had an interview with the committee of the Board of Health of that city, with a view to learn the sanitary arrangements adopted in Bristol. At three p.m. the high sheriff, Alderman Proctor, entertained the deputation, the Mayor of Bristol, and the committee of the Board of Health, at a sumptuous luncheon at the Royal Hotel, when sentiments of reciprocal respect and good wishes were exchanged between the members and the officers of the two sanitary committees. The Lord Provost of Glasgow intended by an engagement in London in connexion with the visit of the King of the Belgians. The deputation during their stay visited several of the poorest localities in the city, and expressed themselves highly pleased with the sanitary arrangements of the Board of Health. Such exchange of opinions and amenities between different sanitary authorities must result in the improved health of our large cities, and it is highly desirable that such practical authorities should "compare notes" more frequently. It is to be hoped that the deputation will make public the result of their observations.

TELEGRAPH SYMBOLS.

THE advantages of a system of telegraphy, have been widely advocated by the Press. Publicity and mutilation of telegrams and telegraphic matter are two evils in the present system, which, it seems strange, have never yet been abolished by the use of a regular cypher or secret code for the transmission of messages. Recently, however, the Postmaster-General decided in sanctioning for the use of the public a numerical telegraph code. This is Major Bolton's code, which did good service during the campaign in Abyssinia, and is now in use by the military and naval services. The system of the code consists in an alphabetical list of sentences numbered, as is likewise the page upon which they stand. The entire of our language has been, it is asserted, collected together in this way, so that a person is able to code an ordinary message of twenty words into a couple of Bolton groups, or ten figures.

There is also a spelling code, for rendering proper names and uncommon words, and an arrangement of symbols to express decimals, fractions, stops, &c. The code book is a key or dictionary of a language. The pages are numbered in consecutive order, and also the lines of each page, and when it is desired to send a message, all that is necessary is to transmit the number or numbers, referring to the page and line in the code where it is to be found the letter, word, or sentence which the correspondent is to be acquainted with.

THE MATERIAL FOR MEMORIAL TABLETS.

I HAVE recently been trying various experiments in the construction of tablets of a permanent, indestructible, and, so far as practicable, an ornamental character, for street nomenclature and other purposes. I may briefly mention that among other methods which I have tried, the most durable and useful seems to me to be that of stamping letters out of silicate of iron and pressing them upon zinc plates, which upon exposure to the air become perfectly united and extremely hard. For better preservation (although not essentially necessary) from the mirkiness of the London atmosphere, I encase the whole in a zinc case prefaced with common glass, which renders them air-tight, water-tight, and anti-rustive; and, as regards legibility, equal to any tablets for the purpose yet brought under public notice, and at a considerably reduced cost.

It may be urged that the liability of glass exposed in a public thoroughfare to breakage would form the chief objection in the construction of street tablets, but the same objection might be raised with regard to the construction of street lanterns, &c., irrespective of the penalty attaching to the wilful destruction.

In appearance these tablets resemble, as nearly as possible, the enamelled iron tablets now in use, which, owing to the contraction and expansion of the iron by the fluctuation of heat and cold, the exposure to damp (more especially fog), together with the coarseness of their construction, are to some extent objectionable.

I have ventured to address you on this subject believing that it may, perhaps, afford some information, or be made in some way applicable to the purposes of memorial tablets.

W. S. BRAINE.

LIVERPOOL ARCHITECTURAL SOCIETY.

At the last meeting of this society, December 1st, Mr. W. H. Pictou called special attention to the fact that the publication of the Dictionary of Architecture, which had been partially in abeyance for some time, was being resumed, and it was expected that it would be carried on with more rapidity than formerly. The promoters of the Dictionary were desirous to receive the support, in the way of subscriptions, of all who were interested in the art which it was to illustrate. Mr. C. E. Beale read a paper, illustrated by diagrams, descriptive of the new works of the Rhyll District Water Company, now in progress, and in which some peculiar difficulties had to be encountered, owing to the geological formation of the site, and the heavy gradients on which some of the pipe lines had to be laid.

FIRE!

STR.—Without wishing to find fault with any particular person, I beg to ask whether it really is not time that some serious inquiries should be made as to the most expeditious and best mode of extinguishing fires in the metropolis. I happened to be at a fire that took place in the Brompton-road within this week, when two large shops thrown into one, with four stories above each shop, and the large stock of a linendraper, were consumed. I was not there till after the shops were fully on fire, yet for quite half an hour after there was no other but a hand-power engine. The Life Guards were there, but they either would not or could not get into play. However, when the whole of the ground and first floors were in full blaze, other engines arrived, and the system seemed to be to try and extinguish the fire at the lowest part, instead of playing upon the highest part, when the lower part would then receive the surplus water. As it was, the houses were seen to burn upwards, story by story, till the roofs fell in, and burnt themselves out. Surely some

reasonable men could meet and settle rules to guide the firemen in extinguishing fires, instead of increasing them by draughts below.

The course pursued on the night in question was certainly not the way to tackle such a terrific enemy. S.

FOREIGN JOINERS' WORK FOR ENGLAND.

STR.—I notice a memorandum in your last, to the effect that some of the joinery for St. Thomas's Hospital was made in Sweden. Will you allow me to add that I have also executed a large order for windows for the same building.

Touching the concluding paragraph (that the Swedish work is cheaper than work made at home), I would observe that I have just received orders for a second and larger quantity of windows, and that for this order the Swedish firm referred to estimated against me, and lost it.

W. H. LASSELLS.

A NAME FOR THE STREET BY THE MANSION-HOUSE.

A CORRESPONDENT, "W. H.," writes:—I have seen it mentioned that the authorities are in want of a fitting name for the new street leading to the Mansion-house. I am, I confess, surprised at there being any doubt whatsoever as to what the name should be.

In all London there is not a street that I know of—I am certain not a street of importance—named after the greatest name in all literature. "Shakespeare Walk" was named after a Mr. S. of the last century—not after the immortal bard. The new street must pass quite close to the house in St. Anne's, Blackfriars, which occupies the site of the house which belonged to Shakespeare's own self. Are not the contracts connected therewith in the City Museum? Could you not advise the appellation? Some years ago I made a pilgrimage to the court in which the house stands. A boy, seeming to understand what must necessarily be the object of my search, pointed to a house, saying, "That is the house, sir."

TECHNICAL EDUCATION.

STR.—With reference to the subject of technical education, the meeting held at the Royal School of Mines, Jernyn-street, some time ago, was called a failure, I must admit; but there is no effect without a cause. Had there been a lecture by any of the doctors or professors on any scientific subject, it is a proved fact that the theatre would have been crowded, and many new ways that it would have been impossible to admit. I think that the meeting was called for the purpose of inducing persons to become members of working-men's clubs, at 2s. 6d. each, irrespective of character or calling. Circumstances prove that the working classes are setting to more solid work, as the attendance at the lectures last winter at the Royal School of Mines shows that where there is anything good to be heard, where there is any real knowledge to be obtained, at any time when the working classes have leisure, there you will find them. But "Reasoner" must not look to the employers of this country to promote the cause of technical education. It is not to their interest to do so. If the capitalists, the wealthy consumers, do not look to their own interest, and join with the workers who produce the articles they require, they must bear the consequences; they must be prepared to admit into their associations, to expect the friendly greeting in Rotten Row of some persons whom, only a few years back, they looked upon as their enemies, and who, in the case of the present day, employers and others have acquired their wealth at the expense of the capitalists and the workmen alike. "Reasoner" shows truly that good workmen are frequently discharged, and spoilers of materials kept on. Who pays for that? The employers. But who pays the employers? The capitalists, to be sure. So, therefore, you will see the necessity of the workers to acquire a good technical education; it will therefore be obvious who will be parties benefited by a good system of technical education, the capitalist and the real producer, or workman.

ALEX. KAY.

BRTON'S FARM UNDERDRAINAGE, HORNCHURCH, ROMFORD, ESSEX.

STR.—For the above, tenders were invited for the construction of the same, for which two estimates were submitted, varying from 6300. to 2000. the "engineers" being 3577., and No. 1 in the list of estimates being also 3500., who submitted a second estimate, which came between Nos. 11 and 12 estimates, and has been accepted. Now, I ask, if fair play has been exercised after the trouble and expense taken by contractors, why should No. 10, like those below, being responsible and competent persons to have carried out the works, have been set aside, otherwise than through partiality. Your giving publicity to the above will greatly oblige. A CORRESPONDENT.

ANOTHER SITE FOR THE GREAT LONDON FISH MARKET.

STR.—The very best site for a new general fish-market would be the water part of St. Katherine's Docks. All sites which are not upon the river side are objectionable for the purpose; as, though 60 per cent. in weight of our fish now come to London by railway, it is certain that in a few years' time, when the present arrangements are carried out in ships so as to increase their speed to perhaps thirty or even fifty miles an hour, nearly all the fish will come again by water as it did twenty years ago. The up-river docks cannot stand the close of the down-river docks; and while the buildings of St. Katherine's Dock might still be used as bonded warehouses, the water part of the St. Katherine's Docks might with advantage be adapted to the unloading dock computers be sold, and on it a grand market built. It would be close to the projected Tower Bridge, and so would be very convenient for the dwellers in south London; it would be close to the Blackfriars branch of the Great Eastern Railway, by which a deal of fish comes; and it would be close to the Tower-hill station of the

Underground Railway. Any man who takes a map (and without a map it is impossible to understand the matter), and looks at it with an unprejudiced eye, must see that this is of all others the best spot for the great London fish-market. Nightingale-lane should be done away with, and thrown into the dock property; and a road should be made right across the proposed site, commencing in Lower East Smithfield, just west of Barr-street, and coming out in Upper East Smithfield, somewhere about what is now the principal entrance (not the office entrance) of St. Katherine's Docks. F. D. W.

MIRRORS IN ARCHITECTURE.

I WAS not aware, until I read the letter of Mr. F. R. Wilson, in your impression of the 27th, that mirrors had ever been used as a decoration in a Medieval church. As there is a precedent for such a mode of decoration, it may not be out of place in me to state that I have long entertained the idea that small mirrors might be so used. In the final of a spire, for example, they might be made to play a brilliant part, as when the sun's rays struck upon them, they would glitter like gems. Suppose the final to take the form of a cross, I would insert a mirror of about 9 in. in diameter at the intersection, and one of about 3 in. diameter at the extremities of the three upper limbs. They would require to be framed in the metal, and secured against rain penetrating to the back, and washing off the quicksilver. W. G. S.

DOBROYD CASTLE.

STR.—With reference to the roof of Dobroyd Castle, we beg to state that the whole of the building has been covered by us in thick Vieille Montagne zinc. The zinc-work to skylights was also executed by us.

J. W. TYLER & Co.

* Mr. James Davis, of Malvern Wells, also writes to "regret that he is not noticed as the builder." His name appears in the lines we printed. Mr. John Underwood wishes it to be known that he executed the carving and modelling.

RAILWAY MATTERS.

THE Metropolitan Railway Company have at length decided upon running workmen's trains at more convenient hours, and with extended privileges to the holders of the tickets. This will be felt as a great boon by those who are compelled to reside in the suburbs. It is also intended to reduce the fares between some of the stations on the Brompton and Westminster line.

The first ten locomotives ever built in Russia have just been completed at the works of Herr von Struve, at Kolomna, near Moscow. It is said that no pecuniary assistance on the part of the Government was required by these gentlemen for this purpose.

It is estimated that by the end of the year 1869 there will be laid in the United States, in round numbers, 110,000 tons of steel rails, equal to 1,100 miles of steel road; and of this amount about 36,000 tons (equal to 360 miles) will be laid during the present season. These rails are in use on more than fifty different roads, and are partly of American, principally of English, and to a small extent, of Prussian, manufacture.

MONUMENTAL.

Bust of Lord Palmerston for Harrow.—A massive pedestal of Cornish serpentine has just been placed in the library at Harrow; and on it will be placed a bust of the late Lord Palmerston. The stone is from the quarries of Lord Falmouth, near the Lizard. It is of a dark ground, with bright red figure, and contrasts with the white statuary marble of the bust. On the front of the pedestal is the word "Palmerston" in large gilt letters, and on the opposite side, "Presented by W. Grant, 1869." The pedestal was manufactured by Mr. John Murphy, of the Penzance Serpentine works. This is the third pedestal of the same material which Mr. Murphy has made for the same place.

Torquay.—An elaborate canopy in wrought iron has been completed for the tomb of the Rendle family in the Stoke Gabriel Church of Torquay, by Messrs. Barnard, Bishop, & Barnard.

A Poet's Monument at Leek.—A memorial cross will shortly be erected in Horton churchyard to the memory of George Heath, poet, by the subscriptions of his friends. It has been designed by his friend, H. Wilson Foster, of Kensington, and is in course of execution by Mr. Barlow, sculptor. It is a shaft, 9 ft. 8 in. high, on a plinth of one block, surmounted by an ornate cross, 3 ft. wide and 16 in. thick, in the centre of which is the sacred monogram, surrounded by a wreath of bay-leaves in relief. Up the shaft runs a sunken panel, containing the inscription, in old English, with red capitals. The front of the column and the three wings of the cross are ornamented with carved arabesques in relief. It will be executed in the hardest Kettridge stone, polished. The inscription is as

follows, the lines being a quotation from one of the deceased's poems:—

"Erected in memory of Geo. Heath, of Gratton, who, with few aids, developed in these Moorlands poetic powers of great promise, but who, stricken by consumption, after five years' suffering, fell a victim to that disease May 5th, 1859, aged 25 years.

His life is a fragment, a broken clue—
His harp had a musical string or two;
The tension was great, and it sprang and flew,
And a few brief strains—a scatter'd few—
Are all that remain to mortal view,
Of the marvellous song the young man knew."

Monument to King William I. of Holland.—A national monument in honour of William of Orange, first King of the Netherlands, has long been in course of erection at the Hague, and has now been inaugurated by the King and Queen of Holland, in the presence of the diplomatic corps, a large gathering of the nobility of the country, and an immense concourse of spectators. Two flights of stone steps lead up to an extensive basement area, on which is erected a pedestal supporting a statue of King William I. and some allegorical figures. The sides of the pedestals are adorned with reliefs of the most important events in the king's life, and amongst them is one of the landing, while he was Prince of Orange, at Scheveningen, from her Majesty's ship *Warrior*, on the 31st March, 1813, after an exile of nineteen years. An officer of this ship, Vice-Admiral Sir William H. Hall, K.C.B., who was a midshipman at the time of the prince's return, was specially invited to be present at the inauguration ceremony, and he was accompanied by the Hon. Lady Hall, who, it happens, is the daughter of the captain who commanded the *Warrior* when she performed this service;—viz., the Hon. George Byng, the sixth Viscount Torrington.

COMPETITIONS.

Clapton, N.—A limited competition for the new Christ Church, at Clapton, has just taken place, Messrs. Brooks, Dolman, Truefitt, Wigington & Morris, and Tanner & Stone, being the competing architects. After several meetings, the building committee selected the design "Sine Dubio," by Messrs. Wigington & Morris, who will carry out the works.

Printers' Almshouses.—At an adjourned meeting of the council of the "Printers' Almshouse Pension Corporation," held on Tuesday last, for the purpose of appointing an architect for the additional wings to almshouses at Wood-green, the design of Mr. Charles Bell, of Craven-street, Charing-cross, was selected out of the five designs sent in competition; and under his superintendence, the work will be proceeded with forthwith.

CHURCH-BUILDING NEWS.

Bilston.—St. Leonard's Church has been reopened for divine service. The work of improvement has been confined as yet to the rearrangement of the former chancel, and a portion of the nave immediately adjoining, for the purpose of completing the requirements, which the insufficient space originally provided had hitherto rendered impracticable. The original chancel (of about 11 ft. in depth) has been extended westward about 10 ft. into the nave, where its line of limit is marked all round by a stone step; thus raising the new portion of the "chancel" (as it may be termed), upon a platform to that height above the general level of the floor of the church. Upon this platform are arranged the new choir seats, which face north and south on each side of the central passage; and on the south side is placed the prayer-desk; while against the northern corner of the chancel arch stands a new pulpit, erected as a memorial of the late Bishop Lonsdale. The altar-rail is also new—partly of oak and partly of metal; and from it rise two ornamental gas standards, with branch lights, which serve to light the chancel. Other gas-standards are fixed in convenient positions, to serve for the choir seats generally. Iron scroll-work is introduced into the open fronts of the book-decks on each side of the central passage. On the several floors there is an intermixture of pattern-tiles with red and plain ones, and with the occasional introduction of glazed tiles, and black glazed strips, ranged in zigzags, and lighted up by white squares at the angles, as within the altar-rail. The work generally has been carried out from the designs and under the superintendence of Mr. J. D. Wyatt, of London, architect. Messrs. G. & F. Higham, of Wolverhampton, were the contractors. The tiles for the paving were pro-

cured from Mr. W. Godwin, of Lugwardine; the metalwork from Skidmore's Art Manufactures Company, Coventry; and the stone carving was done by Mr. Earp, of London. The total cost of the alterations amounts to 275*l*.

Sutton.—The church here has been re-opened by the bishop of the diocese. The edifice has been renovated. The west gallery has been removed, and the tower-arch opened, and the whole area of the building is seated with open benches. A stone pulpit, with the panels filled with alabaster carved figures, stands at the entrance to the chancel. Choir-seats and organ are placed in the chancel. The altar, which is 8 ft. 6 in. long, has a green frontal, embroidered.

Strood.—The new church of St. Mary has been consecrated by the Bishop of Rochester. The building is in the Early English style, with nave, chancel, and side aisles, the entire length being 98 ft. and the width 48 ft., with a tower and spire at the west end. The architect was Mr. Arthur W. Blomfield, and the contractors were Messrs. Foord & Sons. The church is built of Kentish rag, with freestone dressings. The entire cost of the church, with the sum appropriated for the endowment, was about 10,000*l*. Accommodation is provided for 500.

Pedmore.—The church of Pedmore, a small parish adjoining Stourbridge, has long stood in need of restoration, and of late had become so dilapidated that a few weeks ago the greater part of it was taken down, for the purpose of rebuilding. The structure contained some Norman work in the chancel arch, south doorway, and other portions; Early English in the chancel, and the rest fifteenth century. On the tympanum of the door is a crowned figure in the act of benediction, supposed to be the Deity, or the Saviour, surrounded by the *vesica piscis* and symbols of the four Evangelists. Others have thought that the central figure was meant either for a bishop or king of Mercia, as it is difficult to say whether the headcovering is an ecclesiastical or regal device. This curious relic of Norman work is to be preserved in the renovated building, as will also be the chancel arch and tower. According to estimate, the cost of the rebuilding will be about 3,000*l*, and one-half of this amount has been granted by the trustees of Oldswinford Hospital, who are the patrons of the living and owners of the manor. The sum of 1,200*l*. has also been raised by subscription, so that there are only 300*l*. deficient at present.

Great Yarmouth.—The south-west pinnacle of the great church of St. Nicholas has been completed. From want of sufficient funds, the restoration committee has been compelled, reluctantly, to postpone the completion of the angle-tower, which, rising in a straight line of 70 ft. from the ground, forms a feature in the design, both of the south aisle, now under restoration, and also of the west front of the church. The ladies of Yarmouth determined to raise the sum of 200*l*., in order to complete the tower. Contributions rapidly flowed in from eighty donors and collectors. A small balance remains in hand, and further donations will be applied towards the restoration of the second of the four pinnacles of the west front. At the point where the work thus carried out by the ladies' fund was commenced, it is proposed to insert the following inscription:—"To the glory of God. This south-west tower was restored by the ladies of Great Yarmouth. 1869."

Books Received.

Memoir of the late Henry Booth, of the Liverpool and Manchester, and afterwards of the London and North-Western Railway. By ROBERT SMILES. London: Printed for private circulation by Wymann & Sons, 73, Great Queen-street, Lincoln's-Inn-Fields.

This is an interesting memoir of one of those far-seeing, long-headed men, to whom, after the inventors and maturers of the locomotive, the world is indebted for one of its most wonderful agents of progress,—the railway. Without the support of enlightened men of business and capital, what could even a Stephenson have done towards the establishment of the railway system? Mr. Booth was a leading man in the locomotive trial on the Manchester and Liverpool Railway, and in the promotion of that line generally; the result being the establishment of the modern railway system. His long and useful public life was mainly devoted to the promotion of railway interests, and his name was well known to the public in that connexion. He was

born in Liverpool in 1788, and was the eldest son of a well-to-do corn-merchant of that town. He only died in March last, so that he lived to the goodly age of 81. The contents of the volume under notice first appeared in a series of articles, by Mr. Robert Smiles, in the *Railway News*, and have now been reprinted for private circulation.

Vegetable Physiology; in a Series of Easy Lessons. By EDWIN LANKESTER, M.D., F.R.S. London: Cassell, Petter, & Galpin.

This little treatise was written as part of a series of lessons for reading in schools; and although it does not appear to have been newly written, the preface shows that it has been revised by Dr. Lankester, and printed separately from treatises by other authors along with which it first appeared in print. It is illustrated with diagrams, and forms an instructive and interesting outline of vegetable physiology. The rising generation owe much to Dr. Lankester.

Pictorial Scenes from Pylgrim's Progress. Drawn by CLAUDE REIGNIER CONDER. London: Hodder & Stoughton, 1869.

The immortal tinker of Bedford never dreamed, great dreamer as he was, that men would go on, generation after generation, setting forth his work and seeking to illustrate it by pencil, brush, and graver. So, however, it is; and so with little doubt it will long continue to be. The last illustrator,—at least, he was so yesterday,—Mr. Claude Conder, gives a series of pictorial dreams, with imaginative backgrounds, in chromolithography, in a manner founded on that of M. Doré. The first, "Yonder Shining Light," is immeasurably the best of the series, and raises hopes which are scarcely fulfilled by some of the others. Our second favourite is "Out of the Wilderness," with its suggestive expanse of wood and high horizon. They show much poetic feeling.

VARIORUM.

"TWICKENHAM DRAINAGE: Report on a proposed System. By H. M. Ramsay, Surveyor to the Local Board." By the system here proposed, the sewage of the parish of Twickenham would be collected to a point of outfall on land near to Marsh Farm, and would be available whether under a system for irrigation, filtration, or deodorisation. The surveyor proposes the separation of the rainfall from the sewage. If deodorisation should be resolved upon, the milk of lime process is what he advises; and pumping power and settling tanks are provided for. The outfall sewer, according to the plan, is so arranged or laid down as to levels, that it could be extended to any other point deemed desirable for working on the irrigation system, and without any alteration in branch or other sewers. The report is accompanied by a key plan of the proposed scheme.—"Transactions of the Institution of Engineers in Scotland: 13th Session, 1869-70." This portion of these Transactions contains papers on the Debnuru Valley Railway; by Mr. G. S. Hird, C.E.; and on some Improvements in the Scantlings of Iron Steam-vessels; by Mr. John Price; besides the report of the Council; introductory remarks by the President, Professor Rankine, C.E.; and a number of plates, illustrative of the papers read.—"Statistics of Invention; illustrating the Policy of a Patent Law. Part II. of a Letter addressed to the Right Hon. Lord Stanley, M.P. By Henry Dircks, C.E., &c. London: Spon." Mr. Dircks here ably advocates the cause of the inventors, and attacks those who wish to pick their pockets of the fruits of their brain-work.—"How to make Money by Patents. By Charles Barlow. London: Barlow & Clare, Office for Patents, Chancery-lane." Although this pamphlet is liable to be regarded as a trade book, promotive of the business of a patent agent, still it contains much wholesome advice to inventors and would-be patentees; and shows how valuable and lucrative many inventions have been to the patentees and inventors; and how best to proceed in order to secure similar results even under our very defective and obstructive, but improvable patent law.—"The People's Guide to the new Law of Bankruptcy, &c., written in plain English. Houston & Wright, Paternoster-row." This is a timely and useful, as well as a cheap guide. It behoves all who are liable to pecuniary difficulties, and some among them who have unwarlike desires to cheat their creditors, to know how

the new law may affect them; for it is in some respects very different from the old. For four persons starting they can now ascertain this from Honston & Wright's—Whittaker's Almanack for 1869. Office, 12, Warwick-lane, Paternoster-row." This is an excellent almanac of nearly 400 pages, containing, besides the almanac proper, with the usual astronomical and other phenomena, also a large amount of information respecting the government, finances, population, commerce, and general statistics of the British Empire throughout the world, with some notice of other countries, &c.—"Notes on the Geology of Powys Land. By W. Boyd Dawkins, M.A., F.R.S., &c. No. 1." This is the first portion of a paper reprinted from the "Montgomeryshire Collections," issued by the Powys-land Club. It contains a popular account of the geological features of the vicinity of Welshpool.—"Golden Arrows" is the title of the Christmas number of the *Quiver*, and contains for sixpence a large amount of pleasant reading. The last of the stories, "Marion Lee's Good Work," by the author of the wonderfully popular "Trap to Catch a Sunbeam" (Mrs. Henry Mackarness), will commend itself to many of our readers. It tells in a charmingly simple manner how a little helpless peasant-girl built a church, and it inculcates the value of faith and perseverance. The events follow each other so naturally that the result seems quite probable. The story, like the rest of the book, is prettily illustrated.—"The same author has added to her "Sunbeam Stories" (Lockwood & Co.) a pretty little tale, under the title of "Married and Settled."—The title of "The Boy's Home Book" (Lockwood) sounds a little too much like an endeavor to confuse it with a well-known standard work of the same character. However, it is a smart little volume, pleasingly illustrated.

Miscellaneous.

A Pre-Historic Pompeii.—Under this title the *Revue des Deux Mondes* publishes an article by M. F. Fouque on some underground villages discovered in the small Island of Therasia, adjoining Santorin, of volcanic notoriety, in the Greek Archipelago. The writer affirms that we have here a distinct proof, not only that the human race may be traced in the quaternary period, but that even then it had made some advance in civilisation. It appears that these primitive villages were destroyed by volcanic agency. The houses were built in the open air, on the old soil, and were afterwards buried under a stratum of pumice-stone and tuff, ejected from a crater. The inhabitants were taken by surprise in the midst of their daily vocations, and their tools, vases, and domestic utensils have remained for thousands of years on the spot they occupied at the time. At Santorin and Therasia the strata of tuffaceous pumice have been worked from time immemorial as building material, and a good deal of it has been exported to the Suez Canal. But the habitations consist of large blocks of lava, heaped one upon another without any order, the interstices being filled, not with any kind of mortar or cement, but with reddish volcanic ashes, having no cohesion whatever. The only house hitherto entirely exhumed is composed of six rooms, the largest of which is 18 ft. by 5 ft., and the smallest about 8 ft. square. One of the main walls of the building encloses a court. Three windows and one door have been recognised. The ceiling was composed of a series of wooden cross-beams, on which stones and a thick layer of volcanic earth were spread. Among the objects found inside there was the skeleton of a man, besides flint implements, earthen vases manufactured on a turning-wheel, and containing various seeds, such as barley, peas, cardamom, &c. The most curious relics were certain stone disks with a hole through the middle, and which are still used in the country by weavers to stretch the threads of the warp.

Fall of a Bridge on the Rhine: Forty Lives Lost.—The *Rhine Gazette* says:—"The iron bridge, yet unfinished, which the Railway Company of Berg was having constructed across the Rhine, has fallen, in consequence of a laden vessel having come into collision with the scaffolding of the construction. About forty workmen have been killed and twenty wounded in the catastrophe. This accident will retard for six months the completion of the bridge."

Pantomime Architecture.—Very reasonable, indeed, are the resolutions made by a select committee of the House of Commons on the sources of authority in matters of public architecture in the great metropolis. The report of this committee is full of hints for the scene-painter; and perhaps those adventurous artists might easily obtain a loan of the photographs that were submitted to the committee, to furnish hints for comic scenes in the coming Christmas festivities. One of these, produced by Mr. Cole, showed the railway-bridge across Ludgate-hill, with a breadth of wall advertisements, and Alderman Waitman's monument, the bridge blotting St. Paul's Cathedral out of the view, "a sort of thing for a pantomime." London abounds with architectural anomalies and absurdities of the same sort, and we did not need a Parliamentary committee to remind us of them. But the committee has done good service nevertheless, for it has placed solemnly on record, in the most emphatic manner possible, the too well-established fact that in matters architectural London is as much without a government as it is in matters political and social. Although such trite examples are set before us in the report, it is impossible to be angry. It is like a mirror in which, while looking at ourselves, the conviction is quietly forced upon us that we are supremely stupid.—*City Press*.

New Mode of Setting Boilers.—Several boilers in Sheffield have been set upon a new plan. By a simple arrangement of fire-clay plates, says the *Sheffield Independent*, so managed as not to contract the capacity of the flue at any single point, the gases, after being thoroughly intermixed, are at four successive stages in their progress through the flue, thrown, in thin streams, against the surface of the boiler. No part of the gases can escape this repeated forcible contact with the boiler, and in the process the heat they contain is so thoroughly extracted and absorbed that the result obtained, as proved by careful tests, is the evaporation of nearly 12 lb. of water for every single pound of fuel, common boiler slack being used. This gives a large saving of fuel as compared with the heat modes of setting previously in use. The patentees, we understand, guarantee a saving of 25 per cent. The apparatus has the additional advantage of being an effective smoke-consumer. The plan is applicable to any class of boiler; can be applied without unseating boilers already fixed; and the plates being of fire-clay, the cost is so moderate as to be very soon recouped by the saving of fuel.

The Proposed Public Hall for Newcastle-under-Lyme.—A meeting has been held in the town-hall, to further consider the desirability of erecting a public hall in the town. The need for a building with a large hall, rooms for building and friendly society meetings, and for the accommodation of the volunteers, was generally admitted; and it was thought no difficulty would be found in raising the required capital to carry out the project. The only difficulty experienced was as to securing a suitable site. The Rectory Field, situated in the centre of the town, was thought to be the most eligible spot on which to erect the hall. An area of 1,200 ft. it was thought, would be sufficient, and a building to meet all the requirements of the town could be erected for 3,500l. On behalf of the Temperance Society of the town, it was said that if they could get the accommodation they needed, they would abandon their own idea of erecting a temperance-hall, and fall in with the present scheme. The meeting resulted in the appointment of a committee, and a deputation to wait upon the Rector of Newcastle, to see upon what terms the land mentioned could be obtained.

Channel Railway Bridge.—M. Bontel's proposed bridge across the Channel is obtaining attention. Lord Henry Lennox, in his address at the Society of Arts, said, "My impression is, that this is the best scheme for a bridge over the Channel that has been proposed. There is in Paris a model, on a large scale, which bore ten times the weight which would require to be borne by the Channel Bridge, constructed with less than one ton of metal, and resting on two abutments of rough timber, which were incapable of sustaining a very great strain. M. Bontel was kind enough to describe his drawings to me at length; and even if the Channel Bridge were not attempted, his plan of building in bridges is capable of such astonishing results as to make it well worthy the study of our own engineers."

New Lighthouse Apparatus.—In the Lochinda Lighthouse, in the island of Islay, Argyshire, Messrs. Stevenson, the engineers to the Northern Lighthouses, have introduced dioptric prisms of a new form. They are described in the "Transactions of the Royal Scottish Society of Arts," by Professor Swan and Mr. Thomas Stevenson. The light which passes behind the flame has hitherto been sent forward by two optical agents, so as to reach the eye with the front light, and thus to reach the eye of the mariner; but the object is now effected for part of the upper core of rays by means of the new prisms alone, so that one agent is saved, and the loss of light by absorption and superficial reflection is prevented. The prisms act by refraction and total reflection, and they consist of glass of the ordinary index of refraction. By means of these prisms and a spherical mirror, the whole of the back light is sent forward. They can be modified in various ways to suit the requirements of different localities.

The New Workhouse, Hertford.—At a recent meeting of the Hertford Board of Guardians, a letter was read from the Poor-law Board, which stated that the inspector had reported that the Hertford Workhouse was over-crowded, the number of inmates exceeding the prescribed maximum by 16; and asking why the guardians did not take possession of the new workhouse. The clerk was directed to reply that a dispute had arisen about the amount to be paid for building the new house, and that an architect was making an inquiry into the subject. A letter was read from Mr. Trollope, the architect engaged by the board to measure the work in the new building, in which he stated that the work had been delayed in consequence of his attendance being required at an arbitration, and that the measurements had occupied more time than he expected, but that he hoped to have his report ready within a fortnight. It was finally agreed to request Mr. Trollope to let the board have the report, if possible, forthwith.

Compensation Cases.—At the Guildhall, Westminster, before Sir W. Bodkin, Justice of the peace for Middlesex, and a special jury, an important case was tried with reference to the liability of a parish to compensate an individual owner for compulsory removal. The claimant (Miss Birch) was a teacher of dancing, residing at No. 5, Hinde-street. She numbered amongst her pupils duchesses, countesses, viountesses, both English and Irish; and even archbishops patronised her establishment! In order to carry out certain local improvements it was necessary to pull down her house in Hinde-street, which she held under a lease, dated the 16th of July, 1852, for twenty-one years, at a rent of 150l. per annum. The lady claimed from the vestry 4,000l. as compensation for her forced removal. After a number of witnesses had been examined, it was agreed to settle all claims by the payment of 1,550l. Mr. Hunt, a surgeon, who lived next door, and also claimed 4,000l., accepted 1,300l.

Carpeaux's Sculptures on the New Opera House, Paris.—It has been decided that M. Carpeaux's group of dancing-girls in front of the new opera is to be removed. The reason given for this resolution is because, quite apart from the question of their artistic merit *per se*, they are an eyesore in their present position, being out of proportion with the other sculptured ornaments of the façade of the edifice. A place will be found for them in one of the interior courts. But as M. Carpeaux is commissioned to execute another statue, or statues, to be placed on the spot where the objectionable group now stands, the change will probably not be made for the next two years.

Death of Mr. David Napier, Marine Engineer.—The Scotch papers contain the announcement of the death, on the 23rd ult., of Mr. David Napier, of Gleneshellie, Argyshire, at the age of 79. Along with his relative, Mr. Robert Napier, of Shandon, he laid the foundation of the world-wide fame of the firm of Napier & Sons as shipbuilders and marine engineers. As far back as 1818 he was the first to introduce British coasting steamers, as well as steam packets for our Post-office service. He was also first to establish a regular steam communication between Greenock and Belfast. Mr. Napier invented the steely-engine, which was a great improvement on the side lever, as occupying much less space.

Householding under Difficulties.—A contemporary states that a warehouseman at Bradford has built a house for himself at the top of Pasture-lane, Clayton, near Bradford, which is described as "an attractive structure." This enterprising individual, who is of frugal habits, a teetotaler, and blessed with a family, purchased a piece of land with his savings. He excavated the foundation of his intended house himself, and fetched the building-stones from a quarry 300 yards distant, the total number of harrowfuls required numbering 548. He pitched the stones in his leisure hours, and the structure grew under his hands, until "Virginia Cottage," as he calls his mansion, stands an enduring monument of plodding perseverance. The style is said to be "Gothic," and there is one room on the ground floor, a kitchen in the rear, and a sleeping-room upstairs. The heads of two noble ancients—Demosthenes and Socrates—carved in stone, ornament the front of the cottage, and a carved representation of the head of little Eva, of "Uncle Tom's Cabin," is built into the homestead.

The Age of Iron.—In these islands alone 500 blast furnaces are blazing; reducing, by their intense heat, nearly 12,000,000 tons of iron ore to 4,800,000 tons of metallic iron, which, at its place of production, has a value of about 11,000,000 sterling. These blast furnaces consume more than 14,000,000 tons of coal; and to convert the pig iron obtained into bars, rails, and the like, a like quantity of coal is required. The great iron industry is not confined to the British Isles alone. In France it is no less active, and it boasts of ironworks which rival those of Downais, of Barrow, or of Middlesbrough. The works of Messrs. Schneider & Co., at Le Creusot, the largest in France, have fifty acres under cover. Here are fifteen blast furnaces, with twenty-seven steam-engines blowing air for them, and forging iron besides. At the mines and works over 3,500 men are employed. Belgium, Prussia, Austria, and Sweden are active in this great race; and America is striving, with earnest and honorable zeal, to overtake Europe in the production of iron from her native ore, with her own coal.

Remarkable Discoveries on the Yorkshire Wolds.—Near Bridlington, the Rev. Canon Greenwell, of Durham, and his party, have made the most remarkable of their archaeological discoveries, in the examination of two very large round tumuli, at Radstone, where the only known megalithic monument in the East Riding is,—the famous example of the Celtic menhir, or long stone, in the churchyard. The harrows are in the immediate vicinity. They were full of secondary burials, in deep graves, dug in the chalk rock, in one case 11 ft. This contained a double kist of great stones of oolitic sandstone, which must have been transported 12 miles, from Filey Brigg. Some of these stones must weigh a ton or more. Fine specimens of pottery and stone implements were found, with the human remains. Drinking-cups with ornamental patterns, in zigzag, or waving and chevron lines, &c., one of them still containing some substance in it, were found, together with a bronzeawl.

Parish Rating.—At the annual dinner of the Brompton and Little Chelsea Benevolent Society, Mr. William Corbett (of the firm Corbett & McClymont) presiding, the vice-chairman, at the close of the evening, proposed the health of the chairman in eulogistic terms, and alluded to the benefits he and his partner had conferred upon the parish by their building operations. Mr. Corbett, in reply, said—About eight years ago he commenced to build in the neighbourhood, and had erected upwards of 800 houses, nearly 500 of which were occupied, the remainder being unfinished. Notwithstanding the large number of houses that were occupied, it was a fact that the rates increased. He should much like to know how this was. He had another 250 houses to build, but if rates went on increasing so, he thought he had better leave building alone.

Committee of Mechanics.—The Council of the Society of Arts have determined to appoint a committee to take into consideration and discuss all matters of mechanical invention which may come before the society, and which may be of too strictly a technical character to interest the members at large at the Wednesday evening meetings. The action of the committee will resemble, to a great extent, the mechanical section of the British Association.

Memorial of the late Rev. Dr. Todd.—The services rendered by the late Rev. James Henthorn Todd to the elucidation of ancient Irish literature are admitted by all Celtic scholars at home and abroad. These services claim a distinguished recognition from the people of Ireland, and from all those who appreciate the high and springing agencies for social advancement which emanate from the cultivation of a sound national literature. At a public meeting held at the Molesworth Hall, Dublin, it was decided that the most suitable memorial would be to endow a Professorship of the Celtic languages, the study of which is becoming every day of increasing importance at home and abroad. Efforts are now being made to raise funds for this purpose. The Society of Antiquaries are co-operating. Sir William Tite and Mr. Chappell have been named to represent them on the committee.

The Repavement of London Bridge.—This work is now completed. The mode of paving is much the same as previously, viz., a new tramway, 12 in. in width, next the kerb, to take the near wheels of the vehicular traffic, the old tram being redressed and relaid to carry the off wheels. The whole of the remaining space is paved with new 3 in. by 9 in. Aberdeen granite cubes, with Guernsey guard stones. The length of the carriage-way is upwards of 1,000 ft.; its width 35 ft. There are about 3,500 courses of stone in its entire length, and the number of stones necessary for the roadway (including the trams) is about 105,000. The total number of tons (inclusive of stone, sand, lime, water, &c.) is between 3,000 and 4,000. The stipulated time for the completion of the work was twelve days. The contractors, Messrs. Mowlem, Burt, & Co., have had on this work about 400 skilled workmen.

Gift of Almshouses to Meltham, near Huddersfield.—Mrs. Hirst, wife of Mr. Joseph Hirst, J.P., Wilshaw, near Huddersfield, and Cheshire, has intimated her intention to build and endow six almshouses on a portion of a plantation near Wilshaw Church. Mr. Hirst, at his sole cost, has erected two churches (Wilshaw and Thornton) and schools, and also contributed largely to various charities. The houses are to be built from designs by Messrs. Kirk & Sons, architects, Huddersfield, in three couples, and each dwelling to have connected with it living-room, scullery, larder, and two bedrooms, and conveniences adapted to the requirements of aged or infirm people. The houses will be situated a mile and a half from the Convalescent Home, which Mr. Charles Brook, of Meltham, is building and endowing at a cost of 30,000.

Pulpit, Sutton Courtney.—An elaborate stone pulpit has just been erected in this church, and was first used on November 21st. It has a square base, with semi-columns and carved capitals, over which is a circular platform; the part above is formed by the half of an octagon, panelled and arched, having carved capitals. The four panels will have, on a gold ground, painted figures of the Four Evangelists: these are nearly finished, and will shortly be added to the pulpit, which was designed by Mr. Wm. Gibbs, architect, who was also the architect for the recently restored and enlarged vicarage-house in this village. Mr. C. Selby, of Oxford, erected the pulpit.

Excavating by Machinery.—A machine for the excavation of the earth and for throwing it into trucks or otherwise disposing of it, has been exhibited in operation on the grounds of the Ashburnham estate, next to Cremorne, Chelsea. The inventors consider it likely to effect a revolution in railway and canal work as at present done, as it cuts away, removes, and throws into wagons or upon the bank as required, about 60 centimètres, by 250 high, and 2-95 wide, or 2,655 cubic mètres per diem, at the cost of a few shillings.

Eeds Archaeological and Architectural Society.—The annual meeting of this society has been held in the library of the Literary and Scientific Institute, Bedford. The chair was taken by Mr. A. E. Birch, mayor of Bedford, who is *ex officio* vice-president. After the election of office-bearers, the Rev. J. W. Haddock read the report, which was adopted. Various objects of interest were then exhibited, and a vote of thanks to Mrs. Mendham, for valuable cases of coins, was passed by acclamation. A paper on Bedfordshire in the Danish period was then read by Mr. C. E. Prior, of Bedford, M.D.

Frepeterous Tenders.—The following tenders have been received for roads and sewers at Brixton Manor estate. Mr. C. Sewell, architect:—

	Roads.	Sewers.	Total.
Wigmore	£2,499	£1,740	£4,239
Waterfield	1,840	1,801	3,741
Turner & Cole	1,646	1,906	3,552
Mayo	1,565	1,781	3,346
Hardman	1,576	1,593	3,169
Young	1,553	1,815	2,868
Coker, in one sum for the whole			2,342
Porter			1,950

Similar discrepancy has been lately observable in other tenders for roads and sewers, but probably never greater than in these. Such incidents bring scandal on the trade.

The threatened New Prison.—The Middlesex Magistrates, at their last meeting, decided against the proposed and half-sanctioned scheme of rebuilding the county prison. A wiser and more timely decision was never come to by a irresponsible body. The scheme was viewed as both superfluous and untimely. The magistrates have done wisely in listening to the emphatic protests of the ratepayers against it. The amendment passed declares that our whole system of criminal treatment needs revision, and "is a great and needless burden on the honest inhabitants of the country."

Crystal Palace.—Since the erection of the new stage and theatre, Operas in English have been played with great success two or three days in each week. Large as the theatre is, has been constantly crowded. The necessary rehearsals and preparations for the Christmas pantomime, which is always produced at the Crystal Palace a few days before Boxing Day, necessitates the termination of the English Oper performances after next week,—up to which time they will be continued, in order that visitors to London for the Cattle Show may witness one or more representations.

Lighthouse, Ceylon.—Messrs. Shearman & Smith, & Co., of the Dalbeattie Granite Quarries, N.B., have obtained from the Trinity House Corporation the contract for the supply dressed granite for the Great Basses Rock Lighthouse, Ceylon.

Discovery of a Roman Altar at Eastgate, Stanhope-in-Wearside.—A Roman altar has been discovered in a wood near the little village of Eastgate. The stone belongs to the millstone grit strata, and is finely wrought. It is 4 ft. in height, 22 ft. in breadth, and 12 in depth. It bears the following inscription:—

"DEO
SILVANO
AVBELIYS
GVINIYS
TRAE."

Which signifies that the altar had been dedicated to the deity Silvanus, the beathen god of the woods, or country, by Aurelius, Praetor the 1st Cohort of the "Gordian Legion." This was in the reign of Gordianus (the third of that name). M. Antonius Gordianus Pius reigns A.D. 238-244.

TENDERS.

For rebuilding the White Horse, Pond-street, Haverhill, Mr. F. New, architect:—

Maidlow	£1,400 0 0
Watson	1,201 0 0
Till	1,121 0 0
Bean	1,095 0 0
Kelly	1,082 0 0
Haley	1,057 0 0
Cook	1,050 0 0
Watts	996 0 0

For the erection of a pair of model cottages, at Moul's earth-closets, &c., at Wilton, Taunton, Mr. Henry Badoeck, Mr. Houghton Spencer, architects:—

Rendell	£241 14 6
Davis	430 0 0
Pollard	388 0 0

For country residence, stabling, lodge, &c., at Rhayader, Radnorshire. Mr. E. H. Lingen Backer, architect:—

Washington & Co.	£3,456 0 0
Morgan & Potter	3,407 0 0
Yates	3,278 0 0
Wood & Sons	3,236 0 0
Moreland	3,213 0 0
Birrell	3,124 0 0
Jones	3,117 0 0
Evans	3,115 0 0
Lewis	3,194 0 0
Morgan	2,771 0 0
Williams & Bolton	2,764 0 0
Harrison	2,754 0 0

For first portion of draining and fencin works to the St. James's Building Estate, Hereford, Mr. E. H. Lingen Barker, architect...

The tender of Messrs. Crab & Vaughan, by schedule of prices, has been accepted, for building the warehouses on the Charterhouse Estate, Goswell-street.

(for Notices of Orders received, H. H. B. (as divided into compartments would have any water draughts. An arrangement for conducting smoke by spray of water down chimneys, &c. (next week).—Editor for Architects' Assistants (next week).

Various communications in type are necessarily postponed. We compelled to decline pointing out books and giving addresses.

All statements of facts, lists of Tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication, but in order to be able to refer to them.

Not.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stial, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Commisstees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Church and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to the Royal Highness the Prince of Wales. Steam Fagot for Clocks and Watches, 55 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

ADVERTISEMENTS.

RELLY'S PRACTICAL BUILDERS' PRICE BOOK; or, Safe Guide to the Valuation of all kinds of Builders' Work; with the Modern Practice of Measuring, and an Appendix of Lists for Stone-cutting, for the Use of Workmen; the General Value of Materials and Labour. Arranged by an Architect of long Experience, and compiled by Royal Engineers and numerous Woodcutters, &c. &c. A Description of the various Materials employed. 10s. 6d. London: Published by T. KELLY, Paternoster-row; BIRMINGHAM: and may be had in Quotations of the following Practical Amateurs' Works:

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET MAKING, Revised by TREDGOLD being a new and complete System of Lists, for the Use of Workmen, on a Descriptive and Mechanical Principle. Ten Parts at 3s. or in boards, 39s.; containing upwards of 120 Steel Plates, and numerous Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD) both plain and ornamental; containing a new and complete System of Lists for Stone-cutting, for the Use of Workmen; the General Value of Materials and Labour. Arranged by an Architect of long Experience, and compiled by Royal Engineers and numerous Woodcutters, &c. &c. A Description of the various Materials employed. 10s. 6d. London: Published by T. KELLY, Paternoster-row; BIRMINGHAM: and may be had in Quotations of the following Practical Amateurs' Works:

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE, containing Rules for Drawing and Executing them in the purest style, including an Historical Description of Greek Architecture. Illustrated by upwards of One Hundred Steel Engravings, executed by Artists of the first Class, including Situations Diagrams, &c. Twelve Parts at 3s. or in boards, 36s.

4. DESIGNS for COTTAGE and VILLA ARCHITECTURE, containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Cottages and Villas, by R. H. BROOKS, Architect. Beautifully engraved on steel, with Directions for Building, and the estimated cost of each edifice. Twelve Parts at 3s. or in boards, 36s.

5. DESIGNS for PUBLIC BUILDINGS, containing Plans, Elevations, Sections, Perspective Views and Details of Churches, Schools, Almshouses, Gas Works, Markets, and other Buildings for public purposes. By R. H. BROOKS, Architect, and W. H. and A. ARROWSMITH, House Decorators to Her Majesty. Ten Parts at 3s. or in boards, 30s.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE, containing a Series of Designs for Decorating Apartments with taste, and suited to various Styles of Architecture. By W. H. and A. ARROWSMITH, House Decorators to Her Majesty. Ten Parts at 3s. or in boards, 30s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION, containing a complete Treatise on the Art of House Painting, including the Origin of Colours, the Laws of Harmonious Colouring, the Manufacture of Pigments, Oils, Vermilion, &c. By W. M. HIGGINS, Esq., Accomplished Practical Painter, and Author of the Treatise on the Walls of Houses, &c. &c. Ten Parts at 3s. or in boards, 30s.

8. THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA; a new and enlarged Edition, comprehending Detailed Illustrations of the Machinery and Processes employed in the Erection of Buildings, the Construction of Bridges, &c. &c. by upwards of 2,000 Wood Engravings. By LUKE HERBERT, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many of the important facts since the first publication, in 1835, of the Encyclopaedia. The inventions and discoveries recently made have augmented the materials for the Editor, far as the materials previously used. Each was tested by experiment, a description was accordingly prepared. By the selection of new articles, and care to the revision of old ones, this edition has now become systematically and well adapted to be used as a ready and faithful expression of the existing state of the "Art of the Nation." In two large 8vo. vols. cloth, lettered, price 30s.

DERECTION IN BOOKKEEPING.— BUILDERS and others desiring a really good system, can have a SET of MODELS for BUILDERS' BOOKS, by DOUBLET & CO., to which was awarded the prize offered in "The Builder," in 1859, and which has been adopted by many large firms. Also a NEW ARRANGEMENT by Single Entry, suitable for small builders.—Address, E. A. & S. George-road, Regent Park, London.

Recently published, in crown 8vo., price 10s. 6d. ELEMENTARY INTRODUCTION to PRACTICAL MECHANICS, illustrated by numerous Examples, being the Third Edition of "Wisener's Geometrical and Practical Mechanics." By the REV. JOHN F. WISENER, M.A., Professor of Mathematics in the Staff College. London: LONGMANS, GREEN, & CO. Paternoster-row.

Just published, in 32mo., price 5s. 6d., cloth. THE TIMBER TRADES PRICE-BOOK. By W. RICHARDSON, Accountant, Author of "The Calculator, or Timber Merchant's and Builders' Guide," "Packing Cases Tables," &c. London: LONGMANS, GREEN, & CO. Paternoster-row.

Now ready, in 8vo., with Portrait, price 10s. 6d. THE LIFE of JOHN GIBSON, R.A. Edited by LEVY EARLHARE. London: LONGMANS, GREEN, & CO. Paternoster-row.

STUDENTS' EDITIONS, each COMPLETE in a SINGLE VOLUME, and APPROPRIATE for READING in the HOLIDAYS. THE LIFE of JOHN GIBSON, R.A. Edited by LEVY EARLHARE. London: LONGMANS, GREEN, & CO. Paternoster-row.

LORD MACAULAY'S CRITICAL and HISTORICAL ESSAYS contributed to the Edinburgh Review, 12s. in every article; 1855 Morocco, gilt edges.

THE REV. EDWIN SMITH'S MISCELLANEOUS WORKS, including his Contributions to the Edinburgh Review. New Edition, complete in One Volume. Crown 8vo., 10s. 6d., in 2 vols. 12s. 6d.

THE LIFE and LETTERS of the REV. SYDNEY SMITH, Edited by his Daughter, Lady HOLLAND, and Mr. ARDIN. New Edition, complete in One Volume. Crown 8vo., price 10s. 6d., in 2 vols. 12s. 6d.

THE WIT and WISDOM of the REV. EDWIN SMITH: a Selection of the most memorable Passages in his Works, Letters, and Conversations. New Edition. Crown 8vo. price 3s. 6d. cloth.

THE EXTRAORDINARY USE of FUEL in HOUSE OPERATIONS, with an Account of Benjamin Count of Rumford, and his Economical Systems, and numerous practical Suggestions and Operations for domestic use. By FRANK C. EDWARDS, Jun. By the same Author.

THE VENTILATION of DWELLING-HOUSES, and the Utilization of Waste Heat from Open Fireplaces. In 8vo. 8s. with Illustrations. Price 10s. 6d.

SMOKE CHIMNEYS: their Care and Preservation. Full Edition, revised, in royal 8vo., with 48 Illustrations. Price 3s. 6d.

The new edition of Mr. Edgeworth's "Domestic Appliances" will be published in January. London: LONGMANS, GREEN, & CO. Paternoster-row.

SIR W. FAIRBAIRN'S WORKS on ENGINEERING, &c. THE First, Second, and Third Series, in crown 8vo., with Illustrations, and Useful INFORMATION for ENGINEERS. By SIR WILLIAM FAIRBAIRN, Bart. & C. R. S. Esq. Works by the same Author, illustrated.

TREATISE on MILLS and MILLWORK. Second Edition, carefully revised, of both volumes, price 10s. each. LONDON: Published by T. KELLY, Paternoster-row; BIRMINGHAM: and may be had in Quotations of the following Practical Amateurs' Works:

OWEN JONES'S GRAMMAR of ORNAMENT. Impl. 4to, 112 separate Plates in red and colour, with Letterpress Descriptions, extra cloth, gilt edges.

ORNAMENT of SAVAGE TRIBES.—See Owen Jones's Grammar of Ornament.

EGYPTIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

ASSYRIAN and PERSIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

GREEK ORNAMENT.—See Owen Jones's Grammar of Ornament.

POPEIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

ROMAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

BYZANTINE ORNAMENT.—See Owen Jones's Grammar of Ornament.

ARABIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

TURKISH ORNAMENT.—See Owen Jones's Grammar of Ornament.

MORESQUE ORNAMENT.—See Owen Jones's Grammar of Ornament.

PERSIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

INDIAN ORNAMENT.—See Owen Jones's Grammar of Ornament.

HINDOO ORNAMENT.—See Owen Jones's Grammar of Ornament.

CHINESE ORNAMENT.—See Owen Jones's Grammar of Ornament.

Now ready, with Three Plates and nearly 100 Woodcuts, 6s. 6d. STRAINS in GIRDERS: a Handy-Book for the Calculation of strains in Girders and Trusses, and their Strength; containing of Forme and Corresponding Diagrams. With numerous Details for Practical Application, &c. &c. By WILLIAM WHEATSTONE, Assoc. Inst. C.E. Author of "Cast and Wrought Iron Bridge Construction," &c. A good, clear, and useful office reference volume for practical men. Price 6s. 6d. in the ordinary run of office publications, it is not more than absolutely necessary for the complete engineer by producing a work especially treating on the methods of detecting the strains on iron beams, roofs, and bridges, by means of diagrams."—LONDON: LOCKWOOD & CO. 7, Stationer Hall Court, E.C.

Just published. QUANTITIES MADE EASY. A quick and accurate method of taking out quantities from plans or buildings, with or without a specification. Sent free by post for 50 stamps.—Address, A. C. S., Northrup-street, Burnt Ash-lane, Lee, Kent, S.E.

SCHOOL FITTINGS.—MESSRS. BANKS & CO'S PATENT REVERSED ILLUSTRATED FOLDING SYSTEM of every article required in a well-furnished school, sent for three stamps.—FARQUHARSON WORKS, ALBERT-STREET, MANCHESTER.

How to MAKE MONEY. By CHARLES BARLOW. Published by BARLOW & CLARE, 23, Southampton-buildings, Chancery-lane, London. Post-free for Thirteen Stamps.

WORKING PEOPLE and IMPROVED HOMES. The new and illustrated edition of "The Dwelling of the Labouring Classes," by HENRY ROBERTS, Esq., F.S.A. (author of "Household Economy," &c.) and "The Physical Condition of the Labouring Classes," &c.) is now published in a new and improved form, and contains a most valuable handbook. Price 6d. Sent free by post for 50 stamps.—Address, A. C. S., Northrup-street, Burnt Ash-lane, Lee, Kent, S.E.

JOBING CARPENTER (preferred), and Mill, to the country, making themselves useful (the wife as a servant, Home rent, firing, lights, vegetables, and all paper accounts. In exceptional references direct, with a guarantee to PERMANENT, Post office, Bath.

WANTED, for a Builder's Office, a good perspective DRAWINGSMAN, and ACCOUNTANT. Must have a thorough knowledge of masonry, wood, and stone.—Address by letter, or leading references, to ALFRED, 24, Charterhouse-square, London, E.C.

WANTED, in a Builder's Office, a gentleman of considerable experience, and who is practically acquainted with the Building trade in all its branches. None but persons of undoubted efficiency and unexceptionable character need apply.—Address, stating the nature of present and last occupations, and salary required, 92, Office of "The Builder."

DECORATIVE ARTS.—R. YARROW (late YARROW & SON), ARTIST, INVERIOR DECORATOR and DESIGNER, Established 1814. Decorations carried out, Designs and Working Drawings prepared in any style, and in any position and on the most reasonable terms.—Address, 67, HARBURGH STREET, New York-road, N.

TO BUILDERS, DECORATORS, &c. GILDERS, thoroughly experienced in House Work, Decorative Furniture, and Gilding in all its branches, may be OBTAINED at the House of Call, Marlborough Inn, Bleantham, Great-street, Work done by the day, hour, or job. Materials found if required.—Address to the Secretary.

TOWNHALL, TUNBRIDGE WELLS.—TO ENGINEERS and SURVEYORS.—WANTED, by the Local Board of Tunbridge Wells, a HEAD ENGINEER or WATERWORKS and DISTRICT SURVEYOR. It is required that the applicant be competent to undertake all the duties of the District Surveyor and Waterworks Engineer, as defined in the Statute, together with those of Head Engineer of Waterworks, and to devote his whole time and attention to the duties of his office. Salary commencing at £100 per annum, rising to £175 yearly, with £500—Applications, with testimonials, to be sent in on or before the 31st of DECEMBER, addressed to the Clerk of the Local Board of Tunbridge Wells, whom full particulars as to the amount of salary required, &c. may be obtained on inquiry.

TO ARCHITECTS, BUILDERS, CABINET MAKERS, &c. THE JOURNEYMEN CARVERS' TRADE SOCIETY have RESUMED from the "Adams Arms," Liverpool-street, in 10 "Crown" 8vo. volume, 1859, square, where the unexpired list can be seen at any hour during the day. CHAS. F. COLE, Secretary.

TO ARCHITECTS and SURVEYORS. PARTNERSHIP or otherwise.—A Country Practice will admit a Gentleman, a good draughtsman, to the HALF SHARE of well established and increasing PRACTICE. No one need apply who cannot command £1000. None but particulars or their portfolios tried with.—Address, L. Colbeck, Esq. of Mr. B. T. Hatfield, 55, High Holborn, W.C.

TO THOSE contemplating BUILDING in LONDON or the COUNTRY.—A CIVIL ARCHITECT and SURVEYOR, of considerable experience, OFFERS his SERVICES. His remuneration based upon a fixed scale of charges.—Address, BETA, 10, Old-street, W.C.

TO DISREGARDED ARCHITECTS' ASSISTANTS. A GENTLEMAN requires some Geometrical and Perspective ELEVATIONS prepared immediately. Minute accuracy and neatness indispensable.—Apply from Three to Four o'clock this Afternoon at No. 8, Portland-street, Regent's Park, N.W.

TO FIRST-CLASS DRAWINGSMEN. AN ARCHITECT will shortly REQUIRE an experienced DRAWINGSMAN, well practiced in perspective drawing and Gothic details, to succeed a gentleman about to leave the office. He must be a native of this country, to the care of Mr. Brook, 3, Lancaster-place, Strand.

BOROUGH of BRADFORD.—WANTED, in the Office of the Borough Surveyor, a duly qualified ASSISTANT. Must be a good surveyor and draughtsman, and have knowledge of the construction of buildings. Salary 1000 per annum.—Applications, endorsed "Applications," stating age, and accompanied by testimonials, to be sent to me on or before MONDAY, 6th DECEMBER next.—CHARLES GOTT, Borough Surveyor, Corporation Office, Swine-street, Bradford, Nov. 24, 1869.

FOREMAN of MARBLE WORKS. WANTED, for the Hillyars Works, Mill, must be a good carver and draughtsman, and thoroughly understood marble work in every position.—Address, 21, 10a, a week, and a free house.—Apply to A. COLLES, Hillyars.

WANTED, a PARTNER with 9,000l. to work a Site in Germany...

WANTED, a Person of gentlemanly appearance, competent to direct...

WANTED, a FIRM of leading Belgravian Estate Agents...

WANTED, a CLERK of WORKS, or FOREMAN, who has been engaged in Theatre work...

WANTED, in a Builder's Establishment, a thoroughly efficient STORE and TIME KEEPER...

WANTED, by the Advertiser, aged 38, a constant SITUATION as PHOENIX CASSETTER, and ZINC WORKER...

WANTED, EMPLOYMENT, by a respectable Young Man, aged 34, as PLUMBER, PAINTER, GLAZIER, and ZINCWORKER...

WANTED, PIECEWORK in large or small quantities, by a thoroughly practical BUILDER, Joiner and Carpenter...

WANTED, by a respectable Young Man, a SITUATION as PLUMBER, Good references...

WANTED, by first-class PLUMBER, Painter, Lead and Sash Glazier, and Paperhanger...

WANTED, a SITUATION as PLUMBER. Willing to fill up in other branches if required...

WANTED, a SITUATION as FOREMAN of PAINTERS, or as Measuring and Estimating Clerk...

WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN of SMITHS, one who has had great experience in Engines and Builders' Lines...

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, by a thoroughly practical, energetic Man...

WANTED, CONTRACTORS, and OTHERS. WANTED, immediately, a RE-ENGAGEMENT, by a Young Man...

WANTED, a RE-ENGAGEMENT, as SHOP and MILL FOREMAN, or as GENERAL FOREMAN...

WANTED, by an experienced CLERK of WORKS, a RE-ENGAGEMENT, or as MANAGING FOREMAN...

WANTED, by a steady practical BRICK-LAYER, a RE-ENGAGEMENT as FOREMAN...

WANTED, a RE-ENGAGEMENT, as SHOP or WORKING FOREMAN, or Take Charge of a Job...

WANTED, EMPLOYMENT as CARPENTER and JOINER, by a steady Man...

WANTED, a SITUATION as ARCHITECTURAL and ORNAMENTAL PATTERN DRAUGHTSMAN...

WANTED, a SITUATION, in an Architect's Office in Town...

WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK of WORKS, or GENERAL AGENT...

WANTED, by the Advertiser, a RE-ENGAGEMENT, as CLERK of WORKS, or GENERAL AGENT...

WANTED, a RE-ENGAGEMENT, by an experienced and practical MEASURING and QUANTIFYING CLERK...

TO ARCHITECTS, SURVEYORS, and BUILDERS. WANTED, a RE-ENGAGEMENT, by a good general ASSISTANT...

WANTED, a SITUATION, as CLERK of WORKS, or SURVEYOR, in a country town or office...

WANTED, by a thoroughly practical, energetic Man, an ENGAGEMENT as GENERAL FOREMAN...

WANTED, by an active Man of Business, and of a permanent ENGAGEMENT in any department of the Building Trade...

TO LAND SURVEYORS, &c. WANTED, by a Gentleman, who has a very fair knowledge of Land Surveying...

TO MASTER BRICKMAKERS. WANTED, by a respectable middle-aged Man, a SITUATION as FOREMAN...

WANTED, by the Advertiser, aged 24, a RE-ENGAGEMENT, Can prepare finished working and detail drawings...

WANTED, a RE-ENGAGEMENT as OUTDOOR FOREMAN of JOINERS, or as general FOREMAN...

WANTED, by a JOINER'S MACHINIST, a SITUATION to work GENERAL JOINER, or MOULDING MACHINERY...

TO ARCHITECTS, BUILDERS, &c. WANTED, a RE-ENGAGEMENT as CLERK of WORKS, Shop or General Foreman...

WANTED, an immediate RE-ENGAGEMENT, by a thoroughly efficient GENERAL ASSISTANT...

TO BUILDERS and CONTRACTORS. WANTED, by the Advertiser, a Builder's Foreman...

TO TIMBER MERCHANTS. WANTED, by a thoroughly experienced Man, a SITUATION as FOREMAN...

TO BUILDERS and PLUMBERS. WANTED, EMPLOYMENT, as JOBBING PLUMBER, ZINCWORKER, and CASSETTER...

WANTED, EMPLOYMENT, as IMPLANTER, in a Plumber's Shop...

TO BUILDERS, PLUMBERS, &c. WANTED, by a Young Man, who is a good PLUMBER...

TO BUILDERS. WANTED, by a Builder's Son, aged 19, a SITUATION as KEEPER...

TO MASTER PLUMBERS and BUILDERS. WANTED, by a Young Man, a constant SITUATION as PLUMBER...

TO PLUMBERS, BUILDERS, &c. WANTED, by an experienced Man, a SITUATION as PLUMBER...

TO BUILDERS AND DECORATORS. WANTED, a SITUATION as PAPER-HANGER...

TO BRONZEMEN and BUILDERS. WANTED, by an experienced middle-aged Man, a SITUATION as LOCKSMITH...

TO BUILDERS, ARCHITECTS, and PLUMBERS. WANTED, a YOUNG MAN, a good PLUMBER...

A PLUMBER is in WANT of a JOURNALLY ASSISTANT...

WANTED, EMPLOYMENT, by a good CARPENTER and JOINER...

TO BUILDERS and CONTRACTORS. WANTED, by a practical builder's clerk...

TO RAILWAY CONTRACTORS and OTHERS. THE Advertiser, a Contractor's Agent...

TO PLUMBERS, BUILDERS, and OTHERS. THE Advertiser, a thoroughly good Third-hand...

TO QUANTITY SURVEYORS, BUILDERS, &c. THE Advertiser, who has had considerable experience...

THE Local Board of Bideford invite applications for the appointment of BOROUGH SURVEYOR...

TIMBER TRADE, English or Foreign. WANTED, a RE-ENGAGEMENT, as BALEMAN, YAPEMAN, BUYER...

TO CIVIL ENGINEERS, SURVEYORS, and OTHERS. SURVEYOR, &c.—WANTED, an ENGAGEMENT as SURVEYOR, ENGINEER, or DRAUGHTSMAN...

HOT-WATER WORK—EMPLOYMENT. WANTED, by a thoroughly practical FITTER...

EVENING EMPLOYMENT is solicited for a Builder's Clerk...

TO BUILDERS and SURVEYORS. BUILDERS CLERK—WANTED, by a Gentleman...

A GENTLEMAN, aged 35, a competent ACCOUNTANT...

TO LEAD, OIL, and COLOUR MERCHANTS. A GENERAL FOREMAN, for many years engaged in this capacity...

A GOOD GENERAL ASSISTANT as a CONCRETE and WATER SITUATION in London...

TO BRICK, TILE, and DRAIN PIPE MAKERS. A RE-ENGAGEMENT is WANTED, to MAKE BRICKS...

A BUILDER'S ASSISTANT is open to an ENGAGEMENT as CLERK...

TO ARCHITECTS, &c. A GENTLEMAN of experience is open to an OFFER of PARTNERSHIP...

TO BUILDERS, ENGINEERS, or ARCHITECTS. A YOUNG MAN, capable of making a trade of his own...

ARTICLED PUPIL WANTED, by an Architect holding a public appointment in the City...

TO CARPENTERS, MASTERS, and FOREMEN. A YOUNG MAN, who has served his time in a good shop...

TO BUILDERS, ARCHITECTS, and PLUMBERS. A YOUNG MAN, a good PLUMBER...

A PLUMBER is in WANT of a JOURNALLY ASSISTANT...

A constant place. No objection to fill up his time in other branches...

A YOUNG MAN, a good PLUMBER, and close worked journeyman, wishes to IMPROVE his trade...

A PLUMBER is in WANT of a JOURNALLY ASSISTANT...

The Builder.

VOL. XXVII.—No. 1401.

The Catastrophe at King's College, London.

It has never fallen to our lot to visit the scene of a more significant and instructive calamity than that which, about eight a.m. on the 6th instant, converted the dining-hall of King's College into a scene of ruin and desolation.

The first and most natural suggestion that must occur to any man of right feeling, on hearing of the event, is that of thankfulness for the escape of the students. The timing of the fall was—we may almost say miraculously—happy. That no human being should have been overwhelmed, either in the hall or in the kitchens below, by a downfall as sudden and as irresistible as if it had been

caused by an earthquake, is matter of wonder as well as of satisfaction. Five hours later the hall would have been occupied for its appropriate purpose; and, had the event then taken place, the number of families that would have been put in mourning, and the feeling of horror and of pity that would have thrilled through the country, would have been something the like of which we have not seen.

To the constant readers of our columns the investigation of the details and of the cause of this great disaster presents unusual claims for attention. On more than one occasion we have pointed out the necessity for narrowly observing the effects of the works carried on for the walling of the Thames Embankment. Our notice of a somewhat menacing appearance on the northern abutment of Waterloo Bridge called forth a reply from the officials connected with that structure, which was, perhaps, more vigorous than courteous. No one could have hailed with greater satisfaction than ourselves the announcement that the bridge had been carefully watched, and that the unsightly defect to which we called attention not only might be, but was, attributable to a cause other than that of the subsidence of the foundation. Recent assurances on that subject have been given by an authority that we all respect. But that our counsel was not the voice of unreasonable alarm is demonstrated by what has now occurred within a few dozen yards of the very spot to which we called attention.

The disaster at King's College possesses this rare character. Its cause, and the exact mode in which it occurred, can be defined with almost as much exactitude as if they had resulted from a definite, intentional experiment. And as we can enter into the discussion without throwing any heavy blame on any living culprit, without having our feelings harrowed and lacerated by any calamity to life or limb, and without any fear of well-informed contradiction, we cannot but feel that the event is one which may render

eminent service, as an instructive warning, to all interested in the science of construction.

In front of the river façade of Somerset House stretches an arcaded terrace; a feature frequent in Italian palaces, though rare in our own country, and which is one of the elements of the architectural grandeur of this noble building. Fortunately, as the case now turns out, this terrace is rather an independent building than a part of the main structure itself. A pathway, or area, lies between the rear wall of the arcade and the face wall of the main building, so that it would be practicable (however undesirable) to pull down and rebuild the former, without structurally weakening the latter. The arcaded terrace is, in the main, as solid in its building as it is noble in its proportions. The rusticated stone piers, 17 ft. 6 in. apart, are 4 ft. by 6 ft. in depth and width. Arches issue from these piers at a height of some 16 ft. from the ground, and the interior portion of the soffit of each arch is supported by a transverse, or jack arch, springing some 6 ft. lower than the main arch, and reaching from the rusticated piers, visible from the river, to an inner wing pier, which is of solid brickwork. Thus the face of the arcade is one solid structure of masonry, well-proportioned and massive in its dimensions, and compact by the lapse of time.

Behind the top of the arcade, for the greater portion of the length of the river frontage, the terrace itself, which is covered with turf, is supported by substantial groined arches. At each end, however, is an apartment (below the terrace), 70 ft. long by 26 ft. wide, the floor and the roof of which are, or rather were, supported by cast-iron girders.

Lengthways of the apartment three pairs of piers, 3 ft. deep and 1 ft. 9 in. wide, supported three cross girders. Longitudinal girders rested on these and on the end walls, so that the roof of the dining-hall in question, which was the eastern of the two girder-topped rooms, was divided into sixteen bays of brick arching. Above the arching was a layer of tiles, then a species of sand concrete, then earth, and lastly turf, for a total depth of about a couple of feet.

Now the point, or at least the points, where this superstructure gives way are ascertainable with absolute certitude. Notwithstanding the low state of our scientific knowledge of cast iron thirty-five years ago (which is stated to be the age of the structure), it seems incredible that any founder should have cast, or any engineer designed, girders so unmechanical in their structure; for each cross-girder had a top flange 3½ in. wide by 2 in. deep, which, so far from adding to the strength of the beam, created by its useless weight, a positive tendency to its destruction. The longitudinal girder had bottom flanges and upright webs. The cross-girders, which bore in one case the entire weight, and, in the end bays, half the weight, of the longitudinal beams and their superincumbent load, had bottom flanges—upright webs, deeper in the centre than at the sides, and a rounded top flange, as previously stated.

But,—and here is the knot of the matter,—in the very place where the longitudinal girder rested on the transverse girder,—the very spot where the main weight came upon the latter,—*the top web was omitted!*

It is easy to see that the fatal structural fault was perpetrated for the sake of allowing the longitudinal girders to be dropped and slid vertically into place. But the destruction of the whole value of the upper table is unquestionable. And the matter was made worse by the fact that a pair of vertical snags, or projections, were cast, in each instance, on the vertical web at this point, with a bevel or dovetail inwards, forming a sort of pocket to receive the butt end of the longitudinal girder. This complication in the form of the casting was likely to affect the run-

ning and the cooling of the metal at the very weakest part of the beam. It had this natural effect. In one of the castings (only two or three are as yet accessible) ugly air-holes are detected close by the fracture. In every case the cross girders have broken at the pocket. The regularity with which the longitudinal girders in the two end bays have fallen, pointing inward to the central bay, which was evidently the first to fall, is a remarkable and unprecedented feature in our experience of demolition.

The actual mode of the downfall, then, is perfectly clear. Girders, assumed to be capable of bearing a given weight (we leave the details of the calculation aside for the moment), were weakened at the parts where the actual strain came upon them, by the excision of the top flange, for the convenience of fixing. The whole top flange, which should have constituted some half of the resisting power of the girder, was thus converted into mere useless weight. And when a new stress was thrown on the structure, it suddenly gave way in one or more of these weak points. At them all the fractures occurred, and one of them, the central girder, the south end of which was left *in situ*, and projecting some 3 ft. from the wall, and which we saw removed on Wednesday morning, presented a conchoidal fracture, of a coarse texture, which, in all probability, was the very point that first failed. The downfall of the rest of the structure would have been the instantaneous result.

Thus much for what Lord Bacon would call the formal cause. It now remains to inquire what was the efficient cause of the calamity? What was it that thus brought upon these girders which, however mechanically faulty in their design, had done their work for some third of a century, a new strain which they were unable to bear?

To this question it is as easy to give a reply as in the former instance. Above the surface of that large basin of stiff blue clay, over which the native fogs of London so fondly hang, lies a stratum, varying in its thickness, of gravel, or ancient sea-beach. Above this, again, lies the surface soil, local beds of clay, in some instances immediately covering the gravel. On one of these local beds, consisting of brick clay, or pot earth, which appears to have been worked as far back as the period of the Roman domination, stands the greater part of St. Paul's. We say the greater part, for at the north-eastern corner of the site the ancient potters had worked away the whole thickness of the material, and here the cautious architect, fearing to trust any portion of the great weight of the Cathedral to a water-logged gravel foundation, sank down to the London clay below, and planted a solid pier of 40 ft. in depth to bear that corner of the edifice. And this was done after shifting the centre line of the Cathedral from its due ecclesiastical orientation, so as to take advantage of the largest possible area of the "pot earth."

Through this bed of gravel or heath, penetrated, as it is, everywhere by water, the engineer of the Thames Embankment has cut a broad and deep trench to the clay below. The foundations of the granite quay wall rest on this geological "rock" at the depth of 32 ft. 6 in. below Trinity high-water mark. To excavate and to keep clear these foundations, a steam-engine of 14-horse power, was in each section constantly at work, and the chain-pump which it propelled discharged a perfect river from the subterranean source. The flow of water thus caused would not desist from exerting its own mechanical influences out of respect for the Lord Mayor, or for any of the officers, institutions, or buildings, of the City of London. What the natural effect of this mighty pumping would be, in theory, we all know. Gradual loosening of the permeable stratum, displacement of the smaller particles, consequent tendency of the larger ones to come down together, disposition

of the whole water-applying area to move—microscopically—infinitesimally, may be—but still with mathematical certitude. As to this there could be no doubt,—although we had small thanks for saying so fourteen months ago.

One point might have been considered doubtful, and that was, how far the weight of any very massive building, compressing and consolidating the subjacent gravel, might have prevented the mischievous action of the infiltration (or rather, if there were such a word, *exfiltration*) of the water. On this point we have now not only information, but a flood of light, and a very unpleasant flood into the bargain.

From the time of the formation of the quay wall to the south of Somerset House, indications of movement have been observed in the arcade which we have before described. Since the commencement of the works of the Metropolitan Railway, which lies so much nearer to the noble facade of Sir William Chambers than the quay wall itself, those indications have become more formidable. How much may be attributed to the works under Mr. Bazalgette, and how much to those under Mr. Fowler, it is not necessary now to inquire. It is sufficient to be able to state the date of the commencement of the evil, and to add that it has been so far from being unexpected, that wrought-iron tie-riods have already been provided, for the purpose of binding together the arcade which has actually, to a certain extent, got under weigh. The river face is at this moment from 3 in. to 4 in. out of plumb, inclining, of course, towards the river. The parapet shows a line which is anything but straight, and the pavement on the terrace presents in several places indications of motion.

On examining the substructure of the arcade, we do not find that the massive stone piers and arches show any signs of movement, other than that which may be detected by the application of the plumb-line. Whatever movement has taken place has been in block, and, were it not for the absolute certitude that such a structure could not have been built to overhang, an examination of that exterior arcade would give no cause for alarm. Inward, however, the case is different. Cracks are very visible in the longitudinal arches; and, what is more remarkable, the piers themselves are giving signs of being actually torn in two.

The cause of this fault, which is betrayed by cracks proceeding downwards from the top of the piers, and wider above than below, might have been puzzling, without that knowledge of the structure at which the downfall of the dining-hall enables one to arrive. It is palpably this. The cross girders, before described, are cast with enlarged bearings at the ends (each 18 in. by 24 in.), and at the extremity of each of these sledge of iron is a snag, or downward projection, which is let into, or slips behind, the stone impost on which the girder rests. If the river wall, therefore, should tend to move outward, the girder must act as a tie; and, if the motion were solicited by any great force, must either hold back the outer wall, fall over the inner wall, or break. In point of fact, it has divided its power between the two first duties, and finally divided itself.

Had the girders been without snags, and merely laid on the stone imposts, there is every reason to suppose that the motion which has actually occurred would not have materially damaged the roof. The pavement on the terrace would have yawed, far more than it does; but the girders would not have given way. On the other hand, however, the outer wall might have gone further.

It is thus evident that a double strain was thrown on the bottom flanges of the cross-girders. We may call it an unanticipated strain; for, although the very existence of the snags may be taken to denote an expectation that there might be a tendency to lateral movements in the works, to provide against which the girders were thus disposed to act as a tie, we cannot admit that an engineer who was so ignorant of the first principles of structure in iron as to cut away the top flange of his girder, in three separate places, on each side, could have anticipated the extra tensile strain which might come on the bottom flange—deprived as it was of the aid which it ought to have derived from the upper table.

That explains, too, the peculiar conchoidal form of that which we take to have been the first fracture. The weight of the terrace hung, as it has done since the building was completed, on the system of girders. The strain of the

outward inclining wall was thrown, with increasing force, on the bottom flange of the centre girder, which already was, unsuspectingly, doing the work of both upper and under flange. Add the vibration caused by the pumps and the railway trains, and the tearing asunder of the bottom flange on the instantaneous fracture of the vertical web as weight came upon it, the rapidly succeeding fracture of the other cross girders at the pockets, and the inward, whirlpool-like collapse of the whole terrace, follow with as much regularity as a train of carriages after a locomotive.

The lesson is very important and very serious. It behoves all those who have interest in any buildings, public or private, that may by any possibility be affected by subjacent waterflow, to be on the look out. It is well that it is no worse. It is well that the Embankment has stopped where it has. He would be a hold man who should resolutely assert that St. Paul's could not be affected by the same cause that has undermined Somerset House, if we were to draw out a stream of water from the bed immediately underlying the ponderous weight of this great cathedral. Nor can we omit to add that those are not alarmists who point out, in due time, the dangers arising from neglect of mechanical principle. Forewarned is forearmed. Great watchfulness is now necessary; wary observation, prompt execution with regard to one of our noblest edifices, which is actually on the move. It is to prevent, not to cause, panic, that we suggest that there are others to be looked after, and that a subterranean river cannot be led from the subterranean lake, on the coast of which London may be said to float, without impelling other buildings than that which has given us such a loud and sudden alarm.

MODES OF MURAL DECORATIONS.

A TECHNICAL work of much value has just appeared from the pen of Mr. W. Cave Thomas on the subject of mural decorations, evidently the result of much thought and labour.* Just as archaeological artists now con over the old pages of the monk Theophilus for glimmerings of the various processes disseminated in his work on kindred subjects, so, we venture to prophesy, in time to come will retrospecting minds delight to dwell upon Mr. Thomas's descriptions and instructions. For immediate use, however, the volume has still more value, as the indication we are about to give of its contents will show.

The experience of the author in the matters of which it treats, and his power of relating this experience in terms sufficiently close to enable those following his instructions to obtain clear ideas of his meaning, appear to us to be used in a very generous manner, for the benefit of all studying in the same departments of art. But over and above accounts of the processes of fresco, encaustic, water-glass, mosaic, and oil paintings, he has compiled a list of the principal mural decorations of Europe, accompanied by a statement of the name of the painter by whom they were executed, and the method he employed; and besides this he has drawn up a list of painters, showing under whom they studied, the period at which they lived, and the kind of excellence for which they were renowned; and a tolerably full list of works upon painting.

One of the author's leading theories is that art should endeavour to depict or model perfect humanity; and that education should endeavour to make this ideal, ultimately, a living fact. He says at the onset, pertinently, that he cannot understand why poets and painters should wish to infer that their "inspiration" is independent of rules and science; for order being Heaven's first law, it must be certain that no success can be achieved that is not the result of either consciously or unconsciously, working in accordance with scientific principles. Thus pronouncing himself in the ranks of order and moderation, as he has done before in other works from his pen, Mr. Thomas proceeds to state the antiquity of mural painting as the earliest form of pictorial art, and its value as a memorial of national existence, and of the aspirations of that existence. Michelangelo spoke of easel-painting as an occupation fit for women, compared with mural painting; and Mr. Thomas, like our friend, follows in his wake as far as the highest appreciation of the last-mentioned branch of art takes him.

* Mural or Monumental Decoration: its Aims and Methods. Comprising Fresco, Encaustic, Water-glass, Mosaic, and Oil Painting. By W. Cave Thomas. London: Winsor & Newton, 38, Rathbone-place.

He treats of fresco-painting first. Odd confusion has long existed as to the meaning of the word fresco; for people even now constantly speak of all pictorial mural decorations as frescoes; but, as most of our readers must be aware, the term properly applies only to those wall-paintings that are executed by means of a particular process. Encaustic paintings, oil-paintings, and water-glass paintings are easily applied to walls; but that application does not constitute them frescoes. Although we are not going to give the details of the processes described by Mr. Thomas, which should be studied from his work, we may point out that frescoes are paintings made with colours simply mixed with water, upon fresh wet mortar. The necessity for newness in the mortar is so important that only sufficient is placed upon the wall to enable the painter to execute the piece he has undertaken for one day's work. On the following morning, or whenever he resumes his task, another piece of wall is newly plastered to admit of his operations. But it is within the limits we have set out for ourselves to quote the nature of the preparations a wall should receive that is intended for frescoes. The Italian masters preferred this vehicle to any other, if we may consider their most frequent use of it a sign of preference; but, with the exception of the frescoes in the summer-house at Buckingham Palace, and those in the Houses of Parliament, there are scarcely a dozen examples of the process to be counted in this kingdom.

Mr. Thomas states that a brick wall, a brick or brick and a half in thickness, well dried and of equal hardness, is the best kind of wall for the purpose. The use of laths is sometimes resorted to for special circumstances, but never when a dry brick wall is available. Outer walls, having a liability to damp, he would have lined with brick; and he records the suggestion of a detached inner wall, bound here and there to the outer one, without, however, quoting any actual experiment of this plan. Speaking now, out of our own experience, we should hesitate to adopt this last mode, having known the places where the junction is made between the two walls to be so many means of conducting the outer damp to the inner surface and spreading it in patches. Mr. Thomas objects to battens and laths on account of their perishable qualities; but he mentions that many of the fine Italian ceilings are on lath and in good condition. He thus describes their construction:—

"Most vaulted ceilings, in what is termed the *piano nobile*, or principal floor of every palace, are constructed of wood. The lathing in this case is not attached to single thin pieces of timber, cut to the shape of the ceiling, but to a strong grating; in some cases the ribs and transverse pieces of this grating are 4 in. thick each way. The lathing in Italy is a very peculiar process. The material is the reed, which is cultivated so extensively in that country, and used in so many ways. It grows to the length of about 15 ft., and is rather more than 1 in. in diameter at the base. When these reeds are used for lathing, they are split, and not being strong enough for the purpose in this state they are wattled upon the grating. The result of this somewhat complicated contrivance is a framework of great strength."

Assuming, however, that the surface intended for a fresco is a brick wall, the face of the bricks should be chipped, so as to enable them the better to hold the rough coat of mortar. This last requires to be applied with care, for if it be uneven, there will be patches of dust lying on every projection, and if the inequalities are filled up in the after-coat, there will be cracks occurring between the thick and thin places. The tendency dust has to adhere even to a strictly perpendicular surface has been taken into account, and a suggestion made that walls intended for frescoes should incline slightly forwards. The rough cast should be left to harden thoroughly before the next process is attempted. If the lime used in the mortar be fresh, two or three years will be required for it to attain the necessary condition. The quality of the lime is a matter, too, of the greatest moment in the next stage. The limestone used by the cinquecento artists was travertine, which is almost a pure carbonate of lime. Mr. Thomas gives the proportions as,—

Carbonate of lime	99.4
Alumina with a trace of oxide of iron6
.....	100.0

While the lime used by the Genoese, which has resisted the effect of sea air for centuries in a remarkable manner, yields—

Carbonate of lime	63
Carbonate of magnesia	36
Earthy matter, oxide of iron, and bituminous matter	1

A limestone equal to that of the Romans, is fortunately procurable on the Durdham Down, near Bristol, which is composed of—

Carbonate of lime	99.5
Bitarumens matter.....	0.3
Earthy matter.....	0.2
	100.0

Hence, we have no difficulty to contend against in this particular. Nothing remains but to attend to the causticity of the lime, for if used too soon after being slaked, it blisters, and pictures executed without this proper precaution, have flaked off, leaving, in the white patches exposed, all the effects of a snow storm. Some authorities aver that it should be kept for several years; some for three; some only for a few months. The German painter, Cornelius, prepared his lime for the frescoes in the Ludwig Kirche eight years before he used it; and an Italian writer of the sixteenth century, Leon Battista Alberti, speaks of a honey-like consistency gained by lime that had lain by for 500 years. But Mr. Thomas shows all that is requisite in that it should regain its maximum of carbonic acid. He adds that some degree of causticity is necessary to give the adhesive firmness required for induration; and is very precise in his details of preparation for both the rough cast and the upper coat, or *intonaco*, destined to receive the colours, and the mode of operation, the colours, and the mode of operation, from the time the painter applies his tracing to the fresh mortar, till his day's work is glowing, finished, under his hand, are described minutely. No painter can need further instruction. All this seems very clear in words, and yet the truth is that we do not know how to make our fresco work permanent in England.

The section of the work on encaustic painting is more interesting. Though not used to so large an extent as fresco by Medieval artists, the process was well known to them; and the three kinds of painting described by Pliny are supposed to have been none other than different forms of this. The art was endeavoured to be revived in the middle of the last century, since when various experiments have been made, beginning with those of Count Caylus and M. Bachelier, without, however, any certain or settled mode of operation having been digested. Mr. Thomas records the inquiries and experiments made to elucidate the ancient practice, though he thinks it not unlikely that advanced chemical science may arrive at a manner of making wax without the application of heat. Encaustic painting has the advantage of having a richer range of colour than fresco-painting, and yet is without the gloss of oil-painting; moreover, he describes the process as less encumbered. Count Caylus thus set about his plan of proceedings. He first waxed the cloth, canvas, or wood, designed for his picture, with beeswax, and then covered the groundwork for his colours with chalk or whiting. His colours were mixed with pure water; and when they were applied, and his picture was dry, he placed it near the fire, when the wax melted and absorbed the tints upon it. An important piece of attention consists in heating the wax gently, and allowing it to cool slowly. The advantages of this method over oil-painting were tested by the following experiment:—

"The same colours were prepared in oil and encaustic, and the strips of canvas bearing them were each cut into five equal pieces.

"First.—One piece of each was exposed in the open air to the influence of sun, dew, wind, and rain.

"Secondly.—One piece of each was nailed to the wall of a damp cellar.

"Thirdly.—One piece of each was nailed to a kitchen ceiling, near the chimney, where a fire was kept the year round.

"Fourthly.—A piece of each was nailed to the side of an ordinary dwelling-room.

"Fifthly.—One piece of each was put between several quires of paper, and placed in a close drawer."

After an interval of twenty-seven months the pieces were collected and examined, and compared with the same tints newly painted in both manners, when it was found that the specimens of encaustic painting submitted to three out of the five experiments were as good as new, while all five of the pieces of oil-painting had materially suffered. The two specimens of encaustic painting that presented any appearance of deterioration were those that were submitted to the first and third experiments. The piece that was exposed to the sun and weather, though dimmed by the side of the new tints, was still bright by comparison with the oil-painting that had gone through the same roughing; and when it was washed with a brush and pure water, recovered considerably, though its companion did not. The

experiment of putting it before the fire was next tried, when many of the tints recovered their original brilliancy, the exceptions being pinks, yellow ochre, lake, terra di sienna, and verditer. The piece hung over the kitchen fire-place, though smoked, recovered after being washed with soap and water, with the exception of its pinks, yellow ochre, smalt, and verditer. Thus it will be seen that encaustic paintings have many points in their favour.

An important part of Mr. Thomas's book includes an exposition of the water-glass process, first discovered, or invented, at Munich, which many think may prove superior to all other modes of decoration. The information he publishes concerning it is a reprint, he has been permitted to give, of the pamphlet by Professor Fuchs, first translated from the German, printed and privately circulated, by command of the late Prince Consort. And this is supplemented by the report of Mr. Macleise on the process, and the correspondence that took place with German artists on the subject preparatory to its use in the Houses of Parliament. To those of our readers who are not acquainted with the nature of this composition, we may explain (though it has been before fully set forth in our pages), that there are four kinds of it, potash water-glass, soda water-glass, double water-glass, and fixing water-glass. The first is a mixture of fifteen parts of pulverized quartz, ten of well-purified potash, and one of powdered charcoal, mixed and exposed to a strong heat in a melting-pot till melted, when it is taken out, broken up, pulverized, and dissolved in about five parts of boiling water in an iron vessel; where it must be stirred and the water replaced as it evaporates, for three or four hours. This mixture, which is prepared with a care duly inculcated, when applied to surfaces has the property of rendering them compact, hard, and solid. Like glue, the Professor says, it may be employed for imparting solidity and greater cohesion to loose masses, for filling up cracks, and similar purposes. The other water-glasses have such differences in their ingredients as their names suggest, all of which are faithfully given and their effects described; and it is yet a matter of conjecture which will answer the purpose best. The chief purpose for which they are applicable and prized, is that of mural painting. They cause the colours to adhere well; and they give great durability, if not indestructibility, to them; and it is expected that when applied to existing frescoes they will prevent their further decay. But it is as a medium for new paintings that water-glass has raised the most sanguine expectations. As in frescoes, a coating of mortar cement is first applied to a wall intended to be covered with a painting, but before the *intonaco* is thought of this first coat has to be saturated with water-glass several times. When dry, the second coat is proceeded with, and in its turn impregnated with the same binding and cementing material. The German artists, Baron Kaubach and M. Echter, who have done most for perfecting the application, find that the colours must be ground with pure water and the wall kept moist, whilst the artist is engaged upon it, by means of syringing it with water. Professor Fuchs applied water-glass to a stove-tile with some success; and the director of the telegraph-office at Munich has applied it to iron. A suggestion is thrown out, too, that plates of lithographic limestone might be used as a ground for water-glass paintings, which stone plates could be let into walls so as to appear to be part of them, and yet could be removed if necessary. In his list of mural decorations, Mr. Thomas mentions one painting executed with this material besides those in the Houses of Parliament,—a procession subject, by Mr. Gambier Parry, at Coombe Abbey.

Touching mosaic, he speaks of the history of its revival by the Murano glass-blower, Lorenzo Radi, however, and its recognition by Dr. Salvati, of Venice. Its application in this country in the Wolsey Chapel, Albert Memorial, and Westminster Abbey, after designs by Mr. Clayton, is well known. But although France had a school for mosaic artists in Paris thirty or forty years ago, and Russia and Venice have now their rival manufactories, and Rome still encourages the art within the privileged precincts of the Vatican, there is little effort made in England out of South Kensington to further the use of this style of decoration. Two or three English writers have kept the subject before the public, and urged its advantages. Furthermore, Mr. Cole has a strong desire to create a

taste for this kind of decoration, and Messrs Minton, Maw, Simpson, Knut, and others produce ceramic tessera; hence it is probable that in a future edition Mr. Thomas may have to record that the art has taken root in this country. It is best applied in lofty spaces, such as vaults and domes of public buildings, where the limitations of its powers are least apparent; and needs caution and moderation in any treatment of it that may be contemplated, whereby the meagreness of the earliest efforts and the redundancy of the latest may be alike avoided. It has but little of our author's sympathy, and he makes no effort to obtain for English art the honour of having made Abbot Ware's opus Alexandrinum in Westminster Abbey, though the substitution of Parbeck for cippolino, the usual groundwork, has led others to believe it was executed in this country.

After reading Mr. Thomas's book, we think of the great masters of old, not as the portraits of many of them show them, idle, clad in velvet and furs, with plumes in their caps; but in their equally pictorial blouses, pied with daubs of colour, moving about on scaffolding, or ascending ladders, with their clever hands gritty, their speaking faces full of wonder, anxiety, and conjecture as to the result of the processes they are employing; and we feel that some of this uncertainty will be diminished for future painters by the care with which the various processes are described in it, and the fulness with which the results of many experiments are stated.

PROPOSED DESTRUCTION OF THE GALERIE DORÉE OF THE BANK OF FRANCE.

It is with sincere regret that we call attention to the contemplated rebuilding of the celebrated Galerie Dorée of the Hôtel de la Vrillière in Paris, which now forms a portion of the Banque de France, and in which the board meetings of that body have been held since the year 1812, when the Bank was removed from the Hôtel Mazarin.

This gallery is the only remaining part of the original building as erected by François Mansart in 1620, the rest of the hôtel having been restored in 1719 by Robert de Cotte, and is a very complete and characteristic example of the florid architecture and redundant decorative treatment of the seventeenth century. The gallery is a spacious room, about 130 ft. long and 23 ft. wide, divided into five bays. It is lighted on one side by five large windows, corresponding to which on the opposite wall are five blank bays filled in with mirrors in frames. The ceiling is coved, and is richly decorated with bas-reliefs and allegorical paintings, in panels, in the elaborate style of the time of Louis XIV. The piers were decorated by the best French and Italian artists, among whom were Possenti, Carlo Maratti, Pietro di Cortona, Valentin, and Guercino; the ceiling was painted by Perier in 1646.

It is proposed to pull down this interesting building, and to replace it with a new structure, under the superintendence of M. Questel; and the brothers Balze have been commissioned to make copies on canvas of the frescoes on the ceiling to be placed in the new gallery.

It is hardly necessary to point out, that to pull down and reconstruct an edifice of this description is simply to destroy it. No amount of care or respect for antiquity, on the part of the architect, can preserve the spirit and interest of the original. It is, says a French critic, like repainting an old master. The consul Mammia did a similar thing when he proposed to remake at Rome the statues of Phidias he was reproached for having destroyed at Corinth.

The reason alleged for this act of vandalism is, that the gallery has been represented to be in an unsafe condition. This is the report by M. Questel; but on this point he is contradicted by M. Labrousse, whose opinion is on every ground entitled to equal respect, and who has declared, after a careful survey of the building, that it is possible to replace the defective portions by underpinning, and to preserve intact the two tiers of frescoes. A similar operation was carried out at the Galerie Mazarin, and the pictures by Romanelli were restored with the most scrupulous care. A portion of the ceiling of the Galerie Dorée was also restored by Vien in the year 1766.

Independently of its architectural value, the Galerie Dorée is particularly interesting, from the historical associations connected with it.

Built originally for the Duc de la Vrillière, whose name is given to the street which runs on the north-east side, the Hôtel de la Vrillière became afterwards the residence of the Comte de Toulouse (son of Madame de Montespan and Louis XIV.), and of his son, the Duc de Panthièvre, and remained in the possession of this family until the time of the French Revolution. The unfortunate Princess de Lamhale and the poet Florian have been among its illustrious residents.

The widening of the northern end of the Rue des Bons Enfans, which bounds the Bank on the west side, has been hitherto deferred, although it is an improvement very much required, out of regard to the preservation of the gallery of the Hôtel de la Vrillière, which would be interfered with by the extension of the street northward, from the Rue de Baillif, in the same line as the portion extending southward from that street to the Rue St. Bonoré. This respect for the integrity of an ancient building is a pleasing incident in the history of Parisian improvements. If, however, the Galerie Dorée be once pulled down, and its character as an historical monument destroyed, there will be no reason why the desired improvement may not be effected. It would be a great mistake to re-erect the building upon its present site, and so shut out an obvious and desirable rectification of the line of thoroughfare between the Rue St. Honoré and the Rue Neuve des Petits Champs.

Perhaps, while we are in England committing such a barbarism as the virtual destruction of such an interesting monument of pre-Norman art as Worth Church, a protest in favour of the preservation of a building which dates no earlier than the beginning of the seventeenth century, may come with an ill grace; but it is worth consideration whether a friendly remonstrance from the Institute may not be of service to the very numerous body of people in Paris who are anxious to avert the demolition of one of the few remaining specimens of the magnificence of Paris under Louis XIV.

An interior view of the Gallery will be found in the volume of the *Builder* for the year 1857, vol. xv., page 11.

LECTURES ON ARCHITECTURE AT THE LONDON INSTITUTION.

The fourth and concluding lecture of this suggestive series was delivered by Professor Kerr, on the 2nd inst., and had for its subject, "Modern Architecture." The fifteenth century, said the lecturer, saw the ecclesiastical European system breaking up; but it was not to this that the impending change in architectural style was due. It was to the birth of a new idea rather than the death of an old one. This new idea, in a word, was *Antiquarianism*. It had been hitherto unknown; it was now to advance towards a kind of universal authority,—to become in its turn a ruling principle in the world, and like other ruling principles before it, to pass away, no doubt, in due time. At any rate, it had arisen thus. The poets had led the way. The ancient writings of the Romans, and then those of the Greeks, were being held up to admiration on grounds which former students had not discovered. Other literature, logic, and philosophy followed. The venerable scholasticism of the church was de-throned; and dogmatic religion and casuistry were no longer to be the all and end-all of knowledge. In the middle of this century also, Constantinople, like Rome a thousand years before, was overwhelmed by the assault of barbarian hordes, and the Byzantine scholars were thus dispersed westward. Towards the end of the century Protestantism was coming to an issue; the desperate remedy of the Inquisition had to be established and there came to be such a pope as Borgia. The Italian cities, Milan, Florence, and others, and notably the maritime Genoa and Venice, together with Rome, now the sole centre of learning, constituted the head quarters of commerce, enterprise, and intelligence. As for other countries, it was not till the succeeding century that even the period of Francis I., Charles V., and Henry VIII. came into view. A new condition of civilisation was, therefore, being initiated, to bring with it, by rule, a new development of architecture; and it would be to Italy that we must look to discover the introduction of both. It was well known how on this Italian ground "the revival of arts and letters" was the result; and the next question would be what place to assign to architecture in such a revival. Literature and philosophy went together; whilst,

as a separate group, sculpture, taken directly from the antique, painting following indirectly, and architecture coming with sculpture hand in hand, and equally directly from the remains, were made to form the complete circle of the arts. It was on this basis, indeed, that the "Academies" were founded, to cultivate these supposed inseparables, our own Royal Academy of Arts exhibiting still the same principle; and to a somewhat inconvenient extent in these very different days, when painting, having expanded in our trading community into a profession of prosperous picture-sellers, had left architecture in another field altogether. Turning next to the particular form of revival in the case of architecture, the lecturer dwelt for a little on the provisionally existing Italian Gothic as a sound "grafted" mode, upon which there had been engrained, as the preliminary of revival, the late Roman or early Romanesque; and he could not help seeing in this the architecture of medium stones, as distinguished from the large-stone manner of Greece and early Rome, and the small-stone manner of the middle ages. In religious edifices the disposition towards greater grandeur had approached before long to the larger-stone style in the imitation of the ancient temples; the theories of Vitruvius, also, had been accepted (with "the five orders" of a sort of superhuman merit), although only theoretically; but in ordinary civil architecture there appeared three distinct schools of the new Italian style,—the Florentine, massive and fortress-like; the Venetian, light and elegant; and the Roman, of an intermediate character. The great cathedral of St. Peter in Rome was then spoken of, whose costliness led to the reformation, and the progress of whose building extended through the whole of the sixteenth and a half of the seventeenth centuries, under twenty popes. The new style thus arising in Italy (as all things modern were arising in Italy) had spread meanwhile over Europe, and become, what it still continued to be, the modern European style, reaching France first about 1540; Germany, through France, a century after; and England about 1610. Confining the survey then to England, the career of Inigo Jones was spoken of; his design for Whitehall Palace for Charles I.; the building of the Banqueting-house in 1619-21; the advent of the Puritan domination shortly after, during which architecture seemed to have been wholly discouraged; and the occurrence, at the close, only six years after the restoration, of one of those accidents which at such times often turn the current of affairs,—namely, the Fire of London. The remarkable genius of Wren was then referred to in some detail, his Parisian study of art, the especial grace and elegance thus acquired, and his manifest observation of the scientific principles involved in Gothic design. But one could not help acknowledging, with candour but regret, that this otherwise great architect, the pride of our country, had introduced a practice which could not be spoken of without reproach; namely, that of sham design. The Cathedral of St. Paul had a sham dome, the first of its class in history, and one entire story of its side wall was but a mere disguising screen to cover a range of flying buttresses within. Following the English history of art, the lecturer mentioned Vanbrugh, the architect of Blenheim; Hawksmoor, of St. George's, Bloomsbury; Gibbs, of St. Martin's; Chambers, of Somerset House; Dance, of the Mansion House; Soane, of the Bank; Wilkins, of the National Gallery; Smirke, of the British Museum; Nash, of Regent-street and "compo" generally; Barry, of the Houses of Parliament; Scott, the great church architect of the present day; and a very good friend of his audience (long connected with the London Institution), Sir Wm. Tite, the architect of the Royal Exchange. The discourse then turned to what the lecturer proposed to call the "Reproduction System," arising naturally out of the further pervasiveness of the accepted idea of antiquarianism. Ancient remains had been assiduously measured in the minutest detail,—first, Roman, afterwards Greek; design was then taken to be the exact reproduction of the antique; and no matter for what purposes, no matter in what material, the porticoes of Rome and Athens were re-erected on English soil, with such perfect precision as to be the admiration of diletanti, albeit perhaps in stuccoed brick-work out of doors, and even lath and plaster within.*

* The conclusion in our next. Our attention is directed to a typographical error in the last report of these lectures, namely, the misplacement of a parenthesis at the top of page 961. This parenthesis should close after the word "theories," as most of our readers would perceive.

A CITY ON FIRE.

The fatal incidents which have been associated with many outbreaks of fire in the metropolis of late has resulted, as we had apprehended, in attracting public attention in various directions as to the efficiency of existing means towards the timely extinction of fire and the preservation of human life.

Since a recent notice which appeared in these columns in reference to the subject of metropolitan fires, we had been led to the supposition that certain modifications of the present system had been introduced with a view of limiting disasters of the nature to which we felt called upon to refer. Had anything more been needed to have demonstrated the inadequacy of existing arrangements, apart from the occurrences at Bayswater and Newington to which we adverted, it might assuredly be discovered in the still later calamity in Southwark, also, unhappily attended by loss of life. The extraordinary prevalence of fire within the limits of the metropolis during the past two or three months, in view of the destruction of human life and property by which it has been unhappily attended, might fairly be held to justify an inquiry into the metropolitan mode of suppression; for, notwithstanding some recent official assertions, we are almost constrained to say that little indication has been afforded of any abatement of those evils of which we were led to complain. In reference to the Seething-lane fire, it has been asserted that so alarming did the circumstances appear that ample employment would have been presented for more than one half of the Metropolitan Fire Brigade Corps.

This statement embodies one of those elements of danger with which the case is invested which, in our view, appears to call for speedy recognition on the part of the public. No less than nine fires have been reported recently as having occurred within the same day, many of which were attended by a great destruction of property, and seventeen fires have a short time previously been recorded as having broken out within a period of forty-eight hours. As we have remarked on a former occasion, it is no express wish of ours to impute blame in any quarter; but, from the circumstances of the case, we think it appears obvious that the Fire Brigade system, as at present conducted, cannot comprehend such occurrences as these. A correspondent in last week's impression informs us that he happened to be at a fire that took place lately in the Brompton-road, when two large shops thrown into one, with four tenement-shops, were consumed. Our correspondent remarks, "I was not there till after the shops were fully on fire; yet for quite half an hour after there was no other but a hand-power engine;" and he asks whether it really is not time that some serious inquiries should be made as to the most expeditious and best mode of extinguishing fires in the metropolis.

It is to be deprecated, perhaps, that at so ineluctable a juncture the chief officer of the Metropolitan Fire Brigade should have been betrayed into certain statements to which we have alluded in a former instance, and which, it appeared to us at the time, were calculated to foster a mistaken sense of security on the part of the general public.

The fire to which our correspondent alludes occurred in the premises of Messrs. Howells & Beaumont, drapers, in the Brompton-road; and the case, from its proximity to the scene of the fatal Bayswater disaster, may be calculated to attract a larger share of attention in that locality.

It may be regretted by many that any interference should have been made with regard to the recommendation of the coroner's jury in the instance of the Bayswater calamity by Captain Shaw; as, had the jury been invested with that perspicacity which the Captain claims, or the advantages of his co-operation in the aim which they had in view, no doubt some more effectual arrangements would have been made, and possibly the extent of loss by which the later occurrence has been marked, would have been more limited. Apart from any indirect interest which insurance associations may possess in occasional losses of uninsured or other property by fire, as tending to attract public attention to the advantages which such institutions afford,—a system which embraces the protection of property for which a special payment is made, and property for the protection of which a rate may be compulsorily levied, whether properly protected or not, would be calculated at times, perhaps

to occasion some degree of perplexity; and, as a matter of public interest, this is an element which would be in no way detrimental if severed from that branch towards the efficacy of which the public at large contributes. It would be far from us to impute too sordid a motive in this direction; but we believe that it would not be sought to be contradicted, that one of the corollaries of the insurance system may be said to be traceable to occasional losses in certain directions by fire. In view of the immense revenues possessed by such associations, compared with their restitutions amounts, ample facilities would appear to be afforded for a disassociation of the present united and conflicting elements of the metropolitan fire extinction system. One insurance association, in remarking upon its own extent of business in fire insurance, says—"To show the great value of insurance against fire, as one of the prudential practices of the age (so long as our houses continue to be built for burning, as they now are), it may be stated that the losses paid by this company alone in the years 1864, 1865, and 1866, amounted to the enormous sum of 1,780,000*l.*; a sum, however, which was, fortunately for them, exceeded by the very much larger amount of premiums received in the same time, namely, 2,300,000*l.*"

This instance alone would indicate that a sufficient margin exists to facilitate the establishment of a system of fire protection with especial reference to assured interest, leaving that system for which the general public pay, more unfettered and operative.

The interest which persons of note have sometimes displayed in witnessing extensive conflagrations will no doubt be familiar to many of our readers.

It may be, no doubt, fair subject of inquiry whether by some more active interference the public could not effectually interpose to take away from outbreaks of the nature under consideration that spectacular character to which they now so frequently arrive, and which attaches to a fire sometimes, for a few moments, the grandeur and destructive features of war. We are for our part disposed to regard the question and the existing state of affairs in reference to this subject as a matter of paramount importance, and one which, if not speedily taken into consideration, will at length put forward such claims to notice as may no longer be safely disregarded.

TECHNICAL INSTRUCTION MADE EASY.*

If technical instruction is to be the order of the day, as it should be, it is plain we must have a supply of cheap elementary works on technical subjects. Messrs. Cassell & Co. have anticipated this demand to some extent in the issue of a series of technical manuals, illustrating the various kinds of drawing required for the different arts, trades, and manufactures. The price of each volume is now 2s., but we hope the circulation will ultimately admit of the reduction of this sum to half that amount, as they will thus be brought really within the easy reach of all who can have need for them. To make this reduction possible, or at any rate, profitable, the public must be purchasers on a large scale; and we speak faithfully in its interest when we say so. Every working-man should look into the merits of the question now being agitated, which promises to place the young among them in such a different position, with reference to their labour, to that which is filled by those who have not had the advantage of technical instruction in a scientific manner; and one of the easiest ways of doing so is to examine the contents of such manuals as those we are about to mention, when they will be able to judge for themselves how far such knowledge as is contained in them would have benefited them, or, if not too indisposed to learn, may still do so, or might benefit their sons. We need not add that the aim of these works is not to furnish such insight, but to assist the artisan to develop into the artist, by enabling him to look at his work with intelligence and understanding instead of blunt bewilderment. They have been prepared by writers who are

masters in schools of art; who have, therefore, a practical as well as theoretical knowledge of the best modes of imparting their special information.

To begin with that first on our list, a Manual of Linear Drawing; we observe the author assumes that those he is about to teach are ignorant of geometrical terms, and accordingly phrases his instructions in language the most elemental scholar can understand, till he has explained those in technical use, which are then introduced. He gives upwards of 120 diagrams to illustrate his lessons, each figure being initiatory to that which follows; consequently, a student is gradually led from one to the other, and must be ever indeed to find a difficulty in his path. From the simple task of bisecting a line, or of raising a perpendicular upon it, he is helped up the ladder of learning till he is able to see how to construct ovals and spirals; how to draw the cycloid, spirocycloid, and hypocycloid; and how to describe the conchoid and cissoid. Furthermore, when thus much progress has been made, there are ample instructions how to apply the knowledge gained to different arts and trades. A friendly finger points out to the smith how to arrange the geometrical figures he has mastered to form an iron haloozy; to the joiner, how to draw a cornice; to the mechanical engine, how to show wheels and pinions, and the like parts of a machine; to the mason, how to draw the plan and elevation of an arch; and to the house-decorator, how various combinations of figures form dainty diaper patterns.

A second manual treats of orthographic and isometrical projection, and explains the simplest methods of projecting solids, shows the curves formed where one solid penetrates another, and the shape metal must be cut so that, on being rolled, bent, or folded, it may give the required form. This little volume is written by the author of the preceding one. There is a third department in the delineation of solids, we know as perspective; but he confines himself in this manual to the divisions mentioned above, which, it is unnecessary to observe, call for a little more intensity of study than linear drawing. There are trades, however, such as that of the plateworker, the boiler-maker, and the tinman, to whom a knowledge of the principles of projection are indispensable, if they would, literally, master their businesses. With Mr. Davidson's help, workmen may exchange the famous "rule of thumb" for the more wonderful lamp, the rule of Science.

Systematic drawing and shading are treated, in a third manual, by Mr. Ryan. Here, in the course of the volume, we have an epitome of the teaching in the Government Schools of Art; and at the end, a chapter detailing the means to be taken by any half-dozen respectable persons, who would procure, for the inhabitants of the towns in which they are resident, the advantages of Government instruction, supplemented with hints how such a school should be conducted. Upwards of eighty illustrations gradually lead the pupil from the outline of a leaf to the necessary instruction for drawing from models and landscapes, and thence to figure drawings; and this information is accompanied by the most minute directions as to the road to success. "Drawing," urges the author, "increases the power of the eye by systematically exercising it, while an uncritical habit of observation will permit the beauty and point of many things to escape notice. This is no unimportant matter, and none who know the power the eye gains by learning to draw, would willingly dispense with it." As soon as elementary outline drawing is mastered, but not before, Mr. Ryan suggests shading should be studied. When the effect of light and shade in copies is familiar, drawings from real objects may be attempted. The routine recommended is drawn up in twelve stages. After the three progressions just mentioned, follow studies from advanced models, such as chairs; from casts of ornaments, fruit, &c.; from casts of the human figure; from real fruit and flowers; of practical geometry; of perspective; of orthographic projections; of machine drawing; and of architectural drawings. Such is the bare sequence; but, as unfolded by Mr. Ryan, it comprises sufficient instruction to make a very creditable scholar. Nothing seems to have been forgotten, for the pupil is taught how to cut a pencil before he begins to draw, and to put his copy and drawing in their places after he has finished his lesson. Many excellent suggestions are made in the course of the work, which contain the pith of more pretentious teaching. To increase their powers of observation and knowledge of

the features of the face, for instance, students are recommended to ask themselves what is the predominating expression upon the various faces they see, and to endeavour to answer the question; also to note what is the speciality of each face, and how it differs from the regular Greek type. To draw from memory is another exercise insisted upon; and working men are shown that work and working clothes are some of the most pictorial things to be found in the range of subjects and objects. We quote Mr. Ryan:—

"Never lose an opportunity of drawing rustic figures in their working clothes, as such form most picturesque additions to landscapes, and are eminently pleasing in themselves. Draw them in groups and out of doors when you can, to get the full effect of day or sunlight upon them. Figures in strong action are particularly valuable, and you should frequent places where work of some violent kind is being carried on, and secure in a few expressive lines the balance, action, and grouping of figures acting with energy and rapidity."

The fourth work of the series on our list relates to building construction. We took occasion a few weeks ago to mention this little work with praise. We refer to it only to name it in connection with the set of volumes of which it forms a part. Thus it will be seen Messrs. Cassell & Co. are assisting the technical education movement by the issue of cheap works upon various branches of it. Mr. Davidson, the author of three of these manuals, deprecates the want of enthusiasm in British workmen, and appeals to them to warm up and cultivate the sciences on which their trades are based, that they may hold their own against the men of other countries, which manual superiority alone may not enable them to do. We pass on the watchword.

ON SANITARY POLICE. SOCIAL SCIENCE ASSOCIATION.

At a meeting of the Health Department on Monday evening last, Mr. G. Godwin, in the chair,

Mr. A. H. Safford read a paper "On Sanitary Police," in the course of which he said, when, at the suggestion of a friend, I some time since directed my attention to the improvement of our existing police establishments, I was much struck by the limited meaning attached to the word "police," in its popular acceptation. This term "police," in our best dictionaries, is employed to designate those regulations which have for their object to secure the maintenance of peace, good order, cleanliness, and health in cities, towns, and country districts. A similar definition is given to the word in France and America. But while I found that on the continent and in the United States, their police forces were employed for the maintenance and protection of the public health, I was well aware how little of this important duty was entrusted to our own constabulary. I knew that when in the metropolis the force had been employed in matters connected with the protection of the working classes from the nuisance of overcrowded lodgings, the security of the public from dangerous structures, and the improvement of the air we breathe, by the enforcement of the Smoke Nuisances Act, the work had been thoroughly and efficiently performed. I saw, on the other hand, that the laws relating to health were not executed by the local authorities with that vigour the case allowed. The medical officer of the Privy Council complained in his last report that—

"Not only have permissive enactments remained for the most part unapplied in places where their application has been desirable; not only have various optional constructions and organisations, which would have conduced to physical well-being, and which such enactments were designed to facilitate, remained in an immense majority of cases unbegun, but even nuisances which the law imperatively declares intolerable have, on an enormous scale, been suffered to continue, while diseases which mainly represent the inoperativeness of nuisance law have been occasionally fully a fourth part of the entire mortality of the country." Medical officers of health lamented that they were hampered by the vestries under which they acted. The press, with one consent, found fault with the local authorities.

The execution of our sanitary laws being, therefore, admitted on all side to be unsatisfactory, principally on account of a want of energy in enforcing legislative enactments, and the little effect of public opinion on local bodies, it seemed to me that if the permissive laws were made compulsory, and the prosecution of offenders against those laws was entrusted to the police,

who are amenable to the State (and who to be a true police should be the proper officers of the State to enforce the laws affecting public health), much might be done to reduce the death-rate so fearfully large in our principal towns, and to increase the wealth of the nation by an improvement in its health.

It may be said that the medical officers of health are the proper persons to carry out all laws relating to public health. I am most anxious that we should still retain the invaluable services of these gentlemen, but at present they are not sufficiently responsible for the carrying out of the sanitary enactments; we are left at the mercy of the activity of the medical officer, who may, by a too great zeal for the public good, offend his best patients. They should be paid by the county, and used as witnesses in the prosecution of public nuisances. I am convinced that not infrequently a medical officer proceeding before justices for the enforcement of health laws loses much of the weight which would attach to his evidence from the fact that he is, or appears to be, the prosecutor in the case. He should be appointed for life, and independent of all private interests whatever. Another objection to medical officers being held responsible for the health of the public is that they cannot, however active they are, be ubiquitous: a police force, on the contrary, is, or should be, as nearly so as it is possible to be. The question of the health of a district may be only of a few hours, and it is, therefore, most important that the proper officials should be easily accessible. This is not so at present. I know, for example, in my own neighbourhood great difficulty is experienced in getting the ashes removed from the dwelling-houses. It would involve the loss of some time to ascertain who is the responsible officer; but could I simply apply to the constable upon the beat, the nuisance would be removed in a few hours. Again, take the case of an adulteration of food, or the sale of diseased or stinking meat. The first person to whom a poor man would apply for advice or assistance would be the first police constable he met. At present he would be handed about from one authority to another, until he became sick of the whole business, and contented himself with his first loss, while the offending tradesman would escape scot-free. This is no hypothetical case. I know many instances where labouring men have been referred to the proper authorities with unwholesome food still in their hands, in which no prosecution has ever been attempted.

I therefore propose that the addition of a sanitary company of police should be made to each constabulary force throughout the kingdom, to be paid for from the general rates of the county or division; that the powers of the local authorities should be transferred to the magistracies or the Commissioners of Police; that nuisance laws should be compulsory, and enforced by summary proceedings before magistrates, and that in the event of the parties being dissatisfied, appeal might be made to the Court of Quarter Sessions; that sufficient medical officers of health should be attached to each constabulary force, and that their appointment should rest with the Privy Council or the Home Secretary. The sanitary police would be men specially selected for the work, with higher pay than the general run of the constabulary, and with special knowledge. It would be their duty, on report being made to the chief constable by any ordinary constable, or by a private individual, to investigate the charge, to call in, if necessary, the medical officer, and, if necessary, to take proceedings against offenders before the magistrates. Men having such important duties to perform should be under strong checks, and be changed from one neighbourhood to another to prevent improper influence. There is no existing body in which such precautions can be taken but the police. I have had many communications from chief constables in favour of my proposition; but with the suggestion that they should, in the event of its being adopted, receive the assistance of a public prosecutor, or be enabled to call in legal aid.

At the close of the paper, an interesting discussion ensued.

Dr. Tripe thought that the plan suggested by the paper of placing sanitary matters in the hands of the police would be more efficient in the country than in London. There, the police would be more likely to be communicated with than the health inspectors. But it was otherwise here. In London there already existed, in some districts at least, a thorough organiza-

tion. He, for example, had an inspector under him, whose sole duty it was to examine houses and report upon them to him. He could show the state of every house in his district under 20l. a year rental since the passing of the Sanitary Act of 1866. He had another whose duty it was to look after the new work done in the district, and so on for other necessary parts of sanitary superintendence. He therefore thought there was no need to substitute the police for the present officers. Indeed, he could easily show that the police did not carry out the provisions of their own Police Act. He had repeatedly seen instances of ammoniacal liquor passing through the streets in the daytime, and the occurrence of the smoke nuisance, both of which had been placed by law under the supervision of the police, but in which the police failed to do their duty. The evils of which Mr. Safford had complained he believed were mainly owing to the conflicting laws which existed on the subject. Overcrowding in workhouses, for example, was not overcrowding in the houses of poor persons not paupers. The medical officer of health should be appointed for life, and should have sufficient salary to enable him to devote his whole attention to the duties of his office.

Mr. Holland thought that consolidation of the statutes relating to sanitary matters was the most pressing want. The United States had been alluded to; but he could say from personal experience, within the last twelve months, that the sanitary state of Philadelphia and of other large towns was much less satisfactory than that of England. We required a concentration of our offices. We had too many authorities. He thought that the guardians in each parish should have the right of superintending many sanitary matters, over which now they had no control.

Mr. Alfred Carpenter thought that a permissive system at first was necessary. They had not made up their minds as to the best system. The measures which were taken were only tentative. It would therefore have been a mistake at the outset to have had a rigid, compulsory system. He thought, however, the time had come when this might be changed. He thought that the first requirement in carrying out sanitary law was to obtain an educated man as medical officer; that such officer ought to be independent, and that he should have nothing to do with private practice. As the police were not an educated body of men, nor, with the training they were likely to have, could they be easily made one, he arrived at a conclusion different from that come to by Mr. Safford.

Mr. A. H. Hill believed that the great want of our present system was organisation; one set of officers had no connexion with another. The relieving officer, for example, in a case which had come under his own notice, had been unacquainted with the address of the health officer. The fact was that on such questions the public took little or no interest. Even the press was profoundly ignorant on all questions connected with sanitary law. But he maintained that the great want was of organisation. He hoped that before long, as one step to remedy this, our telegraph system would be extended to every public office in London.

Mr. Elk pointed out that Dublin and Paris were worse off in regard to sanitary matters than London. The argument that the employment of the police would be advantageous, because they were responsible directly to the Government, was fallacious, inasmuch as it only applied to London, and even then it did not apply to the City.

Dr. Hardwicke thought that there was much to be said for the view advocated by Mr. Safford. There were many advantages in the fact that the poor knew the police, and could readily find them. Really there was not much difference between Mr. Safford's view and those of some of the previous speakers. The police proposed were to be educated men, and what was wanted was to combine the organisation of the police force with the education of the officers of health.

Mr. Arthur Cherry thought that organization was the principal object to be attained.

Mr. Pears moved—

"That the thanks of the Association be given to Mr. Safford for the paper now read."

The Chairman, in seconding, said it would be worth considering how public attention could be called to the discussion of questions of this kind by the society. He thought he had waited long enough for codification. The want of a uniform system, which could be obtained only

when codification had been accomplished, often caused serious injury. He gave some instances from the Building Act and Local Management Act to prove that a Sanitary Police, as aid to existing officers, was needed.

The resolution was then put, and carried unanimously.

THE EASTER ISLAND STATUES.

SINCE my last little paper on this mystery, several supplementary matters respecting it have been brought before my notice, and I think these may interest some readers of the *Builder*.

First. So numerous are those gigantic images on that mere rock in the middle of the Pacific, that a recent visitor (Lieut. Harrison, R.N.) has informed me that he counted nearly 150 of them in the course of a thirteen miles' ramble along the south-west coast of the island; while some of his shipmates of the *Topaze* similarly at the same time met with about 120 from La Perouse Bay, on the north side, to the smaller western extinct volcano. Altogether there are nearly 300 known to us, and each has its separate name among the Easter-islanders; but, as Europeans have not traversed the interior, how many more than this number may exist is uncertain. There are likewise in one place no fewer than 30 of the gigantic red-tufa carvings, quarried for imposition on the images, and seemingly not used; some having rude carvings on them of birds, donkey ovals, and crosses. When the men of the *Topaze* secured the two large images now in the British Museum, their loose and fallen crowns were not to be found near them; and, of the above 30, some are represented as 5 ft. in diameter, and 6 ft. high.

Lieutenant Harrison tells me also of a cave, inaccessible except by swimming, wherein are two large images below the sea-mark, "a proof of submergence; for otherwise the statues would not and could not have been placed in such a situation. I learn likewise that the main reason why the island is so cleared of trees is because the cocoa groves were all destroyed some generations back in a civil war that raged between various factions of these wretched savages; though an additional and more permanent cause of treelessness is that Easter Island is in the very eye of the Trade Winds in their alternate prevalence. As to absence of fresh water, too, it is true that from indolence the inhabitants use almost solely sea-water filtered through the sand; but there are large lakes of fresh rain-water in the two volcanic mouths eastwardly and westwardly, one being three miles round! Imagine, what a vast crater on so small an island.

In my last, I named the place as Teahy in the native language; let me correct it (if need be) as more properly Rapa Nui; Teahy being elsewhere in Polynesia. Lieutenant Harrison states again (and I have not only heard him orally, but have seen his journal written on H.M.S. *Topaze* at the time), that carved emblems of nature-worship and of this-headed figures abound on the rocks,—evidencing thus a connexion with far-off Mexico and Peru, as well as with Egypt at the very Antipodes; and he drew and still possesses a picture to scale of one of the prostrate figures, which is 30 ft. long, and nearly of man-height in thickness as it lies on the ground. Neither is this bulk uncommon nor extreme; there are several larger as well as smaller; and the built platforms on which these colossi have stood (the most having been overthrown, probably by earthquakes) are of cyclopean masonry, of vast square blocks fitted closely without cement.

If we found these mighty remnants of an extinct people, this necropolis of their illustrious but forgotten dead, in the middle of Africa or Australia, we should think the matter sufficiently wonderful; but we could see there around us for hundreds of miles "ample space and verge enough" to have supported in ancient times a population sufficient to have raised such structures, as the ever-during memorials of their kings and warriors. But, how that wonder must increase, when, barring a mere fringe of sand and rocks, the "ample verge" round Easter Island is in every direction ocean for 2,000 miles! Can there be any other solution of the mystery than that I ventured to throw out in my last paper,—a submerged continent? I then fancied the idea original; but since I have learned, and now tell your readers, that Professor Sedgwick, in his geological lectures at Cambridge, announced his "suspect" that Polynesia was once a conti-

ment." This great authority is most satisfactory as to my independent guess; and the wondrous human remains at Easter Island confirm it. How comparatively easy, also, thus to account for the early peopling of America from China, via this submerged belt of land; for the Pacific would seem to have had a volcanic bridge, quite denied to the Atlantic; and man probably traversed it from primeval Asia to America.

With reference to the question of man's extreme antiquity in this mystery of Easter Island, it may be doubted whether, under the given conditions of total isolation and volcanic forces, we have reason to guess at or require any longer period than the popular one. Let us recollect that the western half of our planet was utterly unknown to the eastern half for more than 5,000 years; that the volcanic destruction of a Pacific continent might have happened at any time, without even a suspicion raised amongst our European races; and that entire submersion of all but the summits of a mountainous range (since known as islands) would destroy instantaneously and wholesale man and his works, excepting only (let us theorise, as we now can all but prove) such monumental remains in the imperishable rock as were placed,—*honoris causa*,—on or near the flaming tops of volcanoes (fire-worshipped possibly, like Japanese Yokohama), and thus preserved for our modern reasoning wonder, as evidence of an extinct but once mighty people.

The question receives further elucidation from the recent travels of Messrs. Bickmore and Wallace, among the numerous islands of the Malayan Archipelago. We learn from them that the whole of Oceania is the most igneous region on the face of the earth, containing literally hundreds of volcanoes, active or extinct, some of the craters whereof are several miles in diameter, and extending over a belt known to those travellers 4,000 miles long and 50 broad. Now, nearly 2,000 miles beyond the length of this tether, but in the same direction, lies Easter Island, with its two enormous craters now full of water, the Pacific outlier of a volcanic range which reappears more than 2,500 miles on the other side, near the recently destroyed cities on the Chilian and Peruvian coast under the Andes. That all the islands were once united would seem to be well nigh proved by the identical character of their fauna and flora; for how otherwise should islands hundreds of miles apart be crawled over by the same families of flies and beetles, and produce the same sorts of ferns and flowers? Also that they were once much more elevated is shown by the fact that the plants growing on the sea level in the Polynesians are identical with those on the sides of the Andes at a medium height of 1,200 ft. But, to our mind, the greatest proof both of a submerged continent and of an extinct people, civilized and numerous, however unhistoric, is the great fact of these hundreds of colossal statues that desolate Easter Island. Whoever carved and reared them, each must have been a work of the most enormous labour. No metal nor even flint, occurring on the island, but only some hard stones capable of being fashioned into rude adzes, or so-called celts of obsidian or basalt,—those vast images of hard, heavy burnt granite must have been scamped or pounded into form with a patient and persevering amount of toil we scarcely have the means of estimating: as well might we Englishmen now fancy the possibility of cutting down oak-trees with ivory tooth-picks, as in those old days we can imagine how that extinct nation of the Pacific could carve colossal figures in granite rock by means of harder bits of shingle.

And now let us look in some detail on an insulated one of those colossal,—a smallest unit among three hundred known to us, transported in the *Topaze* by Commodore Powell, for its lighter weight, and (from having been buried up to the neck in sand) for its almost perfect preservation. Lieutenant Harrison tells me that this statue,—a sort of rude Polynesian Memnon as we now may see it at the British Museum,—was the superstitiously honoured inmate of a native hut constructed over it, wherein, as before some deified potentate of old times, the modern chief of Rapa Nui is normally elected. The weight of the whole figure as we have it (without its tufous crown of probably a ton more, for some cause, as aforesaid, left behind) is three tons and a half: the material, a black granite within, weathered to light grey without; the height, 8 ft. 6 in. by 3 ft. 6 in. across the shoulders, and 9 ft. round the body; the features of a Mexican or Ainoe cast, with large pendent ears, deep sockets, probably for coloured

eyeballs long lost, and a large straight nose and mouth not deficient in a sort of grotesque and barbaric dignity. Arms and hands are rudely indicated at the sides, and the lines round the body possibly intend a waistcloth. On the back, flattened like a common wooden doll, are some strange sculptures in slight relief, picked out with red and black pigment, representing a pair of paddles, with squared human faces atop, and two bird-headed quadrupeds below, apparently worshipping a central bird-headed idol standing on a circle, with an emblem beneath indicative of natural idolatry. The smaller figure is shorter in size and less in weight, in worse preservation, and of inferior workmanship; but, as a special point of interest, has on its back a rude handled-cross, known to archaeologists as an emblem of the creative power, and changed by Rome into the crucifix.

After considerable inquiry, I find there are no other known instances of such colossal among the Pacific islands; but a naval officer tells me that in the Right of Benin, on the west coast of Africa, there is an island, seldom visited, which contains similar rock images to those we now speak of, the type of such being a deposed Mexican, or (as we now see it exemplified on wooden idols, paddles, prows of canoes, tattoos, &c.) savage Polynesian.

To us modern lovers of prehistoric anthropology nothing can be fuller of suggestive interest than these rude colossal. If those "*langues-de-chat*" of Achenil, if our own frequent stone hatchets and flint arrowheads (I have myself picked up specimens of both on a Sarrey heathland), if the "kitchen-middens" of Denmark, the troglodytic Pict-houses of Orkney, and, in chief, the carved antlers of reindeer from the Anvergne cavern,—if all these are intensely interesting as proofs of man's most primitive existence, how much grander and more wonderful every way are these huge stone statues, some of them 30 ft. high, and one at least not less than 50 ft. (the very nose of this is 6 ft. by measure), standing by hundreds on a small rocky island in the midst of the Pacific, and witnessing to the most ancient process, religion, and civilisation of an utterly extinct people. Once upon a time the spot that now is named by us Easter Island, was the central eminence, lofty as Cotopaxi, of a vast and fertile continental plain, that circled it for a thousand miles on every side: it had its cities, with their kings, priests, and warriors, who served their generation honourably, and then were immortalised in death by those mighty fire-thrones of their god, believed by them to inhabit the smoking crater of the volcano. Suddenly, on one dark day, we know not how long ago, nor how lately (for all that side of the earth was a total blank to this side for 5,000 years), there were fearful signs on the sea and sky, rollings and rockings of that populous land, shaking its cities into ruin; thunders and fiery hail showered from the hursting crater, while the land was shattered in all directions by an outbreak of internal fires, soon quenched by the steaming in-rush of the immeasurable ocean. Down to the depths that happy land (possibly in Peleg's time, "in whose days the earth was divided"), sank suddenly, the smashed-up shell of a volcanic crust, whereon those idolatrous millions so long, perhaps so criminally, had lived, and fought, and multiplied; and nothing thereafter soon remained above the surface of that woe-smitten waste of billows but the summit, as we see it, of an extinguished volcano thus sentinelled by its colossal statues, mute witnesses to that long ago visited those idolatrous fire-worshippers, and sank their country like a millstone to the bottom of the sea. Is not all this written on the wonderful carved rocks of that isolated Mystery in the midst of the Pacific,—Easter Island? And are any of the statues of Egypt, Greece, or Rome, in our British Museum, equal in suggestive interest to these rude colossal of the Polynesians?

MARTIN F. TUPPER.

Value of Property, Worcester.—At a sale last week two semi-detached villas, situate in Chesnut-walk, producing 41l. 18s. per annum, were sold to Mr. Thomas for 600l. Two similar houses adjoining the last lot, and producing 44l., were sold to Mr. Thomas for 640l. Six dwelling-houses, situate at Diglis, and called "Willow-terrace," producing a rental of 62l. 8s., were sold to Mr. W. Z. Baker for 570l.

LAND SURVEYORS' CHARGES.

A "TRUSTEE" who needs the plan of an estate written, and many have written to us before to the same effect, asking what are the settled charges of land surveyors. He says he can get no precise answer, nor can he expect it to such an inquiry. Unless he gives some particulars as to situation and extent of the farm he mentions, as well as the scale to which he wishes the plan drawn, no one can tell him the proper charge for making the survey. Leaving out of question the cost of access to the spot, a survey which would be dear at 1s. per acre in the open parts of Lincolnshire or Leicestershire, might be cheap at 2s. or 3s. per acre among the woodlands of Kent or Sussex, or on the slopes of the Welsh hills. If he wishes to know how cheaply his work can be done, he had better insert an advertisement in our pages giving full particulars of his requirements. If he is content with having his work well done at a fair price, he should apply to some respectable and well-known land agent or surveyor at the nearest large town, who will give him the information required. Our chief object in making this note, however, is to say it would be advantageous if the Institute of Surveyors were to agree on a scale of charges, under various circumstances, and make it public.

OF DEFINITE PROPORTIONS OF LENGTH, WIDTH, AND HEIGHT, TO EFFECT ARCHITECTURAL HARMONY, OR SYMMETRY, IN REFERENCE TO DISTRIBUTION OF SOUND.

"*Difficileque Symmetriarum questiones!*"

VITRUVIUS.

VITRUVIUS held that symmetry in architecture resembles what nature has ordained in a well-formed human body: a union of parts wherein each part combines with all other parts to a good configuration of the whole. He adopts the Greek name *Harmonia* only in reference to sounds; but concord of sounds, and concord of substances, is by other Latin writers alluded to in the same, or similar, terms. Thus, *harmonia corporis* expresses a concord of substantial parts; and *ad harmoniam canere* is to effect concord of sounds. *Modulatio* is measure in music; *commo-dulatio*, measure in architecture.

Vitruvius uses this word *commo-dulatio*; and in reference to it he names exact proportions of length and width in different buildings; but his rules are not precisely applicable to modern structures.

Some thirty years ago I arrived at the conviction that the leading proportions of Lichfield Cathedral, in the thirteenth century, were each a multiple of 8 ft.; the number eight having been then, for ages, considered the Christian mystical number. I have also read somewhere, that in Notre Dame de Paris, certain heights and widths are each a multiple of 7 ft.; and that the length of the transept and the height of the great tower are each a multiple of 12 ft. Again, it is said that the length of Notre Dame de Rheims, and that of Chartres Cathedral (the largest church in France), are each a multiple of 12 ft.; and that the same number was attended to in the first plan of Cologne Cathedral; but on the whole the information obtained about these churches is incomplete.

The following rules are based on the forces of the squares of the numbers 2, 3, 4, and 5:—

First.—In the series 3, 4, 5, the square of five is well known to be equal to the sum of the squares of the other two numbers added together.

Secondly.—In the series 2, 3, 5, the square of five is only one less than twice the sum of the squares of the other two numbers added together.

Thirdly.—In the series 2, 4, 5, the square of five is to the squares of the other two numbers added together as five to four; and moreover, in the series 2, 3, 4, and the series 4, 7, 9, the square of the greatest number, in each case, is to the sum of the squares of the two smaller numbers added together very nearly as five to four.*

Rules of Proportion.

The width being in all cases greater than the height, and the height varying from 21 to 30 per

* A peculiarity of the series 4, 7, 9, is, that the square of four (as height) is precisely a quarter of the combined measures of 7 and 9 (as length and width). In any such series as 1, 2, 3; or 2, 3, 5; or 3, 4, 7, and so on, the measure of the greatest number is, in each case, equal to the combined measures of the two smaller numbers, and its square is only one less than twice the sum of their squares added together.

cent. of the combined measures of length and width. The smaller the room the greater is the proportion of height required.

Class 1. The square of the length is equal to the sum of the squares of height and width added together, or nearly so.

Class 2. The square of the length is equal to twice the sum of the squares of height and width added together, or nearly so.

Class 3. The square of the length is to the sum of the squares of height and width added together as five to four, or nearly so.

EXAMPLES.

CLASS 1.		Squares of Proportions.	
Proportions.			
Height	12	144	} 685
Width	21	441	
Length	24.2	585.64	
Height	20	400	} 1,300
Width	30	900	
Length	36	1,286	
Height	34	1,156	} 4,000
Width	62	3,844	
Length	70.7	4,998.49	
Height	61	2,601	} 9,597
Width	86	7,396	
Length	100	10,000	
CLASS 2.			
Height	12	144	} 685
Width	21	441	
Length	34.2	1,169.64	
Height	20	400	} 1,300
Width	30	900	
Length	51	2,601	
Height	34	1,156	} 5,000
Width	62	3,844	
Length	100	10,000	
Height	39	1,521	} 5,002
Width	69	3,481	
Length	100	10,000	
CLASS 3.			
Height	40	1,600	} 8,000
Width	80	6,400	
Length	100	10,000	
Height	44.3	1,962.49	} 7,999.78
Width	77.7	6,037.29	
Length	100	10,000	
Height	48.75	2,376.56	} 8,001.56
Width	75	5,625	
Length	100	10,000	

Ten to eight are as five to four, the proportions required for Class 3.

Examples of Rooms, Theatres, and Halls.

It has been more than once stated that the Theatre of the Royal Institution of London is almost perfect for a single speaker. Its dimensions of height, width, and length, are nearly 30 ft., 45 ft., and 60 ft.; and, therefore, nearly in relation to one another at 2, 3, and 4. If the height were only 9 in. less than 30 ft., the proportions of the theatre would correspond almost accurately to the requirements of the foregoing rule for Class 3.

The Free Trade Hall in Manchester is said to be admirably adapted for musical performances, and for public speaking. It is 135 ft. long, 78 ft. wide, and 52 ft. high. If it were 132 ft. 7 in., instead of 135 ft. long, the proportions of the hall would conform strictly to the foregoing rule for the second class.

A new room in Edinburgh is named as one remarkably successful for music. Its proportions are 36 ft., 48 ft., and 90 ft. If the room were 36 ft. high, 52 ft. 6 in. wide, and 90 ft. long, its proportions would be such that the square of the length would be only a trifle less than twice the sum of the squares of height and width added together, as required by the second rule.

There are various accidents to proportion which may completely mar it. Some such are the introduction of a gallery, or the place of an organ. In the year 1840, Canon Hyder having taken much interest in the advantages of restoring the arrangements of Lichfield Cathedral as ordained at the completion of the Reformation, he and I made experiments on the diffusion of sound throughout the church. On one occasion, he stood near the east end of it, while I stood at the west door, and thus placed, we were able to converse in a moderate tone of voice. The aisle of the north transept has since been blocked up with a large organ; and now a confusion of sound is heard in the nave, when men either read, or sing, in the choir.

On All-Saints Day, 1869 (when there were but very few saints in the nave), I could, at the west door, clearly distinguish a ringing in the organ-pipes, while the sub-organist was reading the Epistle for the day, south-east of the organ, and speaking towards it. When the Gospel for the day was read, no such ringing could be discovered; the reader, of course, standing north of the Lord's table.

Again, some few years ago, when a large assembly of chorists met in Lichfield Cathedral, the day being fair, one of the south windows of the church was opened. Service had commenced when I entered the close on the south side; and the singing was to my ear so loud, that I fancied it must be over-loud at the west door. But at this door the chorists were indistinctly heard; the wave of sound from the organ carried, or rather drove, their voices out of the church southwards, and compelled them to "waste their sweetness on the desert air."

It is now the fashion to rail against Wyatt's alteration of Lichfield Cathedral; but assuredly his design for the position of an organ in free space when the chorists ranged between it and the congregation, was far better than the present contrivance. It is undeniable that the instrument ought to stand in free space; and that all sounds issuing from it should be unobstructed in every direction, over it, and around it; and that when accompanying the human voice, they should carry the voice without obstruction to the hearers. Consequently, in Lichfield Cathedral, the best position for an organ would be in a room of ample size, and low down, either south-east or north-east of the places for the vicars-choral, even at the expense of trespassing on the chapter-house.

JAMES RAWSON, M.D.

THE PROPOSED NATIONAL OPERA HOUSE.

IN the second edition of the *Opera and the Press*, now published, Mr. Grannison says:—

"What was foreshadowed in the first edition of the *Opera and the Press* is to be a reality. There will be a National Opera House, co-operating with an Italian enterprise, and there will be an extended repertory, which will comprise the productions of composers of all countries, so that a school of acting and singing may be combined, to afford the fullest encouragement to native talent. The motives which have influenced the formation of a new opera-house are especially patriotic. There will be no speculative joint-stock company, and the enterprise will not be in the hands of operatic traders. The capital will be large, and sufficient to carry on the theatre for the time which most necessarily elapses before an English company can be thoroughly organized and trained. There is no lack of fine voices in this country. Now, unfortunately, the music halls are absorbing ability which, properly drilled and directed, would suffice for the formation of a working troupe."

Further on he writes,—

"The great want in this country is a National Opera House co-operating with an Italian establishment. It can be tested when this deficiency is supplied—when this disgraceful gap is filled up, when we can point with pride to such a representation of the lyric drama of all schools as can be based on a permanent establishment—whether there is but one style of music which will satisfy the fashionable frequenters of the Italian opera-house. But in combined action, in a management on the mutual principle, in securing for all classes of the community the execution of music of the master minds, as well as of works specially written to show off the *prima donna* for the time being, we may anticipate art advancement in this country. The Opera House for the purposes described will be built; the enterprise will be undertaken conscientiously, with ample means to carry it out for a term of years."

INVERNESS CATHEDRAL.

WE give in our present number a plan of the cathedral recently completed in Inverness. Next week we shall publish further illustrations of it, and a full account of the building.

ST. COLUMBA'S CHURCH, HAGGERSTON.

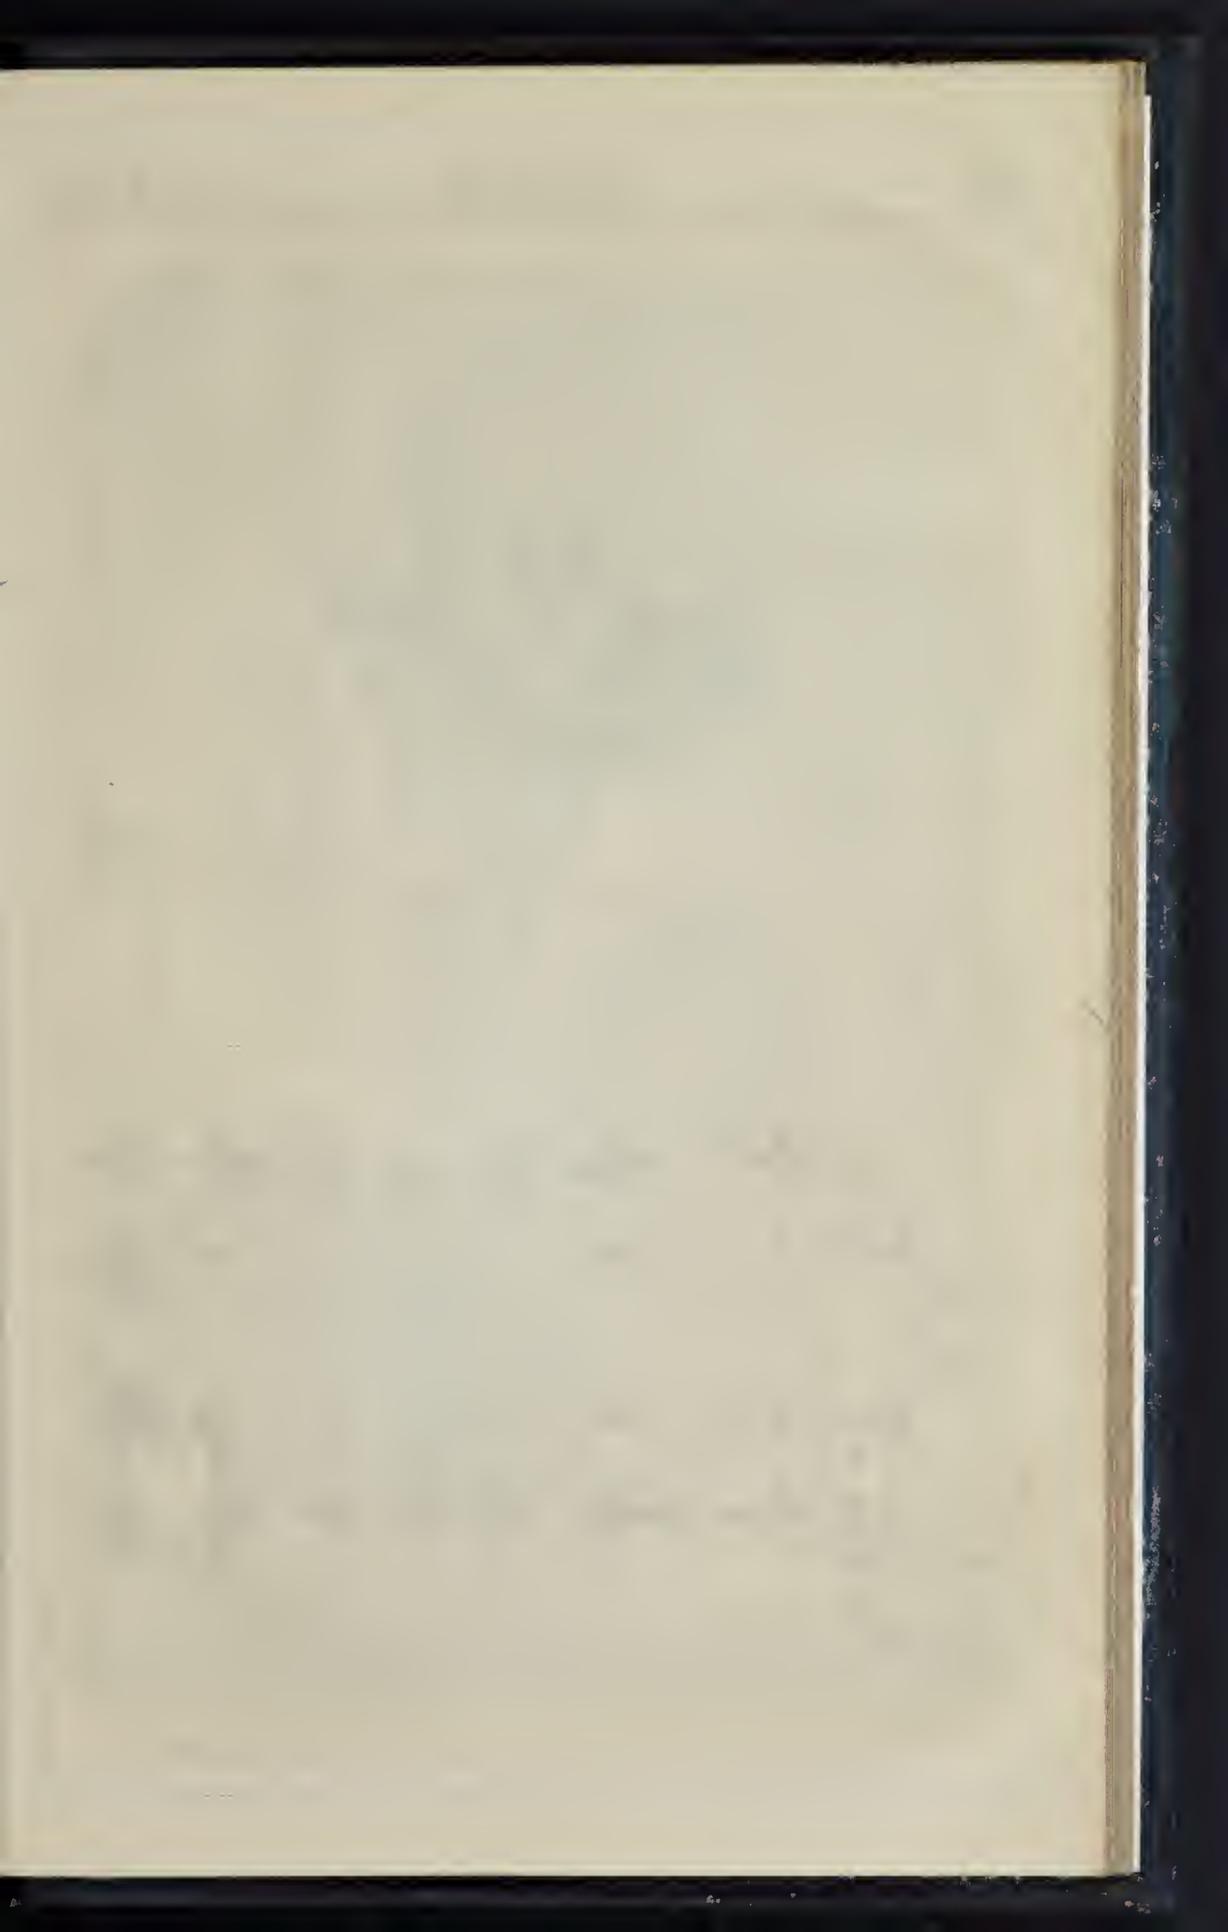

THIS very noticeable church stands in the Kingsland-road, immediately adjoining the Shore-ditch Workhouse. It is built entirely of brick, with stone hands and dressings; is 160 ft. long and 82 ft. in height to the ridge; height being made imperative by the adjacent block of building belonging to the Union. It was designed and superintended by Mr. James Brooks, architect, and was built by Mr. W. Henshaw, at the cost of from 9,000l. to 10,000l., accommodating 1,200 persons.

The east end of the building abuts on the main thoroughfare, Kingsland-road, where the chief entrance is situated, through a picturesque gateway surmounted with a high-pitched and hipped roof, pierced with two dormer windows, which light the upper sacristy. This archway leads into a quadrangle, on the north and east west

sides of which will be grouped the clergy-houses and schools, forming a cloistered court, on the south side of which is the church. Internally the plan is simple: it consists of a lofty nave with narrow aisles; centre lantern, vaulted; and shallow north and south transepts, which do not appear on plan, but form a striking feature in the interior; a spacious chancel, also vaulted, without aisles, with sacristies on the north side. The chancel includes the centre crossing. The arrangement of the east end is similar in idea to the church of St. Cross, Winchester, and to Romsey Abbey, in its double grouping. The altar is not placed against the east wall, but is isolated, with its reredos some 10 ft. from it. The wall, from the floor to the height of 17 ft., is perfectly plain. Above this there are two subjects in mosaic, in Maw's material, representing the Adoration of the Magi, and the Entry into Jerusalem. The vaulting, which is plain quadruplicate, with moulded stone ribs and brick filling in, has an extra rib starting from the centre of the east wall, thus dividing it into two bays as before mentioned, which contain broad lancet windows deeply played: this arrangement is continued on the north and south sides of the chancel, as are also the mosaic decorations. The vaulting under the crossing rises considerably higher to the centre, where there is a circular well-hole for the passage of bells. The north and south transepts are respectively barrel-vaulted with stone ribs. The organ is placed in the south transept, on a raised loft. The choir is stabled on the north and south, with six return stalls on the west. A dwarf stone wall, with a high metal screen, separates the chancel from the nave; which is of five bays in length. The arcade, of moulded brick, has clustered columns of stone, with carved caps and moulded bases, the centre shaft being of red brick, in the arcade and the bottom string-course of the clearstory; the latter is nearly of the same height as the arcade, and consists of a large circular window filled with plate tracery placed over two short lancets, the whole placed within a wide-continuing arch deeply played. Above this rises the roof of a bold and good character of the trussed rafter type, with curved principals and moulded and chamfered tiebeams, and wind braces. The chancel arch is lofty and well proportioned. The west wall of the nave is occupied by a large wheel window. The design consists of an inner circle, with six foliations, surrounded with eight smaller circles, perfectly plain. Below this is an arcade of four lofty stilted arches, enclosing four lancet windows. In the spandrels of this arcade are three circular sunk panels, filled in with diaper patterns; below this the wall is perfectly plain.

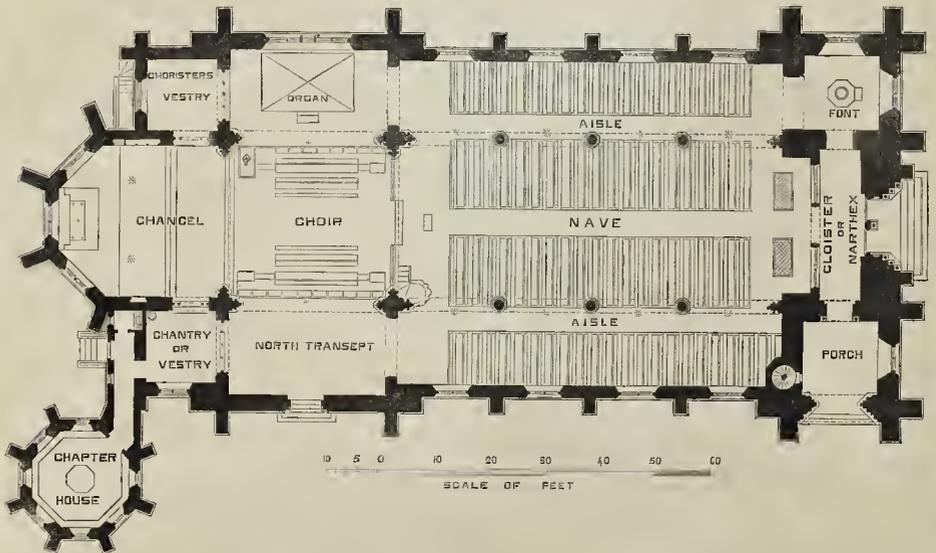

The aisles, which are unusually narrow, are windowless, in consequence of the close proximity of adjacent buildings. The wall space is treated in a very pleasing and artistic manner: a series of *arc-boutant* springing from little corbelled shafts, at intervals, to the main arcade of the church, divide it into panels, which will be eventually filled with subjects in mosaic. At the west end of the north aisle is the baptistery, which takes the form of a large projecting transept, the nave arcade being continued across. It is lighted by lancet-windows in the north side. In this baptistery the two principal doors of the church open; there is another doorway in the north transept, which is used only as a means of exit.

The exterior is very plain, relying solely on its breadth of treatment and its outline. The tower is only temporarily roofed with a pyramidal tile covering, just above the main roofs of the church. The east end towards the Kingsland-road is a little more ornate: the two broad lancets in this gable are recessed, and placed under gabled strings, which are surmounted at the apex with a carved finial; between these windows is a massive buttress, in the upper part of which, under a stone canopy, stands a figure of St. Columba, the first abbot of Iona. On each side of this, below the lancets, are sculptured subjects, representing scenes from his life. The upper part of the gable is pierced with a large circular wheel, with seven foliations, and three smaller quatrefoil openings, and is flanked by buttresses, terminating in pinnacles with stone finials: a large stone cross crowns the apex of this gable. Adjacent buildings hide very much the rest of the exterior, especially on the south and west sides. The principal feature, externally, is the lofty tiled roof of the nave, with its clearstory, from which internally this very striking church derives most of its light.

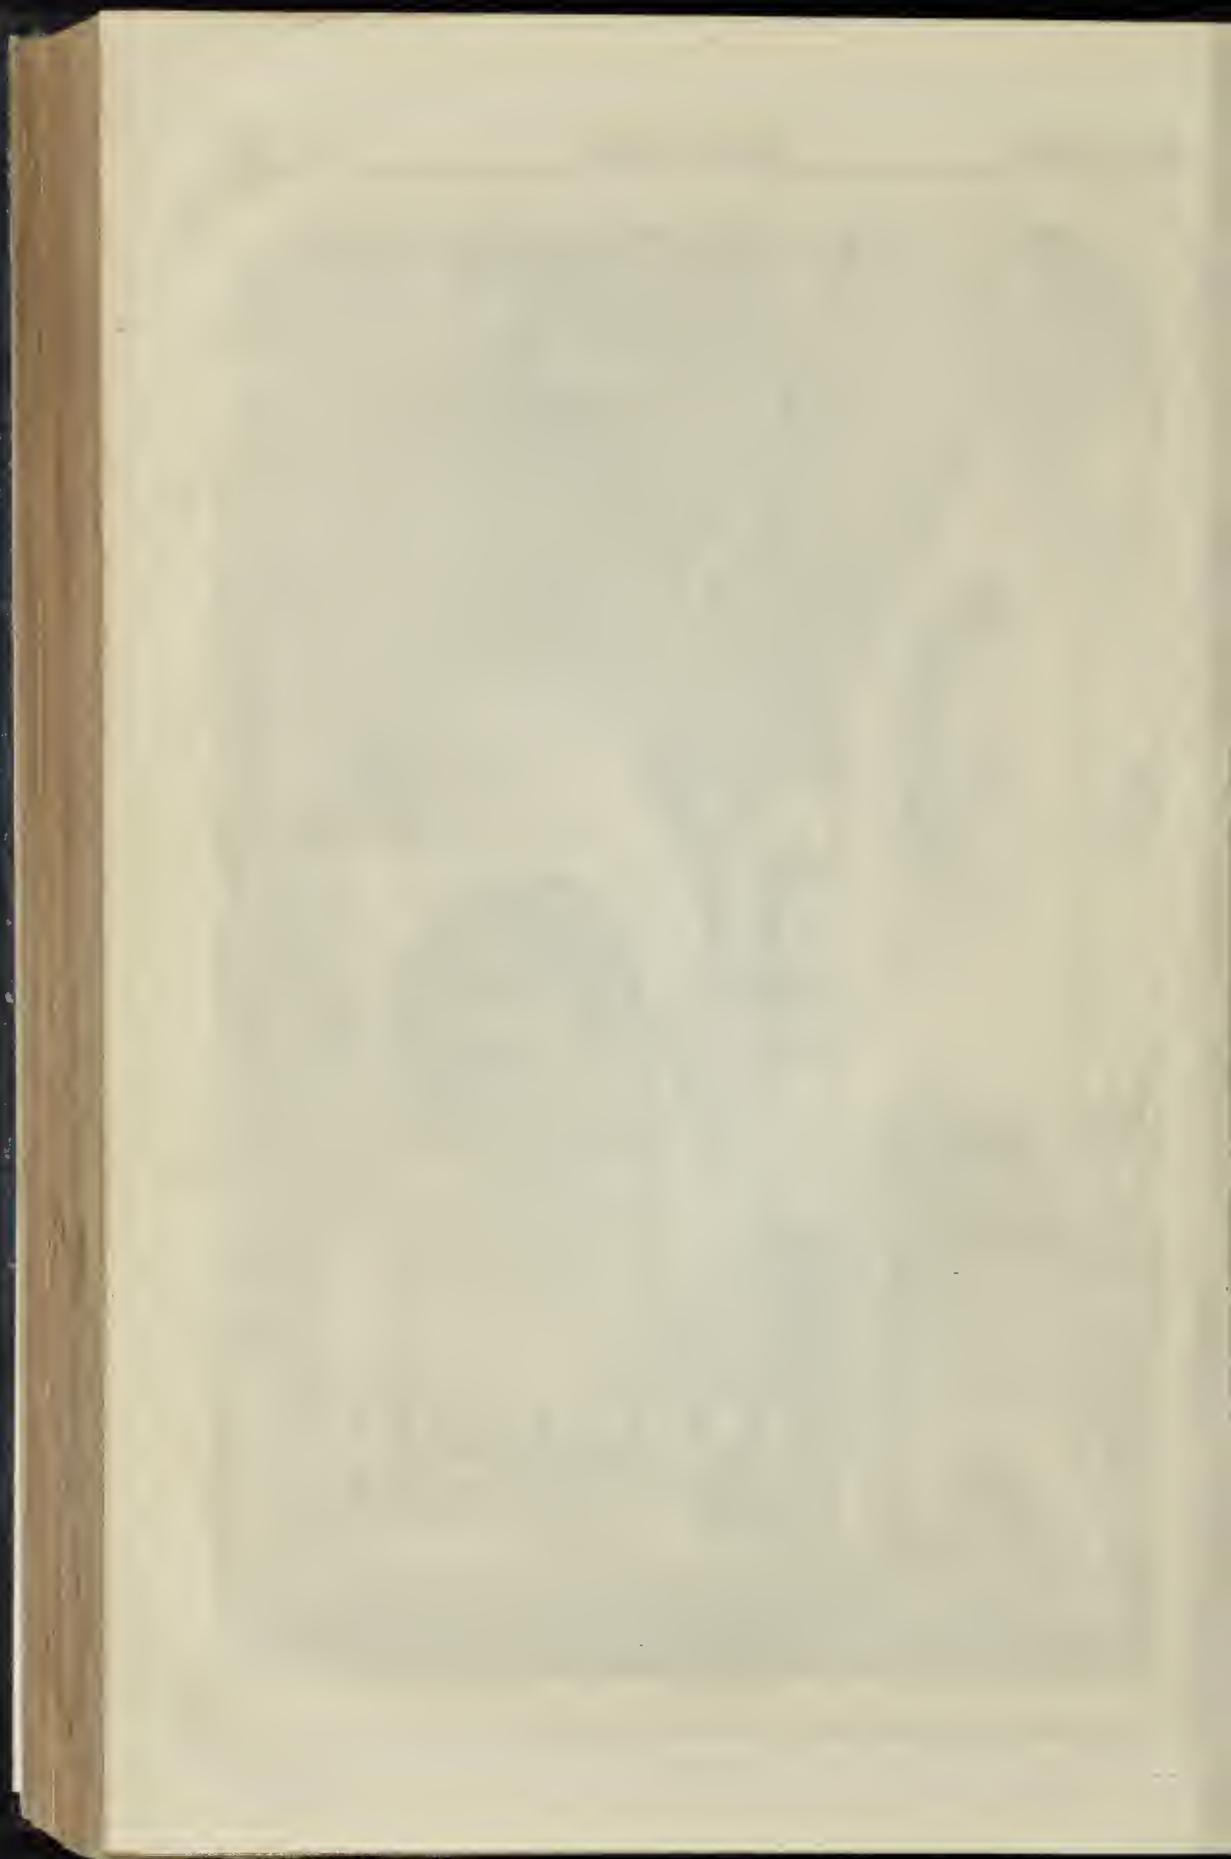

MR. OWEN JONES, ARCHITECT,
Author of "The Grammar of Ornament."

ST. ANDREW'S CATHEDRAL CHURCH, INVERNESS.
Plan.

THE CHURCH OF ST. COLUMBA, KINGSLAND ROAD, LONDON. — MR. JAMES BROOKS, ARCHITECT.

THE PARISH CHURCH OF ALL SAINTS,
LATHBURY, BUCKS.

This church has lately been re-opened, after undergoing considerable repairs. The chancel was restored some years back under the direction of Mr. Hussey. The church contains features of great interest, and is believed to have originally consisted of a western tower, and narrow nave and chancel. Now, however, it presents a western tower, pure Norman below, transitional Norman above; a clearstoried nave, flanked by a transitional Norman arcade, on the south side, and by a Decorated arcade on the north; a south aisle, with Norman door, and Decorated windows and porch; a north aisle and chancel of Decorated style throughout. The roofs are of late date, very low pitched, and masked by heavy hatted eaves, except in the case of the chancel. Several interesting discoveries have been made during the progress of the works, such as a Norman window over the south arcade, an arched entrance and stairs to the roof-loft, a low window in the north-west corner of the chancel, and a fragment of intricate Norman carving in the south-east pier of the nave. The church has long been noted for its frescoes throughout the nave and aisles. The internal appearance of the church is much altered by the substitution of new fittings instead of high pews, &c. the walls have been strengthened, and the porch almost rebuilt, with a new roof. A carved font, standing upon an encasement tile pavement, was a special gift.

The woodwork has been executed by Freshwater, of Bedford; and the general repairs by Shackshaft, of Newport Pagnell; under the direction of the architect, Mr. E. J. Tarver.

CARRIAGE-WAY PAVEMENT v.
MACADAMISING.

Sir,—The question of carriage-way pavement requires, I think, to be better understood by those most interested in the matter,—I mean the large body of ratepayers.

About thirty years back, the prevailing opinion among the commissioners of paving, their surveyors, and, indeed, the general public, was that the larger the stones used, the sounder and better the pavement would be, and the longer it would last. But those two great tenets, time and experience, have now brought us to know better, and the wide stones have been condemned in the City, Southampton-row, and various other places for many years; and, in their stead, stones 3 in. in width substituted. I feel sure, from a very long and practical experience, that these stones are by far the best, there being less friction, less noise, and better foot-hold for the horses; but all carriage-way paving ought to be laid on a bed of concrete, as that cannot work up through the joints, however great the traffic may be.

What I wish particularly to impress on the minds of the different paving boards is the great waste of the ratepayers' money which is made, from time to time, by continuing the process of macadamising the public streets and roads. In illustration of this take the following example:—I should say the paving in Cheapside, Fleet-street, Holborn, and other thoroughfares of equal traffic, would be on the average reduced in depth about 1 in. in ten years; but if the same stone, or Gurnsey stone, which is much harder,—should be broken and spread on the roadway, then the wear would be in ten years from 18 in. to 2 ft.; and the great difference between the two is to be accounted for in this way. In the macadamising you have the friction of the wheels on the surface, and at the same time the small stones are pressed and rubbed against each other, until a great portion of them becomes dust, which works on to the surface in wet weather, or by the too free use of the water-cart. But this cannot be the case with paving, as there is but one friction on the surface, and I dare say it will appear strange to many of your readers to be told that the wood-paving laid in Cheapside and other parts of London some years back would last much longer than broken Gurnsey stone; but that was proved to be the case, and facts are stubborn things; and in confirmation of this statement I beg leave to direct attention to the durability of the present wood-paving in Cornhill and elsewhere.

I would respectfully advise those paving boards who are treated with the power to borrow money, to avail themselves of the privilege, and urge upon them to follow the good example set

them by the gentlemen of the St. Pancras Paving Board, and two or three other parishes, by substituting paving for macadamising, if they wish to prevent the accumulation of slush, reduce their contractors' bills for cleansing the streets, and save the pockets of their fellow-ratepayers.

Last my motive in writing to you should be misconstrued, I may perhaps be permitted to state that I have no interest in the matter beyond the wish to benefit my fellow-men,—if within my power,—by giving them the result of a long and varied experience.

ONE WHO HAS HAD FIFTY YEARS'
PRACTICAL EXPERIENCE.

THE ENGINEERING WORKS OF THE
BOARD OF WORKS.

Sir,—The ruling spirit of the engineering department, having achieved great successes for the Board, from overwork of mind and body, a short time since, became invalided, and leave of absence was granted him for the purpose of re-orienting his health. Whereupon, it became necessary that the chair thus vacated should be filled,—and so it was.

The new broom, moving, no doubt, with praiseworthy zeal, proceeds at once to sweep clean, thereupon kicks up a great dust; finding fault with everything that has been done by the now dormant chief and his executives, save and except that portion of the work which had been under his own immediate supervision, and which work is now declared the standard of excellence, and below which nothing should be allowed. The facts are briefly these. All sewer works on the north side of the river have been specified, contracted for, and worked out with hard-picked stocks,—the inner ring, where subjected to soot, being of blue Staffordshire bricks, which, in the opinion of the most experienced engineers, architects, contractors, and builders, is the best class of work for sewers; and they are satisfied that works so constructed with best Portland cement will last for centuries. But the new chief goes in for the pretty, regardless of cost, and puts in such work as is seldom to be found even in the fronts of most princely mansions; the strength and durability of this class of work over the other not being increased one iota, whilst the cost of its production has been absolutely doubled.

I should not have trespassed on your space to this extent did I not regard it as a subject of great importance, and one to which the attention of the public ought to be earnestly directed; for it is clearly one of two things,—either a class of work has been admitted on one side of the water under the Metropolitan Board of Works which is absolutely inadequate to the requirements, or, if it is all that can be desired as regards substantiality, then they have sanctioned a most lavish waste of public money on the opposite side of the river to a spirit of engineering rivalry.

I enclose my card and address, and am,
A RATEPAYER.

MANAGEMENT OF COMPETITIONS IN
GERMANY.

As it has of late been suggested that the Institute of British Architects should take up the question of public competitions, it may not be interesting to note what has been done in this direction by other countries. At the Congress of German architects and engineers in 1868, the following ten rules were agreed to, and ever since the public and profession in Germany have been guided, we are told, by the principles there laid down.

1. The jury must be chiefly composed of architects.
2. The instructions must be approved by those architects, whose names must be stated.
3. No jurymen can in any way participate in the proposed work.
4. Unnecessary drawings and details should be avoided, and the required scale should be stated.
5. If the intended outlay is named, the instructions must state whether that sum will be adhered to, or whether it is approximate only, in which case the competitor may use his own discretion.
6. A design will be excluded from the competition if sent in too late, or is found to contain considerable deviations.
7. The premiums must be awarded under all circumstances.
8. The various designs must be publicly exhibited for a fortnight at least, and the report of the jury must be published.

9. The premiated design becomes the property of the client (or building committee) only if carried out.

10. The first premium must not be less than the amount due to an architect called in without competition.

THE MATERIAL FOR STATUES.

I HAVE read with some interest the observations contained in recent letters in reference to our London statues, and cannot help thinking that, after all, the bronze statue for durability and adaptability will hold its own; its chief defects are contained in the following few sentences of Mr. Moore's letter:—"Whatever may be its original colour, &c., soon loses its original agreeable tint, and becomes the most monotonous, melaucholy, and disagreeable tone that it is possible to conceive; the statues constantly reminding us of sweeps;—not a clear, transparent, lustrous black like marble, but a dull, heavy hue that will not allow the light and shade, even in our brightest days, to be seen at a short distance, and obscuring all the details and minor beauties which add so much to a work of art."

This defect appears to me to arise from the want of lustre rather than from the colour of the material. To take a common illustration, the ornaments on a stove, although quite black, when well polished with black lead will allow of the pattern of the ornament being perfectly seen. In imitation bronze figures, the effect is produced by painting them of an olive or dark brown colour, and wiping off or touching the prominent parts, with bronze powder; showing clearly that the fact of a bronze figure having changed to a dark colour does not of necessity render it disagreeable, so long as the surface can be kept bright. And why could not this be done by means of a periodical hard brushing? Bronze is a material that would bear the process; and if the prominent parts thus became of a lighter colour than the depths, we have then the effect so much sought after in all imitations of bronze. Some of the bronze statues in Trafalgar-square, and that of George III. at Charing-cross,—not long since were thoroughly brightened up, but are now as black as ever. Marble and stone statues, of course, will not bear the process I have suggested, as the tips and prominent parts would become black. I remember the last time I saw the statue of the Queen in front of Holyrood (Edinburgh), before the new fountain was placed there, she was undergoing the process of painting; and some years since it frequently fell to my lot to blow the statue of Sir David Wilkie (then in the entrance-hall of the National Gallery) with a pair of bellows. Even then, by the very unrequent, though necessary, use of a dusting-brush, his nose got nearly black, giving Sir David a most stotish appearance. I believe the statue in Cavendish-square has not been replaced; it was taken down a year or two ago, as was stated, to be recast, at the expense of the Duke of Portland, and the staging was left standing as if for its re-erection; this was afterwards cleared away, and I think no statue but that of Lord Bentinck can there be seen.

Speaking or writing of statues, when will a companion be found to George IV. in Trafalgar-square? It is a wonder that the Duke of Kent, being the father of her Majesty the Queen, has not been placed before this time in a more prominent position. If brought from within the railings, and placed some 10 ft. or 12 ft. forward from its present place, it would be an improvement. Can any of your readers tell me when the dagger formerly (as represented in old prints) in the hand of the Achilles in Hyde Park, was removed? For many years he stood empty-handed; but within the last few has been supplied with a formidable instrument like a large oyster-knife. So with the iron St. Georges on the gates at the Marble Arch. They formerly held spears; now they content themselves with shaking their fists at the dragons beneath their horses' hoofs. Does not Richard Cobden deserve a better statue than that at Camden Town? His trousers and coat are "too long and too loose," requiring the sleeves to be turned up considerably. Would not Livingstone be more suitable to face Franklin, and shift Lord Clyde to Trafalgar-square? In these anti-vaccination days, I suppose I dare not say a word in favour of poor Jenner, or would suggest the courtyard of Middlesex or some other metropolitan hospital. EFF. DEE.

CHEAP MEALS FOR THE POOR.

A MEETING was last week held at the Cannon-street Hotel, for the purpose of considering the best means of providing cheap meals for the poor during the ensuing winter. The chair was taken by Sir William Tite, M.P. Mr. Robinson said he wished, in the first place, to disclaim any commercial interest in the project he wished to promote. His attention had been first attracted to the subject by the success of the cheap dining-room for Australian meats in Norton Folgate, where 1,000 working men obtained, at a very low rate, a good and nutritious meal every day. He had visited that establishment himself, had tasted the food, and had been perfectly satisfied. A resolution in favour of the object of the meeting was carried.

It is proposed to establish kitchens and eating-rooms in Poplar, the London Docks, Farringdon Market, Westminster, Lambeth, and Brompton. It is estimated that about 1,000,000 will be required to provide the necessary premises and fittings. Of this sum nearly 500,000 have been subscribed.

Besides the Norton Folgate establishment alluded to by Mr. Robinson, another has been opened in Islington. It is also said that the acceptance which the Australian meat is finding in its cooked form is rapidly stimulating the sale of it uncooked. The savory smell of the Irish stew has formed a more cogent argument than "opinions of the press," and the advice of the savans. Hundredweights of the preserved meat are now sold for pounds disposed of four months ago by Mr. Tallerman, who introduced it.

Some specimens of beef have been imported from South America by Messrs. G. F. Dickson & Co., of Great Winchester-street-buildings. The beef had been prepared for exportation by Señor Maximo Terrano, an extensive landed proprietor of Buenos Ayres. The process of preparation is said to be exceedingly simple, and the result neither the "jerk" beef of the West Indies nor the "oharou" about which so much has been said in question. The meat is simply cut from the carcass of the newly-slaughtered animal, next steeped for twenty-four hours in ordinary brine, and finally dried in the open air. When dry it is fit for shipment, and it performs the voyage to England in loose sacks, without any other precaution or covering. The meat is said to be in appearance very like the Hamburg beef of the Italian warehouses, and quite equal in succulence and flavour. It can be sold retail in London at 3d. or 4d. a pound. It is sold without bone, has plenty of fat, and would make a first-rate *pot-au-feu*, with cabbages, or other vegetables.

CEMENT.

Sir.—At page 912, *ante*, your correspondent, "W. W." asks: "Does cement compress when loaded into carts, &c.? If so, when it is essential the correct proportions of cement should be used, would there be no diminution of strength as there is of bulk?" I beg to suggest, in reply to "W. W.'s" first inquiry, "How much is a bushel?" that an imperial bushel measure, duly stamped, contains that quantity, or 2,218 cubical inches; and is applicable to seeds, grain, ground lime, cement, &c., or those articles not sold under the custom of heaped measure.

It is the practice at the various cement works I have visited, to place a bushel measure under the spout delivering from the sifting machine; when this is full to the brim, any excess in the form of a cone on the top is struck off, and a fair bushel filled into the sack or cask. Now, as to loss of bulk, when the cement is ground, the particles are covered with scales or feathers projecting, increasing considerably the space they occupy at the first time of measuring.

These projecting particles are broken off when the sack or cask is filled—the sacks being thrashed—the casks shaken and rammed until they hold the quantity in the smaller space. There may be unprincipled merchants in this trade, but that is apart from the question. I was a large consumer of Portland cement from 1854 to 1864: the earlier part of that time I found great deficiencies in the quantities of cement delivered as against that charged for; subsequently, I purchased by weight—a course now generally adopted.

If the proportion or quantity of cement to be used is specified, doubtless an engineer or architect considers he has a right to have his bushel measure filled at the time of using or on the

work, and would refuse to entertain the plea that it must not be filled because the material had lost bulk in transit.

If the "proper" quantity of cement be ordered to secure strength, and less be used, strength will not be obtained. The means not being equal to the end, the end cannot be attained.

Y.

COST OF THE MUNICIPAL BUILDINGS, LIVERPOOL.

At a recent meeting of the Liverpool Town Council, the cost of the Municipal Building, of which we gave illustrations some time ago, was stated. It is rather large, and stands thus:—It was decided, after due consideration, to give Messrs. Haigh & Co. a sum of money equal to an advance of 988l. on the sum awarded by the architect and surveyor, with whose award their claim differed to the extent of 4,000l., and, though not satisfied, they were bound by their arrangement to accept this. Including this vote, the cost of the building up to the present time has been 126,410l. 7s. 3d., exclusive of the land, which cost about 323,900l. The total already mentioned includes the cost of the fixtures, &c., which have been very expensive, because large in quantity. The furniture, fixtures, gasfittings, bells in the tower, the tower clock with its expensive arrangements, and similar extras, came alone to about 16,000l.; Messrs. Haigh's bill for fittings amounting to 12,431l. 18s. 3d.

THE INVENTOR OF THE STEAM-ENGINE'S NAME,—NEWCOMEN, OR NEWCOMIN?

FOLK were not particular in their spelling 200 years ago—notably so in the matter of surnames. My family name, e.g., used to be spelled *Lidstone*, though it is now rendered *Lidstone* by all but one branch of the old stock. And, being desirous to have Newcomin's name printed correctly, I examined the gravestones of his family, which was located in Dartmouth for several generations, and on all of them it was given—Newcomin, as in my pamphlet reviewed in your last issue.

T. LIDSTONE.

HAND-RAILS.

For safety of aged or infirm persons I suggest that the flights of stone steps outside our modern villas should be provided with a hand-rail on each side. They are very dangerous to descend after dark by aged persons, and it is a modern custom to dispense with them. I do not know the reason why. OCTOBERIAN.

LAW COURTS.

It is a most unfortunate thing that this work—a matter which would have given employment to hundreds,—should have been stopped; at a time, too, when it would have been a real boon to the working classes. Does the Chancellor of the Exchequer, by the way, really imagine that he will be able to anticipate taxes not due? If so, he can little know the condition of 75 per cent. of the community, who at present are all but unable to pay taxes really due.

INQUIRE.

A CONTRACT IN NOTTINGHAM.

Sir,—May I give an instance of contracting in Nottingham. Last week tenders were invited for 31 houses in Kirke White-street, Nottingham, for Mr. J. Abbott; Mr. John Collyer, architect.

At the appointed time tenders were sent in from twelve different firms, myself being one of the competitors. The following day I met the architect, when he told me that the lowest tender had been withdrawn, in consequence of a mistake, so that I stood a good chance, but it was not quite settled. I waited upon him last Saturday, and was informed by him that they had not yet settled who was to have the job. He (the architect) inquired of me whom I should employ as sub-contractors, and named a stonemason and a painter. Finding I was willing to employ them, he then told me that I was not the lowest contractor, that Mr. Attenborow's contract was a little below mine, but if I could alter my tender I should get the job. I refused to do so, and came away, fully expecting that Mr. Attenborow would get it. But such was not the case, for on Monday the job was given to

Mr. Vickers. As soon as I heard of it I applied for a list of the tenders, and was handed the office list to copy from, which was as follows:—

Hindell	£1,283	0	0
J. Smith	3,000	0	0
Sedgewick	3,640	0	0
Wool & Slight (second tender)	3,640	0	0
Vickers (accepted)	3,745	0	0
Messum	3,821	10	0
Slim	3,820	0	0
Boatock	3,822	0	0
Rushworth	3,807	0	0
Jelley	3,789	0	0
Tutin	3,769	10	0
Attenborow	3,767	0	0
Wool & Slight (withdrawn)	3,400	0	0

Having made the above copy, and carefully looked over the list, I could plainly see that the figure had been altered opposite Mr. Vickers's name: the 7 had evidently been a 9, and the 4 a 2, making 3,925l. I turned to the architect, and asked him if the figures had not been altered. He replied that he had taken the iron-work out. I pointed out the altered figure, the old one being plainly visible, and told him that 75l. which is the price of the iron-work, did not account for the alteration; and reminded him that all the contractors would include the provisional sum of 75l. for the iron-work.

Being thus pinned, he admitted that he had allowed Mr. Vickers to alter his tender, and that I had had the opportunity of doing so, if I had chosen, but would not; and as I was not the lowest, I had nothing to do with it, but for all that, he had no doubt that I could do the brick-work, for he had spoken to Mr. Vickers about me. I told him that I would have nothing to do with the matter; and, although I have no claim upon the job, I consider that I owe a duty to my brother tradesmen, and, though an unpleasant one, I must not shrink from it.

Nottingham.

THOS. TUTIN.

PRE-MISES v. PREMISES.

Sir,—The arguments of your correspondent "R" will not likely avail much, for the tide sets in strongly for using the double s in premises, "arguments taken for granted."

It is substantially the same word, in root, derivation, and etymology, as premises, "house and tenement;" but convenience suggests this distinction in spelling. Individually, I would prefer to retain the verbal form, for the noun pre-mise, as two syllables, like eur-mise; and in the plural pre-mises, sur-mises, for which we have a strong analogy. A. H.

THE OPEN SPACE AT THE MANSION HOUSE.

METROPOLITAN BOARD OF WORKS.

At the last ordinary weekly meeting of the members of the Metropolitan Board, a deputation from the council of the Royal Institute of British Architects presented a memorial on the advisability of preserving, as an open space, the triangular piece of ground opposite the west side of the Mansion House. The deputation was introduced by Sir William Tite, M.P. Professor Domelidon said the deputation was influenced by no motives of criticism, but rather by feelings of fellowship towards the members of the Board. They had all seen the great improvements brought about by the Board during the last few years, and they now desired to draw attention to the open space near the Mansion House, and prayed that it might be preserved, not only from the fact that it would give to the public residence of the chief magistrate of the city of London a more appropriate and conspicuous aspect, but from the fact, also, that it would be a great public convenience. Indeed, had the plans of Sir Christopher Wren been carried out, the present memorial would have been unnecessary. Charlotte-row and Bucklersbury were too narrow for public convenience already, and if the space referred to was built upon, the inconvenience to public traffic would be greatly increased. Sir John Thwaites said he had no doubt the deputation were influenced by motives of public consideration, and assented the deputation that none more than the members of the Board of Works desired improvements in architecture. Indeed, they had for some time impressed upon Parliament the necessity of improving the City. What the deputation desired the Board also desired, and while he endorsed the necessity of preserving the open space, still he had no power to move in the matter at present. After other remarks, the question was referred to the Works and General Purposes Committee.

The chairman reported that the loan so far had proceeded most satisfactorily, as they had raised it under 3½ per cent., and he could not but feel gratified that the question he had agitated for nearly eleven years had been attended with such advantages to the public and the ratepayers of the metropolis.

THE NEW WORKHOUSE, HERTFORD.

At a recent meeting of the Local Board of Guardians, the clerk read the following letter from the Poor-law Board:—

"Poor-law Office, 22nd November, 1869.
SIR,—I am directed by the Poor-law Board to acknowledge the receipt of your letter of the 3rd instant, in which you request their sanction to the guardians of the Hertford Union raising a further sum of £5000, to pay any balance that may be due in respect of the erection of a new workhouse above the amount for which it was contracted to be built, in consequence of an error having been discovered in the quantities taken out by the guardians' architect. I am directed to inquire why this error and default was not brought by the guardians under the notice of the Board at the time of its discovery.

The Board also request to be informed whether the contract with Mr. Norris was entered into after the receipt of tenders, all made upon the basis of the quantities erroneously taken out by Mr. Peck, and without reference to such other tenders.—I am, &c.
A. FLEMING, Secretary.
Mr. Thomas Swodes, Clerk to the Hertford Guardians."

After some discussion, the clerk was directed to reply to the letter of the Poor-law Board, referring them to the letter from the guardians of the 3rd of November, and stating that the guardians expected to receive Mr. Trollope's report in a week.

The Rev. L. Deedes said Mr. Trollope's instructions were simply to measure the work, but he had told him (Mr. Deedes) privately that the house was well built, and that he did not see any fault with the work.

A NEW NORTHERN ARCHITECTURAL SOCIETY.

A MEETING of architectural students was held in Newcastle last week, and a society formed for the purpose of enabling the members to advance themselves in all matters appertaining to the study of the architectural and collateral profession. The following members were enrolled and officers elected:—Mr. W. L. Newcombe, president; Mr. W. S. Hicks, vice-president, committee,—Messrs. Thornhill, Oliver, Morton, and Thompson; ordinary members,—Messrs. O. Hall, W. Bedington, M. Reed, and J. H. Robinson; honorary secretary and treasurer, Mr. Joseph Oswald. It is called "The Northern Architectural Students' Society."

There is already one "Northern" society. Why do not the students join that? These infinite divisions are wasteful and weakening.

LADIES' SANITARY ASSOCIATION, MANCHESTER.

THE annual meeting of the Manchester and Salford Ladies' Sanitary Association has been held at the Town-hall, King-street. Mr. Hugh Birley, M.P., occupied the chair, and there was a numerous attendance.

The Rev. C. Keeling (the honorary secretary) read the report, which stated that the association was formed to direct the attention of ladies interested in the welfare of the poor to the great need for sanitary reform, and to attempt something in the way of woman's work in comfortless and lost homes. In November, 1867, the special mission agency was started, and a mission woman engaged to visit the lowest districts, under the supervision of the committee. This was now the chief work of the association, and that upon which the committee had to report. The mission woman in her visits from house to house was directed, first, to give instruction upon the common laws of health, and kindly to draw attention to the want of cleanliness and ventilation, and to provide, where desirable, disinfectants and other simple remedies for bad air. If the poor were better housed, there would be need for home sanitary influence, so long as the two great causes of moral degradation were at work,—ignorance and drunkenness. During this year the mission woman had been engaged in the parishes of Collyhurst and Red Bank. Although there were no stories to tell of wonders worked, still the minds of the people had been roused to a sense of the terrible consequences of the bad smells and filthy surroundings, which they too often regarded as necessary evils. She considers that

drunkenness is one of the greatest hindrances to a proper observance of sanitary laws. The report was adopted, and it was resolved, "that considering the wide prevalence of intemperance and other causes of social and moral degradation, this association sees every reason for going on with increased vigour in the work of home sanitary reforms." The meeting pledged itself to support the suggestion made in the report to endeavour to acquire funds in order to have another sanitary mission woman appointed.

THE OXFORD DRAINAGE SCHEME.

THE Local Board intend applying to Parliament for powers to take otherwise than by agreement 300 acres of land in the parish of Radley, the property of Sir George Bowyer, and 300 acres in the parish of Nuneham Courtney, the property of the Rev. W. Vernon Harcourt, for the purposes of carrying out the drainage of the city. It is understood, that although power will be taken to obtain 600 acres, not more than 300 will actually be required for the utilisation of the sewage; and that endeavours will be made to obtain land by private contract, if possible, the application to Parliament being only a provisional and precautionary measure. On the portion of the land selected a pumping-station will be erected, for the purpose of pumping up the sewage, and thence distributing it by carriers over the surface of the land. The effluent water, after purification, will be led through pipes into the river Thames.

The committee, as far back as May, 1869, resolved that "the principle of excluding all rainfall from the sewers should be adopted as far as practicable." Since then Lieut.-Col. Ewart, who was appointed by the Home Secretary to inquire into "the plans for the drainage of the several towns situated in the valley of the Thames, with a view to the purification of that river," has recommended the adoption of the "separate system" of drainage in the towns of Oxford, Windsor, Eton, and Abingdon.

STATUE OF THE LATE EARL OF DERBY.

WE hear with much satisfaction that it is proposed to erect a statue of the late Earl of Derby; but instead of presenting it to the Carlton Club, as is suggested, where few of the public would have the opportunity of seeing it, surely it should be placed in some conspicuous spot, say St. James's-square; and attached to it should be an appropriate pedestal, with *reliefs*, of some telling incidents of his life, and let the architect as well as the sculptor be consulted, so as to render it a work worthy of the present age, and as an example of what a pedestal should be in addition to the statue.

Hitherto there has been a great lack of judgment in this country shown as to such matters, totally different from what is accomplished in foreign states. There would be no lack of subscriptions towards such a work. It cannot be expected the public will subscribe to present a statue to the Carlton Club.

Since this was written, it has been intimated that the committee have adopted what is obviously the proper course, and will seek a public site for the statue.

THE STAGE.

"MORDEN CRANGE" is the title of Mr. Burnand's drama at the Queen's Theatre, a drama founded on Mr. Mark Lemon's novel, "Wid for the End." The morning papers have scarcely dealt fairly with it; but we shall not be surprised to see it in the bills for some time to come. There are plenty of incidents, two or three strong situations, and some very effective scenery. It requires cutting (How can you get a piece without cutting? asks a joking friend hard by), and a little wedging together, and when this has been done it will interest many an audience. Mr. Ryder has one good opportunity, and uses it finely; and Mr. F. Masthew, Miss Pouncefort, and Miss Henrietta Hudson give effective aid; nor will we smit under that head Mr. W. Belford, who plays the inevitable detective. Some very elaborate scenery has been prepared for it by Mr. G. Gordon and Mr. W. Phillips; some of it, indeed, almost too elaborate, considering the very short time during which it is seen; the exterior of Wray's Mill, for example, at the commencement of the second act. The first scene of all,

Riverside Farm, is a built-up landscape of considerable merit; the Drawing-room in Morden Grange is very agreeable in design and tone. The Hall of the Grand Central Hotel is very cleverly constructed, but is a little marred by the recollection of the same staircase in the "Turn of the Tide," seen for many scores of nights. The red covering should, at any rate, have given place to one of another colour. Be this as it may, all who like the sensational and realistic drama of the day will find plenty to interest them in the mysteries of "Morden Grange."

AN ABATTOIR FOR NEWCASTLE-UPON-TYNE.

THE butchers of Newcastle, incorporated under the title of the "Freelind Butchers' Company," have erected in a suitable situation a large abattoir. The new buildings consist of seventeen separate slaughter-sheds, with corresponding stabling for cattle, cart-sheds, and other conveniences. At the entrance of the premises a gate-house has been erected, and various storerooms are immediately adjacent to this. The slaughter-sheds vary from 35 to 50 square yards in area, the cattle-sheds being about one-half of these areas. The height to the beams in the slaughter-sheds is 14 ft., and to the apex of the roof, 22 ft. The roofs are covered with pantiles, laid without mortar, and in addition to a continuous trellis-work filling in the tympanum of the internal gables between each shed, unglazed windows of large size are placed opposite to each other, in which are inserted upright iron bars for protection, while on the inside window-shutters are provided for when required. The floors are laid in cement, with channels and inclines running towards the doorways; and in each slaughter shed a small blood-tank is provided, the contents of which are removed by specially constructed carts, at periodical hours of the day, no refuse-heap being permitted on the premises. The whole of the open avenues spaces are cemented, with inclined slopes and channels running towards the gully-grates. The cost of the undertaking has been over £5000, and already the premises are rented by forty butchers, as frequently two, three, or four butchers use the same shed at different times. Mr. T. Oliver was the architect.

KEENE'S CEMENT AND PAINT.

SIR,—It would not be seemly that we, the manufacturers of Keene's Cement, should enter into a controversy in your columns with the manufacturer of another cement. We confine ourselves to saying that that firm (unintentionally, no doubt) states what is inaccurate in their letter about Keene's Cement.

"Clerk of Works" is probably correct in defining the cause of the failure complained of to be due to the use, indeed, a somewhat long-learned experience shows us that that point is liable to be thrown off these hard cements when they are laid on a backing of green Portland Cement work.

If the under coat, whether of Portland Cement or other material, be bona dry, the overlying cement may be painted without risk. J. B. WHITE, BROTHERS.

GRANITE COLUMNS.

SIR,—Your correspondent signing himself "J. S." in your last impression, states that he never saw "holes drilled through granite columns from end to end excepting where provision for gas pipes is necessary." Allow me to state that when a column is required, say 15 ft. or 14 ft. long, such column would be in three stones, a hole would be drilled through each stone, and screwed up in the lathe with a bolt through them; this, I find, is a general custom, having myself seen it done.

"The words" perfectly smooth," which I used in my letter in reference to the beds or joints, and to which your correspondent objects, are words which convey the greatest meaning in the most simple form, as all experienced persons are better able to understand these words than if I had used the term "fine axed." WILLIAM CROSS.

FOREIGN JOINERY.

SIR,—My attention has been drawn to a letter in your paper of the 4th instant, signed "W. H. Lasseles," respecting the windows supplied to the new St. Thomas's Hospital, in which that gentleman states he has seen the memorandum in your previous impression, that some of the joinery was made in Sweden; and also remarks that he, too, has executed a large order for windows for the same building.

Now, I have not the slightest wish to rob Mr. Lasseles of any credit due to him in the execution of his order for these windows, but I must be allowed, very respectfully, to contradict the last paragraph in his letter as not being in accordance with the actual facts of the case. He says, after referring to your remarks, that from the inquiries you had yourself made at the hospital, you were able to state that the work was obtained at less cost than it could be produced for in this country; that the Swedish house had "estimated" against him for the second and large order he has received, and "lost it." Now, the truth of the matter is this, Mr. Elman, the proprietor of

the joinery works at Stockholm, has really obtained the order for the whole of the windows for which he did estimate, and the reason why he allowed a considerable quantity of windows to pass him, was because he feared, from the great size of some of them, there would be much difficulty in procuring a vessel for their transport, with sufficiently large hatchways to take in the goods without damage; and in the case of the "second and larger order," of which Mr. Lascelles speaks, I have simply to say that the order was first given to Mr. Ekman, without his preparing any estimate at all, but his reasons for not accepting it, it is not necessary to name here. I think, however, the fact speaks for itself, that there must be some advantage in either price, or quality, or both, in having the windows prepared abroad, otherwise he would not have had the order sent to him without competition.

H. ATKINSON,
Agent to P. J. Ekman, Stockholm.
* * With this the correspondence may end.

THE STREET BY THE MANSION HOUSE.

ALTHOUGH a profound admirer of Shakespeare, I must differ with "W. H.," as to the propriety of calling the new street after the name of the immortal bard. A grove or park would better claim the title. Allowed me to suggest "Whittington-street," Sir Richard lived hard on College Hill, I believe.

CHURCH-BUILDING NEWS.

Victoria Park, N.E.—This new church to be built near Victoria Park-road will be commenced early in the new year. It is designed by Mr. Wigginton, will accommodate 750, and cost, with tower and spire, 5,500*l*.

Islington.—A new church, to be dedicated to St. John the Baptist, is to be erected in Cleveland-road. It will accommodate 800, and will cost 4,000*l*. The architect is Mr. W. Wigginton.

Sasby (Lincolnshire).—The church here has been re-opened, after having been closed for some time for repair. Originally built and used as a mortuary for the Earls of Scarborough, it was fitted in the style in vogue in the last century for similar structures. The seats have now been altered in accordance with modern ideas. They are entirely of old oak, somewhat elaborately panelled. Out of a gigantic pulpit and sounding-board, and the carved mouldings belonging thereto, a screened vestry at the west end, a reading-desk, and new pulpit have been constructed. The vestry will also serve as a baptistry. The small apse forming the chancel has been decorated with paint and gilding. The work has been done by local handicraft. The designs for the alterations and decorations were furnished by Mr. Nevill, of London, and some of the painting immediately over the altar was executed by that gentleman.

Tewkesbury.—A meeting of subscribers to the fund for the restoration of the Abbey Church has been held in the vestry, to consider what steps were necessary to be taken, if any, with reference to the Abbey Church restorations. Mr. G. G. Scott, B.A., and Mr. Skidmore, of Coventry, were present. The chairman stated that subscriptions to the amount of 3,000*l*. could be confidently relied upon. Mr. W. E. Dowdeswell had suggested that Mr. Scott should be asked to furnish an estimate of some part of the work, which might be executed with the funds at the command of the committee, and which, when done, would be complete. It was his opinion that a commencement should be made, otherwise subscriptions would be lost, and the funds, instead of increasing, would grow smaller. It appeared to be the general opinion that the choir would be the best part to begin on, as being the grandest as well as the most useful part of the church. Mr. Scott said that if that was done he should advise that the nave be temporarily fitted up for service; that the whole of the galleries and other obstructions between the choir and nave be removed; the entire length of the structure be opened up from end to end; the organ placed in one of the transepts; and all deficiencies occasioned by these removals be made perfect, so that one specific part of the work should be completed. He should be able in a short time to present an estimate of the cost of this, and tenders might be obtained, so that the committee might know the amount of liability before beginning. The practical result of the meeting was that estimates for the restoration of the choir, and for other sections of the work, are to be furnished, and an immediate effort made to obtain sufficient funds to complete one of them (the choir if possible) and that the work be then at once commenced.

North Ormesby.—The new church at North Ormesby has been consecrated by the Archbishop of York. It is dedicated to the Holy Trinity, and is situated in the Market-place, the site, and also a donation of 300*l*., having been

presented by Mr. J. S. Pennymann. The style of architecture is Early English, from the designs of Mr. W. White, of London; and the contractor for the work was Mr. A. King, of North Ormesby, builder. Messrs. Readman did the brickwork, Mr. T. C. Taylor the stone-work, and Mr. Unthank the painting. The contract estimate was 1,600*l*., but the total cost will be about 2,000*l*. The church is built of the common brick of the district, relieved with coloured bricks, in patterns at the gables, and with stone-work in the windows. The building consists of a simple nave and aisle, with a porch on the north side. The south aisle has not been built, but will be added when required. The interior is not relieved with carving of any kind, except plain and shallow mouldings at the capitals of the pillars. The roof is heavy and strong, and the chancel contains stalls for thirty choristers, besides seats for the priests. It is divided from the body of the church by a low wooden screen. The east window is of five lights. Sitting accommodation is provided for 450 persons, in open seats of stained and varnished deal. The pulpit and reading-desk are also of deal. Heat is supplied from a hot-air apparatus furnished by Messrs. Blake & Co. of Coventry, and the gaslighting by the North Ormesby Gas Company.

Maidstone.—The chapel which has been recently added to the main building of the Church of England Female Penitentiary has been opened. The architect is Mr. Arthur Blomfield, and the addition has been accomplished at a cost of about 1,400*l*. The dimensions of the chapel are 45 ft. by 18 ft. A kind of gallery, constructed at the end of the chapel, and communicating on a level with the dormitories, will give any of the sick inmates an opportunity of attending service without the trouble and fatigue of entering by the staircase entrance, and taking their seats with the general body of the hearers. A doorway at the front of the building leads on to the chapel staircase. The ground floor immediately beneath the chapel is used for kitchens and other domestic offices. The building was commenced in the spring, and some of the interior work was only finished on the day before the opening. The chaplain, the Rev. G. B. Howard, states that during the whole of the time the workmen have performed their labour in a very quiet and respectable manner, with an entire absence of drinking and swearing.

Anstey.—The parish church of Anstey "is in a deplorable condition," cracked, broken, altogether in a state of disrepair. But it is difficult to find where the responsibility rests. The living belongs to Christ's College, Cambridge, which would probably contribute to the work of restoration. The landowners are non-residents, and the population, who number about 530, are mostly very poor. A letter addressed to the rector, the Rev. T. T. Sale, by Mr. W. Butterfield, the architect, gives a general view of the state of the church. He says:—

"I have examined carefully and made plans of the church at Anstey. It is one of very unusual character and interest, but is now in a deplorable condition, it requires in some parts very substantial repairs and rebuilding. The south wall of the south transept, the south-east angle of the chancel, and the walls of the tower, are very seriously cracked. The external stonework of many of the windows, doorways, and porch is so much decayed as to require to be entirely renewed. Drains, gutters, and stack-pipes are urgently required. The above works press for attention.

The church has been much defaced, and its proportions altogether destroyed, by some works executed about forty years since, which included new roofs to nave, chancel, &c., and new east and west windows. . . . The fittings of the church are of the worst possible kind, and many, with the exception of the font, a screen, and a few of the ancient seats, be entirely removed. The floors must be taken up, and a very inconvenient and unsightly west gallery must be destroyed.

For the absolutely necessary works, a sum of about 2,000*l*. will be required. If, however, the church at Anstey is to be ever really restored, as it is well deserves to be, it will be necessary to spend a much larger sum."

We understand that the rector has been promised about 1,000*l*., one half the sum which is wanted to prevent the building from falling to pieces.

North Shields.—Christ Church, North Shields, after undergoing improvements, has been re-opened for divine service. The committee obtained the assistance of their fellow parishioner, Mr. F. R. N. Haswell, architect, in the carrying out the resetting and other alterations in the body of the church. Tenders being obtained, that of Messrs. Hedley, Chapman, & Co., North Shields, proving the lowest, was accepted. The seats are arranged in four groups facing eastwards, with those against the east wall looking eastwards. The front benches of the transverse seats are divided into stalls, those on the north side being for the use of the churchwardens, and

on the south side for the members of the corporation of Tynemouth. The organ, which was inconveniently placed in the tower gallery, has been removed into a chamber built on the north side of the chancel, and the choir are to occupy the stalls on each side of the chancel. The tower gallery, by the removal of the organ, is much enlarged, and will be devoted to the almost exclusive use of Sunday-school and other children. Sundry other alterations have been made, such as the paving of the chancel floor with encaustic tiles, in the centre of which is a brass to the memory of the late vicar; the removal of the high wood lining to the walls of the body of the church; the removal of an unsightly and unnecessary staircase to the west gallery; the erection of an inner screen to the west entrance (the south door is to be used only for greges); the decoration of stone pillars, and placing a border of encaustic tiles down the side of the centre passage.

FROM SCOTLAND.

Edinburgh.—The clearing-away of houses in Argyle-square, with a view to the extension of the Industrial Museum, has exposed a portion of the old city wall, the existence of which is probably unknown to the bulk of the rising generation.

Glasgow.—Extensive alterations are about to be made on the suspension bridges. The Bridge Trustees, being desirous of putting these bridges in a thorough state of repair and efficiency, instructed their engineers, Messrs. Bell & Miller, to prepare the necessary plans and take tenders for the work. The Portland-street bridge, which oscillates very much, will be subjected to the greatest amount of alteration. The suspension chains will be lowered in the centre to near the level of the roadway, by which the tension on the chains will be greatly reduced, and the angles at which they leave the towers on the landward and river sides rendered more equal. To give greater strength, the sectional area of the chains will be increased by additional bars. The platform of the roadway will be entirely reconstructed. At present it is formed of timber, which is now much decayed. The new platform, with the exception of the timber planking, will be entirely of wrought-iron framing. A lattice-girder on each side will extend from end to end of the bridge. Other alterations will be made.—A malicious scamp who acts as a steeple Jack at Glasgow so interfered with the tackle of an Englishman who was employed in the same capacity at Port Eglington spinning-mills, that the Englishman's life was endangered. The case was brought before the magistrates, and the presiding judge, at the conclusion of the evidence, said that during the whole course of his official experience no worse case had ever been brought before him. There could be no doubt that serious injury had been intended. Under the circumstances, however, he could not impose a higher penalty than a fine of 5*l*., with the alternative of thirty days' imprisonment.—The new barracks about to be erected at Glasgow will be provided with a small regimental hospital, which, as we are informed, constructed on the most simple, and at the same time the most modern, principles. According to the *Lancet*, the natural method of cross ventilation by opposite windows is supplemented by the artificial system of fresh-air inlets with Nettleton's stoves, and extracting shafts. The lavatory, baths, water-closets, and sinks are separated from the remainder of the building by the interposition of a lobby provided with means for its own ventilation.

Dalkeith.—The foundation stone of a new west United Presbyterian Church has been laid at Dalkeith. The site is at the west end of the town, and nearly opposite to the railway station. The new church is to be built after competitive designs, prepared by Mr. R. Thornton Shiels, architect, Edinburgh, and the style is Early English, bordering on the Decorated. The church has been planned to accommodate 700 of a congregation. It is estimated to cost 3,000*l*.

Bantaisland.—The representatives of the late Mr. Joseph Young, of Dunsarn, have presented to this town the music-hall built by that gentleman in 1857, at an expense, it is believed, of nearly 2,000*l*. The hall is situated back off the east end of the High-street. It is furnished with a regular stage, footlights, and movable scenery—the latter comprising some ten drops, painted by Channing, scenic artist. The gift has been

conveyed to the Town Council on the simple conditions that it be kept in good repair, and devoted only to the purposes of a public hall.

Alcoa.—A new drinking-fountain has been erected here, but interdicted. The local police commissioners erected the fountain in the square fronting the Crown Hotel, in Bank-street. It has a stone base, 4 ft. 6 in. square, with an elevation of 8 in.; and consists of four columns, from the capitals of which consoles, with griffin terminals, unite with arches formed of decorated mouldings encircling ornamental shields. An open dome surmounts the shields, the apex being occupied by a crown, and the whole being finished by a lamp. The font stands under the canopy, with a basin, 2 ft. 6 in. in diameter, and having four water-supply taps and four drinking-cups. The fountain had scarcely been erected when it was interdicted by Mr. James Blair, Glenfot, who, being the proprietor of the property near the fountain, objected, on the ground that the fountain was erected without his knowledge. The interdict has been considered before Sheriff Clark. The commissioners questioned the right of Mr. Blair to object, and contended that the works were finished some hours before the interdict was served. The petitioner maintained that the interdict was served several hours before the work was completed, and that he afterwards showed his title to object. The consideration of the case, after discussion, was adjourned.

PROVINCIAL NEWS.

Ravenstall.—A new police-court is now in course of erection in this place; the plan comprises a court-room, with retiring-rooms for the magistrates and solicitors; three cells for prisoners, with open yard; police-office, house for sergeant, and rooms for policemen on duty. The cells are heated with hot water, the air from the outside passes over the warm pipes into the cells, and escapes by a ventilator in the roof. The outside of the building is faced with stone. The buildings have been designed by Messrs. Maxwell & Tuks, architects, and are expected to be ready for occupation by next Midsummer.

Whitehaven.—Plans and estimates for the construction of a wet dock have been prepared by Mr. Stiver, the harbour engineer, for the consideration of the town and harbour trustees. The probable position of the dock, says the report, is nearly parallel to Tangier-street, and takes up as little of the North Harbour and Shipyards outside of North Wall as possible; at the same time not encroaching on the inner harbour. It is four acres and a half in extent, and will be a clean gain to the water space of the harbour of 2a, 1r. 19p. The sill of the dock will be 4 ft. below zero of the tides gauge (on the bath-house show-board) which will be the same level as the entrance between the Old Quay and the North Jetty. This with an ordinary spring tide, which is taken at 16 ft., will give 20 ft. over the sill, and with a 16 ft. neap tide will give 14 ft. over the sill. The bottom of the dock will be 1 ft. lower than this, or 5 ft. below zero. The following is the estimate:—

Wet Dock, with quay walls, entrance-gates, railway, &c., including the diversion of Craney Beck	£42,994 8 2
Add 10 per cent. for contingencies	4,209 8 2
	£47,203 16 11

The masonry in the viaduct, bulwark, and part of the North Wall, and the material in the timber jetty are not taken into account, nor is anything allowed for the cost of land, buildings, &c., taken up by the proposed dock. The present entrance to the North Harbour is very much confined, and vessels of any great length have a difficulty to enter. An alteration to obviate this appears on the plan.

Bristol.—Messrs. Wait & James's new granary, which is situated on the Welsh Back, is nearly ready for occupation, and is described in the local Times. The premises have been designed in the Italian Gothic style of architecture. The building is 40 ft. by 100 ft., and about 100 ft. in height. It consists of ten stories, and provision is made for the warehousing of as many as 120,000 bushels of grain. The walls are thick, and are constructed of brick, with moulded and coloured surface. The floors are supported by one range of brick columns, and by this means lifts without obstruction, 20 ft. in width, are obtained, whereas, under the old system, the whole surface would have been interrupted with numerous iron pillars. The lifts to receive the grain are

formed in niches in the thickness of the wall, so that the safety of passengers is secured, and the provision of the usual external doors rendered unnecessary, as the sacks ascend within the building. The sacks of grain will be delivered into carts from the granary through circular openings under the first-floor string-course, the ordinary skid being used to bridge over the foot pavement. The offices are on the ground floor. The architects were Messrs. Ponton & Gough, of Bristol; and the builder, Mr. J. Thorn, of Clifton.

STAINED GLASS.

Wolston Church.—This church has lately been enriched by a window on the north side of the chancel, filled with stained glass, to the memory of the late Rev. Walter Thursby, who was for many years curate here. The window is in the Perpendicular style of architecture, and consists of three lights, which have been filled with subjects illustrative of the office of the deceased. In the centre light is a figure of Our Lord, as the good shepherd, with a pastoral crook in his left hand, and a sheep on his right. At the base of the same light is a kneeling figure of Mr. Thursby, in a surplice. The side lights contain two groups of subjects each. In the dexter group, the upper subject is the charge to St. Peter. Our Lord is represented giving to St. Peter the keys of the Kingdom of Heaven, and the charge, "Feed my sheep." The lower group in the same light is St. Philip baptising the eunuch; in the background are seen attendants and camels. In the sinister light there is represented, in the upper part, the Breaking of Bread at Emmaus; and in the lower, St. Paul preaching at Athens. The framework surrounding the groups is of an ornamental character. The work has been carried out by Messrs. Hardman & Co., of Birmingham.

Burdwell Church.—Two painted windows have been erected in the chancel of this church. One is the gift of Sir Henry C. Blake, bart. (one of the lords of the manor), and Lonias, his wife. The subject is our Lord joining the disciples on their journey to Emmaus, and their petition to Him, "Abide with us." The other is the gift of Mrs. James Dunlap, of Windsor, in memory of her late husband. The subject of this is our Lord as the Good Shepherd giving his commission to St. Peter—"Feed my sheep." The artists were Messrs. O'Connor, of London, who also previously executed the east window, the subject of which is "The six works of mercy." It was the gift of Mrs. Hutchins, a sister-in-law of the rector, to her husband's memory, who lies in India. The whole chancel is thus furnished throughout with painted glass.

Baldon Church.—A painted window has recently been placed in the chancel of this church, in memory of the late Rev. G. E. Green, rector of the parish. The window, which is in the Early English style of architecture, has two lights, in one of which is represented Christ's Entry into Jerusalem; in the other, the Last Supper; and in a quatrefoil is a monogram with the initials "G. E. G." The window was executed by Mr. Wailes, of Newcastle.

All Saints', Sheffield.—This church, erected and endowed some time ago by the liberality of Sir J. Brown, has just received the addition of a stained glass window. Sir John's recovery, after a prolonged illness, determined Lady Brown to express her thankfulness by presenting a stained window to the church with which he was most intimately associated. The subjects were suggested by her, and carried into effect by a lady friend—an amateur, who made the original sketches, and arranged them for execution. The window occupies the eastern end of the chancel. The whole has been executed, under the immediate superintendance of Mr. Robert Drury, by the firm of Baillie & Mayer, of London. The window consists of five panels, upon each being two groups representing prominent incidents in the life of the Saviour, with mosaic ornamentations.

Langton Church, near Malton.—A two-light memorial window of stained glass, by Mr. J. W. Knowles, of York, has been erected in this church. The subjects are "Christ blessing little Children," and "Christ setting a Child in the midst of his Disciples." At the base of the panels is the text, "Of such is the kingdom of heaven," and at the bottom of the window is the inscription. The stone work, which is new, was executed by Mr. Keswick, builder, York.

St. Mary's Church, Witney.—Recently, the west window in this parish church has been filled

with painted glass, the gift of Miss Raine, as a memorial of her lately deceased father, Mr. Richard Raine. The window contains five principal compartments, the left representing Joseph interpreting the dream of Pharaoh, and the one in the extreme right the storing of the corn in the granaries of Egypt. The three central compartments comprise one group. Above the compartments are the badges of the twelve tribes of Israel, as prophetically set forth by the patriarch Jacob in Genesis xlix.

Books Received.

Wonders of Italian Art. By LOUIS VIARDOT. Illustrated with Engravings. London: Sampson Low, Son, & Marston. 1870.

This translation of M. Viardot's "Merveilles de la Peinture," illustrated not so much with engravings as with fine photographs from engravings, makes a charming gift-book for either sex. It is very agreeable reading, and conveys a large amount of information on the subject of which it treats. It may be considered either praise or blame, according to the age and tastes of the readers, when we add that the engravings photographed are of the most widely-known pictures.

Normandy Picturesque. By HENRY BLACKBURN. London: Sampson Low, Son, & Marston. 1869.

ANOTHER pretty gift-book; nicely printed, illustrated, and bound. Mr. Blackburn has the pen of a ready writer, plenty of recollections to afford comparisons, and good command of the pencil, to illustrate his amusing words. The volume is very pleasant reading, but it is very light. The buildings are scarcely described, or commented on, so fully as we might have expected. Still, it has much local colour, recalls the country, and leaves the right sort of impression. We have often before now advised such of our readers as have not visited Normandy to do so at once. The trip is inexpensive, and affords not merely pleasure, but good materials for study and the sketch-book, especially at Caen and Bayeux. We have no doubt that Mr. Blackburn's interesting hook will aid in bringing about what we wish.

Miscellaneous.

Additions to the London Fever Hospital. The Board of Management of the London Fever Hospital have displayed energy and resource in the provision they have for dealing with the prevailing epidemic. They proceeded to erect two new wards at the back of the hospital, capable of accommodating sixty patients, with the required attendants, and giving to each patient 2,000 cubic feet of air. The Lancet says, these wards stand upon a plot of ground on which, on Tuesday, November 16th, cabbages were flourishing; and they will be occupied by patients before this page is in the hands of our readers. The building is well raised from the ground on brick foundations, and is constructed of corrugated iron, lined first with felt, and then with deal boards, accurately fitted and jointed. These boards are stained, sized, and varnished, so that they can be washed all over with carbolic-acid soap. The two wards adjoin one another, and are separated by a partition that does not rise quite to the roof. Each ward measures about 140 ft. by 42 ft., and is 16 ft. high. The bedsteads are of iron. There is a small table to each bed, and a nightstand to each two beds. There are also small shelves over each bed-head, in a position easy of access by the patients. Each ward contains six stoves, with open fireplaces, arranged in three pairs. The numerous windows are made to open at the top; and there are also ventilators in the roof, and openings through which the chimney-pipes of the stoves are carried. Gas has been introduced, and there are two star-burners in each ward. At the entrances there are inner doors to exclude draught. The nurses are provided for in a separate building close at hand.

Fall of a Railway Station.—The wooden station for the Caledonian Railway, at Edinburgh, has fallen. The building was about 400 ft. long, by 80 ft. wide, and was approaching completion. Shortly before the accident most of the workmen had left; four made a narrow escape.

Re-opening of the East Suffolk Hospital, Ipswich.—This hospital, after enlargement, has been re-opened. The additions have been so extensive as practically to form a new hospital. The old hospital forms the centre of the present one, and is now principally appropriated to the apartments of the resident staff, and what may be termed the domestic department of the hospital, the number of beds it is intended to place in the small wards it now contains being about twenty, whilst the total number of patients for which there will be accommodation is about 100. The entrance is under the portico, and on either side of the old hospital (the length of the frontage of which is 80 ft.), a new wing of greater length than the old building has been added, and to break the somewhat monotonous extent of white brick front, the end of each wing in which are the baths, &c., has been brought forward 2 ft. or 3 ft. The total length of the building is 250 ft.; the width at the centre remains as before the enlargement; the new wings contain wards 24 ft. wide, and at the back is an entirely new building some 60 ft. square for out-patients, a chapel, board-room, &c. Mr. F. Barnes, Ipswich, was the architect, and the hospital, which has been erected from his plans, is regarded as a model building, so far as the provision for the patients in the wards is concerned. The arrangement of the offices, &c., is, perhaps, not all that could be desired, but for that Mr. Barnes is in no way responsible, they having originally been intended for a much smaller building, and it was no easy task to render them suitable for the extended requirements of the enlarged hospital. The contract was taken by Mr. G. Hewitt, Ipswich, for 3,000*l.*, but some alterations were made after the contract was signed, which considerably increased the amount, and the total expense, including the apparatus for supplying hot water, &c. (which was executed under contract by Mr. West for 150*l.*), will be somewhat short of 4,000*l.*

The Earthquakes.—Earthquakes at Gross-Gerau, in North Germany, continue. From last report down to the evening of the 28th ult. the shocks were frequent, but slight. In the evening of the 28th, however, without any previous warning, the ground began to tremble far more violently than it has done since the 22nd ult. Three separate shocks were distinguished, and they lasted together seven or eight seconds. The sensation is described as resembling what would be felt if the whole surface of the earth were sliding down an inclined plane. The inhabitants have begun to look on every accession of these interesting but uncomfortable phenomena as a sign that an outbreak of more than usual violence is at hand. The whole site of the small town of Gross-Gerau, according to measurements by engineering officers, is now two or three inches lower than it was before the earthquake visitations. None of the houses have fallen, but walls curve outwards, and between 40 and 50 chimneys are in a precarious condition. Nervous diseases, and even insanity, have been produced by anxiety and fear.—A serious earthquake has occurred in Algeria, Barracks, and other military buildings have been much injured and split up in some places, and other buildings have been damaged. There has also been a violent storm in Algeria, which has destroyed the harbour of Oran.

Parquet Floors.—Messrs. Burn & Co. have submitted to us a number of specimens of flooring, and other wooden ware, by the Iffeld Company, Prussia, which are very good both in design and workmanship. According to their advertised prices, handsome floors may be had from them, made of walnut, rosewood, and sycamore, for 1*s.* or 1*s.* 3*d.* a foot. One great point in having work of this kind done is to obtain assurance that the woods are thoroughly dried and shrunk, and this they profess to give.

Public Hall and Institute for Baldoek near Hitchin.—A large and influential meeting of the inhabitants of Baldoek has been held for the purpose of considering this matter. The meeting resolved itself into a committee, to ascertain and report upon the most eligible site, the probable cost of erecting a suitable building, and the steps to be taken to raise the necessary funds. Subscriptions to the amount of 300*l.* and upwards were promised during the evening.

Art and Industrial Exhibition at Cardiff. An Exhibition of Art and Industry is announced to take place in Cardiff during the autumn of next year. The Marquis of Bute has accepted the presidency of the undertaking.

New Moravian Schools at Little Horton.—The Moravians at Little Horton, where they have had a chapel for some years, have built new schools. The schools are part of a scheme which includes the erection of a new chapel and minister's house adjacent. A design for the whole pile was prepared by Messrs. C. S. & A. J. Nelson, architects, Leeds, but the promoters thought it desirable first to proceed with the schools, and these have been built at a cost of 1,150*l.* The building is two stories in height, each of the school-rooms measuring 40 ft. by 30 ft., of good elevation, well lighted and ventilated. Each room has two class-rooms and other conveniences. The upper room is approached by a stone staircase. The roof-timbers are shown. It is lighted by seven windows, the outer edges filled with coloured glass, while at one end of the room is a slightly elevated platform, serving for concerts, lectures, or meetings. The lower room is lighted in a similar manner, and the pillars supporting the beams of the floor above are finished with capitals and other ornaments. The walls round each school-room are panelled in stained wood, a few feet in height. The chapel forms a narrow oblong square, with a gallery at one end almost reaching to the ceiling. It must have needed self-denial on the part of the congregation to think first about the juveniles when the adults were so badly provided for.

The Suez Canal.—The traffic from the opening to the 29th—that is, in eleven days, was as follows:—Fifty-two vessels arrived from Port Said at Lake Timsah, between the 17th and 19th of November, and seven between the 20th and 28th; fifty-one vessels left Lake Timsah for Suez from the 19th to the 21st, and five from the 22nd to the 28th. The arrivals at Port Said from Suez in the interval between the 18th and 28th were altogether forty-five. Of these vessels seven were from eastern seas on their way to Europe; nine were from the Mediterranean on their way to the Indies. The total number of vessels that passed through the canal during the period referred to was 130, the aggregate tonnage of which was 80,000. A telegram from M. de Lesseps, with reference to the passage of these vessels, says,—“Notwithstanding this extraordinary traffic, only six vessels touched the ground slightly; of these, four got off without aid, and but two required a little assistance to set them afloat. No loss of cargo, no vessel damaged. Neither the bottom nor the sides of the canal injured.”

Iron and Steel Institute.—By permission of the Privy Council, a general meeting of the Iron and Steel Institute was held in the Lecture Theatre at the South Kensington Museum. In the absence of the Duke of Devonshire (the president), Mr. Bell occupied the chair. After the transaction of some routine business, Mr. W. Menelaus (vice-president) read a paper on “Improved Machinery for Rolling Rails.” Mr. G. H. Benson, of Staleybridge, read a paper on “The Generation of Combustible Gases under a Pressure.” Details of experiments in the use of gaseous fuel were given. Another paper on “A Firebrick Hot-blast Stove” was read by Mr. Whitwell, of Stockton. Discussions followed. Amongst those present were Mr. Samuelson, M.P., Mr. Pothergill, M.P., Mr. J. Lancaster, M.P., and Mr. Roden, M.P.

Report on Coventry Free Library.—The first annual report to the City Council of Coventry of the Free Public Library Committee has been printed. It shows that the library is being appreciated. The total number of issues of books for ten months has been 57,954; the daily average, 231. Of course, by far the largest number are under the head of “miscellaneous, poetry, fiction, &c.” being 37,501; but there is a goodly sprinkling of readers in history, biography, voyages and travels, &c., and in magazines and reviews. Only twelve volumes are “missing.” Of 3,172 borrowers 1,170 were of the age of 14 to 20, and 345 of 21 to 25.

New Schools and Church at Highgate.—We learn from the *Hampstead and Highgate Express* that Miss Burdett Coutts has given a site, worth about 700*l.*, for new schools to be erected upon at Highgate-new-town. A new church is also to be built in the same locality.

Kendal Drainage.—The corporation of Kendal are about to carry out a new scheme of sewer works throughout the whole town, and to apply the sewage to the purpose of irrigating some low-lying lands adjoining the river Kent. Mr. Brierley, of Blackburn, is the engineer.

New Bells in the Parish Church, Earls Colne.—The inauguration of a new set of bells in the parish church of Earls Colne took place on St. Andrew's Day. There were formerly six bells in the tower, which have from time to time become so dilapidated that a peal has not been rung on them, it is said, for upwards of thirty years. The new bells are six in number, and were manufactured by Messrs. John Warner & Sons, London, and were hung under the superintendence of Mr. Boswell, their foreman. The weight of the tenor bell is 144 cwt., and it is cast in the key of F natural. The weight of the whole peal is about 60 cwt. There is also a new clock bell, weighing about 2 cwt., forming a spiral finish to the tower, and surmounted by an ecclesiastical coronet. A slight mishap occurred during the hanging of the bells. The large tenor bell was being hoisted in its place, when a rope breaking, it fell and struck a piece of wood, causing it to rebound and strike one of the workmen rather severely. Several others were near the spot, and narrowly escaped injury. No blame is attributed to any one, it being purely the result of an accident.

Opening of a New Gymnasium in Sheffield.—Recently a movement was set on foot for the amalgamation of the existing gymnastic clubs into one body, to be called the United Gymnastic Club. A meeting of the members and subscribers of the clubs was accordingly held, and it was decided to take a large building in Hill-street, Highfield, and to adapt it to the purposes of a gymnasium. The arrangements have been completed, and the building has been opened to the public. It is 91 ft. in length, and 40 ft. in width, is lighted by nineteen windows and twenty-three gas jets, and the height is 16 ft. from the floor to the beams. All the requirements for a modern gymnasium are provided; there being two horizontal bars, a trapeze, rings, climbing ropes, ladder, jumping apparatus, parallel bars, ohlms, and dumb-bells. Arrangements have also been made with a member of the dragoons for the teaching of the use of foils and singlesticks, and facilities will be afforded for bicycle practice. Already 200 members have given in their adhesion to the new club. Mr. Councillor Chatterton opened the club, in the absence of Captain Preat, the president.

The Trade of Clerkenwell.—A Clerkenwell watchmaker, writing to us respecting a proposed meeting of the trade at Clerkenwell, to consider its present stagnation, asks—

“What possible good can arise from a meeting to discuss a fact well known, but which chiefly arises from causes almost beyond our power entirely to prevent or control. Let it be borne in mind that the staple trade of Clerkenwell consists in the manufacture of articles of luxury, and that we are now feeling the effects of the ‘panic’ of 1868, and of the ruin, misery, and straitened means it entailed upon thousands previously in comparative affluence. Let us also remember the frightful civil war in which we are now engaged, and which has done our principal trade, and then reflect whether the depression in the watch trade is relatively greater in proportion than in other branches of English industry. Great and incalculable injury has been inflicted upon our manufacture by the constant reiteration of the alarming decay in the watchmaking trade, leading many to suppose that a first-rate English horologist belonged to an almost distinct species of the *genus homo*. Foreign competitors press us closely; but this must be met by manufacturers selling at a minimum of profit, and uniting with the workmen in devising expeditious methods of execution. Lastly, I would suggest that retailers should treat us as they do our rivals, and sell our manufacture at a small profit. Quality is the real test of cheapness. If we stand by that there is still hope of a bright future for our trade.”

Surely he gives very good reasons why a meeting should be held, if but for the purpose of considering these very points.

Reopening of the Thames Tunnel.—The extension of the East London Railway, which utilises the Thames Tunnel, has been opened for public traffic. Special trains run over it, starting from New-cross on the south side of the Thames, running northward as far as the western extremity of the Surrey Commercial Docks, and thence by Rotherhithe to the Thames Tunnel, and passing under the river to Wapping, where for the present the line terminates. The cost of these works (including interest and discount on shares), has been 1,357,900*l.* In this little hill the cost of the Thames Tunnel is put down at 200,000*l.*

Athens.—Herr Ernest Ziller, architect, while conducting some excavations in Athens at his own cost, has hit on the site of the stadion of Lyongrus. This is the most important archaeological discovery that has been made there since Strack, of Berlin, had the good fortune to find the Theatre of Bacchus in 1862.

Christmas Decoration.—A "Country Lady" asks us how she should make wreaths to decorate a house this Christmas. An extract from Cassell's Household Guide for December comes opportunely as an answer:—

"The best wreaths for decorating the banisters of a house, or any pedestals, pillars, or columns, are those made in a rope of evergreen sprigs. There are several ways in which such wreaths are made. One way is as follows.—Get a rope or stout cord, of proper length, and a quantity of twine and a handful of evergreen twigs. Begin at one end of the rope, which should be attached firmly to something. Dispose a bunch of the twigs round the rope, and tie them on with the twine; then dispose another bunch so that the leaves may conceal the stalks of those already on, and give the twine a turn round them, fastening it with a running knot, and so on until the rope is finished. This must be done at the fastening of each bunch of twigs. Another way very frequently adopted is, in place of a rope, to use only a piece of stout twine to run through the wreath, so as to prevent its falling to pieces, and, instead of twine to tie the twigs on, to use fine wire, which must be firmly twisted round the twigs."

The Pulpit, Sutton Courtyn.—The designer of this pulpit was Mr. John Gibbs, Oxford, not "William" Gibbs, as stated in our notice of it.

Prevention of Floods at Leicester.—A report has been made by Messrs. Hawksley & Hawkshaw, in reference to the prevention of floods, and improving the land belonging to the Leicester corporation adjoining the bed of the river. The object of the corporation was to ascertain whether an effectual scheme for the prevention of floods in the borough could be advantageously carried out, so as to reduce the line of extrusion in the valley of the Soar, and thereby render available for building purposes the land lying on each side of the river or canal, and at what cost. The reporters indicated on an accompanying plan, a complete scheme of drainage which, if the cost were not, in the opinion of the corporation, too large, would, in their judgment, effectually attain the objects in view. The scheme was in three divisions, and the cost would be—

Table with 2 columns: Division, Cost. For the 1st division £35,110; For the 2nd division 36,150; For the 3rd division 60,110.

In any case, according to the report, the first or upper section of the scheme should be the first to be undertaken.

Destruction of a Theatre by Fire.—On the night of the 15th ult. the Gaiety Theatre, Milwaukee, Wisconsin, America, was burnt to the ground. The building was crowded to excess. The proprietor had turned the gas off from the building, and lighted it with brilliant oil, a new article just introduced, and distilled from naphtha. Lamps with this oil were scattered about through the building. As the drill was in progress one of the actors struck a lamp, and it fell to the stage. So rapidly did the fluid burn that the building seemed one mass of flames. Within an hour after the fire broke out it was quenched. Thirty persons were seriously injured and two killed.

A Curious Museum.—M. Nestor-Roqueplan, the author of "Parieine," &c., has hit upon a line of collection for a museum, in which he has certainly had no predecessors, and in which, for a time at least, he needs fear but few rivals. M. Roqueplan collects warming-pans! In his apartment in the Boulevard Haussmann, says the Pall Mall Gazette, he has devoted a gallery to the exhibition of these utensils de la vie intime. There you may see more or less authentic warming-pans of Diane de Poitiers, Mary Queen of Scots, Catherine de Medicis, Gabrielle d'Estrees, Madlle. de la Valliere, Madlle. de Fontange, Madame Pompadour, and Marie Antoinette. Chacun a son goüt.

Newspaper Press Fund.—Mr. George Tomline, M.P. for Great Grimsby, has recently had engraved by Mr. Vernon Minnie a magnificent picture of the "Pool of Bethesda." This plate Mr. Tomline, through the engraver, has presented to the society, and it is intended to devote the proceeds of the liberal gift to the foundation of a separate fund, to be called the "Tomline Fund." With the view of giving effect to this resolution, and carrying out those arrangements which Mr. Tomline's generous presentation necessitates, a sub-committee, consisting of Lord Houghton, the president, some vice-presidents, and the working members of the committee, has been nominated.

Incorporated Society of British Artists.—At a meeting of the Society of British Artists, held on the 1st inst., Mr. Alfred Clint was elected to the office of president, vacant by the decease of the late Mr. F. Y. Hurlstone.

New Church at Hornsey.—The foundation of another church for the accommodation of residents in the newly-built district of Brownwood Park, South Hornsey, has been laid by Mr. R. N. Fowler, M.P. After consideration of four sets of plans and estimates, the committee finally selected those presented by Mr. Frederick Wallen, of Furnival-inn, who was appointed architect for the intended church. The building is cruciform in plan, with a central tower and lofty spire. It consists of nave, north and south aisles, transepts, chancel with aisles, eastern and western apses, with a vestry on the north side. The style is Early Pointed, and it will be built of Haesoch and Kentish rag facings, with Bath stone dressings. The contract for the whole work has been taken by Mr. Carter at 8,590l.

British Rainfall.—Mr. G. J. Symons, on the part of the Rainfall Committee of the British Association, wishes it stated that recorders of rainfall should communicate with him (62, Camden-square, N.W.) if willing to assist in the general ascertainment of British rainfall, by forwarding copies of their observations, and their names and addresses, so that duplicate gauges may not be started unnecessarily near them.

Iron Stains in Marble.—A correspondent says:—"I shall feel obliged if any of your readers can tell me how to remove iron stains from white marble." The question has been often asked without eliciting a satisfactory reply. Details of the process by which the ink-stains were removed from M. Carpeaux's statue, Paris, might be useful.

TENDERS.

For new bank buildings for the Hull Banking Company, at the corner of Silver-street and Lowgate, Hull. Mr. W. Botherick, architect. Quantities supplied by Mr. G. W. Kanwell:—

Table of tenders for bank buildings. Items include W. & J. Hall, Clarkson, Stamp, Shaftoe & Barry, Waller, Habershaw, D. Jackson, Keswick, Foster, Weatherly & Hymer, Hutchison & Son, Scholesfield & Taylor, Hockney & Liggins, Sergeant, G. Jackson, Simpson & Malone, Mcgraw (accepted).

For basement and new party walls, No. 113 and 114, Cannon-street. Mr. E. A. Gruning, architect:—

Table of tenders for basement and party walls. Items include Mansfield, Price, & Co., Conder, Trollope & Sons, Brass, Newbery & Mansfield, Foster, Holland & Hannen (accepted).

For building thirty-four houses on the Ashburnham Estate, Chelsea. Quantities by Messrs. Gardiner & Bell:—

Table of tenders for Ashburnham Estate. Items include Brass, Carter & Son, Simpson, Pisman & Fotheringham, Macey & Son, Keble, Clemens, Longmore & Burge, Axford, Manley & Rogers, Ebbs & Sons.

For alterations to three warehouses in Fell-street and Hart-street, City. Mr. Herbert Ford, architect:—

Table of tenders for alterations to warehouses. Items include Myers & Sons, Biesse, Condon, Morley, Brass.

For new entrances and sundry alterations to a warehouse in Friday-street, City. Mr. Herbert Ford, architect:—

Table of tenders for new entrances and alterations. Items include Myers & Sons (accepted).

For a detached villa residence, with stabling, &c., on the old Manor House Estate, Brixton, for Mr. J. G. Pearce, Mr. C. Sewell, architect:—

Table of tenders for villa residence. Item includes Hutchison (accepted).

TO CORRESPONDENTS.

The Gibraltar notice.—We are forced again to postpone an article on this subject, although advertised. A number of letters and papers are unavoidably displaced by our present one on this topic.

G. H. (Manchester).—R. N. J. R. M. J. R. —A. S. —A. R. —K. —G. W. —T. L. —E. K. —J. W. K. —J. D. P. —O. H. —A. K. —M. P. —O. J. —B. M. —N. J. —H. —T. & P. —W. J. —A. —T. J. H. —T. G. —T. R. —W. IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Chrono, Turret, Stable, and Tall-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committee, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Chrono and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales, Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

ADVERTISEMENTS.

TURNER & ALLEN'S NEW DESIGNS

Advertisement for Turner & Allen's lamp posts, gas pillars, and other ironwork. Includes an illustration of a lamp post and text describing various designs and materials.

SIR W. FAIRBAIN'S WORKS ON ENGINEERING, &c. The First, Second, and Third Series, in crown 8vo with Illustrations, price 10s. 6d. each Series.

USEFUL INFORMATION for ENGINEERS. By Sir WILLIAM FAIRBAIN, Bart. &c. &c. &c. Works by the same Author, fully illustrated.

TREATISE ON MILLS and MILLWORK. Second Edition, carefully revised, of both volumes, price 16s. each. IRON SHIP-BUILDING: its History and Progress to the Present Day, recently published, price 18s.

APPLICATION OF CAST and WROUGHT IRON to BUILDING PURPOSES. New Edition in preparation. London: LONGMANS, GREEN, & CO. Paternoster-row.

THE TIMBER TRADES PRICE BOOK. By W. RICHARDSON, Accountant, Author of "The Calendar of Timber Merchants and Builders' Guides," "Packing-case Tables," &c. London: LONGMANS, GREEN, & CO. Paternoster-row.

THE LIFE OF JOHN GIBSON, R.A. SCULPTOR. Edited by Lady EASTLAKE. London: LONGMANS, GREEN, & CO. Paternoster-row.

THE EXTRA-VANTAGE USE of FUEL IN COOKING OPERATIONS, with an Account of Benjamin Count of Rufford, and his Economical Systems, and numerous practical Suggestions adapted for domestic use. By FREDERICK EDWARDS, Jun.

THE VENTILATION OF DWELLING-ROUSES, and the Utilization of Waste Heat from Open Fireplaces, in Royal 8vo, with 107 Illustrations. Price 10s. 6d. SMOXY CHIMNEYS: their Cure and Prevention. Fifth Edition, revised, in royal 8vo, with 49 Illustrations. Price 3s. 6d.

The new edition of Mr. Edwards' "Domestic Fireplaces" will appear in January. London: LONGMANS, GREEN, & CO. Paternoster-row.

New ready, in 8vo, with Portrait, price 10s. 6d. THE LIFE OF JOHN GIBSON, R.A. SCULPTOR. Edited by Lady EASTLAKE. London: LONGMANS, GREEN, & CO. Paternoster-row.

STRAINS IN GIRDES: A Handy-Book for the Calculation of Strains in Girders and Similar Structures, and their Strength; consisting of Formulae and Corresponding Diagrams. With numerous Examples for Practical Application. By WILLIAM HUMBER, Assoc. Inst. C.E.

"A good, clear, useful pocket of office reference volume for practical use."—"Practical Mechanic's Journal." "Designed to afford ready assistance in the ordinary run of office work giving no more than is absolutely necessary for the complete solution of practical problems."—"The Engineer." "Mr. Humber has rendered a great service to the architect and engineer by producing a work especially treating on the methods of locating the strains on iron beams, roofs, and bridges, by means of diagrams."—"Builder." London: LOCKWOOD & CO. 7, Stationers' Hall Court, E.C.

Just published, with the other Almanacs of the Stationers' Company.

Price 1s.

COMPANION to the ALMANAC: a Year-Book of General Information for 1870 on Subjects connected with Mathematics, Geography, Fine Arts, Political Economy, Public Improvements, Legislation, &c. Price 2s. 6d. OF BRITISH ALMANAC and COMPANION, bound together in cloth, price 4s. To be had of all Booksellers.

The Builder.

VOL. XXVII.—No. 1402.

In Chester.

ARCHITECTURAL work in the walled city on the Dee seems to be for the present pretty nearly all concentrated on the restoration and re-erection of St. Werburgh's Cathedral. The rebuilding of a few shops in the Rows of Eastgate and Bridge-street, during the last few years, in a style, for the most part, carefully assimilated to that of the old work, has not as yet been adopted as a precedent by the owners of the property in those picturesque old-world streets, much of

which still looks as though, were the end bones removed, the rest of the buildings must of necessity come down in succession; while the consequences of a fire breaking out amid this beam and story-post construction would be of a nature not pleasant to contemplate. Having the aspect of these older buildings in view, it seems a questionable proceeding to perpetuate this carpentry construction in modern buildings, wherein, even if special care be given to ensure stability, the danger from fire must remain the same. There are other elements, however, as are, if more slow in their effects than fire, and from which no structure can be guarded; and those who have spent money on half-timbered "fronts," may say, with some show of reason, that the old houses of the same class seem to have resisted the ravages of time and weather better than the stone walls of the cathedral adjoining.

In fact, the decree which went forth a little while since, for rejuvenating at least the external aspect of Chester Cathedral, came not a day too soon, whether the question be considered from a practical or an artistic point of view. Travellers who on approaching the city sighted the outline of the old heavy-looking square tower as a landmark, would have found on a nearer approach scarcely a recognisable detail left in many parts of the building; and at this moment, while the work of restoration is proceeding, the original design of many of the mouldings and decorations is being painfully traced out by the comparison of one old rain-beaten stone with another. The tower in its recent state presented to the eye hollows and pitfalls in the masonry alarming as well as unsightly to contemplate; and the aspect of this, and of much of the work in the aisle and clearstory of the nave, where a string-course is represented by an uncertain wavy projection in the masonry, and the vousoirs of the windows by shapeless lumps of stone from which nearly all trace of the hood-mould which must have crowned the window has been obliterated, might

lead to the idea that restoration was a hopeless attempt, but that the cuts made into the masonry to prepare for refacing reveal the essentially solid and well-bonded character of the work. The sandstone used, doubtless from some part of the adjoining district, has, in fact, utterly failed as a weather-resisting material, though it is noteworthy that some of the oldest portions have stood better than more recent ones, as if an inferior vein of stone had been struck upon afterwards. The stone used in the restoration is mainly, if not entirely, from the Runcorn quarries, a few miles distant, and though belonging, of course, to the same formation as the original stone, is one of the hardest and best qualities of the red sandstone to be found in the neighbourhood, both as to texture and colour. It is singular that the Medieval builders, careful in the construction of masonry above ground, should (in this case, at least), have shown themselves so careless as to obtaining adequate foundation and footing underground for their walls; at the east end the walls of the Lady Chapel have long been out of the perpendicular, and must remain so now, as it is not found convenient to take them down and rebuild them, though a great deal of underpinning has been resorted to, as a preventive against further settlement. The east window of the Lady Chapel was, in fact, restored some twelve years ago, being then in a most dilapidated, if not dangerous, condition; and, having regard to the heavy expense to be incurred in other parts of the work, it was thought advisable to make the most of this former partial restoration, although standing rather in the way of Mr. Scott's present designs, practical and aesthetic, upon the east end. The inefficient nature of the foundations at this point is further indicated by the fact that even in this comparatively new window the arches of the two outer lancets have visibly dropped away from the keystones. What, by the way, would some of our ultra-Gothic brethren say to the keystone arches, not only in this, but in Mr. Scott's restoration? We confess to liking the sight of the vertical joint at the apex in Gothic work, as visibly indicating the constructional theory of the pointed arch, the balancing against one another of two segments of arches; as a matter of construction the point is indifferent, save that the masons probably will prefer the keystone system as giving them less trouble.

The work now going on at the cathedral is divided into two portions. One section, for which a contract has been taken out amounting to 21,000*l.*, includes the refacing of the tower and of all the work to the west of it, also the rebuilding of the upper portion of the angle turrets in the tower and of the parapet connecting them. The tower has now been faced for about three-quarters of the distance from the nave roof to the parapet: below this the work is at present confined to the south porch, the heavy buttresses of which are being gradually refaced, indeed, nearly rebuilt, and the niches and other ornamental work over and in connexion with the entrance restored. The work about the eastern part of the building, which was not of a nature to be easily estimated for, is to be valued on subsequent measurements. This consists partly in similar refacing, the greater part of which has been completed in the clearstory; in the underpinning before mentioned, which has been a troublesome and expensive portion of the work; and in the rebuilding of the end of the south aisle adjoining the Lady Chapel. This last is the most interesting portion of the work. It has been rebuilt, at a late period, in a very debased style, and this portion it was the intention to restore, preserving what appeared to be the original plan, with a square end and a lean-to roof, but, of course, substituting true Gothic detail for the more recent "improvements." In taking down the masonry, however, with this object,

indubitable proofs have been discovered of a former apical termination to this aisle, evidenced not only by the position and course of some of the old groin ribs still retained, but by the discovery of part of one of the original buttresses, standing obliquely at the angle originally formed by the first face of the apse with the main wall of the aisle, and preserved in almost its pristine freshness by the newer masonry built over it. Over this part of the aisle a weather-line on the south wall of the Lady Chapel furnishes evidence of the former existence of a high-pitched pyramidal roof over this apse, unlike anything usually found in English Gothic, and which has been conjectured to be in some degree connected with the fact of the rule at one period of an abbot from Normandy, who may have brought with him the taste for a style of roofing of which examples are not wanting in his own land. This can be little more than conjecture; nor would we undertake to say, from the rather hasty examination we were able to give to the building, whether we can quite concur in accepting this single trace of a steep-pitched roof as warranting the production of such a disproportionately lofty roof, almost a spirelet, in fact, as is indicated in the model which has been made for the restoration. Still less can we positively concur as to the advisability of replacing this roof, supposing the evidence of its original form to be conclusive. Had the original been left it would have had an undoubted historical interest of its own; but this interest cannot exist in a copy made, moreover, in some degree from conjecture; and in any other point of view than an archaeological one, it must be regarded as an exercise, out of keeping with the state and with the sober lines of the rest of the structure, and therefore on artistic grounds to be deprecated. Yet more strongly should we be opposed to the carrying out of the spire indicated in the perspective view of the cathedral as restored, which is exhibited in the Chapter-house. This is, of course, a timber and slate spire, as no one would dream of trying the old tower with the burden of a stone one. Now we don't very much whether, merely as a matter of outline and composition, Chester Cathedral would not rather suffer than otherwise by the superimposition of a spire; the whole expression of the edifice is that of solidity and repose, and this unity of expression would be interfered with, and the old local associations, too, with the massive square tower which has marked the site of the city for so long would be lost; and such associations are not altogether to be despised. But to place a large slated or shingle spire on such a building as a cathedral, would be at once to deprive it of its monumental expression, to rob it of part of its architectural dignity and grandeur, and give it a patchwork appearance, picturesque in a certain way, perhaps, but far inferior in architectural effect to the expression of a homogeneous stone building. We object on this ground even to the crowning of the pinnacles at the end of nave and transepts with small conical roofs, as apparently contemplated; we would far rather see them finished with stone finials, whether of solid or open work; and, with regard to the central tower, we do earnestly hope that those with whom the decision finally rests will interpose a "thus far shalt thou go and no further" when the parapet is reached, and save it from being bonneted by the threatened termination. A rough sketch for an octagonal stone lantern to form an alternative finish to the tower, attached to the drawing before mentioned, would be in every way preferable to the spire, but we have our doubts whether even that would produce an effect commensurate with the expense of constructing it; and whether in fact the simple tower, restored as nearly to its original condition as may be, would not prove more effective, and

group better with its surroundings, than any finish that may be put to it.

The central tower of the new Town-hall, recently completed, is a new feature in Chester, and peers over—a modern visitor—into the sacred *temenos* of the cathedral cloisters, with a decidedly Norman-French air. Its general aspect is pleasing, though the circular plate-traceried windows in the gable on each face, consisting, of course, of a big round hole in the middle, and little ones round it, look painfully like a set of clock-faces, so that we almost miss the hands which we expect to see on them. It is to be regretted that architects often seem to overlook the very great effect which small details may have in increasing or diminishing the scale of a building. In the Town-hall tower the triple windows on each face have been filled up by two immense wooden louvres of great depth, an exaggeration of the Norman fashion. We have no hesitation in saying that these materially dwarf the scale of the tower, when seen (as it is from many points) out of connexion with the substructure, and that its apparent scale would have been rendered decidedly greater by the employment of a large number of smaller louvres. *At rest*, the building is a pleasing specimen of the modern style of Gothic Town-hall so much in vogue at present,—more pleasing decidedly, than the average of such buildings, as it is quiet and unpretentious in treatment, and with thorough unity of expression throughout: moreover, the contrast of tint in the different stones employed is singularly happy and effective now that the building is new; it may, perhaps, be too delicate to retain its full effect for more than a limited period. As to the question of preserving and reproducing the Medieval style in a city like Chester, much may be said on both sides. Were a general rebuilding of the principal rows to take place, we would decidedly advocate the adoption of a style more in accordance with modern feeling and modern wants; sham antiquity is always contemptible. But as this does not seem likely to take place at present, it may seem only reasonable to endeavour, in isolated buildings, to avoid clashing with the *genius loci*. If such a feeling is reasonable anywhere, it is in Chester, for the preservation of the antique Medieval aspect, to this extent, in a modern town, is so rare now, that it would seem a pity to lose this example of it, even to gain a little in comfort, convenience, and stability. To keep up the delusion fully, however, and cheat us pleasantly into dreams of the Middle Ages, we ought to have the costumes in keeping; whereas at present the chignons, mantles, hats, not to speak of other articles *propria que maribus et mulieribus* respectively, peripatetic in Eastgate-row, are unmistakably what an architect might call "nineteenth-century work." Perhaps some Medievalising young ladies and gentlemen may take the matter up, and devote one day in the month (to be duly advertised) to parading their favourite Row in costumes judiciously selected from illuminated MSS. of the fifteenth or sixteenth century. The principle is the same as that adopted in rebuilding some parts of the said Row, and it would be much the less expensive amusement of the two.

CHRISTMAS DECORATIONS.

ALTHOUGH the decoration of churches at this season of the year has become the rule instead of the exception, there are several points of consequence connected with the custom that are not yet properly considered, and some cogent of vanlage about it that are not duly estimated. The practice, indeed, appears to be in some danger of running to extremes before a due amount of sober usefulness is obtained from it. People are beginning to think of Christmas decorations only as manufactured articles that can be had by the yard or square foot cheaper than they can make them. This is, of course, losing sight of much of their poetry and picturesqueness, and of all the opportunity of artistic expression that the occasion affords. "There's rosemary," cried Ophelia, "that's for remembrance, pray, love, remember; and there's pansies, that's for thought." After this manner we should bear in mind the associations of idea and the meaning of the materials used in the decorations to which we are referring, as well as the proper methods of using them. Over and above these desiderata it should be remembered that the temporary decorations at Christmas time afford an excellent opportunity of realising the effect of many proposed permanent additions to the interior

features of a church. Is a reredos contemplated? Make one at Christmas, and the improvement will be recognised and welcomed. Is a screen thought of? Try the effect in a skeleton framework of wood dressed with evergreens, when those interested will be the better able to decide on its merits. Is a church bald and cold-looking? Enrich it with parts most appropriate for its beautification temporarily, as Christmas decorations, and there will be eyes to see the improvement, and most probably purses ready to make the additions permanent. Are the wall spaces bare? Show specimens of a scheme of enrichment, and the issue will be, doubtless, prosperous. We might continue this string of questions for a column; but we hope enough has been said to convey a hint that may be useful to many.

Although most of the handbooks published on this subject dwell upon the importance of preserving the architectural lines of a building in the floral decorations of the season, several of them furnish illustrations in which such propriety is altogether lost sight of. Banners, medallions, texts, and bosses of foliage are dabbed here and there, in some cases with no preservation of lines whatever; and in other instances with only a feeble attempt to hang them in rows. These are the consequences of attempting to design schemes of decoration that will suit any church; and also of providing for the manufacture of many of the items in wholesale quantities in certain centres. We would impress all in charge of churches that there is no merit in decorating them all in the same fashion, any more than there would be in building them exactly alike. Originality, appropriateness, and beauty can be combined with as much diversity as charm. We suggest that the lines of a building are best followed by such methods as placing crests where objects would be artistically enriched by them, and courses of foliage where these are not desirable. Detached dots are as patchy as festoons are theatrical, and suggestive of the *ballot*. Texts, as well as foliage, look well when following some of the leading architectural lines as facio of cornices or string-courses. Screens formed of evergreens, with cornices inscribed with illuminated texts, may be made very satisfactory features in large and lofty churches. In smaller edifices the decorations are more suitably confined to existing spaces and features.

When writers who have given time, if not taste, to the consideration of decorations go astray, we cannot be surprised that without trained guidance of any kind amateur decorators make very serious mistakes. Sometimes there is a committee of ladies formed, every member of which carries out a small idea of her own, which is independent of any general scheme. Some are Maries; others are Marthas; some are for tender lavishness; others for prudent frugality. One will take the font; another the pulpit; a third the reading-desk; a fourth will undertake a scroll to paste up over the doorway; a fifth will volunteer a star of Bethlehem to bang from the apex of the chancel arch; and so on: here a variety is certainly obtained, which may be like a peep-show, but is anything but pictorial. Red flannel, white cardboard, tinsel, coloured papers, everlasting flowers, others that are immediately perishable, more that are artificial, bunting, wire, cord, silk laces, cloth, calico, velvet, suggest the probable performance of a mystery play rather than special services in remembrance of the Nativity of the Founder of our faith. In another place there will be a committee of rustics who, in the fulness of their hearts and strength, will drag trees into the sacred edifice that convert it almost into a thicket. Again, the decorations are placed in the hands of the gardener of the neighbouring square, and straightway the church becomes an irregular green-house. We have heard of wheaten flour being sprinkled upon the evergreen decorations of a country church to give the effect of snow, which was considered by the volunteer artist reasonable, and quite indispensable to carry out the idea of Christmas, even indoors. We have known other volunteers of this thorough-going kind cut out letters in scarlet cloth or flannel, and glue them one after another upon the mouldings of a chaste chancel arch, to spell out what they considered appropriate texts. All this earnestness properly directed would have produced a very different result. Thus left to run unrestrained, damage is often done to the fabric, great pieces are knocked out of plaster work, and good oak-work is riddled with rough nail-holes.

George Herbert is one of the chief autho-

rites on the lips of most church decorators. His quaint conceits and similes furnish many a hint for typical devices, though the subject of decorations is not approached nearer than in his verses, entitled "A Wreath," beginning,—

"A wreathed garland of deserved praise,
Of praise deserved, unto thee I give,"

He speaks of the Oriental fragrant of ambergris, the speaking sweetness of pomander, of cloves, nutmegs, and cinnamon, flowers, and garlands, but not of foliage, as applied to decorations. He gives us a warning, incidentally, however, that should be taken to heart:—

"Love built a stately house; where Fortune came,
And, spicing fancies, she was heard to say
That her fine oolives did support the frame,
Whereas they were supported by the same:
But Wisdom quickly swept them all away.

Then Pleasure came, who, liking not the fashion,
Began to make balconies, terraces,
Till she had weakened all by alteration."

Here is an intimation of the value of the point we urge. In all decorations there should be one considered scheme that takes in all the parts of the fabric, and is especially adapted to each of them. This settled, and shown upon paper, for reference, a division of the work can be next made, and much more easily carried out than without such guidance.

We perceive imitation evergreens and imitation holly-berries are now regularly manufactured to meet the demand for foliage at Christmas. Dried moss, too, has become an article of commerce for the same purpose. Everlastings, once sacred to the memory of Père la Chaise, are now pressed into the decorative service, and are not only dyed various colours, but spotted, to increase their motley appearance. Roses are made of white paper for half-a-crown a dozen, and more cunningly devised in pink paper for three shillings per dozen; and camellias deftly made of white paper, range, to adopt the phraseology of the market, from three shillings per dozen. These scentless theatrical adjuncts have elbowed and flanted out three sweet old floral favourites, —rosemary, lavender, and rue. Once upon a time rosemary was as much a part of strictly Christmas belongings as roast beef and "plum-porridge," but now, probably, almost the only instance wherein it makes its appearance in public is on the dish on which the celebrated bear's head is served at Queen's College, Oxford,—if, indeed, it has not been displaced there, too, of late years. The poet Gay speaks of rosemary and bays being "baw'd in frequent cries through all the town" before he mentions holly, "lawrel," and mistletoe as signs of the season. The Christmas song, in Poor Robin's Almanack for 1695, mentions bays and rosemary, as well as holly and ivy, for decking of houses. The carol appointed to be sung when the bear's head was brought into the hall, as given in the book of "Christmas Carols, printed by Wynkyn de Worde, 1521," speaks of "garlands gay and rosemary" as the proper equipments of the dish. Ophelia, looking over her collection of the shrub, as before quoted, continues,— "There's rue for you, and here's some for me. We may call it herb of grace of Sandys: you may wear your rue with a difference." The association of rosemary and rue with the tall delicate spiked blue lavender occurs over and over again in old English ditties and sayings. A graceful chapter, giving a gathering of quotations showing the association, may be found in Mr. Longstaff's *Hylton Chaplets*.

"Rosemary green,
And lavender blue,
Thyme and sweet marjoram,
Hyssop and rue,"

form a combination that is mentioned by Gerard with especial favour. In a word, rosemary, lavender, and rue, were fragrant favourites in the days of yore. The first-mentioned was so much so, that it stood for a sign for inns; as the celebrated hostelry in Finsbury Fields, called the Rosemary Branch, shown on old maps, as well as others, under the same sign in Islington and elsewhere still existing, bears witness. There was some subtle fancy connected with it, too, for a great body of Roundheads besieging Pontefract wore rosemary in their hats. Washington Irving failed not to see that it was something specially English, and noted it in his Sketch-book.

"And lavender is passing sweet,
And so's the rosemary."

Being a singer long ago; but both have been elbowed out of place by paper roses and cambric holly. Surely it would be better to reinstate some of our old favourites than to have recourse to sham substitutes.

THE LIGHTHOUSES OF THE BRITISH ISLES.*

The Gunfleet Lighthouse is erected upon the same principle, with this difference, that it is entirely built of wrought iron, upon seven piles, 15 in. diameter, sorowed down 40 ft. into the sand, as being on the edge of a bank; its position is unusually precarious, in the event of a shift taking place in the sand.

The piles are in three thicknesses of wrought iron, and the whole of the bracing is tubular, of the same material. The angles where the brass cross are made of forged sockets of wrought iron, in one piece, hollow, to receive the ends of the braces; they resemble a huge four-way cock, and are certainly curiosities in their way.

The light is 41 ft. from the water. The internal arrangements are similar to the Maplin, but the cost was about 11,000*l*.

As a parallel example of insecure foundation, satisfactorily dealt with, we may here notice the lighthouse at the mouth of the river Usk, in Monmouthshire, though the means adopted were diametrically opposite.

It is built upon a foundation of soft, pulpy clay, the stratum being 37 ft. deep.]

The old tower became insecure, leaned dangerously towards the water, and had to be taken down, and the method adopted for the new one was as follows:—

From a circular pit of 60 ft. diameter, as much of the clay was removed as the nature of the material would permit, and a depth of 9 ft. was reached; at this level an elm curb was placed, and the whole filled up with solid concrete, forming as it were a circular landing, 60 ft. across, and 9 ft. thick.

Upon this has been erected a circular brick tower, 40 ft. in diameter, and two stories high, containing commodiously the living-rooms, stores, &c., necessary for the keepers, and the whole is surmounted by the lantern. The light is 45 ft. above high-water mark.

When the work was in progress, and for some short time after its completion, it gradually sank in the clay to a depth of 7 in., without any disturbance of the general level; it has remained at that point without further subsidence, and is now perfectly secure.

As a contrast between an ancient and a modern lighthouse, we cannot give a better illustration than the "Smalls." We will describe first the old house and then the new one. The old house was commenced in 1772, by Mr. Whiteside, and finished in 1775. The highest part of the rock is 12 ft. above the sea at high water, and the lighthouse was 70 ft. high.

It was carried upon nine oak piles, about 2 ft. 6 in. diameter, sunk 7 ft. in the solid rock, with six raking braces of somewhat similar dimensions, and when subjected to a storm the whole structure rocked so that a pall of water standing on the floor would be more than half split by the simple rocking.

This has repeatedly produced the effect of sickness upon those unaccustomed to the motion, as proved the case when the workmen sent down to erect the new lighthouse were lodged in the old light room.

The house was only about 18 ft. inside diameter, and 10 ft. high, and was entirely constructed of wood secured together with wrought iron. It needed constant repairs: every summer new stays and other matters had to be provided from the time of its erection; a new house was more than once prepared upon the mainland, taken out in the summer, and fixed.

In this place occurred that terrible incident, of one of the keepers being taken suddenly ill and dying, when the season was so awfully stormy that no boat could approach. The survivor did not dare commit the body to the deep for fear of suspicion of foul play; however, having previously been a cooper by trade, he managed to construct a coffin and secure it to the external gallery, and here for four mortal months he was alone with the dead. The signal of distress was seen flying, vessels approached, but no boat could land; he was at length rescued, but so altered that he could hardly be recognised. We may think it wonderful that reason did not give way under the fearful ordeal; but ever since that time three men are invariably stationed in similar situations.

Fifty years ago the dues claimed for this light were 2*l*. per ton, now they are one-fourth of a farthing; yet the amount received is not

materially altered, so vast has been the increase of our tonnage in this direction in the interval.

As a contrast to the above, we will now describe the new lighthouse.

It is 125 ft. high, of granite, the lower 29 ft. solid; above this, there are in succession the water-store, the oil-room, the general store-room, living-room, bedroom, and watch-room, each a separate story, and above the lantern; the accommodation thus provided replacing the little cabin on a tree top, which occupied the post and did the duty for nearly 100 years; and for which, with its dues, the Trinity Board had to pay the enormous compensation before quoted* (170,48*l*. 7*s*.). With regard to the practical construction, we may say the courses of which it is built are at the base 2 ft. high, each stone weighing from two to three tons, and that the courses gradually diminish till at the top they are 1 ft. 3 in.

The joints are plain square joints, radiating from the centre, and each stone is secured to its neighbour vertically and horizontally by strong dovetailed lead dowels.

The stories are divided by landings, each in twelve stones, eleven radiating from the circumference to the centre, and a rebated stone dropped into the centre making up the number, leaving a well-hole for the spiral staircase, which ascends throughout the house; thus replacing the old rope ladder of the old house, which was drawn up and secured when not in use, and formed the only means of access.

Where the light has to be placed upon the top of a cliff, the erection becomes a far more simple affair. We may instance the new house recently erected at St. Bees, near Whitehaven. The elevation of the light is 336 ft. above high water.

The residence for the keepers, which may almost be called a small villa, has a tower 30 ft. high, attached by a covered corridor. At the top is the lantern.

The total cost, including apparatus, was under 5,000*l*. It was built with the red sandstone of the district. It is only within the memory of the present generation that the old coal beacon was discontinued, and replaced by modern appliances.

The development, if we may use the term, of the lighthouse system and its extension in the future will probably take the following direction. The erection of rock lighthouses upon reefs farther removed from the mainland, where the construction of the foundations is the greatest difficulty, and demand the utmost efforts of the science of the day.

The Wolf Rock Lighthouse, just completed, is the last, probably the best, as it was the most difficult of recent undertakings. A carefully detailed account of its design and construction will be brought before the Institution of Civil Engineers in the course of the ensuing season.

The next important feature is the substitution of pile lighthouses for floating lights. Here the difficulties of sand foundation have generally to be dealt with. This, however, is rather a measure of economy than extension, and has for its motive the annual economy of a fixed light, as compared with a floating one, as before mentioned.

Those who would like to study in full detail, course by course, and almost stone by stone, the erection of a great rock lighthouse, we may refer to Mr. Smeaton's well-known work on the Eddystone, and to the similar one by Mr. Stevenson on the Skerryvore.

The Lights.

After our rapid sketch of the constituted authorities, and the funds at their command, and notes upon various matters of interest in the erection of the lighthouses, we now come to the question of lights. What were the lights of olden times? Beacons, simply: large fires—primarily wood, latterly coal.

The last coal-beacon used was at St. Bees, and was extinguished so lately as 1822. They were efficient in their way. The old coal-beacon at Spurn Point, the mouth of the Humber, could be seen for thirty miles.

When the Eddystone was first lighted, it was with a chandler of twenty-four wax candles, five of which weighed 2 lb. At that time the great Cordovan lighthouse was lighted with hillets of wood, and oil-lamps with reflectors were just coming into use.

The lights under the control of the Trinity Board vary from a simple gas or oil lamp, pro-

bably kept up by a local board, and costing a mere trifle, to the larger Argand burners used singly or in groups, sometimes as many as thirty each, with its separate reflector, till we come to the first-class dioptric lights of the largest class, with their elaborate and expensive arrangement of lenses, costing about 2,000*l*., the expense of erection, maintenance, and attendance proportionally increasing.

The great object in lighting arrangements is, of course, to obtain the maximum of light with a minimum of cost, and to ensure the direction of the light to the proper point. Some attempts in this direction were made with the old beacons, but we have no record of anything satisfactory or successful. But with the Argand and similar lights, and our recent scientific researches, immense improvements have been made in the direction, and by the judicious application of the proper means, the scope and direction of the lights can be managed to a nicety; and not only is the efficiency of the light increased, but, by the careful direction of all, as they may be called, stray rays in a proper direction, a distinct economy is the result.

The invention of the Argand lamp, in 1780, was the first great step to the improvements above alluded to.

As is well known, in principle it consists of a cylindrical wick open in the centre, and covered externally by a glass chimney. To the present day its modifications are the principal instrument in our lighthouse system. The later discoveries are the Drummond light produced by jets of oxygen and hydrogen upon a hall or cylinder of lime, and the magneto-electric light produced by the direction of a powerful magnetic current through two opposing points or pencils of charcoal; they have both been employed in first-class lighthouses to a limited extent. Gas-lighting has also been tried; but at the present moment nine-tenths at least of the light of our lighthouses comes from the Argand burner with colza oil. It is employed in various ways with many scientific applications, which grow day by day in perfection and complexity. The systems of lighting all houses of the first-class may be divided into two—the catoptric and the dioptric; the principle of the first being reflection, that of the second refraction.

On the catoptric plan a number of lights are usually employed, ordinary Argands, of about 1 inch diameter, each with its separate silvered parabolic reflector. The power of the light becomes a question of simple multiplication; a second-class catoptric has eighteen burners, a first-class one thirty.

On the dioptric principle one central light is used—either an Argand of great size with four concentric wicks, a Drummond, or a magnetic light; and the direction and concentration of the rays are controlled by a scientific arrangement of prisms of glass disposed all round the light generally in a circular form. The angles and proportions form an element of the nicest mathematical calculation, and we may fairly say that upon the head there is yet much to learn, and that it is in this direction that future improvements will develop themselves. Messrs. Chance, of Birmingham, have been distinguished for the great attention they have paid to the manufacture, and the success that has attended their efforts. The cost of these various lights varies in proportion—the new light recently erected at the Smalls costing 1,600*l*. (dioptric), the catoptric apparatus being much cheaper; the larger outlay, however, repays itself in course of time by the economy of working, an extensive average calculation, showing that the annual outlay of a first-class catoptric is about 310*l*., while a first-class dioptric costs only about 265*l*.; the principal item of difference being the oil, of which the large central lamp consumes less than the thirty small Argand burners. And here we may notice the great advance that has been made in the construction of the lanterns that enclose the lights as well as of the lights themselves.*

When the dioptric light was first introduced at the Eddystone, the upright divisions of the glass were about 5 in. wide; the following was the result:—From a Government vessel in Plymouth harbour a letter was written to the authorities in London, stating that at a day and hour named, the Eddystone light was out. An immediate inquiry was ordered, and it was ascertained beyond a doubt that such had not been the case. It was suggested

* See p. 958, ante.

P. 958, ante.

* Illustrations will be found in earlier volumes of the Builder.

that the vessel might have anchored in the line of shadow caused by one of the bars. A yacht was sent round to make accurate observations as to whether this effect really was produced, and a cruise round the light at some distance convinced everybody that this was what had really taken place.

To obviate the difficulty, a lantern was designed by Mr. Stevenson, the engineer to the Northern Commissioners, composed entirely of triangles, without any upright bars, each pane, as it were, forming a three-cornered facet of flat glass, and this was a great improvement; the drawback was that a large proportion of light was lost by reflection; it was almost impossible to fix the glass in the facets perfectly true, and consequently the light was reflected in quarters where it became useless, the loss being estimated at about 10 per cent.

Mr. Douglass, the engineer to the Trinity Board, then invented the present lantern, which is a perfect cylinder, divided into lozenge-shaped panes, by a bar following a true helical coil, so that at every point of contact the side of the bar is at a true tangent with the circumference of the cylinder, and the maximum of strength is gained with the minimum of obscuration.

The bars are of rolled steel, $\frac{1}{2}$ in. by 5-16ths of an inch, with a head of gun-metal, L shaped, and $\frac{1}{2}$ in. thick to secure the glass; the outer edge is finished with the ordinary astragal and hollow, and the inner edge, the gun-metal, is rounded; the bars are all rolled in halves, and each lozenge-shaped pane is complete in itself; they are built up, as it were, and fastened together with rivets, the right and left hand lozenges meeting at any given point, thus forming a complete stay and connexion with the panes above and below. The glass is bent exactly circular to the lines of the lantern, consequently both lozenge frames and glass are everywhere interchangeable. In case of any strain occurring to the lantern and breaking the glass, a fresh pane can easily be substituted by the keeper without a skilled workman. To show the perfection of the construction, however, we may say that though fourteen lanterns have already been constructed upon this principle, there has not yet been one broken pane of glass. We may add that this construction of lantern was most carefully investigated by the late Professor Faraday before its final adoption, and that it reduces the loss of 10 per cent. of lights upon the old system to 3 per cent.; while the bent glass has been proved by experiment to be 68 per cent. stronger than the flat. There are six different recognised sizes of dioptric lights, and as many or more of catoptric; and, besides the distinction of size, different lights are exhibited, in different ways, and in different colours, to enable mariners to distinguish one light from another.

They may be distinguished as fixed, revolving, flashing, intermittent; the times of different lights varying in their intermittence from five seconds, with many variations up to four minutes. Many lights, harbour lights principally, are coloured, blue, red, or green. It will be seen what infinite varieties of combination may be introduced by these various means; the intelligence so conveyed may fairly be called the language of the lighthouses.

To give our readers a general idea of the lighting of our coast as a system, we will ask them to accompany us in an imaginary cruise from the Nore to Dover, noting simply the lights as we go.

We start from the "Nore Light-vessel," which shows one bright white light revolving at intervals of half a minute. We next pass the Girdler Light-vessel, showing a similar light; then the Princes Channel Light-vessel, showing a red light revolving every twenty seconds; and the Tongue Light-vessel, which shows two fixed lights, the upper one white, the lower one red.

This brings us to Heme Bay, showing one white fixed light on the pier head; then Margate, with a red light on the pier head; next the Mouse Light-vessel, with a green revolving light. Then the "Maplin" pile lighthouse (before described) with one red fixed light.

The Swin Middle Light-vessel, one bright light, with a revolution of one minute; the Gunfleet pile lighthouse (described at the commencement of this paper), with a red light revolving at an interval of two minutes; the Sunk Light-vessel, one bright fixed light; and the Kentish Knock ditto, with one bright revolving light, of one minute revolution; and the Galloper, two fixed lights;—these bring

us to the North Foreland Lighthouse, with tower 73 ft. high, light 184 ft. above high-water mark, fitted with a dioptric apparatus of the first class, showing one bright fixed white light; then the Ramsgate Tide-light, one red and two green lights; the Godwin Light-vessel, three bright white fixed lights; the Gulf Stream ditto, one bright light, with revolution of twenty seconds; to the South Sand Head Light-vessel, at the other extremity of the Godwin Sands, showing one bright fixed light. Next, the South Foreland, with two bright fixed lights, 1,300 ft. apart, until we arrive at Dover, with one green light, two red lights, and one blue light on the Admiralty Pier. It would be tedious to follow this detail further. The sketch we have given may, however, be sufficient to convey an idea of the variety of method and adaptation of light.

In England there is upon an average a lighthouse to every fourteen miles of coast; in Scotland, to every thirty-nine miles; and in Ireland, to every thirty-four miles. In this calculation, however, the light-vessels are not included; and, of course, in the more frequented channels, as in the case just quoted, the lights are much nearer together than elsewhere. On some portions of the Scottish and Irish coasts more lights are certainly required; but as far as England is concerned, the general opinion seems to be that the system of lighting is sufficient and satisfactory. Of the lights under the control of the Board, about 50 per cent. are dioptric, and the remainder catoptric, and of the local lights, about 25 per cent. In Scotland, about two-thirds are on the dioptric principle; and in Ireland, one-third. The consumption of oil has occupied in past days much attention as a question of economy; but the principle has lately most judiciously been adopted of sacrificing this point to the thorough efficiency of the light. Something resembling the French moderator principle is adopted. The oil is supplied to the lamp by mechanical pressure, and it is found in practice that the best light is obtained where the overflow is about three times the consumption.

The old Smalls Lighthouse (described above) only burnt about 200 gallons of oil per annum. About nine years ago the average consumption at the Start Point and North Foreland was about 500 gallons; but at the present time the usual consumption of a first-class dioptric is 700 gallons. The cost of a first-class dioptric apparatus complete, with lights, apparatus, and lantern, is about 3,000l. It is about 9 ft. high and 6 ft. diameter. The second size is about 4 ft. 6 in. diameter; the height in proportion; the cost about 2,200l. The third size about 3 ft. 3 in. diameter, costing 1,500l.; the fourth, 20 in. diameter, costing 400l.; the fifth, 15 in. diameter, costing 350l.; the sixth, 12 in. diameter, costing 220l.

Combinations of the catoptric and dioptric systems are respectively called the catadioptric and holophotal. Mr. T. Stevenson also invented a light, called the Azimuthal Condensing, the object of which was to direct the whole of the rays down one narrow channel, confining, as it were, the horizon in every direction. The distance to which lights are visible is bounded by the horizon. Sufficient elevation being given, it has been ascertained that in clear weather a first-class light may be visible at 100 miles. Practically, 250 ft. from the water are considered the maximum; this gives a horizon of eighteen miles, or twenty miles from the mast-head. When a light is too high it is liable to be obscured by fogs, with the most dangerous results; as a case in point, the light at the Needles may be quoted, which was actually removed from a tower on the top of the cliff to a much lower level, so as to be more readily observed by passing vessels.

The last novelty in pharology is the division of the lantern into sectors of different coloured light. Thus throwing a light of a different colour towards different quarters of the horizon. We will give one or two examples. The approach to the port of Sanderland presents two dangers; the Mill Rock on the one side, and the Hendon Rock on the other, situated at some distance along the coast; it is a dangerous coast in the immediate vicinity of Whitburn, a name connected deservedly or undeservedly with false lights. There are two lights now designed and in course of erection: the upper one, a first-class light, with a one-minute flash; the lower light so arranged that the sector which exactly attends the Mill Rock throws a white beam over that portion of the horizon; while in the sector which subtends the Hendon Rock a red colour is shown. With these guides ships approaching

from either direction, by skirting, as it were, the division of the lights, are safely guided to the point where the harbour lights, closer in shore, show the exact entrance. A similar arrangement is made at Caldy, though modified by circumstances; there is a white light out to sea, a red ray or sector eastward, and another red ray or sector westward. By skirting the division of lights west, the shoals off the old Castle Barge are cleared, and the east ray clears the Woolhouse Rock. The anchorage is gained by passing through the red ray at this point, until the fainter white light at the back appears, which defines the safe anchoring-ground.

Another instance, at another port, shows two wide sectors of red light, with a narrow white sector between them, which safely conducts the vessel that follows it to the very mouth of the harbour.

In concluding our paper upon the lighthouses of the British Isles, we may remark that the most perfect system of lighting cannot insure the safety of our ships: it can only warn in case of danger. Sometimes the fury of the storm defies all precautions; and hence all else the safety of a vessel depends upon the knowledge, the judgment, and the vigilance of its captain.

INTERNATIONAL CONGRESS ON EDUCATION IN INDUSTRIAL ART.

THE general silence of the press of this country as to the proceedings of an important Congress, held in Paris during the month of October, 1869, is such as to prove that the busy gleaners who cater for the demands for public information, may sometimes overlook fields of no ordinary richness. Few of the popular questions of the hour, asked as they are into fictitious life by the scourge of the journalist, as a top is kept in movement by whipping, have the real national and international importance of the proceedings of this unnoticed assembly.

The Central Union of Fine Arts applied to Industry (*l'Union Centrale des Beaux-Arts appliqués à l'Industrie*), opened at Paris, in the Palace of the Champs Elysées, an international Congress, which held session from the 29th of September to the 5th of October last. The president was M. Louvrier de Lajolais,—it looks almost as if his name should be spelt with the apostrophe,—the vice-president, M. Paul Bénard, architect. The honorary presidents were M. Guichard, the president of the Central Union, and Mr. Cole, director of the museum at Kensington; the honorary vice-presidents, M. de Schwartz, councillor of his Imperial and Royal Apostolic Majesty, and Austrian Consul-General at Paris; M. Cannel, director of the Royal Academy of Ghent; General Novitzky, aide-camp of his Majesty the Emperor of Russia, and attached to the Russian Embassy in London; M. Baumer, professor of architecture to the Polytechnic School of Stüttgard; and M. Sajon, vice-president of the Central Union. Among the secretaries we find a manufacturer and a designer of lace, a professor of drawing, and a professor of sculpture. Thus art, both fine and industrial, is adequately represented by the composition of the "Bureau."

M. Émile Galichon, whose eminent services to art literature are well known to all who are familiar with the subject, has expressed opinions with reference to this industrial congress, with which we are disposed very fully to sympathise. Having expected nothing, or next to nothing, to result from the discussion, he took the occasion which offered itself on his being asked to return thanks to the president, to declare, with the most perfect candour, that he had been entirely mistaken. In the six sessions to the proceedings of which he had been a silent and attentive listener he learned, he declared, more than he had done in ten years of his life. Little by little the horizon extended itself before his view. New ideas arose, and mutually illustrated one another. The gaps and breaks of his thoughts became filled up, and points that had long been obscure became clear and intelligible. A great and important step in the knowledge of the arts of design has been attained by the labours of the congress.

In the Palace of the Champs Elysées have been united to an Oriental museum, and to an exhibition of modern works, specimens of the work of pupils belonging to more than three hundred schools. The presence in Paris, at the same time, of so many professors and teachers, both French and of other nationalities, has thus been wisely turned to advantage, in order to

draw up an exact report of the present state of art education in France, and to suggest the best means of developing and improving the same. In the assumption, by private co-operation, of that initiative which has hitherto been considered to appertain exclusively to the Government, not only in France but generally on the Continent, lies the first step of a veritable revolution, commenced without tumult or violence, from which it is not difficult to augur the happiest results.

Acquaintance with the arts of design can no longer, in this nineteenth century, be considered a non-essential part of education. The progress and the permanence of those important branches of industry which so largely contribute to the national welfare depend mainly on the possession of an enlightened and educated taste. Without culture in this respect it is in vain to hope for any but a limited, and strictly home, demand for the various art manufactures, whether textile, ceramic, metallic, or of mixed and compound origin. A lump of clay, in the hands of an uneducated rustic, remains a mere clod of earth, or, at the best, is fired as an unsightly brick, or an archaic garden-pot; placed in the hands of an educated workman, in the same space of time it may be fashioned into a work of art, of value and of beauty.

The questions, then, which were debated, and to a great extent decided, by this self-elected International Congress, have a high economic and social value. Those narrow and limited views as to the wealth of nations, which were received with so much respect, by men in the van of intelligent life, because they were new to men unacquainted with the works of Aristotle, and because they were true, in themselves, although false, if regarded as constituting the whole doctrine of political knowledge, are being reduced, year by year, more distinctly to their proper proportions. Year by year we are learning that a market is not a school; that to buy cheap and to sell dear is not the chief end of man.

Nay, what is of even more importance, the idea has become intelligible, and soon must become dominant, that an exclusive devotion of the energies of a people to those lower and less noble objects has a certain and fatal tendency to defeat itself. The man who is content to turn out the cheapest and the least artistic productions, hoping to command custom by the mere brute force of low prices, finds his customers falling away from his wares. People are beginning to find out that excellence is economical; that low price does not mean actual cheapness; that the productions of a good chemist, a good mechanic, or a good artist, are actually worth much more money than cheap drugs, clumsy machinery, or ugly and ill-constructed articles of domestic use. And, as it is not possible to select and extract the money-getting faculties or functions of the mind, and to cultivate them exclusively, but, on the other hand, it is always uncertain when and how the special advantages resulting from general culture may become available, so it is that, in spite of the venomous hostility entertained by a certain class of politicians to all artists, all men of taste, all men of refined culture, all men of classical education, the guidance of the future instruction of the people is gravitating irresistibly to the hands of this intellectual aristocracy.

In a word, Art, using the term in the widest sense, from being the delight of the few, is about to become the benefactor of the many. The neglect and despite of art is no other than the retrogression of a people towards barbarism. There are, it is true, many minds whom that argument must altogether fail to reach. It is well, therefore, that it can be put in different terms. Neglect of art-culture is a certain cause of national poverty. It is in this view of the case that the advance of any one of the European family of nations in education, whether scientific, technical, artistic, or literary, acts as a spur and a goal to the progress of every other nation. The electric chain has become complete, the contact being effected in the sensitive region of the pocket; and any advance made by Prussia, France, Italy, Belgium, must, *periculis nostris*, be responded to by a great effort in England.

Four distinct questions have been submitted to the International Congress. Each of these has been clearly stated and intelligently discussed; and with regard to each the congress has expressed both a judgment as to actual fact, and a desire as to the course to be adopted in the future. We proceed to refer to these questions in the order in which they were discussed.

The first question thus raised was that of the character and conditions of modern productions in industrial art. On this subject the congress forms the opinion that the dominant character of contemporary production is that it is essentially "mobile," by which term the reporters seek to express the capricious variations of fashion. Further, it is pointed out that the desire to produce objects in great numbers, in great variety, and at a low price,—a desire which is ministered to by the employment of machinery and by the infinitesimal division of labour,—is, in general, diametrically opposed to the existence of any true art sentiment in the objects fabricated.

Under this head the congress further calls attention to the preference given to routine as compared to the encouragement of personal initiative; the preference given to a mechanical perfection of surface detail, to the neglect of the general subordination of harmonious finish; and the frequently misunderstood application of scientific discovery. Thus far the work of the congress seems directed rather to the indiction of some of the rampant evils of the day than to any attempts to remedy them.

The second question relates to the nature of public taste, and of its influence on production, and to the means of developing and of improving the same.

Public taste, the congress holds, is the exact reflexion of the intellectual and moral condition of society. So striking a proposition demands attentive meditation.

The principal causes to which the imperfection or the capricious character of taste may be referred are, first, the tendency to prefer the perfection of mechanical finish and detail to the true sentiment of art. Secondly, the general inclination towards apparent, rather than towards essential, excellence. The union of these two causes exercises a deplorable influence on production.

The remedy for this state of things lies in the creation of a general and complete system of education in all matters relating to art, by means of which sound views may be communicated to all classes of society. It is difficult to impugn the abstract truth either of the described evil, or of the proposed remedy.

The third question raised by the congress is that of the actual organisation of the theory of the arts of design, of the development to be given to that study, and of its direction, considered with regard to teachers, to methods, and to examples.

The congress declares that the actual organisation of tuition in art is not adequate to the requirements of the day, because, in the first place, the examples handed down to our times are imperfectly known and generally ill understood, from want of well-regulated education; and, secondly, the study of nature is generally insufficient and ill-directed.

The congress declares that it is necessary, first, to insist on primary instruction in the preparatory study of drawing; secondly, to develop the taste from early infancy by the daily view of what is beautiful in all its forms; thirdly, to give a great and entirely new importance to museums of instruction, in villages no less than in towns.

The congress expresses the desire that instruction in drawing should form an integral part of the obligatory course of primary instruction.

It declares in the most distinct manner, that, in its opinion, instruction in the art of design admits of no radical division, admitting in the matter of tuition but one law, and one principle, viz., the *Unity of Art*.

The congress denounces that mode of primary instruction which is limited to the servile and textual imitations of the graphic model.

It expresses the desire that, from the very commencement, the pupil of the primary school should have placed before him the geometric models which constitute the *Alphabet of Forms*, as well as examples of the most simple ordinary objects.

It recommends, as indispensable, oral explanations on the part of the teacher.

The congress disapproves the present direction of secondary education, in so far as it leads to the abuse of the graphic model.

It declares that a proportioned mode of rendering (by reduction or enlargement in size), drawing from memory, and the free choice of methods of execution, should be substituted for literal and servile copying.

With reference to *professional instruction*, the congress expresses the desire that, in all the schools, attention should be given rather to general instruction than to any particular in-

dustrial application, such as the demands of manufacturers require.

In such premature labour it can see only danger both to art itself, and to the future excellence of the pupils.

For the instruction of teachers for the primary schools, the congress demands the extension of instruction in design in normal schools, by the assistance of special professors.

It consequently requires the foundation of a superior normal school, for the education of these professors.

As to *method*, the congress neither recommends nor proscribes any special method; although it warns against those which, by the employment of rapid and mechanical processes, tend to diminish direct, personal, and sincere observation on the part of the pupil.

With regard to models, the congress blames the use of all such as involve the serious fault of leading to the substitution of the study of the picturesque effect, which is only accidental, for that of form, which gives permanence of character.

The fourth question relates to the comparison of the efforts hitherto made, in different countries, to advance industrial art, to develop public taste, and to improve the method of instruction in the arts of design.

The congress remarks with satisfaction that, for some years, a movement has been manifest in public opinion, tending, in all civilised society, towards the extension and the progress of industrial art, the improvement and the generalisation of instruction in the arts of design, and that development of good taste which exerts a distinct moral effect; and that, under the influence of this excellent spirit, efforts have been made and are daily making, due to the initiative of Governments, of associations, and of private individuals, which have already led to the creation of important institutions, museums, schools, societies, and the like.

The congress expresses the desire that effect should be given to the proposal made at the close of the Exhibition of 1867, and approved by the honorary presidents of all the International Commissions, to the effect that each country should execute reproductions of the objects of art which it may possess, and should spread the knowledge of such treasures as far as possible through other countries.

The concluding recommendation is to the effect that serious attention should be paid to the improvement of the condition of the professors and teachers of the arts of design, because it is on this condition that the quality of the instruction which they impart must essentially depend.

It is undeniable that the philosophic grasp and sound practical good sense of nearly the whole of the conclusions and recommendations of the congress are such as to justify the strong terms in which M. Gallichon has allowed himself to speak of the result of their labours. To ourselves, almost the most interesting reflections that are suggested by the report will be those which concern the application of the conclusions of the congress to the actual system which, under the impulse of the Department of Science and Art, has been within the last fifteen years introduced in our own schools.

As far as regards the first two questions, the ill-regulated character of contemporary production, and the untought caprice of public taste, no less than the fourth, the development of public taste, the general remarks we have already cited are most pointedly applicable to our own country. Nor are we altogether unaware of the primary necessity of a well-designed education of public taste.

For the third point, the education of the taste from early infancy, by the view of what is pure, noble, and beautiful, it is one on which we have been long accustomed to dwell with a persistence which has not always met with warm and intelligent sympathy. We rejoice to see the necessity of this course indicated as a canon of education. Nor must it be forgotten that the law is universal. It is negative no less than positive. It applies to literature, music, dramatic representation, all forms of moral and religious teaching, no less than to art-education. It involves the proscription of the coarse, the base, the meretricious, the tawdry; in one word, the false—in every department of human thought. Frustrating games, of chance or of violence; demoralising exhibitions of all kinds; literature, illustrated or otherwise, which, under the stolen appellation of comic, never rises above buffoonery; high-strung moral or religious discourses,

the tenets of which are contradicted by the tone, the appearance, or the daily life of the teacher,—all these stumbling-blocks in the path of true intellectual and moral culture, are condemned by this noble utterance of the International Congress.

With regard to the abuse of the graphic model, we think we have reason for great satisfaction in the superiority of the method adopted in our schools of art over that which the congress appears to consider to be almost or altogether universal. The selection of the best and purest examples of what is happily termed the alphabet of form, the definite study of the principles, in preference to the mere details, of design; the successive or alternate presentation of designs on the flat, of well-executed relief, of models in the round, of natural forms of vegetation, and of the living model, to the student, are distinct elements of our normal art-education. We call attention to the report of Mr. R. Redgrave, R.A., in the year 1857, on the state of design as applied to manufactures, treating of the great questions of style, of constructive truth, of the subordination of decoration to utility, of the special character of ornamentation suited to different materials, of unity of style and decoration, of subordination, and of the exigencies of size and of scale.

As to the danger, indeed, pointed out by the congress, which menaces both the progress of art and the future of the student, arising from the displacement of general and thorough art education by the study of those special branches which may command a direct pecuniary return, we hold, as we have previously stated, that it is the evil which most imminently threatens the development of our own art schools. One defect, as it appears to us, of our own system, is the strong tendency which it has to blind the pupils to the fact that, after all, decoration is but the 'prentice-work, or the amusement, of the artist. The rude diction of the Scottish poet shadows forth a truth far more noble than often lies concealed under the fugitive disguise of lyric song. The "prentice-hand" of Nature was tried in the production of strength and of ability,—the more perfect exercise of her skill was devoted to the creation of beauty.

As to that which relates to the status of the teacher, it is unnecessary for us to express our hearty concurrence. We recognise in the decisions voted by the congress one of the most promising signs that have yet appeared as to the education of the future. We desire to supplement one omission, that of recognising that it is to the wise and patriotic effort of the late Prince Consort of England that the plan, recommended by the congress, of the reproduction and interchange of national art treasures owes its origin. But had the congress only emitted two of its many valuable votes it would have rendered a noble service to humanity. To those two utterances we are desirous to give the widest circulation, and the most faithful echo. We refer to the importance of elevating the mind, from early infancy, by the daily view of what is beautiful, and to the enforcement of "one law and one principle, the unity of art."

THE ROYAL ARCHITECTURAL MUSEUM.

SOME evidences of life are apparent in the Museum, in the shape of a further appeal for money. Subscribers are invited to double their subscription; and one original member writes to us to say that he certainly will do nothing of the kind till he sees some endeavours to obtain more satisfactory results than are at present apparent. The hours during which the Museum is open and the arrangements made virtually shut it against working men, even if they were anxious to avail themselves of the collection, which unfortunately few of them seem to be. It is impossible to ignore a very widely-entertained impression that the building is unsatisfactory—in no way adapted for study. One "Would-be Student" writes us that he found it simply impossible to sit on the tiled floor, in a frightful draught, to make a sketch he desired to have. Some alterations must be made in this direction, also in the arrangement, if the word may be used, of the casts. The staircase is perhaps the most abominable thing in plan that ever was seen. It is so out of square with the side walls and the pavement that a view backwards from the landing is calculated to produce vertigo. One would be curious to know which of the two architects employed will take the credit of it.

However, all this will get righted in time: the value of the Institution properly adminis-

tered remains, and the Council are anxious if not lucky. They have just now issued a proper invitation to members, that, being desirous of making their collection available for the study of architectural pupils, students, and draughtsmen, to such all the advantages of the Museum through its lectures, collection, &c., are offered for a subscription of 10s. a year, and they ask the names of any gentlemen who wish to join for the year commencing January 1. They are also co-operating with the Institute of British Architects and the Architectural Association to bring about the establishment of a school of architectural drawing to meet in the Museum. A joint committee has been formed and rules have been framed for discussion. This school might be rendered subservient to the maintenance of the Museum, as well as highly advantageous to the rising generation of architects. Strenuous efforts should at once be made to render the collection more completely a museum of architecture than it can be deemed at present, representing as it does little more than one division of the art. As one of the first and fastest friends of the Institution, we shall be credited with a desire to say nothing but what is likely to advance its interests.

THE FEMALE SCHOOL OF ART.

MISS JULIA POCOCK stands so completely at the head of the exhibitors on the present occasion, that 1869 will probably be spoken of in the school hereafter as her year. By a very clever drawing from the cast, she has obtained the Queen's Gold Medal, while for a charmingly painted head of a girl in prim, if not Puritan, costume, she has the Queen for purchaser; and her Majesty may be congratulated as well as the artist. When we add that Miss Pocock also exhibits the model of a hand, which has obtained the M'Arthur prize of 5 guineas, and that she also gets a prize from the Department, it will be seen that Miss Gann has, at any rate, one pupil of whose progress she may be justly proud. But there are others with nearly equal claims. Miss Whitman Webb gets the National Silver Medal for fruit admirably represented, and one of her flower-pieces we like even better than the fruit. Miss Alice Locke has a charming arrangement of flowers; Miss Blanche Macarthur exhibits two very effective heads in oil from the life; Miss Alice Manley maintains her position gained last year; and Miss Lavinia Dixon makes an advance.

Miss Slous worthily gets a prize for modelling; and in the same department Miss Ellen Macra deserves praise.

Some friends of the school have lent a number of paintings and drawings, which will remain for a time for the study of the pupils. It may be well to mention that a class meets on three evenings in the week, Mondays, Wednesdays, and Fridays, from seven to nine, for the study of elementary and model drawing, geometry, and perspective, and that schoolmistresses, teachers, and pupil teachers of National and British Schools are admitted at half fees. The fee for the advanced class for the study of water-colour, figure from the round, &c., is 6s. per month, or 11. for five months.

LECTURES ON ARCHITECTURE AT THE LONDON INSTITUTION.*

PROFESSOR KEER proceeded to consider the Gothic revival. Still confining his attention to our own country, and now with more especial reason, he returned to the seventeenth century, and remarked that while the revived or more properly modern Classic style was becoming established by the spirit of antiquarianism in Italy, and beginning to spread westward therefrom, English building was pursued in the well-known Elizabethan manner, and especially, perhaps, in those country mansions which we still hold in such high esteem. Even when the new fashion had taken complete possession, this old one was not entirely forgotten; and in 1753-70, for example, Horace Walpole was employing himself pedantically, if no more, in building at Strawberry-hill a sort of Mediæval retreat, eminently absurd, but equally suggestive. Then the French Revolution became the great historical landmark of the age. War between the new principles and the old, exhausting all other nations, left England alone in possession of what might be called unconquered feudalism.

It was only natural at such a time that good old-country gentlemen should build Castles; and accordingly, through the whole period from 1770 even to 1830, under such architects as Wyatt, the now execrated restorer of cathedrals, Wilkins, of the National Gallery, and Nash, of Regent-street, sham fortresses, in the finest imitation of the "baronial" manner, were built all over the country, in stone, or brick, or Roman cement, or lath and plaster, with wood painted for masonry, cast-iron painted for oak, and, in short, anything that came to hand painted to represent anything else that might be convenient, with such an exuberance of sham accessories of every kind as to be bewildering to the most patient of critics. But, in the meantime, John Britton had been perseveringly laying before the public admirable engravings of English antiquities (1805-35); and the appreciation of the picturesque and the veneration of the traditional combined to give a fixed direction to antiquarianism in favour of Mediæval lessons in design. Then came the great apostle of modern Gothic, Welby Pugin; truly a very remarkable man, possessed fanatically with the one great idea, whether ultimately for good or evil he cared not. Before long he exhibited the precise effect of his enthusiasm in becoming one of the first of our "perverts," as the phrase goes; and the result of his whole life from its eccentric opening to its melancholy close,—every day of it, the life of an indomitable genius,—was to fix irrevocably the revival of Mediæval art upon the assertion of Mediæval social principles,—ecclesiology, symbolism, sacerdotalism, ritualism. By this time, however, the mere fact of the Gothic revival had been accomplished; for after 1835 the new Houses of Parliament were brought under discussion as affording an opportunity for a signal assertion of baronialism; and, as all the world knew, Pugin was Sir Charles Barry's right hand in the design and development of that great example,—now a good deal carpèd at by those who forgot the fact that the fashion of its architecture was not the free choice of the architect, but rather the contrary, forced upon him by Parliamentary amateurs. Since that period, at any rate, all our churches had been of the Gothic style; and of late there had been colleges, schools, parsonages, and even convents, built all over the country in the same fashion, until at length secular and civil architecture was being claimed in its entire field for Gothic administration,—a condition of things which sooner or later must lead to something unexpectedly amazing. At the present moment, antiquarianism, in this fashionable form, was urging its most uncompromising maxims: severity of manner, muscular harshness, and intentional ugliness, being openly and expressly advocated by extremists every day, with at length the most minute reference to ancient models, not for principles or suggestions, or even for canons of style, but for copies, so that cruder Norman, French, and Spanish turrets should be literally reproduced, in precisely the same way as the fastidious porticoes of Classicism less than half a century ago,—so turns the wheel!—were so slavishly, as the saying goes, and unintellectually accepted. Thus, then, stood "The Battle of the Styles," the inevitable effect of an antiquarian age which must inevitably run its course; and, in pursuance of the certainly remarkable uniformity of chronological periods exhibited by the scheme offered by the lecturer at the commencement of the course, he would venture to suggest that it seemed not at all unlikely that the termination of the current five hundred years, in about a century and a half from the present time, would prove the end of the antiquarian period, and the commencement of some novel development both of society and of art, in which existing actors must be content to have no part. But in the immediate form of the controversy as to style, the arguments might be stated thus:—Gothicists affirmed that their mode was "our national style;" but this was obviously fallacious, for it was not in England alone, nor in England even chiefly, that Mediæval architecture was produced, but in the whole of Mediæval Europe: it was simply the style of all Europe for a period,—one that had passed away. Then the rejoinder of the Classicists was this,—that their mode is Italian merely because modern Europe was cradled on Italian soil; that it is modern European, certainly not English peculiarly, but again the style of all Europe for a period,—one that has not yet passed away. Observing briefly that no revival of Gothic, in our sense of the term, had been found possible on the Continent, the lecturer remarked upon the exquisite

* See p. 890, ante.

elegance with which Classic architecture had been pursued in France; while, on the other hand, the highest possible praise seemed to him to be due to English architects, even those of inferior pretensions in some cases, for the great artistic success with which they were effecting the production of a constant succession of picturesque Gothic works. The particular form of this rivalry he considered to be most interesting and suggestive to the student, and most creditable to both countries, in the eye of the critic. As to the demand sometimes advanced that a new style should be expressly invented, he need only say that a style in art was not to be so produced, but only by the slow operation of natural laws, of which, in the present age, Italian-European, galvanized Gothic, and universal Antiquarian, were the inevitable products, for good or ill, and in spite of us. Then, if he were called upon to offer a prognostication of the future, he would accept the formula of Archbishop Manning, that there was but one alternative offered to modern intelligence, namely, that between faith and science; and, taking these terms in their most comprehensive sense, he could not help thinking that what was erroneously called faith must inevitably yield, while that which was more properly called science must inevitably prevail. New principles of society, philosophy, and art were every day being introduced, the current of debate was setting in one invincible direction; and if he were to suggest that in architecture the next period would be that of science as the successor of Antiquarianism, he might, perhaps fairly, so leave the question to its destiny.

FALL OF A RAILWAY STATION AT EDINBURGH.

Sir,—I have just read with much profit your article on the catastrophe at King's Collegio. Will you allow me to bring under your notice a similar accident which has just occurred in Edinburgh (where I am at this moment residing), with the view of directing public attention to the scandalous want of supervision in all matters relating to building in this northern capital? You will probably remember that I addressed you on one or two former occasions of a like nature, particularly with regard to the fall of an ancient tenement in the High-street, and also after the severe storm of February, 1868, in which I made a very narrow escape from the fall of a chimney. Edinburgh is, no doubt, a pleasant place of residence; but the risk of life in it is very great from a number of causes, one of which is the constant occurrence of such accidents as I shall proceed to describe. I shall quote as much from the local reports as may make the narrative intelligible, interspersing a few observations of my own in the way of supplement. In the *Scotsman* of Friday, December 7th, appears the following startling announcement:—

"Yesterday evening, just after darkness had set in, people at the west end of the town were startled by a tremendous crash, caused by the unaccountable fall of the enormous wooden shed which was in course of construction on the Lothian road for new station premises of the Caledonian Railway Company."

I dwell nearly two miles from the scene of the accident, and the report reached me like the firing of a battery of artillery:—

"The beams and timbers of the great shed were all down upon the ground in the utmost confusion, and large masses of timber were hanging over the retaining wall against St. Cuthbert's-lane, where they had been lodged, seeming as if they would come down any moment. It was deemed advisable to warn the public against going into the lane, which, indeed, was already partly blocked up by the material which had fallen into it."

St. Cuthbert's-lane here mentioned is the locus of the old poorhouse of that parish, which is now removed to the snarbs of the city, fortunately for the paupers. Part of the building plan provides for blocking up this lane, and the ground for the station has been otherwise obtained by an extensive and destructive clearance of valuable property, Dr. Caudlish's Free Kirk among other things.

The site of the building (*i. e.* of the wooden erection) is the space which has been recently cleared between Rutland-street, Rutland-square, and the Lothian-road, with a prominent corner to Princes-street, where the principal entrance is exposed.

"The permanent way and platforms were to be covered with a shed constructed in two spans, one 32 ft. and the other 40 ft. wide, with a height of 28 ft., and it is this shed which has fallen. The erection measured about 450 ft. in length, and the platforms were to extend some 350 ft. beyond its lower end, thus attaining a total length of 800 ft. The roof of the shed was designed on the wrought-iron girder principle, provision being made for lighting in the shape of longitudinal glazed spaces on each side of the

roof. The whole of the buildings were being constructed of wood, with the exception of some partition walls in the offices, where drop-laths and chimneys necessitated the introduction of brick. The walls between the platforms were being formed of what is termed louver boarding, the boards overlapping each other to the extent of an inch. The principal elevations, relieved with pilasters, colonnades, and parapets, present, as we have said, a tolerably neat appearance, considering that they form part of what could only be considered a temporary structure."

Temporary as it is, however, this structure is to cost 10,000*l.*

Messrs. Blyth & Cunningham, engineers to the company, made the plans; and the contractors are the well-known firm of Messrs. William Beattie & Sons. The intention was that the station should be ready for occupation by the 1st of February next. It was commenced in the month of August. The work was advanced with a view to completion against that day, and the whole of the rough part of it would have been finished in about three weeks. Already a portion of the shed,—though only a small portion,—was slated, and part of the glass had been put in.

But on the evening already mentioned, *viz.*, on the 6th day of December, the whole of this passenger-shed fell with a tremendous crash, shortly after the workmen, to the number of about eighty, had given over and left the ground.

"The building itself has been reduced to a sorry plight, the whole of the great passenger-shed having gone entirely to ruin. The front portion of the station with the offices connected therewith, and the baggage-sheds, refreshment-rooms, and the carriage-shed or store forming the long line of boundary towards the Lothian road, are fortunately untouched; but nothing else is left, so that what is gone was no, insignificant part of the building."

The *Scotsman* goes on to say that the cause of the accident in all probability was owing to some of the iron castings forming the junctions of the connecting rods giving way. Next morning, however, we have the result of investigations (it is not stated by whom), which is thus described:—

"There is now no doubt that the accident was caused by some flaw in the iron rods. The damage is found to be less considerable than was at first feared, as not more than a tenth of the dislodged material has been rendered useless. Some of the iron beams have been so twisted as to be made unserviceable, and a quantity of the timber and slates is destroyed. Early yesterday morning, 100 men from Carrstairs and elsewhere were set to work to clear away the material, and this operation, it is expected, will be completed to-day; so that the reconstruction of the shed will be proceeded with on Thursday. A peculiar circumstance is, that the glass for the whole shedding was stored within the building at the time of the catastrophe, and that none of it is broken, a heavy beam having fallen in such way as to protect the crates."

And so ends our local authority in the report of this most serious accident.

Now, sir, permit me to say one word in further explanation. I believe the cause of the accident was neither due to the iron castings, which gave way, no doubt, as cast iron always does upon a strain being applied, nor to the timber-work of the superstructure, which appears to me to be as soundly done as such temporary timber-work can be, but to the deplorably unsatisfactory character of the foundation. The whole thing is built—not upon sand, but upon genuine and unmistakable rubbish,—the *débris*, in fact, of the demolished buildings, combined with the aggregation of innumerable "rooms," as they call a cartload of rubbish when it is deposited in Scotland. It is true that the foundations were partially piled; but those who know anything about driving piles will know how to estimate this precaution at its proper value.

But I will not encroach further on your space at present. Supposing my view of the case correct, I should like to inquire who is to blame? In my opinion, the whole responsibility and the entire odium of the matter properly belong to a wretched remnant of municipal antiquity we have in Edinburgh, which goes under the name of the Dean of Guild Court. This respectable institution—which is chiefly composed of grocers and cheese-mongers—is supposed to fulfil the functions of the district surveyors in London. But you will judge with what success. I have already compared it in your columns to the Court of Arches; and the Lord Dean of Guild to the man-at-arms in the Lord Mayor's Show. Having by a seal of course, or some such antiquated instrument, a sort of legal existence and a corporate constitution, it has no personal responsibility,—*i. e.*, it has neither a body to be kicked nor a soul to be saved. Why the citizens of modern Athens submit to have their lives and property at the mercy of one of those curious social paradoxes of which Scotland is so fruitful, and so conservative, and concerning which I may take some future opportunity of enlightening your readers. In the meantime I hope you will assist in enforcing the true cause of these building accidents in Edinburgh.

AN OBSERVER.

THE CHANNEL PASSAGE.

MR. ZERAH COLBURN, C.E., has read a paper on this subject at the Society of Arts, in which, after describing "an improved means for laying a tunnel for the transit of passengers across the Channel," he says, in conclusion,—

"It has been mainly the object of the present paper, however, to examine into the engineering merits of the various schemes proposed for crossing the Channel, and the writer cannot close without expressing the belief that the balance of certainty, economy, and, all things considered, the safety and even the comfort of the travelling public, remains with a large and suitably organized Channel ferry service."

The plan described by Mr. Colburn consists of an iron tube to be laid at the bottom of the Channel, which could be laid in two or three years, at a cost of six millions sterling.

"It is not to be lost sight of," he remarks, "however remote the bearing of the question upon the present subject may appear to be, that a sudden demand, within a couple of years, for half a million tons of cast-iron, not for export, and not for immediately productive employment at home, would most certainly inflate the iron trade, and indirectly affect nearly every branch of our industry. The very home demand, whereby we would be literally throwing our iron, and with it our money, into the sea, to no immediate profit, would give to other nations an advantage of which they would not be slow to avail themselves."

The sudden abstraction of such a quantity for a single work, having no immediate prospect of success, might be attended with consequences which the whole country would long have occasion to deplore."

We may here add that Messrs. Ward, Hunt, Fowler, and Abernethy have had an audience of the French Emperor, to explain to him their plan for the passage of the Channel by large ferries. The project is particularly recommended by the small sum of money and short time required to carry it out, as compared with the schemes for bridges and tunnels of doubtful possible realisation, and of the ultimate time and cost of which it seems scarcely possible to form a reliable estimate. Not only would passengers and their luggage gain a couple of hours by the proposed ferry between Paris and London, but heavy goods trains would be enabled to take their course through France and England without the expense and considerable delay caused by transhipment.

THE ROYAL ACADEMY.

THE prizes presented to the students on Friday evening, the 10th inst., in the new rooms of the Royal Academy, included:—

For the best design in architecture; the subject, a design for a theatre—the gold medal, books, and a scholarship of 25*l.* to Henry L. Florence.

For the best architectural drawing of the garden front of Bridgewater House—the silver medal and books to Merton M. Glover.

For the second best architectural drawing—the silver medal to George Stanley Rees.

The one year travelling studentship in architecture, to Henry L. Florence.

The President, Sir Francis Grant, in his address, said the first attempt to establish a College of Science and Art was made during the reign and under the auspices of Charles I., but the civil strife which soon followed put an end to this institution. Charles I. was an enlightened patron of art, and the President naturally deplored the loss to the nation of the art treasures which the king had accumulated, and which were sold and dispersed during the Commonwealth. According to Walpole, art was expelled along with the Royal Family; but it languished in the reign of Charles II., and was almost a blank in the reigns of James II. and William and Mary. After various attempts to establish an Academy of Art by Sir Godfrey Kneller, John Evelyn, Sir J. Thornhill, and afterwards by the Dilettante Society, an important epoch in the history of art was reached when Hogarth, with eighteen other artists, agreed to adorn the walls of the Foundling Hospital with paintings. These, being publicly exhibited, proved a source of great attraction, and first suggested to British artists the idea of holding an annual exhibition of their works. It was in 1760 that the first exhibition was held in London, and it had a great success. Then came the establishment of the Incorporated Society of Artists of Great Britain, but strife and contention among its members led to its disruption, and it was followed by the founding of the Royal Academy, with George III. for its patron, and Sir Joshua Reynolds its first president. Referring to the periodical attacks made on the Academy, the President spoke of the attention paid by members of the Academy to the teaching of the pupils. Men, he said, who had gained a European reputation, and

whose names would reflect honour on their country in coming ages, became under this system painstaking instructors of the youthful student. "Do we hear of such disinterested zeal," asked Sir Francis, "in any other profession? Do judges, or men of science, or skilful physicians devote their time gratuitously to the education of the young?" Such has been the practice of members of this Academy, and how small has been the acknowledgment of its services?"

The impression abroad has been, that the professors, keeper, hangers, librarian, secretary, &c., received, and rightly, very respectable fees for their services in assisting the students. Was this impression wrong?

The President further said that the members of the Academy are now actively engaged in the improvement of their schools, and will spare no labour or expense to make them, if possible, the first in Europe. Measures, he said, would shortly be adopted in order to attain this all-important end; and he dwelt on the necessity of retaining the system of visitors, which conduced to originality and freshness among the students, while insuring for them a friendly sympathy among the masters of the art, and stimulating their best energies.

At a full meeting of the members, held on Wednesday evening last, Mr. James Sant was elected as an Academician. The following honorary foreign members were elected:—Messrs. Gallait, painter; Guillaume, sculptor; Viollet le Duc, architect; Henriquet Dupont, engraver; Meissonier, painter; and Geromo, painter.

PRINTS AND THEIR PRODUCTION.

UNDER this heading Mr. S. T. Davenport, of the Society of Arts, read there, on the 8th, a very instructive paper on the processes of engraving, wood engraving, colour printing, lithography, surface blocks, photography, photogalvanography, and other methods of producing prints, which he illustrated with a large and interesting collection of engravings and photographs, that will be open to the inspection of members and their friends till the end of this week.

Mr. Davenport, in accounting for his enthusiasm on the subject, said—"I may perhaps be open to the charge of attaching more importance to reproductive art than the subject merits. But, if so, the fact is easily accounted for. My boyhood and early youth were spent amidst engravings—for many of you are probably familiar with the works of my late father, who was a contemporary of Finden, Heath, Le Keux, and other eminent engravers. Many of his productions are before the meeting. I was myself educated for the same profession, and before I became an officer of this Society (now more than twenty-five years ago) I practised the art for some time. Indeed, I may mention that I was one of the first to produce, by electro-deposition, copper-plates from engraved steel-plates. These facts must plead my justification for what I have said; and it will appear not unnatural that I should continue to take a warm interest in every new process that may promise to give greater facilities to reproductive art, and thus to increase the means of affording one of the purest and best sources of gratification, not only to the rich, but to the people at large."

NEW CO-OPERATIVE STORES AND PUBLIC HALL AT RAWTENSTALL.

THE Rawtenstall Industrial Co-operative Society have inaugurated their new stores by a *soirée*. The society commenced short of twenty years ago with a capital of one guinea, and it now possesses a capital of 30,000l., and its profits at the rate of 4,000l. per annum. Larger premises were secured as their business increased, but for some years they found that they were out-growing the premises they still occupy, in Lord-street. Resolved on building new stores, a suitable site was found in Blackburn-road, which forms the principal street in the town, and which is also central. Application was then made to eight architects to submit designs in competition for the proposed erection, two premiums being offered, in addition to the premium for carrying out the work. When the designs were sent in, the two best were found to be by Messrs. Maxwell and Take, of Bury, to whom the two premiums were therefore awarded; they, however, consented to forego the second premium,

which was divided as an honorarium amongst the unsuccessful competitors.

One part of the premises consists of stores and shops for the grocer, draper, tailor, shoemaker and clogger, butcher, &c. Another portion of the premises comprises a news-room and library, club-room, large assembly-room 90 ft. long and 55 ft. wide, &c. The description of the exterior of the building may be summed up in a few words. The instructions to the architects were to spare nothing in construction, but economise in ornament; and the result is a large and strong but not an elaborate building. The walls are faced with parquetry, with Longridge stone-dressings, nearly 7,000 cubic feet of which have been used. The cost of the whole work, including heating, painting, fittings, &c., will be a little under 7,000l., the principal part of which has been done by Mr. Roberts, of Rawtenstall.

BARKING REPORT.

MR. ROBERT RAWLINSON, the Government engineer appointed to inquire into the complaints of inhabitants of Barking, with reference to the outfall of the metropolitan sewage, has made his report, and it is now with the Home Secretary. We are able to say that Mr. Rawlinson considers the allegations to be not proved; that he considers the cesspools and general want of drainage in the town of Barking to be more prejudicial to the health of that town than the proximity of the outfall of the sewage of London; and that there has been no diminution of water by silting in the main channel of the Thames consequent upon the outpouring of the sewage. We further understand that the Government engineer reviews the reports of the Metropolitan Board of Works, pointing to the fact that while they have protested against the fouling of the Thames above London, they themselves continue to pour into it the sewage of the London population. It appears that the question of the utilisation of sewage was not referred to Mr. Rawlinson, but he expresses an opinion to the effect that to accomplish this the Board must either subsidise or guarantee any company undertaking the work, or carry it out themselves. Experienced engineers have stated that the cost of taking the sewage to Sea Reach would have greatly exceeded the total cost of the metropolitan system of main drainage as executed, and that the area requisite to utilise the sewage would not be less than 70,000 acres. It appears in the evidence attached to the report that as compared with guano at 11l. a ton, the chemists' annual value of the London sewage is not less than 1,000,000l.

"A NEW STYLE."*

"ART is long, and time is fleeting," says the poet. That time is fleeting seems to be pretty well understood by the present generation, but that art is long, is understood by few indeed. We are in a hurry with everything nowadays, in haste to be at the end by the shortest possible road; but there is no short road to art, it cannot be reached by driving a straight line through hill, and o'er valley. It can only be got at by wandering, by devious paths, and gathering flowers by the wayside.

The young man just come of age, who has hurriedly passed through the routine of an architect's office, does not hesitate at attempting to design a large and important building in as many days as it required months of the anxious thought and care of the great men of old to accomplish a like object. Nothing great in art has ever been done in haste: read the lives of the sons of genius, and you will find them, one and all, great workers, striving towards perfection. But even those amongst us who know the necessity of care and deliberation in the maturing of a design are forced, by the ignorance of the general public, into the vortex. Your building committee only gives a week or two in which to design the most important building in a city; nay, more, they must also have an estimate of the cost and other particulars; and great is their indignation against the profession if everything does not tally to a tittle. So, too, with the private client who has for years been deliberating upon building a new mansion: the design must be produced forthwith, hundreds of artificers are set to work, and the plaster is not dry before he hastens to enter into occupation; he, too, is indignant when

he finds the work badly finished and unstable; but greater is the harm done to art by the crudity of the design.

We are in haste, too, to create a new style! Who is to do it? Who ever did it? Turn we to the past, and we find that a new style was the slow growth of centuries, fostered by the circumstances and peculiarities of the times. Why the architectural profession, more than any other, should be subjected to the parrot cry of copyism is more than I can comprehend. It appears to me that there is as much ability and originality displayed by some of its professors, as is done by any of the *littérati* who decry them. Architects are moulded in the fashion of the times just as are men of letters, and when the general public show as deep an interest in the production of fine architectural works as they do in the publication of books, men fit and able to meet their requirements will surely be found. Do the people of this country exhibit any love for our art? Do our legislators, as representing the people, give encouragement in promoting public buildings worthy of the richest and greatest of modern nations? With what prodigality are iron-clads constructed that are unseaworthy! what niggardliness is exhibited when a building that might be "a joy for ever," is in question.

In tracing the history of any nation, it becomes apparent that its literature and art act and react upon each other; there is a distinct sympathy between them. Compare the literature of Greece, with its architecture, and you find the qualities of the one those of the other,—proportion, symmetry, and harmony. The grandest structures of Rome are but a petrified echo of the orations which resounded in their halls. So was it in the republics of Italy; and so is it, too, in the Britain of today. A few of our architects translate the poem in stone of ancient Greece and Rome into the vernacular; the style of others is influenced by that of the homes of Dante, Petrarch, and Boccaccio; and many give the legends in stone of the Middle Ages a modern significance. The designs for the new Courts of Law, which were the occasion of a new outburst of the cry, were no more copies than were the "Idylls of the King." And such works as the Strand Music Hall, and the Alhambra, in Leicester-square, find their prototypes in "East Lynn," and "Lady Andley's Secret." And many works there are issuing from the press that will not outlive the structures that spring into existence with them.

Our sculptors and painters, too, are engaged *more majorum*. Venus and Cupid, Nymph and Satyr, are year by year produced in marble; and knights in armour and gallants in doublet and trunk hose figure in every exhibition of pictures. Pre-Raphaelitism has had its day, and the classical style is now coming into fashion.

The artist must be in sympathy with the spirit of the hour if the seal of genius is to be set upon his work: he will come in a manner unlooked for, his advent may be nearer than we suspect, the indications of the agenda are faintly apparent even now, I think.

To the furtherance of this desired end one thing is absolutely necessary, and that is, that our architects boldly face the exigencies of modern requirements. It will not do, for example, to assert, as I have heard done, that a church must not have galleries; if such are an indispensable condition, the object of a true artist should be to make that adjunct part of his design, combining the whole into a harmonious work. That an interior, sacred or secular, is more dignified without being so incumbered, is certainly the case; but that one possessing this feature is necessarily devoid of that quality, I emphatically deny.

The study of Greek art is the prelude to the attainment of symmetry and proportion; that of Gothic to freedom, variety, and lofty aspiration. The combination of these would lead to the production of a work of high art. Power restrained within due limits by the exercise of reason and judgment contains the elements of the sublime. Weakness is ever apparent where there is no restraint; but it is not by mere plodding or confining yourselves merely to the work before you, that you will succeed; by so doing the mind is sure to become cramped, and narrowed, and so the capacity to design enfeebled. There

* Miss Braddon, in one of her novels, makes the hero, after coming into possession of a large estate, build "a beautiful stuccoed villa," in place of a Tudor mansion destroyed by fire.

* From a paper read by Mr. W. G. Shields before the Edinburgh Architectural Association on the 8th inst.

is a time for everything, and however busy you may be, a portion of your time should be devoted to literature and science, poetry and music. The man who knows nothing beyond his own profession can scarcely be great in that; but the main object should be kept steadily in the foreground,—the attainment of proficiency in your own particular art.

The successful architect, then, must be a man of cultivated mind; possessed of a vivid imagination, he must be able to conceive, in his mind's eye, how his work will appear when completed, how it will look as seen from different points of view in combination with surrounding objects; for it is a great mistake to suppose that a design, excellent in itself, is suited for every situation. Obvious as this may appear, it is the cause of the poor effect produced by many works of merit; and I know of few cities, the architectural effect of which would not be enhanced by the transposition of some of the buildings in them. Of one thing be assured, if your heart is not in your work, failure is certain; if you do not take delight in your profession give it up ere it be too late. Art is a jealous mistress, and unless you are devoted to her she will reject you.

What has been done, then, to forward the desired result? Is the prospect all bleak? Is there no "silver lining to the cloud?"—No gleam of sunshine to enliven the scene?

There is, doubtless, a large crop of rank rubbish sprung up, but it may serve as fuel wherewith to light us on the way. That we have produced any work of high art in a new style can hardly be affirmed, but it cannot be denied that great mastery over the old styles has been shown by not a few; and we can point to structures which, had they been erected a few centuries ago, would have been looked upon by us as masterpieces. If so, is not this so much accomplished? Compare some of our best works with the cream of those erected at the beginning of this century, and I think it will be seen that some progress has been made. By and by, when every ancient style has been thoroughly mastered, we may look for something new springing up; a thorough knowledge of what has been done is the necessary prelude of what is to do. We must begin with the lesser and gradually proceed towards the greater, ever keeping the highest object in sight, so that each step may be one in the progress to perfection.

Strive on, then, drinking freely as you go from the pure fountain of Nature, wherein the excellence of beauty is ever reflected,—

"A thing of beauty is a joy for ever."

The influence of the masterpieces of Greek art is felt to this day, and will continue to be felt so long as the human race exists; the more remote the period the more difficult will it be to trace that influence; but still it will be there, and so will it be with every true and noble work of art. Here, then, is an incentive to earnest work: the creations of the brain live for ever: the immortality of the soul is no myth.

Art is the aim at perfection, and a work of high art comes nearer to perfection than any other work of man; in it we can tolerate nothing false or mean, "the beautiful includes the good and the true." A new style, if new style there is to be, must be built upon the foundation of both, and the most hopeful sign of the times is the hatred of shams entertained by every real student of art.

Now it is alleged by your commonplace unimaginative individuals (*practical* they call themselves) that art is destructive to usefulness. The reverse is the case; the most beautifully formed object is ever the most useful,—

"It is no part in prudence to decay an art,
And what it may perform decay,
Because you understand not why."

These people mistake a superabundance of ornament for art, and do not seem to be aware that many things "when unadorned are adorned the most," that simplicity is the greatest beauty. This lavish use of ornament is one of the phases of the hour which tend to retard the progress towards the attainment of a new style. If we trace the development of any existing style it will be found that at first ornament was sparingly used, and that in its decadence quantity, rather than quality, is the characteristic of the detail.

"Art is long" there is hope in the future: what is good lives, that which is bad dies; the good which we do will exercise its influence on the art that is to come, the harm will be overcome and set aside. It is a grave error to measure the progress of art by years only; centuries are requisite for its development, and

it is only by taking a broad and comprehensive view of it that a true estimate can be arrived at.

It would require more time than I have at my disposal to make clear what is the true meaning of the phrase "a new style." So gradual is the transition from one style to another that you cannot fix a bard and fast line where one ends and another begins. A language has never sprung into existence at once; but as new ideas, new inventions, and discoveries have appeared, it has gradually developed. And so in architecture, "the language of stones," as new materials have come into use, and new requirements have arisen, new phases and combinations have produced new styles. It is impossible, therefore, I maintain, for any one to create a new style, but it does not follow that an individual may not lend powerful aid towards its formation; there is abundant scope for each and every one of you to exhibit the latest power that is in him.

If I may venture to give a simple hint, I would say that after having acquired a thorough knowledge of the old styles, then throw all books of reference aside, and with plain paper only before you, and pencil in hand, draw a design of the building wanted, with nothing but what is absolutely necessary in its construction; then look to its proportion, and finally to its ornamentation. The result will, doubtless, in most instances, be that the designer will fall into the old rut; but in some few instances a new light may dawn upon the artist. At all events, if the building is structurally true, it will not be altogether contemptible. A plain harsh truth is better than an eloquently-expressed falsehood.

In art, as in politics, there is a party of progress and one that desires no change, of those who strive to create a better state of things, and of those who revere the part and maintain the perfectness of the works of our ancestors. The goal reached by one generation is that from which the next starts; but in running the race it is sometimes advantageous to retrench our steps, for a space, in order to acquire the impetus necessary to surmount an obstacle. This is what we have been doing. Has it been a leap in the dark? For my part, I think we are at the starting-point of a new style.

"There is a history in all men's lives,
Figuring the nature of the times diseased,
The which observed, a man may prophesy,
With a near aim, the main chance of things
As yet to come to life; which in their seeds
And weak beginnings lie intreasured."

INVERNESS CATHEDRAL.

The foundation-stone of this building was laid on the 17th of October, 1866, by the late Archbishop of Canterbury, Dr. Longley, in the presence of five of the Scottish bishops, the Bishop of North Carolina, and about 60 clergymen of the Scottish Episcopal Church. From that time till September of the present year the works were prosecuted vigorously, and were then so far advanced as to permit opening for service. At the ceremony were present the Bishop of Winchester, then Bishop of Oxford; the Bishop of Rochester; and a large number of clergy, both of the English and Scottish Churches.

The work, except the altar, reredos, candelabra, and windows, has been entirely executed by Inverness workmen; and the effect of the cathedral, which stands near the river, is, from whatever point of view, very effective.

The building is in the Decorated Gothic style, and has been erected from the designs and under the superintendence of Mr. Alexander Ross, architect, Inverness. The cathedral is built of a pink freestone from Conon quarry, and the dressings are of a warm cream-tinted stone from Covesea Quarry, in Morayshire. The slates are the Westmoreland green, and were selected to harmonize with the quiet warm tone of the walls. The following are the external dimensions:—166 ft. long by 72 ft. across the west front; the height of the towers is 100 ft.; and the architect's design shows a further elevation of 100 ft. by the erection of spires on the towers. The height to the ridge of the roof is 88 ft. The transepts are arranged after the old Scottish model, to project only slightly beyond the aisles. Viewed from the outside, the building shows a nave, with aisles, transepts, and apsidal chancel of equal height. The chapter-house, of an octagonal shape, is situated at the north-east angle, and at the west end are the towers, carried up to the springing of spires. It is to be regretted that funds are wanting for the erection of these

spires, which are required to finish the external design of the building, and harmonize the whole structure. At the base of the north tower there is a side entrance, and the main entrance is situated between the towers, facing Ardross-street. It is formed of a deeply-recessed archway, in a wall upwards of 8 ft. thick, and is approached by a flight of steps. The sidea are formed of a series of shafts with carved capitals, resting on a dado of rich panelling, and the archway is enriched with five courses of beautifully-carved foliage. A pointed gable rises over this to a height of 35 ft., ornamented with perforated tracery. The doorway is divided by a pier into two openings, and in front of the centre is a column of Peterhead granite, intended to carry a life-size figure of St. Andrew, the patron saint of the cathedral.

Proceeding into the interior by this entrance we find ourselves in a porch, formed by a handsome stone screen fitted with plate glass, and through which the whole extent of the building can be seen.

Passing through the screen, we come into the nave, which consists of five bays, the western one being flanked by the towers. These bays are divided by monolithic columns of Peterhead red granite, 7 ft. 9 in. high by 2 ft. 4 in. diameter, surmounted by foliated capitals of freestone, from which spring the nave arches. Over these run the clerestory windows, consisting of triplet windows, with stone rear arches resting on detached columns with carved capitals. There are twelve lights on each side, with traceried heads, forming, with the columns referred to, a very effective arcade along the upper story of the nave. The transepts are carried, both externally and internally, to the full height of the nave, and the interior stone arches, where they intersect the nave, choir, and transepts, are carried up on clustered columns the full height of the roof, viz., 58 ft., a novel feature in timber roofs, but which has a most satisfactory effect, by giving dignity to the choir, and continuing the line of the nave roof to the end of the chancel.

The choir is raised two steps above the nave, and is divided from it by a low ornamental stone parapet. The chancel rises six steps to the sacarium, in flights of three steps, and two more to the altar, giving the latter a total rise of ten steps from the floor of the nave.

The building is lighted by three five-light traceried windows, measuring 16 ft. by about 30 ft. each, at the ends of the nave and transepts; and further, by double-light traceried windows in each bay of the nave; by triplet in clerestory; by three double-light traceried windows in the apex of the chancel; and by two wheel windows in the ends of the aisles.

The roof of the building is composed of an outer roof to carry the slating, and an inner of varnished red pine, covered and divided by principal complex and ribs over each column into bays, each bay being divided into panels. It is designed for coloured decorations; but in the mean time it is simply varnished, with anticlinal patterns on each panel, to relieve the plain timber.

The nave will accommodate about 800, and the north transept 90; the seating throughout being of pitch pine, varnished.

The flooring throughout, except immediately under the seats, is of Minton's tiles. Those in the chancel and sacarium are extremely rich, being laid in panels, each containing a Scriptural representation.

The heating of the building is by hot-water pipes, passing round the building under the passage floors. Advantage was taken of the space underneath the building to form tunnels, and into these the gas and water pipes are introduced. These tunnels are sufficiently large to allow a man to pass along; so that access can be had for repair to all the pipes without disturbing the tiles of the flooring.

The lighting is entirely by standards, placed at the side of the aisle passages, and between the piers of nave; the chancel being lighted by very good standards of solid brass. These, as well as the gas-fittings of the nave, are supplied by Hart & Son, of London.

In the contemplated event of the windows being filled with stained glass, as memorials, a design was prepared which should illustrate, on the one side, the early life of our Lord up to the period of his Baptism, and on the other his Acts of Mercy, reserving the windows at the east end for illustrations of the Passion, and the three large windows for illustrations of "The Ascension," "The Descent of the Holy Ghost," and "Our Lord in Glory." With the exception of these last, every window—except those in

CAPITALS OF THE NAVE, ST. ANDREW'S CATHEDRAL, INVERNESS.

the chapter-house, vestry, and clearstory—has already been secured by different parties, and the design will be fully carried out. Ten are already in the cathedral, while the others are in course of execution, and will be completed before the end of the year. The preparation of the glass was entrusted to Messrs. Hardman & Co., of Birmingham; and, so far as executed, the windows fully sustain their credit.

The outlay on the building up to the present time, including gifts of furniture and fittings, amounts to 18,000l.

The special gifts are very numerous. The pulpit is a costly work of art, composed chiefly of Caen stone and green marble. It is a gift from Mr. Fontaine Walker, of Foyers; is from a design by Mr. Ross; and has been entirely executed by Messrs. D. & A. Davidson, of Inverness. The pulpit rests on short columns of Abriachan granite, is trefoil in plan, and on the panels are carved three bas-reliefs. The first is a representation of "St. John preaching in the Wilderness;" the centre shows the figure of Christ as "The Good Shepherd," and the third "St. Andrew preaching from his Cross." The subjects are separated by columns of green marble, and between these are figures of angels,—the one holding a palm branch, the emblem of victory; the other, a lily, the emblem of purity. The cope is formed of green marble.

The altar is the gift of the Primus, and Mr. Fletcher, of Rosehaugh, gives the retables. The front of the altar is formed by trefoil arches, supported on serpentine marble shafts, the panels between the columns being of alabaster; the centre one containing a cross of pure white alabaster, set with crystals. Those on the right and left contain the "Lamb of God," and "The Pelican" respectively. The spandrels are relieved by crystals of Derbyshire spar. The top of the altar is formed of a single slab of Caen stone, with incised crosses at each angle, and also in the centre. The super-altar is composed of rich alabaster slabs. The retables is formed of Caen stone, and rises a height of 17 ft. 6 in. The lower portion, forming the altar background, consists of rich incised diaper work. Above rise three arches, enclosing panels, containing a subject in alto-relievo in each,—in the centre, "The Crucifixion," and on either side "The Agony" and "The Resurrection." Purbeck marble columns support these arches. Over the centre panels rises a richly-carved and crocketed gable

terminating in a cross, flanked by buttresses, resting on spiral columns of white alabaster, jewelled. These buttresses run up into carved pinnacles, and are surmounted by the figure of an angel. The sacred vessels for the Holy Eucharist, the handsome candlesticks, and the other altar furnishings are the gift of Miss Charlott's Temple, Aberlour. They consist of the flagon and ewer, of ruby glass, set in silver, gilt; the chalice of solid silver, gilt, and studded with pearls and carbuncles; two patens, both of solid silver, one gilt; the brass alms-dish; polished brass candlesticks, studded with crystals and carbuncles; polished brass cross, set with carbuncles; two flower-vases, beautifully painted; and a double set of the necessary linen. The altar-desk is of solid brass, and has been presented by Miss Macsedilia, placina, and ordence have only been temporarily fitted up. The altar-rails and sanctuary standard lights are of solid brass, given by Mrs. Perry, Devon Cottage, Inverness. They are very fine specimens of work. There are twenty-five lights on each standard, the ornamental foliage being of beaten brass, set with crystals and carbuncles.

On the south side of the entrance to the choir is the lectern, a very fair specimen of brass work, the gift of the Rev. G. S. Simcocks. The litany-desk is made of solid British oak, massively framed, and carved, with pillars and capitals. The panels contain various devices. It is the gift of the Misses Shilleto, Inverness. The bishop's throne—the gift of Mrs. Campbell, Devon Cottage—is placed at the south-east angle of the choir. The form of the cathedra or chair has been adhered to, with an attached prayer-desk in front. It is made of solid oak, moulded and carved. The back is 7 ft. high, and finished with figures of angels on each post. In the centre of the back on a shield are placed the arms of the Bishop of Moray and Ross, surmounted by a mitre. The prayer-desks for the officiating clergy are placed next the nave, and the Provost's stall is at the north-east angle. There are besides twenty-two stalls for clergymen, and twenty-two seats for choristers.

The organ, the gift of Miss Macpherson-Grant of Aberlour, has been made by Messrs. Hill & Son, of London, under the superintendence of Professor Oakeley. It is placed in the south transept, and contains the following stops:—

GREAT ORGAN—CC TO G.

Feet.		Feet.	
1. Bourdon	18	6. Wald Flute	4
2. Open Diapason	8	7. Twelfth	3
3. Cone Gamba	8	8. Fifteenth	2
4. Stopped Diapason	8	9. Mixture, 3 ranks	13
5. Principal	4	10. Trumpet	8

SWELL ORGAN—CC TO G.

1. Bourdon and Double	16	5. Mixture, 3 ranks	0
2. Open Diapason	8	6. Cornopean	8
3. Stopped Diapason	8	7. Oboe	8
4. Principal	4	8. Vox Humana	8

CHOIR ORGAN—CC TO G.

1. Dulciana	8	4. Suabe Flute	4
2. Gedact	8	5. Clarinet	8
3. Gemshorn	4		

PEDAL ORGAN—CCC TO E.

1. Open Diapason	16	3. Violone	8
2. Bourdon	16		

COUPLERS.

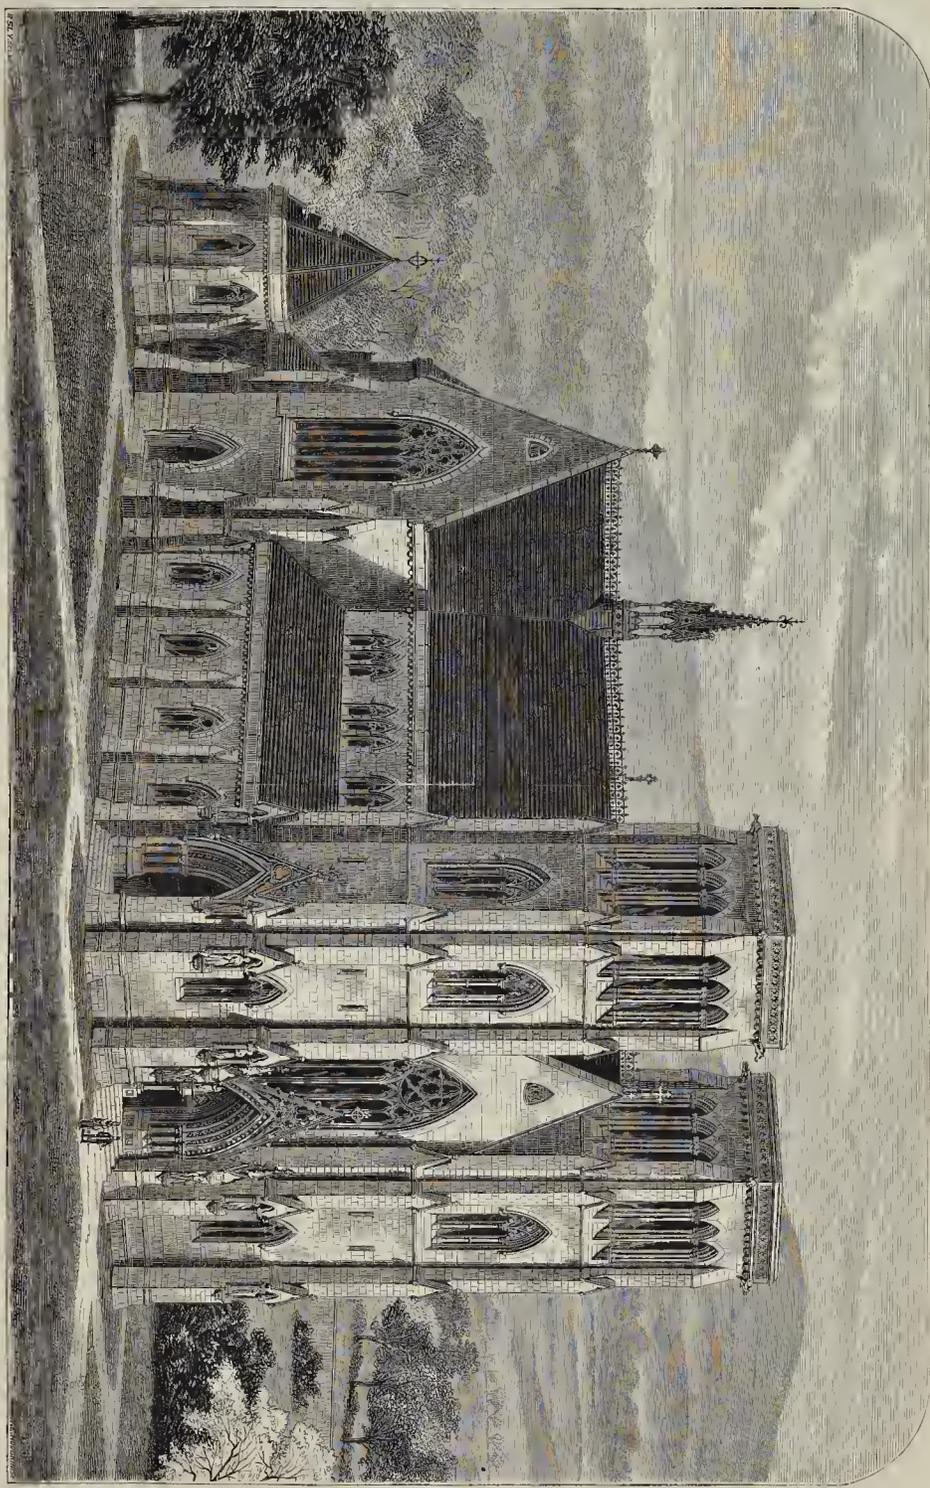

1. Swell to Great Organ.	3.	Swell to Pedal.	
2. Swell to Pedal.	4.	Choir to Pedal.	
Three Composition Pedals to Great Organ, two Composition Pedals to Swell, Tremulant on Swell.			

It is contemplated to place a peal of eight bells in the north tower. The tenor, of 20 cwt., is the only one as yet hung. The estimated cost of the peal is 800l.

Mr. William B. Mackintosh was clerk of the works. The various contractors were:—Mason, Mr. Andrew Fraser; carpenter, Mr. G. B. Mackintosh; plumber, Mr. Simon Mackenzie; slater, Mr. John Russell; plasterer, Mr. Allan Mackintosh; painter and glazier, Mr. Donald MacDonald; stone-carving, Messrs. D. & A. Davidson, all of Inverness; the retables, Mr. Earp, of London; standard and altar rails, Messrs. Hart, Son, Peard, & Co.; tiles, Messrs. Minton, laid by Mr. Hawley, of Edinburgh; heating, the Inverness Iron Company; stained glass, Messrs. Hardman & Co., of Birmingham; clearstory glass, Messrs. Powell; bells, Messrs. Warner & Son; organ, Messrs. Hill & Son, all of London; bishop's throne, Mr. Andrew Fraser; litany desk, Mr. Ritson, both of Inverness.

Much remains yet to do; but, from the want of funds, the committee are obliged to pause for the present. The completion of the spires is estimated to cost 1,600l.; enclosing walls and entrance gates, 300l.; besides sedilia, font cover, interior painting and decorations, &c.

We give a view of the building from the Castle-hill, and a representation of two of the capitals of the nave. In our last issue we published the ground-plan.

ST. ANDREW'S CATHEDRAL CHURCH, INVERNESS.—MR. ALEXANDER ROSS, ARCHITECT.

THE WORKMEN'S INTERNATIONAL EXHIBITION, 1870.

WE have received a letter from the honorary secretaries of this Exhibition, Messrs. Auberou Herbert, Thomas Paterson, and J. W. Probyn, in which they say:—

"The Council of the Workmen's International Exhibition, to be opened on the 7th of July, 1870, at the Agricultural Hall, Finsbury, has determined to send a conference of delegates from the towns of the United Kingdom, and of other countries, on the 10th of January next, at the rooms of the Society of Arts (in John-street, Adelphi), which have kindly been lent for that occasion."

The subjects to be considered will relate to the method of arrangement of this Exhibition; the system of prizes, and appointment of jurors; the opening of workshops in the Exhibition; suggestions, &c., from local committees; and the means to be adopted to make the Exhibition promote the interests of technical education.

Mr. Mundella, M.P., and Mr. S. Morley, M.P., will successively occupy the chair during the day's sitting.

The following among other resolutions will be moved:—

"That the principles laid down in the prospectus of the Workmen's International Exhibition of 1870, which require the worker's name to be attached to the article produced, are both just and useful; as tending to give workmen their share in the credit of production, and to increase the pride and interest which attach to skilled labour."

"That it is of the highest importance to develop amongst all the people a true perception of what is beautiful in colour and form, and a scientific knowledge of the machinery and material employed in existing industries."

The Council will provide accommodation for the night of the 10th of January for those delegates who wish them to do so, and will otherwise do all in their power to facilitate the attendance of their visitors, on receiving communications on the subject.

WIDENING LONDON BRIDGE.

THE Common Council have given permission to Messrs. Farren & Featherstonhaugh to submit designs for widening London Bridge to 88 ft. Their proposition is to sink caissons to low-water mark, the width of the present piers, in front of the end of every pier, and as close to their cutwaters as the foundations will allow: to fill these with concrete and brickwork in cement in the usual way, and connect the new work with the old at Trinity low-water mark spring tides; and to erect upon these foundations piers and cutwaters faced with granite ashlar, in courses exactly corresponding to those in the existing piers, so that when complete the piers would present a perfectly uniform appearance, but would be 40 ft. longer than at present, 20 ft. having been added at each end. These piers would carry iron girders corresponding in form with the arches of the present bridge; one of these girders would be placed close against the face of each of the existing arches, altogether concealing the masonry faces of the present arches. Upon the girders supported by the piers a superstructure would be formed carrying the footpaths, parapets, lamps, recesses, or pedestals for statues, &c. So that if the bridge were altered as suggested, it would appear as a granite and iron bridge with five arches, retaining its present shape, approaches, and levels. The estimated cost is put at \$0,000.

NORTHERN ARCHITECTURAL ASSOCIATION.

At the last meeting, on the 10th inst., Mr. F. Charlton in the chair, the following officers were elected:—President, Mr. A. M. Dunn; vice-president, Mr. R. J. Johnson; honorary treasurer, Mr. F. Charlton; honorary secretary, Mr. Thomas Oliver; honorary solicitor, Mr. G. W. Hodges; committee, Mr. J. E. Watson, Mr. C. H. Fowler, Mr. J. Hogg, Mr. M. Thompson, and Mr. W. Parnell. The secretary drew attention to the report of the Architectural Alliance, but as it was a voluminous pamphlet, he recommended that it should be reported upon by the committee, and it was agreed to. He also drew attention to the proposed establishment of an association of younger men, and hoped, if they could see their way clear to it, they would become connected with the Northern Association. The members of the class could have that room, they could have the benefit of the books of the association, and also of the instruction certainly of Mr. R. J. Johnson, the vice-president, and the president, Mr. A. M. Dunn.

A short discussion ensued upon the question of the suggested class, and it was pretty generally understood that should the members of the society recently formed apply to the Northern Architectural Association, they would be admitted as associates, and reap, for the small entrance subscription, the benefits of the society. The discussion (to be introduced by the ex-president) "On the Principle involved in the Establishment of Professional Charges for Valuations in connection with Compensation Cases," and the paper by Mr. Oliver "On Architectural Retrogression in the North of England," were deferred until the next meeting.

CONSECRATION OF ST. LUKE'S CHURCH, NEW KENISH TOWN.

On Saturday a church was consecrated, in lieu of the old church of St. Luke, King's Cross, which was demolished by the Midland Railway Company in making their station at St. Pancras. The new building is situated in Kenish Town, to the west of the Camden-road. It is in the Early English style, and is constructed of red brick in the main parts of the structure. Stone is, however, used in the interior around the windows, for the ribs of the groining, and for the span of the arches. The dressings are of Tisbury stone, supplied by the Wardour, Chilmark, and Tisbury Stone Company, London.

The chancel is groined, and the nave is separated from the side aisles by four bays, with marble pillars on each side, surmounted by a clearstory. The interior roofing is wagon-shaped, and of timber. A square tower marks the intersection of the chancel and nave. Beneath it are the reading-desk on the south, and pulpit on the north side; and in the sacristium are three sedilia, a piscina, and a credence-table.

The sum of money paid as compensation by the Midland Company was not sufficient to rebuild the edifice, and there still remain about 1,400l. to be cleared off before the church will be free from debt. Mr. Champneys (a son of the Dean of Lichfield) was the architect.

THE DISPOSAL AND PRODUCTS OF DRY SEWAGE BY BURNING.

THE production of gas by burning and distilling dry sewage in India has excited some interest in this country. A pamphlet giving an account of "the carbonisation or dry distillation system of conservancy," by W. R. Gilbert Hickey, C.E., of Darjeeling, the inventor of the system; with a note on dry sewage, by F. J. Monat, M.D., inspector-general of jails in the lower provinces of India, has been printed at the *Darjeeling News Press*. Mr. Monat speaks very favourably of Mr. Hickey's process, and Mr. Hickey thus speaks of it himself as "the carbonisation or dry distillation system of conservancy."

"This system proposes to render filth of all kinds innocuous, by carbonising in close retorts,—using the residue in the retorts for deodorising fresh filth in transit to the apparatus, utilising it and the products of the distillation for manure. The gas being available for heating or lighting purposes, or for both.

- The system may be divided under three heads.
- 1st. When the gas is to be utilised only for heating the furnaces.
 - 2nd. When the gas generated from the filth itself is to be partially or entirely used for illuminating purposes.
 - 3rd. When the gas from the filth is to be utilised for heating the furnaces, and fresh gas made at small expense for illuminating."

The filth carbonised by these systems, Mr. Hickey remarks, is at once and for ever rendered innocuous even on its journey to the apparatus. It can never regain any of the objectionable qualities of filth. The vitality of all organic bodies is destroyed. The poudrrette (carbonised residue in the retorts) is a black powder, perfectly free from smell, and is an admirable deodoriser for solid and liquid filth.

The gas yields a very brilliant light, and is perfectly unobjectionable. The poudrrette and the refuse in the condenser, &c., contain animal and vegetable charcoal, with phosphates, carbonates, and sulphates, of potash, soda, magnesia, lime, iron, &c., the mineral or earthy materials of plant food, and also ammonia and carbonic acid. The price cost of the apparatus, he says, is trifling, and the system will be self-maintaining as regards fuel for the furnaces.

By means of a desiccating or evaporating pan on the top of the furnace, and mixing some

hydrochloric acid with the refuse from the hydraulic main, sal ammoniac may be made in large quantities.

He claims for his invention that it is perfect in a sanitary point of view; that it is economical; that the manure is of first quality, portable, and innocuous; and that the gas is luminous and innocent; and that the poudrrette is a perfect deodoriser for solid and liquid filth.

ON THE PUBLIC WORKS DEPARTMENT OF INDIA.

IN your article of October 30th, attention is drawn to the manner in which the Public Works Department of India is carried on. A few observations on the salient faults of the system may not be out of place.

Up to comparatively lately the East-India Company were so occupied with the extension of territory, that it was necessary almost every man in their employ should be a military man, at a moment's notice to throw aside the pen and the rule, to gird on the sword; to be more capable of attacking and defending positions than of erecting civil works. Hence, it followed, military engineering was the only road to preferment. As territories were subdued, it became necessary to make roads: on occasions so engineering was to be had.

Officers of the other branches of the service, who at school had obtained an inkling of surveying and military engineering, professed their services. With the energy of young men placed in difficult positions creditable work was accomplished. As a reward they were kept to engineering duties.

On the demand for the greater extension of public works, engineers of all classes were pushed up by the rules of seniority into high positions, and had to undertake the construction of works for which many of them had not knowledge. Thus it is, that men who had earned high position by gallant and faithful service in the field, lost their good name from failing to carry out works they were never brought up to.

The Public Works Department is composed of men of different grades, but all depend for their position on knowledge of the surveying branch, which enables that service to be carried out in as able a manner as in any part of the world, as each one has to work at it, and is master of the subject; but the constructive branch presents a contrast, from none of the department having been educated in the art of building.

The officer brought up at Addiscombe, and sent out to India, has not been in a position to learn the practical part of building, but is only acquainted with it theoretically, and all subsequent knowledge is only obtained from the natives, the very ones he is supposed to teach. The civilian engineers educated in India are in a like position.

As plans are prepared at head-quarters, the probability is a resident engineer has only to erect a building (the word building is meant to include every description, from hangarons to bridges) similar to what has been done before, the cases cited of buildings falling are solely owing to faults in construction; and, from having charge of a large district, perhaps 100 miles in one direction by 50 in another, he can not visit it now and then. An overseer, perhaps an excellent man for laying out and repairing of roads and keeping accounts, is put in charge; but, being entirely ignorant of building, the construction is left entirely to the native workmen, who are not very particular about building perpendicular and straight. As the bricks are very soft, it is easy to edge the walls, if they will get wide at the top than the bottom. Also, they are not at all particular about the bond. Very often the walls are built with mud, only the top course and wall-plate being laid in mortar. Saplings are at times used for the rafters. In these cases it is but a question of time for the roof to come down, as white ants are sure to get into it.

The difficulties to be contended against in the construction of works, and the incessant minute attention required, are only known to those who have encountered them. The facilities afforded by residing in towns is no criterion for the country at large.

The faults of the present system are, that the members of the engineering staff are all brought up to one department of their profession, leaving up to one department of their profession, leaving up to one department of their profession, leaving up to one department of their profession for a man who only understands building, and native

workmen are expected to carry out English design.

The remedy is to divide the Public Works into two departments: one for the surveying, road-making, &c.; the other for works of construction. To form this latter, inducements must be offered, for such men as clerks of works, foremen, &c., who have a thorough practical knowledge of the trade in all its branches, who can use their hands as well as their heads, to enter the service. To obtain them, liberal terms must be given, and no demands made as to proficiency in languages. The advantages would be great. The Eurasian, whose ambition is now to be a road overseer, would be taught the European method of building, and would learn that the craft he now despises is as great a science as that of surveying; the native would learn that, wonderful as are the buildings erected in former ages by his forefathers, the method is too cumbersome for the present age. A new era has arisen in his craft as well as in that of English policy in India.

MIKROS.

SYMMETRY, IN REFERENCE TO SOUND.

Sir,—Referring to Dr. Rawson's paper on the above, I am unable to see what is gained by considering the squares of the numbers instead of the direct relation of the numbers themselves to each other. If the latter be in proportion to one another, will not their squares be so of necessity (but geometrically, not arithmetically)? Agreeing with the principle that the length, breadth, and height of apartments should bear proportions to each other in whole numbers rather than in broken ones; as 6, 4, 3, rather than 6, 4, 3, for instance, I would point out, in addition, that this brings all the surfaces of the room into proportional relations. In a room 24 by 16 by 12 (proportion 6, 4, 3), the floor and ceiling are each 384; the side walls, 288; and the end walls, 192; or in the proportion of 4, 3, 2—still whole numbers. Is not this circumstance more likely to influence the acoustic properties of a room than the arithmetical relation of the squares of the numbers to one another; the former being in fact what constitute the room, and the latter being non-existent materially?

I beg to suggest, however, another system, in which the dimensions bear a geometrical relation to one another, viz., by using the square and its diagonal, or the base and height of an equilateral triangle. By the former, a room 24 ft. long would be 17 ft. wide and 12 ft. high (not exactly, but sufficiently near for practical purposes), and the wall, &c., surfaces would bear also geometrical proportions (in figures 408, 288, 204, or as 34, 17, 12).

By the equilateral triangle it is believed that the section of Milan Cathedral was determined, and some indeed consider it to have been used generally in the Middle Ages.

W. R. COBSON.

A PLAN FOR WIDENING THE STREETS.

Sir,—The plan proposed by Mr. Fred. Taylor requires careful consideration before it be pronounced upon.

Practical experience has not shown that it is desirable in large towns to have covered pathways in the public thoroughfares, as they usually become the resort of not the most respectable portion of the community, possessing an attraction from the partial seclusion they afford, and as a shelter in all seasons. But as a temporary remedy for the evils of our crowded thoroughfares, a plan open to fewer objections might be suggested.

The number of columns to support the upper line of houses would, as shown in the diagrams, most materially intercept the light to the shop windows, which are 10 ft. from the columns, greatly to the disadvantage of the unfortunate who would be compelled to work partially or wholly by gaslight.

If the streets are to be widened by taking a portion of the shop frontage and converting the space into a covered caseway, attention should be directed to three important matters, viz., the adoption of a plan giving the maximum amount of light and ventilation, and the least obstruction to a crossing traffic.

The diagrams show the minimum of each, and a heaviness of cloth, combined with great loss of light and ventilation, would be the inevitable result.

The number of columns should be reduced and the height increased, and instead of 9 ft.

apart, a distance of 30 ft. or more is desirable. The upper line of houses might be supported on wrought iron horizontal girders, the depth for which would be found between the top of the columns and the under-side of the sill-line of the windows above, and the width in a partial projection of the girder as an ornamental front, and in the thickness of the brick and stone wall to be supported.

A very handsome and elegant effect might be obtained by a judicious treatment in design of the columns and the front of the girder, and the result desired would be attained, probably, in the most satisfactory way. To give additional light, the girders might be pierced at intervals of 10 ft., and a circular light introduced, which would occupy a space between the lower flange of the girder and the floor-line above, giving light to the upper portion of the shop-windows, which would otherwise be in shadow.

The shops in the narrow streets are probably already too small for the business transacted therein; and if a space of 10 ft. is taken from the front, the gutting and reconstruction of the whole of the ground-floor would be necessary, and it is questionable in many cases if the area available would permit so large a space to be abstracted.

The cost would be much greater than appears at first sight, and ultimately the money spent would not confer, I fear, advantages of sufficient magnitude to warrant the outlay.

JOSEPH S. FORBES.

UNEMPLOYED LABOUR.

Sir,—At this period of the year, when over 100,000 hands are out of work, and the pressure upon the money market has shut up private sources of work, an observer of the desolation apparent upon the site chosen for the Law Courts begs to suggest, through the *Builder*, the expediency of redeeming some of the time already lost by setting to the works with a will. The employment of even 100 men would give stimulus to trade, and perhaps lead to the engagement of 500 hands more in tributary employment; it is hard to see great public works slumbering whilst so many operatives are idle at this inclement season.

EDIFICATOR.

THE ART-UNION OF LONDON.

The Art-Union Council have issued their capital little Almanac for the coming year, containing, as we have often said, information on societies and collections in connexion with matters of art and science, not to be found collectively noted elsewhere. Every subscriber of one guinea will receive, besides the chance of a prize, a beautiful volume of twenty illustrations of "Hereward the Wake," drawn by Mr. Henry C. Selous, a volume intrinsically worth much more than the amount of subscription.

The *New York Citizen and Round Table*, gives an Art-Union anecdote. The writer says,—"Among the pictures purchased by the American Art-Union for distribution in 1845, were three pictures by Mr. George Harvey (formerly a resident of this city, but now living in England, and a good artist), one of which was a flower-piece. As a return for the compliment paid him by the association, Mr. Harvey subscribed for three chances in the Art-Union, placing his own name down for two, and for a little girl of his acquaintance the name of Daisy, presenting her with one of the tickets. When the distribution (by lot) took place, the flower-piece by Harvey became the property of his little friend Daisy; but the most singular circumstance of all was that the companion of the said picture had been purchased by the father of the child, so that a pair of the artist's productions are now hanging side by side in the same drawing-room." The *Comopolitan* adds, "We have heard Mr. Harvey tell a similar case, which occurred to his sister in England, to whom he had made a present of two tickets in the London Art-Union. The first one gained nothing beyond the sugar print given to every one. The next year his sister stipulated with Mr. Watson (assistant secretary), that by paying 7s. in addition to the ticket (we think that was the sum), she could have the statuette which she desired to possess. Mr. Harvey persuaded her not to conclude the bargain till after the drawing of the prizes. Her ticket drew the statuette." We could relate dozens of such coincidences.

We have received a letter from New Bedford, Massachusetts, United States, wherein mention is

made of the interest with which a landscape of English scenery, by W. Laker, gained in the last distribution of the London Art-Union by Mr. C. Hazleline, of New Bedford, has been viewed. The wide-spread relationships of this Association are amongst its most interesting and valuable characteristics.

GASIELLERS IN THEATRES.

FEELING sure that theatrical managers are ready to abate any supposed risk of danger to their patrons, allow me to point out to those whom it may concern the following risk easily removed before being too late. Some of our theatres have large central glass gaseliers, with pendants, which are, by the draught of air drawn up, in a constant swinging motion. Friction is going on with the slight supporting wires, and sooner or later a few of the pendants will quietly drop on the head of an attentive auditor, and may cause a scene never contemplated by any when first entering the theatre. A word from you, I am certain, will be sufficient to lead to a remedy.

S.

IMPROVEMENTS IN BUENOS AYRES.

THE municipality are seeking to raise a loan of 35 million piastres, to carry out some important public works which will amount to 24 millions, and the rest is required to cover the deficit of the ordinary expenditure for 1870. Nothing can be more landable than this disposition to improve the state of the city, but those who know most about it see great difficulties in the plan, and urge that it would be better for the municipality, instead of raising 35 million paper dollars for contractors in the shin-plaster way intended, to negotiate with some respectable London firm for the whole job at a million sterling. The public will have every confidence that the money is not squandered, and that the improvement will be done in a workman-like way.

The proposed works are the following:—

	Piastres.
New Men's Hospital	4½ millions.
New Cemeteries	3 "
New Law Courts or Cabildo	2 "
Paseo Julio decorated	2 "
Plaza Victoria	1½ "
Lunatic Asylum	1 "
Lazzaretto	2 "
Taving the Suburbs	5 "
New Plaza	1½ "
Repairs (old) Men's Hospital	1 "
Town-hall	½ "
Total	24 "

Besides the sum of 69,000*l.* already laid out on the waterworks, the estimates for extending the water supply, and draining and paving the city, are:—

Waterworks	£ 35,000
Drainage	839,748
Paving	178,571
	£272,317

Mr. Oogblau's waterworks are said to be a great success.

THE TREATMENT AND UTILISATION OF SEWAGE.

THE Hon. Secretary to the Committee of the British Association on the Treatment and Utilisation of Sewage, Mr. G. F. Barnes, has issued a circular in which he sets forth the circumstances under which the committee were appointed, at the meeting of the British Association at Norwich, for the purpose of reporting on the treatment and utilisation of sewage. Through the kindness of her Majesty's Government, the committee have been enabled to obtain reports respecting the methods of dealing with town refuse practised in most civilised countries, and information has now been collected in a more complete form than hitherto existed in any country. This preliminary work having been completed, the committee was reappointed at the meeting of the Association, this year at Exeter, and they now propose to investigate the entire subject in all its bearings,—whether chemical, physiological, or engineering, sanitary, municipal, or agricultural,—and in a manner worthy of the body they represent. Properly to carry out such an inquiry to a practical end, numerous observations, gaugings, and experiments, aided by simultaneous analyses, are essential; and these cannot be accomplished, especially the analyses, without the continued aid of efficient and therefore highly-paid assist-

CHERTSEY CHURCH.

The old parish church was re-opened on the 2nd inst., after a complete internal cleansing, and restoration of the nave and chancel, and repairs of the roof, at a cost of £1,300. The ground-floor of the nave has been re-seated throughout in oak; the galleries in the nave, which contain private pews held under an Act of Parliament, have been repainted, and the pews in part cut down. A new pulpit by Messrs. Farmer & Brindley has been erected at the cost of Mr. T. J. Worthington. Messrs. Herring & Son, of Chertsey, presented the hot-water heating apparatus. A recess in the east wall, with columns of Devonshire marble, and oak seats for the choir, have been put in the chancel, the ancient oak roof of which has been thrown open by removing the ceiling. The floor of the chancel has also been raised.

The nave was built in a curious manner in 1808. Across the church, at a point where the columns and buttresses were designed, strong oak beams were laid resting upon wooden frames, and on these stout posts of whole timbers were erected, which carried the massive wooden roof and plaster vaulted ceiling. Rumour says that the contractor then drew the money that was due on "covering in" the building, and disappeared. The walls were afterwards built so as to enclose the nave, and the external upright timbers were encased in the buttresses.

The work has been executed by Messrs. Doye, Brothers, from the designs and under the superintendance of Mr. Bishall, of London.

AUCTIONEERS AND PUFFERS.

GILLIAT V. GILLIAT.

The question in this case, tried in the Rolls Court, was of interest to auctioneers and others having to do with sales of land by auction. An estate in Sussex was offered for sale by auction by Messrs. Norton, Frist, Wainey, & Co., subject to a reserved bidding fixed by the judge, and this was stated in the conditions of sale, in compliance with the requirements of the Sale of Land by Auction Act, 1867. Mr. Bridges, to whom the estate was knocked down for 29,000*l.*, having found out that a "puffer" was employed, although no right of bidding on behalf of the owner was reserved, contrary to the provisions of the above Act, took out the summons to the puffers. It was proved that a "puffer" had been employed, who had bid on himself and made in all four bids, though he did not go beyond the reserved price.

Sir Richard Baggeley, Q.C., Mr. Jessel, Q.C., Mr. Whitehorse, and Mr. Langworthy appeared in the case.

The Master of the Rolls said that the Act was clear to the effect that sales should be void in equity as well as in law where a "puffer" was employed, although no right of bidding on behalf of the owner was reserved. The sale must be set aside, and the deposit returned.

CHURCH ARRANGEMENT.

Sir,—May I venture to suggest that "Galilee" is the proper term for the western entry of Inverness Cathedral (which resembles the plan of Melbourne Church) rather than "narthex," or "cloister," both of which are inappropriate. The word "chantry" is evidently an oversight on the part of the architect, in conjunction with a vestry, or any sacred building of the reformed church.

May I urge, in unison with Dr. Rawson's letter, how desirable it would be to have a large organ set free for music adapted to its capabilities, and a small choir-organ to accompany the chanting, psalms, services, and anthems, near the choir. At Meaux Abbey, in England, such was the custom before the Reformation, and in the north of France it is still observed. The huge organs now in vogue are utterly out of proportion to the size of the choir of singers, whom they overpower, and are too often insisted upon merely for the sake of display in performing elaborate music. They occupy a great amount of space, and constitute a piece of furniture for which it is difficult to find room.

MACKENZIE E. C. WALKOTT.

THE LEEDS VOLUNTEER ARTILLERY HEAD QUARTERS.

A BUILDING for this purpose is about to be erected on the drill-ground of the Leeds Volunteer Artillery, Fenton-street, in that town, from the design of Mr. James Fox, C.E.

It will include on the ground-floor:—Drill-shed, (inside) 120 ft. by 83 ft.; armourer's shed, 18 ft. by 18 ft.; armoury, 30 ft. by 18 ft.; adjutant's room, 18 ft. by 17 ft.; orderly-room, 18 ft. by 17 ft.; non-commissioned officers' room, 17 ft. by 15 ft.; harness-room, 15 ft. by 10 ft.; sitting-room, 18 ft. by 13 ft.; kitchen, 15 ft. by 13 ft.; and on the first floor,—mess-room, 45 ft. 6 in. by 18 ft.; quarter-master's store-room, 59 ft. by 17 ft.; vestibule and stairs, 18 ft. by 15 ft.; officers' room, 17 ft. by 15 ft.; dressing-room, 15 ft. by 10 ft.; bedroom, 18 ft. by 13 ft.; ditto, 15 ft. by 13 ft.; promenade, 18 ft. by 10 ft.; balcony, 30 ft. by 4 ft.; band-room (in open yard on ground), 25 ft. by 16 ft.; two rooms in tower, each, 12 ft. by 8 ft.

The building, which will be of stone, and with some pretensions, professes to be Norman in

style, with tower over an open porch in centre, the whole desperately battlemented. While we are glad to recognise the evidence such a building shows of a liberal spirit, we cannot refrain from expressing a hope that the design may be revised before it is put into stone. The proposed building on paper has a toy-like, not to say gaudy, aspect.

EUSTON SQUARE.

Poor Euston-road is losing one of its lungs. The north lung—in other words, the northern part of Euston-square, to all appearance, in the hands of the railway company; boarded in, dug into, and cut about, and I am afraid not to improve the breathing of the inhabitants. Some say it is for a road to the station; the deep digging appears to say no to this. Others think it is for the station itself. What do you, Mr. Editor, say? Can it be possible that the central third part of that side of the square is to give way to another monster building, both in size and look, as the one a little higher up the road? To stop it I am afraid is too late, according to the saying, "that possession is nine parts of law;" then I ask, how many points has law? Perhaps the railway will answer, "Nine, only; and we have them all." I long to hear what is to be this new feature in our street despoilation.

S.

FOR TAKING STAINS OUT OF WHITE MARBLE.

In answer to your correspondent's inquiry, as to the most effective method of taking stains out of marble, I have generally found the following recipe the most effective, viz. :—

- 1 gall.
- 1 wineglass of soap lye.
- ½ wineglass of turpentine.

Note.—The mixture must be made into a paste with a little pipe-clay. Spread the marble with this, which should not be removed for a few days, and if on wiping it off the object is not effected, a second application will generally be found sufficient.

GEORGE HAND.

"CABBY" IN LITCHURCH.

At the usual monthly meeting of the Litchurch Local Board, Mr. Thompson, the chairman, referred to the recent endeavour of the Board to get the Midland Railway Company to provide shelter for the cabmen at the station, and said that he had noticed a paragraph in the *Builder*, which stated that the experiment had been tried in Edinburgh, where an erection for the accommodation of the cabmen at one of the stands had been raised by public subscription, and had been attended with good results. Cabmen, in consequence of their exposure at the cab-stands to all kinds of weather, were great sufferers from consumption, acute chronic rheumatism, and bronchitis, aggravated by their intemperate habits, which, there could be no doubt, were indulged in under the (greatly mistaken) belief that intoxicating liquor was a great preventive against cold. The *Builder*, he was glad to say, hailed with pleasure this movement in favour of poor "cabby."

Mr. T. Roe, jun., had no doubt some good would result from their late application to the Midland Railway Company, and that even in Derby something would ultimately be done to provide shelter for the cabmen.

COMPETITIONS.

Bexley Church Competition.—The committee for building a church at Bexley Heath are obtaining for themselves an unenviable notoriety. After receiving designs from Messrs. Walford & Eville, and Mr. Hewitt, they invited a competition, to which 79 architects responded, from amongst whom they then selected the following gentlemen to re-compete, the majority of whom, if not all, sent in drawings:—Messrs. Joseph Hewitt, H. W. Burgess, C. H. Cooke, Walford & Eville, Price & Linklater, Wigginton, E. L. Blackburne, Drury, Goodchild, Knight, Joseph James, and T. E. Knightley. A pledge had been given that the committee would call in an architect to assist them in their selection, and Mr. W. Burgess was appointed by them to do so. This gentleman selected three as best deserving consideration, the mottoes being "*Veritas vincit*" (1); an oval with orb and cross in it (2); "*Simpler sed*

Veritas" (3). The committee, however, by a narrow majority, threw overboard the three named by their referee, and have, we believe, made a selection for themselves. At any rate, the honorary secretary, Mr. Blyth, resigned his office, as his predecessor in that office, we understand, had done before.

Ventnor Cemetery Competition.—The designs selected by the Burial Board have been rejected by the Bishop-Elect of Winchester, his lordship requiring the buildings to be detached. Mr. Newman, the architect, has, therefore, been instructed to so modify his plans as to comply with the hishop's requirement, and the consequently altered views of the Board now is to have two distinct but uniform chapels, one placed conveniently on the consecrated ground, and the other on the unconsecrated portion.

Printers' Almshouses.—We mentioned the decision of this matter last week. Considerable dissatisfaction is expressed on the ground that Mr. C. Bell's design was not selected as the best, but that by a small majority he was appointed architect to carry out the work. Every competition appears to bring its scandal.

THE ARCHITECTURAL EXHIBITION SOCIETY.

A STRONG appeal is to be made to the profession generally for earnest support to prevent the collapse of this institution,—in the proper maintenance of which all are interested. We shall hope to find it responded to with warmth.

FROM NEW ZEALAND.

Dunedin.—A Presbyterian church is now in process of erection at Dunedin, the capital of the Scottish colony of Otago, on the south-east side of Middle Isle, or New Munster. The edifice is called the new "First Church." It occupies a prominent site in the centre of the city, within a large reserve set aside for church purposes at the time the province of Otago was first colonised. The foundation stone was laid by Dr. Burns, who accompanied the first colonists, in 1848, to their new home in this distant isle. The length of the building now erecting is, over all, 173 ft., its width 91 ft., and its height inside from the floor to the top of the exposed work, 51 ft. The tower in front is 20 ft. square, independent of the buttresses, and its height 180 ft. About 50 ft. of the rear end of the building, at a reduced width, is intended for a lecture-room. The church is being built of white stone, known as Oamaru stone, with inside lining of brick. The cost is 11,000*l.*, and when completed the church will be the largest ecclesiastical structure in New Zealand. The building was begun in January, 1868, and its walls are now some 12 ft. above the foundation. The architect is Mr. R. A. Linton; and the contractors are Messrs. Hunter & Goodfellow.

CHURCH-BUILDING NEWS.

Bampton.—Clanfield Church has been for many months closed for repairs and restoration, and has been re-opened. The plans for restoration were drawn up by Mr. John Laker, of Faringdon; the contractor for the church was Mr. Smith, of Highworth, and for the chancel Mr. H. J. Clinch, of Charlton, near Islip, son of the churchwarden of Clanfield.

Ryde (Isle of Wight).—The new parish church is making satisfactory progress. When the corner-stone was laid on the 4th of August last, the walls were up to a level with the top of the plinth. Shortly after the ceremony had taken place, Messrs. Jackson & Shaw, the contractors, made an offer to the committee to substitute Swanage stone for the facing to the walls, in lieu of Binstead rag and lime stone, which were specified to be used. Their motive for making this offer was understood to arise from a desire to push on the works faster than they would be able to do with the limited supply of stone from the Binstead quarries, which may be said to be now all but worked out. Mr. Scott having reported favourably of the qualities of Swanage stone, which had been used by him some years since in the restoration of Chichester Cathedral, the committee accepted the offer of the contractors, who have pushed on the works with vigour. The walls are carried up to a considerable height; those of the north aisle to a level with the springing of the window tracing.

The nave piers, with their capitals, are also fixed, as well as the responds of the tower and chancel arches. The latter show a contrast by the introduction of red Mansfield stone for the columns, or shafts, supporting the capitals. The committee have it under their consideration to proceed with those portions of the church which were not included in the present contract. Efforts must be made, however, to raise the necessary funds. Mr. Bindley is acting as Mr. Scott's representative in the superintendence of the work.

Hunslet.—The new church of St. Silas, at Hunslet, has been consecrated by the Bishop of the diocese. The foundation stone of the new edifice was laid in July of last year, since which time the work of erection has been rapidly pushed forward by the Leeds Church Extension Society, who have defrayed the entire cost, supplemented by some pecuniary aid from kindred associations. The new church of St. Silas consists of nave, aisles, and chancel, with organ-chamber on the south, and vestry on the north, side of the chancel. There are also at the west end two porches, entering from the north and south respectively. The nave is divided from the aisles by an arcade of five arches on each side, supported by pillars, alternately round and square, on plan, with moulded bases and caps, the former being visible above the seats, not hidden by them as is usual. The space that otherwise would have formed a sixth bay to the west end is occupied by doors from the north and south porches. The chancel is finished as an apse of five piers, with a single-light lancet window in each, and stone shafts in the angles, with bases corbelled out from the wall, bands and carved caps supporting the ribs of the roof. These ribs form pointed arches spanning the chancel, and meeting in a carved boss at the centre of the apse. They are each formed in several thicknesses of deal, and are bolted to the tie-beams and rafters of the principals, so as to form an additional tie or brace. The spaces between are boarded to the sawn curve so as to form a vaulted ceiling. The chancel arch, between the nave and the chancel, springs from the caps or pillars corbelled out from the wall on each side. The caps are carved with natural foliage, the fern being used on one side and the maple on the other. The corbels are formed as shields, bordered with foliage; the emblems of the Fall are carved on the shield on the north side, the emblems of the Redemption on the shield to the south. The organ-chamber has an arch opening into the chancel and one into the aisle, and the vestry has a similar arch towards the chancel, with a screen framed in pitch pine rising to a certain height. The fittings of the chancel are all of pitch pine. The other fittings of the church are all of red deal, and the whole are varnished. The font is of Caen stone, the bowl being octagon on a circular shaft. The floors of the porches, passages, chancel, &c., are laid with Staffordshire tiles, in red and blue. The church is heated throughout by hot-water pipes laid in grated channels in the floors; and it is lighted by large gas brackets over each pillar, smaller ones between the windows of the aisles, and a corona suspended from the boss of the chancel roof. The west end of the church has two tall narrow windows, with circles in the heads; and a centre buttress, with a circular window over it, quatrefoil. Over these stands the belfry, with steep gable and iron cross, the body being pierced with a double arch and circle, within a larger arch. One bell, weighing 3 cwt., has been supplied by Messrs. Taylor, of Loughborough, and hangs in one of the smaller arches. The aisle windows are three-light, within one arch, the spandrel being filled in with a large cusped circle. Those of the clearstory are two lights, within one arch, and a circle in the spandrel. The glazing is throughout in lead, the heads and circles being treated geometrically, and halions used in those of the aisle windows; but the lower portions are in rectangular quarries, within a border. The principal dimensions are as follows:—Nave, 32 ft. by 29 ft. 6 in. between bases of pillars, and 62 ft. high to ridge; aisles, each, 79 ft. by 11 ft. 6 in. from wall to pillar, and 24 ft. high to ridge; chancel, 33 ft. 4 in. by 24 ft., and 53 ft. high to ridge; organ-chamber, 14 ft. 6 in. by 12 ft.; vestry, 24 ft. by 15 ft.; porches, each, 12 ft. by 10 ft.; belfry, 90 ft. high to top of cross. The contractors for the various works are as follows:—Messrs. Longley & Sons, for mason work and joiner work; Messrs. Watson & Wormald, slaters; Messrs. Dawson & Son, plumbers (for whom Mr. T. Wilson did the glazing in lead); Mr. Miller, plasterer; Messrs. Galloway & Son,

painters; Messrs. Heaps & Robinson, for heating apparatus and embit work; Messrs. Mawer & Ingle, carving and font; Mr. Kidney, lightning conductor,—all of them being Leeds tradesmen. The gas-fitting, locks, hinges, and cross were supplied by Messrs. Charles Smith & Sons, of Birmingham; and the tiles were laid by Messrs. Charles & Taylor, of Leeds. The chancel floor within the rail, and a broad footway from the nave up to the rail, are covered with a carpet designed by the architect, and made by Messrs. Wilkinson & Co., of Hunslet, who have given it to the church. The architect was Mr. Corson, of Leeds, who also designed and built for the society St. Clement's Church, Sheepshead, which was consecrated in September, 1858. The organ is being built by Messrs. Radcliffe & Sagar. It is blown by a patent hydraulic engine. The cost of the church, exclusive of the site and the organ, will somewhat exceed 4,100l. The edifice will afford seating accommodation for 700 persons.

Brackley.—The Brackley Chapel of St. John and St. James (known as the College Chapel) has been opened to the parishioners of Brackley, after having been closed for nearly thirty years. The chapel is the only relic of the Brackley Hospital or Monastery of the Knights' Hospitalers of St. John of Jerusalem, at Brackley,—a religious house of very ancient foundation, which afterwards passed to Lord Lovell, and eventually to Magdalene College, Oxford, the present proprietors. The work of restoration, which commenced in April, is now completed. The work has been carried out under the plans of Mr. Charles Buckridge, of Oxford and London, architect. Mr. Nurse was clerk of works.

Smethwick, near Birmingham.—St. Paul's Church, West Smethwick, has been re-opened by the Bishop of Wellington, New Zealand, after undergoing some important alterations. One of the principal features in the recent improvements is the roof, which is entirely new, and contains a considerable amount of ornamental and constructive detail. The interior has been thoroughly remodelled and beautified. The church is lighted at night by means of eight gasaliers suspended from the roof. The whole of the work has been carried out from the designs and under the superintendence of Messrs. T. C. & J. P. Sharp, architects, Birmingham.

Barnard Castle.—The general committee for the restorations of the parish church have reported that the works have thus far progressed satisfactorily. The foundations of the walls and pillars in the nave and aisles, being found very bad and insecure, have been underpinned and rebuilt where needed, the surrounding accumulation of earth removed, and stone channelling laid outside the walls to convey away the water and prevent damp. The outer and inner walls have been and will be repaired, restored, strengthened, and cleansed, and new windows, where needed, introduced. The lead and oak roofs, being found in a decayed and dangerous state, have been entirely taken off and renewed. The unseen had condition of the roofs and foundations has occasioned a considerable and unexpected increase of expense. The chancel is being restored by Trinity College. In reference to the ancient steeple, it was hoped that if repaired in some defective parts, it might stand; and therefore the estimates included a small sum only for underpinning and repairing the buttresses, but upon a further examination the steeple was found altogether so insecure in the foundations, and so ruinous and tottering in the foundations, that it was deemed necessary for immediate safety to prop it temporarily with timber until funds be raised to take it down and rebuild it, which must be at once effected. The first estimate for restoring the nave and aisles, and underpinning the steeple, was 1,800l., which is found to be insufficient. The voluntary subscriptions (received or promised) of the principal landowners and others, supplemented by a collection from house to house, and including special subscriptions for the new clearstory windows, amount to 1,959l. 11s. 3d. It is now ascertained that in order to complete the nave and aisles (exclusive of the steeple) the further sum of 700l. is wanted; and that the erection of a new steeple will require 1,000l. more, making together a total of 1,700l. now to be raised.

St. Colomba's Church, Kingsland-road.

We are asked to mention that the roofs of this church are covered with Whitland Abbey green slates.

DISSENTING CHURCH-BUILDING NEWS.

Farsley.—A new Baptist Chapel has been opened here. The building is 90 ft. long by 54 ft. wide, and 40 ft. in height from the ground-floor to the crown of the ceiling, affording room for 1,200 sittings—650 on the ground floor and 550 in the gallery. A lobby 17 ft. by 8 ft., with folding-door and plate-glass panels, leads at each end to the body of the chapel and to the gallery stairs. In the rear of the chapel there are two vestries,—one for the minister, 14 ft. by 13 ft., and the other for week-night meetings, 35 ft. by 14 ft., the latter being convertible into two rooms by a moveable wooden partition when required for baptismal purposes. The ceiling of the chapel is a flat eegment: the roof-beams are dressed and varnished, showing beneath the ceiling. The gallery is supported by ten ornamental cast-iron pillars each 9 ft. 6 in. in height. It is circular in shape at each end, and has an open area in the middle, 48 ft. long by 26 ft. wide. The gallery front is formed into panels, decorated with ornamental trussae painted white and tinted with gold size, and finished with a mahogany capping for books. The pews on the ground floor, as well as those in the gallery, have sloping backs, yellow pine being used for the pews and internal woodwork. Externally the chapel is of Italian design, having a projecting porch at the front 25 ft. wide, consisting of six rusticated piers next the wall, and finished with an entablature and ornamental vase over the piers. Over the portico is an ornamental Venetian window, the remainder of the windows having moulded circular architraves and pediments, with horizontal cornices. A cornice runs round three sides of the chapel, rising into a pediment in front. The chapel stands in the centre of an acre of ground, which is being laid out ornamentally. The architect is Mr. John Simpson, of Leeds. The total cost of the chapel, including the boundary walls, warming, lighting, architect's commission, and legal expenses, will be about 4,000l.

Lanncoston (Cornwall).—A new Wesleyan chapel has been begun in this town, from designs selected in competition by Messrs. Alfred Norman & James Hine, architects, Plymouth. It will be in the Early Decorated style, and consist of nave, with clearstory, aisle, transept, and chancel. Including a small west gallery, the accommodation will be for about 700. It is proposed to build a tower and spire at the north-west angle, and there will be a school and classrooms adjoining the church. The contract account is 3,005l., and Mr. Blatchford, of Tavistock, is the builder.

Sheffield.—The memorial stone of the new Baptist Church, in Glossop-road, has been laid. The edifice is in course of erection on a site immediately above the junction of the Glossop and Northumberland roads, and will be a conspicuous building. The style is Geometric, adapted to suit the requirements of dissenting worship and the peculiarities of the site. The front to Glossop-road presents a large gable containing a tracery window of five lights, beneath which is the principal doorway, which has two openings with trefoil heads, surmounted by a port canopy, are of polished Aberdeen granite, the central shaft resting upon the memorial stone. At the sides of the front gable are the gallery staircases, the one nearest the town being carried up in the tower, which rises to a height of 140 feet, terminating in a pinnacled octagon spire. The arrangement of the doors will admit of easy access to the church, either by steps from Glossop-road or from the level of the side street. The sides of the church have alternately two- and three-light tracery windows, and the roof at the sides is relieved with five gables. The slating is arranged in ornamental patterns. Internally, the ceiling will be boarded. The baptistry, lined with Milton's majolica tiles, will be placed in a chancel-like recess behind the pulpit; and at the side of it the organ is to be fixed on a raised tribune. There are three vestries, respectively for the minister, the deacons, and ladies. Seats are provided for 500 persons in the body of the church, on benches 3 ft. wide, and for 320 persons in the gallery, which occupies three sides, making a total of 820 adults. The internal woodwork will be of pitch pine. The school behind the church is arranged to accommodate 250 scholars in one room, besides which are infants' school-room and six separate class-rooms. The scholars can pass from the school to the church under cover. The care-taker's house con-

ains five rooms distinct from the other parts of the building. The cost of the structure will exceed 5,000l. The contractors for the masonry are Messrs. B. & T. Nelson. Mr. Wm. Dickinson is the clerk of the works. The other contractors are for joiners' work, Messrs. Carside & Shaw; slating, Mr. Ellis; plastering, Messrs. Harrison & Chadwick; plumbing and glazing, Mr. Cropper; and staining, Mr. Jenkinson; warming, Mr. Hydes. The architects are Messrs. Innocent & Brown, of Sheffield. With organ and fittings, the building will probably cost little short of 6,000l., exclusive of the site.

Chesterfield.—The foundation-stone of the new Wesleyan Methodist chapel to be erected on the site of the old one, in Saltergate, has been laid by Sir Francis Lytett, of London. Mr. Edward Taylor, of York, is the architect.

Walthamstow.—The memorial-stone of Trinity Congregational Church, Walthamstow, has been laid. The building is of Kentish rag, with free-stone dressings, and will be capable of accommodating nearly 600 persons. The contract has been taken by Messrs. Dove Brothers, at 3,100l. The total cost will be about 3,800l., and a previous expenditure of 900l., for school-houses, &c., will bring it to about 4,700l.

Tendring.—A newly-erected chapel, belonging to the Wesleyan Methodists, has been opened for public worship in this parish. The building, which is capable of seating 200 persons, together with a school-room, was erected at a cost of 850l., which sum, with the exception of 200l., has been entirely raised by voluntary subscriptions. The design for the building was by Mr. Barnes, of Ipswich, architect; the builders being Messrs. Saunders, of Dedham.

Grantham.—The memorial stone of a new Congregational church has been laid at Cranham. The church is planned to seat upwards of 600 persons, and consists of a nave and two side aisles, divided by painted arches on columns having carved capitals and moulded bases. The design is in the thirteenth-century style of English architecture. The walling is of Ancaster rag, and the dressings are of Ancaster freestone.

Vestries are attached to the church, and schools have been planned in connexion with it. A minister's house is also in course of erection on the same site. The contract for the entire work has been taken by Messrs. Rudd & Son for 3,220l. The architect is Mr. Tait, of Leicester.

Northampton.—The new Iron Chapel for the Independents, which has been erected in Victoria-road, [in this town,] at the sole expense of the Rev. E. T. Prust, minister of Commercial-street chapel, has been opened for divine service. The chapel has been erected from the designs of the iron-church builders and engineers, Messrs. Francis Morton & Co., of London, Liverpool, and Glasgow. The principal framing of the church is of timber scantling, covered on the outside with Morton & Co.'s galvanised plates and iron tubes, the roof being also felted and boarded. The main supports are secured to masonry foundations. The ground body of the church is a parallelogram of 57 ft. by 35 ft., with a tower, 60 ft. high, facing the street. The tower is ornamented with finials. The chapel is lighted with Gothic side windows and ornamental circular or rose windows in the gables. Attached to the chapel is a school-room, constructed of the same material. Ventilation is provided for by a double ridge piece, and along the lines of the eaves, and by openings in the windows. The wood-work is stained with oak colour of various tints, and the side walls are finished with plaster. At night the building is lighted with burners suspended from the roof. The chapel is warmed.

Bedford.—During the past ten months a new building has been in course of erection in Mill-street, to supersede the very old and inconmodious chapel, formerly and for many years occupied by Baptists. The work having arrived near completion, the opening ceremony has taken place. The old building being found inadequate it was resolved to purchase the property in the foreground in order that by its removal an increased area might be obtained, with an elevation also to the main street. This having been accomplished, instructions were given to Mr. Usher, architect, Bedford, to prepare plans for the new building at a moderate cost. The design is Romanesque in character. The chief materials used in the structure externally are bricks, stone of several colours, and slate. The front elevation assumes the gable form. The entrance doorways are formed of wrought Mansfield columns on stone bases, with moulded and carved capitals, and extended and continuous frieze, carved; the voussoirs with which the

arches are constructed are in alternate Bath and Dunston stone, with moulded and incised key-stones and moulded label. The central and principal feature of the elevation is a five-light window, constructed with similar materials to the doorways; it is 20 ft. wide and 17 ft. high, with carved capitals and a vandyke frieze extending to each extremity of the front; and above this window is an open arched recess, containing a Bath stone scroll, with raised letters, "Baptist Chapel, erected 1869." The ascent to the chapel is by a flight of stone steps, and the area will be enclosed by a wrought-iron fence with folding gates. The interior of the building is approached through a lobby, at the end of which are stone stairs for access to the galleries. The plan consists of two aisles with open seats, with moulded ends of pitch pine, a book-board, hat-rails, and sufficient space to kneel. The platform is on a slightly raised dais, approached by a double flight of steps. The baptistry is immediately in front of the platform, with a double flight of steps, and is supplied with water from the public works; it is lined with Keene's patent cement, and surrounded by a stone curb. There are galleries on three sides of the building, and an upper gallery for the children over the front entrance. All the timbers are free from plaster, and varnished, and the fronts are of arabesque open work, supported on cast-iron columns with foliated capitals. The roof construction consists of six laminated iron and wood ribs, in the form of an arc, resting on carved corbels. In consequence of the nearness of the surrounding buildings, the architect has implanted an ornamental clearstory, 40 ft. in length, in the roof, composed of thirty-two ogee-headed lights, by which means light is diffused throughout the building, and ventilation effected. The altitude from the floor to the ceiling of the clearstory is 54 ft., and to the external apex it is 58 ft. The number of sittings is 720. The mode of lighting at night is by star burners suspended from the roof. In the rear and on the east side of the chapel there is a commodious suite of school-rooms and class-rooms, with minister's vestry; and in the basement kitchen and store-room, accommodation for tea-meetings, &c. The total cost of the chapel and site is about 2,700l. The builders were—Bricklayers and plasterers, Messrs. Smith & Mercer; mason, Mr. S. Jarvis; carpenter, Mr. John Hull; plumber, &c., Mr. T. Carling; ironwork, &c., Mr. W. W. Kilpin.

Wolverhampton.—The congregation of the United Presbyterian Church are about to erect a chapel adjacent to their school-room, where divine service has hitherto been held, on the Merridale-road. The chief stone has been laid. The general plan of the new building is 75 ft. in length by 48 ft. in breadth, and it will be roofed in one span. The elevation of the west front will be that of a centre gable, with a tower and spire at the north angle, and a staircase wing at the south angle. The height of the tower and spire will be 68 ft. The chief features of the west front will be a central doorway with a grouped four-light and rose-headed window. On each side will be gallery staircases doorways, with single-light window on the second stairs. The building will be faced with Cefn stone. Internally the plan of the sitting on the ground floor will be divided into three bays by two side passages. It is intended to erect galleries, though only a west gallery is included in the present contract. The interior will be ceiled at the level of the wall-plate, a deep cove, springing from the impost of the second tier of windows, being continued all around. The centre of the ceiling will be of an arched form, and the total height from floor to ceiling will be 34 ft. On the south side of the church will be a vestry for the ministers, and hereby also will be out-buildings in connexion with the Sunday School and Lecture-room. The contract has been taken by Mr. Cookerill, of Wolverhampton, builder, for about 2,400l. The architect is Mr. Bidlake, of the same town.

Bolton.—A new chapel in connexion with the Baptist denomination has been opened in St. George's-road, Bolton. It is in the Italian style, with a portico to the front entrance, and around the chapel is a gallery with a semicircular sweep at each end. Accommodation is provided for upwards of 1,000 persons. Beneath the chapel is a school-room, containing eight class-rooms, three of which are obtained by the introduction of a mezzanine floor and balcony at one end. This room will seat 500 children. The architect of the building is Mr. George Woodhouse, of Birmingham; and the contractor Mr. J. Robinson, of Hyde. The total cost, including furni-

ture, has been about 6,500l., of which a considerable sum has yet to be raised.

Walsall.—The Baptist chapel, Stafford-street, has been re-opened for divine worship. The building, the foundation-stone of which was laid by the borough member a few months ago, is an improvement upon the old structure, which stood on the same spot, and part of the shell of which has been made available for the new chapel. The new edifice contains about 750 seats, being something like 250 more than the old building; and in addition to being more lofty than it, it is furnished with open stained pine seats, and is decorated. It is also supplied with commodious vestries, and school-rooms, capable of accommodating 600 children. The work of rebuilding has been carried out by Messrs. Trow & Son, of Wednesbury, under the direction of Mr. G. Ingall, of Birmingham, architect. The cost will be about 1,800l., of which in round figures 1,000l. have yet to be raised.

SCHOOL-BUILDING NEWS.

Bloxham.—The new wing of All Saints' School has been opened. The new wing, as the rest of the buildings, has been erected by Mr. T. Barrett, of Bloxham, after designs of Mr. G. E. Street. It forms the third side of the quadrangle, and comprises on the road level, kitchen, larder, and other offices; and on the ground level of the rest of the buildings, a large dining-hall, 70 ft. by 23 ft., and 18 ft. 6 in. in height, with a lift from the kitchen into it. Above this again are two floors containing dormitories, master's rooms, wardrobe-room, &c., access to all of which is gained by an oak staircase, connected with the old part by a porch and passage as well as by the staircase of the older buildings. The building has been furnished with steam boiler, steam kettles, and hot-water apparatus, by Messrs. Benham & Sons, of London; and with gas-fittings by Mr. Potter, from designs by the architect.

Reading.—The new school-room erected at the rear of the Baptist Chapel, King's-road, has been opened. The building is 60 ft. long by 25 ft. wide and 30 ft. high. The rafters are of stained deal, corresponding with the seats and pulpit. There are two porches, 6 ft. wide, on either side, and three class-rooms beneath. A small iron girder trellis bridge crosses the Holy Brook. The architects were Messrs. W. & J. T. Brown. The site, which was estimated at the value of 150l., was the gift of Mr. J. H. Blagrave, Calcot Park.

Books Received.

Our Iron-clad Ships: their Qualities, Performances, and Cost; with Chapters on Turret Ships, Iron-clad Rams, &c. By E. J. REED, C.B., Chief Constructor of the Navy, &c. With illustrations. London: Murray.

This volume will satisfy public curiosity and respond to an immense deal of public disquisition on the subject of iron-clad ships. The iron-clad ship question is so continually under discussion in the public press, and is justly deemed of so much importance to the country that the publication of further information respecting it appeared to the author to be in many ways desirable; and here it is, and given by the fittest hand to satisfy the requirement. The work forms an appropriate sequel to the author's previous book on "Shipbuilding in Iron and Steel." It frankly and freely discusses the respective merits of our individual iron-clads, and forms a very interesting and important volume. One of the results of its publication, Mr. Reed trusts, will be to induce persons to look a little more closely than heretofore to the true causes of the different performances of the ships, both under steam and under canvas. He considers it not only idle but against common sense and experience to visit upon the designer all those shortcomings which are obviously the consequences of imperfect management. The best seamen in the navy know well that ships perform very differently in different hands. "It is only those who have combined great ability with great devotion and professional love of their work who have been eminently successful in establishing that delicate and beautiful relationship between the ship, the sails, the helm, and the wind, which is essential to great success in this branch of the sailor's art."

The volume treats in separate chapters on the varieties, the armour, armament, structure,

steaming, sailing, rolling, dimensions, forms and proportions, and cost of the iron-clad; also on turret ships, iron-clad rams, and the conversion of line-of-battle ships into iron-clads. There is an appendix on the stability of Monitors under canvas.

Miscellaneous.

Prehistoric Monuments of the Channel Islands.—At the meeting of the International Congress of Prehistoric Archaeology, held last year at Norwich, a committee was formed for the purpose of inquiring into the present condition of the prehistoric remains in the British Isles. Subsequently the functions of this committee were transferred to the Ethnological Society, and the first fruits of its labours in this direction have just appeared in the shape of a valuable report on the prehistoric monuments of the Channel Islands, prepared by Lieut. Oliver, R.A., and read before the society. The Channel Islands are remarkably rich in megalithic structures of noble proportions, but from their unprotected state they have for the last fifty years been subject to the most ruthless destruction. No only have they been demolished by the hands of the navy and of the more treasure-seeker, but they have also suffered considerably from injudicious attempts at restoration. The report is divided into chapters, treating successively of the remains in Guernsey, Herm, Sark, Jersey, and Alderney. Lieut. Oliver alluded to the resemblance between many of these megalithic monuments, and those in Madagascar, erected at the present day by the hill tribes of Hovas. Other reports on our prehistoric structures are in preparation, and will probably be submitted to the society at an early date.

Costly High Altar in New York.—St. Stephen's is the largest of the Roman Catholic churches in New York, and has been erected at great cost. The correspondent of the *Morning Post* describes the completion in of a high altar of white marble, costing 35,000 dollars, with two side altars of the same material. The grand altar is 45 ft. high, and is a magnificent temple in itself. It has been executed by artists of great skill and taste, and I have seen nothing here or in Europe which is superior to it in beauty. Above and behind it, filling the entire space to the roof of the chancel, is a colossal painting of the Crucifixion, by Bramidi, an Italian artist well known in the States, and who has in this painting, despite some glaring faults, achieved a wonderful work. The paintings above the side altars, of the Blessed Virgin and St. Joseph, are by the same artist, and represent the Immaculate Conception and the Martyrdom of St. Stephen. Throughout the rest of the church, in niches, are the figures of five female and five male saints; and the roof, arched and groined, and supported by groups of delicate and graceful columns, is a heaven of blue, studded with golden stars.

The Site of Trajanopolis.—The often sought-for site of the Roman city of Trajanopolis has recently, it is said, been discovered. The remains have been found in an extensive marshy district near Eaos, a league and a half from Dymes, at the mouth of the Hebrus. That these are really the ruins of Trajanopolis is supposed to be proved by an inscription found on a stone built into a monument being in exact accordance with the position assigned to the city in ancient books of travel. The ruins are very extensive, and a mere cursory inspection shows that an acropolis formerly existed there, the remains of edifices of the third century, consisting of architraves, broken columns, pedestals, and some inscriptions, fully establishing this.

The Serpentine.—A correspondent writes,—"Can any one of your numerous readers inform the remainder what is being done, and to what end, at the Serpentine in Hyde Park? You may pass week after week, and see the same men shovelling the same mud into a heap, to be shovelled into another heap, and so on, to all appearance *ad infinitum*. Truly, it does seem queer. Why was it not made publicly known what was to be done in detail, and the number of weeks it would take? The public would then have been prepared, and would not grumble as they now do, knowing nothing of the curious process.

The Suez Canal.—Mr. C. Clarke, President of the Liverpool Chamber of Commerce, has read a paper there on the "Suez Canal," from which he has just returned. Mr. Clarke's conclusions are that, as regards either to fill up Said, it may be necessary either to fill up permanently the interstices between the blocks which form the western breakwater, or dredge away the bank as it is formed. Either course is practicable, and may be taken at a moderate expense. With respect to the injury of the banks by wash, it may be necessary, in several portions of the canal, to reduce the slope of the banks, and to pitch them with stone to a height of 2 ft. or 3 ft. above the water line. This is already being done between Suez and the Bitter Lakes. There are inexhaustible supplies of stone in the mountains near Suez, and the cost of transport now would be trifling. The fear of the canal drying up by evaporation Mr. Clarke regards as chimerical. The filling of the canal by shifting sands is a real danger, though greatly exaggerated. Of the hundred miles which form the entire length of the canal, about 57 miles are made through lakes which have existed as natural basins for at least 2,000 years without being filled with sand. Of the remaining 43 miles the greater part consists of a mixture of sand and gravel, in consistency resembling a garden walk. The enormous dredging-machines will dredge out in a month all the sand which is likely to be blown in a year. The cost of maintaining the canal when completed, an eminent English engineer on board estimated at 60,000l. per annum. As regards the prospects of the canal as a paying investment, Mr. Clarke confesses himself unable as yet to arrive at a satisfactory opinion.

Death of Mr. George Smith, C.E., Belfast Harbour Engineer.—Mr. George Smith, C.E., was for twenty-four years the resident engineer of the Belfast Harbour, and during that long period of active service did a large amount of work. He was an Englishman, and was appointed Harbour Engineer in 1839, on the recommendation of Messrs. Walker & Burgess, the engineers, who at that time designed some improvements in the harbour. Mr. Smith was previously engineer of the Leeds and Selby Railway. It was under his superintendence that the new cut at the Queen's Island and the channel between the Twin Islands were formed, the contractor being the late Mr. Dargan. The Queen's Quay, Clarendon Dock, and all the timber wharfs on the Down and Antrim sides of the river, were also constructed under his superintendence. He was the architect of the new Harbour Office; he designed the lighthouse on Holywood Bank, and all the great improvements in the harbour of Belfast completed during the past thirty years, were carried out under his management. From failing health he became unable to continue the more active duties of his office, and in 1863 he was appointed Consulting Engineer to the Harbour Board. For some time past increasing infirmities and age proved too much for him, and on the 3rd he expired at the age of seventy-seven.

Gift of a Public Park to Warrington.—Colonel Wilson-Patten, M.P., who resides in the town, and is a large landholder, has expressed his intention of presenting the borough with eleven acres and a half of land to be used as a public park for the people. The right hon. gentleman added that his property had so increased in value lately, owing to the prosperity of the town, that he felt himself compelled to do what he proposed to do, so that the inhabitants of the borough might enjoy the benefit of a public park, and participate in the land should not Colonel Patten wishes that the land should not be laid out as an ornamental park, but left open for purposes of recreation and out-door amusement, stipulating that the Militia and Volunteers should have the use of it as a drill-ground. The mayor and corporation have expressed the gratitude of the inhabitants, and formally recorded their feelings, upon the minutes.

The Ventilation of the Law Courts.—It is asserted that the death of Mr. Justice Hayes was accelerated by the foul air of the court over which he presided. Whether this be true or not, we know, and have often pointed to the fact, that the atmosphere of the law courts is very far from being as pure as could be desired; in truth, at times it is little less than pestiferous. We have here an additional reason for the speedy erection of new courts.

The Cooke Memorial, Belfast.—The committee of May-street Church, where the late Dr. Cooke preached, have given the erection of his memorial to Mr. John Robinson, of Belfast. It will be a mural monument, and will be erected in the vestibule at the sides and over the door leading into the central aisle, and will be 21 ft. long by 15 ft. high. There will be a pedestal long by 15 ft. high. There will be a pedestal at each side, of red Peterhead granite; and on each of these will rest two Corinthian columns each of these will rest two Corinthian columns each of Carrara marble, about 9 ft. high, surmounted with an entablature of similar marble. Surmounting and showing breaks over columns, will be the door, and from door to columns, will be verde antique marble, and to columns, will be columns will be white marble slabs, eventually intended to be filled in with sculptured bas-reliefs, and over the panels will be carved festoons. The columns and entablature will be after the best examples of ancient Roman work, the various members of the entablature being carved; the frieze, also, and other parts, will have carved ornament. The cost, when completed, will be over 500l. The design and working plans have been supplied by Mr. J. Boyd. Messrs. Boyd & Batt are the architects.

Local Taxation in the Metropolis.—An elaborate return, in a tabular form, has been prepared by Mr. John Pollard, clerk of the Metropolitan Board of Works, "showing the total amount of local taxation in the metropolis for the year ending March, 1867 (including the poor, county, and police rates, and the amounts raised to meet the precepts of the Metropolitan Board of Works); the rateable annual value of property in the metropolis according to the county and poor rate bases, with the rate in the pound on each of those rentals; also the population, the area in statute acres, and the number of persons per acre according to the last census (1861). We may give a few of the totals and averages. The population was 2,808,941; the rateable annual value, as per county-rate, 16,196,547l.; as per poor-rate, 16,019,895l.; the total amount of local taxation by various authorities, 1,526,843l. 10s. 3d.; rate in the pound, as per county-rate, 1s. 10d.; poor-rate receipts, 1,683,750l. 17s.; rate per pound, 2s. 1d. Mr. Pollard has performed well a very laborious work.

Windsor Parish Church.—The foundation-stone of the new chancel of the parish church of New Windsor was laid on Monday by her Royal Highness the Princess Christian. The proposed work consists of a new chancel, the reseating of the interior, and such other alterations, both in the exterior and interior, as will bring it more into harmony with the present character of ecclesiastical buildings. The entire scheme of the new chancel will be a considerable enlargement of the church. The cost of the entire scheme is estimated at about 8,000l.; but at present only a portion of the erection of the chancel and organ chamber, the reseating of the church, and the reconstruction of the western gallery, which has been contracted for by Mr. Kelly, builder, of Windsor, for 4,168l. The chancel will be proceeded with during the winter without interfering with Divine worship.

The Accident at King's College and the Metropolitan Board.—At the usual weekly meeting of the Board, a letter was received from Mr. Cunningham, secretary to King's College, dated December 6th, stating that on that morning a most alarming accident had occurred at the college, in consequence of the works which had been going on with the Embankment and railway. A large portion of their terrace had fallen, carrying away the dining-hall and kitchen; but happily no loss of life had occurred. Had it happened at one o'clock, 160 lives might have been lost. The solicitor to the Board had replied that no works had been executed by the Board near there for some years, and they were in no way responsible for the accident. A copy of the letter had been sent to the collectors to the Metropolitan District Railway Company.

A Cordoves National Exhibition.—The rules and regulations of an Exhibition at Cordova (Argentine Republic), in South America, have been issued, and an English form printed at the Standard Office, Buenos Ayres. The Exhibition is to be opened on the 15th of October, 1870. From what is said as to foreign exhibitors, it would seem to partake, to some extent, of the nature of an international exhibition.

The Sanitary State of Paddington.—Practical sanitary hints have been issued in a printed form by the medical officer of health as to the best measures for preventing the spread of the "catching" or epidemic diseases, such as scarlet fever, small-pox, measles, typhus, &c. These hints relate to pure drinking-water, drains, sinks, closets, &c., dust-hins, ventilation, food, the sick-room, infected clothing and bedding, &c.; and particularly as to disinfectants. Of these the medical officer says:—

"The most generally known disinfectants are chloride of lime, Condy's fluid, Burnett's fluid, and carbolic acid. Of these four, Condy's fluid is one which, in all circumstances, is most efficacious and unobjectionable. Its very agent is oxygen, which has no odour, and is the active principle is oxygen, which has no odour, and is the very agent by means of which ventilation and fresh air promote natural disinfection; chloride of lime and carbolic acid require care and experience in management; when used too freely in inhabited rooms, they give rise to irritation of the air passages and lungs, among the inmates. Burnett's fluid and carbolic acid are poisonous as well as comparatively inefficient. . . . By the addition of a small quantity of muriatic acid (spirit of salt), to solution of Condy's fluid, chlorine gas is slowly disengaged in a state of great purity."

The circular is signed "Wm. Hardwicke, M.D., medical officer of health." Poor persons are offered small quantities of disinfectants at the Vestry-hall.

A Convertible Billiard Table.—Many persons would be glad to have a billiard-table in the house, but have not space they can specially devote to it. Messrs. G. & H. Story, of Coleman-street, have devised something that may meet these circumstances, namely, a combined billiard and dining table; and they place among its advantages economy, as the game of billiards can be played on a table costing half that of an ordinary billiard-table, with a large handsome dining-table combined. The dining-table is converted into a billiard-table in a minute by a simple screw movement, which can scarcely get out of order. When raised, the billiard-table is complete and perfectly level, without the least vibration. It ought, of course, to stand on a sound, stable floor.

Worcester Cathedral Clock and Bells.—The peal of twelve bells, and the extra bell required for the Westminster quarter chimes, are now completed, and have been sent to Worcester during the week. Men have been for some weeks engaged in fixing the massive oak frames for their reception in the cathedral tower. The huge beams forming the frame-work filling up the shell of the tower are so constructed as to carry the weight of the whole to the base of the tower, resting mainly upon the four great piers which support that structure, and conveying the thrust as nearly as possible to the ground, so that the stability of the tower may not be affected.

Honorary Work in the City.—At the last meeting of the Court of Common Council, Mr. Isaacs, chairman of the City Lands Committee, presented a report from that body, recommending that Mr. Thomas Henry Fry, Deputy, he presented with a service of plate, at an expense not exceeding 500 guineas, as a suitable mode of testifying the appreciation of that Court for his services throughout the execution of the Holborn Valley Improvement works. The report was adopted with acclamation, and the Court adjourned.

Death of Mr. W. Jones, of Derby.—We hear of the sudden death of Mr. William Jones, of Derby, building surveyor; a gentleman much esteemed by all who knew him, on account of his many excellent traits of character, both in business and social life. Mr. Jones was the brother-in-law of the Derby borough surveyor (Mr. Geo. Thompson, C.E.). The professional skill of the late Mr. Jones was estimated at a very high rate, both by the master builders and operatives of his neighbourhood.

The St. Petersburg Exhibition, 1870.—There seems to be some misconception afloat concerning this Exhibition. It has been announced officially that the Exhibition is to be strictly Russian, not international; and yet we have received from America full particulars of the arrangements that are being made by the different States to send to it suitable specimens of their produce. Commissioners have been selected to attend the Exhibition. How are the two accounts to be reconciled?

The Slade Professorship, Cambridge.—Sir M. D. Wyatt has been elected to the Professorship established under the will of the late Mr. Slade. What is the London University doing in the matter?

Wonders in Wine.—At the last sitting of the Academy of Science a paper was received from Dr. Scoutetten on a curious effect of electricity on wine. The house of a wine-grower at Digne (Basses-Alpes) was struck by lightning a few months ago. The fluid penetrated into the cellar and broke several casks, the wine of which flowed into a small vat which was purposely sunk into the floor to receive any liquid by accident spilt. The proprietor, thinking his wine was spoiled, at first sold it at the rate of 10 centimes a litre; but on tasting it some time after, found it excellent, and sold it at 60 centimes. Struck with the curiosity of the occurrence, he asked Dr. Scoutetten whether he could explain it, and was told that it could only be the result of electricity, a proposition which should be tested by direct experiment. This was done, and succeeded to such an extent that absolutely bad qualities have been transmuted into valuable drinks. To perform the operation the wires of the voltaic pile were tipped with platinum, to which were attached electropes of the same metal, and both dipped into the liquid to be improved.

Utilising Waste Heat.—Mr. E. Crowe, of Middlesbrough-on-Tees, employs a boiler of two horizontal tubes arranged one over the other, and connected by a number of upright tubes arranged at short distances apart along the horizontal tubes. The water-line of the boiler is at the diameter of the upper tube or thereabouts, and the boiler below this line is inclosed in a chamber of brickwork, into which at one end the products from the furnace enter, and which, at the other end, is connected with the chimney, so that the chamber is, in fact, the flue of the furnace. The sides of the chamber at the level of the vertical tubes are corrugated so as alternately to approach and recede from the vertical tubes, so that the draught is caused to pass in an undulating direction. This causes it to impinge more effectually on the vertical pipes, and at the same time sufficient space is obtained for a man to pass through the chamber to clean it from time to time.—*Mechanic's Magazine.*

Roman Remains, Maidstone.—Some interesting Roman remains have recently been found in Maidstone. As some workmen were lately trenching in the grounds of Mr. Fanchon, Upper Stone-street, they struck upon a hard foundation which appeared to be ancient remains. Before they had proceeded farther with the excavation, Mr. Lightfoot, the curator of the Charles Museum, was called to the spot, and on a careful examination found that they were strictly Roman remains. Subsequently, Mr. Roach Smith examined them, and fixed the date at A.D. 300, or a little later.

Polytechnic Institution.—Last week Dr. Brewer, M.P., distributed the prizes and certificates to the successful candidates connected with the evening classes of this institution. The Prince Consort's prize was won by W. J. Wilson, who also took many others. This was the second occasion upon which this prize had been carried off by a member of these classes. Thanks to the chairman, to Professor Pepper, and the Rev. Prebendary Mackenzie, M.A., were carried. Some of our readers would do well to inquire as to these classes.

St. Martin-in-the-Fields Library and Reading-room.—The series of meetings arranged by the Rev. R. G. Maul, incumbent of St. John's District Church, Broad-court, terminated on Tuesday, the 14th, with "readings and vocal and instrumental music," affording a pleasant evening to a well-filled room.

The Marquis of Westminster's Statue at Chester.—We regret to hear that the state of the Marquis of Westminster's statue in the New Park, Chester, has led to a communication with Mr. Thorneycroft, from the legal adviser of the corporation, upon the subject.

District Surveyors.—At the meeting of the Metropolitan Board of Works, on Friday last, consent was given to the appointment of Mr. Arthur Allom, by Mr. Kendall, as his deputy, in the district of St. Martin-in-the-Fields and St. Ann, Soho, Westminster.

Aboyne Castle, Aberdeenshire.—Extensive alterations, rebuildings, and additions have just been commenced at Aboyne Castle for the Marquis of Huntly. The architect employed is Mr. George Trefnit, of London; and the builders are Messrs. Warrack & Daniel, of Aberdeen.

TENDERS.

For sewers at Ferry-rale and Catford-hill, for the Lewisham Board of Health:—

Kesbie	25,938 0 0

The Builder.

VOL. XXVII.—No. 1403.

The Autobiography of John Gibson,
Sculptor.*

OR the same reason that sculptors should judge a sculptor's work it seems to us those who write of sculpture or sculptors should be sculptors too; if not by profession, by taste and natural feeling. The practice of the art is so removed from everyday life and experiences, and leads those who follow it so far beyond the threshold of the antique

world, that sympathy with the modern one, doubtless, becomes more and more difficult, as proficiency is gained. Hence, we are bound to judge a sculptor as one whose art takes his thoughts into a different sphere of action to that in which most of us live. We were glad, therefore, to learn, that Mr. John Gibson did not leave his biography to accidental authorship, but drew up a sketch of the chief events of his life; and that this outline was to be placed in the hands of the public, edited by Lady Eastlake.

This autobiography is now published. We confess we are disappointed with the work. Perhaps one reason of this disappointment is the fact that Lady Eastlake claims so much for the sculptor, and makes out so little that is really in his favour, save negative qualities. Throughout life Gibson appears to have been the recipient of constant kindness from friend after friend. While still serving his apprenticeship at Liverpool, he was noticed by Mr. Roscoe, invited to his house, and privileged to make use of his superb collections; and directly he arrived in Rome, with the aid of his Liverpool friends, he was received with open arms by Canova. "I am rich," said he; "I am anxious to be of use to you, and to forward you in your art as long as you stay in Rome." Now, with the single exception of Miss Hosmer, the editress has failed to show that Gibson ever aided, or was the means of bringing out, any English artist or foreigner during his forty-eight years' residence in Rome, in return for this supreme obligation. He may have done so; but Lady Eastlake has not seen the responsibility of the payment of such a debt sufficiently vividly to make a point of recording it. Again, his editress claims for the sculptor that he was so above all money-getting considerations that he did not make *replicas* of his subjects. She remarks, "He might have done as other sculptors did, and do (at least, in Rome), and have kept a supply of *replicas* of his most popular works all ready in his studio, for sale to those who like to come, to see, and to carry away,—such *replicas* representing literally so much ready money to a sculptor of established fame. But Gibson refrained from such practice." But when we turn to a list of his works we see *replicas* of most of them were sold by him. The instances in which he made no repetition of a popular work were the exceptions, and not by any means the rule. He made eight repetitions of his "Cupid

disguised as a Shepherd" after he had finished the original; four copies of his Venus; three of his Narcissus; three of his "Hunter and Dog," and a fourth was unfinished in his studio at the time of his death; two of his Pandora; two of his Hebe; two of his "Sleeping Shepherd Boy"; and single repetitions of several others. Lady Eastlake mentions, too, that Gibson's employer in Liverpool, Mr. Francis, sold several of the former's works under his own name; thus several pieces of sculpture are to be seen in that neighbourhood that were in reality the work of Gibson, though now assigned to Francis; but she omits to state that in the galleried sheds forming the sculptor's studio in La Via Fontanella, there was a staff of *Giovanne* and *formatore* that must have numbered from twenty to thirty members, some of whom probably furnished him the like clever assistance. One of them, Nncol, has since executed the figures for one of the sculptured chimney-pieces in Alnwick Castle, illustrated in the *Builder*,—consequently must have been an adept in his art; and during Gibson's annual long absences from Rome, after he became unable to hear the beat, these assistants must have made much progress without him. Yet she does not hint at the existence of such an establishment, except in one line, where, dwelling on his generosity, she says, "he paid his men not only liberally, but lavishly, making them frequent presents." Nor does the editress make her case good when, to prove the beautiful sincerity and "guileless simplicity" of her subject, she quotes a passage from one of his letters to this effect: "The sons of Adam are very bad animals: the beasts would be as bad as Christians if they could speak." This opinion from one who had been encouraged so kindly by Roscoe, and received such warm welcome and long teaching from Canova, not to bring in other instances in which he was the object of unaccountable assistance and lavish patronage beyond those already mentioned, certainly does not sound well. "Write me as one who loves his fellow-men," cried Alton Bon Adhem to the angel writing in the hook of gold. A second thought on the part of Lady Eastlake, we are sure, would have caused her to give a less questionable illustration of Gibson's amiability.

"If you are to be a sculptor," Mr. Roscoe used to say to Gibson, as he was showing him the contents of his portfolios in his library, on his weekly visits to Allerton, "I must remind you there is but one road to excellence, and that is the road trodden for you by the Greeks, who carried the art to the highest perfection. Michelangelo, with all his powerful genius, missed the purity of the Greeks. But it is their principles established from nature that you should endeavour to imitate." Gibson took this road, so clearly pointed out, kept to it, turned neither to the right nor to the left, and attained excellence, celebrity, and fortune. It was smooth and rendered pleasant by prompt recognitions as he went, as well as by the beautiful ideal who tripped before him. He wrote to Mrs. Sandbach, the granddaughter of Mr. Roscoe, in 1842,—“In my art, what do I feel? what do I encounter? Happiness, love which does not depress me, difficulties which I do not fear, resolutions which never abate, flights which carry me above the crowd, ambition which tramples no one down.” And so he travelled onwards, with scarcely more encumbrance than the Greek hat and little cloak with which Cupid was disguised as a shepherd; for he lived and died a bachelor.

The autobiography, curiously, begins with an inaccuracy, which Lady Eastlake corrects in a note. Gibson states he was born at Conway, which is famous for the beauty of its scenery; whereas it was a little hamlet, Gylfin, near that place, that was in reality his birthplace, though his mother and father soon after removed to Conway. They all spoke Welsh; and thought speaking English a very laborious business. But as they after-

wards removed to Liverpool, intending to take passages there for the United States, which intention, however, was subsequently relinquished, English must have ultimately become less foreign to their tongues. The sculptor relates that when his mother, who was a very earnest, passionate, strong-minded woman, saw the great ships in the docks, she formed the most determined resolution never to put her foot in one of them; and as her will ruled the family, the plan of emigrating was given up. Gibson was put to school in the great mercantile city, where he got into trouble with his master, and favour with his fellow-scholars, for drawing, instead of attending to his lessons. But his good luck predominated even in these early days, for the stationer of whom he bought his materials lent him drawings to copy, talked to him of the Academy, and, generally, gave him ideas that he could not have picked up in his little Welsh home-circle. Then he was apprenticed to a firm of cabinet-makers, who ultimately allowed him to cancel his indentures, and place himself with Mr. Francis. He had been but a few months employed in his workshop, when Mr. Roscoe visited it, to order a chimney-piece for his seat, Allerton; and his drawings and models being shown to that friend of art, his kind encouragement commenced. After this, to use a North-country phrase, Gibson never once looked behind him: all was progress with him. His route was pointed out, as we have seen; funds furnished him; and Liverpool, London, and Rome were only so many successive stages to the road that had been trodden by the Greeks; and his adoption of colour in later life was only carrying into effect his ingrained creed that "Whatever the Greeks did was right." Friendly hands were held out to him in many directions, as we have said, from the first. Dr. Voss instructed him in anatomy gratuitously; the family of Mr. Solomon D'Aguilar cultivated his mind; John Kemble sat to him; and Mrs. Siddons and Sir Thomas Lawrence landed his work, and many copies of it were sold; in London, Mr. Christie, the auctioneer, introduced him to fresh supporters. Fuseli, West, and Flaxman all gave him the strongest encouragement. Flaxman confirmed him in his desire to go to Rome; but Chantrey disapproved of it, saying there was wanting in London requisite for the education of a sculptor. Arrived in Rome, Canova received him as a pupil, giving him instruction for five years; and Thorwaldsen greeted him as a friend, and whenever Gibson modelled a new work came to him and corrected whatever was amiss. Canova advised him to study the Greeks, and to frequent the studios of the other sculptors, "and especially go as often as you can to that of Thorwaldsen: he is a very great artist." This he was enabled to do by virtue of the custom of the sculptors in Rome to visit one another, criticising or admiring work in progress. By and by people came to view his work in like manner. He records first a visit from the Duke of Devonshire in 1819, who tapped at his door and told him Canova had sent him to see what he was about. We will quote Gibson's appreciation of this friendly custom:—

"One of the great advantages I subsequently enjoyed in Rome, was the listening to conversations on art, not only between Canova and Thorwaldsen, but between artists of talent from all countries. In Rome all the studios are open to each other, every man sees another's work, and holds free communion with him, giving and receiving advice, and carrying on the labour of art by a combination of minds. On my return to England, how surprised was I to find that none of the sculptors visit each other in this way, nor does one sculptor consult another in the process of a work. This isolation is one reason, I believe, for the errors in public works, though some of them show talent and power. To advance sculpture in England, it is necessary that the artists should come in contact with each other, and also, if possible, with artists from other countries."

Lady Eastlake arrests the progress of the narrative, to insert letters that throw light upon various passages or elucidate views advanced by the author. Gibson's chief commissions, and the circumstances attending their acceptance and execution, are given. We need scarcely remind our readers that he executed

* Life of John Gibson, R.A., Sculptor. Edited by Lady Eastlake. London: Longmans, Green, & Co., 1870.

two statues of her Majesty, whose graces way on the occasions of her sittings are recorded, and will be read with interest by many. He wrote to Mrs. Sandbach, December, 1846,—“Since my return to Rome, I have given myself up body and soul to finishing the Queen's statue, and have wrought her up as high as possible. My enthusiasm has also carried me beyond the practice of sculptors, for I have added colour. The diadem, sandals, and borders of drapery, are tinted with blue, red, and yellow. Since this statue has been finished, my studio has been constantly visited, and it makes a greater impression than the model did.” A replica of this well-remembered statue was in some danger during the bombardment of Rome; but, during Gibson's absence from the scene of strife, the more martial Wynt entered his studio, and caused a pent-house to be erected over the work, upon which the shells would have been harmless. An inundation of the Tiber, too, threatened it, without, however, any actual damage. Wynt and Gibson worked together under Canova; lived for many years opposite to each other; and on the death of the former, we may add, our sculptor placed a monument to his memory. He performed this last tribute, too, to the memory of his brother Benjamin, who lived with him, in Rome, for some years, pursuing classical scholarship. Many such details are related in the narrative; but we must limit ourselves now to an indication of Gibson's impressions of the prospects of art in this country.

“Speaking from an experience of forty years' study and practice at Rome, where I had also the advantage of intercourse with the greatest artists, and most enlightened connoisseurs, I have come to the conviction that one great evil as regards the art in England arises from the class of committees to which the decision in such matters is intrusted. These committees are composed of miscellaneous individuals, united only in the common qualification of having no knowledge of or connection with the art, beyond that which most educated individuals possess. . . . At the Academy of St. Luke (in Rome) the system of competition for public monuments is condemned.”

He would have every young sculptor repair to Rome and place himself under a great master, if he wished to become one. At the age of thirty, by this plan, he ought to be able to commence a work for posterity. And every committee appointed to judge each and all other sculptural works, he would have composed of sculptors, as now arranged at the Academy of St. Luke.

There is a profile outline of the sculptor given in the volume, taken from a bust modelled by Theod. But this, too, is disappointing—not in its beauty, for it is beautiful; but the handsome youth, with the almost Greek features shown, is not the grey-headed artist of La Via Fontanella. Many persons interested in Gibson have carried away from his studio a remembrance of a quiet, almost languid, elderly, grey-bearded man, in a blouse; wan and worn, perhaps, with the creation of the groups of sculpture with which he was surrounded; and this portrait, fresh and youthful, breaks the thread of reminiscence.

THE ACCIDENT AT THE HOLBORN VIADUCT.

The fair and candid, if not exhaustive, report of Messrs. G. P. Bidder, T. E. Harrison, and E. Clark on the state of the Holborn Viaduct, was received, on the 16th inst., with great satisfaction by the members of the Improvement Committee of the Corporation of the City of London. That feeling will, to a certain extent, be shared by the public at large, and by men professionally interested in the science and art of the builder in particular. The unhesitating testimony borne, by men of such well-established reputation, to the solidity and safety of the foundations of the Viaduct, is matter for congratulation. We thought the matter, as a whole, more serious than they appear to do. We fear it is so still, but we are very glad to hear that they do not find it so. The investigation given by the reporters to the details of the setting of the columns, is, perhaps, from an engineering point of view, the most valuable feature of the report. Much has been said, and much written, on the subject, by more or less competent judges; the voices of the latter, as naturally constituting the majority, having for the most part prevailed. We have, for ourselves, delayed any detailed criticism of the misfortune since our announcement of the occurrence, on the ground that no such professional judgment was possible (otherwise than as a leap in the dark), without such a careful examination of the entire case as would be only within the

competence of men professionally employed to report on its character. Careful examination of the drawings and working plans, determination of the weights, verification of the levels, perfect or otherwise, of the cornice and other main horizontal lines of the Viaduct, were, of course, indispensable. These points might, more or less fully, have been within the cognisance of not a few engineers. But with, and even above, all these requirements, the power of putting questions was indispensable to the cautious investigator. Not a byword to a laborer, or a hint snatched from a mason,—not even a courteous explanation from one of Mr. Haywood's staff, but that full information which can only be elicited by something like a judicial inquiry,—was a due preliminary to the process of making up one's mind. For this we felt that it was necessary to await the report which has now been issued.

Messrs. Bidder, Harrison, and Clark have presented us with a sort of abstract of their minutes of evidence. In this part of the report its main value to the profession consists. While the reporters have thus explained the reasons for the conclusions at which they have arrived, they have enabled us to push the inquiry somewhat further.

Explanations, the reporters tell us, have been furnished them by the engineer, by the two clerks of the works in charge during the construction, and by the mason who executed the works for the contractor. Careful examination of the viaduct itself, and of the plans and designs, combined with this oral explanation, has thus placed at the command of Mr. Bidder and his associates something of the history of the failure.

In one respect the reporters have omitted to give an item of information of no slight importance to a correct judgment of the case. The omission is the more remarkable as it does not appear, from any paragraph of the report, as if the attention of the reporters had specially been directed to one of the most critical points of the case. It is mentioned, quite incidentally, that the weight imposed on each column is about 180 tons. We conclude that the eight interior columns, in which the fractures occur, are thus indicated, and that the pressure on the four angular, or external, columns is only about half that weight, plus the extra weight of parapet, cornice, and footway. But an essential feature in the case is the distribution of this weight. Not only does the skew of the span—the angle at which the upper roadway crosses the lower one—throw the actual weight of the superstructure on a portion of the columns, leaving a large section of each to discharge a merely ornamental, if not injurious function; but the great difference between the span of the central and of the side arches is such as to throw a much larger part of the 180 tons upon the portion of the column facing the roadway (where the fractures occurred) than that which rests upon the opposite face of the granite hexagons.

It is unnecessary now to inquire what would have been the result of this uneven weighting of the columns had the mass of each been perfectly homogeneous, and the bed mechanically true. But, under the actual circumstances of the case, we have here, perhaps, the knot of the matter. Without denying that motion may have taken place from the effect of temperature, and that thus a rocking of the piers upon their bases may have increased the effect of a crushing, wedge-like action, we must yet observe that no evidence is afforded of the occurrence of such motion. The holting of the central girders together by a vertical joint in the centre, like what masons call a she-arch, is probably more obnoxious to the mechanically trained eye than it is deserving of any more grave condemnation. Still, the behaviour of these joints is a point to which attention should have been directed.

But as to the fact that it is the effect of positive and ascertainable weight, rather than of possible and problematical motion, which has split the 13-in. stones, the bridge tells its own story. Let any one compare the state, almost or altogether uninjured, of the outer or less heavily weighted piers with that of those under the interior of the bridge, and he will see that weight has been the element of disintegration. The very close resemblance to one another of the form and position of the cracks in the inner columns struck us from the first moment as being one of the most remarkable features of the case, and it is one as to which the report in question enables the public to form a definite and positive opinion.

The 13-in. beds of Ross of Mull granite, in which the main fractures occurred, were finished to a true bed for a depth from 1½ in. to 2 in. all round their periphery, the centres of the beds being left purposely hollow to an extent not exceeding one-eighth of an inch on each bed. Opposite each angle, and at a distance of 1 in. from the face, pieces of lead, weighing from 5 lb. to 7 lb per foot, were placed, the interior of the bed being filled in with fine mason's putty. Thus the bearing surface of the column, instead of being that due to a hexagonal prism of 4 ft. diameter, was reduced to an interrupted ring of from ½ in. to 1 in. in width, and from 6 in. to 8 in. in length for each point of support. On the half of these points, which, speaking approximately, afforded a bearing surface of some 30 superficial inches, upwards of 130 tons, the weight of the half of the central arch and spandrel, directly pressed. On the equal area of bearing surface towards the footway less than fifty tons have to be supported. The granite prism thus resembled, at the points where it transmitted the weight of the superstructure to the adjacent plinth, a ring of piles firmly bound together, rather than a monolithic column. A tendency to cant the columns towards the roadway would be one result, but, even independent of this, the actual direct pressure on the angle immediately under the girder was too much for the stone. The regularity with which the fractures occurred in the interior columns seems thus accounted for.

It appears to us to be of much more importance thus definitely to point out the fact that a weight, perfectly manageable if distributed over the area of the column, became destructive when thrown by ill-judged setting upon half a dozen points, than to enter into the vexed question of expansion and contraction of the girders. On this point men capable of forming an opinion materially differ. All that has been said on this part of the subject has been the assertion of what the girders must have done theoretically. No observation of what they actually do or did has, so far as we can learn, been attempted. The referees speak of a maximum contraction in the width of the centre girder, due to the variation of temperature between the time of fixing and that at which the fracture was detected, amounting to a quarter of an inch. It is very curious that they omit to explain that on any other hypothesis than that the iron arch was a perfectly unyielding and non-elastic structure (which, of course, they would not contend to be the case), the effect of such contraction would be to lower the crown of the arch, and thus throw an increased pressure against the columns, the effect of which, if ascertainable, would have been on the side opposite to the actual fracture. We therefore think it is matter of regret that the vague nature of this part of the report tends to leave in some degree of obscurity an occurrence which is perfectly intelligible by the light of the very simplest laws of mechanics.

Another point on which the report is silent has not, we believe, been at all alluded to. On a visit to the Viaduct on the day on which the report was issued, a phenomenon became apparent which it is impossible to disregard. The upper line of roadway demands careful examination, no less than the state of the columns which support it. The beautifully regular surface which the pitching over the Viaduct presented a month ago will not now be found equally faultless. As far as variations of level are concerned, the change is not greater than—not, we think, so much as—we have often observed in newly-pitched roads upon terra firma; but that which is peculiar to the Viaduct road, and not only peculiar, but to some extent at least new, is the appearance of a system of sharp, well-defined cracks, separating the sets, or pitching stones, from one another, and extending over the greater portion of the area covering the arch. On the occasion to which we refer, these cracks were as fresh and distinct as if they had been just formed. In very muddy weather they would probably not be perceptible, but on the morning of the 16th inst. there could be no doubt as to their presence.

What is the exact indication given by these cracks it would be unwise to attempt to decide, without full and patient investigation. It is clear that they cannot result from any bodily settlement of the viaduct, as the foundations are perfectly solid; and any displacement due to the fracture of the piers is infinitesimal. That they result from the vibration of the platform, caused by the rapid passage of heavy vehicles, we suppose, no one can doubt. The combination of

granite sets, with a substructure possessing a certain amount of elasticity, under the stress of a traffic such as that of Holborn, is one without any very close parallel. It will be very interesting to compare the early experience of the very elastic bridge over the Thames at Westminster with that now to be derived from the City structure. It may turn out that this disposition of the sets to play on one another is only a practical mode of increasing the elastic resistance of the roadway. But it may turn out, on the other hand, that some modification of the pitching is advisable. The more or less elastic action of the corrugated plates forming the iron platform of the Viaduct, must also be regarded. On the whole, these very numerous cracks, whether they have been overlooked by Mr. Bidder and his colleagues, or whether they have made their appearance since the preparation of the report of those gentlemen, require careful investigation. They afford no ground for panic, or for serious alarm, but they certainly do demand examination and continued observation.

A lesson of great importance is to be deduced from the Holborn fractures. Many men have spoken of the "thin bed of Ross of Mull granite," as if a block of stone 4 ft. in diameter and 13 in. thick was a mere mason's span. On the contrary, these damaged blocks are in themselves noble stones. To suppose that granites of these dimensions is too slaty and paltry to be used when great weight has to be borne, is simply ridiculous. But the evil lies in the juxtaposition of beds comparatively thin with ponderous monoliths. And here it is most interesting to observe how closely the taste of the artist accords with the science of the builder. The architectural beauty of the piers was somewhat diminished by the same cause. We do not say that it was thus necessarily diminished, but practically it was greatly injured. Had the hexagonal piers been built in 13-in. courses of the rose-coloured granite, no undue stress would have been thrown on the exterior part of a single layer. Whether they had been bedded in mortar or in lead, the weight would have been freely distributed, course after course, instead of being thrown on a few points under the angles of a monolith. The very care requisite for the formation of the single joint led to the evil. It is not, therefore, merely as an eyesore, but as an offence against structural rule, that we must hereafter carefully avoid the juxtaposition of stone courses of very unequal magnitude. The ancient builders were well aware of this important canon of their craft.

Avoid the intermixture of monoliths and of slabs. See to the execution of your most important works with your own eyes. These are the inscriptions written on the Holborn Viaduct in a character more hold and more durable than golden letters.

ART TEACHING: ITS PURPOSES AND ADVANTAGES.

At the annual distribution of prizes at the Gloucester School of Art, Mr. Gambier Parry put these questions: "What is this art teaching? What is its purpose? What are its advantages?" and answered them by reading a paper, part of which we print:—

What is this art teaching? It is a significant fact that the Government have of late years put into active operation schools of art over the whole country. There are at present as many as eighty-five schools of art in England alone; in Scotland, eight; in Wales, four; in Ireland, five. The arts,—I mean those of high aim, above mere arts of ingenuity and handiwork, and therefore called fine arts,—had fallen to a very low degree of estimation and in practice in this country. There had been a time when the case was entirely otherwise—when we had national arts clustering beautifully round a national architecture; but then came a time of great trouble and confusion, which forced men's attention and energies into a very different channel. Great social and political troubles supervened. The foundations of society had been very much shaken at the time of the Reformation, and by the events following or resulting from it. The shock had been great, indeed. The habits, the principles, the tastes of the people were changed by the political, quite as much as by the religious, results of that great event. For some time society appeared to be going through a process of reconstruction. Among other results of this great social disturbance the finer arts suffered much. They were in some cases discouraged for reasons supposed to be based on religious objections; and in other cases they drooped for want

of national interest and sympathy. What taste for them remained was to be found exclusively among a limited number of the wealthier families. But their patronage was not sufficient to call out native talent, because the nation was itself indifferent. The result was that, in answer to the demands of the small upper-class, such men as Vanduyck, Sir G. Kneller, and Sir P. Lely were induced to come to England to paint their portraits, and Canaletto to paint views of their houses and landscape scenes in London. There were at the same time a few English artists in oil painting and miniature, for portraiture; but for higher inventive and illustrative art on a large scale there was no one. A few anecdotes may serve to illustrate the decadence of art in England after the time of the Reformation. Much had been destroyed then. But later, in the time of Queen Elizabeth, in the thirteenth year of her reign, at a Convocation of the Bishops, a canon is recorded to this effect:—"The churchwardens shall see that the churches be kept clean, &c., the pictures of false and feigned miracles be demolished, and that the walls of churches be fresh whitened,"—and so forth. This was a sweeping order; but I beg you to observe that it only applied to false and feigned and untrue inventions. Still, the result was most distressing. Religious and political partisanship existed then, in its own degree, as we have it in our own degree in our days. The order for destruction was exaggerated out of spite, and party antagonism was carried to great excesses. Horace Walpole mentions a story of a certain ruffian named Bles who was hired, at 2s. 6d. per day, to destroy the painted windows of the church at Croydon. Of course, this, like scores of others, was one of the Puritan excesses never contemplated by the order of the bishops. We find the tide turning soon after, and the expression of grief and vexation at this destruction being loudly expressed. Among the State trials in the time of Charles I., there is a case of a certain H. Sherfield, against whom proceedings were instituted for breaking sacrilegiously the painted windows of a church. One of the witnesses against him speaks thus:—"I undertake that there are some spirits abroad now, that if they had been alive in King Solomon's time would have gone night to have done violence even to the Cherubims in the Temple. God only knows what would have become of them!" But, to bring the illustration of the decadence of art still nearer to our own time, I must quote from the report of the first Commission on Arts and Manufactures in the year 1836, in which one of the witnesses examined about the condition of the art world in this country refers to his early days, and tells this story:—"A fellow-student of mine, named Baxter, who was educated in art at the Royal Academy, being in distress, went to one of the leading patrons of art in his day, and, speaking about ornamental porcelain, the gentleman said to him:—"I obtain all my vases beautifully painted from France: there are none equal to them." He then took some of them down from his cabinet, and showed them to the poor artist. Baxter was delighted to see them, and said,—"Sir, they are all of my doing; I painted them all. But they have the French mark upon them, because such is the estimation in which art is held in this country, that works will not sell without undergoing this wretched transformation." Poor Baxter was much employed in the early days of art manufacture in the Porcelain works of Worcester: to such a point had all national care for finer arts fallen in this country. It is only when things have arrived at their lowest point that they begin to rise. That rise in the matter of art has been steady and permanent. In the year 1813 an accomplished man, Prince Hoare, writing in his work entitled "The Epochs of Painting and Sculpture," thus ends his essay on the revival of art in England, saying, in words which now sound like an inspired prophecy,—"The arts of design await the encouraging mandate of the State. To attain the position due to them, there are these three essential means: 1. Let the knowledge of design be generally diffused. 2. Educate artists honourably to themselves. 3. Employ them honourably to their country." Thus was the note struck for the turning point of fine art as a matter of national interest and concern. Those words of Mr. Hoare have been carried into most effective practice. The recommendations of Commissioners of Parliament have been adopted, and a department for the cultivation of the fine arts has become a national institution, fostered by the authority of the Government, aided by

the votes of Parliament, and, I am happy to say, responded to by the approval and satisfaction of the country. Thus, sir, we see that instruction in fine art has been adopted by the voice of the country as one of the branches of national instruction. This is my answer to the first question which I proposed to you. The second question was—What is the purpose of this teaching of art? My answer is, that necessity is the mother of invention in more ways than one. As times of peace and the arts of peace progressed together, our national aptitude for mechanics developed itself in manufactures: we were, with all our power, and many valuable qualities, a rude and rough people. Our climate was rough and chilling; our geographical position obliged us to great exertion in the world's competition: the great principles of our constitutional liberty, not only opened the way, but forced the way, to national advancement by individual exertion. The consequence was that to recover our national and individual losses, our people threw their whole energy into trade. Our manufactures were developed by the application of machinery, and our commerce was spread over the whole world. We became proud. But as pride cometh before a fall, so surely were we to be humbled. We became great, and proud, and vulgar in the wealth we gained. But our work was that of the hewers of wood and drawers of water. We could labour and produce, but the finer sense of other nations demanded something beyond mere gross material production. Our commerce flagged; we found that there was an element in production superior to our own. As a nation, we had despised and neglected the finer arts. But we soon found that without them our productions failed. We learnt the humiliating lesson that our part was the gross material part of labour, but that there was an intellectual quality which in our folly and pride we had despised, but without which, to give life and value to our productions, they were worthless. So we had to beg from other nations: French, and Germans and Italians were invited to our principal seats of manufacture; and to them, by their accomplishment in the arts, we are indebted for those qualities which enabled our manufacturers to retain their place in the world's estimation; to those foreigners I say we were thus humiliated by obligation, while our workmen merely performed the material labour of production, and our tradesmen performed the labour of the counting-house. The grosser material labour was ours; the higher qualities, which made our manufactures saleable, were due to foreigners. This was humiliation; but it was humiliation of pocket no less than humiliation of intellect. Our manufacturers awoke to the idea of how great gain it might be to train our own men rather than thus be dependent on foreigners. Our more intelligent workmen next awoke to the idea of how much was lost to their class by the national hinder. The finer qualities of intellectual cultivation had been neglected. Our people at last acknowledged the error and the humiliation. If there is one characteristic quality of our very mixed race, as English people, more valuable than another, it is that, be the demand upon us what it may, some of us are certain to be found who will answer to that demand. The variety in our blood insures us variety in our powers. Our national difficulties may have depressed us, and our political and religious habits may have discouraged the cultivation of our finer qualities; but those qualities were within us, only dormant, and when the call should be made upon us we should rise to it. Small as our country is compared with other nations, we have gained, always and only under God's Providence, a gigantic position in the world. By energy and enterprise, by naval and military prowess, in war, in peace, in industry and commerce, we have gained the highest honours of our national position. But we have something yet to gain in the world's race: we have been excelled by others in the finer qualities of intellectual cultivation. But who need fear if only our energy is called forth? If in those finer qualities of cultivated genius England has produced in poetry (which is the living spirit of the arts) such men as Chaucer, Shakespeare, Milton, Spenser, and a host of others, grave and gay—and in the arts themselves such men as Wren and Chambers, Gainsborough and Reynolds, Flaxman, Chantrey, Turner, Wedgwood, and scores besides them,—surely there can be no fear that if the nation calls forth the spirit of the finer arts, it will not come forth. Such is, then, my answer to the second inquiry—What is the purpose of

education in the arts? It is to raise our people in those attainments of intellectual cultivation in which we have been surpassed, and to call forth their dormant genius. This is a great aim and purpose.

THE LAST PROPOSAL FOR UNITING ENGLAND AND FRANCE.

A FRENCH engineer, M. Eugene Burel, has been in England to explain his plan for shortening the distance between England and France. He has nothing to do with bridges over the sea, or tunnels under it, but would simply improve it off the face of the earth; in other words, fill up the Channel on both sides, and reclaim the land, leaving only a passage a mile wide to be traversed by ferry-boats every five minutes. M. Burel is a grave, serious gentleman, and really believes in his scheme, whatever our readers may think of it. They may like to hear him speak for himself, and this is what he said on the subject the other night at the dinner of the Society of Engineers, when he returned thanks as a visitor. "My scheme," said he, "is for neither a tunnel nor a bridge; it is the old mother-land restored from the sea as it was seven thousand, seven hundred, and twenty-four years ago. Allow me to add one new county to England and one department to France across the Channel, and thereupon to establish a railroad. By the time this will have been accomplished, with the increase of speed that will be attained I will make you go from London to Paris in five hours. I do not wonder that you laugh at the first communication of such an idea; for some of our master engineers said to me, in the similar instance, that this was a folly a little worse than the other proposition to the same end.

However, I want you to think of it, and not to be too hasty in decreeing the impossibility. One thing is in my favour, and that is the numerous examples of such restorations of land, although on a minor scale; and it requires nothing but a combination of the most approved systems of assisting nature (as your celebrated engineer Telford said) to accomplish this, at first, extraordinary-looking work. Some say that England would never admit of being altered from its present situation of an insular land to which she considers she owes her independence and her supremacy on the seas. I will not discuss now any political question, although I consider the unlimited increase of the means of communication between all the nations of the world to do the best some day or other, and set at rest every bit of unworthy consideration of this kind, especially when time will have still more proved the benefit of the general union of the trades and commerce between all nations.

But I will say one thing, and that is, that assuming the isthmus to be still there as it was formerly, before the Diluvium Cimbricum, as

reported from ancient traditions by Florus, and demonstrated by all the geological transactions, we should have to call M. de Lesseps to bore it, as there should be still a greater need of his scheme there than at Suez. Now, under such considerations, I would restore the land, not completely, but only so far as to leave a narrow channel one mile wide in the middle, and thus both the free circulation of the seas and the political question would be safe. In fact, my solution of the difficulty is a solution of contiguity. You say one mile is too little; I answer,—No, it is not; for, I do not care whether it be one or twenty miles, when I think of the ferry-boats that are spoken of for the next year, which will be able to transport an army, or when I think of the guns that will soon afford us the possibility of firing against each other without parting from our shores. Had we not better advance at once, facing kindly to each other, so near as to shake hands over the water, while the ferry-boats would cross it every five minutes, transporting backward and forward all the treasures of our industries?"

With the best possible feeling we advise M. Burel to waste no money on the prosecution of his scheme. We will not venture to say what changes in opinion may take place one of these days, but at the present moment England has no desire to give up her insular position.

SOME ACCOUNT OF A NEW TESTING MACHINE.

THE recent accident at King's College brings vividly before us the necessity of the greatest precaution being taken as to the strength and quality of the materials of which our buildings, particularly our public buildings, are constructed. By a special providence no lives were lost; but had the failure occurred only a few hours later, more than one hundred families would have been driven to mourning.

But for faulty cast-iron girders the accident probably would not have happened. When the building was erected, about thirty-five years ago, the use of iron was less understood than it is at present; and even had the material been sound and perfect, it appears to have been charged with more weight than would now be considered prudent, so that the moment adverse circumstances occurred it failed.

The difficulty of obtaining correct data for the calculation of the strength of various materials in their practical application to constructive works has been very considerable. In one instance where the quality of iron was in question, and before the erection of Mr. Kirkaldy's apparatus, it was desired to test certain girders, not as to the actual weight they would carry, but as to the tensile strength of the iron (wrought) of which they were made (they

were riveted girders), and, after a good deal of trouble and delay, as it was for a Government work the use of the cable-testing machine in Woolwich Dockyard was granted. The result was satisfactory—more than 25 tons to the square inch. Had it not been, however, for the peculiar circumstances of the case, it would have been almost impossible at that time (about eight years ago) to obtain within reasonable distance of London an independent satisfactory solution of a similar question.

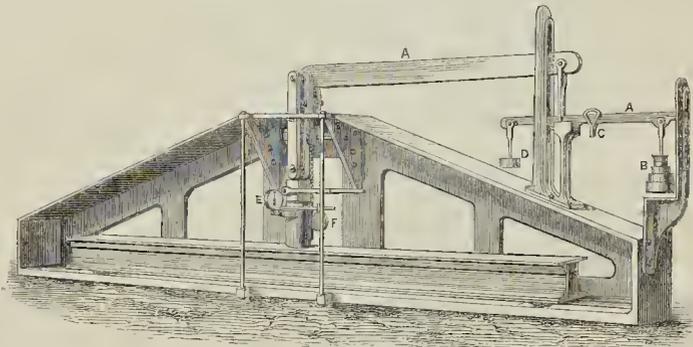

Hodgkinson's experiments on cast iron have considerable completeness, and as cast iron breaks and does not bend, the test is tolerably absolute, and, with the usual large allowance for bearing weight in proportion to breaking strain, his results may be taken as satisfactory data. But the great objection to the use of cast iron is the uncertainty of the manufacture. One girder, apparently equal to its fellow in strength, may have a hidden flaw in the casting which reduces its strength one-third or perhaps one-half; while in wrought iron, from the method of manufacture, this is impossible, and equal sections may be reckoned to carry equal weight. The use of cast iron, especially for long bearings, is rapidly going out of date; it is superseded, for ordinary building as well as for engineering works, by rolled iron, either in the form of solid rolled beams or as riveted girders, with which we are all familiar, built up of plates. In many instances these girders are of such large dimensions as to preclude any test being applied previous to their completion *in situ*, except,—and this is most important,—as to the quality of the iron of which they are composed.

Again, Belgian and other foreign irons are being introduced into the market, and it becomes therefore more and more desirable that the architect, the engineer, and the contractor should have some ready means of ascertaining the quality of the material he is purchasing; such means, however, being rarely within the compass of a private establishment.

There is another point also of much interest in the general building trade, which will, no doubt, have some additional light thrown upon it by actual experiment,—the opinion that most of the constants in use for calculating the strength of beams are too high. A comparison of Tredgold, Barlow, and Clark will show a difference of something approaching 100 per cent.; Tredgold being the highest, Clark the lowest, and Barlow about midway.

It is very desirable that a fresh set of experiments should be instituted extensive enough to furnish us with a really authoritative formula, especially for the large scantlings, which are not so strong in proportion as the smaller ones, upon which, however, the higher constant is based. Some of the failures of heavily-framed timber constructions may probably be traced to this cause.

MESSRS. SHAW, HEAD, & CO.'S TESTING MACHINE FOR GIRDEES, &c.

Operation of the Machine:—

- 1st. By levers (A), which re-act, direct with the press, and are so arranged that 2 lb. at D equal one ton on the specimen, the weight C counting the cwts., D being the adjusting counterpoise.
- 2nd. By pressure-gauge (E), which registers the pressure per square inch, or can be changed to register the tons.
- 3rd. By lever-gauge (F), which is arranged in the proportion of area of valve to area of piston of press, and thus registers tons on the object tested.

Messrs. M. T. Shaw, Head, & Co., of Cannon-street, have recently erected a machine at their Bankside wharf which provides the necessary facility for submitting these various materials to the test; its more special object, however, being to bring home, as it were, to every man's door the opportunity of ascertaining the tensile strength of the wrought iron he may be purchasing. The machine is an ingenious combination of the cast-iron girder, the hydraulic press, and the compound lever, as shown by the accompanying diagram.

The frame, somewhat resembling a queen-truss in shape, is built up of three heavy castings (bolted together) at the points, occupied in a truss by the queen-posts. The width of the upper and lower flanges is 2 ft. 9½ in., and the cast iron is 1½ in. thick; it is further strengthened by two tie-bars of 2-in. wrought iron from top to bottom at the same point. It is, in fact, a gigantic application of the principle of the scull-beam, the weights being adjusted at the extremity, and simply exerting their force by the principle of balance, as applied by the compound lever on the hydraulic press in the centre, by which the "proof" is applied with accuracy and facility, by the simple depression of the ram at that point. The maximum pressure that can be thus exerted is 50 tons in the centre, equal to 100 tons distributed, and the machine will prove anything up to 34 ft. long, 1 ft. 6 in. wide, and 3 ft. high. In the diagram the girder is not shown sufficiently raised up at the two ends.

The proportions are as under:—The length of the first lever is 3 ft. 11¼ in., and that of the second lever 13 ft. 4 in., the first lever giving a multiple of 40 to 1, and the second of 28 to 1. It thus follows that whatever weight is applied at the extremity multiplied by these figures, gives the amount of pressure exerted downwards upon the centre of the material to be proved; e.g., 28 lb., one quarter of a hundred weight, 28 × 40 × 28 gives an exerted force of 31,360 lb., or as nearly as possible 14 tons.

The levers are of polished steel, manufactured with the greatest care, and the dial gauge indicates the most minute alteration of pressure. The ram is 6 in. diameter, and there is an escape valve, that, when the pressure reaches the limit of safety, releases the oil with which the ram is charged, and precludes all chance of accident. A clever adaptation of reversing power enables the force to be exercised as a tearing strain, thus giving facility for exactly determining the strength of any section of iron submitted to the strain.

Many questions which are continually occurring in practice, both to engineers and architects, as to the comparative strength for various purposes of different sections of wrought or cast iron may here be readily decided at a moderate expense, as Messrs. Shaw, Head, & Co. propose to put the machine at the service of the profession at a low charge, so as to enable any to ascertain with accuracy the comparative strength of the many varieties and manufactures of rolled and wrought iron. It is right, however, to say that what they mainly desire is not so much entering into rivalry with elaborate testing machinery set up for public use elsewhere, as to enable their own customers to make themselves certain as to the strength of girders and other works manufactured by the firm.

We subjoin the record of an experiment made in our presence as an example of the working of the machine.

It was made upon a wrought-iron rolled solid beam, 21 ft. 6 in. clear bearing, 12 in. deep, flange 6 in. wide. Total sectional area, 17 square inches; sectional area of each flange, 6½ in.

At 5 tons the deflection was	Inches.	(No set.)
8	"	1½ (trilling)
16	"	"
20	"	2½
22	"	4

The top flange buckled with less than 24 tons in the centre.

The calculated breaking weight of the girder, bearing as above, was 22 tons.

ON THE LIMITS OF VARIETY IN ARCHITECTURAL DESIGN.*

WE are going to inquire how far it is possible for us to produce perfect originality in design; and to that end we must examine the different sources of variety in design, some of which appear to be unlimited, others more or less limited, in extent. There are two important matters that would appear to require special attention in these inquiries; that is to say, outline and style. The first, however, of these we must leave, as requiring a separate treatise of sufficient extent to occupy a whole evening's attention; and the other—that is, style or school—being a result, and not a primary source of variety in design, we shall only introduce incidentally, and by way of occasional illustration.

In the more detailed view of art that we are about to take, we shall observe six of those sources of variety:—1. Order of proportion. 2. Mode. 3. Order of projection. 4. Method of construction. 5. Material. 6. Individual taste. And we do not pretend to make any new or wonderful discoveries, but only to lay before ourselves that which we all know already in such a manner that we may be better able to make, perhaps, better use of it than we have hitherto succeeded in making.

We shall use the word order in such a way that it may apply not only to those two schools of architecture with which conventionalty associates it, but to all schools, as far as possible, that now exist, or that may hereafter be produced, or discovered in plans at present unexplored.

We shall before very long be met with the remark that our predecessors in art designed what they thought looked well, without regard to any rule. But real experience in designing will show us that a good sound fundamental, not scholastic rule, is a great help, and far from being a means of restraint.

Most buildings of any importance are divided into a certain number of bays, compartments, or sections, for the convenience of construction, and of lighting the interior, and for other economic purposes.

The word section is more properly applied than to the cutting through of a building to show its construction. The Latin word *sectio* means a portion or division of a treatise or object for architectural section, longitudinal or transverse, would be more properly termed a *scissura*, from *scissura*, a Latin word of identical meaning with this.

It will not be too presumptuous to suppose that the class of objectors above mentioned will admit that in any one of these sections or divisions there must exist some proportion between the height and width,—that is, from centre to centre of column, buttresses, pilaster, pier, or attic. The height being that of a single story from base line to top of column, springing of arch or underside of epistylium, according to the mode of construction.

We must now beg leave to be allowed to divide that width into as many parts as we like to form a scale for our orders, and having obtained permission, we will divide it into four parts, and according to the number of times these parts are contained in the height, so we may classify our orders.

Now, you see, in this source of variety there is no certain limit, though at the same time it is not of infinite extent. It is left to individual taste where to place the boundary.

Except in such a building as a bridge, which may be considered a sub-ordinary, less than three parts should not be used for the height. Our old church architects in their simplest structures, and the Italian masters in their attic stories, seldom went below this. Calling this the first order in ordinary designs, nine of these parts will give the seventh order,—a proportion seldom exceeded either by precedent or good taste, except in a peristyle of detached columns, which may be looked upon as a superordinary structure.

Now, concerning ordinals, that is, accompanying details to the several orders. The Greeks to a certain extent, the Romans to a greater extent, the Italians to a still greater extent, and the modern uninventive imitators to a positively insane extent, associated a certain mode inseparably with each order, so that we have come to use the proper adjectives, Doric, Ionic, Corinthian, as though they were ordinal numerals, and suitable for distinguishing one degree of successive rank from another.

* Read before the Architectural Association, Friday, December 3, by Mr. W. Scargill.

If we use a simple shaft for our first order, as the English church architects generally did; four shafts for the next order; eight for the next, as the above masters also frequently did, and if we add four shafts, also, to each successive order, our sixth order will contain twenty and our seventh twenty-four. Now, substituting hollow flutings for shafts in these upper orders (they are more suitable), this is exactly what we find in those two well-proportioned Greek examples, the temple of Theseus and the Ionic temples of the Lysseus. The first of these is in the Doric mode, and the other in the Ionic; but in the Temple of the Winds at Athens, the columns have but twenty flutes, and are lower in order as regards their distance than any Ionic example; and yet, here you see the mode is Corinthian. This example draws our attention to another ordinal,—foliation. It belongs to a particular mode, and we must not forget to revert to it in its proper place.

The Assyrians put their columns still closer together, and used rectangular indenters for ordinals, and went as high as thirty-two or thirty-six to each shaft. Some good examples were burnt at the Crystal Palace, which is to be deplored. The convex flutings of the Egyptians, generally more in number than the Gothic shafts, and generally though not always less in number than the Greek flutings, are specially adapted for the middle orders in our scale. Now, it so happens that having granite instead of stone, and not requiring the arched construction, we find that the Egyptians actually did use these middle orders of proportion. The chief ordinal of the Roman school may be taken to be the leading horizontal lines in the entablature. The several orders show 3, 4, 5, 6, and 7. These are the faces of the architrave, the frieze, the modillion, muntin, dentel, and corona courses. The leaves used for decoration in the initiative mode of architecture, are in most schools more simple and less indented, or cut up, in the lower orders than the higher; this is noticeable in the example above quoted in the temple of the eight winds. This minor detail of decoration then forms another ordinal, and it is a useful study for the designer to sketch everything of this kind in nature that presents itself to his notice, and then to classify them according to his own taste and judgment.

The profile of mouldings should also vary according to the order of the composition. Both precedent and good taste authorise this arrangement. For while Mediaeval and modern masonry in the Italian school use in the lower, and even sometimes in the higher orders, mouldings of circular outline, we find little or no precedent for it in antique examples. In modern Tuscan and Doric, we find a quadrant-shaped echinus to the capital, but in Roman examples of these modes, we find ellipses of greater or less variation. In the high order of the Greeks, parabolas and hyperbolas are used, and in the low order of the English schools the circular profile finds its proper place. Now, we propose a scale of ornamented mouldings to agree with our orders of proportion, called the *declension of the conic scissure*. To provide for a series of seven orders, we take a cone of 60 degrees. The vertical scissure gives a hyperbola for the seventh order. The next, declining 15 degrees, gives an oblique hyperbola for the sixth order. The next, declining 15 more degrees, a parabola for the fifth. The next three, each declining 15 degrees, give three ellipses of decreasing variation for the next orders; and the oblique, prostrative, horizontal scissure, a circular contour for the lowest or first order.

The next source of variation is that of mode. All ornament may be said to belong to three simple modes, or to combinations of two or of all three of them, making four additional composite modes, and the plain unadorned, or Tuscan mode, as we should say, in reference to the Roman school, makes an eighth. And of those simple modes we have, first, the Geometric; 2ndly, the Decorative; and, 3rdly, the Imitative. The Geometric mode is illustrated in the Greek and the Roman schools in the ornaments of the Doric examples; in the Norman school, in the capitals and ornaments of the arch, such as the chevron and hillet; and in the earlier Gothic schools, in the geometric tracery of the windows.

The Decorative mode includes all ornament not geometric or imitative, such as is illustrated by free-hand drawing, without copying from nature. This is the true architectonic style, and is found in every school of architecture, in the time of the ancients, and in nearly all varieties of the

The Site of the Fleet Prison.—The Common Council have agreed to convey to the London, Chatham, and Dover Railway Company, or the sum of 60,000l., the freehold interest of the corporation in a piece of ground on the east side of Farringdon-street, the site of the late Fleet Prison.

Arabic, Hindoo, and Moorish schools, in the Romanesque, the Byzantine, and Lombardic.

And the remaining mode in the Corinthian mode of the classics, in the Egyptian, the Romanesque, and the middle periods of Gothic, in which latter it is used irrespective of order.

By the imitative mode we mean that class of ornamentation which is copied from nature, more especially from natural foliage, and to which we have before alluded in our remarks upon ordinals.

The third source of variety in design is that of Projection. As regards this matter, we must have recourse to precedent, which furnishes us with six orders or degrees. 1. Incised ornament; 2. Superficial ornament, such as mosaic work and ornamental paving; and this order, though a minor order of architecture, embraces the whole art of painting,—a great art in itself, extending itself, in a manner, beyond the province of this art of architecture in which it finds its place as a subordinate feature; 3. Positive projection next begins in basso-relievo; that is to say, for the most part imitative ornament, in which the outline is preserved literally, but with a depressed projection or profile; 4. Mezzo-relievo, where both outline and profile are strictly true to nature, but the objects projecting but half their bulk from the plain surface which they serve to decorate; 5. Alto-relievo, which differs from the last only in the figure being nearly detached, or sunk but a fourth of its depth into the superficial plane; 6. And beyond this comes detached ornament, and this applied in the imitative mode develops itself in another of the fine arts, expanding beyond the province of architecture, and bearing the honoured title of the *Art of Sculpture*.

In the methods of construction we can hardly find room for an ordinated or classified arrangement. There would seem here to be two extreme points of limitation in construction: that is to say, the reponent and the salient, but with one or two points of transition. And beyond these we can find no new orders or arrangements sufficiently distinct to characterise a school either entirely new or entirely original and unique as regards its method of construction. But we must now explain the meaning of these terms *reponent* and *salient*.

Reponent, then, is the proper term to apply to solid masonry, in which every portion of material has a solid bearing. This construction only provides us with an enclosing wall to our building; for as soon as the necessity of a door, window, or roof presents itself, one step is taken in the direction of the other mode of construction, and this step is the habitative method. This construction, however, is associated with the reponent, and forms the great line of distinction of the Greek, Egyptian, Hindoo, and Syrian schools, from the Saracenic, Moorish, Romanesque, and Gothic.

The semicircular arch, belonging rather to the salient method, has this imperfection in its character; that, at one single point, viz., at the crown of the arch, it is related to the trabeative construction. The zenith of a vertically-placed circle being in that one point, and only one point horizontal in its direction.

The Gothic schools may be looked upon as perfect illustrations of the salient method, both in their arches and in their timber roofs,—that is, in those that have no tie-beam.

And all arcuate constructions, whose arches are formed by one curved line, whether circular, segmental, hyperbolic, or parabolic, may be looked upon as homogeneous one with another, as the same remark applies to them, as we just noticed, as applying to the circular.

These methods of construction, then, show us but little variety for our designs, the most we can make of them being these three,—the trabeative, the multilined arcuate, and the bilinear arcuate. We must leave this head of our treatise for the present,—we shall revert to it in our concluding remarks,—and proceed to consider the question of material.

Both Vitruvius and the dogmatizing revivers of classic art, insist very strongly upon a column of a certain mode, contain in its height a certain number of diameters, whether constructed of brick, stone, marble, granite, iron, or wood; and whether supporting a simple epistylum, a roof, or one, two, three, or twenty stories of superstructure. Now, if we wish to design with truthfulness, originality, or common sense, we must at least throw off such oppressive fetters of conventionality as these.

There are two circumstances in nature or in the conditions of architectural construction that

will determine the thickness of a column or pier, after we have determined its height to suit our convenience, and its order and mode to suit our taste. One of these is the superincumbent weight to be sustained, and the other the material selected for construction. We may reduce these materials to about four orders, so that here we shall have another multiple wherewith to extend the limit of design.

The weight of superstructure being a fixed quantity, the greatest diameter will be required for columns of brick; the next less for those of stone or inferior marble; the third for those of granite or hard marble; and the least for those of iron, and also of wood,—for this, though less hard or durable than the others, is, or ought to be, used only to support superstructures of the same material.

There remains one more source of variety in design that has no limit and never will have. We have seen how many combinations and a chosen number of orders of proportion and of projection, and a determined number of modes, methods, and materials. But we shall never determine how far these may be extended by that inexhaustible multiple *individual taste*. We might propose not only to each of those present in this room, but to all the profession that now exist, have existed, or are predestined to come after us to produce a composition of one fixed proportion, in one particular order, one mode, one order of projection, one material, and one method of construction; and if each one's own individual taste were followed, there would still be no two exactly alike.

We now see how unbounded in some directions, and in others how narrowly hemmed in, are our resources of originality. We see clearly how in one sense any number of new schools of art may be produced, and in another sense how impossible it is to do much more than reproduce; and this leads us to a few concluding remarks on the much-ventilated subject, the possibility or probability of a new school.

We almost disbelieved our own experience, when it first occurred to us that there does not exist to our knowledge a school of architecture in which the semicircular arch forms the leading feature, and which at the same time has a regular system of orders. In the Roman school the arch is a subordinate feature springing from an impost built against the column to receive it. The column of the Roman school is by no means adapted to carry an arch. In the first place, it diminishes upwards, as in the Greek school. The ill effect of a column of this kind supporting an arch may be seen at St. Leonard's at Shoreditch, Spitalfields, and other churches of the eighteenth century. Then the capitals and abacs are most evidently of a suitable form to carry an epistylum, but not tabularia is stuck into each column, the effect of which is both hideous and laughable.

Now, by the time we have cleared away such an obtrusive feature as that above mentioned, done away with the tapering of our column, and designed a capital of the right form to connect the arch with the column, we shall have done something towards the production of a new school. But you will object that all has been done already in those several schools that may be called Romanesque, but in these schools there is no ostensible system of classification: there are no orders or ordinals that we can lay hold of so as to know at once how to treat a given subject, when perhaps we have little time for thinking. It is chiefly to save your time that the foregoing classifications of order, and mode, and other matters have been placed before you. And here we have just pointed out to you an admirable opening for originality in as perfect a form as that quality can be said to exist. Revert to what we have said concerning order, make your scale of orders, say seven, as above suggested. Draw these out in the eight modes we have described, simple and composite. There are fifty-six changes for you at once. Now vary these in five orders of projection, and you have 112 changes. Now try each of these in four different kinds of material, as we have also described, and you have 448 varieties of treatment, or, as some would say, 448 orders; and we may flatter ourselves that 448 orders are pretty good for a new school of architecture.

We said that we should leave out of the question the subject of outline, but it occurs to us at this moment that there is a noticeable analogy between this and method of construction; the trabeative being associated with a

square, flat skyline; the salient with a pyramidal outline; and the circular-arched formation with the dome.

It remains for us now only to request of you that in any critical remarks you may be led to make upon this treatise, you will observe that it is composed of these distinct elements:—1. Matters of natural fact; 2. References to precedents; and 3. Our own suggestions; and that you will as much as possible recognise the difference between these as they occur, and not mistake one for another.

NEW BUILDINGS IN OXFORD.

ACCORDING to custom, the local *Journal* and the local *Herald* give accounts of the progress of new works in Oxford during the past year. From the *Journal* we condense the following particulars. Restorations and building operations still continue. New thoroughfares are being thrown open, streets are being formed, houses built, and here and there a church, chapel, or school added to meet the spiritual and educational necessities of freshly-established localities. On the site of the old workhouse a large square, to be called Wellington-square, is being made, of a metropolitan character, with a garden in the centre, and "sub-ways" beneath the houses, as an improved means of inspecting the pipes and drains of middle-class dwellings. Houses of all kinds continue to be constructed, and the large villas on Norham Manor, as well as on the more recently laid out Bavington Estate, are cited as offering facilities to those desirous of residence here.

Balliol College.—The new Buildings in Broad-street, designed by Mr. Waterhouse, of London, are now completed.

Merton College.—The restorations commenced in 1863 in the ante-chapel of this college have been fully completed by Mr. J. Fisher, of this city, under the direction of Mr. C. Buckeridge. The stonework of the windows, columns, and other parts of the structure, has been entirely renewed.

Easter College.—The filling in of the arches of the arcade in the chapel of this college has been proceeded with during the vacation. The apical termination of the chapel, at the eastern extremity, has five sides, and each of these sides contains three arches, immediately below the windows. Nine of the arches are now filled with enamelled glass mosaic, and the others will be used as sedilia, with appropriate hangings. These also will possibly be filled in with mosaic at some future period. The central arch contains a representation of our Saviour, sitting, the right hand lifted in blessing and the left one holding the globe, surmounted by a miniature cross. The figure is crowned, and has a nimbus round the head. Right and left of our Saviour are smaller half-length figures of St. Peter and St. Paul. The figures (and the observation applies to all) stand out boldly from a gorgeous ground of gold; below them is a border of gold and colour, and beneath that again alabaster, inlaid with floriated crosses of Sienna and other foreign marble. Beneath is a second band of mosaic, diapered with deep-colored marble. The northern division of arches is filled in with full-length figures of the Evangelists St. Mark and St. Luke. It is only on a very close inspection that the spectator discovers the separate pieces of mosaic which go to form the whole. The arch between the two Evangelists is ornamented by representations, also in mosaic, of the Lamb, with passion-flowers, cross, &c. The corresponding central arch, on the southern side, is occupied by an alabaster credence-table, with pedestal of carved Corinthian stone. The work was designed almost entirely by Dr. Salviati, of Venice; the inlaid alabaster and marble was executed by Mr. J. B. Philip, of Hans-place, Chelsea; the credence-table was carved by Mr. O'Shea, of Oxford; and the enamelled glass mosaic was the production of Salviati; and was placed in position by Luigi Verona and another Italian artificer, of London. The cost of carrying out the work has been defrayed from various sources.

New College.—The bells in New College tower have just been taken down and their hangings restored. Messrs. White & Son, of Appleton, bell restorers and ringers, have been employed, and have completed the work. In the course of these operations, the following inscriptions were found on the different bells, viz., on the treble: "Manners maketh Man, A.R., 1712." [The initials refer to Abraham Rudhall, of Gloucester,

who cast the bell in that year.] Second bell: "Manners maketh man. W.W., A.R., 1712." Third bell: "Michael Darbie made me. W.W., 1655." Fourth bell: "Manners maketh man. W.W., A.R., 1703." Fifth bell: "Michael Darbie made me. W.W., 1655." Sixth bell: "Henry Knight, of Reading, made me, 1672." Seventh bell: "Prosperity to New College. A.R., 1712." Eighth bell: "Michael Darbie made me. W.W., 1655." Ninth bell: "Manners maketh man. A.R., 1723." Tenth: "Michael Darbie made me. W.W., 1655."

Magdalen College.—A marble tablet has been placed in the ante-chapel of this college, bearing an inscription in memory of Dr. Daubeny, the late Professor of Botany and Rural Economy. Considerable additions have been made to Dr. Bulley's residence. The collegiate style of architecture has been adhered to by Mr. Buckridge. The masonry has been executed by Messrs. Knowles, the carpenter's work by Messrs. Castle, and that of the plumber by Mr. Taylor.

Brasenose College.—A considerable work of restoration has just been accomplished at this college. The south and west elevations of the ante-chapel have been refaced with stone by Mr. Geo. Wyatt, from the designs of Mr. J. C. Buckler, the college architect. It may not be generally known that the roof of this chapel is a specimen of timber-work of the age of Henry VII., not constructed for its present situation, and was not applied to it without considerable injury to the design.

Corpus Christi College.—It was last year found that the roofing of the fellows' building was becoming so decayed as to let in the rain, and repairs were at once commenced; they are now complete, together with a new stone open balustrade round the whole of the top of the building, and renovated chimneys. These repairs and restorations have been carried out by Messrs. Castle & Co., Cowley-road.

Christ Church.—Several improvements have been effected at Christ Church, and carried out, as usual, under the direction of Mr. E. G. Bruton, architect. A stone building, in keeping with Wolsey's architecture, is in course of erection on the site of the stables in the lane leading from St. Aldate's-street into Christ Church meadow. The structure is for the use of the servants. It will be supplied with books and newspapers. The builder is Mr. John Fisher, of Oxford. The heraldic window placed in the hall by Archdeacon Clarke, has been completed during the past vacation, by Messrs. Powell, of London. The window is an emblazonment of the principal quarters of the arms of the Prince of Wales on the dexter, and of those of the Crown Prince of Denmark on the sinister; with a statement of the donor's long connexion with the College.

Pembroke College.—New buildings, from Mr. Buckridge's designs, have been erected on the west side of the hall, with mace-keeper's room, plate scullery, strong-room, and butler's bedroom above. Mr. George Wyatt was the builder.

Forester College.—The Renaissance decorations of the College Chapel are now nearly complete. Mr. Henry Holiday, who painted the Prophets, and designed the windows of the chapel, is now painting a frieze or series of panels above the stalls, the subject of which is the *Te Deum*.

Keele College.—The work at Keele College has progressed considerably towards completion. The buildings include, at present, rooms for 100 undergraduates and six tutors, with lecture-rooms and temporary hall, chapel, kitchen, and offices. The gateway is at the south-east corner of the quadrangle. It is intended to add another story and a permanent roof to it at a future day. The quadrangle is about 220 ft. square. Rooms for undergraduates are arranged on the east, west, and north sides of it. The temporary hall and chapel are on its south side. A large opening on the north side is left for the proposed chapel, which is to be raised on a crypt, and approached by a staircase. The piece of ground to the west of the buildings will be laid out as a college garden. That to the south is left for future buildings. Red brick is used for the main body of the walls, relieved with a considerable amount of stone and of black and white bricks in bands and diapers. Brick, although largely used in collegiate buildings at Cambridge, has hitherto not been used in Oxford. But in the absence of large funds, brick was a necessity. The effect, however, of the too free use of black and white bricks is not considered satisfactory. It is regretted that the east front is so near to the trees, and a strong expression of opinion has been given that the whole of that

front ought to be pulled down and re-built some 15 ft. or 20 ft. further back.

New University Schools.—The site for the new University Schools (where the Angel Hotel stood for more than 200 years) still remains unoccupied.

The Clarendon Laboratory.—This may be considered an extension of the New Museum, being, in fact, a connected wing at its north-west corner, providing a new habitation for the department of physics, presided over by Professor Clifton, F.R.S. The lectures theatre will accommodate 150 students or other persons. Forty students can work simultaneously in the experimental rooms. The cost of the building will be about 11,000*l.* The architect is Mr. T. N. Deane, Mr. Bramwell acting as local superintendent; and the work of the builder is being carried out by Mr. R. J. Symm. The dimensions of the principal rooms are as follow:—Ground floor, lecture theatre, 30 ft. by 50 ft.; examination-room, 20 ft. by 26 ft.; central court, 36 ft. square. First floor, lecture-room, 20 ft. by 27 ft. The effect of the building in connexion with the New Museum, and its proximity to Keele College, are not considered satisfactory. The style of architecture corresponds with that of the Museum. A view and plan of it have appeared in our pages.

Proctorial Rooms and Cells.—The establishment of a force which has absorbed the once separate element of University police has necessarily entailed considerable alterations in the accommodation required for the Proctors' men. The basement of the old Clarendon Buildings has undergone a complete change. The two cells in the eastern extremity will, as heretofore, be devoted to the detention of any females who may be found *flagrante delicto*. The old entrance at that end of the building has been closed, and one made at the western extremity, reached by a flight of stone steps. These will lead immediately into an ante-room and offices for the Proctorial staff, which is now entirely separate and distinct from the police, and is kept up for University purposes only. The basement premises will be warmed and ventilated, gas and hot-water pipes being laid throughout, on the "Perkins" system. The architect is Mr. Bruton, and the builder Mr. Wyatt.

Radcliffe Infirmary.—To the north wing have been added two turret-like structures at the north-west and south-west angles of the wards, containing ward-sculleries, lavatories, baths, &c. It is intended eventually to make similar additions to the wards in the south wing. The foundations also of a new pavilion for fever wards has been laid, and the building, which is of considerable size, is beginning to rise out of the ground. It will contain two wards, 51 ft. by 26 ft. and 15 ft. in height, with nurses' rooms, ward-sculleries, lavatories, baths, and all other offices; also a spacious hall, with an ample and easy staircase, and arrangements for ventilation. This pavilion will be eventually connected with the main building by a cloister-like corridor on the boundary between the infirmary and the observatory grounds. These works are from the designs of Mr. C. Buckridge, the builder being Mr. Wyatt; whilst Mr. G. G. Scott has acted as consulting architect.

THE WORKS OF THE METROPOLITAN BOARD OF WORKS.

THE matter of the following communication is serious, and seems to call for the careful consideration of the Board of Works. We have the personal guarantee of the writer to establish the correctness of his statements should they be questioned:—

Sir,—Attention has been called at the Fulham Board of Works, to certain works in Westminster, Rotherhithe, and Kennington, under the control of the Metropolitan Board, at a suggested expense of a quarter of a million of money—partly executed, but either stopped or delayed from a difficulty in obtaining "Gault bricks."

The increased cost of these works is suggested at 35,000*l.* to suit the wishes of Mr. Grant, recently appointed for three months, to act, *pro tem.*, as chief engineer, at the rate of 4000*l.* a year. The advance on his previous salary of 1,000*l.* The works of the Metropolitan Board that can well be executed, and costly character of the sewers,—which, when completed, merely form a culvert for conveying filth from our midst, and very shortly become thickly coated with a dark slime,—is constructed either of white Suffolk bricks, at a

cost on the work of probably 8*s.* per thousand; of pressed Gault bricks, at 50*s.* per thousand; or of wire-cut Gault bricks, at 3*s.* per thousand; and a selection from the best stocks, at 27*s.* per thousand, is permitted to be used at the caprice of the officer or officers for backing.

The bricks are tried by a gauge, and unless perfectly true as a cube, are rejected, if not entirely, at least for face work: any dirt or discoloration or chipping renders them objectionable. The bricks are packed and delivered on straw, and probably other expenses render the work needlessly costly.

In every possible way the work is made to look smart and pretty; kept clean, brushed, rubbed, swept out, tivated, and brilliantly lighted up for the inspection and approval of a committee. All this has to be paid for, and adds another straw to the camel's back.

The labour in the works of the same wasteful character, and varies in amount from 5*l.* to 7*l.* per rod, occasionally much more, and then is not safe from being condemned, and done over again.

Much of the brickwork in the sewers of London has cost from 25*l.* to 30*l.* a rod, while under the late Commission of Sewers the contracts ranged from 11*l.* to 13*l.* a rod.

The quantity of work executed on the south side of the Thames under the assistant engineer in a portion of the main drainage may be approximately taken in the "Low-level-sewers and Southern Outfall" as 10,700 rods, and the facing or extra labour on the joints in "Pressed Gault Bricks," "struck, cut, flush, &c.," as 1,290,000 feet superficial; the arch covering cleaned off and pointed in Portland cement: this last quantity is exclusive of that due upon a length of about nine miles of sewer. These quantities, be it remembered, represent but a portion of the Southern drainage. If the assumption as to quantity be correct, and that a saving of 10*l.* per rod might have been effected in the cost; the suggestion at the Fulham Board, instead of 35,000*l.*, should be on the brickwork only in Mr. Grant's district, 100,000*l.*, and on the whole Metropolis a sum for Mr. Silas Taylor to calculate and possibly comment upon, or some other energetic member of the Board.

Granted that it is all-important such works be of the most enduring character; that the work should be in all respects equal to the object in view; still a due regard should be had to economy, and an overtaxed ratepayer's public;—*ergo*, the bricks should be of the best description suited to the purpose, bearing in mind their relative value; and it is a fair question to ask,—Are Gault Clay bricks best suited for this purpose? and is it absolutely necessary to pay the increased cost of the work by their adoption?

Pressed Gault bricks, delivered for sewerage works, cost about 50*s.* per thousand; Wire-cut Gault bricks, delivered for sewerage works, cost about 3*s.* per thousand; best selected stocks, delivered for sewerage works, cost about 27*s.* per thousand.

So much for cost. Now a word as to strength and quality.

Pressed Gault bricks, under a recent trial, crushed with 102 tons on the superficial foot; wire-cut Gault with 153 tons; and best stocks with "137 tons." Are not the latter a material entity both as regards strength and price for sewer work, and the general works of the Metropolitan Board? and is not the using any more expensive material simply wrong? Again, why should the labour be more costly in sewer work than in our finest edifices, or in the palaces of our beloved Queen? If certain indefatigable members of the Metropolitan Board will look into this matter, and see who is the officer or party propping up this wasteful expenditure, they will do more service to the ratepayers than by superintending the works in progress as amateur engineers.

Rumour is abroad that one of the great outfall works is rather shaky; perhaps some member will suggest that the engineer-in-chief be requested to report upon the present condition and state of efficiency of the "Northern and Southern" outfall reservoirs and buildings, so that we may be assured the rumour is incorrect, or prepared for a further outlay on one of these gigantic works just and hardly completed, of probably 100,000*l.* The value of the works of the Board, especially on the south side of the Thames (where it has ranged 15 to 20 per cent. above the other districts, chiefly, it is assumed, through the severity in the supervision), is a matter fully understood by contractors; and the prices, although proportionately high, yet fre-

quently cause the failure—or, as it is termed, “smashing up”—of the parties, and all sorts of evils and inconveniences to the public. If what has been suggested be the case, the recent loan of 10,500,000 will prove but an instalment of something more for the metropolitan ratepayers to contemplate and repay in part, leaving no mean legacy to future generations.

These matters will force their way on public attention, and the ventilation of the subject cannot be in better hands than those of the “editor and readers of the *Builder*.”—In fact, the engineers and architects of our time; the leaders and framers of public opinion in such matters; against which neither vestry, local or Metropolitan Board, nor Government itself, can long stand.

Finally, is it a fact that the cost of the works of the Board is excessive and unreasonable? If so, who is responsible? Secondly, is either of the “great reservoirs” shaky, and about to follow the College Dining-room,—i. e., come to grief? Y.

THE WORKING OF THE HIGHWAY ACT.

THE Government is again preparing to take up the question of roads, both turnpikes and highways. The turnpike system will doubtless be abolished as speedily as possible, having now outlived its time in liquidating generally the expense of forming good trunk or national roads throughout the kingdom, and these roads since the introduction of railway communication have become highways of only a local or district character, though still important and in many cases as heavily subjected to traffic, and in some cases more so, than ever. In Ireland there have been no turnpikes for a good many years, while in Scotland toll-bars are rapidly disappearing, and in France none exist. The mode of collecting road tolls, moreover, becomes much more costly than that of any other public rates.

With respect to highways in England, now of equal importance generally as turnpikes, and already comprising many of the latter whose Acts have lapsed, a circular letter from the Secretary of State has been issued to district highway Boards, requesting both information and suggestions as to the working, practically and financially, of the Highway Acts of 1862 and 1864 (which apply only to England). These Acts, in most of their provisions, such as the formation of district Boards, facility for the appointment of qualified surveyors, and the more enlarged and improved practical powers in their hands, are substantially the same as the Highway Acts for Scotland, which have worked so very successfully and satisfactorily for long, and we cannot see any reason why England should not have had sooner the benefit of an assimilation of law and practical experience on the subject; or certainly why, having received it, it should not realise in good time similar successful results as to roads, first in efficiency and ultimately in economy.

But the new Highway Act for England has an important drawback to general or speedy success,—which must be remedied,—in that it was made so far a permissive measure in the hands of Quarter Sessions for the counties, and not at once compulsory throughout the country, as Road Acts are in Scotland. The consequence is that its adoption led in many quarters, such as Yorkshire, Northumberland, &c., to much contention and delay, while in various counties it has not been adopted at all, and even in such counties as have been placed under its operation, the Act allows the local parish or township Highway Boards, with their nondescript surveyors, in existence at its passing, still to continue, though these, from the same inherent causes as above quoted, have proved little or no better than the annually elected, so called “surveyors.” When the new Act was passed, it should have been compulsory and complete, and all such limited primitive institutions abolished.

It is therefore premature to ask or answer the Government inquiries, unless in districts where the Act has from its passing in 1862 been all the while in full operation. In Northumberland, notwithstanding the best intentions of the county justices, a great mistake, and consequent failure, was at the outset made, from the highway districts being constituted of an extraordinary size, that were impracticable alike for a Board or a surveyor to manage with either credit or comfort, certainly at all events for a good number of years, when an amalgamation and extension of districts might possibly afterwards have been made, where not counterbalanced, in the meantime by growing importance.

The Act commenced in April, 1863, in Durham and other counties which adopted it immediately after its passing, and, therefore, can only have been anywhere in operation, at most for a period of six years and a half. With districts of reasonable size, varying according to the extent of population, agricultural or manufacturing traffic and general importance; by the active administrative agency of *reasonably* constituted, unprejudiced, and intelligent District Boards, composed, as the Act at present provides, of a “waywarden” elected annually by each township, and the various county justices, *ex officio*, resident within the district or towns adjacent; and the appointment of qualified surveyors, with professional training and practical experience; the new Highway Act for England has, we believe, worked successfully, both as regards efficiency and economy, wherever thus fairly, fully, and judiciously tried, effecting already many necessary permanent improvements, as well as accomplishing much towards putting the highways generally into proper form and condition, and regularly so maintaining them.

We trust the Government letter will receive that candid, unprejudiced, and respectful consideration from public bodies which the adoption by the Legislature of such means of obtaining general and practical information on the question highly merits.

Special meetings of District Highway Boards are being held on the subject of the Government inquiries for information and suggestions relative to the Acts, and from what we know of several, altogether favorable replies and intelligent suggestions have been forwarded. D. B.

CONCRETE MACADAMISED ROADS.

My attention has been directed to several letters that have lately appeared in your columns commenting on the present inefficient system of constructing and maintaining the streets in London. I beg to bring under the notice of your readers a new system of constructing streets with macadamised concrete, invented by the engineer, Mr. Jos. Mitchell, of Inverness. An experiment, extending to 100 yards in length, was made with this concrete, on one of the principal thoroughfares in Edinburgh, three years and a half ago, and although subjected to heavy traffic during that period, the general surface has not worn half an inch. There can be no doubt the result of this experiment has clearly proved that it is the best formation of streets. It is free from dust in summer, and from mire in winter, and carriages running over it produce no more noise than over a well-made macadamised metal road in perfect order. Any irregularities that may occur in the surface can be easily repaired; and where there are gas and water pipes, the concrete can be cast in blocks, and laid over them, and so prevent the necessity of cutting up the surface. Of course the macadamised concrete is more expensive in its original construction than the ordinary macadam; but the saving to the community consists in the total freedom from mud and dust, the easiness of traction, and the saving of constant repairs and consequent annoyance and expense they entail. I wish also to refer to street-making with blocks (which, I think, is not required, except where the declivity is such that there would be a danger of slipping on the concrete); I think it has been proved that, for making durable work, a solid and unyielding bottom is necessary.

An experiment of this kind was also made in Edinburgh at the same time as the above was done. 3 in. of the macadamised concrete was first laid, and the blocks set and grouted with cement, and since then no stone has sunk or worn irregularly, simply for the reason that the beds and joints were set in this concrete, which when set is inflexible and impervious to water. There can be no doubt but the present mode of constructing streets generally adopted is very inefficient and a great waste of material.

Having brought those two modes of constructing thoroughfares with heavy traffic under the notice of your commissioners of paving and their surveyors, I would only suggest, in order to satisfy themselves fully on the subject, that they should see the experiment I have referred to in George IV.'s Bridge, Edinburgh; for I feel confident that some further experiments with this concrete will result in great economy to the public, as well as infinite comfort in the absence of mud and dust.

JOHN MENZIES, C.E.

THE FORMATION OF TASTE.*

If you, or any of you who are engaged in any work of the hands where beauty, even in this least degree, can enter in,—if you will become once for all well grounded in the principles of ornament, your mind and judgment will tell what is right, and your eye will guide your hand to execute it. I do not say that knowledge alone will form true taste, and leave you to derive forms of beauty, but I will affirm that natural taste is at all events either very rare, or very rarely capable, unless instructed, of being turned to account in manufacture or in judging the merit of manufactured articles. True taste, it is certain, seems to be as it were an instinct with some men; even if they have no conscious knowledge of the rules of proportion and harmony as applied to form and colour, yet the moment they see an ornamental or decorated object they can tell whether it be false or true. In the last lecture I gave you some notions of what these rules of proportion and harmony are as applied to ornamental art, saying a good deal about form, and very little about colour, for reasons I will presently give. I showed you that good ornament has always more or less of meaning in it: it can be understood,—it conveys, though often in very humble form, some particle or other of truth. This I called the *human* side of ornament, possessed in the highest degree by the highest kinds of ornament, paintings, and buildings, and sculptures. The other condition which ornament must fulfil was that of fitness,—*appropriateness*. This is a fetter, a bondage, but it is necessary,—necessary on three accounts. Firstly, because of the artifice; secondly, because of the use of the object to be ornamented; and thirdly, because of the material to be employed. The less artistic the workman, the lower and rougher the use of the object; the more stubborn the material, the more removed must ornament be from the wildness, the freedom, the variety, the richness, and the grace of nature—or even from that close representation of nature which a good picture very properly shows. Nature must still be the storehouse from which our ornaments are drawn: the egg must give us our cups, and bowls, and vases; the hramble, the rose, the lily, and the flag a thousand beautiful combinations of form and colour, which we can adapt to the particular object we are fashioning or decorating. But I will not further travel over the ground of my lecture on “Ornament,” but proceed at once to see how far we can in our daily life and work carry out the principles of true art in metal work, wood-work, leather-work, and some of the other manufactures of the day.

Art in Manufacture.

Art in manufacture means something more than mere skill and cleverness,—it requires something more than a good workman. The steady hand, the strong arm, the powerful blow, the ready jerk, the proper twist, the true aim, and sound material, are all essential to good work of one kind or another, but the article turned out by their aid may be, and often is, though well made, plain, if not ugly. It answers, we grant, the purposes for which it was made, but we do not and cannot take any pleasure in looking at it, and as a result of this where we can we try to hide it. Is it a hinge? We make it so small that it becomes weak, and so very plain, that we countersink it to get it out of sight. Is it a chair? We use no tenons, no wedges, we seem ashamed of the means by which the chair has been put together, and it is only when it comes to pieces, or breaks up,—which, if it is what is called an elegant piece of furniture it is very likely to do before long,—that we discover that the secret of its make was the *glue-pot*. The plainest, the simplest, the cheapest objects are often better than those that cost more and pretend to be better, especially where the manufacture is an old one, handed down from generation to generation, and the forms of the article have changed but little for centuries: mats, water-pitchers, baskets, and pails and tubs of the cooper illustrate this fact. But especially when we compare these simple objects with the attempts at ornament seen on many or most of our household articles now-a-days, do we learn that the simple and unadorned often more nearly approaches what is beautiful. Bad attempts at ornament—ornaments which have no connexion with the thing ornamented—stuck-on ornaments—are worse than no ornament at

* By Professor Church; in a Lecture to the Cirencester School of Art.

all, but where ornament is true and appropriate, then not only is it a source of pleasure in itself, but may actually extend the usefulness of the object of which it forms an essential part. For if this object has become really pleasing, we no longer care to make it small and contemptible, no longer wish to put it out of sight. In speaking of two or three kinds of manufactures to-night, I want to show how soundness and strength of material, honesty of construction, appropriate design, and good form and colour, may be so combined as to make common and cheap things as well as costly things, not only answer their particular purposes, but give a real, thorough, quiet pleasure to those who daily use them. I can select a few only of the numerous manufactures of the country for my illustrations to-night. I propose to speak chiefly of the artistic treatment of the following materials.—1. Stone; 2. Wood; 3. Metal; 4. Pottery, Porcelain, Glass, Enamel; 5. Leather, Bookbinding; 6. Textile Fabrics, Lace, Embroidery, Basket-work.

Stonework.

It scarcely comes within my plan to speak of stonework, since it usually and rightly forms part of a fixed architectural structure, and is rarely fashioned into objects which can be moved. But a few words about the ornamental treatment of stone and marble may not be altogether out of place, since I shall thus be enabled to speak more intelligently concerning the ornamental treatment of wood, pointing out the great differences in the nature of decoration which should be given to materials so different in kind as stone and wood. That the differences between these materials are great is evident enough when we think of the ways in which stone is fixed in stone, and, on the other hand, wood to wood. Stonework properly executed is capable of giving a sense of great pleasure even when it is not carved stonework, and not intentionally ornamental. If we wish to follow out the rules of good taste we should not build a very small house with very large blocks, nor put a very fine face on the stone if we intend it to remain quite plain. I know it is often the practice here to dress the stone of the smallest and plainest cottages until it presents the appearance of a new cheese just cut. This is called "saw," I think it feels. This high finish of the surface is out of place where there is not a hint of ornament—no high gables, no shadow from projecting eaves, no chamfered edges, no rich mouldings,—but just a thin painted square frame set in a square opening for a window, and a long painted piece of boarding set in an upright opening for a door. But though art may be shown in the simplest structures of stone if the proportions be just and the construction sound, yet it attains a more evident excellence in the carved capitals and mouldings of a richly-ornamented building. Here the nearer the eye and the finer the stone the finer the work may be; but to put fine work at the top of a building, 50 ft. above the eye, for instance, is not merely labour wasted, but is artistically wrong, for ornamental stone carving must be suited to the place it has to occupy, and must be worked not only in a rougher and bolder way, but in a different way, when it can only be seen from a good distance. Sculptured ornament must usually be strong, and if the stone be coarse-grained, broad and rough, no delicate tendrils and slight veils, but broad expanses of leaves and large massive flowers, arranged in true accordance with the spirit of nature, on carved stems, full of strength and springiness; no mere inconsiderate imitation of natural objects, but the disciplined expression of natural forms and facts; yet no false-ness to nature, on the other hand,—no putting of leaves opposite where they should be alternate,—no combining the fruit of one plant with the foliage of another,—none of the common tricks of the carver to make his work look effective, if they cause it to be false. When you carve a capital, never forget it is a capital, and should look the thing; but never forget, too, that the lily-work with which you adorn your pillar should be as full of facts about that flower as its material, its position, and its use permit. No good carver will make two capitals exactly alike—that is to sink intelligence and feeling. You can carve a line of capitals, can you, because you can copy ten times over some poor copy of a capital that is put before you to imitate? A man who can do this and nothing more has no more learnt the nature of carved work than a man who can only turn the handle of a barrel organ knows how to discourse in harmonies of

sweet sounds. In the times when the art of carving in stone was at its best in this country, we know from almost every building that remains that the workmen felt a real interest in their work, strove amongst themselves who should excel in novelty of thought, in richness of invention, in the nobleness of work. The master-mind of the architect directed indeed all, that there might be oneness in the design; but the working sculptors put their minds also to active use, that there might be variety in the details. Go out into the hedges and the road-side wastes, gather oak, and rose and ivy; bring in the broad leaves and pure flowers of the water-lily; take the hollyhock, and the arm, and the hart's tongue; put them before you as you cut the stone, for they are no less necessary than the mallet, the chisel, and the gong. In the wilderness of these natural forms to your purpose; keep balance of form, strength of construction, temperance of curve. You may make mistakes; you may forget the nature of your material and the use of your work; but to make mistakes when striving after truth is better than to be correct, and cold, and meaningless. Do not copy over and over again old examples which have lost, at all events, their freshness, and their meaning too; ornament the buildings of your town with the plants of your country. I must add a word about marble. Marble when of one colour admits of similar (but more delicate) treatment to that of stone. But when marble is veined or mottled its surface must not be carved, nor is it a suitable material for foliaged capitals. If you cut a fine diapered ornament on veined Derbyshire alabaster, its regularity, which is one of its chief characters, is interfered with by the irregularity of the veining, which is its chief character. So with capitals carved out of variegated marble: the hollows and shaded parts may happen to be wrought in the white veins, and so their depth and repose be broken, while on the other hand the projecting masses may happen to be wrought in the dark parts, and so their relief be lost. Do not as a rule mix marbles with artificial materials, as tiles.

Wood.

I have lingered too long over stone-carving for I have much to say about wood-work. If you think for a moment of the texture and grain of wood you will see that it must not be worked into ornaments like those we should execute in stone. But before I speak of the kinds of decoration which are suited for wood, I must refer to two very essential points in all carpentry and joinery, namely, *construction* and *shape* or form. Unless we have sound notions about the way to put woodwork together, and to shape its general outline, we are not ready for decoration. From the earliest times of which examples remain almost to the present century joinery was put together honestly, and showed its wooden pins, its tenons, its joints, and its wedges. It could be taken to pieces for removal or repair without the least injury or disfigurement. Now the construction of a piece of furniture is concealed as much as possible, and is found to depend upon glue, nails, and screws almost exclusively. Not only is modern furniture, &c., less picturesque, less interesting, less convenient, less durable, and less strong on this account, but putty and paint have been thereby brought in to hide still further all construction, and to complete the disfigurement of the work. Mind, I do not say that you should always make a show of construction, nor that glue, nails, screws, putty, and paint are not useful in their way, but that when the balance of convenience and beauty is in favour of these things you should use them, when against them discard them. One common error in the shape or outline of most pieces of woodwork for the house is their roundness, their curves, their extravagant contour. There is a want of simplicity and quiet in them. They worry you by hanging about in all strange directions. Sofas, chairs, sideboards, even chests of drawers show this error, and are often rendered uncomfortable if not useless by it. The legs of various objects of furniture, instead of being turned with slight mouldings and fillets are often either violently twisted or even spiral, or else are made of a podgy pear shape at once ugly and weak. Having drawn diagrams of the backs of sofas, pianoforte legs, chairs, and so on, on a black board, the professor said as many curves as possible had been introduced, but without successful result. The curved back of the sofa would not allow you to rest upon it, for which purpose it was intended. The legs of chairs, instead of being straight, to support the weight, are made weak by being twisted, and in some cases made

spiral. Some people, too, admire the spiral-shaped legs, and yet they cannot support the weight put upon them. Another form in which extravagance of curve is shown, is on the peculiar pear-shaped legs of pianos, and I do not know anything more wrong than the leg of a piano. Now just look at the next leg of a piano you come across, and you will observe it has certain faults of construction. The curves are very extravagant, and such as you do not require. Sound construction and sober form being granted, we may now consider what kinds of ornament are best suited to wood. I can only refer to a few, such as carving, veneering, inlaying, staining, and painting. Some woods are too soft and too easily split to be carved well; to relieve large plain surfaces of such woods, grooves and mouldings may be run. A tough and hard wood like oak is well suited to carving, but it is not well as a rule to carve wood very round or in high relief. A wooden capital with such work would look weak, and the decoration would appear not to be part of the pillar, but stuck on. Wood works less easily than stone, and so our decoration of it must be more stiff. In the fifteenth century wood-carvers tried to overcome this difficulty by taking a curved piece of wood half an inch thick, carving it slightly, cutting out the pieces between the leaves, &c., and then mounting it in front of a hollow moulding.

FORD HOUSE, LINGFIELD, SURREY.

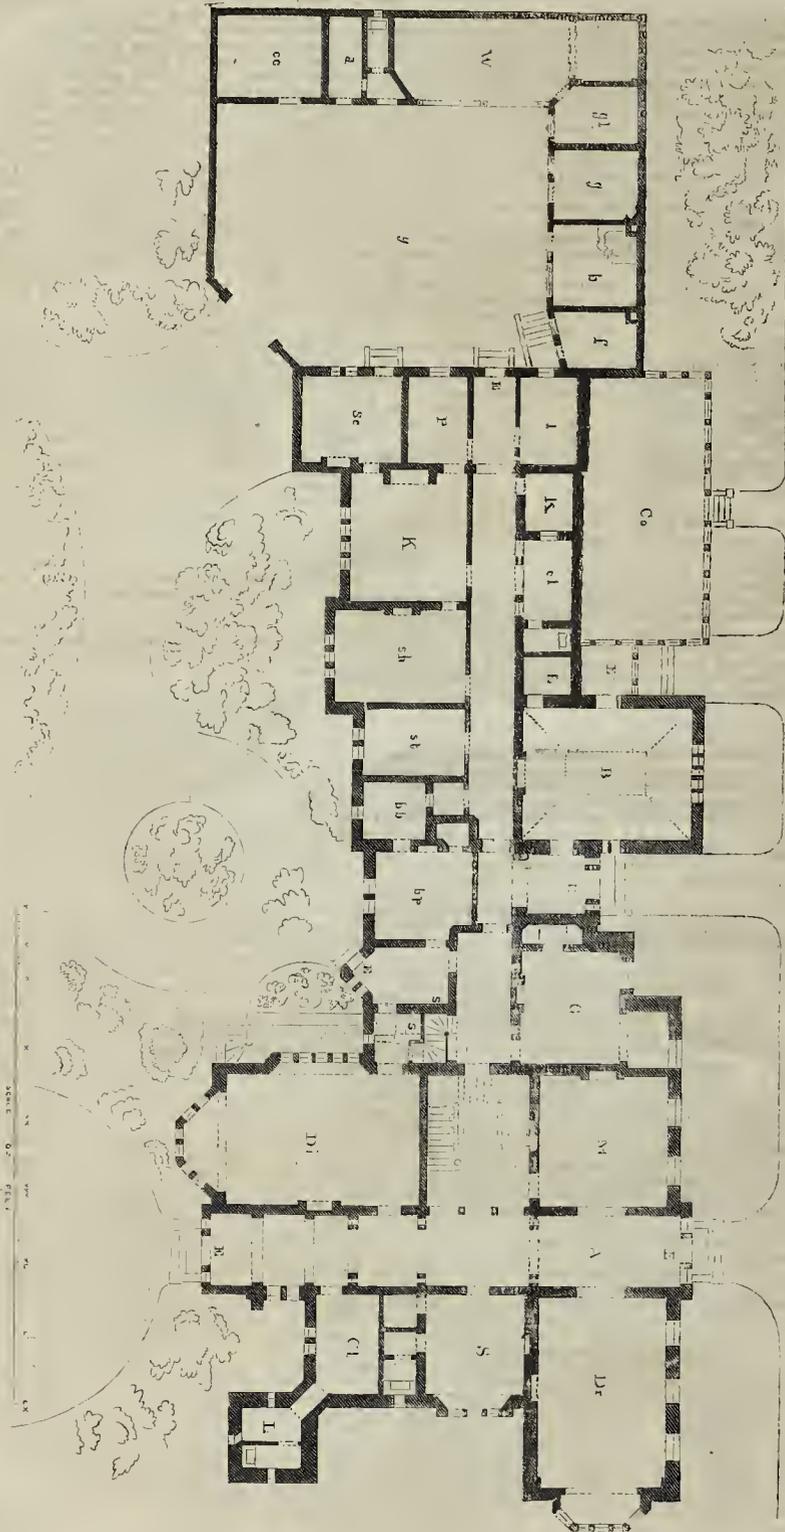

This house, which occupies a favourable site in the centre of a charming residential property, has been well built by Messrs. Haward, of Old Quebec-street, under the directions of Professor Kerr as architect. A description of sandstone found on the estate, although not of any high quality, has furnished an effective material for the wall-facing, with hacking of brickwork; and, indeed, the effect is rather increased, as not unfrequently happens, by certain defects in the colour of the stone, which at first almost led to its rejection. The ground plan which we furnish will sufficiently explain itself; the aspect being north for the chief entrance, dining-room, luggage entrance, and offices; and south for the drawing-room, morning-room, gentleman's room, conservatory, &c., towards the terrace; an ornamental lawn lying westward. The billiard-room is one of the standard dimensions, with the ceiling light according to rule; the wall windows being not for light, but for cheerfulness. In the school-room, we see a feature which is capable of being adopted in many forms, according to family circumstances,—namely, the ground-floor day-room for the children,—of which we need only remark that in suitable circumstances it is one of the most convenient of all domestic arrangements. In the offices, we have an instance of the application of the principle which the architect of this house has dwelt upon in his writings, that these should always be under rather than fully up to the scale of the house. The bedroom arrangements, although not of any such peculiarity as has limited amongst our engravers, provide, southward, two complete self-contained suites of apartments, one including a hoidoor, over the school-room, which is also entered from the staircase landing. There is a second floor over part of the house, occupied by secondary bedrooms; the servants' bedrooms being separately provided over the butler's rooms and the gentleman's room. The cellarage is small, accommodating no more than wine and beer cellars. The internal finishings are of that character of every-day custom which fortunately accords efficiently well with a plain Elizabethan exterior to divest that style of all embarrassments in this important respect.

The contract amount was a little over 11,000l.; the conservatory, part of the outbuildings, and the usual interior fittings, decorations, &c., being afterwards added.

FORD HOUSE, LINGFIELD, SURREY.—GROUND PLAN.

17

FORD HOUSE, LINGFIELD, SURREY. — PROFESSOR KERR, ARCHITECT.

[The text in this section is extremely faint and illegible due to the quality of the scan. It appears to be a list or a series of entries.]

HOW A VELOCIPEDE WAS BUILT.

The *Builder* is a great power, and you, Mr. Editor, have much to answer for. A decade of years has almost elapsed since my attention was first turned to the construction of velocipedes by reading one of your articles. The result was fearful, and had nigh been terrific.

I had long been brooding over some plan of locomotion that should entirely and for ever throw Hansom cabs into the shade, and place me upon the biggest pinnacle reserved for the greatest economist of animal power.

I lived at a respectable elevation above the sea, and my ahodo was reached with some difficulty by both man and beast. In watching the overloaded borses toiling painfully past—I was by no means at the top of the hill—and in often being the anxious spectator of a timber-wagon slipping its "skid," and thundering down, prevented simply from becoming an extempore avalanche by the poor brute in the shafts, who, upon its haunches, with fore arms extended, trumpet nostrils, and darting eyes, exerted its whole energy to keep the pressing mass from overwhelming it, my sympathies were enlisted for beasts of burdon, as well as for man; for I had seen both equally overloaded in ascending and descending. Your paper roused me to action, and I determined to make the weight do the work. Being a draughtsman, I did not theorise entirely. I soon found, by reducing my ideas to a 1-in. scale, and some of Whatman's drawing-paper, that even without a knowledge of mechanics it was easy to conceive that cranks and levers would not do. Of course, my idea was to make the load run up the hill by its own weight. I could make it run over a little hill,—a very little hill, but not over my hill,—that took me very little time to ascertain, and eventually I abandoned the investigation, so far as my four-footed friends were concerned. The difficult part of the question, I am ashamed to admit, I shirked, after a suggestion to the town council that they should construct tramways on the main thoroughfare, the loads going down pulling up those bound heavenwards, which suggestion was not discussed with that courtesy which I had expected from such an intelligent body of gentlemen. However, time being money, I could at any rate save some by giving to the world a machine that should entirely supersede walking, except for pleasure.

Weight here, I had wild ideas, should be to a great extent self-motive; but since I had to do with a living mass, who, by its own volition, could change position, the problem seemed at first sight much easier than I found it. Fewness of parts and simplicity were essentials; multiplication of parts and intricacy hope, over which there was no hope of riding. My idea was hot; it had germinated. My scale and pencil forwarded it to such an extent that you only wanted to hear the sound of the beak pecking at the shell. By the aid of a builder I had this extreme pleasure, after a proper time of incubation. Night after night, week after week, went by in anxious expectancy; chips of the shaly lay scattered in all directions, with here and there a tenpenny nail and some copper wire; the prodigy gradually unfolded itself; and the night it burst its shell in a harn, and appeared the fearful, the ghastly skeleton it did, in all its parts fleshless, but a living reality, which never be effaced from my memory or that of the one true and honouring friend who had had the felicity of working with me and sharing my confidence. "Is it done?" he exclaimed. My answer was a lofty nod. There it stood ready to bear me without fatigue, forty miles an hour, and with a little extra exertion ten or twenty more. I will not say I was proud of my achievement; the feeling was too ethereal. I was aroused from my ecstatic trance by my fellow labourer saying—"Try it." No, no; that would have been abrupt; the poetry would have been spoiled. I intended to dally with my love. Softly and silently I led him from the presence, noiselessly closed and locked the door, and then we had a night. Probably the excitement was too much, or "Moets" was a little too sweet; but we could not manage breakfast on the morrow, neither did the design for the Manchester Assize Courts progress in that rapid manner which was its wont.

The day passed, however, and a moonlight night followed; and precisely at twelve, midnight, "it" was led forth, and was smiled upon by as much of nature as was visible. Its fleshless nakedness was not inviting—it was not beautiful; but the proud satisfaction was that

it was useful. I adjusted the gear; I attached a stout rope to the axle; and I mounted, having previously, much to my friend's amusement, handed him the end of the rope to hold by, and keep me from going too fast. He pooh-poohed the idea, and let the cord dangle in his hand. "It" was not strong. It averted weakly. One or two spokes started. The tire had a peculiar wave. The nave hardly looked in the centre. But we were together; had it collapsed, so should I, but it bore up gamely. In a second I should be darting forward, with an admonition to D. to hold fast. It moved. I remembered no more until D. picked me up. I was a little stunned as much by my success as by coming crack against a wall. My first sentence was, "Why didn't you hold?" Whereupon a lacerated and bloody hand was presented. The rope had been whipped out of his hand, and in his anxiety to stop me he had grasped at the revolving wheel; our workmanship not having been particularly smooth, his hand was scored rather deeply, and I was borne forward—nearly thrown into my bed-room window, and "it" was very severely damaged. Thus, sir, I proved beyond dispute that my principle was right. Tenderly we placed the remains in the building which had sheltered it in its growth, and then to supper. I became generous before seeking my couch, and, had my promises been kept, one of the twain would have been somewhat richer than he is this day; but we cannot all keep our promises.

I knew that discretion was the better part of valour, so ere launching my invention upon the world I thought I would take time to consider; for although I had proved a principle, I had hardly reduced it to everyday life: thus it happened my pet invention gave me much trouble and much pleasure, as I was continually asked what the machine was, producing no end of mirth when I boldly stated that it would carry me 50 miles an hour.

I candidly state that hills have been my *bête noir*, and corners, sharp corners, troublesome affairs, otherwise something would have come of my thought and work; as it is, I am holding back in case a better man should step forward, still ready to prove that I can produce a velocipede that can go on level ground at the rate of 30 or 40 miles an hour.

Supposing you have obtained a machine which will do all you expect on the level, the next question will be to render it efficient in ascending hills. At the end of the question I found no entry; I therefore need my wings of fancy, and bore both myself and my machine to the top of the hill. As its own weight would be more than sufficient to take it down, my weight could be used to create a reserve force in the shape of a chamber of compressed air. By the use of a crank and piston this could be accomplished. The chamber being of what? I found upon consideration iron was the only material suitable for the reception of this compressed air. Here I had a good theory; but what with cranks and pistons, valves and chambers, my velocipede had become a weighty matter, so weighty as to be beyond my powers; for, had I been lucky enough to have had a down-hill always before me at the start, each hill I ascended must of necessity have been of less altitude. A rough road would undo me. My roads must be of the smoothest; and, in fact, the creation of reserve force, owing to the weight of material to receive this force, was not worth creation. A lever which acted in a small cog-wheel being a ridiculous theory was dismissed as soon as ascertained; but how about powder? Here was an instant solution: grand idea! pile-driving gave me the key to the riddle. Here I am, then, probed on a seat 7 ft. high. I gradually descend turning the wheels of my velocipede by my own weight. I arrive at my lowest point: pop goes a charge of powder, and I am instantly projected to a 7 ft. throne. Again I descend, and again I am projected upwards. As I could also use my arms and legs for propulsion I had certainly bit the right nail on the head, but how long my head and frame could stand such jerks, I was, I flatter myself, too wise to try by actual experiment. Feeling that I was not equal to the solution of rendering the ascent of hills easier by some light and simple reserve or storage of waste power, I have confined myself to the construction of a velocipede, simple, light, frictionless (?), and of such construction as to allow me to throw weight as well as muscle into its motion on the level or up hill. In the ascent of hills all velocipedes fail; you push against yourself; in other words, you pull yourself up by strength of thigh; you push against the hill, which has a tendency to send

you down one yard for every two which you ascend. Hence you not unfrequently see a velocipede going up hill backward: his body by this means, being inclined at a less angle to the plane of ascent, assists him by its weight.

I cannot say my invention is even yet perfected. My first attempt was extremely crude; it nevertheless embodied an idea. It existed for several months, being the wonder, not admiration, of all who beheld it. The wheels were not ordinary ones, and attracted attention. The fact is, I had to forsake my harn. In the small hours of the morning, when most respectable people had sought their couch, my friend and I tenderly and cautiously guided the offspring of my fancy to a new house. Nothing but a garden wall shielded it from the vulgar gaze. Its hearing being decidedly too lofty under these trying circumstances, I determined to dismember it, and one chilly afternoon I did what I almost looked upon as a deed of sacrilege. In the commencement of this communication I hinted that the result of my becoming the inventor of a velocipede had nearly proved terrible. The Crimean war was then, or soon after, raging; and from the construction of velocipedes I turned to that of infernal machines. I made drawings, wrote reports, and through an M.P. introduced them to the consideration of the Lords of the Admiralty. I was kept in suspense some time, but eventually received a communication stating that their lordships had duly set upon my invention, and could not recommend its adoption in Her Majesty's service. M. U.

SELF-SUPPORTING PRISONS.

THERE is a strange though unintentional perversity about the national treatment of criminals and paupers. In both cases the industrious ratepayers, while in too many instances overworked themselves, provide for all-bodied criminals and paupers, but especially for criminals, good food and lodging, with attendance, and nothing profitable to do. In the case of criminals, the most attention is paid to their sanitary welfare; and while their paymasters are stifling themselves and their families in stuffy back shops and unventilated underground bedrooms, lighted by dim "dips;" they provide for Bill Sykes and his friends well aired and ventilated, clean, tidy, winter-warmed, snug, and cheerfully-lighted places of abode, where, if they sing "We've got no work to do," it must be with a wink of the eye, if it is not with the tongue in the cheek. And Bill may well think what donkeys his bread-winners are! How long is this ridiculous and absurd system to continue? Not only ought both criminals and paupers to labour while able for their own food and lodging, but criminals ought to make restitution for the wrongs they have done. If criminals knew that in prison they must earn their bread like honest working people, they would soon learn to prefer work with liberty, to work with imprisonment. If paupers were called upon to provide for themselves and their families in work houses, there would be fewer suicides and family murders on account of starvation, because there would be less disgrace in the name of a workhouse than there now is. It is shameful that such is the state of matters, that the name of a prison is not more disgraceful nor more repelling than the name of a workhouse, if so much, and that so much better is the treatment of villainous criminals than the treatment of honest but unfortunate paupers, that there is thus an evident temptation of the starving poor to steal and so prepare for a prison, rather than go to a workhouse. The nation is thus truly inculcating—teaching—crime. In this money-worshipping age, to be poor is itself virtually a crime; and really, as bankrupt debtors used to be put into prison where criminals are put, it would be more consistent, and almost better, to do away with workhouses altogether, and send all paupers to prison. They might at least obtain treatment on a level with that of criminals, and not fare worse than they in all respects.

On the subject of self-supporting prisons, there is an able article in the *Christian Times* of November 12th, from which we shall quote a few passages:—

"The State prison of Massachusetts returns a clear revenue of \$500,000 per annum to the State, after paying all costs and salaries. Many French prisons are nearly self-supporting. Even in the distant Antipodes the goal of Dunedin, with 750 inmates, defrays all its charges by the profit of its prison labour, and retains a surplus of nearly £4000. In France, the prisoners are provided with lodging, bread, and water; by the State; what further is needed must be earned by their own hands, opportunity

being given. Why should it not be so here? Because the House of Lords Committee in 1863 reported against remunerative prison-labour, contrary to the evidence of the two experienced prison inspectors and many able officers; and the 1865 Act carried into effect their lordship's views. Will the ratepayers of Middlesex and other counties cheerfully permit their pockets to be thus lightened to support strong and law-abiding men, merely because such a system has once been agreed to by a Lords Committee?

It is a question which materially affects the morals of the kingdom, the security of property, and the country rates. The chaplain of a self-supporting American gaol last year visited this country and inspected its prisons. On his return he published the result of his observations, and after remarking "I was greatly surprised in my visits to learn how very little the prisons in Great Britain generally yield to their own support" (about 1½d. per day per head), he states that he was told that the present system was considered more "deterrent." He adds, "I asked if this was the practical result of the course, and was assured it was not; for that the number of recommitments was large—not less than 30 per cent."

During the past three years the London Howard Association, for the diffusion of information on criminal treatment, has widely aroused public attention to this question, and much progress has been made, considering the restrictions of the prison laws. At Wakefield Gaol the inmates earn about 8,000*l.* per annum, chiefly by mats. At Holloway nearly 1,000*l.* have been received in one year for tailoring (coloured uniforms) done within the walls. At Bedford Prison the inmates earn about 600*l.* per annum. Manchester New Bailey, Preston, Durham, Newcastle, York, Birmingham, Hull, Peterborough, Liverpool (borough), Devonport, Leeds, Chester, and other prisons are also making much progress in this direction. It is found by experience that useful labour may be rendered quite as punctual and deterrent (by means of task-work) as the hardest treadmill exercise; and, indeed, far more so. The governor of Devonport gaol recently related to Mr. Tallack, Secretary to the Howard Association, an incident which well illustrates the effect of requiring prisoners to contribute towards their own maintenance and punishment. A vagrant, who had been confined for a fortnight, was obliged to work at hard but useful labour in his cell; and on his discharge the governor informed him that his earnings during his imprisonment had amounted to double the cost of his food, "so that you have also contributed so much towards my salary." This was quite a new idea to the vagrant, who at once perceived that he was making a fool of himself by entering a gaol where he must compulsorily pay for his own punishment, in addition to his support. He replied, "Then you shall never see me here again." And he kept his word. Now this by and by means a solitary instance. Let this plan be more extensively adopted, a greater variety of prison industry enforced (in lieu of the too general mat-making), and a more practical prison legislation enacted, and the result, instead of increased prisons, will be not only diminished rates, but also a most gratifying reformation of criminals as a class.

HOLKHAM CHURCH, NORFOLK.

THIS church, after having been closed for the last eighteen months, was re-opened last Tuesday, the 14th inst., by the Bishop of Norwich. It has been restored, and many portions, where necessary, rebuilt, at the sole expense,—amounting to about 9,000*l.*—of the Earl of Leicester. The church previously to the late works was in a lamentable condition, having been plastered both inside and out, and the roofs concealed by plaster ceilings. Many of the windows were bricked up, and plaster panels substituted upon the walls inside. The walls of the tower, as well as many other parts, were in a very unsound condition. In the restoration the plaster casing has been removed, the stonework renewed, where necessary, and new windows were inserted where the old ones had been destroyed. The east end of the chancel has been rebuilt, with decorated buttresses and five-light windows of geometrical tracery. The tower, which is attached to the south aisle, has been underpinned, and the south wall taken out and rebuilt as high as the belfry window. The lower portion is of the thirteenth century, and there was sufficient evidence to show that the entrance to the church was through a large double door; but it had become nearly obliterated by alterations and repairs. A new double door has now been added, with a centre clustered shaft and arch mouldings, enriched with dog-tooth moulding. A new open-arcaded stone staircase leads to the ringing-chamber.

The whole of the roofs of the church and chancel are new, of pitch pine, and have carved ribs resting upon stone carved corbels. The west window, which is new, as well as the east window, is filled in with grisaille glass by Messrs. Lavers, Barrard, & Westlake; the west windows of the aisles have stamped grisaille glass by Messrs. Powell & Sons.

The pulpit is of Caen stone, with foliated panels and capitals, supported on polished red granite shafts. The seating is of oak, and every hench-end is enriched with carved arm-rests and tracery panelling, containing carved representations arranged conventionally from nature, embracing a great variety of designs—every hench-end being different. The lectern consists of an oak double desk of a pyramidal form, with carved ends and diapered surfaces, supported on a carved twisted oak central shaft, surrounded by four other carved shafts at the base.

The font, which is situated at the west end, opposite the west door, is of Caen stone, with panels enriched by carved panels containing the emblems of the four Evangelists, carried on nine polished red granite shafts, with rich foliated capitals. The chancel aisles, which are open to the nave and chancel, are separated by carved openwork screens executed in oak. The spandrels and other portions contain a variety of designs, carved on both sides of the screens, arranged—with an admixture of birds—from natural foliage. The reredos, consisting of an arcade of enriched trefoiled arches, with foliated spandrels embracing among other subjects from nature the lily and passion flower, is executed in Caen stone, with polished red granite detached shafts. The floors of the church are laid with Maw & Co.'s tiles, and the communion space is laid with a combination of marble and tiles, by Messrs. Simpson & Co. The whole of the work has been carried out by Mr. Robinson Cornish, of North Walsham, from drawings and under the superintendence of the architect, Mr. James K. Colling. The iron work is by Mr. John Parlour, of Norwich. A peal of six bells has been put up in the tower by Messrs. Warner & Son, the tenor weighing 20 cwt.

A WORKING MAN ON EDUCATION.

SIR,—For at least forty years many leading minds have mourned over the ignorance of the masses, and devised schemes to remedy the deficient education of the people. The question is once more becoming interesting; and perhaps in these latter days the education of the working classes will receive that attention which so mightily a matter deserves. Already two great organisations are formed, and have begun to agitate the question; and it now becomes a matter for consideration as to which is most worthy of public support. I read with much interest the programme and proceedings of the National Educational League, and I felt the conference was in earnest; and I believed that, to make the movement successful, it required the earnest support of all who believe in the necessity of a permanent provision for securing to the great body of English people the means of early moral and intellectual culture. Without quoting educational statistics, it is well known that millions of our fellow countrymen are debarr'd from all intellectual pleasures. They feel no interest, and can take no part, in the great questions of the day. Their pastimes are grovelling and degrading, and their highest aims sensual gratification; and it is appalling to know that millions are still growing up in the like condition. It appears to me that it is a public duty to support the National League, as the members and council are for immediate action. Ever since the question of national education has been agitated, there have been alarmists, whose prophecies have been most doleful, and all sorts of things were to happen when the working men had become educated. The present movement is no exception. Priests, clergymen, and laymen, Liberals and Conservatives, have met at Manchester, and inaugurated an opposition scheme; they state, which is no doubt true, that a good deal has of late years been done in the way of education; and if they are left alone, they will do a great deal more. But whether they are left alone or not, they intend to oppose with all the forces at their command the Birmingham godless plan to make all the working classes atheists. When the late Lord Brougham forty years ago proposed a scheme for the education of the poor, he was assailed by various writers as one who was going to turn the country upside down, and create a nation of atheists. A country gentleman of that time, in a letter to Lord Lansdowne, to show the consequences that would ensue if the theories of Mr. Brougham were to be put in force, among other things said,—"Unwilling as I am to trespass further upon your lordship's patience, I cannot resist calling your attention to a few further observations which occur in opposition to this baneful project. Suppose, for instance, that some friend to humanity were to attempt to improve the condition of the beasts of the field: to teach the horse his power, and the cow her value; would he be that tractable and useful animal he is, and would she be so profuse of her treasures to a helpless child? Could anything be more impolitic? Yet there is not, that I know of, any express law against it; nor would it be one jot more ridiculous than teaching tailors and cobblers 'the beautiful system of geometry.'"

In the year 1820, Mr. Brougham, in the House of Commons, moved for leave to bring in a Bill for the education of the poor in England and Wales. He said there were at that time 2,750,000 children that ought to have been receiving an education. Of that number, 750,000 were receiving an education, and 2,000,000 were totally unprovided for; in other words, every fifth person was without the means of education; so that the then condition of "Switzerland in respect to education was twelve times better than our own." Since that defeat of the friends of national education in Parliament, forty years have elapsed, and the difficulty is almost as great as it was then, and friends to education are still obliged to state that England, which ought to take the lead in all that is intellectually great, is still, so far as the bulk of her people are concerned, almost the worst educated country in Europe. It is a well-known fact that Parliamentary grants for educational purposes are increasing year by year, and yet the people are not educated. It has been clearly shown that, under the present system, the districts most requiring help have not, from a variety of causes, received any benefit from the grants; one cause being the low estimate of the inhabitants of the poor districts of the value of education; and, as no system of compulsion is in force, the young are left to street education, whilst the fat districts get all the educational grass, and the poor are left to starve; while education, the key to national prosperity and well-being, is withheld for want of a compulsory system to keep it in motion. When one remembers how little was taught in working-class schools twenty-five years ago, and how few our educational wants were supposed to be, it appears to me that for all those who, like myself, have retained the little we then learned, there is work for us in supporting the National Education League; and determining that England shall have as good an educational system as other nations possess, and that it shall not be left to the caprice of volunteers or any other class to mar its progress; so that it may no longer to England's disgrace be said that her working classes are the worst educated of all the progressive nations in Europe. It is a foul blot upon the national escutcheon; and, in spite of all obstacles, it is to be hoped the earnest friends of the movement will not rest until it is wiped out, and a universal system takes its place.

I hope the above remarks of a working man will not be out of place in the columns of the *Builder*, and that in another letter I may be allowed to state my reasons for supporting the programme of the League in preference to the one proposed by the Manchester Educational Union. JACK PLANE.

BUILDING OPERATIONS IN THE YORKSHIRE COLLIERY DISTRICTS.

THE building trade in the Yorkshire Colliery district has, during the past few years, been largely indebted to the opening out of new coal-mines for a good share of the prosperity which it has received, and which it still enjoys. This important branch of the trade seems to be almost entirely overlooked, but there can be no doubt that to it the builder is largely indebted for the numerous small towns which spring up in districts where new coal-fields are being opened out. On the other hand, the builder is also one of the most important artisans that are to be found about a new colliery where engine-houses, &c., are sure to be needed. The Yorkshire coal-field is of a very large extent, commencing as it does not far from Nottingham, and extending near to Normanton, a distance of about 70 miles. It would be more appropriately known by the Midland coalfield. It is, however, to the Yorkshire coal-field proper that we more particularly refer, and in which within the past two years some thousands of pounds have been expended in building operations connected with new collieries alone. Many of the engine-houses and colliery offices are no mean specimens of architectural skill or workmanship. We have first to notice the very beautiful works at the Denaby Main Colliery, which is not only the nearest to the magnesian limestone formation, but the deepest pit in Yorkshire. The engine-house is a large and well-constructed building, and supplied with two beautiful engines, each 100-horse power, which were made by Messrs. Bradley & Craven, of Wakefield. Eight large boilers are also fixed on the premises, and are set on a new principle. The shafts are 13 ft. 6 in. in diameter, and are partly walled with brick and partly "tubbed"

with metal plates. The offices and manager's residence are a fine block of buildings. In addition to these the company have also just completed about 150 cottages on the pit premises for their workpeople, who number between 600 and 600 hands. About two miles nearer the centre of the coal-field, viz., at Wath, a very large undertaking is now being opened out. The new project, which is to be known as the "New Miner's Main Colliery," will be one of the largest pits in Yorkshire, and has involved a very large sum in building operations. Here the visitor and admirer of neat and substantial workmanship and design will amply be repaid by a visit. The engine-house is a very large and commodious one. It is to have an open roof, similar in design to those in churches. The whole will be boarded and polished, which will give the building a neat and healthy appearance. Two of the largest engines in the district are now being fitted by Messrs. Black, Hawthorne, & Co., of Gateshead. Each is 180-horse power, and can, if needed, be worked up to 200-horse power. The shafts—an upcast and a downcast—will be nearly 300 yards deep; and those, with the exception of 50 yards, are walled all round with bricks. Nearer Barnsley, the Oaks Colliery Company are also sinking two new shafts, which are now about 140 yards deep. Here, also, a very neat engine-house and other buildings have been erected, which have found a good deal of work for masons. At Mearns Dyke, the Darby Main Company have sunk new shafts, and are building engine-houses and offices, which for style and finish cannot be excelled. At Barton Bridge, near to the Cadworth Station on the Midland line, a large plant has been fixed, and sinking operations are going on rapidly. In the West Yorkshire coal-fields there are at the present time a number of new collieries being opened out, which are finding employment for a large number of masons, &c. At Featherstone, a new coal-field is being opened out by Messrs. Shaw & Co., who have erected a handsome engine-house, which has just been finished by Messrs. Tattersall & Horsley, builders, of Featherstone. In the Normanton and Castleford districts, great improvements have been made, and whole streets of buildings have sprung up within the last two years, in consequence of the opening out of the numerous new collieries, which are to be further augmented in a short time.

NEW MASONIC HALLS.

Durham.—The new hall which has been erected in this city in connexion with the Marquis of Granby Lodge of Freemasons, has been formally opened with the rites and ceremonies of the Royal Arch Chapter. The new hall is situate in Old Elvet, opposite the Court Houses, and the foundation stone was laid on the 22nd December, 1868. The building has been designed by, and the work carried out under the care of, Mr. T. C. Ebdy, of this city, architect. The style of the architecture is Early Geometrical Gothic. The front facade, which is not very extensive, owing to the limited site, is executed in dressed ashlar from the Brasside quarries. The principal entrance is formed by four polished red granite columns supporting a bold pointed arch, above which is a large bay window, which is formed by cusp lights, and the spandrels are filled with Masonic devices. Over the entrance is carved in stone "The All-Seeing Eye," surmounted by crosses formed of intersecting triangles. The portico leads to an ante-room, 21 ft. 9 in. by 16 ft. 3 in.; and a corridor, 11 ft. wide, leads to the principal staircase and banqueting hall. The hall, which is 46 ft. 3 in. long by 25 ft. 5 in. wide, and 15 ft. high, is lighted from the east by two three-light pointed windows, warmed by open fires, and ventilated by a system of syphon tubes. Adjoining the hall are the steward's room, lavatory, and wine-cellar, &c. Between the ante-room and banqueting-hall is a triple staircase, leading to the lodge-room on the left, and to the robing and preparation-rooms on the right. The lodge-room is approached by an ante-room (or tyler's room), through a pointed Gothic doorway supported by semi-detached columns, with carved capitals. In the tympanum of the arch, carved in bas-relief, is a figure representing Moses descending from Mount Sinai with the tablets. The lodge-room is the same size as the banqueting-hall, and 30 ft. 9 in. high to the apex; the roof is open-timbered, the principal forming an arch. All the woodwork is wrought, stained, and varnished.

Halifax.—The Freemasons' Hall in Halifax has

been formally dedicated to Masonic purposes by Earl de Grey and Ripon. It is in the Italian style, having in the front a projecting portico of 7 ft. 6 in. The large room, which is on the principal upper floor, is 48 ft. long by 24 ft. wide, and 24 ft. high, and is enriched with a coved and paneled ceiling, with ornamental marginal counter lights. The walls are divided into compartments by pilasters, having carved bases and capitals, and a Corinthian cornice with full enrichments. The east end is adorned with a large canopy, supported by two pillars with carved capitals; and the west end of the room has single columns, forming central projections. This room is approached by a spacious staircase of stone, and opposite the foot of the staircase is the entrance to the dining-room, which is the same size as the lodge-room, except that it is only 14 ft. high. The interior also contains instruction and other rooms, for both the lodges of Prohiby and St. James, together with smoking-rooms, cloak-rooms, lavatories, &c.; and the basement contains living apartments for hall-keeper, with requisites for cooking, &c. The architects were the late Mr. J. E. Oates, Mr. B. W. Jackson, W.M. of Prohiby, and Mr. W. H. D. Horsfall. The cost of the building is about 4,251l., exclusive of furnishing, which is calculated to cost 500l., so that when completed the entire cost will be 4,751l.

AN EFFORT FOR ARCHITECTS' ASSISTANTS.

Sir,—The interest which you appear at all times to take in everything which may conduce to the advancement of the architectural profession impels me to request the insertion in your valuable paper of a few remarks upon a very important question; namely, the status, social and professional, of the class of architectural assistants. I am not of those who would claim for assistants some share of the honours of the practising architects in whose offices they may happen to be; but I do think that an assistant ought to be looked upon as something less of an inferior being, and as something more of an equal, and a fellow-worker in a noble emulation, and more especially as a gentleman, by profession, at least, if not otherwise.

But my more immediate purpose in addressing you, sir, is to propose the formation of an association for the social and, still more, the professional advancement of architectural assistants, and to ask for your kind assistance, and that of the profession generally, in what I believe to be a proper and praiseworthy object.

I would propose an Association of Architectural Assistants; that its great centre of operations should be in London; and that there should be branches in every town in the kingdom; and that as early as possible it should be extended to the Continent. The branches to have direct intercommunication with each other, and with the London centre, and to have a direct voice in the government of the association.

The present objects of the association should be,—1st, the drawing up of some standard of qualification for an architectural assistant, and for a practising architect; 2nd, the advice and pecuniary aid to assistants out of employment; and 3rd, the professional advancement generally of the class of architectural assistants, and such others as might afterwards be thought suitable.

For the first of these objects a sufficient reason may be found in the numbers of assistants and practising architects who, neither by nature nor by education, are fitted for the positions they occupy.

As to the second, I may ask a question which seems to puzzle every one: what becomes in old age of assistants who have not the means nor the opportunity to commence to practise, and so gain themselves a competency? Their salary as assistants will allow very few of them to retire altogether.

The third object requires further explanation. Generally, the assistant has to work close at his desk eight or nine hours a day, and very often eleven or twelve hours. Many of them have not the Saturday half-holiday at all. The rest very often, even if they nominally have it, have it not practically. This long and close application during the day is so severe, that the assistant can neither have the power nor the inclination, in the evening, to enter into those more refined studies of art, through which alone he can hope to make himself worthy of his profession. The greater part of the bright day of his life he is a

slave; how can he, in the dark and drear evening, "when no man can work;" how can he labour and toil to become a master of his art, a worker in and a lover of art? The mechanic, the artisan, and the working man generally around us, are having their daily toil shortened, and time given them for self-improvement; but the architect's assistant, the professional man, and the worker in art, forsooth, stand still. Is architecture a profession and an art? It is because I believe that it is, that I would seek for its advancement to its proper position, and would ask every earnest worker in it to labour to obtain the art-education and knowledge of the architectural assistant. Let the office-work of the day be limited. To the shame of the practising architect be it said, there is but one way to obtain this, and that is the offensive and defensive union of assistants. Of all arts and professions, architecture sorely pays worst, *as far as the assistant is concerned*. But this is an unpleasant part of my subject, and may well be left to your readers.

As to the social position which an assistant occupies in an office, I would remind practising architects that, if architecture is a profession, the assistant, as such, is socially equal to themselves, and ought to be regarded and treated as such. Very often outside the office the social rank of the assistant is superior. At least, let both of them remember, at all times, to behave as architects and gentlemen.

I have written these few remarks with the hope that some abler man, and some abler pen, will espouse the cause, and will help to stir up the architectural mind to the consideration of this important matter. If the assistants will unite, they must obtain that which is justly theirs. And here I would yet deprecate all such pressure being brought to bear as is unhappily being done by trade-unionists. I would simply say, let the architect's assistant conduct himself always as one who believes himself to be a member of an honourable profession, and as an Englishman and a gentleman.

AN ARCHITECTURAL ASSISTANT.

THE SEWAGE QUESTION AT WATFORD.

At a recent meeting of the local board of health, the clerk read the report of the committee (accompanied by Mr. Lovejoy, the surveyor) appointed to visit Stroud, and inspect the system of sewage deodorisation and utilisation adopted there. The report, which was signed by all the members, recommended this system to the consideration of the Board. The clerk read a letter from the secretary to the Stroud Sewage Company, to whom the patent belongs, stating that the royalty which must be paid by the Board for permission to adopt the Stroud system would be 50l. a year, and one-fourth of the profits on the manufactured manure. The directors of the company would give such instructions as would enable the Board to render the affluent water as pure as that of Stroud.

An elaborate and able report by Mr. Lovejoy on the same subject was read by the chairman. The report stated that the Stroud system involved an expenditure of 250l. a year. Neither the tanks nor the levels belonging to the Watford Board were adapted to the process, and he estimated the cost of adopting the Stroud system at 1,150l., in addition to the working expenses. The quantity of sewage at Stroud was less than one-third that of Watford, without taking into account the London Orphan Asylum and the increase of population at Watford. He calculated the working expenses at 750l. per annum, and to that must be added the interest on the original outlay, which would make a total yearly payment of 820l., in addition to the royalty. With regard to the sale of the manufactured manure he was not at all sanguine, after seeing the quantity on land at Stroud; and, although the quantity of sewage at Watford was much greater than at Stroud, there would not be a much larger amount of manufactured manure. The estimate of the expense of adopting and working the Stroud system contrasted very unfavourably with that of the scheme proposed by Mr. Cadia (one of the committee), which was from 350l. to 400l.; while, as regards the return for outlay, irrigation was far more likely to prove remunerative than deodorisation or precipitation. At places where the irrigation system had been adopted it was stated that they were realising sums of money, the lowest of which would amply cover the working expenses and the interest on the outlay. It was the opinion of

many scientific men that all processes of deodorising sewage, except the application of earth pure and simple, rendered it nearly if not quite valueless as manure. If the Stroud system were adopted at Walford, it would be necessary to separate the sewage from the storm-water. At Leicester, after ten years' trial of the deodorising process, and a loss of 12,000*l.*, the Board of Health were now about to adopt irrigation. In conclusion, Mr. Lovejoy said he could not advise the Board to adopt the Stroud system. He believed that in the course of a few years the value of the application of sewage to the land would be better understood, and there would be as great a competition amongst farmers to obtain it as there is now a difficulty in disposing of it.

RAILWAY MATTERS.

WHILE the Metropolitan Underground and the Metropolitan District companies seem both to meditate the repudiation of their obligations to extend their lines to the east of London, uniting them at the Tower, a new company is being started for the purpose of obtaining an Act to enable them to form these same extensions, and combine them with further extensions. The scheme is one to incorporate an East and West Metropolitan Junction Company, which proposes not only to complete the "inner circle," but to extend the Metropolitan District Railway to Bow, to connect both Metropolitan lines with one another, and with the Great Eastern, the North London, and the East London, and to make a central station for east and west near the Mansion House. This larger extension of the scheme already authorised would probably be more profitable than the mere extension to Tower-hill, as it would unite the whole east and west of London in one great system.—At a recent meeting of the North Eastern Railway Company in the North of England, the chairman said, "several years ago, when the company was prosperous, the directors pledged themselves to the public to reduce the fares to 2*d.* per mile for first-class, 1*d.* for second class, 1*d.* for third-class; but falling on adverse times, it was decided to postpone the reduction. Now that the company was again prosperous, the directors felt that the reduction could be no longer delayed." The fares on the Newcastle and Carlisle section have been particularly oppressive on the travelling public. This line opens up some of the favourite places of resort for both the tourist and the excursionist.

HOUSE BUILDING AND BUYING.

YOUR correspondent, "J. M.," advertising in the *Builder* of December 4 to the mannikin condition of the houses in certain "terraces, places, and villas" in the suburbs of London, has described a state of things which no doubt exists largely. In his estimate of the causes which have led to the building of houses such as those described, however, I venture to think that "J. M." is to a great extent mistaken; whilst he is certainly wrong in concluding that the class of persons who occupy these houses is at all at the mercy of either landlord or builder.

It is true that the circumstances under which the trade of the "speculative builder" is too frequently carried on may often cause economy to degenerate into "scamping," but the fault is in principle, and in arrangement, indicated by your correspondent—together with many others of varying character—as frequently arise from ignorance on the part of the builder as from the desire to save money.

The fact is, that many of these "terraces, places, and villas" are built, and the work personally directed, by men who have never previously had any experience in building, but who, encouraged by the prospect of "advances" held out to them by ground-rent-creating speculators, go into business as builders.

Now, sir, building being a business the conducting of which in a proper manner necessitates the possession of a large amount of very varied knowledge, in combination with much practical experience, I do not think that it is in the least degree remarkable that tailors, shoemakers, and publicans, or even smiths, painters, or other mechanics, who have possibly worked almost exclusively at one branch only of the building trade, should not be able to secure this knowledge by simply assuming the title of "builder."

It may, perhaps, at times occur, that men who really do know better, but who are building side by side with such builders as those above

referred to, are rendered careless by knowing that they will have to "sell" at the same price as their neighbours; but this is of comparatively rare occurrence, and would cease at once, and for ever, if tenants and purchasers were disposed to stop it. The simple and obvious remedy is, for those about to rent or purchase a house, to employ a respectable surveyor to report upon it; but in the course of a rather long experience, I have found that it is quite an exception for this precaution to be taken, even by persons who are not in other respects negligent.

As soon as it becomes the rule to employ a competent and independent surveyor before purchasing, or otherwise incurring responsibility in connexion with house property; the erection of houses such as those described by "J. M." will no longer afford even the slightest hope of a profit to the builders of them, and therefore the trade must collapse for the operation of the natural laws which influence any industry so situated.

Enlarging the powers of district surveyors, and inspectors of nuisances as suggested, or even the indefinite multiplication of those very useful officers, would effect but little in the required direction, so long as houses may be sold or let, as they now frequently are, by the simple expedient of papering the walls in an agreeable manner.

In conclusion, I have to state my conviction, that respectable builders who know their business, would be extremely pleased to see such a common-sense plan universally adopted, whilst the would-be tenant or purchaser would, by paying the small fee which a surveyor would charge him, frequently save very much money, and sometimes avoid illness or possibly death.

A BUILDER.

FALL OF A MILL AT BRADFORD.

IN the vicinity of Park-road, Bradford, Osborne Mill has fallen in. It was built about six years ago. The building consisted of three floors. Above the third floor was placed a large tank or cistern, which has been the cause of the destruction. The cistern extended the whole length and breadth of the building, and was about a foot high, being intended to hold 10 in. of water. It was to supply the boilers and the premises generally with water. The sides of the tank were bound with iron, and it possessed a wooden bottom. This tank has for some time been observed to stand in an unsafe condition. The tank broke through the two first floors that intercepted its progress, and carried all before it to the ground. Fortunately all who were in the building succeeded in securing their safety before the fall took place; but though no lives have been lost, the accident has been of a disastrous character. The interior and part of the sides of the building (which was 70 ft. long and 24 ft. broad) have been destroyed. Three machines, valued at upwards of 200*l.* each, and 300*l.* worth of press paper, have been rendered useless, and a large number of pieces have been seriously damaged. Two of the machines were not working, and the workpeople were thus enabled to hear, what they could not otherwise have done, the first warning of the crash.

INDIAN ART WORKS IN BIRMINGHAM.

A COLLECTION of East-Indian works, selected from the Indian Museum, Whitehall, is now being exhibited in the Birmingham Corporation Art Gallery; and Mr. W. C. Aitkin, who is always to the fore when he can serve the cause of art, has written a very useful guide to it, which is sold at 1*d.*, and materially increases the value of the collection. At the conclusion Mr. Aitkin says,—

"Viewed with intelligence, these examples, their teachings properly understood and applied, would go far to correct the vulgarities recognisable in the art-manufactures of England, France, and other countries. In the metal, ceramic, and textile manufactures of India can clearly be traced those invaluable rules of art, a proper definition and recognition of which form the great want of our more civilized industrial systems, more especially as regards the elements of truly appropriate designing for articles of manufacture, in which youth and beauty go hand-in-hand. This want is not recognisable in the manufactures of India.

In a commercial point of view, the contents of this collection may be rendered useful, apart from the purposes which have been pointed out. With the intention of encouraging the manufacture of textile fabrics for export to India, and with the cognizance of its Council of State, Dr. J. Forbes Watson (who made the selection from the contents of the East-Indian Museum now exhibiting here) wrote and published, in the year 1863, a most able and interesting volume on 'The Textile Manufactures and the Costumes of the People of India.'

"Now, it does occur to us, in glancing over the objects now open for exhibition in the Corporation Art-Gallery,

(that, that which has been done for manufacturers of textiles ought to be done for our own manufacturers of hardware."

Mr. Aitkin thinks that the objects which form the Indian Collection now exhibited there should be supplemented with others from the East India Museum; and that the Council of State for India, by a permanent gift of these, will only be doing a graceful act, and that which has been done for the manufacturers of textiles. These objects would form a most excellent addition to a Free Industrial Museum, which Birmingham must have, and would afford its manufacturers the opportunity of entering the East Indian markets, did they see it to their advantage to do so.

LIGHT AND AIR.

A PLEA FOR THE POOR.

GIVE TO CROWDED LANE AND COURT

Light and Air.

Give to all, for life's support,

Light and Air.

To the toiling craftsman pale,—

To the poor on half a meal,—

To the workhouse and the gaol,

Light and Air.

Hear our gasping children cry,

Light and Air.

Give us, Lord, or we shall die,

Light and Air.

Rend Thy clouds and let Thy sun

Shine on homes by plague undone;

Give to each and every one,

Light and Air.

Why will man withhold from man

Light and Air?

Is it not a crime to have

Light and Air?

Give our city's darkest spot,—

To loam creatures long forgot,—

To brain and brow with fever hot,

Light and Air.

Give to hut and hall forthwith

Light and Air.

"Let there be light," said Holy Writ;

Light and Air.

Come, Hope, and cheer the wan and frail,

That Heaven's judgment may not fail;

Blest health, blest health—All Hall, All Hall,

Light and Air!

EUSTON SQUARE.

SIR,—In reply to your correspondent, "S.," the works now being executed are to form a carriage and footway approach from the Euston-road to the Portico in Drummond-street. The only buildings to be erected, are two lodges, and the deep digging is to form an underground passage of good width and height for the frequenters of the gardens, to pass from one side to the other. ONE WHO KNOWS THE WORK.

THE JOINERS' TRADE.

SIR,—The remarks of your correspondent "Query," in the *Builder* of November 20th, has, in a great measure, solved a difficulty to those of your readers who could not account for the high rents and increased value of house property all over the country. His statement is a fair explanation of where the 35 per cent. goes, and also accounts for the fact of finished joiner-work being imported from Sweden at less cost than it can be manufactured at home.

I do not labour under the same disadvantage as your former correspondent, who states that he is merely a spectator. Having been nearly thirty years an operative in the joiner department of the building trade of Glasgow, I have had an opportunity of observing all the different phases of the trade, some of which I heartily support, others as firmly detest, as tending ultimately to ruin our home trade.

Blood-money, referred to by your correspondent, was never understood to be paid to foremen or for the purpose of "driving" men, but rather for putting on men. I will describe it, and your readers will easily see the effect on the cost of building between twenty and thirty years ago and the present time. At the time referred to it was often the case that some of our leading hot-headed unionists would leave their ranks and become contractors and employers; but seldom were their views modified by the change; they were only transferred from the side of the workmen to that of the employers. It was these hot-headed men who introduced the tyrannical system of paying blood-money, which was carried to a great extent. The method of doing it was this:—In a squad of, say, from twenty to forty men, the employer would select a pair of ready-handed go-a-head fellows, and pay them a few shillings a week extra. These were generally put to doors and windows, or such work that several pairs could be put to the same quantity of work at the same time; but the blood-suckers proved their value to their employers by putting on the ordinary workmen, and those that were left behind either had to submit to reduction of wages or leave the work. This state of things induced many to become unionists who were not otherwise favourable, except to get rid of these oppressors. The first effort made was to agitate for a

LONDON TRAMWAYS.

LAST week saw the commencement of the construction of the tramway, in the East of London, authorised in the last session of Parliament. This is, we believe, the first breaking of ground for this purpose since Train's trams were removed in Westminster and the Kennington district. The new line, which will be double, has 4-in. rails, level with the roadway. The rail proper is smooth and on the outside of the surface; then a groove for the reception of the flange of the wheel intervenes: the inner surface of the rail is corrugated to afford foothold for horses. The rails are laid upon longitudinal sleepers, of Baltic timber, 6 in. deep by 4 in. thick; these are laid upon Portland cement, and are kept at equi-distance by cross ties of iron, about 1½ in. by ½ in., which are bound to the cast-iron shoes in which the rails are laid. Mr. Hopkins is the engineer of the line, Mr. Page, resident engineer, and Messrs. Fisher & Parrish, the contractors, with Mr. M. W. Anderson as their managing overseer.

CESSATION OF WORKS IN PARIS.

WE learn by a letter from Paris "That the authorities there are about to enter upon a system altogether opposed to that of the last fifteen years. After having built outrageously, they are now going to do nothing, and will hardly finish the works already begun, at least in Paris. The Opera 'grugs its slow length along,' and the Hôtel Dieu, which it was intended to complete at the same time, does not proceed more rapidly."

It does not appear whether this sudden change proceeds from financial or political considerations. But, perhaps, the recent conduct of the *classe ouvrière*, in regard to the election of candidates personally hostile to the Emperor, may have disgusted him.

SCHOOLS OF ART AND OF SCIENCE.

The Newcastle-under-Lyme School of Art.—The annual meeting of the friends and supporters of this institution has been held at the Town-hall, and was, as usual, well attended. The chair was taken by the Rev. E. J. Edwards. The walls were adorned with the principal productions of the students, and although there were fewer of the works in the elementary section than usual shown, the drawings which were exhibited were as a whole of a better class than on any former occasion, and reflected credit upon Mr. Bacon, the head master, as well as upon the students themselves. They included outline drawings from flat examples, outline drawings from the cast, shaded drawings of ornament from the flat and from the cast, flower-painting from the flat and from nature, shaded drawings from the cast of figure, painted monochrome from the cast in oil, and designs for the decoration of porcelain. The last-named should, perhaps, take the first position as regards excellence, the student who produced the designs (W. P. Rhodes) having, as the reports showed, obtained a medal in the national competition, and also been honoured with a national scholarship as an art student. The report of the committee, which was read and adopted, stated that as far as the success of the school was concerned this year in competition, the committee had every reason to be satisfied. The report of Mr. J. P. Bacon, head master of the school, was also read and adopted. It stated that the attendance in the classes and the progress of the students had been satisfactory. In the month of March the annual examination was held. Twenty-four students were examined; thirteen passed satisfactorily; and one obtained a prize. All the drawings finished in the school during the year are required by the Department of Science and Art, to be sent to London in April for examination. At the first or separate examination the works of sixteen students were satisfactory, four obtained prizes, and one honourable mention. The chairman distributed the prizes. The meeting pledged itself to support the school.

The Bristol School of Art.—The distribution of the Government prizes and certificates awarded to the pupils of this school has taken place in the large hall of the institution. There was a numerous and influential gathering. Mr. S. Morley, M.P., occupied the chair. In opening the proceedings, Mr. Morley expressed his deep conviction of the importance of institutions like that,

and said he hoped soon to see an arrangement which would secure the education of every child in Great Britain. But the object of that institution had a special reference for those who needed what had recently been known by the term "technical education,"—an education that shall adapt them for the future occupation that may lie before them, and in connexion with which their power would be greater in securing an honourable maintenance for themselves. He was quite unconscious of being in any sense an alarmist, but he confessed he looked with a great deal of anxiety to the commercial future of this country; he believed they needed to pay attention such as they had never yet paid to the precise objects which their schools of art and science were seeking to secure. They needed cultivated workmen; and when he referred to the working class, he believed that the sons of our manufacturers, and those aiming to be foremen in the various manufactories equally needed cultivation in the race upon which they were entering. Nevertheless, he believed that England, at the present time, distinctly held her own; but with the prospect, he hoped, of a large disarmament on the Continent, there would be a large addition to the force of labour brought into the labour market. They would have to look very keenly at all those points in connexion with which they were exposed to competition and difficulty, and he was therefore present to press upon all who had influence, whether manufacturers or occupying positions among the poor, who by a little kindly help or suggestion might be induced to avail themselves to an extent that had never yet been witnessed, of the power ready at their own hands, upon certain conditions. Two students of the school had obtained Queen's prizes; twelve had their works selected for national competition; and many prizes and extra prizes were gained by others among the students.

The Oxford School of Science and Art.—Evening classes in several scientific subjects have been formed, numbering in all some seventy or eighty students. The present arrangements include Building Construction and Drawing, Animal Physiology, Elementary Mathematics, and Inorganic Chemistry.

The Birmingham School of Art.—The usual meeting of the Art Students' Literary Association has been held in the Reference Library of the school, Mr. C. E. Emery, chairman. The business of the evening consisted of a selection of readings from art works. Mr. Jenks's selection was from "Dresser's Art of Decorative Design," on the "Power of Ornament to Express Feeling." Mr. C. B. Agnesse's readings were "Selection from Ruskin" and the "Rev. E. Young on Pre-Raphaelitism," comprising the thoughts of the two authors on the subject of historical painting. A discussion followed each of the readings.

The Cambridge School of Art.—The annual distribution of prizes to the successful students in this school took place in the small assembly room, Guildhall, on which occasion the room was filled to overflowing. Professor Lightfoot occupied the chair. Mr. W. M. Fawcett (hon. sec.) read the report, which said:—

"The committee had to congratulate the students and friends of the School of Art on its continued prosperity. The success on the Government examination, and in prizes awarded by the Government for works done during the year, has been greater than for several years past.

Thirteen have this year received third-grade prizes, against six last year.

Two have been honourably mentioned, five having been last year.

Ten have received second-grade prizes, against six last year.

Forty-one have received certificates of having satisfied the examiners, against twenty-eight last year, and one free student has been elected, against two last year.

The names of these prize-holders will be announced when the prizes are distributed."

Mr. F. T. Palgrave afterwards read a paper on "The Practical Laws of Decorative Art."

The Salisbury School of Science and Art.—The annual distribution of prizes to the pupils of this school took place at the Council Chamber, in the presence of a numerous and influential assembly. The Bishop of Salisbury presided. The Rev. R. G. Swayne read the report, which said, as to the progress of the school:—"It has now been at work for more than four years; for nearly the three last of these under the present master, Mr. Fraser, and the results attained have fairly answered the expectations formed. The number of students at the evening classes, who are, almost without exception, young men and lads, the sons of tradesmen and artisans, is at present 31; that of the day classes, 22. During the summer and winter sessions of this year 46

students in all have attended the evening classes." There were 13 successful competitors for the prizes, which were distributed by the bishop, after which appropriate resolutions in support of the school were passed.

The Evans School of Art.—The presentation of the Government prizes to the successful pupils of this school has been made by the Marchioness of Bath. There was a numerous attendance. The school has got new and spacious premises in the literary and scientific building. The Rev. Prebendary Horner, the president of the school, was in the chair. In course of his address he said he was glad to state that they had better prospects of success than they ever had before. They had had, as they knew, a great deal of trouble arising out of a change of masters. The school, in consequence, went down, and the committee were in the utmost perplexity. However, they succeeded in obtaining the services of a gentleman, whose careful attention to the school and every pupil in it had re-established their school; and now that they had a fitting place to meet in, and a very good master, they hoped they were entering on a prosperous way. In the evening there were forty-six pupils, all of the artisan class, besides twenty-six morning pupils; and twenty of the artisan class attended the science class. The result of the examination held here was that 480 works had been sent up to London—which in itself was good proof of Mr. Geopel's activity, for last year they had only 360. Thirty-four of their pupils had passed the examination, and thirteen had obtained prizes, while three had full certificates in all the grades. It should be remembered that this was in a competition wherein 50,000 or 60,000 specimens were sent in. Moreover, one of their pupils had gained a scholarship of 50l. a-year at Kensington; and they had been paid for twenty-three pupils, as against thirteen last year. This showed the interest taken in the school by the artisan class,—the class they hoped to do so much good for. Science and art ought never to be separated, and therefore it was he was glad to see that twenty of their pupils had been examined in science.

FROM SCOTLAND.

Carlaverock.—The publishing firm of Messrs. A. & C. Black have just done a kindly deed to mark the spot where rest the remains of Robert Paterson, the "Old Mortality" of Sir Walter Scott's novel, a deed similar to that of the great wizard himself, when he caused to be erected in the churchyard of Irongray, stewardry of Kirkcudbright, a tombstone over the resting-place of Helen Walker, the prototype of Jeanie Deans. The venerable renovator of the tombs of the Covenanters, in the last of his peregrinations at his hallowed work, was in the neighbourhood of Bankend, parish of Carlaverock, about eight miles from Dumfries, when he was seized with illness, and was found on the roadside. He was removed to a friendly house, where he died in a few days, and was interred in the churchyard of Carlaverock. No stone marks the spot where he reposes; but the particular place is known. Messrs. A. & C. Black recently gave orders that a monument should be erected over Old Mortality's grave, and with good taste directed that the memorial should be in keeping with the simple taste of him it was designed to commemorate. In accordance with Messrs. Black's instructions, Mr. Thomas McMeekan, monumental mason, Dumfries, has finished a headstone of red freestone, and which has been placed in Carlaverock Churchyard. The stone has a circular top, with a beaded moulding. Near the upper part a mallet and chisel, crossed, are cut in relief, and underneath is the following inscription:—

ERECTED
TO THE MEMORY
OF
ROBERT PATERSON,
THE
OLD MORTALITY
OF
SIR WALTER SCOTT,
WHO WAS BURIED HERE,
FEBRUARY, 1801.

Why seeks he with unwearied toil
Through Death's dim walks to urge his way,
Reclaim his long arrested spoil,
And lead oblivion into day?

Perth.—Workmen have been taking down an old house in the Watergate, for an ingress to the Free West Church, which is to be built in Tay-street. The house in question, says a local paper, is, without doubt, one of the oldest, if not

the most ancient house in the town. It had a wooden front, which hid the massive wooden work behind. Judging from its style of architecture, the house must have been built either in the twelfth or thirteenth century. The architect is the Early Scottish, approaching to the Norman. As originally built, the house had on the ground floor three circular archways, which served either for doors or windows. The arches were built of ashlar-work, and were faced in front with two large polished stones meeting in the centre. On the ground-floor there are no windows to the back. The town houses of the higher class, down to the sixteenth century, had balconies in front, and so had the one taken down in the Watergate. According to tradition, the house was, at the time of the Reformation, occupied by Mr. Patrick Murray, whose son, as John Knox states, was killed when the queen regent and a portion of the French army entered Perth, on May 29th, 1559.

Books Received.

Marvels of Glass-making in all Ages. By A. Sauzay. Illustrated. London: Sampson Low, Son, & Marston. 1870.

The marvels of glass are great and innumerable. The transparency whereby to the eye alone this hard and solid substance seems as if it had not even form or aerial, far less solid existence, is not the least of its marvels. By its telescopic arrangements, we see into otherwise impenetrable space, and bring invisible worlds into sight. By its microscopic forms, we bring up of the invisibility of minuteness, new worlds of being and of life as far beyond our limited sight as are the star-dust suns and worlds with which it shows us that the firmaments of heaven are strewed. Even yet its marvels are on the increase. By the spectroscopic prism we now can see infinitesimal traces of substances where before not a ghost of them could be seen; and can identify the existence of known elements of earth in the sun, and even in the wisps of hydrogenous nebulae which form the far-off background of the firmaments.

The marvels with which the work under notice chiefly deals, however, are marvels of another kind, such as forms of art; and many of these are not only described, but beautifully illustrated by autotypes and wood engravings. The chief interest of the book in any one subject may be said to be centred in goblets and drinking-glasses, many fine examples of which are illustrated. Next in interest come glass-cutting and engraving, with more illustrated examples. Then there are elaborate mirrors and looking-glasses, to which other arts lend their aid. The colouring of precious stones, and the formation of false pearls, the marvels of spun glass, iridescence of glass, water-glass, optical glasses, lighthouses, and various other cognate subjects, are also treated of; as well as the composition of glass itself, and the processes of its manufacture, both as a raw material and as a work of art. These, with an introduction and an alphabetical index, pretty well exhaust the work as a treatise.

The author is not quite correct in all his statements. He states, for example, that soluble glass was invented in 1825 by Dr. Fiesch, of Munich, who called it water-glass; whereas soluble glass was well known of old,—it is hard to say how long,—under the name of "oil of flints."

We may here quote the recipe for making water-glass given by M. Sauzay:—

"Soluble glass is obtained by melting in a refractory crucible a mixture of ten parts of potash, fifteen parts of quartz finely pulverised, and one part of charcoal powder. When it is melted, the glass is cast; it is afterwards pulverised and treated with four or five times its weight of boiling water. A solution is thus obtained, which, applied to other bodies, dries rapidly in contact with the air. Let skilful workmen take up this idea and perfect it."

The less quartz there is, we may here note, or the more potash, the more apt will the glass be to be affected by damp, or even to deliquesce. It may be a question, therefore, how far pulverised quartz may be incorporated with the already formed glass, as a paste, after its basis has been set by furnace or other heat. Spread on a wall, for example, in solution, with a brush, a powdering with finely-pulverised quartz, would probably convert even weak or deliquescent water-glass into an anhydrous substance no longer affectable by damp.

The remarks on spun glass are curious and interesting. We dare say it is not generally known that at one time not only were glittering dresses of a mixture of silk and spun glass worn, as well as aigrets for ornamenting ladies' bonnets, which waved about with the lightest breeze, but "the flowing black curls, which, when worn by a prince, became the admiration of all Paris, were likewise made of spun glass, curled with irons." Here is your material, ladies, for no end of "golden hair," and without fear of natives inhabiting it, or obligation to still on their heads it and perhaps die with it still on their heads. In the Conservatoire des Arts et M^{étiers} at Paris, it seems, in the glass-room there is a lion of life-size "with splendid hair and bristling mane," whose capillary attractions are all of spun glass, which, by the way, is truly capillary or tubular, just as real hair is, and can even be filled with mercury by help of an exhausted receiver.

The publishers merit a little compliment for the way in which they have got up M. Sauzay's volume.

Art in England. Notes and Studies. By Dutton Cook. London: Sampson Low, Son, & Marston. 1869.

The title of this little book is too large, and, moreover, will keep off buyers; for many, if they know that the volume simply consists of a number of pleasantly-written papers about artists and art-doings, might in this age of careless reading be disposed to look to it who certainly would give no thought to the study of "Art in England." The headings of some of the chapters will better show the nature of the book:—"Mrs. Hogarth and her Lodger" (Alex. Runciman); "George Romney"; "The Story of a Scene-painter" (Louthborough); "Sir Joshua's Pupil" (Northcote); "The Peplid of Sir Thos. Lawrence" (Harlow); and so on. An interesting paper on that very indigent man and wonderful artist, Turner, closes the volume, which is instructive as well as readable.

The Lord's Prayer Illustrated. By F. R. PICKERSGILL, R.A., and HENRY ALFORD, D.D. London: Longmans, Green, Reader, & Dyer. 1870.

Dr. ALFORD, in his preface, says Mr. Pickersgill's designs were submitted to him during the last autumn, with a suggestion that he should connect them together by writing some letter-press in accordance with the leading idea of the artist. It seemed to the dean, however, that this idea would be most clearly brought out by throwing the illustrative text into a poetical dramatic form, and he has accordingly, in a charming poem, entitled "The Children of the Lord's Prayer," developed at once the meaning of the artist and the spirit of the words which enter into the daily prayer of all Christians. Parts of the poem are of the highest order of merit, and will live. Mr. Pickersgill's designs are nine in number, and are characterised by great breadth and beauty. We should especially point to the first, "Our Father which art in Heaven;" and the third, "Thy Will be done on Earth as it is in Heaven." The drawings are engraved with great skill and excellence by the Brothers Dalziel. With beautiful print, paper, and binding, this book is not for 1870 alone, but for a long string of years after.

Mottos and Aphorisms from Shakespeare. London: James Hogg & Son.

This wonderful wisdom and variety of Shakespeare is well shown by this little book, wherein, with more trouble and pains than some would suppose involved, "T. E. J." has set forth 2,700 mottoes and aphorisms culled from our great bard's works. They are all brief,—two or at most three lines each,—are ranged alphabetically, and made further available by a copious index of words and ideas.

The World of Wonders. London: Cassell, Petter, & Galpin.

A book better adapted than this to open the mind of the young to a perception of the wonders of nature, science, and art, we do not know, while as a half-hour's reading-book for all, to be taken up and put down again, it affords an ending resource. Truly, as Coleridge says,—"In wonder all philosophy began, in wonder it ends, and admiration fills the interspace; but if the first wonder is the offspring of ignorance, the last is the parent of adoration."

VARIORUM.

We have before us a number of Letts's popular Diaries for 1870; some a shilling each, one sixpence. They include a variety of useful information, and will meet the wants of a large class. The "Appointment Diary" gives the means of entering engagements for every hour. The Medical Diary is extremely portable, and well suited for the purpose intended. It gives an opening of two pages to each week, the left hand being divided into the days of the week, the right equally applicable to daily entries, but arranged more especially for lists of patients. The Large Print Almanac is specially prepared for dark offices and short or aged sight. The days of the week and month are printed in bold black type, so as to be promptly legible where ordinary calendars would be useless. We must add a word of recommendation for the gummed labels (250 for 3d.) issued by the same firm. They will be found very handy for many purposes.—"Gutch's Literary and Scientific Register and Almanac" for 1870 is literally crammed full of all sorts of information.—"Dietrichsen & Hanway's Royal Almanac" holds its own.—The Christmas number of the Publishers' Circular is full of specimen engravings from new illustrated works, which give it a special value.—Mr. J. W. Anson's "Dramatic and Musical Almanac" includes a notice of the fall of the Brunswick Theatre in 1828, "Sauterlings in South-west," and notes on "the difficulties experienced in building the Victoria Theatre."

Miscellaneous.

The Glasgow City Improvement Scheme. Down to the date of their last report the trustees had expended in purchases, &c., 565,017, including 25,000 paid for ground to form the new park for the north-eastern district of the city. Against this expenditure, there had been borrowed 462,980, the assessment having yielded an additional sum of 92,937. The purchases are scattered over most of the areas intended to be operated upon, and comprise a population estimated at 20,000. In some cases nearly the whole of the property required has been secured, while in others considerable purchases yet remain to be negotiated. Speaking generally, the greatest progress has been made in the most necessitous localities; that is to say, in areas adjoining the High-street and Saltmarket, in Gallowgate, and in the Main-street of Govanhill. The new park is on the lands of Kennymill, on the banks of the Monklands Canal, about a mile eastward from the Cathedral. For twelve months past the park has been in course of formation, and now a considerable portion of the grounds is open for public resort. In conjunction with Mr. Dennistoun of Golt'hill, whose property adjoins, the trustees have made arrangements for laying out a suitable approach. The carrying out of this design, while obliterating numerous eyesores, will result in the establishment of a noble thoroughfare, which cannot fail to improve the general character of the Townhead district. With regard to the future action of the trustees in the direction of reconstruction, nothing has been positively decided on; but it is expected that a beginning will be made in the course of a few months. Of their extensive operations, the trustees' committee would seem to have pitched upon two as specially eligible for speedy execution. One of these is the extension of Ingram-street eastward to the College, and the other the continuation of Bell-street through the district north of Gallowgate. In each of the areas in question, the trustees have acquired nearly all the necessary property. Mr. Carriok, the city architect, is the practical adviser of the trustees.

Columbia Market.—It is stated that the Artisan and Labourers' Dwellings Company (Sir Sydney Waterlow, chairman) are in treaty with Miss Burdett Coutts for a long lease of a portion of her vacant land, outside the market, and near Shoreditch Parish Church, with a view to erecting buildings of a cost value of 20,000, to be completed by the close of the year 1870. Other building negotiations are in treaty, and the approach to the market, nearest to London, is being widened to the fine extent of 50 ft. The iron columns for the covering of the Market-square are already cast, and Messrs. S. C. Hemming & Co., of Moorgate, will, early this week, commence to roof in, preparatory to the opening of the Market-square, as a great wholesale fish-market, some time in January next.

The Drains and the Habitability of a House.—In the Court of Queen's Bench, Westminster, on December 10 (sittings at Nisi Prius, before Mr. Justice Mellor and a special jury), the case of *Davies v. Remmett* was concluded. It was an action by a gentleman against the landlady of a furnished house at 24, Queen's Gate-terrace, South Kensington, for letting it to him in a state unfit for occupation, by reason of the drains being in such a bad condition that they gave rise to foul air, which rendered the house unwholesome and uninhabitable. The case lasted nearly three days. It came out in the course of the defence that the traps to one of the drains had been mended carelessly (with cement instead of solder), and it also appeared that there was a hole in one of the traps. The jury had a view of the house. Sir J. Karlake, upon the part of the plaintiff, put the case upon the ground of an implied warranty, and cited the recent case of "*Campbell v. Lord Wenlock*," 4, *Foster and Fintison's Nisi Prius Reports*, as supporting that view. Mr. Sergeant O'Brien, on the part of the defendant, the landlady, denied the alleged warranty, and appealed to earlier cases where it had been doubted. The Judge said he should abide by the recent case, where the point had been distinctly ruled. The jury, at the close, requested a physician's certificate to be read, in which it was said:—"My attention has been called to the state of the drains from my own observation. We could smell the drains. It might be from a sink, but I satisfied myself that it was from the drains. Such smells would not originate fever, but would tend to aggravate the symptoms." After being absent a great part of an hour, the jury returned into court with a verdict for the defendant, the landlady.

Charge of Conspiracy against Master Brickmakers.—Thomas Hayes, Francis Gregory, and Enoch Bowker, were indicted at the Manchester Assizes, on Tuesday, before Mr. Justice Willes, for conspiracy, inasmuch as being members of the Brickmakers' Associations they conspired to refuse a supply of bricks to the prosecutor, a bricklayer, for the completion of a particular work. The defence was, that bricks had been supplied for the same building to a contractor who had failed to pay for them. Defendants then refused to supply more bricks until the others had been paid for. Mr. Justice Willes said, if one man supplied bricks to build a house it would be lawful, and if, having supplied bricks, he refused to supply more till those were paid for, it would be justifiable; but if three persons combined to do the same thing did it become unlawful? Mr. Lereche, counsel for the prosecution, thought if a number of persons combined to coerce a man to pay a debt which was not his own, by not supplying bricks, it would be wrong. Mr. Justice Willes.—Is coercion wrong, except in the abstract? Mr. Lereche thought so. Mr. Justice Willes.—It appears to me that it is not. Coercion by illegal means is wrong, but coercion by legal means is right. Mr. Lereche quoted a number of cases more or less supporting his view of the case; but the learned judge said he was well up in all these points, and counsel's reasons had no more effect on him than a shower of rain would have on a duck's back, the rule of law being quite clear to his mind. He suggested that the prosecution should be withdrawn on both parties agreeing to take no further proceedings. This was agreed to, and Mr. Justice Willes directed the jury to find a verdict of acquittal, in which they acquiesced.

Society for the Production of Art Books.—In Paris a society has been established, under the title of *Société d'Encouragement pour la Propagation des Livres d'Art*. Its object is to favour the publication of books calculated to spread a knowledge of and taste for art. The seat of the society is at Messrs. Goussier & Co.'s, Boulevard Montmartre. M. Davion, architect to the city of Paris, is the president, and the committee includes other architects, painters, and sculptors.

The New Street by the Mansion House.—At the last meeting of the Metropolitan Board of Works it was decided that the name Queen Victoria-street be applied to the new line of street from the Thames Embankment to the Mansion House. With all our loyalty, we cannot applaud the Board for their decision. There is already a Victoria-street hard by (the continuation of Farringdon-street), not to speak of Victoria-street, Westminster.

Rome, the City of Dirt.—A correspondent of the *Times* says, with equal force and truth:—"I do really believe that the Pope and his people far surpass the efforts of ordinary national profligities in their zeal for their place, their city, their temples, and their thrones. But what churches, what domes, what columns, what statues, what marbles, what mosaics, what paintings, what tissue of gold, what jewelled tiaras, what processions of cardinals and bishops from all the world, what candles and lamps, what guns and bells, what fountains shooting upwards or running down, can make up for dirt, dirt, dirt, as ubiquitous always as the plagues of Egypt were for one dreadful hour or so? Whatever else this is, it is a city of dirt, and whoever tries to change the air by a stroll into the suburbs only finds them a good deal filthier than the city itself. And this is the State which proposes to lay the greater part of the civilised world under terrible curses, unless it will receive some mysterious dogmas on the most inscrutable subjects, and he also content to repose on an infallible judgment upon any political, social, or economic question that may happen to divide society! We may not tell the physician first to heal himself, but we request him, at least, to clean himself [since "cleanliness is next to Godliness"] and to establish some claim to teach us mysteries by a little improvement in matters cognizable to bodily sense.

A Town Swallowed by an Earthquake.—The *Impartial* of Smyrna gives an account of a frightful catastrophe. The town of Onla, in the district of Mentché, a dependency of Aidin, has disappeared,—entirely swallowed up in the earth after three successive shocks of earthquake. The inhabitants were to some extent warned of what was about to occur by dull rumbling and alarming sounds, which were soon followed by a first shock that made them fly terrified to the neighbouring hills. Except three persons, therefore, all the inhabitants escaped with their lives. Marmaritz and Moula, in the same district, have also suffered severely. The governor *ad interim* has sent provisions, tents, and money to the unfortunate people, who are thus left without a roof, or even the common necessities of life. This extraordinary persistence of earthquakes in divers places is getting serious. The worst of it is that if Professor Phillips, the geologist, be right in thinking, as he is said to do, that a period of recurring activity in the disturbing causes which affect the earth at great intervals of time has commenced, a long continuance of them may at least be anticipated, if not an increase in their intensity, beyond their mere initial action.

Flint Arrow-heads in Egypt.—Messrs. Hamy and Lenormant write to the *Académie des Sciences* to prove that Egypt has had its age of stone as well as Europe. Their letter is dated from Luxor, and they say:—"The existence of an age of stone in Egypt has often been the subject of controversy. The facts we are about to relate will, we think, give some information that will exercise an influence on the opinions entertained hitherto on the question. On the elevated plateau which divides the celebrated valley of Bihan-el-Molouk from the escarpments which overlook the Pharaonic edifices of Deir-el-Bahari, we have ascertained the presence of an enormous quantity of wrought flints, lying on the surface of the ground, to the extent of upwards of a hundred square yards. These wrought flints, which are of the well-known type designated arrow-heads, lance-heads, lanceolated axes, knives, scrapers, &c., evidently constitute the remains of an ancient manufactory, according to all probability pre-historic, and exactly resembling those known in France under the denomination of 'Factory of the Neolithic Period.'

The Ceiling of the Paris Opera House.—A curious account is given of the ceiling of the new Opera House in Paris. It will be composed, we are told, of a vast number of plates of copper screwed one to another in such a way as to be easily put together and taken to pieces again. Part of the advantages of the plan is said to be that the ceiling can thus be raised or lowered at will. The whole is divided into several sections, which are now being painted with allegorical representations of the hours of day and night, more than a hundred figures being included in the whole. The place in which M. Leneveu, the artist, carries on his labour is situated in the grand cupola over the pit, and forming an immense rotunda, 120 ft. in diameter and 65 ft. in height.

Gasometers Blown Down.—At Cambridge, during a recent gale, the largest gasometer in the University and Town Gasworks was capsized and the gas was set fire to, although there was no light within thirty yards of the gasometer. No explosion occurred, but the immense flame caused a fire on the premises. As so often and so seriously happens by coincidence, a gasometer was shortly thereafter blown down at the Gloucester Gasworks. It had been recently erected at a cost of nearly 4,000*l.*, and was capable of holding 240,000 ft. of gas. One of the chains gave way, then another, and while the gasometer was descending an iron pulley broke a hole in the top of it, and the gas all escaped. There was a light near, but no explosion nor firing took place. As such accidents not infrequently happen, more care ought to be taken in the steadying of such enormous and top-heavy structures as large and filled gasometers, which cannot, in such cases, have any fixed basis on which to rest, and must naturally tend, like balloons, to wobble about, even though made and weighted with iron. The giving way of chains under such circumstances might well be anticipated, and ought in some way to be obviated.

Extraordinary Scene in a Church.—On Sunday, the 5th instant, the inhabitants of the village of Horndon-on-the-Hill, according to the *Chelmsford Chronicle* of 17th December, were thrown into a state of great excitement in the church during divine service, when a very strong sulphurous smell spread over the edifice. It was with difficulty the vicar was enabled to continue his sermon on "The evidence of things not seen," towards the close of which the school children, who were seated beneath the belfry and near one of the stoves, began to be much affected. Some vomited, others fainted, and had to be carried out, causing no little commotion. The congregation now began to find that the fumes from the coke of the church stove, instead of being conveyed up the chimney, were beaten down into the church, caused by a heavy atmosphere and a defect in the flue, thereby checking the necessary draught. Several ladies, upon leaving the church, inhaled the vapour, and were thrown prostrate, some were attacked when coming in contact with the air, while others were able to reach their destination before feeling the ill effects. Upwards of thirty people were more or less victims to the carbonic and sulphurous vapours. Fortunately no one was fatally affected.

Wolverhampton.—At Wolverhampton the Great Western Railway Company have established extensive works for the building of their large engines, the manufacture of railway fittings, and other purposes. The works are under the superintendence of Mr. G. W. Armstrong, and employ altogether upwards of 2,000 men and boys, for whose mental improvement a commodious lecture-hall, reading-room, and library, are provided. The Stafford-road Institute, as it is called, is not only supplied with the principal daily and weekly newspapers, and books of an entertaining character, but care is also taken to provide for the use of the members the best magazines and periodicals on mechanical and scientific subjects, diagrams, &c. such as will prove advantageous to them in connexion with their daily employment. Lectures are also delivered occasionally; and on the 9th inst., Mr. C. Manton, architect, delivered a lecture on "The Architectural Antiquities of Athens"—the subject of the lecture being illustrated by a number of panoramic views (each view occupying a space of 12 square feet of canvass) painted by the lecturer.

A Universal Telegraph.—Mr. T. W. Tobin, of the Royal Polytechnic Institution, is said to have invented a telegraph without a battery, so that we cannot call it an electric telegraph. It simply comprises the usual wires and two terminal discs, judicious, and semaphores, with two boxes, the contents of which would seem to be a secret at present, but which, of course, must contain no electric batteries. Not being as yet in the secret, and not, therefore, being bound to secrecy, we are free to guess or suggest what it may be; but all that we can suggest is that unless it be a magnet that is contained in each box, we must "give it up."

A Statue of the late Earl of Dundonald.—Considerable funds have been raised for a statue in Valparaiso to the great naval hero, Lord Cochrane, whose merits, like those of Admiral Napier, we have not yet fittingly acknowledged in this his native country, although tardy justice was done to the maligned reputation of Lord Cochrane.
