GLOSSARY

Benchmark Projections--the level of resource use necessary if BLM is to maintain the same share of local industry production in 1980 that they were furnishing in 1970.

Community Dependence--the percentage of the district's total personal income coming from the resource in question.

Extrinsic Values--used with recreational or hunting activities. It refers to the impact of actual expenditures for that activity on the local personal income (As opposed to intrinsic values).

Industry--a sector of the economy. This report emphasized the industries of agriculture, mining, recreation and hunting since these industries rely, at least in part, on BLM resources.

Industry Dependence--the percentage of the industry's personal income originating from BLM resources.

Initial User Dependency--used with agriculture only, it indicates the percentage of the permittees' gross income that results from leased BLM range.

Intrinsic Values--used with recreational and hunting activities. It refers to value of the activity to the participants, i.e., what he would have paid to participate if he had been required to do so. It is a very difficult value to measure.

Multiplier--measures the total change in personal income of a community as a result of changing the value of production in that industry by one dollar.

Personal Income--is the sum of wages and salaries, proprietor income, rental income, dividends and transfer payments resulting from the business activity of a particular industry or use of resources, including those furnished by BLM.

Region--as distinguished from District refers to the District Statistical Region.

SUMMARY AND CONCLUSIONS

Since economic data are available on a county basis it will be necessary for statistical purposes to include all of Eureka, Lander, and Nye Counties as being component counties that make up the Battle Mountain District Statistical Region.

Table S identifies and displays the basic natural resource economic data for the region. The term "Public Lands" is used to refer to "National Resource Lands," i.e., those lands managed by the Bureau of Land Management.

Population

The total population of the region in 1970 was about 9,000 people and this accounts for 1.9 percent of the state total. As regards population density, the Battle Mountain District is sparsely populated with an average density of 0.3 people per square mile compared to 4.4 percent for the state.

The population is projected to increase to over 12,000 people or 32 percent by 1980.

Income

Total personal income for the District Statistical Region is about \$33 million or 2.1 percent of the Nevada total. Per capita personal income is \$3,365. The median family income for the region is about \$8,700 in Eureka and Lander Counties and \$10,224 in Nye County which is lower than the state average of \$10,692. It also appears that the percent of families having incomes below the poverty level of \$3,000 per year income level, which is a reasonable approximation of the average family poverty level, ranges from 6 percent in Nye County to nearly 19 percent in Lander County.

The most important sectors from the standpoint of personal income produced are, in order of importance: services; mining; construction; tourist-related services. The lowest contributors are: military and finance, insurance and real estate.

Employment

In 1970 total civilian employment within the Battle Mountain District amounted to nearly 3,900 people or 2 percent of the state total. The major employment sectors, in descending order of importance are: mining, services, and tourist-related services; with manufacturing and finance, insurance and real estate at the lower end of the employment scale.

TABLE S
SUMMARY TABLE

Item	District Total	Public Lands
<u>Present Resource Consumption</u>		
Livestock Forage (AUM's)	1,262,772	345,645
General Recreation (Recreational Days)	223,224	26,814
Hunting (Hunter Days)	53,236	30,558
Mining	a	a
<u>Monetary Measures for Computing Industry Dependence</u>		
Value of Livestock Products Sold	\$6,370,334	\$1,743,560
General Recreation (Local Expenditures)	942,005	113,155
Hunting (Local Expenditures)	212,944	22,232
Mining (Value of Products Sold)	33,249,000	14,577,202
<u>Dependence of Resource Based Industries On Public Lands</u>		
Livestock (Percent)		27.37
General Recreation (Percent)		12.01
Hunting (Percent)		57.00
Mining (Percent)		43.80
<u>Personal Income Attributable to the Resource Products</u>		
Total District Personal Income	\$33,041,497	
Livestock Forage	1,282,908	351,132
General Recreation	245,863	29,528
Hunting	55,575	31,903
Mining	7,035,488	3,142,941
<u>Dependence of Community on Resource Products</u>		
Livestock Forage (Percent)	3.882	1.062
General Recreation (Percent)	0.793	0.095
Hunting (Percent)	0.179	0.102
Mining (Percent)	21.292	9.512
Total Community Dependence	26.146	10.771
<u>Benchmark Projections--1980</u>		
Livestock Forage (AUM's)		316,657
General Recreation (Recreational Days)		81,631
Hunting (Hunter Days)		37,060
Mining (Dollars)		21,793,566

^aNot available in common units of measure because of the variety of minerals.

Mining employment in 1970 contributed nearly 20 percent of the total employment within the region. If projections as to increased mining production materialize, the region will experience a substantial increase in mining employment.

Livestock Forage

In 1970 some 100 livestock operators depended on the Public Lands for livestock forage in the Battle Mountain District. These operators have been, on the average, 50-55 percent dependent on Public Lands for their total forage supply and this dependence has remained fairly stable with a slight decline in recent years.

The livestock industry depends on Public Lands for 28 percent of its total forage production while community dependence on public land forage is relatively insignificant at 1.1 percent. Personal income for the livestock sector of the economy accounted for nearly \$1.3 million in 1969, or which \$350,000 was attributable to Public Lands. The contribution of livestock production from Public Lands is important to the total economy of the region and any land use decision that could potentially affect the livestock sector may also significantly affect the economy of the region.

By 1980 total livestock feed requirements within the Battle Mountain District are projected to decrease. This reflects a decrease in total cattle and horse numbers while total sheep numbers will remain relatively constant. The Public Lands within the District Statistical Region presently supply 346,000 AUM's of feed. The 1980 projected decreases in livestock numbers will not make additional forage requirements necessary.

Hunting

Initial users (hunters) of wildlife resources in the District Statistical Region are dependent on Public Lands for about 31,000 out of a total of 53,000 hunter days. This represents a 57 percent dependence. These figures include all types of hunting -- upland game, big game, and waterfowl. Nonconsumptive uses of wildlife are considered to be general recreation and the values are included in the general recreation data.

The hunter user group is more dependent on Public Lands than any other group of users (excluding mining), therefore, they are probably most

affected by BLM land use decisions. Economic returns from wildlife hunting are less than from other user groups such as miners and livestock owners. Local expenditures for hunting within the Battle Mountain District Statistical Region amounted to \$213,000 compared to a local expenditure for hunting attributed to Public Lands of \$122,000. Personal income attributable to hunting amounted to \$56,000 compared to \$32,000 on Public Lands. Based on these earnings values, the community dependence on all hunting is about 0.18 percent, while dependence on public land hunting is only 0.1 percent.

Demand for sports hunting on Public Lands is expected to increase a projected 21 percent from 1970-1980. Based on this, the public land benchmark projection for 1980 is 37,060 hunter days or an increase of 6,500 hunter days. Demand for hunting on private and public land is expected to stay in balance at least until 1980, i.e., dependency on Public Lands for hunting is expected to stay at its current 57 percent level.

Recreation

Total outdoor recreation use in the District Statistical Region for 1970 was over 223,000 recreation days, with only 27,000 recreation days or 12 percent occurring on Public Lands.

Personal income attributable to recreation use within the region is about \$246,000 or 0.8 percent of the total personal income. Recreation on Public Lands generates less than 0.1 percent of the region's total personal income, about \$30,000. Although 0.1 percent dependence on Public Land recreation for total personal income is low, in comparison to the high personal income producing sectors in urban areas, it is in smaller towns and rural areas that outdoor recreation generates a more significant part of their personal income. Therefore, the general outdoor recreation industry on Public Lands is important to local communities near recreational attractions and to those people deriving their income from trade and service type businesses in these areas.

Benchmark projections to 1980 indicate a 205 percent increase in recreational demand. Based on this figure, the benchmark projection is about 82,000 recreational days, or an increase of nearly 55,000 days. As indicated above, recreation use on Public Lands is relatively light and it is expected that the lands can sustain increases in recreational use without damage to

the resources. Therefore, it is expected that the Public Lands can and will meet the projected demand by 1980.

Minerals

The total value of mineral production in the District Statistical Region for 1970 was over \$33 million and \$15 million or 44 percent was produced from Public Lands.

The region is dependent on the mining industry for 21 percent of its total personal income. Income generated by the mining industry is about \$7 million out of \$33 million in total personal income. Mining industry income generated from Public Lands is \$3.1 million. This represents nearly 10 percent of the region's total personal income attributable to mining operation on Public Lands. If income from lands patented from Public Lands for mining purposes were considered, community dependence becomes more significant.

Mining produces a substantial part of the communities' total personal income and these mineral products are required either directly or indirectly in almost all other sectors of economic activities.

The demand for mineral production in terms of value of minerals produced in 1970 constant dollars is projected to increase 50 percent from 1970-1980. In order to maintain its current share of production, an increase of \$7 million from Public Lands would be required.

Industry Comparisons

Slightly different monetary measures are used in computing resource industry dependence on public land resources (Summary Table). These resources are reasonably comparable, however, because each represents the gross money exchange in the local economy for the initial product either to or from the initial producer or user.

Considering total money exchanged, the resource industries in descending order of importance are: mining, livestock, general recreation and hunting. This order applies to the industry importance of production from Public Lands (Summary Table).

The District Statistical Region depends upon the four resource sectors for over 26 percent of its total personal income. The contributions from hunting and general recreation are of minor importance producing less than

one percent of the total personal income within the region. The most significant sector is mining, producing over 21 percent of the region's income.

Community dependence on public land resource production from the four resource sectors is significant to the region's economy producing nearly 11 percent of the area's total personal income. Mining is the most significant sector producing nearly 10 percent. Income from Public Lands produces \$3.6 million to local communities.

It must also be remembered that initial users of the forage resource depend on this resource for at least part of their livelihood. This important distinction is shared by some users of the mineral resource and separates this dependence from the kind typical of the initial users of recreation and hunting resources. In the latter cases, the dependence does not affect the initial users' livelihood. Secondary users such as suppliers of goods and services do, however, depend upon these uses for part of their livelihood. When the analysis shifts to a comparison of the community dependence on the various resources, this distinction ceases to exist.

Other Resources and Land Use

Vegetative products, water and land use are not analyzed in the same way as other resource industries. Harvesting of vegetative products from Public Lands within the Battle Mountain District is limited and the value of production is not significant to the economy. Water and land use are both important to the economy, but are not subject to measurement and analysis in the same economic terms as livestock production, recreation and minerals. (See body of the supplement for brief analysis of each.)

INTRODUCTION

Purpose

The "Battle Mountain District Supplement" provides a detailed analysis of the general economy of the District Statistical Region and the resource production from national resource Lands¹ compared to the total resource production of the region. The purpose of the data and analysis provided in this supplement is to provide measures of need and community economic impact of changes in use of National Resource Lands. These data are designed for use in the BLM Planning System to assist the resource manager in allocating among resource uses and BLM program.

Analytical Areas

District Statistical Region

For statistical purposes, the Battle Mountain District will include all of Eureka, Lander, and Nye Counties (Table 1). Although not all the land within these counties is exclusively managed by BLM, a substantial portion are under BLM control (see Tables 2-4). The District Statistical Region throughout this economic supplement will include only whole counties since much of the economic data is available only by counties. Although it is recognized that district boundaries do not conform to county lines, it will be shown here as coinciding. In order to alleviate some of the confusion of determining district lines, a majority of the tables presented throughout this supplement will be on a statistical region basis. Those referring to present district boundaries will be called "Districts" for ease of distinguishing them from "District Statistical Regions."

Community Impact Areas

Community impact areas are geographical units which correspond to the concept of trade areas. They include a trade center of sufficient size to account for a significant proportion of economic transactions occurring among people in the area. They are used to measure the economic significance of BLM resources on local economies. Since economic data is available on a county basis, community impact areas therefore consist of one or more counties.

¹National resource lands are defined as those lands in public ownership administered by the Bureau of Land Management (BLM).

The Battle Mountain District encompasses three counties, Eureka, Lander, and Nye.

User Influence Zones

User influence zones identify the area from which initial users of resources (specifically resources produced from public lands) originate. The zone for the various resources will vary greatly. For example, initial users of mineral and forage resources (mining operations and ranchers) tend to be resource location oriented, whereas initial users of recreation and wildlife resources are more likely to be from major population centers.

Initial users of mineral products taken from public lands are almost exclusively of local origin and the final products are used locally. Although primary metals produced from private lands are also exported to other areas for manufacturing of finished products, the initial users, including mining operations and smelters, are located within the District Statistical Region.

Although most of the ranchers with permits on public lands reside in the local area, absentee ownership, out-of-state and corporation ownership of livestock grazing permits prevails in the district. The extent and implications of the latter phenomena is not readily known at this time.

The primary user influence zone for hunters is somewhat difficult to establish from available data, but it can be said that a large percentage of the hunting in the district originates from within Nevada. Out-of-state use represents a small percent of the total and varies by species hunted.

Recreational use, based on water-related recreation activity, indicates that the primary users are mainly in-state residents at 73 percent, non-residents make up about 27 percent of the total.

Benchmark Projections

Planning, by its very nature, is focused on the future. Resource managers need to know what to expect in terms of future changes that may affect public land resources. For this reason "benchmark projections" are made for each public land resource. These projections indicate the amount of resource products required in 1980 if the public lands were to continue providing the same share of the total area production as they do today. For example, if the Public Lands are supplying 27 percent of the total cattle forage in the District and the production of cattle is

expected to drop 9 percent by 1980, then the benchmark projection shows how much forage must be harvested by cattle from Public Lands in 1980 if these lands continue to supply 27 percent of the total area production.

This projection is not a target, but rather a reference point for future analysis. Obviously, the fact that total demand for forage is expected to decrease by 9 percent does not mean that BLM should plan to decrease production by this amount. The key factor is the analysis of why the benchmark projections may be too high or too low for the Public Lands within the study area.

Projections may be at nearly any level of complexity, from a simple extension of past trends to an extremely complex analysis of the factors that cause production to change.

Income Multipliers

The concept of income multipliers is useful in assessing the total impact of change in the resource use on the economy of the community or area. The economy of any area is a complex set of interrelationships between initial users, processors, final users, general population (both as labor force and consumers), and service activities. These interrelationships are the mechanism by which income is generated in the local economy. The multiplier measures the total income generated from the introduction of new economic activity through various sectors of the economy -- each of which might have a different multiplier.

There are two basic methods for estimating the multiplier effect: the first is to measure the interrelated flow of production between sectors of the economy (input-output analysis); and the second is to estimate the multiplier effect directly from an analysis of aggregated exports, imports and local (domestic) production (Keynsian multipliers). It is the latter method, from the Socio-Economic Data System of BLM, which was used in computing the multipliers used in this study.

In evaluating the impact of resource use at the County and District Statistical Region levels, only direct measurements have been used for initial users and industries. Income multipliers have been shown in order to assess the impact of a change in resource use on the economy of any given county, community impact area or region as a whole. For example, if

the multiplier for an industry was 1.716, and something happened to cause an increase in the output of this industry (such as increased grazing capacities), the total impact on the economy would be magnified by a factor of 1.716 rather than the simple increase in output. Each industry within the economy will have a different multiplier, depending upon the interaction of that industry with others in the local economy.

DISTRICT ECONOMY

Population

The population of the Battle Mountain District Statistical Region in 1970 was 9,213 people compared to a total population of 488,738 people for the state (Table 5). This is nearly 2 percent of the total for Nevada. Approximately 61 percent of the region's population lives in Nye County.

The District Statistical Region (D.S.R.) as compared to other D.S.R.'s within the state is sparsely populated with an average density of 0.3 person per square mile compared to 4.4 for the state as a whole. One can see from Figures 1, 2, and 3 that population distributions within the district are centered around Battle Mountain, Tonopah, and the southern portion of Nye County.

The 1960-70 population growth rate for the District Statistical Region was 37.3 percent compared to 71.3 percent for Nevada (see Table 7). There was a wide variance between counties with Lander County experiencing the largest increase of 70.2 percent while Nye County (the most populous in the region) experienced a 28 percent increase. Eureka County has a growth rate of 23.6 percent.

Important to any discussion on population growth is the direction of net migration patterns. An indicator of growth is the ability of an area to attract people. In this regard, the Battle Mountain District experienced a positive net migration of 28.2 percent (see Tables 7 and 8), i.e., almost 1900 people migrated into the area.

The rural-urban population distribution for the D.S.R. compares much differently with the state in that the region is totally rural-oriented (see Tables 9 and 10). However, this is not to imply that the entire region is composed of farms. Rural non-farm distribution accounts for 91.4 percent of the population (the population residing outside the city limits of incorporated cities and towns, and in the unincorporated towns within the region). The farm community makes up 8.6 percent of the population distribution in the region.

Population of the Battle Mountain District Statistical Region is projected to increase from 9,213 to 12,118 or about 33 percent by 1980 (see Tables 5 and 6). If the expected growth of the mining industry in Battle Mountain Region materializes, then population growth will expand even more. See Table 23-06 indicating mining and employment projection in mining for Battle Mountain Region.

Figure 1
1970 POPULATION DISTRIBUTION, EUREKA COUNTY

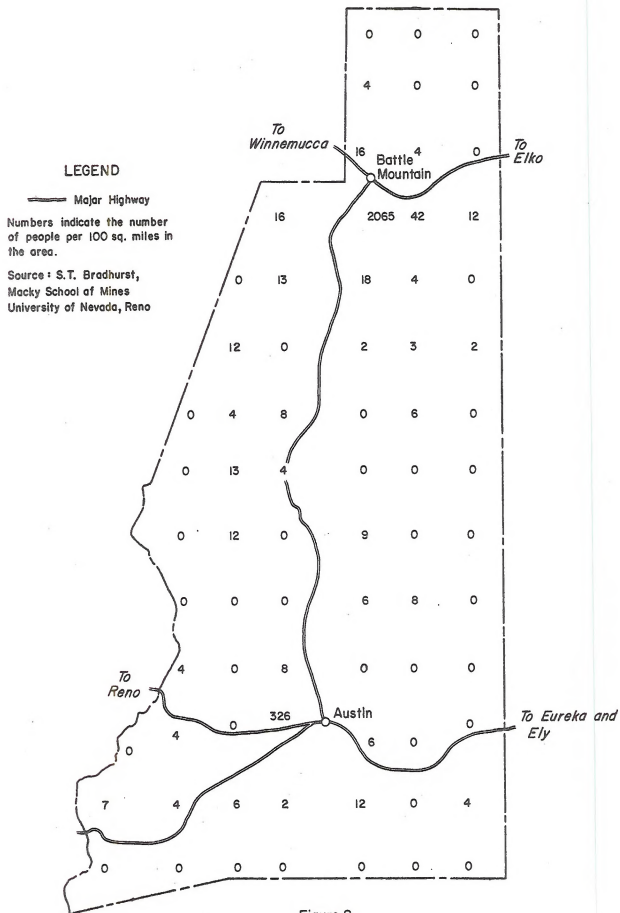

Figure 2
1970 POPULATION DISTRIBUTION, LANDER COUNTY

The age distribution (Tables 11 and 12) for the district in comparison to the state does not vary significantly in spread, and there are no sharp breaks between age brackets other than would be expected according to county location, proximity to population centers and employment characteristics to warrant special description. The sex ratio in the Battle Mountain District does not follow that of the state. There is a higher percentage of males, 55 percent, compared to 51 percent for the state.

The race characteristics of the Battle Mountain District are rather homogeneous in that the white population makes up over 95 percent of the entire population (see Tables 13 and 14).

In summary, an increase in population can be expected within the district in the upcoming decade, and if the mining industry projections materialize, then not only will population growth follow, employment and income benefits will be of no small importance to the district.

Income

The total allocated personal income² within the Battle Mountain District Statistical Region is about \$33 million or 2.1 percent of the total for the State of Nevada (see Table 15). Nye County contributes over \$22 million or 68 percent of the region's total income. Lander and Eureka Counties contribute \$7.5 million and \$3.1 million respectively.

The average per capita income for the district is \$3,365 which is lower than both the state and national average (see Table 16). Nye County per capita personal income is higher than the state average and has the third highest per capita income level in the state (\$3,844). High levels of personal income and employment in the mining and construction sectors, which tend to maintain reasonably high personal income levels, contribute to the county's high per capita income. These two industries contribute 70 to 80 percent of the county's personal income and employment.

Lander and Eureka Counties have lower per capita income levels, \$2,659 and \$2,519 respectively. The factors which contribute to these low income figures are in part due to the small contribution from the tourist-related services and services sector, both which tend to maintain reasonably high personal income levels.

²Allocated personal income simply refers to the fact that the industry from which the income was derived has been identified.

The percentage of families with incomes under the poverty level, as based on a range of poverty income cut-offs adjusted by such factors as family size, sex of the family head, number of children under 18 years, and farm and non-farm residents, ranges from 5.9 percent in Nye County to a high of 18.9 percent in Lander County, the highest in the state. The state average is 7.0 percent and Eureka County is also above this level with a 10.4 percent poverty level.

The major economic sectors within the District Statistical Region from the standpoint of personal income (Table 15-06) in descending order of importance are: services, which contributes over 23 percent of the region's total allocated personal income; mining at 21 percent; construction at 17 percent; and tourist-related services at 10 percent. The lowest contributor to the region's personal income is finance, insurance and real estate at 0.99 percent.

The major economic sectors in the region differ somewhat from those of the state. The services sector provides the highest personal income to the region but makes up only 2.7 percent of the state total. The mining sector contributes nearly as much income as the services sector but makes up nearly 22 percent of the state total, indicating the importance of the Battle Mountain Region to the state. Nye and Lander Counties contribute the highest personal income in the mining sector (Tables 15-P and 15-Q). The tourist-related services provide a majority of the personal income to the state but only 10 percent for the region. It provides less than one percent of the state total.

Employment

Based on 1970 employment data, the total civilian employment in the Battle Mountain District Statistical Region is nearly 4,000 people or about 2 percent of the total for the state. Nye County accounts for some 2,400 employees or 62 percent of all the region's employment.

The major employment sectors for the region in descending order of importance are: mining, services, tourist-related services, and construction with manufacturing and finance, insurance and real estate at the lower end of the employment scale (Table 17-06). Services and tourist related services are in the top employment sectors in the region and state, while mining ranks first in employment in the region and last in the state.

Resource Based Industries

Agriculture

Based on income data, the Battle Mountain Region is not dependent on the agricultural industry in any meaningful way (Table 15-06). Likewise two of the component counties within the Region also are little dependent on agriculture, Nye and Lander Counties (Table 15-P and 15-Q). However, Eureka County is quite dependent on the agricultural sector. Nearly 23 percent of the county's personal income is derived from agriculture (Table 15-0).

The value of all agricultural products sold (cash receipts) in the District Statistical Region for 1969 amounted to about \$8 million, which is 10 percent of the total for Nevada. Eureka County is the major agricultural income producer with 46 percent of the region's total value of all agricultural products sold (see Tables 18 and 19).

Meat animal production accounts for about 81 percent of total agricultural production, but among the regions it accounts for only \$6 million or about 11 percent of the total value of livestock and livestock products sold. The Battle Mountain Region is the third ranking crop producer in the state accounting for over 12 percent of the total value of all crops sold. Cotton and cottonseed are produced in only one county in the state, Nye County which is in the Battle Mountain Region. Cotton production accounts for 24 percent of the region's principle farm products sold. Field seeds, hay forage and silage are the region's most important crops grown and are produced in all the counties in the region (see Tables 20-22).

Mining

The total value of mineral production in the District Statistical Region in 1970 was over \$33 million (Table 23-06), compared to \$176 million for the state (Table 24) or about 19 percent of the State's total production. About 61 percent of this is derived from Lander County. Personal income derived from mining activities within the Battle Mountain District is over \$7 million or 21 percent of the total allocated personal income.

At present there are a variety of minerals produced within the region which include gold, silver, copper, iron ore, barite, petroleum, refractories, gems and semiprecious stones, and others.

District employment in the mineral and related manufacturing sector is about 770 people or 21 percent of the district's total employment³ (see Table 17-06). Although it is not possible to accurately separate employment for the mineral industry into employment by mineral for the District Statistical Region for 1970 due to disclosure rules, it can be generally stated that those minerals with the highest value in production contribute the most to both total employment and personal income. Employment figures in the mineral extraction industry are to an extent misleading, not only because of definitional problems as to who actually mines and who manufactures, but also in showing the relative importance of the mining industry to an area. Actually, a substantially larger percentage of the total work force than shown in the mineral extraction sector depends on mineral extraction, at least indirectly, for their jobs.

Outdoor Recreation and Tourism

The importance of the recreation and tourism industry to the state and region can be clearly seen in the personal income received from the tourist-related services sector (Tables 15 and 15-06) but recent data on tourism expenditures, numbers of tourists and their activities plus other useful information delineating the importance of tourism to the state are not available. It is paradoxical that a state so heavily dependent on recreation and tourism activities as a basis for economic survival has no data on the most important resource available to it, the tourist.

In 1958 and again in 1963 the State of Nevada did conduct an out-of-state visitor survey showing visitor and expenditure data, but that was the last time such a study has been carried out. In 1963 out-of-state tourist expenditures in Nevada were nearly \$530 million. Of that amount, around \$4 million or 0.7 percent of total tourist expenditures was spent in the Battle Mountain District Statistical Region.⁴ Today, 10 years later, assuming the same percentages hold true then we can say that

³The employment figure of 770 is higher than one reported in Table 23-06; because of aggregation difference between sources, i.e., Table 23-06 indicates mining employment that includes some manufacturing employment related to mining.

⁴Nevada Out of State Visitor Survey, 1963, prepared by Planning Survey Division, Nevada State Highway Department, P. 88.

tourist expenditures have increased to about \$15 million within the Battle Mountain Region by 1972.⁵

The fact that U.S. Interstate Highway 80 runs through the region probably accounts for a significant proportion of this expenditure. Outdoor Recreation⁶

The data in this section reflects the assumption that the majority of outdoor recreation experiences in Nevada are in some way related to water-associated activities. Although water-based recreation does not tell the entire outdoor recreation picture, it does illustrate a very important segment. This factor is further backed up by the findings as outlined in "Recreation in Nevada - Part III, 1971" which ranked water-based recreational activities extremely high, i.e., on a scale of the top ten ranked recreational activities, water-associated recreational experiences appeared in eight out of the ten activities ranked.

Within the District Statistical Region, out-of-state resident visits accounted for only 27 percent of total visitor use. Nevada residents constituted the bulk of outdoor recreational visits at 73 percent⁷ (see Tables 27 and 28). Of the total 21 million outdoor recreational visitor days spent in the state in 1970, the Battle Mountain Region received about 223,000 of those visits or 1.1 percent of the total.

In Tables 29-34 one can see that water-associated recreation takes on a broader meaning when the type of sites and activities are analyzed, i.e., not only are recreational activities along streams and reservoirs measured, but county, state, and federal campgrounds are surveyed along with other unclassified parks and campgrounds.

Although putting a dollar value on the recreational experience is of

⁵Total tourism figures estimated by the Department of Economic Development, and Chamber of Commerce data, e.g., it is estimated that 30 million tourists stayed an average of two days, spending around \$55.00 per day in 1972. Assuming a 0.7 percent figure for the Battle Mountain Region, this works out to be about \$15 million that tourists spent within the region in 1972.

⁶Data for recreation taken from Water-Related Recreation in Nevada -- Present and Future, by John G. McNeely, Jr. and Ted Dixon, Division of Agricultural and Resource Economics, University of Nevada, Reno, 1973.

⁷At the present time there are not figures delineating county residence of in-state recreationists.

current interest in most recreational literature, there are no absolute standards of measurement or agreements as to whether intrinsic or extrinsic values would be more useful. It is the purpose of this section on outdoor recreation to present both intrinsic and extrinsic recreational values.⁸ Since we are concerned with relating personal income as a tangible benefit of resource management we will concern ourselves more with the extrinsic values of the recreational experience. Tables 32 and 33 use intrinsic values as an example of values derived by assuming a "willingness to pay" as based on Water Resources Council Guidelines; they do not reflect "real" expenditures. Many studies on recreational values are based on the above guidelines and Senate Document No. 97, 86th Congress, Supplement No. 1, entitled Evaluation Standards for Primary Outdoor Recreation Benefits, June 4, 1964. Resource agencies such as the Forest Service and the Bureau of Outdoor Recreation plus the new National Outdoor Recreational Plan have used intrinsic values in their measurement of the recreational experience. Accordingly, the BLM decision-maker now has at his disposal, through this report, figures indicating both types of values. In this way, he will be able to compare and contrast data in Tables 32 and 33 with other sources of information as they become available.

Table 34 indicates that estimated expenditures for outdoor recreation in the Battle Mountain District Statistical Region totaled over \$942,000 or 1.1 percent of the state total in 1970. This expenditure for outdoor recreation within the district was accomplished through 223,000 recreation days of use, the majority by Nevada residents (see Tables 27 and 28).

It is interesting to note that although many recreational studies assume that tourism and outdoor recreation are related (a correct assumption in most cases), in Nevada and the Battle Mountain District this is not necessarily the fact. This is due primarily to the influence of the gaming industry. Although no figures are available indicating percentages and expenditures by local (Nevada) residents on in-state tourism, studies show that the majority of outdoor recreational pressure in the state and district is locally generated while tourism is not. The outdoor recreationists (as distinguished from tourists) are mainly local (Nevada) residents

⁸Intrinsic value of a recreational experience indicates the price a recreationist would be willing to pay, whereas extrinsic value refers to the actual expenditures.

and they spent around \$942,000 in the District Statistical Region.

Looking into the future, and assuming that leisure time and population increases will continue at their present rate, we can then expect that demands for recreational opportunities will also increase. Accordingly, it has been estimated that outdoor recreation within the District Statistical Region will increase to nearly 680,000 recreation visits by 1980, an increase of 205 percent from 1970 (see Tables 35, and 30 for estimates by type of site). If we assume our conservative present rate of \$4.22 expended per person per recreation day, around \$2.9 million will be expended by recreationists by 1980 in the Battle Mountain District Statistical Region.

Tables 36-38 are inventories of some of the recreationally related resources currently available. Table 39 shows the activities people usually participate in while visiting the different types of outdoor facilities.

Hunting⁹

Hunting is an important part of the outdoor recreation use throughout the District Statistical Region. Total hunter use is about 480,000 hunter days of pressure of which the Battle Mountain D.S.R. accounts for over 53,000 days or 11 percent of the total (Table 40). There is, however, some double counting because some of the activities surrounding the recreational experience included hunting, but this poses no problem because hunting activities at the recreation site contribute little to the overall hunting picture.

Of all the hunting use within the district, big game and upland game hunting are the most important, each accounting for 42 percent of all hunting pressure within the district. Mule deer hunting is the major activity of big game hunting and occurs throughout the district. Hunting of big horn sheep occurs only in Nye County, 3 percent hunting pressure, while the Las Vegas District accounts for 97 percent of the hunting pressure for big horn sheep. Partridge hunting accounts for the greatest pressure of upland game bird hunting and occurs almost entirely in Eureka and Lander Counties. Tables 42-63 reflect the hunting pressure for the major game species over a three-year period.

Although no data is yet available indicating county residence of

⁹Basic county data on hunting compiled by Robert E. Walstrom, Natural Resource Consultant, State Department of Water Resources, State Engineering Office. Data is based on 10 percent questionnaire and tag returns.

Nevada hunters, it can be seen by Tables 64-66 that hunting in Nevada is primarily carried out by state residents. Out-of-state residents make up only a small portion of all hunting pressure by type of species hunted.

Forestry and Vegetative Products

The forestry and vegetative product industry is very minor to the Battle Mountain Region. A minor amount of woodland product is produced within the district, e.g., juniper. The only other products harvested within the district were Christmas trees and desert plants used as ornamentals. Total earnings produced from this activity are not readily available, but are considered to be insignificant to the economy of the district. Perhaps the most important value of the product lies in "free use" disposal to the people of the district. Tables 68-71 indicate the production and use disposal of the major vegetative products within the district. With increasing population there will be increased demand for some of the forest products currently growing on BLM land within the district, e.g., Christmas trees. Self-harvesting will be more and more tied into leisure time activities.

Other Industries

The primary resource-based industries are covered above. Unfortunately, some (i.e., recreation, forestry and vegetative products) are not separate economic sectors but are part of other designated sectors. Therefore, good secondary data are not readily available from the usual basic sources. The other major industries within the region which depend to some extent on the resource-based industries are: manufacturing, contract construction, transportation, communication, public utilities, trade, finance, insurance and real estate, services and government.

PUBLIC LAND RESOURCE PRODUCTS AND LAND USE

Livestock Forage

Dependence of Initial Users on Public Land Forage

In the Battle Mountain District Statistical Region, BLM permittee dependence on public lands for their total livestock forage supply for the past eight years has been running between 50-55 percent dependency. Figure 4 indicates that this dependence has remained fairly stable with a slight decline since 1969. The number of permittees using BLM lands has been steadily declining over the years. However, this is a slight decrease when compared to the total permittees in Nevada (Fig. 5).

These dependency figures reflect only the permittee dependency on public lands for their total forage supply and not dependency on public lands for total income. Initial user dependency on public domain forage is an unreliable measure of need because a permittee with a 5 percent dependency can be more dependent on public domain than one who is 50 percent dependent. The permittee with a 5 percent dependency may need the federal range for a critical period in order to survive. On the other hand, initial users may in reality be much less dependent on public lands than is indicated by the percent of the total forage supplied by these lands due to the fact that the ranching operation may not be the sole source of income for the operator. In any case, each operation must be individually studied when decisions affecting land use are brought forth.

Dependence of the Livestock Industry on Public Land Forage

The dependency of the livestock industry on forage from public lands within the Battle Mountain Region can be determined in two ways: (1) determining the percentage of BLM provided forage to the total livestock feed requirements in the area; and, (2) comparing the total personal income received from livestock to the total personal income generated by livestock use of the public lands (see Tables 72 and 73 indicating both these approaches). Since we are concerned with attributing the value of BLM resource use, we shall deal with the latter method mentioned above. No attempt is made to compare production from public lands to the range livestock part of the livestock sector. The contribution to the total livestock industry is considered to be more relevant.

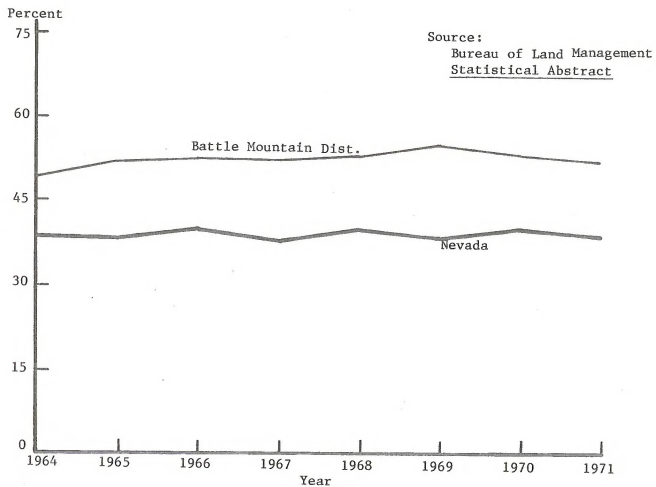

FIGURE 4
USER DEPENDENCY OF BLM FORAGE

FIGURE 5
NUMBER OF BLM PERMITTEES

The livestock industry of the District Statistical Region produces 81 percent of the value of all agricultural products sold. Eureka, Lander and Nye Counties produce 88, 85, and 65 percent respectively (Tables 18 and 19).

As based on a 27 percent industry dependence, personal income from livestock produced on the the public lands in the district by district-based ranching operations amounted to \$351,000 (see Table 73, \$1,282,908 x 27.37 percent). This represents nearly three percent of the total personal income produced by the livestock industry statewide (Table 73). The percent of total personal income in the district attributable to the use of BLM forage is 3 percent and adjustments in grazing use on public lands will have a definite effect upon the livestock industry in those counties where the industry dependence on public lands is significant (e.g., Nye County being 57 percent dependent).

Community Dependence on Livestock Operations

The dependence of local communities on livestock production and livestock production attributable to the public lands is based on the contribution of these sectors to the communities' total personal income. The community dependency ratio can be interpreted as the percentage of total income to the community originating from the livestock use of public lands.

The livestock industry provides about 4 percent of the District Statistical Region's total personal income or about \$1.3 million. By comparison, personal income attributable to public lands from livestock production is of minor significance producing only 1.2 percent of the region's total personal income (Table 73). The total dollar income attributable to livestock production on public land is \$351,000 (27 percent of \$1.3 million) compared to over \$12 million estimated personal income in the livestock sector statewide.

Benchmark Projections -- 1980

Projections of feed requirements to 1980 are estimated for the District Statistical Region based on projected livestock numbers (past and present grazing use is shown in Tables 76-78). Cattle numbers in the Battle Mountain District are projected to decrease 9 percent by 1980 (Table 79).¹⁰ Sheep

¹⁰Individual county projections can be found in the soon-to-be published "Estimated and Projections of Agricultural, Livestock and Forestry Production in Nevada to 2020," John G. McNeely, Jr. and Charles E. Woerner, Associate Professor and Graduate Research Assistant, respectively, Division of Agricultural and Resource Economics, University of Nevada, Reno.

numbers are not expected to change considerably from their 1969 levels. Horse numbers are also projected to decrease over this period by 11 percent. Consequently, the grazing use on BLM provided forage will require nearly 30,000 less AUM's than the 1969 levels (Table 80).

Some increases in forage production is possible through better management practices, i.e., instituting more AMP's and rest-rotation.¹¹ Table 81 and Figure 6 suggest that the Battle Mountain District is about the same as the state average in the percentage of range capacity being utilized by livestock.

Recreation

Hunting

Dependence of Hunting on the Public Lands

Estimates of total hunter use on public and private lands (combined) were obtained from Robert E. Walstrom, Natural Resource Consultant for the State Engineering Office as part of the development of the State Water Plan. Hunter use and pressure data were from fish and game management areas and based on a 10 percent expanded questionnaire and on volunteer tag returns.

Total hunting use on all lands within the Battle Mountain Region is estimated to be about 53,000 hunter days or 11 percent of the total hunting days within the state (Table 40). Table 82 indicates about 31,000 hunter days were on BLM administered lands within the district. Although no data are available for hunting use by species on specific management areas (private, BLM, USFS), hunting pressure on BLM lands can be estimated by assuming that species habitat and hunting use are related. An example of estimating hunting on BLM administered land can be seen in partridge hunting, i.e., chukar habitat is primarily located on BLM land rather than USFS, private, or other. Therefore, approximately 80 percent of hunting pressure for partridge occurs on BLM land. Since Table 83 indicates hunting use on both private and public lands, the above-mentioned method for estimating BLM use is applicable in finding user and industry dependency on BLM land by species. Estimated percentage for all species within the District Statistical Region are estimated to be:

¹¹C.T.K. Ching and Charles Hancock, "The Economic Feasibility of Rest-Rotation Grazing, A Case Study."

FIGURE 6
RANGE FORAGE CAPACITY UTILIZED

<u>Species</u>	<u>Percentage Hunter Days on BLM Land</u>
Big Game	
Antelope	100
Deer	50
Big Horn Sheep	100
Upland Game	
Dove	50
Quail	50
Partridge	80
Blue Grouse	0
Sage Grouse	80
Pheasant	0
Small Game	
Rabbit	60
Waterfowl	
Geese, Duck	40

These percentages were multiplied by the number of total hunting days, by species, within the district (Table 83); thus a total of about 31,000 hunter days on BLM lands are estimated for the Battle Mountain District. In other words, 57 percent of all hunting within the district is carried out on BLM administered land. The major big game species hunted in the area is primarily mule deer, which accounts for about 36 percent of all hunting on BLM land. Major upland game species hunted are partridge, sage grouse, dove, and quail.

Nonconsumptive uses of wildlife such as bird-watching, nature study, photography, general observation, etc., are considered to be a part of general recreation. These values are probably not as important as hunting (consumptive uses) within the district. Wildlife values are, therefore, greater than the hunting data given in this section would indicate. These values are included as an unidentified part of the general recreation values (see Table 39 indicating recreational activities within the district).

Total expenditures for hunting in the district were based upon an estimated daily expenditure in the local area of \$4.00. The total expenditure for hunting on all lands in the district for 1970 was about \$213,000 while expenditures for hunting on Public Lands were \$122,000 or 57 percent of the total (see Table 82). Since this percentage is also the industry and initial user dependency ratio, both groups would be significantly affected by any

decision which would beneficially or adversely affect the total amount of hunting available from the public lands of the district.

A review of studies made to determine the value of hunting to an economy indicates that while expenditure per day are often quite high, local expenditures are less. Average expenditures per hunter day on a statewide basis (resident and non-resident combined) is \$25.00. Expenditures in the Battle Mountain Region for hunting is \$4.00 per hunter day.¹²

Community Dependence on Hunting

The community dependence on hunting is derived by taking the total personal income derived from expenditures related to hunting on all lands and Public Lands (Table 82) as a percent of total personal income in the district (Table 15).

Hunting within the district generates about \$56,000 in total personal income from all lands, both private and public, or about 0.2 percent of the total personal income within the district. Income generated from hunting on Public Lands is \$32,000 or 0.1 percent of the District Statistical Region's total personal income. It is evident from these dependency ratios that hunting is rather insignificant to the total economy of the district. Although the contribution from Public Lands to the total community economy from hunting is insignificant, it should be remembered that public lands provide over 57 percent of the total hunting use within the district. Deer hunting within the district is of particular importance for it accounts for nearly 42 percent of the total hunting pressure in the district (see Table 40). Hunting is an important use to many individuals and groups, and hunting on Public Lands contributes about \$32,000 in personal income annually to the local economy, particularly the service and trade industries.

Benchmark Projections -- 1980

Since no projections for the District Statistical Region have been made by other agencies, universities or other study groups, estimates have been derived by utilizing data presented in Table 83-06. Based on these projections demand for hunting on public land is expected to increase by 21 percent from 1970-80.

¹²See footnote "b" in Table 82.

In 1970, hunting on Public Lands within the district was about 31,000 hunter days (Table 83-06). Based on a projected 21 percent increase, the benchmark projection for 1980 is 37,060 hunter days or an increase of about 6,000 hunter days. This projection represents the production level which would have to be attained on Public Lands by 1980 in order to maintain the present level of importance to the sports hunting sector. It is not a target production level.

General Recreation

Dependence of the Recreation Industry on Public Lands

The recreation industry dependence on Public Lands in the District Statistical Region is based on the value of recreation expenditure in the local area. These values are derived by multiplying the recreation days times an estimated average expenditure per "recreation day" of \$4.22 (see Table 84, footnote "a").

Based on this value, expenditure for recreation is over \$900,000 (Battle Mountain District), while expenditures for recreation on Public Lands is about \$113,000. Therefore the recreation industry dependence on Public Lands is 12 percent.

Community Dependence on Outdoor Recreation

General outdoor recreation community dependence ratios are based on personal income attributable to outdoor recreation use as a percent of total personal income in the District Statistical Region. Personal income attributable to recreation is derived from expenditures in the area for recreation related goods and services.

General outdoor recreation is an important producer of personal income to the district, generating over \$246,000 or about 0.8 percent of the total personal income within the district. On the other hand, public land recreation generates about \$30,000 or 0.1 percent of the total.

Benchmark Projection -- 1980

No projections for the District Statistical Region have been made by other agencies, universities, or study groups. Projections in this section are taken from Table 35 indicating outdoor recreation attendance at Nevada water-based recreation sites. Although these projections indicate demand on both private and public lands, the procedure here will be to take the

percentage demand expected by 1980 on all lands within the district times the number of current public land recreational use (1970). As Table 84 indicates, recreation use on Public Lands within the district for 1970 amounts to nearly 27,000 recreational days. Based upon a projected 205 percent increase (see Table 35), the benchmark projection for 1980 is nearly 82,000 recreational days, or an increase of approximately 55,000 days. This benchmark projection represents the amount of public land recreational use which would be required by 1980 if the Public Lands are to maintain the same share of total recreation use at present. This is not a target level for Public Lands.

Minerals

Dependence of the Mining Industry on Public Lands

Dependency of the mining industry on Public Lands is, by nature of the current mining law, minimal at best. This is due primarily to the patent process which transfers public land to private land status once a profitable claim is discovered. However, future production will depend on exploration on the Public Lands. Therefore, dependency of future development is almost totally dependent on public land. The procedure here will be to assume mining industry dependency as synonymous with the percentage of BLM administered land except for districts where copper extraction predominates on private land (see Table 85 indicating these ratios). It is important to note that this procedure reflects a somewhat higher dependency than actually exists, thereby inflating the importance of Public Lands to the mineral industry since the larger mineral producers within the district have not been counted as production from Public Lands. However, without Public Lands the mining industry cannot expand as projected (see Tables 24-26 indicating future mineral production). Therefore, the primary benefit and value of the Public Lands to the mining industry is the land itself. No other activities on the public domain can say this, i.e., there is no alternative open to the mining industry regarding the supply of land (raw material) as input to production; whereas, the livestock, recreation and timber industries all have alternative means such as can be provided by the private sector. The following discussion will now consider dollar values of both public and private mineral production with the assumptions states above.

Within the Battle Mountain District the total value of mineral production from Public Lands for 1970 was nearly \$15 million based on the percentage of BLM managed land. Lander and Eureka Counties accounted for over \$12 million of the mineral production on public land. The state in comparison depends on public domain for about 26 percent of its total mineral production (see Table 85). Although these dependency ratios reflect overall mineral dependence, it can be said that extraction of quarry products is primarily carried out on Public Lands, specifically around the more populated towns of the district. Much of the dependence on Public Lands for sand and gravel within the district stems from the fact that most county, state and federal highway construction in the region is dependent on sand and gravel for construction purposes.

Community Dependence on Mineral Production

The Battle Mountain District Statistical Region's economy is quite dependent upon the mining industry for a substantial part of its total personal income. Total personal income from the mining sector (not including related manufacturing) accounted for over \$7 million in 1969 or nearly 23 percent of the district's total income (see Table 15-06). Lander County is heavily dependent upon the mining industry for a part of its total personal income. Over 49 percent of the county's total income is derived from the mining industry. Industry dependence based on income and production is shown in Table 86 while dependence based on production is shown in Table 85.

The community dependence on personal income from mineral production on and the entire mining industry is relatively significant. The dependence on Public Lands for the District Statistical Region is nearly 10 percent, or over \$3 million in personal income within the Battle Mountain District originates from Public Lands (see Table 86). Inherent in the development of these community dependency ratios is the assumption that the proportion of direct earnings (income) from Public Lands to total mining earnings (income) is the same as the proportion between the value of mineral production from Public Lands to the total value of mineral production. Although this statement is generally true, there is not a constant relationship between the two. See Table 86 illustrating this fact.

The mineral income multiplier used for all minerals except sand and gravel in the Battle Mountain District is 1.092. This multiplier is low and reflects the fact that there is a low level of exports of mineral commodities within the district to users outside the area. Sand and gravel with a multiplier of 1.067 reflects the fact that insignificant amounts are exported to outside markets.

Benchmark Projections -- 1980

Benchmark projections are taken from Nevada Bureau of Mines and Geology, Mackay School of Mines, University of Nevada, Reno (see Tables 23-06 and 23-0 through 23-Q).

The value of mineral production within the Battle Mountain District should be \$50 million by 1980, which is an increase of 50 percent over the 1970 levels. (See Table 23-06 indicating kinds of mineral and expected employment by mineral for 1980). If current production from Public Lands is to be maintained, then the value of mineral production in the Battle Mountain District will have to increase to \$22 million or an increase of \$7 million by 1980 in order for Public Lands to maintain the present level of importance to the mining industry. This benchmark projection is not a target production level.

Woodland and Vegetative Products

The permitted harvest of woodland and vegetative products from Public Lands is quite minimal. Brush and shrubs cover 87 percent of the district. The only products harvested are Juniper and Christmas trees.

The forestry products industry and the community impact areas (counties) have no dependence on these products. Should woodland and vegetative products become completely unavailable from the Public Lands in the area, the only effect would be an inconvenience to those few individuals who have been harvesting these products for personal use.

Land Use¹³

General economic and population growth of the District Statistical

¹³See Decentralized Decision Criteria for Evaluation of Changes in Public Land Use, Jack D. Edwards, Economic Staff Leader, Denver Service Center, Bureau of Land Management, U.S. Department of the Interior, Denver, Colorado. This paper was presented at the Third Regional Science Conference, Honolulu, Hawaii, August 24-27, 1973.

Region, and nation, has a definite impact on patterns of land within the region. Population growth coupled with the demand for more conveniences require more energy, communication facilities and transportation facilities which, in turn, increase the needs for electrical transmission facilities, electrical generating plants, gas pipelines, communication lines, communication microwave sites, highways, railroads, airports, etc. Pressures on public land for these uses may be expected to equal or exceed the pressure on other land within the area.

Increased population coupled with changing leisure patterns (i.e., shorter work weeks) increased mobility and more disposable income generate more demand for recreation (see Tables 30 and 31), including space for private recreation homes, recreation businesses, etc. Private lands have been meeting much of the demand for this type of use; however, demands on Public Lands to satisfy these needs will increase at a much faster rate.

In addition to these major land-use demands on Public Lands, an increase in the demand for various special uses may be expected. These uses may include refuse disposal sites, advertising displays, and many others from both the private and local public sectors. Although these uses are single use oriented, they represent a real demand for use of the Public Lands.

These land use demands are a necessary part of any growing economy and must be recognized and considered in the planning process.

Water

The water resources cannot be analyzed as an industry or economic sector. Personal income from water use or other economic measures as used for other resources are not available. (Table 88 does show estimated water runoff by districts.) However, water affects the economy of both the state and the District Statistical Region more significantly than any other resource. For a detailed look at quantity, quality and use of surface and ground water, see:

1. Nevada Survey of Bureau of Land Management. Water Requirements, January 1973, Nevada State Office, Reno.
2. Estimation and Projection of Livestock, Crop and Forestry Production in Nevada and Related Land and Water Needs, by John G. McNeely, Jr. and Charles E. Woerner, report prepared for the Division of Water Resources, Department of Conservation and Natural Resources, 1973.

3. A Model for the Determination of Wildland Resource Values, U.S. Forest Service, pp. 9-12, 1967. In this model, water values are estimated at the watershed as one-tenth of its market price when impounded, piped and treated.

See footnotes on page A-38a

FOOTNOTES FOR TABLE 15

- ^aAgriculture - derived from agricultural census information.
- ^bMining, Construction, Manufacturing - derived from number of employees listed in census and annual average earnings derived from information from Nevada Employment Security Department.
- ^cPublic Utilities - derived from number of employees listed in census and annual average earnings derived from information from Nevada Employment Security Department. The census industry classification included are railroads and railway express service, trucking service and warehousing, other transportation, communications, and utilities and sanitary services.
- ^dTrade - derived from number of employees listed in census and annual average earnings derived from Nevada Employment Security Department. The census industry classifications included are wholesale trade; food, bakery, and dairy stores; general merchandise retailing; motor vehicle retailing and service stations; and other retail trade.
- ^eFinance, Insurance, and Real Estate - derived from number of employees listed in census and annual average earnings derived from Nevada Employment Security Department. The census industry classifications included are banking and credit agencies and insurance, real estate and other finance.
- ^fServices - estimates were made from census data and annual average earnings were derived from information from Nevada Employment Security Department plus being adjusted to include the earnings of all certified teaching personnel in educational services. The census industry classifications included are business and repair services; private households; hospitals; health services, except hospitals; elementary, secondary schools, and colleges (public and private); other education and kindred services; welfare, religious, and nonprofit membership organizations; and legal, engineering and miscellaneous professional services.
- ^gTourist-related services - the average annual earnings of the services category was multiplied by the census count for persons employed in eating and drinking places, other personal services, and entertainment and recreation services to get the estimated personal income.
- ^hGovernment-civilian - includes those persons working for all types of government but not in the military. In most cases this was based on the persons employed in the public administration category in the census data.
- ⁱGovernment-military - data from Federal Outlays in Nevada, 1970, Office of Economic Opportunity were used. Included in this figure were military active duty pay and military reserve and national guard pay.
- ^jTransfer payments - the estimate of transfer payments was taken from Federal Outlays in Nevada, 1970, Office of Economic Opportunity. Included as part of transfer payments are Social Security Benefit Payments, Federal Supplementary Medical Insurance Trust Fund; Social Security Benefit Payments O.A.S.I. Trust Fund; Social Security Benefit Payments Federal Disability Insurance Fund; Old Age Assistance Payments; Aid to the Blind Payments; Aid to Families with Dependent Children Payments; Unemployment Insurance; Federal Employee Injury Compensation; Civil Service Retirement and Disability Fund; Veterans Disability Pension; Veterans Dependency and Indemnity and Death Compensation; Veterans Death Pension; Veterans Disability Compensation; Veterans Burial Awards and other miscellaneous benefit payments; Sons, Daughters, Wives and Widows Education; Veterans Insurance and Indemnities; Military Retired Pay; and Railroad Retirement Payments.
- ^kUnallocated - includes rental income, interest income, proprietor's income, sources outside county and unaccounted incomes.
- ^lThe total personal income estimate was derived from census data by multiplying the number of persons in each county by the per capita income for the county.
- ^mSumming the various county totals gave the following total allocated personal income for the state -- \$1,564,931,618. This figure was used in computing district income as a percent of State Allocated Income.
- ⁿLess than .01 percent.

Corrections of Table 16

U.S. and Nevada personal income estimates shown in Table 16 were from different sources and are, therefore, not comparable. To assure comparability the figures in Table 16 should be changed to:

U. S. per capita income -- \$3,139

U. S. median family income - \$9,590

These estimates are based upon the census taken in 1970 and represent income received during calendar year 1969.^c

^aDistrict Statistical Region figures aggregated from county data totals only.

^bU. S. Bureau of the Census, Census of Agriculture, 1969, Vol. 1, Area reports, Part 45, Nevada. Farm data based on Class 1-5 Farms.

^cEstimated personal income in livestock sector determined by taking value of livestock products as percent of all products sold, and multiply this figure by estimated personal income in Agricultural sector.

^dEstimated personal income in Agricultural sector determined by subtracting total farm expenses from value of all Agricultural products sold. The remainder from this computation is then added to hired farm labor to arrive at a final figure.

^eState figures do not add due to data withheld from Storey County.

^fIncome figures do not add to total due to inconsistent data from Lincoln, Mineral, Nye and Storey Counties.

^aDistrict visitor-day figures reflect total recreational use on all lands (public and private) within the district statistical region. Presently, there are no data available delineating visitor-day use exclusively on BLM administered lands (excluding BLM campgrounds). Visitor-day use figures are based on a "visit" measurement which is defined as any portion of a day (24 hours) of recreational use at any of the recreation sites by one individual.

Note: Since the above data reflects total use by type of site, to determine a specific district's percentage of the total visitor-use, it is suggested that:

- (a) Type of Site #6 (city and county parks) recreational use be subtracted; and
- (b) consult the district's recreational specialist or the person most knowledgeable about recreation use in the district as to an estimate of the percentage of the remaining figure which would then be the recreational use on BLM administered lands.

^bThe column numbers refer to the following descriptions of type of site:

- 1 - All streams and rivers under 15 c.f.s. average minimum flow (August-October).
- 2 - All streams and rivers 15 c.f.s. or more average minimum flow (August-October).
- 3 - All lakes and reservoirs with less than 500 total visits in 1970.
- 4 - All lakes and reservoirs with 500 or more total visits in 1970.
- 5 - All surveyed springs.
- 6 - All city and county parks as of 1970.
- 7 - All state parks as of 1970.
- 8 - All other unclassified parks and campgrounds.
- 9 - All Forest Service and Bureau of Land Management campgrounds as of 1970.
- 10 - All other developed and undeveloped recreation areas with less than 500 total visits in 1970.
- 11 - All other developed and undeveloped recreation areas with 500 or more total visits in 1970.

^aThe type of site numbers refer to the following descriptions:

- 1 - All streams and rivers under 15 c.f.s. average minimum flow (Aug.-Oct.).
- 2 - All streams and river 15 c.f.s. or more average minimum flow (Aug.-Oct.).
- 3 - All lakes and reservoirs with less than 500 total visits in 1970.
- 4 - All lakes and reservoirs with 500 or more total visits in 1970.
- 5 - All surveyed springs.
- 6 - All county and city parks as of 1970.
- 7 - All state parks as of 1970.
- 8 - All other unclassified parks and campgrounds.
- 9 - All Forest Service and BLM campgrounds as of 1970.
- 10- All other developed and undeveloped recreation areas with less than 500 total visits in 1970.
- 11- All other developed and undeveloped recreation areas with 500 or more total visits in 1970.

^aValue of Recreation visit determined by type of activity at each site (see Table 33) for activities by site. Value by activity by site varies by county due to quality differentials, i.e., fishing in Clark County as opposed to fishing in Elko County by same type of site carries different values due to quality of site even though both sites are characteristically the same. Values based on Water Resources Council Guidelines, 1972.

^bSite definition can be seen in Table 30.

^aA recreation visit, visitor-day, and recreation-day are all terms referring to the same thing. They are defined as any portion of a day (24 hours) of recreational use at any of the recreation sites by one individual.

^bSee Table 30 for definition of sites.

TABLE 34

^aExpenditure value based on O.R.R.R.C. Study Report 24, Economic Studies of Outdoor Recreation, 1962. Estimated expenditure per person per day for 1970 came to \$4.22, i.e., in the local area (recreational site) \$4.22 was expended per person per day. Original 1962 dollars updated to 1970 dollars by assuming: (1) A 3.5% rate of inflation per year, (2) $S = P(1 + i)^n$.

^bSite definition can be seen in Table 30.

^aBLM district figures are aggregated from county data totals only.

^bStatistical Reporting Service, Cooperative Extension Service.

^cU. S. Department of the Interior, Bureau of Land Management, Annual Grazing Statistical Report.

^dDependency concept assumes that livestock industry operations are necessarily dependent on BLM forage for part of the grazing year. Percent dependency figures are somewhat high due to fact that all of the BLM provided forage may or may not have been taken off the range. Thus, figure represents outside limits.

^eState figures omit Susanville District.

^fIncludes 37,622 AUM's of Section 15 Leases.

^gIncludes 34,876 AUM's of Section 15 Leases.

^aRange forage capacity determined by:

1. combining authorized nonuse and active use to indicate forage availability;
2. taking total AUM's of licensed livestock and dividing this number by one to obtain percent range capacity utilized during the grazing year; and
3. percentage figure reflects a somewhat higher percent due to the fact that during a grazing year, all of the total AUM's of licensed livestock may not be taken.

^bState totals omit figures from Susanville District.

^cAvailable capacity estimates omit mechanical and chemical altering of AUM production.

^dSection 3 permits only.

^aSee Table 83.

^bHunter days multiplied by \$4.00 except for Elko and Ely (multiplied by \$8.30). The estimated daily expenditure in the local areas. Data source for hunter expenditures taken from "Characteristics of Nevada Hunters," James R. Garrett, Agri. Exp. Sta., Univ. of Nevada, Reno, June, 1970, and Donald H. Beeler, "The Value of Multiple Use of Water in the Newlands Reclamation Project," an unpublished Master's Thesis, Div. of Agri. and Resource Econ., College of Agriculture, Univ. of Nevada, Reno, September, 1971.

^cTotal expenditures multiplied by \$0.261 (the estimate of direct personal income derived per dollar expenditure derived from "An Interindustry Analysis of the Elko County, Nevada," John W. Malone and Stanley G. Detering, Agri. Exp. Sta., Univ. of Nevada, Reno, 8-20, May, 1969).

^dIncome multiplier obtained from the "Activity Analysis Report of the Socio-Economic Data System" on file at the Nevada State Office.

^eCommunity Dependence -- industry dependence of hunting (column 2) as a percentage of total personal income in district (Table 15).

	Total 33,249,000	Total 14,577,202				
Nevada		\$176,071,000	26.1	\$46,098,491	26.1	

^aSee Tables 23.

^bTaken from 1970 Nevada Land Statistics. Exceptions noted for Lyon and White Pine Counties, see Table 86, Footnote b.

^cColumn 2 x Column 1.

^dColumn 3 ÷ Column 1. Industry dependence concerned only with private vs. public land mineral value production. Industry dependence in Table 86 concerned only with income dependency between private and public sector mining.

TABLE 86
COMMUNITY AND INDUSTRY DEPENDENCY ON MINERAL PRODUCTION
BY BLM REGION, 1969

D.S.R.	Total Income		Mining Industry Dependency on BLM Administered Public Lands (%) ^b	Derived Personal Income From Public Lands ^c
	Personal ^a	Mining ^a		
Elko	\$ 39,941,906	\$ 2,752,756	61.20	\$ 1,684,687
Winnemucca	24,235,278	2,340,042	40.00	930,580
Carson City	530,227,240	9,820,115	26.95	2,646,937
Ely	27,090,787	5,805,682	9.95	577,665
Las Vegas	912,594,610	5,281,296	55.68	2,940,636
Battle Mountain	33,041,497	7,035,488	44.67	3,142,941
Nevada	1,567,131,318	33,035,379	34.33	11,923,446

^aSee Table 15.

^bDependency here assumes that the ratio of BLM administered land within a district is the same as mining industry dependency on public lands. Exceptions noted where copper extractions dominated the mining industry. These activities were assumed to be on private land solely, e.g., copper mining in Lyon and White Pine Counties. This dependency indicates the ratio of columns 5 and 7.

^cColumn 3 times column 2. See text for rationale.

TABLE 87
 COMMUNITY AND INDUSTRY DEPENDENCE ON MINERAL PRODUCTION
 BY COUNTY, NEVADA, 1969

County	Total Income		Mining Industry Dependence on BLM Administered Public Lands (%) ^b	Derived Personal Income From Public Lands ^c
	Personal ^a	Mining ^a		
Carson City	\$ 44,309,151	\$ 199,340	44.8	\$ 89,304
Churchill	26,330,053	142,186	73.0	103,796
Clark	904,452,988	4,758,951	52.3	2,488,931
Douglas	22,356,405	104,797	38.2	40,032
Elko	39,941,906	2,752,756	61.2	1,684,687
Esmeralda	1,876,109	181,818	92.8	168,727
Eureka	3,110,374	587,384	76.3	448,174
Humboldt	16,110,033	1,159,314	68.5	794,130
Lander	7,523,438	3,486,054	27.0	941,234
Lincoln	6,265,513	340,527	83.1	282,978
Lyon	20,959,775	5,672,712	1.5	85,090
Mineral	21,049,212	737,352	70.4	519,096
Nye	22,407,985	2,962,050	59.2	1,753,533
Pershing	8,125,245	1,180,728	75.5	136,450
Storey	2,043,832	76,283	10.3	7,857
Washoe	393,178,881	2,887,440	62.4	1,801,762
White Pine	27,090,787	5,805,682	9.9	574,762
Nevada	1,567,131,318	33,035,379	34.3	11,923,666 ^d

^aSee Table 15. Data listed for other counties used for comparison purposes.

^bSee footnote d, Table 95 for explanation of dependency.

^cColumn 3 times column 2. See text for rationale.

^dColumn 4 does not add to total due to rounding of percentage figure in column 3.

TABLE 88

ESTIMATED RUNOFF FROM PUBLIC LANDS ADMINISTERED BY BLM FOR 1972, NEVADA

D.S.R.	Area of District (Acres)	Runoff (Acre-Inches)	Runoff (Acre-Feet)
Elko	7,370,181	5,230,716	435,893
Winnemucca	8,216,159	1,406,136	117,178
Carson City	5,346,629	2,261,148	218,429
Ely	8,014,473	1,610,784	134,232
Las Vegas	9,489,144	1,845,672	153,806
Battle Mountain	8,419,417	1,532,592	127,716
State Total	46,856,003 ^a	14,247,048	1,187,254

^a1,484,873 acres of Nevada public land administered by the Susanville and Boise Districts are not included in this total.
