The Commissioners agree that a tint of colour derived from peat would not be acceptable to the inhabitants of London. They also think the action of soft water on lead a serious objection to it.

They anticipate a "powerful and determined opposition" to this scheme, if brought before Parliament, on the part of the interests connected with the River Severn.

They object to London being dependent on one supply of water, which might be easily stopped by any one of several causes, such as "wild damage, frost, or the failure of any work along the line." Mr. Bateman admits these objections, but defends the plan against the first by showing that he has provided three weeks' storage within 10 miles of London to cover any interruption from accident or repair. He admits that as against hostile occupation no provision could be made to prevent the water being cut off, but considers the contingency so remote as not to weigh against the advantages of the plan. Mr. Bateman does not make so good a defence against the second objection, that of frost, for there is no analogy between this proposed aqueduct and that of Glasgow, which is nearly all in tunnel, and therefore well protected from the outer atmosphere. "In a river like the Thames the temperature in winter is kept up by the springs which feed it, an advantage an aqueduct does not possess." We shall return to this Report.

SUBTERRANEAN ROME.*

TAKING UP again Messrs. Northcote and Brownlow's book, we would mention the care with which the rude scribbings, or *graffiti*, of ancient visitors are now scanned. De Rossi calls them "the faithful echo of history and infallible guides through the labyrinth of subterranean galleries." Sometimes the writing is a mere name, with or without a title; others are exclamations connected with distant or departed friends; and others are invocations addressed to the martyrs upon whose tombs they are inscribed. The names are of two kinds, the most convenient parts of the walls being scribbled over with such classical appellations as Rufina, Felix, Polymeicos, Leo; and those higher up with more Medieval designations, such as Idebrand, Bonizo, Joannes Presb., &c. The ejaculations correspond with the simplicity of the earliest epitaph. They repeat "VIVAS, VIVAS IN DEO CRISTO, VIVAS IN ETERNO," and similar aspirations, over and over again. This custom is referred to one among the heathens that prompted them to write the names of those they loved on sacred places they visited, in the hope they might then

partake of any benefit to be derived from the attention. An inscription in the island of Phylis, Egypt, is quoted as an illustration, where Serapion, son of Aristomachus, wrote, "Having come to the great Isis, Goddess of Phylis, he makes a remembrance there of his parents, for their good." One Christian pilgrim can be traced, from sanctuary to sanctuary, by his masons. On the vestibule of the principal sanctuary he wrote, what was evidently the wish nearest to his heart, which we translate, "Sofronia, mayest thou live with thine own;" and when he approached the entrance he wrote and prayed, "Sofronia, mayest thou live in the Lord;" again, when he came to an altar tomb in another chapel, he scratched, "Sweet Sofronia, thou shalt ever live in God;" and before he left he added, "Sofronia, thou shalt live." Other *graffiti*, calling upon the martyrs, take the following forms among others. "Holy souls, have in remembrance Marcianus Successive Severus, and all our brethren. Holy souls, ask that Veronduus and his friends may have a prosperous voyage. Ask for rest, both for my parent and his brethren; may they live with Good. Holy Sixtus, have ye in remembrance in your prayers Aurelius Repentinus. Have ye in remembrance Dionysius." We have selected these as extremely ancient examples. Sometimes they are cut off in the middle of a sentence by some alteration or renovation that has been made since they were written. As such works were executed chiefly by St. Fabian about the year 245, or by St. Damasus in 370, we get a tolerably precise clue to their date. One of them, De Rossi states, must have been written whilst the plaster was wet. This is an apostrophe to Pontianus, who was probably an exiled pope of that name, brought home after his death in Sardinia, and hurried here by St. Fabian.

Of the paintings in the catacombs, De Rossi ascribes two to the first century. These are the Virgin and Child, with the prophet Isaiah in the catacomb of Sta. Priscilla; and the tree and flowing vine covering the roof of the entrance to St. Domitilla. The decoration of the roof of the Chapel of St. Janarius, in the catacomb of St. Proxetatus, with the paintings of the fish carrying a basket, and the lambs on either side of a milk-pail on an altar, on the walls of a *cubiculum* in the crypt of St. Lucina he ascribes to the second; while the great bulk of the Biblical paintings he considers the work of the third century. He divides the paintings, generally, into six classes, those that are symbolical being the earliest and largest; the next, allegorical; the third, Biblical, depicting histories from both the Old and New Testaments; the fourth, pictures of our Lord, the Virgin, and the saints; the fifth, scenes from the lives of these latter, or from the history of the church; and scenes from the Liturgy being the sixth. There does not appear to be any addition to the known circle of symbols recently discovered, but the instances in which they are associated with one another, interchangeably, and sometimes with the names of the deceased on whose gravestones they occur, make the array large. One gravestone is illustrated, which the *fossor* inserted in the wall with the name upside down, but upon which the artist sculptured his dove correctly, showing it must have been executed after the stone was fixed in its place. The subjects of the Biblical paintings are limited in number, and are also treated in a symbolical manner. We have Noah in the ark, typical of baptism,—the ark a small box, with a man in it, and sometimes a woman, as in the instance in which a dead person's name is painted on it, Juliana; Jonas and the fish, a type of the resurrection,—the fish being a large-headed dragon with a long neck, perhaps, it is supposed to keep the representation distinct from the fish, which was so often employed as a symbol of the Saviour; Daniel in the lion's den, intended either to encourage the persecuted, or as an emblem of the resurrection, and used for both purposes by the Fathers; upwards of twenty examples of the adoration of the Magi; Moses striking the rock, whence issued the living water, which was Christ; and the resurrection of Lazarus, or the Victory over Death; and Moses taking off his shoes as he approaches the burning bush, typical of the renunciation of the world, the flesh, and the devil. This limited range of subjects occurs over and over again, as though they were current illustrations of the thought of those old times. No real portraits of Christ or of the Virgin have been found, though it is shown that there is always an adherence to certain leading characteristics in the faces of

* See p. 564, ante.

SS. Peter and Paul in the glasses found in the catacombs, as though from an attempt to maintain a likeness. There are representations of Christ, however, one of which is quoted by Kugler as the oldest portrait in existence, and, in consequence, is eagerly inquired for by visitors to the catacombs. This is a head and bust in a medallion, occupying the centre of the roof in a cubical in the cemetery of Saints Meniscus and Achilles. Its claim to the highest antiquity is not allowed by all. The liturgical paintings are very rare—quite, in fact, exceptional; they are found in the cubical near the Papal crypt we have mentioned, and belong to the end of the second century. They are all illustrated in colours in the volume under consideration. Baptism and the Consecration of the Holy Eucharist are the subjects of representation,—the first mixed up with Biblical stories and allegories, and the second still further veiled and complicated by the sign of the fish, and both associated with full-length figures of fossors about to haw with their pikaxes fragments of rock. A man fishing, another baptizing a youth in the same water, and a paralytic carrying away his bed, are painted on one wall. On that which faces the doorway is a three-legged table with bread and fish upon it, with a woman on one side of it and a man on the other. The first is standing with arms thrown up and hands extended, which is called an attitude of prayer; and the second, partially draped only in the pallium, extends both hands towards the table, which he actually touches with his right. This attitude has been interpreted by some to indicate the act of consecration. Again, seven men sit at a table with two dishes of fish before them, and eight baskets of loaves upon the floor; and close to them Abraham is preparing to offer up his son. These last three scenes, which are painted side by side between two graves, have the figure of a bare-headed, bare-legged fossor on either side of them. The same series of subjects is introduced, slightly varied in details, in the other cubical in the neighbourhood of the Papal crypt, which persistence again suggests some familiar homily or teaching. The authors quote Tertullian's explanation of their meaning as sufficient for their complete interpretation.

We must give a slight indication of the contents of the chapter upon the gilded glasses found in the catacombs; for at the present time there are some examples of them on loan in the South Kensington Museum, which, if examined by the light of this clever compression of the labours of Do Rossi, will give our readers some very precise information. There are about thirty specimens also in the British Museum, and a few others in the museums of Paris, Florence, and Naples; but the largest collection is in the Vatican Library. Mr. Wislizen, the owner of the specimens at South Kensington, possesses about twenty. In all not more than 340 examples are known; and Do Rossi's twenty-three years of labour in the catacombs have only yielded two fragments. In 1864 a fragment of a gilded glass-plate was found at Cologne, and in 1866 another fragment was discovered in a stone-chest in an excavation near the church of St. Ursula, in the same place; with these exceptions they have been so invariably associated only with the remains of the primitive Christians of Rome, that archaeologists have supposed the manufacture of them was confined to those people. They are, we need scarcely add, generally the bottoms of drinking-cups, with designs executed in gold-leaf between two surfaces of glass, so arranged that the figures and letters were seen from the inside. The cups of which they were the base were stuck in the cement round newly-made graves before it hardened; but as they were thinner than the double glass enclosing the gold-leaf and more exposed, they have in nearly every instance got destroyed; and sometimes in detaching the bases from the cement these have also perished. Boldetti records having found three glasses entire, and Bosio found about half a dozen perfect examples; the rest appear to have been fragments when first found. A clue to another cause of their destruction has been found in the fact that some portions of the gold-leaf between the coatings of some fragments recently found have been scraped away by some instrument; and as, according to Martial, there were deslers in broken glass in Trastevere, it is thought likely the glasses may have been destroyed for the sake of the gold and their value. The subjects depicted upon them are more numerous than those painted on the walls of the catacombs; and are minutely described by the authors of the

work we are now recommending to our readers. One of those in the possession of Mr. Wislizen has the Apostles Peter and Paul in the centre, with six compartments round them, each having a distinct subject. Another, belonging to the same gentleman, has Christ with the rod of power, changing water into wine; and, again, enabling the paralytic to carry his bed, and also protecting the "three children" in the fiery furnace; as well as Tobias with the monster fish. Our Lord is frequently represented as the Good Shepherd upon them. The Virgin also occurs very frequently, and in various combinations. There are inscriptions upon them, too, such as "Joyfully mayest thou live with all thine; happy mayst thou live for ever in the peace of God." Eighty of the known examples have figures of Saints Peter and Paul upon them; and some of these have inscriptions which are of a convivial character, as though they were intended for use at feasts, or especially at the feasts of those Apostles. The examples of these quoted are, when translated, as follows:—"A mark of friendship, drink, and [long] life to thee, with all thine. Mayest thou live [long]. A mark of friendship, drink, and [long] life to thee, with all thine, drink [or, live], and propose a toast. Mayest thou live happily with thine own. Life and happiness to thee and thine." We refer our readers to this chapter.

The Christian sarcophagi are another distinct department in the antiquities of the catacombs. By far the largest number of these have been transported to the great hall of the Lateran palace, where they were arranged by Padre Marchi, and have since been increased in number by Do Rossi. They are not so early as the paintings. Only eighteen can be identified by their inscriptions as belonging to the first four centuries, and of these only four are considered us anterior to the time of Constantine. The earliest, with a definite Christian subject depicted upon it, the nativity, has a consular date, which determines it as the work of A.D. 343. The cause of this tardy use of sculpture is attributed to the fact that the painter could prosecute his work underground safe from observation, while there would be not only the danger of drawing attention to any sculpture executed in a workshop, but the difficulty of getting it conveyed to the catacombs. But directly the Christian religion became protected by the conversion and profession of Constantine, the sculptor was freely employed. Sometimes, we know, a Christian desirous of placing some beloved object in a sarcophagus in preference to depositing the remains in an ordinary recess in the wall of a catacomb, bought a sculptured stone of a Pagan artist, and then effaced his work with a chisel, or turned the ornamentation to the wall that it might not offend Christian eyes when fixed. On the reverse of a tomb slah inscribed Irene, for example, was found a Bacchanalian scene; and a representation of Cupid and Psyche was found with signs of plaster upon it buried beneath the floor, as though it had been likewise hidden from devout eyes. This branch of the subject is also ably treated.

The mode of construction, and the gradual development of a cemetery is the next department broached. It is illustrated with several plans, which make it extremely clear notwithstanding its intricacy. Taking the catacomb of San Callixtus as an example, it is shown that after the Christian proprietor had scored a site 250 ft. along a road, with a depth of 100 ft., he caused a staircase to be dug down to a certain level, and then a gallery to be picked out which extended round three sides of the area, and was furnished at the extreme end with a second staircase to the surface. The second side, of course, connected the two tiers, but at intervals down the length of footage there were two other galleries that extended and also communicated right through the site with both. Besides these, there were also four other galleries crossing the depth, but not quite extending to the opposite side. One of these shorter galleries led to the Papal crypt and its accessories; and opening out of the main passage close to the approach to this celebrated centre were formed three cubical. Thus the plan is three sides of an oblong, with passages crossing from one side to the other, and others beginning to cross, but not completing the undertaking; and one of these shortened galleries widening out and opening into crypts, all alike being filled with graves. Afterwards fresh excavations, on a lower level, gained by steps, formed more galleries stretching across the area; and additional cubical were made to open out of the first main gallery, uniform with the first set,

only instead of ascending a few steps into them as in their case, a descent of several was made. A third extension of the cemetery is visible when the fossors endeavoured to penetrate to a still lower level; but when they had made thirty-three steps down they found themselves through the stratum of *tufo granulare* in which they had hitherto been working, and in one of a friable *pozzolana*. They strengthened their wall with brickwork, and made some *loculi* with bricks, and pushed on, probably thinking to get through this unassailable stratum, but eventually abandoned the plan of obtaining space by this means. The tiles and bricks used by them are found to be all stamped with the mark of the imperial brick-kiln of Marcus Aurelius, and must therefore have been manufactured between the years A.D. 161 and 180. The fossors enlarged the crypt of the Popes at this time. By and by we find means taken to prevent approach to the cemetery by concealing the entrances and blocking up the staircases. About 6 ft. of the base of one staircase was removed, and several entrances were made from an adjacent sand-pit, so that, in case of pursuit, escape was facilitated. Finally, this cemetery was enlarged by communications made into others, into the history of which we cannot enter. And, after all, in the days of the persecution under Diocletian, the galleries that had been made with so much care and lined with the pious dead from the floor-plates to the headways, were purposely filled with earth, so as to baffle the tyrant's attempts to dishonour them.

The analytical description of this cemetery is that, perhaps, which would interest our readers most; but, as it should be studied with the excellent map of "Roma Sotterranea" opened before them, we have forbore to do more than touch upon these archaeological particulars.

The work is supplemented with an account of a relic intimately associated with the personages and period to which it relates,—the chair of St. Peter, so carefully guarded that for 200 years it was not seen by mortal man. There is an illustration of it, obtained from a photograph when it was exposed on the eighteen hundredth anniversary of the martyrdom of the apostles. It is an old yellow oak chair, formed of four uprights united by horizontal bars, two being higher than the others to form the back:—

"The four oak legs were evidently once square, but they are much eaten away by age, and have also had pieces cut from them. These time-worn portions have been strengthened, and rendered more ornamental by pieces of dark acacia wood, which form the whole interior part of the chair, and which appear to have hardly suffered at all from the same causes which have so altered the appearance of the oak legs. The panels and the front and sides, and the row of arches with the tympanum above them, which forms the back, are also composed of this wood. But the most remarkable circumstance about these two different kinds of material is, that all the ivory ornaments which cover the front and back of the chair are attached to the acacia portions alone, and never to the parts composed of oak."

Some of the ornamentation is attributed to the age of Charlemagne, and some, such as the Labours of Hercules in the ivory panels, is more ancient; the oak-work is deemed likely to be as old as tradition states it to be. Every known historical mention of the chair is quoted, beginning with Bede's statement:—

"King Cadwalla, the powerful in war, for love of God left all, that he might visit and see Peter, and Peter's chair, and humbly receive from his foot the cleansing water."

It is known that St. Damascus placed it in the baptistry of the Vatican, and considered probable that up to that period it may have been preserved in the crypt of St. Peter's tomb, or in the Basilica of Constantine. It was moved from chapel to chapel on the Vatican before the days of Alexander VII., who enclosed it in the bronze monument, where, until the anniversary mentioned, it has since been held. To account for the fact that the Abbot John, in the list of relics he gathered for Queen Theolinda, states that he obtained "oil from the chair on which Peter the Apostle was first enthroned" on the Via Salaria Nova, it is suggested there may have then been in existence a second chair, used by St. Peter, as he made two visits to Rome, and that both may have been at first equally treasured as relics. We avail ourselves of permission to reproduce the view of the chair, but give no undertaking as to the age of the relic.

The publishers have spared no pains to enable us to realise, with maps, woodcuts, and chromolithographs, the various remains of the momentous times when Christianity was a new and simple faith opposed to a gorgeous array of mythological deities.

PYRFORD CHURCH, SURREY.

This church has lately been reopened after restoration. Those features of the old building which were concealed by modern disfigurements have been restored to view, and the whole building has been put into a state of repair. The walls, which were badly cracked, have been buttressed and made sound as far as possible; the timbers of the wooden halfy, which was entirely decayed, have been replaced by new oak; the foundations have been drained; the roofs have been boarded and felted, and the tiling relaid.

The church, though small, possesses many features of interest. It retains throughout its fifteenth-century roof, and the greater part of the pewing of the same date. The east part of the nave roof has a curious boarded ceiling, of five casts decorated with yellow flowers on a dull red ground, constructed below the braces of the roof, which once formed the ceiling or canopy of a roof-loft. Several wall paintings have been discovered, and, where possible, preserved.

The elaborate Jacobean pulpit and sounding-board have been cleaned from paint, and restored and completed with a new base. They are partly of oak and partly of fir, with a strong red vein, and are curiously inlaid. The removal of the paint has brought to light the date 1628, which is inlaid with wood of a different grain in the centre panel.

The church has been paved with Godwin's tiles, and warmed; a new font has been given, and a vestry added. The architect was Mr. T. G. Jackson, of London. The builder was Mr. Durnell, of Brastead, Kent.

ON JEWISH SYNAGOGUES IN GALILEE.

The second quarterly statement of the Palestine Exploration Fund Committee contains some notes on this subject by Captain C. W. Wilson, R.E. No date is given, so that they may not be quite recent; but as we have not met with them in print before, and they are really so much more instructive, so far as they go, than what we are just now getting from the Holy City, we print the pith of them:—

"During the late expedition to Palestine, the remains of several undoubted Jewish Synagogues were examined, and it is proposed in the following paper to give some account of their arrangement and construction as shown by the existing ruins. The synagogues visited, nine in number, are situated in the district north of the Sea of Galilee at Nebartein, El Jish, Kefr Birim, Meiron, Um el Amud, Irbid, Tel Hum, and Kerazeh. Some other remains of the same description were said to exist in the hills above Tyre, but that part of the country did not come within the work of the exploring party.

In choosing sites for the synagogues in the different towns, the builders have by no means selected the most prominent positions. That at Nebartein lies below the old town; at Meiron a site has been excavated in the rocky side of the hill; and at Irbid the building is awkwardly situated in the lower part of the town, some distance down the northern slope of the hill, which has been partly cut away for it. Little is left of any of the synagogues. The stone has been carried away for more recent erections, and with the exception of Irbid, Tel Hum, and, perhaps, Kerazeh, they have not been made use of by the races who have occupied Palestine in later times. Those at Tel Hum and Kerazeh have possibly been turned into churches; that at Irbid, where the door is on the eastern side, has been used as a mosque. The entrances of the others being at their southern ends, which would have obliged a Moslem on entering to turn his back on Mecca, seem to have rendered them unsuitable for this purpose.

The buildings are always rectangular, having the longest dimension in a nearly north and south direction, and the interiors are divided into five aisles by four rows of columns, except in the small synagogue at Kefr Birim, where there have been only two rows of columns and three aisles. The masonry of the walls is well built and solid, of native limestone; the stones are set without mortar, the heads and joints being 'chiselled in' from 2 in. to 5 in., and the remainder rough picked; the exterior faces are finely dressed, but the backs are left rough, more readily to take the plaster with which the interiors seem to have been covered, and of which some traces remain at Tel Hum. Great attention was paid to the heights of the several courses, in the hope that some clue might be

obtained to the length of the cubit or other measure used by the masons; but they proved to be very unequal, no two in the same building being alike.

With the exception of Irbid, where the form of the ground necessitated a different construction, the entrances are at the southern end, an arrangement hardly expected, as every Jew on entering must have turned his back on Jerusalem. The entrances are three in number, one large doorway opening into the centre aisle, and a smaller one on either side; the small synagogue at Kefr Birim has only one entrance. The door-posts have peculiar architrave mouldings, the details of which may be seen in the plans and photographs. Those at Meiron and Kefr Birim are identical, and those at Irbid are of the same character. The doors have all been folding ones with socket hinges, and closed by bars on the inside. In the large synagogue at Kefr Birim, which is used as an Arab house, the modern doors are hung in the old fittings. On the lintels over the doors there is much variety of ornament. At Nebartein is an inscription in Hebrew, and a representation of the seven-branched candlestick, similar to, though of rougher workmanship than, the well-known one on Titus's Arch, and identical with one found in the catacombs at Rome. At the small synagogue at Kefr Birim is another inscription, and some defaced sculpture which evidently represents two animals lying down, one on either side of an open flower, possibly intended for the Paschal Lamb. At the large synagogue at Kefr Birim is a wreath with two lambs defaced in the same manner; and above this a moulding with a well-executed scroll of vine-leaves with bunches of grapes, and at one end a vase, perhaps the pot of manna. At Kerazeh, Meiron, and Irbid, the architrave mouldings of the door-posts have been carried round the heads of the doors. At Tel Hum, on one lintel is what appears to be the pot of manna, and on either side of it something like a reed, which may possibly be Aaron's rod. The sculpture on the main lintel is too much destroyed to distinguish its subject; on the top, cut in low relief, is a garland held up in several loops, over which is a flower. Above the centre door at Kefr Birim, there is a semicircular relieving arch, with several mouldings carried round its face. It is the only instance in which a doorway remains entire; but the others, judging from a curious slab found at Tel Hum, were in the same style, and it seems probable that the ornamented blocks uncovered at Kerazeh were situated immediately over the lintels of the doors in place of such arches.

At Kefr Birim there is a sort of porch with a sunk court in front of the entrance, and there appears to have been a similar one at Meiron. In the former synagogue, above the plain face of the enclosing wall, runs a small projecting moulding, corresponding in height and position with the abacus of the capitals of the porch; and as fragments identical in character were found at Tel Hum, Irbid, and Meiron, it seems to have been used in all the buildings. Above this moulding is an architrave of which there are also remains at Tel Hum and Meiron. It cannot be certainly determined what was above the architrave. At Tel Hum and Um el Amud a number of slabs with different floral ornaments were found, which appeared to have formed part of a frieze, and at the former several portions of a heavy cornice of peculiar shape, which may have run above the frieze; but the style of decoration of this synagogue is so different in most respects from that of the others that it would hardly be fair to take it as a general example; and no fragments of cornice were seen at any other place.

The floors of the synagogues are paved with slabs of white limestone. The arrangement of the columns is the same in all. The inter-columnar distances are excessively small; but whether this arose from want of constructive skill or an attempt to assimilate the buildings to something of the same kind in the Temple at Jerusalem, is difficult to say. There is one striking peculiarity to be noticed, that the two corner columns at the northern end invariably have their two exterior faces square like pillars, and the two interior ones formed by half-engaged columns.

The capitals are various. At Tel Hum and Kerazeh they are Corinthian, and the fillet round the neck has a pretty rope moulding. On the Tel Hum slab Ionic only are shown; at Irbid there are Corinthian and Ionic; and at El Jish, Kefr Birim, Meiron, Um el Amud, and Irbid, a peculiar description of capital, which seems to

be of pure Jewish growth. At Tel Hum and Meiron a number of blocks of stone were found which evidently went from column to column, and received the rafters of the roof. Their faces have architrave mouldings, and the soffits is also ornamented; the rafters, judging by the spaces left for them, 8½ in. deep by 2 ft. wide, were of large size; but this would be necessary if the roof were flat and covered with earth. It may be objected that there is no large timber near; but the description given by Josephus of the fleets on the Lake shows that in his day there was no difficulty in procuring a good supply. This flat roof, with thick earthen cover, which seems also to have been adopted for the private houses at Kerazeh and other places in Palestine, is, perhaps, one reason for the closeness with which the columns are placed to each other. It is still used for nearly all modern Arab houses, and is the best adapted for keeping out the intense heat of the sun.

In the front of the large synagogue at Kefr Birim there are two small windows for lighting the interior; but whether there were others at the sides, and whether this was the usual mode of admitting light, there are not sufficient remains to show."

"Tel Hum, 'Capernaum'.—The whole of the surrounding wall of this synagogue was uncovered, and a number of pedestals were found *in situ*. It appears to have been rather better finished than the others, and to have been ornamented much more profusely. The capitals are of the Corinthian order, and there are remains of a heavy cornice and frieze. The exterior was decorated with pilasters, the only instance met with in this class of building. On the eastern side is a later addition, the walls of which have disappeared down to the plinth course. It consists of a rectangular building, having three entrances on the north side and one on the east, and the exterior was ornamented with pilasters similar to those on the synagogue. There is no doorway connecting the two buildings, and the walls meet with a straight joint, those of the later addition abutting on and hiding the corner pilasters of the original construction. During the excavations a portion of a curious slab was found, on which is represented the face of some large building, possibly a synagogue. The front, as here shown, has ten columns or pilasters with Ionic capitals set on a plinth course. Two of the pilasters form the jambs of the door, which has a circular head and ornament like those found entire at Kerazeh, and in fragments at Irbid and Tel Hum. The door is slightly open, and is panelled. The entablature, which runs above the columns, is carried round the arch of the door. Mixed with the *debris* were found several remains of a much later date, which may have been added if the synagogue was ever used as a church. There are no traces of a mihrab or of its ever having been turned into a mosque."

DOBROYD GASTLE, TODMORDEN.

We have before now mentioned this structure which has been built under the direction of Mr. John Gibson for Mr. John Fielden. The owner has now taken possession of it, and we avail ourselves of particulars given by the clerk of the works, Mr. W. Glover. It is in the castellated style of the Tudor period, with four angle hatching turrets, surmounted by a main tower, having a flag-turret at the north-west angle, and a spiral staircase up the same. The Castle is built of native stone, and about 1,500,000 bricks, made of native clay, have also been used on the works. The building is 223 ft. long, by 50 ft.; the height of the flag-tower from the floor line, 82 ft.; the top of the main tower is 27 ft. square. Entering at the tower (or principal) entrance, we are in the vestibule. The walls of the vestibule are carried up in Bath stone, with oak-pannelled ceiling; the floor is of red and white Mansfield stone, and the dadoing round is in Riga and Pollard oak. Passing forward we find ourselves in the saloon. The columns and pilasters are of Devonshire marble, the capitals of the columns being carved with representations of English national sports. The panels over the doorways are of Caen stone, with representations—(1st) picking cotton, (2nd) packing cotton, (3rd) Arkwright, represented with a lathe, wheels, and mechanical instruments near him, in his father's barber's shop, apparently in deep thought upon some invention, (4th) working the cotton—girls in a mill. There are several carved shields in the saloon, each bearing the monogram of the founder and his wife, J. R. F.

THE ROYAL ARCHITECTURAL MUSEUM.

The new building in Bowling-street, Westminster, was inaugurated on Wednesday evening last. Mr. Beresford Hope, M.P., presided, and was supported by a large number of well-known and influential persons.

The President, on taking the chair, said the time has come at which we may formally open the proceedings of this evening. You are all of you, I hope, aware of the object for which we are met here to-night. This architectural museum of ours has existed now these eighteen years, which means to say that many of those who are studying at the museum,—and studying there, it may be hoped, with honour to themselves and good to their country,—were not born when this museum was instituted. Some of you will remember the good old times we used to have at Canon-row, and how, after we went to the ground, we were long at the South Kensington Museum, as lodgers and visitors, and not as proprietors. Well, we had our ups and downs, but, on the whole, we had a good time there; and now that we have left South Kensington Museum, we owe great thanks to those who were there for the many kindnesses and the many helps we received from them, and we have parted, shaking hands together in a spirit of the most perfect friendship and good will. And now here we are in our own building. Here we are pursuing the work that was laid down before us at first. And what is that work? It is the hard, humble, and yet good and glorious work of taking the young artist workman by the hand and training him in his important profession. We do not go in for any grand success—any great display. We are a teaching institution. We are a school. We are the machinery for knocking the details into the fellows' brains, so that being knocked into their brains they may come out at their fingers' ends. That is what we are for. We hear a great deal, both in and out of Parliament, about technical education. Technical education is a good thing, and we are the people who found it out a good many years before it was found out by those who are now boasting about it. We are the oldest school of technical education in England, and we hope we may be the most successful. You know who have worked this institution from the first. You know how Mr. Scott, whose time and thoughts are so valuable to him, has most successfully given up time and thought to us as our treasurer; and I deeply regret, that though he made every arrangement to be here to-night, a grievous illness in his family keeps him at home. You know also how Mr. Lomas, who is up early and to bed late, and here and there and everywhere, he is heart and soul devoted to your work. As to our council, our friends, and supporters, I say nothing. Their names [referring to the report of the museum for the year] are written in this book. But there is one announcement I am proud to make to-day, and it is that her gracious Majesty the Queen has in the kindest manner consented to be our patron, and has given further proof of her sympathy for us, for she has given the very magnificent donation of 50*l.* to our building fund, and I have no doubt that in a short time we shall soon formally have, what we virtually are now, the Royal Architectural Museum. I do not attempt to be the showman of all the things around this gallery, and around the ground-floor of this museum—specimens not only of the remains of ancient architecture, and ancient casts, but specimens of modern art generously contributed by many of those who are foremost in the good work of renewing art-workmanship in our day. Behind me, on this platform, there are many distinguished men,—men distinguished in the church, in the State, and in art; I shall call on them successively to speak. I shall impose upon them the role of giving short stirring discourses, of five or seven minutes' duration. The first I shall call upon to speak is an old friend, and earnest supporter of ours—one respected, venerated, beloved; and one who, with the good will of his country, has been placed in the second highest position which a British subject can fill—I mean the Lord Chancellor.

The Lord Chancellor, after alluding to the warm interest he naturally felt in the establishment of such an institution in that part of the metropolis with which he had been so long and intimately connected, observed that a few steps beyond the building which had thus been erected for the promotion of archi-

teatural taste, it would be found that there was great need for encouragement in that respect. It was true there were some most magnificent buildings in that part of the metropolis—some of the greatest buildings that were to be found in England, or perhaps in the world, such as Westminster Abbey and the Houses of Parliament,—but he was afraid that neither from Westminster Abbey, with all its ancient beauty, nor from the Houses of Parliament, with all their architectural ornament and scientific arrangement, had we derived much instruction with regard to the important work of building our domestic edifices. He recollected that in the earlier days of his residence at Westminster, when setting up house at Dean's Yard, he had a notable illustration of architectural taste from a person who supplied fenders and fireirons, and who recommended to him a highly ornamented Gothic fender, his reason for doing so being that it would match the Abbey. He was much struck with this illustration of architectural taste, and although it had something ludicrous in its aspect, it was architectural taste notwithstanding, and betrayed a love of art which deserved to be commended even in its faintest indications. There was something else now than a highly-ornamented fender to match the Abbey; there were very elegant architectural decorations; the museum contained many excellent specimens of architectural design, calculated to afford both pleasure and instruction; and it was to be hoped that the commendable efforts of the promoters of this institution to advance the cause of architectural science amongst us would meet with that appreciation which they so well deserved—that there would emanate from this institution a spirit which would animate and guide all those who were devoted to the study of architecture, so that, mastering and improving on the secrets of architectural art possessed by those who preceded them, they might turn them to account in their time, and perpetuate them for ages to come.

Sir H. Bartle Frere referred to the progress which had been made in the metropolis during the last thirty or thirty-five years, in this during the last thirty or thirty-five years, in the art to which this building was dedicated—an object of which his long absence in other parts enabled him to speak with some confidence. He could well remember the time when, to show a foreigner a new building in London, was to show him about the ugliest and most tasteless edifice that human ingenuity could devise. But when he came back to London, after a long interval of years, the scene was changed, and he was glad to find that our good old metropolis, with all its shortcomings, had in no respect fallen behind the other great cities of the world, so far as a tolerably extensive range of travel enabled him to judge. It was true that we missed in London the long straight streets and uniform buildings which were characteristic of other great capitals of Europe, such as Paris; but he found in London, as in other great cities of England, what was, perhaps, more precious to Englishmen—evidences of individual thought and liberty of action, which would go far to compensate for defect of architecture, and which, with respect to this particular art, he regarded as lying at the root of all excellence. He might be wrong; he spoke only as a layman; but the effort which had been produced on his mind by much that he had seen of the new buildings in foreign capitals of Europe was that they have too much of the impress of one mind. There was about them, so to speak, too much of personal government,—too much despotic ordering that this street should be here and that house there, and that the architecture should be of the same uniform character. But when he came to England he found in the great masses of new buildings which adorned our capitals the traces of independent thought and action, which, as already said, he regarded as lying at the root of all real excellence in architectural art generally. At the same time he saw in every part of England evidence that men entertained a real reverence for what was excellent in the architecture of ancient times. There was a time when what might be called the old churchwarden spirit used to rule in our church architecture as well as in other matters; and when, if an ancient carved stone were found, it was thought well to root it out of its place, and put up in its stead something of painted wood. But that day, which he was old enough to remember, had passed away, and now he found that amongst all classes, gentle and simple, educated and uneducated, wherever there was anything good in old art, there was a disposition to preserve it, and to make the

From the floor line to the top of the saloon is 34 ft.; the floor dimensions are 27 ft. by 44 ft.; the grand staircase rising from the saloon to the upper corridors. The billiard-room (31 ft. by 21½ ft.) is to the right; it is fitted up with oak. The centre flower over the gaslight is emblematical of the room, being composed of figures representing energy. All the chimney-pieces and fenders are of choice marble of different hues, the stoves all bearing the monograms of the founder and his lady. The inner portion of the chimney-piece, next to the stove, and the hearth, are of Milton tiles, porcelain, and burnished steel. All the floors are of oak; there is no painted wood nor papering in the building; all the walls are painted. The principal windows are fitted with Clark's patent revolving shutters, and Meakin's self-acting sash fastener, which is applied to 130 windows. The hot-water arrangements have been applied by Mr. D. O. Boyd, London. The gas arrangements are by Strode & Co., of London. The whole of the plaster work is done in Parian cement. Every room in the Castle is ventilated by a distinct ventilating shaft, and all the rooms have pure air thrown into them. The grates are also arranged that hot air is thrown into the rooms in winter and cold in summer; the grates are the patent of Mr. D. O. Boyd (mentioned above). Next we come to the breakfast-room (20 ft. by 22 ft.); the frieze in this room is ornamented with rose enrichment. The centre flower is also emblematical of the room. Next the breakfast-room is the drawing-room; the whole of the woodwork in the drawing-room is inlaid in designs in the following kinds of wood: walnut with satin-wood, ambona, Hungarian ash, purple-wood, and ebony. The drawing-room is lighted from the sides by gas-lights opposite to mirrors. The frieze is worked with passion-flower in enrichment. The chimney-piece is of statuary marble, inlaid with cameo. Between the drawing and dining rooms is the entrance from the oastle to the east terrace. The wall and arches of this entrance are in Bath stone, and the woodwork and floors are similar to those in the vestibule. Passing on to the dining-room it may be observed that the frieze and centre flower are emblematical of the room, with vine enrichment. In the staircase from the saloon to the corridors the banisters are gilt solid; the steps and landings are Spinkswell stone; the handrail is of Kiga and Pollard oak. Two massive Devonshire marble columns form the newel. The columns of the corridors are of Devonshire and Greek green marble, with carved capitals representing floral and animal life. The base of the saloon and the staircase is a square; it then forms into an octagon and culminates in a circle. It is lighted by a glass lantern-light by day, and at night by two magnificent and lighted by Strode. All the work here, inside, is carried up in Bath stone, and the top of the banisters round the corridor is covered with crimson velvet. In the sections between the columns, at the top of the staircase, are mirrors. Of the rooms along the corridors, the first to which our attention is drawn is Mrs. Fielden's hoidoir. The passion-flower enrichment is in the frieze of the cornice. Most of the woodwork is of Hungarian ash, the door is chastely inlaid with purple-wood, hirsch, ambona, and ebony; the wardrobe adjoining is entirely furnished with fittings of pencil-cedar. The bedrooms are of uniformly good character, all the woodwork being oak. The stables, fitted up by Messrs. Mnsgrave & Brothers, Belfast, have a accommodation for seventeen horses, with a coach-horse, harness-room, &c., and a dog-kennel large enough to hold a pack of hounds. The stables are floored with bricks inside the stalls, and with Loch quarry stone in the passage; the walls are done with Milton tiles and oak. The stables, &c., are 100 ft. by 90 ft. The area of the greenhouses and vineries is 120 ft. square; one of the walled-in kitchen garden, 150 ft. by 130 ft. The total number of rooms in the Castle is sixty-six.

Designs at the Manchester Exhibition.

Mr. J. E. Watson, architect, Newcastle, president of the Northern Architectural Association, has been appointed by the Council of the Royal Agricultural Society of England one of the judges to adjudicate and report upon the merits of the different designs and plans sent for competition at the Society's exhibition, at Manchester. Mr. Watson himself was awarded the first premium at the society's exhibition at Leeds in 1861.

most of it, and, as far as possible, to follow its peculiar excellencies. These two things, freedom of thought and freedom of action, which Englishmen had in this, as in other things, joined to a reverence for the past, seemed to him to contain the germs of great future excellence in art, and especially in architecture. The fruits of this were seen everywhere in our buildings—not only in London, but in Manchester and elsewhere. He had been in Manchester last week, and having known that city thirty years ago he was quite astonished to see what excellent architecture there was there, not only in the public buildings, but also in the dwelling-houses. He saw one dwelling-house, belonging to a man who had himself wielded the hammer as a working mason, which for hearty and general conception would compare with,—whilst in details it would certainly far surpass,—any palace he ever saw in any foreign metropolis. In the midst of all this, there were few things, he believed, of greater importance, both to the architect and the workman who carried out his conceptions, than such a museum as had just been opened by the labours of the President and his coadjutors.

The Hon. W. Cowper said that having been one of those who fostered the early existence of the South Kensington Museum, he acknowledged that he rather grudged the day when this Architectural Museum left those hospitable walls; and yet, looking at the admirable lodging which the latter had found, he could not find it in his heart to say that it ought not to have made the change to Westminster. The public must necessarily take great interest in the proceedings of this society. We were living at a time when rich persons were willing to spend money on large and costly buildings in London; but although care and skill and science were exercised upon these buildings, it was to be regretted that comparatively few people who moved about the streets of London took the slightest interest in or cared one fig about the general quality of buildings that were erected to adorn our streets. There were to be seen in these buildings beautiful proportions, great massiveness, and scientific attainments; but there was something wanting to interest the people in our modern architecture. And why was our modern architecture not interesting to the people? He believed it was because there had not been in it free scope for the exercise of the skill and art of the workmen. Very few of our buildings had any decoration in stone. There was Pall-mall, that stately street, with its rich columns, showing successions of columns and windows resembling one another; but the only decoration of stone to be seen there was put up at such a height that without the aid of a glass few people could discern what it meant. What immense scope would buildings like the United Service Club, the Travellers' Club, and the Athenæum afford for decoration if artists were allowed to exercise their skill upon these buildings, giving to them such decorations as would remind us of the wars or travels of the men who constituted these clubs. He believed there was springing up in London a truer sense of what was calculated to interest people in our architecture; and now that this great and happy Gothic revival had begun to make itself known throughout the land, there was good hope that architecture would become more interesting, if not more in accordance with the canons and rules of criticism. There was a good future before us in many ways. There was in this country, in regard to architecture, entire freedom of competition. There was no canon or test which prescribed to people what sort of style might be adopted. In our streets we had a happy variety of buildings—a Classic building standing next to one of the Byzantine order, or an old red house of the time of Queen Anne, or perhaps, a house erected in no style at all, but consisting of a brown wall with a certain number of square holes in it. The architect who was likely to succeed was not the architect who clung slavishly to any particular style, but who studied to produce what would interest the public; but it must be remembered that if much was to be accomplished in architecture, it must be by sympathy, co-operation, and brotherhood. Those great cathedrals which adorned the country were reared by bands of men who were united together in sympathy, and in an earnest desire to produce something worthy of the purposes for which those buildings were erected; and so little was their desire of fame, that we did not know the names of the people who planned, much less the names of the men who reared, these magnificent

fabrics, which excited the admiration and increased the devotion of succeeding ages. We might still at the present day continue that form of combination and brotherhood which constituted the strength and the glory of the Middle Ages. That meeting was brought together by a common feeling for artistic beauty; by a common love of architectural beauty; a common desire to arrange forms of beauty in the exterior of our buildings which might render them more acceptable and more profitable to the inhabitants of our towns; and this museum afforded an instance of the sort of co-operation which could also be successful in attaining the object in view.

The Earl of Powis believed there was no art to which a museum was a greater necessity than to the art of working in stone, whether as regarded architecture or sculpture. Whether we took architecture or sculpture, we were obliged to go back to ancient and classical times; and so far from our having yet been able to improve upon or excel those classical works of the past, the greatest triumph men had hoped to achieve was to emulate, not to rival, the old masters. In Greece we found buildings which, even in their ruins, were our admiration, which we ourselves were not able to surpass, and which had furnished models of architecture for all civilized Europe. The worst specimens of architecture that disgraced England were those which our architects servilely copied without studying the spirit of the particular order to which the works belonged. Architecture was a study which required the whole energies and devotion of the mind, which must be taken up as a living art, and not as a mere trick of the servile copyist. He was not without hope that the efforts of this society would do something to arrest that decay which he believed began in the last century, and which had already in many respects been checked in the present century, and do something to redeem the character, illustrate the dignity, and promote the progress of the architecture of England.

Sir Chas. Trevelyan referred with satisfaction to many important architectural improvements that were now being carried out in the metropolis, instancing Threadneedle-street, the Strand, and the Thames Embankment, for which last-mentioned improvement he said that neither Government nor Parliament could claim the least credit, the credit being entirely due to the good sense and public spirit of Sir John Thwaites and Mr. Bazalgette. He contrasted the irregular but not unpicturesque streets of London with the long, straight, uniform streets of Paris; the latter, which had the worst of the contrast, owing their rigid uniformity mainly to the fact that the improvements of Paris proceeded from a single administration—he might almost say from a single mind; whereas, in London we had proceeded with all the independence, originality, and variety of the Anglo-Saxon race. He hoped these improvements would go on, and that the Government, the great companies, the clubs, and private builders, would be all found uniting in doing their duty. What he wished especially to call attention to was the houses of the working classes and the poor—the last and best result of the improvement which had been effected or was being effected in architecture. Architecture had an important bearing on domestic happiness and virtue; and he looked forward to the time when every man in London would be able to live in a house consistent with health and comfort, and, above all, with pure morality.

Sir Digby Wyatt, after referring to the necessity for co-operation on the part of employers, architects, and workmen, and especially to the necessity for the training of the workmen both in mind and in hand, in order to success in architecture, observed with regard to what had been said as to liberty of design in architecture, that that was a source of strength, but that design in proportion to its freedom involved the responsibility of refinement. You must learn to do much, but you must learn still more to do well; and you must make this or that particular style of work subservient to the great principles which ran through all styles of architecture. Do not let us leave behind us works which would show our minds to have been wandering and unsteady; that we had been blind followers of antiquity on the one hand, or had, on the other hand, turned our backs on it as something worthless. He had faith in the catholicity of the institution which had just been established, and he hoped it would be the means of handing down to posterity some specimens of architectural perfection which would be regarded as favourable attributions of the nineteenth century.

Mr. George Godwin said it had been his privilege to be one of the first to urge the desirability of establishing an architectural museum. So far as placing the idea upon paper, and inducing the late Marquis of Northampton and others to move in the matter, he might perhaps claim to have been the first. The museum he saw before him, however, was not exactly what he had desired, and still hoped to see. The history of architecture meant the history of a progress of some four or five thousand years. The works at present in that museum were mainly confined to one period of the art in particular, a period of four or five hundred years, and did not illustrate other periods of art. He earnestly desired to see for the metropolis an architectural museum, in which the Assyrian, Egyptian, Indian, Grecian, Roman, Byzantine, Gothic, Renaissance, and, in fact, the whole of those characters which architecture had assumed, should be fairly represented so that the progress might be seen, and the steps understood. He hoped that out of the present museum might grow such an institution as that to which he had aspired; and if the museum was to lay hold of the sympathies of those who wished to see a living architecture practised amongst us, and not a mere system of copying, it must eventually take that shape. With regard to the art-workmen themselves, he was afraid they did not take so much advantage as they might do of the facilities which were thrown in their way for instruction. The Society of Arts had offered prizes for works of various sorts, but they had not responded so cordially as might have been expected. It was no use their saying that they desired to rise, unless they took those steps which would enable them to do so,—unless they put their hearts in the work, and performed it with a will. He wished hearty success to the Architectural Museum; but it was not meeting there, coming in now and then and looking at these specimens of architecture, that would accomplish the object in view; he wanted to see a body of willing students, who would work and make the best of the materials that were before them.

The Dean of Westminster believed Lord Macaulay used to say that the greatest museum of architecture or sculpture in England was Westminster Abbey; and it was surely a great advantage to have established the Architectural Museum in such close connexion with that museum of which he had charge; and it would be a great pleasure to him if he could render his museum of additional value in the way of instruction by enabling the students at the Architectural Museum to come to the Abbey and finish their works.

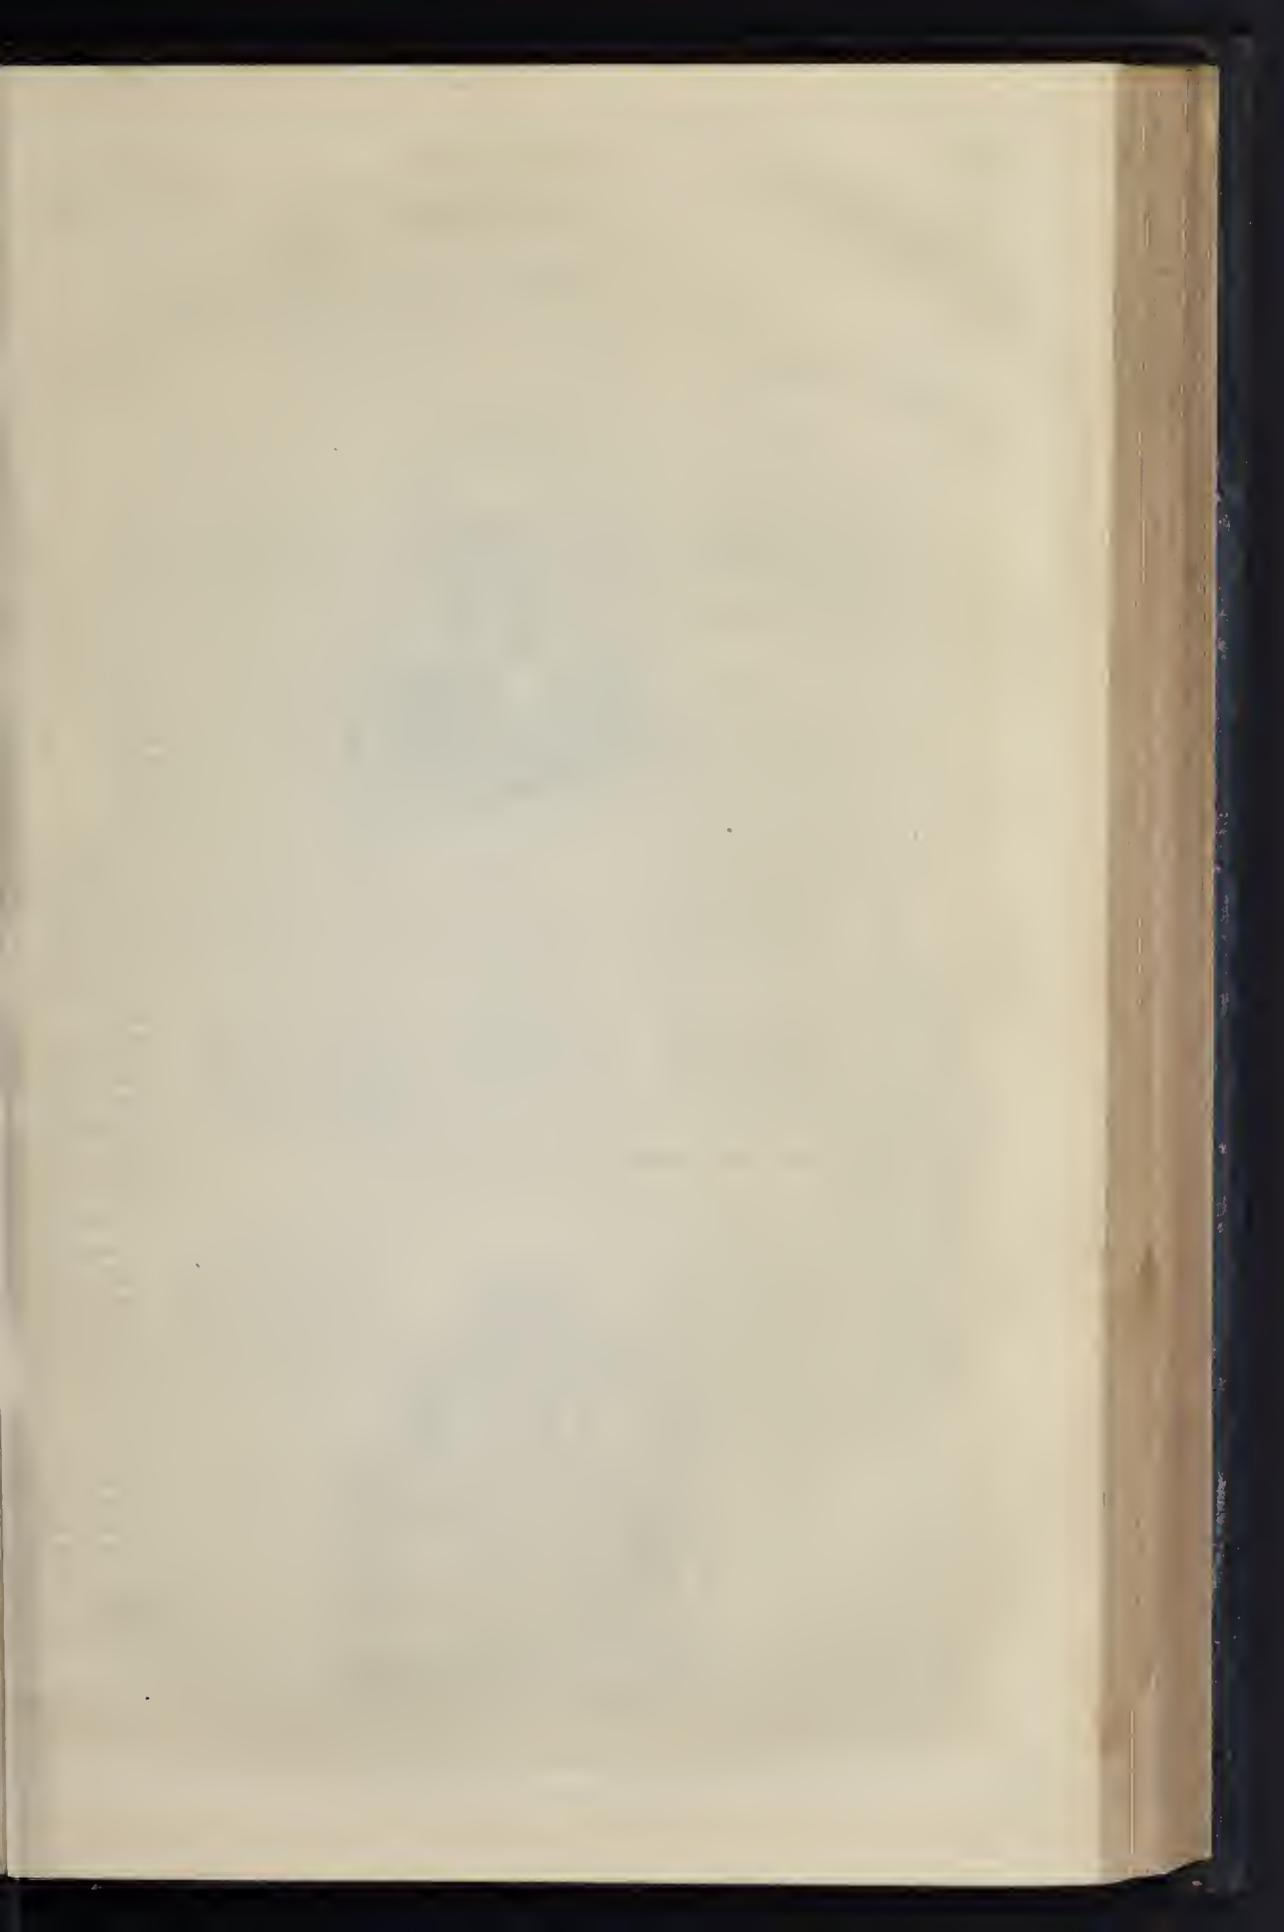

Lord Nelson having made some observations, Mr. S. C. Hall dwelt on the great antiquity of architecture—architecture having, in fact, preceded the fig-leaves. He spoke hopefully and ably of the future of the new museum as a medium of instruction, pointing out that it originated and was conducted mainly for the benefit of the workmen.

Mr. Franço Powell thought that of all the services which good citizens could render to their country there was at this moment no service more required, and none which if well done would bring greater benefit to England, than that which might be rendered by an architect, whether a scientific or a practical workman, who should devise means whereby cheap and commodious houses might be furnished to the working-classes, with the necessary accompaniment of life-giving light and air. If there was to be real or true advance, either in art or in any other department in which the human mind exerted itself, there must be reverence for the works that had gone before. We must learn to imitate what was good in them, and to correct their defects when once we had learnt to appreciate their merits.

Mr. Gambier Parry regarded the establishment of this institution as a matter of congratulation to all parties interested in the arts in this country; and he trusted it was but the nucleus of a more extensive organisation of the same nature which would hereafter arise.

Mr. G. Hubbard moved a vote of thanks to the President, who only acknowledged the compliment, and this closed the proceedings.

Late in the evening Sir William Tite, M.P., was present, and with his usual liberality gave (a second) 100l. to the building fund. We publish in our present number a view of the entrance front of the new building.

MR. THOMAS LEVERTON DONALDSON.

Emeritus Professor of Architecture, University College, London; Past President of the Royal Institute of British Architects.

PORTRAITS OF ARCHITECTS, WRITERS ON ARCHITECTURE, AND FRIENDS OF ART.

SOME few years ago we announced our intention to publish a series of portraits of contemporary Architects and promoters of architectural art. Modesty on the part of the two or three architects first applied to, and some other circumstances, led us to abandon the idea for a time. At the beginning of the present year, however, we revived the intention; and having now put ourselves into a position to proceed continuously, we publish in our present number, as the first of a series, the portrait of Professor Donaldson,—widely known and esteemed, not alone for his abilities and acquirements, but for the large amount of time he gives to the service of the public, and his constant readiness to further a good purpose or assist a colleague. He has recently returned from interesting travels in the East.

We do not propose, as a rule, to give any biographical particulars with the portraits. They will appear from time to time as occasion serves or circumstances dictate, and will be so selected that all our readers will know what is in the heads we represent.

"THE CHAIR OF ST. PETER," ROME.

THE ROYAL ARCHITECTURAL MUSEUM: BOWLING-STREET, DEAN'S YARD, WESTMINSTER.
MESSRS. CLARKE & CHRISTIAN, ARCHITECTS.

THE ROYAL AGRICULTURAL AND HORTICULTURAL SOCIETIES' SHOWS.

The Prince and Princess of Wales have received a right hearty greeting from many thousands of inhabitants of Manchester and its environs, and the many visitors who are straining the accommodation of hotels and private houses to their utmost capacity. The accommodation that was provided for spectators was something wonderful. Apart from walls, wall-heads, chimneys, and windows—there are no "battlements" available as "coigns of vantage,"—there were stands erected along the line of the royal procession to accommodate, not tens of thousands of spectators merely, but literally hundreds of thousands. The route included Stretford-road, a fine thoroughfare, formerly a "road" in the ordinary acceptation of that word, but now a wide street, of which there is a stretch of two miles in a straight line, one end of which is near the principal entrance to the Royal Agricultural Society's show-yard, at Old Trafford, of about 80 acres, which includes the site of the Art-Treasures Exhibition of 1857. In this fine road there was accommodation provided for an enormous multitude of spectators; "Alexandra" and "Victoria" stands, stands with other names, and without names, in front of the fine town-hall of Hulme township, of Holy Trinity Church, Chorlton town-hall, St. Andrew's Church, and on or in front of numerous open places, and public and private buildings. A stand over All Saints' burying-ground, at the junction of Orford-road and Stretford-road, was alone capable of accommodating 10,000 persons. In the city, also, extensive provision of the same kind was made, particularly in the neighbourhood of the infirmary; but these matters are more proper subjects for notice in the columns of the daily local and London journals than in the *Builder*, and it will be more fit to give a few notes suggested by the inspection of objects exhibited at the Royal Agricultural and Horticultural Societies, which relate more or less closely to structural art. Such objects and subjects are not so numerous in the two exhibitions as to be embarrassing. Our notes are made from visits to the exhibitions of both of the royal societies named.

As touching horticulture, among the exhibits,—very homely in appearance, but calculated to be very important in results,—are those of the plant protectors of Mr. W. E. Rendle, of Cavendish-square, London. This simple contrivance seems likely to revolutionise gardening operations entirely. It consists simply of an arrangement of grooved bricks, or of brick material, hollow tiles, with grooves at their upper edges, in which squares of glass are introduced, but not fixed, and can be slid with the greatest facility to regulate temperature. The materials used are of a common and inexpensive character; red earthenware and common orchard-house glass; no paint or putty is used; broken glass can be easily replaced by an ordinary labourer; ventilation is regulated easily; they cost much less than ordinary hard-glasses; and the protectors afford facilities to persons of limited means to grow almost all sorts of flowers, plants, and fruits early, and to a degree of perfection not hitherto possible, except to those of comparatively large means. We cannot doubt that this invention,—already very highly approved,—will rapidly force itself upon public approval and acceptance. In another department, but scarcely less important are the exhibits of Messrs. Major, of the Patent Tile Works, Bridgewater. These consist of numerous well-designed ornamental objects, moulded in the well-known Bridgewater clay, and thoroughly burned; but the special item that attracted our attention was their singularly corrugated roofing-tiles, 90 or 100 to a square, with ridge-tiles to match. They are laid upon laths, like the ordinary hollow tile by buttons, but make a much prettier and better roof, without pointing on the under side. They are produced either as ordinary tiles, or tinted with the colours burnt in, or with a metallic surface by treatment with lead burnt in. The perforated blocks of this firm for malt and paper pulp drying are also very meritorious: these are present, we believe, in great quantities to France and other countries.

Among the exhibitors of green-houses, conservatories, and vineries, we should mention the specimens exhibited by Mr. James Cranston, which have great merit in the principles of construction, and their system of ventilation. No putty is used in the construction of these green-

houses, the glass being fixed between watertight grooved bars screwed together. The ventilation is managed satisfactorily on a principle peculiar to Mr. Cranston's structures. Mr. Messinger, of Loughborough, exhibits a model curvilinear conservatory, with a graceful outline and a good ventilating arrangement, which admits of numerous modifications, according to requirement. In the same class is the Tenant's portable Conservatory, by Mr. S. Titley, of Congleton, in which the glazing is done without putty, but by a different mode from that before referred to. No brickwork is used in this construction, and such conservatories may be easily removed by tenants. It is a neat and economical structure. Wheeler, of Nottingham, is also a notable exhibitor in this class; as is also Boulton, of Norwich, who exhibits a very handsome conservatory, in which the ornamental iron work, in ridge and finials, and in the formation of an elegant elliptical arch in the interior, plays a very conspicuous part.

WORCESTER MODEL DWELLINGS ASSOCIATION.

The general annual meeting of the Worcester Association for building Dwellings for the Labouring Classes has been held at the Guild-hall. The chair was occupied by Mr. G. W. Hastings; there being also present Rev. T. L. Wheeler, Admiral Sir Thomas Hastings, K.C.B., and other gentlemen.

Mr. Aldrich, Hon. Sec., read the report of the past year, the opening paragraph of which was as follows:—

"In presenting the proprietors their 15th annual report your governors cannot conceal the regret they feel in announcing that its tenor is not very satisfactory. From the depressed state of trade which has prevailed in Worcester during the past twelve months, a very large number of houses generally occupied by the artisan classes have been void, and there are at this time upwards of 150 unoccupied. This state of things has, as a matter of course, militated against the model dwellings, and the amount received by the association for rent has not been so much as usual, taking into consideration the rentals from the block of eight new houses, which were completed about the beginning of the present year."

The chairman said he thought they might fairly look forward, when the depression in trade had passed away, to being enabled to pay a fair interest for the money invested. If they had not succeeded from a financial point of view, it must be remembered that they had cleared away a block of miserable houses, and had erected in their place some model dwellings; and therefore they had succeeded in a moral and sanitary point of view.

The adoption of the report was carried unanimously.

In answer to one of the shareholders, Mr. Aldrich said that £100 had been paid altogether in dividends since the formation of the society. The shareholders must not be surprised at their not paying a dividend if they were to keep the houses as model dwellings should be kept.

The statement of accounts showed that after paying all expenses, amounting to 982*l.*, a balance of 42*l.* remained in the treasurer's hands.

THE TRADES MOVEMENT.

The dispute between the Yorkshire masons and their employers has terminated. The latter have withdrawn the demands they recently made as to the introduction of the bourn system and other matters, and are willing to take back the men on the old terms.

As to the masons' strikes elsewhere, as well as in Yorkshire, a week or ten days since Mr. Harriott, general secretary of the Operative Masons' Society, reports,—“The strikes are now reduced to five—namely, Birmingham, 25; Chester, 7; Hanley, 2; Manchester, 218; and Newcastle-under-Lyme, 3; total, 249. The partial locks-out now pending are eight—namely, Coventry, 4; Liverpool, 190; Leeds, 20; Lynn, 4; Old Swan, 8; Sheffield, 4; Wigan, 4; and Wolverhampton, 6; total, 252. The aggregate is 501,—119 less than last return!”

Manchester.—An important resolution bearing upon this strike has been passed by the representatives of the London and Manchester Bricklayers' Societies, at a meeting held in Sheffield. After disposing of the differences of the two societies, the meeting adopted unanimously the following resolution:—

“That, in the interests of both employers and workmen, this meeting recommends that the dispute existing in the bricklaying trade of Manchester should be settled by the following mode:—That a Board of Conciliation be ap-

pointed, of an equal number of employers and men; that a chairman be selected, who shall be acceptable to both parties; and that the decision of the Board shall be binding upon both employers and men.”

Darlington.—About 150 delegates from the various lodges of the Bricklayers' Labourers' Accidental and Burial Society have had sittings at Darlington, the conference commencing on Monday and terminating on Saturday. Delegates attended from all the chief towns in England—Manchester, Birmingham, Leeds, Liverpool, Sheffield, Hull, Newcastle, &c., even places as distant as Torquay being represented. Mr. John Kennedy, of Halifax, presided over the conference, Mr. Hinman, of Hull, being vice-chairman. No question as to wages was raised, the meeting confining itself to carrying out the business connected with the financial affairs of the society, and making such levies as would be requisite to meet future contingencies. Members seeking work are aided by the society, relief is afforded in case of accident, whilst a bonus is given to the friends of a member on his decease.

Birmingham.—Arrangements are in progress for the second annual congress of trade councils and trade societies, to commence at Birmingham, on Monday, August 23rd. Up to the present time twenty-one trade councils and amalgamated societies have intimated their adhesion to the congress, including the associations in Dublin, Preston, Glasgow, Bristol, London, Manchester, &c. The programme contains a list of twelve subjects, upon which papers will be read by selected delegates.

THE GREAT AMERICAN PEACE JUBILEE AT BOSTON.

THE Americans have been making a great noise in the world,—though we did not bear it on this side of the Atlantic,—with a grand chorus of 10,371 voices, 115 first violins, 100 second violins, 65 violoncellos; an equivalent force of trombones, bassoons, drums, &c.; and a grand chorus organ with 1,011 pipes, and a wind pressure of 4,000 lb. upon the reservoir. Not satisfied with all this piping and fiddling, they added the music of 100 blacksmiths' anvils! a park of artillery! and “all the bells of the city;”—everything “under the control of the leader.” It does not seem to have occurred to them to let us partake in the jubilee by ringing our telegraph bells in chorus. The audiences, for five days, during which all this was going on, were 50,000 to 60,000 people, inside a great building purposely erected, and a vast multitude outside. Madame Parera-Ross, whose portly dimensions well accorded with her gigantic surroundings, had the distinguished honour of singing a solo (Gomonada's "Ave Marie") in the midst of all the din, if that can be called a solo which was accompanied by 200 violins. Nevertheless, “she was heard throughout the building.” On the fourth day a little dancing was practised by 10,000 persons; and on the fifth day the voices of 8,000 children were added to the orchestral accompaniments.

In the preparation of the plans for the Colossium, as the building was called, architects were engaged for months beforehand.

“The structure was 600 ft. by 300 ft., and took the whole of St. James's Park. To add to the convenience of the public the city laid out new streets to the building, three foot bridges across other streets, erected lamps, &c. One of these bridges was 250 ft. long by 44 ft. in width, and roofed. Extra railroad tracks were put down, as well as gaspipes and water-mains. The building inside was 100 ft. high. The amount of timber used in the building was two millions and a half of feet, while the iron and glass was almost beyond computation. The roof comprised an area of 170,000 square feet. In this building the orchestra was 100 ft. deep and 115 ft. wide; the north or front balcony was 125 ft. deep, and the side balconies were each 75 ft. deep; the south balcony was 200 ft. deep. The parquet was 150 ft. in length by 175 ft. in width. Under the balconies were lobbies 36 ft. deep, and in the rear of the balconies there was a promenade 11 ft. wide and 1,600 ft. long. There were twelve arched entrances to the building, each 24 ft. wide. Besides this the building contained the executive committee's room, 125 ft. by 45 ft.; two reception-rooms of the same size; two refreshment-rooms, 75 ft. by 37 ft.; two large rooms for the reporters, and numerous smaller rooms. The building was illuminated by gas, for which purpose four miles of pipes were put up. The burners numbered 2,400 and about 1,400 cubic feet of gas were consumed each hour. Besides this, the building had an abundant supply of water, a steam fire-engine, and a perfect fire department, together with fifty patent fire-extinguishers.

The inside of the whole of this building was elaborately decorated and frescoed. The prevailing colours were gray, gold, and pink. The coats of arms of Massachusetts and Boston were conspicuously displayed, as well as the excellent motto, “Peace on earth; goodwill towards men.” Over the great chorus organ there was a design, representing a white dove bearing in its beak an olive branch, and in the spandrels of the arch upon each side there were floating angels, 18 ft. in length. The press-room was elegantly fitted up for the accom-

modation of the 300 editors and reporters who represented the press from all parts of the country. The reporters' tables were 180 ft. long, and at night were flooded with artificial light. A telegraph office was opened close at hand. Busts, paintings, flowers, &c., adorned the room. A branch post-office was opened at the Colosseum, and there was an hourly delivery of letters. The reception parlours were beautifully carpeted and supplied with black walnut furniture, while the City Forester filled them with rustic work, flowers, &c."

Before the opening of the concert, tickets sold at the rate of 100,000 dolls. a day, and it is estimated that on one day of the performance the tickets must have sold for a quarter of a million of dollars. And although the tickets of admission ranged in price from 2 dolls. to 5 dolls., yet they readily sold at a premium of from 15 dolls. to 25 dolls. The whole American people, as it were, have been music-mad on this great occasion.

The originator of the grand idea was an Irishman.

The festival appears to have shown that the volume of sound produced does not increase in proportion to the means employed. On this head the musical journalists of America are said to be unanimous. For example, an able correspondent of the *Musical World*, quoted by the *Pall Mall Gazette*, says:—"The 10,000 voices really produced no more apparent noise or power than 1,000 in an ordinary concert-room. Those present at the Handel Festival in 1867, and present also at this Boston Jubilee, declare that the chorus at the latter seemed less powerful than those at the former." The feeling appears to have been one of disappointment, the sound not being at all adequate to the vast numbers employed. The conclusion arrived at is, that "an average chorus of 5,000 voices is about all that the human ear will accept, and that further additions of singers only affect the eyes." According to *Dwight's Journal of Music*, "the hundred anvils [in the anvil chorus] were a failure. A single honest blacksmith's anvil has more ring in it."

ACCIDENTS.

THE Windsor goods station of the Great Western Railway has been totally destroyed by fire. The conflagration was remarkably sudden, and although no clear reason can at present be given for its origin, it is conjectured that the extreme heat of the sun may have ignited some of the contents of the building, which were consumed within half an hour; and, notwithstanding that in an incredibly short space of time the Windsor Volunteer Fire Brigade, with their Merewether engine, reached the terminus yard, their exertions were at first completely paralysed by the miserable supply of water. The passenger terminus, with the Queen's private waiting-room, was saved from destruction. The burning goods-shed was in the most dangerous proximity to the large gasometers of the Windsor Gas Company, but the wind fortunately drove the flames in an opposite direction.

A fire has also occurred at the Victoria Station, and was not extinguished until a good deal of damage was done. The cause is unknown.

In Stockport a house and shop in Park-street have fallen. The premises were in an unsatisfactory condition. The kitchen floor suddenly subsided in consequence of the giving way of supports underneath, disturbing the perpendicularity and involving the safety of the whole structure, extending also to the next shop and house. Fortunately no person was injured. Workmen are engaged in re-erecting and improvements, and providing for the re-occupation of the houses.

The roof of a large new weaving-shed for the Savile Mill Company, at Dewsbury, has been blown down by a heavy gust of wind, bringing down the scaffolding upon which masons and others were employed, as well as overturning the iron pillars on which the roof was to rest. Three persons sustained severe injuries, one being one of the firm of contractors, Messrs. Frith & Sons. Mr. Frith had a narrow escape from instant death; he was thrown to the ground along with scaffold-planks, roof-trees, &c., and was pinned to the floor by a beam of timber. His clothing had to be cut in order that he might be extricated, and when he was released it was found that his ribs were broken, and that he was otherwise seriously injured. Two working men were also injured in a similar manner. An examination of the ruins shows that the roof timbers had not been fastened into the masonry at the end of the building, but

were merely resting on the iron pillars until the stonework was completed.

The bridge which crossed the Leithen on the Galashiels-road, in Scotland, was recently taken down, as from its narrowness and steepness it was quite unsuitable for the extensive traffic that now passes along that road. The erection in its place of a more suitable bridge, of a single arch, as before, was begun, and considerable progress had been made, the mason-work of the arch having been almost completed, when the woodwork on which the masonry rested being insufficient to support the pressure, gave way, and the whole came to the ground, the woodwork being smashed to splinters. The masons fortunately had not begun work, and no one was hurt.

At Krenholm, near Narva, in Russia, a number of persons having collected on a bridge, the parapet gave way. Sixty-five persons were precipitated into the river, and twenty-one drowned.

The chain bridge leading to Vauxhall Island, Richmond, in Virginia, on a recent occasion, was so crowded that it gave way, carrying down about sixty persons. A prominent man, a candidate for the Senate, was instantly killed; also a policeman, who was on duty striving to prevent the crowd from rushing on the bridge. Seven coloured men were fatally wounded.

COMPETITIONS.

New Almshouses, Salisbury.—It has been decided to pull down the present dilapidated buildings at the top of Winchester-street known as Eyre's Almshouses, and to erect six new houses and a matron's residence to replace them. The trustees of the charity advertised for designs for the new building, offering a prize of 10l. for the one selected. No less than forty-nine were sent in, some of them, says the *Dorset Chronicle*, of a very elaborate character. They were exhibited at the council-chamber, and the building committee met, and after a careful examination of the plans, five of them were selected, from which reduced number the charity trustees will make a final choice.

New Schools, Eastwood, Rotherham.—The committee have selected the plans of Messrs. Blackmoor & Mitchell-Withers, in a limited competition, and the work will be commenced forthwith.

Isle of Man Legislative Hall.—We have received a number of letters and papers on this competition, tending to show that an erroneous and unfair selection has been made. The Manx papers seem to agree in pointing to Mr. Ellison's design as superior to that which has been selected.

SANITARY MATTERS.

Brighton.—In compliance with an advertised request of Mr. Hawkshaw, C.E., who has been selected by the town council to advise them upon the best course to pursue in order thoroughly and effectively to drain the borough and dispose of the sewage, several influential gentlemen have had a conference with him, in the council-chamber of the town-hall, to lay before him what information they possessed, or deemed necessary, on the subject. Mr. Hawkshaw, in course of the proceedings, stated that his hands were not tied in any way.

St. George's, Gloucestershire.—For some time past there has been a sewer authority in existence in this parish, but they have hesitated about doing anything, through fear that any arrangements they might make might be overruled by the inhabitants. Complaint, however, has recently been made to the Home Secretary, and by his order Mr. Rawlinson, C.E., recently investigated the state of the parish. As the result of his report, Mr. Bruce sent a letter to the sewer authority, giving them notice that, unless they carried out the duty devolving upon them within three months, he should make an order for the work to be done by an independent person, and the parish would have to bear all the expense.—In consequence of his notice a vestry has been held, and the inhabitants have resolved to leave the sewer authority to adopt the order of the Home Secretary or abide the alternative. The opinion was expressed, that the appointment of a local Board would be almost tantamount to a return to the close vestry system, as the parishioners would not have the control over such a body which they now have over the sewer authority.

Chester.—The town council are considering as to taking steps at once for the proper ventilation of the city sewers, and the preparation of plans for carrying out the system effectually. The total want of ventilation in the Chester sewers, and necessity for remedying this defect, had been reported on by Mr. Baldwin Latham, C.E.

Carlisle.—At a recent meeting of the Local Board of Health a letter was read from Dr. Elliot complaining of a case of typhus fever in a house behind the Blue Bell, at the low end of Rickersgate, which had been caused by stench arising from a midden and heap of slaughter-house refuse. The head of the house stoutly and stupidly resisted the doctor's advice that the patient should be removed to the fever hospital, and the young woman was left to struggle through it at home. The other three inmates were all similarly seized, but they were removed to the hospital, where the old man recovered to himself died. Dr. Elliot advised that the place be in the mean time declared unfit for human habitation, forthwith famigated, and done out thoroughly with quicklime. The letter was handed over to the deputy-inspector of nuisances for immediate investigation.

OBITUARY.

THE death of Mr. Charles Freeman, architect, of Lincoln's-inn-fields, will be heard of with regret by all. It took place at his residence, on the 16th inst.: his age was but 55. He is probably best known as surveyor to the Sun Fire Assurance Company, in which capacity he erected not long ago a handsome building at Charing-cross, to be used as a branch office; another also in Vere-street. Schools at Hendon, and the extensive buildings known as Tattersall's, at Knightsbridge, are amongst his works. Mr. Freeman had been greatly affected by the rapid death, one after another, of a number of friends, all in the prime of life, including the two sons-in-law of Mr. J. R. Planohé (the Rev. Henry Macharrese and Mr. W. Wholan, of Tenterden), and Mr. Halliday, the artist, and his brother. On hearing of the death of Mr. Whelan, he exclaimed with some vehemence, "God God, who next?" Within a very few weeks his own name was to be added to the list. Mr. Freeman was a Fellow of the Royal Institute of Architects (elected 1845), and was much respected for integrity of character.

Mr. Horatio Nelson Goulty, architect, who died in Brighton, on the 7th inst., was but thirty-nine years of age. In conjunction with his partner, Mr. Gibbins, he had executed several important works in that town, particularly the Norfolk Hotel (illustrated in our pages), the Turkish Baths, and a Congregational Church and schools at Hove. We published some time ago a design by him for an arcade in Brighton, but this has not yet been carried out. Mr. Goulty was a pupil of Mr. Herbert Williams, and had the prospect of a good career.

THE MAIN DRAINAGE.

SIR,—Mr. Bazalgette has drawn my attention to the account of the discussion on the "Ventilation of Sewers," at a meeting of the Social Science Association, in your impression of the 10th inst., in which I am reported as saying, "The great embankment sewer which had a fall of only 1 ft. in a mile from Fulham down to Abbey Wood, admitted only of a very tardy flow of sewage." Also to the remarks made by the chairman (Mr. Chadwick), at the conclusion of the evening, founded upon what I had said. Mr. Bazalgette points out that the upper part of the sewer, not yet constructed, will have a fall of from 3 ft. to 4 ft. per mile, while that already constructed in the embankment has a fall of 2 ft. per mile. I am sure, in justice to him, you will allow me to make this correction, and in justice to myself to state that I attended the meeting with a view rather of gaining information than of imparting it; but being called upon by the chairman by name, I could not refuse to state what had been done in the matter under discussion by the Metropolitan Board. In the course of my remarks I alluded to the sewer in question as showing how impracticable was the principle laid down by the chairman, viz., that no sewer should be constructed with a fall of less than 1 ft. in 60 ft., pointing out that, assuming the distance from Fulham to Abbey Mills to be 10 miles, such a fall would give the depth at the Abbey Mills end as 1-6th of a mile beneath

the surface of the ground; and stating that I believed the fall of it, although it was undoubtedly one of the finest pieces of sewer work in the world, was only about 1 ft. in the mile.

EDWARD RIDER COOK.
Metropolitan Board of Works.

DINNER AT THE MANSION-HOUSE.

SPECIALLY to do honour to the Council of the Royal Society, and to the members of the Royal Academy, the Right Hon. J. C. Lawrence, Lord Mayor, entertained in the Mansion House some 250 gentlemen connected with art, science, and literature, on Wednesday evening last.

In proposing the toast, "The Royal Society," the Lord Mayor, who discharged the duties of the position with his accustomed ability and force, said that it had been one of the chief pleasures of his year of office to look forward to this gathering of the members of the learned and literary societies; and, if it was sometimes said that they were not to be found so frequently as might be wished in palaces, he hoped, at all events, that in the palace of the City of London no year would pass without the recognition on the part of the chief magistrate of the position which the prominent members of these societies occupied in the affections and feelings of the people.

Lieut.-General Sabine returned thanks, as Sir James Grant did for "the Royal Academy." For the Lords and Commons, Lord Houghton spoke happily. Sir R. Murchison (for "the other Learned Societies"), and Mr. Hepworth Dixon and Mr. Martin Tupper (for "Literature") also spoke. The gathering was one to be remembered.

THE CARILLON AT BUFFALO CATHEDRAL.

The following paragraph, or some variety of it—copied from an American journal—is going the round of our English papers:—

"A carillon of forty-three bells was consecrated with religious ceremony at St. Joseph's Cathedral, in Buffalo, on the 1st inst. This is the only instrument of the kind in the United States, and there are only two others in the world."

Now, I happen to know that this is the very same instrument which was exhibited by M. BOLLÉ in the Champ de Mars, Paris, in 1867, and which gave great satisfaction to numerous visitors. Nevertheless, the assertion that "there are only two other instruments of the kind in the world," is, to say the least, fallacious and deceptive. It is true that there are very few carillons possessing so many bells as the one at Buffalo. But it does not follow from this circumstance that the latter is superior in a musical point of view to all the other instruments in the world except two, or even equal to some which have a shorter range of notes.

The magnificent carillon in the tower of Antwerp Cathedral, which has only forty bells, is perhaps the finest in the world. The instrument placed in the famous tower of Boston Church, within the last two years, has forty-four; but I do not hesitate to say that had a smaller number of bells been cast from the same quantity of metal, the result would have been far more satisfactory to competent judges of carillons and musical sounds.

To prevent the possibility of being misunderstood, however, allow me to say in conclusion, that the carillon at Buffalo is a very fine instrument, which does M. BOLLÉ great credit.

THOMAS WALESEY.

THE "DICTIONARY OF ARCHITECTURE."

SIR,—The "Dictionary of Architecture" is a work so important and valuable that I hope you will not object to deviate the attention of the profession, as well as of the public generally, to the proposal recently made by the Society to secure its early completion.

If within the next week I am favoured with a sufficient number of copies to the circulars which have been issued, the committee anticipates that the complete work, A—Z, can be supplied for 15 guineas—a very moderate sum, considering the magnitude and importance of the work.

It is quite possible that many persons who would desire to possess the work may hold back, in the hope of being able at a future time to secure it at a less price (by the sale of the remainder or otherwise) even than that at which it may now be obtained. This opportunity can never occur, because the number of copies printed being limited to those required, and the entire work being the absolute property of the committee, the price given, that not at any time shall any portion be issued at less than the subscription price, will be strictly maintained.

It would be very discreditible to the profession that so

valuable and important a work should be allowed to remain incomplete, when a small exertion would place the committee in possession of funds to insure its completion.

Should it be found that sufficient response is not given to the present appeal, and that within the United Kingdom there are not 150 architects or others with sufficient interest in the literature of the profession to contribute (even by the easy instalments suggested) the small sum of 15*l.* for such a book, its further progress must be stayed, or the cost to the present subscribers must be much increased, should they determine to complete it.

ARTHUR CAYE, Hon. Sec.
Architectural Publication Society.

7*a*, Whitehall-yard.

THE GARRISON CHAPEL, PORTSMOUTH.

THE restoration of this interesting old church has been completed, on the whole, in a satisfactory manner, but attended with circumstances which have given much pain to many whose ancestors or relatives lay buried in the surrounding churchyard.

A most extensive removal and desecration of the old tombs have taken place. Some of them have found their way into petty builders' yards, and others are used in the repair of old pavements.

Who is to blame for this? Is it the architect, or is it the reverend chaplain who took so much interest in the restoration?

Whoever it may be, it is sorely the duty of the committee to inquire into the matter, and cause every inscribed stone to be replaced in the old cemetery, remembering that not only are these removals an injustice to the friends or descendants of those buried there, but that also serious questions of property may depend on the existence of an inscription on a grave-stone.

SULLA TOMBA.

CHURCH-BUILDING NEWS.

Hastings and St. Leonards.—The memorial stone of a new parish church at Ore has been laid. The site was given by Mr. Habershon. It is a little to the north-west of the old church, abutting on the south side of the turnpike-road, and a short distance from the boundary-wall of the borough cemetery. The architect is Mr. Edgar P. Loftus Brook; and Mr. H. Hughes is the builder.

Little Birch (near Hereford).—The church of this parish has been restored. The old edifice, if it can be so called, having only stood twenty-eight years, has been pulled down, and the new one erected on its site. Mr. W. Chick, of Hereford, was the architect, and Messrs. Coleman & Son, of Chaxhill, near Gloucester, were the builders. Though the new church stands as nearly as possible on the old site, it will be a trifle larger in dimensions than the old edifice, some little extra space being obtained by the lengthening of the chancel as much as possible, and by taking in a few feet from the churchyard on the north side; an additional aisle is thus obtained, and the nave is also rendered proportionate. The present building consists of a nave, 49 ft. by 18 ft., with aisle, 10 ft. wide, adjoining. The chancel, which is formed by a polygonal apse, is 15 ft. by 15 ft., and has on the north side a small vestry. The style of architecture selected is the Early Decorated. The principal entrance to the church is through a porch in the north side. The nave is lighted by two cinquefoil and two quatrefoil windows, built alternately for architectural effect. There is a west gable window, and in the aisle four small two-light windows. The chancel has five traceried windows, similar to the nave, except that they are more highly cusped. The west gable is surrounded by a bell-tower, in which is hung a bell, cast by Messrs. Taylor & Son, of Loughborough, and weighing over 4 cwt. The whole of the external stone dressing beyond what could be re-used from the modern church, was supplied by Mr. John Trask, from the Ham Hill Quarries. The internal dressings are worked alternately with Ham Hill and Bath stone. Throughout the church the mouldings are undercut, so as to produce the effect of light and shade. The whole of the seats and the woodwork generally are of deal; but the chancel, stalls, and upper portion of the pulpit are executed in oak. The carving throughout the church has been executed by Mr. Welsh, jun., of Hereford, and the building is paved throughout with encaustic tiles, from the manufactory of Mr. William Godwin. Mr. Lewis Powell has been the clerk of works employed, and Mr. Halliday the foreman. A new wall has been built round the churchyard, with Ham stone piers, copings, &c. The whole of the windows have been filled with stained glass by Messrs. Hartland & Fisher, of London. The

roofs are all open-timbered, with boarding on the back of the rafters, a layer of asphalt being placed between that and the tiles. The whole of the timber exposed to view is stained and varnished. The principals of the roof are supported by carved corbels on each side.

Tydd St. Giles.—The parish church, recently reopened, is one of the most ancient and interesting in the Isle of Ely, the date of its erection being about A.D. 1200. The nave is late Norman; the aisles are partly decorated and partly perpendicular. The western doorway is considered to be the work of Alan de Walsingham, the architect of the original lantern of Ely Cathedral. The chancel, which was taken down about a hundred years ago, appears to have been Early English. The restoration has been carried out under the direction of Mr. G. Gilbert Scott, jun., and comprises new roofs to the nave and aisles, the taking down and rebuilding upon foundations of concrete 4 ft. or 5 ft. deep, all the five columns on each side of the nave, some of which were 8 in. or 9 in. out of the perpendicular, the construction of a new chancel within the two easternmost bays of the nave, the under-pinning of the western wall and all angles and buttresses, new floors and pews, new doors, and repaired windows, &c. The contractor was Mr. Wm. Brown, of Lynn, whose contract amounted to 2,300*l.*

Winford.—The church of St. Katherine and the noble Army of Martyrs, at Felton-common, has been consecrated by the Bishop of Colombo, as commissary of the Bishop of Bath and Wells. The church was completed and opened for divine service about three years ago. It is a small stone building, furnished with chairs, all the seats being free. It was built entirely at the cost of the Rev. J. W. Hardman, LL.D.

Carlisle.—The site and plans for the proposed new church of St. Mary's Without have been approved of at a meeting of parishioners. Messrs. Habershon & Brock are the architects. The building committee propose to raise 3,000*l.*, but for tower and spire inclusive the cost will be 4,000*l.* About 1,000*l.* more than what has been already subscribed will be required before the edifice is contracted for. The building will contain a nave and two aisles, north and south. It will be 95 ft. long and 55 ft. wide, and seated for 600. The chancel is 21 ft. square. The height of the side walls of the nave, from the floor, is 26 ft., and the aisles 12 ft. The height from the ground to the top of the spire is 115 ft. There are handsome intresses on each side, and on the ends and corners of the church. Between the intresses on the north and south sides there are two tracery windows, and on each side one three-light tracery window, over which is a gable. The main features in the church are ornamental tracery windows at the east and west ends. The east window, in five lights, is 14 ft. high by 9 ft. wide, daylight size. Looking east, there is also a large three-light tracery window, which lights the end of the south aisle. At the west end there are two ornamental tracery windows, three lights each, 15 ft. high by 7 ft. wide; and one three-light smaller window, filled with tracery, which lights the end of the north aisle. The clearstory is lighted on each side by twelve quatrefoil and cinquefoil windows. The walls are supported by five circular columns, and arches springing over. The chancel arch is 25 ft. high, and width 20 ft. The font stands at the west end in the centre of the nave. It is not yet decided what kind or colour of stone is to be used. The site is in Spencer-street.

Boroughbridge.—The corner-stone of the new aisle to the ancient parish church of Kirby-on-the-Moor, near Boroughbridge, now undergoing restoration from the design of Mr. Scott, has been laid. The workmen of Messrs. Shaftoe & Barry, the contractors, were afterwards entertained at a substantial luncheon, at which Mr. A. Roope, the clerk of the works, presided. During the progress of the works Mr. Scott's opinion as to the architectural interest attaching to this church has been established by the discovery of numerous antiquarian remains of Norman and Saxon date.

Ulster.—A new church is being erected here, with funds provided by the late Rev. Jonathan Cape. The style is Gothic, after a design of Mr. Grayson, architect, Liverpool. At the south-east angle rises a square tower, containing the belfry, surmounted by an octagonal spire. The tower and spire rise to the height of nearly 90 ft., and are protected by a lightning conductor. The east window has to be filled in by a firm in Manchester with stained glass, in memory of the late Rev. Joseph Cape and his wife Phillia. The

other windows are filled in with slightly tinted glass, and bordered with an edging of deeper hue. The cost of the whole will be about 3,000*l.* Messrs. Brough, Bromfield, were the contractors for the walling and mason's work; Mr. Sheffield, Wigton, for the joiner's work; and Mr. Joseph Mark, Wigton, the painting, plumbing, and glazier's work. Stones were obtained from the quarries of Mr. H. Richardson, on Uldale Fell and Falds Brow, and certain portions from Howrigg.

Freeland.—A new church, situate in the hamlet of Freeland, in the parish of Eynsham, the gift of the family of Mr. W. E. Taunton, has been consecrated. The character of the church, which is dedicated to St. Mary the Virgin, is Early Pointed. It consists of a nave (44 ft. long and 21 ft. wide), southern porch, with parvise over, leading to parsonage on the north side, apsidal chancel (33 ft. long and 15 ft. wide), vestry, and tower on the north side of the chancel. The outside walling is local rubble stone, in unequal horizontal courses. The inside is Bath stone, and Bath stone is used for all the dressings inside and outside. All the roofs are covered with red plain tiles. The font is of Caen stone, as is also the pulpit, which has a carved cornice and green marble columns. The eastern portion of the nave is seated with open oak benches, the western part with chairs. The chancel is paved with Minton's tiles, and the other portions of the church with Staffordshire tiles. The nave is lighted by coronae of four lights each, suspended from the boarded ceiling on either side. Mr. Bartlett, of Witney, was the builder; and Mr. J. J. Smith the clerk of the works. The whole of the work was carried out under the superintendence of Mr. J. L. Pearson, of London, architect.

Dodleston.—The foundation-stone has been laid of Dodleston New Church, which is to be rebuilt on the old site, but will be somewhat larger than the old structure. Mr. Douglas is the architect, and Mr. Wigginner the contractor.

Lynn.—A plan has been proposed by the churchwardens of St. Margaret's, under the advice of Mr. G. G. Scott, architect, for the removal of the organ, and of the east and west galleries; and to authorise an application to the Bishop of Norwich for a faculty for these purposes. At a recent meeting of the vestry a majority were in favour of the scheme. It is proposed to abolish the west and east galleries (the latter cutting off the chancel); to remove the organ from the west gallery to the north transept; and repair it to the necessary extent; to remove the pulpit from the middle of the north side of the church to the north-east corner; to remove some of the Corporation pews; and to turn all the pews in one direction, *i.e.* eastward, which at present turn in every direction conceivable. The total cost of the alterations is estimated at 50*l.*, or 100*l.* at the outside, and of the organ repairs, 135*l.* The alterations will also form part of a plan for the entire restoration of the church, should this ever be entered upon. No steps towards the execution of the work, however, will be undertaken without the full consent of the congregation and the parishioners.

Walton-breck.—A reredos has been erected in Holy Trinity Church, Walton-breck, at the sole cost of Lieut. Colonel A. H. Brown, M.P., according to designs and under the superintendence of the Messrs. Hay, of Liverpool, architects, and executed by Mr. Rogerson, sculptor. It consists of an arcading in Caen stone, extending all round the five bays of the chancel, with crocketed pinnacles, gables, and arches set up on polished shafts of Irish red and green marble. The central bay, immediately behind the altar-table, is divided into three compartments, with the middle one widest, the marble shafts standing clear, and the recess behind filled in with a representation of the Last Supper in *alto-relievo*. This is cut in alabaster, and occupies the three compartments of the central bay, the arch and gable over the middle one rising well up, and terminating in a cross. The materials are left of their native colours, the white alabaster coming well out, the nimbus of the central figure of our Lord being alone touched with gold. The rest of the chancel is tinted of a light pea green, with a dash of brown, separated by a stencilled border of cinquefoils, with the top of the walls illuminated with texts and emblematic devices.

Castlemorton.—A new church for the outlying portions of the parishes of Castlemorton and Berrow, which are situated long distances from their parish churches, is being completed, and will probably be opened for divine service this autumn. Earl Somers allowed the stone to be

quarried free of royalty, Earl Dudley and others subscribed liberally, and the site was given by the Dean and Chapter of Westminster. The spot selected is the common near the Hollyhush Hill, about three miles from Castlemorton Church, and an equal distance from that of Berrow. Mr. Preedy furnished the plans for the building, which is to contain seventy sittings, will be 40 ft. long by 20 ft. wide, with a nave and chancel, open timbered roof, bell-turret, south porch, triple-light window at east end, and the other windows of two lights. Mr. Smart, of the Wells, is the contractor for the work, and the stone was partly got from Eastnor and Ombersley, with also some Bath stone. The total cost of the work will be about 650*l.*

SCHOOL-BUILDING NEWS.

Bradford.—The memorial stone of Moravian Sunday schools has been laid in Little Horton-lane. The estimated cost of the schools, with furniture, is 1,100*l.* A Moravian chapel is also proposed to be erected as soon as four-fifths of the estimated cost have been raised, which is 2,000*l.* In the meantime the services will be conducted in the school-room. The site presented difficulties in carrying out both chapel, schools, and minister's house, but these have been overcome. The architects are Messrs. C. S. & A. J. Nelson, of Leeds. A general hall on the ground-floor gives access to all the rooms, the main school-room being 40 ft. by 30 ft., well lighted by windows on two sides. In addition to this, on the ground-floor there is a vestry, 14 ft. by 11 ft., and tea and class room, 21 ft. by 14 ft. A broad stone staircase leads from the hall to the upper floor, where again is another large room, the same size as below, with open roof, and three class-rooms adjacent. The large rooms are about 14 ft. high. The designs are in the Italian style, the ground-floor windows of the school building having square heads, the upper windows being circular-headed. The main front and entrance to the new chapel will face into Little Horton-lane. On each side it will be lighted with long circular-headed windows. The contractors for the several works for the school buildings are as follow:—Masons and bricklayers, Messrs. Hey & Smith, Bradford; carpenter and joiner, Mr. William Ives, of Shipley; plumbers and glaziers, Messrs. Midgley & Jowett; plasterer, Mr. Benjamin Dixon; slater, Mr. James Smithies; painter, Mr. Edward Haley.

DISSENTING CHURCH-BUILDING NEWS.

Rochdale.—Trinity United Presbyterian church has been opened for divine service. The edifice is situated at the corner of Manchester-road and Gashouse-lane, and immediately opposite the road opened out in front of the new town-hall. The building is in the Gothic style, faced with Yorkshire parapets and dressings from Slaithewaite, near Huddersfield. At the north-east angle there is a tower, with buttresses. The spire is not yet erected, but when complete, will rise to the height of 140 ft. There are three entrances, one in the tower and the others in the centre of the front and side porch. The central doorway leading to the vestibule has a moulded arch, with label, terminated by carved bosses. In the front gable there is a five-light window, with double reveals and tracery head. The side windows to the nave are two-light, with tracery heads, varied in alternate design. The transept windows are four-light, with tracery heads. The chancel window is also a four-light, the tracery being arranged to symbolise the Trinity. The building is cruciform on plan, and consists of nave, transepts, and chancel; the inside dimensions of the nave are 74 ft. (exclusive of vestibule), and 43 ft. wide; the transepts, 24 ft. by 14 ft.; and the chancel, 22 ft. by 14 ft. There are no galleries in the church, with the exception of a small one over the front vestibule. The glazing, which has been executed by Messrs. Edmondson & Son, of Manchester, presents a series of geometrical designs in varied tints, all the windows having painted borders. The roof is open-timbered. The chancel is divided by a dwarf wall in Bath stone, and is intended to be surmounted with Medieval wrought-iron cresting and gate in the centre. The chancel arch springs from granite columns, with Bath-stone corbels and capitals. The whole of the wood-work inside is of pitch pine, and will be left free from stain or varnish.

The carving, which has been executed by Mr. Bonehill, of Manchester, is natural generally, but slightly conventionalised. On the four transept corbels are sculptured the four Evangelists. There is a school-room formed in the basement, but it is only intended for temporary use, and will eventually be converted into a lecture-room. There are about 800 sittings provided, and the cost will be upwards of 5,000*l.* The general contractor was Mr. Robert Rhodes, of Rochdale, the joiners' work having been executed by Mr. Crabtree. The whole of the work has been carried out from the design and under the superintendence of Messrs. Woodhouse & Potts, architects, Oldham.

New Ferry, near Birkenhead.—St. Mark's free and unappropriated Church, which was consecrated about three years ago, has been enlarged at the expense of Mr. Harwood W. Banner. The new north chancel aisle, which provides about eighty additional sittings, consists of two bays, and is built of Tranmere stone, with Storeton dressings. The seats are of pitch pine. The work has been carried out by Mr. J. H. Mallin, of Liverpool, under the direction of the architect of the church, Mr. E. Haycock, jun., of Shrewsbury.

Wibsey (Bradford).—The memorial stone of a new Wesleyan Chapel at Wibsey has been laid. Up to the present time about 1,900*l.* have been subscribed for the edifice. Mr. Samuel Ackroyd, manufacturer, of Great Horton, gave the site, which cost about 600*l.*, and, in addition to that, subscribed 500*l.* for the building fund. The site which has been selected for the new chapel is a piece of ground immediately in front of the old schools, and to make a suitable entrance from the High-street, two cottages, which previously hid the site from the street, have been removed. The new building has been designed by Messrs. Andrews, Son, & Pepper, architects, Bradford. The plan, which does not differ materially from the usual arrangement, is externally 82 ft. long by 50 ft. wide, and has in front a central entrance and vestibule, 8 ft. wide, and vestries in the rear. Two rows of columns divide the chapel into nave and aisle, and support the roof. They are also intended to carry galleries; provision also has been made, in the event of extension, for clearing away the vestries. The exterior is designed in the Gothic style. Above the central doorway is a four-light window with geometrical tracery, and the gable, which is brought forward in advance of the side aisles, is surmounted by a bell turret and flanked by pinnacles. Without the galleries the chapel will at present accommodate 450 persons, and the galleries could be made to contain 500 more. The cost of the building will be about 1,500*l.*

Hungerford.—The new Wesleyan chapel erected in Charnum-street, has been opened for divine service. The chapel is in the early Gothic style, situated at the entrance to the town from Marlboro' and Newbury, and seen from the town itself. It is built to seat 400, and has an end gallery. The seats are open, of stained deal, and the windows are of three tints of cathedral glass. Messrs. Wilson & Wilcox, of Bath, were the architects; Mr. Phillips, of Swindon, the builder; and the tiles for the chancel pavements were supplied by Messrs. Malkin & Co., of Burslem. The entire cost of the building will be about 2,000*l.*

Walsford.—The foundation-stone of a new Wesleyan chapel has been laid here by Mr. M'Arthur, M.P. for Lambeth. The site was given by the late Mrs. Petty, of Lady's Close, and a piece of land adjoining was purchased for a school-house. It was decided to build the school-house first, and to use it as a temporary chapel. A building fund has been raised. The estimated cost of the new (temporary) chapel, including the purchase of the land, is 1,900*l.*, which sum, with the usual extras, will probably be increased to about 2,000*l.* Before the foundation-stone was laid the sum of 1,100*l.* was provided for, leaving about 900*l.* to be raised.

Bognor.—A new Congregational Church has been opened here. Its architecture is Early English, from the designs of Mr. C. O. Blaber, of Brighton, and it has been erected at a cost of about 2,500*l.*, the building contract having been taken by Mr. Snewin, of Littlehampton, for 1,560*l.* The coping and finials are not included in the contract, and will cost 55*l.*, being a gift. The building is 60 ft. by 35 ft. in the clear, and accommodation is already effected for 350 persons, but provision is made for the erection of galleries. The walls are of flint with white stone dressings, the windows being of Box-ground Bath-stone, filled in with Hartley's patent quarry

colled plate glass and Moore's louvre ventilators. The roof is ceiled about half way up to the principal rafters, the bottom of which, together with the braces and principals, are open, and rest upon stone corbels. The seats are open deal and varnished. Mr. James Reed acted as clerk of the works under the architect.

STAINED GLASS.

Hazlewood Castle (Tadcaster, Yorkshire).—A stained-glass window has just been erected in the old chapel attached to Hazlewood Castle, in memory of the late Sir Edward M. Vavasour, bart. (who died in 1847 on his way to Rome), and his lady, who predeceased him many years. The window (which is the gift of the Rev. Philip Vavasour, youngest son of the late baronet) consists mainly of two lancet lights, containing representations of the patron saints of the persons commemorated. In one light is a figure of St. Edward, King and Confessor, and in the other light is a figure of St. Marciana, Virgin and Martyr, both the figures standing, surrounded by their distinguishing attributes or emblems, beneath foliated canopies of characteristic design. At the top of the window is a four-pointed tracery panel, which is filled up with a monogram, and across the bottom of the two lancet lights runs the inscription. The window was executed by Mr. Francis Barnett, of Leith and Edinburgh.

Sidmouth Parish Church.—The last plain glass window in this church has just been replaced by one from Messrs. Ward & Hughes, in memory of Emma Pennant, widow of the Rev. Thomas Pennant, who died June 9th, 1865. The new window consists of three lights. The centre one depicts above St. Peter attempting to walk on the water, and below the poor widow's offering, as contrasted with the rich men's gifts. The eastern side light pictures the miraculous draught of fishes, and the western side light the Saviour stilling the tempest.

Patcham Church.—Stained glass has been recently placed in the east window of the chancel of this church. The window itself is of the Decorated period of architecture, consisting of three main lights, and six openings above of tracery in stone work, which has been cleaned and repaired. In the lower and principal portion three scenes, in connexion with our Saviour's earthly mission, are delineated, and in the upper divisions His welcome of the good to the heavenly reward. The first group at the base represents our Lord as an infant in the manger. In the second, or central division, is depicted the crucifixion. In the third compartment are seen the holy women sorrowing at the tomb of the risen Saviour in the garden. In the top margin of the tracery is a figure of our Lord with outstretched arms, receiving the just, who, attended by their guardian angels, are seen ascending. These occupy the two largest quadrifolials. In the three trefoils are full-length figures of the archangels, St. Gabriel, St. Michael, and St. Raphael. The subjects in the lower portion are enclosed within decorated tabernacle shrines. The window is dedicated to the memory of the late Mr. H. C. Lacy, of Withdean Hall, and the artists who designed and executed the work are Messrs. A. & W. O'Connor, of London.

St. Andrew's, Norwich.—A stained glass window, by Mr. Hughes, of London, has just been placed in the south side of the chancel of this church. It is a memorial to the deceased children of the present vicar, and the subjects are—in the eastern light, Christ receiving little children; in the next one, His charge to St. Peter, "Feed My lambs;" and in the western light, Christ teaching by the example of a little child. Textual illustrations of the subjects appear in the tracery above. There is still too much light for stained glass to appear at full advantage; but it is an important step to darken the clerestory windows, and if, at the same time, money is forthcoming, it removes the block of old pews still standing in the chancel.

St. Peter-Port Church, Guernsey.—A stained glass window, to the memory of De Beauvoir de Male, has been placed in this church. The design is intended to illustrate our Lord's parable of "the good Samaritan." In the three main lights the parable is thus represented:—1st. Pouring oil into the wounds of the man who lay among thieves. 2nd. Bearing the wounded man on his beast to the inn. 3rd. On his departure commending the poor man to the care of the innkeeper. In the tracery our Lord and the angelic host are represented. The text is

"Va-toi aussi, et fais de même." The window has been executed by Mr. O'Connor, of London. This is the sixth window which the same artist has placed in this church. The insertion of the different compartments has been performed by Mr. Daniel de Patron.

Ecclesfield Church.—Another stained window has been added to the chancel of this church. It has been erected to the memory of Mr. J. F. Macben and his son, Mr. T. M. Macben. It has been designed and executed by Messrs. Hardman, of Birmingham. The three upper lights contain subjects as follow:—St. John leaning on Christ's bosom, St. Peter and St. John at the Sepulchre, and the Meeting of Christ and Mary Magdalene in the Garden. The three lower lights are taken up by as many subjects relating to the raising of the widow's son of Nain. The window is on the north side of the chancel.

FROM MELBOURNE, AUSTRALIA.

THE entire collection of the Fine Arts Exhibition includes 567 paintings in oil, and 237 in water-colours. There are in addition 114 sketches and drawings, 2 etchings, 15 engravings, 18 chromo-lithographs, and 286 photographs and photo-lithographs.

Some account of new buildings in Melbourne is given in the *Illustrated Australian News*, from which we select and condense the following:—Commencing at the eastern end of the city, and working our way westward, the first building that attracts our attention is the new residence in Spring-street of Messrs. Gerard & James, the well-known medical men of this city. This pile of buildings, which is now rapidly approaching completion, comprises two houses, and occupies a considerable frontage to both Collins and Spring streets. They are in the Romanesque style, built of brick and stone, cemented. They are of three stories in height. The grouped arched windows, supported by light columns, the balconettes, and the parapet all combine to produce an agreeable effect. The cost of the two houses will be, when completed, over 8,000*l.* They are from the design of Messrs. Barnes & Reid, architects; from which firm we have also another illustration of the same style of architecture, in the warehouses of Messrs. M'Arthur, Sherrard, & Copeland, situated in Flinders-lane. Here, too, the buildings are of brick, cemented, and the effect is produced by the grouped windows and the style of ornamentation peculiar to this order. The next building which attracts our attention on returning to Collins-street is the new Town-hall, which is now beginning to make itself seen. Continuing up Collins-street we arrive at the site of the Victorian Permanent Property Building and Investment Society's new offices. To make way for them, the old Central City Hotel (Collins-street) is now in course of demolition. The new buildings will consist of a large office in front, of three stories in height, with a warehouse, auction mart, and store in the rear. The facade is to be in the Italian style of architecture, and will occupy a frontage of about 29 ft. The lower portion of the building will be ornamented with rusticated piers. The windows on the first story will be circular-headed, and embellished with Ionic pilasters, entablatures, and cornices, while those of the next story will be pedimented windows, ornamented with moulded trusses, Corinthian pilasters, architrave friezes, and cornices. The building will be surmounted with a balustrade. Tenders are now being called for. The architects are Messrs. W. H. Elliker & Co., of Elizabeth-street. A few doors farther on are the sale-rooms of Mr. H. Beauchamp, which are being rebuilt under the superintendance of Messrs. Crouch & Wilson, in a style which forms a remarkable contrast to the building it supersedes. The premises, which are of two stories, are built in bluestone and brick cemented. Immediately at the rear of the two last noticed premises, and fronting Flinders-lane, we come upon the excavations for the foundations of Messrs. Bank Brothers, Bell, & Co.'s new warehouses. These mammoth stores are to occupy a frontage of 65 ft. 6 in. to Flinders-lane, by a depth of 157 ft., and are to be five stories in height, and will be, with the exception of Messrs. L. Stevenson & Son's, the largest warehouse in Melbourne. The superstructure is to be of brickwork, finished externally with cement, in the Italian style, and resting on a basement story of finely-worked bluestone. Though not very elaborately decorated, it will be of an appropriate character. The build-

ing will be somewhat loftier than either Messrs. Stevenson & Son's, or Lang & Webster's warehouses, its elevation from the pavement to the top of the parapet being 72 ft. The offices, next the entrance, are to be constructed of polished cedar. Iron columns support the wrought-iron girders of the floors, and the capacious staircases are to be finished in a style of great magnificence. The buildings are from the design of Mr. Charles Webb, of Collins-street. The contract has been taken by Messrs. Turnbull & Dick. Turning up Elizabeth-street, we arrive at the junction of Little Bourke-street, and here, too, we find extensive excavations going on, and on inquiry discover that two splendid three-story shops are to be erected, in place of the rickety wooden structure which had been removed. Returning to Bourke-street, and continuing our way westward, we pass two new brick shops, Nos. 40 and 52, the former of two stories and the latter of three, the basement in both cases being of bluestone, and the superstructure of brick cemented. Though they do not present any special architectural features, they are nevertheless great improvements to the neighbourhood. In Lonsdale-street we observe a private residence in course of erection, the principal features in which are the balcony and corridor which run round the building. At the old site of Westby's timber-yard, great changes and improvements have been effected. The front portion of the property has been leased by Messrs. Noyes & Head, on which they have erected extensive grain and general produce stores. The building, though presenting no very striking appearance to an outside observer on Collins-street, covers an area of over a quarter of an acre, and is provided with every convenience for carrying on an extensive business. The building, which is rat proof, being provided with an asphaltic floor, is capable of storing 3,500 tons of grain, besides other more perishable articles of farm produce, for which a cellar is provided.

The City Corporation determined last year to erect a meat-market. Plans were prepared for the building, and on the 27th of December last Mr. P. Cunningham, being the successful tenderer, became the contractor for the work. Since that time rapid progress has been made in the erection of the building, which is now fast approaching toward completion. The superstructure, which is of red brick, ornamented with white brick facing, rests on a foundation of bluestone, and has a surbase of finely wrought stone of the same description. It occupies an area of 73 ft. frontage by a depth of 132 ft. From the front the building exhibits no remarkable architectural features; the side view, however, is effective, the monotony of the wall being broken into arched recesses, surmounted by semicircular lights and ventilators. The roof, which is of iron, is in a single span, and with one exception the largest span in the colony. The approaches to the market are from Elizabeth-street and Queen-street. The centre of the market is devoted to a cartway 38 ft. wide, on each side of which is a flagged space 20 ft. wide, which is to be provided with the requisite appliances for hanging the meat exposed for sale. The water is laid on to all parts of the building. The cost will be about 3,800*l.*, and the revenue which will be derived from it will be something considerable.

Telegraph communication with the island of Tasmania has been successfully re-established, after having been interrupted for a period of nearly ten years.

The great Melbourne telescope has been mounted, and the building in which it is erected is nearly finished. The roof over the portion of the building devoted to the telescope is of iron, and is so constructed that it may be drawn over the telescope or removed to the other end of the building with ease. When the telescope is in use, the roof remains covering the southern half of the building. The great instrument, when ready for work, will be used in the first place mainly for the examination of the southern nebulae.

The Consumption of Australian Preserved Meats.—The greatest satisfaction has been expressed at Melbourne at the success of the Australian preserved meats. The London agents had not only sold all their stock and that which was afloat, but had booked orders to the extent of 213,000 tins, or 1,093,250 lb.; and they had, moreover, closed their books, fearing to commit the Melbourne company further. They report that they can with ease dispose of 100,000 lb. tins per week, and this would absorb 25,000

sheep a week, and is ten times the amount the company is at present able to produce. Besides, meat has been dearer of late at Melbourne, but this was not expected to continue long.

Miscellaneous.

Government Schools of Science.—On the order for going into committee of supply in the House of Commons, Mr. Samuelson called attention to the higher Government schools of science in the metropolis in connexion with the Science and Art Department, as there had been little or no criticism on the votes on science. The vote which was to be taken that evening amounted to something over 207,000*l.*, but that did not cover the whole expenditure annually made on behalf of science and art. Votes for buildings and for the University of London should be added in order to obtain an adequate idea of the amount spent on science and art. It was clear, however, he said, that the schools in Jermyn-street and Oxford-street, owing to want of sufficient space, could not be allowed to continue in their present position. He would not remove from Jermyn-street the lectures for working men, because it was essential that they should be delivered in the centre of London. It might also be necessary to continue the teaching of geology in Jermyn-street; but with these exceptions all the Government science schools should be concentrated at South Kensington. In the foreign polytechnic schools that was the practice that was observed. The result would be economy of teaching power, and in the buildings now in course of erection at South Kensington they would have all the space that would be required for some time for a polytechnic school. Mr. W. E. Forster appealed to the House to postpone the discussion on the question referred to, until the vote was in the regular course of business brought before them.

Consecration of a New Church in Newfoundland.—On 1st June the fishermen of Burnt Head, in the mission of Brigus, in the Church of England diocese of Newfoundland, witnessed the consecration of the church dedicated to St. Augustine, which has, after much anxious labour and painful waiting, been erected there. This is the third church consecrated by the present Bishop of Newfoundland in this mission of Brigus. The newly-consecrated church consists of chancel, nave, and vestry. The chancel is 16 ft. long by 14 ft. wide, fitted up with stalls for clergy, and singing-seats with carved finials, for twelve singers, besides panelled altar, credence, &c. The east window is a three-light one. In the centre light are the arms of St. Augustine's College—the cross upon a shield. The nave is 50 ft. long by 25 ft. wide, and is fitted up with two blocks of open seats, which will accommodate 300 people. The roof is an open pine one, of a steep pitch, as the position is a very exposed one. There is a cloistery of five small windows on each side, and five lancets on each side of the nave, finished externally with hood moulding. At the west end are three detached lancets, and a porch with a double door and parallel sides. At the west end of nave is an open belfry, from which rises a spire to the height of 75 ft. from the ground. Nearly one-half of the building is free and unappropriated for ever. The edifice, which is built of wood, is exclusively of native work, and was designed by the missionary, the Rev. R. H. Taylor, who was born and educated in Stockport.

Court of Common Council, London.—The Wright testimonial picture, "The Condemned Cell," has been lent to Mr. Davie, engraver, to complete an engraving of it.—Alderman Salomons proposes presenting a window to Guildhall.—A joint committee of the Corporation and the Metropolitan Board of Works for the freeing of bridges on the Thames has been appointed.—The subject of a new building for the library and museum is under discussion in the council. The question is, whether a new building be erected at the east end of Guildhall, at a cost not exceeding 25,000*l.*, or whether the large building need at *Nisi Prius* in Guildhall be devoted to the purpose in view when the Law-courts are removed.

The Greenwich and Woolwich Railway. The local committee, of which the Rev. Dr. Miller is chairman, for promoting the construction of the Greenwich and Woolwich Railway are, it is stated, about to take steps to enforce the formation of the line by the South-Eastern Company.

Iron and Steel Institute.—A meeting of gentlemen interested in this newly-formed association has been held at Middlesbrough. Mr. Isaac Lowthian Bell, Vice-president of the Institute, presided, and explained the circumstances under which the Institute had consented to hold its first provincial meeting in the Middlesbrough district. It was agreed, on the part of the iron trade, that the quarterly business meeting of the iron and allied trades, and which now stands for September 23, should be held one week earlier, so as to afford visitors a means of attending a business meeting of the trade, if they should desire to do so. The programme of the proceedings in September was discussed, and a general outline was adopted. An exhibition of models, specimens of iron or steel, or other matters likely to interest the Institute, will probably be organized in the large hall of the Exchange Buildings. It is proposed that the party should steam down the Tees, in order to see the various works on the banks of the river, and should land at Eston jetty; visit the iron-works and mines in the neighbourhood, and finally go to Salthurn-by-the-Sea. With respect to papers, it is likely that some of considerable interest will be contributed, including communications on blast-furnaces, the manufacture of rails, gas fuel, and others.

Monastic Buildings of Worcester Cathedral.—A short time ago some interesting discoveries were made at the western end of Worcester Cathedral, while workmen were engaged in making alterations in the late Canon Benson's residence. These premises were either the site of the monastic infirmary, or immediately southward of it. Professor Willis fixes the infirmary due west of the cathedral, but from documentary evidence in the possession of the Dean and Chapter, that office, the local *Herald* thinks, would appear to have been nearer to, if not on the site of, Canon Wynter's house. This house stands upon a substructure of excellent Norman rib vaulting, originally open from one end to the other, 70 ft. long, 13 ft. 6 in. wide, in five compartments, which opened to the ground without by as many arches. Two buttresses projected westward from the gable, which stands on a high bank next the Severn, and from its peculiar form and position near the river, Professor Willis believes this to have been the monastic "necessarium," as that office is similarly situated at Durham. These vaults under the infirmary were filled up in 1691, except such portions as Drs. Reynolds and Jephcott, the canons then residing there, preserved for their own use. The discoveries just made consist of a small cell, a large room at the north end of the premises, containing some good Early English arches with groinings, double lancet-lights, &c., and another apartment of Transitional Norman work. The discoveries have been allowed to remain intact, for the inspection of the curious.

Health of Ireland.—The reports from the local registrars of births and deaths in Ireland show this year, as usual, the need of sanitary reform in that part of the United Kingdom. The registrar of Kilkenny writes that there has been much fever in that district this year, apparently without any other law than that banishing the ill-fed, the dirty, and the overcrowded. He finds it on the seashore and the mountain-side, but he cannot point to a case unassociated with either the manure-heap close to the dwelling, the open cesspool, the filthy pigsty, or the badly-lighted, ill-ventilated, and often overcrowded abode. These conditions, he regrets to say, are the rule. The poor of the district are very poor indeed, and to most of them animal food is an extreme rarity.

Sailors' Orphan Girls' School and Home. The ceremony of opening a new building dedicated to this institution, took place on Friday in last week, at Church-lane, Hampstead, under the auspices of Prince Arthur. The building which the children at present occupy is old and quite inadequate to the wants of the institution. Hence arose the necessity for the erection of the new edifice, the building of which, including the freehold land, has cost about 9,000*l.*

Schools at Anerley.—A visit is to be paid to the North Surrey District Schools at Anerley (this) Saturday, July 24th, to inspect infant schools, workshops, laundry, and children's drawings in the board-room; see the drill and exercises in the school-yard, and hear singing and music in the hall. The object is to show the advantage of mixed mental and industrial training.

Workmen's International Exhibition, 1870.—A public meeting to promote the objects of this exhibition was held on Tuesday, the 20th, in the Pimlico Rooms, Winchester-street, Pimlico, when a resolution was unanimously passed, approving the operations of the council of the exhibition; and a petition to Parliament, asking for legal security for new inventions exposed in the forthcoming exhibition, was signed by the chairman on behalf of the meeting. It was stated, in course of the proceedings, that local committees had been formed in the principal towns throughout Great Britain, one in Ireland, and others in various towns on the continent. Favourable accounts had been received from Denmark and Prussia. In the latter, the Crown Prince and Princess had placed themselves at the head of the movement. By the direction of the India Office, products from India will be displayed. The Earl of Clarendon, through the medium of our ministers and consuls abroad, has roused the interest of the Continental Governments in the success of the undertaking. A lively discussion took place on the present patent law.

The Rhewl, near Gowhen, Salop.—A mission chapel has been erected on an elevated spot in an outlying part of Whittington parish. It is built of brick, with dressings of Oeuf stone, and consists of nave and chancel under one roof, vestry, south porch, and western bell-turret. The style is Early English, and the building provides for rather more than 100 persons, in open seats. The cost has been about 500*l.* There is a reredos of marble and enamelled tiles. The windows are glazed with cathedral tinted glass, by Messrs. Dove & Davies, of Shrewsbury, and the work has been carried out by Mr. Sharmon, of Ellesmere, and Mr. Evans, of Oswestry, under the direction of the architect, Mr. E. Haywood, jun., of Shrewsbury.

Monthly Report on the Health of Saint Marylebone.—The report for June, by Dr. Whitmore, medical officer of health, and chemical examiner of gas for the parish of St. Marylebone, has been printed by order of the vestry. The returns are highly favourable, inasmuch as they show a death-rate of not more than 19.9 per 1,000, or something like 5 per 1,000 less than the average death-rate of this parish, and which means an annual saving—presuming the present low rate were to continue, which it will not—of 815 lives. The cause of this exceptionally low rate of mortality has been that whilst, owing to the improved temperature of the month, the deaths caused by bronchitis and whooping cough declined, the temperature nevertheless, had not yet risen so high as to favour the spread and fatality of summer diseases. Scarlatina was fatal in seven cases during the month. The reporter's attention has recently been called to an outbreak of this disease in Park Crescent-mews West. He found some of the stables in a very bad sanitary condition, and it was in the lofts of these stables that the disease existed. The converting of stable lofts into human habitations is very objectionable, nor should it be tolerated, except everything connected with the stables beneath as well as in the inhabited rooms, is in the best possible sanitary condition.

The Trade Unions Bill.—The Home Secretary's Bill to protect the funds of trade-unions from embezzlement and misappropriation has been printed. It is proposed to enact as follows:—"1. An association of persons having rule, agreements, or practices among themselves as to the terms on which they or any of them will or will not consent to employ or to be employed shall not, by reason only that any of such rule, agreements, or practices may operate in restraint of trade, or that such association is partly for objects other than the objects mentioned in the Friendly Societies Act, be deemed, for the purposes of the 24th section of the Friendly Societies Act, 1855, for the punishment of fraud and impositions, to be a society established for a purpose which is illegal or not to be a friendly society within the meaning of the 44th section of the said Act. 2. This Act shall not continue in force after the last day of August, 1870. 3. This Act may be cited as 'The Trade Union Funds Protection Act.'"

Reopening of Llandaff Cathedral.—The complete restoration of Llandaff Cathedral has been celebrated by a religious and musical festival in it, to which the choristers of Bristol Cathedral contributed. After service a luncheon was partaken of in the newly-erected school.

Smeatonian Society of Civil Engineers.—This society made an excursion down the river, and afterwards had an entertainment at Greenwich, on Tuesday, the 13th instant.

New Patent Brick Works in Worcester. Mr. D. W. Barker, formerly of Frome, Somersetshire, having some time since purchased a plot of land on Gregory's Bank, close to the canal on the north side of Worcester, commenced clearing the ground in January last, in order to erect a patent brick-work.

Mr. Gasser's Statue of Adam Smith.—This statue has been placed on a temporary pedestal in the ground-floor of the Randolph Gallery, Oxford, for public view.

The Roman Pavement found near the Poultry, London.—A further discovery connected with the fine pavement recently found near the Poultry was made while digging to the south or south-east.

Increased Value of Property in Newcastle.—The premises situate at No. 3, Collingwood-street, were sold by auction, and realised exactly double the amount obtained when the same premises were sold ten years ago.

TO MERCHANTS AND OTHERS. WANTED, a SITUATION, as CONFIDENTIAL CLERK or CASHIER. First-class reference and security if required. Age 35, and married.—Address, C. C. 4, Abchurch-lane, Birmingham.

The Builder.

VOL. XXVII.—No. 1382.

Artificial Harvesting and Steam Culture.

READERS of the *Builder* will readily remember the treatment in our columns on various occasions, some years since, of the subject of the artificial drying of corn and hay-crops. The attention which the dissonance of the subject attracted at the time was evidenced by the fact, that the farmers themselves entered the literary arena in defence of the conservative

system of leaving the harvest to that evil chance which people are not ashamed to term Providence; and the discussion commenced in our pages was carried on in some of the local journals of agricultural districts.

The glorious harvest weather of July, filling, as it has done, the cornfields throughout the country with hourly augmenting wealth, offers fair promise of the best mode of ripening the crops of 1869—that of a beneficent sunshine. But, in our island, exposed as it is to such conflicting climatic influences, the weather is proverbially uncertain. And it is not to be wondered at, that one of our most anxious and most successful agriculturists should have taken this very occasion to call the attention of the public, in the columns of the daily press, to an arrangement for that artificial harvesting on the necessity of which we have insisted.

The gold medal of the Society of Arts, and a prize of fifty guineas, have been given, as our readers know, to the inventor of this aid to the garner. The description is not perfectly intelligible, a misfortune which is of ordinary occurrence when mechanical inventions are spoken of by non-mechanical men; and we are not quite clear what is meant by the "smoke box of a coke furnace." Also, the statement that the heat employed for the purpose of drying the crops will cost nothing, because it would otherwise be wasted, is hasty and erroneous. But these smaller sources of error being eliminated, enough remains to command the very serious attention of the agriculturist.

The process employed, as we have before mentioned, consists in the use of a fan, which drives air, heated to the temperature of above 300° Fahrenheit, through the grass as soon as it is cut, thus rapidly extracting 60 out of the 75 per cent. of water which it contains, and leaving a sweet, dry hay, charged only with its proper quantity of 15 per cent. of moisture. For corn, a perforated cone is made use of, on which the sheaves are impaled, and the heated air rushes out from the centre, carrying the superfluous water away with it. It is stated, on chemical authority, that the hay and corn which are dried by this rapid process, are superior in quality to such as are acted on by the uncertain and intermittent action of the sun and wind by day, and dew and cold by night.

It cannot be doubted that the adoption of a process of artificial drying is only a complementary or additional step in that progress of steam culture, which is becoming yearly so much more general in the country. The farmer who makes use of a steam-engine for ploughing, for thrashing, and for other agricultural services,

has only to add a fan to his machinery, in order to render him, as far as harvesting is concerned, to a great extent independent of the weather. The same, or very nearly the same, expenditure of fuel that serves to raise the steam that will drive the fan, may be a second time made use of, this duly effected, to heat the blast. It is well known that we are far from making a full use of the heat which we liberate by the combustion of coal. Having made it perform one act of service,—the heating of a single drop or teaspoonful of water, or the impulsion of one revolution of a driving-wheel,—we are in the habit of dismissing the slave of the lamp, and sending it to mingle with the elements with all the freedom which Ariol claimed of Prospero. The new drying process steps in at this point, and exacts a second act of duty from the dose of heat, as it makes its escape up the chimney.

There can be little doubt that it is only necessary to present to the contemplation of agriculturists an efficient, easy, and cheap method of applying artificial heat to the drying of crops, in order to ensure the gradual adoption of the system. The introduction may be slow, as well as gradual, for the more men dwell apart from each other, face to face with nature, the more slow are they, as a rule, to avail themselves of any innovation on ancient custom. How many a farmer, now hale and sturdy, will be gathered to the churchyard, as a steadfast disbeliever in steam agriculture? But the introduction is certain, because it appeals to the pocket. With the more thoughtful and enterprising men, it will be sufficient to lose the crops of a single year, at the same time that a neighbour saves his own by the aid of the drying-fan, in order to induce the sufferer to guard himself against the repetition of the misfortune. Let us have the statistics of the crops of a single farm, well harvested, well sold, and well spoken of, in the face of a wet season, and the spread of the method will be a mere matter of time.

For the farmer the boon is immense. But we look to a wider interest than that of the farmer. We think of the food of the people. How much discomfort, want, ill health, are caused by an ill-gathered harvest! Who has not experienced the disgust due to eating bread made of ill-saved corn?

Of the fifty-seven million statute acres of Great Britain, rather more than half are returned as being under cultivation. Of these about one-third are devoted to raising cereals and leguminous crops. The yield in bushels of dressed corn per acre of these nine millions of acres, differs in the proportion of nearly six to one, twelve bushels being a not unusual return from neglected, unmanured lands, and upwards of fifty-five bushels being attained by the application of artificial manure. A possible difference in return of 15L sterling per acre (equal to a difference of forty-three bushels at 7s. per bushel) over, say the half of our nine million acres, gives an amount equal to the entire expenditure of the State for a twelvemonth. We could not, indeed, under the most extreme case of dearth produced by a persistently wet harvest season, rate the loss of our corn crops at so large a total. But, on the other hand, we have to bear in mind that three and a half million acres are under green crops, and nearly fifteen million acres under grass; and that the loss of the hay harvest has its *replian*, or rebound, in the loss sustained by the owner of live stock. It is thus certain that in speaking of the question of insuring the harvesting of those crops which sun and rain have brought to a period of more or less precious maturity, we are dealing with a subject that affects the national wealth by tens of millions sterling per annum.

The main point is to impress on the mind of the agriculturist the fact, that Science can—and will, if he woos her to the concession—provide him a method of counteracting, in whole or in

part, the misfortune of a wet harvest season. Or, the sun, indeed, so long as we resort to the processes of nature alone for the production of food, we must ever remain to a great degree dependent. The want of rain we can, to some extent, and in most cases, supply by irrigation; the excess of rain we can remove by drainages. Poor land we can enrich by culture, and some day, instead of polluting our rivers by the refuse of our great cities, we shall turn poison into wealth. The influence of the sun on *growth* we are not likely, to any great extent, to be able to supplement. The cloudy skies and inclement east winds of the late spring, have taught us this lesson very forcibly, as well as very recently. The necessity of sunshine for the production of fruit of all kinds have been unusually evident this year. But when, for better or for worse, the crops arrive at that state beyond which no improvement is possible; when soil, and rain, and sun, and time, has all been utilized, by annual vegetation, to the utmost, for the existing season, then we hold that science may step in, and may render the crops, as a matter of ingathering, of drying, and of storing, independent of the weather. The value of that independence is to be measured by the large sums of which we have previously spoken.

It is impossible patiently and intelligently to regard the subject of agricultural development by the aid of chemical and mechanical science, without coming to the conclusion that we are only on the threshold of an immense and most beneficial revolution in our mode of dealing with the matter. Nothing is more striking to the engineer than the increase in the *manageability* of the steam-engine which has marked the last quarter of a century. The men to whom we are indebted for our present rapid rate of locomotion were great believers in finality. Neither Robert Stephenson nor his father could be brought to regard an attempt at applying steam traction without the use of rails as anything but waste of time and of money. The stationary engine, with its firm enshrouding of stone or of brickwork, and the substantial six-wheeled locomotive, calculated for service on railways laid with solid permanent way, at inclinations not exceeding from 16 ft. to 20 ft. per mile, were considered by those illustrious mechanics not only to be the *ne plus ultra* of their science, but to afford indications, from the experience acquired in their construction and employment, that it was idle to attempt to employ the steam-engine in any less costly and cumbersome manner. In fact, the Stephensons took up, in engineering, very much the same position that Cuvier occupied in natural science. Successful discoverers of so much, they considered that they had gone far to exhaust the subject of their study, and that, even if improvements of detail were possible, they had laid down permanently cardinal and unquestionable principles. Neither of these great men,—for each they undoubtedly were,—felt that he was but an infant progenitor of a giant race, who would as far exceed their own utmost triumphs, as they themselves had outrun their most illustrious predecessors. Thus it was that Robert Stephenson was so eminently safe as an engineer. His father had fought the great battle of steam, Chat Moss had been crossed, and the steam-horse had been driven at a rate limited only by the strength of the materials of which the two concurrent parts of the great invention,—way and locomotion,—were composed. The constant, unresting, extravagant, inspired genius of the Brunels, father and son, was strange to the cool Northumbrian blood of the Stephensons. Thus, while it fell to the lot of the latter to do more to advance mechanical science, in certain branches, than any other men, they were no less influential in spreading a tendency to consider the improvements actually obtained as final, and, as it were, stereotyped.

The great builders and contractors set the example of looking for the aid of steam in a new, and, as it were, in a domestic direction. The dangerous, painful, costly toil of our old friend the Irish labourer was found to be far more readily performed by the aid of a few scufflefuls of coals. Pumping from foundations was only a repetition in miniature of the process of draining mines. So it came to pass that miniature steam-engines were constructed and were found to answer for the purpose. The donkey engine was born, his work multiplied. Cranes and lifts, pumps, fans, saws, the rams of pile-engines, the hammers of smiths, the ventilation of galleries, the mixing of mortar, — to all these purposes the ever-ready service of steam proved economically adapted. Then the imprisoned demon was set to till the ground. The experiment showed that the horse may come to be regarded as an article of luxury alone, — as a costly superfluity for the farmer. All that now seems marvellous is the application of a kettle to the bicycle. We shall probably live to see that. We have seen, within the last week, a ponderous steam carriage, with broad ribbed wheels, creeping slowly along a Wiltshire turnpike-road, drawing after it three large ordinary wagons, each full of bricks. The machine came from the works of an engineer at Reading, and the reply to inquiries as to the reason of employing this method of sending such heavy materials by road, along a line to which both a railway and a canal run parallel, was, that it was cheaper than either of the other methods! How far this may be the case we are unable to say; but as to the fact of the steady progress of the unaccustomed convoy, again, and again, and again, we can speak from ocular witness.

The steam plough, the steam thrashing-machine, and the road traction-engine, are all of them more difficult and less promising applications of mechanical power to the service of the agriculturist, than is that of the hot-air blast to haymaking or to harvesting. Each of the former, notably the plough, might well have been considered likely to present insuperable obstacles to the civil engineer. The drying of corn by artificial means, on the contrary, has been long indicated as practicable. It formed a portion of the Austrian arrangements for the defence of the famous Quadrilateral. It has been, in a limited and peculiar manner, familiar to Englishmen from the distant time when beer displaced mead as a national drink. M. H., and D. H., and similar cabalistic letters, on the doors of our great breweries, tell us of the artificial fortification of the greater part of our annual crop of barley. And yet, ever since we first learned to brew malt and hops, we have been content to let our precious wheat crops germinate in the very shock, if St. Swithin came upon us in anger.

We shall be glad to hear more of the premiated machinery for harvesting. We must not be understood as committing ourselves to vouch for the excellence of this particular plan, or of any other which we have not had the opportunity of testing. But as to the importance of the object to be attained, and the perfect feasibility of attaining that object, as to the tens of millions sterling which the farmer may annually pocket at the cost of a few hundreds of guineas spent in fees to the civil engineer, and a few thousands or tens of thousands laid out in machinery, we have no more doubt than we have as to the combustibility of coal. Englishmen will have only themselves to blame, henceforth, for dearth caused by a wet harvest.

REPORT OF THE ROYAL COMMISSION ON WATER SUPPLY.

ON THE PRACTICABILITY OF OBTAINING LARGE SUPPLIES OF WATER FROM THE MOUNTAINOUS DISTRICTS OF ENGLAND AND WALES.

THE Cumberland Lake scheme of Messrs. Homans and Hassard is reported on less fully than that of Mr. Bateman, for it has many points of resemblance, and therefore the same remarks in many cases apply to both. The lakes of Thirlmere, Ulleswater, and Haweswater are the source proposed in this scheme, and the water, having been brought through a tunnel $\frac{7}{8}$ miles in length, under a range of hills to a point above Windermere, would thence flow by gravitation through a conduit to London.

The rainfall has in this district been well ascertained, and Mr. G. J. Symons infers from

the whole number of observations, that the true mean rainfall may be taken at 77 in. per annum, and the mean of three dry years, at 61·6 in., or 80 per cent. less. In the driest year he would take 66 or 68 per cent. of the average, which would give about 53 in. During the ten years ending 1859, there was only one drought of more than forty days' duration, and more than 1 in. of rain fell during its continuance.

The available storage would be 5,563 millions of cubic feet, which is equal to 120 days' supply, at the rate of 250 million gallons a day, or to 157 days' supply, at 200 million gallons a day, after giving credit for the average minimum summer yield, and allowing for compensation.

From the south end of the tunnel above-mentioned, the conduit would pass by Ambleside and Kendal, along the east side of Lancashire, to the east of Manchester and of Birmingham, and following a route nearly parallel with the London and North-Western railway, would terminate in a reservoir to be formed near Edgware, at a distance of 12 miles from Hyde Park, containing fifteen days' supply, at the rate of 250 million gallons a day. This reservoir would not supply the higher districts of the metropolis, which must still be supplied by pumping.

The promoters of this scheme propose to supply 50 million gallons a day to the populous districts, on the route of the conduit. To compensate for water thus supplied, an additional supply is to be brought from Bala Lake to join the main conduit at Stoke-upon-Trent, and a reservoir is to be formed there to hold twenty-one days' supply. The cost of these additional works is estimated at 1,500,000*l.*, and the quantity expected to be obtained thereby 50 to 60 million gallons a day.

The total estimate is 13,500,000*l.*, of which 360,000*l.* would be required for the long tunnel at the head of the conduit.

It is proposed to levy a compulsory rate in this case, as in that of the Welsh scheme, and to purchase and incorporate the existing works and secure the companies in their present incomes.

The Commissioners have made a similar independent investigation into the quality of this water to that they have made into the quality of the water of North Wales. The results of the analyses are very similar to those of the Welsh waters, as regards softness and purity, but are open to the same objections that they are liable to be coloured by peat.

The Commissioners' remarks on this scheme are very similar to those on Mr. Bateman's; — the plan is practicable, — the estimates are uncertain, — the quantity of water obtainable abundant, — quality of water satisfactory, subject to the same objections that are mentioned in the Welsh case. "There would probably be less formidable opposition to this scheme than to Mr. Bateman's on account of the less magnitude and importance of the river flowing from the district; but the objections from possible stoppages of the flow in the conduit would be increased in proportion to its greater length." (The length of Mr. Bateman's aqueduct is 180 miles; that of Messrs. Homans and Hassard 270 miles.)

The water would be delivered by this scheme at a level 37½ ft. lower than by that of Mr. Bateman, and therefore the necessity of pumping is increased to a greater extent by it than by the latter.

"There is no doubt that the lake district is a very fine gathering-ground for soft water; but it is deserving of consideration that this district is not unlikely to be claimed as the most natural source of supply for large and increasing manufacturing populations in the North of England, for whom soft water would be particularly valuable; and we hold it to be erroneous in principle that any one town or district should take possession of a gathering-ground geographically belonging to another, unless it can be clearly shown that circumstances render such a step justifiable."

This is the key-note of the report.

Mr. Hamilton Palton's plan is to take water from the upper sources of the River Wyre in Mid Wales, having a drainage area of 410 square miles. From an assumed rainfall of 60 in., giving 30 in. available, it is calculated that there would be a yield of 393 million gallons a day. The conduit to convey the water to London would be 180 miles long, passing Glassbury and Hay, and thence near Kingston, Ludlow, Tonbury, Bewdley, Stourport, Bromsgrove, Henley-in-Arden, Warwick, Banbury, Tring, and Watford, to a point near Barnet, eight miles from Hyde Park, where a service reservoir would be con-

structed at a level 276 ft. above the mean sea level. The aqueduct is intended to be 15 ft. wide and 14½ ft. deep, with a fall of from 6 in. to 24 in. per mile, and it is calculated to deliver 230 million gallons a day. For the first portion of the scheme, to bring 130 million gallons a day, the cost would be 7,000,000*l.*, and for an additional 100 million gallons a day a further sum of 2,000,000*l.* The Commissioners have had no evidence on this scheme, except from the promoter himself. They consider, however, that from its general similarity to Mr. Bateman's plan it might be further investigated if any scheme of the kind for the supply of the metropolis should be deemed necessary; and we think so too.

Mr. George Remington's plan is to bring water from the source of the River Dove, in Derbyshire, by a conduit 135 miles long, to a reservoir to be made on Barnet-hill, at a level 300 ft. above the mean level of the sea. It is proposed to appropriate a drainage area of 262 square miles. By assuming a rainfall of 48 in. it is calculated that 100 million gallons a day may be delivered at Barnet at an estimated cost of 5,000,000*l.*

The Commissioners regard this scheme merely in the light of a suggestion, and say that in any case it could only form an auxiliary source; while, from the proximity of a number of important manufacturing towns, they consider such a source should be reserved for their supply, for which it seems to them well fitted.

In some "Remarks on Gravitation Schemes generally," the Commissioners say that there has not yet been a sufficient experience of these works to enable engineers to make accurate calculations, in all cases, as to their sufficiency.

The Rivington Pike scheme was expected to yield a supply to Liverpool of 12 or 13 million gallons a day, but "the Rivington works are practically a failure as gravitation works; three dry years in succession reduce the available water to 6 millions of gallons per day, and four successive years of drought, which may very possibly occur in future, would reduce it still further; and unless enormous reservoir or lakes could be made, capable of storing the surplus waters of three or four years, these works must prove insufficient."

At Newcastle-on-Tyne the gravitation works failed, and after an enlargement are still insufficient, and a permanent pumping establishment is now in course of erection.

The supply to Bristol, from the Mendip Hills, established in 1851, failed in 1864, and recourse is now had to pumping from springs nearer the town.

All gravitation works in England were subjected to a severe test in 1868. From the end of April to the end of September there was scarcely any rain.

At Manchester the corporation, on the 3rd of August, limited the supply to 12 hours a day, stopped the street watering, and diminished the trade supplies by one half. They also made an arrangement with the mill-owners to reduce the quantity of compensation water by one half, giving money compensation for the deficiency. In the middle of September, the general supply to the town was further limited to 8 hours a day, and the quantity to trades also diminished. The 8 hours supply lasted 7 days, and the 12 hours supply 76 days.

On the 25th of September, after 150 days' drought, there were in store 435,000,000 gallons; but supposing the supply of the full quantity had been continued, the store would have been exhausted before that time.

The storage at Manchester is at present deficient; it is but 2½ million cubic feet per acre of the gathering-ground. At Liverpool it is 48,500, at Dublin 25,500, at Loch Katrine 30,000, and at Gorbals 52,000.

At Halifax, Sheffield, Bradford, and Rochdale, the water supply was also reduced in quantity during the year 1868, these all being gravitation works; and at Preston, Newcastle, and Kendal, the supply failed outright, and pumping was resorted to.

The Commissioners remark that "the causes of this difficulty may be either in an over-estimate of the available rainfall, or in an insufficient provision of storage. The sufficiency of water-collecting plans in these respects must be tested both by the concurrence of several dry years, and by occasional droughts of long duration; and to obtain the necessary data on these points for any particular district must require local observations on that district extended over a considerable time."

For these and other cognate reasons the Commissioners do not recommend the adoption of any

* See p. 579, ante.

of the four plans submitted to them for the supply of the metropolis. They then turn their attention to wells and springs, and finally to the river Thames.

EXHIBITIONS THAT CONCERNED US AT THE MANCHESTER SHOWS.

In addition to the comparatively small number of objects at the shows of the Societies at Manchester, that were noticed in the *Builder* of last week, there were other stands on the grounds, the contents of which were fairly entitled to a passing notice.

One of the exhibits meriting comment may have been seen by some visitors by accident, as it somehow failed to get placed, in any form, in the catalogue of 526 pages. Stand 244 contained a special attraction in a working model, exhibited by Messrs. Cockshott & Weatherill, of Manchester, of a new railway-brake. The model consisted of two quarter-sized railway carriages, fitted with the new apparatus, and which ran experimental trips upon a short length of narrow gauge railway, the carriage conveying a few passengers at each trip. The brake performed admirably, and stopped the little train with unflinching precision after it ran down a steep gradient to a short level reach. Some of the visitors to this stand had their attention attracted by its floor, which was laid, in their concrete pavement, by the Liverpool Cement Company. This material seems to possess decided merit, and the specimen shown presented an excellent surface, perfectly smooth and very hard. It is alluded concerning it that it costs only from a half to a third of the price of ordinary flagging, and that it is being tried alongside of granite in the Liverpool New Exchange, where it has been laid for two years. If we mistake not, the cardinal virtue of the material lies in the circumstance that there is a proportion of oxide of iron in the clay used in the composition.

The most artistic objects in the exhibition relating to the building trade were probably the large collection of enamelled state mantelpieces, shown by Messrs. Belcher, Gee, & Co., of Gloucester. The examples included imitations of serpentine, red and green, Rouge Royale, Egyptian green, red, and grey granites, with floral and fruit panels that might have come from Lancelotti's palette and pencil.

Messrs. Maugrave, Brothers, of Belfast, had a large stand well furnished with the improved stable, cowhouse, kennel, and piggy fittings, and appurtenances, for which they have achieved a high reputation. Their tumbling mangers and water-pots, sliding barriers between stalls, and loose-ho doors, were specially worthy of note. In the same department, there was a good show at Stand 190 of the prize stable fittings manufactured by Messrs. Cottam & Co., of London, including a variety of their excellent enamelled mangers and water-troughs, and general stable furnishings. The St. Pancras Ironworks Company were also large exhibitors at Stand 93 of the same class of good fittings and articles.

The exhibits of Mr. James Howorth's archimedean screw ventilator excited much interest. They were shown in great variety, of all sizes as adapted for the chimney of a cottage, or for the roof of a church or public hall. The arrangements for lubrication are ingenious, but the statement that the repositories for the lubricating agent will serve for seven years without replenishment should be received *cum grano salis*.

Messrs. Francis Morton & Co., of Liverpool, had a plentifully furnished stand, an excellent exposition of their manufactures, and of their application of iron to various structural purposes, including churches, schools, warehouses, volunteer drill-halls, ornamental sporting lodges, cottages, cricket tents, corn-shed roofs, bridges, and a great variety of other erections.

Mr. James Braggins, of Banbury, made an excellent display of oak park and field gates, hung with his patent hinges, and fitted, in some instances, with his patent gate-lock,—a useful contrivance for bridle-road gates, and much more convenient than the padlock. It can be locked without key, but requires the key to open it. It is sunk flush into the gate-post, and offers no tearing surface to passers-by.

To select, from such a host of objects, almost all more or less interesting and important, a necessarily small number for mention might seem invidious, and is certainly not an easy task. It may be mentioned, in general terms, that machines in motion seemed to attract the greatest degree of popular interest, especially those that were doing real work. On the shilling days

there were certain stands constantly surrounded by thick fringes of spectators, especially in the case of machines devoted to the working of wood and stone. Among the first were the beautifully made machines of Messrs. Allen Ransome & Co., of Chelsea, and the interesting exhibits of Powis, James, & Co., Roston, Proctor, & Co., the Reading Iron Works Company, Clayton & Shuttleworth, Hancock & Foden, Samuel Worsam & Co., of Chelsea; Robinson & Son, C. Powis & Co., and numerous others in the same class. Of the stone working machines the most interesting was the stone-dresser of Messrs. Conlter & Harpin, of Huddersfield, for dressing granite, marble, delfstone, or free-stone, without chiselling. The dresser was exhibited at work, as was also Marsden & Co.'s stone-breaking machine. Near akin to the stone-breaker are the road-rollers, by which such a remarkable improvement has been effected, of late years, in the laying and repair of public roads. Of these there were two exhibited, one by Messrs. Aveling & Porter, with whom this important machine is a well-known specialty; the other, which met with an accident, by which it was unfortunately disabled from competing, by Messrs. Manning, Wardle, & Co., of Leeds,—a French machine. It may be mentioned on this subject, that Messrs. Aveling & Porter laid half an acre of solid road in ten hours at the commencement of the show for the principal approach. The more notable of the other machines in motion included a superb portable engine, by Ransomes, Sims, & Head, of Ipswich, and a beautifully-finished stationary horizontal engine, by Messrs. Clayton & Shuttleworth, of Lincoln. The brick-making machines of Clayton, Page & Co., Morton & Co., Scragg, Whitehead, and Middleton, exhibited, for the greater part at work, also attracted much notice and admiration; as did also the pumps of Tunge Brothers, J. & H. Gwynne, Owens & Co., Warner & Sons, Norton, Tuxford, & Sons, Hayward, Tyler, & Co., Woods, Cocksedge, & Warner, and Williamson Brothers, with the productions of numerous makers of hand-power pumps.

A large number of articles and implements of American invention were displayed by English exhibitors; but further enumeration or reference to the exhibits of either English or other inventors is beyond the limits of space at disposal.

THE PEABODY STATUE IN LONDON.

The newspapers have told how that a statue of the magnificent George Peabody was unveiled, on Friday last, by H.R.H. the Prince of Wales, in company of the Lord Mayor. The Prince said happily and heartily,—“I can never forget the reception which I had in America nine years ago, and my earnest wish and hope is that England and America may go hand in hand in peace and prosperity.”

The American Minister, Mr. Motley, spoke like a scholar and a gentleman, though we quite agree with him that when he said he could not tell which was the more like, the statue to Mr. Peabody, or Mr. Peabody to the statue, he used “a confused expression.”

The committee went all the way to Rome to get a sculptor, Mr. W. W. Story, who is an American (and an able man too), and could not find a founder to put the work into metal nearer than Munich,—Fredk. Miller. After all this long travel, and the expenditure of some 3,000*l.*, what is the result? We answer, with regret, an entire mistake and disappointment,—at least, for the present. The excellent philanthropist sits hatless in an ordinary library-chair, without a single touch of ideality to make it other than a seated man most awkwardly placed amongst some irregularly-shaped buildings *à propos* of nothing, and square with nothing.

The first impression on seeing the figure is that it is something put up for sale; the second, especially if there be a number of persons gathered round about it, that it is an auctioneer, not for sale, but selling. We are not joking; neither do we desire uselessly to find fault. Our object is improvement if possible.

The figure cannot remain where it is. Before the permanent pedestal is ready to be erected a better site should be found for it, and a carefully-designed canopy should be put over the statue. The stalwart form of good George Peabody, in his coat and trousers, as he lived, sitting without his hat amongst the Insurance Offices at the back of the Exchange, in a pelting shower or pea-soupy fog, is a sight that surely cannot long be endured even in London.

GEORGE PEABODY,

MERCHANT AND HERO.

A Sonnet.

(In view of the City Statute, uncovered 23rd July, 1869.)

Rise, and the priceless blessing of the poor
Be with thee, in the land that gave thee birth;
No better fruit grows on the treading earth
Than such sweet thanks as spring beside the door,
Be it in populous town or lone some moor,
That human kindness wings its healing flight,
And waking beauty in the homes of night,
Floods as with angel-track the cottage-door;
Yet would we keep thine image near us still,
And, therefore, in the face of all our store,
We throne thee, and th' fortune good or ill
Go with the restless tribes that round thee pour,
Long shall that kindly face true message bear,
And turn to mercy all our greedy care.

ASACOR HAY HILL.

PROPOSED DESTRUCTION OF THE LIVERPOOL TOWN-HALL.

It appears from the Liverpool papers that a proposal has been made to remove the Town-hall containing the Mayor's Reception-rooms and the Council Chamber, and erect it on a vacant plot of ground behind the new Public Offices in Dale-street, with such modifications as will bring it into harmony with the latter building.

Considering the fate of this edifice as a matter not merely of local, but one of national interest and importance, and as such not unworthy the notice of the *Builder*, I beg to occupy a brief space with some remarks relative to the building, and the proposal in question. I do not believe the latter at all likely to meet with acceptance at present; but the mere existence of such a proposal, with the feelings or wishes that proposal induces, renders it high time to set forth the claims to continued existence of an edifice, the destruction of which should not even be named or dreamt of.

The Liverpool Town-hall, the design of Wood, of Bath, is not a building of historic interest, save so far as it associates itself in the mind with the growth and history of the town. But it is as genuine a specimen of Italian architecture as any the last century could show; exhibiting an obaste and harmonious combination of what is most noble and majestic in the Classic styles, with much of the picturesqueness of the Gothic; and though its beauty may not be so organic as that of Nature and the Gothic, it is nevertheless, I believe, genuine architecture also. It presents a grand square mass of building, fronted by a two-storied portico, and finished above with a poetically relieved rotunda, crowned by a dome,—for the successful treatment and application of which (the noblest feature of architecture), in the production of a most graceful composition, a rare merit now-a-days, I consider this structure remarkable; as it is also for its unique and effective sculptural embellishment, which fully satisfies the eye, and not the eye alone.

It has, in short, all the elements and qualities of a great work of structural art, and much that is wanting in examples which men cross oceans or continents to see, some of which would look tame or ugly compilations of undigested elements beside it. I do not know a domed composition either in this country, in France, or in Italy, so wisely and tastefully crowned as this is by, instead of the stereotyped lantern, the colossal figure of Britannia complacently looking down on the busy hating life below; or where sculpture and architecture are everywhere more skilfully blended.

Of the interior of the edifice I will only say that it is worthy of the exterior, comprising a noble staircase and a fine suite of apartments.

Such is the structure it is proposed to destroy. I say destroy, for there is no consolation in the promise of its reappearance at the back of the new Municipal Offices, but the reverse; so much so that I should pray, if the building is to come down, in mercy let it remain down. Let us have no reproduction of it as that proposed, which would be far worse than its final demolition. But let us consider for a moment what the scheme holds forth. It is proposed to remove the present Town-hall from the most respectable and proper position it could possibly occupy in the town,—in front of a grand quadrangle, where it is the central crowning feature of a noble group of commercial edifices surrounding it on all sides, which it unites and dignifies by its more majestic character and style, and which, without it, would stand like a family bereft of its head,—it is proposed to take it from this position, where it sits “like a king in the army,” and to re-erect it, despoiled of its old familiar face, now more beautiful from the rich tints of time

and weather, and modified to harmonise with a building of an entirely different composition,—on a site abutting upon some of the meanest streets in the town, which cannot and will not be remodelled for a century. What all this can result in, but the production of a spectacle such as those who had seen and loved the old building, streaming with life, and in sympathy with earth and sky, would be thankful even to an earthquake to bide from them, I am unable to imagine.

There are few objects, either of art or external nature, that so wind themselves around the heart as beautiful edifices, as the eye grows familiar with them. This one has wound itself round mine; and, I believe, their name is legion who could say the same. I know artists, now distinguished, born or brought up in this town, who with myself first awoke to the wonders of the world of art, and were inspired with a love of it, while roaming in boyhood about the old Exchange and Town-hall area, and round the beautiful monument of Nelson. By these, and by thousands who are not artists, would the disappearance of the Town-hall be felt like the loss of a beloved friend.

There is another consideration which I urged in defence of it a year or two ago in a paper read to the Architectural Society of Liverpool, and published in an influential local magazine, viz., its being essential to the very identity of the town. There are in every city certain buildings the removal of which would impair that city's identity in the minds of the inhabitants. Such are St. Peter's Church and the Coliseum to Rome; Notre Dame and the Louvre to Paris; St. Mark's and the Doge's Palace to Venice; their great cathedrals to Cologne, Florence, and Milan; St. Paul's and Westminster Abbey to London. They are, in each case, the pinnacles, and as it were—or a sort of moral abstract and epitome of the whole city; they are the image which its genius assumes in the mind or wears to the heart of every true native. And such is the Town-hall, Liverpool. You may mangle the Custom House; you may beat down the railway stations and a score of other public works, with but little violence to any mental impression of the town; but touch the Town-hall, and you touch the apple of its eye. Remove this, and you have changed its character; you have destroyed its identity. The Liver may fly over it again, but it is Liverpool no longer, and may receive a new name; or, as at Edinburgh and some other places, it may be called "the new town," save that, unlike these cities, it would be unaccompanied by any old one.

But the architectural qualities of the Town-hall should be its sufficient shield. Those who render it the Parthenon of Liverpool, whose architecture appropriately reaches its highest tone in the building of highest civil destination. The destruction of that building would be as great a disaster to the architectural status of Liverpool as the greatest enemy of the town or foe of architectural beauty, if there be one, could wish. A week's bombardment of the port from the Mersey might be less mischievous.

Let me respectfully submit these considerations to the attention of the Town Council of Liverpool, which numbers among its members many men of taste, and some who, from professional ability and culture, are, I know, fully alive to the merits of the Town-hall. The premium offered by the scheme of removal, which only shows how inferior the proposed site is deemed to the old one, were it increased tenfold, should weigh nothing against a building which is the chief architectural ornament and glory of the place, related to all inhabitants of taste and feeling by their sympathy with it, and possessed of a power to stir the memory, the heart, or the imagination of each, and which, once destroyed, the wealth of the Indies could not replace.

The insufficiency of space in the council-chamber complained of may surely be obviated by extension, for which there is ample space; and this is the only fault of the old building; for the protrusion of the front beyond the general line of street which has been urged, is a beauty rather than a blemish, for it heightens the effect as you approach the Hall from either direction. Let the street continue to bend round the building, which it may wish even advantage to itself, since the finest streets in Europe, and had to be shown to greatest advantage, are not those bounded by straight lines, but those which, like the High-street of Oxford, are ever changing their direction.

I need scarcely say that I have no interest but that of art and the public taste to serve by

these remarks, and design no offence to any one. But having known and loved the subject of them from infancy, I should feel myself something like a traitor to my profession and to the soul-born art of architecture were I to see it menaced without protest. Should my protest eventually prove vain, I shall still be happy to have recorded it on the enduring page of the *Builder*.

SAMUEL HUGGINS.

THE ARCHÆOLOGICAL INSTITUTE AT BURY ST. EDMUND'S.

Great efforts were made by those in authority that the meeting of the Archæological Institute of Great Britain and Ireland (so called, although during the twenty-five years of its existence it has never been established or endowed in the latter country) should not be so meagre as that at Lancaster, and the result has been very considerable success. This is a great source of congratulation, seeing how busy death has been of late years among its members, and how few young men, unfortunately, present themselves to fill up the vacant places. A book that has just been published calls to mind some former meetings, when Crabb Robinson, and his kind-hearted contemporary, Hopkinson, of Stamford, used to join in a contest of wit and experience. Since our last meeting, too, we have lost Pettit, whose critical accuracy and artistic skill were ever given to the Institute with ungrudging liberality,—a loss which causes a void that cannot easily, perhaps never may, be filled.

The success on the present occasion is the more noteworthy, also, as the political exigencies of the times left us without many of our great men. The Marquis of Bristol and Lord Talbot de Malahide were not present at the opening meeting, and we were without even a member of Parliament. The most jovial of our members who had been engaged to return thanks for their attendance, had to waste the speech that he had prepared under his midnight champagne. We had the advantage, however, of one of the most genial of mayors, to whom no small debt of gratitude is due for the pleasure we experienced and the facilities offered for the attainment of the objects which the Institute had in view.

Lord John Hervey took the chair, in the absence of his brother, and spoke gracefully. The address from the corporation was cordial and poetical. The speakers who followed acquitted themselves in a way that made us forget the fears, which the absence of the "great ones" had engendered. Lord Arthur Hervey, on behalf of the Local Society, tendered a welcome in words replete with kindly sentiment. This was seconded by Mr. J. J. Beran. The Rev. J. R. Green returned thanks for the Institute in a good speech displaying local knowledge and illustrative of the polemics of the town in bygone days. The Rev. F. R. Chapman welcomed the Institute on the part of the clergy; and with a candour not always characteristic of the clerical mind, asked absolution for the neglect of the clergy in past years in allowing the buildings which had been entrusted to their keeping to go to decay. But he hoped that the care they were now displaying would atone for their former indifference.

The business being concluded, the members adjourned to the Angel Hotel, where they were hospitably entertained by the Mayor. We then proceeded to visit the objects of interest in the town under the guidance of Mr. J. H. Parker; the remains of the abbey being the first. The destruction of the monastic buildings has been so complete that scarcely an ashlar remains to tell its story, and a mass of rubble, or a mound, is all that is left to show where mired abbot sat in state, or pious pilgrim trod. The Norman Tower, the Abbey Tower, and the Abbot's Bridge, remain to illustrate more sadly the ruin that is around them. At Moyses' Hall, or the Jews' House as it is called, Mr. Parker took occasion to say that as the Jews were the richest, they were the first to build stone houses. This does not agree with our early reacting of the persecutions of the Jews, and how they were obliged to conceal their wealth to evade the outrages of kings, barons, and priests; and even in our own time we know till what a recent day they have had to "thank God that there was a House of Lords" that kept them from their rights of citizenship.

In the evening there was a sectional meeting, at which Mr. Morant, of Norwich, read an interesting paper on the Abbey. Mr. Leo Warner

read a paper on a petition, hitherto unpublished, from the Prior and Augustine Canons of Walsingham to Lady Clove, asking her to abandon her project of allowing the Franciscan friars to settle in their neighbourhood. It was a curious petition, showing in those good old pious days, which some are striving to revive, how pounds, shillings, and pence were mixed up with the glory of God, and the ease and comfort of the prior and his canons.

On Wednesday we made excursions; first, to Clare. After visiting the remains of the priory and the castle, we proceeded to the church. On my arrival there I was convinced, of what I have before suggested in another publication, (that Dowling, who is so often quoted as an illustration of the iconoclasm of Cromwell, said "the thing that is not.") He writes "in the church of Clare I destroyed one thousand images in niches." It is a tall perpendicular church, with not a niche in it. He says also, I destroyed "the sun and the moon." I do not know how many suns and how many moons the good people of Clare required in the olden time; but there is a sun and there is a moon still in the east window. Mr. Bloxam, who, I believe, is an authority, avers that the yellow glass in the east window was of the reign of Elizabeth. If Dowling's attack on Clare church was so "thorough," how could he have left the monogram of the Virgin that is still on the finely carved wooden pew or chapel that remains? The glass that remains is more than in many places of which we have not such a detailed account of the destruction.

We then went to Long Milford Church, where Mr. Almack gave us a capital account of the manner in which he had restored the old glass. He also produced a very interesting "Churchwarden's hook," in which were entered the proceedings in connexion with the church in the sixteenth and seventeenth centuries. There are the particulars of the "cleansing of the church," in the reign of Edward VI., and the disposal and destruction of various articles. Among others it mentions an alabaster tablet, having on it a bas relief of the adoration of the Magi: this was "sold to Maister Clapton for two shillings." And, according to Mr. Almack, the said Maister Clapton buried it to prevent discovery, and it now adorns the north-east wall of the church. Verily the Reformers and the mercenary left very little for the Puritans to destroy.

We then visited the fine old halls of Kentwell and Melford, the owners of which displayed a most cordial sympathy with the curiosity that prompted our visit. The next place seen was Lavenham, where we were received by the rector, the Rev. J. M. Croker. The church had considerable attention, and a fine timber-house in the town attracted several sketchers, and invoked much interest.

In the evening there was a meeting in the Guildhall, at which a paper was read by the Rev. J. R. Green, which, I hope, will be published *in extenso*, illustrating the struggles of the Burgesses of Bury with Abbots on the question of jurisdiction, and the attainment by the people of their liberties, and the destruction of priestly domination.

On Thursday there was the annual meeting of members. The report stated that the financial condition of the Institute was very satisfactory; that efforts were being made to bring up the arrears of this Journal, so as to prevent the accumulation of papers which were read at meetings in 1869 appearing under the date of 1868. It was resolved that, in consequence of an earnest wish expressed by the corporation and other persons of Leicester, the Institute would meet at that place in 1870. The report also contained an earnest appeal for new members. Afterwards there was a meeting of the Historical Section, at which Lord Arthur Hervey (who was indefatigable in his exertions to make the meeting successful and pleasant) read an address. He pointed out the qualifications necessary for an historian, and said that "a good critical judgment was not always found in antiquaries;—" a mild reproach to those who manifest too great an intrepidity of conjecture.

A paper was read that had been kindly written for the Institute by Mr. John Bruce, V.P.S.A., on the biography of Sir Simonds d'Ewes. It was a model of what such a paper should be—short, but containing all the traits of character necessary to illustrate the mind and circumstances of the individual, the times in which he lived, and the social and political influences that surrounded him.

In the afternoon we went by invitation to visit

the Marquis of Bristol at his quaint mansion of Ickworth. After partaking of his lordship's hospitality, we proceeded to Little Saxham Church, with its round tower. Afterwards to West Stow Hall and Ikengrave Hall. The last we had visited when the Institute met at Cambridge, but time did not seem to have diminished the admiration of the fine old mansion. In the evening there was a *conversazione* in the well-stored and interesting museum. There were the cross and chain belonging to the Queen which had been found at Clare. In my poor judgment it does not seem of very ancient workmanship. That which was the source of most attraction was an autograph of Shakespeare discovered in a small book which had been sent to show the signature of Dryden and others. They had been pasted in by some collector.

On Friday there were sectional meetings, at which several papers were read. The most notable was that by the Rev. Dr. Margoliouth on "The Vestiges of the Historic Anglo-Hebrews in East Anglia." It displayed a large amount of learning and an immense deal of conjecture. He upset Mr. Parker's theory of Moyses's house being a private house, saying that it had been built for a synagogue. He even went so far as to identify the rabbi after whom it was named. The Jews did doubtless possess great wealth; but without some documentary evidence it is hard to believe that they would have employed the skilled Norman architects to raise a building that would have inspired the jealousy or cupidity of the neighbouring monastery. It may have been used as a synagogue in after years; but at its erection it was most likely a toll-house of the town, or a place where the abbot sought and wrung his dues from the people.

In the afternoon we were kindly invited by Lady Callam to Hardwick House to inspect the "Etruscan antiquities." They were described by Professor Churchill Bahington. In the course of his remarks he said it was now quite certain that the Etruscans obtained all their fiddle works from Greece; that in their bronzes and other works they had bodily copied the Greek forms and styles without any alteration or modification. He expressed great surprise that at this time any one should know so little of the subject as to describe those vases which were in the museum as Etruscan instead of Greek. The gentleman who exhibited them felt his toes trodden upon, and was sore accordingly.

After the lecture, we strolled about the lovely grounds, and forgot the disputes about ancient art, in the contemplation of modern cultivation and beauty. In the evening a large number of the members dined together. In the olden and most prosperous time of the Institute, it was the custom to have a dinner, but of late years it had been tabooed. On this occasion the experiment was again tried, and resulted in the greatest possible satisfaction and success. Mine host Guy, of the Angel, gave a most excellent dinner; every one was cheerful, and pleased. There were to be no speeches on the occasion, and of course, as is always the case when such a rule is laid down, there were plenty. But they were all of a gratulatory character, and no one could grudge that the arduous exertions of Mr. Tucker and his colleagues should be recognised with warmth of expression.

On Saturday we were again out early, pursuing our way to Framlingham. We first visited the church. The timber roof, vaulted from the corbels over the clearstory, with its fan tracery carving, caused a great number of "pattern books" to be put in requisition. We then proceeded to the castle, which was admirably, nay eloquently, described by Mr. G. T. Clark. He did not give a dry catalogue of measurements, but he re-edified it with the right historical colouring, and with appropriate sentiment, making the past give a lesson to the present. We then proceeded to Ipswich, where we were received by the Mayor, Mr. E. Packard, who entertained us at a most sumptuous banquet. Besides the usual complimentary speeches, the Town Clerk gave a useful paper on the treasures that the town possesses in the shape of old charters, books, and manuscripts. These were examined by many of the members with the greatest interest. We then paraphrased the town under the guidance of Mr. B. M. Phipson, concluding with a visit to Christ Church Hall, a very interesting and characteristic house belonging to Mr. Fomereau, by whom we were kindly welcomed. On Sunday the members, preceded by the Mayor in state, attended service at St. James's Church.

For such as could stay on Monday, there was an excursion to Hangleigh Castle, Cipping Witherden, Woolpit Hesse, and Rougham churches, and Rushbrooke Hall, showing that there was no lack of objects to exercise our criticism, improve our taste, or add to our knowledge. The meeting was more numerously attended than at Lancaster, though a visitor who travelled down on the Monday might have anticipated a larger congress from the way in which a few taxed the resources of the Great Eastern Railway Company. At Marks Tey Junction there was not an extra carriage to be obtained, and the crowding of the three or four carriages that ply between that important station and Bury was so great that a gentleman whose passion is for Early Italian Art was compelled to go in the luggage-van, and his wife and daughter were seen sitting on their boxes like servants waiting for an omnibus.

There can be no doubt in any one's mind that the meeting was a success, and if we inquire to whom this was due, the Ven. Lord Arthur Heryng must have the first place. His graceful courtesy and kind consideration of every one; his cheerful and unfeigned participation in all that was done, will be long remembered. The next place must be awarded to Mr. Thompson, the mayor, through whose instrumentality every one must have carried away a most agreeable impression of their pilgrimage to Bury St. Edmund's. F. S. A.

FOUL AIR IN A SEWAGE TANK AT LIVERPOOL.

It being intended to turn on the sewage into the tank at the Sandhill pumping station, a man in the employment of the Sewage Company went down into a tank to do something to a valve. Immediately on descending he was overcome by foul air which had accumulated in the tank, and fell down. On perceiving this, Mr. Charles Beloe, C.E., who is engineer for the works, bravely, but inconsiderately, went down to assist the poor man. Immediately on reaching the bottom of the tank Mr. Beloe was, of course, also overcome, and fell to the floor. Another person, as is usual, then went down, and also fell. All three were brought out in a state of prostration and insensibility. The last who went down was found also to have sustained a very severe scalp wound. It is very strange that the frequent repetition of this same sort of thing does not prevent its further continuance. Where one man is overcome by foul air, how can another resist it? If there be the least suspicion of the accumulation of foul air, a light should be lowered down first. Where a light will not burn, there a man cannot breathe. But if a man descend and become insensible, and another be induced to follow, he ought, at least, to be tied with a rope, and so soon as he can fasten one around the fallen man, both should be lifted out without a moment's loss of time. Where carbonic acid gas has accumulated, however, it ought, first of all, to be cleared out; and perhaps the best way to do so is to pump it out, for though invisible, it is like water in this and other respects. When pumping apparatus cannot be had handy, quick lime in large quantity might be scattered about so as to absorb the gas. Setting fire to anything to clear it away is worse than useless, for it only adds more carbonic acid gas to what has already accumulated. A not bad plan, where more effectual means are not at hand, is recommended in the *Albion*, namely, tying bulky carpets, &c., into a wisp, and plunging them in and out repeatedly. This may mix good air with the foul, but it will not clear away the foul air as pumping or a sufficiency of lime would do.

THE OFFICE OF WORKS.

In the House of Commons the other night, on the report of supply being brought up, — Mr. Solator-Booth, referring to the report on the vote for the Board of Works, complained of the arrangement by which Mr. Pennethorne had been removed from his office, and another architect (Mr. Fergusson) appointed in his place. He contended that the arrangement was unjust to an old public servant, and led to an increased charge on the public funds. Mr. Layard said, it appeared there was not a single person in the Office of Works to check any part of the enormous outlay on them. Mr. Pennethorne was a practising architect, and was receiving 5 per cent. on every shilling expended. The system was a false one which led to the employment of Mr. Pennethorne to look after the

buildings. Thinking it necessary to have some disinterested person attached to the office to give advice to the First Commissioner, he selected Mr. Fergusson, whose appointment had given general satisfaction, who had already effected a large saving to the public, and who, if appointed some years ago, would have prevented much extravagant expenditure.

After some remarks from Mr. Ward-Hunt on the one hand, and Mr. Ayrton on the other, the former condemning and the latter justifying the arrangement, the report was agreed to.

We have before us a Copy of Papers relating to the recent changes in the Office of Works, from which it would seem that there has been a bit of a mess. We cannot, however, just now go into the matter.

ANCIENT DECORATION.

At the recent successful congress of the Bucks Architectural Society, Mr. J. H. Parker made a suggestion that at these meetings a photographer should accompany the members, who might take instructions what objects were most worthy of being reproduced, and who might take photographs within the next week or two. Local societies might thus, by means of exchanges, know what was being done elsewhere. This plan was adopted in Somerset and Kent, and he hoped that it would be more widely extended. Archaeology was perhaps more indebted to photography than any other science. It was impossible that a drawing could represent, for instance, the joints of the masonry, which were often a guide to the date of a building.

The Rev. H. Bull read a paper on the Frescoes in Lathbury Church. The writer commenced by referring to the almost universal custom of decorating places connected with divine worship, and alluding to the catacombs, he observed that the earlier paintings, some of which reach back to an earlier date than is usually supposed, are characterized by a calm and cheerful tone. Very few forms of human suffering are here exhibited—not even the Crucifixion, the Passion, or the Day of Judgment. "The Good Shepherd," Miracles of Mercy, and similar subjects are chosen in preference. As we advance to Medieval times, we come to legends of the saints, the Day of Judgment, and subjects of a darker and severer type. The paper then proceeded to describe the remains of the frescoes, which are not properly so called, being done in what is termed distemper. Mr. Bull remarked that the chance being less visible to the people was probably on that account least profusely illustrated (but Mr. Parker observed that he had known instances in which the chance was more richly ornamented than any other part). In the chancel of Lathbury Church is a design representing a vine branch, and on the other side of the communion-table is the quotation from John vi. 53, "Whoso eateth my flesh and drinketh my blood," &c., which, belonging to the period of the Reformation, is worthy of notice. In the south of the chancel is a quotation from the Corinthians, in Wycliffe's Bible. The designs which occupy the arcade to the north and south of the aisle appear to represent the sacraments of the Church—one evidently referring to extreme unction. Another design represents the favourite subject of the weighing of souls, and another is supposed to represent Cain after the perpetration of his crime. It was perfectly clear to him from personal observation, that from the earliest period in the history of the Church, every place of assembly for Christian worship was decorated with colour, as far as the means were available. Up to the fourth century, when what was called the "peace of the Church" was established by Constantine, the early Christians could only meet in the halls of their own houses,—whence the name *basilica*. But from the earliest time when they were permitted to have churches at all, they were decorated with pictures and mosaics as far as possible. They were all aware that the early paintings were Scripture subjects, and it is not until the eighth or ninth century that we have the legends of the saints. With regard to the material used, he did not know what might be the case in this particular instance, but generally the ochres were employed, which, being the natural colour of the earth, never changed. These were fixed with sizes of various kinds. Properly, fresco was work done while the mortar was wet, and work done subsequently was termed distemper. In the catacombs were drawings certainly from the fourth and fifth century down-

wards. In the churches of Rome there was a series of mosaics which compare with those to be found in the catacombs. In the time of Charlemagne there was a great revival; many mosaics were put in the churches, and many new frescoes were painted in the catacombs; but whether some of these were in most instances repetitions of old ones it is difficult to say. Many of them were clearly additions, not corresponding at all with the early work. He did not attribute any dishonesty to the later work, but change of fashion made it different. The principle of decorating the House of God was one adopted by the Catholic Church from the very earliest antiquity.

THE OPENING OF LLANDAFF CATHEDRAL.

The ancient cathedral of Llandaff may be said to have been rebuilt between 1811 and 1870, mainly under the superintendence and from the designs of Mr. Pritchard, architect.

The last and most important part of the work of restoration has been the repairing of the north-western tower, and the erection of the south-western one. The north-western tower has been simply restored, repaired where necessary, but the main features remain as they were at the time of its erection by Jasper Tudor. It has been surmounted by an elaborate, lofty, pierced battlement. The greatest work of the whole is the erection of the south-west tower, the foundations of which were laid in 1853, but with not the least hope that the work would be accomplished in this generation. The new tower is built externally of wrought ashlar work, of different descriptions of oolites, harder in their texture than that of the Bath quarries. The bulk of these stones came from the Dundry and Campden quarries, the latter stone from its golden tint imparting a cheerful and warm expression to the work. The lower part of the tower, internally, up to its groined ceiling, is lined with Bath stone, but from its first-floor upwards it is lined throughout with strong flat bedded stones, from the Kadyr quarry, which is composed of conglomerate of red limestone. At intervals there are thick, strong, bond courses of this material, formed of huge stones dovetailed together with lead. There is no symptom of a settlement, though the building has attained the height of 195 ft. 7 in. to the top of the vane, the lower stage of the tower being groined. To resist this thrust, massive buttresses project at the west, south-west, and south-east angles, which, as soon as they have discharged the duties required of them, terminate in open canopies, with pyramidal roofs. Each canopy contains a figure,—that of the west, St. Peter; that of the south-west, St. Paul; and the south-east, Bishop Olivant. The tower, exclusive of the spire, is 104 feet to the top of its parapet, and is divided into three stages. The first is within the church, and is groined over, being lighted by two windows in its west and south faces. The second forms the ringing-floor, and communicates with the passage in the triforium; then above this comes the grand heltry stage. It is recessed back within two broad piers at angles, forming a pannel, as it were, shelving up by laminated courses to the cells of the windows, and again brought to the original face of the work over the windows by a machicolated cornice. Above the machicolations runs a cornice, with angles adorned by the common insignia, acting as gargoyles, and over the cornice comes an arched parapet. The contractor was Mr. Williams.

SANITARY MATTERS.

The official inquiry into the state of the Thames at Barking, has been going on. Mr. Bidder and Mr. Hawksley were of opinion that the sewage outfall could not affect Barking or cause deposits to obstruct the navigation of the Thames. Mr. Gregory, C.E., saw nothing objectionable at the outfall works. Furthermore, Dr. Miller and Dr. Odling, who analysed the mud from Barking Creek and other points, reported that it was not exceptionally unwholesome. Mr. M'Dougall, one of the surveyors of the Metropolitan Board, was examined, and maintained that there were just such deposits of mud in Barking Reach, and on the Kent shore, and other parts of the river, before the establishment of the northern outfall works as now, and that the sort of mud was the same. Mr. Bazalgette said the memorial on which the inquiry was

based was purely imaginative and contrary to facts. No sewage from the northern outfall ever got into Barking Creek. The water at the town quay at Barking was worse than at the creek's mouth. He had seen a sewer discharging black and offensive mud into the creek at low water, and a barge of manure lay at the quay side, and gave off an offensive odour in the neighbourhood. The site selected for the outfall was the best that could be obtained, all circumstances being considered. Mr. Hawkshaw stated that in his opinion the sewage discharge from the northern outfall contributed very little, if at all, to the accumulations at the mouth of the creek. That portion of the river was prevented from being kept free by the form of the shore, and the Gas Company's pier now building would aggravate the evil. He considered the site of the present northern outfall the best that could have been fixed upon, bearing in mind the question of cost. He should, of course, prefer the sewage being wholly diverted from the river, provided it could be used for agricultural purposes, so as to prove commercially remunerative.

In the Commons, in answer to Mr. Dodda, Mr. Knatchbull-Hugessen has stated that the report of the Rivers Pollution Commission would be presented shortly, but he was afraid not before the end of the session.

Dr. Stephenson, one of the district medical officers of Mile-end has died after an illness of nine days' duration, from fever caught while in the performance of his duty. Ten days before his death he was in attendance upon two serious cases, one in the filthy houses in Edward-street, so emphatically condemned by the coroner's jury, and the other in St. Dunstan's-road. Dr. Stephenson was remarkable for his unremitting attention and personal kindness to the poor who were under his charge.

The *Clarkenwell News* reports a case to show how fever is engendered in St. Pancras. The owner of 56, College-street West, Camden-town, appeared before Mr. Barker to answer a complaint made by the Vestry of St. Pancras, for keeping a pony in the yard of 56, College-street West, so as to be a nuisance and injurious to health. In consequence of complaints having been made by the residents of College-street West, Dr. Stephenson, the medical officer of health to St. Pancras vestry, in company with Mr. Roach, the sanitary inspector, went to 56, College-street West, and found in the back-yard a small stable with a pony in it. The stable was about 6 ft. from the house, and was injurious to the health of the persons who resided in the house. The owner of the stable was cleaning it out, and a very offensive effluvia arose. The stable had been whitewashed since the inspector had called, but it was still a nuisance and injurious to health. It was stated that the pony was taken through a bedroom to get to the stable. Mr. Barker made an order for the removal of the nuisance in fourteen days.

Fever has broken out in Babylon, a place situated opposite the Wateraide, Ely. The cottages where the fever exists are in a very filthy condition.

RUGBY.

Sta.—There are few Englishmen to whom Rugby Junction is not familiar, but there are many who neither know nor care what manner of place Rugby is. The people of Rugby, like Sir Christopher Wren, have gone to Rome or to Euston Station for their type almost to a man. The pediments and pilasters, cornices and cantilevers of the latter are repeated a thousand times, and the inhabitants appear to believe that no building is safe without these, and that the safety of the structure depends as much upon the proportion of them as upon the things themselves. The houses being all freeholds, this peculiarity can be accounted for in no other way. The only tenable one left is that there may be an impression that nothing without them would pass the local Board, which is certainly an error, or Mr. Butterfield's extraordinary design would not have passed, in which there is more invention displayed than in all the other buildings. Precedent is set utterly at defiance in it, both in its details and in the proportion of them. It stands like an oasis in a desert. It is well to make use of the brains of our forefathers and of the inventions of foreign brains when we lack them ourselves; but when we have them, let us use them by all means, and this Mr. Butterfield has insisted upon. His design displays thought, and stands like a protest against the works of the poverty-stricken brains

that surround it. Of course, these stiff sticklers for precedent condemn it as sensational, and "we are a prudish law-abiding people, who would not take a shunter down on Sunday, or use a brick that was not exactly 9 in. by 4½ in. by 3 in. to save a fellow creature's life, and we want no sensation here."

That Mr. Butterfield has been so successful in his design for the additional buildings to the great school as he generally is, admits of a doubt, but as an original work the design is highly commendable. Another word of praise is due to Rugby. The streets are broad, and so clean that one cannot help wiping one's boots before stepping out into them; they are likewise rendered deliciously cool by chestnut, sycamore, lime, laburnum, and beech trees, so that every street is a classic grove, in which Minerva peacefully passes her days, free from the excitement of Diana or the griefs of Venus. I.

DESIGNS FOR THE PLYMOUTH NEW GUILDHALL.

The designs sent for competition for the erection of the Plymouth New Guildhall and Public Offices have been arranged in the tea-room of the Loyal Hotel. There are twenty-six designs. The majority are Gothic in style. Many of them are adapted to the locality and for the uses to which the building will be devoted. Some of the designs are most elaborate, and the architects do not hesitate to say that if these were selected, the cost would exceed from 10,000, to 15,000, the stipulated sum as to the cost, fixed by the corporation at 20,000, to 25,000. Two modes of laying out the site have been adopted. In most of the plans the buildings are arranged in two blocks, the Guildhall forming one and the Public Offices the other, leaving a kind of court or public place between them. The Guildhall building in many of the designs is surmounted by a tower, and in some of them two towers are introduced; whilst in others the fine old tower of St. Andrew's Church has been thrown into conspicuous prominence in the arrangement. The designs are open to the public for inspection, by tickets, which may be procured on application at the Guildhall, until the 3rd of August next.

DRAWING AT A DISTANCE.

The account which you have given in your number for July 17th, p. 560, of the manner in which M. Revoll,—whose admirable work on the Romanesque Architecture of the South of France ought to be in the hands of every lover of Early Art,—has combined the use of the camera lucida, and the telescope, is interesting to every artist who desires to transfer to his sketch-book architectural details situated beyond the limits of ordinary powers of vision.

Justice to others, however, who realized long ago what M. Revoll no doubt honestly believes to be a recent invention of his own, obliges me to resist the claim of originality in this matter to which you apparently lend your countenance in the article I refer to. Thirty-four years ago Professor Miller, of Cambridge, recommended to me the application of a small speculum, or steel mirror, of about the eighth of an inch in diameter, to the eyehole of an ordinary telescope, for the purpose of presenting,—after the fashion of the camera lucida,—when inclined at the necessary angle, and on looking downwards, an enlarged reflection, on a sheet of paper placed at a given distance, of any object towards which the telescope might be directed.

I succeeded, after some trouble, in obtaining one of these small mirrors, from the watchmaker at Vienna who made them, and in adapting it, with Professor Miller's assistance, to a telescope of moderate power; and for seventeen years I used this instrument with the greatest advantage in all cases where the distance or the inaccessibility of the object to be drawn rendered enlargement necessary, my first successful effort with it being a panoramic drawing, 12 ft. long, which I still possess, taken from the roof of the parish church of Lancaster, of the opposite shore of Morecambe Bay, fifteen miles distant, extending from Peel Castle on the south-west to Arnsaid Knot on the north-east, and including the well-known outline of the Lake Mountains.

At the Great Exhibition, however, of 1851, I fell in with an instrument specially designed for and adapted to this object, and greatly superior to that which I had hitherto used. This instrument was invented, patented, and made by

Varley, the optician, and brother of the well-known water-colour artist; he called it the Patent Graphico Telescope. The advantages which this instrument possessed over that which I had formerly used, consisted chiefly in its portability; in the firm and convenient manner in which it was attached to the drawing-board; in its powers of adjustment; and in its diminished telescopic power, not exceeding that of an ordinary opera-glass; and in its consequently increased field of vision.

This instrument has been my constant companion for many years past, and I think I may venture to recommend it to M. Revell as, in all probability, a considerable improvement on that of which you have given a description, and which appears to me, from that description, to resemble more nearly in its combinations my earlier instrument of 1835.

I am not aware whether Mr. Varley is still living, nor have I ever met with any one else who knew of or used this instrument; but I quite agree with you in thinking that there are many uses—pictorial, military, and scientific—to which it may be advantageously applied.

EDMUND SHARPE.

SANITARY PRINCIPLES OF COTTAGE IMPROVEMENT.*

A FEW days ago, Mr. Edwin Chadwick invited the committee of the Ladies' Sanitary Association, the council of the Society of Arts, and a number of other distinguished persons interested in the sanitary improvement of dwellings, to his house at East Sheen, for the purpose of showing some new forms of construction, and especially for displaying a mode of ventilating with air—warm as well as fresh—arranged by Captain D. Galton, R.E., in a new model cottage, occupied as a gardeners' lodge, attached to his house, on principles which were explained in an address. We publish in our present issue illustrations of the lodge, including details of the warming arrangement, and let Mr. Chadwick explain them in his own words:—

I shall have difficulty in conveying, within any compass, for this occasion, my sense of the great importance of the rising movement which may be aided by the principles of the construction of the very humble-looking little cottage to which I have heaped the honour of your visit. The sanitary object attainable by the improvement of the dwellings of the wage-classes is no less than a reduction of nearly half the prevalent premature disability from sickness, and half their mortality, which is proved to be due to the conditions in and about their dwellings, including overcrowding. The Society of Arts has promoted new arts, such, recently, as pinculture and oyster-culture, which are being earnestly pursued, with a special solicitude as to the habitat of the creatures as the chief means, and it may really befittingly promote, as a new, or as a neglected art, on which the progress of other arts must depend, pinculture, for which earnest solicitude as to the habitat is also needed, and for the result of which there is great promise; for we have had of late evidence attested by medical officers and heads of establishments that is consolatory for past efforts of sanitary improvement, displayed in district orphan asylums of the metropolis, most striking to those who have visited them, as I have done, after lapses of time; that as the common lodging-houses have been regulated under Lord Shaftesbury's Act, and the low courts and dwellings—former fever-nests—from which these orphan and destitute children chiefly come, have been improved by rudimentary measures of a sanitary police, the type of children has been improved; they are less ugly, and ferocious, and repulsive in their aspect, and the school teachers attest that they are less difficult to teach and to train industrially. In this view I may, I hope, suggest to the noble ladies of the Sanitary Association that the principles in question have, moreover, claims upon them in respect to the extension of an improved order of marriages, and the reduction of a demoralising celibacy amongst the wage-classes; for, of the million and a quarter of men of the marriageable ages who remain single, has it been seriously considered how many are withheld from marriage by the want of hefiting homes? how many are deterred by having only places presented to them which are dark and filthy, deprived of due light and air (yet dear) to which

they could take a partner? how many are deterred by the aspect of squalid misery they witness on the part of the married, of whom, in Manchester, Liverpool, and Glasgow, even in times of prosperity, large proportions of the children are born only to die; and, of all born, one-half, as Dr. Farr's dire records show, are in their graves before their fifth year? Of a sound, well-trained, industrial, self-supporting, and productive population, I assert as an economist, that notwithstanding the present depression, our country needs more population, especially to supply the increasing claim by emigration, which is commonly of our best population, leaving larger proportions of the dependent, the pauperised, and the worst; but practical sanitary science affords brighter prospects. Large aggregations of orphan and destitute children in the institutions, such as those to which I have referred, were formerly, notwithstanding high dietaries, the seats of devastating epidemics; but now, with clean air, clean persons, and clean constructions—with yet much to do—these same institutions have become sanitary standards, with death-rates less than one-fifth of those prevalent amongst children of the same ages of the general population. My confident belief is that, by the rudimentary sanitary principles and practical sanitary art, to which I would now solicit your attention as applied in the model cottage, you will see the death-rate amongst children and the common insurable disability to work on the part of adults may be reduced to one-third of what it now is. In various model dwellings the death-rates have been reduced by about one-third, but, unhappily, with economical results which do not encourage, and, indeed, rather discourage, imitation. By the application of the principles of construction you will see displayed, I have a confident expectation that the greatest reduction may be effected, with a better promise of a "commercial return." The great sanitary evil to be contended against in cottage and house site and the habitat for pinculture is damp, which lowers temperature and lowers strength; generates painful diseases—rheumatism—and, lowering strength, predisposes to all other passing causes of disease, and especially to consumption. The first article to be insisted upon in a sanitary specification is, that by drainage of the site if it be necessary, the water-table shall be lowered not less than 3 ft. below the surface. Throughout the country it has been of late observed that a diminution of consumption has followed good subsoil drainage works. In this particular instance, the site being a deep gravel, in which the water-table is several feet below that minimum, there was no necessity for this precaution. My first condition of a sanitary preparation, as respects the construction of the house itself, is "that the flooring shall be impervious to rising wet, the walls to driving wet, and the roofing to falling wet or to snow, and that they shall be absolutely damp-proof." As illustrative of the conditions of the common construction, I may here mention that the common bricks of which cottages are made, absorb as much as a pint or a pound of water. Supposing the external walls of an ordinary cottage to be one brick thick, and to consist of 12,000 bricks, they will be capable of holding 1,500 gallons or 6½ tons of water, when saturated fully, which they sometimes are. To evaporate that quantity of water would require nearly a ton of coal well applied. These bricks give off their moisture slowly. It is unsafe to inhabit, in less than nine months or a year, the houses constructed of the common materials, and almost a double death-rate has attended recently the occupation of a brick-huilt model dwelling. When I examined, as a reporter, the model dwellings built at Paris by the Emperor, I found the appearances of damp on some of them that had been built two years. The cottages who showed one block had her head bound up, and was suffering from an attack of rheumatism, connected with the dampness of the houses. The Empress has since paid attention to the subject, as I am informed, and I hope with better effect. But it is proper to mention, as showing what may be expected, not merely from architectural science as it is, but from curative science when uncombined with preventive or sanitary science in construction, and also to show that the poor are not the only persons who suffer, that the medical officers at the recently-constructed hospital at Netley have been afflicted with rheumatic fever, arising from the excessive dampness of the brick construction of their quarters. Some military officers' quarters, constructed not long ago at Dover by an eminent

civil architect, chiefly, I believe, of stone,—which is often as bad as brick,—were, I am assured, so damp, that it was found to be impossible to occupy them, though they had cost 1,000*l.* each. A gallant friend who, the other day, examined the cottage I shall show to you, exclaimed, "What superior officers' quarters such cottages would make," though they would cost one-tenth the sum expended on the damp construction at Dover. I think it right to mention these things in illustration of the common state of information on the question. The opportunity of my constructing a model cottage, as I may call it, arose from the need of erecting a new lodge for my gardener and his mother, in lieu of one enlarged from a two-room to a three-room cottage, built by my predecessor as tenant to this house, my learned friend, the Hon. Augustus Liddell. He is a man, as every one who knows him is aware, of solid virtues, who would be the last to do harm to any living creature. If he happily had had a ray of sanitary science, he would have been aware that in keeping the poor woman in that cottage he was victimising her, as happened, with rheumatism, from the damp brick floor and the damp walls and ceiling. His regret at what he unwittingly did to this poor old woman by the common error will be sharpened when he learns that it was at double the expense of the construction by which I trust she will now be relieved. Parliament has—what shall I say—conferred great sanitary powers, not upon a Minister of Health, but, of all men, upon the Secretary of State for the Home Department, from whose visible occupation with other subjects you may see what is his power of attention to that subject. Now, it may be mentioned, as a point of observation for the Sanitary Commission now sitting, that his only adviser within the office, so far as I am aware, for the selection of sanitary officers and the exercise of very large sanitary powers must be, on very important questions for the health of populations, the permanent Under-Secretary of State, my predecessor here, the Hon. Augustus Liddell, who, I should be glad to hope might find, amidst the multiplicity of his other duties, any smallest scraps of time to amend his deficiency of sanitary knowledge, of which his old lodge, which you may see, may be presented as a monument. His late lamented Royal Highness the Prince Consort, with whom I had correspondence on this question, accepted completely the principle of the dry, damp-proof construction, and endeavoured to apply it by hard-burned hollow bricks, glazed for interior wall facings. I undoubtedly consider that a construction of vitreous tiles or bricks is the best possible, but for trade reasons, stated in my report on the exhibition of model dwellings at Paris, they are unattainable at present. The late Captain Fowke first directed my attention to concrete, as the most advantageous and the cheapest material available for cottage construction, and gave some specimens at the South Kensington Museum. Portland cement is a stronger material than Roman cement, and, as was shown at the International Exhibition, its use is extending throughout Europe. These who wish to be informed particularly in relation to it will find all about it in the report of the Children's Employment Commissioners,—that it originally imbibes less water than the common brick material, parts with it more rapidly, hardens, and becomes utterly impermeable to water. My specification, "that the walls and ceilings shall be impermeable to water or damp," is complied with in this instance by the contractor, Mr. Nicoll, with a new material of wall and roof construction, of which Portland cement concrete forms a part. You may imagine, as adopted for houses, the Crystal Palace principle of construction, with iron framing and h arers, but instead of glass opaque slabs, made of a web of straw compressed to about one-fourth the space of loose straw into a mat or web, which is spread over a framework of iron wire. Upon this compact web of straw, layers of hard bitumen are put on both sides. Over the bitumen is placed a layer of concrete. If the bitumen be of sufficient thickness and hardness, and properly spread, it appears impossible that wet can penetrate that walling, although the outer layers of concrete might, if not well made, for a time imbibe some portion of moisture. The straw, kept dry—and it should be kept completely dry,—by the bitumen—is, as we know, a non-conductor of heat, and the bitumen should be preserved in hot weather by the non-conducting power of the outer layer of concrete, which is an entire non-

* See p. 607.

conductor of damp. Mistakes have been made with the first attempts, in carrying the economy of the iron framing too far, and occasional cracks in the roofs; but two years and a half's experience of a lodge on this principle of construction at South Kensington is very satisfactory. The next articles of a sanitary specification applicable to cottage construction are, "that the wall shall be washable," "that it shall be such as not to harbour vermin," and "that it shall be of a light, agreeable colour."

It is a sanitary rule, as applicable to closely occupied dwellings, that the walls shall be cleansed at least once a year, and some authorities have required that it shall be done at least four times a year. To provide for lime-washing it has been provided that the brick walls of the Pashody and other model dwellings shall be kept here. At the Board of Health, at epidemic periods, when houses were struck with fever, we ordered the inmates to leave, and the houses to be cleansed. In some instances the orders were disobeyed, and fresh population came into the uncleaned houses, and they were attacked with fever, proving the deleterious quality of the deposit on the walls. The cost of lime-washing, as often as it is required to be repeated, is a serious tax. In hospital construction the cost of the washable wall-facings is often as much as 10s. a superficial yard. You will see the sort of wall-facings that have been given by Mr. Nicol in several rooms of the cottage, at from one-tenth to one-twentieth of the hospital prices. The way in which the sanitary specification that the floor shall be of good non-conducting material, and be watertight and damp-proof, you will see is attained by squares of the cheaper wood laid upon a layer of bitumen. The occupant alleges that this flooring, which you will see, is a great immediate improvement in comfort. So far as the shell of the cottage is concerned, it is submitted that it is an improvement in the principle and the quality of construction upon the common dwellings. If the workmanship be good,—and the contractor ought to be held to make good for a period of time all defaults from the sanitary specifications,—I do not see that the dilapidations will be greater, and I do believe they will be less, than in the common constructions. The contest is for reduction of price as well as for improvement in quality, and the economy may be achieved at the expense of stability, unless the point be guarded against; but at the worst I do not believe that the new construction can be so bad as the more common old one.

Constructions in most forms of entire concrete walling appear to be better in quality, and may be lower in price, than brick, where good sand or gravel, or other wall material, is close at hand. But if the 3-in. walls of this cottage construction have sufficiently good non-conducting power, or as good non-conducting power as the common 9-in. walls at the same price, they give an important gain in space. The cottage, you will see, has a gain of 564 cubic feet of interior space from 3-in. instead of 9-in. walls; and, by having the entire space up to the roof, there is a gain of 720 cubic feet, or 1,284 feet in all; that is to say, space such as in some constructions would be considered to suffice for two more persons. This is an undoubted gain for the next great point of a sanitary specification:—That the ventilation shall be (that is to say in cold weather) with air that is warm as well as fresh." All common modes of cottage ventilation ventilate by cold air, and are almost invariably contended against by the inmates. This method of ventilation, invented by Captain Douglas Galton, of the Royal Engineers, by a fresh-air flue, and warmed by it, has been experimented upon in this country, and tried in a number of barracks. It has been tested by Dr. Park, of Netley, as to the hygienical condition of the warmed air, which he pronounces to be satisfactory, and he tells me that he intends to apply the principle to his own dwelling. It has also been carefully tested in many experiments in Paris, by General Morin, of the Institute, and, undoubtedly, it is in principle a decided success. The soldiers in the barracks warmed by it declare that they are no longer, as heretofore, roasted in front whilst they are frozen behind. By this method the air may be changed three times an hour, and more; and nearly 50 per cent. of the chimney heat, now wasted, brought back into the room. Though the ventilation is, of course, the most active when the fire is alight, it was found, upon experiment, that from the continued warmth of the flues and the mass surrounding the flues, the change of air effected

was considerable, even as late as six o'clock in the morning. The concrete is peculiarly adapted for the construction of tubular smoke and air flues at a cheap rate. This, as far as I am aware, is the first instance in which the important principle has been applied to a cottage, and until we have a winter experience, it cannot be pretended that the best adjustment of the fresh-air flue, and the means of warming it by the chimney flue, has been attained. According to General Morin, it is a means of saving 50 per cent. of the coal consumed in domestic fires, and the estimated consumption of coals in our domestic fire-places is 50,000,000 tons of coals annually. I commend to your notice a newer arrangement, by Mr. Nicol, by which the same fire-place that gives radiant heat, and warming, and ventilation to the front room, keeps a boiler and an oven at work in the next. This is already reported, on trial by the housewife, to be a success. To those who are accustomed to the box-beds of Scotland, his new form of bed, folded up to save cottage space, may be commended for notice; also his mattress, made of seaweed, and his reversible table. In conclusion, I may state for consideration another article of a sanitary specification, which will be realized here:—"That the complete construction of the house shall be such that if it be left clean, unoccupied, and closed for any time, it shall remain dry, free from any close, mussy, or foul smell, and shall be immediately habitable, without the need of fires or of any special preparations for safe occupancy in winter or in summer." This cottage is detached, and unconnected with any system of sewers; and the plan in use here is a movable pail under a seat, into which pail is to be put all the soap-suds, house-slops, &c., which serve to dilute excreta, the whole being removed daily, or before decomposition can commence, and deposited in a trench, or applied at the discretion of the gardener as liquid manure, the principle of the plan being to take the manure to the prepared soil, instead of bringing prepared soil to only a part of the house manure, as is the principle of the earth-closet system. Where the house is connected with a public system of sewerage, which, it is to be hoped, would be a self-cleansing system of sewers instead of sewers of deposit, which are only extended cesspools, the fundamental item of a sanitary specification, I take occasion to state, would be in the following terms:—"The house shall be provided with a water-closet on the syphon principle, so shaped, and so provided with water as to be effectually self-cleansing throughout, and to remove at once from beneath the premises all fecal matter or waste water, and to be so trapped as to prevent the ingress of vitiated air from the sewer in the event of accidental stoppages, and to be at all times free from foul smells.

Now, as to the cost of this cottage construction, my conclusion is that an improved cottage construction, on whatever principle, will be only obtainable when cottages become a manufacture (which is not yet), with the advantage of much machinery for the repetition of numbers. I think acknowledgments are due to Mr. Samuel Sharp, the architect, and to Mr. Nicol, the contractor, for their steady efforts to reduce and to keep down prices. I am assured by them that detached cottages, such as the present specimen, with 4,800 cubic feet of internal capacity, may be repeated in half a dozen at a time for about one hundred pounds each; or, if a dozen cottages in a row (where it must be so, for I do not like cottages in rows) be taken of the same qualities, guaranteed damp-proof, but without decorations, at about eighty-five pounds each. These (apart from the present main question of quality and economy in use) are, as far as I know, important reductions in prices. To the members of the Ladies' Sanitary Association, who do so much with little money, who have circulated such admirable tracts on the sanitary treatment of children and on domestic management, I respectfully commend the promulgation of sanitary principles for the improved construction of the people's homes. The first of these principles are the requirement by specification of dry foundations, of dry and warm floors, of perfectly damp-proof walls and ceilings; walls washable and fair to see, and means of ventilation with air that is warm as well as fresh, a saving of half the common consumption of fuel, and really comfortable homes. To my colleagues of the council and to the members of the Society of Arts, I venture to commend the consideration of the perfectionment of the arts and appliances by which these several ends may be best attained for the poorest of the population.

THE GERMAN HOSPITAL, NEW YORK, U.S.*

This hospital is to be built on the ground enclosed by Seventy-sixth and Seventy-seventh streets, and Lexington and Fourth avenues. It will be constructed on the principle of separate pavilions, and, when fully completed, will consist of seven buildings, and cost about one million of dollars. The present project is to build two pavilions, an administrative building, a laundry, and an engine and boiler room.

Each pavilion will be 167 ft. long, and 52 ft. wide at the ends, and the centre, in which are the wards, will be 30 ft. wide. The pavilions will have cellars, basements, first and second stories, and attics. The principal wards on the first and second stories will be 106 ft. long, 27 ft. wide, and 16 ft. high. They will accommodate thirty-two patients each, allowing 1,431 cubic feet to each patient.

At one end of the pavilions adjoining the wards will be the physicians' and nurses' rooms, convalescent and dining halls, pantry, scullery, linen-room, hoistway, dumb-waiters, and a stairway 6 ft. wide, with a platform at half the height of the story.

At the opposite ends of the pavilions will be water-closets, baths, and lavatories, separated from the wards by a lobby.

The wards are to be warmed with hot air, the air being heated by coils of steam-pipes arranged in chambers in the cellar. The cold air is to be conducted by these chambers from a large air-shaft outside the building, receiving its supply some 30 ft. above the surface of the ground.

The basement is to be devoted to accident and ophthalmic wards, examining and store rooms, closets, &c. The attic is to be appropriated to private wards, attendants' rooms, tank, and ventilating chambers. Each pavilion is to have a surgical operating ward. The laundry will be 42 ft. by 60 ft. The administrative building will be 60 ft. by 80 ft., and will contain in the basement, the principal kitchen, apothecary's room, an laboratory, servants' dining-hall, and store-rooms. The upper stories will be used for offices, officers' sleeping apartments, &c.

On each side of the first floor of the pavilions will be balconies. There will be a dead-house, post-mortem examination-room, morgue, &c. The grass-paths, neatly laid out with fountains in the centre, will be between each end of the administrative building and Fourth and Lexington avenues. The building will front on Seventy-seventh-street. It will have a slated Mansard roof, and a high dome on the central building. The front will be of Philadelphia brick, and the cornices and window buildings of cream-colored stone, brought from the vicinity of Cleveland, Ohio.

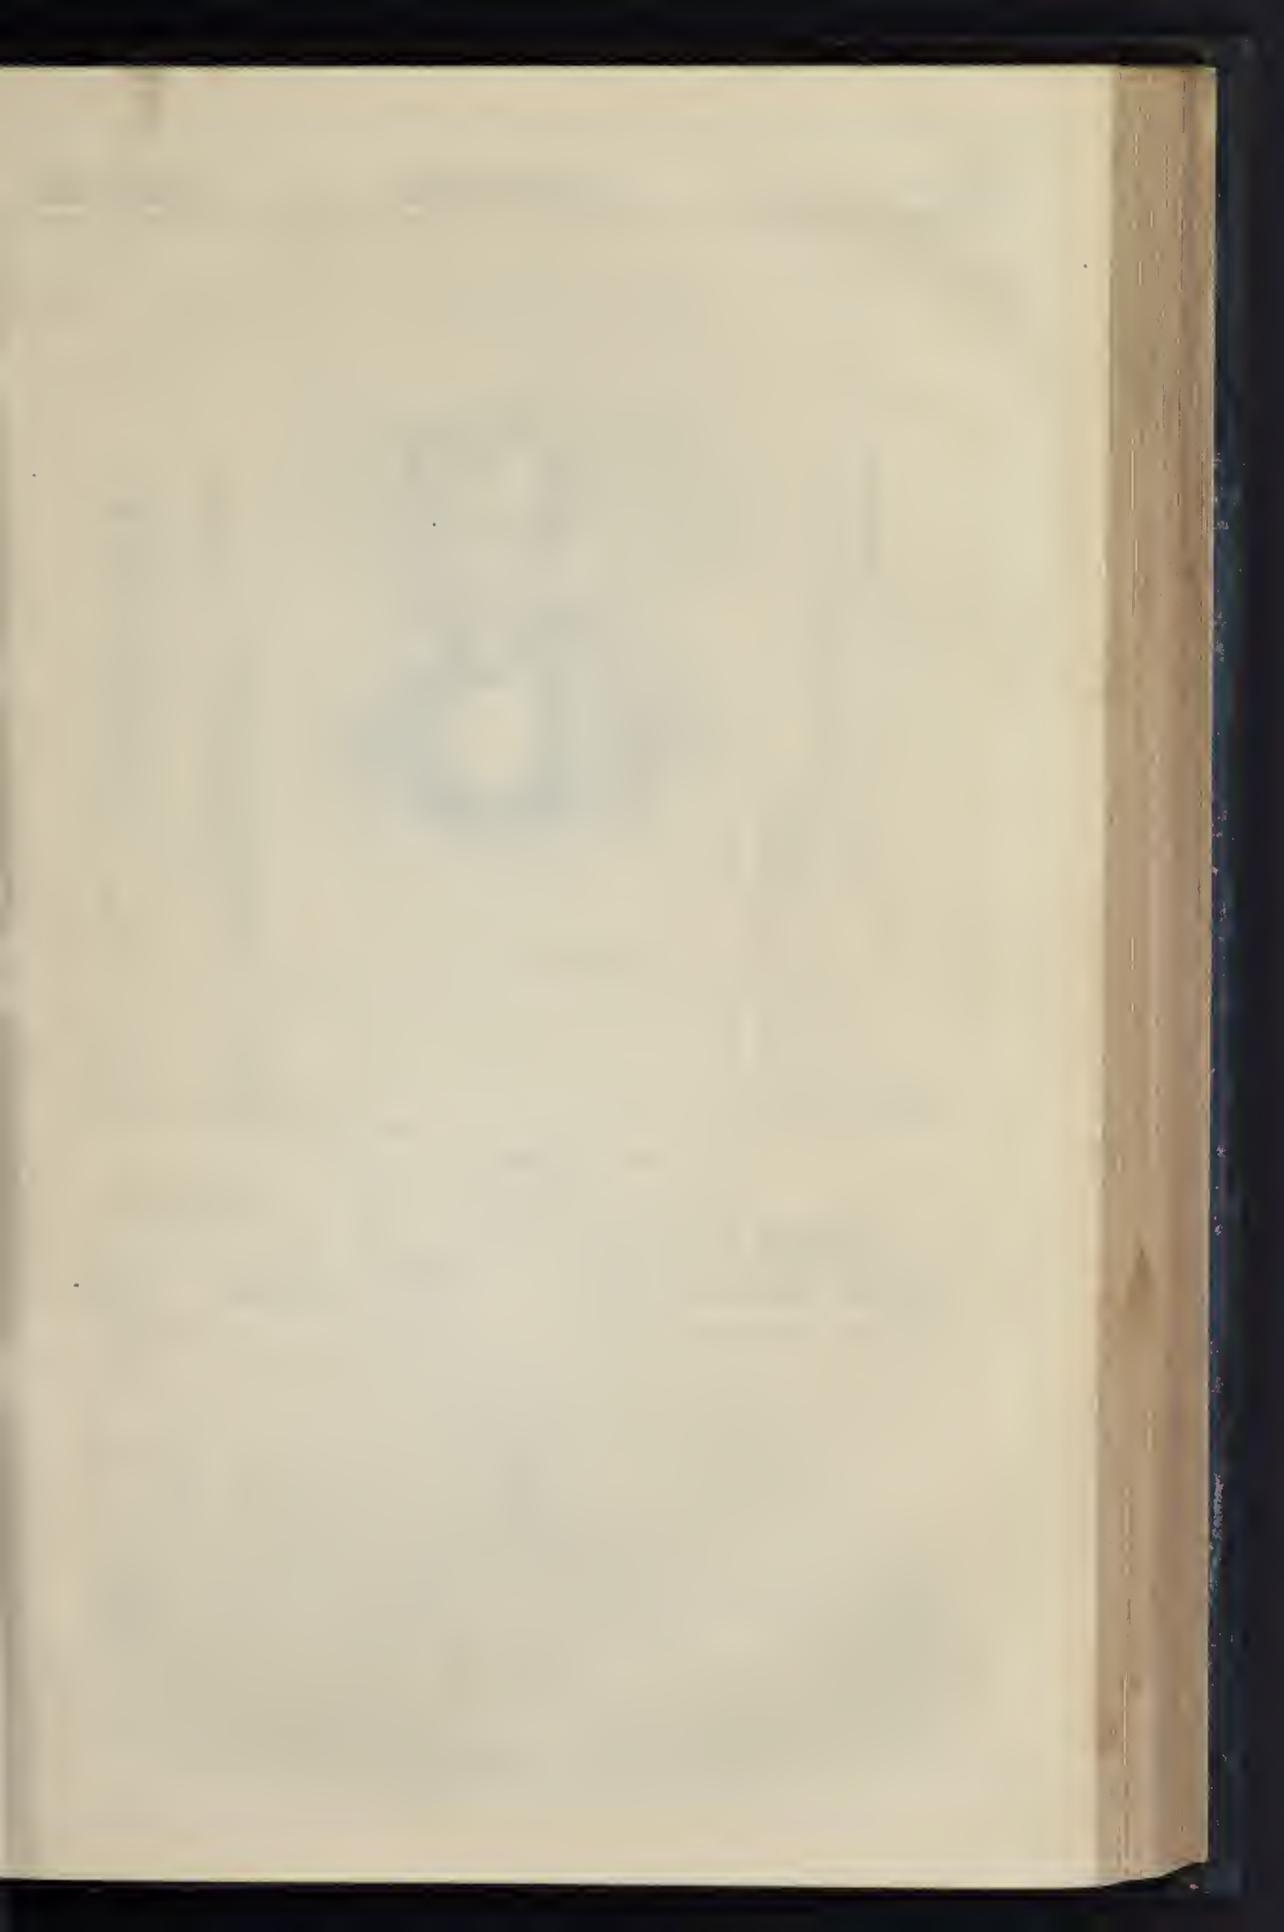

The funds for the erection of this hospital were raised by the private subscriptions of German citizens. It is intended for German patients, where those who cannot speak English will be attended and cared for by doctors and nurses to whom they will be able to make their wants known in their native tongue. Other nationalities will not be excluded; but the above is the primary object of the institution. The architect is Mr. Carl Pfeiffer.

The Proposed Law Courts.—We are glad to hear it reported that the committee appointed to inquire into the respective merits of the Howard-street and the Carey-street sites for the New Law Courts have decided to recommend the Carey-street site, both on economic and aesthetic grounds. The report of the committee is expected to be out this week.

SIR WILLIAM TITE, F.R.S., M.P.,

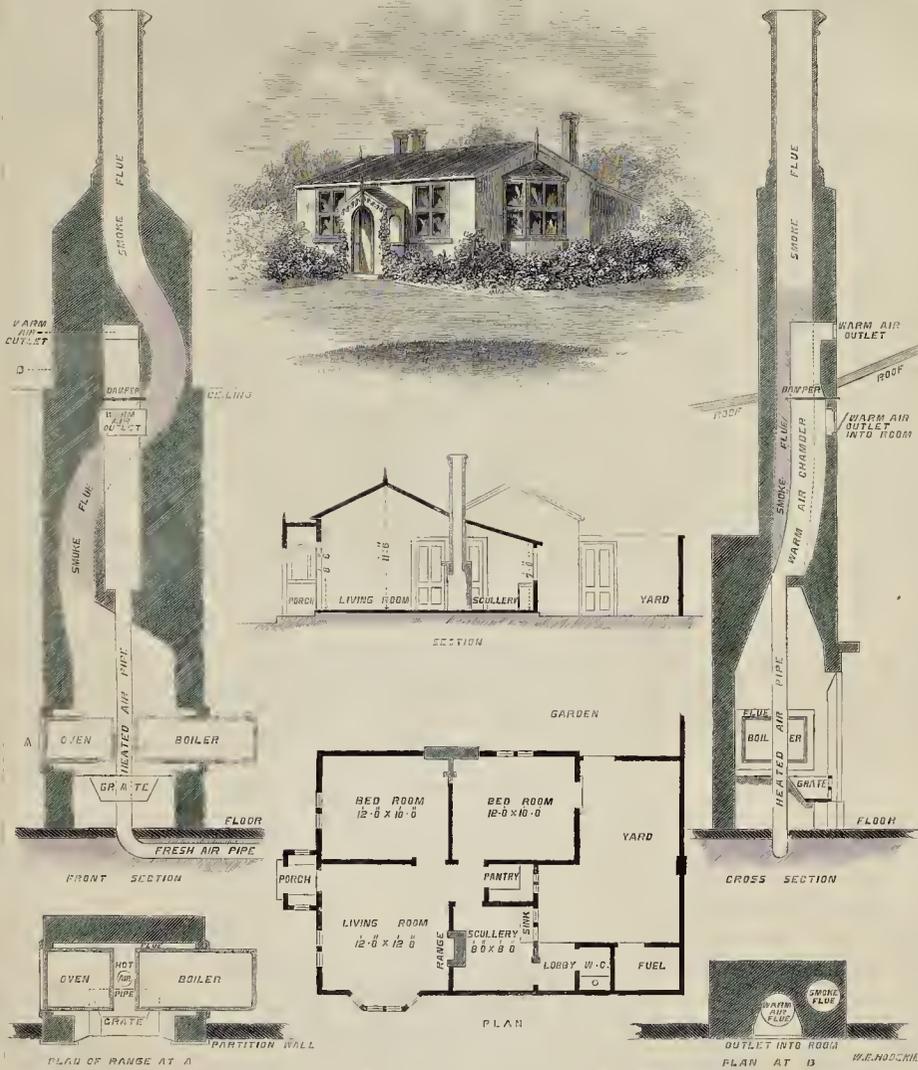

President of the Royal Institute of British Architects; Architect of the Royal Exchange, London.

HOSPITAL FOR GERMANS, NEW YORK.

Ground Plan.

ENTRANCE LODGE, PARK COTTAGE, EAST SHEEN, SURREY.

THE GERMAN HOSPITAL, NEW YORK, UNITED STATES.—MR. CARL PFEIFFER, ARCHITECT.

BRIXWORTH CHURCH.

The esteemed vicar of Brixworth, the Rev. C. F. Watkins, writes as follows:—

"When I stated to you in positive language that 'not a brick or stone of the original Saxon work had been displaced by us' in the restoration, you charge it as contradictory to evidence and 'sheer nonsense.' Now, sir, I reiterate it as a fact that can be substantiated by the able and conscientious architects, Messrs. Slater & Smith; their able clerk of the works, Mr. Thompson; and the workmen employed.

You quote against me the use of 'original fragments' in the reparation of the arches. Those fragments were collected from the *débris* of former waste—first, by the Danes, who destroyed the aisles, and subsequently by barbarous innovators; and our reparations were of the mischief which they had wrought, and not alterations of the Saxon work.

You insist upon the *cubicula*, and quote Mr. Roberts, a very able architect and antiquary, and a man of genius and energy in pursuing his inquiries; but had he been present when I removed the bank of earth which had been heaped up against the north side of the church to cover the dislocation of the aisle from the arcade, he would then have seen that the transverse piers of the arched corridor-like aisle met the piers of the arcade low down, and rested upon these foot buttresses. Part of that evidence is lost from the necessity of underpinning the wall of the arcade, and filling in the holes which the Danes had left, with imminent danger to the north wall of the church. After Mr. Roberts had reported of *cubicula*, I had an interview with Professor Willis at Cambridge upon the subject, as he had seen the foundations of the destroyed aisle laid open by me for the inspection of the public many years ago, and examined everything very closely with Dean Peacock and others. He is equally positive with myself respecting these foot buttresses; and I need no better authority.

As to the lack of usual characteristics of Saxon work in Brixworth Church, we have not indeed long and short work; but we have two of the original pillars, with the arched window between, remaining to us of the eastern apse, which was semicircular within, polygonal without. We have also a three-light balustrade window in the west end, of the same kind and age as that at Earl's Barton and St. Bennet, Cambridge, of the ninth century. This is superimposed upon an original arch of the seventh century, the crown of which is cut away to receive it; and hence this wall must be earlier than the ninth century. We have also herringbone work in the walls. A clear proof that there were no *cubicula* is, that there have been no divisional walls in the aisle to enclose them, whereas the foundations of this longitudinal wall are clear enough.

Leaving these unpleasant differences, I heartily coincide with you in your view of the Saxons as a people far more advanced in the arts of life than has been generally admitted. Their illuminated MSS.; their works in jewelry and metals; the description of their churches by their early writers; their wise laws and customs; their agriculture; and the 4,000 churches existing at the Conquest, portions of many of which, especially in the towers, as the least liable to destruction, are sufficient proofs for any candid minds."

MISTAKES IN SILVER.

The Goodwood Cup for 1869, produced by Mr. J. W. Benson, has much to recommend it. It takes the shape of a fine old English tankard and cover, modelled by Mr. J. E. Boehm, the subject being taken from Frith's "Derby Day." The body of the cup is surrounded in high relief with the principal features of this well-known work. Commencing at the left hand, we have the gambling booth, the thimble-rig table, and the country bumpkin more than half disposed to stake his money on the little pea; the group of acrobats; the swells lounging round the carriage; and so on. These subjects are modelled with skill.

The lid is surmounted with a cleverly modelled group of three horses with their jockeys, rearing and plunging in too spirited attitude. The handle is formed of very large vine-branches, and the lip or spout has the shape of a jockey's cap reversed.

It is in these latter particulars that the mistakes have been made. The vine-branches are out of all proportion with the composition, and

the jockey's cap that disagreeably forms the spout is simply preposterous, and utterly ruins the cup, on which something like 500*l.* have been spent. The rest of the work is so satisfactory that we seriously advise Mr. Benson to remove, at any rate, the jockey's cap, and substitute a spout pure and simple.

BINSTED CHURCH, SUSSEX.

This church, which was in a very dilapidated and unsafe state, has lately undergone a substantial and decorative repair. The walls, which were dangerously cracked, have been secured by buttresses and grouted with cement, and a massive oak roof has been placed on the church throughout, of the same construction as the old one, which was entirely decayed. A new vestry and a porch have been added, and new windows inserted in the place of the sashed windows with red brick jambs, which had been put in in modern times.

The church has been resented, and the floor of the nave laid with Godwin's tiles. There is no chancel arch, but traces remain of a thirteenth-century screen, or rood-beam, which formerly divided the nave and chancel, and a new screen of oak has been placed in this position. The chancel has a pavement of a new material, invented by Messrs. Powell, of Whitefriars Glass Works, and used here for the first time. The stained glass for the east window was also supplied by Messrs. Powell.

Some interesting wall paintings were discovered on removing the whitewash, of which it has only been possible to preserve a figure of St. Margaret, and some decorations on the splay of a lancet in the chancel.

The architect was Mr. T. G. Jackson, of London. The builder was Mr. Booker, of Walberton.

THE TERRACE OF SOMERSET HOUSE.

Sir,—As the river embankment is now a splendid addition to the metropolis, we, who are neighbours dwelling in the same parish as yourself, ask your help to utilize the noble terrace of Somerset House as a public walk on Sundays. The red-coated gentry who "har the entry" on other days might surely be allowed to open it for health and recreation one day in seven, and it would be a great boon to us, for whom no parks have been made. A trifling expense would prevent abuse, and make such a promenade enjoyable. Pray help us, Mr. Editor, to liberty which accords with the spirit of the age in which we live, and earn the gratitude of those around you.

ROUND ROBIN.

CASTLE ASHBY.

MR. SCRIVEN, the Marquis of Northampton's agent, confirms our remark as to the carved aprights in the staircase:—"They were put up by the late Marquis of Northampton, as it required support. The chimney-piece in the large drawing-room," continues the writer, "was brought as it is (except a piece on the top to make it higher) from Canonbury House, Islington, which came into the possession of the family through the wife of the first earl, who was the daughter of Sir John Spencer, of London, in the time of Elizabeth. It was her money, I believe, that fitted up that suite of rooms, the same arms being worked on the ceiling that are on the chimney-piece."

Mr. Scriven says the architect of the town-hall designed both the entrance-lobges. Mr. Street was the architect for the church restoration. "The low railing on each side of the entrance-gates is only temporary. I believe there is a design for continuing the terra-cotta work."

GREEN TREES.

Sir,—Knowing you are always ready to advocate any idea for the improvement and health of London, and, like yourself, having great faith in green trees, permit me to suggest that it would be an acceptable boon, if the Metropolitan District Railway Company could be induced to plant a few trees and shrubs in the open gravelled spaces fronting most of the stations.

It may be urged, it is a very easy task to suggest improvements as others' cost; but, I submit that, as the Company is well supported by the public, it would not be the loser by thus adding to the "picturesque" of the metropolis; and even should shareholders object to a small charge upon their dividends for such a purpose, surely if a collecting-box were placed in each booking office, many would drop in a spare halfpenny towards the expense incurred, and thus assist in making London "Beautiful for ever."

G. F. FRANKS.

DISTRICT SURVEYORS' RETURN TO BOARD OF WORKS.

The report of the Superintendent Architect, just published, shows that the total of the gross fees received for the year is 37,790*l.* 13*s.* 5*d.*, in respect of 21,915 works, of which more than two-thirds were done within the year.

The gross fees received in twenty-eight districts, vary from 1*l.* to 493*l.*, six being under 200*l.* each, seven under 300*l.*, nine under 400*l.*, and six under 500*l.* In thirty districts the incomes vary from 511*l.* to 1,869*l.*

The expenses of district offices are 7,039*l.* 4*s.* 9*d.* The fees remaining due for all arrears are 30,984*l.*, but probably are mostly of little value. The sums abated or lost are 1,837*l.* Compared with the results of former years the present abstract shows still a considerable increase.

THE VALUE OF THE OVAL.

Sir,—I believe I am right in asserting that the ugly forms of round and square mts, in the development of architecture, give place to the oval and oblong, as they have in art. In the inclosed sketch (from a model prepared for the first Great Exhibition, but not sent to England in time), I attempted a building which should be cheaper in construction, should fill and empty quicker, be better fitted for sound, and which should last longer than any other of the same size; and also to induce my friends to think it possible that a new order might have some advantages, and that the value of the *true oval* in architecture and engineering was not sufficiently considered.

J. L. STATHAM.

** We will say nothing on our correspondent's theory, but certainly the example he sends will not recommend it. Anything more appallingly ugly was, perhaps, never seen. We are glad to observe that it is "entered at Stationers' Hall."

TECHNICAL EDUCATION IN THE BUILDING TRADE IN LONDON.

Sir,—I am induced to address a few words to your journal on the above subject, by seeing the letters of "The Plane" and "Reasoner." Sir, I want to know what interest it would be to the journeyman joiner to acquire technical education? Would he be better paid, supposing he still remained journeyman (and you know we cannot all be foremen or clerks of works)?

The employers know, and we know, perfectly well, the less thinking or studying in the shop the better they are pleased,—that is, if you leave off work with the arms to work with the brain for a few minutes.

In this age of competition, sir, quantity is the order of the day, and quality quite a secondary consideration. A skilful handi-craft, who can execute his tool on geometrical principles, or a clever joiner who knows something about lines is valued no more and gets no more pay than some men who manage by a knack or rule of thumb to get over the work quickly, and do it now enough to pass.

I think, sir, this explains the reason why the masters are indifferent about promoting the technical education of their workmen. The more machine-like a man is the less likely is he to kick against the driving of a pushing foreman.

JACK RAYNER.

Sir,—I have for years devoted my leisure time to self-improvement, and gained distinctions in the Science and Art Examinations; but the only result as yet is to keep me in hot water with my employer, because the knowledge I have gained enables me to obtain a few shillings extra, with a less expenditure of physical force.

My impression is, that until the architects take up the matter, and insist that clerks of works and foremen shall possess certificates of competency, things will go on pretty much as at present.

J. T.

THE MIDLAND RAILWAY STATION HOTEL, ST. PANCRAS.

Sir,—What on earth induced the architect, engineer, or whoever had the matter in hand, to erect such an eyesore as the heavy looking walling and parapet in front of the Hotel at the Midland Railway Station, in St. Pancras, with a steep roadway up to the offices? Surely no idea of any art in the brain of those concerned for our not over-powerful cab horses, especially after having performed a hastened journey with a cab containing six human beings and luggage for five. Perhaps the directors have provided a stationary engine to pull up horses, cabs, and all, in case there should be a stoppage or loss? By this parapet, or whatever name it may have a claim to, the Hotel is entirely hidden from the street; and all travellers who may chance to take up their temporary abode will be debared the view of the road traffic, but will have the benefit of the noise and the sight of the upper windows and chimney-pots of the unbecomely houses in front. Why not have made the ground floor of the Hotel level

with the roadway, with a neat terrace in front enclosed with iron railings and other trimmings, such as a grass plot, flowers, and fountains, with stairs to platform, and lifts for luggage? As it is now, the expensively bright red brick Hotel is entirely lost. S.

THE CROSSINGS.

ALLOW me to ask whether it is not possible that the vestries might be induced to give strict injunctions to their watering-cart attendants not to water the recognised crossings. It would prevent many a tumble and preserve many a person's temper, not mentioning the boots. Should there be dust on the crossing, it would soon fly to and be absorbed by the wet sides. S.

"16 A PRIME (?) NUMBER."

SIR,—Your correspondent "E. G." (June 19th) makes a mistake when he calls 16 a prime number. It is a composite number; and herein lies its value as a numerical radix. If he consults Kavanagh's Arithmetic (Longman & Co.), he will there see its clearly defined what a prime number is, and how to find such numbers.

In answer to his question respecting the decimal system of weights and measures, "why it has made the progress it has," I would say, 1st. That scientific men having long and abstruse calculations to make, found in decimal fractions an immense relief from the labour and tediousness of common fractions; and many of them, forgetting that the number 10 was a bad numerical radix, unwisely, therefore, thought that what was good for them in their calculations would be good for commercial and business men; not considering that, for the rough and ready purposes of practical occupations and domestic dealings, we want to halve and quarter our weighings and measurings again and again, which we cannot do with the decimal system. Hence they were continually urging its adoption in their hooks. 2nd. Some modern commercial men, thinking only of their own advantage, and how they may increase their dealings with foreign nations that use the metric system, have strongly urged its adoption; and for this purpose have tried to persuade the people of this country that it would be the best for national use. 3rd. A few enthusiastic men, in love with the decimal system, have kept hammering away, in Parliament and elsewhere, while those who would have to use it have been careless or asleep, until they have partially fastened it on the nation, and hope yet to fasten it still more on. Also they have been aided by some who can see no beauty in anything but uniformity, and who would have everything done mechanically and unvaryingly; not caring to see that nature presents the utmost variety in all things, and that there is an immense utility in that variety.

But division by 16 and its multiples and sub-multiples is not so scarce amongst us as would be supposed by reading the extract from Mr. Ferguson's work. Although not so systematic in our adoption of it as the Hindoos, yet we have a good deal of it. Our yard measure has a division of 16; our inch also. We have eight half-crowns to the sovereign, 16 oz. to the pound, and at one time there were 32 grains to the pennyweight. And I would just remark that the division of the pound into 16 oz., and of the inch into 4ths, 8ths, and 16ths, is the best for common and practical use; and, if ever abolished, it will be a source of great inconvenience to the public.

Sir, I agree with Mr. Ferguson when he says that "it was a mathematical misfortune when counting by fingers and thumbs,—that is, by tens,—was adopted," but not when he says we ought to have stopped at eight. We ought to have gone on to twelve, which number, I believe, is considered by most mathematicians as being the most practical and yielding the least number of interminable fractions. And, therefore, it is to be considered another mathematical misfortune that scientific men should have suffered themselves to be ousted by the notation of the savage (for counting by fingers and thumbs truly is such) out of a truly scientific notation, which, if adopted, would have been for their advantage and for that of the whole calculating world. But is it too late, as Mr. Ferguson says it is, to remedy this now? I think not. We have in our modes of calculating, the nucleus, or rather perhaps the remains, of counting by twelves. In our cross-multiplication rule we have a duodenary notation worked by a denary notation. Now, if this rule were worked by a duodenary notation, it would be a perfect sample of the duodenary system of calcula-

lating by twelves. De Morgan, in his Arithmetic, recommends the student to thus practise the working of cross-multiplication. Our year is divided into twelve months, our foot-rule into twelve inches. Then we have the dozen and submultiples of it much in use; also the gross, or square of twelve, and the great gross, or cube of twelve. These and other facts lead to the idea that counting by twelves was more prevalent amongst us, or those with whom we traded, and from whom we may have received it, than at present. And why should it not be further extended? As regards the division of our foot-rule into twelve parts, to have it reduced to ten would be productive of the greatest inconvenience. Consider the millions of small measurements that are made by it in the course of one day, and which could not be so advantageously made if it only contained ten parts. If working men would take a slip of wood, 1 ft. long, and divide it into ten parts, and one of these parts into ten, and practise with it so as to compare it with the present foot-rule, they would thus ascertain which would be the most useful of the two divisions, ten or twelve. The Roman foot was divided into twelve parts, and also into sixteen. Thus, 4 digits made a palm, 4 palms made a foot,—16 parts. Thus they had the advantage of both divisions. If our foot-rule were thus divided, would it not be advantageous for many purposes?

But our heterogeneous system, as some term it, is not so unworkable as many would make it to be. A good calculator in cross-multiplication can work the rule with advantage against another working by decimals, and in some cases with a less number of figures. Men of business have in their respective callings ready modes of calculating, which are oftentimes not found in school books, and by which they facilitate their business reckonings in a manner which many who are zealous for the decimal system are not aware of. Our present divisions of weights and measures can be ascertained in many instances to be founded on certain wants and requirements of our forefathers known to them at the time, and by which divisions they were able, with little knowledge of arithmetic, to make their calculations. It is amusing to trace those things, but they would occupy needless time and space to dwell upon them.

In answering the question of "E. G." which should in all his connexions be considered a national one, for it is not a trifling matter to change our modes of calculation, and make it necessary to alter or renew every weight and measure we possess, I have endeavoured to avoid intruding too much on your space. There is, however, much to be said respecting the best numerical radix. As regards the French metric system, I apprehend it would not be for our benefit to adopt it, notwithstanding all that has been said in its favour. But it is well to stimulate inquiry, and I shall feel pleased if this letter should contribute towards it.

In conclusion, allow me to add the following figures, which, I think, are correct. They are copied from a memorandum made some time ago, but which I have not now had time to verify again:—

	Ter. Fractions.	Inter- misible Fractions.	Practi- cable.
The Vicenary (20) notation gives.....	7	12	12
The Sedenary (16) " " " " " " " "	4	11	11
The Duodenary (12) " " " " " " " "	7	4	4
The Denary (10) " " " " " " " "	5	4	4
The Octary (8) " " " " " " " "	3	4	4

On first reflection it might be supposed that the Sedenary and the Octary notations, from the perfect subdivisions they are capable of, would furnish the most terminable fractions, in proportion to the interminable; but by the above table it is the duodenary that gives the most satisfactory results in this particular.

DUODENARY.

The Wolf Rock Lighthouse, Cornwall.—The last stone of the Wolf Rock light-tower, nine miles from the Land's End, has been laid by Sir Frederick Arrow, the deputy-master of the Trinity House. The deputy-master thanked the resident-engineer, assistants, and workmen, for the zeal they had displayed in this difficult and dangerous work, and gave each a gratuity as a memento of the interesting event. The resident engineer is Mr. W. Douglas. The men are now going on with the work of getting up the lanterns and fittings for the tower. It is expected that by September the light will be exhibited.

SCHOOL-BUILDING NEWS.

Chertsey.—The foundation stone of new schools has been laid at Ottershaw, about two miles from Chertsey. The amount proposed to be expended in the building is estimated at 1,300l. or 1,400l., the land being given by Sir Edward Colebrooke. Mr. Burns, of London, is the architect, the design being made by that gentleman free of cost; and Messrs. Knight & Son, of Chertsey, are the builders employed.

Sutton-on-Plym (Plymouth).—The foundation stone of new schools for girls and infants has been laid here. The parish of Sutton-on-Plym includes the south-eastern portion of the town of Plymouth, the manufacturing district of Cossids, and the village of Cattedown. The total costs of the schools will be a little over 1,000l. The building, which will be in the shape of the letter L, will comprise two stories, and accommodation will be provided for about 350 children. The plans have been prepared by Mr. O. C. Arthur, architect; and Messrs. Hodges & Martin are the builders.

CHURCH-BUILDING NEWS.

New Ferry (near Birkenhead).—We are asked to state that the free church of St. Mark, which has been enlarged under the direction of Mr. E. Haycock, jun., architect, was consecrated by the Bishop of Chester, and is not a Dissenting church.

Northampton.—On Tuesday, the 20th inst., the Countess Spencer laid the foundation-stone of the new church of St. James's, Dallington, Northampton. The building is being erected upon a site given by the Rev. William Thornton, and is designed to accommodate 500 persons, with facilities for extension, as the necessities of the district may require. The plan consists of nave, chancel, south aisle, south chapel, vestry, and turret. Mr. R. Wheeler, of Tunbridge Wells, is the architect; and Mr. Kightley, of Northampton, has contracted to build the church, at a cost of 2,355l.

Newent.—The restoration of Oxenhal Church is being completed. The chancel ceiling, just finished, consists of red deal, divided into panels. A battlemented cornice runs along both sides. The corbels, of Caen stone, are all carved, as are also the enrichments round the east window, which was erected to the memory of the late Mrs. Onslow. The carving was by Mr. Boulton, and the woodwork by Messrs. Spring & Son, builders. The architect under whose direction the work was executed is Mr. John Middleton, of Cheltenham.

Letwell.—The church at Letwell, a small village about six miles from Worksop, has been reopened. The old church was destroyed by fire on December 8, 1857, everything being destroyed except the tower and the outer walls. The new church has been built on exactly the same site, the same walls and tower being used, the interior being lined with Roche Abbey and Mansfield stone. The seats are of oak, in open sittings, all free, and facing north and south. The space under the tower has also been seated, and a gallery which formerly stood there has not been replaced. The roof, which is high pitched, is of stained deal, excepting the part over the chancel apse, which is to be painted light blue. The windows at present are of plain glass, but the three in the chancel apse and the west window under the tower are to be memorial windows in stained glass to different persons.

Tamworth.—The church restoration and other tenders were recently opened, when the following obtained the contracts:—Messrs. Wood, of Derby, for the church restoration; Mr. G. M. Holdrich, of London, for the organ; and Messrs. Edwards & Son, of London, for the heating apparatus.

Powerstock.—The foundation-stone of West Milton church has been laid. The old church, which stands at the eastern end of the parish, served as a chapel of ease to the mother church at Powerstock, and was a small building, consisting of nave, chancel, and western tower. The style was of the late Perpendicular period, and there are a few specimens of Norman work still remaining in the ruined structure. In the south side of the chancel is an old decorated window, which it seems a pity to destroy.

Heigham.—The design selected by the building committee of St. Philip's, Heigham, new church was prepared by Mr. E. Power, of London. It is in the Early French style applied to modern requirements, all unnecessary ornament being avoided. It consists of a nave, apsidal chancel, and side aisles, with a tower and spire at the

north-west angle. The western front will form a feature in the Heigham-road. The accommodation will be for nearly 800 persons. The total cost (inclusive of tower and spire), with architect's commission, gas-fittings, and the required repair fund, will be about 5,200l.

Bedlington.—The church here, which has lately been undergoing extensive alterations, has been re-opened. On making an examination of the tower the stones were found to be much decayed. These were removed and new substituted. The plain parapets on the top have been removed and battlements substituted. The old Perpendicular window in the tower, which was much decayed, has been removed, and a new one, filled with stained glass, substituted, the subjects being, "The Adoration of the Magi," and "The Queen of Sheba's Visit to King Solomon." This window is the gift of the rector, and is the work of Messrs. Clayton & Bell. The tower arch, which was partly blocked up, has been opened. The chancel has been remodelled, an oak screen being placed across the chancel arch, and the old stalls have been replaced by new ones. An organ-chamber has been built, and a new organ placed in it, with an illuminated screen in front. The old reredos and diapers have been taken down, and a new one, of mosaic, erected, some of the subjects being "The Flight into Egypt," "The Adoration of the Magi," and "The Holy Apostles." This is the work of Messrs. Harland & Fisher. A sedilia has also been erected. On removing the ashlar, part of the old piscina was found embedded in the wall. The old Perpendicular oak screen, which divides the chancel from the Carew Chapel, has been cleaned.

Egglestone.—The new church at Egglestone has been consecrated by the Bishop of Durham, and opened for Divine worship. The edifice, which is dedicated to the Holy Trinity, is cruciform, the nave being 52 ft. 6 in. long, and 21 ft. 6 in. wide. The north and south transepts are 13 ft. wide, and 9 ft. and 11 ft. deep respectively. The chancel is 26 ft. 6 in. long, and 18 ft. wide. On the south side of the nave is a large porch, engaged with the nave and the west end and south walls is a bell-turret, rising to a height of nearly 60 ft. The roof of this turret is slated, and decorated with wrought-iron finial-cross and gilded vane. On the north side of the church is the vestry, underneath which is a heating-chamber. The style is Early English, carried into Early Geometrical at the east end, which has a traceried window of three lights. The other windows are lancets, excepting the large circular west window, and a sex-foiled one in the gable of the south transept. The west-end circular window has seven smaller moulded circles within the outer inclosing arch, and forms a prominent feature both internally and externally. Entering the church we observe the font against the west wall, and the altar against the east. The benches are all open, of stained deal, the panels relieved by difference in depth of colour only. The transepts are separated from the nave by two stone arches, resting on pillars. The north transept is intended to be used as an organ-chamber. The chancel-arch, separating the nave from the chancel, has stone jambs, and the inner arch is carried by stone corbels with moulded caps. The pulpit is placed against the north jamb of the chancel-arch. The chancel seats are placed longitudinally, those on the south side being shortened to admit of the prayer-desk, which, with the lectern, is at the extreme west end of the chancel. The roofs are boarded inside. The height from the floor to the apex of the roof is 25 ft. 6 in. Externally the roofs are covered with Westmorland green slate, and the apses with ornamental red tiles. The stained-glass windows are private gifts to the church. The whole of the work was contracted for by Mr. Benjamin Hepworth, of Barnard Castle. The architect was Mr. F. R. N. Haswell, of North Shields. Mr. Adamson, of Egglestone, was sub-contractor for the carpenter and joiner's work. The smith's work has been done by Mr. Rutter, of Barnard Castle. Accommodation is provided within the walls for about 220 adults, and the outlay on the building alone, exclusive of professional charges, is between 1,300l. and 1,400l.

Ode Pitcauld.—The church here has been restored and reopened. The work of restoration includes the removal of all the floors and of the old pews, the substitution in place of the latter of new moveable deal seats, the cleaning and repointing of the walls (after the removal of the plastering which formerly disfigured them), the paving of the church throughout with Godwin's encaustic and inlaid tiles, the underpinning of

the walls, and the fixing of drains round the outside of the fabric; also new altar-rails and new stone pulpit, together with chancel stalls, having traceried fronts and carved ends. New windows have been inserted in the place of others destroyed; a new oak door has been placed at the north porch entrance, and new and ornamental scroll hinges have been fixed to all the doorways; the whole of the seats, stalls, &c., have been stained and varnished, and the oak doors oiled. The cost of carrying out the work is about 440l., exclusive of hassocks, mats, &c. Much, however, remains yet to be done if funds could be provided. The architect employed was Mr. Chick, of Hereford; and the contractors were Messrs. Lewis & Day, also of Hereford.

Liverpool.—The new church of St. Margaret, Prince's Park-road, has been consecrated. It is in the Early Decorated style, of grey brick externally, with red brick arches surmounting the various windows, and West Derby stone dressings. The roof is of pointed green slates, supported by a red ridge casing. It has also an octagonal turret, which stands over the junction of the nave and chancel, and contains the bell. In a niche in the centre of the west end is a carved figure of St. Margaret. In the interior, the church consists of a nave with five arches on either side opening into the aisles. These arches are supported on Devon marble columns with moulded caps and bases of West Derby stone. The inside walls are finished in plaster intended for decoration. There are small north and south transepts breaking the line of the interior, and separated from the aisles, each by two arches. The roof of the nave is polygonal in form, and is divided into panels by moulded ribs for decoration. The chancel roof is already decorated. The principal entrance is by two doors in the west end. There are large windows both in the east and west ends. The floor of the nave and aisles is laid with Staffordshire tiles, two colours, in patterns. The chancel is laid with encaustic tiles in variegated patterns, and it rises 4 ft. between the nave level and the altar. The chancel screen, which rises to the height of 4 ft. 6 in. above the nave floor, is composed of Isle of Man limestone, dark mottled alabaster, and Derbyshire fossil stone, and the chancel is separated from the nave by two wrought-iron gates, picked out in various colours. The chancel stalls are composed of English oak, and will accommodate a choir of thirty-eight. The seats in the body of the church are made of pitch pine, and are open, furnished, and free. The accommodation provided, including the chancel, will be for 1,000 persons. The pulpit is carved out of Caen stone. The font is of polished marble. The reredos is composed of alabaster, with Salvati's Venetian mosaics in the side panels and in the background of the subject, which is the Crucifixion, carved out of white alabaster by Mr. Earp, of London. On the north side of the chancel is the organ-chamber, which contains an instrument by Mr. Willis. Adjoining the church is the parsonage, with which it is connected by a covered way. The contractor for the whole of the works was Mr. Horsman, of Wolverhampton, with Mr. James Peers as clerk of the works. Mr. George E. Street furnished the designs for the whole of the works.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Sunbury.—A new church has been opened at Sunbury-on-Thames. The edifice is built of Kentish rag-stone, with free-stone dressings, and is in the style prevalent in England in the thirteenth century. The plan comprises an apsidal chancel, a nave of four bays, 60 ft. in length and 24 ft. wide, and an aisle with circular columns and octagonal capitals, supporting pointed arches. There is a window of four compartments with geometrical tracery over the principal entrance. The lateral windows of the nave are coupled lancet openings with trifoliate in the arched heads. Those of the aisle are simple lancets, except the end window, which is of two lights with trifoliate. A chancel arch with sculptured capitals supports the gabled bell-turret. The roofs of the nave and aisle are of open timber work; the roof of the chancel is arched and boarded, stained, and decorated. The coloured glass in the lancet windows of the apse contributes to the adornment of the church. The temporary high altar has been translated from the old chapel, which chapel is henceforth to be used for the poor school. The church was built by Messrs. Whittle & Castle, of

Sunbury, from the designs and under the superintendence of Mr. C. A. Buckler, of London, architect. The sculpture was done by Mr. Earp, of Lambeth, and the windows of the apse were by Mr. Barnett, of Leith.

Manchester.—The corner stone of the new church of the Holy Name, at the corner of Ackers-street, Oxford-road, has been laid. The church is named after one of the oldest churches in Rome, and is the first church which the Society of Jesuits have set up in Manchester. It will be about 180 ft. in length from the west to the east end; nearly 80 ft. wide in the body of the church (including the aisles); and will be 120 ft. across the transepts. It is calculated to seat 1,500 or 2,000 persons comfortably, and will afford, on the occasion of a press, accommodation for upwards of 4,000 persons. The height of the roof in the nave at the west end is 100 ft. There will be a tower structure facing Oxford-road, opening into the church, which will be surmounted by an ornamental spire about 240 ft. high. The church will contain a great sanctuary, placed at the east end of the church, in which will be placed the principal altar, and on each side of it two chapels will be erected, each containing an altar, both opening into the transepts. On the side of the church, facing Ackers-street, there will be three chantry chapels, containing altars. In all there will be eight altars in the church. There will be a south approach to the building, and the great western approach will be from Oxford-road. The elevation of the church floor will be 5 ft. above the level of the road, and the church will be approached by a double flight of steps. At the west end of the tower the great organ gallery will be placed, covering an area of 42 ft. by 27 ft. At the south-west corner of the building the baptistery will be erected,—an octagonal building with a pyramidal roof. At the opposite corner there will be a large turret staircase leading up to the gallery. On the north side of the building there will be eight confessional rooms, which are approached by a distinct corridor, having separate access from the church. At the east end of the ground it is intended to build a large collegiate presbytery as soon as the church is sufficiently advanced to require it. The style of architecture of the building is Gothic of the fourteenth century. The exterior will be built of stone, and the interior of terracotta. The estimated cost of the building, exclusive of the erection of the tower, the completion of the altars, sacristy, and presbytery, is about 14,000l. The architects are Messrs. Joseph A. Hansom & Son, of London, and the contractors for the erection of the building are Messrs. Ibberson & Marshall, of Manchester.

Books Received.

A Manual of Machinery and Millwork. By WILLIAM J. MACQUEEN RANKINE, C.E., F.R.S.E., &c. London: Griffin & Co. 1869.

THIS is an entirely new work of Dr. Rankine's, the Regius Professor of Civil Engineering and Mechanics in Glasgow University.

The book is divided into three parts. The first treats of the Geometry of Machinery; the second, of the Dynamics of Machinery; and the third, of the Materials, Strength, and Construction of Machinery. Under the head of the Geometry of Machinery, machines are considered with reference to the comparative motions only of their moving parts; and rules are given for designing and arranging those parts so as to produce any given comparative motion.

Several problems in mechanism are solved by methods which appear not to have hitherto been published, and which possess advantages in point of ease or of accuracy. Such are those regarding the drawing of rolling curves, and of some kinds of cams; the construction of the figures of teeth of skew-bevel wheels, and of threads of gearing-screws, by the help of the normal section; and some improvements in the details of processes for designing intermittent gear, link motions, and parallel motions.

Under the head of the Dynamics of Machinery are considered the forces exerted and the work done in machines; the means of measuring those quantities by indicators and dynamometers; of determining and balancing the reactions of moving masses in machines, and of regulating work and speed; and the efficiency, or proportion in which the useful work is less than the total work, in the different sorts of moving pieces, and in their various combinations.

Under the head of the Materials, Strength, and Construction of Machinery are considered, first, the properties of various materials, as affecting their treatment and use in the construction of machines; secondly, the general principles of the strength of materials; thirdly, the special application of those principles to questions relating to the strength and the construction of various parts of machines; and fourthly, the principles of the action of cutting-tools.

The work is illustrated with numerous diagrams. We need scarcely say that any work of Professor Rankine's on a subject such as this cannot but be of great practical value. We have here simply to draw the attention of readers interested in machinery and millwork to its publication.

Recent Improvements in the Steam Engine: A Supplement to "The Catechism of the Steam Engine." By JOHN BOURNE, C.E. New Edition. Longmans & Co. 1869.

Examples of Modern Steam, Air, and Gas Engines, minutely and practically described. By JOHN BOURNE, C.E. Part XIV., July 1869. Longmans & Co.

ALTHOUGH the former of these two works was originally issued as a supplement to the Catechism of the Steam Engine, it now makes its appearance as a separate treatise. In this edition many examples of engines given before have been superseded by newer examples, among which are some of the more remarkable engines which figured in the Paris Exhibition of 1867.

"Steam Superseded" has for many years been a standing title of the press, announcing all sorts of new inventions; but the time has not yet quite come for that. Mr. Bourne, however, is of opinion that the steam-engine, which has always, he remarks, been a most imperfect machine, has now nearly fulfilled its destiny, and is on the eve of supersession by other motors, though steam may, he adds, be still used in them to some extent, but not exclusively, and only in combination with other fluids. Under this belief it is that the author has undertaken the production of the second of the works here under notice. As to the precise sort of engine which shall have the distinguished office of taking the place of the steam-engine, Mr. Bourne says:—

"The engine which will supersede the existing steam-engine will, I take it for granted, still derive its power from heat, which heat will be produced by coal, as heretofore. But the coal, instead of being burnt upon grates in the manner now practised, will be carried as dust into a suitable chamber and be converted into carbonic oxide gas, which gas may be burnt [into carbonic acid gas] as it issues in jets from the sides of hollow furnace-bars of the kind prescribed in my patent of 1835, the flames passing through an artificial fire of brick or pumice-stone, by the aid of which the gas will be effectively burnt. Gas thus consumed may be used for generating steam in the same way as coal; and its advantage over coal is, that the combustion may be made much more perfect than is possible in the case of coal, and that the necessity of stoking the fires will be obviated. But the gas may also be used in other ways to generate power. It has often been before proposed to transform the coal into carbonic oxide, but never before with the antecedent condition of first reducing it to fine dust. When this preliminary is neglected, the gasifier is necessarily large and uncertain in its action from the eating of the coal. Its temperature is also low, and the incumbrance matter which would otherwise pass away in the gas in the form of dust, will be melted into slag, which may be run out through an orifice like an iron furnace, so that only pure carbonic oxide gas mixed with nitrogen and a little hydrogen will present itself for combustion. This, it is true, constitutes but a small part of the advance that is necessary for the supersession of the steam engine. But the improvement here indicated must be the first step, and there is no difficulty in taking it at once."

The Principles of Perspective Illustrated in a Series of Examples. By HENRY D. HUMPHRIS. Descriptive Treatise and Atlas of Examples. London: Chapman & Hall, 1869.

A Popular Outline of Perspective or Graphic Projection: Parallel, Diagonal, Pan-Angular, Graceful. By THOMAS MORRIS, Architect. London: Simpkin, Marshall, & Co. 1869.

MR. HUMPHRIS, who is the son of an architect well known in his locality, has issued what is rather a series of examples to illustrate the principles of perspective than an elaborate essay on the science. They are drawn out of good size, and will be found very useful to art-masters, architectural students, and others. Mr. Humphris rightly points out that it would be useless to read the letter-press and look at the plates, and to imagine that a knowledge of perspective is to be obtained by any such means: while to copy the figures line for line from the examples would be time as badly spent.

The student desiring to master the subject should read slowly and carefully through the description of each problem, so as to understand what is required to be done, with a general idea of the method of doing it, and then, recommencing, endeavour to draw each line as directed, referring to the plate to see if he be successfully accomplished. Having completed the problem thus, construct a different scale,—say half the size, and re-work it: this will be the first step alone, for, although the drawing will be identical with the example given, with the exception of its size, it will, nevertheless, involve a little more thought, and the student cannot yield to the temptation of taking his measurement from the plates, which should always be carefully avoided.

The whole success of the undertaking depends upon mastering the principles, and not copying the examples, those principles being few and identical in every case, although their application may be manifold.

The work is dedicated, with permission, to Mr. Gambier Parry; and can be recommended. The object that Mr. Thos. Morris has in view is obviously to give the general reader a general notion of the science, and to that extent his little volume carries out his intention.

Miscellanea.

Lighting Mines with Gas.—In improving the method of lighting mines, Messrs. M. Wilku and J. Clark, of Paddington, propose to use lamps, burning gas, oil, or other illuminating materials, with air propelled from a pump source at the bottom or top of the shaft, through air-tight tubes, to the interior of the said lamps. An overplus of air they cause to blow gently out by escape-valves or covers near the top of the lamps, thereby preventing the entrance of foul air, or air which has become mixed with fire-damp. By preference, they glaze the lamps about half their height with glass: the upper half they prefer to make of sheet metal to withstand the heat. When gas-lamps are used, the gas is produced, and conveyed in pipes in the usual way. The air is propelled through the tubes referred to by any well-understood method; such as by fans, air-pumps, steam-jet, &c. In lighting the lamps, they propose to use safety-matches, such as those manufactured by Bryant & May. After the match is inserted into the lamp by an escape-valve, it is struck, and the lamp is lighted, while the match is extinguished in a tube into which it is thrust.

The Mosaics in the Central Hall of Westminster Palace.—On a motion in the Commons for a Committee to inquire as to the contract or agreement made by the Office of Works with the Venice and Marano Glass and Mosaic Company (Limited), for the decoration of the central hall, it came out that Mr. Layard had aided Dr. Salviati, for the sake of art, previously to his connexion with the Government, and had taken shares in the Company got up for the sale of his art works, simply to help Dr. Salviati, but that these shares had been sold, and that while a member of the Government he had no pecuniary connexion with Dr. Salviati or his Company. Moreover, that the contract referred to was neither entered into by Mr. Layard nor by the Office of Works, but by the architect; and that the transactions with Dr. Salviati's Company had begun not since Mr. Layard became connected with the office, but previously. Mr. Layard said he had not the slightest objection to the inquiry, and made a suggestion for facilitating it; but the House was adverse to any investigation, and the mover of the resolution expressed his regret if he had given pain to Mr. Layard, and withdrew his motion.

To Clear a Room of Mosquitoes.—As some of our readers may be contemplating travel, they will like to hear what a writer in a South Carolina paper says:—"I have tried the following, and find it to work like charm. Take of gum camphor a piece about one-third the size of an egg, and evaporate it by placing it in a tin vessel, and holding it over a lamp or candle, taking care that it does not ignite. The smoke will soon fill the room, and expel the mosquitoes. One night I was terribly annoyed by them, when I thought of and tried the above, after which I never saw nor heard them that night, and the next morning there was not one to be found in the room, though the window had been left open all that night."

Improvement in Steam Carriages.

An invention was exhibited on Thursday, and an experiment made, before a number of professional men and others, of interest to the public and the railway world. We refer to trial trips of Mr. R. F. Fairlie's steam hogie carriage at the Hatoham Iron Works (Messrs. England's), Old Kent-road. The engine, carriage, and framing, all complete, in working order, but exclusive of passengers, weigh under 13½ tons, and including its full load of 100 passengers, 18½ tons only. The carriage, when finished, will have a broad step on each side, extending its entire length; this step is protected by a hand-rail on the outside, with an arrangement for lifting it on the platform side at the doors to allow the passengers to get in and out. The object of this platform is, as we have always urged, to enable the guard to pass completely round the train at all times. Passengers can also pass along the platform to the guard, so that in this manner there is an easy and perfect mode of communication between passengers and guard. It is intended, however, in the standard steam-carriage, to provide, alternatively, a central passage inside instead of out along the entire length of the carriage, leading direct from end to the guard's compartment. The compartments in the carriages will be quite as separate and distinct as they are at present, or as the most fastidious could desire. Passengers in the higher class compartments can pass to the lower, but the lower cannot get to the higher, while all can pass to the guard when required. These carriages, it is said, will convey their full complement of passengers at 40 miles an hour up gradients of 1 in 100, and will pass round curves of 50 ft. [not 500] radius, at a speed of 20 miles an hour with perfect safety. The carriage passed round a line that had been laid specially for the purpose. There were straight runs on the sides connected at the ends of the course by curves of 50 ft. radius. The bogies—one under the engine and the other under the hinder end of the carriage—took the curves quite smoothly, without grinding upon either the rail or the flanges of the wheels. A large number of gentlemen witnessed the experiments, and, in so far as we can learn, all agreed in pronouncing them perfectly successful.

Well-sinking with an Untoward Result.

At Murat, a village situated between the valley of Mont Dore and that of St. James, a civil engineer had caused a rectangular well to be sunk to a depth of 53 metres through a stratum of hard tufa, which covers the primitive formation in that district. At this depth, which is insignificant compared to the shaft of a mine, the heat, nevertheless, became so intense that the workmen had to be relieved at short intervals. At last a loud rumbling noise was heard. The men in a fright jumped into the cage and called to be pulled up; but they had barely got to a height of a dozen metres, when a thick column of hot water, preceded by a violent report, rose up in the air, projecting huge stones upwards. The water in falling scalded the men grievously. The jet diminished, however, in getting out in time. In the course of ten hours the well got quite full, and from that time a rivulet of thermal water has been flowing from the spot into the Dordogne. Upon analysis it has been found to contain upwards of twenty milligrammes (nearly half a grain) of arseniate of potash per litre, a proportion unheard of before. The Minister of Public Works has sent a commission of engineers to the spot for further investigation.

The Clergy House of St. Mary's, Soho.

The foundation of the clergy house, or rectory, in connexion with the new church of St. Mary the Virgin, Crown-street, Soho, has been laid by Mrs. W. E. Gladstone, in the presence of a very numerous and fashionable assembly, principally composed of the friends and supporters of the House of Charity in Greek street. It is proposed to rebuild, on an enlarged plan, the church of St. Mary, with school-rooms for 600 children, and a house for the clergy connected with it. The cost of these buildings will be 10,000*l.*, towards which sum 2,700*l.* have been subscribed, including 1,700*l.* from the Bishop of London's fund. The new church will accommodate 700 persons, all the sittings being free.

Social Science Association.—The annual congress will be held in Bristol (as we stated would probably be the case), commencing on Wednesday, September the 29th.

Caversham Bridge.—This bridge has been opened for traffic. The work has been carried out by Messrs. Shaw, Head, & Co., of Stockton-on-Tees, and the ironwork was designed by Mr. Woodman, Borough Surveyor. There are five spans, the centre being 43 ft. wide, and the other four 62 ft. each. The roadway is 20 ft. wide, and there are two footpaths, each 5 ft. wide. The approaches on either side commence at a distance of 100 ft., and the incline is not greater than that of the old structure. Mr. Neale was the foreman to the contractors, and Mr. Dorrner the clerk of the works on behalf of the Reading Corporation. The bridge is built on sixteen piles, screwed into the ground about 8 ft. These piles are filled with Portland cement concrete. The piles, being in pairs, are connected together with wrought-iron bearing girders, which form the pier. The whole span of the bridge, in clear from Berkshire to Oxford abutment, is 290.9 ft. The girders are of lattice form, with cast-iron ornaments, giving it a Gothic appearance; and cast-iron ornaments are riveted to the gravel plates. Cross girders are riveted to the main girders, on top of which comes the flooring, which consists of Barlow rails and plates riveted together. The number of rivets in this flooring exceeds 12,000.

Drinking Fountains Association.—The tenth annual meeting of the Metropolitan Drinking Fountains and Cattle Troughs Association was held on Saturday at Willis's Rooms—the president, the Right Hon. Earl Grosvenor, M.P., occupying the chair. The report stated that the intense heat of last summer brought the value and importance of the society's operations very prominently into notice. Existing fountains and troughs were maintained in the most perfect state of efficiency throughout the year, and nine new fountains and 90 new troughs were erected during that time. Her Majesty had forwarded a donation of 100l. The ordinary donations for the year amounted to 1,687l., donations for special fountains and troughs 830l., and annual subscriptions 771l. There had been a steady increase of about 100l. a year to the annual subscription list, but the additional expenditures involved in the new work was far greater than that sum. In some cases the committee were paying 30l. a year for water to supply one trough. More than 1,200 horses alone (besides oxen, sheep, and dogs) frequently drank at one trough in a single day. The committee have now 123 fountains and 125 troughs under their care, and the amount required for these is 24,200l. a year. The report was adopted, and other resolutions agreed to.

Proposed Trade School for the City of Worcester.—A number of gentlemen interested in the promotion of education have had a meeting in the Guildhall, Worcester, to take into consideration the subject of a Trade School after the method of that so long and successfully established at Bristol, and to hear the statement of Mr. Buckmaster, of the Government Educational Department, respecting the whole question. The Rev. Canon Wood was in the chair. At the close of Mr. Buckmaster's address, several questions were asked, and elicited replies to the effect that the Government would help a committee to adapt school premises, or even under peculiar circumstances would build. It would also help to procure apparatus. It was probable that Worcester might receive 150l. from Government on the results of examination in a trade school. Mr. Spencer had been remarkably successful with the young men who attended his evening classes. It was not possible that such a school as was under consideration could interfere with any existing institutions, as the work to be done was quite different from that which is included in the scheme of either national, middle, or upper schools. A provisional committee was formed to give effect to the suggestions thrown out.

Proposed Restoration of the Parish Church, Watford.—A public meeting has been held in the Corn Exchange, Watford, in aid of the restoration of the exterior of the parish church. The attendance was not large, the chair was taken by the Bishop of Rochester, and there were present on the platform, the Earl of Essex, Viscount Malden, the Hon. W. Cowper, M.P., and various other influential persons. A general committee was appointed, with power to appoint a working committee. The estimated cost of the restoration of the exterior to make it worthy of the interior is 5,000l., of which 1,800l. remain to be raised. Mr. Christopher, of Watford, is the architect.

The New Convalescent Hospital at Eastbourne.—This new building has been opened by the Bishop of Oxford in the presence of a large and influential assemblage. The hospital is intended, when completely finished, to contain accommodation for about 300 inmates. It is situated on the east side of the Downs which terminates seaward by the well-known Beachy Head. In plan, the hospital consists mainly of a parallelogram, 340 ft. in length; this is divided by a party wall into men and women's sides or wings, which are for the most part alike, and consist each of a central pavilion containing stone staircases, which give access to all the wards, &c. On the ground floor are two convalescent day wards, two smaller rooms for patients requiring separate treatment, and a large ward for incurable cases. Every large ward has attached to it a nurses' and sisters' room overlooking it, and lavatories and baths and other ample conveniences in small projecting wings, ensuring thereby thorough ventilation. The south wing is the sisters' house. When the building is all completed a chapel and kitchen courts will be formed on the north side, but at present the kitchen court only is completed, funds still being wanted for the erection of the chapel and the dining-hall. Attention has been paid to the ventilation, drainage, and warming (with hot water). The hospital is built of red brick, with Bath stone doors and windows of Geometrical Gothic, and is covered with plain tiling, the blue or grey Forest of Dean stone being used for the main piers and steps of staircases, window shafts, &c. The cost of the building now constructed and the enclosing walls, gardener's lodge, and chaplain's apartments, will, it is estimated, amount to about 35,000l., of this about 26,000l. (exclusive of the amount contributed at the opening) have been already subscribed.

Accidents.—The fronts of several small houses, situated in Westbourne Park passage, Paddington, have suddenly fallen down, and a man who was passing at the time was buried beneath the debris. On being extricated he was taken to the hospital.—At Conpar Angus, on the occasion of the annual Highland games and athletic sports, the grand stand, which was fully occupied, gave way, carrying everybody with it. One person died about a quarter of an hour after he had been taken out of the ruins. Several others who fell received severe injuries.—One of the houses on the north side of Duke-street, Brighton, has fallen to the ground, burying with it a number of workmen. The building fell without a moment's warning. The men were employed upon a scaffolding and elsewhere at the time of the accident. A number of workmen engaged on buildings being erected in the same street, immediately rushed to the spot, and rendered valuable assistance in extricating the unfortunate men from the debris. Three of the men were found to be near the top, and were speedily recovered, all more or less injured, as were two others: one of these, a bricklayer, was entirely buried beneath a large mass of rubbish and timber. It was found, however, that, though he had sustained grievous injury, no bones had actually been broken. The height of the building when it fell was 40 ft., and the walls were 14 in. thick at the basement. The building was being erected by Mr. Joseph Saltor, for the business and private residence of a plumber and glazier. At the time of the accident there were sixteen hands employed on the building. It was extremely fortunate that the walls fell inwards. Workmen at once set to work to demolish the back part of the building.

The Irrigation Works at Harrogate.—At a recent meeting of the local improvement commissioners, the surveyor was asked whether the irrigation works were in such a state that the sewage could be thrown over the whole of the ground. The surveyor replied in the affirmative, and said it had been thrown over the whole of the land which they at present proposed to irrigate, ever since the 31st of May. It was working satisfactorily, and was effective in purifying the water, as would be seen by the bottles which he produced. Mr. Cotland said he had examined this water; and (having described it) expressed the opinion that the water, after it had passed the works, was purer and freer from organic matter than it was in the watercourse above where the sewer entered it.

Chesterfield House, Mayfair.—We understand that Mr. C. Maguire has purchased this property for 180,000l.

Physical Commotions.—As the time of year recurs when the dreadful commotions of last year took place, one feels anxious lest there should be a recurrence of them, perhaps nearer home. In this it is to be hoped we shall be agreeably disappointed; but there are not wanting indications of something being still wrong below the surface. There have been several slight shocks of earthquake at Comrie, in Scotland, where, however, earthquakes appear to be quite a normal phenomenon, especially in the month of July. But on the Continent there have been unpleasant indications. "A few years ago," says the *Morning Post* of a few days back, "certain phenomena which occurred this morning at Paris would have created great excitement amongst the ignorant. A leaden mist covered the city—the sort of atmosphere which those who have lived in lands where earthquakes occur remember as preceding a convulsion. Then the water of the public fountains and ordinary supplies was of a rose tint." In Italy, too, something similar is occurring. "For several days," says the *Corriere delle Marche*, "a singular phenomenon has been observed in Ancona. The sky has been covered by a mist so thick that, on the 10th, the sun appeared enlarged as an object deep immersed in water, and like an immense red ball." The same phenomenon was observed in Naples and the neighbourhood, from the 19th to the 17th inst. During this interval the Bay and the whole coast were enveloped in something like a London fog. The upper air was clear and cloudless. Not a drop of rain had fallen, not a clap of thunder been heard; but the heat was fearful, and the sun appeared like a ball of red-hot iron, always of a deeper colour in the afternoon. On the return of the troops from their exercises at Bagnoli, many soldiers fell in the streets, and some were sent off to the hospital, where one at least has since died. At an earlier period of the year we had a similar ominous fog in London, it may be recollected. The fog hung over the City, but the streets were clear. Mr. Claisher says that a recent London fog was of a density that was remarkable, as experienced while experimenting in the "captive balloon."

The Condition and Prospects of the Suez Canal.—At a special meeting of members of the Liverpool Chamber of Commerce, a paper was read by Mr. Edward Rae, on the actual condition of the Suez Canal, and on the probability of its being opened for general traffic at the time announced by the company. There was a good attendance. Mr. Rae was of opinion that the canal will be opened by the time appointed; and if not, in a very short time thereafter. He gave an interesting account of the canal. The dredges on it, he said, are the most enormous ever constructed—they cost some 20,000l. each—and one actually excavated over 110,000 cubic yards of sand in one month. There was no question about the financial position of the company. He believed the future of Ismailia would be a great one. It was proposed to create there a sort of universal market and exchange, where goods would be brought from all parts of the world (after the fashion of the great Russian fair of Novgorod, though on a far grander scale). He hoped the Prince of Wales would take a decoration with him for Mons. de Lesseps. Only vessels under 50 tons would be allowed to sail through the canal, larger ones being either towed or propelled. There were no locks. The whole of Mr. Rae's paper was intended to show that there was no reason why the canal should not be opened at the date announced. When opened, the canal would have a depth of 26 ft., as asserted. When last he looked, a month ago, the company's shares were selling in France at a premium of 15 per cent. Sufficient funds had now been supplied.

The Bavarian Art Exhibition.—The building is the "Glass Palace" in the Sophien Strasse and Botanical Garden, which was erected for the International Industrial Exhibition of 1854, and in which a similar exhibition to the present was held in 1858. About two-thirds of the building are devoted to the International Art Exhibition, the other third being given up for an Industrial Exhibition of Munich Manufactures. England only figures for 20 pictures out of 2,000. Austria is the largest foreign contributor, being down for 300. Italy sends 230, Paris 280, Berlin 220, Belgium and Dusseldorf 100 each, and so on in nineties and seventies, &c., down to ten for America, and the same for Russia and Sweden taken together, Munich bringing up the rear with 500.

The Sheffield Architectural Society.—On Thursday, the 22nd, there was an excursion of the members of this society to Hatfield and Fishlake. A large party left Sheffield by the noon train to Doncaster, and after visiting St. George's Church and other objects of interest, they proceeded in carriages to Hatfield, where they stopped to examine the fine old church. The president (the Rev. J. Stacey) read a paper describing the church, and giving an historical account of Hatfield Chase. The present church, dedicated to St. Lawrence, was mostly erected in the fifteenth century, though portions of the twelfth and thirteenth century work still remain to mark the existence of an earlier building. It has a large nave, with north and south aisles, a fine tower, a chancel, with side chapel, and a vestry on the north side, under which there is a curious crypt. The roof screen and the peculiar stone arches supporting the roof of the north aisle were specially noticed. Proceeding on to Fishlake, the party were met by the vicar of that place, and conducted over the church (dedicated to St. Cuthbert), which is similar in character to that at Hatfield, but in better condition, having been recently restored. The old Norman doorway in the south porch was an object of interest.

Inauguration of the New Western Dock at Hull.—This new dock has been opened by the Prince and Princess of Wales. It is 3,300 ft. long, is of a somewhat singular shape, being 430 ft. broad at its widest part, and only 130 ft. wide at its narrowest part. Its area is 23a. Or. 1p., so that it is one of the largest docks in the empire. There is a large amount of quay space all round the dock, and the average width of the quay is 100 ft. to 150 ft. On the north side, not far from the entrance to the dock, Custom-house offices will be built, and it is also proposed to erect in succession several warehouses and sheds, the first of which is being carried out under the superintendence of Mr. R. A. Marillier, resident engineer. Considerable difficulty has been experienced in getting a good foundation, and the walls of the dock have been laid in some places on no less than 20 ft. of concrete, and in other places on 8 ft. of concrete. The whole of the hydraulic machinery has been supplied by Sir W. G. Armstrong & Co., of Newcastle-on-Tyne, and it has been fixed under the superintendence of Mr. C. Waure. Mr. W. McCormick has been the general contractor for the dock works. The engineer, who designed the dock and its appendages, was Mr. J. Hawkshaw, who has been assisted and represented by his son, Mr. J. C. Hawkshaw.

Encaustic Tiles.—A novelty in the manufacture of encaustic and other ornamental tiles, has just been brought to our notice by the Architectural Pottery Company. The patterns which have hitherto been inlaid in self colours, have in this process been produced by an admixture of coloured materials very finely prepared, which give the appearance of inlaying of granites and Florentine mosaics, according to the combinations of colours used, and may also be applied either in the ornament or as a ground. This contrast of coloured ornament against the ground has a pleasing effect, and is capable of introduction in elaborate ornamentation. We are at the same time assured that this new process intensifies the hardness of the surface, rendering the pavement still more durable. We were pleased with the specimens we have seen of the patent encaustic tiles produced by the same manufacturers. The ornament is more deeply inlaid than is customary on this description of manufacture, and the outlines are symmetrical.

Purchases for National Gallery.—In reply to questions in the House of Lords, one of the trustees of the National Gallery, Lord Overstone, entered into particulars to show the probability that the picture representing Christ blessing little children, ascribed to Rembrandt, was a genuine specimen of that master, and stated that the trustees shared the responsibility of the purchase as well as the director. "The Warrior adorning the Infant Jesus," had been said to have cost 3,000l., and not to be entered in the catalogue; but it only cost 520l., and was entered in the catalogue; it never had been designated a veritable Giorgione, as was said, but a specimen of the school of Bellini. The "Ecce Homo" never had been ascribed to Correggio, as alleged, but to Ludovico Carracci; and it was not sold, as also said, but was at present in the private room attached to the gallery.

The Horse's Head in Acoustics.—A writer, in *Notes and Queries*, says,—“When an old ‘meeting-house,’ in Bristo-street, was taken down, I think about 1805, to make room for the church now occupied by Dr. Pedit's congregation, the old sounding-board above the pulpit was found filled with horses' heads—I should say five or six at least. I was a mere child at the time, and for long after the heads presented themselves to my dreams. The matter had long passed from my memory, till now vividly recalled by the recent articles in your columns.” Were they intended to take the place of the vases of the ancients?

Testimonial to a Foreman.—The other day, at Cholesey, the under-foremen and workmen in the employ of Messrs. Mansfield, Price, & Co., the contractors for the Berks County Lunatic Asylum, presented Mr. S. Rolfe, the general foreman of the works, with a chased silver tankard, having an appropriate inscription, a double set of silver mathematical drawing instruments in a rosewood case, and a large box of colours, as marks of their respect for him as foreman of the works.

Immersed Socket for Upright Tubular Boilers.—An improved socket for tubular boilers has been registered provisionally. The socket is immersed so as to be protected from the direct action of the fire, and the joint may be formed with india-rubber with flucolay or ashes above it; or it may still be made with yarn and iron cement, so that the cement would be at the strongest part of the socket instead of at the weakest, as in the present socket. Both socket and pipe expand and contract together, from both being in contact with the water.

The Manchester Albert Memorial.—An incident of the royal procession in Manchester last week has escaped notice. At the memorial in Albert-square, Mr. T. Worthington, the architect of the memorial, was presented by General Knollys to the Prince of Wales, who expressed his admiration of the work. Mr. W. H. Wood handed to the Earl of Sefton, from Mr. Worthington, for presentation to the Princess of Wales, a photograph of the memorial, which her royal highness very graciously received.

Cockermouth Board of Health Surveyorship.—At the proceedings for the appointment of a surveyor, there were for Mr. Thomas F. Taylor, Cockermouth, 5 votes; for Mr. Edward Routledge, Thirlak, 4; for Mr. Henry Piele, Cockermouth, 1. As it required a clear majority of members present to secure the election of any one candidate, a vote was withdrawn from Mr. Piele, and given to Mr. Taylor, who was thereupon declared duly elected.

The Albert Memorial, Exeter.—The new wing of the Albert Memorial Museum is now nearly completed, and it is expected that it will be out of the builder's hands in the course of a fortnight or three weeks. The building has been illustrated in our pages. We understand that the museum will be used as the headquarters of the British Association during their visit next month.

The Charges of Architects in Germany.—We have received from Mons. Böckman, President of the Society of Architects at Berlin, through Mr. Charles Fowler, papers relating to the scheme for architects' remuneration, which was adopted by the last general congress of German architects, as we mentioned at the time. We may have occasion to return to them.

Porosity of Bricks.—Chemists in *Land and Water*, says that six years ago, being consulted by a maltster as to the best means of rendering the walls of his malt stores impervious to wet, he suggested the application of a mixture of one pound of tallow to one gallon of boiled oil, and that two coatings of this compound, applied hot, and while the sun was shining on the wall, have answered perfectly up to the present time.

New Small-pox and Fever Hospital.—It has been definitely decided, notwithstanding the opposition of the inhabitants, that one of the small-pox and fever hospitals proposed to be erected in the suburbs shall be commenced at once at Stockwell, in the Bedford private road.

New Workhouse for the Strand Union. The foundation-stone of the new workhouse at Tanner's End, Edmonton, was quietly laid on the 23rd inst. The anticipated expenditure is at about 60,000l.: Mr. W. S. Cross is the architect. The tenders for some of the fittings were given in our last.

West Australia.—News have been received at Perth, West Australia, from the settlements on the north-east coast. The pearl-shell gathering season was just at its close, after a fairly successful haul by most of the boats. Attention was being directed to the gathering of tortoise-shell, some samples of which have been sent home to ascertain the market value. Turtle are said to swarm upon the coast. Five beautiful pearls, found at the newly-discovered fisheries in Western Australia, have been brought to this country by the last mail.

TENDERS.

For the erection of a Small-pox Hospital at Homerton, for the Managers of the Metropolitan Asylum District, Messrs. John Giles & Hiven, architects. Quantities estimated by Mr. D. W. Young and Messrs. Richardson & Waghorn:—

Gannon & Son	£25,521 0 0
Nutt & Co.	23,774 0 0
Hornam	23,615 0 0
Howard	23,390 0 0
W. Perry	22,837 0 0
Tarrant & Son	22,547 0 0
Myers & Sons	22,506 0 0
Scrivener & White	22,444 0 0
Hill, Keddell, & Wadtram	22,038 0 0
Manley & Rogers	22,094 0 0
J. Perry	21,952 0 0
Kirk & Parry	21,540 0 0
Webb & Sons	21,400 0 0
Baton & Chapman	20,920 0 0
Mann	20,918 0 0
Chapple	20,815 0 0

Unexceptionable references.—Address, A. B. 115, Fetter-lane, London.

The Builder.

VOL. XXVII.—No. 1383.

The Arms and Armour in the Tower of London.

PROGRESS is now being rapidly made in the re-arrangement of the ancient armour in the Tower, and will be probably completed in the course of another fortnight. To the mere sight-seers who stream through the building at the rate of from five to seven hundred *per diem* the alterations may be of little importance or interest; but the student and the antiquary who may have visited the collection in its previous state will immediately recognise the advantages afforded to them, and join us in thanks to Mr. J. R. Planché, Somerset Herald, under whose superintendence it has been effected. [Proceeding on the same plan which has given so much satisfaction in his arrangement of the Meyrick collection at South Kensington—the success of which, as an exhibition, at length woke up the Government to the discreditable state of the National armoury, and induced them to solicit his services—Mr. Planché has ferreted out the unappreciated because unseen rarities scattered and hidden away in various nooks and corners of the store-house, and classified and arranged them chronologically in the several compartments appropriated to the successive periods of English history.

The dingy, brick-dust coloured canvass monstrosities that did duty for banners, and were, all but four, inscribed with the names of illustrious personages, who never wore the armour attributed to them, have been completely swept away, and the wall above the arches is painted with the livery colours of the Royal Families of England, from the Plantagenets to the Stuarts, and bearing the names and dates of the sovereigns in gold from Henry II. to James II. Greater length is thus given to the vista, variety of decoration to the arcade, and, what is of infinitely more importance, useful instruction to the public.

The first compartment presents us with a most interesting series of helms and other head-pieces, from the twelfth to the end of the fourteenth century; portions of mail, iron gambiats, and swords, and specimens of all the early weapons, from the gaisarme of the battle of Hastings to the bill and glaive of the Middle Ages. The second compartment, ranging from the deposition of Richard II. to the death of Richard III., is rich beyond description with relics of the fifteenth century, which witnessed the battle of Agincourt, the Wars of the Roses, and the final triumph of the House of Lancaster on the field of Bosworth. Beside the beautiful armour of this period, which was of the most elegant and fanciful description, the attention of the antiquary will be arrested by a curious painted German helmet, of the class called *Saelder*; another, with its original ornamentation of velvet and gilt *four-de-lys*, and a saddle

of bone and wood, which is only surpassed by a similar one in the Meyrick collection. An exquisitely modelled articulated hack-plate and a long-toed solleret, with its original long-shanked spur attached to it, of the time of Henry VI., with examples of every kind of head-piece in and during the fifteenth century, the whole railed in with the glittering hills, partizans, and other weapons of the period, make of this second compartment an exhibition of Mediæval military antiquities which would alone repay an intellectual visitor for the trouble of his journey; but then he must be allowed to contemplate and examine it at his leisure, and not compelled to "move on" with a gaping bewildered crowd at the heels of the inevitable hee-feater. This is a nuisance which must be abated if any benefit to art and education is to result from the scientific arrangement now making, and the conversion of a lumber-room into a museum.

With the third compartment commences "the Line of Tudor," distinguished by its colours of white and green, which alternately decorate the spandrels of the nine succeeding arches, in front of which, as formerly, are ranged a series of knightly panoplies, some mounted, some on foot, displaying the various changes in the form and fashion of defensive armour from the time of Henry VII. to the end of the reign of Elizabeth. Amongst the suits are those which actually belonged to King Henry VIII., to his brother-in-law, Charles Brandon, Duke of Suffolk, and to the great favourite of the "Virgin Queen," Robert Dudley, Earl of Leicester; that of the latter being elaborately engraved with his badge of the ragged staff. To these, our old acquaintances, have now been added a series of the tilting helmets, and examples of all the weapons in use during the successive reigns. Amongst the latter may be noticed two English long-bows of yew recovered from the wreck of the *Mary Rose*, a ship of war, sunk near Spithead in 1545. Examples of this celebrated and most favourite national weapon are exceedingly rare, and these interesting relics have been transferred from the obscure position to which they had been consigned, and placed in a conspicuous one amongst the armour and arms of the reign they were last used in. Fronting this line of Tudor, are ranged some exceedingly fine and perfect foreign suits of corresponding periods, Burgundian, German, French, and Italian, and in the recess formerly occupied only by the armour for man and horse, said to have been presented by the Emperor Maximilian to Henry VIII. on the occasion of his marriage with Katherine of Aragon, now stand also two other most interesting suits made for the same monarch, one "rough from the hammer," the other highly polished and engraved with the collar of the garter and the Tudor rose, with laminated skirts or bases sliding on what were called *Almaine rivets*, a unique example of armour in fashion at the commencement of his reign. Stars and ornaments composed of modern swords and pistols have been replaced by cross-bows, helmets, and targets of the time. On the right, under glass, is a superb heart-shaped shield of embossed steel, representing the last battle of Charles the Bold, Duke of Burgundy; and, on the left, is a lantern-target used for night attacks, the interior painted with the story of Camillus, after Giulio Romano. This curious specimen of Mediæval art, purchased from the Bernal collection, was found by Mr. Planché covered with dirt, fastened at the top of a column in the ante-room to the Indian compartment,—"out of sight and out of mind!"

Eight more arches, surmounted by the yellow and red livery colours of the Stuarts, bring us to the end of what is called "the Horse Armoury," the last figure being that of James II., "in the armour," and, from its appearance, we should say, the wig, "which he wore at the Battle of the Boyne," so at least the warders assure us; and it would be petty treason

to don't those voracious personages, although it is difficult to reconcile the account of one with the other, each having his own story, illustrated by his own especial comments. In this particular instance, however, we may safely agree with them that the armour did belong to the second James, though it may possibly be questioned as to its being the identical suit which saw the Boyne water, considering that he was not taken prisoner, and that the armour he wore more probably found its way with its owner to St. Germain's.

The last weapons arranged on this line are those used by the rebels who rose in support of the misguided Duke of Monmouth, and which were, oddly enough, nailed up close to the tail of Queen Elizabeth's horses, in what is designated her armoury.

Appropos of this armoury whereto the public are conducted from the point we have reached in our review. It was originally called "the Spanish armoury," and supposed to contain the spoils of the Invincible Armada. Years ago Sir Samuel Meyrick demonstrated to the authorities that there was not a Spanish weapon in the whole collection; that "the consecrated banner presented by the Pope" was a leather shield or pavoise, with a cross cut out of a common playing-card stuck upon it; and that "the partizan of the Spanish commander-in-chief of the expedition" had, rather unfortunately, the arms of Sir Dudley Carleton engraved on its blade. He was only permitted to change the name of this apartment to "Queen Elizabeth's armoury," a figure of her Majesty on horseback, attended by a page, occupying a recess at the end of it. This, however, was its only claim to the title, as the chamber was merely made a receptacle of all the odds and ends which could not be conveniently disposed of elsewhere. A great change is now taking place in this apartment; figures representing every arm of the service in the reign of Elizabeth; the Bowman, the hillman, the halberdier, the musqueteer, the pikeman, the demilancer, the knight, in his full suit of tilting armour, ready to enter the lists against all comers, are now assembled in presence of their sovereign, and justifying for the first time the title of their hitherto gloomy chamber to the name of an Elizabeth armoury. Light by the way is here greatly needed.

Repassing through the magnificent Indian collection, which has been enriched by the transfer of several Oriental rarities which had been incongruously mixed up with the European armour below—notably the mounted figure which had been successively exhibited as "Edward the Black Prince," and "a Norman Crusader"—the public descend to the Horse Armoury, and are led down the passage at the back of the mounted figures to the door, by which they depart on their way to the White Tower. On their left the firearms, invented and adopted from the latest period to their first introduction, remain as previously arranged; but on their right the work of classification and chronological arrangement has been thoroughly carried out. Breastplates and helmets, instead of being crammed in the glass cases, under no regard to date, in the glass cases, under the platform, are now fairly displayed in due order, from the reign of Charles I., up to that of Henry VII., and on the platform are mounted, in corresponding rotation, a most interesting series of small pieces of artillery, from the cannon made for Charles II., when Prince of Wales, to the "iron gunne, with a touch," of the time of Edward IV.

Having long persistently and alone exposed the improper condition of the national armoury, and called for a revision and arrangement of it under competent direction, we may be permitted to feel a little gratification at the very successful result which has at last been brought about. The reform, however, must not rest here: the con-

stant supervision of a qualified person should be given to the collection, or in less than a year it will relapse into its former state of disorder,—labels will be misplaced, pieces when taken out to be cleaned will be put into wrong compartments, and so forth. Moreover, purchases should be made, so as to complete and enrich the collection, and this of course should be done under scientific direction. The public voluntarily supplies plenty of money, but at present this is misappropriated. Why, for example, should the armour be made to pay the whole cost of the 25 beefeaters, at 30s. a week each, or nearly 2,000l. a year in the whole? Surely, and to go no further, the other departments, the jewel rooms for example, should bear some of this cost, so that more of the money paid by the public to see the arms and armour could be applied to increase the efficiency of the collection. With the good result of the present experiment before them, the Government will surely take heart of grace and go forward in the same direction.

GUILDHALL LIBRARY AND MUSEUM.

The city of London is full of hidden treasures. We do not refer to the bars of bullion and other specie in the strongholds of the Bank of England, or to the heaps of precious metal in the safe security of the Mint, or, again, to the priceless collections of plate belonging to such corporations as the Goldsmiths' Company. It is not to her mines of wealth in gold and silver that our remark is intended to apply, but to her literary and archaeological treasures, in which the City is no less rich, though very few are aware of the fact. The reason is that these are hidden away in all sorts of obscure nooks and on-of-the-way corners. Few are aware of their existence even, fewer still have ever seen them. Literary searchers and students of antiquity are to some extent familiar with the valuable archives and rare collections we allude to, but to the public generally they are a sealed book. How many Londoners, for instance, have made a visit to the Armourer's Museum in Coleman-street—it will certainly repay one—or to the Trinity House Museum, with its interesting models of light-houses and apparatus of all kinds connected with seafaring life? How many have inspected that extremely curious gathering of heathen idols and other relics of savage life in the Missionary Museum in Finsbury, or spent an hour among the many historical curiosities of great value in the museum of the Herald's College? The library and museum of Guildhall may be said to be of far greater interest than any of these, yet who, besides the antiquarian or the enthusiastic book-hunter, ever visited it? Until the other day, who knew there was such a place? Extensive and highly valuable as are both the library and the museum—in some respects, indeed, unique—some correspondence which appeared a short time since showed that even eminent citizens knew nothing of the collection. Thanks to Dr. Sedgwick Saunders, this collection is no longer one of the hidden treasures of the City. In his capacity of chairman of the library committee, Dr. Saunders, at a recent court of Common Council, brought forward a motion recognising "the great importance of establishing a library and museum worthy of the city of London," and proposing to erect a new building for such purposes on a site now in possession of the Corporation at the eastern end of Guildhall, at an expense not exceeding 25,000l. Dr. Saunders has been so far successful in his project that, at an adjourned discussion, the motion, omitting that part referring to the site, was unanimously carried, and a special committee has been appointed to obtain plans and estimates, and report thereon to the court. Whether an entirely new building be provided, as this gentleman proposes, or whether the large building now used for the trials of *Nisi Prius* in the Guildhall-yard (which will be at the disposal of the Corporation on the removal of the Law Courts), can be made available, as another member of the Council suggests, matters not so much, so long as the Free City Library and Museum shall be comfortably lodged. At present it is not even decently housed, and it will be a grave reproach on a corporation which can be lavish in its generosity when it likes, should matters be allowed to remain as they are any longer. However, there is now no fear that this will be the case. A glance at the history and contents of the collection may be interesting as well as useful. The present is the second Guildhall

library. The exact date of the foundation of the original library is not known. We find it, however, spoken of by the famous Whittington, who was one of its earliest benefactors. John Carpenter, in 1441, also gave several important works during his lifetime; while in his will, proved the following year, he directs:—"If any good or rare books shall be found amongst the residue of my goods, which by the discretion of Master William Lichfield and Reginald Peckok Guildhall for the profit of the students there, and those discoursing to the common people, then I will and bequeath that those books be residue in such form that the visitors and pray for my soul." The inference is that this "common library at Guildhall" was then the national library, and, as Dr. Saunders remarks, in his able appeal to the Corporation, the citizens of London may fairly claim to be the parent of that monster Bibliothèque now annexed to the British Museum. Government took up the idea of the formation of the latter at a comparatively late period (1753). Stow refers to "a fayre and large librarie, furnished with books pertaining to the Guildhall and Colledge," and further informs us that in the reign of Edward VI. the books were "sent for by Edward, Duke of Somerset, Lord Protector, with promise to be restored shortly. Men laded thence three carriages [carts] with them, but they were never returned." This reminds us of the story of the Duke of Buckingham, who "borrowed" a portion of the stone provided for the restoration of St. Paul's, and built with it the water-gate at York House. Buckingham's transaction, however, was by no means so black as Somerset's. The handiwork of Inigo Jones is still to the fore at the foot of Buckingham-street. Whatever may have remained of the library after the Lord Protector's theft—if aught did remain, which seems doubtful—was destroyed in the Great Fire of London. Nothing was done to repair the loss until 1824, when the present collection was formed. It has been created by grants of money from the City funds, and donations from private individuals, and by the concentration of valuable documents from all the departments of the Corporation. The progress of the library has, indeed, been very remarkable. Even now it is one of the largest and most valuable in England, though up to the present moment it is the most meanly housed. It contains a more complete collection of books and manuscripts relating to the City of London than even the British Museum, while the various departments of literature, science, and art are fairly represented. Among the more valuable features of this Bibliothèque, we found a complete series of the *London Gazette*, from their commencement in 1665 to 1732, purchased at a cost of 250 guineas, and another extensive series of ancient City triumphs, called "City Pageants," and also Royal Processions, serving to illustrate the progressive alterations and improvements in manners, buildings, and society in the metropolis. The first edition of Stow's "London" is here, also an original copy of Aggas's Map of London (1560), and a copy of that very scarce work, Higden's "Polychronicon." There are several thousand prints and drawings, consisting chiefly of metropolitan topography and portraits of eminent characters, including, among the latter, a series of the Lord Mayors, Sheriffs, and Records. In old tracts relating to the customs, laws, and privileges of the City, giving accounts of the great Plague, the great Fire, and other historical incidents, the library is particularly rich. In 1847 the institution received the munificent gift of 400 volumes of Hebrew and Rabbinical literature from a private source. These works—a library in themselves—have since been carefully catalogued. In 1863 the authorities of the Dutch Church, Austin-friars, handed over their ancient and valuable library to the custody of the corporation. The addition thus made to the Free City Library has enriched it with nearly 2,000 volumes of the literature of the early period of the Reformation—theological works for the most part, in Latin, German, Dutch, and English—and a large collection of manuscripts and letters, many of the latter by the founders of the Dutch Republic. A brief extract from the catalogue, descriptive of one portion of this priceless collection, will, we think, interest our readers:—

"There is also another collection of two hundred and seventy-two original communications, addressed to Abraham Ortelius, geographer to Philip II. of Spain,

from most of the learned scientific men of the time. Several of the letters are accompanied by engraved portraits; a portrait of Ortelius, and one of Christopher Plantin, the printer of the Polyglot Bible of Cardinal Ximenes, whose house at Antwerp was the resort of the learned of all countries; Gerard Mercator, cosmographer, geographer; William Camden, one of the most illustrious of English antiquaries; Dr. John Dee, Astronomer of Queen Elizabeth, mathematician and astrologer (his geographical collection is still preserved in the Cottonian manuscripts at the British Museum); a Latin physician to the same Queen; also letters and documents signed by Lord Burleigh and Walsingham; the Paris of Leicester, Sussex, and Lincoln, Lord Bacon, and other ministers. A Latin quarto Bible, written upon vellum, with titles and beginning of chapters illuminated. Another Bible, in Dutch, with illuminated titles, in two volumes, 1360; one printed at Delft, in 1477, in German; some early folio pieces, and the manners and customs of the people; and Blaeu's views of the several towns and villages in the Low Countries, printed in 1649."

In accepting the library of the Dutch Church, the corporation agreed to the stipulation that a separate room should be set apart for its reception. It has been put in a garret, though it is only fair to add that a sum of 300l. has been expended in binding and repairing the books, and in providing suitable cases for them. Another curious case of literary pilfering ought to be mentioned here. In 1861 Mr. Riley, in the course of his researches, discovered that a portion of the *Liber Custumarum* had been abstracted from the City's archives. It was found among the Cottonian manuscripts of the British Museum, whereupon the Library Committee wrote to the trustees of the Museum inquiring as to the circumstances under which the important MS. had been removed, and requesting its restoration. The trustees replied, and expressed their inability to surrender the abstracted folios. It would appear that Sir Robert Cotton, in the early part of the seventeenth century, borrowed several of the City's records under various pretexts, retained them for a considerable period; and they were only restored to the Corporation after much pressure, and then in a defaced and mutilated condition. The total number of volumes now in the library is about 30,000, exclusive of a large collection of maps, plans, prints, drawings, and portraits.

It is now time to say a few words regarding the museum. The resolution to form a civic museum was taken in 1820, and the foundation of this desirable object was laid by a donation of several Roman antiquities discovered in digging the foundations of the new post-office, and in the excavations for the new London Bridge, and the Guildhall Chapel. The local antiquities of the City are perhaps the most valuable and interesting we possess, and additions are being continually made to them, such as the Roman pavement lately found in Bucklersbury. This splendid relic is now in the possession of the museum, and it will surprise most persons, we dare say, when they find this young institution so wealthy in relics of the Roman era, the whole of course having been dug up within a stone's throw of Guildhall. A large portion of the curiosities of this class was added to the museum in a lump four years ago, when the Corporation authorised the purchase, for the sum of 200l., of a private collection of Roman and Medieval antiquities, selected with great care during the excavations carried on in the City for the last fifteen years. Other of the contributions have been acquired more gradually; a single precious bit here and another there. So far as the limited and crowded space allowed, the contents have been arranged and classified, though a large number of objects of rare interest have (of necessity) been stowed away like so much lumber. Still the visitor will find much to engage his attention and to excite his wonder. Under one glass case we have a collection of fine Roman pottery found in Thames-street in 1864, and we cannot but regret that it should be in so fragmentary a condition. Another case contains specimens of figured Samian ware cast up in the excavations for New-street, Southwark. It is ornamented with scrolls of foliage, of beautiful design and exquisite workmanship. In a third case we come upon specimens of Roman fresco or wall-painting and bits of mosaic work, earthenware urns in variety, many of them quite perfect and of shapes that we moderns are content to copy because we cannot surpass them. With what care, too, a batch of frightfully old shoes has been placed under lock and key! We soon discover, however, that these are worn-out crepebs of different kinds, most of the specimens showing the ordinary Roman method for making

soles of extra thickness by rows of nails driven through several layers of leather from the outside. The nails differ little in shape from what are used for navvies' boots in the present day. The shoes were found on the site of the Royal Exchange. There is a fine collection of Roman pins and needles of home and jet, and here we decidedly beat our ancient invaders in the matter of making stitches. They certainly never dreamed of the modern sewing-machine, but they have left us some whorls for spinning. Interesting also is a group of styli (iron and bone) for writing on tablets, with specimens of tabellæ found on the site of "Steelyard," spoons (cochlearia) with circular bowls and pointed handles, used by the Romans in eating eggs, extracting shell-fish, &c., almost identical in size and shape with some egg and salt spoons of these days, though of coarse manufacture; Roman knives with bone handles, fibulæ or brooches, armlets, rings, locks and keys. Cæsar's countrymen were in the habit of making use of that little article of modern utility, a latch-key, though it was not a Cubb. In addition to these we may notice a number of lead signa, or pilgrims' signs, dating from the time of Edward the Confessor, most of which were found in the Thames at Westminster; old English padlocks and keys from 1350; iron, bronze, and brass spurs, of different dates, some of them of so formidable and ornate a character that we pity the poor horses of the period; buckles and medals of Charles I.'s time; gold motto-rings and other trinkets and personal ornaments worn by our ancestors. There is a unique collection of tradesmen's tokens relating to London, Westminster, and Southwark, as also an attractive display of bronze medals commemorative of various events connected with the history of the City from the opening of the Royal Exchange by Queen Elizabeth, in 1570, to the entry of the Princess of Wales into London. Here may also be seen a massive tombstone erected to some Roman citizen who was interred in Ludgate-hill, then one of the highways leading to the City; the sign-stone of the famous Boar's Head Tavern, in Eastcheap, is preserved here, and a sword presented to the Corporation by Lord Nelson after the battle of the Nile. The manuscript documents in the museum are not many, but they are highly valuable. They include, among others, autograph letters from Queen Elizabeth (1589), Victoria, Napoleon III., Victor Emmanuel (in reply to the address of the Corporation in 1855), Count Cavour; a letter written by Dr. Johnson, dated Streatham, 1778; another of more interest, addressed to the "Commissioners of Public Works of the City of London," with reference to the Fleet ditch; from Sir Christopher Wren and Robert Hooke, and dated 1673. There are two letters written by Cromwell—one to the Lord Mayor, dated from the Cockpit, 1653; the other addressed to the Gresham Company, requesting them to suspend the appointment of a Geometry Professor in Gresham College, until he should have an opportunity to speak with some of them. This is signed, "Y' loving friend, Oliver P.," and is dated Whitehall, 9 May, 1656. A letter, written in an unusually large but modern-looking hand, by the Duke of Buckingham, gives a description of the Great Fire then burning, &c., on the 6th of September, 1666. But unquestionably the gem of the autograph collection is the signature of Shakspeare affixed to a deed of sale of a house in Blackfriars, purchased by the poet from Henry Walker, dated March 10th, 1612. This deed was sold by public auction in 1843, and bought by the library committee for 145l. The signature is one of the best of the six autographs of Shakspeare in existence acknowledged to be genuine (omitting reference to the recent asserted discovery at Bury St. Edmund's), of which three are attached to his will in Doctors' Commons, one is in Montaigne's Essays in the British Museum, and one on a mortgage-deed of the 11th of March, 1612. For this document the British Museum, in 1858, gave the sum of 315l. It is unnecessary that we should again refer to the miserable accommodation afforded for the display of these treasures of antiquity. They are literally stowed away in a narrow and ill-adapted corridor, with bad light and worse ventilation. Not very long ago a distinguished American Professor visited Guildhall. Having seen the rest of our municipal buildings, and greatly admired the splendour of that temple in which "our civic hospitalities are dispensed with a profusion worthy of Lucretius," he was conducted to the library. The librarian hoped that, in the enthusiasm created by the literary gems

and treasures of antiquity there shown him, he had overlooked the equal of the building. But on leaving, with many thanks to the librarian for the treat he had given him, the Professor said,—"If we possessed such jewels as these we should provide them with a more worthy casket." At last the Corporation has resolved in earnest to take the hint of the enlightened American.

THE GEOLOGY OF BUILDING STONES.*

The next division of the great Oolitic series in descending order is that of the Portland stone and sand, upon which the Purbeck beds are seen to rest in Dorsetshire, this indeed being the only county which possesses any good sequence of these Upper Oolites. Unlike the fresh-water conditions of the Purbeck, the Portland stone is of marine origin, as is also the accompanying Portland sand, as shown by the fossils. As its name implies, the great storehouse from which this world-wide building-stone is obtained, is in Portland Isle, near Weymouth, the particular merits of which were first seen by Inigo Jones, who chose it for the banqueting-hall at Whitehall, and used it largely all through his career. The beds are about six in number, and are called, beginning at the top,—the top-cap, skull-cap, roach, top bed, middle bed or curf, and bottom bed. The "roach" bed, in the geological division of Middle Portland, is valuable when great strength is required, such as for the bottoms of breakwaters; but it will not bear a close, even face. In this respect the "top bed" is best of all, and the "bottom bed" the worst. In fact, the building-stone underlies the whole island like a great floor, of which about an acre annually gets worked, and it is calculated that at this rate there is enough to last for the next two thousand years. About 40,000 tons annually are raised from the Portland quarries, and their destination is—everywhere.

The Isle of Purbeck, too, near Swanage, supplies good Portland stone, and furnished the material used in Goldsmiths' Hall and the Reform Club.

At Tisbury, in Wiltshire, the Portland stone is called the "Devil's Bed." When first cut, it is of a green colour, and soft, but becomes hard and nearly white after exposure to the atmosphere. Near Salisbury there are valuable quarries, which give the stone the name of Chilmark stone. It is of a greenish brown, and has been largely used in Salisbury Cathedral, and at Wilton.

These are the principal sources of Portland stone, although the formation is seen slightly developed and partially worked in other counties, such as Oxfordshire; at Great Hazley, where there are quarries; and in Bucks, near Aylesbury, where it is locally called "pendle," and is used in buildings in that town.

Underlying the Portland stone, and forming the base of the Upper Oolite series, is the Kimmeridge clay, useful to the builder, as the great sources for tiles, draining-pipes, and bricks, in the counties of Wilts, Dorset, Bucks, &c. The two former alone supply many millions annually.

The Middle Oolite is by no means of such economic value as the upper or lower divisions. It contains the Coral Rag and the Oxford clay, the former being subdivided into two, viz, the calcareous grit and the Coral Rag proper. It is so called because it is principally composed of petrifed corals, which retain their position in great masses just as they grow in the sea; in fact, it is nothing less than a fossil coral reef. It is used pretty largely, but locally, in Dorsetshire for building, while in Oxfordshire and Berks principally for road metal. The higher beds, however, in the former county (at the base of the Kimmeridge clay) produce a coarse oolite freestone, quarried at Headington, which has been largely used for buildings in Oxford of later date than the fifteenth century; but the geological surveyors state that it does not answer well, partly from inherent defects in quality, and partly from sufficient attention not having been given to placing the stones in the buildings as they lay in the quarry.

In Dorsetshire it is a rough stone, but has been used a good deal. A large portion of Shaftesbury has been built of it from the quarries near Bruton and Gillingham; also Gillingham, Hinton St. Mary's, Marnhall, and Sutton Waldron churches. There are extensive quarries of Coral Rag at Swindon, Parton, and Melksham, in Wiltshire.

* See p. 559, ante.

The Oxford clay is generally recognised by the agriculturist, from its being usually laid out in meadows and permanent pastures. It is generally a dark-blue clay and shale; but in some places, as in Wiltshire, it takes the form of a concretionary limestone full of shells. Here it is called Kelloway rock; but it is seldom or never used for building.

The Lower Oolite is, perhaps, the most important of the whole series; not that the quality of the stone is better for the Portland stone cannot be excelled, but because it is spread over a larger surface of country. It is found all the way from Dorsetshire to Yorkshire, attaining its greatest development about Bath and the Cotswold districts. Like the other divisions of the series, it is subdivided into Corbrash, Forest Marble, Great Oolite, and Stonesfield Slate, Fallers' Earth, Inferior Oolite. Geological terms are often very vague and misleading, as in this case, when people would naturally consider the Lower and Inferior Oolite as the same thing, whereas the Inferior is really only a component portion of the Lower.

The Corbrash and Forest Marble are generally found together. The former consists of clays and calcareous sandstones passing down into the latter, which is usually an argillaceous limestone, although it is not always constant.

The Corbrash, when exposed to the atmosphere, becomes a rubly cream-coloured stone, and breaks into small blocks with uneven surfaces. It is not oolitic, and seldom yields good building-stone, but is useful for making lime. Agriculturally it is a remarkably good soil for corn, which Dr. Voelcker thinks arises from its containing a large amount of phosphoric acid suitable to wheat. The Forest Marble, on the other hand, is generally a cold wet soil, favourable for pastures, and particularly when clay predominates, as at Bradford (Wilt).

In some places it yields good building-stone— at Sherborne, for instance, where it is known as Crackmore Marble, of which the chancel steps of the abbey church are built. The Bath Forest Marble is mostly used for slabs for flooring and roofing, and also for road metal. In the neighbourhood of Cirencester it is also used for roofing and pitching stone. They are here frequently dug from a few feet beneath the surface, the gap being filled in again with rubbish, and the soil replaced.

Forest Marble is largely developed in Wychwood Forest, Oxfordshire, where it is generally yellowish at the surface, but when reached at some depth is of the usual blue colour. The beds differ a good deal in different places, sometimes being a fissile oolite, splitting into rough slates, and in others blue and grey flags with beds of clay. Frome and Blandford churches, with Trinity Church, Cirencester, are built of it, and the most important quarries are found at Sherborne, Milborne Port, Frome, Tebury, Wellington, Cirencester, and Bladon in Oxfordshire. The Great Oolite contains those valuable beds which yield the Bath freestone, which, like the Portland stone, is known all over the world. The term freestone, however, although usually applied to the Great and Inferior Oolite, has different local meanings; as, for instance, in Hampshire, near Alton, where a rock in the Upper Greensand or Upper Malm rock is called freestone; and in Cornwall the term is applied to the stone from a granitic dyke. The topmost beds of the Great Oolite afford beautiful road metal, and the bottom zone is geologically termed Stonesfield Slate, from the village, in Oxfordshire, where they are so finely developed. Everybody is familiar with the splendid slabs of freestone sent out from the Bath and Wiltshire quarries, and it is used all over the country for "dressings," and very largely as "ashlar," for partitions, &c. The Cirencester quarries produce walling, paving, block, and road stones, the walling stone being used for most of the buildings, such as the Town-hall, the Agricultural College, and St. John's Church. It is capable of being easily faced. The block stone is used instead of Bath stone when expense is an object; but it does not do for wet and frosty weather, for it must be kept dry, whereas Bath stone will stand wet and frost. There is much variety in the quality of the Great Oolite; for instance, at Chipping Norton, it does not produce good building-stone, whereas at Taynton, near Barford, in the same county, it is remarkably good, and furnished the material for Blenheim, and a number of churches in Oxford and thereabouts. These churches, of the dates of the twelfth, thirteenth, and fourteenth centuries, have stood better and retained

sharper mouldings than some of the later buildings, which are of Coral Rag. The same variations are found in the Stonesfield slate. At these quarries, which are getting exhausted and too expensive to work, the bed is only 1 ft. thick. The blocks are brought to the surface in early winter and exposed to the frost, which causes them to split along the planes of bedding. The equivalents of these beds are found in Gloucestershire, at Sevenhampton and Eyeford. Here they are sandy and fissile, and make good slates; but as they go east to Windmarsh and Taynton, they become quite oolitic, and fit for building. Burford Church is built of Stonesfield slate.

In Northamptonshire, the sands which yield such splendid beds of iron ore are all in the Great Oolite, and the stone is deeply tinged with the ferruginous stone. In fact, Wellingborough and the villages adjoining are built of oolitic iron stone, and at a pinch might be carted off bodily to the furnace and then smelted.

The principal Great Oolite quarries are at Bath. Combe Down furnished the stone for the restoration of Henry VIII's Chapel in Westminster Abbey; Farleigh Down supplied Buckingham Palace; Box, Corsham, and Baynton supplied Windsor Castle, Laycock Abbey, and Wilton House; from Shepton Mallet came the stone for Prior's Park College and the Orphan Asylum at Slough, close to the station. Besides these, there are well-known quarries at Bathampton, Bridgwater, Wellington, Yeovil, Stroud (where it is called Painswick stone), Tetbury, Eyeford, Sevenhampton, Bradford, Charlbury, in Oxfordshire (from which many buildings in Oxford have been supplied), Ancaster, in Lincolnshire (Belvoir and Wollaton Hall were built from hence), and Lincoln, from whence came the stone for Grantham, Boston, and Newark churches, and Lincoln Cathedral. The quarries near Stamford furnished stone for Ely Cathedral, and that known as Barnack Rag for Peterborough. In Yorkshire, the Aislaby stone was used for Whitley Abbey, Docks, and the New University Library at Cambridge; while those from Brough supplied Beverley Minster.

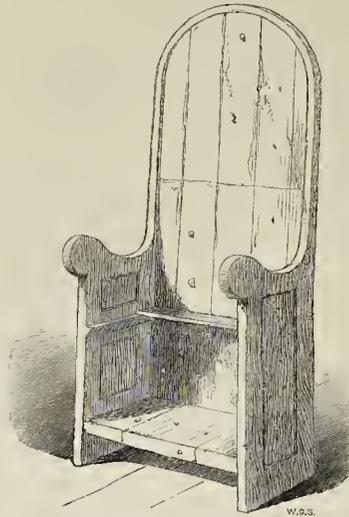

The Fullers' Earth is principally seen at Bath, at the base of the Great Oolite, and is not of much account to the builder, though it furnishes good soil for the farmer. The Fullers' Earth Rock in Dorsetshire is a limestone (not oolitic), and is burnt for lime.

The Inferior Oolite, the lowest of the oolitic series, is a calcareous freestone resting upon the lias. It is pretty constant in its range, although it differs very much in its development, being most splendidly seen in Gloucestershire, at Birdlip, Crickley, Leckhampton Hill (Cheltenham), Winchester, &c. To the east, however, in Oxfordshire it dwindles away, until it is only a few feet thick. Geologists again subdivide the Inferior Oolite into Ragstone, Pea-grit, Upper Freestone, Oolite Marl, and Lower Freestone. The ragstone is principally used for roads. The Upper Freestone at Leckhampton is about 23 ft. thick. It is not so constant in quality as the Lower Freestone; for at Stanway Hill it yields fine blocks, whereas at Broadway and Bourton it is fissile, and made use of as slates.

The Lower Freestone at Cheltenham is 127 ft. in thickness, and when carefully examined, is found to consist of fragments of shells cemented together by carbonate of lime. It is one of the most beautiful stones in the kingdom, rivalling Caen stone in purity of colour, durability, and capability of being moulded.

We close these few remarks on the oolite series of building-stones with a list of the weights (avoidpois) of a cubic foot of some of the principal ones, which we have extracted from the Mining Record of 1858, a valuable compendium of quarries and quarry-stones in the United Kingdom, a new edition of which, brought to the present time, would be of immense use to all concerned in building:—

Locality.	Formation.	lbs. oz.
Tisbury	Portland stone	111 2
Bath (Combe Down)	Great Oolite	116 0
Burford	"	118 2

The Papal Chair stripped of its Finery.

ST. PETER'S CHAIR, ROME.

In contrast to the venerable chair of St. Peter, of which a recent number of the *Builder* contained an interesting representation, I send you a sketch of the present chair of St. Peter's successor, stripped of its finery, and reduced to the bare boards of which it consists, or did so in 1855, when last I was in Rome.

It happened that, strolling from the Vatican into the Church, on the 15th of January, I found the workmen preparing for a *capella papale* to be held on the 18th, the anniversary, it was said, of the return of the Papal See to Rome, though later by five days than the date assigned to it by Batista Platina. The drapery was being put up for the occasion, and the papal chair, the object of so much pious regard, was there in all the nakedness of its bare boards, a rough, unseemly seat of dirty deal, made up of odds and ends of old materials.

The idea occurred to me that this chair, thus exposed, was not symbolically a bad representation of the Papacy itself, made gorgeous to the sight by its showy externals, as this deal chair by its royal trappings of crimson velvet, and trimmings of golden tissue, so I sketched it and roughly measured it. It was 8 ft. high, 2 ft. deep, and about 2 ft. 9 in. broad. For the sake of Romanism I could have wished it to have been of less homely material, but, wooden as it was, it answered every purpose, was capacious, and had a firm bottom. *Au fond*, all orthodox religions are pretty much the same, the principles of humanity do not alter, nor human duties either, though the tastes and feelings of times and peoples may dress them up differently. Divested of its finery, no plain Protestant parson could desire a more humble chair than the wooden throne of St. Peter's successor: that it is of so perishable a material also suggests a moral, and a deeper meaning when spiritually discerned.

H. C. BARLOW.

ROYAL PRINCESS'S THEATRE.

The interior of the Princess's Theatre, as left by the late Mr. Charles Kean, with whom the conductor of this journal was long connected in the production of his Shakspearean revivals, had become faded and dirty, and Mr. George Vining, the present manager, did not too soon determine to renovate and adorn. The house has been entirely redecorated at the cost of something like 3,000*l.* The architectural ornaments of the proscenium have been altered, and to the flat surfaces of the front of the dress circle and of the upper boxes, formerly decorated with painting, coupled griffins, and Italian scroll-work, in low relief, more elegantly modelled than we sometimes see them in this position, have

been applied. The whole is solidly gilt on light backgrounds, and so, too, are the enriched plasters that enclose the stage and the proscenium boxes. As a question of principle this substitution of ornament in relief for flat surfaces painted by good artists is open to discussion, but we are willing to admit the necessity for change and novelty that exists with reference to the adornment of places of amusement, as well as other exigencies, and to give praise to the decorative artist employed, Mr. MacIntosh, of Langham-street, for the successful manner in which he has done his work. The ornamental work in relief, we should add (of *carton pierre*), was executed by Messrs. White & Co. The front of the Queen's box and that of a box for the Prince of Wales on the opposite side, are heavily draped with crimson velvet and gilt ornaments, and there being no strong colour elsewhere in the house, look somewhat spotty. The drapery might be lessened with improved effect. The ceiling is painted with Cupids and flowers by Mr. Homan. The lighting of the house was entrusted to Messrs. J. Defries & Sons, and is very well done. The central light—a handsome work of its kind—is a combination of sunburner and glass chandelier, and in addition to this there are two smaller chandeliers with sunlights close to the proscenium, one on each side. The footlights, too, have been altered, and made to obstruct less the view of the stage than was formerly the case. Some improvements have been made in the seating, and Messrs. Telbin and W. Telbin have painted one of their handsome masses of white and red satin curtains for a drop scene; so that altogether the public have reason to be pleased with what Mr. Vining has provided for them before the footlights. Behind them, no less. Handel's "Acis and Galatea" (the words by Gay, Pope, Dryden, and others) is most successfully revived, Mr. Vernon Ripby, Mr. Montem Smith, and Miss Blanche Cole singing so well as greatly to surpass all that was expected of them, and Herr Formes very little disappointing even those who had formed extravagant notions of his fitness for the giant's part.

Mr. F. Lloyds and his assistants have reproduced very admirably the sketches of the late Clarkson Stanfield, including "The Rolling Wave" on the coast of Sicily by moonlight, view from a vineyard looking into a valley, and the Bay with the Temple of Neptune hard by.

London Bridge.—A correspondent again suggests that as the roadways of London-bridge are about to be taken up and relaid, an ornamental iron footway should be thrown out on each side of the bridge, so that the whole of the present footways might be taken into the roadways, to the great relief of the traffic.

THE ROYAL COMMISSION ON WATER SUPPLY.

SOURCES OF SUPPLY OTHER THAN THE MOUNTAINOUS DISTRICTS OF ENGLAND AND WALES.*

HAVING disposed of the gravitation schemes, the Commissioners consider the propositions that have been made to supply the metropolis from—

1. The river Thames and its tributaries.
2. The river Lea.
3. The chalk and oolite formations in the basin of the Thames.
4. Miscellaneous sources.

Mr. McLean proposed, in 1849 and 1850, to dam up the Thames above Medmenham by a series of embankments across the present channel so as to form reservoirs, from the lowest of which, at an elevation of 105 ft. above low water at London, he would make a canal 40 ft. wide and 12 ft. deep to bring the water to London, delivering it at about the level of the Paddington Canal or the New River Head, from which level the lower parts of London might be supplied, and the higher parts by pumping from this level to reservoirs at Hampstead and Clapham.

The drainage area of the Thames to the point selected for the reservoirs is 2,500 square miles, and the mean annual rainfall is taken to be 26 in. The quantity obtainable in this way is estimated by Mr. McLean at 200 million gallons per day.

Mr. Bailey Denton's plan is to collect the water from the oolite sources on the north of the Thames between Cricklade and Oxford, and from the various streams rising in the chalk throughout the whole area. The average rainfall is 26 in.; the minimum between 19 in. and 20 in., and that minimum is disposed of in this way:— 3 in. support the perennial supply of the river; that is to say, maintain the river in summer at the ordinary height." Of the remaining 17 in. a very large share runs off to the sea in winter. The ordinary winter flow as compared with the ordinary summer flow is as 21 to 1.

Mr. Denton proposes three sources of supply: the upper sources of the Thames giving 100 million gallons a day; the Lee 60 millions; the Wey and the Mole 40 millions; making in all 200 million gallons per day, exclusive of the Colne and Wandale, which may provide a share at some future time.

Using the North Wiltshire Canal, and the Thames and Severn Canal, which joins the Thames at Lechlade, for the collection of water, Mr. Denton proposes to bring the water from Lechlade to London by a conduit 127 miles in length. This conduit would collect the water from the various tributaries into a concentrating reservoir to be made just below Oxford. Then, taking in other tributaries, the conduit would bring the water to Hampton, to be delivered to the present Waterworks Company, and by them raised to high-service reservoirs for distribution by gravitation.

The cost is estimated by Mr. Denton at 5,320,000*l.*

Mr. T. C. Brown, of Cirencester, gives information of the rainfall in the upper part of the basin of the Thames from 1815 to 1868. It varied from 19.9 in. in 1854 to 48.8 in. in 1852, and the mean of the twenty-three years was 30 in.

Mr. Bravender says, in respect of some large springs, that Boxwell spring yields 1 million gallons a day. At Ewen there is another of

about the same strength. Ampney spring gives out from 20 to 30 million gallons a day. Bibury spring gives out rather more than that. At Abington a spring gives out more than 2 million gallons a day. A spring above Winson gives out 1½ million. These springs are at a level of from 300 ft. to 380 ft. above the sea. Mr. Bravender estimates that from 9 in. to 11 in. of the mean annual rainfall is available over the whole district.

Mr. R. W. Mylne proposes to bring 70 million gallons per day from the streams and chalk springs of the basin of the River Lea, at a cost of 1,250,000*l.*, in substitution of the present supply of the New River and East London Companies. Of this quantity 47 million gallons would be from the upper sources, impounded in reservoirs on Enfield Chase, and it is proposed to retain the New River channel for the flow of the Chadwell spring, and to collect all the springs issuing from the west bank of the valley between Amwell and Rye House, and lift them into the New River; also to purchase the water rights of the springs which now work Hoddesdon Mill, and to collect these and others in the locality, and lift them also into the New River. The quantity thus obtained would be 18½ million gallons a day, and from the gravel and sands near Hoddesdon 4½ millions additional might be lifted into the New River, making a total of 23 million gallons, which would increase the daily supply to 70 million gallons, in substitution of the present supply of the New River and East London Companies. Mr. Mylne says the advantages of this plan to the East London Company would be that they would obtain water from a purer source, and could distribute it by gravitation instead of pumping, as at present, and the New River Company would have an increased and improved supply.

The Commissioners then refer to the chalk formations in the basin of the Thames. Out of the 3,676 square miles drainage area of the Thames above Kingston, 1,047 square miles, or two-sevenths of the whole, consist of chalk downs. These strata absorb and store a large portion of the rainfall.

In some "general remarks on the sources and springs in the Thames basin," the Commissioners state the drainage area at Kingston to be 3,676 square miles, which receives an average annual rainfall of 27.2 in., and one-third of the quantity due to this rainfall flows down the Thames at Hampton. One-third of the area consists of impermeable clays, and two-thirds, or about 2,450 square miles, of permeable oolitic limestones, sands, and chalk. The rainfall on this latter area does not pass off into the streams at once, but is stored up, and its ultimate delivery through springs to the streams and rivers is spread over weeks or months. "To this cause is owing the permanence of flow of a river draining a permeable rock district, compared with the irregular delivery of a river draining an impermeable district, and it is a consideration of great importance in a question of water supply."

ON THE PRESENT WATER SUPPLY OF THE METROPOLIS.

London is now supplied with water by eight companies. On the north side of the Thames, the New River Company, the East London Company, the Chelsea Company, the West Middlesex Company, and the Grand Junction Company; on the south side, the Lambeth Company, the Southwark and Vauxhall Company, and the Kent Company. The particulars of the present supply are as follow:—

The quantity of water above stated is the daily average of the whole year, but in summer the quantity reaches the following maximum:—

	Gallons per day.
Chelsea	9,042,800
West Middlesex	9,776,707
Grand Junction	11,985,742
Southwark and Vauxhall	13,975,000
Lambeth	10,257,800
New River	26,710,000
East London	20,321,182
Kent	7,198,708
Total	108,312,909

ON THE SUPPLY OF WATER AVAILABLE FROM THE BASIN OF THE THAMES.

The minimum flow of the Thames at Kingston is variously estimated, but looking at all the circumstances, the commissioners conclude that a daily flow of 350,000,000 gallons is an exceptional thing, occurring only for a few days in the course of many years.

The companies are empowered to take the following quantities of water from the Thames:—

	Gallons daily.
Chelsea Company	20,000,000
West Middlesex	20,000,000
Grand Junction	20,000,000
Southwark and Vauxhall	20,000,000
Lambeth	20,000,000
East London	10,000,000
Total	110,000,000

The commissioners are led to believe that storage reservoirs could easily be made on the upper part of the river, to collect floods and equalise the flow, and so neutralise the effect of the severe droughts, and therefore to admit of a still larger abstraction of water if required hereafter.

But apart from the main stream of the Thames, it is also necessary to inquire into the additional quantity which may be obtained from the subsidiary basin of the river Lea. Its area is about 500 square miles, and the mean annual rainfall 25½ in. The upper part, above Hertford, is almost entirely chalk; the lower part almost entirely London clay. The New River Company take 15 million gallons per day from the upper part, between Hertford and Ware, and the East London Company, 19½ millions lower down, being on the whole 37½ million gallons per day, on the average of the year, the quantity in summer being increased to about 40 millions. Adding to this the 5 millions that the companies are bound to leave for the lockage of boats, the present demand on the river is 45 million gallons per day.

Mr. Beardmore, the engineer of the river, makes the quantity passing down the river at Field's Weir for the last nineteen years 108.8 million gallons per day; and in the months of June, July, August, and September of five dry years he makes it (including the companies' supplies) average 45.2 million gallons, which is increased by springs in the valley below the weir. It is therefore clear that without storage reservoirs no more water can be relied on. The Commissioners consider that even with proper storage the Lea valley cannot contribute more than 50 millions.

As to a subsidiary supply from the chalk, the Commissioners do not approve of tapping the reservoirs of water contained in the chalk that feeds either the Lea or the Thames above Hampton, believing that that would only be to reduce, *pro tanto*, the water flowing in those streams, and, therefore, little or nothing would be gained by that; but there is a reservoir of water in the chalk on the south and south-east of London that does not feed either of those streams, but whose surplus waters find their way by springs into the Thames below London.

Seeing that the Kent Company pump from the few wells they have 7 million gallons per day, and are said to be capable of supplying twice as much, that the Grays Springs are said to be capable of yielding 10 millions, and that a small district near Gravesend has furnished an equal quantity, they believe they may safely estimate that an additional supply from this source of 30 millions gallons per day may be had. Combining these several sources, they estimate that, if ever required, they may calculate on getting from the basin of the Thames:—

	Gallons per day.
From the main stream, supplemented by the aid of store reservoirs, say	220,000,000
From the Lea	50,000,000
From the chalk to the south and south-east of London	30,000,000
Or, say, a total of	300,000,000

* See pp. 593-8, ante.

	Capital.	Approximate area of district supplied.	Number of houses supplied in 1867.	Estimated number of inhabitants supplied in 1867.	Average daily supply in 1867.
From the Thames:—	£	Square miles.			Gallons.
Chelsea	795,000	6½	26,875	170,000	8,087,258
West Middlesex	798,571	10	36,881	275,000	8,816,486
Grand Junction	85,000	24	27,190	245,000	9,533,432
Southwark and Vauxhall	1,100,449	30	71,558	468,000	13,029,758
Lambeth	736,245	25	33,320	230,000	8,975,530
					48,042,467
From the Basin of the Lea:—					
New River	2,609,418	19	113,462	800,000	23,790,867
East London	1,400,000	50	62,462	675,900	19,208,241
					43,088,908
From Chalk Wells in Kent:—					
Kent Company	489,240	60	34,504	240,000	6,468,873
Total	8,760,514	224½	441,442	3,100,000	98,600,248

ON THE PRESENT QUALITY OF THE WATER IN THE THAMES AND ITS TRIBUTARIES.

Mineral or inorganic contents, such as metallic and earthy salts, are found present in water at its first sources, while the organic contents have been added to it by accidental circumstances during its flow.

The mineral or inorganic contents of the water supplied by the companies from Hampton amount usually to about 15 grains per gallon of water, of which more than half is carbonate of lime, and the rest sulphate of lime, with salts of magnesia, soda, potash, and silica, and traces of alum and iron. The waters of the Lea Valley as supplied by the companies differ little from those of the Thames; but those of the Kent Company, being drawn from the chalk, contain a considerably larger quantity of the salts of lime.

The presence of lime gives the water the peculiar quality of *hardness*. Water charged with salts of lime has the property of decomposing soap to a certain extent, by the combination of the lime with the alkali, and this is what is meant by the popular description of the water being "hard." Dr. Clark, of Aberdeen, discovered a mode by which the hardness of water could be defined with great exactness. He first formed a series of artificial waters of several grades of hardness, each containing a known proportion of bicarbonate of lime; and when any unknown water was to be tried, he compared its effects on soap with these as standards, and so at once obtained an accurate measure of its hardness. He proposed to designate the hardness of water by the number of grains of bicarbonate of lime contained in one imperial gallon (or 70,000 grains) of a standard water producing the same curdling effect. This process is known as "Dr. Clark's test," the number of grains being called degrees.

The Thames water at its source is somewhat hard; but flowing water tends to part with a portion of the carbonate of lime it holds in solution, and after a flow of some miles the Thames water falls to a uniform standard varying from 12 to 15 degrees of hardness.

A gallon of perfectly pure water when exposed to contact with chalk (carbonate of lime) will dissolve only two grains of it. It is the carbonic acid gas in the water that dissolves the greater amount of lime, and when the water is boiled the gas is driven off and the lime falls to the bottom, in proportion to the quantity of gas driven off by boiling. The water of Hampton of 14 degrees of hardness is reduced to 3 degrees by boiling. It is the first five minutes' boiling that has the greatest proportionate effect, reducing it to about 6 degrees; but it will go on reducing in hardness by further time.

The professors of chemistry whom the Commissioners consulted considered that moderately hard water is not injurious to health. A change, however, from hard to soft, or from soft to hard, is sometimes injurious.

Water used for culinary purposes is mostly boiled, and thereby the Thames water is reduced from 14 to about 5 degrees of hardness. Water may be temporarily or permanently hard. It is temporarily hard when its hardness is caused by carbonate of lime, which is separated by boiling, while other salts of lime, such as sulphate of lime, are generally dissolved in water without the intervention of carbonic acid gas, and therefore remain in solution although the water is boiled, imparting hardness. The Thames water is of a temporarily hard character.

In making tea soft water acts more quickly and more powerfully on the leaves than hard water does.

With soft water tea is required to stand but a short time before it is ready for use—say five or ten minutes—and the action goes on until the bitter principle of the leaves is extracted, which is not agreeable to some people, while with hard water the tea is required to stand a longer time before it is ready for use, and the bitter principle will not be extracted at all.

For washing and manufacturing purposes all the evidence goes to show that soft water is superior to hard, and for house cleansing and personal ablution it is indeniably so.

So far the *entirely inorganic impurities*. The organic impurities and contamination of the Thames water, though more indistinct in their form, and less appreciable in quantity, render the water at least liable to suspicion.

Owing to the absence of minerals and the non-attraction of any large manufacturing interest, the Thames basin above Hampton is thinly populated. About 230 persons per square

mile, or rather less than 3 to the acre, is the present population.

The sewage from the towns situate on the river and its tributaries, that finds its way into the streams, is subject to a provision of nature for effecting spontaneously its purification. Some of the noxious matter is removed by fish and other animal life, and a further quantity is absorbed by aquatic vegetation; but, in addition to this, important changes are effected by chemical action, the great agent being oxygen. Running waters always contain much air dissolved in them, especially when frequent falls organic matters are seized upon and broken up, and their peculiar organic constitution destroyed, their elements being rearranged into permanent inorganic forms, innocuous and free from any deleterious quality.

All the professors of chemistry agreed with this view, but disagreed upon the question of degree to which water could be thus purified which had been contaminated with sewage, and of how far analysis of the water was a safe guide to its quality as affecting health. Dr. Frankland relies on analysis to indicate, by the presence of nitrates and nitrites, that the water had been in the same proportion subject to "previous sewage contamination," contending that these nitrates and nitrites are the skeletons of previous organic matters derived from sewage, while others consider they may be derived from other sources. The presence of these nitrates and nitrites in moderate quantity is not considered by any of them prejudicial to the consumers of the water, but it is just that degree of moderation which they cannot determine.

Sir Benjamin Brodie, Professor of Chemistry in the university of Oxford, does not rely on analysis for a proof of whether water is fit to drink or not, and thinks the only safe way is to keep the sewage out of the river. Mr. Simon, Medical Officer to the Privy Council, says of one has to do is not to take water out of a reservoir or out of a tap and give it to a chemist, and say, "Tell me, is this wholesome water?" What one has to do is to guard the supply with the utmost strictness against every foul admixture. It ought to be made an absolute condition for a public water supply that it should be uncontaminable by sewage.

With regard to the future influences likely to affect the quality of the water from the basin of the Thames, the Commissioners look forward to the prospect of a probable increase of the quantity of sewage from towns, and rely on the Thames Conservancy Act of 1866 being put in force to prevent sewage passing into the river, or into any of its tributaries, for a distance of three miles upwards. The Conservators have authority under the Act to enforce a penalty of 100*l.* upon any person or body who may do this, and a further penalty of 50*l.* for every day during which it is allowed to continue.

By the same Act the five metropolitan water companies drawing water from the river are bound to pay each of them 1,000*l.* a year to the Conservators in consideration of this Act being enforced.

As to the effect of sewage irrigation in purifying the water, most of the chemists agree that it would be effectual, and that the water, after passing over-land, would part with its deleterious ingredients, and become fit to be mixed with the river water that is supplied to London; but Dr. Frankland goes only so far as to say that four-fifths of the sewage matter is destroyed by irrigation under favourable circumstances.

The Commissioners consider that effectual filtration (that is, we presume, an effectual adoption of the ordinary mode of filtration through sand) is essential to the good quality of the Thames water. Analyses of filtered and unfiltered water show a decided improvement in the quality by the operation.

By the Metropolitan Water Act of 1852, "Every company shall effectually filter all water supplied by them within the metropolis for domestic use." All the companies profess to comply with this provision, but the evidence shows that the filtration has been imperfectly carried out in some cases from the want of a sufficient area of filtering surface, and the Commissioners call special attention to this neglect.

The Commissioners are of opinion that when the sewage and other pollutions are excluded from the Thames and the Lea, and their tributaries, and perfect filtration adopted, water taken from the present sources will be of suitable quality for the supply of the metropolis.

As to the population of London, it was 3,082,374 in the middle of 1867. Mr. Bateman estimates that in nine or ten years it will be 4,500,000, and the Commissioners agree nearly with this estimate, allowing more time than Mr. Bateman does for this population being attained. They assume an ultimate future population of 5,000,000.

As to the quantity of water required, ten gallons per head per day are sufficient for ordinary domestic requirements, including water-closets, but to this have to be added large supplies for street watering, flushing sewers, trade purposes, and other consumption, which, in London, have been estimated at another ten gallons. Then there is waste, often amounting to another ten gallons. Mr. Bateman takes forty gallons as the least quantity that ought to be reckoned on in the future. In Glasgow it is fifty gallons. Mr. Duncan says that in a large town where care is taken to prevent waste thirty gallons per head per day would be about the right quantity, but he thinks it will go on increasing to about forty-five gallons.

Mr. Hawksley thinks thirty gallons abundant. Mr. Simpson says thirty gallons, including all public wastes.

Mr. Hassard states that the Dublin Water-works are estimated to supply forty gallons.

Mr. Rawlinson conceives thirty gallons a head is sufficient, allowing for waste.

Mr. Muir has found ten gallons ample for domestic purposes, and twenty for all purposes; the difference between that and thirty, the present consumption, being entirely due to waste.

Mr. Graves thinks twenty-four gallons ought to be sufficient.

Mr. Beardmore considers that, for all purposes, including waste, the quantity required for London would not be less than thirty-five gallons per head per day.

On the whole, the Commissioners have arrived at the following estimate of the quantity to be provided:—

	Gallons per Day.
The present supply is, say, for 3,000,000 population, at 35 gallons per head, equal to.....	105,000,000
Assume the population to have increased to 4,000,000, and at the same time the additional waste due to the new introduction of the constant service to have increased the supply to 40 gallons per head, equal to.....	160,000,000
By the time the population has increased to 5,000,000 it may be hoped that the allowance may be reduced again to 35 gallons, which would give.....	175,000,000
Or for the maximum summer consumption, say 200,000,000 which they consider the highest demand that need be looked for to.	200,000,000

As to the constant service system at high pressure, they come to the conclusion to recommend it for the metropolis, although the fittings, being adapted to an intermittent supply, will require great alteration. It would appear that the fittings of the London houses are unusually defective, for with a supply of only an hour or two a-day, the waste is very great, while if a constant supply were attempted without a change of fittings, it could not be kept up with the present means of the companies. But the Commissioners recognise the difficulty of introducing a constant supply while the works remain in the hands of private companies, for without constant inspection of the fittings waste could not be prevented; and this done by private authority would be looked upon as an intrusion, and for this and other reasons they recommend that the water supply of the metropolis should be consolidated under public control.

Meakin's Self-acting Sash Fastener.

This sash-fastener is designed to give greater facility for getting immediate ventilation to rooms by readily lowering and raising the large plate-glass sashes now in general use, and to provide a self-acting means of securing them when closed, irrespective of the height of the meeting rails from the floor, many of which are much above ordinary reach. The arrangement consists of two lines attached to the upper sash, passed over suitable pulleys at the top, and terminating in tassels or handles at a convenient hand height. One line passes through "the fastener" in such a manner that on proceeding to open the sash, a spring catch is withdrawn, and the sash is lowered at pleasure. On raising the sash, the catch engages in a locking-plate, and the two sashes are firmly secured, and proof against external violence by burglars. This invention, if the cords can be made strong enough, will supply a great want.

THE NEW LAW COURTS, BRISTOL.

The new buildings in Small-street are now approaching completion. The centre of the site, formerly occupied by a portion of Colston House and Messrs. Ashmead's offices, is now covered with a building intended for the Nisi Prius Court, 34 ft. by 49 ft., and 38 ft. high; and as this room forms the key to the whole plan, it was necessary to place it as nearly as possible at the back of the old courts, in order that the judges' rooms may be together for the purpose of consultation, which has been effected by means of an ante-room. Three doors in Small-street give access to the new buildings, the one under the tower being intended for the judge and barristers and the law library. Upon entering the doorway under the tower, in Small-street, one will pass into a small hall, 22 ft. by 20 ft., and from thence into the law library, formerly the printing-room of the local *Times* and *Mirror*, but now restored and forming a library. The old Norman arches and pillars have been retained in the walls, and parts of these show the marks of having once suffered from fire. An oak screen will divide this room from the barristers' room. The adjoining room (the old type room) will be thoroughly restored, and fitted up as a barristers' reading-room, with a doorway leading into the law library, the old room above it being retained as a consultation-room, and communicating with the rooms on the one pair, towards Small-street, by means of an oriel in the corner of the law library. Passing along the barristers' corridor, one will next come to a wing built upon what was the back yard of the office, and containing the barristers' robing-room, lavatories, and barristers' clerks' rooms. The floors of this corridor will be laid with Minton's tiles, and the skylights be filled in with enamelled glass of a suitable pattern. The end of the corridor will be connected with the centre corridor into Broad-street, the roof of which will be lowered, and skylights similar to those in the roof over the barristers' corridor, be placed in the same. The rooms under the Bankruptcy Court will be converted into housekeeper's room, sheriff's office, and two consultation rooms, lavatories, &c., attached. The roof of the present court will be raised to the same height as the new court, and a range of windows formed looking over the corridor. The front towards Small-street will be a reproduction of the details of Colston House, and two statues of the Queen and Prince Albert will be placed over the judges' entrance. The whole of the buildings will be warmed and ventilated by Messrs. Haden, of Trowbridge. The Joanna Southcott chimney-piece has been refixed in one of the witnesses' rooms, and the two other large chimney-pieces have been retained in their original positions.

HUMAN FLIGHT.

Man shall fly. These three monosyllables are a clear prophecy of the next great coming event, and involve the only new invention worth mention remaining to be discovered. Man has subdued all his earthly heritage but the air; and his humblest vassals, the sparrow and the bee, are not perpetually to have the privilege of floating the lord of creation on their own domain, and his. But, how to do it? that is the question. How not to do it, though on a colossal scale, has hitherto been the proved triumph of aërostation. An enclosed cloud of wood-smoke, or of carbonated hydrogen, lifts itself up,—and man with it,—fill he over seas creation from its circling belt of upper firmament, and fancies he has flown there; but he has not: he has simply risen like a bubble, and is no more master of the air than a wandering thistle-star. We must manage flight on quite a different principle from that of Montgolfier or Glaisher. How, then, to do it? Well, we must copy Nature. When Brunel found difficulties in nudertunnelling the rotten Thames, he took counsel of a beetle, which works its way through mud with a shield over its head; when a speaking doll had to be made for aristocratic nurslings, it must have bellows for lungs, a clapper for a tongue, and two nostril pipes to divide the syllables; when the constructor of the navy found it necessary to improve upon paddles,—a fish's side fins,—he added a tail, and forthwith there was a screw steamer. So, with flying, we must imitate birds, or rather bats, and not balloons or bubbles; and for this imitation, the one thing needful is increased muscular power. It is a common mistake to fancy much comparative lightness in a bird. Weigh your culinary

goose and judge; yet this heavy carcass, once well and strongly on the wing, can soar with eagles, and can cross an ocean. What we want is not so much levitation, as an enlarged and continued power of flapping. Give us hundreds of muscles like the breasts of birds,—add the caoutchouc hatlike wings, and the steel-elongated arms, and flight would be as easy to an ordinary man as—let us put it!—to the familiar goose on the common.

How then to give us muscles, and so to adapt them to our extraneous wings as to fly as aloft like Peter Wilkins, and enable a paterfamilias to call for his wing (with a reasonable expectancy of being them), as Ingoldsby's Baron of Shurland to call for his boots?

Now, we know that a little wheel, shrewdly cogged, will work a bigger one, and this a bigger still, and so on; until a child's finger, by multiplication of power, may work a mill. Why not apply this principle to the force of a waving arm, which, by help of wheels and springs contained in a breastplate, might work the flappers almost automaton-fashion, and, at slight effort to the man, might keep him energetically flying? The idea is to be well thought out and wrought out, and we shall soon have Sammel Brothers advertising Mr. Spurgeon in a flying suit.

To this Dædalus-and-Icarus theory and practice of the matter our thoughts are tending as to human aërostation. It is curious and instructive to find how true that earliest intuition was of flying, even as the birds fly; how, simply by feathers, and wax, and imitative wings, those practical philosophers, though falling, did their wisest for success; and how, sagely, in these deep days, a statesman, plus minister, plus duke, corroborates that wisdom of old Dædalus, and that filial heroism of young Icarus, in his Grace's "rule of law."

To the writer of these few lines the subject is not a new one. Some five-and-twenty years ago, in an earliest number of *Ainsworth's Magazine*, a certain "Flight upon Flying" from his pen goes fuller into the subject; and sundry lucubrations since have touched it parenthetically; but he now takes leave to throw his fancies once again thus into print off-hand, convinced that the time approaches for man's conquest of the air, as of the sea, the land, the fire; and that the only true principle for success in such a matter is a servile copying of Nature.

MARTIN F. TUPPER.

EDINBURGH.

BUILDING operations are by no means active in this city at present; no new work of any importance has been started since the spring, but there are several rapidly approaching completion. The large site cleared for the Caledonian Railway Station, at the Lothian-road, still remains a scene of desolation, although something is being done in the way of levelling up. There is a hitch as to the erection of the design prepared by Messrs. Peddie & Kinnear owing to the want of funds; but when the Government purchases up the telegraphs the Company will have a large sum in hand, and it will be greatly to their discredit if they erect an unsightly edifice on so conspicuous and admirable a site. In this neighbourhood Mr. Gowans is proceeding with the second block of houses in Castle-terrace; those already erected have an effective skyline broken by high pitched gables and ornamented chimney shafts; but we cannot reconcile ourselves to the so-called "geometric" details; its novelty is its only merit. In the interior arrangements Mr. Gowans has also departed from the usual routine, and here we meet with things more worthy of approval. For example, dark bedrooms in the centre of a corner block are entirely got rid of,—a consummation devoutly to be wished! The water-closets are all ventilated from the outside, and a ventilating pipe is carried from the drains up the chimney shafts to prevent the possibility of foul air entering the houses. Mr. Gowans is appropriating part of the garden-ground opposite the terrace for a boneward, which will be open to the public; the remainder is to be railed in, and laid out as a garden for the residents.

Free St. George's Church is almost ready for occupation, and so is West Coates Church. Mr. Bryce is not so happy in his ecclesiastical as in his secular designs. Neither of these churches is worthy of admiration. The former is classical, and might with perfect propriety be used as a concert-hall. The latter is Gothic, clumsy, squat, and badly detailed.

The Fettes College is progressing slowly, and forms a fine feature in the landscape; Mr. Bryce has been as successful here as he has been the reverse in the other two instances. The bank of Scotland now appears unfettered with scaffolding, and is a commanding and picturesque structure; a little crowded perhaps, but it must be kept in view that the old building had to be incorporated in the new one, and that the site is an exceedingly difficult one to deal with. The dome has been surmounted with a figure entirely gilt, which some facetious individual has designated "the imago of Mammon."

A new church has been erected in the Canonsgate for the United Presbyterian body; it is a plain, unpretending building, in the thirteenth century style. Mr. James Paterson is the architect, and this building is less amenable to criticism than other two more pretensions churches by the same architect in this city, which are miserable adaptations of Italian Gothic.

At the west end a new terrace has been commenced, overlooking the grounds of Donaldson's Hospital; an endeavour has been made to produce variety, by raising high-pitched roofs over oriel windows, and adding metal crestsings; with this exception, the detail is of the same commonplace character which prevails in the domestic street architecture of the fashionable quarter.

The city improvements in the Old Town are progressing slowly but satisfactorily, and the designs, prepared by Messrs. Cousins & Lessells, in the Scottish Domestic style, are in keeping with the surroundings, and group well. The tenement forming the angle of the Canonsgate and St. Mary's-street, is five storeys in height; the angle is splayed off, and has an oriel corbelled out from it, and is surmounted by a cross-stepped gable. The stair leading to the upper floors is continued in a tower at the south-west angle in St. Mary's-street, and is finished with a high-pitched roof, with an iron finial. The remainder of the buildings towards St. Mary's-street, are four stories high, and have gabled windows and string courses; but there is little or no attempt at enrichment, such being un-called for in the class of houses intended. To the south of these tenements a building has been erected for the Catholic Young Men's Society, which is in keeping with the rest, the only distinctive feature being large windows divided by mullions. This building is to cost about 5,000*l.*, and will contain a library, reading-room, lecture-hall, &c.

At Heriot-mount,—a street which stops abruptly at an eminence overlooking the Queen's Park,—are two notable tenements, as they form a feature in the landscape from their elevated position and bold detail. They are in the Scottish style, and were designed by Mr. R. Thornton Shields. Although possessing all the distinctive features of the ancient buildings,—a characteristic of which was broad wall surface,—this has not been acquired by ignoring the modern requirements of a sufficiency of light, but by taking advantage of the gable ends where few openings are required, and placing them irregularly where needed, and adding large angle turrets, which form useful additions to the interior.

To the west of the Meadows several new streets and terraces have been completed, and others are in progress; generally, they are of the usual stale, flat,—though, unfortunately, not unprofitable,—caste. In one instance, however, incised ornament has been used with good effect.

HOSPITAL CONSTRUCTION.

In the course of the meeting of the British Medical Association in Leeds last week,

Captain Galton said the first object of a hospital was that it should enable the sick to recover in the shortest possible time; and it was now recognised by all that, in addition to skilled attendance, medicine, and food, the essential requirements for insuring speedy recovery were:—Pure air, that was to say that there should be no appreciable difference between the air inside the ward and that outside the building; the air supplied to the ward should be capable of being warmed to any required extent; pure water, so supplied as to insure the removal of all impurities to a distance from the hospital; the most perfect cleanliness within and around the building, a hospital being a place that never rests from fouling itself, and all the products of its foulness being poison. In order to give effect to these principles it was necessary to consider

in the first place, the site of the proposed hospital. The qualities of a site most favorable to a hospital in this country were a situation in the open country, upon porous and dry soil, with free circulation of air round it, but sheltered from the north and east, raised above the plains, with the falling ground from the hospital in all directions, so as to facilitate drainage. The next most important question was the structural arrangement of the building, which must be such as to secure free circulation of air. The first thing was to obtain good healthy wards, everything else, such as administration, means of access, and discipline, being made subsidiary to the question how the sick were to get well in the shortest possible space of time and at the least expense. He spoke in considerable detail of the manner in which this would be best accomplished. Having considered the principles which governed the size and general form of wards, and having shown that, on the ground of economy of nursing power, a ward should contain thirty-two beds, the next point upon which he dwelt was the material to be used for the walls, ceilings, floors, and windows, after which he described what he considered to be the best kind of necessary apartments, such as bathrooms, &c., and spoke of the necessary subsidiary accommodation. It was in the detailed application of the principles of hospital construction that so many errors were committed. The architect ought to make his whole design subservient to these principles, and his waterwork should be—light and airy, speedy removal of refuse, and great facility of cleansing. The smallest number of parts compatible with the wants of the hospital should be arranged in the simplest form, and solely with reference to the wants of the patients, and to the way in which the service could be carried on with the smallest number of attendants. The architecture should be an expression of the need, and nothing more. Any sacrifice of sanitary requirements to architectural features was wrong. Ornament meant too frequently the creation of corners which delayed and stagnated the air; it meant present outlay and continual cost in repairs. While so much suffering remained unprovided for in the world, it was melancholy to see a large portion of the money gathered with much difficulty for the relief of that suffering diverted from its main object in order to create a monument of the architect's taste. In conclusion, he added another word of caution against building for a long futurity. Rooms used for the reception of the sick became permeated with organic impurities, and it was a real sanitary advantage that they should be pulled down and entirely rebuilt on a fresh site periodically.

Under ordinary circumstances, Capt. Galton's paper would have been received merely as a lecture or expression of advanced scientific knowledge with regard to the subject, and would have excited little or no discussion; but it happens that Sir J. Y. Simpson, as we have already told our readers, has lately called attention to an alleged very high rate of mortality in hospitals after surgical operations, as compared with the mortality after the same operations when performed in the homes of the patients. Sir James further asserts that the mortality after operations performed in hospitals containing more than 300 beds is greatly in excess of that in hospitals containing less than 300 beds; and his statements, if hereafter proved to be well founded, would go far to show that all surgical hospitals are absolute evils, and that great hospitals are great evils in exact proportion to their magnitude. At present, however, these statements command only a very limited assent from the profession. Sir James quotes an old practitioner in Scotland, who has kept no notes, but who says that he has performed fifty-four limb amputations at the homes of the patients, and that none of these patients died. In hospitals the mortality from all causes of limb amputations is considerable, rising in the case of the thigh perhaps to one in three.

A Statue to Cromwell at Manchester.—At a recent meeting of the general purposes committee of the city council, a letter was read from Mr. Noble, the sculptor, stating that some time ago he received a commission to execute a large statue of Cromwell, the condition being that the corporation of Manchester should find a suitable site for it,—inside the new town-hall being preferred. The town-clerk was authorized to assure Mr. Noble that the council would gladly find a site for the statue in the town-hall.

SANITARY MATTERS.

The Sanitary Act.—The Bill to facilitate the raising of money in certain cases for the purposes of the Sanitary Act (1868), enacts that the Secretary of State may certify the amount of expense incurred, or to be incurred, by any person appointed to perform the duty of a dep. expense has been certified the Public Works Loan Commissioners may advance the sum requisite on the security of the local rate. Any expense incurred in performing the duty of a defaulting local authority shall be recoverable as if it were a debt due from such authority. If the amount of loan raised be not wholly expended, the surplus may be paid to the defaulting authority. The Secretary of State may make orders for the payment of costs of the proceedings under the several Acts, and such orders may be enforced in the same way as orders for costs of appeals. The Bill is entitled "The Sanitary Act (1868) Amendment Bill," and is the production of the Home Secretary and Mr. Knatchbull Huggess.

Conference on the Sewage Question at Leamington.—A conference of the three Boards of Leamington, Milverton, and Lillington has been held, for the purpose of arranging matters with respect to the disposal of the sewage of the three districts. The clerk submitted an estimate of the works necessary to carry out the new scheme of sewage irrigation. The total cost would be 19,000*l.* in round figures. The annual repayments of instalments and interests, at 6½ per cent., would amount to 1,235*l.*; working expenses, 700*l.*; total, 1,935*l.*, less 450*l.* to be received from Lord Warwick; leaving a balance of 1,485*l.* to be provided for. According to the estimate, Milverton and Lillington would have to contribute from 18*l.* to 150*l.* in aid of the annual outlay. After some discussion respecting the details of the scheme, Mr. Bidde accepted on behalf of the scheme, Mr. Bidde accepted on behalf of the local Board of Milverton, and Mr. Haddon did the same for that of Lillington. The terms of the arrangements were subsequently embodied in a resolution, and adopted by the meeting.

The Water Supply of Bradford.—The residents in the district which is dependent for its supply of water upon the high-level service, have again been threatened with the serious inconveniences resulting from shortness of water from which they suffered last year. In consequence of the continued dry weather the store of water in the Stabden Reservoir had become much reduced, and the waterworks committee found it necessary to announce that, unless the greatest care were taken to prevent the waste, and diminish the use of water as much as possible, both for trade and domestic purposes, they would be under the necessity of placing the district on a short supply. They, therefore, prohibited the use of portable pipes, the watering of gardens, the washing of causeways, yards, or windows.

THE ARCHITECTURAL INSTITUTE OF SCOTLAND: A GRIEVANCE.

On the 1st of April last I, along with a number of architects' pupils, sent drawings in competition for one of the prizes usually offered by the Architectural Institute of Scotland, and we feel very much annoyed that they should be lying there all this time without any adjudication having been made. The usual meeting did take place, I believe, about the 20th of the same month, but no decision was then come to on account of the number of members present being insufficient to form a quorum.

Surely it would require but small exertion on the part of a few of the members to meet and come to a decision so that the drawings might be returned to their respective owners without any more vexatious delay.

P. A.

LITTLE MUNDEN CHURCH, HERTFORDSHIRE.

In our volume for 1868, we mentioned the restoration, under the direction of Messrs. George & Henry Godwin, of Brompton, of All Saints Church, in Little Munden, one among many of the Hertfordshire churches that have been recently brought again into a good state of repair and decent condition, after long years of neglect and outrage. In our present issue we give views of the church, internal and external. The manor of Little Munden, as we have before said, is very ancient. Domesday Book mentions the name of a vassal of Earl Harold, one Levine, to whom it belonged in Saxon times; and tells how

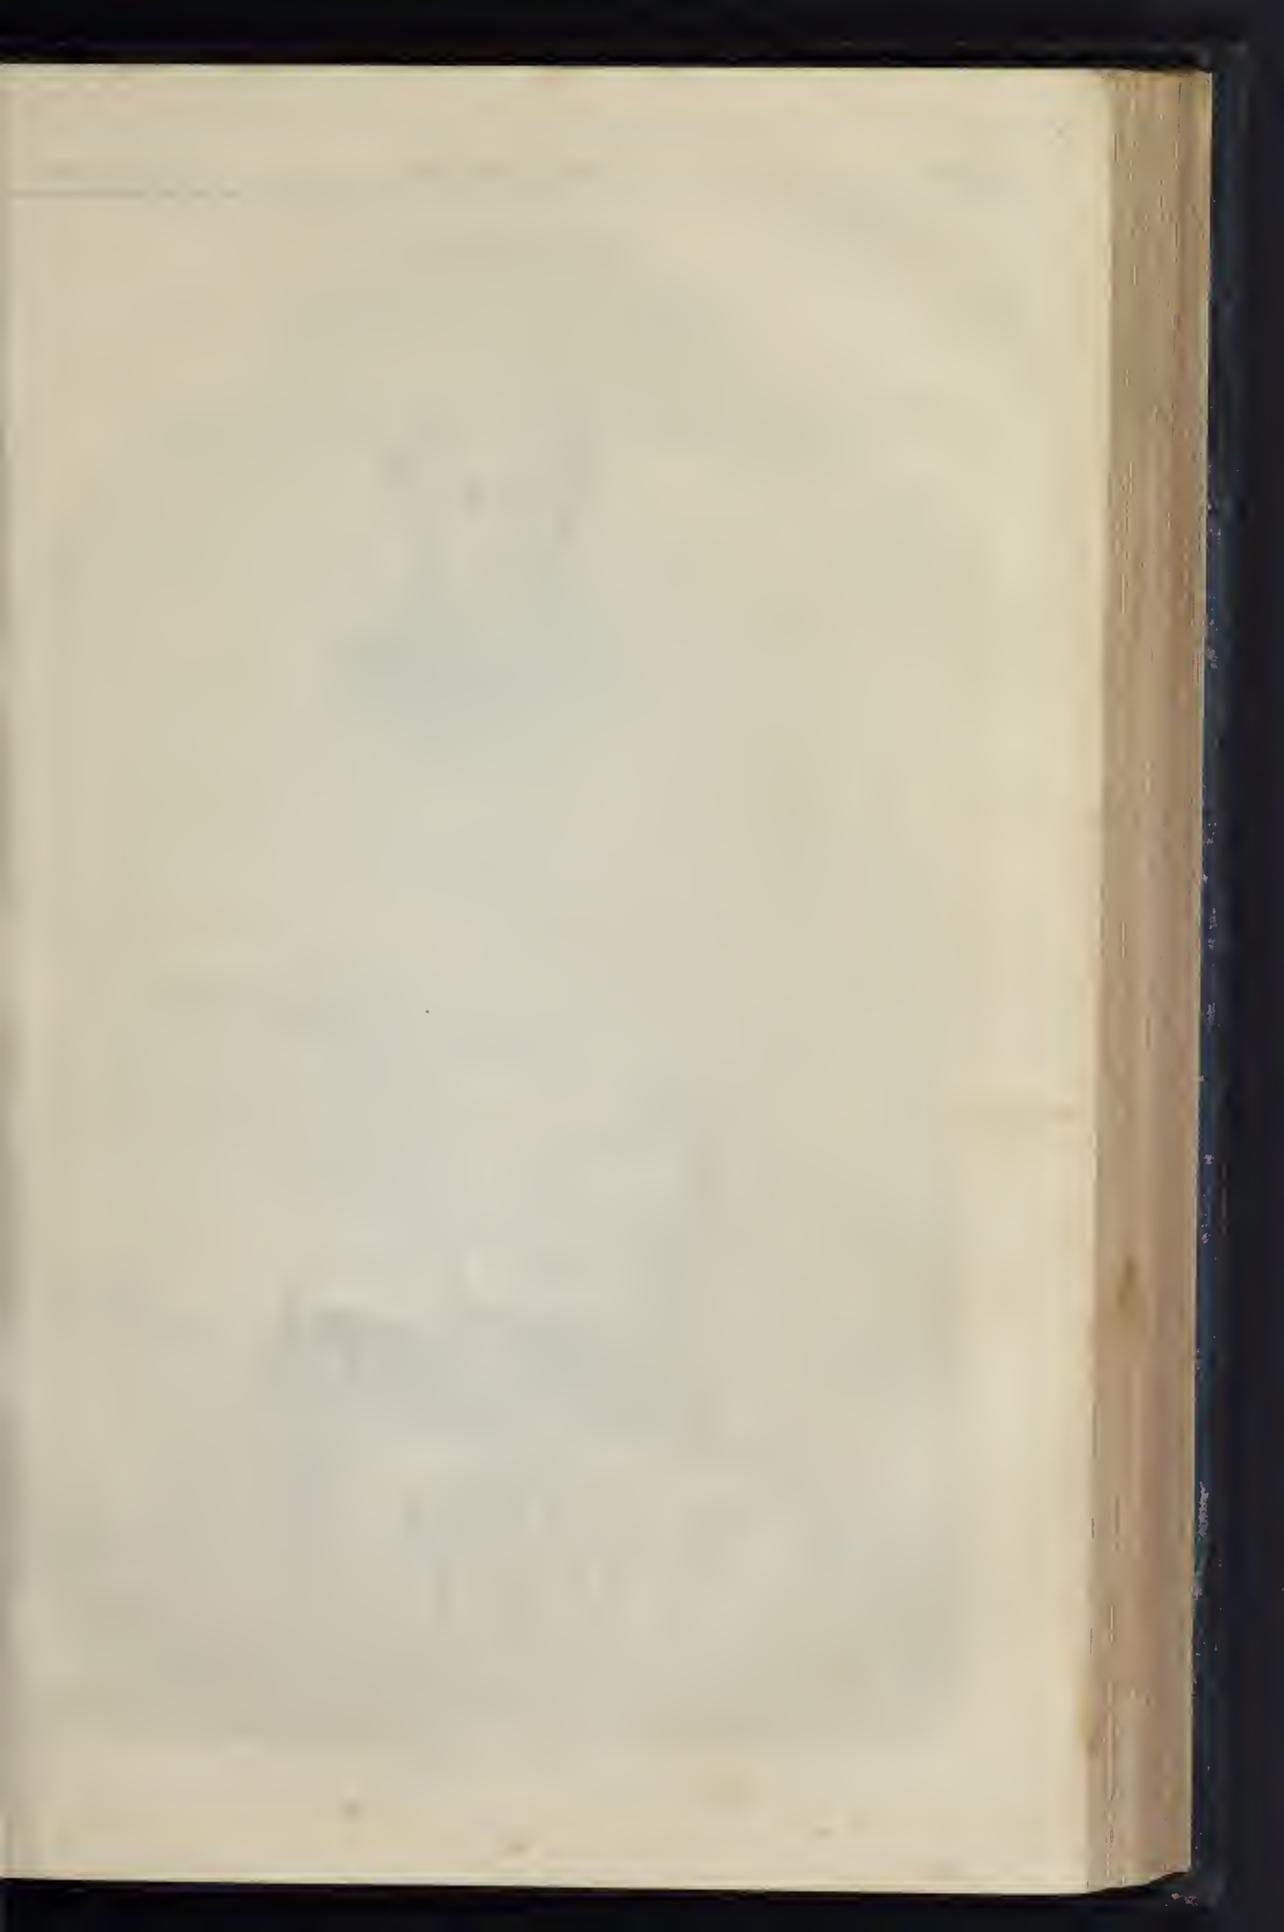

William the Conqueror afterwards disposed of it. The church belongs chiefly to the beginning of the fifteenth century. It contains some remarkable canopied monuments with sculptured effigies, seen in the view. (The church had fallen into a very bad state; the walls required re-facing; the stonework was decayed; the woodwork of the roofs had been disfigured by alterations and time; drainage and paving were bad; new seating throughout was required, with means to warm the church. Through the strenuous exertions of the rector, the Rev. F. A. L. Foster, and the parishioners, money was raised, and the restoration has been carried out.)

The church consists of a west tower, nave, north aisle, a north chapel, and chancel. There was doubtless a much earlier church on the same spot. Some vestiges of this are observable at the north-west corner of the building inside, and have been carefully preserved. The walls, which are of flint, with freestone dressings, have been re-faced, and the windows restored. The modern porches have been removed, and two new ones erected at the north and south entrances, constructed of the same materials as the main body of the building, and in accordance with its style of architecture. A stone groined vault, of which only indications remained, has been put in at the western entrance through the tower. This ought really to be the chief entrance to the church; but it is at present obstructed by a large raised pew, resembling an organ-loft, just over the door. This is private property, and the owner unfortunately could not be persuaded to allow the removal of the unsightly obstruction. The interior of the church and the porches have been paved with tiles. New open seats, of stained deal, have been substituted for the old pews, except in the north chapel and the chancel, where such of the ancient seats as could be used have been worked in. The pulpit and reading-desk are carved in oak. The rood-loft is of tiling. The roof of the nave (one of the Hertfordshire king-post kind) is open, showing the rafters. The drainage has been attended to, and the interior is warmed by hot-water pipes. At the south-east angle of the church a vestry has been erected, the want of which has caused some inconvenience hitherto. The path through the churchyard leading to the north entrance, which was five steps above the floor of the church, has been lowered and levelled. Mr. Ginn, of Puckeridge, was the builder; and Mr. Leigh clerk of the works. The first contract was for something under 1,600*l.*, exclusive of the tower. Afterwards, and mainly through the liberality of the lay patron, Lieut.-Col. Loyd, the tower and spire were restored, and some other works were done, bringing up the total outlay to something under 1,900*l.*

In the churchyard are two yew trees, one comparatively young (seen in our view), the other an aged and noble tree, the hollow trunk of which is more than 19 ft. in circumference, measured 5 ft. 6 in. from the ground; it is reputed to be nearly a thousand years old. Near the west end of the church is a splendid oak of great size, and in the full vigour of its growth. Although "pollarded" many years ago, it promises to become a magnificent tree, and now measures from 15 ft. to 18 ft. in circumference, 5 ft. or 6 ft. from the ground; it has the huge spreading arms so characteristic of well-grown oaks.

At the back of this church, and seen in our view, is one of those fine mixed plantations of fir, larch, and other trees, that always prove so prolific to naturalists. In the early summer of the present year the Giant Morel (*Morchella crocipipes*) abounded in this small wood, but with a few exceptions the specimens were allowed to perish ungathered: this enormous and delicious fungus attains a height of 12 in. or more, and a single specimen is sufficient for a hearty meal; with a little care, the morels can be dried and kept for winter use. Though probably not uncommon in this country, it has only been recorded from two localities, and in both cases by the same observer.

The Roman snail is also common throughout the district, but though introduced and "cultivated" with care by the ancient Romans, few people think of eating it now in this country; in other countries of Europe, however, it is used as food during Lent, and is exposed for sale in baskets in the markets of Rome and elsewhere, during the month of March. It is far larger in size than any of our indigenous species, and by this character alone may be recognised at a glance.

MR. GEORGE GILBERT SCOTT, R.A.
Professor of Architecture, Royal Academy.

LITTLE MUNDEN CHURCH, HERTFORDSHIRE.

View of Exterior from South-east.

LITTLE MUNDEN CHURCH, HERTFORDSHIRE: VIEW OF CHANCEL.
RESTORED BY MESSRS. GEORGE & HENRY GODWIN, ARCHITECTS.

BRITISH ARCHÆOLOGICAL ASSOCIATION AT ST. ALBAN'S.

THE Congress has gone on well. Lord Lytton, the President, delivered, as might have been expected, a fine address, in the Town-hall. In the course of it the President said:—The Romans were to the ancient world what the railway companies were to the modern—they were the great constructors of roads and highways. Again, to the Romans the Britons owed the introduction of civil law, and the moment the principle of secular justice between man and man was familiarised to their minds the priestly domination of the Druids, with all its sanguinary superstitions, passed away. It was to Rome, too, that Britons owed that institution of municipal towns to which the philosophical statesman, M. Guizot, traced the rise of modern freedom in its emancipation from feudal oppression and feudal serfdom. When the Romans finally withdrew from Britain, 92 considerable towns had arisen, of which 33 cities possessed superior privileges. Among the most famous of these cities was Verulam, which was a *municipium* in the time of Nero, and the remains of which were being more clearly brought to light by the labours of the association, under the skilful guidance of Mr. Edward Roberts. The members would on Wednesday be enabled, he believed, to see at least the stage, the proscenium, and the orchestra of the only Roman theatre yet found in this country. Lastly, it was to the Roman conqueror that the Briton owed, if not the first partial conception, at least the national recognition of that Christian faith whose earliest British martyr had bequeathed his name to St. Alban's. When they passed to the age of the Anglo-Saxons, their vestiges in that county surrounded them on every side. The name of place familiar as household words marked their residences. And here he might observe that the main reason why the language of the Anglo-Saxon had survived the Norman invasion, and finally supplanted the language of the Conqueror, did not appear to him to have been clearly stated by our historians. He believed the reason to be really this. The language that men spoke in after life was formed in the nursery; it was learnt from the lips of the mother. The adventures of Scandinavian origin who established themselves in Normandy did not select their wives in Scandinavia, but in France, and thus their children learnt in the nursery the French language. In like manner, when they conquered England, those who were still unmarried had the good taste to seek their wives among the Saxons, and thus the language of the mothers naturally became that of the children, and being also the language of the servants employed in the household, the French language necessarily waned, receded, and at last became merged into the domestic element of the Anglo-Saxon, retaining only such of its native liveliness and adaptability to metrical rhyme and cadence as enriched the earliest fragments of our English poetry in the muse, at once grave and sportive, at once courtly and popular, which inspired the lips of Chaucer. In the county in which they were assembled were the scenes of fierce, heroic conflict between the Saxons and the Danes. Where now stood the town of Ware anchored the light vessels which constituted the Danish navy as it sailed from London along the Thames to the entrance of the river Lea. There they besieged the town of Hertford, and there the remarkable genius of Alfred the Great, at once astute and patient, studying the nature of the river, diverted its stream into three channels, and stranded the Danish vessels, which thus became an easy prey to the Londoners. Nor was the county destitute of memorials of the turbulent ages which followed the Norman conquest. When Prince Louis of France invaded England to strengthen, with the exception of Dover, resisted his siege with more valour, or with greater loss to the invaders, than the Castle of Hertford, and under the soil around its walls lay the bones of many an invading Frenoman. At St. Alban's, on the 22nd of May, 1455, Henry VI. pitched his standard against the armies of the Duke of Burgundy, led by Richard, Duke of York, and the great Earls of Warwick and Salisbury; and once again, on the 17th of February, 1461, Henry VI. was brought from London to be the reluctant witness and representative of a conflict against his Queen, who, however, delivered him from the clutches of the Yorkists, and sullied her story by a marriage under and cruelty as a few days afterwards insured the Crown to Edward IV. In the summit of Christ Church tower, at

Hadley, was still to be seen the lantern which, according to tradition, lighted the forces of Edward IV. through the dense fog which the expectation of the time believed to have been raised by the incantation of Friar Bungay, and the battle of Barnet, where the power of the great feudal barons expired with Warwick, the king-maker, and a new era in the records of liberty and civil progress practically commenced. But Hertfordshire had also furnished the birth-place or the home of no inconsiderable persons. According to tradition, Cassiobury was the royal seat of Casibelanus, and passing to the noble family that now held its domains, it found an owner as brave as its old British possessor in the first Lord Capel, faithful in life and in death to the cause of Charles I. King's Langley was the birthplace of Edmund de Langley, the brave son of Edward III., and close beside it was born Nicholas Brakespear, afterwards Pope Adrian IV. Moor Park was identified with the names of Cardinal Wolsey and the ill-fated Duke of Monmouth. Sir John Mandeville, the famous traveller, who, if he invented his travels, certainly beat them all in the art of romance, was a native of St. Alban's. Penshanger was associated with the name of Cowper, while the delightful essayist, Charles Lamb, boasted his descent from Hertfordshire. Future archæologists will revere at Brocket the residence of the two distinguished men who swayed the destinies of the country in our time as First Ministers of the Crown,—Lords Melbourne and Moreton by the English connexion, akin still more common,—an exquisite geniality of temper united with a robust and simple manliness of character. At Hatfield, members of the Association would find a place stored with brilliant memories and associations. There still stood the tower from the window of which, according to tradition, the Princess Elizabeth envied the lot of the humble milkmaid, and there was still seen the trunk of the oak under which she heard the news of her accession to the throne. And what Englishman—nay, what stranger from the foreign nations to which, conjointly with the posterity of his native land, Francis Bacon intrusted the verdict to be pronounced on his labours and his name—would not feel that he was on haunted ground when he entered the domain of Gorbamby, and examined the remains of the abode on which the Shakespeare of Philosophy united the most various knowledge of mankind with the deepest research into the secrets of nature and the elements of human thought?

SOUTH KENSINGTON IMPROVEMENTS.

ADVANCING in the style of its buildings, this western suburb is now distinguished by the importance of its wide thoroughfares, and the succession of open squares and spaces, which connect by spacious roads Kensington, with Thrice-square, and the Gore-road with One-square and Earl's-court. Nearly two centuries back the Royal Palace conferred distinction upon the gardens, and the unbroken woodland range to Park-lane, for a mile and a half, together with a dry gravel soil, sloping imperceptibly towards the south, secured a preference for this suburb as the abode of fashion. The foundation of the Exhibition and Horticultural Gardens, and afterwards of the Museum and the Hall of Arts and Sciences, soon transformed nurseries and market gardens into the richest site of residence for the aristocracy: the grand Boulevard of Cromwell-road, the Exhibition and Albert roads, were completed, lines of palatial houses erected, and now a fresh stimulus is given by the Metropolitan Railway, which has placed two stations at convenient distances, bringing Westminster Palace within fourteen minutes, and the City half an hour's journey; and so soon as the Embankment Railway is finished, twenty-four minutes will carry passengers to Cannon-street, when the returns of this portion of the line will be quadrupled. The original founders of this great quadrangle of fashion were, first, Mr. Peake, who built Princes-terrace and the Exhibition road, with the adjacent squares; then Mr. Jackson, who commenced the Albert-road, Queen's Gate-square, and adjuncts; and afterwards Mr. Aldin, who completed the whole extent, as far as Mr. Jackson's present works in Gloucester-road, and at Stanhope-gardens. The houses are all first-class private mansions up to this point; and here a new wide thoroughfare of nearly half

a mile, parallel to Cromwell-road, has been finished in direct line from the Brompton to Gloucester-road Station.

Opposite to the latter, an important range of fourteen shops has been erected, which are nearly all tenanted, and a spacious inn or public-house, which looks full upon the crowds issuing from the station. What that inn may be called—the "Metropolitan" or the "Gloucester"—is yet undetermined. The two spacious thoroughfares enter the Gloucester-road close to the station on either side, one being an extension of the Cromwell-road, 100 ft. wide, at least half a mile, as far as Earl's-court.

A vast improvement is now also in progress by widening the Kensington main street in the narrowest part, near the church. Here an obtruding angle has been cut off and added to the road, at the public expense, and by the Board of Works; but at the Kensington Gore end, opposite to where the old barracks stood, Messrs. Cubitt have made a total transformation. They have built a fine double range of houses, and opened a road leading in continuation to Gloucester-road, which at this point turned off in a narrow defile eastward. No one knew the object in view, until that firm bought the old Campden Arms, at the corner of Kensington Gore, pulled it down, shut up the old road, and then commenced a suitable range of private mansions facing the Park and Gardens, giving the public a straight thoroughfare in lieu of the old dingy hollow. Messrs. Cubitt, at their own expense, removed the dead wall and the quaint old summer-house to the Bayswater side; thus opening out the view of the long walk. Some years back the writer treated the subject of the barracks, in the public press, as most unsuitable for troops, and obtrusive upon public liberties of the Gardens; since which they have, under care of the Commissioners, given place to beautiful floral parterres.

The dry gravel soil, open south aspect, and healthy atmosphere of South Kensington secure for it the preference over the north side of the Park, and thus the houses, even in the lateral streets, are purchased or rented, and occupied as soon as finished. T. H. H.

THE NEW POST-OFFICE FOR SHEFFIELD.

THE Post Office authorities have submitted to the Mayor of Sheffield the plans for a new post-office in that town. The site is at the corner of Old Haymarket and the new street about to be made to the new Midland station. To the Haymarket the frontage is 45 ft., and down the side street about three times that length. The corner will be occupied by a square building three stories high, bold in its architectural characteristics, and behind it will be an oblong one-storey building, 80 ft. long and 30 ft. wide, for the sorting of letters. Under the latter will be a basement floor, containing refreshment-rooms and other conveniences for the sorters and letter-carriers, with living-rooms for the porter of the establishment. The arrangements of the office are briefly these:—On the ground floor, entered from the Haymarket, will be the front office, where the business with the public will be transacted; and behind it the sorting-office, where the letters will be received for transmission or delivery, and whence they will be despatched. In the front office applications for letters, money orders, the sale of stamps, savings bank business, the receipt of telegraphic messages, &c., will take place. The room for this purpose will be 32 ft. by 30 ft., and 16 ft. high. It will be occupied by a counter in the horse-shoe shape, 62 ft. long, with space for twelve clerks, instead of the four or five now employed. It is stated that this arrangement of transacting business at a counter instead of at a window, has been found in other places very much to conduce to despatch, economy, and to the keeping of good order. Behind this will be the box (in the new street) for the receipt of letters and newspapers, and the station for the postmistress, who will be so situated as to overlook all the business going on in the front office and in the sorting office behind. The mail bags will be received at, and sent out from, a door in the side of the sorting office next the new street. This office will be lighted with windows on each side and from the open roof. It will be 80 ft. long and 30 ft. wide, and will rise to the height of 30 ft. It will afford accommodation for 120 sorters, the highest number now required being fifty. On the first floor will be a room 30 ft. long

and 12 ft. wide for the telegraph instruments, and this floor will also be occupied by other rooms for subordinate purposes. The second story will be 14 ft. high.

The top story containing rooms 11 ft. high will be occupied by the Inland Revenue officers.

ART AND SCIENCE INSTITUTE FOR LEEDS.

A MEETING was held in the Town Hall at Leeds at the latter end of July, to establish an Institute of Art and Science for the town. A committee was formed, with the head-master of the Leeds Grammar School as chairman. A head-master, Mr. Walter Smith, and a second master, Mr. A. Stevenson, were appointed. It was resolved to commence operations with a school of art and science, the final object being stated to be to provide efficient schools for art and science teaching, and to establish galleries of art and museum of industry free to the public, and free also to the students of the art and science schools. It was determined to carry on the schools under the direction of, and in connexion with, the Science and Art Department of the Government, and eventually to erect a building wholly devoted to secondary education, with the advice of the Art Department.

This has long been required in the town, which is the last of the large towns whose schools have ceased connexion with other institutes not of an educational character.

The movement may be regarded as one of the first fruits of the Leeds Art Exhibition of 1868, and we hope will lead to a permanent record of the effects of that exhibition, in the form of a building to advance the taste and education of the district. The Art and Science School was formally opened on August 4th.

SOUND.

SIR,—In the last number of your esteemed publication are a few words on the effect obtained from 10,000 voices as "producing no more apparent noise or power than 1,000 in an ordinary concert-room." This can be accounted for on the following grounds:—The space of a room or large building regulates the amount of sound produced from a certain number of performers in proportion to its size, and where, like the Crystal Palace, the space is great, the sound diminishes on the ear through having so wide a space to traverse; and this is one reason why a chorus of 700 at Exeter Hall produces as much sound as four times the number in a building three times the size. While listening to a performance at the Crystal Palace I have observed one drawback in particular, that of the solos being partially lost in effect, like a vocalist singing in the open air; and until the division where the performances take place was partially enclosed it was worse than at the present time.

HAYDON WILSON, Professor of Music.

MEMORIAL OF THE LATE COUNTESS OF ELLESMERE.

THE memorial of the late Countess of Ellesmere, at Walkden Moor, Manchester, has been formally presented to the keeping of the present earl, at an open-air ceremony, which took place on the occasion.

The memorial stands in a large open space near Worsley Stocks. A view of the design was given in our vol. for 1868, p. 510. It is in imitation of the crosses which at the end of the thirteenth century were erected to the memory of Queen Eleanor. It is raised on a pyramid of steps, and the superstructure is divided into three stages. The lowest is square in plan, and consists of a solid basement on which rests a central column, surrounded by four groups of clustered columns, one at each angle, which carry pointed arches, trefoil cusped, and surmounted by pinnacles with crockets and finials. There is an enriched pinnacle at each angle, containing at its lower part a niche. The four statues which fill these niches represent a Lancashire operative, a collier, and two factory girls in their characteristic costume; these were copied from life studies. A parapet of open tracery finishes this stage at the top. The second stage is octagonal in plan, with buttresses on the four oblique faces which unite it in outline with the square stage below. The four direct faces of the octagon contain niches with

enlaid and pedimented canopies in which are life-size statues of the four virtues—Piety, Charity, Munificence, and Prudence. This stage is also finished with a parapet of open tracery. The third and top stage is cruciform in plan, with pinnacles and crocketed gables on the four direct faces, and is surmounted by a spirelet and a stone cross. The total height from the ground to the top of the cross is 50 ft. The foundations, including 4 ft. of concrete, are 6 ft. deep below the ground.

THE EAST LONDON RAILWAY.

ON the 30th ult. the members and associates of the Society of Engineers visited the works of the East London Railway. The line, as at present laid out and nearly completed, commences at the Wapping end of the Thames Tunnel, through which it proceeds, running past the Grand Surrey Canal Docks and through Deptford to the Old Kent-road Station of the South London Railway. A branch which leaves the line near Rotherhithe runs to New-cross, where it communicates with the North Kent and the London and Brighton Railways. The Surrey Canal is crossed by these two lines, in each case by a lattice girder bridge of 80 ft. span, with two side openings of 13 ft. span each. So far, the line is nearly ready for opening, a preliminary notice to that effect having been given by the company to the Board of Trade. The works remaining to be executed consist of the portion of the line between Wapping and Liverpool-street, which latter place will eventually be the terminus of this railway. The completion of this section of the line, however, will occupy about two years, the works upon it being of a heavy nature. It will be seen that the East London Railway will unite the Brighton, South London, South-Eastern, and North Kent Railways, accommodating in its course the Surrey and Commercial Docks, the London Docks, and the east of London. The London and North-Western Railway will also be brought into this system. The line will thus open up the districts of Rotherhithe, Wapping, Deptford, St. George's-in-the-East, Limehouse, Stepney, Whitechapel, Bethnal-green, Bishopsgate, and Shoreditch, thereby affording an outlet by the principal railways of the kingdom for the most densely populated parts of the metropolis. The terminus is to be erected in Liverpool-street, close to the Bank and Royal Exchange. Mr. J. Hawkshaw is the engineer-in-charge of the line, the contractors being Messrs. Brassey, Wythes, and Lucas, Brothers.

ANNUAL INTERNATIONAL EXHIBITION.

HER Majesty's Commissioners for the Exhibition of 1851 announce that the first of a series of annual international exhibitions of selected works of fine and industrial art will be opened in London, at South Kensington, on Monday, the 1st of May, 1871, and be closed on Saturday, the 30th of September, 1871. The exhibitions will take place in permanent buildings about to be erected, adjoining the arcades of the Royal Horticultural Gardens. The productions of all nations will be admitted, subject to obtaining the certificate of competent judges that they are of sufficient excellence to be worthy of exhibition. The objects in the first exhibition will consist of the following classes, for each of which will be appointed a reporter and a separate committee: I. Fine arts; II. Scientific inventions and new discoveries of all kinds; III. Manufactures; and IV. Horticulture.

LOWESTOFT PUBLIC HALL AND ASSEMBLY ROOMS COMPETITION.

SIR,—Will you allow me to draw attention to some particulars of the above, a copy of which I send you? First, as to accommodation. Required, "a public reading-room; a class-room, with suitable cloak and retiring rooms; two lodge or club rooms, each to seat 150 persons; hall and cellars. A good elevation must be furnished. Roughly calculating the least space required for the above, I make the cubical contents 240,000 ft. Now as to outlay—"the cost of the buildings not to exceed £5,000; 100 guineas to be put in as premiums offered for the two best designs." For the first 50; for the second 150; and "the successful competitor will be expected to furnish details and drawings and specifications before receiving premium, and should be called upon to superintend the erection of the building, such premium will be deducted from the commission to be paid for the same."

I shall make no remarks; such insults to the profession have been too often brought before your notice; but I think it is as well that this case should be made public.

F. A. KILLEN.

BRIXWORTH CHURCH.

SIR,—I believe the British Archaeological Association, while publishing its journal papers read at its meetings, by no means undertakes to become responsible for the correctness of the theories of the authors, nor even the implicit accuracy of the plans or drawings produced with the same; in this way acting like all other societies. In respect to the plan given in their journal for December, 1863, together with a paper, by Mr. E. Roberts, on Brixworth Church, and referred to in your Note from Northampton, in a recent number, I would say I was present when Mr. Roberts read his paper, did my best to demolish his theories on the building, and produced my correct, with a sketch-plan, rough, and not to scale, but open by the Rev. Mr. Watkins, its rector, for the British Archaeological Association, when they visited Brixworth. Mr. Roberts's plan is utterly incorrect, in so far as three of his five cubical never had an existence, but that a transept space, if one may so call it, finished off the end of the original north aisle, with a vestry space to east of it again, the top of the original door from which vestry into church is actually shown in Mr. Roberts's northern elevation.

There is also no doubt that the circular nave columns (dotted) shown on his plan are merely a fancy, as also his idea of the vaulting of the nave. As to its being a Roman building, I am desperately sure in this view is as little tenable as are those of Mr. Roberts.

As a member both of the Association and of the Northamptonshire Architectural Society, it seems to me such views should not quietly be allowed to pass unquestioned.

JAS. THOS. INYAE.

P.S.—In justice to Mr. Roberts I may mention, that the Rev. Mr. Watkins, to show that walls did not occur between all the piers and the original exterior north wall, had trenches also made in those places, and these cross trenches which here showed earth alone, are shown on Mr. Roberts's plan as walls, and probably led him into the mistake.

BUILDERS' BENEVOLENT INSTITUTION.

THE 22nd annual meeting of the subscribers and friends of this charity was held on the 29th ult., at Willis's Rooms, King-street, under the presidency of Mr. G. F. Froding, president of the institution, in the chair. The secretary read the report, which stated that the directors are not able to announce an election of pensioners in November next, which they much regret, more particularly there being a larger number of applicants than usual (12). The directors do not consider this circumstance to be owing to any decreased interest in the charity, but to the want of relief funds and 10s. 6d. for the building fund, making a total of 14,760. 9s. 11d. stock, divided as follows:—11,792. 9s. 6d. for the relief fund, and 3,014. 10s. 3d. for the building fund.

The above, together with the balance sheet, having been approved and adopted, Mr. J. M. Macey was elected president for the ensuing year. The usual routine business was then proceeded with, and the meeting closed with a vote of thanks to the chairman.

ESSEX ARCHAEOLOGICAL SOCIETY.

THE annual excursion and meeting of this society have proved, in most respects, a success. The part of the county chosen this year for the society's visit—the district lying around St. Osyth—is full of antiquarian and historic lore, and the weather was genial. There was a large assemblage of members and their friends, including several gentlemen of extensive acquaintance with archaeology. It was arranged that, contrary to the usual custom, the excursion should partly precede the meeting for general business. Accordingly, the visitors were taken first to view the churches at Brightlinges and Thorington. The principal objects of the two buildings were pointed out and explained by gentlemen forming part of the excursion.

The Priory erected in memory of St. Osyth and the grounds were then visited; and the "meeting" proper was held in a room over the gateway. The chair was occupied by Sir T. B. Western, bart., lord-lieutenant of the county, and there was a numerous assembly. Many objects of interest were exhibited, and some of them commented on. The report was read and adopted, and other business transacted. Mr. Watney, of London, then read a paper on the Priory, and Mr. C. F. Hayward communicated his ideas on the subject to the meeting. The examination of the Priory was resumed with interest, Mr. Hayward explaining many of its features in detail.

The church of the village was next inspected, and a luncheon succeeded in the schoolroom, the day's proceedings being wound up by visits to the churches of Great and Little Clacton.

It was resolved that the general meeting of the society shall be held next year at Braintree or Witham.

INAUGURATION OF THE REGENT'S PARK FOUNTAIN.

The new drinking fountain which has been presented to the metropolis by Cowasjee Jehangheer Ready money, Companion of the Star of India, has been inaugurated by the Princess Mary, of Cambridge and Teck. The structure is composed of ten tons of Sicilian marble, with four tons of red Aberdeen granite, the latter forming the four corner pillars, which are polished and surmounted with capitals carved in the semblance of flower leaves, &c. The four streams of water come from white marble lilies into as many polished granite basins, and the pediments over them are carvings to represent the Queen, the Prince Consort, and the donor of the fountain, the fourth side having a timepiece. A lion and a Brahmin hull are also among the ornamental sculptures. The whole structure rests on three hexagonal granite steps, and is surmounted by something resembling a steeple, and giving the fountain at a distance a Gothic effect. It is, however, not confined to any special style of architecture.

The address to the Princess stated that the fountain had been erected at the cost of Cowasjee Jehangheer Ready money, esq., a member of one of the most distinguished Parsee families of landed proprietors in Bombay, who had long been renowned in his own land for his assiduity and acuteness in financial operations, and his munificent support of all works of benevolence, and who during the last few years had contributed more than 40,000, to colleges and schools, 30,000, to hospitals and dispensaries, and more than 30,000, to other benevolent institutions in India. The design was prepared by Mr. Robert Kerrie, the architect of the Metropolitan Drinking Fountains Association. The works have been executed by Mr. Henry Ross, sculptor, the cost being about 1,400l.

PLYMOUTH PUBLIC OFFICES COMPETITION.

The twenty-five sets of designs sent in are set forth in the Tea-room of the Royal Hotel awaiting the decision of the Town Council. We take the liberty of advising that body to obtain professional assistance in arriving at this decision. The council have asked for more than they can get for the sum named (without asking for all that is needed), and this sum they have described sufficiently vaguely to induce the authors of some of the best designs to submit proposals for buildings that will cost more. All the circumstances should be duly weighed before the selection is made.

SOCIAL SCIENCE ASSOCIATION.

THE annual business meeting of members of this Association was held on Friday, the 30th ult., to receive a report from the Council, and to elect officers and standing committees for the ensuing year; Mr. G. W. Hastings in the chair. It was reported that during the session just brought to a close there had been thirty-six meetings for the reading and discussion of papers; representations by means of deputations or memorials had been made to the Government in reference to the control of criminals, the Bankruptcy Bill, the Endowed Schools Bill, the Scotch Education Bill, the Extension of the Contagious Diseases Act, the suppression of gambling farms in Hong Kong, and the registration of nurses. A deputation also waited upon the Earl of Mayo previous to his lordship's departure for India, to urge the necessity of instituting inquiries as Governor-General into the prison discipline of that country. Petitions were presented to Parliament on the subject of the Habitual Criminals Bill, the Endowed Schools Bill, the Beer House Licensing Bill, the Real Estates Intestacy Bill, the Evidence Further Amendment Bill, and the Married Woman's Property Bill. A communication was made to the Trades Union Commission, strongly recommending the appointment of a public prosecutor or the repression of outrages of the kind which had been brought under their notice. A form or the preparation of hospital accounts had been drawn up and circulated among the principal metropolitan and provincial hospitals, with a view to introduce uniformity, and render investigation comparatively easy. The Joint Committee of the Association and the British Medical Association had framed a schedule for presentation to the Sanitary Commission illustrative of

an inquiry into the whole subject, and for the United Kingdom. Officers and standing committees were elected for the ensuing year, and a vote of thanks was passed for the services of officers during the last year. The next annual Congress was announced to take place at Bristol on the 29th of September next.

COMPETITIONS.

Newcastle Industrial Dwellings Company, Limited.—In answer to their advertisement the directors of this company have received a large number of competitive plans and models, many of them possessing considerable merit. The committee appointed to adjudicate on them met on Tuesday, and unanimously selected the design bearing the motto, "As the home, so the people," as best adapted to carry out the objects of the undertaking. We understand they are by Mr. Johnson, of Clayton-street, Newcastle, the architect of the New Town Hall, and other public buildings.

Blairgowrie.—The Committee of the Working Men's Club have selected the design sent by Mr. Alexander Johnston, Architect, Dundee. As the site is fixed, the building is expected to be commenced at once.

CHURCH-BUILDING NEWS.

Reading.—The new church of St. Mary, at Mortimer, has been consecrated. In the spring of 1868, the old church was pulled down to its foundation, a temporary building having been previously erected by Mr. R. Benyon, M.P., at his sole expense, in the rick-yard of the Church farm. It had been decided that the new church should be erected on the site of the old one, but with a somewhat extended area. One curiosity, a sepulchral monumental stone of great antiquity, but, unfortunately, broken transversely, was discovered under the floor of the south aisle. It proved to be of the Anglo-Saxon period, and referred to the tenth or eleventh century. It is built into the wall of the vestry in the new obchuro. Mr. Benyon offered to defray the cost of the new building, which will amount to between 14,000l. and 15,000l. The approach to the church has been greatly altered and improved. The ground has been lowered nearly 3 ft., and now the church is approached from Mortimer-street by a good road 30 ft. wide. The church has a lofty tower and steeple. It is built in the Early Decorated style. The material is principally Swindon stone, the interior being lined with Bath stone. The church will seat nearly 600 persons. The whole of the work has been carried out by men employed on the spot, under the superintendence of the clerk of the works, Mr. William Rhind. Mr. R. Armstrong, of London, was the architect. There are two entrances to the church, north and south. The nave is about 70 ft. long by 21 ft., the aisles are 14 ft. wide, and the chancel is 30 ft. by 19 ft. The roof is throughout of American pitch pine, and hammer-beamed, with moulded principals, left unpainted and uncoloured. The roscos is composed of a variety of marbles, including Emperor's red (Italian), Irish green, Sienna, Devonshire, Derbyshire spar, and jasper. The windows are mostly stained glass, and the geometrical tracery throughout is varied. The east window was subscribed for by the parishioners, as an acknowledgment of the liberality of Mr. Benyon in building the church. It is of stained glass, and represents several incidents in the life of our Saviour. Mr. O'Connor was the artist. On the south of the chancel is a double lancet memorial window, presented by the relatives of the late Capt. Gould. The west window of the north aisle is also in memory of Captain Gould, and the artists were Messrs. Clayton & Bell. In this window the three Graces,—Faith, Hope, and Charity, are represented; and there are three medallions, illustrative of the Relief of Lucknow, where the late Captain Gould distinguished himself. The west window in the south aisle is in memory of Mrs. Forsyth, and was manufactured by Mr. Hardman, of Birmingham and London. The window was the gift of Mr. Forsyth, Q.C., of Mortimer. The west window is large. It represents the four Evangelists, and was the gift of Mr. Benyon. It was executed by Mr. Clinterhuck, of Stratford, Essex. In the north aisle are memorial windows presented by Sir Paul Hunter, bart. The subjects are the Nativity, the Triumphal Entry into Jerusalem, the Resur-

rection, and the Ascension. They are double windows, and one is in memory of Sir Paul Hunter's father and the other of his grandfather. A portion of the glass belonging to the old church was removed, and has been used in the present building. The window in the north was the gift of Mrs. Bazalgette; that on the south by the sons and daughter of the vicar, in memory of their eldest brother; that on the north side of the west end by the vicar and Mrs. Gould, in memory of their eldest son; that in the west end of the north aisle, representing the Marriage in Cans (Hardman), by the two sisters of the vicar; the window in the south aisle (transferred from the old church) is a memorial to the Nohle family; and the window in the south aisle, to the memory of the late Mr. and Mrs. Fellowes, was the gift of Mr. Benyon. All the other windows were given by Mr. Benyon. This is the sixth church built or restored by Mr. Benyon.

Hungerford Newtown (Berks).—The foundation stone of a new school chapel has been laid on a site given by Mr. F. Loveleek Coxo. The building is to be erected from plans prepared by Mr. A. W. Blomfield, of London, the contract having been taken by Mr. Woodbridge, of Hungerford. It will afford accommodation for sixty or seventy children, the dimensions being 44 ft. 6 in. by 18 ft. wide, with a 10 ft. apse or chancel. The material used will be brick, and the building will be covered in with plain tiles. The estimated cost is 500l.

Lindfield (Sussex).—The first step has been taken in a movement having for its object the restoration of the roof of Lindfield Church. At present the interior is disfigured by a lath-and-plaster ceiling. It is proposed to remove this, and to repair the roof. A gentleman who recently visited the place, made the following offer to the rector, the Rev. J. Milner;—that he would give 20l. towards the repair of the roof if twenty-five others would contribute like amounts. This would yield a sum equal to the estimated cost of the work,—about 500l.

Rawmarsh.—The corner-stone of the new tower for the parish church at Rawmarsh has been laid. The old tower, which has now been demolished, formed part of a church which stood on the site of the present one some 600 years ago; the nave of the church was from time to time altered, until at last it was superseded by a new one, and then it was found that the old tower did not correspond very well with it. The architect, Mr. Pritchard, of York, now deceased, was consulted, and he was of opinion that the tower was strong enough to bear an addition being made to it. The advice was acted upon, but it was subsequently found that it would be dangerous to allow it to remain. The cost of the new tower will be about 700l., and will be defrayed by subscriptions and a voluntary rate of 6d. in the pound. The work has been contracted for by Mr. Harper, of Mashro'; the architects being Messrs. Blacknoor & Mitchell-Withers, of Rotherham. Besides the erection of this new tower, the interior of the church will undergo some alterations, and there will be a new pulpit and reading-desk.

Longsight.—St. John's Church, Longsight, has been reopened. It has been cleaned, painted, and decorated. The chancel, nave, and transept arches are surmounted by ornamented scrolls, containing texts from Scripture. On either side of the chancel arch the commandments have been placed. The walls of the chancel are painted in the style of the thirteenth century. The spaces are partitioned off in mimic masonry, crossed at intervals with hands, the spays and borders round the stained-glass windows having conventional representations of leaves and flowers. The roof is coloured deep Antwerp blue, spangled irregularly with stars of different sizes. The painting was executed by Mr. Joseph Bardsley. Most of the windows are filled with stained glass by Messrs. Lavers & Barrand.

Bampton.—The chancel of the parish church and other parts of it which have undergone restoration have been reopened for divine service. The contractor for the chancel was Mr. Luker, of Faringdon; the contractors for the transepts were Messrs. Lord, Williams, and Robert & David Plaster; Mr. Wakeford was clerk of the works. The heating apparatus was supplied by Messrs. Bacon & Co., London. The committee gave all employed a supper, at which one of the members took the chair. For the necessary expense of a forthcoming contract 700l. are already promised, and 1,000l. more are required. Of the sum already expended, 500l.

have been contributed by Mrs. Southby and her family; and the carved lectern was presented by a member of the same family. The interior fittings of the nave and aisles are being taken out, and the old portion will soon be subject to the operations of the contractor.

Kea.—A vestry meeting of the parish of Kea has been held "to consider the dilapidated condition of the church, and to ascertain the opinion of the parishioners as to the desirability of its being rebuilt." Plans and elevations from Mr. St. Aubyn, architect, for church and tower in the Early Decorated style, on the site of the present building, were exhibited, and the vicar expressed his belief that the body of the church would cost about 1,500*l.*, and the tower, which might perhaps be postponed, about 1,000*l.* The promised contributions at present amount only to about 700*l.* Eventually it was resolved that it is desirable that the parish church be rebuilt, provided the necessary funds be obtained, but that the work be not commenced until two-thirds of the estimated cost of the rebuilding shall have been subscribed.

Kinnersley (Herefordshire).—St. James's church here has been repaired and restored, under the superintendence of the diocesan architect, Mr. T. Nicholson. The old pews have been swept away and replaced by modern benches, new floors have been laid—black and red tiles and boards—and the floor itself, which was originally on one level, has been graded, being now divided into nave, chancel, and sacristian levels. A single window, to match others already existing, has been inserted in the west end of either aisle. The roofs have been stripped, new boarded and newly tiled, and the plaster ceilings which used formerly to exist, have also been cleared out, and the ancient woodwork, being considered of sufficiently sound character, has been cleaned and varnished, and allowed to remain; new pine cornices having been added. A new chancel arch, in the pointed style, has been added, that part of the partition above the chancel roof being pierced on either side with a lancet. Here, too, a low sub-wall has been added, dividing the chancel from the nave. The church is warmed with one of Gurney's patent radiating stoves. The whitewash has been cleaned off the interior windows and arches wherever necessary—the decayed state of some of the stonework necessitating a coating of plaster on the principal walls. A new organ, the gift of Mrs. Fenwick Reavely, has been placed in the east end of the south aisle. This instrument is by Bevington, of London, and contains open stop, diapason, dulciana, and principal. The work has been carried out by Mr. Powell, of Hereford, at a cost of close upon 1,000*l.*

Yelling.—Holy Cross Church, Yelling, Hants., has been re-opened, after having been closed for sixteen months, for necessary repairs. A great portion of the foundations had been discovered to be in an unsafe state, and the walls exhibited unmistakable signs of a tendency to fall. It was consequently found indispensable to rebuild the north aisle, and to strengthen a great part of the rest of the fabric. This has been done under the direction of Mr. Preedy. A window, also by Mr. Preedy, representing St. Paul before Felix, has been placed in the north aisle, as a memorial of a former rector.

Teddington.—The memorial stone of Christ Church (Free Church of England) has been laid here by Lord Ebury. It will be an Early English structure with nave and aisles, north and south chapels, and chancel. There will be a tower with broach spire at the west end, 160 ft. high. The walls will be of Kentish rag, with Bath stone dressings. The inside will be lined with the Burnham pressed bricks, and the spandrels of the nave arches will be filled with Pether's diaper bricks. There will be seats for 800 persons. The woodwork will be all stained and varnished. The works are being carried out by Messrs. Manley & Rogers, from the designs and under the superintendence of Mr. Thos. Goodchild, architect.

Highclere, Hants.—The Countess of Carnarvon has laid the foundation-stone of a church at Highclere, near Newbury. The old parish church being in a very dilapidated state, Lord Carnarvon determined to erect a new edifice, which is now being built on a site close to his lordship's park, and within a very short distance of the village of Highclere. Mr. G. G. Scott is the architect, and Messrs. Jackson & Shaw, of Westminster, are the builders.

South Hornsey.—The foundation-stone of a new church is about to be laid at Brownswood

Park, South Hornsey, opposite the entrance to the new Finsbury Park, in the Seven Sisters-road. The site chosen is a piece of land about midway between the Sluice House and where Hornsey Wood House formerly stood, the whole neighbourhood of which—only a year or two since nothing but fields—is being rapidly built upon. The new church, which will be in the early pointed style, with a spire, is to be built from the designs of Mr. Frederick Wallen, and is to be dedicated to St. John the Evangelist. It will be built without galleries, and will afford sitting accommodation for nearly 1,000 persons, and the cost of the building will be about 7,000*l.*

Lapford Church (Devon).—This church, noted for a good perpendicular tower, and a roodscreen one of the richest in the West of England, and good cradle roofs, was in a very dilapidated state, and has recently undergone a good deal of repair. The chancel, which was thoroughly dehed, has been entirely rebuilt, in the perpendicular style. The church has been reseted, for the most part, with the old carved bench ends and fittings repaired, exhibiting great richness and variety in the devices. The chancel seats are new, of wainscot, and the pavement of Minton's tiles. The rich screen has been partially repaired and laid open, the north aisle roof repaired and opened; its covering was of oak shingles a good deal decayed. A new vestry hall has been erected, and the screens partially repaired, but further restoration is needed in the fabric generally. The architect was Mr. E. Ashworth, of Exeter. The Bath stone work was executed by Mr. N. Jones, the seating by Mr. Stamp, builder. The principal part of the costs of the work, exceeding 1,000*l.*, have been defrayed by the Rev. John Vicars, the rector.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Exton.—A new chapel has been erected by the Earl of Gainsborough on a site adjacent to Exton House, and has been opened for divine service. The new edifice is attached to the east side of Exton House, forming an extension of the south front, and communicating with the ground and first floors of the mansion by the ante-chapel, with trimmes above and below, in two stories. The plan is cruciform, 75 ft. by 20 ft. in the internal dimension of the main building, with an eastern apse for the high altar. The south transept forms the Lady Chapel. The north transept is devoted to the choir, and opens into the north aisle of the sanctuary, which leads to the sacristy. Beneath the entire area of the chapel there is a vaulted crypt, with a north porch roofed with stone, over the descending steps. The style of the architecture is that of the latter part of the thirteenth century. The walls are ashlar externally with Clifsham stone, and on the inside with stone from the park quarries. The windows of the apse are of two compartments, with cinquefoils in the heads, and cusped recess arches. The east window of north aisle is a sexfoil within a circle. Near the altar is a sepulchral recess, and in the pier of the arch a piscina. The south transept has a window of three lights, with geometrical tracery. In the gable is a shield with the monogram of the Virgin Mary, encircled with a wreath of lilies. The principal entrance to the chapel from the village of Exton is by a porch towards the north, by an ascent of eight steps. The windows of the nave are of two lights, with trefoils in the heads. The roof is of stone slates. The south front forms a feature of the gable, a facade on the terrace walk. The roof is a cradling of arched principals prepared to receive oak boarding, moulded cornice and ribs of the same. The masonry has been executed by Mr. T. C. Halliday, of Greenham; and the carpentry and joinery under the superintendence of Mr. John Fancourt, lately deceased.

Longton.—The new church here, which surpasses a humble structure erected by the Roman Catholics some thirty years since, has been opened with the usual ceremonial. The church, which is dedicated to St. Gregory, is 140 ft. in length, 60 ft. high, and about 50 ft. wide. It is built of red brick, with Bath stone dressings. The plan comprises nave, chancel, and sanctuary, with aisles and chapels to the Virgin Mary and her husband, Joseph. The chancel terminates in an apse of five sides, each of which is crowned by a gable dying into the roof. Between the gables are shafts supporting figures of Saints Peter, Paul, Gregory, and Patrick, and round the

apse are five two-light windows, the heads of two of which are filled with sexfoil tracery. Similar windows, of less height, are carried down the aisle, with variations in the tracery. In the eastern walls of the aisles are two wheel-windows of complex design. High up in the western gable is another and a larger window of this description. With one exception, the whole of the windows are filled with moulded and tinted quarries leaded in patterns, bright spots of colour giving warmth and character to the whole. Below the western window an atrium or corridor extends the whole width of the church, and is entered at each end by oak doors, fixed in deeply recessed arches. The sacristies and confessionals adjoin the north side, presenting two gables to the street; and the baptistry is projected in a similar way, breaking the long line of aisle roof. The presbytery is to be built against the western half of the south aisle, and the architect's plan includes a future tower and spire at the west end. A stained-glass window over the altar in the Lady Chapel is the offering of Mrs. Moore, of Longton. It is filled with representations of "The Mystery of the Blessed Virgin," and is from the works of Messrs. Hardman, of Birmingham. The church has been built, from the design of Mr. W. E. Pugin, by Mr. Heveningham, of Wolverhampton. The sum of 7,000*l.* has been expended upon it. The church will seat a thousand persons.

Seaham Harbour.—The foundation stone of a new church at Seaham Harbour, to be dedicated to St. Mary, Magdalen, has been laid by the Roman Catholic Bishop of Hexham and Newcastle, with the usual ceremonies. The site was granted on the usual terms of ground-rent, and a lease of 75 years. The erection of the church, which will accommodate 600 persons, and to which a presbytery and school will be attached, has been undertaken by Mr. Sedd, of Sunderland, the cost being estimated at 1,500*l.*

PROVINCIAL NEWS.

Middleton-in-Teesdale.—In addition to the public facilities and privileges of this quiet little town in the shape of railway and telegraph, water and gas, may be mentioned the establishment of baths and washhouses of the London Lead Company, at the west end of the town, for the use of their workmen's families, and the public generally. A penny per hour is charged for washing, drying, and mangling; and a cold bath may be had for threepence, and a warm one for fourpence, including a shower bath. Their workmen enjoy a reduction in these rates for baths, but the charge for washing is the same in all cases. There are three bath-rooms.

Burnham.—A new market-house has been opened here. The building is situated in Princess-street, a central position. The large room is 71 ft. long, 31 ft. wide, and 21 ft. high. Messrs. Hawkins & Son, Glastonbury, were the contractors, for the sum of 1,545*l.* Mr. Down was the architect.

Rendlesham.—The foundation-stone of the new mansion now in course of erection for the residence of Lord Rendlesham, has been laid. The new mansion, Rendlesham Hall, is to be in the Elizabethan style of architecture, of red brick, with stone dressings. Mr. Burn, of London, is the architect; and Messrs. Lucas, Brothers, are the builders. Mr. Chalk is clerk of the works; and Mr. Boase, superintendent.

Books Received.

Modern Art in England and France. By HENRY O'NEIL, A.R.A. London: Chapman & Hall, 1869.

The task Mr. O'Neil has set himself to perform in this brochure is from a survey of the pictures in the Salon des Beaux Arts, Paris, and in the Royal Academy, London, to point out the particular defects and merits of the respective schools. He finds little to applaud in Paris. He acknowledges the genius of the painters there who have recently passed away,—Delaroché and others,—but does not discover in the works of their respective pupils any proof of the superiority of this French system of education over that practised (if there be any) at home. Mr. O'Neil correctly argues that the absence of completeness is one chief defect of modern art. Let us have freedom, by all means but let it be the result of an expe-

Miscellaneous.

ence which "knows when to leave off," and not the mere audacity of ignorance which knows not "how to go on." Until artists have the honesty to execute their works to the utmost of their ability, and will not content themselves with eluding ignorance, or satisfying a half-formed intelligence, there is little hope for the progress of art. Art is now a lucrative profession, and the belief is, that instead of doing their best, satisfied that when done reward will follow, modern artists are anxious to reap the pecuniary harvest the sun of popular favour has ripened, and will take no more pains than will entitle them to do so. Our author illustrates this with a had figure. "When I think," says he, "of those who, in all intellectual pursuits, have not fulfilled the promise of their youth, I am reminded of the tale in the "Arabian Nights," which describes the perseverance of a traveller climbing up a mountain, undeterred by the stones that fell on him, and I come to the conclusion, that those stones being guineas, the said traveller would have had less chance of ever reaching the summit." Of modern criticism he has a better opinion, and thinks that evil rather than good has been and is being produced by it; and he considers, but without giving any evidence in support of the opinion, that the evils arise from its anonymous character. The pamphlet is necessarily slight and incomplete; but it contains observations that may usefully be discussed at greater length.

Architect's Guide; or, Office and Pocket Companion for Engineers, Architects, &c. London: Atchley & Co., 1869.

Without being able to express entire contentment with the first edition of this work, we noted to it as containing a considerable amount of information in a handy shape, and we can repeat with somewhat greater satisfaction in mentioning the publication of a new edition. An added essay "On the Profession of Architect," by Mr. Billings, has much in it that deserves consideration.

Bibliar Quotations. By JOHN BARTLETT. Author's Edition. London: Routledge & Sons. 1869.

This book of quotations, originally published in America and now considerably improved, is more or less taken separately, beginning with the Index, and the extracts are made in sequence. To find a quotation, if the book went no farther, would be a work of difficulty, but by means of an "arkly" full index, about 170 pages in length of 524, the difficulty is altogether removed: the leading word of the quotation be correctly numbered, it can be found.

VARIORUM.

The Twenty-third Report of the Commissioners in Lunacy, to the Lord Chancellor, is summarized given in the outset of this report, and that the number of persons of unsound mind under official cognizance in England and Wales on 1st January, 1869, exclusive of 225 males, so found by inquisition, was 53,177. These the greatest number, 26,867, were in asylums and borough asylums. In workhouses there were 11,151, besides 6,987 out-door paupers; in licensed houses, 4,796; and in unlicensed houses, 2,352. The summary shows a total increase of 2,177, compared with the number on 1st January, 1868. The average proportion of deaths per annum to 100 of the population was 7.80; from 1859 to 1868, in country and asylums the proportion was 8.40; in metropolitan licensed houses, 7.80; in unlicensed houses, 5.47; amongst private patients, 4.01; and in criminal asylums, 2.41. "Cassell's Popular Educator," No. XXXI. of the new edition has the second part of a useful series of papers under the title of "The Natural History of Commerce." Attention is to convey just that special information which, at this day, is felt to be most necessary to the British artisan.—The talk of railroads and other tunnels across the British Islands has not yet passed away, as appears from a pamphlet on an "International Floating Railway," by E. W. Young, C.E." (Spou). This is to cost only nine millions sterling.—The August number of "The Publisher's Circular" (Sampson Low) contains lists of works especially designed for educational purposes, and is particularly valuable in that respect.

National Education League.—The first meeting of the London members of this society, whose object is the establishment of a system to secure the education of every child in England and Wales, was held at the Westminster Palace Hotel. It was numerously attended, and great unanimity prevailed as respects the general scheme of the league, which at present comprehends the following "platform."—"That local authorities shall be compelled by law to see that sufficient school accommodation is provided for every child in their district; that the cost of founding and maintaining such schools as may be required shall be provided out of local rates, supplemented by Government grants; that all schools aided by local rates should be under the management of local authorities and subject to Government inspection; that all schools aided by local rates shall be unsectarian; that to all schools aided by local rates admission shall be free; that school accommodation being provided, the State or local authorities shall have power to compel the attendance of children of suitable age not otherwise receiving education." A large provisional committee for the metropolis has been formed for the purpose of co-operating with the provisional committee of Birmingham, and of preparing for the first general meeting of the members of the League, to be held at Birmingham in the course of the ensuing autumn.

Tracing Paper.—Artists, architects, land-surveyors, and all who have occasion to make use of tracing-paper in their professional duties, will be glad to know that a new method has been promulgated by our clever neighbours across the channel, for rendering any paper capable of the transfer of a drawing in ordinary ink, pencil, or water-colours, and that even a stout drawing paper can be made as transparent as the thin yellowish paper at present used for tracing purposes. The liquid used is benzine. If the paper be damped with pure and fresh-distilled benzine, it at once assumes a transparency, and permits of the tracing to be made, and of ink, or water-colours, being used on its surface without any "running." The paper resumes its opacity as the benzine evaporates, and, if the drawing is not then completed, the requisite portion of the paper must be again damped with the benzine. The transparent calico, on which indestructible tracings can be made, was a most valuable invention, and this new discovery of the properties of benzine will prove of further service to many branches of the art profession, in allowing the use of a stiff paper where, formerly, only a slight tissue could be used.—*Once a Week.*

Cohesion Figures.—Nearly ten years ago Mr. Tomlinson showed that when essential oils, kerosene and other liquids sparingly soluble in water, are allowed to fall drop by drop upon the surface of a wide vessel of perfectly pure water, films of peculiar and rapidly-changing form are produced. It appears that every liquid has a characteristic figure, but hitherto careful observation has been found impossible, owing to the very short duration of the phenomenon. Dr. Carter Moffatt has succeeded in fixing the evanescent forms by a very simple process. A sheet of lithographic paper is laid upon the surface of the water at the moment when the experimenter has obtained a suitable figure. The paper is instantly withdrawn, drawn through a plate of ink, and washed with water. Of a book of these *oleographs*, as they are termed, it is said that from the great beauty of many of the patterns thus produced, the process will ultimately prove of great service to paper-stainers and others.

The Preservation of Wimbledon Common.—The committee of the Wimbledon Common Defence Fund has just issued a report respecting Wimbledon Common. The report says Lord Whaler claims to be absolute owner of the whole common. The committee urge that the freeholders and copyholders of the manor, the inhabitants of the neighbourhood, and the public at large should co-operate with Mr. Peek and the committee in bringing this important question to a decision by the Court of Chancery, and, if necessary, by the House of Lords, as the final Court of Appeal. The committee are unanimous in their determination to preserve the common for the benefit of the commoners and of the public; 5,000. are required for the purposes of the suit, of which subscriptions to the amount of half this sum are already guaranteed.

The Work of Building the Wolf Rock Lighthouse.—Now that the masonry of this useful structure is complete, a brief chronological glance at the progress of the labour is given by the *Cornish Telegraph*. Mr. Douglas and his staff formally commenced work on the 17th of March, 1862, and for five hours worked at the preparation of its surface for the foundation of the pharos. Between this day and the last practicable time of working (Sept. 29th), eighty-three hours only could be spent on the part of the Wolf where any useful work could be effected. In 1863, from the first date of commencing work to October 24, the last date, 200 hours and 35 minutes were passed on the rock. August 6, 1864, the foundation-stone was laid, only 2 ft. 4 in. above ordinary low-water spring tides, and 6 ft. 8 in. below ordinary high-water spring tides. The men laboured 267 hours on the Wolf this year, quitting it on the 15th of October. In 1865, they had to discontinue a month earlier, after working for 248 hours and 5 minutes. By July 24, 1866, high-water mark was reached, but the Wolf was left on the 22nd of August, with 224 hours and 30 minutes of work done. In 1867, 313 hours and 30 minutes were spent on the edifice. Until October 14, 1868, the builders were 276 hours and 20 minutes on the rock. 23 hours and 50 minutes more would have completed the masonry, but these could not be gained till July 17 of 1869, when Sir Frederick Arrow fixed the opystone of the building. In all, 1,736 hours, and 50 minutes had been busily passed on the Wolf Rock, up to the fixture of the opystone.

Southwark Park.—We were in hopes that a scheme had been hit upon whereby the Metropolitan Board of Works might be induced to open spaces in various parts of London for the recreation of the people, by devoting portions of ground purchased to building purposes for the recoupment of the outlay; but we fear the desire of the Southwark people to appropriate the whole of the space purchased for their behoof will put an effectual extinguisher upon the hope of other districts being provided with such open spaces; for the Metropolitan Board, tired seemingly of persisting in their excellent scheme, the nature of which the Southwark people well know, have just rejected the recommendation of their Works and General Purposes Committee to persevere with their plans for building on portions of the Southwark Park site, and have referred the matter back to the Committee. It is to be hoped, however, that as this was done merely by the casting vote of the chairman, there being 17 votes for and 17 against the proposal, the committee will persist in their recommendation, and that the majority will reconsider their own opinions.

The Royal Polytechnic Institution.—The half-yearly general meeting of the Royal Polytechnic Institution took place on Tuesday, with the usual satisfactory results of a flourishing report and a substantial dividend. The directors felt justified in recommending the shareholders to declare a dividend of 10 per cent. on the paid-up capital of the company out of the earnings of the last half-year. The meeting expressed a cordial vote of thanks and confidence in the directors, Professor Pepper for his able management, and Mr. Tohn for the efficient service rendered during the period in question.

Working Men's College, 45, Great Ormond-street.—The annual excursion of the members and friends of this college took place on Saturday week, the party proceeding, as on several previous occasions, to Petersham Park, Richmond, a special train being provided by the South-Western Railway. The athletic sports, under the direction of Mr. Thomas Hughes, M.P., Q.C., consisted of various races, and of "putting the shot," the winner of the latter being Mr. G. Rosenthal, who threw the 20 lb. shot 27 ft. 9 in. After indulging in various games, the party, 271 in number, sat down to tea under the grand old trees in the park.

An Aerial Machine.—Is California to have the distinguished honour of acquiring dominion over the air for man? Detailed and minute particulars of a cigar-shaped, propeller-fitted, steam-moved, air-traverser, and of a perfectly successful trial of it, are given in the *San Francisco News Letter* in such a way as to render it doubtful, at all events, whether this be a Yankee hoax or not, ingenious and elaborate as these not seldom are.

A People's Park at Landport, Portsmouth.—At a recent meeting of the Local Government Board the Roads and Works Committee submitted a letter from the War Office on the subject of the proposed lease of the People's Park, with a recommendation that the terms thereof be accepted, provided the right to make another railway through the park be waived. The letter was to the effect that the War Office did not feel justified in granting a lease of the land until something had been done towards converting it into a park by completely enclosing it, and building two lodges to complete it; and by laying out roads and planting portions of the land with ornamental trees and shrubs; and making another line of railway to the park. The War Office were willing at once to enter into an agreement with the Board to continue them in possession of the land for seven years; and if these works are completed to the satisfaction of the Secretary of State for War within that time, to grant the Board a lease for a term of 99 years, at a rent of 50l. per annum. The report was adopted with the committee's recommendation.

The Proposed Pier at Hastings.—At the first ordinary general meeting of the shareholders in the Hastings Pier Company, Mr. Birch, the engineer of the company, produced the plans of the projected pier, and entered into explanations. He stated that the pier would be 910 ft. in length, and would be similar to the new pier at Brighton, but much larger at the head, and considerably less at the land end. As to the use of cast-iron piles, he referred to Margate pier, where these piles were found to be uninjured after thirty-five years' immersion. There was no oxidation, because the piles were protected by the action of the molten which covered them. The pier head would be 16 ft. above high water mark, and would not be touched by the solid water in the roughest weather. The meeting was then made special, to receive the tenders for the erection of the pier, and to decide thereon. There were 15, as appears from the list given in the *Builder* of 31st July. The directors recommended the acceptance of the lowest tender, that of Messrs. Jukes, Conson, Stokes, & Co, for 22,126l., subject to the necessary inquiry. The recommendation was carried unanimously. In reply to Mr. Mann, it was stated that the engineer's commission would be 5 per cent. on the cost.

National Portrait Gallery.—On the motion for going into committee of supply, Mr. Disraeli said, with reference to a vote that had been passed in supply, that the trustees of the National Portrait Gallery had offered for the portrait of Hogarth at his easel, by himself, 355 guineas, but a Manchester gentleman bid a larger sum and obtained it. It appeared that the purchaser was not a private person at Manchester, but the well-known firm of Agnew & Sons. They had purchased the picture for their collection unaware that they were bidding against the Government, and they have therefore, they say, the greatest pleasure in waiving their claim, and allowing the National Portrait Gallery to obtain the picture.

Metal Coated with Copper or Brass.—Plates coated with either copper or brass, by a process that has been patented in England, the United States of America, and the leading countries of Europe, are now made at Southampton. These patented plates are said to present advantages compared with tinned or galvanized plates, as the newly-invented plates can be annealed, as much as is requisite, during the process of stamping, without injury to the copper or brass coating. Articles manufactured from them, too, are not so readily bent or deformed as when made of brass or copper. They are also said to be about 40 per cent. cheaper than sheet copper, or sheet brass, and they can be burnished, planished or spun, and so brought up to any required degree of finish.

Dusty Roads.—W. R., a correspondent of the *Leicester Advertiser*, draws attention to the fact that at our marine watering-places, sea water, used for allaying the dust on the roads, acts "with wonderful success; for long after its evaporation the roads retain a cool and refreshing appearance of moistness, with no dust visible;" and suggests that where no sea is at hand, limestone, treated with hydrochloric acid, mixed with common salt, and dissolved in water, might be used instead of sea-water. W. R. does not seem to be aware that he is here suggesting an encroachment on a process already patented by Mr. Cooper, of London, and brought into use in the metropolis and elsewhere.

Fall of a House in Everton.—In Rosemount, Breckfield-road North, Everton, Liverpool, about eight labourers were employed by Mr. Fredk. Southcoat, to pull down a block of houses in Rosemount, Breckfield-road, and they seem to have commenced with the bottom story, as, when they reached the attic, the space beneath was quite clear for their work. They began to loosen the bricks which formed the flooring of that room, when it suddenly gave way, and five of the men were precipitated to the basis. They fell amongst the *debris*, and it was with considerable difficulty that their fellow-workmen succeeded in extricating them before fatal consequences ensued. They received severe fractures of the limbs.

A Mortuary for the Poplar District.—At a recent meeting of the Poplar District Board of Works, the General Purposes Committee brought up a report recommending that the offer of the Tower Hamlets Cemetery Company to sell a plot of land for the erection of a mortuary should be accepted, and the plans prepared by the surveyor for the building adopted. Also that when built the mortuary should be open for the use of the three parishes comprised in the district, and that they should contribute towards the cost of erection on the same basis as was observed in regulating their payment of the general expenses of the Board. These recommendations were adopted. The chairman explained that the adoption of the committee's report would not in any way interfere with a future proposition to erect other mortuaries in the extensive district over which the Poplar Board presides.

Preservation of Historical Monuments in Ireland.—Mr. Layard having been written to by the Rev. James Graves, the secretary of the Historical and Archaeological Association of Ireland, pressing the claims of Ireland to be considered in any arrangement for a Government department of national antiquities, has replied that the Office of Works has no jurisdiction in Ireland, but that the Irish Board of Works is under the Treasury, and such being the case he is unable to take any steps in the direction indicated; but that if at any time hereafter he should have the power he will do his best in the matter.

Thames Embankment.—The committee upon the Thames Embankment and its approaches met on the 30th ult. to consider their report, and rejected the recommendation of Lord Eicho, the chairman, which he proposed with a view to control the erection of buildings. The committee also rejected his proposal for a committee composed of persons eminent in art to be consulted with reference to the erection of public buildings. It appears from the evidence that if the roadway which the committee desire from Charing-cross is to be made, it will be cheaper and more direct to pass over the site of Northumberland House.

Blackfriars Bridge and the Holborn Viaduct.—The opening of these two great works, carried out by the Corporation of London, at a cost of two millions of money, will, it is almost certain, take place the second week in September. It is the desire of the Court of Common Council, the Bridge-house Estates Committee, and the Improvement Committee, that the two great works should, on account of their close proximity, be opened upon the same day if practicable, and directions have been given to make the necessary preparations for the ceremonies attendant upon the double event.

Railway Matters.—It appears from the financial speech of the Secretary for India that it is contemplated, during the next ten or twenty years, to construct seven thousand additional miles of railway in India, being nearly double the amount thus far completed. Taking fifteen years as the average time over which the outlay is to be spread, it would thus be necessary to raise about 6,000,000l. a year throughout the whole period.—The National Congress of Costa Rica have ratified a contract for carrying a railroad across its territory from the Atlantic to the Pacific.

Local Boards and Local Architects.—A correspondent from Gorton, Manchester, complains that the Local Board pay their consulting surveyor 75l. per year, and, with a view to improve his salary, wish to monopolise all the business in the township; and he says they have almost succeeded, as most of the landowners and builders are afraid to employ any one else but the Board's surveyor.

Epping Forest.—A deputation has waited on the Chancellor of the Exchequer, with a view to obtain the assistance of the Government in preserving Epping Forest to the people. The reply of the Chancellor of the Exchequer was not encouraging. While admitting the desirableness of the object the deputation had in view, he said he could not accede to the arguments by which it was pressed upon him. The rights of the Crown over the forest were feudal rights, which it would be inexpedient to revive or enforce. He promised, however, to consider the subject.

An Arctic Exhibition.—The inhabitants of the coast of Norwegian Lapland (districts of Finmark and Troms), have resolved to promote the holding of an exhibition at Tromsø, during the months of August and September, 1870, of all the raw materials found in those districts, as well as of every description of work and industrial production of the inhabitants of those districts. His Majesty King Charles XV. of Sweden, has already made a considerable grant towards the formation of a fund conferring prizes for the best articles exhibited.

New Bridge at Gloucester-gate, Regent Park.—The vestry of St. Pancras resolved to construct a new bridge over the Regent's Canal at a cost of 0,025l., and a deputation was appointed to wait upon the Crown Commissioners of Public Works, and application ordered to be made to the Metropolitan Board, asking them to contribute their quota towards the carrying out of this great public improvement.

The National Cottage Hospital for Consumption at Ventnor.—On laying the foundation-stone of the second pair of buildings of this hospital, the Princess Louise, in her reply to the address presented by Viscount Eversley, the president of the hospital, said:—

"It has ever been the desire of her Majesty's husband (and every member of her family shares it) to promote every enterprise for the relief of her suffering subjects. The special diseases for which the hospital is designed, those for which art can do least and nature most. May God therefore grant that the pure and health-giving climate of this beautiful district may be blessed to the restoration of all who shall be admitted to the shelter of this noble institution."

Brill's Brighton Baths.—The gentlemen's baths, designed by Mr. G. G. Scott, R.A., which complete the scheme of baths for which this company was organised, were thrown open to the public for use, on Monday last. The contractors, Messrs. Jackson & Shaw, have laboured with the directors, and the directors with the public. Of the external features of the building the public can judge for itself. The pity is, that there is no good point of sight of the structure. The swimming bath is 60 ft. diameter.

Value of Building Land at Norwich. Messrs. Butler sold by auction, on Monday last, 4a. 2r. 5p. of freehold garden ground, lying in the Hamlet of Heigham, Norwich, for 3,500l.

TENDERS.

For building a wing to Lower Stoford Farmhouse, Bradford, Taunton, for Mr. John Henry Warre. Mr. Houghton Spencer, architect.—
Moss & Rendell (accepted) £360 0 0

For whitewashing, colouring, and painting the interior of St. Marylebone Workhouse. Mr. H. Saxon architect. Quantities supplied:—

Blackmore & Morley	£320 0 0
Manley & Rogers	287 0 0
Crabb & Vaughan	283 0 0
Elbs & Sons	213 0 0
Till	191 0 0
Temple & Forster	173 0 0
T. G. & E. Howard	148 0 0
Brasier & Son	119 0 0

For rebuilding premises, Nos. 51 and 52, New B street, Oxford-street, for Mr. Thos. Chappell. Mr. Lee Bross & Pain, architects:—

Clemence	£3,673 0 0
Seivener & White	5,478 0 0
Thompson	8,200 0 0
Foxley	8,200 0 0
Myers & Sons	7,800 0 0
Trollope & Sons	7,767 0 0
Farrick & Sons	7,615 0 0
Elbs & Sons (accepted)	7,177 0 0

For alterations and additions to the Rev. H. Br house, Lyddington. Mr. W. Langley, architect, Highgate:—

Jeffs & Stanger	£737 2 4
Clarke & Dean	718 7 0
Drake (accepted)	647 0 0

For additions and alterations to Mr. Sharmans house, Lyddington, for the Ecclesiastical Commissioners. Quantities supplied. Mr. W. Langley, architect:—

Jeffs & Stanger (accepted)	£321 16 0
Clarke & Dean	819 10 8

For the erection of a national school and schoolmaster's residence, Lyddington, for the Rev. T. W. Gillham. Plans applied for by Mr. W. Langley, architect—
 R. Jeffs £73 9 0
 Clarke & Dean 732 11 0
 Dore (accepted) 725 0 0
 Jeffs & Stanger (too late) 723 0 0

For alterations to No. 87, Whitefield-street, Fitzroy-square, for Mr. William Legis, Messrs. Gasdian, Elliot, & Scorer, architects—
 Perkins (accepted) £315 0 0

For the erection of a small poor hospital at Stockwell, for the managers of the Metropolitan Asylum Board, Mr. Henry Wyatt, architect. Quantities by Mr. G. Cowland £31,450 0 0
 Crockett 28,800 0 0
 Myers & Sons 26,500 0 0
 Hill, Keddell, & Co. 27,063 9 0
 Henshaw 26,939 0 0
 Dove, Bros. 26,842 0 0
 Hart 25,975 0 0
 Higgs 26,712 0 0
 Bull & Sons 24,800 0 0
 Coll & Howard 24,497 0 0
 Howard 23,741 0 0

For the erection of a fever hospital at Stockwell, for the managers of the Metropolitan Asylum Board, Mr. Frederick Marriale, architect. Quantities by Mr. G. Cowland—
 Henshaw £38,500 0 0
 Colls & Sons 35,360 0 0
 Myers & Sons 34,988 0 0
 Hill & Keddell 34,633 0 0
 Tarrant 33,930 0 0
 Higgs 33,624 0 0
 Dove, Bros. 31,967 0 0
 Bull & Sons 31,750 0 0
 Howard 30,460 0 0

For new parish school, Cowfold, near Horsham, for Mr. Hoper, Messrs. Habraham & Brock, architects—
 Fowler £1,219 0 0
 Shearburn 1,140 0 0
 Pango 1,099 0 0
 Sharp 1,088 0 0
 Nightingale 1,067 0 0

For repairing, repaving, painting, and graining chapel, school, &c., Queenstreet, Woolrich, Kent—
 Vickers £240 0 0
 Linger 240 0 0
 Leadbetter 235 0 0
 Carter 230 0 0

In the list of tenders for the Kennington and Lambeth sewers, last week, for "Mr. Joseph Simmons" read "Mr. Joseph Simmons."

KELLY'S PRACTICAL BUILDERS' PRACTICE BOOK, containing the Valuation of all kinds of Artificers' Work; with the Modern Practice of Measuring, and as applied to Building, and the New Building Act for Regulating the Construction of Buildings, and the various Regulations of the Building Acts, and the present Value of Materials and Labour. Arranged by an Architect of eminence, assisted by several experienced Measuring and Valuing Surveyors. Illustrated and exemplified by Steel Engravings and numerous Woodcuts. Price 5s. 6d. per copy. Sold by Mr. T. A. Richardson, 11, York-street, Covent Garden, London; and by Mr. K. V. Paternoster row; SIMPKIN & MARSHALL; and may be had of all Booksellers.
 Of whom may be had, new editions of the following Practical Architectural Works:

1. **PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, AND CARPENTERS' MARKS.** Revised by F. TREDGOLD, being a new and complete System of Lines, for the Use of Workmen, founded on Geometrical and Mechanical Principles. Ten Parts 4s. 6d. or in boards, 3s.; containing upwards of 1000 Steel Plates, and numerous Woodcut Diagrams.
2. **PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, AND PLASTERING.** Revised by F. TREDGOLD, both plain and ornamental; containing a new and complete System of Lines for Stone-cutting, for the Use of Workmen; the System of Marking, and the various Rules which are used in a variety of new Designs for Mausolea, Tombs, Gravestones for Cementation, &c.; and a Description of the various Materials employed. Ten Parts 4s. 6d. or in boards, 3s.; containing upwards of Ninety Steel Plates, and numerous Woodcuts.
3. **TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE;** containing plain and simple Rules for Drawing and Resolving them in the present style, including an Historical Description of Gothic Architecture. Illustrated by upwards of One Hundred Steel Engravings, and several Articles of fine rare metal, including numerous Diagrams. Ten Parts 4s. 6d. or in boards, 3s.
4. **DESIGNS FOR COTTAGE and VILLA ARCHITECTURE,** containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Cottages and Villas. By H. BROOKS, Architect. Beautifully engraved on steel, with Directions for building, and the estimated cost of each edifice. Twelve Parts 4s. 6d. or in boards, 3s.
5. **DESIGNS FOR PUBLIC BUILDINGS,** containing Plans, Elevations, Sections, Perspective Views, and Details of Churches, Chapels, Schools, Almshouses, &c. Works, Markets, and all Buildings for public purposes. By S. H. BROOKS, Architect. Six and a half parts engraved on steel. Ten Parts 4s. 6d. or in boards, 3s.
6. **THE HOUSE DECORATOR and PAINTER'S GUIDE,** containing a Series of Designs for Decorating Apartments with wallpaper, and suitable to the various Styles of Architecture. By H. W. and A. ARBORNTHNOTT, House Decorators to Her Majesty.
7. **THE HOUSE PAINTER, or DECORATOR'S COMPANION,** containing a complete Treatise on the Art of House Painting, Graining, and Staining, including the Origin of Pigments, the Laws of Harmonious Colouring, the Manufacture of Pigments, and the best Specimens of Hand-brush Graining and Marbling. Ten Parts 4s. 6d. or in boards, 3s.

THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA a new and enlarged Edition, comprehending Practical Illustrations of the Mechanical Processes employed in every Description of Manufacture of the British Empire. Illustrated by upwards of 500 Wood Engravings. By LUKE HERBERT, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many of the important Laws since the first publication, in 1855, of the Encyclopaedia. The inventors and discoverers recently made have engaged the attention of the Editor; for, as the value of such works is tested by experiment, a description was accordingly prepared. By the selection of new articles, and care in the revision of others, that it may be received as fully and faithfully expressive of the state of Engineering and Mechanism, adapted to the wants of "Working Men." In two volumes, each lettered, price 30s.

The Builder.

VOL. XXVII.—No. 1384.

The Amsterdam Exhibition.

HE more that we see of exhibitions, which may be said to be one of the characteristic features of the age, the more evident it is that their success or the lessons taught by them are not always to be measured by their size.

The present undertaking at Amsterdam is well worth

a visit, not on account of its size, heauty, or intrinsic value, but because, for the most part, it really is what it pretends to be,—an exhibition of the common articles of daily life, in which we see, as it were, a bird's-eye view of what is used and what is most in request in the middle and working class houses of the various countries. Holland, as mistress of the feast, and as being at home, shows to advantage, both numerically and in quality, and has arranged a series of exhibits of great interest, varying from a four-post bedstead to a besom, or even a bundle of straw. Other countries have followed suit, according to the fancy of each, and whatever may be the value of each display, the comparative results are interesting. France alone does not seem to have grasped the spirit of the occasion with great quickness, for not only was she shamefully late with her exhibits, as though the whole thing was an *arrivée pensée* on her part, but she has gone in too much for the show, and presents a great contrast to the plain utility of the Dutch section. We have jotted down a few remarks on those exhibits which would be most interesting to the readers of the *Builder*, merely adding, that when the Exhibition itself has been exhausted by the visitor, he will find much to interest him in the quaint streets of Amsterdam. The marvel of the whole city is the simple fact that houses should ever have been built at all, considering that there is literally no foundation, and that for the upper 10 ft. or 15 ft. of the surface there is nothing but loose bog, sand, and clay. Every house is built upon piles of great length, so that Erasmus, writing from Amsterdam, said that he had reached a city whose inhabitants, like crows, lived on the tops of trees. The Palace or Stad-haus (equivalent to our Guildhall) is built upon 13,659 piles driven 70 ft. into the ground; and we can scarcely marvel when we see the enormous mass of building that they have to support. We were informed by the manager of the gas works that even the gas pipes not uncommonly sank a couple of feet or so in the treacherous soil, and the engineer of the new dam at the entrance of the Zuyder Zee, which forms the commencement of the North Sea Canal, has seen his bags of sand disappear 6 ft. or 8 ft. at a single blow of the pile-driving machine. The amount of stagnant water that we saw between the piles of an old house in

course of demolition horrified us; but it can scarcely be wondered at, when we know that Amsterdam is built on ninety islands, to which the communication is kept up by 250 bridges. Drainage there is none; cesspools, which frequently have to be emptied out through the houses, being in common use. Indeed, if gas pipes disappear so, it is difficult to understand how drainage pipes could ever be induced to remain, let alone the difficulty of crossing the canals, which are all used for navigation, and yet could not be crossed below their bed. Of course the smells are very grievous, but these arise from the stagnation of the water, the gas from which bubbles up to an extent that makes one think it is raining. The streets themselves, which are all pitched with stone from Belgium and the Rhine, are, generally speaking, clean, the gutters being frequently formed of long wooden boxes with a hinged cover; so that at all events, whatever may be the state of the current inside, the pedestrian is not annoyed by the constant sight or smell of slops.

The English exhibitors in Classes I. and II. (building and household requirements) have evidently an eye to drainage or deodorisation. Of the former, Messrs. Cliff, of Wortley, show very large 36-in. draining pipes made of Yorkshire coal-measure fireclay, for which they claim an openness of texture capable of bearing great vibration. They also show crucibles and a good selection of terra cottas, in which sharpness of outline has been obtained with success. Next to them are the stands of Messrs. Doulton & Watts, and that of Messrs. Gallichan & Co., of Leigh, Essex, which contains a large selection of glazed drainage pipes, pans, interceptor traps, &c. Cargey & Co., of Newcastle, show cements; and Engert & Rolfe, of London, their asphalt for roofing and foundations. Roofing papers are also exhibited by Erichsen, of Copenhagen, and Lint, of Rotterdam, who is the only Holland contributor in this section. He has also drawing papers of small dimensions and coarse material, together with a rough concrete for foundation purposes, which in districts other than Amsterdam would appear to be of great use. In an annex to the park he has a small piece of brick-wall, in which there is considerable taste, and we must remember that this is the material of which every house in Amsterdam, and indeed, in nearly all Holland is built. With the exception of a small quantity at Maestricht, there is not a square yard of building stone in the whole country, which, however, contains some good clay beds. The bed of the IJ furnishes most of the clay for Amsterdam and the towns on its banks, but it is not of snob good quality as that from the interior.

The decorative class is represented in England principally by Messrs. Maw, who have a small but excellent collection of tiles, and M. Szerelmy, who exhibits zopissa paper and artificial stuccoes. Durignean, of Magdeburg (Prussia), has some exceedingly pretty medallions and imitation marble tiles. Mander, of Wolverhampton, shows varnishes and lacquers; and Stephens, of London, an interesting series of his wood stains. In the Belgian department, there are imitation marble mantel-pieces shown by Mignot & Siglitz, and the wall papers of Everests, of Louvain. Mr. W. Cooke, of Leeds, shows paperings which, for beauty of design, are not easily surpassed; and Messrs. Klinkaert & Heysins, of Haarlem, have an exceedingly simple and easily applied paper for halls and passages. It is merely thin black tissue paper cut into wavy lines and placed over plain white paper. A child might make it, and improve a bare wall at the expense of a very few shillings. Blinds are, on the Continent, the object of a good deal of decorative art. With us the sun is rarely so troublesome as to require them; but a Dutch lustrous, or an Austrian garden temple,

would not be complete without its blinds. Schnbert, of Vienna, has a large exhibit of them, the greater part ingeniously made of reeds, or thin rattans, by which flexibility is obtained, while the surface is close enough to allow any kind of painting upon it.

One of the specialties of Holland is the manufacture of hamboo and cane articles, which is largely carried on, one exhibitor having a large kiosk in the park full of bamboo chairs, mats, tables, and small furniture generally. It is perhaps in furniture and dress that the best points of the exhibition lie. England is by no means largely represented in the former, which is to be regretted. Peyton & Peyton, of Birmingham, have a fine display of spring bedsteads, which must be very attractive to Dutch eyes; and Heal shows a good collection of bedding, in which cheap hospital bedding is conspicuous. Holland is especially great in bedding, a love of which is one of the Dutch weaknesses. The Kapok struck us as being particularly good for stuffing, being exceedingly light, of silky texture, and cheap. It is the product of a plant from Java and the Celebes, and appears to be somewhat extensively used in Amsterdam. Hege shows a mattress stuffed with it for 16½ guilders, or 1l. 7s. 6d.; a bed, two pillows, and bolster, for 12 guilders, or 1l. 16s.; if a spring mattress, 6s. 8d. more. For the benefit of the poorer classes, Valletta, of Amsterdam, has a collection of the various materials used for stuffing beds, which run as follows:—

	fl. c.	s. d.
Dried seawrack ...	0 12	per kilo, = about 2 1/2 per lb.
Mountain grass ...	0 15	" " " " 0 1 1/2 "
Horsehair	1 29	" " " " 1 0 "
Wool	1 50	" " " " 1 3 1/2 "

An upholsterer from Middleburgh, named Billerbeck, shows a headstead of common painted deal, a projecting wing of which contains a cupboard and receptacles for the various toilet requirements. The price of the whole is thirty-two florins, or £2. 13s. 4d., which, as it includes bedding, cannot be said to be dear. Vogelpeel, a joiner from Haarlem, sends a bed and table in one—the legs of the latter being made to work within the posts of the former. It is ingenious, but scarcely an article required for practical life, except perhaps by snob people as the cobbler in "Pickwick," who preferred sleeping under a table, as it recalled to him the times when he owned a four-post bed. Belgium sends two exhibits worth notice; one a movable roof by Paris-Isaac, of Engbien, which, by turning a winch, is made to travel over a considerable extent of framework. This might be well applied to railway stations, when a portion of the building is wanted at a time. Roelants, of Antwerp, has garden-seats and tables, convertible at pleasure for two or four. The chief ingenuity is in the number of positions that the awning is made to assume,—such as letting down at the front, back, or on either side, and also becoming a water-proof umbrella when it rains. The price of the seat is 47 florins (3l. 18s. 4d.). He shows, too, a *multum-in-parvo* headstead, inside of which are convertible chairs, commode, table, and looking-glass,—no bad arrangement for small lodgings or a bachelor's room. The price in ordinary deal is 125 florins (10l. 8s. 4d.). In the Austrian section, Knoblock, of Vienna, has a good collection of polished bedroom furniture, cheap and pretty; a washing stand, charmingly fitted up with toilet appendages of opalescent glass, is priced at only 13 florins, 1l. 1s. 8d. Still cheaper, and of much commoner material, is the Gothenburg furniture, in its own special house in the park. Here the prices in stained deal are,—chair, 1s. 8d.; chest of drawers, 10s.; table, 3s. 4d.; combined table and working-stand, 5s.; large table (3 ft. 6 in. by 2 ft. 7 in.), 5s.; side-board, 6s. 3d.; sofa-bedstead, 12s. 10d.; garden-seats, unpainted, 5d. Everything else in the cottage was in the same proportion, and the workmanship, though plain, appeared strong and

good. Holland shows very cheap ware; while Belgium has a large number of tinned articles from the Cereheim Carpenters' Society, which, however, did not strike us as particularly cheap. Smisnaert, from Bergen-op-Zoom, exhibits coarse brown-ware tea-pots, at 10 cents, or 2d. An urn, with a rather pretty pattern in relief, and with hot-water lamp, costs only 6d. So that a Dutch cottage can be supplied with necessaries at a ridiculously cheap rate.

Workmen's tools are well shown, but in cutlery there is nothing which can approach the English. Sewing machines are an important item in the exhibition, every country sending a contingent. The chief English contribution is the Weed machine, the speciality of which is its capability of penetrating the thickest materials, not excepting lead. Class VI., that of instruction, is marked by a very large and interesting display of models, designs, and drawings from the various commercial and technical schools, which are numerous in Holland. The clay modellings for cornice-work of the Amsterdam Ambacht school (trade school) and of the Zaanbaar Brugher Avond School are remarkably clever. Deventer School is particularly good in wood-cutting, and Rotterdam in its building plans and elevations.

From the Hague comes a most minute model of the baths and wash-houses, which contain in one wing twenty-eight first and second-class baths for men and women, and in the other, boilers and apparatus for clothes washing. The minuteness of Dutch workmen is well displayed in this model. Each bath was represented with extraordinary fidelity, even to the taps, and the bells even rung. And, *devoos* of washing, which is the *bie not* of every household, we must mention an ingenious copper, called the Niagara boiler, the hot water of which is forced through the clothes in a constant shower or stream, thereby saving an immense amount of labour and a good deal of wear and tear to the clothes. To match this, Hilgers of Rheinbrohl, Prussia, sends a particularly neat little wringing machine for small articles, so that washing will soon be denuded of most of its disagreeables.

THE DECORATIONS AT THE PRINCE'S THEATRE, MANCHESTER.

THOSE who hold, with ourselves, that "theatrical surroundings" in England are not, artistically, what they ought to be, would have recognised with pleasure a step in the right direction in the decorative treatment of the Prince's Theatre in Manchester, which was reopened on Friday, the 6th ult., after a temporary closing of some weeks. The house, erected some time since from the designs of Mr. Salomons, and which has enjoyed a prosperous career of late under the able management of Mr. Charles Calvert, had been found deficient in accommodation for the audiences which were attracted to it; and accordingly the management called in the assistance of Mr. A. Darbyshire (the original architect of the theatre having, for whatever reason, declined to undertake any alteration) to devise means for meeting the difficulty. Under his direction the ceiling has been raised 8 ft., and the "upper circle," which formerly consisted of only two tiers of seats, has been extended backward to the limit of the auditorium, filling the space before occupied by the "gallery," while the increased height obtained by raising the ceiling has enabled the architect to reconstruct the gallery over the upper circle. By this means three hundred additional seats are gained. But while this important practical improvement was carried out, it was determined, also, that the occasion should be seized, while the house was necessarily closed, for entirely remodelling the decorations. To this end the valuable aid of Mr. H. S. Marks was invoked, and the space over the proscenium, left by the raising of the ceiling, was turned over to him as a field for the exercise of his talent, with what result we will describe just now. The proscenium itself has been designed anew, and is now flanked by a massive square pilaster at each side, carrying an architrave, the main lines of which run right round the house, and form the front of the new gallery. The pilasters are partially fluted and partially paneled, with flat decoration in the panels, and surmounted by a form of capital which Mr. Darbyshire may claim as an invention, and which may be described as a combination of a bracket and a foliated capital. We are glad to see a new feature sometimes, but think the present one would be more satisfactory if the

capital were less cut into and more solid and homogeneous in appearance; the leaf under the bracket on each face does not satisfy the eye as a means of support. The rest of the decorations have been mainly from the designs of Mr. Gordon, with subordinate figure-subjects from the pencil of Mr. Phillips (both of London); all, however, subject to the general control and judgment of the architect, who has signified himself by a merciless raid upon nearly all the remnants of the time-honoured style of ornament which may generically be termed "pie-crust," and which has too long been the curse of theatrical decoration. "Sweet things in festoons" of plaster fruit and flowers have been ruthlessly excised, and the fronts of the various tiers treated as much as possible in flat ornament in colour. The front of the dress-circle shows a series of panels illustrative of Shakspeare's principal plays, consisting of a head of the principal character within a circle in the centre of the panel, the rest of the space being filled up on one side by a scene from the play, painted on a small scale, and on the other side by the name in a label surrounded with scroll-work in keeping with the assumed date of the play. Some raised panels over each column (part of the old design), which formerly contained medallion heads, now bear the initials W. S. in a monogram; but, though a monogram is a most appropriate decoration in a single central position, its unvaried repetition in this fashion is not, we think, a very happy idea. The upper circle is decorated with arabesque designs on a gold background, and the gallery by a simple but very effective and pretty design picked out with gold on a light-blue ground. The whole of this decoration is of the Gothic type so much in vogue with many architects at present, and which has a tinge of what one may call Egyptian character about it. If we were to say that we regarded this as the most desirable type of decoration for modern buildings, we should "say the thing which is not;" we look for something more of classical refinement and grace of form than are found especially in the designs for the panels of the ceiling of this theatre, and in the intermediate panels which alternate with those already described in front of the dress circle; both which appear to us also somewhat too large and coarse in detail: this particularly with reference to the dress circle, which, of course, is nearest the eye from all the best parts of the house. The two other tiers are excellent in their effect, and there is ground for great satisfaction in seeing the old meaningless style of theatrical decoration fairly broken through, and the whole of the work of decoration carried out in a consistent and painstaking manner. One of the most pleasing points is the way in which the curtains and bangings over the boxes have been "architecturalized" into harmony with the other decorations, instead of banging in those eternal festoons which we are used to see. The only bit of the "old heaven" is the act-drop curtain, which is splashed over in imitation of heavy folds of draped stuff in the old-fashioned style. It is a pity that this was allowed.

Neither architect nor decorator, however, will quarrel with us for saying that the most important feature in the new work is the painting on the frieze by Mr. Marks, before referred to. In the same manner and style as the painting at the Gaiety Theatre, it is nevertheless a decided step in advance of the latter. The composition, which is kept rigidly to one plane (without even such slight attempt at perspective effect as laid the painting at the Gaiety open to some criticism as a mural decoration), shows Shakspeare enthroned in the centre, Tragedy and Comedy seated at his feet to left and right respectively of the spectator, while the rest of the space is occupied at each side by the principal characters from his greatest plays. On the Tragedy side are to be seen Othello, Hamlet, Macbeth, Ophelia, Lear and the Fool, Romeo and Juliet, Coriolanus, Timon, and Julius Cæsar; on the opposite side Prospero, Shylock, Touchstone and Audrey, Puck, Falstaff, Benedick and Beatrice, Henry VIII., Richard III., Henry IV. The central figure on this latter side is Falstaff seated with a wine-cup in his hand, and with as much joviality of look and manner as could be consistent with a style of painting which must of necessity be removed considerably from anything like objective realism. Over his head rises a flowering plant in full bloom, typical of exuberant life, and he is balanced on the opposite side by the grandly conceived figure of Lear, marked by great breadth of treatment in the drapery and general pose; this is also a sitting

figure, and backed by a withered and blasted tree, which further emphasises the contrast of the two characters. These two seated figures, from their position, assist the artist in his skillful varying of the outline of the composition, which is not in the least chargeable with monotony. The rustic figure and pose of Touchstone's sweetheart ("bear your body more seeming, Audrey," is evidently the last sentence she has heard) form an admirable foil to the graceful and beautiful figure of "the gentle lady wedded to the Moor" opposite; and the sentiment and gush of youthful love exhibited in Romeo and Juliet is contrasted with the light half-sarcastic attachment of Benedick and Beatrice (Benedick does not look quite gentlemanly enough, according to our conception of him); and the classic group on the extreme left balances very bappily that of the Mediæval English monarchs on the right. Prospero is a fine dignified figure (we should have liked to have seen our pet female character, Miranda, in the scene); Hamlet we think not so successful—a little too sentimental, and wanting in that manliness which, with all his philosophy, was an essential part of his character, but which painters and actors alike too often miss. The central figure of the bard is backed by a laurel tree which is of great value in giving breadth and importance to the centre group, and perhaps the most successful figure in the series is that of Tragedy, a refined and beautiful conception, as she sits with drooped head, not exhibiting such an image of horror as those which flank Reynolds's grand painting of Mrs. Siddons, but rather giving us the aspect of Tragedy when so far removed from the real into the ideal world as to be contempered with pleasure unmingled with anything of abhorrence. The satisfaction to be derived from a study of this fine work, however, is less perhaps dependent on the beauty of individual figures than on the harmony and completeness of the whole both as to colour, composition, and the amount of thought displayed in it; and highly as Mr. Marks is already esteemed by many, we should say that those who have not seen his work at the Manchester theatre are not fully conscious of his powers.

We ought not to omit mention of the side panels in the frieze over the boxes, which have been painted by Mr. Phillips, with subjects illustrative of painting and music in very fair imitation of Mr. Marks's style; the female figure in "painting," standing as a model for the artist, is particularly elegant both in pose and costume. The glaring mistake made at the "Gaiety," of having figures in the side panels on a different scale from those in the principal painting has been happily avoided here. A panel at each end of Mr. Marks's painting is filled with what the local papers, acting, we suppose, under proper information, describe as "conventional drapery," but which look to us as painfully like two big pocket-handkerchiefs hung up on high: something better might certainly have been devised for the situation. Beyond this, it is sufficient to say that Mr. Calvert delivered an opening address on the occasion; expressive, among other things, of a conviction that the stage was not in so deplorable a condition as critics are representing it to be; that the acting of himself and his clever lady, as *Benedick* and *Beatrice*, in the performance of "Much Ado about Nothing," which followed, went far to confirm his views; that there was a nice bit of part singing of Macfarren's "Who is Sylvia?" introduced in place of Balthasar's song, "Sigh no more" in Act ii.; and that the orchestral music was neither better nor worse than in most English theatres. Perhaps some enterprising artist may now attempt to do for English theatrical music what Mr. Marks is doing for theatrical painting, and endeavour to raise it to the level of high art. Let us add in conclusion that to those who were in any degree "behind the scenes" nothing could be pleasanter than to witness the enthusiastic and friendly manner in which manager, architect, artist, and decorators acted together, in endeavouring to produce a satisfactory result, and to do honour to the memory of the great poet whose name they have endeavoured specially to associate with this theatre.

Salisbury Cathedral.—The scaffolding by the aid of which the statues have been fixed in their several niches on the west front of this cathedral has lately been removed. Miss Caffyn Grove, of Zeals House, has sent to the treasurer of the restoration fund 100l. for the purpose of placing two additional statues on the west front.

VISIT TO ST. ALBAN'S ABBEY.

AFTER the address of Lord Lytton at the opening meeting of the British Archaeological Association's Congress in St. Alban's, the members repaired to the Abbey, where Mr. Gordon Hills became their guide. Taking them to the spot whence they could survey the northern side of the abbey, he asked them to observe the peculiar nature of the construction of the church, to take note of its vast proportions, its great length, and of the unusual circumstance that it is largely constructed of brickwork. The materials of which it was formed (he said) given it a character which no other church of its size possessed. The tower, which is covered with plaster, is built of brick, visible everywhere inside of it. All the exterior was covered over as the tower still is.

The company then returned to the western entrance, and attention was called to the singular appearance of the west end of the church, its unfinished character, and the beautiful and elaborate work in the porches. Having taken up a position in the nave, Mr. Hills proceeded to say that this noble church was one that connected, more than any other in this country, memories of the past with the present. It was founded on the spot where the first Christian martyr of Britain shed his blood. The date was not exactly known, but it might, with sufficient accuracy, be said to be within a few years of 300 A.D., in the time of one of the persecutions under the Emperor Diocletian. The ancient city of Verulam stood on the opposite hill, and from that city Alban was led out by one of the gates, and decapitated on the neighbouring hill, and on this hill the first church was founded. When Germanus and Lupus visited Britain for the purpose of putting down the Pelagian heresy, they visited this church, and the tomb of the Martyr was opened, and some sacred relics, brought by them, were put in it. The next that was known of the church was that, in the time of Bede, a church stood on this spot. Then there was a blank, until the end of the eighth century, when Offa, King of Mercia, founded a monastery on this spot. In the lapse of time, the memory of the first church had perished, and it was said that Offa was miraculously guided to the place where the remains of Alban were entombed. From that time there had been a church on this site. After this we came down, 300 years at a leap, to the time of the Norman Conquest, when Abbot Paul began to build the church, which, in the main, was that now before their eyes. This building was consecrated in 1115. It was particularly interesting to notice that the church was not only itself of great age, but that it was constructed of the fragments of other buildings that had fallen into ruins. Abbot Paul ransacked Verulam, and brought a great quantity of materials therefrom for the erection of this church. The interior walls were full of Roman bricks, and the outside wall was of Roman brick and very little else. Even where the brickwork did not appear, the flint and rubble were Roman materials brought to this spot. Two abbots before Paul had collected materials for the building of the church, but a time of famine coming on, they sold the materials to relieve the wants of the poor. In the time of John de Cella (1195-1214), the idea of improving the church was conceived. This abbot pulled down the west front, and proceeded to rebuild, but after collecting all the money he could, he was obliged to stay his hand for want of funds, and the work remained in abeyance till William of Trumpington took the rule in 1215, and completed the construction of four arches on the north side at the west end, and of five arches on the south side. The rudeness of the original Norman work, as compared with other works of the same period, was thus to be accounted for. Paul, in building the arches of bricks from the old city, had to use his materials as he found them, and was unable to mould them into the more graceful forms. In the newer work built of Tottenham stone, which was easily moulded by the skill of the mason, is seen the advantage gained in the change of material, as well as the striking advance which time had made in architectural development. In part of the newer work it would be observed that it had been commenced in an elaborate style, and then dropped from a high to an inferior style. The columns at the west end and on the south side were pointed out as illustrations of this, the columns beginning with seven marble shafts, and the number, as the work progressed, being reduced to two and three.

Mr. Hills next called attention to the bases of columns exposed on the north side at the west end of the nave, as openings into the chapel of St. Andrew, which was a church until the time of the suppression of the monasteries. The chapel of St. Andrew was a church of three aisles, and containing three altars. It seemed to have been a large structure attached on the north side of the abbey. At the suppression the abbey was purchased and made the parish church, and St. Andrew's was pulled down. He next pointed to the paintings of the Crucifixion on the piers of each of the arches of the older portion of the building on the northern side, remarking that it had been suggested there might formerly have been altars placed against these piers; but they had a description of the altars in the building of the date 1440, in which no mention was made of there having been altars in these places, and the character of the paintings precluded the idea that they were there, at any rate at a later date. He then called attention to the south wall at the west end, pointing out that there were no windows, as on the northern side, which arose from the abbot's house being against the south wall. He then described, by a reference to the construction of similar buildings, the probable character of the external buildings,—the abbot's house, the great kitchen of the monastery, in which provision was made for almost unbounded hospitality, and pointed out the door from the abbot's chapel into the church. Further on he noticed also the transept by which the monks descended from their dormitory into the abbey for midnight service. Attention was next called to that portion of the south side of the nave approaching the Virgin, where, in 1323, during the Mass of construction, two columns fell. This led to the construction of five arches totally different in character from those of Abbot William of Trumpington, on the south side, and those of Abbot Paul, on the north, and also to the construction of the beautiful screen across the nave.

Attention was then called to this screen, and to the altars on the right and left of it. The centre altar is wrongly called the altar of St. Cuthbert. It was really dedicated to the Holy Cross, the altar of St. Mary ad Colmanam being to the south, and that of St. Benedict to the north, the latter being also dedicated to St. Oswin. Notice was also taken of alterations made after Trumpington's time, on rebuilding the fallen tower, in which the arches had fewer mouldings, not so good and deep as in the time of that Abbot, and the windows were imitations of Trumpington's work, but much inferior in beauty. This attempt to imitate previous work was seldom made in Mediaeval times. The five columns (at the part indicated, on the south side of the nave) were erected in the time of Edward III., and it would be seen that the shafts were, like those of Abbot Trumpington, of an earlier style. But their caps and bases were of the later style. On the walls above the arches were heads of the King and Queen, the royal arms of England and France, and a shield which was supposed to be that of Offa, but coats of arms came into use about 1215, and there were none in Offa's time. That, therefore, was a fancy. Inasmuch as the abbot who constructed these arches had been prior of Tynemouth, which monastery had a shield identical with this one, he was inclined to think that the arms were those of Tynemouth. Another coat of arms on the wall was said to be that of Edward the Confessor. There were no coats of arms in his time, but when it became the fashion for great people to have them, they were sometimes invented for the illustrious of former days, who never had them.

Mr. Hills next proceeded towards the choir, and taking up his position centrally between the transepts, he remarked that they were now in a part of the church where they could see more of the original Norman architecture than in any other. He would not say that they could see more of the original condition of the church, for the part before them must be deplorably shabby when compared with what it was in other days. Everything that they saw in the transepts was characteristic of the simplest form of Norman architecture, and nowhere had he found any work which he could positively say was the building of Offa. There were, however, stones which there was good reason to believe belonged to his church. In the arches of the triforium they would notice the handed columns, which were of an obviously earlier date than the Norman buildings, and

which he could not help thinking had been taken from the Saxon building, and were used by Abbot Paul in the construction of the transepts. The columns could not be identified as having formed part of Offa's church, but he thought it very likely that they did. The great tower was, he believed, the work of Abbot Paul entirely. A timber spire was subsequently put on it by Abbot Trumpington, but that was swept away at an unknown time, and the tower reduced to its former proportions. It was not often they met with so tall a Norman tower of the early period. The doors on the side of the south transept were the entrances of chapels. In the fourteenth century the chapels on the south side were taken down, and larger chapels built outside. There were two chapels at this part in 1440, but between then and 1540 one of them was turned into a vestry, and a wall separating it from the other chapel was erected. A small archway in the south wall of the south transept, which led to a vaulted passage, was visited by the company. In this vaulted cell, as it now is, there are exquisite specimens of Norman arches, the round Norman arch being intersected and forming pointed arches. It was suggested that this form marked a period of transition, but Mr. Edward Roberts, who accompanied the exploring party, said that the intersected arch was found in the earliest Norman specimens. He, however, traced in the hands of the heads of the arches signs of incipient change. Some very beautiful carved work on the inner part of the doorway excited much attention. It was extremely minute, and of the most exquisite design and workmanship. It constitutes, Mr. Hills said, the only remaining fragment of the works of Abbot Robert Gorham, who rebuilt in this elaborate Norman style the chapter-house to which this passage adjoined. The passage-way had a door at each end, and led from the cloister to the monks' cemetery. This cemetery lay in the angle east of the south transept, and south of the choir.

Before leaving the transepts, he referred to the Roman materials employed in the construction of the building, remarking that there were two or three very peculiar tiles at the end of the north transept—flue tiles built into the wall. On examining the upper part of the tower he had found some curious marks on the Roman tiles. It was not unusual to find on Roman tiles the mark of a dog's foot, which was to be explained in this way,—the tiles had been laid out to dry, and dogs, with which the country abounded at the time, ran over them while they were in a wet state, and left the impression of their feet on the yielding material. But on one tile in the tower he had found the impressions of a pig's foot, of that of a bird, and of a cat's foot. In the last-mentioned case the tile had got nearly dry when the cat passed over it, and the impression was faint.

Mr. Edward Roberts said he was much gratified to hear the remarks made by Mr. Hills with reference to the use of Roman materials in the construction of the abbey. On another occasion it had been stated here that a great part of the building was of Saxon construction; and he had heard that the gentleman who said this challenged any one to contradict his assertion. He was not present at the time when the statement was made, or he should certainly have disputed it. He was happy to find that Mr. Hills had come to the conclusion to which every one acquainted with the subject must come. The assumption that, because some balusters and shafts which had been put in were of a Saxon character, the work itself was Saxon, was as idle as could be.

After listening for a few minutes to the tones of the great organ upon which the organist, with the consent of the rector, kindly performed, the company proceeded to the space before the high altar. Mr. Hills called attention to the elaborate work of the fifteenth century on the altar screen, mentioning that the shrine of St. Alban was originally so raised, and the screen so low, that the shrine could be seen by the priest when he stood at the high altar. There was at that time above the high altar an elaborately carved beam, with the crucifixion upon it. Abbot Trumpington, however, removed this roof beam, and put it across the south transept. It was the custom to have the aisle opening to the choir by arches, but this building was not so constructed, there being a solid wall between the aisles and the choir, the open arches having been added in Trumpington's time, and the solid wall panelled to match them. The ancient shrine must have stood where the present high altar was, Abbot

Trampington having lengthened the church eastward.

Attention was then called to the tomb of Abbot John, of Wheathamstead, who came to the rule about 1420. The roof of this part of the building was then referred to, and the decoration of it was said to be the work of Abbot Wheathamstead. The symbols on it were those of John the Baptist and St. John. The shields were used to conceal the junction of the wood and stone vaulting in the roof. The tomb on the left was built to Thomas Ramryge, one of the last of the abbots.

The company next assembled in the Saints' Chapel, at the back of the high altar, where Mr. Hills pointed out marks on the centre of the area of the chapel which they were able to recognise as the place of the shrine of St. Alban. The marks were those of the feet of the columns which carried the canopy over it. Most of them (said Mr. Hills) would probably come to the conclusion that the relics of St. Alban never were enclosed here. The history of these relics was very curious. He believed that Germanus and Lupus did see the relics of St. Alban, and placed others with them. Afterwards, in Bede's time, they still remained there, but subsequently the place of their deposit was lost sight of, and it was said to have been revealed to Olla by a miraculous light which led him to a spot where bones were found that were treated as the relics of the saint. Afterwards, the country was overrun by the Danes, who carried away the supposed relics. A monk of St. Alban's undertook to recover them. He set out for the Scandinavian monastery to which the relics had been carried, and, representing that he was led thither by the fame of the salutary effects of the relics, sought admission into the brotherhood. Having conducted himself satisfactorily for some time, he was admitted a monk, and in course of time advanced to the office of Sacristan, and, with what we should now consider doubtful morality, made use of his office to get possession of the relics. He made a hole at the bottom of the shrine of the saint, got out the relics, and having packed them, procured a merchant to deliver them up, sealed with his seal, to the Abbot of St. Alban's. After that England was again invaded by the Danes; and the monks of St. Alban's, becoming alarmed for their sacred treasure, the abbot took the relics out of the shrine, and made a hole in the wall under the Chapel of St. Nicholas, and buried them there. Having done this, he sent to Ely the bones of a monk, which he carefully delivered, pretending that they were the relics of the saint. This led to a curious dispute in after times. When the Abbot of St. Alban's restored his own relics to their place, and wanted these relics back, the monks of Ely refused to give them up, for they reverenced them as the true relics of St. Alban. The Abbot of St. Alban's, however, deceived them, and inquiry having been made from the Pope, it was pronounced that the supposed relics of the saint had not been removed from the Abbey of St. Alban's. The actual possession of the relics was further established in the year 1256 by the discovery in the church at this part of a coffin containing an inscription on lead, which averred that this stone coffin was the coffin of the saint. Other places, however, claimed some of his relics. Two canons coming here from abroad, said they possessed his shoulder-blade, given them by Canute, King of England. A church in Germany also claimed to possess most of his bones, and even now this possession is claimed for a church at Cologne, where, in a magnificent shrine of very ancient date inscribed to the saint, these relics may still be seen. The history of them is succinctly preserved, and would make them to be some relics actually taken from his tomb at St. Alban's by Germanus and Lupus about the year 400.

Attention was next called to the monument erected to Humphrey, Duke of Gloucester, on the south side of the Saint's Chapel; and, on the north side, to the closet erected for the reception of the articles given to the shrine, and to the quaint watching-chamber,—over a Medieval gem. The tabernacle work over the capitals of the pillars behind the shrine was particularly noticed as rarely to be met with.

From the Saint's Chapel, the company passed out at the south side, into the open air, and proceeding along the passage which now forms a thoroughfare, intersecting the abbey and separating the Ladye Chapel from the rest of the building, entered the vestibule leading to the

latter. At this point, just outside the door of the Ladye Chapel, Mr. Hills paused, and said they were now assembled in a part of the building which formed the ante-chapel to the chapel of the Virgin. At the end of the twelfth century a great change took place in the celebration of services to the Virgin Mary, which led to the erection of more splendid chapels to her honour than had formerly existed. They were now outside one of these which was begun by Abbot Trampington. To reach this place they had just passed along what was now a public thoroughfare, and which his lordship, the bishop, had this morning spoken of as a desecration of the place. He (Mr. Hills) was told that the public way through the building at this point was a great convenience, and that it was impossible to give it up. He hoped, however, that there was no insuperable difficulty in the way. When they heard of a project for making a tunnel under the channel to connect England and France together, it could not be impossible to construct a tunnel under the abbey, which would serve the purpose of the present thoroughfare, if, indeed, a thoroughfare in that direction were necessary. In this part of the building there were formerly three altars, one to St. Edmund on the north side, and another to St. Peter the apostle on the south side, with the shrine of St. Amphibalus to the west. Looking up to the roof, they would see, from the marks on the columns, that it was originally intended to have vaulting, but it never had any, and was covered with a flat ceiling in oak, of which there were, as they would observe, some remains. The work was begun by Abbot Trampington, and continued for a long period, but it was not finished until a century later, in the time of Hugh Eversden (1308—1326).

From the ante-chapel the company passed into the Ladye Chapel, when attention was called to the beautiful windows of Hugh of Eversden and the hall-flower ornament running round the window arches, and to the exquisite little statues, many of them but slightly injured, which was remarkable, considering that the chapel had been used as a boys' school for four hundred years. Next was noticed the partition which separates the Ladye Chapel from the ante-chapel, under the hoarding of which there were traces of an elaborate screen. This partition ought to be taken down with the greatest care, so that no injury might be done to the screen. All were happy to hear that steps were in progress for the removal of the screen to that part of the old building which formed the gateway of the monastery, and which had been used as a goal. Every archaeologist will rejoice at a removal which will facilitate the throwing of the Lady Chapel into the church, of which it was a part.

LABOUR SAVING MACHINES FOR BUILDERS.

IN our recent notice of the show at Manchester, we mentioned briefly the remarkable labour saving machines exhibited by Messrs. Allen Ransome & Co. They seem, however, to call for a fuller description than we could then give. Some time ago we described the "General Joiner" and other machines that had been set up for Messrs. Corbett and McClymont on the Redcliffe Estate, West Brompton, where they have raised a town of excellent houses. Messrs. A. Ransome & Co. have now, however, patented a new "General Joiner," of which they say that it will work saws up to 20 in. in diameter, and saw stuff up to 7 in. thick; it will cross-cut wood of any length, up to 4 in. thick; it will plane both sides and thickness, in one operation, boards up to 7 in. wide; it will cut single or double mouldings of any pattern in any kind of wood up to 5 in. wide; it will cut grooves from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in. in width; it will make perfect planed tenons in one operation; it will make mortises from $\frac{1}{2}$ in. to 2 in. of any length in any kind of timber; and it will bore holes from $\frac{1}{2}$ in. to 2 in. diameter. In addition to the above, it may be used for relaying and moulding sash frames, mitring, chamfering, tonguing, heading, and a great variety of other purposes. It is worked by two hands, and will do the work (they assert) of at least thirty skilled joiners. The advantages it has over other machines of this class appear to be that the tenoning, planing, and thickening, and moulding operations, can be carried on without interfering in any way with those that are done at the sawing end of the machine, such as ripping-out, cross-cutting, squaring-up, tonguing, and grooving, &c.; the tenons are formed

at one operation by cutters, which finish them much more accurately than is the case where saws are employed for this purpose, as in other machines of this class; the wood to be tenoned, which may consist of several pieces up to a total width of 18 in., is cramped in a horizontal position upon a light sliding plate, instead of each piece being fixed separately in a vertical position, as is the case in other General Joiners; tenons can be formed with shoulders of unequal lengths, by simply altering the position of one of the tenoning blocks on its spindle; and it will plane both sides at once, and thickness boards up to 7 in. wide, and will cut single or double mouldings of any pattern in any kind of wood. In other machines of this class one side only can be planed at a time.

Without endorsing all the claims made for it by the patentees, we have no hesitation in asserting that it is a very valuable machine, and that every large builder ought to take an opportunity to inquire into its merits.

Parkinson's patent "Universal Joiner," made by the same firm, combines improvements never before introduced into machines of the class known as "General or Universal Joiners," for example, it will plane, groove, tongue, edge, and thickness boards up to 7 in. wide, or will work all four sides of a moulding at one operation, whereas the most perfect "General Joiner" yet produced will only plane two sides at a time; it is provided with a complete band saw for sawing circular work up to 10 in. thick; and it will mould and rebate circular sashes, or stick curved or circular mouldings of any pattern. The hand saw and table are attached in such a position as not to interfere with the working going on at either side of the machine; and as the planing arrangement and saw are driven separately, the lad operating either part can stop or start his portion of the machine without interfering with the working going on at the other side.

Frazer's patent equilibrium deal frames do a large amount of work. These machines are furnished with two separate swing frames worked from one crank shaft, so arranged that when one is at the top, the other is at the bottom of the stroke; and thus in ascending and descending, they counter-balance each other, and the result is that they can be driven at 400 revolutions per minute with less vibration than other deal frames driven at half that speed, and the necessity for a fly-wheel is obviated. The swing frames are made entirely of cast steel, thus combining great strength with the least possible weight, and the crank shaft and other working parts do not require to be nearly so strong as in other frames, in which a heavy swing frame is counter-balanced by a heavily-weighted fly-wheel.

The plain band saw machines, exhibited by Messrs. Ransome & Co., are intended chiefly for sawing curves, and among the many purposes for which they are peculiarly adapted may be mentioned sawing out hand-rails, gothic work, &c., for builders and contractors; cutting out buffer blocks, break blocks, curved supports for roofs of railway carriages and trucks, for railway carriage builders; preparing chair backs and legs, for cabinet-makers; and sawing out fellos and naves of wheels for wheelwrights, &c. By simply changing the saw it is equally adapted for cutting out delicate ornamental work, or for sawing through a piece of oak 15 in. thick.

We have before now spoken of their Self-Acting Saw Bench and their Planing and Tying-up Machine. In the latter the cutters are attached to a wrought-iron adze block, which revolves at a very high speed, and cutters of any form may be fixed to it so as to cut a moulding, band or rebate, upon the timber at the same time as it is being planed. The table is of cast-iron, planed all over, and fitted at intervals, with screw-cramps, fitted with gun-metal nuts and wrought-iron flanges, by which the timber is readily and securely fixed. The table is worked by a self-acting feed motion, giving it a forward speed equal to 12 ft. a minute, and taking it back much faster.

We advise such of our readers as are practically engaged in building operations not to content themselves with reading of such machines as these, but to inquire for themselves as to the expediency of making use of them. All are advanced ultimately by machines that lessen human labour.

The Ellesmere Memorial.—We may remind our readers that the architect of this memorial was Mr. T. G. Jackson, of London.

HOLME'S STONE-DRESSING MACHINE.

Mr. SHEARER, of the Dalbreath Granite Quarries, and Mr. William G. Freeman, of the Penryn Granite Quarries, having taken up the stone-dressing machine invented and patented by Mr. Joseph E. Holme (of the United States), have given us an opportunity to inspect it in action. The object of the machine is, of course, to facilitate the dressing of stones, and especially of the harder and more enduring class, enabling contractors and hinders, or quarry owners, to avail themselves of steam or water power for the more laborious part of their trades. The machine consists of a simple arrangement by which a block of stone can be made to travel beneath a transverse bar, carrying either a series of chisels or a single knife. To this bar (differing from other stone-working machines that we have seen), a kind of oscillatory motion is imparted by a crank axle, so that the action of a workman's hand and mallet is very exactly imitated, but with a speed and force that no workman can attain. Certain varieties of granite that has hitherto had no market value on account of their extreme hardness, the cost of dressing having exceeded the worth of the material, can be worked by the machine with facility. The ordinary process is first to subject the rough stone to the action of a row of chisels, separated by interspaces, so that the surface is grooved, and then to replace the chisels by a continuous blade, that reduces the grooved surface to one that is uniformly level. Two blocks of Portland stone were exhibited, measuring about 6 ft. in length by 21 in. in width, and 14 in. in depth. One of these blocks had been dressed by hand by a skilful workman, who completed his task in 15½ hours. The other was dressed by the machine, in the presence of visitors, in 2 hours only, and the machine-dressing was certainly superior in finish to that done by hand. The inventor considers that 1-horse power should be used for each foot in width of the surface acted upon.

With these machines, the quantity of stone dressed depends more upon the convenient arrangements for handling and turning over the stones, than upon the actual time of cutting. The forward feed over the surface of even the largest stones will be 18 to 24 in. per minute; if well quarried and scabbled, two or three cuts will finish a face of 15 to 20 superficial ft. in as many minutes. On smaller stones, of course the proportionate quantity dressed would not be so great. Beds and joints require but two cuts, if well shaped, and by using only the punches or grooving points, a regular matching or dovetailing of the courses may be obtained. A smaller machine is made to be worked by hand, in situations where power is not available, for making window caps, sills, and such small matters as are used in connexion with brickwork. This machine will take in a stone 5 ft. by 17 in.

There seems to be danger in trying to chip off too much at once, and care must be taken to keep the chisels in good order; but, with any little drawback of this sort admitted, the impression the machine gave us was very satisfactory, and we can scarcely doubt that it will come into general and advantageous use.

VERULAM AND POMPEII COMPARED.

ROMAN ENGLAND.

AMONGST the papers laid before the recent St. Alban's Congress,

Mr. J. W. Grover read one with the view of showing the similitude between Verulam and Pompeii. After introductory observations he proceeded to say,—"Verulam is variously named by the Roman writers. Tacitus, whom we follow, calls it Verulamium; Ptolemy, Urolanium and Verolanium; and Antoninus, Verolanium. It occupied an oblong area about three-quarters of a mile long by half a mile wide. Our excavations have traced the principal streets—running north-west and south-west; one of these formed part of the great military road from London to the north-west, and generally follows the present turnpike-road from Edgware, Elstree, Park-street, then Verulam, and Redbourne, Market-street, Dunstable. These streets were intersected by others running at right angles to them. One seems to have followed the hedge between the Rectory fields and Mr. Aldridge's farm; another was probably, though not certainly, on the site of the present Hemel Hempstead-road. Both these streets ran south-west and north-east. The first may be traced in the fields to the west of the city, on which side

Stukely says a gateway was formerly visible. This road, no doubt, formed the famous Camlet way; it ran in a straight line from the western gateway to the southern side of St. Michael's churchyard, and thence through Major Gape's garden, across the Fishpool, and straight for Oster hill; part of this road was visible in 1826, when it was destroyed, I believe. Now let us for one moment consider the shape of the city. It is an oval; the major axis of which is traversed by the Roman Watling-street, the minor axis by the Camlet way; the intersection of these two great streets is close to St. Michael's Church, and in nearly all the Roman Cities of Britain this seems to have been the site of the great Temple and the principal buildings. I will venture, therefore, to propound a theory which I believe is consistent with analogy—That St. Michael's Church occupies the site of the Temple, and that temple probably was dedicated to Apollo. In Bath, the city of Apollo or the Sun, we have two St. Michaels—one of which stood near the site of the famous temple. When the world became Christianized the saints received and perpetuated the attributes of the deities they superseded. St. Mary de Stall in Bath succeeded Suli Minerva. St. Sul was worshipped in Brittany in the place of Sol. The Templum Salutis in Rome became St. Vitale; the Pantheon, All Saints. Fire and light were the prevailing idea in the temple of Vesta, which is now the Madonna of the Sun. The twin brethren—Romulus and Remus—were perpetuated by Cosmo and Damien. Cases might be multiplied indefinitely; as in Bath St. Michael succeeded the worship of Apollo Baal, so I think he did in Verulam; the saint slew the dragon, as Apollo the python; the last drove the rebellious angels from heaven, the last destroyed the cyclopes. Moreover, it is curiously confirmatory of this argument to remember that both the St. Michael's monns in Cornwall and France, were said to have been consecrated by the Druids to the sacred fires of the Sun or Baal—Belien, as they are now called, and which still exist. The Romans especially adopted and engrafted their religion upon that of the nations they subdued. When they came they found this land devoted to the worship of the Sun and Moon, the Baal and Ashtaroth. So they built their temples to the Sun and the Moon,—divinities—Baal or Apollo here, Diana at Dunstable, and propitiated the Druids. Then came Constantine, and Christianity prevailed. We know that the Christians of the Roman Empire converted the temples into churches; and this fact accounts for the sites of several of our cathedrals in the very centres of the old Roman cities. Sir C. Wren supposed that St. Paul's stood on the foundations of a temple of Diana. Chichester Cathedral stands on Roman remains in the centre of that city. Stone-street points direct upon its spire for miles. The great Roman western road to Gloucester, the Ermine street, runs in a long straight line for miles upon the tower of that city's cathedral; other cases might be brought forward in support of the argument, but those I have named will suffice. In Pompeii the theatre occupied very nearly the same relative position as in Verulam; and a temple stood near it dedicated to Hercules, and occupying nearly the same situation as St. Michael's Church does to the theatre here. The principal forum in Pompeii was about 500 ft. long by 110 ft. wide; on the eastern side came the Basilica and Temple of Venus; this, no doubt, was the arrangement in Verulam, and would place the forum in Mr. Aldridge's meadow, to the south of the rectory paddock, where Stukely shows a large building. In Uriconium the same plan is followed. The western gate of Verulam, near the Hempstead-road, at the entrance of the Camlet Way, would correspond exactly with the Vesuvius gate in Pompeii, and the crater of the volcano, with regard to the shape of the city and its distance, would come at Langley Bury. In the case of the Campanian city the sea represents the fish-pool of Verulam, but it extended on another side also, viz., on that here facing St. Stephen's Church. The dimensions are most strikingly similar in both cities. The length of Pompeii is 4,300 ft.; of Verulam, 4,488 ft. The width of Pompeii is 2,400 ft.; of Verulam, 2,541 ft.; the area of the former being 167 acres, and of the latter 190 acres. But the shape is most singular, and this can be best understood by applying the plan of one to the other. It seems as if the municipal authorities of our British town had taken the Campanian city as their model. So in the streets a similar agreement seems to exist both as to position and width. In both cases they

seem to run nearly at right angles along the axes of the ellipse, and range from 24 ft. to 27 ft. in width. Verulam, however, has the advantage of the greatest regularity, being built evidently on one formal plan—as the American cities are now-a-days. The theatre of Verulam not only occupies the same relative position, but is, singularly enough, nearly the same size as that of its model, being 193 ft. 3 in. in diameter, against 195 ft. approximately in Pompeii. Mr. Wright estimates twenty rows of seats here: in the Italian example there appears to have been twenty-two rows, not including those within the proscenium of the orchestra, which in Verulam appears to be 70 ft. against 62 ft. in the other. The distance from the stage to the back is same in both cases. The stage in the Italian theatre is, however, much wider than in ours; so is the postscenium; the wall of one theatre at the side of the stage are placed at an angle, which is a difference. Both theatres appear to have been richly adorned with frescoes and marbles; at Verulam slabs of the latter material, thirteen-sixteenths of an inch thick, are found, and appear to resemble the material used for lining the fountain's basin at the famous Roman villa at Bignor, in Sussex. It is worth while remembering that at Pompeii a second and smaller theatre exists close to the large one; perhaps further explorations may show a similar one here; it should come on the northern side. The presence of this unique and interesting relic throws much light upon the manners and customs of our Romano-British ancestors. That civilisation could have been of no contemptible kind which enabled the inhabitants of this remote province to appreciate the drama of Plantus and Terrence, or the cadence of a Greek chorus. Remembering that every Roman town in Britain seems to have possessed an amphitheatre dedicated to the less humane pastimes of the gladiator, in Verulam also has a refined Greek stage been discovered. The position of the amphitheatre in Verulam has been promised us by an eminent local antiquary, so I will not speculate on its site. It stood, to judge from other cases, outside the walls, and Mr. Harris has pointed to a hollow between the town and St. Stephen's, which deserves attention. I refrain from any observations, however, pending further exploration. The streets of Verulam seem to have been composed of gravel metalling; on the top of this may be seen a quantity of oyster and mussel shells, which are always found in Roman towns; on the top comes a debris of burnt wood, the charred remains of the fallen rafters; then fallen walls and the Italian roofing tiles with the rolls. Large quantities of the fresco painting of the apartments may also be seen. The intonaco, or thin finishing coat of plaster, is very perfect; it is generally of a cream or white tone, with brown, red, and blue stripes, as in Pompeii, and sometimes painted with flowers. In the field where the theatre stands, which is still called the "black ground,"—probably from the quantity of burnt wood found there,—I am informed by the tenant, the plough frequently brings up a quantity of tesserae, showing the pavements are very near the surface. It would be trespassing beyond the province of this paper to enter into any discussion respecting the roads in the vicinity, yet I cannot help remarking upon the foss ways, one of which leads from the western gate towards Gorhambury, and another of which may now be seen in Beechbottom, which points towards Verulam, and no doubt formed part of the Camlet-way. These curious sunk roadways were one of the peculiar features of Republican Rome, and they have lately been explored by Mr. J. H. Parker, and explained by him and Dr. Fabio Gori, for the British Archaeological Society of Rome. It is singular to find similar works in Verulam, and their precise object cannot be explained satisfactorily; yet their existence here proves the connexion which existed between our ancestors and the rising capital of the world, at a much earlier period than history records. One question has, I think, been determined by our recent explorations, and that is the existence of the wall on the Fishpool side, the remains of which may be seen on the property adjoining Major Gape's house. The pool itself must have formed an extensive lake, and in Gough's Camden mention is made of subterranean arched chambers running under the water; it is also stated that Abbot Ealred found on the hanks oaken planks fastened with nails, and pitched over; also ships' tackle, fir oars, rusty anchors, and so forth; showing that the water was deep enough for

navigation of some sort; a road probably passed between it and the wall. In conclusion, I would draw attention to the fresco painting; and trust that if there is any chemist amongst our congress he will be induced to make an analysis of its composition. What medium could have been employed so durable as to withstand not only the action of the fire but also of the damp of fifteen centuries. I believe the ancients employed wax mixed with oil in a warm state. The subject is one of much interest. Finally I venture to hope that the labours of this association may lead to the full explanation of this most interesting relic of antiquity—Verulam. Mr. Grover concluded by remarking, that the fields in question certainly contained most valuable treasures, and he hoped that some day this inquiry might lead some one to continue the excavations on the spot. The more they investigated the subject the more astounded they would be to see that this country was in as high a state of civilization 1,700 years ago as it was in the time of Charles, and certainly, as far as the means of communication were concerned, infinitely better. The Romans were a thoroughly practical people, and though they did not stand upon any ceremony in taking it, it would be admitted that they had introduced into it the highest amount of science and happiness compatible with the then existing state of things.

FINSBURY PARK.

On Saturday last Sir John Thwaites, chairman of the Board of Works, attended by many members of the Board, vestrymen, and inhabitants of the district, and heralded by the band of the Stoke Newington Rifles, opened in pleasant weather the so-called Finsbury Park, for the formation of which the Board purchased 120 acres (and some more), under a statute dated so long ago as August 17th, 1857. According to the official particulars, a well-known suburban recreation ground, known as Brown's Wood, or Hornsey Wood, and Hornsey House, also formerly called Coyt Hall, was selected as the site for the Park, and the lease having all but expired, after the Board acquired the property, the cost of buying up the business was avoided by waiting a short time. The ancient designation of the estate is the Prebendal manor of Brown's Wood, in the parish of Harringay, otherwise Hornsey.

The ground has a gentle southern slope from Highgate on the west, and towards Stoke Newington on the east, and is skirted on the south by the Seven Sisters' road, and on the east by the Green-lanes. The Great Northern railway bounds it by a cutting and embankment on the western side; and latterly the London, Edgware, and Highgate railway has been made, with a station adjoining the park.

Certain public footpaths had to be preserved for the use of the adjacent lands, and the course of the New River is through the northern portion of the land. Since the park was formed, Parliament has permitted the East London Water Company to form a great reservoir, of some acres in extent, under the surface, for the storage of water on a high level; but as the ground will be trifled over and belted with shrubs the public will not be losers by the arrangement. Contracts were made in 1866 for the drainage of roads, the formation of roads, footpaths, and ornamental water, the erection of the entrance lodges and the gateways, inclosure, and palings. Last year, also, the planting of trees and shrubs was completed.

The expenditure for the park up to 30th of June last has been as follows:—

	£.	s.	d.
For Parliamentary Expenses.....	4.	7	3
Provision and Compensation.....	54,847	18	8
Professional and Office Charges, &c., during 11 years.....	11,252	0	10
Works.....	28,814	9	2
Trees, Shrubs, Planting, &c.....	2,381	8	2
Wages for Supervision of Works.....	451	12	10
Incidental Expenses.....	610	10	0
	87,275	3	3
Less moneys received on account of old materials, interest on balances, and rents ...	2,677	0	9
Total ...	84,598	2	6

The cost of the freehold land was about 4721, per acre.

The funds were raised by a loan in 1864 of 50,000*l.*, at $\frac{1}{2}$ per cent. for thirty years; with 43,000*l.* borrowed on debenture in 1868.

The necessary works have been done under the direction of the superintending architect of the Board, who has designed appropriate entrances and lodges, and has laid out the

ground picturesquely with the assistance of Mr. McKenzie. Two strips of land, one bordering the Seven Sisters' road, the other the Great Northern Railway, were purchased by the Board with a view to letting for building purposes, and so lessening the cost of the park to the public. A loud outcry, however, has been raised against this much as if the Board were endeavouring to flinch land that belonged to the public. Of course, if the rate-payers of the metropolis generally desired that the park should be made so much larger than it was at first intended, and were willing to pay for it, the Board would carry out this desire; but the wisdom of their original arrangement would not be impeached. In letting or selling the land retained for building on, and which is now bounded by the new road on the park side, sufficient margin ought to be retained to admit of planting out the enclosure wall. A very large amount of wood fencing is used in the park. We should have preferred to see something more durable. The land in this neighbourhood should now be brought under the control of the Metropolitan Building Act.

FROM PARIS.

STROLLING up to the Arc de Triomphe, at the *rend point de l'Étoile*, we examined the preparations made for the Napoleon *Mé* of the 15th of August. The nasal festoons of lambs are there, but in an increased number. In the Tuilleries garden, which is to be dressed out as in the *Mé des Souverains*, so says the programme, 13,750 luminous globes, red and white, are to be affixed to 241 posts, sustaining the bouquets and garlands, all gas-lighted, as of old. Place de la Concorde and Champs Elysées, 24,705 globes, other sundry lights, 15,000; total, 53,455.

The Arc de Triomphe of the Etoile is to be crowned by an imperial diadem, 23 ft. high, electric light, Bengal light, &c. We give a few historic details of this arch. On the 29th of July, 1836, the Arc de Triomphe, at the Barrière de l'Étoile, was formally inaugurated. The first stone was laid on the 15th of August, 1806, without any ceremony; it took, therefore, more than thirty years to build, the works having been interrupted twice, and undertaken three times, viz., under the First Empire, the Restoration, and the reign of Louis Philippe. The total cost was 385,045*l.*, and the dimensions are as follows: height, 162 ft. 7 in.; width, 147 ft.; thickness, 75 ft. 6 in. It is the largest triumphal arch in the world, and the foundations are carried down to a depth of 26 ft. below the surface. The stone employed was that of Châteaufort; it is hard, resisting, and capable of receiving a high polish as marble. The architects employed successively were MM. Chalgrin, Gonst, Huyot, De Gisors, Fontaine, Labane, Debrat, and Blomet, who terminated the work as we now see it. The crowning of the arch by an allegorical group, so as to complete it, has been proposed ever since it was begun, and recently it has been talked of, but nothing done as yet.

The project of constructing a popular theatre for grand operas and opera comique is again brought forward. It is said that the plans have been elaborated by M. Adolphe Sax, and completed by MM. Laglaise and Gate. It is to be placed in the centre of Paris, and will contain 4,000 seats, 1,000 of which are to be at 1 franc each.

The restoration and rigilding of the dome of the Invalides has been so far terminated that the tarpaulins and scaffolds set up for many months are being removed. It is the work, as we all know, of Mansard, in the seventeenth century, and has been gilt three times, the last being by the present Government, the former one by Napoleon I. in 1806, and the first gilding by Louis XIV.

A sand accident took place on the 28th ult. at Enghien, at the very gates of Paris, and which is celebrated for its sulphureous waters, its lake, and charming villas. One of the stokers attached to the service of the baths having descended into the reservoir of sulphureous waters, made a false step and fell into the pit. In trying to save him, the second engineer, another stoker, and one of the chief bathmen, met with the same fate. Thanks to the exertions of M. Allègre, and the precautions taken by him, the four mentioned are the only victims, though many persons were in great danger in trying to save the first, seven having fallen in, and only four having been safely extracted. Three others exposed their lives.

At the same hour, in the same day, four men were killed in the cellars of a large brewery at Montrouge, in the Rue de la Voie Verte. The barrels of beer are kept in cellars in the catacombs at a great depth, from which they are hoisted by a steam windlass capable of lifting only 330 lb. at a time, and reserved exclusively for hoisting the beer. Four men, down below, instead of mounting by their ladder, heedlessly risked themselves on the hoist platform, and when they came near the surface the rope broke, and they were all killed instantly.

Several old sepulchres have again turned up in the quarter of the Gobelins, while excavating the foundations of some houses in the new Boulevard Arago. They appear to be of high archæological interest; the kists being of very hard stone, and covered with roughly dressed flags of the same stone. The vault measures about 5 ft. 7 in. in height, the arch being of rough stones laid in mortar. We remarked that there was no particular system in the disposal of the coffins; some were placed end to end, and others piled one over the other; and when we saw the spot most had been removed to the catacombs; but it was plain from our examination of two, one being of very small dimensions, and containing the remains of a young child, that they were either Celtic or Gallic;—perhaps, no relics forthcoming to denote the period: as distance lends enchantment to the view, so relics disappear by diggers.

One of the most interesting works now drawing towards completion in Paris is the new Orleans Railway terminus. What strikes forcibly a professional eye is the new carriage-shed, called here the *grands halls aux wagons*; the height from the rails to the apex of the iron-ribbed roof is 197 ft., the length is 984 ft., and the span about 200 ft.; a bold piece of work, yet without of graceful lightness. The immense ribs are of pierced wrought iron, designed by and executed under the orders of M. Edmond Renaud, to whom great credit is due for his architectural skill displayed in this gigantic structure. The roofing is of glass, and the general design, on the exterior, differs widely from that of the *Nord* or the *Est* termini, inasmuch as there is no attempt at monumental display; but, once inside, we observe a wonderful combination of great accommodation with good taste and comfort. In many of the continental railway stations the waiting-rooms are wretched affairs, in which absence of comfort seems to be the principal object. In the case, however, of the new Paris Orleans station, we find a comfort that we have vainly sought for elsewhere. This extends to the carriages. The State carriages for the Emperor and suite, built by this company, are very sumptuous, and they are the only ones able to pass through the "templates" or *gabaris* of all the lines. When he paid a visit lately to Chartres, by the Orest line, these State carriages were hauled by the circular railway to the St. Lazare station.

A VISIT TO PORTLAND ISLAND.

Nor many days since, in the pursuit of knowledge under difficulties, we shaped our course due south, booking from Paddington station for the pleasant watering-place of Weymouth, en route for Portland Island. We held a Government order for admission to visit the Convict Prison in our pocket; and, although still in a state of single blessedness, we insured our life against railway accident to the extent of the modest sum of 500*l.* Our return-ticket was a special one, and it extended for a couple of clear days. After starting on our journey, we proceeded at a moderately brisk pace, without encountering any delay or obstacle on our way, through Berks, Wilts, Somerset, and Dorsetshire. The early rye and oats were yielding to the reaper's sickle, and the sparrows and the rooks were enjoying a rich Sabbath plunder while man rested. The train whirled on through many a deep cutting, round many a war-shattered outcroachment, over many an historic stream, and hid in its thick volume of smoke not a few antique tenements by matted wood and straggling hamlet. A look upon an open country is pleasant, even through the medium of a railway-carriage window; but the sight of passing villages is flashed upon the eye too abruptly to make a very lasting impression. Yet one can see much, and enjoy much, even by rail in a journey of 150 miles. We reached Weymouth after a run of between seven and eight hours; but it was night, and our walk upon the

Esplanade was by moonlight. Resting for the night at one of the hotels convenient to the beach, we arose early in the morning for a look over the town before proceeding onward to Portland Island. Later in the day we proceeded by train to Portland. Leaving the station, we proceeded by a circuitous sweep, passing on our right a steep and curious ridge of shingle of all sizes and colours, known as Chesil Bank. In appearance and formation it is unlike anything else that you will meet with in any other part of Great Britain. It stretches for several miles from the island of Portland to Bridport, but it is separated from the mainland at Weymouth, and on as far as Abbotshay, by an estuary or inlet called the Fleet. Between Portland and Weymouth the stones are of a larger size than those forming the bank as you recede along the coast. This accumulation of pebbles has little variety in size in the vicinity of Weymouth and Portland, and falls little short of 200 yards in width. It is utterly and completely sterile; nor could we discover thereon, except at a few points, the least sign even of marine vegetation. The cottages that flank this dreary stretch of natural breakwater for miles are constituted of ragged stone. No green grass-plats—no sweet or blooming hedge-rows—no flowers “born to bluish unseen”—nothing but sand, sea, and shingle, squalid dwellings, and stricken human nature. Yet there is something to be seen and heard here and about that will interest the visitor; for his intellect is not of the idiotic Dunderdrey type. The Chesil bank is undoubtedly formed by the action of the waves, in conjunction with the south-western gales which sweep up the pebbly shingle from its ocean bed. The isle of Portland, as it has been remarked by others, contributes to this accumulation of pebbles, acting as a caterer or a collector of it, by the obstruction it offers to their farther drifting. Thousands of pounds have already been expended since 1849, by the aid of free and convict labour, to construct the Portland breakwater, a work certainly of considerable labour; but here, on the coast of Dorset, nature outpaces man in the formation of a natural breakwater, at once a miracle and a curiosity.

Many shipwrecks, in past and recent times, have occurred along the historic Chesil bank. From the fact of these disasters there is a particular part along this pebbly ridge, known by the ominous name of Deadman's Bay. Dead men, they say, tell no tales, but the *debris* of the well-attested wrecks in the vicinity of Deadman's Bay tells alarming tales indeed. Leaving the railway station at Portland behind, we proceed up the zig-zag road, and through a tolerably respectable village or town. On the brow of the island rock a new church, of the Methodist connection, is being erected. Hotel accommodation and every other usual or creature comforts required for summer visits, are to be had on Portland rock for the legal tender. Portland proper, that is, the island rock, is nearly 4 miles long, by 1½ mile in breadth. At its highest point it is not much under 500 ft. above the level of the sea. The shape or configuration of the island can be distinctly seen by looking at the map. It is tongue-shaped, and probably for that reason its extreme point gets the name of Portland Bill, or “The Bill of Portland.” The circumference of the island is computed at about 9 miles. The west cliffs are very high, the fall considerably lower, perhaps under 20 ft. at some point on the south side of the island. Very little vegetation is observable upon the island. No green meadow, no golden corn, no smelling garden, no silvery stream; the hinc vault of heaven is above you, and black, barren, and ragged rock below. The carol of the lark, the chirp of the wren, the sound of the corn crane, or the voice of the cuckoo, each and all are unknown. Besides a human shout is heard, and a detonating report rumbles through the welkin; but nature affords no music. We are approaching now the vicinity of the Portland Quarries. There is quite a legion of them, and they are all distinguished by different names. In the vicinity of the convict prison the Government quarries are worked by convicts, who mostly procure the stone by a system of splitting. A thin channel has been cut along the edge of the rock first to a certain depth, and then an uniform tapping has been resorted to, assisted by the driving in of thin wedges. The quarries of the private proprietors are worked energetically. They are leased by the Crown, who takes 1s. royalty on every ton exported. The wages paid to the quarrymen is very low indeed. Considering

their heavy and wasting toil, and their summer and winter exposure to the atmosphere, it is to be deplored that the wages of these men do not average, the year round, more than 12s. per week. It will be recollected, however, that the Dorsetshire agricultural labourers are the worst paid in England. The ordinary system of blasting and quarrying is so well known to the majority of readers, that it is hardly necessary to describe it. After the vertical hole is drilled in the rock, and the gunpowder introduced and rammed tightly, a train is connected with the outside. When the explosion takes place, the rock is rent into several perpendicular fissures and blocks, from 20 to 50 tons in weight are detached. These are soon removed by the aid of winches, screw jacks, and other appliances, to their required position, where they are shaped, measured, weighed, and marked, and finally carried down to the wharf on iron cars for shipping.

There has been some considerable talk lately about the exhaustion of our coal fields: the question might be put also with a like anxiety concerning the exhaustion of Portland stone. However, we will quiet the fear of our gentleman amateurs and practical builders, by informing them that there is as much stone in Portland as will furnish all the requirements of the world for the next 1,500 years, and perhaps more. One acre, we understand, is annually removed. Portland stone has been used as far back as the twelfth century in some of our abbeys. But it was only in the reign of Charles II. that the quarries on Portland Island began to be worked with any activity. It was Charles who instituted the humane provision of enacting that half of the royalty exacted from the quarry proprietors should be put by as a trust fund for the benefit of the islanders. The provision, it is said, was intended by the king as a compensation to the islanders for the loss of their island pastures. If fruitful pastures ever existed on Portland rock they are no longer visible. Portland stone is much used at the present hour, and it is well adapted to building purposes from the facility with which it can be worked. But there is a very inferior description of it which often goes into the market.

Sir Christopher Wren gave the use of Portland stone a great impulse in London by using it in the erection of St. Paul's. The most of the Queen Anne churches in the City are of this material. Several recent public institutions in the metropolis are also built with Portland stone. In Dublin, Glasgow, Edinburgh, and several large towns through the three kingdoms, Portland stone has been used extensively.

The convict prison of Portland Island, which is rendered somewhat historic of late from the fact of the detention of many of the Fenian convicts there for the last three years, was erected in 1843.

It is capable of accommodating upwards of 1,500 convicts. The Fenian convicts at present confined in Portland are employed in working in the quarries. They work together, and not in conjunction with the ordinary convicts. Among their number at present are two editors of Irish newspapers, a couple of American officers who served in the late American war, some clerks, and several skilled mechanics. A short time since some of the Fenian prisoners confined here were amnestied unconditionally. The political convicts have to work the same and to go through the like discipline as the ordinary ones. Governor Clifton is rigid in carrying out the discipline laid down for observance in the prison.

On the score of health, the convicts could not have a better place. Infringement of the rules, or a refusal to obey a warder, is at once reported, and the offending convict—political or otherwise—is brought before the Governor, who, on hearing the charge, orders him confinement to his cell for a certain number of hours, and a reduction of his diet: probably bread and water for forty-eight hours.

We passed through several gangs of ordinary convicts during our visit to Portland Prison, and we certainly witnessed types of human nature, to whom Lavater would refuse a certificate of character if he took the face as an index of the mind.

The convict system, however, seems to have a brutalizing effect. We have seen Russian counts, some of them noblemen who but five short years ago were honoured with the friendship of the noble and the grand; youths who were made members of West-end clubs, and who, in their wild career of fast life, were tempted to do wrong, and fell. We have seen ex-bankers and members of Par-

liament in their convict garb, who have, since they entered Portland prison, “ceased to do evil and learned to do well.” We have seen many whose social life was once above reproach, and we shudder to think how fallen humanity grows debased in contact with criminal intercourse, and the penalties they have to bear for outraging society. We are not, however, going to write a history of the convict system. We merely look at it as we find it—think a little more than we write, and musically pass on.

Comprised within Portland Prison are a chapel, a hospital, a soldiers' barracks, and a number of warders' houses. Gas is manufactured within the prison. The prison is ruled over by a governor, a deputy governor, and, in addition to those, are a chaplain, schoolmaster, and a host of warders. The yearly cost of a convict is put down at 33l. 10s.

The Portland breakwater was constructed by convict labour. It was laid by a man-of-war in the bay was here a an import spectators

EXCURS

The se in last y Club. A among th Mr. Gra Fowler, explained visitors crops, first acres (whic sewage farm ported on w. Lodge Farm, manager, the Ho. full information in first field contained wurzel and beans, and latter growing on land of potatoes had already h sugar-beet, which from year by Professor Voelck ent. of sugar in the sewe pected to be one of the i under sewage. There were onions, carrots, parsnips, and luxurious crops; also straw wheat growing the third year the same land; oats which the would produce 10 quarters to on a poor gravel; and Italian had already been cut six times ducing on an average 10 tons p crop, or 60 tons in all; the whole being produced by the applicati manure, London sewage. The n was a walk down the line of the co posed culvert, about a mile of wh constructed, to the outfall of the m works. The day was wound up by a dinner at the Ship, Greenwich.

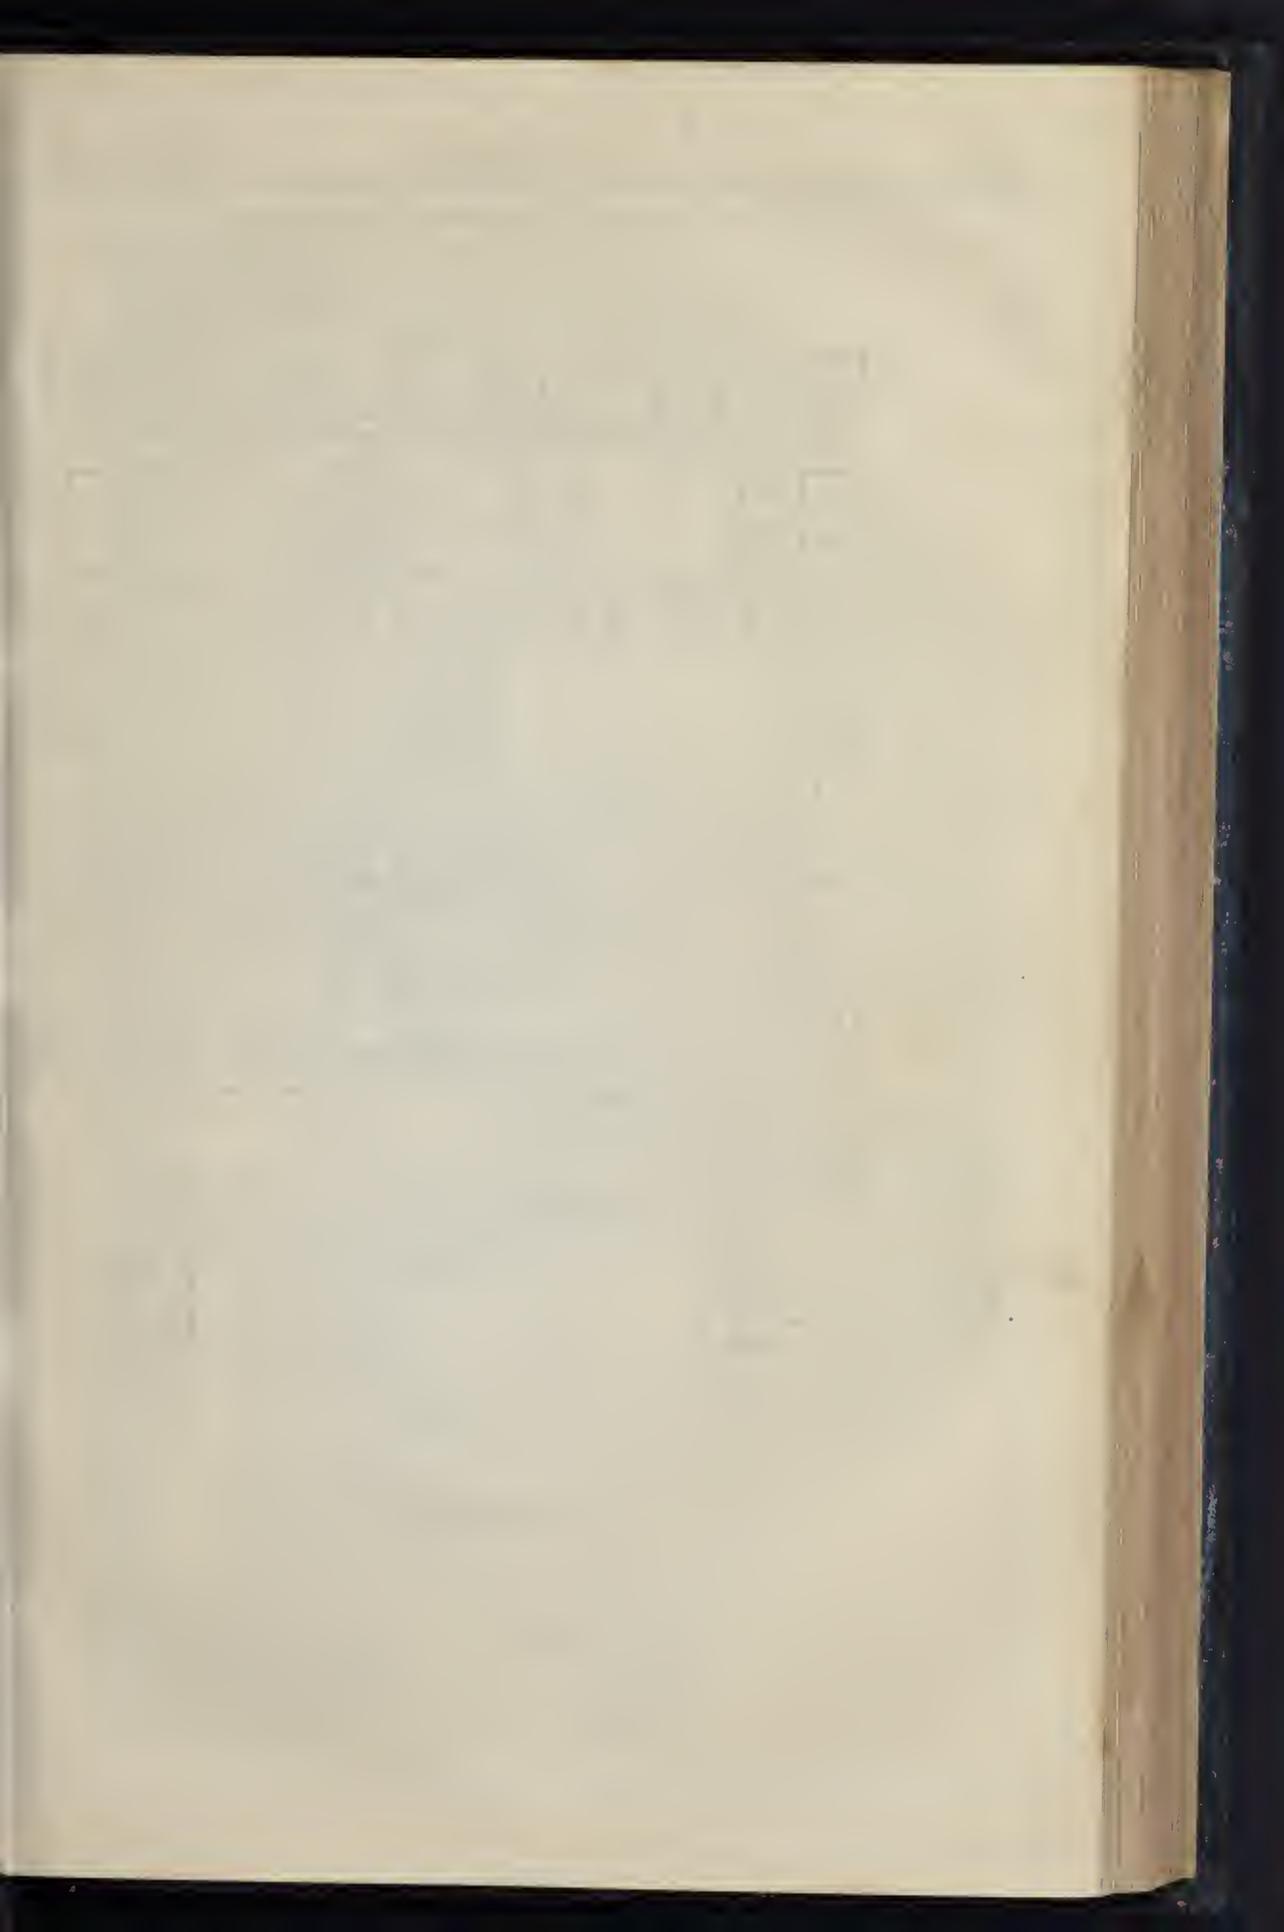

ART-UNION OF LONDON.

EXHIBITION OF PRIZES.

We can cordially endorse the opinion of the *Times*, “that the present exhibition of works selected by the prizeholders of this Association shows a decided improvement on the average of the last few years.” There has been, in fact, a gradual advance in the character of the pictures chosen, in spite of the increasing difficulty of finding meritorious works of moderate price unsold, which proves that the Art-Union is accomplishing the chief object of its existence; that, in fact, which especially constitutes its *raison d'être*—the improvement of the public taste in matters of fine art; and though it has been objected that this argument loses much of its force because the same persons are not likely to have the opportunity of outliving their knowledge of art by making selections as prizeholders year after year; yet it must be remembered that the same persons do visit, as members of the body, the exhibition of prizes—in very many cases the only collection of pictures they have an opportunity of inspecting—year after year, and by comparing, and, as far as they are

HOUSES OF PARLIAMENT AND GOVERNMENT OFFICES, SYDNEY, NEW SOUTH WALES.—MR. W. HENRY LYNN, ARCHITECT.

ACTION FOR ALLEGED NEGLECT AGAINST AN ARCHITECT.

In the Cork Record Court, before Mr. Justice Fitzgerald and a special jury, the case of Stoker v. Hill was tried on 26th July. The action was for negligence, and the damages were laid at 1,500l. The plaintiffs were Messrs. Stoker, provision merchants, and the defendant Mr. Henry Hill, architect. The case, as stated for the plaintiffs, was that in 1868 plaintiffs, having taken the premises formerly occupied by Mr. M'Sweeney, resolved to have them rebuilt, and engaged Mr. Hill to prepare plans and specifications. The tender of Mr. D. Barrett, for 800l., was accepted. One of the plaintiffs had an interview with Mr. Hill, and said to him, "Now, as the contract is arranged to be given to Barrett, is it not better for me to go to some attorney to draw up a letter of agreement?" and Mr. Hill replied that there was no necessity, and that he would do it for him. "Then," said Mr. Stoker, "mind that you bind him to give sufficient security for the due performance of the work." Mr. Hill prepared an agreement, which he got signed by Mr. Barrett, and which he accepted on behalf of the Messrs. Stoker. One of the adjoining tenants saw that the party wall was bulged in, and consulted an architect of experience, who pronounced it to be in the very worst possible state. Messrs. Stoker's attention was called to the state of the wall. Mr. Barrett saw it, and pronounced it bad. Mr. Hill said to Barrett, "Go on with the work, and I will bear all the consequences."

Evidence was led to establish the view of the case; and for the defendant it was denied that Mr. Hill was guilty of gross neglect, or any neglect at all. To relieve Mr. Stoker, and to relieve Mr. Barrett, Mr. Hill offered to contribute 50l. towards the rebuilding of the premises. He, on the part of Mr. Hill, repudiated all liability. What induced Mr. Hill to offer the 50l. was this: his medical adviser told him that he had a tendency to heart disease, and that he in consequence should avoid excitement and annoyance of all kinds. Sooner than run the risk of any trial (though he knew he would succeed if the case came to trial)—sooner than expose himself to any annoyance, he willingly offered to contribute his profits on the building towards repairing the damage that had been done. As to the conversation about the agreement relative to the builder's securities, Mr. Hill's recollection was exactly at right angles with the Stokers. Mr. Hill said that he could not draw a special contract; that if they wanted such a thing, they should go to an attorney. Mr. Hill drew up this agreement, and forwarded it to the Messrs. Stoker and Barrett. Now, the Stokers allege that they never read the agreement until the action was commenced, although they swore that they told Mr. Hill to get securities from Barrett. Mr. Hill gave instructions with the view of having the defects in the wall remedied, but the same night the storm commenced, and the All-ruining power frustrated Mr. Hill's good intentions by tumbling down the whole thing. Surely Mr. Hill was not responsible for that? Up to that time there was there any neglect on the part of Mr. Hill? He erected the structure on what he, a man of experience, considered quite a sufficiently good wall. The only question that the jury was—Did Mr. Hill exercise sound judgment or not? Did he exercise *bona fide* judgment in giving his opinion for the retaining of the old wall? Now, Mr. Hill was paid by the outlay on the building, and if he wanted to put money into his pocket, he would be in favour of having all the walls pulled down, because the more extensive the work was, the more money would Mr. Hill get.

Mr. Barrett, the contractor, a witness for the plaintiff, in his cross-examination admitted that Mr. Hill's plans and specifications were properly prepared; they could not be better prepared; Mr. Hill did everything he could in the way of work and direction during the progress of the works; the proper time to fix up an old wall is when there is a roof on the premises to protect it and the wall from bad weather; it would be better, however, to do it in the first instance when it is feasible.

John Delaney, another witness for the plaintiff, said he was engaged in the building of these premises as mason; saw the bulge at the commencement of the work; the mason work was efficiently done; the storm that blew the house down was nearly as great as the celebrated "roarer" of 1839, which left almost all work in ruins; the mode by which Mr. Hill pro-

posed to remedy the defects in the wall was the proper one.

For the defendant, Mr. Robert Walker, architect, and Mr. Osborne Edwards, civil engineer, were called. Mr. Walker said the plans and specifications were properly drawn; when the roof was covered in was a proper time for the defect to be remedied; he had examined the premises, and apprehended no immediate danger from the condition of the wall. Mr. Edwards said the plans were carefully prepared and the agreement in the usual form; the building could not resist the gale in its temporary position; the new front wall seemed to have gone down first and pulled the side walls with it.

The jury returned a verdict for the defendant on all the counts.

SAUCE FOR GOOSE NOT SAUCE FOR GANDER.

A WELL-KNOWN builder writes to us as follows:—

I observe by the published reports that in the plan submitted by the City architect on behalf of the Markets Improvement Committee of the City Corporation for utilising the site of old Newgate Market, it is proposed to form streets on the site of the market by the erection of four blocks of building, divided by cross streets, one of 20 ft. and the other of 30 ft. in width, and surrounded by a narrow passage; and that the Building Act Committee of the Metropolitan Board of Works, considering that by the plan proposed an improvement will be effected, having recommended that the plan be approved, the Board, under the circumstances, set aside their standing orders as to the width of new streets being of 40 ft., and sanctioned the plan.

Now, sir, either it is necessary that streets should be 40 ft. wide, or it is not. If it be necessary the Corporation ought not to be allowed to supersede the rule; and if it be not, other persons who have less influence ought not to be compelled, sometimes at great sacrifice, to adhere to it. I applied to the Board some time ago for leave to make a good street 30 ft. wide in lieu of some of very bad property (by which an improvement would certainly have been effected), and I was unconditionally refused. On reflection I came to the conclusion that the Board had no alternative, had adhered to their bye-law, and were not to be blamed for so doing. If the report I have quoted as to the streets on the site of Newgate Market be correct, I shall not be able to resist the impression that I and others have been unfairly dealt with.

TREES ON THE THAMES EMBANKMENT.

WAITING for the completion of the Metropolitan District Railway, the opening of this causeway has been deferred, and the whole extent of reclaimed land has been kept in desolate waste for three years. The works are now, however, progressing, and will be carried out with that rapidity which characterises the Metropolitan Railway engineers.

The steam-boat piers are for the most part complete, and exhibit an advance upon the old floating barge principle; there remain, however, on the wide reclaimed spaces, piles of waste lumber, sand, and other "décombres," which ought to be removed, as advised early last year in the *Builder*, in order to make way for plantation, also on the off side of the causeway.

A range of Oriental planes has been planted along the wide footway, at 30 ft. intervals; but they are flagged over, having an open space of only 3 ft. square to admit water and atmospheric influences; therefore it is only by the water jet that vegetation is kept up, and the trees, although well chosen, are barely struggling for life. These ought to have been set outside the paved range, or should have been alternated at intervals of 40 ft., by a second range of, say a different species; keeping the distance of only 10 ft. between each row. Now, as this causeway will be, when complete, the principal walking route between west and east, it is of importance that it be made as ornamental as possible; and as there is ample space throughout the whole length from Westminster Bridge to Blackfriars, there surely ought to be a double line of planes planted along the north side; if alternated at the distances recommended, there would be sufficient room for a footway on that side also, with space for the natural growth and expansion of the foresters (for which the site, save the flagway, is particu-

larly favourable), and the shade in our summer season, whilst the trees are in leaf, would be a real elixir to the professional and saunterers, who will regard it as "*un chemin du luxe*."

The expense of iron gratings for each tree is wholly unnecessary, for they might be planted outside the pavement, and the external footway gravelled, so as to give the election of a softer and cooler walk; besides that, the double range must give a better aspect, whether viewed from the river or any other position; and in case this plan is adopted, the treble range of trees will impart to it a woodland effect quite unrivalled. Whatever buildings may be erected along the reaches between Hungerford and Waterloo, and thence to the Temple, the trees will confer dignity and grace upon them; and the new soil, if duly prepared, must promote their rapid growth under riverine influences.

The hints given before in the *Builder* were quite in time for spring plantation, one full year before it was effected. The present suggestion is offered in order to secure, if possible, the autumnal preparation of the ground, which now lies in repliable waste, although the demarcation and allineation of an outer boundary need in nowise interfere with the advance of works in progress.

T. H. H.

EPHING FOREST.

SIR,—The discouraging reply given by the Chancellor of the Exchequer last Monday to the deputation introduced by Mr. Samuda, M.P., is a sad damper to the hopes which the First Commissioner of Works had previously held out on a similar occasion. It is the more provoking, too, as Mr. Lowe did not have his denial of Government aid on the ground of expense, but of liberal principles. Now, sir, it is obvious from the tone of general remark on the subject of inclosure, that the historical and legal knowledge that may be made to hear upon them is very much locked up from ordinary readers.

But in connection with building operations, we are accustomed to scan with interested eyes—nay, almost to think light reading—a class of documents in the shape of specifications and bills of quantities, which not merely to novel readers, but to many more solid students, must seem more utterly dry as dust than any possible studies of old laws, charters, and usages. I suggest, then, if the *Builder* would be kind enough to point out the passages, whether in Blackstone, Coke-upon-Littleton, or in still less known books that bear upon so interesting a subject as Epping Forest, there would be abundant ability in your readers to understand them. In such a case I indulge a hope that it is quite possible that as strong a case may be made out for Mr. Layard's view of the subject as for Mr. Lowe's.

Mr. Lowe said, "Ceasing the reason of the law, the law itself ought to cease." Might not a special pleader answer, "Well and good. Lords of manors were officers who led out to fight for their king and country those bands of commoners who vegetated on the wastes of the manore. If the commons are enclosed, and the commoners are all gone to Australia, or to be pent up in stifling town lodgings, is not 'Othello's occupation gone,' as regards the lord of the manor? Ought not his demesne lands to be put up for sale, or taken possession of for a national park?" Ceasing the use of a lord of the manor, the lord of the manor ought to cease.

G. M.

EXCURSIONS OF ARCHITECTURAL AND ARCHEOLOGICAL SOCIETIES.

Northumberland and Durham Archeological and Architectural Society.—One of the most successful meetings which has yet been held in connexion with this society has just taken place. On this the third excursion of the year, the historic district which includes Holy Island, Norham Castle and Church, Ford Castle and Church, and Etal Castle, was selected for a two days' excursion. Through the liberality of the North-Eastern Railway Company members were granted return tickets at a single fare. The spot fixed for the assembling of members was Beal Station, near Belford. The members were taken in carriages to Holy Island, which was reached at one o'clock. Unfortunately the weather, which up to noon had been brilliant, changed, and by the time the village of Holy Island had been reached the rain fell in showers, and so continued during the afternoon. The members, however, proceeded to the site of the

monastery. In the old parish church adjoining, the president, the Rev. W. Greenwell, of Darham, delivered an interesting address. The Rev. J. F. Hodgson, at the president's request, then commenced an examination of the chief architectural features in the old parish church, describing the different parts as his eye rested upon them. The Rev. J. L. Low delivered a brief address in the ruins "On the Life of St. Guthbert," and the Rev. Mr. Hodgson gave a succinct sketch of the ruins. The time being limited for the visit to the island, the members then returned to Beal Station, and proceeded thence to Berwick, which they reached about five o'clock. At this place the members and their friends dined at the King's Head Hotel, at the conclusion of which a meeting of the society was held, the chair being occupied by the president. During the evening the members proceeded to examine the various objects of note in connexion with this ancient historic town. The parish church, built during the Commonwealth, was minutely examined. The walls of the town next came under notice, the inner series of which date from about the time of Elizabeth. The second day's excursion of the society was to Norham Castle and other places fixed in the programme.

Kent Archaeological Society.—The annual gathering of this flourishing society was held at Town Malling, one of the most picturesque and historically interesting villages in the county. Every facility was afforded by the society and the railway company for reaching the spot, and the Assembly-room was crowded by a large company from all parts of the county. In the absence of the president (Lord Amberst) Sir Walter Stirling was unanimously voted to the chair, and the secretary (Mr. T. Godfrey Fansett) read the report. Mr. Geo. Gilbert Scott was then proposed and elected as an hon. member, and about thirty other gentlemen were unanimously elected as members. The company afterwards proceeded to view the various objects of antiquarian interest to be found in the neighbourhood, including West Malling Abbey, the church, St. Leonard's Tower, Leybourne Castle, and the church. At four o'clock about 200 ladies and gentlemen sat down to dinner in a spacious tent, erected in the grounds of Malling House, lent for the occasion by the Hon. Ralph Nevill. Sir Walter Stirling presided. The company afterwards adjourned to the Assembly-rooms, to examine the various objects of interest there collected, and to listen to various papers.

ARCHITECTS' COMMISSION.

At a recent meeting of the Guardians of the Preston Union a matter of very grave importance connected with architects' charges and claims was introduced, and led to a long discussion. It appeared that according to an agreement made in February, 1866, with the Guardians of that Union, when Mr. Leigh Hall, of Bolton, was appointed architect for the erection of the Preston Union Workhouse at Fulwood, that gentleman was to receive 2½ per cent. on the buildings, and 1½ per cent. additional for taking out the quantities for the contractors, and that these percentages should cover all his charges and claims of every description. It very recently transpired, however, that a few months after the commencement of the building Mr. Hall made a certain demand on the contractor, Mr. Saul, for what may be called "consideration" money. He alleged verbally to Mr. Saul that as his contract with the Guardians did not sufficiently pay him for his labour, and as he could not obtain an increase from them by legitimate means, he must endeavour to make up his commission in some other way, and hence his demand upon the contractor. Various sums—first, 100*l.*, and afterwards three 50*l.*s.—have been paid to the architect by Mr. Saul, and this having come to the knowledge of the guardians, has led them to suspend further progress at the new workhouse in order to afford time to all parties to come to a settlement on the points in dispute. It may be stated that while the architect sets forth in a communication to the Guardians that not very much in excess of 1,500*l.* is owing to the contractor, the contractor himself says that there is a balance due to him of upwards of 4,000*l.* What makes the matter of more importance at the present time is the fact that Mr. Leigh Hall is the architect for several workhouses in Lancashire, contemplated or in course of erection, and the Guardians of the Preston Union, at their meeting recently, were on that account much more guarded in their expressions than perhaps, under other cir-

cumstances, they would have been. The agreement, which was read and commented upon at length, clearly states that the 3½ per cent. above specified was to include all charges of every description, and under all conditions. It may be observed that the new workhouse at Fulwood has been constructed at a cost of about 50,000*l.*, upon which sum Mr. Hall has already received upwards of 1,000*l.* as commission, exclusive of the 250*l.* he has received from Mr. Saul.

Thus far we have been quoting the *Times*. To show the opinion of the profession on such a charge as is here made against Mr. L. Hall, it will be sufficient to say that "the receipt or acceptance of any pecuniary consideration or emolument from any builder, or other tradesman, whose works he may have been engaged to superintend," subjects a member of the Royal Institute of British Architects to immediate expulsion from the body. Guardians and others who by competition seek to obtain the services of an architect for less than the recognized rate of payment may take a lesson from the above statement.

THE TRADES MOVEMENT.

Mr. R. HARNOTT, general secretary of the Operative Masons' Association, has issued his fortnightly return, which states:—

"More than three months have now passed away since the majority of the notices expired, and of the 25 or 29 towns threatened with the hour system by the Master Builders' Association, in 7 only is the contest still proceeding. At present there are on strike at Birmingham 11, and at Manchester 165, or a total of 176; while on lock-out there are—at Coventry 5, Old Swan 8, Liverpool 116, Lynn 2, and Wolverhampton 2, or a total of 137. Thus the aggregate number on strike and lock-out is 313, or a reduction of 575 since May 27th, the date upon which the greatest number of members was upon the funds. So far the struggle has been decidedly in favour of the operatives."

—Six thousand working masons have just struck at Berlin for higher wages.—The masons' strike, which has lasted seventeen weeks, makes no approach to a settlement, and, like that at Birmingham, seems to be dying out. According to the *Manchester Guardian*, there are now close upon 500 non-union masons at work in Manchester; and, although at least 300 more are required, any chance of the masters giving way is not entertained. They seem as firm and determined as on the first day of the strike. There is evidence that a goodly number of men are at work. Many of the buildings that have been standing are now progressing: in fact, we are informed that no building is entirely at a standstill, and the whole of the good work in the town is in the hands of the associated employers. So far as the bricklayers are concerned, the strike, though not settled, is virtually over. There are plenty of bricklayers to be had who are willing to work for 8*d.* an hour, and they have established a new society in Manchester, based on the rules which have for some time existed in London, and to which the Manchester employers do not object.

OUR RUNNING BROOKS.

WHOLESALE poisoning! How long shall this be easily possible with the utmost impunity? How long shall such outrages on society be actual all over the land, and yet so entirely unavenged? When shall it at length be made a felony to spoil and pollute the purest gift of nature, and to pervert her simple and most needful blessing into something little better than a curse?

Our kindly and pious, but uneducated ancestors loved a welling springhead, and usually consecrated that spontaneous mercy of our hounteous mother earth to the honour of some one of her sainted children; they were wont to build an arch over the fountain, and sacredly preserved the runnel from all manner of pollution. Earth received into her purifying bosom whatever would taint or could offend, and the clear brook was let to dance and sing through the country,—ay, and through the town,—ministering life and health in its happy course, and no one daring to desecrate that blessing by deliberately making it the vehicle of all manner of abominations. But we, their irreligious though enlightened children, in these days of hypercivilization, think and act quite differently. A running stream with us is mainly looked upon as a convenient drain to every sort of nuisance; no one cares for his neighbour's weal, so he can but win some small convenience for himself;

and so it comes to pass that from their very sources our running streams are allowed to be common sewers, as well as the only public aqueducts any neighbourhood possesses. Why, then, should not some wise law now at last be soon enacted, making it highly penal to pollute running streams? Why should the water we drink, and the stream we bathe in, be redolent of horrible infections through the selfishness and folly of society in general, and no paternal government despotically order in to stay this plague by a wholesome step in Council.* It is an unsavoury subject altogether that sewage question; but the way in which it is practically mixed up with our water supply obliges us to urge that no time should be lost in correcting the frightful state of most of our little streams—nay, of our big rivers—both in towns and villages. Let nothing but the surface rainfall be suffered to drain into a stream; let the thousands of cleaves that now fringe every brook be denounced as illegalities, and swiftly be swept from their water-sides through the energy of covetous informers; let every poison-bearing sink and drain be sealed from the channel wherefrom neighbours lower down must drink; let heavy fines be inflicted after some set day on those who make no land-pits for their nuisances; and let us all exercise common sense, common charity, and common decency in the matter of a general crusade over the land for the preservation of our running streams from every kind of infection and pollution.

MARTIN P. TUPPER.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

On Wednesday, the 4th of August, the members of the Birmingham Architectural Society made their annual excursion to Banbury, and from thence visited Bronghton Castle, Compton Wynyates, and Wroxton Priory, which, by the special permission of the respective owners, Lord Saye and Sele, the Marquis of Northampton, and Colonel North, M.P., were thrown open for their inspection. These noble mansions, together with the churches in the neighbourhood, are well worthy of the study of the architect and the archaeologist; and from their excellent state of preservation were examined with great interest. The party dined at Banbury in the evening, and returned to Birmingham after a most enjoyable excursion.

PRIVATE BILL LEGISLATION OF THE LAST SESSION.

SOME of the bills that have become Acts during the last session are worthy of comment. That may be given to them in a future number, but meantime a brief *resumé* of the business of the session may be acceptable to our readers.

For several years past, since the last of the series of outpourings of speculative fever in 1866, the number of private bills petitioned for has become small by degrees and gradually less. In 1866, not to detail the facts as touching intervening years, there were 633 bills petitioned for, of which 337 became Acts; for the session of 1868-9, just closed, there were 217 private bills petitioned for, of which 160 have received the Royal assent, including about a dozen on Monday last. Scarcely any of the private bills passed in the last session are of much general interest, and few of them involve much expenditure in new works. They may be classified, according to the classification directed by Parliament itself, as follows:—

Railway Bills	58
Tramway Bills	3
Roads Bill	1
Bridges Bills	4
Waterworks Bills	22
Ports, Harbours, and Docks Bills	11
Canals and Inland Navigation Bill	1
Churches and Chapels Bill	1
Cemeteries Bill	1
Faving, Lighting, and Town Improvements Bills	26
Markets Bills	2
Estates Bills	1
Naturalization, Royal Bills	1
Miscellaneous Bills	20
Total	169

The twenty miscellaneous Bills include such as the Brighton Aquarium and Improvements, the Great Tower-hill, the Imperial Fire Insurance, and others that would require enumeration to give any idea of their character.

* The law is already sufficiently strong to prevent this, if rightly put in motion.—Ed.

THE LATE M. BERBRUGGER.

LOUIS ADRIEN BERBRUGGER, an eminent archaeologist and philologist, conservator of the Library and Museum of Algiers, and inspector of ancient monuments of Algeria, corresponding member of the Institute of France, and Commander of the Legion d'Honneur, died at Algiers, on Friday, the 2nd of July, in the sixtieth year of his age, and after a sojourn of thirty-four years in North Africa. The whole population of Algiers, headed by Marshal McMahon, the Sub-governor-general Darrien, and the civil and military authorities, the staff of the militia, the corps of sappers, and the battalion of French tirailleurs, accompanied his remains to the grave, in testimony of his virtuous private life, and of the great literary services he had rendered.

Mr. Cherbonneau, the epigraphic archaeologist, and director of the Imperial Arabic College of Algiers, pronounced an eloquent discourse suited to the occasion.

GLASS IN BLANK WINDOWS.

Sir,—Permit me to thank your correspondent "Pro" for his suggestion in your issue of 24th of April last. Adhering strictly to his instructions, I put in a dozen squares, one only of which is broken. I have since inserted a number of squares in oak frames, the frames being related, and sunk flush in the mullions, and the glass stopped in with putty in the usual way; these are all sound. There is, however, an objection to this method,—the stopping will require occasional painting in order to preserve the wood; and it does not present so neat an appearance as where the glass is let into the stone. W. B.

ACT TO AMEND THE METROPOLITAN BUILDING ACT, 1855.

THE "Metropolitan Building Act, 1859," which has just now received the royal assent (62 and 63 Vict., c. 52), is simply for the transfer of the powers over dangerous structures from the police to the Metropolitan Board of Works, who will, after the 1st of October next, have the appointment of persons and making of regulations for carrying into execution that part of the Act which relates to such structures.

ROCHESTER CORN EXCHANGE COMPETITION.

We learn from the local papers that the committee have decided in favour of the design marked "Perseverando," by Messrs. Flockton & Abbott, of Sheffield. The plans "Che sara sara" are considered to be entitled to the second place; and the architect who sent them in, Mr. H. H. Collins, will receive the premium of forty guineas. The other competitors who will receive for their plans twenty guineas each are Messrs. J. Young (architect of Chatham Cemetery), A. Baker, F. W. Porter, and J. Taylor, jun.

TECHNICAL EDUCATION IN THE BUILDING TRADES OF LONDON.

Sir,—Are the employers expected to provide for the education of their workmen? This would indeed be a work of supererogation. A journeyman when engaged is supposed to be already perfect in his trade, or at least to be able to take up and finish his work in a skilful and workmanlike manner. If he cannot do this, he is below his profession, and ought to serve another apprenticeship. But how is it that there are so many dullards? I think that carelessness on the part of the workman has a great deal to do with it, and that carelessness is in a great measure produced by the absurd trade society rules by which they are governed. I mean those establishing an inequality of wage and an lishing of piecework. There is no incentive for a man to improve, except to be chagrined by seeing the vessel which carries the same wage as himself, and that with as much cheek and impudence as himself. It is to be expected, therefore, that the sooner this state of things is remedied the better; and we can only expect it as the result of a more general and more judicious system of technical education, so as to counterbalance that at present overwhelming majority, whose interest it is to uphold such unjust and overbearing laws.

But are we to expect the masters to do this for us? I think that as British workmen we have the means within our own reach, and as it were to advance we have every facility by seeing the vessel which carries the same wage as himself, and that with as much cheek and impudence as himself. It is to be expected, therefore, that the sooner this state of things is remedied the better; and we can only expect it as the result of a more general and more judicious system of technical education, so as to counterbalance that at present overwhelming majority, whose interest it is to uphold such unjust and overbearing laws. But are we to expect the masters to do this for us? I think that as British workmen we have the means within our own reach, and as it were to advance we have every facility by seeing the vessel which carries the same wage as himself, and that with as much cheek and impudence as himself. It is to be expected, therefore, that the sooner this state of things is remedied the better; and we can only expect it as the result of a more general and more judicious system of technical education, so as to counterbalance that at present overwhelming majority, whose interest it is to uphold such unjust and overbearing laws.

A STONEMASON.

LIGHTING MINES.

Sir,—In your journal of 31st July, page 612, I find a paragraph stating that Messrs. M. Wilken and J. Clark have proposed a new and improved method of lighting mines, which consists in supplying pure air to gas or oil lights in such a way as to prevent them ever coming in contact with the foul air of the pit.

Allow me to state that the very same plan was proposed by me about two years since, and being persuaded that by this means explosions in coal and other mines would be altogether prevented, and, consequently, a great saving of life effected, I communicated it to Mr. Walpole, then Home Secretary, who proposed a preliminary consideration of it by one of the inspectors of mines. Since then other engagements have prevented me pressing the consideration of the matter.

I trust that your usual impartiality will insure the insertion of this note in the next issue of your journal. R. DONALDSON.

DECORATION OF THE PRINCESS'S THEATRE.

Mr. W. HOMANN writes as follows:—

"In your notice concerning the decoration and embellishment of the above theatre in the modern Italian style, you have inadvertently stated that praise must be given to the decorator artist employed, Mr. M. Vining, of Langham-street, for the successful manner in which he has done his work. Permit me to state the actual facts. Mr. Vining and myself were joint contractors in the execution of this work. The whole designs of the decoration belong to myself, and were selected by Mr. Vining, the enterprising lessee of the theatre. I likewise undertook the superintendence of the execution of the same. I beg that you will be so good as to insert these facts in the next issue of the Builder.

We have stated nothing "inadvertently" and must refer Mr. Homann to Mr. Vining, who advertises the name of the decorator precisely as given by us.

LOWESTOFT PUBLIC HALL AND ASSEMBLY ROOMS COMPETITION.

Sir,—The profession is certainly indebted to Mr. F. A. Klein for bringing into general notice this competition. Having obtained the particulars myself, I can fully endorse his statement as to the unsatisfactory nature of the conditions and the insufficiency of the amount proposed to be expended by the committee. If they really want all the accommodation they ask for, I should say 7,000*l.* would be nearer the cost of the building than 2,500*l.*

As I am well informed that upwards of 100 applications have been made for the particulars, I think it behoves all who have applied to consider well what they are about before going to the expense and trouble of preparing designs under such unsatisfactory conditions, and, unless they can see their way more clearly than I can mine to an honourable conclusion, to decline the competition, and thereby hold the example of

ONE WHO LOOKS BEFORE HE LEAPS.

CHURCH-BUILDING NEWS.

Hoylandswaine (Yorkshire).—The new church of St. John the Evangelist, Hoylandswaine, has been consecrated by the Bishop of Ripon. The plan of the edifice comprises a nave, 41 ft. 6 in. long by 19 ft. 6 in. wide, with north aisle, 17 ft. 3 in. wide, and chancel, 20 ft. 6 in. by 19 ft. 6 in., with north chapel for organ and vestry, divided from each other by an open tracered screen. The tower is at the west end of nave, and is 20 ft. 6 in. square, and the porch opens into the westernmost bay on the south side. The body of the church is 44 ft. high to the ridge, and the tower is 65 ft. high, finished with crocketed pinnacles and embattled parapet, and covered with stone weathered roof. The whole of the masonry is of dressed stone, from the Thurlstone quarries. The roofs and seats are open, and of pitch pine, and the roofs are covered with green Westmoreland slates. The chancel floor is laid with encaustic tiles, supplied by Mr. Godwin, of Lurgardine, and the nave and aisle passages, with rubber flags. The church will accommodate 308 persons, including eighty children. The chancel is fitted with stalls of pitch pine, and is divided from the sacrum by a stone tracered aisle screen. Mr. W. H. Crossland, of Leeds and London, is the architect; and the contractors are Mr. Benjamin Swift, of Cawthorne, for the mason, slater, and plasterer's work; Mr. Thos. Wade, of Horforth, for the joiner's work; Mr. Joshua Snowden, of Ossett, for the plumber's work; and Mr. Moore Westerman, of Horforth, for the painter's work. The cost of the church, about 4,000*l.*, has been principally defrayed by Mr. Walter Spencer Stenhope, of Cannon Hall. The site was given by Mr. Vernon Wentworth, of Stainborough.

Gumfriston (Pembrokeshire).—The interesting church here has lately been restored from the very neglected and ruinous state into which it had been allowed by several generations to fall. The nave and chancel have been new roofed throughout; and the stone roofs of the other parts of the building, which are formed of masonry within and without in the Pembroke-

shire fashion, have undergone some repairs. The pavements have been laid with Godwin's tiles, the interior walls have been replastered, and new wooden floors properly ventilated have been prepared for the seating, which is to be of oak, and is being completed by instalments as fast as the restoration fund will allow. Two windows in the chancel have been filled with stained glass supplied by Messrs. Powell & Sons. The whole has been carried out from the designs and under the superintendence of Mr. T. G. Jackson, of London. The builders were Messrs. Morris & Co., of Tenby.

Checkendon.—The church here has been reopened for divine service. The restoration has been carried out by Messrs. Honour & Castle, builders, under the superintendence of Mr. Burton, of Oxford, architect. The restoration now completed involved the placing a new open timbered roof on the chancel, and repairing the vault and walls of the apse, repairing the stonework of columns and arches of chancel and apse, the stonework of the several windows in chancel, apse, and nave, and the placing a new parapet and moulded cornice upon the nave. All the external faces of the walls and the internal face of the walls of the chancel have had the roughcast and plastering removed, and the original pointing restored. The walls were evidently built with flints nearly on their ends, but slightly inclined, one course leaning to the right and the other to the left, and between them was a broad band of mortar nearly 2 in. wide. This has been restored. Wherever alterations had been made in recent times the flints were not laid in courses as in the original work. In the course of the work traces of colour were discovered, and the architect found the remains of the twelve apostles and our Saviour painted upon the wall and vault of the apse. These paintings were of the date of about A.D. 1300. They have been restored by Messrs. Clayton & Bell. Other remains of paintings were discovered, but none that could well be restored. The south doorway, which is of the twelfth century, had been built under and blocked by a doorway of the sixteenth period. This was discovered by removing the plaster, and has been restored.

Alfreton.—The ancient parish church of Alfreton has been reopened, after being restored and enlarged under the superintendence of Messrs. Bine & Sons, of Nottingham, architects. The reredos is of alabaster and polished marble, with a large white Latin cross in the centre. The organ is new. The church will seat 500.

Rochdale.—The church-building movement in Rochdale is going on rapidly. All Saints' Church, Hamer, is built and consecrated. Milnrow Parish Church has been rebuilt, and is just ready for consecration. St. Mary's Church, Balderstone, is nearly ready for the roof. St. Peter's Church, Newbold, has 5 ft. or 6 ft. in height of masonry built. St. Edmund's Church, Falingo, and Shaw Church have just been begun; and St. John's Church, Facit, is to be commenced in a few weeks. Mr. Drew and Mr. Street, of London, have respectively in hand the churches at Shaw and Milnrow. The architects for the other five churches are Messrs. Medland & Henry Taylor, of Manchester. Newbold Church is to seat 670 persons, and to cost about 3,500*l.* It is being built mainly of the local stone, with coigns, hands, and cornices of red brick. The window tracings and other ornamental features will be of Yorkshire stone. The church will have a hexagonally-ended chancel, aisles to both nave and chancel, clerestory windows above the aisle roofs; and at the west-end a large porch, steeple, and baptistry.

Sharrow (Sheffield).—The church just erected at Sharrow, and which adds another to the list of churches which have been erected in the town by the Sheffield Church Extension Society, has been consecrated by the Archbishop of York. The edifice is capable of accommodating about 750 persons. The site, which was presented by Sir John Brown, occupies an elevated position above Shirle-hill, and the edifice can be seen from a great distance. It has been erected at a total expense of about 5,600*l.*, by the Sheffield Church Extension Society, aided by a local subscription of 2,500*l.*, and a grant from the York Diocesan Society of 400*l.* The plan is cruciform, and consists of north and south aisles, a chancel, organ chapel, chancel aisle, and vestry. The length of the edifice is 124 ft., the nave is 21 ft. wide, the aisles 13 ft. 6 in., and the width across the transepts, 9 ft. The style is Early Decorated, carried out in a simple manner. The interior arcade of five arches is moulded, and is

carried on clustered shafts with conventional carved capitals, and surmounted by a clearstory of circular windows filled with plate tracery. The roofs are open timbered. The chancel has a window, filled with stained glass, the gift of Mr. Charles Gould, as a memorial of his late wife. The subjects in the upper tier are the Nativity, Baptism, Crucifixion, Entombment, and Resurrection of our Saviour; Christ blessing children, the Transfiguration, the Lord's Supper, St. Thomas, and the Charge to Peter. In the tracery are the evangelistic symbols and the Agnus Dei. The window is the work of Messrs. Clayton & Bell. The floor is laid with tiles by Messrs. Maw, of Broseley, in the geometrical pattern, the sanctuary being encaustic tiling. Under the east window is a recess of various coloured marble, combined with alabaster and Hopton wood stone, which is the gift of the architects. Turning westward, the vista is completed by a window filled with stained glass. Two lights represent the calling of the Apostles on the Lake of Galilee, and other two, the charge to Peter—"Feed my lambs." A lower tier of subjects represents the Widow's Mite, the Women at the Sepulchre, the Charity of Dorcas, and the raising of Tabitha. In the centre of the tracery there is a medallion, upon which is a representation of our Lord in the act of benediction. The window is the work of Messrs. Heaton, Butler, & Bayne, of London. The church will be warmed by means of Messrs. Stuart & Smith's hot-air apparatus. The masons' work has been done by Mr. Harper, of Mashrough; the joiners' work, by Messrs. Badger & Holmes; the carving, by Messrs. Farmer & Brindley; and the gas-work, by Messrs. Ward & Jackson. The architectural designs were furnished by Messrs. Blackmoor & Mitchell-Withers.

Walkley (Sheffield).—The church of St. Mary, at Walkley, has been consecrated. This is another church, for the erection of which the local public is indebted to the Sheffield Church Extension Society. Its building was commenced so long ago as 1861, when the work was proceeded with so far as the erection of two bays of the nave, the chancel, and the vestry, the whole forming a temporary church, where divine service has been held for some time. This portion of the work was completed at a cost of 900*l.*, when the Church Extension Society undertook the completion and extension of the edifice to the dimensions which had been originally intended. The building, as now completed, is of the simple decorated period, and is erected from the plans of Messrs. Weighman & Wilson, architects. At the west end of the building is placed a tower, 17 ft. square, surmounted by a spire, which is again surmounted by a vane; the height from the ground to the top of the stone finial of the spire is about 86 ft. Beneath the west window is introduced an arcade, which affords light to the seats under the gallery. The dimensions of the interior are—Nave, with north and south aisles, 45 ft. wide, 82 ft. long, 21 ft. high to the square of nave, and 38 ft. to the ridge. The roof is formed of framed couples or rafters. The chancel is increased in length, and is now 21 ft. wide and 28 ft. long. The size of the vestry is as originally intended, viz., 11 ft. by 11 ft. The organ-room, 15 ft. by 18 ft., is enclosed by a wood screen, giving a side entrance from South-road. The principal entrance to the edifice is by the tower, approached by a broad flight of steps from South-road. A separate door, with a stair turret, is provided for the children's approach to the gallery, which is 21 ft. the width of the nave, and 13 ft. deep. The church is warmed by heated air, the apparatus for its production being placed at the west end of the building, and fitted up by Mr. Firth, of Mashro'. The church will accommodate a congregation of 700, and all the sittings are to be free and unappropriated. The entire cost of the building is 3,200*l.* The contractors' work has been executed by Mr. Benjamin Carr, masons' work; Mr. Spink, carpenters' work; Mr. Bisset, plumbing, glazing, and gasfitting; Mr. Stamford, slaters' work; Mr. Samuel Smith, painting; Mr. Dorey, of Manchester, ironwork; and Messrs. Harrison & Chadwick, plasterers' work.

Polesworth (near Tamworth).—The ancient church of St. Edith, Polesworth, has been reopened after extensive restorations and additions, under the direction of the architect, Mr. G. E. Street. The church is a portion of an old Norman abbey dedicated to St. Edith, a princess of Saxton times, who is described as having been the first abbess, and is represented in some accounts as the daughter of Egbert, whom historians usually treat as having first exercised regal

sway over the whole of England. An ancient archway leading to the former monastery grounds, the remains of a Norman cloister on the south side of the church, a sundial on the same side, and the refectory, which forms part of a house close to the church, with many other remnants, suggest the existence of an extensive religious establishment, which was dissolved in the reign of Henry VIII. Previous to the recent restoration there was no chancel, and the church consisted simply of a nave and a north aisle, with a tower placed at the east end of the aisle. This, being the newest part of the church, has been left as it was. The building was in a very dilapidated condition. The north wall was entirely pulled down, and the other walls have been faced and lined with new stone; whilst a new chancel has been built within the foundations of the previous tower and church, which originally took the form of a cross, with the tower at the centre. The roof is new, and is covered with red tiles. The interior has been fitted with open seats. The chancel is raised by successive steps above the level of the nave, and is fitted with oak stalls and paved with encaustic tiles. A small window in memory of St. Edith has been placed in the north aisle. Mr. Street's plans have been carried out by Mr. Fox, builder, of Abberstone. Some needle-work in the chancel was specially designed by the architect. A new organ, by Mr. W. F. Jardine, of Manchester, who built the organ in Eocleshall Church, has been placed within the tower, at the north-west corner of the chancel. It has cost 260*l.* The total cost of the restorations is about 3,000*l.*

Malton (Yorkshire).—The North Riding of Yorkshire has made great strides in church building and church restoration during the last few years, and in no portion of the riding has there been more activity than in this neighbourhood. The two churches in Malton, St. Michael and St. Leonard, have each undergone considerable restoration, both exterior and interior. Crossing over the Derwent, we have in the neighbourhood, although in the East Riding, the churches at Ackham, Westow, and Burythorpe, all of which have been rebuilt within a few years. Scrayingham Church has been restored, and a new church built by Mrs. Cholmley at Howsham. Then, returning to the North Riding, we have a new church at Butterwick, another new church at Hutton, and also a new church at Appleton-le-Moors, and new churches at Whitwell and Flaxton; the church at Helmsley has been rebuilt by the Faversham family; the church at Stonegrave has undergone a restoration, both exterior and interior; the church at Hovingham has been rebuilt by the Worsley family, at a very considerable cost; and the Hon. Admiral Howard has just completed the rebuilding of the church at Slingsby; Ampleforth Church has been rebuilt by private subscription, promoted by the incumbent; and the principal inhabitants of Terrington are about to expend 2,000*l.* in the restoration of their church. The small Norman church at Barton-le-Street, now closed in consequence of its dilapidations, is to be immediately rebuilt, by Mr. Meynell-Lagman, the proprietor of the parish; Admiral Howard has notified his intention to rebuild the ancient church at Bulmer, which is in very bad repair, and a new church in the village of Welburn, also on the Castle Howard estate, has been erected. Sir Tatton Sykes has just laid the foundation-stone of a new church at Finher, one of a series of churches which his family have built or restored on the Sledmores estates during the last few years.

Elton (Yorkshire).—St. Mary's Church, which was re-opened in November last, after being restored, chiefly by the expense of Lord Hotham, and which had previously possessed but two bells, has just been provided with a third bell, the gift of Mr. James Hall, of Scarborough. The new bell was cast by Messrs. Mears, of London, and was rung by Messrs. Simpson & Malone, of Hull. We understand that so long ago as 200 years it was intended to add a third bell to this church, but the complete execution of this intention was frustrated by accident. The bell was ordered, cast, and shipped for Hull, but was lost in the Humber during transhipment.

Hedon (Yorkshire).—The church of Hedon has been reopened for divine service, the south transept having undergone a restoration. Mr. Street, architect, prepared the plans, and Messrs. Shaftoe & Barry, of York, contracted to carry out the work. The entire front of the old south transept was taken down, and the whole of the

old roof, and renewed in the Early English style. The windows have been rebuilt. The flooring of the transept is laid with cesselated pavement, from the works of Messrs. Godwin, Hereford.

Howden (Yorkshire).—The ancient church of St. Peter, at Howden, has had the nave restored. At first it was intended only to clean the walls and arches; but the original plan was extended, and the result has been the renovation of the interior. The whole of the masonry was covered with various coats of pigment and colour wash. By a series of chemical and mechanical processes, superintended by Mr. Saville, this has been removed. The clearstory has been brought out, the proportions of the tower arches and the arches separating the nave from the aisles, with their mouldings, are now more clearly defined. Similar results have been attained with the arcades at the west end, and with the chancel screen, which forms the reredos. The organ has been removed to the north transept. By this removal two windows in the south aisle have been opened out, and they have been glazed with cathedral glass. The old tower, 135 ft. high, was erected by Bishop Skirlaw. Its roof has been replaced by a new one. The bells are eight in number; three of them were found on examination to be cracked, and have been recast. The tenor bell weighs 27 cwt. The estimated cost of the restoration is 800*l.*

DISSENTING CHURCH-BUILDING NEWS.

Mark.—The foundation of a new Wesleyan chapel has been laid at Mark. The old building was erected in 1797, and has long been too small for the congregation. The new chapel, which will be built by Messrs. Hawkins & Sons, of Glastonbury, from designs by Mr. H. F. Price, of Weston-super-Mare, will be erected near the old site. It is to be in the Decorated style, and the total cost will be about 1,000*l.*

Old Hill (Dudley).—The memorial stone of a Primitive Methodist chapel has been laid at Old Hill. The chapel will be 60 ft. long by 40 ft. broad, and when the galleries are put in will seat about 800 persons. The architect is Mr. William Keen, of Crayley Heath, and the builders are Messrs. Stockton & Sons, of Oldbury.

Irchester.—The memorial-stone of a new Wesleyan chapel has been laid at Irchester, a goodsized village, pleasantly situated about 3 miles south of Wellingborough. The site faces the village street. The building is to consist of a chapel and a schoolroom. The internal dimensions of the former are 40 ft. by 30 ft., and of the latter 20 ft. by 30 ft. The chapel will be 22 ft. high in the walls, and the schoolroom will be 13 ft. high in the walls. The extreme height of the chapel from the apex of the roof to the floor will be 30 ft. The chapel is to have a gallery at the north end, and there will be accommodation for about 400 persons. It will be built of Wellingborough pressed brick, with freestone arches. The style is a mixed one, but approaches more particularly the Italian, with circular-headed windows. The fitting up of the interior is to be of stained deal. The estimated cost is between 600*l.* and 700*l.* Mr. C. Day, of Bedford, is the architect, and Mr. L. B. Moore, of Bedford, is the contractor.

SCHOOL-BUILDING NEWS.

Ratlinghopa.—A new district school has been opened at the Bridges, Ratlinghopa. The building is the design of Mr. Smalman Smith, of Stonbridge. The walls are of the Norbury shelly limestone, mixed with Stiperstone granite, quoined with a mixture of red and white brick, which is also carried around the windows. A bell-turret rises to a height of 55 ft., and is roofed with majolica and encaustic tiles, supplied by Messrs. Maw, of Broseley. The one principally used in the work is termed the "Amber." The tiles are banded together horizontally at intervals, with blue and white, and capped with the same colours. The summit of the turret is surmounted with a gilt cross. The school-room is lighted by four windows, with cottage panes, of cathedral-tinted glass. This part of the work, together with the supplying of three chandeliers, was done by Messrs. Done & Davies, of Shrewsbury. In the school-room is a Gothic chimney-piece, in Bath stone, by the architect. Adjoining the school is the master's house, with rooms for boarders, and good yard, garden, and other conveniences. The school is half surrounded by a

group of beeches and other forest trees. The whole of the work was carried out by Mr. Cook, miller, Critten.

Clayton.—The congregation worshipping in the General Baptist Chapel, at Clayton, have determined to erect new and more commodious school premises. A committee has been appointed, and has set to work in earnest, with a resolution to raise at least 1,000*l.* before May next. A site has been obtained at a cost of 500*l.* in an eligible situation. Plans have been prepared by Mr. T. Horsfall, architect, Halifax. The entire school premises will occupy an area of 1,700 square yards, and the building itself will be 28 yards by 14 yards, comprising one large room 18 yards by 12 yards, with four classrooms at each end. The style of architecture will be English-Gothic, and the estimated cost, including the ground, is 1,500*l.*

Devonport.—St. Mary's National Schools have been opened. Mr. Piers St. Angh, of London, was the architect; Mr. H. Moorhead, of Devonport, the clerk of works; and Mr. T. Jenkin, of Devonport, the builder. The design is plain Gothic. The building comprises two large rooms of an L shape, each 18 ft. wide, and every requirement in regard to ventilation has been observed. The rooms together will accommodate 500 children.

Hendon Mersey.—The existing schools are to be enlarged by providing for an infants' school and parochial reading-room. The present schools consist only of two rooms, with glass-rooms, and the larger of the two has recently been devoted to the girls and infants. Encouraged by promises of assistance, the committee obtained plans and designs for a new wing at the north end, corresponding to some extent with the wing at the south, used as the boys' school, and giving to the ground plan the form of the letter H. It is intended that the girls' school shall be removed to the new wing, the centre room being applied exclusively to infant teaching. There is also a new committee-room, and a reading-room for the village, with lavatory. The nucleus of a reading-room, supplied with newspapers and periodicals, and in which draughts and other innocent games are provided, has been established some time; but it is hoped that the erection of a more suitable apartment will induce a larger number of working men to avail themselves of the opportunity of forming an acquaintance with the literature of the day. The new buildings are progressing, the walls having reached as high as the windows, and it is expected they will be completed about Christmas. The contractors are Messrs. Robinson, of Hyde. The estimated cost is 1,200*l.*

Coatham (Redcar).—The free school of the foundation of Sir William Turner, knight, removed from Kirkleatham to East Coatham, and just completed, at a cost of 4,000*l.*, in pursuance of a scheme of the Court of Chancery, approved in 1855, has been opened. The foundation-stone of the new building was laid on April 25th, 1868. The premises comprise school-rooms, master's house, and other requisites. The northern point of the building is towards Coatham, and surmounted by a tower rising to a considerable elevation. The style of architecture is Gothic, and the principal material used is red brick.

FROM SCOTLAND.

Dunfermline.—The plans and specifications of the new infirmary, prepared by Mr. Starforth, architect, Edinburgh, have been received from Mr. W. Waterhouse, of London, to whom they had been remitted by the governors, for his report on the expediency of the proposed structure. In the report Mr. Waterhouse says:—"I am of opinion that the specification has been carefully drawn, and that the materials and workmanship provided are good and sufficient for the purpose; and that the plan is, in my opinion, considering the space it occupies, an excellent one."

Selkirk.—For a twelvemonth past a new bridge has been in course of construction.—Mr. Moncrieff, Edinburgh, contractor—on the Selkirk and Galashiels branch of the North British Railway, in substitution for the wooden bridge which crosses the Tweed immediately below the confluence of the Etrick. The new bridge, which is now opened for traffic, has six piers, with iron girders. The former bridge was inspected by Colonel Rich in the winter of 1867, and his report on it, it is understood, has led to the erection of a new and more substantial one.

Stirling.—In consequence of the water in the reservoirs being lately much reduced, the local

water commissioners issued a notice intimating that, until further notice, the water would be cut off each evening at eight o'clock until six o'clock next morning. They also cautioned the inhabitants against any waste of water, and prohibited it being used for watering gardens.

Dumbar.—For some time past the drought had been telling very much upon the supply of water to this town. Some houses had not had any water for a week, and others had not any for three weeks. The Water Committee resolved that the public wells should be closed from 10 p.m. till 6 a.m. They also prohibited the water from being used for gardens, or in any other way not imperatively requisite.

Forfar.—The foundation-stone of a new hall which is to be presented to the inhabitants of Forfar by Mr. Peter Reid, a confectioner in the town, has been laid with Masonic honours by the Grand Master, the Earl of Dalhousie. His lordship also placed the corner-stone of a new court-house in course of erection for the county of Forfar. The day was observed as a general holiday in the burgh.

Glasgow.—Since the last annual inspection the Clyde Trustees have conferred a great boon on the shipping interest of the port by the erection of three light towers between the mouth of the Cart and Bowling, to indicate to pilots and others the head of the channel between these points. The light towers are of cast iron, on stone foundations. They are each upwards of 14 ft. high, 3 ft. 9 in. diameter at the bottom, 3 ft. at the top, surrounded by a 6-sided lamp, and are so placed that the lights are 24 ft. above ordinary high-water springs. The towers being painted white form conspicuous objects on the river banks. The light shown at night is red and white in alternate panes of the lantern. The oil used is paraffin.

Ballater (Balmoral).—Considerable difficulty has been experienced for a number of years in finding accommodation at the village of Ballater for the troops who form a guard of honour during her Majesty's residence at Balmoral Castle. The barracks are now all but finished. The ground on which they are built is situated at the west end of the village, about 120 yards off the main turnpike road leading to Balmoral, and has an area of upwards of 1½ acre. The barracks en masse may be said to consist of seven cottages built in a mixed decorated Anglo-Gothic style of architecture. They will only be used during the summer months, and efforts have been made to secure proper ventilation.

STAINED GLASS.

St. Mary's, Theford.—Two windows have just been inserted into the south wall of the chancel of this church. The stone used is Portland, and they are in the Third Pointed or Perpendicular style, to be in character with the rest of the church. The designs of the stonework were by Mr. Augustus E. Brown, of London, architect, and it has been executed by Mr. Robinson Cornish, of North Walsham. The painted glass which fills the windows was designed and executed by Messrs. Ward & Hughes, of London, who have already executed other windows in the church.

Chelmsford Church.—A new stained-glass window has taken the place of the old pane one in the west face of the tower. The work was done by Messrs. Clayton & Bell. The west window is divided into three bays. Each of these is filled in with two representations relating to the nativity of our Saviour.

Convent Chapel of the Good Intent, Birkenhead. In this small chapel there have recently been fixed two single-lighted stained-glass windows. In each richly attired and devotionally disposed figures of two early Christian martyrs, Saints Philomena and Agnes, are placed, surmounted in their semicircular headings by crowns of martyrdom, and under each figure are angels denoting with their respective devices what is traditionally ascribed to them. The whole is supplemented with a lily border. The artists were Messrs. R. B. Edmundson & Son, of Manchester.

Tretton Church, Yorkshire.—This interesting church, the chancel of which has recently been restored by Messrs. Hadfield & Son, has had the complete series of windows filled with memorial glass. The style is that of the fifteenth century English glass, carefully studied from old models, and has been executed by Messrs. Lavers, Barrard, & Westlake, from the designs and direction of Mr. Bentley, the cartoons being the joint work of Messrs. Westlake & Bentley. In the east window, under canopies, is the Resurrection

and in side lights are St. Peter and St. John. This is in memory of the late Mr. John Wheat. The two windows on the north side have figures of St. Helen, patroness of the church, St. Alban, Protomartyr, St. Mary Magdalen, and our Blessed Lord. The former is in memory of the deceased wife of the rector, the Rev. B. E. Watkins, M.A., the latter in memory of Mr. May, of Catcliffe. In the south side window are figures of the Archangel Gabriel and the Virgin, with legends on scrolls, "Hail Mary full of Grace," and "Behold the Handmaid of the Lord." This is in memory of the late Mr. H. Sorby, of Rotherwood. The windows were carefully designed to suit the architectural specialities of the church, a due regard being given to the fragments of the original glazing, which was of the Perpendicular period.

Worcester Cathedral.—A new painted glass window has been placed in the great north transept. The masonry of the window is itself new, having been erected by Mr. Perkins during the present restoration. It is of four lights, with Decorated tracery in the head, consisting of trefoils and cinquefoils in circles. The glass just inserted is the gift of the Masonic body of the province of Worcestershire, and is the work of Messrs. Lavers, Barrard, & Westlake, of London. The cost is about 600*l.*, but this sum is said to be no measure of its actual value, as one member of the firm by whom it was produced being himself a brother of the Masonic craft, the work was accomplished *con amore*, and without absolute reference to profit. The subjects chosen for the window are the twelve Apostles, in three rows of four each. In the tracery above are emblems of the Master and his Wardens, together with those of other officers. In the sinister tracery are the Masonic arms, and in the dexter those of the Prov. G. M. Roys, and these are surrounded by Masonic emblems. The base of the window is occupied by an arcade work, underneath which are the figures of Hiram Rex, Hiram Abiff, and Solomon Rex, Zerobabel, with Esdras and Nehemia. On a brass plate inserted in the wall under the window is the following inscription:—

"To the glory of God, and for the adornment of this Cathedral, the north transept window is erected by the Free Masons of Worcestershire, Albert Hudson Roys (High Sheriff of the county) Provincial Grand Master, A.D. 1862."

FROM AUSTRALIA.

The Victorian Water Supply.—Considerable interest was manifested both by the public and the contractors respecting the tenders for water supply, the former being anxious to know whether Government intended to proceed with the Coliban and Geelong schemes, and the latter being concerned personally in a business point of view. When the tenders were opened at the Board of Lands and Works, the room was quite filled with contractors. Mr. Grant, President of the Board, read out the list of tenders accepted. With respect to tenders sent in for contract 30, construction of outlet works for the Barker's Creek reservoir, he said the lowest tender is that of Mr. E. O'Keefe for 2,783*l.* 4s. 2d. It is accepted by the board, subject to his filling in the schedule as specified in the first clause of the general conditions. There were eight tenders for this work. For contract 31, for the completion of the dam across the Coliban, the construction of outlet tower, and other works for the reservoir at Malmsbury, there were 10 tenderers, and the contract of John Butler Dwyer, 21,823*l.* 11s. 10d. is the lowest, and is accepted, subject to his filling in the quantities in the schedule. There were five tenders for the construction of outlet works for the Stony Creek reservoir, and that of the Langlands Foundry Company, 5,685*l.* 5s. 2d., is accepted. For contract 33, construction of a service reservoir and filter-beds at Lovelybanks, the tender of Messrs. Simmie & Co., 5,508*l.*, is accepted: there were 12 tenders for this work. Seven tenders were received for the construction of outlet works for the Expedition Pass reservoir, and the board accepts that of John Stewart, the sum being 3,074*l.* 10s. 9d. For the completion of No. 4 tunnel the lowest tender is that of Gardner, Lyons, & Aherm, 19,814*l.*, which the board accepts. For the carriage of pipes from Geelong, and distribution along pipe track, *via* Lovelybanks, to Anakies, Mr. Robert Carrick's tender, 2,532*l.* 15s. 9d., is accepted. Respecting contract 39, construction of aqueduct, flumes, and tunnels, from Stony Creek reservoir to Anakies, he said the tenders received were all excessive, and the board had decided that the work should be re-advertised. The total amount of the tenders accepted was 64,531*l.* 7s. 8d.

Miscellanea.

Death of Mr. Roehling, C.E.—The death is announced of the eminent American engineer, John A. Roehling, which took place on the 22nd of July. While Mr. Roehling was engaged in making some measurements connected with the East River-bridge, on the 28th of June, a boat at Fulton Ferry caught and severely bruised one of his feet. The immediate result of this accident was the amputation of his toes, which led finally to his death. Mr. Roehling was born in 1806, in the city of Mulhausen, Prussia. Among numerous works Mr. Roehling in 1848, undertook the construction of a series of five suspension aqueducts on the line of the Delaware and Hudson Canal, connecting the anthracite coal regions of Pennsylvania with the tide-water of the Hudson River. They were all completed in the course of two years. Public attention for some time past has been directed to the problem of connecting the New York Central and Great Western Railway of Canada, by bridging the chasm of the Niagara River. Mr. Roehling was invited to make plans and estimates for the bridge, and was at the same time appointed the engineer. For four years, commencing with 1851, the work was continued without interruption, until, in March of 1855, the first locomotive and train crossed a railway suspension bridge, and it may be safely said that up to the present day it is still the only example of the kind of any magnitude.

Portable Gas Machine.—Mr. G. Flintoff, gas engineer, has patented a process in gas making, with the view of rendering gas consumers independent of gas companies. The machine is simple,—a cylinder fixed within another of larger size is charged with rock oil; provision is made for the oil to trickle from the reservoir to the bottom of the space between the outer skin of the machine and the cylinder. The bottom of this space is filled with wool, which absorbs the oil as discharged. When gas is drawn off from the machine, a piece of clock-work apparatus on the top of the machine is put in motion, and pumps in the atmospheric air proportionately to the consumption or discharge of gas. The mixture of atmospheric air and oil vapour constitutes the inflammable gas. Any number of burners may be supplied from the machine in the same way as from an ordinary meter, and the pressure regulated at the "main," that is, the discharge-pipe from the machine, and at each burner, in the usual way. The light was somewhat unsteady in the burner we saw, but this was said to be caused by a remediable defect in the clockwork. Two shillings and sixpence per 1,000 cubic feet is said to be the cost of the gas.

A Second Peabody.—An act of princely munificence on the part of a citizen of Birmingham has just been completed by the formal delivery to the trustees of Josiah Mason's Almshouses and Orphanage at Erdington. The amount of money expended in this benefaction is no less than 260,000*l.* A singular coincidence in the lives of the two men is that they were both born in February, 1795. In 1858 Mr. Mason began a set of almshouses and an orphanage on a small scale, and these have gradually developed till the result is the erection of two separate establishments, one for the residence of twenty-six poor widows, and the other a huge pile of buildings for the accommodation of 300 boys and girls. The orphanage building is in the Lombardic style; and it is sited on 13 acres of pleasure-grounds at Erdington, near Sutton. The cost of erection was 60,000*l.*, and the endowment consists of over 1,000 acres of land—yearly increasing in value, in and around Birmingham, and estimated to be worth over 200,000*l.* The present annual income of the charity exceeds 10,000*l.* Provision has been made for the exclusion of sectarian teaching, it being a special proviso in the deed that the Scriptures alone shall be the religious teaching of the children.

Alleged Defalcations by a Town Surveyor.—Several members of the Scarborough Town Council having been for some time dissatisfied with the manner in which the Borough Surveyor's duties were being conducted, particularly in their financial relations, an examination has been made, the result of which is said to be the revelation that upwards of 90*l.* remain unaccounted for, and proceedings are about being instituted against him by the Town Council.

Bituminous Composition.—Messrs. F. Labat & J. Meric, of Boulevard Bonne-Nonvelle, Paris, have specified their patent for a novel bituminous composition. The bitumen, the subject of this invention, is composed of white or liquid resin, otherwise galipot, of lampblack, and of sulphur and red sand from the pit or mine combined in about the following proportions:—For every 100 lbs. weight of bitumen—Sulphur, 37½ lbs.; galipot (or in case of necessity colophony), 25 lbs.; lampblack, 12½ lbs.; sand, 25 lbs. = 100 lbs. For bitumen to be applied on wood the quantity of sand may be reduced by about 5 lbs. weight, and it is preferable that the wood be rough—that is to say, not planed. In preparing this bitumen the sulphur must first be thoroughly melted in a sheet iron caldron or an earthenware pot: the galipot is then added, and when this has almost entirely melted the lampblack is introduced, and, lastly, the sand, and the whole is carefully mixed over a moderate fire. This bitumen may be used in the shape of bricks, or be laid as a coating upon any desired foundation. It is suitable for bottoms of reservoirs, for pavements of streets or terraces, and other applications too varied for enumeration.

The Position of Pre-historic Burial Grounds.—Everybody knows that it was the universal rule of English Gothic architects to build their churches east and west. But it was discovered some thirty or forty years ago that in some cases the line from west to east was drawn so that the altar faced that exact point in the eastern horizon at which the sun rose on the festival of the saint to whom the church was dedicated. Canon Greenwell, who has done so much in the Yorkshire Wolds with the ancient British barrows, now finds, on examining the Yarsley or "long barrow," that it was the custom of the half-savage tribes who raised these funeral mounds to place them east and west, but shifting their exact direction according to the point where the sun rose at the time they were piled together. Among other of the reasons on which this conclusion is founded, was the presence of a large number of acorns, indicating a late period of the year, and precisely corresponding with the point at which the sun rises, when, from the direction of the line of the tumulus, it is supposed to have been built.

Railway Travelling.—In 1866 the number of railway passengers of all classes was 238,137,000, and the expense of carrying them, without reference to the distance they travelled, was just 6*l.* ahead. As the total gross receipts from passenger traffic during the same year were 13,125,000*l.*, the average fare paid by each passenger, whether he travelled first, second, or third class, from one station to the next, or from one end of the kingdom to the other, was 13*d.* and a fraction. The average first-class fare was 2*s.* 6*d.*, and the average journey 15 miles; the average second-class fare 1*s.* 2*d.*, and the journey nine miles; the average third-class fare 8½*d.*, and the journey also nine miles. The average number of passengers per train was seventy-five, and the working expenses were 2*s.* for each train mile. As to goods, in the eight years between 1856 and 1864, the charges have been lowered on an average by 28 per cent.; the public have sent 2,706,000 tons more goods, while they have saved more than 800,000*l.* on the cost of carriage; and the public treasury has earned an increased net profit of 231,240*l.*

Somersetshire Archaeological Society.—The annual meeting will be held at Axbridge, on Tuesday, the 7th of September, and the two following days, under the presidency of Mr. Wm. Long, F.S.A. On Tuesday, after hearing papers, there will be an excursion to Cheddar Church and Cross, and Rodney Stoke. On Wednesday an excursion to Rowherrow Church and Manor House; Dolbry Camp; Burrington, Church, Combe, and Caverns; Hut Circles, Amphitheatre, Charter House; and the Cheddar Gorge, Cheddar Cavern; and on Thursday to Winscombe Church; Loxton; Christon; Banwell Cave, Church, &c.

Great Canal from Amsterdam to the North Sea.—The great ship canal which is to connect Amsterdam with the North Sea at a cost of 27,000,000 guineas is now in progress after a temporary stoppage of the works. The canal will be about 15 miles in length, at one part strongly embanked, and a harbour of refuge will be built at its mouth at a part of the coast where a harbour is greatly needed.

Stanley Park, Liverpool.—The new public park at Anfield, Walton, which has been constructed for the recreation and amusement of the inhabitants of the north end of the town of Liverpool, is rapidly approaching completion; and will shortly be handed over to Mr. Kemp, the landscape gardener, from whose designs it has been formed, preparatory to its being formally inaugurated and opened to the public. Although smaller than the Newsham and Sefton Parks (its area being not more than 100 acres, it is, nevertheless, in many respects, more picturesque than either of the former. It is favourably situated for a view of the surrounding country. There are four entrances. The park is enclosed by planting and iron railing 6 ft. in height, and outside this there will be an equestrian drive along Priory-road and Mere-lane. The intention of the corporation was to give the land now being converted into an equestrian drive to the Walton Local Board, in consideration of their widening the road and keeping it in order, but this the local Board declined to do, and hence the equestrian drive which is now being constructed. The only drawback to the appearance of the park is that it is not in two by Mill-lane, a public highway, and which the Walton Local Board refuse to give up. The Walton Board proposed that the corporation should give up an equal width of land at the Arkley-lane boundary of the park, which would thus have widened that thoroughfare; but to this proposal the corporation would not assent. The council intend to go to Parliament for powers to close Mill-lane and throw it into the park. The works in connexion with the laying-out of the park have been executed by Mr. Pearson Lea, and the buildings and general stone-work by Mr. Campbell.

The New Fish Market, Swansea.—The Corporation is afraid the Corporation has made a serious mistake in the erection of the new fish market. The old market was simply a disgrace to the town, and the council was doubtless actuated by good motives when they voted some 600*l.* or 700*l.* for the erection of the new market. The new structure is, however, perched up over the hutchers' stalls at one end of the market; is only approachable by a long flight of steps; and until the past week or two was surrounded with glass, which made the place during the late intense heat a perfect hot-house, almost unheatable to the fishmongers. The large glass windows have now been entirely removed, but will have to be replaced if the market is to be made available in the winter. The market itself is commodious enough, but the fishmongers complain sadly that, in consequence of the long flight of steps, the ladies refuse to patronise the stalls, and several stall-holders have intimated their determination to give up their stalls.

The Honduras Railway.—Some statements having appeared in a New Orleans paper to the effect that though "a loan of 2,000,000 dollars has been negotiated in Paris for the completion of the Inter-oceanic Railroad in Honduras, not a rail has been laid, nor a sod turned toward commencing, neither has the route been surveyed." Mr. B. Baylis, an engineer engaged upon this line of railway, writes to us to refute them. He says,— "As one of the engineers employed on the line these last six months, I have to state that the first section of fifty miles has been surveyed, and the rails laid on a portion of the way. When I left the works, three weeks ago, there were six hundred labourers on the line, and the numbers were increasing every day. I may also state that the amount of the loan raised in Paris is two millions sterling instead of two millions of dollars only. The report evidently emanates from some parties not quite disinterested, perhaps some of those who have a stake in a rival line."

A Smart Young Architect.—The *Gazette de Cologne* is responsible for the following little anecdote. It seems that the basilica of St. Peter's, in anticipation of the Ecumenical Council, is undergoing some repairs. One morning the architect's son brought to the Pope some of the necessary plans and drawings connected with these repairs. His Holiness was highly delighted with them, and taking the boy by the hand, led him to a drawer, in which were lying some gold pieces, telling him to take as many of these as his hand would hold, in honour of the very beautiful workmanship of his father. "Please, holy father," said the unabashed boy, "let me have what your hand will hold—it is so much larger!" The Pope, adds the *Gazette*, good-naturedly did as he was desired.

Death of Mr. William Crawford, of Edinburgh, A.R.S.A.—The death of this artist is announced by the *Spectator*. Mr. Crawford was born at Ayr, his father being Archibald Crawford, the author of "Bonnie Mary Hay," and other popular lyrics. At an early age he was despatched to Edinburgh, where he became a student in the Academy under Sir William Allan. He would seem to have presented his studies with some distinction, and his success in copying one of Emy's great pictures secured for him a travelling bursary. The young artist was thus enabled to visit Rome, where he studied for two or three years. He then returned to Edinburgh, and settled down to the practice of his profession. As a painter, Mr. Crawford achieved his greatest successes in the department of portraiture. His forte was drawing in crayons. Among his contributions to the annual exhibitions at Edinburgh also were various sacred subjects, and a considerable number of genre pictures. Mr. Crawford was married about seven years ago to a lady who has since been known as a contributor to the Academy's exhibitions.

Conference of Engineers.—The annual congress of the Institution of Mechanical Engineers was opened in the theatre of the Literary and Philosophical Society, Newcastle, under the presidency of Sir William G. Armstrong, C.B. The attendance at the opening meeting was very numerous. The secretary read a paper on "The Mechanical Ventilation of Collieries," by Mr. W. Cochran. The paper was also illustrated by diagrams, and led to a very animated and lengthy discussion. The next paper read was by Mr. J. Daglish, of Seaham, on "The Mechanical Firing of Steam Boilers." A long discussion ensued, in which Mr. Hawkesley, Mr. Compton, Mr. L. J. Bell, and the President took prominent parts. The members then adjourned to take part in the various excursions. In the evening a large and influential company, including many ladies, again assembled in the theatre of the institution for the purpose of hearing the annual address delivered by the president.

Prehistoric Archaeological International Congress at Copenhagen.—The *London Gazette* announces that the Committee of Privy Council on Education have received, through the Foreign Secretary, a note from Her Majesty's Consul at Copenhagen, relating to an International Prehistoric Archaeological Congress, under the special patronage of the King of Denmark, to be held at Copenhagen from the 27th August to the 3rd of September next. The programme relating to the congress has also been forwarded, and is given in the *Gazette*. Amongst other arrangements are excursions for some days, when dolmens, ancient kitchen middens, &c., will be visited.

Workmen's Trains.—A public meeting, convened for the purpose of promoting the extension of the system of workmen's trains upon those parts of the Metropolitan and Great Western railways which embrace the suburban districts of Kensington, Hammersmith, Chelsea, and Notting-hill, has been held at the St. James Hall, Notting-hill. Sir Charles Dilke, M.P., offered some suggestions. The Board of Trade was the department of the Government to deal with this question, and he therefore would advise the committee to form a deputation to wait upon Mr. Shaw Lefevre. They should request the Government to bring in a Bill for the object desired. The principal clause of the Bill should be one which should fix the maximum compensation in cases of accident at 100*l*. Resolutions approving the object of the meeting were adopted unanimously.

Two Men Suffocated in a Sewer.—In Dublin two men have lost their lives in a large sewer which was being cleaned. The men went down to begin work, and had scarcely reached the bottom when they were heard to cry for help. They then fell, evidently overcome by impure air. Without any delay two men were sent down in a bucket to their assistance, but they were also overpowered by the rush of poisonous gas, and had to be drawn up. Efforts were again made to rescue the poor fellows, but they were unavailing for upwards of an hour, when a young man succeeded in fixing a hook to the clothes of one of the deceased, and he was thus brought to the surface. The tide had meanwhile risen and carried the other body up the sewer for some distance, and it was not recovered for a considerable time.]

Industrial Dwellings.—The annual meeting of the Improved Industrial Dwellings Company (Sir S. Waterlow's) was held on Tuesday. The report showed an available total of 4,131*l*, and recommended a dividend at the rate of 5 per cent. per annum, leaving 1,623*l*. to be carried forward. The subscribed capital is now 125,000*l*, the amount to which the directors propose to limit it, and which practically represents an available total of 250,000*l*, a sum corresponding to the amount of the subscribed capital being obtainable at 4 per cent. from the Public Works Loan Commissioners. Until the whole of the 250,000*l* of subscribed and borrowed capital has been actually invested, the directors do not propose to recommend higher dividends than at the rate of 5 per cent. per annum. The report and accounts were read and adopted.

Holloway.—The foundation-stone of a new Roman Catholic church has been laid in Edengrove, Holloway. The edifice is dedicated to the Sacred Heart, and the stone was laid by Archbishop Manning. The new church is being built according to the designs of Mr. Pownall, in the early English style, and will be of red brick, with a tower. The size is 90 ft. by 50 ft. The site is a good one at the west end of Edengrove. The cost of the edifice, with glebe-house and schools attached, will amount to 7,000*l*. Mr. Carter is the contractor.

Free Libraries.—The Hon. Auberon Herbert (brother of the Earl of Carnarvon) proposes to devote a sum of 1,000*l*. to the encouragement of free libraries in Berkshire. To Reading, as the largest of our Berkshire towns, he says, I offer 250*l*. and 150*l*. to any other five towns (including Oxford) which are the first to comply with the following condition—This condition is that an amount equal to that received should be raised by each town. Should any part of the 1,000*l*. be unclaimed at the end of six months, it will be dealt with as may seem best under the circumstances.

Mortuaries.—At an inquest held in Clerkenwell, Dr. Hardwicke, the deputy coroner, spoke strongly of the necessity of carrying out the provisions of the Sanitary Act of 1856, which provides for the establishment of public mortuaries. The condition of the parish death-houses was, he said, disgraceful. The jury were of the same opinion. The report of Dr. Little, a medical officer to the Whitechapel Board of Works, calls attention to the necessity for a similar provision in that district—a want which was pressed on the attention of the Board more than two years ago.

Agricultural Improvement in India.—The Duke of Argyll held out to the Indian Committee of the Society of Arts last week the prospect of a liberal scheme for the promotion of agricultural improvement in India. It will most likely resolve itself into several large agricultural societies, in which the native princes and zemindars will be invited to join, and which will be largely subsidised by the Government, for holding exhibitions and carrying on model farms.

Demolition of City Churches.—Two churches in the City of London are doomed partly to disestablishment and disendowment, and entirely to demolition. One is the church of St. Mildred, in the Poultry, where there has never been a congregation of more than two or three for many years past, and the other the church of Allhallows Staining, which has not had a vicar during the last three or four years. Both these churches are now to be taken down under the Union of Benefices Act.

Drink for Workmen during Hot Weather. A tablespoonful of Scottish oatmeal put into a large tumbler or small jug, and filled up with clear cold water, well stirred up, and allowed to settle until the large particles of the meal fall to the bottom, forms a refreshing drink in hot weather, and quenches thirst well. English oatmeal is bitter, and will not be so palatable, unless it be to those who have a taste for bitter drinks.

The Proposed New Bridge at Ongar.—At a meeting in the town-hall, Chipping Ongar, to consider the report of the Bridge Committee and the plans prepared by the county architect, Mr. H. Stooks, relative to the proposed bridge over the washway at Shelley, it was decided that the plans be accepted and the work commenced forthwith. The bridge will be composed entirely of iron, and will rest on strong abutments at each end.

Northern Architectural Association.—The quarterly meeting of the Northern Architectural Association was held in the Old Castle, Newcastle, Mr. Watson in the chair. After transacting some business of a purely formal nature, the members present proceeded to St. Nicholas' Church. They were there shown over the works in connexion with the restoration of St. Nicholas' Church and steeple, by Mr. Snellgrove, clerk of the works.

The Whitworth Scholarships and Exhibitions.—The competition for the practical work for the ten scholarships of 100*l*. each will be conducted by Colonel Rich, R.E., Mr. Manby (secretary of the Institution of Civil Engineers), and Mr. Marshall (secretary of the Institution of Mechanical Engineers). In addition to these scholarships, tena for the present year, Mr. Whitworth has just offered to the Science and Art Department eighty exhibitions, of the value of 25*l*. each, to be awarded to students in the universities, colleges, and schools, public and private, in the United Kingdom. These exhibitions are to be held for one year, and the students must show an aptitude for mathematics, mechanical science, and drawing.

Conference Hall, Islington.—The first stone of the new Conference Hall, Midway Park, Islington, was laid on Wednesday, August 4th, by the Rev. William Pennefather, vicar of St. Jude's, Midway Park, before a large assemblage. Messrs. W. G. Hahershon & Pite are the architects; Mr. W. T. Turner, of Hornsey, is the builder; Mr. Daniel Smith is clerk of the works. The hall, when finished, will hold 2,300 people.

Works in Exeter Cathedral.—It is stated that the choir of Exeter Cathedral is to be restored by Mr. Gilbert Scott, at a cost of upwards of 12,000*l*. towards which the Chapter subscribes 3,000*l*., the Bishop of Exeter 1,000*l*., and the Dean 1,000*l*. This is part of a great work of restoration at a vast cost, which, it is hoped, the means will be forthcoming to carry out in portions from time to time.

TENDERS.

Accepted for conservatory and vinery to the Hall, at Peckering, for Mr. James Mitchellson. Mr. J. Gibson, architect. Quantities supplied:—

Mason and Bricklayer's Work	
W. & G. Salton	4210 0 0
Carpenter and Joiner's Work	
Kirby & Kinsdale	218 0 0
Plumber and Glazier's Work	
Gray	92 5 0
Smith's Work	
Fletcher, Brothers	137 10 0
Painter's Work	
Firth	40 0 0

Accepted for villa residence, Rookingham-terrace, New Malton, for Messrs. J. Slater & Sons. Mr. J. Gibson, architect. Quantities supplied:—

Mason, Bricklayer, Plasterer, and Slater's Work	
Wood	4399 13 0
Carpenter and Joiner's Work	
Dodsworth	204 0 0
Plumber and Glazier's Work	
Leefe	36 13 0

For new shop-front and alterations to premises, at New Malton, for Messrs. J. Slater & Sons. Mr. J. Gibson, architect. Quantities supplied:—

Dodsworth	4305 13 0

(author of "Home Reform," and "The Physical Condition of the Labouring Classes") will be found a summary of the efforts at home and abroad to improve the "Healthy Homes" for working class women. A most valuable handbook.—"The Builder."

To be had at the Office of the Society for Improving the Condition of the Labouring Classes, 4, Abchurch Lane, Strand, near 77, also Designs for Cottages, numbered on sheets, with Specification, &c.

New Edition. Royal 8vo. cloth, 3s. 6d. BLUNT'S (I. J.) SKETCH OF THE REFORMATION IN ENGLAND. Illustrated with full-page engravings. London: WILLIAM TREGO, Paternoster Row, Chesapeake.

PERFECTION IN BOOKKEEPING.

Builders and others desiring a really good system can have a SET OF BOOKS FOR BUILDERS (ROYAL PATENT SYSTEM), to which was awarded the Prize offered in "The Builder," No. 138 and which has been adopted by many large firms. Also, a medical arrangement by Single Entry, suitable for small Builders.—Address, R. A. St. George's-road, Regents Park, London.

TESTIMONIALS.

"I have tried your system of bookkeeping, and like it very much."—"O. D." "Your system seems thoroughly to meet our requirements."—"J. & M. H." "As long as your system is in use, and I shall adopt it."—"W. W." "Having adopted your system of bookkeeping, we can recommend it to the builders generally. Having had it in use ever since we began, we find it takes much less time to keep the accounts than formerly."—"R. & M." "I received yours in due course. They appear to show an excellent mode of bookkeeping. Your directions are most explicit, and sufficiently explanatory."—"O. C." "Messrs. R. A. & S. have examined your system, and consider it simple, clear, and very satisfactory."—"I greatly appreciate your plan and system of keeping builders' books, and am convinced that it will be made known, and be generally adopted."—"T. H." "I am glad to hear you have improved your system of bookkeeping. Since then we have been keeping the accounts according to it. I consider it the best system. It meets the requirements of contract work perfectly."—"T. R. H." "I received your models. They fully meet my expectations."—"A. B." "Your system of bookkeeping appears to me to be excellent."—"G. O." "The model form of books you sent me is very good."—"G. C." "Your plan of bookkeeping has given me many good ideas."—"J. H. C."

The Builder.

VOL. XXVII.—No. 1385.

History from Marble.*

MONG the literary treasures of the library at Stanton Court is a manuscript quarto, profusely illustrated with clever pen-and-ink sketches of churches, gentlemen's seats, monuments of many kinds with their epitaphs and arms, preaching crosses, pulpits, seals, coins, stained glass, and other objects in which architects, artists, and sculptors are specially interested. On its carefully set out title-page are two female figures—the one representing Sculpture, the other Painting—who are holding up a curtain, on which is written, "History in Marble, being Ancient and Modern

Funerall Monuments in England and Wales, by T. D. Gent." From dates appended to some of the sketches, we perceive it was the work of different years in the latter half of the seventeenth century; and from the signature of the author to others, we learn that T. D. was Thomas Dingley. There is scarcely a page in the volume that has not one or more sketches upon it depicting antiquities in different parts of the country, but most frequently in the counties of Herefordshire and Wiltshire, and the cities of Bath and Oxford. Thanks to the free-hearted generosity of Sir Thomas E. Wynnionton, this interesting record has now been published by the Camden Society. The new art of photolithography has been brought to hear upon the task by the council, and instead of printed copies of the notes, with woodcuts, or lithographs of the sketches, they have produced, with the aid of Mr. Vincent Brooks, *fac similes* of the work. Every page is reproduced by this process, line for line, stroke for stroke, erasures and mistakes; the only difference being that the red lines ruled round some of the drawings by way of finish appear to be as colourless as the rest.

Mr. J. G. Nichols, who has written an introduction to the work, tells us there are two other manuscripts by the same author in the library at Stanton Court. One of them is a journal of a "Journey in the Low Countries," and the other, "Observations in a Voyage in the Kingdom of France." Two more, relating to antiquities in Ireland and Wales, have been published recently by the Kilkenny Archaeological Society and the Duke of Beaufort, respectively; and a sixth, a commonplace book, likewise full of pen-and-ink drawings, is mentioned in a catalogue as having been offered for sale in 1864, but is now, unfortunately, lost sight of. From casual statements in his MSS., Mr. Nichols has been able to trace out somewhat of the history of the author, and having ascertained that he lived at Dilwyn, he visited that parish, and was rewarded for his trouble by finding in the register several frag-

ments that had once formed portions of this "History in Marble," relating to the monuments of the church, and those of the neighbouring parishes, stuck upon the first page of it. The biographical facts collected, however, amount to scarcely more than this. He came of the ancient family of Dingley of Woolvorton, believed to be a branch of a still more ancient family in Lancashire; was educated by James Shirley, post-laureate; admitted of Gray's-inn; travelled in the Low Countries, in France, in Ireland, in Wales, in the suite of the Duke of Beaufort, and perhaps in Italy; had a residence at Dilwyn; and died, while on further travels, at Louvain, an old bachelor, leaving his possessions to a niece.

Mr. Nichols also gives a brief account of works of a similar character to that which Dingley compiled for us. He reminds us that before the revival of appreciation of ecclesiastical architecture, church notes and monuments were held in high estimation by genealogists and biographers. He says professional heralds deemed such evidences among their most reliable materials, and when they went on their visitations they made a point of gathering church notes, as well as notes of the armoury displayed on the walls and windows of manor-houses, to assist them in the construction of genealogies. Their visitation-books are enriched with many such notes. Amateurs pursued the same course when heraldry was a favourite study. Camden, both before and after he was a professional herald, collected church notes. Stowe gave many of the epitaphs of the metropolitan churches. Strype, Seymour, and Maitland followed in his wake; and more recently Malcolm, the Lysons, and Hutton. Then we have Weaver's "Funerall Monuments;" the Diary of Richard Symonds, a cavalier in the army of Charles I., printed by the Camden Society; the magnificent work of Gervase Holles, a colonel in the service of the same monarch, preserved in the Harleian collection, though not yet printed; and Dugdale's most industrious labours, all belonging to the seventeenth century. Topographers took up the subject about this time, and made church notes a feature in their works. About a century ago Gough published his "Sepulchral Monuments;" and since then Stothard and Blome have worked in the same field. As we look down the long list of antiquaries and topographers who have taken church notes, Dingley's book falls into place and becomes a link in the chain of great interest.

The first entry in his curious collection is an alphabet of arms, or catalogue of the arms of families not mentioned in other forms in the course of his work. This is immediately followed by an east view of Bath Cathedral, and a note of "Advice from a Father to his Son in ye University:"—

1. Serve God, that will make you a good Christian.
2. Follow your study, that will make you a good scholar.
3. Keep within compass, yt will make you a good Husband.
4. Be humble and mecke, that will make you a good man.

By the careful performance of these—

1. God will be glorified.
2. Your college credited.
3. Your father comforted; and
4. Your self commended."

And on the next page we find the antiquary in the interior of the cathedral, sketching. He gives a view of the edifice, however, from the south-east before he stepped inside, and then goes on to note the position of the principal tombs, giving the heraldry, sketching the pulpit with its inscription, and copying a great number of the epitaphs. We give a sample of his mode of treating the latter:—

"Upon ye wall is seen this ancient inscription or Rebus, following which in the late times of usurpation of Crowwell, being read by a person of Quality, Loyaltie, and Honour, startled him; the words are—

The trees going to chase their King,
Said hee to us thou Oliver King.

But upon inquiry he was informed by one learned in the records that this was wrote in honour of one Oliver King, abbot of a monastery yt layed the foundation of this

minster. This inscription is allusive to a passage in Judges, where the trees consented to choose them a king, and pitched first upon the Olive, in French named Olivier, though at last the bramble carried it."

But for its length we would give the epitaph upon the "right virtuous and worthy lady Jane Lady Waller;" close by, which, he says, "though neither silly nor witty enough to deserve note, followeth." But we must pass on. The King's Bath, the Queen's Bath, the Cross Bath, the other places of note in the city, and the Roman antiquities, are all duly represented. There are two views of the King's Bath. We are shown a large oblong tank of water, in the centre of which is an arcaded erection surmounted by a spire and finial, and inscribed "This pump was set up directly over the Hot Spring at ye charge of the chamber of this city, by the advice, order, and direction of ye Honorable Sir Alexander Frazier, Principall Physitian in Ordinary to his Majesty." A walk with an ornamental parapet surrounds the water, and an archway gives access to the Queen's Bath adjoining. Near the door, too, of a pump-house, intended for those who drank the waters without bathing, was a long inscription, wherein Richard Roe testified to the healing qualities of the springs, which he also copied, calling it "a dull though honest acknowledgment of a Parson set out with poetry of the same stamp." Against the north view of this bath, "taken from ye Widow Walker's house," he wrote, "Here note that these baths are not in an wholesome condition to be used continually, but require a time of cleansing from ye sordid scum, not only exhaled from foul bodies wreaking and padding therein, but what by ye heate and working of yt is cast up. So that until they are drawn and cleused, entrances is forbid to the Patients resorting hither for health."

Mr. Dingley calls Bath the prettiest city in the kingdom, "in a double construction, for it is little and handsome." He describes the properties of the waters, and then states that the sole manufactures of the place are apothecaries' wares, and good mutton the only commodity. "But," he continues, "the people chiefly get their bread by their water,—I mean the baths; and those clownish fellows and ugly old witches who never knew how to govern themselves are yett guides to others. To these may be added also a masculine sort of *bona roba* women, which attend you at your lodgings and are called rubbers. The continued noise in the King and Queen's Bath is not unlike that at Billingsgate, London, in Maguaret's time."

Some of the monuments in Winchester Cathedral are next given; Southampton is slightly touched upon; Chippenham visited and "touched off," to use the author's quaint expression; and Rowd Charoh sketched from the road: "In it ye minister teacheth school, and by reason of ye intolerable cold of the winter 1684 he erected a chimney therein. Inscriptions in this church ure none of account." A stage-coach running between Bath and Bristol during the season, fare half-a-crown, appears to have afforded him facility to see Bristol, where he made sketches of all the best monuments. Against the drawing of the handsome Tudor tomb of Sir Charles Vaughan, he noted: "He heareth saith a chevron between three children's heads, coupled at ye shoulders, Argent, their perrigues Or enwrapped about the necks, with as many snakes proper by ye name of Vaughan. It is said (how true I know not) that some one of ye ancestors of this family was born with a real snake about his neck." Among other entries made when in this neighbourhood, he records a remarkable gathering of aged persons, longevity being, by the bye, a subject to which he refers more than once:—

"In Bitton Hannam parish, near Bristol, ten yeers ago from 1681, were twenty-four men able to ride in one day and capable of being jurymen at Gloucester, which made above three-and-twenty hundred and fifty yeers."

St. Mary's, Redcliffe, is sketched, and the monuments of Sir William Penn and William

* History from Marble. Compiled in the Reign of Charles II. By Thomas Dingley, Gent. Printed in Photolithography by Vincent Brooks, from the original in the possession of Sir Thomas E. Wynnionton, bart. With an Introduction and descriptive Table of Contents, by John Gough Nichols, F.S.A. Printed for the Camden Society, 1867-8.

Canyree, the so-called founder, with their epitaphs, are given; and a recumbent effigy of Johannes Lavington, then in an office belonging to the school-house, was also made a note of. St. Antin's Church, too, was figured; and before he left the city Mr. Dingley seems to have peeped at the Mayor's sword as one of the sights, for he says the "best sword of magistracy" belonging to it is called the Pearl sword, on account of the pearls set in its scabbard. He quotes the inscription upon it:—

"John Welles of London mayor
Gave to the City this sworde faier."

Gloucester Cathedral is sketched from the south, and a list made of its curiosities, including the whispering place, a "picture of ye Virgin Mary painted in ye window glass," and the royal tombs. The monument of Robert Courthorpe, earl of Gloucester, surrounded with the arms of the nine worthies, and the sepulchral brasses of Thomas Payne, and his wife Ursula, are the chief objects in the interior that he depicted.

His stay here seems to have been short and insufficient, as he has added the initials of a friend to one epitaph, which he probably inserted afterwards to make his account fuller. Thence he took Oxford. This was the birthplace of Richard I., he records, at the palace there called Beaumont. When looking over Christ Church College he remembered to look for the carving over a window of the porch-tower which Cardinal Wolsey caused to be put up, representing a bull-dog gnawing a shoulder of mutton, about which there was some talk in those days. At St. Mary's he sketched the college arms and entered several epitaphs; and going on to Oriel College, he was shown the brown howl of the first provost, wooden, and tipped with silver about the brim, and ornamented with a boss in the centre of the same metal, with a Latin inscription on the rim. Wadham College, too, he saw, and copied the arms and inscription over the gate. But the last entries relating to his investigations here are interpersed with those made at his next destination, Windsor, an isolated achievement belonging to Cirencester, and the monument of Cowley, erected by the duke of Buckingham in Westminster Abbey. Among the curious epitaphs he gives as "somewhere in Oxford," the verses upon a bellows-maker, that have been attributed to Ben Jonson, and another of a similar light scoffing character, upon an ale-wife, called Gannier Trueman, who died of dropsy, after being tapped in the leg:—

"Here lyeth one, disprove it who can,
Who lived a woman yett dy'd a Trueman.
Amongst all her skill this was her cunning,
Whilst one leg stood still the other was running."

The cathedral city of Hereford enjoyed considerable care at our author's hands. He drew a group of cottages on the road, the cathedral, when it came in sight, the west front that has since fallen, the inscriptions on the bells, the preaching cross, now fallen, the white cross, which in our time has been restored by Cottingham as to its base, and by Mr. Scott in its upper stage, St. Ethelbert's well, now destroyed, the town-hall, and a large number of the brasses, marble monuments, and gravestones, and the silver mace of the cathedral. Among the effigies Dingley shows that of Sir Richard Pembridge, which was originally in the church of the Black Friars, but conveyed to the cathedral at the dissolution. It is placed upon a tomb between two pillars, and he shows his shield hanging upon that at his feet. It was then mutilated, one leg only being drawn. In these days his leg has been restored and his helmet taken away. The Rev. Lord Saye and Seal went to the expense of the restoration; and the jousting helme,—we speak on the authority of Bloxam's "Funeral Rites of the Middle Ages,"—has been taken down and presented to Sir S. E. Meyrick.

There are other vicissitudes of fortune to be made out by means of Mr. Dingley's record. Thus he sketched the font in Leominster church, where there is now a modern one; and that he delineated has been recognised by Mr. Curzon serving as a bowl in a cottager's garden. Curious questions of identity, too, arise as his pages are scanned. He sketches a recessed tomb and effigy of Robert Kilwardby, Bishop of Hereford, 1285, the recess of which is still to be seen minus the effigy, which has been replaced by that of a modern layman, although there was never a bishop of Hereford of that name. Mr. Nichols explains that a bishop died in the year

mentioned, but he was Thomas de Cantelupo, afterwards canonised, a fresco of whom is also shown, and that Robert Kilwardby was the name of the contemporary Archbishop of Canterbury. Another peculiarity belongs to some of his drawings. They are marked with letters for references to keys, and these letters sometimes spell out THOMAS DINGLEY; and some of his best drawings he inscribes with dedications to his friends, whose names are, in this way, handed down to us.

The second portion of the work opens with notices of the churches of Stoke, Edith, Stretford, and an account of the town as well as the church at Weobley. Of the last-mentioned place, he says, "This town hath more fair cellars than most market towns of its hignes in England, hence the Welsh of South Wales furnish themselves with ale, which they bought up in bogs-heds, barrels, kilderkins, and other vessels, and sold and feasted the friends with in Wales by the name of Coragh Dah. Since the increase of good eyder the Bell for Weobley's Ancient Ale." Part of the spire of the church in this town is shown as absent, it having been blown down in a tempest in the year 1640, and not repaired for many years. One of the bells Dingley thought must be Saxon, as he copied the rude characters of its inscription, in which conjecture, however, he was probably mistaken. Tedbury, with its church and hospital, with the portrait of the founder of the latter, Hugh Foliot, Bishop of Hereford; Pembridge church and almshouse, and Bradwardine visited; and we find ourselves at Dilwyn, the residence of the author. Here he surpassed himself in minute attentions to details. His view of the interior of Dilwyn church shows the nave with north and south aisles and chancel, a flat-timbered roof, the pulpit, "reading pew," the tablets inscribed with the Ten Commandments, the entrance into the chancel, and the seats of the leading inhabitants are indicated by letters referring to a key furnished below the picture. He gives an epitaph from the churchyard upon a child of Wm. Taylor, of Boisfield, buried there about the time he was making his sketches of the venerable edifice:—

"Here lies a Tailor, garments never made
A Taylor, yett no Prætoric to the trade;
But Deary's his master, Parents never mourn,
For when his time's expir'd, he will return."

Monkland, Pershore, Evesham are visited, and other antiquities figured, before the author shows how Worcester Cathedral appeared in his time. When at Worcester he first gives us an epitaph on a gentlewoman who fell dead while striking a ball upon the palace-green, and then sketches a north view of the cathedral, which he calls a college. He notes, first, among the monuments six "fair figures" kneeling, two and two, in their ancient decent habits, which are the memorials of the Moore family, and then he goes carefully round noting a great many others, including the epitaph of Prince Arthur, son of Henry VII., and figuring most of them of any architectural, sculptural, or heraldic character. Queenhill Church, Spetchley, Ripple, Norton, Fladbury, are next taken in turn, and at Crowle Mr. Dingley sketches the coffin-lid of the celebrated Moore, last prior but one of Worcester. Then Burford Church, in Shropshire, with its fine monuments of the family of Cornwall, and its epitaph on the heart of Edmonde Cornwall, esq., who died at Cologne, 14 Henry VI., attracted his attention; only, however, to relinquish it in favour of the churches of Leominster, Harkirk, and Cropton. In the last-mentioned church there is a remarkably fine monument to Francis Dingley, upon which is set forth the descent of the family from the ancient kings of Scotland, and those of England, through his mother, who was a descendant of Edward I. This, with the manor-house of Charlton, the residence of the Worcester Dingleys, our author drew with great care, as being objects of especial interest to him. The epitaph of the representative of the family here mentioned shows that he, too, felt an interest in genealogy, like our author. Towards the close of a long inscription it says, he was "happily married with Elizabeth, the daughter of Tho. Bigge, esq., descended by his mother side of the noble family of Bruliges Salwey Bracey, at Brace, and Magdalene Hobbys wife, by whom he had eleven issue sons and eight daughters, and with whom, having spent the space of fifty years in comfortable wedlock, he died in peace, leaving behind him the precious memory of a zealous patriot, a worthy justicer,

a true friend to true religion, a great example of wisdom and valor." Elizabeth, his late consort, hath consecrated this mean monument of her love and his merits." No wonder Dingley was proud of his relative! Mr. Nichols compared his sketch of the old manor-house, in which this worthy resided, with its present remains, and found that about one-half of the structure is still standing, having survived a remodelling early in the last century. It had dwindled down, however, into a farmhouse since 1780, but has quite recently been purchased by Mr. Workham, who is having it restored to its original importance, with due regard for its ancient features.

As a pleasant change to the pagefuls of monuments of the dead, we read the bill of fare of a mighty banquet given at the installation of Archbishop Neville at York; but as Hoarne has also inserted it in the appendix to Island's Collectanea, it does not give us any new information. Mr. Dingley proceeds with his usual class of subjects at Tewkesbury, where he makes use of Dugdale's Baronage of England for some of his statements. His drawings here, too, are not so accurate as others. His monument of Abbot John is not so rich as the original, Mr. Nichols says; that of Abbot Richard Cheltenham is shown short of a shield in each spandrel; and the cross in that of Abbot Alan is totally unlike the actual one. Again, he confused the Bryans with the O'Briens or Fitz-Briens; and an effigy now assigned to Abbot Wakeman he attributed to a man found dead in Tewkesbury Park. His industry, patience, and regard for every record of the dead were by no means diminished, and his heraldry, notes, and sketches, are as numerous as in other instances. He lingered to draw the chapel of the Lady Isabella Le Despenser, who died in London at the convent of the Minories, 1439, but whose body was brought here and buried on the right hand of her father. The arms in the painted windows he also loitered over; and he copied the inscription of a tombstone even with the pavement, that he knew would interest his friend, Mr. Ayle, who furnished him occasionally with some of his information. The communion-table he did not pass unheeded, but sketched it for the sake of its "marble top not to be paralleled in England for its Bigness and Beauty, being in length 13 ft. 3 inches and an half, in breadth 3 ft. and half, and 9 inches wide." He took down the inscriptions on three bells, but as he left a blank space in which to state the total number, it is to be presumed he did not mount to inspect them personally; and he looked into the churchwardens' book of accounts:—

"In it I find these remarks A 1378. There is said Payd for the Playes Geer (for that playes were acted nere ye church) six sheppskins for Christ's garments. And in an Inventory recorded in the same book A 1585 of the same geer, there are mentioned in these very words and order, 8 heads of hair for the Apostles and ten beards, and a face or visor for ye Devil."

By and by, Mr. Dingley copies from his friend's paper an account of the opening of a tumulus at Leek, when some stones were required to pave the town, in which an urn with some writing on a parchment relating to some hidden treasure was said to have been found. Wolverhampton seems to have come under his own notice on his road, perhaps, to the next place described, Lichfield Cathedral. And here we have another break, consisting of a set of "Apothegms taken at several times from King James," from which, although not altogether new, we may make this selection, as a vindication of his right to the title of Solomon: "Much money makes a country poore, for it sets a deep price on everything." At Lichfield he noted the stained glass figure of Anne (Neville), Countess of Stafford, the arms of Elizabeth, Countess of Kent, the lists of preachers and feasts, the monuments of Lord Paget and Colyngshed, the emblems of the Crucifixion that, perhaps, had formerly figured in miracle plays, and various inscriptions. Warwick, however, allured him, and he was there scanning the collegiate church, and sketching another lady on a stained glass window, Eleanor, Duchess of Somerset. Then Stoke Castle, Albrighton Church, and Whitchurch successively drew his footsteps towards them. Whitchurch, where Hotspur was torn apart by Richard, fell down in 1711, but the monument of the first Earl of Shrewsbury, drawn by Dingley, is preserved in the new building. Coming so close into Wales, he naturally transcribes a poem in praise of the leek. Lincoln is next visited, with, however, but slight mention; then Cheshire, with Malpas Church, Banbury Church, and the principal churches in Chester, with the cathedral, are

examined, and their monuments, brasses, and inscriptions entered in his journal. The monument he considers most noteworthy in the city he describes as being in Trinity Church, "in marble, in armor, with a shield, which I have touched off." It is the effigy of John Whitmore, who died 1478; one of whose descendants, George Whitmore, was Lord Mayor of London. We must give one of the Chester epitaphs he dotted down in St. John's Church:—

- "1. To God, 2. To Prince, 3. Wife, 4. Kindred, 5. Friend, 6. The Poor.
 - 1. Religious, 2. Loyal, 3. True, 4. Kind, 5. Steadfast, 6. Dear.
 - 1. In Zeal, 2. Faith, 3. Love, 4. Blood, 5. Amicitie, 6. And Store.
- He that so liv'd, and so deceas'd lyes here."

A large space is next given to the monuments in St. Paul's Church, London. Some he has copied from Dugdale; but, on the other hand, he gives some that Dugdale does not. Four gravestones, with brass plates in a row, especially are noticeable in this work which do not appear in the other. An epitaph on the tomb of Sir Francis Mansell he copies in St. Gregory's "by Paul's" and then, like a sight-seer as well as antiquary, he wended his way without loss of time to the Temple Church. Here he made a somewhat longer stay, captivated, doubtless, by the stores of archaeological treasure, and copied the epitaphs of Wye, Quatreman, Portman, and Selden, and some of the monuments, St. Bartholomew's, behind the Royal Exchange, detained him, to give an account of the monument of Sir William Capel, and transcribe the epitaph over Miles Comerdale, bishop of Exeter; and then he made his way to Westminster Abbey. Here, of course, he would suffer from that embarrassment of riches that afflicts most collectors some time or other. His first selection is the mention only of the tomb of Edward I, erected over his father Henry III, and then he gives a drawing of Edward's own tomb. It would take up too much space to follow his footsteps round this great tomb-house, as it has been somewhat irreverently called; for he filled nineteen sheets before he thought it was time to cease his recordings. St. John's, Clerkenwell, at last tempted him away, for we find the shields on the gatehouse, and the shields over the gate of the Earl of Elgin's chapel in the church next "touched off." St. Bride's, Fleet-street; St. Olave's Church, Old Jewry; St. Dunstan's in the West; St. Stephen's, Walbrook; St. Andrew's in the Wardrobe; St. Olave's, Silver-street; Great St. Bartholomew's, the Charterhouse, Mercer's Chapel, Savoy Hospital, successively attracted him, only for cursory glances and notes, the remembrance of the riches of the Abbey willing him back again for further study. In this second batch of entries relating to Westminster he drew the cradle which represents the tomb of the Princess Sophia, the youngest daughter of King James, and the inscription upon the coffin-lid of her sister the Queen of Hearts, as her Bohemian subjects named her; also the epitaph upon the monument of her grandmother, Mary Queen of Scots,—three magnets of sufficient power to have drawn him from a still greater distance. The Inns of Court come in for mention of their arms; and, after notes of the arms of Philippa of Clarence in St. Katherine's Church, and the tomb of John Gower at St. Mary Overy's, his London visit appears to have come to an end. Among memoranda of antiquities seen in other parts of the kingdom, we find one glance sent back to the metropolis. It is an epitaph "on two fat men lying in one grave" in St. Sepulchre's,—

"Here lies Robert Digges and William Digger, There's no living soule knew which was the bigger; They fared well and liv'd easy, And now they're both dead, and y^e shall please ye."

The close of this book brings us nearer to his own neighbourhood; and it is cheerful with views of pleasant manor-houses. Corsham, about six miles from Bath, is comparatively fully described. One monument in the church of this place the sexton told him had been drawn there from the quarry, one entire stone, by twenty-four yoke of oxen and steers, which number of yokes are represented on the monument doing duty for punctuation to the inscription. Lacock Abbey is also delineated with precision and profusion. There is a view of the exterior and of some of the enrichments of the interior. "The offices of the house," he says, "are very large, necessary, and faire, with aqueducts to each through leaden pipes from Bowden Hill, sending down admirable water. The kitchen is famous for a large potage-pot, founded of bell-metal, for the use of this abbey. It was cast in Malmes-

or Mechlun, in Flanders, little less than two hundred years ago, as appears by the following inscription in Latin round it helly. It is capable of nine bushell of pease, Winchester measure. The shape I have touched off in this sketch;" and by the side of this note stands a huge three-legged pot, furnished with two handles, and enriched with a legend round the widest part of the girth. When he looked upon it, on St. George's day, 1684, there were turnips growing in it. He admired the "fair vaults" of this place, then employed as cellars, larders, and the immense trough in the wine-cellar that set every one who saw it wondering how it could have got there; and passing out into a quadrangular court enumerates the purposes of the buildings around it. The roof of the cloisters, with its figures illustrating the vices, and its arms, he also dwells upon. The monuments in the church are very numerous and rich, and occupy several sheets. The fine brasses of Robert Baynard and his wife Elizabeth are amongst those drawn. A pedigree of Richard Talbot, temp. William the Conqueror, and an epitaph for Robert Rich, third Earl of Warwick, inscribed to his son, are the last entries made by this persevering personage.

We must compliment Mr. Nichols for his careful editorship of this curious relic of hygone days.

ULTRAMARINE REFLECTIONS.

THE *Revue des deux Mondes* for July 15th contained an elaborate article by M. Ch. d'Henriet, under the title "Les Ecoles des Beaux-Arts en Europe," which, in addition to the interest arising from the nature of the subject, and the very full information conveyed as to the regulations and practical working of the Parisian schools of art, is varied by occasional comments which may not inaptly suggest a remark or two in the way of criticism, both adverse and otherwise, on our part. On one point, at least, we are thoroughly with the French critic. After a very detailed review of the history and present state of the French School of Art, and the great facilities afforded for acquiring accurate technical knowledge, he says,—

"We must note one cause of decline which was seriously felt under the old organization, and is still sensible under the new: the greater part of the students are deficient in general cultivation. They even boast of this, and are very willing to mistake their ignorance for independence. Such a confusion of ideas is to be regretted. The Greeks, to whom in such matters one must always return, knew nothing of it. We know that Pamphilus, the master of Apelles, exacted from his disciples ten years of close study in his atelier, together with a profound knowledge of history, literature, and science. . . . Too many of our sculptors are fully persuaded that statutory demands nothing more of them than the knowledge of superficial forms, the study of antiquies, and the education of the hand. Those among contemporary artists who have not been content with this slender baggage, nor seen in simpler acquisition any danger to their originality, have no reason to repent of this. Their works have an unmistakable and readily recognized stamp upon them."

In days when shallow rough-and-ready critics, or would-be critics, amongst us are endeavouring to reduce all pictorial and sculptural art to the level of mere clever and exact imitation, it is well to give as wide as possible a circulation to any well-judged and temperate protest in the opposite direction. At the same time it is gratifying to learn that this disdain of general education is not the same in all branches of art. "Les architectes sont ordinairement fort portés à s'instruire. Ces ouvriers trouvent leur raison d'être dans l'ensemble des connaissances très variées que réclame l'architecture." This view of architecture, as the art which more than any other deals in recondite and abstract sources of beauty, not even cognisable save by a well-educated mind, has been so often and so strongly insisted upon in these columns, and is yet so little generally recognized, that it is quite refreshing to meet it again in the pages of what has been termed the "first review in Europe." But, alas! when will our own architectural students be "fort portés à s'instruire"? Further on M. d'Henriet justly observes that,—

"The ensemble of studies which is for the most part sufficient for a painter, is nevertheless a very different thing from that amount of precise knowledge which an architect, to be a complete artist, cannot dispense with. He must lay hold closely on his science, and make himself master thereof. He must, besides, have some notion of all that has been done before him, must institute comparisons, must travel, must in some measure, even as the pious Æneas and the wise Ulysses, have seen the cities and the manners of men. Mere natural acuteness will not enable him to comprehend or divine that which he is bound to know."

While giving credit to recent and present French Governments for their liberal patronage

of art and provision for art-instruction, M. d'Henriet is not, however, blind to the evils attendant on governmental interference:—

"Our architects," he says, "wait but the word to give proofs of their invention, their knowledge, and their taste. But they have hitherto been too much restrained and hampered by the caprices imposed on them by (Government) commissions; we have made an administrative architecture. Those artists who are not sufficiently pliable are removed, and replaced by others more amenable to discipline. The painters have not passed under the yoke to the same extent, but we could mention those, nevertheless, who have shod in their tents rather than submit to conditions which seemed to them unreasonable."

And elsewhere he observes,—

"The mistake of the administration has been to get into the habit of domineering over everything; the mistake of the artists has been to end in accepting this as the natural order of things. Art is not a business plant, receiving as a beneficent dew the favours of Power."

"That art may attain its brightest bloom, it is not necessary to contrive for the artist easy legitimacies and pleasant paths; art puts up ill with such niceties. We can connect it with the throne, as has been said, in placing it under the hand of an administrator or of a soldier; but we shall not by such means give it a more racy flavour (*plus de saveur*)."

In all which is wisdom. M. d'Henriet, be it observed, dates the popularising of art in France from 1789, before which there had never been any public exhibition save for academicians, whose works were hung "par rang d'ancienneté;" other painters having to content themselves with an annual exhibition in the open air, on the *place Dauphine*, and which lasted two hours. It is possible, however, to have too much even of patriotism in art, if we are to believe the statement, that some years ago the competitors for the prize for medallion designs in the French Academy were invited to represent *la France dotant l'Algérie de puits artésiens*. "Il faut supposer chez un artiste les facultés d'abstraction bien développées pour lui imposer cette patriotique, mais froide allégorie." Truly!

In the second part of the article, devoted to the art schools of other nations, we read that "l'Angleterre," which has done a good deal lately for popular instruction in drawing, seems little inclined at present to encourage art-study of a higher kind. Then follows some account of the Royal Academy, where among other things the writer notices the "faits caractéristiques" that the "jennes gens, à moins qu'ils ne soient mariés," are not admitted till their twentieth year into the studio where "one draws" from a living model "do sexe féminin." We might retort by a hint at some "faits caractéristiques," as to the choice of subjects in French art; still it must be admitted that our national character has in it a good deal of that false modesty called "pridishness," and which is certainly a quality very much adverse to a due appreciation of art. More astonishing is the reason assigned for the fact (if it be a fact) that the most promising of our art-students do not go much to Rome to complete their education, as the French do. Why, does the reader think? "Les Anglais ont si peu de goût pour le qui est l'Papisme." We venture to assure M. d'Henriet that our art-students do not trouble their heads much either about the Pope or Exeter Hall.

But what follows is worse still:—"Those who travel for the most part return very much as they set out; they know more, they have seen more; but they have very little changed their manner. *L'art étranger n'a guère pris sur le Saxon.*" Thinking of some of the developments of "l'art étranger," we are minded to say, "Thank God for that, at all events." But which manner does our French critic mean to say that we do not change? For we have twenty at least. And, seriously, the charge, coming from a Frenchman, is surely open to a retort of *tu quoque*. If there be one nation more than another which is bound down in its art to certain national types, which is incapable of judging of works of art save by its own national standard, that nation is the French. Our own fault is much more in the other direction, viz.—that we have no fixed path and no national style (unless a general absence of style be accepted as such); and French artists might with some justice bring against our art the charge made by Wordsworth against their own literature, as having

"No code, No master spirit, no determined road."

But to return to M. d'Henriet's comments upon us, which we will give as far possible in his own words. If it be true that a considerable number of our artists go to study in France and Belgium, they are practically none the better for it, for when they return the last thing they think of is

of grand studies or beautiful compositions. "Ils s'entendent avec un marchand, et produisent couramment la peinture que réclament les acheteurs." We wish that examples of the truth of this statement were more exceptional than we fear they are. "Ils se complaisent aux effets de lumière dure et intense, comme les Russes du nord." (He means that there is some light and atmosphere in our landscape.) "Ils ont en bien et en mal certains préjugés esthétiques maisés à défrancher." This, we sadly fear, is as true a remark as ever was made; but "aesthetics" never were our strong point; it was because we had not the thing that we thought it well to borrow the name from Germany. "Ils detestent de toutes leurs forces la sauvage peinture des Espagnols, et s'prennent d'une ardente passion pour deux Français d'Italie, Poussin et le Lorrain." Here, the good man is dreaming, and has gone back thirty or forty years. Has he ever seen a picture of Vicat Cole's, and will he show us where Mr. Cole is indebted to "Poussin et le Lorrain" or Mr. Graham, or Mr. M'Whitner either, for that matter. He thinks we excel in painting animals, which we execute "avec une grande sincérité," and in *genre* and landscape (we cannot return the latter compliment), and in the representation also, notably, of fields of corn in which one can count the ears (*moissons dont on peut compter les épis*). Oh! M. d'Henriet, *fi donc!* We can laugh at that, though; but, alas! "Quand ils abordent l'histoire, ils sont plus de médiocres." Thinking of Mr. Ward, we should like to be a little more indignant than we find ourselves able to be at this judgment; but the remembrance of certain paintings "on the line" at the Academy checks us. "Pour l'architecture, on en est resté par-delà le détroit à l'art ogival de Normandie," as, indeed, we know to our cost; and there we suppose it will rest, until every bit of plate-tracery has been sketched and reproduced a score of times, when it will be time to turn to something else.

In sculpture we have done nothing but a few statues "hors ligne," some of which, when one sees them in public places, "appellent involontairement le sourire." Our best works, let us say, are not in "public places," and some of the worst of those which are have not been the work of Englishmen, both which facts M. d'Henriet ought to have known if he went into the subject at all. Looking to the sculpture-room of the Academy this year, however, we cannot but join him in wondering at the poor estate of the art amongst us, particularly seeing, as he says, that we have in the British Museum the very finest of ancient models ready to hand. As to the painters, he thinks they have some reason to complain that they have not what they want. "Les galeries publiques sont fort incomplètes, et dans les galeries particulières, véritables propriétés féodales, il est difficile d'être autorisé à faire des études."

So much for the critic of the *Revue des deux Mondes* on the state of English art. If his views are strongly tinged by that national vanity which belongs as much to French artists as to English shopkeepers, and that thorough persuasion of the unassailable position of their own school of art which characterises all Callio artists, whether musicians, architects, or painters, it is yet instructive to see how our art-education and its results appear in the eyes of people so peculiarly gifted in systematising as the French have always been, and who, with whatever shortcomings from restricted and narrow sympathies, have at least the credit, more than any other nation, of seeing clearly what they want to do, and devising deliberate and well-considered means to that end. As to *la France* need we say that she is tolerably safe, in the eyes of our critic? In painting she has names which "certainly will yield to none in the estimation of posterity," and we will leave posterity to decide the point accordingly, not without suspicion that the verdict may be as M. d'Henriet thinks. In sculpture "nous tenons sûrement le premier rang," a happy confidence which we allude to in order to supplement an observation occurring immediately afterwards. The writer is surprised that certain critics wish to place the contemporary school of Italian sculpture by the side of that of France. The latter is mannered, wanting in grandeur, &c., though M. d'Henriet admits its exceeding "cleverness" (*habileté*); "mais est-ce surtout de l'habileté qu'on demande à la statuaire?" Most assuredly not; and we can only regret that the popular admiration lavished on such productions as Monti's "Sleep of Sorrow" should have tempted any of our own

artists to try the same *tours de force*, as, for instance, in the figure of "Salrina," in this year's Academy, a subject fit only for painting or very low relief.

M. d'Henriet cannot conceal, however, that the "monopoly of art is no longer with his nation." Stranger artists come to France nowadays already formed, and merely to consult her traditions and perfect themselves in practical details. This, however, only proves that the general level of art education is rising, and M. d'Henriet and his colleagues will never have the bad grace to feel hurt at this. Their superiority, if more disputed, will not be less glorious than before. "Ce que nous devons désirer, c'est non pas de nous enorgueillir d'une supériorité solitaire, mais plutôt nous montrer les premiers parmi nos pairs. C'est la formule de l'émulation moderne." And with this magnanimous and consoling sentiment we will close our remarks, before we feel tempted to spoil its effect by any poor words of our own.

SCIENCE AND ART.

TEACHING UNDER GOVERNMENT.

THE march and movement of scientific and artistic education throughout the United Kingdom is indicated by the annual reports of the Science and Art Department of the Committee of Council on Education. Of these the sixteenth has just been issued, under the signature of Lord De Grey and Ripon, and Mr. W. E. Forster, and a copious appendix enables the reader to check the accuracy of the inferences which their lordships have drawn from the reports of their various subordinates.

The results of the efforts to promote education of a technical nature may be viewed under two aspects—the absolute and the relative. As far as the first is concerned, we have no great cause to feel content with our position among educating nations. The total number of pupils included in "every institution in which scientific instruction is given" (of course, the expression must be held to be limited to those educational establishments which come under the purview of the official examiners), is stated at 15,010 for the year 1868. The grand total of persons taught drawing through the agency of the Department, during the same year, was 117,000. Now if these numbers be regarded as proportioned to the population of the United Kingdom, the advantage hitherto derived from the labours of the "Department," can only be called microscopic.

The population of the Canton of Zurich is about 260,000. In the year 1864, 25,797 scholars, between the ages of seven and thirteen, attended the communal day-schools. Every one of these scholars is instructed in drawing, and in the elements of natural philosophy and of geometry as well as in the mother tongue, arithmetic, history, geography, hand-writing, gymnastics, and singing. The contrast thus presented to our own country is striking. On the other hand, our science students have increased since 1860 no less than thirtyfold, 500 pupils only, in nine schools, having been under instruction in that year. In 1867 the number was 10,230, which has been subsequently increased by 50 per cent. The number of persons taught drawing in 1867 was 105,529, giving an increase of about 11½ per cent. for the year now under consideration. The expenditure of the Department, exclusive of the vote for the Geological survey, was 198,701l. 5s. 11d. in 1868, against 179,954l. 6s. 1d. in 1867.

When we descend from the general statements of the Report to the details sent in by the professional examiners and printed in the appendix, we become more and more impressed with the conviction that the very bases of a satisfactory system of technical education have yet to be laid. Mr. Bradley, in reporting on examinations in practical plane and solid geometry, machine drawing, and building construction, complains that "the pupils in the various schools have apparently only been set to copy diagrams, without having the principles of building construction explained to them;" and that, "as on previous occasions, the candidates have shown a reckless disregard of the general instructions placed on the paper." "The relation of plan, elevation, or co-ordinate projection is not explained properly to the pupils. They often place the plan and elevation in different parts of their paper, and often to different scales, and will select the plan of one subject, the elevation of another, and the section of a

third, in the most arbitrary and absurd manner, and do not appear to be aware of the futility of such proceeding."

In naval architecture, Mr. W. B. Baskcomb, the examiner, remarks on the rough character of the sketches, which ought to have been drawn neatly to scale, and on the attempts made to answer questions without the indispensable aid of diagrams; and remarks, that "the teachers, therefore, would do well to enjoin upon their pupils neatness and accuracy in drawing." Of what use are teachers who require this advice?

The examiner in elementary mathematics and theoretical mechanics, Mr. B. M. Cowie, complains that "young men are sent into examination who ought not to be allowed to try. Their knowledge is so small that they merely give trouble with no corresponding advantage to themselves." "Some candidates do not seem to understand that when a proposition is stated it is to be proved, not assumed." Mr. Cowie remarks on these defects as indicative of defective teaching.

In applied mechanics, Mr. Anderson observes that the general result of the last examination can barely be considered satisfactory; and that, from remarks made in several of the papers, it would appear that many of the students were scarcely prepared for the questions that were put to them. In geology, Mr. Ramsay remarks that a considerable number of the pupils do not know the meaning of the words *genus* and *species*. In physical geography, Professor Ansted says, "I have been obliged to reject nearly one-third of the candidates;" and gives evidence "proving that the teaching has been confined to mere cram." "It would not be difficult to point out special cases where the teaching has been exceedingly bad."

In animal physiology and zoology, Professor Huxley, after some dry remarks on the spelling and grammar of the candidates, says, that many of them exhibit obvious signs of having undergone the process of grinding instead of instruction, a defect arising from slovenly teaching. But we must take occasion to differ very widely from the view expressed by Prof. Huxley as to the proper outline of instruction in this department of science. He thinks it is "to be regretted that any attempt should be made to teach zoology to persons who have not already passed in physiology, and, at lowest, in the second class." If zoology is to be regarded merely in the light of an accomplishment, or of a subsidiary portion of the special study of the pure surgeon, or even of the physician, this view is very tenable. But we hold that the range and function of education in natural history, botany, as well as zoology, is far wider and more lofty. One of the greatest thinkers of modern times has pointed out an invariable double relation of all branches of human thought and study which can, since the distinction has been made evident, never be neglected with propriety. He has shown, and all experience of tuition confirms him, that formal knowledge invariably precedes physical knowledge. Thus formal astronomy had attained a high degree of comparative perfection long before Newton laid the bases of physical astronomy. The apparent movement of the heavenly bodies had been mastered and reduced to matter of calculation long before man raised the question of gravitation, or comprehended the laws of motion. In the same way the knowledge of the forms of life described by the zoologist must always far precede the knowledge of function and of organisation, which constitute the province of the physiologist. The intelligence of even the youngest children is to be stimulated, in the most natural and wholesome manner, by directing their attention to the common, but no less divinely taught, phenomena of animal life. The wisest of English men regarded natural history as a subject fit to form one of the very bases of general education, and the neglect of a course of instruction in natural history at once simple, intelligible, and based on truly philosophical principles, involves a great waste of the best facilities for tuition.

To suppose, then, that it is of more importance to be aware that the gastric juice is not alkaline, and that the diaphragm is not composed of cartilage, than to understand that man, endowed with the four limbs, and partially covered with with the hair, proper to those animals that suckle their young, forms a portion of one great constituent class of the vertebrate province of animal forms, is to our mind to invert the relative value of the knowledge of facts. The perfect zoologist must possess a sound acquaintance with the details, no less than with the theory, of physiology. How many admirable students and elegant describers of the

wonders of the animal kingdom have lived, and thought, and written, whose science was confined to that of form, and habit, and abode. Buffon, with all his drawbacks, is a better textbook for the earlier period of education, than Owen, with his sequepdalian terminology—a man of whom it seems impossible to write except in terms of the highest respect, and in words of the most unobtrusive sound. We shall much regret if Professor Huxley's view be allowed to influence the course of tuition, and thus infallibly to stifle the study of natural history throughout the country.

It will be observed that a perceptible difference is to be detected between the tone of the reports of the professional examiners and of the more permanent officers of the Department. To a certain extent such a difference is neither unnatural nor unjustifiable. In all cases in which difficulties have to be overcome it is necessary, in order to form a fair judgment of the degree of success which has been attained, to hear the accounts given by those who have actual experience of the struggle. Captain Donnelly's report is an endeavour to "correct several inaccurate impressions which appear to exist with regard to the action of the Department, some of which have found expression in the report of the committee of the House of Commons of last session on Scientific Instruction." It is well, however, to bear in mind that, while the abilities and devotion of the higher and more responsible officers of the Board may be deserving of the warmest commendation, the personnel on which they have had to work (as regards teachers no less than scholars), has often been of the rudest and most unprepared description; so that we may at the same moment deplore the actual state of things, and pay a just tribute to those who are endeavouring to ameliorate it; and to whom, in great measure, is due the improvement which has already taken place.

With regard to the Art-schools, we are not furnished with the same means of forming an unbiased opinion as to their condition and progress that is afforded with reference to instruction in science. The report of Mr. Bowler, the official inspector for art, is of the nature of an index or summary, not at all of a criticism or appreciation of results. The returns from the various schools give merely details of attendances, of expenditure, and of prizes obtained. It is much to be desired that, in future reports, all the officers should be directed to adopt an intelligible and exhaustive mode of enumeration. We have long and copious tables, which not only fail to give to the ordinary reader the information which might be readily supplied by the aid of this small additional trouble, but which can hardly be fully intelligible to the Committee of Council, in the absence of such distinct numbering. At all events, the labour of forming any distinct abstract idea of the import of the tables is considerably augmented by this want of precision. If the Report of Mr. Iselin, in which each institution inspected by him is clearly and distinctly numbered, be compared with the List of Science Schools in Appendix B, and with the whole of the series of tables and reports in Appendix C, the justice of the above remark will become very clearly apparent.

An admirable step has been taken with a view of imparting precision and tact to the examinations which are conducted simultaneously over the country under the superintendence of local committees, by means of papers prepared by the examiners of the Department. Many members of these committees are altogether without experience as to the duties of an examiner, and in the course of 1,150 examinations many mistakes and irregularities have consequently occurred. Great hardship is thus entailed on both teachers and pupils; and that the more so because the payments of the former depend on results. The late Government, therefore, arranged with the Commander-in-Chief that the services of a certain number of officers of the Royal Engineers, who were stationed in different parts of the country, should be rendered available by way of consulting and supervising the action of the local committees; and the experiment, the present Report states, has been perfectly successful. "At a comparatively small cost, and without interfering with their ordinary duties, these officers rendered much assistance to the local committees, and exercised a most wholesome supervision over a large proportion of the examinations."

The results of the munificent gift of Mr. Whitworth come for the first time into the province of the annual report of the Department. The original proposal made by that eminent manu-

facturer to found 30 scholarships of the annual value of 100*l.* each, dated 18th March, 1868, is to be found at page 7 of the Fifteenth Report of the Department, together with the acceptance by the Lords of the Committee, and the memorandum drawn up by Mr. Whitworth for the guidance of the competitors. The Sixteenth Report contains the text of a "deed of covenants and trusts for founding 60 exhibitions of 25*l.* each, and 30 scholarships of 100*l.* per annum each." This indenture is entered into between Joseph Whitworth and his Grace John Winston Spencer-Churchill, Duke of Marlborough, K.G., as Lord President of the Privy Council, and President of the Committee of Council on Education. It is followed by the regulations for the examination, in May, 1869, for any of Her Majesty's subjects under 26 years of age; by a statement of Mr. Whitworth's examination in the use of tools; and by a summary of the replies received from the towns and educational institutions to which the 60 exhibitions of 25*l.* each for the year 1868 were offered. With the exception of Chester College, which found "no eligible candidate," the offer is, in every instance, more or less gratefully accepted. We call attention more particularly to the examination in the use of tools, because it is the first example within our knowledge of an attempt to combine the precision of scholastic regulation with the traditional, practical, master-and-apprentice relation, of the craftsman and his teacher. Every candidate is required to perform one or more of certain clearly-specified pieces of work, with either the axe, the saw and plane, the hammer and chisel, the file, or the forge. Examples are, to square up (with the axe) a block of wood 1 ft. long and 6 in. diameter; to make a box 18 in. long by 9 in. wide, by 9 in. deep, planed up true, and the joints dovetailed together; to chip a piece of cast-iron 6 in. square over one of its surfaces ready for filing; to file up true a wrought-iron hexagonal $\frac{1}{2}$ in. nut; and to make the head of a hammer. The workman who reads this paper will not only at once understand it, but will also see that it has been written by a master.

With reference to the Royal School of Mines, Sir Roderick Murchison calls attention to the inadequacy of accommodation in the Metallurgical Laboratory, as well as in the Royal College of Chemistry, and to the report of Dr. Frankland as to the great advantages over this country, in that description of educational establishment, which, during the last thirty years, "have been possessed by Germany, France, Switzerland, and Belgium." The Prussian Government has recently expended more than 70,000*l.* in two magnificent chemical laboratories in Berlin and Bonn. The Government of Saxony has laid out 12,000*l.* in the building (exclusive of land or fittings) of a laboratory in Leipzig. The Federal Government of Switzerland has recently built a new chemical laboratory of instruction in Zurich at a cost of 20,000*l.* In our own college "the number of students working daily has been about 45, while the building does not possess sufficient accommodation for more than 20." The laboratory of the Royal School of Mines is "not adapted for more than nine or ten; as at present 15 students are at work, and 12 have been refused admission."

Appendix D contains 113 pages on the subject of the South Kensington Museum.

Appendix E gives the Annual Report of the Director-General of the Geological Survey, the Museum of Practical Geology, the Royal School of Mines, and the Mining Record Office, for the year 1868. The staff of the Survey has been augmented by 33 new surveyors, making a total of 57 persons. In England 2,152 square miles of country have been geologically surveyed. In Scotland 628½ square miles; in Ireland 1,033 square miles. Nearly 7,000 species of fossils have passed through the hands of the palæontologist. The visitors to the Museum of Practical Geology have numbered 49,132, against 43,402 in 1867. Index maps, showing the state both of the 1 in. and of the 6 in. surveys in England, Scotland, and Ireland, are conveniently appended to the report.

Professor Archer reports, in Appendix F, on the Condition and Progress of the Edinburgh Museum of Science and Art for 1868; which has been visited by 294,830 persons, being 20,739 more than in the previous year. The artisans' lectures, commenced in December, 1867, have been carried on with great success, and attended by 2,566 persons up to the end of the series of courses in March last.

Appendix G contains the report, by Sir Robert Kane, of the Royal College of Science for Ireland; and that of Dr. Sidney, the secretary. The council have arranged for the admission, under certain conditions, of female students to the lectures of the professors. The propriety of this step is evinced by the fact that a young lady took the first prize in the class of pure mathematics. The council rely, as the true test of the value of the college, not on the number of pupils who have gone through the curriculum, but on the practical success and tried efficiency of the students. Such a mode of challenging the verdict of the public demands a very hearty acquiescence. The programme of the educational arrangement for the session 1868-69 is included in the Report.

The Royal Dublin Society consisted, on the 31st of December, 1868, of 1,084 members. Lectures on musical and sensitive flames, on the diseases of cattle, and on painting, have been delivered on the invitation of the council, and the twelfth annual examination for general and commercial certificates of merit resulted in the granting of twenty-seven general certificates, and three commercial certificates, to thirty out of seventy-five persons who applied to be examined. The library has been open to the public on 283 week days, from eleven o'clock a.m. to six o'clock p.m., and on 228 evenings. The hotanic garden and museum have been maintained in good order. A large zoological collection from Utrecht, has been added to the natural history museum, besides other valuable additions of fossils, and of zoological, botanical, and mineralogical specimens. In addition to these educational steps, the society held during the year four exhibitions,—one in the spring, of breeding cattle and poultry, a show of horses at Midsummer, a show of breeding sheep in autumn, and a show of fat cattle, farm and dairy produce, and poultry, in winter.

The Royal Zoological Society of Ireland, the gardens of which have been visited by 127,000 persons during the year, and the Royal Hibernian Academy of Arts, with a modest expenditure of 467*l.*, close the list of annual reports. Appendix L gives "a statement of the expenditure of the several divisions of the Science and Art Department of the United Kingdom," from which we gather that the expenditure for the year ending 31st March, 1869, has been 155,012*l.* 12*s.* 5*d.*, and that the total national outlay on industrial education, from 1st April, 1853, to 31st March, 1869, has been 1,324,452*l.* 6*s.* 7½*d.*

THE CONTRACTION OR SHRINKING OF TIMBER.

In a "Cantor Lecture" on Applied Mechanics, delivered by Mr. John Anderson, C.E., at the Society of Arts, some information was given on the contraction of timber, which calls for transference to our pages:—

Notwithstanding the extent to which timber is used in the mechanical arts, it is singular that the natural law by which the contraction or shrinking of wood is governed is too much disregarded in practical operations. It is a subject which seems to have been entirely neglected by writers on the subject, for I am not aware of any book that explains the subject fully, and have only met with one individual (Mr. Wilson, of Patricroft), who has thoroughly studied it as a philosophical question, and reduced it into the every-day nattering practice of his own works. The wretched state of the floors, doors, and shutters in many of the London houses too plainly gives ample and complete evidence of our persistent disobedience of the law, more especially in this quarter, and the only hopeful consolation is that we do not go unpunished, as the penalty inflicted may in time lead to improvement.

An examination of the end section of any exogenous tree, such as the beech or oak, will show the general arrangement of its structure. It consists of a mass of longitudinal fibrous tubes arranged in irregular circles that are bound together by means of radial strings or sheaths, which have been variously named; they are the "silver grains" of the carpenter, or the "medullary rays" of the botanist, and are in reality the same as end wood, and have to be considered as such, just as much so as the longitudinal woody fibre, in order to understand its action. From this it will be seen that the lateral contraction or collapsing of the longitudinal porons or tabular part of the structure cannot take place without first crushing the medullary rays, hence the effect of the shrinking finds relief by splitting in

another direction, namely, in radial lines from the centre, parallel with the medullary rays, thereby enabling the tree to maintain its full diameter, as shown in fig. 1. If the entire

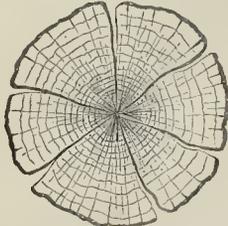

FIG. 1.

mass of tubular fibre composing the tree were to contract bodily, then the medullary rays would of necessity have to be crushed in the radial direction to enable it to take place, and the timber would thus be as much injured in proportion as would be the case in crushing the wood in the longitudinal direction. If such an oak or beech tree is cut into four quarters, by passing the saw twice through the centre at right angles, before the contracting and splitting have commenced, the lines *a, c*, and *c, b*, in fig. 2

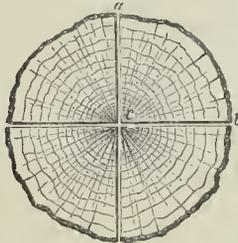

FIG. 2.

would be of the same length, and at right angles to each other, or, in the technical language of the workshop, they would be square; but, after being stored in a dry place, say for a year, it would then be seen that a great change had taken place both in the form and in some of the dimensions; the lines *c, a*, and *c, b*, would be the same length as before, but it would have contracted from *a* to *b* very considerably, and the two lines *c, a*, and *c, b*, would not be at right angles to each other by the portion here shown in black in fig. 3. The medullary rays are thus

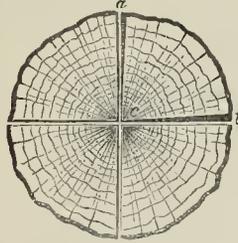

FIG. 3.

brought closer by the collapsing of the vertical fibre. But, supposing that six parallel saw-cutures passed through the tree so as to form it into seven planks, as shown in fig. 4, let us see

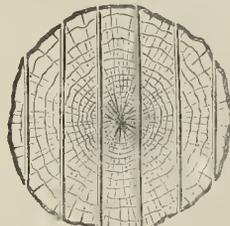

FIG. 4.

what would be the behaviour of the several planks. Take the centre plank first. After one

seasoning and contracting, it would then be found that the middle of the board would still retain the original thickness, from the resistance of the medullary rays, while it would be gradually reduced in thickness towards the edges for want of support, and the entire breadth of the plank would be the same as it was at first, for the foregoing reasons, and as shown in fig. 5.

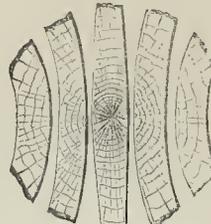

FIG. 5.

Then, taking the planks at each side of the centre, by the same law their change and behaviour would be quite different; they would still retain their original thickness at the centre, but would be a little reduced on each edge throughout, but the side next to the heart of the tree would be palled round or partly cylindrical, while the outside would be the reverse, or hollow, and the plank would be considerably narrower throughout its entire length, more especially on the face of the hollow side, all due to the want of support. Selecting the next two planks, they would be found to have lost none of their thickness at the centre, and very little of their thickness at the edges, but very much of their breadth as planks, and would be curved round on the heart side and made hollow on the outside. Supposing some of these planks to be cut up into squares when in the green state, the shape that these squares would assume, after a period of seasoning, would entirely depend on the part of the tree to which they belonged: the greatest alteration would be parallel with the medullary rays. Thus, if the square was near the outside, the effect would be as shown in fig. 6, namely, to contract in the direction from *a* to *b*, and after a year or two it would be thin, as seen in fig. 7, the distance between *c* and *a* being nearly

FIG. 6.

FIG. 7.

the same as they were before, but the other two are brought by the amount of their contraction closer together. By understanding this natural law, it is comparatively easy to know the future behaviour of a board or plank by carefully examining the end wood, in order to ascertain the part of the log from which it has been cut, as the angle of the ring growths and the medullary rays will show thus, as in fig. 8. If a plank has

FIG. 8.

this appearance it will evidently show to have been cut from the outside, and for many years it will gradually shrink all to the breadth, while the next plank, shown in fig. 9, clearly points

FIG. 9.

close to the centre or heart of the tree, where it will not shrink to the breadth but to a varying thickness, with the full dimensions in the middle, but tapering to the edges, and the planks on the right and left will give a mean, but with the centre sides curved round, and the outside still more hollow.

The foregoing remarks apply more especially to the stronger exogenous woods, such as beech, oak, and the stronger home firs. The softer woods, such as yellow pine, are governed by the same law, but in virtue of their softness another law comes into force, which to some degree affects their behaviour, as the contracting power of the tubular wood has sufficient strength to crush the softer medullary rays to some extent, and hence the primary law is so far modified.

But even with the softer woods, such as are commonly used in the construction of houses, if the law is carefully obeyed, the greater part of the shrinking, which we are all too familiar with, would be obviated, as the following anecdote will serve to show:—It was resolved to build four houses, all of the best class, but one of the four to be pre-eminently good, as the future residence of the proprietor. The timber was purchased for the entire lot, and the best portions were selected for house No. 1, but by one who did not know the law, and to make certain of success this portion of the wood had an extra twelve months' seasoning after it was cut up. The remainder of the wood was then handed over to a contractor for the other three houses, who had an intelligent young foreman, who knew the structure of wood, as well as how to obey the law, and who, therefore, had the wood for the three houses cut up in accordance therewith. The fourth house was built the following year by another man; but long before ten years had passed, and to the great surprise and annoyance of the proprietor, it was found that his extra good house, No. 1, had gone in the usual manner, while the other three houses were without a shrinkage from top to bottom. As Solomon says, "Wisdom is profitable to direct."

A similar want of correct knowledge of the natural figure and properties of the structure of wood, such as the oak, is constantly shown by the imperfect painting to resemble that wood, as exhibited on the doors and shutters of many of the houses of this metropolis. If we cannot afford to have genuine wainscot doors, as in France, but yet desire to have an imitation, it would surely be worth the trouble to have a block cut from the quarter of an oak tree, and to have each of its six sides planed and polished, in order to make plain their several features. The house-painter would then see what nature really is, and thus save us from the ridicule of other nations, when we mix up "silver grains" and all the other natural features upon one side of a board or panel.

NOTES DOWN EAST.

UPWARDS of two years ago, we drew attention to the bad and ruinous condition of many of the London steam wharfs. Our remarks led to the condemnation of some of them, and the reforming of others. One of the latest instances was the St. Katherine's Wharf, belonging to the General Steam Navigation Company. This wharf and its stores, after we had drawn notice to its unsafe state for shipping purposes, was at once shut up, on due investigation by the Government and harbour authorities; and at the cost of several thousands a new wharf and stores were erected, which wharf and stores were again opened for shipping traffic last autumn. The General Steam Navigation Company during the rebuilding were obliged to rent the use of the British and Foreign Wharf. The Irongate Wharf Company, whose stores were beside that of its neighbour, was snuffed in the interim to have reaped a good harvest of profit, to the other's loss, during its forced removal. Negotiations, however, were entered into by the General Steam Navigation Company with the landowners of the Irongate Wharf Company, which resulted in the purchase of the latter, over the heads of the present lessees, at the expiration of the lease, which takes place in about a year's time. The consequence is that the Irongate Wharf Company, whose term is unexpired, has come under an interdiction similar to the St. Katherine's Company, from the similar reason that its landing stage and stores are in the same unsafe state for traffic, as was its next-door neighbour before its condemnation.

A jealousy has sprung up between the companies, and Saturday, 7th, was the last day on which sailings were allowed to take place from the Irongate Wharf. The company of the latter removed on Monday their shipping traffic to the place known as Hour's Wharf, but now dubbed the "Hermitage Wharf," having already, in anticipation of their removal, purchased some property in connexion with it beside Hour's Wharf, for the rebuilding of their new concern. A temporary wooden landing-stage is here erected, and the foundations are being laid for the new Hermitage Wharf.

A litigation between the companies is not only likely, but certain to ensue. The Irongate Company accuse the General Steam Navigation Company of leading to the ruinous state of the wharf it is forced to leave, by the incautious method of piling adopted by the builder em-

ployed, which they ever led to the shaken condition of the stores and landing, now about changing hands. This charge is denied by the new purchasers, who aver that it is only a set-off made by the retiring company to escape the paying of damages, for not giving up the stores in the same condition in which they received them when they first occupied them. The General Steam Navigation Company, however, in view of their future possession, have thought it advisable to take steps for the better safety of the building and landing of their new purchase. So they have accordingly commenced sinking a row of piling some feet out in the bed of the river, with the intention of constructing a jetty in front, or in continuation of the present landing; thereby forming a bulwark or breastwork against the further spread of the present landing-stage or the certain dropping asunder of the stones. Apparently much of its ruinous condition is owing to proper care not having been taken in the construction of the new St. Katherine's Wharf. Had the landing-stage been brought out further into the bed of the river, the effects of the heavy pile driving would not have shaken the foundation of the landing-stage and stores of the Irongate Wharf.

The several wharfs along the river by Wapping are in anything but a good condition. They want a thorough overhauling, and we would advise an inspection of them at once by those whose duty it is to see after these matters. Without going down so far as Barking Creek, the Thames Conservancy would find on the beach of "Wapping Old Stairs," at low-water mark, a sufficient depth of indistinguishable "dirt-hed," to use a geological phrase, to afford those practical chemists and deodorisers work for a season to examine and pronounce upon.

In connexion with east-end matters, we may remark, the Thames Tunnel, which has ceased to be a footway, is fast assuming the appearance of the usual underground railway. The rails are laid on one side, and the other is in the course of laying. In the necessary cutting and levelling it has been discovered that the foundation of the tunnel and the structure altogether is a great deal stronger and more securely built than had been supposed, thereby evidencing the sagacity and skill of its engineer, Her Brunel.

The Tower Subway is being pushed on energetically. At the opening shafts, on Tower-hill, the engines are constantly at work in lifting excavated matter, and lowering materials of construction.

SHAM STONE WESLEYAN CHURCH IN NEW ZEALAND.

A LARGE church for the Wesleyans has been erected in Wellington, New Zealand, Mr. C. Tringham, architect. About 3,000l. have been spent on it, with what little wisdom will be seen from the following flaming account written by one connected with the erection of it, and proud of what has been done:—

"I have enclosed to you a view of a new Wesleyan Church recently erected in this city, which I thought you would be glad to bring out in your paper, to show the progress of architecture in the colony. The building itself is universally acknowledged to be the finest church in any of the Australian colonies.

I will give you a brief account of it. The style is Gothic; the main building is 100 ft. long by 68 ft.; the sides and front have paneled buttresses; the tower and spire stand in the centre of the front, 90 ft. high and 16 ft. wide, with tracery windows in front, with stained glass. Round the spire are towers boarded frames, with tracery, and turret and finials. There is a highly-ornamental parapet running along the sides. The inside has a gallery all round, with handsome paneled work and columns, with arches beautifully carved, which give a very handsome effect to the interior. The pulpit stands on eight columns, and has beautifully carved panels all round. The cost of the pulpit will be nearly 200l. The whole of the building is erected in wood, and is sanded to imitate stone work. The building cost about 3,000l. There are three handsome porches, with turret and finials, and carved work over each. The church will accommodate 1,600 people. The whole of the inside is varnished and painted, ceiling in centre only, which is a Gothic ellipse. The height of the main building is 43 ft. Mr. Corbett was the builder."

A more distressing example of "sham" could scarcely be quoted; and the *Wellington Independent* describes the church as "undoubtedly one of the finest in the colony." Years hence, when its architect and congregation have learnt to understand the absurdity of the structure, it will stand there with its sham buttresses and pinnacles, an object of ridicule, and, let us hope, a heacon to warn. Liability to earthquakes, and other circumstances, make wood the chief building material in Wellington, whether for public or private edifices, and we earnestly advise our friends in the colony to waste no more money in

trying to make wooden buildings look like stone. Let them use honestly the material they employ, and bring their skill and taste to bear upon it to produce an agreeable result. Wood is as susceptible of beauty as stone. We shall hope to hear from Wellington before long that a wooden church has been erected, looking like what it is,—well proportioned, elegantly shaped and fashioned, and showing here and there lovely pieces of carving that may serve to teach as well as delight.

THE HEALTH OF TOWNS.

At a recent meeting of the British Medical Association in Leeds, Sir William Jenner delivered an interesting address, in the course of which he referred to the important subject of the health of towns, and the effect of polluted water in propagating cholera and typhoid fever. He said:—"The proof seems complete that a large proportion of those who drink water containing a minute quantity of the intestinal excreta from a person suffering from cholera will suffer from cholera; and that a large proportion of those who drink water containing a minute quantity of the intestinal excreta from a person suffering from typhoid fever will suffer typhoid fever. Had the water supplied to the east of London been as free from organic impurity as was that supplied to the west of London, the death-rate from cholera at the east would have been a little larger only than was the death-rate at the west of London. The persons who died at these places from typhoid fever, and a large proportion of those who died at the east of London from cholera, were as certainly killed by the water they drank, and killed without need, as if the water supplied to them had been contaminated with arsenic; and I am sure we all agree with the most distinguished medical officer of the Privy Council, that "the distribution of fouled water by the Guildford Board is as proper a case for judge and jury on action for damages by any of the 500 people who had typhoid fever in that town, as any case in which a railway collision brings some score of passengers into harm; and the fact that these water purveyors gave typhoid fever to their customers would be brought home to their consciences, and be suggested as a warning to other water purveyors, in a far more conclusive and effective manner by such legal proceedings than it can by any departmental statistics and remonstrances."

The air of towns as well as their water has been receiving close attention. A report under Government authority has just been published by Dr. Angus Smith, on the operation of the Alkali Act of 1863, which contains some curious information. Dr. Smith tells us, "A great deal is now in our power which was before impossible." By examining rain we are enabled to discover what are the gases and substances which float in the air. When there is no rain it is possible to wash the air in bottles, and under this process to make it yield the foreign matters with which it is impregnated. Rain varies greatly in its character according to the source whence it proceeds, and the locality where it falls. Mr. Dancer has aided Dr. Smith with his microscopic skill, and has studied the character of the solid particles contained in the air of Manchester. Samples of the air were washed by Dr. Smith, and the fluid was afterwards examined by Dr. Dancer. A single drop of the water was computed to contain no less than a quarter of a million of fungoid spores. The fact was verified by examining an extremely small particle, and multiplying the result. The bottle of water having been kept for thirty-six hours, the quantity of fungi, already so great, "visibly increased," and on the third day minute creatures were observed moving about in the fluid. They found that 150 drops of water would contain more than 37,000,000 of the fungi, these 150 drops being the washings of 2,435 litres of the air of Manchester, which is about the quantity of air passing through the lungs of a man in ten hours! But this is by no means the whole of the story. The drops of water yielded a kind of dust which in the space of three or four days produced considerable numbers of animalcules, in which monads were most conspicuous. In this dust were particles of partially-burned wood, fragments of vegetation, filaments of cotton, and granules of starch. Spores and germs, acids, salts, and gases, dust and rubbish,—such is the air of cities! On the pages of this report there are sundry wood engravings representing the crystals obtained by

evaporating the rain-water of various towns. Here we see at a glance that Manchester is not as London, nor London as Newcastle. In colour and form the metropolitan crystals resemble nothing so much as the circular brush which forms part of a chimney-sweeping machine. The Manchester crystals look like a mixture of beads and broken glass, while Newcastle has much less variety in form.

The vaccination question has suddenly assumed gigantic and threatening proportions. It is evident that a very strong prejudice against vaccination, as at present practised, prevails throughout society; and fathers and mothers have displayed a determined resolution to defy the law of compulsory vaccination, and rather to suffer imprisonment, as well as fines, than allow their children to be vaccinated. They insist that the most hideous, heastly, and fatal diseases have been fastened upon their children by vaccinating matter; and even many who admit the utility of pure matter in diminishing the occurrence or the virulence of small-pox, still insist that the modern practice is so foul that other and still viler diseases are introduced. Without saying a word against vaccination, which has certainly been the means of saving the lives of thousands, we do think it is full time that an authorised inquiry should be made into the grounds of complaint against its present practice. We happen to have seen most violent, hideous, and difficultly-healed sores on young children, which were clearly contagious, and had been transferred to the mother, who had an invincible belief that they originated in foul vaccine matter. In one such case that we know of, the child ultimately died from such sores, but internal, and called "caruncle," and the mother did not get rid of the dreadful-looking sores on her feet for nearly twelve months, during all which time she was more or less disabled. In another case the child caught the sores at school from other children; and, strange to say, a grown person, who slept with this child, was also attacked, and in the feet too, with fearful sores!

The error, if it be so, of the idea that such cases have originated in foul vaccine matter cannot be too soon inquired into and confuted, else the law will be set at naught, and the unquestionable benefits derived from vaccination and inoculation be brought to an end by the prejudice of the public against the whole system. That it is but too possible that cattle diseases may be transferred with foul vaccinating matter to human beings, the very subtlety and wonderful multiplication of such matter render evident; and we know that human beings have been attacked by diseases of animals, such as glanders from horses, hydrophobia from dogs, &c. If Jennerism has degenerated, the sooner its foul practices can be arrested, and new rules established, the better; and if not, the sooner the public is convinced of its errand prejudice by an impartial and searching public inquiry the better. The researches of Dr. Blanc are said to show that a system of animal vaccination might be introduced which would at once afford the necessary protection, and remove the objections at present entertained by many persons to the use of humanised lymph. The public, which is so deeply interested in the matter, will wait anxiously the decision of the medical department of the Privy Council on this vitally important subject.

WELSH ARCHÆOLOGY.

At the opening meeting of the Cambrian Archaeological Association's congress, held on the 9th, at Bridgend, in Glamorganshire,

Lord Dunraven, as president, made a very interesting address, in the course of which he pointed out that the neighbourhood contained an unusual variety of objects of archaeological interest, extending in date through a great range of time, and of varied character. They may be said to commence, he remarked, if we include the excursion to Gower, under Mr. H. Vivian's auspices, with the annual and barrows of prehistoric times. Then we have the British or Celtic fortifications, such as that still remaining at Dunraven and other places along the coast; next comes a class of monuments which, I regret to say, are but scantily appreciated here, namely, the ancient Christian inscribed stones and crosses. This expression will not be deemed too strong when I remind you that they are, for their number and for the length of their inscriptions, unequalled in any portion of the kingdom where crosses of a similar date exist. Certainly, as Dr. Petrie

pointed out at Cardiff, there is no such collection within a few miles of each other in Ireland as is to be found in the group comprising Llantwit, Coychurch, Llangan, Merbyr Mawr, and Margam. At the last-mentioned place no less than eight are to be seen now erected within a few yards of each other; and yet little or nothing has been done towards identifying the persons they commemorate, with the different ecclesiastical establishments which must have once existed in this neighbourhood, and with which they were obviously connected. Passing to a later period, you will see some interesting churches containing characteristic local features, including among them the very peculiar church of Llantwit, and the remarkable semi-fortified abbey of Ewenny. Of abbeys of the first rank we have the ruins of Margam, with its beautiful chapter-house, and within our reach is the finest of Welsh cathedrals, so lately restored by the zeal and munificence of the inhabitants of this county. Of castles you will see a variety, ranging in date from the simple Norman keep of Oymore to the latest portions of St. Donata. This most interesting castle, now happily saved from becoming a mere ruin, so beautifully situated on the shore of the Bristol Channel, with its ancient church and elegant cross, would alone repay the archaeologist many miles of travel to see. In addition, you will visit one of the grandest mediæval fortresses in the kingdom, Caerbylly, exhibiting even in its decay the most instructive example of military skill and of feudal power. In our excursions will also be included several examples of the domestic architecture of our ancestors, dating from the fifteenth to the seventeenth century. From this enumeration you will see the justice of a previous remark, that few places in the Principality afford so great a variety of objects to be visited, extending over so vast a range of time in the dates of their erection, and including among them several of peculiar interest and of considerable importance. Having touched upon what has been effected in the archaeology of Wales since the commencement of our association in 1846, may I be permitted to point out very briefly how much still remains to be done? First, for this country, a complete description, with accurate views and measurements of our cromlechs, and an examination of the ground within them, is still a desideratum. Our Roman roads and stations have not been thoroughly explored and mapped down; we have no accurate descriptions with measurements of the various earthworks which exist, particularly along the coast. When properly examined they will probably be found to be divisible into more than one class, and to belong to more than one age. It appears that the Rev. H. H. Knight read a paper at the Monmouth meeting, in which he advocated the idea that the coast forts or earthworks were erected by the Danes. This paper, unfortunately, was never published, and I am unacquainted with the arguments by which his theory is supported. One of the most interesting features in the archaeology of this country is the number of the inscribed Christian stones to which I have already alluded. This class of monument has been entirely neglected by our local antiquaries. May we venture to hope that the owner of the most remarkable group—that which stands upon the ruined walls of his noble chapter-house of Margam, a building which appears almost modern by the side of those venerable monuments of a ruder age, and a more primitive state of art—would give to the world accurate drawings or photographs and measurements of them; and, what would be better still, would include all the similar Christian inscribed stones of the neighbourhood, forming as they do the most important collection of the monuments of the pre-Norman Church to be found in England and Wales. Researches should be diligently made among the ancient Welsh ecclesiastical records such as the book of Llandaff and others, in order to try and identify the names which appear upon their inscriptions, so as to obtain a better clue than we at present possess of the date of their erection. By these means the foundations would be laid for obtaining some definite knowledge on the rise and progress of industrial art in this country before the Norman Conquest. This very interesting branch of archaeology is being admirably worked out for Ireland by one of the biggest authorities on the subject of the accomplished author's labours, in tracing the progress of Irish monumental ecclesiastical art, may, by her kind consent, be laid before you, for the purpose of comparison, during the present meeting. Not one

half of our Mediæval castles have as yet been described, and scarcely anything has been done towards illustrating the manners, houses, and other examples of domestic architecture, so many of which are to be found in this country. To any one conversant with the early ecclesiastical architecture of Ireland, it appears curious that so few remains of the Welsh Church, prior to the eleventh century, have been as yet noticed; while, on the other side of the Channel, hundreds of churches remain, some tolerably perfect, many of them erected centuries before that date. It is not probable that any portion of these primitive churches exists in this country; but on the islands along the coast of Pembrokeshire, or in the most out-of-the-way portions of some of the western counties, small, early oratories, analogous to those on the western coast of Ireland, may be discovered. It must be very interesting to see whether any difference in the place or size of the building, or their mode of construction, is observable; whether there may be the same sort of difference in the primitive churches as exists in those crosses and monumental stones between those of Ireland, Scotland, Wales, Cornwall, and the Isle of Man. Lord Dunraven rightly urged the importance of forming a museum for Wales, that the national antiquities might find a suitable depository. There was a fine one in Dublin, another in Edinburgh, and the British Museum had made a good start in the same direction. He really thought Wales should start and get up one that would be worthy of the country.

The president, in the first part of his address, bore strong testimony to the merits, as an antiquary, of Mr. G. T. Clark (of Down), to whom the readers of the *Builder* have been often indebted for papers descriptive of our ancient Castles.

TECHNICAL EDUCATION IN THE BUILDING TRADES.

Sir,—In most Continental states the employers and their workmen are willing to improve their education, and are not asking what advantage it would be to them to attain a scientific knowledge of their trade. From what I read of their educational work they are not afraid of learning too much, as they know the benefits to them will be in proportion to their advance in scientific knowledge. A paragraph appeared recently, stating what has been done, and what is doing, in Wurtemberg, since the first French Exhibition. It appears the examination of various articles exhibited showed them their deficiencies, and they set on foot work to remedy them. Since then the scholars in the primary schools have been taught the elements of industrial science, and being thus early initiated into the fact that a thorough acquaintance with whatever they are engaged in is necessary to their well-being, they through life never lose sight of that fact, and are always ready to do their best to promote and develop industrial science and progress, and their employers are foremost in the good work.

What is doing in Wurtemberg is but a counterpart of what is taking place in every German state. I was somewhat surprised at the letter of "A Journeyman Joiner" on this question; and, as he put some questions, perhaps it would not be amiss to give a little information on the different points in his letter.

Technical education, as I understand it, means a thorough knowledge of all the principles connected with the trade; or, in other words, the highest science applied to the trade at which a mechanic works. For instance, the practical engineer ought to understand "the nature and application of mechanical forces." He should also be able to point out the various parts of the machines he works on; their action as well as the principles of their construction. The journeyman joiner, to be a thorough workman, should understand practical geometry, and yet how few there are who can draw an ellipse, bisect a circle, or give a definition of an angle. Although every man cannot be an employer or a foreman, he can and ought to be an expert workman, and take a pride in the craft to which he belongs. I am aware there are many joiners who can only undertake the commonest work, and yet get as much pay as the better workman. It appears to me that if it is no reason those who are able to see the others' failings should try to imitate or keep on a level with them. Sometimes it happens they are required to undertake higher work. It is then found they are out of place, and, after much roaming about, they find

out a nearer route than going straight, and a discharge is the result. I believed that when a man had a good knowledge of his trade it was less irksome to him than the same work was to the man who had neglected his opportunities, and who had to be continually spurred on by the foreman, whether pushing or otherwise. The technically-educated workman, if not better paid, has many advantages over the ignorant or inferior workman, as he can work with more ease to himself; his scientific knowledge enables him to take the nearest and quickest method; and while the other is puzzling his brain and thinking how he is to do it, the first has completed his, and, of course, under such circumstances as the second labours under, the less thinking in the shop the better it is for the employer's interests.

It is too true that masters have not as yet done much to improve the condition of their workmen. But I do not believe there is one employer who thinks ignorant workmen are best. But, supposing employers desire their "men should be machine-like," they, of course, would like them to be perfect machines. An imperfect machine is only half as profitable as a perfect one, and a great deal more trouble; and so it is with workmen,—the ill-educated one is always more trouble than the able workman. He, as a rule, is shifty, and requires a pushing foreman to keep him in anything like order; while the more perfect man, like a well-developed machine, goes about his work in an orderly manner. He requires but little looking after; he knows his duties, and can be trusted by the foreman. When a piece of work is given to him, it is done in a perfect manner, and without waste of time. It is the want of education that causes disagreement; and when the workmen are educated so as to be able to be foremen, it will be for the benefit of all concerned, and they will then work harmoniously together.

JACK PLANE.

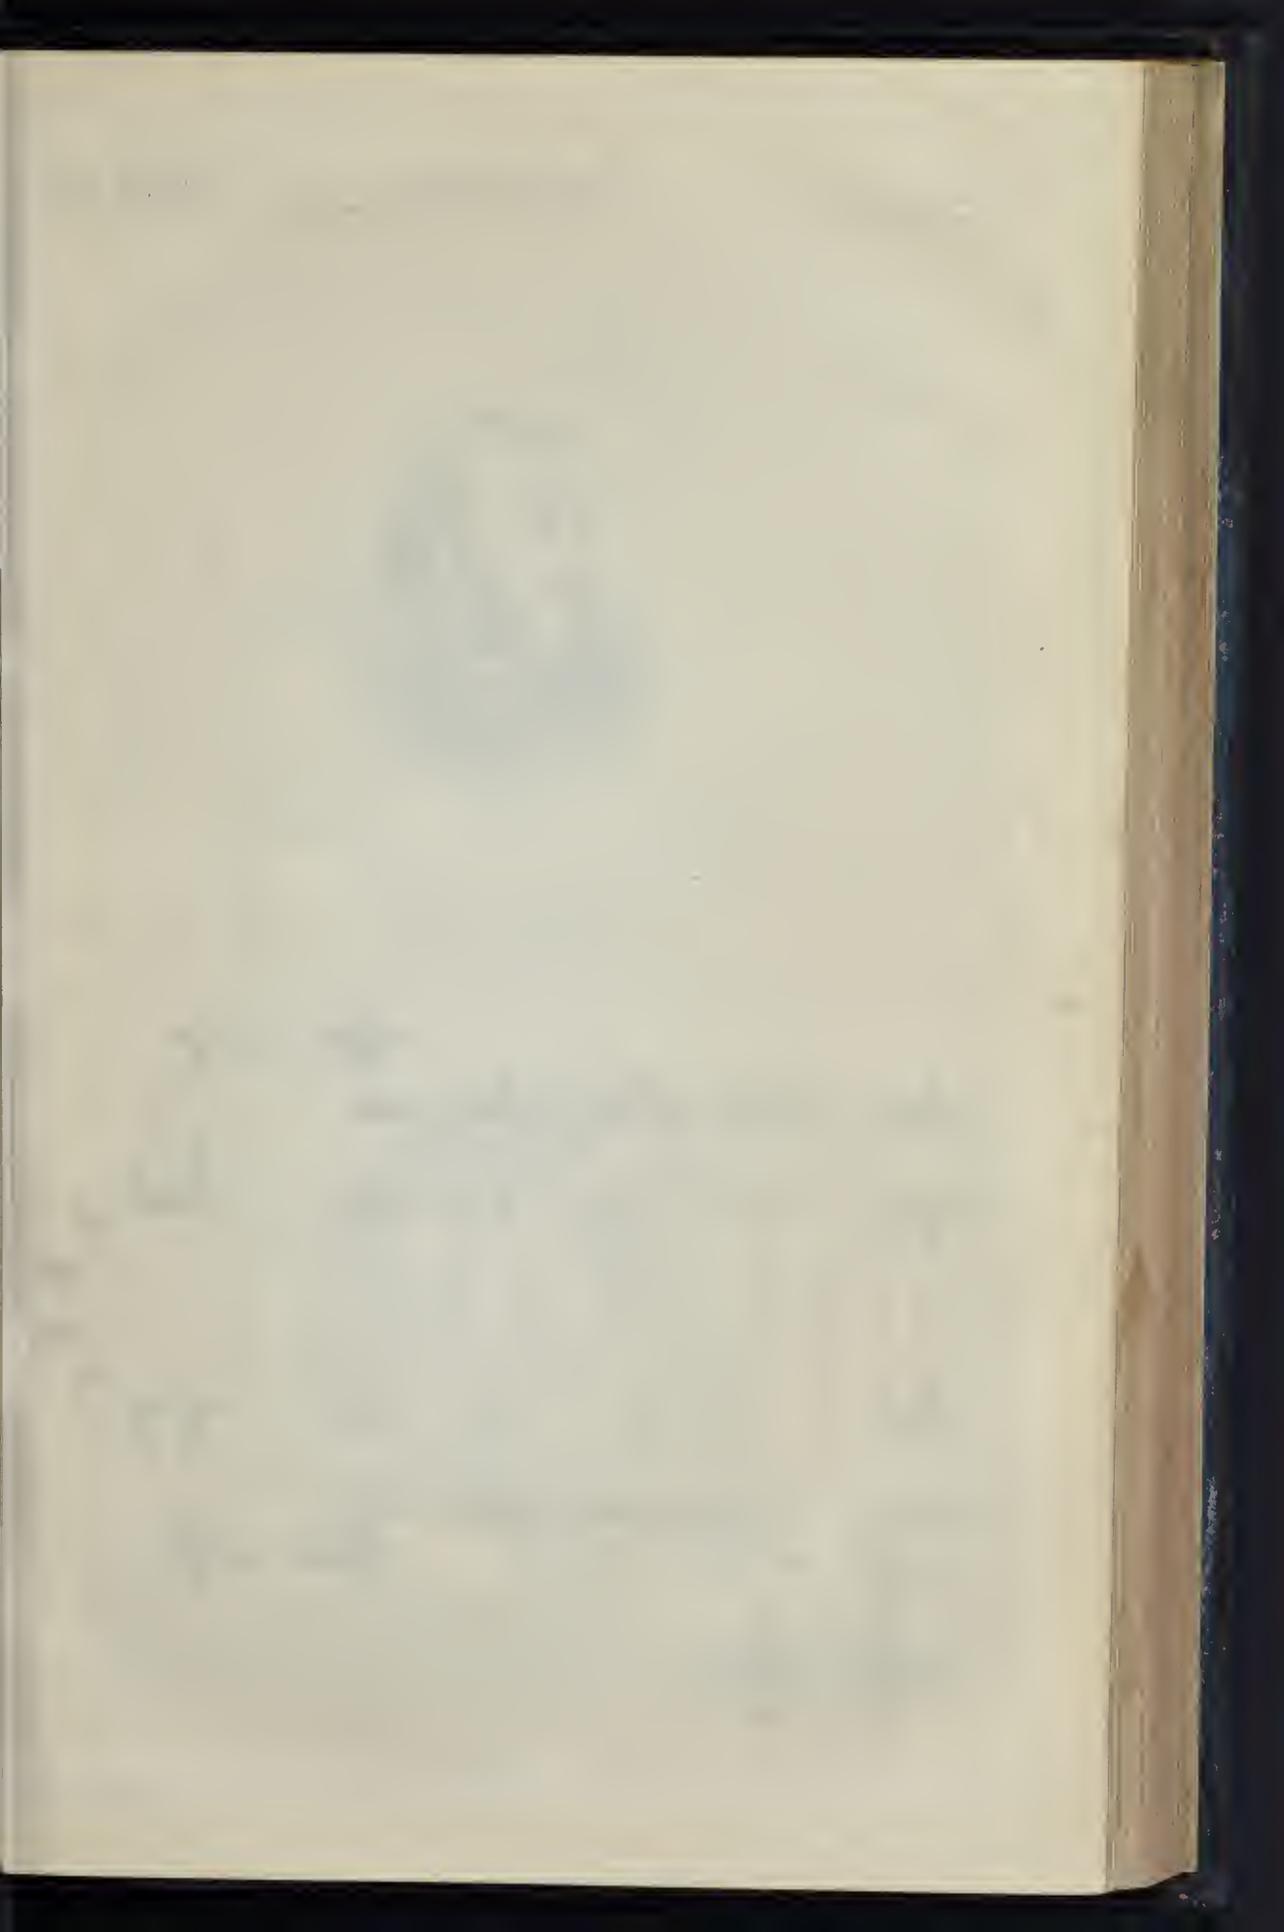

ALL SAINTS' CHURCH, DRESDEN.

This church, which has been built for the use of the English residents at Dresden, is erected in memory of Mr. W. H. Goschen, by his widow.

The church has a chancel, with polygonal apse, 35 ft. long by 21 ft. 3 in. wide, with gabled transepts. The nave is 64 ft. by 22 ft. 3 in., with a clearstory; the height of the nave to the apex of the roof is 52 ft. 6 in. There are north and south aisles the whole length of the nave, which have lean-to roofs, and are divided from the nave by arcades of four arches, which rise 19 ft. from the floor; the chancel arch is 32 ft. high. The entrance is on the south side, under the eave, forming a porch 9 ft. square. The tower is buttressed, and rises to a height of 58 ft.; the spire has angle pinnacles, which are panelled and crocketed, and rises 85 ft., making the steeple in all 143 ft. high. The roof timbers are all framed in fir, and will be open. The walls are built of sandstone of the locality; the window tracery and other dressed stonework are executed with finer stone from the same quarries. The walls are of dressed stone within as well as on the outer face. The chancel is correctly fitted with oak stalls; the floor has a rise of seven steps to the altar-table. The organ, by Walker, of London, is in the north transept, immediately behind the choir. The nave and aisles are partially seated, and it is calculated that there will be accommodation for 400. The west window, of five lights (the gift of Mrs. Goschen), as well as all the aisle windows and the five apse windows, will be filled with painted glass, by Hardman. Mr. Preedy, of London, has been commissioned to paint the windows for the south transept. Eventually, it is hoped that every window in the church will be filled with painted glass. There will be a sculptured retable of the Crucifixion by Birnie Philips; the architectural carving of the nave, pier-caps, and other capitals and string courses is by Earp; the encaustic tiles for the floors are by Maw & Co. The painted windows, retables, organ, carving, tile floors, and pavements, are the gifts of members of Mrs. Goschen's family and the English residents at Dresden.

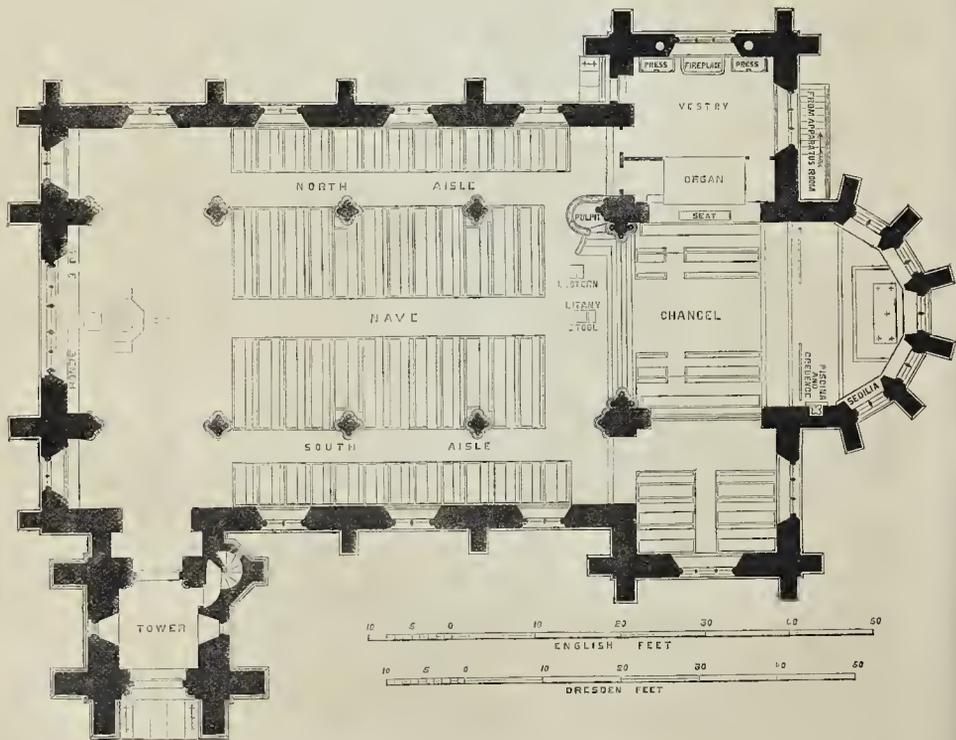

The church is heated with hot air, by Kolling, of Dresden. The works have been executed from the designs of Mr. J. P. St. Aubyn, of London; Herr Pieper, architect, of Dresden, superintending the erection.

The cost will amount to about 6,000*l.*, and it is hoped that the church will be consecrated during the present year.

MR. EDWARD M. BARRY, R.A.
Architect at the Houses of Parliament.

ALL SAINTS' CHURCH, DRESDEN.
Plan.

ALL SAINTS' CHURCH, DRESDEN.—Mr. JAMES P. ST. AUBYN, ARCHITECT.

EXCURSIONS OF ARCHÆOLOGICAL AND ARCHITECTURAL SOCIETIES.

The Bads Archæological and Architectural Society.—The members of this society made their annual excursion this year to Sharnbrook, Odell, Harrod, Fardish, Hinwick, Podington, and Wymington. Odell church was first visited, then Odell Castle. At Hinwick House the party were entertained by Mr. R. E. Orlebar. At Podington Church, the Rev. J. Geldart, the vicar, directed attention to the features of the edifice; as did the Rev. W. Monk, the rector, at Wymington Church. The party then returned to Sharnbrook.

Surrey Archæological Society.—The annual excursion of this society took place on Wednesday in last week. The weather was extremely pleasant for travelling, with the exception of one or two heavy showers, and the country through which the excursionists took their way was beautiful. A special train left Guildford station at 11.30 a.m., and landed the visitors at Witley a quarter of an hour afterwards. The party was at once driven off to Witley Church, having a glimpse on their way of the King Edward Schools at Witley. They next proceeded to Chiddingfold, where the church and the Crown Inn were visited. Mr. Heales, F.S.A., delivered an address on the church; and the rector, the Rev. L. M. Humbert, read a paper on "Chiddingfold: its Registers, and its Rectors." A number of the excursionists accompanied Mr. Baily to the Crown Inn, an old manorial house of the fifteenth century, of which he gave a description. A luncheon was provided by Mr. Skinner, of the White Horse Hotel, Haslemere, in a large marquee. Mr. R. A. C. Godwin-Austen occupied the chair.

Mr. Butterworth, F.S.A., proposed the health of the hon. secretary, Mr. E. Vaughan Austin. He said the council, feeling that Mr. Austin had done so much for the society, and rendered it so many valuable services, had made up their minds to present for his acceptance a Mazer Bowl; and the members, hearing of this, insisted upon putting something into it. The bowl and fifty guineas were therefore presented to Mr. Austin. Shortly afterwards the party passed on their way to Dunsfold. At Burgate there was a pull-up to admire some famous chestnut trees of immense size, size, and beauty, and the old manorial house occupied by Mr. Chitty. A paper on Dunsfold Church was read by Mr. Baily. A special train took the party from Godalming to Guildford, all satisfied with their day's outing.

DRAINAGE.

Oxford.—The Thames Conservators have conceived a letter to be sent to the Oxford local Board of Health asking whether any, and if any, what steps have been taken by them to direct the flow of sewage from the Thames. The letter has been referred to the drainage committee of the board, while acknowledging receipt of the letter and referring to an application for extension of time for discontinuing the flow of the sewage, as well as informing the Thames Conservancy Board of the general proceedings of the Drainage Committee.

Leamington.—The local Chronicle states that the local board are on the eve of disposing of the town sewage to a neighbouring landowner, the Earl of Warwick, at what is regarded as an estimated loss of 30,000L, the terms of an agreement having been arranged by which his lordship undertakes to pay the board 450L per annum for thirty years, in consideration of their supplying, at their own cost, the sewage of the town to a farm belonging to his lordship, about two miles from Leamington. It is calculated that under this arrangement the loss to the town during the period mentioned will be as above stated, and that without including the large additional cost to the board of providing a separate system of drainage for the rainfall, without which economy and efficiency of working in the irrigation system cannot be secured. The local paper remarks on the fact that the local board are accepting this certain heavy loss as an inevitable condition of the settlement of the question, notwithstanding the profitable results which are said to have attended recent experience in irrigation, and in direct contravention of the last report (1865) of the Government Commissioners, who declared that "towns may derive a profit more or less considerable by the employment of their sewage in agriculture."

Windsor and Eton.—The official report of Messrs. Ripley & Simonds, the engineers who

have made the survey under the direction of the local Board of Health, has been printed. The engineers commence by showing the existing means of drainage. The whole of the sewage and rainfall is at present thrown into the Thames, but the Thames Conservators now require that it shall be otherwise disposed of. The towns in the Thames valley have therefore been diligently inquiring as to the best means of getting rid of their sewage. Eton has adopted the "separate system" advocated by Mr. Menzies, and is proceeding to carry it into effect at once, under the superintendence of the reporting engineers. The Board of Health at Windsor have now the same method recommended to them in the report. The report recommends that the present sewers should be retained for receiving the sewage proper, and that separate drains should be constructed to carry off the rainfall into the river. The cost of this latter is estimated at 4,200L. Then as to disposal of the sewage, which is calculated at 600,000 gallons daily; it is proposed to purchase a farm in the parish of Stanwell, lying between Horton and Staines, and on this to utilise the sewage matter. The farm, known as Moor Farm, consists of 12½ acres, which is said to be sufficient to receive the whole of the sewage from the present population of the borough. Its disadvantage is its distance (2½ miles) from the pumping station. This pumping station is proposed to be near the Old Windsor Lock. Here tanks would be constructed, to hold 150,000 gallons each, for filtering the sewage. The pumping is proposed to be done by a turbine wheel, with the overflow from the locks, provided the consent of the Conservators of the Thames can be obtained. The main through which the sewage is to be pumped will be 10 in. in diameter, and in the course of 2½ miles will have to cross the Thames twice, the River Colne once, and the South-Western Railway once. To carry the sewage to the pumping-station from the point where it is now discharged, will involve an expense of 4,500L. The alteration and reconstruction of the drainage is therefore estimated to cost 9,000L; the pumping-station, machinery, sewage main, and preparation of land, 9,200L; contingencies, plans, and supervision, 3,000L. Besides this, compensation will have to be paid to owners and occupiers of land; average estimate of the whole 33,000L, besides the annual cost of maintenance and wages to be paid. Against this must be placed the annual product of the sewage farm.

Doncaster.—The Town Council, anxious that the drainage of the borough should be improved, entered into contracts with Messrs. S. Pearson & Son, of Bradford, at the sum of 3,225L for the construction of entire new sewers. The works are in a forward state of progress. Mr. B. S. Brundell is the engineer. The outlet, instead of being below the wheel, as from time immemorial, is at Docken-hill, near the Gas Works. By this means the river Cheswold is free from all impurities, and the vicarage will not suffer from the sewage.

RAILWAY MATTERS.

Signalling.—A Hungarian paper, the *Hermannstädter Zeitung*, mentions a new system of railway signalling, invented by Herr Ednard Krejcsy, the special advantages of which are said to be the following:—1. A train, without slackening its speed, can communicate with any other train or station on the same track. 2. In case of accident the train itself can signal for assistance, and make the casualty known along the whole line. 3. A concussion is impossible, as two trains in motion can constantly exchange signals. 4. The working of the new system is very cheap. Herr Krejcsy has placed his invention in the hands of the Hungarian Government, with the stipulation that in case of its being sold he is to receive one-half of the purchase-money and the State the other. We recollect of an English invention of this kind many years since, in which the iron rails and electricity in the trains were concerned.

Whistling.—We are glad to observe that the intolerable nuisance of railway whistling, or screeching, to which we have repeatedly adverted, is now receiving more attention than heretofore. Mr. Justice Hannen, the other day, at the Camberland Assizes, complained that he not only could not do his duty by day, on account of the unnecessary screeching of locomotives, but that he could get no sleep by night by reason of the same nuisance; and Dean Close reiterates a frequent complaint

of his that divine service is interrupted, and that his sleep is also murdered by it. In truth, it is evident that railway directors just allow their stokers and engine-drivers to "use their own discretion,"—or, rather, their own want of discretion,—in this matter; because some of these *employés* habitually use the screech ten times more than others; and if the lesser amount of screeching be a sufficient quantity, then the greater must be outrageously excessive; and if the lesser had been insufficient, no doubt the amount would have soon been increased. Some idiots evidently make a hideous plaything of it, and strenuously and habitually try to imitate the crowing of cocks and braying of donkeys with their engine-whistles. We notice an excellent "Plea for Sleep" in the *Times*, in which all sorts of minor nuisances are brought under review, but, strange to say, no mention is made of this monster nuisance. Were some mere costermonger to cause a tenth part of the noise, even by day, he would soon be put down. It is to be earnestly hoped that when the District line past Westminster is fairly open, the ears of Parliament will be well dimmed. We shall then have some chance of shutting the whistle-mouths of railway directors. Their selfish disregard of the public comfort is abominable.

NETLEY HOSPITAL.

EARLY readers of the *Builder* who remember our strenuous and repeated warnings against the plan adopted for the costly hospital at Netley,—warnings given before the building was erected, and when alteration could have been made at little cost,—will not be surprised to hear what was stated as to this building at the recent Medical Congress.

Dr. Ramsey said he rose to give a little more in detail a fact to which Sir James Simpson had alluded. Two or three months ago he went over the magnificent hospital at Netley, and was at once struck with its grand defect,—namely, that all the wards were erected parallel, and that there was no possibility of thorough ventilation. As showing the defect of the corridor, he was told—he believed by Professor Longmore—that in the case of a putrid effluvia at one end of the corridor, the smell from which was frightfully bad, the first announcement that the horrible smell was felt in the hospital was made at the other end of the corridor, a third of a mile distant, showing that the putrid air had been carried by the corridor that distance. He thought a stronger condemnation of the corridor walls, and of the parallel construction to which the corridor gave access, could not be brought forward. It was a most important element in the construction of pavilion hospitals that the pavilions, instead of being parallel, should diverge, as was the case at Swansea.

Dr. A. P. Stewart said that, owing to the high winds which frequently prevailed at Netley, anything like proper ventilation had been found to be impossible. He had been repeatedly over the hospital, and had been assured by the attendant that it was a matter of difficulty to keep the wards in anything like a healthy state.

We received but little support from any of the medical profession when we pointed out the defects in the planning of this hospital,—a considerable amount of abuse from some. Time brings its revenges.

PROGRESS AT ROYAL LEAMINGTON SPA.

It is rather remarkable with what rapidity some of our most beautiful resorts have been developed. Saltern-by-the-Sea has, since the year 1861, increased from a poor fishing village to a fashionable watering-place, so extensive that it now possesses two very large hotels, one of which, the Zetland, contains 120 rooms. As with Saltern so, in a great measure, has it been with Royal Leamington Spa. The great extensions which have been made in the town within the past 30 or 40 years are remarkable. While in its primal state it consisted of 45 mud huts. Now the handiwork of the builder and architect stands out on every hand. Its suburban residences, terraces, and spacious streets, were, including Milverton and Lillington, at the last census occupied by 19,277 persons, whilst at the present time, in the season, no fewer than from 24,000 to 25,000 persons find a home in a town which has been designated "a home for the homeless all the year round." But this great improvement, and this great influx of population,

cannot have taken place without producing corresponding results which the building trade has in no insignificant way contributed to. On every hand spacious houses have risen, and are still being built. The Assembly Rooms, which were erected in 1813, cost 13,000*l.* The Regent Hotel, which is a large building, and with no external embellishments, was built in 1819, at a cost of about 80,000*l.* Its ecclesiastical buildings and chapels are numerous, but, with the exception of the parish church, they are by no means distinguished by architectural skill. There are, however, amongst the many erections which are going on, several important works which, when properly developed, will add to the reputation of the town. Amongst others, may be noticed the additions which are being made to the parish church by Mr. Marriott, of Coventry, and which have been in the course of construction for some time.

Mr. Gascoyne, of Leamington, builder, is at present engaged in the erection of a new central post-office not far from the present building which does duty for the country. In the well-known Jephson Gardens, where stands the statue to the gentleman from whom they take their name, the work of Hollins, of Birmingham (in a temple), a memento to the late Mr. John Hitchman, who suggested the idea of planting the road-sides with trees, is now being erected near to the entrance to the gardens fronting the Parade. Workmen are also busy in the erection of a large mansion and a Roman Catholic chapel in Newbold Walk, which are being erected by Mr. Gascoyne for Major Seale, and it is said will cost 20,000*l.* New Dissenting chapels have just been added to the cemetery, and in the neighbourhood in which they are situated stands the Arboretum Hydropathic establishment, which was erected by the late Mr. John Hitchman, at a cost of many thousands of pounds, but which was scarcely ever used for the purpose for which it was designed, owing to the death of its promoter. Mention may also be made of a very large addition to what is known as the "Manor House," by Mr. Masters, builder. Judging by present appearances, there is plenty of work for the building trades at Leamington.

BAYSWATER IMPROVEMENTS.

ON this road, which forms in nearly a direct line the main central route of London from east to west, much has been accomplished both in widening and straightening the causeway, and in the erection of stately buildings suitable to the importance of their position. Throughout the whole extent, from Notting-hill to the Bank, the range is along the highest elevation of the London central plateau; and on the opening of the Valley viaduct next month there will be no perceptible variation in the level from end to end.

Newgate-street has been for the most part widened, a spacious causeway continued over a solid bridge, and the obstruction of Holborns cleared away; all this, done at an enormous outlay, so far as the City is concerned, reflects much credit on the civic authorities; and when the approaches to the market are taken into account, together with the immensely increased facilities for traffic, and the improved value of building sites, it will repay them with advantage.

The important line continuous from Oxford-street to Notting-hill is, however, of more value to residents in Town; and here, commencing at Lord Grosvenor's mansions, near the Marble Arch, and continuous along the whole park border nearly as far as Notting-hill Gate, the ranges of noble mansions, in terraces, have been completed along the Bayswater-road, which, facing the park and Kensington Gardens, and fronting the south, make them the most favoured residential abodes; shrubbed flower borders, and the open views of forest scenery, together with a dry sandy soil, offering attractions which no other suburb can rival.

The fine terraces of Lancaster Gate begin the more modernised ranges opposite Kensington Gardens, and are continued along the highest elevation of the whole line, at least 100 ft. above high-water mark, and 50 ft. above the South Kensington level; and here, where the road is widest and most elevated, two terraces of mansions, most commanding in style and position, have been finished by Mr. W. Marler, together with houses in Inverness and Queensborough terraces, to complete those roads which issue at right angles into the main Bayswater road. The style of these terraces is a decided improvement

upon the comparatively plain elevations of Hyde Park Gardens. A double range of balconies, on entrance and first stories, extends throughout, supported upon monolith columns, and the terminal houses of each terrace have also bay windows, plastered and finished in character with the rest, giving an air of magnificence to the whole; the interiors being decorated and gilded, whilst the division and allocation of the internal spaces discover a great advance upon former modes of distribution. Mr. R. W. Edis is the architect, by whose designs these buildings have been carried out.

The afforested gardens descend at an impalpable decline from these frontages, and glades open leading south-east and south from wickets of approach opposite to these terraces. Nothing can be more rural than the thick groves of ivy trees in the gardens, and a little cove on the part of the Commissioners would vastly improve the scenic effect, if they would only cut away the redundant and decaying trees; it would enliven the scene, and give purer air and light to promenaders, whilst it would liberate the healthiest of the struggling giants, and so allow the natural expansion of the aged forester to become an object of beauty.

A BAD ROOM FOR HEARING IN.

THE town-council of Lichfield have lately built a magistrates' room, the construction of which is such, that if you can imagine reverberations of sound caused by a few Lilliputians talking inside a big drum, you can imagine the kind of sound produced by as many ordinary persons conversing in the room.

This room is 38 ft. 6 in. long, 21 ft. wide, and 15 ft. high to the base of the roof. The roof is an open one of high pitch without a tie-beam, and without a lantern. Each side of it, having two skylights, inclines at an angle of forty-eight degrees, or less, with an imaginary line parallel to that of the floor; and consequently, the whole roof is eminently calculated to reflect sounds to the floor, at the same time that the floor, boarded over a hollow space, is remarkably sonorous.

The walls are plastered, and there is only one window in them,—a rather small window in the north wall. The south wall has but one break in it,—a door 4 ft. wide. The side wall surfaces are broken by two smaller doors; but all the doors lead into confined entrances.

Different causes, therefore, exist for transmission and reflection of sound in different measures of time; and hence the confusion of sound which every one complains of.

To me it seems that the chief sources of evil are the boarded floor and the open roof. But both these sources of evil may be done away with by substituting a solid tile floor for the sonorous wooden one, and by cutting off, as side-beams favour, more than the upper two-thirds of the roof-space by means of a panelled ceiling. This new feature of the room would be 18 ft. 6 in. high; and this measure added to that of the width would be only 1 ft. more than the measure of the length of the room,—a near approach to good proportion on acoustic principles.

The ceiling would cut off the skylights; but, as substitutes for them, four windows each 7 ft. high, might be inserted in the side walls, at a height of 7 ft. above the floor. The south wall surface, being immediately opposite the platform, requires to be broken; and it might be broken by means of sash-windows glazed with fluted glass, placed at a height of 10 ft. above the floor. These south windows would materially assist means of ventilation; but besides them, one full-sized hopper-shaped ventilator over the north window, and one over the south door, would, like the windows, be attended with benefit to sound, as well as to ventilation.

My notions, however, about any acoustic defect in a building being mere theory, I can only hope they will elicit instruction to guide persons who are as much puzzled over the matter as I am.

JAMES RAWSON, M.D.

Cab Reform.—An invention has been produced in Paris for settling disputes between cab-hirers and cab-drivers, which seems to deserve attention. A correspondent says it is a "compteur mécanique," or calculating machine, and that it not only reckons the distance traversed, but indicates as well the exact sum of money due to the driver.

SMOKE-LAND.

As with the water we drink, so with the air we breathe, some atmospheric Baron Haussmann is required despotically to rescue us from poisoners. We are not here hinting at the ordinary cabbage-cigar, nor at the supposed right that so many claim of blowing its miasma into other people's lungs: we will not vainly tilt against tobacco; but would parenthetically invoke a blessing on the man who will invent a pipe to consume its own smoke, or a "weed" chemically cured of its narcotic qualities as not to pour out headache on the air, nor trouble innocent inhalers with a land-imitation of seasickness. This by the way. We speak of far more wholesome methods of pouring poison on the atmosphere,—due, so far as the present writer is concerned, to a recent journey on the North-Western.

Who will devise a plan for clearing our midland provinces from their normal state of misery and dirt from gaseous exhalations? Wednesbury and its neighbourhood would have given Dante some terrible additional ideas for his "Inferno;" and how those wretched myriads can live and breathe in such an atmosphere, we denizens in a purer air can only plyingly guess; while we must pretty well be sure that rude health and ordinary cleanliness are to them well nigh impossible luxuries.

But is there really nothing to be done in the way of cure or mitigation of those cursed clouds of gloom and stench that overhang half Staffordshire and Worcestershire? Can no one find out how to give clarity to the air, greenness to the fields, ruddiness to the cheeks of children, and muscle to the withered frames of man and woman, by saving to the manufacturer's pocket all that half-consumed coal, and all those chemical salts, which blacken and pollute the firmament, and might, no doubt, be far better utilised in the all-voracious furnaces? It may really be a matter of economy so to cleanse the atmosphere; and not idly to let tons of carbon sail away in stifling soot all over the neighbourhood of those tall chimneys, which by thousands are now seen belching out clouds by day and pillars of fire by night, to the destruction of vegetation, and by no means to the health of poor humanity. Birmingham would give a well-deserved statue of gold (if cash were preferred in that glorified form) to the clever pyrotechnical philosopher who could invent the scheme of a perfect combustion: so let somebody try again even to improve on Dr. Arnott, and to make it the economical interest of every ironmaster and copper-smith and potter to save his fuel by using up his smoke. In East London we have partially succeeded; why should they not stretch a wholesome piece of legislation, so as to include West Staffordshire? Surely the Midlands would be grateful. Surely those toiling myriads would rejoice in sweeter air, whiter skins, and a greener country. They are not so heedless of health and comfort and the decencies of life as to despise cleanliness; and if only their great capitalist-employers can be made (through self-interest, and as a mere measure of economy) to harm their own smoke and utilise all those escaping gases, the discoverer of such a process will speedily be rewarded with a fortune, and for ever after he hailed as one of the happiest of philanthropists. MARTIN F. TUPPER.

SIR WILLIAM ARMSTRONG ON THE SMOKE NUISANCE.

A TOWN'S meeting, presided over by the mayor, has been held at Newcastle-on-Tyne "for the purpose of considering and adopting measures to remedy and prevent the injuries to health, and the damage to vegetation arising from the escape of smoke and noxious vapours in the town and the country near to it." The meeting ended in the appointment of a committee to investigate and report on the nuisance complained of. Among the speakers were Sir William Armstrong, who said he stood up quite as much on behalf of those who produced smoke as for those who suffered from its effects. It was an undoubted fact, however, that the quantity of smoke that was produced was far more than was unavoidable. He believed that so far as black smoke was concerned, by far the greater portion of it was produced by steam boilers. He had himself at Elswick nearly fifty steam boilers in operation, and if there were no means provided for destroying the smoke of those fifty furnaces, the place would be

perfect pandemonium. But to every boiler was applied a smoke-consuming apparatus, and the effect was inadequate. The chief cause of smoke was the inadequate boiler power generally employed in manufactories, in which it was required that the fires should be stoked much more energetically than would otherwise be necessary. Sir William recommended the self-stoking smokeless furnace of Messrs. T. & T. Vicars, engineers, Newcastle-on-Tyne, which had been applied to all the boilers at the Elswick Ordnance and Engine Works.

PARLIAMENTARY DINING-ROOMS AND THE LADIES' GALLERY.

The report of the select committee appointed to consider plans for new refreshment and dining rooms for both Houses of Parliament, and for improvements in the ladies' gallery of the House of Commons, have agreed to their report, which has been published. The committee say that a change is much required with respect to the existing arrangements for the House of Commons' dining-room; that the accommodation is insufficient when there is a full attendance of members, the temperature of both dining-room and kitchen excessive, and the ventilation of the kitchen very bad. The estimates for the proposed change, amounting to 24,517*l.*, exclusive of furniture, seemed to the committee to be extremely high, and there was no time to test their accuracy in the usual way during the session just passed. They think the House should have an opportunity at an early period next year of fully considering whether such an expense should be incurred. In the mean time they are of opinion that some steps should be taken to lower the temperature and improve the ventilation of the existing kitchen. An estimate of 1,050*l.* and plan for improvement in the ladies' gallery have been submitted to the committee, and they are of opinion that this improvement should be carried into effect in the vacation. From the evidence appended to the report it appears that Mr. E. M. Barry guarantees that this can be done.

THE NATIONAL ARMOURY.

We observe, with considerable satisfaction, that Mr. Cole, the director of the South Kensington Museum, in his report to the Lord President of the Council, has adopted our suggestion (see *Builder* for 20th March, 1869) as to the union of the Meyrick Collection of armor with that in the Tower of London. Mr. Cole says of the Meyrick Collection,—"It is intended to be offered to the Department for sale. If purchased, and united with that in the Tower of London, the whole would be the finest in Europe. The Tower Collection is visited by upwards of 60,000 persons annually, who pay 6*d.* each, and the receipts more than pay the cost of attendants, &c."

DEATH IN THE WORKSHOP.

INDUCEMENT OR COMPUSSION?

Sir,—Having a liking to acquaint myself with the various modes and processes in factories and workshops, I have visited black-lead mills, emery and glass mills, pipe cutting mills, bark mills, grinders, felt makers, wool carriers, workers in cow hair, radiators, &c., &c.

In all these deadly occupations life is short and illness rare, improvements are seldom attempted, the owners aver they have nothing to gain, they are not amenable for the death of the man, and when one falls they have many applicants for the situation, that cannot afford to experiment, the public would not pay more for an article produced without murder!

I maintain that most of these evils can be prevented or mitigated. Were Government to indemnify owners, improvements would be made. R. T.

CHESTER SEWERAGE.

Sir,—On my return home from abroad, my attention was called to a paragraph in the *Builder* (July 24, p. 690), referring to the drainage of Chester, and stating that Mr. Latham had been called in to report on and rectify the total want of ventilation of the sewers.

It must be known to you and others, that Chester led the van (in 1848) in carrying out sanitary works, long before the General Board of Health, or their acute engineers, were called into existence, and descriptions of the works were published in the *Builder* at the time, and they were inspected by many professional men from Liverpool, Manchester, London, Warrington, and other places, and information was furnished to them as to the *modus operandi*. At the same time the sewers were being carried out, a system of ventilation was adopted, both at dead ends and in several places in their course; and these evidently must have acted well, judging from the Registrar General's returns, as Chester is classed amongst the healthy towns with a mortality somewhat below 20 per 1,000.

It is only recently that Croydon has been struck off the dirty list, and been classed amongst the healthy towns, after a desperate struggle, and doing and undoing of works for a period of years; and it is only three years since she commenced to correct the defective ventilation of its sewers, while a system of ventilation had been in operation in Chester since 1848. As well as a system of ventilation, other plans were proposed for the disposal of the sewage refuse, which is still thrown to waste and defiles the River Dee; and I suppose, with the usual obduracy of corporate bodies, it never will be done unless the Government or Parliament compel them to do it.

I trust the report of Mr. Latham will be made a public document, so that I may have an opportunity of reviewing it, and that the world may be enlightened on the very perfect system he advocates. B. BAXLES.

THE STRIKE OF MASONS AT MANCHESTER.

A CONFERENCE of Manchester and Liverpool master builders recently took place in Liverpool, in which it was determined to insist upon the terms which brought about the strike and lock-out. Notwithstanding this, however, one builder in Liverpool, Mr. Hugh Yates, has withdrawn from the contest, and his masons resumed work on Tuesday last.

It appears to me, sir, that there has been a very great want of *esprit de corps* on both sides during the struggle. We have seen a large number of the master builders of this country associated together for the purpose of compelling the adoption of certain rules which the other side deemed unjust, and yet at the very first shock of the contest we have seen the whole of the employers in certain towns giving up their demands without the slightest reference to their fellows in other places; and we have, on the part of the operatives who are also associated, the same regular conduct manifested, neither party seeming to care how the struggle ended so long as they themselves were out of it. It seems to me to be selfish in the extreme, and to defeat the objects of either organisation. B. G.

TRAVELLING THROUGH THE AIR.

Sir,—Mechanicians are waiting, like Mr. Micawber, for "something to turn up" in the way of a very powerful, compact, not too heavy means of obtaining a motive power, to adapt it to an aerial machine. None of our present known means are applicable, as involving too great an amount of dead weight. Steam, for example, requires boilers, engines, and coals, besides the framework of the machine—all too heavy. Inflammable gas, although better, is still unwieldy in its employment. It seems to me to be in the direction of electricity, as a motive power, that we shall find a solution. The science and its practice are very young as yet; and although it has done wonders, it is capable of doing infinitely more. That an amount of dead weight is necessary in the machine itself is now universally admitted, but it must bear about the same proportion to its power as the body of the goose does to the muscles of its wings, and not more. When that power is discovered, it can be applied at once: the means are known. G.

AERIAL NAVIGATION.

Sir,—It is remarkable that your Number containing Mr. Tupper's "fancies" on human flight, with a description "how not to do it"—i.e., by means of balloons, contains in another column a notice of the Californian steam-propelled balloon, which appears to have succeeded as far as a model can in proving the practicability of aerial navigation by such means.

Your correspondent's idea "how to do it"—i.e., by bird or bat-like wings worked by the human muscles,—has been the motive of experiments from time immemorial, which have always proved abortive, except in fables. So lately as last year we were promised an illustration of human flight at the Crystal Palace by a member of the Aeronautical Society, but that gentleman found it inexpedient to air his wings in public. The most noble president of the society, however, exhibited a model to show that both the upward and downward strokes of a bird's wing assisted in propulsion. It consisted of mechanism somewhat like the "springs and wheels contained in a breast-plate" of your correspondent, attached to real wings from a bird. It certainly proceeded along a line with a movement resembling a very lame duck, but if intended as an example for human flight, showed in a very convincing way "how not to do it."

On the other hand, the steam-propelled balloon exhibited by M. Canalis Vert, of Paris, at the same exhibition, was as completely successful as the Californian model.

It is wise, doubtless, to copy Nature, but not too servilely. Our achievements in locomotion on land and water, by railway engines and steamboats, have not been attained by such servile copies of racehorses and fishes, but we have plainly no chance of moving in the air unless we closely imitate the birds.

Like your correspondent, I have studied the subject many years. In a pamphlet on "Aerial Navigation by Means of a Steam-propelled Balloon," published in 1861, I ventured to adopt some hues of his as a motto, and regret being compelled to dissent from him years ago the means of accomplishing this great desideratum. These views regarding balloons are shared by most members of the Aeronautical Society, and I believe have greatly retarded the good time coming.

If the reported enterprise be fairly undertaken by the American adventurers, I have no doubt it will succeed with a facility which will set the world wondering why it was not done before.

I hope the spirit of generous rivalry now manifested between England and America may produce a similar undertaking here, in which I should be most happy to co-operate. J. LUXLEY.

THE TOMB OF HENRY VII.

The well-known central monument in the chapel of Henry VII., Westminster Abbey, has been cleansed and revived. The tomb itself is seen to be of black marble; the effigies and other metal adjuncts are gilt. The gilding is for the most part in an excellent state of preservation. The subjects of the sculptured groups in the circular panels round the tomb are now obvious, and the inscription is legible. The dark metal screen around the tomb would prevent its newly-restored brightness from interfering with the sombre harmony of the chapel as a whole, even were that brightness more garish than it is. It was a decidedly desirable work to do. Nothing has yet been done to the screen; but doubtless it will be cleaned, and the small portions that are gilt brought out. Looking at the tolerably complete appearance of the monument at first sight, it is somewhat startling to hear that 1,500 pieces are wanting to make it perfect; yet such we believe is the case.

RESTORED PAINTINGS AT NORTHAW.

SOME interesting mural paintings in a mansion of James II.'s time, in the possession of Mr. J. J. Monney, at Northaw, Herts, have just been preserved from obliteration and decay. The paintings decorate the ceiling and walls of the principal staircase. They are attributed to the joint efforts of Sir James Thornhill and Maria Verelst. There was evidence that attempts had been made a century ago to clean off the thick coating of discoloured copal varnish with which the designs had been covered, but the operator failing in his efforts the greater part of the pictures were repainted in a substantial manner, and another generous coat of copal given to the whole. The double incrustation has now been removed. The original work is seen in an admirable condition, and there seems no reason why it should not keep so for many years to come. The restoration has been effected by Mr. Manfred Holyoake.

SCHOOLS OF ART.

The Maclesfield School.—At a meeting of the council, held at the town-hall, Mr. J. Ford, the master of the school, applied for instructions as to the sale of designs by pupils. The custom as to this varies in several parts of the country. The subject was referred to the Class Committee. It was resolved that all the hanks in the town be requested to receive subscriptions for the schools, and Mr. G. W. Clarke, the secretary, was instructed to arrange with Mr. H. Cole, C.B., the director of the Department of Science and Art, to accept the invitation of the council to a breakfast at the townhall.

The Wolverhampton School.—The annual meeting in connexion with this school, for the presentation of the prizes awarded to the pupils by the Government Department of Science and Art, has been held in the large room of the Institute, when the prizes were distributed by the mayor. There was a good attendance of the subscribers and parents and friends of the pupils, the number present being larger than at any similar meeting for several years. The general report congratulated the friends and supporters of the school on its continued efficiency, and also on the steady increase of pupils to the whole of the classes. One hundred and ten pupils attended the school during the past year. Forty-nine certificates of merit and prizes had been awarded at the examination, and on works submitted to London for inspection.

The Drawing Schools in Wurttemberg.—One of the most remarkable features in the primary schools of Wurttemberg (says the report of the French Commission on Technical Instruction), is the extraordinary attention paid to teaching drawing. The department of trade and manufactures has persuaded the Ministry of Public Instruction and Worship to add classes for industrial drawing to all these schools, and the ministry has had the wisdom to leave to that department the care of organising and superintending their progress. They were founded, after the Universal Exhibition of 1851, to enable the manufacturers of the country to compete with France in the industrial arts. These schools were at first gratuitous, but experience proved that attendance was better secured by requiring a small payment, varying, according to the means of parents, from half a florin to twelve

florins a year. The teachers are, as far as possible, chosen from among the workmen or masters of the chief industries of the place, who having been taught in the same schools have there acquired the requisite knowledge. But these workmen thus made teachers do not abandon their trades, and receive an indemnity of about two florins per hour's lesson. They generally give three a week of two hours each, from seven to nine o'clock in the evening. At Geisslingen, for instance, there is a school where 150 scholars are taught by a master mason. It has been remarked that artists of considerable talent have not succeeded so well, as masters, as they have as mere artisans.

CHURCH-BUILDING NEWS.

Goolse (Yorkshire).—The church here has been reopened. In 1868 the tower was completely gutted by fire, with the destruction of the clock, and the bell was cracked. At the time of the fire the building was insured in the Phoenix Office for 3,000*l.*, but the company paid the full amount of damage, 7,12*l.* Since that period the work has been progressing in the hands of Messrs. Kassell, contractors, Goolse.

Ryde.—Although it at present numbers 12,000 inhabitants, and is the largest and most fashionable town in the Isle of Wight, Ryde has remained till now without a parish church, both it and Ventnor having been included in the parish of Newchurch. The latter was, however, a short time since divided into three parishes, Ryde, Newchurch, and Ventnor, and since then efforts have been made to erect a new church. The corner-stone of the new edifice has now been laid by the Princess Christian. The church is to be finished within two years from the present time. Mr. G. G. Scott is the architect.

Linslade, Leighton Buzzard.—Linslade church, which was erected in the year 1848, has just undergone considerable alteration. A south aisle, with a large organ-chamber and a massive tower, have been added, the latter containing a peal of six bells, removed from the old church at Linslade (now used as a burial-chapel). The new aisle, with the organ-chamber at the east, is separated from the nave by a stone arcade, composed of four arches of bold and simple character. The works have been executed by Messrs. Car-side & Holdstock, builders, at a cost of 1,800*l.* from the designs of Mr. Ferrey, the architect of the original church.

Louth.—The parish church here has been reopened. The clearstory and arcade have been cleaned and underpinned where necessary. The west end of the north aisle has been rebuilt, as also have the north and south porches. (The south porch is the gift of Mr. Cornelius Parker, and has been built under the direction of Mr. R. J. Withers, of London.) There is new open seating throughout, with stalls for the corporation, the whole of oak, with sunk traceried panels to bench ends. The floors have been laid with Milton tiles of a costly pattern from the designs of the architect. There is a reredos of alabaster, Ancaster stone and serpentine, with piscina and credence-table of Devonshire marble. A new oak screen, carved, has been put across the east end of the north aisle, the gift of the architect, and the old screen on the opposite side has been restored. The roofs, which are of modern date, have been cleaned. The organ has been removed from the west to the east end of the north aisle. A new heating apparatus has been fixed by Messrs. Haden & Son, of Trowbridge. A stained-glass window has been fixed at the east end of the south aisle by Mr. Preedy, of London, the gift of Mr. J. L. Flytche; and another window at the west end of the north aisle, by Messrs. Clayton & Bell, in memory of Mrs. Barnard (Claribel), who was a native of Louth. A window, also by Messrs. Clayton & Bell, has been placed in the south aisle, in memory of General Sir George Patey, the gift of Mrs. and Mr. L. R. Lucas. Mr. J. Fowler was the architect of the restorations, and Mr. C. Clarke the builder.

Windsor.—Contributions to the amount of 3,050*l.* have been promised towards the renovation of the parish church. This sum includes donations of 100*l.* from the Diocesan Church Building Society, and 50*l.* from the Incorporated Church Building Society of London. It is intended to proceed at once with the erection of a chancel, then with an organ-chamber, the removal of the organ, reseating the church, and reconstruction of the western gallery, the estimate for which is about 3,600*l.* When these works shall have

been completed, and money sufficient contributed, it is contemplated to spend between 2,000*l.* and 3,000*l.* upon the decoration of the church, which is at present a very plain structure. Amongst the contributors are her Majesty the Queen, 200*l.*; and their Royal Highnesses Prince and Princess Christian of Schleswig-Holstein 50 guineas.

Workshop.—St. John's new church has been consecrated. The plan of the church consists of nave and aisles, chancel, vestry, and organ chamber, western tower, and north porch. The nave is 82 ft. by 22 ft. 6 in., and the aisles are 82 ft. by 15 ft.; the chancel, 30 ft. by 31 ft.; organ-chamber and vestry, 16 ft. by 13 ft.; porch, 13 ft. by 9 ft.; tower, 13 ft. internally. The height of the edifice at the bridge of the nave is 53 ft.; to top of spire, 140 ft. The aisles are lighted by two-light lancets. The pier arches are quatrefoil in plan, with carved caps and moulded bases. The chancel arch has three detached shafts and moulded arch and hood mouldings. The roof trusses are trefoil, ribbed principals, supported in detached stone shafts with carved caps and foliage corbels under bases. The organ-chamber opens into the aisle and chancel. The tower is groined in stone with moulded ribs. The style of the church is Early English. All the windows have columns, caps, and bases. The belfry of the tower has a two-light window in it, and is arcaded all round. The spire is a parapet spire, with large pinnacles at the four angles, and two tiers of Fucane lights. Messrs. Robert Clarke & Son, of Nottingham, were the architects; and Mr. Charles Wright, of Nottingham, the builder. The carving has been executed by Messrs. W. P. Smith & Sons, of Nottingham. The capitals are carved in the broad type of Early English, chiefly from original designs. The upper carving in the clearstory is of the more cut-up style, a little more of the ancient carving being introduced. The new organ has been built by Mr. Brindley, Sheffield. The benches are open and stained. The windows are all of plain glass.

White Waltham.—The church of St. Mary, White Waltham, has been re-opened for divine worship, after extensive alterations and improvements. The edifice has been almost entirely rebuilt, according to plans by Mr. Street, of London. Mr. Silver, of Maidenhead, was the builder, and the work has been carried out under his superintendence.

Everton.—The ancient parish church of Holy Trinity, Everton, after undergoing considerable repairs and alterations, has been re-opened by the Bishop of Lincoln. The alterations just effected include the entire removal of the three lofts, and also of all the internal fittings except the communion table. Through the lowering of the floor some 2 ft. or 3 ft., the bases of the pillars, the walls in front sight, are now visible. All the walls in the interior have been repaired, and plastered. The arch leading into the tower has been opened, while the western door of the tower has been walled up, and in its place has been erected a stained glass window, the gift of Mrs. Metcalf (the vicar's wife), being a memorial of her parents. The subject of the design is Christ blessing little children. The other windows are of common glass, except the side panes, which are filled with glass stained in yellow, blue, and red. A floor for the ringers has been placed in the tower and filled up with open seats similar to those in the other parts of the church, all being of pitch pine. The old font, which was in a very dilapidated condition, has given place to a new one near the west end of the nave. The porch also has been restored and newly roofed. Additional seat-room has been obtained for about 40 hearers, or, in all, 250. The cost of the repairs and additions is between 600*l.* and 700*l.*

Eaton-under-Heywood.—The parish church has been re-opened. The plaster has been removed from the walls; the stonework has been redressed, and left bare; the old ceiling has been removed, and several new lights have been put in. Among the latter must be mentioned two small windows in the south wall, which were discovered on the removal of the plaster, and which correspond with two similar windows on the north side of the church. In each of these windows is a figure, in stained glass, by Messrs. Done & Davies, of Shrewsbury, representing an Evangelist, and the same artists have reglazed several other of the windows with tinted cathedral glass. A stained glass window, which was placed in the chancel in 1859, in memory of a member of the Pinches family, of Tickleton, has been restored by the artists named, and placed in this west end of the church. Its place

in the chancel has been supplied by three lancet windows, filled with stained glass, by Mr. Preedy, of London. This alteration in the windows of the chancel has been made in order to restore that portion of the church, as near as possible, to what it was originally; and, indeed, this has been the main object throughout the work. The whole of the stained glass in the chancel, together with a new oak communion-table, was presented by Mr. A. Sparrow, the lord of the manor. In addition to other improvements, one of the old bells in the tower has been recast, at the expense of the vicar, and the others have been tuned and otherwise improved. The masonry work in connection with the restoration was done by Mr. T. Clifton, Beam Bridge. A carved ambry door, and some wood crosses, are the work of Mr. William Hill, Smethcote. Six Mediaeval faces in the nave, together with a carved oak chair, are the work of Mr. Carter, who also stained the woodwork of the roof and varnished the seats. The other part of the work has been performed almost entirely by local workmen. The designs for the restoration were supplied by Mr. W. J. Hopkins.

Ashelworth.—St. Andrew's Church has been restored and re-opened for divine service. The works lately effected include the removal of the galleries and all the modern seats, and the substitution for the latter of benches of oak and elm; the repair of the ancient open seats, adorned with linenfold carving; the throwing open, cleansing, and repairing of the timbers of the roof; the cleansing of the stonework of the piers and arches; the restoration of the tower and spire and the external portions of the fabric; the removal of the plaster and rough-cast from the walls; the building of a new arch at the transept; the reseating of the chancel, and the laying of a tile floor to the passages, and the construction of new and open seats and enamelled tile floor for the chancel. A new vestry has been built on the north side of the chancel, in the place of one formed out of the lower floor of the tower, which is now thrown open to the nave, exposing the arch and west window. The church has been rendered dry by the removal of the soil from the walls, and the erection of proper spouting, with drains to carry off the surface water, and by the introduction of one of Garney's stoves to warm and air the building. The east window of the north chancel and the two windows on the north side of the chancel are filled with painted glass, as memorials of departed parishioners. In the three-light east window are represented the Birth, the Crucifixion, and the Resurrection of our Lord. In the north wall is a deeply-recessed window of our light. In this is represented the Virgin bearing the emblematical lily. West of this is a three-light window: the subjects are, Christ blessing little children, the Good Shepherd, and the Annunciation of our Lord's Resurrection to Mary Magdalene, Mary the Mother of James, and Salome. All these windows are by Mr. Gibbs, of London. Mr. Atwood has presented an organ of four stops, with pedals, to the church. It has been placed in the south chancel.

Whitfield.—The foundation-stone of a new church, in the course of erection at Whitfield, near Brackley, has been laid by the Hon. Mrs. Pierrepont, of Evelyn Hall. On the 1st of February last, during a very heavy gale of wind, the tower of the old parish church, supposed to have been built in the thirteenth century, was blown down. Mr. Harry Woodyer, architect, of Grafton, near Guildford, was consulted, and, in consequence of his report as to the insecure and dangerous state of the whole building, a meeting of ratepayers to consider the matter was held, and it was unanimously agreed that the old church should be pulled down, and that a new church should be built. When about 1,500*l.* had been promised, tenders were advertised for the erection of a new church, according to Mr. Woodyer's design. The lowest tender then sent in was 2,860*l.* The committee did not feel justified in entering into such a contract with the funds they had in hand, and new tenders were advertised for, the contract to be limited to the erection of the fabric, with the understanding that that portion of the work should be completed by Christmas next. A tender for 1,740*l.*, sent in by Messrs. Mansfield & Booth, of Buckingham, was accepted, and the work is now in rapid progress.

Heigham (Norwich).—A meeting of the parishioners has been held in the temporary church of St. Philip, Heigham, when the designs for

the proposed new church selected by the committee were inspected and approved of.

Hambodarn-Pawr (Cardiganshire).—The great care of the church here has been re-opened, after having been partly rebuilt, under the superintendence of Mr. J. P. Seddon, architect. The old church is supposed to have been founded by St. Padarn, after whom it is named, and who was a clergyman from Brittany, who laboured unwearingly in preaching over the wild coasts of Cardigan, and was made its first bishop, about the year 516. The entrance, which is of ancient workmanship, has been preserved. Mr. Williams, of Cardiff, was the contractor.

DISSENTING CHURCH-BUILDING NEWS.

Kibblesworth.—The foundation-stone of a new Primitive Methodist Chapel about being erected at Kibblesworth, has been laid. The style employed in the new building is Medieval Gothic, and the edifice will be situated on a high part of the village. The interior dimensions are 42 ft. in length by 27 ft. in breadth, and accommodation will be provided for about 350 persons. The plans have been prepared by Mr. Mitcheson, architect, free of cost, and other preliminary arrangements have been carried out gratuitously by members of the society. It is estimated that the cost of the erection, when complete, will be about 300l.

Staindrop.—The foundation-stone of a Wesleyan chapel has been laid here. The edifice will provide seat accommodation for 220 persons. It will be built of stone, in the Romanesque style. The architect is Mr. Ross. The gables facing the street will have a circular tracery window, and at this end of the building the entrance porch and vestry will be placed. The roof will be wagon-headed, the principal timbers, which divide the ceiling into panels, being displayed. The contractors for the mason's, plasterer's, and slater's work are Messrs. Aldred & Stephenson, of Darlington; for the joiner's work, Mr. Martin, of Darlington; and for the plumber's and painter's work, Mr. Simpson, of Staindrop.

Buxton.—The foundation-stone of a Primitive Methodist's new chapel has been laid here. The edifice will be erected on a site in Higher Buxton, fronting the London-road. It will be built in the Gothic style of architecture, faced with ashlar stone, and is calculated to seat about 300 persons. There will be no galleries. Mr. J. D. Simpson, of Fairfield, is the architect. Messrs. Smith & Bennett have contracted for the woodwork, and Mr. John Hardy for the stonework. The estimated cost of the chapel and a house, together with the land, is about 1,000l.

SCHOOL-BUILDING NEWS.

Louth.—The new grammar-school here has been opened. The school and beds-houses have been erected by Mr. T. Maxey, of Louth, from designs by Mr. James Fowler. The school fronts schoolhouse-lane, and is of red brick, with dressage of Ancaster stone, and slate roof. The bosses of the labels over the windows are carved, forming busts of persons who have in some way been connected with the school. A niche, containing a statue of the founder of the school, King Edward VI., is placed in the north wall of the beds-house, facing the playground. The schoolroom is lighted by four three-light windows, facing the west, and four roof-light windows, facing the east. The schoolroom and head master's rooms form north and south wings, with hay windows. A fire-escapement and the requisite offices have been provided. The playground is enclosed by a dwarf wall and iron railing. The beds-houses are to the east south of the school, fronting Gospel-gate, and are twelve rooms, six on the ground floor and six on the second.

Manchester.—The Manchester district schools for orphan and necessitous children of workmen and clerks, the erection of which has recently been completed at Cheadle Hill, have been formally opened by the Earl of Ellesmere, at the presence of a large assemblage. The building is situated close to the railway, a short distance beyond Cheadle Hill Station. The cost of the building and furniture was about 10,000l., and there is accommodation for about 100 pupils.

Cootham (Kirkcaldum, Yorkshire).—The new grammar-school at Cootham has been completed and inaugurated. The total cost of the edifice is about 4,000l., exclusive of the site. Mr. J. C. Adams was the architect.

Gloucester.—The foundation-stone of a national school for St. Aldate's parish has been laid. The site has been provided by the taking down of some old houses almost in front of the church. The new building will be a parallelogram, 40 ft. 8 in. by 18 ft. 2 in. inside, with additional space for lavatories. A movable partition will divide it into two schools for boys and girls; and space will be given for about 100 children. The walls will be of red brick, with black heads, the heads and sills of the doors and windows of Bath stone. The style is of an Early Geometrical type. The south front has four small lancet and two large three-light windows, with circles in the heads, the latter carried up above the eaves and dormered in the roof. The roof will be covered with tile, and four trefoiled ventilators will rise from it. At the north end there will be a porch, and the usual offices under a lean-to roof. Internally, the roof-timber will appear and be varnished; the ceiling will be on the top of the rafters and collars. The floor will be of deal, and at each end there will be an ornamental Painswick-stone fireplace. The architect is Mr. J. W. Huggall, of Oxford; the builder, Mr. King, of Gloucester. The cost is to be about 315l.

STAINED GLASS.

St. James's, Flockton.—The great east window of the new church of St. James the Great, Flockton, near Wakefield, has just been filled with stained glass to the memory of Lady Lister-Kaye. The window consists of five openings and elaborate tracery. The centre compartment is occupied entirely with the Crucifixion, with the figures of the Virgin, Magdalen, and St. John. In the openings on either side are groups in medallions on grisaille, the Nativity, Agony, Barial, Resurrection, Christ blessing little children, the Supper at Emmaus, the Communion to the Apostles, and the Martyrdom of St. James; in the tracery are groups of the Ascension, Christ sitting in majesty, angels, &c. Along the base is an inscription, "To the glory of God and in memory of Matilda Lister-Kaye, who fell asleep April 4th, 1867. This window is erected by her children." It is the work of Mr. Baguley, of Newcastle-on-Tyne. The chancel is to be consecrated early next month.

FROM AUSTRALIA.

Progress of Victoria.—An interesting statistical paper on the religious, moral, and intellectual progress of Victoria up to the close of 1869 has been issued from the registrar-general's office, and presented to the Colonial Parliament. From it we gather that there are 1,006 churches and chapels, 331 school-houses, and 537 dwellings or public buildings, making a total of 1,874 buildings used for public worship. There is accommodation for 271,753, but only 167,894 avail themselves of this on the Sunday. The number of graduates in the Melbourne University during the ten years ending 1867 was 221. There are 1,385 schools, and the number of children attending them amounts to 91,336. The common schools, numbering 779, receive about 230,979 annually. There are 1,682 Sunday schools in the colony, the average attendance being 77,282. The National Museum was visited by 67,954 persons. There are seventy-six mechanics' institutes and public libraries in the colony, containing 134,067 volumes, and 767,933 visitors availed themselves during the year of the benefits offered by these institutions. There are twenty-six hospitals in the country, giving in-door and out-door relief to 47,470 patients. There are six benevolent asylums affording relief, in-door and out, to 40,846 destitute people; and there are six orphan asylums which take charge of 1,022 of the waifs and strays of humanity. 30,858l. are annually raised in the colony from private contributions in aid of its hospitals, 10,000l. in aid of its benevolent asylums, and 6,370l. for its orphan asylums: all this is independent of the public grant in aid. The industrial schools at Princes' Bridge, Sunbury, Geelong, and the Naval Training Ship expended 45,782l. in the reclamation of the forsaken and the precociously vicious of the colony. 1,680 lunatics cost the country 61,849l. for care and maintenance. All this was in 1867.

Ballarat District Hospital.—The corner-stone of the new pile of buildings to be called after H.R.H. the Duke of Edinburgh, and named the Alfred Wing, has been laid. This so-called wing will form a material portion of the centre at some future time, with which view it will be carried to

a higher altitude, and he surmounted with a tower. The portion now being proceeded with will give additional room for 150 patients; there are only 105 beds in the older part of the building. Upon calling for prize designs that of Mr. J. H. Jones was selected from six sent in. Messrs. Dene & Cranston are the contractors for the erection of a portion of the building for the sum of 3,688l.

Books Received.

"*The Church Builder*" for July, besides other matter of interest, and reports, lists of grants, &c., contains some interesting particulars as to the little known and early church of Checkendon, and the discoveries made during the restorations, which are still in progress.—"*Recent Discussions on the Abolition of Patents for Inventions.* London: Longmans & Co." This volume contains reports of various speeches made and that were to have been made in favour of the robbery of inventors by abolishing all protection by patent law as something "good for trade." "The matter," says the author, "comprise the jottings and materials which I collected for a speech intended to be delivered on the 28th of May, when proposing a motion in favour of abolishing patents for inventions;" and from this it appears that the author or compiler of the volume is Mr. Macfie, M.P., "Director or Member of the Liverpool, Edinburgh, and Leth Chamber of Commerce, and Merchants' House of Glasgow."

We need not say that we have no sympathy with Mr. Macfie's mode of solving the problem of the patent law by cutting the Gordian knot, much as it needs cutting. The matter in his volume, however, is of importance in its bearing on the abuses and defects of the law, and may be read with profit by those interested in the radical amendment of that law; as may a pamphlet which happens to be before us, with the title, "Reform of the Patent Law: a Working Man's Question. By M. A. Soul, C.E. London: Inventors' Protection Office, 14, Finchbury-place." We quite agree with Mr. Soul that reform of the Patent Law is necessary in the interest of the working man, no less than in that of the public,—nay, that inasmuch as the working man is not seldom the inventor, reform is necessary in his behalf before the interest of the public comes into consideration, because justice to individuals ought to be considered before generosity to the public, who have no right to steal the fruits of any individual's brains, whether these fruits take the shape of current coins or of new invention.—"*The Royal Guide to the London Charities for 1869-70.* By Herbert Fry. London: Hardwicke." This is the seventh annual issue or edition of this useful alphabetical list of London charities. No other city in the world can produce such a list of its charities as this: it is wonderful: more than 200 octavo pages in ordinary type, comprising a mere list of the titles of London charities, accompanied with two or three condensed lines each as to their objects and purposes! Whether we should not be better without some of them is another question. The volume is worth laying out a shilling for, even as a curiosity.—"*Description of a New Method of Treating the Sewage of Towns.* By John Hart. London: Simpkin, Marshall, & Co." In this pamphlet an account is given of a somewhat curious system, some of the details of which the author has patented. It comprises the exposure of sewage to the air spread out in a steady flow over an apparatus arranged in concentric circles with radiating walls, the purpose being to oxidize and deoxygenate or deodorize the sewage while precipitating its sediment. As to the utility of applying the sewage to the soil, we suspect the author's opinions are neither sound nor self-consistent. He tells us "it has been proved that rye-grass, the crop usually selected for the purpose, can be as successfully grown when plentifully supplied with river water as when irrigated with sewage containing all its impurities;" and yet that "foul sewage continuously applied, causes the coarser grasses to grow so freely that they soon overpower the finer sorts" on turf land; and that "by taking out the enspended matter, a liquid remains that possesses such properties that its occasional use is of great benefit in stimulating vegetation." This, he says, has led to the introduction of a system of distribution which he proceeds to describe, and which includes his patented and concentric-radiate apparatus.—"*Handbook to*

the Parish of Titsey, by Granville Leveson Gower, F.S.A. London: Wyman & Sons." This is strictly what it professes to be, except that it is a pamphlet rather than a book. It contains information as to the church and church monuments, the rectoryship (of which Mr. Granville Leveson Gower is the patron), the parish registers, and the Gresham family.—"A House and its Furnishings; How to Choose a House and Furnish it at small Expense. By Mrs. Warren. London: Bemrose & Sons." This little volume is by the author of "How I Managed my House on Two Hundred Pounds a Year." The limit is still two hundred a year in the book under notice, with 100l. to lay out in furniture, &c., and as we dare say no young couple will ever come up to all the author's requirements, they may have all the letter for what they can retain of them; although, were they all she desires, we could scarcely regard them as an amiable young pair of housekeepers.

Miscellaneous.

Buildings of the "Improved Industrial Dwellings Company."—At the recent general meeting of this company, mentioned in our last number, the chairman said there was a point not referred to in the report, upon which he was anxious to say a few words. The shareholders would have observed that the buildings in Ebury-street, Picnic, were to be erected by Messrs. Perry & Co., of Stratford, who were now building the new St. Thomas's Hospital. It was right he should explain that all the buildings hitherto erected had been constructed by Mr. Matthew Allen, the designer and builder of the first block of Langbourn-buildings in 1853, the model upon which all the subsequent buildings had, with minor variations, been constructed. The charge had not arisen from any quarrel between the company and Mr. Allen. Although the directors were, as far as they could judge, satisfied with Mr. Allen's work and the prices paid for it, they felt that, as they were not spending their own money, but that of the shareholders, they were bound to determine by competition whether the price they were paying was the lowest market price. Mr. Allen, feeling aggrieved at the course taken by the directors, declined to tender with the others, and hence they had had to change their builder. It was due to Mr. Allen and to the Board that he should state that the prices to be paid to Messrs. Perry, who sent in the lowest tender, were rather higher than those they had been previously paying to Mr. Allen.

Rewards to Schoolmasters for Teaching Science and Art.—The Lords of the Committee of Council on Education, having by a minute dated the 3rd day of January, 1868, offered prizes, viz., one sum of 50l., three sums of 40l., five sums of 30l., ten sums of 20l., and twenty sums of 10l., to the head masters of the schools of art in the United Kingdom, in which the general amount of work, considered with reference to the number of students under instruction, should be found after the examinations to be most satisfactory, and having had the results of the recent examinations laid before them, have awarded the above prizes as follows, viz.:

W. H. Simes, Sheffield, 50l.; C. D. Hoader, Edinburgh (male), 40l.; Louise Gann, Bloomsbury, 40l.; J. S. Rawle, Nottingham, 40l.; Henry Woolner, Coalbrookdale, 30l.; Edward R. Taylor, Lincoln, 30l.; D. W. Rainbach, Birmingham, 30l.; Walter Smith, Bradford, 30l.; George Stewart, West London, 30l.; John Parker, St. Thomas's Charterhouse, 20l.; John Anderson, Coventry, 20l.; Edwin Lyne, Dublin, 20l.; Walter Smith, Leeds, 20l.; Joseph Kennedy, Kidderminster, 20l.; Robert Grosvenor, Glasgow, 20l.; W. J. Mutchley, Manchester, 20l.; John Sparkes, Lambeth, 20l.; Susan A. Ashworth, Edinburgh, 20l.; W. H. Stophord, Halifax, 20l.; W. C. Way, Newcastle-on-Tyne, 10l.; Walter Smith, Wakefield, 10l.; John N. Smith, Beeston, 10l.; Herbert Lees, Carlisle, 10l.; Robert Cochrane, Norwich, 10l.; W. L. Casey, St. Martin's, 10l.; John Bentley, Birkenhead, 10l.; James Carter, Hanley, 10l.; J. P. Bacon, Stoke, 10l.; William Stewart, Paisley, 10l.; J. P. Bacon, Newcastle-under-Lyne, 10l.; John Menzies, Aberdeen, 10l.; R. C. Puckett, Chippenham, 10l.; W. J. Baker, Southampton, 10l.; John Kemp, Gloucester, 10l.; David Wood, Cambridge, 10l.; W. P. Griffiths, Ipswich, 10l.; S. F. Mills, Spitalfields, 10l.; J. C. Thompson, Warrington, 10l.; and J. S. Goepel, Frome, 10l.

Art-Professorship, Oxford.—There were ten candidates, we hear, for the newly-created Slide Art-Professorship, from amongst whom Mr. John Ruskin has been elected.

Dock Extension at Leith.—The new Albert Dock, at Leith, will be opened this Saturday. This dock has been five years in construction, and has cost about a quarter of a million.

Presentation to Messrs. G. & A. Maw, of Benthall Encaustic Tile and Majolica Works.—The employees of Messrs. Maw have presented to each of their employers as a special mark of their esteem a two-handled enamel-cup and cover, both of porcelain, and manufactured at the Coalport works of Messrs. John Rose & Co. It stands, with the cover, about 10 in. high. The outline of the cup is an inverted ogee. The ornamentation is elaborate. On each side of the cup is a small medallion enclosing a geometrical ornament, flanked on either side by a large medallion, surrounded with a circular band, the inside of which is finished by a bead border, the band intersected with green foliage. In a space above the centre medallion is the family crest. Between these medallions and the border around what may be called the neck or upper part of the cup the interval is filled in with a diaper of flowers in proper colours. On the reverse of the cup, in the large medallions, are the monograms "G. M." and "A. M." in gold. On the reverse, in the large medallions, the following inscription:—"A token of regard presented to Mr. George Maw and to Mr. Arthur Maw, August 2nd, 1869;" the medallion on the right-hand side completes the inscription, "By the operatives in their employ at the Benthall Encaustic and Majolica Works." The prevailing colours are a deep red ochre, light brown ochre, and green. Messrs. Belfield, Bowdler, & A. Evans were the artists who executed the cups, from designs prepared at the workmen's request by Mr. J. H. Maw.

Sinking by Pneumatic Power.—On the invitation of Mr. L. T. Woodhouse, a number of the members of the Midland Institute of Mining Engineers have visited the sinkings at the Battersfield Colliery, at Baglit, in North Wales, where an application of pneumatic power, which seems to differ from previous uses of the same power in sinking, has been introduced. Owing to the influx of water, it has been found necessary to draw the water from the bottom of the shaft to a height over the sinkers' head, so as to allow them to work. The colliery shaft is 20 ft. clear in diameter. An iron tube, 6 ft. in diameter, is let into the shaft, passing through the water to the bottom, and into this compressed air is forced by means of a 17-in. cylinder and two 10-in. pumps. By this means the water is elevated or suspended over the heads of the workmen to a height of about 50 ft. They can thus continue working at the bottom; but the work is rather exhausting, and the men only work four-hour shifts. By the aid of dampers and doors the pressure can be so arranged that the buckets with the stuff excavated can be put in and taken to the top with very little loss of compressed air. Thus water is no bar, as hitherto, to sinking operations. According to our authority, the Engineer, those who had been to the colliery spoke highly of its efficiency.

Discovery of a "Trotter Floor" in Oxford.—A somewhat curious discovery has been made in one of three old houses in Broadstreet, between Kettel Hall and Trinity College, now undergoing repair. Upon the removal of the flooring boards, in a room on the ground floor, having underneath them a considerable depth of earth and loose rubbish, the original floor of the room, which is 10 ft. square, was brought to light. It was laid with "trotter bones," in a pattern of squares arranged anglewise, within a border. The pattern, says the local journal, was defined by bones about 2 in. square, rubbed or sawn to an even surface, and filled in with the small bones of sheep's legs, the knuckles uppermost, closely packed and driven into the ground to the depth of from 3 in. to 4 in. It has been hastily and needlessly destroyed. Floors thus composed full two centuries since are now not infrequently discovered, during the alteration of the timber and plaster edifices of the early part of the seventeenth century. Oxford has supplied several examples. A specimen should be preserved.

Another Monument for Rome.—It is stated that a monument is to be erected in memory of the (Ecumenical) Council, and is to take the form of a column, the base to be of white marble, flanked with five statues, representing the five divisions of the earth, and on it are to be engraved the names of the hishops who attend the council. The column itself is to be surmounted by a statue of St. Peter formed of gilt bronze. The cost of the constructions for the meeting, together with the memorial column referred to above, is estimated at nearly 50,000l.

Muller's Orphanages on Ashley Down, Bristol.—This pious establishment still prospers in a wonderful way, which Mr. Muller as usual ascribes to "faith and prayer." There are now five buildings erected,—each one larger than the largest factory or warehouse in Leeds,—and costing in all more than 110,000l. They are of plain architecture, and will accommodate more than 2,000 children. The total sum that has been entrusted to Mr. Muller since the 5th of March, 1834, is over 430,000l. In his "Brief Narrative of Facts," just issued, he says:—

"The almost universal complaint of religious institutions and societies is the want of funds; but as to ourselves, we state joyfully, to the praise of the Lord, that through Him, our patron, we not only have had enough, but have abounded, though the expenses of the last three years amounted altogether to 113,622l. With regard to pecuniary supplies, I have, simply in answer to prayer, and without application to any one, obtained for this work 430,000l.

With this money nearly 17,000 children from all parts of England, Scotland, and Ireland have been taught in the various schools; 95,000 copies of the Bible and New Testament, and about 30,000 smaller portions of the Holy Scriptures, in various languages, have been circulated; as have also 33,000,000 of tracts.

A Great Chimney.—A huge stack or chimney has just been completed on the Earl of Dudley's estate, at Conegrove Works, near Dudley. It far surpasses anything of the kind in the neighbourhood. A patentee has in more than one instance fitted huge tubes upon the top of furnaces, and conveyed the heat, at one time thrown into the air, from thence underneath the boilers attached to the works. By doing this a vast amount of coal and much hard labour in the way of firing have been saved. The flames, too, stretch out along the surface of the boiler with greater regularity than "friers" could make them, and the boat-loader and unloader are dispensed with. It is necessary to have a good draught to carry out all this, and therefore the Earl of Dudley's agents have determined to give it a full trial. The stack alluded to is 150 ft. high, and 10 ft. 6 in. in the clear, both top and bottom. It is strengthened considerably by ironwork for a distance of 100 ft. from the ground. The whole work, which has been rapidly accomplished, was carried out by Mr. Harland, master mason to the Dudley estate.

Fatal Fall of a Scaffold.—An inquest has been held by Dr. Hardwicke at the Royal Free Hospital, Gray's-inn-lane, on the body of a workman who lost his life by the fall of a portion of a scaffold at the Midland Railway Hotel, Euston-road. It appeared that the deceased and another man (still in the hospital) were in the employ of Messrs. Jackson & Shaw, the contractors. Both were believed to be good scaffold builders, and the one in question had been erected by them. A brick wall had to be raised, and on its completion the scaffold was ordered to be removed. The deceased and his mate had the entire control. Some portion of the scaffold gave way, and both the men fell from a height of 29 ft., poles and boards falling on them. The jury endeavoured to discover why the scaffold should have fallen, but without result. One of the jurors, an architect and surveyor, was of opinion that the men had released the pulgots, and so caused the mischief.—Verdict, accidental death.

International Velocipede and Locomotive Exhibition.—This exhibition will take place at the Crystal Palace, Sydenham, and open on the 6th of September, to be closed on the 6th of October, 1869. Velocipedes with one, two, three, or four wheels will be exhibited; also machines having other motive power than the hands or feet, or both jointly; including locomotives to be used on common roads, having any locomotive power except horses. The grand prize will be a gold medal for the velocipede or loco-machie most applicable for business purposes, and especially for the use of country postmen and telegraphic messengers. We are glad to observe that both in this country and in France, as well as America, the application of some other power besides either feet or hands is receiving attention. At Birmingham and in Paris endeavours are being made to use the weight and general movement of the body, as in riding, by way of a motive power.

Bath Abbey Church.—During the progress of the works here some considerable remains of the Norman building that formerly occupied the site have been exposed to view. Although below the present floor level, means of access to them will be preserved.

Preservation of Antiquities.—A landable desire to preserve the products of the faith and piety of the old people, says the *Cornish Telegraph*, has been shown by Mr. C. D. Bevan, in some alterations at Boskenna, near Penzance. The former drive from the high road to the mansion is blocked, and a new approach formed by what was always known as Boskenna Gate, where three roads met. Here, from time immemorial, a cross has stood, half-buried, in the hedge. Each of the three roads has been widened, the cross has been placed on a pedestal, equidistant from the three. Within a radius of half a mile are three or four other crosses, as well as, at slightly further distances, huge monoliths known as pipers, boled stones, and nineteen pillars known to the country people as Merry Maidens. Had equal care been taken of Cornish antiquities for the last century, that district would have been invaluable to the student of early and pre-historic remains.

Proposed Memorial of Colston, the Philanthropist.—It is somewhat remarkable that although the inhabitants of Bristol have, for nearly 150 years, enjoyed the benefit of the munificent charities of Edward Colston, yet no monument has been erected at the public expense, as an expression of what Bristol owes to that great philanthropist. It is now proposed to remedy this neglect, by filling the large window in the north transept of St. Mary Redcliff Church with stained glass to his memory (at an estimated cost of about 500*l.*), and a sum has been promised in aid of the work. To render it a public act, it is desirable that as many persons as possible should take part in it; and, accordingly, all those who desire to do honour to Colston are invited to contribute to the undertaking; and it is hoped that by means of their united efforts a work may be produced not unworthy of the noble building in which it is to be set up, or the great and good man with whose name it will be associated. Contributions may be sent to the vicar or either of the churchwardens.—Mr. Warry or Mr. Arthur Baker, Redcliff Backs.

Yellow Fever from want of Ventilation.—H.M.S. *Eclipse* has just lost her captain by yellow fever, and the crew have had to thank the strength of their constitutions for having survived the pest. At the trial trip of this ship, says the *United Service Gazette*, it was found that the ventilation was seriously faulty, and the fact was reported, backed by the recommendation of the officers in charge at the trial. The engine-room hatch vomited all its hot air and impurities close to the ward-room door, and nothing was provided in the way of ventilation to carry off the poison. The Admiralty demanded an estimate for the additions necessary, and, finding that they would cost 300*l.*, preferred to poison men and officers rather than put such an item on the estimates! Nearly all the ward-room officers had the fever, and narrowly escaped with life, and the men also came in for their share. No wonder that the Navy detests the Admiralty.

A Charcoal Flower-pot.—A "scientific flower-pot" has just been brought out, and is thus described in *Scientific Opinion*:—"The object of it is not only to purify the water which is supplied to the plant—a process we should certainly question the advisability of,—but to condense ammoniacal gases. It is from this aspect that we think the new flower-pot deserves attention. Agriculturists are well aware of the effect of porous substances, like cinders, &c., as it were, accumulating ammonia in the soil. There can be no doubt that charcoal absorbs ammonia in very large quantities, and possibly, by afterwards allowing it, when converted into a salt, to be taken up by the water of the soil, it may stimulate the nutrition of the plant." It may also affect the colours of the flowers either for good or for ill. Red colours it will probably intensify. The hues of white or yellow flowers it may totally change.

A Huge Steam Hammer.—One of the largest, if not the largest, steam-hammer ever made is now being constructed by Messrs. T. Swaine & Garbutt, of Bradford, for the Russian Government, and is intended to be used in the forging of steel gns. The total weight of the machine when erected will be close upon 1,000 tons, the anvil block will weigh 500 tons, the other castings belonging to the hammer about 300 tons, and the "tap" or hammer-head 42 tons.

Coal Getting.—A correspondent, "R. T." writes,—The highly dangerous practice of blasting down the coal in mines is fraught with frightful results. Hydraulic and atmospheric appliances have been suggested, but they are costly, complicated, and ill adapted to shift up the low drifts, cuttings, &c., amidst the falling coal. I believe any machine that is powerful, portable, and simple, not likely to be damaged by the rough and dirty work in the pit, would be eagerly adopted. I beg to suggest that the "Jack" be used, hoping it will prove the desideratum. I formed the above idea on seeing an old mason moving a ponderous mass of stone along the ground by the aid of a small jack; it will hit at any angle or posture, or upside down. What an immense amount of pressure two herculean colliers, by the aid of a *double Jack*, would bring to bear against the seams of coal. Almost any amount of power can be attained, if placed to the end of iron lever wedges, and no special skill is required to work them.

Close of the Burslem Art Exhibition.—The Art Exhibition, with which was inaugurated the Wedgwood Memorial Institute, at Burslem, and which was formally opened on the 21st of April by the Lord President of the Council, was closed last week. The attendance has been such as to leave it doubtful whether the revenue is equal to the expenditure. The debtor and creditor account has not yet been made up, but there is too much reason to fear that, if there is not a balance on the wrong side, there will be very little in the way of surplus. Recollecting the bungling way in which the committee have managed some departments of the affair, and their disregard of persons best qualified to aid in making the undertaking successful, we are not at all surprised to hear of this result.

Napoleon's Prize to Artists.—Our readers will remember that the Emperor of the French offered some time ago a prize of 4,000*l.* for the completest work of art executed in France within the past five years. There were nine competitors, whose claims were seriously considered: three painters, three sculptors, and three architects. After much voting, the prize has been adjudged to M. Duc, architect (firm of Duc & Domme), for the new Palais de Justice. Illustrations of this building, the design of which is remarkable rather for propriety and elegance than for novelty, are given in recent numbers of the *Gazette des Architectes et du Bâtime*. The architect of the new opera-house, it has been said, would have received the prize had his building been finished.

Drainage of Bromley, Kent.—The inquiry into the vexed question of the Bromley drainage, held before two Government commissioners—viz., Mr. Michael, barrister, and Mr. Harrison, civil engineer—is adjourned until October next. The scheme of the Board of Works to convey the sewage to Holloway Farm for irrigation was opposed by Mr. Boyd, whose park is near the outfall; also by Major Foster. Mr. Coles Child, whose mansion and estate are close by Bromley, visited Ealing, and was so well pleased with what he saw there that he offered to take Bromley sewage on to his land, to be dealt with as at Ealing, the receiving tanks to be within 2,000 ft. of his residence, the effluent water to be spread over the field adjoining. The rate-payers were stated to be much in favour of the Ealing system.

The New Public Buildings at Truro.—The inauguration of these new buildings will take place on the 16th and 17th of September. The great hall, which is intended for concerts and public assemblies, is 85 ft. long and 38 ft. wide. It is lighted with six large windows in the south wall, looking across the Green, and has an open roof of stained deal. It is estimated to seat about 1,400 persons, and has probably standing-room for nearly 2,000. A gallery is erected, reaching from the masonic entrance some distance into the room. On the north side there is a supper-room, 40 ft. by 21 ft. 6 in. The foundation-stone of these buildings was laid, with Masonic honours, on the 10th of December, 1867, and all the works are now in a forward state.

Columbia Market.—Some of our readers considered that we spoke but coolly of the advantages likely to follow from the formation of this costly affair. Unless we are greatly misinformed as to the condition of the neighbourhood, evidence will soon be given that the fears which led to our reticence were but too well founded.

The Asserted Discovery in Birch-lane.—In reply to inquiries still made as to the asserted discovery of a Roman tomb in Birch-lane, we find it necessary to say that the statement sent to the *Times* was an entire fabrication. It is much to be wished that the lying scoundrel who wrote it may be discovered and punished. The most carefully conducted papers are open to be similarly misled, and every member of the community has an interest in detecting the perpetrators of such deceits. The absurdity of the date given, of course, threw doubt on the communication; but this, it was thought, might be due to the stupidity of the writer; and many persons were led to waste time in seeking out the site of the supposed discovery.

The Delay in Opening the Holborn Viaduct.—Great dissatisfaction prevails respecting the postponement of the opening of the Holborn Viaduct. According to the *City Press*, a meeting of some of the principal inhabitants of Newgate-street has been held, and the speakers expressed themselves as much aggrieved. The deviation of the traffic, coupled with the removal of Newgate Market, had caused great loss and inconvenience to the tradesmen and others depending on chance trade. Several houses were entirely closed, and fears were expressed that rain would be the result to many unless energetic steps were taken to open the Viaduct.

The New Bridge at Saltburn-by-the-Sea.—This bridge, which spans the well-known Skelton beck gien, is within a day or two of completion. The whole of the ponderous girders, 85 ft. in length, are now fixed, and the roadway laid. The bridge is 800 ft. in length, there being seven spans and eight cast-iron piers; the highest point is 160 ft. and the width is 25 ft. The contractors are Hopkins, Gilkes, & Co., of Middlesbrough, who here had Mr. Charles Willman, C.E., as chief superintendent.

Statuary in Peel Park, Bradford.—The committee of the Bradford Band of Hope, as an acknowledgment of the generous manner in which the corporation have granted them the use of the park for their summer demonstrations, are about to present a statue of Ceres. This work has been executed in stone. The figure is tall, and it stands upon a pedestal of large size. It is hoped that the foundation will be laid of a fund for providing for the further embellishment of the park.

"Exeter: a Retrospect."—Under this heading the *Athenaeum* gives fourteen columns of exceedingly interesting matter concerning the annals and habits of Exeter, preparatory to reporting, as usual, the proceedings of the British Association for the Promotion of Science now at work in that city.

Shop-rent in Liverpool.—The Liverpool Recorder has given judgment in an appeal from Messrs. W. & J. Jeffery, the proprietors of the shop known as Compton House, Church-street, Liverpool, who had been assessed by the parish authorities at a net rental of 7,470*l.* The Recorder fixed the assessment at 6,000*l.*

Portraits.—The portrait in our present number is drawn from a photograph by Mr. John Watkins, of Parliament-street.

TENDERS.

For repairing and re-pewing Baptist Chapel, Queen-street, Woolwich, for the Trustees, Messrs. W. Gosling & Son, architects. Quantities supplied:—

Vickery	£240 0 0
Ginger	240 0 0
Ledbetter	255 0 0
Carter (accepted)	230 0 0

Accepted for the erection of Burngreave Congregational Church, Sheffield, Mr. J. Creswick Brameld, architect. Quantities supplied:—

Mason's and Bricklayer's Work.	
Norman	£350 0 0
Carpenter and Joiner's Work.	
Flowerday	787 5 0
Slater's Work.	
Harrison & Chadwick	109 0 0
Plumber, Glazier, and Gasfitter's Work.	
Norton & Son	158 0 0
Ironwork.	
Newton, Chambers, & Co.	145 0 0
Plasterer's Work.	
Unwin	110 0 0
Painter's Work.	
Standall	61 8 7
Warming.	
Newton, Chambers, & Co.	85 0 0

For erection of hotel to be built at New Swindon, Wilt. Mr. Thos. S. Lansdown, architect:—

Kimberley	£1,223 0 0
Drew	1,571 7 0
Dyer	1,620 0 0
Dover	1,416 0 0
Wiltshire	1,350 0 0
Phillips	1,348 0 0
Newcombe (accepted)	1,338 0 0

For rebuilding Nos. 11 and 12, Upper Lisson-street, for Mr. R. I. Hickman. Mr. C. Kales, architect:—

Credit of Materials	£20 0 0
Clark & Mannoch	£2,589 0 0
Fish	2,569 0 0
Fanson	2,547 0 0
Morsman	2,430 0 0
Kelly, Brothers	2,463 0 0
Serven & White	2,457 0 0
Ebbs & Sons	2,387 0 0
Longmire & Burg	2,385 0 0

For two houses, with shops, &c., at the Brewery, Hampstead, Messrs. Bird & Walters, architects:—

Holland & Hauser	£2,248 0 0
McLachlan	2,543 0 0
Newman & Mann	2,465 0 0
Ebbs & Sons	2,437 0 0
Kelly, Brothers	2,421 0 0
Brown	2,380 0 0
Henshaw	2,380 0 0
Williams & Son (accepted)	2,357 0 0

For alterations and repairs to the Angel Hotel, Islington. Messrs. Bird & Walters, architects:—

Brown	£3,377 0 0
Gannon & Sons	3,115 0 0
Newman & Mann	3,455 0 0
Bishop	2,907 0 0
Henshaw	2,980 0 0
Kelly, Brothers	2,863 0 0
Ebbs & Sons	2,945 0 0
Williams & Son (accepted)	2,883 0 0

Accepted for the erection of a power-loom shed at Birstal, for the College Mill Company (Limited). Messrs. Sheard & Hanstock, architects:—

Mason	£639 0 0
Willans & Law	319 0 0
Akeroyd	314 0 0
Armistage	314 0 0
Stead	93 18 0

Accepted for co-operative stores at Birstal, for the Birstal Industrial Co-operative Society. Messrs. Sheard & Hanstock, architects:—

Masons	£633 0 0
Broole	314 0 0
Nelson	95 10 0
Hey	45 16 0
Thornton	79 10 0

Accepted for chapel at Adwalton, for the New Connexion Society. Messrs. Sheard & Hanstock, architects:—

Mason	£510 0 0
Traver	498 10 0
Snowden & Son	13 10 0
Gott	83 0 0

For the restoration of All Saints' Church, Surrey-square. Mr. Robert Parris, architect. Quantities supplied by Mr. Samuel Field:—

Downs (accepted)	£3,720 0 0
------------------	------------

For Wesleyan Chapel, Portmadoc, North Wales. Mr. Thomas Roberts, architect:—

Hughes (accepted)	£172 0 0
Lloyd (accepted)	350 0 0
Williams (accepted)	80 0 0
L. Hughes (accepted)	77 8 0

For rebuilding 29, Great Titchfield-street, Oxford-street, for Mr. A. Giles. Mr. George Lettbridge, architect:—

Tracey	£639 0 0
Grover	875 0 0
Sheffield	833 0 0
Pope	805 0 0
Hyde (accepted)	749 0 0

For hotel and tavern, and a house and shop, at the corner of Charterhouse-street and Farringdon-road, E.C., for Mr. Hobbs. Quantities supplied:—

Wills	£5,983 0 0
Turner & Son	5,882 0 0
Sibley & Webster	5,469 0 0
Newman & Mann	5,293 0 0
Brown & Robinson	5,195 0 0
Longmead & Way	4,993 0 0
Serven & White	4,948 0 0

For building villa, stabling, &c., at Wallham, Hertzs, for Mr. John Dorman. Mr. J. S. Gomme, architect. Quantities not supplied:—

Hentley	£674 10 0
Archer	821 0 0
Brudenell	171 0 0
Deer (accepted)	754 0 0

For detached villa residence, for Mr. James Neal, at Wandsworth Common. Mr. S. Durrant, architect. No quantities. Mr. Neal binding all bricks, lime, and sand:—

Forde	£1,099 0 0
Heaver & Coxes	1,080 0 0
Strong	899 0 0
Hearn	795 0 0
Thornton	795 0 0
Atkinson	778 0 0
Cox	745 0 0

For the erection of premises, Basnet-street, Liverpool, for Messrs. Peck & Sons, drapers, &c. Mr. Joseph Brattan, of Liverpool, architect:—

£8,351 13 0	
Henshaw	7,877 0 0
Haigh & Co.	7,899 0 0
Tomkinson	7,767 0 0
Urmson	7,707 0 0
Witter	7,589 0 0
Richards	7,405 0 0
Black & Co.	7,417 0 0
Jones & Lon (accepted)	7,330 0 0

Accepted for the erection of five houses for Mr. John Watton, Chesterfield, Derbyshire. Mr. S. Rollinson, architect:—

Mason and Bricklayer	£630 0 0
Chester	300 0 0
Carpenter and Joiner	300 0 0
Glossop	62 0 0
Plumber, Glazier, &c.	62 0 0
Mitchell	62 0 0
Including Smith and Founder.	62 0 0

For alterations to premises in the Broadway, Hammer-smith, for Messrs. Hunt, Mr. Roberts, architect. Quantities supplied by Mr. Shrubsole:—

Extra for Cement Front	£249 0 0
Hanley	£1,690 0 0
Davies	1,580 0 0
Vine	1,600 0 0
Rogers & Walker	1,575 0 0
Hankin	1,323 0 0
Taylor & Co.	1,290 0 0
Pitcher	1,083 0 0
Turro	1,080 0 0
Knights	1,049 0 0
Parris & Soul	985 0 0
Snowden	968 0 0
Courbes	865 0 0
Wigmore (accepted)	840 0 0
Salter	844 0 0
Melville	748 0 0

For alterations and additions to 60, Rochester-terrace, Mr. Charles Dunch, architect. Quantities by Messrs. Osborne & Russell:—

I'Anson	£1,530 0 0
Rigby	1,514 0 0
Macey	1,397 0 0
Longmead & Borge	1,369 0 0
Keyes & Head	1,260 0 0

Hastings Pier.—The tender of Messrs. R. Laidlaw & Son, of Glasgow, for the erection of this pier, has been accepted for £2,250. Messrs. Laidlaw & Son have already erected several of these structures round the coast.

WORKING PEOPLE AND IMPROVED HOMES.
 The new and illustrated edition of "The Dwellings of the Labouring Classes," by HENRY ROBERTS, Esq. F.R.S., (author of "Home Reform," &c.) The Physical Condition of the Labouring Classes, &c. will be found a summary of the efforts at home and abroad to secure "Healthy Homes" for working men and women.
 "A most valuable handbook."—The Builder.
 To be had at the Office of the Society for Improving the Condition of the Labouring Classes, 21, Essex Hall, Strand. Price 7s. Also Designs for Cottages, numbered on sheets, with Specifications, &c.

SCHOOL FITTINGS.—MESSRS. BANKS & CO'S PATENT REVISED ILLUSTRATED PRICED SKEET OF every article required in a well-furnished School, sent for three stamps. PARONAS WORKS, ALBEMARLE STREET, MANCHESTER.
 Now published, 4s. 6d. in neatly bound, price 12s. 6d.
PICTURESQUE ARCHITECTURE, with thirty full page illustrations of Old English Churches, Cottages, &c. in Sussex, and adjacent parts of the counties of Kent, Surrey, &c. by W. YOUNG, Architect, London. Birmingham: S. BIRBECK, Publisher.

TO ARCHITECTS, SURVEYORS, or SOLICITORS.—TO BE LET, FOR OFFICES, A spacious GROUND FLOOR, with a small garden, in the rear of a street line from the Bank, admirably lighted. May be taken for a term of years.—For particulars and view, apply to the proprietors, GEORGE KINO & SON, 25, Finsbury-square; or to PHILLIPS & SON, 2, City-road.

PARTNERSHIP, or AS MANAGING ASSISTANT.—A first-rate QUANTITY SURVEYOR, who has been in practice some years, and can give references, is desirous (at the present juncture of his time) of entering the Office of a Surveyor in the above capacity. Would introduce his services to the Office of the Director of the London Dock Co. TO ARCHITECTS AND SURVEYORS.
PARTNERSHIP.—TO BUILDERS, &c.— A thoroughly practical and energetic Quantity Surveyor, with capital, is desirous to correspond with one similar to himself with a view to PARTNERSHIP.—Address, R. M. H. Post-office, St. John's-road, Hoxton.

PUPIL.—An ARCHITECT in London, in search of a PUPIL, for the study of ARCHITECTURE, must under 16. A liberal premium required.—Address, F. B. A. Messrs. Water & Sons, London-wall, E.C.

TO ARCHITECTS AND SURVEYORS.
DESIGNS PREPARED FOR ROUGH SKETCHES or OTHERS, in the style of ART, or any other, (invested on steel). Terms moderate.—Address, Mr. TAYLOR, 7, Thavetia, Holborn.

J. NEILL & SON, QUANTITY SURVEYORS, 11, COOKRIDGE STREET, LEEDS.
 Highest testimonials from several eminent architects. Terms on application.

TO BUILDERS, DECORATORS, &c.
GILDERS, thoroughly experienced in House Work, Decorative Furniture, and Gilding in all its branches, may be OBTAINED at the House of Col. Marlborough Inn, Broomfield-street, Oxford-street. Work done by day, hour, or job. Material found if required.—Address to the Secretary.

BOROUGH OF PENZANCE.—SURVEYOR WANTED.—The Corporation and Local Board of Health of the above Borough having with great regret received the resignation of Mr. J. H. B. of the office of Surveyor, and the duties of that office being of a very extensive nature, and a survey of twenty-five years, will be prepared to receive APPLICANTS from one who is well qualified to discharge the duties of the office in that class at Michaelmas next. The duties consist of the superintending and management of the works belonging to the Pier and Market and other property of the Corporation, and of the water, sewerage, highways, lighting, and other works of the Local Board, comprising an extensive and important business. The salary of the Surveyor is £1,000 per annum, and he is empowered to receive a percentage of the gross receipts of the Local Board, and to have a freehold interest in the discharge of those duties. Arrangements have been made for the continuation of Mr. Matthews' services in the capacity of Consulting Surveyor. Convenient Office are provided. Applications for the office, and particulars of conditions, may be accompanied by testimonials of character and ability, should be forwarded on or before SATURDAY, the 4th day of SEPTEMBER next, to my Office, at the above address, where any further particulars may be obtained.
 EDWARD HERBES BODD, Town Clerk.
 August 11th, 1869.

CRUYDON LOCAL BOARD OF HEALTH.—WATER SUPPLY.—APPOINTMENT OF INSPECTOR.—Notice is hereby given, that the Local Board of Health for the district of Craydon are about to APPOINT an INSPECTOR to superintend and perform various duties in connection with their system of water supply. The services of an active energetic person are required, who must devote the whole of his time to the duties of his office, and whose age must not exceed 35. A list of the duties (practical knowledge of which is indispensable) may be obtained on application at my Office, at the Town-hall, Craydon. Salary 100s. per annum, with a yearly increase of 10s. up to 150s.—Applications, accompanied by testimonials, must be sent to me on or before MONDAY, the 29th AUGUST, next.—By order of the Board, R. J. CHEESEWRIGHT, Cl. Secy. Town-hall, Craydon, August 10, 1869.

ESSEX.—LENDEN and WINSTREE HIGHWAY DISTRICT.—The Highway Board will, on SATURDAY, the 29th inst. proceed to the election of a DISTRICT SURVEYOR at a salary of 100s. per annum, to include 10s. per cent. on the gross receipts of the district. The person appointed will be required to devote his whole time and attention to the duties of the office, and to the execution of the duties of the Highway Board, and to give satisfaction to the ratepayers of the district. The salary is not more than 20s. per week. Applications, accompanied by testimonials, must be sent to my Office on or before SATURDAY, the 29th inst. next. Application for district surveyor.—Such candidates must be sent by address to me at my Office on or before SATURDAY, the 29th inst. next, at TEN o'clock in the forenoon.—By order of the Board, HENRY JONES, Clerk. Colchester, 14 August, 1869.

MARGATE PIER and HARBOUR COMMISSIONERS.—The Directors of the Margate Pier and Harbour Commission, having appointed a CHIEF CLERK to succeed their present one, who retires. The salary will be 100s. per annum, payable monthly. It would be desirable to keep all the books of the Company (except those of the Assistant Clerk), to attend all meetings of directors and committees, and to keep the minutes of all meetings, and to attend to all the landing and unloading of passengers by steam packets; to superintend the subordinate officers generally in the performance of their duties, and to be ready to attend to any business that may be of any special importance to the Company. A more detailed description of the duties of the office may be had on application to the Clerk, at the Pier Office, Margate. Applications to be made on or before the 7th SEPTEMBER next, to CAPT. BROWN, the Chairman of the Company, at the Pier Office, Margate, August 10, 1869.

The Builder.

VOL. XXVII.—No. 1386.

On the Pollution of Rivers.

N the year 1865 a Royal Commission was appointed to inquire how far the present use of rivers and running waters in England for the purpose of carrying off the sewage of towns and populous places, and the refuse arising from industrial processes and manufactures, can be prevented without risk to the public health or serious injury to such processes and manufactures, and how far such sewage and refuse can be utilised or got rid of otherwise than by discharge into rivers or running waters, or rendered harmless before reaching them; and to inquire into the effect on the drainage of lands and inhabited places, of obstructions to the natural flow of rivers and streams caused by mills, weirs, locks, and other

navigation works; and into the best means of remedying any evils thence arising; and the then Secretary of State for the Home Department directed the Commission to select several river basins illustrating different classes of employment and population, suggesting that these localities might be:—

1. The Thames valley.
2. The Mersey valley.
3. The Aire and Calder basin.
4. The Severn basin.
5. The Taff valley.
6. A river basin comprising a mining district in Cornwall.

In pursuance of their instructions the Commissioners took up the question in the order of, first, the river Thames; secondly, the river Lea; and thirdly, the Aire and Calder rivers, and made their report in March, 1866.

The River Thames.

The Thames basin extends from Shoeburyness to a point five miles west of Cirencester, and from Fernhurst, in Sussex, to Priors Marston, in Warwickshire, and embraces an area of 5,162 square miles, or 3,303,680 acres. The main stream of the Thames, which drains the water from this area into the sea, is 201 miles in length from the estuary to the source in the Cotswold hills, and the height of the Thames-head spring, in Trewsbury Mead, is 340 ft. above the mean level of the sea.

The Thames receives 22 tributaries in its course to the sea.

As the main river supplies most of the water that is consumed in London for domestic and other purposes, the Commissioners considered it important to distinguish the tributaries that come into it above where the water is taken, from those that come into it below the intake. Those below the intake are the Yeding, Brent, Lea, Roding, Darent, Ravensbourne, Wandale, and Hogg's Mill. The tributaries of the Thames above the intake of the waterworks companies

are the Mole,* the Wey, the Loddon, the Kennet, the Ock, the Cole, the Ray, the Colne, the Thame, the Cherwell, the Evenlode, the Windrush, the Coln, and the Churn.

On the Thames and its tributaries above the intake of the waterworks companies—subject to the note we have made on the Mole—there are 1,001 distinct places of settlement, containing a population of 888,088, including 89 towns above the number of 2,000 population. Of this population of 888,088, 179,881 are situated on the banks of the river, or on tributaries immediately at their junction with it, and after making every allowance for retention in cesspools and for villages and houses removed from the banks of the river or its tributaries, the number of persons whose sewage daily finds its way into the water from which London principally draws its supply, amounts to hundreds of thousands.

As the sewage travels down with the flowing water of the river, a process of oxidation goes on, which tends to purification. The volume of sewage is small as compared with the volume of the river; and upon analysis the water pumped into London proves to contain only a very limited quantity of organic matter. But neither the one nor the other is satisfactory ground of assurance that the metropolitan supply is wholesome. The process of oxidation which the sewage more or less undergoes in its course is no sufficient guarantee of its arriving at Hampden purged of its injurious sewage taint. The London drinker of Thames water may be drinking with it some remnant of the filth of Oxford.

Again, it is the general opinion of medical men that what causes the presence of organic matter in water to be poisonous is not its quantity, but its quality; and this special quality cannot, as yet, be detected by either microscopic or chemical analysis, and is indeed at present known only by its occasionally noxious effects.

The result seems to be that as a water supply the Thames, polluted with the sewage of the inhabitants of the river basin, is open in kind, if not in degree, to the same objections as well-water infiltrated by liquid from an adjoining cesspool. Well-water so tainted may appear to sight, taste, and smell to be harmless, and has been known to have been drunk for a length of time without apparent mischief; but beyond all doubt that same water is liable, under particular conditions, to become poisonous.

Oxford and Reading add largely to the pollution of the river; and Windsor and Eton, being more thoroughly drained, pour out continuously a much larger proportionate volume of sewage. The amount of pollution from Cirencester, Cricklade, and Lechlade, is apparently small, though it is impossible to estimate the amount of liquid which finds its way from cesspits into the river.

Where the sewage is drained into the river, much of the flocculent insoluble matter floats down the stream until caught by vegetation or deposited on the banks. The weeds and banks for a considerable distance thereby acquire a disgusting slimy appearance, and when exposed to the sun smell most offensively. The rest of the insoluble part of the sewage accumulates in the bed of the river at or near the point of discharge, and there lies, a mass of putrescent matter, sometimes of many feet in depth, until stirred up by boatsmen or raised in the form of the gases of putrescence, giving off an offensive exhalation, or is swept down by floods, and its corruption transferred to the banks at a lower part of the river.

The foul condition of the outlets of the sewers at Oxford and their noxious effects upon re-

* Two of the companies take their water below the Mole, but the other companies who take water from the Thames—viz, the West Middlesex, Southwark, Vauxhall, and Grand Junction—take it above the entrance of the Mole, and in any question affecting their interests in respect of the impurity of the water they supply, it is but right that this should be stated.

sidences in the vicinity are described by Professor Danbony and Sir Benjamin Brodie.

At Windsor, Mr. Menzies says that in dry weather a nuisance occurs where the sewage is discharged into a river with a current as slow as that of the Thames. "There is a bend in the river immediately below the mouth of the sewer which has the effect of sweeping round all floating filth and lodging it against the bank; people have to be constantly employed to push it with rakes from this bank into the stream. The solid parts of the sewage float and keep on the top for about three miles down the river, until they lodge against something, and there become dissolved."

At Kingston the sewage is still discharged into the river, and although Sir W. Page Wood, the late Vice-Chancellor, refused to grant an injunction against the corporation, on the ground that a nuisance had not been proved, it needs only a reference to his judgment to prove, what is notorious, that a "nuisance" is a relative term. The Thames above Kingston was already fouled by sewage. It received the sewage of Surbiton immediately above Kingston, and about one-half of that of Kingston above the point where the new outfall was made; and merely to intercept the former by many outlets, and discharge the sewage at one outlet lower down, formed no sufficient ground for the interference of the Court. The case, therefore, properly understood, proves that the Thames was foul before rather than that it would be fouled by the additional influx of half the sewage of Kingston.

It should be stated, however, that both Kingston and Surbiton are below the intake of the waterworks companies.

Richmond, being within the tideway of the Thames, has its sewage thrown back upon it, and not only its own, but that of the towns lying between it and the metropolis. In addition to this the low-water level has been somewhat permanently lowered at Richmond, and so a larger area of foreshore is exposed when the tide is out of the river. The low-water level at Richmond is now 3 ft. lower than it was formerly. This is variously accounted for, but the Commissioners are convinced that it is in consequence of the removal of old London Bridge and the constant dredging between that point and Putney, causing the stream now to run down from Teddington more quickly.

The navigation between Putney and Richmond was always a tidal one, but the period during which barges can pass and repass is now still further reduced. The channel available for boating purposes is considerably curtailed. Residences on the river's edge, once constantly accessible by water, are now at low tide cut off from the stream by an unsightly interval of offensive mud. Nuisance from sewage is greatly augmented. Not only is the stream more fouled by the volume of sewage thrown into it having increased, but the banks on either side are to a larger extent laid bare, and covered with sewage deposit.

In the manufacture of paper a large quantity of water is used in washing the fibre, nearly 250,000 gallons to each ton of paper; and in consequence of that being requisite, more than for the advantage of water-power, paper-mills are always located where there is plenty of water, and those in the Thames basin help to pollute the water of the river and its tributaries, although in a secondary degree to the pollution by sewage. There are not many paper-mills on the main stream; they are chiefly on the tributaries, where the water is purer and more suitable for the purpose.

The other special subject of inquiry was—"The effect on the drainage of inhabited houses and lands, of obstructions to the natural flow of the river caused by mills, weirs, locks, and other navigation works, and the best means of remedying any evils thence arising."

The interests connected with weirs are conflicting. Those of the owners of land adjoining the river and those of the navigation are directly antagonistic. The landowner requires the water to be kept down so as to afford an outlet for the drainage of his land; the navigation interest is to keep it up so that there may be a sufficient depth of water in every reach, from weir to weir. The owner of a fishery requires it to be penned up temporarily and then let go, the fish running with the stream being caught in "bocks" placed in the weir.

The interests of the miller agree so far with those of the navigation, that both require the head of water to be kept up in general, but the miller sometimes wants it drawn down so as to use more of the water for a short time than the ordinary flow yields. This is just before the time when he expects a flash to come down, which will again raise the mill-head quickly. This system of flashes is carried on chiefly in the upper parts of the river, where the navigable channel is defective. The water is let go from weir to weir, at intervals, to carry barges over the shoals on the wave thus caused, and the time being known approximately when this accession of water will take place, the miller for a short time previously makes too free a use of the water, and then imposes the flash. But he sometimes disagrees with the interests of the navigation in not passing on the water so soon as the barges are ready to pass on.

The water of a flash sometimes rises so high as to flood the land, and here the miller is on the side of the navigation as against the interests of the riparian proprietors. The millers again are diverse in their own respective interests. A miller increases his own head of water at the expense of increasing the height of the tail water of the mill above him, and so reducing its fall, while he sends down the water he uses, regardless whether the miller below him is ready to use it.

At the time this report was made, May, 1866, the upper part of the river, i.e., from Staines to Cricklade, was under the management of the Thames Commissioners, a very numerous and heterogeneous body, deriving their powers from Acts of Parliament, the first of which was passed in the reign of King George II., while the Conservancy Board date their powers back only to the year 1857. Since this report was made, the Thames Commissioners' powers have ceased in respect of the river, and the management is now placed in the power of the Conservancy Board from the mouth of the river to Cricklade.

The Commissioners draw attention to the fact that this report does not deal with the tributaries of the Thames, but this omission does not invalidate any of their suggestions; and had the delivery of their report been postponed till the inquiry into the state of the tributaries had been completed, it would have been too late to have been of service in any scheme providing for the immediate necessities of the upper navigation. For the same reason, the question of water supply and storage reservoirs has been left for subsequent consideration.

As to the latter subject, we may remark that it has recently been dealt with by another Royal Commission in a report of which we gave a *résumé* recently in the *Builder*.

In looking at these two reports, it seems on the whole preferable to draw a supply of water for a town from an unpolluted source, rather than set one chemist's opinion against another's as to the salubrity of the water we drink or otherwise, and try to find by a majority of testimony whether a water like that of the Thames is a fit and proper source of supply.

If sewage is to be kept out of the river, the question is, of course, what is to be done with it? and, although the "sewage difficulty" has been so long on the *tapis* , we will venture to roam to the subject of the disposal of town sewage as reported upon by the Royal Commissioners. They say that they agree with a report that had been made previously by a separate commission appointed to inquire into the best means of distributing the sewage of towns, the gist of which is that "the right way to dispose of town sewage is to apply it continuously to land, and that it is only by such application that the pollution of rivers can be avoided."

The Commissioners say that cesspits in towns corrupt the air and corrupt well-water; they are incompatible with health, and should be done away with. All attempts at deodorisation or disinfection have failed. As an instance of the beneficial use of sewage on land by irrigation Crofton is adduced (since this report was made

other places attest the propriety of this mode of disposing of sewage; Bedford and Banbury, for instance), and it is curious that the Commissioners in this report say that there were at that time, 1866, some objections raised against the practice of irrigation by Dr. Cresswell, a local practitioner, who thought that some peculiar cases of illness resembling ague that had occurred in the district near the irrigated land at Crofton, might have been caused by miasma from that land. Now, in the present year, an inquiry took place at Kingston as to the desirability or otherwise of irrigating some land in the immediate neighbourhood, and Dr. Cresswell was brought as a witness in favour of the scheme, in consequence of his having since found that he had been mistaken in his former opinion in respect of sewage irrigation, and has now satisfied himself that it is harmless when properly conducted; that it, kept constantly moving, and never allowed to stagnate.

Mr. Reynolds, who resides near the outfall of the Beddington irrigation, says he occasionally finds a smell; but, on inquiry, always finds it has been caused by neglect of the workmen to keep the sewage in motion over the proper areas of land. The same land will serve the purpose of sewage irrigation continuously. The process to the soil is one not of exhaustion, but of constant renovation. Sewage can be pumped any height and carried any distance. Its conveyance, therefore, to any point is merely a matter of cost. There is no real difficulty in dealing with sewage. On a clay soil, or wherever pumping is necessary, it is desirable to restrict the dilution. On a gravelly porous soil, on the contrary, as shown by Mr. Marriage, it is an advantage that the sewage should be largely diluted, since it is then much more readily distributed over the surface. If a farm be large enough, there is no time when some portion of the land may not be capable of receiving the sewage. The process of irrigation may go on day and night, in wet and drought, in summer and in winter. Sewage must be applied to land while fresh, not allowed to stagnate anywhere; and then there is no smell, the soil seizing upon the constituents and appropriating them to the uses of vegetation, and preventing the escape of foul gases into the atmosphere.

Filtration is not applicable to sewage. Town sewage cannot be filtered through an ordinary sand-filter, nor is it necessary in any case to attempt it. Deposition and separation of grit and flocculent matter are alone required.

The most profitable way of applying town sewage by irrigation is to sow Italian rye-grass, and to sell or use the crops fresh out for horses and cows. A field will in a year produce four or five crops, and 50 tons per acre have been grown in the year. But root crops and cereal crops are also beneficially grown with sewage. At Lodge Farm, near Barking, nearly every description of crop is grown with sewage by irrigation. For other than grass crops the sewage cannot be so freely or so often applied, and therefore a grass crop should form the staple; but sewage irrigation promotes the growth of all kinds of vegetation; and, where plenty of land is at command, any kind of crop may be grown with it. At Lodge Farm a large number of milking oows are kept on the premises, and fed with the grass off fresh.

Apropos to this subject, Mr. W. Hope writes a letter to the *Times* of August 12th last, in which he says, "Italian rye-grass is worth to a dairy-farmer, who sells his milk as milk, or who makes it into butter to be sold fresh, 15s. a ton. It is unnecessary to take into consideration farmers distant from towns, who are compelled to turn their milk into cheese, because a farmer within reach of sewage is within reach of his market."

STRIKING NOVELTIES AT SOUTH KENSINGTON.

A remarkable peculiarity distinguishes the South Kensington Museum from other exhibitions, temporary or permanent. Its wardens never sleep. Constant novelty—ever recurring change—is the law of the place. New objects of wonder, of beauty, or of luxury, are ever and anon making their appearance in the courts more especially devoted to the Loan Collection, which, when you seek to revisit, you find in their turns replaced by others of no less interest. Certain grand forms of Ancient and of Medieval art—the colossal Melpomene, the gigantic David, the majestic Moses—look down in unobscured grandeur on a constant whirl of minor but not

less beautiful objects. The *cachet* of the first Exhibition, the unrivalled and wonderful scene of 1851, seems to linger in the halls of its offspring, the Art Museum.

Since the halls and courts of Kensington were thrown open to the numerous and brilliant assembly that did honour to the invitation of the Council of the Society of Arts early in July, some striking additions have been made to the contents of the Museum. In *terra cotta* we are presented with rare and beautiful relics of the art of Magna Græcia, as well as with the results of the latest improvement of contemporary manufacture. From Japan we have one of the most perfect examples of the counterfeiting of nature which Oriental skill and untrifling patience have yet produced; and the present happy juxtaposition of two Madonnas by Raffaele—one the property of the nation, and one exhibited on loan—is an occasion such as no lover or student of the works of that most spiritual of painters should fail to seize.

Indeed, the noble room in which are displayed seven original cartoons, together with the actual tapestry representing the committal of the keys to Peter, possesses an unusual claim to the appellation of the "Raffaele Saloon." It is rich in relics of *Il Divino*. The great chalk drawing of the Transfiguration, executed from the original by John Casanova, is a work of the highest value, and of extreme beauty. It would be in many respects desirable that the magnificent tracing of the Sistina Madonna, the finest picture, beyond dispute, in the world,—could be removed from its altogether unworthy position on the staircase of the National Gallery, and hung in this saloon. Then we have the exquisite pilasters of the Loggia,—arabesques, and flowers, and birds, and human forms,—treated in a style which unites the quaintness of northern art to the love of beauty characteristic of southern climes. There are ten paintings from the Frescos in the Vatican, together with the conventionalised but marvellous scenes from Scripture history that recall the name of "Raffaele's Bible." Then we have a *Terra Cotta* sketch for the marble statue of the JONAH in the Chigi Chapel, in the Church of Santa Maria del Popolo, at Rome, a work which it is interesting to compare with the wax and clay models from the hand of Michelangelo in the court below. The Emperor of the French has contributed a magnificent specimen of the modern *Gobelins* tapestry,—a Holy Family, after that by Raffaele in the Louvre. The exquisite beauty of the face of the Madonna is such as to lead one to realise and to understand the importance which, in days when the sewing-machine was not, was attached to the instruction of high-born and delicately-nurtured women in needlework. It is more than questionable whether so perfect a representation of living female beauty could be produced, either in fresco, in oil, in water-colours, or even in crayons, as that which has been here wrought by the graceful fingers of the French women of 1855.

At a moment when questions as to the authorship and the authenticity of pictures, purchased at a very large sum, are so freely debated by the press, and even in Parliament, it is especially instructive to note the vouchers of the two Madonnas hung in this noble company. One of these, the Towseend bequest, was purchased by the Right Hon. H. Hare, at the sale of the collection of the Duc de Massa, after that officer's death. The name of Regnier, Duc de Massa (who, like his kinsman the Comte de Gronan, was one of the Buonaparte mushroom creations, and no relation of the very ancient noble family of Reigner), may be held to bear witness to the value of those works which he, like others of his fellow troopers, "collected" with such facility during the Imperial wars, in which what vulgar people call chivalry was quite *selon les règles*. There was no time to manufacture originals, or to "discover" antiquities for the grasping hands of the invaders; and notwithstanding all promises of restitution, much of the plunder of Italy never returned from Paris. As to the sister picture, the property of Mr. Verity, the evidence is unusually full and complete. The records of the monastery of Vallombrosa speak of the payment, in eleven installments, of the sum of sixty gold florins, together with a cask of wine, to the painter. The *Libro di Ricordanza* of the Institution mentions the picture down to the year 1808, when the monasteries were suppressed by the French, and the Madonna was "acquired" by M. de la Forêt, a gentleman in the service of the pseudo-King Joseph of Naples. This gentleman had it transferred from panel to

canvas, and it passed from the hands of his widow into those of the present owner thirty-four years ago.

The contrast between these noble works of the great Master is highly interesting and instructive. The condition of the two pictures differs in some important respects. In each the original azure of the distant landscape has faded into a sort of grey. Viewed closely, the flesh of the Vallambrosa group is somewhat—we must use the word—grubby; it asks to be cleaned, if cleaning were all that would result from the process. The Townsend Madonna appears to have undergone this peril without disaster, unless it be to the landscape. The limpid purity of the flesh tints, the perfect beauty of the left foot of the Virgin, and the grace, tender and significant, of the pose of the infant, standing on the naked right foot of his mother, are truly characteristic of Raffaello. The expression and outline of the face, however, in the children no less than in the mother, are inferior in dignity and in beauty to those of the companion group in the Vallambrosa "Holy Family" which, though less brilliant to the eye, is by far the finer picture. Even here, however, the expression of the Infant Christ is as inferior to that of the Garvagh Raffaello as if the child had been of a lower and different race. The latter is, as far as our knowledge extends, the most exquisite human infant ever painted,—for the infant in the arms of the *Madonna di Santo Sisto* is divine.

Turning to a more modern subject, we find the place of Mr. Woolner's marble statue of David Sassoon, which for some time stood under the shadow of the great Melpomene in the North-west Court, filled by a very remarkable work of art. The *soirée*, to which we before alluded as held by the Society of Arts in the courts and galleries of the Museum, gave us the opportunity of seeing this marble by artificial light; the result being, as might have been expected, a further illustration of the truth of the important canon that no work "in the round" should ever be viewed except in the position, and in the light, intended by the sculptor. With much humbler claims to rank as a high art work than those which are instinctively admitted on behalf of marble, the porcelain Palissy comes before us with the dignity of some man of the people borne to unexpected power,—a Masaniello, or a Rienzi, or a Garibaldi. Call the figure a bit of pottery, if you will,—it is of a noble *patte*. The back is somewhat unfinished, and very probably was not intended to be exposed to view. The texture of the doublet is somewhat questionable as to the material which it represents,—the full trunk hose are slightly open to the same objection; the stockings cling to the well-turned limbs as to the points on which the artist has exerted his higher skill, the verdict must be highly favourable. The face is not portrait, but idealization. The brow is thoughtful and well proportioned; the nose admirably modelled; the lips delicate and well cut. The hair and beard are good; they lack but a very little of being extremely good, and we think that little is rather the fault of the material than that of the artist.

With the hands we are less content. Not that they are not very distinctly and carefully treated, but they are not Palissy's hands. No man could have been an artist who had such rectangular fingers,—such square ends to them; such an elemental hand as is to be found only in a savage, or a man of the very rudest nature. For such a hand, too, the finger-nails are defined with too much sharpness. The sharp centering angle that marks the side of each almost fibret-shaped nail is, to our mind, inconsistent with the clumsiness of the joints. We believe that the hands have been modelled from imagination. If there ever was such a human hand, we cannot decipher what would have been the character of the owner. And what is the meaning of the sharp grip with which the finger and thumb of the left hand are squeezed together? Can it be that the great potter is represented as taking snuff? It looks horribly like it. Certainly that delicate nostril was never so misused.

Notwithstanding these minor criticisms, the statue marks an era in industrial art. The fine glazed white biscuit of which it is composed offers almost as fair a surface as marble, and is far preferable to marble when deformed by veins, or by the appearance of something like the blue mould in cheese. For our angry climate, and for any situation even partially exposed to the weather, the introduction of the material is a great boon. We must not forget that we have been applying a criticism by which not even

Luca della Robbia would be unscathed; the difficulties of the task are immense; they have been nobly grappled with, and, in the main, admirably surmounted.

A small furnace at the base of the figure bears the inscription—"C. Levy, exécuté pour la maison de Londres (the ordinary French scorning of English detail). Poyard, Vion, Baur, fait à Paris, 1869." Palissy holds in his right hand one of his well-known dishes, embossed with reptiles, although not stamped with the natural vigour of his actual work.

Turning our attention backwards from Mediaeval to ancient pottery, we read that the rare beauty of the objects occasionally found in that part of the Italian peninsula which was known by the name Magna Grecia, is but little known in this country. The Sicilian kings of the House of Bourbon, in whose blood there lingered a love of art that ever and anon broke out, now in worthy, now in grotesque activity, were so far aware of the fertility of this ancient mine as to insist with great precision on the right of the Crown (that is, of the reigning monarch) to all such treasure trove. Even in the concession of the railway from Naples to Brindisi a clause was inserted to maintain the rights of the king to all objects of antiquity found in the prosecution of the works. This in the fine terra-cotta fragments found at Canosa (the Bilingua Canosa of Horace's journey to Brundisium, where the bread is even now as gritty as it was in the days of Augustus), which Signor Castellani has lent to the South Kensington Museum, we have something rare and novel, as well as interesting from its intrinsic excellence.

The objects in question are for the most part of grey *terra-cotta*, many of them having been painted in different colours. In some the original tint seems to have been a pale red. The largest object is a globular vase or jar of the form called *assus*, with circular spout, and depressed, strap-shaped handle above. It is ornamented by masks of Medusa and other figures; and is in very fine condition. The date of the entire collection is stated at about 200 B.C.

There is another vessel, probably for mortuary purposes, with a lid ornamented with figures, of the form of a gigantic cold-cream pot, except that the lid overhangs the drum. Two curious masks, with a figure standing on each, and a strap-shaped handle behind the figure, seem to have been the covers or tops of vases or ewers of some description. Three statuettes of females, in short cloaks above the undergarment, one with a hood, and all with the hair arranged in a close approach to the present fashion, are also noteworthy. Smaller figures may be regarded as *laves*, or memorials of the departed. There are also a few terra-cotta plaques, of inferior workmanship, which are said to have been found at Capua. But the chief glory of the collection is a group of male statuettes of men, horses, and other animals, engaged in a chase. The detached figures only have been preserved. They appear to have formed a sort of double band or frieze round a vase, or some similar vessel, which, if such were the case, must have been an object of no ordinary beauty and value. The fragments are much damaged, and probably were never very delicately finished, but the spirit and movement, in a word, the *go* of the entire group is wonderful. We can call to mind, at the moment, no exact parallel. That stag tosses his head as if he had been that moment transfixed by an arrow. Near him a man throws out both hands as if to exclaim, "Perito, ferito." Another figure stumbles and falls, with perfectly natural awkwardness. A man on horseback, looking over his shoulder, gives to his *monture* the air of a donkey. The bridles of the horses are adorned with the hoeses and knobs to be found in the country at the present time; a cumbersome, heavy bridle, pressing on the nose, and with no bit in the mouth. A wild hoar stands at bay viciously; and this little bit of Greek life comes out from the fragments of what was a great work of art 2,100 years ago, with a freshness as of to-day.

Interesting as is the comparison of examples of the earliest and of the latest exercise of ceramic art, a yet more striking contrast may be found, beneath the same roof, between Italian and Oriental *chefs d'œuvre*. From the ideal portraiture of the Holy Families of Raffaello, we are enabled to turn to one of the most emphatically realistic productions in the world. We refer to the Japanese painting on silk, representing a tiger crouching and clinging on a tree. It is very much to be suspected that the silk (which is adorned by a pair of very incon-

gruous bands of purple and gold arabesques above and below, though not on either side) has been dressed with a paper pulp, or in some similar way prepared for the colour. The tree on which the creature is perched, and the waterfall close by, are so Japanese as to require explanation, as they by no means convey to the English spectator the idea of either wood or water. But the marvel and miracle of the matter is the fur of the tiger. It is almost impossible to believe that it is only a representation. You find yourself blowing on the frame, and tapping the glass with your finger, to disturb the hairs. The closer the magnifying-glass is brought, the more perfect is the deception. Were it not that the artist has been entirely neglectful of shadow,—so that none is cast by the terrible, cruel paw, and so that it is impossible to distinguish the outline of the back of the head from the neck, or rather shoulder of the mighty Cat,—the portraiture would be closer than a photograph. Each individual hair of the long fur has been portrayed. The little radiating points, or "crowns," on the shoulder-blades, from around which the fur falls away in every direction, are so marked, that you note the soft undergrowth of the hair. The expression of the face of the brute, with its large eyes, like rough, uncut emeralds, its open mouth, and glistening *carassier* teeth) is such as to give the impression of the head of a snake. The tip of the tail, curling from beneath the tree, resembles pretty closely that of an ermine. Pass from a contemplation of this wonderful coat to that of one of Landseer's noble dogs, in the picture-gallery, and you find that however we may pity or affect to despise the narrow conventionalism of the Japanese artist (his name is Gauko, and his date was A.D. 1700), the coats of the animals depicted by the great English master,—and we use the expression in perfect good faith,—look like mere dabs of paint when viewed with the same minute attention that is again and again deceived by that matchless fur.

Certainly the close of the season may be said to be heralded at South Kensington by a very brilliant display of novelties.

ERWIN VON STEINBACH AND HIS WORKS, IN STRASBOURG, THANN, AND FREYBURG.

Strasbourg.—On arriving at Strashourg, and finding himself, for the first time, face to face with the great cathedral,—indisputably Erwin's master-work,—an art-student is involuntarily moved by a strong and yearning desire to know all, and more than all, that either record or tradition has preserved concerning the life and works of the great artist-mason; and he at once sets to work to hunt out all that can be learnt of the career and genius of the great artistic magician who, in the midst of what some have been pleased to call dark and barbarous times, was inspired, not only with the daring to conceive, but also the consummate skill to carry into practical execution, one of the most marvellous architectural dreams that ever stirred the towering fancy of a great and enthusiastic artist; a dream of exquisite combinations and marvellously intricate details, which were not destined to remain merely ideal, the "airy fabric of a vision," but to be developed by the cunning of his head and hand into a vast lace-work of indestructible stone, and to remain through the long course of centuries one of the most wonderful monuments of the daring and energetic art-spirit of the Middle Ages. It was under the influence of an active curiosity thus aroused that the materials for the present incomplete and fragmental notice of the life and works of the great Gothic artist were collected and strung together.

In endeavouring to estimate the share of glory in the production of the cathedral of Strashourg, which is the just due of Erwin of Steinbach, it becomes necessary to assess very carefully how much ought to be conceded to his predecessors and followers. Such vast works as the great Mediaeval cathedrals were in almost every instance the result of the successive labours of several generations of architects, and yet it not infrequently occurs that one great artistic name of more than ordinary celebrity absorbs all those that either followed or came before in the work; as, for instance, in the building of St. Peter's at Rome, the vast fame of Buonarroti has swallowed up nearly the whole of that which was due to Brunelleschi, Bramante,

San Gallo, Vignola, Maderno, and many others; even that of Raffaello himself among the number. Such, however, is not the case with regard to Erwin and the cathedral of Strasbourg. It is true that he had able coadjutors and still abler followers; but, after he had once taken the great work in hand, he may be said to have made it his own, and it was, in the main, in strict accordance with his designs alone that all future operations were carried forward. His master-share in the great work may be clearly traced by the characteristics of his peculiar and well-marked treatment of the Gothic style of his epoch; and it may be roundly asserted that by far the greater part of the vast structure bears the impress of the unmistakable signet which has stamped his well-defined individual style. The share of artistic merit and originality due to his predecessors and successors is equally well defined, and a careful estimate of the claims of each leaves, plainly enough, the chief glory to Erwin, and to no other.

The site of the present cathedral, now near the centre of the city, was originally occupied by a pagan temple, which Clovis is said to have converted into a Christian church about the close of the fifth century, that was greatly enlarged by Dagobert about a century later. That edifice, constructed in great part of wood, was eventually destroyed by fire, and several succeeding structures, raised upon the same site, were in their turn destroyed, either by fire or lightning, or by the ravages of war. It was not till the middle of the eleventh century that the nucleus of a building was raised, of which the present cathedral may be considered the ultimate development. At that period Bishop Werner, of Hapsburg, commenced the plan of a truly grand edifice, vast in its proportions and magnificent in the forms of its projected elevations—a structure which, had it been promptly completed, before the Germanic style of that period gave way to the development of lighter and more ornate schools of Gothic art, would have added one more to the list of great Romanesque churches, such as those which form the chief architectural glory of the Rhine country and the neighboring regions. That it was intended to be of truly colossal dimensions is seen by the proportions of the gigantic columns at the intersections of the transept, which are among the undisturbed and unaltered features of the building commenced at that epoch.

A variety of interrupting circumstances which succeeded each other with scarcely any intermission, prevented the advance of the works so ambitiously commenced by Bishop Werner, and they had, in fact, made no really hopeful advance towards completion, after two centuries of struggling but ineffective endeavour. At that period, however, an entirely new epoch was about to dawn upon the cathedral of Strasbourg. In 1276 the Bishop Conrad of Lichtenstein determined to make a great and energetic effort to complete the great episcopal church. He called upon Erwin of Steinbach, whose skill as a sculptor, was becoming celebrated all over Alsatia, to produce a grand and comprehensive plan for that purpose; and Conrad and Erwin being both men of energy and action, there was at last a fair prospect of the work being carried forward rapidly to completion, and no time was lost in taking the first steps necessary to the fulfilment of their common object. The period was precisely that at which Gothic art had attained to its greatest excellence—a truly classical period (if that term may be used) in the progress of its manifold developments. The architectonic sculpture of the period even rivalled that of the best days of Greece, after its own peculiar theories of the beautiful; for it thoroughly succeeded in fascinating the beholder by the quaint and charming *novelties* of its conception and treatment, and, perhaps, gained in that direction more than it lost by the absence of the grand idealistic graces of the Greek and Roman schools.

The main architectural features, with their subordinated enrichments of delicate ornamentation, had also reached a climax from which they afterwards declined; and the magnificent plan produced by Erwin at the command of his bishop proved him to be one of the greatest masters of his art at that great period, the final developments of which had probably owed some of their most beautiful characteristics to the special influence of his own works.

Bishop Conrad, fully appreciating the wonderful excellence and completeness of Erwin's grand design, and perceiving, at the same time, the

vast amount of labour that would be required to carry it into effect, felt that more than ordinary efforts must be resorted to for that purpose. Under these convictions, he despatched proclamations to all parts of Europe promising "indulgences" and other ecclesiastical inducements to all who should at once come forward and energetically assist in carrying the magnificent plan of Erwin of Steinbach into execution. From the chronicles of the time we learn that the appeal of the bishop was enthusiastically responded to, and that such great numbers flocked to the work under the influence of the proffered inducements, that the city of Strasbourg exhibited a most extraordinary and unwonted spectacle on the sudden assembling of a vast multitude of artists, artisans, workmen, and unskilled labourers of every description, of both high and low degree, all anxious to commence the vast undertaking. It will be seen by this statement of the chroniclers that the army of volunteers thus suddenly assembled to commence and carry forward the great work was not solely composed of skilled artisans of the various classes required, but also of vast numbers of all classes, anxious to work as common labourers in what was deemed a holy cause; and we are informed that even women and children were among the number of those assembled—each eagerly impatient to aid in the great undertaking according to his strength and capacity, utterly regardless of rank, station, age, or sex.

This multitudinous enthusiasm was, however, soon proved to have its inconveniences as well as its advantages, as may be seen by the following graphically recorded incident. When all had been prepared under the directions of Erwin for the laying of the corner stone, and the bishop himself had performed his part in the ceremonial by digging out the first spadeful of earth, several enthusiastic master-masons rushed forward at the same instant to secure the highly coveted honour of digging the second, and the two foremost being equally determined not to give way, hard words ensued, which led to harder blows, and the weapons being heavy iron spades the contest soon terminated fatally for one of the combatants. This untoward event was regarded as a bad omen; and a great discouragement fell upon the assembled multitude; but the bishop, having announced his determination to devote nine days of continual prayer to the purification of the spot, and carried his declaration into effect, it was believed that the evil augury was removed, and the work was recommenced with undiminished spirit and determination. The accident was, indeed, turned to good account in the form of a fortuitous stimulant; for a band of priests, who were always present to incite both artist and labourer to the greatest possible amount of exertion, ingeniously compared the event which had just occurred to the story of Hiram, at the building of the temple of Solomon, who, according to the sacred records, was slain by his fellow architects, who were jealous of his superior skill. This kind of encouragement is said to have had wonderful effect, for the men belonging to the guild of masons were well versed in Scripture reading, and fully appreciated and relished the analogy thus set before them. The story of the building of the Temple of Jerusalem was, indeed, still further utilized after the same fashion, and the high rewards bestowed upon its constructors unctiously dwelt upon, especially those apocryphal ones described in the Medieval legends which in Roman Catholic countries have so closely associated themselves with the Biblical account of the building of the Temple.

Erwin was aided in his great undertaking by his sons, John and Wynkin, and also by his daughter, Sabine, whose features and figure are said to be reproduced in several of the graceful statues of female saints which enrich the decorative portions of the cathedral, and more especially in the delicately sculptured figures of the "wise virgins" in the niches of the great portal. Several of these are traditionally asserted to be her own work, for it was in the higher kinds of decorative sculpture that Sabine is said to have chiefly excelled. The general style of the extensive works undertaken by Erwin in order to carry the structure rapidly forward on its way towards completion are, naturally, stamped with the general impress of the phase of Gothic art which developed itself during the last quarter of the thirteenth century; but in general richness and infinite delicacy and refinement of detail it exceeds most other examples, and marks a decisive advance towards the more florid development of the fourteenth century, during which, in fact,

the greater part of the design was carried into execution.

In this great monument of Gothic art, not only do the lateral portals and those of the principal façade exhibit an excessive richness of design, but the whole external surface of the structure is elaborately enriched with delicate ornamentation in almost equal excess. The feature of detached columns in front of recessed portions of the work, such as windows and niches, which was one of the most charming general characteristics of the more richly decorated works of the period, is more profusely and delicately carried out at Strasbourg than in other great works of the same epoch. Erwin has, indeed, made this feature a very leading one in his system of external ornamentation, inasmuch that the vast number of detached columns, delicately slender, and combined with attendant ornamentation, might almost be compared to a profusely embroidered veil cast delicately over the entire face of the building. So delicate, indeed, is this profuse display of detached column-work, that one can scarcely understand how it should have withstood the wear and tear of time and tempest, in a severe climate, at the foot of the Vosges mountains, through a course of 600 years, with a comparatively small amount of injury. Yet this slight and almost detached work has, in fact, stood better, in many places, than the more solid portions of the building, and seem to require less renovation in the course of the careful restorations that have been in progress for several years.

The architectural critic Milizia speaks of the cathedral of Strasbourg as resembling in many respects those of Paris and Rheims, "*à un goût consistant à quello di Rheims e di Parigi*;" but the resemblance is by no means so great as might be inferred from the words of the Italian critic, its far more lofty proportions giving to it a general character very distinct from either of those well-known structures. For instance, the tops of the towers of Notre Dame are scarcely higher than the upper line of the main façade of Strasbourg, before the commencement of the upper part of the tower and steeple; the total height of the Parisian structure being about 202 ft., while the general mass of the main façade of Strasbourg is near 200 ft., and the total height of the building to the top of the steeple is 496 ft.* It is in this great elevation which removes it beyond the sphere of comparison with almost every other architectural structure in Europe; and we therefore find it occupying a prominent position in those diagrammatic compositions in which the relative heights of the greatest edifices of the world are estimated, and in which the height of Strasbourg challenges even that of the great pyramids of Egypt. It is, indeed, one of the most remarkable of the gigantic temples which the spirit of Christianity produced through the medium of the earnestness and enthusiasm of the great masonic architects of the Middle Ages. Felibien, in his "*Recueil Historique de la Vie des plus célèbres Architectes*," asserts, in his brief outline of the career of Erwin, that all the thirteenth and fourteenth century work of Strasbourg Cathedral must be attributed to the designs of that great artist, although he did not live to see the whole of his plans carried out. And Felibien is no mean authority, for although an architect of the most roccoco school of Louis XIV., at a time when Le Pautre was putting the finishing touches of his *bric-a-brac* fancies to the palace and gardens of Versailles, he had nevertheless a fine capacity for judging liberally, broadly, and critically of the architecture of all styles and ages. He was, in fact, a true cosmopolite in art, and expresses his regret, while speaking of the beauties of Strasbourg Cathedral, that he has not sufficient space at his command "*pour faire connoître avec quel art et quelle magnificence on bâtissait alors en diverses lieux d'Allemagne et en Angleterre*" while he frequently expresses great and genuine admiration of the architectural monuments erected by the Moors, which most of his contemporaries looked upon as neither more nor less than absolutely barbarous.† When the French critic goes on to speak in some detail of Strasbourg, he says, "*On ne voit guère d'édifices Gothiques plus grands ni mieux construits*," exclaiming, "*On ne saurait bien connoître la beauté de cet ouvrage sans en voir au moins le dessin*." He then enters

* Felibien states the height of the spire of Strasbourg to be 490 ft.

† Felibien's interesting work was published in 1696, and dedicated to the minister Louvois.

into many interesting particulars which have been made use of by Milizia without acknowledgment—especially those relating to the relative proportions of contemporary Gothic edifices. Milizia also appropriates the passage of the French biographer in which he states that the architect introduced his own statue among the decorative sculpture of the interior of the cathedral, describing the precise spot where the effigy of Erwin might be seen against the upper part of one of the great pilasters; from which position, on the level of the upper range of gallery-work, he appears in the attitude of taking a general survey of the interior of the building. The intelligent biographer, Felibien des Avans, who relates to us these interesting facts, was born at Chartres, and it may be that the remarkable cathedral of that city first aroused in him that general love of architecture which not only determined his choice of a profession, but at the same time developed that enthusiastic appreciation of Gothic art in particular which was so unusual in his time, both with architects and their patrons, that many most noble Gothic interiors were entirely encased in work of the fashionable Franco-Italian style of the Louis XIV. epoch; in which Vandalié process corbelles, canopies, statuettes, and tabernacle work of the most exquisite kind were ruthlessly chopped off close in order to make a smooth and convenient surface for the reception of the fashionable stone or stucco-work of the time, which was destined to form a courtly garment of white and gold, after the manner of the glittering chapel of Versailles.* Perhaps even Felibien himself may have been active in desecrations of this kind, when tempting "jobs" turned up; but however this may be, he was a genuine admirer of the great Gothic cathedrals. After describing the statue of Erwin, he goes on to state that among the more noticeable statues were the three equestrian figures of Clovis, Dagobert, and Werner of Hapsburg, the most illustrious among the successive founders and refounders of the cathedral. Such statues, as the works of Gothic art, are extremely remarkable and interesting; equestrian statues being rarely found of such considerable dimensions. These were, no doubt, subjects upon which Erwin lavished much of his own artistic labour, and were deemed the chief pieces among the sculptures of the great work in hand. It is in unusual features of this kind that the student feels the greatest interest,—comparing them, perhaps, with the equestrian statue of St. Martin above the chief entrance to the church, dedicated to that saint, at Laon, or to the celebrated life-size equestrian statue of Stephen of Hungary, supported by a great projection of corbelled work against a massive group of columns in the cathedral of Bamberg; for, with the more general characteristics of Strasbourg Cathedral ordinary descriptions have already made him familiar. Among the external features, none strike the spectator more forcibly, or produce a more indelible impression upon the imagination, than the well-known exterior staircases, which, running up the angles of the towers, form a kind of perforated hexagonal turrets of the lightest and most attractive aspect, and are a peculiarly Erwinian feature, which, as will be seen, he was so well pleased with that he introduced it in subsequent works. The spire itself is also peculiar in treatment, the lower portion consisting of a series of pinnacles, rising one above another from the central cone, of acuminating stonework, until, within a certain distance of the apex, the cone itself becomes a grand central pinnacle or spire, formed of perforated work of very rich tracery. The general composition of this elaborate spire has been an object of admiration and curiosity ever since its construction, and the names of visitors of all countries are to be seen at the top of the internal staircase, more or less deeply cut in the stone, among which are those of Herder and Goethe. The final *bouton*, or finial, which crowns this lofty spire can also be reached by external climbing, the only protection being obtained by means of small projecting iron bars, which the adventurer clutches with a feeling that a tight hold is his sole chance of safety; yet many have successfully scaled this giddy eminence, and while there inhaled a bottle of Alsatian wine to the prosperity of the good city of Strasbourg.

Among other points of excellence that cannot fail to strike a visitor, notwithstanding a previous general knowledge of the main characteristics

of the structure, are the three portals of the great western façade, especially the two with the series of nearly life-size figures in the highly decorative niches, representing the "wise and foolish virgins," one of the subjects most favoured by the Gothic sculptors of Germany. In one of the niches devoted to the "foolish virgins" Satan appears in the character of the tempter, holding in his hand the typical apple. The Scriptural symbol of the serpent is most ingeniously blended, in Mediæval fashion, with the human form. As a tempter he presents a very pleasing and attractive front; but on looking to the back of the figure, the spectator perceives that its form is entirely composed of the coils of one or many serpents, the presence of which, it is supposed that his guile enables him to conceal from those on whom he is about to exercise the fascination of the tempter. The nearest of the virgins to this figure, the last among her companions remaining to be tempted, wears a self-satisfied smile as she meets the satanic advances, to the flattering blandishments of which she is evidently about to succumb, and adopt the pomps and vanities of the world which, under the symbol of the apple, are proffered to her. The features of those of her companions, who have already fallen away, are stamped with various degrees of despair and remorse, which the sculptor has expressed with wonderful art. This skillfully-wrought expression of the faces is powerfully supplemented by the apparent action imparted to the arms and hands, which is highly dramatic in character. It is true that the artistic treatment is marked by a certain stiffness inseparable from the naive realism of Gothic art, but at the same time full of a certain charm of quaint simplicity which equally belongs to it, and which modern art, in its attempts at reviving the forms and treatment of Mediæval sculpture, has signally failed to reproduce. The placid beauty of the "wise virgins" in the opposite niches, forms an exquisite contrast to the remorse-stricken forms of their fallen sisters; the quiescence of their easy positions and the expressions imparted to their features of sweet and confident repose and hope, are of the highest kind of that truly refined art which the sculptor-masons of the thirteenth century displayed in their architectonic sculpture; and in more than one of them it is probable that we may trace the face and figure of Erwin's artist-daughter Sabine.

The central entrance, though perhaps still richer, is not so interesting in its statue-sculpture; and the feature which formerly gave to it a fitting pre-eminence—namely, the superb doors of bronze, celebrated masterpieces of the sculpture of the period—are no longer in existence, having been melted down during the French Revolution, in order that they might be coined into pieces of one and two sous for the use of the republican government.

The interior of Strasbourg Cathedral, even after the most careful study of the various published descriptions, never fails to produce a striking impression on the spectator, on account of its great height, which, from the floor to the centre of the groining of the roof, is said to be 230 ft.; a height so great that the towers of Notre Dame, of Paris, or those of York Minster, might stand within this lofty interior without touching the ceiling. This enormous height has afforded the architect the opportunity of introducing the line of lofty and splendid windows which form such a noble feature above the line of the clearstory, admitting a flood of light and atmosphere to the upper part of the vast interior which produces an unrivalled effect of brilliant lightness; while beneath these spacious and magnificently traierced openings a richly contrasting effect is produced by the smaller line of windows at the back of the double arches of the clearstory. It would be idle to attempt anything like a detailed account of the general ornamentation and decorative sculpture of this well-known and often-described work; but in its profusion of remarkable features each fresh visitor finds something new to dwell upon which has been especially singled out for criticism or admiration by his predecessors. Among such special *meritoir* the writer of the present notice was especially attracted to the close examination of the exquisitely elaborated stone pulpit, which is perhaps one of the most intricately wrought pieces of delicate tabernacle work in Europe; and, although the treatment of some of the details would appear to suggest a somewhat later period for its execution than the time of Erwin, yet there can be little doubt that the design, in all its main features, and the disposition and

proportions of its details, is due to no other, although his design may have been carried into execution, and perhaps modified by some of his successors in the great work.

There is also another feature, and that a peculiarly Gothic one, which has been wrought out with more than usual richness and success in this wonderful interior, namely the corbelled and canopy-work attached to the columns for the reception and display of statuary. This device for varying the ascending lines of lofty columns was certainly a most happy thought of the Gothic architects, and is the more interesting as being entirely absent in classical architecture, in which the moderate height of the columns does not, in fact, admit of its successful introduction. In the great Gothic cathedrals, on the other hand, this device serves at once as a point of agreeable repose to the eye in measuring the enormous height of the columns, and forms at the same time a most graceful and picturesque means of furnishing the edifice with all the convenience for a gallery of sacred sculpture without trenching upon and crowding up the lower portions of the space for the accommodation of the congregation. One of the most remarkably rich examples of such displays of statuary, supported on lofty corbelles at the mid-height of the towering columns, to which they are made to appear almost necessary adjuncts by the addition of the elaborate canopy, is the series of sculptural figures, of life-size, and in fully-detached relief, which, tier above tier, cluster round a massive group of columns in the south transept, and which, in their own distinct style of form, an architectural feature fully as striking as the celebrated spiral series of marble pictures which wind round the wonderful column of Trajan from base to summit. The lower set of figures clustered round that group of columns at Strasbourg consist of the four evangelists, supported on very magnificent corbelles, the carvings of which represent, with a marvellous addition of intricate ornament, the well-known symbols of the four evangelists,—the angel, the lion, the lion, and the eagle. Above the figures are exquisitely-enriched canopies, surmounting which are four figures of angels, of remarkably fine execution, in attitudes of flying downwards, and in the act of communicating the inspired records to the authors of the Gospels. Above these is another tier of figures, the chief of which is the Saviour, descending from heaven, guarded by other angels. Such are a few of the more remarkable features of Erwin's great work, which, long before its completion, was awarded the first rank among the seven wonders of Germany.

THE NEW OPERA HOUSE, PARIS.

As all municipal buildings have almost stopped work, the New Opera remains in almost the same state that it was in a few months ago, except the principal front, which, a few days before the 15th of August, was denuded of its box-sockets, sheltering the four groups of statues at the entrances. These groups, one on each side of the doorways, are as follows: Music (by M. Guillaume); Lyric Prose (M. Jouffroy); Dance (M. Carpeaux); Lyric Tragedy (M. Perrand). Between these groups are four allegorical statues: Idyll, Cantata, Fable, and Elegy, the works of MM. Acelin, Chapus, Dubois and Vatinelle, and Falguères.

On the summit of the building, active operations are being undertaken to place the crowning statues, &c. At the angles of the façade, Lyric Poetry and the Muses occupy one; on the other are Lyric Poetry and the *Renouée*. These are due to M. Gumery. The colossal statue of Apollo, lyre in hand, has already been placed on the pediment of the great stage wall. It is by M. Aimé Millet, the artist to whom France owes the grand statue of Vercingetorix, set up in 1865 in one of the provinces. On each angle of the wall is a flying horse, or a Pegasus, by M. Lequesne. All these figures are of colossal proportions, and are executed in galvanoplastic bronze, with profuse gilding.

While the scaffolding and hoardings were up, the four fronts of the New Opera were a mystery to the Parisians, whose curiosity in matters of decoration and ornamentation is proverbial, and criticism was deemed both unwise and unfair. Now that the four fronts are thrown open to the public every one is at liberty to judge of the general external effect of the structure, especially as it is now unalterable in design.

Placing ourselves between the "refuges" in

* The writer has recently examined several interiors so treated, of which the cathedral at Wurzburg is perhaps the most notable example.

a line with the north side of the Boulevard des Capucines, we have a good view of the front elevation as far as the cast cornice-work which is the starting-line of the attic story for the rest of the building, but we see no more of the great pile. Passing to the eastern elevation, we find a totally different façade and of a style hard to be reconciled with that of the front elevation. At the rear the elevation is not devoid of boldness, differing, though it does, from any of the others. The same remarks apply to the western front. It seems that the aim of the architect has been to group together all the known styles of architecture, and to make as much use of them as he can, by disposing them conventionally.

By taking up a position, however, in the Avenue Napoleon (the new street leading from the Opera to the Palais Royal), there appears at one certain harmony of outline and details in the structure seen in perspective. It is lawful for an architect to make any two opposite façades, or building, of totally different aspect and style; but the adjacent fronts should harmonise so as to give no shock to the eye when seen in perspective. This M. Garnier seems to have understood; and the perspective lines of two adjacent sides of the quadrangular building are so conceived that the structure thus viewed seems to possess all the desired harmony, amplitude, and elegance. For instance, returning to the Avenue Napoleon, all the timidity of the low front elevation disappears; all the building rises up in its grandeur; first the cupola of the *salle*, then the terminal pediment of the stage; and the mascarons of the front correspond with the commencement of the gables of the roof of the building, above the attics.

Some cry has justly arisen against the "Dance" of M. Carpeaux on the principal façade, in which group he has given us the model, *in puris naturalibus*, of a drunken Bacchante, the attitudes and attitude of which are disgracefully impure and immoral. An official journal says that there is some rumour it will be removed,—1,500*l.* thrown away. Carpeaux's model was approved of by the Government, so that they are in fault for not having added a little drapery in time.

As to the interior decorations of the new Paris Opera-house, it is too early to criticise the work.

TENTERDEN, KENT.

A READER asks us to tell him something about "the stupid story that calls Tenterden Tower the cause of the Godwin Sands." It is a very old story, not quite so "stupid" as our over-clever correspondent seems to think, and we might refer him to the guide-books for an answer.

However, in a dozen words, the tradition is that the abbot of St. Augustine's, Canterbury, employed in building Tenterden Tower, stone that had been provided to strengthen the sea-wall of land belonging to Earl Godwin. The wall falling in consequence during a great storm, the land was submerged, and became the perilous sands of which we are speaking. The story was first told, so far as we know, by the witty and unfortunate Sir Thomas More, by the witty and "Utopia" and friend of Erasmus, and though probably a fable, is anything but "stupid."

"What great events from trifling causes flow,"—

trifling, indeed, if we could really get back to them and trace the connexion of events. A word casually uttered has set its hearer on a track that has led to a discovery of immense importance; and was there not once a great war because of the breaking of a brace-buttock that disconcerted an enemy, and prevented the completion of his speech? For want of a single nail in his horse's shoe, a man was ruined: we all know the story. And who shall say how the ruin of one man may affect the course of events? Sir Thomas More's statement, if not correct itself, includes a great and useful truth. If the building of the tower of Tenterden Church was not the cause of the Godwin sands, it might have been.

It is a fine tower, bold and lofty, that of Tenterden, Perpendicular in style and good in proportions. The church itself is partly of the thirteenth century, partly of the fourteenth and fifteenth. The nave has a paneled ceiling, and the tower arch is open, so as to show the west window. This was filled not long ago by the late Mr. William Curteis Whelan, of Heronden Hall, with a costly memorial in stained glass, by Lavers & Barrand, of his father and mother, the figures in it typifying their qualities.

By the care of Mrs. Whelan, too, a widow has been set up at the east end of the church, in memory of the late vicar.

Heronden Hall is a handsome mansion, good serviceable modern Gothic in style, designed by the late Mr. Donthorne, but recently much enlarged, the original architect sacrificing too much to a lofty open-roofed hall, certainly a striking feature. The park has in it a noble oak and the largest ash-tree in the county. No one supposed when the owner of Heronden set up the window to his parents that he was soon to follow them; but so, under the dispensation of Providence, it has been, and the Hall is now to be let for a time until recollections soften. The nearest station to London, by the South-Eastern line, is Headcorn.

Biddenden, on the way from this station to Tenterden, has a church ranging from the thirteenth to the sixteenth century in date. At Standen there is a good sixteenth-century timber house; and at Rolvenden a Perpendicular church worth looking at. These endings in "den" are noticeable. Kemble, in his "Saxons in England," gives some information on the point, which is quoted by Murray. The "dens," part of the Saxon Mark, or settlement, denoted pasture, usually for swine, and were within the unenclosed forest which surrounded the settled habitations. There was a Den Court, he says, for this part of Kent, which, up to comparatively recent times, had jurisdiction over forty-four Dens, for the most part still traceable.

SOUTH EASTERN RAILWAY MANAGEMENT,—OR OTHERWISE.

THE following communication has been addressed to the directors of the South-Eastern Railway:—

"Last Saturday morning, at 9.23, I took a first-class return ticket at Charing-cross station for Headcorn. My servant was with me to carry portmanteau to the carriage and to take back replies to a bundle of letters brought to me at the station. The officer at the gate, with a certain amount of insolence, refused, however, to let him pass with me to the carriage, although I explained the serious importance of having him by me to the last moment. The man admitted that if my servant, whose capacity was evident, had been in livery he could not have prevented him from passing through. The course pursued by your officer on this occasion caused a most serious inconvenience, and I must take the liberty of saying that, if he acted in accordance with orders, such orders are not calculated to serve the interests of passengers or company.

On the following evening, the 8.13 train, when it stopped at Headcorn, included but one first-class wagon, which was full, and I was compelled to return to London in a second-class carriage, having paid for first, amongst, as it happened, mewing infants and reeking men. At London Bridge, at Cannon-street, and at Waterloo Junction, we loitered to take up and send down passengers, and the result of this and previous proceedings was that we arrived at Charing-cross at 10.40 instead of 9.55 as advertised, or 45 minutes after time; and as my coachman had thought it necessary to wait only 40 minutes after the hour for which he had been ordered, I was left to the chance of a cab, with the consequent expenditure.

Any one of these incidents would reflect on the management of a railway: and, having been subjected to the series consecutively, I feel bound to complain gravely as well for the sake of the public as of myself."

THE EMPEROR-ARCHITECT HADRIAN.*

THE antiquaries who have espoused the cause of Hadrian v. Severus, as being the author of the great Roman wall in England, will be glad to hear that a French biographer of the imperial architect commences an enumeration of his works with mention of this great barrier. The writer in question, M. Charles Lucas, after stating that Hadrian was born in Rome, January, A.D. 76, and succeeded Trajan in 117, and enjoyed the supreme power for twenty-one years, gives a few of the opinions of ancient authors concerning his accomplishments. He was pronounced poet, painter, and architect. It is, however, only with this last capacity that M. Lucas deals. Without quoting any authority, or throwing any new

* L'Empereur-Architecte Adrien (Publius Ælius Adrianus). Étude Antiquaire par Charles Lucas, architecte. Paris: Ernest Thorin, 1869.

weight into the scale, he merely states as a fact, that after the year 120, to the end that he might preserve the Roman colonies in Great Britain from the incursions of the Picts and Scots, Hadrian constructed an immense wall to the south of the Cheviot mountains, which strong stone line M. Lucas erroneously believes to be the boundary between the two countries at the present day. Continuing the account, Hadrian built a temple in honour of Ploutine, the wife of Trajan, at Nîmes. At Tarracoe, he rebuilt the Temple of Augustus. He embellished Carthage, and added to it a new quarter which took his name. Between the years 123 and 125, during his first stay in Asia Minor, he reconstructed in great measure the city of Cyzique, which the Emperors Augustus and Tiberius had also attempted to improve. At Ephesus, he reared a temple to Roman Fortune; at Antioch, where he first heard of his elevation to the imperial power, he built a public bath, an aqueduct, and a temple, dedicated to Nymphs, in which water sources formed fine fountains. At Athens he built a new city, divided from the old one by an arch, which bore two inscriptions; the one looking upon the old city, of Minerva, reading, "Here is the Athens of Theseus;" and that facing the new buildings notifying "Here is the Athens of Hadrian." Among the edifices he erected here were two temples, whose magnificence we can picture from the account of Pausanias, who says that the porticoes were formed of 120 columns of Phrygian marble, that the walls were of the same marble, and the halls were decorated with sculpture, paintings, gold, and alabaster. Moreover, he restored the temple of Jupiter Olympus, in recognition of which task the Athenians placed a colossal statue of him near it. He made more than one visit to Athens, for in the second visit he consecrated some of the edifices he commenced on the first. At Corinth, too, in his day were built baths and an aqueduct; the tomb of Epaminondas was embellished by an inscription composed by the emperor; at Matinée was rebuilt a temple in honour of *Neptune Hippius*; at Hyampolis a portico which bore his name; at Abis he rebuilt the great temple of Apollo, and at Némée, the hippodrome. Visiting Egypt he built a monument to Pompey the Great. He ascended the Nile as far as Thebes, and visited the statue of Memnon with his wife, their stopping-places being handed down to posterity in inscriptions. Here he lost his favourite Antinous, to whose memory he built a city he called Antinopolis. On his return to Rome, A.D. 135, he only quitted it occasionally to reside in his celebrated villa. In the Eternal City he founded the Athenæum, restored the basilica of Neptune, the forum of Augustus, built a circus, threw a bridge over the Tiber, and placed on it the magnificent mausoleum intended for his remains. M. Lucas has not taken the trouble to collect evidences of his numerous works in other parts of Italy, although he states they exist in the form of inscriptions on many of great importance.

The villa built by Hadrian at Tivoli is described at some length, with references to the works of Ligorio, 1563; Antoinedel Re, 1611; Kircher, 1671; Contin, 1634; Piranesi, 1781; besides the more modern authorities, Bardi, Nibby, and Caletta; but a French account of it by M. Daunet is specially cited as exhaustive in an artistic point of view. This villa, or assemblage of buildings, grouping together all that the emperor had seen and wished to reproduce in the course of his travels in Greece and Egypt, it will be remembered, did not long survive its author intact, having been dismantled by Caracalla for the enrichment of his own thermae, and finally devastated by Totila, in his siege of Tivoli. About ten miles in circuit, containing a Lyceum, an academy, a Pæcile, a palace, a Serapeum of Canopus, Greek and Latin libraries, barracks for the guards, several theatres, numerous temples, fountains, a vale of Tempo, besides other landscape features in imitation of celebrated scenes, this remarkable villa provided the columns and other marbles for all the chænobes, palaces, and principal habitations in the neighbourhood; and its ruins have furnished antiquities for every museum of note in Europe. M. Lucas not inaptly couples it with mention of the South Kensington Museum and Sydenham (the credit of which last, with the usual French difficulty the matter of English titles he duly places to the account of "Sir Paxton?"), both reared within the last fifteen years for the purpose of gathering together, in like manner, though for a different purpose, specimens of the architecture and arts of the known world.

LONG SPAN BRIDGES.

PROFESSOR DE VOLSON WOODS gives the following tables of bridges having long spans, in the "Journal of the Franklin Institute":—

TRUSSED BRIDGES.

NAME OF BRIDGE.	Total length in feet.	No. of Spans.	Longest Span.	REMARKS.
Schaffhausen, Switzerland	365	2	193	Weisbach Mech., Vol. II., p. 253.
Trenton, N. J.	890	5	200	{ Wooden arch trussed. Haupt on Bridge Con- struction, p. 244.
Columbia, Pennsylvania	5,280	29	200	{ Burr's—destroyed during rebel invasion, 1863. (Mahon, p. 24.)
Newark Dyke, Eng.	21' 1"	{ Longest span of Warren's Girder. Jour. Frank. Inst., Vol. XXVI., 3d Series, p. 156.
Roset, Mass.	250	1	250	Mahan, Civ. Eng., p. 238.
Chepstow, Eng.	6 6	4	3 98	Queen Post—Theory of Bridges—Weak.

THE STATE AND PROGRESS OF MECHANICAL SCIENCE.

THE hearty vote of thanks which, on the motion of Mr. Ramshottom, of Crewe, was so readily awarded to Sir William Armstrong, for "the valuable and interesting address" delivered by that gentleman, as President of the Institution of Mechanical Engineers, at their recent annual meeting at Newcastle, is entitled to a sympathetic echo in our columns.

In portions of his address Sir William went over ground familiar to the readers of the *Builder*. It is a matter of just satisfaction to a public writer to find views which he has been long endeavouring to bring before the world so fully adopted, and so eloquently enforced, as in the present instance, by the President of the Mechanical Engineers.

The President referred, *apropos* of the use of steam, to that great problem of hydraulic engineering to which we have repeatedly called the

attention of our readers (*Builder*, October 28th, 1867, *et passim*), the great enigma of which M. de Lesseps is the sphynx.

The direct application of steam power to the excavation of the Suez Canal is indeed one of the most remarkable of the recent features of engineering achievements. Sir William observes that in quantity of material moved, the Suez Canal is far more vast than the Great Pyramid. Quantity, however, is a relative term. If we compare the actual amount of labour involved in the quarrying, the transport, the working, and the setting of the three millions and a half of cubic yards of solid masonry which the Great Pyramid approximately contains, with that required for the scooping out of the ninety-six millions of cubic yards estimated as the material to be removed for the sinking of the canal, the balance will incline heavily in favour of the former, notwithstanding the immense service rendered by steam to the latter work. But there is yet another feature not hinted at by the President. The

work of Soudhis has endured for some fifty-four centuries, according to the best modern calculations of dates. Having suffered the utmost violence that the caprice or the curiosity of man could inflict, it is as likely to endure for a second or for a third period of equal length, as the Nile is to continue to run through Egypt. Whether all the ingenious toil and unsparring cost of the enterprising French engineer will ever succeed in making a channel 28 ft. deep from sea to sea, and how long, if once made, this channel will last, are questions as yet entirely unanswered. The last attempt to elicit an authoritative statement, made in the House of Commons on the 2nd of August, entirely failed, as the Under-Secretary of State replied that the Foreign Office was not in the possession of any official information on the subject. In fact, Mr. Otway seemed to have no more recent guide than a report made, in the columns of the *Times* newspaper, by Mr. Fowler nearly six months ago, to which he added the statement from "other sources," that the intended depth of 26 ft. was reduced to 18 ft. As to the progress of the great experiment of the filling the basin of the Bitter Lakes, not one word of assuring information seems to have reached this country, the testimony of the last traveller (a man well fitted for forming an opinion) being in the last degree unfavourable.

From the Suez Canal, Sir William Armstrong passed to a subject very fully entered into in our columns last July, and introduced to public attention in the *Builder* of 17th August, 1867, as well as previously, that of the coal supply of the future. The additional information to be gathered from the address referred to the use of pneumatic coal-cutting engines in the Hetton Colliery, by which not only is human labour to a great extent superseded, but a supply of air, at a temperature of 7 degrees below freezing point, escapes into the mine, the influence of the expanding air that is discharged by each machine being sufficient to lower the temperature of the circulating atmosphere by one degree. The combination of pure ventilation with a supply of cool air affords a means of penetrating to greater depths than has been hitherto reached.

From the contemplation of these various and distinct portions of the field of mechanical engineering, the address passed on to that in which the President may be expected to be more especially at home,—the condition of artillery, and the present state of the ever open question of the relative strength of our means of attack and of defence. Here again we meet a subject not unfamiliar to our readers. (See *Builder* of February 3, 1866; July 27, 1867; and May 10, 1868.) The remarks upon the function of heat in increasing the projectile force of powder were such as to demand attention. By the discharge of fifty rounds in succession, a field-piece is made so hot that it cannot be touched. The actual flame contact which produces this effect is limited to the third of a second, or the 150th part of a second for each discharge. The calorific effect of the thin film of heated matter deposited in the bore at each discharge, may be set against the intermediate loss of heat by radiation. In small guns the area of absorbing surface surrounding the charge is proportionally greater than in large guns. The greater heat attained in the latter both adds directly to the explosive force of the powder, by expanding the gas, and acts indirectly by accelerating the inflammation of the powder. When the additional resistance to the expulsion of the projectile which is caused by the rifling of the barrel is taken into account, it is estimated that the pressure actually reached in guns of a large size when fired with English service powder, is not less than seventy thousand pounds on the square inch. It would be interesting to have some more distinct indication of the data which lead to so prodigious an estimate.

To resist this terrible harrowing pressure it becomes of the last importance to understand the most appropriate material, and the best method of manufacture, for a heavy gun. Krupp and Whitworth advocate the use of steel; but it is rather the hoped-for steel of the future, than any as yet produced by human hands, to which they can look with any confidence. The American Rodman gun is of cast-iron, the inside being cooled first, and the external portion of the metal being allowed to shrink upon the hardened interior; the object being to keep the metal in the interior in a state of compression, and that on the exterior in a state of tension. Sir William adheres to his opinion that coils of

welded iron, surrounding a steel tube, form the best guns. The main reason for the preference of iron is the fact, or at least the positive opinion, that steel, while possessing much greater tensile strength than wrought-iron, is less adapted to resist concussive strains.

The last point on which the address enlarged was one with which our readers are not unfamiliar. It relates to the mounting of guns, both for land and for naval service. The views which we have taken occasion to express as to the mode in which the fortifications of the future will be modified in consequence of the important invention of Capt. Moncrief were fully endorsed by Sir William Armstrong. Still more interesting was the accordance which he expressed with our opinion as to naval artillery. A mere floating gun-carriage, as small as possible, in order to carry a heavy gun, and the machinery requisite for propulsion, is that which we have indicated as the great desideratum of naval construction. Sir William not only agrees with this opinion, as theoretical, but illustrates it by the experience of the proving-bergs of the Elswick Works, which is a mere floating gun-carriage. This proving-bergs was the origin of the idea of Mr. Rendell's now well-known gun-boat *Staunch*, which is provided with steam power for propelling a twin screw, and for working a 12-ton gun. This vessel is so small as to be a very difficult mark to hit, and is, at the same time, very inexpensive. Guns of the largest size may be mounted in vessels similar to the *Staunch*, without increasing their tonnage in more than a proportionate degree.

We feel quite assured that our readers will share our own satisfaction at the reproduction, in an address which authoritatively sums up the recent progress of mechanical engineering, of so much on which we have insisted within the last three or four years. When we use the term reproduction we refer, of course, only to that community of results arrived at by different thinkers, starting from different stand-points, and advancing by different routes, which is one of the happiest triumphs of science. The lover of truth for its own sake will rather prefer that views which he advocates should be independently arrived at, than that they should be adopted on his own authority. The balance of probability inclines far more in favour of their exactitude in the former than in the latter case.

FROM PARIS.

A REPORT on the financial situation of the hospitals and asylums (*hospices*) of the French empire has just been issued by the Inspectors General of the establishments of *bienfaisance*.

On the 1st of January, 1869, there existed 1,557 hospitals and hospices, under the charge of 1,382 administrative commissions. The towns of Nancy, Rennes, and Saint-Omer have 4 establishments; Bordeaux, Valenciennes, 5; Lyons, 7; Paris, 32. Before 1790 there were 1,224 hospitals and hospices; 16 under the first empire; 53 under the restoration; 71 under Louis-Philippe; 11 under the republic; 172 under Napoleon III.; thus bringing up the number to 1,557. The number of beds available in 1847, viz., 126,142,—is now raised to 141,576; difference, 434. The towns which have the greatest number of beds in hospitals and hospices are as follows:—Paris, 18,785; Lyons, 4,176; Nantes, 2,716; and Lille, 2,188.

This document touches upon a question of importance: it is this, examples of which are daily brought before the public: the difficulties thrown in the way of the free admission of the indigent living in rural districts into hospitals; and, worse again, the insufficiency of out-door attendance on the sick at their own homes.

On the 18th inst., the works for constructing two new groups of public schools on the vast site left free by the demolition of the Grand Hospice des Petites-Ménages, were let in contract. This old building was situated at the angle of the Rues de Sèvres and de la Chaîsse, and was founded by Henri II. on the site of the ancient leper hospital called Maladrerie Saint-Germain, demolished by order of Parliament in 1544, and transferred without the precincts of Paris. With the exception of the *præaux* and shady trees nothing remains of the Hospice des Petites-Ménages now transferred to the new municipal building at Issy. There a certain number of aged married persons, one above sixty and the other not less than seventy years old, are received. In consideration of a certain sum once paid, the aged couples find there a comfortable repose for the rest of their lives.

During the excavations for a new sewer on the site of the above hospice a great number of human bones were discovered, among which were fifteen skulls. These remains were so phosphorescent that they spread terror among the men.

At the Église Saint-Vincent de Paul a new chapel dedicated to the Virgin is being constructed, at the end of the nave, behind the grand altar. M. de Niewerkerke, superintendent of fine arts, has presented to the curé of St. Vincent de Paul, at his request, the statue of the Virgin, executed by M. Carrier Belleuse, for which he gained the grand medal of honour at the Salon of 1867.

The ten marble busts of the crowned heads who have visited the Hôtel de Ville during the last ten or twelve years have been placed on marble plinths of coloured marble. They are in the gallery leading from the Salle du Trône to the grand apartments of the prefect, behind the Salon du Zodiaque, the splendid woodwork of which has been recently restored to its primitive grandeur. The busts are as follows:—Queen Victoria, Prince Albert, the Queen of Portugal, the Emperor François Joseph of Austria, the Emperor of Russia, the Sultan, Victor-Emmanuel, the King of Portugal, the King of Prussia, and the King of Bavaria.

The official statistical return of the number of persons who came to Paris to see the Exhibition of 1867 has just been published. It appears that the total number was only 682,205 persons, of whom 200,347 were strangers. Among the latter were 59,367 British, 48,865 Germans, 146 Oceanians, 27,368 Belgians, 33 Georgians, 4,289 clergymen, 4,779 persons of title, 50,335 independent proprietors, 320 journalists, 115 post-masters, 222 ship-owners, 501 men of letters, 23 rabbis, 4 Cochinchinese, and 19,212 photographers! How was this found out?

Two new Jewish synagogues are being constructed in Paris, one in the Rue de la Victoire, with a front on the Rue de la Chaussée d'Antin, very vast and elevated. The second is being built in the Rue des Tournelles in the Marais, and is to be as important a building as the first; its site is a portion of that of the memorable palace of Tournelles which belonged in 1390 to the Chancellor d'Orgemont; there Leon de Lusignan, king of Armenia, lived and spent the last days of his existence in 1393. During the British occupation it was the residence of the Duke of Bedford, regent during the minority of Henry VI., about 1422. Bedford so increased and ornamented the Tournelles Palace, that, as history informs us, Charles VII., having been reinstated in the possession of Paris, preferred it for a residence to the Hôtel Saint-Paul. It was in front of the spot where the new synagogue is being built that Henri II., king of France, was mortally wounded in a tourney by the Count de Montgomery. The last vestiges of the Tournelles Palace were cleared away by order of Henri IV., to construct the quarter of the Place Royale.

In front of La Petite-Vilette, and the park of the Buttes Chaumont, the new iron bridge, of very bold design, by which the Rue de Crimée crosses the Chemin de Fer de Ceinture, has been opened for traffic. Under it, in deep cutting, pass the Chemin de Ceinture and that leading to the great cattle market of La Vilette, abattoirs, &c. This bridge is composed of several sections, one of which is in the line of the Rue de Crimée; another section unites the two portions of the Boulevard de Mexico. As was the case with the Pont de l'Avenue de Clichy, under which pass all the lines of the Ouest, the bridge carrying the Rue de Crimée was constructed without for a moment interrupting the traffic of the Chemin de Fer de Ceinture.

The new Clichy bridge over the Seine at Anvers is now open to the public; it is of cast-iron, of good design, and consists of three arches spanning the three branches of the Seine, divided by islands at that spot.

Monument at Rome Commemorative of the Coming Council.—The design submitted to the Pope by his architect, Count Vespignani, for the monument commemorative of the Council, has been approved of. This will consist simply of a column of African marble from the Emporium, raised on an hexagonal base, which will be enriched, on five of its faces, with bas-reliefs, representing five parts of the world, while the sixth face will bear the arms of the Council. The date of the opening and close of the Council. The column will be surmounted by a statue of Pius IX. pronouncing the benediction *urbis et orbis*.

THE RADCLIFFE INFIRMARY CHAPEL, OXFORD.

The Chapel of the Radcliffe Infirmary at Oxford, Mr. Blomfield, architect, has just received an interesting addition to its internal decoration, in the shape of four remarkable pictures, done by Russian monks. During a tour in Russia, in 1867, the founder of the chapel, according to the *local Journal*, visited the celebrated Monastery of Troitzka, or Holy Trinity, about forty miles from Moscow, in the midst of a wild forest. Its massive walls extend 4,500 ft. in length, are from 30 ft. to 40 ft. high, and 20 ft. thick. The building is flanked by eight towers, and forms a fortress of great strength, which has triumphantly withstood siege and assault. It contains a cathedral, ten churches, palace, university, convent, schools of art and industry, and all the requisite accommodations for its thousands of inmates. It is replete with objects of interest, and there are shrines of solid gold and silver, adorned with precious stones, frescoes, carvings, and pictures. The monks have a school of painting, from which are supplied all the pictures and decorative work for the Eastern Church in Russia. About sixty monks are constantly engaged, under the chief direction of the Monk Symeone, on the various pictures in progress, and there is besides a class entirely devoted to miniatures, which are exquisitely executed on mother of pearl, and for beauty of drawing and delicacy of colouring equal any we have in this country. There are three large apartments occupied by the artist monks and their pupils. In the first, are the novices who are instructed in drawing; in the second, the younger monks who have made some advance are initiated into the mysteries of colour; and in the third are the elder monks, proficient in their art. It was here that the four pictures which have just been placed in St. Luke's were produced. They consist of full-length figures of the Evangelists on panel, about 4 ft. 4-in. by 2 ft. They are painted, says our authority, with all the delicacy of miniatures on a golden ground, richly chased and adorned with an exquisite border, the rich colours sparingly introduced into which combine and harmonise charmingly in the general effect.

THE SPIRIT-LEVEL.

Its invention.—He who first filled a glass bottle with a liquid, leaving a small quantity of air therein to form a bubble, then corked the bottle and laid it flat on one side, with the bubble floating against the upper part, was the unconscious inventor of the spirit-level, which is a very simple instrument in appearance, but of the utmost value, when properly made, to the astronomer, the engineer, and the builder; for when the bottle is placed horizontally, the bubble always mounts to, and rests at, its most elevated point; and the tangent to that point, when the middle or apex-point of the bubble coincides therewith, is a horizontal line; that is, a line at right angles, or perpendicular to the direction of gravity or the plumb-line passing through that point.

This was first perceived and applied, so far as is known, in France in 1666, by Melchisédec Thévenot, who was a great amateur of science and a writer of books of voyages and travels. In this respect he enriched the literature of France as much as Hakluyt enriched that of England half a century earlier. It was at Thévenot's house that the learned men who founded the Academy of Sciences of Paris met to assemble; and it was at one of their meetings that he propounded the spirit-level.

A description of the instrument, accompanied with figures, was first published in the *Journal des Savants*, Paris, November 15th, 1666, under this title:—"Machine nouvelle pour la conduite des eaux, pour les bâtiments, pour la navigation, et pour la plupart des autres arts." The instrument is there called an *air-level*; and is described as a glass tube, hermetically sealed at both ends, containing spirits of wine, which do not freeze, and a small quantity of air forming a bubble. It is stated that the instrument is capable of giving, with much exactness, the direction of the horizon, the perpendicular to the horizon, and vertical angles; and that it is easier to make, more convenient to use, and indicates a level line more readily and accurately than any other instrument. One figure represents the tube charged with liquid, and an air-bubble; a second shows it fitted, under the centre part, with a spindle dropping into a socket fixed on a staff so

as to turn in any direction, and with sights on the ends for levelling to long distances; a third represents it fixed to a square, and a fourth to a short flat bar of wood, as levels for workmen; and a fifth shows it fixed to a quadrant for navigation.

In this first publication the inventor is not named. But in a small work, called "Recueil des Voyages de M. Thévenot," Paris, 1681, there is a description of the instrument by Thévenot,* preceded by a statement that he invented it fifteen years before that time; and that he then gave a description of it to the public. This agrees with the description in the *Journal des Savants* referred to above, which no doubt was written by Thévenot himself. He also states that soon after his invention an account of it was sent to the Royal Society of London. The celebrated Dr. Hooke was then a constant attendant at the meetings of this body. By this means he became acquainted with it; and, seeing that it would be of the greatest advantage to astronomy, to navigation, to engineering, and to building, he had some excellent tubes prepared, and applied them to various instruments; and he subsequently produced the spherical spirit-level. From this circumstance the invention of the spirit-level, now in common use, has been ascribed to Hooke, but it is undoubtedly due to Thévenot. Much merit is due, however, to Hooke for aiding to perfect it, and to apply it to science. He was the best practical mechanician of his time, as is evidenced by his numerous valuable inventions. He, as well as Wren, whose name is displayed in the most prominent of red-letters on the fame-roll of British architects, were contemporary with Newton; and both Hooke and Wren were within an ace of seeing and propounding the principle of universal gravitation at the moment when the great intellect of Newton had grasped and mastered it,—dispelling for ever the mist that had obscured it.

As, however, the instrument was new, and there were difficulties in constructing it with precision, nearly a century elapsed before those difficulties were removed, and it obtained the preference it merited over the water-levels and plumb-levels then in use, as well as over those that were invented during the interval, most of which are now almost forgotten. It was first practically employed in this country in 1756 by Smeaton for levelling the foundation and courses of stones of the noble lighthouse which he designed and erected on the Eddy-stone. Thévenot's simple glass tube is now applied to nearly all the instruments used in levelling, and is the level *par excellence*.

Its Construction.—The spirit-level, as ordinarily constructed, consists of a short cylindrical glass tube, whose interior surface is, or should be, ground to a slight regular curvature lengthways, and then polished. The curvature, which is much exaggerated in the figure, is almost imperceptible in the tube, the radius being from 300 ft. to 600 ft. The tube is nearly filled with a very limpid liquid, leaving a small space occupied by an air-bubble. The open ends are then hermetically sealed by melting the glass around them with the blow-pipe.

Alcohol or sulphuric ether, whose specific gravities are respectively 792 and 715, water being 1000, are preferred for charging the tube,

because these liquids are much lighter, possess the property of fluidity in a higher degree, and are more sensitive than any others. Moreover, intense frost does not affect their fluidity—no observed degree of natural or artificial cold having ever frozen them; and they also have the property of wetting the glass more readily and completely than other liquids, owing to the greater capillary affinity subsisting between them and the glass.

If the tube's curvature were the same as the earth's curvature, the upper line or surface of the liquid would be truly level, and therefore no part of it would have a tendency to fall, or seek a lower position; nor would the bubble, which is considerably lighter than the liquid, have a tendency to rise or seek a higher one, but would remain uninflected at any part, because the action of gravity upon the surface of the liquid would be everywhere precisely equal. It is essential, therefore, that the tube should be made not only of equal bore, or perfectly cylindrical throughout, but with a uniform and sensibly convex curvature, lengthways, in order that the middle or apex-point of the bubble may rise to, and rest at, the middle or apex-point of the arc.

As, then, the bubble moves in an arc of a circle convex upwards, it may be regarded as a plummet of air, analogous to a plummet of metal or a pendulum swinging in an arc of a circle convex downwards; and the centre of gravity of the bubble is brought to rest, by the earth's attraction, in the vertical line passing through the centre of the circle in an arc of which the bubble moves, the same as the centre of gravity of the plummet or the pendulum is brought to rest, also by the earth's attraction, in the vertical line passing through the centre of the circle in an arc of which the plummet or the pendulum swings, or through the point from which they are suspended. When, therefore, the apex-point of the bubble coincides with the apex, or zero point, as it is called, of the tube, which is marked thereon, or the ends of the bubble mark equal distances therefrom, the instrument is in adjustment,—that is, the tangent to the tube at the zero point is horizontal, or at right angles to the vertical passing through that point.

Two symmetrically divided scales are usually engraved across the top surface of the tube—one on each side of the zero-point, or one from each end of the bubble when its apex-point is identical with the zero-point; so that when the bubble marks equal divisions on the scales, the tangent to the arc at the zero-point, as also a visual ray, a straight edge, or a line parallel thereto, is horizontal. When, on the contrary, one end of the tube is raised above the other, the bubble runs from the zero-point towards the elevated end, and the tangent to that point, or the visual ray, the straight edge, or the line parallel thereto, inclines upwards in one direction, and downwards in the other, from exact horizontality, while the tangent to the arc at the apex-point of the bubble, wherever situated, remains horizontal.

When, therefore, the radius of curvature of the tube is known, the scales across the tube are capable of measuring vertical angles with the same accuracy as a sector, whose radius is equal to the radius of the tube's curvature. Thus, when the apex-point of the bubble deviates from the zero-point of the tube, the value in seconds of the angle contained between the horizontal tangent to the bubble's apex-point, and the tangent to the tube's zero-point is

$$206263' \times \frac{\text{deviation of bubble,}}{\text{rad. of curv. of tube.}}$$

For example, let the bubble's deviation from the zero-point be three divisions of the scale, or $\frac{3}{10}$ of an inch, and let the tube's radius of curvature be 300 ft.; then we have $206263' \times \frac{3}{10} = 206263' \times 0.1 = 20626.3 = 34' 22'' - 65$, the value of the angle from horizontality.

The radius of curvature of the tube may be found by the formula

$$R = \frac{d}{h};$$

where R is the radius, d the deviation of the bubble, h the height traversed on a distant staff by the run of the tangent from the tube's zero-point to the bubble's apex-point, and D the horizontal distance from the bubble's apex-point to the staff. Let $d = 5$ inch, $h = 1$ inch, and $D = 600$ feet; then $R = \frac{d}{h} = \frac{5}{1} = 5 \times 600 = 3000$ feet.

Hence the longer the radius the less will be the curvature of the tube, and the more

sensible will be the bubble of any deviation of the tangent to the tube's zero-point from the horizontal; because the bubble must move over a greater length of the tube in proportion to any small elevation of either end. In delicate levels the curvature is very small, and the bubble quivers with the slightest touch or tremour; while in levels made for common use the curvature is more rapid, and the bubble is more readily brought to a stand, and remains steadier.

The volume and length of the bubble are affected by every change of temperature. The glass and the liquid both expand,—the glass very slightly, the liquid very considerably. If they expanded equally, the capacity of the tube and the volume of the liquid would be enlarged in the same proportion, and the volume and length of the bubble would remain always the same. But, as just observed, the dilatation by heat of the glass is only slight, while that of the liquid is very considerable. Hence the capacity of the liquid increases much less than the volume of the liquid, and hence the volume and length of the bubble become smaller as the volume of the liquid becomes larger. This may be verified by heating the tube; when, as the liquid receives heat and expands, the volume and length of the bubble will be seen to decrease; and also by cooling the tube, when, as the liquid parts with heat and contracts, the bubble will be seen to increase in volume and length. Alcohol expands regularly $\frac{1}{1000}$ for every degree of heat that it receives above 32°, and it contracts with the like regularity for every degree of heat that it parts with below 32°.

In common levels the tubes are used just as they leave the glass-factory. Those having an apparent uniform calibre, perceptible convex curvature lengthways, and smooth interior surface, being selected for the purpose; and after the alcohol or the ether is enclosed in sufficient quantity to form a suitable bubble, the ends are hermetically sealed. Now it is evident that if there be any irregularities in the arc against which the bubble runs, they will be imparted to the bubble,—one end of which will be broader or narrower than the other, and shorter or longer from the zero-point; and in proportion to the irregularities will the ends of the bubble be unequally distant from that point, and will the tangent thereto deviate from horizontality.

Should the bore of the tube be uneven or of irregular curvature, or should the parts on each side of the zero-point not be symmetrical, the ends of the bubble, as they augment or diminish in length by changes of temperature, would not rest exactly equidistant from the zero-point, or mark equal divisions on the scales. The tangent, however, to the zero-point would be horizontal, although the bubble would have an apparent inclination; and therefore, to bring the ends of the bubble to coincide with the equidistant divisions of the scales would be to give the tangent an inclination, and throw the instrument out of adjustment. This results more or less with all unground or defective tubes, and consequently sections plotted, estimates made of works, and works set out and regulated from levels taken or given by such tubes must be in error in proportion to their imperfection.

In levels of precision, especially those employed for astronomical and engineering purposes, the interior surfaces are made truly even and cylindrical, and with a sensible curvature upwards exactly to an arc of a circle, by grinding them with emery-powder and oil or water on steel cylinders, and then polishing them. This process is repeated until the bubbles prove, by turning the tubes end for end on a delicately-adjusted support, to be perfectly symmetrical, or until the ends appear at, or mark precisely equal distances from the middle or zero-point, the tangent to which is then horizontal.

Hence, in the preparation of these tubes the chief objects to be attained are, uniformity of bore, perfection of curvature, and smoothness of surface; and it should be observed, in conclusion, that whatever care and finish are bestowed on the exterior mountings of the tubes, if the interior of the tube itself be imperfect in the above respects, the tangent given by the bubble will not be horizontal. Tubes have been and can be made to indicate a point half a second of a degree from exact horizontality, or within one-hundredth of a foot of horizontality at the distance of one mile. This slight deviation is due, not to the principle of the instrument, but to mechanical defects, from which no instrument, however delicately made, is absolutely free.

JOHN PHILLIPS.

* C'est un instrument où l'air enflé avec quelque liquide fait un niveau, mais qui a ces avantages sur tous ceux dont on s'est servi jusqu'à cette heure.

1. On le trouve plus juste que les autres, car n'y a point de petite inclination qu'il ne passe connaître. 2. Il est ailleurs d'autant plus sûr pour la pratique, que les changements de l'air, le sec, l'humide, et le vent, qui altèrent les autres niveaux, ne peuvent en façon du monde compromettre sa justesse.

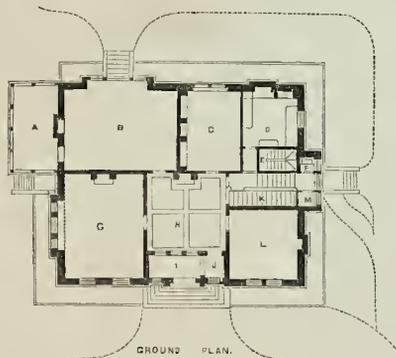

3. Le manège de l'ouvrier n'est point occupé à le tenir lorsqu'il s'en sert. 4. L'on emploie moins de temps à s'en servir, qu'à se servir des niveaux ordinaires; ce qui est fort considérable dans une pratique que les ouvriers sont obligés de recommencer si souvent.

5. La construction en est aussi plus aisée que celle des autres niveaux. On choisit un tuyau de quelque matière transparente; un canon de verre, par exemple, dont les cotés soient parallèles; d'un diamètre qui puisse recevoir le petit doigt, et qui soit environ sept ou huit fois plus long que large. On le forme par un bout, et on y met quelque bague. L'esprit de vin y est fort propre, parce qu'il ne fait point de sédiment, et qu'il ne gèle jamais. On laisse du tuyau environ un peu moins de onde qu'il n'a de diamètre; on le bouche après, ou on le scelle par le lieu.

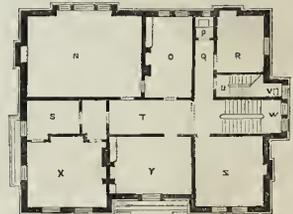

Lorsqu'on s'en sert, et qu'on l'applique sur le plan que l'on veut examiner, l'air qui y est enflé monte aussitôt vers la partie du plan la plus élevée, et demeure sans mouvement lorsque le plan est horizontal, et cela toujours avec la même justesse, quelque temps qu'il jasse.

C'est d'air qui donne l'horizon avec tant de justesse, et étouffe les différents angles, si vous y ajoutez les divisions sur lesquelles il les puisse marquer. — Thévenot, Recueil des Voyages.

"THE QUARRY," SEVENOAKS, KENT.—MR. T. E. KNIGHTLEY, ARCHITECT.

GROUND PLAN.

FIRST FLOOR PLAN.

THE QUARRY, SEVENOAKS.

THE above engravings illustrate a mansion, together with the entrance-lodge, lately erected for Mr. Andrew Swanzy, in one of the most beautiful parts of Sevenoaks, Kent, on the Kippington Estate, adjoining that of Lord Amberst, and situated about four miles from Khole Park. The works were commenced in the autumn of 1867; the materials used being the Fareham red bricks and Ancaster stone.

The almost invariable practice in building a country house is to erect the offices on the ground-floor level, and lateral to the main building, and rightly so: here there are no trees to screen them. This, therefore, together with the slope of the ground (which naturally created a basement), was taken into consideration, and it was consequently determined to utilize the basement. The

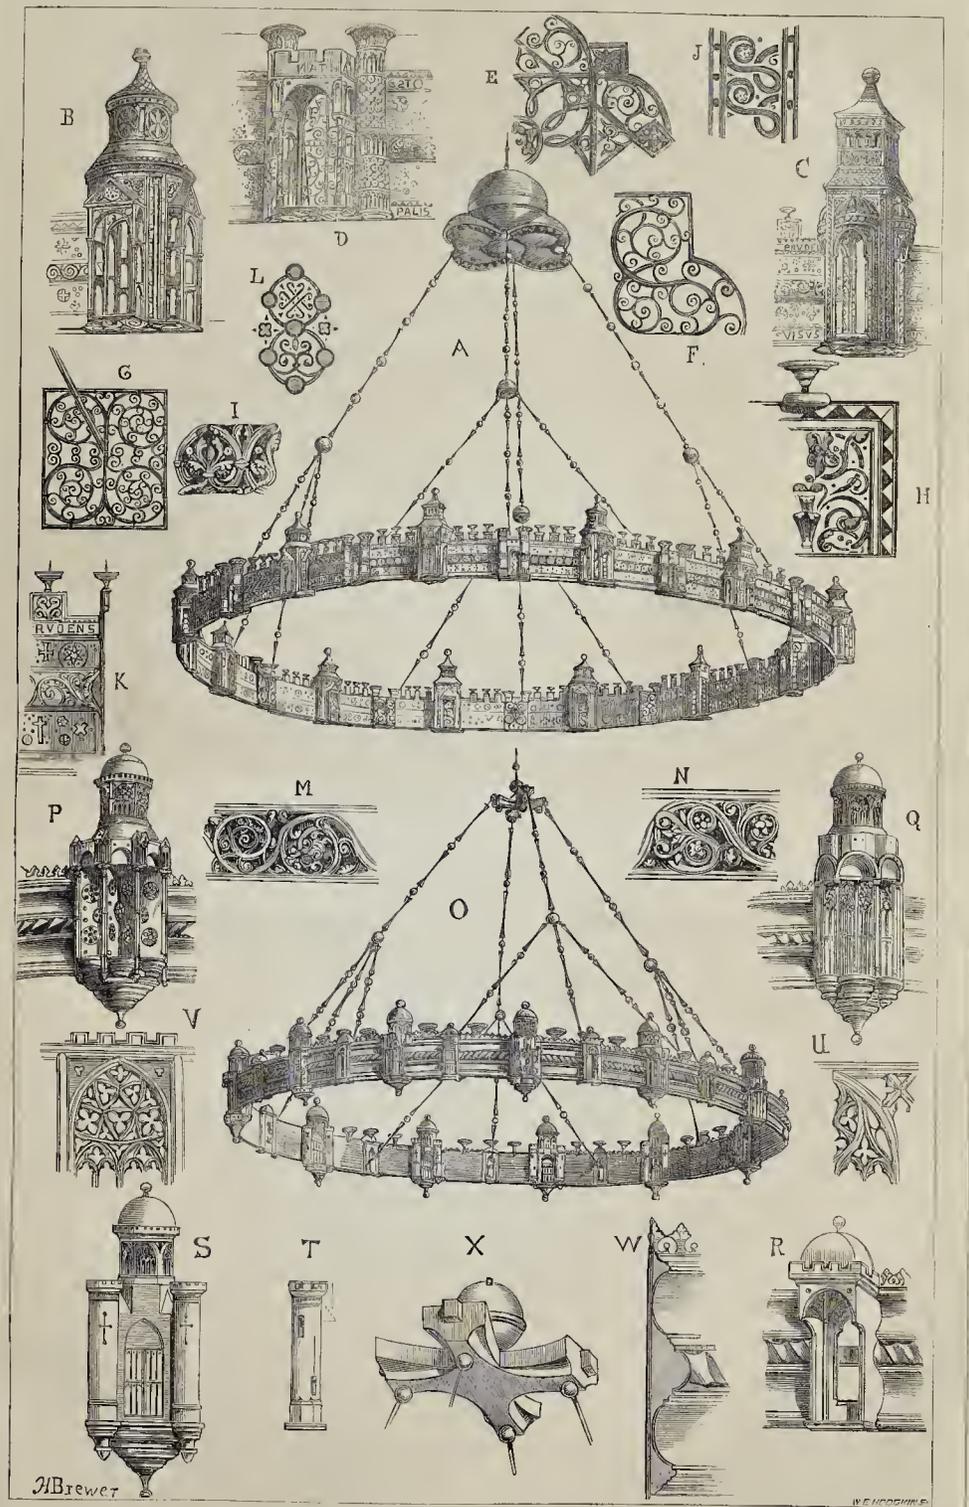

house is surrounded by a broad open walled area and an earthwork terrace beyond, the latter sloping towards the grounds, which, with the new planting, prevent them from being overlooked by the windows of the servants' offices. To prevent the smell of cooking and the heat from the kitchen proving annoying, the dining-room being over the kitchen, a match-boarded false ceiling has been constructed, 10 in. below the ordinary one of plaster, and, by means of air-bricks in the external and cross walls, a current of air is maintained.

The basement contains a servants' hall, large kitchen, a scullery, dairy, store-rooms, &c. On the ground floor are dining and drawing rooms, conservatory, morning-room, and library; and on the upper floors are ten bed-rooms, two dressing-rooms, and a bath-room. Mr. T. F. Knightley was the architect, and Mr. J.

Scott the clerk of the works. The contractor employed was Mr. C. N. Foster, of Whitefriars; the carving being executed from the architect's drawings by Mr. G. Seal, of Walworth. The cost may be considered about 10,000*l*. Not having been able to obtain a scale, we must content ourselves with adding that the house is 56 ft. 6 in. in width and 45 ft. 9 in. in depth.

ANCIENT CORONÆ IN HILDESHEIM CATHEDRAL.

HILDESHEIM.

The town of Hildesheim, in the lately annexed kingdom of Hanover, is situated in the centre of a province of the same name, which was, until the year 1802, the principality and bishoprick of a prince-bishop. The town is of great antiquity, and contains twelve churches, most of which are exceedingly interesting. The population is about half Catholic and half Lutheran, and the churches are divided amongst the two religions as follows:—The Cathedral, the churches of St. Godehard, St. Mary Magdalen, St. Cross, St. Maurice, and the Seminary Church, belong to the Catholics; and those of St. Andrew, St. Lambart, St. James, and St. Michael (except the crypt), belong to the Lutherans. St. Paul's Church is shut up, and St. Martin's used as a museum. The Cathedral, St. Michael's, and St. Godehard's are wonderful specimens of Romanesque church architecture; they are, perhaps, the most perfect examples of the Basilica form existing in North Europe. The Cathedral stands in a kind of close, planted with lime-trees, in the centre of which is an object which at first strikes one as being a model of Trajan's Column at Rome. This remarkable monument is about 14 ft. high, exclusive of the modern base upon which it stands, and is of bronze, ornamented with a series of figures standing upon a spiral curve, representing scenes from the life of Christ. A modern inscription on the base records the fact that this column was made by St. Bernard, Bishop of Hildesheim, in the year 1015.

The cathedral itself is externally rather a mean-looking church, and is not improved by the ground about it being 6 ft. above its original level, so that the building is buried nearly up to the window-sills. The west front has been rebuilt in a most detestable style—a kind of mixture of Romanesque and Third Pointed. There is a large porch called the Paradise before the western door, and another still more important, being nearly 60 ft. deep, leading to the north transept. Upon entering the church one is terribly disappointed, for the whole building has been thoroughly modernized during the last century, when the greatest pains seem to have been taken to convert every feature of the old church into some abomination of the "pig-tail" period. When, however, one has recovered from disgust at the heartlessness and want of taste of the architects and churchmen of the last century, much will be found to interest the architect or antiquary in the Cathedral of Hildesheim. The first objects worthy of attention are the noble bronze doors of the inner western doorway. They are entirely of bronze, 17 ft. high, and about 10 ft. wide. They are contemporary with the column on the Dom-platz, and are also the works of St. Bernard. The left valve is ornamented with eight square panels, separated by a semicircular rib, richly ornamented with foliage. Each panel contains a series of small figures representing scenes from the Old Testament: the right valve contains eight subjects from the New Testament. These little groups, although stiff and thoroughly Byzantine in character, are full of spirit, and have much more action expressed than is usual with works of such an early period.

Hung from the ceiling in the centre of the nave is the superb chandelier or corona represented in our engraving (A). It is composed of silver and copper-gilt, and is 22 ft. in diameter. It is said to have been commenced by St. Bernard; if so, however, little of his work remains, as the detail is evidently late twelfth century. The general design of this remarkable corona is intended to represent the Heavenly Jerusalem, and originally each of the towers, B and C, contained three silver statues, and each of the gates, D, one statue. These statues represented the prophets and apostles. They were, however, stolen by the soldiers of Constantine Adolphus, and so great was the violence used in tearing them down, that the corona now no longer forms a circle, but is a kind of broken horseshoe, and nearly all the towers are out of perpendicular. E, F, and G represent the perforations at the back and base of the towers. L, J, and H are patterns in enamel on various portions of the corona. The enamel is dark green, on a gold ground. I, M, and N are the arabesques upon the centre bar. K is a portion of wall showing the perforated ornament, &c.

The next object which demands our attention is the superb roof-screen. This is an early specimen of Cinque-cenio work, entirely of stone, and covered with the most

delicate and beautiful sculpture. It is divided into five compartments, from the centre of which projects a large pulpit, with a brass eagle for reading the gospel from. The side compartments contain metal gates of very elaborate design, leading into the choir, and low archways leading down to the crypt. The upper portion of the screen consists of a kind of open arcade, upon which is supported the great roof and attendant figures. In front of the screen is a small altar, and on the steps leading up to it is a singular column of red marble, bearing a crown of metalwork for holding candles, of late Romanesque work, and a modern statue. This column is said originally to have borne the statue of the Saxon god Irmen, and it is also related that Charlemagne fought two great battles to obtain possession of it. The choir is exceedingly rich in ancient furniture, and from the roof is suspended the second or smaller corona, represented in our engraving (O). The general design is very similar to the great corona; but it will be seen by the detail that it is the work of a later age, probably the fourteenth century. Like the large corona, it has lost the figures which once adorned it, and is very much beaten out of shape. Of the details, P and Q represent two of the towers; R, one of the gates; S, the back elevation of one of the towers; T, the alternate turrets; U and V, details of upper portions of towers; W, section of wall portion of corona; and X, the pendant. This corona is about 14 ft. in diameter.

On a future occasion we shall continue this description, and give other illustrations of works of art in the cathedral of Hildesheim.

GOOD WORKS IN GUATEMALA.

It may not altogether be uninteresting to many of our readers to hear something of the public improvements that are taking place in so distant a part of the world as Guatemala, the more so in consequence of the loan of 500,000*l.* lately contracted in this country for public improvements, and the resources there are to be found in Guatemala, a wide field for emigration is opened there. With the kind assistance of Don Enagues, Palaces Chargé d'Affaires for Guatemala, and who is one of the munificent friends of the institution we are about to speak of, we are enabled to give a description of the Girls' Orphanage, which is one of the principal benevolent institutions in Guatemala, and for which a proposed chapel is about to be erected at a cost of 3,000*l.* or more, from the designs of Mr. E. W. C. F. Schmidt, architect.

The design is Gothic in style, and well adapted to the site, and the requirements of the above establishment. The interior of the chapel, as Minton's tiles for the flooring, and the coronas, scones, and altar furniture are suitably designed to harmonize with the rest of the building. The orphanage was commenced in November, 1853, with six poor girls, and fifteen dollars collected in charity. To Donna Luz Batres de Aycinena, a member of one of the chief families in Guatemala, is due the honour that the execution of the noble idea of presenting the city with an asylum which now honours the capital, has been thus far carried out. Poor as its origin was, yet in due time it met with such support from the authorities and the public, that, in fifteen years, in November, 1868, the ceremony of removing "the orphanage, now consisting of 120 girls, from a private house to the present now building, which was purchased by the Government at a cost of 20,000 dollars, was celebrated in a manner becoming the occasion." A proof of the liberality of the citizens is given by the establishment being now capable of accommodating 300 girls. At present it is occupied by 120 orphans, maintained at a cost of 400 dollars per month.

The building is in the form of a parallelogram, 473 ft. in length, by 253 ft. in breadth, comprising twenty-eight rooms and seven quadrangles, distributed in such a way that out of 1434.6 square feet 12317.5 are occupied by the building, and by 921.3 ft. of corridors; 16192.7 by the quadrangles, and 14803.3 by the garden, which runs the whole length of the building, and separates it from the surrounding houses, and also gives light and ventilation to the classroom and dormitories. The main building runs north and south, and has on one side a corridor 440 ft. in a straight line, giving access to the temporary chapel (689 ft. in length), to two workrooms 60.6 ft. each, while situated

above is a dormitory 239.3 ft. in length. The refectory, occupying one wing, is 137.6 ft. in length, which has a terrace roof. Adjoining is the laundry. Another of the wings running east and west contains the kitchen, stores, and offices. The two wings divide the premises into three quadrangles, 4,875 ft. square. Parallel to the refectory and adjoining is a gallery covering the laundry, in which is situated the washing-tank, fitted with eleven divisions for washing the linen, containing also hot-water apparatus, hot-water baths, closets, &c., and it has a continuous stream of water running through it. In each quadrangle a fountain is erected, with running water, and in the garden there is a large bathing-tank for the use of the inmates. The establishment is partially maintained by the work of the girls, in washing, making lace, embroidery, and other needlework. Especial care is given in the training of the girls to fit them for domestic servants.

This state also contains a hospital, which relieves yearly 5,000 sick persons gratuitously. Another large public building is occupied by 100 orphan boys and 80 infirm people, amongst whom figures conspicuously an old king's messenger, who formerly rode from Guatemala to Mexico, and who is now at the advanced age of 100 years, and, with the exception of being deaf, in possession of all his faculties.

PENARD CASTLE.

This castle is situated in the southern part of Gower, upon the margin of Oxwich bay, and on a cliff which here forms the left bank of the brook which descends by the two deep valleys of Park-le-Braose and Ilston to reach the sea a few yards below the castle.

The bold abrupt cliff of rock occupied by the castle and indicated by its name, rises about 150 ft. above the water, and, in common with all the east or leeward side of the bay, is capped by a deep deposit of wind-blown sand. This sand, not now in progress, widens out into extensive harrows, parts of which are covered with short but fragrant herbage, while the remainder is arid sand, contrasting sharply with the fertile grass and woodland which occupy the west and more favoured side of the bay.

The castle is an oblong enclosure about 108 ft. east and west by 84 ft. north and south, at its longest and widest. The sides are flattened and the west end rounded. It is composed of a single court or ward, enclosed by a curtain-wall, upon which are the gatehouse and one mural tower.

The gatehouse is, out of proportion, large for the court, and occupies much of the east end. It is rectangular in plan, 40 ft. in front by 23 ft. deep, having two half-round towers, 15 ft. in diameter, between which is the entrance-gate, of 10 ft. opening. The sides and rear are rectangular. The entrance is beneath a flat porch, hacked by the remains of a vaulted roof, in which are the chase and usual grooves for a portcullis. On either side are loops; but the lodge doors, now broken down, were in the rear wall, towards the court. The towers have a basement and a low first and lofty second floor, with three loops outwards, 2 in. broad, and of the unusual length of 6 ft. There are also lateral doors opening upon the curtain. In the centre is the portcullis-chamber, and above it the usual battlement. The floors were of timber, and there do not appear to have been stone stairs. There are no traces of a drawbridge, though the ditch shows one to have existed. The rear parts of this gatehouse are in ruins.

There is one peculiarity about the portcullis worthy of notice. The lateral grooves, about 5 in. square, stop abruptly about 2 ft. below the spring of the arch, and 6 ft. above the sill, so that the grate must either have remained suspended at the upper level, which is improbable, or have been constructed with two shoulders, so that the lower 6 ft. would be about 8 in. narrower than the upper part, and be deprived of the steadiness given by lateral grooves. It does not appear from the ruinous state of the entrance what other defences existed besides this one portcullis. The gatehouse is not in the centre of the end, but has 12 ft. of curtain on its south wing, and 30 ft. on its north.

The curtain is about 3 ft. 6 in. thick, and 20 ft. high, within, to the rampart wall. The battlement is of unusual height, about 3 ft., so that the wall outside is at least 28 ft. high. The embrasures are far apart, the merlons being very broad, and some of them are pierced by a loop.

This curtain remains tolerably perfect from the gatehouse along the north side, and round the north-west corner. A short piece also remains on the south side. The rest is gone. On the curtain, near the north-west end, is the solar mural tower, half round, about 12 ft. diameter outside, and closed by the curtain, in which is the door. The upper floor was open in the rear, and entered from the rampart wall. There was no stone stair, and the roof was of timber.

Close east of this tower, in the curtain, is a small high recess with a segmental arch. There is a wardrobe on the inner ground level. Its place is marked on the exterior by a flat pilaster buttress, in which is the shoot, opening at the foot of the wall. It is probable that a second shoot descended from the ramparts.

Outside and against the north-west corner of the curtain has been added a rectangular building, 18 ft. deep and 20 ft. broad within, with walls 3 ft. thick. This is of one floor of less height than the adjacent ramparts, and it had two large windows, one to the south and one to the west. In another position it might have been a chapel. It was probably some kind of hall, added when the country was at peace, though its position on the cliff would render it moderately secure.

The castle on the north and west faces is protected by a steep cliff. Towards the south and east was a ditch, now partially filled up by sand. There were probably lean-to dwellings round the court, in one place indicated by a loop. There are, however, no remains of buildings.

The material is the quartz conglomerate known as millstone grit. The workmanship is a very inferior rubble, only partially coursed. There is no trace of ashlar in the place, and, excepting over the entrance, probably never was any. This castle has no history, and enjoys the rare, if not singular, distinction of having been omitted in the Ordnance Survey of the district. Its general plan, and such details as remain, refer it to the reigns of Henry III. or Edward I., probably the former.

About 100 yards south-east of the castle, near other foundations, are the remains of the ancient parish church of Penard, now *Consumptum per Sabudonem*. This was composed of a nave 45 ft. by 20 ft. within, with walls 2 ft. 6 in. thick, and a chancel 20 ft. by 15 ft., in the broken-down walls of which are traceable a south window, with a deep splay and a 2 ft. opening, and a cavity for a piscina. The piers of the chancel arch were thick, with a narrow opening, and probably Norman. On the outside of the north pier is a thickening of the wall. Of the nave only the foundations remain, save of the west wall, which is tolerably perfect, showing the usual putlog bores, and the gap for a moderate west window.

Penman Church, in the adjoining parish, has in like manner been swallowed up and deserted, as here, for a later building, placed out of the reach of the sand. C.

MISTAKES IN TENDERS.

IN the Vice-Chancellor Sturt's Court, on Monday, May 24, the case of Neill v. The Midland Railway Company was tried.

This was a demurrer. The facts, as stated in the bill were these:—

In January, 1866, the Midland Railway Company advertised for tenders for the erection of certain buildings on their premises at Leeds, and at the same time they issued a form of tender with a schedule of quantities for the intended works. Shortly after the date of the advertisement, the plaintiff, James Neill, a contractor residing at Bradford, applied for a form of tender and schedule, which, having been sent to him, he filled up and returned to the defendants.

An agreement was entered into between the parties, and soon after its date the plaintiff began to erect the works, but, before their completion, disputes arose between him and the defendants as to the execution. An arrangement was then entered into that the defendants should complete so much of the works as remained unfinished, and charge the plaintiff with the cost.

The plaintiff, in filling up the schedule of quantities annexed to his tender, had inserted after each item what he considered would be the total amount of the cost in reference to the item. In calculating these amounts, however, he had inadvertently made several mistakes, some in favour of himself, and others in favour of the defendants. In one instance he had stated that

5,086 yards of concrete at 5s. per yard would amount to 55l. 19s. 2d. instead of 1,271l. 10s. In another he had set down 1,374 yards of concrete at 5s. per yard as amounting to 44l. 3s. 6d. instead of 493l. 10s. The result of these various mistakes was, that there was a balance of about 1,881l. 0s. 2d. too little.

The plaintiff alleged that the defendants' architect and engineer, or one of them, either before or immediately after the date of the agreement, knew of the mistakes; that he himself did not discover them till November 1868, when he immediately applied to the defendants to have them rectified; but this they refused to do, and insisted that he was only entitled to the sums mentioned in the agreement.

Thereupon the plaintiff filed his bill, praying that the schedule of quantities might be rectified.

In support of the demurrer it was contended that the Court had no power to relieve persons from the consequences of their own negligence. The plaintiff had offered to do the work for a certain gross sum, and on the faith of that offer his tender was accepted by the defendants. The agreement was binding on both parties. Plaintiff's allegation that the defendants' architect and engineer knew of the alleged mistakes was unsupported by evidence. They referred to *Wason v. Wareing*, 15 Beav. 161; *Story's Eq. Jur.*, s. 146, *et seq.*

The Vice-Chancellor said,—There is no pretence for this demurrer. It is the ordinary and well-established practice of this Court to grant relief in cases arising out of mistake. In the present instance the mistake is so palpable that it appears to me strange that the defendants should wish to take advantage of it. The demurrer must be overruled with costs.

A BUILDING ON CHAT MOSS.

THE 3rd Manchester Regiment of Volunteers have recently erected a new building at the shooting range, about eight miles from Manchester, and near Worsley Hall, and which is upon a portion of Chat Moss, noted as having presented one of the earliest and most formidable difficulties in railway engineering. Where the building is erected the moss was found to be 22 ft. deep, necessitating the use of piles, and upon these the pavilion was erected in the fifteenth-century style of timbered houses, of which so many good examples are found in this and the adjoining county of Chester. The style has the advantage of making the superstructure much lighter than a building constructed wholly of brick would have been. It is planned in four distinct compartments, forming quarters for officers, non-commissioned officers, members, and a cottage, with store-rooms and other conveniences, for the range-keeper, all having connexion with the bar. The officers' mess-room has an open roof exposing the timbers, and these, with other woodwork, are stained and varnished. In the upper portion of the tower are the prospect and smoking-room, and from which the officer in charge of the range has a perfect view over the ground. It is surmounted by a staff on which the flag denoting firing is hoisted. On the vergeboard of the centre gables is carved the motto adopted by the Volunteers of Great Britain—"Defence, not defiance." The building was designed and superintended by an officer of the regiment, Ensign Redford, architect.

OPENING OF A NEW IRON PROMENADE PIER AT DOUGLAS.

THE new iron promenade pier at Douglas, Isle of Man, has been opened with much *clat*, the ceremony of christening the pier being performed by Mrs. Loch, wife to his Excellency H. B. Loch, C.B., Lieutenant-Governor of the island. The pier runs up 1,000 ft. from the end of the present promenade, and at the outer end it is 35 ft. high, and in about 22 ft. of water at high water of ordinary spring tides. The pier is a light iron structure, similar in construction, but on a much smaller scale, to that at New Brighton, and is 1,000 ft. in length, and 16 ft. in width. The quantity of iron used in its construction was 301 tons, and of timber 5,000 cubic feet. It is supported by 76 piles, placed at intervals of about 14 ft. The principal entrance to the pier is from the shore road, and will be reached by means of a flight of broad stone steps, which will shortly be constructed. There are, however, two side entrances

from the promenade by means of a curved ascent. The pay-house, with entrance-gates, &c., is in the style of a Chinese pagoda. Each person passes through a turn-stile, which will only move by the pay-taker placing his foot upon a plate inside, and every time he does so it registers, thus keeping a check upon the amount of money received. The railings and posts along the pier are painted in variegated colours, and seats are placed at each side of the pier, and at the outer head a pier-head has been formed. This pier-head is 90 ft. by 40 ft., with a flight of iron steps leading down to a landing-place for small boats. There is also a refreshment-house erected here, with a flat roof, on which a band can be stationed. The engineer and contractor for the pier was Mr. John Dixon, of London; and the resident engineer by whom the work was carried out was his brother, Mr. Wayman Dixon. The contract was for 6,000l., or about 6l. per foot, and the work has been carried out for the estimate. Mr. John Dixon is engineer for the steam landing-stages in connexion with the Thames Embankment, and also for the extension of the Southport pier. The pier has been put to the tramp test, as a large body of the Douglas Artillery passed over it in military order. No shake or oscillation took place.

ARCHAEOLOGICAL EXCURSIONS.

The Sussex Archaeological Society.—The annual general meeting of this society was held at West Grinstead. With the exception of the parish church, there is very little in this parish to interest the archaeologist; but the park, belonging to Sir Percy Burrell, presents some beautiful scenery, and the society were favoured with delightful weather. Steyning Church was visited, and the Rev. T. R. Turner read a paper by his father, the Rev. E. Turner, of Maresfield, on the subject. Many of the visitors then went to the vicarage to see the carved wainscots there. West Grinstead Church was then examined, and the house and park, with the old oaks, under which Pope sat about the time when he wrote the "Rape of the Lock," were visited, as also the parsonage house and the ruins of Knepp Castle, a paper on which was read. After seeing the Shipley reliquary, the members proceeded to their large marquee in the grounds of Knepp, where the business meeting was held, followed by the usual repast, the Rev. E. Turner, chairman of the committee, in the chair.

Cambrian Archaeological Association.—The last excursion of this Association for the season has taken place. The party went first to Laleston Church, and then to the church at Newton Nottage, Mandlam Church, Kenfig, and Margam Abbey, where they had luncheon in the oratory with the Lord Lieutenant of the County, Mr. C. R. M. Talbot, M.P. Afterwards they went through the grounds, and Mr. Freeman gave a description of the building. A business meeting was held in the evening.

Stafford Architectural and Archaeological Society.—There has been an excursion of this society to Haddon Hall. In the old banquet-hall there were two papers read, the first by the president, the Rev. J. Stacey, giving an account of the early history of the place, which was followed by Mr. J. D. Webster showing its character and arrangement compared with buildings of earlier and later date. After partaking of tea at Bakewell, resolutions were passed deciding to have the *conversazione* in the autumn, and appointing a sub-committee to make the necessary arrangements.

DRAINAGE, RAILWAYS, AND SMOKE.

SIR,—Your last number is an interesting one. From page 669 I am glad to learn that they are about to erect a large water-wheel at Windsor falls (Eton side). I suggested it in the *Builder* some months ago. In the same column, Herr E. Kröjsey is mentioned as the inventor of a new system of signalling from train to train while running or standing on the line, by transmitting electricity along the iron rails. Perhaps you, sir, may remember a letter of mine on the above precisely. I hope the present promoters may carry it out.

Smoke-town fumes down trillion of blacks;
Millions of chimneys, millions of stacks;
Thousands languishing amidst the smoke,
Hundreds eye-simmer'd, and some quite choked.
One will arise and remedy bring—
Laud and reward him, genius slog;
A clear blue sky, the free air pure,
Honour to him who'll work the cure.

R. T.

ARCHITECTS' WRONGS AND RIGHTS.

"An Architect" writes.—"A builder, who is now carrying out a building from my drawings, has actually copied my plans in every respect for a client of his, and is now building the very house not a quarter of a mile from the one he is carrying out from my designs. This is very annoying. Can I not make him pay me the commission on the amount of his contract, inasmuch as the house is exactly the type of my plans?"

Some one or two of my clients have made a call for the plans and specification, and conditions of contract that I have carried out for them; and I have told them, in justice to the profession, that they belong to me, and have refused to deliver them up. Have I not acted rightly in doing so?"

By the custom of the profession, and the printed Declaration of the Royal Institute of Architects, the drawings and specification belong to the architect. As to the shameful theft of his design complained of by our correspondent, this law is in so had a state, that the case would have to be looked into very carefully before it could be said a remedy did or did not exist. If our correspondent will send the name of the builder who has given this extra publicity to his design, we will print it, so that at any rate other architects may know what builder to employ when they desire a similar result.

ARCHITECTS' CHARGES.

You will oblige by inserting the accompanying brief reports from the Dublin papers of two arbitrations recently held, in which I was concerned, and in which the rates of charge set forth in the Institute scale have been recovered. It is undoubted that in both these cases the opposition was grounded on the indecisive result of an important case tried in Dublin last year, in which two architects, one a member of the Institute, appeared and gave evidence directly contrary to the Institute scale. On this account I was given to understand that as these charges were thus publicly contradicted by members of the body who published them, they would not be recognised. However, as I was determined to bring matters to a proper issue, notwithstanding this, and the certainty that the same architects were ready to do the same again, my opponents gave way, and reluctantly consented to arbitration under orders of Court, but resorted, as a last device for evading payment, to the expedient of trumping up counter claims against me for damages for real or fancied defects in the work. These, as you will see, were soon exploded, and verdicts given in my favour for nearly the full amount in both cases, carrying with them costs against the opposite parties, amounting, in one instance, to three or four times the amount in dispute.

These cases will, I think, serve to show the mischief that the architects who gave evidence against the rates of charge now generally adopted throughout the profession have done, not only to the profession, but to the public, setting them by the ears on questions on which there ought to be no room for difference of opinion. However, though it is no satisfaction to me to have to go through these contests and multiply my opponents in enormous costs, it is some satisfaction to have decisions given in accordance with the principles contended for, and which I hope will form useful precedents, and prevent litigation on the same subject in future.

W. FOGERTY.

An Arbitration Room, Four Courts, Dublin, August 16-17.—Fogerty v. Hasleton & Others, Hasleton & Others v. Fogerty.—These cases, which came on for trial after sittings in the Court of Queen's Bench, and were ordered by Mr. Justice George to be referred to arbitration, have just been decided by the arbitrators, Messrs. John Shillbroke, Samuel Lloyd, and John McCarty. The first action was brought by Mr. William Fogerty, architect, of Harcourt-street, to recover his fees for the design and superintendence of the new warehouses of Messrs. Hasleton & Co., drapers, in Henry-street. His claim was for 5 per cent., on the total cost, nearly 8,000*l.*, and sundry incidental charges as per scale of the Institute of Architects. Of the 25*l.* had been tendered by the Messrs. Hasleton lodge nothing in Court, pleading that no work was done. The second action was a cross claim for damages, laid at 300*l.*, brought by Messrs. Hasleton & Co. against the architect for alleged negligence in overseeing the work, in consequence of which the builder (Mr. Michael Meade) had been allowed to execute the plastering in an improper manner. The architect denied the negligence, and filed a special defence that he had, under the contract, withheld his certificate from the builder, and employed another builder to remedy the defects, and that while doing so Messrs. Hasleton & Co. had entered into an arbitration with Mr. Meade on the subject of the alleged defects, which had not as yet been adjudicated upon; also, that he had been at

all times ready and willing to direct the remedy of said defects, but was prevented by plaintiffs; and that the said defects were not of the nature and extent alleged. After examining numerous witnesses on both sides, and viewing the premises, the arbitrators awarded to the architect in the first action the sum of 150*l.* beyond the amount paid, making 453*l.* in all. In the second action they found that Messrs. Hasleton & Co. were not entitled to any compensation from the architect. The costs of both actions and of the arbitration, to follow the award, and be paid by Messrs. Hasleton & Co.

The New Wesleyan College, Belfast.—An important arbitration was held recently at the rooms of the Church of England Young Men's Association, Belfast, between the committee of the above college and their architect, Mr. Wm. Fogerty. The result has just been declared. It appeared that the committee of the college having, in the year 1864, invited a limited number of architects to submit designs for the building, the design of Mr. Fogerty was selected, and the work has been since carried out under his direction, at a cost of about 16,000*l.* His claim amounted to somewhat over 1,000*l.*, out of which 550*l.* had been paid during the progress of the work. It was made up of the usual commission of 5 per cent., travelling expenses, and other items, in accordance with the scale of charges of the Institute of Architects. This the committee refused to recognise, alleging it to be excessive, and the matter having been referred, by mutual consent, to Sir Charles Lynton, the committee also brought forward several counter claims against the architect for alleged delay, and defects in the work. The matter having been carefully investigated, and the building examined by the arbitrator, he awarded the total sum of 840*l.* to the architect, the balance of which he is to pay him after giving credit only for the sum paid on account.

TILES.

Sir,—Will any of your correspondents inform me whether ribs (formed on the tile) to hang on the lath, or holes in the tiles for nail or pins, are best when flat faces or tiles are used for roofing?
If holes, whether cast-iron pins, to hang over the lath, or copper or iron nails, to drive into the lath as they are used for slates, D. D.

THIN GLASS.

Sir,—I am the father of a small family, occupying a new house near Finsbury Park, rent 63*l.*, purchase 80*l.* Most of the windows are glazed in four large squares, with glass so very thin and brittle that it affords no protection from weather, and leads to daily breaking—a most expensive item on my purse. I see by your advertising pages that sheet glass is very cheap. Cannot you persuade builders to use something stronger, to save tenants' pockets (rents are dear enough) and injury, by constant knocking out, to the widow sashes? 23 Ounces.

A BUILDER'S "PLANT."

THIS is at present in the possession of Mr. George Terry, a builder in Clerkenwell, says the *Gardener's Magazine*.—

"A most remarkable plant, for which the owner has refused considerable sums of money. It is about the size of an ordinary gooseberry bush, and, although living and growing, bears no semblance of vitality. It has no foliage, but little pieces of flint bud out of the twigs and stems, which are likewise encircled with rings of flint at every joint. In some places the flint, which it appears, has exuded from the plant itself, causes the stems like a pipe. The plant looks black and dead, but the twigs, instead of being brittle like dead wood, are tough as leather thongs. It has been suggested that the flint, which forms so large a component of plant life, has, by some freak of nature, been extruded in this case from the natural vesicles of the plant, and developed outwardly instead. Several men from various public institutions and learned bodies have inspected this phenomenon, but without arriving at any conclusion respecting it beyond its indubitable singularity."

The "plant" here referred to is simply a large arm of black branched coral, the pieces of "flint" exuding from it are sea-shells naturally embedded in the coral; as to its living and growing, that is a mere invention, as it has not grown since it came out of the bottom of the sea. So far from its being the truth that scientific men can come to no conclusion regarding it, its true nature has been fully explained to the proprietor by competent persons; amongst others, by a gentleman attached to this paper.

The owner keeps it well watered in a large flower-pot, but he cannot be induced to turn it out, and thus expose the stump of the coral.

MARGATE CESSPOOLS.

Sir,—I have recently spent a fortnight at Margate, to which town thousands of Londoners flock, by steamboat and rail, during the summer, to endeavour to benefit their health. But, to my surprise, instead of a well-drained town, I found the most reeking cesspools abounded. In the higher part of the town, adjacent to Hawley-square, the houses have W.C.s built over these stagnating abominations; and the wonder is that fever and diarrhoea do not more prevail. Diarrhoea was the common complaint. On the road leading to the country, I was hurried to go over one of the new houses just finished, and the proprietor, who accompanied me, after

pointing out the advantage of two W.C.s, in reply to my inquiry as to drains, said, "Oh! there is a cesspool. The chalk is so porous that nothing more is required. If the contents were not emptied for twenty years, there would not be a husel of refuse!" When such is the opinion of the builders of the present day, what sanitary arrangement can be expected in the houses of the past?

Another advantage (?) pointed out was a small room in the upper part of the house without a fireplace, "which would just suit a servant!" *Punch* recently showed a sleeping-place in a cellar, but then it was only for a servant!
VISITOR.

ST. CATHERINE'S, BREDA.

The new church of St. Catharine, at Breda, in Holland, was opened with much pomp and splendour on Wednesday, August 11th. The church, which is the largest that has been erected in Holland since the Reformation, is of noble proportions, and consists of a nave, with double aisles on either side, large transepts, and a long and spacious choir. There is a central lantern, and we believe it is proposed eventually to erect towers at the west end. The whole church is vaulted, and there is a large triforium over the nave aisles, which serves the purposes of a gallery, likewise vaulted. We believe that the church is to be used as the cathedral for the Roman Catholic diocese of Breda. The architect of the building is Mr. Cuyppers, who has also just completed a fine church at Eindhoven.

CHURCH-BUILDING NEWS.

Warwick (Cumberland).—The parish church, which has during the last two or three months been partly rebuilt and repaired, has been reopened for divine service. The north wall has been rebuilt from the foundations, and the south wall from the window-sills. On the north side a vestry has been added. At the west end a temporary porch of brick has been erected. The roof has been replaced by a new one of slate and finished stone. The material used is red sandstone, which matches that of which the old walls were composed. Within, a new chancel arch has been substituted for the old one. It is formed of multi-circular pillars, with small floral designs round the capitals, and a carved stone face at each side. An old Norman arch in the west end, which has until now been closed up, has been opened out. The windows are double lancet, the glass being parti-coloured, and each window surrounded by a rim of coloured glass. The circular apse at the east end has not been interfered with, except so far as regards the replacing of the roof. It is lighted only by one small window of stained glass at the east end. The church has been re-seated with varnished open seats.

Waltham.—The church here has been re-opened. The new church has been built from plans by Mr. G. E. Street, of London. Mr. R. Silver, of Maidenhead, was the builder. The church, except the chancel and mortuary chapel, has been entirely rebuilt. The original Norman and Early English character of the building has been preserved. A north aisle has been added in addition to a tower with staircase turret at the north-west angle. The tower is opened into the church by a stone arch, and the ground ceiling under the floor of the ringing-chamber, and is lighted by a three-light window. The aisle is separated from the nave by an arcade of two arches on circular columns with carved caps. The floor throughout is laid with Godwin's tiles, and the chancel floor is laid with encaustic tiles inlaid with marble. The church is fitted with open seats of slightly stained deal, and the stalls in the chancel are of oak with carved poppy-heads. The pulpit is of stone, with Norman arches, and is circular in shape. On the south side of the chancel is the mortuary chapel, which has been restored to its original and Early Decorated character by Mr. C. Ellis, of Waltham Place. It is fitted with oak stalls and deal seats. On removing the colouring from the chancel walls, a mural painting, covering the whole of the surface, was discovered; and on taking down the walls of the old tower a group of carved alabaster figures was found embedded in the wall. These figures, it is supposed, formed part of the retables of the ancient church. Two stained-glass windows have been placed in the south aisle, in memory of the late Dr. Vanisart and his daughter. The subjects are "The Good Shepherd" and "The Sower." Mr. Wales, of

Newcastle, was the artist. There is a two-light window in the south aisle, by Mr. R. Silver, in memory of his mother and sister. The subjects are "The Baptism of Christ," and "Suffer little children to come unto Me." These windows were executed by Messrs. Clayton & Bell, and designed by Mr. Street. The whole of the iron work has been carried out by Mr. Leaver, of Maidenhead. The five bells will be recast by Messrs. Warner & Son, of London. The porch is built of old oak. The Communion cloth was designed by Mr. Street. Upwards of 1,000*l.* are still required to clear off the expenses incurred.

Udale.—The new church at Udale has been consecrated. It has been erected at the cost of the late Professor Cape, of Addiscombe College, Croydon, whose wishes have been carried out by Mr. Canon Cape and Miss Cape, of Peterborough. The church, which is seated on a slight eminence at the end of the village, is of the Decorated style of architecture, and is terminated by a tapering spire. It stands in a walled enclosure, and contains accommodation for 150 persons. It was built by Mr. Sheffield, after the design of Mr. Grayson. Immediately above the altar is a stained-glass window, the centre compartment of which represents the Crucifixion, while the miracles of Peter are depicted on the other portions.

Wootton Bassett.—The trustees of Sir Henry Meux, bart., at this place, have recently been granted permission by the Lord Chancellor to expend the sum of 5,000*l.* in the restoration and enlargement of the parish church. This sum will enable the architect, Mr. Street, to place painted glass in one or more of the windows. The trustees approve of the site for a burial ground, selected by the ratepayers. It is said that the owner of some property near this place, and who objected to it, has withdrawn his opposition.

Hawden.—The parish church is being restored. The cracked bells have been sent away to be recast, the whitewashed altar-screen is being restored, and the organ has been removed and repaired. The pews and woodwork have shared in the work of restoration. There is still a further sum of money required, but everything necessary to be done to complete the restoration can be accomplished for less than 1,000*l.*

Maidstone.—The temporary iron church which has for a long time done duty for this district, is shortly to be superseded by a more substantial structure. 820*l.* have already been promised by various church-building societies, and the work will be commenced as soon as sufficient funds are provided. Designs have been submitted by several architects, and one prepared by Mr. E. W. Stephens has been selected. The plan consists of nave, apse, chancel aisles, tower at angles, vestry, &c., in the Decorated style. The interior will have an arcade of five bays and range of clerestory lights, an open timber roof, chancel arch, and chancel, the latter formed for coloured decorations, both upon the roof and around the walls. The church is to be built of redstone, with Bath stone dressings, and at the south-west angle a tower, 150 ft. high, is to be erected. The tower is to be apart from the angle of the nave.

Handsworth.—The chancel of the parish church, which has suffered even more from the hands of modern church builders and renovators than from the decay of old age, is about to undergo a restoration at the hands of Messrs. M. E. Hatfield & Son, architects. The works comprise, amongst others, a new roof of the original steep pitch, of English oak, carved and moulded rafters, the removal of the modern debased windows in the south wall (which are to be reconstructed in a style conformable with the old architecture), and a new chancel arch. The stonework will be cleaned and repaired. These various alterations have a good authority in an old drawing taken about forty years ago by the late Mr. J. Hibberd, showing the then existing state of Handsworth Church; and this drawing has been a guide to the architects in the identification of various old features in the building. The works have been let to Messrs. Greenwood & Son, masons, Handsworth Woodhouse, and J. Hayball, joiner, &c., Sheffield, in the commencement has already been made, and the course of which a double sedilia of thirteenth century date, with a piscina, hagioscope, and other matters of interest, have been brought to light. The Norfolk Chantry will be opened out and seated with open oak benches, and in the chancel are to be oak choir seats and fittings of a suitable character. The church dates from early in the thirteenth century.

DISSENTING CHURCH-BUILDING NEWS.

Nottingham.—The General Baptist Chapel in Broad-street has been re-opened after having undergone considerable alteration and improvement. The seats were narrow and uncomfortable, and the gallery objectionable for several reasons. In addition to this there was no place in which to erect an organ, and these things, rather than the actual want of room, induced efforts to be made to entirely renovate and alter the building. The sum of 1,100*l.* was raised by the congregation, and the work was at once commenced, Messrs. Booker, of Short Hill, being the architects, and Messrs. Ellis & Son, the builders. The actual number of sittings has not been increased, but the area of the place has been extended. A new front in the Italian style of architecture has been built nearer the street, the seats have been improved, and the gallery made more commodious. The ventilation has also been made better. At the far end, behind the pulpit, an organ has been erected by Messrs. Lloyd & Dudgeon, on each side of which the singers are arranged. The organ will cost about 200*l.* The entire expense of the whole alterations, including the organ, will be about 1,600*l.*

Camelford.—The foundation-stone of a new Wesleyan chapel has been laid at the old Duloboy slate quarries, by Mr. John Allen, of Ivy-bridge. The present edifice which was erected in 1808, and enlarged about the year 1850, has now become too small, but it will be kept for the use of a flourishing Sunday school. The builders are Messrs. Hitchins & Pannell. The interior dimensions are, 54 ft. in length, and 31 ft. in breadth, and accommodation will be provided for about 275 persons. The entire cost is estimated to be from 600*l.* to 650*l.*

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Petworth.—A new church in Burton Park, has been opened for divine service. The church, which is dedicated to St. Anthony and St. George, is in the Transition style of architecture, and the total cost is stated at about 3,000*l.* On either side of the inner doorways there are ambreys, the porch itself being lighted by windows of peculiar construction, and fitted up with Caen stone benches or seats. In the gable of the porch are canopies, containing statues of the patron saints, and it is surmounted with a foliated cross. The slender columns that support the arcading of the nave are four in number, the arches being of Caen stone, with moulded caps and bosses. There is also a moulded arch carrying the organ-loft, and another of a similar character over the font. The chancel arch is supported by columns of polished Devonshire marble, with carved capitals representing the passion-flower and lily, and angels bearing scrolls. The roof of the nave is of Memel wood, stained and varnished. It is supported by trusses standing on corbels, the family arms and other heraldry being carved upon it. The roof of the aisle is of a richer character, with braces and wall-posts springing from moulded corbels. The chancel roof (as is the case in the Lady Chapel) is moulded and formed into panels and closely boarded. The floor and altar-space are paved with Minton's encaustic tiles. The altar was the gift of Mr. Morley, the steward of the Burton estate, the cost being 500*l.* In the recesses the sculptures represent the adoration of the Lamb, St. Anthony, and St. George. It is built of Caen stone, and was the work of Messrs. Farmer & Co., of London. The seats in the nave and aisles are open, and are made of deal stained and varnished. From the chancel and aisle are arched openings leading into the Lady Chapel, which is fitted up with altar, &c., and is lighted by a three and two-light tracery window, and finished with foliated cross on gable. Under the chancel is the family vault of the Biddalps, and above the chancel arch rises the bell-turret, containing two bells, and surmounted by a finial of brass. There is also a finial at the apex of the apse roof of chancel. The roof of the whole edifice is covered with brown tiles, and the ridges (which are from a new design) are of colour which blends with the other. The east window is composed of five lights, with a tracery head, under which are two moulded quatrefoil windows, and above a carved stone cross may be seen. The nave has three pointed and deeply moulded windows on the south side, and the aisle has two two-light on the north side, and a two-light window in the eastern end. The chancel is lighted by one double and

three single windows with tracery heads, and all the corbels spring from carved bosses. The whole of the glazing is done with Hartley's thick rolled glass, with coloured borders and panels, and devices. Hayden's patent apparatus is used to warm the building, the furnaces being under the sacristy. The walls of the edifice are faced with stone obtained from a quarry on the estate, and laid in random courses. The architect was Mr. Gilbert R. Blount, of London; and the builder Mr. John Ellis, of Chichester.

SCHOOL-BUILDING NEWS.

Newbury.—A new infant school has been erected, in connexion with the Roman Catholic Church of St. Joseph, London-road, at the cost of the Rev. F. E. Riley. The schoolroom, which is 35ft. by 17 ft. 6 in., has an open timbered roof of stained deal, plastered between the rafters. The walls are built of local red and grey bricks. The roof is slated, and has a red ridge cresting. The whole of the works have been carried out by Mr. S. Elliott, builder, from the plans and under the superintendance of Mr. J. H. Money, architect.

STAINED GLASS.

St. Peter's, Newcastle.—A memorial window of three lights has been erected in the north aisle of St. Peter's Church, Newcastle-on-Tyne, in memory of the late John Unthank and his wife. The subjects are—"The Agony in the Garden," "Christ and Mary in the Garden," and "The Three Marys at the Tomb." In the lower part types of the Great Sacrifice are introduced; viz., "Moses Lifting up the Brazen Serpent;" "Slaying the Paschal Lamb;" and "Sacrifice of Isaac." The tracery is filled with archangels. The window is of the Decorated period, and the groups are surmounted by foliated canopies. It was designed and executed by Mr. Bagley, of Newcastle. There are sixteen windows of stained glass in this church.

St. John's, Wainesbury.—A painted window, to the memory of the late Mr. Ambrose Lees, has just been placed in this church by Mr. Thomas Bill, the people's warden. The window is similar to the others in the south aisle, is in two compartments, and intended to form a companion window to the one given by Mr. R. Williams. The subject of the new window is the declaration of the Angel to the three women at the sepulchre, telling that Christ was not there, but had risen. The artists were Messrs. Ward & Hughes, of London.

Banbury Church.—This church has been enriched by the addition of another stained-glass window, which has been placed there by the Vicar, the Rev. H. Buck, to the memory of his father. In the upper portion is the calling of St. Peter, encircled with the text, "Follow me and I will make you Fishers of Men." The centre compartment is Christ's Sermon on the Mount, with the text, "He opened his mouth and taught them." In the lower one is Christ healing the sick of the palsy,—"He said unto the sick of the palsy, Son, thy sins be forgiven thee." At the bottom, in the left-hand corner, is the crest and coat of arms of the deceased gentleman; and in the right is an ornamental circle with the words, "Via Tria, Via Tuta," centred with the monogram, "H.B." It has a border, with a groundwork of orange trees in leaf bearing. The window is from the firm of Heaton, Butler, & Bayne, of London, the same firm who did the decorations of the church and the stained-glass windows already erected.

St. Augustine's, Birmingham.—Five windows have just been completed by Messrs. Hardman & Powell for this church, at the cost of a few members of the congregation. Lightho St. Augustine's had only one stained window, erected by the firm already named, in the centre of the apse. By the additions just made the number of pictorial windows is raised to six, and the chancel lighting completed. The series which may be described as illustrating the history of our Lord, commences on the north side of the edifice, with the incident of the Agony in the Garden. In the dexter or right-hand light our Lord is represented kneeling in prayer, whilst below sleeps St. Peter, his hand on his sword, as if engaged even in dreams in defending his Divine Master. In the companion light appears the figure of the Ministering Angel, presenting the figurative cup alluded to in the prayer of our Lord. St. John and St. James are

seen peacefully sleeping below. In the second window is pictured the Procession of the Cross. In the adjoining light the three Marys and St. John are seen mournfully following the procession, whilst a number of Jews issue from the city gate in the background. The third window, illustrating the subject of the Crucifixion, is the one previously erected in the centre of the apse. The fourth window represents the sepulchre in which our Lord's body is entombed. Window number five depicts the Resurrection. In the dexter light our Lord is shown, rising in glory from the tomb, bearing aloft the cross and banner of Victory. In the adjoining division, beneath and beside the tomb in the companion light, the guards recoil in terror and amazement from the prodigy, whilst two angelic witnesses descend from above. The Ascension is the subject of the sixth and last window. In the tracery, over the third and fifth windows of the series, are inserted the symbols of the Lamb and the Pelican, typical of our Lord and His Passion. The glass employed is from the works chiefly of Messrs. Chance Brothers & Co. The designs for the whole were by Mr. John Powell, of the firm of Hardman & Powell. In addition to the works described, Messrs. Hardman are engaged upon the manufacture of a brass altar railing, which is being presented to the church by Mr. Joseph Gillett. It is understood that the congregation have provided for the completion of the chancel in all its details.

FROM SCOTLAND.

Peterhead.—A statue of Marshal Keith, who was a native of Peterhead, and became an exile along with his elder brother, Earl Marischal, in 1715, has been presented to the town by the King of Prussia, and was recently inaugurated. Keith was a Marshal in the Prussian army, and was killed in 1758 at the battle of Hochkirchen. The statue is a duplicate (in bronze, it would seem) of the marble monument erected by Frederick the Great. The pedestal is of granite, and was provided by the inhabitants of Peterhead. The statue is 7 ft. in height, and the pedestal 8 ft. The figure is in the attire of a Prussian Field-Marshal of 1758, and holds a marshal's baton in the right hand.—The foundation-stone of a new Court-house, in course of erection at Peterhead, has been formally laid with full Masonic honours, and in presence of a large concourse of spectators.

Edinburgh.—In the Civil Service estimates for the year ending 31st March, 1870, there is included a sum of 400l. for renewing the tracery and mullions of the four windows on the west side of the Parliament House. At present the windows in question are partially blocked up by buildings, but it is intended that these obstructions shall be removed. The present mullions and tracery are to be taken down, and the windows will be remodelled, so as to harmonise architecturally with the great south window put in last year. They will afford a considerable increase of light to the interior. It is hoped that ere long appropriate designs in stained glass will be introduced. The designs for the alterations now decided on are being prepared by Mr. Mathieson, of her Majesty's Board of Works, who designed the south window.—A granite fountain has just been erected at Boroughmuirhead, on the north-east entrance of Morningside. It is arranged in the pillar form, and hewn from Aberdeen granite. It comprises, besides drinking apparatus for pedestrians, a water-trough for the use of cattle, as well as a smaller one for dogs, &c. The design also includes an ornamental lamp on the top of the pillar. The fountain is the gift of Mrs. Nicol, of Hantly Lodge, Morningside.

Leith.—The Albert Dock at Leith has been completed. The new dock owes its origin to the rapid extension of the trade of Leith, more particularly within the last ten or twelve years. As the dock now stands completed, after five years of strenuous exertion, its leading features are briefly as follow:—The whole area, reclaimed from the sea measures about 36 acres, the enclosing embankment being 3,480 ft. in length. The area of water in the dock proper extends to 10½ acres; the entrance lock, at its eastern end, is 60 ft. broad by 350 ft. long; and the outer basin leading to the lock has an area of 12 acres. On the lock sill there is at high water of spring tides a depth of 26 ft. 5 in. In the dock the depth is 25 ft. 5 in.; and in the outer basin 27 ft. 5 in. The length of the dock is 1,010 ft., and its breadth 450 ft.; the extent of

quayage, 3,049 lineal ft., and the breadth of the quays, where narrowest, 200 ft. Of the whole 36 acres enclosed, the dock, lock, and outer basin together occupy 13, leaving 23 acres for wharfage, with a frontage of 1,800 ft. towards the town. At the north-west corner of the dock is provided a timber slip 80 ft. wide, with hydraulic power for unloading vessels. The lock gates are constructed of yellow pine and greenheart timber, bound together with iron bolts and straps. Each gate weighs 170 tons. By the use of the lock vessels will be enabled to leave the dock without waiting for high water. Keeping in view the construction at no distant date of the second basin designed by the engineers, provision has been made for the necessary entrance in the eastern wall of the dock just completed. The opening has been filled up with masonry. In the south-west corner similar provision has been made for establishing a connexion between the new basin and the Prince of Wales Graving Dock.

Prestonpans.—The Rev. Mr. Struthers, Prestonpans, has found a large and valuable assortment of old Scottish coins that have lain buried beneath the earth for the last three centuries. They were found a little to the east of Bankton House (Colonel Gardiner's old mansion), and are coins of the Stuard's among others, a gold noble of the reign of Mary. Another discovery of a somewhat interesting character has just been made at Haddington, in the same neighbourhood. In the course of certain alterations made in the vicinity of the Mansion House, the workmen uncovered the foundations of what are conjectured to be the old walls of the nunnery that formerly stood here. They also came on an old well. An iron key, of a very odd pattern, was the only thing found in the well.

Janestown, Dumbartonshire.—A new Established church has been opened here. It is in the Early English style, and is from the designs of Messrs. Clark & Bell, of Glasgow. It is divided into nave and aisles, and there are three galleries, one on each side and one at the back. The interior dimensions are 60 ft. by 48 ft., and there are 800 sittings. The cost of the building is about 3,000l., which has been nearly paid by subscriptions. The spire is 130 ft. high. The large west window is divided by mullions, and has elaborate tracery. The other windows are simple lancets, with the exception of a wheel window, which rises over the pulpit, and this last, together with a lancet on each side, is filled with stained glass, while all the other windows have rough cathedral glass in quarries, with colored borderings. The whole has been executed by Messrs. Ballantine & Son, of Edinburgh.

PATENTS CONNECTED WITH BUILDING.

BUILDINGS.—*G. Woodhouse & J. G. McMillan.* Dated July 30th, 1868.—This invention refers, first, to the construction of buildings in which arches are required. For this purpose girders stretching from bay to bay, or other such division or compartment, are employed, and from these girders arches are sprung. Another part consists in forming the arches of tiles, brick, or similar moulded article, manufactured to the required shape and dimensions, in one piece or in two pieces, with the addition, if desired, of a central portion or key. Another part consists in the use of cast-iron beams and wrought-iron girders. The beams extend across the building, and are supported by the walls with intervening pillars. Upon these beams, and below their top surface, are formed stops or brackets, for the reception of the ends of the girders, which are then secured to the beams by angle-irons.

BRICK MAKING.—*C. G. Johnson.* Dated August 4th, 1868.—A pug-mill is employed in combination with boxes or moulds, set in a circular or rectangular table, revolving or sliding reciprocatingly beneath an aperture in the pug-mill, in such manner that the boxes or moulds are, by the movement of the table, brought in succession opposite the orifice of the pug-mill, and are from it filled with clay, concrete, coal-dust, or other substance to be moulded into a block, when the moulds have been moved past the orifice of the pug-mill, the materials in the moulds are subjected to pressure by a piston which forms the bottom of the mould being forced upwards by its lower end coming against an incline or cam surface, whilst the top of the mould is at this time covered over with a lid or plate. The bricks or blocks are subsequently discharged from the moulds by cams or levers,

and are removed, it may be, either by hand or by appliances to push them off the table on to a creeper.

PUMPS.—*E. Edwards.* Dated August 6th, 1868.—This invention consists in making pumps with flexible rings instead of pistons or plungers, and flexible discs or plates for valves. For ordinary lift pumps a tube is formed, the upper part of which is expanded into a cup shape, and has a flange at the top. Upon this tube another cup, having a corresponding flange, is fastened. In the upper part of the lower tube, and in a recess just below the cup, a horizontal plate, perforated with holes, is placed, which forms the seat of a flexible valve; a bar is fitted, having a perforation through it of sufficient length and depth to allow a disc of flexible material to be passed through it, which disc, being held down by the bar, but allowed to bend up on each side of it, forms a watertight valve opening upwards.

BUILDING CONCRETE WALLS.—*J. Tall.* Dated 21st August, 1868.—The object of this invention is to dispense with angle or corner pieces, and also with the upright parting pieces, to which the long panels of the apparatus are attached, and also to simplify the fastenings, whereby the several parts of the apparatus are connected together, and further to construct the panels in such a manner that they may be lengthened or shortened as may be required to suit circumstances. This is accomplished by fixing the panels by means of bolts passing through tubes; the corners are composed of plates fastened to the panels in a similar manner.

SASHES.—*J. Sawyer.* Dated 20th August, 1868. Window sashes are constructed with rebated joints at the part where two sashes meet together when shut for the purposes of better excluding the air, rain, and wind. The window sashes have metal plates with teeth or cogs on one side thereof, or are formed with indentations or slots, forming racks. These racks are of the same length as the height of the sashes, and are let into grooves, or rebated in the sides or edges thereof flush therewith, or they may form projections therefor for the purpose of hanging or suspending the window sashes.

ARTIFICIAL FUEL.—*W. H. Crispin.* Dated 5th September, 1868.—The fuel is formed by taking about 1 ton of coal in a pulverized state, and adding thereto about 6 or 7 per cent. by weight of pitch, the same having been previously dissolved in about an equal weight of creosote or "heavy" oil resulting from the distillation of coal-tar, or in any hydrocarbon fluid or fluids possessing similar solvent powers. The coal and pitch having been thus combined, about 3 per cent. by weight of lime, and 3 per cent. of chloride of sodium (common salt) are added.

PRESERVING SUBMERGED IRON STRUCTURES.—*H. J. Turnbull.* Dated 14th September, 1868.—In order to prevent the oxidation of the iron it is covered with a composition, consisting of gutta-percha and resin dissolved in combination with pine varnish. The surface of the metal is first cleaned and prepared, and the composition is mixed and applied in the following manner. The surface of the iron is, first, to be made clean by the application of muriatic or other acid brought to a proper consistency by the addition of ivory black and pine varnish. This mixture is then applied with a brush, and after being left upon the iron for a few hours, it must be scraped or washed off with water in which a little soda is dissolved. When the surface of the metal thus prepared has become dry, the anti-oxidising composition is applied. The anti-fouling composition, for preventing the adhesion of barnacles and marine vegetation to the surface of iron or other submerged material, is made by dissolving four ounces of phosphorus in 10 ounces of bisulphuret of carbon, and 2 ounces of absolute vegetable naphtha spirit. Then 2 pounds of shellac and 2 ounces of gum benzoin are dissolved in absolute vegetable naphtha spirit, bisulphuret of carbon, or other solvent, to the consistency of thick paint, and the solution of phosphorus is added thereto.

MANUFACTURE OF GASFITTINGS.—*E. Sarjeant.* Dated September 15th, 1868.—This consists in connecting or joining together the parts of the gasfittings by the process of casting in metal or chill moulds.

FASTENINGS.—*F. F. Greenwood.* Dated September 16th, 1868.—The patentee combines the frame of the buckles with the frame or box of a lock, so that the whole forms one piece. Beyond, and raised above that part of the buckle which receives the free end of the tongue when closed down, he forms a bow-shaped bar or loop; or he makes a hole in that part of the buckle to

receive the tongue at pleasure, and he hinges the base of the tongue upon the bolt of the lock. When the bolt tongue is discharged from the lock he thrusts the free end under the bow-shaped bar. The protrusion and withdrawal of the bolt tongue may be accomplished either by the use of a separate key or by means of the mechanism of the lock handle itself.

FIRE-GRATES.—*G. B. Sharpe.* Dated September 16th, 1868.—The grate or fire-holder is made of bars of iron bent into a semicircular or other form, and the ends of these bars are riveted on to two upright pieces of iron. The bottom of the grate consists of bars riveted on to the lowest semicircular side bar. The ends of the top and bottom semicircular bar project beyond the upright pieces, and are bent down so as to form hooks, which fit into iron eyes secured by and fixed in or upon the fixed back of the grate.

COMBUSTION OF LIQUID FUEL.—*J. H. Johnson.* A communication, dated 15th September, 1868.—This invention consists in burning liquid fuel directly, and without any admixture of steam or water, upon a peculiar grate disposed either vertically at an angle or horizontally. When horizontally disposed, the liquid fuel is impelled or caused to flow over the surface of the grate by pressure. It flows in a number of small streams along the face of the several grate bars, which are grooved or channelled longitudinally for that purpose, and having connected to them at their upper ends small liquid fuel supply pipes. These several supply pipes are fed from a regulator above, which receives the liquid through pipes, and a stop-cock in connexion with a tank or reservoir situate at a higher level. The air for supporting combustion enters between the grate bars as in the ordinary furnace grate. The furnace chamber may either be composed of fire-clay or surrounded with water spaces, and fire-brick deflecting arches or bridges may be disposed therein as found requisite.

HOT-WATER APPARATUS.—*F. Dyer.* Dated 19th September, 1868.—This invention consists, first, in the use of the tubular fire-back made of malleable iron or other metal, cast in one piece from tubes crossed, or cast, or wrought in any other way, or constructed of pipes or tubes of any form or shape, and of any metal. Secondly, in the manner of connecting the tubular fire-brick with the hot-water cylinder. Thirdly, in the application and use of a return pipe with ball-valve inserted to prevent the upward flow of water in the return pipe. Fourthly, in the method or mode of connexions, by which all parts of a dwelling-house or other building can be supplied with hot water by the use of a hot-water cylinder, reservoir, or tank placed near the kitchen fire and in connexion with the tubular fire-back.

DOOR HANDLE.—*W. R. Lake.* A communication, dated 9th November, 1868.—This consists chiefly in the employment of a spring setting into a ratchet cut on the knob spindle. This spring is fitted in a chamber formed in the spindle aperture of the knob or handle, and ratchet teeth are formed on one side of the spindle at one or both ends, a longitudinal aperture being formed or left at that part of the spindle in which the said teeth are cut, in order to permit of the spring being forced out of the teeth when the handle or knob is required to be placed nearer the end or withdrawn from the spindle. A small hole is formed in the shoulder of the knob or handle, and near the working or loose end of the spring, to permit of the insertion of a braidawl or other simple instrument that will pass through the aperture or slot, and press against the said loose end of the spring, in order to force the latter from the teeth, and thereby release the said knob.

DISTRIBUTING SEWAGE WATER.—*O. G. Abbott.* Dated 10th November, 1868.—The centre portion of the apparatus consists of two lightly-constructed wheels capable of revolving upon a perforated tube, which constitutes the axle. The ends of the tube project from the wheels, and are provided with flanges, for the purpose of connecting additional perforated tubes thereto, and by means of which the range of the apparatus can be extended as desired, such additional perforated tubes being supported at their extremities by wheels, each of which revolves upon a short hollow axle, the same being loose and flanged on each side of the nave. The axle of the central portion of the apparatus is furnished with projecting bars, from which strengthening ropes of wire or other suitable material may be extended to the extremities of the additional tubes, for the purpose of keeping

them in position, such ropes being tightened by means of any suitable contrivance.

WALL PAINTINGS.—*G. E. Brownan.* A Communication, dated November 12th, 1868.—This consists in producing or effecting the painting or coloring upon metallic foil, by preference tin-foil. The inventor takes thin tin-foil, which possesses great flexibility; he spreads it upon a hard, smooth surface, such as glass, taking care to damp the glass, in order to facilitate the spreading and retention of the foil. The foil thus spread constitutes a very smooth surface, on which he paints or colours in oil, either plain or ornamental, as on walls or wainscots. The inventor now allows the colour to dry, and varnishes it. This portable painting, when removed from the glass with its lining of tin, is ready to be applied in a house or otherwise.

Books Received.

Picturesque Examples of Old English Churches and Cottages from Sketches in Sussex and adjoining Counties. By WILLIAM YOUNG, Architect. S. Birbeck, Birmingham, 1869.

WHETHER the brilliant cover of this book, with the title "Picturesque Architecture" upon it, induced unreasonable expectations, or however it may be, we are forced to confess to a certain amount of disappointment with reference to it. It is, in fact, a collection of pen-and-ink sketches, thirty in all, of a number of buildings for the most part thoroughly well known, and more precisely delineated elsewhere. Several of the sketches are clever and pleasing; but what Mr. Young can find to admire in the frightful Thatched Cottage, Isle of Wight (pl. 21), or in the lumbering West End of Radpole Church, Dorset (12), we are at a loss to conceive. We speak thus candidly with less hesitation as the author informs us in his preface "that the first edition was nearly all sold when the work was no more than half done."

Every proper endeavor has been made to render the names appended to the views illegible.

Dictionary of Scientific Terms. By P. AUSTIN NUTTALL, LL.D. Strahan & Co., 1869.

At a time when scientific and technical education is so much needed, the issue of a dictionary of terms in use in the practical sciences is timely, and cannot but be useful; more especially a good one as this seems to be; although, no doubt, within the limits of it there are not a few omissions. Nevertheless, great pains seem to have been taken to render it as complete as possible, considering these limits. The work is preceded by a useful introduction to the classification and study of the sciences.

Report of the Metropolitan Board of Works, 1868-9. Waterlow & Sons, Printers.

THIS last annual report of the Metropolitan Board is not so voluminous as some previous reports have been.

Under the head of Utilization of the Sewage, the Board state their regret that the Metropolitan Sewage and Essex Reclamation Company, who had formed a portion of the culvert to convey the sewage to Maplin on the Essex coast, "have not been able to continue the works;" and the Board gives no hope of any immediate resumption of these works, or of anything to supersede them; except that under the head of South Side of the Thames they say that they trust that the "postponement of the question (as to the utilization of the sewage on both sides of the river) will be only temporary, and that a revival of enterprise and the re-establishment of more favourable financial conditions will enable the subject to be successfully dealt with at some future period."

It is said, as to the Thames Embankments:—

"In reference to the Thames Embankment (North), the Board have before them the question of forming a subway under the Embankment roadway to the Westminster Steamboat Pier, in continuation of the one now in course of construction under Bridge-street, for access from the Houses of Parliament to the Metropolitan District Railway Station and the intended footway on the land side of the Embankment. The formation of the roadway still remains in abeyance, pending the completion of the works of the Metropolitan District Railway, which would materially interfere with and obstruct the traffic of the thoroughfare; but arrangements have been made for the construction, when the proper time arrives, of the entire roadway from Westminster to Blackfriars, the work being included in the contract for that portion of the Embankment east of the Temple Gardens, now being executed."

With regard to the Southern Embankment, the report says:—

"At the present time the whole of the river wall is complete, and the dam, with the exception of about 150 ft., has been removed. The Westminster Landing, Stairs, the dock entrances, and other incidental works, are either already finished or fast approaching completion. A footway, 20 ft. wide, extending from Westminster Bridge to Lambeth Church, has been open to the public since the 1st of May, 1868. About 8½ acres of the ground of the Embankment westward from Westminster Bridge has been purchased by the governors of St. Thomas's Hospital for the purposes of the new hospital, the construction of which is now being proceeded with. The amount of the contract for the Southern Embankment is 308,000*l.*, and the value of the works executed up to the present time is 238,000*l.*"

As regards the ventilation of sewers, the report states that the Board have hitherto not been able to adopt any mode of dealing with it sufficiently sure and practicable to enable them to apply it generally throughout the metropolis. The subject is now under the consideration of a committee of the Board.

VARIORUM.

"Van Nostrand's Eclectic Engineering Magazine. Selected from home and foreign Engineering Serials. New York: D. Van Nostrand, Murray-street." Several monthly numbers of this magazine, including No. 8 (vol. 1) for August, 1869, are before us. Being selected from standard sources, including English ones, such as the *Engineer*, the *Builder*, *Scientific Opinion*, and various others, the work, of course contains much useful matter, but we have little regard for "eclectic" publications, which, without either leave or payment, appropriate matter, right and left, for which respectable journals have incurred considerable outlay.—"The Fresh and Salt Water Aquarium," by the Rev. J. G. Wood. This little volume, by the well-known author of "Common Objects of the Country and Seashore," is full of interesting and curious matter, and forms a competent guide to those who wish to form aquariums for fish and shell-fish, sea and fresh water reptiles, and insects.

Miscellaneous.

Report on Health of St. Marylebone.—The annual report of Dr. Whitmore, the medical officer of health for the parish of St. Marylebone, has been issued in a printed form. On the subject of sanitary work, the report says:—"2,413 houses and 131 mews and stables were inspected, 9,298 ft. of new pipe-drain were laid down to supply the place of old and defective brick drains, 616 houses were wholly or partially cleaned, and 1,695 other houses underwent sanitary improvement in various ways; 1,841 yards were cleaned, repaved, and limewashed, and a water supply was laid on to 589 closets. By comparing these with the returns of previous years, it will be seen that the sanitary work of last year greatly exceeded that of every other: this is satisfactory as showing commendable activity on the part of the sanitary inspectors, and eminently so if considered in connexion with the reduced death-rate, to which this work, it may fairly be assumed, has materially contributed." But a very large portion of such sanitary work is but of very transient benefit, owing to the filthy and destructive habits of many of the destitute poor; with them there is an ever-recurring necessity for such work, and nothing short of the most unremitting care and vigilance will suffice to maintain, even at its present standard, the health of our local poor.

Proposed Abattoir for Bath.—The local officer of health, Mr. Barter, has made a report to the City Act Committee, in which he protests in the strongest terms against any plan of rebuilding the old slaughter-houses in Boatstall and Lott Lanes. He further recommends the local authorities to avail themselves of the opportunity which now offers for constructing an abattoir for the general use of the city, and thus removing from the centre of the town and the midst of residences, buildings which cannot fail to be an offence to the immediate neighbourhood in which they stand, as well as a detriment to public health.

Burns's Pew.—The pew formerly in St. Michael's Church, Duffries, used by Burns, and bearing in one part the initials R. B., cut with a knife by his own hand, was bought in at a sale recently, the reserved price 5*l.* not being reached in the bidding! What bad the auctioneer been about?

Inside an Abyssinian Church.—Dr. Blanc, in an interesting series of papers on Abyssinia in the *British Medical Journal*, writes:—Except in the province of Tigre, all the churches in Abyssinia are circular, the walls generally of mud and stone, the roof conical, and thickly covered with straw. The church proper consists of three concentric circles:—the first, a kind of verandah, wherein the congregation assembled; the second, the church itself, where the priests perform their ceremonies; the third, or innermost circle, the "Holy of Holies," containing the sacred vase and the "Tabot," a small square piece of wood, having on one side a cross, and on the other three stars, symbols of the Trinity, and on which are carved the name of the church, and that of the bishop by whom it was consecrated. The verandah is, for the stranger, the most interesting portion of the edifice. In some, like "Medani Alum" (Saviour of the World), the church we visited that day, the paintings that adorn the walls, all considering, are not hadly made. St. George and the Dragon in the church of Medani Alum held a prominent and conspicuous place; next came the Twelve Apostles and the Trinity, God being represented in the form of a benevolent-looking old gentleman. Several representations of our Lord's sufferings graced the walls.

New Chapel of St. John, Ripon.—On Tuesday, the 10th instant, the above new hospital chapel was consecrated by the Right Rev. the Lord Bishop of Ripon. The chapel is rectangular in form, with apsidal chancel, the total length being 72 ft., with across nave 24 ft. 6 in., the height to ridge 33 ft. The entrance porch is on the south side, and is of open timber-work in oak, with tracery sides and bargeboards. The vestry is in the north-east corner, and communicates direct with the chancel, which is paved with eucastie tiles. The altar wall and pulpit are of oak, and the seating throughout is of deal, stained and varnished. The ceiling is formed in panels of moulded timber filled in with plaster, and the roof is covered with green rag slates. The west gable is surmounted by a wrought stone bell-cot. The chapel is intended to accommodate 250 people, including children, and is carried out in the Late Pointed style, at a cost of about 1,300l. The architect is Mr. W. H. Crossland, and the contractors are—Messrs. John Chambers & Son, of Bishop Monkton, for mason, slater, and plasterer's works; George Grange, Pateley Bridge, joiner; Christopher Daniel, of Ripon, plumber; and John Burton & Son, Ripon, painters. The heating apparatus, which is fixed in a cellar under the vestry, has been fitted up by Mr. R. Nicholson, of Ripon. The chapel is lighted with gas, the fittings for which have been supplied by Messrs. Hardman & Co., of Birmingham, who also provided the lectern and pulpit-desk.

Omnibus Traffic.—There are one or two facts of interest in the report of the London General Omnibus Company. The number of passengers carried during the half-year was 20,157,926 against 20,313,821 the year before; and the average number of omnibuses working on week-days was 590 against 594, and on Sundays 460 against 461 in the same half of 1868. The company have been giving their horses maize instead of oats, and have saved by so doing about 14,000l. in the half-year! The gross receipts of the company during the half-year ending 30th June, 1869, were 270,925l. 16s. 8d., showing a comparative decrease of 13,854l. 17s. 10d.—The scale on which omnibus traffic is carried on in Paris may be judged from the fact that during the year 1868 the number of persons carried in these vehicles amounted to 120,000,000, or nearly 65 times the entire population of Paris; while during the same period the number of passengers conveyed by the French railways was only 115,000,000. The average fare was four sous and a half (six sous in the interior and three on the impériale). The gross receipts must have amounted to about 27,000,000f.

Public Drinking Fountains for Swansea. At the last meeting of the trustees of the Swansea Harbour, the Mayor, Mr. C. T. Wilson, asked permission to be allowed to erect two public drinking-fountains, one at each end of the South Dock, on the land of the trust. Permission was unanimously granted. At the meeting of the Corporation, also, the Mayor obtained the permission of the Council to erect a third fountain near the public weighbridge on the Quay. The necessary accommodation for animals will be provided for.

Erection of another Race-stand at Doncaster.—The stand for the special accommodation of county families is approaching completion. It is situate at the west end of the enclosure, just beyond the judge's chair. It is built of white pressed bricks, and is carried out in a style uniform with that of the other stands, with balustrades and pillars in front. The basement comprises weighing-room, an office for the clerk of the course, and reporter's room. The weighing-room occupies the principal portion of the lower floor, being 35 ft. 6 in. long and 17 ft. 3 in. wide. The second floor is occupied by the saloon, 61 ft. 4 in. in length and 17 ft. 6 in. wide. It contains thirteen windows, and communicating with it are two rooms for ladies. On the ground floor is a room for gentlemen. The roof of the stand will be divided into two parts, one portion to be appropriated to the lessees for whom the stand is erected, and the other to the reporters, trainers, jockeys, &c. The work has been let to Mr. Thomas Wood.

Free Libraries.—The free library question was thoroughly discussed last year in Leeds, and at a public meeting the necessary proportion of ratepayers' votes was obtained in favour of the establishment of such an institution. The scheme, however, met with considerable opposition in and out of the town council. A special meeting of the council was recently held to reconsider the subject, and it was resolved, after a long discussion, to carry into effect the resolution passed at the public meeting last year.—At Wokingham, a preliminary meeting has been held in the town-hall, presided over by the alderman, to consider the subject of establishing a free library, in consequence of a liberal offer by the Hon. Anthon Herbert in aid of the object. A discussion ensued, in which all heartily joined in the opinion that an effort ought to be made to enable the town to participate in the benefits which the foundation of a free library on a large scale was likely to confer. Windsor will also take advantage of Mr. Herbert's offer.

Philomatic Society of Paris.—At the sitting of the society on the 24th ult., M. Caligny made a communication on the subject of the means of utilising the force now expended uselessly by the waves of the sea. This subject has recently commanded a good deal of attention in America, where already an apparatus has been described and a patent, we believe, taken out for this purpose. M. Caligny stated that the question was raised as early as 1851 by the Philomatic Society. [A proposal to use the tides at Westminster as a motive power was published in an old volume of the *Builder*.] The machine described now seems to consist of a series of curved tubes which are so placed that the shock of the wave passes along their horizontal portion and sets in motion a column of liquid, which in its turn moves a series of pistons, and so transmits in any fashion that may be desired the force of the wave.—*Scientific Opinion.*

Another Railway Bridge over the Rhine. The great railway bridge which is to cross the Rhine, near the village of Hamm, a little above Dusseldorf, will probably be completed before the end of November. The structure consists of four arches, the upper part of which is of iron. The ironwork of each will weigh 14,000 cwt. The bridge is united to the main line on the left bank by a viaduct consisting of fifteen stone arches, but this does not immediately join the bridge, being separated from it by a revolving draw-bridge, so that the line can be rendered impassable at any moment. The first arch of the great bridge is completed.

Overcrowding in Barracks.—It surely cannot be true, as reported, that experiments are being conducted in the barracks at Gosport and Portsmouth to obtain data as to the possibility of increasing the number of inmates in each room without severe injury to health. Overcrowding in our barracks has long been a prolific source of disease, and has been proved to be one of the most powerful agents in the production of consumptive maladies. Every step taken ought to be in the opposite direction.

Official Building on the Thames Embankment.—We hear a report, the correctness of which we cannot guarantee, says the *Pall-mall Gazette*, that the sanction of the Government has been given to the erection, somewhere on the Thames Embankment, of a building which shall accommodate both the War Office and the Horse Guards.

Trade-Union Congress.—The second annual congress of trade societies of the United Kingdom has been held in the Odd Fellows' Hall at Birmingham. The list of subjects covered pretty nearly the whole ground of trade legislation. There were on the list 12 subjects, and 17 papers; and the number of societies represented was 32. Applications by Mr. Dixon, M.P., for the secretary of the National Education League, and by Mr. G. J. Holyoake, to read papers, the latter on co-operation, and the former on the League, were acceded to. The congress passed a resolution, by a large majority, in favour of courts of conciliation and arbitration.

Inverness Cathedral.—The cathedral of St. Andrew, Inverness, of which the first stone was laid in 1866 by the late Archbishop of Canterbury, is to be opened on the 1st of September. This new edifice is situated on the west bank of the River Ness, and nearly opposite the Castle. It is in the Decorated style, and has been built from the designs of Mr. A. Ross, architect, at Inverness, and consists of nave, north and south aisles, transepts, and apsidal east end, with an octagonal chapter-house on the north-east side. It is flanked by two towers at the west end, each 100 ft. high, and an ornamented iron *fiche* springs from the intersection of nave and transepts to a height of 110 ft. from the ground. The building with all its internal fittings and decorations, will cost something under 20,000l., it is stated. Various gifts have already been presented, such as eleven stained glass windows (by Hardman, of Birmingham), a pulpit carved in Caen stone, and ornamented with marble shafts, by native artists; an altar and reredos in Caen stone, marble, and alabaster, executed by Earp.

Preston House of Correction.—A range of 150 cells for male prisoners and a new hospital were recently erected at the Preston House of Correction, and a range of 72 other cells for females has been just completed from plans of Mr. Hughes, of Preston, architect; the contractor being Mr. Bickerstaff, of Preston, and the clerk of the works Mr. Chappell. The contract for the last-mentioned cells has been completed for a sum less than the amount of the accepted tender, some alteration in the work having been made during its progress which has led to larger deductions than extras. The original contract was 6,017l., and the bills paid amount to 6,005l.

The Velocipede Movement.—A short time ago an intimation appeared in *Punch* that a velocipede capable of carrying a man and his family would be useful, and a man employed at Staveley Works, named William Minkley, has acted upon the hint and has constructed for himself, during his leisure hours, a family velocipede. The machine is said to be capable of carrying himself, his wife, and family—four of them—and is very strongly built.—A new velocipede is being patented in Paris, which is to throw all others into the shade. It has five wheels, and the motive power is communicated to it by the mere weight of the riders.

Metropolitan Railways' Artillery.—"Nervine" writes,—Kindly urge the directors of these railways to be good enough to affix something like the following notice at the several stations:—"As the public in general, and females in particular, have nervous, the porters and guards are desired not to slam, bang, or crash the doors to, as they have got into the habit of doing, to the great annoyance of passengers, but to close them as gently as time will permit."

Evil Writings at Railway Stations.—The "Retracts" at railway stations are in many cases disfigured with indecent writings,—more shame to the contemptible perpetrators of the offence. A correspondent suggests, and wisely, that the porters should be instructed to use the white-wash brush once or twice a week. If an offender were detected, and the porter poured the contents of the pail over him, the whitened blackguard would get no pity from us.

South Shields Townhall Competition. The committee appointed to select a design from those sent in for the proposed new townhall, South Shields, have held a meeting in the Mechanics' Institute, South Shields, where twenty-seven sets of competitive plans were exhibited. A few of the designs, and only a few, deserve serious attention.

The British Association for Science will hold its next meeting in Liverpool. Professor Huxley will be the president.

A Machine that Reaps and Thrashes.—A private letter from California gives a description of the reaping-machine in use there, known as a harvester. It is pushed by six horses, and cuts, heads, thrashes, and delivers into bags at one operation, the grain being sufficiently dry to be thus dealt with. The straw is afterwards set on fire.

South Kensington Improvements.—A correspondent says the old summer-house was removed to the Bayswater side, and a portion of the dead wall taken down and replaced with iron railing, at the expense of Mr. Cawley, the holder of Prince of Wales-terrace, Kensington, opposite whose property it stood.

Harrogate Surveyorship.—At a meeting of the Harrogate Improvement Commissioners and local Board of Health, held on Monday last, it was resolved, on application from Mr. Richardson, the surveyor, that he be allowed to practise privately in conjunction with his public appointment as town surveyor.

TENDERS.

For minister's house at Paulersbury, Northamptonshire. Mr. T. Heygate Vernon, architect:—
Shelton £320 0 0
Shakespeare 615 10 0
Ansell 456 10 0
Leeper 443 17 0
Wheeler (accepted) 416 5 0

Accepted for five houses and two shops at Oasett for Mr. Joshua Whitaker. Messrs. Sheard & Hanstock, architects:—

Chapel Mason's Work £784 0 0
Lockwood Joiner's Work 250 0 0
Snowden Plumber's Work 61 0 0
Wilson & Co. Slaters' Work 80 0 0
Thornton 65 12 3

For dwarf wall and enclosure railing to lead belonging to the Clock and Watchmaker's Asylum, Colney Hatch. Mr. Henry Carpenter, architect:—

Foxley £230 10 0
Thompson 233 0 0
Clark & Hunt 343 0 0
Turner & Co. 331 15 0
St. Pancras Iron Co. (accepted) 320 0 0

For a new house on Wandsworth-common, for Mr. James Neal, who provides bricks, lime, and sand. Mr. S. Durrant, architect:—

Easton Brothers £1,000 0 0
Hearn & Cousins 1,089 0 0
Strong 899 0 0
Heron 795 0 0
Thornton 795 0 0
Atkinson 778 0 0
Cookes 745 0 0

For alterations to two houses in Essex-street, Strand. Messrs. Clarkson, architects:—

Howard £890 0 0
Langmaid & Co. 871 0 0
Atford 845 0 0
Sykes 746 0 0

For the erection of a Wesleyan chapel at the Old Delabols Estate Quarry, Mr. Patterson, architect:—
Westlake & Cann £177 0 0
Hitchins & Paul 475 0 0

For roads and drains, Chaseville Park, Winchmore-hill, for Mr. Charles Stokes. Quantities by Mr. J. C. Tomlin:—

Haynes £1,348 0 0
Turner & Cole 1,114 15 0
Jay 1,083 0 0
Potter 1,050 0 0
Burgess 975 0 0
Crockett 960 0 0
Hubbard 845 10 0
Henley 888 0 0
Hookham 830 0 0
Cohen 828 0 0
Paice 818 0 0
Morris 810 0 0
Nicholson 810 0 0
Bloomfield 8 6 0
Keeble 775 0 0
Porter 760 0 0
Kent 759 0 0
Alford 745 0 0
Capper 688 0 0
Carter 640 0 0

For alterations to the Parochial Schools at Sarbridge-ward, Herts. Mr. Pritchett, architect. Quantities by Mr. Strahale:—

Hockley £519 0 0
Thackeray 512 0 0
Dickson 455 0 0
Crabb & Vaughan 433 0 0
Clascock 397 0 0
Burton 359 0 0
Prior 378 0 0
Shirley & Horne 370 0 0
Bent 339 0 0

For detached villa residence, with tower, for Mr. J. Linder, at Nightingale-lane, Balham. Mr. Rowland Plumble, architect. Quantities supplied by Mr. C. W. Brooks:—

Wilson (accepted) £3,127 0 0

For new Parochial Schools at St. Paul's, Acreley (first portion). Mr. Elkington, architect:—
Perry £910 0 0
Buck 742 0 0
Langman 680 0 0
Bowyer & Sons 650 0 0
Hollidge (accepted) 635 0 0

For building warehouses in Camomile-street, for the London and County Land and Building Company, Limited. Mr. Robert Walker, architect:—

Bayer & Ramage £10,786 0 0
Sewell & Co. 10,371 0 0
Colts & Son 10,352 0 0
Browne & Robinson 10,176 0 0
Oxford & Willer 10,074 0 0
Newman & Mann 10,079 0 0
Myers & Son 10,028 0 0
Ashby & Sons 9,966 0 0
Macey 9,497 0 0
Hill, Keddell, & Co. 8,491 0 0
Kilby (accepted) 8,167 0 0

For new church in St. Andrew's parish, Hastings, for the Misses Sayer. Messrs. E. Habershon & Brock, architects:—

Paiss £4,053 0 0
Sharlington & Hole 3,889 0 0
Wilkins & Son 3,843 0 0
Nightingale 3,653 0 0
Viglar 3,691 0 0
Perry 3,489 0 0
Hughes 3,350 0 0
Langridge 1,131 6 8
Howell 3,235 0 0

For the erection of three shops and premises in High-street, Aldershot, for Mr. Phillips, Junr. Mr. Mueselwhill, architect:—

Hughes £1,230 0 0
Siff 1,178 0 0
Scribblitt 1,131 6 8
Mether 917 0 0
Wells & Batchelor (accepted) 811 0 0

For the alterations and additions to eight houses, and for erecting two new houses in the St. Mary's terrace, Paddington (being contract No. 1), for Mr. T. Dinshaw, Mr. Albert Bridgman, architect. Quantities supplied:—
Bennett (accepted) £1,650 0 0

For the erection of a pair of semi-detached villas in the Loughton Park, Essex, for Mr. Henry Ellis. Mr. Albert Bridgman, architect:—

Bennett £1,969 0 0
Egan 1,969 10 0
Keppence 1,965 0 0
Knight & Sons 1,751 0 0
Pavitt (accepted) 1,734 0 0

For horse, stable, boundary wall, &c. at St. Waltham Cross, Herts, for Mr. J. Dormer. Mr. J. S. Gomme, architect:—

Bentley £274 0 0
Ar her 321 0 0
Brumden 371 0 0
Dean 754 0 0

For the erection of a villa residence in the London road, Reading, for Messrs. Sutton. Messrs. Wm. & J. T. Brown, architects. Quantities supplied:—

Wheeler Brothers £1,966 0 0
Woodroff 1,866 0 0
Sheppard 1,834 0 0
Strong 1,821 0 0
Mathews 1,777 0 0
Barnicot (accepted) 1,746 0 0

For the erection of a house and shop, London-street, Reading, for Mr. Lowjoy. Messrs. Wm. & J. T. Brown, architects. Quantities supplied:—

Mathews £1,095 0 0
Barnicot 1,091 0 0
Sheppard 999 0 0
Clacy 998 0 0

For alterations and additions to house and shop, Broad-street, Reading, for Mr. Pooley. Messrs. Wm. & J. T. Brown, architects:—

Wheeler Brothers (accepted) £800 0 0

For a pair of villas at Fortis-green, Finchley, for Mr. George Emden. Messrs. W. Wymouth & Son, architects. Merritt & Ashby (accepted) £2,068 0 0

Birmingham: S. BIRKBECK, Publisher.

PERFECTION IN BOOKKEEPING.
BUILDERS and Others desiring a really good system, can have a SET of BOOKS for BUILDERS BOOKS, by DOUBILENTY, to which was awarded the prize offered in "The Builder," No. 126, and which has been adopted by many large firms.
Detailed Account by Single Sheet, suitable for small builders.—Address, E. A. St. George's-road, Regent's Park, London.

KELLY'S PRACTICAL BUILDERS' ARCHITECTURE—A PRACTICE-BOOK, or, A Guide to the Practice of Measuring, and an Abstract of the New Building Act for Regulating the Construction of Buildings, Revised and Corrected by Mr. Calculations upon the Use of Materials and Labour. Arranged by an Architect of Proven and extensive Experience. Merely Surveyors' estimate, assisted by several experienced Measurers Surveyors, &c. Royal 8vo. price 5s. neatly bound.
London: W. & A. GILBERT, Stationer, No. 1, SIMPKIN & MARSHALL, and may be had of all Booksellers.
MARSHALL, & may be had of all Booksellers.
Of whom may be had, and sent by Quire, of the following
Practical Architectural Works:—

1. PETER NICHOLSON'S PRACTICAL ARCHITECTURE, or, A GUIDE TO THE PRACTICE OF ARCHITECTURE, CARPENTRY, JOINERY, and GABLET, with a complete System of Lines, for the Construction of Buildings, including a Historical Description of the Use of Worked, founded on Geometrical and Mechanical Principles. Part I, containing upwards of 150 plates. Ten Parts at 2s. 6d. in boards, 20s. in cloth.
2. PETER NICHOLSON'S PRACTICAL ARCHITECTURE, or, A GUIDE TO THE PRACTICE OF ARCHITECTURE, CARPENTRY, JOINERY, and GABLET, with a complete System of Lines for Stone-cutting, for the Use of Worked, and a variety of Foundations for Marble Tablets, Tombs, Ornaments for Churches, &c. &c.; and a Description of the various Materials employed. Part II, containing upwards of Ninety Steel Plates, and numerous Woodcuts.
3. TREGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE, containing plain and simple Rules for Drawing and Executing them in the present style, including a Historical Description of the Orders, illustrated by upwards of one Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams, &c. Twelve Parts at 2s. 6d. in boards, 30s.

4. DESIGNS FOR COTTAGE and VILLA ARCHITECTURE, containing Plans, Elevations, Sections, Perspective Views, and Details, for the Builders of Cottages and Villas. By H. BROWN, Architect. Beautifully engraved on steel, with Directions for Building, and the estimated cost of each edifice. Twelve Parts at 2s. 6d. in boards, 30s.

5. DESIGNS FOR PUBLIC BUILDINGS, containing Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other Buildings for public purposes. By H. BROWN, Architect. Not fully engraved on steel. Twelve Parts at 2s. 6d. in boards, 30s.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE, containing a Series of Designs for Decorating Apartments with taste, and suited to the various Styles of Architecture. By W. W. and A. GILBERT, Stationers, No. 1, Essex Hall, Strand, 2s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION, containing a Series of Treatise on the Art of House Painting, Gilding, and Marbling, including the Origin of Colour, the Uses of Harmonious Colouring, the Manufacture of Pigments, &c. &c. By W. M. HIGGINS, Esq. Accompanied by actual Specimens of Hand-brush Gilding and Marbling. Ten Parts at 3s. 6d. in boards, 36s.

8. THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA: a new and enlarged Edition, comprehending Practical Illustrations of the Machinery and Processes employed in every Description of Manufacture of the British Empire. Illustrated by upwards of 2000 Wood Engravings. By JAMES HEBBERT, Civil Engineer, &c. The rapid progress which has since the first publication, in 1855, been made by the improved facts since the first publication, in 1855, of the Encyclopaedia. The inventors and discoverers receive the value of their inventions, and care in the revision of the work, by the selection of new and more valuable articles, and the substitution of such as were found to be obsolete or of less value than those which it may be removed as fully and faithfully explained to the state of the art, and the substitution of new and valuable articles, "Scientific Men." In two large 8vo. vols. cloth lettered, price 30s.

QUANTITIES SUPPLIED by an experienced Surveyor, on moderate terms. Accuracy and promptness guaranteed.—Address, SURVEYOR, Lumbo's Library, Westbourne-grove, W.

The Builder.

VOL. XXVII.—No. 1387.

The Harvest and "The Builder."

GLORIOUS spell of harvest weather has come, during the latter part of August, to raise the spirits of farmers, and to cheapen the loaf for the poor man. It was time. The

prospect of the harvest, till the occurrence of the recent welcome change of temperature, was far from cheering. It seemed as if what has been sarcastically termed our English summer, "three hot days and a thunder storm," had come and gone; and that our hopes of plenty, or even of the avoidance of dearth, for the next twelve months, had gone with it. The price of corn was creeping up. The price of bread, ever ready to rise with the slightest upward movement of the corn market, although by no means distinguished by a corresponding "alacrity in sinking," responded to the threat. The long succession of cold, sunless, ungenial days that frowned upon the corn plant, while the process of fertilisation of the seed was taking place, was thought to have so seriously affected the crop, both in quantity and in quality, that a very low average would be the consequence.

The result of the occurrence of a few days of not only seasonable, but really hot, weather, at the very crisis of the harvest, has been signally instructive. The effect is the more striking from the fact that the change occurred too late to have any appreciable influence on the swelling and increase of the grain. The sole effect has been to render the barvesting more commodious, and to present both grain and straw to the hands of the ingatherer in the very best possible condition for ingathering and for storing. In a word, the sun having failed to show much of his accustomed benevolence in the raising of the corn-plant, has come late to the rescue, as if with the express intension of showing how important is that particular part of his annual service which, and which alone, can be, to a very considerable extent, performed, in default of his smiles, by artificial means. The great Light having long turned his back upon the cultivator, has returned only in time to show the reaper how much depends on the one condition of dry harvesting.

We trust that the attention to this important subject which the *Builder* has to no small extent awakened throughout the country, will not be distracted by this timely benevolence of Nature. We rejoice to see that the question appears to have taken considerable hold of the public mind. Those veteran pioneers of agricultural reform, Mr. Meobi and Mr. Smith, continue their appeals, powerful in the logic of common sense, to their less enlightened and less economic brethren. They appeal to that sense which is rarely unimpressible, among Englishmen any more than among foreigners, the sense of fulness or emptiness of purse. They show how cheaply they can carry on cultivation, when the soil has once been thoroughly cleared of the most obnoxious and persistent weeds. One of these benefactors of his country, on a recent visit of a curious party to his model farm, offered to give a sovereign for every piece of conch grass that any of his visitors could find growing on his land! The area to which steam culture is applied

is annually increasing. During the present year one of the simplest and most useful mechanical aids to the farmer, the elevator, has been merrily at work, driven by horse power where steam was not at command. The unusually heavy supply of straw, which marks the present season, has rendered this method of superseding the most fatiguing part of the labour of the farm, namely, the pitching up of trusses, especially valuable.

We should not be remiss in gaining the full benefit of the lesson that a season so unusual as that of the present year is calculated to impart. The very irregularity of our climate has prevented us, in great measure, from taking steps to guard against the preventible evil results of bad seasons. If a farmer, for instance, had just laid out a considerable sum in buying machinery, he would think that the sun in Leo, in the year 1869, had been laughing him to scorn. When a danger can be certainly foreseen, it is the more likely to be prevented. If drought be a certain accompaniment of a known declination of the sun in a given country, the cultivator of the ground becomes aware that his sole chance of a crop depends on irrigation, and irrigates accordingly. The difference, in such a year as 1868, between an irrigated and a non-irrigated meadow, was simply that between crop and no crop. In the South of Europe, in Egypt, in many sub-tropical regions, this is always palpably and admittedly the case. Therefore, in these regions, from the earliest times, the well, the bucket, the scoop, the water-wheel, have been employed to feed the constant silver lines of beneficent moisture which alone convert a desert into a garden. But the farmer who, when *in extremis* for the supply of food to his stock, at the close of the summer of 1868, might have been led to say, "I really must see how best to utilize that large supply of water which I have hitherto allowed to be wasted, or worse," would have been more persevering and more resolute than most men, if he had carried out his wise projects in face of the heavy swathe of 1869. Thus, the past backward and perilous spring, adverse as it has been to the cereals, while highly favourable to the grass crops (of which there are nearly 33,000,000 of acres under cultivation in the United Kingdom), has been hostile to the progress of irrigation, although it should have furnished, if intelligently regarded, the strongest argument in its favour. In the same manner, with all but the most thoughtful and provident farmers, the fine harvest weather that succeeded will defer the adoption of facilities for artificial harvesting; although, in point of fact, the good effect of the late, but torrid heat, has been little more than that which, at the expense of artificial means, man may independently secure.

Another lesson of no little significance has been legible to those who have watched the vegetation of the present year. The entire growth of the United Kingdom, in a botanical sense, may be divided into the two groups, of indigenous plants, and of those cultivated vegetables which, sowed and reared by the hand of man, may yet be considered as only partially or artificially naturalized. Now, as far as the former of these are concerned, we have had a proof of the equitable compensation afforded by Nature herself for her apparent irregularities. The forest trees suffered scarcely less than the smaller and humbler plants from the drought of 1868. The ferns were generally baked. The grass was burnt up. The vegetative power, dominated by a heat which evaporated the usual liquid food of the plants, retreated into the stem and roots. It retreated, but it was not lost. It awaited but the return of the customary moisture, and the more direct rays of the sun, to burgeon and to bud, and to clothe the face of the earth with verdure. Accordingly, it is the testimony of all observers of the phenomena of natural history that rarely, if ever,

have they witnessed a year remarkable for such fertility in the flowers and seeds of the forest-trees. The hazels have been laden with nuts, the beech with mast. The key-bearing trees, ash, and plane, and sycamore, were hung in early spring with such a wealth of blossom as to be barely recognisable. Their ordinary barren, leafy, dicotyledonous branches were hidden by an unwonted bloom, lacking, indeed, the varied hues of the petals of the flower-garden, but not lacking either the beauty, or the promise, of abundant flower. The sycamore looked, in many cases, so like a gigantic currant-bush, that the observer was almost tempted to seek for the crimson *grappe*. The ash threw out its groups of apetalous flowers this spring, before the buds of the oak opened, and looked, in many instances, as if it was covered with a thick veil of greenish grey lichens. Nature, in these children of the soil, avenged herself, by an unusually wild riot of fertility, for the fast of last summer.

Farmers, they say, always grumble. We are happy to know some who do not. Those of that honourable fraternity who belong to the former class may, if they like, contradict us. Our pleasanter friends of the more complacent category will confirm the remark, that the grass, wherever it has had a chance, has this year emulated the vigour of the forest trees. Fruit-bearing trees, indeed, seem to follow laws and cycles of their own. Apples and pears, wall-fruit and stone-fruit, all the products of the skill of the horticulturist and of the orchard-grower, have each their own special seasons and reasons for fertility. But we are speaking of the indigenous vegetation, which offers a far surer test of the compensative power of nature than can be the case with any semi-artificial growth. None the less does such a recuperative power in the natural denizens of the soil indicate what may be done by the enlightened agriculturist. Nor can it be urged that the vigorous growth of the spring of 1869 is the result of unexpended, and, as it were, hoarded, vegetative power alone. The store of food available for the roots of all kinds of plants, was not drawn upon during the season of drought in the habitual manner, because it did not meet with enough water to hold it in solution. Of this food, therefore, an extra quantity may be thought to have been available during the present spring. Hence the unusual growth of the stem and haulms of the annual artificial grasses, which we call the cereals. Had the sun not played us false, the crop of 1869 would have been such as to cause that season to be denominated the year of plenty.

No better service can be rendered by any public writer to his time and to his country than the awakening of the general intelligence to the advantage to be derived by the farmer from taking counsel with the engineer. We spoke, in our recent article on Artificial Harvesting, of the yield of fifty-five bushels per acre as a high, though not the highest, result of careful steam culture. Since that time a competent authority, in estimating the unusually productive wheat crop of 1868, has averaged it at thirty-six bushels per acre. That of the present year is estimated at twenty-eight bushels per acre, a return which is more likely to be exceeded than otherwise. At the same time the area under corn crops is steadily increasing. From rather more than nine and a quarter million acres in 1866 (in Great Britain), we are advancing to a broader acreage. The margin, then, of that increase of return, which depends, not on the accidents of the season, but on the intelligent industry of the farmer, still exceeds the proportions of the annual public expenditure of the country.

Attention is, we rejoice to repeat, being now directed to the subject on all sides. The daily journals, which only occasionally can be regarded as leading, or even attempting to lead, public opinion, have for the most part a wonderful faculty of reflecting and intensifying its ex-

pression. The long library of unpublished letters which find their way to the waste-paper basket, furnishes the conductors and editors of the daily press with an infallible indication of the turn which thought is taking. The unprinted authorship of many an eager writer has thus its imperceptible influence in the spread of his opinions. The prominence which, in more than one of the most widely-circulated daily journals, has been given to the subjects of artificial harvesting and of steam culture, within the last few weeks, is thus a clear proof of the tendency of public interest in that direction.

With questions of tillage, of storage, and of desiccation,—with theories of irrigation, of sewage, and of chemical manures,—with efforts to preserve and utilise, for the benefit of agriculture, the rain which God sends from heaven, and the salts and other valuable products which are returned, from the costly laboratory of the human body, for the fertilisation of the soil (both of which invaluable gifts we now simply throw into the sea as rapidly as possible), is connected the discussion of a similar subject of no less universal interest. Man, in a state of barbarism, seems always to think himself wiser than his maker. He pitics, or patronises, or strives to cajole or to frighten, the invisible powers. The negro will beat his fetish. Sir John Lubbock tells us of races who erect scarecrows to alarm their divinities. We have long ago heard of the prayer-mill, and it has even been suggested that it might prove a good commercial speculation to export, to countries where that form of Ritualism is not yet disestablished, prayer-mills to go by steam.

But in no respect is this inherent disposition of ignorant mankind to correct the errors, and to supplement the negligence, of the supernatural powers, more marked than in the war which is so unsparingly carried on between man and his natural partners and servants, the inferior animals, especially the insectivorous birds. In our own country there is not even that unanswerable excuse of the cravings of banger which leads the Chinaman to snare the small game which he converts into a savoury *saïmê des rats*, or the self-admiring Frenchman, eager for "le sport," to army himself in mighty boots and military *juste au corps*, to insert himself in the convulsion of a ponderous *cor de chasse*, to hang a *couteau de chasse* (another name for a veritable sword) to his side, and to sally forth to shoot a tom-tit. He would shoot a fox with the like avidity, if he could. It is not clear whether he would cook the latter. The voracious nature of the former morsel (after all it is as big as an ortolan), has much to do with the popularity of "la chasse." In France and Italy it is rather the desire of an addition to the *menu*, at no expense beyond that of powder and shot—or, may be, of hemp, wire, or horsehair, that sweeps the small birds from the fields. In England it is sheer ignorant brutality—unhappy birds-nesting among boys, followed up by yet more wanton and wicked slaughter on the part of those unblest adults into whom birds-nesting boys naturally are developed.

Mr. Dresser has been bringing the subject under the attention of the British Association. He regards it, not from that point of view which shall persons call the sentimental, and men of more serious thought consider to be the moral, or even the religious, aspect, but from the sure basis of physiological data. A hundred and eighteen sparrows have been offered upon the altars of science. As was the case with the Pagan sacrifices, their entrails have been carefully inspected, in order to furnish guidance to the inquirers. But it has not been in search of the cabalistic information to be derived from quaint contortion, or the credited, though impossible, absence of the heart, or some other vital organ, that the sacrificial knife has been bared. The contents of the stomachs of the victims have been examined, tabulated, recorded. Three culprits alone, out of this hecatomb of the favourites of Cythera were proved, by this unsparing search, guilty of having lived for the past four-and-twenty hours upon grain. In fact, there were three thieves out of the 118; all the other victims had worked more or less, for their living. Beetles, and grubs, and flies, and larvae of all obnoxious kinds, had been their diet. In 75 of the birds, infants of all ages, from the callow fledgling to the little Peckey and Flapjack that could just twitter along the ground, hardly any but insect *spoggie* were detected. What would the starved and industrious pioneers who have reared their wonderful temple and city by the Great Salt Lake have given for the aid of an army of English sparrows

against that greater and more formidable host of grasshoppers which thrice all but annihilated the settlement?

It is not alone the purely insectivorous birds—such as the titmouse, who eats a thousand insects (egg or chick) per diem, and whose favourite diet is that unscrupulous *Bombus Pini*, which, in its turn, preys on the young buds of the pine-tree—or the partially insectivorous birds, such as our friend the sparrow, that an intelligent regard to the works of nature bids man to spare. The same killing kindness, or, at least, an investigation of a similarly practical, if a less mortal nature, has been extended to the birds of prey.

In the romantic glades of Marlborough forest, near the cottage of one of the keepers of the Marquis of Ailesbury, is to be found a scene that recalls the terrors of the middle ages, of the times when the gibbet bore its terrible fruit, in the vain hope of deterring future practitioners of crime from the peril of their way. Stoat, and weasel, and owl, and hawk, and kite, and cat, domestic or otherwise, and jay, and magpie,—almost everything that eats,—are strung up in a long and most unsavoury line on the gylvan gibbet. We should like to have had a photograph of the spot exhibited to section D, and to have heard the eloquent appeals that would have been made to the intelligence of the most noble owner against the ferocity of his keeper. The bizzard, now almost entirely destroyed in Great Britain, lived upon frogs and reptiles. The kestrel and the merlin were not created by the Author of evil. The owl enjoys a rich diet of droning beetles, chaffers, moths, and nocturnal insects, together with his more familiar *pidés de résistance*, the shrew mouse. The grouse disease is attributed, or at least its unchecked spread is attributed, to the destruction by the gamekeepers of their useful, if well fed, allies, the natural surgeons and blood-letters of the game birds; and the flights of wood-pigeons, which, in some parts of the country, are becoming almost portentous, are due to the extinction of the bird which is naturally most *friend* of the wood-pigeon—the beautiful little sparrow-bawk.

Let us remember the character given to man, by one of the wisest of his race, *nature minister of interpres*. When he thus acts, he may cease the wilderness to rejoice and blossom as the rose. But when he becomes, as he so often does, *nature hostis et carnifex*, the case is altered. True, his blind cruelty brings its own reward, but he is too blind to see, too stupid to understand, the lesson. He vainly curses the wireworm, forgetful of the gins he has so unsparingly set for the mole. He sees a prodigy in a swarm of lady-birds, and gives them no thanks for freeing his hops from destructive blight. He looks with dismay on the ravages of the turnip-fly, and, instead of inquiring what bird is especially addicted to feeding on that active heeble, in the locality where the *Brassica Napa* is indigenous, he institutes a sparrow club! Entrusted with the rule over the birds of the air and the beasts of the field, he strives to act like him of whom it was said, *Solitudinem facti, pacem appellat*; forgetful that, if his impious warfare could ever prove thoroughly successful, his own race would, in its turn, be improved away from off the face of that planet the laws of which he so steadily violates.

MEDIEVAL CHRISTIANITY AND SACRED ART IN ITALY.*

MR. HEMANS has now supplemented his "History of Ancient Christianity and Sacred Art in Italy," with a volume on "Medieval Christianity in Sacred Art," in which he brings up the subject to the middle of the fourteenth century; and in his preface to this instalment of it, he announces his intention to carry it further on in a future work. Like the first-mentioned volume, the present undertaking consists to a large extent of notices of the events in the pontificates of the successive popes, with a list of the architectural and pictorial remains of each century. The author has striven to engraft upon these the history of religious institutions, and the aspects of Christian society, so as to make his narrative more comprehensive in its scope; but the nature of both of these divisions of his task brings them continually drifting into one or other of the first-mentioned branches. If

* A History of Medieval Christianity and Sacred Art in Italy (A.D. 600-1350). By Charles I. Hemans, Williams & Norgate, Henrietta-street, Covent-garden, London; Goodban, Florence; Fiale, Rome. 1869.

the social history of an institution is sketched, it is constantly affected by the events that likewise affected the head of the church, or emanated from his will; and when the structural history is given, it comes as closely into the category of existing remains of the art-work of the century to which it belongs. The field is too large and too crowded with figures for us to see more than patches of it; hence, perhaps, this tendency to drift towards the central and chief personages in it is no real disadvantage. We could not hope to see all Italy in the tenth century, for instance; consequently it is well that the fragment it presented to our view, represents the leading men in the foremost circles. The popes of the tenth century, however, have not left a pleasant reputation behind them, for Mahillon declares, with the exception of Stephen VIII., Leo VIII., Agapitus II., and a few others, they were all unworthy of the Holy See, and lived more like monsters and wild beasts than bishops. The art-works, too, of their period, very few in number, and of these many have since been destroyed. All that remains in Rome may be catalogued in half a dozen lines:—An aisle of the Lateran basilica; a wing of the monastery of S. Croce; mosaic from the tomb of Otho II., in the crypt of St. Peter's; paintings in the crypt of SS. Cosimo and Damiano; and perhaps some in the subterranean church of S. Clemente; the ivory statuettes in the capitol hall, St. Peter's; and some bronze crucifixes in the Christian Museum of the Vatican. The crypt and golden altar of St. Mark's belong to this same dark sterile age; Naples, Genoa, Piacenza, Spoleto, Subiaco, and S. Germano, have each a solitary trophy; and then the tenth-century art-work of Italy is all told.

The eleventh century bore better fruits. It was ushered in with comets and earthquakes, but as the end of the world was confidently expected to take place then, those were comparatively trifling occurrences which were soon forgotten. A general improvement was made in monastic institutions; wonderful abuses had crept in which had to be cast out; and there arose vigorous souls equal to the task. Many edifices that were in ruins were restored. Monte Cassino, that had been destroyed by the Saracens in the previous century, was in this the home of two hundred monks, and the seat of learning. There were twenty abbeys in Rome, besides many other ecclesiastical buildings. Only one new church seems, however, to have been built within the walls in this period, which was that of S. Bartolommeo on the Tiber island. A fragment of a fortified mansion built by Nicholas Crescentius for his son David, popularly known interchangeably as the palace of Pontius Pilate and that of Rienzo, belongs to this date; and there are some wall-paintings at S. Urbino, and some crucifixes and ivories in the Vatican that bring us again face to face with the artists of the time. Out of the Imperial City there is more evidence of the vitality of the century. Cathedrals were founded at Ravello, Matera, Bitonto, Salerno, Novaro, Parma, Modena, Luca, Pisa, Ancona, and Fiesole; those at Siena and Bari were enlarged and finished; St. Mark's, Venice, was built over the crypt of the preceding century; monasteries were perfected at La Cava, Monte Cassino, and Sosa; and churches built at Subiaco, Spoleto, Florence, Empoli, Piacenza, and Palermo. Sculptures at Spoleto, in the church of S. Pietro, mosaics at Capua in the cathedral, and wall-paintings in the church of S. Angelo in Formis, at the same place, are details of this period.

In the twelfth century there were wars that took the Popes into the battle-field, foreign armies encamped before Rome, crusades and anti-popes; nevertheless, sacred art lived on, in spite of the fact that the palace of the pontiff lay in ruins at one time and many churches were converted into fortresses. Our own countryman, Adrian IV., contrived but little to the structural triumphs of the Holy City, for of his pontificate there are only a solitary portico and a ruined chapel as memorials. Mr. Hemans strings the Roman monuments of this period into the following list:—

"S. Maria in Trastevere, rebuilt 1130—mosaics, 1153; S. Clemente upper Church, about 1113; SS. Quattro Coronati, rebuilt 1111; S. Maria in Cosmedin, 1123; S. Croce, rebuilt 1131; S. Giovanni a Porta Latina, 1107; SS. Giovanni e Paolo, portico (?); S. Eustachio, restored; Campanili of the above-named churches, of S. Lorenzo in Lucina, S. Eustachio, S. Maria in Monticelli, S. Bartolommeo, S. Salvatore alle Coppelle, S. Salvatore in Corte (?); Clusters of S. Lorenzo and SS. Vincenzo ed Anastasio, both extramural; wall-paintings at S. Sebastiano on the Palatine, and on the chapel of S. Christino; Paschal Cathedral at St. Paul's; antiques in the Vatican Museum of Vatican."

With the thirteenth century and the pontificate of Innocent III. came the highest elevation to which the papal power attained, and this was founded, not upon successful wars or the discomfiture of anti-popes, but upon the working out of Christian principles. Innocent III. it will be remembered, revived the name of the Roman curia, and on three days in every week sat to decide questions submitted to him by the great and small, when the poorest were heard and justice done them as inexorably as though they were sovereigns. With a charity that was probably little wiser than that it would be now, he maintained 8,000 persons by his secret alms, and with similar self-denial founded hospitals for infants and the sick. He is recorded, too, to have parted with all his silver and gold plate, to further the Crusades, contenting himself with wood or pottery for his own use. It was this pope who excommunicated our King John. He was equally energetic with his clergy, and weeded out from their practices many that should never have prevailed.

His cousin, who was an octogenarian, succeeded him, and lived to be nearly 100 years old, followed in his footsteps in several particulars, most especially in structural works for charitable purposes. He was also a sanitary reformer, and enlarged the sewers in Rome. The successive popes were more or less involved with the great crusading movement of the day, which now included attacks upon Christian monarchs, as well as upon infidel possessors of sacred territory. As if to exemplify that time and chance happen to all men, one pope of this century was killed by the fall of some buildings he had ordered for his palace. The architectural and other art remains of this century are more numerous than those of preceding eras. Many churches were rebuilt, and many beautified with mosaics. In the Papal States there were new monasteries founded. At Viterbo a municipal palace was built, as well as S. Domenico; at Civita Castellana the facade of the cathedral was erected; at Subiaco the inner cloisters of S. Scolastica, and the frescoes at S. Benedetto were added. The cathedral at Florence, S. Croce, S. Maria Novella, the baptistry, S. Trinita, S. Maria Maggiore, and the palace of Podestà and Priori in the same city; and the Campo Santo, Pisa, are some of the well-known works of this period. Mr. Hemans points out upwards of fifty more.

The commencement of the fourteenth century saw Rome continually full of pilgrims. Two millions of pilgrims are said to have been present on one occasion, when lives were lost in the crowds. Every Friday the Veronica of the handkerchief of Christ was shown to the faithful, and 200,000 pilgrims, besides the native people, says the traveller Villani, were present throughout the year, and properly supplied with food for themselves and horses, without tumult or strife. Two priests stood at the high altar with rakes in their hands, raking in the money laid in piles as offerings,—a very important part of the edifying proceedings. This was the year that saw Giotto at work in St. Peter's, and upon the frescoes in the church of St. George. As the century progressed Cola di Rienzo appeared upon the scene, and before it began to wane Roman society was so decayed and corrupt that a French cardinal, consoled with an Italian one on the occasion of his having been shot at, declared that "to regenerate Rome it would be necessary to destroy it utterly and then build it again." Notwithstanding the decay and corruption of the times art was still making its silent way. Niccolò built S. Trinita, Florence; S. Domenico, Arezzo; the Pieve and S. Margarina, Cortona; commenced S. Michele in Borgo, Pisa; and erected the wonderful four-storied campanile of S. Niccolò at the same place, besides enriching with his sculpture many other buildings. Giovanni Pisano was likewise at work, sometimes by his father's side and sometimes independently of him, specially excelling in the sculptural treatment of pulpits. The pupils of this last also worked worthily; one of them, Tino da Camaino, having left several noble monuments. Giovanni Balduccio, Andrea Pisano, Tommaso di Stefano, supposed to be the grandson of Giotto, were respectively engaged, too, upon work that has suggested many a bold master-stroke. All these things and many more are duly set forth by Mr. Hemans, who has worked sedulously for years. Those who are interested in sacred art would do well to study his gleanings and classifications of historical facts as a substantial basis for a more extended appreciation of it.

THE SEVEN CURSES OF LONDON.*

Has London only seven curses? we ask ourselves as we observe the title of a work just published by the adventurous endurer and clever describer of a night in the casual ward of Lambeth workhouse. Too well we know the ground over which Mr. Greenwood has walked in this volume, to be able to answer in the affirmative. Even as Cologne has seventy stenoses, so has London an innumerable array of evils, not by any rough sifting process to be reduced to seven headings. Too well do we know of hundreds of dismal places, cellars and the like, full of unwholesome human beings; made so, more or less, by their horrible homes; too well do we know of cellar nurseries; of overcrowded tenements, to the extent often of three and sometimes of five families in a room; of houses crammed with inmates with no water supply; of cesspools under living-rooms; of living-rooms close to and over cowsheds and stables; of densely-packed workrooms; and many more miserable things not included in Mr. Greenwood's selection of horrors, all of which are curses. We can accept, therefore, the enumeration only as euphonical, or as a culling of seven of the most prominent evils, from the author's point of view. The particular metropolitan institutions he counts as curses are:—1st, Neglected Children; 2nd, Professional Thieves; 3rd, Professional Beggars; 4th, Fallen Women; 5th, Drunkenness; 6th, Betting Gamblers; and 7th, Waste of Charity. And under these respective headings he gives a series of glib, glossy, pictorial chapters, into which each subject is subdivided. Thus, the first curse, neglected children, has five chapters devoted to it, wherein paper children, gutter loaves in the streets, market prowlers, gutter children and their parents, baby-farming, errand-boys and their leading amusements, the penny gaff, and the ways to treat such cases, are glanced at. Not intended for a scientific investigation nor for a basis upon which to raise a code that should remedy the cases of such of these inheritors of woe, Mr. Greenwood's work may be called a series of racy sketches of the unfortunate, idle, and dissolute in London. When he comes to remedies he is somewhat vague. For baby-farming, in elucidation of which he repeats usefully the story of inquiries made by him in answer to specious advertisements and his detection of a gross case of brutality, he prescribes the issue of licenses, just as cowkeepers are required to be provided with them. But his grand general cure for everything is emigration, which, though a necessary thing in its way, does not, we all know, apply to all the curses of London.

The professional beggar, more than the professional thief, affords the author fair field for the display of humor. Some of the individuals and their callings he paints on his pages as curiosities with which the anthropologist could do nothing. The theory of the non-correspondence of the two hemispheres of the brain would scarcely account for the choice of the "shallow dodge" as a means of getting a livelihood. This calling was explained by one young casual to another in the course of the evening Mr. Greenwood spent in the casual ward. It consists of begging in as ragged and tattered garments as will hold together, leaving here and there patches of flesh exposed, which are powdered blue, to give an appearance of intense cold. It is only available in winter; but in a long frost a lucky practitioner, such as the mother of the young casual who explained the imposture, could make enough money to live on all the rest of the year. The operations of the Mendicity Society have, however, spoiled this branch of begging, to some extent, as Mr. Greenwood relates in the words of the young good-for-nothing:—

"Peeps are as soft-arted and as green as ever they was; and so they would shell out like they used to do, only for them — lurchers of the city. . . . Talking about the shallow lay; Lor' bless yer, you should have knowed what it was no longer ago than when I was a kid, and used to go out with my old woman. Ah! it was a summat to have winter then! . . . The old gal used to summat a wheeking lot in a big pocket she had in her petticoat, and I used to put away a 'dollop' in the busum of my shirt, which it was tied round the waist-bag hid under my neth my trousers for the purpose. But, Lor' bless yer, sometimes the blessed trade would go that agrarvative that we should both find ourselves loaded up in no time. Lor', how my old woman would swear about the grub and sometimes. . . . Then somebody 'ud beckon us, and a p'rhaps it was a servant-gal, with enough in a dish for a man and his dawg. And the old woman 'bliged to curtsy and look pleased! They ought to have heard her! 'D— and b—'em! 'my old gal used to say between her teeth, 'I wish they had them broken wittles stuffed

down their busted throats! why the — can't they give it in as copper?' But she could not say that to them, don't yer know; she had to put on a grateful mug, and say 'Gord bless yer, my dear!' to the gal, as though if it might be, she had that lot of grub turning up that blessed tion, she must have dropped down dead of starvation."

The disadvantage of the reproduction of such revelations as these is, that people feel almost ashamed of themselves for having believed there was such a thing as real poverty in the world. They feel confident they must have been taken in over and over again, and resolve to cast off their hearts the heavy load and dark shadow that the sight of misery brings with it. They think they never need make themselves wretched with pity for the poor, or anxious about means to help them. They conclude that poverty is a hoax from beginning to end. On the other hand, this class of information is useful to show the absolute error of indiscriminate almsgiving.

Another kind of professional beggar is well touched off by the author. It is he who makes himself up to look like a respectable working man so long out of work, that, driven desperate by the hunger of his children, and the tears of his wife, he, at last, for the first time in his life, has darted out into the streets to beg. So unaccustomed is he to the sort of thing, and, indeed, so ashamed of it, that he does not know how to begin, and makes several false starts with preliminary clearances of his throat. "Hem!" he says at last, as with well got up emotion he dashes into the middle of the road, looks up at the windows, and states his case like a maddened victim. "Doubtless, my friends, you are astonished to see me in this humiliating attitude, addressing you like a common beggar," he begins; "but what is a father to do when his little one cry to him for bread?" and, continuous with similar appeals till a copper shower has fallen, when he begins afresh further on. Sometimes this shy, unpractised beggar, is acted by a whole gang at a time, got up to look as much like individuals of one trade all thrown out of employment at once by its depression as possible, when they merely lounge along the streets crying "Willin' to work, and got no work to do!" Concerning the gangs, Mr. Greenwood says, he does not wish to convey the impression that every one is of this imposture class. He writes:—

"It is not difficult to imagine a company of hard-up poor fellows genuinely destitute; mates, perhaps, on the same kind of work, resorting to this method of raising a shilling rather than apply at the workhouse for it. An out-of-work navvy, or a bricklayer, would never think of going out to beg alone, whereas he would see no great amount of degradation in joining a 'gang.' He thus sinks his individuality, and becomes merely a representative item of a depressed branch of industry. There can be no doubt that a stipend given to such a man is well bestowed for the time being; but it would be much better, even though it cost many sixpences, if the labourer were never permitted to adopt this method of supplying his needs."

And so we are thrown back again upon the two knotty points how to discriminate between real and mock poverty, and how to deal with the former so as to banish beggary and destitution. Mr. Greenwood also attacks the deceits of genteel advertising and letter-writing beggars. These, as doubtless many of our readers are aware, now enlist photography in their aid, and their begging-letters enclose portraits as further appeals to sympathy. One case the author describes in which were circulated the portraits of six young children neatly dressed and well groomed, with the startling heading to his application of "Children to save." Another, purporting to come from an Adelaide T., then in deep affliction and pecuniary embarrassment, enclosed the portrait of a young lady of captivating beauty, and of real rank and worth, as her own. The fraud was discovered by the accidental encounter with the original, who, however, could not throw any light upon the manner in which the portrait came into the possession of any one likely to have made such a bait of it.

Various police cases, fragments of magazine articles, and statistics are worked into the sketches depicting the seven curses. When treating of the fallen women of the metropolis, those of the great camp on Curragh Common are described at great length; and in every other section the work is made as varied and entertaining as the doleful subjects permit.

Our author condemns the Music Halls of the day in the strongest manner, and shows the way in which evil is produced by them. It is mainly at the refreshment-bars of these palatial shams that profligacy may be seen reigning rampant.

"Generally at one end of the hall is a long strip of metal counter, behind which supple-stripped barmaids vend strong liquors. . . . Any night may be here found dozens of prostitutes enticing simpatons to drink,

while the men who are not simpletons hang about, smoking pipes and cigars, and merely sipping, not drinking deeply, and with watchful, wary eyes on the pretty game of fox and goose that is being played all round about them. No one molests them, or hints that their behaviour is at variance with the second and third of Victoria, cap. 47. Here they are in dozens, in scores, prostitutes every one, doing exactly as they do at the infamous and prosecuted Haymarket dens, and no one interferes."

The author picks out drunkenness as the crowning curse. This vice is still rampant, but it is gradually receding. It was once fashionable, but it is now vulgar. The son of the old country squire, who drank his two or three bottles of port every night before he was assisted to bed, now,—gested at the same table, in the same room,—wonders at the paternal performance, as he cautiously sips a glassful or two instead, and imputes much of his own indigestion to his parent's freedom. Fast novels need not now necessarily have a tipsy scene in them; nor need a screaming farce have a drunken character in it. Nevertheless, when there are still a hundred thousand persons summarily proceeded against in the course of the year for being drunk and disorderly, the attraction of the fatal vice should be fought against to the uttermost. To this end the author runs through the list of horrible ingredients with which the beershop keeper and pub-

lican adulterate their liquors, such as *cocculus indicus*, foxglove, green coppers, hartshorn shavings, henbane, jalap, nut-galls, nux vomica, opium, oil of vitriol, quassia, wormwood, yewtops, mostly bitter intoxicating poisons. Then the wine-merchant's contrivances to increase his stores are laid bare. All stories thrice told, of course, yet none the less appalling when told again. When all men are as intelligent and well-educated as the sons of the old unlearned fox-hunting country squires are now, and it is no more of a stride for all mechanics to make than it was for the former, the utter folly of such monstrous waste of health and opportunity will be too apparent to require a word of exhortation. Of newer growth is the wickedness of the professional gamblers, the tempters who hold out to silly lads that for the risking of a small sum they may obtain a large one—by betting on horses. And this Mr. Greenwood reviews in every phase. He explains "specs" and the "modus," turf characteristics, and the nature and treatment of welchers so fully, that all those who are wondering if there really be anything in the alleged "safe to win" often advertised, need do no more than study his interesting and useful pages for a reply.

Thus it will be seen that the seven curses Mr. Greenwood has depicted are bad enough, though, as we protested at first, there are others that are in equal need of ban and book. His curses are nearly all men, women, and children; those to which we allude are the conditions that have resulted in their being so contorted from the dignity, beauty, and grand intention of life.

BETROOT DISTILLERIES.

AGRICULTURAL distilleries are indispensable to all well-established farms. In Germany the cultivators have understood better than we have done the necessity of creating such departments; already more than 16,000 agricultural distilleries exist beyond the Rhine, and new ones are mounted every day. In France there are only about 500. They produce pure alcohols, free from oil, and the remaining pulp is eagerly sought for by cattle, while the farmer has his manure for nothing.

In Austria, the return of farms, mounted with the Savalle or improved distilling and rectifying stills, has been hitherto up to 6 per cent. of fine alcohol at 58 over proof. In France this return has been 5½ litres of alcohol at 53 over proof

(Sykes) per 100 kilogs. of heatroot, pulp re-maining, 65 kilogs.

The following is the cost of production in France of 100 litres (22 gallons) of fine spirit, as witnessed by the books of an agricultural distillery operating upon 25 tons of heatroot daily:—

	f.	s.
Heatroot, 1,800 kilogs., at 15s.	32	40
Coal, 120 kilogs., at 30s. the ton.	3	60
Acid, 2 kilogs., at 20s. the 100.	9	40
Labour	3	0
Sundry expenses, interest on stock, &c.	5	60
	45	0
1,170 kilogs. of pulp, at 11s. the 1,000 kilogs., deducted.	11	70
	33	30
The 100 litres of spirit at 5s over proof are thus	33	30
Pipes and casks	4	70
	38	0

Now the market price varies from 66 to 70 for heatroot alcohol, so the benefit is enormous when the agricultural establishment is well mounted. In Austria several heatroot distilleries have been set up by M.M. D. Savalle, Son, & Co., of the Avenue de l'Impératrice, No. 64, with the same apparatus which we saw in Gallery 6 of the Paris Exhibition, 1867, consisting of well-finished pure copper columns, 20 ft. to 30 ft. high, for which they obtained a gold medal.

The establishment of M. Camille de Laminet, at Gattendorf, near Vienna, is shown in the figs. 1 and 2. Fig. 1 represents the elevation, and fig. 2 the plan. The same letters apply to both:—

- A. Heatroot store.
- B. Washing apparatus.
- C. Lift for the roots.
- D. Macerating vat.
- E. Root slicer. It is supplied by self-acting machinery, and lets fall the slices by their own gravity, through a pivoting shoot into each of the macerators.
- F. Series of macerators.
- G. Four fermenting vats, grouped together.
- H. Distilling and rectifying apparatus.
- I. Distilling column.
- J. Boiler, heated by a steam worm.
- K. Store and reservoir, where the pure alcohol is kept.
- L. Boiler-house.
- M. Steam-engine, for pumping, &c.

M.M. Savalle have put up, since the Exhibition of 1867, up to the end of 1868, 83 new stills, in America, England, Austria, Belgium, Spain, Brazil, France, Holland, Italy, Sweden, and Valakia. Some of them treating daily from 35 to 40 tons of heatroot, and yielding from 410 gallons to 1,500 gallons of fine spirit, from 68 to 70 above proof.

THE POLLUTION OF RIVERS.*

HAVING presented their report on the river Thames, the Commissioners proceeded to investigate the state of the river Lea, which drains an area of 500 square miles, equal to 320,000 acres. Within this area there is a population of 733,072, of whom 73,526 reside above the intake of the New River Company, between Hertford and Ware, and 153,030 above the intake of the East London Company at Ponder's-end. The Lea is navigable for twenty-eight miles; and the Stort, which joins it near Hoddesdon, for a distance of thirteen miles and a half; and two canals, the Lee Union and the Limehouse Cut, join the river at Old Ford and Bromley respectively.

From the watershed on the north of the basin down to Hoddesdon the ground is chalk, and thence to the ontfall London clay, in the main.

The average annual rainfall is stated to be 25 in.; but although averages are useful for comparison between one district and another, they are not to be relied on for the purposes of either navigation or water supply. The rainfall of the driest year is the test, and this was, in 1864, as follows, according to different gaugings:

	Inches.
Mr. Greaves, at the East London Waterworks	15.891
Mr. Beadmore, at Field's Weir,	17.339
Mr. Muir, at Hoddesdon.	16.405
" " at Enfield.	18.400

These minima are about half the greatest rain-fall.

The relative areas of the Thames and Lee valleys are as 9 to 1 nearly; that is to say, the area of the Thames basin, including the Lee valley, is about 5,000 square miles, that of the Lee being 500; but the relative areas above the places where the water is taken by the London companies are as 8 to 1 nearly. The dry-

weather flow of the Thames at Kingston is 350 million gallons a day, and of the Lee at Lee Bridge 40 millions. Taking the areas above the points of gauging, there seems to be a dry-weather flow in the Thames of nearly 100,000 gallons a day per square mile of drainage area, while in the Lee there is but 80,000. Perhaps this may be accounted for by the fact that two-thirds of the area of the Thames basin is of permehle strata, while of the Lee valley only about one-half seems to be of that nature.

The two companies named supply 1,515,000 persons in the metropolis, out of a total of 3,037,991. The entire dry-weather flow of the Lea, except the small portion required for the lockage of boats, is taken by these two companies.

The Commissioners divide the river into three portions:—

1. That portion above the intake of the New River Company at Hertford.
2. The middle district, between their intake and that of the East London Company at Ponder's-end.
3. The lower district, from thence to the junction with the Thames at Blackwall.

The upper district contains a population of 73,000. The first great source of the pollution is the sewage and manufacturing refuse of Luton, a town of about 20,000 population, near the head of the River Lea. The sewage of Luton is treated with lime, and the solids precipitated, but the fluid which flows into the River Lea remains sewage, and if allowed to stagnate would become putrid and offensive. After the mixture with the Lea water, it becomes in a degree purified, and after flowing a few miles loses a further portion of its ingredients. Large quantities of various metallic salts, dya stuff, brimstone, &c., after use in the processes of cleansing, bleaching, and dyeing the goods, are discharged into the Lea. The poisonous character of the large quantities of oxalic acid that are thrown in is destroyed by the carbonate and sulphate of lime contained in the river water. But the Commissioners think we ought not to be dependent for a supply of water on such fortuitous protection.

The system of sewerage adopted at Hatfield, having a population of 4,300, is the dumb-well system, and the effluent must be more or less to pollute the subsoil water, which ultimately finds its way into the river.

At Whitwell the privies hang over the water; and at Welwyn the whole of the sewage runs in. Sheep-washing is carried on extensively in the Lea valley.

The middle district comprises a population of 79,000 persons.

The sewage of Hertford is dealt with by the New River Company. It is treated with lime, and delivered into the river below the intake, and they spare no trouble or expense to purify it, but being, as it is, the sewage of nearly 7,000 persons, it cannot be otherwise than a nuisance, and it is a constant cause of complaint to the people of Ware.

Ware, in its turn, shows no consideration for towns below it. It has a population of 6,000, and the sewage flows directly into the river without any liming or other process.

Every house on the River Stort drains into it, farmyards also, and carcasses float on the surface; the beds become silted up with refuse, and altogether it is yearly becoming fouler.

Below the junction of the Stort, the towns of Hoddesdon, Broxbourne, Cheshunt, Waltham Abbey, Waltham Crose, and Enfield discharge sewage into the Lea. All these places are above the intake of the East London Waterworks Company.

The Commissioners say that all sewers and house-drains should be fully ventilated. At Luton and other towns, where a system of sewerage has been carried out without proper ventilation, sickness has resulted from gases entering the houses.

"Sewage can be very generally throughout the Lea basin be applied to land without difficulty, by gravitation. When pumping is required, towns may fairly be required to adopt it. The purification of the watershed of the River Lea from sewage may involve separate sewerage systems, and also the application of sewage to land for agricultural uses at several points, as at Dunstable, Luton, Stevenage, Buntingford, Bishops Stortford, Harlow, and several towns and villages in the lower valley, from Hertford and Ware downwards. Schemes to drain all the towns and villages below Hertford would probably be very costly in the first outlay, because

the subsoil is so full of water that large volumes would enter in the process of forming the sewers. On the other hand, under proper control, this abundance of water would eventually be an advantage, as sewage largely diluted is moved to the outlet more quickly and steadily, and in a fresher state, than when sewers and subsoil are drier. Combination of the sewerage of towns situated in the higher or middle districts of the valley would involve large and long expensive culverts; whereas small sewage farms would find a readier market for the produce than large farms removed from the population."

On the subject of the application of sewage for purposes of irrigation, the Commissioners say,— "Main carriers should be laid in nearly level lines, so as to command the area below; and secondary carriers, at from half a chain to one chain apart, should contour the whole surface. The main carriers may be covered in, having valves or sluice-boards, of a simple and inexpensive kind, to retain and let out sewage as required." "Small carriers may be formed with common agricultural tiles, but jointed and laid only three parts in the soil, so that one tile or more can be removed temporarily at any point to allow of the sewage overflowing at such point when the tiles are removed for this purpose.

All ordinary conduits may be open trenches, readily formed by hand labour or by the plough. These subsidiary contour gutters must not necessarily be looked upon as permanent. After one sowing of Italian ryegrass has run its course (this should not exceed two years), these minor conduits may be ploughed up with the rest of the land. Some farmers will probably clean the land by taking a root crop of it, and then lay it down again for a second course of grass, and so on. Proper irrigation and cultivation neither fouls the land nor exhausts it. Where sewage irrigation is the cause of a nuisance, it will be found to proceed either from use of old and putrid sewage in large and foul open ditch-like carriers, or from open tanks and large carriers being allowed to become foul."

"A sewage farm not only requires a peculiar mode of cultivation, but also special management in dealing with the produce. Tolerably good land under sewage will produce from five to seven crops of Italian grass per annum, weighing in the aggregate, when green, from 50 to 60 tons per acre. The grass is used to the best advantage on the day it is cut, and is most profitably applied to stall-feeding dairy cows." "Where there is sewage there must be population. Milk, butter, and beef will, therefore, necessarily be in proportionate demand; so that, when the true use of sewage is understood, that which is the cause of nuisance by being wasted, will be turned to profit on the land."

Looking at these reports of the Pollution of Rivers Commission, in conjunction with that of the Water Supply Commission, recently presented, it seems to us beyond dispute that it is highly advisable and proper, even if not absolutely necessary, to guard against a serious outbreak of illness in London generally, that all sewage should be kept out of the rivers from which we draw our supply of water. Chemists may analyze and may find nothing in the water that they can call injurious to health, but really this is not a chemist's question; it is a question of common sense whether we are to run the risk of using water for domestic purposes into which has been poured the enormous quantity of foul matter that we have here proof is daily poured into it; while all the protection we have that it is destroyed before it reaches us is that of the action of nature in counteracting our deeds by beneficent processes of oxidation and other chemical transformations, which are and can only be accomplished by a sufficient length of time being allowed for their action, and therefore the purification of the water we use is a matter of degree only, which degree may in most cases be sufficient, but in some may not be.

An Artist's Monument.—It is stated that a movement is on foot to erect a fitting memorial stone over the grave of the late Mr. Robert Scott Lander, the distinguished Scottish painter, whose death was recorded a few months ago. The initiative in this movement has been taken by a number of the younger Scottish artists, whom Mr. Scott Lander was wont to call "his boys." Many of these boys, both in Edinburgh and London, have now achieved fame and fortune, and are anxious to pay tribute to the memory of their old friend and master.

* See p. 677, ante.

SOUTH SHIELDS' NEW TOWN HALL
COMPETITION.

The designs sent in competition for this intended building were on view at the Mechanics' Institute last week. They are twenty-four in number, and of these six have been selected by the council from which ultimately to choose the one best fitted, in their opinion, for adoption. These six are distinguished by the following mottoes, "Always Ready," "Well considered," "Phoenix," "I Work to Win," "Northumbrian," and "Nota Bene." Taking them as they lie in order on the table, we find the design "Always Ready," with a blue cross and in a circle (for the same mottoes are appropriated by different competitors) to be comprised in a square of about 50 ft., and to consist of four floors, of which the basement is chiefly occupied by vaults suggested "to be let out" as cellars and such like. The cunning device is, no doubt, meant to go a long way with the worthy councillors, and perhaps it does suggest one reason why this design is placed among the lucky half-dozen; but it must, at the same time, be admitted that this is not its only recommendation, for the arrangement of the post-office and telegraph department on the ground-floor is excellent. The public on entering would immediately find three ways presented to them, which, at a glance, would announce themselves as leading respectively to the post, money order, and telegraph offices, and they could go from one to the other with great facility. If all the plan arrangements were as good as the postal, this design would be one of the best in that respect; but, as it is, the principal stairs are pushed back into a corner, and the council chamber, on the first floor, is too small, although 27 ft. by 23 ft. might possibly prove large enough to hold the assembled wisdom of the borough. Another drawback is the total omission of lavatories and other conveniences which ought to be attached to the council chamber; the nearest being only gained by passing through the mayor's parlour, or by mounting a flight of stairs. The town clerk's offices are conveniently placed on the first floor, and the borough surveyor's offices and housekeeper's rooms above.

The architectural beauties of this design, so far as the exterior is concerned, and this only is shown, are nil. A plain, bald, high-shouldered red brick building, intended, we presume, to be all Gothic, although some of the windows might be anything, is topped by a raised part which is too low to be a tower, and too high to be a mere gable. This "tower," however, although it does not contain the staircase, and is for no apparent purpose, is good, but only from its simplicity.

"Well considered," upon the whole deserves its title. If anything, perhaps, the design is rather too "well considered," and the consequences, in the shape of future cost, not considered quite well enough. Certainly, if South Shields get this design carried out in its entirety, with all its carving complete, for 6,000*l.*, it will get a bargain. Like the former, too, this plan appeals to the pocketed feelings of the council by devoting large spaces in the basement as cellars, "to be let." It also provides a fire-proof monument-room, which is certainly a desideratum in a town-hall.

The author exhibits two designs, one Gothic and the other "Classic." They are both good, and either would prove a handsome building. The front of the Gothic design shown in elevation is very elaborate. There is a hand of shields run along the entire front, which is a great mistake, as they are meaningless and certainly not ornamental. The clock-turret is too small, and, whilst pretty in itself, is insignificant in proportion to the building, and would look still worse in execution. Whilst in the former design the council chamber is too small, in this one it is too large; it is a noble room, indeed, but it is a pity competitors could not ascertain the number of gentlemen sitting in the "local parliament" before designing this apartment. The rest of the requisite rooms are well arranged; but the post-office, &c., is not so well planned as in the design first mentioned. In the alternative design the windows are very large, and, perhaps, might prove unmanageable in the smaller rooms: this design is bold and effective altogether, though failing in detail, the turrets notably, being too small and frittered away.

"Phoenix" does not offer any bait in the shape of cellars to let. On the ground-floor are given a fine hall and staircase, which lead to the council chamber, mayor's parlour, and town-

clerk's offices on the first floor. The last are decidedly too small, and the two former are ill arranged with regard to each other, and ought to communicate. This competitor seems to be the only one who has any idea of the proper size of a rate-collector or inspector of nuisances' offices; the others, apparently thinking that all the rates to be collected and all the nuisances to be inspected are to be brought to the offices themselves, have made the rooms so large. "Phoenix" disdains any such modern contrivances as sash-windows in the council chamber, and has carefully shown them all as casements,—a piece of true Gothic feeling which those who would have to use the room would probably not thank him for, especially as the windows in the room are very numerous. The borough surveyor's rooms are not well arranged, being separated from each other, and otherwise inconvenient.

Of the architectural merits of this design we can, without hesitation, speak highly. It is a temperate and well thought-out specimen of Gothic architecture. It is well grouped and, whether as to its general appearance as a whole, or as to its details and component features, does credit to the architect who created it. The chimneys are boldly taken in hand and disposed of in picturesque and pleasing groups, which really become part of the design; and a balcony running entirely round the building is so well worked that it has not the least appearance of cutting it in half, as is so often the case under similar circumstances. The interior views of the council-chamber and staircase show the same talent, and power of developing it. The chamber is a long room, with pointed windows on each side, and the vaulted roof and spandrelled ribs arching across are really excellent, the walls and splay, &c., of the windows being, we presume from the drawing, finished in stone or brickwork.

We are forced to regret that the plan is so immeasurably inferior to the elevation. Had this not been so, we think "Phoenix" would certainly be the fortunate winner of the prize, notwithstanding that a little more than the prescribed amount of money would be required.

"I Work to Win," taking it altogether and judging it upon its merits, is probably the one, of the six selected, most likely to work its way to the winning-post and receive the wished-for commission. Though not so good in an artistic point of view as the last-named, yet its arrangement is the best of all, and must on that account strongly recommend itself to the Council. It has four entrances, the chief one leading through a fine and spacious hall, and up a wide staircase to the council-chamber and other rooms on the first-floor. Another entrance leads to the post-office department, which has all the good points desired, in its planning, without any of the defects found in the other drawings ("Always Ready" excepted), if we correct one slip only, and that is, the telegraph office and the savings' bank ought to be reversed, which can easily be done, as both are about the same size. Another entrance leads to the rate collectors' and inspector of nuisances' offices, which are of moderate dimensions.

On the first floor the council-chamber, mayor's parlour, and town-clerk's offices are excellently arranged, and will work well together in execution; and on the second floor the borough surveyor's offices are prominent with regard to the public staircase, and any person seeking them will not be likely to wander inadvertently into the housekeeper's bed-room, as in some of the designs. The design itself is a substantial-looking Gothic structure, which, if not purely English, goes no further than our sister country, over the border, for its borrowed features. The tower is deserving of its name, and will show out well from the surrounding neighbourhood. We must advise the author, however, not to "shirk" his chimneys, and hide the flues in his tower, as he appears to do with some of them; but to bring them boldly out as chimneys, and make the most of them. In our opinion they will add to the attractions of the design, and, moreover, will obviate much misery to the occupiers of those rooms from which the flues in question rise, for, as they are arranged at present, the chimneys will inevitably smoke at the wrong end.

When we say that "Northumbrian" has a high tower and spire, which would show conspicuously for many miles all round, we exhaust its merits. For the rest of the exterior, it is a badly-imagined Gothic red-brick building set on top of a freely used Italian one. To build a

townhall of stone or white brick, half way up in one style of architecture, and to finish the top stories of red brick in another, the line where they join being straight and well defined, is certainly novel and startling, if not ingenious.

Nor do we find any redeeming merits in the interior arrangements. On the ground-floor the post and telegraph offices are not well planned, and the former is shown of so small a size as to make it quite useless in execution. The entrance-hall and staircase are small. On the first floor the council-chamber is rather small, and badly contrived with regard to the mayor's parlour: the stairs down from one and up into the other, in going to and fro between them are absolutely a fatal objection.

The sixth and last of the selected designs is marked "Nota Bene," and is inferior in most respects. Exterioy it is a red brick building, of a mixed style, in which the Roman, Grecian, Italian, and Venetian are discernible.

Of the rejected designs the plans and general drawings are not exhibited. Amongst the views we do not find anything very striking. "Architresque" and blue cross, is a good Italian design, and would look well in execution. The tower, however, is rather too florid for the rest of the building. "Always Ready" in a shield, is a handsome Gothic design, which would at once announce itself as a town-hall. The defects are the roof and tower, which look stuck on as an after-thought. "Foi" is rather good. It is a Gothic design "freely treated;" the roof line is picturesque; the tower and spire, however, look as if they did not belong to the remainder. "Always Ready" is a rather rough pen-and-ink sketch of a Gothic design, with a tower and spire, that would do credit to the town.

A hand of meaningless shields, however, runs in a line along the front, and somewhat spoils it. "As you like it" is an ecclesiastical Gothic design, which would suit well as a college building or library. It is quiet and tasteful, and only wants a good entrance and campanile to make it one of the best designs in the room.

As a whole, this competition seems to us below the average, only nine or ten of the designs out of the twenty-four being worth any consideration whatever.

THE EARLY MILITARY ARCHITECTURE
AND WEAPONS OF THE CELTS.

The military architecture and the military weapons of defence of the Saxons are pretty generally known; but until recently the military architecture of the Celts was a field which few cared to explore. Although there is much similar in the early history of the two peoples, yet when we come closely to examine it separately, there is a wide and distinctive field marked with peculiarities common alone to the Celtic race. As war is an institution coeval almost with the creation, and as the profession of the soldier is up to this our day looked upon with a feeling of pride, the study of that architecture hegot of warfare and appertaining to military life must prove more or less interesting. To begin, therefore, at an unequivocal point in our subject, let us ask what were the particular modes of military defence adopted by the Celts. The simplest modes of defence that could be adopted by the aboriginal inhabitants of any land would naturally be confined to the shelter and retreat that their forests, woods, mountains, and hogs could afford. Fences, of course, were next constructed, made of wattles or branches of trees; evidence as to these methods of simple defence having been adopted among the ancient Britons we have from Cæsar himself. The advent of the Gothic element into Britain led, no doubt, to improved methods of defence; for shortly afterwards we find that small forts were constructed on the boundaries that separated the territories of the different tribes. These forts are and were to be found at the entrance to woods and forests, on rocks, and hills, and other elevated places. These places, of course, were chosen with an eye to strategic effect. The forts of the Celts were known by the name of Rath. There were two kinds of raths, called respectively the *dun* and the *ban*. The former were isolated hills, or very elevated mounds, compassed by walls and entrenched with a rough stonework, without any mortar or concrete. Sometimes they were simply mounds of earth, square or circular. Many exist in the sister kingdom Ireland at the present day in towns whose name begins with the word Dun. The other description of fort called the *ban* or

babban, said to be derived from the Teutonic *bawen*, to construct with trees, were wide spaces or areas, surrounded with thick ditches of earth. Sometimes square, sometimes circular, these were impaled with rude stakes, perhaps improvised branches of trees. Until late years a great number of these forts were to be met with in Great Britain as well as in Germany, Sweden, and other places in Western Europe. Among the Celts the name of *dun* was likewise given to any entrenchment whose inside was elevated with the design of having an advantage over the enemy.

Some writers have remarked a very striking resemblance between the Pagan military architecture of the Celts and the early Pelasgic monuments in Greece. The forts or fortresses of the Celts are of Cyclopien architecture. The walls range in thickness from 3 ft. to 16 ft. The entrances to them are by a narrow doorway, with inclined sides, wider at the bottom than at the top. Although these forts were constructed of loose stones, they have stood from time immemorial without any being displaced. It is marvellous how some of the stones that went to the construction of the walls were mounted to their position, unless we imagine that a similar facility for lifting stones by mechanical means existed amongst the Celts and Britons as existed among the Egyptian workmen when the Pyramids were being erected.

The Celts, when on a military expedition, had other species of fortification for the protection of their camps and the route of their armies. These fortifications were mostly constructed of timber. The Brehon law, or ancient code of Ireland, compelled every chief to find timber sufficient for the construction of every description of fortress. Timber, however, was easily procurable in England and Ireland when the Brehon code was in force. The largest species of the Celtic fortifications were identical with those of Britain. They were called in the Celtic language *Caithair*, or cities; and according to the best account we are able to find of them, they were divided into the following important divisions: the *beallagh*, *dun*, *mote*, *ban*, *raib*, *uagh*, &c. The *beallagh* was the outward inclosure, which swept a circuit, like the baillium of the Norman Castle, or answering to it; only with the Celts it was not much more than a staked fence, and not always accompanied with an entrenchment. Within the inclosure the whole property of the chief was collected—servants, animals, &c. The *dun* was inclosed within the area of the *beallagh*, but elevated, and formed the residence, or habitation, of the chief and his family. The *mote*, or *mothar*, was the intrenchment which inclosed or encircled the *dun*. The *ban* was the rampart which (mostly situated with the *mote*) inclosed the *dun*. *Mothar* means an enclosed park, and *mote*, a mound. The court, or open space within the *ban*, was the *raib*, and herein was situated the Celtic *rightlann*, or Royal Palace, comprising several detached buildings. Lastly, the *uagh*, or *uagh*, was the cave, or under cellar, where provisions were kept, or where the chief and his retainers might retire in case of danger.

Some of the stone forts erected by the pre-Christian Celts may be seen in Ireland at the present day, in the west, north-west, and south-west. Perhaps the most remarkable one is that one in the island of Arran, supposed to be two thousand years old; there are some in Donegal, Mayo, and Kerry, similar in construction. In the massive walls of some of these forts there are chambers and stairs to be met in the interior, which lead to platforms varying from a few feet to upwards of 40 ft. On these platforms, doubtless, the defenders of the fort stood during attack.

Forts of dry wall masonry are very numerous in the south-west of Ireland. They were plentiful at one time all over the kingdom, but they have disappeared now except in remote districts. In Kenmare, near Derryquin Castle, there is a fort called *Staigna Fort*, of a very ancient date. It has a diameter of 80 ft. The stones forming the masonry appear to have been quarried, or, at least, split evenly off, from larger blocks. The stones are flatly bedded one upon another. So compact is this piece of dry masonry that you cannot even dislodge the filling-in stones without applying more than ordinary force. No masonry of the present day erected dry, as it has been, can compete with it for strength and durability. At Granard, in the county Longford, there is another remarkable fort of great antiquity. It is a good example of this kind of construction, and it exhibits traces of many

divisions with a view to defence. In the northern counties of England and along the Borders, a good deal of dry ordinary masonry may be seen, forming divisions to land. It stands well, but not having been erected with a view to military defence, of course there is no comparison.

The *cranogoes* of the Celts, although evidently designed as a means of concealment, or a place for retreat, can hardly be treated under the term Military Architecture. Small islets of clay were formed in the centre of lakes. Into this were driven piles of wood, heaps of stones, and other material,—bones, for instance; for an extraordinary amount of bone has always been discovered in connexion with these structures. The *cranog* or habitation was used certainly as a place of retreat. They are to be found in close proximity to old forts and castles, which are not far removed from lakes. Those islets most likely were submerged in the winter. A causeway is found connecting some of them, though canoes were probably used in reaching them, as remains of such have been found mostly in or near these singular habitations.

Near to *Danshaughlin*, in the county Meath, was to be seen one of the earliest specimens of those singular structures. The Annals of the Four Masters mention the destruction of this *cranog* A.D. 933. It is recorded also in 1246 that *Turlough O'Connor* escaped from one of these keeps after he had drowned his keepers. This would argue that they might have been used as prisons or places for the concealment or detention of hostages. Again, we find in 1560 one *Teigne O'Rourke* is mentioned as having been drowned in his passage across to one of those island structures. So recent as the sixteenth century we have accounts of these *cranogoes* (having been used in Ireland as a system of general defence.

The Round or Pillar Towers of Ireland have given rise to such an amount of controversy as to their origin and use, that we do not care to claim them as a piece of Pagan or Christian military architecture. We have an account of the destruction of many Round Towers in the Annals of Ulster in the year 448, caused by an earthquake. We have no authentic account in any of the Irish annals of the building of them since the Christian era. Whatever their history, we have no proof that the Celts and Britons did not know the use of lime and mortar long before the age of St. Patrick. Evidence of their knowledge of the building art exists in structures which are indisputably theirs, and which are evidently not of a Christian but a Pagan era.

Whether we can claim the Round Towers in part as here used or designed for military purposes, or as places used as a defence against sudden attack, they are singular and wonderful structures. Studding the island, though hundreds of them have disappeared, they are lasting like the Pyramids. There they stand, almost defying time, still pointing their cone-crowned summits to heaven, although they have forgotten the names of their founders.

Before treating of the military architecture that sprang up subsequent to the Danish invasion and the arrival of contingents from other Northern nations, it would not be amiss for our purpose to give some account of the warlike weapons in use among the Celts. Those weapons which were chipped into the form of a hatchet, axe, or spike, could be used for a variety of purposes, for specimens exist which would answer for arrows, knives, or mortise-chisels for framing purposes. The material was flint, and some of these stone celts or weapons exhibit great skill in their formation and felicity in the design. Taken in connexion with the early military architecture of the race we are talking of, they throw a flood of light upon our pathway; but of this we may speak hereafter.

C. H. C.

Proposed New Baths for Gloucester.

It is proposed to form a company, and plans have been prepared by Messrs. Medland & Son, for the erection of baths at the back of the Crypt School playground and near the Park. The plans contemplate the providing of a swimming-bath, 70 ft. in length and 35 ft. in width, with dressing-rooms attached, and six private baths, 9 ft. by 8 ft. The swimming-bath is to be so constructed that during the winter months the water would be let off, and the bath would then form a gymnasium or hall, 90 ft. by 45 ft.

PATENT-OFFICE REPORT.

THE Report of the Commissioners of Patents for Inventions for 1868 has been issued in a printed form. It states that,—

“The number of applications for letters patent, recorded within the year 1868, was 3,391; the number of patents passed thereon was 2,499; the number of specifications filed in pursuance thereof was 2,456; the number of applications lapsed or forfeited, the applicants having neglected to proceed for their patents within six months of protection, was 1,601; the number of patents void, the patentees having neglected to file specifications in pursuance thereof, was 34.

Thirteen thousand one hundred and one patents bear date between the 1st of October, 1852, and the 31st of December, 1868. The additional progressive stamp duty of 50s. was paid, at the end of the third year, on 3,392 of that number, and 9,400 became void. The additional progressive stamp duty of 100s. was paid at the end of the seventh year on 1,274 of the 3,392 remaining in force at the end of the third year, and 3,418 became void. Consequently about 70 per cent. of the 13,101 patents became void at the end of the third year, and about 90 per cent. became void at the end of the seventh year. The proportionate number of patents becoming void, by reason of nonpayment, continues nearly the same to the present time.”

The Commissioners thus conclude their report:—

“New rooms having been built for a library on the second-floor of the Patent Office building, the printed specifications, indexes, and scientific works were removed into them (without inconvenience to the general readers), and the library was opened to the public on the 16th of April, 1867. In the report to Parliament for the year 1865, it is stated that ‘the building at present devoted to the purposes of the Patent Office, with the recent additions and alterations, is not now, nor can it ever be made to be suitable for the requirements of the office.’ Experience has proved this statement to be correct; the building is now filled, and there is a continual increase of specifications and scientific works, for which provision must be made.”

ARCHITECTS' CHARGES IN GERMANY.

SOME months ago, at the time when the representatives of several associations of German architects were assembled at Hamhurg to discuss a scheme for the better regulation of their remuneration, we briefly alluded to their proposals. We now purpose to investigate and further explain the matter by giving a more detailed account.

Before entering upon the minutiae of the elaborate network before us, we will shortly apprise our readers of the main results embodied, and, we may almost say, hurried therein. Buildings are divided into five classes; the labours of the architect are detailed under six heads, and the building sums total have been arranged in nine divisions. Thus a table containing 270 categories has been produced, for which our friends over the water would find plain acceptance throughout the fatherland.

It becomes plain at a glance, that 5 per cent. is not looked upon as an adequate remuneration, being hardly sufficient for all purposes. While in the erection of a shed at a cost exceeding 30,000l., the architect would have to accept 2 per cent. only, it is clear that the average charge for all classes exceeds 6 per cent. (6.08 per cent. exactly). We shall not attempt to follow the compilers of the system into all its ramifications. To us it seems hardly necessary to instruct an architect as to the per-centage which he may rightfully claim when called upon to erect a building costing from 120l. to 300l., and we should not give a moment's attention to such points, were it not that they afford a striking instance of the zeal with which the German architects have attempted to make even impossibilities easy in the scheme before us.

The following is a short sketch. For brevity's sake we have appended a designation to each class, and have omitted six categories of building sums for the same reason:—

Classes of Buildings.	Per-centage for Buildings costing—		
	A few hundred £.	A few thousand £.	Above £30,000.
I. Rural Buildings...	6.0	3.0	2.0
II. Town Houses.....	6.5	5.0	3.0
III. Mansions.....	8.0	6.0	4.0
IV. Palaces.....	9.5	7.7	5.0
V. Ornamental Structures.....	11.0	9.0	6.0

The amount of care bestowed on avoiding mistakes as to the class to which a building belongs may be argued from the fact that there are about a hundred specifications enumerated in the original, besides the necessary et-ceteras. Class I. comprises warehouses, market-halls, temporary exhibition-hoofs and buildings; the most simple cottages, vaults, and coverings for large hollow spaces, workshops, &c.

Class II.—Villas, stables in connexion with them, greenhouses, dwelling-houses, middle-class family residences, public schools, simply constructed hospitals, barracks, baths and wash-houses, prisons, railway stations, &c.

Class III.—Superior residences, verandas, pavilions, large shops; buildings with fittings, for ventilation or other purposes, requiring special thought and attention; churches, museums, theatres, &c.

Class IV.—Palaces, rich churches and chapels, magnificent cinchouses, triumphal arches, guild-halls, &c.

Class V.—Interior and exterior decorations; altars, pulpits, monuments, &c.

The labours of the architect are comprised under the following heads:—

1. *Sketches*.—Preliminary designs drawn to scale, with an approximate estimate, as desired.
2. *Plans*.—Elevations, sections, &c.
3. *Detail Drawings*.—Constructive as well as ornamental detail drawings.
4. *Estimate*.—A special estimate.
5. *Superintendence*.—Negotiations, &c., exclusive of special superintendence, which latter the client has to provide.
6. *Revision*.—Settlement and scrutinizing of accounts.

(Measurement excluded.)

In each class a special allotment is made for every one of the above items. These allotments are to some extent proportional, and, considering the source from which they sprang, we are at a loss to understand why they are not exactly so. When in Class III., line 4 and 5 (see detail table, lower down), we meet with a proportion like the following,—0·6 : 0·5 = 1·6 : 1·5, and many others similarly incorrect,—we are divided between two opinions. Either there is an essential reason for such anomaly, or there is not. If there be, it surpasses our comprehension, and we should have to put in on one side an account of its depth, that being too great for our limited capabilities to fathom; if, on the other hand, it is merely an expedient for avoiding two decimals, we are again at a loss to understand how such a thing could possibly have disturbed the scrupulous compilers. Failing

to see the depth, if there be any, we must presume that the irregularity here complained of by us is due to the nature of that particular kind of systematizing which never tires until a straight-jacket has rendered its victims motionless. It moves no more in that condition, but it writhes. Just so with the elaborate plans before us. We have round per-centages and fractions of per-centages. The latter are the straight-jacket, necessitating more fractions, more hair-splitting. At last the minute threads will not split any more, and it is at the time when they are brought to an almost inappreciable size that the necessity arises, always consequent upon a course of this kind being pursued, of darning and patching and filling up. No extent of system will do away with all disputes, and dealings between men and men cannot be reduced to rule. A leading principle, however, is needed, and of this we are as deficient as our neighbours. Both our practice of 5 per cent. and their system of 270 different percentages are extreme measures, the one too loose, the other too narrow. They will have to be blended so as to produce one sound and practical medium. In looking through any of the vertical columns shown in the detailed table below, it will be readily perceived how the percentages have been spread over the different labours composing the architect's duties. We will here quote one, the first one:—

Architect's Charges for	For Buildings valued between £120 and £300.
1. Sketches	0·7
2. Plans	1·0
3. Detail Drawings	1·0
4. Estimate	0·8
5. Superintendence	1·2
6. Revision	0·5
Total	5·0

It will be observed by noticing all the first vertical columns that while the item "revision" (0·5 per cent.) remains about the same throughout all classes, the charge for estimate varies little with the class of building. The per-centage for drawings, however, rises almost in equal proportion with the classes:—

DETAIL TABLE OF GERMAN ARCHITECTS' CHARGES.

ARCHITECTS' WORK.	Per-centage of Architects' Remuneration for Buildings costing (in Prussian Thalers) from—									
	800 to 2,000 incl.	2,000 to 4,000 incl.	4,000 to 8,000 incl.	8,000 to 16,000 incl.	16,000 to 24,000 incl.	24,000 to 40,000 incl.	40,000 to 100,000 incl.	100,000 to 200,000 incl.	200,000 to 300,000 incl.	above 300,000

Together	11·0	10·2	9·6	9·0	8·4	7·8	7·2	6·6	6·0	6·0

We may here add that the taking out of quantities is not included in the architects' charges above enumerated; that, further, the client has to bear the expense of clerks of works (overseeing, keeping of journal, adjustment of calculations respectively), whether he engage them himself, or whether the architect does so. In the latter case expenses involved are debited to the client by the architect in addition to his per-centage. Special inspections or loss of time occupied in journeys are rated low, being about half a guinea in the one case (for seven hours in railway travelling), and double that amount in the other, besides actual outlay for lodgings, refreshments, &c. Drawings and designs remain the property of the architect. Money is to be advanced by the client in proportion to the progress of the building.

VENTILATION OF DWELLING HOUSES.

A CORRESPONDENT sends us some not very clear particulars of a plan of ventilation for dwellings that has been in use for two years in four houses in Keston-road, Bermondsey, and is said to answer expectation. He says:—"The houses are built on an improved plan of constructing the chimneys: one smoke-shaft for each series of rooms, instead of a separate chimney from each room, by the sides of the single smoke-flue, is built in the air-shafts, for the supply of fresh and pure air to each of the rooms; the used air is taken off at the ceiling line into the smoke-shaft. By this plan smoky dwellings are prevented, and draughts from windows and doors greatly decreased. The cleaning of the chimneys is done in the basement, saving the sweep entering any other part of the house."

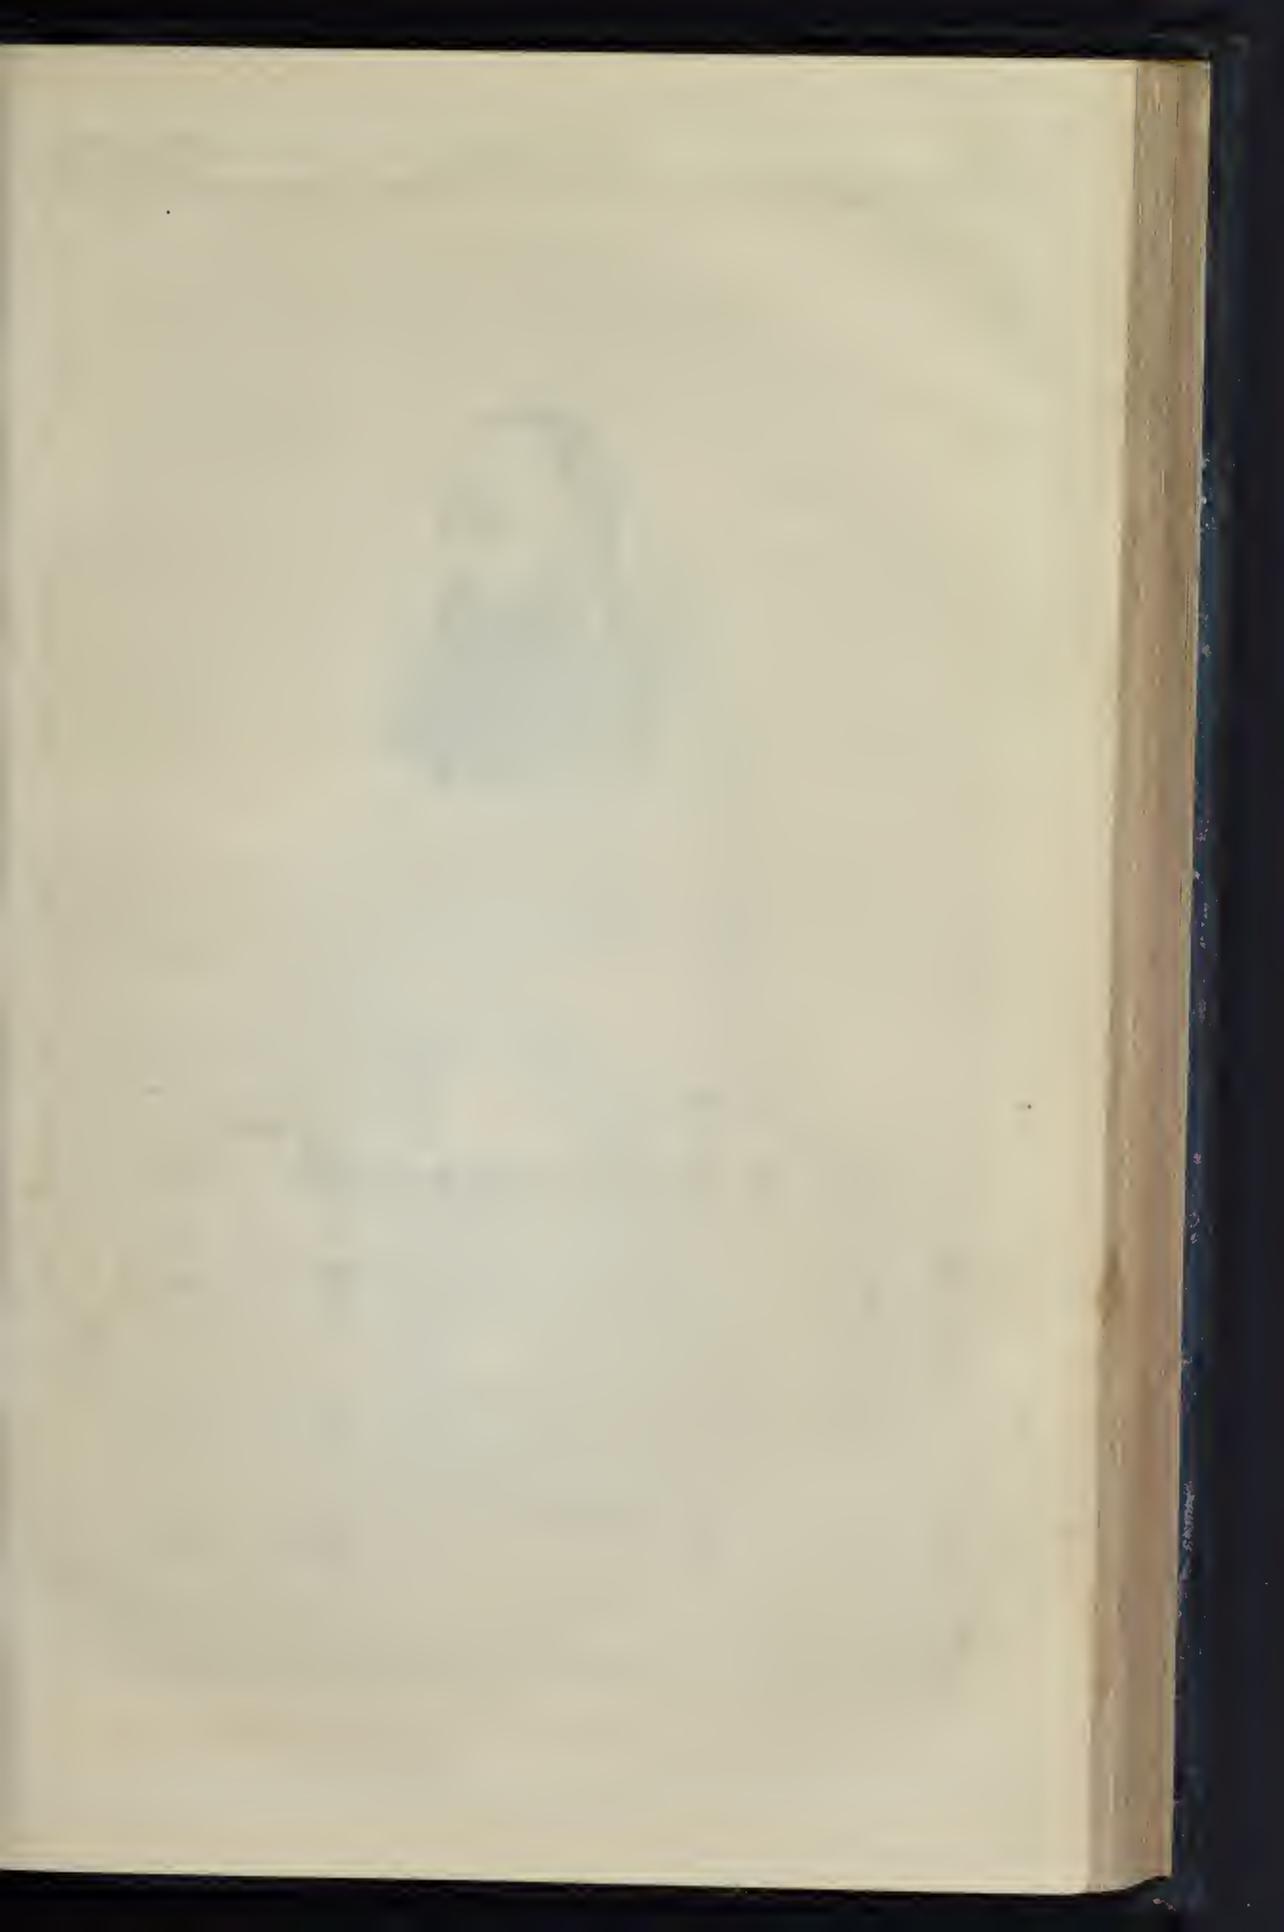

POUNDS.

NOTHING to do with pence; no sympathy with scruples; no questions about troy-weight, or avoirdupois, or money's worth, or balances; but Pounds of that other sort, into one of which (to give a notorious classical instance) our dear old friend Mister Pickwick was ignominiously wheelbarrowed, when unconscious how far the cold punch—with or without lemon-peel—might have disagreed with him.

We speak then here of those innumerable little prisons, square and bare, and cruelly inhospitable, dotted all over the land (for where is there not a manor?) and everywhere handy for the incarceration—and semi-starvation—of innocent dumb creatures.

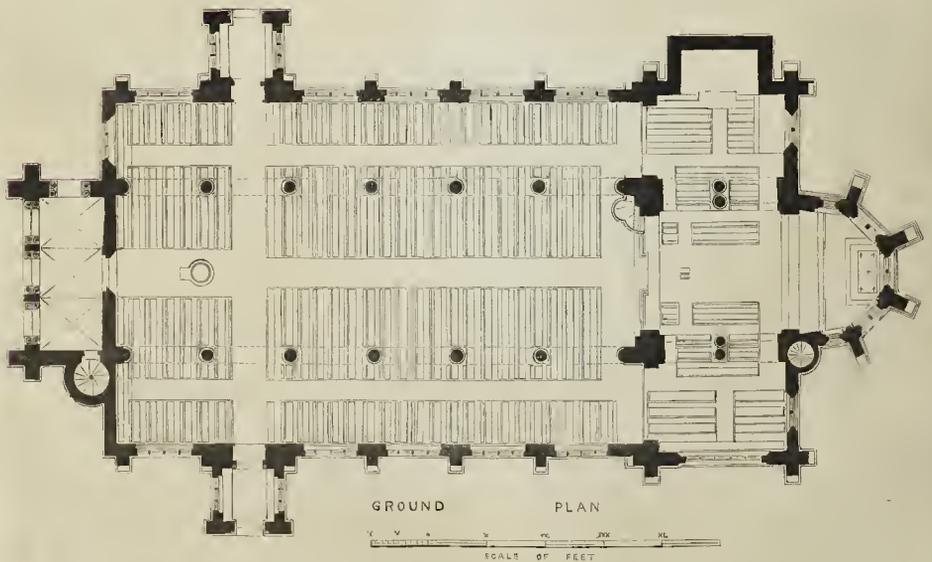

Of course, we know they must be incarcerated; for, through the carelessness of their ignominy masters, they have strayed out of open gates, or got into ill-fenced corn-fields, and wander up and down the roads to the righteous indignation of waywardens; by all means, let them be impounded wherever found, and kept well till called for, and not let forth without payment of all dues. But, if impounded, is there any reason why the poor creatures should not also be sheltered? A slight modicum of food is enjoined by law, though frequently not provided; water, however, is a luxury almost out of hope to the unhappy beasts; but (and here is our heaviest grievance), shelter of any kind is quite unknown, and certainly not imperative, in any of our thousands of Pounds all over the country. Be it the fiery heat of summer, or the ice and chilling blasts of winter, in heavy rains, or snow, or hail, by night and by day alike, the poor estrays crouch miserably in their cruel pens, without a corner provided to creep into against the inclemency of our seasons, and patiently dying out before the nipping eyes of those who pass by! Surely, in these better days of humanity towards everything living, the old Pound ought to be improved by the small but most important matter of a shed in one corner; a mere roof to keep off rain,—and perhaps a side screen against the wind. This, as a piece of law and duty, ought to be imperative on every pound-keeper; and if any manorial magnate sees these lines, let him kindly accept the suggestion, and bid his bailiff tend more carefully those poor estrays imprisoned for their masters' fault, but certainly not therefore to be starved for want of forage and water, nor to be left unsheltered in our open Pounds till well nigh perished by the slow tortures of an English climate alternately tropical and arctic. It may be within the useful province of the *Builder* to improve upon the wisdom of our ancestors in even so humble an edifice as a Pound.

MARTIN F. TUPPEL.

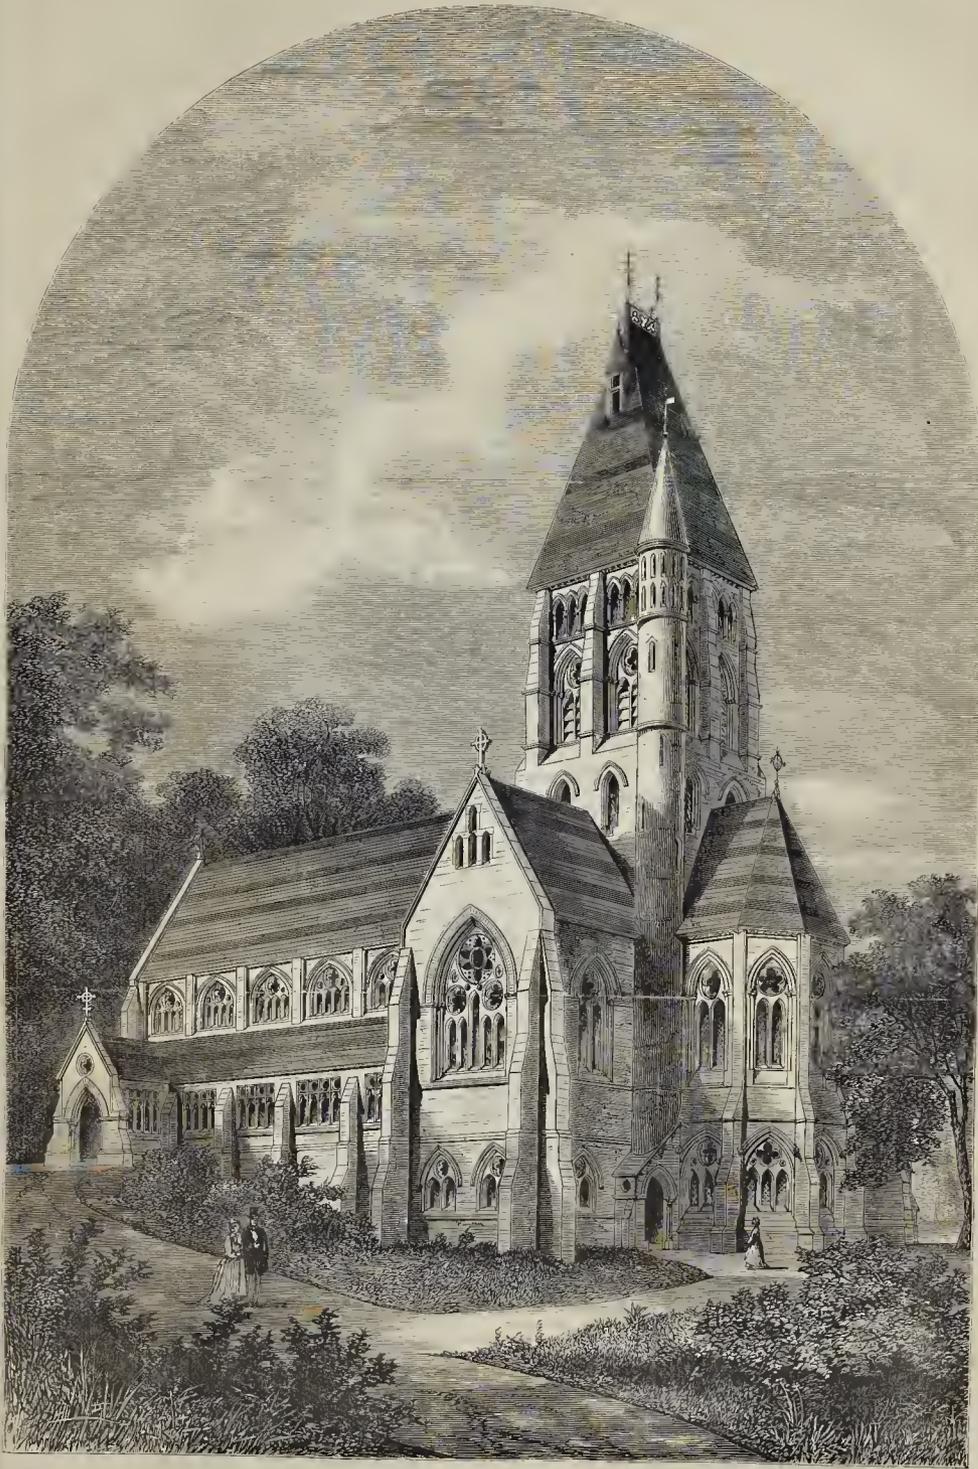

MR. GEORGE EDMUND STREET, A.R.A.
Architect Designate for the Proposed Law Courts.

ST. STEPHEN'S CHURCH, HAMPSTEAD.
Plan.

ST. STEPHEN'S CHURCH, HAMPSTEAD.—Mr. S. S. TEULON, ARCHITECT.

ST. STEPHEN'S CHURCH, HAMPSTEAD.

This church is now in course of erection from designs by Mr. S. S. Teulon, of Craig's-court, Charing-cross. It consists of a nave and aisles 90 ft. long by 57 ft. wide (the width of the nave itself being 26 ft.), with a tower 21 ft. square, internally forming a part of the chancel, which is completed by an apse eastward of the tower. The tower is to be flanked by transepts, but these and the aisles and the upper part of the tower are to be left unfinished for the present for want of funds. Advantage has been taken of the fall of the ground from west to east to obtain some spacious rooms for vestries and other purposes under the chancel. The character of the architecture inclines to that of the Early French ornithoses. The tower when completed will be nearly 130 ft. high.

The portion of the church in progress will accommodate nearly 600 worshippers. When the aisles and transepts are added there will be sittings for more than 900.

THE SOLICITOR-GENERAL ON ART AND MANUFACTURES.

At the opening of the Science and Art-Exhibition, in Devonport, lately, the Solicitor-General, Sir J. D. Coleridge, M.P., made first a very great flourish, and then an interesting speech. He started, as reported, thus amazingly,—"One of the first things we may learn from this collection is the inaccurate and hazy character of much of the talk we hear as to the union of manufactures and the arts. There is in correct language no such union. They are things in their nature altogether different and distinct." and then he went on to show throughout the whole of his speech, the practicability of this union, the fact of its existence in the Classical and Renaissance times, and its great value.

"No one will deny," said the speaker, "that if we manufacture he sound and useful, it is a great advantage it should be refined and lovely too. Now, why was it so formerly, and why is it not so now? Mainly, I think, for two reasons. First that the greatest men employed themselves, or were employed, in making beautiful models of things in ordinary use; and next, that these models were constantly followed and repeated. As to the first, we know, historically, that the fact was so in the finest periods of the mediæval and Renaissance art. Great artists in those times never thought it beneath them to devote beanty of design to things of common use, and the makers of such things availed themselves of the greatest men amongst their contemporaries to give beanty to their wares."

In his other words, they wisely brought art into union with manufacture,—they carefully wedded genius to Vulcan. The mistake made by the Solicitor-General at starting, led those of his audience who knew anything of the matter to doubt the soundness of all that he said afterwards.

THE DUKE OF NORTHUMBERLAND'S BOOK OF ROCK SYMBOLS.

The late Duke of Northumberland and the present duke have caused a splendid and no doubt costly folio volume of plates to be printed, for special presentation, in which are depicted many of those curious markings on rocks and stones in Northumberland, Argyleshire, and various other parts of Britain, and in Ireland, as well as elsewhere, which have been associated under the general name of "Rock Symbols."* regarding which, as a class, a discussion took place in the Builder, as our readers may recollect, in 1864 and 1865. The plates are accompanied by a few choice pages of letterpress by Dr. Bruce, the Newcastle archaeologist, who had been employed by the late duke to superintend the work of preparing the plates for the press. The letterpress contains an account of the successive discoveries of the markings, but nothing of the least importance towards an explanation of their origin, meaning, or purpose. Most of what is said on this subject relates to suggestions which are admitted to be not satisfactory, such as that the holes pierced out concentric circles and radiate grooves, with central "cups," were for the flow of blood in sacrificial processes, whereas many of the

carvings are on rocks at natural angles, and anything but horizontally placed. It is a curious fact in idiosyncrasy, if not in archæology, that the suggestions in the Builder on the subject are still, as heretofore, totally ignored by Dr. Bruce, and make no appearance whatever, even in his list of suggestions that are not satisfactory; unless, indeed, the solitary remark that "some papers 'On Circular Rock Marks and other Symbols' appeared in the Builder, from the pen of Mr. John E. Dove and others," he supposed to contain, wrapped up in it, an implied inference that the suggestions in these papers were not worthy of even being included in the list of those that are not satisfactory. This is all the more notable inasmuch as the suggestions in these papers, as has already been clearly shown in the Builder, included the germ, or key-note, of Dr. Bruce's own subsequent attempt, and those of others, to explain the meaning and purposes of the carvings; and they also include the first if not even yet the only suggestion of anything analogous or similar to them in known symbolism,—namely, the centre-and-circle symbol, of known meaning and of almost universal antiquity, which is absolutely identical with many of the rock symbols; and the "Sephiroth" concentric-circled symbol, which is also of known meaning, and closely resembles many others of the rock symbols. Surely these suggestions merited a place either amongst those which were not satisfactory, or amongst those which were, especially as considerable space is allowed for suggestions of the most improvable and unsatisfactory description, such as that about the blood of sacrifices. Why, then, is it that Dr. Bruce has ignored especially those suggestions which pointed attention to the remarkable similarity, or identity rather, between symbols whose meanings as well as forms are known, and those recently discovered symbol-forms whose meanings and purposes are held to be utterly unknown? Dr. Bruce himself says, "When so much obscurity prevails, every suggestion is worthy of consideration;" and he quotes approvingly a remark by the Rev. William Greenwell, who first brought the subject under public notice, that the Northumbrian carvings "differ from all other symbolical expressions with which we are acquainted, and seem peculiar to the Celtic tribes which once peopled all Western Europe: further inquiry may make known other instances of their occurrence; and it is not impossible that on being found, as it may happen, in connexion with other and known symbols, some light may hereafter be thrown on their meaning."

Dr. Bruce also quotes a remark made to him by Mr. John Stuart, the author of "The Sculptured Stones of Scotland," that "the great thing is to trace analogies and correspondences in examples from different localities," and

"This [adds Dr. Bruce] was the principal object which the Duke of Northumberland had in view when he directed the preparation of these plates: still, something may be done to clear the way for the discovery of the true solution of the mystery: negative knowledge has its value; to ascertain what the incised markings are not, limits the channel of inquiry, and prevents, to some extent, the waste of ingenious conjectures."

The exclusion of similar or identical forms, whose meanings and purposes are known, from any consideration whatever in reference to the obscure subject under notice, was not the way either to carry out the enlightened intention of the duke, or to shed any light worth looking upon that subject; and Dr. Bruce's Introduction, notwithstanding the excellent advice admittedly given him, must merely be regarded as little else than a bald record of the times and places when and where the carvings represented in the plates have been discovered, and is of no other value whatever.

It is unnecessary for us to re-enter on the more important subject of the connexion of the rock carvings either with similar forms in known symbolism, or with the doctrines of antiquity with which these latter were associated. Not a spark of additional light on these interesting subjects is even attempted to be given here, where it was to be expected, and where it ought to have been; and all we either can or need do at present, is to refer our readers back to the papers in the Builder already alluded to, which gave the tone to all attempted explanations; and especially the papers of July 2nd, September 3rd, October 22nd, and December 17th, 1864; and April 22nd, 1865. In reference to the intimate relationships in which the ancient heathen religions in general stood to one another, we may specially refer to that of October 22nd, 1864; and as to these religions being

all essentially magical, and hence the practices connected with them also magical, as urged in these papers, we may here remark, as we had occasion to do on a previous occasion, that it is no doubt the most popular and sceptical, and hence the safest policy, to ignore all magical doctrines while attempting to unravel the mysteries of ancient practices such as the Celtic one of carving centre-and-circled, concentric-circled-and-radial-grooved, or other forms, on rocks, in sorcery halls or chambered tumuli, and on funeral kists; but there is no better ascertained fact as to ancient times than that pre-Christian and heathen nations in general, in all parts of the world, were deeply,—intensely,—and probably universally, imbued with magical practices and doctrines; and no archæologist who is ignorant of these, or who attempts to unravel the mystery of ancient sculptures and structures without taking them into consideration, is at all likely to be able to evolve the true theory of the uses or purposes and meanings of such sculptures and structures. Of course the truth, error, or imposture of the practices and doctrines themselves, here referred to, is not the point at issue; and, except indirectly, has little or nothing to do with it.

THE TRADE-UNION CONGRESS.

MANY subjects closely affecting the future well-being of the working classes have been discussed by this Congress, who, in fact, have touched upon most of the topics comprehensively dealt upon in Mr. George Potter's paper on the "Disorganisation of Labour." Perhaps the most satisfactory issue that has been reached, is the resolution approving Courts of Arbitration and Conciliation, after a serious discussion following upon a paper by Mr. W. Owen, of Burslem.

Mr. Owen thus put the case of labour in its relation to capital:—

"It had been often said that labour was but a commodity, to be bought and sold as are other commodities, and it had also been maintained on the other side that labour was not a commodity, but a human power, from which all commodities resulted. The latter view was that to which he inclined, and he believed that labour, as the maker, was greater than that which it made. It seemed to him to be wrong to ask that labour, and the great produce, should be as passive in the hands of capital as the piece of ware that the potter had made."

Mr. Owen's account of the successes of Courts of Arbitration in various centres of industry (in Staffordshire particularly), is encouraging; and these successes will, it is to be hoped, be rapidly extended, by the influence of the resolution adopted by the Congress.

The subjects next in importance to that of conciliation by arbitration have been,—the legalisation of Trade-unions and the Commissioners' Report; reduction in the hours of labour; and the number of apprentices.

Mr. Potter made a sensible suggestion to his hearers to wage war against drunkenness among the working classes if they wished to improve their condition. For the rest, the prevailing idea of the unionists seems to be the abolition of all laws whatever affecting trade-unions, either with respect to their funds or against combination. They claim the right to morally coerce their fellow working-men, considering the ordinary laws of the land sufficient to deal with any form of physical coercion.

On the subject of the numerous papers read, and discussions carried on, our limits prevent us from attempting to enter; but we here give a number of the more important resolutions passed by the Congress on the several days of meeting:—

"That this Congress is of opinion that the establishment of courts of arbitration and conciliation would greatly conduce to the just and peaceable settlement of all disputes between employers and employed, and be the means of preventing strikes and lock-outs as well as being conducive to the commercial and industrial enterprise of the nation."

"That in any attempted legislation in regard to trade-unions, the following principles should be distinctly recognised:—1. The entire repeal of the combination laws. 2. Complete protection of their funds. 3. No interference with or attempt to separate benefits from trade funds. 4. In respect of the recommendation of the Commissioners to compel the registration of trade rules, and to open accounts to the registrar, this Congress would be against any exceptional clause from that enforced with reference to other legal societies in this country."

"1. That this Congress is of opinion that the working-classes have advanced their wages and shortened the hours of labour by strikes, when all other means have failed of settling such disputes, and believe that strikes and lock-outs have produced poverty to workmen and bankruptcy to employers. 2. The Congress is further of opinion that co-partnerships of industry will considerably improve the industrial relations between employers and employed, and are, therefore, worthy of general adoption; further it is the opinion of this Congress that nothing

*The Incised Markings on Stone, found in the County of Northumberland, Argyleshire, and other Places; from drawings made in the years 1863 and 1864, by direction of H. Grace the late Algonquin, Duke of Northumberland, and J. London; printed for private circulation, 1869.

short of co-operative production applied to manufactures and land can be accepted as a cure for the conflicting interests of labour and capital. 3. The Congress is nevertheless of opinion that it is the duty of the working-classes to unite more closely in the future than they have done in the past, for their mutual protection will continue imperative so long as the interests of employers and employed remain antagonistic."

"That this Congress believes that nothing short of a system of national, unsectarian, and compulsory education will satisfy the requirements of the people of the United Kingdom; and expresses a firm hope that the Government will not allow the next session of Parliament to pass away without dealing with the question, upon the basis above suggested; and that copies of this resolution be sent to the Right Hon. W. E. Gladstone, the Premier; and the Right Hon. W. E. Forster, Vice-President of the Council on Education." A resolution was also passed, recommending the trade-unions to support the National Education League in their efforts to carry out the foregoing resolution.

"That this Congress is of opinion that in trades where the supply is in excess of the demand, the limitation of apprentices is justifiable, a fair proportion being allowed, in keeping with the number of men employed to teach them."

"That in the opinion of this Congress the great destruction of human life in the working of the coal and ironstone mines of this country calls aloud for investigation, and for further legislation for the protection of life; and the representatives here assembled deeply regret that the Mines Regulation Bill introduced last session by the Right Hon. H. A. Bruce, Home Secretary, should have been withdrawn, knowing that the miners of the United Kingdom have been, during the last six years, doing all in their power to induce the Government to pass a measure to prevent the fearful sacrifice of life which is constantly taking place. We are further of opinion that all trades and associations connected with this Congress should use their influence with the members of Parliament for boroughs and counties in their respective localities to aid the miners in passing an efficient bill for their protection next session of Parliament."

To this list of resolutions we may add a resolution recommending trades' societies to support the "eight hours' movement."

As we early brought the subject of industrial partnerships before our readers, we may here say that Mr. G. J. Holyoake, of London, read a paper on "Industrial Partnerships as a Means of Aiding the Objects of Trades-Unions." His definition of an industrial partnership was that it was a plan of conducting a manufacturing or producing business, in which the chief management was in the hands of those who supplied the chief capital, and the profits or losses were proportionately distributed between shareholders and workmen. He believed that both this method and the ordinary form of co-operation could be used to raise labour to a position of due equality in its bargains with capital. But it was industrial partnerships that offered to trade societies the advantages they needed. With industrial partnerships the men would have honour and security. There would be less loss, less care, less strife; indeed, great gain for them, and an honourable content around them. The employer would be a king, and every workman a citizen in the Commonwealth of Industry. But alas! that was not to be. That workman was only half conscious of his own interests, and only half informed how to advance them, who did not take into account the prosperity of his employer, and who pushed his own claims regardless of his master's. But the other half of the case should be stated with equal plainness. The employer who did not see that the competence, content, comfort, health, leisure, thought, and goodwill of his men were his interests also, and that he was not to push the claims of capital against the self-respect and well-being of labour, was ignorant of the art of snatching a fortune with honour and security. The fair consideration by the employers of the workman's interest, and industrial partnerships, were a means now at hand for accomplishing that. In conclusion, Mr. Holyoake expressed his belief that many employers would accept a proposal for industrial partnerships, but they could not do so at once, nor do it at all without the co-operation of the workmen.

The next conference is to be held in London. Nottingham was also proposed, but London was selected.

Ventilation of Mines.—Mr. Lloyd, the engineer of the Lilleshall Company, has invented a mechanical apparatus, which the company have patented, and which, taking advantage of the elasticity of the atmosphere, seeks to ventilate coal-mines by means of exhaustion, by using a centrifugal fan, driven by an engine. A model has been erected, with a fan, 18 in. in diameter, and 6 in. wide over the blades, which, measured by the anemometer, produces exhaustion at the rate of 1,500 ft. per minute. Mr. Lloyd first made a 2-ft. 3-in. fan, which exhausted 3,500 ft. of air per minute; and another, with a 5-ft. fan, 1 ft. 10 in. broad, which exhausted 26,196 cubic feet per minute.

STEEPLE JACKS.

"STEEPLE JACK" is commonly but erroneously supposed to be an individual, whereas, as we have before pointed out, he is a genus, or a species, though, it may be, few in number. As his way of working is not known to every one, we may here describe it in connexion with one or two of his more recent exploits. Some of the factory chimneys at New Swindon having got out of repair, the company resolved to employ a "Steeple Jack," who accordingly made his appearance at New Swindon and set to work. His plan of proceeding was to fly an Indian kite, with two strings attached. The kite rises nearly perpendicularly, and when above the chimney-top is guided over it. The second string is then pulled and thus a complete communication is formed over the chimney. By means of the string a double copper wire is drawn up, and by this wire some pulleys and tacking, "Steeple Jack" then ascends hand over hand, and places an iron hand around the chimney, which he secures tightly. Planks are then drawn up and laid upon iron projecting from the band, and thus in a short time a scaffolding sufficient for his purpose is erected, and at a cost very much less than that of a regular builder's. "Jack" had two or three assistants, and managed, in this aerial manner, to pull down one of the factory chimneys which had become so badly out of repair as to require rebuilding. He is still engaged in repairing others. His scaffolding looks at a distance like a huge indiarubber band, around the chimney, with ropes depending from it.

An exciting occurrence, displaying great intrepidity, and involving the almost peril to the person concerned, took place lately at Millbank Chemical Works, Carnagad road, Glasgow. Messrs. Burns & Son, of Ayr, who have been employed in similar duty at Townhead and other establishments, had been engaged to point a stalk at the works mentioned, measuring 260 ft. in height. The preliminary process of flying the kite was gone through no fewer than fifteen times, but on each occasion it failed, in consequence of the string being burnt through by the gas and flames emitted from the stalk. About an hour and twenty minutes were spent in these fruitless endeavours, when Mr. Burns, resolving that whatever personal risk might be incurred, the object must be accomplished, determined for this purpose to ascend the stalk himself. Accordingly, in spite of the remonstrances of his son, he proceeded to mount by the aid of the conducting-rod, but no sooner had he got safely at the top than the rope was again burnt through, and he was left hanging by the hands. Not a moment was to be lost. The son flew the kite in about five minutes afterwards, and having succeeded in once more fixing the rope, the father was got down; he was, however, in an extremely exhausted condition, and notwithstanding the leathern gloves he wore, he was much burned about the hands, while his left side was likewise considerably scorched.

A GOTHIC OAST HOUSE.

A LARGE oast-house (oast is a kiln for drying hops) has been erected in Bekeshourne, a pleasant hamlet in East Kent, by Mr. Sargent for the Marquis Conyngham, upon a piece of land nearly opposite Patrixbourne vicarage-grounds. The front, from end to end, measures 70 ft., and the kilns (three in number) extend about a like distance to the rear. The ground front is intended to be devoted to the temporary storage of hops, and for this purpose is cemented and laid with asphalt. A passage divides this place from the kilns, and here the fuel is stored. The *South Eastern Gazette* enables us to give a description of the internal construction of the kilns, which will perhaps interest some of our readers. The number, as mentioned above, three; and each is approached by a separate entrance opening into an arched pile of brickwork extending to about the centre of the kiln. In this brickwork are built the stoves, one on each side and another at the inner end, which open into the kiln. As an aid to the equal distribution of heat, and also to avoid the possibility of sparks ascending to the drying cloth above, roofs of metal are fixed above the open fires. There is, of course, arrangement made for ventilation; if necessary a strong current of air may be introduced into the kiln without necessarily interfering with the fires. The chief aim to be kept in view in the construction of hop-kilns is, it need hardly be mentioned,

a controllable and equally dispersed heat, and it has been proved by previous experience that the plan carried out in the building under notice is successful in this important particular. On the drying floor—really easily convertible into a first-class dancing-room—and in the green loft above, every device has been used calculated to lessen the tedious labours of the dryers, and at the same time to perfect the work of curing the hops. Over the upper landing-stage in front is raised a turret, Gothic in style, and the dormers are built in the same style. The overhanging gables at each end are artistically decorated, and the end walls are further adorned with a heraldic crown and armorial bearings of the noble owner.

NEW MUSEUM, BRISTOL.

The new Philosophical Institution at the top of Park-street, Bristol, is making rapid progress. The old institution at the bottom of this street did not meet modern wants, and the Bristol Library being, moreover, amalgamated with it, led to the erection of the new structure, which adjoins the Drill-hall, and is in the close neighbourhood of the Victoria-rooms, and the School of Art, both handsome structures. The design for the new institution is the joint production of Mr. J. Foster (Foster & Wood) and Mr. Panton (Panton & Cough), the former gentleman being responsible for the elevations, and the latter, we believe, for the arrangement of the plan. The building is in the French Gothic style, floridly treated. A contract has been entered into with Messrs. Warburton, Brothers, of Manchester, to erect the building for 10,000*l.* The design includes two fronts.

The building is set back 23 ft., and is entered on this side by a flight of Pennant steps, 32 ft. wide, leading to the ground floor, which is 6 ft. above the level of the road. The steps lead to an open portico, 11 ft. wide, and stretch the whole length of the front, 78 ft. It is supported on columns, with carved capitals and bases, from which spring seven pointed arches. The front of the building is thus divided into seven bays. It may be mentioned that the base of the building curves out a little instead of being perpendicular, as is ordinarily the case. The portico is laid with Coalbrook Dale tiles, and is built throughout of freestone. The front wall is divided into the same number of bays, each one corresponding in dimensions with the arch which faces it. The three middle ones are devoted to doorways, and the remaining four to windows which light the entrance-hall and offices. These windows each consist of three lancet-headed lights, surmounted with a hexagonal tracery light, the whole being enclosed in a richly-mounted pointed arch, resting on carved shafts, with foliated capitals. Passing through the entrance-doors (which slide on iron rails) we get into the entrance-hall, 53 ft. long and 18 ft. 6 in. wide, which is tastefully corniced and decorated. There is a committee-room to the left, and directly in front of the entrance is the door to the ground-floor museum. This is a large apartment, 52 ft. by 40 ft., and 22 ft. in height. Running down the middle of the room is a series of octagonal freestone shafts, from which spring arches, for the support of the floor above. The room is lighted by five windows on the Baskerville-road side, of geometrical tracery, exactly the same as those described in the front, and four on the opposite side, which looks into a small yard. Light is also borrowed from the entrance-hall and back staircase, so that there is no lack of that essential element. Each of the side windows is 14 ft. high, and 8 ft. in width. From the entrance-hall access is also gained to a spacious library, 60 ft. by 24 ft., and a reading-room, 40 ft. by 24 ft.; librarian's room, curator's room, and all necessary offices. The reading-room and library are lighted by means of a lantern roof, all windows being thereby dispensed with, and quietness and seclusion—the great requisites of this department—ensured to the students. The height from the ground floor to the eaves of the lantern is 36 ft. A gallery runs round both rooms, communicating with a ladies' reading-room, and on the same level as a mezzanine floor. A flight of steps from the entrance-hall takes us to the first floor, which is devoted to a larger museum, covering an area of 4,864 square feet, and 24 ft. high.

So much for a picture of the finished building. Under the superintendence of Mr. Clayhorough (Messrs. Warburton's manager) rapid progress is being made. All the first floor timbers of the work are laid, and the fronts are ready for the

sills of the first-floor windows. The library and reading-room are ready for the roof timbers, and the contractors expect to have the roof on by Christmas. We may mention that the building is being erected of Farley Down red-stone, supplied by Mr. Rogers, of Bradford-on-Avon; and the timber used is supplied by Messrs. Barnes & Son.

LOWESTOFT PUBLIC HALL AND ASSEMBLY ROOMS.

SIR,—As an instance of the great energy and profound wisdom which characterise many of the promoters of public competitions, I beg to supply you with the following particulars, which I trust, you will publish for the benefit of the public generally, and competitors in particular. The directors of the above company advertised in your columns a week or two ago for designs for New Assembly Rooms, &c., to be sent in on or before Monday, the 23rd day of August, in reply to which twenty-four designs were received and duly exhibited in the Town-hall, Lowestoft. On the 27th, or just four days later, a printed circular was forwarded to the competing architects, informing them that their drawings "not having been accepted have been carefully re-packed and forwarded to your address," also that the first premium had been awarded to the design bearing the motto "Nil Desperandum," Oswestry; and the second to that marked with "Keystones, with interlaced triangles," Lowestoft. On looking over the pages of a local paper, I find a satisfactory solution of what at first sight appeared to me the possession of a somewhat marvellous amount of discrimination on the part of the directors. Quoting from the newspaper report. "The first prize has been awarded to Mr. W. H. Spaul, Oswald Chambers, Oswestry, a nephew of our fellow townsman, Mr. W. Spaul; and the second prize to our fellow townsman Mr. W. Oldham Chambers."

I would merely add that the name of the secretary to the company is Mr. W. Spaul, and with this intimation I leave the competitors to draw their own conclusions.

JUSTITIA.

THE NEW POPLAR WORKHOUSE.

ALLEGED BREACH OF CONTRACT.

The ordinary weekly meeting of the Poplar Union Board of Guardians, held on Friday, the 27th ult., was of a very exciting character, in consequence of a special report being presented by the workhouse committee, in which was the following resolution:—"The committee regret having to express their opinion that the timber materials used in the construction of the new buildings are not in strict accordance with the terms of the specification." It will be remembered that in March last the guardians and for the alteration of the present workhouse, in order to provide accommodation for 808 able-bodied inmates. Out of thirty-two tenders, Messrs. Hill, Keddall, & Waldram, of 24, Abchurch-lane, were chosen, and the works were forthwith commenced. The buildings have so far progressed, that the builders have already received payments to the extent of 4,000*l.*, and work valued at nearly 8,000*l.* has been accomplished. It appears, however, that during the past few weeks the members of the workhouse committee, amongst whom are three well-known timber-merchants, have expressed considerable dissatisfaction with the quality of the materials brought on to the premises. Hence the resolution presented to the Board last Friday.

The specification provides that "the timber is to be of the best quality, Danzig, Memel, or Riga yellow, and the sills to be the best Christiana—no Swedish deals to be used in the works."

The Board severely interrogated Mr. Weister, the clerk of the works, who said that 1,100 deals brought on to the ground had been rejected as defective, and had been nearly all sent away. Some Danzig and Memel timber was on the premises, but that which had been used was not first quality; in fact, he did not believe there was a piece of timber on the premises which would accord with the terms of the specification. He was well acquainted with the specification, and he was of opinion that there was not a first quality deal on the ground. The machinery work was also defective, and was not of first-class manufacture, as required by the contract. The timber used in the works had been used under a special meeting of the Board. He had called the architect's attention to the defective quality of the timber, and also of some bricks, and some Swedish deals. He believed that the 1,100 deals were Swedish deals.

An animated discussion followed this statement, and for long time it was a question whether the works should be suspended, and the matter referred to arbitration. Eventually it was decided to hold a special meeting of the Board on the following Monday, and to summon the attendance of the builders, the architect, and the clerk of the works. At the special meeting on Monday afternoon, Mr. Morris, the architect, was examined, and after making a few preliminary remarks, he said, in reply to questions, he had examined a quantity of material brought on to the premises by the builders, and had ordered its immediate removal. There was no doubt that the clerk of the works, who appeared anxious to have the contract carried on to its integrity, had experienced great difficulty in consequence of large quantities of defective material being brought on to the premises. In reference to the timber used, he did not think there had been any made use of that was not in accordance with the specification.

A Member.—The clerk of the works says that all the timber on the ground is of an inferior quality to that specified in the agreement.

Mr. Morris.—That is not a fact. A Member.—The clerk of the works also says that there is not a first-class quality deal on the premises.

Mr. Morris.—Allow me to explain that first-quality timber does not always mean the best timber.

Another member (Mr. Lenanton).—I have had many years' experience in the timber trade, and I am not aware of the distinction referred to. I have always understood that there are three classes of timber, viz., 1st, 2nd, and 3rd quality; or, in other words, best, seconds, and thirds. I am greatly astonished to hear Mr. Morris make that statement.

The chairman, who is a timber merchant, signified that the last speaker's remarks were quite correct.

Mr. Ravenhill (engineer).—Has any Swedish timber been used?

Mr. Morris.—No: we have used yellow deals, which are allowed by the profession to be stronger than Danzig of the same standard.

Question.—In your opinion, what is the quality of the timber being used?

Mr. Morris.—The best timber, first quality, free from all defects.

Mr. Morris was questioned as to the quality of the lime used, and it appeared that he had substituted "town-made blue lime" for Athertham blue lime, the latter being specified in the contract. He was next asked as to the quality of the bricks, and he said that they were according to specification. Several guardians were of a different opinion.

The architect then retired; and after a discussion it was moved and seconded that "After hearing the statements made by the architect, it was advisable to engage a practical man to decide for the guardians whether the materials used in the buildings were in accordance with the specification." An amendment to this was proposed, namely,

"That a letter be written to the builders stating that the Board's attention had been called to the fact that material had been used which was not in accordance with the specification, and calling upon them for an explanation." The amendment was eventually carried, and the meeting adjourned until the following Friday, when the builders' statement will be laid before the Board.

CAUTION TO BUILDERS.

SIR,—Having to remove and reset the arch, and refix a chimney-piece and stove, of a house in Oxford-street, it never occurred to me to call in the district surveyor; for, during many years' experience as a builder, I had never heard that it was necessary so to do, and I am of opinion that the trade are generally as ignorant upon this point as I was.

Mr. Jennings, our district surveyor, has set the matter at rest by summoning me before Mr. Knox, at Marlborough-street, who consulted the Building Act, and decided in Mr. Jennings' favour.

I therefore venture to ask you to insert this letter in your journal as a necessary piece of information to builders who are desirous of avoiding the loss of time, vexation, and expense of attendance at a police court.

Yours, &c., JOHN W. SNOW, JEV. * * Builders who read the Building Act (and there are builders who do not do so) will not require our correspondent's caution. The Legislature regards with great jealousy any meddling with chimney breasts; and very properly so too.

LIGHT THROUGH GLASS.

SIR,—Will one of your correspondents be kind enough to inform me, through the medium of the *Builder*, as to the difference between the amount of light transmitted through ground glass and that through crown glass? I also desire the composition of a good cement for stopping large squares of glass in stone windows? A SUBSCRIBER.

INSURANCE OF THEATRES AND MUSIC-HALLS.

SIR,—Now that Mr. Lowe has taken off the duty on fire insurance, would it not be possible to form an insurance company for the special purpose of insuring theatres, music-halls, and other public buildings? The premiums at present charged for insurance are something enormous. In the *Era Almanac* for 1868, at page 45, there is a list of fires which have taken place in London theatres and other public places of amusement, from July, 1833, to December, 1867. In these 34 years the number of fires amounted to 53, but of these only 7 were totally destroyed, whilst in several others the damage to the buildings was only partial.

A late number of the *Daily News* (in June, I think) gave a list of the theatres in all the principal nations of Europe, and, if I recollect, in Great Britain there were 372. Modern theatres are much safer than the old ones, as stone and iron are so much more used in their construction.

CHARLES GATE.

THE SHRINE OF EDWARD THE CONFESSOR, WESTMINSTER ABBEY.

THERE is now on view at South Kensington, in the upper gallery next the Horticultural Gardens, a series of three drawings, showing a restoration of this unique relic of Medieval time. This shrine was executed by Italian mosaic workers, whom Abbot Ware brought from Italy. It was completed in the year 1269, so is exactly 600 years huilt. The ancient inscription recorded that it had taken ten years to complete, and that its maker was Peter of Rome (supposed to be identical with Pietro Cavallini, who executed several works of this kind in Italy). This restoration is by Mr. Thomas Henry Lingfield, of Dublin.

The drawings are very elaborate, and show zeal and ability. Without accepting the restoration in its entirety, we can offer Mr. Lingfield hearty commendation.

STRASBOURG CATHEDRAL AND ITS BUILDERS.

SIR,—The following quotation, being a note (p. 68, vol. i.) in Bader's "Badenia," may be read with interest after the article on Erwin von Steinbach, in your last issue:—"An old author says, 'Thereupon were given into the hands of the magistrates and of the priests in those lands certain money-hoxes, and on the four festivals of the Virgin these men did exhort the people, saying, My dear friends, give for the edifice of our Lady of Strasburg; whosoever would entreat her mercy, let him put money in this box; no matter whether it be unhallowed goods, or gotten by theft or robbery; and he shall have indulgence and pardon for his sins; it is a good gift unto our Lady.'"

This passage, in the translation of which I have ventured to imitate the quaint phrasing of the original, is not only curious, but edifying from a moral point of view, and was issued by Bishop Conrad, of Lichtenberg (not Lichtenstein), when he determined to finish Strasburg Cathedral, begun two centuries earlier by Bishop Werner.

ALFRED STRONG.

COMPETITIONS.

Bridlington.—The committee for the proposed new church on the Beaconsfield Estate invited five architects to compete in the preparation of designs, &c., for the new building, viz.,—Messrs. Atkinson & Son, York; G. Fowler Jones, York; R. G. Smith, Hull; Chambers, Sunderland; and A. Crouch, Bridlington Quay. The various drawings have been exhibited in the Victoria-rooms during the past week, and on Monday the committee held a meeting to decide on the merits of the designs. In addition to the plans of the before-mentioned architects, a set of drawings signed "Con Amore," was admitted to the competition. The decision of the committee was thus—1st voting, Fowler Jones, 2 votes; "Con Amore," 3 votes; R. G. Smith, 9. The work is to be proceeded with immediately.

The Hampton Schools.—We are informed, in respect of this limited competition, that the committee have selected the designs of Mr. Arthur Allom.

CHURCH-BUILDING NEWS.

Richmond.—The want of church accommodation in the neighbourhood of Richmond, in Surrey, has long been felt, and the inhabitants of the parish of St. John having some time since raised a fund for building a new church, application was made to several architects for designs, and from those sent in that of Mr. Raphael Brandon was selected. This is for a building in the Early English style, or Gothic of about the period of the thirteenth century. Messrs. Dove, of Islington, have taken the contract to erect the church, in the most solid style of Bath stone and Kentish rag-stone, for the sum of 5,000*l.* This contract includes the body of the church, which is calculated to seat comfortably 800 persons, and the lower stage of the tower, the spire being for the present not contracted for until the fund shall receive considerable accessions. The interior of the edifice will be 120 ft. in length and 56 ft. in breadth, including the aisles. The breadth of the nave will be 27 ft., of the chancel 24 ft., and of the transept 19 ft. On the north side will be a large vestry-room, and the tower will be in the angle formed by the chancel and the south transept. The apex of the roof will be 50 ft. from the floor of the church, and the roof will be constructed with open timbers. The foundation-stone was laid on the 26th ult. by the Princess Mary of Cambridge and Teck.

Sandwich.—An appeal is being made for subscriptions to the restoration of St. Clement's Church in this town. This church has been for years in a lamentable state of disfigurement and decay. Out of its twenty-four stone windows there were only four at the commencement of the present effort not filled up with unsightly wooden frames. Sufficient, however, of the stone-work remains to allow of exact restorations in nearly every case. The area of the church comprises nearly 7,000 square feet, and thus the thorough restoration involves a large outlay, far beyond the means of the parishioners or the immediate neighbourhood to supply. An attempt is to be made to restore in some measure the middle chancel, which is 40 ft. in length.

Mordiford.—The parish church of Mordiford, near Hereford, has been re-opened for divine service. Prior to its restoration the church was

filled up with high pews and galleries, fixed not many years ago, and the walls were plastered and limewashed not only inside, but outside as well; some of the original Norman and Early English features, however, remained, though they were greatly disfigured by having been plastered over, while in some cases the mouldings had been cut away to afford room for wood panelling. There was an ancient Norman entrance doorway to the nave on the south side, which has in the restoration been cleaned and repaired, and fitted up with a new oak door and ornamental iron hinges. An early Norman doorway of very simple character was also found walled up in the north wall of the nave; this has now been inserted in the outer wall of the vestry. An Early English lancet on the north side of the chancel has been taken out and reset; the arches to the choir and chancel bays likewise been taken out and repaired; the larger of the two, which is between the nave and the choir, was found to be in such an unsound condition that it was necessary to take it down and entirely rebuild it; but by preserving the old stones, the character of the original arch has been preserved. The roofs of the nave, choir, chancel, and porch, which were plastered internally, have been replaced by open timber roofs; an aisle has been added on the north side of the nave, and divided from it by an arcade of four bays, the pillars of the arcade being of blue Hamam stone, with carved capitals and moulded bases. The whole of the interior of the walls of the new aisle are executed in grey stone, ashlar faced, the windows and other external stone dressings in the north aisle, vestry choir windows, east window of chancel, and west window of nave, being executed in stone obtained from the quarries at Gainsbill, near Shrewsbury. The old font, which was a small basin placed on the top of a pedestal, has been replaced by a new one. The old oak pews in the nave have been converted into open seats, with sloping backs; the new aisle has also been fitted with new seats. The church is fitted with Moulle's patent warming apparatus. The passages between the seats throughout the church are laid with encaustic tiles from Mr. W. Godwin's manufactory at Widdington. The whole of the works have been executed from the design and under the superintendence of Mr. F. R. Kempson, the contractors being Messrs. Webb & Son, of Hereford; the carving was executed by Mr. Welsh, a son of the contractor. The three-light chancel window has been filled with stained glass, containing three subjects from the life of our Lord, namely, the Nativity in the first or left hand division, the Crucifixion in the centre, and the Ascension in the third or right-hand compartment. These are placed in panels of geometrical shape, intersecting. The window is the work of Mr. Charles A. Gibbs, of London, by whom, it may be remembered, the whole of the windows in the lady chapel of the cathedral were also executed.

Debenham.—The church of Debenham is soon to be placed in the hands of the builder for the purpose of being restored as far as funds will permit. Eight large clearstory windows have already been inserted on the south side, in the Perpendicular style. This work was executed by Mr. James Gunn, of Debenham, and was paid for by the parishioners through a rate. The church has an open roof of stained oak, which was partially restored by the Rev. J. Bedingfield. It is proposed to place the organ, which now occupies a gallery at the porch end, at the end of the north aisle, and to shift the pulpit and reading-desk nearer to the chancel arch, doing away with the sounding-board now over the former. As to the end of the south aisle, it is suggested that a vestry should take the place of the chapel. By removing the organ to the spot named, the present gallery, which is propped up, can be taken away, and the old Saxon arch exposed to view. It is intended, as soon as the required sum is forthcoming, to re-bench and re-floor the church. There are about sufficient of the old benches left to re-seat half the church. When the pews were erected the old benches were not removed, but covered over, so that,—excepting in instances where the poppy-heads have been awn off,—the old benches are perfect, and as the boards are of great thickness, they will admit of the required planing. It is estimated that the cost of reseating and re-flooring the church will be about 600*l*. The project has been in hand since last September, and about 230*l*. have already been raised in various ways. It has been determined not to begin the work until the sum required has been raised.

Milnrow (Rochdale).—The Bishop of Manchester has consecrated a church at Milnrow, a thriving village, containing a population of about 5,000 inhabitants, and situated between two and three miles from Rochdale. The new church has been built near to the old edifice, which was erected in 1798, and of late years found to be inconvenient and too small, as well as dilapidated. Now that the new one is completed, the old church is to be pulled down and cleared away. The late Mr. James Schofield, a wealthy manufacturer of Milnrow, bequeathed 3,000*l*. to the erection of the new church, and Mrs. Hannah Schofield and Capt. Schofield also contributed. The late Mr. Robt. Ashworth, of Bellfield, bequeathed 300*l*. for a memorial window, and there were other contributions. The church is built on an eminence, with a tower 90 ft. high. In shape it is a parallelogram, 64 ft. by 34 ft. It is divided into chancel, 31 ft. 3 in.; a nave, 79 ft. 6 in., by 28 ft. 2 in.; an aisle, that on the north, 86 ft. by 15 ft. 3 in., and extending the whole length of the nave; and that on the south, 79 ft. 6 in., meeting the Schofield chapel and another apartment, which increases the length to 105 ft. 3 in. On the north side of the chancel is the vestry, and also the organ-chamber; and the tower, with a bell-chamber, and peal of bells, is at the west end. The design is Decorated. The edifice is built of Huddersfield ashlar and of Dumford Bridge pier-points. It will seat about 1,140 persons, and the cost will amount at least to 10,000*l*. The church has been built from the designs of Mr. Street.

Horsmonden.—The foundation stone of a new Chapel-of-Ease to the parish church of St. Margaret, Horsmonden, has been laid. A suitable site having been presented by Mr. E. Wilson, and about two-thirds of the amount required to erect the building having been promised, a design was obtained from Mr. B. Wheeler, architect, and a contract entered into with Mr. Anscombe, of Maidstone, to erect the church, which, when completed, will accommodate about 150 persons.

West Kirby.—The old parish church of West Kirby, situated near Hoylake, at the mouth of the Dee, is about to be restored at a cost of about 3,000*l*. Some of the preparatory work has been proceeded with, and the foundation-stone of the new edifice has been laid. Messrs. Kelly & Edwards, of Chester, are the architects of the new building; and Mr. John Dobson, of Rock Ferry, the builder.

Pavenham.—During the last two months this church has undergone various alterations. A new roof has been erected on the chancel, an oriel window has been put up, and a communion-rail has been laid, the expense of these works having been defrayed by Trinity College, Cambridge, patrons of the living. In addition, the side chapel has been newly roofed, and a window erected, at the expense of the parish, Mr. J. Tucker contributing 50*l*. towards the fund. The repairs and alterations have been carried out by Mr. Cunvin, huilder, Bedford. The church has been re-opened for divine service.

DISSENTING CHURCH-BUILDING NEWS.

Swansea.—A new Congregational chapel has been opened here for divine service. It is the third opened in this town within some three or four years. The foundation-stone was laid about three years ago. The entire structure will not be considered complete until the addition of a tower to the chapel, school-rooms, &c., the total cost of which will be between 5,000*l*. and 6,000*l*., of which amount a considerable sum has already been raised. The site has streets on three sides of it; but owing to its shape and position, the chapel presents a side elevation instead of a front to the main road, Walter-street. The width of Humphrey-street at the west end of the site is, however, sufficient to allow of the front being seen in connexion with the side, and the building line is set back 15 ft. from the road boundary in each case. It is intended that at the south-west corner a tower shall appear, 85 ft. high to the foot of the spire, the latter rising 50 ft. above, or 115 ft. in all. The entire scheme includes a chapel capable of seating 1,000 adults, and measuring 95 ft. by 50 ft. within the walls; a school-room, 60 ft. by 30 ft.; a lecture-room, 44 ft. by 24 ft.; an infants' class-room, 24 ft. by 17 ft.; two vestries, and other apartments. At present, however, the chapel only and the vestries, &c., in immediate connexion with it, have been erected. When the whole group, including chapel and school,

is completed, it will present a line of building facing Walter-street 135 ft. in length. From the floor to the springing of the roof the chancel walls are 28 ft. high; and the apex of the ceiling, which is in fact an inner roof, is 46 ft. from the floor. The roof is one span, and the interior is not obstructed by columns. Side galleries are provided for, four seats deep, including a seat in the passage next the wall. The end gallery is eleven seats deep. Two tiers of windows appear in the side bastion, one below and the other above the galleries, all fitted with geometrical tracery. All the constructive timbers in the interior of the building are in view, and are stained and varnished. The walls are of native stone, faced with dressed wall-stones in level courses, and all the windows and doorway and all external angles have dressings of Bath stone. The style of the building is English-Pointed Gothic in the geometrical period. All the details are simple and inexpensive. The entire building has been fitted up by Messrs. Haden's warming apparatus, and ventilation and extraction of foul air will be effected by means of the tower and spire. The architect is Mr. H. J. Paull, of Manchester. The builders are Messrs. Thomas Watkins & Jenkins, of Swansea. The lighting fittings were done by Mr. Holmes, brazier and gas-fitter. The organ was manufactured and placed by Mr. H. S. Dane, of Swansea.

Dudley.—At Kate's Hill a new Wesleyan chapel is to be erected. Some time ago a meeting was held, at which the sum of 1,100*l*. was collected or promised towards the expenses of erecting the new chapel, &c., and renovating the old one in King-street. Messrs. Holland & Sons have contracted to erect the new edifice, which is to be in the Gothic style, for 2,020*l*. Two memorial stones have been laid in the presence of a large assembly. The work, including the renovation of King-street Chapel, new vestries, and class-rooms, will cost 4,000*l*.

STAINED GLASS.

St. Mark's, Broadwater.—This church has been enriched by the addition of two stained-glass windows, erected by public subscription to the memory of the late Earl of Abergavenny. These windows occupy the whole of the north and south transepts of the church, and the subjects are the Four Greater Prophets and the Four Evangelists. They have been executed by Mr. O'Connor, of London. The walls of the transepts have at the same time been ornamented with mural decorations in oil, forming a setting to the windows themselves. In addition to these windows the committee have had sufficient funds to fill with coloured glass the two smaller windows in the organ chamber and vestry, and also to add two additional steps to the organ, which was Lord Abergavenny's last gift to the church, which he had previously built and adorned.

FROM IRELAND.

New Roman Catholic Church of Crosshaven.—The foundation-stone of the new Catholic church of Crosshaven, co. Cork, was laid on the 22nd ult. The church is dedicated to St. Bridget, as patroness. The site chosen for the church is picturesque and commanding. It stands due east and west on a bill, opposite the entrance of Carrigaline river. In plan it has chancel, side chapel, nave, and aisle. The side arches of the nave will be supported by polished column of red Cork marble, and over the arches will run the clearstory. On the south side of the edifice will be the sacraments, and on the south-west angle a baptistery will be provided. The roof will be open-timbered work, with ceiling spaces, panelled. In length the structure will be 92 ft. by 42 ft. in width in the clear, and from ridge pole to floor it will be about 55 ft. The building will be externally faced with limestone, the doors and windows having Bath stone dressings. On the western or main entrance an outside porch is provided, and a lofty spire will stand midway in the length of the north elevation. A statue of the patron saint will stand in a niche in the centre of the lower part of the chancel gable. Over the niche, in the upper portion of this gable, and filling up the space above the high altar, as seen from the inside, will be a very large and well-designed rose window. Smaller windows of a similar form, but varying in design, will appear in the gable of the aisle. The style of the new church will be what is lately called Victorian Gothic.

the church will be from the designs of Mr. E. W. ... and the work will be carried out under ... personal superintendence of Mr. Collinridge ... The contractor for the building is Mr. ... Evans, of Cork.

Ballyhooley New Church.—The new Catholic church of Ballyhooley recently erected, of which ... previously gave a description, has been dedicated by the Right Rev. Dr. Keane, Lord Bishop of Cloyne. As far as the exterior is concerned, the church may be said to be complete ... appearance outside is effective, being built of limestone, alternated with bandings of ... of red sandstone. The inside, which is ... completed as to the fittings, which are at present in some cases nearly temporary, has received further additions, which give it more an air of comfort. The nave is diamond-paved throughout, and the aisles are boarded; the ... is also provided with seats to accommodate a large number of persons. The altar yet is ... temporary, and is, of course, of wood. ... are required to finish the intended internal ornamentation of the church.

Books Received.

Studies for Art Designers and Manufacturers. By JOHN GIBBS, Architect. Oxford, 14, Pembroke-street. 1869.

MR. JOHN GIBBS, of Oxford, best known as the designer of the Memorial of the late Prince Consort in Abingdon, the memorial of Sir George Arncliffe Lewis, and that of Sir Tatton Sykes, has commenced the publication of a large work, entitled, "Studies for Art Designers and Manufacturers,—being a Series of Designs for the details proper for Ecclesiastical, Domestic, and other Buildings, developed after the Manner of the Roman, Byzantine, Gothic, Elizabethan, and other Styles, up to the present Day." It is intended for the use of architects, sculptors, painters, masons, builders, goldsmiths, decorators, and artists, as well as for schools of art, and other places where the arts of designing and drawing are taught. The first part now before us consists of twelve large plates (in a cover), all drawn and printed in tinted lithography, including capitals, sculptured strings, paterae, places, scrolls, diapers, iron work (very good), foliage (bold and free), and aeredos. The drawings are printed on stiff paper. The author says, "The work will not be issued in any bound form, as each plate, being a picture and complete in itself, can be more conveniently handled; in some instances it may be found advisable to mount and suspend the plates." This being the case it would have been advantageous if each plate had borne some slight descriptive particulars. Three other parts, each containing the same number of plates as this, will complete the work. It is a costly and important undertaking, and should receive support from those competent to give it.

Arms and Armour in Antiquity and the Middle Ages: also a Descriptive Notice of Modern Weapons. Translated from the French of MONSIEUR P. LACOMBE, with Additions, by CHAS. BOUTELL, M.A. London and New York: Cassell, Petter, & Galpin. 1869.

MR. LACOMBE'S book is by no means a complete and satisfactory work, but it was desirable we should have in English what he had said: moreover it includes a number of very good wood engravings of arms and armour. Mr. Boutell, in endeavouring to supply some of the deficiencies, has added a sketch of the history of English Arms and Armour altogether omitted by the French author; also a number of notes at the end to connect the text with matters interesting to English readers.

The objection that may be taken to the book is the want of order and arrangement that prevails; the same thing is treated here, there, and all over. On the other hand it is very pleasant reading, and will doubtless lure many to a more precise study of the interesting subjects of which it treats. Moreover it is a pretty volume for the drawing-room table.

An Illustrated Natural History of British Moths. By EDWARD NEWMAN, F.L.S., &c. London: Tweedie. 1869.

This handsome volume one thing is much to be regretted, that its numerous and beautiful specimens of moths have not been chromolithographed. The want of the colours is a great

defect, though certainly the addition of colours would have necessitated the withdrawal of each specimen from its context; but this, we think, would have been a minor defect compared with the want of colours so characteristic as those of many insects are.

Each insect form is given of the full size, and the text is not a mere compilation, very much of it being original, and having no previously published source, in fact, from which to copy.

VARIORUM.

"Suggestions for a Railway Route to India." By Thomas Chenery, M.A., Ch. Ch., Oxford Professor of Arabic, and Barrister-at-Law.—Mr. Chenery is sanguine as to the success of a railway route to Constantinople, and right through Turkey in Asia and the South of Persia, to Kurrachee, or at least to Bunder Abbas. The time-distance he calculates at nine days, reducible perhaps to six. The scheme, he urges, would be one at least as practicable as that now accomplished in America. "From the information I have collected," he says, "on good authority, I believe that a railway constructed with real English solidity, and capable of bearing traffic at a high rate of speed, can be made through the whole of Asiatic Turkey, from the Bosphorus to the Persian Gulf, for 12,000,000 a mile; and a much cheaper one, he adds, could no doubt be constructed. As such a line would, he estimates, take ten or twelve years to complete, and as no doubt India will by that time be pretty well traversed by railways, now is the time to consider of such a project. The Turkish Government, he thinks, with the aid of the British Government would take an active interest in the opening up of Turkey in Asia by such a route.—"Borough of Salford: Report of the Surveyor as to the State of the Sewers in the Salford District." In this report Mr. Bowden, C.E., reports that the Salford sewers are in general acting satisfactorily; but the mortar is, in many cases washed out of the brick joints, and a great number of the old sewers are too near the surface, and too large in sectional area, thereby encouraging the deposition of detritus and filth within them, and turning the whole into a vast cesspool.

Miscellaneous.

Discovery of Roman Remains in Scotland.—At a railway cutting which passes through old Camelon, near Falkirk, a drain of remarkable size, built of squared blocks of freestone, and covered with slabs of the same material, was exposed. This drain had long provoked the wish of antiquaries for a further exploration. Mr. Wilson, of Banknock, with a band of workmen, recently devoted two days to excavation. Penetrating as far as was practicable on each side of the railway cutting, they reached strong foundations of walls, two on the south and one on the north side of the railway. The points on which they struck were the corners of buildings, which were found to rest on a pavement of flagstones bedded in clay. Above these walls, and all around, was an accumulated mass of debris of ruined buildings, through which were dispersed bones of the ox, sheep, pig, and deer, fragments of pottery (some of which were of Samian ware), handles of amphoræ—on one of which were distinct letters—many bricks, and bits of tile flues. A circular disc of bronze about the size of a florin, attached to a nail, was found in one of the buildings. On a large square brick was the impression of a dog's foot, a circumstance which has been often noticed in Roman bricks. It is to be regretted that circumstances would not permit of a more thorough search.

New Waterworks at Leeds.—The first sod of the Lindley Wood reservoir,—which is to be about a mile and a half in length, and capable of receiving 749,000,000 gallons of water,—has been cut by the Mayor of Leeds, in the presence of the members of the council. The reservoir is intended to gather the waters of the Washburn, from which the improved water supply for the borough is to be secured. It will supply about 10,000,000 gallons per day, of which 4,000,000 will be sent into the wharf as compensation water, and the remainder conveyed to the Arthington pumping station, and thence to the town through the Westwood filter-beds. The cost of the works will be from 60,000l. to 70,000l., and their completion will extend over from two to three years.

The Offices for the Poplar District Board of Works.—At a recent meeting of this Board, reported in the *Clerkenwell News*, the chairman directed attention to the fact that under the specification for the new offices, zinc would be used in covering the dome of the octagon tower, and upon the roofs of the main building. He felt himself that the material was not a proper one for the purpose, and that it would be better to use lead. He had seen Mr. Harston, the architect, on the subject, and he said that he should certainly prefer lead for the dome of the tower, but that he thought that 15 gauge zinc would do very well for the flats of the roof. The architect had roughly estimated the cost of substituting 6 lb. lead for the zinc, and he found that this over the whole roof would be about 279l. or 55l. for the dome only. Mr. Edinger adverted to the difference of opinion even among builders on this matter. After considerable discussion, it was moved that the dome should be covered with 6 lb. lead in the place of zinc, provided the expense did not exceed the amount specified by the architect, and that the contract was not in any way infringed by the change. The motion was put twice without a sufficient majority being obtained to carry it. On putting the question the third time there seemed to be 13 votes for and 12 against the motion; but a division was taken, and the numbers were reversed as follows—For, 12; against, 13. The motion was accordingly lost.

Parish Mortuaries and Dead Houses.—At the last meeting of the vestry of the parish of Greenwich, the state of the dead-house was discussed. It was ultimately resolved to convert the present toll-house into a dead-house, to be fitted with proper slabs, means of ventilation, a water supply, sinks, and other requisites. The present old dead-house had been in use in its present state for about fifteen years.—The Poplar District Board of Works, at its last meeting again considered the proposal to erect a public mortuary for the parishes of Poplar, Bow, and Bromley, a report from the works committee recommending that such a building should be constructed in accordance with the plan of the surveyor. It will thus be seen that the parish of Poplar has been added to the area for the use of which the mortuary was originally proposed. The recommendation of the committee was adopted. The *Clerkenwell News*, commenting on this decision, rightly remarks that there should certainly have been a separate mortuary for the spacious and populous parish of Poplar.

Alarming Occurrence at Manchester.—Twenty persons were thrown into the Irwell at Lower Broughton, Manchester, on the laying of the coping-stone in connexion with the new suspension-bridge connecting Congleton and Salford. The Mayor of Salford and the bridge committee were assembled on the Broughton side of the Irwell upon a platform erected round three sides of the stone pier, there being also a large concourse of other spectators. The Mayor was making a few introductory remarks, when that part of the platform on which he and the committee, together with ladies and others, were standing, and which projected slightly over the river, suddenly fell with a crash, forming a sort of inclined plane to the water, and tipping about twenty persons into the river. The water being only shallow in that part, there was little danger of drowning, but for a few minutes panic and confusion prevailed. The most serious injuries were to clothing, though some bruises and scratches were also sustained.

Boiler Explosion in the North.—A boiler in the kitchen of the house of Mr. Edward Pease, of Greencroft, Darlington, exploded without warning. The force of the explosion was so great that the boiler and grate were broken in pieces and blown in all directions, one part going through the wall at the back, and another into the kitchen. A large portion of the wall was blown out. The cook was severely scalded. We have before now asked the question, why there are so many more kitchen boiler explosions in the North of England than in the South, and wish some one acquainted with both districts would look into the matter, as it might lead to a remedy or preventive for such explosions.

Model of an Indian Gateway.—We understand that the Government of India has made arrangements for having a cast taken of the principal remaining gateway of the Sanchi Toppe, near Bhilsa, with a view of having produced several copies of this work, which is supposed to date about 250 years B.C.

Steam Fire Engine for Hamburg.—An engine on a new principle was tried on Wednesday in last week, at the Grand Surrey Canal, in the presence of a number of engineers and other gentlemen connected with fire-engines and fire-escape matters. It is the first that has been made of the newly-patented Equilibrium Steam Fire-Engine. Materials for the fire being laid, and the boiler supplied with cold water, steam, it is said, was raised to a pressure of 100 lb. to the square inch in seven minutes and four seconds from the time of lighting the fire. The engine was then set to work, with two jet pipes, being one each, 10-16ths and 12-16ths of an inch in diameter; afterwards with four jets, being two each, 10-16ths and 12-16ths of an inch diameter, reaching an altitude of 120 ft. Then one jet, 1½ in. diameter, to a height of 150 ft.; a jet 1½ in. diameter was then tried, throwing the water over 100 ft. high, concluding with a jet of 1½ in. diameter.

A Self-supporting Gaol.—The annual report of Mr. James Caldwell, the governor of the gaol at Dunedin, New Zealand, dated the 14th of April last, states that the value of the labour of the prisoners during the year ending March last, more than covered the entire expenditure of the establishment, without taking into consideration the labour of such prisoners as were engaged in prison employment, such as cooking, washing, cleaning, &c., and various other works connected with the gaol, which contained, when the report was printed, 789 inmates, of whom 43 were debtors and 6 inmates. During the year there were received into the gaol 595 males and 147 females. The expenditure on account of the gaol for the year was 7,365l. 2s. 8d., and the value of the prisoners' labour was 8,778l. 3s. 7d., showing an excess of 1,393l. 0s. 11d. over the expenditure. A considerable number of the male prisoners are employed in dredging the harbour, reclaiming swamps, and even in sweeping the streets of the town, &c.

The Facade Sculptures on the New Opera House, Paris.—Carpeaux's "Dance," against the indecency of which we protested last week, has, we regret to learn, given occasion to considerable damage, both to itself and to others of the group of sculpture, as well as to the façade itself, from having been splashed with ink by some one who seems to have thrown a bottle of ink at the Bauchante. Endeavours are being made to remove the stains. This was not the proper way to get rid of an objectionable ornament, and we have no sympathy with the malicious scamp who did it, whatever his motive might be. Some ascribe it to envy of the sculptor, but that is not so likely a motive as the desire to get rid of an indecent figure by disgracing it. Another outrage of a similar description has been committed in the garden of the Luxembourg, where a bottle of ink has been thrown over the marble group of Acis and Galatea of the Médicis fountain.

Interesting Discovery.—A correspondent of the *Midstone and Kentish Journal* says:—"My attention has been called to an interesting discovery just made at the Palace. In repairing one of the old panelled rooms the modern wooden mantel-piece fell down, and exposed to view an ancient stone chimney-piece carved in Kentish rag. It is arched, and in the spandrels are two shields, which, on examination, I find bear the arms of the see of Canterbury, impaling those of Archbishop Warham—'Gules, a fesse or; in chief a goat's head couped argent, armed of the second, in base three escallops of the third.' The arms on the right-hand shield are curiously reversed, Warham occupying the dexter, and Canterbury the sinister side of the escutcheon. Warham held the see of Canterbury from 1504 till his death in 1532, and was succeeded by Granmer, the last episcopal owner of the Palace."

Working Men's Club Union.—On the 28th ult., in accordance with arrangement, some 200 members of the Working Men's Club and Institute Union paid a visit to the outfall of the London sewage at Crossness Point. They also went to Barking, but by some accident preparation had not been made there to receive them.

An Acoustic Dodge.—It is stated in an American paper that Mr. Ossian E. Dodge, of Minnesota, has invented an "acoustic register," by means of which he tunes concert-halls to the size of the audience, and makes a whisper audible whether there be ten or ten thousand to hear!

Lincoln Cathedral.—An improvement has just been effected in this cathedral, the north gate of the upper transept, leading into the choir, having been renovated at the cost of the Ven. E. Trollope, archdeacon of Stowe. This gate is of great age. The upright bars have been continued, and are unmounted by gas jets, forty-six in number; the wooden beam at the top has been taken away and iron substituted; and the whole of the ironwork has been cleaned and repainted a chocolate colour, the bands of the tracery being gilded. New scroll-work has been inserted at each side in place of the old wooden beams, and the wood skirting on which the gate rested has been removed, and ironwork of a similar pattern continued to the floor. The organ is undergoing renovation by Messrs. Hill & Son, of London, organ-builders.

Lighting Beacons by Electricity.—Mr. Thomas Stevenson, C.E., of Edinburgh, has had a submarine cable laid between the East Breakwater of Granton Harbour and the Chain Pier, at Trinity, near Leith. The operator occupies a station near the centre of the breakwater, and the light is shown at the point of the pier, the current being thus transmitted a distance of fully half a mile. Experiments, according to the *Scotsman*, have been satisfactorily made before the Northern Light, Trinity House, and Board of Trade authorities. The flashes were emitted with a rapidity which caused them to assume almost the appearance of a steady light, and again they came at intervals—one every one, ten, or fifteen seconds.

Action of Water on Lead.—A paper "On the Solubility of Lead and Copper in Pure and Impure Water," by Dr. T. L. Phipson, was read at the Exeter meeting of the British Association. Having, said Dr. Phipson, tested a number of specimens of commercial lead used for domestic and other purposes, the result of my experiments is that lead, copper, and perhaps zinc, are metals which can be dissolved in water at ordinary temperature, and in presence of air when submitted to friction, and that the water need not be so pure as the Surrey spring-water in order to exert this solvent action.

The Edinburgh Improvements and the Lord Provostship.—Mr. William Chambers, who at the end of his three years' Lord Provostship was re-elected last year, has announced his resignation at the end of the current year. The London *Scotsman*, in reference to this announcement, says:—

"The same energy which carried him from the occupation of a dingy second-hand book-stall at the head of Leith-walk to be the head of one of the largest educational publishing firms in the world, was brought to bear upon his office as chief magistrate, and the transformation which he has initiated in the heart of the old town will be an enduring monument to his enterprise and philanthropy. The changes he has set on foot have been planned with a due and even a loving veneration for those characteristic features of the city which won from the heart of Sir Walter Scott the epithet of 'mine own romantic town.'"

The improvements are still in progress. Mr. Law, the coffee merchant, of Oxford-street, London, and of Edinburgh, is named as Mr. Chambers's successor.

Proposed New Prison for Middlesex.—At a recent meeting of the Middlesex magistrates a committee of 17 was appointed to consider in what way the criminal business of the county can be expedited. A motion had been brought forward, but was withdrawn, to the effect that the prison is insufficient for the reception and confinement therein of all the untried and non-convicted prisoners of the county, and that it is necessary it should be enlarged.

French Science Congress.—The French Scientific Congress (which corresponds to the British Association) will hold its meeting this year at Chartres on the 5th of September. The directors are anxious to have the attendance of English men of science. The meeting will last to the 14th of September. The president this year is M. de Caumont, of Caen, Normandy, to whom letters may be addressed.

Drinking Fountain in Aberystwith.—A drinking-fountain was opened on Saturday evening, the 21st ult., by the mayor, Mr. John Matthews. It has long been needed in the town, which is well known as one of the most frequented watering-places on the coast of Wales. The stone-work is by Messrs. Ellis & Owen. The fountain was paid for by public subscription.

Thetford.—The Maharajah Dhuleep Singh is adding a new wing to his mansion at Elveden, near Thetford, Norfolk. The work is being executed by a metropolitan firm.

New Wesleyan Chapel in France.—The foundation-stones of a new Wesleyan chapel Asnières have been laid. The chapel is to be erected in the Gothic style of architecture, at the estimated cost, including the site, is about 1,000l.

The Tower Subway.—Mr. Peter Barlow estimates that the Tower subway will be able to convey fully 2½ millions of passengers annual working twelve hours each day. He says to estimate of 16,000l. will not be exceeded.

Bells, Milnrow Church.—The peal of eight bells, tenor 48½ in. diameter, about 19 wt. 2 note G, hung in this church, were cast by Messrs Warner & Sons, for Captain Schofield, of Greeroyd, near Rochdale.

Surveyor to the Sun Fire Office.—The directors have filled this appointment, left vacant by the death of Mr. Chas. Freeman, by the election of Mr. Fredk. W. Porter.

TENDERS.

For rebuilding the chancel of Frettenham Church, Norfolk. Mr. R. M. Phipson, architect:—
Cornish (accepted).....£617 0 0

For alterations and additions to Horing Hall, Norfolk. Mr. R. M. Phipson, architect:—
Newall.....£1,949 16 6
Cornish.....1,639 19 4
Wright.....1,780 0 0

For restoring and beautifying the nave of Fundenigo Church, Norfolk. Mr. R. M. Phipson, architect:—

BOROUGH OF MARGATE.—FLINT.
 Mayor's APPOINTMENT OF SURVEYOR AND SANITARY INSPECTOR, AND INSPECTOR OF WEIGHTS AND MEASURES.—The Council of this Borough require a competent person to undertake the duties of SURVEYOR AND INSPECTOR OF WEIGHTS AND MEASURES. He will be required to perform all the duties of these offices, including those specified by the Public Health Act, 1874, the Local Government Act, 1858, an Act of the 5th & 6th William IV., cap. 63, relating to weights and measures, and any other Acts in force; to be hereafter incorporated therewith or amending the same respectively, and by the by-laws of the Council of the Borough; and to render the plans, specifications, and estimates which by the said bye-law the Surveyor is required to prepare. He will be required to prepare all such other plans, specifications, valuations, and estimates as the Council for the Borough may from time to time require for the purposes of the borough, and generally to do, perform, and execute all such other duties, matters, and things, as shall be incident to the duties of the several above-mentioned offices as the Council of the Borough may from time to time require. He will also be required to reside in the borough, and have no other place of residence; to devote his whole time and attention to the duties of the several offices, and not to engage in any other business or occupation without the special sanction of the Council. He will also be required during the business hours to have his best and soundest to prevent any interference of the bye-laws relating to bathing. The engagement will be made terminable by a three months' notice from either party. The person who may be elected must be prepared to enter upon his engagement immediately he may be required to do so after his election, and to give sufficient security for the faithful discharge of the duties of his office. Applicants for the office are requested to forward their testimonials, accompanied by a letter in their own handwriting, stating their age, the names and address of two sureties, and salary required, addressed to the Town Clerk, at the Town-hall, Margate, before THURSDAY, the 14th day of SEPTEMBER next. Such Candidates only as shall receive a invitation from the Town Council will be expected to attend on the day of election. But the Town Council do not pledge themselves to appoint any of the Candidates.

BOROUGH OF MIDDLESBROUGH.
 WANTED, a SURVEYOR and ENGINEER to the Council of the Borough of Middlesbrough, in the North Riding of the county of York, a Surveyor to the Local Board of Health of the same Borough, a Superintendent of the Burial-grounds for the district of the said Borough, and a Manager of the Ferry Works, Wharfs, and Landings, the property of the Corporation. The person appointed to fill these offices (which will be held under the title of "The Borough Surveyor") will be required to devote the whole of his time to the duties thereof. These duties will be those ordinarily performed by persons filling the offices above described. All plans and designs, Parliamentary and otherwise, being prepared by him. The Corporation, Local Board of Health, and Burial Board, however, reserve to themselves the right of further defining and regulating these duties in the future should they deem it advisable. The appointment will be made subject to a quarter's notice to terminate the same, expiring at any time, being given by either party. The salary will be 300l. per annum, no extra whatever being allowed beyond actual disbursements incurred by authority. The requisite office staff will be appointed and remunerated by the Corporation, Local Board of Health, and Burial Board. Applications to the undersigned of the Candidates, stating age and present occupation, and the exact day upon which the applicant, if elected, could enter upon the duties of the office, accompanied by testimonials, must be sent and sent by post to the undersigned, in an envelope, on the outside, "Application for Borough Surveyorship," on or before the 1st day of OCTOBER next. Candidates of the Corporation by or on behalf of any applicant will be considered a disqualification for election. No Candidates will be required to attend in Middlesbrough, unless officially written to for that purpose.
 J. W. T. BARK, Town Clerk.
 Corporation Hall, Middlesbrough, September 1, 1869.

WANTED, by an energetic Young Man, who has been used to good jobs, a SITUATION as CARPENTER and JOINER, in any part of the country, as a constant work. Good references.—Address, F. BASHAM, 69, Hillingdon-street, Fulham.

TO BUILDERS. WANTED, a SITUATION, as GENERAL FOREMAN, who is also a first-class staircase hand, and will undertake any quantity of carpentry and joinery work. Good references.—Address, A. X. Z. Post-office, Seven Sisters-road, Hoxley, N.

WANTED, by a PLUMBER, PAINTER, and GLAZIER, in the country, a RESPECTABLE ASSISTANT (preferred), as ASSISTANT WORKMAN in any branch. Must be energetic, well up in all the branches, and capable of taking charge of men. References required.—Address, B. J. Post-office, Wandsworth, Finsbury.

TO BUILDERS, PLUMBERS, AND CONTRACTORS. WANTED, by an experienced PLUMBER, a SITUATION of JOB, in town or country, or will fill up his time with gas-fitting, and iron pipe work, for a permanent. A good jobbing shop not objected to. Aged 33 years.—Address, FLEMING, care of Mr. Weekly, 4, Harford-place, Drury-lane, W.C.

TO ARCHITECTS AND SURVEYORS.—A Gentleman, with some capital, and who has studied the principles for some years, wishes to RE-ADVERTISE for a JUNIOR PARTNERSHIP.—Address, TUSCAN, South-street, Colingdon-terrace, Edgware-road, Kensington, W.C.

TO ARCHITECTS, &c. TEMPORARY ASSISTANCE.—DESIGNS FOR MAKING DRAWINGS, SPECIFICATIONS, and QUANTITIES FOR PAINTERS, and also for Surveyors. H. and P. at own offices, 23, Royal Exchange, E.C. Artists' Printing and Engraving.

THE Advertiser is desirous of a RE-ENGAGEMENT in an Architect's Office. He can make finished detail drawings, draw perspective, and is accustomed to the general routine of a London office.—Address, ALFRED, Post-office, 2, Oxford-street, W.

TO CIVIL ENGINEERS AND CONTRACTORS. THE Advertiser, who is competent to perform general duties in connection with the above, and has had long liberal experience in the estimation of sundry works, will shortly require a SITUATION.—Address, O. C. care of Mr. MacClelland, 23, Upper Brock-street, Brixton.

TO ARCHITECTS, SURVEYORS, &c. THE Advertiser, who is a thoroughly efficient ASSISTANT, and accustomed to the management of a provincial office, is open for an ENGAGEMENT as MANAGING CLERK, or otherwise, in Town or country.—Address, VILRUVIUS, 6, Finsbury-park, E.C.

TO ARCHITECTS, SURVEYORS, &c. THE Advertiser, a respectable Young Man, is open to a RE-ENGAGEMENT as ASSISTANT DRAUGHTSMAN. Nine years' experience. Neat and quick at work. Will go to any part. Good references.—Address, A. B. care of Mr. Wilson, 3, Canterbury-place, Lambeth-road, S.W.

TO BUILDERS, &c. £1000.—The Advertiser seeks an ASSISTANT, GASFITTER, and HO-WATER, in view to ultimate PARTNERSHIP or otherwise. Is a good accountant. French and English spoken. Accompanied with the Building trade, estimating, drawing, &c. In the meantime views an investment of £1000, on security. References as to ability and respectability will be given.—Address, W. 15, Gloucester-road, Regent's Park, N.W.

TO SMITHS AND BUILDERS. SITUATION WANTED by a Young Man, as WHITEHEAD, GASFITTER, and HO-WATER, &c.—Address, R. H. 3, Chapel-street, Stamford Hill, N.

SITUATION WANTED as MANAGER, CLERK, or SALESMAN. Thoroughly conversant with the routine of Foreign and English Timber trade and saw-mills. Good references.—Address, W. J. Mr. J. Ashworthy, Trafalgar-street, Stockford-road, Northfleet.

TO CONTRACTOR, ARCHITECTS, AND SURVEYORS. GENERAL FOREMAN or CLERK of WORKS.—A person of considerable experience with extensive works requires a SITUATION. Unexceptionable references and testimonials.—Address, X. Z. 3, Highgate-street, Hoxney-road, London.

BUILDERS' CLERK.—WANTED, by a Young Man, a SITUATION as above. Can make plain drawing, trace, measure up, &c., and is a good book-keeper. First-class references.—Address, F. SANDY, 5, Regent-street, Red Lion-square, Clerkenwell.

TO BUILDERS AND OTHERS. A LONDON PRACTICAL FOREMAN.—A wish for a RE-ENGAGEMENT, to take entire charge of building works, including the design, drawing, and setting out. Good references. Aged 30. Well up in estate work.—Address, J. B. 13, Gloucester-terrace, Beckenham, Kent.

TO ARCHITECTS. A GOOD GOTHIC AND PERSPECTIVE DRAUGHTSMAN requires a SITUATION as ASSISTANT. Can design, prepare working drawings, details, &c. and is well up in the general routine of an office. Aged 27. Good references.—Address, A. B. 22, Fenton-street, Fentonville, N.

A CLERK of WORKS, who has just completed two large jobs (one a church, and the other an Italian). Is open to a RE-ENGAGEMENT. Thoroughly experienced. Well acquainted with all branches of building and surveying. First class references.—Address, L. X. F. No. 203, Nishopgate Without.

A BRICKLAYERS' FOREMAN wants a RE-ENGAGEMENT, or the Lease of Piecework. Is well up in cutting, pointing, and setting. Good references.—Address, 35, Town of country.—Address, S. 10, Orchard-terrace, Newland-street, High-street, Kensington.

TO CONTRACTORS, SURVEYORS, &c. A BUILDERS' CLERK, possessing experience in every branch of building and surveying. Is an excellent correspondent and rapid draughtsman; and well up in all the usual details. First-class testimonials and references to present employer.—Address, A. 2, Mount Pleasant, Egham, Staines.

AN experienced PLUMBER is in WANT of a SITUATION. Can do painting, glazing, &c.—Address, FLEMING, 32, Raffle-street, Knightsbridge.

TO CARPENTERS AND JOINERS. A YOUNG MAN, aged 20, wishes to be employed as a Carpenter and Joiner. Has been used to bench work and likewise fixing.—Address, G. B. N. 13, Sturton-street, Golders-lynn-road, N.

TO BUILDERS. A RESPECTABLE MAN, a competent PLUMBER, who has just completed a large job, or otherwise. Can be well recommended from a good London firm.—Address, W. W. No. 10, Aldford-road, Harrow-road, Finsbury, W.

TO QUANTITY SURVEYORS, &c. A YOUNG MAN, who can bring dimensions down to his well-learned capacity, and without any assistance, and who possesses a thorough knowledge of builders' accounts, is desirous of an EVENING ENGAGEMENT. Terms in Ed. per hour. Wants a three months' or permanent situation in the country, on moderate terms.—Address, S. Post-office, Chancery-lane, W.C.

TO BUILDERS, DECORATORS, &c. A FIRST CLASS PAINTER, GLAZIER, and DECORATOR, who WANTS a CONTRACT, Town or country.—Address, A. B. 31, Prince-street, Edgware-road, W.C.

TO BUILDERS, &c. A YOUNG MAN requires a SITUATION as TIMEKEEPER or STOREKEEPER. Seven years' good character.—Address, X. X. Post-office, Aldon.

TO ARCHITECTS, &c. A QUICK DRAUGHTSMAN and a superior GENERAL ASSISTANT in all liberty. Good designer, perspective draughtsman, and fair colourist, and thoroughly conversant with the routine of a London office.—Address, ARCHITECT, Post-office, Pall-mall-street, S.W.

TO BUILDERS, CONTRACTORS, AND OTHERS. A BUILDERS' CLERK, aged 26, good at correspondence and accountant, and thoroughly experienced in the trade, wants EMPLOYMENT. Five years in last situation. Town or country.—Address, G. S. 42, Lee-street, Chelsea, S.W.

TO BUILDERS, &c. A YOUNG MAN, aged 32, of good experience, is in want of a SITUATION as FOREMAN, or to take Charge of a Job. Is a thoroughly practical Plumber, Painter, Glazier, Writer, and Gasfitter; and used to the Charge of Men, &c.—Address, 457, Office of 'The Builder.'

TO ARCHITECTS AND DRAUGHTSMEN. A GOOD DESIGNER and DRAUGHTSMAN requires a RE-ENGAGEMENT. In or near London, is competent to prepare finished, perspective, or working drawings. Has had considerable experience in quantities, abstracting, billings, &c. First-class testimonials.—Address, A. B. 2, care of Mrs. Stuchart, 17, Tavistock-lane, Holborn, E.C.

AN Architect and Surveyor's ASSISTANT requires a RE-ENGAGEMENT.—Address, COMPASS, 39, St. Mark's-terrace, Notting-hill, W.

A YOUNG MAN (active and strong) wishes to meet with a SITUATION for IMPROVEMENT in the LAPIDARY, Paperhanging, and Printing business. Has had some experience in the same. Will make himself useful.—Address, W. 15, Hanover-square, Kensington.

TO BUILDERS AND MARBON. A GOOD MASON and FIXER is in want of EMPLOYMENT. Can carry out a Job, and do better than any. References if required.—Address, W. 15, Finsbury, Finsbury, W.C.

The Builder.

VOL. XXVII.—No. 1388.

Adam Kraft and his School.

1490—1507.

HERE are few visitors to Nuremberg who do not gaze wonderingly and admiringly, in the church of St. Lawrence, on the Tabernacle, or Sacraments' House, a pile of flowery stone-work that runs up to the groined vault of the choir, a height of more than 60 ft., and then bends down gracefully, if deceptively, as if there checked by the roof. They admire also the three sculptured figures at the base, representing the sculptor and his two assistants, and mostly learn that the former was called Adam Kraft. Other works from the same cunning hand they meet with in the town, notably the great tomb outside the church of St. Sebald;

so that there are few of the Mediaeval artists whose names are more widely known than that of Kraft. Still the extent of his work is little recognised by the large majority, and Professor Wanderer has done a good deed in bringing together a collection of his sculptures with descriptive letterpress in German, French, and English.* The volume includes sixty engravings on wood to a large scale, and if it do not substantiate the right of Master Adam to be considered a worthy compeer of that great genius, Albert Dürer, as the author would have it, it advances his long-recognised claim to be considered a great craftsman. In estimating the merits of Kraft, the period at which he worked, when love for and skill in the severer style of pointed architecture were passing away, and the style of Renaissance was about to take its place, should always be considered. The present work, the author says, "is intended to fulfil an obligation which the partiality of the followers of modern Gothic, in their exclusive pursuit of a pure style, has, hitherto, caused to be omitted."

The materials for an account of the life of Adam Kraft here presented are very slight, and, to some extent, contradictory. Thus, in the sketch of him left in the first half of the sixteenth century by Johannes Neudörffer, a writing-master of Nuremberg, it is asserted that in 1490 he took for his second wife a widow, who, to please him, changed her baptismal name from Magdalen to Eve; whereas, a "spaanbrief" not long ago discovered in the archives of Nuremberg, and dated February 20th, 1510, states that his

widow, Barbara Kraft (not Magdalen nor Eve, and nothing is said of a third marriage) appeared with her late husband's creditors before the Court, and renounced in their favour the house on St. Jacob's Steig which he had bequeathed to her;—an incident that seems to show, moreover, that Kraft's circumstances when he died were not in a very flourishing condition.

Neudörffer says that Kraft was as dexterous with his left hand as with his right, and that he died in the hospital at Schwabach in the year 1507, a statement which is to some extent corroborated by the fact that one of the last works he executed was a handsome Tabernacle for the church there.

The founder of the Tabernacle in the church of St. Lawrence, the finest and best known of Master Adam's works, was one Hans Imhof, who on the 25th of April, 1493, in the presence of two witnesses, Michael Lemlein and Jörg Holzschuher, entered into a contract with Adam Kraft for its execution. This document, which is drawn up with some care in the details, is still in the possession of Imhof's descendants. Amongst other matters it sets forth,—

"That the aforesaid master shall he bound to work at it with his own hands; and to appoint four, or at least three honest and skilful men to work with him therat, and meanwhile they are not to take any other employment. But since the said Master Adam has likewise other works on hand, and may have more, he shall keep for those other workmen, so that the men employed hereafter shall not have to quit the work. Farther, it stipulates that he shall be at liberty to give directions to such workmen for the space of one hour daily, but no longer without permission of the said Hans Imhof."

Kraft engaged to complete the work within three years for the sum of 700 florins (something less than 600l.). In the rash presumption of being able to finish within three years this work, and likewise to undertake others, Kraft, as we shall not be surprised to learn, deceived himself. His receipts, of two of which facsimiles are annexed by Mr. Wanderer, show that between 1493 and 1495 he had already received by instalments the stipulated sum; and, finally, a gratuity of 70 florins, which Imhof thus sets down:—

"Item—On St. Barbara's day, A.D. 1495, I settled accounts with Master Adam: paying him, first, according to his contract, 700 florins; and, secondly, an agreement of 70 florins—total, 770 florins."

Our author goes on to say that the founder did not live to see the accomplishment of his work. "He died 1499, and it was not until 1500 that Adam Kraft first brought his labours to a close."

This is not quite satisfactory. If the work were not finished in 1495, why did Imhof then settle accounts with Kraft, paying him not merely the amount of his contract, but the extra sum agreed on?

Our author seems to misunderstand a portion of this agreement when, speaking afterwards of the probability that Kraft kept a large number of men employed elsewhere, he says, "It was not without some reason that the contract for the Tabernacle so expressly stipulates that he should not employ more than one hour daily in correcting the work of the two chosen men." The stipulation in the contract evidently referred to the workmen employed on other works on hand, not to the two men at work with him on the Tabernacle.

The form and construction of the Tabernacle are fully illustrated and described in the interesting volume now before us. The wreathed pinnacles, curling and twisting almost like a living plant, have been viewed as remarkable pieces of stone-cutting; they led to the popular belief, indeed, that Kraft possessed the secret of softening stone and hardening it again after it was worked. Mr. Wanderer, however, shows

that these each consist of ten and often of more small pieces of stone bored through and connected together by an iron wire, the joints being run with lead.

Some years have passed since we visited Nuremberg;—

"Quaint old town of toil and traffic, quaint old town of art and song,
Memories haunt thy pointed gables, like the rooks that round them throng."

It was in student-days, and it seemed to us then a town of pictures, a romance in stone. There was a queer old "public" near the Town-hall called "Zum Gläsernen Himmel," and there we sat in the seat said to have been the usual place of Adam Kraft, who did not disdain the "wheat beer" for which the place was celebrated. The old house has been pulled down since then; but his Madonna and Child, which formerly adorned it, is set up in the new building that took its place.

A TRIFLE FROM MARGATE.

ALTHOUGH Margate has been very full, and even now is well filled, the inhabitants complain of bad times. The spring was cold, so that the first arrivals were late, and the rough weather lately sent hundreds away to their homes. The season has therefore been short, and hence "the season." Last week, nevertheless, the Jetty, at certain times of the day, was a sight,—so crowded with persons that circulation was difficult. Where all the young girls, in their Noah's-ark dresses and wonderful heels, came from, and where they expect to go to, is a puzzle to the best friends of the sex. On Sunday afternoon, at half-past four, there could not have been fewer than from 3,000 to 4,000 persons on the Jetty and Parade, when suddenly burst a thunder-storm. The sea was enveloped in mist, the lightning flashed, and a flood of rain descended that laid the Parade roadway under water, and made it, as acted on by the wind, a mimic lake. As to the people,—an ant's nest violently agitated affords the best simile. The sea was terrific, and to those who, safely sheltered in the comfortable White Hart, could drily look on, not without interest. Every vehicle, too, was taken up, and in ten minutes not a person was to be seen,—man, woman, child, or nigger. It spoke something, too, for the arrangement of the surface drainage, that so soon as the storm had passed over the roadway was fairly dry again. We cannot say quite as much for other drainage, and the town will do well to take the cesspools seriously in hand. They are now advertising for a new sanitary inspector, and inviting candidates to say for how little money they will perform the duties of that and some other offices combined.

The mayor, who looks like a sensible man in the photographic shops, and his colleagues doubtless know, if they would but remember it at the right time, that cheap things are not always economical. We earnestly invite them not to let the lowness of salary named by any particular candidate blind them to the enormous importance of obtaining a thoroughly competent and suitable man. To maintain the reputation for health of such a place as Margate is of paramount importance; and if one able to do this should offer, and who is, moreover, a man of taste, likely to aid in improving appearances and making the town attractive, an extra 50l. or 100l. a year to secure him would be a profitable investment, they may be assured. If Margate could be refined, so to speak, and the South-Eastern Railway Company taught their duty, there would be an enormous future in store for this place. Its fine air and admitted salubrity, so far as it is not interfered with and counterbalanced by man, to say nothing of other advantages, afford a foundation on which a great town might be built, and, we may venture to say, will be built. When the right man comes, Margate will make a start that will astonish its present stagnant owners and regulators. About the immediate neighbourhood of the Parade there is a mixture of Cremorne and Wapping that wants improving away. On the heights spreading away from the Fort, the aspect is different. A large hotel, the Cliftonville, built by a company, is in full swing, and many new streets have been built. There is a want of life, however, up here, and the need of a presiding mind is evident. It was a good thought to name some of the rows

* Adam Kraft and his School. Being a Collection of his Sculptures still extant in Nuremberg and its Vicinity. By Fr. Wanderer, Painter, and Professor at the Royal School of Art at Nuremberg. London: Williams & Morgate, Henrietta-street.

Ethelbert-road and Ethelbert-place; all historical, traditional, and poetical associations should be carefully preserved at resorts of this kind. The Isle of Thanet is so much a place of mere pleasure that the amount of deep interest that attaches to it, its connexion with the earliest history of the country, is apt to be forgotten. At Ebbs's Fleet, near Pegwell Bay, St. Augustine landed in the sixth century; Hengist and Horsa possibly at the same place. The meeting of St. Augustine and King Ethelbert took place a few miles from Margate (the gate or passage through the cliff, near the mere or streamlet), and it was wise, therefore, to recall the connexion with Saxon times by the names of the new streets.

A good sea-drive would be a valuable addition to the attractions of Margate, and the town ought to look forward and arrange for the formation of one. Some better arrangement is needed with the owners of hired carriages. They refuse to let the drivers go for the hour. They insist on a charge being made for each place visited, which, nine times out of ten, involves a swindle. Moreover, visitors constantly desire a drive without exactly knowing where to go, but are prevented by the present system. An enormous carrying trade is done in the shape of excursions all day to St. Peter's, Broadstairs, Kingsgate, Pegwell Bay, Ramsgate, Richborough, or Minster, and back, and this may make the coachmen careless about accommodating the public in another way. Some of these places afford inducements for a more quiet visit than these excursions admit of, which address themselves only to a part of the community. The view at Kingsgate, which includes Lord Holland's sham Roman villa, ivy covered; Harley's Tower, the tower erected to mark the site of a great battle between the Danes and the Saxons in the beginning of the ninth century; the north Foreland Lighthouse, and other landmarks, all come into sight, and, with the precipitous cliffs and the sea, form a panorama of great beauty.

The cliffs at Margate, by the way, near the Jetty, have been embayed and rounded in a remarkable manner within the last twenty years, and one wedge-shaped piece of the cliff is left standing in a gap alone, and, as seen from near Goodman's photographic studio, produces a remarkable effect.

At Birlington, a ride out from the other side of the town (and on the road several new houses are being carried up), the church, mainly of the thirteenth century, with remains of Norman work, has been soundly restored. Daundellon and Salmeston both afford remains of ancient buildings, worth investigation.

We mentioned as amongst the steps required to put Margate in the proper track for advancement,—the reform of the South-Eastern Railway; and, without now going into the whole question, we will prove the necessity of it, at any rate, in one direction. We recently printed the complaint of an individual traveller on this line, showing a series of annoyances to which he had been subjected in one journey out and home. We have before us the substantiated complaint of another that, coming from Margate on two occasions within the last fortnight, the train had been forty minutes after time, and that all his arrangements were consequently upset. It is obvious, therefore, that these inexcusable irregularities are not exceptional, but constant. It is of no use upbraiding a board more than a stone. We appeal to Lieut.-Col. Eborall, advertised as General Manager, and ask if this be proper management, or whether it be not the management that snobs, dignists, and drives away! We have no hesitation in saying that similar management in the Board-room and offices, if it be going on, is quite competent to wreck the company, and we advise the shareholders to look to it in time. We reiterate our belief that a great future is in store for Margate if those who are concerned act rightly; but they have a great deal to do to assure it.

State of the Serpentine.—A correspondent writes:—As there is every probability of a great number of men being out of employment during the coming winter, I would beg to suggest that the Serpentine River (Hyde Park), which is in a most filthy condition, be properly cleaned out, levelled, and cemented. There, I believe, a Government grant for this purpose, so there would be no difficulty in the way. It is well known how dangerous this sheet of water is in summer to bathers and in winter to skaters.

THE BRIDGES OF THE METROPOLIS.

The various bridges recently constructed, and in course of construction, over the river Thames, possess a certain degree of historical importance.

They not only serve to mark the progress which has been made during the last century in engineering and architectural science, but they afford, at the same time, remarkable facilities for a comparison of the relative merits of the several systems and designs embodied in the respective structures.

If civilisation finds its origin in, and is maintained by, the useful arts, rather than springing from the triumphs of warriors and statesmen, there is certainly as yet but little indication of its decay. The New Zealander who is to sketch the ruins of Saint Paul's, at all events is likely to discover a more favourable accommodation than historians have predicted.

Within some few years past, besides the removal of the Suspension Bridge which formerly existed at Hangerford, we have witnessed the disappearance of two of the principal structures which hitherto nited the shores of Surrey and Middlesex, and in each instance they have been supplanted by works of more magnificent, and apparently durable, construction. In one case, that of Blackfriars notably, there are fair indications that the substituted structure may last as long as Saint Paul's itself.

In 1739, the stone bridge which formerly existed at Westminster, and which occupied a portion of the site of the present iron bridge, was commenced from designs by Labaley. This bridge was constructed of Portland stone, at a cost of 490,000*l.* It was 1,220 ft. in length, 40 ft. wide, 25 ft. above high-water mark, and had 15 openings. Its total altitude above high-water mark was 27½ ft., and the centre opening spanned a distance of 100 ft.

The present bridge was begun in 1853, and finished in 1862. It is from the designs of Mr. Thomas Page, who also designed the handsome but inglorious structure which spans our polluted river between the new barracks at Chelsea and Battersea Park. The present Westminster Bridge is, perhaps, the widest bridge in Europe, and certainly yields to none in beauty of design and finish, remembering the circumstances under which it was carried out. The necessity of a favourable gradient at both sides for the accommodation of traffic, of leaving sufficient headway at the same time for the navigation of the river, and of keeping within bounds that would not outrage upon the grandeur that is claimed for the structure of the Houses of Parliament which adjoin it, affected by many complicated restrictions the appearance and durability which otherwise might have been given to the undertaking. It is to be wondered at that with all these difficulties to encounter—and they were not the only difficulties which presented themselves—the bridge shows so many claims to consideration as it undoubtedly possesses. It is 55 ft. wide, 20 ft. above high-water mark, comprises seven openings, and the centre span is 120 ft. wide. It was erected at a cost of 393,000*l.*, and completed, notwithstanding much unforeseen and uncontrollable delay in the progress of the works, within nine years. Old Blackfriars Bridge, of which the last vestiges have scarcely yet disappeared, was commenced in 1710. It was constructed also of Portland stone, like old Westminster, from the designs of Mylne, at a cost of 300,000*l.* This bridge had exhibited marked symptoms of crumbling and decay before steps were finally taken towards its removal. It was the most interesting representation of the possible decay to which such structures may arrive of which we have any modern record. Arch after arch was propped up, as many of our readers may recollect, until at last a serious obstruction was opposed to the ordinary navigation of the river. It was only 995 ft. long, 42 ft. wide, 27½ ft. above high-water mark, and had nine openings, the centre one of which measured 100 ft.

Waterloo Bridge, which Canova, the sculptor, thought to be the finest in Europe, is to all appearance as untouched by time and unharmed and perfect in every way as when first finished, now some fifty years ago. It was begun in 1811, while the first Napoleon was centering all his forces towards the invasion of Russia, and was carried out while history looked down on the dreadful spectacle afforded by the retreat of the Grand Army. This bridge is 1,326 ft. in length, 43 ft. wide, having a headway above high-water mark of 27½ ft., and has, as old Blackfriars Bridge had, nine openings. The centre arch of

Waterloo Bridge is 120 ft. wide. The bridge is constructed of granite, from designs by Rennie. Its erection cost the sum of 937,391*l.*, and only occupied six years.

This bridge, notwithstanding the number of arches upon which it is built and its numerous river piers, from the width of the river at this point, still leaves a total clear water-way of 1,080 ft., an amount which no other metropolitan arch bridge affords.

The next bridge which comes under our consideration is Southwark Bridge, which has only been completed within the past fifty years. This bridge was designed by Rennie, but is accompanied by circumstances which mark it out as one of the most extraordinary contributions towards the science of constructive architecture. It was the first occasion of the introduction of a cast-iron span of such truly gigantic proportions in structures of this character, and, as an experiment boldly testifying to the applicability of cast iron upon a large scale, it paved the way to a new theory and practice of building.

The span of the central arch of Southwark Bridge is equal to that of the roof of the new Midland Railway Station at St. Pancras, and in comparison with the magnitude of this last-named building, the roof of the Moscow Riding-school no longer remains the standard of colossal architecture that it was formerly. It has been surpassed. Southwark Bridge was commenced in 1814, and was successfully carried out and finished in 1819, at a cost of 660,000*l.* The entire length of this bridge is only 700 ft., and the centre opening is spanned by a cast-iron arch of 240 ft., probably the largest single cast-iron span extant.

The present London Bridge was begun as recently as the year 1824. This, like Waterloo Bridge, is constructed of granite. London Bridge was designed by Rennie, occupied seven years in erection, and cost the sum of 2,566,268*l.* This enormous expenditure represents an amount exceeding the aggregate cost of nearly all the other bridges over the Thames.

The total length of London Bridge is 920 ft. It is 45 ft. wide,—not much more than half the width of Westminster Bridge, and has an altitude above high-water mark of 29½ ft. It is composed of five arches only, the central opening measuring 150 ft.

The cost of this structure was provided out of a fund called the Bridge House Estate Fund.

The estates appertaining to this fund—it was stated in evidence which was taken before a select committee appointed in May, 1855, to consider the abolition of tolls on Metropolitan bridges—are held in trust for the maintenance and support of London Bridge. "When the Act for this bridge passed, and the money was to be raised on the credit of the Bridge House Estate, the Government contributed 150,000*l.* out of the Consolidated Fund. The Government also suggested that the bridge should be made 6 ft. wider than it was originally intended to be, which involved a further outlay of 42,000*l.* That amount was also contributed by the Government towards the construction of the bridge out of the Consolidated Fund. The residue of the expense was defrayed by money raised on the credit of the Bridge House Estate, amounting to 431,000*l.*, and the difference was made up out of the surplus rents and profits of the Bridge House Estate. The 431,000*l.* were advanced by the Lords of the Treasury upon terminable annuities for forty years, now partially expired, and ceasing altogether in 1871."

Hammersmith Bridge was opened in 1827, and is remarkable on account of its being the first bridge which was erected upon the suspension principle over the Thames. The platform of the bridge is held up by vertical iron rods, let fall from chains which stretch entirely across the river, and are so adjusted as to support the general structure. The main chains themselves are in the course of their length across the river and two places of support upon stone piers erected in the river way.

There are two of these piers, as is mostly the case in suspension bridges, upon which a superstructure of masonry or iron is carried up to support the chains. In the case of Hammersmith Bridge the superstructure of the towers is of masonry, in the form of an arch, comprising the width of the roadway. These towers support the suspension chains, which disappear at each extremity into anchorages on the margin of the river at each side. The anchorage plates rest against a firm bed of masonry, which constitutes the abutments. The vertical rods descending from the main chains are fixed to cross girders

of the requisite width, upon which the roadway of the bridge is laid.

Apart from the singular novelty of the structure embodied in this undertaking, it is also remarkable as having afforded that particular design of construction upon which the minimum cost of bridge accommodation was reached. The cost of Hammersmith Bridge did not exceed \$5,000.—a sum scarcely equal to the cost of a single arch of many of the other bridges.

A bridge upon the same principle as the Hammersmith one was subsequently erected by Brunel at Hungerford, and was not many years since translated bodily to Bristol, where it is now known as the Clifton Suspension Bridge. The old piers of this bridge still do duty in supporting the girder bridge of the Charing-cross Railway, aided by numerous cylinders sunk in the river. The piers themselves are now chiefly remarkable for their singular conclusion at the summit. The Suspension Bridge at Chelsea, which has already been mentioned as having been designed by Mr. Page, is, perhaps, the handsomest form in which this class of structure has ever been embodied. This bridge was finished in 1858. Three years later the Lambeth Suspension Bridge was begun, as designed by Mr. Peter Barlow, and it was erected at a cost scarcely more than half that of its prototype at Hammersmith. The Lambeth Suspension Bridge, however, is something more than a Suspension Bridge, pure and simple, for some very singular modifications of the suspension principle have been here introduced. In place of a succession of bolted or pinned links for the principal supporting chains, we here find a number of iron wire cables or twisted ropes stretching in unbroken continuity entirely across the river. In place of the usual vertical supporting rods, a series of pendent triangular supports have been substituted to take the roadway, and their operation is stiffened by the application of a giant system of strutting along their line of direction. Each tower is supported on two iron cylinders, which are sunk in the bed of the river and built up internally with concrete and masonry. By this means the usual stone piers have been superseded, and their great cost escaped. There is an entire absence of meretricious adornment in this structure, and by some it is apprehended that it is attended by difficulty to discover anything in it that is fairly ornamental. Still, as a bridge which was begun in 1861 and finished in 1862, at a cost of \$10,000, apart from the challenge which it holds out to scientific criticism, it possesses many claims to consideration. It is 950 ft. long and 20 ft. wide, having three divisional spans of 300 ft. each, its altitude above high-water mark being but 22 ft. only.

Old Vauxhall Bridge, which seems alike to defy criticism and escape it, is a compound structure of stone and iron. It has no less than seven arches, within a total waterway of 765 ft., whereas Waterloo, with the same number of openings, gives a waterway of 1,080 ft. The span of the centre opening of Vauxhall Bridge is but 100 ft. It was erected from designs by Mr. J. Walker, at a cost of 370,000.

It is very curious to observe the order in which modern bridges have arisen over the Thames between London Bridge and Southwark there the South-Eastern Railway Bridge designed by Mr. Hawkshaw, a substantial and costly-looking iron structure. It is a plain girder bridge, supported on rows of fluted-iron columns, embedded in the river. What little ornamentation has been attempted in this structure is in keeping with the general design, which fairly ranks as one of the most notable achievements of the adaptation of iron to structural purposes.

Looking from the other side of Southwark towards Blackfriars, we find the London, Chatham, and Dover Railway Bridge now interesting, although from that spot it is somewhat remote for critical inspection. Between Blackfriars and Waterloo there is as yet no new structure interesting.

Between Waterloo and Westminster is to be met with the conglomerate or insoluble structural metamorphosis known as the Charing-cross Railway Bridge. From the circumstance that this bridge being largely used by foot passengers, the superior objectivity of the Warren

of distinction between the footpath and the railway. As it is, it is a utility bridge, and, perhaps, it aims at being nothing more in appearance. Between Westminster Bridge and Vauxhall, Lambeth Bridge is interjected,—not a railway bridge, however, as the three preceding ones alluded to as late intermedial erections.

Between Vauxhall and the New Chelsea Bridge, which has itself only been erected during the past eleven years, is to be found, perhaps, the widest, and certainly the most unique, railway platform over water in the world. This is formed of the noted bridges of the London, Chatham, and Dover, and London and Brighton lines. Although outwardly these two bridges seem to correspond and closely resemble each other, appearing from their connexion but as one structure, their features and style of construction are altogether dissimilar. The half-width more recently added possesses many novel claims to notice. It is, in the first instance, a genuine and very fine example of wrought-iron riveted girder work. None of the riveting is counter-sunk, and it shows up in harmonious lines of strength admirably along and upon the surface of the work. This is an exception to the practice which is usually observed in analogous cases, and appears to be a very commendable one. Its more special and singular feature, however, in a scientific point of view, is perhaps attributable to the circumstance of its main girders being continuous girders throughout its whole length across the river. It is an *experiment crucis* as to the holdness and freedom with which iron may be skillfully handled.

Some further distance up the river, beyond the old Battersea wooden bridge, but still within the limits of the metropolitan railways, there is also a fine substantial railway-bridge, recently erected in connexion with the Clapham Junction system and the railways encircling London, from Hammersmith at one extremity, to the Thames Tunnel at the other.

The expansion of modern civilization, in one form of national embodiment, at all events, seems clearly exemplified in the multiplication of bridges along the course of the Thames.

No doubt a paramount regard for the unimpeded navigation of the river has long retarded or prevented the erection of suitable means of accommodation over the river below London Bridge. The only attempt ever made in this direction was made under ground. We are at a loss to imagine any explicable reason why in the face of the unbounded extension of the metropolis on all sides, and the extraordinary railway facilities to which we may have recourse, London Bridge should for ever remain the common goal of navigable merchandise and the arbitrary line beyond which people must either cross the river in a balloon or harrow under ground. Owing to the vexatious barrier offered by this structure to the uniform extension of that accommodation which prevails elsewhere, we find that the whole of the eastern and south-eastern districts of the metropolis are totally cut off. From London Bridge to Bow on the one side, and to Blackheath and Greenwich on the other directions of dense and fastly-extending population, no practical means of communication exist,—while, within equal limits on the other side, there may be probably as many as twelve or fifteen bridges. Since the usurpation of the Thames Tunnel by the railway, the only prospect of intercommunication held out to the inhabitants of the opposite shores at about these points is that likely to be afforded by the Tower subway now in course of construction for the accommodation of immense portions of the metropolitan area, where, if anywhere, the population may be seen gravitating in unhealthy numbers and mass around the head-centres of traffic and manufacture.

Should population and traffic tubes be multiplied eastward along the course of the river, they would doubtless effect much towards giving vent to a long-felt want of commercial intercourse across the river; but it is questionable whether their utility would recommend them to unhesitating and general adoption, as in the case of a good substantial undertaking above ground. It all depends upon the question as to how much longer London Bridge is to be tolerated as the commercial extremity of the metropolis; that being once satisfactorily determined, we may speedily have half a dozen bridges further down the river, uniting the very busy and very populous localities of Bermondsey and Whitechapel, Rotherhithe and Shadwell, Poplar and Deptford, Greenwich and the Isle of Dogs, and all those circumjacent districts which have parted years since with their suburban reputation. Some few years ago, a design for a high-level railway-

bridge below London Bridge was projected upon novel principles, which afforded ample room and verge enough for the passage of the highest masted vessels, and of which structure no portion whatever would have been within river limits. Should high-level bridges be opposed in any way to those interests which congregate round Old London Bridge, it is fair time to take into consideration whether London Bridge itself might not, with many advantages, date its claims to attention from some more favourable situation.

In that case a more convenient class of structure might be substituted than such as should necessarily leave so great an amount of headway beneath them as the present mode of traffic would demand.

HOUSE-BUILDING: CHISWICK.

The continuous and prodigious growth of London manifests itself in a constantly widening circle round its centre. One open space after another disappears, and green fields and gardens in all directions are speedily assuming the neutral tint characteristic of building plots. In one quarter that may be called suburban, say in the East of London, rows of cottages are run up; and in other quarters, less remote from the centre of the metropolis, great blocks are built of improved dwellings for the working classes. In another locality, say New Cross, or Peckham, newly laid-out streets or roads are being quickly lined with ranges of houses for the occupation of persons of a higher status in society than the conventional working-man,—the tenants who can or do, pay from 28l. or 30l. to 50l. a year. In other localities again, "terraces" and "places" are laid out, and rows of houses erected, of a larger size and more pretentious character, for which still higher rent is required. And yet, again, there are other localities in which single and semi-detached villas are provided, which rank next to mansions, concerning which last-mentioned class we have not, at present, anything to say.

While there has been an increase in the number of new houses provided in the metropolis from year to year, there has been little or no improvement in the style of the majority, materials, or workmanship. To this remark exception should perhaps be taken in favour of the improved dwellings for the working classes here and there, in which a beginning has, at least, been made in the march of improvement. For the rest, from the detached and semi-detached villas downwards, there has been little or no improvement. It is in but few instances that these new erections are put up with a view to either permanent possession or occupation: like Peter Pindar's razors, they are made—to sell. An ordinary mode of proceeding is, for the speculator to run up the houses at as cheap a rate as possible, to get them tenanted, and to sell before time has been allowed for the tenants to find out fully the wretched and comfortless character of the brand new houses into which they have entered. In a good many instances, indeed, the first tenants are induced soon after entering to purchase their houses, by the help of a building society or otherwise. In time—and it does not take a long time—they discover what's what. They cannot drive in a hook to hold, in the brick joints without, for a bird's cage, nor fix a brass-headed nail to hang up a picture within. Very soon locks, latches, window catches, and other ironmongery fittings, low-priced but not cheap, which never performed well, are universally unfit to serve their purposes. All the woodwork shrinks to an amazing extent; doors hang and windows rattle; there are chasms everywhere and fierce draughts through them, and the house becomes a place unfit for a human being either to be born, to live, or to die in.

Among our favourite suburban building localities a new one has recently sprung into popularity. We refer to "Strand-on-the-Green," in the parish of Chiswick. The favour with which this locality is now regarded may be attributed to several causes, and amongst them to the fact that the Prince of Wales has taken a lease of the delightful seat of the Duke of Devonshire, Chiswick House, immediately adjacent. The locality has, besides, its own great and independent charms in the number, variety, stature, and exceeding beauty of its forest trees, and the profusion and luxuriance of its gardens, orchards, and shrubberies; in the ever-attractive Kew Gardens hard by; in the stately river flowing past; in a word, in the greenness, fertility, and salubrity of that portion of the Thames valley.

As compared with building districts in the higher regions to the north of London, such as Kensal Green and Highgate, Strand-on-the-Green is at a disadvantage, that may, however, be estimated lightly—namely, the provision of cellar accommodation, which, from the comparatively narrow margin between the natural ground-level and high water in the Thames is impracticable. One "Gothic" mansion in the district, with a river frontage and two peaked round towers, suffers from being cellared, and at high tides has sometimes 3 ft. or 4 ft. of water standing in the bottom, which, of course, saturates the greater portion of the house, and keeps it in a damp condition for an indefinite time after each flood.

Some good houses are in process of erection, or have been recently finished, at the "Strand-on-the-Green;" amongst others a pair of semi-detached villas in the Swiss chalet style. They are lofty and roomy, and apparently substantially built, but are hard and angular in outline. Some of the others in process of erection show the old vices of construction in fall bloom and vigour.

One new house has been recently erected in the locality for Mr. W. T. Wells, of Regent-street, and is fast approaching completion, which is in contrast with all this. Mr. John M'Ewen, the designer of the house in question, has certainly set a good example to other builders, and taken a step in the right direction. Thames Bank House, to which we are referring, has its principal front to the river, from which it is separated by a gently-sloping lawn and carriage-drive, about 80 yards wide in all. It is divided into five bays, including three gables,—one in the centre, and one at each end, rather higher than the central gable. All the external angles of the house and the chimney-stacks have stone quoins, and the several parts appropriate cornices and copes. A good view of the house is presented to the river on the angle from both up and down stream. The entrance to the hall, which will be laid with Minton's tiles, is on the ground floor of the centre gable, the door having one chamber window above, and over that, in the pediment, a stone shield projected. There is not any pretension to purity of style or elaborateness of decoration. It is noticeable as a piece of substantial work.

We look for a change in matters generally that will make buildings be what they seem, that will prolong the life of houses sufficiently to cluster such associations round them, and to make such comforts in them possible, as to entitle them to the designation of homes.

FROM PARIS.

The group of figures representing Dance, in front of the new Paris Opera,* has been cleansed of the ink-stains produced by a bottle being dashed against the naked Bacchante. We all recollect the mutilation of the allegorical figure of the city of Lille, in the Place de la Concorde, by a maniacal workman, because the figure resembled his mother. He was punished, not severely enough, by the law, but the disappointment of the man must have pained him when he saw how the monument had been completely restored.

The new commission appointed to represent France in the collective labours of the International Congress of Weights and Measures, call upon all governments anxious to adopt the metric system, to delegate *anoms* who will aid in carrying out the work, and to provide standard copies of the platinum prototype under the surveillance of the Superintendent of the Director-general of the Archives of the Empire, to serve for the verification of the real equivalents between the French metric system and those of other countries.

We have already mentioned that the statues of Acis and Galatea, at the Luxembourg, were defaced by colouring matter, about three months ago. The same gentleman (calling himself Esquires) who cleaned up—as only a practical chemist could do—the Opera-group, has succeeded at the Luxembourg. The Acis and Galatea, at the Luxembourg are due to the chisel of M. Otton.

It is said that successful experiments have been made with an American stone-cutting machine, worked by steam, giving a result of an economy of one-eighth of that required to do the same amount of work by the old system of

manual labour. We have been long acquainted with M. Gay's machine, and have seen it at work in the quarries near Paris. There is a great difference between stone-sawing or stone-cutting, and quarrying by steam. In the two first we have only to place the block to be dressed under the wheel, or in face of it, so that the stone shall not shake. The operation of quarrying requires another system, by which M. Gay, of 5, Rue Jean-Jacques-Rousseau, cuts the stone into square blocks, leaving the sides of the drift perfectly smooth—fit for setting. We must say that a result of 40 square metres cut into handy blocks of any dimension, instead of 5 to 7 metres per day, by ordinary quarrying and blasting, is the proof of a certain intellectual and ingenious progress on the part of M. Gay which has attracted the attention of the highest authorities of the Mining School. Cutting into a face of limestone to a depth, horizontally, of 2 ft., with the clean seams about 2 in. wide, and a scouring stream to take off the dust, the machine seems to be to us the best as yet tried at large quarries in the open air or in pits. There is not an atom of waste to signify, or chips; so that future labour of dressing being much saved, the economy is great.

THE LATE MR. E. BUCKTON LAMB, ARCHITECT.

We refer with very considerable regret to the decease of Mr. E. B. Lamb, who died suddenly at his residence, No. 3, Hinde-street, Manchester-square, on the 30th ult., in his sixty-fourth year. He was the son of Mr. James Lamb, who held an important Government appointment, and who was an amateur artist of talent, and an occasional exhibitor at the Royal Academy. It was from his father that Mr. E. B. Lamb first imbibed his taste for art, and he was articled to the late Mr. Cottingham, architect, with whom he duly served his time. One of the first buildings superintended by him was the church of St. Philip, Lloyd-square, Clerkenwell, in the early days of the Gothic revival. Since that period he has erected other churches to the number of between thirty and forty in various parts of the country, of which the most noteworthy are at Healy, Thirkleby, and Aldwark, all in Yorkshire; West Hartlepool, Egham, Gospel Oak-fields, Kentish-town, Addiscombe, &c. He was also extensively employed in remodelling and adding to country mansions; and amongst works of this description may be mentioned Great Brickhill Manor, Hingehuden Manor, and Wakefield Lodge, all in the county of Bucks; Holt Hall, Norfolk; Thorburn Hall, Suffolk; Mopleton, Yorkshire; Montreal, Kent; and many others. Illustrations of several of his buildings will be found in our volumes. In addition to works of this class he carried on an extensive and varied general practice. Mr. E. B. Lamb published several works on architecture, and was an early worker with the late Mr. Loudon. Mr. Lamb was an enthusiast in his profession, and took a great interest in all matters calculated to advance and improve the public taste in matters architectural.

On some future occasion we may speak more fully of Mr. Lamb and his works. He was by no means an architect of the pattern-book school, but constantly endeavoured, even at the expense sometimes of beauty, to exhibit originality. He was a Fellow of the Institute of Architects.

THE CHADWICK MEMORIAL COMPETITION, BOLTON.

The sub-committee appointed to obtain designs and estimates for the monument proposed to be erected to Dr. and Mrs. Chadwick, of Southport, formerly of this town, reported at a recent meeting that they had obtained models from Mr. W. Calder Marshall, R.A., the cost to be 1,400l.; Mr. Jos. Darham, 1,050l.; Mr. Birch, 850l.; Mr. E. G. Papworth, 1,200l.; Mr. E. E. Gellowski, 1,050l.; and Mr. J. Birnie Philip, large model, with pedestal of fine axed granite, 2,200l.; small model, with granite pedestal, 1,600l.; or if denuded of its bronze figures, 1,200l. If stone be substituted for granite Mr. Philip would accept the following prices:—Large model, 2,000l.; second model, 1,450l.; with the base devoid of figures, 1,050l. Mr. Gellowski had also since written, that in case no alto-relievs be desired on the sides of the pedestal, his price would be, for statue not less than 8 ft. 4 in. in height, with pedestal in

granite or stone, 840l.; with two alto-relievs, 160l. extra; and with three alto-relievs, 210l. extra. The town-clerk stated, that in addition to the above, Mr. Mathew Noble, Mr. John Bell, and Mr. Woolner were also invited to send in competitive designs, but declined.

In answer to questions, the town clerk said the sum named to the sculptors was 1,000l., and they were requested to make the statue of such a size as would be consistent with that of Crompton, behind which it was proposed to be placed. The dimensions of the Crompton memorial were sent to all the artists.

Mr. Hall asked how much money the committee had in hand, because that might determine to some extent the selection to be made.

The Mayor said if they spent about 1,000 guineas, they might take it for granted that they had 500l. at least to raise yet.

At a subsequent meeting of the general committee, the models submitted by Mr. Birch and Mr. Gellowski obtained the preference, and on a division, there voted for the model of Mr. Birch, 15; for that of Mr. Gellowski, 6. It was then resolved that the commission for the execution of the statue be entrusted to Mr. Birch. At the suggestion of Mr. Taylor, it was resolved that a medallion portrait of Mrs. Chadwick, or a design commemorative of her works of charity and benevolence, should be incorporated with the statue.

CONCERNING CERTAIN CORNISH TOWNS.

ONE would think, after so much showing-up as Truro and Falmouth have had, that the sewerage in those towns would have undergone some improvement.

Not a bit of it. I have, in a run into Cornwall, just visited those towns, and anything more loathsome than their state cannot well be conceived.

I would sincerely caution all intending tourists to avoid those two towns; or, if they will not, so far take my advice then simply to be content with a walk through the principal street of each town. The stenches,—the fearful, intensely wild, compressed essences of stinks,—they will meet with in the other streets are sickening for me only to contemplate.

Contemplate! I have been out of Cornwall just five days, yet those stenches I fancy I now have half-way down my throat. Fancy every, any, foul, loathsome, nauseating, noxious smell you can, and in either Truro or Falmouth you shall have its equal. Is it any wonder? In Truro the sewers are of common dry stonework, rectangular in section, and various in size. They are for the most part about 18 in. wide by 2 ft. or 3 ft. high, covered with large flat stones as they come from the quarry. If their edges do not meet, why they put some smaller stones upon top; no mortar or cement is used in their manufacture. Where the wisdom of the commissioners has so dictated, there is on the side of the road, or in the *trotoir*, nearly always under a window, a cesspool 3 ft. or 4 ft. square, made of dry stone work, and covered with a cast-iron slab; at the upper end, on a level with the gutter, the road-water runs into this, an untrapped opening. This untrapped opening is by the people living near taken advantage of: they throw into it their slops, garbage, and nightsoil.

Fish have been plentiful in Cornwall this year: fish bones and fish offal lie in every opening, mixed with human excreta, soap-suds, and so forth. One of the cesspools I saw in Campfield-hill, so nauseously foul, that I fairly retched; and that in Mitobell-hill had such an effect upon a friend that it acted as Epsom Salts upon him, and he lay on a sofa taking brandy in the evening: it was close under a window. The one in Campfield-hill was placed on the other side of the road to the cottages: the road is from 10 ft. to 11 ft. wide. As I looked in astonishment, I heard one poor wan-looking middle-aged woman say to another—"Ah! it's too bad: that there place stinks so, it do, one can hardly live here, and it's no use to say nothing."

In Ryder-street, Union-street, Fairmants-street, Cardew-street, are these cesspools to be found, and all in the same state. The gutters in these streets, and, generally speaking, throughout the town, are paved with quartz, locally called *spar*, pebbles of irregular shape; of course the paving is badly joined, so in this way the garbage and liquid refuse that the inhabitants throw into them are as much as possible retained on the surface, and the spreading of noxious exhalations expedited. Some of the streets are

* See p. 681, ante.

paved in the same outlandish manner, and this in a county famed for its beautiful granite!

I question if either commissioners or surveyor ever heard of granite paving-stones. By the bye, the surveyor has 60% per annum, I believe, but am not sure, paid fortnightly, and he is not allowed to do anything else. If these cesspools are bad undisturbed, how much worse do they become when the man comes round "to clean 'em out a bit when the weather is nice and dry." The operator has a shovel made like a spoon, only not so much dished: with a handle or shaft to it, I should say, from 6 ft. to 7 ft. in length, he raises the cast-iron cover, at once exposing the bluish-black, putrid, bubbling, semi-liquid mass; sinking his shovel into it, and using the long handle as a lever, he brings up shovelful after shovelful of the horrible stuff, and lays it, spreading itself like something animate at the side of the reservoirs of poison, "out of the way of the road you know, sir," where it remains until it is fetched, which may be this afternoon or to-morrow morning; perhaps to-morrow morning, seeing there is but one scavenger's cart in this town of 11,300 inhabitants. No regular system of sewerage is there in the town; they do not even see that the new drain empties itself properly into the river that runs through the town. If they meet with an existing drain, of whatever size it may be, "why they make 'em join, o' course: stans to raise the drain emptye himself somewhere." The cesspools are in untrapped communication with the sewer: the matter in the cesspool cannot get beyond a certain height in it, for a hole in one of the sides of the pit takes it off into the sewer. The sewers are all supposed to empty themselves into the river. The river is a piece of mud, several feet thick, nearly two miles in length, and of a width for the upper half of its length (that closest to the town) of 100 to 300 yards, through which meanders a narrow channel, which is every year getting narrower and shallower.

In Falmouth the same sort of sewerage exists. In describing that of Truro I have described that of Falmouth, though of the two Falmouth is the worst, if worst there can be.

In Falmouth the surveyor has, I believe, 12 a week, paid fortnightly. There the drains empty themselves into the sea. On landing from the steambath on the jetty in Market-strand, I could at once testify that some drains empty themselves into the sea; even the pebbles on the little beach are bluish black from the sewage matter pouring over them. But even a blind tourist could discover the proximity of sewage matter. In a boat going along the shore, you see drain after drain, high up the wall, pouring its foul contents into the lovely sea; you see block after block of rank, ill-looking houses, and you see privies and ash-pits overhanging, or bordering the sea, the stain from the matter coming from them all down the sea-wall.

Falmouth in one respect is ahead of Truro, for it has waterworks. The reservoir is about four or five miles from the town; the fishing in it is strictly preserved, for it is rented by some gentlemen who keep boats on it.

I did not go into Cornwall to get cholera, or fever, or even to get sick on foul smells; I had quite enough of it in Truro and Falmouth, so I did not go on to Penzance: therefore I know nothing of its state other than I heard a lady complain of the dust and the absence of anything remotely resembling a water-cart, save one day when she saw on the Esplanade an empty one pass by.

This is the way Cornwall seeks to have a healthy population, empty workhouses, low rates; and this is the way she encourages tourists to visit her lovely coasts.

And—will you believe it?—though some splendid water can be found in the neighbourhood, yet influential people in Truro have again and again opposed its being brought into the town; and now that, after repeated attempts, an Act for the creation of waterworks has been passed in the last session, grave doubts are entertained if a company can be formed to do the work.

No Truro people prefer having their water from the wells that are sunk in different parts of the town, having water that is full of organic remains of diluted sewage; and, as if that was not enough, to have a fine lot of zymotic diseases in stock, they must allow conduits full of poisonous gases to distribute their contents throughout every street in the town.

Falmouth will not have a proper system of sewerage, for the present system did when they were children, and why not now?

Truro believes itself a marvel of cleanliness,

and is inclined, in solemn council assembled, to speak slightly of people suggesting any alterations. Perseverance is generally rewarded; and so, if in Truro and Falmouth they have not had fever nearly all the year round, they ought to have it.

Pro.

THE PICK AND THE SHOVEL AT WORK AT CHATHAM.

To those who entertain the conviction that "the noblest study for mankind is man," it follows, with some degree of logical sequence, that the worthiest title by which architecture can claim the respect of the philosopher is its rank as a branch of ethnology.

To those who are habitually accustomed to regard the art, the science, and the practice, of the builder, as a special, and by no means secondary, branch of the finer and more subtle crafts which it is given to the human intelligence to perfect, such a view as the above may seem, at the first glance, utterly inadmissible. And yet, on further reflection, it will not prove altogether strange to our readers. The more our attention is directed from the practice, to the history, of architecture, the more distinctly does the mind become impressed with the mode in which the important function of reflecting, and recording, the phases of social life, is fulfilled by the creations of the builder. Of how many nations and races, of whom no other relics remain, have we the unnam'd and crumbling walls, or the carefully constructed, and long hidden, sepulchres? The art of the potter, himself an early servant, or brother, of the builder; the art of the founder, exercised on implements that appear to have served alike the purposes of the warrior, the hunter, and the timber hewer; the yet earlier and ruder toil, for it can scarcely with propriety be termed art, of those who chipped knives and arrow-heads out of flints, or scraped bone into the predecessors of what we call needles; these alone have left some faint and few relics of human life that are more ancient (possibly, for even that is not certain) than the ruins of prehistoric buildings. Thus the steadiest, if not absolutely the longest, ray that is thrown back into the unmeasured night, which preceded our present early dawn of civilization, is lent by the lantern of architectural research. Those who will not allow architecture to be called a branch of ethnology, must yet admit that some of the most important data of the later quasi science are due to the ancient teutonic art.

Nor is the relation confined to the province of historic architecture,—of antiquity and archaeology. It is no less apparent in the practical, striving, busy life of the day. To how many of the most cultivated workmen—workers with the intelligence, or with the fancy, no less than with the skilful hand—is not the architect called on to ally himself? In the mathematical science of construction: in knowledge of the strength and qualities of materials; in the operations of the quarry, the ravine, the kiln, the forest, and the timber-yard, the architect stands on common ground with the engineer. In decorative art, he is linked with the painter, the sculptor, the smith, the moulder, and founder of metal: his occupation is not foreign to that of any apt student in the wide field of artistic design. In regarding the surroundings of his creations, he must seek the aid, if he do not himself possess both the taste and the experience, of the landscape gardener, the horticulturist, or even the cultivator on a wider scale.

No less close is the link which binds the architect to the soldier, especially to those corps, the élite of all armies of the world, to which the opposed and complementary functions of the arts of construction and of destruction are especially committed,—the *gens* of foreign armies, the Royal Engineers and Royal Artillery of our own. So close, indeed, is the similarity between the education of the Royal Engineer officers of the day, and that of the civil engineer, the architect, and the surveyor, that the officers of that illustrious corps are looked to, by the Government of this country, to discharge many of those functions which we may be pardoned for considering to come rather within the province of the civilian, who has been specially trained to their discharge. Thus not only one special function of the mechanical engineer,—the construction of ordnance,—is discharged as a military duty, but the formation and maintenance of the great constructive works of our arsenals and dockyards, the Ordnance Survey, and minute

mapping of the entire kingdom, and even the purely architectural work required for the accommodation of the Department of Science and Art at South Kensington, are all committed to Royal Engineers. We must not be understood as wishing to express an opinion, at this moment, as to the greater or less advisability of this course; we are only concerned to point out the close and intimate relationship existing between the architecture of peace and the engineering of war.

We have before referred to the influence of the progress of the art of war, on the public, and, in a minor degree, on the private, edifices of a country. It is evident that by far the greater part of historic architecture reflects the exact state of the relation between the offence and the defence at the date of erection. The clustering towers of Mediæval Italy came down before the face of the rude falcon, or saker, or whatever was the name of the clumsy engine that was the predecessor of the rifled ordnance of the day. It was not necessary to command them all. The subjugation of one stubborn noble chieftain, such as the one of whom Carlyle tells us in his "Life of Frederick the Great," by the hoarse and unaccustomed eloquence of one gun, such as was then thought heavy, sapped the very foundations of the keeps of that chieftain's peers. When towers and turrets were known to be undefensible, they ceased to be built. And thus it has come to pass that, within less than 500 years, that form of seignorial dwelling which was, in some parts of Europe at least, so common as to be universal, attracts, by its relics in Ireland, such curious speculation at the present day. Bel, Apollo, Priapus, ugly forms of Indian, of Phœnician, or of African worship, are all appealed to, or ransacked in order to explain the very simple fact that, when times were rough, the arm of law feeble, and cannon unknown, gentlemen built towers to live in, because they were safe with a double safety. They afforded their owners a wide and reassuring look-out, so as to give a tolerable safeguard against surprise, and they were so difficult of access as to be able to resist anything but a blockade.

It is not only, therefore, for the reason that we have habitually kept open a limited space in our columns for matters of vital social interest, although not directly and immediately connected with either the science, the art, or the trade, of the Builder, but from the fact of the intimate relation of military engineering to architecture proper, that we have, from time to time, called the attention of our readers to the rapidly alternating phases occupied, during the last few years, by the arts of attack and of defence.

On one point of military order alone, the Builder has been led more than once to insist, from the profound conviction of its vital importance to the defence of the future. First, and almost, if not altogether, alone, among the science publications of the day, we have pointed out the indispensable necessity of rendering each soldier of our small but admirable army, an engineer, or, if the term is better liked, a sapper. Familiarity with the employment of labour, intimate knowledge of the difference between the speed and facility with which a taught and an untaught pickman can make a hole in the ground, some personal acquaintance with science, and circumstances of war on the Continent, and a careful study of the current incidents of both the German and the American wars, have led us again and again to insist on the importance of the spademan a weapon no less essential to the soldier than the bayonet. It is with great satisfaction that we now see, for the first time, that the efforts of the advocates of common sense have not been altogether lost in this important matter. We are abandoning our time-honoured English method of learning nothing without the sanction of a drubbing. We are actually thinking it desirable to turn practical attention to the best method of providing sudden shelter for our troops, without having had of a campaign, of a division, or even by the loss of a lesson for the thinking of a man. "The Pick and Shovel for Troops" has appeared among the broadsides by which our daily contemporaries strive to attract the notice of those casual purchasers who are fain to look for amusement in their columns when London is out of town.

The French, we are told, have for some time recognised the primary importance of the view we have so strenuously urged. In 1867 were issued, "Observations sur l'Instruction sommaire pour les Combats," in which it is distinctly stated that the use of arms of precision (and still more, of arms of repetition) has trans-

ferred the advantage from the attack to the defence, in the case of troops advancing over open ground. The distance of three or four hundred yards is enough to expose an advancing corps to an annihilating fire. Distance, within such limits as to constitute actual military pressure on the field, is no protection. Courage, pluck, discipline, all that distinguishes an army from a mob, are utterly valueless in the face of a sustained fire; so that the enemy do not run short of ammunition, and the period of exposure extends over more than a few minutes. In any case, the French strategists urge, an advancing body of men would arrive too much weakened to contend with success against an enemy prepared to receive them, and who had themselves been protected from fire.

Again, in a paper called "Instruction sur les Franohes d'Abris," rules are laid down for the rapid construction of trenches for the shelter of the troops forming them from fire. Before the death of Marshal Niel (a great loss to the French army), a conference of officers was held under the presidency of that distinguished administrator, in which the necessity of acconing infantry to protect themselves by *impomph* field works was fully admitted and insisted on. Napoleon, himself an engineer (as proved by his noble works of national intercommunication, no less than by the great development given in his tactics to the artillery), especially condemned the reluctance shown by officers and soldiers to using the pick and shovel. If, with the artillery of his day, Napoleon held that field fortification should be improved, and that the art of the military engineer was in arrears of that of the officer of infantry or of cavalry, what would have been his views, and what his dispositions, if he had been a grim witness of the strife between Armstrong and Whitworth.

In the American war the country was furrowed with trenches, and turned into a perfect rabbit-warren of rifle-pits. General Grant, no less than his antagonist, made more use of the spade than had ever been the case in the previous history of war. An extract from an American work is quoted in the French report to which we have referred, to the effect that a Federal brigadier, having had to change his position twice in less than an hour, left behind him two lines of nearly completed entrenchment.

After having received, in the Royal Military Academy at Woolwich, the only systematic education which, in this country, can be in any way compared to that given in the seats of the highest Continental culture, the newly-commissioned officers of the Royal Engineers are now sent to pass a certain course of practical study, at the School of Military Engineering at Chatham.

Experiments have for some time been going on at this establishment, as to the method of providing instant shelter for troops, regard being had both to the minimum section available for use in a field, parapet, and ditch, and to the maximum amount of labour that might fairly be expected from the individual soldier, duly trained and directed. The section arrived at is that formed by the excavation of a trench 4 ft. wide, and 15 in. deep, the erection being thrown into a mound, of course on the side exposed to fire. An untrained party is said to have executed such a trench in less than half an hour. Of course much must depend on the nature of the soil. Military drill has the great advantage of acconing the sappers to work more closely to one another than is the wont of our navvies and miners. A linear yard of trench is allowed to each man in common trench work, and only 2 ft. in flying sap.

A more serious experiment is reported as having been made last week, under the immediate inspection of the general officer commanding the Chatham district. The 27th Inniskillens, the Royal Marines, and the 1st and 2nd Depot Battalions, furnished a total force of rather more than 1,000 men, who were employed, distributed into three reliefs, in the formation of a redoubt under pressure as to time. The length of the face of the work is stated at a little under 140 ft., and the work, with all its requisite defensive details, was completed in eighteen hours. The ground was somewhat unfavourable over a portion of the line selected, being hard, compact gravel. But the officers threw themselves on the resisting element, not horsed, but pick in hand, and rough and smooth were overcome, guns mounted, and trenching instruments removed, before the time fixed for the visit of the inspecting officers.

We have witnessed with the utmost satisfaction this step in the right direction. The method

adopted is not identical with that to which we endeavoured to direct (the attention of the service; but, on the other hand, it is thoroughly and entirely military, and appears to have been eminently successful. We entertain no doubt as to the advantages of our own suggestion, but it is possible to hold to that conviction, without in any way underrating the result actually attained. The essential thing is that the infantry soldier should, as a matter of course, become accustomed to the use of trenching tools; the pick and shovel drill, if officers like to call it so, should be as familiar to him as rifle and bayonet drill. As to the best method of doing this, especially considering the small size of our army, we are willing to speak with great deference to the practical experience of the staff. So long as the *non possumus* was opposed to the plain prevision of common sense, we held it right to speak in an unflattering tone. The Papal excommunication and the speaking of actual written communications from the highest military authorities) is now withdrawn. The order from the Horse Guards is "Experiment." To the result of that experiment, boldly and energetically carried out, we can only wish God-speed.

It will be remembered that the financial element was not excluded from our calculations. That under the energy and spur of emulation, officers and men may freely work, to show what they can do, has now been happily proved. But human nature is not absolutely changed, even if some of its weaknesses be eradicated, by military drill. It must be remembered that, as far as the present private soldiers of our army are concerned, they are under contract with the public. It would be an undue strain upon that contract to insist upon the performance, under its terms, of the work of the sapper, in addition to that of the rifleman. Nor must the rightful interest of the officers be neglected. Uniforms are extremely expensive. We can speak, from a very vivid experience, of the influence of hard civil work on the augmentation of the tailor's bill. For the infantry officer, this influence will be as important as it will be unwelcome. To maintain that spirit of hearty satisfaction which is essential to the wellbeing of an army in time of peace, those considerations must be borne in mind. Even if officers and men, from sheer patriotism, *esprit de corps*, or any other motive of noble emulation, will freely give to Old England an amount of muscular labour which is "not in the bones" do not let us expect to mulet them also in pocket. The House of Commons, not always wishing to loose the paras-trings of which it is a somewhat capricious guardian, must be applied to in support of the new educational movement, unless, as we had the honour to suggest, that movement can be made self-supporting. That such can be the case we have no more doubt than we have of the necessity of the change. Marshal Niel and H.R.H. the Duke of Cambridge have come over to this opinion as to the latter part of the question. We anticipate, sooner or later, a similar conversion as to the former fact. In a question which, after all, is a matter of engineering, we have no doubt of the value of engineering experience. That the experiment now reported from Chatham is successful we rejoice to believe; but success, to be success, must be permanent.

We trust, therefore, that amid all the satisfaction which must be so justly entertained by those who have advanced thus far in the course of teaching the soldier to protect himself, there will be room for a whisper to be heard from the source whence the first alarm on the subject proceeded. The *Builder* rejoices in the fraternisation of the soldier. He desires it to be durable. To insure durability he wishes to see it based on those sound principles of fair play, common sense, and respect for the most powerful motives that ordinarily actuate mankind, which may be left out of sight on a spurt, but can never be safely neglected in the long run. Let every soldier be an hearty concourer, with the least possible delay, not at his own cost, and not at the cost of the tax-payer. If this can be done without such arrangements as shall tend to make the British army in some sort a self-supporting institution, well and good. But, in any case, no one of the above-named requisites can be neglected without great disadvantage.

Royal Manchester Institution.—The Exhibition of modern paintings and works of art here will be opened to the public on Monday, the 13th inst.

BOLTON SEWERAGE: PROPOSED INTERCEPTING WORK.

For a long period much agitation has been going on in Bolton on the subject of the outfall of the sewages. We are at last glad to find there is a probability of the work being carried out under the pressure of the powers possessed by the Home Secretary, as Mr. Lawson has just decided between the rival plans suggested by the engineer, and the Sanitary Sub-Committee. Bolton, it should be understood, contains a population of 70,000 inhabitants; the area of the borough is 1,840 acres, one half of which is drained. The river Croal, running through the town, takes 720 acres; the river Torge, 122 acres; and the Jenny Bech, 73 acres; and the portion in dispute was the outfall drainage of the area falling towards the river Croal. The total quantity of the sewage of Bolton is 1,725,780 gallons, 7-8ths of which flow into the river Croal. The bed of the river Croal, we should remark, is pitched, for the distance it passes through the town. According to the engineer's report (February 4, 1867), it appears that all the sewers are so constructed that the sewage can be intercepted at any period. The proposed outfall sewers have been so designed as to intercept all the sewage of the town, and to carry it outside the borough a distance of one mile and three-quarters (measured along the river course), from the Market House.

From the proposed point of exit it is intended to make a sewer, 5 ft. by 3 ft. 9 in. of uniform shape, along the right bank of the river to the sewer discharging at Rosehill; from Rosehill a sewer of reduced size, 4 ft. by 3 ft. to the new sewer at Church Wharf; from thence one of 3 ft. 9 in. by 2 ft. 9 in. to Water-street; from thence a circular sewer of 3 ft. diameter to Great Bridge; from thence a circular sewer of 2 ft. 6 in. diameter to Gilroy-lane, and terminating with a sewer of 2 ft. diameter at Pike's-lane, the total length being 3 miles 270 yards.

At Pike's-lane he proposes to form a flushing tank, with sluices, &c., complete, to flush out the whole length when necessary, and also at this point to erect a chimney-shaft and furnace for the ventilation of the sewers, as it is the highest point.

It is also intended at all convenient points along the course of the outfall to construct storm overflows to deliver excessive rainfalls into the river and these overflows are to be trapped.

Manholes are to be placed at frequent intervals, and junctions left at such places as may serve for the drainage of the land and houses, when built upon. The estimated cost of the proposed works is 13,684l.

The general inclination of the sewers varies from 1 in 43 to 1 in 325, except in one instance, which is 1 in 12.

No scheme is at present recommended for the ultimate disposal of the sewage, as, in consequence of the great sacrifice attending experiments in many places, and the failures that have occurred, the engineer has been deterred from doing so; but he has watched for a long period the progress of sewage utilisation works in other places, a list of which he gives. At Leicester, Exeter, Uxbridge, Ely, and Clifton, deodorisation has proved a failure. At Cheltenham and Coventry a system of filtration has proved only partially successful. At Hitchin and Blackburn, precipitation has proved a failure at the former, and at the latter place it has only been recently adopted. At Croydon, Rugby, Edinburgh, Tavistock, Harrow, Crediton, Fasey, Clipstone, Bannry, Watford, and Carlisle, irrigation has been tolerably successful; but at Croydon, systems of precipitation, filtration, and deodorisation had been previously tried, but each had proved a failure.

Upwards of fifty patents for dealing with town sewage had been taken out, and there is no instance on record of any one having been successfully applied. At Croydon, it is stated that until recently the disposal of the sewage cost 3,000l. a year, but at the present time a profit of about 300l. is made by it. There are 350 acres of land irrigated by the Croydon sewage, and the profit realised is said to be 1l. per acre.

The report was submitted to the sanitary committee, and one member, the mouthpiece of that body, opposed the plan, and suggested a crude and undigested scheme, as will afterwards appear, of their own, as more economical.

From Great Bridge they proposed to take up the pitching of the river bed, and reduce it in

* This system is said by some to produce the foot and mouth disease now prevalent amongst cattle.

width from 6 ft. wide by 19 in. deep, to 4 ft. wide by 15 in. deep, and to lay an iron pipe of 16 in. diameter in the line of the river underneath the invert. This iron pipe, of 16 in. diameter, was to take the sewages of twenty drains, between Great Bridge and Water-street, the sectional area of the sewage being stated to be 45 square inches, the sectional area of the pipe being estimated at 256 square inches. From Water-street to Bridge-street, to take the sewage of eleven additional sewers, computed at 69 square inches, they proposed a 20-in. pipe, of 400 square inches area, to take the united quantities of the above sewer, calculated at 114 square inches of sectional area.

From Bridge-street to the weir at the wharf they propose to lay down a 24-in. pipe, the sectional area of which is 576 square inches, to convey the sewage from the thirty additional sewers which discharge into the river between these points, the flow of sewage from which they estimate to be 84 square inches, and which, added to the former quantities, gives a sectional area of 198 square inches. From the wharf to Messrs. Marsden's Bleach-works, they proposed to lay down a pipe of 30 in. diameter, the sectional area of which is stated to be 900 square inches, to convey the sewage from six sewers, of 176 square inches area, making the total quantity of sewage 374 square inches. In other words, as they say, to provide an outfall sewer of 900 square inches, to take the whole of the sewage, which is estimated at 374 square inches. The large pipe is to be cast in 6-ft. lengths, in two pieces horizontally, and secured by flanges and bolts in the centre. To connect the present large street sewer with the intercepting pipe, they propose to use pot-pipes of just sufficient size to take the ordinary drainages, and at these points to have (*vaque*) storm overflows, to take the rainfall into the river.

They also provided for a system of ventilation, approved of by Government engineers (?) of 4-in. pipes affixed to, and carried up above, the roofs of the houses; and a plan of flushing by means of slide valves fixed to the pipes.

They state that the estimated cost of these works is 4,966*l.*, or say 5,000*l.* The size and weights of the pipes are as follows:—

Diameter.	Cwt.	Cwt. Qr.	Lb.
16 in.	1,088	or 2	2 20 per yard.
20 in.	881	" 2	1 13 "
24 in.	2,318	" 4	0 0 "
30 in.	5,093	" 5	0 0 "
Branch pipes, &c.,	99	"	"

Total weight... 10,080 required for the pipe sewer.

We may in this place point out the errors in the calculation in the later report, as must be self-evident to the veriest tyro in the profession. First as to the area of the pipes,—

	Pipe.	Sq. In.	Sq. In.
Instead of a	16 in. = 256	should be	201.06
Ditto	20 in. = 400	"	314.16
Ditto	24 in. = 576	"	432.39
Ditto	30 in. = 900	"	706.85

In estimating the quantity of sewage, the question of the velocity of flow appears to have been altogether omitted,—a very important element in estimating the amount of a discharge in these days of hydraulic engineering.

And with reference to the weight of iron and the estimate, we must add 50 per cent. to the former, and about 75 per cent. to the latter, to be nearer the truth, which would very much augment the totals of weight and price.

The report above mentioned, was reviewed by the engineer (March 11, 1867), its errors of calculations as to quantities of sewage and acres of pipes pointed out, also the estimate of cost; and it was not until the inhabitants of the district affected by it took up the case, and petitioned the Home Secretary for the purpose of putting the Local Government Act on "Pollution of Rivers" in force; and that Mr. Arnold Taylor was sent down, and the result of his inquiry was to approve of the scheme of the engineer, and to condemn that of the committee in unmistakable terms, and his recommendation was pressed on them by Mr. J. Taylor, of the "Local Government Act Office."

To evade this, they proposed another *economical* scheme, viz., "a double line of iron pipes, one on each side of the pitched invert of the River Croyal, and this was referred to the Home Secretary, who objected to it, and referred them to the original plan of the engineer, and gave them notice under the Act that if they did not proceed with the works, he should take the necessary steps to do so; but he was recently requested to postpone it, in order to enable them to consult another engineer to decide these knotty

questions, and Mr. Lawson was instructed to make the necessary investigation.

Mr. Lawson, in his report, points out the merits and defects of both plans; and one question, he says, is to settle the point as to the time the overflow shall come into action, and the sewage be allowed to escape into the river Croyal.

Mr. Lawson thinks that neither plan on that head will have full effect, that the sewage after the first rush of water from heavy rain contains a great amount of filthy deposit, and that ten times the amount of the ordinary sewage is required to effect a perfect clearance, say ten times 1,500,000 gallons, equal to 15,000,000 gallons. If it is intended that the river Croyal shall be purified, the engineer's scheme is ample, and that of the committee somewhat small, and both plans would fail as the overflows are arranged, and the committee's plan is besides impracticable. He is of opinion that substantially the plan of the engineer is the best, as affording facilities for regulating the flow, and better calculated for future requirements. He then proposes reduction in the sizes of the smaller sewers to 3 ft. 6 in. by 2 ft. 6 in., 3 ft. by 2 ft. 6 in., 27 in. diameter, and 24 in. diameter, and overflows to be so fixed as to discharge the flood water above mentioned, and so constructed as to be capable of adjustment. He then incidentally recommends depositing tanks to relieve the sewage of a portion of its solid matter. He also points out the errors of the calculations of the sub-committee, both as to the area of the pipes and the sewage flows, the latter arrived at without reference to its velocity. Thus, it appears after two years and a half, or more, of discussion and agitation, the plan of the engineer is substantially to be carried out, after a small reduction in the sizes of the sewers.

ERWIN VON STEINBACH AND HIS WORKS.*

CHRONICLE and legend have inseparably associated with the name of Steinbach that of his daughter Sabine in the production of one of the noblest monuments of Gothic art in Europe. That much of the more delicate and elaborately executed sculpture is due to her chisel there appears to be little doubt, and her personal beauty is also a feature in the traditions which have made her name that of the chief heroine of Medieval art. A complete romance has, in fact, been embroidered upon the canvas supplied by her story, the main features of which have possibly their foundation in truth. As an example of the kind of material which the art-career of Sabine, as told by tradition, has furnished to the novelist, the following half-legendary anecdote may be cited. The story is thus told; Bernard Sunden, a young Silesian sculptor of average promise, who was engaged, like many others, in carrying out the designs of Erwin, became deeply imbued with an enthusiastic admiration of the beauty and artistic talents of Sabine, who was, however, too closely wedded to her art to listen to declarations that might in any way distract her attention from it, or retard the progress of the work, in which she was aiding to raise a monument to the glory of her father, by forwarding the completion of his great design. There was also, as usual, a rival, one Polydore of Bologna, a young French sculptor, from the plains of Picardy, in whose ardent nature the charms of Sabine had developed a similar but far more violent passion than that which had stirred the breast of the more passive Silesian, who found consolation in the genial though quiet routine of his professional pursuits. It soon, however, became evident to the watchful and jealous eye of Polydore, that while Sabine did not allow her attention to be diverted for a moment from the ardent pursuit of the art to which she had devoted all her energies, she yet seemed to favour the pretensions of Bernard by allowing him to assist her occasionally in the works on which she was engaged. Matters stood thus at the time that she was near completing some conspicuous figures and elaborate enrichments above one of the principal portals. In this special work Bernard had been allowed to assist, and the last finishing touches having been given just as daylight began to fail, the protective hoarding was removed after dark, in order that the newly-finished portion of the work might be seen as a pleasant surprise by the public spectators. This state of things soon got wind,—the evening's gossip spread it far and wide; and when the

following morning arrived, and many hastened to the place to see the newly-exposed work, great was the surprise and consternation experienced on finding the whole of the figures and ornaments mutilated and disfigured, beyond, as it seemed, the possibility of repair. Some considered the act that of the incarnate fiend himself, who, it was averred, had more than once sought to interrupt and retard the building of the temple; but others shrewdly attributed the work of destruction to Polydore, whose ill-concealed rage and jealousy since Sabine had accepted the aid of Bernard, seemed to know no bounds; and moreover he did not appear at his usual post that day, nor on several succeeding days. But then comes the miraculous part of the story. It was said that Sabine had had a vision in the night, in which she was promised celestial aid in the restoration of the mutilated work, and that in the morning she had discovered a beautifully drawn out plan for the repair of the work, upon her little table in the window niche of her bedroom. However this may be, say the relations of the tradition, the mutilated work was found partially restored on the morning following the vision, according to the design furnished to Sabine, and each night still further progress was made. Many were induced to believe, such was the beauty of the restored portions, that they were the work of angels, who had wrought under cover of the darkness; and it was asserted in corroboration, that the blows of a mallet, as though striking upon a sculptor's chisel, had been heard in the dead of the night, when every other sound was stilled. These reports and surmises appeared to be borne out by the rapid and continuous progress of the restorations themselves, accounts of which spread far and wide, till it was evident that another night's operations of the supposed celestial sculptors would complete the work, with even more perfect beauty than it had originally possessed, though even then considered the masterwork of Sabine. At this juncture it was said that Polydore had been again seen in Strasbourg, and Bernard, who believed that the Bolognese sculptor had more to do with the mutilation than the foul fiend, determined that night to set himself to watch the work, notwithstanding many pious scruples on the score of interfering with the work of the angels, and also some dread of the devil, who, in spite of his suspicion regarding Polydore, he still thought might possibly be at the bottom of the work of destruction, and perhaps ready to recommence it after the miraculous restoration. His scruples and fears being, however, both overcome, he proceeded to the scene of his nocturnal watch, where, contrary to expectations and fears, nothing occurred till nearly midnight, when he thought he distinguished, coming from the sculpture of Sabine's portal, slight sounds like those of a chisel struck gently by a mallet against stone or marble; but the sound was very faint, and he persuaded himself it was only fancy, the more especially as he had not the amount of courage requisite for approaching the spot more closely. He had, however, placed himself at the precise spot at which a human enemy was most likely to make his way to the part of the scaffolding in question—and this point he thought it his duty to guard,—though he was not prepared to contend with an enemy of more mysterious nature. But this was not the only point of possible approach, and he just then clearly distinguished the creaking of a plank on the scaffold itself, leading to the stage in front of the miraculously restored wall. Almost immediately after, his eyes having become sufficiently accustomed to the darkness to distinguish dimly the forms of objects in favourable positions, he discerned a dark form, the outline of which was rendered tolerably distinct against the lighter colour of the new stonework. The form appeared to be unmistakably that of Polydore, and it glided along the scaffolding towards the point he was so anxiously watching, and where he had heard the sound. Then came another slight blow, like that of a mallet, and a fragment fell upon the stage below, and immediately after a white object appeared gliding round the projection of a buttress. The dark figure turned towards the new apparition, and started back upon the narrow scaffold as though in sudden terror. Then came a sound like that of a heavy mass falling to the ground, followed by what seemed like a sigh, or a groan. Bernard, whose gaze had been riveted upon the white form that glided out of the shade of the buttress, soon perceived that it was not that of an angel, as he

* See p. 679, ante.

bad at first supposed, but simply a slight graceful human figure, and in an instant he was on the planks of the stage above; for he knew every ladder and every intricacy of the scaffolding, and was just in time to catch the falling figure of the somnambulist, Sabine, who had been pursuing her dream work, and was in the act of returning, when the noise of the fall which had just taken place had suddenly roused her from her trance, and but for Bernard's timely arrival she would have fallen to the ground. The simple explanation was that the destruction of her work had preyed upon her mind in dreams, under the influence of which she had glided safely, night after night, to the scene of the devastations, and bad, in her sleep, effected those restorations which the peculiar spirit of the times had so readily attributed to supernatural intervention. Sabine's impression, that she had been favoured with a divine vision, combined with the excitement of her religious enthusiasm, may have induced both the acts of simple somnambulism, and also her nocturnal labours at the injured sculpture; and this explanation has been very successfully suggested and expressed by M. Grasse, in the well-conceived statue before alluded to; in which she is made to hold a prayer-book in one hand, while with the other she grasps a mallet and chisel, which she presses to her breast, as though she felt that the instruments were imbued with a miraculous power, by which their action would be guided, rather than by the skill of her own hand. This story, whether wholly or only partly true, has taken a strong hold upon the literary and artistic men of Germany; and, as previously stated, a German novel-writer has made Erwin and the progress of his great work the subject of a graceful and very graphically treated fiction,—in which, of course, Sabine occupies a prominent place. There are many such legends, partly true and partly legendary, associated with the erection of the great ecclesiastical edifices of the Middle Ages, showing us that architecture is very far from being without its romance.

The great artist-mason, with his sons and danghter, continued the work together till the beginning of the fourteenth century, by which time the fame of Erwin and the renown of his cathedral had spread to other parts of Germany. In Strasbourg he was styled *gubernator fabricæ ecclesiæ argentinus*, and he was also more familiarly styled *hüttenherr* and *werkmeister*; generally considered to express "engineer" and "principal architect." One of the consequences of the successfully carrying forward of so vast a work at Strasbourg led to the nomination of that city as the seat of the principal Masonic guild or lodge of the Free Society of Masons, and it may be that his title of *hüttenherr* had reference to his being elected master in chief of the Germanic lodges, as the German common term for a lodge was *hütte*, the Strasbourg lodge becoming the *haupt-hütte*. Another consequence of the widely extended repute of Erwin of Steinbach was, that the aid of his fertile invention in design and skill in construction was called for in various quarters; the principal works which he designed or executed beyond the walls of Strasbourg being the graceful church of Thann and great part of the cathedral of Freyburg, including its elaborate spire.

Thann.—Thann is a beautifully-situated little town nestled close to one of the narrow valleys of the Vosges Mountains, and, with its elegant Gothic church, forms such an exquisite picture, with its ancient houses and mountain background, that a painter in transferring the scene to canvas would scarcely deem it necessary to either heighten or subdue a single feature. At the first aspect of the beautiful spire of Thann the student is at once satisfied that the traditions and records which attribute the erection of the church to the architect of the great work at Strasbourg are no myth, for the whole structure is plainly enough stamped with the true spirit of Erwinian design. The elegant steepled tower is at the southern angle of the east end of the building, and is furnished, like the tower of Strasbourg, with external winding stairs, cased in a spiral shell of open-work, all the way to the top of the lofty tower, from which rises the elegant steeple, supported at its springing by the slenderest and most fanciful of flying buttresses; the steeple itself being perforated with open-work, light and beautiful as a richly-traceried window of delicately intricate design. The whole composition is, indeed, unmistakably from the same hand as the tower and steeple of Strasbourg, of which the perforated staircase turrets at the angles form so

remarkable a feature. The south portal is a marvellously-beautiful example of lofty and elegant proportion, wrought out with the richest conceivable details; the capitals of the slender detached columns forming corbels for small statues, remarkable for their graceful execution; and above which are delicately perforated canopies, surmounted by pinnacles, as light and slender as lacework. The double western portal is also quite a masterpiece, and altogether exceptional in regard to its elaborate and minute enrichments; while the exquisite touches of sculpture encrusted upon and about the buttresses are of very remarkable elegance and most ingeniously devised in regard to appropriateness of attitude in reference to situation. In short, the western facade is a perfect jewel of elaborate art,—the amount of finely-designed patterns, of minute perforated work and lacy canopies, being perfectly astonishing. Part of this work appears to exhibit manipulative touches of a later period than that of Erwin; but the main features and the distribution and proportion of the general elevation, as well as all the principal enrichments, are indubitably due to his fertile and graceful invention.

The interior is by no means so remarkable as the exterior; but its exquisite lateral chapels, with their elaborate and interesting stone altars, should, nevertheless, be carefully examined; especially one of the fourteenth century in the chapel of the Virgin, which is a masterpiece of its class; its intricate tracery, and delicate pinnacles and tabernacle work, being of the most highly-wrought kind. Another chapel, also, contains a stone altar marvellously rich in florid decoration, the deep panels being entirely filled with richly wrought interlacings of foliage; one having vine branches with large bunches of grapes, another fig branches and figs, and the others different foliage and fruit, equally rich in design and treatment. There is also another very splendid altar in the southern aisle, which, however, has been so elaborately restored, that it has acquired somewhat the stamp of the modern Gothic of the Munich school, and lost much of the charm of the original manipulation. The groining of the ceiling of the south aisle differs from that of the rest of the church, and is very distinct and characteristic in its style.

How much of the work of this elegant structure may have been executed in Erwin's own time it is difficult to say. But it is known that the works were proceeding during the time that his son and successor, Jahn, was still directing the works at Strasbourg, though much of the work was evidently executed at a later period, as proved by a passage in a local chronicle, which states that the building of the church was still going on in the year 1431, when the wine produced along all the eastern slopes of the Vosges was so abundant that during a drought which occurred in the autumn of that year it was used instead of water to prepare the mortar used in carrying on the building of the church. Nevertheless, it is stated in the chronicle in question that the building was from the design of Erwin, of Steinbach.

Freyburg.—The same chronicle also states that Erwin was likewise the architect of the cathedral of Freyburg, of which there is also sufficient evidence of other kinds to leave little or no doubt upon the subject. The cathedral of Freyburg is a much more important building as to scale than that of Thann; but the style of the spire resembles the one at Thann more than that of the Strasbourg edifice, which last, however, it nearly rivals in height. The portal of the cathedral is fine in form, but not greatly enriched with sculpture, the abundant smooth surfaces appearing to have been provided expressly for polychrome treatment by painting, as was more the custom in this part of Germany than in Alsace; and the columns and moldings are accordingly painted in the usual Medieval style, with geometric or slightly foliated patterns. The first porch leads to an inner one, or "Paradise," as it is termed; the walls of which are enriched with arcade work up to a certain height, and then corbels rise between the arches, starting from immediately above the columns, and supporting a series of statues which are surmounted by elaborate canopies, the general effect being rich and picturesque. The main interior is not comparable in any way to that of Strasbourg, but is yet very good, and certainly attractive in its general aspect; and there is a particular statue, against a massive group of columns, which produces a remarkably picturesque effect, on account of a delicate spiral

canopy rising to a great height above it, rich with the most profusely elaborate decorations. It should be observed that in examining the numerous statues with which the interior is enriched, none can fail to detect, not only the same banding as in the sculpture of Strasbourg, but also the same faces as those of the "wise and foolish virgins" previously described, and must feel convinced that the cunning hands of Erwin and his danghter Sabine have been at work upon them, and that Sabine's own face and figure are faithfully reproduced in more than one of the statues of female saints in the cathedral of Freyburg. The pulpit is a very remarkable work, but appears of somewhat later date than the productions of Erwin, though the design itself may be his; for it bears a strong likeness to that of Strasbourg, which, though executed by Hammerer, and with certain additions said to have been suggested by the great preacher Koyersperger, is yet known to have been originally designed by Erwin. The ceiling of the choir appears to have been completed in 1410. The three eastern altars at the termination of the nave and aisles are of very rich tabernacle work, which might belong to the end of the fifteenth or beginning of the sixteenth century; but, then, in the profusion of decorative features, and in the intricacy of the decorations themselves, Erwin was so much in advance of his contemporaries that for fully a century afterwards his followers had enough to do to work up to the point he had previously reached, without dreaming of going beyond; and this may account for some of the work, even of his own hand, being attributed to a more recent period; for his original genius developed a daring advance of style, which was not only accepted by his contemporaries, but followed by his successors. It will not be without interest, while describing this interior, to call attention to the work of a modern emulator of the decorative style of Erwin, namely, the throne of the archbishop,—a rich composition of tabernacle work entirely carved in sycamore wood, or box, which has assumed a most beautiful golden tone, of almost metallic effect. The work is most delicate and intricate, and the carver stipulated, before parting with the result of his labour, that it should never be either gilt or painted; and, not content with promises, he had a dead drawn up to that effect, which was willingly signed by the venerable archbishop, now above 90 years of age. The artist's family possess the Dead, regularly drawn up on parchment, and signed by the archbishop, both for himself and his successors. The idea was probably suggested to the modern carver by the three altars which are entirely gilt, so that the spectator cannot guess whether they are of wood or stone—or even gilt iron, which they might very well be taken for, on account of the delicate slenderness of their features, did we not know that Erwin treated stone, even in external decorations, with such excessive slenderness and attenuation of the more delicate features, that the proportions are positively more like ornaments wrought in metal than carved in stone.

The windows of the choir are fine in general form and proportion, but the tracery does not seem to present the Erwin *cachet*. In fact, the windows are of various dates in this structure; some of those of the original Romanesque character remaining, and also some of the Early Lancet period, which are by no means good specimens of the style. The famous windows with the painted glass presented by the different trade guilds of the city in the thirteenth, fourteenth, and fifteenth centuries, form a very interesting series; they are large, and their tracery simple, and they seem to belong to the close of the thirteenth century. The paintings they contain are each enriched, as a main feature, by the armorial bearings of the respective guilds; the hootmakers' shield having a yellow field, representing gold, and bearing in the centre a black loose boot turned over at the top with red. The shield of the brick and tile makers bears an object which may be called a brick or tile; that of the smiths a hammer and pincers; that of the tailors a pair of open scissors; the bakers, an unmistakable loaf; and the weavers, a shuttle. The window of the Vinedressers' Company is perhaps the richest in its general pictorial subjects; but all are very interesting monuments of local art, and all more or less good. The windows above these are undeniably the work of Erwin, and their forms are stamped with his peculiar elegance of proportion and design.

But it is the exterior, perhaps, that exhibits the Erwin style more conspicuously. The grand

and at the same time elegantly perforated spire, in the style of that of Thann, rises from a lofty tower, the upper or second story of which is of the most delicate design, highly enriched with a profusion of the tall and slender panel, niche, and open-window work, for which the style of Erwin is so well known. It is probable that Erwin's work, in the tower, commences with the second story, as a marked change of style takes place at that point. Two lateral towers near the entrances of the present transept are parts (still perfect) of the original Romanesque structure, but both are crowned with two upper stories of Erwin's work. The whole of the choir was probably an addition to the ancient Romanesque edifice, and the greater part of it, containing all the more decorative portions of it, are from the hand of the great mason of Strassburg. The buttresses of that portion of the building, with their connecting gallery work, are extremely rich in ornamentation, which is exquisitely varied in its detail; and the profusion of richly-canopied niches, with their appropriate statues, is most remarkable. There is, especially, an equestrian statue surmounted by a delicately-enriched canopy, in the style of the equestrian statues of Clovis and Dugobert at Strassburg, which at once attracts attention. In short, the beauties wrought out at Freyburg are almost as remarkable as those of the more famous cathedral at Strassburg, and are just as indubitably the work of Erwin of Steinbach.

The works, or at all events the preparation of the designs, had been going on simultaneously with those of the master-work of the great sculptor-architect, whose unceasing industry was busily plied in his atelier close to the cathedral at Strassburg during twenty-eight years, where he died in 1304, after having established a more brilliant and widespread reputation as a successful and unrivalled architect than had been achieved by any of his predecessors in Germany.

Erwin's tomb may be seen close to the cathedral, in a little court attached to the chapel of St. John the Baptist, the epitaph giving him the titles of Hüttenberg and Werkmeister previously referred to. It is intended to remove it eventually to a conspicuous place in the interior of the cathedral itself, as near as possible beneath his sculptured portrait, which appears to look down from an upper gallery. In the mean time another memorial has been erected in memory of the great artist-mason at Steinbach, his native village, among the vineyard-clothed hills on the borders of the Black Forest. The village itself, which was visited by the writer of this notice, possesses no remarkable features, no interesting old houses, and especially not one that could with any show of probability be pointed out as the birthplace of Erwin. Moreover, there was not in the place a suitable site for a statue. But on a neighbouring hill, at the highest point of a finely undulating vineyard, is a spot from whence the distant spire of Strassburg may be seen or imagined, and on that spot a statue has been placed, which appears to look intently towards the marvellous work which the man it is intended to honour conceived and planned with such consummate skill. The attitude of the statue is well designed, and as well executed. It is, indeed, a worthy tribute to the memory of a great artist.

The fame of Erwin and his work continued to spread even after his death, and his son Jahn was with universal acclaim appointed to carry on the great work at Strassburg towards completion; Sabine appearing to have been appointed, conjointly with her brother, to direct and carry forward the execution of the decorative portions of the building. Jahn continued the work with vigour for even a longer period than his father—viz., for five-and-thirty years, from 1304 to 1339, when he died; and doubtless very great progress had been made at the time of his death.

His sister Sabine, according to the legendary accounts of Erwin and his family, became the wife of Bernard of Sunden, and eventually settled with him in the North German provinces, where they produced many works of note, especially a great portion of the chevet at Magdeburg, in the decorating of which they reproduced several of the groups and figures which they had worked upon together at Strassburg; the style of the sculptors in question appearing to render the tradition probable.

Wykin, the younger son of Erwin, also became celebrated as an architect, and built the collegiate church of Hasseloth, in the duchy of Baden, where he died, and where a tomb was erected to his memory, which is still in perfect preservation.

After the death of Jahn, Hültz, of Cologne, one of the most rising architects of the day, was called upon to continue the great work at Strassburg; but he only lived ten years after his appointment, yet, in that time, as the tradition goes, supported by contemporary records, he completed the exquisite steeple according to Erwin's design, and raised the repute of the cathedral and its original architect to its highest pitch, inasmuch that Strassburg was finally acknowledged as the seat of the chief Masonic Lodge of Germany. After Hültz several other architects succeeded each other, but at last Josse Dörtzinger, of Worms, was appointed to carry on the works, and his competency soon approved itself by the continued rapid progress of the building, the influence of which on architectural art throughout Germany became more and more apparent, and it was under his leadership that in 1452 the various lodges of Germany handed themselves together in one association, the chief of the Strassburg Lodge, Dörtzinger, being appointed its permanent head, to be succeeded by his descendants. Representatives of all the lodges met at Ratishon on the 25th of April, 1459, to draw up formal articles of association, the various secrets and signs and other forms being agreed upon at that meeting.

Dörtzinger appears to have died in the year 1486, after carrying forward Erwin's vast design for 36 years, the work having then lasted with little intermission, for 147 years after the death of the younger Erwin. Hammerer and Larechut succeeded Dörtzinger as architects of the cathedral from 1486 to 1495, and then came Conrad Waght, who in 1498 obtained a ratification of the Masonic articles of association, confirming them in the possession of considerable judicial powers in the settlement of all disputes in matters appertaining to building transactions,—privileges which were subsequently subscribed by Charles V., and which remained in force for more than two centuries.

In concluding these remarks on the great mason-architect Erwin and his family, and on the progress and contemporary celebrity of his greatest work, it may not be without interest to recall the fact that in 1481 the Duke of Milan, wishing to complete the noble cathedral of that city, a work not inferior in celebrity to that of Strassburg itself, wrote on the 27th of June, 1481, to the chief magistrates of Strassburg, asking from them, on the faith of their own celebrated temple, an accomplished mason capable of completing the great rival cathedral of Milan; and from its peculiar style, so distinct from any other great Gothic edifice in Italy, it appears probable that one or more architects responded to the invitation, and that those German artists had a leading share in imparting to it those forms of the Germanic Gothic which peculiarly distinguish it.

HILDESHEIM.

In addition to the works of art already described,* the choir of the cathedral at Hildesheim contains a superb set of stalls of fourteenth century work; the canopies and ends are beautifully carved; the stalls themselves are forty-two in number. The centre space of the choir is filled with two large cantors' desks and two lateral desks. Although this arrangement is probably not older than the seventeenth century, it is uncommonly picturesque, and, as far as we know, peculiar to this cathedral. The "sanctuary" is separated from the choir by three steps. In the centre of the sanctuary is the high altar, with a silver frontal, tabernacle and candlesticks; they are unfortunately of a very wretched design. On either side of the altar are doorways leading to the apse, which is screened off from the choir and sanctuary by an immense Italian retables. Over these two doors are brackets supporting two most superb Early Romanesque shrines: one contains the bones of St. Bernard, and the other those of St. Godehard, or Gotthard; they are both of silver gilt, set with precious stones, and are about 8 ft. long. The sides of St. Godehard's shrine are ornamented with an arcade of round arches supported upon little columns. Each of these arches contains the statue of a saint worked in high relief.

On the altar is a fine fourteenth-century bust of St. Catherine, in silver; on the credence-table is a copy of the Gospels made by St. Bernard in the eleventh century; and on the left of the high altar is a "Madonna and Child" of the tenth century. It is carved in black wood,

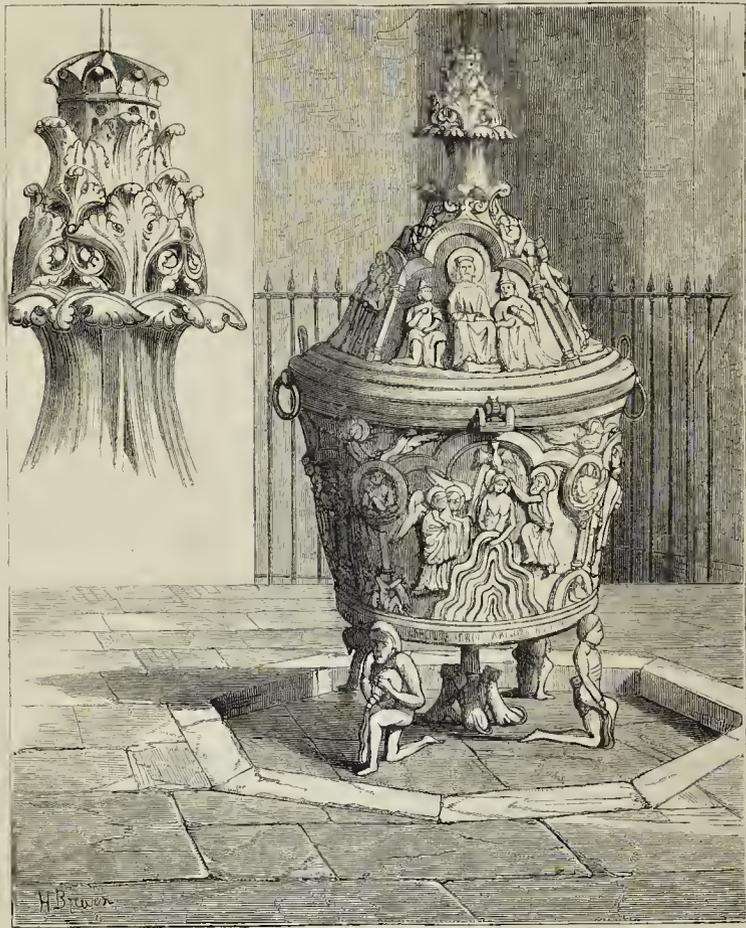

with the faces and hands covered with plates of gold. Two horrible curly wigs disfigure this remarkable work of art.

The space at the back of the high altar forms a kind of treasury, full of most superb works of Medieval art; amongst others, the following are perhaps the most remarkable:—The chalice of St. Bernard, ornamented with ancient classical cameos, on one of which are the three Graces; a magnificent chalice of the thirteenth century, with pattern to match; a fourteenth-century pastoral staff, still used by the bishop; and many other articles of church plate. The cloisters enclose three sides of a square, to the east of the cathedral, the fourth side being formed by the apse and eastern sides of the transepts. These cloisters are of early Romanesque work, and are arranged in two stories, the lower composed of large single arches, and the upper of narrow arches, arranged in sets of three, separated by slender columns. In the centre of the cloister square is a beautiful little spidal chapel of the fourteenth century, and leading out of the south wall is a Romanesque chapel, divided into four equal aisles by low columns and round arches. This chapel contains several very early monuments, and in it are deposited the remains of the superb incised pavement which once adorned the choir of the cathedral. Under the choir is a crypt of very early Romanesque work, on one of the altars of which is a fine ivory crucifix of the twelfth century, and fixed to the altar-rail is a singular bronze lion of the same date. The sacristy leads out of the south transept; it is, like all German sacristies, of very large size, and contains an altar dedicated to St. Thomas à Becket. Above the large porch called the New Paradise, is a large room divided into three aisles by lofty columns; it is a kind of treasury or museum, and is full of most interesting works of ancient art. Amongst other curiosities are the silver bust containing the head of St. Oswald, and a silver model of the original central tower of the cathedral. This tower, which is replaced by the present ugly dome, stood over the junction of the nave and transept; judging from this singular model, it was probably of wood covered with copper or lead. Returning into the body of the cathedral, we must notice the singular and beautiful bronze font represented in our engraving. We gave a description of this font in the *Builder*, when speaking of the font at Würzburg Cathedral: so it will be unnecessary to describe it again.

We must now leave the cathedral, and say a few words about some of the other churches in the town. The abbey churches of St. Godehard and St. Michael are most interesting Romanesque buildings. They have originally both possessed apses to the east and west, but the eastern apse of St. Michael's Church was destroyed many years ago, and the altar is now placed in the western apse. St. Michael's Church is one of the few churches which retain their ancient flat boarded ceiling with the oak leaf decoration, very similar to the work lately executed at Ely Cathedral by Messrs. Le Strange and Gambier Parry. There are some fine stalls, two old altars, a bronze font of fifteenth-century work, a fine thirteenth-century side screen to the choir, and some very interesting old paintings by an early Flemish painter. St. Godehard's Church is the noblest church in the town, and has been excellently restored. In the choir is a modern corona, copied from those at the cathedral, and an incised pavement, a restoration of the one which originally adorned the choir of the cathedral. This pavement is formed of a hard white composition, and figures, birds, beasts, foliage, and inscriptions are incised on it with lines cut in and filled with black and red mastic. The ancient roof exists, but is placed across the south transept. The western apse of this church does not contain an altar, as is usual in the double Basilica churches in Germany, but is divided into two stories, the lower of which forms a baptistery, to which there is a descent of several steps. The upper story opens into the church by a large arch, and is used as an organ-loft. There is a well-designed modern altar.

The remaining churches in Hildesheim are interesting buildings, but our space will not allow of our entering into any detailed description of them. St. Cross's is a large modernised Romanesque church; St. Andrew's, a lofty and very striking fifteenth-century building; St. Lambert's and St. Paul's are late Third Pointed; and St. Moritz's very Early Romanesque, with a later chancel: the whole building is terribly modernised.

ANCIENT METAL FONT, HILDESHEIM CATHEDRAL.

THE NEW NORTH BRIDGE, HALIFAX, YORKSHIRE.

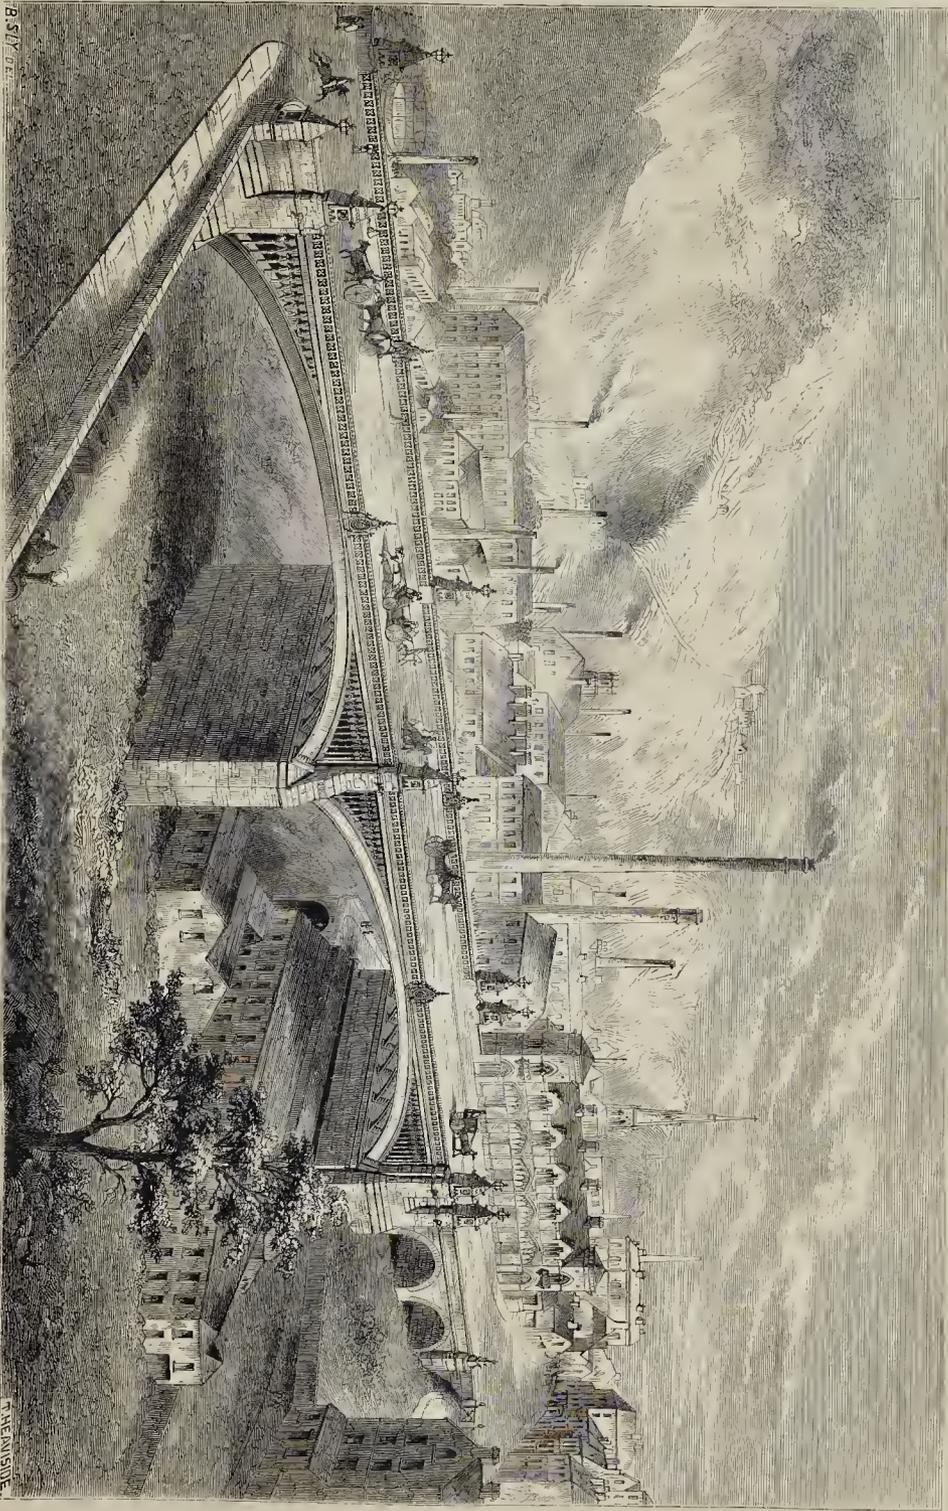

HALIFAX has made wonderful progress within the last few years, and many changes and improvements have been required to meet the altered circumstances. Amongst other things the old North Bridge has been found insufficient for the requirements of the present age, and a new structure is being erected in its place. The population of the town of Halifax in the year 1764 numbered about 6,500, and there were then, according to an authenticated return, 1272 inhabited houses. The present population of the town is about 57,000, with 11,000 inhabited houses, and the rateable value of the borough is 180,000*l.*—so considerably has the town grown in numbers, wealth, and prosperity. The first stone of the new bridge was laid on the 14th day of April last, by Mr. John Dysen Hutchinson, mayor of the borough. We now give a view of it as it will appear when completed.

The old bridge, which is of six arches, carrying a roadway 27 ft. wide, at a height of about 56 ft. above the level of the stream at the bottom of the valley, served its original purpose, and was useful in avoiding the steep and winding road formerly in use only by packhorses. Of late years, however, as we have said, the old bridge has been found totally inadequate to the requirements of the town, and the corporation, taking up the question with energy, determined upon having a new erection of increased proportions. Various schemes from time to time were suggested, and eventually Mr. John Fraser, civil

engineer, of Leeds, was consulted. Ultimately a design for an iron bridge of two spans, 160 ft. each, and with a clear width between the parapets available for traffic of 60 ft., prepared by Mr. Fraser, was adopted. In designing a bridge of two spans, the engineer had several objects in view, one being to span over the station ground on the north side of the valley, now in course of construction, and also to clear some valuable property on the south side. Moreover, in a sanitary point of view, a light iron bridge of two spans resting on one pier is far preferable to a stone bridge with six arches resting upon five piers, as had been determined upon at one time, as forming a much less obstruction to the proper current of air so necessary for the ventilation of a steep and narrow valley. The new bridge has been designed in the Gothic style of architecture. The elevation shows two flat elliptical arches of 160 ft. span with a rise of only 16 ft. The outside ribs, which are of cast iron, are 4 ft. deep at centre, and 5 ft. 3 in. deep at the springing, and carry open trussed spandrels at the haunches crowned by a cornice and a partly open quatrefoil and battlemented parapet with a central feature comprising a shield for the corporation arms, with foliage on each side on a diapered background and terminated at the top with a lamp. The inside ribs, six in number, are placed at a distance of 8 ft. 7 in. apart. The centre part, for a space of 52 ft., is composed of wrought-iron plates, the remaining parts of the ribs being of cast iron. The transverse bracing connecting the wrought-iron part is composed of

wrought-iron bars, but that connecting the cast-iron part is of cast iron. These ribs carry open cast-iron spandrels; upon the top flange of these are placed the cast-iron road-plates, the road being formed by layers of asphaltic concrete, upon which the paving is laid. The total weight of the cast-iron work is 1,200 tons, and of the wrought-iron work 150 tons. The iron, made by the West Yorkshire Iron and Coal Company, has been selected after some experiments. The masonry of the abutments on each side of the valley and of the central pier will be finished by five spire-like terminations, which will rise 15 ft. above the parapet on each side of the bridge, and will carry large octagonal lamps to be supplied with gas for lighting the roadway. As a portion of the new bridge will stand upon the site of the old one, it is intended to build one half of the new bridge, and then to turn the traffic from the existing structure on to the new half. The present bridge will then be pulled down and the remaining half completed. The roadway of the new bridge, when completed, will be 11 ft. above the level of the old one; by this means a gradient almost level will be obtained from Cross Hills to the opposite side of the valley, at the junction of the Haley Hill and New Bank roads.

Mr. Archibald Neill, of Bradford, has undertaken the construction of the bridge and of a new road called Bridge-lane diversion, rendered necessary by the increased width of the approaches, for the sum of 21,000*l.* The ironwork is being furnished by Messrs. Joseph Cliff & Co., also of Bradford.

THE NEW NORTH BRIDGE, HALIFAX, YORKSHIRE.—MR. JOHN FRASER, ENGINEER.

The history of the United States of America is a story of growth and change. It begins with the first settlers who came to the shores of the continent, seeking a new life. Over time, these settlers grew into a nation, facing challenges and triumphs alike. The story is one of a people who have shaped a unique identity, a nation that has stood as a beacon of freedom and democracy for the world.

The early years were marked by exploration and discovery. The brave men who sailed across the vast oceans brought back tales of a new world, a land of opportunity and promise. They laid the foundation for a nation that would one day become a superpower, a nation that would lead the world in science, technology, and culture.

As the years passed, the United States grew in size and power. It expanded its territory, from the Atlantic coast to the Pacific, and from the mountains to the plains. It became a nation of diverse peoples, each bringing their own traditions and customs to the new land. Together, they built a nation that was greater than the sum of its parts.

The United States has always been a nation of progress. It has led the world in many ways, from the invention of the printing press to the development of the atomic bomb. It has been a nation of firsts, a nation that has never been satisfied with the status quo. It has always been a nation that has looked to the future, a nation that has always been a nation of hope.

Today, the United States stands as a nation of peace and prosperity. It is a nation that has overcome many challenges, a nation that has always been a nation of resilience. It is a nation that has always been a nation of strength, a nation that has always been a nation of courage. It is a nation that has always been a nation of greatness.

PENS.

As the Ponds of our last little paper had no reference either to shillings or to pennyweights, so these Pens in the present have as little as possible to do with their usual and familiar accompaniments, ink and paper. We speak not of that great gosequill sceptre of rule which shares with the sword this broad world's sovereignty,—nor of that hybrid between both, the Magnum Bonum, or Gillett's No plus ultra,—but of a certain generation of smaller ponds, otherwise pens, wherein to be atrinhabitable no small amount of cruelty from man towards his humblest servants. Let it be the happy province of the *Builder* to advocate humanities even to the lowest, and to reform architecture even in respect of such unconsidered dwellings as many poor beasts and birds are compelled to live and die in.

We have in our mind's eye some certain matters in modern farming which appear to us pre-eminently cruel to the animals, and cannot be otherwise than conducive to disease in the meat they generate: as, the solitary confinement system of fowl-houses, where the poor creatures have not room to turn nor the chance of ridding themselves of parasites, but, with only heads and tails exposed, fatten in unwholesome misery; and, still worse, as those pits into which a bullock is lowered and is fed therein week after week without air or exercise until he gradually reaches the level on the mass of manure he has been making, and finishes his dreary and pestilential existence by crawling for his first walk into the fresh field, an unwieldy mass for the shambles; and, more familiarly, as the very common case of the close, hot, filthy pigstye, or your dog-kennel in the sun, where poor Juno mournfully clanks her perpetual chain, while all things round are free; or your lark, thrush, bullfinch, or canary, cribbed, caged, and confined in the smallest possible cages, and hug out in the hot sun.

Do let us, in these happier days of enlightened kindness, give more consideration to all the poor dumb creatures round us. A kind heart and a modicum of common sense would cure more evils than we have time or space to enumerate. Larger, cleaner, better-shaded styes and kennels, with more frequent healthy "outings" for their prisoners; fowls fed in the open and not stewed-up in pens; cattle fattened in wholesome stalls and strawyards, not on subterranean dungheaps; with plenty of Nature's great free gifts, air and water, always accessible, and as much exercise and liberty and enjoyment of life to bird or beast as can reasonably be conceded. Depend upon it, such humanities are also economics.

MARTIN F. TUPPER.

IMPROVEMENTS IN CAST STEEL.

In an able address before Section G of the British Association, at Exeter, Mr. C. W. Siemens, F.R.S., thus spoke on this important subject. A great revolution of our constructive art has been prepared by the production, in large quantities and at moderate cost, of a material of more than twice the strength of iron, which, instead of being fibrous, has its full strength in every direction, and which can be modulated to every degree of ductility, approaching the hardness of the diamond on the one hand, and the proverbial toughness of leather on the other. To call this material cast steel seems to attribute to it brittleness and uncertainty of temper, which, however, are by no means its necessary characteristics. This new material, as prepared for constructive purposes, may indeed be both hard and tough, as is illustrated by the hard steel rope that has so materially contributed to the practical success of steam ploughing. Machinery-steel has gradually come into use since about 1850, when Krupp, of Essen, commenced to supply large ingots that were shaped into railway tyres, axles, cannon, &c., by melting steel in balls containing hundreds of melting crucibles. The Bessemer process, in dispensing with the process of puddling, and in utilising the carbon contained in the pig iron to effect the fusion of the final metal, has given a vast extension to the application of cast steel for railway bars, &c. This process is limited, however, in its application to superior brands of pig iron, containing much carbon and no sulphur or phosphorus, which latter impurities are so destructive to the quality of steel. The puddling process has still, unless the process of decarburisation by Mr. Heaton takes its place, to be resorted to,

and to purify these inferior pig irons, which constitute the bulk of our productions, and the puddled iron cannot be brought to the condition of cast steel, except through the process of fusion. This fusion is accomplished successfully in masses of from three to five tons on the open bed of a regenerative gas furnace at the Landore Siemens Steel Works, and at other places. At the same works cast steel is also produced, to a limited extent as yet, from iron ore, which, being operated upon in large masses, is reduced to the metallic state and liquified by the aid of a certain proportion of pig metal. The regenerative gas furnace, the application of which to glass houses, forges, &c., has made considerable progress, is unquestionably well suited for these operations, because it combines an intensity of heat, limited only by the point of fusion of the most refractory material, with extreme mildness of draught and chemical neutrality of flame. These and other processes of recent origin tend toward the production, at a comparatively cheap rate, of a very high class material, that must shortly supersede iron for almost all structural purposes. As yet engineers hesitate, and very properly so, to construct their bridges, their vessels, and their rolling stock of the material produced by these processes, because no exhaustive experiments have been published as yet fixing the limit to which they may safely be loaded, in extension, in compression, and in torsion, and because no sufficient information has been obtained regarding the tests by which their quality can best be ascertained. This great want is in a fair way of being supplied by the experimental researches that have been carried on for some time at her Majesty's dockyard at Woolwich, under a committee appointed for that purpose by the Institution of Civil Engineers. I have also pleasure to announce an elaborate report, by Mr. Fairbairn, on this subject. In the meantime excellent service has been rendered by Mr. Kirkaldy in giving us, in a perfectly reliable manner, the resisting power and ductility of any sample of material which we wish to submit to his tests. The results of Mr. Whitworth's experiments tending to render the hammer and the rolls obsolete by forging cast steel, while in a semi-fluid state, into strong iron moulds by hydraulic pressure, are looked upon with great interest. But assuming that the new building material has been reduced to the utmost degree of uniformity and cheapness, and that its limits of strength are fully ascertained, there remains still the task for the civil and mechanical engineer to prepare designs suitable for the development of its peculiar qualities. If, in constructing a girder, for example, a design were to be adopted that had been worked out for iron, and if all the scantlings were simply reduced in the inverse proportion of the absolute and relative strength of the new material as compared with iron, such a girder would assuredly collapse when the test weight was applied, for the simple reason that the reduced sectional area of each part in proportion to its length would be insufficient to give stiffness. You might as well almost take a design for a wooden structure, and carry it out in iron by simply reducing the section of each part. The advantages of using the stronger material become most apparent if applied, for instance, to large bridges where the principal strain upon each part is produced by the weight of the structure itself; for supposing that the new material can be safely weighted to double the bearing strain of iron, and that the weight of the structure were reduced by one-half accordingly, there would still remain a large excess of available strength in consequence of the reduced total weight, and this would justify a further reduction of the amount of the material employed. In constructing works in foreign parts the reduced cost of carriage furnishes also a powerful argument in favour of the stronger material, although its first cost per ton might largely exceed that of iron.

The Visitors to the South Kensington Museum.—The number of visitors to the Museum proper last week was 17,437; more than 5,000 above the average of corresponding week in former years, and this has been the case for several weeks past. Considering the emptiness of London, this is the more noticeable. It affords a very conclusive answer to those who assert that the situation of the Museum puts it out of the reach of any but the well-to-do and upper classes of society, the vast majority of whom are at this time seeking health and change anywhere but in London.

THE WALLACE MEMORIAL MONUMENT, STIRLING.

This monument on the Abbey Craig, near Stirling, is now all but complete, and is to be handed over in a few days to the Town Council of Stirling, who have agreed to receive it in trust. Some 12,000*l.*, we are told, have been spent on it. It has been determined that no public proceedings shall take place on the occasion, which we regret, if only because they would have been made the occasion for a pleasant day by a number of persons. The friends of a Rev. Dr. in London have been setting up rather extraordinary claims on his behalf as originator, while different things are said by others equally acquainted with the history of the affair. We do not find it desirable, however, to go into the question. Whether personal matters of this kind have had anything to do with the determination arrived at we scarcely know.

A view of the monument, which was designed by Mr. J. T. Roched, architect, will be found in our volume for 1860.* It is 220 ft. high, and 36 ft. square at the base, and enjoys a fine position.

A CHANNEL RAILWAY.

The exceeding importance which is attached by many persons to the idea of a continuous railway across the Channel may be judged of by the numerous projects which have from time to time attracted the attention of the public, and which involve some of the most remarkable schemes of modern engineering. To minds unaccustomed to follow the progress of science in the present day, it would at first sight appear to be an impossibility to connect by a continuous line of railway the opposite sides of a sea nearly twenty miles apart; but we have seen three cables stretched across the Atlantic; we find one railway ascending the hitherto almost inaccessible heights of the Alps, and another penetrating through them; and we are about to witness the realisation of what has long been considered by able engineers an impracticable dream, viz., the opening of the Suez Canal.

To span the Straits of Dover is not more contrary to experience than any of these realised projects, and the numerous plans for effecting this object sufficiently attest that if it could be done it would yield to none in importance and value. It would afford a line of railway over which the traffic of the world with Britain would pass.

Such a railway must be made either by means of a bridge above or a tunnel below the water; and supposing both to be practicable, there can be no doubt that most people would rather pass over it by a bridge than under it through a tunnel thirty miles long; but objectionable as such a journey would be, the desire for a connecting railway is so great that it would probably be made through a tunnel if no better means of accomplishing it could be discovered.

We are led to make these reflections by a report which has recently been made by Capt. Tyler to the Board of Trade, which throws some light upon this very subject. A deputation had previously waited on Mr. Bright, and represented to him that the French Government were desirous of having the co-operation of the English Government in determining on the best course to adopt for effecting a railway communication between the two countries. We are glad to see that Capt. Tyler does not hesitate to recommend that the whole matter should be referred for the consideration of the French Government with a view to the appointment of an international commission for the purpose of dealing authoritatively with the important interests involved, and satisfactorily deciding the general question.

It appears from Capt. Tyler's report, that of the various projects which have been proposed, "those which have of late made the most progress are the bridge scheme of M. Bontel, and the tunnel scheme presented under the chairmanship of Lord R. Grosvenor." The British Government has been at great pains to ascertain their practicability, for it has referred the latter to three commissions of inquiry, and "the Council General of Mines, to whom the question was last referred, concluded that in the present state of things they would not form any estimate either of the probable duration of the works or their cost."

Of M. Bontel's bridge, Capt. Tyler reports that an association has been formed for making

* Vol. xviii., p. 67.

experiments. Two small bridges have been built on his system, and arrangements made for a third, in two spans of half a mile each; and that the engineer visited the works, on a site which has been granted by the French Government, and is stated to have expressed himself favourably with regard to the project. The bridge is intended to cross from Dover to Blanc-nez, near Calais, and is advocated as (1) being less costly than a tunnel, (2) occupying less time in construction, (3) giving no trouble in ventilation, and (4) avoiding the danger of sudden inundations. It is contemplated that the bridge can be completed in three years, and that the pending experiments give reason to expect that the estimate of 8,000,000*l.* will not be exceeded.

Capt. Tyler states, and truly, that there is nowhere a sea-service of equal importance which is so much in want of improvement, and we shall look with great interest for the result of the pending experiments in Paris which are being made by the direction of the French Government in reference to M. Bontel's bridge. Anyhow, the evils attending the existing modes of communication should be removed.

We are informed on good authority that the pending experiments in Paris are considered, so far as they have progressed, to be satisfactory.

BELLS AND CARILLONS, OR CONTINENTAL CHIMES.

Our great musical historian, Dr. Charles Burney, in his interesting work, "The present State of Music in Germany, the Netherlands, &c.," London, 1773, speaking of his visit to Courtray, says,—

"It was in this town that I first perceived the passion for *carillons*, or chimes, which is so prevalent throughout the Netherlands. I happened to arrive at eleven o'clock, and half an hour after the chimes played a great number of cheerful tunes, in different keys, which awakened my curiosity for the species of music so much, that, when I came to Ghent, I determined to inform myself, in a particular manner, concerning the *carillon* science. For this purpose I mounted the town belfry, from whence I had a full view, not only of the city of Ghent, but could examine the mechanism of the chimes, as far as they are played by clock-work, and likewise see the *carillonner* bells, as those of the harpsichord and organ do with strings and pipes. The great convenience of this kind of music is, that it entertains the inhabitants of a whole town without giving them the trouble of going to any particular spot to hear it."

So far so good. The respected author then goes on to say,—

"But the want of something to stop the vibration of each bell, at the pleasure of the player, like the valves of an organ, is an intolerable defect to a cultivated ear; for by the notes of one passage perpetually running into another, everything is rendered so inarticulate and confused, as to occasion a very disagreeable jargon."

Now, having myself examined the bells and mechanism—*cylindres et claviers*—of the most celebrated *carillons* in Europe, and repeatedly listened to their music at various distances, I beg to assert most distinctly that the statement made by the learned doctor in the last paragraph is false. I deny that "everything is rendered inarticulate and confused," or disagreeable. On this point I speak the more plainly, because almost every Englishman who has written a line about *carillons* since 1773, has followed Burney's dictum, and told us that the great defect is the want of a damper to each bell. Several examples relating to Boston and other chimes have been contributed to public journals since Christmas last.

Perhaps the following observations may suggest what led the Doctor to entertain and publish the notion just mentioned:—

Every musician worthy of the name knows that instruments strung with wire "which have nothing to stop the sounding-strings, make an intolerable jangle to one that stands near," as I may add, bells do to one that is in the *bell-chamber*, and hears the continuing sound of dissonant tones. Such an instrument of the wire-string kind is the dulcimer. But the piano-forte has a simple contrivance—a damper—for stopping the vibrations of the strings when the fingers are lifted from the keys.

If, then, instead of going to a spot at some convenient distance from the tower, as he ought to have done, with a view to "inform himself in a particular manner" concerning *carillon* music, Dr. Burney stood in the *bell-chamber* during a performance, the effect must indeed have been intolerable to a cultivated ear.

I maintain, however, that musical bells suspended in a tower, require no damper whatever; for, when their sounds have issued from

the openings in the sides of the building, they spread themselves in the air, and ultimately reach the auditor with precision in subdued and pleasing tones. Even rapid passages in *carillon* music, if properly harmonized so as not to weaken or confuse the melody, and executed by, or upon, a good instrument, produce an admirable effect.

It would be well if the vibrations of many noisy and discordant things called bells were completely stopped. But to say that musical tower bells require dampers in order to produce the desired effect is truly absurd. It is equal to any of the "moonshine" on bells in general with which we have been favoured during the last fourteen years. THOMAS WALESBY.

MATHEW DE RENZY, KNIGHT: A QUENRY.

As a pendant to the sketch of Richard Castles, architect, which appeared in the *Builder* a few weeks ago, the following waif of another forgotten German worthy may be of some little interest. The annexed epitaph is copied from a monument in the churchyard of Athlone, Ireland:—

"This monument was erected for the Right Worshipful Mathew de Renzy, knight, who died on the 29th August, 1631, being of the age of 57 years. Born at Cullen, in Germany, and descended from the family and renowned warrior George Castrol, *alias* Sanderberg, who in the Christian wars fought 23 battles with great conquest and honour against the Great Turk. He was a great traveller and general linguist, and kept correspondence with most nations in many weighty affairs, and in 3 years gave great perfection to the nation by composing a grammar, dictionary, and chronicle in the Irish tongue; in accounts most expert, and exceeding all others for his great aplausus. This work was accomplished by Mathew de Renzy, his son, August 29, 1635."

Do any of our Celtic archæologists or philologists know anything of the above works? Are they still extant? The above epitaph is another proof that the Celt is not a little indebted in past time, as at present, for the preservation of his mother tongue, to the intellects of the German "vaterland." G.E.

THE PATENT LAW QUESTION.

MR. C. W. SIEMENS, in his address as chairman of sections of the British Association at Exeter, thus dealt with the Patent Law question:—

"A patent is, according to modern views, a contract between the commonwealth and an individual who has discovered a method peculiar to himself of accomplishing a result of general utility. The State, being interested to secure the information and to induce the inventor to put his discovery into execution, grants him the exclusive right of practising it, or of authorizing others to do so, for a limited number of years, in consideration of his making a full and sufficient description of the same. Underneath this simple and equitable theory of the patent system is very imperfectly carried out, and is beset with various objectionable practices which render a patent sometimes an impediment to rather than a furtherance of applied science, and sometimes involve the author of an invention in endless legal contentions and disaster instead of procuring for him the intended reward. These evils are so great and palpable that many persons, including men of undoubted sincerity and sound judgment on most subjects, advocate the entire abolition of the Patent Law. They argue that the desire to publish the results of our mental labour sufficient to ensure to the commonwealth the possession of all new discoveries or inventions, and that justice might be done to meritorious inventors by giving them national rewards. This argument may hold good, as regards a scientific discovery, where the labour bestowed is purely mental, and carries with it the pleasurable excitement peculiar to the exercise and advancement of science on the part of the devotee; but a practical invention has to be regarded as the result of a first conception, elaborated by experiments and their application to existing processes in the face of practical difficulties, of prejudice, and of various contingents, involving also great expenditure of time and money, which no man can well afford to give away; nor can men of merit be expected to advocate their cause before the national tribune, unless they are offered only very narrow and imperfect views of the ultimate importance of a new invention would be taken, not to speak of the favoritism to which the doors would be thrown open. Practical men would not only prefer the power to exercise their inventions in secret where that is possible, or to desist from following up their ideas to the point of their practical realization. If we review the progress of the technical arts of our time we may trace innumerable practical inventions, almost without exception, to the Patent Office. In cases where the inventor of a machine or process happened to belong to a nation without an efficient patent law, we find that he readily transferred the scene of his activity to the country offering him the greatest encouragement, there to sell the ranks of intelligent workers. Whether we look upon the power appliances that furnish the shapeless masses of iron and steel into railway wheels or axles, or into the more delicate parts of machinery; whether we look upon the complex machinery in our cotton factories, our print works and paper mills, or in a Birmingham manufactory where steel pens, buttons, pins, buckles, screws, pencil-cases, and other objects of general utility are produced by carefully-elaborated machinery, at an extremely low cost; or whether we look upon our agricultural machinery, by which England is enabled to compete without protection against the Russian or Danubian agriculturist, with cheap labour and cheap

land to back him, in nearly all cases we find that the machine has been designed and elaborated in its details by a patentee who did not rest satisfied till he had persuaded the manufacturers to adopt the same, and had removed all their real or imaginary objections to the innovation. We also find that the knowledge of its construction reaches the public directly or indirectly through the Patent Office, thus enlarging the basis for further inventive progress. The greatest illustration of the beneficial working of the patent laws was supplied, in my opinion, by James Watt, who, just 100 years ago, he patented his invention of a hot-working cylinder and separate steam-engine condenser. After years of contest against those adverse circumstances that beset every important invention, and with falling health and scanty means, was only upheld in his struggle by the deep conviction of the ultimate triumph of his cause. This conviction gave him confidence to enlist the co-operation of a second party, after the first had failed him, and of asking for an extension of his declining patent. Without this opportunity Watt could not have succeeded in maturing his invention; he would, in all probability, have relapsed into the mere instrument-maker, with broken health and broken heart, and the introduction of the steam-engine would not only have been retarded for a generation or two, but its final progress would have been based probably upon the coarser conceptions of Papin, Savory, and Newcomen. It is a hopeful circumstance that during the next session of Parliament the whole question of the patent laws is likely to be inquired into by a special committee, who, it is to be hoped, will act decidedly in the general interest, without being influenced by special claims. They will have it in their power to render the Patent Office an educational institution of the highest order."

BRADFORD TOWN-HALL COMPETITION: CAUTION.

Sir,—We think it is necessary on behalf of the profession generally, and of the competitors in particular, to call attention to what we consider not only a flagrant breach of good faith, but also of the instructions issued by the Town Council to the architects competing for the design of the new town-hall. These instructions contain a clause providing, as far as possible, that the authors of designs shall not be known, and to that end a motto "is to be affixed to each drawing, and to the inside only of the envelope in which they are sent; the author's name is only to be written inside a sealed envelope, which will be opened after the award is made."

On the 9th September the lot was the last day on which designs would be received, and you may judge of our astonishment, on passing through the streets in the evening, to see quite a procession of men carrying some large drawings, forming part of a design submitted by an architect well known in this town, from their offices to a warehouse in Bridge-street, being, in fact, the same warehouse in which were exhibited the recent designs for the covered market, and which is in no way alluded to in the "instructions." These drawings were carried openly, and without cover of any kind, and were received as openly by the officials as if they were designs submitted to the "jurors." These drawings were carried to the offices of the architects, and the architects were to be addressed to the mayor, and the mayor's rooms are in quite another part of the town, with the municipal offices. The result of this proceeding is, that the names of the authors of this design are known to the officials, and to every one who saw them.

The question also arises, how did the authors get their instructions to take their drawings to the warehouse alluded to, which, as we have since learnt, to be used for exhibiting the designs?

We think the competitors would be justified in asking that a design delivered in such a manner should be excluded from the competition, as having broken one of its principal conditions. W.

THE ROMAN WALL: HADRIAN *versus* SEVERUS.

M. LUCAS writes:—

"Permettez-moi, en vous remerciant à nouveau de la bienveillante attention accordée à mes œuvres dans votre établissement, de vous adresser mes vœux et de vous prier que j'en aie fait l'appréciation de l'Empereur Archéologue Adrien, 'without quoting any authority,' que tout mon travail a pour base la Nouvelle Biographie Universelle de Didot citée à la première page, et, pour ce qui concerne la grande muraille d'Angleterre, Spartien, que je cite souvent, dit, &c., 'Britanniam petit; in qua murum per octingenta milia passuum ducit; qui barbaros Romanosque dividit.'"

"Veuillez agréer, Monsieur et très-honoré collègue, mes respectueux remerciements."

Without wishing to seem to imply blame by repeating the observation, we think it right to inform M. Lucas that the writer to whom he referred, *Ælius Spartianus*, is quoted as an authority by those who set up Severus as its author. The partisans of Hadrian have to explain away the statement of Spartian in his life of Severus,—"Britanniam quod maximum ejus imperii decus est, muro per transversam insulam ducto, utrimque ad finem oceanii munitur; unde etiam Britannici nomen accipit,"—before they can accept as conclusive the passage in his life of Hadrian to which M. Lucas alludes,—"Britanniam petit; in qua nulla corruvit, murumque per octingenta milia passuum primus ducit, qui barbaros Romanosque dividit." And not only is the authority of Spartian in this matter,—capable of being quoted by both sides, but all his work is scarce to be considered testimony at his if the accuracy of its value in Smith's "Dictionary" is correct. Speaking of MSS. of Spartian's "Historia Augustana Scriptores Sex," the writer of the article Capitolinus says,— "No trustworthy conclusion can be drawn from

the styles of the different portions, for the lives do not exhibit the well-digested result of careful and extensive research, but are in many instances evidently made up of scraps derived from different sources, and possessing different degrees of merit, loosely tacked together, and often jumbled into a rough mass destitute of form and symmetry. Hence we find numerous repetitions of frivolous details, a strange mixture of what is grave and valuable with the most puerile and worthless rubbish, and a multitude of irreconcilable and contradictory statements, freely admitted without remark or explanation.

We should have rejoiced if M. Lucas had happily lighted upon some new testimony that could have been cast into the scale in favour of Hadrian. Those who second the claims of Severus quote successively, after Spartian, Aurelius Victor, Eutropius, Cassiodorus, and Paulus Diaconus. One of the latest, if not the last, antiquary who has taken up the cudgels in favour of Severus, is Mr. Robert Bell, Nook, Irthington, whose work, "The Roman Wall: an Attempt to substantiate the Claims of Severus to the Authorship of the Roman Wall," was answered by Dr. Bruce, the champion of Hadrian, in a paper first read to the Society of Antiquaries, Newcastle-upon-Tyne, 1852, and subsequently published, entitled "Hadrian, the Builder of the Roman Wall."

SQUABBLES IN BANBURY.

A VISITOR to Banbury who had looked in at the last vestry meeting would have seen a new version of "Banbury cross." The vicar and others wanted to improve the chancel of the parish church, and Mr. Blomfiel has submitted designs for it, which include a flight of seven steps up to the communion-table, to which and other points in them a number of the ratepayers object. The following conditions were sent to the architect:—

"That this meeting approves of the plans now submitted for altering the chancel of the parish church subject to the following conditions:—

1. That there is to be no elevation of the communion-table by means of steps.
2. Nor any elevation of the chancel floor as now existing.
3. That the communion-table is to be of wood, and movable, and without any super-altar; (and that communion table is to be as at present.
4. The screen as shown is to be omitted or removed to the western extremity of the chancel.
5. That no decoration shall be made without consultation with the churchwardens and parishioners.
6. And that the plans and specifications shall be submitted to the churchwardens, and be approved by them before any alterations be commenced.
7. That the parish vestry is not to be appropriated for the choir, or for any other purpose than a parish vestry."

At the meeting in question the architect's reply was read, containing these passages:—

"I may as well say at once that it would be quite impossible for me to proceed with the work in accordance with some of these resolutions. I may particularly specify Nos. 1, 2, and 4. To say nothing of my own reputation as an architect, and the naturally suffer when a church architect is not in accordance with the work was done and the blunder apparent, I am sure such a plan would never receive the approval of the bishop, nor should I like to ask it. No. 3, I need scarcely say, is a matter of course. It would be illegal otherwise. The question of a super-altar is one in which I should always be guided by the wish of my employers.

No. 4, there would be no difficulty about. Nos. 5, 6, and 7 have no objection to; but Nos. 1, 2, and 4 so completely upset any possibility of a proper or even decent arrangement of choir and chancel, that if insisted on I must decline to have anything more to do with it."

This led to a considerable display of feeling on both sides, and ultimately the meeting was adjourned for three weeks to allow it to cool and consider.

One ratepayer, wishing to answer those who asked the use of the steps leading to the chancel, said,— "For the same reason that in a theatre the stage is always raised above the people, or they would not be able to see," which led one of the most moderate of the objectors to remark that,— "A gentleman near the vicar had made a singularly happy illustration when he talked about a theatre, for where these restorations of churches took place, performances had followed as a necessary consequence. Almost as natural as any sequence in the world in these churches the practices— or rather a bad imitation of them— of the Church of Rome immediately followed. (They had no objection to the church being made as beautiful as they pleased, provided its Protestant character was preserved."

A very little yielding on both sides will, we have no doubt, bring about a satisfactory result. Unless brought about by some structural necessity, the great body of the English laity object to see the communion-table exalted to the extent there contemplated.

THE BUILDERS OF STRASBOURG CATHEDRAL.

Sir,—In common fairness to our Christian forefathers, such a passage as that quoted by Mr. Alfred Strong, with reference to Strasbourg Cathedral (p. 711, ante), should not be allowed to pass unnoted. The inference that you are not allowed to draw, is, that the correspondent, by his italics, appears to draw, is, that the priests called on the people to steal in order to get money for the building. Now, any one acquainted with the very worst features of Medieval Christianity will feel sure, at once recognize that this is simply preposterous. The carefully concealed "old author" must either carelessly or maliciously have altered the text of the apse. It will be patent to every one that a very slight modification of the sentence as it stands would convey the meaning that, any one in possession of goods which he knew to be stolen, but which he had no means of now restoring to the rightful owners, would be at liberty to offer them for sacred uses. Such advertisements were, I believe, not uncommon in those days. J. A. S.

THE POPULATION OF LONDON.

It is not easy to form a conception of the enormous aggregation of human beings which constitutes the London of the present, without some standard of comparison.

It may be furnished by the consideration that it is sufficient of itself to supply a very large colony with cities, towns, and hamlets, as follows:—

	Population.	Population.
1 Capital city, of.....	25,000	250,000
2 Large cities, of.....	100,000	2,000,000
10 Smaller cities, of.....	50,000	500,000
20 Large towns, of.....	25,000	500,000
30 Smaller towns, of.....	15,000	450,000
40 Ditto, of.....	10,000	400,000
50 Ditto, of.....	5,000	250,000
100 Villages, of.....	1,000	100,000
200 Ditto, of.....	500	100,000
400 Ditto, of.....	250	100,000
1,000 Ditto, of.....	100	100,000
1,000 Hamlets, of.....	60	50,000
2,833		3,000,000

Two thousand eight hundred and fifty-three cities, towns, and villages, with an average population of over a thousand, with a surplus of several thousands over the three millions for a sprinkling of detached houses.

THE NEW POPLAR WORKHOUSE: THE ALLEGED BREACH OF CONTRACT.

At the meeting of the Poplar Union Board of Guardians, held on the 3rd inst., Mr. J. Barringer presiding, the Board's clerk announced that in accordance with a resolution passed at the special meeting,* he had written to the builders of the new workhouse, stating that the Board's attention had been called to the fact that the materials being used in the erection were not in accordance with the specification, and requesting an explanation. He had received the following reply:—

Sir,—We are in receipt of yours of the 31st ult., written at the request of your Board, informing us that it had come to their knowledge that "some of the material used in the construction of the new workhouse implements are not in accordance with the description given in the specification;" and in reply beg to state that the only material objected to by your architect as not being in accordance with the description on the contract and specification, consists of a large-load of bricks, and the timber details that have been removed from the premises. With reference to the bricks, we supplied better stocks, in our opinion, than the specification required, and the large of bricks referred to was sent to us by the same manufacturer whose bricks are now being used (and were selected by your architect as being the best of the various samples sent in for his approval), and immediately one of our firm saw them upon the ground (before the receipt of the written notice to remove them), he ordered them to be carted away, and a letter sent to the party forwarding them to us, asking them for an immediate explanation why bricks of such a character had been delivered. The reply was to the effect that they were not of his make, but had been sent on from an adjoining maker's field, to keep up the regular supply, in consequence of an accident to his barge, which had sunk just as it was ready for leaving.

Respecting the timber, we admit that the specification describes "best Danish." We had your architect's permission to use deals for the joints of the pavilion, and we quite agree with him, and are prepared to maintain, that the deals which were sent for this purpose are infinitely superior to any Danish timber which is imported. The timber in the roofs of the workshops and relief-offices was objected to by your architect, and has been removed by us, not because we thought it inferior, but to show our desire to meet the wishes of your architect and the Board.

We must also direct your attention to the fact that in every case we enter into contracts for the supply of the material to be delivered to your works to the satisfaction of your architect, and according to the specification. It cannot, therefore, be of any interest to us to use material of an inferior description.

We must beg that you will inform your Board that we have no desire to depart from the conditions of the specification. At the same time, however, we expect the architect to put a fair and reasonable interpretation upon its clauses.

In conclusion, we cannot help remarking that the course taken by your Committee and the Board in receiving the architect's statements made, especially those of the Clerk of the Works (many of which are now proved to be totally

* See p. 711, ante.

with out foundation, and the others capable of explanation), without giving us an opportunity of contradicting them until they had been published, is a course which we very much regret, and one that is unjust and calculated to do us a considerable amount of injury.

HILL, KEDDIELL, & WALDRAM.

The Chairman said this letter was a very satisfactory one, and he would now suggest that no further proceedings be taken in the matter.

Mr. Blott said he was very far from satisfied. Messrs. Hill, Keddell, & Waldram did not acknowledge by their letter that they were wrong, except in the matter of the large-load of bricks; and they said they removed the timber not because of its inferior quality, but because the architect desired it.

The Chairman considered that the builders had answered the imputations in a satisfactory manner, and he did hope that affairs would now go on smoothly again. He would be very sorry to show other than a conciliatory spirit over this question.

After a lengthy discussion, a general agreement was made that the matter should now be allowed to drop, and that the Clerk should merely acknowledge receipt of the builders' communication.

THE NEW OFFICES FOR THE POPLAR DISTRICT BOARD OF WORKS.—STOPPAGE OF THE WORKS.

At the meeting of the above Board, held on Tuesday evening last, at the Office, in East-India-Dock road, Mr. Edward Coleman presiding, a letter was read from Messrs. Baker & Constable, of Blenheim Works, Hornsey-road, the builders of the Board's new offices, intimating that in consequence of certain circumstances it would be impossible for them to go on with the building, therefore the works had been stopped.

It appears that the architects (Messrs. Hills & Fletcher and Messrs. Barton) recently objected to the use of some material, principally timber. The builders felt aggrieved on account of the material being condemned, and did not have it removed. Since then Messrs. Baker & Constable have applied to the architects for a certificate of payment of a portion of the contract sum (7,300l.), which they (the architects) were unwilling to grant until the whole of the material condemned as defective had been removed. Thereupon the builders refused to proceed with the works, and for the past few days nothing has been done.

In the event of Messrs. Baker & Constable being unable to establish their grounds of refusing to proceed with the works, it will be a matter to them of 5d. per day, after a certain date of November, as the contract contains a clause to that effect.

AGRICULTURAL PROGRESS.

Harvest Carting by Steam.—A new use has been made of steam power on the farms of Messrs. Howard, at Bedford. A steam ploughing-engine, which is also used for traction purposes, is now employed in drawing wagon-trains of corn. Many farmers who use steam power for cultivating the land, have thought that if the dormant power in the engine could be used during harvest to facilitate operations in fine weather, they would be able to reduce their stand of horse, amounting from 20l. to 25l. a horse per annum, besides their first cost. It has now been proved satisfactorily that not only the breaking up of the land, but the seeding or drilling can be done most expeditiously and economically by steam. In utilizing its power at harvest, a missing link has, so to speak, been found, so that on a large farm the few horses kept can be used as an auxiliary to steam, instead of employing a greater number with steam as an auxiliary, as is now the general practice.

Harvesting Crops independently of Weather.—In a letter to the Times, Mr. R. Neilson, a tenant of the Earl of Derby, says on this subject:—

"My experience will be found to have anticipated to some extent the recent trials on this subject on a farm of under 300 acres, which I have held for some years as a tenant of the Earl of Derby. During the wet autumn of 1863 my friend and brother magistrate for this county, Mr. Gosage, of the well-known chemical and soap manufactory at Widnes, in this neighbourhood, paid me a visit to explain and impress upon me some ideas he had long entertained as to harvesting crops so as to be independent of weather. Mr. Gosage's notions were, that if corn (however wet it might be) were placed in ricks in such manner that a current of dry or heated air could be forced through it, the superfluous moisture would be speedily driven off and the corn become thoroughly cured. He proposed to do this by means of a centrifugal fan driven by horse or steam power; and if the latter were employed, to use the gases which were produced by combustion of fuel under the boiler to yield heated air to be applied to accelerate the drying."

Mr. Neilson then details his experiments based on Mr. Gosage's idea, and adds:—

"I commenced these operations by the advice of my friend Mr. Gosage, in 1863, and have continually pursued them since that period. I consider that I have now so thoroughly proved the practicability and advantage of these operations, that I can recommend their universal

adoption by my brother agriculturists, in the full conviction that, by these means, we can render ourselves, to a great extent, independent of weather in harvesting our crops."

Danger in Stackyards.—A suggestion has been made, in a letter to the newspapers, by Messrs. Charles & H. White, that corn should always be stacked in the fields in which it is grown. When ricks are placed, as they generally now are, close to each other in a rick-yard, whenever a fire occurs, either through accident or malice, great destruction of property is the result. By stacking the corn in the fields where it is grown a great saving would be effected. With reference to the firing of stacks by the overheating of hay, Messrs. Merryweather & Sons, of the London Fire Engine Works, recommend the use of a "Patent Rick Ventilator," manufactured by Messrs. R. Garratt & Sons, of Snuffalk. The ventilator consists of a perforated tube, which is passed into the centre of the stack. A perpendicular funnel is attached to the outlet, and by this means a current of air is caused from the centre of the rick to the open air, all superfluous heat being thereby removed.

Pannification.—A method has been discovered of making bread without grinding the corn, and a patent has been taken out for the process. It is said that whereas in the process of making bread from flour there is much waste, so that 100 pounds of grain yield only 112 pounds of bread, according to the new process 100 pounds of grain will produce 115 or 150 pounds of bread. The new bread is not only increased in quantity, but is also said to be of better quality. According to the old process much of the gluten was decomposed and lost in the heat of grinding. It is preserved when grinding is unnecessary, and the new mode of fermentation contributes greatly to the whiteness of the bread. The new method of bread-making is called "pannification."

Progress in Australia.—At the meeting of the Agricultural Society of New South Wales, in May last, the first prize, class 205, for a portable steam-engine suitable to agricultural requirements, was awarded to P. N. Russell & Co., Sydney, for a 12-horse power portable steam-engine of Clayton & Shuttleworth, with enlarged fire-box for burning wood, and otherwise adapted for agricultural purposes.

OUTBREAK OF FEVER AT SCOTHERNE VILLAGE, LINCOLN.

At a recent meeting of the Lincoln Board of Guardians, the sanitary state of Scotherne was alluded to, and a terrible state of things was revealed. The subject was introduced by Mr. Mantle, who said that he had requested Mr. Martin to accompany him to the village, and they, with Mr. Grimes and the Rev. E. M. Barry, made an inspection of the place. What they saw he should never forget. The village was full of fever cases, and no wonder. The beck was dried up, and the wells were filled with sewage matter. They went to one pump and found the water emitted an unbearable stench. He (Mr. Mantle) asked a woman if she drank the water from the well, and she replied that she did, but that it stank a bit; and there could be no doubt about that, for the well was full of "pure" sewage matter. They went to another house, occupied by a widow with five children, the head of the family having died of fever last year. This family were now on the books of the union. The house was built on a declivity; the pigsty, privy vault, and cesspool were quite full; and, after a shower of rain, the contents were washed up to and past the door. The family were in an emaciated state, and one of the children was suffering from fever. After inspecting that part of the village, they proceeded to the house of a man named Harrison, who, with his wife, were laid up with fever, and who were both buried in one grave on Sunday last, leaving five children to be supported by the union. On the Wednesday the unfortunate couple were in the last stage of fever, and the villagers had such a dread of the disease, that none of them would enter the house, and the clergyman and the relieving officer had to administer the medicine themselves. Harrison was the best workman in the parish. The cost to the union had already been 12l., and at the lowest computation a cost of 600l. would fall upon the union in maintaining the children, and probably they might remain paupers for life. This amount would have been sufficient to thoroughly drain the parish. Mr. Marshall's foreman had since been stricken down with fever, and there were many other cases in the

village. Mr. Mantle concluded by moving that the guardians put in full force the power vested in them by the Nuisances Removal Act, and that a committee be appointed to take action in all sanitary matters outside the city. They ought to thoroughly cleanse and drain every village in which fever existed. Fever had existed at Scotherne for two years, and he had noticed that his horse would never drink water at the place unless the beck was running. Mr. Mantle then read a special report, drawn up by Dr. G. M. Lowe, of Lincoln; and after some discussion, several guardians were appointed as a local authority to visit Scotherne and Ingham, and do what was necessary.

CHURCH RESTORATION IN ESSEX.

We have lately noted the progress of a good many restorations in the eastern counties, and particularly in Essex. It is proposed to make a complete internal restoration of Hornchurch old church. For the work proposed the sum of 2,000l. is required, and subscriptions are being now received. The restoration of High Easter Church has cost 2,300l. At Margreting a contract for 630l. has been entered into, that sum having been already raised, but to complete the restoration 200l. more are yet needed. The ancient church of the parish of White Colne is about to undergo a thorough renovation, external and internal, towards the expense of which 400l. have been subscribed. Fryerning Church is in a dilapidated state, and has been out of use. In addition to what has been contributed towards the restoration of the fabric to its original character, some 200l. are still solicited. At Broomfield the church was re-opened a few weeks ago, after having undergone extensive alterations and improvements. With the exception of the ancient tower and part of the south wall, the whole fabric has been rebuilt. A sum of between 300l. and 400l. is yet required to make the interior correspond with the exterior. All Saints', Springfield, has recently undergone extensive repair, and been supplied with a new organ. In addition to these the parish church of Barling has been restored and the churchyard increased in size at a cost of about 700l.; while in June last a new north aisle was added to Southend Church, but the demand for summer accommodation is so great that the erection of a free south aisle is now in hand, to be completed by November. The restoration of St. Mary's Church, Chelmsford, has been in hand some time. Gifts have lately been made in the shape of a font and memorial window. After works extending over nine or ten months have been done, the church of All Saints, Snton, has been re-opened and re-dedicated. It is contemplated to make extensive alterations and improvements in church accommodation at Prittlewell, and also at Walton-on-the-Naze, which is very rapidly rising into repute as a sea-side resort. It is desired to erect another church at Walthamstow to meet the spiritual wants of the large and increasing population there. At Writtle the work of re-seating the church and making other improvements has been prosecuted; and at Bishop Stortford and other places on the borders of the county similar efforts have been and are still being put forth.

THE NEW READING GRAMMAR SCHOOL.

Subscriptions are being solicited for the erection of the projected new grammar-school for Reading. The site of the school is on the Redlands estate, and the land will cost 4,000l. It contains ten acres. Mr. Alfred Waterhouse, of London, is the architect, and the entire block of buildings, as designed, consists of two masters' houses, one at either end; a large common hall or schoolroom in the centre; and between it and them the various apartments for school purposes and for the use of the boys. The central common hall will be on the first-floor, and approached by a circular turret staircase; its dimensions are 82 ft. by 26 ft. Below it are lavatories, hat and coat rooms, &c., and a covered cloister, leading on either hand to the rooms, for school purposes. The accommodation on either side of the central common hall is a repetition of that on the other. It will suffice, therefore, to describe one of these wings. The master's house on the ground-floor contains a drawing-room, 18 ft. by 15 ft.; dining-room, 19 ft. by 15 ft.; study, butler's pantry and serving-room (these communicate with the boys' common dining-hall), kitchen, scullery, &c. On the first-floor are four bedrooms, two dressing-

rooms, bath-rooms, &c., and on the second-floor two bedrooms. The boys' room in each wing consists of,—on the ground-floor, the dining-hall, 30 ft. by 23 ft.; study, 22 ft. by 17 ft.; four separate class-rooms, all connected together by a corridor. On the first-floor, approached by a staircase between the study and class-rooms, are the dormitories, thirty in number, each about 9 ft. by 7 ft., opening out of a corridor, which communicates directly with the first floor of the master's house. On this floor also are the bath-room and linen store-rooms. Above the dormitories is a story devoted to hospital purposes, containing two sick-rooms, a day-room, a nurse's kitchen, which obviates the need of communicating with the floor below. It is proposed to place the building which would have a total frontage of 400 ft., at the upper end of the site, so as to have as much space in front for play-ground, cricket-ground, &c., as possible, and leave room for future master's residence in the lower portion of the ground. The building has been planned in a straight line, rather than in a quadrangular form, in order to receive the maximum amount of sun and air. Each boy will have his own bed-room, and each room its own window. It is proposed that the building should be erected of red brick and with tiles. The entire cost, as stated by Mr. H. J. Simonds, will be 25,000l., and the subscriptions may be paid by three yearly instalments. Subscriptions are received at the three Reading banks.

VENTILATION OF DWELLING HOUSES.

SIR,—Not knowing your correspondent who has brought this principle (see p. 704) under your notice, and not very clearly as you state, allow me to say, for your information, that the plan of constructing one shaft instead of one from each room has been in use for over five years, and answers very well; and that the further improvement of introducing the ventilation to each room in connexion with the single smoke-flue, as stated by your correspondent, has been in use over two years, and gives general satisfaction to the tenants and owner of the property. He kindly consents to show any friend I may introduce to see the houses. W. H. KELSY.

HIGH RENTS AND LOW AGENTS.

May the owner of numerous houses and shops in the suburbs address a few lines to you (leaving others to renew the subject) on his sad, unprofitable experience of false rents and advertising house-agents? Diablic trouble, I at one period largely employed this class of men. They induced and persuaded me to increase the rents fully 30 per cent., studying, as I foolishly thought, my interest,—a woeful mistake. My houses were always changing tenants; some were one and two quarters empty; from others the inmates "shot the moon." Every new tenant wanted expensive repairs, causing me nothing but diminished income and dilapidations.

Let me explain why agents create this mischief. The higher the rent the greater their charges; the oftener empty the better, as they obtain 1l. for the agreement, their commission, and a profit from the builder who is employed. Now I am wiser and more just. Letting myself, at rents which tenants can afford to pay, I secure a regular income, and freedom from the above annoyances.

WM. PERCY TRUEMAN.

SOCIAL SCIENCE CONGRESS, BRISTOL.

The arrangements for the forthcoming annual congress of the Social Science Association, to be held in Bristol, from the 29th inst. to the 6th of October, are progressing satisfactorily. Sir Stafford Northcote, bart., M.P., will preside over the whole association, and deliver his inaugural address on the first evening of the meeting. Mr. G. W. Hastings takes the presidency of the Jurisprudence Department, in which arrangements are being made for a thorough discussion of the questions of the relations between England and her colonies, charitable endowments, and the occupation and ownership of land. The Rev. Charles Kingsley, lately appointed a canon of Chester, takes that of the Education Department, where the subject of education, whether of the upper, middle, or lower classes of society, will be discussed. J. A. Symonds, M.D., of Bristol, will take the Health Department, where the special ques-

tions for discussion are,—1. Can Government beneficially further interfere to limit the spread of infectious diseases? 2. What legislative measures might be proposed to deal with cases of uncontrollable drunkenness? 3. Should the Contagious Diseases Act be extended to the civil population? The Economy Department will be presided over by Mr. Stephen Cave, M.P., and will specially discuss,—1. Is it desirable that state aid should be given to emigration, and, if so, in what form? 2. In what respects may the administration of the poor law be improved? 3. How may the condition of the agricultural labourer be improved? The congress will be opened by a sermon to be preached by the Lord Bishop of Gloucester and Bristol. During the sitting there will be a conference of ladies interested in educational, sanitary, and other social subjects, under the able superintendence of Miss Mary Carpenter. A working men's meeting is being organised, and *soirées* are to take place. There will be excursions to Cheddar, Tintern Abbey, and the training-ship at the mouth of the river.

THE SOUTH SHIELDS' TOWNHALL COMPETITION.

In our report on the designs sent in for the above, we expressed an opinion that the one under the motto of "I Work to Win" was the one most likely to take the first premium. Since those remarks were written, the town council have made their final selection, which, after considerable discussion, resulted in the first premium of 50*l.* being adjudged to "I Work to Win," and the second of 25*l.* to the design "Well considered."

The following are the authors of the six sets of plans originally selected by the committee for the consideration and final jurisdiction of the council:—"I Work to Win," Mr. John Johnstone, Newcastle-on-Tyne; "Well considered," Mr. John Johnson, 35, Moorgate-street, London; "Phoenix," Messrs. Potts & Son, Sunderland; "Always Ready," Mr. J. T. Meredith, Kidderminster; "Northumbrian," Mr. J. W. Bailey, Leeds; and "Nota Bene," Mr. C. J. Adams, Stockton-on-Tees.

NEW BUILDINGS IN BELGIUM.

The new church of St. Antoine, at Louvain, is rapidly approaching completion. It is a large and striking edifice, and consists of a nave of six bays, western tower, aisles, north and south transepts, and a deep apsidal choir. The total length is about 220 ft.; the width of nave and aisles internally about 70 ft.; height to the vaulting about the same, and the width of transepts about 110 ft. The church is built of brick, with simple stone dressings. The west front, however, is entirely of stone, and is the least satisfactory portion of the whole design. The tower is at present only carried up to a few feet above the ridge of the nave roof. The interior is vaulted throughout, the vaulting columns and arches being executed in rough moulded brick, which is to be covered with a very thin coating of plaster; the capitals, bases, triforium, arcade, and more ornamental portions of the work being carved in stone. Although there is plenty of ancient authority for this kind of construction, yet it seems to us hardly satisfactory; and one would think that first working the arches in moulded brick, and then again in plaster, would be little less costly than stone. All the details of the church are excellent, except portions of the west front, which seem to us to be later in character and less satisfactory than the rest of the church. Mr. Lavalle is the architect.

A new church has been opened some months ago at Ostend; it consists of a nave and aisles, all vaulted, a deep chancel, and a western tower and spire over a porch. The spire is of slate, and has four tall slated pinnacles at the angles; it is the best portion of the design. The porch below the tower is very shabby, and looks internally more like a scullery than the entrance to a church. The high altar is well carved in oak, and there are a set of rich canopied stalls in the chancel. There is a great deal of stained glass of doubtful merit.

The new church at Laeken, near Brussels, has been opened, though far from finished. Although this is one of the largest and most costly Gothic churches of modern times, the general effect is not satisfactory. The three towers crowded together at the west end want boldness; the

whole front is cut up with perpendicular lines, and the huge extinguisher roof crowning the lady chapel at the east end, surmounted with an immense acorn, bears no resemblance to any kind of Gothic architecture that we have ever seen. We are sorry to have to speak in this way of a building erected with such noble intentions, but our duty as critics compels us to call attention to these defects in a building of such magnitude and pretension as the new church at Laeken.

CHURCH, BRIDLINGTON QUAY.

Sir,—Not having seen your last week's number, I am not aware that you mentioned the result of the select competition for the new church at Bridlington Quay, proposed to be erected on the Beaconsfield estate.* I now beg to send you an abstract of the protest three of the competitors have forwarded to the committee.

On the grounds of unfairness in choosing a design that was not the best or in accordance with the instructions, but said to have been carried by the votes of relatives of its author, who were on the committee.

That a sixth competitor was admitted, and his design put to the vote; by which they broke their agreement with the five they invited, in accordance with the resolution passed at one of their meetings, in which the five architects were named; and as the placing of this nameless individual's design, "Con Amore," in competition, was quite irregular, and contrary to their own resolutions, as well as damaging to the chance of the others, they required the matter to be re-opened, and professional assistance called in to decide on the merits of the designs,—or that they should be fully remunerated for their time and trouble in preparing plans, &c., as instructed.

J. B. & W. ATRINSON.
ALFRED CROUCH.

RAILWAY MATTERS.

New Works at Liverpool.—The extensive new works on the London and North-Western Railway in this locality, and which include the construction of an additional double line of railway from Edge-hill to Huyton, Prescott, and St. Helen's, in order to afford increased accommodation to the over-crowded local traffic, are proceeding with rapidity; and the new railway, as it may be called, between Liverpool, Huyton, Prescott, and St. Helen's, is expected to be ready for opening in the course of a few months. The new double line commences near the company's large engine depot at Wavertree, from which point the existing line is in course of being widened to double its present extent, the excavation through Olive Mount being exceedingly heavy. Nearly the whole of the excavation on the south side through the Mount has been completed, 140,000 cubic yards of stone having already been taken out; and we may state that 14,000 cubic yards of this stone have been removed in large blocks or squares and conveyed to Garston, where it will be used for the walls of the new docks which the company are immediately about to construct there. All the bridges across the railway from Wavertree, through Olive Mount, have also been taken down and widened to nearly double their former extent, and an additional new bridge has also been constructed. Amongst the more important works which the company have in progress between Liverpool and Huyton is the reconstruction of the several stations at Broad Green, Roby, and Huyton, in order to extinguish the objectionable and dangerous level crossings at each of those stations. Extensions of great magnitude have recently taken place at the Edge-hill station, which now occupies an area of 95 acres.

The first half of the vast road at the Lime-street station has just been completed. Messrs. Thompson, the contractors, have entered upon the contract for the other or western half, whilst the company's monster hotel facing Lime-street is being covered in.

The Three-penny Fares.—Mr. Brandon has brought his scheme for the wholesale reduction of fares before the British Association, in a paper titled "Some Statistics of Railways in their relation to the Public." Mr. Brandon showed that the returns made for railway investments had not been such as might have been expected from capital laid out, and that the public had every reason to complain of the present railway system.

He suggested that it could only be accomplished by uniting all the railways under one general management, to form them into a separate branch of the public service. Mr. Brandon contended that a passenger should be enabled to travel one journey, of any distance, in a given direction, for a sum little more than nominal. In 1868, 310,150,915 passengers travelled on the railways, paying an average fare of 11*d.* to 11*½d.* Six times the number of passengers could be carried for a very small (if any) additional expense; and if a universal fare of 3*d.* was charged for any distance for each person, at a very moderate computation, six times the present number would travel, and would produce 23,261,318*l.*, being 8,536,510*l.* in excess of the receipts of 1868 from passengers only. But he would fix the fares for any distance at the following rates: first-class, 1*s.*; second, 6*d.*; third, 3*d.*; and for such first-class passengers as would pay 10*l.* and 5*l.* annually in addition for such distinction, should travel in carriages provided exclusively for them. In conclusion, he showed that the scheme would have a beneficial effect on the labour markets, by enabling a workman to remove at once to the district where his skill is in demand, and would thus tend to equalize the value of labour in the country.

ACCIDENTS.

By the fall of a builder's scaffolding at the gasworks, City-road, Manchester, some seven or eight men have been severely injured. The city corporation are constructing at these works a large circular pit, which is about 200 ft. in circumference. The boundary-wall of the pit, which is of brick, is in course of erection, and has already been raised to a height of about 26 ft. The circular scaffold for the workmen which surrounds this wall appears to be of a somewhat slender structure, supported by a horizontal beam embedded in the brickwork and an upright plank, which apparently had no means of support apart from its own equilibrium. About 26 ft. gave way, and eight or ten men who were working on the scaffold were precipitated a depth of 26 ft. The scaffold was repaired soon after the accident, and work resumed. The fall had not been caused by any breakage, but simply from the slipping of the upright plank, which had lost its balance.

A new chimney is now in course of erection at Shrewsbury, on Mr. Cook's premises, at the bottom of Barker-street. The shaft, which, when completed, will be 120 ft. high, has been raised nearly 80 ft., and lately a man had been working at the top, and was descending, with his feet upon some weights, which were attached by a chain and hook to the rope, when the hook broke, and he fell a distance of about 50 ft. The chimney is so narrow internally, that the man did not turn over, and he fell, consequently, upon his feet with fearful force. He now lies in a sad state, his spine, it is feared, being injured, as well as the lower part of his body. At the end of the rope, which is a strong one, a chain is attached with some weights, and when a workman wishes to ascend or descend this chain should be removed, and a stronger one, which is provided for the purpose, put in its place. The workman, however, neglected to do this, and attempted to descend by placing his feet upon the weights and holding on by the rope, when the hook broke.

FROM SCOTLAND.

Edinburgh.—George Watson's Hospital has been sold to the Royal Infirmary for 43,000*l.*, on condition that the necessary consent of the subscribers to the building fund of the Infirmary be obtained, and also an Act of Parliament got for granting sufficient powers to accept the offer. This resolution of the Governors of the Hospital is subject to the special approval of the Merchant Company.—The extensive area of ground belonging to Mr. William Cunningham Glen, of London, barrister, and his sisters, adjoining Lauriston Park-street, has been feued to Messrs. Shore & Crawford, builders, who have commenced operations for the construction of two streets, running north and south, in which will be erected houses of a respectable class, similar to those in Lauriston Park—the north frontage of the ground opposite Portland-place being to be occupied with handsome shops having flats of dwelling-houses above. The plans of the new buildings have been prepared by Mr. R. T.

* See p. 711, ante.—Ed.

Shiells, architect, and revised by Mr. D. M'Gibbon.—The nursery ground on the east side of Leith Walk, which has recently been recovered from Messrs. Dicksons & Co. by the Governors of George Heriot's Hospital, was exposed for public sale in the Council Chambers, Mr. Murray being the auctioneer. The front space was divided into four fens. The first of these, that to the south, measuring 55 ft. in breadth, was put up at 12s. per foot, and after a little competition was knocked down at 14s. Lots 2 and 3, measuring each between 60 and 70 ft., were sold at 12s. per foot. Lot No. 4, also measuring between 60 ft. and 70 ft., was put up at 12s. per foot, and sold at 15s. Lots 1, 2, and 3 of the back fens, measuring, one of them a third, and the other two each half an acre, were sold at the value of 100l. per acre, with 2l. additional on the actual price of the smaller lot. The whole of the lots were knocked down to one purchaser, Mr. Wilson, contractor, Granton. Other seven lots to the east, which had also been marked off for sale, were not disposed of.

Glasgow.—A meeting of members of the City Improvement Trust, with factors and others having charge of property recently acquired by the trustees, was lately held in the Council-hall, with a view to adopting measures to mitigate the evils of overcrowding and uncleanness in the densely populated parts of the city. In the course of the proceedings reference was made to the unusual increase in the number of fever cases at this season of the year; and the opinion was generally expressed that, as the Improvement Trustees were now proprietors of property in the lowest portions of the city in which nearly 12,000 families found accommodation, they were in a position to grapple with the matter with a firm and vigorous hand—to prevent overcrowding, and almost to enforce cleanliness. It was resolved that a notice should be issued to the tenants, and inserted in a prominent place in their rent-books, containing various special intimations as to expulsion for overcrowding, uncleanness, &c.

Greenock.—A meeting of the Greenock Water Trust was recently held to consider the state of the water supply. The Provost stated that there were 5 ft. of water in Loch Thom, and 16 ft. in the compensation dam—equal to 13,000,000 cubic feet, or 81,000,000 gallons. The supply to the mills, refineries, and public works along the line of falls, had been stopped; and the present water in store, with the compensation water saved from Cartburn and the shortened interval of domestic supply, was estimated to be equal to thirty-one days' domestic supply as at present. Of the works along the line of falls, two only had been granted a supply for machinery.

Alyth.—A meeting of the promoters of new water-works has been held. The principal object of the meeting was to hear the report of the surveyor, Mr. James Lamond, as to the probable cost of the entire undertaking. His estimate for forming a reservoir at Fyall—the place from which it is proposed to take the water—laying a 4-inch metal pipe from there to the north side of the town, a distance of about 3,000 yards, forming a small reservoir there, and distributing pipes through all the streets of the towns where there are no pipes laid, besides erecting twenty additional fountains, would amount to 1,061l.; but with glazed clay pipes of the same diameter the whole distance, there would be a saving of 300l. The meeting was unanimous as to the desirability of immediate action by framing and signing a requisition to the Parochial Board as the local authority. It was shown that the rateable rental of the town was 3,000l., and that 6d. per l. would pay stock and interest of 1,100l. in twenty-five years: so that ample provision remains to meet all outlay.

CHURCH-BUILDING NEWS.

Chellington.—The church of Chellington has been re-opened for public worship. It had only been partially repaired for many years past, and had fallen into such a dilapidated state that it was pronounced no longer safe to use it. It required a new roof, floor, and seats throughout the whole building. The arch at the west end of the nave, and several windows and arches blocked up and disfigured, were to be restored. A hell, cracked how long no one knew, was to be recast, and other works required attention; and these works have been begun and in a great measure brought to completion.

Tilley (Herefordshire).—The re-opening of this

church took place on the 3rd instant. The new church, which replaces one erected a century ago, consists of nave, north aisle, with arcade of four bays, south porch, chancel, organ chamber, and vestry; the old tower is retained. The walls are built of Penrhos stone, Bath stone being used for the dressings. The arcade shafts are hlsus Pennant. The fittings throughout are of oak, and the accommodation provided is for about 220 persons. The church is warmed by underground stoves. The windows, with the exception of the two on the south side of the chancel, which are filled with stained glass by Messrs. Baillie, are glazed with cathedral tinted glass by Messrs. Done & Davies, of Shrewsbury. The encanitic tile floors are from Godwin, of Lugwardine. The style of the church is Early Decorated; and the work has been carried out by Messrs. Lewis & Day, of Hereford, under the direction of the architect, Mr. E. Haycock, jun., of Shrewsbury.

Wettenhall.—The chapel-of-ease here is to be rebuilt on an enlarged scale, and, as a parish church, dedicated to St. David. It is also proposed soon to commence the erection of schools, and eventually a rectory-house. The edifice will be built on the site of the old chapel-of-ease, on the road from Over to Bumbury, and about nine miles to the north-west of Crewe. As the funds are limited (the cost, allowing for the old materials, will be about 700l.), it was determined to construct the edifice of brick and other inexpensive materials. The style is a simple type of thirteenth-century architecture. In shape the church will be cruciform, the total dimensions from east to west being 67 ft. 5 in., and in the body of the church 26 ft. 9 in. wide, and from north to south walls of transepts 36 ft. 5 in. and by 14 ft. 4 in. wide. The entrance is by a south porch. The minister's vestry is in the arm of the south transept. At the side of the nave coupled windows alternate with buttresses. Triple windows are placed in the gable walls of the chancel transepts and west end. The west end gable is surmounted by a bell-turret, and other gables by ornamental stone and iron crosses. White Kelsall stone is to be sparingly used; the roof is to be of open timber-work varnished. All the sittings—180—will be free and unappropriated, and will be made of Savannah pitch pine, which has been supplied to the builder at a nominal price by a tradesman of Winsford. The architect is Mr. James Redford, of Manchester, and the contractor Mr. P. Hodgkinson, of Sandbach. A fete has been held at Calveley Hall, Earl Grosvenor's seat, in aid of the funds.

Long Eaton.—The parish church of Long Eaton has been re-opened, after having undergone considerable enlargement and improvement. For many years past the old church was felt to be inconvenient; and as the population of the parish increased it became totally unsuited to its requirements. It would only seat 252, and those in pews of the most unseemly description. Accordingly, about four years ago, the vicar, the Rev. Mr. Atkinson, determined upon making an effort to enlarge and restore the edifice, and a subscription was started. Many of the parishioners coming forward to assist, instructions were given to Mr. Street to prepare plans for the enlargement of the church. Mr. Street soon submitted his designs, which met with general approval, and the work of restoration was commenced; Mr. Hunt, of Long Eaton, being the contractor. The old church has been made to form the south aisle, and to this has been added a north aisle, a nave, and a chancel, the architecture of which corresponds to that of the old building. All of it is built of stone. The old pews have, of course, been swept away, and plain open seats erected in their stead. A new pulpit of carved stone, by Mr. Earr, of London, has been procured, and two stained windows have been placed in the chancel. One of these represents Christ in the manger, and also in the Temple; and it has been given by the teachers and children of the Sunday school. The other represents Christ's baptism by St. John, and His disputation with the doctors in the Temple; it has been contributed by the children and teachers attending the night school. They are the work of Messrs. Ward & Hughes, of London. The vicar has been at the expense of another painted window, manufactured by Messrs. Hardman, of Birmingham, which is placed in the south aisle. The cost of the whole improvements will be about 3,000l.; and towards this sum 2,200l. have been raised. The church will now accommodate about 600.

London.—The foundation-stone of a proposed

new and enlarged chancel to Longdon Church has been laid. Mr. Griffiths is the builder, by whom the work of renovation has been undertaken. The funds at the disposal of the vicar being inadequate, it is proposed to do no more at present than to render the body of the church more suitable for the performance of Divine service by rebuilding the chancel, with the addition of an organ recess and vestry, opening and affording space for additional sittings in the old tower. The tower is the only remains of the old church, which, being somewhat dilapidated, was pulled down, and the present edifice was erected. It is proposed to substitute open sittings, to remove the pulpit to a proper position, to remove an obnoxious gallery, and erect a church portal on the southern side. It is hoped that ere long funds may be forthcoming for casing the present brick and stucco structure of the body of the church with the grey sandstone obtainable on the spot. It is also proposed to convert the Grecian windows into a more Ecclesiastical style.

Barnard Castle.—The foundation stone of a Free Christian Church has been laid in Newgate, Barnard Castle. For more than a quarter of a century a Free Christian Church has existed in Barnard Castle. The members have assembled in a building in the Broadgates, but the situation being somewhat obscure and out of the way, it had long been felt to be desirable that a commodious place of worship should be built by the community in a more central and public situation, and the site for the building was purchased in Newgate. The church will be Gothic in style, and will be built from designs by Mr. Harrison, of Manchester. It will contain 150 open sittings, but no gallery. A school will also be attached to the church, and by the removal of two screens 100 more sittings in this school can be added to the church at any time. The estimated cost of the building is 1,000l., of which 900l. have been subscribed. Mr. Donaldson has contracted to do the stonework, Mr. Carter the joinery, and Mr. J. Jackson the plumbing work.

Books Received.

"On certain Economical Improvements in obtaining Motive Power." By Richard Eaton. This is a reprint of a paper read by Mr. Eaton before the Mechanical Science section of the British Association at Exeter. It relates to an invention of a Mr. Warsop, of Nottingham, which is held to be of great importance. Patents for "obtaining motive power" are not seldom schemes of perpetual motion; but with such schemes this has nothing to do. It relates to what is called "Warsop's Aero-Steam-Engine," in which compressed air is introduced by means of the air-pump into steam-boilers, for the purpose of aiding in the production of power and the economization of fuel. Professor Tyndall is said to have volunteered to investigate the scientific bearings of the results, as personally observed in Nottingham, by Lord Richard Grosvenor, who is an amateur engineer, and by others.—"Twickenham Drainage: Report on a Proposed System for the Drainage and Disposal of the Sewage." By Henry M. Ramsay, Surveyor to the Twickenham Local Board.—"Twickenham Local Board: Report on the Drainage and Disposal of the Sewage." By the Local Drainage Committee.—These reports recommend that the plan for the drainage of the parish should comprise the town and all outlying districts, as shown in the surveyor's plan. The committee recommend the board to adopt irrigation as the system for dealing with the sewage; and advise 100 acres to be purchased, although they consider that 60 acres, as stated in the surveyor's report, would suffice, according to a report from Banbury, which has 120 acres for a population of 11,000. The committee are of opinion that the parish drainage will thus become not only self-supporting, but a source of pecuniary profit.—"Natural Philosophy." By John Tyndall. London: Cassell, Petter, & Galpin.—We need not say anything in recommendation of Professor Tyndall on Natural Philosophy, which in this case is intended for boys.—Other two of Messrs. Cassell's little books for children, which happen to be within reach of us, are "Æsop's Fables" in words of one syllable, by Mary Godolphin; and "Evenings at Home," in words of one syllable, by Uncle John, author of "The Children's Album."—Whatever we may think of the peculiar English which authors are

constrained to write where no two or three-syllabled word is allowable, the ingenuity with which these books are written is surprising; they are fair specimens of good sound Anglo-Saxon, too; all the more, it may be, that they are free from long Latin and other importations.—“The Civil Service Book-keeping: Book-keeping no Mystery: its Principles popularly explained, and the Theory of Donhle Entry analysed.” By an Experienced Book-keeper. Lockwood & Co. This treatise on book-keeping is intended for the use of young men commencing business, examination candidates, and students generally. We have no doubt it has been prepared by “an experienced book-keeper,” who appears to have belonged to Her Majesty’s Civil Service.

Miscellaneous.

Mortuary House, Marylebone.—Dr Whitmore says in his last monthly report:—By an order of the vestry, the mortuary-house, situated in the Paddington-street Burial Ground—and which has been ready for the reception of the dead for the last six months—will be opened for public inspection for the next five or six weeks. It is to be hoped that the poorer classes in particular will take the opportunity of visiting it, in order that they may judge for themselves of its extreme fitness for the purpose for which it has been erected. It is a thing of common occurrence that bodies are kept unburied for eight or ten days, owing to the inability of surviving friends or relatives to find the money to pay for the interment. In such cases it most frequently happens that the bereaved family have had one room in which to live, sleep, and perform every domestic office; here, then, in the midst of them lies the decaying mass of mortality, poisoning the atmosphere they breathe, and endangering their health and even their very lives. Surely, both on the score of personal safety, as well as from a feeling of respect and reverence for the mortal remains of those whom in life they loved, the poor will see the desirability of making use of this fitting manseum, as a temporary receptacle for the bodies of their deceased children or relatives, to which they will have daily access, and for the use of which no fee or charge whatever is required.

A Mission of Inquiry.—Mr. Conolly, artisan, has been deputed to go to the United States in order to report upon the condition of labour in that country, and has hidden farewell to the South London Lodge of the Operative Masons’ Society. An address was presented to him, and in reply he said he was not undertaking the mission with any view to his personal advantage. His object would be to find out the hours of labour in every branch of trade, as well as the amount of wages. He should further inquire whether workpeople lived in boarding-houses or houses of their own. He should endeavour to ascertain whether, with their dollars in America, people were better off than with their shillings in England. He should make inquiries, too, with regard to education, the system of which in America was said to be one of the best in the world for the youth of the working classes. His object would be to find out whether, under that system, the lads became more skillful artisans, better citizens, or more worthy heads of families. He would particularly inquire into the working of Abraham Lincoln’s Act, whereby, it was said, any steady man was enabled to acquire 150 acres of land after residing upon it for five years. He would ascertain in what respect the trade-unions as there existing differed from trade-unions at home. One member of the Government (Mr. W. E. Forster) had sent him 5*l.*, as well as an introduction to Mr. Adams, the late American Minister to this country.

Driving Piles by Gunpowder.—An improved pile-driving machine has been invented by a Mr. Shaw, and is manufactured at Philadelphia by a new company. Hand and steam are superseded in this invention by gunpowder, which, by its explosion, excited by the fall of a hammer on a small quantity of fulminate, in cartridges fed into a cylinder, causes a recoil of the cylinder, which forces the pile into the ground. The cartridges can be thrown in at the rate of 50 per minute, and the hammer is thus kept going without a lever. The charges of powder are said to be only one-third of an ounce each. The hammer is one of 675 lb. weight: it is thrown 8 ft., and exerts a force on the head of the pile equal to a dead weight of 300,000 lb.

[New House, Sink, Yard, and Ventilating Trap.—Mr. James Mansergh has lately designed a trap with a special view of keeping sewer gas out of dwelling-houses. The waste from a sink-stone, &c., is discharged into the trap out of sight. The vertical socket for receiving the waste-pipe is buried in with the trap, so as to form with it one piece of stoneware. The upper part of this socket is tapered to take in any size of pipe; the lower part extends an inch or so below the tip of the opening into the gully forming a water-trap. Over the gully is an open grating for the ingress of surface water; the plate forming one side of this gully is carried down below the bottom of outlet to drain, forming a second water-trap entirely independent of the first. Behind this trapping plate, and in free communication with the drain, is a socket, to which may be connected a ventilating pipe of any size up to 4 in. diameter. By this ventilator, which is to be carried up above windows and away from chimneys, the house-drain is relieved of pressure, and the gas has therefore no tendency to struggle through had joints or traps into the space under lower floor. On the waste-pipe from the sink, there is a junction into which the wastes from baths and lavatories, and especially the overflows from cisterns, are to be taken, thus cutting off these from becoming direct lines for the ventilation of drains into the upper parts of houses.

Covering Walls with Glass for Protection of Fruit Trees.—In a paper read at the Manchester Congress, July 22, 1863, it was said: Where there are walls with a southern aspect in gardens, a covering of glass will be found the cheapest and most certain way of securing crops of the finer fruits, such as peaches, nectarines, and apricots. When the new kitchen garden was planned at Welbeck, a range of south wall nearly 800 ft. long was covered with glass on a novel principle. All the framework is of iron, and the roof made on the ridge-and-furrow mode, and glazed with strong plate glass, cast on purpose to suit the curve in the roof. The openings for top ventilation are made in the back wall, and every alternate light in front is opened and shut by machinery worked from the inside. The height of the back wall inside is 13 ft. in the front 7 ft. 6 in., and the inside width 7 ft. 4 in. This structure is heated by hot-water pipes, and these were found very useful this spring, for good crops of peaches and nectarines have been secured, as well as plenty of cherries, plums, and pears grown in pots. Fire-heat is only used at the time they are blooming, or in the autumn, to ripen the wood, as the object of this structure is to get a succession of peaches and nectarines after the hot-house ones are over.

Magnetic Disturbance of Watches.—An American watchmaker has made the curious chance discovery that the balance-wheel in nearly every watch is, if made of steel, converted into a magnet. By what process in the manufacture it has become one it might be difficult to say; but whether the wheel be indeed a magnet or not may be easily discovered by fixing it upon a small piece of cork, letting it float in still water, and seeing if it always turns in one direction. The fact of the magnetic character of the wheel will account for many irregularities in watches which have hitherto been inexplicable. A key, an iron brace-buckle, or the steel blade of a knife near or in the same pocket as the watch, may exert a disturbing influence. But even if there should be no piece of steel in or near the pocket, the magnet will necessarily tend towards the north, and so far interfere with the calculations of the watchmaker in a very delicate piece of mechanism. Gold-balanced watches must thus be far preferable to steel-balanced ones.

Wrought-iron Chimney at Creusot.—A new wrought-iron chimney has been recently erected at the Creusot Ironworks. The Engineer gives particulars of it. It is 137 ft. high and 6 ft. 7 in. in diameter. At the bottom the diameter is increased to 10 ft. by a curved base which is fastened by vertical bolts to masonry work. The thickness of the sheet iron is $\frac{3}{8}$ in. at the top, and $\frac{1}{2}$ in. at the bottom. There is an inside iron ladder. The weight of this chimney is 40 tons; it has been riveted horizontally and lifted afterwards with a crane. Another, 275 ft. high, will soon be erected, but by a different system; it will be riveted vertically, with an inside scaffolding. These chimneys are built for an extension of the Creusot Works, especially intended for steel-making.

Telegraphic Progress.—Mr. Verley, the electrician, is at Brest for the purpose of remedying a fault in the French cable of a point about 1,000 miles from the French coast. Mr. Verley, without raising the cable, hopes to be able by some manipulation of electricity to produce at the precise spot of the fault an effect similar to electrotyping on the surface of the conducting wire, and by this means prevent the escape to earth of any portion of the electric current. Sir William Thomson notifies that a plan for electric testing at sea has recently occurred to him as available with Mr. Verley’s form of cable, which will give a security against faults not attainable with any form of cable having metal in its outer covering. According to this plan a fault existing in the coiled part of the cable on board ship, and merely producing an addition to the general leakage scarcely recognizable as due to an incipient fault, will make a sudden and decisive indication after it passes out of the tank, and before it reaches the stern pulley. The alarm will thus be given at the right time to stop the egress of the cable, and cut out the fault with a minimum of risk and delay.

The Workshops Act.—Mr. Redgrave, one of the inspectors of factories, in the half-yearly report just issued, says:—“I am very sanguine that this Act will eventually be a success. I found this opinion upon the expressed willingness of employers to accept it as legislation in a wise direction, upon their readiness to observe its provisions, and upon the entire absence of quibbling or misrepresentations to escape the restrictions. Granted that in some respects it might be improved, yet in its main features, in the restriction of the labour of females and young persons, it has already entirely changed the features and aspects of some trades; and in the necessity it imposes upon children to attend school it has already in a great number of trades prevented the improper employment of infants, and is preparing the way for a general observance of school attendance. A very slight pressure of the local authorities would make this Act as well observed and as popular as the Factory Act itself. But the educational effect of the Act is by no means satisfactory. Manufacturers will not employ school children—half-timers—in their establishments.

Opening of the Southern Embankment of the Thames.—The second portion of the Thames Embankment on the south side, namely, that which commences at Lambeth Bridge and terminates at the end of the Poteries, is now so far completed that the public have been permitted to walk along it instead of, as formerly, proceeding through the dirty thoroughfare which runs parallel with it. Nearly the whole of the Embankment is now paved, and as soon as the roadway is finished it is understood that the Metropolitan Board will permit its instant use for traffic. The first portion of this Embankment, it will be remembered, was opened about twelve months since from Westminster Bridge to Lambeth Bridge. The extensive demolition of houses in the Poteries has considerably improved its appearance.

The International Horticultural Exhibition at Hamburg.—This exhibition has been opened. The buildings stand on a site between Hamburg and Altona. The boathouse in which the principal productions are exhibited is adorned with a figure of Fame, a copy of the work of Paul Delarocche in the School of Fine Arts in Paris. The walls are decorated with flags of all nations, surmounting names of naturalists and horticulturists. The exotic plants in the park give something of a tropical character. Competent authorities are engaged in arranging the flowers as they arrive, so as to suit the architectural details of the building.

Descendants of the Nearly Extinct British Barbarians.—Some savages in the parish of St. Hilary, according to the *Cornish Telegraph*, have wilfully destroyed Trewhella Cross. The matter is to be brought before the Penzance Natural History and Antiquarian Society, with a view to their prosecution in a criminal court.

The New Theatre, Croydon.—Several alterations and improvements have been made in this theatre during the recess. The stage has been lengthened 22 ft., and a separate approach added to the stalls. The gallery floor has been sheathed and felted, which will deaden the treading of feet overhead. The theatre has been taken on a lease by Mr. Clarence Holt.

Santiago-de-Chili International Exhibition.—Last year the Chilean Government advertised an agricultural exhibition, in which some large prizes were to be distributed to the successful competitors. A grand prize of a gold medal and 800 dollars, or 160*l.*, was offered for the best collection of agricultural machinery; and another of a gold medal and 500 dollars, or 100*l.*, for the best steam-thrashing machinery. Many other gold medals and prizes of smaller value were offered. English firms have carried off the lion's share of the prizes. Messrs. Hansomes, Sims, & Head, for their thrashing-machine, got the first prize; and gold medal; Messrs. Clayton & Shuttleworth the second gold medal. Special prizes were also gained by Messrs. Howard. American manufacturers came in second for the chief prize.

The Smoke Nuisance at Newcastle-upon-Tyne.—The committee appointed at the meeting held in the Guildhall, Newcastle, has had a conference at the council chamber, under the presidency of the Mayor. Considerable discussion arose as to the steps to be taken. The most perfect unanimity, however, prevailed as to the desirability of acting in such a way as not to embarrass unnecessarily the important manufacturing and mining interests of the neighbourhood. There is said to be a general feeling among owners of works, collieries, &c., that the time has come for doing something towards suppressing the nuisance. A sub-committee was appointed to inquire into all the plans proposed or in operation for the prevention of smoke and noxious vapours, and to report to the general committee at their next meeting.

School of Art for Burslem and Tunstall. A meeting has been held in the Lecture Hall of the Wedgwood Institute, Burslem, in furtherance of the opening, at the Institute, early in October, of a school of Art and Science for Burslem and Tunstall, and to appoint a master for the school. A committee of eleven gentlemen in each of the towns named was appointed. Mr. Hope, a manufacturer, said he trusted the committee now appointed would prove to be an active one. He remembered a former school of art at Burslem, which decayed, he feared, partly from lack of activity on the part of the committee. Now they had such a noble building for their purpose they were doubly bound to activity. Burslem and Tunstall ought not to be one whit behind Stoke and Hanley in artistic skill. The members of the new committee present proceeded to make choice of a master, and Mr. Theaker was elected.

The Building Trade in Paris.—The Paris correspondent of the *Telegraph* says:—

"One of the largest branches of Parisian industry, that of house building, is threatened with a strike on the part of the workmen, who seem to be in a great state of agitation and discontent, especially the masons and stonecutters. I must tell you that the number of contracts for this department is limited to three or four great firms, the most important of which has just lowered the men's pay considerably. Where they gave 3*fr.* 50c. before the 1st of September, they pay only 2*fr.* 75c. now. In 1868 and 1869, at the height of the building fever, the wage was 4*fr.* 25c. Now that the furor is fast declining, and that most of the anticipated speculations are realised, contractors no longer think it worth their while to pay the workmen at the same rate. But the remaining works of Paris will certainly come to a 'stand still,' if the discontented corporations carry out their plans, which are not only to strike, but to emigrate, as they find there is now no chance whatever of their gaining nearly as much as they did formerly."

Proposed Alterations of Liverpool Town-hall.—The town council have agreed to a recommendation of the finance committee, to adopt a general plan submitted, showing alterations of the Town-hall for the accommodation of the mayor, and the enlargement of the council-room, at a cost not exceeding 3,000*l.*; but have added to their resolution that the appropriation of the several rooms, and the details of the plans, and also of the fittings and furniture, be postponed for further consideration.

The English Congregational Church, Swansea.—We are asked to say with reference to the notice of this building in our last issue, that the interior is not in one open span as stated, but is divided by iron columns into "nave and aisles." Further, the gas-fittings were manufactured by Dovey, of Manchester, though supplied by the local gas-fitter, Mr. Holmes.

French Prizes for Architecture.—M. Doc, the architect who lately obtained the Emperor's prize of 100,000*fr.*, has paid 40,000*fr.* into the treasury of the French Institute to found an annual prize for the encouragement of architecture.

Leavesden, Woodside.—Mr. Mann, the contractor for building the St. Pancras Parochial Schools, has protested against Messrs. Killingback & Rudley entering on the ground for the purpose of carrying out the drainage works; but the guardians, acting under legal advice, are determined to proceed with the works. Mr. Mann did not send in a tender for the drainage works, but forwarded a schedule of prices, through the architects, which the guardians could not accept, as they had invited tenders for a fixed sum.

Removing Incrustation in Steam Boilers. A mixture called halogium, says *The Penny Mechanic*, is sold and used in Germany for preventing the formation of incrustations in steam-boilers. The mixture consists of 65 per cent. of sal ammoniac, 17 per cent. of chloride of barium, and 18 per cent. of catechu, and is said to answer its purposes very well. Chlorine, which exists in the sal ammoniac, as well as in the chloride of barium, is a halogen, which seems to account for the name halogium.

Proposed New Hospital at Royston.—It has been determined to erect at Royston a small hospital, for the treatment of the poor who cannot properly be attended to at their own homes. It is intended that the hospital shall be partially self-supporting. Lord Dacre has given a site for the hospital and its garden. Mr. E. Nash has undertaken to provide the architectural plans for the building, which will be constructed with a due regard to sanitary arrangements, as recommended by Captain Galton, R.E.

TENDERS.

For rebuilding house and premises, No. 87, London-road, Southwark, for Mr. J. R. W. Rells, Mr. R. J. Dickens, architect. Quantities supplied by Mr. C. B. Midland:—
Canning & Mullins 4710 0 0
Kent 655 0 0
Falkner 647 0 0
Cooper & Cullum 845 0 0
Linfild & Son (accepted) 597 0 0

For five houses and shops to be erected in Long-lane, West Smithfield, Mr. L. H. Isaacs, architect. Quantities supplied by Mr. L. C. Riddett:—
Simpson & Son 48,200 0 0
Patman & Fotheringham 6,082 0 0
Macey 5,495 0 0
Mansfield, Frick, & Co. 5,475 0 0
Holland & Hannen 4,940 0 0
Browne & Robinson 5,369 0 0
Phillips 5,195 0 0

For rebuilding house and premises, No. 343, Walworth-road, and alterations, &c., No. 345, ditto, for Mr. J. E. W. Rells, Mr. R. J. Dickens, architect. Quantities supplied by Mr. C. B. Midland:—
Canning & Mullins 4,940 0 0
Kent 333 0 0
Falkner 314 0 0
Linfild & Son 298 0 0
Cooper & Cullum (accepted) 298 0 0

For the erection of six cottages at Kingston, for Mr. H. Nash, Mr. J. S. Ellis, architect:—
Wells (accepted) 41,530 0 0

For erecting two shops in forecourt of house, High-road, Upper Footing, Mr. Herbert Taylor, architect:—
Potter 470 0 0
Fid 885 0 0
Kilby 677 0 0

For new post-office, Bank-street, Ashford, for Mr. J. E. Munns, post-master, Mr. King, architect:—
Steady, Joy, & Steady 2,845 0 0
Clifford 839 0 0
Dryland 789 0 0
Frybaird 778 17 10
Fowler 769 0 0
Hamett 749 0 0
Petters (accepted) 722 12 0

For alterations to Bramerton Hall, Norfolk, Mr. R. M. Phipson, architect:—
Hawes (accepted) 42,410 0 0

For restoring the nave and aisles of Fressingfield Church, Suffolk, Mr. R. M. Phipson, architect:—
Grimwood (accepted) 6,622 0 0

For new Congregational Chapel, Romel-road, Bermondsey, Messrs. Lander & Bedells, architects:—
Little 3,379 0 0
Axford 3,835 0 0
Simpson 4,800 0 0
Browne & Robinson 4,795 0 0
Dove, Brothers 4,745 0 0
Grover 4,575 0 0
Mann 4,375 0 0
Manley & Rogers 4,347 0 0
Hart 4,310 0 0
Rider 4,270 0 0
Renshaw 4,205 0 0
Kant 4,275 0 0
Coleman 4,231 0 0
Hill & Sons 4,165 0 0
Wells 4,180 0 0

For enhancing Offton Church, Suffolk, Mr. R. M. Phipson, architect:—
Smith 4,297 4 0
Cornish 195 0 0
Tooley (accepted) 180 0 0

For rebuilding 59 and 60, Wilson-street, Finsbury, Mr. Hammon, architect:—
Brass 4,743 0 0
Grover 1,663 0 0
Ennor 1,600 0 0
S. Saby 1,483 0 0
C. Saby 1,293 0 0
Preedy & Son 1,251 0 0

For dwelling house and shop, in North-road, Brighton, for Mr. J. Sayers, Mr. Dallimore, architect:—
Childs & Simmonds (accepted) 4,733 0 0

For sewers in Sloane-square, for the Vestry of the Parish of St. Luke, Chelsea, Mr. Pattison, surveyor:—
Bloomfield 259 0 0
Morris 210 0 0
Lacy 207 0 0
Sayers 195 17 0
Wignore 187 0 0
Neave 178 0 0
Whittick (accepted) 178 0 0

For rebuilding warehouse, Nos. 4, 5, and 6, Maiden-head-court, and 19, Nicholl-square, E.C., for Messrs. Salomon, Mr. B. Talbot, architect:—
Brass 4,182 0 0
Turner & Sons 3,974 0 0
Henshaw 3,788 0 0
Pritchard 3,747 0 0
A. E. Robinson 3,737 0 0
Browne & Robinson 3,676 0 0
Perry 3,547 0 0
Craib & Vaughan 3,638 0 0
J. Pritchard 3,342 0 0

For sewerage works connected with the utilisation of the sewage, for the Borough of Cheltenham, Mr. D. J. Humphris, Borough Surveyor. Quantities furnished to contractors by Mr. J. Simmonds. Pipes supplied to the Commissioners by Messrs. Gibbs & Canning:—
Hall & Frice 4,770 0 0
Moore 4,120 0 0
Dierden 4,612 0 0
Ford 4,180 0 0
Feywick & Mantle 3,293 0 0
Field 3,392 11 4
Abell & Co. (accepted) 3,300 0 0
Coker (exclusive of compensation) 2,999 0 0

TO CORRESPONDENTS.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of Tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rest, of course, with the authors.

IMPROVED MACHINERY, combined with STEAM POWER, is employed by J. W. BENSON in the Manufacture of Church, Turret, Stable, and Tell-tale Clocks, Sun and Wind Dials, Perpetual Calendars, and every description of Clock and Watch Work. Architects, Builders, Committees, &c. can be promptly supplied with estimates. A descriptive Pamphlet on Church and other Clocks, post-free, 2d. J. W. BENSON, by special appointment, Watch and Clock Maker to His Royal Highness the Prince of Wales, Steam Factory for Clocks and Watches, 58 and 60, Ludgate-hill; Showrooms, 25, Old Bond-street, London.

ADVERTISEMENTS.

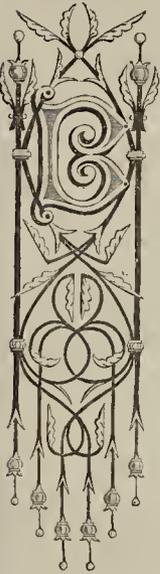

THE TREATMENT OF SEWAGE.
By JOHN HARRIS.
A Pamphlet for Municipal Authorities, and those interested in the Cultivation of Food.
London: H. WIPPELL, MARSHALL & CO.,
Leamington: H. WIPPELL, Victoria Library.

In 12mo, with Diagrams and 9 separate Plates, price 5*s.*
TREATISE ON LAND-SURVEYING, IN THEORY AND PRACTICE, giving the best methods of Surveying and Levelling for Statistical, Estate, Colonial, and Engineering purposes; together with Full Explanations of the Construction, Adjustment, and Use of the Theodolite, Levels, and other Instruments required in the field and office work of Surveying and Levelling, for the use of Engineers, Surveyors, &c. Students in Colleges and Schools.
By J. A. SMITH, Civil Engineer.
London: LONGMANS, GREEN, & Co. Patent Stationers.

ABOLITION OF PATENTS FOR INVENTIONS.
Just published, in 8vo, pp. 350, price 5*s.* cloth.
DISCUSSIONS IN THE UNITED KINGDOM, FRANCE, GERMANY, AND THE NETHERLANDS, on the ABOLITION OF PATENTS; Speeches and Papers by Count Bismarck, M. Chevalier, R. A. Maudslayi, M.P., Sir Roderick Palmer, M.P., Lord Stanley, M.P., James Stirling, Esq. &c. with Suggestions as to International Arrangements regarding Invention and Copyright.
London: LONGMANS, GREEN, & Co. Patent Stationers.

The Builder.

VOL. XXVII.—No. 1389.

Titian's Country.

ALMY evenings, gilded gondolas gliding on shining waters, with reflections of brilliant hues in the rippled shadows, matches of love-songs floating in the air, garden banquets, with witty, sparkling converse, within sight and sound of such accessories, and a general impression of artistic luxury and sumptuousness, if not of voluptuousness, come into the mind at the first mention of Titian's country. To the general public the home of this great painter was Venice; and its palaces and lapping waters are the first objects thought of when his name is

spoken. The letter of Il Priscianese, doubtless, accounts for much of this association of idea. The description given in it of the evening he spent with Titian in his pleasant garden, when Aretino, Il Sansovino, and Nardi were present at the supper, and his mention of the situation of the painter's house, as being within sight of the island of Murano, and of the fact that as soon as the sun went down, and the tables were set in the garden, that part of the sea within view was filled "with a thousand little gondolas adorned with beautiful women, and resounded with divers harmonies,—the music of voices and instruments," till midnight, have made us a little word-picture that is difficult to dismiss. But if we would know more of Titian's life than this one evening, or the series of similar garden feasts to which the notes of Aretino also bear testimony, we must dismiss it. Titian was no sybarite whose rest a rose-leaf would have disturbed; no opionore; no voluptuary; but a hardy mountaineer, "canny" rather than otherwise, hardworking, and indefatigable. Although for forty-nine years he occupied the house and grounds in which he gave these famous supper parties, he rarely failed in the summer time to visit the mountain district in which he was bred and born. This was Cadore, a town on the Piave, about eighty-six miles distant from Venice, in the heart of the Alpine region. On fine days in the early dawn, his native mountains could be described in the horizon from his studio windows, ever reminding him of their majesty, and ever urging him back to their beauty. No wonder, then, that after he had passed the great age of our score and ten he still wended his way to their feet, charmed as at first, and strengthened with the bracing mountain air to climb their steep sides. Thither, after an interval of three centuries, he has recently been followed by an admirer, who has, as literally and exactly as may be, sought out his footsteps, rested on the route where he rested, gazed at the scenes he surveyed

from the successive stages of his journey, searched out the pictures he saw in churches in or near the way, and traced some that he painted with his own hand to the country churches for which he designed them. We allude to a task just completed and described by Mr. Josiah Gilbert, whose familiarity with the Dolomite Mountains in the same part of the world enabled him to accomplish more than an uninitiated person was likely to have undertaken.* Some thirty years ago the Abbate Cadorin identified the Casa Grande, the large house with a studio extending over the extent of its upper floor, in which Titian lived for so many years, but which, up to that time, was not known to have been his residence. It is on the north side of Venice, rarely visited by strangers, and is now so blocked in with modern dwellings probably built upon the garden, as to appear like one side of a narrow court. It is subdivided into a row of houses, at the top of which, however, still runs the bold cornice of Titian's time, showing it was formerly one handsome residence. The Abbate ascertained that Titian had a mortgage upon the house, and that it finally became his, and passed at his death, with his other property, into the hands of his spendthrift son Pomponio. And now Mr. Gilbert has thrown as much light upon his birth-place in the little mountain republic, and shown how it was that mountains and forests were so much upon his canvas. He has done more, too, for Titian. The trumpeted blot upon his fame left by the imputation that many of the lovely faces he painted and made more lovely still, were those of his mistresses, Mr. Gilbert has laboured to remove. He believes that the famous "Violante" introduced in a picture for the Duke of Ferrara, which he spoke of as "the object dearest to him on earth," was his fond wife; and that another portrait of a beautiful woman sitting by his side was that of his dear daughter; and that probably the other paintings described as mistresses of Titian's were merely so called in default of names forgotten.

Walking in his garden, as we have said, Titian, when there was no opal haze rising off the sea or along the plain, could see the range of hills that sheltered his native place; nay, more, he could identify the Antelao, the chief guardian of Cadore. There is a picture of his, a shepherd playing on a pipe, in which Mr. Ruskin has identified this view as a background. And his great picture, the "Peter Martyr," so unfortunately destroyed in the burning of the hall in the ducal palace, portrayed a nearer range, through an opening in which the Antelao is seen, the hills of Ceneda. His famous "Battle of Cadore" afforded a legitimate field for their portraiture; and accordingly we find his native hills again depicted. Mr. Gilbert gives both a fac-simile of Mr. Ruskin's sketch of the Cadore mountains, and a view of the Alpine scene that was in the painter's mind when he sketched the outlines for his battle-piece. A more valuable illustration than either of these, we may as well add here, is a fac-simile of Titian's original design for the piece that was to celebrate the prowess of the Cadorini, a drawing that passed through the collections of Sir Thomas Lawrence, Esdaile, the engraver Rota, and the late Dr. Wellesley, at the sale of whose effects it was purchased by Mr. Gilbert. There are numerous illustrations of the mountain scenery etched by the author; several woodcuts, and a photograph of Fontana's rare engraving of the "Battle of Cadore."

We can assure our readers they would enjoy setting out for Cadore in Mr. Gilbert's company. He starts from Venice, so travelling northwards. He tarries first at Treviso, a stage of eighteen miles, where there is one of Titian's choicest works on the "Annunciation" in the Duomo,

* "Cadore; or Titian's Country." By Josiah Gilbert. London: Longmans, Green, & Co. 1869.

and where doubtless the great painter often scrutinised the works of his rivals, Giorgione and Pordenone. Thence he passes on to Conegliano, whence the road leads through a plain that is covered with vines, mulberries, and Indian corn, to Ceneda. Here is the range of hills seen from the studio window of the Casa Grande, an abrupt, grassy, serrated ridge, rising behind the town, one point crowned with a pilgrimage chapel. And here, too, Titian possessed property, including a villa, earned by his industry; for the inhabitants of a village close by agreed to transport stone for it, and find the manual labour, as the price of a picture for their church, also to supply him with corn and wine at a fixed price for eight years. Mr. Gilbert, of course, sought out the picture in the poor village, and found it in a "forlorn-looking little church," at the end of a long acacia-hedged lane, at the edge of a hare knoll. It is a Madonna, with two detached figures of apostles, all very much perished, and with some of the great master's work, doubtless, coarsely painted over. The view from this mountain village, looking down upon the vast plain between it and Venice, and catching glimpses of the intransigent city itself, just as glimpses of the hills are caught at Venice, is thus pictorially described by the author:—

"An expiring thunderstorm was moaning along the terraces of Alpine hills, rising into mist and blackness on the north; but, under a ragged canopy of cloud, the distant Julian Alps stood out in opal clearness, and a flood of golden light was poured over the plain, which spread boundless beneath the eye, east and west, and south, a sea of verdure, whose purple distance might have been the sea itself, as the shining campaniles, dotting it all over, might have been the sails of innumerable ships. One of the most distant due south was pointed out as that of St. Mark's. Thus arrayed in glory, and with all the advantage of vivid contrast, the prospect was one of the most captivating that can be imagined. . . . Fortunately Titian to possess a resort like this, which no Venice garden could rival in attraction, and that associated in one view almost all the elements of the highest landscape beauty. . . . Here beneath your feet the fortunes of the world have ebbed and flowed for ages. Now it was Roman armies passing to Eastern conquests; now barbarian hordes pressing westward into Italy; now German, now French invaders contending for the mastery."

Near Ceneda is Serravalle, the residence of Titian's married daughter Lavinia,—another charm that drew his feet to the spot; and the longer the stay amidst mountain influences, the more, we may be sure, his soul drank in a sense of their splendours. One of his favourite effects was a representation of ranges of low hills beneath a cloudy sky, but the peaks of the hills relieved against a sunset or twilight, just as he saw them, night after night, in this neighbourhood. His mixtures of woodland and plain, of sweeping lines of hills broken by a jutting rock, or sinking into soft vales, Mr. Gilbert also ascribes to his impressions from Ceneda. The Duke of Devonshire's picture, "St. John in the Wilderness," gives an expanse of country, with white mountain crags in the distance, which he considers is a reminiscence of Ceneda; and a picture in the Royal collection at Buckingham Palace, in which mountains, clouds, light, and rain are marvelously treated, contains, he concludes, another recollection of views from this part of his journey. At Serravalle there is another picture by the master,—a splendid specimen and in good preservation, representing the Virgin and Child in glory surrounded by Angels, who fade into a golden haze about; and on each side of this hang a picture by his contemporary Pordenone. Leaving Serravalle, which is in a mountain gorge, and protected by a turreted wall climbing the steep hills around, a gloomy Lago Morto varies the scene, a haunted place where every one who ventures upon the water is supposed to meet with certain death; and then comes a great wood, ninety miles in circuit, overhanging the road on the summit of precipices, further on, with cbamois, roehuck, wolves, and bears roaming on it, and believed to possess stalactite caves and hollows, and a great central cup-formed meadow seven miles in circuit.

This forest Mr. Gilbert penetrated, and describes very cleverly. When he had climbed and

climbed, and threaded glade after glade of beeches, and then climbed again from spur to spur, and wound in and out among the beeches, he actually arrived at the vast central meadow, then speckled with herds feeding, where on a knoll stood a building composed of church, inn, and Government office, for the management of the timber. The reason he undertook this investigation was an impression that the wood must have furnished Titian with some of the inspiration with which he treated woodland scenes. And before reaching Cadore he makes another detour to the Val di Mel, a lovely country, that had also an influence upon the landscapes of Titian. A number of sketches accompany the description, some of the scenery, and others of drawings in which it is introduced by Titian. "Other painters," says Mr. Gilbert, "had dealt in mountain shapes of delicate blue reposing in pure ether, and for clouds scattered a few woolly patches in the void above. Titian, a mountain man, and better taught, brought the vapours down among the hills, gave them involution and coherence, wrapped them round his mountain peaks, or piled them into vast competing bulks far into the sky." He regarded the great mountains as friends, not enemies, his commentator continues, looking at them, not as a Lowlander shrinking from their awfulness, but as a mountaineer welcoming their terror. At last after many detours undertaken for love of the great master, and with a view to realise the influences that worked in his mind, and see every fragment of work that he has left, Mr. Gilbert arrives at Cadore. Seen in the distance, this is a small white town on the side of a hill, with hills in every direction around it. On approaching nearer, a modern looking church and an old brown tower are leading features rising out of the white houses. In the town is a little piazza with a central fountain, where, "go when we will," says the explorer, "we shall find women washing at the fountain of 'limpid sweet water,' or sitting among piles of peaches and pears; one or two country carts, a few idlers with cigars in their mouths, several idlers without, and scores of ragged boys." On the south side of the piazza is the brown tower mentioned above, an appendage of the town-hall, in which is a large and somewhat tawdry painting representing Titian standing by a pedestal, in which are placed his palette and brushes. The house, too, in which he was born, now an osteria, is in good preservation. It is a small cottage in a lane, winding down the castle hill, and must have been the first one Titian came to after his three days' journey from Venice. The fresco he is said to have executed when only eleven years old, with the juice of flowers, is still to be seen. It is on the wall of a house Mr. Gilbert thinks must have belonged to his grandfather, which wall was once an external one, but owing to additions is now an internal one. A sketch of it is given. It represents a Madonna with the child standing on her knee, and a youth kneeling by her side in adoration. The background and drapery have suffered, but not from wanton destruction; the Cadorian in this and every other respect apparently delighting to honour their celebrated townsman, and preserve every vestige of his genius. In the strong room of the church they have preserved several letters in his handwriting relating to loans he was able to make the little community in the days of his prosperity; and in the church are specimens of his art. The groined ceiling he painted in arabesque, in a chamber in his cousin's house, has, however, been so unfortunately restored as to be no longer worth seeing. Titian's family, the Vecelli, appear to have first settled in Cadore, in 1320, in the person of Guocello, who came there in the capacity of administrator for its feudal lords, the Counts of Camino; and to have speedily risen to importance, their names figuring repeatedly in the annals. They seem to have acquired some property, for the house in which the painter was born was given to his father by his grandfather during his lifetime, and probably on the occasion of his son's marriage. Titian's elder brother, Francesco, lived in it, and carried on the timber trade of the place in it, till his death in 1560, when it became the property of the painter, then in his eighty-third year. Mr. Gilbert gives many interesting facts about Titian's household, both here and in the Casa Grande; but his chief effort consists in refuting the statement of the artist's contemporaries that he only excelled in portraits, and proving that he was not only the first painter that threw feeling into landscape, and so created a new branch of art, but that all

his inspirations were due to the magic of his mountain home. Mr. Gilbert's book is a very pleasant addition to the literature of art. No one may plume himself upon knowing all that is to be known about Titian and his masterpieces, his household in Venice, and his first home in Cadore, until he has read it.

SUB-AQUATIC TUNNELS.

THE anticipated success of a well-designed, though cheap and simple, tubular driftway under the bed of the Thames, has attracted a considerable share of public attention to the subject of subterranean, or sub-aquatic, communication. The idea of a tunnel, indeed, has been rendered so familiar to the inhabitants and to the visitors of London by the convenient service of the Metropolitan Railway, that persons who are devoid of the slightest idea of the difficulties with which the engineer has to contend, from the moment when he bids farewell to open daylight, come to speak of a tunnel as a very ordinary piece of work, and gravely discuss the feasibility of a structure of this nature, of the modest length of 30 miles, and at a level dipping some hundreds of feet beneath the bottom of the Straits of Dover.

Mr. Barlow's success, we trust, is now beyond doubt. Of the 1,320 ft. demanded for his driftway, he has already safely constructed upwards of 1,000 ft., and the tube, advancing from a shaft on the northern bank of the Thames, has been pushed beyond low-water mark on the opposite shore. In his letter published a few days since, Mr. Barlow asserts that the very moderate estimate of 16,000*l.* for the entire work will not be exceeded. Should this prove to be actually the case, there can be little doubt of further demand on the skill of so economical an engineer. But the reason for which it occurs to us that it is most important that the public should not be misinformed as to the actual risks and difficulties against which the engineer of a tunnel has to provide, is as follows.

In all normal times of engineering activity a marked and novel success, especially if it be a financial success, is apt to force a heavy aftercrop of more or less similar schemes. In these cases it too often follows that the modest anxiety and patient forethought which have led to the first triumph are altogether discarded by those who rush to follow in the same path. B was tunnelled under the Thames; therefore C and D will fight for authority to tunnel under the Mersey, and E and F to tunnel under the Channel. Talk of the latter project as wild, and its supporters will point with triumph to the little *cut* by the Tower.

Tunnelling, indeed, is not an invention of the present day nor of the present century. That great engineering people, to the influence of whose institutions we owe so much of the very framework of modern civilization, wrought tunnels which endure to the present day. Two thousand two hundred and sixty-four years ago, the miners of Furius Camillus drove the famous *Emissarium* through a part of Mount Alba, and tapped the swelling waters of the lake of that name. Etruscan science, on this occasion, directed Roman energy. But the *tufa* of Italy, a material which behaves under the pick of the miner in a mode very similar to the English chalk, is bored and drilled with shafts, and *adits*, and lofty tunnels, in all directions. The gallery of Posillipo is familiar to every visitor of Naples. The cruciform system of galleries and caverns known by the name of the Grotto of the Sibyl, dates from a remote antiquity. Whether it were from an observance of hydraulic laws, from want of a trustworthy material for pipes, or from the conviction that the steady unchecked action caused by gravitation was best suited for the permanence and purity of a water-supply, we need not now pause to inquire. But certainly a knowledge of the engineering works of ancient Italy might have taught the English predecessors of Brunel more than they ever knew about tunnelling.

The school for tunnelling in England has been, of course, underground. In our mines, especially in our coal mines, the problem of constructing subterranean galleries has long been solved. In certain districts, such, for instance, as that of the Peak, in Derbyshire, vast natural caverns open out in the living rock, glittering, when lighted up by the miner's torch, with sparkling stalactites, accessible, in places, only by narrow and low-roofed passages; and at times traversed, or occupied, by rivers, which

long barrow from the light of day. In one Derbyshire cavern a river precipitates itself down an unfathomable abyss, and what becomes of the water is unknown.

But with all our practice as to mining, and all our acquaintance with natural subterranean galleries, the progress of the tunnel engineer was slow in this country, until the exigencies of the line selected by Stephenson for the London and Birmingham Railway led to the simultaneous construction of four wide and lofty tunnels, of dimensions before rarely attempted. It is true that the method of piercing the barrier that divided valley from valley had been pointed out, no less than the main directions of the best line of communication had been indicated, by Telford. The Grand Junction Canal was the pioneer and guide of the London and Birmingham Railway. But the canal tunnels were reduced to the minimum cross section. They admitted a canal boat, with the depth of water requisite to float it, and no more. In the earlier tunnels the boats were propelled—or, we might say, coaxed through—by the barbarous and painful expedient of the boatman's lying on his back and pressing his feet alternately against the roof of the tunnel.

In the case of the Thames and Medway Canal, a tunnel of larger dimensions was cut, through the chalk, at Rochester. A narrow tow-path was formed, in this instance, by the side of the water-way. In that tunnel, of some 2,000 yards long, the chalk in some places gave way, and lofty caverns diversified the usual elliptical section of the arch, which, in only a few places, was protected by brickwork. When the Gravesend and Rochester Railway was laid through this tunnel, the Government Inspector, Lieut.-Gen. Sir C. Pasley, satisfied himself of the solidity of the chalk roof by the military expedient of firing at it from a mortar. He only used, however, wooden plugs.

The Kilsby tunnel was the scene of a most protracted, and for a long time a precarious, struggle of Robert Stephenson, with the great enemy of the tunnel miner—water. So long and so continuous was the influx, and so far were the methods at first employed from being adequate to keep it under, that the abandonment of the works was at one time all but resolved upon. A quicksand fall of water had been tapped by the tunnel, and, till this was emptied, satisfactory progress was impossible. Notwithstanding the increased command of steam and of mechanical power which the last thirty-five years have placed at the command of the engineer, the experienced man will yet even now look grave at the prospect of tunnelling through a hill that is likely to be wet, unless he can allow of the tapping of the springs, and the bleeding of the internal lake, by gravitation.

In his contest with the water at Kilsby, Robert Stephenson could indeed avail himself to some extent of the experience gained by Sir Mark Brunel and his assistants in their long struggle with the Thames. But the Thames Tunnel was unlike any other work. It was long considered, deservedly, and is still ranked by foreigners, as one of the wonders of the world. Skill, patience, energy, enough to have reared a monument of the loftiest dimensions, were buried in that horrible mine. Engineer after engineer was knocked up by labour, by damp, and by the ill effects of the deposit of the London sewage in the bed of the river. But the Thames Tunnel was a work *per se*,—a marine, or rather river, work, under most unfavourable circumstances, rather than a tunnel proper. The normal idea of the latter work is that of boring through the earth. The material may vary; props, and struts, and polling boards may be more or less constantly required; water may pour in, and necessitate constant pumping; but these are the accidents of the case (and very unpleasant accidents they are). They are not essential or constant obstacles to the boring through of a rocky or chalky barrier. Earth, or rock, is the natural bed of the ordinary tunnel. But Sir Mark drove through shifting mud. The square platform which grew together, brick by brick, as his many-partitioned shield was driven forward, was often within but a few feet of the bed of the Thames. It is even probable that, had the problem been affronted in the first instance, the engineer would rather have preferred to construct a double brick arch, working from one end, through nothing but water, than to deal with the ever-varying difficulties of mud, and silt, and clay, and whole-sale impour of the tide.

Indeed, Mr. Barlow claims for his well-considered and simple shield, the merit that it would

be so adjusted as to drive a tube ahead through water. It is far from being impossible that such a procedure should be carried out.

In the case, however, of the actual subway, the chief point to note is, that a wise provision has been exercised in fixing the level of the work so deep in the London clay that not a drop of water has entered the drift-way. That necessary for the purposes of the work has been sent down the shaft. In fact, though no engineer would have felt justified in making the experiment, there is little doubt that the simple expedient of mining through the clay at the same level, "polling" the drift-way, and following the miners by a gang of bricklayers, who should have turned a brick and a half ring round the aperture, would have met with uninterrupted success. The one thing necessary in a case where, as in this instance, no faults occurred in the clay, would have been to keep up such a rapid rate of progress that the arch should always have been keyed in before the clay began to "creep." How certain, and how formidable, that creeping action is, Mr. Stephenson had ample proof in the Primrose-hill Tunnel. Under the influence of the successful experience of the Watford Tunnel, driven for the most part through solid chalk, the originally designed invert of the Primrose-hill Tunnel was countermanded. But the clay betook itself to fill up the hole drilled through its bowels; and the invert had to be put in, in very much of a scramble, after all.

Men familiar with this description of work looked with a sort of amused surprise at the recoloured statements which from time to time appear in the public journals as to a "Channel Tunnel." They do not say that such a work is impossible. They do not even care to form a distinct opinion on that head. But they are very well contented with the applicability of the proverb, "*Le jeu ne vaut pas la chandelle.*"

A heter communication with France is no doubt both extremely desirable and perfectly feasible. Our present mode of transit, onomoxious as it is to the majority of ourselves, islanders as we are, and still more miserably and terrifically onomoxious (to judge from their countenances on deck) to most of our Continental neighbours, is hardly up to the requirements of the day. A safe, speedy, regular transit, free from donk, from risk, and, above all, free from the fear of that horrible *mal de mer*, is what the English public have the right to expect of the profession of civil engineers, and what that profession will place at the command of the public, on the one sole necessary condition of being furnished with funds. These funds must be large, for the waves of the Channel are rough and tempestuous. But to speak of the same requisite as one which would be adequate to the construction of a submarine tunnel, 30 miles long and 250 ft. (some say yards) below the level of the *Manche*, is, to our mind, nothing better than grave trifling with an important practical subject.

It is curious to see how the non-professional imagination has not only run to lower, but to seed, about this question of crossing the Channel. The most remarkable feature in the case, moreover, is, that hardly any scheme is so absurd as not to find solemn-visaged propounders and open-mouthed admirers. It is evident that the material on which Law counted as the basis of his imaginary wealth is still to be found in rich abundance within our shores. It is only necessary to dig. *Les badauds ne passeront jamais.* Neither railway kings, with their royal mode of making things pleasant, nor colossal contractors, with their lines to develop traffic; nor financial companies, with their periodical crashes; nor Brighton directors, with their eight millions laid out so as to earn an annual loss, exclusive of the perished and annihilated interest; nor Chatham and Dover magnates, with their discounts of all per cent, have had more than a temporarily enlightening influence. We are told of scientific French evidence in favour of a grand Channel tunnel. By way of making a few preliminary inquiries, the Chancellor of the Exchequer is to be asked for the trifling sum of a couple of millions on account. The French Emperor, it is added, looks favourably on the scheme, and has given a conditional promise of as much more. All right; we rejoice to hear it. We have only one point on which to insist. Let us get the French Emperor's money down *first*. Then it will be time enough to inquire about our own instalment.

It is proposed, as caution is always desirable in engineering matters, that a drift-way should just be run under the Channel in the first instance, to prepare the way for the tunnel. The sugges-

tion is at once economical, prudent, and practical. Let us suppose a drift-way to be run, timbered—or arched—or lined with iron? As the meeting from the two ends would be a thing forbidden by the calculus of probabilities, it will have to be worked from one extremity. As we get on—say beyond the twentieth mile, how will the miners be sent in to their daily work?—how supplied with air, or with materials?—how will the excavated chalk be sent back to land?

Galleries in chalk are infected, as miners are well aware, with choke-damp. What would be the quantity of choke-damp that would exude from 280,000 superficial yards of chalk surface (when the drift-way had advanced *only* twenty miles), and how would it be withdrawn?

Water infiltrates through chalk. A very small head of water will cause infiltration for a considerable distance. Where hands of flint occur they act like layers of sponge. All the wells in Strood, within a considerable distance of the Thames and Medway Canal, were rendered salt by infiltration through the chalk, when the brackish water of the Medway was admitted into the canal; and the company had to pay, and did pay, heavy damages in consequence. What would be the infiltration through the grey chalk due to the pressure of the water of the Channel? What would be the difference between the exudation from the 280,000 yards of surface at high tide and at low tide? How would the water, on the most modest estimate of its rate of infiltration (which, by the bye, would increase *de die in diem*), be removed? A few of these practical questions must be answered before we can undertake to speak, with any idea of serious investigation, as to the prospects of the Channel Tunnel.

But we are not limited to one scheme. Their name is legion. One amateur proposes the formation of an embankment across the Channel, the top to be some 30 ft. below low-water mark. Rails are to be laid on this embankment (which is kept down for the benefit of navigation), and long-legged carriages, of novel structure, are to run backwards and forwards over the submarine railway. We should like to let the laying of the permanent way to the projector.

Another gentleman proposes a floating tubular tunnel. It is to be moored at certain distances by chains. The process of anchoring and straining the chains at the bottom of the Channel would be highly interesting. Supposing—not to make two bites of a cherry—the tube complete, moored, and at work. What a grand idea to think that the whole service of the Continent, and the lives of all who happened to be at any time in a structure that recalls the legend of Mahomed's coffin, would be at the mercy of a heggary gun-boat, or a mischievous torpedo!

In fact, we warn our friends, when called on for subscriptions for a Channel bridge, or tunnel, or hybrid between the two, to button up their pockets, and wait. The limits of the service of the engineer are, no doubt, rather financial than physical. The limits of speculative imagination appear to be equally removed from the barriers of prudence and from those of experience.

Returning for a moment to the Tower subway, we would mention that the work has been carried forward by the advance of a tubular wrought-iron shield, about 8 ft. in diameter, which is so constructed as to form a close head in case of need. As this shield is pushed forward by screws, the excavators opening out the ground for a few feet in advance, the permanent tube of the subway is fitted into place behind it, being cast in 18-in. lengths, each consisting of four segments; three of which are of equal size, and the fourth is a mere key-plate, 14 in. or 15 in. wide. Length by length these narrow plates are bolted on the face of the tube, being protected, until firmly fixed, by the shield. The introduction of the narrow wedge-piece has proved a great facility in fitting together the segments of the tube.

The internal diameter of the completed tube is 7 ft. A narrow railway will be laid throughout, and the passengers, being lowered down the shaft by a vertical hoist, will be carried through the subway in an omnibus specially constructed for the purpose, propelled partly by gravity and partly by haulage by a stationary engine. A curious feature in the actual construction of the tunnel is the filling up of the small space, excavated outside of the tube, with blue lias grout. A hole is left in each plate, and through this the grout is driven by a large syringe until the aperture is completely full. The mixture dries so rapidly that it is unnecessary to plug up

the holes on the removal of the nozzle of the squirt. How far that irresistible oxidation of the iron (by absorption from the grout), of which we have recently seen such a striking instance in the tomb of King Henry VII., will proceed, remains to be seen. It seems almost a penny-wise-and-pound-foolish proceeding not to have enamelled, galvanised, or otherwise protected, the inaccessible exterior of the tube from a very formidable danger which there is no means of detecting until it is too late. Mechanically considered, the injection of the grout is admirable. Chemically regarded, we fear that the same cannot be said.

We avail ourselves of the opportunity to call the attention of all managers of tunnels, mines, and similar works, to the immense facility afforded to the work by the use of the electric telegraph. A constant and instantaneous communication is kept up by the wires between the engine-driver and the face of the work. Lowering and raising of materials, and admission of air by the fan blast, are thus precisely directed by the foreman on the work itself. The sense of confidence that would be inspired in any case of danger by the possession of this mode of communication would be beyond all price.

NOTES UPON SOME OF THE DUTCH TOWNS.

ENGLISH travellers passing from Rotterdam to Belgium or Northern Germany generally perform the journey as rapidly as possible, and scarcely ever think of stopping for a single hour on the way. In fact, most people imagine that there is little to be seen, and that the sooner this long and monotonous day's travelling is over the better. Even those who delight in antiquity and are interested in archaeology usually content themselves with the idea that the flat plains of Holland contain nothing to interest them, and that the best thing to be done is to get on as quickly as possible to Bruges or Cologne. Now we do not for a moment mean to imply that the architecture of Holland is so fine as that of Belgium or Northern Germany, or that the Medieval buildings existing there are so grand or in such a perfect condition as those in the two last-named countries; yet we think that the student of architecture would find a few days well spent in examining some of the ancient towns between Rotterdam and the German frontier. We will point out a few places at which we think those who take an interest in Medieval art might find things to interest them.

The third station from Rotterdam is Gouda. The principal church here is well worthy of a visit. It was commenced in the year 1155, but was nearly rebuilt after the fire, which took place in the year 1552. The dimensions of this church are extraordinary; its length is over 300 ft., and the height to the top of the wooden barrel vaulting of the nave is over 140 ft. The architecture is, of course, very poor, but what is most worthy of notice is the wonderful amount of stained glass which this church contains. There are nearly sixty windows entirely filled with stained glass, varying in date from 1553 to 1603. The earlier windows contain religious subjects, but those which date after the year 1572-9 (at which period the Protestant religion became established in this part of Holland) are filled with allegorical subjects, and are inferior, both in design and execution, to the earlier windows. Of course, the style of all these windows is Renaissance, and many of them were the works of the brothers Crabeth. It is worthy of note that one of these windows was given by Queen Mary of England, and contains a very good portrait of that queen and her husband.

After again travelling for about two hours by the railway, one's attention is attracted by a tower of noble elevation and a lofty detached choir, the whole surrounded with a belt of fine trees, with here and there an old church tower-crooping up. This is Utrecht, one of the proudest of the prime of all Holland, and one of the most important bishoprics in all Europe; at later times celebrated for the "Synod," which decided the established religion of Holland, and even now an important and flourishing town, with 60,000 inhabitants.

Utrecht contains three cathedrals and twenty-three churches. Of the cathedrals, one belongs to the Calvinists, one to the Roman Catholics, and one to the Jansenists. Of the churches, ten belong to the Calvinists, seven to the Roman Catholics, four to the Jansenists, one to the

Lutherans, and one to the Remonstrants, or Arminians.

The cathedral (Calvinist) is the relic of what was once a most glorious church. All that now remains are the choir and aisles, transepts, and the great western tower. The nave and aisles were allowed to fall into disuse, and after many years of neglect, were destroyed by a thunderstorm at the end of the seventeenth century. When perfect, this church was over 400 ft. in length, and was probably the largest church in the "Low Countries." The great western tower is 70 ft. square at the base, and rises to the height of 350 ft. For two-thirds of the height it is of brick, and very plain, but the upper portion consists of a beautiful open lantern octagon on plan, and entirely of stone. In each face of this lantern is a large unglazed three-light window. This lantern is crowned with a pyramidal slate cap; it probably originally terminated with an open-work stone spire. This tower was erected between the years 1321 and 1352. The space originally occupied by the vast nave and aisles is now an unenclosed square. The transepts are of great size and magnificence, with large windows at the ends. Both the transepts and choir bear a strong resemblance to Cologne. The height to the vaulting of the choir is rather over 100 ft. The great apse is surrounded by seven apsidal chapels. The choir was erected between the years 1298 and 1329. The transepts are probably 40 or 50 years later, the detail of every portion of the building is rich, but not overdone with ornament; the tracery of the windows is remarkably elegant. The interior of this superb church has been frightfully ill-treated; the only portions now used are the transepts, and they are formed into a conventicle, which bears a stronger resemblance to a lecture theatre than a Christian place of worship. This portion of the building is divided off from the choir by a wooden "hoarding" nearly 60 ft. high. The choir itself is entirely bare and empty; but even with these disadvantages its noble arches and graceful columns at once attract observation. The vaulting is simple but very good, and the row of chapels surrounding the apse have a most charming effect even in their present neglected and degraded condition. A fine fifteenth-century monument of black marble is pointed out as the tomb of St. Boniface, but there is not the least reason for this supposition. There is also a good Cinquecento monument to Bishop Egmout, who died in 1549. On the south side are the remains of the cloisters. They are very rich, and rather wild late Geometric work. Some feeble attempts at restoration have been made outside the choir of this cathedral, but they are not to be commended, and have done rather more harm than good.

The churches of St. Peter and St. Gertrude contain crypts and other remains of the Romanesque period, but so spoiled by the barbarous treatment of the last three hundred years, that they are of little value to archaeologists. St. James, St. John, and St. Nicholas and St. Mary, have been large and striking fifteenth-century churches built of brick; but they have been denuded of every kind of ornament which they once possessed; even the tracery of the windows and the capitals of the columns have been cut away as savouring of "idolatry" and "superstition." The interiors of these churches are covered with whitewash. In startling contrast to these is the Church of St. Catherine, formerly belonging to the Carmelites, but now the Roman Catholic metropolitan cathedral. This church was erected in the fourteenth century, and is a fine building, consisting of a nave and aisles, of five bays, transepts, and a very spacious choir without aisles. Over the junction of the nave and transepts is a *flèche* of metal-work. The whole church is vaulted in stone, and is lofty and well proportioned. It has lately undergone a very judicious and costly restoration, and, what strikes one as most remarkable in Holland, is the fact that every portion of the interior is decorated with colour and gilding, but the whole has been so skillfully done that the effect, though brilliant, is not gaudy. The walls and columns are painted of a parchment tint and have "masonry patterns" traced upon them in dark red lines. Half-way up the nave columns, which are cylindrical, is a kind of conventional arcade or band of flat niches. These are at present left white, but will, we suppose, be eventually filled with subjects or single figures. The spandrels of the nave arches have large angles, with their wings extended, holding emblems, &c. The chancel is simply and quietly treated, and the

vaulting is pale blue, with very rich borders and powderings. All the windows of the nave are glazed with mosaic patterns in pale colours. The choir stalls and sedilia are most elaborately carved in oak, and are of remarkably good design. The same may also be said of the bishop's throne and the pulpit: the latter has a canopy reaching to the roof of the church. The side altars, though not bad, are not so satisfactory. The high altar is temporary, as is also the glazing of the choir windows. We were unable to find out who was the architect to this very remarkable work of restoration, but from the care and knowledge displayed, we think we cannot be wrong in attributing it to Mr. Cuypers. It is proposed to add a new west front, flanked with towers, surmounted with spires, to this church. The foundations for this work have been laid some time since. One of our illustrations represents the panelling of the west door.* The great singularity is that the framing of the door is external. Although this is by no means uncommon in Italy, it is hardly ever to be met with north of the Alps in Medieval work.

The other churches in Utrecht possess nothing remarkable or worthy of notice. There are several good examples of ancient domestic architecture, particularly one large house near the cathedral, and a building now used as a charity school.

Arnhem possesses two fine churches. The great Calvinist church is an immense building, chiefly of brick, with a lofty square tower at the west end, a spacious nave and aisles, transepts, choir, and aisles, and an apse with the aisle continued round it. The south porch is a good specimen of late fourteenth-century work, with some good canopy work. The choir is cut off from the nave by a metal screen, and is disused. The whole church is vaulted apparently in wood, but every portion of the interior is covered so thickly with whitewash that it is difficult to say for certain what is the material used in any part of the building.

The church of St. Walburg (Roman Catholic) is rather a remarkable building. The west front, flanked by two square towers crowned with slate spires, is exceedingly plain Romanesque work. There is a short nave of three bays, transepts, and a chancel of three bays, with an apse. The whole of this portion of the church is good, but plain fourteenth-century work. The whole church is vaulted in stone. The interior is fitted with modern Gothic altars of poor design, and the pulpit which formed such a conspicuous object in the Dutch court of the Great Exhibition of 1851 is to be seen here. It is from a design by Mr. Cuypers, but very inferior to his later works. Some of the windows are being filled with stained glass. A large Roman Catholic church has just been built near the railway station. The exterior is unsatisfactory, and the spire is what we should call "Brunnagem," the interior is rather striking. The whole church is vaulted in stone, and the walls are lined with the same material. All the windows are of stained glass. The church is, in fact, rather a costly than a successful example of Modern Gothic architecture.

Our space will not allow us to enter into any account of Zutphen or Nimegueu, though both these places are well worthy of a visit.

The other example of panelling given in our illustration is from the door of an old house at Münster, in Westphalia. It is highly probable that this kind of door, with the framing external, was not uncommon in Holland and Westphalia during the Middle Ages; very few examples, however, are to be met with. From the fact that this sort of door is found in Lombardy, and not in either Belgium, France, or South Germany, it is most probable that the Dutch took the idea from the Lombards, who probably borrowed it from the East.

Competition in the English and Belgian Iron Trades.—Recently, some iron girders, rolled and riveted, were required in the construction of a mansion between Leeds and Bradford, and tenders as to the price at which they could be furnished, in accordance with a specification, were sought from a number of ironfounders in both England and Belgium. The highest tender received was from a Bradford ironfounder, and was 120*l.* and the lowest, which included the delivery of the girders on the spot, was from a Belgian ironfounder, and was 63*l.* The latter was accepted.

THE SEWAGE QUESTION.

Consideration of the Subject by the British Association.—At the late meeting of the British Association, at Exeter, the subject of town refuse was in several ways brought prominently forward; and in the chemical and mechanical sections the various methods of dealing with sewage refuse were so fully discussed that it is evident this subject is now felt by the Association, especially one of the most urgent importance, especially in reference to the well-being of town populations. At the previous meeting, Mr. Grantham had moved for the appointment of a committee to inquire into the treatment and purification of sewage, and the preliminary report of this committee was brought forward in the chemical section by Dr. Paul. A series of questions had been sent to the various local sewer authorities throughout the kingdom, and replies had already been received from upwards of 100 towns, most of which have adopted the water-carriage system, either wholly or partially. A few of these towns are not sewered at all; in many the sewerage appears to be only partial, and frequently it is very defective. In fifteen cases where the water-carriage system has been adopted the sewage is applied as manure in irrigating land. The results obtained in those cases vary considerably according to local condition, so far as relates to the expenditure and return; but in most instances, while the application of sewage for irrigation is said to have been attended with marked improvement in the state of the neighbouring rivers and watercourses, there does not appear to be any evidence of prejudicial effects from the irrigation on the sanitary condition of the localities. In regard to the treatment of town sewage with the twofold object of preventing pollution of rivers, and of extracting from it material of value as manure, it appears that, so far as the committee has been informed, the various plans tried for the purpose have been only partially successful. Mechanically suspended material is generally separated both by filtration and by those methods which comprise the use of some precipitating agent; in the latter case there is sometimes also a partial extraction of the substance held in solution; but this is always so partial by any method yet tried, that the effluent water still retains much of the organic substance that chiefly causes the pollution of rivers, and much of the materials that are of value as manure. The results said to have been obtained in this way are generally described as satisfactory, so far as the appearance of the river is concerned. It would appear, as regards liquid town sewage, that the only course to be adopted at those places where the water-carriage system of removing town refuse is established, is the application of the sewage to land by irrigation. For the settlement of the mode in which that is to be effected, a number of questions require to be considered as to the influence of local conditions in regard to the cost and possible return. As yet the committee has not sufficient information to report on this subject, and it will be the object of their future labours to collect the information. The report says as to—

"Treatment of Liquid Sewage."

At fifteen of the places which are sewered wholly or partially, the liquid sewage is subjected to treatment either by allowing it to remain for a time in settling tanks from which the deposit is occasionally removed, as at Burton-on-Trent, Birmingham, Epsom, Farham, and Andover, or by filtering, as at Uxbridge and Baling.

In eight instances deodorising materials are added, such as lime and carbolic acid, as at Carlisle and Harrow. Lime alone is used at Leicester; lime and chloride of lime at Luton; perchloride of iron at Cheltenham; perchloride of iron and lime at Northampton; ferruginous chloride with sulphuric acid at Stroud; and at Leamington the lime treatment has lately been superseded by the method proposed by Messrs. Sillar & Wigney.

By this treatment the sewage is clarified, and a deposit is separated, which is sold as manure.

In regard to the effects thus produced, it is stated that at Leicester the sewage runs off as pure as ordinary rain water; at Baling it is said to be free from smell, colourless, and harmless to vegetable or animal life; at Stroud and Luton the effect is stated to be satisfactory; at Harrow the nuisance is said to be somewhat mitigated; and at Aberystwyth the stench is said to be abated by this treatment of the sewage.

At Bury St. Edmund's, upward filtration through charcoal and gypsum has been abandoned in favour of costly irrigation. At Banbury, treatment of the sewage has failed. At Hereford, where it was proposed to be adopted in the parliamentary places, it has not been tried, on the score of expense. At Tunbridge it is about to be tried; and at Hastings and Cambridge experiments are being made.

The cost of treatment amounts, at Leicester, for a population of 7,500, to 300*l.*, and the cost of the plant for the purpose was 3,000*l.* At Luton, with a population of 18,000, the annual cost is 500*l.*; at Cheltenham, with a population of 34,000, it is 350*l.*; at Uxbridge, with 7,000 population, it is 200*l.*; and at Alton, with 3,300 population, it is 45*l.*

* See p. 746.

The solid deposit obtained by treating liquid sewage is sold at prices varying from 6d. to 2s. 6d. per ton. At Leicester as much as 5,000 tons are produced. At Luton the deposit is mixed with night-soil, at Banbury with street-sweepings, and at Stratford it is made the basis of a manure that is sold at 7l. 10s. per ton."

The committee sought to obtain information from foreign countries as to the practices adopted there; and, through the liberal assistance of the Home Secretary, Mr. Bruce, a number of official reports had been obtained from various foreign Governments. From these documents it appeared that, as a rule, the use of waterclosets is but rare, both on the Continent and in America. The complete sewerage of towns as a means of removing excreta refuse is even still more unfrequent. The general practice is to use either the old form of privy and pit, or some improved modification of it. In some towns, still more objectionable methods are adopted—as, for instance, in Berlin, with a population of about 600,000, where 50,000 night-stools are said to be in daily use. Hamburg is the only town on the Continent where the water-carriage system is carried out to any great extent. At other places portable reservoirs are used, and these are periodically removed and emptied outside the town. At some places the householders pay for the removal of the refuse; at others, they sell it to neighbouring farmers. Where the town authorities carry out the plans for disposing of town refuse, a profit is sometimes derived from the sale of it. At Groningen, for instance, the yearly profit amounts to 1,600l.; at Antwerp, to 2,700l.; and at Ostend, to 700l. At other places the return only just covers the cost of removal, and at some places the expenditure is much greater than the return, as in the case of Stockholm, where the difference amounts to more than 2,000l. a year.

Mr. Stanford read a paper in the Chemical Section, in which he endeavoured to show that the water-carriage system as at present carried out could not be regarded as perfect. He strongly advocated a particular form of dry-closet system, in which the use of earth, as in Monie's closets, was superseded by the [certainly impracticably expensive] use of ocherous, so as to produce a mixture that could either be used as manure, or charred so as to yield a fresh supply of charcoal for future use. The earth system for towns is infeasible enough, but this improvement on that system would be far worse.

In the Mechanical Section a paper was read by Mr. Barry, advocating the treatment of liquid town sewage with some precipitating material, as practised at Leamington, and opposing the use of sewage for irrigation, on the grounds of expense and detriment to the public health. A long discussion took place, in which the facts already mentioned were referred to by the several speakers; and the president, Admiral Belcher, somewhat surprised the meeting by the statement that he was the originator of the Thames Sewage Scheme, by which the outlet should be extended through Essex, and the sewage delivered by the river Crouch into the German Ocean. The interest excited by this subject was still further evinced by the re-appointment of Mr. Grantham's committee, together with the addition of Mr. W. Hope, of Barking, and by the grant of 50l. for the prosecution of the inquiry.

Sewage Irrigation at Banbury.—The sewage of Banbury formerly polluted the Cherwell, but certain parties complained of the nuisance, and a decree of the Vice-Chancellor ordered its discontinuance. The Board of Health subsequently rented a farm of 137 acres, about a mile from the town, on the Northampton side of the Cherwell, over which they have since continued to pump the liquid, the quantity being 300,000 gallons in the twenty-four hours, which is the refuse of 11,000 inhabitants. The solid matter is detained in tanks, mixed with the sweepings of the streets, and with ashes, and disposed of to canal boatmen, who sell it to the farmers. The rent of the farm is 616l. 10s. Thirty-five acres were laid down with Italian rye-grass, which is now in its third year. During 1868 the sales of produce realised upwards of 1,300l. Up to the present time for this year the amount received has been 912l. 15s. 10d. This sum includes successive cuttings of rye-grass, mowing grass, laternath, and cabbages. There is now growing on this sewage farm a crop of mangolds (16 acres), the like of which is rarely to be met with. A great many of the roots are 24 in. in circumference, and it is impossible to guess what size they will attain before the end of the season. Good experience, *pro* and *con*, is being gained with other crops; and the irrigation scheme at Banbury

has, so far, proved a success. The liquid, after passing over the land, enters the Cherwell some distance below the town. No nuisance is complained of, and fish may be seen sporting in the river close to the outfall of the effluent water from the farm. It is calculated that the receipts from the farm this year will exceed those of last year.

The Bradford Sewage.—Mr. Angus Holden, son of Mr. Isaac Holden, late M.P. for Knareborough, has been endeavouring to establish the practicability of purifying the dark and feculent streams of Bradford, and of utilizing the matter removed from it for a beneficial end. A piece of ground in the immediate proximity of the main outfall of the sewerage of the corporation having been placed by that body at the service of Mr. Holden, he has erected his works there. The experiment is watched with deep interest by neighbouring corporations, and particularly by those of Bradford and Halifax, both of which have already been involved in litigation, the first on account of the alleged pollution of the Aire, and the second for fouling the waters of the Hefle. The results are said to be so far as a week or two's proceedings can show, quite satisfactory. The process used is described as being a combined chemical and mechanical process, of French invention, whereby the sewage water is deprived of its impure and fœtid matter, which is retained for some useful purpose, while the apparently pure water from which it has been removed is sent forward on its natural course. The Bradford corporation is under legal obligation to deal with the question practically before the 11th of January, 1872.

The Liverpool Sewage Utilisation Company.—This company, in which the Liverpool Corporation are largely interested as shareholders, have just commenced operations on the first portion of their works, which have been constructed between Sandhills (at the north end of the town) and Ince Blundell. The company themselves have taken about fifty acres of land at Ince Blundell for the purpose of making experiments and testing the merits of the project. It has already been ascertained that the engine at Sandhills is sufficiently powerful to admit of the sewage being pumped up from the well at the station, passed through the pipes, and distributed over the land at Ince Blundell within from twenty minutes to half an hour. Branch pipes have been laid down to a farm at Ince Blundell, and they are also about to be laid down upon other farms in the neighbourhood.

The Sewage Question at Leamington.—Sewage deodorisation at Leamington has recently entered on a new phase, and the patent process adopted for the dejection of the sewage and the conversion of the solid residuum into "native guano" has already attracted the attention of the governing bodies of many towns. The Leamington sewage works are situated on the western side of the town, close to the viaducts by which the London and North-Western Railway crosses the Leam, and about half a mile from the Avenue Station. The works, which were originally constructed for the lime system of deodorisation were, early in April last, transferred from the Leamington Local Board to the "Native Guano Company," which has been formed to work the A. B. C. process, patented by Messrs. Sillar & Wigner, of London. The rainfall is only partially separated from the sewage by surface drains. The effluent water is said to be perfectly free from smell when discharged into the river, even when the works are seen under unfavourable circumstances; but some samples, on being kept in a closely stoppered bottle, according to the *Mark Lane Express*, have a smell which is strongly suggestive of the nature of the source from which the water has been obtained. On the other hand, other samples, under precisely similar circumstances, were perfectly bright, and free from even the slightest smell.

The Castle Caverns, Guildford.—The Castle caverns are still closed. The *Surrey Standard* thinks it is a little strange that a party of archaeologists who took the train at Guildford the other day in quest of objects of interest in the neighbourhood, neither halted at Rack's Close, nor, during the day, in their papers or speeches, made the slightest allusion to the excavations. It would be satisfactory, doubtless, adds our contemporary, to know the date of the formation of the caverns: that they are distinct from the castle, and that they had an origin independent of it, is pretty certain.

ARCHÆOLOGICAL EXCURSIONS.

The Somerset Archaeological Society.—This society held its annual meeting this year at the ancient little town of Axbridge, making excursions to the villages and various objects of interest in the neighbourhood. The country comprised within this year's programme is one of the most beautiful districts of Somersetshire, and offers a wide field of research to the archaeologist. The programme this season was of the usual character, comprising a museum, the reading of papers with discussion, and excursions. The general meeting was held in the town-hall, the president for the year, Mr. W. Long, in the chair. The Rev. W. A. Jones, the hon. sec., read the report; and, after some official business, the president read an able address, on the meetings of the society; the Mendip country and the explorations therein, the traces of prehistoric man; megalithic remains; and the traces of Roman occupation; and suggested further explorations. While treating of megalithic remains, he spoke of the stone circles and avenues, as well as barrows:—

"With respect to the stone circles and avenues at Stanton Drew (he said), I would merely submit to your consideration, whether we may not reasonably assign their origin to Phœnician influence reaching these shores through the energetic maritime people, the Veneti, who extended a portion of the coasts of Armerica (Gaul) were still carrying on a brisk trade with Britain in the time of Cæsar; and in whose district were the remarkable stone structures of Kennec and its neighbourhood. The traces of the Belgic occupation of this district are to be seen in the camps, barrows, circles, hut circles, trackways, and cattle enclosures which abound on the Mendip and neighbouring hills. Their extreme western boundary, the Wansdyke, may be very distinctly seen in many places between the Bathampton Camp above Bath, and Meesknoll above Keynsham, but from this point, in its supposed course either to Porchester or to the Clifton Camp, Mr. Scarth and I have sought for it in vain. It is probable that, although the use of bronze, both in the East and on the continent of Europe had prevailed for a considerable previous period, the Belgic race was the first which introduced the bronze age into Britain. Even in the time of Cæsar, bronze was an imported article ("Ere utantur importato," B. G., v. 12); and it is not likely that the Phœnicians, if they found it to their advantage to have settlements on these coasts, would allow the native population to possess any weapons of a more formidable character than their sling stones and arrow-heads of flint. Of the Belgic race, which drove westward, and reduced to slavery, the previous and long-headed occupants of this district, Dr. Thurnam, the great authority on the craniology of our early British races, says, "The brachycephalous people or roundheads, who buried in the round barrows were more civilised than the dolicocephal (or long-headed race); and may be inferred to have brought with them the more common use of iron knowledge of bronze. The exploration of their tombs, shows that hurrying the dead was with them the prevailing and fashionable, though not the exclusive, mode of burial; and the appearances are consistent with what we are told of the Gauls of the Gauls (their supposed conquerors) by Cæsar and Pomponius Mela. From the same source, or the appearance in the tombs, we should infer that they had advanced from the nomadic, hunting, and pastoral condition, to a more settled agricultural stage of culture; and that if they had not altogether abandoned the more barbarous customs of their ancestors, and in particular that of human sacrifices (which all history tells us, was at one time, everywhere prevalent) they had at least restricted them within narrow limits." These British brachycephaly of the bronze period," Dr. Thurnam adds, "are to be regarded as descended through the Belgic Gauls, from the great brachycephalous stock of central and north-eastern Europe and Asia, in all the countries of which,—France, Switzerland, south Germany, Bohemia, Poland, Russia, and England,—the broad and short cranial type is still the prevailing one." (Paper on the ancient British Barrows of Wiltshire and the adjoining counties, read at the opening of the Blackmore Museum, September, 1867.)

The Barrows upon the Mendip range, and which may be seen in clusters near Meebury Castle at Priddy, near the Castle of Comfort Inn, and on Blackdown, are not nearly so numerous or of such varied form, as those which are to be found on the Wiltshire downs around Abury and Stonehenge. They were the burial places of the more distinguished occupants of these hill tops during this Belgic period. The greater number of them were opened about fifty years ago by the Rev. John Skinner, rector of Comerton, near Bath. His manuscript account of their examination is in the Library of the Bath Literary Institution, but it has been printed in *extenso* by the Rev. Mr. Scarth in the 16th volume of the Proceedings of the Archaeological Institute. The interments were all in circles of the Belgic or bronze period, cremation having been practised in every case; and the few articles discovered with the burnt ashes consisted of bronze spear-heads, some amber beads, and some coarse clay cups. There appears to have been a considerable Belgic mining settlement at Charterhouse, which, from the articles discovered in it, must have been subsequently occupied by the British, who here worked the mines for their Roman master.

I take this opportunity of commending to the attention of Somerset archaeologists a remarkable and extensive collection of hut circles, which seems to have been hitherto unnoticed by them. It is on the slope of the northern harrier of Cleve Combe. Some of these circles are in the wood on the crest of the Combe, but the greater number are in the open space adjoining. In some instances the stone which has been dug out in forming them has been used on the surface to wall them round, so as to provide the occupants with a better protection against the weather than their walled covering could afford. One cannot traverse this ground without wishing to examine some of these circles with pick and shovel."

After the address was delivered and thanks voted for it, the Rev. W. Hunt, of Conglesbury, read a paper on the Monuments of the Borough

of Uxbridge, and Mr. C. Pooley one on the Remains of an Old Cross found at West Harptree. In the afternoon the members visited the parish churches of Axbridge, Cheddar, and Rodney Stoke. At a *conversazione* in the evening, papers were also read, and on the following two days excursions were made to various places of interest in the district.

The Wiltshire Archaeological and Natural History Society.—The sixteenth annual meeting of this Society commenced at the New Hall, Chippenham. The president (Sir J. Awdry) occupied the chair, supported by a numerous body of the leading families of Chippenham and neighbourhood. The secretary (the Rev. A. C. Smith) read the report, and after the appointment of officers for the ensuing year, Sir J. Awdry delivered the inaugural address, in which he said that any one who read the first chapter of Genesis must be of opinion—be he Darwinian or not—that creation was a progressive thing, and that Scripture and geology both told them that man was the final work of his Creator. Whatever were found among the pyramids of Egypt, or in the rubbish heaps on the Danish coast, were historical chronicles, if they were anything, that man existed there. He combated the idea that it was impossible to believe anything except there was a contemporary narrative. They, on the other hand, possessed trustworthy monuments, arising, as it were, out of the swamps of the ocean, to confirm them in what many persons believed to be only a supposition. Such things were as historical as they could possibly be, but still it behoved them to be careful. The business of the meeting, he said, would include a paper on the pit dwellings near Salisbury. In the Blackmore Museum were a large number of curiosities obtained from the Wiltshire clay. Wiltshire possessed Stonehenge, which was so vast a work that it excited the admiration of all who viewed it, and he asked whether those things were not historical in regard to the works of man. After alluding to the geographical position of Wiltshire, the president particularly noticed the church at Bradford, and the many conflicting opinions concerning the building. He said it was evidently a piece of workmanship prior to the arrival of the Romans, while some persons put it down as a work coinciding with that of the eighth century. The Rev. Canon Jackson read a paper, announced as "A few Odds and Ends about the Town and Neighbourhood of Chippenham." The Rev. J. J. Daniel followed with a long paper on the town of Chippenham, during the great rebellion. At the conclusion of the meeting, the Rev. Mr. Barnwell drew attention to the church at Bradford, of which we have before now spoken, and suggested that the society should take the initiative and assist in preserving such an ancient edifice. He said the building had been visited by various architects, all of whom were unable to fix any date to the church. After inspecting the church the members met at the Angel Hotel, and dined together under the presidency of Sir John Awdry. At half-past seven a *conversazione* took place in the school-room, when papers were read by Mr. C. H. Talbot on "The Existing Structure of Lacock Abbey," Mr. W. Cunningham, on "Iron Ore and Iron Working," and Mr. Goldney, M.P., on "Corsham." A temporary museum was opened in the room at the new hall, the articles for exhibition being lent by the members and friends of the Association. Next day the proceedings commenced by the party assembling at the New Hall, Chippenham, whence they proceeded on a visit to Lacock Abbey, where the company inspected the antiquities of the Abbey Church, &c., and then started for Corsham Court. From Corsham they returned, about 50 or 60 in number, to Castle Combe, where they were entertained at luncheon, provided by Mr. Lowndes. The church was visited; and then the whole party climbed the steep hills with which Castle Combe is environed, and drove on to Grittleton. Here Sir John Neeld entertained them with tea and coffee, and other refreshments; and then the pictures and statues and other works of art were examined by the large number of visitors who spread themselves over the suites of rooms and galleries. The gardens, and of course the church, were visited; and then the archaeologists drove back through Kingston St. Michael to Chippenham, where the meeting was announced to commence at 8 p.m.; and arrangements had been made for the delivery of a paper by Mr. E. T. Stevens, on the "Ancient Pit Dwellings in Salisbury;" a paper by the Rev. E. C. Awdry, on "Monumental

Brasses in some of the Churches near Chippenham;" a paper by the Rev. W. H. Jones, F.S.A., on "Some Names of English Occupiers in the time of Edward the Confessor, still preserved in those of Wiltshire Persons or Places;" a paper by Mr. H. A. Merewether, on "The Head Gear of the Ancients." Next day (Thursday), the excursion took the following route, viz.: Chippenham, by Langley Buller Church to Draycot, by Sutton Bengier and Christian Malford to Clack, Bradenstoke Abbey (where the Society were invited to luncheon by Mr. Goldney), by Foxham, Cadnam Manor House, and the Tythertons, to Chippenham.

NEW BOROUGH LUNATIC ASYLUM, IPSWICH.

This new establishment, though not finished, has assumed its outward form. The site is at Felixstow, and consists of two fields and a plantation, forming part of the Rose Hill farm, lying between the Foxall and Felixstow roads, and containing rather more than fifty acres. The situation is high and healthy, and the distance from the town convenient. The committee appointed the town surveyor, Mr. W. P. Ribbans, as the architect.

Mr. Ribbans accepted an offer of the Commissioners in Lunacy to allow him to examine plans they had approved of other asylums which had recently been erected, but he was informed that the Commissioners did not consider they had yet got an asylum which could be put forward as a model; and Mr. Ribbans, it is said, did not find the plans he saw of any great use to him. He prepared plans of a building calculated to accommodate about 130 patients, and these were sent to the Lunacy Commissioners for their approval. The Commissioners suggested some alterations, the principal being in the arrangement of the infirmary, which the architect had proposed to build two stories high, whilst the Commissioners suggested that it should be enlarged, and should be entirely on the ground floor. These alterations were made, increasing the estimate of the cost from 13,500l. to 16,500l. The altered plans were approved by the Commissioners, and tenders advertised for, the result being that that of Mr. Edward Gibbons, in 18,950l., was accepted at the end of April, 1868. Mr. E. Catchpole was appointed clerk of the works, he having acted in a similar capacity during the erection of the town-hall, and the work was at once commenced, and has now so far progressed as to be externally nearly completed, though it will be several months (the contract gives till next June) before the building will be entirely out of the contractor's hands.

The entrance to the asylum is from the Foxhall-road, from which the building is recessed about 120 yards, but the principal front is that which faces to the south, and is seen from the recessed and the Felixstow-road. The asylum, says the *Suffolk Chronicle*, in describing it, is a larger building than we should have thought would have been required; and from the nature of the arrangement of the asylum proper—a three-storied building, the main part only one room in width—it appears even larger than it really is. The length of the south front is 395 ft. of the high building, and then on either side is a low one-storied building—the infirmaries—extending 64 ft. further, so that the total length of the building is 526 ft. The material used in its construction is red brick, with white brick dressings, and here and there—as at the main entrance, and the bow-windows on either side—further relief is given by white stone; the roofs are slated, and the sky-line of the centre block is broken by an iron cresting. The centre of the south front is formed by the dining-hall and the chapel above it. These rooms are lighted by larger windows than the dormitories and corridors on either side; and the dormitories beyond the general line of front; they project beyond, and at each end of the high part of the building the day-rooms—large, bright, and pleasant rooms, built in the form of bays—are brought forward; and above these the towers, containing the ventilating-shafts, upon which a judicious amount of ornament has been bestowed, are seen. The windows in the first two floors have semicircular heads of white brick, and in the upper floor elliptical.

The arrangements, dimensions of the rooms, &c., are exactly similar on each side of the house. On the ground floor a corridor, 12 ft. wide, runs the whole length of the wing; it is lighted by windows looking southward, and from

it open nine rooms, each intended for a patient, and each 7 ft. 2 in. by 9 ft., besides attendants' rooms of rather larger dimensions, one of which is at the end of the corridor and next a dormitory, 18 ft. by 22 ft., in which several patients will sleep. Opposite the dormitory is the day-room of the patients located on this floor, 32 ft. by 20 ft., a light, cheerful room, with a southern aspect. The corridors will be used by the patients in the day-time as well as the day-rooms. Beyond the day-room on the ground floor is the infirmary, with a similar corridor with three single bedrooms, 11 ft. by 9 ft., and a dormitory, as well as a day-room somewhat smaller than that for ordinary patients.

The first floor is exactly similar in its arrangements to the ground floor, except that it ends with a day-room, the infirmary being only one story high. A few more steps lead to the chapel, a noble room of the same length and breadth as the dining-room, over which it is, and 2 ft. higher, lighted by seven windows, from which there is an extensive view.

Care has been taken that the wall which encloses the airing-grounds should not appear to be high and prison-like, and from the windows of the ground-floor it looks as if one could jump it with ease, but in reality it is a 7-ft. wall, the ground having been excavated close by it, so as to form a gravel walk some 3 ft. below the level of the rest of the garden. The ground slopes towards the east, so that on the female side of the house there will be a terrace, with steps leading to the garden.

The carpenter's and tailor's shops and the laundry are to be connected by covered ways with the main building. The drainage is easily carried off the premises, owing to the natural fall of the land. The gas-fittings and water-piping are being done by Messrs. D. & E. Haggart.

NOTES FROM THE SOUTH OF IRELAND.

The new cathedral to be erected in Cork from a design by Sir John Benson, will be one of large proportions, and will show variety in its treatment. The ridge of both transept and nave will be 80 ft., crossing each other at an equal elevation. The transept will be 114 ft. in length, and from east to west within the walls will be about 237 ft. The transept gable will be of a richly ornamental character; that on the south side will have a porch deeply moulded with a carved tympanum, the triangle over the archway being perforated for effect. Flanked at either side with double aisles, the choir will be seen, those aisles constituting chapels, this part of the building being joined to the transept by a flying buttress. Sacristies below, square, and securely built, will give the air of solidity to the adjoining slighter superstructure. To the west the view will show the south aisle and clearstory, and a tower, which, to the top of the parapet, is 157 ft., but, on completion, with finished spire, will be about 250 ft. A rich cushion of pillars will be presented to the sight on entering the transept door, five altars standing in the centre, others forming the termini of the double aisles, running along and forming part of the choir. In either end of the building will be large traceried windows, and above a long arcade resting on stone columns, around which will be a cluster of parasitical marble pillars, a triforium will rise. Over its arches will be the clearstory window; three stories will be then presented. The fascia of the nave will be open woodwork, suitable for coloured decoration. A groined roof of stone will cover the aisle. The choir beyond the transept will differ from the nave in some particulars, the floor being raised by a series of gradations to give effect to the altar; the triforium is cut off in this part, leaving the main arcade to possess the most height. These provisions are designed for the purpose of enhancing the internal appearance of the cathedral. The structure will partake of the "Marble City" Kilkenny, which boasts of "a fire without smoke, water without mud, and streets paved with marble," have at last resolved on lighting the old historical town with gas. Kilkenny has been long in the dark.

In Waterford a very pretty quarrel is going on between the Harbour Board and the Corporation, as to who has the right to seize the water-bailiff's fees.

The Sligo and Ballaghaderreen Junction Railway works are being proceeded with, and it is hoped it will open up the trade and facilitate the traffic due west.

In Limerick the Corkanree Embankment is nearly finished. The city surveyor is pushing on the works energetically. In a sanitary point the works will be an advantage to the city. It is intended to have its sides planted with ornamental shrubs, making the work at the same time ornamental as well as useful.

An infants' school is in course of erection by a society of the Sisters of Mercy, in Accommodation-road, Carlow.

In Kinsale, in Cork, for ten weeks there has been a dead-lock in the water supply. The streets were torn up during this time in laying down mains, but in the meantime the inhabitants are forced to resort to the surrounding districts to seek water. There has been banging or miscalculation somewhere in sinking the reservoirs.

Measures are about being adopted in Cork to obtain a training-ship and a capitation grant from the Government for the purpose of establishing a Naval Industrial School for Destitute Boys in the harbour.

The inauguration of the Royal Docks will take place on the 28th instant; the Lord-Lieutenant has accepted the invitation to a civic banquet on the occasion.

WATER SUPPLY.

THERE is a population of 30,000 at St. Helier, Jersey, who are dependent on any chance supply of water for ordinary or exceptional use. There are a few pumps and a few wells; but the population generally have to depend entirely on water-brought. *The Jersey Times* says,—

"The long drought of last summer ought, if anything can, to arouse us to the necessity of water storage. Neighbours quarrelled and fought for water, and the police magistrates were frequently engaged in investigating assaults arising out of the joint users of the same pump. The fear was before the eyes of large numbers of the people that the rain supply being exhausted, the wells would fail next, and they might actually go without water—a fate infinitely worse than deprivation of bread."

Even were the well-water more plentiful, it is hard, and otherwise unsuitable for domestic purposes. The only alternative, therefore, is to provide a reservoir for the storage of the water supplied by the mountain streams, and that which descends as rain. To carry out this scheme, a company has been formed, and, since there seem to be no engineering difficulties in the way, and as the want of a supply of water is beyond all doubt, there is every prospect, if the works are carried out, not only that a great public good will be done, but that a fair dividend will be paid to the shareholders. St. Helier is overlooked on several sides by hills, and among them it is suggested to construct a large reservoir from which the water will descend by its own gravity to all parts of the town. The company (a limited liability), is already incorporated, and of the 5,000 shares, at 10*l.* each, which it is proposed to issue, 2,000, it is stated, have been taken up, leaving 3,000 to be disposed of. The directors feel confident that a dividend of 10 per cent. per annum may be relied on. A contract has been entered into with Messrs. C. W. Harrison, G. Redgrave, and R. Robson, of London, for the completion of the works for 48,000*l.*

The water supply of Dover engages the attention of a committee to whom the question has been specially delegated. Experiment has disclosed the low levels to be the seat of an enormous waste complained of. Efforts should be made to discover the cause of waste in some systematic manner.

THE TRADES MOVEMENT.

London Carpenters and Strikers of Blackburn Joiners.—A representative meeting of the carpenters and joiners of London has been held. Mr. George Potter in the chair, to consider the propriety of lending pecuniary assistance to the joiners of Blackburn and Darwin in their existing strike for a reduction in the hours of labour. Mr. Sternale, a delegate from Blackburn, explained the origin of the strike, which arose out of a demand of the joiners to reduce the hours of labour from 54 to 49. The men declined to arbitrate the question, because the hours they asked for had been granted to other trades. The General Union of Carpenters had already spent 1,200*l.* on the strike. It was unanimously resolved:—

"That in the opinion of this meeting the short-time movement is the necessity of the day, and that its adoption will tend to the intellectual, physical, and moral improvement of the working classes; that this meeting,

therefore, views with satisfaction the efforts of the Blackburn joiners to reduce their hours of labour, and tenders them its warmest sympathy in their struggle."

A committee was appointed to receive the subscriptions of the London carpenters, and forward the same to Blackburn weekly. This strike, however, is now said to be nearly settled by a compromise.

Masons' Strike at Sheffield.—A meeting between master builders and operatives, to endeavour to settle the strike, has been held in order that representatives from each body might discuss the questions at issue. The mayor presided. After some little discussion upon the rules in question, the mayor proposed that the matter should be postponed till January, when the questions then in dispute should be decided by arbitration, the masters meanwhile to withdraw the notices they had given, and open their workshops to the men. This proposition was eventually agreed to, subject to the approval of the general body of masters and men.

Fruits of a Strike.—The secretary of the Operative Spinners' Association at Preston has issued a statement to the members. The contract entered into between the association and the members out of employment will expire in four weeks, by which time the society will have expended, since February last, over 6,000*l.* The association has now discovered that "those who most advocated resistance were the very first to desert the men they advised to leave their work."

Strike at Dundalk.—There is a strike of the masons and bricklayers employed in the construction of the Dundalk and Greenore Railway. They ask an increase of wages from 2*s.* to 2*s.* 6*d.* a week, accompanied by a decrease of the hours of labour. A strike of the labourers employed on the same works occurred recently, but ended in a return to work on the old terms.

Strike at Stettin.—In Stettin, where a short time ago the corn-carriers left their work demanding a rise of wages, and where the cabinet-makers are still on strike, the carpenters, to the number of about 700, turned out on the 30th August.

SEWAGE UTILIZATION AND THE ESSEX SCHEME.

At the recent meeting of the British Association at Exeter, apropos of the grants for various purposes, Sir William Tite, with reference to the 50*l.* granted to Mr. Grantham for the treatment of the nitrification of sewage, said he thought that there was a large company in existence under the superintendence of Mr. Hope, and that they were doing all that was possible in the inquiry, without the necessity of the Association spending money in following it out. He did not deny the importance of the question, but simply wished an explanation of why the 50*l.* were granted to Mr. Grantham, when the question was in the hands of a powerful company, with large means, and who were doing their best to show the advantage of the nitrification of the sewage.

Professor Rankine said it was well known that the company was a large, powerful, and interesting one; but he wished to ask whether the company was established for inquiry into every conceivable way of treating sewage, or only to carry out a particular plan.

Sir William Tite said he believed it was for both. The scheme of the company was that, at the outfall of the sewage on the Essex side, a large channel should be cut down to the Maplin sands. It was said, and probably in truth, that if the sewage was poured over these sands, and the sands inclosed, a large and valuable tract of land would be recovered. The question was, was it true that sewage water possessed that fertilizing quality? That, of necessity, was the nature of the company; they had taken a farm, and were doing their best in every possible way to show that the utilization of sewage was an advantageous process. That being so, why should they take it up at the expense of the British Association?

Mr. Vignoles said it was the feeling in Section G that, however useful might be the efforts of the company, a more scientific and independent inquiry by the Association would be more satisfactory.

Dr. Farr said the Chemical Section at Norwich considered it very important that this committee should be appointed. The question of sewage nitrification was of vital interest, both in an economical point of view, and as regards the public health; and they thought it very desirable that a scientific committee should investigate the sub-

ject, entirely unembarrassed, as Mr. Hope might perhaps be, by the pecuniary or other concerns of the company, or such considerations as might arise in the Metropolitan Board, of which Sir W. Tite was so distinguished a member. The committee took the question up in a purely scientific point of view, and 50*l.* could not be better employed.

Sir W. Tite said, after the explanation, he withdrew his objection.

We take this opportunity of drawing the attention of our readers to the voluminous and excellent reports of the proceedings of the Association given in *Scientific Opinion*, from which we here quote. These reports are far more complete than any others we have seen.

RAILWAY MATTERS.

THE promoters of a system of "Universal Penny Railways" have matured, and now submit for public consideration, a scheme by which, as they believe, the so-called "impossibility" of penny railways may be overcome. The basis of the plan is, of course, the assumption of all the railways by the State. By a number of economical changes in the management of the traffic, —for example, by doing away with tickets in the case of third-class passengers, who constitute two-thirds of the entire bulk of travellers by railways, and by the institution of "stop stations," the projectors of the scheme expect to produce results of the most startling character. In the "People's Class" passengers will be conveyed from London to Holyhead for 1*s.* 6*d.*; from London to Edinburgh for 1*s.* 11*d.* At a "stop station" the traveller will leave the train, and if he desires to go further will go through an "on room," and pay a toll of 1*d.* to the next station. By the disuse of tickets, &c., the promoters hope to save an enormous sum.

An embankment on the Oxford and Wolverhampton Railway, at Dudley, has been partially destroyed by a singular accident. The line is constructed over a bed of coal, which in one case comes to the surface. Owing to some cause the coal has ignited, and is still smouldering and the accumulation of water on the line is greater than can be carried off by the ordinary channels.

WORKING-CLASS DWELLINGS.

The Artisans and Labourers' Dwellings Act.—It appears that some of the metropolitan vestries are undecided as to the course of procedure they should adopt under Mr. Torrens's Act. At a recent meeting of St. Luke's vestry, the medical officer reported, under the Act, that certain huts or shanties in Wood's place, Chequer-alley, were unfit for human habitation; and the vestry clerk remarked that the vestry was empowered to shut the premises and keep them closed until they were put in a proper state of repair. Thereupon it was pointed out by several vestrymen that if they carried out the provisions of the Act they must employ several additional officers; and that if they put the premises into a proper state of repair, an expensive machinery would have to be put in force. The clerk, however, explained that if the vestry failed to carry out the provisions of the Act, the Home Secretary would cause them to be carried into effect, and charge the expenditure to the vestry; and Mr. Adams remarked that, if, after the receipt of the medical officer's report, an outbreak of fever occurred in the neighbourhood, the vestry would most certainly be held responsible to a great extent. Some of the vestrymen were in favour of proceeding under the Nuisances Removal Act; and Mr. Daniel suggested that the matter should be allowed to stand over for a month, and that meanwhile each member of the vestry should be furnished with a copy of the Act, so as to become master of its clauses. After a long discussion, the matter was referred to the sanitary committee, and copies of the Act were ordered for the vestrymen. In the meantime, the huts or shanties in Wood's place, Chequer-alley, remain "unfit for human habitation."

The London Labourers' Dwellings Society (Limited).—The report of the directors stated that they had completed the purchase of twenty-three leasehold houses in Watson's place, Kingsland-road, for 5,020*l.* The whole of the property had been put into thorough repair, which necessitated the temporary removal of most of the tenants in succession, and only the most respectable were allowed to return. The new block of buildings at Vauxhall was ready for occupation

in May, and out of eighteen tenements sixteen had been occupied. They consisted of two rooms, each with a scullery in common to each three tenements, and the rent ranged from 4s. 9d. to 5s. 6d. per week. The directors continued to allow one week's rent in the half-year to all those weekly tenants who paid quite regularly, and who also kept their houses in good order. Upon the whole, the directors were quite satisfied with the practical working of the plan. The total net rents had amounted to 982*l.*, and the net profit to 88*l.*, which was sufficient to pay the usual dividend of 5 per cent. per annum, free of income-tax. The benevolent fund was 500*l.*, invested in shares of the society, and the annual dividends were applied to support charitable and useful institutions in the localities. It appeared there were twelve distinct properties, containing 292 tenements, purchased for 29,276*l.*; solicitor, 446*l.*; repairs, 2,416*l.*; buildings, 9,300*l.*; interest on cost, 300*l.*; surveyor, 129*l.*; sundries, 62*l.*—total, 41,930*l.*

THE NEW OFFICES FOR THE POPLAR DISTRICT BOARD OF WORKS.

SIR.—In reply to the *ex parte* statement contained in your last impression in reference to the stoppage of these works, we beg to inform you that it is entirely incorrect, likely to mislead the public, and seriously to injure the contractors.

All the timber and other materials hitherto supplied on the ground have been approved by the architects to the Board of Works, and (contrary in our opinion to the contract between our clients Messrs. Baker & Constable and the Poplar Board of Work) Messrs. Hill & Fletcher and Messrs. Harston, the architects to the Board, have refused them a certificate for a portion of the contract sum due to them for work done and materials supplied until the whole of the timber required for the completion of these works is put upon the ground; and, as we deem this course to be utterly illegal, we trust to your sense of justice to insert this letter in the next number of your journal.—We remain, &c.

NOON & DAVIES (Solicitors).

JOSIAH MASON'S ORPHANAGE AND ALMSHOUSES.

THE reading public have been lately informed far and wide of a magnificent act of thoughtful charity on the part of Mr. Josiah Mason, of Birmingham, an act involving the appropriation of as large a sum of money as that devoted by Mr. Peabody to the improvement (more or less) of the condition of the poor of London; that this was determined on and commenced two years before the American philanthropist announced his first donation; that the two donors were born within a few days of each other, commenced life in the humblest manner, and were the builders of their own great fortunes. It seems that as far back as 1858 Mr. Mason established in the village of Erdington, about four miles from Birmingham, an Orphanage for the reception of 30, and afterwards of 50 children, and this institution he maintained entirely at his own cost. Desiring to engage in some large work of charity, he resolved, in the first place, to extend the Orphanage on its original site. By degrees, however, this plan was expanded, and Mr. Mason determined to erect a new Orphanage in another part of Erdington, for the reception of 300 children, two-thirds of these being girls, and one-third boys.

The new building in Bell-lane, Erdington, of which we now give a view, was commenced in 1860. Owing, however, to the endowment consisting of land, it was necessary that, in order to validate the gift, the donor should live twelve months after the deed had been registered, and, therefore, no public announcement was made in reference to the charity. The statutory period expired in July; and then, without ceremony, Mr. Mason handed his magnificent gift of 260,000*l.* to the appointed trustees, thus divesting himself of all control over the property, and devoting it formally to public uses.

The trust consists at present of seven gentlemen, residents in or near Birmingham. At the death of Mr. Mason the number of trustees is to be raised to fourteen, of whom one-half are to be always elected by the town council of Birmingham, either from its own body or from other persons. It is provided that the trustees shall always be laymen and Protestants, and any of them making default in either condition thereby becomes excluded from the trust. The property in the endowment and the general management of the estates and the institution are devolved by the deed immediately upon the trustees, but during his life Mr. Mason retains the right of acting as a member of the managing body, and of taking the general oversight of the charity, which is to be called "Josiah Mason's Orphanage and Alms-houses."

The endowments of the Orphanage, as we understand, consist of about 1,032 acres of freehold land. Of this about 220 acres, almost all of it valuable building land (and including Mr. Mason's own house and grounds), are in the village of Erdington; and the rest is in the parishes of Northfield, Bickenhill, Feckenham, Sutton Coldfield, and other places in the counties of Warwick and Worcester. About two acres and a half consist of building land in the heart of the town of Birmingham, mostly covered with buildings, and of increasing value. One of these properties, recently erected, is let at 1,500*l.* a year, and it is stated the total rental of the Orphanage estates cannot be much less than 10,000*l.* a year even now. In a very few years this amount will probably be doubled by the increasing value of the endowments, and in view of this contingency the trustees are directed to apply any surplus funds, when these are sufficient, to the erection of other orphanages, in accordance with the general scope of the trust deed.

A few of the clauses of the trust deed will show our readers the plan of education and religious instruction to be followed in the Orphanage:—

"The children who are admitted into the Orphanage shall be lodged, clothed, fed, maintained, educated, and brought up gratuitously, at the exclusive cost of the Orphanage income.

"Proper arrangements shall be made by the trustees for the instruction of the children, and having due regard to their respective ages and capacities in reading, writing, spelling, English grammar, arithmetic, geography, and history, and such other subjects of general and useful knowledge as may be, from time to time, directed or authorised by the trustees, subject to the condition which the said Josiah Mason doth hereby declare to be fundamental, that no instruction in any language or grammar other than in the English language and English grammar shall be given to the children in the said Orphanage.

"And it is hereby declared to be the express wish and direction of the founder, that all the children shall be brought up in habits of industry, and that, as far as practicable, the girls be instructed in sewing, baking, cooking, washing, mangling, and in all ordinary household and domestic duties, and in other useful knowledge, with a view to their being fitted to become useful members of society in those positions in life to which it may please God to call them, and which He may give them talents worthily to fulfil.

"And, under the deep conviction that the fear of Almighty God is the beginning of all true wisdom, the said Josiah Mason doth hereby declare it to be his special desire and direction that the children shall be carefully instructed in the knowledge of the Holy Scriptures, and taught to love, reverence, and obey the doctrines and precepts therein graciously revealed, and, through the Divine blessing upon the labours of those engaged in their instruction, the words of the Apostle may be addressed with truth to every child who shall have been brought up in the Orphanage: 'From a child thou hast known the Holy Scriptures, which are able to make thee wise unto salvation through faith which is in Christ Jesus;' provided always that all the religious instruction given in the Orphanage shall be confined to the Holy Scriptures in the authorized English version, and to the truths therein contained, and that no catechisms, formularies, or articles of faith, whether of the United Church of England and Ireland, as by law established, or of any other body of professing Christians, shall be taught to the children.

"The trustees shall make such provision as they shall, from time to time, think fit for the assembling of the children for divine worship in the institution, having regard, as far as practicable, to the earnest desire of the founder, that the children may be trained up as simple and sincere followers of the Lord Jesus Christ, without reference to sectarian distinctions and prejudices; and it is hereby declared that the trustees shall, out of the income of the Orphanage, expend such sum as shall from time to time be, in their judgment, necessary to provide for each orphan, on leaving the asylum, a sufficient outfit in clothes, in the discretion of the said trustees, together with a Bible, and the said trustees may also pay such sum as an apprentice fee as they may, in their discretion, think fit."

The almshouses in the village of Erdington are intended for the reception of forty-six female inmates; twenty only have been admitted during

the past ten years; the building which formerly served as an orphanage is now being converted to accommodate the twenty-six additional aged women. These almshouses and the new Orphanage are at some distance apart, and form distinct institutions, the latter standing in its own grounds of thirteen acres in extent. The aged women are received at the discretion of the founder. The admission of children to the Orphanage is controlled by one condition only, "that every child shall be under the age of nine and the legitimate child of poor parents both then dead." There is no other condition whatever, neither of position, country, nor religious persuasion. The children remain in the Orphanage, if boys until they are fourteen, or if special permission a twelvemonth longer; and if girls, until they are eighteen years of age. Provision is also made for girls willing to enter service at the Orphanage "with the *bona fide* intention of becoming teachers, nurses, or assistants, either in the Orphanage or in other like institution."

The view we give of the Orphanage shows on the left the south-west front, and on the right the south-east front. The building was designed by Mr. J. R. Botham, architect, but, through circumstances, was not carried out by him, as we understand, to completion. It is of brick, with stone dressing, and in style may be called Lombardic. The three towers which give it character (two only appear in the view) are made to assist in the ventilation of the establishment, and receive the smoke from all the fireplaces.

On the ground-floor, at the end of the south-west front (left wing), is the library, 36 ft. by 30 ft. 6 in., at the back of which is the chapel, 50 ft. by 30 ft. 6 in.; between the two projecting wings of this front are six private rooms for officers, each 20 ft. by 14 ft. 6 in., and the infants' nursery, 30 ft. by 20 ft.; at the angle of the building (right wing) is the infants' schoolroom, 36 ft. by 30 ft. 6 in. Along the south-east front are two storerooms, each 23 ft. by 18 ft.; the officers' dining-room, 23 ft. by 18 ft.; and the dining-hall, 70 ft. by 23 ft. Behind these are the kitchen, 61 ft. 9 in. by 30 ft.; and the laundry, 52 ft. by 30 ft.; together with the stores, pantries, and servants' offices.

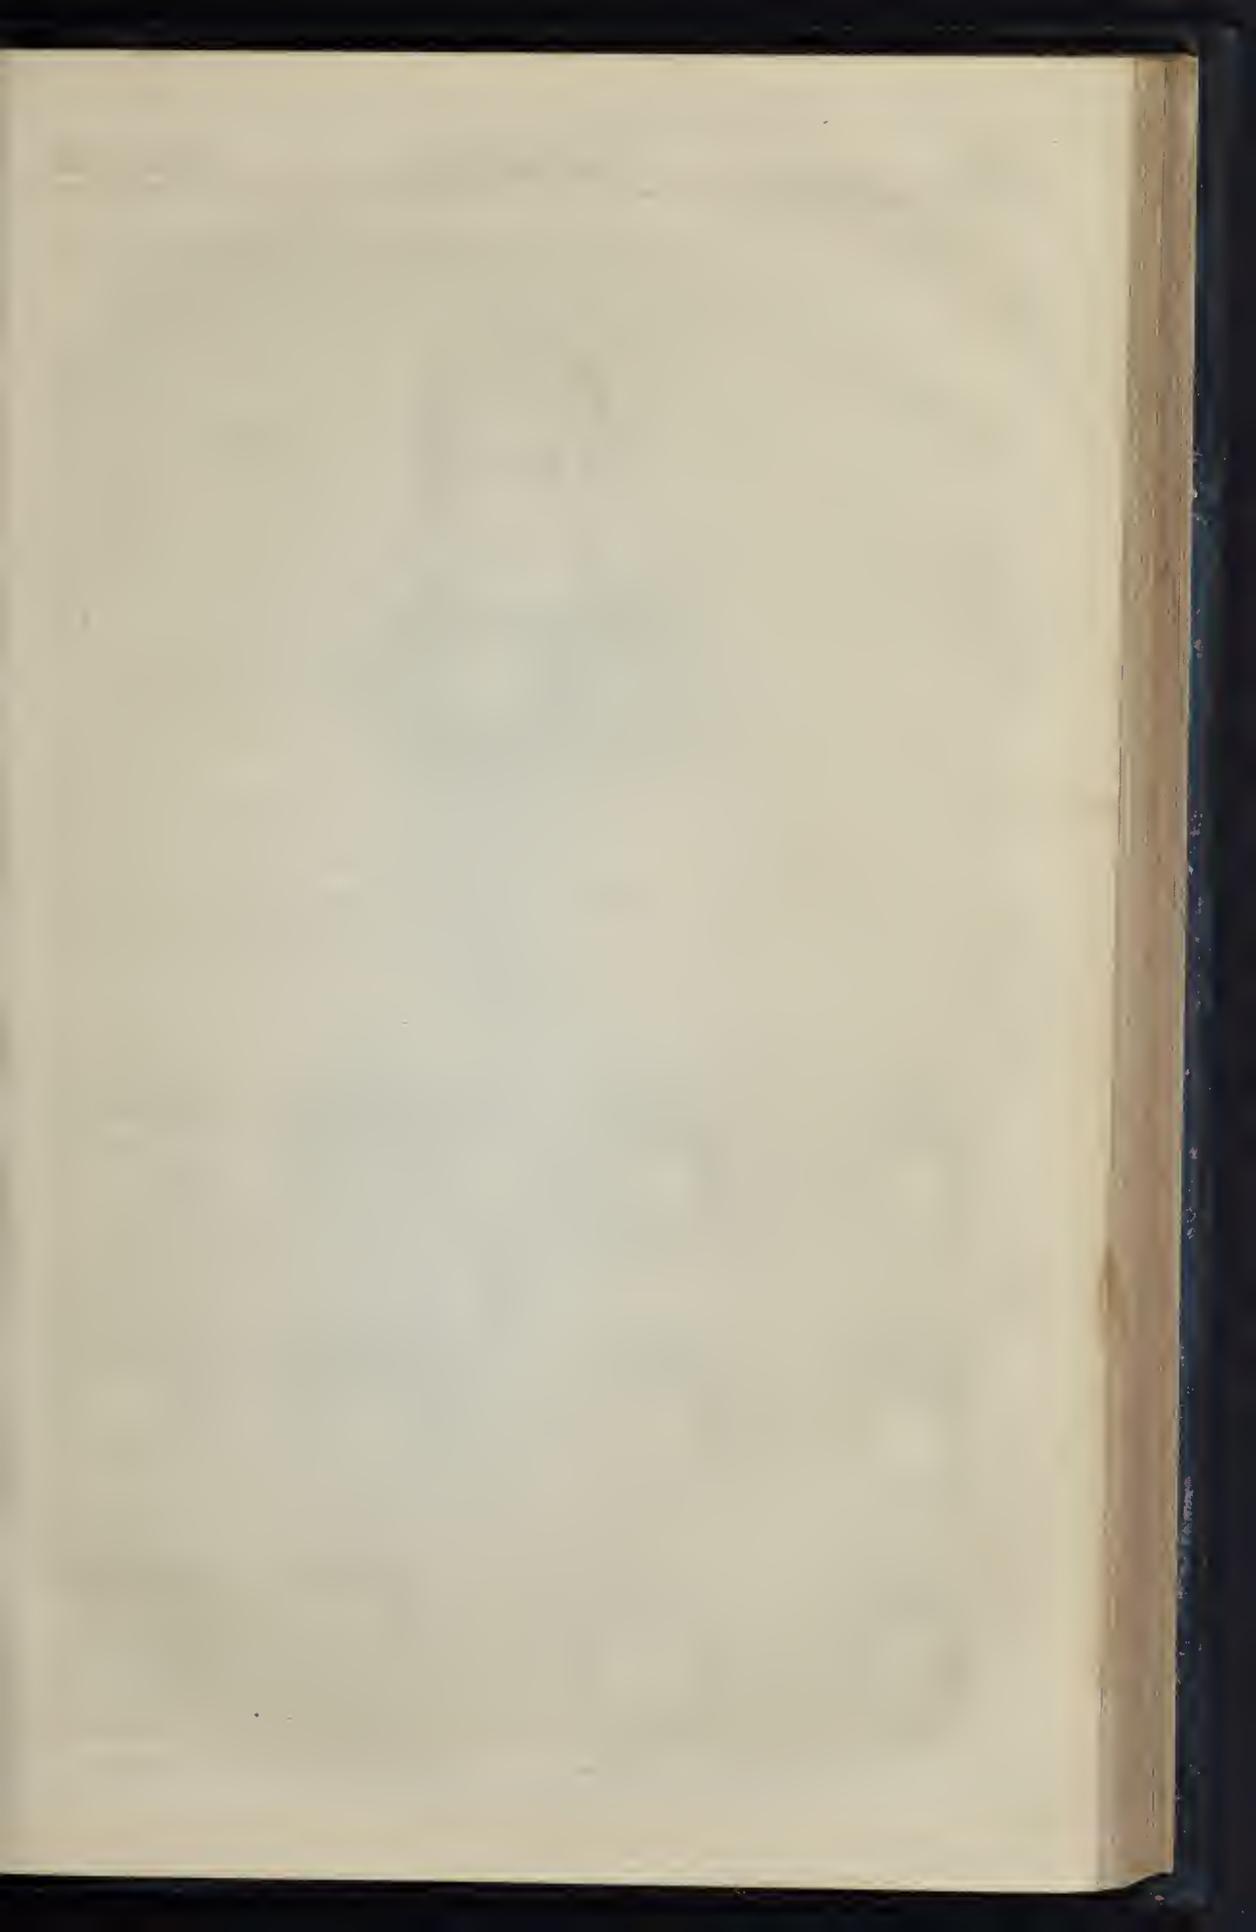

On the one-pair floor, over the library, is the infirmary, 46 ft. by 30 ft. 6 in.; eight bedrooms, each 14 ft. 6 in. by 13 ft. 6 in., over private rooms; girls' sewing-room, 36 ft. by 30 ft. 6 in., over infants' schoolroom; three class-rooms, each 23 ft. by 18 ft., over stores and officers' dining-room; and schoolroom over dining-hall, 70 ft. by 23 ft. Over the kitchen are two lavatories, each 56 ft. by 14 ft. 6 in.; and above the laundry is a large storeroom, 52 ft. by 30 ft. Over some of the offices at the back is a girls' playground, 38 ft. by 16 ft.

The two-pair floor is occupied by the dormitories.

The basement under the whole of the south-east front is appropriated to a covered playground.

In the various accounts published, the cost of the building is given as 60,000*l.* We are enabled, however, to say that this can scarcely be correct unless indeed there was much unwise expenditure; as, according to a carefully prepared estimate made by an experienced surveyor, it would not have exceeded 33,200*l.*, including fence walls and gates, had the work been executed by a builder in the usual way. Mr. Mason, it should be mentioned, was his own builder.

The career of the admirable founder of this great charity has already been sketched in several journals. We must content ourselves with a very brief allusion to a few points of it. How unfurnished he was at starting with the good things of this life, is shown by the statement that he commenced it by selling rolls and cakes about the streets. Working his way, we find him in 1823 (when he was twenty-eight), engaged in the manufacture of split key-rings in Birmingham, and commencing the foundation of his present large fortune. All the world knows Perry's pens and Elkington's electro-plating, but until this orphanage was talked of only a very few persons were aware that these titles might be with equal justice Mason's pens and Mason's electro-plating; in the one case his ingenuity and skill, and in the other his spirit of enterprise and his capital having placed these matters where they are. Join to these undertakings some successful copper works at Pemble, and it will be unnecessary to look for other sources of his wealth, part of which he is now spending with a noble motive.

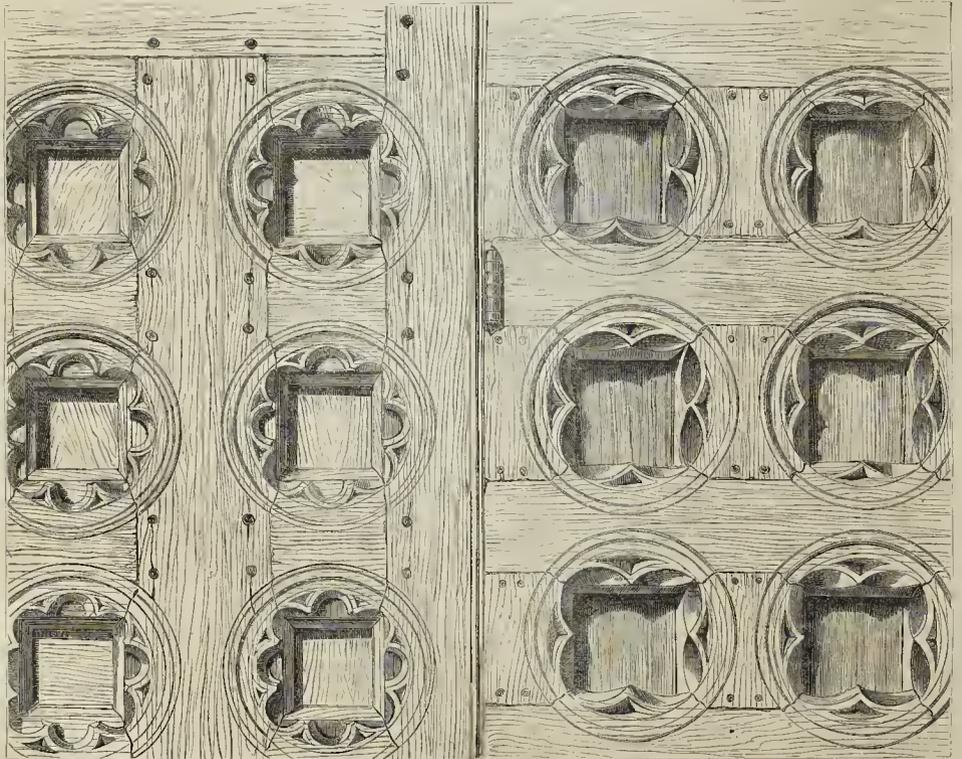

MR. JAMES PENNETHORNE,

Architect of the New Buildings for the London University, Burlington Gardens.

MR. MASON'S ORPHANAGE, IN EDDINGTON, NEAR BIRMINGHAM — DESIGNED BY MR. BORTHAM, ARCHITECT.

WORTHING SEA-DEFENCES COMPETITION.

SIR,—To show the fair way in which the competitors in this affair have been treated, I beg to forward you the following extracts from the local press.

In the *Brighton Daily News* of September 13 appears the following:—

"Among the schemes which involve the least expenditure, is one proposed by the Board's surveyor, Mr. Johnson, which is very simple, but, we think, would prove effective if carried out. He suggests the erection of twenty-four groynes, and a breastwork 1,300 ft. in length. . . . Mr. Johnson was, we believe, engaged in the construction of the sea defences at West Worthing. . . . The Board will hold a meeting this evening, when a motion will be made respecting the plans; but we are not able to state whether one of them will be decided on at this meeting."

In the next day's impression of the same journal appears the following:—

"A meeting of the Local Board was held in the Town-hall last evening, when the plan for the sea defences of the Lancing-road was decided on. Mr. Patching said they had met together to decide upon a very important question. . . . He proposed that the Board adopt the plan bearing the motto, 'Resisto Oceanus.' . . . Mr. Smith said by some means it had been made known who were the owners of some of the plans which had been submitted. He regretted this, as it was a secret matter, but he did not believe it was mentioned by any member of the Board. It should be mentioned that the plan selected proposes the erection of twenty-four groynes and 1,300 ft. of breastwork."

Is it just, I ask, after such a flagrant breach of the usual rules in competition, to thus award the premium, and trifle with the valuable time of professional men? R. S.

SIR,—Would you kindly insert in your next issue, that the plans selected by the Worthing Local Board and their consulting engineer for the above works, was that bearing the motto, "Resisto Oceanus," Mr. C. W. Johnson, Town Surveyor, Worthing; and the plan under the motto, "Desideratum," Mr. R. Blaker, Builder, Worthing, was the second best. C. W. JOHNSON, Town Surveyor.

COTTAGE HOSPITALS.

A COTTAGE HOSPITAL is about to be established in Ashford, Kent, at the cost of Sir Edward Hoare, bart., and other influential residents, to provide for the treatment of the poor, during illness, as nearly as possible with the surroundings of their own cottage home, but with better sanitary appliances, more skilful nursing, and more liberal diets than can be obtained by them under ordinary circumstances. Some cottages and other property in Ashford have been taken for the purpose, and plans prepared by Mr. Thomas Henry Watson, of London, for the necessary alterations to carry out the above objects. The alterations proposed are not considerable. Mr. Watson reported that it is desirable in such works to keep constantly in mind the importance of not destroying the "cottagestyle" of the building, and of maintaining the homely feeling of the poor when treated in small rooms, instead of in the large wards of county or metropolitan hospitals. Good ventilation and supervision, together with separation of the sexes, are indispensable. The works are to be carried out under the direction of Mr. Wm. King, of Ashford, as local superintendent.

A WORKMAN ON THE TRADE-UNION CONGRESS.

SIR,—It is said, and with some truth, that this is an age of congresses; and, no doubt, all the evils which affect society would be eradicated if the resolutions passed at the meetings could be carried out. I read with some interest the report in the *Builder* on the late Trade-union Congress; and as I dissent from the canons of trade-unionism, and believe that heterodoxy in relation to that question is the best course, I wish, sir, with your permission, to give in the columns of the *Builder* my reasons, and to state the other side of this great social question.

The Trade-union Congress is unlike all others, inasmuch as the delegates did not meet to consider what was best for society, but how they could make the public serve the ends they had in view. It appears trade-unionists live in a world of their own, the creation of which is not for the benefit of the community, but only to protect their privileges, and to get more wages for less labour. I am not going to state that no honour is due to the delegates for their exposition of trade-union wants, and what they

intend to do; but it must be remembered they represented the aggregated wisdom of the whole body of trade-unionists. Mr. Potter, in his introductory paper, for once deviated from the usual course, and got but small praise for his pains; and in treating politic and impolitic questions he told some truths relating to the misexpenditure of earnings by the working classes. That part of the social question has been treated on often before. The author of "Lives of the Engineers," in the *Quarterly Review* for July, 1860, showed what could be done by the working classes if they would understand wise spending as well as great earnings. Teetotalers, for the last thirty years, have told the public that the expenditure of wages by the working classes in intoxicating drinks was the cause of untold misery. It led to short work, had pay, ill health, and pauperism, and, in short, was the cause of almost all the evils which afflict society; and they also add this proviso, which science and experience prove,—that man is best without intoxicating drinks, as they supply no physical want, and no place is found for them in the human organisation. We teach and practise teetotalism, not for the purpose of winning strikes, but to win humanity into better and wiser paths. The question of arbitration is an important one, and touches a practical one, which may in time be successfully carried out. It seems that but few are aware that arbitration was tried some time prior to its re-introduction by Mr. Mandella, and I think it would have been well to have inquired into its partial success and collapse. In the "British Almanac and Companion" for 1857, an article appeared giving "A History of Arbitration in Trade Disputes;" and I find so early as 1854 a conference was held under the auspices of the Society of Arts; and as far back as 1829 the lace-makers of Nottingham established a sort of court of arbitration to lessen certain evils then existing. It further gives the results of hours of arbitration, in connexion with 16 other trades, some of which were successful for a time, and then failed for want of a compulsory law to keep the machinery in motion. The "Conseils de Prud'hommes" in France appear to be unsuited to trade disputes in this country, as they only deal with minor cases, which are personal to the employer and single workmen; while in this country arbitration seems to be established to settle disputes in which hundreds or thousands are concerned. I think an amalgamation of the two systems is wanted in England, which must be made compulsory; as, without a law to enforce arbitration, it will, after the novelty has worn off, fail when it is most wanted. Some doubts have been expressed about the working of a compulsory law, as it is said the law cannot, in a free country, force workmen or employers to accept an adverse decision. And herein lies the difficulty of arbitration. I think employers would, as a rule, accept the conditions of the board, as their interests are materially affected by a strike, and some method might be found to deal with those who would not accept the ruling of the board. And as to the workmen, the law should be framed so as to protect employers in respect to their obtaining other workmen, by making it criminal to obstruct or molest them, by picketing or otherwise, in obtaining workmen willing to work on the terms agreed to by the board.

The repeal of the combination laws was demanded by the congress, or, at least, that "part which prevents a number of workmen coercing or intimidating a smaller number from following their usual employment." The delegates also demand that trade organisations of working men should be placed in the same position as other legal associations. The question resolves itself into, What are legal associations? In most cases they are easily defensible;—a trading or manufacturing company which fulfils the conditions imposed by the legislature; or a number of men engaged in a co-operative business, and carrying it on without interfering with the action of others, is a legal association. But if three out of four were to unite, and determine the fourth should in all respects conform to the rules and regulations of the others, and, by molestation, try to force it into compliance, they would no longer be legal, and the public would not recognise them as such. Trade-unionists demand that the law shall legalise their right to work, or refuse to work, with certain persons. One speaker gave an illustration of who one class of these certain persons were; i.e., if a man took 5s. a day when the market value was 6s., and they said they had as great a right to refuse to work

with him as he had to take that payment. If it happens a man is an inferior hand, or has some other misfortune, or no employer would give him work at full wages, trade-unionists would turn him into the world to starve, because he was not gifted with the same powers as they possessed. Such law, if passed, would be an outrage on humanity, and ought to be condemned by all who claim to belong to civilised society. It does seem that legal trade-unions are to be different from all legal associations, and will have nothing in sympathy with the progress of the age. A barbarous people might, perhaps, pass such laws as the trade-unionists demand, and savages might be found to put them into effect; but for a number of men to ask, in this the nineteenth century, for retrogression and despotism, is adding one more to the curiosities of civilization.

In another letter I will examine other favourite dogmas of trade-unionists, to show they are bad in theory, and an agitation for them to be put in practice would do great injury to the working classes; and that there is something more than the profits of capital which regulate the rate of wages. JACK PLANE.

ARCHITECTS' ACTIONS.

BECK V. STEWART.

THIS was an action brought in the Queen's Bench by Mr. George Beck, an architect, of Hastings, against the Rev. Halley Stewart, a Dissenting minister of the same place, to recover 143l. 17s. 3d. under the following circumstances:—

The defendant paid 15l. 15s. into court. This action was referred from the last assizes at Maidstone to Mr. John Phillips, of Mire-court, Temple, by consent of both parties. The reference took place on Monday, the 31st ult.

The inquiry was a protracted one, and lasted from 11 a.m. to 8 p.m. Several witnesses were examined *pro* and *con*, and among them the plaintiff and defendant. The case was shortly as follows:—In the year 1838 defendant came to plaintiff, and having stated he had some money at his command, instructed him to look out some properties in Hastings which might be converted into a ladies' seminary. Plaintiff accordingly did so, and viewed and inquired into several properties likely to be had for the purpose. This lasted until the middle of 1838, and that scheme was abandoned. Soon after defendant purchased some land on the Clive Vale estate, Hastings, and instructed plaintiff to prepare plans, &c., for about twenty-four labourers' dwellings, to be built in flats; this was done. Specifications prepared, quantities taken, notices for tenders for the works issued, and tenders received; and in consequence, as defendant alleged, that the amount exceeded his resources, the buildings were abandoned. Defendant asked for his bill, which was tendered, amounting to 1897. 12s. 3d., and defendant paid him 75 guineas which he considered was all he was entitled to; and the ground of his defence was, that the plaintiff undertook that each dwelling should not exceed in amount the sum 300. Plaintiff, on the other hand, proved to the complete satisfaction of the arbitrator in the suit that no such stipulation was made, and on Saturday, the 1st, the arbitrator published his award, which was in favour of the plaintiff, Mr. Beck, for the full amount claimed, and also the costs of the cause and the reference.

NEW WORKS OF THE CHARTERED GAS COMPANY.

THE Society of Engineers paid a visit the other day to the new works of the Chartered Gas Company near Barking, which have been erected for the Company by the Messrs. Aird, from the designs of the Company's engineer, Mr. Evans, at the cost of about 600,000l. According to the official account of the visit, the cylinders to carry the pier are now being sunk. The method employed is one well known. It consists in excavating the ground from the interior, and allowing the consecutive sections to sink by their own gravity. If necessary, they can be weighted, should any obstacle obstruct their descent, and should they get fast, the aid of a driver is called in to ascertain the cause. Being 6 ft. in diameter, these cylinders offer great facilities for carrying on the sinking operations. The separate lengths are 13 ft. in thickness, with flanges on the inside, through which they are bolted together. As it is necessary to carry them down about 10 ft. into the hard gravel, they are sunk some 30 ft. below the Ordnance datum, and their total height is not far less than 60 ft. The superstructure will consist of wrought-iron girders fixed on the cylinders, and the pier will form a direct communication between the river and the retort-houses. It projects at right angles from the river wall, and after continuing in this direction for about 400 ft., it turns suddenly "up stream" for nearly double that distance. The coal will be raised by steam or hydraulic power from the barges into tracks on the pier, which will run

from it along a viaduct, which forms, in fact, a continuation of this pier into the retort-houses. The river wall extends 1,000 ft. of the 1,500 ft. frontage belonging to the Company. It is built of brick, coped with stone, and protected in the usual manner by fender piles, which are bolted right through the wall in a secure and substantial manner. The gas having been made will pass into gas-holders, which have a diameter of 180 ft., and the nited contents of the four will amount to 4,000,000 cubic feet. To supply these reservoirs, the retort-houses, which are also four in number, will contain 1,080 retorts, each of which is 20 ft. in length, and capable of being charged at both extremities. The main pipes are 4 ft. and 3 ft. in diameter respectively, and the operation of laying them was inspected by the party. They were conveyed to the spot, over a light railway, which has been laid down on a road which will eventually connect the gasworks with a point on the Barking-road. In consequence of the isolated nature of the locality, it was necessary to construct this road in order to effect inland intercommunication.

EXETER HALL, STRAND.

The large room at Exeter Hall and the approaches to it have been painted and decorated with more force than finesse. The covered ceiling is divided by bands of yellow and whie wreaths of red and green, upon a greenish blue ground, into geometrical forms, amongst which the numerous ventilators play a prominent part. The walls are of a sort of fawn colour, with pilasters of light green, and all the enrichments—which are Greek in style—have been painted in bright colours; the whole being supported by a dado prilled in vermilion and black. The large organ is painted and gilded in patterns that suggest Egypt.

The forms into which the ceiling is divided are somewhat large and coarse, and the pattern is awkwardly broken in the centre. The side walls, too, are a little gloomy. What the effect will be when the room is lighted up with gas we have not yet had the opportunity of seeing. The work has been carefully done by Messrs. Harland & Fisher, under the direction of Mr. A. W. Maberly, architect.

"SPARE THE TREES."

As large tracts of land are continually being let on building leases in the neighbourhood of the metropolis, and as the Finchley-road estate, long preserved from being built upon, will now, I suppose, be gradually covered with houses, allow me to ask your powerful aid in drawing the attention of builders to the ruinous mistake they so often make in cutting down all the trees on their ground. In a large field close to my residence there was a fine row of lime-trees fronting the main road. The field was let for building. Every one of these trees was immediately cut down, besides three or four fine old elm-trees along the side road. Large houses were run up, and a set of wretched little stuccoed arches, by way of entrance-gates, were built where the trees had previously stood. The houses do not let, and the builders are in the *Gazette*. Had the houses been rather smaller, placed further back from the road, and protected from it by the said trees, they would have been most attractive residences for gentlemen worried with the day spent among noise and glare, worned of people and interminable brick and mortar in the great city. But if those gentlemen can find something more countrified within reasonable distance, we may be sure they will not take houses with nothing to look upon but a brick wall, stucco arches, and the houses on the opposite side of the way. When will builders understand that men who come away from business in London want, of all things, to look on trees and grass, to be free from the sights and sounds that would have been pressing on them all day long?

It would seem as if, to some extent, builders are already aware of this fact, from their often planting little eaplings in front of their houses when finished. But this only makes their suicidal policy of cutting down well-grown trees (which no money and only many years can replace) the more painfully absurd. In the case just referred to, a few little things have been stuck into the ground, but they will give no real refreshment or shelter to the eyes for many years. The foreman's mind, at least, was enlightened on the subject one day, but too late, when a gentleman came to look at the houses,

and said, pointing to some trees yet undemolished on the further side of the field, "Ah! if they were only near those trees I would take one of them," little thinking how many had been destroyed close by.

GAS.

The present price of gas per thousand cubic feet is, in Leeds, 3s. 6d.; Bury, 3s. 4d.; Salford, 3s. 4d.; Manchester, 3s. 2d.; Ashton, 3s. 2d.; Salford, 3s. 3d.; Liverpool United, 3s.; Dudley, 3s.; Stockport, 3s.; Carlisle, 3s.; Birmingham, 3s.; Derby, 2s. 11d.; Warrington, 2s. 9d.; Plymouth, 2s. 9d.; Cardiff, 2s. 9d.; Birmingham and Staffordshire, 2s. 6d.; Newcastle-on-Tyne, 2s. 6d.; and Walsall, 2s. 4d. Not only have the Manchester people the advantage of cheap gas, but what is more, and what the Londoners with their higher-priced gas have not, the Manchester gas consumers have gas that is good as well as cheap; and still more than all, the Manchester gas yields to the corporation, who provide it, and of course to the people, handsome profits, which have been laid out in reducing local taxation, and carrying out city improvements.

LINSEED OIL.

SIR,—Can any of your readers inform me of some easy way of testing linseed oil? It is important to the trade, as I believe it to be largely adulterated with resin oil or other material; preventing the work from drying hard. I am, &c., E. L. D.

*A considerable amount of information on the subject of the too general adulteration of linseed oil will be found in an earlier volume of the *Builder*.

"SOUTH-EASTERN RAILWAY MANAGEMENT, OR OTHERWISE."

SIR,—As you have already entered a protest on the above subject, will you allow me to state that I yesterday sent a clerk, to meet a clergyman, a client, who was leaving town by the 4 p.m. train from Charing Cross Station. The business was, of course, urgent. The clerk arrived in reasonable time, but was informed that he could not on any account be allowed to pass the barrier, although he stated the circumstances and the urgency of the case, and pointed out the gentleman at the further end of the platform. After many minutes wasted in solicitation on the part of my clerk, and stern denial on the part of the official, that dignitary deigned to state that my assistant must obtain a porter, who could inform my client that he was required. Of course, some time was consumed in finding this clergyman in corridors; and, of course, also by that time my client had taken his seat in one of the carriages, and Mercury had to inquire for him at each compartment, my client having eventually to walk from the further end of the platform to the barrier, as the train was starting. As it was, I believe, he did regain his carriage, or at all events went by that train; but had the business taken two instead of one minute to transact, it is obvious that he would have been seriously inconvenienced.

ARCHITECT.

MANCHESTER ARCHITECTS.

SIR,—For several months past the following advertisements have been inserted in the *Manchester Guardian*:

No. 1.—Plans, specifications, &c., by an Architect, upon exceedingly reasonable terms. Preliminary sketch designs gratis.

No. 2.—An Architect is open to make plans, &c., for Buildings at his own Office on advantageous terms. On Saturday last there was also the following advertisement:

No. 3.—Plans by an Architect 15 per cent. A clerk of mine who had been a book-keeper in a builder's office, and who only came to mine to copy specifications, I found practising on his own account, calling himself an architect, copying my plans, &c. On finding that out I immediately discharged him. I then asked a friend to answer the above advertisements in order to ascertain whether any other of my assistants were doing the same, when he received three replies, of which the enclosed are copies. What will the so-called profession come to? AN ARCHITECT.

THE SOUTH SHIELDS' TOWNHALL COMPETITION.

SIR,—I think it is due to the competitors that they should know the way the above competition has been conducted; therefore I extract from the *Newcastle Chronicle* the following intelligence:

"Mr. Ald. James said he would, if the council was willing, read Mr. Hall's report about the plan of 'I Work to Win.' Mr. Young jumped up and protested against reading of the report, as unfair to the other competitors. It was understood that no one should know who the architects were who were competing, yet he understood that one of the architects had sent circulars to the members of the council, and the letters contained his initials and the post mark. When he voted for 'I Work to Win,' he knew for whom he was voting. Such a proceeding was very unfair to the other competitors. Mr. Stanton asked if it was generally known by the council who this man was who signed the initials 'J. D.' so plainly."

Mr. Young said it was Johnston. Mr. Stanton said, if the name of the man was generally known, he would propose that his plan be knocked out of the competition.

Several cried, 'No, no.' The name is only surmised; but Mr. Young persisted in shouting, 'Johnston; his name is Johnston.'

After further discussion the vote was taken, when the first premium was given to 'I Work to Win,' the plan 'Well considered' being declared the winner of the second prize.

The envelopes bearing the mottoes of the winning plans were then opened, and it was found the winner of the first prize was Mr. J. Johnston, architect, Clayton-street, Newcastle.

Mr. Young: I told you so."

I wish to ask the architectural profession in general, and Mr. Johnston in particular, if it be considered decent for a professional man to take unfair advantage of other competitors by sending circulars to members of the town council so as to obtain votes for a design submitted.

HONESTY.

VENNOR CEMETERY COMPETITION.

SIR,—The Vennor Burial Board must thoroughly believe the proverb which tells us that "a corporation has no soul to be saved or body to be kicked," otherwise they would have a wholesome dread of an attack of that disease which a coroner's jury declared to have been the cause of death of an old miser, who suddenly dropped dead after giving a beggar a farthing,—viz., "enlargement of the heart."

This liberal Board offer the magnificent premium of 20l. for plans, specifications, and estimates for laying out and erecting burial-ground, and building a house for the aged and two chapels. But, stop a moment: the Board are not so liberal as they appear to be; for, on reading the advertisement carefully, you will observe that the Board offer the premium, not for the best set of plans, estimates, &c., nor even for that one which the Board in its wisdom may consider the best, but "for the plans which may be adopted." The Board have only to decline to employ a plan, and they will then have very cheaply sucked the brains of all those who may be so innocent as to respond to their invitation. Nothing is said about employing the successful (?) competitor to superintend the buildings on the usual terms, and for a very good reason, which is this, I am told:—The Burial Board, some time ago, looked out for the work a young man, who calls himself a civil engineer, and has appointed him surveyor to the Board. It appears, therefore, their surveyor having had no experience in architecture, that the Board are desirous of getting, at little or no cost, an idea to set him to work. Will the Board offer their 20l. in the *Builder* and the local newspapers a whole week before advertising in the *Builder*, which is the recognised organ for such announcements? VENNOR, SAT. SAT.

BRIDGE AT LEEDS: COMPETITION.

SIR,—Allow me to draw your attention to an advertisement which has lately appeared in the newspapers of a competition for a bridge at Leeds, and which appears to me to be worthy of special notice. The premium offered for the best design is 100 guineas, and that for the next best is 50 guineas. The remarkable part of the advertisement is, that competitors are told that before they can be furnished with the block plan and conditions to enable them to compete, they must pay out guineas to Mr. C. A. Curwood, the town-clerk of Leeds. Thus if 150 competitors (no unusual number in these days) apply, they will, between them, pay the two premiums; and, as the corporation guard themselves from undertaking to employ the recipient of the first premium in the execution of the work, the competition resolves itself into a sweepstakes, where the entrance-money is one guinea, and the first and second prizes 100 guineas and 50 guineas respectively.

It appears to me that the competitors might as well invest a guinea in a good sweepstake on next year's Derby as spend it in guineas in acquiring the plans and particulars of this competition. In the former case their guinea would have an equally good chance of being returned with 50 more guineas, and they would save themselves the trouble and expense of preparing the competition designs. If the guinea were demanded as caution-money, it should be returned to those who send in designs; but, as the case now stands, it is an ingenious device for making the competitors pay all or part of the premiums, and it does credit even to a Yorkshireman's acuteness. C. E.

THE "SENTINEL AT WINDSOR."

SIR,—The anecdote of the "Sentinel at Windsor" being saved by a clock being verified to have struck "thirteen"—which is doubtless true—was considerably older in date than the existence of the present "St. Paul's" clock, or bell, and, I believe, occurred about the time of James I., or a little later; and the bell which he heard was the great one in the old tower of St. Stephen's, Palace-yard (seen in views by Hollar, &c.); which being nearer the water, and at a different aspect of the river, was, perhaps, more audible at Windsor. At any rate, that was the bell. J. D. P.

MARGATE.

SIR,—Amongst minor matters that require attention, some improvement might surely be made in the reception given to those who arrive by the "husbands' boat," which is simply disgraceful, to say the least. Jaded, and perhaps ill, after an unaccustomed roll on the sea, the passenger no sooner finds himself on the top of the steps of the Jetty than he is compelled to "run the gamut" of a long lane of hooting and yelling beings, more like savages than civilized friends, who treat him as though he had committed some horrible crime, and eadly try the nerves of a sensitive man. B.

American Institute of Architects.—We have before us reports of papers read before the New York Chapter of the American Institute of Architects, and will give some account of them on another occasion.

FROM SCOTLAND.

St. John's Episcopal Church, Forres.—This church has been reopened for divine service by the Bishop of Moray and Ross, Primate of the Scottish Episcopal Church. The building consists of a nave, with transepts and circular chancel, and is arranged after the style of the Basilica. The interior has been entirely renovated, and the whole apse richly diapered in colour with devices about the altar and on the part forming the reredos. The three apse windows are by Barnett, of Newcastle. They are memorial windows, placed respectively by Captain and Mrs. Dunbar, of Seapark, Lady Gordon-Cumming, and Mr. John Grant, of Glenmoriston. A circular window at the west end of the church is also of stained glass, and is contributed by members of the congregation. The altar, and the whole of the apse in which it stands, the pulpit, reading-desk, pews, &c., have been renewed at the cost of Mrs. Dunbar, of Seapark, and her son, Mr. J. A. D. Dunbar, jun., of Seapark, after designs by Mr. Ross, of Inverness.

Consecration of St. Paul's Episcopal Church, Strathnairn.—This church was opened on Tuesday last, and consecrated by the Bishop of Moray and Ross. The building has been erected from funds left for that purpose by the late Mr. Macgillivray, of Danraglassa. It was designed by Mr. Alexander Ross, architect, and is of the early English Gothic style, built of granite, with freestone dressings. It consists of a nave with apsidal termination, and heltry at the west gable. The interior woodwork is of red pine, with open timber roof. The stained glass windows are four in number, by A. & W. O'Connor, of London, and are placed by Mr. Sutherland Walker, of Aberarder. The rose window in the west gable is in memory of the late Archdeacon Mackenzie, the centre representing the Sermon on the Mount, the quatrefoil surrounding containing illustrations of the Beatitudes. The other three windows in the apse represent the conversion of St. Paul, the Crucifixion, and the Good Samaritan. The church is seated for 150.

CHURCH-BUILDING NEWS.

Hammer-smith.—A new church is to be erected in Masborough-road, Brook-green, Hammer-smith. The district to be assigned to it has sprung up during the last few years, and contains a large extent of building ground, which is being rapidly covered with houses. The population is upwards of 4,000, of which at least 3,000 are of the working classes. The cost will be about 6,000*l.* The new church will be dedicated to St. Matthew.

Disley.—The church here has just been reopened, after refitting and alterations, carried out under the direction of Messrs. Medland & Henry Taylor, architects, Manchester. It is situated on the brow of a hill overlooking the Buxton railway. It has a tower, and a wooden-panelled ceiling to the nave. The interior was pewed up in an unsightly and uncomfortable fashion. The chancel had no fittings, except the table and iron rail, and had a flat white-washed ceiling, with a small parlour-like plaster cornice all round. Mr. Legh, M.P., of Lyme Hall, provided a sum for the first work that was undertaken, and there have been some special gifts for the altar-rail by a number of the communicants, and for the pulpit by Mr. Scott, and also general subscriptions liberal in amount. The chancel has been laid with encaustic tiling, and furnished with brass altar-rails and carved oak stalls. The plaster ceiling and "parlour" cornice have given place to a panelled ceiling of pitch pine. On the north side of the sanctuary there is a niche, used as credence and piscina, the stone arch over it being carved into a fleur-de-lis, with reference to the dedication of the church to St. Mary. The chancel window-sill is so near the floor that there is no room for a reredos; but all the space round the east window has been decorated in coloured devices with legends and emblems, at intervals. The pulpit is mainly of white Caen stone, carved and tracered all over. Red stone is used for the cornice, and for panels, &c., to show by relief the patterns wrought in the white stone. There are alabaster shafts at each angle. The heads of the four evangelists are carved in the cornice. The stairs wind round, so that the preacher enters the pulpit direct from the vestry. All the old pews in the nave and aisles have been removed, new floors have been put in, the decayed timber removed, ventilation underneath provided, and new open benches of pitch pine have been put in through-

out on the ground floor. The gallery has yet to be made comfortable, and, if possible, more church-like. The baptistery has been raised off at the north-west corner of the north aisle, and the old font removed there.

Silloth.—The chief stone of a new church, according to the *Carlisle Journal*, has been laid at Silloth. An accumulation of blocks of granite lying between Esk-street and Caldew-street, and fronting the promenade which intervenes between Criffell-street and the sea, forms the materials with which the new church is to be built. The edifice will be Early Decorated, and comprise a nave of five bays, with north and south aisles; an apsidal chancel, with two small transepts, that on the south side forming an organ-chamber and vestry, with cellar underneath for the heating apparatus. The church does not stand due east and west, but presents its longest front to the sea, the principal entrance being under the contemplated tower, which will stand at the corner towards the sea first reached from the station; a second entrance being provided in the transept for the benefit of visitors from Skinbunness; and a third entrance on the opposite side adjoining the vestry, and facing the town of Silloth. The aisle windows are trefoil-headed; the clearstory and windows of the so-called west front, facing Esk-street, have crispings of an early date, and are all to be worked out in the white Tollerite stone, with which all the external dressed stone of the building is to be carried out; while the walls themselves are faced with the granite now on the site. This will make Silloth Church to differ in appearance from all the others in the diocese. The interior of the church will be lined with white brick, relieved with bands of red brick, introduced to mark the most prominent architectural features. The church is about 50 ft. from the floor to the apex of the roof. It is not contemplated at present to build the tower and spire. The tower will be about 20 ft. square, with buttresses at each corner, and will be of three stages in height, with moulded and recessed doorway on the first stage, and heltry windows on the upper story. The centre stage is to be furnished with a clock with gabled cover in itself. The tower is to be surmounted with a slender spire, to be covered either with slate or shingle banded with lead, rising in all to a height of about 130 ft. to 140 ft. The church provides 503 sittings, and is from the designs, made some four or five years ago, of Mr. Charles Ferguson, of the firm of Cory & Ferguson, of Carlisle, architects, under whose superintendence the work will be carried out. The concrete foundations are rapidly being put in.

Exeter.—The new hospital chapel, which has, at the cost of Mr. Arthur Kempe, been erected for the use of the inmates of the Devon and Exeter Hospital, has been formally opened. Mr. Hayward, the architect of the Albert Museum, prepared the plans. It is built of brickwork, in uniformity with the hospital. The exterior is plain and simple, though of a sufficiently ecclesiastical character to proclaim its use. The chapel stands at the north end of the hospital, and is approached by a covered passage. It will seat about 150 persons. It is 64½ ft. in length, and 23 ft. wide, and has an apsidal eastern end. For the interior side of the walls cream-colour bricks have been used, the arches and other parts of the work being relieved by red bricks. The ceiling is polygonal, and is divided by wooden ribs into panels, which are now plain surfaces of plaster work, but which are intended to be ornamented with colour and appropriate devices. The ribs of the ceiling spring from marble shafts, which have carved pendants and caps. The chapel is lighted by a large window of three lights at the western end, by nine lancet openings in the sides, and by four circular windows in the apsidal end. All the windows are filled with thick rolled white glass, relieved by holders of pale green. The walls adjoining the seats are lined with oak boarding, as high as the string course at the bottom of the windows, and the seats themselves are of the same material, space being allowed for the infirm and crippled. The eastern end of the chapel is raised two steps above the general level. Here the walls are covered as high as the string course under the windows with tiles arranged in plain and ornamental bands. Immediately over the altar-table a cross of alabaster is inserted in the tiling. The whole of the floor, except in the seats, where boarding is used, is laid with Maw & Co.'s tiles, plain red and black in the passages, and mixed with encaustic at the eastern end. The building will be heated by

warm-water pipes under the floor, supplied from the apparatus in the hospital, and is ventilated by openings in the roof, as well as by casements in the windows. The exterior of the chapel shows no attempt at embellishment. At the western end rises a bell turret, which has a square pyramidal roof resting on four pillars of Bishop's Lydeard stone, having carved capitals of Bath stone. On the north side is a vestry for the use of the chaplain. The high brick wall, which formerly inclosed the ground now occupied by the chapel, is replaced on the Southern-hay side with a light iron railing, and granite piers. Messrs. Moass & Sons are the builders. The carving has been done by Mr. Hems, who did the carving at the Albert Museum. The entire cost of the structure will be about 2,000*l.*

Bridgend.—St. Catherine's Church, Pontypridd, has been opened for divine service. The edifice is the first church of which Pontypridd can boast. The town has, during the last twenty years, advanced as much as any other town in South Wales, and the fact is testified by there being many Dissenting chapels, hut up to the present time the members of the Church have had to attend divine service in a narrow low room, uncomfortable to all. St. Catherine's Church, from want of necessary funds, has been in course of erection nearly four years. The architect was Mr. Norton.

Howden.—The ancient collegiate church at Howden, which has been for some time undergoing a renovation, has been re-opened for divine service. The thick covering of whitewash and dirt which hid the masonry has been removed from the arches in the nave and the clearstory. The proportions of the structure are now more clearly defined, and the removal of the organ to the north corner of the transept and the consequent opening out of two windows in the south aisle, has added to the architectural effect of the interior. Of the bells, three have been recast. The total amount expended in the restoration of the church is about 800*l.*

Newcastle-upon-Tyne.—A meeting has been held in the vestry of St. Nicholas's Church, to consider the plans and site for the proposed Archbishop Longley's memorial church, in the new parish of St. Philip's, Arthur's-hill, Newcastle. The Archdeacon of Northumberland was in the chair. The Rev. S. Shepherd, jun., hon. sec. to the committee, and incumbent of the new parish, said they had already received subscriptions and promises amounting to 1,000*l.* Several friends had also intimated their intention of subscribing. Mr. Boyd, one of the committee, stated that they had applied to Mr. Redmayne, architect, of Manchester, for plans, and he had sent them those produced. If the church were completed in accordance with the plans, it would be capable of accommodating 650 persons. The rough estimate of the cost was about 5,000*l.*, including the full height of the tower, and excepting one of the aisles. According to the plans, the full height of the tower would be 175 ft., the cost of which would be 1,300*l.*; but if it were raised to 40 ft., the cost would be 600*l.* It was finally resolved that the plans should be provisionally accepted, subject to the approval of the archdeacon and bishop, and to any alterations which the committee might afterwards propose; and "that the secretary be authorised to treat with Mr. Walters, agent for Mr. Darnell, for his site, subject to the approval of the bishop."

DISSENTING CHURCH-BUILDING NEWS.

St. Laurence (Ramsgate).—A small mission chapel is now in course of erection in the Denmark-road, for the Primitive Methodists. Mr. John R. Collett is the architect, and Mr. W. Osborn the contractor.

Plymouth.—The new Presbyterian Church at Eldad, the foundation-stone of which was laid in August of last year, has been opened for divine service. It has been erected to take the place of an iron building, which was opened in 1862, and which provided accommodation for about 650 persons, with school premises in the basement for 400 children, but owing to the accommodation of the iron church proving inadequate to meet the wants of a growing congregation, it was resolved that a large stone church should be erected on the same site, and the new church will provide accommodation for nearly 1,200 persons, while the schools and class-rooms in the basement will accommodate 700 children. The new church is 80 ft. long by 50 ft. wide, and is 40 ft. high from floor to ceiling. The design is an adaptation of the Italian style of architect-

ture. The walls are built of limestone obtained from Pomphlete. The entrance doorways and window openings are framed of Portland stone and the cornices, capitals, and other moulded work are executed in Portland cement. The ceiling is pannelled with gilt mouldings, and the church is lighted by means of sunlights, with ornamental work surrounding them. These are attached to the ceilings, and there are also brackets under the galleries. The galleries form three sides of the church, and the fronts are ornamented. The pulpit is constructed of pitch pine end deal; the seats are also of deal, and all the woodwork is stained and varnished. The entrance lobby will be paved with Maw's tiles. The works have been carried out by Mr. Walter Lettbridge, of Plymouth, from the designs and under the immediate superintendence of Mr. J. L. Hodge, of Plymouth. The carving of the stone capitals of the window mullions was executed by Mr. Hems, of Exmouth, and the gas-fittings were supplied by Messrs. Monk & Westlake.

Lynton.—The foundation-stone of the new Wesleyan Methodist chapel to be built at Lynton has been laid. The site is in the Front-street, and the south façade is to be in the Front-street, and the chapel will extend backwards to Middle-street. A central entrance into a large lobby, with doors on each side, leads respectively to the staircases of the galleries and the ground-floor; the pulpit is at the further end, the minister's vestry behind, and over this is a gallery for the organ and choir. The style adopted for the building is the Renaissance, and the stone selected for use is the Prudham. The central part is advanced slightly to obtain a subordination of parts. The circular-headed entrance-door forms a prominent feature of the front, with carved caps, spandrels, &c., and other mouldings. On each side of the door are two windows divided by pilasters; these light the lower part of the staircase lobbies. The lower part is divided from the upper by a cornice, on which rests the pedestal of the upper order. There are to be six columns or pilasters, with windows, in each division. The columns, having carved caps, support the cornice, extending across the entire front end round the ends of the building. The centre projecting part is to be terminated by a pediment. The entire width of the front is 52 ft., the internal width 46 ft., 4 in., and the extreme length of the inside is 74 ft. The sides of the chapel are partially concealed by adjacent buildings. The front of the galleries is supported by rows of metal columns, which divide the pews on the ground-floor into three groups; in the side galleries there are three, and at the south end eight pews. The roof is high pitched and open, carved brackets from the roof beams resting upon stone corbels in the wall. Consideration has been given to heating and ventilation. Accommodation has been provided for 720 adults. The contract for the execution of the whole of the works has been let to Mr. Thomas Robson, builder, South Shields. The cost of the building will be about 3,000l. The architect is Mr. F. R. N. Haswell, of North Shields.

Ipswich.—The Congregational chapel, the memorial stone of which was recently laid, will occupy a site in the centre of a part of the town, St. Clement's district, where a church was much needed. Messrs. Cattermole & Eade were the architects employed to prepare plans for the new chapel. Part of the site is described in the deeds as a place on which a chapel stood. Coins were found of Elizabeth's reign. The ground presented considerable difficulties, owing to the irregularity of its form, and the rapid rise of the ground from the Front to the Back Hamlet. The architects have planned a chapel which will give accommodation for about 450 people, besides a school-room calculated to hold 150 children, and class-rooms. The principal front of the chapel will be that facing the Front Hamlet, and will consist of a gable of red brick with white brick dressings, of no pretensions to architectural beauty. Owing to the rise in the ground, the chapel floor will be some 9 ft. 6 in. above the level of the street, flights of steps leading from the two doors, one on each side, to the entrance-lobby of the chapel. The basement will be used for class-rooms, lighted by rectangular windows. Above these are three plain pointed windows, and then a window with five lancet lights. The edifice will be 60 ft. long by 39 ft. in width, and the height to the ceiling line in the roof will be 32 ft., the height of the walls being 22 ft. At the back of the chapel there will be a minister's vestry, and a vestry for the deacons, and behind the school-room

separate yards for the boys and girls. Mr. W. G. Cunbold is the builder, the amount of the contract being 1,237l.

Luddenden.—A new Congregational choral house has been erected at Booth. Mr. Ralph Nicholson, of London, supplied the plans, while resident at Halifax in 1868. The new building, which is in the Lombardic style, is erected close to the old one, on an elevated site, a little above the Luddenden stream. It is 100 ft. long, 40 ft. wide, and about 40 ft. from floor to ceiling. The principal front, facing south, is flanked at each end by towers, and in the centre of the gable is a large circular window filled in with seven plain circles. On each side of the chapel are double rows of windows, the upper row consisting of five two-light windows, with a circular light over each. The interior of the church has, on three sides, galleries sweeping round the south end in a half circle, the fronts having ornamental iron panels, backed with scarlet cloth. The seats are all open, and are constructed of red deal, which will be stained. In the bottom of the chapel the aisles will be laid with Mosaic tiles, by Messrs. Hargreaves, of Manchester. The organ recess is at the north end. It is a circular one, being supported by two clusters of three iron pillars, and two single ones. The old organ will be removed into it, and there is also room for the choir. Underneath this is a minister's vestry, with a smaller vestry for the deacons. Behind the organ recess is a half circular lobby leading from the north-east staircase. The entrance to the gallery is on the north-west side, on a level with the chapel yard; there being also a staircase on the north-east side, and one from the front entrance. The pulpit is a temporary structure, which will be replaced by one in keeping with the style of the chapel. The roof is a partly open one, and the chapel will be lighted by two sun-lights, about 8 ft. from the top, in addition to pendants on the walls, which are to be painted in imitation of stone work. The accommodation will be ample for about 700 people, allowing 20 in. for each person. The scholars will be seated at the south end of the gallery, opposite the organ and pulpit. As it is intended to convert the old chapel into a school, a wide passage of communication has been constructed between it and the new building. The windows are all filled in with tinted cathedral glass, and the building is warmed by an apparatus, supplied by Mr. Thornton, of Huddersfield. The moulding round the windows is made to form an architrave. The works, though not yet complete, are so far advanced as to allow of the church being opened for divine service. The new edifice is surrounded by grounds laid out in rockeries, flower-beds, &c. The new and old chapels with minister's residence, chapel-keeper's house, &c., are all now within one boundary wall, and there are several approaches to the grounds from the roads both above and below the buildings. The builders are Messrs. King & Pickles, of Halifax; joiner, Mr. Fox, of Sowerby Bridge; painter, Mr. Binns, of King Cross; and plumbers, Messrs. Firth & Sons, of Halifax.

STAINED GLASS.

Sunderland.—The windows in the north transept of the New Church, Stockton-road, have recently been filled with stained glass. The centre window contains a representation of our Lord dispensing the Last Supper, and the two side windows are illustrative of the Agony in the Garden. Above is a rose window, traceried principally with three cinquefoils, which are filled with devotional angels. Texts and ornamentation are introduced throughout. The windows are erected by Mr. Samuel Alcock, Ashmore, to the memory of his son, William Charles Alcock, who was unfortunately drowned in the Mediterranean. The artists were Messrs. James Ballantine & Son, of Edinburgh.

St. John the Evangelist's, Leeds.—A stained glass window, by Messrs. Ward & Hughes, of London, has been placed in the south-east of the chancel of this church as a tribute to the late vicar, the Rev. Edward Monro, M.A. Rich and poor have contributed to the window, and the Sunday-school children contributed 20l. From this circumstance it is usually called the children's window and is placed close to their seats in the chancel aisle. The design is similar to one in Sidmouth Church, executed by Messrs. Ward & Hughes, by command of the Queen, in memory of her father, the late Duke of Kent. The principal group embraces the greater portion of the two centre compartments, and represents

our Lord as saying, "Suffer the little children to come unto me, and forbid them not. And He took them up in His arms, put His hands upon them, and blessed them." The two side lights and lower compartments of centre lights represent the acts of mercy, as follows:—Feeding the hungry; giving water to the thirsty; receiving the stranger; clothing the naked; visiting the sick; aiding the prisoner; teaching the young; caring for the orphans. At the base of the window is a large block of polished Connemara marble, on which is placed a brass, with the inscription.

PROVINCIAL NEWS.

Grimsby.—A private meeting of the corporation was recently held in reference to the scheme for a bridge over the railway and old docks. Mr. Sacré, civil engineer of the Manchester, Sheffield, and Lincolnshire Company, coming to Grimsby on other business, attended the council meeting by prior arrangement. Reporters were refused admission. Both the proposed bridges, however, were considered, and Mr. Sacré expressed himself desirous of meeting the wishes of the council as far as possible in the matter of economising the cost of the bridges. He undertook to draw the best plans be could with that view, and submit them at an early day to the council, and intimated that he would not charge the corporation anything for his professional services.

Ripon.—The almshouses of St. Anne, otherwise called Maison-de-Dien Hospital, supposed to have been erected in the time of Edward VI., having become dilapidated, and the late Mr. H. Greenwood and his sister, of West Lodge, Ripon, having left a sum of money to be laid out in rebuilding the almshouses, the foundation-stone has been laid by Miss Greenwood. Messrs. Parkens & Sons, of Leeds, are the architects; and Mr. J. Thackway, of Ripon, the builder.

Macclesfield.—The works connected with the building of the new county asylum in Macclesfield, which have been in progress about eighteen months, may be said to be approaching towards the half of their completion. The extensive ground-plan is nearly covered with the several sections of the buildings, and about two-thirds of the main building, as well as the governor's house, are covered in. The recreation hall, which will form one of the chief features of the centre block, is now being roofed, and three out of the four large day-rooms,—two in each wing of the building, are also covered in, likewise the intervening corridors, dormitories, &c. The offices, store-rooms, cooking, washing, and other departments are situated in the centre block, and have ready communication with the male and female portions in the right and left wings of the building, each of which will be complete in itself, having separate infirmaries, fever wards, &c. The clock tower, standing about 90 ft. high, will be supplied with dial plates, 8 ft. in diameter, and will be seen from a considerable distance. The town's water has been conveyed to the spot, but the pressure is much below what is desirable: provision, however, for the storage of water is being made by the erection of several water towers. The governor's residence occupies a central position, and, like every other part of the institution,—being on a high level—will command charming views of the surrounding country. A chapel is being erected on the ground for the accommodation of the patients. Excepting this edifice, which is of stone, the whole of the buildings are of red brick, varied by the introduction of black and white blocks of Staffordshire ware. The whole of the brick used in the construction has been made on the spot from several beds of clay found on the site. The architect is Mr. Griffiths, of Stafford, and the contractor, Mr. Lovatt, of Wolverhampton. Between 400 and 500 workmen are employed on the works, the great majority of whom, together with the extensive building plant, steam engines, horses, carts, &c., have been brought by the contractor from his works at Wolverhampton and other places.

The Wolf Rock Lighthouse Door.—The brass door made for the Wolf Rock Lighthouse weighs 13 cwt., and cost 170l. Where it will be fixed, a door, of solid oak, 4 in. thick, was shivered into fragments by the sea, and one 4-in. thick, strengthened by bars of iron 4 in. square, is *locum tenens* till the brass one be put up.

PATENTS CONNECTED WITH BUILDING.

BRICK-KILNS.—*G. & J. Wilson.* Dated November 11th, 1868.—The inventors make a number of openings about half way up the kiln, through the external walls thereof, for the admission of cold air into the bags at or about the centre of the kiln, whereby they obtain greater control over the heat and prevent the formation of smoke. Three perforated quarries, or fire-brick lumps or slabs, are employed, placed one behind the other, and standing over the inner arch of the fire-hole. These perforated quarries further assist in preventing smoke, and serve to keep the fire to the bottom of the kiln. Extending straight down from the center perforated quarry or brick above referred to is the regulator hole or passage, which communicates with a perforated hot and cold air chamber immediately above the fire-hole. This regulator hole and chamber are for facilitating the supply of fuel to the fire-hole, and for admitting hot and cold air thereto. The front of the fire-hole is perforated with numerous holes leading into various parts of the fire-hole, and supplying air thereto for keeping up a uniform and active combustion.

CLOSETS AND URINALS.—*N. Voies.* Dated 18th January, 1869.—This consists of a mechanical arrangement for operating the pan valve of water-closets, and for regulating the supply of water thereto by the simple opening and closing of the closet door. The arrangement consists of sliding rods or bars connected to the door, and by an arm to the valve lever, so that when the door is opened the rods and arm cause the valve lever to rise or move, whereby the pan valve is lowered, and the valve for admitting water to the basin is opened; and again, when the door is closed, the valve lever is lowered or returned, and the reverse action takes place. The valve lever may be weighted so as to return the parts to their normal position, and close the door when pressure is removed from the door; but as the weight for this purpose would have to be heavy, it is preferred to fit a strong spring to the door, so as to keep the same closed when not pushed or pulled open.

HORSE NAILS.—*J. W. Price.* Dated January 18th, 1869.—This consists in providing a machine employed in this manufacture with a special furnace through which the nail-rod is passed continuously before arriving at the anvil or anvils; also in an automatic feed motion for propelling the nail-rod, and in the employment of such machines of two distinct anvils and hammers, one of which anvils is stationary and the other moveable. One of these anvils has formed on its face a die representing a nail on its side, and the other a die representing a nail on its flat, or those dies may be formed on the faces of the hammers of the respective anvils, or partly in the hammer and partly in the anvil in each case.

BURNING BRICKS.—A communication.—*John H. Johnson.* Dated 18th January, 1869.—The essential feature of this invention consists in so constructing a brick kiln that the products of combustion from fires contained in furnaces at one end of the kiln are caused to forcibly permeate the mass of bricks by the action of jets of steam or other equivalent exhausting device situate at the opposite end of the kiln, and *vice versa*, the products of combustion being caused to pass through the mass from one end to the other of the kiln, first in one direction and then in the opposite direction, thereby heating the bricks uniformly throughout; jets of steam are also directed into the combustion chambers and over the fuel of those fireplaces which are in action for the time being, as well as into their corresponding ash-pits.

FLOORING CRAMP.—*W. J. Paine.* Dated 19th January, 1869.—This improved floor-dog is composed of a metal plate, having a boss pierced with a slightly inclined screw-tapped hole, through which passes a screw, the head of which is perforated to receive the end of a lever, and the opposite end socketed in a foot plate. The metal plate traversed by the screw also carries two gripping levers bolted loosely on its underside, the plate being pierced with several holes, so that the pivoting of the grippers may be shifted at pleasure.

WATER CLOSETS.—*J. Steel, N.B.* Dated 13th January, 1869.—A space is enclosed by walls outside of the staircase, and is carried up the entire height of the building or nearly so. This space is partially boarded over and a closet with a seat is constructed at each flat, but the several closets are arranged so that the space

below each seat is perfectly clear down to the bottom. Thus if the space or shaft enclosed by the walls were continued with the same width up to the top, which could be done if preferred, then the top closet would occupy the whole horizontal area, the next below it would occupy that area diminished by a shaft from the seat above, and the lower ones would occupy spaces diminished by the other shafts corresponding to the number of shafts above.

WINDOW BLINDS.—*W. P. Wright.*—Dated 15th January, 1869.—This consists first in making blind-rollers in two parts, that is to say, using a strip of wood of a semicircular or other convenient form with a semicircular or other shaped groove on the flat sides, and by cutting off strips so formed in suitable lengths, using two of such pieces or lengths for a roller, and securing them together by glue or other means; the internal groove will be continuous and uniform from end to end, with an open joint sufficiently apart to allow the fabric or material of the blind to pass between in the following manner:—A broad hem is formed on the top of the blind, into which a strip of wood or other suitable material may be inserted, sliding the same with the blind into the groove of the roller from end to end, an opening being formed in the single flanged metal end for allowing the blind proper to pass in, and securing such end by screwing in the ordinary way, and the other metal end has a sunken groove, or double flanges, which metal end it is preferred to put together in parts, produced partly by casting, drawing, and pressing, and fixed together with press tools, to which a single elevating blind-cord is connected and wound around the same by the drawing down of the blind, the metal ends having projecting centres in the ordinary way working in brackets formed on the window frame.

Books Received.

The New Bankruptcy Act, 1869; together with the Act for the Abolition of Imprisonment for Debt. By T. T. Weightman, B.A., Barrister-at-Law. London: Routledge & Sons.

THE whole law of debtor and creditor is so interfered with by the new Bankruptcy Act, and the Act for the Abolition of Imprisonment for Debt, that it becomes necessary for all persons to make themselves acquainted with these statutes. The author of the little book before us, Mr. Weightman, has arranged the sections of the new Act under their different headings, and endeavoured to place the new law before the general reader in a simple manner. His *résumé* of the new Act may be usefully quoted:—

"Let us see what are the general provisions of the new Act, 32 & 33 Vict. c. 71, which comes into operation on the 1st of January, 1870, and which repeals the whole of the existing law of bankruptcy. The court has hitherto consisted of commissioners in London and the country, with a number of officers, registrars, official assignees, inspectors, and others, who had the government of bankruptcy proceedings. In their stead the new Act substitutes a London court, with one chief judge, and gives in the country districts the bankruptcy jurisdiction to the county courts.

Creditors elect their own officer, called a trustee, and choose further a committee of inspection to superintend the proceedings. By these provisions there will be a better opportunity for the creditors to realize the assets, and prevent any improper dealing with the property of the bankrupt.

A petition for adjudication might be presented by the debtor himself, according to the Act of 1861; but that provision is now repealed, and under the new Act a petition can only be presented by some creditor or creditors. The trustee is to collect the assets. When the bankrupt has paid 10s. in the pound, he will be entitled to his discharge; and he will further be entitled to his discharge involuntarily incurred. Where no discharge is granted, the bankrupt is to be molested for three years; but at the expiration of that time any portion of his property, on application of creditors, may be sequestered. This latter provision of the new Act was also an enactment of the old Insolvent Debtors Act, but never applied to bankrupts, an omission productive of much evil and abuse. All imprisonment for debt is to be abolished, provision for which is made by a separate Act, 'The Debtors Act,' 32 & 33 Vict. c. 62; but in certain cases imprisonment is made the punishment, where any fraud has been committed in contracting a debt. Under the existing law, county court judges have the power of imprisoning debtors who have the means and refuse to pay their creditors. This is to be extended to the superior courts, in cases where the debt is above 50*l.*"

Both the Acts come into operation on the 1st of January next. Mr. Weightman's book will be found useful.

VARIORUM.

Mr. J. N. Reddick's "Report on the Results of an Inquiry into the Causes of the Turbidity of the Water supplied by the Southwark and

Vauxhall, and Lambeth Water Companies" has already properly received attention in many quarters. We will look to it another time.—"Modern Workshop Practice," by John G. Winton, Engineer (Strahan & Co., Ludgate-hill), applies to the manufacture of marine, land, and locomotive engines, floating docks, dredging machines, bridges, and cranes. For 3s. it gives a very large amount of useful and suggestive information.—Alnwick Castle is the subject for Mr. S. C. Hall's "Stately Homes of England" in the current number of the *Art Journal*. It is very fully illustrated. The *Journal* agrees with us in condemning the position of the Peabody statue behind the Royal Exchange.

Miscellaneous.

The Naples Waterworks.—The plan for the execution of the Naples Waterworks, which is now before the Municipal Council of that city, is supported by Baron Erlanger, who has made financial arrangements in Paris, amounting to about one million and a half sterling, for carrying out the entire matter at once. The preliminary deposit, 200,000 francs of the caution money (40,000*l.*), was paid by him on the 24th ult. The plan of the engineer and concessionnaire, Mr. E. Pettis, adopted by Baron Erlanger, is to conduct the spring waters of the basin of Sereno, which are of the greatest purity, to Naples, a city of 600,000 inhabitants, from a distance of about twenty miles. The whole system is high pressure and a constant service of an unlimited supply in the loftiest houses, an inestimable advantage in a hot climate. It is understood Messrs. Laschi, of Vicenza and Varona, are the contractors for a considerable portion of the works. Messrs. Coathape & Co., 88, Cornhill, are the English agents.

The Pollution of the River Aire.—The following resolutions, amongst others, were adopted at a recent meeting of the proprietors of the estates on the banks of the river Aire below Leeds:—

"That the pollution of the river Aire, below Leeds, occasioned by the discharge of offensive matter from the sewerage works of the Leeds Corporation, has recently increased so rapidly, and has now become so serious, that the health of the inhabitants throughout the valley is seriously affected, and during the summer months it is unsafe to reside on its banks; and that the water itself has become so impure as to become totally unfit for cattle, and destructive to fish." "That by the provisions of the 23rd section of the 'Towns Improvement Clauses Act, 1847,' incorporated with the 'Leeds Improvement Amendment Act, 1848,' under which the corporation obtained Parliamentary power to convey their sewerage into the river Aire, the corporation are under express obligation to take care that their works shall in no case create a nuisance." "That Messrs. Dibb, Atkinson, and Brewster be requested, on behalf of the proprietors present and represented at this meeting, to apprise the corporation of the proceedings in contemplation, and that the corporation be requested to state, within one month, whether they are prepared to give a satisfactory assurance that measures will be forthwith adopted for effectually abating the existing nuisance; and further, that no additional drainage ducts shall be connected with the existing sewers until such measures have been carried into effect."

Megalithic Monuments.—At the Exeter meeting of savants, Mr. A. L. Lewis read a paper on this subject. He pointed out the practically unbroken chain of megalithic monuments extending from India to Great Britain, and asked who were their builders? Such an identity of plan as could not be accidental, extending through an unbroken chain of communication, and the existence of common practices and superstitions, and other traces of affinity throughout that chain, led to the conclusion that there must at least have been a great common influence at work throughout this area, though possibly not an absolute community of race. They were probably constructed under Celtic influences, at least in Europe and Africa. The consideration of a number of facts, he urged, induced the belief that the single upright stones (menhirs) were used as memorial pillars, the circles and alignments primarily as places of sacrifice, and the dolmens, or table stones, of which there are two well-marked varieties, as places of sepulture on the one hand, and places of sacrifice or memorial on the other.

Flowers and Fruit for Sick and Poor.—Leiston, in the United States, has a well-organized system for the distribution of flowers to the sick, the idea of which, according to the *New York Times*, was suggested by a little girl, and inquiries are now being made in the city of New York whether a similar arrangement cannot be made to secure the distribution of fruit among the poorer classes.

The International Statistical Congress.—The seventh meeting of this congress was held this year at the Hague. The previous meetings were held successively at Brussels, in 1853; Paris, in 1855; Vienna, in 1857; London, in 1860, under the presidency of Prince Albert; at Berlin, in 1863; and at Florence in 1867. The British delegates and fellows of the Statistical Society present were Lord Houghton, W. Newmarch, F.R.S. (the president), Dr. W. Farr, F.R.S., J. F. Hamrick, R. Valpy, P. L. Simmonds, S. Brown, W. T. Thomson, E. Chadwick, C.B., W. Donnelly, C.B., J. Heywood, &c. The other foreign representatives numbered more than 100, exclusive of the Dutch. The countries which have sent delegates to the congress are the United States, Austria, Baden, Bavaria, Belgium, Denmark, Spain, France, Great Britain, Greece, Hamburg, Hesse, Hungary, Italy, Mecklenburg, Norway, Prussia, Roumania, Russia, Saxony, Servia, Sweden, Switzerland, and Württemberg. The general assembly was divided into the following five sections:—1. Theory of statistics and application of statistical facts; 2. Statistics of justice, civil and commercial; 3. Finance; 4. Fisheries and commerce; 5. Statistics of the European Transatlantic possessions. Rooms were placed at the disposal of each of these sections in the Parliament House. On Sunday, the 5th inst., a public dinner was given to about 100 guests in the great room of the Zoological and Botanical Society, M. Quetelet, presiding, supported by the ministers of the Interior and of Finance. On Monday, the 6th, the king received the delegates officially, at a special audience, at ten o'clock, and afterwards they visited the queen, at the palace in the wood. On Monday evening there was a special musical *fête* in the Zoological Gardens, which were brilliantly illuminated. On subsequent days there were other receptions, dinners, *fêtes*, &c. The palaces, picture-galleries, museums, libraries, hospitals, and other public buildings were thrown open free to members of the congress.

Opening of New Dock at Birkenhead.—The Morpeth Branch Dock, which has been constructed on the site of the old Morpeth or Woodside Basin, has been opened. The original Morpeth Dock was entered by an opening in the north-west corner of the Woodside Basin, which was simply a large open space that dried at low water, and was principally useful for vessels to beach on, being fitted with a large gridiron alongside the west quay. Soon after Mr. Fosbery Lyster took engineering charge of the dock estate, he found that this basin was rapidly silting up, and that the necessity of constantly dredging the approach to the Morpeth Dock quite overbalded any advantage derived from the sheltered parts of the entrance. He accordingly proposed to the Dock Board that in addition to enlarging the Morpeth Dock itself, a new entrance should be made, consisting of a passage 85 ft. wide, running from the dock in a southerly direction, and opening directly upon the river, having four pairs of gates, and including a locking chamber 398 ft. in length,—the south-western quay traversing the site of the old Morpeth Basin in a slanting direction to its river face at the south-east corner. The portion of the basin thus enclosed he suggested should be made into a branch dock of triangular form, having an opening from the Morpeth Dock at its old entrance of 85 ft. width. The work was in progress about two years, and has been recently completed. The depth of the new branch dock is about 3 ft. below the level of the sill at the entrance, and, with a 20 ft. 4 in. tide, there is a depth of 34 ft. 6 in. water in the dock.

London General Omnibus Company.—The extraordinary (half-yearly) general meeting of shareholders has been held. It appeared from the report that the gross receipts of the company during the half year ended 30th June last amounted to 270,925*l.* 16*s.* 8*d.*, and that during the corresponding half-year of 1868 the gross receipts amounted to 251,780*l.* 1*s.* 6*d.*, showing a decrease of 18,354*l.* 17*s.* 10*d.* The total expenses during the half-year ended 30th June last were 252,455*l.* 12*s.* 2*d.*, and the expenses in the corresponding period of 1868 were 277,722*l.* 12*s.* 3*d.*, showing a decrease of 25,267*l.* 0*s.* 1*d.*; balance remaining from previous half-year, 686*l.* 12*s.* 7*d.*; profit on the working account, 18,470*l.* 4*s.* 6*d.* The directors proposed to declare a dividend of 2*s.* 6*d.* per share, or 6*½* per cent. per annum, free of income-tax, amounting to 18,708*l.* 11*s.* 2*d.* The report and accounts were adopted, and the dividend was declared.

The Earthquake-proof Dwellings of the Japanese.—The frequency of earthquakes in Japan is a reason for nearly all the habitations of man there being built of wood; and by long experience Japanese builders have arrived at certain modes of building by which the great danger of a house coming down upon the inmates is in many cases obviated. They seem, says Mr. Dickson, in his book on Japan, to depend upon the roof for weight; and the piles upon which this heavy roof rests are not fixed firmly into the ground, but some of them are fixed slightly into a square framework of wood, laid on stone, while the others stand simply each upon the surface of a large, round, hard, water-rolled stone, which has been firmly imbedded in broken-down sandstone. By this means the snap of a sudden shock is avoided, and some slight motion is allowed. Whatever be the principle upon which these houses are erected, it is wonderful to see buildings which seem to be put up in a shape the most ready to topple over upon the least motion, withstand the shocks of earthquakes for ages. There are pagodas in many parts of the country of seven and even nine stories high. At Kamakura is a temple with a narrow circular neck, above which the eaves of a square roof project to about 10 ft. on every side, resembling the projection of a Chinaman's hat. It is said to be two hundred years old. The Californians, who want to know how to make earthquake-proof buildings, should make a run across to Japan and study the subject there.

Drowning by Carbonic Acid Gas in Wells.—Two more cases have occurred, in which four persons have been suffocated or drowned in the heavy gas which is so apt to lodge in wells. In one of these cases, at Rochdale, well-sinking was going on: the well had been sunk 24 ft. by 4 ft. 6 in. wide: water had been got, and, after a night's interval, one of the well-sinkers was lowered, without previously testing the air with a light, and almost immediately he fell over as if in a fit. Another slid down to his aid, and of course met with the same fate. Then a rope was tied round a volunteer, who also became stupefied, and had to be drawn up. Wool-hooks were then got, and the two poor fellows were hooked up quite dead. In the other case, a well-fitter was engaged about 16 ft. down a well in altering the piping and must have been overcome by the gas. He fell into the water, and disappeared, while no one was looking on. Another went down in about an hour, but had to be raised to the surface again from the influence of the foul air upon him. A third man then insisted on going down, though warned of the state of the well, and was allowed to do so, even without any rope attached to him. He also, of course, was overcome by the gas; and in fifteen or twenty minutes a young man was lowered, at last with a rope attached, and succeeded in fastening ropes round the two dead bodies, when all were hauled up. Warning and instruction are of no avail. Some people will believe in nothing they cannot see or handle. Well-sinkers and fitters, however, ought to know better.

The "Wand-laus."—To ears polite this German word may be more tolerable than the vulgar cognomen "bug," with which, as wall-louse, it is synonymous. A correspondent, "W. H. C.," the 101st, at least, who has made anxious inquiries of us, one time with another, as to this celebrated and interesting creature, wishes to know how to dispose of him in a wall without injuring the paper. The pyrethrum powders are said to be of use, and as these powders may be blown into crevices, or on to papers, from the puff-balls, we should think they might be blown off again without injury to the paper; but we doubt the possibility of getting them out of a wall without scraping off the paper, and dosing them well with something like chloride of lime. The chloride, however, might be used in their favorite haunts, and the paper on these parts renewed after scraping, at very little expense, if the paper pattern happened to be obtainable. As the wall-louse feeds on the paste of wall papers, could not the paste be well spiced with something that would be good for them, especially if that could be done without necessitating resort to heroic remedies such as corrosive sublimate, arsenic, *et hoc genus omnia*? It is said there are insect powders, such as Keating's of St. Paul's Chantry, which kill insects without being poisonous to animal life generally; but whether such powders would be still effectual when mixed with paste we do not know.

The Question of Public Mortuaries.—At the last meeting of the Clerkenwell vestry, Mr. Franklin referred to the strong remark made by Dr. Hardwicke, the deputy coroner for Central Middlesex, upon the condition of the Clerkenwell mortuary, and suggested that some improvement in the way of ventilation should be made, as its present state was most discredit-able. Mr. Croucher "hoped the ratepayers' money would not be foisted away in altering the building." Mr. Thompson thought the erection of the mortuary was one of the most proper works undertaken by the vestry. Mr. Hopkins "hoped the vestry would let the matter drop; and, as to improving the ventilation, he hoped nothing of the kind would be done, as a storm of indignation would be raised over their heads if the ventilation were improved." Mr. E. D. Johnson was astounded at the observations of Mr. Hopkins, and he agreed with Dr. Hardwicke that the public mortuaries should be kept in a fit and proper condition. Mr. Brooke should be glad to vote such a sum as would place the building in such a state as to induce the poor to take the dead bodies of their relatives there until they were buried. Mr. Gillingwater suggested that a disinfectant should be used in the mortuary. After some further discussion, a resolution, moved by Mr. Hopkins, and seconded by Mr. Croucher, to the effect that no further outlay should be made upon the mortuary, was put and lost, and the matter was referred to the sanitary committee to report upon.

Miss Coutts's Market and the Tradesmen.—A meeting of the tradesmen of Hackney-road and neighbourhood has been held, for the purpose of considering the great detriment to trade in the vicinity, occasioned by the destruction of a large number of houses in the erection of Miss Burdett Coutts's Columbia-market. The demolition, it was stated, had resulted in the removal of a large number of people from the locality, and the tradesmen had consequently sustained a serious loss. The chairman said that 91 houses had been removed to make room for the market and the model dwellings, but in consequence of some misunderstanding in the purchase of one of the houses, affairs had remained *in statu quo*, and the ground was unoccupied. Resolutions appropriate to the occasion, and to the opinion of the tradesmen present, were passed, including a memorial to Miss Coutts. Mr. Mortlock, in moving a resolution, which was passed, that a deputation be sent to the vestries of St. Leonard, Shoreditch, and St. Matthew, Bethnal Green, said he thought the market was entirely out of place in the east of London, and was better suited to the west. Passers-by inquired whether it was a cathedral. He thought Miss Coutts was not aware of the fact that 400 families had been driven away, and that distress had been caused by the ground remaining un-occupied.

Does Brain Work shorten Life?—An American paper, treating on this subject, says,— "In the Massachusetts report for 1867, it is stated that in twenty-five years nearly, the deaths of 3,663 professional men had been reported, with an average of 50.5 years, and 9,856 merchants, financiers, agents, &c., with an average age of 48.4 years. The average of those who died in some of the most important professions and occupations was as follows:—

	Years.	Years.	
Bankers.....	517	Judges and Justices ...	68.4
Bank Officers.....	54.8	Lawyers	59.1
Merchants.....	50.6	Physicians.....	59.0
Booksellers.....	50.5	Professors.....	59.9
Clergymen.....	57.8	Public Officers.....	64.5

Many more are injured by excessive indulgences of the bodily passions and appetites than by excessive indulgence in literary labour. Tobacco and alcohol produce far more softening of the brain and disease of the heart among students in this country than close application to their studies. The leading public men of all countries, notwithstanding their severe mental labour and the excitement of their anxious life, reach old age. In fact, the brain men, independent of dissipation, seem to outlast ordinary men.

The Velarium.—The fresco lately discovered in Pompeii, and now in the Bourbon Museum at Naples, is said to show that the Velarium was not, in all cases at any rate, a covering for the whole area of the amphitheatre, to protect from sun or rain, but merely a curtain or awning for the upper galleries. Stairs are represented, leading up to the boxes set apart for the gladiators. Some remains of these stairs may still be traced in the ruins.

Whitworth Scholarships.—The following is a list of the successful candidates, with their ages, occupations, and the number of marks they obtained, who have been reported to the Science and Art Department as entitled to the ten Whitworth scholarships of 100*l.* a year each:—William H. Greenwood, aged 23, engineer, student at the Mechanics' Institution, Manchester, 143 marks; Thomas A. Hearson, aged 23, engineer student, Royal School of Naval Architecture, 137 marks; John Hopkinson, B.Sc., aged 19, student at Cambridge University, 134 marks; Thomas S. Elgood, aged 24, mechanical engineer, Leicester, and Owens College, Manchester, 127 marks; George A. Greenbill, aged 21, student at Christ's Hospital School, and Cambridge University, 116 marks; John R. Brittle, aged 23, engineer, student at Sir Walter St. John's School, Battersea, 113 marks; Thomas W. Phillips, aged 23, student at British School, Millwall, and Royal College of Science, Dublin, 100 marks; Richard Bennett, aged 21, engineer, student at the Royal School of Naval Architecture, 98 marks; Robert B. Buckley, aged 21, engineer, student at Merchant Taylors' School, 97 marks; Charles E. Leeds, aged 23, B.A. (Oxon), student at Oxford University, 96 marks.

Tramway Branchlets to Railways.—The prospectus of the Tram-Railway Company of Great Britain, with a capital of 500,000*l.*, in five series of 100,000*l.* in shares of 10*l.* each, has been issued. The company, which proposes to purchase the patent of Mr. Thomas Page, G.E., and Mr. Haworth, is started for the purpose of bringing, by properly constructed tramways or road rails, into direct communication with the existing railway systems, outlying towns and districts, without building costly viaducts, embankments, and bridges, or making tunnels and cuttings. It is stated by the company's engineers that the cost per mile of a tram-railway on the company's systems will average about 2,000*l.*, while the cost per mile of the railways already existing, including purchase of land, &c., has averaged 35,000*l.* The prospectus informs us that "The public highways will not in any way be obstructed, nor the ordinary traffic impeded," and that "an ingenious locomotive, the invention of Mr. Page, will be employed where required, which will ascend steep gradients, make no noise, and, by incorporating with it the leading characteristics of Allen's economic engine, will be worked at a cost of about one-third of an ordinary locomotive."

Self-moving Velocipedes, Cabs, and other Vehicles.—In reference to an announcement in the *Builder* from Paris that a velocipede, or travoiser at least, has been invented in which the weight of the siter on the vehicle is made to act in impelling it, a constant subscriber, who dates from Manchester, and says he is "one who desires a change in the old-fashioned time-worn carts, cabs, omnibuses, &c.," thus writes to us:—"You may say that it is easy for the weight to be placed so as partly to revolve the wheel, but how is the weight to be brought to bear a second time? I say simply by a lever. I believe that the plan of the French velocipede that they are about to patent will be something in this shape; but if it is, I will bet them, for I am making one that is like a young horse that will not stand still except I hold it. I feel quite convinced that this weight as a motive power will revolutionise all kinds of conveyances." We do not quite see it in the light in which our correspondent puts it; but what is of decided importance here is to find that the subject of self-moving vehicles is fermenting in the public brain as it is in that of our correspondent.

Death of Dantan, the French Sculptor. The death of Dantan, the younger, telegraphed from Baden, has caused regret in the artistic world. Jean Pierre Dantan was born in 1800. Like his brother and many other sculptors, Marochetti among the number, Dantan was a pupil of Botic. His comic statues of Count D'Orsay, Lord Brougham, Talleyrand, and a host of notabilities, won him fame and gold. His chisel, however, produced serious works, such as the statue of Adelaide Kemble, the bust of Gristi and one of Rose Cheri.

A Friendly Pitcher.—Mr. Sidney Davey's "Pitcher" machine has been in operation at St. Agnes. It will receive sheaves from six bands at once and deliver to as many more, at a height of 30 ft., or any lesser height. By means of the "pitcher," and other machines, Mr. Davey secured the produce of 125 acres of corn in four days.

The Royal Albert Asylum at Lancaster. A public meeting in aid of this institution has been held at Ulverston, under the presidency of the Duke of Devonshire. The object, according to the chairman, was to raise funds to build and start, free from debt, an institution on the model of Earlswood, which would afford accommodation for 500 inmates, and be capable of easy extension. Considering the wealth of the seven associated counties there ought to be no difficulty in obtaining the 19,000*l.* still needed; and his Grace concluded by forcibly appealing to Ulverston and the North Lonsdale district generally to do its full share of the work in raising the amount. Resolutions expressive of hearty sympathy with the object of the meeting, and appointing an influential local committee, were carried.

South London Music Hall.—The foundation-stone of the new South London Music-hall, in the London-road, Southwark, has been laid by Mr. Stanley Vickers, M.P. The building is being erected by Mr. Edwin Villiers, a caterer for the public in music-hall entertainments. The building is 118 ft. long, 70 ft. wide, and 50 ft. high, interior measurement. The stage, which will be erected on the south side, will be the whole width of the building, and will have beneath it a space of 20 ft. deep, to receive the scenery. The style of the building will be Italian. The pit and stalls will be on the ground floor, the boxes on the first floor, and the gallery above. The hall will be capable of holding between 3,000 and 4,000 persons comfortably, but on a pressure as many as 5,000 persons can be accommodated. The orchestra will be 30 ft. wide, and will hold forty performers. The internal decorations are not yet decided upon. The outer walls have been nearly completed.

The New Telegraph Act.—Under the new Telegraph Act, passed on the 9th ult., arrangements are being made by the Postmaster-General with the various telegraph companies, and in a short time it is expected the telegraphs will be in the hands of the Government. By the Act of last year, the sum of 5,715,048*l.* 8s. 11d. was authorised to be paid to the companies mentioned. The chief object now sought is to give authority to the Treasury to raise funds which will be required to enable the Postmaster-General to carry into effect the arrangements he is making. The Treasury may raise sums not exceeding 7,000,000*l.* for the purposes of the Act, either by terminable annuities, or by the creation of Exchequer Bills or Bonds, and the moneys raised are to be placed at the disposal of the Postmaster-General under certain regulations. The accounts, &c., are to be laid before Parliament. Messages are to be deemed "post letters," and the present and last year's Act to be considered as "Post-office Laws."

Free Libraries in Berkshire.—A public meeting in furtherance of a proposed free library in Wallingford, in response to the Hon. Anthon Herbert's offer of pecuniary assistance, has been held in the town-hall. Mr. Edward Wells, the president of the Wallingford Mechanics' Institution, occupied the chair. Mr. W. Blake Atkinson, the hon. secretary to the provisional committee, gave a statement of the steps that had been taken in the matter, from which it appeared that 177*l.* had been subscribed by inhabitants of the town and neighbourhood. Resolutions were then passed expressive of hearty approval of the undertaking, and recommending that the proposed free library should be incorporated with the mechanics' institution. The general feeling expressed was that a building should be erected; and further promises of substantial support were made. It is stated that Wallingford has been the first town to lay claim to one of Mr. Herbert's gifts of 150*l.*, having been the first to fulfil the required conditions.

Opening of the Corporation Baths, Sheffield.—These baths have been formally opened by the Mayor. The building possesses no architectural points whatever, being merely a red brick building of a very ordinary character. Mr. S. F. Holmes, the borough surveyor, having but a limited estimate to work upon, set aside architectural features to make the inside as spacious and comfortable as possible. The swimming-bath is large and well lighted. The water which will be used in the baths will be applied to the flushing of the defective sewers in the adjoining streets. For this purpose drainage pipes have been laid from the baths to the sewers.

A Canal from Calais to Calcutta.—Sir Arthur Cotton has proposed to the Indian Government a scheme for a canal from Calcutta to Calais, *via* the Caucasus. He points out that a great deal of work has already been done, there being already a canal from Hurdwar to Cawpore, and one from Calcutta to Oolyabarrah, besides numerous portions in Europe, while the Black Sea might be made use of in fine weather, and until the work was finished. The summit level of 13,453*ft.* would be reached by a series of locks, worked by steam machinery; an abundant supply of water would be obtained there by an ancient across the source of the Euphrates; the surplus, after filling the canal, to be applied to irrigating the Khadir of the Caucasus, whence alone, he says, an abundant revenue might be obtained. Sir Arthur calculates that by means of this complete inland water communication, goods and passengers could be conveyed from India to Manchester at one-ninth of the cost of the present route, at an average speed of 2*½* miles per hour; and, in face of these facts, he protests against the public revenue being squandered upon railways.

A New Use of Photography.—The important problem of measuring distances and constructing plans and maps by means of photography has at length been solved, says the *North German Correspondent*. Since the art of photography has been sufficiently improved to permit the apparatus to be easily moved from place to place, and to produce pictures which are correct in a perspective point of view, the Berlin photographer, Mr. Meydenbauer, has paid great attention to the subject. At length he succeeded in convincing the Prussian Government of the correctness of his theories, and was commissioned to survey a fortification. In six months he had succeeded in obtaining 800 plates, and he met with no great difficulty in completing a photogrammetric instrument of such simplicity that a workman quite unacquainted with the art was able to draw up a special plan of a fortress on the scale of 1 to 2,500 after a few short instructions. The photographic camera can therefore in future be employed for a number of important purposes.

Enamelled Glass Mosaic Work.—Some specimens of enamelled glass mosaic work have recently been placed in the arcade of Ereter College, Oxford, immediately below the apse windows of the college chapel. The work was executed in Venice, by the Salviati firm, and placed in its present position by Luigi Verona and another Italian artificer, of London. The arcade stretches round the five sides of the chancel, each side containing three arcades. Dr. Ridding, head-master of Winchester College, gave 300*l.* towards the work, the remainder of the cost being defrayed by several donations given at various times, supplemented by a vote from the college authorities. The altar steps, also just added, are of red Devonshire marble, and are the gift of one of the fellows of the college.

House-moving in Boston U.S.—In the work of straightening and widening some of the very crooked streets of Boston, it became necessary to move a building known as "Hotel Pelham." This building is of freestone, 96*ft.* high, and weighs, it is estimated, 10,000 tons. It was moved 14*ft.* in three days, by means of rollers and screws, a portion of the side-work being also moved with it. No crack was made in the building, and nothing in it was at all disturbed. The fastest rate accomplished was 2 in. in four minutes. A large bank building adjoining the hotel was used to brace the screws against. A great number of these screws, 21 in. long, were employed. 25,000 dollars were paid to the contractor for moving the hotel.

Salisbury Cathedral.—The proposal to restore the choir of Salisbury Cathedral, at a cost of some 15,000*l.*, as a memorial of the late Bishop Hamilton, has been adopted throughout the diocese, and already upwards of 6,000*l.* have been subscribed towards the object. Mr. G. G. Scott has made a personal survey of the choir, and is preparing plans for the restoration.

Lead-encased Block-tin Water-pipe.—A tin pipe, covered with lead, was a desideratum for water and other liquids, and for gas, but especially for water. A pipe, which seems to be of American invention, has been patented by a Mr. Haines, in this country, to meet the desideratum. It is highly spoken of by Professor Silliman, and may not be so worthless an invention as some tin-lined lead pipes we have seen.

Aberystwyth.—A memorial stone of a new English Baptist chapel in Aberystwyth has been laid by Mr. E. M. Richards, M.P. for the county. The site is on the west side of Alfred-place. The plan is a parallelogram, 56 ft. by 33 ft. inside measurement. The ground floor and a gallery on one end will seat about 450 persons, and there are schoolrooms and vestries underneath. The back and side elevations are to a great extent hidden by other buildings, and are consequently plain, but the principal façade to Albert-place will present an elevation carried out with Rbanon stone dressings and local stone worked square random. The ceiling will be of a wagon-head shape, cut up into ribs and panels with a large quantity of detail. All the pews are to be of pine, stained and varnished. The minister's platform will be of pitch pine, French polished. The contract has been let to Messrs. L. & J. Evans, local builders, for 1,560l. The architect is Mr. R. Owens, of Liverpool.

Saltley.—The inscription-stone of the Saltley Training College Schools has been laid. The buildings will occupy part of a plot of ground, 2½ acres in extent, recently added to the college, at a cost of 1,000l. They are designed by Messrs. Paull & Robinson, of Manchester, and are being erected by Messrs. Parnell & Son, of Rugby. They will consist of three principal schools, besides class-rooms, and will be especially adapted for giving to the students of the college practical instruction in the art of teaching. It is estimated that the cost of the schools (exclusive of the site) will be 2,500l. Towards meeting the expense of the purchase of the land and the erection of the schools there have been promised or received about 2,400l.

Some Effects of Combustion.—It is asserted that one hour after the gas of London is lighted the air is deoxidised as much as if 500,000 people had been added to its population. During the combustion of oil, tallow, gas, &c., water is produced as well as carbonic acid: in cold weather we see it condensed on the windows. By the burning of gas twenty-four hours in London more water, it is estimated, is produced than would supply an emigrant-ship on a voyage from England to Australia.

New Blackfriars Bridge.—The report now is that the new bridge at Blackfriars will be opened to the public on Michaelmas-day, but we should think this very unlikely. At any rate, there can be no ceremonial of any consequence if it be so. The course of the traffic over the temporary bridge has been changed at the two ends so as to admit of the formation of the approaches to the new bridge.

Removal of the Sabloniere Hotel.—Often threatened, the building materials of this hotel in Leicester-square have at last been sold, and the clearance of the site for the purposes of projected improvements will shortly be effected. Hogarth came to live in 1733 in what is now the northern half of the hotel. If he were alive now he would make a telling picture of the present disreputable condition of the enclosure.

The Seat of H. H. Prince Duleep Singh.—The mansion, Elydon Hall, Norfolk, is in course of rebuilding, from the design of Mr. John Norton, the builders being Messrs. Cubitt, of Gray's-inn-road. The west wing is the first instalment. The present house was erected by Admiral Keppel, first Earl Albemarle, but in size is inadequate for the uses of the present owner.

TENDERS.

For the erection of St. Luke's National Schools (boys and girls), Preston. Messrs. Myres, Vevers, & Myres, architects:—

Cowell & Clayton	£1,917 0 0
Cooper & Pugh	1,712 3 6
Exton, Brothers	1,655 0 0
Bamber	1,630 0 0
Aiston (accepted)	1,628 0 0

For rebuilding No. 3, Little Warner-street, Clerkenwell. Mr. W. P. Griffith, architect:—

Lidstone & Son	£378 12 0
Banford	349 0 0
Martin	329 10 0
Wagstaff & Son	288 0 0

For new house and farm buildings, on the Redstone Estate, near Brackley, Northamptonshire, for the Warden and Fellows of Merton College, Oxford. Messrs. Lavender & Son, architects:—

Hawkins	£2,590 7 8
Hedges & Son	2,610 16 8
J. & T. Davis	2,400 0 0
Munday	2,288 18 0
Haddon	2,185 0 0
Claridge	2,016 0 0

For the erection of large hall and offices for the Hammer-smith Town-hall Company. Mr. H. Saxon Snell, architect.

Quantities supplied:—	
Pollard	£2,397 0 0
Taylor, Pitts, & Co.	2,360 0 0
Cowland	2,060 0 0
Henshaw	1,867 0 0
Blackmore & Morley	1,850 0 0
Manley & Rogers	1,670 0 0
Snowdon	1,615 0 0
Nutt & Co.	1,800 0 0
Nightingale	1,864 0 0
Crabbs & Vaughan	1,862 0 0
Rankin	1,850 0 0
Capps & Ritso	1,765 0 0

For alterations and additions to house and outbuildings at Stoke Prior Mills, near Bromsgrove, Worcestershire, for Mr. W. H. Wall, Mr. W. Seckham Witherington, architect:—

First Design.		
House.		Outbuildings.
Lovatt	£1,300 0 0	£318 13 3
Beasly	1,200 0 0	287 0 0
Wood	1,159 12 0	237 18 0

Second Design.		
House and Outbuildings.		
Wood	£232 4 6	
Shilcock	—	694 1 6

For the erection of a dwelling-house, with offices and stabling, at Priory Park, Roehampton. Mr. F. Warburton Stead, architect:—

Hill, Keddell, & Waldram	£1,686 0 0
Gannon	1,648 0 0
Gascoyne	1,610 0 0
Wacombe	1,658 0 0
Adamson	1,600 0 0
Elbs & Sons	1,398 0 0

Accepted for alterations to Bancroft House, Hitchin, Herts, for Mr. C. W. Wislere. Mr. J. Shilcock, architect:—

Bricklayer's and Plasterer's Work.	
Warren	£160 0 0
Carpenter, Joiner, and Painter's Work.	
French	£143 5 0

For new school and class rooms, for the Trustees of the Independent Chapel, Hitchin. Mr. J. Shilcock, architect:—

Jeeves (accepted)	£1,020 0 0
Butterfield	1,000 0 0

For building three small houses, at Hitchin, for the Trustees of the Two Brewers' Benefit Society. Mr. J. Shilcock, architect:—

Anderson	£451 7 0
Stapleton	440 0 0
Ansell	465 0 0
F. Jeeves	400 0 0
G. Jeeves	398 0 0
Joyner	398 17 0
Butterfield (accepted)	387 15 2

For villa residence, at Aisager, for Mr. John Keen. Mr. Geo. B. Ford, architect, Burslem:—

Lea	£1,761 17 0
Ellis	1,647 0 0
Hodkinson	1,613 6 3
Wood (accepted)	1,514 0 0

For cottages at Spring Bank, near Tunstall. Mr. Geo. B. Ford, architect:—

Birtch	£692 0 0
Hammerly	650 0 0
Sambrook (accepted)	6 0 0

For a pair of cottages on Feag Hays Estate, near Tunstall. Mr. Geo. B. Ford, architect:—

Seragg	£213 0 0
Rowley & Whittingham (accepted)	210 0 0

For schoolmaster's house, at Crewe. Mr. Geo. B. Ford, architect:—

Ellaon	£220 0 0
Wood	210 0 0

For erecting show-rooms and offices, in the Grosvenor-road, Pimlico, for Mr. B. Fabricotti. Mr. F. G. Widdows, architect:—

Rider & Son	£4,107 0 0
Candler	4,100 0 0
Pritchard	4,084 0 0
Troploe & Sons	4,067 0 0
Finch	3,958 0 0
Conder	3,968 0 0
Ennor	3,954 0 0
Newman & Mann	3,676 0 0

For two residences, in the Woodford-road, Sharnbrook, for Mr. B. Rowbotham. Mr. F. G. Widdows, architect:—

Hunt & Ellington	£2,280 0 0
------------------	------------

For additional farm buildings, Burchell Chesham, for Mr. T. Hampidge. Mr. F. G. Widdows, architect:—

Cleussum	£413 0 0
----------	----------

For new wing, at Royal St. Ann's Society's School, Brixton-hill. Mr. J. Wimble, architect:—

Jones	£1,491 15 0
Candler	1,480 0 0
Smith	1,415 0 0
Bartlett	1,370 0 0
Taylor	1,359 0 0
Ramsay	1,331 0 0
Andrew	1,290 0 0
Colls & Sons	1,245 0 0
McLuscan	1,160 0 0

For the erection of ten dwelling-houses (containing 100 suites of rooms, each suite consisting of living room, scullery, two bedrooms, and W.C.), in Lisle-street, Finsbury, for Mr. E. Foster. Mr. John S. Ellis, architect. Quantities not supplied:—

Dove, Brothers	£11,655 0 0
Maxwell	13,000 0 0
Bates (accepted)	11,000 0 0

For new rectory, Hutton, Somersetshire. Mr. Hans F. Price, architect:—

Shorney	£2,050 0 0
Essett & Co.	1,925 0 0
Harvey	1,763 13 0
Perry	1,710 0 0
Hartree	1,700 0 0
Hawkins & Sons	1,673 0 0
Bunsell	1,512 10 0
Dale	1,348 0 0
Corrill (accepted)	1,265 0 0
Tucker	1,151 5 0

For additions and alterations to the Clock House, at Potter's Bar, Middlesex, for Messrs. Haddock. Quantities furnished by Mr. Shrubsole:—

Warne & Co.	£1,380 0 0
Leach	1,340 0 0
Walton	1,199 0 0
Cooke & Green	1,149 0 0
Crabbs & Vaughan	1,077 0 0
Till	997 0 0
Knight	997 0 0
Scrivener & Stephens	968 0 0
Turner	837 0 0
Shirley & Horne	838 0 0

For a block of buildings containing dwellings for sixty-five families, in addition to four large shops, to be erected on the Marquis of Westminster's Estate, Ebury square, Pimlico, for the Improved Industrial Dwellings Company, limited. Messrs. Beck & Lee, architects. Quantities furnished by Messrs. Weich & Atkinson:—

Ash & Horner	£14,369 0 0
Hill, Keddell, & Waldram	14,326 0 0
Brass	13,230 0 0
F. Anson	14,120 0 0
Jackson & Sharr	14,110 0 0
Conder	13,805 0 0
Henshaw	13,795 0 0
Myers & Sons	13,578 0 0
Perry & Co.	13,273 0 0
Allen & Son (accepted)	12,327 0 0

For erection of two houses, in the Lewes-road, Brighton, for Mr. H. Lester. Messrs. Gouly & Gibbons, architects:—

Lockyer (accepted)	£998 0 0
--------------------	----------

For a new billiard-room, at the Clarence Hotel, St. Andrew's, for Mr. W. Finch. Mr. Cutler, architect. Quantities supplied by Mr. Shrubsole:—

Danstan	£288 0 0
Davis	860 0 0
Pitcher	810 0 0
Webb	790 0 0
Warne	700 0 0
Cooke & Green	700 0 0
Till	651 0 0
Smith	630 0 0
Crabbs & Vaughan	650 0 0
Cubitt	649 0 0
Chisholm	630 0 0
Blease	593 0 0
Shirley & Horne	580 0 0
Blackmore & Morley	575 0 0
Stone & Co.	570 0 0
Turner	528 0 0

For reseating and general repairs to Clerkenwell Parish Church. Mr. Bashill, architect. Quantities by Mr. T. M. Rickman:—

Oak	Pitch Pine	Deal
Conder	£1,493	£1,265
Colls & Sons	1,433	1,252
King & Sons	1,363	1,197
Knight	1,357	1,255
Dove, Brothers*	1,180	1,031

* Accepted.

Poplar and Stepney Sick Asylum.—[List previously given.] Accepted tender:—

Mann	£29,932 0 0

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

The Builder.

VOL. XXVII.—No. 1390.

Technical Education in France.

WE are not about at this moment to enter into any of the numerous ingenious arguments that have been put forth, both for and against the introduction of an extended system of technical instruction amongst our working men. Our present purpose is merely to show what is the extent and the nature of the instruction which the working man of France may get, if he has the mind to seek it. The great French Exhibition of 1867 told us how sharp was the competition of Continental manufacturers with this country. We saw there the wonderful steel-castings of Krupp, and of the Bochum Company in Rhenish Prussia. We found Borsig, of Berlin, sending to Paris his two-thousandth engine of better make than any from French and Belgian factories. Subsequently we heard that M. Schneider, of the Great Creusot works in France, had made a score of engines for our Great Eastern Railway, built from drawings and specifications sent to his workshop from this country. The cry has arisen, and is getting louder and louder still, that the foreigner should be shut out, or at any rate restricted in some way or other, from coming into competition with ourselves, to our manifest detriment. But is such a thing possible at the present time? Can we ever prevent our capitalists from buying in the cheapest market, be that market home or Continental? Whether or not the immense strides made by Continental manufacturers are due to superior education we do not intend here to inquire. This, much, however, we may affirm, that the Continental educational system is preferable to our no-system and rule-of-thumb way of going about the business in hand. And certainly, if a workman has within his breast the high, the laudable desire to excel in his calling, and to improve his condition, we say, without hesitation, that technical education will prove his best and truest friend.

As respects technical education, workmen are constantly being told of the superior advantages enjoyed by the Continental; but hitherto we have not been very fully informed as to the details of the foreign system of teaching. Some information in this direction derived from official sources, will not be out of place.

The Imperial Conservatory of Arts and Trades, or, as it is styled in French, the "Conservatoire des Arts et Métiers" is the oldest establishment for affording technical instruction in France. It owes its origin to a mechanical genius, Vaucanson, who, during his lifetime, was apparently fritter-

ing away his talents in contriving complicated pieces of automata, which nevertheless formed the delight of those who had an opportunity of seeing these triumphs of mechanical skill.

Vaucanson constructed, among other things, an automaton flute-player, which executed several airs in a charming way; and a duck which waddled in the water, arranged its plumage, picked up its food, and apparently digested it; together with other ingenious imitations of the natural habits of the bird.

These, however, were but the playthings of a great man, and Vaucanson, while he lived, did much that was of service to his country, and at his death bequeathed his valuable collection of looms and other machines to the Government, for the free use of artisans, native and foreign. The Government accepted the gift, and placed the collection in a building which was open to all. The collection was enlarged, and just as the great French Revolution burst over France, the institution had become an important aid to the mechanic. During the early tempestuous days of the revolution, the Conservatory was at first neglected, and then shut up. But the period of its vicissitudes was short, and in a very little time the institution resumed its teaching. In 1796 a drawing-school was established. This was an era in the records of technical instruction in France, for until this time no establishment for the teaching of drawing applied to industry, and based upon descriptive geometry, was to be found in the country. From this school, as the Government report assures us, proceeded a number of pupils, who, in various ways became useful to their country, as well as several eminent manufacturers.

In 1810 the Continental blockade, devised by Napoleon to strike a death-blow at English manufacturing industry, was in full operation, and the importation of English cotton goods was almost entirely prevented. This condition of affairs gave rise to the establishment of a spinning-school at the Conservatory. Looms were set up, and a sufficient number of workmen were trained to give an impulse to the weaving trade of France. This school did not long continue in operation; the weavers found employment in private manufactories, after which the establishment was closed as being of a character foreign to the general nature of the Conservatory.

With the exception of this temporary educational workshop, and the elementary drawing-school, the only object of the Conservatory down to this date was the formation of a collection of machines, looms, and apparatus employed in the industrial arts. Its scope was much widened in consequence of a decree of 1819. Prior to this, the Conservatory merely offered to industry a mute museum, from which the manufacturer or artisan might doubtless derive useful instruction; but this instruction was unaccompanied by the teaching of the principles which should form its foundation.

In December of the latter year an important step was taken. There was established a public and gratuitous course of instruction on the application of the sciences to the industrial arts. Here, indeed, was an immense stride, the consequences of which are everywhere to be witnessed in France at the present day. A decree of 1829 added fresh popularity to the Conservatory by the inauguration of a course of physics as applied to the arts. In 1836 three more additions were made. These were,—a course of cultivation, a course of mechanics and buildings applied to agriculture, and a course of agricultural chemistry. There were now seven courses in full operation. But these were still insufficient for the increasing development of industry, as well as for the general demand for more scientific instruction. In prompt obedience to this demand an enlightened French ministry decreed five new public and gratuitous courses. They

were,—a course of mechanics applied to industry a course of descriptive geometry, a course of law as applied to industry, a course of chemistry applied to the arts, and a course of agriculture, to which the previously existing course of cultivation was added as a second course. Thus the number of courses was raised to ten. In 1843, a course of ceramics was opened by M. Ebelman, director of the Sèvres Government porcelain manufactory; but at his death the lectures were discontinued. Many improvements were also suggested at this period, but were delayed in consequence of the political condition of France during 1848 and subsequently. The foundation of new courses recommenced in the year 1852 with the establishment, at the instance of the Paris Chamber of Commerce, of a course of spinning and weaving, and a course of dyeing, printing, and dressing of tissues. In the same year a course of zoology applied to agriculture and industry was opened. A course of civil architecture was founded in 1854. At this period, the number of gratuitous public courses in the applied sciences had reached the number of fourteen. But the augmented advantages of the Conservatory were not restricted to oral teaching; the collection of models and machines was enlarged, classified, and in every way improved. Since 1849, a catalogue had been in existence; but now every object exhibited was accompanied by a card explanatory of its use. Projected in 1849, and at the present time in full operation, is a gallery for experiments, and for machines in motion. This department has an important office to perform. It is used for trying, either at the demand of the different ministries, or of private manufacturers, any new machines or apparatus presented for examination. These experiments have been received with great satisfaction, and reports of them have been published by the Conservatory. The experiments are made gratuitously. The Conservatory also undertakes the verification of the standard weights and measures required by those foreign Governments which have adopted the French metrical system.

The collections of models are estimated to be worth 1,300,000 francs, or 52,000*l.* of our money. The library contains 18,000 works on the sciences and industrial arts. In the gallery of drawings there are upwards of 7,000 designs of the newest and most useful machines, to scale, and with dimensions given. There is likewise a collection of expired patents. As early as the Exhibition of 1851, the industrial artists of France were, according to their own confession, alarmed at the strenuous efforts England was beginning to make to dispute with them the empire of taste. From this feeling arose the demand made by the industrial interest for increased facilities in art-teaching. The director of the Conservatory addressed a memorial upon the subject to the Emperor. There are two characteristic paragraphs in this memorial, dated 1854, which we will translate. They show that our indifference to what is going on upon the Continent respecting the teaching of science and art, is not shared by the foreigner, who, as a matter of fact, has been closely watching all our efforts at improvement in technical instruction. The first paragraph says,—“The Universal Exhibition of London has proved to England the superiority of France in the arts dependent on form, taste, and colour. Instead of disputing the fact, the English have set to work at once, with their immense resources and habitual energy, to found museums and drawing-schools all over the country. The Queen and private individuals have stripped their galleries to enrich the museums of practical art with the finest specimens of Sèvres porcelain, bronzes, sculptures, &c.”

The second paragraph is still more characteristically French:—“It would seem as if the English were bent on operating on the human species in the way they have upon races of

animals, so as to transform a nation of traders and artisans into a nation of men of taste. How far the Anglo-Saxon race is susceptible of this transformation is a philosophical question beyond my province; but one thing is certain—namely, that a few years hence England will have made immense progress in the arts of design."

To return to the Conservatory. According to the yearly reports addressed to the Minister of Agriculture, Commerce, and Public Works, the number of persons attending the public courses of the Conservatory is constantly increasing. In six months it has reached 180,000 persons. The great amphitheatre of the institution will accommodate 700 persons; the smaller one 300 persons; and both are found too small.

When the courses were first started, Sunday was the day which the public appeared to prefer. Gradually, however, the week-day evenings came into favour.

The teaching so freely given at the Conservatory is exclusively devoted to science applied to industry. The audience is for the most part composed of foremen, workmen who have already received some instruction, and apprentices. There are also a few foreign professors, and many persons who take an interest in the progress of technology. As we have seen, these public courses are gratuitous, and are open to both natives and foreigners. The teaching of this institution is so constantly kept on a level with all the improvements continually being made in France, England, and elsewhere, that the courses are attended by a great number of young foreigners whose intention it is to become professors.

The special influences which this institution brings to bear upon the progress of science applied to industry, may be thus summarised:—The collection of models, machines, and products; lectures on science relating to industry, and upon industrial arts; a gallery of drawings which the public are permitted to copy; and an elementary school. The sum at present voted for its maintenance is 285,500 francs a year.

The Conservatory of Arts and Trades is situated in the Rue Saint Martin, and the visitor to Paris may go over it on any Sunday or Thursday free; on other days he would have to pay a franc.

The Central Imperial School of Arts and Manufactures is a highly esteemed and most important educational establishment, and has been already described at some length in our pages.* By its means many pupils who cannot avail themselves of the opportunities offered by the great Polytechnic School, are enabled to obtain a most complete and practical education.

For the purpose of comparison, we will give a short sketch of the Polytechnic School. It was founded in the year 3 of the Convention (1791), for the instruction of young men in mathematics and drawing for the artillery and engineer corps. None but candidates who can pass a very severe examination in mathematics are admitted. Its effort has always been to educate, above all things, good engineers; and some of the most celebrated military and civil engineers have been bred within its walls. Still, the time required by this school (seven years), including the preparatory and complementary studies, is much too long for candidates who are anxious to commence their practical and money-earning career as soon as possible. The difficult preliminary examination also excludes a great number of candidates. Again, more than half the pupils of the Polytechnic School choose the military service, whilst the greater portion of the other half abandon the civil service to follow scientific pursuits. This is why the admirable Polytechnic School has never been able to satisfy the ever-increasing demands of industry.

The Central School, therefore, fills up a manifest deficiency in the French system of technical instruction. It was founded in 1829 by the celebrated chemist Dumas, assisted by three other gentlemen, without any aid from the Government; but, after some years of success, it first of all passed into the hands of a proprietor, and was then transferred to the State. In the Central School have been educated a considerable number of able engineers, who have taken high rank as constructors of railways, &c. Many directors, managers, and other functionaries of important industrial establishments, civil engineers, mechanical engineers, architects, &c., have emanated from this school.

The Central School is very popular, even with

persons of narrow means, though what in France is held to be a high charge (500 francs, 32*l.*, a year) is demanded from pupils. The Government and several of the departments have founded scholarships in favour of the sons of parents in very humble circumstances, and in some cases money for board and lodging has been added. The sons of rich parents pay for their education, as they naturally ought; whilst the doors of the school are also open for the sons of artisans who have given proof of the talents necessary to profit by the instruction.

At the central school the pupils are compelled, whatever may be the careers they intend to follow, to attend all the courses, and to pass very strict and frequent examinations. During the first year the instruction is purely theoretical. In the second and third years theory and practice are blended. The teaching is not confined to unaided oral instruction; for laboratory experiments, and mineralogical and geological excursions are made use of to complete what the lectures of the professors have commenced. As we have stated, there are frequent compulsory examinations during the courses and at their close, in addition to which there are searching examinations at the termination of each year's studies. The effect of this system is to keep the pupils always up to their work. Discipline is also strictly maintained.

The Central School is quite international and cosmopolitan in its character; pupils of all nations are admitted on the same footing as natives of France. Not a county in Europe is without a representative, and at one time or another pupils have come here from every part of the civilised globe.

There can be no better way of showing what this institution imparts to its scholars than the quoting in full the programme of the three years' studies.

First Year.—Analysis and general mechanics, sixty lessons; general physics, sixty lessons; inorganic and organic chemistry, sixty lessons; theoretical and applied kinematics, twenty-four lessons; construction of machines, twenty lessons; hygienic and applied natural history, twenty lessons; mineralogy and geology, thirty lessons; architecture, ten lessons; industrial drawing, twenty lessons.

Second Year.—Applied mechanics, sixty lessons; strength of materials employed in machines and constructions, twenty-four lessons; construction and mounting of machines, sixty lessons; analytical and industrial chemistry, forty lessons; metallurgy, twenty lessons; civil constructions, sixty lessons; industrial physics, forty-five lessons; industrial and commercial legislation—ceramics, eight lessons; dyeing, twelve lessons; glass-making and mining, twenty lessons.

Third Year.—Applied mechanics, sixty lessons; construction and erection of machines, fifty-five lessons; analytical chemistry, twenty lessons; industrial and agricultural chemistry, general metallurgy, and metallurgy of iron, sixty lessons; mining, twenty lessons; public works, sixty lessons; steam-engines, thirty-five lessons; railways, forty lessons; naval constructions, twenty-five lessons.

In addition to the above the following practical exercises and studies are required:—

First Year.—Various chemical manipulations; exercises in general physics, stereotomy, and taking of plans; architectural and topographical designs, and working drawings; problems in the infinitesimal calculus, general mechanics, and general physics. During the vacation, after the first year's studies, the pupils are expected to make plans of buildings and machines; also to write an essay on the resistance of materials.

Second Year.—A practical essay on the flow of gases, with the aid of an anemometer and a ventilator; each pupil to draw up a paper on the subject. Construction with bricks according to given plans of various kinds of chimneys, a baker's oven, a lime-kiln, a hot-air stove, &c. Each pupil to make a survey, and draw a plan of a watercourse, and measure the volume of water in a stream; a paper to be sent in on the details of these operations. Practical exercises in a factory on the construction of machines. Twenty-seven manipulations in analyzing and assaying. Drawings and projects of machines and buildings. During the vacation after the second year, the pupils to visit manufactories, &c., and to hand to the director, on resuming their studies, a diary, giving a summary account of the studies made and the factories visited; an album containing notes and sketches made on the spot; fair copies of the most remarkable

objects contained in the album, and a paper on questions in applied mechanics.

Third Year.—Projects in two series: the first on the more important subjects in all the courses; the second on subjects connected with machines, buildings, metallurgy, and chemistry.

Such is the profound and comprehensive course of technical education carried out at the Central School. After the Exhibition of 1861, this institution was proposed as an excellent model for the great industrial school which Prince Albert thought of founding in this country. Under the auspices of the prince, a report was drawn up, in which it was alleged that it was indispensable, in order to maintain English industry at the proper height, that an establishment upon this model should be set up in this country. Unfortunately the prince's project has not yet been realised.

The subject will need another paper.

THE PROPOSED CHANNEL DRIFTWAY AND OUR COMMENTATORS.

A LETTER bearing the not very distinctive signature "Engineer," printed in the *Times* of the 20th inst., in reply to observations in these pages, affords, what most disinterested and impartial persons will probably consider to be very weighty testimony in favour of those views as to the doubtful, or at least fabulously costly, project of a tunnel underneath the Straits of Dover, which we intimated, rather than enforced, in our last number.

Let us say at once that in using the term disinterested, we make not the slightest allusion to the possible pecuniary interest of any man, scientific or otherwise, in the scheme. Let professional schemes, once for all, be subjected to the fair course of professional criticism without any approach to an imputation, on either side, of unworthy motives. But there is nothing more likely to bias and swerve the judgment, especially when it is not matured by an adequate amount of experience, than that kind of party spirit which almost invariably springs up on the proposal of any great scheme of a nature altogether novel. That engineer would be almost more than man—he certainly would be no ordinary man—who, when asked if he would undertake the direction of some colossal enterprise, should calmly reply, "All things are within the reach of money; but this which you propose can only be attained by a disproportionate and unjustifiable outlay of money." Thus, let a man, let us say of eminence, be once consulted on a brilliant project, however wild; let some degree of preliminary work be attempted, some degree of preliminary expense incurred, and eager advocacy is sure to be forthcoming. Nor is such advocacy to be regarded, by any impartial judge, in any other light than that under which we criticize the opening speeches of those able men, who in gowns of silk and of stuff, have learned so much of the language of the civil engineer in the committee-rooms of the Houses of Parliament.

In the present instance the advocacy of "Engineer" is peculiarly *maladroït*. Bearing in mind that the one great engineering difficulty is that of expense, it is certainly rather an Irish mode of procedure to propose to halve the difficulty by doubling the cost. A certain—or rather a very uncertain—amount of the stifling gas known as choke-damp exudes from the surface of freshly-cut chalk. A known amount of the same irrespirable vapour is produced in the lungs of workmen, and by the combustion necessary for illumination. For the greater facility of dealing with this snuble enemy, "Engineer" proposes to double its quantity—to double the superficial area of damp chalk, to double the number of workmen, to double the combustion, to double the expense: in a word, "to construct two parallel drift-ways." If the problem had been how to ventilate of the utmost possible expense, the suggestion of this plan would have been the proper answer.

It should also be observed that this part of the scheme as it now stands, is irreconcilable with the purpose of "proving the possibility of making the tunnel below 20 per cent. of the necessary capital is expended." Without having before us the plans and sections (if the scheme has advanced so far as the construction of plans and sections), it is impossible to speak with certitude as to the proportionate cost of the drift-way and the tunnel respectively. But every one who has any practical experience in such matters knows that the cost is by no means pro-

* See p. 409, ante.

portioned to the areas, or to the cubic quantities of the larger and smaller bores. A driftway, though costing less per linear yard than a tunnel, costs far more per cubic yard. It is more than questionable whether a driftway of any description could be run under the Straits of Dover for one-fifth of the cost of a tunnel of an area adequate to allow of the passage of a locomotive. It is certain that a pair of parallel driftways could not be constructed for so small a proportion. Some discrepancy in the results of the studies of "the most eminent engineers . . . for many years" here requires explanation.

It is also unfavourable to the upshot of those studies that "Engineer" speaks of the commencement of the driftway in the tone,—or at all events illustrated by the analogy,—of a six months' tour. The projector has not made up his mind whether to use a great coat or an umbrella to keep out the tide. Whether his two parallel driftways shall be timbered, or bricked, or iron-lined, is to be as it pleases Providence. Each costly material "will doubtless be employed in its proper place." There is a great convenience in this easy mode of leaving the morrow to take thought for the things of itself. Into the cost per foot cube, or per hundred-weight, of timber framework and polling, of temporary brick arching, or of bolted and calked iron-lining (all of which has to be removed before the tunnel itself can be constructed), fixed in place, at 250 ft. depth below the centre of the English Channel, it is, on this view of the case, unnecessary to inquire.

A different, but scarcely a more practical, style of argument is applied to meet the difficulty of the great length of headway which it is proposed to run from one end. The actual length of tunnel proposed by "Engineer" and his friends is not stated. The account on which our remarks were principally founded spoke of a total length of sub-aquatic tunnel of thirty miles. "Little over twenty," is the estimate of "Engineer." Accepting this recommendation (as really one of no great practical importance to the matter in its present state), we are told that because a full-sized tunnel, twelve miles long, run from each end, under the Alps, will meet accurately somewhere,—that is, because the engineers of the Mont Cenis tunnel feel perfectly "sure that the two ends will meet,"—therefore the meeting of driftways running for "over twenty miles" under the Channel is "reduced almost to a matter of certainty." We are grateful for the concession "almost." To those who know by long practice the hourly difficulties attendant on the charge of both the centre line and the levels of a troublesome tunnel, the encouragement drawn from the expectation that the hopes of the French and Italian engineers, who are working under circumstances of an entirely different character in Mont Cenis, will be fulfilled, fails to be absolutely reassuring.

Again, as to the water. There is, we are told, "every reason to believe that the tunnel will be a comparatively dry one." Of three universal reasons two only are hinted at; one is, that because coal workings, under the same strata of the coal measures, are, in a particular instance, "comparatively dry," therefore chalk workings will be so. The other is, that because, above the level of the sea, no "considerable amount of water has been found in the lower chalk," therefore, under the hydrostatic pressure of the entire depth of the Channel, the same happy state of things will be found to exist. It must be observed, moreover, that, in the absence of definite borings, the very nature of the material through which the experimental driftway is to be run, whether upper chalk, lower chalk, chalk with flints, or half a dozen other materials, is, to say the least, only matter of geological inference, or, in other words, of scientific guess-work.

Not more conclusive is the comfort to be derived from the experience of the Kilsby Tunnel, "if an immense quantity of water were met with." In fact that experience points rather in the opposite direction. It was by the exhaustion of the sandhilled filled with water which was encountered in that mile of work,—subterranean indeed, but far above the level of the sea,—that progress in the works was rendered feasible. In that case, and in similar instances, had the engineer run an adit through the deep cutting at each end of the tunnel to the face of the work, the cost would have been enormously lightened, at the price of a delay in the actual commencement of the tunnel. The tunnel and the enticings once complete, the water could not again accumulate. Under the Channel the reverse would

be the case. The reservoir of superabundant water is absolutely inexhaustible. If entrance were once obtained, in any considerable volume, no pumping machinery in the world would make any permanent impression upon the flood. Every drop of water that percolated into driftway or into tunnel, would clear the way for a larger drop to follow. Every hocketful of water that was pumped out would increase the infiltration from above. And above is the ocean!

If then "semi-professional journals," among which we have not the false modesty to rank the *Builder*, "have suggested to the public that there are insurmountable difficulties of the most obvious character, which have been overlooked, with reference to this scheme," we can only join them in the regret that the skill of "some of the most eminent engineers" who "have carefully studied the subject for years," has not been illumined by a little more practical wisdom. The more closely the certain difficulties that oppose the prosecution of such a scheme—to say not a word of contingencies—are studied, the more obvious and formidable do they become. The more widespread, and the more accurate, our experience of actual tunnel work (and it will be clear to all practical men that it is in virtue of such experience, that we speak), the more hazy, visionary, and indefensible does the project of a subterranean communication with the Continent appear, on mature consideration. That there exist neither commercial, financial, nor political reasons to justify such an attempt, is our dearest opinion. Of the physical possibility of liberate opinion. Of the physical possibility of the undertaking we have not spoken, nor have we at all exhausted the question of its certain cost, and attendant dangers. But no one can, in the present state of our geological and engineering science, actually demonstrate that the execution of the scheme lies within the power of man, or that, even if the amount of money estimated were raised, a sub-aquatic gallery to France could be attempted with more success than a tunnel through the volcanic bowels of Etna, or a railway to the moon.

NEW STEPPING-STONES.

Two little hooks, purporting to be stepping-stones to architectural design and building construction, have just appeared, which are likely to be useful, so far as they go, to the rising generation. The one we shall speak of first is a catechism (of the Pinnock class), such as might be conveniently used in schools. It is called a "Stepping-stone to Architecture." It is certain that if some general idea of architecture were to be given in schools our young people would be provided with an inexhaustible source of pleasure. All our ancient remains would be looked at in a different light to that in which they are but too often now regarded. Instead of associating such sites only with the scene of picnics, or matches of one sort or another, such as are now kindled only at the sight of classic shores. The different amount of interest felt for a building by a person who has some knowledge of architecture, and one to whom all details are a confused mystery, is so considerable as to be alone a sufficient reason for instructing youth with a fair understanding of the subject. A superb piece of architecture creates in the mind of those who can appreciate it exactly that exquisite kind of intellectual rapture that the cadences of a consummate poem impart, or that is wafted into the mind with the sound of matchless music.

A series of papers in our pages on the subject, addressed to ladies, some years ago, and afterwards gathered together as a little hook, were not without a certain amount of good effect, as we have reason to know.

Both student and building cannot be otherwise than benefited by an early knowledge of architecture, and we earnestly recommend its study in schools. The mere familiarity with the masterpieces chosen as illustrations would be a gain. And because early impressions are often nearly indelible, a conscientious endeavour should be made to render them exactly correct. Mr. Mitchell has evidently taken great pains to make his stepping-stones trustworthy, and but few blemishes can be found

* "The Stepping-stone to Architecture." By T. Mitchell. London: Longmans, Green, & Co. "The Elements of Building Construction and Architectural Drawing." By Ellis A. Davidson. London and New York: Cassell, Peter, & Galpin. "A History in Ruins: a Handbook of Architecture for the Unlearned." By Geo. Godwin. Now out of print.

upon them; but still there are on his stones what we may, perhaps, call two or three patches of wet lichens that, to the unwary foot, might lead to disaster. In reply to his question, "Of what materials is it most probable that the earliest buildings were constructed?" he makes his wistful scholar reply, "It is most probable that the earliest materials used were rushes, reeds, and the branches of trees tied together, plastered with mud and thatched with leaves. The ancient Britons constructed most of their dwellings of wickerwork." Did they? From the very numerous remains on our wolds and hills of ancient British dwellings built of stone, we might conclude that was the material most frequently used in their construction. Again, the querist is anything but clear about the distinctive details of Saxon architecture. The so-called triangular arch is not mentioned, though the flat-headed and shoulder-beaded so-called arches of later times are given; nor is anything said of the halluastre columns that are so distinctively pre-Norman. And, unfortunately, the illustration of an arch given as Saxon is a Norman. Once more, the illustration of the Doric order should be described as not purely Greek, but Roman. Still, the general merit of Mr. Mitchell's book is considerable, and it is very cheap. There are twenty-four engravings in it reprinted from Gwilt's "Encyclopaedia of Architecture," and forty-nine woodcuts.

The second stepping-stone is a link in a series of technical manuals. It is furnished with a hundred and thirty-three illustrations drawn on wood by the author,—consequently is a work of rather more pretension than the catechism just noticed. Moreover, it is adapted for the use of youth rather than children. Mr. Davidson states his aim is to give a general knowledge of the principles of building construction, and at the same time to afford elementary practice in architectural drawing. To this end he wisely advises students to read each section of his work carefully with frequent reference to the cuts, and attention to the lettering; and then to draw the illustrations to a larger scale and letter them, taking care to give underneath the drawing, a description, or abstract, of the principles upon which the construction is based. This plan will enable them to remember what they study; and should they feel that what they have acquired is slipping out of their memories, they will have but to glance at their own drawing to revive their acquisitions. He asks, on the part of the artisan, whether the ability to understand and apply the principles of building construction will bring him wages, and answers— "we quote his words—'Yes, it will; for we may fearlessly assert that never in the whole history of labour has there been a period when the workman has been deemed more worthy of his hire, or when greater efforts have been made, firstly to teach the artisan, and then to show appreciation of his work, than the present.'" So far so well.

After explaining the drawings required for building purposes, Mr. Davidson treats of the various departments in building construction, beginning with natural and artificial foundations, and going through the various kinds of masonry, brickwork, woodwork, roofs, floors, joinery, and fire-proof construction. And besides this varied information, he gives a special chapter concerning drawings for masons, another relating to drawings for bricklayers, and a third devoted to drawings for carpenters and joiners. This is an admirable arrangement, and one advised, by the best minds, as more suitable for our schools of scholars one sort of drawing, irrespective of the different trades in which they may be engaged, or about to be employed. As considerable licence is taken in the application of tints to trade drawings, the author gives a list of those chiefly in use among architects to express various building materials:—

Materials.	Colour.
Brickwork to be executed (in plans and sections)	Crimson lake.
Brickwork in elevations	Crimson lake mixed with burnt sienna or Venetian red.
The lighter woods, such as fir	Raw sienna.
Oak or teak	Vandyke brown.
Granite	Pale Indian ink.
Stone generally	Yellow ochre or pale sepia.
Concrete works	Sepia with darker markings.
Wrought iron	Indigo.
Cast iron	Panque's grey or neutral tint.
Steel	Pale indigo tinged with lake.
Lead	Gamboge or Roman ochre.
Brass	Pale Indian ink tinged with indigo.
Clay or earth	Burnt umber.
Slate	Indigo and lake.

The drawings for masons are an example of planking, brick footings, and stone piers, as adopted in the circular vaulting at the London Docks; a bridge to cross a road; and a stone staircase; all worked out in every detail of their construction carefully. The drawings for carpenters show the various kinds of joints in timber, including the French scarf, "Trait de Jupiter," in which the key is placed at right angles to the slanting line of the scarf instead of parallel to the line of the beam; trusses, tenons; complete roofs; trimming; double and framed flooring; and a trussed partition for supporting floors, leaving a space for folding doors in the centre. Those for joiners show the construction of the woodwork for finishing the interiors of houses. In the matter of fire-proof construction, Mr. Davidson gives a notion of both the French and English methods in outline, reserving a more complete examination of them to a future manual. The French plan differs from our iron-gird system, our readers will remember, by using timber quarterings. The account given in the late Mr. Hoeking's neglected book is quoted:—

"The framed structure being complete, strong oak batten laths, from 2 in. to 3 in. wide, are nailed up to the quarterings horizontally, at 4 in., 6 in., or even 8 in. apart, according to the character of the work, throughout the whole height of the enclosure and partition; and the spaces between the quarterings and battens are built up with rough stone rubble, which the laths prevent falling out till the next process has been effected. This is to apply a strong mortar, which in Paris is mainly composed of plaster of Paris, which is there of excellent quality, laid on from both sides at the same time and pressed through from the opposite sides, so that the mortar meets and incorporates, imbedding the stone rubble by filling up the interstices and with so much body on the surface as to cover up and imbed also the timber and the laths, in such manner, indeed, as to render the construction of stone and plaster, when thoroughly set, an independent body, and giving strength to, rather than receiving support from, the timber. The ceilings are constructed on a somewhat similar system."

We hope the day is not far distant when every workman in Great Britain will be able to make a working drawing, as well as understand that which is placed in his hands for execution. Both the little works we have here noticed may play a certain part in advancing matters towards this issue.

FALSENESS IN TRADE.

So that it seems to be, never mind what it is. Such is the maxim of thousands in this God-fearing country and wonderfully intellectual age. So that a house will just stand, a printed cotton just wash, or a soldier's coat hold together till it is appropriated; so that the inferior stuff at the end of a piece of cloth cannot be discovered till it is opened, and the untempered worthlessness of the axes and picks will not be known till the bales are broken in the backwoods by eager workers dependent on sound tools, it is all right: trade has been done, profit has been made. Never mind the loss, the disappointment, the sorrow inflicted on others: profit has been made. The falseness and sham, the want of truth on the part of workmen in matters connected with their trade, are little less than appalling. You can be certain of nothing. You may buy pens that will not write, pencils with which you cannot mark, milk innocent of the cow, beer that is poisonous, looks that will not last a week, manure that has no pretence to a fertilizing quality, and seeds that could not grow in it even if it had. These last are amongst the worst kinds of deceptions,—deceptions that cannot be discovered till it is too late to supply a remedy, and the user's hopes for the year are blasted. Nearly the last Act of the past session of Parliament was one to prevent the adulteration of seeds, declaring that the practice of adulterating seeds, in fraud of her Majesty's subjects and to the great detriment of agriculture, required to be repressed by more effectual laws than those in force. To "kill seeds" means to destroy by artificial means the vitality or germinating power; and to "eye seeds" is to give to seeds by colouring the appearance of seeds of another kind. The penalty is £l. for the first offence and 50l. afterwards, with publication of the offender's name at his expense in newspapers. We would have had the punishment heavier. For such scoundrels we have no consideration, no mercy; nor can we see any valid reason why the Act should not have come into operation at once, instead of being postponed, as we believe it is, till the beginning of next year. Surely it is not to enable these honest traders, disappointers of men's hopes, to get rid of adulterated stocks on hand?

The tendency of the world to listen to specious promises, to be beguiled by apparent cheapness, to

"Give to dust that is a little gilt,
More laud than gilt o'er-dusted."

encourages the vice to which we are pointing, but does not in the least excuse it.

We remember hearing of contractors, during one of the recent wars, who sent out to our soldiers boots so made and of such materials that they became saturated with the first shower, and endured no time. The commonest feelings of humanity, apart from thought of gratitude, prompt indignation, and should have prevented such an infamous proceeding. The indignation it excites within us has no bounds. We say with Emilia, and with our whole heart,—

"O Heaven! that such companions thou'dst unfold,
And put in every honest hand a whip
To lash the rascals naked through the world."

Even this baseness is paralleled, if it be not exceeded, by those who manufacture life-boys of materials incapable of floating. Hard as it may be to believe, there is good evidence to prove that many of the life-boys sold at seamen's sloop-shops, instead of being stuffed with solid cork-wood, as they should be, are filled with rushes, straw, or cocco-fibre, which being tied up in canvas will float for a little time, but are gradually saturated, and sink,—destroying what they should have saved. We have talked of whipping, but with the manufacturers of these painted lies, with these murderers for money, we would adopt a shorter course: we would unhesitatingly hang them.

VICTORIA-STREET AND THE ABBEY.

As compared with any other portion of the metropolis, the hallowed precincts of the ancient Abbey exhibit a melancholy account of ecclesiastical management. The whole district as far as Vincent-square is Church property, and in it we find more wretched dilapidated tenements,—we cannot call them houses,—than in Stepney or Rotherhithe. Within these precincts there are over thirty narrow courts, having an average of eight hovels with six rooms in each; every room tenanted by at least four human beings, and paying weekly rents. By day, if any one venture on an inspection, the whole is revolting to the sight; by night, after nine o'clock, it is horrible.

So far as Victoria-street has been completed, the improvements have kept pace with modern taste and requirements, and now that the Picnic end of this fine thoroughfare has been opened out to Grosvenor-place a more direct route to the Houses of Parliament and the Abbey has been secured for the inhabitants of the West-end.

From Hyde Park Corner to the Victoria Hotel buildings of superior description have been ranged along the line, generally in an efflorescent French style, and the contrast becomes flagrant when a comparison is made with the adjacent church slums, which occupy a no less valuable position, in close proximity with the glorious Abbey and the Houses of Parliament. Is it that Churchmen are wholly wrapped up in what concerns futurity, and therefore take less interest in merely mundane affairs?

The squalid condition of all the surroundings of the Abbey induced us before to suggest for the improvement of that important though neglected district that a continuation of Victoria-street should be made in a direct line from Stratton Ground, opposite Christ Church, to Victoria Tower.

At this point the street diverges in a slight angle, in a radius that would, if continued, strike in upon the Westminster Bridge: the continuation recommended, forming an elongated delta, would cut Abingdon-street in the centre, and issue in the broad space 50 ft. southward of the tower, being about 500 yards long, and opening out from the planted grounds of Christ Church, it would strike in upon Great College-street, passing clear of the good buildings in Dean's Yard, and would require only a few feet (say half the roadway) to be cut off the Dean's garden: thus securing for the Dean and Chapter site for the erection of suitable canons' houses, in lieu of those old red deformities which at present defile the venerable old cloisters, and which wholly blind and screen off the Abbey.

The work of restoration now in progress will be wholly lost as to external view, unless the old shapeless masses of brick hovels are cleared

away from the south side. Some space with the standing trees should be left open, both for street effect and for the aspect of the Abbey, and then this thoroughfare would not only be one of the noblest of the far West, but it would open out resources of building profit.

At the present moment there are but two unappropriated building plots on this line, which has lain so many years in hideous fallow: one is at the end of Stratton ground, and it is yet open for the practicalisation of this thoroughfare,—we cannot call it a boulevard, being only 60 ft. wide; the continuation might, however, be enlarged 10 ft. more, and with effect.

The new street would keep clear of Old Pye-street, allinating nearly with it; and in cutting across at right angles Duck-lane, New Pye-street, St. Ann's-street, Great Smith-street, and Bowling-street, would in a range of about 1,000 ft. strike in upon Great College-street, clear of the College School, necessitating the clearance of some of the filthiest lairs in Westminster.

The fine ranges of chambers extending to Dean's-yard would branch off at an angle of forty degrees, and the intervening space now occupied by dens called Union-court, Cottage-gardens, New-square, and two or three other nameless courts, together with a dozen decrepit houses in the traverse streets, would make room for fabrics of a more respectable, profitable, and durable character.

By the practicalisation of this new street, the Houses of Parliament would be approached in the distance of a quarter of a mile less than by the present issue into Great George-street; for there is a considerable deviation northward from Dean's-yard to be added to the return south from that point to Abingdon-street.

The most telling improvements of the metropolis are its bridges, quays, and grand causeways, and the present year will add much to the value and beauty of our city by the opening of Holborn, of Blackfriars, and of the Embankment. By the formation of a fine thoroughfare as here recommended, our old Abbey and the Houses of Parliament would be better developed, whilst a central, valuable, and vicinal district might be redeemed from waste for the convenience and intercourse of the whole population.

When it is considered that the fashionable quarter surrounding Eaton-square, and called Belgravia, is a mile farther westward from the centre; that its range is no higher above high water than these purlieus of the Abbey; and that all the noble mansions built there command the highest rate of rent and purchase, there can be no doubt but that clearances about the Abbey, extending in width even from St. James's Park to Vincent-square, would produce a good return financially, whilst the adaptation of the space to modern constructions would effect the redemption of a district now a disgrace to the metropolis.

REPORT ON SOUTH OF LONDON WATER SUPPLY.

The Report of Mr. J. N. Radcliffe to the Medical Officer of the Privy Council on the results of an inquiry into the causes of the turbidity of the water supplied by the Southwark and Vauxhall, and the Lambeth, Water Companies, has been issued in a printed form.

In the outset the Reporter says:—

"Professor Frankland, in his Reports to the Registrar-General on the waters supplied by the Metropolitan Water Companies in the years 1867 and 1868, makes the following statements:—Of 1867 he writes,—

"Only on one occasion during the whole year have I obtained a transparent sample of water from the Southwark company's mains." Of 1868: "On several occasions the water of the Lambeth, Southwark, and Chelsea companies was in such a muddy condition as to render it totally unfit for domestic use. In February last the Lambeth company's water was so turbid, that brightly illuminated objects could not be seen through a stratum of it 12 in. deep. On account of the great amount of sewage which commingles with the river waters supplied to London, their efficient filtration before delivery is of the utmost importance. . . . The Southwark company's water is almost invariably sent out in an imperfectly filtered condition. Only on one occasion in the entire year did I obtain a sample of clear water from this company's mains, and the same was the case in 1867."

Referring to an instance of exceptional contamination of the Southwark company's water during the months of August, September, and October, 1868, Professor Frankland remarks:—

"I directed the attention of the company's engineers to the abnormal conditions of the water, pointing out that the admission of a certain proportion of tidal water of the

Thames at Battersea, where the company's reservoirs are situated close to the river, would cause the excess of impurities which I had observed."

The following table shows the number of occasions, out of a total of twenty-four monthly observations, on which, according to the reports of Professor Frankland to the Registrar-General, the different Metropolitan Water Companies delivered turbid water from their mains during 1867 and 1868:—

Name of Company and Source of Supply.	Number of Occasions when Clear and Transparent.		Number of Occasions when Slightly Turbid.		Number of Occasions when Turbid.		Number of Occasions when Very Turbid.		
	1867.	1868.	Total.	1867.	1868.	Total.	1867.	1868.	Total.
Thames —									
Chelsea	9	7	16	3	2	5	0	1	1
West Middlesex	11	12	23	1	0	1	0	0	0
Southwark	1	1	2	0	0	0	0	0	0
Grand Junction	8	9	17	1	2	3	5	4	9
Lambeth	9	6	15	3	1	4	0	2	2
Other Sources —									
New River	12	10	22	0	2	2	0	0	0
East London	10	3	13	2	8	10	0	1	1
Kent	0	8	8	2	3	5	2	1	3

The Report then goes on to give evidence of the turbidity of the water of the Southwark and Lambeth companies at various times in course of the present year; and also as to the causes of that turbidity, and what had been done to obviate it. The great and rapid increase of demands upon the Southwark company's supplies,—an increase said to have overpassed, for the time being, all measures to meet it satisfactorily,—is referred to.

The Report states that

"The Southwark company has for some time been taking measures to overtake the increasing requirements of its district, and to remedy the insufficient provision for subsidence and filtration described. They have constructed extensive additional works at Hampton, which it is believed will be in full operation before the close of the present month (July); and they are making an important addition to the works at Battersea. The new works at Hampton are adjacent to the old works, and are supplied with water for the same intake. They consist of (a), a subsidence reservoir, having an area of 3½ acres, and capable of containing 10,000,000 to 15,000,000 gallons, according to the height of the river; and of (b), three filter-beds, having a joint area of 3 acres, and estimated to be capable of filtering, when in full action, 420,000 gallons per hour. In connexion with these works two engines are being built, and are now well-nigh completed, having a total horse-power of 450. The new work in progress at Battersea consists of a subsidence reservoir having an area of 2½ acres, and a capacity of 24,000,000 gallons."

It is proposed, when the new works at Hampton are brought into operation, to devote them entirely to the supply of that portion of the Southwark company's district which lies westward of Vauxhall Bridge; the operation of the works at Battersea being limited to the district east of that point. It is estimated that from 35 to 40 per cent. of the entire supply of the company will be distributed from Hampton.

When the additions now in progress are completed and brought into operation, the Southwark company will have placed its works fairly on a level with its present requirements; but if the demand upon its supply continues to increase at the rate of the past two years, the margin of safety, even for the near future, appears to me to be too scanty. It must, also, however, be stated, that the company has recently bought land at Battersea with a view to a further extension of their works when needed."

The general summary of the Report, with suggestions, is as follows:—

"In bringing this Report to a conclusion, I would state:—

I. As to the Turbidity of the Southwark and Vauxhall Company's Water.

(a) In respect of Causation.—(1) That it is dependent upon the deficiency of provision for subsidence; (2) the insufficiency of the area of filtering surface; (3) and, in certain instances, upon one or other of the following causes; (a) the admission of tidal water from the Thames into the reservoirs at Battersea, either by direct inflow, by breakage, or by leakage; or (b) upon the admission of unfiltered water from the subsidence reservoirs into the pump-wells.

(b) In respect of Remedy.—(1) That the company has already taken measures which will remedy for the present (a) the defective provision for subsidence and the insufficiency of the filtering area; (2) but it should be required also, in order to secure the permanent remedy of the turbidity of the water at Battersea with the tidal portion of the Thames, by means of the old conduit leading to Battersea Resch, and the direct communication of the subsidence reservoirs with the pump-wells, should be entirely cut off. Any contingencies that might arise, which would apparently, at the moment, justify the company, as a matter of expediency, in continuing the legality of the acts, in consequence of the company taking through the conduit of taking water into their reservoirs through the conduit communicating with the tidal water of the Thames, or in permitting unfiltered water to pass directly from the subsidence reservoirs into the engine-wells for distribution, can be provided for in other and more legitimate modes.

II. As to the Turbidity of the Lambeth Company's Water.

(a) In respect of Causation.—(1) That the source of impurities is objectionable; and (2) that the provision for subsidence, and (3) filtration, is insufficient.

(b) As to Remedy.—(1) That the intake of the company

should be removed above Moulsey Lock; and (2) that additional provision should be made for subsidence and filtration.

The removal of the intake above Moulsey Lock would not interfere with the present works at Long Ditton, and would let once do away with the cause of difficulty in the way of effectual filtration, which arises from the exceptional turbidity of the river at the present intake of the Lambeth Company's supply. The same remarks and suggestions apply to the Chelsea Company, it must be noted, in constructing two additional filter-beds at Seething Wells, having a joint area of two acres.

POSITION AND PAY OF ENGINEERS IN INDIA.

A PROPER understanding of the position of the Public Works and other Departments in India, and the right management of them, being of great consequence to a large number of our readers, we have on numerous occasions allowed representatives of the various branches to state their own views and grievances, and have advocated such reforms as seemed necessary. Continuing in this course, we give insertion to the following as representing the views of a considerable body of public servants.

Though in India the two things, position and pay, go very much together, yet one can be treated separately from the other, and position can be considered apart from pay. The subject as affecting civil engineers in that country is very important, and to understand the bearings of the question it is necessary to go back some years, and depict the state of Indian official society when there were no civil engineers. There were to be met with then five grand divisions of covenanted civil servants, officers, medical men, and chaplains of the army; a very small body of white brought up on the hills, chiefly sons of officers, and known as "country born," half castes, and natives. The Covenanted Civil Service was, as every one knows, the best. It was entirely filled by nominated youths from England, trained at Haileybury, had a monopoly of civil appointments, and extraordinarily good salaries. Originally these covenanted civilians were the East India Company's mercantile assistants, and under the name of writers, junior and senior, merchants drew poor stipends, and boarded in the forts and factories, as if they were the clerks of a business house. In fact, no firms could in these days bring out subordinate agents on anything like the terms to fill the most minor situation.

They were, however, allowed to trade on their own account, and on the Company getting territorial sway, they were sent into the districts to collect the revenues, and rule the subject people. Salaries remaining what they were, the Company's civilians exercised their authority as much as possible for their own advantage, levied protective duties on merchandise passing through their provinces, thus favoured their own ventures, and made enormous profits. Lord Clive saw that this easy state of affairs was ruinous to the interests of the Company, and an immoral method of Government, and that, though salaries were extremely low, the revenues were being absorbed at a fearful rate, and the servants of the Company were so but nominally, and taking things with a high hand. He therefore enormously raised the table of salaries, and strictly prohibited clandestine adventure and private trading. To ensure this result, the salaries had of course to be fixed so as to allow of civil servants living as they had been accustomed to do, and till recently it was very difficult to spend more than two thousand rupees a month in domestic establishments. To the very last of the Company, civil appointments were called writerships, but the consequence of increasing the salaries was to impart a tone which has made the covenanted service one of the most upright bodies in the world. The possession of a majority at the consultable and heritable in all the places of authority in the regulation provinces of three presidencies gave the civilians an exaggerated power, one that could be exerted for the advocacy of their own views, and the furtherance of the interests of their order. It was not to be supposed that such advantageous conditions would not make them entertain a very good opinion of themselves, and from the court of directors downwards there was a general acquiescence in their elevation, and a conviction that they were qualified for any appointment, provided it was well enough paid. Where there was a good thing going, or one that could be set a-going, there would be a covenanted civilian he found at the head of it. And if a particular person was suited to a particular place or office, and belonged to the Civil Service, the salary had to be amplified to the dimensions of his expectations. In point of rank, the civilians hardly needed any special graduation, as their published drawings would sufficiently indicate how they stood; but there was in India grown up with the remodelled Civil Service a very numerous army, most of whose offices were very moderately, not to say poorly, paid, but which had colonels and generals with emoluments almost rivaling the common run of civilians, and military rank, decorations, and glitter to add lustre to these. It was necessary

III. I have stated in an earlier portion of this report that no measures are adopted by the Southwark and Lambeth Companies, nor by the other Water Companies obtaining their supplies from the Thames, to ascertain upon the provision of the law as to the thorough filtration of the water delivered by them is properly carried out. The law (Metropolis Water Act, 1852, sect. 4) requires that the water supplied shall be effectually filtered; but it does not direct that any steps shall be taken to ascertain whether effectual filtration is accomplished. It is obvious that if the action of the filter-beds upon the water transmitted through them be not subjected to regular observation from day to day, filtration becomes little more than a hap-hazard process.

It is greatly to be desired that the different Thames Water Companies should keep a register, open when required to the inspection of any properly authorised public officer.

It is desirable, also, that the other Metropolitan Water Companies should keep a like register, modified in accordance with the nature of their source or sources of supply. It is further desirable that the state of filtration of the water delivered by the different Metropolitan Water Companies, as indicated by transparency or turbidity, should be subjected to more frequent investigation by some public authority than at present.

IV. The remarkable differences existing in the provision for filtration by the different Thames water companies, and, indeed, among the Metropolitan water companies generally; the absence of any common consent among the engineers of the companies as to what are the conditions of efficiency, as indicated by these differences; and the too frequent inadequacy of the filtration of the water of all the companies (except that of the West Middlesex), suggest the necessity of an official investigation of the subject, with a view to determine some common rule of guidance.

V. Professor Frankland's references to living organisms in the sediment deposited by the water supplied by the Southwark and Lambeth companies suggested a comparative microscopical examination of the companies' water at different points from the source in its passage through the works. I collected samples for this purpose and forwarded them to Dr. J. Burdon Sanderson, F.R.S. I append Dr. Sanderson's extremely suggestive report.

P.S.—After this Report was written, the Report of the Royal Commission on Water Supply appeared. The suggestion of the Commission that all the Metropolitan water companies should be superseded by a municipal authority appears to provide in another way for the kind of supervision contemplated in Section III. of my recommendations. J. N. K.

Dr. Sanderson's Report states that in each of the waters derived directly from the Thames he found an abundant deposit, which presented all the characters of the deposits described by Dr. Hassall in his paper on the "Microscopical Characters of the London Waters" published in 1851. It consists partly of formless granular matter, shells of diatomacea and other organic debris held together by a gelatinous-looking transparent substance, partly of living plants and animals, and partly of shreds of vegetable tissue and fragments of grit.

It appears to him to be of greater importance that time should be devoted to the investigation of the extremely minute and elementary structures which he describes as "rod-like bodies and microspores," than to the enumeration and description of the higher forms, e.g., ciliated infusoria, diatomacea, and desmidea, &c., with respect to which he holds that their only significance lies in their affording evidence of defective filtration. As regards monads, and more particularly as regards the actively moving microspores and rods, he remarks, they probably afford proof that chemical decomposition is in progress, and that the water containing them is in such a state as to be improper for consumption.

The Dresden Theatre.—The Court Theatre, Dresden, has gone the way of all theatres,—it was destroyed by fire on the 21st inst.

to introduce some relative order, and the table of Indian precedence was framed. The civilians were divided off into classes according to length of service. On first coming out they ranked with subalterns, after four years' service as captains, after eight years' residency as majors, and after twelve years as lieutenant-colonels, and so it went on. In framing the table they had taken good care of themselves, as it took an ensign from fifteen to twenty years to become captain, and he often retired from the army on a pension without getting over the rank of major. Moreover, salary was not taken into account, and a civilian with a good round income need have cared very little about what class he was in.

The writers on appointment in England had to undergo a smart pass examination, chiefly in classics, and then spent two years at Haileybury College, where there were the facilities for studying law, Indian languages, and political economy. Once in the college, it would require great indolence not to be able to get out of it. The military services were entered in two ways. For the cavalry and infantry services cadetships, as they were called, were given direct,—that is, the cadet immediately on passing a test examination to show he had received what is termed a military education, went out to his regiment in India. Certain cadetships were called Addiscombe appointments, and no one could go out to India under this form of nomination without spending two sessions at the Company's military seminary. There those who qualified received engineer and artillery commissions, and those who did not, or for whom there were no vacancies in these branches of the service, went out in the infantry, counting the time spent under instruction as *bonâ fide* Indian service for pension. Taking the case of two brothers, one nominated to Addiscombe and one to Haileybury, and looking at their position after, let us say, twelve years, the one would be a subaltern of artillery, on 250 rupees a month, and the other, with the relative rank of Lieutenant-Colonel, an acting collector on 2,000 rupees a month. There was nothing to account for this difference of position except the original nomination.

The cadet might have changed places with the civilian, according to the caprices or accident of patronage. Such overwhelming differences in prospects could not but produce a strong jealousy between the services, and a practical belief in the minds of the civilians who had the giving of appointments in India, that a post intended to be filled by a military man, or for which an officer of the army was eligible, should be much lower paid than if it was a civilian that was to occupy it. Thus a military paymastership was worth half what a civil paymastership was. The feeling had sometimes a ludicrous manifestation. The wife of a civilian at Calcutta, narrating, so the story goes, who formed the party at a certain entertainment, said So-and-so were present, and So-and-so, and a lot of trash from the fort, meaning officers and their wives from Fort William. Such vulgarity of sentiment, it need hardly be said, cannot well have been general among the civil servants; but their immense distance from their contemporaries in salary cannot have failed to impart a certain claim to superiority in spite of themselves, and which at times would be apparent; but, in truth, the civil servant became in some ways superior to the mere regimental officer. From entry into the service his expenses had been of a much more varied kind, and his attention had been devoted to mental exercises, such as learning the Indian languages, observing the working of political economy, practising the law, adjusting taxation, or secretarial duties; while the subaltern was from day to day drilling his men, attending station committees, and dining at mess in the evening, for the most part physical occupations. The military life suited those who were not fond of study, contented with moderate allowances, and aimed at the reward of a soldier. There were also other things to be mentioned further on, which somewhat melted down the silver barrier between the Services. No power could be expected to pay its army upon the liberal scale of the Indian Civil Services; still less when there were thousands of Indian officers to hundreds of civilians. Besides, Parliament had fixed limits to the covenanted Civil Services. The Court of Directors availed themselves of no similar bounds existing to the extension of the army; and though their regiments were not over-officered, and promotion was excessively slow, still the number of native regiments was almost always on the increase till they matured in Bengal. After that event,

those curious to see what reductions have been made can consult a local Army List belonging to each period, and may observe in India itself what further curtailment is desirable. Having a large native army gave the opportunity of getting away cadetships by wholesale. Coincident with the augmentation of the army was the extension of the Company's territorial sway; and for the many civil duties of Government in these increased domains there was no organisation except an inexpensive covenanted Civil Service educated as magistrates and private gentlemen. Accordingly, where civil engineers and architects were wanted, the corps of military engineers were distributed, supplemented by chance selections from the cavalry and infantry of those who expressed a wish to act in these capacities, or who were considered to have a taste for drawing. If a chaplain was wanted, an army chaplain was supplied. All doctors were military surgeons; and in districts where the benefits of English rule had to be conferred officers were taken as commissioners and assistant commissioners on passing an examination in a native language, and performed generally very fairly the duties of collector and magistrate, or sessions judge. It became the practice for a considerable number of officers to be permanently absent from their regiments in time of peace, liable to recall to take the field with them. There was thus an unlimited opening for a virtual increase of the Civil Service; and it had this advantage, for the Directors were prudent legislators, that they could obtain almost equally efficient service on lower terms. It has always been the custom to remunerate military staff appointments, such as those of adjutant-general and quartermaster-general, with their deputies and assistants, aide-de-camp, and the like, by salaries in addition to the pay of military rank. So that a major and adjutant-general would get a little less than a colonel and adjutant-general, and lieutenant and aide-de-camp less than a captain and aide-de-camp. This was the principle of the army. It kept a value to military rank; was the custom of every civilised country in dealing with the staff of armies; and was for the East-India Company a very cheap method. They could say to a young officer, "It is very true your staff salary and pay combined are small compared with the emoluments of your contemporaries in the covenanted Civil Service, but wait till you are a colonel, and you will receive all the benefit of your elevation." The principle was applied to all the services in connexion with the army, the commissariat, stud, &c.; and as public works were then administered by the Military Board, which also directed the foregoing civil branches of the army, all engineer officers received staff salaries on much the same scale as the commissariat, and, in addition, the military pay of rank. But the Civil Service owned no such law. Certain consolidated salaries were fixed for each class of appointment, and those in them got the full rate of remuneration, irrespective of their age or standing. Latterly the same privilege was extended to military officers holding office in the non-regulation provinces, but the Public Works Department remained on the old footing. The covenanted Civil Service had a fixed pension of 600*l.* a year granted to each member on completing a limited service; and, in order that the inducement to retire might be sufficient, Government deducted regularly 4 per cent. of each civilian's salary, and gave an annuity to make up the pension to 1,000*l.* a year. No civil servant could remain more than thirty-five years in India. The army had also pensions much according to length of service, and varying from, for twenty-two years, 191*l.* up to 450*l.* for thirty-two years; and for those able to stay on for an average period of forty years there were off-reckonings, bringing up the pension to 1,000*l.* a year. Any officer obtaining the position of full colonel could reside permanently in Europe without retiring from the service. The East-India Company were provident, and knew the circumstances of Eastern service. The Civil Service had a Widow and Orphans' Fund, to which they paid in subscriptions as a condition of appointment, and from it the widow of each civilian got 300*l.* a year. The army in each presidency had also a military fund, to which all cadets had to bind themselves to belong on their arrival in the country, and which they could not resign without severing their connexion with Government. Subscriptions to the fund were—for a single ensign in India, 13*s.* a month; on leave in England, 5*s.* a month. For a married ensign, 1*l.* a month in India, and 8*s.* 8*d.* in

England. A colonel paid, unmarried, 4*l.* 13*s.* a month, or, married, 7*l.* a month in India; and 1*l.* 7*s.* 6*d.* and 2*l.* 1*s.* 3*d.* in England respectively. The ensign paid a donation to the fund on entrance of 33*l.*, and additional donations on attaining higher rank, the colonel's being 60*l.* On marriage an ensign paid 66*l.*, and a colonel 440*l.* The return for these payments was that bachelors who fell sick got their passage paid when it was not paid by Government, and, if subalterns, an income allowance in England; but the fund was mainly instituted for family purposes. It paid a widow's passage home with her children, gave her a pension of from 81*l.* a year for an ensign's widow up to 235*l.* a year for a colonel's. Besides this, children received from 20*l.* to 40*l.* each, and girls the latter sum till marriage or death. An officer wishing to bring out his family could obtain a loan of the needful sum. So that such an institution as the military fund was invaluable.

The medical services had also funds of their own, which, in addition to widows' pensions, gave annuities to prevent retired members having to go into practice again. The noteworthy feature about all these funds was that they were Government institutions, which the East India Company warmly supported. Every person in their employment was required to belong to them. The subscriptions and donations were levied by the State paymasters, and the money was deposited at high interest in the public treasury. The country-born population was a trifling fraction in the white community of India. Many of them received cadetships for which they were examined in India, and joined their regiments on exactly the same terms as those who came out from England. During the construction of the Ganges Canal, several educated at the Roorkee College were taken on as engineers, but in a subordinate capacity and with no assured position, and their prospects were very unsatisfactory. The fact is that no greater injustice can be done to a boy of pure European blood than to attempt to bring him up either on the plains or hills of India. The constitution is rendered sapless. Instead of a rosy colour and full development, there is a pallor with only a slight hectic flush to show the purity of origin. The face looks pinched and old. The association with natives continues, and a life only is not conducive to moral health; and a life in a country like India, where society is totally different from that of Europe, and abnormally constituted, is not calculated to give any breadth of view or real knowledge of the world. Such a person's ideas must be contracted, and they must be quite out of sympathy with the ordinary run of British gentlemen. This great difference in breeding is one of the chief causes of the gulf so often noticed and deplored between natives and Europeans, and neither in their case nor that of individuals country born can education bridge it over. A person brought up in the country can be told at once by a peculiar vacancy of expression, and if that does not reveal it a few moments' conversation does. A young lady of this class once, on being told a sumptuous banquet had been given on some public occasion in England, remarked, "Of course, everything on the table was hermetically sealed," being unable to conceive any luxury procurable out of a tin case, such as they are invariably only to be found in India. But as the second generation of pure Europeans is, according to the report of the Colonisation and Settlement Commission, unknown in India, the country-born class is a very small one, and not self-increasing. It seems, however, to have furnished the first civil engineers engaged on terms not very flattering to the profession, and is interesting in that respect, and as illustrating the subject in hand.

The next subdivision of society in India is the "Half Castes," a rather numerous, and, as may be supposed, varied body. The term is that usually employed to designate a mixed race in all parts of the world, but it is strongly objected to by the class in question, as being an epithet of reproach, and oscillating by turns between the entitlings of "Eurasian" and "East Indian," have adopted the latter. They, however, consider it very hard that there should be any special nomenclature for them, and are much afflicted with false pride. The term "half caste," or its equivalent, is seldom or never applied to any but those East Indians who have never been out of the country; such of them as may have received an English education take their place with any other European; and there are many in all branches of the service who have not found

their descent a barrier to their advancement or reception into society. Of such we are not speaking, nor are we of a few who, though strictly East Indians, have risen as merchants or otherwise, to wealth and local repute. But the great body of half-castes were, from the very fact of their being brought up in India, excluded from the advantages a pure European would possess through his knowledge of men and manners alone. They generally intermarried with persons of colour, and by degrees the tendency was for them to become darker and darker, till at last they could hardly be distinguished from natives. From their knowledge of the vernacular tongues from childhood, they could not but have an intimate acquaintance with native ways and modes of thought, and so close a connexion could not fail in resulting in their horrowing much that was non-European. For various reasons they would not engage in manual labour or any pursuit that required much physical exertion. The more successful and best educated turned to Government service, and were employed as clerks: the only thing they were fit for. Others became assistants in the Presidency town shops, or apothecaries, headles, pew-openers, and held those little offices which are filled in England by poor deserving people. But the summit of their ambition was to be a clerk, and it was a vocation into which they all pressed. A few made very fair overseers in the Public Works Department, but had neither the ambition nor the energy to rise higher. In aspirations and bent of mind they could have nothing in common with British gentlemen; their manners were not those of polished European society; their training had been acquired solely in India, and theirs was a constitutional inertness, the effects of climate of which the Englishman would not be very tolerant. But in the sphere which they selected, East Indians, by their respectability and docile demeanour, gained approbation, and they professed Catholicism. The natives were more at home than any of the other classes, and had a natural and complete development. The climate told even on their frame and activity, and caste determined their walk in life, but no scheme of government could be worked in India without their assisting largely. The higher castes, as the Brahmins, will not stoop to severe manual labour, but consider any kind of official employment highly honourable, and will begin on very small salaries, and sometimes on no salary at all, working their way up in the grades of clerks to higher posts. Every other description of Government work was done by some caste of natives. Their habits are very simple, the man of wealth dressing and feeding little better than the lower classes. So that their personal expenses are very few, and they can afford to accept moderate pay, and would only hoard or waste in marriages and indiscriminate charity an excessive remuneration. Before the expansion of education in late years the stock of knowledge with which a candidate began his official career was mostly confined to the three Rs, and he worked away side by side with his relatives at rote forms and judicial processes, till he attained a technical proficiency, and they left vacant places. The vernacular languages of India have no literature, and very few natives indeed have any acquaintance with the celebrated Sanscrit classics, and they rarely read English books except as a school task; so in the public offices there were no natives of really liberal education who could be introduced into society and associate on equal terms with European civilians and officers of the army. Among so numerous a body as the natives in the offices of Government there could not fail to be clever intellects; but these had quite a different forming from the European mode, and were exercised on the practical routine of life of their countrymen, and the details of revenue collection and law-court decrees. The great bulk of the native officials received not more than 15l. a month even as head clerks of offices, subordinate and the actual collectors of revenues from the land, or junior magistrates. But their intimate knowledge of the ways of the people,—a thing that the oldest European servant of Government finds it impossible to fathom,—enabled them to materially increase their incomes, and no appeal against assessment or suit at law could be properly presented to the covenanted collector or judge without a regular fee being given to all those members of the office from the doorkeeper upwards with whom the client had to deal. Over this practice the European officers could have no check, as the advice of natives was essential to

the conduct of business, and the increase of salaries, in a country where moral notions were so loose, would not necessarily abolish the evil, though it might and has diminished it.

In the Public Works Department the qualifications for an ordinary clerkship, and such skill as could be picked up from watching masons and labourers, would not lead very high. Much of the duty was out-of-door exercise, involving travelling from day to day, and though the expenditure of the department was considerable, a tangible result had to be produced, and a rigorous account system would disclose or suggest the taking place of wholesale embezzlement. Besides, the offices of public works were for design and audit, and little frequented by the mass of the population; so that there was scarcely any opportunity of adding to the Government salary. In consequence the more talented natives hetrock themselves to other departments, and the Public Works Department had to make the most of their inferior castes, and such Brahmins as could not get in elsewhere. There has always been this inferiority in the raw material of the Public Works Department to contend against, and it is a thing likely to continue, as the causes are ingrained in the disposition of the people. There were thus, several years ago, in India, the civil servants appointed and sent out from England. The military, medical, and clerical services, supplied directly or indirectly from the same source, all of them Europeans, and socially British gentlemen, wielding the supreme power, and occupying the positions of mark and most emolument. They contained within their bodies all heads of departments and the prime authority in military and civil matters. They constituted also the European society of India. One with another, they had a rank given them in this society by patent. They had either covenants or privileges which meant that they could not be dismissed during good behaviour without compensation, and the welfare and good name of their families was carefully guarded by means of insurance funds, for which Government was responsible. The ordinary functions could, of course, be carried on by a cheaper agency, and as a matter of obvious necessity the natives and those allied to them were employed in all petty and subordinate capacities in immense numbers. All classes were mixed up together, and employed in situations indifferently as their abilities pointed. The half-caste head clerk might have an office of natives under him, or a native might preside over a roomful of East Indians and natives, or a motley assemblage. The whole of this ancillary class were civilians engaged in strictly civil duties. They were persons gazetted to the posts they held, with a large share of the practical administration divided in minute distribution amongst them, and were virtually civil servants as much as a clerk in Somerset House or a tide-waiter. But they were in nationality, bringing up, acquirements, notions, demeanour, and social organisation totally distinct from the civil servants sent out from England, and incapable, in their own view or any one else's, of being confounded with them. They did not require sick leave or furlough to Europe, or to retire at an early period of life, or premiums for studying the native languages and the like. But being members of the Civil Service they could call themselves civil servants. It was found there was one distinguishing feature. The Haileybury civilians signed certain documents styled covenants at the East India House before coming out. Natives and others appointed in India signed no covenant. So at once a suitable appellation was discovered, and they were popularly said to belong to the uncovenanted Civil Service. Thus "uncovenanted" for years in India was taken to mean no European education, birth in the country, a humble social position, or a native one for which there is no European equivalent, and incapacity for rising beyond an income on which a gentleman could hardly subsist. An uncovenanted service of this nature required no provident funds. Natives are polygamists, and hold much of their family property common, and the principle of caste ensures them against dire calamity. Half-castes, though more in need of some sort of insurance than natives, can, from the nature of the climate and their social system, which takes a good deal after the natives, suffer little domestic misery. Government accordingly promulgated an entirely different set of leave and pension rules for uncovenanted servants to those in force for their European officers. Read side by side they appear to go to the extremes of harshness

and liberality. The sick leave of the covenanted civilian was to count as service; that of the uncovenanted was to be deducted. Where one had three years' furlough the other could only have one, and so on. But when the circumstances of the two parties were had regard to, the rules were fair enough as applied to each respectively. One of the first disturbances of the Indian fabric took place by the introduction of individuals who were neither in the army nor covenanted civilians into scientific appointments. Prominent instances were gentlemen entertained as civil engineers. It would have been thought that as they had satisfied the Home authorities as to their qualifications, and had the same requirements, they would as to leave, furlough, and pensions, have been treated like other civil servants sent out from England. But no special clauses were inserted in their covenants to render their condition as nearly allied to that of uncovenanted civil servants as it could be made. Of course, the nominees unacquainted with Indian society would not immediately perceive the indignity to which they were subjecting their profession by signing such a covenant, which moreover was so incomplete as to leave sundry matters unsettled. On going out to India, and there presenting themselves, the Government ordered that in all respects not provided for in their covenants, civil engineers should not be, as might be supposed, under the generous rules of the covenanted service, but under those of the uncovenanted, specially framed to suit persons who were not gentlemen in the English sense of the term, and had never been out of India. This attitude and action of the Government shows an aim all through, and a desire to place civil engineers on a lower footing than they were entitled to, and which could not be done without abstracting from the local dignity of the engineering profession. Further, the names of civil engineers' grades were entirely left out of the table of precedence, and they take no rank with other covenanted officers. Such civil engineers as happened to enter the Government service in India from the railways or colleges were naturally put under the full operation of the uncovenanted service rules, and had no covenant at all, and thence it comes that there are three varieties of engineers in that country—the Military, the Covenanted, and the Uncovenanted,—according to its leave and pension rules. If there were any satisfactory pretexes for treating civil engineers, professors of the State colleges, headmasters of the educational department, others in the geological survey, and in posts which this advancing civilization of India calls into existence, as half-castes and underbred native clerks, there would be less inducement for complaint. The Government says, "Fair for one, fair for all. We now acknowledge neither race, nor caste, nor creed, in our services, and we wish to make it as homogeneous as possible, and many offices Europeans now are brought to fill we hope in course of time natives will be fit for; and we wish to have no more exclusive services and special rules founded on physiological differences between Englishmen and Asiatics. So long as we have our own old institutions of the Covenanted Civil Service and the Army, we intend to maintain their privileges. But your professions stand upon a much lower platform, and are not so influential, and we do not see it advisable to give them to you." The ratiocinating of jealous Anglo-Indian civilians who direct the Indian Government can scarcely hold ground in Great Britain, which owes so much to engineers, and some effectual redress may be looked for when it becomes understood what uncovenanted really means.

A. E. I. O.

Glue which will unite Polished Steel.—

The following is a Turkish receipt for a cement used to fasten diamonds and other precious stones to metallic surfaces, and which is said to be capable of strongly uniting surfaces of polished steel, even when exposed to moisture. It is as follows:—Dissolve five or six hits of gum mastic, each the size of a large pea, in as much spirit of wine as will suffice to render it liquid. In another vessel dissolve in brandy as much isinglass, previously softened in water, as will make a two-ounce phial of strong glue, adding two small hits of gum ammoniac, which must be rubbed until dissolved. Then mix the whole with heat. Keep in a phial closely stopped. When it is to be used set the phial in boiling water.—*The Stationer.*

GUTTER CHILDREN AND DRUNKEN PARENTS.

THE benevolent scheme of Miss Rye and others for the exportation of neglected female children to America forms the subject of a burlesque and sarcastic brochure from the pen and pencil of good George Cruikshank, the champion of the total abstinence movement. He depicts Miss Rye as the driver of a dirt-cart, into which her assistants in the emigration movement are sweeping and shovelling the poor little "female" vermin, by wholesale, off the street, before the Angel public-house. "My own opinion of this matter," says Mr. Cruikshank, may be seen in the sketch at the head of this paper, for the proposition appears to me like sweeping up the little girls, as so much mud out of our gutters, and pitching them into a mud-cart, to be "shipped aboard of a ship," like so much guano, or like so many cuttle, for a foreign market. And if such a transportation of innocent children, of that tender age, either girls or boys, should take place, it will not only be a degradation and a disgrace to this nation, but also a disgrace to the Christian world; for I consider such a proceeding would be contrary to the laws of nature, and also Christian civilisation. . . . Has 'Glorious Old England' come at last to such a state as this!!!! . . . The cause of nearly if not all this misery, crime, lunacy, neglect, and desertion of our 'Gutter Children,' and disorganisation, is, because the Christians and the Jews use intoxicating liquors as a beverage. It has been stated over and over again, by many of the leading men of the day, that 'Drunkenness is the curse of the country;' but this is a very great mistake. Drunkenness is a terrible thing, no doubt, but it is the drink, the intoxicating liquor, that is the curse of this country, and of many others. Most persons take these intoxicating liquors with a relish, and in many cases for many years, without any apparent harm or injury; but they, nevertheless, produce disease, and shorten life, except in a few solitary cases, and are the cause of all sorts of evils, from small offences up to the most diabolical deeds." He proposes, as an aid to its suppression, the formation of a "society for the prevention of cruelty to human beings and of the murder of children."

It is in all probability the cursed drink, he remarks, that has shortened the lives of the parents of these gutter children; and in cases of neglect or desertion, the drink has been the cause of the father and mother losing all paternal feeling, and unnaturally leaving their offspring, without caring what becomes of them. "And I must impress upon my readers the fact," he adds, "that there is not one neglected or deserted child amongst the millions of teetotallers, even of the most humble classes; and should there unfortunately be any orphans, they are also taken care of, and properly trained. . . . Let us try to support these neglected children in their native land. And let every woman ask each other if she is a member of the Society for the Prevention of Cruelty to Human Beings, and for the Prevention of the Murder of Children."

We may here add on to Mr. Cruikshank's brochure brief notice of a pamphlet titled "An Inquiry into the Causes of the Present Long-continued Depression in the Cotton Trade, with Suggestions for its Improvement." By a Cotton Manufacturer. (Manchester: Heywood.) This, like the preceding, has the excellent object of reducing the dreadful evil of intemperance in view, but it is also a little Quixotic. The author argues indirectly that if the three hundred and odd millions sterling expended within the last three years in drink had been expended in the purchase of cotton and other manufactured goods, the building of houses, and so on, how much better it would have been both for trade and for the morals of the people; and no doubt it would. It is strange, he thinks, that men of intelligence cannot see this. We should rather think they can and do, although they may differ as to the best or most practical, and speediest and most effectual way of remedying the admittedly enormous evil. Dreadful as the effects of drink are, we are persuaded that a vast proportion of the "nine-tenths of all crime brought before the magistrates" attributed to drink are more particularly ascribable to the admirable and infuriating adulterations of the drink, to give intoxicating effects without the alcoholic intoxicant. "Toxicology" means the science of poisons, and brewers and distillers, as well as other drink-sellers, are highly skilled in this science. Are not they responsible for much of the crime which drink produces? The writer

of this has a painful recollection of the loathsome prevalence of drunkenness in certain Scottish towns previously to the last quarter of a century, and for nearly a quarter of a century in all, but it never was accompanied by anything like the fearful crime with which it is now continually associated; and this difference he is convinced is attributable mainly to the increased skill and rascality displayed in the adulteration of all sorts of alcoholic liquors.

The total suppression of liquor traffic is simply out of the question; but we should not regret to see it so heavily taxed that the drinking of it in relatively large quantities in any shape by the masses of the people would be rendered totally—though not quite tea-totally—impracticable, from sheer want of means.

A puzzling problem has just been put before the Home Secretary by Mr. Darrab, a resident of Manchester. Mr. Darrab, it seems, is acquainted with a drunkard who suffers from frequent attacks of *delirium tremens*, during the existence of which he is obliged to be placed in a lunatic asylum. His wife is willing to pay for his retention in safe custody, but the officials declare that they have no power to detain this confirmed drunkard after recovering from the rabid symptoms of the disease. Mr. Darrab asks the Home Secretary, "What can be done to protect the wife and save the man from his own folly?" Mr. Bruce replies as follows:—

"The Government has announced its intention of introducing a measure for the better regulation of the trade in intoxicating liquors, which it may be hoped will have some effect in diminishing drunkenness and its attendant evils. The method, however, of dealing with persons in the condition of the man described in your letter is one of great difficulty, and Mr. Bruce is not at present prepared to recommend any change in the law with respect to such cases."

The Americans have taken the subject of the disposal of drunkards in hand, and are erecting homes for drunkards, or "Inebriate Homes" as they call them. A site comprising fifteen acres of land, in a pleasant locality, having a fine view of Statue Island and New Jersey, has just been set apart for the erection of what, on such a scale, is a novel institution—an Inebriate Home for King's County, New York. A charter has been obtained for the home, and about 30,000*l.* have been appropriated for the purchase of land and the erection of the buildings. An Act of the Legislature of New York has also been passed, granting it about 1,500*l.* a year from the excise licence fees and from fines levied in King's County for violation of the excise laws.

EXETER HALL.

SIR.—In the notice published in your last week's issue upon this work, it is said that it has been executed "with more force than fluency;" also that the forms into which the ceiling of the Great Hall is divided, are somewhat large and coarse together with other remarks upon the treatment generally, to which we hope you will give us an opportunity of replying.

That a considerable amount of force is necessary in the arrangement coloured described, in a building of the chief uses require the aid of artificial light, we think you will allow; and whether the force employed in this case is more than sufficient, we submit, cannot be positively decided until the building has been exhibited. We have had great experience in such work, and our fears have only been those of an opposite result, through being obliged to consider the hall is occasionally used by daylight. The forms into which the ceiling is divided are large, it is true, but the size of the ceiling itself, with the huge ventilators, placed at irregular intervals (which irregularly causes the break in the line you remark), and the necessity that existed of making these an important part of the design, quite prevented any more intricate arrangement, even should such have been thought desirable; and the coarseness of which you complain, is a matter of colouring only, which, as we have said, has not yet been tested. The walls of the building have been kept somewhat neutral in tone (but, at the same time, a colour that reflects light well), for the sake of emphasising the pilasters in order to carry out the bright colouring of the ceiling down to that of the dado. That the pattern on the large organ should "suggest Egypt" is unfortunate, as with the exception of the Ionic-like arrangement, which was adopted for the sake of effect, upon the large central pipes, there is nothing Egyptian in its character.

Mr. Maberly having placed the entire work on his hands, we trust that on his account, as well as on our own, you will think proper to insert this explanation.

HARLAND & FISHER.

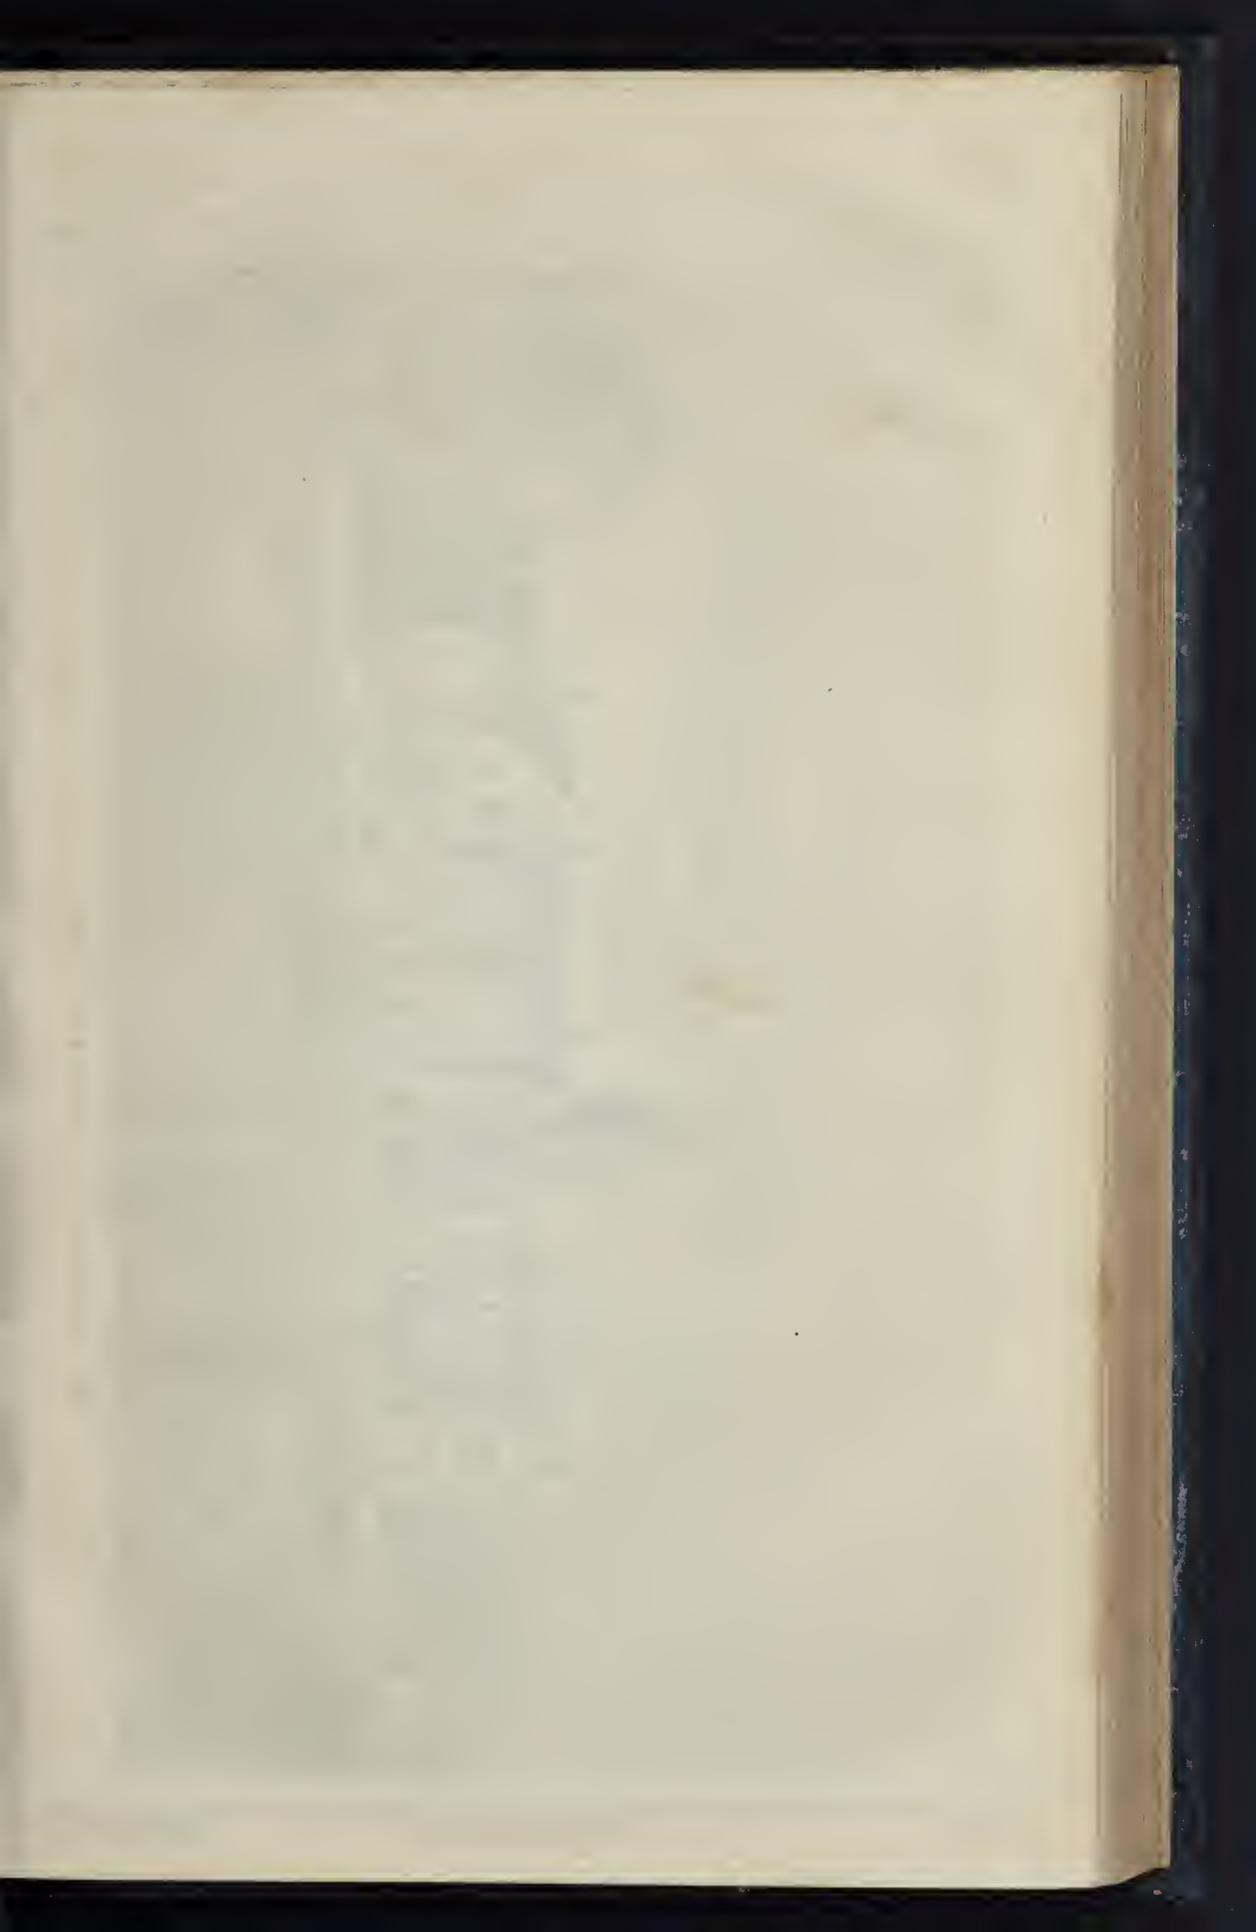

THE ROCK OF CASHEL.

THERE are perhaps but few of those in any degree acquainted with the history of Ireland who have not at some time heard of, if perchance they may not have actually seen, the remarkable structure which is known as the "Rock of Cashel." The district in which it is situated formed at one time the metropolis of the kingdom of Munster, when Ireland—somewhat like England during the Saxon heptarchy—was divided into several kingdoms. The original territorial divisions of the sister country are

still in a great measure recognisable in the provinces of Ulster, Munster, Leinster, and Connaught, all of which provinces are in some way distinctly remarkable. It is in what was in ancient times the chief city of Munster that the Rock of Cashel is located. It may be remembered that a recent visit was made to this spot by His Royal Highness Prince Arthur, with the especial object of inspecting the architectural ruins which have rendered the place so celebrated. Upon a rock which is called after a name which the Prince himself hears, and by which he will be alone known in Ireland, Saint Patrick's Rock, the remains of chief interest are to be discovered. From the warmth of the reception which was accorded to the youthful Prince in Cashel, it formed, as was well known, one of the most pleasing incidents of his journey through the country; and His Royal Highness, judging from the remarks which he made upon the occasion, was apparently far from displeased at the way in which his metamorphosis into an Irishman was actually accomplished. The building, or series of buildings, more accurately speaking, which were inspected on the occasion of the Prince's visit, are commonly designated by a title which altogether fails in conveying an adequate or intelligible construction. It is not simply the Rock of Cashel that is intended to be described. Were it possible that the memory could embrace a period anterior to the erection of the venerable pile of buildings thus entitled, the Rock of Cashel itself, upon which they are founded, would still possess some claims to attention. This rock is an irregular elevation of the surface of the land in a locality where a dwarf mountain of this kind would perhaps be least expected, and from its isolation alone it would probably attract notice as a onerous freak of nature. It is in reality a bold upheaving by subterranean pressure of the stratified limestone of the district, as described by Archdeacon Cotton, sloping down gently at some parts towards the surrounding level, while at other points it is precipitous, straggling, and steep, and clearly exposes to view the strata of which the hill is constituted.

It presents the appearance of a prodigious natural mound, which may have been discovered to have been composed of material adapted to building purposes—which it undoubtedly is—and of which no inconsiderable portion came to be quarried and removed from the locality. So far is the rock disassociated from the general features of the neighbourhood, that its existence is attributed altogether to a legendary source. There is in the northern part of the county Tipperary a range of mountains out of which, at one particular spot, a large gap may plainly be distinguished from the summit of the rock. This huge indent is geographically known as the "Devil's Bite" or "Bite." Tradition runs to the effect that Saint Patrick, the titular saint of Cashel, so nearly annihilated Satan's influence throughout these parts, that in sheer discomfiture his enemy began to prey upon the mountains. Being observed in attempting so orthodox a piece of devilry as this, Saint Patrick gave chase to Satan, who, in order to facilitate his escape by flight, let fall that considerable morsel which constitutes the Royal Rock.

It might perhaps, says Archdeacon Cotton, be thought rather unfortunate for the credit of this story that the mountain from which this bite was fished is not composed of similar material: a circumstance which, in the Archdeacon's view, seems calculated to invalidate the hypothesis. Upon this rock, on the more level portions at its highest elevation, are the remains of various buildings in a more or less perfect state of preservation. They afford evidence of having been erected at different periods, but in order of erection appear to have been nited and blended together in one common structure, until in the mass they have acquired features of considerable attraction and interest, and indeed of magnitude. As in the case of many other ancient historical structures, much difference of opinion prevails amongst those who claim to speak with authority upon such subjects with regard to the comparative antiquity of the assemblage of buildings upon the rock. Much diversity of opinion exists also as to the actual character of the architecture exhibited by them. We should premise that the pile of buildings is composed of a round tower, differing but little from numerous similar structures which abound in Ireland, of a chapel known as Cormac's Chapel, and of a large cathedral building, with which the other structures are incorporated.

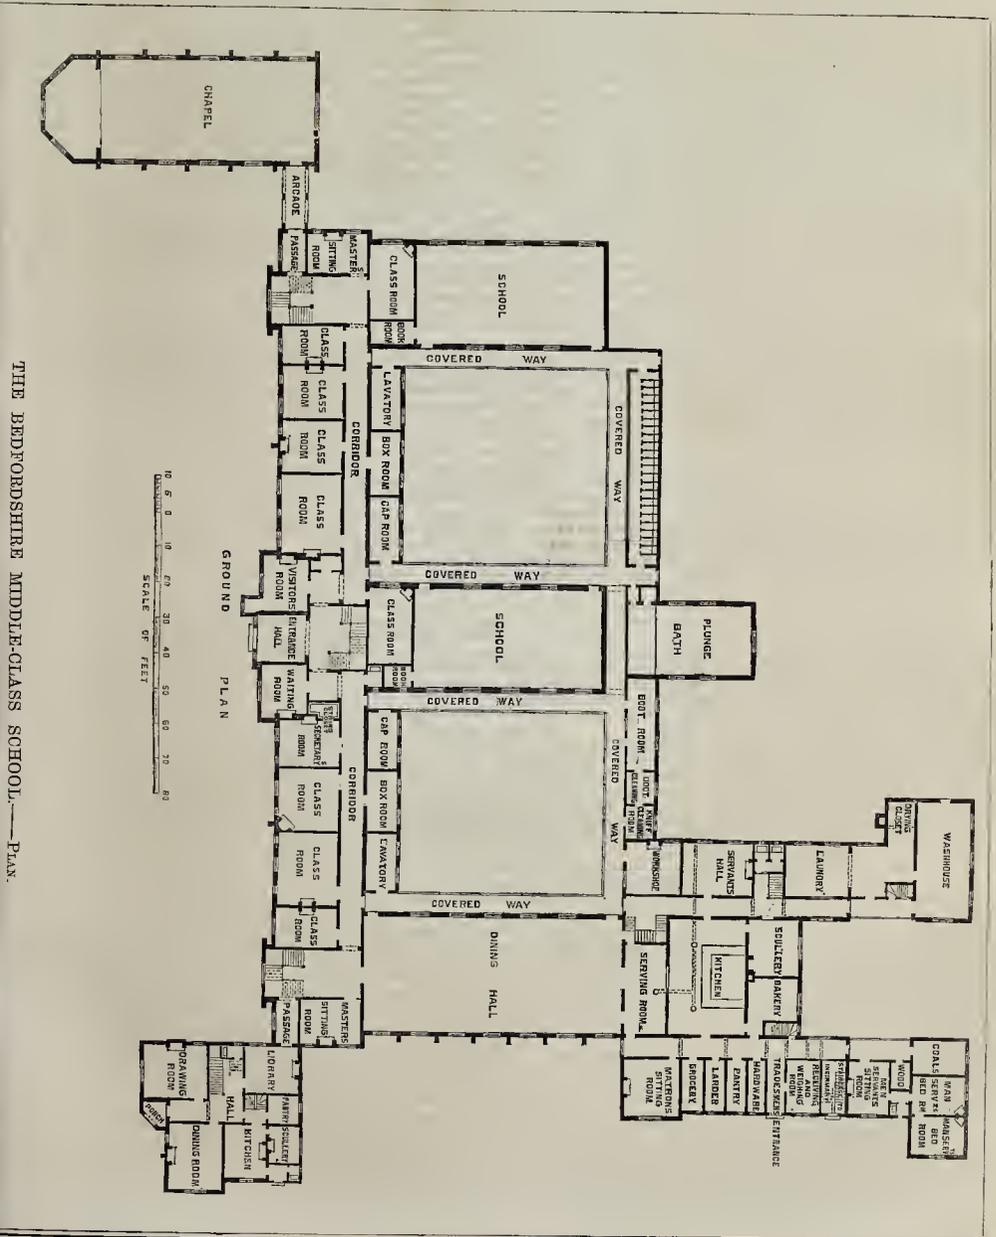

THE BEDFORDSHIRE MIDDLE-CLASS SCHOOL, BEDFORD.—MR. F. PECK, ARCHITECT.

which is approached from the high road along a ward leading by a flight of steps to a spacious terrace—a lower rise to the height of 90 ft. The plan we give shows the appropriation of the ground-floor. Opening into the main corridor, which runs parallel with the frontage, there is a suite of rooms for chess map, as also for the accommodation of the directors, the secretary, visitors, &c., in the rear of which are two school-rooms and the dining-hall, respectively divided by partitions. The kitchens, storehouses, and other apartments occupy the remainder of the area. On the upper floors there are seven dormitories, furnished with iron bedssteads and built mattresses, while a master's bedroom, with a window for inspection, is provided at the extremity of each hall. In close contiguity to each, also, there is a lavatory, together with a separate apartment for washing feet, fitted up conveniently situated with respect to this hall, being separated from it by a serving-closet, which is a four-light gas pendant. The kitchen is six feet high, is 72 ft. by 32 ft., and has six four-light gas pendants. The kitchen is throughout the building and the gas pendants have been supplied by Messrs. Richardson & Co. (Nottingham), and a patent boiler by Messrs. Howard, Bedford Britain Works. The piping (English bond), with bath dressings. The architect was Mr. P. Peck; and the contractor, Mr. Huddleson, of Luton.

The terms for board and education are 30*s.* per annum, including every expense. Bedfords, however, will provide with the means of education, however ill or well they may be used.

THE BEDFORDSHIRE MIDDLE-CLASS SCHOOL.—PLAN.

THE ANSTICE MEMORIAL INSTITUTE AND WORKMEN'S CLUB, MADELEY.

This building has been completed as a memorial of the late Mr. John Anstice, a public man much esteemed in the locality. The building has been erected by Messrs. Nevett & Sons, builders, Ironbridge, after a design by Mr. Johnson, of London, whose design was approved of out of upwards of fifty sent in for competition. The exterior is faced with pressed red brick, the eap, strings, cornices, and other architectural portions being executed in white local stone. In the centre of the facade, and forming one of its principal features, is the entrance porch, which is built entirely of stone. The windows of the ground floor are coupled, the division being a stone pier, with moulded cap carrying the architrave and lintel. At the level of the first floor a deep string-course is placed, which is continued round the building. At each end of the facade a portion is slightly projected, forming in appearance wings. The seven first-floor windows are of large size, semicircular-headed, the arches being of stone springing from piers with moulded caps. The building is crowned with a cornice of bold proportions. The roof is covered with slates. The principal entrance is under the porch with vestibule, beyond which is the entrance-hall, 25 ft. long, with the stairs to lecture-hall at one end. The floors of the entrance-hall and porch are laid with encaustic tiles, the gift of Mr. G. Maw. Adjoining the entrance-hall are the men's and youths' othn-rooms, smoking, reading, and librarian's rooms, lavatories, &c. A corridor leads to the hall-keeper's apartments, to the general kitchen, scullery, stores, larder, pantries, &c. On the first floor, at the landing of the principal stairs, are ladies' retiring and committal rooms. Adjoining is the large lecture-hall, 40 ft. wide, and 70 ft. long, with raised platform at one end and gallery at the other. The inside face of the walls is of white pressed bricks, relieved by a few red bricks in bands and arches. The ceiling is boarded and divided into rays, by moulded wood ribs with ornamental pendants. At the intersection, the ceiling is flat in the centre, with very large cones at the sides, this form being considered best for sound. The warming is by hot-water pipes fixed behind the projecting skirting with iron gratings on the top, the furnace being in the basement. The lighting is by star harness fixed to the pendants on the ceiling. Ventilation is provided for by a number of small openings communicating with the external ventilators. The whole of the internal woodwork is stained oak-colour and varnished.

OUR BUILDING STONES.

PERMIT me through your valuable journal to express still further my thoughts on building stones. In your number of January 23, I gave a general outline of various stones, noticing their causes of decay, &c., and hope that many of your readers who visited the buildings mentioned, where they can have ocular evidence, and thus be enabled to judge of the truthfulness of my remarks in your journal of the above date.

There have been a great number of letters published lately on this subject, and some of the writers have given us their experience of six months' labour, such time being too short for any gentleman to be able to gather the information which is essential for any inexperienced man to know before he gives his opinion.

First, we will commence with Portland stone, it being most extensively used in London, and as there are so many various descriptions, we will merely mention three.

1. Some of your readers may not be aware that there is a class of brown Portland which possesses all the elements of decay, and will decay in whatever atmosphere it is placed. This brown Portland is of a sandy nature, each particle being placed loosely together. When the face of such stone is rubbed you are enabled to see each particle separated from the others, and some of this stone is of a hard nature; but all practical men, who have been in the trade more years than some have months, can detect this stone wherever it may be, and without applying a magnifying glass or subjecting it to a chemical analysis.

2. There is another kind of Portland stone, having a cream colour, or lighter than the one just mentioned. The grain of this stone is close, and appears cemented together by a liquid; it is softer than the brown stone before mentioned.

This kind of stone when rubbed on the face looks almost like marble, it being so fine. It will resist the weather and stand in whatever atmosphere it may be placed.

3. The white Portland, or so-called "best bed." The first bed of this kind which I will mention runs thin, and the texture is of a silmy nature, much resembling soap. It is very fine in the grain, and those who are not acquainted with the quality of the stone admire it for its fineness, but there are very few elements in it but what will decay. Another bed which I will mention as belonging to this "best bed" runs 3 ft. or 4 ft. thick, and is of a harder nature than the thin bed just referred to. This is also a white stone, but possesses more of the qualities of the cream-coloured stone. This stone I have seen used very extensively, and it stands the weather well; at the same time it requires great care in its selection for outside work.

Bath Stone.—A number of opinions have been recently expressed upon this stone, but none of the writers have stated anything in relation to the various beds. Allow me to say just a word or two. The thin beds of Corsham Ground stones, Fareleigh Down, and a number of other stones, are generally of an inferior quality, as you will often observe an inch or two on each side of the bed which is of a red, soft, sandy nature. These thin beds will not stand the effects of the weather so well as the high beds, for the bigger the beds are the better the stones generally is. It is cheaper for the contractor to buy the high beds; it may, perhaps, cost more in price, but he is saved in a great measure from those soft outside portions referred to, and also from waste.

Darley Dale is of a brown colour, the grain finely cemented together, and extremely hard; for instance, after it has been removed from the quarry for some six months, it is almost as hard to work as granite. The best quality of this stone sparkles like silver; it will stand the weather well, for several works have been constructed in London with this stone, and are now in excellent preservation.

There are a great number of Grit stones which I could mention that will stand our atmosphere, such as Hawley Park, Gazeby, and many others from the neighbourhood of Halifax, all of which can be used with safety.
