I HAVE taken our glorious Abbey Church of St. Peter at Westminster as the subject of what I shall have to say to you to-night, not because of the novelty of the theme, but because the abbey is in our midst, and because it has no equal either for beauty or historical associations. We, the present students and lecturers of the Academy, may contemplate afresh, for our own interest and profit, that noble pile, "the most lovely and lovable thing in Christendom," as Street called it, which has afforded so much instruction and delight to those who have preceded us in this room.

I must at the outset acknowledge my obligations to the works of Sir Gilbert Scott, who not only restored the unrivalled chapter-house and refitted the choir, but made the whole fabric and every treasure it contains the objects of his unceasing care and loving regard, and who was never tired, as Professor of Architecture, of bringing its beauties before the students of the Royal Academy, as the best illustrations of the marvellous Mediæval art to which he devoted his life.†

Any interest my lecture may have, will I am sure, owe much to the beautiful drawings by Messrs. Vacher, Milner Allen, McLaren, and Slater, which are hung upon the walls. The plaster casts of carving in the Abbey, and

as acolytes on the occasion left such tangible proofs of their presence in the droppings of their candles, as to remove all doubt of the voracity of Eddric, the Thames fisherman, who acted as ferryman to the Apostle, and witnessed the supernatural consecration.

You will, doubtless, remember that Ethelred and his consort, the beautiful Norman princess Emma, took refuge from the Danes in the Queen's fatherland, Normandy. There their son Edward (afterwards the Confessor) was brought up, and after living twenty-five years in the Norman Court, and witnessing the erection of those imposing churches at Caen, which even now excite our admiration, was induced in 1041 to recross the Channel and re-establish in his own person the Saxon line on the throne of this country.

Edward rebuilt the church at Westminster in 1049-55, establishing there a Benedictine monastery in fulfillment of a vow. And, though little or nothing of his church, the first of cruciform plan erected in England, has come down to us, it is fair to presume that its characteristics were those of an early Norman church of enormous dimensions and daring construction, rather than of the last of those more primitive buildings, modest in size and rude in design, which we suppose to have been the rule in the Saxon period. In fact, we know from ancient contemporary documents that the choir was lofty,

minster School-room), the lower part of the walls of the refectory, on the south side of the cloister, and the bases of a column or two within the church itself, but the Bayeux tapestry gives us an outline of the Saxon church as it existed in its glory.

As the Confessor had made of the abbey a Royal Chapel, so Henry III. conceived the idea that the church should become a royal hurrying-place. At least such became his determination during the fifty years in which the Royal Abbey Church was in course of rebuilding. The king was fond of ritual. His visits across the Channel made him acquainted with the already achieved glories of the cathedrals of Amiens, Beauvais, and Reims. His enthusiasm for church services and for art combined to make his wish that his church should be incomparable for beauty, a natural one. Besides the native masons employed on the church, a host of foreign artists were invited to expend their skill on the monuments and furniture of the fabric.

In the course of his long reign Henry III. finished the Lady-chapel, the Confessor's shrine behind the high altar, the whole of the surrounding east end, the transepts, including the first bay westward from the crossing, and the chapter-house, with its vestibule and the revery or Chapel of St. Faith. Edward I., his successor, erected the next four bays westward in the nave, the corresponding portion of the north walk of the cloisters, and the south end of the east walk beyond the part which belongs properly speaking to the south arm of the transept, and which, as carrying the triforium, was built naturally with it by Henry III.

The remaining six bays of the nave were erected by different abbots, Abbot Littleton in Richard II.'s time building the lower portion of the western towers. He also added the refectory or college hall on the Confessor's substructure, the abbot's house, the Jerusalem Chamber, and the rest of the cloisters; while on the north side he built Solomon's porch in front of the grand portal at the end of the north transept. In fact, after Henry III. we owe more to him than to any other of the abbey builders. While the nave was in course of construction Henry V. had erected his picturesque shrine over the ambulatory. The great west window appears to have been put in by Abbot Estney in 1498. In 1502 Henry VII. pulled down the Lady-chapel of Henry III., and erected on its site the wonderful mortuary-chapel which bears his name. The upper parts of the western towers were only completed in 1714 by Sir Christopher Wren. Before beginning to build he took down some of Littleton's work, shown in Hollar's view you have in your hands, and used the material thus at his disposal in repairing the south-western haies of the nave, putting the abbot's Perpendicular mouldings inwards. These have been discovered in the recent restoration, and will be useful in determining the real contour of the mouldings of the lower part of the tower.

Having now reminded you of the most important dates of the building, I must say a few words about the materials of which it is composed.

The stone most largely used in building the Abbey was the green sandstone called "Firestone" from its resistance to fire. It came from "Godstone" in Surrey,—a name implying the sacred use to which the stone was put. It was of a fine warm greenish yellow tone, and easily worked. Associated with it was chalk from the lower beds at Merstham in Surrey, and elsewhere,—an excellent material when kept from damp, most perishable when subjected to it. The excellent effect of colour produced in the filling in of the vaults both in the cloisters and the church itself is due to the alternate banding of these stones. In addition, the curious in such matters may find *trufa*, a coarse, loosely compacted, and very light limestone used in the east wall of the dormitory, where the Westminster boys now have their gymnasium. Caen stone was also used, or an oolite from Normandy very like Caen, which was really one of the most easily procurable stones for building in London, owing to the difficulties of land transit in those days.

The Early Norman ashlar work of the Confessor is easily to be distinguished by its surface being covered by coarse diagonal tool marks, and by the wide mortar joints between the squared stone, $\frac{1}{2}$ in. and sometimes $\frac{1}{4}$ in. wide. The corresponding work of the Plantagenets, on the contrary, is characterised by fine vertical tool-marks, and by thin $\frac{1}{4}$ in. joints.

Plan of Westminster Abbey.

the specimens of stone and marble used therein, are kindly lent by Mr. Brindley. I am able to present you with seven hand illustrations, due to the courtesy of the Editor of the *Builder*. They are most of them reproductions of drawings made by pupils of the Academy.

First, I must give you in a few words the history of this remarkable structure. On two great metropolitan churches sprang into existence almost at identically the same time. It appears that Ethelbert in 610 founded St. Paul's Cathedral at about the time when King Sebert, who died in 616, is credited with the first building of the church of the rival Apostle, St. Peter, on the then so-called Thorney Island. This was a tract, a part of peat and in part of gravel, covered with scrubby vegetation, lying between the Thames and the mouth of the brook Eye, which, flowing from Hampstead, passes through Tyburn (the Eye burn), and, disguised as a sewer, it is said, under Buckingham Palace itself, falls into the Thames where Great College-street runs out Abingdon-street. I need hardly repeat to you at length the familiar legend of the consecration of the church by St. Peter himself, on the eve of the day on which Bishop Mellitus, the companion of St. Augustine, was to have one it; nor how the angelic host who assisted

was vaulted, turned circular to the east (that is to say, was apsidal, had double vaulted aisles in two stories, one above the other, had a crossing or transept, with a lofty tower, whose timber roof, like the other roofs of the church, was covered with lead, and had five large bells.

That, further, the Confessor built a cloister, a chapter-house, vaulted and round, a refectory, a dormitory, and the usual monastic offices. Moreover, it appears that as the western end of the original early Saxon pile was left standing to avoid interrupting the services during the building of Edward's church, the latter must have been somewhat to the east of it. That Edward's church was conceived on a grand scale, and occupied, with what may have been left of the earlier Saxon nave, substantially the same ground as the present structure, is proved by certain structural facts, among others, by the remains of Edward's dormitory abutting against the present south transept wall in the usual manner, and also by the remains of the south wall of his cloisters, extending almost as far West as the present limits of the nave (and cloisters, I believe, always stopped in that direction short of the nave); and, lastly, by the fact that the Lady-chapel of Henry III., erected some years before he began the rebuilding of the church (and only pulled down to make way for Henry VII.'s Chapel), was placed adjoining the apse of the Confessor.

Of the buildings of the Confessor, nothing now remains to us but the Chapel of the Pyx, the cellars under the dormitory (now the West-

* A lecture by Mr. Waterhouse, A.R.A., delivered to the students of the Royal Academy on Wednesday evening last.

† To his son, Mr. John Oldrid Scott, I am indebted for the loan of most of the large drawings on the walls, which were prepared by his father to illustrate papers read here elsewhere.

In addition to the fire-stone, the chalk, the tufa, and the Normandy oolite, which appear to have been used by all the great builders of the abbey,—Edward the Confessor, Henry III., and his successors,—Purbeck marble was largely employed for the detached shafts and frequently for both bases and capitals, sometimes also for the piers themselves, though, owing to its extreme hardness, it was seldom used when elaborate carving was intended. There is a notable exception to this in the central pier to the Chapter-house, which has a splendidly-carved capital in Purbeck. The old Purbeck was much richer and more varied in colour than that now to be obtained. A sample of the original polish still lingers in the Chapel of St. Michael, north transept. It was introduced also into the pavements for steps, and, as you will see, it played an important part in the priceless pavements of the shrine of the Confessor and the Sacrament. Owing to its decay externally Sir Gilbert has substituted for it a Derbyshire fossil marble in the new north porch.

Abbot Litlington, in the fourteenth century, appears to have used Roche Abbey stone, and Abbot Islip in the sixteenth, an oolite from Oxfordshire, in the north-west tower. In the upper part of the western towers, rebuilt by Sir Christopher Wren, Portland stone was employed. This stone, though too cold in colour, is unequalled for durability in London, and its use was continued, as I find the six western clearstory windows on the south side were rebuilt externally with it in 1730. But the surveyors of the abbey after Wren, Dickinson (who restored the great rose-window of the north transept and who has buried within the north porch) and Tufnel, are said to have employed, in their day, the Oxfordshire stone. The so-called restoration undertaken by the latter surveyor was, after all, chiefly demolition, for it was he who scraped off the exposed surface of the stone externally to get rid of the decay, thereby destroying the contour of the mouldings, reducing their size and effect, and, by exposing another surface to the corroding air, leading to the necessity, in our day, of replacing much of the masonry with entirely new work to save the fabric from utter ruin and accident to passers-by.

Sir Gilbert Scott appears to have used Ketton or Mansfield Woodhouse stone in his excellent restoration of the south walk of the cloisters, Tadcaster in the west walk, Bath for the front of buttresses north side of nave, Tishury in the Chapter-house, and Chilmark from the Trough or Wardor beds elsewhere.

This latter admirable stone has been selected by Mr. Pearson, the present architect, for the works he has now in hand.

You will see, therefore, that Westminster Abbey is practically a geological museum of the greatest interest and value to the architect practising in London, enabling him to watch the effect of its climate on almost every description of building stone in common use, except it be the millstone grit and other sandstones so much used in the North.

The terrible effects of our present climate upon stone are strikingly exemplified by an incident which occurred in taking down the Chapter-house. There some ashlar was found of Henry III.'s work, with delicate masons' marks or scratchings which had been exposed for three centuries without any deterioration, and afterwards cased with brickwork. When discovered by Sir Gilbert these stones were again used in re-building the Chapter-house with their old surfaces again exposed, but the nineteenth-century atmosphere of Westminster destroyed the marks in less than a year. There were no potteries in Lambeth in the early days of the abbey; now the abbey officials declare they know glazing days at Lambeth from the sulphurous taste of the air.

The danger of using lead in joints is strikingly shown in various parts of the fabric,—at least, molten lead. Sheet lead, as now used, would not have done the mischief we have to deplore,—the destruction of so many of the neck-moulds of the smaller capitals. The material destroyed is Purbeck marble, a calcareous stone. The lead was applied through a small hole drilled in the bell of the capital. The heat of the molten metal, doubtless partly calcined the stone, and rendered it friable. The weight which the capital had to sustain gradually squeezed out the lead, which, curling up, has in numberless instances broken off the delicate neck-mould.

You will notice the tie-rods which go from pier to pier in the east end of the church and at the crossing. These were built in originally,

and go right through the piers; for it will be observed that these rods do not keep to an exactly uniform horizontal line around the church, the upper rods terminating in eyes which drop into books forged on the beads of the lower rods, which pass through the piers. In the Chapter-house when taken down, they were found, as the strain was not direct, to be attached to rings embedded in the masonry of the piers, the attachments being made in the same way with hooks and eyes. In one part of the ambulatory rods of oak, about 5 in. square in section, are wedged in between the caps of the columns, their ends abutting against lead pads. These rods have the reputation of being 400 years old, and probably took the place of the wrought-iron rods where likely to be subjected to compression merely in case of any bulging of the masonry, and not to tensile strain.

Two courses of 1½-in. chain bond go right through the walls, one at the springing of the arches of aisle windows, and another half-way down the windows. Across the glass they acted as stay-bars to the glazing. No doubt there are other courses of ties in the walls at greater altitude.

As before mentioned, there is an interesting morsel of the early church of the Confessor yet remaining, but quite concealed from ordinary observation. Just in front of the tomb of Edward Crouchback, on the south side of the sacrum, is a trap-door of marble in the modern pavement. If that be raised, and a light lowered into the dark space below, the first course of the drum of a column, with a base of two shallow circular members on a square block, is seen. That is part of the church of the Confessor. This late discovery proves two things; that his nave was narrower than the present one by 10 ft., that the pavement of it was scraped by 3 ft. or 4 ft., and taken in conjunction with the base of another column discovered *in situ* also on the north side, that the lines of the arcade converged rapidly towards the east. This is a remarkable arrangement, and was most likely productive of a happy effect when looking towards the altar. Though Edward's nave was thus only about 23 ft. wide, his bays, if the one in question may be taken as a fair specimen, were 18 ft. 9 in. centre to centre, instead of 17 ft., the average dimension of one of Henry's bays, but then they were spanned by semicircular, not pointed, arches.

To return to the building erected by Henry III. in the middle of the thirteenth century, to us the centre of attraction. It is peculiarly fortunate for us as Englishmen that the Royal Abbey Church was rebuilt when it was. Reims, Beauvais, and Amiens had just reared their splendid cathedrals, in which the Romanesque, or round-arched Gothic of the twelfth century, had given way, by an entirely natural and logical series of changes, to the fully-developed Pointed style. This effected all at once a revolution in architecture in this country, as in France. In English work, however, the windows, as a rule, were kept detached, singly or in groups, and were emphasised or adorned by a profusion of surrounding mouldings of exceeding delicacy and beauty, the use of the circular abacus in the capitals adding to the elegance of the work. It was only when the openings were unplugged (in the triforium or the bellries, for instance) that they continued to be grouped together under a comprising arch, and divided by detached shafts, as in the earlier Romanesque or Norman style. Glazed windows in England were then mostly of single lights. While the English builders were perfecting their single lights, the French were turning their attention to the mullioned and tracery window. At first their efforts were somewhat clumsy,—at any rate, when they forsook what is called "plate" tracery. The piercings in the window-heads consist exclusively of geometric figures, as circles, quatrefoils, or cinquefoils. At length at Reims, in the middle of the thirteenth century, or rather earlier, our neighbours the French achieved a great success in what is called bar tracery. In the two-light window of the apse there we find not only the head filled with a circle subdivided by six cusps or foils; but in addition the spandrels and gussets are all pierced, and the mouldings of the millions are carried all round the circle, as well as the two main divisions of the window.

It appears, therefore, that we are indebted to French architects for this bar tracery, and that in all probability because our own artists were concentrating their energies in another direc-

tion and achieving results equal to, or surpassing in beauty, the efforts of their French brethren. Our neighbours in the same time were developing another feature very characteristic of their productions when compared with our own, the chevet round the apse, handed down to the thirteenth century from the preceding century, but discarded generally in England, we should suppose from its interfering with the splendid grouping of our Early English windows, which could only be fitly displayed in a flat wall.

In all probability the Confessor's church had simply an apse, terminating the eastern end of the cross, with square ends to the aisles, after the plan of St. Stephen's, at Caen. Soon after this, however, the aisles were continued round the apse. We see it in our own Norman and Transitional work, as at Norwich and Bury and at St. Bartholomew's, Smithfield, but rarely afterwards.

The French then began to group around their chevets a number of radiating chapels arranged as polygons, so that they exactly fitted each other; their axes radiating from the centre of the apse. This involved great complexity of plan, produced varied effects of light and shade, and was brought to perfection in Reims, Amiens, Beauvais, and in other churches founded on these. These three great examples were probably the churches which served as Henry's models; for, though the Lady-chapel was begun in 1220, the rebuilding of the church itself did not begin till 1245, after Amiens had been twenty-five years in building. It would appear probable that Henry's English architect had been sent to study these stupendous works, for the new abbey took their form in apse, chevet, radiating chapels, and har-tracery windows of the Reims type, though in detail it was essentially English. The bar tracery, if this were, indeed, its first introduction into this country, took ultimate root here; not so the radiating chapels, of which there is hardly another example.

The difference of plan is interesting. In Reims the chevet follows the five sides of a decagon, and is a very simple affair. Westminster, on the other hand, is more complex and beautiful in effect. The sides of the apse are five in number, as at Reims, but instead of being five sides of a decagon the three eastermost are sides of an octagon, and the others incline slightly to meet the octagonal end from the straight sides of the church. This is very subtle, and gives a gentler transition from the straight walls of the main arcades into the circular form of the apse. This is one of the lessons which the abbey gives to the architectural student. This peculiar plan, you will observe, also prevents the apsidal arcade being so crowded as in the French churches, because to the east of the transverse line from the centre of each of the apse proper radiates there are but two semi-arches and three whole ones, four altogether, instead of five as at Reims; and the same holds with regard to the arches opening into the radial chapels, which are thus much wider than the ordinary bays of the church, whereas at Reims they are the same width.

At Cologne the apse takes the form of half dodecagon. It is consequently very crowded; the arches not being twice the width of the piers, except the two first bays, which are only half in the apse, and which fall inwards, as at Westminster.

No French example that I know of presents so cunning a treatment of the apsidal east end, except it be St. Ouen, at Ronen, which follows the Westminster treatment at a much later date. In another very important particular the church differs from the usual arrangement. The triforium, instead of being covered with a sloping roof descending from below the sills of the clearstory windows to the parapet over the windows of the aisles, has a flat timber lead-covered roof. Was it ever intended to vault this triforium roof? I think so, as we see in the earlier parts of the gallery detached shafts against the piers between the open arcading, and which stop suddenly below the roof. The triforium thus formed might have been in imitation of that which existed in the church of the Confessor, as such festoons were not uncommon in Romanesque work, and were used for the accommodation of worshippers where not so elevated from the floor of the church as in the case in our present abbey. Whatever may have been the motive in giving such dignity to the triforium, there is no question as to its beauty in itself, at any rate internally, or to the

ewilding charm of the views of the nave and pise when seen from the parts of the triforium near the crossing. At this height the spectator is not so much distracted by the garish modern monuments, and he is able to calmly contemplate the unity and splendour of the fabric itself. The triforium is lighted by windows whose quadrilateral arches spring from their sills without any intervening jambs, and are filled by three circles, each decorated with an inner order arranged as a cinquefoil like almost all the other tracery of the abbey.

The triforium arcade is perhaps the most noticeable feature in the church. Its richness and complexity is due to its being double. Each bay has two principal arches, with beautiful carving or diaper on the vousoirs. Within each of these arches are two others, delicately moulded, supported by a detached central shaft of Purbeck, with cap and base of the same material. These inner arches are cusped, and support a circle enclosing the customary cinquefoil. Behind all this, and detached by the distance of 2 ft., is its exact counterpart. In neither range of arches, however, has "the lamp of sacrifice" aided the builder to mould them on the triforium side, except in that part of the nave erected in Richard II.'s time. Seen from below, nothing can exceed the beauty of this triforium. It is perhaps a trifle too beautiful for so great a repetition. Through the courtesy of Mr. Fisher, you can compare this triforium with that of the Angel Choir at Lincoln, in his two remarkable drawings.

The abbot in Richard II.'s reign built the north westernmost windows of the triforium on the south side, and it is curious to observe that they have reversed the cinquefoil tracery in the heads of these windows to their normal position, with a circle at the crown, whereas the previous builders had for some reason placed a cusp at the crown and a circle at the base of each of these figures. This was a rather bold departure from precedent for the abbey, where one does not observe many of the usual characteristics of the architecture of Edward I. and Richard II., owing to their raising as he mentioned to their setting aside their natural predilections in favour of the style of their day to secure the unity of the building. Both Edward and Richard, therefore, though employing their own mouldings, carried the main features of the Henry III. work right down the nave, so that there is no break in the grand rhythm of the building, though, on careful inspection, there is no doubt as to where each builder began and left off. The story they told was exactly Henry's story, but the language used was their own. In the south and west walks of the cloisters you see exactly the same restraining influence at work. The openings are filled in with the geometric forms of a previous century, but the caps of the columns and other details are of Richard's own time, so that, though the student would not go to Westminster Abbey to learn the ordinary progression of the styles, he may go there with profit to learn the far higher lesson of how to sink self in labouring with others in a common cause.

Another slight change in the mode of treatment may be remarked in the mode of treatment of the triforium. Edward, and indeed Henry, did not put bosses to the tips of their cusps, but Richard did. Wren, when he restored Richard's work omitted them. Perhaps he did not care for Gothic carving, nor for Gothic mouldings. In fact, we know he did not, since he replaced with hideous acorns some of the little capitals on the window mullions. These are being replaced, and with excellent effect by Mr. Pearson on the south side of the nave, also the sensible mouldings of the great quatrefoils which in the fourteenth century took the place of the cinquefoils in the heads of these aisle windows. These mouldings die away on a broad spay towards the lower part of the quatrefoil, where they would not be seen from below, and where they would interfere with the proper throwing off of the rain.

The two last triforium windows west (south side) appear never to have been glazed. The rasonry was finished, and then subsequently they were bricked up, for what reason does not appear. Wren wanted to return one of his classical intermediate cornices against the last window, so he removed a few of the bricks and mitred his cornice into the moulding of the window, of course in a workmanlike manner, but did not remove more of the brickwork than he could avoid. He left that to Mr. Pearson, who has glazed them for the first time.

After the triforium perhaps the most beautiful feature is the wall arcading. Observe the beauty of its mouldings, of its bold trefoiled pointed arches, the plain spandrels between these and the circumscribing arch having once been resplendent with colour. The larger spaces or spandrels over these circumscribing arches are filled with exquisite sculpture, either conventional or natural foliage with here and there a figure. The capitals also of the slender Purbeck shafts of the arcading carry sometimes natural foliage, sometimes conventional forms, and in some of these latter Sir Gilbert Scott thinks he discovered the hand of a French carver, from the stalks carrying, not as in English work of the time, conventional, but little tufts of natural foliage, as at the Ste. Chapelle, and in other French work of the middle of the thirteenth century. In other capitals you will find the naturalism more arrowed, and leaves and stalks flung more carelessly on the bells of the capitals, which, however, whether carved by English or French workmen, had always their delicately-moulded circular abacus.

I have before spoken to you on the subject of architectural proportion based on geometry, disparaging to a certain extent the idea that certain relative dimensions in the height, length, and breadth of interiors are productive of beauty, inasmuch as it is quite possible to make two apartments of exactly the same relative dimensions, of which one shall be of acknowledged perfect proportion and the other bidiously the reverse by simply unduly emphasising some of its subordinate parts either by exaggerated size, proportion, or depth of mouldings, or by striking contrasts of colour. On the other hand, though, perhaps, not so easily, it will be possible by the same means to impart to an interior a satisfactory sense of proportion, which might hitherto have been lacking. It is astonishing how little change is required to alter not only the architectural, but the acoustic effect of apartments of exactly the same size and proportion. In my own experience, a curious instance of this is in the Manchester Assize Courts, where the two principal courts are of precisely the same size. One of them has always borne a good character for its acoustic properties, whether comparatively empty or crowded; the other has to be filled in order to be satisfactory in this respect. The latter is divided into seven bays longitudinally, by five transversely; the other, the success, into five by three; but then the latter has a large massive central gaselier which breaks the sound waves, the other four very attenuated specimens of Mr. Skidmore's art.

Though, therefore, I do not think that mere general proportion can ever be insisted on as an infallible guide to success, either in architectural beauty or acoustic excellence, it is well worth the student's while to ascertain what are the proportions of celebrated buildings, as well as the size of their mouldings, with reference to the building itself.

Now, in the case before us, taking the distance between the centres of the columns as the width of the nave, or the elementary scale, we find that the height of the apex of the vaulting from the pavement of the church is as nearly as possible three equilateral triangles placed one above another, the base of all being the width of the nave. The triforium string-course is one half this total height, or a triangle and a half.

In the Chapter-house, measuring from the centre of the central shaft to any of its angles for the elementary measure, and inscribing thereon an equilateral triangle, it will be found that the bosses of the vaultings are just the height of two of these figures from the pavement; or the proportion of a regular *vesica piscis*.

You will not allow the discordant colouring of the glass in the windows at the ends of the transepts to prevent your noticing the architecture there. The lines of the general design are here continued, but diversity is likewise secured, and a truly admirable effect produced. Neither of the rose-windows is original. That in the south transept was renewed in the fifteenth century, and again in the seventeenth, about forty years, as Sir Christopher Wren informs us, before the date of his report. In general design, however, there are good reasons for supposing that the original form has been pretty closely adhered to. It appears there was found on the Chapter-house floor (I cannot find it now) the pattern of a wheel-window on four tiles of

thirteenth-century work, which bears a most striking resemblance in all its intricate subdivided tracery to the rose-window in question. This is strong corroborative evidence.

The north window, however, is of the eighteenth century, and cannot much resemble its predecessor. There is fine figure sculpture, representing angels censuring, in the triforium at the ends of the transepts, and on the window jambs below, the latter now much effaced, and, in some cases, hardly to be discovered in the gloom which the heavily-coloured opaque glass throws over this part of the church.

I have hitherto chiefly spoken of the work of Henry III., supplanting the older edifice of the Confessor built two centuries before. Henry's work terminated in 1269, just west of the crossing. I suppose that the eleventh-century nave existed up to this time. Edward I. continued the rebuilding of the nave for the next five years. You will see certain diversities of treatment in details, but the design, on the whole, remains the same. The columns have four attached and four detached Purbeck shafts, instead of merely four detached Purbeck shafts round a central cylinder in Henry's work. The Edwardian vaulting ribs are more complex and of different section, not to be compared, in my opinion, with the severe beauty of the earlier work; the capitals of the wall arcade are moulded, of Purbeck, not carved, and shields have been introduced into the foliage which adorns the spandrels. The modern monuments have, however, left but little of these original beauties of the abbey for your study in the nave. Those shields which remain carry the arms of the great men of the day.

The capitals of the window shafts are likewise simply moulded, instead of being carved, in Edward I. work. The bosses of the vaulting ribs, on the other hand, in his time were exceedingly elaborate and beautiful.

Still going west we come to the work of Richard II., or rather of the abbot in his reign. There you will see in the aisle windows the cinquefoil filling to the upper circle gives place to the somewhat gaping quatrefoil before mentioned; the window-shafts have octagonal instead of circular shafts, and other slight changes may be discovered by the attentive observer, though the general design remains the same.*

ARCHITECTURAL ASSOCIATION.

This Association last Saturday visited the new St. Paul's School, West Kensington, over which they were conducted by Mr. Waterhouse, A.R.A., the architect of the building. This was the second visit paid to the School by the Association, as they previously inspected them in 1883, when in progress. The buildings have now been completed by Messrs. Parnell & Son, of Rugby, the contractors. Mr. Leeds is the ventilating engineer for the structure, and explained to the party the arrangements for heating and ventilation. The schools were illustrated in the *Builder* of August 26th, 1882. The school was founded by Dean Colset, in 1512, and twice rebuilt on the original site in St. Paul's Churchyard. Among its former scholars are included the names of Milton, Leland, Halley (of the Comet), Strype, Pepys, and the first Duke of Marlborough.

Mr. H. D. Appleton then proceeded with the members to inspect four houses in course of erection on the Collingham Gardens Estate, South Kensington, from designs by Messrs. Ernest George & Peto, architects, the contractors being Messrs. Peto Bros., builders. The members were received by Mr. W. Jacobs, foreman to Messrs. Peto, who explained the plans and details.

Mr. Edward W. Wyon died last week at the age of 74 years. He was the youngest son of Thomas Wyon, the Chief Engraver of Seals to George III. and George IV. His early life was chiefly devoted to gem modelling, and he assisted in many of the important works of his brother Benjamin, who succeeded their father as Seal-Engraver-in-Chief. In later years he produced his larger works, notably Britomarte for the Egyptian Hall of the Mansion House, Edward III. and Queen Philippa in the Drapers' Hall, and many other statues. The lunettes in his relief in the dome of the National Gallery are from his hands.

* The remainder of the lecture, together with some additional illustrations, in our next.

ROYAL INSTITUTE OF BRITISH
ARCHITECTS.
MEDALS AND PRIZES, 1885.

At a special meeting of members, held on Monday evening last, Mr. Ewan Christian, President, in the chair, the awards of medals and prizes were considered.

The Royal Gold Medal, 1885.—The following resolution, moved by the President, was carried by acclamation, namely, "That, subject to her Majesty's gracious sanction, the Royal Gold Medal for the year 1885 be presented to Henry Schliemann, F.S.A., Hon. Corr. Member (Athens), Hon. D.C.L. (Oxon), &c."

The adjudication of medals and other prizes was then proceeded with.

The Tite Prize (value 30l.).—Subject, a grand pavilion in a fashionable watering-place (seven competitors). Medal awarded to the author of the design bearing the motto "Spes dulce malum," who was found to be Mr. John Archibald Campbell, of 16, Woodside-crescent, Glasgow.

The Grissell Gold Medal.—Subject in Iron Construction, Central Hall of a Fruit and Vegetable Market.—The Secretary announced that no design had been submitted for this medal.

The Soane Medallion and 50l.—Subject, a Municipal Mansion (thirteen competitors).—The recommendations of the Council respecting the award of the Soane Medallion and (subject to the usual conditions) 50l. were that the medal, &c., be awarded to the author of the design bearing the motto "Here we are again!" (Mr. Arnold Bidlake Mitchell, of 36, Pembury-road, Clapton); a Medal of Merit to the author of the design bearing the motto "Acanthus" (Mr. Alfred A. Cox, of 16, St. George's-terrace, Queen's Gate, S.W.); and a Medal of Merit to the author of the design bearing the motto "Forward" (Mr. John Thompson, of 3, Selwood Terrace, Onslow-gardens, S.W.).

The Institute Medal and Ten Guinea (Measured Drawings).—Six competitors. Upon the recommendation of the Council, it was resolved that the Institute Medal and ten guineas be awarded to the author of the drawings bearing the motto "Forward," for his drawings of the Church of Ottery St. Mary, Devon. The name and address of the successful candidate were found to be Mr. Ernest A. Coxhead, Montrose-villa, Grove-road, Eastbourne. It was also resolved that a Medal of Merit and ten guineas be awarded to the author of the drawings bearing the motto "Spectentratione," for his drawings of King's College, Aberdeen. The author was found to be Mr. James Cromar Watt, of 71, Dee-street, Aberdeen. It was resolved that a Medal of Merit be awarded to the author of the drawings bearing the motto "Hope," for his drawings of Woodsome Hall, near Huddersfield. The author was found to be Mr. John Holmes Greaves, of 15, Park-row, Leeds. And that a Medal of Merit be awarded to the author of the drawings bearing the motto "Ars," for his drawings of All Saints Church, Walsoken, Norfolk. The author was found to be Mr. A. G. Adams, of 1, Ely-place-crescent, Wisbeach. It was further resolved that a Certificate of Honour be awarded to the author of the drawings bearing the motto "Perseverando," for his drawings of Wenlock Priory, Shropshire. The author was found to be Mr. Thomas Locke Worthington, 25, Bransnose-street, Manchester.

The Institute Medal and Ten Guinea: Essays. Subject, Pediments and Gables. (One competitor).—On the recommendation of the Council it was resolved not to award this prize.

The President then stated that the Council had that day given consideration to a wish formulated by the Medals and Prizes Committee that the sum of money, namely, ten guineas, which accompanied the Institute Medal for essays, should be largely increased in amount; and the Council recommended that for the said prize next year the sum of twenty-five guineas should be offered as well as the medal. After a somewhat long discussion, the matters touched upon therein by the President and the other speakers were left to the Council to consider and settle.

Subjects for Medals and other Prizes, 1885-86.—The recommendations of the Council, in the matter of the subjects for medals and other prizes to be competed for during the session of 1885-86 were then discussed, and the Council were requested by the meeting to take note of

the various opinions expressed by members upon the character of the subjects recommended for adoption, and to consider and settle the same.

The proceedings being then at an end, the meeting adjourned.

ON GREEK ARCHITECTURE.*

I HAVE chosen a very ambitious title for this lecture, but it seemed best to make the title as comprehensive as possible, because it is obviously impossible in one evening to do more than take a general view. I will now endeavour to point out the heads which I propose to work out more fully, viz., firstly, to consider why it is so important to study this style; and then to glance very rapidly at the sources from which it was derived, and the phases it went through.

Then to refer to the characteristics of the different orders in succession, and to mention some of the principal monuments in each period.

Afterwards to endeavour to find the secret to which we owe the beauties which are recognised by all intelligent critics, whether by careful adjustment of light and shade, or by proportion, or by more delicate optical refinements than have anywhere else been practised.

Greek architecture has had so many admirers that it might seem almost needless to bring forward reasons why it should be studied; but there are also, undoubtedly, persons who have occupied high places in literature and in the arts who have spoken slightly of it, and the term Grecian has been often used opprobriously by the too exclusive followers of the Gothic. I do not for a moment contend that Classical interpolations in Gothic works, where they have no business to be, may not have given reason for opposition to particular cases of intrusion; but we must all have heard or read of general denunciation of Greek architecture, which can only prove in their authors inability to see more than one side, or rather only part of a side, of the palace of art.

It is true that we have made many unsatisfactory attempts to introduce Greek architecture into our ecclesiastical and domestic works. I do not admit that they are all entire failures, but no doubt there are a great many. But this is almost a necessary result of merely copying the features of a by-gone style, adapted to conditions different to our own.

But the Classical copyist has no monopoly of failure. Many of our experiments in Medieval architecture have been equally misapplied.

Our proper object in studying ancient architecture should not be for the purpose of collecting "bits that will come in well," but that we should imbibe the principles of so great and noble a style as that of Greece; and as in whatever style we work we must use certain details by way of expression, it is important that we should well understand the aim and success of those of Greek architecture, which was the base and root of all modern work whether Classical or Gothic. The analogy of language is just to the point. Who would say that because Greek is to some extent a dead language, it is of no consequence that our scholars should study it? There is not only a great reward for those who can read Homer and Thucydides in their own language, but the person who is familiar with such authors will express himself better in his own than if he had been ignorant of them. In the same way in architecture, merely to understand such a building as the Parthenon is a great pleasure and advantage, but to be imbued with its spirit and art principles cannot fail to have a useful effect upon a designer. But your presence here shows me that it is not necessary to occupy any more of your time with an apology.

Firstly, let me acknowledge, with thanks, the loan of many of the diagrams on the wall. For some of them I am indebted to Professor Donaldson; for others, to the collection left to the Royal Academy by Professor Cockerell; and for those illustrating the Erechtheum and the general views of Athens, to Mr. Fergusson.

In seeking for the derivation of Greek architecture, we must at once notice the two main branches, the Doric and the Ionic. In point of absolute date, the Ionic seems to have first occupied the ground, although we have no temple architecture to which so great an antiquity can be assigned as to some of the Doric structures. A leading tribe of the

* A lecture by Mr. F. C. Penrose, M.A., delivered to the students of the Royal Academy on the 27th ult.

Pelagic family, and in immediate relationship with the Hæmeric families of Argos, occupied Ionia, in Asia Minor. These Greeks, whether in Asia or Europe, must have had much connexion with the Phœnicians,—a people so celebrated for its art development, that Solomon when building his temple, sought for the assistance. Cadmus, one of the least uncertain of the mythological heroes, was of Phœnic extraction, and the legend of Europa, daughter of a king of Tyre, points in the same direction. One of the most characteristic ornaments of Mycena was the scrollwork pattern which is frequently found in Asiatic work. The pattern exhibited is an enlargement from a piece of pottery discovered by Dr. Schliemann near the tomb of Agamemnon. The Ionic capital preserved, in the full developed architecture, this type.

The oldest temple at Athens, of which we have any traces, was no doubt the Erechtheum—not the temple which we now see, but its predecessor,—and we may be quite sure that the original Ionic architecture was purposely continued in the newer structure. In the time of Homer this Pelagic or Ionian family was dominant; but shortly afterwards a great revolution occurred in Greece from the invasion of the Dorians, a race bearing somewhat the same relation to the Pelag as that in our own country the Normanns bore to the Saxons. These became the rulers of the country, and especially of the Peloponnesus, and introduced the Doric architecture, which seems to have been partly based on Egyptian prototypes. A branch of the Dorians had sojourned in Crete as mentioned by Homer, and so would be favourably situated for correspondence with Egypt; indeed, it can hardly be doubted that the Doric column had its origin on the banks of the Nile, and was there executed in stone, but the Dorians combined it with a superstructure which had its motive in wooden construction. We know nothing of the first attempts in this combination. All the early experiments have perished, and we find the union completely full grown, though not yet fully educated in the massive temples of Corinth, Ægina, Selinus, and Paestum. The Dorians threw out colonies to Sicily and the south of Italy called Magna Græcia, and the earlier temples in those countries are almost invariably Doric. There is an Early Doric temple at Assos, in the south of Phrygia, and a Late Doric temple at Delos; but these architectural inroads into the Ionic countries are rare.

The Ionians still held their ground in Asia, and in most of the islands of the Ægean Sea, and were, on the whole, in the ascendant at Athens, or, at least, the two races were blended on fairly equal terms, and there, at any rate, we find the most happy combination of the massive and simple Doric and the more elegant Ionic. The Doric is more refined and the Ionic more forcible than elsewhere. There was also one important Ionic temple in the Peloponnesus, namely, Tegea, but of it nothing is now extant, or, at any rate, known.

A third order, as we all know, was developed, namely, the Corinthian,—so called, I suppose, from its rich and ornate character and so suited to the luxurious Corinthians. Vitruvius, indeed, tells us it was first used in the neighbourhood of Corinth; but, as by the same authority, it was invented by Callimachus, an Athenian architect, and the oldest examples extant seem to be the single column in the interior of the temple at Bassæ, the work of an Athenian architect, and after that the exquisite choragic monument of Lysicrates at Athens, we may fairly doubt the priority of Corinth in its use. It is as true of this order as of the Greek poetry that,—

"Græcorum sunt antiquissima quæque Scripta vel optima."

All subsequent examples are inferior to these earliest, so that the Corinthian did not go through the same process of refinement and perfection as the other two orders; but that, no doubt, was owing to the political and artistic decadence of Greece, for this order, was, as it were, the child of the old age of Greece, and its education ere long had to be entrusted to a stepmother. The Corinthian order was used by the Romans almost to the exclusion of the others, and through them had an immense effect in producing the Medieval styles. Many of the features of Romanesque architecture in France and Italy are scarcely distinguishable from later Classical work, and these merged into the Gothic by steps easily traceable.

The phases which the architecture of Greece went through were exactly such as come by natural growth, but of which at the present day we can have no experience in consequence of our having no true or living style. Exactly as the massive Norman produced the refined, but till forcible, Early Gothic, then the rich Decorated and towering Early Perpendicular, and, lastly, the attenuated Tudor or Flamboyant; so a Greek architecture the severe and simple features of the temple at Corinth were educated into the perfection of the Parthenon and Propylæa, and then became drawn up and refined as in the later examples. When it had reached this state the soil had lost its vigor, and it was very properly supplanted by the Corinthian.

In the diagram I have represented the relative proportion of the entablature to the column in several examples. The scales are so adjusted as to make the column of the same height in each, so that the relative heights of the entablatures show their comparative heaviness.

Judging from the architecture, which alone remains, the temple at Corinth has the most ponderous entablature. Then follows the earlier Parthenon, of which part of the entablature and some drums of the columns remain all into the north wall of the Acropolis of Athens. It is true that the height of the column is conjectured, but judging from the character of what remains, and from the known character of the column, it seems proper to put intermediate between the Corinthian and the Egyptian example which is next to it. After the latter,—taken from the Temple of Jupiter at Hellenus at Ægina,—follows the Thesæum. The Parthenon is slightly less massive than the Thesæum, but it wants nothing in appearance of dignity. The three later examples are inferior in dignity, but it should be mentioned that the temple from Nemea is from a temple which carefully worked in every respect, and is of good period, and it is not unlikely that the richness of the entablature may have been designed expressly on account of its situation in a valley, where a primary consideration would be the total height of the temple, as obtained by an unusual height given to the columns. At the portico of Philip at Delos and the gate of the New Agora at Athens were civil, not religious, structures, and their lightness may very be accounted for on that ground; for we learn from Vitruvius that this was one of the principles acknowledged:—"Aliam enim in forum templis debent habere gravitatem aliam porticibus et ceteris operibus subtilitatem." The approximate dates of the buildings I have mentioned are:—

Corinth	B.C. 650
Earlier Parthenon	" 600
Ægina	" 550
Thesæum	" 497
Parthenon	" 440
Nemea	" 400
Delos	" 350
New Agora, Athens	" 40

There were also important Doric structures at Eleusis and Olympia, but we may omit their consideration in this general résumé, because they were of a less refined character than most of the works mentioned above, and their proportions cannot be satisfactorily quoted, as the height of the column would be to some extent conjectural. Many of the remains in Sicily are of a large and well preserved, but all are comparatively coarse unless it be the fine temple at Segeste, and in Italy there is the noble Temple of Neptune at Paestum, but I am not aware that either of these has been examined with the scrupulous care that is necessary to establish the relations of accurate proportion.

The Ionic architecture followed no doubt a richly analogous career, but from various reasons,—especially that of the Persian wars,—we have not any specimen of nearly so early a date as we have of the Doric. Subsequently to the invasion of the Dorians, as already mentioned, this architecture had never been in vogue in the Peloponnese. Its chief expansion was in Asia Minor and in Attica, but all this country was overrun by the Persians, who made a point of destroying the temples.

The oldest specimen known to us in Greece seems to have been the small Temple of Epitoleum on the Ilissus at Athens, which, unfortunately, does not now exist, but was carefully measured and drawn by Stuart. This, with great probability, he assigned to one of the years immediately following the battle of Salamis, or about B.C. 478. The proportions

of the entablature to the column in this temple contrast very remarkably with those of the Erechtheum, and still more so with the examples for the most part in Ionia. In this temple the diminution of the column is also small, being about one-ninth of the lower diameter instead of something between one-seventh and one-eighth, and its height is only eight and half diameters instead of nine and a half in the case of the Erechtheum, and ten in some of the best of the Ionian specimens. There are not, however, examples enough extant to illustrate sufficiently the gradual development of the Ionic, for the conditions most favourable to this style of building had only a short duration, namely, from about 450 B.C., when the peace with the Persians resulting from the victories of Cimon, the son of Miltiades, secured the practical freedom of the Asiatic Greeks until the wars of Alexander and his successors, which commenced about 340 B.C. When Ionia was again brought under a stable government by the Romans, the Corinthian had become the dominant style. The oldest of the Ionian temples is at Samos, which seems to be of a very early type, and probably is anterior to the subjugation of the country by the Persians, and therefore may be about 500 B.C., but the remains are too scanty to afford sufficient data for criticism. The other principal works are the Temple of Diana at Ephesus, that of Didyme or Branchidæ, at Sardis, the extremely elegant but smaller temple of Minerva at Priene, and the Mausoleum at Halicarnassus. The principal remains of Greek architecture are the temples, and a circumstance which has preserved many of them to us is that they were, after the decay of Paganism, many of them converted into churches. There are also theatres and stadia, and occasionally tombs. The traces of domestic architecture, however, are very scanty. This remark, indeed, does not apply to the later and provincial towns of Pompeii and Herculaneum, which have been handed down to us by Vesuvius. But there is no doubt that in the best days of Greece the temples occupied a somewhat similar position as did our ecclesiastical architecture in the Middle Ages. The domestic structures were not prominent,—

"Nulla decembris
Metata privatis cœcis
Porticus accipiebatur Arcton."*

The palaces of kings were, perhaps, sometimes exceptions, as the recent explorations of Dr. Schliemann at Tyrus seem to show; but they were also citadels. Still the temples were pre-eminent; very great care was taken in the choice of their sites. Vitruvius, who has preserved some of the traditions of the ancients in a curious conglomerate, at the end of his first book, directs that the temples of Jupiter, Juno, and Minerva should be placed in the highest ground in a city. As remarkable instances of this may be cited pre-eminently Athens,—the Temple of Jupiter Panhellenus at Ægina, Segeste and Agrigentum in Sicily, and Sunium; but all, or nearly all, are well placed, and doubtless the situation was carefully considered in the design, and exerted great influence upon it.

It is a great error to suppose, as some have imagined, that all the Greek temples are built upon one model, and, given the number of the columns and their diameter, it would be possible to restore the design of a temple without knowing anything more about it, except, perhaps, the order. On the contrary, we find in each temple variations both of distribution and detail, which entirely disposes of so limited a conception of the duty of a Greek architect.

Let us, however, leave generalities, and examine some examples more particularly; and as fortunately the same city which in the judgment of antiquity received the highest praise for the magnificence of its architecture still retains for us the best-preserved models, we shall do well to confine our attention for this evening to the city of Minerva.

The Acropolis is a detached rock with a fairly flat summit, having a general extension from east to west, very precipitous towards the north, east, and south, but sloping more gradually towards the west, where the ridge again rises, but to a less elevation, in the Areopagus. Although in ancient times, when Athens had its greatest development, the Acropolis was surrounded with buildings on all sides, yet the most populous part was to the north, where also

* "The loggia, built to invite the cool north wind, were small, and needed not to be measured by the ten-foot rod."

the modern town is situated. The rock rises about 300 ft. above the general level of the town. A little way off, on the south side, is a range of hills which on one point rises almost to the level of the Acropolis, namely, the ancient Museum, which is crowned by the monument of Philopappus, a work of Roman times. There is a tolerably deep valley between this hill and the Acropolis, and against it were built many important structures, especially the great Theatre of Bacchus, capable of containing 30,000 spectators; and various temples, of which many traces have been recovered by recent excavations, notably the Temple of Esculapius, with the fountain described by Pausanias. Its architecture was Doric, but not of the very best period. There is also the Odeum, built by Herodes Atticus in later times.

Beyond the Areopagus, and towards the bottom of the slope, on a spur trending away to the north, still having sufficient elevation to offer a splendid site, and standing well above the plain is the exquisite Doric temple of Theseus, of which we do not absolutely know the origin, but Leake is probably right in considering it was built during the pre-eminence of Cimon, the son of Miltiades. Not far off is the gate in the city wall, called Dipylum, and the commencement of the sacred way leading to Eleusis, lined with tombs, many of them of remarkable sculpture. From this point, turning eastwards, we come to a four-column Doric portico, the gate of the New Agora, built about forty years B.C. Its architectural character has already been referred to. Near it is another building of municipal character, and not much earlier in date, the Horologium of Andronicus Cyrrestes, commonly called the Tower of the Winds. It formerly contained a water-clock, and still retains the hour lines of a sun-dial. There is much architectural elegance and simplicity about it, but the sculptures which are carved in relief on the eight faces of the octagon are very rude and inartistic, and show an extraordinary decline from the days of Pheidias. Northward of the Horologium is a work of Roman times, the Stoa of Hadrian, of considerable extent and magnificence of material, but the profiles of the mouldings and the carving of its Corinthian capitals are very inferior. Under the east end of the Acropolis rock is the exquisite little temple or choragic monument of Lysicrates, which used to be called the Lantern of Demosthenes. The illustrations on the wall will give some idea of its extreme refinement (notice the moulding of its base). The date of this earliest known example of the Corinthian order, except the one column of the Temple of Bassæ, is 334 B.C., the same year in which Alexander invaded Persia.

We may pass through the arch of Hadrian,—a work which, at least at Athens, does not invite much observation,—to the very fine remains of the enormous temple of Jupiter Olympius. This temple, though contemplated by Pisistratus, does not seem to have been proceeded with until the time of the successors of Alexander. Antiochus Epiphanes, between the years B.C. 174 and 164, made great progress with the work, having employed a Roman citizen as architect, named Cosuttus. It is, no doubt, this design in the main which we see, but the work was discontinued after his death, and resumed under the influence of Augustus, again to be postponed and finally finished and dedicated by Hadrian. The columns are of fine work, and though much less graceful than those of the monument of Lysicrates, are altogether of a superior character to the neighbouring arch of Hadrian or the Stoa mentioned above. It would therefore seem that although there can be no doubt that Hadrian finished and dedicated the temple, the design was of a much better period. Only fifteen columns remain standing out of the original number of 116 which formed the porticoes and peristyles, and these were only preserved to us by the fact that a small church was built in amongst the columns of the south-eastern angle of the temple. Still, their great height,—about 56 ft.,—gives to these fifteen columns a most impressive effect. The temple was surrounded by an ample peribolus, which was formerly full of statues.

Near the temple of Jupiter Olympius, and on the other side of the Ilissus, was the small temple of Triptolemus, which has already been mentioned.

Having thus completed the round of the existing remains outside the Acropolis, we may ascend by its only access, the Propylæa towards the west, and here was, in the opinion of the

ancients, and which seems thoroughly justified by the existing remains, the finest monument in Athens. A grand flight of marble steps, about seventy in number and 70 ft. wide, led up to a portico of six Doric columns, more than 5 ft. in diameter, contrasted by two smaller Doric porticos on either side. On the right hand approach was a small but exquisite Ionic temple; Victory without wings,—for the Athenians fancied they could secure continued victory by making the goddess wingless,—and on the left a large pedestal supporting a group of statues. Both these smaller and subordinate structures were out of parallel to the Propylæa, and so caught the sun's rays at a different angle, giving great beauty and variety to the scene, and as they were independent of the main design they did not in the least disturb its continuity. The main central portico was divided into three aisles by two ranges of Ionic columns. The ceiling was entirely of marble, and supported by marble beams, more than 20 ft. in length. Having passed through the propylæa the spectator emerged close under the pedestal of the gigantic statue of Minerva Promachus, and passing up a street full of sculptured memorials, and rising rather rapidly all the way, soon came in front of the Parthenon. The access was not in the central axis of the temple, but giving an oblique view, which was far more interesting and picturesque. The combination of symmetry and freedom in Greek architecture is one of its most important characteristics, and most deserving our attention.

No doubt the architecture of the Parthenon was enriched with the grandest accompaniment of sculpture that the world ever saw. We have fortunately sufficient remains of the work of Phedias from the east front to establish this, but it would be quite a mistake to consider the architecture merely as a frame for the sculpture. It has its own qualities, its harmonies of proportion, and its contrasts of light and shade. I shall refer later to the exact proportions which rule in the principal masses; but it is desirable to remark that in smaller features, such as the metopes, there is a remarkable inequality of width, those in the centre of the front are, on the whole, the widest, but in no regular gradation. There is thus a law of liberty, quite consonant with the works of nature, introduced, which enlivens the general effect. A modern builder would be shocked if he were told to make some of the metopes 4 in. wider than others.*

The temple, technically described, is peripteral and octastyle, with pronaos at the east and posticum at the west, each having its own portico of six columns. The interior was divided into two parts, the cells embracing both these parts; and to the east was the naos, or temple proper, containing the colossal gold and ivory statue of Minerva; and to the west was the opisthodomus, which was used as the Public Treasury. Both the naos and the opisthodomus were closed with wide and lofty folding-doors, and there was a communication by means of two small doors between the opisthodomus and the naos. The naos was divided into three aisles by two ranges of columns one over the other, as we see still standing at Pæstum and Ægina. The traces on the pavement show that the lower columns were Doric, and the upper columns were probably Doric also. The opisthodomus was supported by four columns. The alps on which they stood still remain, but there are no traces of the columns. It is, however, presmable that they were of the Ionic order.

In addition to the Parthenon there were several temples and some municipal buildings on the Acropolis; but little remains of these. Nor do the accounts of Pausanias and other ancient writers lead us to suppose there was any great interest in any of them, excepting the Erechtheum, which is, perhaps, both on account of the beauty of its architecture and the interesting intricacy of its plan, the most valuable relic of antiquity. After the Propylæa and the Parthenon it certainly is so. In the Middle Ages it was converted into a church. It afterwards became the Turkish pasha's residence, and, finally, a storehouse, and partly a gunpowder magazine. It has suffered very much, but still enough has been preserved to indicate the beauty of the original, and to be the groundwork of volumes of archaeological discussion. It was a double structure.

* Probably this arose from variations in the sculptor's treatment of the metope subjects.—Ed.

The temple of the goddess Athena Polias, the original Minerva tutelary of Athens, and the fame of the hero Erechtheus, and also combined with it was a compartment sacred to the nymph Pandrosus. The temple (speaking of it as a whole) preserved evidence of the contest of Neptune and Minerva for the protectorate of Attica. The mark attributed to Neptune's trident on the rock was there,—and, indeed, it may still be seen,—and the sacred olive which Minerva produced, and which decided the contest, was preserved in some part of the sanctuary.

It is a curious point in the archaeological discussion having reference to the distribution of the area of the temple that the behaviour of a certain dog throws more light upon it than even the narrative of the traveller Pausanias. The story is told by one Philochorus, who had no doubt been scandalised by the desecration of the sacred spot.

"A dog having entered into the Temple of Minerva Polias rushed into the Pandroseum, and, having mounted upon the altar of Jupiter Hærcæus, which is under the olive tree, lay down." Now, consider the temple itself divided into two parts (for the levels differ by many feet), the eastern and upper part sacred to the hero Erechtheus; the larger and western part, which is approached by the four-column portico of the noblest proportion, to be the Temple of Minerva Polias; and the Pandroseum, to be the space immediately to the west of the temple, we can see at once the manner in which the dog behaved, not having the fear either of Minerva or Jupiter before her eyes. There are still evidences of steps leading down through a doorway in the western wall, and there are evidences of an enclosure of the space westwards of the temple. Here would then be the olive tree and the altar of Jupiter, and the garden and residence of the virgins who attended to the worship of the nymph Pandrosus. This space is bounded on the south by a rather lofty and very rough wall, which seems never to have been cased with finer work, but was probably concealed by the shrubs or creepers of the garden, and very probably helped to support the open work beams of a trellis or pergola. There seem to be traces of some such construction against the west walls of the Erechtheum. The staircase shown in Inwood's plate is quite imaginary.

It should be borne in mind that the Minerva of this temple was more reverently worshipped than the Minerva of the Parthenon. In the great Panathenæic festival every year, and with more extraordinary pomp every fourth year, there was a procession to this statue, and as the new temple which we see, was necessarily limited in size by the original sacred site, it was of the more importance to embellish it with ornament, and this has certainly been done in the most appropriate way. We do not know whether there was any sculpture in the pediments,—it may reasonably be concluded there was not,—but the frieze still shows the attachments of figures. The hand of ornament which carries round the line of the capitals,—themselves the perfection of all Ionic work,—is extremely graceful and tender, and the bases were beautifully carved. But there was also plenty of solid and plain masonry, some of the stones being very massive. However the problem arose, how to give sufficient importance to the south front facing the Parthenon. This was solved by the, perhaps original, conception of the Caryatid portico. The plan of the Erechtheum did not admit of a public entrance at this point,—a small private door for the use of the privileged is there. It is, therefore, rather a loggia than a porch. The pose of the figures themselves is most remarkable, and they appear quite sufficient for the work they have to do. They differ enough amongst themselves to have individuality, whilst the idea given at first sight is that of exact resemblance, excepting that they are contrasted in the pose of the legs upon which they chiefly bear their weight. The folds of the drapery falling with a general appearance of verticality towards the outside of the portico have a columnar effect. All this has been well stated by your President in some remarks on a paper by Mr. Fergusson on the Erechtheum in 1876, which will be found in the "Transactions" of the Royal Institute of British Architects for that year.*

The temple of the goddess Athena Polias, the original Minerva tutelary of Athens, and the fame of the hero Erechtheus, and also combined with it was a compartment sacred to the nymph Pandrosus. The temple (speaking of it as a whole) preserved evidence of the contest of Neptune and Minerva for the protectorate of Attica. The mark attributed to Neptune's trident on the rock was there,—and, indeed, it may still be seen,—and the sacred olive which Minerva produced, and which decided the contest, was preserved in some part of the sanctuary. It is a curious point in the archaeological discussion having reference to the distribution of the area of the temple that the behaviour of a certain dog throws more light upon it than even the narrative of the traveller Pausanias. The story is told by one Philochorus, who had no doubt been scandalised by the desecration of the sacred spot. "A dog having entered into the Temple of Minerva Polias rushed into the Pandroseum, and, having mounted upon the altar of Jupiter Hærcæus, which is under the olive tree, lay down." Now, consider the temple itself divided into two parts (for the levels differ by many feet), the eastern and upper part sacred to the hero Erechtheus; the larger and western part, which is approached by the four-column portico of the noblest proportion, to be the Temple of Minerva Polias; and the Pandroseum, to be the space immediately to the west of the temple, we can see at once the manner in which the dog behaved, not having the fear either of Minerva or Jupiter before her eyes. There are still evidences of steps leading down through a doorway in the western wall, and there are evidences of an enclosure of the space westwards of the temple. Here would then be the olive tree and the altar of Jupiter, and the garden and residence of the virgins who attended to the worship of the nymph Pandrosus. This space is bounded on the south by a rather lofty and very rough wall, which seems never to have been cased with finer work, but was probably concealed by the shrubs or creepers of the garden, and very probably helped to support the open work beams of a trellis or pergola. There seem to be traces of some such construction against the west walls of the Erechtheum. The staircase shown in Inwood's plate is quite imaginary. It should be borne in mind that the Minerva of this temple was more reverently worshipped than the Minerva of the Parthenon. In the great Panathenæic festival every year, and with more extraordinary pomp every fourth year, there was a procession to this statue, and as the new temple which we see, was necessarily limited in size by the original sacred site, it was of the more importance to embellish it with ornament, and this has certainly been done in the most appropriate way. We do not know whether there was any sculpture in the pediments,—it may reasonably be concluded there was not,—but the frieze still shows the attachments of figures. The hand of ornament which carries round the line of the capitals,—themselves the perfection of all Ionic work,—is extremely graceful and tender, and the bases were beautifully carved. But there was also plenty of solid and plain masonry, some of the stones being very massive. However the problem arose, how to give sufficient importance to the south front facing the Parthenon. This was solved by the, perhaps original, conception of the Caryatid portico. The plan of the Erechtheum did not admit of a public entrance at this point,—a small private door for the use of the privileged is there. It is, therefore, rather a loggia than a porch. The pose of the figures themselves is most remarkable, and they appear quite sufficient for the work they have to do. They differ enough amongst themselves to have individuality, whilst the idea given at first sight is that of exact resemblance, excepting that they are contrasted in the pose of the legs upon which they chiefly bear their weight. The folds of the drapery falling with a general appearance of verticality towards the outside of the portico have a columnar effect. All this has been well stated by your President in some remarks on a paper by Mr. Fergusson on the Erechtheum in 1876, which will be found in the "Transactions" of the Royal Institute of British Architects for that year.*

* We will give the remainder in our next, accompanied by reproductions of a few of Mr. Fergusson's diagrams.

Illustrations.

WESTMINSTER ABBEY.

IN connexion with Mr. Waterhouse's lecture at the Royal Academy last week, reported in another column, we publish a series of measured drawings, various portions of the abbey. The reproduction of Hollar's view of the abbey from the north is a fair example of the English architectural engraving of the period, and corresponds fairly with Newcourt's plan, which frequently accompanies it. It was engraved in 1654, only two years after Hollar's return to England. The central lantern was not erected; on the other hand, the porch of the north transept is still shown. It was removed when the transept was restored, in the early part of the last century.

The other illustrations include one half of choir, section and elevation, measured by Mr. E. Emlyn White; the interior of the south transept, measured and drawn by Mr. J. Atwood Slater, to whose careful and beautiful work we call the more attention because he has not signed his drawing, as the other contributors have. Both these drawings, obtained for their owners the Royal Academy Silver Medal. Mr. H. O. Cresswell contributed a drawing of the screen of the tomb of Henry VII., which obtained a Medal of Honour in the last competition for the Pugin Travel Studentship; Mr. Maclaren contributed drawings of the cloisters, which obtained similar recognition on the same occasion; and Shearman contributes an elevation of Chapter-house doorway.

The building is fully dealt with in Mr. Waterhouse's lecture. It only remains for us to express our best thanks to those who have kindly lent us their drawings, and our appreciation of their merit as specimens of architectural draughtsmanship.

CENTRAL ASSOCIATION OF MASTER BUILDERS.

The annual general meeting of the Central Association of Master Builders of London was held at 27, King-street, Covent-garden, on the 25th ult., Mr. F. J. Dove in the chair.

The Secretary read the balance-sheet, audited and signed, and copies were handed round for inspection. It was resolved "That balance-sheet as audited and read be adopted."

The Secretary next read the report, and the Chairman having addressed the meeting on the several matters referred to therein, motion that the report as read be adopted.

The motion, having been seconded, was carried unanimously.

The Secretary reported that the hallooting had been prepared in accordance with Rules XV. and XVI., and it was resolved:—

"That the officers and committee, as printed on hallooting-list forwarded to members, be elected for ensuing year."

The newly-elected members having taken office, the Chairman, referring to the rates and wages in the London district, mentioned that he had been invited and had attended the meeting of the Industrial Remuneration Conference, and had refrained from speaking, as he did not feel justified in committing his colleagues to opinions without their having been consulted, he could not help saying to those present that he was surprised at the earnestness and intelligence shown by several of the working-delegates, and he had come to the conclusion that this Association would do more by meeting the representatives of the men than it would by opposing the action of the trade unions in Parliament. After some discussion of the subject, in which several members took part, it was resolved:—

"That if the workmen have any just grievance to complain of the Committee are hereby empowered to meet them without any further authority."

A letter to the *Builder* of February 14, 1885, signed "H. S.," having been read, the subject* spoken to by some of those present it was resolved:—

"That the attention of the Committee be called to the desirability of writing the First Commissioner of Works and Public Buildings requesting that, in accordance with the almost universal practice of architects, when tenders for building works have been received and a decision arrived at, the parties tendering be permitted to see a copy of the same."

The meeting was concluded by a vote of thanks to the chairman.

* "Government tenders."

FREE LECTURES TO ARTISANS AT
CARPENTERS' HALL.

BLACK, WHITE, AND RED LEAD.

The third lecture of this series* was delivered on the 25th ult. by Professor Church, M.A. The air was occupied by Mr. Alfred Preston, Pastor of the company.

Professor Church commenced by saying that though the lecture bore the title of "Black, White, and Red Lead," there was, strictly speaking, no such substance as black lead. There were three ways in which white lead was manufactured. The first was the Dutch process, consisting in taking metallic lead in the form of a grid and coating it, or placing a coil of wet lead in a crucible or vessel containing vinegar, and surrounded by a quantity of fermenting manure. A large quantity of carbonic acid is thus given off, and was the chief agent in the manufacture of white lead. Two other constituents entered into its composition, the one being the oxygen of the air, and the other being water in the form of vapour. The result of these was to produce an attack on the metallic lead, which was a pure elementary substance, and in the end they got the metallic lead with its shining surface thoroughly corroded, a mass of white lead with lead in the centre. The next process was a much simpler one, but required a great deal of attention. It was invented by a French chemist, and was also practised in England by a chemist named Goussier. In this case carbonic acid gas from any source, such as that resulting from the action of sulphuric acid upon chalk, was passed into a solution of acetate of lead. The acetate contained oxide of lead in excess of the quantity requisite to form it, and when the carbonic acid was passed through it a white powder was deposited in the form of white lead. The third process was invented by two chemists,—Dale and Milner. In this instance, a yellow combination of lead and arsenic was used in the proportion of four parts of the common salt one part, and water sixteen parts. These were ground together for four or five hours. The mixture was then transferred to a leaden vat, and on carbonic acid gas being passed through it to a certain point, they got white lead. There was still another process, and that is produced white lead of an inferior character, he would not deal with it. White lead consisted of two substances, not always present in exactly the same proportions, but very nearly so in all good samples. It was a compound of two proportions of carbonate of lead and one proportion of hydrate of lead. The following was the chemical formula of white lead:—

Sometimes the samples were grey, arising from the iron or core not being separated from the white lead, a small quantity of finely divided iron spoiling the white tone of the mass out of it. Occasionally a sample would appear bluish, caused by one of the oxides of lead being present. Another defect of white lead arose from the presence of too much hydrate of lead. It sometimes contained too much carbonate of lead, and then it would not grind readily. It was desirable that white lead should be thoroughly washed from sngar of lead if it was to be used for the finest work,—and, indeed, it is a better for all work. The lecturer then referred to Venice, Hamburg, and Dutch white lead, demonstrating by experiment how to tell whether the material was adulterated. Nitric acid was a useful agent for detecting adulteration. He had bought several samples, and found that the majority were unadulterated, but in employing house-painters had detected that the paint with which they had been supplied had been adulterated. The advantages of white lead were body and density, drying character, and its economical union with oil containing the particles of paint and surface on which they were spread. This was to be seen in the case of old oil paintings and putty made only of white lead and linseed oil. In the National Portrait Gallery they could notice that the parts of the pictures which had been best preserved were the high lights, in which flake white had been largely used. The preservative effect of flake white formed a lead soap, and a substance which was almost imperishable. The disadvantages of white lead were that

it discoloured and was poisonous. Peroxide of hydrogen would get rid of the tarnish of lead. White lead, again, would dissolve in the acids of the stomach, and in cases of lead poisoning there was a peculiar effect to be observed: at the point where the teeth joined the gums there was a slaty blue line. This arose chiefly from want of care in eating with unwashed hands, and sometimes from the powdered lead being inhaled and swallowed. There were two remedies for lead poisoning; a pleasantly acidulous drink of diluted sulphuric acid turned the white lead into sulphate of lead, which was practically insoluble. The other remedy was iodide of potassium, which should be carefully used. A specially prepared respirator was a most important precaution. A species of white lead which was practically non-poisonous had lately been introduced. It was a sulphate of lead, to which was added a small quantity of zinc white. Red lead was the densest of the three, and often was made by roasting white lead. It was an oxide of lead, and its formula was:—

Red lead when boiled with oil had a great power of drying and preserving wood. It was sometimes adulterated with brick-dust and red oxide of iron. Weak nitric acid dissolved red lead into a clear solution by the addition of a little bit of sugar. If the red lead contained brick-dust or oxide of iron, they would not dissolve. Black-lead was carbon, and was as such an element as oxygen. The carbon existed in three forms,—in diamonds, black-lead, and charcoal or soot. Graphite or plumbago was a better term than black-lead. Graphite had been said to be the only perfect pigment, and would stand a high temperature. Black-lead was adulterated with ground anthracite coal, and with gas carbon from the retorts. Graphite would stand a fire-red heat without burning, while the soot or carbon burned away.

The fourth lecture was delivered by Mr. Thomas Blashill, F.R.I.B.A., on Wednesday evening last. The subject treated of in this lecture was "The Shoring of Buildings." The lecture was very fully illustrated by models and drawings, and the large hall was completely filled by an attentive audience. We defer a report until next week.

PUBLIC WORKS AT BRUSSELS.

THE Communal Council of Brussels has applied to the Belgian Government for authority to spend 55,720*l.* during the current year for the completion of primary schools. There is a school in the Rue Haute, which will cost more than 10,200*l.*; another in the Rue Schaerbeek, 4,000*l.*, and a third, Impasse Canivet, estimated by the architect, M. Samyn, at 20,440*l.* But these are not the only expenses that the town is incurring for the promotion of education. The building of the Royal Athenaeum cost 19,884*l.* in 1853 and 40,000*l.* in 1854. This important structure will be completed during the course of the present year for a further cost of about 20,000*l.* When we consider that Brussels is, after all and comparatively speaking, a small town, this expenditure in the noble cause of education is very creditable. But there are many other calls on the public purse. The tourist and the student of Renaissance and Gothic architecture will rejoice, this year, in the restoration of the Maison du Roi. This celebrated building, formerly used as the seat of local authorities, was built from 1514 to 1527. Here it was that Counts Egmont and Hornes were confined the night before their execution. To prevent a rescue, planks, it is said, were placed, reaching from the balcony to the scaffold, situated in the great square. Thus the building is intimately associated with the independence of the Netherlands and the rebellion against Catholic and Spanish domination. In 1707, this structure, which is also sometimes designated as the Halle au Pain, was most clumsily and injuriously restored. Some years ago the original plans were found, and, in 1873, it was determined to efface the traces of the previous restoration, and reconstruct according to first and superior designs of the sixteenth century. On this work close upon 40,000*l.* have been spent, and during the present year 8,000*l.* more will be required, principally for fixtures, doors, &c. M. Jamar has completed his studies of the galleries and balconies, and the

gallery leading to the office of the Burgomaster is almost finished. In the Gothic hall two large bronze statues will be placed, but the models of the nine other statues, also required, have not yet been approved by the Fine Arts Commission.

Early in the year works for the Provincial Government House of Brussels will be put up for competition. The details concerning these adjudications fill a volume of 625 pages; and, according to the calculations of M. Hans, the principal engineer of the Ponts et Chaussées administration, the total cost is put down at 98,280*l.*, and the caution money required from the contractors, at 4,920*l.* These works relate principally to the enlarging, deepening, &c., of the Brussels and Charleroi Canal. There will be also ten aqueduct siphons, five draw-bridges, ten ordinary bridges, together with pavement, embankments, &c. To explain all these details it has been necessary to draw up sixty-five different plans; and the entire work must be completed in two years, or a penalty of 100 francs for every day's delay will be inflicted. Something also is to be done with respect to the beautifying of Brussels, and the housing of the poor; 44,000*l.* will be devoted to the transformation of the small district of La Vierge Noire,—a quarter which has barely 400 inhabitants. Finally, 24,000*l.* are put down for continuing the improvement and development of the north-east or fashionable Quartier Leopold. Altogether it will be seen that neither political disturbances nor commercial depression have checked the forward movement of the town of Brussels. No important project has been abandoned, and many new proposals are seriously entertained. This is most fortunate, as the number of workmen out of employ is daily increasing, and the distress would be doubly keen if the Government as well as private enterprise failed in providing work.

ARCHITECTURAL SOCIETIES.

Glasgow Institute of Architects.—The annual dinner of the Glasgow Incorporated Institute of Architects took place at St. Enoch's Hotel on the 27th ult. Mr. James Sellars, President, occupied the chair, and Mr. David Thomson, ex-vic-president, was crozier. The Chairman, in proposing the toast of "The Institute," said that the names of such men as the late Alexander Thomson and James Salmon, George Bell, John Baird, and John Burnet, would long be remembered as the fathers of the Institute; and, thanks to the efforts of those men, and of those who came after them, the Institute had long ago entered on a useful career, doing good earnest work in the past, taking part in all matters of public interest connected with the architectural profession, and justifying its claim to a position of influence among similar societies in Glasgow. With regard to architectural education, Mr. Sellars said that a Chair of Architecture at the University was required, in order to secure the status and the proper recognition of architecture as one of the learned professions. Referring to the "Alexander Thomson Travelling Studentship," the funds for which will be available in about two years, Mr. Sellars said that a sum of money was collected by the friends and admirers of Mr. Thomson at his death, and after providing a host of the deceased architect, which is now in the Corporation Galleries, the balance has been invested, and every three years a sum of 60*l.* or 70*l.* will be available and competed for by young architects, the successful candidate being awarded the money, under certain conditions, to help him in his studies. No more fitting tribute, said Mr. Sellars, could be paid to the memory of Alexander Thomson, who was himself an earnest student all through his too short career, and it will be the means of handing down to posterity the name of one of Glasgow's most distinguished architects. Something is also being done for the architectural education of the young men in the profession, and that by the young men themselves. The Glasgow Architectural Association is doing excellent work in this way. Mr. Sellars concluded by referring to the proposed Police Bill for Glasgow and to other matters of local interest.

Birmingham Architectural Association.—The sixth ordinary meeting of this Association was held at Queen's College on Tuesday evening last. Mr. H. H. McConnal was in the chair.

*For reports of the two previous lectures see p. 264.

A paper was read by Mr. W. Doubleday on "Symbolism in Art," which was copiously illustrated by diagrams and sketches. The lecturer expressed his opinion that the age of symbolism had not passed away, and that in modern architectural works the necessity of symbolic representation would frequently occur, more especially in all buildings erected for the worship of the deity. A vote of thanks to the lecturer was proposed by the Chairman, and supported by Messrs. Victor Scruton (hon. sec.), J. Cotton, and F. Cross.

THE FOLK-LORE AND ART OF OLD JAPAN.

This was the subject of an interesting lecture delivered by Capt. Charles Pfoundes, F.R.G.S., at the meeting of the Society for the Encouragement of the Fine Arts, Conduit-street, on Thursday evening, the 26th ult. The chair was occupied by Sir J. Whitaker Ellis, Bart., M.P., and vice-president of the society. The lecturer pointed out that the art of Old Japan, that is, the true art of the cultured natives, derives so much of its art motive, and so many of its ideals, from the folk-lore, the myths, and legends, that we must know something of these before we can properly understand the art, or have any true conception whatever of the meaning, the origin, of the compositions that are so ably depicted in the characteristic Japanese delineations. In the decorative design of wares, even of those fabricated for foreign use, however cheap, we find those well-known groupings that to the native, and also to the well-informed foreigner, recall the most popular poetic ideas, the best known legends, and the numerous plots of the Japanese. Beginning with the native myths, the Japanese story of the Creation, when from Chaos order was evolved; then the successive acts of creation of beasts of the field, birds of the air, fishes of the sea, and semi-divine man, we follow on from legend to legend, throughout the most important epoch of Japanese history. War and love, loyalty and revenge, efforts to improve the condition of the people, to civilise the rude aborigines, all form salient features in the art work of the designers. Besides the pictorial art and book illustration, the calligraphic art takes a high place. In a former lecture before the Society on the System and Meaning of the Art of Old Japan, some of these points were dealt with by the author, and in a still earlier lecture he essayed to elucidate the connexion between the art and the literature, and entered somewhat fully into the calligraphy of the Japanese. It was not necessary, therefore, to again travel over that portion of the subject, but a little explanation might bear repetition, as to the peculiarity of the written character, and why it affected the art so much. As it is not an alphabet or a mere syllabary, but an ideographic character, derived from hieroglyphic forms, it appeals to the eye, beyond its mere phonetic value; and in illustrations of myth legend, or curious rites or custom, a few of these Chinese written characters, as used by the Japanese, throw much light upon the suggestive sketch as to the intention of the artist. The enamel and cloisonné wares called "seven jewels" show the seven colours: pink, coral, amber, mother-of-pearl, emerald, agate, pearl, and crystal; gold and silver are included in the term, as a matter of course, and it is interesting to find these groupings in ancient Indian and Chinese jewelled articles intended for religious uses. Whilst the Japanese have incorporated much from the adjoining continent of China, all this appears as merely engrafted on the indigenous stock; and the scholarly native draws a sharply-defined line between the "foreign" and the "native" myth, legend, and poem. Whether in wood or ivory carving, in bronze casting, in inlaid metal, or other work, the same series of ideas are found repeated and perpetuated; but the Japanese are judicious and expert in the selection of material, and of design to suit the uses and the forms of the articles. Indeed, an extensive knowledge of the daily life, the manners, and the ceremonies of the people of all classes, is absolutely essential for a true understanding of the art of this most interesting people. Unfortunately, in recent years, they have diverged widely from the traditional lines, and are sinking into imitation, not only of foreign wares, but actually are copying foreign imitations of

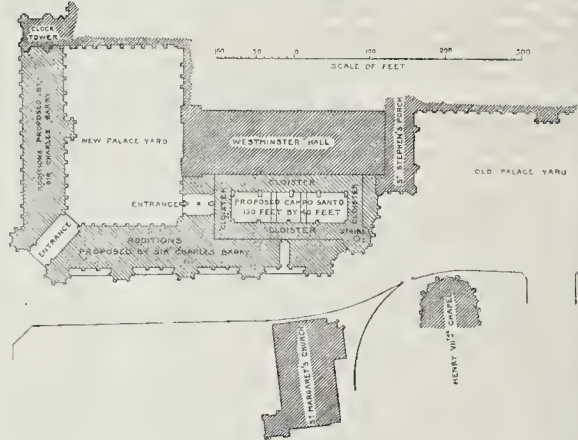

their own older wares, now scattered over the face of the earth, and much of which is to be found, not duly valued or appreciated, anywhere but in Japan. With our modern arbitrary art canon and recent "scientific educational" art machinery, we cannot criticise Japanese work in its detail of execution; but in the sketch, or group depicted on any Japanese article, in the "lozenges" that contain the "blazon" of an ancient clan, much will be found of deep interest. The realistic and servile copying of the beautiful Nature that the Japanese is so happily surrounded by, and which he so thoroughly appreciates, is not the sole forte of the Japanese artist; but to grasp the idealistic art, to adequately enjoy its beauties and depth of meaning, one must undergo a course of training, a long series of studious investigation into classical and native literature, into history, legend, poem, and folk-lore.

amongst them a little more. He was quite sure that many of them would be very pleased to comply for architects could not but feel their indebtedness to such men as were to be found amongst the members of the Institution. He should like to see an eminent architect like Mr. Waterhouse occupying their chair on such an occasion as the present.

WESTMINSTER HALL.

SIR,—The appearance of the beautiful drawing of the late Sir C. Barry's design for completing the new Palace at Westminster in the *Builder* of Jan. 24 shows evidently that the public are interested in the completion of the surroundings of Westminster Hall.

I venture, therefore, to inclose a sketch plan containing an idea for devoting the central space, called "The Hall Court," to the purpose of a "Campo Santo." I wish it to be con-

Suggestion for Devoting the Ground formerly occupied by the Law Courts at Westminster to a Campo Santo.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.

THE annual dinner of the members and friends of this Institution took place at the Holborn Restaurant on Saturday, the 26th ult., the Governor, Mr. George Plucknett, J.P., in the chair, supported by Mr. F. J. Dove, Mr. W. Scrivener, Mr. Hall, Mr. Thomas Stirling, and several other master builders and builders' merchants. The company numbered upwards of 130.

The Chairman, in proposing the toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works," asked all who were present to do what they could in support of so excellent an institution. Such support could, perhaps, best be given by making known the objects of the Institution to those for whose advantage it was established, now upwards of forty years ago. The annual income at the disposal of the directors was very limited, but, small as it was, it enabled them to do a great amount of good. There were, he hoped, many builders' foremen who would some day be masters, and he hoped they would not then forget the claims of the Institution, which had two classes of members, viz., ordinary members and honorary members. The first-named class of members subscribed to, and were entitled under certain conditions to participate in, the Provident Fund.

Mr. Bedford, the secretary, in responding, said that among the members of the Institution who had risen to be masters, was the late Mr. William Bangs. Since its establishment, the Institution had expended the sum of 5,539, 15s. in affording relief and granting pensions to infirm and aged members, their widows and orphans. In consequence, Mr. Bedford referred to the great services which had been rendered to the Institution by Mr. Plucknett as Governor during the last sixteen years.

Mr. George Groome, vice-chairman, next proposed "The Governor," Mr. Plucknett briefly replying.

The other toasts included "The Trustees," proposed by Mr. J. Derry, financial secretary, and coupled with the names of Mr. W. Scrivener, and Mr. J. Dove; "The Builders," proposed by Mr. Ross, and responded to by Mr. Hall; "The Officers of the Institution," proposed by Mr. Johnson, and replied to by Mr. Welch, treasurer; and "The Architects and Surveyors," proposed by the Chairman, and responded to by Mr. Thomas Stirling, who suggested that architects should be invited to come

considered an addendum to Mr. Barry's plans, and not in any way conflicting with them.

The grand idea of Sir Gilbert Scott to devote a large portion of Abingdon-street to the object I have in view will probably never be carried out. I therefore submit the scheme with greater confidence, because it can be initiated at once, and at no expense for purchasing the land, &c.

As far as I can gather from your pages, professional opinion is generally opposed to Mr. Pearson's proposal to cover and inclose the space between the flying buttresses as a stand for horses. This would be sacrilege!

The idea I submit does not in any way interfere with Mr. Barry's plan, except that it narrows St. Margaret's-street in order to obtain a more rectangular quadrangle for my suggested Campo Santo. This I propose to be 150 ft. by 40 ft., with a cloister about 20 ft. wide round it. This cloister might be two stories in height, and would provide accommodation for tablets, busts, and statues for the illustrious dead, whose remains would be deposited in the central space, or Campo Santo, for many years to come. Access could be obtained from New Palace Yard and St. Margaret-street, and from Westminster Hall, and a circular staircase would connect the two floors.

J. W. WALTON-WILSON.

* * * Of course, as will be seen, Mr. Walton-Wilson's plan involves setting the line of the new buildings parallel to Westminster Hall, and therefore producing that narrow strait in St. Margaret's-lane which Mr. C. Barry's plan was specially modified to avoid.

The Alexandra Home for Lady Students of Music.—We are informed that the American Elevator Company have been instructed to furnish one of their "Standard Hydraulic Elevators" for passenger service in this building, which is being erected in connexion with the Royal College of Music, as a home for those of the lady students of the college whose homes are out of London.

TREGOLD'S CARPENTRY.

SIR,—I am much obliged to your reviewer for pointing out some typographical errors that have occurred since the new edition of this work; these will all be corrected before any more copies are issued by the publishers.

With regard to the apparent error in "infraction," at page 50, upon which the reviewer has laid so much stress, I beg to say that it is simply the omission of the figure "4" before "s" in printing the equation of the second integration.

Your reviewer suggests that I "might have drawn the line at the calculus"; but in this respect I only followed the example set by previous editors and by Tregold himself, who used the "calculus" in several parts of the work.

Allow me to say that especial attention was paid to the revision of the "Tables of Scantings," every scantling being carefully considered; in some cases it was thought inexpedient to adhere strictly to the results obtained by the rule, but in general those results have been published with some allowance for contingencies.

In the references to other works the "page" has been purposely omitted, as many of them have gone through several editions, and it appeared to me that giving pages would in many cases tend only to mislead and confuse the reader.

E. WYNDHAM TARN.

TAXATION OF SURVEYORS' CHARGES IN COMPENSATION CASES.

SIR,—In the interests of surveyors, and also in those of owners whose property may be required by public bodies or railway companies, we think it right to bring to your notice the facts as to a compensation case in which we have been engaged on behalf of the land-owner, with reference to the unfair and needless manner in which the surveyors' charges have been taxed by Master Francis. In the early part of the year 1881 the Kingston and London Railway Company gave notice to take some twenty acres of land and good dwelling-houses, with large gardens, &c., situated at Wandsworth, and claim was sent in by us amounting to 42,561l. The case was taken to arbitration, and an amount of 34,500l. was awarded as compensation in March, 84, the business having been in hand nearly three years. This case required a great deal more consideration than is usual, in consequence of its dealing with building land, ground-rents, sovereignty, and consequential damage.

The railway company had five surveyors, all of whom gave evidence, and two counsel were employed for the company.

We acted as the claimant's surveyors, and our C. W. Lee was her arbitrator, and gave evidence for the umpire, being supported by Mr. Driver, Mr. Galsworthy, and Mr. Bousfield, who were all called and gave evidence.

The surveyors' charges were as under, viz.:

C. W. Lee (arbitrator) for valuations, reports, plans, and all other services extending over nearly three years, and attending on three days and giving evidence before the umpire, and several disbursements.....	4282
Driver, for valuation and report, and witness in support and giving evidence two days before the umpire.....	201
Galsworthy, ditto, ditto.....	201
Bousfield, ditto, ditto.....	201
Total.....	£886

The bills were taken before Taxing-master Francis taxation, with the following result:—

£. s. d.	
Lee was allowed qualifying fee.....	31 10 0
and two days' attendance.....	6 0 0
Bousfield, ditto.....	31 10 0
and ditto.....	6 0 0
Driver, two days' attendance only.....	37 16 0
(No qualifying fee)	6 0 0
Galsworthy, two days' attendance.....	6 0 0
(No qualifying fee)	6 0 0
Total.....	£88 4 0

There is an utter want of principle shown in the mode of taxation.

Mr. Lee, whose work extended over about three years, is only allowed the same amount as that given Mr. Bousfield, one of the supporting witnesses, and Mr. Driver and Mr. Galsworthy, who were in precisely the same position as Mr. Bousfield, were allowed one-sixth of the amount allotted to that gentleman.

The scale of fees allowed is also entirely inadequate, being less than one-tenth of the amount awarded, Messrs. Driver, Galsworthy, and Bousfield being charged on Ryde's scale, plus 3l. 3s. per m for attendance before the umpire, and Mr. Lee's charge being a moderate one for the amount of work done.

If the bills of claimants' surveyors are to be dealt with in this manner by taxing-masters, it will become necessary for the claimants to add their surveyors' charges to the amount claimed as a separate item of compensation, and these charges will have to be seriously considered by the tribunal sitting in judgment on the case.

LEE BROS. & PAIN.

"NON-ACCEPTANCE OF LOWEST TENDER."

SIR,—Observing some letters on the above subject in your valuable columns, it has struck me to suggest to builders, contractors, and, in fact, to all firms who are constantly giving tenders for doing certain work and for the supply of goods, that they should resolve to refuse to tender when it is stated in the specification "that they [the authority] will not bind themselves to accept the lowest or any tender"; and in order to accomplish this I would suggest the forming of an "Association" or "Defence League," with a large representative committee, to enlist firms willing to be members, and to organise branch leagues, so that every information could be gathered on any such tender in existence, and, if necessary, to bring their grievances before Parliament. With a combined movement of this kind, I am sure it would succeed in stopping such secret practices and favouritism as are known to exist. This is a matter I have often thought about, and I am willing to start an honorary movement of this kind if firms who would be willing to join will communicate with me, and if I find plenty of such support, I will ask you again to assist me by giving publicity to the movement.

WM. ANDREW WILLIAMS.

No. 4, Brighton-terrace, Foberry-road, Brockley.

THE ROYAL ARMS.

SIR,—“M. of M.,” “J. E.,” and other Scotch enthusiasts, are in error on the subject of what they call the national arms of Scotland. What they speak of are the arms of the sovereign,—individual, personal property. If the sovereign of the United Kingdom chooses when in Scotland, from amiable condescension to weak national vanity, to alter the arms as usually borne, he or she can do so: they are dealing with their own; but it is absurd of the Scotch people making claim to such alteration as a right, as though the arms belonged to them. As a matter of common sense, England, being the greater nation, the arms of its sovereign, as derived from Henry II., should take precedence when in combination with those of James VI., as both cannot be first. The arms of Scotland are the St. Andrew's cross; of England, St. George's cross.

P. E. MASEY.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

8,526, Locks for Railway Carriage Doors
W. H. St. Aubin.

The body of the lock-case is cast in one piece, to it is fitted the iron end. The body of the lock has circular bosses at each end working in circular holes, formed partly in the sides and partly in projections from the front. In place of the mainspring generally used, the bolt bears upon one end of a lever and is centred at about the middle of the lock, and the other end of the lever is connected to a spring. The great advantage is the replacing of the spring, which is likely to get out of order, by a device which, answering the same end, is simple and far less likely to get disarranged in working.

145, Fire-grates and Stoves. J. Bate.

The fire-grate is divided by a grating or partition, and the space behind is used for burning cinders or small coal whilst larger coal is consumed in the main portion of the grate. Thus a cheerful fire may easily be maintained. The grating may be replaced with a fire-basket with fine perforations, which answers the same purpose.

408, Spades, Shovels, &c. T. Parkes.

The piece joining the blade to the handle is made wedge-shaped, and is furnished with a double flange on each side. It fits into a wedge-shaped slot on the blade, and the flanges are then riveted to the blade.

164, Sash-fastener. F. Lea.

A curved lever is actuated by a projection over the lever of the ordinary sash-fastener, so as to bring a part of the fastener at right angles across the meeting-rails of the sash, from which position it cannot be moved from without.

2,123, Combination Tool for Gasfitters. G. Plumpton.

This is a modification of the ordinary gas pliers, with the handles widened out so as to receive a solid screwing die as near to the joint as possible. Square lugs on the die fit into corresponding holes in the handles, which again may be utilised upon the removal of the dies for turning an ordinary tap or receiver. If desired, cutting-tools in place of the screwing-tools may be substituted.

4,176, Constructing and Applying Blocks for Building. W. R. Cornell.

This is a method of constructing and applying blocks of concrete, &c., for building and other purposes, and for ventilation. The blocks are applied in forming air spaces or passages in the walls of a building through which foul air may be withdrawn from within the building by the action of the heat from the ordinary fires, and either be discharged into the outer air, or burned in the said fires as may be desired. The walls are built of concrete with a deep depression on one face, and these leave an open passage in the section of the wall which is utilised for the extraction of foul air, &c.

APPLICATIONS FOR LETTERS PATENT.

Feb. 20.—2,312, J. Dutterworth, Hot-water Supply Apparatus.—2,316, R. Wellford and Others, Sanitary and other Pipes.—2,315, J. Bewick, Roofing or other Lath or Wood Cutting Machines.—2,319, T. Normanton, Water-pipes and Flushing Cisterns to prevent bursting by frost.—2,323, G. Oulton, Soldering Irons heated by Gas-jet or Flame.—2,326, J. Smith, Mounting or Attaching Door handles.—2,340, A. Clark, Combined Truck and Ladder.

Bout, Manufacture of Tiles and other Articles from Plastic Materials, and in Apparatus for same.

London Sanitary Protection Association.—The report of Council for the year 1884, presented to the general meeting on the 28th of February, states that

"The total number of houses inspected for the first time by the engineers of the London Association during the year 1884 is 424. Of these, two, or '47 per cent., were found to have their drains entirely closed up, and no connexion whatever with the sewer; all the foul matter sent down the sinks and soil-pipes simply soaking into the ground under the basement of the houses. In 75 houses, or about 17½ per cent., the soil-pipes were found to be leaky, allowing sewer-gas, and, in many cases, liquid sewage to escape into the houses. In 56, or 13 per cent., the overflow pipes from the cisterns were led direct into the drains or soil-pipes, allowing sewer-gas to pass up them and contaminate the water in the cisterns, and in many cases to pass freely into the house. In 21, or about 50 per cent., the waste pipes from the baths and sinks were found to be led direct into the drain or soil-pipes, thus allowing the possibility of sewer-gas passing up them, instead of these pipes being led outside the house, and made to discharge over trapped gullies in the open air as they should be."

The Student's Column.

DESCRIPTIVE GEOMETRY. — V.

WE may wish to know the angle formed by the meeting of two hips or of a hip and a ridge; if we do not, the plumber will, when he makes the apron for that part of the roof. This is found by turning down the surface of the roof round any horizontal line belonging to it such as the eaves.

In our diagram we take as hinge of the rotation the eaves a^h, b^h , the apex d of the roof will move in a plane perpendicular to the eaves; we can consider that plane as an auxiliary elevation and draw thereon d^v and the arc it will describe in rotating round c^h ; the angle of the hips is, therefore, a^h, d^h, b^h . (See fig. 25.)

If it be the angle of the hip and the ridge which is required, the turning down of the roof surface is done as before, only we must remember that the ridge once on the turned-down surface remains parallel to the eaves. (See fig. 26.)

If you order ornamental lead at a great distance from the job, say in Paris where they have selections of highly artistic patterns, either

the architect or the Paris plumber will have to find from the drawings, plan, elevation, and section the exact inner angle formed at the meeting of the two roof surfaces.

In fig. 27 the plan of the eaves is a^h, b^h, c^h , the line $b^h d^h$ is the hip of the roof. If we intersect the roof by a plane perpendicular to the hip, the angle formed by the intersections of that plane with the roof on each side will be the angle required. The horizontal trace a^h, c^h of that auxiliary plane will be perpendicular to the plan of the hip, and if we make an auxiliary elevation on the vertical plane which contains the hip, we shall have the vertical trace a^v, c^v of our auxiliary plane perpendicular to the hip, the point a^v will be the apex of the angle required:

we have only to turn it down round a^h, c^h , hinge of rotation, and a^h, a^v, c^h is the angle formed by the roof surfaces at this hip.

We may have to draw on a roof a given figure; it may be some pattern produced with different coloured tiles, it may be the opening of a skylight. We shall study the most difficult case that in which the eaves are not parallel to the main elevation; this would happen for the side of an octagonal roof, for instance.

The method used consists in turning down the surface of the roof on the plan, the eaves serving as hinge of the rotation. Then you draw on the turned-down surface the figure you wish to represent and rotate back the whole of the surface comprising the figure drawn thereon to

ner position. The two following diagrams make the operation clear.
 The fig. 25 a plane P is given by its horizontal trace P^a and a point a thereon, of which plane a^b is given and its height equal to a^c is known. If we turn down the plane and its trace P^a, a will come to a^d; suppose mark on the turned-down plane a point b^e in you rotate the plane back to its former position, the plan of b will be b^d and its height be b^e b^f.
 In the fig. 29 we merely apply the preceding method of finding one point to the four angles

priced at 1s. 8d. per foot super; the 2-in. sashes and frames, double hung, at 2s. 2d.
 The prices of American pine joinery are given, and will be found useful, for the best of this kind of work is good, and is found to stand well; there is also a list of Swedish joinery.
 The cast-iron columns and girders are priced at a much lower scale than is usually given by price-books, the minimum of 8s. being given for town castings. This is really a low price; we think wrought-iron chimney hars at 30s. per cwt. very high, and the rolled joists are

Fig. 29.

square of which m-n is the side. Again, the wrought-iron welded gas or steam pipes are put at the gross prices given by the makers in their lists; we think this is high, even to include labour and profit.
 There is such an enormous number of prices contained in the work that it is impossible to do more than select a few as we have done. They are formed, it seems to us, on one basis, and, as we have already said, they are intended for the very best work and material and a fair profit added, so they must be used with thought, and the nature of the work being priced must be taken into consideration when they are used.
 There is an interesting chapter on sanitary work and drainage that will be found very useful to those who are not well experienced in these matters.
 The regulations and fees for hoards and scaffolds within the City of London form a useful addition, and also some notes as to rules necessary for the use of those desiring to obtain the sanction of the Metropolitan Board of Works to the erection of furnace chimney-shafts; additional law decisions are given, the list of patents granted is added to, and the book altogether is a very useful and complete one, containing, as it does, outside its enormous list of prices, a vast amount of useful memoranda and information for all those concerned in building operations.

Books.

Builder's Price Book for 1885. Originally compiled by WILLIAM LAXTON. Sixty-third edition. London: Kelly & Co., and Simpkin, Marshall, & Co. 1885.
 HIS old-established work, which addresses itself to the builder and contractor, rather than to the architect, is in bulk every year. We notice many additions to the last edition. The prices are on a very high scale, and are intended for the very best labour and materials. It is useful to see a list of prices that is added for ordinary contract work. For instance, the drain-pipes are priced at the gross on lists. The price of brickwork is now at 13l. 17s. 6d. per rod, inclusive of profit, this is too high for ordinary contract work; 2-in. four-panel square-framed doors are

square of which m-n is the side. Again, the wrought-iron welded gas or steam pipes are put at the gross prices given by the makers in their lists; we think this is high, even to include labour and profit.

MEETINGS.

SATURDAY, MARCH 7.

Association of Public Sanitary Inspectors.—Dr. J. W. Tripe on "Disinfectants and their Sanitary Uses." 6 p.m.

Clerks of Works' Association.—Visit to new buildings in Brook-street, Grosvenor-square. 3 p.m.

Edinburgh Architectural Association.—Visit to Corstorphine Church and neighbourhood.

MONDAY, MARCH 9.

Surveyors' Institution.—Adjourned discussion on "Less-should Enrichment." 8 p.m.

London Institution.—Mr. H. M. Statham on "Architectural Character and Expression." 5 p.m.

Society of Arts (Garden Lectures).—Mr. J. Hungerford Pollen on "Carving and Furniture." I. (Types and Fashions of the Wood-carvers' Art.) 8 p.m.

Inventors' Institute. 8 p.m.

Leeds and Yorkshire Architectural Society.—Paper by Mr. T. G. Jackson, of Oxford.

Edinburgh Architectural Association.—Mr. W. W. Maclean on "The Painter."

Society of Antiquaries of Scotland.—Five communications. 3 p.m.

TUESDAY, MARCH 10.

Anthropological Institute.—Rear-Admiral F. S. Tremlett on "The Sculptured Dolmens of the Morbihan." 8 p.m.

St. Paul's Ecclesiological Society.—Mr. Charles Browne on the "Ecclesiology of the Roman Catacombs." 7.30 p.m.

Institution of Civil Engineers.—Discussion of Mr. Froudeley's paper on "Locomotive Engines." 8 p.m.

WEDNESDAY, MARCH 11.

Architects' Benevolent Society.—Annual Meeting. 5 p.m.

British Museum.—Mr. W. St. C. Boscawen on "Assyrian and Babylonian Antiquities, III.—(The Palace, its Architecture and Ornament.) 2.30 p.m.

Carpenters' Hall, London Wall (Free Lectures to Artisans).—Professor A. B. W. Kennedy on "A Piece of Steel." 8 p.m.

Civil and Mechanical Engineers' Society.—Mr. C. S. Herthon on "Steel Guns." 7.30 p.m.

Manchester Society of Architects.—General Meeting. 3 p.m.

THURSDAY, MARCH 12.

Society for the Encouragement of the Fine Arts.—Mr. C. M. Campbell, M.D., on "Physiology in Art." 8 p.m.

Society of Arts (Applied Chemistry and Physics Section).—Mr. W. K. Burton on "Recent Improvements in Photographic Development." 8 p.m.

Society of Telegraph-Engineers and Electricians.—(1) Sir David Salomon on "Constant Electro-Motive Force in an Electric Light Circuit." (2) Mr. Andrew Jamieson on "Electrical Definitions, Nomenclature, and Notation." 8 p.m.

Parke Museum of Hygiene.—Mr. A. Wynter Blyth, M.R.C.S., on "Household Poisons." 8 p.m.

Society of Antiquaries.—8 p.m.

FRIDAY, MARCH 13.

Institution of Civil Engineers (Students' Meeting).—Mr. William Kidid on "The Blasting and Removal of Rock under Water." 7.30 p.m.

University College.—Professor C. T. Newton, C.B., on "Greek Inscriptions." V. 4 p.m.

British Museum.—Prof. J. F. Hodgkiss on "Medieval English Remains." IV. (Armour.) 2 p.m.

Royal Institution.—Sir Frederick A. Abel on "Accidental Explosions caused by Non-explosive Liquids." 9 p.m.

SATURDAY, MARCH 14.

Architectural Association.—Visit to the Hampstead Hospital and Messrs. Reed's Bottling Stores, Gospel Oak. Assemble at Hospital at 3 p.m.

Miscellaneous.

Presentation to Mr. E. R. Robson.—An interesting ceremony took place at the London School Board offices on Saturday last, in the presentation by the members of his staff of a token and address to Mr. Edward Robert Robson, late Architect and Surveyor to the Board, on the occasion of his retirement from that position. Mr. Lewis Wall was unanimously voted to the chair, and was ably supported by Mr. T. J. Bailey, the Architect, Mr. Andrew Young, the Surveyor, and other heads of the Department. The token consisted of a silver casket in the form of a Greek temple, supported by twelve pillars, the address, in the shape of a book, being placed in the top. It is of sterling silver, weighs 85 ounces, and was manufactured by Messrs. J. G. & E. Meyer, of Northampton-square, Clerkenwell.

Scottish Memorial to Archbishop Tait.—The Scottish Auxiliary Committee charged with the erection of the memorial to the late Archbishop Tait have concluded their labours, and the ceremony of handing over the monument to the custody of the Edinburgh University authorities took place on Friday, the 27th ult. The memorial consists of a colossal bust placed in a mural monument, 16 ft. high, which is built into the eastern facade of the Medical School Buildings,—this site having been chosen as that of the house formerly existing in Park-place in which the late Archbishop was born. The monument is designed in the Italian Renaissance of the "Cinque Cento" period, in harmony with the University Buildings, and consists of a pedestal about 5 ft. high, divided into three compartments, in the central one of which is the inscription. On the pedestal rest two columns of polished grey granite, with moulded bases and sculptured capitals in bronze. These support a full entablature, with sculptured panels in the frieze, displaying in the centre the mitre, crozier, and pastoral staff, and in the sides the Christian monogram, I.H.S., and the crest and motto of the Archbishop's family. The entablature is surmounted by a segmental pediment, in the tympanum of which is a bronze panel, in the relief, displaying two cherubs supporting an Italian shield bearing the arms of the See of Canterbury impaled with those of the Tait family. The bust, which stands upon a moulded plinth over the pedestal, and is set within a semicircular panelled niche, between the columns already described, has been executed in bronze by Signor M. Ragzi, London. The monument has been designed and executed under the direction of Dr. R. Rowand Anderson, architect, Edinburgh.

"The Buckingham Theatre."—A Committee of the Metropolitan Board of Works has had under consideration the question of the safety of the building known as the Buckingham Theatre, No. 153, Buckingham Palace-road. The "theatre" is about 107 ft. long, by an average width of 21 ft., and occupies the upper floor of a building, the ground-floor of which is used as a stable. The floor of the "theatre" is of wood, and the joists are not cailed. The approach is in Buckingham Palace-road, by two doorways, each 3 ft. wide, leading to an entrance vestibule, out of which is a staircase, 4 ft. 5 in. wide. The treads and risers of the staircase are of slate, 1½ in. thick, and the staircase is enclosed by wooden partitions. The total superficial area of the theatre is about 2,240 square feet. There are no fixed seats, but there is probably room for an audience of about 300 persons. The place was licensed for music in October last by the Justices of Middlesex, but it has not received the Lord Chamberlain's licence for the performance of stage plays. The Committee, after an examination of the drawings made by the Superintending Architect of the Board, and a full consideration of the circumstances of the case, reported that the building is totally unsuitable for use as a place of public entertainment, and it was resolved that the Justices of Middlesex and the Lord Chamberlain be informed accordingly.

The Sunday Opening of Museums, &c.—The Duke of Westminster and the Committee of the Sunday Society have issued invitations to a National Conference with authorities and officers of museums, art galleries, and libraries which have been open in the United Kingdom on Sundays. The Conference has been called specially for the purpose of directing the attention of Parliament to the results which have attended the Sunday opening of museums, art galleries, and libraries in the United Kingdom, and it is expected that representatives will be present from each of these institutions. The Conference will be held in St. James's Hall, on Wednesday, March 25th.

Building Progress in Sydney.—According to the Immigration Agent for New South Wales, there is little or no cessation of building operations in the Australian metropolises, where, during the past year, 521 buildings, including large warehouses, were completed, besides additions to 198 old premises,—numbers about equal to those of 1883. But the list for 1884 includes a larger number of extensive warehouses. "Any visitor must be struck by the large number of fine new structures, as well as by the number in course of erection. The work of construction has been considerably promoted by capital sent from England for investment."

Brighton Recreation and Health Society.

We have received the second annual report of this useful society, though its usefulness is apparently hampered by want of adequate support. One of the questions which has engaged the attention of the society has been the proposal to establish a public abattoir in the town. The society having collected a good deal of evidence bearing upon the subject, this was embodied in a circular, and copies were sent to every member of the Town Council. The circular was followed by a special appeal to that body, to take up the matter, and, as a result of this, the Sub-Committee has been appointed by the Council to report upon the whole question. The evidence obtained on the various points shows that, where established, the public abattoirs are a great gain to the locality, on the grounds of health, humanity, and public utility. Further attention has been given to the condition of some of the poorer districts of Brighton, and the society has again been represented in connexion with the sanitary cases before the Borough Magistrates. The increased power given to the Corporation officials by some of the sanitary clauses of the Brighton Improvement Bill will, the report says, lessen the need for the work of the society in connexion with the insanitary condition of the courts and slums.

Female School of Art.—The Duchess of Westminster presided at the annual distribution of prizes to students of the Female School of Art, Queen-square, Bloomsbury, on Monday last, the ceremony being held in the Prince's Hall, Piccadilly. The report showed that during the past year 208 students received instruction in various branches of art. Fourteen national awards were gained. Towards the fund for the extension of the school house the sum of 1,480 had already been received, and the adjoining house was now the property of the school. Some structural repairs and alterations had still to be made, and it was proposed to erect a building for class-rooms in the rear of the school. To enable them to meet these additional expenses, amounting to about 4,000, and to pay off the balance of the debt incurred for the purchase of the house (1,500), the committee appealed to the public for liberal subscriptions. Sir Philip Caultley-Owen moved.

"This is the opinion of this meeting it is of the highest importance that early possession of the new premises should be obtained, and for this purpose it is essential that the debt incurred to complete the purchase should be paid, and a further sum of 24,000 raised. In order to effect these worthy objects, the proposal to hold a grand bazaar is approved, and increased donations are solicited."

This was seconded by Mr. George Godwin, and passed unanimously, as also were the succeeding resolutions.

The Vital Statistics of the Peabody Buildings.—The vital statistics of the resident population of the Peabody Buildings afford trustworthy evidence of satisfactory sanitary condition. The birth-rate was equal to 44 per 1,000, and exceeded by 10·9 the rate for the whole of London. This high birth-rate indicates an age constitution of the population which should give a low death-rate. The recorded death-rate, after correction for the deaths of residents recorded in hospital, was 19·1, and was 1·2 below the general London rate. Infant mortality, measured by the proportion of infants under one year to births, was 138·7 per 1,000, and 13·7 below the mean rate in London. These figures are somewhat more favourable than those recorded in recent years. It is necessary, however, to point out that mortality statistics of improved or model dwellings are of somewhat doubtful value for comparative purposes. The inhabitants of such dwellings consist for the most part of a "selected" population, selected indirectly as being healthy, steady, thrifty, and respectable.

Incandescent Electric Lamps.—Messrs. Woodhouse & Rawson have just introduced what appears to be a marked improvement in incandescent lamps. One great trouble hitherto with such lamps has been with the platinum loops, which, being more or less fragile, have been very liable to be strained or broken when the lamps are being attached to or detached from the holder. The improvement to which we are referring consists in the provision of a "vitrite" holder, by the use of which there is no strain at all on the platinum connection. "Vitrite" is described as a vitreous material perfectly hard and incapable of fusion, except at very high temperatures. The new vitrite holder is adaptable to existing installations.

"Jamaica Coffee-House."—This celebrated coffee-house, in St. Michael's-alley, Cornhill, demolished. It was for many years headquarters of those who represented the big interest. The old lockers still remain, and were used by the City magnates of a past age. A new building is about to be erected on the site, from the designs of Mr. Banister Fletcher, the accepted contract being 7,173*l*. Record of the past will be kept by painted scenes, representing scenes which have taken place within the walls of the building, and the old City merchants.

Carving and Furniture.—Subject of the next course of Cantor Lectures at the Society of Arts will be "Carving and Furniture," by Mr. J. Hungerford Pollen. The course will consist of four lectures, to be held on March 9, 16, 23, and 30. Lecture I. will deal with the types and fashions of the carvers' art. Lecture II. will be devoted to the Renaissance; while the subject of Lecture III. and IV. will be the Age of Louis XIV., and that of their successors.

Hydraulic Door-Spring.—Messrs. Add Smith & Stevens, of Leicester-square, held at the Royal Institution Conversazione, on Friday evening, February 27, by request, a new hydraulic door spring, which attracted considerable amount of attention.

Mayorship, Hendon Local Board.—We had there were upwards of a hundred applicants for this appointment. The applicants were referred to a committee to report to the Board. We have not yet been advised of the result.

Hydrographic Surveying.—At the last meeting of the Institution of Civil Engineers of Ireland, Dublin, the paper read was by Mr. James Dillon, member and past vice-president, "On the patent hydrographic surveying and sounding apparatus used for the preparation of plans, sections, soundings, and charts of sea, canal, lake, estuary, and river beds; also for determining the rate of silting-up of same when necessary; and for the use of the mariner when navigating shallow waters."

Hydraulic Lifts.—The directors of the Employers' Liability Assurance Corporation, 84, King William-street, E.C., have instructed Messrs. R. Waygood & Co. to fix for them a direct-acting lift worked from the London Hydraulic Power Company's mains.

The Electric Railway at the Alexandra Palace.—The work of making the electric railway from Wood Green Station to the Alexandra Palace, which will be completed before the 30th of March inst., has been commenced, the contractors being Messrs. Wilkinson Bros., of Finsbury Park.

The New Buildings at St. Pancras Workhouse.—On the invitation of the St. Pancras Guardians, the Lord Mayor has consented to open the new buildings on the 13th inst. Mr. H. H. Bridgman is the architect of the buildings.

The Burns Memorial.—The bust of Robert Burns, which has already been placed in Westminster Abbey, will be formally unveiled on Saturday afternoon at four o'clock, when the Dean will be present.

Tenders for the erection of an infirmary at East Dulwich-grove, Champion Hill, S.E., for the Guardians of St. Saviour's Union, Messrs. Henry Jarvis & Son, architects, 23, Trinity-square, Southwark, S.E. Quantities supplied by Messrs. Franklin & Andrews:—

Burch (accepted)	167 0 0
Deacon	160 0 0

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 48, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.

"Mitre Cut" (we never set on information on important matters of that kind without name and address of writer)—B. & Sons.—E. E. W. & B. (Bank)—W. & R.—J. W.—E. F. H.—A. & Co. (no responsible use to the—L. Paris—Smith (no name or address given)—G. & A.—W. G. S.—G. A. H. (the comparison can hardly be made; the same work could not be carried in both materials. The cost of frame as material would be the lowest; the cost of working would be the highest, but really a goodly profit is hardly possible in granite)—J. A. C.—J. A.—P. (last week)—under G. H. (weekly)—C. J. T. (if you will send the MS. we will look at it).

All statements of facts (letters, notices, &c.), must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving public notices, &c., of our own volition.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests with the authors.

We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS.
SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS.
Six lines (about ten words) or under 0s. 6d.
Each additional line (about ten words) 0s. 6d.
Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Commission, Contract, Date by Auction, &c. may be obtained on application to the Publisher.

FOUR Lines (about THIRTY words) or under 3s. 6d.
Each additional line (about ten words) 0s. 6d.
PREPAYMENT IS ABSOLUTELY NECESSARY.
* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINIER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.
The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, but strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Reprints forwarded to the Office, 48, Catherine-street, Covent-garden, W.C. Free of charge. They will be forwarded if addressed envelopes are sent, together with sufficient postage to cover the postage.

TERMS OF SUBSCRIPTION.
"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, PREPAID. To countries within the Postal Union, 25s. per annum. Remittances payable to DOUGLAS FOURDRINIER, Publisher, No. 48, Catherine-street, W.C.

Sewage Treatment by Intermittent Filtration.

R. DENTON has taken advantage of an opportune moment for publishing a second edition of his work on "Intermittent Filtration,"* for the appearance of the Royal Commissioners' Report on Metropolitan Sewage Discharge has been the signal for re-opening the discussion on that much-debated subject, on which, if on anything, it may be truly affirmed *quot homines tot sententia*. Not that too much consideration can be given to so important a matter, on the effective treatment of which, as in the case of our own metropolis, the health of millions of human beings may depend; but very many of those who have joined in the debates on this question have apparently been unable to apprehend the distinction between a scheme of sewerage and the processes for the disposal of the sewage; hence acrimonious contentions as to the actual merits and expenses attending sewerage schemes in different localities, notably the Lower Thames Valley scheme, have been carried on under a confusion of ideas. Sewerage schemes must necessarily be governed by various existing physical conditions; sewage disposal is possible, and can be effected independently of those conditions. The former is an engineering question, confined to the best method of conveying and delivering the sewage at the lowest possible cost. The latter is complicated with the additional difficulty of satisfying social and sanitary requirements in which efficiency can only be secured at a seemingly disproportionate cost. It is comparatively easy to carry away from the metropolis its vast volume of sewage, but the difficulty commences when it is once clear of its boundaries, in determining how and where it is to be disposed of. From the recorded opinion of the Royal Commissioners, Mr. Denton's plan meets with their favourable appreciation, primarily on the ground that it makes filtration through porous ground the *principal*, instead of an incidental, process of sewage treatment; and after enumerating the objections which have been urged against his system, and the replies furnished by Mr. Denton, they express their own views in the following words:—

1. That the process has great scientific merit, and offers valuable practical advantages

for the disposal of sewage in situations where broad irrigation is impracticable, and where land suitable for filtration can be obtained.

2. That, however, it appears desirable where the area of land is considerably reduced, the sewage should be previously treated by some efficient process for removing the sludge.

3. That an arrangement of this kind would be applicable to the metropolis.

Intermittent filtration is explained by Mr. Denton to be "not crowding sewage continuously on porous land in the careless manner often adopted to get rid of sewage, but its concentration at regulated intervals on as few acres of land as will absorb and cleanse it without preventing the production of vegetation. It is by this means that the assimilative powers of growing plants are brought to bear on the fertilising elements of the sewage at the same time that the percolation of the sewage through the soil brings it in contact with the atmospheric air pervading the soil, and renders it harmless by oxidation."

In this it is distinguished from what is termed broad or surface irrigation, which consists rather in the distribution of sewage over as many acres as it will wet without supersaturation, having in view a maximum plant growth.

Three objections to the process of intermittent filtration were urged by the Rivers Pollution Commissioners, who, in consequence, hesitated to recommend its adoption. They were:—

1. That soils became after a time so loaded with sewage that their powers of absorption and percolation cease.

2. That the concentration of sewage for filtration on a small area is attended with greater nuisance than other modes of treatment.

3. That the cost of preparing the land is so great as to preclude its adoption.

Those objections have been replied to satisfactorily by Mr. Denton, who shows how, in practice, at Merthyr Tydfil and other places, the operations had been modified by the lessons learned in land under-drainage. Originally, Dr. Frankland, by whom the idea of intermittent filtration was first conceived, was of opinion that one acre of suitable soil, drained 6 ft. deep, would suffice to cleanse the sewage of 3,300 persons; but Mr. Denton subsequently reduced this proportion to 1,100 persons, and less, per acre, and instead of covering the whole surface of the land so utilised with sewage, he distributed it by furrows, so that the sewage might reach the roots of the plants growing on the ridges laterally through the soil, without touching their edible parts. He further pointed out that the area of land

necessarily differs with the various descriptions of soil, the extent of surface required depending on the capability of the upper soil to absorb, and of the subsoil to infiltrate the liquid, as well as on the depth to which the land may be thoroughly drained in order to provide the necessary bulk of filtering material. Mr. Denton claims for his process the advantages of:—

1. That when adopted separately it will, by minimising the quantity of land required, ensure the purification of sewage at the least cost to the ratepayer; and

2. When systematically adopted in combination with surface irrigation, it may be made the means of removing the greatest drawbacks experienced by the sewage farmer, and thus afford a tangible benefit to agriculture.

In illustration of his claim, Mr. Denton details the operation carried out by his firm in a dozen cases, varying in size and character, and with populations ranging from 50,000 to 3,000. It is not possible in the limits of a short article to enter into the particulars of the various instances cited, but the accounts given of the expenditure and revenue connected therewith fully bear out his contention that his system effects the object sought at the least cost to the ratepayers.

In Merthyr Tydfil the return obtained from 336 acres over and above the expenditure was 452l. 9s. 7d.

In Abingdon the whole of the farm was let for 4l. 10s. per acre.

In Forfar, after charging 4 per cent. on 4,000l., the purchase-money of the land, as well as on 1,500l., the expense of the engineering works, there was a net profit of 1l. 13s. 8d. per acre.

In Great Malvern the district accounts for last year show that there was a balance in favour of the farm of 162l. 15s. 1d., which was carried to the credit of the district rate.

On the other hand, at Watford, in Hertfordshire, there has not been the same financial success, owing, it is stated, not to any fault in the system, but to the careless mode in which it was carried out, checking the aeration due to the under-drains, and to the sewage itself having been applied without the required intermittency.

The cardinal points to be observed in the process are explained to be:—

1. The preparation and formation of the land which is intended to receive the sewage, with precision. Irregular surfaces and steep slopes are to be avoided even more carefully than clay soils.

2. Intermittency of application and regulation of quantity, the former being positively essential to secure a continued good effluent.

3. The under-drainage of the filtration areas

* Sewage Disposal: Ten Years' Experience (now fourteen years) in Works of Intermittent Downward Filtration. By J. Bailey-Denton. 1865. Second Edition, with Additions. London: E. & F. N. Spon, 125, Strand.

ould be laid out as carefully as practical science will suggest, so as to ensure drawing the liquid sewage down from the surface only through the prepared ground.

With a view to prove its financial soundness, a table is given showing the comparative expenses of land treatment and chemical precipitation, in the cases of Abingdon and Hallowstead on the one hand, and Aylesbury and Hertford on the other, from which it appears that in the last two towns the annual charge on the ratepayers is 1s. 7d. and 2s. 1½d. per head, while in the two others it is only 1s. 0½d. and 5d. per head of the population.

The chapter treating of experiences and results of sewage farming contains several facts which are not commonly known, especially that of the actual market value as compared with the chemist's value of sewage,—the former, owing to attendant drawbacks in the present mode of application, is less than ½d. per ton. Even with such a diminished value, Mr. Denton observes, the country has a valuable property, which it is its duty to preserve. "In England alone, exclusive of the metropolis, there are 13 towns which have a population above 100,000, 19 towns between 100,000 and 50,000, 178 towns between 50,000 and 10,000, and 549 towns between 10,000 and 2,000, and if only half of these towns with an aggregate population of 5,000,000 ultimately determine to utilise their liquid refuse by application to land, the annual quantity at disposal will be 305,000,000 tons, the value of which, at ½d. per ton, would amount to upwards of 300,000l. a year." How is it, then, that at the present time there are various sewage farms to be hired at rents less in amount than would be given for the same land without sewage? Mr. Denton's answer is, that it is entirely due to the adoption of the hap-hazard method of distributing the sewage, instead of a regulated flow of the exact quantity, neither more nor less than is absolutely required for the particular crop sought to be raised.

So far, then, the process of intermittent downward filtration seems to afford a practical solution of the disposal of sewage as far as combining efficiency with economy. Why, then, it will naturally be asked, is there any hesitation to recommend its adoption in the case of the metropolis? The Royal Commissioners evidently think well of it, though they have pronounced rather in favour of a combination of chemical with land treatment,—that is, of precipitation supplemented by application to land,—as the plan which offers the most feasible means of solving the difficulty. In support of their view they cite the recommendation of the Rivers Pollution Commissioners, of Dr. Letheby, and even of Mr. Denton himself, their own opinions being:—

1. That it would get rid of the chief objection to chemical treatment only, as the effluent, being thoroughly purified, would no longer be injurious to fish, while the land treatment of the already clarified liquid would, if properly designed and conducted, reduce to a minimum, if not do away with, any danger of contamination to subsoil waters.

2. That, though it would add considerably to the expense in the purchase and working of the land, and in the necessity for pumping at the outlets, a fair return of crops might be expected, and part of the expense be thereby reimbursed.

In the discussions which ensued at Captain Douglas Galton's recent lecture at the Society of Arts on the Royal Commission's Report, the opinions of the principal speakers on the subject were not in favour of any particular treatment of the sewage, but tended rather to the view that the best and cheapest plan in the end was to carry the sewage of the metropolis to the sea and bury it out of sight altogether. Such a conclusion, however, seems scarcely conducive to our claims to be considered either as a scientific or a practical nation.

Institution of Civil Engineers of Ireland.—At a general meeting of the members of this Institution, held in the Museum-buildings, Trinity College, Dublin, on the 4th inst., Mr. H. A. Ivatt, member, read a paper on "Breakdown Tackle for Railway Work."

NOTES.

T seems to be now generally believed that the Railway Rates Bills will be withdrawn. The supporters of the measures are both annoyed and astonished at the extent of the opposition; and it has been asserted by a railway magnate that "people have been stirring up traders and taking advantage of their ignorance to oppose the Bills." This is not very complimentary to Sir B. Samuelson, Mr. Agnew, M.P., Mr. F. M. Eden, and the host of practical men who have closely studied the question and explained it to the poor ignorant public; and we cannot but incline to the belief that the charge of taking advantage of the ignorance of the public has been laid at the wrong door; and the unanimity pervading all the meetings held to consider the subject proves unmistakably that the counsels of these gentlemen are appreciated and accepted by those to whom they are addressed. Lord Henniker's motion in the House of Lords last Monday evening for a copy of certain judgments of the Railway Commissioners led to an interesting discussion of the subject, and Earl Granville, who is a very extensive producer and trader, said that it must be obvious to every one that the railways were necessary to the producers, and the producers to the railways; and that whatever mode they might adopt for arriving at the end, that end would be one common to both interests, and that they should not be treated as antagonistic one to another. Much was said as to "terminals," "preferential rates," and other points dealt with in our article of last week upon this question, and the subject occupied nearly the whole of the sitting.

MR. FIRTH asked the Home Secretary on Tuesday last "whether he was aware that, under the working of the Metropolis Valuation Act, 1869, there had thus been an increase of nearly eight millions sterling of assessed annual value upon which the water companies were able to charge London consumers, and thus enormously increase their income without any increase of supply; and whether, as this year a further assessment of the metropolis was taking place, he would take steps to prevent the continuance of the system under which, in default of immediate legislation, the London water companies would this year be able to increase their income by 100,000l. a year, and the capital value of their property by more than 2,000,000l. sterling, at the expense of Londoners, and without in any way improving or increasing the water supply." Sir William Harcourt replied that, although it was true that water rates were founded in law on the net annual value, it was quite certain that a rise in the assessment was extremely likely to lead in the future, as in the past, to a rising in the estimate of the net annual value; and that he thought the continual increase in the charge for water, without any proportionate increase in the supply, a great injustice to the people of London. It certainly looks like it, to people who do not hold shares in water companies.

ON the same day, Mr. Dixon-Hartland put a practical question in the House of Commons as to the great inconvenience caused by the present postage-stamps being all of one colour. Mr. Shaw-Lefevre replied that he had given consideration to the matter, and that it was being considered by a Departmental Committee. The inconvenience, though seemingly a small matter, is a real one, and should be remedied.

THE Westminster Hall Committee resumed its sittings on the 9th, Mr. Shaw-Lefevre in the chair, and Mr. William Morris was called and examined by Mr. Dick Peddie, and gave evidence to the effect that he did not believe anything was necessary for the protection of the exposed wall, but that if anything were done it should be merely for protection. It was one of the views of the society which he represented that all additions to ancient buildings should be conspicuously modern. This is news to us. If the repeated declarations of the Society for the Protection of Ancient

Buildings mean anything, their view has always been that no additions at all should be made to ancient buildings. It is to be regretted that so much of mere doctrinaire views should be mixed up with and confuse the questions at issue in such cases. We observe that a timber and canvas representation of Mr. Pearson's design has been put up between the buttresses, the lower and the higher or double-storied cloister. It harmonises well enough with the buttresses, but that is not the question, or not the main question. The authorities have not ventured to put up a representation of the proposed mean building at right angles to Westminster Hall.

AT the meeting of the Chelsea Vestry on the 6th, the question of the competition for the new Vestry-hall came up; fifty-two sets of designs had been received, and it was recommended that Mr. H. A. Hunt be appointed professional assessor, with a fee of 100 guineas. To the question of a member, whether Mr. Hunt was an architect and surveyor, the Chairman replied that he "could not say." An amendment was proposed that the matter be referred back to the committee, and another member supported this on the ground that Mr. Hunt did not practise as an architect, and his name was not on any list of architects. The amendment was lost. We have every belief that Mr. Hunt would be an impartial judge and an entirely able one as far as the practical side of the question is concerned; but that is not everything, and we doubt if the appointment will satisfy the competing architects. It is not what has been contemplated by those architects who have resolved not to compete except when a professional assessor is called in. They look for the appointment of an architect of high standing, not of a surveyor.

A CIRCULAR letter from Captain Douglas Galton, on behalf of the Council of the Parkes Museum, notifies the fact that the results of the recent Mansion House meeting have enabled the Council, after discharging their liabilities, to secure a continuance of the lease, and to provide accommodation for the valuable addition which the Council of the International Health Exhibition have made to the Library. The chief remaining immediate wants of the museum are a curator to take charge and to explain to visitors the uses of the various exhibits, and the provision of a printed catalogue of the contents of the museum and library. The Council are desirous to provide the additional income necessary for these purposes, by extending the number of members or annual subscribers. We hope that many who understand the value of the objects for which the museum exists will rally round it and strengthen the hands of the Council to carry out their wishes for the future. The annual member's subscription is one guinea; life membership, ten guineas.

FOR some weeks past correspondents have favoured us with letters as to the right of persons, who have tendered for works, against the employer in relation to the acceptance or rejection of such tenders. There is no doubt about the law. In Roscoe's "Digest of Building Cases" it is thus stated, at p. 48,—“A person who invites, by writing or word-of-mouth, tenders for work, or for the purchase of anything, does not, by so doing, impliedly promise to accept the lowest or the highest offer, or to accept any one of such tenders. The notice to persons willing to tender is a mere proclamation that he who issues the notice is willing to receive and consider offers.” The authority for this statement is the case of Spencer v. Harding, Law Reports, 5 Common Pleas, p. 561, decided in 1870. The judgment in the case was delivered by the late Mr. Justice Willes, one of the most eminent of English judges, and has never been overruled. Unless, therefore, there is any language in the advertisement for tenders which can be construed as an undertaking to accept the lowest tender, the offer of the person who makes it can be rejected. Nor is this contrary to common sense; for it may well be that a tender may

be so low as to be obviously incompatible with sound work, or may be made by a person undesirable to be employed, and it would be absurd for an employer to be bound to accept his offer.

AS some of our readers are aware, a Bill has been introduced by the Chancellor of the Exchequer to make further provision for enabling Deans and Chapters to repair their cathedral churches. This is to be done by the establishment of a fabric fund of such annual amount as may be approved by an Order in Council. This fund will be a first charge on the revenues of the Dean and Chapter. The Bill also gives the Ecclesiastical Commissioners a kind of control over the expenditure of the funds; also enables the property of the Dean and Chapter to be at their option transferred to the Ecclesiastical Commissioners, who would then pay them a fixed annual income. As a matter of fact, this Bill does not make any serious alteration in the law, for Deans and Chapters are bound to repair the fabric of the cathedral churches which belong to them. It is, indeed, a kind of supplement to the Act of 1840, which organised the duties of Deans and Chapters in regard to canopies, and so forth, and it makes the state of the law in regard to repairs clearer, and causes the care of the cathedral church to be the first duty of a Dean and Chapter. The proviso by which a Dean and Chapter may hand over their property to the Ecclesiastical Commissioners is rather a step towards disestablishment, because it points to a way by which the fabrics of our cathedrals may be preserved as national property without the intervention of a State clergy.

THE statement, attributed to the South Staffordshire Coal Owners' Association, that "1884 offers the first instance of a decrease in the national output of coal," is incorrect. The output of 1878 was less, not only than that of 1877, but also of that of 1876. The figures were:—1876, 133·3 millions; 1877, 134·6 millions; 1878, 132·6 millions, of tons. The output in 1879 was 600,000 tons less than that of 1877. There is no doubt that a diminution of 3·7 millions of tons in 1884 as compared with 1883, if it be verified, is serious enough; but it is better not to exaggerate. It is now twenty years since the late Professor Jevons, in a work on "the coal question," startled the world by a calculation founded on the rate at which the output of coal had annually increased during the decade for which statistics were available. The output of 1854 was 64·6 millions; that of 1864, 92·8 millions of tons; and Mr. Jevons estimated that by 1871 it would amount to nearly 118 millions of tons. It reached 117·35 millions; and this accord between forecast and fact, coupled with the inefficient report on the subject made by the Royal Commission "on matters relating to coal in the United Kingdom," had no doubt much share in causing the rise of price from 9·8 shillings per ton in 1871 to 20·9 shillings per ton in 1873; a rise which, however, was accompanied by a rise in quantity won from 117·35 to 127 millions of tons. That definite relations exist between output, demand, and price, is indisputable. But there is much reason to conclude that price is the resultant, and not the cause, of proportionate demand.

IT is gratifying to note that not only was the vote of 70,000l. for the purchase of the Duke of Marlborough's Raffiello agreed to in the House of Commons last week by a large majority, but that it was agreed to, although after a long conversation (rather than debate), with more of enthusiasm and more generally expressed faith in the real value of a good picture than we generally meet with in art debates in the House. There were the usual eccentricities,—there was the member who "had had the advantage of seeing the Louvre," and who for some freak of logic connected with that memorable visit, wanted the French to have the picture; there was the member who wanted it hung in the tea-room, that honourable members might estimate its value,—and so on; but in the main there seemed to be a

general conviction that a great Raffiello was a precious possession; and considering that there can never be any more of them than there are now, the price is not exorbitant. There are, as was suggested, private collectors who would have given more than that to possess the work,—

"Bequeathing it, as a rich legacy,
Unto their offspring."

THE ruins of a Temple of Juno have been recently laid bare at Civita Lavinia, not far from Rome. Fragments of sculpture have been discovered which formed part of a square block of marble. The fine character of the work leads to the supposition that if not actually Greek, they were executed under Greek influence. There have also been found the head of a goddess and six torsos of warriors clad in armour, also a head of Jupiter in very good preservation. The excavations are still in progress.

THE Rector of St. Bartholomew the Great, Smithfield, appeals for help towards purchasing the premises adjoining and covering the ambulatory and sanctuary, which are offered for 6,500l., with a refusal till April 3. The rector and churchwardens have no funds for such a purpose, and if the money cannot be raised, the site will pass into the hands of the speculative builder, and the sanctuary will remain, as it is now, with a factory over it supported by iron columns standing within the altar-rails. St. Bartholomew's, as every one knows, is one of the most interesting fragments of ancient architecture in London; and we hope that money will be raised for the purpose of removing the permanent disfigurement and danger to which it will otherwise be subjected.

THE Hellenic Society held a meeting at No. 22, Alhemarle-street on Thursday afternoon, Professor C. T. Newton in the chair, when Professor Ramsay read a paper on pottery discoveries on the Ionian coast. The finds in pottery in this part of Asia Minor have been very few and far between, and the work is all archaic. Professor Ramsay inclines to think that the disappearance of any remains of pottery at an early stage may have been owing to the predominating influence of Attic art, and that terra-cotta statues took their place. Among the few objects that have been found, however, were some ornamented fragments of great interest, as showing unusual forms of decoration, and a complete vessel discovered by Mr. Ramsay, and believed by him to be Phocæan. This has a very unusual shape, and is decorated by horizontal cylindrical rings of various colours on the lower part, and a kind of trellis ornament above, with "metope" spaces between, on which faces with long hair are painted, the hair curled round at the extremities in a sort of conventional ornament. The prominent features of the ordinary fragments of pottery found on the Ionian coast, as at Myrina, are bands of red painted on the natural buff-colour of the clay. In the discussion it was suggested that much more light might be thrown upon our knowledge of ancient lines of commerce by the study of even the ruder remains of pottery, which passed from land to land in ships, and even the material substance of which was a record of their locality.*

THE death of Mr. Louis Haghe deprives us of one of our most versatile and accomplished architectural draughtsmen. Mr. Haghe was educated as an architect, but forsook the practice of his profession for the more congenial work of illustrating old buildings, devoting himself principally to those of his native country, Belgium. His views of the town-halls of Bruges, Courtrai, Ypres, are well known, and were rendered popular by being reproduced in lithography. Mr. Haghe was for several years in partnership with the elder William Day, and, as the art director of the

* The meetings of the Hellenic Society would probably be better attended if each meeting were called by a card announcing the agenda. People do not bear in mind monthly meetings always, especially when they have no notice of what is to be done.

firm of Day & Son, did much towards improving the taste of the public. David Roberts's "Holy Land," Sir M. Digby Wyatt's "Treasures of Industrial Art," and other important works, were among a number issued by this firm. Mr. Haghe was a man of genial disposition, and retained his facility of hand almost to the eve of his life, and it was only last year that he resigned his position as President of the Water Colour Society.

BUILDING STONES.*

WHATEVER opinion we may hold on the vexed question of architectural evolution, whether we accept or not the theories of Professor Semper which have lately been brought to our notice, I imagine there would be but little difference of opinion among us as to the fact that the earliest habitations of men constructed *ad hoc* were made of wood. Where naturally-formed caves existed, affording shelter from the elements, and a secure retreat from wild animals and still wilder men, these would doubtless be resorted to as dwellings; but where such habitations did not exist there can be little doubt that the material which was most easily manipulated would be used for the construction of huts, in preference to that which required more laborious efforts to adapt it to the purpose. In some countries a timber architecture survives to the present day, as in Japan, and in other parts of the world, but as a rule, as men advanced in intelligence and skill, they could not fail to contrast the ephemeral and destructible nature of their timber dwellings with the solid and lasting properties of the various rocks and stones which nature has so lavishly provided in nearly all parts of the globe. It is a trite remark that the architecture of a country or district is largely influenced by the nature of the building materials found ready to hand in the immediate neighbourhood, and in those parts of the world where stone is not abundant a brick or terra-cotta style has been evolved. But where stone existed we may be quite sure that as soon as men settled down into communities and began to abandon nomadic existence, they would speedily devise means to utilise so lasting a material for purposes of shelter and defence. The probability is that, having before their eyes many examples of naturally-formed caves, men would first of all increase the number of such dwellings by boring into the rock, and every one knows that rock-cut chambers, whether they be called temples or tombs, are among the earliest specimens of architecture which have been discovered. There is, however, no necessity to assume that rock-cut buildings must have been anterior to those erected of blocks of stone. We know what an effect the weather and time have upon rocks, so that large blocks are perpetually being split off, and these accumulate in enormous quantities in any billy district. Thus stone may have been used for building purposes long before any means of quarrying it existed, and the character of the earliest stone erections which are known to us points to this having been the case. As far as can be judged from the few remains which have come down to us, the method of the primitive stone builders was the same everywhere, their work being characterised by great size and great simplicity. The difficulty of cutting stone into blocks of a portable and manageable size was far greater than that of moving the largest and heaviest blocks, because the primitive builders had an ample quantity of manual labour at their command, but very few cutting-tools, and those of a rude character; and this seems to me quite sufficient to account for the colossal nature of such ruins as those of Mycæne, Tiryns, &c. No doubt, a considerable amount of artistic skill is shown in the carving of some of these Cyclopean masonry, but it must be borne in mind that implements for carving could be made much more easily than tools for dividing huge masses of very hard stone. The durability of the early stone buildings depended partly upon the climate and partly upon the nature of the stone, and this was a matter of accident, for the most valuable characteristic of any building-stone would be its proximity to the place where it was to be used, and no selection of one kind of stone

* A paper by Mr. John Slater, B.A., read at the meeting of the Architectural Association on the 6th inst.

before another would be attempted. But, as civilisation advanced, and various cities began to vie with one another in the elaboration of their buildings, the stone of certain localities became widely known, and, with the spread of luxury and the desire for excessive ornamentation which characterised the age of the Roman emperors, the rarest and most costly marbles and other kinds of stone were obtained at vast expense from the furthest limits of the known world. The suitability of a stone to resist the climatic conditions to which it would be exposed was, probably, never thought of in early times, and it is an extremely fortunate thing for us moderns that in so many instances the early efforts of the stone-worker's craft were embodied in a material which has proved itself almost impervious to the attacks of time. The liability to decay when exposed to the weather is the most important point for consideration in selecting building stones, and, as this depends upon the nature of the stone itself, we ought to know what this is before deciding upon any building-stone that we propose to use. It would be manifestly utterly impossible in the course of a short paper to attempt to classify or describe the numerous kinds of building stone that are now in use in this country, and I shall confine myself to a few practical remarks upon the three kinds which are chiefly used for buildings, viz., granite, sandstones, and limestones. There is a word that used, I think, to be more frequently used than it is nowadays, and that is "freestone," which is quite without signification as to the real qualities of a stone, as it simply means a stone that can be worked, and includes both limestones and sandstones; in fact, it is one of those delightfully vague pieces of nomenclature which are rather plentiful in all the branches of practical architecture.

In the first place, it is very desirable that we should have a clear idea of the difference that exists between the two great classes into which rocks are divided by geologists. These are the stratified or sedimentary rocks, and the unstratified or metamorphic, the former having been produced by aqueous agency, the latter by igneous. Now, I dare say nearly every one here has watched the sands of a seashore after the tide has receded, and has noticed the number of little runnels which drain off the pools that have been left in hollows of the sand by the tide. These tiny streams gradually wear out channels for themselves in the yielding sand, and you may notice how the small particles of sand are gradually deposited some distance from the point whence they were rubbed off. Or, to take another instance, it sometimes happens during a heavy rain storm that the street gullies get stopped up, and you may see how all the fine particles of granite, earth, and what not have been washed away from the centre of the roadway, and are deposited on both sides of the stopped-up gully. Now, it is precisely these simple operations of water magnified a thousand fold that have originated nearly all the building stones which we now use. Ages and ages ago aqueous action was busy eroding various parts of the crust of the earth and carrying off the eroded particles and depositing them at the bottom of some sea or lake, the heavier particles being, of course, deposited sooner than the lighter ones, the particles consisting of sand, gravel, mud, clay, and so on; and in process of time layers upon layers would accumulate, vast changes would take place, and these same particles, according to the pressure to which they were subjected and to various chemical changes that they underwent, would become,—the sand, a sandstone; the gravel, a conglomerate; and the mud or clay, shale or slate. But the layers, or laminae, would still be distinctly visible under the altered circumstances, and these layers enable us to tell what the natural bed of the stone is, and these rocks thus formed by the ordinary sedimentary agency of water are called sedimentary or stratified rocks. But when we examine lava or any matter ejected from a volcano we see no such laminae in it. The materials have all been fused together into one mass, and in many cases rocks thus formed have burst through other stratified rocks. These rocks are, therefore, called metamorphic, or unstratified rocks, and are produced by igneous agency.

1. Of the igneous rocks granite claims our attention first, partly because of its hardness and durability, but chiefly because of its antiquity as a worked builder's stone. The columns, obelisks, sarcophagi, and other monumental remains which have been found in such

numbers in Upper Egypt, owe their preservation partly to the dryness of the climate, but mainly to the fact that they are worked in the hardest granite, the inscriptions on which, being so accurately cut and sharply defined, have enabled us to reconstruct faithfully all the features of a civilisation which dates from the earliest antiquity. This Egyptian granite was quarried chiefly in the neighbourhood of Syene, the modern Assuan, and it must have been worked on a very extensive scale when we consider the numerous specimens that exist not only partly hidden under the sands of the desert, but also in almost all the principal cities of the South of Europe, Rome possessing no less than twelve Egyptian obelisks. The most remarkable of these are monoliths, such as the column supporting the statue of St. Theodore at Venice, the obelisk of Luxor in Paris, and Cleopatra's Needle on the Embankment; but there is a great probability that many of the columns which now form part of the churches in many Italian cities were quarried, carved, and polished in Egypt, because we know how fond the enterprising Mediaeval republics were of carrying off the art treasures of the East to adorn their own cities. Granite is a stone of extreme hardness, so that it is impossible to work it into small and intricate mouldings, and, therefore, in those countries where it is plentifully distributed, and forms the staple building stone, the architecture will always be of a somewhat severe and massive type. I dare say many of you have travelled in Brittany, a most interesting and easily accessible district for a short foreign tour, and although you will not find the charming lightness and the play of artistic fancy that are so fascinating in the churches of Normandy and on the banks of the Loire, yet to my mind there is a quiet grandeur and breadth of effect in the simple massive character of the Breton architecture that are most impressive. And when you get a city like Aberdeen or St. Petersburg, almost entirely built of granite, the effect is undeniably grand.

Granite is one of the oldest of rocks geologically, and is of igneous origin, consisting in the main of quartz, felspar, and mica, with minute quantities of numerous other foreign ingredients, which, according to their nature and the proportions in which they occur, cause endless varieties of texture, colour, &c. Granite is not extensively distributed in England, the principal quarries being in Devon and Cornwall, and at Mount Sorrel, in Leicestershire. The latter granite is practically a syenite; that is, the mica is replaced by hornblende, and it has a very pleasant, warm, rosy tint.* The Cornwall granites vary very much in their composition. Scotland is rich in granites, the red of Peterhead and the grey of Aberdeen being the best known, and the pink granite of the Isle of Mull is now being largely worked. When chemically analysed, the preponderating constituents of granite are found to be silica and alumina, and when we come to examine the causes of decay in stone, we shall see that this is the main cause of its durability. As a rule, no signs of lamination are visible, and consequently it is not so important in the case of granite as with other stones that it should be laid on its natural bed; but wherever distinct signs of lamination are seen, then it should always be laid on its bed. But I shall have to recur to this point further on. You have probably all remarked in any very old specimens of granite, that it has somewhat of rough weather-worn appearance, and this shows that, hard and impervious as it is, certain constituents of its composition are decomposed by the action of the weather: these are the felspar crystals to which the red granite owes much of its beautiful appearance, and, therefore, if granite is required for an extremely exposed situation, the grey will probably be found the most useful. You may distinguish the felspar crystals in granite by their laminated glassy appearance, and by the fact that they can be scratched with a knife, while the quartz crystals resist this. The specific gravity of granite is 2.66, and the weight of a cubic yard is as nearly as possible two tons.

2. Building stones of the Sandstone Group, which is widely distributed over the United Kingdom, are of aqueous origin, mechanically formed, of varying geological age, from the old Red Sandstone of the Devonian system, to the Kentish rag, which lies at the base of the Cretaceous system. Sandstone is chiefly com-

* It is this stone that is used so extensively in the manufacture of artificial stone by the Victoria Stone Company.

posed of grains of quartz united by various kinds of cementitious material, either siliceous, ferruginous, or calcareous, and it is mainly upon the nature of this cementing substance that the suitability of the stone for building purposes depends. Occasionally immense pressure under heat has been the only consolidating cause. Some varieties are extremely hard and close-grained, and some are very coarse; sometimes the stone occurs in thick beds, sometimes in thin, and sometimes it is so mixed up with pebbles as to be unfit for architectural work. The colours of the sandstones are also very varied, ranging from red through brown and yellow up to almost pure white, the chief colouring agent being iron. From the composition of sandstone it is less liable to be affected by the weather than limestone, but still great care in selecting a sandstone is required, as the evil results of using inferior qualities are sadly apparent in Chester, Carlisle, and Durham. I can only mention a few of the principal sandstone quarries in England, but I must strongly caution you on one point,—that is, if you want to be particular about a stone, never rely only on the name of a quarry, as the quality of stone varies very much in the same quarry, and it by no means follows that because a certain quarry was producing an excellent building stone two years ago it is doing the same now. A personal investigation at the quarry is always desirable. In Yorkshire, the Bramley Fall stone, which is a fine-grained combination of quartz and felspar, joined by an argillio-siliceous cement, is good and durable.

The stone from Aislaly, which is used in Whithy Abbey, proved very durable, and this building was noticed as a good instance of preservation of sandstone by the Commission which sat in 1839, for the purpose of deciding upon the best kind of stone for the new Houses of Parliament. Elland Edge, Park Spring, and Gatherley Moor, used for the Doncaster Town-hall, are also well-known Yorkshire quarries. In many of the Yorkshire quarries in the neighbourhood of the coalfields the stone lies in a series of comparatively thin beds, from which are taken the well-known York flags. In Northumberland are the Heddon and Kenton quarries, the stone from which much resembles the Bramley Fall; in Lancashire, the Longridge Fell, much used in North Lancashire and for Preston Town-hall; in Derby, the Darley Dale; and in Durham, the Stenton Quarries, the stone of which was used in the round keep of Barurd Castle, may be mentioned as having supplied excellent stone for buildings in their respective localities. Manley, in Cheshire, is supplying the red stone with which Chester Cathedral has been partly restored, and Pocklington, in the same county, supplies a stone of very similar quality. Hollington, used in Trentham Hall and Crumpwood, in Staffordshire; Grinshill, in Shropshire, yielding extremely large blocks; Hadley, in Worcestershire; and Calverley, in Sussex, all supply a fine grained sandstone of first-rate quality. Some of the Kentish rag stone, which is a calcareous sandstone, quarried in Maidstone and the neighbourhood, is, if carefully selected, excellent for building purposes, and it compares very favourably with other kinds of stone in price. At Craigleith, near Edinburgh, is a quarry of beautiful light-coloured fine-grained sandstone, to which that city owes its striking appearance, and which has also been largely exported.

The chemical composition of sandstones varies considerably, but they generally contain over 90 per cent. of silica. The weight of a cubic foot averages about 140 lb.

3. We now come to the Calcareous Group of building stones, or limestones, which, like sandstones, are of aqueous origin, but formed organically or chemically, instead of mechanically. Whereas sandstone is composed mainly of the sedimentary deposits of inorganic matter, limestone is largely, and in some cases almost exclusively, formed of the stratified organic remains of living creatures of low organisation, such as starfish, coral animals, and molluscs. Limestones range from the carboniferous to the lower tertiary geological age, and may be classed for building purposes as crystalline, magnesian, and oolitic. The crystalline limestone generally exists in the form of marble, and as such is used for ornamental purposes mainly in this country, so that it scarcely comes under the category of building stones. It is, however, widely distributed over England, and is found in numerous varieties of tints, so that for decorative purposes it can be used with admirable effect as a contrast to other kinds of stone.

The Derbyshire, Devonshire, Perbeck, and Irish marbles are now becoming more extensively used for ornamental work; but it should never be forgotten, however tempting it may be to adorn the façades of modern buildings with beautiful variegated marble columns, that the constitution of the material is such that it will not stand if exposed to a smoky atmosphere.

The magnesian limestones or dolomites are amongst the best building stones in this country. As a rule they are slightly crystalline, composed in the main of carbonate of lime and carbonate of magnesia with a little silica. At Mansfield, however, the red magnesian limestone has so large a proportion of silica,—nearly 50 per cent.—that it is difficult to decide whether to call it a sandstone or a limestone, and you must always bear in mind that *ceteris paribus* the silica in a stone determines largely its durability.

These magnesian limestones acquired a greatly increased reputation through the report of the Commissioners in 1839, who recommended that the stone from Bolsover Moor should be used for the new Houses of Parliament. This stone, or one very similar, was used in the construction of the choir of Southwell Minster in the twelfth century, and it is still in good preservation. The stone of Roche Abbey, near Bawtry, has proved very durable, and in the main the magnesian limestones have always stood well in country districts, although at Doncaster and York the reverse is the case. But the present Houses of Parliament, which were built out of Bolsover Moor, but of Anston stone, are a striking instance of failure, and I shall endeavour to show later on why these stones are not suitable for London. The colour is generally a yellowish brown or red.*

THE SHORING OF BUILDINGS.

This was the subject of the fourth of the "Free Lectures on Matters connected with Building," delivered under the auspices of the "Carpenters' Company." The lecture was given by Mr. Thomas Blasbill on the 4th inst. After speaking of some of the various ways in which structures become insecure and require temporary support during repair, Mr. Blasbill continued:—

Next to a knowledge of the ways in which structures become insecure is the question of the methods of making them temporarily safe. Shoring of some kind must generally be employed, and it is important to employ the right kind in the right way.

In the great majority of cases it is not necessary to carry any material portion of the weight of any wall or building. Still less is it required to lift it or to force any inclined wall back into the upright. These last are operations of a very peculiar and exceptional kind. We generally want to stop the present mischief by providing some firm and sufficient resistance to any continued tendency towards falling over. The following headings will cover all these cases:—

1. The flying shore, which carries no weight, but is generally a trussed beam, placed horizontally between two buildings in order to prevent one or both of them leaning over the vacant space between them.
 2. The raking shore. An inclined prop also used to keep a wall from falling outwards, but which will carry some dead weight if applied carefully for that purpose.
 3. The strut, or dead shore, used only for carrying weight, and generally placed under eaves or floors.
 4. The needle, a short beam supported at the ends by struts and used to carry a short length of walling.
 5. Framed systems of shoring and centring used under arches to carry the dead weight of heavy structures during the rebuilding of them.
 6. Shoring used in combination with some mechanical power for forcing walls back into an upright position.
- In using any of these contrivances we cannot be too much impressed with the necessity for proceeding gently, so as to avoid all jarring or shock to the building. Shoring is not an affair of sledge-bammers, but should be quietly put in place and made tight up to its work with wedges, so as not to injure the structure. It could also be fixed so that it can at any time be eased, and finally removed without any damage to the building.

The remainder of the paper, with some notes of the session, in our next.

violent shock; and, lastly, it should be so arranged that it will be well out of the way of any work that has to be done while it is in its place.

A flying shore (see diagram) is the best contrivance for preserving the position of a wall that is simply in danger of falling over. The assistance that such a wall requires is usually extremely slight. A horizontal beam is fixed across a street or across vacant ground, each end being carried on a short piece of wood that goes through a plank which is fixed upright against the wall. The beam is braced against these two pieces, and has straining pieces secured to it, to form abutments for the braces, which are stopped on the wall-pieces by cleats. The beam is tightened up at one end by wedges. We shall see how all these parts are used in relation to the raking shore.

Flying shores can be made of ordinary timber up to a span of between 30 ft. and 35 ft., for longer spans timber of extra length must be used, or the beam must be scarfed. In such cases, great care is necessary to stiffen the beam and to wedge it tight, but flying shores can be supported and stiffened by connecting them to others above or below them, or at a few feet distance, or by taking upright posts up from the ground. When the shore has to be removed, the wedges can be loosened, and the upper braces taken away for a few days if it is desirable to test whether the building has been made secure by the works that have been done to it for that purpose.

A flying-shore placed across a street is usually put to support one house against an opposite house that is supposed to be firm. But when deep excavations are being made in the street the houses on both sides may be supposed to require support from each other, and this is the case when one house in a row has been taken down and the houses left on each side of the gap require mutual support. It is usually supposed that the flying shore should be made stronger,—perhaps twice as strong,—when both houses incline to fall as when only one of them is inclining. But, if each house is exerting a thrust equal to one ton against the shore, the one will simply counteract the other, and the strain upon the beam will be the same as if one house only was pressing with the force of a ton against another house that was standing firm.

In considering the raking shore, we will go back to the illustration which Professor Kerr gave us of the relation between the beam and the truss. If we have a beam that is fully loaded in the centre we may draw two lines from the point where it is loaded to the two points of support, and if we remove the two upper gusset-shaped pieces outside these lines, the beam will still carry its load. If we remove the remaining substance of the beam, except these two lines strong enough, we have two rafters in compression and a tie in tension, and these will carry the load. If we provide two good abutments and remove the tie, the rafters alone will carry the load. We will now go a further and final step and remove one of the rafters,—that which remains is a raking shore. In order that it should support even the smallest load, it is necessary that, in addition to the abutment at the base, it should have some sufficient resistance at the top to supply the place of the opposite rafter. If there is no such resistance, the load will bring the shore down, describing a curve struck from the foot of the shore. There must first be something to shore from; and, secondly, something to shore to. What such a shore will carry when properly arranged may be accurately calculated according to its degree of inclination. It will carry most weight when it slopes least.

As a matter of practice, the raking-shore is not generally used to carry heavy weights, but to afford such moderate support to a wall or building as may resist its tendency to incline out of the upright. Heavy weights are carried by dead shores and needles. The first thing is to get a solid foundation to start from. If the ground is soft or loose it may be rammed; if very bad, a floor of planks or stout timbers may be laid down. If vaults or areas exist close to the outer face of the wall, you plant your shore beyond them, or go down to the bottom of them, or use any solid wall you may find between them. When a wide excavation for a sewer is being made in a street, the houses may be shored from whole timbers laid across the street, as well as by flying shores from

house to house. It is generally sufficient to take up a part of the paving and lay the sole piece on the ground below it with the necessary inclination towards the building.

It used to be the practice to merely plant as many single shores or props as seemed necessary in the ground, to insert the upper ends for a few inches in the parts of the wall that seemed to need them, and to wedge them tight into these holes. The present practice is to observe the part of a wall that needs a shore (or if the whole wall be inclining, to fix on several places a few feet apart), and there to put up shores, as I shall describe.

I have said that you must have something to shore to. Such defective walls as we constantly see are not fit to have a prop put to them in any careless way. For, if the wall is settling and continues to do so,—ever so little,—after a raking shore is put, the shore, having no firm resistance at the top to supply the place of the opposite rafter, will be brought down by the weight and will push in the wall. The more the shore slopes out of upright the greater is the danger of this accident. I have seen it happen to one of the unbraced 9 in. walls that I have described, which fell inwards upon the chamber floor and the store floor it.

When a flying-shore is made to incline so that its foot comes down on a lower building the danger of injury to the lower building is very considerable.

The safest place for fixing a raking-shore in front of a building is against the end of a party-wall, where most old buildings are insufficiently bonded. There the party-wall gives the necessary resistance, and the same may be said of other cross and return walls. If the part to be supported is between such return walls the points of support must be fixed near to the under side of the floors, which will offer sufficient resistance.

The mode now adopted for applying the shore to the wall is to provide a long plank called a wall-piece fixed upright against that part of the wall which needs support. Pieces of wood, called pins or joggles, are passed through the plank and made to project 4 in. into the wall, a half brick being removed at each place where the head of a shore is to come in order to admit the joggle. The wall-piece must be carefully fitted to the face of a wall that has strings or other horizontal projections, by packing or otherwise.

It is usually necessary to put more than one shore from the same sole-piece, so that as many as three or four may be made to support the joggles at different heights of the wall-piece. The outer ones may be fixed as "riders" carried on short pieces of timber. Thus, instead of propping a wall at irregular points by several shores having independent foundations, and acting independently against the wall, we have one strongly-framed compound shore, which may be repeated at intervals in the length of the wall as may be required.

As to the manner of fixing the shore, having been cut to fit in its place, is set on the sole-piece, and the top, which has been cut with a couple of horns to clip the head of the joggle, is brought up to it. It is dangerous to drive up the foot of the shore with a big hammer, as that would certainly give severe shocks to the building, and probably make the shore too tight. It requires to be just brought well up to its place, and no more: with this object a crowbar is put into a notch cut in the beel of the shore, and it is then gently levered up until it is felt to be tight. It can then be secured by iron dogs, so that, should the shore become slack, or be subjected to any shock, it may remain fixed at both top and bottom.

In fixing a rider the short piece of timber to form the foot is first set on the sole-piece so as to lie against the back of the shore; the rider is next made to rest on a pair of oak wedges, and is gently brought up so as to clip the joggle by driving the wedges. The feet of the shores are fastened together by hoop iron, which is wrapped round them and well nailed; if necessary the foot of the outer shore might be cut with a very short tenon and dropped into a mortise in the sole-piece. It is the common practice to connect the rider and the shore by nailing stout boards in one or more places across each side of them, which are continued to the wall-piece, the whole system thus becoming a strong piece of framing in a triangular form. Solid timber might be used instead of the boards, but these are easily fixed and are sufficient for ordinary cases. The cleat that is put above the joggle should

be very securely fixed, and may be let into the wall-piece if much strain is expected. It is usually nailed and, practically, has very little to do.

As to the dimensions of timber used in shoring there is a common practice of using deals, which, from their thinness, bend aside as soon as any weight comes upon them. When half-timbers are used there is less strength from the same cause. The square stuff from 5 in. by 5 in. to 9 in. by 9 in., is the best material for shoring, particularly as there is much chance of accident from a side blow or from the pressure of wind.

Fir is the best timber to use on account of its straightness of grain, cheapness, and lightness when being moved.

The way in which raking shores may be employed to carry dead weight is shown in the operation of removing a column from the arcade of a church. The shores, two or four in number, and perhaps used together with struts and needles, are placed opposite to each other, so that the indirect action of each of them against the part supported may be counterbalanced. In Viollet-le-Duc's "Dictionary of French Architecture" some examples of this are given.

The action of raking shores is a question which those acquainted with mathematics may study with advantage. The whole question of shoring and underpinning has recently been dealt with in a book published by Batsford, High Holborn, price 4s. 6d. It was written by the late Cecil Haden Stock, an earnest student in architecture, who managed to do this very useful piece of work at an unusually early age.

The various ways in which the dead shore or strut is useful need not be catalogued. As a temporary support for girders during the rebuilding of a wall, or during the replacing of a column, it is in common use. I have seen such struts fixed by simply driving them into their place with a sledge-hammer, which very seriously shakes a building. They should be wedged up at the bottom, driving the wedges very gently, and stopping as soon as the strut is made tight. The timber should be solid and sound. One sometimes sees three or four deals lashed together, and made to do duty as a strut. It should be better known that the strength of a column or strut depends very materially on its thickness or diameter, and that three deals, however firmly you may fix them together, are very far short of the stiffness of a post of solid timber of the same dimensions. The utmost care must be taken to see that the strut is set on a solid foundation. A soft subsoil, old vaults, or cesspools must be searched for, and a good sill of timber used to start from.

We now come back to our old friend the beam, pure and simple. The "needle" is a short beam loaded at the centre, and usually carried at each end by a strut. It should be of good, sound, and solid timber, and if it is over necessary to use a combination of deals, they should not be laid flat upon each other (as is often done), but placed edgewise, bearing in mind that a 9 in. by 3 in. deal so placed is three times as strong as the same deal laid on its side. Wrought-iron rolled joists are now very often used as needles, for they only require a hole of 4 in. in width, instead of 10 in. or a foot.

The illustration shows the common operation of putting in or replacing a bressummer. You first strut up the floors, not trusting to the bottom floor without examination. Put some timbers in the window openings, and support any balconies or projecting parts. Raking shores are then put to steady the upper part of the house, and the needles are passed through holes under the solid parts of the walling. If any of the struts cannot be fixed sufficiently near to the front the needles must be made longer, and stiffened by strong raking pieces from the foot of the struts. The bressummer is then passed into its place, bedded, and the brickwork over it made good in cement.

It is often necessary to make a large opening in a front or cross wall, high up or in a position where struts cannot be easily fixed. Then a number of square frames may be made, best of iron, consisting at top and bottom of short needles joined by uprights at the ends. These are put through the walls in the place of ordinary needles, the bottom pieces resting on the brickwork, the tops pinned up tight to the wall above. The brickwork along the wall is then cut away of depth sufficient to admit the girder, and after it is made right the frames may be removed and the wall below may be cut away to form the opening. In the same way

an arch may be turned over an intended opening by making the temporary frames of height sufficient to suit the rise of the arch. There is a good illustration of this plan in the *Builder* for 1859.

In order to place or to change the column at the angle of a building, a needle is put through the corner diagonally with other needles and raking shores, of which two should stand close to the corner. When a raking strut is put under a bressummer, catching it with a bird's-mouth, remember that there is the same danger and need of good resistance at the top, as in the case of a raking shore, and that the more nearly upright the strut is the safer and stronger it will be.

Whether the formation of an extra basement beneath a building shall be a dangerous or a safe operation depends chiefly on the way in

trench close behind them, another trench being made between the shores and the wall for the purpose of underpinning. In that condition of insecurity the wall was left with the rotten work cut out and several courses of underpinning left still undone from Saturday to Monday.

You may be surprised to hear that no accident happened,—more surprised, perhaps, that I tell this story,—for, if it proves anything, it proves that such work will stand. I am sometimes met by a man whom I have warned for doing something of this kind with the triumphant announcement that nothing has happened. One can only reply that it ought to have happened, and this leads me to make the following observation. There are many things done in dealing with old buildings which may or may not be dangerous,—one can only judge by the

which the shoring is arranged and maintained during the work of underpinning. The most obvious course is to secure the walls of all adjoining buildings by flying shores and by raking shores planted on the old level of the ground, deferring the excavation until the underpinning is completed. This is executed in intervals along the face of each wall and needling all parts that require it. The mass of earth that has afterwards to be excavated is thus made to support the shoring and the timbering of the shafts until the adjoining buildings are made secure.

One of my illustrations shows a curious specimen of shoring, of which a record happens to have been kept. A party-wall, the lower part of which was split and ruinous, had to be underpinned, and raking shores were applied to it. These stood upon soft "made" ground, with a

result. The thing is an experiment. What shall we say of it? I say it is risky. Let me offer that most useful word for your careful consideration. I do not find it in the dictionary, yet I can count over twenty words in the column where it ought to be that will never be of the least use to any of us as long as we live!

It is never worth while, for the sake of a saving in trouble, or even in cost, to run risks that are plainly to be seen. All prudent constructors go a great deal further than that. From a sense of risks that are not obvious, or that may only arise at a distant time, we usually make all kinds of beams strong enough to carry three or four times the greatest weight they are expected to bear. Columns are made of ten times the strength that might seem to be necessary. Provision is thus made for contingencies, and yet accidents sometimes happen in spite of this caution.

ON GREEK ARCHITECTURE.*

The heaviest works of shoring that we have dealt with are connected with failures in the walls and piers of our old churches and cathedrals. I have found the towers of ordinary village churches, with walls 5 ft. thick, threaten to fall to pieces, because the inside or core of the walls was made up of dry, loose materials at would run out of the cracks like sand out of a bag. Raking shores, and good wall-pieces were to be put against them simply to keep the outer casing of stone steady while the cracks were cut out and some solid stonework introduced bit by bit. In the case of large central vaults the openings between the four great arches are filled with strong framed shores, and raking shores are put at the angles, until piers and arches are rebuilt. The shoring of the tower of Grosmont Church, Moomouthshire, carried out under Mr. J. P. Seddon, and very good example, is illustrated by my drawings and a photograph which he has lent me for this lecture. This tower, sighted, above the arches, about 800 tons, the weight of a cathedral tower will be ten times as much as this. Thirty-five years ago I saw with interest the enormous shoring that carried the tower of Hereford Cathedral while its piers were rebuilt. In such a case a deep and solid bed of concrete is first laid under and around the tower, the defective parts have to be surrounded with a jacketing of masonry to keep the outer casing of stonework together, and prevent the bursting out of the crushed rubble work in the core. Strong frames of the largest timbers are built up, carrying the centres of the great arches. All the walls of arches near the tower are shored up, and great part of the shoring must be made to move, bit by bit, as the stonework is renewed. The largest amount of shoring ever used has always seemed to be insufficient. I exhibit a photograph of the shoring put by Sir Gilbert Scott under one of the tower arches of St. Alban's Abbey, not to carry it, but only to form a moderate amount of support.

The operation of restoring a wall to the upright is not often undertaken. We have here a drawing of that used 155 years since in forcing back the transept wall of Beverley Minster 4 ft. A very interesting operation of the same kind was carried out at St. Alban's Abbey 60 years since, where strong frames of timber were fixed in the nave to receive the wall as it was forced into its place by machinery placed inside the building. If any one has occasion to undertake any of these grand operations, he can be no difficulty in his ascertaining, by inquiry, full information as to what has been done before. References will be found in a book on shoring that I have named.

I will venture to add to this lecture a few observations on shoring done in other materials than wood. If you walk round Westminster Abbey or look at the newly-exposed side of Westminster Hall you will see in the great flying buttresses specimens of shoring in stone, such as was done hundreds of years ago, on the grandest scale and in infinite variety. Between the western towers of Lincoln Cathedral there is a flying shore in stone of 14 ft. span, and only 11 in. deep. It forms a flat arch, the rise of which is barely 15 in. The tower of Salisbury Cathedral has on every side of it double raking shores built up behind the outer architecture of the lower parts of the church. At Salisbury and Wells Cathedrals, and at some other churches, very curious arches, acting as flying shores, were added to prevent the piers of the tower arches from yielding under their load. In the deep cuttings of the Metropolitan Railway lines flying shores of cast-iron have been very extensively used. All these are well worth our study, even if we only have to prop the front of a common bonse, and such study ought to sweeten our work. I own that I should feel more hesitation than I do in addressing you on this subject if I thought that every error and omission I may make could lead to permanent mischief. But I comfort myself with the belief that every one who may be hearing what I say will take all opportunities of studying the subject in actual execution, and thus correcting his wrong impressions by an appeal to that great foundation of valuable knowledge,—the experience of practical work.

Proposed International Exhibition in Edinburgh.—A committee has been formed in Edinburgh with the object of holding an international exhibition in that city in 1886.

We have now glanced at the principal buildings which remain to us at Athens. We should not, however, have an adequate idea of their effect without an allusion to the exquisite colours which nature has infused upon the marble of which they are built, of which, however, the surface is itself, except where the sea air has caught it, is as perfect as the day when it was finished. There is a small proportion of iron in the constituents of the marble, invisible when fresh, but which in time produces the most mellow tones of ochre and of amber imaginable.

But this is not the colour which the ancients saw and admired. No doubt much polychromy was used, but within due limits. How far it was allowed to appear on the works in marble is very difficult to determine. In some of the Greek works which were executed in common stone, and, I believe, then always coated with a very fine stucco, as at Ægina, the colour was probably applied pretty freely, and considerable remains have been so found. But not only our natural feeling would be outraged if marble were so spoiled and obscured by the paint-brush, but there is this absolute fact. In all the principal buildings, and nowhere more so than in the Erechtheum, the joints are made as fine as possible. There could be no object in doing this if they were to be obscured by paint. Moreover, in the columns the drums are, with the slightest exception possible, made of equal stones, so that the joints range on the same level. This, again, would not have been done had they been hidden, for it is no easy matter to select serviceable stones on Pentelicus. That the columns and general architecture were in some way toned so as to subdue the raw new white is most probable, and that some colour of greater force was introduced in the soffits and shady portions is also likely. How these limits could have been secured is very difficult to imagine, but we may, at any rate, feel sure that it was done in exquisite good taste and harmoniously.

The genius of Gothic architecture aims principally at subdivision and a flowing harmony throughout, connecting the members at the top of a design with the base. The Greek aims more at contrast, providing a sufficient mass for the support, and cutting it sharply off by the entablature; in fact, the one is arcuate in its principle, the other is truncate. The brilliant sunshine of Greece must have had much to do with the actual proportions and details employed. The powerful reflections from the pavement served to supply an adequate half light for the columns and even the sculptured ornaments of the internal porticoes of the pronaos and posticum. Again, the cast shadows of the columns upon the colles, or that which fell upon the columns themselves from the architrave or the broad shafts of the Doric capital, produce an effect which we can little understand from copies executed here under the influence of our paler sunshine. The echians of the Doric capital may seem in our copies ineffective, but it is not so under a brilliant sun, when every square inch of the surface has a delicate gradation arising from the light and shadow playing upon the subtle curvature of its profile. If, under any circumstances it should be required to be reproduced in this country, some carefully-studied modifications of the original form would be required. The way in which the shadow of the cornice is broken upon the channels of the triglyphs and the metopes, if sculptured, gives a subdued richness which is more lovely than superfluous ornament. The marvellous accuracy of the workmanship is another reason for the excellence of the effect. The gradations of shadow are not haphazard, but can be followed in the mind as to cause and effect. When the sun glances upon the columns carved with shallow flutes, each of them towards the shade side deepens in intensity until we come to the part fully in shade.

Much depends also upon the profiles of the mouldings. In these we not only feel the refinement of the artists who designed them, but also their scientific knowledge of form. There are no jerky curves, as we find in Roman and most modern work; but, for instance, in ogee curves, the line passes from the sharpest curvature of one part through infinite gradations to absolute straightness at the point of

* Continuation of a lecture by Mr. F. C. Penrose, M.A., delivered to the students of the Royal Academy on the 27th ult. See p. 334, ante.

contrast, and then recovers its contrasted curvature by degrees. Compare the Roman method of two arcs of uniform curvature meeting against one another in opposite ways.

In these curves the technical skill of the workman went parallel with the discoveries of the geometer. At the time of the greatest development of the architecture, the mathematicians had begun to investigate the sections of the cone; or, indeed, it might be that the artists were using them practically, whilst the geometers were speculating on their properties, we find continued examples of curves of parabolic and hyperbolic section, and occasionally, but not so frequently, elliptic. There seem to have been other geometrical curves, ovoids, and conchoids used in the outlines of vases; but in architecture the conic sections seem to have been used exclusively, and they are sufficient for all its wants. The hyperbolic especially has the advantage of variety and gradation. This curve can be selected so as to have within the space of a few inches the sharpest possible curvature and practical straightness, or any desired gradation. Consequently it became very suitable for the echians, and for the delicate hollows of the upper cornice. The shafts of the columns have also a hyperbolic outline, simple in the Doric, but in the Ionic composed of three contrasting curves, the long delicately-curved shaft, of which the convexity or entasis is not intended to be apparent. Growing out of this is a more divided but shorter curvature outwards under the necking of the cap, and a spreading curve also like a tree-root, where the shaft springs from its base. In modern work this refinement is often omitted, to the great inferiority of effect. In Greek work of the best period, the circle is rarely used in profiling the mouldings. I know of but one instance of a continuous moulding, namely, the cymatium on the pediments of the Parthenon. In that case its absence of gradation was, I think, specially aimed at so as to produce a quiet effect above the varied sculpture which adorned the pediments.

Occasionally, indeed, the torus mouldings of the bases of Ionic and Corinthian columns are circular curves, but elliptical shapes are more common. You will see on a diagram (Fig. 1) the difference between the ordinary Roman base moulding and the Greek; the example here is taken from the Choragic monument of Lysicrates. On the same paper are two cymas or ogee mouldings,—one a Greek example with the gradation of curvature referred to above, and the other a Roman character, which is formed of two circular arcs.

Fig. 1.

The Ionic volute is of sufficient importance to have suggested many methods of drawing it. Vitruvius, in a passage somewhat difficult to interpret, shows that in his day it was produced by a system of centres and circular arcs, and much ingenuity has been expended upon the contrivances. The volutes of the Erechtheum and other good Greek examples will not adapt themselves to these jerky expedients. I have a diagram of a volute drawn by continuous motion on the principle of the equiangular spiral, a curve which cuts the radius always at the same angle. This, however, although the curvature is faultless, does not fit the Greek example. I was led to try another method from the observation that there is usually a hollow in the centre of the eye of the volutes into which could have been fitted some kind of instrument suited for the purpose. This hollow was doubt-

less afterwards filled up with a suitable plain or sculptured boss. The great convenience of such a contrivance would be that the workman having always the generating instrument at hand could at any time verify his work. The small instrument referred to takes the shape of a spiral having equidistant convolutions after the first turn, and, therefore, not itself the volute. It is called the spiral of Archimedes, because its geometrical properties were investigated by him. It so nearly resembles another spiral called the involute of the circle that it may in practice be used instead, and this spiral is generated by unwinding a string from a cylinder. Carry this one step further and unwind a string from the spiral of Archimedes or the involute spiral and we obtain a curve which has all the characteristics of the Ionic volute.

I have tested the volute generated by the little instrument referred to, and the approximation with the Greek examples is most remarkable. To obtain any other line of the convolutions of the fillets of the volute nothing is necessary but to turn the instrument a little about its centre and tighten it again.

One of the great secrets of the perfection in Greek architecture arises from the harmony of proportion which exists not only in the main elements, but also among the subordinate details. That this was so was felt by all attentive observers,—but the rule by which these harmonies were produced for a long time eluded research, and sometimes encouraged unprofitable speculation.

The secret was revealed to Mr. Watkiss Lloyd some years ago, after a careful study of the Parthenon and all the monuments of the best Greek time, of which there were measurements which could be depended upon. It was published by him as an appendix to Professor Cockerell's beautiful work on Bassæ and Ægina. There are some diagrams which illustrate his main points (Figs. 2 to 6). The coincidences

low numbers, and must form part of a scale of harmonics belonging to the particular building. The favourite relations are those wherein there is a difference of unity between the numerator and denominator, such as $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots, \frac{9}{10}$;

dimension on the horizontal line on the top of the scale, incline the rule, which is held from the left-hand lower corner, so as to touch it, and its edge will point out all the permitted relationships, amongst which there would be considerable choice (Fig. 15).

THESEVS.

Fig. 4.

between the actual measurements and the theoretical deductions are so close that, especially in the Parthenon, a divergence of one part in 400 would be in most cases rejected. Moreover, as you will see, the relations must be between

and, of course, sometimes equality, as in diameters of columns. In addition to this there is the sequence peculiar to the building which, in the Parthenon, is a system of ratios, having a difference of 5 between the numerator and denominator, namely, $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}, \frac{4}{5}, \frac{6}{5}, \frac{7}{5}, \frac{8}{5}, \frac{9}{5}$.

The length and breadth of the general plan is the first consideration.

In the Parthenon on the top step this is $\frac{2}{3}$. In the Theseum on the bottom step the same proportion.

Then we look to other members naturally correlative, as verticals and horizontals, solids and voids, breadth and height, and find them proportionate:—

Height of column..... : breadth of front :: 4 : 9
 Height of front from top step to apex..... : breadth of front :: 7 : 12

The height of the column (as vertical member) to joint height of steps, entablature, and pediment is found to be thus in different temples:—

Parthenon	9 : 10
Sanium	7 : 8
Bassæ	6 : 7
Rhampusæ	5 : 6
Theseum	4 : 5

There is also almost always a simple relation between the height of the column and the entablature taken together with the steps, as shown on several of the diagrams. Figs. 7 to 14 show the proportionate heights of a number of entablatures to the height of the columns, the latter being supposed to be all reduced to the same apparent height.

The space occupied by three columns and their two intercolumniations was frequently proportionate to the height of the columns,—in the Parthenon it is exactly equal.

The list may be carried very much further, and even amongst the smaller details; as an instance, in the Parthenon, of one of these, the thickness of the horizontal cornice (fronte) is to the total frize as $\frac{1}{3}$.

The effect of a law of this kind is by no means to take away the initiative of the architect, but it had the effect of steadying, as it were, and giving unity to the design. It can be applied with very great ease, and is applicable *mutatis mutandis* to a design in Renaissance, or even Gothic architecture. The main dimensions have first to be approximately chosen, according to the requirements of the case. Then the length and breadth, &c., adjusted so as to have aliquot parts, and in this there is considerable room for choice. Then, when the diagram peculiar to the building has been settled, a diagram may be prepared with lengths proportionate to the different ratios. If the question be to find a term having one of the permitted affinities to a given dimension, set off that given

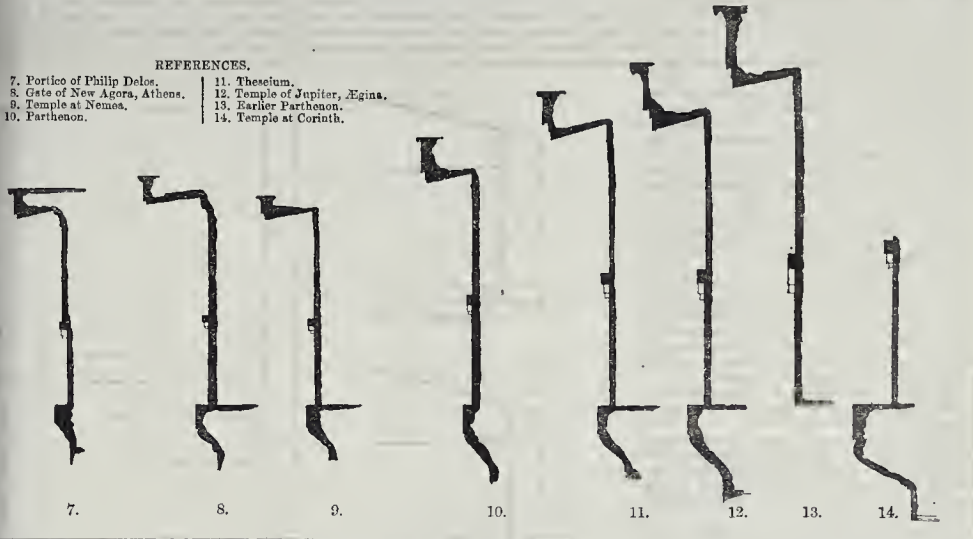

But however carefully proportioned and accurately worked, this Greek architecture would not have been so perfect as it is had not certain optical adjustments been added, which show that the architects were men of extreme refinement. They had noticed that straight-sided columns appeared hollow in the middle, and therefore applied a delicate swelling; and, to counteract this, So delicate is the effect that the departure from the straight line in the Parthenon does not exceed $\frac{1}{100}$ of the column height. Then it was noticed that if the columns were erected absolutely perpendicular they would appear to lean outwards, and they gave to the axes of the columns, and also to the faces of the superstructure, a delicate pyramidal inclination. The axes of the columns are made in the Parthenon to incline from the perpendicular $\frac{1}{100}$ of the whole height. The effect of this is to give a sense of repose and solidity to the whole structure, and it imparts a certain amount of richness also. But this was not all. In a design of whatever kind one part acts upon another, and the apparent direction of any line may be deflected by the neighbourhood of oblique lines. As an instance I point to a diagram where two straight-sided columns are made one to look hollow and the other to look bulged in the middle by the contrasting curves drawn near them. In the same way the included lines of a pediment when we look at it near the angles (especially of a flat pediment, where the angle does not exceed about 14°), the horizontal cornice at each of these points appears deflected, and as the eye passes from one angle to the other there is a very considerable result of apparent deflection. To remedy this the Greek architects gave a considerable amount of convexity to the horizontal lines, which was also shared by the stylobate, because generally the columns were made of equal height. This optical correction at first was made to the fronts only, where the cause operated, and we find it so confined at Paestum, but afterwards generally it was applied to the flanks also.

The amount in the Parthenon is a rise in the centre of the front of about 3 in., and on the flanks of about 4 in. It is also found at Athens in the Theseum and the Temple of Jupiter Olympian, and in the Propylæa, but with this variation, that in the Propylæa, where the step is cut by the ascending roadway, it is found in the entablature only. It is also found in many other temples in other parts of Greece.

These adjustments which I have pointed out

all evidences of careful thought bestowed on the architecture, and are worthy of our attention; for many circumstances will continually arise which may call for adaptations more or less analogous. The harmony which results from their application cannot be questioned.

Let us, in conclusion, for a moment consider the lessons may chiefly be learned from Greek architecture. Last Friday you heard from one well qualified to insist upon it, that one of the earliest points for the student to aim at was refinement. It is impossible to study Greek architecture deeply without advantage in this respect. I suppose no one will question that our earliest master in this quality was the late Professor Cookerell. Another point of great moment which Mr. Bodley called your attention was the economy of ornament. The Greeks never littered their works all about with foliage or sculpture, but reserved it as nature does for important positions, introducing broad masses of plain work for repose. A work executed with the Greek feeling, and with the smallest possible addition from the sculptor's or carver's hand, is always noble. The contrary condition when carving is largely applied without the masses being properly cared for never produces more than a momentary approval. The Erechtemion shows us that the spirit of Greek architecture admits of the greatest variety that can legitimately be desired. No true Gothic building has more. Its different levels, its side porches placed just where the internal plan demanded them, and several other features testify to perfect liberty of general arrangement. But not the less was the architect careful to use the severest symmetry in balancing those effects which judgment demanded. It was not assigned, as so many modern buildings are, for the purpose of looking picturesque, but of being true to the requirements of its plan. No doubt, in the architecture which we received on the eighteenth century the convenience of the plans often suffered from an idea of rigid uniformity, which the study of Greek architecture has shown to be a mistaken one. Let us work while there is time that the twentieth century may not receive from us a system of architecture running, as it were, to riot and disorder from a much more objectionable and usually mistaken misinterpretation of the Gothic.

Queensbury.—A window in memory of the late Mr. W. Foster, of Queensbury, and Hornby Castle, has just been erected in Queensbury Church, from the design of Mr. Thomas Camm, and executed by Messrs. R. W. Wingfield & Co., Birmingham. It illustrates the under-mentioned subjects:—"Abraham, at the command of God, leaving Mesopotamia for the promised Land," the "Offering of Isaac," and "Abraham receiving the Blessing of Melchizedek."

WESTMINSTER ABBEY.*

Of the exterior as it was originally, it is difficult now to form a correct idea. It was found to be in a perilous state of decay in the commencement of last century by Wren, who began the rearing of it throughout with Oxfordshire oolite of a somewhat pinkish tint. At the same time, as I have before remarked, he pared down the mouldings of the parts which he left, so as to render it now almost impossible to recognise their original form, while by exposing a fresh surface this process has given the finger of decay a second bold upon the stone worse than the first.

The details also when renewed were strangely altered. This work was continued by his successors; so that there is very little indeed of the exterior which can be said to be the untouched work of its original builders (that, of course, with such a climate as London has acquired would be simply impossible in the lapse of more than six centuries), but in reality there is little that we can point to as a faithful reproduction of the old work in its old manner, except it be Sir G. G. Scott's work, and that now going on.

Keepe, in 1683, bears his testimony to the ruinous condition of the church. He says,—“On the south side you rather behold the skeleton of a church than any great comeliness in her appearance, being so shrivelled and parched by the continual blasts of the northern winds to which she stands exposed, as also the continual smooks of the sea-coal, which are of a corroding and fretting quality, which have added more furrows to her declining years, that little of her former beauty now remains.”

The pinnacles of the buttresses seem to me to have been tampered with, the crumbling five over the north porch being now by far the most attractive of the series. It is but natural that such features as pinnacles and parapets should be the first to succumb to the corroding influences of smoke and weather, and so we find that in Richard II.'s time the parapets appear to have been renewed with the embattled variety then in vogue. Blom, during his reign as abbey architect, replaced a considerable length of it on the south side of the nave and south transept with a straight-coped variety, pierced with continuous quatrefoils, for which he appears to have had no precedent in the abbey.

The student will not fail to notice the different treatment of the buttresses of the nave on the north and south sides, arising from the necessity on the south side of spanning the cloisters (north walk), and so throwing the weight and energy of the vaulting over and beyond them.

On the south side you will see the two upper flying arches are continued beyond the lofty

* Continuation of a lecture by Mr. Waterhouse, A.R.A., delivered to the students of the Royal Academy on the 4th inst. See p. 351, ante.

pinnacle which rises from the wall of the aisle to an outer range of buttresses south of the cloisters. Externally, the windows of the triforium (on the same plane as those of the aisle below), with the parapet above, shut out the view of the lower part of the clearstory windows, and display, with the haphazard way in which the flying buttresses abut against this wall, a want of system which, as Sir Gilbert says, is not of a piece with the studious exactness of other points of the design, and seems to suggest some alteration during the progress of the works. Could this have been connected with an early intention to vault the triforium, which had to be abandoned as the work proceeded? The height of the triforium gives to the transepts externally what some would call a high-shouldered look, detracting from their elegance, but which, I venture to think, gives them great interest and dignity; in fact, I think few things can exceed the beauty of the outline of the north transept externally.

The most striking and beautiful feature externally has been, and is still, the triple portal at the end of the north transept,—a feature common enough in France; but in England, like the chevet, almost unique. In the time of Richard II. this portal had become much decayed, but was then cased in from the weather by another structure filled with windows, and of sufficient magnificence to be styled “Solomon's Porch.” You see it in Hollar's view.

In 1723 Dart writes of the original stately portico “that is now lately beautified, the time-eaten sculpture and masonry pared away, the Gothic order justly preserved, and the whole adorned by a magnificent window designed by the ingenious Mr. Dickinson, Surveyor of the Buildings.” Pity that the ingenious Mr. Dickinson did not leave the form at any rate of the original rose window. To his ingenuity is probably due the ogee form given to the central canopy of the porch.

It has been reserved for Sir Gilbert Scott to restore this northern portal to something resembling its original form and splendour. Sufficient remnants of the old work were discovered to enable him with his keen eye to decipher much of their original contour, and though some of the sculpture may be on the side of too great a delicacy, it is undoubtedly a very noble work. The light-coloured shafts are of Bath stone and temporary. They are to give way to statue shafts of Chilmark as Mr. Brindley completes them.

All that is visible externally of the central tower is due to Sir Christopher Wren, and is of Portland. It was his intention to crown it with a spire, the design for which is still, I am informed, to be seen in the Denery, and a model of which is in the triforium. It appears, however, he was soon convinced of the futility of proceeding with the work by the piers below showing signs of refusing to carry more than they do at present, and all they were doubtless

designed to do. If, as is possible, Reims and Amiens were the models on which Westminster was designed, we cannot be surprised at the central piers being prepared for nothing weightier than a central *fleche*.

I was prepared to speak to you of some of the more interesting of the tombs, and some of the furniture of the abbey, but I find time will fall me if I attempt it to-night. I will therefore only call your attention to the thirteenth-century pavement, and on the way thither, in passing round the chevet, notice the over-arching chantry of Henry V., which spans the ambulatory at its centre, and throws into impressive gloom the point at which one quits it to ascend the broad flight of steps leading into the chapel of Henry VII. The chapel itself, the burial-place of nearly every English sovereign from Henry VII. to George II., may be considered the finest Perpendicular building in England, called by Leland "the miracle of the world." It was to be the king's chantry as well as his tomb, and almost a second abbey was needed for the monks who were to sing in their stalls, "as long as the world shall endure."

Seventy-three statues, whose natural simplicity and grandeur of character and drapery were greatly admired by Flaxman, surround the walls. Some of the best of them were retained from the ancient Lady-chapel, the rest sculptured expressly for the new work. From the east windows the figure of the royal founder looks down upon the whole.

The glory of the chapel is its roof, the fan-tracery of which is a marvel of constructive ingenuity, and has not been excelled by any other example either in England or abroad.—In fact, this mode of construction was almost confined to our island. This roof has of late been in a somewhat precarious state owing to the extreme lightness of the arches on which it all depends, and it is a satisfaction to know that it is to be at once secured by tie-rods.*

The entrance to the chapel of St. John the Evangelist is through the shrine of St. Erasmus which has a lovely little doorway of the age of Richard II., which leaves little to be wished for either in form, light and shade, or colour. The tabernacle work over this doorway is also exceedingly delicate and beautiful, and of the same date.

Within the chapel of St. John the Evangelist is a fine bit of conventional carving in what remains of the old wall arching under the commonplace Perpendicular arch which covers the Vaughan tomb. Two bays off is a naturalistic treatment of the spandrel. It is interesting and instructive to compare the two.

On those of you who have visited Italy probably nothing which came down intact from Medieval times has made a deeper impression than the splendid mosaic pavements of the class called *Opus Alexandrinum*, composed of slabs of porphyry and serpentine, surrounded by mosaics of these two now precious marbles, and palomino, arranged geometrically and divided by bands of cipollino or other greyish-white marble. In fact, many a noble church that has lost every other trace of its original art, in the degrading changes which it has undergone during the last two or three centuries, has still its pavement of *Opus Alexandrinum* in a nearly perfect state.

The porphyry, of a deep purple red, was brought by the ancients from Egypt for their columns. These were sawn up by the Medieval mosaicist into slices for his work. The serpentine, of a deep green, is of the same formation geologically as porphyry, and was found in nodules in the mountains of Laconia. The palomino is a white marble, in colour like chalk, but extremely hard. It is found near Assisi and in Sicily. These three marbles, from their hardness, formed an almost imperishable pavement; from their colours a brilliant contrast; in fact, they serve to give emphasis to each other; while the cipollino, white with greenish grey stripes, forms an admirable setting for their more decided tones, so that nothing can be imagined more brilliant, and, at the same time, more refined than this work, which was always worked in geometric patterns of the severest type.

Little wonder that Abbot Ware, when in Rome, was attracted by its beauties, and decided to have a specimen at Westminster, in front of

* Mr. Scott has kindly lent me two of his father's drawings illustrating this groining.

the altar. He appears to have brought over two artists, Odericus to do the pavement, and the before-mentioned Petrus for the glass mosaic of the shrine. He must have brought home with him also the porphyry, the serpentine, and the palomino.

The Westminster work, however, presents some peculiarities not found in any Italian example. In the first place, there was no cipollino forthcoming, and so recourse was had to Purbeck, which was a not altogether satisfactory substitute, being a trifle too sombre in colour, and liable to decay in our damp climate. Then there was an inscription in brass letters imbedded in the Purbeck, and as the workmen were without large slabs of porphyry and serpentine, the eyes of the larger circles were composed themselves of mosaic, and in some parts glass mosaic took the place of marble. This pavement has suffered from later restorations and repairs.

In Edward I.'s time there was another importation of tessere for the pavement of the Confessor's chapel, which was laid, in all probability, by English workmen. The ground of Purbeck occupies the greater portion of the surface, the sinkings for the mosaic, which has now unhappily in great measure gone, being formed of a pattern composed of circles and scrolls intertwined.

I may here mention that I was so fortunate some years ago as to discover some rough blocks of porphyry in the area of a house in Belgravia, very near the abbey. These were given me by the owner, and I used them in the pavement of the vestibule of the Manchester Town Hall.

I regret not being able to read my remarks about the tabernacle and the coronation chair, because Mr. Scott has kindly lent me Mr. Stacey Marks's very exact and interesting copy of one of the subjects on that remarkable altar-piece of the fourteenth century, and a facsimile of a portion of the beautiful gliding on gesso at the back of the chair.

The rovestry is a curious and little visited apartment opening out of the south transept, from which it was separated by three doors,—one of which was covered with human skins, traditionally of the Danes, but more probably with those of wretches who had committed sacrilege, and who were thus exposed as a deterrent to other would-be deprecators. The groining of the rovestry is curious and interesting, being very irregular from the peculiar plan of the room, wedged in, as it is, among the great buttresses of the abbey. It contains also the low bridge which the sleepy monks had to traverse to get from their dormitory to the church, to the floor of which they descended by a winding staircase which formerly existed in the corner of the transept. You will see the door and beginning of stairs in your print of the south transept.

Another door, covered with human skins both within and without, was discovered by Scott in the narrow space south of the entrance to the Chapter-house, marking it, he thinks, as the entrance to the Pyx Chapel, used as the treasury of Edward I., from whence a round 100,000*l.* was abstracted in his reign. One word as to the old glass. There is no contemporary glass left, I believe, except the three splendid clearestory windows over the apex, the west window of the south aisle, and a bit of grisaille in the triforium taken out of a window in the Chapel of St. Nicholas.

Scott tells us that in his restoration of the Chapter-house the only parts conjectured were the parapet, pinnacles, the gables of the buttresses, and the roof. There is a curious point in connexion with the west window of the Chapter-house. Before the restoration this window was entirely walled up with fragments of the ruined vaulting shafts. When Sir Gilbert removed them the sill was revealed with seatings for four mullions instead of three, as in the other windows, and Scott gives a very good reason for this, that the window being so short would have looked out of proportion had the mullions been so far apart; and so, in his design for the restoration, he shows a window slightly different from the rest, of five vertical divisions, the circle in its head being necessarily larger, and having eight foils instead of six. What was my surprise, therefore, to find that in execution the window was made precisely like the rest, so far as its tracery was concerned, and in Scott's "Recollections" I find the reason. All the windows have ancient iron ties at their springings of round iron, flattened where they pass through the mullions. In the west, or

shortened window, the tie was discovered, though the tracery was lost, and this tie was flattened like the rest, for three mullions, not four. It was clear, moreover, from fragments of tracery found, that the window had been renewed by Abbot Byrcheston, circa 1345, when he rebuilt the bays of the cloisters, opposite the Chapter-house entrance. It is probable, therefore, that he thought five lights more beautiful than four, and so made his window, though he left the iron tie; while Scott, though agreeing with him, went back in his restoration to the original setting out. This is an illustration of the different spirit which actuated the architects of the fourteenth and nineteenth centuries: both to be commended in their way. Byrcheston tried to improve upon the work of Waro a century before. Scott's critical eye is not allowed to guide his judgment, when he discovers the intention of the original builder of the glorious Chapter-house, with reverent hand he replaced the work as he had reason to believe the builder left it.

In this spirit I trust we shall approach Westminster Abbey, reserving the exercise of our imaginations, our creative faculties, for new buildings; be content at Westminster to keep the structure in thorough repair, but precisely as its builders bequeathed it to us, and so hand down to our children unimpaired the most beautiful and most interesting national monument of which England is ever likely to boast.

One word more to the students of architecture here. You will observe that though, through the kindness of my friends, I have been able to show a great number of illustrations, many of them of a very high order, of detached portions of the abbey, I have not produced any large plan of the church, nor complete sections through it showing the roof and the flying buttresses. The only plans I know of are those in Scott's "Gleanings," from which the small plan in your hands is taken, and the one in Neale's beautiful work on the abbey, the views in which work, however, are of a pictorial character, which fail in giving accurately either the proportions of the architecture or its details. Is it not to be regretted that we have no comprehensive, accurately-measured drawings of this splendid building to refer to?

You know the admirable result of Mr. Neale's labours at St. Alban's. He was himself an Academy student, owing his entrance here as probationer to a measured drawing of a bay of that church, and it was due to the encouragement he received here that he produced his magnificent work, for which he obtained 300*l.* subscribers, and which gained him the Pugin Studentship of the Institute of Architects.

Coming back to our Abbey of Westminster, it is evident that the Royal Academy students of the past must have the credit of having produced the best delineations of detached portions. Now, why should not the present students follow Mr. Neale's illustrious example and have the high honour of giving to the world the first complete set of measured drawings of the abbey? Believe me, the task, if divided among you, would not be superhuman. No work could be more delightful, none more improving to those who undertake it, and none of greater advantage to the profession to which we all have the honour to belong.

Abingdon Corn Exchange and Cattle Market Competition.—The Corporation, assisted by Professor Hayter Lewis, of London, have selected the design "Bonh Fida," by Mr. C. Bell, of New Broad street, London, out of nine designs submitted, the design bearing the motto "No Fac Nisi Bene Facias," of Mr. J. G. T. West, of Abingdon, being placed second, "Commodatis" by Mr. Quilter, taking the third place, and "Z," by Mr. Cobb, the fourth. A correspondent says:—"It is simply a case of the old tale over again, of requiring more than could possibly be had for the money, if well done. The Corporation generously reward the second, third, and fourth men with premiums of 5*l.*, 3*l.*, and 2*l.* respectively."

Herbert House, Belgravia.—Messrs. Banner Bros. & Co., of Billiter-square, have been commissioned to entirely overhaul the sanitary arrangements of Herbert House, Belgravia, the town residence of Lady Herbert de Lea, and substitute the "Banner System" throughout. The work is being carried out under the superintendence of Mr. A. E. Hubert, C.E., Messrs. Banner's engineer.

Ashburnham House : Westminster .

Formerly the Residence of The Earl of Arundel, John Thynne but now converted into Westminster School.

SOUTH CLOSETTA WALK

After visits to the house in 1881 and 1882, the architect proposed a plan which, although differing slightly from the original, was approved in 1883. The house is undergoing alterations, but no notice is taken on these plans of any alterations effected since June 1882. Plans have been added in garden on Ground Plan. All floor use of wood except where otherwise expressed, in plans in writing. On the plan a single line shows wood panelled and a double line shows wood panelled and a second line shows wood panelled where shavings were used.

The house is evidently built upon the site of the old Manorial Buildings and some of the old walls have been apparently utilised. It is impossible to discover to what extent as there is so much paneling, but such walls as appear to be ancient are noted on the Ground Plan. "Hearth" walls have probably been walls raised upon them above the Ground story.

On the plan the kitchen is probably a later addition. It is possible that the small compartment on the right side of the kitchen was at which was probably destroyed when the old wing of the house was added. The iron mantelpiece against the chimney is a later addition. The site of the chimney is shown and remains in the Dining Room extending upwards to the roof.

Illustrations.

IGN FOR A HOUSE AT WARGRAVE. ON-THAMES.

THE illustration shows the Terrace-Front overlooking Wargrave and the river. The site being high and exposed, and materials proposed, hollow walls are provided, the upper portions being faced with her-tiling and rough-cast. The half-erling, roofs, details of windows, &c., are especially contrived to meet the circumstances of the exposed situation. The design by Mr. W. H. Atkin Berry, A.R.I.B.A., of Dover-street, W.C., and the illustration is production by photo-print from his drawing, which was in the Royal Academy Exhibition of year.

D HOUSES, BOPARD AND COCHEN.

These picturesque examples of German half-erling houses, are reproduced by Messrs. Perlow's "photo-print" process, from original or-colour sketches by Mr. W. J. N. Millard.

THE TOMB OF HENRY VII.

Among the Westminster Abbey illustrations presented with Mr. Waterhouse's lecture, we last week Mr. Cresswell's drawings of Henry VII.'s Tomb, and this week some details, in reference to which Mr. Cresswell sends following remarks:—

The screen and tomb of Henry VII., generally attributed to Torregiano, were completed in 1519, years after the king's death, and may be taken as an exact point,—at which the Gothic style was superseded by the Classic revival; a screen enclosing the chantry being a most important example of Late Gothic, whilst the tomb itself displays the most refined Classicism. It is not the fact that the style is so recent, I should think it very doubtful whether Torregiano was in any way responsible for the design of the screen, even if he was concerned in its erection, inasmuch as we find evidence made to it in the will of Henry VII., directing that the tomb should be surrounded 'a closure of copper and gylte, after the fashion that we have begone.' This would tend to point to the fact that the design, at all times, was fairly settled before the king's death.

The screen was adorned externally with six brass statues, gilt, of saints, of which six remain, and is also profusely decorated with the badges of the two rival Houses of York and Lancaster, so auspiciously united in the marriage of the King with Elizabeth of York; and finally there formerly stood, at the east end, a tall altar, dedicated to "Our Saviour Jesus Christ," above which the rood beam still remains, though the panelled canopy, of which there are evidences, and the cross itself, have since disappeared.

In the matter of construction the hexagonal screen at the four angles play a very important part, as, according to the late William Burgess, they carry iron beams concealed in the cove of cornice, upon which the upper portion of screen depends for support, additional strength being imparted by the wide transoms—way up, whilst the stability of the whole is materially assisted by the two projecting piers. The continuous inscription which is round on the transoms just mentioned is a beautiful example of Late Gothic character, and the initials in Latin hexamer lines the various names of the deceased monarch.

In the tomb itself, which is of black and red marble, with copper gilt enrichments, are fine effigies of the king and queen, also upper gilt, the hands together in the attitude of prayer, with supporting angels at each corner, *bas-reliefs* on the sides,—three to the north and three to the south,—the royal arms, and supporters, being at each end.

There is an interesting story told to the effect that Torregiano was anxious to obtain the sanction of Benvenuto Cellini in the execution of his work, and wrote making him liberal proposals, and holding out the prospect of future employment. Cellini, who was then at the court of Francis I., seems to have entertained proposals favourably at first, until he learned that Torregiano had carried his quarrel with Michelangelo so far as to have struck this great

man, an act of sacrilege in Cellini's eyes which nothing could palliate; he then at once declined all further communication."

References to the other drawings from Westminster Abbey will be found in Mr. Waterhouse's Academy lecture, the conclusion of which we give this week.

ASHBURNHAM HOUSE.

THESE measured drawings of Ashburnham House, by Mr. Harry Sirm, formed a portion of the illustrations to Mr. G. Aitchison's Royal Academy lecture on "Staircases," and are here published with the same object of illustrating the lecture, which is reported elsewhere. We may add that a view of the staircase, from a drawing by Mr. Brewer, will be found in the *Builder* for January 14, 1882.

ON STAIRCASES.

THE first of two lectures on this subject was delivered on the 2nd instant to the students of the Royal Academy, by Mr. G. Aitchison, A.R.A., who said that the history of stairs and staircases might be interesting from an antiquarian and ethnological point of view, but here it was the practical question of how they could be made better and more beautiful than heretofore. The steps found in the rocks probably suggested to some pre-historic genius an easy means of conquering steepness. That steps were known at an early time was shown in the rock-cut temples of Egypt. The chronology of Egypt professed to begin 3,500 years before our era; the kingdom of the Pharaohs dated from 1830 to 1312 B.C., and it was to the latter period that the rock-cut tombs with steps and the staircases in the Palace of Rameses belonged. The Chaldean temples, too, were supposed to have had grand flights of steps. The early chronologies were somewhat vague, some giving the date of 1635 B.C., other 1571, and even 1312 B.C., as the date of the birth of Moses; when steps were first mentioned in the Bible it was after the flight from Egypt. Whether Jacob's Ladder was a flight of steps, or a ladder, he would leave the learned to decide. Solomon's birth was said to have been somewhere about 1000 B.C., and they read that when the Queen of Sheba had seen the house which he had built, "and his ascent by which he went up into the House of the Lord, there was no more spirit in her." Then, as now, the employer, and not the architect, got the credit! Persia was probably the country where flights of magnificent steps were principally to be seen, evidently used to give dignity and impressiveness to the buildings. Those in front of the great walled plateau of Persepolis were 34 ft. high. The Palaces of Darius and Xerxes had very fine staircases, which preceded but a little those to the Propylæa on the Acropolis, which must have been the most magnificent in the world. The vestibule at the top of these stairs was splendid and unique amongst Greek buildings; that is to say, amongst the most perfect architecture the world had seen, and which deserved some mention beyond the immediate purpose of the lecture. It was the building at the very acme of Athenian taste, and was looked on as the personification of Athenian supremacy. It was considered the gem of Athens, and united at once the most perfect simplicity, the greatest subtlety of composition, and the greatest originality of any Greek building that had come down to us. Placed on the crag platform of the Acropolis, it was the main feature of Athens, its stairs conferred imperial beauty on it, and gave dignity to the columns of its portico. Mr. Penrose had shown conclusively that the flanks had no pediment. Within the central portico and at right angles to it was a double row of Ionic columns, flanking the carriage-way. We have reason to wonder that such noble works should have been built in so short a time. Plutarch, writings 500 years afterwards, says "even now they have the freshness of modern buildings, and a bloom is diffused over them, as if they were animated with a spirit of perpetual youth and unfading elegance." By referring to Vitruvius they would find the way in which steps should be made. At the Propylæa and in other Greek temples there was a chase out on the bottom of the riser, and another on the back of the tread; the chase looking as if it were out

to catch the rain-water, when the rain ran down the riser, it was apparently caught by this channel. Mr. Penrose found there was no exit to these, so that after rain the channels were full of water. There were some curious points about these channels, some being worked on the riser, and some on both the tread and riser. His hearers might doubtless think that this would be more interesting to the mason than to the architect: still these matters were not so trivial, particularly as the material used was costly marble, and the superfluous marble left, which the chases marked, was to protect the face and edges. They might say that they could not be roused to enthusiasm about steps, but he would try to persuade them that much might be learned from such humble accessories. Was it not possible that these sinkings were found to give accent to the stages, and were eventually used for aesthetic purposes? The beauty of stairs depended on good proportion and the realisation of proper effect; the hand of a master could be traced in the smallest detail of a building. If the mouldings of a building were coarse and ill-proportioned it could be seen that the architect was a savage, although he might be a clever one. In the case of steps, when the treads were too narrow, the whole flight rose up before one like a wall, while, if the risers were too low, the lines which were the beauty of the steps were lost. When he first thought of this lecture he believed he had merely to go to the Institute or the British Museum Library to get full details of every flight of steps or grand staircase he had seen; but it was almost like digging for diamonds on Salisbury Plain! One example that had struck him as being most important, the *scalinata*, was not to be found, nor were there any details of those two grand staircases,—the one at the National Gallery and the other at the Royal Academy, when both were housed in Trafalgar-square. Nor was a plan of the staircase of Santa Maria in Ara Coeli to be found. If the competitors for the silver medal could be set to work on the great buildings of England, and if their drawings could be published or preserved and bound, what an important gallery of English architecture the Academy would possess! External staircases presented infinite possibilities of display, as one was not hampered by want of space or the fear of spoiling the interior arrangements of the building. The *scalinata*, or grand flight of steps, at Santa Trinità dei Monti in Rome, was certainly superb. It consisted of one grand straight flight with three landings, divided into three by square pedestals, the central portion being about three-fifths of the whole width, and above circular flights, the whole being crowned by the two-towered church of Santa Trinità dei Monti. Sir John Soane had evidently taken from this his suggestion for a Scala Regia, published in his work. Another splendid staircase in Rome was that leading to the Church of Santa Maria in Ara Coeli, built in 1348. However inferior in position this staircase might be, it to some extent suggested the magnificence of that to the Propylæa. Though the staircase at the Ara Coeli was not nearly so magnificent as the *scalinata*, it was, perhaps, more striking on account of its perfect simplicity. The art in the other was only too apparent, while the highest art was to conceal it. Every architect who looked at a perfect Doric temple must wish that he had lived before the Greeks, feeling sure that he would have done it in the same way. It looked so simple that it would seem as if he could have fallen on no other form than sublimity. In the same way, on first seeing the inside of the Pantheon one was almost angry with the nameless architect who had lighted the vast dome by a single eye, before one had the chance of doing so. He wished to impress on his audience the advantage of the infinite pains which must be taken, and of the self-denial to be exercised, if they hoped to produce the highest work which should live. Perhaps the most historic open-air staircase was that of the Giants at Venice. This *Scala dei Giganti*, with its two colossal statues of Mars and Neptune, was not the place of execution of the Doge Marino Falieri, as it was not then built. This staircase was a little over 13 ft. wide, and consisted of twenty-eight marble steps, with landings in the middle and at the top. In Mediæval times a large proportion of the staircases was in the open air, built on to or corbelled out from the wall, like that of the Bargello at Florence. There was

a very fine flight of the same sort at the Courts of Justice in Barcelona. This was a wide flight, like that of the Bargello, and at the top where it entered the arcade which surrounded the courtyard, the angle column on which the two arches would rest was suppressed, and there was nothing but a boss. Viollet-le-Duc gave a representation of an outside staircase leading to the ramparts at Carcassonne, which was of interest. The lecturer drew attention to several examples, of which drawings were displayed on the wall. One was an open-air staircase, with a pretty open-work Gothic balustrade, probably from Nuremberg. Another was a view of the Ripetta at Rome, showing a series of three steps and a landing,—a double curve on plan. These had been swept away by the foundations of a new bridge. The President had kindly lent him a sketch of the summer palpit at Jerusalem, and on the wall was a drawing of the celebrated staircase in the cathedral at Burgos, lent by Mr. O'Connor, which had so great a charm for painters. It was an inside staircase, with many of the features of an outside one. In Canterbury Cathedral would be found a noble flight of steps leading from the transept to the choir, which would have been effective if it had not led to dead wall. And here should be named Sir Charles Barry's magnificent stairs in Westminster Hall, stretching nearly across it. Nearly every considerable church or cathedral, both at home and abroad, has, or has had, a more or less imposing flight of steps. The fine open-air staircases of England were mostly to be found in the gardens and terraces of the Tudor and Elizabethan age. Sir Charles Barry was very successful with this form of garden and terrace staircase. In Italy there were numerous specimens of stairs in gardens and terraces. Before going further he would like to draw attention to the splendid flight of stairs by Wilkins to the portico of University College, London. This was well worth studying, and any who were looking forward to doing grand public buildings should spend some time in measuring it, and seeing how the grand effects were produced. To get these effects required commanding genius in arranging steps and staircases so that the proportion which would make them look well, and yet would not prevent their convenient use. This was done by making the risers shallow and the treads wide. Breadth was also of the first importance. Splendid specimens of staircases in gardens and terraces were to be found about Rome and its environs, and J. Gwilt was of opinion that the stairs at Versailles showed magnificence and artistic skill. Any one could now consult books on the subject, but there were so many points that even the best views would not give, that it was rash to speak of effects until they had judged of them with their own eyes. He would like, however, to refer to the beautiful garden and architectural effects of the Villa d'Este, near Tivoli. There was one rule which should not be lost sight of in outdoor steps,—that of giving each tread a slight fall to the nosing, so that the rain-water might run off. He never walked on the grand pier at Brighton without thinking what a fine street could be made from the square to the heights above, finishing with a grand flight of steps, and crowned with a some cathedral, town-hall, or museum. He was afraid that Londoners would have to wait for the crowning of their "Mons. Sacre;" Primrose Hill, with a grand flight of steps and a pulpit for addressing the people, before they could hope to rival the Propylæa at Athens or Santa Trinita dei Monti at Rome.

Mr. Aitchison's second lecture was delivered on Friday, the 6th inst. Mr. Aitchison said that staircases might be divided into the following classes; first, the corkscrew, lantern, winding or newel staircase, sometimes called a ryse; second, the straight staircase between two walls; third, those which went round two, three, or four sides of a rectilinear figure; fourth, a central ascent with two branches, &c.; fifth, the circular, semicircular, or oval well staircase; and, sixth, the compound staircase, with straight flights in conjunction with curves, &c. Properly speaking, the word "staircase" implied its own use, namely that of a case, hut, as was well known, a long flight of stairs out of doors would be called a staircase. Staircases were important features in buildings, as they presented opportunities for all that the architect, sculptor, and painter could do in the way of adornment, and

also for the effects due to light. Lighting from the whole ceiling, vault, or dome was the best, and there was a gravity and uniformity about this mode which caused it to surpass all others. The next best plan was a lantern, hut, if this were adopted, the vertical windows must be ample. Windows on the stairs or landings were dazzling to the eye, but a fine method of lighting was by recesses lighted from the top and partly from the sides, and screened from sight. Winding stairs were used throughout the Middle Ages, and captivated the leaders of the Renaissance. M. Viollet-le-Duc gave some examples of corkscrew stairs, and notably one from Mayence Cathedral. The celebrated screw staircase at the Louvre was another fine example. Mr. Aitchison then described the central staircase at Chambord, and also that in the courtyard of the Castle of Blois. A Greek, in the age of Pericles, would have considered this staircase barbaric, but its depth of shadow and relief conferred holdness and originality upon it. Inside, the newel had a moulded skirting, and was divided above into panels by slender shafts, the panels enriched with delicate arabesque. The staircase at Chambord, since the floors of the great hall had been removed, had a most surprising and astounding effect. One seemed to be in a lofty cathedral, with a piece of tabernacle work rising up through the roof. Though this staircase was not so rich as that at Blois, it was still very effective, and its fame even reached the ears of Palladio, who mentioned it in his book, though he thought it was a well staircase, and had four staircases rising one above another, instead of its being a newel staircase, with two stairways like those by Mr. Bodley at the School Board Office. Another celebrated circular staircase was the Scala Minelli, at Venice. In the leaning tower at Pisa the winding staircase went spirally up between the inner and outer walls, and, though devoid of ornament, was very striking. The great drawback of these newel staircases was the want of vista, and the truly royal staircase was the straight one. Of these he would mention that of Bernini at the Vatican, which had been managed with the most perfect art. The great objection to a columned staircase was the raking of the vault, which looked unsafe and unpleasant. Sir John Soane was aware of this fact, and in his royal staircase he got his vaults springing from a horizontal line by keeping the stairs within the stylobate. He must not omit to mention the Scala Santa, or holy staircase, of St. John Lateran, said to be the stairs of Pontius Pilate's house. It consisted of twenty-eight marble steps cased with wood, and a two-story building was erected to take this staircase, with four other staircases to meet the wants of the faithful. The Norman staircase leading to the school at Canterbury was a type of a common form used in the Middle Ages. It consisted of four large Norman columns, each with a square abacus; a wall about two-thirds of the height of the columns ran up on the rake, and was capped with a plain projecting coping. The shafts diminished in height as they went up the slope, so that their capitals were level, and the whole was covered with a pent-house roof.* He was very much struck with this when he first saw it, and his admiration had not diminished with time; indeed, it was one of the most effective small out-door staircases he had ever seen. The Normans were great architects and sculptors, and it seemed a pity that so much of their sculpture had been restored by those ingenious persons who should carve comic pipe-heads and umbrella-handles. In the third class he would mention Sir Charles Barry's staircases at the Reform Club and Bridgewater House, going round three sides of a square between walls. Mr. Ewan Christian wished him to remark that in every house a staircase between walls should be built, as it was the only fireproof staircase, and would save life in case of fire. Mr. Aitchison then drew attention to some drawings of the celebrated staircase by Inigo Jones at Ashburnham House, and of which Sir John Soane thought so highly that he had drawings of it specially made for his Academy lectures. From the inner hall, a low, plainly-panelled room, about 17 ft. by 23 ft., the visitor passed up a flight of ten steps in the middle of the west wall, and was landed in the

staircase-hall, where three more steps took him to the foot of the grand staircase. He found himself in an elegant hall, about 20 ft. high, 27 ft. 7 in. long, and 14 ft. wide, with two windows at his back. The walls on the first floor level were ornamented with Ionic pilasters. At the top of the stairs was a recess of about 15 ft. by 7 ft. 6 in., the lines of the hall being supported by two engaged columns and an isolated one in the middle, its pedestal forming that of the balustrade. The hall had a cove cornice, and in the centre of the ceiling was an oval lantern, domed at the top, supported by twelve Ionic colonnettes, grouped together in threes, and with balustrades between the groups. The grand staircase had but seventeen steps, one flight of nine, then a square landing, and then another flight of eight landing in the line of the columns forming the front to the recess. The landing in this recess, about 7 ft. 6 in. square, gave access to the dining-room and ante-room. The first flight was 5 ft. 8 in. wide; the second about 7 ft.; the risers being 5 in. high, and the treads 14 in. wide. It was difficult, even with the drawings, to convey the full effect of the art and ingenuity displayed. The low plain inner hall acted as a foil to the elegance and proportion of the staircase-hall. The 12 ft. 6 in. of height to the first floor, gained by three steps, was half cut off insensibly by the steps from the inner hall, and the three to the staircase floor. He doubted if anything so original as the lantern existed. It was constructed in common hipped roof, tiled, and with four dormers, and no one looking at its external homeliness would guess at the elegance within. The drawings of it were lent by Mr. Harry Sims. There used to be elegant staircases in some of the old City houses, but these had been swept away to make room for modern tasteless rubbish, built on the leasehold system. He hoped that some day the Academy would acknowledge the claims of architecture, and would extend its liberality to endowing a Professor of Construction, and thus remove the present reproach that the schools turned out draughtsmen and scene-painters, but not architects. The Palazzo Braschi at Rome contained a celebrated staircase going round three sides of a parallelogram with a well in the middle. The stairs were about 10 ft. wide, and the hall was lighted by three windows on one side, by windows in the cove, and a small skylight in the top. One point which had never been conquered in this kind of staircase was the distortion of the arches, but still there was one was a striking example. There was a similar one at Naples. The architectural details were poor, but the corridor had their windows facing the street, and when he saw it, on coming from London, struck him as a fine and original work. One of the finest staircases he knew was that of Christ Church, Oxford. A straight flight led to the hall, a few steps taking one to the Cathedral Close, another flight going to a small quadrangle, and then came the kitchen. The staircases were without number; this was a central flight with branches to the right and left. One of the finest in London was that of Station House, where the flights went round three sides of a magnificent hall with columns and corridors. The twin flights, however, had a parasitic look, like vines on an elm, and this was peculiar, as the general fault of such staircases was that all view of the ceiling above was obscured, so that it was sacrificed to the very moment when it should be most prominent. When magnificence and not economy of space had to be considered, these spiral flights should be enclosed between walls with double rows of columns and corridors. The bridge staircase was to be seen to perfection in the Comédie Française at Paris; and here the lecturer exhibited a drawing of the staircase at the Paris Grand Opera, designed by M. Charles Garnier, adding that the whole of this magnificent building afforded an example of revived Classic, sweetly proportioned, and yet distinctly French. Of the oval and circular staircases, a well-known example was that of the Palazzo Barbarini, with a riser of 4 in., and a tread of 11 ft. 7 in. There was also a circular staircase in the building of the Belyeders at the Vatican, the well being formed of eight single columns to each story.—Tuscan on the lower, and then Doric, Ionic, Corinthian, and Composite. Sir William Chambers had a similar

* A view of this staircase, from a drawing by Mr. G. H. M. Addison, will be found in the *Builder* for March 4, 1882.

Some of them are enabled to reproduce among photolithographic illustrations.

cular banging staircase in one of the wings of Somerset House, facing the Strand, is well worth looking at, and showed us a beautiful plan might produce a bad effect. The worst feature in it was the landing in the middle, making an ugly break in the spiral lines. Probably one of the most extraordinary compound staircases in existence is that designed by Michelangelo for the Vatican Library. It went from the hall to an upper library, and consisted of a central flight on the bevel with fifteen risers, and with staircase on either side. The steps curved inward like a bent bow with hobs at each end, and we could hardly understand for what purpose these hobs had been made, except for appearance. It was an extremely effective staircase, and quite different from anything I had seen in any part of the world. Another very splendid compound staircase was that of Buckingham Palace, by John Nash. From the hall a flight of eight steps led to a landing lit by a screened side window; nineteen steps led to the next landing, well lighted from above, and then four steps and a landing and one-two more steps between walls, adorned with columns, led in one line to the gallery. Had the exigencies of the building permitted, it would have been better to have had a landing to the gallery-door, lighted from the side like that in the Royal Academy. The balustrade was very handsome, being of gilt ironwork. At the second landing from the bottom two curved twin flights led to a landing lit by a dome over the entrance to the staircase; the part was domed over with a flat dome and impost. The central dome was of ground glass with slight bars of metal, the centre part being in the shape of a star. This beautiful staircase was very worth notice; when a man had been very much struck with it, and had admired it again the other day. He would like also to call attention to the staircase of the Royal Academy. The soffits of the upper stairs were moulded, and had a good effect, and they intensified the lines of the lower stairs. The stairs, which were 8 ft. above, swelled out as we got to the landing, and were 10 ft. at the bottom, and came down well between the coupled columns. The flight between the large Devonian marble columns had the light from above. In the case of the grand staircase at Versailles a visitor came up a straight flight in front, with twin staircases right and left. The first flight was square, with the angles cut off. The staircases were about 10 ft. wide; the first floor had Ionic pilasters all round the cage. He did not omit to mention Wilkins's staircase at Finsbury-square, when the National Gallery Royal Academy were under one roof. Illustrations of this might be seen in Leed's "Public Buildings of London." The entrance was by a central hall lit by windows at the end; the side walls were kept low, with Corinthian columns between them, and a balustrade between; and the stairs to the National Gallery and the Royal Academy were opposite the centre and in two twin flights, so that when you turned round on reaching the first floor you could see the persons ascending on the other side. It had a magnificent effect, and it was much to be regretted that it had been pulled down and other iron-plate staircases put up in their place merely to save a little room. This might be all very well in the case of private mansions, but a scandal in the matter of public buildings. The National Gallery had many splendid points about it, and a great deal of that which was explained of it was forced upon Wilkins against his will. He was, amongst other things, compelled to force back the angles so that one end did not interfere with the view of St. Martin's Church. Mr. Aitchison added that he had a good many photographs of more or less ornate staircases, exhibited on the wall, but was impossible to name all the fine staircases of the world. Had he done so the lecture would have been a mere catalogue. He had been compelled to omit all mention of fine staircases at Genoa, where the whole end-floor of some of the palaces seem devoted to their display. Then there were the odd ones in some of the London balls, and one of F. P. Cockerell, one at the Royal Society Painters in Water-Colours, and one which the architect sketched out, and which he (the lecturer) finished, in South Andley-street. He had been unable to speak of the fine Elizabethan staircases, and many of those designed by Inigo Jones. In conclusion, he would urge that in most every tolerably-sized house, where the

principal rooms were on the first floor, greater attention should be devoted to the staircase than had been paid within the last twenty years. The magnificent examples shown on the walls would not, be hoped, be without some effect on the works his bearers might hereafter execute.

ARCHITECTS' BENEVOLENT SOCIETY.
ANNUAL MEETING.

THE thirty-fifth annual general meeting of the subscribers and donors to this Institution was held on Wednesday afternoon last in the meeting-room of the Royal Institute of British Architects, Conduit-street, Professor T. Hayter Lewis, Member of Council, in the chair. Amongst the gentlemen present were Messrs. T. M. Rickman, F.S.A., Geo. Scamell, E. N. Clifton, Lewis Solomon, B. Edmund Ferrey, and Hugh McLachlan.

The Hon. Sec. (Mr. William H. White, Secretary R.I.B.A.), read the minutes of the last annual meeting, which were confirmed. He next read the annual report, from which we extract the following passages:—

"During the year 1884 your Council have distributed the sum of 521*l.* among thirty-four persons,—an increase upon the preceding year (1883), when the sum of 479*l.* was given away in grants to twenty-eight persons. In 1884 the sum of 332*l.* was received in subscriptions from 227 persons, being about 27*l.* less than in 1883. The donations have reached the sum of 156*l.*, including a legacy of 100*l.* left, free of duty, by the late Mr. Edwin Nash, the senior member of your Council, who was first elected a member in 1876, and who since then has almost invariably assisted in the business of the Society. His death, which occurred in May last, was referred to in sympathetic terms by the President of the Royal Institute of British Architects at the opening meeting of the session,—one of Mr. Nash's claims to professional gratitude being, according to Mr. Christian, that he had devised 'a legacy of 100*l.* to the insufficient funds of the Architects' Benevolent Society.'"

The death, at a comparatively early age, of another of the oldest contributors to our funds, viz., that of Mr. John Whitehead, took place in January last. Elected President of this Society on the death of Mr. Thomas Henry Wyatt, Mr. Whitehead diligently directed its affairs, with advantage and success, during four years, and his place will be difficult to fill. Your Council, however, have decided to recommend that, in future, the President for the time being of the Royal Institute of British Architects should be requested to become also the President of the Architects' Benevolent Society, and in the present instance, Mr. Ewan Christian has kindly consented to act if such recommendation be approved by the general body of contributors to the Society.

Your Council have also to announce, and with deep regret, that the retirement of Mr. George Mair, our esteemed and excellent Honorary Treasurer, has been rendered necessary by the state of his health, which, during some months, has prevented him from fulfilling the duties of the office to his own satisfaction. Mr. Mair has, therefore, mentioned his desire to be relieved from the Treasury, but, at the same time, has expressed a wish to be allowed to continue his connexion with the Society as a member of your Council. And here, perhaps, it may be appropriate to record that he was one of the first life-members, and served on your first Council. In fact, from 1850 to 1872, a period of twenty-three years, he was eighteen years a member of Council, succeeding the late Sir William Pitt in 1873 as Honorary Treasurer,—an office he has held for twelve years, during which the annual statement of receipts and expenditure has undergone great changes. That statement in 1872 showed a capital of about 1,700*l.* It is now more than 6,000*l.*, and our annual dividends are 200*l.*, as against 73*l.* in 1872. The gifts to applicants then amounted to 190*l.*; they are now more than 500*l.* The expenses of working in 1872 amounted to 73*l.*; they average now less than 20*l.* Though much of this steady increase and improvement is undoubtedly due to the impetus given by the late Mr. Wyatt,—who, during his Presidency, worked unremittingly for the Society,—a great deal of gratitude for long service rendered has been worthily earned, and is thoroughly deserved, by the genial Honorary Treasurer who gives up that office to-day, and your Council commend the fact to the notice of all the contributors."

The Council conclude their report by pointing out that the amount received in annual subscriptions is "totally inadequate to the many valid claims made upon the society's funds, and quite unworthy of the members of such a profession as that of architecture." They add that at the present time there are more than 1,000 professional members of the Institute within the United Kingdom alone, and of these only about 176 contributed to the funds of the Society during the past year. On the other

hand, gratification is expressed in the report at the help afforded by the Architectural Association and some of the provincial architectural societies (notably those of Leicester, Liverpool, and Newcastle), and by Mr. John Holden, President of the Manchester Society.

The balance-sheet (the correctness of which was certified by the auditors, Messrs. John Hobb and B. Edmund Ferrey) showed a total income for the year (including 54*l.* 12*s.* 10*d.* brought forward from last year) of 587*l.* 13*s.* 6*d.* The total expenditure was 533*l.* 2*s.*, leaving a balance of 54*l.* 11*s.* 6*d.* to be carried forward to next account.

On the motion of the Chairman, the report and balance-sheet were unanimously adopted, and Mr. Ewan Christian, President of the R.I.B.A., was requested to act as President of the Society.

Messrs. Geo. J. J. Mair, J. Macvicar Anderson, J. H. Good, John Hebb, R. St. Aubyn Roumieu, Thomas Cundy, and J. Goldie Turner were elected members of Council in succession to Messrs. Edwin Nash (deceased), Ewan Christian (elected President), T. Hayter Lewis (elected Hon. Treasurer), Joseph Peacock, Frederick W. Porter, T. M. Rickman, and James Williams (who retired by rotation). The old members of Council who retain office are Messrs. T. G. Jackson, E. C. Robins, A. Waterhouse, E. N. Clifton, Cole A. Adams, William Emerson, and Lewis Solomon, and Professor T. Roger Smith.

Prof. T. Hayter Lewis was elected Honorary Treasurer, and Messrs. Geo. Scamell and Hugh McLachlan were elected auditors. Mr. William H. White was re-elected as Honorary Secretary, and thanks were voted to him for his services and to the Institute for the use of its rooms and for much valuable assistance in carrying on the work of the Society. On the motion of the Chairman, a special vote of thanks was passed to Mr. Mair for his past services to the Society, coupled with the expression of a hope that the Council might for long have the benefit of his experience in carrying on so useful and necessary a work as that in which the Society is engaged.

THE LATE MR. M. E. HADFIELD.

WE announce with much regret the death of Mr. Matthew Ellison Hadfield, senior partner in the well-known firm of M. E. Hadfield & Son, architects, of Sheffield, which occurred on Monday last. Mr. Hadfield, who was seventy-two years of age, had been in failing health for the past three years.

By his death Sheffield loses a well-known figure, one who linked memories of the past with the movements of the present. He was born at Lees Hall, Glossop, on Sept. 8, 1812, being the eldest son of the late Mr. Joseph Hadfield, who married a sister of the late Mr. Michael Ellison, agent of the Duke of Norfolk, in which office he was succeeded by his son, Mr. M. J. Ellison. After receiving his education at Woolton Grove Academy, near Liverpool, he was placed with his uncle in the Duke of Norfolk's estate office. Mr. Ellison, however, discovering that his nephew had a decided talent for architecture, persuaded his father to article him to Messrs. Woodhead & Hurst, of Doncaster. The indentures were signed in 1831, and continued in force for three years, when Mr. Hadfield went to London, and entered the office of the late Mr. P. F. Robinson. In 1836 he entered into practice on his own account. In 1838 he joined in partnership the late Mr. John Gray Weightman. In 1850 the firm took into partnership Mr. George Goldie, and its style then became "Weightman, Hadfield, & Goldie." About the year 1858 Mr. Weightman retired, Mr. Goldie following in 1860, and in 1864 Mr. Charles Hadfield joined his father, and the firm has since been known as "M. E. Hadfield & Son." Mr. Hadfield has carried out many important works, several of which have been illustrated in our pages. We understand that a memoir of him will be read at the next meeting of the Royal Institute of British Architects.

The Common-place in Architecture.—

This was the subject of an able paper read before the Leeds and Yorkshire Architectural Society on Monday evening by Mr. T. G. Jackson, M.A., F.S.A., which we intend to publish, but pressure on our space compels us to hold it over until next week.

ARCHITECTURAL SOCIETIES.

Liverpool Architectural Society.—The fourth ordinary meeting of this society for the current session was held at the rooms, No. 9, Cook-street, on the evening of Wednesday, the 4th inst., Mr. Thomas Mercer, Vice-President, in the chair. There was a fair attendance of members. It was announced that the Council had decided to award the prize for the best series of sketches executed during the recess by a member of the Sketching Club to Mr. Walter H. Brierley. Mr. Mercer then read the paper for the evening, by the late W. Pettit Griffith, F.S.A., entitled "The Rigid versus the Subtle Styles of Architecture," the proceedings closing with the usual votes of thanks.

Edinburgh Architectural Association.—The members of this Association on Saturday last paid a visit to Corstorphine Church and neighbourhood. The party, conducted by the President of the Association (Mr. G. Washington Browne), went first to Old Saughton House, which was inspected with much interest. On the way to the parish church, the site of the old castle of Corstorphine was pointed out. The old stone-built pigeon-house, which belonged to the manor of Corstorphine, and which contains about 1,000 pigeon-holes, was also visited. On reaching the church, the party gathered at the entrance, where Mr. Browne gave a short historical account of the earlier churches which existed before the present collegiate church. The old parish church was taken down in 1646, and a new aisle built, which now forms the south aisle and transept of the church. The north aisle and transept were added in 1826. Inside the church the chief points of interest are the old sedilia and piscina in the south wall of the chancel now the vestibule of the parish church,—and the three tombs of the Forresters,—two in the north wall of the chancel and one in the south transept.

A PARTY-WALL QUESTION.

At the Westminster Police-court last week, Mr. J. Charlton Humphreys, iron building manufacturer, of Albert-gate, was summoned before Mr. Partridge for neglect of an order to erect a party-wall between Humphreys' Hall, used as a "Japanese Village," and the Albert-gate Mansions, which face the Kensington-road, Knightsbridge. A month ago the order was made by Mr. Partridge on the evidence of Mr. A. Williams, the Assistant District Surveyor, that the buildings were separate and not divided by external or party walls of required material or thickness. Mr. Williams now stated that there had been no effort to comply with the order, which was made in the interest of the public.

In cross-examination by Mr. Humphreys, who conducted his own case, Mr. Williams admitted that there was no structural danger in the building, and that the unlet residential flats above were divided and isolated by a fireproof floor.

Mr. Humphreys, in addressing the Court, said that the Japanese exhibition was likely to go on for a long time, and he could not interrupt its success by doing the work. He had spent over 50,000*l.* on the buildings, and at present he could not obey the order of the Court.

Mr. Partridge, the magistrate, said the direction of the Court must be obeyed. The defendant was liable to a penalty of 20*l.* a day, and on this occasion he would be fined 10*l.* and costs. The authorities, too, could exercise the right of doing the required work.

LIABILITY FOR PAVING AND DRAINAGE APPORTIONMENTS.

HILL AND ANOTHER v. EDWARDS.

This case, which came up in the Queen's Bench Division a few days ago, was a dispute between landlord and tenant as to liability for certain work done under the Metropolis Local Management Acts, 1855 and 1862.

It appeared that by lease, dated the 16th day of February, 1877, between W. Love, deceased, and the defendant, land at Highbury was demised to the defendant for twenty-one years from Lady Day, 1877 (determinable at the end of the seventh or fourteenth year), at a yearly rent of 114*l.*, payable quarterly without deduction. The defendant was to pay property-tax, and the lease covenanted that he would pay "the title or rent-charge in lieu of tithes land-tax (if any), sewers rates, main-drainage rates, and all other taxes, rates, impositions, and outgoings, whatsoever then or thereafter to be charged or imposed on or in respect of the said premises or any part thereof (except the landlord's property-tax)." In December, 1882, the Local Board, under the provisions of the Metropolis Local Management Acts, 1855 and 1862, gave notice to the owners or occupiers of the premises requiring them to sewer, level, pave, &c., the portion of the roads upon which

the demised premises abutted and adjoined, and in default the local authority did the work themselves, and apportioned the sum chargeable upon the owners in respect thereof at 10*l.* 6*s.* 6*d.*, which sum the plaintiffs, as the representatives of Love, the lessor, paid, and sought to recover it from the defendant, the lessee.

The case was tried before Mr. Justice Mathew without a jury on the 30th of January, 1885, when it was argued for the plaintiffs that the defendant bound himself by his covenant to repay them the amount so apportioned, as being an "imposition," charged on and in respect of the demised premises. Several cases were cited in support of this contention.

Mr. Lamley Smith, Q.C., submitted that the word "imposition" must be construed to mean charges *quatenus generis* with "sewers rates, main drainage rates, and all other taxes, rates, &c., charged or imposed in respect of the premises," and would not have been meant to include that which is made by the statute, or charged upon the owner in respect of the permanent improvement of the property, and relied upon the case of *Tidswell v. Whitworth* (Law Rep. 2*c.*, p. 326).

Mr. Justice Mathew held that he conceived *Tidswell v. Whitworth* to be good law, and the same had been followed in other cases, and gave judgment for the defendant.

THE STONE USED AT WESTMINSTER ABBEY.

SIR,—I observe from your report [*Builder*, March 7th, p. 331], of the paper read at the Academy that Chilmark stone has been selected by Mr. Pearson, the architect. But what is known of this oolitic limestone that proves it will be more durable than those that have previously failed at the abbey or in its neighbourhood? It was examined by the chemists to the Royal Commission of 1837, Professors Wheatstone and Daniell, and rejected. Mr. Hull, the well-known geologist and chemist, has not a word to say in its favour in his book, "Building and Ornamental Stones," though he speaks of others from the same geological formation as quite unreliable in smoky towns. But though there is little special information, it is well known that oolites and other limestones decay with more or less rapidity in London. Dr. McCormack, who analysed a piece of oolite from the ancient part of Lambeth Palace, found muriatic acid some inches below the surface, and to that extent the stone had perished. The Caen stone of the east front of Buckingham Palace fell to pieces before the workmen were left. A nice little fortune of 60,000*l.* has been invested by the Government to provide for the repairs of the limestone of the palace opposite the abbey. Lambeth Palace has been twice restored in forty years. All this is not surprising when it is considered that these limestones contain 90 per cent. of carbonate of lime, which cannot long exist in the presence of the abundant acids and ammonia of the London air. What is surprising is that, in spite of past unfavourable experience, limestone should be used at all for our great public buildings. Would it not be much better to spend some of the money that these restorations cost upon the extra expense of using the best sandstones? Twenty years' experience in the populous towns of the northern and midland counties justifies my saying that they are the only stones the natural qualities of which render them suitable. The limestones, though equally available in these towns, are not used for building, but only for the manufacture of limes, and for fluxing iron ores. The carboniferous limestone of the Nelson Column, in Trafalgar-square, is in perfect condition after about forty years' exposure. As the abbey is a national building, Mr. Pearson, I do not doubt, will excuse my raising this question.

Woodside, Wimbledon.

H. TRAVIS.

THE ROYAL ARMS.

SIR,—I cannot allow Mr. Massey's letter [p. 359, ante] to pass unchallenged. He asserts that the arms borne by our sovereigns are their own, and not those of the nation. I turn to Parker's "Glossary of Terms used in British Heraldry," and find the following:—"Arms of Dominion, or those borne by sovereign princes; not the arms of their families, but those of the states over which they reign, such as any family or dynasty, but the insignia pertaining to the regal office."

Unless Mr. Massey can quote some better authority to prove his statement about the crosses of St. George and St. Andrew being the national arms of England and Scotland respectively, he is quashed by Parker. He also asserts that the royal arms were derived

from Henry II. Again, I turn to the Glossary and there read:—"The earliest English sovereign, whose armorial insignia we have contemporary authority, is Richard Coeur-de-Lion." Will Mr. M. kindly give his authority?

With regard to "Scotch enthusiasts" (although I am not of that nation), permit me to observe that the precedence claimed for "The rusty rampant in gold" was on account of its representing the older sovereignty of the two. No doubt some of our friends worth of the Tweed will have something to say to this captious critic who treadeth ruthlessly on their traditions, and in their hands, leave him.

In conclusion, might I ask Mr. Massey upon what grounds he included me as a Scotchman? It has never been my task to criticise such a short letter so full of glaring errors, and so delectably asserted.

J. B.

"NON-ACCEPTANCE OF LOWEST TENDER."

SIR,—The suggestion made by Mr. Andrew Williams (Brookley) [*Builder*, p. 359, ante], as to me a good one, and he will do well to suggest would it not be the proper step for him to ask the Committee of the National Association of Master Builders of Great Britain, and also the Central Association of Master Builders, London, to combine in the movement, and then, no doubt, there will be no difficulty in getting the support of those who are tendering outside the builders and contractors.

It appears to me that advertising for tenders was before long only a farce, as I note again in your issue of Saturday last several lowest tenders had not been accepted, especially the East Dulwich firm. In all cases of this kind, the contractor tender being rejected is sure to militate against his and create a detriment to the contractor's ability and stability of carrying out the works.

BONA FIDES.

TAXATION OF SURVEYORS' CHARGES IN COMPENSATION CASES.

SIR,—Messrs. Lee Bros. & Pain are doing good service to the profession in calling attention to the taxation of fees [*Builder*, p. 354, ante]; but they are not quite correct in saying there is no system as for many years (as long as I can remember) the principle has been that only the fees be allowed for the qualifying of two surveyors, no matter how important the claim or how many surveyors are called. Nor is this limitation affected (serious as it may appear) by the number of surveyors who are called on the other side.

Companies purchasing know well the unfair advantage they have, and I have found are sometimes willing to use it. One makes a point of informing one's clients that in refusing any offer it is necessary to remember that they will have to deduct from the sum given in the verdict sufficient to pay for two surveyors, and, therefore, if the company offer the value *minus* these fees, one, of course, advises settlement, and thus the *company gains*.

I may mention when I was recently settling a case at 8,800*l.*, in which I could not obtain anything like satisfactory terms, until when ready for trial, was met (as I fully expected I should be), when I called in four surveyors, who were of opinion that I should not obtain the fees of more than two I went to trial.

I think you, sir, are doing much good by giving publicity to this subject. It not merely relates to compensation cases, but to light and air and cases of a litigious character. In all such cases the fees allowed to surveyors by the Taxing-Masters are insufficient to pay for their services, and therefore there is a manifest injustice to the successful litigant.

BANISTER FLETCHER.

LOUTH BOROUGH SURVEYOR.

SIR,—In your last issue, re the appointment of surveyor for the Borough of Louth, you ask, "What is the meaning of this?" I shall be glad to answer this question as shortly as I can.

The late surveyor, who had 75*l.* per annum, was paid extra for all new work, resumed his office, and was to have charge of the streets, and of which I am chairman, recommended that the salary should be 80*l.* a year, but the inspector nuisances sent a circular to each member of the Corporation, tendering for the appointment at 53*l.* per annum, in addition to his pay as inspector, thereby making, as he said, "a great saving to the town, and acquired some fame as a carver for his work in the Exhibition of 1851, but now called himself civil engineer, surveyor, architect, &c." The Corporation, evidently afraid of the ratepayers, fell into the trap and accepted this bait, and he has since evening been appointed surveyor by fourteen ratepayers. It was some time a protest against the appointment, which the mayor ruled "out of order." One of the candidates had formerly been employed as a stonemason on the repairs of the pavement and I may add, the wages of the foreman are 60*l.* a year.

JAMES FOWLER,

Alderman, and J.P. for Louth, Louth, March 10th, 1885.

The Student's Column.

DESCRIPTIVE GEOMETRY.—VI.

We have in the preceding problems repeatedly made auxiliary elevations; but we have not yet tried to change one of the plan and make thereon an auxiliary plan, an operation we must do if we are to solve problems by changing the plane of projection. To make an auxiliary plan in a different plane than that of the elevation is really not more difficult than to make an auxiliary elevation; but it is so to us because we are accustomed to our plans as drawn on horizontal paper. Fig. 30 illustrates exactly what we do

Fig. 30.

we make an auxiliary plan; and the student will see thereby that the new plan m^h is at the same distance from the horizontal line as m^v was from L T.

Fig. 31.

on the operation on the point m indicated in the preceding sketch. If the student can

Fig. 32.

fully realise the meaning of this drawing he will make at once great progress in descriptive

geometry; nothing is more difficult than our science if our minds remain in a fog, and we see only lines on a flat piece of paper; nothing is easier when once we are able to image forth in our mind the operations in space we are drawing conventionally by means of plans and elevations. This exercise of the power of imagination is one of the main benefits to be derived from this study.

In the fig. 32 we have made a new elevation D^v of the line D.

In the fig. 33 we have made a new plan D^h of the line D.

Fig. 33.

We advise the student to make perspective sketches representing the preceding operations. To assist himself in realising these operations he should consider in fig. 32 that his drawing lies flat on the table, whereas in fig. 33 it is hung up on a wall; nor should he forget that, although we have up to this time always placed our figures above the plan and in front of the elevation, yet they may occupy any position in space; they may be below the plan or behind the elevation, or both combined. In fig. 34 we have a perspective sketch representing the plan and the elevation planes: we

Fig. 34.

see thereby that for a point a its plan a^h will be below L T and its elevation above L T. The point b will have both its elevation and its plan below L T, the point c , both its elevation and its plan above L T, and for the point d we have the plan above L T, whereas the elevation is below L T. We have shown all these positions in the fig. 35 as they appear after the elevation has been turned down on the plan as we are always supposed to have done in our drawings. In short, the student must consider that he has always before him two sheets of paper, one standing upright the other laid flat on the table,

and that they are hinged on L T. He is then supposed to have done all his drawings as represented in fig. 34, and, when completed, to have

Fig. 35.

folded them down afterwards for convenience sake. Such is the convention on which geometrical drawing is based.

Durand Institute of Architecture.—Mr. Geo. S. Aitken on "Ecclesiastical Architecture." 7.45 p.m.

FRIDAY, MARCH 20.
Architectural Association.—Mr. F. C. Penrose, M.A., on "Proportion in Architecture, especially as exemplified in the Works of the Greeks." 7.30 p.m.
University College.—Professor C. A. Newton, C.B., on "Greek Inscriptions." VI. 4 p.m.
British Museum.—Prof. J. F. Hodgetts on "Medieval English Remains." V. (Civil Dress). 2 p.m.
Institution of Mechanical Engineers.—Adjourned discussion on Mr. George Richards's paper on "Wood-cutting Machinery." 7.30 p.m.

SATURDAY, MARCH 21.
Edinburgh Architectural Association.—Visit to Caroline Park and Granton Castle.

Miscellaneous.

Fire in Glasgow Cathedral.—A fire, which was fortunately checked before much damage had been done, occurred in Glasgow Cathedral on Sunday morning. About ten o'clock, Mr. Henderson, the caretaker, was getting the building in readiness for the holding of morning service, when he noticed that the choir was rapidly filling with smoke. On making a search to ascertain the cause he found that the roof of the triforium was on fire at a point above the north aisle of the choir, immediately to the east of the transept. The flames had got hold of the woodwork and were making their way through the wooden covering of the roof. The hydraulic machinery and blowers used for working the cathedral organ and blowers used for the triforium, aid, fortunately, a tap was recently fitted to the main to allow of water being drawn off. Mr. Henderson at once set about extinguishing the fire with buckets of water taken from this source. It is estimated that it will cost about £50 to repair the damage done to the roof. It is stated that the cause of the outbreak was the overheating of a flue connected with the apparatus for warming the building.

Proposed New Vestry Hall for Fulham.—At a meeting of the Fulham Vestry on the 3rd inst., the Rev. F. H. Fisher in the chair, the Building Committee recommended that a sum not exceeding £20,000 be expended in the erection of a new hall, and that the churchwardens and overseers be requested and empowered to take the necessary steps for borrowing the money. Considerable discussion ensued, several members objecting to the expenditure of so large a sum of money. Ultimately the recommendation of the Committee was adopted. It was also resolved to advertise for plans.

The Architectural Association.—At the ordinary meeting of this Association, held on the 6th inst., Mr. Cole A. Adams, President, in the chair, eight gentlemen were nominated for membership. Mr. H. D. Appleton, hon. sec., announced that the next Saturday afternoon visit would be made this Saturday, the 14th, to the Hampstead Workhouse Infirmary extension (Mr. Charles Bell, architect) and to Messrs. Read Bros.' new beer-holding stores at Kensish Town (Mr. Theodore K. Green, architect). Illustrations of both these buildings have recently appeared in our pages. A plan and description of the infirmary extension (which has a circular ward) will be found in the *Builder* for February 2, 1884; and view and description of the premises at Kensish Town appeared in our number for February 7, this year. On the motion of Mr. Appleton votes of thanks were accorded by acclamation to Mr. Waterhouse, A.R.A., for kindly meeting the members of the Association and conducting them over the new St. Paul's School, at Kensington; to Mr. L. W. Leeds, for explaining the warming and ventilating arrangements of the same building; and to Messrs. George & Peto, architects, and Messrs. Peto Bros., contractors, for permitting the members to visit some new houses in Collingham-gardens, as mentioned in our last. The Librarian (Mr. R. E. Cox) announced that Mr. J. L. Pearson, R.A., had presented a copy of his Report on Westminster Hall, and that Mrs. Mockett, sister of the late R. C. Page, had presented a series of forty-nine mounted drawings (made by him when the holder of the Pugin Scholarship). On the motion of Mr. Cox a vote of thanks was given to the donors, and the Chairman announced that Mr. Peto's drawings would be on exhibition at the next meeting of the Association. Mr. John Slater then read a paper on "Building Stones," the first part of which will be found on another page.

British Archaeological Association.—At the meeting on Wednesday, the 4th inst., Mr. Thomas Morgan, F.S.A., in the chair, Mr. Irvine sent a large collection of drawings of antiquarian objects recently exhibited at Peterborough, and found either in the city or in the locality. Mr. Romilly Allen described a hitherto unedited stone at Colsterworth Church, near Grantham. It has been part of a shaft of a Saxon cross, and is covered with interlaced patterns. The Rev. Prebendary Scarth described a carved stone pedestal of which a drawing by Mr. Thompson Watkin was produced. It was found in a Roman hypocaust at Chester, and it is carved with some curious and very unusual patterns, one of the ornaments being very similar to the fleur-de-lis of Mediaeval times. Mr. G. R. Wright exhibited a leaden bulla of Pope Gregory XI., found at Spitzerley, Norfolk, in the ruined wall of a conventual building, some notes of the history of the latter, prepared by Mr. Proctor Burroughs, being read. Mr. A. Cope described an early cross at Dunblane, carved on a massive monolith, probably of earlier date than the cross. The concluding portion of the Rev. G. F. Browne's paper on the cross in Leeds Church was then read. The proceedings were brought to a close by a paper on the old signs of the shops in Peter-noster-row, by Mr. Syer Cuning, F.S.A. Scott, read by Mr. Loftus Brock, F.S.A. The rise and progress of many bookselling-houses was traced, and references given to books published and tokens issued.

National Art Training Schools.—The students of the National Art Training Schools held their annual *soirée* in the galleries of the South Kensington Museum on Wednesday evening last. There was a large gathering of past and present students and their friends, who passed a pleasant evening in the congenial atmosphere of the place. The large lecture-theatre, during the distribution of the prizes, was only accessible to prize-winners, and a few favoured friends, but was, nevertheless, well filled, and the applause which greeted each name was general and generous. Two several concerts were given by the Art Students' Choir to crowded audiences, in the lecture-theatre, and an instrumental concert by the students and their friends in the Sheepshanks Gallery, and in the intervals Mr. Clifford Harrison gave some clever and much appreciated recitations. Notwithstanding these attractions, the picture galleries were always filled with interested visitors, and the land which performed at intervals in the Italian Court attracted considerable numbers.

The Tenders for the Champion Infirmary.—We published the list of tenders for this building in our last (p. 363). A meeting of the St. Saviour's Board of Guardians, on the 5th inst., exception was taken by some of the members to the passing over the lowest tender, between which and the next-acceptance there was a difference of nearly 3,000. Mr. Hilton (after vainly endeavouring to obtain a resolution rescinding the tender) at the previous meeting according to the terms of Messrs. Kirk & Randall, on the ground that it was not in conformity with the terms of an advertisement at the time it was opened, notified that the sureties offered by Messrs. Kirk & Randall should not be accepted. The Rev. S. Wallace said he was going to vote against the sureties, because he thought the action of the Board on the previous week was *ultra vires*. Mr. Henley moved that the names should be referred to a committee to inquire into the position of the proposed sureties. Mr. H. seconded this proposition, which was agreed to it being understood that the committee would report to the next meeting of the Board. The clerk read a letter from Mr. Wall, in which the writer said he could not understand why the tender was not accepted. He desired to know the grounds on which the Board based their decision. After some discussion, it was determined to acknowledge the letter only.

The Mersey Tunnel.—Alleged Land Subsidence at Birkenhead.—The *Liverpool Post* reports that for some time past several subsidences have taken place in Hamilton street, Birkenhead, at the end nearest to Haymarket, in consequence of the excavations going on underneath the thoroughfare in connection with the Mersey Tunnel. The result has been that the gas and water-pipes have become there once broken, and the walls of some of the buildings on each side of the street have been cracked in an alarming manner. Early on Sunday morning another subsidence occurred, which was termed another subsidence of any.

TENDERS.

For the erection of the new law courts, offices, the engine station, residences, and firemen's cottages for the Corporation of Nottingham. Messrs. Veitch & H. architects. Quantities by Messrs. Howden, Berriell & Barnes, Nottingham.—

Doubling Freestone.
 The stone from these quarries is known as the "V. Beds," and is of a crystalline nature, and doubtless one of the most durable stones in England. It is of the same crystalline nature as the Chalybeate, but finer in texture, and suitable for fine mouldings.
THE CHELYNCH STONE.
THE BRAMBLEDITCH STONE.
HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone is supplied in large quantities at short notice. Prices, and every information given on application to CHARLES TRASK & Co., Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C.

Doubling Free Stone For prices, &c. address S. & J. STONE, Quarry Owners, and Lime Merchants, Stoke - under - Ilminster.
HAM HILL STONE, and Lime Merchants, Stoke - under - Ilminster.
BLUE LIAS LIME (Ground or Lump), Ilminster.

Ham Hill Stone! Ham Hill Stone For Ham Hill Stone of best quality and cheapness, apply to JOHN HANN & SON, Quarry Owners, Montacute, Ilminster. Established 1837. Agents, MATTHEWS & GEARD, Abchurch-lane, London. Wharf, Regent's Park Basin, N.W.

Asphalte.—The Seyssel and Metallurgical Asphalte Company (Mr. H. Glenn), Oldbury, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, ware-houses, floors, flat roofs, stables, cow-sheds, and granaries, tun-rooms, and terraces.

Asphalte.
 Seyssel, Patent Metallic Lava, and White Asphalte.
 M. STODART & CO.
 Office:
 No. 90, Cannon-street, E.C.

EVERY DESCRIPTION OF SEASONED WOODS AND VENEERS IN EXTENSIVE QUANTITIES.

Report of the Royal Commission on Metropolitan Sewage Discharge.

AGREEABLY to the intimation made in a brief notice in the *Builder* of the Report of the Royal Commission shortly after its publication at the close of last year, we proceed to lay before our

readers a summary of its contents, dwelling more particularly on some of the interesting facts elicited in evidence, which, until clearly established by more recent and special observations, have not been generally apprehended.

The Report certainly justifies the interest with which it has been awaited, while the quantity and quality of the evidence collected together testifies to the laborious and careful manner in which the inquiry has been conducted. Commencing with a most complete history of a question which has been in agitation more or less for forty years, the Report proceeds with an exhaustive explanation of the circumstances which led to the adoption of the system now existing, and closes with suggestions of a possible solution of the problem which has hitherto baffled the ingenuity of any of the cleverest minds in England. That the problem still remains unsolved indicates an extreme difficulty with which the question is surrounded, the principal cause of that difficulty being undoubtedly the unavoidable necessity of remedying rather than removing existing local defects, and the impossibility of dealing with it on an entirely new basis. Were it practicable to sweep away all the unfortunate arrangements of our forefathers, and to commence *de novo*, the problem could be worked out with comparative ease; but, as the Commissioners observe, so drastic a proceeding would involve not only an enormous expense, it would necessitate so much interference, and give rise to so many inconveniences, that it could create an opposition which it would be impossible to overcome.

The attention of the Commissioners was directed to three distinct subjects of inquiry,—

1. The system under which sewage is discharged into the Thames by the Metropolitan Board of Works.
2. Whether any evil effects arise therefrom; and
3. In that case, what measures can be applied for remedying or preventing the same?

Dealing primarily with the first two of the subjects, the First Report, which was issued at the beginning of last year, is confined to the conclusions resulting from the evidence taken

on these two points. As the Metropolitan Board of Works considered the inquiry almost equivalent to putting them on their trial, that body applied for permission to appear by counsel, and as such a privilege could only be granted alike to all the parties interested, the Commission to all intents and purposes constituted a Court before which the most eminent counsel exercised their talents in pleading for their respective clients. But may it not be asked here, Is such a method of conducting an inquiry absolutely indispensable? Is it not possible for a Parliamentary Commission to be so constituted that its members should be capable of taking evidence and forming a judgment thereon without all the tedious accompaniments of cross-examination, and, in many cases, the futile attempts to confuse a witness and lead him to contradict himself on points of detail, which, after all, affect but little the main issues? It is impossible for an outsider to read the evidence in the present instance without perceiving that many questions were put to the various witnesses, not so much for the purpose of eliciting information as for trying to invalidate previous statements, though such had been made by experts thoroughly conversant with the subject on which they had been examined. A style of cross-examination adopted towards witnesses of the "Winkle" type is scarcely suitable to be used towards professional men of acknowledged ability and experience like Mr. Baldwin Latham, and it is surely matter for regret that counsel should be allowed to occupy the time of the Commission in endeavouring to prove that the "recorded observations" of such an authority are "absolutely worthless," and "as not worth the paper they are written upon from beginning to end." That it was sheer waste of time is clear by the Commissioners' decision that though there might be apparent anomalies in the recorded observations of Mr. Latham, arising from accidental causes, "there is no doubt of their good faith, and, as a whole, of their hearing evidence of trustworthiness, and as representing what they professed to represent."

Part I. of the Report commences with an historical notice in regard to the drainage of London of all the measures proposed or adopted from the beginning of the sixteenth century to the present date. Never before has a record of this subject been presented in so complete and readable a shape, and its perusal serves to show under what great difficulties and amidst what conflicts of opinion the existing drainage system had to be decided upon. The needs of our metropolis, moreover, had thirty years ago become so urgent that the Metropolitan Board of Works were compelled to undertake some scheme without further delay,

and though its weak points have since become apparent, the Commissioners have recorded their opinion that, under the pressure of the attendant circumstances, the Board were justified in adopting Sir J. Bazalgette's design; and further, that whatever differences of opinion there may be as to particular parts of that design, there is no question as to the excellence of the construction of the individual works.

The total cost of the Main Drainage works, according to the Board's Report, amounts to 4,600,000*l.*, while the cost of the "further relief works and extension of the reservoirs" is estimated at 1,650,000*l.* more, raising the total expenditure to 6,250,000*l.* as against the original estimate of Messrs. Bidder, Hawksley, and Bazalgette of 2,300,000*l.*, and of the Referees' alternative scheme of 5,437,000*l.*

Before, however, the present scheme was finally adopted, it was submitted to the consideration of a committee of Referees, who, while agreeing on the main principle,—that of interception from a higher level, and pumping from such levels as were too low for a gravitating discharge, yet differed as to the details in which those principles should be carried out. The most important modification of the Referees was as to the discharge of the sewage, in removing the outfalls to a point much lower down the river, where it would be rapidly and certainly mixed with large volumes of water and be finally carried into the sea. That plan necessarily involved a large amount of work, and a proportionately increased expenditure, as noted above. Their Report was severely criticised by the advisers of the Metropolitan Board, who strongly objected to the scheme of the Referees, and ultimately rejected it under pressure from the principal Vestries and District Boards, and, as it has proved, under the mistaken conviction that the ratepayers would be unduly burdened by its costliness. As events have turned out, however, the wisdom of this objection has not been justified, for the very evils which the Referees predicted, and which their recommendations sought to avoid, have come to pass, while the cost for remedying them will, even if the estimates are not exceeded, surpass that of the Referees by nearly a million sterling! It is little wonder, then, that the controversy is not yet closed, and that it has been scarcely yet divested of the "acrimonious and personal tone" which it had assumed in its early stage.

The weak points of the present system are represented to be (1) the necessity for a large provision of storm-outlets, and (2) the discharge of the sewage in its natural crude state. On the first point, notwithstanding the statements of the Board's advisers to the contrary, the Commissioners justly arrive at the conclusion

that it is impossible to lose sight of the important fact that an expenditure is now going on of the large sum of 1,500,000. for additional "relief sewers" with storm overflows discharging within the metropolis; and that "the discharges of sewage from the storm overflows are frequent and considerable, and that they are occasionally of very offensive character."

On the second point the Commissioners observe that it was always understood that deodorisation would be resorted to, and that it is owing to the failure to carry it out that the Board of Works is now blamed. How far the evil is remediable is discussed in their second Report.

The next subject of interest treated is the distribution of the sewage in the river by the various motions of the water. Its importance is evident from the fact that no less a volume than 19,000 cubic feet per minute is discharged into the river at the two outfalls of Barking and Crossness, and, of course, the interest of the question lies in what becomes of that large volume of sewage after it enters the river, and in what manner it may be distributed about by the various hydraulic currents it encounters there. Herein lies the crucial point of determining the best position for the outlets, and round this, as may be supposed, the battle of the contending parties has most fiercely waged. As, however, a settlement of the question does not depend on any theory, but can be arrived at only by a series of experiments and observations of actual facts, there is, seemingly, not much room for divergence of opinion; nevertheless those very observations, specially carried out for the Committee by Mr. Latham, were sought to be branded as "worthless." So far from being unreliable, the Commissioners declare that they clearly demonstrated the extent and range of the tidal oscillations,—the maximum range recorded at spring tides being 18 miles and the minimum at neap tides 7 miles, the mean of the whole being about 12½ miles. Floats started from the northern outfall at varying stages of the tide ascended, with subsequent flowing tides, to distances of between 7 and 22 miles, clearly proving that, at whatever time of tide the sewage is discharged, some of it may, under certain conditions, be carried up the tidal oscillation alone into the heart of the metropolis, and even further.

There is, however, another force in operation termed "the mixing action," that is, the gradual commingling of the fresh with the salt water, which very materially influences the distribution of the sewage in the river. The proof of this action, and at the same time the means of its quantitative determination, are, it is said, furnished by the amount of *chlorine* in the water, so that the relative quantity of sea water, land water, and sewage can be determined in a given sample of river water, and this discovery has led to the detection of sewage having been carried with the "mixed water" as high up even as Chiswick. But the most startling result indicated by the chlorine test is that the proportion of the sewer liquid contained in the river in the neighbourhood of the outfalls approaches in dry seasons to one-sixth of the volume of the river! The Metropolitan Board, however, assert that a wide distribution of the sewage is favourable to its more rapid oxidation and purification, and that, therefore, in time the discharged fluid is deprived of its offensive properties. This may be admitted, but manifestly the value of the assertion is limited by the time which must elapse before the nuisance ceases.

In regard, then, to the evils resulting from the existing systems of discharge, while declaring that there has been no evidence to lead them to believe that any substantial nuisance attributable to the metropolitan sewage is complained of below Gravesend or above Greenhithe, yet the Commissioners say that it is impossible not to be satisfied of its real existence, and that the effects of the sewage discharge are more or less apparent at all times; that from a considerable distance above to fifteen miles below the outfalls fish have disappeared from the river; and that though there is no evidence of any evil results to the navigation of the Thames by deposits from

the sewage discharge, yet that this discharge adds largely to the quantity of *debris* in the river.

Besides receiving the evidence of others, the Commissioners took the evidence of their own senses by personal inspection of the river, during the summers of 1883 and 1884. The evils which existed in 1883, when there was an abundance of land water diluting the sewage, were found to be greatly intensified during the exceptionally dry season last year. The proportion of sewage liquid in the river near the outfall, which in 1883 amounted to nearly 12 per cent., reached last year 17 per cent. at high, and 28 per cent. at low water. Even within the metropolis it was found at high-water as large as 6 per cent. The sea-water also penetrated as high as Chiswick, that is, 50 to 60 miles from the mouth of the river, and then with a reduced inflow of land water the sewage remained a much longer time in the river before being carried out to sea, so that with the constantly accumulating discharges it culminated in virtually rendering the Thames, between the months of June and September, a huge cesspool, which, in the words of one of the Commissioners, was "a disgrace to the metropolis and to civilisation." It was time, indeed, to declare that "the public interest requires that a remedy should be applied with the least possible delay."

Valuable and interesting as is all the information contained in the first Report of the Commission, yet the attention of the public is more particularly concerned in the views and decisions on the third point of their inquiry, the measures to be applied for remedying or preventing the evils resulting from the present system,—in other words, the disposal of the sewage. It is almost with a feeling of disappointment that we read, that after taking the evidence of twenty-seven witnesses, and themselves personally inspecting the various processes actually practised in various towns, the Commissioners feel themselves "compelled to express their regret at the obscurity in which, after so many years' study and discussion, and after the large experience that has been gained, the subject of sewage treatment appears to be still involved," and that they, therefore, "conceive that their duty will be best performed by stating the various plans that have been proposed or suggested as possible remedies for the existing evils, adding such remarks as seem to be useful in forming a judgment upon them." There is an uncertain ring in this declaration which seems to convey an impression that the Commissioners themselves are not perfectly satisfied as to the successful issue or the finality of the measures they suggest. In so far that it brings all the various proposals under one view, and discusses their respective merits, the Report is valuable in enabling the public to judge of those merits; but there is an absence of the authoritative conviction, which alone can command entire confidence in the skill of the physicians called in to consult over a desperate malady. Perhaps the public must rest satisfied with the completeness of the diagnosis, and trust that the remedies which have been suggested rather than prescribed will work the desired cure.

Before examining the various proposals which have been made for the treatment of the metropolitan sewage, the Commissioners discuss two points which have a very important bearing on the question:—

1. The separation of the sewage from the rainfall; and
2. The prospect of profit by the utilisation of the sewage.

As has already been observed, the impossibility of carrying out the first in the case of the metropolis owing to the necessity it would involve of remodelling the whole of the house drainage at an enormous expense, constitutes the main difficulty to be encountered in designing an effective sewerage scheme; but there is no reason why the "separate system" should not be carried out in all extensions of the metropolitan area. The preponderance of the evidence is conclusive on this point. For though it is quite true that surface drainage, both from town and agricultural areas, must

contain more or less impurity, still by its separation from the actual sewage it allows of the latter being more easily and economically dealt with in its concentrated form.

The second point has given rise to a great deal of discussion, but the logic of facts has led to the almost universal conclusion that, as far as actual experience goes, the positive manurial value of town sewage is so small as not to be worth the cost of carriage, even for moderate distances. Except in very occasional cases, as for instance that of Edinburgh, which, according to Sir R. Rawlinson, could not be applied to the Thames, the application of sewage to land has not been attended with the profits anticipated. Mr. Latham particularly quotes the case of the Croydon farm, where as much as 12,000, have been lost in some years, notwithstanding its favourable position for the disposal of the produce raised.

The only plan hitherto attended with any really successful results is that practised by Mr. Bailey Denton, whose book on the treatment of sewage by "intermittent filtration" was lately reviewed in the *Builder*.

As regards chemical treatment, with the exception of the Aylesbury farm, regarding which, as the Commissioners observe, there is something very unintelligible in the value claimed for the precipitate, the conclusion arrived at is that it is not probable that any marketable manure can be obtained by it, the only possibility being that the precipitated matters might be made to yield some little return in diminution of the cost, and even that is problematical.

On the whole, considering the fact that sewage does contain elements of value, and that the aggregate quantity of the metropolitan sewage is so large, the Commissioners are of opinion that the possibility of realising some of that value should be borne in mind in devising plans for its disposal, and that, as far as is yet known, its application to land seems the probable mode by which this can be done, but that proceedings to free the Thames from pollution must be undertaken irrespective of the question of cost or returns.

While inclining to that belief, the Commissioners proceed to discuss six possible remedies which have been suggested for the evils of the present system of discharge:—

1. The principle known as "Broad Irrigation."
2. Filtration through porous land.
3. Clarification and consequent partial purification.
4. Precipitation and subsequent application to land.
5. Removal of the outfalls farther down the river.
6. Removal to the actual sea coast on the north side.

On the first head the conclusions arrived at are, that although applicable and possibly satisfactory, as well as profitable in the case of small towns, it would be impracticable in the case of the metropolis, owing to the vast area of land required, viz., 40,000 acres, at the lowest computation.

The second remedy the Commissioners think might, with some modification, be applicable, inasmuch as the process seems to be more efficient and certainly more economical in the item of land.

As regards precipitation processes, they would certainly effect an improvement on the existing state of things, but they are insufficient of themselves to purify the river. The annual cost would be at least 200,000, equal to 1s. per head of the population; but its great advantage consists in the ability to bring it into immediate operation, and, when desired, to discontinue it at a comparatively small loss.

A combination of precipitation with filtration through properly-prepared land the Commissioners believe to offer the most feasible, though somewhat expensive, means of solving the problem, for thereby the objection to simply chemical treatment will be obviated by removal of the cause of injury to fish and of danger of contamination of the adjacent subsoil.

As regards the fifth remedy, the Commis-

ioners conceive themselves warranted by the evidence in stating that it would be advisable to remove the outfalls to a point lower down the river than that named by Sir J. Bazalgette, and where facilities are asserted to exist or clarification; but they pronounce emphatically against the admission of sewage in its crude state into any part of the estuary of the Thames from the Nore upwards, though, if properly clarified, it might be discharged below Hole Haven without risk of serious nuisance.

On the sixth remedy, as proposed in the scheme projected by Messrs. Maclean and Stillman in 1849, and condemned by the Referees, to whose notice it was submitted in 1857, and as contained in a similar proposal by The Metropolitan Sewage and Essex Reclamation Company, though supported by Mr. Latham, the Commissioners pronounce a decided negative. A *résumé* of the conclusions and recommendations of the Commission may be stated shortly thus:—

That it is unnecessary and unjustifiable to discharge crude sewage into any part of the Thames, but that processes of precipitation or deposition may be conveniently applied at the outfalls, and the liquid resultant may, as a preliminary and temporary measure, be suffered to escape into the river between high water and half ebb of each tide, the orifices being not less than 6 ft. below low water of lowest equinoctial spring-tides; but for a permanent measure that liquid should be further purified by intermittent filtration through sand, of which, it is believed, sufficient may be found near the outfalls, and if not, then the sewer liquid should be carried down to at least as low as Hole Haven.

These recommendations were criticised by Captain Galton in his recent lecture before the Society of Arts as dealing insufficiently with the fact of the ever-varying strength of the sewage liquid, and with the increasing volume which will have to be dealt with, estimated at 3,000,000 cubic feet in twenty years; also that if the final result of the deodorisation and filtration is to return only a portion of the effluent pumped to the river at a present cost of 4,500,000*l.*, which will have to be increased no distant date to 6,000,000*l.*, additional to the 1,500,000*l.* now in course of expenditure, might be simpler and cheaper to adopt the use of a modified deodorisation suggested by the Referees, *i.e.*, dilution of the sewage combined with its flow through many miles of long tidal channels at a cost of 2½ millions sterling.

Inasmuch as the principal difficulty of dealing with the London sewage arises from the concentration of so exceptionally vast a mass at various points on the river, it seems to suggest the advisability of not attempting to deal with the whole of that mass in any one particular mode, or by any single process. Is there any real impediment to dealing with it in detail, and so availing ourselves of more than one of the several processes, which, although not strictly and commercially successful, have nevertheless practically mitigated the difficulties of sewage disposal? It is acknowledged on all sides that the nuisance must be got rid of at any cost, and as quickly as possible. Would it not, then, be practicable to commence with deodorising and precipitating processes of say one portion of the present volume, carry off another portion on the plan of the Referees, and convey a third right away to the coast, as recommended by Mr. Latham, to be there utilised by private enterprise? By thus dispersing the volume the difficulty of dealing with the accumulated quantity at one point is removed, and the probability of obtaining some value for the annual residuum in diminution of the annual outlay rendered more possible and feasible. In the principle of dividing an enemy's forces, and beating them in detail, may not the metropolitan difficulty of sewage disposal be thus overcome?

Though the suggestions of the Commission are scarcely to be said to amount to a definite solution of the problem set before them, yet the public are much indebted to them for their very able, exhaustive, and interesting report.

NOTES.

T seems that the railway rates question is once more to be referred to a Royal Commission. Mr. Chamberlain stated in the House on the 13th that the railway companies had agreed to this course being adopted, providing that the inquiry be limited to rates and terminal charges without prejudice to other matters. Mr. Chamberlain suggested that the Commission should consist of the Railway Commissioners and two representatives of the railway companies and the traders; intimating also, that the question of preferential rates would be made the subject of special legislation. Both the Railway Association and the Railway and Canal Traders' Association held meetings on Monday last to consider this fresh aspect of affairs. The former merely passed a resolution pressing upon the Board of Trade the necessity of two disinterested statesmen of eminence being appointed members of the proposed Commission; while the latter considered it inexpedient and unfair to send the Bills to a Royal Commission at all, as such a course would entail on opponents all the expense that would be incidental to a contest before a Parliamentary Committee. Their opinion as to the scope of the inquiry is that it should be limited to the cost of conveyance of the articles scheduled in the Bills and the rates charged for such articles in England and other countries, in order to arrive at a just basis for a uniform classification. It, therefore, appears extremely unlikely that the matter will be settled for some time to come, as these inquiries have always proved to be very protracted, and there are already indications of difference of opinion as to the constitution and duties of the Commission.

THE proposal of a Royal Commission on Railways, to be built out of the elements of the existing Railway Commission, two representatives of the traders and freighters, two representatives of the railway managers, and two (if such can be found) of the independent wealth and statesmanship of the country, is of course an improvement upon the prospect of an interminable series of contests before nine or ten committees of each House of Parliament. But it is, at the best, an amateur treatment of a great national question. A commission, or a committee, as generally constituted, may, to a certain extent, thrash out the facts, but it does so in the form of a squabble. The anxious care that the members of the committee who represent the interest sometimes take to close the mouths and discredit the testimony of the witnesses called by B, is, in cases easy to point out, nothing short of scandalous. Opposing counsel sit on the bench, and try to guide the case each in his own way. In France, Germany, Italy, or almost any other civilised state, the first step to be taken in such a question is to call for the report of a competent expert. Were this done now, or even, if there be difficulty in fixing on a man of sufficiently commanding character, were two reports called for, one from the companies and one from the traders, a judicial body, however constituted, would have the materials for a calm investigation placed before them, far better than by the *ex-parte* statements of hostile counsel. An indefinite amount of time and of cost would be saved. And there would, at all events, be the satisfaction that this great question was attacked, rather with a view to its equitable solution, than as a scramble among opposing interests.

LORD CAMPERDOWN'S Bill for the regulation of powers of water companies, which passed the second reading on Tuesday night, and will probably be referred to a Select Committee, paves the way for a very desirable check on the powers that companies now possess of cutting off supplies for non-payment of rates in advance. No doubt the companies have to do with a certain proportion of troublesome customers, but, as the Lord Chancellor observed, they have obtained the practical monopoly of one of the first necessities of life

on very favourable terms, and the very moderate proposition in the Bill, that a company should not cut off the supply except on obtaining powers to do so from a magistrate or from some court of summary jurisdiction, will furnish exactly the amount of check which is wanted to protect the consumer from oppression, while leaving it open to companies to obtain power of summary procedure in cases where they can show good cause for it. The pretence of the Bill being an oppressive one to the water companies is absurd.

THE case of Spackman v. The Board of Works for the Plumstead District, decided by the House of Lords on the 26th ult., and to which we have before referred as being of considerable importance to builders, is also of importance as giving increased weight to the decision of the Superintending Architect to the Metropolitan Board of Works as regards the general line of buildings. The appellant Spackman had been summoned before the Magistrate of Greenwich Police-court under the 75th Section of the Metropolitan Management Amendment Act, 1862, in respect of certain shops erected by him in Lee High-road, which were alleged to be in advance of the general line of buildings in that road. The Magistrate had decided in the appellant's favour on the ground that the certificate of the Superintending Architect was not binding on the Magistrate, who heard evidence and inspected the premises, and was of opinion that the buildings were not in advance of the true general line of buildings. This decision was reversed by the Queen's Bench Division on the ground that the certificate did bind the Magistrate. The Court of Appeal confirmed the decision of the Queen's Bench and remitted the case to the Magistrate to direct the demolition of so much of the buildings as were erected in advance of the general line as certified by the Superintending Architect. The case was carried to the House of Lords with the result that the judgment of the Court of Appeal was upheld.

THE effect of this decision will be to materially increase the responsibility of the Superintending Architect, who will no longer be the assessor appointed to assist the Magistrate in the case of disputed lines of frontage, but the virtual judge or arbitrator, and the only duty of the Magistrate in these cases appears, from the judgment of the Lord Chancellor, to be to register the decisions of the Superintending Architect, and to make orders for the removal of buildings erected beyond the general line of buildings. It would further appear that not only has this officer power to determine the general line of buildings in the case of buildings actually erected, but that he may also define the line with respect to buildings proposed to be erected. This will be a considerable advantage, as hitherto it has been held that the Superintending Architect was not empowered to decline a line except when some building had been erected in advance of the general line of buildings. In the Lord Chancellor's own words:—"If the matter is to depend upon the Justice, the builder and the Board cannot go before the Justice until the building has been erected, and you have the same inconvenience which arose under the Act of 1855; whereas, if the Superintending Architect is to decide, the two parties may settle any question before him before any expense has been incurred or anything has been done." The decision of the House of Lords gives the Superintending Architect a power possessed by no other judge or tribunal in the kingdom, as his decisions are, practically, without appeal, provided, as the Lord Chancellor observes, his judgment was honestly given and the necessary preliminary formalities had been complied with.

IN Mr. Shaw Lefevre's evidence before his own Committee on the restoration of Westminster Hall, he stated that "the completion of the Westminster Palace according to Sir Charles Barry's design might be understood to be given up." Who has given it up, and when? That it will be deferred is likely enough. The object now is to prevent any-

thing being done which will stand in the way of its completion. The proposed "cloister" treatment of Westminster Hall, as now seen in the model, would not do so, though we regard it as "playing at architecture"; the paltry new building, proposed to stand at right angles to the north end of Westminster Hall, would stand in the way, and, as the Committee have not ventured to erect a canvas representation of that structure, we hope we may regard that as "given up." The completion of the cloister design, if carried out, and if Westminster Hall be left exposed to view, would emphasise the discrepancy between the scale of these details and those of Barry's building. The public who take any interest in architecture will hardly support the idea that the completion of a great national building is to be declared impossible because the Ex-First-Commissioner of Works does not like to be contradicted.

DISCOVERIES of considerable interest have recently been made at Eining, which is, presumably, the site of the ancient town Abusina. The excavators have lighted on a large Roman villa with extensive baths. Besides countless architectural matters, which in the arrangement of the heating apparatus have considerable technical interest, relics more distinctly human have been found. Among these are the skeleton of a woman, with by her side a jug, a glass urn, and tear-bottles, the last offerings to the dead; also the apparatus of her toilette hair-pins, pearl necklace, and bracelet; some slight sculptural remains, a woman's head in marble, and a votive stone to the honour of "Dea Fortuna Augusta Faustina," with an inscription of four lines; also a number of weapons, coins, rings, fibulae, spoons, and some tiles with Roman stamps.

IN the course of excavations at the Propylæa at Athens a number of cornice mouldings, made of porous stone, have been discovered. There seems little doubt that these belong to the older Propylæa, and that when the new building was erected, in the fifth century B.C., they were used, as was so often the case, as building materials. The stones are in excellent preservation, and have been brilliantly coloured in red, blue, and gold. They will, therefore, serve as valuable instances of decorative architectural painting. The account of these discoveries in the "Berliner Philologische Wochenschrift" is accompanied by a sketch of the south wing of the Propylæa, conjecturally restored and seen from the south-west. The new restoration, based on these recent discoveries, differs materially from that of Bohn, but the sketch given in the German paper is so exceedingly bad and meagre that it is hardly worth dealing with seriously.

A NEW society of artists is about to be founded at Paris, that of the Pastellists. Besides other eminent names among its founders, we notice those of MM. Baudry and Boulanger, of the Académie des Beaux Arts, and those of MM. Cazin, G. Duhufe, Duez, Jules Lefebvre, Émile Lévy, Th. Rousseau, and M^{me}. Madeleine Lemaire. The society, of which M. Roger Ballu is President, will open an exhibition in the April of each year, at the rooms of M. Georges Petit, its vice-president, in the Rue de Saxe. The first exhibition will open on the 1st of April next, and will include a very interesting collection of works by French masters of the last century.

THERE are some very good pictures to be seen at Messrs. Arthur Tooth & Son's Galleries in the Haymarket, notably two by Gérôme, "In the Desert" (26), and "The Bath" (109). The first represents a bright bay Arab horse lying with his head in his master's lap, apparently fallen from exhaustion; the horse is "and on" to the spectator, and the drawing and painting of the animal in this extremely difficult position form a triumph of technical power such as is not often met with. "The Bath" represents a blond girl kneeling on a seat by the bath waiting to receive a douche from a negro attendant in bright orange turban. Neither

picture has a grain of feeling; but, as representations in painting of the human animal and the equine animal respectively, they are perfect. Among other painters represented are Edouard Frère, Israels, Van Haaften, De Blass, Denly Sadler, Leader, Brett, Heffner, Th. Weber, &c. There are some good small architectural bits, especially a "Venice" by L. Senét. Four hunting-pictures, by Mr. T. Blinks, representing "The Run of the Season," are admirable studies of dogs in varied action.

THE proposal of Lord Brabazon, on behalf of the Public Garden, Boulevard, and Playground Association, to find work for the unemployed in laying out fresh squares and other places which are now in a neglected state, is a suggestion which may be said to be sound as well as philanthropic. The amount of work to be found is, of course, limited, but a good deal may be done with permanent benefit to the community. A lady has given 1,000*l.* to be expended in this manner, and Lord Brabazon hopes to find other funds forthcoming.

THE collection of Frederick Walker's water-colour drawings at Mr. Dunthorne's Gallery, in Vigo-street, is not quite as important or complete as we had been led to suppose, and we looked in vain for some well-remembered favourites. But even so much of Walker's work as is shown here is enough to afford more matter for study and pleasure than most exhibitions of a much larger size afford; there is nothing that is not masterly in its way. It serves to remind us again, rather sadly, what a genius was lost to English art, and what a great career cut short, by Walker's early death.

AT the Fine Art Society's room is to be seen a charming collection of sixty three drawings, by Mr. Alfred Parsons, illustrating "Shakespeare's River." These are various sketches on the Avon, many of them rather finished drawings, illustrating some beautiful bits of English scenery, and some of the best qualities of landscape art on a small scale. An account of the trip, given by the artist in a pamphlet accompanying the catalogue and embellished with some woodcuts, furnishes a general commentary on the collection, the drawings of each place mentioned being identified by marginal numbers.

AT the business meeting of the Institute on Monday, when a memoir of the late Mr. Hadfield was read, a number of his designs for churches were exhibited, which illustrate some of the best class of work of the Gothic revival, now a thing of history, but still dear to the memory and associations of many of us.

IF the drawings by Mr. G. W. Allan, member of the Scottish Water-Colour Society, which are now on view at Messrs. Dowdswells, represent anything like the average level of work among the members of that Society, it is artistically in a very flourishing condition. Mr. Allan has collected a series of drawings made in Venice, Spain, France, England, and Scotland, his native country rather predominating in the selection. These are drawings in a genuine water-colour style,—free, broad, and powerful for the most part; and many of them are of considerable interest to architects from the admirable delineation of some out-of-the-way bits of picturesque architecture with which few people on this side the Tweed are practically acquainted. Among these are the drawings of "St. Monan's Parish Church" (49); "Old Town Hall, Grail" (34); "Pittenweem Parish Church" (7); "High Street" of the same little town (47); and the better known "Elgin Cathedral" (1). There are some good Thames and Venetian studies also.

THE "Society of Lady Artists" opened their annual exhibition in Great Marlborough-street this week, the private view being last Saturday; but we regret to say the quality of the exhibition does not tend at all to modify the opinion we have hitherto expressed that no good artistic object is served by the existence of the society. Scarcely any of the really able

lady artists of the day are represented there at all; and the few works which one pauses to look at are all by those who do not require a special society to make them known (Miss Kate Macaulay, Miss Linnie Watt, Mrs. Marrable, and others). The bulk of the work only shows that there are a good many ladies who take pleasure in painting, but who would have no chance of a place in high-class general exhibitions. Any woman who has attained real artistic mastery and power can find a place for her works in general exhibitions, by the side of the works of men, "without distinction of age or sex." There is no pretext, therefore, for saying that women need an exhibition of their own to make their talents known. The majority of the works that are hung here would be refused in the best exhibitions, not because they are by women, but because they are deficient in artistic power and interest. Then why exhibit them?

THE erection of the new buildings at the High School, Edinburgh, as formerly described in these columns, is meeting with considerable opposition. At a meeting of the Committee of the Town Council an opinion was expressed that the erection of the proposed gymnasium and janitor's lodge would destroy, to a certain extent, the architectural completeness of the building, and proposals were made as to the propriety of taking active steps to prevent their being erected.

IT is not generally known that, according to the original plan, Princes-street was to have a continuous row of buildings on both sides. This was most fortunately prevented, but a beginning was made at the east end by the erection of what are called the new buildings, to the west of the General Post Office. The back of these buildings faces the west, and is far from tightly. The ground immediately behind them, which was occupied originally by stables, &c., has been acquired by the North British Railway, and upon this ground the Company proposed to build a hotel. This proposal caused an outcry from neighbouring proprietors, but it appears that the city does not possess a servitude over the ground. The erection of a hotel here would, if carried out in an appropriate manner, form a happy termination to the east end of this fine street. A proposal has been made that advantage should be taken of the proceedings of the railway company to have the line of frontage of the new hotel thrown back to the same line as that of the north façade of the Post Office, an improvement much needed at a point where there is frequently a conjunction of traffic, and which, if not carried out, may be a subject of lasting regret.

IT has been determined to remove *en masse* to an adjacent site the large house in Whitehall which was lately occupied by Lord Carrington. Careful estimates have been prepared, the necessary funds have been provided, and the responsibility for the work has been placed upon Major-General Sir Andrew Clarke, R.E. The house stands upon Crown property, and is one of the very few domestic works of the architect, Sir Wm. Chambers, which remain intact. Its exterior presents nothing architecturally remarkable; but the beauty of the interior is well known, and was partially illustrated a few months ago in the *Builder* (Aug. 9, 1884). There has of late years been too much activity on the part of the destroying angel, and many houses of great historic interest (amongst them the several residences of Milton, *e.g.*), which might have been wisely preserved for our posterity, have wholly disappeared. It is time that some effort should be made in high places to discountenance the wholesale destruction which has heretofore been going on around us. It is, therefore, with peculiar satisfaction that we regard this attempt to save from the spoiler one, at least, of the many characteristic works of our ancestors. It is estimated that structures of the class to which Lord Carrington's house belongs, may be removed hothly for one half the sum they would cost to rebuild. The intended experi-

ment in Whitehall, although common enough in America, is a novelty with us, and will be watched with general curiosity.

THE Burlington Fine Arts Club have got together in their well-known room a very valuable and interesting collection of examples of Persian and Arab art, the aim of the exhibition being to illustrate especially the more important phases of the art of Persia, "and its effluent arts of Damascus and Rhodes." Ceramic art is most fully represented; but there are also some beautiful examples of metal, some of them of special interest in regard to form and character, and, among the limited amount of textile fabrics to be seen are one or two specimens of remarkable beauty of design and execution. The catalogue is prefaced by a short analytical essay from the pen of Mr. Henry Wallis. We shall return to the subject, and consider the collection more in detail, the crowded state of our columns precluding any lengthened notice of it this week. Among the contributors to the collection are Sir Frederick Leighton, Mr. Holman Hunt, Mr. William Morris, Mr. G. Aitchison, Mr. Ionides, Mr. Louis Huth, and a good many other members of the club.

THE COMMONPLACE OF ARCHITECTURE.*

THE subject I have chosen for my lecture is certainly not the most attractive that could have been selected, and even seems to require some apology, for commonplace at first sight does not promise to be interesting. Lectures on architectural subjects generally deal with the grander side of architecture and its higher branches,—with buildings on a large scale, with the use of costly materials, or with sculptured and other adornments in stone, marble, wood, glass, or metal; and, as a rule, it is very proper that it should be so. When a subject has to be mastered we naturally attack first that side which seems to present it to us in its fullest development and in greatest perfection. If we want to study the poetry of our own or another language we naturally read first the great and not the minor poets. By studying the great masters, who are the recognised authorities, we very reasonably suppose we shall obtain a true idea of the nature and the scope of the national poetical style much more readily than if we began at the other end with the ballads and popular literature, or even the second-rate poets. And in the same way with painting; masters in each school first, and leaves for future and supplementary study that of their followers or less conspicuous companions. It is, therefore, very proper for architectural students to acquaint themselves first with what may be called the monumental architecture,—that of the great public monuments of the art in their own country and abroad, and to learn from them what architecture is at its best; for it is in them that they may expect to find it at its best, not only because those buildings are larger and more splendid than others, but because, being more important, it is natural to suppose that the most skilled workmen of the day were called to work upon them, and that they are, consequently, the fruit of the ripest experience of their style and age.

And yet while we study our art in cathedrals and minsters, palaces, and public buildings, it is obvious that very few indeed among us can expect an opportunity of erecting great architectural monuments of this kind; and while we study in museums the more delicate and exquisite triumphs of the minor plastic arts with which an architect has to acquaint himself, goldsmith's or silversmith's work, enamels, inlays, and the finer work of the chisel, or of the modeller in bronze, it is possible that we may very rarely have to make any direct use of our studies by designing or directing work of this elaborate and expensive nature. The knowledge of ecclesiastical architecture which we have acquired in the fanes of Rome, Vienna, or Amiens, or those of York, Ripon, and Beverley, or among the ruins of Fountains, Rivaux, and Byland, may never be called upon for more than a modest village church; and our know-

ledge of civil or domestic architecture gathered from the stately piles of Rome and Florence, or on the banks of the Grand Canal, or nearer home at Kirby, Knole, Andley End, Hampton Court, and Burleigh, or in the academic halls of our ancient universities, may never find an outlet more important than some suburban villa or small country parsonage.

There seems at first sight to be an irony in this disproportion between our studies and our performances, a disproportion to be found perhaps in all professions to some extent, but more strongly accentuated in ours than in most others. And yet it is in reality a natural and inevitable state of things. Architecture must be studied as a whole or we shall never understand the separate parts of the subject; our village churches will be ill designed unless we have studied our art in the minster as well as in humbler buildings more on the scale of our own, and we shall have small success in designing our small country-houses unless we know what can be done and has been done on a more important scale by the great masters of our art.

I would, therefore, say to the architectural student,—continue to study architecture as a whole; as an art applicable to great works and small; and to prepare yourself for whatever fortune may throw in your way. For if the high prizes and the splendid opportunities that fall only to the few should never fall to your share, knowledge and mastery of your art will be as useful to you in your own simpler work as if you had had the widest scope for its employment, and this knowledge and mastery is only to be had by the study of all that architecture has done and can do.

The student, therefore, need not be disappointed entirely, nor think his training thrown away if he finds himself confined to a less ambitious class of work than he had hoped for, and pictured to himself as entering into his future career. Like every other pursuit, architecture has its "commonplace"; and one object I have in view to-night is to point out the great importance of its commonplace side. There was no doubt a time when architecture was thought to be a luxury which only the wealthy few could command; but that time has happily passed away, and we have begun to recognise it as an art that may be applied to small things as well as great, and one whose function it is to make life pleasanter to the many as well as to the few. And as the lives of most people are necessarily commonplace, for otherwise there would be no meaning in the word, so the character of their homes to be consistent should be commonplace also; and unless architecture can adapt itself to commonplace requirements and commonplace circumstances it fails to be a popular art, and to nineteen people out of twenty it will be of no use at all.

What is it that ordinary men and women have a right to expect architecture to do for them? Its proper function is to take up the work where the art of building stops, and to provide us with houses that are not only well built and wholesome, but attractive and pleasant to live in; with churches that are not merely large enough to hold the congregation, but also decorous and solemn; with halls and places of public assembly, that besides being convenient and airy have an appearance and a dignity befitting their purpose. As long as we have eyesight and sense to distinguish one form and one colour from another we shall never think it enough that our house is substantially built, conveniently planned, well drained, and properly ventilated; all these conditions come at the beginning, they belong to the art of building, and lie outside the province of architecture entirely; they are matters of course, without which we should not be content to live in the house at all. We want something more than this: our home must be pleasing to the eye; its outline must be well imagined, its doors and windows well proportioned, its colouring harmonious, and such decorative features as we are able to afford ourselves must be artistically designed, however simple and unpretending they may be. We want pretty wall-papers, harmonious draperies and carpets, and characteristic furniture; above all, we like our house to have some individuality of character, like ourselves, who are not quite of the same pattern as other people.

All these are really very commonplace demands, and are really within every one's reach, he his means as small as you please, provided he goes to work in the right way to get it. And yet there is, perhaps, nothing more

difficult to find than a successful piece of architecture of this commonplace kind, because, as a rule, men do not go to work in the right way to achieve success within these restricted limits. On the contrary, they generally refuse to be bound by these limits, and seem to think that a house which satisfies these modest requirements does not come within the province of architecture at all, unless they add something to give it an architectural character. It is, as a general rule, precisely this addition which is the ruin of it. The requirements above named make very little demand upon positive architectural details; they afford scarcely any opportunity for them; they are even inconsistent with their presence, and if we insist on dragging them in, they destroy the appropriateness of the building to its circumstances. This is the secret of the execrable design of most of the houses built for professional or commercial men that are springing up in and near our great towns. I do not know whether Leeds is an exception to the rule, but unless it is very superior in taste to London and other English towns, your own experience will tell you that it is impossible to take a walk in the suburbs without having your eyes shocked and your temper ruffled by the vulgar architectural pretence of nearly every other house you see. The provoking thing about it is that the very persons who live in these houses from choice, or are forced to live there from necessity, do, in theory at all events, profess to admire, and in great measure honestly do admire, simplicity. What is the ideal country home that the citizen delights to picture to himself in imagination, whether he thinks he should like to retire and spend the autumn of his days? Some gray farm-house of lichen-covered stone or mellowed brick that he has seen in his holidays, some larger cottage than usual with high tiled roof, dormer windows, and rustic porch, approached by a straight walk between flower-beds and clipped hedges. In imagination, at all events, he longs for rustic simplicity. His ideal is unpretending and homely enough, and there is no reason in the world why he should not realise it if, as I have said, he goes to work in the proper way. And how does he realise his dream? or rather, how does his architect or builder, or both together, realise it for him? No simple cottage or farm-house for them. They ran up miniature turrets, containing inaccessible rooms, and covered with high steeple-crowned roofs; they round off their corners or disguise them with bay windows placed in an absurd manner obliquely across the angle of the buildings, strange excrescences that fritter away money, weaken the construction, and add nothing whatever to the commodiousness of the rooms. They crown the roof with ridiculous or useless balustrades surrounding lead flats, on which no sensible person would ever think of setting foot. They flank the little doorway with odious columns and carved capitals that seem put there to call your attention to the fact that there is an arch to be carried. The walls are bedecked with cheap terra-cotta ornaments, the gables armed with finials or hristling with spikes, the balconies and railings furnished with showy cast-iron work. But I need not exhaust the catalogue of the various splendours or offences of villa architecture. We are all, unfortunately, only too well acquainted with them; they haunt us in our walks and drives, and meet our gaze as we turn the pages of the weekly architectural papers. There are, I suppose, people who like this kind of work, or, at all events, holders think there are such people, because otherwise our suburbs would not be so constantly disgraced by it, but I think most of those who live in such houses live there because they have to put up with what they can get, from necessity and not from choice. The citizen who dreamed of a farm-house or rural cottage, although he calls his new house a grange or a farm, or a cottage, and names it after this or that tree, plant, or flower, can hardly delude himself into the belief that he has got what he sighed for, and has in fact been somewhat hardly dealt with.

It would be easy to follow this subject from the suburbs into the crowded streets of our great towns, where ordinary shops and private houses that call for no display are loaded with unmeaning ornamentation, which, if not had in itself, becomes bad because it is unmeaning, having no justification in the purposes or uses of the building to which it is applied.

But it is not my purpose to tie you with a distribe against Cockney architecture, and I should be sorry to think your Association

* A lecture read before the Leeds and Yorkshire Architectural Society on March 9th, 1885, by Mr. T. G. Jackson, J.A., F.S.A.

numbered among its members any one who required to be warned against the sins of vulgarity and pretentiousness of which it is guilty. These buildings stand self-condemned in the eyes of any one whose judgment is worth having, and although it is an unhappy fact that they are designed and carried out by men who call themselves architects, there can, I willingly believe, be no reason for my occupying your time with them any further. My object is a different one. I wish to point out that these offences against good taste and propriety would not be committed if architects and the world generally recognised the principle that architecture has a commonplace side, and that it can find plenty to do in the way of making our buildings beautiful and attractive without such violent struggles to be original and picturesque.

There are, of course, men in whose eyes architecture is a matter of orders and entablatures, columns and arches, traceries and moldings, and who cannot conceive the possibility of its existing without them; just as there have been and still are painters who think that a picture must represent some grand historical or heroic scene, or some strange natural effect, or some unusual piece of landscape, and who think ordinary scenes of every-day experience unworthy of their pencil. But we know very well what tedious dull work these painters have left us, and how little interest their ambitious canvases possess, and we gladly turn away from their handiwork to the simple unaffected pictures of nature as we know her, in which we find not only more of human interest to satisfy us, but more truth, closer knowledge of nature, and keener artistic sensibility. For it implies a certain dulness of the imagination when it can only be aroused by violent appeals; we do not need to shout except to a deaf man; and so in art extravagant designs calculated to impress vulgar observers will offend and wound those who are less thick-skinned and more impressionable. And do not forget that many modes of architectural design that are appropriate enough to monumental buildings become extravagant when applied inappropriately to commonplace objects. Architecture is good and noble only so long as it is suitable and appropriate to the circumstances or occasion of its employment, and consequently for the commonplace of ordinary life we must have a commonplace architecture.

This is merely saying in other words that good art depends on an accurate sense of proportion: that just as a good literary style depends on the nice accommodation of words to the ideas intended to be conveyed, and to the intelligence of those to whom it is intended to convey them, so a good architectural design depends for its merit on being proportionate to the dignity and character of the building, and of those who use it and to whom it belongs. If it falls in this nothing else will suffice to redeem it. It matters not how good its details are if they are inappropriate, nor how much skill and thought has been bestowed upon them if they are misplaced.

Now, those purely architectural forms which have been developed in what, for want of a better word, I have called "monumental" buildings, are clearly disproportionate and misplaced in the dwelling-houses of ordinary people of moderate means, and, consequently, they never fail to offend. The little roofs of such houses as these require no conical or pyramidal excrescences to break their skyline, nor their narrow frontage any turrets or breaks to interrupt them. Their small windows want no traceries to block them up, nor do their puny doors require shafts with base and capital to carry their insignificant arches. All these are impertinences and vulgar intrusions: they are like the cheap finery worn by people who wish to dress like those who are richer than they are: they make sensible persons reflect that the money they cost might have been much better spent in making the walls thicker or the timbers larger, or the rooms bigger, and that the house might have been not only much more comfortable but much more comely if it had been less showy. The old houses of a moderate size that so charm us in town and country had no need of any of these forced extravagances. Straight simple roofs, ending in plain gables, sufficed for them; their windows, if divided at all, were divided by simple mullions of a pattern which runs through a whole county or district with little or no variation; their doors were surrounded by the simplest moulding, or in the

later Post-Gothic style by a plain architrave surmounted perhaps by a modest hood for shelter. Indoors the same simplicity prevails: there are plain square rooms, with no intentional irregularities of shape; a methodical arrangement of plan according to a type generally accepted for buildings of that class; there is no restless attempt to avoid the ordinary way of planning; everything is straightforward, unaffected, modest, and, in a word, commonplace.

Architecture, then, may be commonplace and yet charming. Indeed, it is a question whether the total sum of pleasure which we receive from the art does not owe more to these humbler examples than to its more splendid achievements. For it is of more direct consequence to us that the homes we live in and those of our friends whom we visit should be pleasing and in good taste, than that our neighbourhood should be adorned by a few magnificent buildings. And that they may be pleasing and in good taste it is essential that their architecture, furniture, and decoration should all be in proportion to one another, and to the scale and importance of the house itself, and to the circumstances of its building. It is difficult to define exactly the limit which divides the sphere of positive architecture from that of commonplace. Indeed, it is impossible, for exceptional cases arise which defy general rule. It certainly does not depend on considerations of size, for many very large buildings, such as warehouses and railway stations, have only commonplace uses to fulfil, and nowhere are architectural impertinences more offensive than in them. And in the case of dwelling-houses it would be absurd to say that houses of, for instance, a certain rental, may be treated in a more distinctly architectural manner than those of a lower rental,—though, of course, as a rule, houses should be simpler in proportion as they are smaller. There is, however, one large class,—indeed, the largest class,—of ordinary residences, which, from its circumstances, admits only of commonplace treatment, and never falls to be offensive unless it is treated in that way. I mean houses that are built wholesale to cover a building estate, built probably by one man, very likely from one set of plans, and at one time.

It is possible that no more difficult problem could be set to an architect than the successful achievement of a large building scheme of this kind. If anything were wanting to prove that we have only to use our eyes to see what deplorable failures, from an artistic point of view, most such schemes result in. To say nothing of those cases, the most numerous of all, where the houses are designed by persons who know nothing of architecture and who would not succeed in any kind of building, the result is often very little better where an architect is employed whose work elsewhere we have had reason to admire and respect. The speculative builder asks for a design for a single house which is to be made use of over and over again some twenty or thirty or even a hundred times in the roads or streets which he has laid out. In his ignorance he supposes that if he gets a good design from a good architect his estate will be covered with well-designed houses; and so it might be if the architect had a chance of designing all the houses, but in fact he designs only one. Grant that he makes this design the best he can, and that if only this one house were built it would be an excellent piece of architecture, still the mere repetition of it so many times in close proximity is fatal. The better it would be if it stood alone, the worse it is if only one of a series, and this may be taken as an absolute rule and a very proper test for this kind of building.

In designing a single house, which is to stand among others by different hands, or, perhaps, quite alone, and especially in building for the person who is to live there, an architect may legitimately indulge himself in original fancies, and give his house a distinctive and individual character. He will consult the habits and tastes and occupations of the owner, and, if they are in any way special, he will arrange his house on a special plan; and the architectural features, however simple, will have some sort of individual character, in consequence of being designed for a particular building, and with some knowledge of those who are to live there. It is only on these terms that domestic architecture of a really high order is attainable nowadays, and it was only under the same conditions that the delightful domestic architecture of the past was produced.

But, if a house with any individuality of design such as this is taken and multiplied twenty-fold, thirty-fold, or a hundred-fold, the special features become meaningless, the original fanes cease to be original and become tedious, and the design, which pleased singly, nauseates by repetition. This seems to me the reason why building estates that are laid out and built over from the designs of really good architects are so constantly very little better than those that are built over by very inferior men of no pretensions to architectural skill. The design is made as if for a single house, and might, possibly, have been very successful in the case of a single house, and for that very reason it is ruined by repetition over a large area.

Now, it is of no use decriing the system of wholesale speculative building: it is the order of the day, and one of the necessities of our age, I suppose, which cannot be dispensed with. The people who can find the ready money required for building a house for themselves are very few compared to those who can find the means to pay a high annual rental, and it is, perhaps, impossible to build a single house at as cheap a rate as several at once. We must accept the system of speculative builders, building leases, wholesale use of designs, and all the concomitants of this extremely artificial mode of providing houses for the many, and we must try to make the best of it.

Now, do what we may, the conditions are commonplace enough, and that is the very first thing to be recognised if we are to succeed in making anything tolerable of such building as this. And if fitness, or exact correspondence with the conditions and circumstances of the occasion, is the mainspring of all good architecture, the style of such buildings must be simple and commonplace. It can hardly be too plain and too free from individuality of design. Only the simplest architectural features, and such as are most obviously connected with the construction, can on any account be allowed, and even of them the fewer there are the better. No caprices or fancies of ornament must be attempted, because, however good they may be singly, they pall by repetition; no quaintness nor picturesqueness of form will be tolerable because it is like a *bon-mot*, which becomes stale if told too often.

If it is objected that the result will be monotonous and tiresome, I reply that the monotony is inevitable whatever you do. You cannot place twenty houses of the same pattern in a row without monotony whether they be plain or gorgeous, simple or fantastic; but it is certain that the monotony will be less tiresome if they are all plain than if they are all gorgeous, or all simple than all fantastic. We must boldly face the monotony of the system and reflect it in our design, and take care to make it as little tiresome as we can. The speculative builders of 100 years ago understood this much better than those of the present day. The squares and streets with which the Bedford, Portland, and Portman estates in London were covered at the end of the last century are far more suitably designed for their purpose than the modern houses in Belgravia and at South Kensington, built by people who thought they knew a great deal better. Harley-street and Gower-street are monotonous if you like, but they are not more monotonous than Grosvenor-gardens or the other "terraces," "gates," and "squares" that have sprung up during the last twenty years to the north, east, and south of Hyde Park or Kensington Gardens; for if the former is a monotony of brown brick, the latter is a more tedious monotony of polished granite columns, stucco finery, and cast-iron trumpery. It is surely far worse to be loud than to be silent, and far better to be dull than to be vulgar.

This wholesale method of building, then, offers no legitimate sphere for positive architectural design, which would only invite attention to its monotony and emphasise its commonplace character. But it does not follow that an architect is altogether debarred from doing a great deal to make houses of this kind interesting and, even in a minor degree, beautiful. It is true he must give up the idea of any strong architectural effect, or any pronounced architectural character in the exterior, and confine himself to a rather neutral and restrained method of design, though even here he can study the proportion of his doors and windows, the levels of his string-courses and parapets,

and the vertical and lateral divisions of his elevations, so as to ensure agreeable proportions of part to part; and he can study carefully the few ornamental features for which there is occasion,—the doorway, the ironwork, the balcony, the chimney-caps,—so that they shall all be graceful and pleasing without being obtrusive, and while one and all thoroughly well designed, still so abstract and neutral as to bear repetition without becoming tiresome. But once indoors an architect has no lack of opportunity, even in these commonplace houses, of showing his skill. The other ninety-nine houses are now out of view, and he may employ more positive forms of design without fear. The last-century houses in London to which I have referred teach a very useful lesson in interior decoration with simple means, and contrast very favourably with their modern-built rivals. Externally they are simple enough,—mere fronts of honest brown brick with rectangular windows and round arched doors. But both windows and doors are evidently proportioned on some accepted canon, and have that "right" look about them that shows they have been thought of by the architect, and not left to mere haphazard, and the whim of the builder's forman. The ironwork of the glazed fanlight over the door, and of the balconies on the first floor, is simple and conventional, and does not call for much notice, but when you do happen to notice it you find it, within its own modest sphere, almost perfect in grace of line and excellence of workmanship. In the interior, if it has escaped the barbarisms of modern decorators, and preserved its original fittings, as is the case with a house on the Portland estate, which it is my fortune to live in, you will find fireplaces with pretty Italian marble chimney-pieces in the best rooms, delicately reeded, and with delightful little plaques carved with Classical subjects and little rosettes, or inlaid with thin veneers of coloured breccia; simpler fireplaces in other rooms, with mantelpieces of wood enriched with festoons and wreaths, moulded in a composition of whiting and glue, all varied in the different rooms, though, of course, used over and over again in the several houses; architraves and cornices over the doors of the best rooms, executed in the same way with little vases, rosettes, and swags of foliage; and doors to the principal rooms of beautiful rich mahogany. Living, as I do, in one of these houses, and by no means a large or important one, I can testify to the constant pleasure to be derived from the little evidences of thought and refined judgment observable in almost every detail. These houses were built, either by the Brothers Adam, who were engaged on this estate, or by followers of theirs, who imitated their manner, and prove conclusively that wholesale speculative building is by no means necessarily productive of uninteresting houses, if only it be done by men with true artistic sense of proportion, who are content to offset themselves so far as any bold architectural elevation is concerned, and to build in a commonplace way to suit commonplace requirements, without, however, neglecting to make every detail within the narrow limits they have imposed on themselves graceful, appropriate, and pleasing.

Contrast with these the showy productions of the modern speculator in house property. Everything is reversed. Outside are pretentious ornaments that no one notices because they are monotonously repeated from house to house, while inside everything is starved just where one would value some attention to detail; or, if there is any ornamentation at all, it is of a careless, coarse kind, that disgraces one and impels one to remove it if possible. The very mouldings round the door-panels are enough to drive one out of the house, especially when one recollects the delicate details of the architraves and doors in the older houses I have just described.

Although, therefore, the interior architecture of ordinary dwelling-houses of this class must be confined within narrow limits, there is abundant room left for its free exercise. It is a wonderful what may be done to make an ordinary room attractive or the reverse by very small differences of design. Let any one who has to build a plain house of little architectural pretension try what he can do by simply drawing out to a large scale, say of 1/2 inch or even half an inch to a foot, the four walls of the principal rooms, with their windows, doors, chimney-pieces, bookcases, and upboards in their proper relative places, and

the skirting and cornices round the walls, and if he has never tried it, and, I believe, it is very seldom tried in practice, he will be surprised to find how many ideas will suggest themselves to him by way of improvement, and with what very slight alterations of proportion and arrangement, and at what very small expense he may raise the character of the room from that of a mere chamber of accidents to the dignity of an architectural composition.

The same considerations that govern the architecture of a commonplace residence should govern the interior decoration. Here, too, everything in order to be appropriate and in proportion should be somewhat commonplace. Elaborate decorations, whether of architecture painting or sculpture, are suitable only for public buildings, churches, or palaces, and are not only thrown away, but positively offensive in the rooms we live in. Even in palaces and noblemen's houses it will be found that the great halls and galleries, with sumptuous decorations and splendid furniture, are kept for show and occasions of state, while the family live habitually in smaller rooms furnished much more simply and unpretendingly.

And so in ordinary houses of a smaller kind, any decoration of an ambitious or striking and unusual kind is misplaced, out of key, and disagreeable. How true this is may be seen every day, especially in the houses of those people who pretend to taste and are afflicted with the fashionable æsthetic craze. They think that they cannot go wrong if they cover their walls with Mr. Morris's papers, of which they generally choose the most pronounced designs, and hang their little rooms with a paper that would suit one of four times the size. They hold that there is safety in sad greens and virtue in dark and dirty colours, and they use these with the most dismal effect in rooms that with simple treatment might be made cheerful and light. One is haunted in these houses by the shadow of art. There are "art colours" advertised nowadays, as if art lay in certain colours, and not in the skillful use of any and all colours whatever; there is "art furniture," as if any good furniture whatever could be made except by the aid of art. By "art" nowadays is understood not the making of these things well and beautifully, but the putting in of plenty of little turned balusters and painting them of a dingy colour. Of all the furniture that has ever been made, even in the most Philistine time of the nineteenth century, nothing has been turned out so bad as the chairs, tables, sideboards, and chimney-pieces that fill the pages of the illustrated catalogues of the "art shops" of the present day. They show no skill in workmanship, no refinement of execution, no grace of line, no beauty in the mouldings, no delicate touches of carving; but in place of these are undistinguished outlines, crude forms unmeaningly heaped together, coarse brackets, and unworkmanlike finish, which, it is hoped, may be carried off by a little cheap turnery and some vulgar scrolls or leaves, not even carved, but coarsely incised in the surface of the wood.

But it is not only because or when the details are bad that such a room is an offence to an artist; it offends because the whole scheme of decoration is disproportioned to the scale of the house and the commonplace uses of the room. Rooms in small houses are not wanted for show, but for use, and an æsthetic drawing-room which is set out as if for the stage of a theatrical entertainment is not a place in which ordinary human beings can live at their ease. However powerful an impression it may make upon the casual caller, it is not a place to be lived in and used, and that ought to be the first consideration in furnishing and decorating a living-room.

This suggests what I venture to propose to you as a useful maxim, applicable not only to the humbler kinds of architecture of which I have been speaking mainly to-night, but to the art in all its branches, high and low. It is this; that those things with which we are constantly in contact, and which we are constantly using, should be of a neutral or commonplace character. If they are not of this character they are sure to be tiresome, fatiguing, and, in the end, disgusting. One does not want to be always examining the chairs we sit on, the papers on the walls of the rooms we live in, the implements we are always handling, the furniture by which we are constantly surrounded; and if they are all designed in such a style that they make constant demands upon our attention, and are always clamouring for notice, they are sure

to end by boring and disgusting us. In proportion as things are common they should be quiet and unobtrusive. This is not inconsistent with their being in their own way beautiful and worth examining. On the contrary, I would have every detail in the house carefully designed and fit to bear examination: the mouldings on the doors, the sections of the architraves and linings, the chimney-pieces, stairs, balusters, and the hundred other little members of the design of the building should all be studied carefully and well-proportioned; and though nothing should be needlessly obtrusive, everything should show care and thought when looked at closely. So with the furniture and decoration. The colouring should be quiet and harmonious, and the designs simple and restrained, and above all proportionate in scale to the modest size of the apartments. The furniture should be simple and graceful, without being fanciful or ostentatious. Our aim should be that the room should be thoroughly usable in the first place; a drawing-room where there is no table on which we can find room for a book, or where we can sit down and write a letter, is a misery, and had art; and in the next place it should be beautiful with that beauty which arises from fitness, from good proportion, from careful though unobtrusive design, and from tender harmonies in quiet keys.

A successful design on these modest principles is quite difficult enough to satisfy the most ardent student of architecture. It demands much more knowledge, much keener artistic sensibility, much higher powers of design than many more important phases of our art. When I commend you to study the commonplace side of architecture, and to confine yourselves to that unless you have a special call to rise above commonplace to grander subjects, I do not ask you to give up art, or to sink to a lower grade as artists, but simply to study the proper mode of dealing with one class of subjects rather than another. To tread among architects the path that Jane Austen marked out among novelists is surely a sufficiently high standard for the holdest aspirants amongst us. It is no doubt a more splendid thing to build cathedrals and public buildings, palaces and mansions, than parsonages and village churches or small houses, just as "Rob Roy" or the "Antiquary" may be considered grander achievements than "Emma" or "Persuasion," but there is surely not less art required for success in one field than another. To make a commonplace story interesting, and even exciting, as Miss Austen has done, in which the incidents never rise above the importance of a pic-nic or a dinner-party, and to keep us in breathless suspense to know whether Catherine Morland goes for a drive with John Thorpe or for a walk with Henry Tilney and his sister, requires consummate skill and supreme art which any one might be proud to approach. And, just as Sir Walter Scott admitted that, though he could do "the big bow-wow" well enough, this young lady was his superior in depicting ordinary daily life, so may it be that many a celebrated architect, who has earned fame by large national works, may fail to succeed when commonplace architecture only is required so well as many a less distinguished man who works truthfully and modestly within the narrower limits to which common sense and good taste confine him.

As to the value to the world of good, simple, and inexpensive house architecture, it would be superfluous for me to say much. These are the houses in which most of us live, and we have most of us in our time suffered from the ugliness and shortcomings which generally distinguish them. It is not enough that the general standard of architecture should be raised so far as concerns our great national monuments, if we are condemned at our own homes to live in the midst of work that is both coarse and careless, and also extravagant and pretentious. We want the improvement to extend to our own roof, and it touches us more nearly that our homes should be made pleasant and beautiful, and our daily life sweetened by association with comely and appropriate surroundings, than that our streets should be filled by splendid buildings of greater public consequence. There is a noble field open for architects in this direction, and an appreciative public waiting gratefully to welcome and applaud their efforts.

I do not overlook what has been done in the last few years towards introducing a more

simple and unpretending style of domestic architecture, in which what is struck out in the way of positive ornamentation is more than made up by careful and thoughtful design of simple details. The school of what is very inappropriately called the "Queen Anne Style" began in the recognition of the quiet, homely grace of some Post-Gothic buildings, and it studied to work on the same modest principles. But no sooner did this style become fashionable and enter into the æsthetic cant of the day, than it began to grow as extravagant and pretensions as its predecessors, and now you may see more offensive work of this kind than, perhaps, any other. Whole fronts are overloaded with carved brickwork or terra cotta, broken pediments, pilasters, consoles, and balusters, in vulgar profusion, that go far to make the name of the good queen a by-word. It is curious that a mode of building which began by renouncing positive architecture should have thus run to seed in the hands of ignorant followers of the style, and should now exceed all others in impertinent extravagance.

I have confined my remarks to-night principally to ordinary domestic architecture, because the conditions and requirements of that branch are essentially commonplace to a greater degree than those of other buildings. But every architectural design, on however grand and splendid a scale, has its commonplace parts, which require to be treated in a commonplace way. It would be interesting to trace the mischief that has resulted to ecclesiastical and civil architecture from the neglect of this principle, but this would open a much larger field of inquiry than we can to-night enter upon, for it is already time that I should bring my lecture to an end.

The main point which I have tried to convey to you this evening is the necessity of cultivating a proper sense of proportion,—of taking care that the design shall be properly proportioned to the subject and the occasion. As an instance of disproportion or inconsistency, I have enlarged on the way in which the designs of ordinary dwelling-houses are constantly overdone with attempts at architecture for which they have no occasion. Such houses do not want extraordinary architectural display; they cannot carry it, and, in point of fact, the fewer actual architectural features they have the better for them. I have also pointed out the need of architects who will work on these humble and self-denying lines, and give us buildings well designed without being pretensions, and quiet without being insipid. That some self-denial will be required must be admitted. To younger men especially, freshly primed with their architectural studies of the past the temptation is, no doubt, strong to seize the opportunity which is at the beginning of their career so sadly infrequent, to realise some of the magnificent ideas that fill their imagination, even when there is no magnificent occasion for their realisation. It is no doubt hard not to be able to let off a little of their store of knowledge and ideas, but, hard as it is, the lesson must be learned that architecture misplaced is worse than wasted, and that design that is disproportionate to the subject is worse than thrown away. The old Latin poet warns those who would be poets not to write comedy in tragic verse, and tells them that if their characters talk in language disproportioned to their fortunes they will only make the audience laugh. And so it is with architecture: we must take care that our little fishes do not talk like great whales, or our work will only be ridiculous; and those who have only commonplace work to do must be contented to wait for more important occasions before launching out into architectural magnificence. Meanwhile, I have endeavoured to show that quite as much art is required in the simple restrained work which is alone under these circumstances admissible, as in work which is more distinctly architectural. Those to whose lot the more important buildings of their age do not fall, and whose life may be passed in work of a less conspicuous kind, will find plenty to interest them, abundant room for the display of considerable artistic gifts, and ample occasion for earning the gratitude of a public which has suffered too long from the vulgarity and impertinence of most modern domestic architecture.

Erratum.—In the letter on "The Stone used at Westminster Abbey" (p. 398, ante), read "sandstone" instead of "limestone" in the last line but four.

THE BUILDING TRADES' EXHIBITION AT ISLINGTON.

THE sixth annual Building Trades' Exhibition in the Agricultural Hall, Islington, was opened on Monday morning, although, as usual, a large number of the exhibits were not ready until Tuesday and Wednesday. In extent, the exhibition falls somewhat short of some of its five predecessors, and is hardly so varied in character as one or two previous displays we have seen. Novelties appear to be very sparsely distributed amongst the large mass of well-known materials and appliances. We are more than ever convinced that, for all practical purposes of comparison as to progress in details of construction, these exhibitions recur much too frequently. If held at longer intervals (say from three to five years) we think they could not fail to be much more useful and instructive than is the case under present conditions.

One of the strongest and best-represented sections of the exhibits is that comprising natural and artificial stones, concrete, brickwork, terra-cotta, &c.; and among the most prominent of the exhibitors in this section are Messrs. W. H. Lascelles & Co., who have quitted their accustomed place under the North Gallery and have come out into the centre of the hall, where a somewhat ambitious structure in their red concrete has been built up. It consists of a lofty porch supported by columns with Ionic capitals, with balustrading atop, and finials or terminals at each end. This porch and a bay window are from the designs of Mr. Bassett Keeling, and are intended for Victoria Mansions, Westminster. Messrs. Bacon & Co., Finchley-road, have a creditable display of pottery, terra-cotta, and brickwork. Hall's Patent Hanging Tiles (shown at Stand 121) are intended for facing old or new walls in courts, areas, and corridors. Some extra light is gained, and the tiles are secured by nails being driven into the joints of the brickwork. Curzon's "Impervious" Concrete Company (Stand 162), exhibit some paving concrete, laid *in situ* and in slabs. These exhibitors show also patent slate bricks for engineering purposes. Mr. James Brown, of Broad-street, E.C., has a display of moulded and ornamental bricks, but there is very little in novelty on the part of old or new exhibitors in this department, although the goods are apparently well selected. G. Middleton Edwards, of Gresham-street (Stand 195), presents dovetailed corrugated iron sheets (Hyatt's patent), to be used in combination with Portland cement concrete in the construction of fireproof flooring and walls. It is suggested that by the use of these corrugated plates attached to timber partitioning and covered with plaster, fireproof and weather-proof external walls could be constructed. This mode of construction would appear to be well adapted for the colonies and for districts subject to earthquakes. At the same stand, Edwards's patent metal laths are put forward as an acquisition in constructing fire-resisting ceilings. Wilkes's Metallic Flooring and Eureka Concrete Company (Stand 210) present an ambitious display in the form of a portico built up. The columns are of red concrete, but hollow. The shafts are surmounted by enriched capitals and frize, and entablature to harmonise. This firm has also in connexion a temporary structure to illustrate different samples of fibrous and fireproof plastering. Messrs. McLean & Co., of Cannon-street and Newark (Stand 228) submit some samples of their cement, and specimens of mouldings made therewith, together with samples of plaster of Paris and Portland cement. Messrs. Thomas Lawrence & Son, of Bracknell, Berks, have a noteworthy exhibit in the form of a profusely carved red brick porch or doorway, with oak door, the whole of the work having been executed by Messrs. W. Cabrit & Co. The workmanship is exceedingly creditable, though much of it is woefully misapplied, for we hold it to be a great mistake to carve, especially with such elaboration as is here shown, a material so unfitted for such treatment as brick. Mr. George Wright, of the East Acton Brickworks (Stand 166) shows a somewhat attractive structure erected for the purpose of showing the adaptation of moulded bricks for ornamental purposes. More than one of these brick structures in the exhibition is overloaded with ornament, and the fantasies and freaks of the so-called "Queen Anne" work are altogether eclipsed with the surfeit of figures and heraldic and other devices that are pressed into service, to the astonishment of the beholder. Messrs.

F. Rosher & Co., Blackfriars (North Side 331), present, as usual, an excellent display of varied goods. Mr. J. Matthews, Royal Pottery, Weston-super-Mare (Bay 24) exhibits Poole's well-known patent bonding square-cornered roofing tiles, very extensively used at present. The Woolpit Brick and Tile Company (Bay 23) have on view special dark red facing bricks, white ditto, and machine-made and hand-pressed white bricks, all well turned out. Webb's Worcester Tiles Company (Stand 181) exhibit a good assortment of geometrical mosaics and encaustic tiles for floors, and printed tiles for walls, ceilings, borders, furniture, &c. White's Hygienic Rock Building Composition for securing strong and impervious walls is shown at Stand 332, North side, under tests which demonstrate its efficacy. The Dunton Green Brick and Tile Company have on view some good specimens of red and white facing and moulded bricks, roofing-tiles, &c. Messrs. May & Co., of the Bentball Works, Jackfield, near Ironbridge (Stand 156), are exhibitors of decorative majolica and mosaic work arranged at for a recess, and of encaustic and other tiles. Hitchins's Fireproof Plastering Company have erected a structure under the east gallery of the hall, to show the applications of their material.

The exhibitors of natural building stones were almost entirely absent from their allotted stand in the beginning of the week, although several well-known firms were announced in the catalogue. Messrs. Trickett & Sons, of Millwall, a firm former years, show some good specimens of rough-hewn and squared building stone of various descriptions. Messrs. Pictor & Son of Box, Wilts (Stand 23), show specimens of Bath stone, Box Ground stone, Stoke Groom and Corsham Down stone, and stones from Farleigh Down and other well-known quarries. An artificial material having all the appearance of a hard natural stone, and designated "Croft Adamant" is exhibited by the Croft Granite Brick, and Concrete Company, of Croft, near Leicester. A structure with traiered windows of various styles is raised *in situ* to illustrate the capabilities of the material. Windows are shown in the four sides of the building of many different styles in the tracery composing them. The material takes an excellent finish and the walling of the different sides of the structure is varied from squared rubble to irregular pointing.

In the department of prepared house-joinery there are sundry specimens of skilled workmanship, worthy of notice and commendation. There is also a varied assortment of imported Swedish joinery, which is sold now at prices that would have been paid a few years ago to the joiner for labour only. Most of this imported work is well seasoned. Messrs. W. H. Lascelles & Co., in addition to their concrete exhibits, employ some creditable and neatly finished joiners' work. Among these is an excellent pine chimney-piece with overmantel, from a design by Messrs. Ernest George & Peto. In high-class joinery in connexion with staircase and handrail construction, Mr. S. Ransom exhibits some admirable specimen in oak, walnut, mahogany, pitch-pine, &c. The joinery exhibits of Messrs. Thomas Andrews & Son, of East Molesey Mill, Hampton Court (Stand 71) are exceedingly good. Mr. S. Putney, of Baltic Wharf, Harrow-road (Stand 165), exhibits a novelty in what he calls Patent "Paradillos" solid wood flooring, floor-borders, panels, dados, and V-jointed boards. The tonguing or interlocking adopted in this system of jointing, which has already been noticed by us, is very ingenious, and without simple. By means of this method of jointing a really good floor is obtained at a comparatively small cost. We recommend visitors to inspect Mr. Putney's exhibits. Messrs. Esdale & Co., City Saw Mills, Wenlock Basin (Stand 208) have on view a varied collection of general joinery work, including English, American, and Swedish goods. Messrs. W. & R. Crow (Bays 67, 68, 69, Arcade) display a very large assortment of joinery work. Messrs. M. C. Duffy & Son, of Bermondsey (Stand 24), are exhibitors of a plentiful variety of balusters, newels, and general turnery,—good and cheap. Mr. J. F. Ebner, of Clerkenwell-road (Bay 21), has an excellent display of his well-known Hungarian parquetry and his hydrofoe parquet. This latter is capable of making a very good fire-resisting and impervious floor, and is well worth the attention of architects. Mr. Ebner also shows some very elaborately-carved

lades, executed in Belgium, and some good chimney-pieces and over-mantels, besides a variety of mosaic panels, most of which are very creditable in design and execution. Messrs. Scheibler Bros. & Co. (Stand 53) are exhibitors of some good parquetry.

There is but a scant display in wood-working machinery. Messrs. F. W. Reynolds & Co. (North side, 327-8) make a very fair display of mortising, planing, tononing, and thickening machines, but they were not in full operation on the day of our visit. Machines are shown suited for hand-power in small workshops and for steam-power. Messrs. M. Powis Bale & Co. present some planing and thickening machines, but these being scarcely in position on the occasion of our visit, we cannot venture in a description. Some other machines for purposes connected with building are shown; or instance, Mr. W. Johnson, of Leeds, exhibits rick-making and pressing machines, which are worthy of the notice of brickmakers, sewer contractors, and general builders. Messrs. Lewis & Lewis (South side, 303), of Cambridge Heath, London, aim at great efficiency and economy with their high-speed steam mortising machine. They also show hand-sawing machines, boring machines, and contractor's portable steam engine with latest improvements. Messrs. Sagar & Co., Halifax (South side, 305), exhibit a good power cased planing and thickening machine. This is used for taking stuff out of what is technically called "twist," surfacing, and straight or taper work. Mr. B. S. Hindley, of Queen Victoria-street, and B. Bourton Dorset (North side, 321), besides his well-known horizontal and vertical engines, shows a circular and hand-saw bench for hand-power, complete, with rising and falling panels. This is a very compact machine, with its boring-table, hand-saw adjustable fence, and fast and loose pulleys for hand or steam power, as may be required. Messrs. E. P. Austin & Co., of West Drayton, are exhibitors of machinery and appliances needed for use in the brickfield. Mr. E. Houghton Brown, of Mill Pond (South side, 296), shows some useful plant and machinery for builders' use. Messrs. Burney & Co., of Millwall (Stand 2), are exhibitors of wrought-iron cisterns and tanks of varied forms and capacities.

Of the decorative exhibits, the Lincrusta and General Decorating Company's stand, and that of Messrs. Woolams & Co., are among the most prominent. The last-named exhibitors are, as usual, a very excellent display of admirably-designed wall-papers, which have the additional merit of being coloured entirely without the aid of arsenical pigments. Messrs. George Jackson & Sons, of Rathbone-place (Stand 164) have on view some good specimens of callings, cornices, friezes, columns, &c., in bronze plaster. The Indestructible Paint Company (Stand 200), and the Electric Paint Removing Company (Stand 155) exhibit their specialties.

The St. Pancras Ironworks Company (Stand 23) are exhibitors of their stable-fittings, cow-house and piggy fittings, iron staircases, and some specimens of ornamental wrought-iron.

Stoves and grates are well represented by Messrs. George Wright & Co., of Queen Victoria-street (Bay 19), who exhibit slow-combustion and other stoves in combination with marble and wood chimney-pieces, tiled hearths, &c. Their louvre fire-bars, to which we have previously called attention, should be seen by visitors. Messrs. Yates, Haywood, & Co., at the eastern end of the hall, are large exhibitors in the same department of industry. Mr. Harry Hunt (Bay 8) shows the Hygiene Ventilating Hall Stove and the Crown Jewel Stove. In connexion with stoves, we may mention the heating apparatus shown by Mr. Renton Gibbs, of Liverpool (Stand 198), and Messrs. Messenger & Co. (Bay 13), who show their "Loughborough" boiler in conjunction with a span-roof conservatory constructed on their system. Of oaks, lock furniture, electric bells, and builders' ironmongery generally, there is a varied display. Messrs. Archibald Smith & Stevens (Stand 76) exhibit Stevens & Major's patent hydraulic door spring and check, and Russell's patent "Binatone" Locks and Furniture. Messrs. Broughton & Co. (Stand 252) show their "Chelsea" centre-bit mortise locks, of which we spoke in detail a short time ago. Messrs. Chambers, Momery, & Co., of Bishopsgate-street (Bays 55 and 56 of Arcade), exhibit cottage ranges and kitcheners, as well as their patent wall-ties. Messrs. W. & R. Leggett, of Bradford (Stand 11), show their handy and easily-worked appliances

for opening and closing fanlights, skylights, &c. Messrs. Meakin & Co., of 84, Baker-street (Stand 170), exhibit their sash fastener and opener and their solid-frame oilable sash-pulleys. Messrs. Smith & Turner, of Bartholomew-close (Stand 33), exhibit their specialties in the way of door-springs and hinges and water-bars for French casements. Mr. Alfred Gill (Stand 192) shows some patent lock furniture, which is very simple, and appears to be likely to prove effective. Messrs. C. D. Douglas & Co., of Queenhithe (Stand 81), are also exhibitors of lock furniture. Electric bells are shown by Mr. Julius Sax, of Great Russell-street (Stand 122a). Messrs. Ecks, Callow, & Co., are exhibitors in the same department.

Among other exhibits, Messrs. Attwood & Co. (late Salmon, Barnes, & Co.) show their patent revolving shutters and school divisions, as well as a model of an expanding grille for a shop-front in lieu of shutters. Mr. Thaddens Hyatt, of Farringdon-street, E.C. (Stand 161), shows varied display of his prismatic pavement lights and lights of various forms for the purpose of illuminating basements and areas. Messrs. Clark, Bunnell, & Co., Limited (Stand 13), show their revolving shutters, metallic Venetian blinds, some good constructional ironwork, and a capital self-sustaining lift. Mr. J. Stannah (Stand 200), exhibits a very good 5 cwt.-power lift, with iron-framed cradle and iron guides; this lift, which is worked by a small gas apparatus, is provided with an effective safety apparatus. Messrs. Hayward Brothers & Eckstein (Stand 126) exhibit their admirable semi-prism pavement-lights, the merits of which are too well known to render their enumeration necessary here. Their self-locking coal plates appear to meet the end in view in a very effectual manner. The same firm are exhibitors of Hayward's Sheringham inlet ventilators and Boyle's mica outlets. Other exhibitors of ventilators are Messrs. Ewart & Son, of Euston-road (who occupy Bay 3 and the centre of the Hall and show some ornamental zincwork), and Messrs. Robert Boyle & Son (of Holborn Viaduct). Mr. F. H. Smith, of Queen Victoria-street (Stand 9) exhibits his "siphonic aspirator" system of ventilation; and Messrs. C. Kite & Co., of Chatham-street (Stand 150), show their exhaust roof and chimney-breast ventilators, and other appliances, of which we have spoken in terms of commendation on previous occasions.

Exhibitors of other sanitary appliances are not very numerous, but Messrs. John Bolding & Sons, of South Molton-street (Stand 120) have a very good representative display of water-closets, bath-fittings, &c. Messrs. Brazier & Son, of Blackfriars-road, are exhibitors in the same department, as are Messrs. Capper, Son, & Co., of Fenchurch-street, who exhibit their "twin-basin" closets in a new form,—that is, adapted for use as "pedestal vase" closets, without woodwork boxing-in. Mr. F. Botting, of Baker-street, Portman-square (Bay 4) exhibits a few things which merit the attention of visitors, including Lyne's patent ventilated closet, Durrans's patent sanitary appliances, a smoke-machine (very portable and convenient) for testing drains, air-tight covers, &c. In Barstow's patent combination water-filter, shown at Stand 72, the water first passes through a natural stone, with which the upper portion of the filter is lined, and afterwards through granulated carbon or charcoal, the latter being renewable from time to time.

We have been necessarily brief in our notes, but they will be sufficient to indicate the general scope of the Exhibition, which will remain open until Saturday, the 28th inst.

The Burns Memorial in Westminster Abbey.—On the 7th inst. the Earl of Rosbery unveiled the national monumental bust of the poet Burns in the Poets' Corner of Westminster Abbey. Mr. Wilson, chairman of the Memorial Committee, said that the monumental bust had been subscribed for with the shillings and pence of the admirers of the poet in Switzerland, Bengal, New Zealand, Nova Scotia, America, England, and Ireland, and in almost every town in Scotland. The committee had selected as the artist Sir John Steell, a veteran member of the Royal Scottish Academy, who had produced no fancy likeness of the poet, but one based on the portrait of Burns by Nasmyth. The work is broad and powerful in style, and full of character; a very successful example of a monumental portrait bust.

WESTMINSTER HALL RESTORATION COMMITTEE.

At the sitting of the Committee on Friday, March 13th, Mr. H. W. Brewer was examined, and produced the drawing of "The Old Palace of Westminster," which was reproduced in the *Builder* for Nov. 15 last. He explained that the drawing was intended to convey some idea of the appearance of the buildings as they existed during the earlier portion of the reign of Henry VIII.; that the drawing had been produced after very considerable research, the examination of very numerous ancient views and documentary evidence, both published and unpublished. Mr. Brewer was strongly of opinion that the ancient palace and the abbey formed one single group of buildings, and that no thoroughfare passed between them; in fact, that the conditions were pretty much the same as one sees at Windsor, where the Collegiate Church and buildings of St. George are inclosed within the walls of the castle. That this state of things continued until the construction of St. Margaret's-street, which necessitated the demolition of no less than four ranges of ancient buildings, is proved by the following extract from Smith's Westminster:—"Hell and Paradise, two portions of the Old Palace, were pulled down in 1793. . . . St. Margaret's-street was made out of St. Margaret's lane, and 34 ft. of that part of the Palace of Westminster where 'Tudor Buildings,' erected by Henry VIII., originally stood, and a portion of the old 'Fish Yard.' At the end of this lane stood the ancient brick buildings called Heaven and Purgatory. . . . Another portion of the Tudor buildings which projected 72 ft. into St. Margaret's-street was also pulled down in 1793."

The construction of Abingdon-street necessitated the removal of other ancient buildings, and thus the Palace and the Abbey became two separate and distinct groups of buildings. Mr. Brewer pointed out that the old Palace could not, at any time, have possessed anything in the nature of a "land front," still less could the west side of Westminster Hall have served that purpose, because there was documentary evidence which seemed to prove, beyond a doubt, that the space to the west of Westminster Hall, between it and St. Margaret's-lane, had been occupied by buildings as early as the reign of Edward III. A list of the buildings restored by Edward II. and III., derived from the existing accounts for these works, and published by Smith, mentions "The Seneschal's Chamber on the west part of the Great Hall," "The Marshal's Chamber under the Great Hall," "Staircase from the Seneschal's Chamber into the small court opposite the conduit," "A conduit in the form of a leopard, within the wall under the hall, called 'Stanneyn,'" "Buttery under the Seneschal's Chamber," "A kitchen in Pergate [Purgatory] ward," "Tower above the Marshal's Chamber," "House called 'Hölle' [Hell] under the Exchequer," "Council-room in Exchequer, 'Saitaria' or 'Salting-house,' under the Exchequer," "Door of Hell in the Exchequer," &c.

Mr. Brewer pointed out also that there are several grants of buildings existing upon this site during the reign of Henry VII. One of these, dated Sept. 20th, 1185 (that is, within one month of Henry VII.'s accession), specifies that "Several mansions within the Palace of Westminster were by letters patent granted to Anthony Keene, esq., for his life. The parcels comprised in this grant are there stated to be 'all the mansions belonging to the king within the Palace of Westminster,' together with the custody of 'Paradise and Hell,' within (evidently close to) Westminster Hall; three tenements which Jacob Fry held and occupied; the custody of Purgatory, within the ball aforesaid, which Nicholas Whitfield had and occupied; a certain house called Potans House, under the Exchequer; and also a tower called 'Lo Greenelates,' which John Catesby held and occupied, which tower and tenements are there said not to exceed the annual value of 21l. 6s. 8d."

We know that Heaven, Hell, and Purgatory were to the west of the hall, and there can be little doubt that the building called in the earlier documents "Paradise" is the same as that called in later times "Heaven." Now this being the case, it seems evident that the site was built over considerably before the reign of Henry VIII.

Mr. Brewer was of opinion that the kitchens and offices connected with Westminster Hall

must have stood to the west of the hall, as there was no other possible site for them, and that the west side of the hall was only visible from two or three small courtyards, but could never have been seen from a distance, and that this accounted for its being so much more plainly treated than the north front, which was, of course, always visible from New Palace Yard. Mr. Brewer thought that the west side of the hall should be repaired, preserving all its ancient features; he could not see the necessity for a cloister, but if one were erected he thought it should be little more than "a penthouse," and might possibly be merely a temporary erection. If this were not sufficient to preserve the Norman walling, he thought it better to leave it alone altogether, rather than to erect a new building against the old hall; he also considered that nothing should be done which would render the ultimate carrying out of Sir Charles Barry's design for the completion of the Houses of Parliament an impossibility.

Mr. Ayrton was then examined. He disapproved of the proposed scheme, and considered that if anything was done, Sir Charles Barry's design should be carried out. Although he himself did not care much for architects, yet the nation having selected Sir C. Barry's design, he thought that the design ought not to be set aside for that of any one else, and he thought some of the ornament might be omitted.*

At a subsequent sitting Mr. E. P. Loftus Brock, F.S.A., gave evidence at length with respect to the antiquarian features of the building. He pointed out that originally the erections on the west side of the hall were but of one story in height, of Henry III.'s time, probably erected as an abutment to the old Norman hall, the wall of which was bending. This one story building was raised from time to time as the need for further accommodation occurred. The heights were never uniform, and there was no evidence that they were as regular as now proposed. He objected to the high two-story design on the ground that it hid the fine range of old windows of the hall except the upper portions only, a defect which did not apply to the lower design.

FREE LECTURES TO ARTISANS AT CARPENTERS' HALL.

The fifth of this successful series of lectures was delivered on the 12th inst. by Professor Alexander B. W. Kennedy, M. Inst. C.E., who took as his subject "A Piece of Steel." In the course of his lecture, which was full of interest, the lecturer expressed the hope that before very long mild steel would, to a considerable extent, supersede wrought and cast iron. Castings were frequently made from the open-hearth furnaces at a price greater than that of cast iron, and with considerable difficulty and uncertainty. There was no reason to imagine, however, that these difficulties were insurmountable.

The sixth lecture was delivered on Wednesday evening last by Professor Bonney, who discoursed of "Flint," dealing, firstly, with its composition; secondly, with its production; and, thirdly, with its uses. Flint, he stated, was composed mainly of minutely crystallised silica, being most abundant in the chalk, but being found also in almost every kind of limestone rock. The formation of a flint was, to some extent, a process of replacement, and at the same time, a process of accumulation around certain spongy organisms. Broken up it made excellent road-metal, for which it was especially utilised in the eastern parts of England. When ground up and mixed with china clay, it was employed in the manufacture of porcelain. It was also largely used for building purposes, and that chiefly in the eastern counties. The professor concluded with an interesting account of the flint implements of the Stone Period.

The City and Guilds of London Institute.—Dr. Sylvanus P. Thompson, of University College, Bristol, has been appointed Principal and Professor of Physics at the Finsbury Technical College. The duties of Principal have hitherto been discharged by Mr. Philip Magnus, the Director and Secretary of the Institute, who temporarily undertook them pending the complete organisation of the College. As Professor of Physics at Finsbury, Professor Thompson succeeds Professor Ayrton, F.R.S., who has now been appointed Professor of Physics at the Central Institution.

* In other words, Mr. Ayrton would spoil the building by cheapening, as he said it the Law Courts. It is fortunate that if the building is carried out, Mr. Ayrton at least will have no control over it.

SIR C. BARRY'S DESIGN FOR COMPLETING WESTMINSTER PALACE.

We publish this week a drawing showing the design made in 1854 by the late Sir Charles Barry, to show the treatment he proposed for the north front of Westminster Hall, with adjacent buildings, part of the New Palace at Westminster, and in accordance with them, whereby the hall itself would acquire greatly inquired dignity, and be externally incorporated with his design for the complete building. Sir Charles, while anxious to retain the great characteristic of Westminster Hall in its noble roof, as seen from within, was evidently of opinion that externally the building did not merit the same consideration, and would not harmonise with the more important structure of which in future it was to form a part. It will be seen from the view that he proposed an entirely new gable, and between the angle towers, and from plans left by him which we have seen, he proposed to have a grand arch at its north end of like treatment to the arch at its south end, which now forms the entrance from the hall into St. Stephen's Porch. He also proposed to reface and heighten the angle towers, which now have so insignificant an effect, by raising them in a like style to the rest of the building. It will thus be seen that whenever New Palace Yard is made (as in old time) the Grand Entrance Court of the Palace, its treatment would be at least as magnificent in an architectural point of view as the river front now is, and as the land front would be if carried out in accordance with his designs as published in the *Builder* of the 21st of January last. As the Westminster Hall Committee is now sitting, under whose consideration that design will doubtless come, we may return to the subject, and the public accommodation which would be provided, to which so much reference was made by Mr. Charles Barry in his evidence given before the Committee on the 20th of November last. For the present we can only express a hope that the legacy left to the nation by one of the greatest architects of our own times will not be inconspicuously thrown away.

NEWBURY DISTRICT HOSPITAL.

The above-named hospital, illustrated in this number, was originally designed for eight beds (male ward 4, female ward 3, and single ward 1 bed), and, by flags, I showed how the male ward could be extended for three additional beds, and the female ward for one additional bed. It is now decided by the committee to obtain tenders for the erection of the building as shown on the plan (with male and female

wards for four beds each), with alternate mates for the extra cost of enlarging the ward to seven beds, as shown by the drawings, and, if funds permit, this latter arrangement will be carried out. The committee also decided to make the corridors 6 in. rather than shown. A cubic space of rather 1,200 cubic feet per bed is given to the male female wards, and of 1,300 cubic feet to single ward. The ventilation of the wards is effected by means of fresh-air inlets through T. Boyle's "mica flap valves" a ceiling level into a flue carried up along the smoke-flue in chimney-stacks. The wards are to be warmed by ventilating open grates. A detail of the ward window given; nearly all the other windows have the ordinary lifting-sashes, and in all cases, a deep bead on the sill the admission of air at the meeting-joint. The walls throughout will be built of h faced externally with selected red bricks r the first-floor level, and above that plastered rough cast stucco,—the front gable and dormer being half-timbered. The mortar and plating throughout will be in Selenitic cement. The roofs are to be covered with permanent g slates, with red tile cresting. The floors of corridors, passages, water-closets, &c., kitchen and offices are to be of concrete; the other floors of tongued yellow deal. The internal work is to be of the plainest character, and to be varnished throughout.

Water supply will be obtained from the waterworks, and great attention will be paid to the sanitary arrangements.

The cost of the whole, exclusive of the furniture, &c., is estimated at about 1,800l.

H. G. TURNER.

DESIGN FOR A MUNICIPAL MANSION. SOANE MEDALLION.

We illustrate this week the design by Mr. B. Mitchell which obtained the Soane Medal this year at the Institute of Architects, and which a reduction of the principal floor plan annexed. The author of the design has realised the idea of the stamp of building required better than any of the other competitors, though in this case the tower is a little superfluous and conveys too much the idea of a town-hall. Architecturally, the plain mass of the tower contrasts well and successfully with the rich fenestration of the adjoining portion of the building.

SKETCHES, MELROSE.

The view of the east window, Melrose Abbey, and the carved terminal from a wall arcade of the cloister, are reproduced from the pen drawings of Mr. T. MacLaren, who obtained the medal of merit in the competition this year at the Pugin Travelling Studentship. The carving is an unusually naturalistic specimen of Gothic foliage, and a very good piece of pencil drawing.

COMPLETION OF NEW PALACE AT WESTMINSTER
VIEW OF THE SOUTH SIDE OF NEW PALACE YARD AND WESTMINSTER HALL, AS I

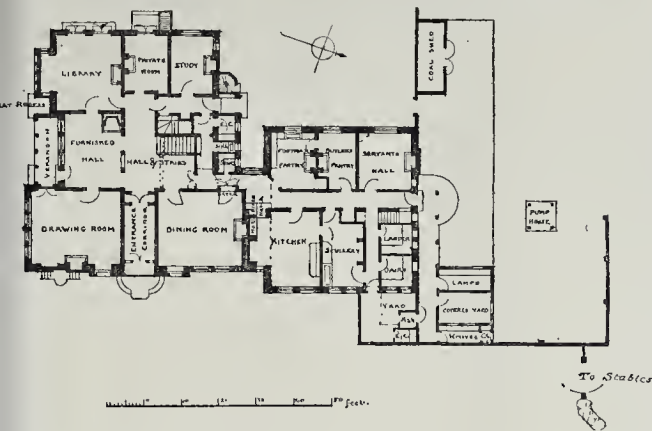

8, Castle St. Holborn, London E.C.

DESIGNED BY THE LATE SIR CHARLES BARRY, R.A.

ON ENTERING THROUGH THE PROPOSED ALBERT GATE FROM PARLIAMENT STREET.

"Collyers," Petersfield.—Ground Plan.

"COLLYERS," HAMPSHIRE.

This house was planned to meet special requirements. The elevation of the principal front, which we to-day publish, is reproduced from a drawing exhibited in last year's exhibition of the Royal Academy, the highly original and artistic character of which we commented on at the time. It is carried out in red brickwork pointed with coloured cement, the door and window dressings and carved work in red Shawk stone, and a few moulded bricks.

The pilasters to doorway, and the hemi-vase above it, are in white hard marble. The panels to arch is inlaid with small en glazed black and white half-tiles. Out of the hemi-vase rises the tilting-spear, which supports the arch above, and which is represented as anchoring out below into (olive) leaves and fruit. A dove flies down from behind the field, &c.

The works were carried out by Mr. John Cook, of Southampton, under the careful direction of the architects, Messrs. Bateman & Bates. All the carving was executed by the senior partner, Mr. Bateman, who informs us that he "had neither time to make elaborate detail drawings, nor temper to see them weakly carried out." We give also a small ground-plan.

BUILDING STONES.*

The oolitic limestones which extend from Wiltshire to Yorkshire comprise the well-known Bath and Portland beds, and the Caen stone of Normandy is of the same formation. These limestones derive their name from the fact that they are composed of a number of minute oviform bodies like the scales of a fish, cemented together in a calcareous matrix. As a rule, the stone is very soft when first quarried, but hardens with exposure, and ranges from a white to a yellowish tint: it is a siliceous organic remains. There are four distinct bands of stone in the oolitic series, viz.,—

1. The inferior oolite, which occurs chiefly in Wiltshire, and from which the stone for Winchester Cathedral and Tewkesbury Abbey is obtained. The best quarry at the present time is at Painswick. (2) The great or Bath oolite, which is of considerable thickness in the neighbourhood of Bath, and is generally worked by tunnelling, as in Messrs. Pictor's quarries at Bath, which extend for many miles underground, and large pieces of stone have to be left to support the roof of the workings. Very large blocks of this stone can be obtained. Among the best known quarries of Bath stone may be mentioned Corsham Down, Monk's Park, Dumbleton Down, Box Hill, and Doulting. The average analysis of Bath stone is: carb. of lime 5, carb. of magnesia 2.5, iron and alumina 1.7, water 1.7. The average specific gravity is 2.3. It will be particularly noticed that this stone contains no silica. The great oolite formation extends northwards of Bath into North-

amptonshire and Lincolnshire, the chief quarries being at Barnack, near Stamford, the stone from which was used at Peterborough Cathedral; Ketton, from which many of the Cambridge colleges were built; and Ancaster, near Sleaford. The latter stone is often crystalline in its formation, and is an excellent building stone. (3) Coral rag, which passes from Somerset to Yorkshire with numerous interruptions. This is a rubbly stone, and is hardly ever found sufficiently compact to be used for building purposes. (4) Portland stone. This is harder and more durable than most of the lower members of the oolitic series; it is cream-coloured and full of organic remains; in fact, such a quantity of large fossils are found in it that it is unsuited for delicate work. This stone derives its name from the Isle of Portland, where it is found, the chief quarries being Gosling's, Vern-street, Waycroft, and Grove. The total thickness of the stone here is about 70 ft., but only about 20 ft. of it, and that in different layers, are suitable for building, the layers differing much from one another. First comes what is called the true Roach, which is very hard and suitable for engineering purposes, but contains such large fossils, chiefly the one well known as the Portland screw, that it is scarcely useable for ordinary building; then the white bed, which gives the best stone on the west side of the island; then the bastard Roach; and then the base bed. This bottom bed is known in the market as "hest bed," a curious corruption of the word base, but it is only in special situations on the east side of the island that this bottom bed is the best. During the last two centuries Portland stone has been extensively used in London: St. Paul's Cathedral, the Reform Club, and Goldsmiths' Hall may be mentioned as some of the principal examples. Of the oolitic limestones Portland is certainly the best adapted to resist atmospheric influences, but the modern stone does not seem to be so hard as that which was used in the seventeenth century. The average analysis is carbonate of lime, 95.16; silica, 1.2; carbonate of magnesia, 1.2; iron, &c., 0.50; water, 1.6. Its specific gravity is 2.2.

In France the great oolite formation yields the beautiful Caen stone, which is very fine-grained and uniform in texture. This stone has been largely exported into England, and no finer stone can be used for interior work; but many parts of Canterbury Cathedral show only too plainly that it cannot be depended upon in a damp climate for exterior use. Mr. Hull, in his work on "Building Stones," has the following interesting remarks on Caen stone:—"The introduction of Caen stone into Britain is curiously interwoven with history. It was probably introduced shortly after the Norman Conquest, having been a favourite stone with the architects who followed the fortunes of William Duke of Normandy and his successors. Its introduction into Ireland may have been of a still earlier period, corresponding to the introduction of Norman and Lombard styles into that country. In England, however, it was largely used in cathedrals and other buildings down to the middle of the fifteenth century, when Normandy was lost to Britain, and it is

only in modern times that its use has been revived."

An English stone closely allied to the Caen stone has recently been pushed energetically in the London market, although it has been in use for many years in the neighbourhood of the quarries. I allude to the Beer stone found near Axminster, in Devonshire, with which the new Empire Theatre, in Leicester-square, has been faced. It is a close-grained, even-coloured stone, but somewhat friable, and I fear that it is scarcely likely from its composition to stand the trying ordeal of the London atmosphere.

Although each class of building-stone contains numerous sub-classes, I have now described the three great divisions which comprise the principal building stones, and I must ask you to follow me in a brief consideration of the qualities which are required in a stone for it to endure when exposed to the weather. I put aside altogether the use of stone for ornamental internal work; what we want to know is, will a stone stand exposure? Now before this question can be answered it is necessary that we should have some sort of notion of the causes of the decay of stone. These are, in the main, two,—disintegration and decomposition, the former acting mechanically and the latter chemically, and the two causes generally act together. All stones, even granite, absorb a certain quantity of moisture, some more, some less, and, as a general rule, those which absorb the most water are most liable to disintegration, because, after absorption, on the occurrence of the slightest frost, the absorbed water expands, and, by mere mechanical pressure, forces apart the minute particles of which the stone is composed. Hence the rate at which a stone absorbs water and the readiness with which it parts with it are very important elements to be considered, much more so, in fact, than the total amount of water which a stone will take up. Experiments have frequently been made to ascertain the proportion of water to its own bulk that a stone will take up when completely saturated; but, although this is an important fact to know, practically stone in a building never has to submit to such a test. It is the constantly-recurring showers and the generally moist atmosphere of this country which play such havoc with our building-stones, and it will be readily understood that if one sample of stone when completely saturated absorbs ten per cent. of its own weight of water and another only eight per cent., yet if the former take three times as long as the latter to become saturated, it is, *ceteris paribus*, the better stone. A complete series of experiments as to the rate of absorption of water would be of great service, but care would have to be taken that at the outset of the experiments all the specimens should be perfectly dry, otherwise the results obtained would be misleading. No kind of stone is so variable in this property of absorbing moisture as sandstone, and hence it is extremely important to test it beforehand.

In London, and in any place where the climate is damp and the atmosphere smoky, the mechanical disintegration of stone is largely assisted and frequently started by chemical decomposition, and in order to guard against this a careful examination of the chemical analysis of a stone is very desirable. The sulphuric and hydrochloric acids in the atmosphere, which are readily taken up by rain-water, act upon the calcareous ingredients of stone, producing oxidation or hydration; where mineral salts occur, various chemical reactions take place, and minute crystals are formed in the interior of the stone which effloresce outwards; and where organic matter exists, as in the case of nearly all stratified deposits, this gives rise to nitration. Inorganic matter, such as the quartz-crystals which form so large a component in the structure of granite, and the

* The following quaint quotation from Herrison, who wrote in Queen Elizabeth's time, and who endeavoured to establish a better reputation for English quarries, is interesting.—"Our elders have from time to time, following our natural vice in milking of our own commodities at home, and desiring those of other countries abroad, most esteemed the Caen stone that is brought out of Normandy, and make even in these our days following the same vain, doo covet in their works to use no other. Howbeit, experience on the one side, and our skillful mason on the other, doo affirme that in the north and south parts of England, and certain other places, there are some quarries which for hardness and beauty are equal to the outlandish greet. This may also be confirmed by the King's Chapel at Cambridge, the greatest part of the square stone whereof was brought thither out of the north."

† See *Builder* for July 12, 1884, p. 61.

Continuation of a paper by Mr. John Slater, B.A., at the meeting of the Architectural Association on the 1st. See p. 367, ante.

eroded grains of which enter very largely into the composition of many of the sandstones, is not acted on by these acids, so that in a sandstone the nature of the cementitious material which binds the grains together is the important point to be looked to; the more siliceous this is and the less calcareous the better. In fact, you may lay it down as a general rule that the more silica you have in a stone the better. If the cementing substance is calcareous, that is, composed of lime, its presence can be detected by the use of dilute hydrochloric acid poured on the stone, which will cause effervescence, and if a powerful action is set up this will show that carbonate of lime is present in considerable quantities. When we come to the limestones their main constituent is carbonate of lime. In the magnesian limestones there is a certain proportion of silica, and they are also crystalline in texture, and it is to these qualities that they owe their durability; but their chief constituents are carbonate of lime and carbonate of magnesia. The Commissioners of 1830, who recommended the use of this stone for the House of Parliament, correctly appreciated its good qualities, but they appear totally to have ignored the fact that magnesia has a strong affinity for sulphur, which exists so largely in the London atmosphere, and hence has resulted the terrible decay in the stone used in the Houses of Parliament. When we come to the oolitic limestones, such as Bath, we find no silica at all, but almost entirely carbonate of lime; but as the stone is soft and easily worked, it has been largely used for coverings and dressings to brick-built houses in London, and it looks very well when first put up. But in the case of the majority of the pretentious stone enrichments of suburban houses, no care whatever has been taken that the stone should be weathered before using, and it is no uncommon thing to find such stone crumbling away after two years' exposure. But however well this stone may have been weathered, it is extremely doubtful whether it ought under any circumstance to be used in a smoky atmosphere. For dry climates where there is little smoke, and for internal work, it is, however, admirably adapted, as it can easily be worked into most intricate moldings; but it must always be remembered that in external work elaboration of ornament means increased liability to decay.

You see, therefore, how necessary it is to ascertain something about the chemical composition of a stone. But what I may call its mechanical properties are no less important. You must examine (1) its hardness,—a soft, easily cut, stone will not, as a rule, be so durable as a hard crystalline one; (2) its weight,—as the denser a stone is, i.e., the greater its specific weight, the more likely it is to last; (3) its compactness, i.e., the closeness of its structure; (4) its porosity; and (5) its colour, if uniformity is desirable. Mr. Hull says that an original bluish grey tint should be avoided, as this indicates the presence of iron, and oxidation will frequently produce an uneven yellowish tint. Now, all these latter points you can examine for yourself, and you should always have a specimen of the stone you intend to use in a building to make a few tests of it. There are two other very simple practical tests which I may mention: one is called Smith's test, and it is to take some small chippings from a piece of stone which has been well wetted and put them in a glass of water, and let them remain for some time and then gently shake the glass; if the water gets somewhat turbid it shows that there is a certain amount of earthy matter present in the stone. Another test is to boil small pieces of the stone in a solution of sulphate of soda, after which the stone will disintegrate if it be of a perishable nature. This test is, however, a very severe one, and I do not think it would be necessary to discard every stone which did not stand this test.

When a stone has once begun to decay it is very difficult to stop the process, but several different methods of treating the stone on its first being fixed in order to prevent decay have been recommended, such as Soredmey's, Hutchinson's, Ransome's, Köhlmann's, and others, but as I have not had any practical experience of them I can say nothing about them. I have used boiled linseed oil, which certainly prevents water entering the pores of a stone, but it slightly darkens the colour of the stone, and I am disposed to think the application ought to be renewed every few years.

I have frequently mentioned the bed of a stone,

and you are all familiar with the clause in a specification which says that stone should always be laid on its natural bed, and it is well that we should all clearly understand why this is so desirable. I have pointed out to you that nearly all our building-stones have been formed by the deposit of sedimentary matter, layer upon layer, and that these layers have consolidated during the lapse of ages, partly by chemical action, partly by heat, and partly by enormous pressure, and however compact a stone thus formed may now appear, all these layers are really existent. Now if you can imagine a great piece of cardboard a foot thick formed of numerous sheets of paper gummed together, and then pressed into a compact mass, you will have some sort of notion of the structure of one of these building-stones. If you were to take such a piece of cardboard and press it in the same way in which it was pressed during its manufacture, you would only consolidate it the more; but if you were to put it on end, then begin to squeeze it, you would not have much difficulty in separating the various sheets from one another, and they would soon begin to fall away, and this is precisely what takes place when stone is not laid on its natural bed. Of course you would not often find that the ordinary pressure of superincumbent weight would actually squeeze out the layers of stone, but it would tend to loosen them, and would greatly facilitate the entrance of water between the layers, which would speedily begin to flake off. There is one other practical point which should always be carefully attended to, and that is that the bedding joints of blocks of stone should be accurately dressed and perfectly level. If this is not looked to, you will get unequal pressure and cross strains set up, and stone is one of the worst materials possible to resist cross strains, which is the reason why we so frequently see lintels over window openings cracked.

In conclusion, I must repeat one caution which I have already alluded to, and that is, do not take any stone on the credit of its name. The quality of the stone extracted from a quarry is always changing, and for a large building it is necessary constantly to examine the blocks of stone as they are delivered from the quarry. If you do this, if you also submit specimens of stone to a few simple tests, and ascertain its nature, you will be spared a great deal of worry and disappointment in seeing your buildings begin to decay before your eyes.

[Specimens of the various kinds of stone referred to were exhibited, and their mechanical and chemical characteristics exemplified, during the reading of the paper.]

THE SANITARY USES OF DISINFECTANTS.

ASSOCIATION OF PUBLIC SANITARY INSPECTORS.
A PAPER ON "Disinfectants," prepared by Dr. J. W. Tripe, Medical Officer of Health for the Hackney District, was read by Mr. G. B. Jerram (the President) at the last meeting of the Association of Public Sanitary Inspectors, Adam-street, Adelphi. Strictly defined, Dr. Tripe regards as disinfectants such substances as when used in proper quantity, and under suitable conditions, take away from any infected body or thing its power of reproducing itself in an uninfected body, and he divides them into two principal classes, viz., germicides which destroy, and antiseptics which arrest, the active principle in specific contagion or infection. In order to be properly employed, the limits within which any particular disinfectant works should be so definitely known that each might be precisely adjusted to the work it is best fitted to perform. An infinitesimal amount of infectious matter was often sufficient to produce the most violent results, and the great danger of filth was not its mere offensiveness, but the presence therein of morbid elements in a solid or gaseous form. Disinfection, to be useful, must, therefore, be perfect. It was unfortunate that the three desiderata of cheapness, general utility, and freedom from poisonous qualities could rarely be found in the same disinfectant. The interesting experiments made by Dr. Klein on swine, some of which were briefly described in the preceding paper, if confirmed by further experiments, that sulphurous acid gas was one of the most powerful of "aerial disinfectants," and would justify the preference now generally accorded to it. The practice of sprinkling with disinfectants was worse than useless as most certain and useful disinfecting agents. The respective advantages and disadvantages attending the use of the desiccating processes of Fraser, of Jennings, of Lynn, and of Ransome, were com-

pared. The proper use of disinfectants which were not germicides was also indicated. Crude fluid, carbolic acid, chlorine, Burnett's fluid, and the more recent disinfectants,—euchlorine, sporocid and chloratum,—being all here referred to. The last-named agent was considered unsatisfactory because it neither removed offensive smells nor destroyed bacteria in sewage, unless added in an inordinate proportion. Carbonyl of lime was an element in McDougall's powder and in Gubert's, and an efficacious mixture for cesspools and drains would be found in a mixture of quicklime and caustic soda in the proportion of 6 lb. of lime to one pint of acid. Terebene was a powerful deodorant.

The offensive smell from the openings of sewers in our streets we believe to be best remedied by placing animal charcoal in perforated trays between the openings; but to be effective the charcoal must be kept dry and be frequently changed. The lecturer, in conclusion, said he had not exhausted the list of useful disinfectants, many of which, like salicylic acid, were chiefly used as preservative agents. Some others, such as arsenic acid, chromic acid, and corrosive sublimate were either too dangerous or expensive for ordinary use.

In the discussion which followed the reading of the paper, Mr. Kinzett, the chairman, and several of the sanitary officers present, expressed opinions as to the practical use of disinfectants. Mr. Kingzett considered that the most satisfactory yet known, because they could be applied to the largest variety of purposes. No disinfectant could, however, be useful for all purposes, as the properties which rendered them efficacious in some cases would not fit them for others.

At the opening of the proceedings a testimonial was presented to Mr. Legg, consisting of a purse and twenty guineas, subscribed for by the members and presented by the President, and the customary vote of thanks to the lecturer brought the proceedings to a close.

THE WESTMINSTER HALL COMMITTEE

SIR,—In the evidence given by Mr. Ayrton before the Committee, now sitting, on Westminster Hall he stated that his opinion was that nothing should now be done to prevent the plan of Sir Charles Barry being carried out, so far at least, as that design comprises a building extending along St. Margaret-street from St. Stephen's Porch to a point in a line with the north front of Westminster Hall; that it should terminate there, but be united to the north front of Westminster Hall at the flanking tower of that front; the whole in accordance with the design of Sir Charles Barry.

It may be well to state that though this would not, as I think, do all that would be desirable, inasmuch as it would not enclose New Palace Yard as the great entrance court of the New Palace, it would have, at least, the advantage of bringing into harmony all the external façades of the New Palace, and I should welcome such a scheme for that reason, as far as it goes.

Now that some of the buttresses of Westminster Hall have been restored in model only, with detail necessarily entirely out of scale with that of the New Palace, the effect is, I think, so unfortunate as to make evident the desirability of screening the Hall, as proposed by my father, with (as I am glad now to hear) the approval of Mr. Ayrton.

A glance at the drawing of my father's design, published in the *Builder* of the 24th of January last, will at once show that it perfectly lends itself to such a partial execution of it, and that a good and complete effect would then be produced when viewed from the end of Parliament-street.

I have stated roughly that the cost of realising the whole of my father's design, including the enclosure of New Palace Yard, would, I estimate, be about 500,000*l.* To carry out the portion to which I have above referred would cost about 220,000*l.* out of the total of 500,000*l.*

Such portion of the design would provide eight committee-rooms on the principal floor and the floor over, larger than those in the river front (which are often found too small for important committees), as well as twenty-six other rooms available for public use on the ground-floor and the upper floor, or thirty-four additional rooms in all.

CHARLES BARRY.

1, Westminster-chambers, 10th March, 1885.

International Inventions Exhibition.—His Royal Highness the Prince of Wales, President of the International Inventions Exhibition, has fixed Monday, the 4th of May, for the opening of the Exhibition.

* Some notes of the discussion which followed the reading of the paper will appear in our next.

THE DECORATION OF ST. PAUL'S CATHEDRAL.

It is sufficiently easy to write a few lines of criticism upon the decorations now set in the cathedral, but we can well appreciate the fact that the committee has evidently found the greatest difficulty in arriving at a conclusion as to feeling its feet on solid ground. It must be forgotten that the examples of such decorations are few; that in this country, at least, nothing of the sort has been done, whilst the building to be dealt with is the second largest church of its class in Christendom. Before offering any remarks on the cartoons, we may not unreasonably attempt to face the difficulties which arise.

Perhaps the first is that of scale. We all know that a fault, very prominent in St. Peter's dome, less prominent, but still very present in St. Paul's, is the clumsy scale of the details, and, as it does, the apparent size of the arches by at least one-third. This defect obscures its climax in the monstrous key-stones of the whispering-gallery, which gallery is saved from appearing as a mere cornice of the scale given it by the rich wrought-ironing with which it is crowned.

The second question which rises, and which is submitted should never have arisen had the so-called decoration been rightly conceived, is the matter in hand that which it pretends to be, the decoration of the existing building, or are the decorations to take the place, using St. Paul's as a mere vehicle for the play of such decorations?

A third point is, what relation are the decorations to bear with regard to the treatment of the entire building?

Are we entitled to take a master work to destroy in it the relation of parts which its originator established, to dwarf it in effect, and alter its structure for the sake of displaying our decorations?

With regard to the first question or difficulty, we cannot be doubted that we cannot be wrong in our decoration is manifestly subservient to, and not dominant over, the design of the author of the building. What do we find? Although the detail is large and crushing in scale, the "decorations" dwarf it to mere insignificance. That which made the building look tall is now made itself to look small. Our eyes cannot get free from the coalheaver prophets and gesticulating giants posturing in the spandrels of the pendentives. The decorations are out of scale. This brings us, at once, to question number two. There should be but one answer to this. There can be no doubt that the present works entirely sacrifice the cathedral and turn it into a mere shell, on the blank faces of which efforts are being vainly made to rival Michelangelo. But is Michelangelo's work sublime merely because it is big, and is imitation of his work appropriate to St. Paul's, even if there were any living man who could approach his power? He could do what he liked on the roof of the Sistine Chapel. That building is hardly an architectural work. The pylons do not crush their surroundings in the way that the cartoons in the pendentives at St. Paul's assert themselves above the building by professing to decorate.

If we are to choose between the cartoons on the north or south side of the dome, the north side has the advantage. It is more numerous in its parts, more interesting, and does not possess the plainness that which is, no doubt, somewhat of a fault in the design of the church, an excess of light in this part,—a height so excessive that it reduces the nave and choir to insignificance. A cartoon on the south side is as crushing in scale and as commonplace as could be imagined, and makes the pointed section of the dome more crowded than it was before.

The idea of the dome is that of a great closed space, and undoubtedly that was Sir Christopher Wren's notion of it. He starts on the floor with eight sub-divisions, then divides into twenty-eight, grouping these in a subordinate way. The cartoon on the north side brings us back again in the most direct way to eight sub-divisions, quite ignoring Sir Christopher Wren's multiplication of parts which carries the eye from the eight great arches.

Wren's system of multiplication emphasised space, but this system of decoration merely emphasises height. The value of the ironing above the whispering-gallery to give life to the drum of the dome has been already

noticed. The decorators have, however, been anxious to set Wren to rights, and to crush his poor efforts.

All manner of devices have been tried on the drum.

On the north side a gigantic text, with thin letters on a gold ground, reduces a good high wall to a mere band, and brings a surface of almost unbroken gold so near the eye that it completely kills the gold in the dome above. One would have supposed that the gold and sameness would have increased as the decoration increased upwards. And, after all, a great flat surface of gold is not decoration; it is merely glare.

The attempt at decoration of the drum on the south side is truly melancholy. This space, the great continuous wall which seems to tie together the base of the dome, is emphatically subdivided into eight parts, exactly as Sir Christopher did not do it. To effect this, the over-large keystone of each great arch is surmounted by a still more prodigious bust of a prophet, or some other worthy, peering out of a circle, over the railings. Each circle is joined to its neighbour by enormous and uninteresting scrollwork, so that that part of the building, which by the ingenuity of its designer was left quite plain, and gave one the sense of horizontality and continuity, is now cut up into eight parts, emphatic and enormous.

Below the whispering-gallery are a series of eight spandrels,—fields for the decorator. Upon these there were faint traces of an architectural type of decoration following the inclosing lines of the spandrels.

The decoration thus suggested was, perhaps, commonplace enough, but, at least, it did not sacrifice the building. This is, however, done away with, and enormous figures of evangelists and prophets half fill the spaces, leaving vacant large areas of the gold ground on which the figures are depicted. From many points of view these figures are little better than black silhouettes on a ground of yellow light. From every point they simply crush the building, and do not even fit the spaces they pretend to occupy. Figures seated on thrones or in circles or hexagons would by such a treatment, at least, be wedded to the architectural lines of the building they are supposed to decorate; as they now appear, the feeling suggested is that the spandrels are too small and the picture is cut down to fit them. Setting aside the text on the gold ground, the unoccupied surface of the spandrels now shows the greatest amount of gilding, and has the effect of fixing the eye at this level. The ceilings in the "Stanze" at the Vatican would have suggested some more suitable treatment, something less assertive.

The third point that has been raised is "What relation are the decorations to bear to the treatment of the entire building?"

We cannot suppose that the gilding is to come to the floor level. The structure, unlike St. Peter's, is of stone, and cannot with propriety be faced with marbles. We have then a sober key of colour to begin with; the enrichments increase as we ascend, and Wren has left large spaces on the vaults obviously for decoration. If a climax of glare is established before we are half-way up; the whole scheme, as established by him, is overthrown.

By way of further destroying his surfaces and the repose of the building, the coffered soffits of the four great arches carrying the dome have been touched with a commonplace French grey. These great soffits, perhaps the most important constructive arches in the building, have hitherto presented to the eye an enriched surface; they seemed full of power to do their work. The one that is painted is frittered away into a mere gridiron of vertical and horizontal lines. The sense of structural unity is obliterated.

If we are entitled to deal with a master work as we choose, and make of it a mere vehicle for our decorations, and to alter its structural lines, then perhaps a justification may be found, not only for the cumbersome prophet, but even for the suggestion to put up sham coffering over the "quarter galleries." It would be absurd to profess admiration for Wren's treatment of this part of the church. But can a defence be found for putting coffers on a vertical face, and in immediate juxtaposition with the coffers on the soffits of the great arches? Even if Wren had done it elsewhere in a diminished form (and he has not in any place that is the least similar to this), it would not make it defensible here.

There is one decoration which Wren has already begun, and which, if carried round the church, would not only add to the effect, but assist the scale of the building. I refer to the gilt railing on the great cornice at the west end of the nave. This rail is unnecessarily high, and need not be continued of the same height. The lower it is kept, within reason, the greater scale will it give. As so many experiments are being tried, it may be suggested that one in this direction should also be tried.

A few boards painted dark stone colour, and with imaginary railings thereon, would, at once, show the effect.

SOMERS CLARKE.
15, Dean's Yard, S.W., March 11, 1885.

IRON TIE-RODS IN SPIRES.

SIR,—An architect informs me that it is a general practice to introduce tie-rods of iron to resist the "spread" of spires.

Molesworth gives 71 x pressure = power required to overcome the friction of stones on stones, which I take to imply the stability of a very flat spire without tie-rods.

If unnecessary, the introduction of rods of iron must be a great evil, unless, indeed, they gradually form channels by their expansion and contraction, and so have room to play without injury to the masonry.

* * * It is unquestionably a great evil; nor is it correct to say that it is a general practice.

TAXATION OF SURVEYORS' CHARGES IN COMPENSATION CASES.

SIR,—Referring to the letter of Mr. Banister Fletcher, which appeared in your journal of March 14th [p. 398], we must repeat that there was an utter want of principle displayed in the taxation in the case referred to in our previous letter (p. 359). We were drawing attention, not to a general principle, but to a particular application (or non-application) of the principle. You would not have been troubled by us if two surveyors' fees had been allowed; but, as a matter of fact, the total sum allowed did not nearly amount to one surveyor's fee upon Ryde's Scale, and we considered that a further injury was done to the profession collectively and individually by the manner in which this inadequate amount was apportioned.

If the taxing-master had even said, I will allow one surveyor's fee on Ryde's Scale, there would have been some principle in it, but to allow one surveyor 37l. 16s. and another 6l. 6s. was putting the matter in the most objectionable form, as clients have an erroneous idea, that the taxing-master is an expert, and is giving to each surveyor the amount to which he is properly entitled as remuneration for services rendered, and it is a positive injury to make it appear that a surveyor of high position is to be compensated for services such as were rendered in the case referred to by a payment of 6l. 6s. or over 37l. 16s.

LEE BROS. & PAIS.

THE SEWAGE DISPOSAL QUESTION.

SIR,—I do not know whether it has ever been considered practicable by experts to treat sewage with sulphate of lime or plaster of Paris. If a small quantity of this material be stirred into sewage and allowed to settle, the water will be quite clear and odorless, and the solid parts precipitated into a stiff mass, which could afterwards be dried and sold for manure. The value of gypsum or sulphate of lime for manure is, I believe, alone considerable; and it would be increased in value by the addition of sewage. On a large scale the sulphate of lime could be produced in London at about 25s. per ton, and one ton would produce one ton and a quarter of dried precipitate.

W. B. WILKINSON.

Architectural Association.—The fourth

Saturday afternoon visit of the Architectural Association was made, on the 14th inst., to the new Infirmary for the Hampstead Workhouse, at New-end, built from the designs of Mr. C. Bell, of Dashwood House, Broad-street. About forty members assembled, at three p.m., at the Infirmary, and were met by Mr. Bell, who conducted the members over the building. The Infirmary is the largest circular ward that has been built in England up to the present date, being 50 ft. in diameter. The circular form was adopted in order to avoid interfering with the light and ventilation of the adjoining buildings. We gave a plan and description of the building in the *Builder* for February 2, 1884. The members afterwards visited Messrs. Read Bros.' new beer-bottling stores at Kentish Town, of which Mr. Theodore K. Green is the architect. Here the members were received by Mr. Green. A view and description of these buildings appeared in our pages a few weeks ago (February 7).

The Student's Column.

DESCRIPTIVE GEOMETRY.—VII.

We have already several times applied the general method of finding the vertical trace of a plane on a new elevation; it consisted in drawing a horizontal line of the plane

Fig. 36.

Fig. 37.

Fig. 38.

and finding the point where this line penetrated the new elevation, giving us thereby one point of the trace required; but in many cases we have a much shorter way of finding a point of the new trace as given in fig. 36, for the two elevation planes intersect one another in a vertical line over α as seen in sketch fig. 37; therefore the height of C^v over $L^1 T^1$ will be the same as that of C^v over $L T$. The same operation holds good when the plane of the plan is changed so as to make an auxiliary plan, as in fig. 38; it is exactly the same case as the former, only the intersection of the horizontal planes is a horizontal line, as can be seen by fig. 39, which represents the operation in perspective.

Fig. 39.

Applications of the method of using auxiliary projection planes; in other words, auxiliary elevations and plans.

Given a line D by its projections D^v and D^h ; select other projection planes in which the line D will be perpendicular to the plan,—in other words, in which D will be vertical.

We first make a new elevation on $L^1 T^1$ parallel to D^v when we shall see D^v with its real inclination; then we make a new plan on $L^{11} T^{11}$ which

Fig. 40.

we select perpendicular to D^v . In this last projection of the line D we shall have for D^{11} only a point at an equal distance from $L^{11} T^{11}$

as D^h was from $L^1 T^1$, and D^{11} will, of course remain the elevation. To realise this operation the student need only turn the paper round so as to place $L^{11} T^{11}$ horizontally before him, but if he have time, we strongly advise him to construct the whole operation with pieces of board for the divers projection planes and a piece of wire for the line D. (See fig. 40.)

Given a line D by its projections D^v and D^h ; select other projection planes in which D will be perpendicular to the elevation.

This is exactly the same problem as the former, except that we begin by first making a new plan on $L^1 T^1$, parallel to D^h , and then we finish by making a new elevation, D^{11} , perpendicular to D^{11} , as in fig. 41.

Fig. 41.

Given a plane P by its traces P^v and P^h ; select other projection planes in which P will be perpendicular to the plan itself.

We begin by making an elevation on a plane at right angles with our plane P; for this we simply take $L^1 T^1$ perpendicular to P^h , and draw the new trace P^{11} by one of the methods already known. The plane is now defined by the traces P^v and P^{11} , but, if we change our horizontals

Fig. 42.

plane of projection and take for $L^{11} T^{11}$ the trace P^{11} itself, the plane P will be contained in our plan; there will be no more horizontal trace whatever, and the vertical trace will be our ground-line itself. (See fig. 42.)

Soudan Expedition.—Messrs. Fraser & Fraser, steam hoiler-makers, Bromley-by-Bow, obtained the order for the supply of nine immense wrought-iron tanks, to occupy the entire hold of the s.s. *Woodcock*, which is to be stationed at Snakim as a water-ships for the use of the troops. The order was received by Messrs. Fraser & Fraser on Saturday, February 28; the iron which had to be expressly made for the work in Staffordshire, was delivered to them on the following Saturday, March 7; and in one week—viz., on Saturday, March 14—Messrs. Fraser & Fraser had the satisfaction of delivering and fixing the whole of the tanks in the hold of the vessel. This is quick work.

RECENT PATENTS. ABSTRACTS OF SPECIFICATIONS. Fire-extinguishing Apparatus. G. J.

Water pipes are led to each room or passage for operating the valves are marked with the letters of each room, and connected to the valves by means of cranks or rods. The levers may be operated by the building if wished. A pipe is laid to each room, which terminates with a jet or nozzle and water is turned on to extinguish fire.

Filter. F. H. Landon. A filter is made sufficiently buoyant to float on the surface of the liquid to be filtered, which is used in any suitable tank. It has legs to rest on it resting on the sediment at the bottom of the tank, and its lower portion is perforated for the escape of the liquid, which escapes through a tube passed over the side of the tank.

Finishing Plaster Casts. F. Von der Berlin. This is an apparatus and process for finishing and leveling plaster-casts. They are hardened, dried, and conserved by applying suitable fluids spray producer. The spray producer is a novel ingenious mechanical arrangement which insures the complete dispersion of the preservative solution over the whole surface of the cast.

Pulleys. O. R. Olsen. A hub, arms, and a narrow rim are first cast in one piece, and a rolled or sheet metal outer rim is riveted over the outer one.

Flue Mouths. T. F. May. The mouth of the flue or chimney is made of metal contracting as it rises from the fire-grate. This contracted portion may be made in one piece, or in sections joined together, the inside being smooth so as not to obstruct the flue.

Metallic Lathing. B. Scarles, Clinton. A cloth is employed to receive the plaster. Strips upon which the wire cloth is secured are used with a flange on each side by which they are fixed in place with a longitudinal channel between them; they are rolled or struck from sheet metal, preferably galvanised iron, and are strong and easily bent into any desired shape for plastering concave, convex, or irregular surfaces. The wire-cloth is attached by staples, and the strips are fixed by nails passing through the wire with heads that overlap.

APPLICATIONS FOR LETTERS PATENT.

7.-2,648, W. Hayhurst, Cramps for Carriers, Joiners, Cabinetmakers, &c.—2,663, J. Drawplate for Domestic Fire Ranges, &c.—J. A. and J. Hopkinson, Hot-water Apparatus for Domestic and similar purposes.

23.-2,691, C. Billington and J. Newton, Knobs to Spindles.—2,715, J. Oliver, a Knob with Removable Grating for Fireplaces.

27.-2,718, E. Adams, Self-closing Application and Check for Doors, and Apparatus in Connection therewith.—2,731, E. Deacon, Locks for Doors and other Purposes.—2,742, R. Golden, Improved Plastic Compounds.

2.-2,749, E. Taylor, Ventilating Apparatus for Application to Windows, &c.—2,751, S. E. Improvements in Sash Fasteners.—2,767, E. Nichols, System of Water Waste Preventers.

MEETINGS.

SATURDAY, MARCH 21. Edinburgh Architectural Association.—Visit to Caroline Park and Granton Castle.

MONDAY, MARCH 23. Surveyors' Institution.—Continued discussion on "Leasehold Enfranchisement." 8 p.m. Society of Arts (Cantor Lectures).—Mr. J. Hungerford Pollen on "Carving and Furniture." III. Age of Gibbons, Bone, and that of their Successors. 8 p.m. Inventors' Institute.—8 p.m. Leeds and Yorkshire Architectural Society.—Mr. Walter Smith on "The Architecture of the Last Half-century." Edinburgh Architectural Association.—Mr. William Bruce on "Timber-fronted Houses to Lammmarket and Milne's-court." 8.30 p.m.

TUESDAY, MARCH 24. Builders' Clerks' Benevolent Institution.—Seventh Annual Dinner (Holborn Restaurant). 6.30 p.m. St. Paul's Ecological Society.—Mr. Somers Clarke, F.S.A., on "Some Churches of North Germany (Lubeck, Lüneburg, &c.)." 7.30 p.m. London and Middlesex Archaeological Society.—(1) Mr. G. L. Gomme on "The Westminster 'Folk-Moot.'" (2) Mr. John E. Price on "City Excavations: Recent Researches." 8 p.m. Institution of Civil Engineers.—Mr. P. W. Williams on "The Electrical Regulation of the Speed of Steam-engines and other Motors for Driving Dynamos." 8 p.m. Anthropological Institute.—(Three Papers.) 8 p.m.

WEDNESDAY, MARCH 25. Carpenters' Hall, London Wall (Free Lectures to Artisans).—Mr. John Slater, B.A., on "Roof Coverings." 8 p.m. Civil and Mechanical Engineers' Society.—Mr. H. A. K. Grible on "The Oratory, South Kensington, from a Scientific Point of View." 7.30 p.m. British Museum.—Mr. W. St. C. Boswell on "Assyrian and Babylonian Antiquities." V.—(Chaldean and Assyrian Libraries.) 2.30 p.m. Builders' Foremen and Clerks of Works' Institution.—Quarterly Meeting of Directors.

THURSDAY, MARCH 26. Society for the Encouragement of the Fine Arts.—Mr. James Orrock on "The English Art." 8 p.m. Institution of Telegraph-Engineers and Electricians.—Professor Oliver Lodge on "The Seat of Electro-motive Force in a Voltaic Cell." 8 p.m. Society of Antiquaries.—8 p.m.

FRIDAY, MARCH 27. Royal Institution.—Professor Sir H. E. Roscoe on "The Spectrum of the Coal Tar Colours." 8 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. F. Platt on "The Compound Principles as Applied to Locomotive Engines." 7.30 p.m. British Museum.—Prof. J. F. Heddets on "Medieval English Remains." VI. (Sports and Pastimes.) 2 p.m. SATURDAY, MARCH 28. Architectural Association.—Visit to Fishmongers' Hall. 2 (Two) p.m. Building Trades' Exhibition at Agricultural Hall.—Closing day.

Miscellaneous.

The Suakim-Berber Railway.—A Parliamentary paper has been issued containing the articles of agreement between the Government and Messrs. Lucas & Aird in respect of the construction of the Suakim-Berber Railway. The agents, as the contractors are described, are to construct "for the War Department for the purposes of the expeditionary force sent out to Suakim, and according to the orders and under the control of the general officer for the time being in command of the same force, a 4 ft. 3 in. gauge single line of railway from Suakim, and thence in sections to or so far as wards Berber as may from time to time be ordered in writing by the Secretary of State; and also an 18 in. gauge single line of railway in or about Suakim, as may from time to time be ordered by the Secretary of State." The staff will be paid by the Government, and rationed and clothed by the War Department. If any of the working staff should be killed by the enemy in the Sudan, or die from wounds or from the effect of the climate, his representatives shall be entitled to a gratuity equal to one year's pay. The agents are to receive a commission of 2 per cent. upon all expenditure by the War Department, such commission not to exceed on the whole 20,000l.; and they will be entitled to a further sum not exceeding 20,000l. if the railways shall be satisfactorily completed in the judgment of the Secretary of State. There is a condition that the contract shall not be sub-let. Some dissatisfaction having been expressed in Parliament in consequence of an order for pumping engines in connexion with this railway having been given to an American firm, it is satisfactory to know that although this is the case, yet the order for the boilers, of which large numbers are required, has been placed with the well-known firm of Robey & Co., engineers, Lincoln. Norfolk County Surveyorship.—Mr. T. H. B. Heslop, C.E., District Surveyor to the Kingston Highway Board, has been elected by the magistrates to the office of County Surveyor for Norfolk.

The Artisans', Labourers', and General Dwellings Company.—The eighteenth annual general meeting of this company was held on the 11th inst. Mr. Ernest Noel, M.P., presiding. The report showed that the rental for the year 1884 amounted to over 84,000*l.*, the net revenue being 67,610*l.*, out of which dividends upon the preference capital amounting to 12,073*l.*, and interim dividend upon the ordinary capital 20,832*l.*, had been paid. It was now proposed to pay a dividend of 5 per cent. on the ordinary share capital for the second six months of the year, carrying over 4,000*l.* to revenue reserve and 1,771*l.* to next year's accounts. The increase of capital during the year had been 125,200*l.*; the total amount paid up to Dec. 31 was 1,171,860*l.*, the authorised capital being 1,000,000*l.* in ordinary shares, and 750,000*l.* in preference shares 4 per cent. The completed estates of the company in London are Shaftesbury-park, S.W., and Queens-park, W., comprising nearly 3,400 separate houses. The cost of repairs upon these estates shows a decrease for the year as compared with 1883 of 1,047*l.* At Noel-park, N., the new estate of the company, work had been pushed on with rapidly, so that at the close of the year 743 houses, including those built or commenced in 1883, were completed, over 460 being let and occupied. This estate, when completed, will comprise 2,600 houses. The directors have had under consideration the question of acquiring a central site for the purpose of erecting block-buildings as dwellings for the industrial classes. The report and statement of account having been adopted, and the dividend declared, the retiring directors and auditors were re-elected.

Liverpool Engineering Society.—At the last meeting of this Society Mr. W. E. Mills, President, in the chair, a paper by Mr. J. J. Webster, Assoc. M. Inst. C.E., entitled "Notes on Constructional Ironwork," was read by the author. After referring to the enormous amount of ironwork used annually in the construction of warehouses and offices, as giving ample opportunities for studying the different modes of construction, he discussed the various forms of beams, and especially those of the rolled-girder type, and showed the errors of design occasionally committed. He said that the tables of safe loads given on published sheets of sections were not to be relied upon, and that in all cases the safe load should be calculated in each particular case as a check. He then went into the investigation of the strength of such beams, and showed how they could be calculated. The question of independent and continuous girders was then considered, and he showed how in many cases girders were designed and constructed as independent girders, yet from the nature of their position in the building and the application of the load they were actually acting as continuous girders, and should, therefore, have been designed as such. He next considered the different forms of joints and covers, and afterwards went into the investigation of columns.

Cemetery Chapels.—It is proposed, by the Local Board of Great Harwood, to lay out a cemetery, the area of which will be barely five acres; but some difficulty has arisen with regard to the erection of chapels, the Board, for economy's sake, desiring to erect one chapel, to be used in common by Churchmen, Dissenters, and Roman Catholics. Objections have been raised to the adoption of this course, and the Local Government Board sent down one of its inspectors (Mr. Stephen Terry) to hold an inquiry into the matter. It appeared from the evidence given by the architect (Mr. Angelo W. R. Simpson, of Blackburn) who had prepared plans for the cemetery, that the cost of one chapel would be about 620*l.*, while the erection of three separate chapels would cost nearly 1,200*l.* extra. It was suggested, as a compromise, that possibly three separate chapels under one roof could be erected for a total of about 1,400*l.* Do any of our readers know of so small a cemetery having three chapels, either under one roof or under separate roofs, or separately disposed upon the ground?

Coventry Sewage.—The Town Council of Coventry have decided to considerably enlarge the sewage works of their city to meet increase in population, and have instructed Mr. Mellis, C.E., to carry out the work. The sewage of Coventry has for the last ten years been dealt with by a combined system of chemical precipitation with filtration through land, and the operations have given general satisfaction.

Architectural Section of the Philosophical Society of Glasgow.—The closing meeting of the Architectural Section of the Philosophical Society of Glasgow was held on Monday evening last, Mr. James Sellars, the President, in the chair. Mr. W. P. Buchan read a paper on "The Past and Present Conditions of Plumber Work from their Sanitary Aspect." The paper was illustrated by several diagrams. In the course of the discussion which followed, Mr. Campbell Douglas said the great point that Mr. Buchan had urged on them was one that had been growing into their knowledge during the last ten or fifteen years, for chemical science had demonstrated that gases were constantly arising from decomposing matter, and that steps must be taken to prevent these coming silently and insidiously into their houses. Mr. Whyte, the Assistant Master of Works, said that traps alone would never keep out gases, and that ventilation was equally necessary. He also agreed with Mr. Buchan in condemning the use of small two-gallon cisterns for water-closets. The Chairman proposed a vote of thanks to the lecturer, which was heartily agreed to. The election of officers-bearers was then proceeded with. The following gentlemen were elected to office:—President, Mr. William Landless, architect; vice-presidents, Mr. David Thomson, architect, and Mr. Alexr. Muir, builder; treasurer, Mr. James Howitt, measurer; secretary, Mr. A. Lindsay Miller, architect; members of Council, Messrs. John Honeyman (architect), T. L. Watson (architect), Thos. Gildard (architect), James Sellars (architect), W. P. Buchan (sanitary engineer), John Dansken (measurer), William Howitt (measurer), C. T. Bowie (decorator), R. A. McCilvray (plasterer), Wm. Gilfillan (marble cutter).

Birmingham Architectural Association. The annual dinner in connexion with the Birmingham Architectural Association was held last Tuesday evening, at the Grand Hotel, Colmore-row. The President, Mr. F. B. Osborn, occupied the chair, and among those present were Messrs. W. H. Kendrick (Vice-President), Victor Scruton (Hon. Sec.), the Hon. R. Lytton, J. Cotton, A. Reading, F. Cross, F. G. Hughes, A. Hale, H. Cleve, W. Doubleday, D. Arkell, J. K. James, H. Lloyd, F. Newton, J. Pratt, E. Taylor, T. Tonks, T. Gann, P. Spencer, Lukin Smith, F. Hart, &c. The President, in proposing the toast of "The Association," remarked that the Association was deserving of the most hearty support, as it was the only representative assembly of the profession of the art of architecture in the town, and also on account of the important educational work it was doing amongst students and younger members of the profession. Mr. Kendrick responded, suggesting that representations should be made to the Town Council for the establishment of a Technical Museum for the benefit of the profession, and observed that in the new Art Gallery accommodation might be found for a section devoted to the interests of the Association. Mr. Doubleday gave "The Health of the President," and urged that the Post-office authorities should be requested to allow the designs for the new Post-office to be confined to Birmingham architects.

Acton and the Thames Valley Sewerage Scheme.—Although the Acton Local Board has accepted tenders for the construction of a separate system of sewage disposal, at a cost of 75,000*l.*, it is understood that Sir Joseph Bazalgette has advised the Board to connect its district with the proposed Thames Valley scheme. Acton proposed to spend nearly 40,000*l.* on sewage precipitation works and an outfall into the river at Chiswick, the whole of which will be unnecessary if Acton determines to join the Thames Valley Scheme. Mr. Mansergh, one of the engineers of the Mortlake Scheme, has prepared a sewage diversion scheme for the Thames Valley which embraces even a wider area than that included in Sir Joseph Bazalgette's scheme. Besides the sewage of the Thames Valley, Mr. Mansergh proposes to divert at the same time that of the two districts of Brent (which includes Hendon, Finchley, Edmonston, and the Barnets) and the Lea, which embraces Enfield, Edmonston, Tottenham, Walthamstow, and Leyton. The main sewer which will carry off the sewage of this wide area, commences at Houslow, follows, but outside, the boundary of the metropolitan area, and ends at an outfall on the Mucking Flats, Sea Reach, where it is proposed to erect works for the chemical treatment of the sewage. The cost of the whole system is estimated at 1,045,000*l.*

Proposed Copper Trade Institute. Swansea paper states that an effort is being made to found a Copper Institute on the part of the Iron and Steel Institute, and with every prospect of success. Some of the most important objects sought to be attained to facilitate inter-communication between persons connected with the trade, with regard to all matters relating to production, manufacture and use of copper or alloys, excluding all questions of wages and regulations; to promote the more extensive application of copper by making its properties and advantages more widely known; to facilitate the discussion at periodical meetings of practical and scientific questions appertaining to copper; to supply its members with reports of the prices, stock, consumption, and of statistics of copper; and to encourage exertions to promote the prosperity of the copper trade by awarding medals and premiums for paper and inventions, which, after the discussion their merits, may be considered worthy of rewards.

The Late Sir Charles Froke.—An elaborately sculptured mural tablet, in alabaster and marble, has just been erected in St. Peter's Church, Cranley-gardens, by Lady Froke, in memory of her husband, the late Charles James Froke, Bart., of Cromwell House, South Kensington, who was the founder and patron of the above church. Her ladyship has also erected a similar tablet in St. Paul's Church, Oslow-square, to the memory of Sir Charles, who built and founded the church also. The tablets are the work of Henry Terry, of the Lambeth-road.

The Civil and Mechanical Engineers' Society.—An ordinary meeting was held on the 11th inst., the President, Mr. C. A. M.L.C.E., in the chair, when a paper on "Stagnation" was read by Mr. Charles Berthon (Leith, R.A.). The author strongly advocated the abandonment of all other materials than steel for guns, and argued that it was not only the cheapest but the best material, and in fact would have been the material always employed but for the extreme difficulty of obtaining large masses of reliable quality.

Huish Episcopi.—A three-light window has just been erected in the Parish Church of Huish Episcopi, Somerset, by Mr. Nicholl, in memory of her husband, the late Major-General Nicholl, C.B., of the Royal Artillery. The subject illustrated is "The Angel at the Tomb," and the artists are Messrs. Mayer & Co.

Church Gasfittings.—Messrs. Jones & Willis, of Birmingham and London, have just completed, under the superintendence of the architect, the whole of the gasfittings at Holbeck Church, Leeds.—The same firm has also supplied the gasfittings and chimneys for St. Anne-in-the-Grove Church, Halifax.

TENDERS.

For the erection of two swimming-baths in Gosdun-street, Whitechapel, for the Commissioners for Public Baths and Washhouses, Whitechapel. Mr. John Hudson, architect, 63, Leman-street. Quantities by Mr. C. Stanger:—

J. Bidout, Charrington-street	26,187 17 0

* Accepted subject to the approval of the High Court of Justice and the Local Government Board.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

COMPETITIONS.

Table with 5 columns: Nature of Work, By whom required, Premium, Designs to be delivered, Page. Includes entry for 'Largest Chapel, &c.' with a premium of 211 and 104 1/2.

CONTRACTS.

Table with 5 columns: Nature of Work, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes entries for 'Liberals Club, Whitehall-place', 'Sewers', 'Waterworks', and 'Public Works'.

Table listing names and amounts, likely a list of contributors or contractors for a specific project, including 'J. W. Wyles', 'North Bros.', and 'O. T. Gibson'.

Accepted for the formation of a lake in Southwark Park, Bermondsey, for the Metropolitan Board of Works.

Accepted for the construction of sewers, &c., in the Pleck and Birchville Districts, for the Walsall Town Council.

For new shop-front in High-street, Wolverhampton, for Mr. J. Steen. Mr. J. R. Veall, architect.

Accepted for new Church Mission-room, Codsall Wood. Mr. J. K. Veall, architect. Wolverhampton.

For forming roads and paths, and draining additional land at the Woolwich Cemetery, for the Burial Board.

Table listing names and amounts for various construction projects, including 'Knight, Northfleet' and 'Carter, Asnerley'.

For new road and drainage, North Town, High Wycombe. Mr. Arthur Vernon, architect.

Accepted for restoring and enlarging St. Mary's Church, Alfrick, Worcester. Mr. Aston Webb, architect.

For additional class-room, and extending the infants' cloak-room, at the Maryland Point School, Leytonstone-road, Stratford, for the West Ham School Board.

Table listing names and amounts for various construction projects, including 'G. J. Hoskins' and 'Hearle & Son'.

For the erection of vicarage house, for St. George's, Perry Hill, Catford. Mr. Gordon M. Hills, architect.

Table listing names and amounts for various construction projects, including 'Totens & Sons, Kensington' and 'Sikhs, Catford'.

Accepted for the construction of roads and sewers on the Park-road Estate, Crouch End. Mr. Wm. Hodson, jun., surveyor.

For the erection of an addition to the brewery, Aston, Birmingham, for Messrs. J. Ansell & Son.

Table listing names and amounts for various construction projects, including 'Surman & Son' and 'Bloore'.

For alterations to the Star Brewery, Walton-on-Thames, for Messrs. Jason, Garvey, & Co.

Accepted for repairing eleven houses at Blythe Hill, Catford Bridge. Mr. Willis, architect.

For rebuilding No. 21, Godgee-street, on the Foyster Estate. Mr. Josiah Houli, architect.

For alterations at the Prince of Wales public-house, North-street, Pentonville, for the City of London Brewery Company.

PUBLIC APPOINTMENTS.

Table with 5 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes entries for 'Inspector of Nuisances' and 'For building warehouses at Blossom-street'.

Table with 5 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes entries for 'For the erection of a factory in the High-street, Catford' and 'For pulling down and re-building Nos. 3 and 4, St. Mary-at-Hill'.

Accepted for various works in the District of the Hornsey Local Board. Mr. T. de Courcy Meads, engineer and surveyor.

Contract No. 1. Surman & Son, £1,770 0 0; Bloore, 932 0 0; Jeffery & Son (accepted), 850 0 0; Smith, 842 0 0.

For alterations to the Star Brewery, Walton-on-Thames, for Messrs. Jason, Garvey, & Co. Mr. T. Willis, architect.

Accepted for repairing eleven houses at Blythe Hill, Catford Bridge. Mr. Willis, architect.

For rebuilding No. 21, Godgee-street, on the Foyster Estate. Mr. Josiah Houli, architect.

For alterations at the Prince of Wales public-house, North-street, Pentonville, for the City of London Brewery Company.

For sewerage, levelling paving, flagging, metalling, and channelling the following private streets, namely, Daniel-street, Maria-street, Coke-street, Peppas-street, and Fern-road, for the Council of the borough of Harwich.
Mr. Henry Ditcham, Borough Surveyor. Quantities supplied.—

For the erection of two cottages at Old Church-road, on Stepney Manor, for Mr. Freeman. Mr. H. F. Simmonds, architect. Cambridge Heath.—

Chillingworth	£310	0	0
Probert	230	0	0
Hardy	210	0	0

Works at Licensed Victuallers' Schools, Kennington.—
Mr. Benjamin Cook, of Stroucture-street, writes to say that in the list of tenders for new lavatories, &c. at the Licensed Victuallers' School, published in our last (p. 491), his tender was erroneously scribbled to "B. Cooper." The mistake was not ours. We printed the list as it was sent to us.

Schools, Shirley.—In reference to the list of tenders (published in our last, p. 402) for new schools in Spring Park-road, Shirley, near Croydon, we find that the name of the builder whose tender was accepted is Charles Bray (not Brass), of Wickham-road, Shirley.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 46, Catherine-street, W.C., not later than four p.m. on THURSDAYS.

TO CORRESPONDENTS.

P. J. M.—F. W. K.—I. W.—J. H.—F. W. R.—E. J. T. (continued).—C. M.—L. de V. (shall have attention another week).—W. H. T.—F. E. M.—W. R. W.—W. W.—W. W.—(shall have attention another week).—A. K. (tar paving).—J. H. G. (cannot continue the correspondence).—A. K. (the subject).—(labour) (cannot answer).—Advertisements correspondents cannot illustrate their inside in our columns. We say and the progress for which the proposed alterations. Any such illustration is by no means so desirable or worthless as you seem to imagine. No same kind of alteration for a similar purpose.
All statements of facts lists of tenders, &c., must be accompanied by the names and address of the tenderer, not necessarily for publication.
We are compelled to decline pointing out books and giving addresses.
Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
We cannot undertake to return rejected communications.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.
All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other notices should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

GOOD FRIDAY.—THE BUILDER for the week ending APRIL 4th will be based on THURSDAY, the 3rd. Advertisements for insertion in that issue must therefore reach the Office before THREE p.m. on WEDNESDAY. Letters of business and notices of advertisements, or ORDERS TO DISCONTINUE the same, must be at the Office by TEN o'clock on THURSDAY Morning.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Each additional line (about ten words)..... 6s. 6d. Six lines (about fifty words) or under..... 6s. 6d. Terms for series of Trade Advertisements, also for Special Advertisements on front page, COMPANION CONTRACTS, BILLS BY Auction, &c. may be obtained on application to the Publisher.

FOUR Lines (about THIRTY words) or under..... 3s. 6d. Each additional line (about ten words)..... 6s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. * * * * * STAMPS ONLY NOT BE SENT, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Government, W.C. DOUGLAS FOURDRINEER, Publisher. Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week must reach the Office before THREE o'clock p.m. on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTS, MONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STAMPING ADVERTISEMENTS OR ORDERS TO DISCONTINUE must reach the Office before TEN o'clock on WEDNESDAY morning.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum. PREPAID. To countries within the Postal Union, 25s. per annum. Remittances payable to DOUGLAS FOURDRINEER, Publisher, No. 46, Catherine-street, W.C.

Persian and Arab Art at the Burlington Fine Arts Club.

THE Burlington Fine Arts Club (Savile-row) opened their exhibition of Persian and Arab art (to which we briefly referred in a "Note" last week) on Thursday, the 19th inst.

It consists of upwards of 600 well-selected specimens of pottery, metal work, and textiles related to one another in certain styles of design and methods of work which are generally held to be common to Persia, Syria, Asia Minor, Arabia, and Egypt, of the fourteenth to the seventeenth centuries. These objects have been gathered from numerous private collections, and the discrimination which has guided the selection of them is suggestive to promoters of museums of art in exemplifying how much can be well done in comparatively small space. The very vastness of large collections often puzzles and misleads those resorting to them for purposes of study. Jostling one another, types of good and bad design, colour, and workmanship too frequently confuse the purpose of such collections; and the hideous and quaint find a justification in that importance which their presence is assumed to supply in support of conjectures on a putative nationality in style of art.

As its title implies, art claims the first attention of the Burlington Fine Arts Club, and it is comparatively an easy matter to define the limits of some exposition of art, whether from the point of view of subject in design, manufacture of object, or special use to which the class of object is put. But the Club has succumbed to an influence in vogue of attempting the elucidation of an ethnographical problem by means of artistic materials; and such questions as whether the geometric ornament of the Arabs, Persians, Syrians, or Sarcens was devised in the desert from Chaldean mathematical figures, or was the result of a Mosaic prohibition to imitate any subject of creation, are preferred to inquiries into the ornamental value of simple, elaborated, and indefinite expressions of involved angular forms. Then, again, the solution of ethnical uncertainties operates adversely to the study of methods of decorative manufactures, such, for instance, as lusted ware, which is not, from the standard of artistic effort, any more the special property of Persia in the sixteenth century than of the Gubbio potters of the same period; and, although the earliest traces of lusted ware are thought to have been found in

thirteenth-century ruins at Kerman and Natinz, who in truth knows whether kindred metallic lustre did not exist years earlier and at other far distant places? So mixed has become the conception of the purview of art that archeology, ethnology, and chronology are confused within it; nevertheless the present exhibition was obviously not undertaken to glorify Persia and adjoining countries as the only producers of certain beautiful objects. The beauty of the works is its central cause; and, in this respect, the position which "Persian and Arab" art may hold in a review of art generally is a foremost consideration.

As here displayed, the subject matter of Oriental designs is almost entirely without a secondary or well-marked interest, as of myths, religions, and history. Geometrically-ordered distributions of geometric forms, orderly arrangements of elegant calligraphical characters, of floral forms and of ornamental devices, conventional in character, predominate. For pottery, colours are used in harmonies of two or three tones, of which the chief are greens (copied from natural subjects), blues (imitated largely from Nankin porcelain), reddish purples (an empirical ensign of Damascus ware), and clay reds (in thick impasto, the mark of Rhodian pottery). In textiles the colouring is more varied, and where the use of the material associates itself with the princely hunter in his tent, animals such as tigers, cheetahs, and antelopes, appear, intermingled with palmettes, Zoroastrian cypresses, and graceful flowing forms; in velvets and other hangings we have flowers and diaperings of bold tulip shapes. On engraved metal works warriors on horseback (as clumsy as those in stamped and painted tiles) are wrought in occasional pointed panels, which serve as the *points d'appui* for intricacies of arabesques. For the rendering of such themes, certain of the modes of expression were brought to a high standard of perfection by the craftsmen; as, for instance, in even and transparent glazes upon earthenware; in fine vitreous ware, a near approach, perhaps, in the absence of necessary kaolin, to porcelain, in specimens of damascened metal (although Scandinavians and Hindus have done as well), and in the costly examples of carpets and golden weavings, in making which, few, if any other people, achieved such triumphs of close velvety piles and wondrous brocades.

But with all this, there is no sign of such acutely-developed perception, vivacity, facility of representation, and daintiness in craft, as exists in Greek, Japanese, and much Italian work. On the other hand, this "Persian and Arab" art no doubt bears the palm, if balanced with that art of India which has recorded Buddhist and Brahmanical rites and events.

After all, however, national rivalries had little to do with the production of "Persian and Arab" works. The wants of the mass stimulated the ingenious worker to make efforts to supply them; and the kingly heads of tribes and groups of people, the Timurs, the Khalifs and Shahs possessed a natural ambition to have things more rare, curious, and valuable than those used by their inferiors. Communities came to be more or less organised into art factories, and succeeded one another. The architectural monuments of earlier dynasties furnished the industrious craftsmen with attractive suggestions for novel purposes. Bodies of art craftsmen moved from place to place to execute imperial commissions. Inter-course, warlike and commercial, was, as it is now, a potent factor in creating imitations and adaptations. And a wave of Oriental art passed on to Europe to be stemmed and guided into devious courses by the differently-circumstanced artificers of the West.

This and much else may be gathered from the present exhibition, judiciously arranged to present an aspect rich in glow and contrast of colour and materials. A very few inferior specimens have unfortunately found their way into the collection. Above and between cabinets or glass cases, the greater number of which contain varieties of pottery, hang carpets, textiles, embroideries, and other fine fabrics. In Cabinets IV. and V. are specimens of metalwork; for the most part, engraved and pierced brass bowls, kettles, ewers, and candlesticks. But the more important of the metal works are near a fine trophy of objects in a recess at one end of the room. In the centre is No. 594, lent by Mr. William Morris, a large carpet of stately design, the elements in which consist of large pointed, curved-shaped panels, interlocking forms, similar in plan, though more fancifully treated in outline; amongst these recurrent figures are groups of floral ornament, some of which are careful representations of leaves, blossoms, and buds. The same character of design, with straight-lined diamond forms as the basis, is to be found in carpet No. 593, lent by Sir Hickman Bacon. The carefully-drawn floral forms,—as distinct from formal ornament,—are noticeable, too, in an exquisite velvet carpet, No. 355, lent by Mr. Salting, who also contributes No. 591, a marvellous carpet, refined in gorgeousness of effect, with light grounds of golden and silver threads picked out with velvet devices in rich blues and delicate greens, bordered with fair blue and yellow arabesques. This specimen is supposed to have been made by Persian workmen in Poland; but the evidence in favour of the supposition does not present itself on the face of the carpet, though there has been consider-

able effort to establish the reputation of a doubtful Polish factory.

Returning, however, to the metal works, two gaunt peacocks of brass (Nos. 262 and 312, lent by Mr. A. Ionides), studded with turquoise, lavishly engraved with ornamental letters and seated figures holding birds, occupy commanding positions upon the two cabinets containing respectively glass works, amongst which is a fine mosque lamp (No. 256, lent by Mr. J. Dixon, not up to the standard of those belonging to the Khedive, at South Kensington Museum), and tawdry Anatolian ware, and Gombroom glassy ware, or "porcelain translucent." These cabinets are numbered six and seven, and flank the recess in which Mr. Morris's carpet hangs. In front of this, low down, is an engraved white metal bowl, good in form (No. 265, lent by Mr. Morris); while to the foreground stand one of a pair of lofty candlesticks,—some 8 ft. high,—of pierced and engraved brass, partly overlaid with white metal (No. 268, lent by Sir H. B. Bacon), covered with Arabic inscriptions and interlacing ornament, but made for use in connexion with Christian rites, since, as the catalogue entry explains, the texts are taken from the "New Testament and from the Liturgy." This is interesting, and so is the moulded Agnus Dei with cross (the device of Knights Templars) upon a salt-cellar (No. 273, lent by Mr. Charles Elton, M.P.); and a rude rendering, on the Coptic lump-balances (Nos. 305 and 306), of the cross-winged heads or cherubimic devices, a favourite detail in English thirteenth century, as well as in twelfth-century Italian ecclesiastical embroidery and sculpture.

The oldest work of art in the collection is (No. 164) a marble fragment of a profile sculptured in bas-relief, attributed to the sixth century B.C., and recalling, in regularity of curled beard and hair, Assyrian treatment. It was discovered at Persepolis, in the year 1800, by Richard Strachey, father of the lender, Mr. R. Strachey, and demonstrates a higher type of drawing and modelling the human face than is discoverable in all the rest of the collection.

The Persians and Arabs are not remarkable in depicting the human form, though they have a distinct power in conveying energy in action to the curiously-represented members of the feline tribe and others, possible lions, probable cheetahs, and undoubted deer and antelopes. This may be remarked in the animals depicted upon No. 93,—a carpet lent by Sir Frederick Leighton. The influence of Chinese designs upon Persian pottery is conspicuous in Cabinet No. 3. Some specimens are marked with imitations of Chinese marks, but to the forms in blue and white the Persians gave, as a rule, outlines of black, which supply a special tone to the appearance of this class of ware. More curious, perhaps, are the Chinese dragons (No. 96) and the Fong Hoang or feathered chimera (No. 151), which appear in relief upon star-shaped tiles of dark blue and lustre. Near these latter is No. 144, lent by Mr. Holman Hunt. It occupies a central place over the chimney-piece, and is an oblong tile with Arabic inscription in relief, which contains the name of the "Expected Imam" of the Shah, also known as the Mahdi. The moulded or stamped ware with inscriptions upon grounds of scrolls and arabesques has kinship with very early specimens of this class of pottery, which has been long known in India, and the technical points of its make are allied with those of the ancient Egyptian bowl (No. 1) and vessel for offering libations to Osiris (No. 2), lent by Mr. Drury Fortnum. No dates are assigned to the examples of lustred ware in Case No. 11, though those of architectural importance, Nos. 507 and 508, lent by Sir H. B. Bacon are probably of the thirteenth or fourteenth century.

The great mass of wares, classified by similarity in design, and conveniently grouped under titles like Damascus and Rhodian, take shape in lamps, great rice-bowls, basins, plates, jugs, and long-necked bottles, and here the intermingling of the palmette, the Tartar cloud (a sort of waving riband ornament), the fine scrolls and concentric spiral lines, with flowers and figures, notwithstanding variations as to

colour, almost merges into one class of design the whole of the articles of use in decorating which these details are employed. Mr. Drury Fortnum's Damascus lamp (No. 527), with its inscriptions from the Koran and the record of Mustafa, the "poor" and "humble" painter, dated, A.H. 956, in the mouth of Jemazi-el-oola (*i.e.* June, 1549), and Mr. L. Huth's bowls (Nos. 529, 533, and 538) are splendid specimens in the central cabinet of Damascus and Persian ware; whilst in cabinet No. 10, of Rhodian ware, the pieces obtained by Sir F. Leighton direct from Rhodes and in Lindos have a paramount importance in furnishing data for a classification of similar works.

In so hasty a survey mention is necessarily omitted of many objects of great interest, and limits of space make it impossible to touch upon such involved matters as must arise in distinguishing between Broussa and Venetian velvets, or in assigning Sicily, at its Norman period, as the birthplace of the "Persian" ivory casket (No. 176) lent by Mr. H. Wallis. The collection is very remarkable in having brought to light a number of treasures never before publicly displayed together, and the Burlington Fine Arts Club has cause to congratulate itself upon the generous co-operation it has received from over forty contributors, amongst whom are such distinguished connoisseurs and amateurs as Mr. A. W. Franks, F.R.S., Mr. F. Du Cane Godman, P.R.S., Mr. C. J. Ross, Mr. Frank Dillon, and others.

It remains to say that the descriptions of the objects have been most carefully given in the catalogue, whilst Mr. Stanley Lane-Poole has translated the Arabic inscriptions. Mr. Henry Wallis has written a few pages of "Introductory Remarks." These latter, however, are scarcely worthy of the exhibition.

AN ARCHITECT'S NOTES IN MALTA.

BY E. INGRESS BELL.

FTER eight happy days passed in sailing over summer seas and under cloudless skies, the Island of Malta, heralded by Gozo and Comino, the outliers of the group,—breaks upon our view, bare, brown, and steaming hot. With our glasses we can see St. Paul's Bay, the white statue of the Apostle of the Gentiles marking the scene of his shipwreck. Next we descry the dome of the famous church at Monsta, read of by all in Fergussan, as to which more anon. We cannot help noting in passing how very ill its contour suits its position, and long for the vertical lines of tower or campanile to oppose the undulations of the surrounding hills. The picturesque outline of Notabile, the "Citta Vecchia," stands out clear and dark against the glowing western sky. Sliema, the Brighton of Malta, is quickly passed, and, with skillful piloting, the good ship is gliding serenely round the dangerous Dragut point, the rusty skeleton of a wrecked steamer lying forlorn upon the rocks, and under the very guns of Fort St. Elmo, about which the history of modern Malta turns. As we pass Fort Manoel we call to mind the time when Sir Walter Scott, in that last vain search for the health which was never again to be his, was kept in quarantine within its ramparts. We can see at the head of the long flight of steps the very gate at which he sat and received from behind a barrier the friends who flocked to visit him, whose hands he was so hardly restrained from grasping, forgetting that a partnership in his "guarance vail" would have been the certain penalty of such an indiscretion. The motion of the screw, to which we have grown accustomed, suddenly stops; perfect rest comes upon us with something of a shock, and our seaward journey terminates under the mighty flank of St. Michael's towering Bastion.

After the entertainment provided for us by the world-renowned Maltese divers, we drive apace up a narrow and tortuous white road, threading in and out between lines of white ramparts,—past priest, peasant, and beggar, all covered with a white powdery dust,—past trees of oleander and hibiscus, also white, across the drawbridge which trembles over the dark abyss of the

main ditch which separates Valetta from Floriana, the bottom of which no eye can see, and whence the poor Turkish prisoners quarried the stone of which Valetta is built,—through the somewhat modernised Porta Reale, guarded by colossal statues of the Grand Masters L'Isle Adam and La Valette; and the Strada Reale, the Royal Street, bursts upon our enraptured view; a mile long, straight as a line, and closed at its lower or eastern end by a white lighthouse, bright in its setting of sapphire sea. No art could have devised so effective a preparation for the scene as that imposed by the exigencies of the lines of defence through which it is approached, and few cities can show so glorious a perspective as that of the Strada Reale of Valetta.

There are traces in Malta of a Phœnician occupation,—witnessed by memorials of high antiquarian interest, of a Roman occupation,—witnessed by the lately excavated "villa," interesting alike to the antiquary and the artist; and there are here and there fragments of beautiful Sicilian architecture. But the real interest of Malta is bound up with the illustrious Order of St. John of Jerusalem,—those dauntless priest-warriors, who, upon their departure from Rhodes in the year 1523, found a refuge in the Island of Malta, and consecrated it by their heroism.

The incidents of the long defence of Fort St. Elmo,—of its fall, of the victorious resistance of Fort St. Angelo, and of the final abandonment of the siege by the exhausted and dispirited Turks,—may be read in the stately narrative of the Abbe Vertot, or in the more brilliant pages of General Whitworth Porter, who, as a soldier, writes with a fuller knowledge of the subject than the churchman could command. For us the immediate interest begins with the resolve of the Grand Master La Valette to build a city on Mount Sciebarra,—that barren promontory which, dividing the two great harbours, commanded the defences of both.

"Of all the several places which had been fortified before the siege, there was none of them better situated than Fort St. Elmo. It was, in a manner, the very key to both ports. The Grand Master, without neglecting to take care of the other forts, formed a design of enlarging this and of adding new works to it, and resolved likewise to build a town upon the same neck of land, to strengthen it with all the fortifications that art could possibly invent, and to make it the residence of the knights."—Vertot, ii. 41.

In furtherance of this design he sent for engineers and workmen from several parts of Italy,—and when the lines were marked out he, on the 25th of March, 1566, went in his robes of state, attended by all his knights, and with great ceremony laid the first stone of the city, which was henceforth to be called after his name.

"To perpetuate to the most distant posterity the memory of so remarkable an event, they threw on the foundation a great quantity of gold and silver medals, on which the city was represented, with this inscription,—

"MELITA RENASCENS."

We know, therefore, the circumstances of the foundation of the modern city, and we can guess the style of architecture which would result from the Grand Master's invitation to the Italian architects of the middle of the sixteenth century.

The "Order" was divided into eight "languages," viz, Provence, Auvergne, France, Italy, Arragon, England, Germany, and Castille, and each language had its separate "Auberge" or head-quarters. These inns were intended not only as the residences of the knights, novices, and serving-brothers of each section of the order respectively; but for the several reception of French, English, Italian, Spanish, and other pilgrims and strangers who might in their wanderings demand hospitality. Accordingly the architects framed their designs of ample dimensions, and in doing so set the key for all future Maltese building. The whole island was a quarry of soft stone, easily won and worked. It is not what we call a "weather stone," but it resists sufficiently well the climate of Malta. There the thermometer never falls below 45° Fahr.;

and fortunately so, for it is probable that an English winter following the rainy season would lay Valetta in ruins. Many of the inns built by the knights have been destroyed or converted to uses which have altered their distinctive character. That devoted to the English "language" appears to have been alienated to other uses soon after the "Reformation." But many of them still exist in all their pristine magnificence, to attest the lordly ideas of their builders. The Auberge de Castille is a palace appropriated as an officers' mess. The Auberge d'Italie is the headquarters of the Royal Engineers, and others are used as barracks. The Auberge de Provence is a club, and in it Sir Walter Scott was sumptuously entertained. Its banquetting-room, 90 ft. long, 50 ft. wide, and 45 ft. high, is a fair sample of the refectory or common room of these old inns. In plan they were arranged round a central court, the apartments on each side being approached by galleries or cloisters on the four sides. In these courtyards orange and oleander trees grow, brightening the interiors by their blossoms, and filling the air with fragrance. The halls, staircases, approaches, and domestic accessories are on a magnificent scale, and produce a marked effect upon all beholders; but the detail is coarse and the ornament meretricious and bizarre. Here, as elsewhere, the art of the smith appears to have been the last to yield, and to this day there is much grace and delicacy of design in the wrought-iron railings and balconies which adorn even the poorest houses.

Valetta and its sister cities are built upon rocky promontories which slope from central ridges to the harbours. For the most part the streets are laid out, as in American towns, in straight lines, crossing each other at right angles. The longitudinal streets of Valetta decline towards the Mediterranean at gradients which do not preclude carriage traffic. But the transverse streets fall towards the harbours at gradients which have necessitated cutting their rocky surfaces into those "stairs" at which,—*teste* Byron,—each traveller "swears." No carriage can, therefore, pass along them, what is to say, comfortably, for your Maltese carrozzi driver would drive you down the side of a house; and the races at Notabile actually take place along a road which in steepness is little short of a precipice. The houses are consequently built with their floors and roofs stepped one above another, and each one is independently designed for the slice of frontage allotted to it. This not only diversifies the skyline, but leads to a variation in the architecture of the streets which the dwellers in level towns lose in a depressing uniformity of façade, and long horizontal lines of cornice. One misses at first the chimneys, which would further break up the skyline, and which in Italian towns are generally picturesquely designed. But the Maltese as a rule light no fires, although they feel the winter cold severely. They cook by the aid of a little lighted charcoal, the fumes of which escape through a tiny channel in the outer wall. You may count upon your fingers the houses which have a "range," and thus it happens that the chimney is absent. There are but very few inclined roofs in the island. One, of low pitch, at St. John's Cathedral; one to the palace; and a roof of high pitch to the new English church at Sliema. The rest are all flat, and give to the towns a Eastern look. They are constructed of timber beams laid 2 ft. or 3 ft. apart, upon which rough stones are placed, and above them a sort of concrete called "turba," which is in turn covered by a kind of cement called "diffone," trodden down by the naked feet of women. In the vast halls of the auberges the beams are mostly of chestnut, of considerable scantling, brought from Spain or Sicily. Their sides and soffits are painted in bright colours, and small cross-beams divide the interspaces into panels of various sizes and figures. These are also gaily decorated, but scarcely moulded or carved at all. The floors are similarly constructed, the upper surfaces being of rubbed stone and painted. The interiors of the rooms are not plastered, but the ashlar shows everywhere, and the architraves to doors, windows, &c., are in stone or

marble. Timber is used sparingly, as the island produces none. The rock would probably grow beech, birch, and pine. The Wellingtonia planted in the courtyard of the palace by the Duke of Edinburgh some twenty years ago is now a magnificent tree. But it is said that the Maltese have a superstition about trees, believing them to be inhabited by evil spirits, and that they cut down those which were planted by Sir Gaspard le Marchant when governor, and so robbed the island of much-needed green and more needed shade.

The Spanish "mirador," or corbelled and enclosed balcony, is a constant feature in Maltese domestic architecture. It enables the occupants of the rooms to which it is attached to enfilade the street in both directions, and it gives the gossips a coign of vantage of which they avail themselves to the full. These projecting windows have seldom any ornamentation other than a little carving on the corbels; but they are sometimes brightly coloured, and always cast deep and piquant shadows down the house front. With a strip of coloured carpet hanging therefrom, they assist in the general gaiety of the streets, and on "Festa" days play an important part in their decoration.

There is a curious similarity between the architecture of Malta and that of some of the Belgian towns, which is explained by the presence of the Spaniard. Spanish architects in great numbers were in all probability employed upon the city of Valetta. Those peculiarly licentious forms of Renaissance art which are distinctive of Spain,—those defiant discursive curly-wurly doorways and dressings, designed in what the late William Burges irreverently called the "God-dam" style, and which are plentiful in Antwerp,—have their exact counterparts in Valetta.

The ecclesiastical architecture of the island conforms in plan pretty closely to the type here sketched, and is impressive from its size and the liberal use of thick walls and broad surfaces. The exteriors are

Plan of Florian Church.

often disfigured by a redundancy of coarse detail and ill-executed ornament, whilst the antics which the saintly personages play who occupy the various niches are grotesque almost beyond belief. But the interiors are often grand, and well adapted for the religious use for which they are designed. The light is admitted through hidden lanterns in the crown of the domed aisles; by a clearstory; or by a ring of sparse lights in the drum of the central dome. This method of introducing the light from a concealed source suggests the favourite trick of Rembrandt, who hides his candle behind a curtain, and only allows its diffusive rays to be seen. Not only does this furnish a very artistic result, so far as a scheme of lighting goes, but it leaves the wall spaces at liberty for the display of pictures, &c. With few exceptions the pictures are not deserving of so much consideration; occasionally they are simply horrible. Where German artists have

been employed the result, if comparatively tame, is far more satisfactory. The Maltese are extremely devout, and the pictures which shock us secure, nevertheless, their warmest regard, and play, no doubt, an important part in the scheme of religious education. Almost every church has its treasures of gold and silver plate and sacred vessels, and in some of them the chalices, processional crosses, &c., are of great beauty and value, the knights having been allowed, on their expulsion from Rhodes, to take with them their church plate and furniture. Fortunately there is little stained glass in any of the churches.

Sacristan's Chair, Florian Church.

The peasants themselves have built their churches with their own hands, each one giving his labour and contributing his share of the materials. I saw a site near Misida marked out for a church by rows of flags of various colours. All day long a caretaker perambulated the vacant ground. But when the day's work in the fields was over, a hundred peasants were busy digging trenches, carting materials, and building the walls. And each day they continued the work, snatching between their ordinary labour and this labour of love a brief interval for a frugal meal of rye-bread and oil, a handful of figs, and a quiet pipe.

The church at Mousa is the show church of the island, mainly because of its variation from the common type. It is a copy,—with a difference,—of the Pantheon at Rome, "asses' ears" and all, and it has been treated by Mr. Fergusson in such detail that we need not go minutely into the particulars of its design. As usual, the exterior ornamentation is absurdly out of scale, and detracts from the really considerable dimensions of the edifice. Of the decoration of the interior the less said the better. It is sad to see the persistent expenditure of gold leaf and ultramarine with such dire results. I accepted an invitation to ascend the exterior of the dome, and found, to my confusion, that there are no parapets of any kind to protect the explorer of its many ascending ranges of masonry. One has to walk along the upper surface of the cornice, a mere ledge, with nothing to catch him if he stumble. The pretty handrail shown in Mr. Fergusson's woodcut does not exist. On the topmost platform but one I sat down to collect myself a little, when a "gamin" who had followed me up unobserved, seeing my embarrassment, thus addressed me:—"Sir, you are the fourth Englishman what have fall down from here and he found dead in our garden. You are the fourth!" "You are a nice boy," I said. "Yes, sir. Give me somsing." I should have liked to have given him "somsming"; but it was no place or time for contentions, and I dissembled.

The costumes of the peasants are, so far as the men are concerned, picturesque and full of colour. The wide-brimmed straw hat, the coloured shirt, the bare brown breasts and feet, the gaily-coloured sash worn round the waist, and the tight blue trousers make a bright and

pleasant *ensemble*. A bevy of workmen returning from work, their mule gaily caparisoned with coloured scarves of the peasant women's weaving, its neck encircled by bells which jingle in the clear air, is a pretty sight. As they draw nearer you perceive that one plays a violin, one a viol, one a mandoline, and they all sing in low plaintive voices some melodious song of love. The women's costume is sombre. The universal garment is the "Faldette" of black stuff or silk, according to the condition of the wearer. It is used as a covering for the head as well as for the shoulders, and was adopted, it is said, as a penitential garb in times of national sorrow, and as a protest against the white costume of the victorious Turkish women. The dresses of the ecclesiastics, both regular and secular, are varied and picturesque; especially that of the begging friars, who are, however, seen all over Italy and Spain, and are not peculiar to Malta.

A few weeks' residence is manifestly too short an acquaintance with the Maltese to warrant a sketch of their character. But I made diligent inquiry on the point from old residents. There are those who say that the Maltese do not always speak the truth (I am putting the statement my own way); that they have confused notions of property; that they are not so courageous as lions. For myself I am not conscious of having been deceived by any statement of theirs. I certainly lost nothing whilst with them, although I left my things about as I should not have done at an English hotel. Of their courage, or want of it, I could form no opinion. But I am well assured that they are an industrious, sober, thrifty, good-tempered, gay, and eminently moral race, and with these virtues,—which all admit them to possess,—they cannot be very bad. They are extremely courteous, with a native courtesy which has all the charm of the highest breeding. The man who took me over (literally) the Mousa Church was the analogue of the English navy,—a man who was employed as a labourer on the public drainage works. His wages for a long day were 10d. only. He took me through the church, the sacristies, the priest's house, and obtained for me specially a sight of the architect's original drawings. At parting I slipped 1s. into his hand, which he instantly returned, politely but quite firmly. My friend the *gamin* tried unsuccessfully to snatch it, and came in for a sound cuff. But my guide could not hear of being paid for a civility which he was only too willing to render. It was *kind of me*, he said, to take the trouble to examine the church, of which he was evidently so proud. I have looked over a good many churches in my time, English and Continental, but I never knew the guardian of any of them take this view. It is to be remembered that the gratuity which this poor man resolutely refused was more than a day's pay.

I have, on the whole, the very pleasantest remembrances of the island and its inhabitants. It has been strangely neglected by painters, who would find there thousands of pictures waiting to be painted. To the young architect it affords a wide field for discriminating study. It is, moreover, a place where hospitality is universal, and where an Englishman can enjoy the sights and sounds of a foreign clime, and yet feel himself completely at home.

British Archaeological Association.—At the meeting of this Association on the 18th inst., the Rev. S. M. Mayhew presided, and exhibited a large collection of ancient objects, mostly found in the City in some of the recent excavations. The first paper was by the Rev. John Edkerg, D.D., of Pekin, read in his absence by Mr. W. H. Rylands, F.S.A., on "Ancient Navigation in the Indian Ocean." Mr. J. T. Irvine read a description of the opening of a barrow at Croyland, Lincolnshire, in which were found some Roman remains, and also some prehistoric flint implements. With these were a great many objects of hard-baked clay, similar to the teeth of a barrow, and the opinion was expressed that they had been used for a similar purpose. Similar articles have been found near Peterborough.

NOTES.

THE question of dealing with Westminster Hall will, probably, be submitted to the House before long, and we must beg leave to repeat our caution to those Members who care at all about such subjects not to allow themselves to be coerced into sanctioning a foolish piece of costly archaeological trifling merely because the chairman of the "Restoration" Committee is pertinaciously bent on carrying his point (for that is really all there is in it), and those who may presently have to vote on the matter should read the full evidence (when published) and not trust to what has been reported in the *Times*, which has omitted all report of the evidence of some of those who were best qualified of all to speak on the matter, and who were adverse to the views of the chairman. Mr. Brewer's full and valuable evidence as to the probable former state of the site west of the Hall was reduced in that journal to a mere paragraph, and the evidence of Mr. Loftus Brock was omitted altogether. These gentlemen are only architects and men noted for special archaeological knowledge, and according to their opinion on a point requiring special knowledge of that kind is of course passed over in the leading journal as of no consequence. Our view of the whole matter will be found in the *Builder* of November 29th of last year, and we have seen no reason to alter it. The side of the Hall was never intended to be seen; the finials and huge battlements at present built up entirely dwarf the details of Barry's buildings (more so even than need be, for the buttress finials are very coarsely designed), and the proposed new rooms will be an absurd failure in regard to size and lighting. What should be looked to is the repair and restoration of the buttresses as far as is necessary for stability and architectural completeness, with the view of ultimately completing Barry's building as it was intended to be, and concentrating the Government work in proper apartments, and not pigeon-holing committees in the partitions between the buttresses of the Hall. Those who vote for this will find out when it is too late what a silly thing they have done; and it may be observed that the promoters of the scheme themselves have been obliged to drop their idea of the carriage porch in the lower cloister, which every practical man knew from the first to be absurd.

ON Monday Mr. Causton inquired whether, before the House was asked to decide on the question of the restoration of Westminster Hall, the painted screen in the two central bays might be removed, and the two buttresses finished temporarily in similar style to the pinnacles now exposed to view; in other words, that those interested might have an opportunity of seeing how the buttresses and flying buttresses would look without the screen: a matter which it is certainly worth while to see.

DURING the last week there has been on view at the Horse Guards the design, shown in plans, sepia drawings, and a model, of a projected Military Hospital for a site in a hot climate, designed by Major-General Sir Andrew Clarke and Mr. E. Ingress Bell. The hospital is a circular ward one, each ward having over it an open roof chamber or "Baracca," which constitutes a protection from the sun, and allows the air to circulate freely between this raised or extra roof and the actual roof of the ward. The wards are also raised 7 ft. from the ground by a hollow basement. In times of emergency the capacity of the hospital can be doubled by closing in the arches of the Baracca or roof story, and using the enclosed area for the sick and wounded: so runs the official circular in regard to the scheme, but it seems to us rather questionable whether it would be good sanitary policy thus to take away the advantages of the open and free passage of air between the roofs just when, from the admission of a double number of patients, the utmost sanitary advan-

tages would be called for. It is like saying, "under special circumstances we can take in double the number of patients, by foregoing the most important sanitary advantages of the hospital." The plans will probably be sent to the Academy exhibition, and we may be able to give an illustration of them shortly, when further remarks as to the adaptability of the building to the site will be more intelligible than they can be without the drawings. It may be observed here, however, that Mr. Bell has succeeded in making a very pleasing architectural effect out of the combination of circular wards, which is what cannot always be said of hospital designs.

ON Tuesday Lord Lunington called attention to what he described as the "extraordinary nature" of the Bill entitled "an Act to authorise the Widening of Parliament-street, Charles-street, and Delahay-street; and the Making of a new Street in the Parish of St. Margaret, Westminster, and for other Purposes," which would come before the consideration of the House of Commons. It was a Bill which transferred the whole responsibility of the Government, in regard to most important public buildings, to a private company. Lord Rosebery agreed that it was highly objectionable that this great site and its improvements should be left in the hands of a private company. The Bill was further objectionable inasmuch as it gave powers to a private company for a considerable period, without laying on them any compulsion to use those powers.

THE recent strike at Saltaire is a fact of the gravest importance. Distressing in itself, it is made doubly unhappy by its locality; and yet more menacing from the wage-disturbances which the signal thus given, like that of the fiery cross, is already arousing, from the Valley of the Mersey to that of the Clyde. Already reductions of wages have been announced at several mills in Burnley, Padiham, and Rossendale Valley; and strikes and lock-outs have followed. About 1,800 miners have received notice to leave the Thorncliffe, Tankersley, and Rotherham Collieries in fourteen days. In the Methley district, at Alerton, and at the collieries of the Weardale Coal Company, and of the Frystone Coal Company, notices of a like kind are given, as the alternative of a ten per cent. reduction in wages. The old Silkstone Coal and Iron Company have given twenty-eight days' notice. The coal-masters of the large coal-mining districts of Airdrie and Slamannan have resolved to reduce the wages of colliers sixpence per day. 40,000 men have been discharged from the South and West Yorkshire collieries. Two thousand men have left work in South Staffordshire and East Worcestershire, where it is said that wages have been reduced by from 10 to 40 per cent., or below the rate needed to support life, through underselling in the foreign trade. The colliers employed at the Bursley pits, more than 3,000 in number, those of the Alloft Colliery, and those of the Middleton Coal Company at Leeds, have received notices of a ten per cent. reduction, and the reduction of miners' wages is becoming general throughout Scotland. Glass-makers, miners, colliers, tailors, moulders, ironworkers, and many other trades have sent representatives to a meeting at Brierley Hill, South Staffordshire, which resolved to form a "federation of labour." The wages of jute-workers at Stratford have been reduced 15 per cent.

THE case of Chester v. Powell, which came before Vice-Chancellor Bacon last week, will be a warning to tenants not rashly to attempt to get rid of houses on the ground of a misrepresentation by the lessor. The house in question was on the well-known Hog's Back, and was supplied by water from rain-water tanks. The water during the tenancy ran short, and the tenant then refused to continue the tenancy, and so the lessor brought an action for specific performance. The defence was that there had been a false representation, namely, that the supply of water was sufficient, whereas, in fact, it was insufficient for the

wants of the household. It was proved, however, that during the lessor's occupation the supply had been sufficient, and that during that of the lessee the pipes had been stopped by leaves, and that, in fact, there had only been a very slight want of water. It was obvious that this was no real defence. People who take houses on places like the Hog's Back cannot expect as much water as if they lived in a valley. While tenants who with good cause bring landlords to book in respect of sanitary or other matters, have our sympathy, the landlord who is brought into court by an unreasonable tenant should not be left unpunished, for the lot of a successful litigant is not a bed of roses when the lawyer's bill is presented.

THE discussion last week in the House of Lords, on Lord Thurlow's motion to support the Trustees of the British Museum in their half-formulated project of opening the Natural History Museum on Sundays, resulted in a tie in the voting,—sixty-four on each side; which, in accordance with a wholesome conservative tradition of the Upper House, *semper parsimonia pro negante*, amounted practically to the adoption of Lord Shaftesbury's amendment, which recommended the opening of the national collections in the week-day evenings by electric light, but not on Sundays. Lord Shaftesbury based his recommendation on the fact that the South Kensington Museum had been open at night for twenty-eight years, with an evening attendance of 6,885,722 persons, and the Bethnal Green Museum for twelve years, with an evening attendance of 3,507,278 persons; that the British Museum reading-room had for some time extended its hours by the use of electric light, and that the Trustees had obtained estimates for lighting the whole Museum with electricity. There is unquestionably much force in these facts. They tend to indicate that as far as putting such institutions within the reach of the classes who are tied to daily hours of labour, the evening opening is sufficient. It is also by no means satisfactorily proved that the majority of the better set of the working class really wish for the Sunday opening of museums. Mr. Broadhurst, their best representative in Parliament, affirms that they do not. On the other hand, it is certain that on Sundays, when the weather is inclement, there is a great want of indoor resource for those who do not wish to remain in their houses all day; and the speakers on Lord Shaftesbury's side of the question forget that their objection, that Sunday opening involves extra labour for officials, applies even more strongly to evening opening six days in the week. As the question at present stands, however, we are inclined to believe it would be best to work for the evening opening of the museums first (now that the electric light gives additional facilities for it), and defer the Sunday question or the present. The former proceeding would be an absolute boon, which would give offence to no one; the latter would inevitably offend the feelings of many, and might not prove such an unmixt benefit as is supposed.

IT appears that in consequence of the expenditure of 70,000*l.* on the Blenheim pictures, the annual grant for the National Gallery is to be withdrawn for the present, being supposed to be committed by this special advance for a special purpose. We were under the impression that the Government had for once done a liberal thing in regard to art, but it seems it is only taken out of one pocket to put into another. It is true that the promise has been made on the part of the Government that any special opportunity of purchasing valuable works should be duly taken into consideration; but the position taken up will certainly throw great difficulties in the way of the National Gallery in the future acquirement of pictures, and form a kind of precedent for drawing the purse-strings tighter in regard to objects about which we are parsimonious enough at present, in all conscience.

THE scheme for a British Hospital at Port Said, in memory of Gordon, seems likely to come into practical shape; and it is satis-

factory to note the determination of the committee that as the hospital is to be a permanent memorial, it shall be constructed in the best possible form, and with the best sanitary arrangements. A Building Committee has been appointed to consider fully this portion of the subject, and to take professional advice thereon. That there should be a first-class British Hospital at Port Said is, of course, a desirable object in itself, and the memorial is suitable enough in spirit so far as it goes, though it seems strangely inadequate in relation to its object. However, Gordon will need no "piled stones" to keep his memory alive. History will take care of his name.

THE annual report of the Kyrle Society contains an account of what the Society has done during the year 1884 in giving voluntary work in connexion with decoration, music, and the provision of open spaces. Under the decorative branch, mission-halls, parish rooms, and club-rooms in the poorer parts of London have been decorated, as also a ward in the London Hospital, and the Children's Ward in the Poplar Hospital for Accidents. Above the public garden formed from the churchyard of St. John's, Waterloo-road, has been placed in mosaic, along the dull brick wall of the church, George Herbert's noble sentence:—

"All may have,
If they dare try, a glorious life, or grave."

It is characteristic of the truly missionary character of the Society that no names of any designers or executants are mentioned in reference to the art-work, the work being apart from all question of personal credit. Whether it is quite a sound theory to give decoration, in charity, any more than other kinds of assistance, may be a question; but, perhaps the efforts of the Society may serve to create an appreciation of and a demand for artistic embellishment where it does not at present exist, and the voluntary character of the work may be a necessary condition for getting in the thin end of the wedge. In the "Open Spaces Branch" the Society is doing admirable work, and really important to public health. Among other things, the disused burial-ground of St. George's, Bloomsbury, which was "choked with mouldering tombstones and rank vegetation," has been laid out as a public garden, under the care of the St. Pancras Vestry. The old burial-ground of St. Nicholas, Deptford, has been similarly laid out and transferred to the care of the Greenwich Local Board. The Society appeals for more funds to carry on this good work.

THE fourth Channel Islands' Art and Industrial Exhibition is announced to be held "in Guernsey and Jersey" during April. From the programme sent to us, it appears to run rather more in the direction of amateur work in the less important branches of art. "Crystoleum" pictures and artificial flowers in waxwork, &c., are amongst the things for which prizes are offered, and "shell work" and "leather work." Considering what these branches of art (?) generally amount to, perhaps prizes for *not* doing them would be more in the interests of artistic culture. Professional artists are offered a prize of 2*l.* "for the best painting on china, terra-cotta, canvas, paper, &c.," in the order named. We fear the Channel Islands are rather in a state of artistic as well as geographical isolation.

AT the meeting of the Institute of Architects last week, Mr. John M. Brydon read a protest in favour of three old monuments that are going to pieces, viz.: York Water Gate, Temple Bar, and Old Burlington House colonnade, concluding by moving "that the Council of the Royal Institute of British Architects communicate with the proper authorities, with a view to the preservation of York Water Gate, and the reconstruction on suitable sites of Temple Bar and the colonnade of Old Burlington House." The motion was supported by Mr. Eastlake and Mr. Phené Spiers, and partially opposed, rather to the surprise of many members, by Mr. Hebb, who objected that the two prostrate structures, if re-

edified, would have to be partially restored, and would not be genuine. Does Mr. Hebb prefer to let them rot away on the ground? Of course, there is a distinction between the case of York Gate which is still standing and only requires keeping in repair; and structures which are actually pulled down. But we reply that those structures are of great historic interest (Temple Bar especially), and very picturesque in themselves, and that their remains are still in sufficient preservation to enable us to set them up again, in the main, as they were; and it is a thousand pities to let them go to ruin. Moreover, the authorities have pledged themselves on both these points. Burlington House colonnade was removed on the distinct understanding that it would be preserved and rebuilt elsewhere; and Temple Bar was a few years since taken down under the same understanding. There is nothing to prevent the intention being carried out in both cases, except miserable parsimony and an indifference to architectural monuments. Mr. Hebb's amendment was not seconded; and, with all good feeling towards Mr. Hebb, we must say we are glad it was not. The original resolution having been carried, we hope the Institute will be able to persuade the official custodians of these interesting architectural remains to take the proper steps for their preservation.

THE CHELSEA VESTRY HALL COMPETITION.

MR. HUNT has presented his report on the drawings for the new Vestry-hall, and at the Vestry meeting on Tuesday night it was proposed, we understand, to conclude the matter at once; but more cautious counsels prevailed, and the drawings have been hung up in a building adjoining the present Vestry-hall for the consideration of members, before finally resolving on the course to be pursued.

The work is in reality an addition to the existing buildings, although the actual hall is to be a new one. The present block of buildings fronting King's-road is to be retained, and a T-shaped block of new building added in the rear, to contain a new Vestry-hall, a smaller hall, committee-room, kitchen and offices, retiring-rooms and a reception-room; the portion immediately adjoining the present buildings to be kept low so as not to interfere with present lights above. The new building will, in the first instance, have a very "hack" front on to some very poor and unsightly house property, which Lord Cadogan is anxious to improve away and make a good street as soon as the lease falls in; but as this will not be for sixteen years, the architectural effect, whatever it may be, of the new building, will be very much thrown away for a long time to come.

The Vestry are so anxious to prevent collision between the less virtuous of the architects and the less virtuous of their own body (for even vestrymen are not immaculate), that the virtuous majority have carried a resolution to cover up all the motives and distinguish the designs by numbers. Those recommended by Mr. Hunt for the first, second, and third premiums respectively are Nos. 25, 14, and 18. No. 26 is, as far as plan is concerned, very ineffective; the author's friends may call it "simple," but the simplicity is not quite of the right sort. The new building having to be approached through the old, the management of the connexion is a little test of the power of doing the thing effectively. No. 26 simply has a short passage, with ladies' and gentlemen's retiring-rooms opening out of it, with the doors opposite each other (not one man in twenty in public competitions seems to know how to plan these accessories), and this gives into an open cross corridor absurdly labelled "reception-room," which would really be like receiving people "in the open" instead of in a well-appointed ante-room. The large hall forms the stem of the T, and the small hall and committee-room the arms. A corridor runs up each side of the large hall, giving access to the smaller hall and committee-room, and to the platform entrance, and so far the access to the upper end is good and convenient. Architecturally the exterior is redolent of Queen Anne, and has a ponderous pediment with a round hole in the tympanum and a flourish of foliage under it; an order of pilasters, with a central window and niches in the interspaces; the wings are more simply

treated, with boldly-rusticated windows. The internal architectural treatment of the hall is suitable and effective; a mixture of mullioned windows with pilasters and circular arches. The windows are high up and rather small; the light would be somewhat deficient.

In No. 14 the hall is also placed as the shaft of the T, and the committee-room and smaller hall as the arms. The committee-room is placed so as to secure quietness, and cut off from the rest of the internal traffic of the building. The arrangement of the approaches and retiring-rooms is not better planned than in No. 26, except that the reception-room is a room, and not a lobby. The design has little to recommend it; the large pyramidal terminations to the principal features are very ugly and commonplace, and the coloured decoration for the interior of the hall is "a caution."

No. 18 is a far superior plan to either of the others in perception of architectural effect. The approach is through a vestibule lighted from a small dome over, and leads to a reception-room similarly lighted. Circular vestibules opening each way from this give access to the large and small halls, which are arranged en suite across the top of the T. The author has cleverly arranged these circular vestibules so as to mask the irregularity of angles arising from the want of parallelism in the lines of the site. Unfortunately there is no proper access to the platform at the end of the large hall, the only entrance to it being in the middle of its length. The arrangement of the two halls en suite is very effective, but as we understand the intention is to allow for the simultaneous use of these rooms for different purposes, this is practically a drawback; but it must be added that there is no hint as to this in the instructions, which only specify "a secondary hall, which may be used as a supper-room," a phrase which appears to imply that it should be connected with the large room, for large entertainments. The instructions generally are not at all explicit as to the ideas of the promoters in regard to the use of the various rooms. The planning of the approaches in this design is open to practical objections, and the committee-room (opening out of the first vestibule) is hardly retired enough. The whole plan, however, is susceptible of very effective architectural treatment, and the exterior, simple and unpretending though it is, is in better taste than either of the others. With some practical modifications this might be made as convenient as either of the others, and would make a much more pleasing and satisfactory building. The detail elevation of the interior of the hall shows good treatment of the architectural features, requiring only a little toning down in some details. If the small hall were cut off from the larger one, and the platform placed at that end of the larger hall it would be possible to arrange all the approaches satisfactorily, with very little modification, and the plan would then certainly be the best of the three; it would also, however, be the most costly.

A look through the other designs, so far as limited time allowed, did not lead us to suppose that any one of them would be superior, taken all round, to any of the three selected. The choice seemed to lie between Nos. 26 and 18. The first fails in being ineffective and almost absurdly naïve in its planning; the second in attempting a little too much in the way of effect without sufficient consideration of practical working; but it is the work of an able hand.

No. 21 is a better plan than most, and not ineffective in exterior elevation. No. 24 is well planned, and the internal design of the hall very elegant,—an elaborate Classic treatment. Several of the sets show great pains and elaboration in regard to detail and drawing, among which No. 46 is pre-eminent; but, architecturally, there is very little which can be said to rise above mediocrity.

Tanks for Suakin.—Another instance of quick work in this line may be noted. Mr. John Bellamy, of Millwall, made and fitted the tanks for the *Camel*, the order being placed in his hands on the 15th of February and the work completed, we are informed, to the satisfaction of the Government surveyors, on the 2nd of March. The tanks in the *Camel* were made to fit the vessel, and they were also fitted with strong internal bulkheads and with an elaborate arrangement of valves and pipes.

ROOF COVERINGS.*

You all know that there is a vast difference in the climatic conditions of different countries, and, in fact, of different parts of the same country. In some places the heat is nearly always very great, and rain of rare occurrence, but when it does fall it comes down in torrents, of the force of which we in this country have no conception; in other parts the snowfall in winter is so great that when the snow lies on the roof of a house the weight of it forms a very serious additional strain upon the rafters, &c. Now it is quite clear that it would be a most unwise thing to construct the roofs in the same way in these two districts; if a steep roof were formed in the hot country these torrents of rain would run off the roof with such velocity as to do serious damage; whereas, in cold countries, roofs must be steep in order to prevent too great an accumulation of snow on them. As a general rule, you will find that, starting from the hot countries of the South, the pitch of the roofs increases as you journey northwards. In Italy you have the flat roofs with wide overhanging eaves in order to get a good shadow; in Belgium you have the high-pitched gables which form so picturesque a feature in the Netherlands; and in Scandinavia you frequently get the exceptionally steep roofs of which Hitterdal church is such a striking example. The suitability of a roofing material depends very largely upon the pitch of the roof; tiles, for instance, which would make an excellent cover for roofs of a pitch of 50° being absolutely unsuitable to a roof of 26°. Some materials which were formerly in general use for roofing have now become almost obsolete. Shingles, for example, or shides, are frequently mentioned in old books, and yet they are scarcely ever seen now. These shingles were pieces of wood, measuring about 9 in. by 5 in., and feather-edged, which were laid over a roof very much in the way we now use weather-boarding. Of course such a roof as this was not very lasting, but these materials are still used in the West Indies. You may still see, in various parts of the country, roofs covered with large blocks resembling thin flagstones, and called tile stones, which may be very serviceable as a protection from the weather, but are so exceedingly heavy as to necessitate very strong timbering. In former times different districts of the country had different methods of constructing their roofs, but the facilities of transport are now so great that all local peculiarities are fast disappearing in a dead level of monotony, which may be that of excellence, but which is undoubtedly most uninteresting and hostile to picturesque views.

The principal roof-coverings now in use are tiles, slates, and metals. Tiles are of very great antiquity, and it is most probable that tiles of baked clay were used in the ordinary houses of ancient Greece, but of course these have all perished. Remains are found, however, of marble tiles which were used on the roofs of the temples. These were large thin slabs turned up at the two sides, rebated at the upper edge for hanging over a horizontal rafter or purlin, and with a notch on the under side of the bottom edge for lapping over a projection on the top edge of the tile immediately below. All the vertical joints were covered up with tiles hollow underneath and saddle-backed at the top, very much like our common slate ridge. As these generally terminated, both at the ridge and the eaves, with ornaments called palmettes, they must have formed a very striking roof-covering.

The earliest Roman buildings were probably covered with wooden shingles, but baked tiles were introduced at a very early period, some say in the time of Pyrrhus, about 300 B.C., and the manufacture was extensively carried on, and a very useful form of tile was finally adopted. These tiles were very similar to the Greek ones, having rims at the sides so that the water was diverted from the vertical joints, over which hollow tiles were laid, themselves overlapping. Another form of Roman tile was made, slightly narrower at bottom than at top, with raised rims on each side, so that the upper tile could be pushed down tightly into the one below it; and here again the vertical joints were always covered with other tiles. The Broomhall tile

* A lecture by Mr. John Slater, B.A., F.R.I.B.A., being the seventh of the series of "Free Lectures on Matters Connected with Building," given under the auspices of the Carpenters' Company. Delivered on Wednesday evening last, March 25.

of the present day is very much like the old Roman tile.

The Romans, you know, were great builders, and nearly all their methods of construction are worthy our attention at the present day, being characterized by great strength and solidity. The all-conquering Romans carried their methods of construction with them, and consequently of the greater part of Europe developments of the Roman tile are found. You will easily understand that hips would present rather a serious difficulty with these flat tiles and their cover tiles, and it is very interesting to notice how this difficulty was surmounted as the builders increased in skill. Sometimes exceedingly heavy and large hip-tiles were used, covering the other tiles on both sides, and the gaps were made good with mortar or cement; and sometimes very ingenious special form of hip-tile was moulded.

In the Middle Ages some splendid roofing tiles were made in France, and I suppose there have never been better tiles made anywhere than in the old province of Champagne during the thirteenth and fourteenth centuries. These were made with one nib for hanging over the lath and one hole for nailing, the rafters being spaced so as to suit the width of the tiles. These were laid breaking joint, and in order to ensure that the nail-hole should always be over the back of the rafter,—which would not be the case if the holes and the nibs were in the same position in every tile,—the positions were reversed in each course. Sometimes the exposed portion of the tiles was glazed, and this would certainly render them much more capable of resisting the weather than if they were merely baked, but it must have added considerably to the cost of their manufacture. To show the extreme refinement which was adopted, we find in many cases, that the upper edge of the exposed portion of the tile was chamfered off, and this would have the effect of reducing the risk of roofs being stripped by a high gale.

The two sorts of tile most used in England are the pantile and the plain tile, both of which are made of clay, purer and stronger than that used for ordinary bricks, and as tiles are a much thinner, greater care is required in their manufacture. The clay is ground and thoroughly mixed in a pug-mill, and then moulded into the shape of the tile required. The clay is prevented from sticking to the mould by dusting the latter with fine coal-dust or sand. Pantiles are not used except for an inferior class of house or for rough warehouse roofs, as it is difficult to keep them quite watertight for any length of time. The general size of a pantile is from 13½ in. to 14½ in. long by 9 in. to 10½ in. wide, and they usually show from 10 in. to 11 in. on the face when laid. They are laid en suite as slightly to overlap laterally, but they do not fit close enough to form a watertight joint, and therefore, when used for dwelling-houses, it is necessary to point them with mortar, which forms a somewhat unsightly joint. They are hung with nibs to fir or oak laths, and as they do not fit very closely at the bottom, a heavy gale of wind is likely to play havoc with a pantiled roof. The weight of a square of ordinary pantiles is about 10 cwt. You all know the appearance of pantiles such as are used in this country, but in Germany a simple hollow tile of semicircular section is used, laid alternately with the convex and the concave side uppermost. The Bridgewater tile is very similar to the pantile, but wider, and formed with a double roll.

Plain tiles are oblong in shape, measuring 10½ in. by 6½ in., and it is a curious fact that the size of plain tiles was expressly fixed by an Act passed in George III.'s reign, at which time heavy duties were levied on their manufacture. They are formed with nibs for hanging on the laths, or with holes for pegs or nails. As there is no lateral lap, it is necessary that each course should overlap the next but one below it, about 2½ in., and the gauge, i.e., the exposed portion of each tile, would thus be 4 in., so that more than half of each tile is covered up. The necessity for this lap causes a tiled roof to be very heavy, 600 being required for a square, and weighing something like a ton. It is somewhat of a moot point whether it is better to hang the tiles to the laths by nibs or by nails. I think I would give the preference to nails, if carefully done. The best plan is to close-board the roof and cover it with felt before laying the tiles. Some builders are fond of bedding the heading-joints in mortar; but I have very grave doubts of the advisability of this

practice. It makes the roof tighter at first, but by my own experience is that tile roofs almost always fail through the laths decaying, and allowing the tiles to slip, and the mortar, in my opinion, accelerates the decay. Certainly, in many old roofs that I have examined, if one part has been laid in mortar, and another not, I have generally found that part where mortar has been used in the worse condition. As far as appearance goes I know of nothing to surpass a good, rich, brown Broseley tile; but the great drawback to all tiles is that they are exceedingly porous, some of them absorbing as much as one-seventh of their weight of water in ten minutes, and the dampness caused by this has a tendency to rot the boarding and rafters underneath. A few weeks ago Mr. Ralph Nevill, described, at the Royal Institute of British Architects, a plan he had adopted for overcoming this drawback, and it was as follows:—The first laths over the top of the rafters as if plastering, and then drives rose-nails into the backs of the rafters, standing out about 1 in.; then covers everything with a layer of fine concrete or plaster about 1 in. thick. Before it gets quite hard the tiles are laid, and the tiles can be pushed into the yielding concrete with the thumb. Of course, only so much concrete must be laid at one time as will allow the tiles to follow on before it sets. The great advantage of this is that you get the porous tiles and the solid concrete on the side of the roof a hard, perfectly impervious slab of concrete, which must certainly keep the rooms under it much more equable in temperature, as well as drier, than the plan ordinarily adopted. It, of course, increases the weight of a roof considerably, and it appears to me that must increase the difficulty of executing repairs if tiles get broken, but I can very well believe that the repairs required would be decidedly less than in ordinary roofs, because the tiles have a solid bearing. Plain tiles are often laid in bay in country districts, and country builders are very fond of this method. There is no doubt that this adds to the warmth of the rooms under the roof, but I am afraid the hay would rot in decay and become very unsavoury, and I can hardly advise you to adopt this practice. There is one thing that you must remember in all ordinary tiled roofs, and that is the pitch of the roof should never be less than 20 degrees, and 60 degrees is much preferable. Of late years several attempts have been made to imitate and improve upon the old man plan of covering the vertical joints of tiles, and thus diminishing the weight of the roof by doing away with the necessity of such a lap. If tiles are moulded with a lateral lap, that they will fit into one another and form a water-tight joint, the successive courses need only overlap enough to prevent the rain driving underneath them, and this can also be prevented by forming a groove at the upper edge of one tile, into which a corresponding projection at the lower edge of the next tile would fit. I have seen several specimens of this new kind of tile. One is the patent bonding roll tile, the Broomhall tent tile, Phillips's patent lock-jaw roofing tiles, and the Bridgwater patent tile. The Bridgwater tiles manufactured by Messrs. Major are of two kinds, one with rounded rollers, called Roman tiles, and one with angular corrugations. They are large and beautifully made tiles, formed with a groove at the side, into which a corresponding projection in the next tile fits, and another groove at the top, so which fits a projection at the bottom of the tile next above it: each tile is very heavy, but it only overlaps its neighbour by about 2 in., so that the whole surface of the tile is available for covering, and the weight per square is only 5½ cwt. These tiles will lie very closely, and the weight of each is such that it is almost impossible for the wind to strip them. Price's patent tiles, supplied by Mr. Matthews, of Aston-super-Mare, have a different kind of lap, and fit into one another very closely. They are made of two colours: one of a natural tint of burned clay, the other coloured by manganese, but a slight rubbing or chipping will wear this off. Ninety of these tiles will cover a square of roofing, and will weigh about 5½ cwt. The Broomhall patent tiles closely resemble the old Roman tiles, except that the cover tiles are precisely the same pattern as the under tiles, only used with the opposite side uppermost. The under tiles are laid on the battens, about 7 in. apart, and the narrow end of the tile next above is pushed down till the splay of

the upper tile fits closely on to the shield of the lower one, giving a 3½ in. lap. These tiles are not nailed, but pegged down by wedge-shaped metal pegs, which keep them in position. When the lower tiles are in position the cover tiles are laid over the intervals between the lower tiles, overlapping the ledges of the latter. The cover tiles are nailed to the battens; 185 tiles will cover a square of 100 ft., and the weight is about 8 cwt.

Perhaps the most perfect form of interlocking tiles yet made are Phillips's patent lock-jaw tiles, which have very closely-fitting grooves and tenons at the sides and at the top and bottom. These tiles are moulded in patterns, arranged so that the rain-water is diverted from the grooved joints, and they fit into one another so closely that no nails are required except in very exposed situations, and they can be easily laid by the most ordinary labourer. Two kinds of this tile are made, the "single grip," of which 150 will cover a square weighing about 5½ cwt.; and the "double grip," of which 170 go to a square, and weigh about 7 cwt.

In all cases the clay for these patent tiles is most carefully prepared and tempered, and they are moulded under great pressure, thus making the clay very dense and diminishing its porosity. The difficulty with all these kinds of tiles appears to me to lie in the necessity of cementing the joints at the hips, no maker as yet having devised an interlocking hip-tile. Ridge tiles and verge boards have been made to suit the tiles, but the hips are in all cases, I believe, cemented.

I do not intend to take upon myself the invidious task of deciding which of these is the best form of tile, but they all have the advantage that you do not require anything like the same thickness of tiles, one above another, that you do with plain tiles, and hence you can very materially reduce the weight of your roof covering, and every one will see the desirability of this if you can insure impermeability.

I now come to what is probably the most extensively used roof-covering at the present day,—slate. You know that tiles are formed of burned clay; but what is slate? Many of you will probably be somewhat astonished when I tell you that slate itself consists of very little else than clay. Ages and ages ago the action of water was depositing in various places layer upon layer of very fine clay or mud, mixed with a little sand, and these layers gradually accumulated to a considerable height; then vast geological changes took place, and this clay became buried deeper and deeper under superincumbent masses of material, and was subjected to enormous pressure and enormous heat, till it became completely consolidated. That is also the way in which most of our building stones have been formed, and the bed of the stone is determined by the direction of the original layers; but in the case of slate, enormous terrestrial forces have acted on it in a lateral direction, and they have been so intense as to rearrange the layers so that they frequently lie in quite a different direction from that in which they were originally deposited. Along the lines of the new layers slate can, as you all know, be split into very thin sheets, and this quality renders it a most useful building material, because although it is very hard and dense, it can be obtained so thin without breaking that the weight of a superficial foot is very small, and, therefore, when used as a roof-covering it does not need a heavy supporting framework. Slate is one of the most compact and close-grained rocks, and has a smooth surface, so that water runs off it very easily, and consequently it can be safely laid on roofs at as low a pitch as 22½°. Curiously enough, it is most probable that its use was brought about by the necessity of finding some close-lying, easily-cut material for covering the high-pitched conical roofs which the Mediæval builders gave to their towers, as they were unable to cut tiles to suit these roofs. Notwithstanding this, its general introduction has acted prejudicially from a picturesque point of view. The quaint old hicken-covered tiled roofs, upon which the eye rests with pleasure in many an old English country town, have given place to the flat, dull, leaden-coloured slated roofs, which frequently seem so ashamed of themselves that they are glad to retire behind a parapet. But this is an age of utility, and though we may spare a word of regret for the picturesqueness of the past, there is no denying the fact that, from the point of view of closeness of fit, strength, and cleanliness, slates are superior to tiles for a dirty, smoky city.

The slates of North Wales are probably surpassed by none in the whole world, and I dare say many of you have visited the celebrated Penrhyn quarries near Bangor, which are situated in the neighbourhood of some of the finest scenery in the British Islands. There are, however, other very good qualities of slates to be obtained besides those of Bangor: Portmadoc slates, for instance, named from the port of shipment, but really obtained from Ffestiniog, Difwys, and other quarries in the neighbourhood. In Cornwall the Delabole quarries are much esteemed, and in the Lake District some excellent specimens of light green slates are found. Ballachulish and Dalbeattie, in Scotland, and Killaloe and Ashford Bridge in Ireland, may be mentioned as the principal places in those countries producing good roofing slates. The characteristics of good slates are that they should be of a blueish-grey tint, uniform in colour, and free from patches; that they should not be tender or friable at the edges; that they should have a good clear ringing sound when gently knocked together; and that they should absorb a very small quantity of water. If the colour be too light the slate will probably be of a stony, gritty texture; if it be a very dark blue you will generally find it absorb water too readily. This quality of absorbing water is, of course, very important, and you can easily test it for yourselves by placing a slate on end in a basin of water with about half its length immersed, and after remaining so for some time you will be able to see how far the dampness which is absorbed has risen in the dry part of the slate. It will not be necessary for me to describe in detail the various kinds of slates used for roofing purposes, such as ladies, countesses, duchesses, &c., as you probably know the names and sizes as well as I do. The kind chiefly used in London are the countess slates, measuring 20 in. by 10 in. It is necessary that slates should be laid so that each course overlaps the next but one below it to a certain extent, and the amount of this overhanging is called the lap. This should never be less than 2 in., and 3 in. is better. There will thus be as in tiles a certain width of slate in each course exposed, and this exposed part is called the gauge, its width diminishing as the lap increases. The way to find what will be the gauge is to deduct the lap from the length of the slate and then halve the remainder; thus, if countess slates are to be laid with a 3 in. lap,

$$\text{the gauge will be } \frac{20-3}{2} = 8\frac{1}{2} \text{ inches. Each}$$

course of slates should, of course, "break joint" with the course below it, and a double course should always be laid at the eaves. The valleys in slated roofs are generally laid with lead, which should be turned up under the slates at least 9 in. on each side, and my own opinion is that lead is the best covering for the hip rafters, but sometimes thick saddle-back slates are used with an ornamental roll, similar to what is used for ridges. As nearly as possible 170 countess slates go to a square of 100 ft., and their weight is about 7 cwt. Slates are laid either on battens, which are slips of wood, about 2½ in. by 1 in., nailed on the backs of the rafters, or to close boarding, which is the best plan, and each slate should be nailed with two copper nails, but they should not be nailed down too tightly or they will be liable to break during a heavy gale of wind. In France the slates are frequently not nailed at all, but secured by clips, the tops of which are secured to the battens, and the bottoms are bent so that the slates rest in them. The consequence is that the slates are free to move, and, although they rattle terribly during a high wind, they are really less liable to be blown off. The reason why slates are broken and blown off a roof during a heavy gale is rather a curious one, and deserves a short consideration. At first sight it would seem that a thoroughly well-slated roof, with each slate carefully nailed, and fitting closely on the one under it, would really offer no purchase for the wind to get under the slates and rip them off. Nor does it, and yet the slates are ripped off, as we see, every time a gale of wind passes over a city. I believe the explanation to be this. Under ordinary circumstances, as you are aware, the pressure of the atmosphere is the same on all sides, and consequently when no wind is blowing the pressure on the inside of a roof is just the same as that outside. But during a gale of wind there are

always exceptionally strong gusts that occur at intervals, and when a particularly fierce gust of wind impinges on a roof it is followed by a momentary vacuum; while this lasts, even though it be for two or three seconds only, the pressure on the inside of an ordinary roof is greater than the pressure on the outside, and the effect will be very much as if a gust of wind were blowing from the inside. Now, whenever any pressure is brought to bear upon any material it finds out the weak points. Just suppose that a gust of wind is blowing on the inside of a roof covered with slates on battens: the slates cannot move when they are nailed, they will resist the pressure then, but at their ends they can easily be forced up, and if they are forced up at their ends while tightly nailed at top they must break, and I really believe that this vacuum which occurs is the cause of the ends of the slates being forced up and the slates broken off. This shows how much safer it is to close-board a roof than to use battens, and it also explains why slates hung on the French system are not so much damaged during a gale. The ease with which slates can be cut to various patterns enables us, if we are disposed to do so, to give endless ornamental patterns to our slating; and in the Middle Ages builders were very fond of working their slates into all sorts of intricate forms, but you must bear in mind that slates when cut into patterns require more lap than when used square.

In cases where roofs are obliged to be constructed at a flat pitch metal coverings should be used, the principal being copper, iron, lead, and zinc. The use of copper for roofs is not very extensive, as it is too costly a material; but where expense is no object, it forms a very durable covering. Sheet copper is formed by heating the metal in a furnace and then subjecting it to pressure between iron rollers. It forms a very light covering, as it may safely be used in sheets not more than $\frac{1}{8}$ of an inch thick, which would weigh about 14 oz. per foot super. Copper slowly oxidises when exposed to the atmosphere; but, as is the case with zinc also, the oxidation is confined to the surface only, and it does not continue to eat into the metal as with iron. Copper has been used as a roof covering far more abroad than in this country; but one large building in London,—the British Museum,—is, I believe, almost entirely roofed with sheet copper. In localities where chemical fumes are abundant, copper should not be used, as it freely combines with most of the acids.

Iron is not a good material for a roof covering, as it is so surely eaten away by the process of oxidation, or, in familiar language, because it rusts very quickly. In order to prevent this, what is called galvanised iron is chiefly used for roofs. The process of galvanising consists in precipitating a thin coating of tin upon sheets of iron by means of weak galvanic action, and then immersing the sheets in a bath of liquid zinc. Thus treated, iron will last for a long while, but when used for roofs, it is almost impossible to avoid nailing it, and where that, sooner or later, water will make its way into the iron core, and this will begin to rust internally, and cause the thin external coating to come off in flakes.

One of the best and most durable coverings for roofs is lead. There are two kinds of lead, called cast lead and milled lead, the latter being formed from the former by passing it through a mill between the rollers adjusted so as to give the metal the required thickness, which varies from 0.68 in. to 0.33 in., the weight of these two extremes being 4 lb. and 14 lb. per foot super. Cast lead used to be preferred to milled; and even now, if sloping roofs are covered with lead, it will be advisable to use the cast, but for flats and gutters the milled lead should be used. Lead is frequently used too light, and you should never lay a gutter or flat with less than 7 lb. lead; but you may use the lighter qualities for flashings. Lead, in common with other metals, undergoes considerable contraction and expansion with changes in temperature, and consequently it should always be laid so that it is free to move without cracking, soldering and nailing being avoided as far as possible. It is this expansion and contraction that render lead undesirable for covering a sloping roof. During the warmth of the day it will expand, and during the night gravity it will expand downwards more than upwards, and consequently it will creep down the roof. Professor Tyndall stated that on the

roof of Bristol Cathedral the lead crawled down 18 in. in two years.

Milled lead is generally made in sheets, about 7 ft. wide and 25 ft. long, so that if you have to cover a large flat you must have lateral joints, and as the expansion and contraction are considerable, it would be unwise to lay it in sheets of the full length. The proper way of forming the lateral joints is to nail fillets of wood on the flat boarding. These should be about $\frac{1}{2}$ in. by 2 in., rounded at the top in order to avoid sharp angles, which would crack the lead. This should be dressed close up to and half way at least over the roll, while the next sheet is brought up to the other side of the roll and lapped completely over it and the turned up portion of the first sheet. If the lead is closely hammersd down with wooden mallets no nailing is required. When a cesspool is required in a gutter or flat, it is a very common thing to cut the sheet of lead into small pieces to fit the sides of the cesspool and to solder the joints, but this is a bad plan, and you should always form your cesspools out of single sheets of lead, hossed up, as it is called, without solder. In some positions, as, for instance, round skylights, nails are required, and these should always be of copper. It has been frequently remarked that lead is not now supplied of such good and durable quality as used to be the case, and Professor Frankland has made some important investigations on this subject, and curiously enough has arrived at the conclusion that it is because it is purer than it used to be. Lead always used to contain a considerable quantity of silver and arsenic, but the modern methods of extracting the silver are so much more perfect than they used to be, that there is now very little silver in the lead supplied to the London market, and this is the cause of its wearing out quicker. Another reason is probably to be found in the fact that we now use timber much less seasoned than it used to be. Oak, for instance, if not free from sap, contains pyroligneous acid, and this has a strong affinity for lead, which will be affected by it even if not in actual contact. Very minute holes are found in lead that has been laid on timber for some time, and these are formed by the tiny larvae of an insect called *Callidium bajulum*, which is nourished in wood, and has been known to make its way out by eating through sheets of lead one-sixth of an inch thick. It is important that the boarding on which lead is laid should be quite close, and, in fact, for good work it should be grooved and tongued. If you were to take up some sheets of lead that had been laid for some time over a hall like this, for instance, where gas is frequently burning, and large assemblies are held, you would be very likely to find, if the joints of the boarding were not close, that along those joints the lead had decayed and been turned into white lead on the underside, and on the top. This is caused by the fact that although moist air quickly tarnishes the bright surface of the metal, and forms a thin film of oxide, it does very little more than this by itself; but if a very small quantity of carbonic acid be present (and this, you know, is always given off from living persons, and also from the combustion of coal gas), the oxidation and decomposition proceed much more rapidly. You must not, therefore, imagine that any roughly-laid boarding will do for lead if you want it to last.

I now come to the last metal covering of which I have to speak, zinc. This metal, as many of you are aware, had for a long time a very bad reputation, partly deserved, because the early samples of zinc which were used in this country were much too thin and of inferior quality, and partly undeserved, because the men who laid the zinc did not know the proper way to use it. It has, however, been very extensively used on the Continent, and during the last fifteen years the consumption in England has enormously increased. This is largely owing to the enterprise of the Vieille Montagne Company, of Belgium, who supply the metal in a very pure state, and who, by means of their agents, have laid down the principles according to which it should be laid. Zinc should be absolutely pure, as it will very soon decay if it contains only a small percentage of iron. It is a very light covering, the No. 16 gauge, which is the thickest that, under ordinary circumstances, need be used, weighing only 24 oz. per square foot; a very material difference this from lead weighing 7 lb. per foot super. Its expansion and contraction are greater than that of any other metal, and hence

it is of the most essential importance that should be laid perfectly free and unconfined every place where solder has to be used has an element of weakness. Zinc can be laid without hoarding, but this plan can only be recommended for sheds and such-like places, but, if properly laid on hoards, it forms a covering scarcely inferior to lead. Messrs. Brahy & Co. have been kind enough to send some models showing the proper way of laying zinc. The hoarding should be even a close-jointed, and upon this wood rolls should be laid 2 ft. 10½ in. from centre to centre, under the wood rolls, and kept down by these placed at intervals of about 3 ft. zinc clips which are dressed closely against the side of the roll, and are then turned over, forming a fold which clips the sheet of zinc, which is turned up under it. Over the top of this roll is close dressed down a zinc cap, which is secured by small pointed pieces of zinc, which slip in under the hooked portion of the clip. This is the method of forming the lateral junctions between the sheets. The longitudinal junctions may be formed in two ways. If the roof has a slight fall clips can be nailed on the hoarding, and the zinc need only be dressed over and under these; but for a flat or gutter drips are required arranged in much the same way as for lead. It was formerly the practice to solder the zinc at the top and bottom of the rolls, but Messrs. Brahy have recently contrived to fold over the zinc, so that solid unsoldered stopped ends and rigid plates can be formed, and this is a very great improvement.

Very ornamental roofs can be formed with zinc tiles cast to a pattern, and the large Mansards at the Grand Hotel, Charing-cross, with the cresting, finials, lunettes, and everything, is formed of zinc. Of course these zinc tiles must be nailed, and the original plan was to punch the iron in the zinc through which the nail was driven, but the punched hole, of course, made a depression in which the water accumulated, and now the hole is punched from the underside, and a small convex boss is formed, in the centre of which the nail is driven, and the water is thus thrown off from the nail-hole. These zinc tiles can only be laid at a very steep pitch.

I have now described the principal roof coverings in general use. There are others such as thatch, asphalted felt, Dachpapp, a material much used in Germany, and consisting in the main of brown paper, and various others; but these are only used in exceptional circumstances.

THE SELECTION AND PRESERVATION OF BUILDING STONES.

In the course of the discussion which followed the reading of Mr. John Slater's paper on "Building Stones."

The President (Mr. Cole A. Adams) said that the thanks of the Association were due to Mr. Slater for the practical manner in which he had treated the subject. His hints for the guidance of architects in the selection of stone were particularly useful, and of no less importance were his remarks as to the proper bedding of stones on its natural bed. Insistence on this was familiar enough in specifications; but when it came to be practically applied it was not always possible to see that so important a requirement was fulfilled; for when a stone had been worked by the mason it was often very difficult (especially with certain kinds of stone) to tell which was its natural bed. Some masons, he believed, were in the habit of marking the stones they worked so that they might know afterwards which was the natural bed of the stone. As to the stone used at the Houses of Parliament, there was no doubt that its repair entailed an enormous cost to the country annually, and that this outlay would have been saved by proper care in the selection of the stone at the outset. But there were some who were of opinion that however carefully a stone might be selected and hedged, it was often irreparably damaged and rendered an easy prey to decay by the pernicious practice of "cleaning-down" by the masons,—especially when the building was finished some months, perhaps a few years, after some of the stones had been

* Read before the Architectural Association and printed in *extenso* in the *Builder* (see pp. 367, 423, ante).

placed in position. Those who held that opinion contended that each stone should be cleaned as it was placed in position, without any attempt at a general cleaning-down of the whole when the building was finished; for, they argued, when a stone was put into its place soon after it was worked, in the course of nature there was set up a kind of efflorescence on the surface, which in time became hard, and ought never to be disturbed. It was, in fact, an effort of nature for self-protection, and the case-hardening thus set up ought never to be interfered with, for its removal would leave room for the admission of the germs of disease. One mason with whom he (the speaker) had conversed on the subject thought that the dipping of each separate stone after working into a tub of prepared liquid lime was a good preservative. Mr. Slater had spoken of "weathered" stone, but how long after stone was quarried should it be kept before "working"? He could not help thinking that a great deal of the unhappy results in the shape of decaying stonework in recent buildings might have been prevented by proceeding a little more deliberately with the work than the hurry and bustle of the latter half of the nineteenth century allowed. He could not but think that the old builders, if only we went back fifty years, were not so "driven" as were the builders of the present day. In the old days, the erection of a building was not settled upon one week, commenced the next week, and finished a few months afterwards; but care was taken in the selection of the stone and other materials, so that if the work was proceeded with more slowly than was conformable to modern practice, the possibility of a much better result was almost assured. As to the use of linseed oil as a preservative, he presumed that the oil would sink into the pores of the stone, perhaps to the depth of an eighth of an inch or more; but what effect would that have on the face of the stone at some future time? He remembered Mr. Hamo Thornycroft once speaking of the Elgin marbles, and expressing his belief that they had once been decorated with colour, and that the vehicle or medium by which the colour was applied was oil. Mr. Thornycroft remarked that he was led to that conclusion by the fact that the skin of the marble appeared to have flaked off where it was most probable that the colour was applied.

Mr. L. C. Riddett, in moving a vote of thanks to Mr. Slater for his paper, observed that there was no doubt that during the last half-century the question of building stones for use in London had become a very important one; for, owing to the great facilities of transport which now existed, the varieties of stone to be obtained were much more numerous than in the days of Sir Christopher Wren. During the last fifty years many building stones had been tried in London, but nothing better than Portland stone had been discovered; indeed, it might be said that Portland stone was "your only wear" for London. As to Bath stone, he thought the architect who used it in London for external purposes was simply robbing his client. Any particular bed of stone was no doubt something like a brand of cigars—the stone obtained a certain name and repute so long as the bed held out. When the bed was exhausted the stone from possibly an inferior bed went by the same name, just as the name of a brand of cigars was retained even when the plantations which produced the tobacco from which they were first made had ceased to produce plants of the best quality. With regard to the stone used at the Houses of Parliament, he believed it was a fact that the Commissioners, after a very long inquiry, settled upon and recommended a particular stone, but failed to ascertain whether that stone could be obtained in sufficient quantity for so extensive a series of buildings. Architects were constantly plagued by the receipt of circulars advertising particular kinds of building stone, accompanied by testimonials and analyses given by gentlemen enthusiastic in their praises of the stones in question. There was only one advertisement for stone,—the evidence of its having endured in the buildings in which it had been used. We in London had no local stone, and, therefore, if stone were to be used at all, it must be a question of importation. Before deciding on what stone to import, the architect could only look around him and see what stone had worn the best in our London atmosphere. The evidence always seemed to preponderate in favour of Portland stone. He knew that Gothic men objected to Portland

stone because it wore so white and gave a bleached appearance; but, probably, if architects were to design with greater fitness and breadth of effect they would be able to discount that objection. He looked with considerable interest to the effect of the weather during the next twenty years on the New Law Courts,—the first large Gothic building in London in which Portland stone had been used for the exterior; it would be interesting to see whether Mr. Street had taken into account the bleaching of the stone which would occur after a few years. In the selection of building stones, the two problems to solve were the selection of a stone for external use, and the choice of a stone for internal wear, in steps especially. The wear of a stone staircase was so serious that the steps would generally require renewing during the first twenty-five years of a building's existence. He had seen a useful proposal in the drawings of one of the members of the Class of Construction, which consisted in the provision of movable stone treads, allowing of easy renewal. It might not be known to every member of the Association that when the Houses of Parliament were about to be built, Mr. C. H. Smith offered, for 200l. or 300l. a year, to test every block of stone brought upon the works. Sir Charles Barry asked that this might be done. The Government of the day intimated that they had no objection to Mr. Smith's offer being accepted, but that Sir Charles Barry must pay the expense which would be involved by its acceptance! As every one knew, the Houses of Parliament was a very elaborate building externally, and it was scarcely to be supposed that the masons selected the hardest blocks of stone they could find for the execution of elaborate details. Mr. Slater had referred to the use of linseed oil as a preservative of stone under certain circumstances. He had seen it directed in North Country specifications that the weatherings of all coping-stones, &c., should be painted. He was not sure but that the adoption of such a course would be harmful, for the effect of the top coat of paint would be to shut the damp in, and the result would be, probably, somewhat analogous to the injurious effects which followed from the painting of an oak sill. Twenty years or so ago the minds of stone-inquirers were very much exercised as to the methods of preserving stone, and various patented "solutions" for coating the material *in situ* were put forward, notably Szelemey's, Ransome's, and the water-glass process. In his opinion, all these things had been found wanting. Most of them had shelled as their basis, and it was only a question of time how long a preservative coating of that kind would last. Probably if stone could be worked in summer and kept unfixated through a winter it would be much better able to withstand the effects of the London atmosphere. The process of "cleaning-down" had, doubtless, much to answer for, and, as the chairman had said, it should either be done as the building was carried up, or left undone. But the process of "cleaning down" was one dear to the heart of the mason, although much of the interest of the building seemed to vanish as the scaffolding was struck. It should not be forgotten that there was a "dry cleaning" as well as a "wet cleaning," and that the former was much less injurious in its effect on the masonry than the latter.

Mr. G. H. Blagrove, in seconding the motion, said that one important and valuable stone not mentioned in Mr. Slater's paper, viz., Craigleith, which was very hard to work, and the particles which got into the lungs of the masons had a very deadly effect, being so sharp. He had been told that five years' work in such a stone would kill a man. He admitted that implicit faith was not to be placed in advertisements; but other materials than stone were advertised, and though many were advertised, few were chosen. As far as his experience went, Red Mansfield lost its colour after a few years' exposure to the weather. There was a Red Corsehill or Dumfries stone, which was of a darker red and kept its colour better in London, but this stone, he was informed by masons, was more liable to laminate. Yellow Mansfield stone was used in the Temple Bar Memorial, and was hardly distinguishable in colour from the Craigleith stone used in the same work. In stones where the differences of colour were sharply marked, there was, he believed, greater risk of the stone coming to grief than in stones where the

alterations of tint were gradual. As to detecting the natural bed of a stone, masons had a good many "dodges." One of them was to look for the mica in sandstones, the face that contained the greatest amount of mica being the bed.

Mr. Leonard Stokes thought that Corsham stone might be made passably durable for external work if it were rubbed to a smooth surface, so that the water might heretofore shot off from it. Although, no doubt, there was much to be said for bedding masonry on its natural bed, he had been told by a mason that every piece of masonry that overhung or was "throated" should be "joint-bedded." He thought there was some force in that.

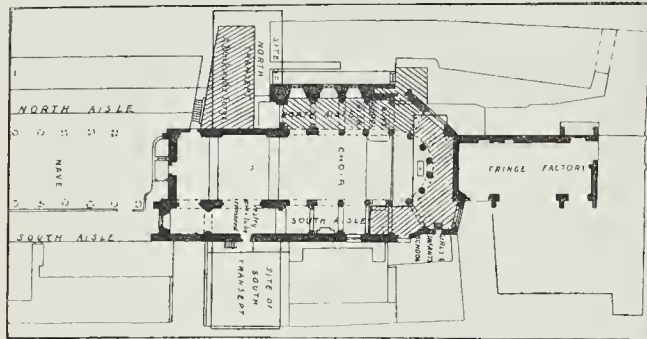

The Chairman having put the vote of thanks, Mr. Slater briefly replied, and the meeting was brought to a close.

COMPETITIONS.

Hartwood Asylum, Glasgow.—At a meeting of the Glasgow District Board of Lunacy, held on the 18th inst., the Chairman (Lord Provost McOnie) moved the adoption of the minutes of meetings of sub-committee on Hartwood Asylum. At a meeting of the sub-committee on 21st January, it was resolved, after discussion, to recommend the selection of ten architects who should be asked to prepare competitive plans, on condition that each of the ten architects who might compete should be paid a premium of 50l. sterling; that on payment of the premiums the respective designs should become the absolute property of the District Board; that the District Board should not be held as bound to execute the work according to any of the plans to be obtained; and that the District Board should be at liberty to employ as architect for the buildings either any one of the architects competing or any other party. In answer to an advertisement in the newspapers, it was reported by the clerk at a meeting of the sub-committee on 4th March that eighty-three architects had forwarded their names in response to the advertisement. The conditions of the competition were agreed to. It was suggested by Mr. Laing that a maximum sum should be named to the architect, and he suggested 120,000l. After discussion, it was agreed to leave the matter to the architects. The following architects were selected:—Baldie & Tennant; Campbell, Douglas, & Sellar; John Baird; James Thomson; Bruce J. Hay; John Burnett & Son; Francis Striratt; H. & D. Barclay; Henry Higgins, jun.; Landless & Clifford.

Blackburn.—A limited competition for new schools in connexion with the new Jerusalem Church, Blackburn, the estimated cost not to exceed 1,000l., has been decided in favour of Mr. Robert Nightingale, Town Hall-square, Bolton. Seven architects were invited, no premium except the appointment of architect being offered. Five of the architects competing were from Blackburn.

Edinburgh Architectural Association.—On Saturday last the members of this Association, under the leadership of Mr. Thomas Ross, visited Granton Castle, Royston, and neighbourhood. Mr. Ross, in the course of his remarks, said that in Granton they had a type of building which had been designed to resist attack, perched on the summit of a rocky knoll overlooking the Firth of Forth, with enclosing walls loopholed for guns, and a walk behind for the defenders. Much of this castellated character had, however, disappeared, owing to alterations which had taken place between the years 1544 and 1696. On the other hand, they had in Royston a stately house, built for the reception and entertainment of guests, but with little or no thought of defence; but, like Granton, extremely characteristic of the Scottish architecture of its period, and further interesting from the alteration it underwent in 1696, when its south front was transformed from the homely Scottish style, and of which Royston is one of the earliest and best examples. At Granton they had a building of the familiar L plan, with a circular staircase and entrance at the re-entering angle. The kitchen appears to have been in the north wing, and is now the only vaulted part of the main building. Perhaps the most interesting features of Granton are the surrounding walls, which follow anglewise the outline of its rocky site, and the skillful way in which the entrance has been chosen so as to be enflamed by a return in the wall at a point where the rock is highest and steepest.

St. Bartholomew-the-Great, West Smithfield.—Plan.

Illustrations.

ST. BARTHOLOMEW-THE-GREAT, WEST SMITHFIELD.

WE noticed in a previous issue the letter which appeared in the *Times* from the Rev. W. Panckridge, rector of this most interesting church, calling attention to its present condition, through the secular encroachments which have been made from time to time, and appealing for funds in order that the opportunity which has presented itself of purchasing these encroaching properties (shown on the accompanying plan) may not slip.

To those who do not know the church it would appear incredible that one of the finest among the very few Mediaeval churches remaining in the City of London has had for centuries, and still has, a frings manufactory overhanging the sanctuary, and occupying the actual walls of the Lady-chapel; a boys' school occupying the north triforium; and a blacksmith's forge the site of the north transept, blocking up the great arch of the crossing,—the vestry blocking up the opposite south arch.*

Our view of the east end shows the projection of the manufacturing premises referred to, and our other view shows the northern arcade, with the founder's tomb, erected to the memory of Rahers by Prior Bolton, who carried out considerable alterations to the church from 1506-32; and these two views show the interesting architectural character of the building.

In 1863 a Restoration Committee was formed by the late rector, the Rev. John Abbiss, and under the advice of the architects, Messrs. T. Hayter Lewis & William Slater, the church was considerably improved,—the floor lowered, the foundations of the four great piers repaired, the building drained and warmed, and many other necessary works carried out, though funds were not then forthcoming to purchase the encroaching properties. The architectural history of this church was published at this time by the Restoration Committee in the shape of an admirable lecture by the late J. H. Parker, C.B. An influential committee is now being formed, and we see by the circular which has been issued that Mr. Aston Webb has negotiated for the refusal of these properties, and from his report appended it appears that the amount required for urgent works, and the acquisition of the properties, will not be less than 20,000l.

We can only express a hope that the funds may be obtained and the church freed from these encroachments, which are a constant source of danger from fire, a serious hindrance to the well-attended services, and, we must add, little creditable to the great City of London.

WORKMEN'S DWELLINGS, CARTWRIGHT STREET.

THE block of labourers' dwellings, which we illustrate this week, is situated in Cartwright-street, a street running north and south between Royal Mint-street and Upper East Smithfield, along the eastern side of the Royal Mint.

A large area of unhealthy dwellings was cleared away at this spot by the Metropolitan Board of Works under the Artisans' Dwellings Acts, and in the early part of this year, the cleared land was put up for sale by auction in

* The portions which are overhanging are shaded on the plan.

lots by the Metropolitan Board, subject to covenants that it should be used for the construction only of workmen's dwellings, naming the minimum number of persons to be housed on each lot and the minimum expenditure to be incurred in building; and one lot, having 372 ft. frontage with a depth of about 60 ft., was bought by the East End Dwellings Company, Limited. The effect of these covenants running with the land has hitherto been to reduce the sums obtained for land so sold to something much below its normal value for ordinary commercial purposes, and also to limit the number of parties likely to become purchasers to a very narrow circle, the speculating builder having as yet hardly seen his way clear to profit in dealing with land hampered by these restrictions. Hitherto, in fact, the building on the "unhealthy areas" cleared under the Artisans' Dwellings Acts have been chiefly erected by the large associations, such as "The Improved Industrial Dwellings Company" or "The Peabody Trust," or, in some cases, as Petticoat-square, by the public authorities in themselves.

From this restriction of competition it has followed that, notwithstanding the great outcry in the early part of last year as to the insufficient number of, and the over-crowding in the dwellings of the town poor, there were large blocks of vacant land, cleared by the public authorities in various parts of London, waiting to receive the buildings which should meet the alleged want. Month after month, nay, year after year, this land continued vacant. The large Associations had their hands full and their capital invested, though the land, cleared at the ratepayers' expense, might be purchased at a price less than its value and far less than its cost to the ratepayers.

This state of things existed and still exists in the Whitechapel district, perhaps to a greater extent than in any other part of London, and attracted the attention of the Rev. S. A. Barnett, the energetic Vicar of St. Jude's, Whitechapel. He saw further that the large public associations have hitherto chiefly provided dwellings for the well-to-do artisan class rather than for the lower grades of the wage-earning class, taking as an axiom that no man with a wife and children should occupy less than two or three rooms at a corresponding rental.

Now the greater number of the day labourers at the East End of London earn upon the average less than 1l. a week, though many months may have to be fed out of that small wage, and it was for that class that accommodation of a better kind was more urgently required. As a result of much discussion and many meetings of sympathising friends at the house of Mr. Barnett, a company, called The East End Dwellings Company, Limited, was formed with a view to try the experiment of building a block of dwellings for the worst paid class of labourers on some of the vacant land in Whitechapel, and the first act of the new company was to purchase at auction from the Metropolitan Board of Works the site in Cartwright-street, on which the block of buildings we illustrate has since been erected.

The nominal capital of that Company is 100,000l., of which 50,000l. was at once issued, and no difficulty was found in obtaining a sufficient number of shareholders.

The directors of the new company resolved that their building in Cartwright-street should

be experimental in character, inasmuch as a greater number of the tenements should be of roomed tenements so arranged that they might be let as two or three-roomed tenements to the tenants who could afford to pay the extra rent.

Considering the destructive habits to be expected in a certain number of their tenants they resolved that every part of the building should be of the strongest and simple character, and with a view to the general arrangement of the building and its details they took counsel with many who, as owners, rent collectors, or visitors, had obtained considerable knowledge of the habits and requirements of the class for whom the buildings were principally intended.

After much discussion they resolved to adopt the outside balcony plan of access, with shop open inlet passages to the groups of rooms that three open staircases, one at the centre and one at each end, would give sufficient access to the balconies on the upper floors and provide safe egress in the event of fire; that the balconies should be in the rear rather than at the front; that wash-house accommodation should be provided in the large common back yard or play-ground; and that, as it was impossible, without unduly increasing cost, to give a separate water-closet to each tenement, it would be best to construct groups of latrines (separate for men and women) on each landing of each staircase, these being flushed by automatic flushing tanks acting periodically.

It was also arranged that each landing of each staircase should be furnished with a waste tap and sink for drawing water, instead of laying water on separately to each room, so as to reduce the plumber's work to a minimum.

A large room has also to be provided to be used hereafter as a club-room, or for such other purposes as might in the future be found desirable.

The buildings have been planned in accordance with these views by Messrs. Davis & Emanuel, the architects to the company.

Peccar interest attaches to this block of buildings from the fact that it is, on a moderate scale, an attempt to solve the great problem of the satisfactory housing of the lower working class as a paying speculation rather than as a matter of benevolence, and the working of this company will be watched by many, for it is to a great extent a pioneer company, and if fairly successful may not only extend its own operations, but bring into existence a number of similar undertakings.

Its success or non-success depends on its balance-sheet, and at this moment one side only of that balance-sheet can be defined.

The buildings are sufficiently advanced to enable us to calculate with certainty their costs and it seems likely that as soon as they are finished tenants will begin to flock in. Assuming, however, that the buildings are rapidly filled, it still remains doubtful how much will have to be deducted from gross rental for outgoings in respect of rates, taxes, and, most of all, repairs; and on this point the success or non-success of the scheme very greatly depends.

To the general public the most interesting point is the rental per room which the company must charge in order to secure to itself a dividend of five per cent. on its outlay, and a secondary point of interest is the amount of ground-rent which each room will have to bear. Treating this last point first, we may state that the site contains 25,420 ft. super., and was purchased at auction for 3,650l. At twenty years' purchase, this means a rent for the ground of slightly under 1½d. per foot super. Now the building will contain 281 lettable rooms, thus making the ground-rent per room as nearly as possible 13s. 3d. per year, or 3d. per week; this will give some idea how small a proportion of the rack rental per room is represented by the ground-rent per room, and how large a proportion of the rack rental is represented by the interest on building outlay and by rates, taxes, and repairs.

Below is a tabulated statement of the capital expenditure involved in this experimental undertaking:—

Cost of site	£3,650
Leveling site and excavating and concrete foundations	1,318
Building contract let to Mr. S. J. Jerrard, of Lewisham	13,793
Probable extras, fittings, and architects' commission, say	1,239
	420,000

DESIGN FOR A SEA-SIDE PAVILION. BY MR. J. A. CAMPBELL.
ELEVATION TOWARDS THE SEA.

100% capital, the net earnings must be 1,000% or more. Those who have had experience in the housing of the lower grade of the labouring class say 50 per cent., viz., one-half of the gross will be absorbed by allowances for unfurnished and irrecoverable arrears, and by rates, management expenses, and repairs. Whether this is so, the future balance-sheets of the company will tell. If it be true, then the annual rental obtained from this building will be 2,000%. We have already said there are 281 lettable rooms, and this will necessitate an average annual rental of 7l. 4s. per room, viz., as nearly as possible an average of 2s. 9d. per room per week, to be paid to the tenants. The lowest rent for a room in the building will be 1s. 9d., the best 3s. 3d.

Another item of public interest is the cost of the building. The total building, exclusive of land, is likely to be about 100,000l., now, adding to the lettable rooms an allowance for the caretaker's room and the kitchen, the building may be said to contain 300 rooms, viz., about 57l. per room, a result which does not compare favourably with the cost of the speculative builder in our suburbs. A superior class of work, however, must be accounted for the cost, and that, no doubt, will keep down the item of repairs in the company's future balance-sheets. A special expenditure has been incurred in the flooring, but concrete and artificial stone have been used for staircases and landings throughout. The hearths throughout are without trimmings, but formed with concrete in a solid mass on the floor to ceiling under. The fireplaces have chimney-pieces, but have margins of Staffordshire brick projecting slightly beyond the wall face of the work. Each of the latrines has a separate outside window in the outer wall, and is well lighted,—the belief of the directors being that there is darkness there may be filthy. As we are informed, have been spared the details of this building, and it may be hoped that success will attend the East End Housing Company in their interesting experiments.

SKETCHES IN MALTA.

These sketches have been made by Mr. E. Bell in illustration of his article on "An Architect's Notes in Malta," for our issue p. 438.

DESIGN FOR A PAVILION FOR A CONSIDERABLE WATERING-PLACE.

Above is the precise wording of the report set by the Council of the Institute of Architects for the Tite prize, and perhaps interpolation of the unfortunate word "conceivable" may be taken to justify the Doric style of the design by Mr. Penrose, which obtained its author the honor for this year, and which we will cite in the present number. There is a deal of clever and elegant detail in it, some of which we will give on a larger scale. The plan is suitable for the purposes of the building, and the whole is very creditable to its author, although, as we before observed, it does not really represent Sir William Tite meant to encourage the awarding a prize for the study of Italian architecture.

Wood-Block Flooring.—Amongst the exhibits whose goods were not noticed in our last week of the Building Trades' Exhibition at Islington is Mr. Roger L. Lowe, of Perth, who entered the lists too late for the inclusion of his name in the catalogue. Mr. Lowe's improvement in wood-block flooring is (amongst other things) the fastest of the blocks upon the hard, dry surface. It is secured by his patent composition, which not only secures the blocks to the concrete, and at the same time prevents them from dampness. Mr. Lowe contends that the usual method of laying the blocks in mortar is wrong, both in theory and practice, as the water in the cement swells the blocks or, at the same time, afterwards they shrink and become loosened.

ARCHITECTURAL ASSOCIATION.

The ordinary meeting of the members took place on Friday, the 20th inst., Mr. Cole Adams, President, in the chair.

The following new members were elected:—Messrs. Montague Sellin, R. W. Roe, H. D. Wilkinson, W. G. R. Bousfield, Theodore Moore, J. W. Lee, F. E. Haarer, and R. H. Mew.

A letter was read from Mr. Thomas W. Aldwinckle, stating that he would be happy to place 20l. at the disposal of the Association for a travelling studentship for this or next year. Mr. Aldwinckle, it was stated, had made a similar offer to the Royal Institute of British Architects for a studentship of 50l. A cordial vote of thanks was passed to Mr. Aldwinckle for his handsome offer.

The next visit, it was intimated, would take place on Saturday, the 28th inst., to the Fishmongers' and Merchant Tailors' Halls.

Votes of thanks were passed to Mr. Charles Bell for kindly conducting a party of members over the new Infirmary at Hampstead, and to Messrs. Read for allowing the members to inspect their Bottling Stores at Gospel Oak, as mentioned in our last.

It was announced that the Sketch-Book Prize Committee had awarded the first prize of four guineas to Mr. G. G. Wallace, and the second prize of two guineas to Mr. H. H. Kemp.

Mr. F. C. Penrose, M.A., then delivered a lecture "On Proportion in Architecture, especially as exemplified in the works of the Greeks." Mr. Penrose commenced by stating that the press of business had prevented his writing a paper, as he had intended. Proportion in architecture, he said, had two branches; one, and that the more important, might be epitomised as the *fortiter in re*, and the second as the *suaviter in modo*. The first was doubtless the more important, but no perfection had ever been attained unless both were combined. The first point was the due adaptation of a building to the needs for which it was designed,—the adaptation of support to the mass it had to bear. This was absolutely necessary in all good architecture, but, at the same time, it did not entirely produce beautiful results. It was, therefore, necessary to combine with it a certain artistic feeling, difficult to describe, which, whether known or unknown, was combined with rhythmical proportion. A well-educated artist would produce graceful works. He might not think that he had combined elegance with harmonious qualities, but, nevertheless, it would be found in ninety-nine cases out of a hundred that he had done so, consciously or unconsciously. It was not necessary that he should be bound and tied by any scheme of proportion, but at the same time there were methods of proportion which might be used as rules, just in the same way that a clever draughtsman would by the hand produce a straight line, which he could have done much more easily by using a ruler. There were certain rules which might be serviceable in attaining results more readily, and these might be frequently used to simplify and expedite matters, while even to those who had not had a full artistic training they might prove useful. The Greek buildings would be found to illustrate these methods admirably in both respects, and he would consider the way in which Greek architecture was developed. There were two branches in the great Greek family, the Doric and the Ionic. The Dorians had a great deal of communication with the Egyptians, and from them learned the massive style of architecture prevailing on the banks of the Nile. The Ionians, on the other hand, were influenced by the Phoenicians, whose architectural attainments were recognised by Solomon when building his temple. At Athens, above all places, the two branches were combined. In the Peloponnese and Northern Greece, and especially in the colonies in Italy and Sicily, the Doric almost entirely prevailed, but, although it produced noble results, the elegance of these works was not comparable to those at Athens. There were two kinds of proportion, one the proportion of strength, the masculine; and the other that of elegance, the feminine. This last was well illustrated in the Ionic, and as Athens contained the characteristics of the styles, he would point out to them the Acropolis and its immediate precincts. Mr. Penrose here described at some length Michaelis's plan of the Acropolis, and then passed on to consider the chief buildings,—the Parthenon, Propylæa, the Erechtheum, and conjoined temples, as exemplified

by Mr. Fergusson's plans.* He also exhibited a diagram showing the development of the proportions of the Doric style, and a profile of the architrave from the great temple of Corinth, from which it would be easy to suppose that the entablature went to a great height. He also showed drawings of the entablature of the older and newer Parthenon, the Temple of Theseus, and later examples. These last, he said, seemed to show that the limit of dignity had been passed, and that the Greeks had drifted into a style too flimsy for the spirit of Doric architecture. The style would bear no more attenuation, and, therefore, other styles took its place, because entablatures of that amount of delicacy were suited to the Ionic or Corinthian, which then became the leading styles. One consideration in the matter of proportion was this,—support must not only be provided sufficient for the superstructure, but what, by tradition and custom, people had been led to believe was necessary. If we were now to begin to form ideas of the proportions suitable to trabeated buildings, without any knowledge of what had gone before, we should probably arrive at something very much lighter than the Greeks did. It was, perhaps, fortunate, however, that we had not to do so, as a very large element of surplus strength in the works of nature should be found, and is felt to be necessary. The Greeks, by degrees, gradually refined and refined, until, at last, they refined the Doric in too great a degree, and it was then necessary to give it up. But we have to consider what to do nowadays, to come to a right conclusion in these matters. We ought to know what the ancients did, and not necessarily copy them (indeed, it was almost impossible to do so exactly), but the principles they had elaborated were for all eternity. The best and highest development of the Ionic was the Temple of Erechtheus, where there was excellent proportion between the columns and the entablature. This was solid enough for all purposes, and yet did not weigh too heavily on the columns; but had this entablature been put on Doric columns, it would have seemed a misfit. This temple was not only an example of the fitness of the support to the entablature but would also illustrate the matter of proportion, respecting means to an end, or the fitness of a building for its purpose. The plan was as irregular as that of any Mediaeval building, not purposely or strangely influenced by considerations of site, or otherwise. Any Gothic building erected with perfect freedom of site, and with no difficult constraining circumstance, was quite as regular, and never more irregular than the Erechtheum at Athens. There was a necessity to make a feature on the south side of it where it was opposed to the Parthenon, and this was solved by the erection of the exquisite Caryatid portico, the usual columnar structure being unsuitable, as the height did not allow of a pediment. The figures were so placed that they bore strongly on one leg, while the other was eased, and this in every case towards the middle of the portico. The straighter folds of the drapery were thus utilised to produce the general effect of fluted columns, and here was an instance of the proportion of support to superstructure. Wherever the circumstances of the case required freedom and relaxation, the Greeks were as easy as possible, but wherever symmetry was called for they were most rigid, and determined to carry it out with extreme accuracy. It was much the same in nature, where they would find the limbs of animals not balanced in the middle of their bodies, but placed symmetrically one to the other. When the Ionic had run the greater part of its course, the Corinthian order was developed. Mr. Penrose then referred to the traditional origin of the Corinthian capital, and stated that the earliest example was to be found in the Temple of Bassæ, built in the time of Pericles. He also explained a drawing of the Choric monument of Lysicrates, or lantern of Demosthenes. The capitals of this little circular temple were extremely beautiful, and somewhat of an adaptation of them could be seen in the façade of Exeter Hall. A capital from the Horologium of Andronicus Cyrrestes, or Tower of the Winds, was next referred to. This was the town clock of Athens, having a sun-dial with eight

* See Mr. Penrose's lecture, at the Royal Academy, on "Greek Architecture," reported in the *Builder* of March 7th, p. 334.

faces on the outside, and containing internally a water-clock. The four porticoes of this building had elegant quasi-Corinthian capitals. The Corinthian order became the rule at Rome, whilst here it supplied the order for the enormous Temple of Jupiter Olympius, in the time of Antiochus Epiphanes. The history of the Corinthian Order was well known, and he would not deal with some of the lesser parts of the structures, notably bases and mouldings, and their proportion in the case of light and shade. The Greek mouldings were invariably formed of portions of the conic section; the circle, however, being rarely used, the lines never becoming parallel, though tending towards it; and thirdly the hyperbola, with its advantages of gradation and variety. The Greeks used the ellipse very much for their egg-and-tongue ornaments; the parabola was used for the section of the cornices; while the hyperbola was a favourite curve. The Doric capital had a branch of the hyperbola in it, the curve always becoming straighter and straighter, and the way in which it caught and distributed the light was wonderful. This was the case where the light was strong, but in a paler atmosphere it would not produce one-fourth of this effect. There was also plenty of room for contrasts, because of the strong shadows and exquisite gradations of light. When the Greeks made use of contrasted curves they did not employ such curves as the Romans did, where there were circles butting against one another, but there was either a flat ellipse or parabola, which became straight at the point of contact and then curved out again to the concave figure. (Mr. Penrose here exhibited a table of Greek mouldings, prepared by Professor Donaldson, and which showed that the circle was hardly ever used.) The Greek Ionic volute was a different thing from the Roman one, and Vitruvius gave a rule for producing it by a system of centres and circular arcs. Good Greek examples, however, would not adapt themselves to this rule, and he had been led to try another method for himself. In the Ionic volute there was a hollow in the centre of the eye, which was afterwards filled up with a boss. The meaning of that hollow, he believed, was for placing in it a little instrument which admitted of volutes being easily drawn. The figure was that of the spiral of Archimedes, the unwinding of a string from which gave all the characteristics of the Ionic volute. He had tested the helical or snail-shell curve against the capitals of the Erechtheum and the Propylæa, and found that his view was confirmed. Having spoken of the proportion of fitness, he would refer to rhythmical proportion. The plans of the temples invariably gave true proportions in length and breadth, though others were also found internally. In the case of the Parthenon, all the main proportions of the parts directly opposed horizontally or vertically would be found to compare with one another. Mr. Penrose here explained several tables of proportions.* The Greeks gave to the outlines of their columns extremely delicate curvature, and made use of the hyperbola in doing so, because of its being the only manageable curve. They wished to have a variety of shape between the upper part of the column and the lower. If, therefore, they had employed a portion of the circle the result would have been of the nature of a nine-pin, while by employing the hyperbola it gave a fully-developed sweep at one place, and a perfectly straight line at another. By this means they got great variety, and all this with a departure from the straight line of less than $\frac{1}{4}$ in. in 32 ft.

The Chairman, in opening the discussion, remarked that the leaders of the revival of Greek architecture many years ago were bound by hard-and-fast rules to give chapter and verse for every building they designed, which tended towards a too mechanical feeling. Mr. Penrose, however, had shown that the same freedom ran through the most beautiful specimens of Greek work, as was to be seen in the best examples of Gothic. In the early days of the Gothic revival Pugin demanded that chapter and verse should be given, but as time went on there had been a breaking away from actual copying, and an adoption of breadth and freedom. There had been a drifting into the "Queen Anne" style, and now there was a tendency to return to the Classic. Might they not, therefore, be led from the bad Classic which charac-

terised so much of the Queen Anne work to a study of the pure Greek?

Mr. J. A. Gotch, in proposing a vote of thanks to Mr. Penrose, asked where the measurements were taken from in comparing the length of a temple with its width? A reproduction of the Choragic monument of Lysicrates could be seen forming the steeple to a church in Regent-street.

Mr. G. H. Blagrove seconded the vote of thanks. The curves of the conic section, he added, approximated closely to natural curves. He could imagine, without investigating the matter, that natural curves produced in vegetation would be allied to the catenary curve.

The vote of thanks was then carried by acclamation.

Mr. Penrose, in replying, said that the measurements of the length or breadth of a temple were taken from the point of the upper step. He was not aware whether the Greeks took their pyramidal construction from the Egyptians or not.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

The seventh annual dinner in aid of the funds of this Institution was held on Tuesday evening last in the Venetian Saloon of the Holborn Restaurant, Mr. James Greenwood (J. & J. Greenwood), President, in the chair. About 225 members and friends of the Institution sat down to table. The usual loyal and patriotic toasts having been duly honoured (Captain A. Stuart Harrison of the First City of London Engineers, responding for "The Reserve Forces").

The Chairman proposed the toast of the evening, "Prosperity to the Builders' Clerks' Benevolent Institution." He observed that the Institution had now been in existence for nineteen years, and its income had been steadily increasing, the receipts last year amounting to 7397.4s.* There were now fourteen pensioners receiving relief from its funds, the males receiving 25s. per annum, and the females 20s., but it was the earnest wish of the Committee to increase these pensions to 30s. for the males, and 25s. for the females. The Institution had also purchased two presentations to the Orphan Working School at Havestock-hill, and they were very desirous to purchase a third presentation (the cost of which would be 2627.10s.), without having to sell out any of their Stock. They were very anxious to be able to maintain a third child at the orphanage. In conclusion, Mr. Greenwood appealed to builders' clerks to be mindful of the good old maxim that "God helps those who help themselves," and urged them to subscribe to the Institution in larger numbers than they do at present, not only with the view to make some provision for their own possible necessities in the future, but also in the hope that they may be able to feel the gratification of having done something by their combined efforts to relieve the necessities of their fellow-men, be less fortunate than themselves in the battle of life. The toast was very heartily received.

Mr. Howard Colls, a past President of the Institution, proposed "The Architects and Surveyors," coupled with the names of Mr. J. Conly and Mr. Ellis Marsland, architects, and with those of Messrs. Stoner and Leonard for the surveyors. Messrs. Condy, Stoner, and Marsland replied.

The other toasts included "The Builders," proposed by Mr. E. C. Roe and replied to by Mr. T. F. Rider; "The Past Presidents," proposed by Mr. Edwin Brooks, treasurer, and responded to by Mr. Thomas Sirling; "The President," proposed by Mr. Joseph Randall; and "The Visitors," proposed by Mr. W. Scrivener and replied to by Mr. Morgan Ross.

During the evening the secretary (Mr. H. J. Wheatley) announced subscriptions and donations to the amount of nearly 300l.

Obituary.—The *Lynn News* announces the death of Mr. William Adams, the senior member of the firm of Adams & Son, Wisbech. The deceased, who was within a few days of seventy-nine years of age, was a native of Wisbech, and was articled with Mr. Swanborough, an architect and surveyor holding a high professional position in the town, and extensively employed by public bodies in those days. For about thirty years the deceased held the offices of Town Chamberlain and Borough Surveyor of Wisbech, but retired from the same some years ago in consequence of his increasing private practice. He was also Engineer to the Nene Navigation Commissioners and the Wisbech Canal Company.

* Further particulars as to the financial position of the Institution will be found in our report of the recent annual meeting. (See *Builder* for Feb. 28 last, p. 323.)

PUBLIC ARCHITECTURAL COMPETITIONS.

We have been requested to publish the following additional list of forty-nine architects who have signed an agreement, in accordance with the suggestion made in a memorandum addressed to the President and Council of the Royal Institute of British Architects, May 24th, 1880, pledging themselves not to take part in any public architectural competition unless one or more professional assessors, established reputation are appointed to advise the promoters on the relative merits of designs submitted in competition:—

Allan, E. C.	Indson, A. B.	Siddall, W. J.
Arden, A.	Jackson, S.	Smith, F. J.
Arnott, F.	Leech, C. S.	Strawbridge, G.

Hodgson, H.		

Mr. Ewan Christian (President of the Royal Institute of British Architects) and other architects have not signed the agreement, on the ground that they do not now compete, but the same time heartily support the objects of those who have signed the agreement.

(The number of signees now amounts to 1,431 (see *Builder* for May 24, 1884, p. 762).)

REARS OF HOUSES.

By Section 29 of 18 and 19 Vic. c. 12 (The Metropolitan Building Act), it is enacted that:—

"Every building used or intended to be used as a dwelling-house, unless all the rooms can be lighted, ventilated from a street or alley adjoining, shall have the rear or side thereof an open space exclusively belonging thereto of the extent of at least 100 square feet."

And the Metropolitan Management and Building Acts Amendment Act, 1882 (45 Vic. cap. 1), Section 14, enacts that:—

"Every new building begun to be erected upon a lot not previously occupied in whole or in part by a building after the passing of this Act intended to be used wholly or in part as a dwelling-house, shall, unless the Metropolitan Board of Works otherwise permit, have direct access thereto and in the rear thereof an open space exclusively belonging thereto of the following extent: Frontage not exceeding 15 ft., the extent of the open space is to be 150 square feet at the least, and so on to frontages exceeding 30 ft., when the open space is at least 450 ft. Every such open space shall be free from any erection thereon above the level of the ceiling of the ground story, and shall extend throughout the entire width (exclusive of party or external walls) of such building, the rear thereof. The provisions of this enactment shall be in addition to and shall form part of the rules of the Metropolitan Building Act, 1855, and the said Act shall be construed accordingly."

Great difficulty arises in the construction of these two sections, but the consensus of opinion seems to be that section 29 of the Act 18 is so far repealed where it is inconsistent with section 14 of the Act, 45 Victoria, cap. 1, and that even if the rooms can be lighted and ventilated from the street or alley adjoining the buildings must now have a space at rear, according to the frontage occupied; the same, unless the Metropolitan Board of Works' dispensing power is exercised or ground has been previously occupied by other buildings. A further difficulty also may arise in cases where there is a doubt as to which the rear of a house, as, for instance, that a house built between two parallel streets, in such a case it would be well to get the Board to define the open space to be left.

Rapid Tunnel Driving.—We are informed that the distance accomplished last week by Colonel Beaumont's tunnelling machine through the red sandstone under the Mersey was six seven yards, which is stated to be "the fastest on record." The heading now being driven and which is nearly completed, has a length of about 950 yards, and this, as we have the previous heading of about 700 yard length, are intended for effecting the ventilation of the main tunnel. The total distance driven by Colonel Beaumont's tunnelling machine (which cuts a circular heading rather than 7 ft. in diameter) in connexion with the Mersey Tunnel is about 2,250 yards, which includes first operation, viz. the boring of the drain heading.

* For these see *Builder* of the 14th inst., p. 372.

HAYWARD'S SELF-LOCKING COAL PLATE.

In our notice of the Building Trades' exhibition last week, we briefly referred to a coal-plate, which has a protecting ring ed in the pavement into which the coal-plate is dropped and immediately secured locked by projecting bolts on each side, fastened by an ingenious arrangement of two all levers with a small weight suspended on the centre. The plate can be pushed up when required by a broom-handle or stick, or by a rod connected to the centre light.

The wood-cut clearly shows the simplicity of the arrangement. The dangers of insecure coal-plates are manifest, and it appears to us that builders and householders will find in this new coal-plate (manufactured by Messrs. Hayward & Eckstein, of Union-street, Borough) that can be desired to ensure security.

STREET ARCHITECTURE IN LONDON.

SIR,—Is anybody interested in the street architecture of London, or are we all,—artists, architects, and editors, and merchants, and engineers,—so busy with the affairs of Afghanistan I Egypt that we cannot see what is going on before our eyes?

A fine street is at last being made, in the very heart of the metropolis, which will unite the north and south in a grand sweep of traffic. It is that all Londoners should be thankful. It begins from the Haymarket to Oxford-street, that the British Museum, at one hand, will be able to shake hands with Pall Mall at the other. But, just as this great highway curves on Oxford-street, having escaped the perils of the old, St. Giles's and Bloomsbury, lo! a sudden obstacle rises in its path. This obstacle does at first sight seem very formidable. It has architectural beauty, it possesses no anti-architectural interest, it recalls no tender memories of departed genius, it bears no specially sacred associations,—it is nothing more than a small public-house, the Black Lion, at the corner of the street. Nevertheless, it appears to be much for the Metropolitan Board of Works get over. The sweep of traffic is made to go around it, and one of the finest streets of London is made to end with an architectural goblin.

Now there must be some reason for this. Nobody would designedly break the beautiful curve with which two such streets would unite by the projecting angle of a tap-m. The Board of Works are bound to take the money of the ratepayers; and if the cost of demolishing the beer-shop is too extravagant, then say so, and we shall at least commend them for economy. The Board of Works cannot rough-sword over the rights of private property; and if the real lion that stops the way is some great and inexorable landowner, again say so, and we shall sympathise with their impotence. But, in contending the cost, do let them forget that if they fail to extinguish the little public-house that ramps at the corner of Duke-street it will be quite enough to deride with derision one of the noblest schemes of the improvement of London.

March 23, 1885. WYKE BAYLISS.

NON-ACCEPTANCE OF LOWEST TENDER.

On p. 366 of your paper for March 14, you give a decision of the late Mr. Justice Willes (who was one of our most eminent judges) upon a case of fifteen years' since. "It is contrary to common law; for it may well be that a tender may be so made as to be obviously incompatible with sound business, or may be made by a person unadvisable to employ." Now, sir, I wish to ask if neither of these two objections can be urged against the contractor, and still more if he, the contractor, is bound by the conditions of contract,—say, for a sum of 40,000*l.*—to provide sureties to the amount of 10,000*l.*, and start the works by placing 50*l.* worth of plant upon the ground, and also to retain ten per cent. retention money, what justice is it in the advertiser's not accepting the lowest tender? A reply from your able and impartial pen would be highly appreciated.

AUGUST KRAUSS, Contractor. Old-street, Bristol.

* The decision in *Spencer v. Harding* was that Justice Willes, Keating, and Montague Smith, in their judgment delivered by the first named, in fact of this decision having remained unquashed for fifteen years indicates that it is a sound one, and reasons why an employer might not wish to

accept the lowest tender might be given; for instance, the lowest tender but one might be by a local man, and the difference between his tender and that of the lowest not very great, and the employer might prefer, either from neighbourly feeling or because he could communicate more easily with the contractor, to accept that of the local man. *Prima facie*, an employer will get the work done at the least possible cost, and so will in most cases naturally accept the lowest tender, but it is ridiculous to suppose that employers will, as a rule, ever bind themselves to accept the lowest tender, and so be obliged to accept the offer of a man about whom they may know nothing. In the case given by our correspondent probably an employer would accept the tender unless he had other reasons to the contrary. Our correspondent, however, does not seem to see that there can be no injustice in an employer not accepting the lowest tender when he has not expressed his intention in the advertisement to accept it. If he had expressed his intention so to do, then clearly he would be under a legal and moral obligation to accept the lowest offer. Moreover, the contractor is in no worse position, if he bids the lowest tender and be not accepted, than if he bids the lowest but one and not accepted; he makes an offer simply on the chance that it may be the lowest and may be accepted.

PROVINCIAL NEWS.

Bournemouth.—One of the oldest houses in Bournemouth, the Tregonwell Arms, is at last being pulled down, in the course of making a new street to the Beckford Estate, under the superintendence of the architects, Messrs. Kemp-Welch & Pinder. By some, its demolition seems to be regarded as almost an act of sacrilege. Though not an ancient historical building, it has been regarded locally with a kind of veneration, partly from the fact that it is one of the oldest houses in the town, and partly because its retired position and ivy-mantled porch gave it an air of respectable old age, that was in contrast to the more modern buildings which have gradually grown up around it. Thirty-five or forty years ago the Tregonwell served the double purpose of inn and post-office, and the letters are said to have been sorted in the public bar. Times have changed since then, and Bournemouth has attained a popularity such as at that time was never dreamed of.

Stratford-on-Avon.—An ancient house, dated 1597, a building of great interest to all visitors to Shakespeare's town, has of late shown signs of decay, the beam carrying the upper floors having given way. The whole of the ground-floor front has been taken out, and a new front, more in character with old work, has been put in, consisting of strong oak mullions and transoms filled in with lead-work. The front removed was about 80 or 100 years old. Mr. T. W. F. Newton, of Waterloo-street, Birmingham, was the architect.

Whitfield.—By the generosity of Miss Wood, the Church of St. James, Whitfield, Glossop, has been furnished with a new clock, manufactured by Messrs. J. W. Benson & Co., of Ludgate-hill, E.C. The frame is horizontal, which allows any part to be removed without disturbing the rest. All the wheels are of gunmetal and the pinions of steel, cut from the solid, and, as both wheels and pinions are engine-cut, their accuracy is secured. The dials, four in number, are 4 ft. in diameter in richly-gilt skeleton iron-work. The escapement is Graham's dead-beat, and the pendulum is compensated to counteract the variations of temperature. The clock strikes the St. Mary's, Cambridge, quarter chimes, and the hours on a tower bell of 12 cwt.

Bristol.—The Bristol Waterworks Company are engaged in making an important addition to the means of supplying Bristol and the neighbourhood with water, a large portion of which is nearly completed. The work undertaken will cost close upon a quarter of a million, and will so strengthen the supplying power of the company as to enable it to meet the growing requirements of the population that it has to serve. An additional reservoir is in course of construction at Barrow, where there are already two immense storage reservoirs, and the company have also acquired new springs at Sherborne. The necessary mains are being laid from that place to Durdham Down, Bristol, some fifteen miles. A portion of the work has been most difficult, necessitating the making of a tunnel through Ursleigh-hill, Whitchurch. The levels are so uneven just here that tunnelling to the length of a mile became absolutely necessary. Operations were commenced some fifteen months since, and are now practically completed. On the invitation of the contractor a party of friends assembled at the tunnel on Monday last to witness the operation of blowing in the wall of stone separating the two parts of the tunnel, it having been driven from both ends simultaneously without an intervening shaft. The engineers are Messrs. John Taylor & Sons, 27, Great George-street, Westminster, S.W.; Mr. G. Gooch, superintendent engineer; Mr. Sellick, inspector; and the contractor, Mr. A. Krauss, of Bristol.

Newcastle-on-Tyne.—About 20,000*l.* is to be expended in making additions to the Newcastle City Lunatic Asylum at Colododge. Mr. Arthur B. Plummer, of 46, Cloth Market, Newcastle-on-Tyne, is the architect for the work, which will shortly be commenced.

SCHOOL-BUILDING NEWS.

York.—A new day-school, in connexion with the Roman Catholic Mission the English Martyrs in Blossom-street has been opened. The school is a two-storied red brick structure, relieved with stone dressings. The cost of the edifice has been upwards of 2,000*l.* Messrs. Goldie, Child, & Goldie, of London, were the architects, and the contract has been carried out by Messrs. Biscomb & Sons, of York.

Snydale (near Pontefract).—New Board Schools here, for the accommodation of 325 children, were opened on the 9th instant. The style of architecture is an adaptation of Domestic Gothic, red brick being the material used for the walls, with Ancaster stone for window-heads, cills, mullions, tabling, and other dressings. The schools, with master's house, stand on half an acre of ground, given by Mr. Rowland Winn, M.P. Messrs. Macfarlane, of Glasgow, have supplied the castings for eaves gutters and lavatory ranges. The schools are warmed with old style hob-ranges, specially made from designs approved by the architect. The amount of contract has been 1,937*l.* Messrs. Jackson, Bros., of Goole, were the contractors, and Mr. William Shackleton, of Pontefract, was the architect.

STAINED GLASS.

Gillingham (Kent).—A painted window has recently been erected in the parish church here to the memory of the late Mr. Runney, of Stubbin's House, Lancashire (father-in-law of the vicar). The window, which consists of two lights and tracery, is treated in the fourteenth-century style, and the subjects are the Marys preparing Spices and the Marys at the Tomb. The window has been designed and executed by Mr. Charles Evans, of Warwick-street, Regent-street, W. The large painted east window, erected in 1869, has also undergone extensive alterations in detail and colour by the same artist.

Capetown.—A large Munich stained-glass window has been erected in St. George's Cathedral, Capetown, in memory of the Right Rev. Henry Alexander Douglas, Bishop of Bombay, who for some years prior to his appointment to that see was Dean of Capetown. The subject represented is the "Charge to Peter," and the artists are Messrs. Mayer & Co. **Knarsborough.**—The first of the aisle windows in Holy Trinity Church has been filled with stained glass. Messrs. Powell Brothers, of Leeds, are the artists.

Elland.—A two-light memorial window has been placed in Elland Church, Yorkshire, from the studio of Messrs. Powell Brothers, of Leeds.

The Student's Column.

DESCRIPTIVE GEOMETRY.—VIII.

GIVEN a plane P by its traces P^h and P^v , select other projection planes in which P will be part of the elevation plane itself.

Here we begin by making a new plan on a $L^1 T^1$ perpendicular to P^v , and then make a new elevation with $L^{11} T^{11}$ on P^h , as in fig. 43. In both these problems each change of projection plane means altering the projections of all the other parts of the figure one may be studying, as well as the traces of the plane P. (See fig. 43.)

Given a plane P on which a cube is placed, of which $a^h b^h$ is the horizontal projection or plan of one side of the base, draw the cube completely in plan and elevation. (See fig. 44.)

We shall call $a c$ the other side of the base of the cube, and $a d$ its height. The problem consists in finding the projections of the points $a b c d$. To do this we shall, as in the former

Fig. 43.

problem, make a new plan and elevation, in which the plane P will coincide with the plan itself.

We first make a new elevation by taking $L^1 T^1$ perpendicular to P^h , then draw P^{v1} ; as the points a and b belong to the plane P, the elevations a^{v1} and b^{v1} will be on P^{v1} , we shall find them by carrying from a^h and b^h lines perpendicular to $L^1 T^1$ up to P^{v1} . Then we make a new plan, taking P^{v1} for our $L^{11} T^{11}$, and plane P coincides with the plane of the plan. The new plans of a and b will be a^{h1} and b^{h1} , we can draw on this plan $a^{h1} c^{h1}$ the other side of the base of the cube; as for the vertical angle $a d$, we know that d^{h1} will fall on a^{h1} , and that the elevation of d will be in d^{v1} at a height above $L^{11} T^{11}$ equal to the side $a b$. This done, we draw the plans of $a b c d$ according to $L^1 T^1$ and then the elevation of these same points according to $L^1 T^1$, following the methods we have studied above. Then we can easily complete the other sides of the cube, as we know that their projections are parallelograms.

This problem is nothing but an application of the preceding ones to a special case, and is

Fig. 44.

Fig. 45.

Fig. 46.

1 worthy of being reproduced on a large scale as an exercise.

on a point a and a line D, draw a perpendicular line from a to D.

We make an auxiliary elevation both of the and the point, taking D' for L' T'. In this position, we know that the elevation of the perpendicular will be at m' perpendicular to and we can easily draw the plan and elevation of the point m on the old projection planes according to E T. The method we used for insuring the length of the hip of a roof would be as the length a m distance of the point A the line D, if we desired it. (See fig. 45.)

Draw a cube in any position whatever. This is done by making successively four elevations and plans as in fig. 46, which we hope clear enough not to need any further explanation.

VARIORUM.

Art Designer (11, Paternoster-buildings), quarterly publication, conducted and edited by us, we believe, in great measure, by us, contains in its last issue, and in its extra supplement of designs only, a series of very pretty outline drawings of work for chintzing; heads, figures, and flowers. — "Sanitary Chronicles of the Parish of Marylebone" for January, 1885, by Mr. Alexander Wynter Blyth, Medical Officer of Health (printed by order of the Vestry) afford record of much useful work done or in hand under Torrens's Act has been taken in regard to three houses in Grafton-court, as to which the surveyor (Mr. H. Tomkins) is of opinion that no structural alteration or repair would render them fit for human habitation, therefore, he recommends that they be demolished. A shameful tale of overcrowding revealed by the following paragraph:—

Prosecution.—For several months a front kitchen at 18, Upper Rathbone-place, was known to be overcrowded, and notices had been served to decrease the number of the inmates. It was difficult to ascertain whether the notices had been obeyed or not; for those slept there left before the hour at which an inspector legally enter the premises. On the 29th of March, however, Mr. Phillips paid an early visit, and in one had three women, a man, and a child. On the floor were two other women and two dogs. The magistrate made an order for the abatement of the nuisance, and imposed a penalty of 20s., with 25s. costs.

The "Builder's Blue-Book" for January, 1885, apparently issued under the auspices of the Central Association of Master Builders of London, is a small but very useful handbook of information about the institutions connected with the building trade. The first number is no means complete, however. Some useful information as to water companies' charges for water for building operations is given. The publication is to be issued quarterly.—The "Tall Chimney Construction," read before the Civil and Mechanical Engineers' Society in January, 1878, and December, 1883, Messrs. R. M. Bancroft and F. J. Bancroft, reported in the Builder on those occasions pp. 461, 490, of the volume for 1878, and 52 of the number for Dec. 29, 1883), have been revised, partly re-written, and considerably enlarged by the authors, and are about to be issued in book form. We understand that the work will contain fully-dimensioned descriptions of upwards of eighty shafts in brick, stone, wrought-iron, with weights, cost, &c., and accompanied by a large number of diagrams. The publishers will be Mr. John Calvert, of Messler, and Messrs. Farcombe & Co., of Essex.—"Street's Indian and Colonial Cattle Directory" for 1884-85 (Street & Co., Cornhill, E.C.) is the tenth issue of that exceedingly valuable work of reference. It contains well-executed maps of all the principal districts, and the work appears to have been carefully compiled. Classified lists of missions and trades are given, and a glance at the particulars set forth in connexion with the leading colonial cities shows that its authors and surveyors are as numerous, comparatively, as they are in London and our provincial towns. For instance, in some there are between sixty and seventy architects, while in Sydney the number amounts to 100.—Messrs. Kendal & Dent's "Chart of the World" (published at Cheapside) is a curiosity in its way. It shows at a glance the exact difference between which mean time and the local time at all principal towns throughout the world.

Upwards of 300 dials are shown,—198 for English towns, twenty each for Scotland and Ireland, and sixty-eight Foreign and Colonial.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

38, Sanitary Traps. W. Henman.

The outer arm of the trap is funnel-shaped, and is either joined to or made in one with a short length of vertical pipe, by which it is connected with the soil-pipe below and the ventilating pipe above. The inner arm or arms are at an angle of about 45 deg., and formed to receive the connecting-pipe from the water-closet, bath, lavatory, or sink. The object is to prevent the entrance of sewer-gas to buildings through faulty joints by avoiding the use of untrapped joints in the building altogether.

211, Exhaust Ventilators. G. W. Wehh.

The ventilator consists of a tube of gauze or perforated zinc, forming a continuation of the shaft. It is circular or otherwise in section, and mounted on a square base-plate. In the plate, and parallel to the sides of it, are oblong holes communicating with the interior of the shaft and covered by vertical cages whose outside faces are made of gauze, the other three being of sheet metal. At right angles to the diagonals of the square, and occupying about half the space between the outside angles of each pair of side cages, are two vertical sheet-metal plates. The whole is surmounted by a pyramidal cover. The wind blowing along the surface of the perforated plates draws or exhausts the air or smoke through them.

1,677, Planes. A. H. Valda.

This relates to an arrangement for preventing wear of the cutting edge of planes during the return stroke. A roller or slide moves in contact with the inclined surface of tapering rails, which are fixed to and are parallel with the length of the plane. The edge of the rails is flush with the bottom of the plane.

10,014, Chimney or Ventilator Tops. H. K. Bromhead.

The chimney top or ventilator is constructed with a series of wedge or cone-shaped apertures or channels, slightly inclined upwards to prevent draught. The tops of these apertures may be open, closed, or partially closed, and a concave cover may be attached to the upper part of the chimney-top or ventilator by hooks and a plug.

259, Girder and Fireproof Floors. H. H. Bridgman.

The girders which carry the floor are cast or rolled on a flange running along the web between the top and bottom flanges. The flooring rests upon the intermediate flange of which the position is fixed by the intended thicknesses of the common joists and concrete. The girders may be smaller than those made of two rolled joists, one above the other, and for a floor having a span of 20 ft., 12 bays of 10 ft., to carry 2½ cwt. to the superficial foot, suitable girders will be 12 in. by 5 in.; with common joists, 4 in. by 1½ in. or 3 in. by 3 in., placed at a distance of 2 ft. apart.

260, Fireproof Floors. H. H. Bridgman.

The floor is constructed without hollow space under the boards, the thickness being thereby reduced and the floor rendered less easily combustible. When the floor-boards are of sufficient thickness they are prepared with grooves in their lower edges. Felt or brown slag or lime is spread between the floor-boards and concrete.

554, Doors for Blocking or Fortifying Tunnels. R. Roper.

The doors are made on turn-tables or arranged to slide up or down or across the line from suitable recesses in the roof, floor, or side. When the tunnel is to be closed, the turn-tables are revolved until the doors abut on projections cut in the side walls. The direction is so arranged that in the event of a train colliding with the door, it is the more securely closed.

661, Ventilator. E. Woolfenden.

A tube, placed inside a casing in the roof of the building communicating with the atmosphere, and has its upper end fitted with a revolving cap or cover and its lower end closed by a hinged door. The cover is provided with a feather, so that the perforations in it will be always facing the wind, and thus air will enter the tube and escape into the building through suitable openings near the lower end of the tube below the casing. Foul air will pass away through the space between the casing and the tube, a cover being fitted to exclude the rain. The inner tube is fitted with a damper to regulate or shut off the current of fresh air.

1,558, Preventing Smoke in Open Fireplaces. R. Wright.

A fine powder, compounded of sea-coal and lime or burned limestone, is sprinkled on the top of the fuel in a box with a perforated cover, so as to effect combustion without the evolution of smoke.

2,524, Access Pipes to House-drains and Soil-pipes. G. C. Davies.

The cover screwed over the aperture for cleaning and inspection is rendered gas-tight by a groove and tongue, the joint being stuffed with asbestos, rubber, or white lead and tallow. The inner face of the cover is formed to the curvature of the pipe, with the object of avoiding any recess in which paper or anything likely to choke the drain could lodge. Rings are provided to the cover for the purpose of removing it.

APPLICATIONS FOR LETTERS PATENT.

March 6.—2,940, N. Bonnett, Window Fastener.—2,964, J. Prince, Improvements in Brick and other Kilns.—2,977, A. Kohlhofer, Improved Construction of Domestic Stoves.—2,985, H. Kinton, Improvements on Water-closets.

March 7.—2,992, J. Bonland, Improved Brick, Quarry, or Slab, for Forming the Smoke and Air Flue in Chimney Stacks.—2,999, E. Newton, Improvement in Frame Saws.—3,012, R. Hale, Joint Connexions for Sanitary, Drain, and other Pipes.—3,021, J. Quirin, Parallel Vices.—3,022, H. Haddan, Machinery for Cutting and Dressing Stone.—3,032, J. Gibbon, Ventilation of Sewers, &c.—3,038, H. Lake, Improved Material for Covering Walls and Ceilings.

March 9.—3,047, T. Normanton, Apparatus for Preventing the Bursting of Cisterns and Pipes by Frost.—3,062, W. P. Buchan, Improvements in Ventilators.—3,065, P. Simons, Improved Tile.—3,070, J. Garrett, Construction of Heating and Ventilating Flues.

March 10.—3,086, G. Taylor, Attaching Door and Other Knobs to Spindles.—3,097, J. and H. Rust, Improved Vitreous Material for Paving Purposes.—3,099, W. Defries, Lubrication of Hinges.—3,105, L. Beauvais, Improved Portable Wastaband.—3,138, G. Martin, Improved Method of Securing Slates to Roofs.—3,139, F. Scheffer, Cement or Lime Kiln.—3,130, J. E. and F. B. Beside, Glazed Structures.

March 11.—3,177, G. Collings, Ventilator for Dwelling-houses and other Structures.—3,183, H. Ransom, Apparatus for Setting Saws.—3,186, W. Royston, Ornamentation of Woodwork.

March 12.—3,213, J. Butler, Apparatus to Regulate the Stroke of Tools for Slotting and Shaping Machines.—3,223, M. Syer, Double Action Flushing Apparatus.—3,227, E. and A. Marples, Improvements in Spokesnaves.—3,228, J. Taylor, Pipe Joints.—3,230, H. Taylor, Movable Ventilating Sewer Manholes and Frames.—3,232, A. Maher, Automatic Door Closing and Locking Apparatus.—3,248, D. Sugg, Inverted Gas Burner.—3,251, G. and E. Hammer, Black or Coloured Plaster, Cement, &c., for Writing Surfaces on Walls, &c.—3,255, W. Mead and S. Jenner, Chimney Top or Ventilating Shaft.

March 13.—3,262, T. Messenger, Interlocking Coupling Joint for Water, Gas, or Steam Pipes.—3,283, R. Pearce, Opening and Closing Fanlights and Casements.—3,284, R. Pearce, Opening and Closing Fanlights and Casements through an Outer Wall.

March 14.—3,315, D. Macdonald, Damp Proof Walls.—3,334, J. Humphreys, Automatic Gas-heating Apparatus.—3,349, E. Biggs, a Spring Hinge.

March 16.—3,368, G. Whiteside and J. Hoyle, Apparatus for Brushing and Cleaning Planks or Timber preparatory to Planing, Cutting, or Sawing.—3,371, J. Hughes, Rack Pulleys.—3,383, W. Souter, Improvements in Water-slide Gasaliers or in Gas Chambers.—3,384, E. Davis and M. Morris, Improvements in Pickers.—3,391, H. Howard, Double Action Shutter Cabinet.—3,396, H. Sans, Improvements in Hinges.—3,405, W. Lake, Improvements in Pavement.

March 17.—3,422, D. Thomson, Improvements in Ventilating.—3,443, J. W. Lowe, Improvements in Pipes.—3,464, R. Eyraud, Flushing Cisterns.

March 18.—3,477, T. Wilson and H. Johnson, Chimney or Ventilating Cowls.—3,482, T. Hawkins, Glazing with or without Putty.—3,488, G. Stephens, Coloured Ornamental Glass for Windows or Decorative Purposes.—3,493, J. Anderson, Automatic Saw-setting and Sharpening Machines.—3,502, W. Goebel, Gas Burners.—3,512, E. Summorfild, Adjusting and Fixing Door Knobs to Spindles.

March 19.—3,534, O. Flagstad, Improvements in Vices.—3,536, F. Nevill, Improved Instrument for Measuring Angles.—3,549, W. Lea and J. Beech, Adjustable Brackets or Supports.—3,552, J. Barnett, Improvements in Stoves.—3,571, A. Sauvé, Joints for Iron Pipes.—3,579, J. Johnson, Improvements in Means for Decorating Surfaces.

PROVISIONAL SPECIFICATIONS ACCEPTED.

Non-acceptance of Lowest Tender.—A writ has been issued against the Mayor and Corporation of Cardiff, on behalf of Mr. A. Krauss, contractor, of Bristol, for breach of faith in not accepting his tender for the new reservoir works at Llanishan, the tender being the lowest. The plaintiff claims 1,000*l.* and the amount expended in the preparation of his tender.

A New Presbytery is to be built at Alexandria from designs by Messrs. Pugin & Pugin, of 19, Surrey-street, Strand, and Westminster.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

MEETINGS.

SATURDAY, MARCH 28.

Architectural Association.—Visit to Fishmongers' 2 (Two) p.m.
Building Trades' Exhibition at Agricultural Hall, Closing day.

MONDAY, MARCH 30.

Society of Arts (Lector Lectures).—Mr. J. Hunge, Pollen on "Carving and Furniture." IV. The Gibbons, Boule, and that of their Successors (contd.) 8 p.m.
Estate Exchange.—Annual Meeting of Members, 8 p.m.

TUESDAY, MARCH 31.

Institution of Civil Engineers.—Discussion on the proposed Bill by Mr. P. W. Williams on "The Electrical Regulation of Speed of Steam-engines and other Motors for the Dynamometer." 8 p.m.
Birmingham Architectural Association.—Mr. H. C. Arlison on "Artisans' Dwellings and Acts of Parliament." 7.30 p.m.

WEDNESDAY, APRIL 1.

Carpenters' Hall, London Wall (Free Lecture, Artisans).—Professor T. Roger Smith, F.R.I.B.A., "Some Celebrated Timber Roofs." 8 p.m.
British Museum.—Mr. W. S. C. Bonnewen on "Arian and Babylonian Antiquities." VI. (The W. Heaven). 2.30 p.m.

Builders' Foremen and Clerks of Works' Institution Ordinary Meeting. 8.30 p.m.
British Archaeological Association.—Mr. Alfred C. Easton on "Ancient Glass." 8 p.m.

General Meeting of the Society.—Mr. William Park, F.R.I.B.A., will read a paper upon "Lunatic Asylums." 7 p.m.

SATURDAY, APRIL 4.

Edinburgh Architectural Association.—Visit to Ros Castle and Chapel.

Miscellaneous.

Sunshine Recorders.—The Royal Meteorological Society opened its sixth annual Exhibition of Instruments on Wednesday, the 1st, at the Institution of Civil Engineers, Great George-street, S.W. This exhibition is devoted to Sunshine Recorders and Solar and Terrestrial Radiation Instruments. With regard to the first-named class of instruments it is stated that the first attempt at obtaining an instrumental record of the amount of sunshine was made by Mr. J. F. Campbell's Islay, in the year 1854, when he mounted hollow glass spheres filled with acidulated water in the centre of a cup of mahogany, so arranged that the sun's rays were focussed on the interior of the cup and burned it. The lines burning, therefore, indicated the existence of sunshine. Solid glass spheres have been substituted for the hollow ones, and cards in metal frames have replaced the wood; but in its principle the sunshine recorder of 1855 differs little from that erected on Richmond-terrace, Whitehall, thirty years ago. Other modes of recording sunshine are based on the action of the end of the other end of the spectrum on the actinometer instead of the heat rays. Among workers in this direction may be mentioned Marchand, Pécamp, Sir Henry Roscoe, and others. The most recent improvements in this direction are those by McLeod and by Jordan.

Iron Exports of the United States.—At a time when the importation of American manufactures is engaging some amount of attention, the following figures may be of value as showing the amount of iron and manufactured iron exported from the United States to Quebec, Ontario, and Manitoba during the last three months of the fiscal year ended June 30, 1884, viz.:—Pig iron, 9,620 tons; iron, 1,188,544 lb.; hand, hoop, and scroll iron, 401,631 lb.; ingots, bars, and rods of steel, 1,889,664 lb.; locks and other building hardware, value 404,222 dollars; machine iron, 1,855,514 dollars; plates and sheets of iron, 1,163,008 lb.; plate and sheets of steel, 172,704 lb.; stationary engines, value 12,000 dollars; other iron and steel manufactures reached considerably over a millions dollars value. Even steel rails were exported 1 year from the United States, and there is some competition with foreign supplies.—*Plumbing and Decorating Chronicle.*

National Agricultural Hall Competition.—The directors of this company have arranged with Messrs. Lucas & Sons, Kensington, to execute the necessary erections and levelling required to place the ground in a fit state for the erection of the superstructure. We understand that the quantities for the whole of the works, including the roof, are now being prepared, with a view to inviting tenders.

The Franciscan Monastery at Upton.—designed by Messrs. Pugin & Pugin, has just been commenced. Mr. J. Gregar, of Stratford, is the contractor.

ompsen Memorial Home, Lisburn.—Building, which was begun in August, is now completed and open for the reception of inmates. It was built and vested to the memory of the late Dr. Wm. pson, F.R.C.S.I., M.D., who met with death by accident on the Great Northern (Ireland) about two years and a half ago. The building is of red brick and red stone. It has been planned to accommodate fifty-two patients and twelve nurses servants, with provision for extension. Corridors and staircase are warmed by a low-pressure hot-water pipes, supplied by R. A. Parnell, of Glasgow, who also the laundry drying-closet. The wards are warmed by Mr. D. O. Boyd's school heating grates. Messrs. R. Waggood supply the hydraulic passenger-lift, capable of a couch and patient or two Bath chairs. Internal plumbing, which, owing to the nature of the building, is necessarily extensive, has been carried out by S. Clements & Acheson, of Belfast. The piping, done by Mr. John Hall, of Belfast, is peculiarly worth attention. The heating, carried on metal brackets outside the plaster of the walls, is made to act as picture-rods round the walls of the wards and along the corridors. The pipes, to supply the brackets, &c., are of this pipe. This arrangement has also the advantage of exposing a leakage, which occurs. Mr. C. C. Macarthy, of Belfast-buildings, Belfast, fitted the electric throughout. The building was carried out by Mr. Robert Corry, from the plans and the superintendence of Mr. Godfrey W. pson, of Belfast. Mr. Peter Butler, of Down, was the clerk of works.

Rock Life Assurance Company.—The new prospectus of this company (one of the oldest of the London companies, having been established in 1806) contains several features worth attention. A special point is made of a new form of life policy issued by the Company, under the title of "Investment Policies," embracing non-forfeiture; fixed surrender values printed on the policies; provision for old age, the premiums ceasing after a definite number; and "large profits for good lives." It is claimed that by this plan every insurer will be able at once to know the maximum amount of payment he will have to make for his assurance. The Company have also issued a small pamphlet giving examples of the application of investment policies to partnership arrangements.

The Lectures at Carpenters' Hall.—The last of the course of free lectures to Artisans at Carpenters' Hall will be delivered on Wednesday next, the 1st of April, by Professor T. Roger Smith, on "Famous Timber Roofs." The Right Hon. the Lord Mayor, Master of the Carpenters' Company, will take the chair.

Uppington.—The ancient church at Uppington, near Shrewsbury, is about to be restored and enlarged, at the sole expense of the Duke of Cleveland, the lay rector. His Grace has appointed Mr. J. P. Pritchett, of Darlington, architect, and a Faculty has been obtained to carry out the work according to his design.

Kingsbury.—The old and interesting church: Kingsbury, Middlesex, is about to be restored and enlarged, from the designs of Messrs. Newman & Newman, architects, Tooley-street, London Bridge.

Sway (Hants).—A chance is to be added to the Church of St. Luke, Sway, Hants, from designs by Messrs. Kemp-Welch & Pinder, architects, Bourne-mouth.

For new schools, Goodrich-road, Honor Oak, for the School Board for London. Mr. Thomas J. Bailey, architect. Mr. T. Thornton Green, quantity surveyor:—

F. Higgs, Station Works, Loughborough Junction (accepted)	790 0 0

Accepted for warehouses, 180 ft. by 89 ft. and 163 ft. by 40 ft., at Millwall, for Mr. J. T. Morton, under the superintendence of Mr. William Eve, architect, Union-court, Old Broad-street:—

Harris & Wardrop.
[On Schedule of Prices.]

For rebuilding St. Michael's Vicarage, Wakefield. Mr. William Watson, architect, Wakefield:—

Flower Bros. (Excavating, Brick, and Stone Work)
C. F. Bycroft (Slating)
C. Driver (Plastering)
J. Loyd (Carpenter and Joiner's Work)
G. Thompson (Plumbing, Glazing, Ironwork, Gas-fitting, and Bell-hanging)
C. Turner (Painting)
Total	£1,352 17s. 6d.

[Sixty tenders were received.]

For alterations to the Boar's Head public-house, Fleet-street. Mr. R. A. Lewcock, architect:—

Colls & Sons	£1,400 0 0
Keble & Nelson	1,369 0 0
R. Maer	1,176 0 0
W. Shurmmr	1,143 0 0
S. Godden	950 0 0
Jackson & Todd	919 0 0

For rebuilding on the sites of Nos. 495 and 497, Oxford-street, for Messrs. Hammond & Co. Messrs. T. Chatfield Clarke & Son, architects. Mr. H. H. Leonard, surveyor:—

Abby Bros.	£3,718 0 0
Clarke & Bracey	8,549 0 0
Holland & Hannen	9,389 0 0
Bywaters	8,334 0 0
E. Conder	8,253 0 0
Brown, Son, & Blomfield	8,250 0 0
Colla & Son	8,200 0 0
Patrick & Son	8,127 0 0
E. Lawrence & Sons	8,033 0 0
B. E. Nightingale	7,853 0 0
J. T. Chappell	7,798 0 0
Hall, Beddall, & Co.	7,684 0 0

For building a chapel at St. John's-hill, Wandsworth, for the Committee. Messrs. T. Chatfield Clarke & Son, architects. Mr. H. H. Leonard, surveyor:—

H. S. Lee	£1,885 0 0
Adams & Sons	1,650 0 0
W. Smith	1,628 0 0
Avies & Son	1,610 0 0
B. E. Nightingale	1,473 0 0
W. Robinson	1,450 0 0
Turtle & Appleton	1,444 0 0
W. Johnson	1,400 0 0
S. J. Scott	1,400 0 0
Searchfield & Son (accepted)	1,384 0 0

For renovating Primitive Methodist Church, Richmond, Surrey:—

Carless & Co., Richmond	£35 0 0
C. Mason, Kew	80 0 0
Lambert & Barnes, Richmond	58 12 0
Robt. Johnson, Richmond (accepted) ..	58 0 0

For new printing-office for Messrs. H. & C. Franklin, Twickenham. Mr. John Warne, surveyor, Teddington:—

F. J. Messum	£310 0 0
F. Rose & Sons	375 0 0
J. Cordery	365 0 0
Potter (accepted)	350 0 0

For the restoration of the Parish Church at Morvil, Pembrokeshire. Mr. E. H. Lingen-Barker, architect:—

Griffiths & Thomas, Kilgeran (accepted) ..	£455 0 0
--	----------

For constructing a new road and sewer on the Dovecot House Estate, Green-lanes, Tottenham. Mr. William Hodson, Jun., surveyor, Philip-lane, Tottenham:—

Thos. Rowley, West-green (accepted) £301 13 3

For alterations to the Caledonian public-house, Stoke Newington-road. Mr. J. Stiles, architect:—

Ollis Bros.	£3,350 0 0
S. Goodall	2,120 0 0
W. Shurmur	1,890 0 0
W. Mower	1,795 0 0
Steel Bros.	1,478 0 0

Accepted for the execution of sundry works of repair, alterations, and additions, sanitary works, &c., at the St. Pancras Infirmary, Dartmouth Park-hill, Highgate, for the Guardians of St. Pancras. Mr. H. H. Bridgman, architect, 42, Poultry:—

S. B. Lamble (lowest tender)	£1,279 0 0
------------------------------------	------------

For fitting-up coffee-house at No. 55A, Houndsditch, for Mr. Ferry:—

G. Mower	£157 0 0
Spice	154 0 0
Tilley	149 0 0

For further extension to lavatories, &c., at the Licensed Victuallers' Schools. Mr. W. T. Farthing, architect:—

W. Shurmur (accepted)	£211 0 0
-----------------------------	----------

For the erection of a steam boiler and heater at the St. Luke's Workhouse, Shepherdess-walk, City-road, for the Guardians of the Holborn Union. Messrs. H. Saxon Snell & Son, architects, 22, Southampton-buildings, Holborn:—

Marshall & Co.	£415 0 0
Fraser & Co.	385 12 0
Fraser & Fraser	356 12 0
May Bros.	323 10 0
J. Collis (accepted)	282 18 0

Accepted for villa residence, Tangle Park Estate, Hampton. Mr. E. L. Swatman, architect, 33, Parliament-street:—

J. Singleton	£750 0 0
--------------------	----------

[No competition.]

Accepted for alterations to the Prince of Wales public-house, North-street, Pentonville, for the City of London Brewery Company. Mr. W. J. Jewhurst, architect:—

W. Shurmur	£24 0 0
------------------	---------

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 49, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.

Ed. F. and D. C.—M. and Co.—A. K.—C. H. (thanks)—A. W. R. S.—W. C. T.—M. Bros.—D. and Co.—W. F. P. (no space)—I. S.—C. B.

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily by publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond new items) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

GOOD FRIDAY.—"THE BUILDER" for the Week ending APRIL 4th will be issued on THURSDAY, the 3rd. Advertisements for insertion in that issue must therefore reach the Office before THREE p.m. on WEDNESDAY, the 1st. Alterations in Standing Advertisements, or ORDERS TO DISCONTINUE the same, must be at the Office by TEN o'clock on TUESDAY Morning.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under

Each additional line (about ten words)

Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under

Each additional line (about ten words)

PREPAYMENT IS ABSOLUTELY NECESSARY.

** Stamps must not be sent, but all small sums should be paid by Cash in Registered Letters or Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOUNDRINES, Publisher.

Addressed to No. 49, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on FRIDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and sundry recommendations that of the latter COPIES ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY morning.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 49, Catherine-street, Covent-garden, W.C. free of charge. Letters will be forwarded if addressed in envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied night from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, PREPAID, to countries within the Postal Union, 26s. per annum. Remittances payable to DOUGLAS FOUNDRINES, Publisher, No. 49, Catherine-street, W.C.

JUST PUBLISHED.

J. A. BERLY'S
UNIVERSAL ELECTRICAL DIRECTORY.

Harbours and Docks.

R. VERNON HARCOURT has done some injustice to himself, as well as to his future readers, by giving to a useful book * a title which is not fairly descriptive of its contents.

Most readers of the title given above would expect something like a bird's-eye view of the harbours and docks of the world, or, at all events, of those of the United Kingdom. How far that is from being presented by the work may be judged from the simple statement that while 588 ports and harbours are enumerated, in a Parliamentary Return of 1874, as existing in the United Kingdom, of which seven are military ports, Mr. Vernon Harcourt only indexes sixty-nine harbours, of which twenty-four are on our own coasts. Of the above-mentioned ports, seven were under the authority of the Admiralty, three under that of the Board of Trade, one under the Woods and Forests, eight under the Irish Board of Public Works, forty-seven are held by railway companies, twenty-five by other companies, fifty-three are owned by private individuals, and the remainder are under the control of Commissioners or Local Boards. It is thus evident that a book containing descriptions of so small a number of harbours as we have above indicated has little claim to the ambitious title of "Harbours and Docks."

What the volume really is, however, as stated in the preface, is an attempt at the exposition of the principles and practice of hydraulic engineering, as applied to the construction of harbours and docks. Thus regarded, it is a compilation of merit and utility, and that all the more so because it is not limited in its facts (as was the case almost wholly in the book on rivers and canals by the same author) to published and accessible data, it contains the pith of communications made by the engineers of several of the principal works cited. Thus, M. Alexandre, engineer of the port of Dieppe; M. Guillaud, engineer of the ports of Calais and of Boulogne; M. Bertrand des Vergnes, engineer of the port of Dunkirk; Mr. W. D. Cay, harbour engineer of Aberdeen; Colonel Mansfield, engineer in charge of the Galveston jetties; the engineer-in-chief at Delaware; M. Prévès, one of the

engineers at Algiers; M. Barret, engineer at Marseilles; M. Pettit (we think it should be M. Petit), engineer in charge of the Artha breakwater; Mr. Messent, engineer of the works on the Tyne; Mr. Hayter, one of the consulting engineers to Murrnagoa harbour; Mr. Dmoe, engineer in charge of Dover harbour works; and Major Lydecker, engineer in charge of the harbour works at Chicago, have furnished plans and details with which Mr. Vernon Harcourt has enriched and illustrated his seventeen chapters on harbours; while his own experience, already given in a paper in vol. xxvii. of the Proceedings of the Institution of Civil Engineers, has furnished the author with the particulars that he gives as to the Alderney harbour. The chief value of a work of the kind lies in the authentic information thus collected from original sources.

After three chapters on winds, waves, and currents, Mr. Vernon-Harcourt divides harbours into estuary harbours, harbours with back-water, harbours partly sheltered by nature, harbours protected solely by breakwaters, and peculiar forms of harbours. Had the subject been approached on the side of the general importance of seaports, the first rank would have been assigned to those noble natural harbours, such as Milford Haven, Falmouth, Cork, and, we may add, the Thames, which distinguish the shores of the United Kingdom. Of these, however, we find but little,—a great defect in a general work, but consistent with the plan of a book that deals almost exclusively with the work of the engineer in those places where nature has not herself provided for the need of the navigator. Of Queenstown Harbour (Cork) there is indeed a partial plan on plate 12, but it shows only Haulbowline Island and a basin in progress, and not the magnificent expanse of sheltered water in the bay. In fact, Queenstown is mentioned, not as a harbour, but as a dockyard. Pembroke Dockyard, which, in the event of a naval war, would probably form our most important arsenal, we have not found referred to in the book.

After describing jetties and breakwaters, Mr. Vernon Harcourt gives two chapters on the different modes in which harbours are protected by the engineer, as matter of practice. He enters, at much detail, into the difference between rubble mound breakwaters, rubble and concrete-block mound breakwaters, harbours protected by sorted rubble and concrete-block mounds, with slight superstructures; harbours protected by a rubble mound and a superstructure founded at low water; harbours protected by sorted rubble and concrete-block mounds, with superstructure founded at low-water; harbours protected by a rubble mound and a superstructure founded below low water;

harbours sheltered by upright wall breakwaters; and harbours on sandy coasts. No doubt, minute as the differences thus indicated may seem to be, we have here indicated so many true species of one genus of harbours. But we think there can be little doubt that, as a general rule, the whole of these compound forms of breakwater are likely to be displaced by the use of the method adopted by Mr. Abernethy at Fraserburg, and the north pier at Aberdeen. The mode of construction there used is as follows:—Bags of liquid concrete of from 80 to 100 tons weight are dropped from hopper barges up to the level of low water. These bags form a solid mass of concrete or an artificial sub-marine ledge of rock. Rubble foundations are entirely dispensed with. Above low water temporary frames are placed for a length of 25 ft. or 30 ft., and the concrete is tipped into these frames *en masse*. In the course of five or six weeks the whole becomes a solid mass of concrete, upon which the sea has no effect. The pier at Aberdeen has been finished for nine or ten years, and has resisted very heavy seas during that period. A pier at Newhaven has been constructed on the same plan. The cost is very much less than that of any other method of construction, and the time necessary for completing a given length of breakwater is also greatly reduced.

The only hesitation which the engineer can feel as to the general adoption of this improved method of breakwater construction is owing to the low specific gravity of the artificial rock thus formed *in situ*. The ordinary weight of cement concrete is about 17 ft. to the ton, or not much more than double the specific gravity of water. This is a serious evil when violent seas have to be resisted, as mere multiplication of the bulk of the wall does not compensate for the low resisting power due to the small preponderance of weight. To this fact are due all the failures of concrete in harbours, according to our opinion. In the case of the Madras Harbour this source of danger was pointed out in the columns of the *Builder*, at the time of the serious damage effected by a storm. But the most remarkable case in point is that of the concrete monolith at Wick harbour. This enormous mass, of 800 tons in weight, bolted and bound to foundations, making a total weight of 1,350 tons, was washed away, under the eyes of the resident engineer, removed *en masse*, and found resting entire on the rubble at the end of the pier, having sustained no damage except a slight fracture at the edge. This event, to which Mr. Vernon Harcourt refers, took place on the 18th of December, 1872; and the particulars cited are taken from a report by Messrs. D. & T. Stevenson, the engineers to the work, dated 14th February,

* Harbours and Docks: their Physical Features, History, Construction, Equipment, and Maintenance, with Statistics of their Commercial Development. By L. F. Vernon Harcourt, M.A., M.Inst. C.E. Oxford: Clarendon Press, 1884.

1873. There can be no doubt that, although the fury of the sea in Wick harbour is exceptional, its effect on such a mass is calculated to raise grave doubts as to the absolute reliability of concrete for breakwaters.

The reply, however, is that there is concrete and concrete. We have cited the specific gravity of ordinary concrete, and it may be admitted that it is too low to be relied on in cases where the action of the sea is violent. But at Swansea Mr. Abernethy made concrete blocks of copper slag, an extremely heavy waste material. Of this concrete from 12 ft. to 13 ft. weighed a ton. This is about the specific gravity of magnesian limestone, of serpentine, or of grey granite. It is a little more than that of carboniferous limestone. Syenite, or red granite, weighs from 15.2 ft. to 12.1 ft. to the ton. Thus, by the use of a material obtainable very readily, and of which the cost will be little more than that of transport, the engineer is provided with the means of forming a monolithic mass of any size that he may require laid *in situ* under water, and endowed with a weight which, in that case, means a power of resistance equal to that of ordinary building stone, and is only exceeded by the rarer and more costly forms of marble or of granite. We think, therefore, that the days of mounds of rubble, sorted or otherwise, of concrete blocks, and of the various kinds of compound breakwater, ably and carefully described by Mr. Vernon Harcourt, may very possibly be regarded as numbered.

A separate volume contains sixteen folded plates, each comprising numerous figures. They are clearly drawn and beautifully printed, and afford ample illustration of the text. There are also twenty-seven woodcuts printed with the text. Of these we call attention to the curves showing the relative duration of winds from different quarters at Havre and at Marseilles; and to the diagram showing the tonnage of vessels entering eighteen of the principal ports of the United Kingdom in each year from 1873 to 1883. With regard to this diagram, however, it should be remarked that while the tonnage entering the Port of London with cargo is stated at 11,500,000 tons, that entering Liverpool being given as only a little over 8,000,000 tons, the "Statistical Abstract" for 1883 gives the following figures. Tonnage of vessels, British and foreign, sailing and steam, that entered with cargoes and in ballast in 1883:—London, 6,589,594; Liverpool, 5,467,274; ditto cleared, London, 4,810,680; Liverpool, 5,167,568. This agrees with the rank given to those two ports in the table on p. 630, but it seems to us quite irreconcilable with the diagram on p. 628. Even taking "Tonnage of vessels entering ports" to include both entrances and clearances, London is only 765,000 tons in excess of Liverpool, instead of nearly 3,500,000 tons, as shown on the diagram. This is a matter demanding explanation, in a book which we have found to be generally accurate. We suppose that Mr. Veron Harcourt has included coasting traffic, which is not given by the "Statistical Abstract"; but, even so, the proportions given in his diagram, and in Appendix V., differ so materially from the figures cited by Mr. Thomas Stevenson in his standard work on "The Design and Construction of Harbours," as to call for clear explanation, as well as for definite citation of authority. The form of diagram employed, if made to show both entrances and clearances, of both foreign and coasting trade, distinguishing each at each of the thirty-seven ports specified in the "Statistical Abstract," would afford interesting information; and might form a basis for a general comparison of the harbours and docks of the United Kingdom.

Pottery Exhibition at Delft.—The Delft Section of the Netherlands Society for the Promotion of Industry will open an International Exhibition at Delft, on the 1st of June, 1885, to be devoted to Ceramic Tiles and Stained Glass. The Exhibition will remain open until the 31st of July. Applications for space must be made to the secretary, at Delft, before the 15th of April, and exhibits must be delivered before May 15.—*Journal of the Society of Arts.*

STONEMWORKING MACHINERY.

BY M. POWIS DALE, M.I.M.E., A.M.I.C.E.

ALTHOUGH the conversion of stone is one of the most ancient of all the mechanical arts, its conversion by means of machinery, in an advanced form, is quite of modern origin. A few years since, owing to the high rates of wages in vogue, operative masons' strikes, and other causes, a very considerable impetus was given to the development of this branch of engineering; however, in consequence of the continued depression in everything relating to the building industries, the introduction into more general use of machinery for the conversion of stone has been very slow. This may be partly attributed to the fact that in one or two cases machinery was erected in which the principle of working was ill-adapted to the nature of the stone operated on, and partial failure was the result. There can, nevertheless, be but little doubt that, by judicious selection, machinery can be made to effect an immense saving over hand-labour.

In the first instance, it is important that the stone it is desired to work be suitable for machine conversion. Most kinds of stone can be sawn without much difficulty, but when they are required to be dressed to a fine surface, or moulded, difficulties varying with the character of the stone present themselves. Stones of the nature of Portland, Bath, York, and Caen, and most kinds of freestones, can be readily worked by machinery if they are tolerably free and even in texture and hardness. Hard grit stones or flag paving, magnesian limestones, and oolites may be dressed to a plane surface. Granite also can be dressed to a plane surface. Slate, unless it be rotten or shaly in its character, may be worked by machinery with facility.

Stones which contain much shelly fossil deposit, especially if this be hard and crystalline, are unsuitable, as also are very tender stones. From a casual inspection of a stone, however, it is impossible to say with certainty whether it will work or not; the best way is to try it practically. Within the scope of this article it will be impossible to do more than glance at one or two of the most advanced machines for sawing, dressing, and moulding purposes.

For rapid sawing of the softer stones used in building construction, the circular saw has quite out-paced the ordinary horizontal blade, as with a well-constructed machine of this class from 150 to 250 running feet can be cut in a day of ten hours; if two saws are mounted they can be used for squaring the faces of the blocks at the rate of from 3 in. to 9 in. run per minute, and for this purpose they are of very considerable value. The advantages in favour of the horizontal blade are lower first cost, and rather cleaner work. In connexion with circular saws for stone conversion the most important point is the construction of the teeth; these, which are usually "false," should be of simple form, and easily and cheaply renewed. After repeated trials we can recommend those with the head of the tooth forged into a cupped or trumpet form; they should be made from the best rod steel, turned at the cutting edge, and hardened. One of the advantages of this form of tooth or cutter is, that when its edge is dulled or chipped it can be turned in its socket so as to offer a fresh cutting margin, and as it wears away on the advancing side, the tool will offer several fresh cutting faces before it is entirely worn out. The tool should be made sufficiently long, so that it will allow of its head being softened, again set up, turned, and hardened. As regards the cutting speed of circular saws for stone, no arbitrary rule can be laid down, as this must depend on the nature of the stone operated on. A speed at the periphery of from 50 ft. to 200 ft. per minute, or with a cutting-speed varying from 3 in. per minute in hard stone up to 12 in. in soft stone, will be suitable. The cost of tools for cutting, say 200 ft. run of sandstone, should not exceed 5s.

In cutting very difficult stone, such as that containing pyrites, the cutting-tools should run very slowly indeed, say 40 ft. traverse at the

periphery per minute, or they will be found to heat red-hot, and will, of course, at once be rendered useless; the feed should not exceed 2 in. per minute. Some difference of opinion exists as to the advisability of sawing stone with circular saws, with or without water. Some stones can, without doubt, be readily sawn dry, but from our experience we prefer wet sawing, as it keeps the tools cool and prevents unnecessary dust. In cutting stone with circular-saws the strain on the saw spindle and bearings is considerable; they should, therefore, be strongly supported by massive side standards, and the bearing surfaces should be ample; the whole framework of the machine should be of massive construction, to overcome excessive vibration in working. Should there be a jag on the saw-teeth in working, they will be found to deteriorate much more rapidly, and the work turned out will be "galled," and not so true on the face. With a well-constructed circular-saw the stone should leave the machine sufficiently true to enable it to be bedded or jointed without further preparation either by hand or on the planing-machine, or rubbing-head. For rapidly squaring large blocks of stone for harbour and similar work circular-saws will be found especially valuable, as they become better known their use should be largely extended. For dividing up large blocks, two circular-saws, placed one above the other, but working in the same vertical line can be used. For joining flat stones, such as paving, all hand-labour may be saved by mounting two saws so as to trim two edges and make them parallel, and by reversing the stone and setting it square by these sides the other edges may be served in a similar way.

Although the advantage of machine conversion over hand-labour in stone-sawing is considerable, it is much greater in the case of stone-dressing and moulding-machinery. In the early machines it was attempted to imitate mechanically the action of the mason chisel or quarry axe, but the whole of the devices have been failures. The principle of working that has proved most successful in dressing plain surfaces on stone is that of circular rolling cutters, and for moulding stone, a combination of revolving cutters and stationary scraping tools.

For dressing plain surfaces the circular cutters are given a determinate rotation of their own axes at the same time that they are carried round in a circle. It is found that with a nicely-adjusted rolling action there is very little attrition between the stone and the cutter, and that this is chiefly due to the forward movement of the stone; at the same time little heat is produced, and the cutting edge wears away very slowly. The principle of working may be stated as a rolling pressure brought to bear at the base of a certain portion of stone with the intent to force it off. The cutters are made of chilled cast-iron, or, if working the harder kinds of stone, of chilled cast-steel; the cost of renewal is small. A variety of machines has been constructed in which a number of tools of various types, having a circular movement in a plane parallel to the face of the stone, are employed. To successfully work them mechanically over the face of a stone may not appear very difficult in theory, but in practice we invariably find, when a large number of tools are employed, that they vary in wear from difference in temper, material, &c. from the work they have to perform; and that, without doubt, one of the chief reasons for the failure of this class of machines, whether for working stone, wood, or other material.

The amount of stone that can be dressed on the best type of machine will depend largely on (1) the nature of the stone being worked, (2) the size of the blocks, and (3) the way in which the machine is kept constantly supplied with stone. With the ordinary stones used in building construction, of a moderate degree of hardness, a fair average would be about thirty superficial square feet per hour, premising, however, that only a moderate amount of stone had to be removed. The cost of this, allowing two men and one boy to supply stone and attend to the machine, would amount to about

, whilst an average price to dress the same hand would be about 6s., leaving a large profit and surplus for contingencies. These cases would, however, vary somewhat in different localities.

Passing to stone moulding machines, in the most advanced type the stone is subjected to the action of both revolving and scraping wheels. The mouldings are roughed out by all trumpet-shaped steel cutters, similar to those already mentioned as being used in circular sawing; these are mounted horizontally in flat tool-holders, arranged in position on vertical spindles, the sizes of the tool-holders being graduated according to the depth of the various members of the moulding. For scraping and finishing the cutters to the desired outline, flat profile steel cutters are used mounted in tool-holders, with vertical and horizontal adjustments, so as to bring the tool to act either on the side or upper surface of the stone, as may be required. For making under-cut mouldings the table carrying the stone is made to swivel, or the stone can be mounted in a cradle. For moulding and facing semicircular windows, and such like curved work, a revolving table is generally employed. For holding shafts and pillars in position whilst being moulded or dressed, suitable head-stocks are used.

For "checking" deep mouldings, a circular wheel may be used with advantage. This is fixed on the top of the other tool-holders, and penetrates into the stone before the cutters following it come into play. In moulding, all complex forms of cutters should be provided; and many members of the same moulding should not be formed on one cutter, except for scraping and finishing purposes, and the temper of the tool should be adjusted according to the hardness or nature of the stone being worked. In making bevelled mouldings, the stone should, if possible, be sawn in an angle before being put on the machine, the cutters, having thus less material to remove, are subjected to less strain and consequent wear. At the same time, the stone is less liable to "pluck" in the working, or break at the arrises. For moulding purposes it is in favour of using a combination of revolving cutters for roughing out, and stationary scraping cutters for finishing in preparation to two sets of stationary cutters. The direct contact of the roughing cutters with the stone being less, the friction in working and the power required to drive are reduced in proportion. The arrises, too, are less liable to break. In the successful application of stone-working machinery, in addition to the nature of the working being suited to the material, the speed, temper of the cutters, and the rate of feed must be adapted to the nature of the stone, as what may be right in one case may, owing to the varying character of the material operated on,—be entirely wrong in another. For example, some stones may be cut or forced off in large chips, whilst others have to be almost scraped or ground away.

With a suitable machine a large range of work may be turned out, such as architrave mouldings, cornices, ovolos, pilasters, astragals, eadings, scotias, string, and other straight, under-cut, and curved mouldings, and these are much superior to hand-work, both in the sharpness of the outlines and in accuracy of finish. The amount of work that can be performed will, of course, vary with the section of the moulding, the size and nature of the stone, and the number of changes of work. The following statement of work done by a duplex-barrel moulding machine was taken by the writer from the e-book of a machine working in Portland stone on a large contract:—String, 1 ft. deep, 1 in. projection, 50 ft. run per day of twelve men; window-jamb, 6 in. face, full of mouldings, worked both sides, 150 ft. run per day; moulded steps, twenty-four per day, worked both sides, with four steps on the machine at a time. As in different localities the conditions will vary,—owing to the varying nature of the work and the prices paid,—it is a somewhat difficult task to compare the cost of hand machine moulding work by absolute figures. Our practical readers will, however,

be able to form their own opinions in this matter. Let us take London prices, and say about 90 superficial feet of Portland moulding be worked on a machine in one day, at an outside cost of 30s.; at the ordinary price of London hand-labour, 90 ft. of Portland moulding, at 1s. 2d. per foot prime cost, would amount to 5l. 5s. 4d., which leaves a very large margin for profit and contingencies.

Another advantage that machine-moulding will be found to have over hand-moulding is that the work is better done, the lines being perfectly straight, and the edges beautifully sharp, and should a large number of pieces of one moulding have to be worked they will be found absolutely alike in section.

In concluding these notes, the successful operation of stone-working machinery as a financial investment may be said to depend on the following points:—(1) The suitability of the stone; (2) the suitability of the machine, the tools, and the principle of working; (3) the constant supply of material to be worked; and these points being secured, in these days of high wages, short hours, and extreme competition, few industrial operations can show a better return.

NOTES.

THE first trumpet-blast to herald the approaching Indian and Colonial Exhibition for 1886 was sounded on Monday last, when the Royal Commission to organise the Exhibition met for the first time at Marlborough House, under the presidency of the Prince of Wales. The Prince referred to the attractive display of Indian art at the Paris Exhibition of 1875, which could only be witnessed by a comparatively small number of the population of these islands; and there can be no doubt that the proposed Indian Exhibition on English ground will be a matter of the greatest interest not only in an artistic sense, but to some extent in a political and social sense also. The Government have not so far signified any intention of making a grant in aid of the Exhibition, though entirely approving of it. It seems desirable that some definite and substantial aid should be given by Government for an Exhibition of which, owing to the cost of transport, the expenses will certainly be abnormal, and which is of quite exceptional and national importance. A guarantee fund has been formed, to which the Indian and Colonial Governments have contributed 51,000l., and the Prince had to acknowledge the cordial response made by Corporations, firms, and individuals in the United Kingdom to invitations to participate in the guarantee. The buildings which have already been used for the Fisheries and Health Exhibitions have been placed at the disposal of the Commission on fair terms, and plans of them showing the available space have been sent to the Government of India, the High Commissioner for the Dominion of Canada, the various Agents-General of the Colonies, and, through the Colonial Office, to the Crown and other Colonies, and have met with their approval. An important variation from the usual conduct of such exhibitions is that no award by juries is to be given, but only a commemorative medal to each exhibitor. The object of this, as explained by the Prince, is that as some colonies, from their age and circumstances, were more advanced than others, those in their infancy should not be placed at a disadvantage in an exhibition from which all thought of trade rivalry will be excluded. This is, we think, an entirely desirable regulation; indeed, one may say that awards of juries in many large exhibitions of the same kind have been scattered so thickly as to lose their real value, and have been "worked" so hard by those who have obtained them as to give a most disagreeably advertising character to exhibitions promoted with no object of the kind. The details of the executive duties will devolve on Sir Philip Cunliffe-Owen, and a special Finance Committee has been appointed, consisting of Sir John Rose, Sir George Birdwood, Mr. Edward Birkbeck, Sir Barrow Ellis, and Sir William Sargeant.

PROFESSOR LEONE LEVI has published some important addenda to his report on the wages and earnings of the working classes, which was reproduced in the *Times* in January last. The estimates then given of the value of wages came down, at the latest, he now tells us, only to the middle of last year, and the Professor is of opinion that the reduction which has since taken place must amount to fully 15 per cent. on the rates of wages in the leading branches of the industry of the country. As the year 1867, from which the comparison starts, was one in which wages had fallen by at least 5 per cent. from the rate of 1865, the reduction intimated is very serious. Mr. Levi does not state how far the 10 or 15 per cent. reduction now under debate in so many parts of the country (as shown in our last number), is included in his estimate. But it is evident that his stated advance of 12·37 per cent. in the rate of wages per wage-receiver from 1867 to the middle of 1884 is altogether swallowed up by the admitted decline,—to say nothing of contingent reductions. And it must be borne in mind that rent, taxation, and almost all the expenses of life are steadily on the increase, and must do increase with the increase of population. Unless, therefore, the rate of wages increases in a corresponding manner, the working man is steadily getting worse off. And this ought to be regarded with due attention by those who would compare (without bearing expenditure in mind) the wages at any former period of our history with those now paid, when they are paid.

CORRESPONDENCE in *re* the Westminster Hall Restoration, resumed itself in the *Times* on Friday, last week, in the shape of two letters from Sir Edmund Beckett and Mr. Butterfield. The former is very much more to the point than he sometimes is, though it may be questioned whether the whole merit of the architectural models is his because he talked about them before, and we may reasonably feel perplexed at being told that "all the Gothic styles used straight parapets" and not battlemented ones. Has Sir E. Beckett, at one blow, dismissed the Perpendicular style with costs, or how? We quite agree in disliking battlemented parapets, because they are a weak and trivial survival of a form really belonging to military engineering, and unmeaning when used as an architectural ornament. Sir E. Beckett recognises the cogency of Mr. Brewer's evidence as to the former state of the site, and that the Hall never could have been outwardly seen from the westward.

MR. BUTTERFIELD thinks the small windows very mean in appearance, but considers this a secondary matter compared with the manner in which the effect of the flying buttresses has been interfered with. "They are cruelly treated by the high-shouldered walls which are made to abut upon them, and I trust that any member of the House of Commons who intends to give a vote upon the subject will first survey, from Poet's Corner, the one buttress of the Hall which has not yet been disguised. The faults which must be felt to belong to the Hall itself are aggravated by the model, while such good points as the peculiar character of these buttresses in their isolation are overlooked, misunderstood, and destroyed." Mr. Butterfield urges that we can only do justice to the buttresses by leaving them in their isolated condition, showing fully the fine outline of their arches. We should not object to a low cloister between the buttresses, which rather seem to want connexion in their lower portion, provided the upper portion and the flying buttresses are left free. The built-up models, the higher one at all events, if carried out, would simply involve the spoiling of the effect of the architecture (if it should remain permanently visible) for the sake of a piece of archaeological trifling. Mr. Butterfield, by the way, has the courage to suggest that both the value of the Norman masonry and the possible damage to it (by being left exposed) "have been perhaps a little exaggerated." We should be disposed to say so too. This is probably the only age

in architecture in which people would have gone on their knees in this way to an old remnant of wall, and worshipped it. Preserve it by all means; but do not make an idol of old stones,—even Norman ones. In reference to this point the "Society for the Protection of Ancient Buildings" circulate a pamphlet on the question, in which the solemn fetish-worship paid to this remnant of Norman walling really approaches the borders of lunacy.

RAVENNA is not usually accounted a lively place, but, in the matter of Byzantine archaeology, the local *savants* show a praiseworthy energy and zeal. A museum is in process of formation in which it is intended to gather together all the fragments of architecture, sculpture, metal-work, &c., which are constantly coming to light in the neighbourhood, and which have been hitherto so scattered as to be only available with great difficulty for scientific purposes. The collection is to find a home on the ground-floor of the Ravenna Library, and is to be under the directorship of the sculptor Henrico Pazzi. It is hoped that at the end of the present year it may be available to the public. At present all is in confusion, but even a passing glance shows that the material is valuable and abundant. Some generous owners have presented their discoveries to the museum; the possessions of others are only on loan, and are labelled with their owners' names. Noticeable among the scattered monuments massed together in disorder are a beautiful fragment of a cornice found in the courtyard of St. Vitale; two capitals, provenance unknown; one side of an altar of the sixth century with a delicate column and capital as support, found by a countryman while digging; and another capital of wonderful intricacy, found in the garden of the Archbishop and lent by him.

PHOTOGRAPHY has done wonders for the preservation of at least the memory of some monuments which cannot, as yet, be removed and placed in the museum. Part of a beautiful arch, originally belonging to the ciborium of the Church of San Pietro, in Bagnacavallo, a work of the fifth century, lay for a long time unnoticed and trodden upon in the pavement. It has been photographed, and is now, though in part defaced, rescued from further destruction by being placed in the wall of the church. Another fragment of a tympanum has been found, built in beneath a column in S. Francesco, and has been photographed, but from its position cannot be moved. Sometimes the Museum finds that its action comes in too late; for instance, a Byzantine capital, found in Ravenna, was sold to a dealer, and resold to the architect who was at the time restoring S. Stefano at Bologna, where it now stands. Owing to the marshy position of Ravenna, draining operations have constantly to be carried on, and it is in course of these works that monuments frequently come to light. Smaller objects of interest in the museum are two metal crosses adorned with extremely rude Byzantine work (both found in the Duomo behind a sarcophagus)—a beautiful necklet of pearls and gold work of the sixth century, found during excavations in the crypt of S. Francesco, and some coins and weights of coarse workmanship. Scarcely less valuable than this work of collecting scattered monuments in the museum is the systematic reproduction by photography of sculptured and architectural details either too remote for convenient personal inspection or exposed to decay from the action of the weather. Sig. Ricci has just recently made a series of photographs of the decorative details of the tomb of Theodorico. Casts of the original are taken, and the photographs are made from the casts, the result being that the student gets a clearer notion from a study of the photographs than from the actual monument itself, unless he be provided with scaling-ladders. The photographs, it is understood, are taken with a special view to the publication of this monument in a work shortly to appear in Berlin.

In a recent report on the condition of the sewers in the district of the Local Board of Health of Bromley (Kent) Mr. Rogers Field makes some special observations in regard to the causes of offensive smells from sewers. The sewerage in the district being on the separate system, and the population rather scattered, the flow of sewage is small; and though the sewers are generally well laid, there are slight irregularities in jointing, of little consequence where a good flow is passing down the sewers, but sufficient to arrest sewage matter when the flow is small, and lead to an increasing accumulation. With frequent flushing this accumulated matter would be washed away before it has time to putrify, and the smells would be only those due to fresh sewage; with infrequent flushing the evil would obviously be much greater. The smell from putrid sewage, Mr. Field observes, is undoubtedly dangerous, that from fresh sewage is not. Another defect which Mr. Field notices as exemplified in the Bromley district sewerage, and one to be guarded against, is bad construction of the open some cases these were rough in surface finish, channels at the bottoms of manholes. In thereby arresting solid matter; in some cases the channels have sunk so as to form small basins for the collection of sewage. No wonder in such a case a bad smell should find its way through the grid of the manhole. Another point noted in the report is that the sewers are all the same size,—12 in. diameter. The one which has the greatest duty to perform never runs more than one quarter full: consequently those which have less duty must be too large, to the peril of the proper flow of the sewage.

THE annual loan exhibition of pictures at St. Jude's Schools, Whitechapel, is open this week and next, and is attracting large attendances in the neighbourhood. Visitors from the West may find an opportunity of renewing their acquaintance with some notable works. There is Sir F. Leighton's large "Alcestis," the struggle of Hercules with Death, and Mr. Watts's "Britomart" and "Esau," and the "Meeting of Jacob and Esau"; Mr. Crane's "Allegory of Human Life," which may be remembered in the Grosvenor Gallery; a very fine selection of the works of Israel; Mr. Poynter's "Zenobia" and "Helen"; a considerable number of small but beautiful sea pieces by Mr. Brett, and many other works by eminent painters. There is one remarkable picture by Mr. G. F. Watts, which has never before been exhibited,—"Godiva,"—not the ordinary "nude study" affair to which that title generally introduces us, but Godiva fainting and helped off her horse by her women at the close of her ordeal, with a countenance almost painfully expressive of mental strain and suffering. Mr. Watts never takes an old subject of this kind in hand without giving a new and deeper reading to it.

THE annual exhibition at Mr. Wallis's Gallery, which opened to the public this week, is rather above than below the average of the exhibitions at this gallery. There is a fine Meissonier (10), which in itself is something to say, for Meissonier has not been frequent of late in English exhibitions. There is a very fine Gérôme, "Botzaris" (33), a single figure enthroned amid beautiful decorative surroundings; there is a fine example of Corot also. To name these three (though none of them are new works) is enough to make the exhibition, if the rest of the walls were bare. Professor Müller sends "Bazaar Street, Cairo" (15); Herr Heffner has some fine works in his last manner, but it is becoming more and more evident what a decided mannerist he is. The two other large pictures are not highly successful; one by Révész (a new contributor) represents "Sandor Petöfi" (108), a poet, who is called the Burns of Hungary, and is a very Hungarian Burns indeed, reciting in a theatrical manner to a theatrical audience; and of the other, "The Genius of Pity staying the Vivisector's Hand" (88), surely the title of the picture and the name of the painter (Gabriel Max) are enough. If Mr. Wallis is to keep up the aesthetic standard of

his gallery he should not let that sort of thing in. There are numerous good works by Chevallier, Laugée, Van Marcke, A. Holmberg, Allan Schmidt, Seiler, E. Frere, and others.

THE exhibition of the works of deceased water-colour artists collected by the Royal Society of Water-Colours Art Club, which was open for a few days at the rooms in Pall Mall East, contained a great deal of highly interesting work. In the collection were included several examples from Sir R. Wallace's fine collection of works of Decamps; a fair proportion of Turners, including the two little masterpieces "Grouse Shooting" and "Woodcock Shooting" from the same owner; sundry Cotmans; Mr. J. P. Seddon's Rossetti, "Giotto painting the Portrait of Dante"; a good many of Mr. Angell's exquisite bird pictures, &c. There was a considerable proportion of architecture work in the collection, some of it of remarkable character. We noticed especially some of De Witte's drawings, notably an interior at Haarlem, which is not indeed artistically effective, but which, as a clean, hard, precise, and realistic representation of architecture, is unsurpassable. Prout was well represented, and there was a fine row of great blotted (rather than painted) landscapes by David Cox at the upper end of the room.

UNDER the title "Echoes from Hellas" there is to be brought out, by Messrs. Marcus Ward & Co., the letter-press of a "Tale of Troy," as performed some little time since at Cronwell House, and that of the story of Orestes (from Æschylus), which is to be produced during the season at King's College. The text in both cases is by Professor War and Mr. Walter Crane has undertaken to supervise and arrange the illustrations of the book as a whole, which will also include designs by Sir F. Leighton, Messrs. Poynter, G. F. Watts, F. Sandys, and Professor de la Motte. We have no doubt the volume will prove a very charming one; though we have the impression that Mr. Walter Crane's Greek may be a little too much tinged with Mediævalist for the occasion in hand.

STREET PAVING.

ONE of the weakest points in the growth and development of American cities is the condition of the streets and roadways, which are usually the last things to be thought of. Streets, both in the older towns and cities of the East, as well as in the newer communities of the Far West, are laid out and planned of magnificent distance and noble breadth; but while the buildings that spring up with such rapidity on either side are costly, and often palatial in character, nobody ever seems to think of the roadway between which is frequently so neglected that it is not only an eyesore, but a serious danger to the health of the inhabitants. Of course, in the large cities, such as New York, Philadelphia, Boston, Chicago, &c., the thoroughfares through which the main traffic of the cities passes have more or less care taken of them, as are also those of the most artistic and expensive suburbs; but once we step aside from these, we find an unkempt and filthy roadway which would disgrace the very lowest mining village in Great Britain. The very first thing that strikes the traveller on his first visit to New York is the magnificence and solidity of the Broadway and the squalor and neglected condition of the streets that open out of it on each side. A drive (not by tram-car) from the dock to his hotel will set the new arrival in a state of acute alarm at the holes and the ruts over which he is jolted, and he will probably have suffered more during the two or three miles ride than during all the three thousand miles by steamer from Liverpool; indeed, a short investigation will convince him that New York in this respect is a white sepulchre, though, unfortunately, its bad example is copied by seven-tenths of the other towns in the States. One reason, perhaps, why the American town dwellers have come to regard the condition of things with equanimity is the fact that the tramway system is so enormously and universally developed that, as a rule, other public vehicles are in no demand, and when they are employed an unconscionable and prohibitory

tariff is asked. The consequence is that not one in a hundred thousand ever travels otherwise than by tram-car, which, indeed, has become a necessity from the extreme length of the journeys; and as the pitfalls on either side of the rails are not felt by the inmates of the car they are supremely indifferent to the discomforts of those on foot.

It is not so much to be wondered at, in the case of a Far West city, like Omaha or Cheyenne, that the streets are looked upon as improvements that can wait, but the inhabitants seem to forget that the very breadth of the roadway may be a serious sanitary drawback, inasmuch as it offers harborage for many inches of mud and sewage, the liquid portion of which naturally gravitates to stagnate at the sides. Crossings are only possible at long intervals, and then by a rickety plank-way, which, in wet weather, generally secures a ducking to the wayfarer. These remarks, which occurred to the writer after an acquaintance with a great number of American cities, will serve to introduce a more intimate knowledge of the Philadelphia paving, which has recently been the subject of a special report, containing some interesting and valuable information on street paving in general. Philadelphia has 1,060 miles of streetway, of which 573 consist of paved street, 447 macadamised, and 443 of unpaved. The former category possesses the following characters:—

Cobble.....	6,118,925 sq. yds.,	or 93 pr. cnt. of the whole
Granite blocks	634,183 "	6 1/2 "
Asphalte.....	25,398 "	3 "
Total.....	8,793,466	100

Practically, therefore, what is paved in Philadelphia is of cobble, which is laid upon a bed of loamy gravel without any sand, the size of the stones being very irregular and varying from 3 in. to 15 in. in size. The granite blocks do not appear to be laid very carefully, as they are not cemented, while the granite itself is of different qualities; and, as the system of repairs is that of letting out a district to the lowest bidder for a year's superintendence, the condition of the pavement generally leaves a good deal to be desired. Philadelphia specially needs good and enduring street pavements, because the streets themselves are unusually narrow (from 50 ft. to 50 ft.), leaving only 26 ft. and 34 ft. respectively for the roadway between the curbs, and even this space is so taken up by the tramway that the carriage-way on each side is reduced to 10 ft. or 12 ft. in width. Macadam is principally used in the suburban portions of the city, being usually 10 in. deep, and composed of blue gneiss rock.

It is scarcely to be wondered at, that, under the circumstances, the cobble pavement should be condemned in the report, as entirely unfit or use in so large a city. It is next to impossible to keep the stones in an even position, owing to their irregular shapes, while the numerous rifts and crannies afford access to immense quantities of street filth, which cannot be got away, and continually give forth insidious odours. The committee, therefore, recommends that no more cobble pavements should be ever laid down, but as it is impossible to deal with the existing pavements as to be able to do away with them altogether, it also recommends that very stringent reforms be made, wherever repairs are wanted, as to the laying down of the materials. The main points are, that the stones should be broken of a uniform size, and none should be less than 3 in. or more than 7 in. in size, while they should also be laid with the greatest dimension vertical. The red gravel upon which the stones are now placed contains about 16 per cent. of clay, and this, it is advised, should be used only as a sub-foundation, spread to the depth of 4 in., and well rammed or rolled. On it should be spread a layer of clean, sharp, river sand, of less than 1/2 in. in size, and quite free from impurities; and when all this has been properly set, washed pebble should be raked over the surface to fill up the joints, and the whole rammed with a heavy rammer. The most important part of the inquiry is, of course, the best kind of pavement to be put down where none exists, or where the cobble can be superseded with advantage; and here the opinion of experts runs in favour of granite blocks and asphalt, either as sheet asphalt or as blocks. The wood pavement, although possessing many advantages, has been well considered, but rejected on the score of

cost of maintenance and construction. The wood pavement of Paris has a first cost of 16s. per yard, while the contract price for repairs (to run for eighteen years) is 2s. (all but one halfpenny) per yard per annum, making the total expense during the eighteen years, 27. 11s. 4d. per yard,—undoubtedly a much heavier undertaking than either granite or asphalt. It has been determined, therefore, to use the granite blocks where the distance between rail and curb (or curb and curb) is less than 20 ft., or, indeed, in any situation where the travel is heavy and continuous. It is to be used also in all streets, whatever the width, where the grade is steeper than 3 in 100. In open spaces, where the travel is slight, and the area wide, sheet asphalt is to be laid down, as also in streets where there are no tramways, and which mainly consist of dwelling-houses. Block asphalt is, however, cheaper, and more readily dealt with, though it has not such good wearing qualities as the other kind. The granite blocks should be laid upon a bed of strong, clean gravel, formed to the cross-section of the street; but if the travel is heavy, it is quite worth the expense of having a 6-in. foundation of concrete, which will make the pavement safe under all contingencies, and does not add to the cost more than 3s. 4d. per square yard. It is not every kind of granite that is suitable for pavement blocks, hard basaltic stone, that takes a polish under wear, being quite as objectionable as a softer quality, as well as gneiss and all rocks that are laminated in texture. The blocks must necessarily vary from 4 1/2 in. to 8 in. in thickness, according to the estimate of travel, but, as a rule, narrow blocks give firmer footing to a horse and cause less noise; while, on the other hand, this must not be carried too far, on pain of injuring the strength of the block. Each block should be regular in shape, with rectangular edges and smooth faces, and they should invariably be laid with tar-cemented joints, so as to make the surface waterproof. Nothing is more destructive to a pavement than open joints, for access is given to all kinds of moisture and stable urine, which ferment, thereby loosening the joint, making the atmosphere of the street extremely unwholesome, and even penetrating into the drainage system of the houses. The expense of this most necessary precaution is very trifling, only 3 1/2 gallons of tar being needed to every square yard at a cost of 1s. The general cost of laying down granite blocks tar-coated as above may be taken per square yard as follows:—

	6 in. deep.	7 in. deep.	8 in. deep.
Cost of blocks.....	7s. 2 1/2 d.	8s. 0 d.	8s. 0 d.
Cost of laying.....	3 1/2 "	3 5 "	3 7 "
Total.....	10 5 "	11 5 "	12 7 "

Asphalte is of various kinds and preparations, but the most valuable may be soon summed up. That which is most in favour in Paris and other Continental cities is the asphalt *comprime*, made from an amorphous limestone, naturally impregnated with bitumen. This material has its habitat in the Vosges Mountains, as well as in Hanover and Sicily. Its after-treatment is simple, consisting of powdering, placing on a concrete foundation, and thoroughly compressing by ramming and rolling. The American asphalt mastic, with which the city of Washington is almost entirely paved, is an artificial compound, made of Trinidad bitumen, powdered stones, and sharp sand. Then there is the coal-tar concrete, which is much used, but is not really an asphalt at all, though improperly called so. It has a foundation of broken stone and coal tar, with a top surface of sand or fine pebbles and tar, made into a mastic, spread and rolled like the others. But this latter, though cheap and easily manipulated, has a serious drawback, and that is, its being a product of gas tar, obtained by intercepting the destructive distillation, when it has reached a certain point. The atmospheric influence to which it is exposed when laid down, causes gradual oxidation, so that the tar loses its cementing qualities, with the result of the sand losing its cohesion, and the pavement pretty quickly disintegrating. The American asphalt mastic can be laid down for 9s. per square yard; and as it is cheaper and less slippery than the *comprime*, it is to be principally used in Philadelphia. All asphalts require an absolutely rigid and unyielding foundation, the best being a concrete of hydraulic cement of at least 6 in. in thickness; and not only must the materials be essentially good and pure of their kind if the

pavement is to have any wearing character, but the contract for maintenance should be carefully specified as to the amount of subsidence or dilapidation needing repair, for otherwise there is no class of work so open to scamping and dispute as this. Asphalt blocks are made of Trinidad asphalt and small particles of limestone moulded under heavy pressure. The best size is about 12 in. in length by 4 in. wide and 5 in. deep, and being uniform, the joints are extremely narrow and soon unite so as to make the pavement compact and waterproof. The cost, including a foundation of gravel and sand, is about 8s. 6d. per square yard.

The commissioners for reporting on the Philadelphia city re-paving, wind up with some excellent suggestions which are applicable to any town or city, no matter where it is. They are to the following effect. The crown or transverse section of the pavement should be the arc of a circle, with versine about 1/10 of the chord, or, say, for

Streets, 26 ft. wide, crown 4 in.	
" 34 ft. "	5 in.
" 50 ft. "	7 in.
" 70 ft. "	10 in.

In wider streets these may be slightly reduced, when the horizontal slope exceeds three 1/100. The distance from the top of the curb to the surface of the pavement at the curb should be between 5 in. and 7 in., depending on the width of the street. Wherever the ground is soft and full of springs, "blind" or broken stone drains should be laid under the foundation, connected at their lower ends with drain-pipes leading into the nearest sewer. No sewer pipe intended to carry house drainage should be laid with open joint for the purpose of draining the soil, as in such a case the soil is sure to become polluted, and insanitary results follow.

The cost of this undoubtedly heavy undertaking of paving so extensive a city as Philadelphia, or rather as much of it as is to be repaved, is thus estimated approximately:—

1,000,000 sq. yds. of granite block at 14s. 7 1/2 d.	£730,000
6,000,000 "	3,120,000
1,100,000 " sheet asphalt, @ 0	435,000
300,000 " asphalt block, @ 8 5	125,000
8,400,000 "	Total..... £4,410,000

From this has to be deducted 252,000l. for the value of 8,400,000 yards of cobble, leaving the net cost as 4,210,000l. It is also advised that an expenditure should be made each year of 400,000l. in laying fifty miles of improved pavement, at which rate all the old cobble streets would be entirely replaced in ten or eleven years.

LETTER FROM PARIS.

As our last letter predicted, the French Government will entrust to M. Alfred Darcel the direction of the Musée de Cluny. The successor of M. Dn Sommerard, who was born at Rouen in 1818, has long enjoyed in artistic and more especially in archaeological circles a reputation which seemed to point him out especially for a post which is also of a very special character. M. Darcel, among whose numerous works we may mention "Les Arts Industriels du Moyen Age et de la Renaissance," "Un Recueil des Faience Italiennes," and "Excursions artistiques en Angleterre," has also distinguished himself by some articles of great erudition on the *mise-en-scène* of the theatre. His successor in the "Direction des Beaux Arts" is far from occupying any such important artistic position. M. Gerspach, who owes his administrative good fortune to M. Maurice Richard, the last Minister of Fine Arts under the Empire, has arrived rather late at his artistic apprenticeship, and the administration of our great national manufactures demands rather more obvious and definite capabilities.

The decision taken by the Municipal Council, on the other hand, in regard to the popular opera, has completely deceived our expectations. The question, as we before said, was that of arranging for first-class popular representations, at reduced prices, assisted by an annual subvention of 300,000 francs. In principle it was approved, but, at the last moment, the Council drew back. It was found, apparently, that "Spartan black bread" was better fitted for Parisian electors than the regal fare of the Athenian Republic; and the Opera, deprived of its subvention, continues to reserve for the children of fortune the *chefs d'œuvre* of its

ft. apart from centre to centre. The principal rafter is 12 in. by 9 in., and the tie-beam in. by 9 in.; in each truss there are five iron rods doing duty as queen-rods and intermediate rods, and the heads of the principal rafters and king-piece are received into a cast-iron hen-head. The pitch, i.e., the slope or angle to the horizon, is 21° only.

The failure of this roof may probably be traced to a series of causes rather than to any prominent defect. The deficiencies of the roof have been already pointed out, and here elsewhere a close examination would not only show that the joints have compressed slightly, and that the timbers have bent. The truss apart of the principals is rather great, which throws a greater load on each truss than ought to have. The pitch is too flat, which greatly increases the strain upon every part of the structure. The braces under the principal truss are too few, and both the principal rafter and the collar beam are loaded not at the strong points, namely, those stiffened by the braces, but at points away from them, so as to be subjected to some cross strain. The scantlings are light, considering the work the timbers have to perform; and the large amount of flat space in the middle, and the small angle of the slope on the sides, would favour the lodgment of snow, that a heavy fall of snow would throw a tremendous burden on to the frame-work of this truss in addition to what it has ordinarily to carry. Putting all these causes together, there is no reason to be surprised at the failure of the roof; and yet its appearance is striking, and as the idea of its being both elegant, skilful, and boldly designed. Boldness has, however, been pushed too far.

It is believed that the widest timber roof in the world, with or without a tie-beam, ever erected is one that was erected over a riding-house at Moscow in the year 1700, of the enormous span of 235 ft. The principal rafters in the truss of this roof were replaced, or rather strengthened, by a vast curved rib made of three thicknesses of timber indented together, and bolted. The design was ingenious, and after a time this roof partly sank, and I believe it is not now standing. The material used, but it is not improbable that it is fir, and if so the use of that material may partly account for the failure of this great structure. Those roofs of considerable span which have been most successful have, in the majority of cases, been framed either in oak or chestnut.

In the roofs with tie-beams which we have been discussing, nothing more is attempted than to roof over a space requiring to be covered, and, in most cases, to carry a ceiling. Sometimes also it has been desired to form a loft or a sort in the hollow space in the roof; and the framing employed for these purposes has been designed to secure only those ends, it has not been possible to use all the timbers in the situation where the very most could be made of them.

In making a roof, however, we enclose and cover in a large space above the top of our walls, and, in many cases, it is desirable to use the space, not by constructing a loft in it, but by adding it on to the space below. This is usually done by putting such a roof as has been described on side walls, and leaving the ceiling; but the tie-beams and framing often have an appearance not in accordance with the architectural design of the building, and in many cases, as, for example, in the case of a church, where the gable is occupied by a large window, the line of them will cut across and destroy the effect of an architectural feature. Accordingly roofs without tie-beams are more readily found requisite, and these form by far the most important and most interesting part of our subject. Roofs of this class were generally employed throughout the period which we have seen progress of Gothic architecture, as well as in modern times.

My friend Professor Kerr, in his opening paper,* was necessarily restricted by his subject to tie-beam roofs, so that this class of structures was not touched upon by him; but I regret that in alluding to an unscientific form of roof occasionally to be met with in churches of small size, he did not do our forefathers the justice to list that innumerable specimens of their skill as carpenters, accompanied by the greatest feat, have come down to us from the past. He is (unintentionally, I am sure) have left on

the minds of some here the impression that the Gothic idea of a roof was only to throw a beam from wall to wall, to stand a post on the middle of it, and then to carry rafters from the top of the post to the wall. I am quite aware that this sort of roof is to be met with, yet I hope to succeed in showing you that in the centuries we call the Middle Ages carpentry was carried to great perfection; and I am the more anxious to do this because there is no country in Europe where carpenters were more skilful than in England, and because the acknowledged masterpiece of ancient carpentry is to be found in this metropolis, the work of English hands and the contrivance of English designers.

We have seen that where a timber is short it may be able to sustain a considerable amount of cross-strain, such as would break it were it long, and the earliest attempts at throwing the roof more into the body of the building than is possible with a tie-beam were made by putting the tie part of the way up the rafters, so that there was a short piece of rafter between it and the wall exposed to a strain which is partly transverse. A second step was taken when, in order to get rid of the straight line of the tie, two oblique timbers, each starting from the foot of one rafter and getting hold of the other some way up, were employed. Sometimes these two methods were combined, as in the timber roof over the vaulting of Westminster Abbey. In this manner, but with all kinds of variations, sundry very picturesque church roofs have been framed. Some of them carry polygonal ceilings, others show their timbers; but in either case the eye is carried upwards, and the space in the roof is virtually added to the building.

One remarkable example of this kind of roof is to be seen at the Hall of the Palace of Justice at Ronen, and those of you who have taken one of the opportunities now open of spending a short holiday in the very pleasant and instructive change of a trip to Paris, will, I have no doubt, have remained for a few hours in that interesting city on the road, and may have seen this Hall. The building of which it forms part is a fine Gothic structure of the end of the fifteenth century, the date being 1493. This hall is 150 ft. long and about 54 ft. wide, and is roofed, in a single span, by a roof without tie-beams. A timber ceiling, of an arched outline, conceals the framing of the roof, but a published engraving of the construction shows that there is a collar three-fifths of the height up the roof, and a second higher still, with a moderate amount of bracing to the upper part of the rafter, but nothing below the collar but oblique ties, and those very long ones. One authority says that the roof had tie-beams at one time, and that they have been cut away. However this may be, it keeps its form without them; there are no tie-beams or rods now, and the roof stands excellently well.

In many of these roofs there are no trusses or rafters stronger than the others, but every pair of rafters is tied in the same manner. It is also worth remark that the material employed in these roofs was, generally speaking, either oak or chestnut. Both these woods combine great strength with great hardness, and the latter quality prevents the danger of joints giving way, as they do in roofs framed of fir timber. Having, therefore, materials which permitted it, the designers of these roofs were quite right to use oblique ties or ties highly placed, and to subject part of their rafters to cross strain, because they could by these means attain objects not otherwise within reach, and could do so without sacrificing the stability of their structures.

A distinct class of roofs of large span, framed without tie-beams, next claims notice. I refer to roofs with ribs. Many of these are mostly of later date and wider span than the greater part of those already considered. The truss of Westminster Hall, it is true, displays, as we shall find, a large rib used for the structural purpose of steadying and stiffening the whole combination, and for the architectural purpose of adding to the framework a powerfully-marked line of an arched form; but such rib is only an auxiliary, as, for example, in the Moscow Riding School already mentioned. In some other examples a rib more or less similar to this forms the chief feature of the roof. The oldest specimens of the class, where the rib does the main part of the work known to me, are two Italian examples, of which Professor Lewis has kindly sent particulars. A great hall at Vicenza, known as the Basilica,—built in 1314, though since modernised,—no less than 70 ft.

wide, is covered with a curved roof in the form of a pointed arch, in a single span from wall to wall, curved outside as well as in, and so resembling very much the hull of a ship turned upside down. The supports of this roof consist of ribs of timber about 12 in. by 12 in. Each rib is tied by two iron tie-rods, the first about one-third of the height up from the springing; the second about two-thirds up. A still larger hall of about the same date exists at Padua. It is 261 ft. long by about 85 ft. wide, and has a similar roof, of which the ribs are about 13 in. by 13 in., and about 6 ft. apart. They (like those at Vicenza) are secured by iron rods; but in this case the rods are introduced differently in alternate ribs, the first at the springing, and the second part of the way up, and so on.

Roofs with ribs did not, however, become common till a much later date. The next example that I have to quote is a roof which was erected over the Corn Market in Paris in the year 1662. This building is circular, and about 130 ft. in diameter. The present roof is a dome-shaped one on iron ribs, interesting as an early example of the application of iron to roofing, but the original timber roof, which was also dome-shaped, is the one with which we are at present concerned. It was destroyed by fire in 1802. A good account of its construction is given by Mr. Tarn in his excellent little treatise on roofs of wood and iron:—"The circular ribs consisted of planks 9 ft. long, 13 in. broad, and 3 in. thick; each rib consisted of three of these planks bolted together in such a manner that no two joints met. A rib was begun, for instance, with a plank 3 ft. long, standing between one of 6 ft. and another of 9 ft., and that was continued to the head. No machinery was needed for hoisting such small pieces, and the whole went up like a piece of brickwork. At various distances these ribs were connected horizontally by pulleys and iron straps, which made so many hoops to the whole dome. Some of the ribs were discontinued part of the way up. Near the top those that were continued were framed into a circular ring of timber which formed a large eye in the middle, over which was an umbrella-shaped glass roof."

French architects and engineers in the sixteenth, seventeenth, and eighteenth centuries occupied themselves a good deal with roofs with curved ribs, and two systems of constructing the ribs were worked out. In the most modern of them, that invented by Colonel Emy, the ribs were constructed of a series of thicknesses of bent timber, one on the back of another, and held together by bolts. In the older system, that of Philibert de l'Orme, the ribs were also built up, but the pieces composing them are placed side by side, and either form a polygon approaching a semicircle, or are cut to bring them to a curve. In fact, the ribs are very much such as have been already described as used for the great dome of the French Corn Market.

There is, however, a great difference between a dome,—the strongest of all forms, and one permitting the introduction of as many rings of ties as may be desired,—and a roof over an ordinary oblong space, where no such binding together is admissible, and where straight rafters may have to be used, which loads the rib at certain points only. In the latter case, a good many precautions have, generally speaking, to be taken to prevent the rib from being unequally loaded, and so either spreading or losing its shape in some other way. The rib made of unbent timbers, side by side, on De l'Orme's plan, is admitted to be stronger than the one made of bent timbers laid one on the back of the other; but both have been largely used, and good examples of both may be met with, even if we confine ourselves to English ones alone, and leave the French ones unnoticed.

A very fine roof with ribs, one on which the load (though light) is borne without a rafter solely by the ribs, covers the great conservatory built by the Duke of Devonshire at Chatsworth. This building was rather notorious at the time of its erection, but has probably now passed out of the recollection of most people not familiar with Derbyshire. It consists of a wide and lofty central portion, with a kind of broad aisle at the sides, roofed at a lower level. The central roof here is of the section of a pointed arch and hipped at both ends, and is entirely covered with glass. It is carried by timber ribs, and the glazing is on the ridge-and-furrow principle. The low aisle referred to forms to some extent an abutment for the ribs, and the ridge-

* See *Builder*, p. 284, ante.

and-furrow glazing helps no doubt to fortify them, but still the greater part of the strength is derived from the ribs themselves. I had recently an opportunity of examining this building carefully, and though it does not appear to have been as well taken care of as one could wish, still the roof remains sound, and the ribs appear true to their curve and in line with one another.

Another rib roof, and one which obtained a world-wide celebrity, was the roof over the nave of the Great Exhibition of 1851, reproduced in its main features in that of the nave and transepts of the Crystal Palace at Sydenham. Here, again, the load is a continuous one, the roof covering being the same shape as the rib.

It was intended that the '51 Exhibition should have a flat roof over the nave, carried by long lattice girders, and it is understood that the matter of suggesting a semicircular roof instead belongs to Sir Charles Barry. The construction was, no doubt, designed by Sir Charles Fox, who made the working drawings of the entire building with his own hands. The span of this roof was 72 ft.; the principals were 24 ft. apart from centre to centre; they consisted of timber ribs measuring 17½ in. deep and 11 in. wide at the back, and 8 in. in width in the main part of the rib, and formed of no fewer than eleven pieces of timber bolted together. This construction combined the two systems of rib-building described. These ribs appear to have stood well, as have the ribs of the Crystal Palace roof.

For the Exhibition of 1862 at South Kensington a somewhat more solid building was designed by Capt. Powke. It had a nave with a semicircular rib, but had also a rafter, so that the covering did not follow the outline of the rib. The span was greater than at the Crystal Palace, being 85 ft. against 72 ft.; the depth of the rib was ½ in. more, being increased to 18 in., and the width of it was 10 in. It was made of six pieces only, and was entirely on the older or De L'Orme's construction. The distance apart was increased to 25 ft. This roof was, I believe, re-created at the Alexandra Palace, and was destroyed in the great fire at that building. In the '62 Exhibition many annexes were built, with ribs having a span of 50 ft., and a distance apart of 15 ft. The ribs were 3 in. by 9 in., and these roofs failed seriously by spreading.

In the great buildings occupying the same site, and covering many acres of ground, which were erected for the Fisheries Exhibition and added to for the Health Exhibition, many acres of roofing were put up by the late General Scott, of which the wider spans recalled to some extent the annexes already alluded to. These are, however, a little stronger in various respects, and they appear to have answered the expectations of those who designed them. The span of these roofs is a little less, and the principals are considerably nearer together, than in the roofs which failed in 1862. The span is 48 ft. The polygonal rib (which is virtually semicircular) springs 10 ft. from the floor. The sides of the building continue to a height of 27 ft. 6 in. from the floor, or 28 ft. from the ground, and the ridge is 40 ft. from the ground. This rib is 2½ in. thick by about 10 in. average depth, and is in three thicknesses, made up of deals,—a middle 1½ in. thick by 9 in., and two ¾ in. by 9 in. at the sides. The pieces of which the rib is composed are 6 ft. long. At every 6 ft. there occurs a radiating brace, 9 in. by 1½ in., pointing to the centre of the arch. Each brace is worked into the substance of the rib, and seems to connect it to the uprights of the side framing or the rafters, as the case may be. The ribs are 10 ft. apart, and the boarding is carried by small rafters, 6 in. by 2 in., laid parallelwise on the back of the principal rafter belonging to the truss. This is probably a slight construction as has ever been successfully employed.

This series of roofs may be closed by a reference to a roof with timber ribs on Colonel Emy's plan that has failed. I refer to the roof put up at the terminus of the Great Northern Railway, King's-cross, in 1852. This was a roof where a semicircular rib was combined with rafters, and the covering did not follow the outline of the rib. The spans were each 105 ft., the ribs were 20 ft. apart, and each rib is stated to have consisted partly of eight and partly of sixteen 1½ in. bent boards, acrowed and bolted together. The trusses soon after being fixed showed signs of spreading, and were buttressed at the feet. The ribs became distorted in shape, being per-

ceptibly flattened at the top, and after remaining in that condition for a good while (probably about twenty years) the ribs of one of the two spans have been replaced by trusses with a wrought-iron semi-circular rib. This experience seems to tell decisively against the use of ribs made on Colonel Emy's plan of bent timber, for they were employed here under conditions on the whole very favourable.

The roofs with oblique ties, like Westminster Abbey or the Ronca Hall, and those with curved ribs, like the Crystal Palace or the Health Exhibition, by no means exhaust the list of roofs without tie-beams. Another method of dealing with the same problem was worked out towards the close of the period which we call the Middle Ages, and, as it resulted in the most splendid and most thoroughly architectural roofs that we have to consider, I have left it to the last.

The earlier stages of the growth I am about to describe may be illustrated from church roofs; the concluding and most complete was employed chiefly for the roofs of halls much wider than the nave of an ordinary church, and it is from such halls that we shall get our best examples. Let us go back to church roofs as they were executed at the middle of the fourteenth century.

The walls in common use were very thick, and, as the gutter was usually an eaves gutter, it became customary to carry the rafters to the exterior, and to frame them into a short horizontal timber, which lay across the wall, and from that timber to carry up a little post or prop flush with the inner face of the wall, to support the rafter near its foot (see fig. 1). The idea suggests itself that by prolonging this short horizontal timber, usually called the wall-piece, the prop assisting the principal rafter might reach it more nearly at the point where its aid was needed (see fig. 2). It will be seen at

Fig 1

Fig 2

Fig 3

a glance that the wall-piece here acts as a lever, of which the inner edge of the wall is the fulcrum. The weight of the rafter presses on the long arm, and the short one is accordingly extremely strong, and affords nearly as good a support for the upright post as though it rested on the wall itself. By degrees this wall-piece was pushed out more boldly, and it soon was felt that a strut, S, from the wall below (see fig. 3)

Fig 4

would give some additional strength, and would also satisfy the eye by preventing the rafter

unsightly overhanging horizontal piece from appearing to have nothing to carry it. So: strut was introduced, and in church roofs became usual to curve or mould it, so as to make it a better architectural feature. The next step was to carry up from this same point a second strut, A (see fig. 4), to a point far up the rafter, and afterwards a tie was sometimes added at B to give a hold on the collar-beam or tie-beam, whichever we call it, above. In roofs having any pretension to artistic treatment the inner faces of these struts and were cut to curves (see fig. 5).

Fig 5

This combination of struts, horizontal posts and tie-beams to be met with in many of the roofs which were successfully framed in England, and a system somewhat similar though not identical, was pursued in France. In the English examples the elongated piece is called a hammer-beam. The horizontal tie or collar-beam is generally about a way up the rafter, and the lower half of the rafter is fortified by support derived from the hammer-beam, through the post and arising from it; the hammer-beam itself is in turn supported by a strut from a corbel into the wall.

The finest and almost the earliest example of a hammer-beam roof, and, no doubt, the finest timber roof in the world, is the roof over Westminster Hall, which I will now proceed to describe.

Westminster Hall is 68 ft. wide between walls, and 238 ft. long. It is 42 ft. high to top of the walls, and 90 ft. to the ridge of the roof. It is divided into twelve bays, with will accordingly average 10 ft. 10 in. Consequently each truss has to span 68 ft., to carry, in addition to its own weight, weight of slates, timber, &c., necessary to cover 1,350 ft. of floor. The pitch or angle with the slope of the roof makes with the horizontal 52°. The material employed was at one time believed to be chestnut, but is really English oak. The appearance of the two woods is much alike that some uncertainty may be pardoned. The date of the roof is A.D. 1180, so that if it escape accidents, in twelve years more it will have been standing 500 years. The timber is in good preservation and large scantling; that is to say, large section-area. The workmanship throughout is of great beauty and accuracy, and no extensive repairs so far as I can find out, has ever been necessary.

The principal rafter of each truss is considerable strength. The collar is placed just half way up the rafter. The hammer beams receive the foot of the rafter at its extremity, and each projects rather more than a quarter of the span from the wall, and has its end beautifully carved with the figure of an angel carrying a crown. A strong post is carried up from the end of the hammer-beam to the point where the collar and the principal rafters join. A timber, which may be called wall-post, rises from a corbel far down the wall and supports the underside of the hammer-beam at the point where it leaves the wall, and a second post vertically above this supports the principal rafter. There is a strong and rigid moulded rib, which acts as a bracket or tie, springing from the corbel just referred to,

* See large photolithographic illustration which will appear in this week, from a drawing by Mr. F. T. Dollman.

ended into the hammer-beam near its free end. A second similar rib, rising from the hammer-beam, supports the middle of the collar. All these pieces, except the principal rafters, are put together by a magnificent arched rib rising from the corbel from which the vest carved rib starts, and framed to the hammer-beam, the post on the back of that beam, the collar, and both the curved ribs. Above the collar a second collar is introduced, and a post connecting the two is added, while the middle of the truss a central post, something like a short king-post, occurs. Between these timbers there is a kind of filling in of pillars or small posts, the spaces between being ornamented at the heads. These, no doubt, perform quite as much the important structural duty of connecting every member of its great framework together as they do the specific duty of filling up the great outline with subordinate features which give scale to it, while its vastness to be appreciated, and bring the variety of its lines by their contrast to the uniformity of the filling in.

The usual longitudinal timbers, called purlins, rising from truss to truss, are employed here, to furnish support to the roof rafters. The purlins are themselves supported lengthways in the great trusses by braces. The middle purlin is supported by a beautiful arched rib rising from the post on the hammer-beam. An upper purlin has a curved brace springing from the principal rafter. The lower purlin has a curved brace springing from the back of a great curved rib. Below this purlin occur openings in the roof covering, which correspond with the great dormer windows, from which the hall receives a considerable portion of its light, but which are said not to have been part of the original design.

I have already mentioned the fitness of the kennship; I need only add that every ornamental part is equally well wrought, and is signed with the greatest skill, so that whether scrutinise a small portion or endeavour to be in the impression to be produced by the whole, we are equally convinced that this is a masterpiece of architectural art as well as of carpenter's skill.

For about 200 years,—that is to say, during the fifteenth and sixteenth centuries,—hammer-beam roofs were in use, and as many considerable halls were built during those two centuries, various examples remain, none of them equal to Westminster Hall, though many of them reaching it in beauty, if not in extent. A few of these I will name to you.

The roof of the hall of Eltham Palace, dating, I believe, early in the fifteenth century, was a fine one. The hall was 101 ft. long by 36 ft. 3 in. wide, and 54 ft. high, and had a hammer-beam roof very much like that at Westminster in general, but without the great ribs, and rather less deep. This roof was of oak, and remarkable for the beauty of the workmanship and goodness of material. This building has been allowed to fall into decay. Fifty-nine years ago Mr. Mage found that water had soaked the walls, and they had decayed, and given way, causing the failure of the roof. Part of it, however, still standing, but soon the whole has disappeared.

At Oxford, timber roofs of various degrees of beauty, but all belonging to this class of construction, occur in the halls of at least half a dozen colleges, namely, Corpus, University, Balliol, Jesus, Oriel, and Christ's Colleges; in Cambridge in two or three such halls, St. John's and Jesus Colleges. There is a fine roof of this sort at Westminster School, more ornamented at Gray's Inn Hall, and other at the Library at Lambeth Palace, an ornament of much dignity and beauty, 93 ft. by 38 ft. wide, and 50 ft. high.

Perhaps, however, the finest specimens after Westminster, certainly among the most ornate, are two that date from the sixteenth century, the roof of Wolsley's Hall at Hampton Court, completed about the year 1526, and that of the Middle Temple Hall, London, erected 1572.

The hall at Hampton Court is 106 ft. long by 47 ft. wide, and 45 ft. high to the top of the ribs, and 60 ft. high to the ridge. The framework is extremely florid, heavily timbered, and remarkably rich in its mouldings and carving, and is adorned with some finely-carved pendants, and red corbels running lengthways of the building as well as across it, serving to add to the richness of its appearance as well as to its strength. The ribs or brackets which sup-

port the end of the hammer-beam spring from corbels unusually far down below the top of the walls, so as to increase the strength of the truss. A peculiarity of this roof is that it is not open right up to the rafters through its entire height, but a wooden ceiling of curved outline is carried so as to cut off portions of the upper part. The outline of this roof is also peculiar externally.

The roof of Middle Temple Hall displays a peculiarity which is rare in hammer-beam roofs of large span, though not infrequent in the timber roofs of moderate span to be found in the churches of Suffolk and Norfolk. I allude to a double hammer-beam. Suppose the collar-beam of one of these roofs to be cut, the middle of it to be taken away, and each of its ends to be treated just like a hammer-beam, that is to say, supported by a curved rib and made to carry a second post, which is carried up to meet the principal rafter high up, and above which there may, perhaps, occur a short collar-beam, we now arrive at a piece of framing to be found frequently in the churches in such towns as Ipswich. This outline forms the basis of the fine roof of the Middle Temple Hall. In addition to its double hammer-beams this roof has a series of very conspicuous curved ribs, placed lengthways of the Hall, carrying the purlins and springing from the posts of the truss near the point whence the curved ribs of the truss itself rise. The foot of the posts is formed with rich bosses, from which the ribs spring, and the whole produces a singularly rich and well-combined effect, which harmonises well with the panelled woodwork that lines the walls, and with a rich screen at the lower end of the Hall.

There is an interesting record in connexion with this Hall,—Shakspeare's play "Twelfth Night" was performed here in the year 1601; that is to say, during his lifetime, and during the time that his theatre, the Globe Theatre at Bankside, was standing and in use. In all probability, therefore, the play was represented by his company, under his direction, and it is even possible that he may have taken part in it.

One other observation not strictly belonging to carpentry arises out of the comparison of the earliest and the latest of the great hammer-beam roofs that have come under our notice, Westminster, dating from 1397 and the Middle Temple from 1572, the first in the reign of Richard II. and the second in that of Elizabeth I. In the interval a great revolution of taste as well as in literature and religion had taken place. Modern Europe, as distinguished from the Europe of the Middle Ages, began in the sixteenth century, and the reformation of religion, the revival of Greek and Roman learning, the birth of the modern literature and fine art, and the return to Classical architecture, are all parts of the great change which took place at this time. The reign of Elizabeth is marked by an architecture of change. You all must have heard something about Elizabethan buildings. Their great interest lies in the fact that in them we can see the old Gothic architecture disappearing and the revived Classic advancing. The two are, indeed, blended in a manner which is at times most picturesque. The Middle Temple Hall is an example, and a very good one, of this style. The roof is still in its main lines allied to the Gothic roofs which went before it, but its ornaments and its mouldings are both of them different, and follow Italian models. Just the same thing may be traced in the roof of Lambeth Palace Library, and it is worth notice,—if for nothing else,—as an example of how the architecture of old buildings properly understood preserves to us visible and tangible records of the political and social history of our country. Such buildings continue to illustrate the past for centuries after the men who erected them, with their manners and customs, have passed away from the face of the earth.

I propose, in conclusion, to mention a few important modern English roofs belonging to recent buildings of Gothic design. I shall first refer to a tie-beam roof of fir, but one in which the general principles adhered to by the carpenters of the Middle Ages are followed,—I mean the roof on the great hall of the Law Courts. This roof is not what is commonly called an open roof,—that is to say, not a visible roof like that of Westminster Hall, as it covers a vault of masonry which forms the ceiling to the hall.

The span of this roof is considerable. The pitch, as will be apparent to any one who notices the

gable of the Hall in passing up the Strand, is comparatively steep, and would have permitted the use of tiles. The truss is a king-post truss, but the principal rafters are each of them double, that is to say, the two usual principal rafters are framed, in the usual manner, into the beam and king-post, but, in addition, immediately within them, a kind of inner and additional principal rafter is employed. This method adds a good deal to the strength of the roof, and was not unfrequently resorted to by Mediaeval carpenters.

Another peculiarity, which was my chief inducement to include the roof over the Law Courts, is the employment of a *flèche* or timber spire to ornament the building. This spire is carried on the ridge of the main roof. These timber spires are among the most difficult and intricate pieces of carpentry known, and, owing to the great height at which they commonly start, few persons recognise their great size and consequent weight. Nor is the weight of a roof spire the only, or even the most serious, strain that has to be provided for. Such a feature rises in the unsheltered region where the full force of every hurricane that blows is felt, with nothing to break the shock; and although such a spire is usually circular or octagonal, so that the wind has less purchase against it than if it were square, we must not forget that it is very tall, so that such pressure as is sustained is intensified at the foot of the structure where the roof has to support it. And this weight and wind-pressure has to be supported, not on any solid basis like the masonry of a church tower, but on the framework of a roof spanning a vacant space. A famous example of such a structure is the *flèche* at Amiens Cathedral, which was measured and drawn by the late William Burgess, and was shown, by the courtesy of the Architectural Museum, in our recent Exhibition. Another well-known example is the timber spire in the Cathedral of Notre Dame, in Paris, reconstructed by M. Viollet-le-Duc, and fully described and illustrated in his "Dictionary of Architecture." Another, but smaller, example surmounts the roof of the Guildhall.

The details of the construction are hardly fit for a lecture like this, and can be best unravelled by a patient study on the spot; but the general principles involved may be said to be, first, the distribution of the weight over as wide a space as possible. This is effected by carrying part of the load on to trusses right and left of the one immediately under the spire itself, by the help of sundry oblique bearers, as strongly framed as possible; and secondly, the *stiffness* of the actual spire. This is sought to be obtained by a central post running from base to top, a large number of sloping rafters, with many diagonal braces, introduced in every possible way, and a large series of horizontal ties or purlins at various heights; thirdly, by as strong a connexion as possible between the spire and the base established on the trusses of the roof. A great many timbers are employed, put in various positions, so as to stay every point as much as possible, and the result seems to be that this lofty structure is perfectly secure.

The roof of Lincoln's Inn Hall, part of the new buildings erected by Mr. Hardwick in 1845, is a fine hammer-beam open roof. The hall is 120 ft. long by 45 ft. wide, and 64 ft. high. The roof is framed of oak. Unfortunately I am not able to produce an illustration of it.

The great hall of the Manchester Assize Courts, a building erected from the designs of Mr. Waterhouse, has a fine open roof, of a construction which presents a somewhat unusual combination. The hall is 100 ft. long, 48 ft. 6 in. wide, and 75 ft. high; it has seven timber hammer-beam trusses dividing the length into eight bays of the somewhat unusual extent of 25 ft. each. The hammer-beam trusses do not, however, carry the whole weight of the superstructure, as is the case with every other roof with which we have dealt; two trussed purlins, or, more properly, latticed timber trusses, 16 ft. 6 in. deep, run, in lieu of two of the purlins, from end to end of the hall and bear on the gable walls. These, of course, framed to each hammer-beam truss, but, being themselves of considerable strength, they do a large part of the work; and, indeed, I gather from the architect's own published account of this roof that, in his opinion, the chief duty is thrown upon them. They, he says, support the upper part of the roof, while the wall-brackets, which form the lower part of each

hammer-beam truss, are needed chiefly to steady them. The architectural effect of this roof is excellent, and I dare say some of those present have seen it.

The last modern timber roof which I shall refer to is the roof over the Guildhall, London, erected a few years ago from the designs of the City Architect, Mr. Horace Jones, whose fine roof over the new Council Chamber, in which, however, the main framework is iron carrying a timber ceiling, is also illustrated by some of the drawings on the walls. Guildhall is 150 ft. long. Its width is not perfectly uniform, but the average is 49 ft. 6 in.; it is 80 ft. high. The roof is constructed, as every roof which is to form part of a public building of the first importance should be, of oak. Practical carpenters will be the first to appreciate the increased strength and solidity and the greater tenacity of the joints, and the freedom from the risk of their crushing in, which the use of oak secures, as compared with deal, or even pitch pine.

In the Guildhall roof there are seven principals, and therefore eight bays of about 19 ft. each. The collar of this roof is 20 ft. long, and it was cut out of timber about 2 ft. 8 in. square. In this roof each principal springs from a cluster of strong shafts carried up within the walls for the purpose of receiving it. Both structurally and as a means of procuring architectural effect this is very advantageous. There might have been some risk in putting the heavy weight of this roof on parts of the very ancient walls of this venerable hall which had not been so weighted before, and these lines of support divide up the length of the hall, and so make its extent perceptible. They also carry up the apparent (and, in fact, the real) support of each principal from the solid floor, and so aid the architectural treatment in more ways than one. The curved ribs are made very prominent in this truss, and the hammer-beam is kept rather modest than otherwise; it is neither carved at the end, nor marked out by a pendant, so that the line which catches the eye is that of the cusped arch of the moulded rib. This is an original treatment, but the success of the roof fully justifies the architect in the course which he adopted.

With these modern examples we leave our subject. I trust that the accounts of great roofs which I have been able to give you, and the illustrations which, in addition to diagrams made specially for to-night, I have been enabled to show you, by the courtesy of the City Architect, Mr. Waterhouse, Mr. St. Aubyn, and others, have been sufficient to prove that a great timber roof requires no small amount of skill to be brought to bear upon its design. I hope we have also seen that it, above most things, calls for very careful selection of good material, and, perhaps, most of all for honest, painstaking care in the workmanship of every part. No single joint should be defective, and every part should bear truly on those into which it is framed. I think, also, we have seen abundant cause for ranking timber roofs as among the important architectural features of a large class of ancient buildings, and especially let me add, of ancient English buildings; but I cannot, lastly, help adding that I think we have seen reason also to be proud of our modern works in this line, as well as of the ancient ones. Neither in the architectural design of these structures, nor in the mechanical skill with which they are framed, need the architects and the carpenters of the nineteenth century fear a comparison with their forefathers of the fifteenth and sixteenth.

ON DRY ROT IN WOOD.

In the Public Health Section of the late meeting of German Naturalists and Physicians at Magdeburg, Dr. Poleck, professor at the University of Prague, read an interesting paper on the life history of the fungus known in this country as "dry rot," and by botanists as *Merulius larrymans*, the ravages of which have of late years assumed alarming proportions wherever the building of new houses has been extensively carried on, but in Germany especially have become a question of almost national importance. For its prevention a knowledge of its life-history and habits is absolutely necessary, and these researches may also serve to explain the curious fact that, while it rarely attacks the timbers of the oldest buildings, it has seriously endangered the

stability of many erected within the last few years.

Its original habitat is not known, for it does not attack living trees, nor is it ever seen in decaying wood in forests. It is found, so far as we are aware, only in the timbers of houses, chiefly, if not exclusively, in deal and pine. The name "dry rot" is not quite appropriate, for a certain dampness and darkness are necessary for the development of the spores. These give origin to a mycelium of elongated cells, which spreads with surprising rapidity, covering the surfaces of the timbers and walls with fan-shaped expansions, and, penetrating the cylindrical fibres and cells of the wood, break it down by a chemical action into a light brittle mass. Complete desiccation of the mycelium permanently destroys its vitality. Though at first developing only in the dark, it seeks the light for the purpose of sporification. The sporangia, which have a reticular structure, vary in size from that of a lentil to that of a sipping, and exhibit a somewhat concentric arrangement of cushiony folds, at first of a wine red, and lastly of a dirty brown colour, when they exude drops of a clear fluid, whence the specific name of *larrymans*. After emitting vast numbers of cinnamon brown spores, not more than 0.1 mm. in diameter, the sporangia become black, dry up, and die.

In the art schools attached to the Breslau Museum the mycelium has spread from the foundations to the wall plates, and the casts and models are covered with the dustlike spores. Some of the threads have been found to measure as much as 5 or 6 yards in length. Dr. Poleck has not succeeded in cultivating it artificially, but another investigator, who has not yet published the result of his experiments, is said to have been more fortunate.

The chemical composition of the *merulius* does not differ much from that of similar fungi. The water varies from 50 to 70 per cent., while of the dry substances 5 per cent. is nitrogen and 15 fat. There are, besides acids, a bitter substance, and indications of an alkaloid. The mineral constituents, among which potassium and phosphoric acid are the most important, throw more light on the action of the fungus on the wood, which, as we have said, is not properly decay, but a chemical disintegration in consequence of the abstraction of these elements of its composition. As these are exhausted, the mycelium spreads outwards, much in the same way as the so-called "fairyrings" are formed.

A clue is thus afforded to the increased prevalence of dry-rot of late years. It is well known that to facilitate the removal of the bark the practice of felling timber during the spring and early summer has become very general, and analysis has shown that the wood of coniferous trees at that season, besides being more watery and difficult to dry, contains five times as much potash and eight times as much phosphoric acid as in winter, conditions highly favourable to the development of the fungus.

If the use of such wood cannot be avoided it should be thoroughly seasoned and dried, if need be, by artificial heat. The use of old building materials should be shunned, and infected or suspected wood be burned. In the absence of experiments on the artificial cultivation of the *merulius* we are without any exact knowledge of the relative value of the several reputed preservatives, but since dampness is an essential condition of its growth, the importance of maintaining the utmost possible dryness of foundations, joists, and floorings by means of concrete or asphalt, efficient damp-proof courses, and thorough ventilation, is obvious. It is scarcely necessary to observe that the treatment of woodwork with arsenical or mercurial solutions is fraught with the gravest dangers to health, however successful in their immediate object. If chemical preservatives must be used they should be restricted to one or another of the products of the distillation of tar, though in this, as in other things, prevention is better than cure.

Proposed New Theatre for Exeter.—An Exeter paper states that a company will be forthwith formed to purchase a site in Longbrook-street, and erect thereon a theatre with every modern appliance. Mr. C. J. Philippe, F.S.A., was in Exeter last week, and surveyed the site, which he considers admirably suited for the purpose, as it affords ample space for double exits from the stage and every part of the house.

NEW WAR AND ADMIRALTY OFFICE REVISED DESIGN.

E publish this week the design by Messrs. Leeming & Leeming for the proposed War and Admiralty Office, as modified, we presume, according to suggestions or wishes of the Office Works; though the modification does not seem so great as we were led to expect was taking place. The most important change is the shifting of the tower from the angle of the Horse Guards to the re-entering angle of the St. James's Park front. This is an improvement as far as the junction of the building with the Horse Guards is concerned, though the position of the tower in itself is certainly effective, nor does it mean anything in relation to the general design. The exaggerated projections of columns and stylobates, carrying nothing but small statues, appear to be *in statu quo*,—on the Park front, as in the events; and the Whitehall front still retains its curious anomaly (or what ought to be an anomaly) of two symmetrical pavilions, one of which leads into the courtyard and marks the main entrance, the other marks nothing in particular; the having, in fact, little relation to what is behind it. This has been so often the case in Civil buildings for official purposes on a large scale that perhaps one ought not to be too over it, only one desires to see some improvement in these aesthetics of architecture, a repetition of old faults which have the responsibility of precedent.

The plan is in many respects a good one, the objection to the enclosed quadrangle has been partially met by widening the quadrangle in the revised plan (which is not yet available for publication). Other improvements have been made, especially in the position and arrangement of the lavatory accommodation, some of which was very badly placed in the original plans, leaving little possibility of proper ventilation for the closets. The Whitehall front has been set back 30 ft. (except two end blocks), with manifest improvement and the entrance widened.

We are indebted to Messrs. Leeming for permission given, pursuant to that of the Office Works, to publish the altered design, should be glad if we could express our thanks in sympathy with it in regard to its architectural character. Considering the urgency of the occasion, we cannot honestly say, or say that we regard it as a design adapted to the situation. But any shortcomings of the design itself are as nothing compared with the tremendous architectural blunders made in the choice of the site, and we protested against from the very first; that, namely, of leaving the two Banks of the smaller buildings between them, and of Charing-cross, and carrying a wing of the building round in their rear. The perspective drawing of the Whitehall front here seems as if made on purpose to show a compromise this mistake. Let those who will be called upon in a few days to report upon the subject just look at that—upon the mean and piecemeal effect of new building half hidden behind the old buildings on its front; and let those who have any architectural sense and any national pride (and we have generally found the two qualities go together a good deal) say if that is a way for a great and wealthy nation to erect a building of the first importance for the palace of its military and naval administration. This defect is no fault of the architects, but had the site given them; but it is no less utterly deplorable one, sufficiently so to justify a reconsideration of the whole arrangement of the site before any money is voted.

THE ROOF OF WESTMINSTER HALL

In illustration of Professor Rogers' *Structural Architecture at Carpenters' Hall* on "Celestial Timber Roofs," we are enabled to reproduce a drawing by Mr. F. T. Dollman of that splendid specimen of the hammer-beam type of roof which spans Westminster Hall, and of which special mention and description are made in our lecture (see p. 476).

Mr. A. A. Cox's Design for a Municipal Mansion.—Ground Plan.

DESIGN FOR A MUNICIPAL MANSION.
SOANE MEDALLION COMPETITION.

The perspective view and detail which we give present the design for the Soane Medallion. Mr. A. A. Cox, which obtained a medal of merit. The ground plan is appended. The design has more of the mansion and less of town-hall about it than some of the others, and is a pleasing and dignified structure in general aspect; and the details, though giving nothing original, are carried out with refinement.

ARCHITECTURAL ASSOCIATION.
VISITS TO FISHMONGERS' HALL AND MERCHANT TAYLORS' HALL.

The fifth Saturday afternoon visit for the present session took place on Saturday last, the 1st ult., to the Fishmongers' Hall, where a large number of members were received by Mr. J. G. Dowse, the Clerk of the Company, at two p.m., escorted by him through the different apartments. Mr. Dowse described the various objects of interest belonging to the Company. The Fishmongers are the fourth on the list of the five great City Companies, and their hall erected in 1831, on the site of the old hall, built by Mr. Jarman, the City Surveyor. The oldest extant charter of the Company is a grant of the 37th Edward III. Having inspected the several rooms, the members proceeded to the

Merchant Taylors' Hall.—This hall is situated in Threadneedle-street, and here a paper was read by Mr. W. Hilton Nash, giving a short description and history of it. This Company was incorporated in 1466. The hall is the best of the Companies' halls, and was, like the Fishmongers' and Drapers' halls, rebuilt after the Great Fire, by Mr. Edward Jarman, City Architect, who was also architect of the second Royal Exchange. The Association had a former visit to the hall, March 6th, 1880, which time very extensive additions were made from the designs of Messrs. E. Pearson & Son, architects, estimated to cost at £23,000. The members having inspected the premises, from the very interesting visit to the several chambers of the new buildings, including the strong room, containing ancient silver "yard stick," formerly used by the Company, and the several "loving cups," soon after took their departure.

* See Builder, March 13, 1880.

THE LONDON AND MIDDLESEX
ARCHÆOLOGICAL SOCIETY.

At a meeting of this Society held on the 24th ult., at King's College, Strand (Mr. J. G. Waller in the chair), Mr. G. L. Gomme, F.S.A., read "Some Notes on the Westminster 'Polk Moot,'" which was followed by some observations by the Chairman and Mr. Alfred White, F.S.A.

Mr. John E. Price, F.S.A., hon. secretary, next described some Roman and other pottery, coins, and various other objects of interest found during the recent City excavations. There was also exhibited the skull of a wolf of prehistoric times recently dug out of a depth of 14 ft. of gravel on the Albany Estate, Albany-road, Old Kent-road, in excavating for a sewer. The gravel commenced 2 ft. or 3 ft. from the surface. The skull was in a very remarkable state of preservation, and was evidently that of a young animal, the teeth being firm and white.

Mr. Price referred to the proposed restoration of the Church of St. Bartholomew the Great, West Smithfield, which was spoken of and illustrated by us last week. A discussion ensued, in which the Rev. W. Panckridge, the rector of the parish, Mr. Alfred White, F.S.A., and others, took part. Mr. A. White strongly dissenting from an opinion expressed by the late Mr. Parker that the fringe manufactory occupies the site of a Lady chapel, his view being that this building was used for some other purpose. The general feeling was to waive any expression of opinion until the ground could be opened and more carefully examined, so as to ascertain what the building actually had been.

Mr. J. E. Price further announced that the Society had been in correspondence with the Chief Commissioner of Works in reference to the proposed restoration of Westminster Hall, and read a letter which they had addressed to him, stating that they had appointed a committee, consisting of Mr. C. B. Thurston, F.S.A., Mr. A. White, F.S.A., Mr. E. W. Brahrook, F.S.A., the President, Treasurer, and Secretary, to represent its views to the Parliamentary Committee if such were desired. The conclusion they had formed was in the main in support of the conservative restoration which Mr. Pearson proposed, but they preferred the lower proposed form of cloister to the

* We understand that the Westminster Hall Committee has completed its public sittings, and is not to meet again until after the Easter holidays, when it will meet with closed doors to consider its report.

higher one. They also desired that no new building should be erected on the space set free by the demolition of the Law Courts, but that the wall and its buttresses might be left clearly visible. They thought it an additional objection to the higher cloister that it would render necessary the intrusion into the interior of the hall of a large and unsightly staircase. The majority of them objected to the raising of the north turrets, as merging the hall in the modern buildings around it. They thought it greatly preferable that its present outline should be preserved and be visible.

The view taken appears to be (as we might have expected) rather that of archaeologists than architects.

A SUGGESTED SITE FOR THE
RE-ERECTION OF TEMPLE BAR.

SIR,—As a citizen of London, I take considerable interest in all that concerns the architectural monuments of the City, and I was, therefore, very pleased to see your protest (p. 441) in favour of the re-edification of Temple Bar,—the numbered stones of which are, I believe, still stowed away on some vacant land in the immediate vicinity of Farringdon Market, and not in Epping Forest, as seems to have been the impression at the Institute meeting. I sincerely trust that you will exert your influence to prevent so stupid a proceeding as the re-erection of the "Bar" in Epping Forest, where it would be an incongruity, severed from all its local and historical associations. Surely, rather than this, it would be possible to find some nook or corner for it within the precincts of those congeries of buildings which go to make up the Inner and Middle Temple? But better still would it be if it could be utilised as a gateway to the Temple, and I venture to point out what would seem to be a favourable opportunity for its utilisation in this capacity. As will be known to many of your readers, the easternmost entrance to the Temple is by a wretchedly-mean pair of wooden gates giving on to the open space in front of King's Bench-walk. My suggestion is that Temple Bar be re-erected on this spot, as it very easily could be by co-operation between two wealthy bodies like the Corporation of London and the Benchers of the Temple. The advantages of this site are—(1) that the "Bar" could be re-erected with its old façades facing east and west respectively, as in its former position; (2) that this historic monu-

ment would still remain in the City; (3) that it would be well and effectively seen terminating the long vista westwards along Tudor-street and Temple-street from New Bridge-street,—the two first-named streets (which form one continuous line of communication) having been considerably widened by the Corporation, although at present a public-house partially blocks the way (only temporarily, as Mr. Wyke Bayliss will be glad to hear); the western face of the Bar would also show admirably from the south front of the Inner Temple Library, from Paper-buildings, and from other points of the large open and tree-shaded place to which it would give admission from the east; and (4) the historical and literary associations of the monument would be preserved, for, if re-erected in the position I suggest, the monument would still be "The Bar by the Temple,—by the Church that is founded in honour of God and of his Temple of Jerusalem."* It would, of course, be necessary that some portions of the two old houses flanking the present mean timber gateway should be demolished, but, as compensation for this sacrifice, the Benchers would get an architecturally-effective and historically interesting entrance, admitting of the passage of two lines of carriages, instead of one line as at present. I am not aware that these houses are particularly worth preserving on historical or other grounds. That some better entrance to the Temple from the eastward will be necessary before long must be apparent to all who are familiar with this improved and improving quarter of the City. Large blocks of buildings adjoining the Temple, and facing towards Temple-street and the new streets which run southwards from Temple-street to the Embankment, are already in progress, and it is therefore sincerely to be hoped that the benchers of the Inner Temple and the Corporation of London will combine to effect an improvement which will not only be architecturally effective, but which will restore to London,—and to that part of London, moreover, where it will be most appropriate,—a most interesting historical monument.

I trust, sir, that you will give early insertion to this letter, and that it may be thought worthy of attention by the authorities concerned.

London, March 30. D.

COLOURED PORTLAND CEMENT.

SIR,—Can you inform me of any means by which the Portland cement with which a brick house is to be coated can be made a permanent red-brick colour, so that the plasterer may lay on a coat of cement instead of cement of the usual grey colour? Perhaps the same means might be used which are employed to colour the red concrete slabs now in use, if any of your readers could enlighten me as to the process? "PORTLAND."

"STREET ARCHITECTURE OF LONDON."

SIR.—A letter appeared in your last issue [p. 465] from Mr. Wyke Bayliss on the above subject, in connexion with the new street which is being constructed between Bloomsbury and the Haymarket by the Metropolitan Board of Works. The writer does not express himself one whit too strongly on the point, and there can be no doubt whatever that by the course the Board has adopted the approach to the new street in question will be entirely spoiled, so that the plasterer may lay on a coat of cement instead of cement of the usual grey colour? Perhaps the same means might be used which are employed to colour the red concrete slabs now in use, if any of your readers could enlighten me as to the process? "PORTLAND."

"STREET ARCHITECTURE OF LONDON."

SIR.—A letter appeared in your last issue [p. 465] from Mr. Wyke Bayliss on the above subject, in connexion with the new street which is being constructed between Bloomsbury and the Haymarket by the Metropolitan Board of Works. The writer does not express himself one whit too strongly on the point, and there can be no doubt whatever that by the course the Board has adopted the approach to the new street in question will be entirely spoiled, so that the plasterer may lay on a coat of cement instead of cement of the usual grey colour? Perhaps the same means might be used which are employed to colour the red concrete slabs now in use, if any of your readers could enlighten me as to the process? "PORTLAND."

Now, it is well known that the Duke of Bedford is the freeholder of nearly all the land in this quarter, and I am in a position to state positively that his Grace has not thrown any obstacle whatever in the way, but was willing to meet the Board in a satisfactory manner. As to other local facts, I may add that the lease of the public-house has but about twelve years to run, so that the cost of purchase could not be very extravagant. There are besides sixteen public-houses within the radius of about 150 yards. The "Black Lion," therefore, would not be particularly missed. The only other parties concerned, the owners of the adjoining building, of which a small portion would be required, and of which the Board has already

* "Temple Bar,"—A Monograph by E. W. Godwin, F.S.A. London: 1877.

taken a part, actually signed the requisition above named.

Last of all, the Board still have power in their original Act of Parliament to carry out this great improvement, the cost of which compared with the 110,000*l.* paid for the Pavilion Music Hall, at the other end of the street, would be absolutely trifling. The enclosed card will show you that I am an old parishioner and A LARGE RATEPAYER. Bloomsbury, 30th March, 1885.

"ARSENIC AND ARCHITECTS."

SIR.—A letter from Sir E. Beckett has been widely quoted upon the danger of my poisoning congregations with arsenic when I apply it beneath the floors of a church for preserving the timbers from dry rot. I never specified or recommended its use, nor ever should use it, and I should much regret that an incautious reply to a clever man's "chaff" should give any ground for the idea that after all it might be used without great danger. I have, indeed, had to answer inquiries made to this effect in consequence of his letter. Sir Edmund is equally deluded in supposing that architects hate his useful little book, when they venture to smile at the idea of its ever superseding their office or their art, or at the probable result of a man becoming his own architect. WILLIAM WHITE, F.S.A.

30A, Wimpole-street, W.

. It would have been better if Mr. White had stated more exactly what was the part he took in the matter, and what he did recommend, and why. We confess that we cannot quite reconcile his note with another which we read in the *Times*. He does injustice to Sir E. Beckett's sincerity in accusing him of "chaff."

Books.

Glass Painting: a Course of Instruction in the various Methods of Painting on Glass, and the Principles of Design. By FRED. MILLER. With numerous illustrations. Wyman & Sons, London (Wyman's Technical Series).

UNDER this title is presented to our notice a small work on "Glass Painting" purporting to be the result of the author's experience. The aim of the author has been, we presume, to compile a work which should treat of the historical technology of glass-painting; at least, we would infer so much from the title. On an examination, however, we find the *matériel* of the work does not fulfil this liberal promise. The art of glass-painting described is an art entirely that of an artist, and not the art *par excellence*. We fail to see how it could be otherwise, as glass-painting (synonymous with glass-staining) is a most elaborate art, and one which, considered technically, apart from any theory of design, would occupy a work of much greater magnitude than that before us. This work is a collection of "hints" rather than principles. Generally, the work is not historical, the practical instruction in glass-painting is merely the method of the author, and as to the principles of design, we have illustrations of the author's and others; as to any theories or rules partaking of the nature of "principles," they are entirely absent. "Tools and Materials" are somewhat briefly described. A short chapter has been devoted to "Tracing and Staining"—staining, of a necessity, to be thoroughly treated would require a chapter to itself. Under the heading of "Enamels" we have a very slight notice of some English colours, &c. The information given could be obtained from any liberal trade catalogue. The ordinary division of an enamel colour into "flux" and "metallic oxide" is not noticed. The information given is of the slightest.

In order to make this work "reasonable," the scientific principles of the art should be gone into. For instance, "In the case of blue, green, and yellow ruby, a thin film of one of these colours is put on the other side. . . . In adding stain to ruby, always do it on the side that is not flashed." This last is the only instruction as to staining "ruby" glass. Now, in point of fact, we have "streaked" ruby, which becomes darker in the kiln, and which is stained by water tintured with the "silver" stain only. Again, ruby never improves in the heat. Some "antique" ruby becomes darker, and cheap flashed ruby usually becomes lighter, while being fired. Why is all this? Copper oxide is the colouring matter of these "rubies." Copper in its higher state of oxidation colours glass blue to bluish green; in the lowest oxide form (Cu₂O) it colours glass a dark "ruby." And as heat alone is sometimes sufficient to

alter the character of the colouring matter,—a piece of glass almost colourless may after firing be almost opaque. The colouring power of copper begins at dark brown, becomes lighter as the higher oxides are being reached, till it is ruby, then salmon tint, next colourless, grey and so on, to blue. When the artist has a good piece of ruby glass which he does not wish changed by the heat of the kiln, he mixes "flux" with his enamel colour in order that the said colour may fuse at a lower heat than will spoil the ruby. Now, the author has said almost nothing about the staining of ruby, and certainly has not described the character of a "flux." Again, no theory or principle of "fluxing" is apparent in this work.

We join with the author in his admiration of the writings of Pugin and Wyatt, whose efforts have conduced so much to revive the artistic feeling of industrial art and architecture. The author, in his introduction, evidently thoroughly appreciates the beauty of the early examples and he is further to be congratulated on his perception of the true value of Munich glass. The argument is most apposite, and has been treated with some skill. The art is shown to have originated in the cloister, and the monk to have been the first glass-painter. In the early days of the art the clergy undoubtedly would perceive its influence on the mind and the invaluable aid it was likely to offer, as an important factor in captivating a mind rude and untutored. The great beauty of the art is shown to exist in the work being an expression of the devotional love of the artist, and never a mere example of skill. The first glass-painters had no precedent to guide them, and much labour must have been expended ere they could produce such effects as we may see existing yet. The motive of the earliest stained glass was to admit light; that is light modified,—not the dazzling brilliancy of the sun, but a quiet, mellow radiance. Beauty of colour was the only merit of this early glass. To the primitive manner in which the work was carried on, we may ascribe the reason of its beauty. The author of the work in question has in no way entered into any consideration of the primary laws of form, colour, and composition of form. There are several minor details which would bear to be more fully considered, merely technical; these we may pass over. Several phrases, however, we may be pardoned for calling attention to. "The painting of every other square only never commends itself to me, as it suggests cheapness, and looks poor and thin." We cannot agree with this opinion. Alternate quarries in domestic stained-glass are so many points of interest, and when delicately treated, finely traced, and merely tinted with "yellow stain," form a very beautiful glass-effect. Again, "A method frequently resorted to in church windows to give tone and softness to white glass is to mat each square, when traced, with amber or ancient brown. . . . When dry, some of it is either rubbed off with the finger or with a stiff hog-hair brush. This plan is sometimes termed *antiquing* the glass, and is supposed to give the appearance of age. . . . If this matting is done to deceive, it is certainly false, and should not be practised; but there is nothing illegitimate in the method itself." We consider this practice most reprehensible, and one which should not be tolerated.

In many of the designs shown in this work there is a certain super-elaborateness, not entirely in consonance with the character of the glass. Simplicity is a quality that cannot well be dispensed with. Glass-staining is entirely a conventional art, and "naturalism" is seldom in place. It is better to suggest merely some incident of plant life, than design a botanically correct adaptation of foliage, &c., trained by force into the regularity of glass and lead. Enamel colours never improve with age; their best period is when they are new. Stained glass is never started at,—the light comes to us; the glass is a window, not a picture; the harmony of colour and beauty of form, with the train of thought excited in our minds by a mere suggestion, give us a pleasure which cannot easily be described. The chapter on ecclesiastical glass-painting enters concisely into the subject.

The illustrations, which are examples of old glass, for the most part, are bold and vigorous. As the work purports to be practical, all historical notices could have been dispensed with, and a chapter or two added on the subject of theory and composition of "enamels" and "fluxes." This knowledge is, to a great extent, the basis of the practice of the art. The

omical formulae of the various glasses should occupy a prominent position in a work of this description.

VARIORUM.

"The Architects' and Contractors' Handbook and Illustrated Catalogue of Materials and Manufactures," edited by J. Douglass Matthews (London: B. T. Batsford, 52, High Holborn. Liverpool: Harris & Co., Drury-street), has reached its third annual issue. We reviewed the first issue at some length in the *Builder* on December 15, 1883, and we note at the editor has acted upon some of the suggestions which we made at that time. There is still a great many things not included in the book in a compilation of this kind it takes time to get all the materials together. The work will be found exceedingly handy for reference, and is provided with two indices,—one to the materials and appliances themselves, and one to the manufacturers and merchants to supply them.—"A Walk Through Lincoln Minster," by the Rev. Edmund Venables, A., Precentor of Lincoln (Lincoln: Ackrill, Ludcock, & Keyworth, printers), is a lecture delivered by the author to a local association. It gives an historical account and architectural description of the Minster, and will be found useful by visitors, although in saying this we do not mean give our endorsement to all the author's views.—"That the Electrician and the Electrical Engineer are finding increasing scope for activity and usefulness would be made evident (even if it were not otherwise apparent) by the 'Electricians' Directory and Handbook for 1885' (London: *Electrician*, 1, Salisbury-court, Fleet-street), which rhymes one or two improvements upon previous issues. A new and interesting feature, first introduced into the work for the first time, consists in a biographical section, in which brief biographies are given of those whose names are best known in connection with electrical pursuits, in some cases illustrated by portraits. The work contains a great deal of useful information relating to dynamos, arc, and incandescent lamps, electrical formulae, as well as a directory of electricians and electric-light engineers.—"The Tenth Annual Report of the Chamber's Shelter Fund" (London: Waterlow & Sons, London-wall), is a summary of the progress made in the useful work in which it is engaged. Thirty-two shelters have now been placed in various parts of the metropolis, and they are used by 1000 cabmen daily. It is stated that until these shelters were established the drivers had means of obtaining refreshment or protection from the weather when on a cab rank, and police regulations prohibiting them from leaving the rank. Those of our readers who may be able to help the work of the fund should address the Hon. Sec., Mr. Walter H. Macnamara, 15, Soho-square, W.—A very useful Illustrated Catalogue has just been issued by Messrs. Treggon & Co., of Jewin-street, E.C., and Brewery-road, King's-cross. Besides being a catalogue of the multifarious articles and materials which are supplied by the firm, it contains some very handy trade memoranda, such, for instance, as the approximate weights per square foot and per sheet of zinc, copper, and black and galvanized iron.—Mr. Edward Stanford, of 55, Charing-cross, sends us his "Catalogue of Maps and other Geographical Publications," published or sold by him, as well as "A Résumé of the Publications of the Ordnance Survey of England and Wales." Those who want maps of any part of the world will be sure to find what they need in these catalogues, while the information as to the publications of the Ordnance Survey shows the progress that has been made in that important work.—"Self's Dictionary of the World's Press for 1885" (London: H. Soll, 167, Fleet-street) brings together in a convenient form a great deal of interesting and useful information to the newspaper press of the world. It is illustrated with a large number of maps, added with red dots at all points where newspapers or periodicals are published. We will, however, to find any information in the work about the newspapers of Malta, although one of the maps the island is almost overlooked by one of the red dots in question. Nevertheless, the work appears, on the whole, to have been carefully compiled, and will be a welcome addition to the reference books of the printing-house or library.

CHURCH-BUILDING NEWS.

Stone (Staffordshire).—Christ Church, Stone, has been re-opened, after extensive additions and alterations. The church, which is a plain brick structure, was built about forty years ago. The old chancel, which was but 20 ft. by 13 ft. 9 in., has been removed, as also the former vestry. A great portion of the east wall of the nave has also been taken down. All the old pews have been cleared out, and the organ has been removed from the gallery. A new chancel, 30 ft. long by 20 ft. wide, has now been built. This is 25 ft. 6 in. high internally, and some 33 ft. to the ridge of the roof externally. It has a polygonal apse, five of the sides having windows the heads of which are filled with tracery. The chancel roof is composed of strongly-framed principals with curved ribs rising from the walls some feet below the cornice. The organ is to be re-erected in a spacious organ-chamber, which has been built on the north side of the chancel, into which, and the nave, there are wide and lofty arches for the double front with which the organ is to be re-arranged. The new vestry is upon the south side of the chancel, and is commodious and lofty. The nave and western gallery have been entirely re-seated with substantial seats of pitch-pine. In the chancel are oak choir-benches, with panelled fronts, an oak prayer-desk, and, on both the north and south sides, stalls for the clergy. The pulpit is placed so as to form the termination of the low screen wall by which the chancel has been extended into the nave somewhat beyond the line of the chancel arch above; the base is of Croxdon Abbey and Hazelstrine red stone, similar to that used for all the other internal masonry; above this base the pulpit is of the finest Painswick stone and veined alabaster. All the external masonry is of Hollington stone. The general works have been executed by Messrs. Lowe & Sons, of Burton-on-Trent, who also have supplied the pulpit and all the joinery, including the chancel seats and prayer-desk. The gas-fittings have been manufactured by Messrs. Brawn & Co.; the brass chancel-rails, a new altar-dish, the frontal and cover of the Communion-table, and other furniture, are supplied by Messrs. Jones & Willis; and the heating apparatus has been remodelled and extended by Mr. Parkes, all of Birmingham. The chancel has been laid with encaustic tiles by Messrs. Minton Hollins & Co., of Stoke-on-Trent. The whole has been carried out under the direction and from the designs of Mr. W. Hawley Lloyd, architect, of Birmingham.

Waterloo (Liverpool).—A new set of choir-stalls in pitch pine, replacing the old and inconvenient fittings which before existed in the chancel of St. John's, Waterloo, a suburb of Liverpool, has just been erected by Messrs. Jones & Willis, of Birmingham and London, under the supervision of the architects.

Brierfield.—There has just been placed in St. Luke's Church, Brierfield, a new steam heating apparatus. The apparatus is fitted up on the gravitation principle, and is easily worked with a pressure of 15 lb. The boiler is in a cellar immediately below one of the vestries. The main pipe, which is 1½ in. in diameter, leaves the boiler, and is conducted in a flue at one time used for a hot-air apparatus (which was formerly the mode adopted for heating the church) into the body of the edifice, from which branches are taken of 1-in. pipes round and the body of the pews in the centre aisle, and the east and west aisles. The steam is taken round in these pipes, and the condensed steam caused by circulation returned to the boiler. The apparatus has been provided by Messrs. Thos. Birtwistle & Co. (Limited), of Burnley. It is stated that this is the first church in the United Kingdom which has been heated by steam.

Hagbourne.—Some time ago it was decided to apply for a faculty to erect a plain oak reredos in place of the faded and dilapidated screen standing before the east window of the parish church. While the negotiations were pending, Sir Robert Loyd Lindsay came forward and proposed to erect a reredos at his expense. The offer was accepted, and the work is now completed. According to a local paper, the east window, though a very fine one, has, when entirely uncovered, quite spoiled the general beauty of the church, as it stretches the whole width of the chancel, and comes down very low indeed. It has been the object of the architect

(Mr. Woodyear) to correct this. The wall, from the ground to the bottom of the window, has been faced with Bath stone, and the reredos proper has been built on to what was hitherto the thickness of wall inside the window-sill. On each of the outsides, north and south, is a narrow canopy divided in the centre, and having panels at the back divided into squares,—these are perforated, and display open work, through which the light can be seen. Next to these, on either side, are two wider canopies, divided from the others by columns projecting far out, and ornamented by a pinnacle and finial. The panels of these are also perforated. In the centre a much deeper and higher canopy, having on either side projecting columns with pinnacles, and at the back a diaper panel not perforated. Standing boldly out under this centre canopy is a white marble cross, and in the front of the whole is the super-altar, projecting some distance from the reredos, and 6 in. above the altar. All the work above the super-altar is done in Caen stone.

Poynton (Cheshire).—The church on Lord Vernon's estate at Poynton has now been completed by the erection of a tower and spire of simple Early Decorated character, corresponding with the rest of the church. The stone for the most part has come from Lord Vernon's quarries. The steeple has been built by Messrs. Ellis & Hinchcliffe, from the designs and under the superintendence of Messrs. Medland & Henry Taylor, architects, Manchester.

Queenstown (South Africa).—The opening and dedication of the nave of the Church of St. Michael and All Angels took place on Sunday, February 15th. The foundation stone was laid on the 14th of November, 1882, by Sir T. C. Scanlan (then Premier of the Colony). The design is Early English, and the work of Mr. W. H. Reid, architect, Cape Town. The only portion opened at present is the nave, north and south aisles, and baptistry, covering a space of 85 ft. long and 45 ft. wide. The walls of the nave are supported by polished marble columns given by members of the congregation. With the object of making a temporary chancel a screen has been erected across the church,—thus forming a choir and sanctuary in the centre, an organ-chamber on the north, and a vestry on the south aisle,—which will all be removed on the completion of the chancel and transepts. The roof is 50 ft. from the floor, and has substantial principal rafters covered with diagonal boarding, all in pitch-pine, well oiled.

Kensington.—A richly-sculptured reredos has just been erected in St. George's Church, Campden Hill, as a memorial to the late Lieut.-Colonel D. W. Lawrell, R.A., by his wife. It rises to a height in the centre of about 13 ft., and occupies three sides of the apse, which has been newly decorated. The main features of the reredos are a sculptured representation of the Crucifixion and statues of St. Michael and St. George. The decoration of the arch was by Mr. Pullen, of Gray's Inn-road, and the reredos is by Mr. James Forsyth, of Finchley-road.

Headon (Notts).—The Church of St. Peter, Headon, near Tuxford, Notts, is about to be repaired under the superintendence of Messrs. Somers Clarke and J. T. Micklethwaite, of Dean's Yard, Westminster. The chancel was roofed, a new east window inserted, and the stonework throughout the church mercilessly scraped in 1858. The plaster then put upon the walls is in a worse condition than the old plaster still remaining on part of the nave walls. A flat plaster ceiling and new roof was put up over the nave some eighty years ago. This ceiling, much decayed, will be lined with boarding and panelled by ribs, the old bosses, many of which remain, being placed at the intersections. The pews, which are of the same date as the nave roof, and are arranged without a central alley, will be used for wall linings. The church is ultimately to be re-seated with oak pews. The Jacobean pulpit retains its back-board and canopy; with this exception, there is not any old wood-work in the church. The repairs are to be executed by Mr. William Johnson, of Doncaster.

Sub-River Tunnel at New York.—At New York preparations are being made for the construction of a tunnel under the river East and Blackwell's Island, which, it is estimated, will be nearly one-fourth of a mile in length. The total cost of the tunnel will be, it is calculated, nearly seven per cent. less than that of a bridge.

The Student's Column.

DESCRIPTIVE GEOMETRY.—IX.

WE have already solved some problems by employing the method of Rotations. In this method the original projection planes are kept, and the object itself is made to rotate round an axis. It is an operation very much easier to conceive than that of changing the projection planes, but in practice, except for a class of surfaces which we shall study hereafter, it leads to very much more complicated operations in drawing. In architecture many of the surfaces we shall have to deal with both in the delineating of shadows and in solving cases of masonry, belong to those where the method of rotations is the most convenient to use; therefore we must thoroughly master it by solving, through its means, simple problems on points, line, and plane.

Draw the new position occupied by the point *a* after rotating round the vertical axis *O*, an angle measured by the arc α .

In rotations the object rotated is supposed to be connected by a radius with the axis of rotation, just like the circumference of a wheel is connected by spokes with its axle. The amount of a rotation is given by the angle formed by the new and the old position of the radius of any point of the object rotated. The arc α , which measures the angle of rotation, has been given us on some definite circle round *O*, which we begin by drawing; this is the measuring circle.

We join a^v to O^v , and, as the radius a^v , O^v will move with the point *a* in the rotation of the latter we have only to mark the point γ where a^v cuts the measuring circle; then carry the distance α from γ to δ , and we have the new radius a^h , O^h , which gives us the new position of the point *A*. The student should note that in rotations the dash which indicates the second position of a point is put directly after the latter, whereas the signs h and v , which indicate the horizontal or vertical projections of the points, remain unchanged, as in a^h or a^v ; if, on the contrary, the point does not

Fig. 47.

Fig. 48.

facilities than any other to the reader in following out the explanations; but, when working drawings are made, those signs are in general dispensed with, or a shorter system of notation, such as a plain letter for the plan of the point, and the letter followed by a dash for its elevation, may be adopted. The lines should be drawn fine, our thick lines are only made to distinguish the various lines according to their importance. (See fig. 47.)

Draw the new position of the line *D* after rotating round the vertical axis *O*, a given angle measured by the arc β .

In the fig. 48 we have marked only a^h , the elevation of *a* being quite useless for our purpose. We could draw the rotation of any two points of *D*, and thereby get *D* in its new position D^h ; but we spare ourselves drawing many lines by selecting for rotation the points *a* and *b* where D^v cuts the measuring circle; we then have only to carry the distances a^h , a^h , b^h , b^h equal to β , and draw the new elevations a^h , b^h to get the new projections D^h , D^h required.

Fig. 49.

projection we may wish of an object, two rotations are required, the axes of which are at right angles with one another; the one axis is vertical, the other is perpendicular to the elevation plane, for they are the only rotation

Fig. 50.

we can draw readily. The student must therefore, exercise himself in drawing horizontal rotations as well as vertical ones. There is no difficulty in doing so; we have only to turn the

Draw the new position of the plane *P* after rotating round the vertical axis *O*, a given angle measured by the arc α .

As for the horizontal trace P^h of the plane *P*, it rotates like a straight line; you will draw it most easily by the means of the points *a* and *b* where it cuts the measuring circle. Where P^h cuts *L*, *T* we have, of course, a point of P^v ; to get another point thereof, we take a horizontal line, *F*, belonging to the plane *P*, we rotate *F* also according to the same angle α , and the point *c* where F^h penetrates the elevation plane is also a point of P^v . A notable simplification to the drawing is obtained by so selecting the horizontal line *F* that F^h pass over O^h , for after rotation the plan F^h of *F* will, of course, still pass through O^h , which is the centre of rotation. Please note in fig. 49 that the points *a* and *b*, as well as *c*, have no signs h or v tacked on to them, because they are not the projections of *a*, *b*, and *c*, but the points themselves. (See fig. 49.)

For the sake of clearness we have made separate diagrams for each operation of rotating a point, a line, and a plane, but in practice we will probably have to carry out the three operations simultaneously on the same drawing.

Draw the new position of an object after rotating round a horizontal axis, *O*, a given angle measured by the arc β .

We have already seen that to obtain any new

drawing upside down to find that the operation is identical with the preceding one. We will limit ourselves to drawing in fig. 50, the rotation of a plane, *P*, round a horizontal axis without giving any further explanations.

move, but new projections are made, we then put the dash to the signs themselves, h or v , as in a^h and a^v , thus clearly denoting the character of the transformation the point has undergone. This method of notation has been adopted in the Builder, as it offers greater

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

Water Waste Preventer for Water-... F. C. Biddiscombe.
System is divided into two parts, upper and lower. The upper one is filled with the usual ball float. The second or lower one is held by a hole in the partition plate. The system has two cylindrical chambers, one above the other, and is worked by a plunger. The lower works the plunger, which, on its descent, forces the water up the other chamber and starts a syphon which empties the lower.

Pavements, Wall Surfaces, &c. J. H. ...

Invention consists in constructing surfaces of tiles, bricks, or blocks, the whole or the edges of which are curved. Borders and made up of tiles of simple shape, having one, or three curved edges, may be combined with a pavement.

Steam Boilers. J. Calverley.

Additional furnace flue is provided in the lower part of a Lancashire boiler to displace water and for more uniform heating.

Cistern Ball Valves. E. Brock.

Outlet is turned downward, and the valve upwards, against an inverted seat. A bent tube fits into the upper end, has its longer arm vertically by legs on the outside of the valve, so that the ball lever passes through it. The valve is attached to the shorter arm, in the form of a truncated cone, with a plug of indiarubber stretched over it.

Brushes. S. Morley.

Washing-brushes for railway cattle-trucks or other purposes are made with a hollow through which passes a tube terminating at the end of the brush in a small T-piece, from which tubes pass through the brush to the bristles. Air or fluid is supplied from an elevated tank and a tube runs either through a hollow in the brush, or on the outside of a solid handle, to the brushes.

Door Letter-box. G. W. Potter.

Sides and top and bottom of the letter-box are of flexible material, so as to allow the door to be opened. The back is rigid, and contains an iron through which the letters are removed.

Nails. J. J. James.

Improvement consists of a shoulder turned down the shank, and which supports the head of it squarely. The shoulder is formed by a rest-stand operating upon the end when the shank is by countersunk gripping dies.

MEETINGS.

SATURDAY, APRIL 4.
Edinburgh Architectural Association. - Visit to Rosslyn Castle and Chapel.
MONDAY, APRIL 6.
Leeds and Yorkshire Architectural Society. - Election of Officers and Presentation of Report and Balance Sheet.
Edinburgh Architectural Association. - Mr. D. Purves on "House Drainage and the Sanitary Arrangements Connected therewith." 8.30 p.m.
Inventors' Institute. - 8 p.m.
TUESDAY, APRIL 7.
Northern Architectural Association (Newcastle-on-Tyne). - Quarterly Meeting.
WEDNESDAY, APRIL 8.
Civil and Mechanical Engineers' Society. - Mr. David Gravell on "The Markets of the Metropolis." 7.30 p.m.
THURSDAY, APRIL 9.
Architectural Association. - Members' Soiree. 7.30 p.m.
FRIDAY, APRIL 10.
Institution of Civil Engineers (Students' Meeting). - "On advances for Crushing Stone and other Hard Materials." 7.30 p.m.
SATURDAY, APRIL 11.
Architectural Association. - Visit to the Northumberland Avenue Hotel. 3 p.m.

Miscellanea.

The Farringdon Vegetable Market.—The *City Press* states that the Markets Committee have recently viewed the site of the fruit and vegetable market in Farringdon-street. It is proposed either to re-model the market, or to entirely re-build it. One thing is certain, the time has arrived when something must be done. The general opinion of those connected with the market is, that nothing short of an entire new building will be of any permanent service. Those who know the dilapidated and forlorn condition of the buildings will be disposed to coincide in this opinion. We notice that Mr. Thomas Rudkin, who is especially conversant with the requirements of the City in regard to market accommodation, proposes that the whole of the area available for market purposes should be excavated to 20 ft. below the level of Farringdon-street; that the basement should be so constructed as to be adaptable for stabling for at least 200 horses,—a requirement much needed by market-gardeners and others bringing their produce to the market; and the remainder to be used as stores for the tenants. The entrance to the basement would be (according to Mr. Rudkin) from Farringdon-street. The market itself would be on a level with Farringdon-street, and would be, practically, the same shape, and its carriage entrances and exits in the same form, shape, and position, as the new Central Fish Market, Farringdon-road. The whole of the market area could be covered with a light iron and glass roof. Wagons and other vehicles would be able to pass in and out of the market at either of the three entrances, namely, Soucenier-street, the present entrance in Farringdon-street, and at a third entrance to be provided. In addition to this, Mr. Rudkin thinks that the market scheme should, in the interest of the public, as also in that of the Corporation, as handloras, be supplemented by constructing on three sides of the site, over the market, viz., the south, north, and east, a range of buildings as dwellings for the working classes, and on the western, or Shoe-lane side, a row of shops or warehouses. This part of the scheme would, of course, be distinct from the expenditure on or construction of the market.

Water Supply in the West of England. Mr. Arnold Taylor, Local Government Board inspector, has been holding an inquiry at Tiverton Town Hall with reference to the application of the Council for sanction to borrow £2,000, to enable them to carry out the scheme prepared by Mr. Robert Ellis, water bailiff, for improving the water supply of the town. Mr. Ellis described his plan, explaining that it was proposed to construct new works near the site of the present, on a piece of ground named "Allers Copse," belonging to Sir John Heathcote-Amory, Bart., and situated about two miles and a half from the town. The supply would be taken from the main stream at a point just under How Farm, and about 400 yards above the settling-tanks. Filtering beds would be provided, and he proposed to utilise the present works as a service reservoir.—We learn that Torquay, Newton Abbot, St. Mary Church, and Cockington are just now in an exceedingly satisfactory condition as regards their water supply. The new reservoir constructed by the Torquay Local Board, at a cost of about 30,000*l.*, is now filled to a height of 24 ft. 6 in., and contains 120 million gallons. The old reservoir, a short distance below, is quite full, and holds 103 million gallons, so that at the present moment there is an available supply of water stored in the two reservoirs of no less than 223 million gallons. It is anticipated that the new reservoir will be quite full in six weeks, and that soon after that time the deferred celebration of its construction will in all probability be held. The work of duplicating another section of the water main, at a cost of 5,000*l.*, is now so far laid and in working order by the middle of April. This further extension of the mains will increase the supply by 200,000 gallons a day, making the total daily supply 1,200,000 gallons, which is equal to about 30 gallons per head of the population.

Partnership.—Mr. Henry H. Leonard, Quantity Surveyor, of 202, Bishopsgate-street, Without, announces that he has from Lady-day taken Mr. Stanley Clarke into partnership, and that the style of the firm will be "Leonard & Clarke."

York Architectural Association.—At the fifth meeting of this Association for the present session, Mr. R. A. Parkin, of York, gave a lecture on "Building Construction," in the course of which he referred to the varying solidity of the earth which formed the foundation for the building, and showed how to overcome inequalities in the foundations. Referring to the construction of walls, he remarked that brickwork could never be crushed by fair means. If the foundation was good, and the areas were all gone into, it was almost impossible to build a building high enough to crush brickwork. There were three classes of walls,—the massive, the substantial (3 ft. to 4 ft. thick), and the walls built to the precision required by the science of to-day. He would only deal with the third class of walls, as the other two were wasteful. A straight wall would give way at the bottom, a wall arched at one end and supported at one end would turn and fall inwards, while a wall with a binding piece at each end would have the greatest pressure in the centre. While speaking of the thickness of walls, he remarked that the scientific construction of the walls was never considered at all by some people building them; they generally built them thick enough to stand, and, of course, the builder had to pay the cost.

An Auger to Bore a Square Hole.—An American paper states that the first and only auger ever manufactured that will bore a square hole is now in the shops of the Cleveland Machine Company. This auger bores a 2-in. square hole, the size used in ordinary frame buildings and barns, but it can be made on the same principle to bore square holes any size. Its application is the ordinary one, and it works on the same principle as round-hole augers. Its end, instead of having a screw or bit, has a cam motion which oscillates a cutter mounted on a steel rocking-knife which cuts on both sides. In order to prevent the splintering of the wood, the ends of the cutter are provided with small semi-circular shaped saws, which help in cutting out perfectly square corners. It is estimated that this new process will save the labour of three men who work with chisels, as one man can conveniently cut a 2-in. hole in the same length of time he can bore a round hole.—*Iron.*

The Preservation of the Thames.—On Tuesday a Bill prepared by the members of the Committee who took evidence as to the "operation of the Acts for the preservation of the Thames, and the steps necessary to secure the enjoyment of the river as a place of recreation," was issued. The object of the Bill is to preserve the Thames above Teddington Lock for purposes of public recreation, and for regulating the pleasure traffic thereon. It asserts a public right of navigation, but private artificial cuts are not to be deemed parts of the river. The Conservators may exclude the public. The right of navigation is to include anchoring and mooring, and the riparian owner is to remove obstructions unless maintained for twenty years. There is a provision for preventing annoyance to riparian owners, and also against shooting or the use of firearms on the river. All pleasure-boats are to be registered. Jurisdiction for offences against the Act will be exercised by the Justices.

Spring-bank Presbyterian Church, Hull. This church, which has been closed for alterations about two months, was re-opened on Sunday last. The works have been carried out under the superintendence of Mr. Samuel Musgrave, architect, Hull. To remedy acoustic defects, Mr. Musgrave recommended the formation of a false roof, commencing a few feet above the wall-plates, and formed into panels, and boarded with narrow boarding; also the erection of a semicircular platform behind, on which an organ might be advantageously placed. These recommendations have now been faithfully carried out.

Furness Abbey.—A provincial paper states that the ruins of Furness Abbey were recently in danger of suffering severe damage through the running of heavy mineral trains on the Furness Railway, which skirts the ruins. To avert the danger the Duke of Devonshire, on whose North Lonsdale estate the remains of the abbey are situated, has had the walls of the north transept, the refectory, chancel, and sacristy supported and strengthened by means of strong stays and tie-rods, and the ruins are now believed capable of resisting the vibration caused by the trains.

The Proposed Woolwich Steam Ferry. The Secretary of State for War has informed the Woolwich Local Board of Health that he has recommended to her Majesty's Treasury the proposal of the Metropolitan Board of Works to provide a steam ferry at Woolwich, a scheme which ought to receive the support of the Government. To say nothing of the convenience, the advantages of the steam ferry to the garrison and military stores at Woolwich in the facilities which it will afford for communication with the docks and railway on the opposite side of the Thames are very considerable. The mounted troops and vessels which have hitherto had a march of eight miles from Woolwich, by way of Lambeth Bridge, to the Albert Docks, will, when the ferry is at work, have a journey of less than five miles.

The Painters' Company.—Mr. G. N. Smith has presented a headle's solid staff to the staff of the company's arms, enamel, proper heraldic colours, supported by leopards rampant, above which is the crest of the company; and surmounting the whole the figure of St. Luke, the patron saint of the company. Round the ferrule at the top of the staff is the following inscription:—"This was presented to the Painters' Company, George Mence Smith, A.D. 1855. John Di Crace (master)." This staff was designed by Mr. J. G. Crace, and manufactured by Mr. G. Edward & Sons, 1, Poultry. The staff was presented at a banquet given on Wednesday evening last, at the Hall of the Company, 1, Trinity-lane.

Val de Travers Asphaltic Paving Company.—The fifteenth ordinary general meeting of this company was held on the 25th ult. H. C. Scott presiding. In their report the directors recommended a dividend of 7*½* per share, making, with the interim payment of 12*½* 6d. for the year, and the carrying forward of 2,061*l.* 10*½* 3d. to the next account. The Chairman moved the adoption of the report, and in doing so said there had been a considerable improvement on the previous year, and the directors were able to pay an increased dividend. The gross profit of the year was 16,886*l.* 8*½* 3d. as against 15,103*l.* 4*½* 2d. in 1887, the increase having been gained at the same rate of expenditure. Mr. James Edmeston seconded the motion, the report was adopted.

Proposed Extension of Aske's, Hatch School.—In connexion with these schools, which the Haberdashers' Company, the governors, it has been provisionally agreed, the managers shall be empowered to borrow a sum not exceeding 25,000*l.*, to be gradually repaid out of income, with a view to the buildings, at present used as a girls' school, for the purposes of a lower department of boys' school, and to purchase land upon which to erect commodious new buildings in which to educate the girls. Upon the completion of enlargement of the schools there will be accommodation for 500 boys and 400 girls, instead of 300 and 200 respectively under existing conditions.

Salford.—The trustees of the Manchester and Salford Savings Bank have purchased as the chief thoroughfare of Salford, where they have hitherto rented premises. The design for the new bank have been prepared by Messrs. Medland & Henry Taylor, architects, and the work has been let to Mr. Thomas S. The architectural character of the proposed work is Italian. The chief front will be built in Ruahon red bricks, with dressings of stone and terra cotta. The interior of the bank proper will be of Cliff's glazed bricks. Beside the bank there is to be extensive cellaring, much of it fireproof,—and five good rooms, fronting the main street.

Obituary.—The death is announced of Henry C. Harris, A.R.I.B.A., which took place after a painful and protracted illness, at residence, "Kingscote," Penarth, on the 1st ult. The deceased was in this thirty-fourth year. He designed and carried out several buildings in Cardiff, Penarth, Bridgend, Maestry, Pontypridd, and other places, most of which were won in open competition. At Penarth he held the office of Surveyor to the Board of Health from its commencement.

Winchester Cathedral.—At a meeting of the Dean and Chapter of Winchester last week Mr. Sadding was appointed the architect for the restoration of the great screen in Winchester Cathedral.

broath.—A four-light Munich stained-glass window has just been erected in St. Mary's Church, Abchurch, the gift of Mr. and Mrs. of Abbey Bank. It occupies the west of the church, and consists of four lights elaborate tracery. The leading features of the window are large-sized figures of St. Paul, Peter, St. Andrew, and St. John, while each apostle is a small subject description of a scene in his life. The artists are Messrs. Mayor & Co.

ventilation at the Law Courts.—It is a difficult task to please every one, and the question of ventilation appealing to various capabilities is rendered none the less easy to the occupants of a room are removed from time to time, as is the case at the New Courts, where much remonstrance has lately been occasioned by more than one.

It appears that the ideas in the judicial as to what constitutes a pleasant temporary some ten degrees, and the officials of the Office of Works, who have charge of the ventilating arrangements, are frequently called to short notice to raise or lower the temperature accordingly. The rule adopted regulating the work is to know in the winter which (particular!) judge will sit on such a court on the following day, and to arrange the necessary alterations to suit, but as the judges change during the day, a further alteration has to be made, and the individual dissatisfaction is a nineteen cents to be thus attended to the rapid displacement of air is expected brought about without draught or inconvenience, and accordingly the principle of the system is condemned, one judge going so far as to enjoin that the apertures should be kept up, in the hope that it would disturb the entire scheme, and that no attempt should be made to ventilate his court at all. This is an unfair tax upon science, or rather a hopeless attempt to make natural

canases immediately subservient to several conditions at one time.—Sanitary Record.

Excavations in the Roman Forum.—A telegram to the Times, dated Rome, March 31, announces that a very important discovery has been made in connexion with the topography of the Forum. In dressing and carrying back as far as possible the escarpment of the accumulation on the unexcavated portion of the north-east side, on which stands, between the Temple of Antoninus and Faustina and the Church of St. Adriano, that row of modern buildings which is ultimately to be removed for the completion of the excavations, a part of the pavement of the ancient street connecting the Forum with the Subura has been uncovered. It lies at a level of some 18 in. below the flagged area of the Forum, which, it must be remembered, is that of the seventh century at the earliest. The street extends along the south-east side of that part of the Curia which is now the Church of S. Adriano. The pavement is in a fine state of preservation, and on one side of the street stands a large pedestal, probably of a statue dedicated, as the inscription shows, to the Emperor Constantinus the Second by Memmius Vitrasius Orfitus, who was Prefectus Urbis from 355 to 359. The point at which the end of this street touches the area of the Forum is still covered with debris and an extraordinary quantity of masses of marble, such as pedestals of columns, pieces of cornice, and other fragments, found lying heaped upon one another beneath the accumulation removed on the carrying back of the escarpment some 10 ft. or 12 ft.

London Bridge.—The Comptroller of the Bridge-house Estates announces that, on and after Monday, the 13th inst., London Bridge will be partially closed for the purpose of repaving. During the execution of the work provision will be made for keeping open two lines of traffic, one leading to the City and the other to Southwark.

For the completion of five houses at Orford-road, Wallington, Surrey. Mr. Thomas Spearling, surveyor. Beconsfield-terrace, St. John's-road, Clapham-junction.—

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 48, Catherine-street, W.C., not later than four p.m. on THURSDAYS.

TO CORRESPONDENTS.

J. E. (Stuttard).—J. F. (Madrill).—W. S. (shall have attention).—E. F. (Havist).—A. S. G.—M. E.—E. J. E.—W. H. S.—A. C. (we can only discuss the question in general principle; if we were to begin to go into special cases in that way we should get into a complicated correspondence which would not be worth the trouble).—H. D. (cannot go into so old a matter now).—J. L. P. (amounts of tenders must be given).—An Amateur (no name and address given. We entirely agree with the opinion you express, but it would be hopeless to attempt to reopen the matter).—E. K. (too late, so we have to go to press a day earlier than usual this week).—A Surfer (letters cannot be published unless authenticated with name and address).
All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.
We are compelled to decline pointing out books and giving addresses.
Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.
We cannot undertake to return rejected communications.
Letters or communications (beyond news news-items) which have been duplicated for other journals, are NOT BOUND.
All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other similarly business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS.
SITUATIONS VACANT, CAPTAINSHIPS, TRADE, AND GENERAL ADVERTISEMENTS.
Six lines about fifty words or under 3s. 6d.
Each additional line (about ten words) 0s. 6d.
Terms for Series of Trade Advertisements, also for Special Advertisements on Train Cars, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.
SITUATIONS WANTED.
FOUR Lines (about thirty words or under) 3s. 6d.
Each additional line (about ten words) 0s. 6d.
PREPAYMENT IS ABSOLUTELY NECESSARY.
** Receipts must not be sent, but all small stamps should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C., to DOUGLAS FOURDRINER, Publisher, addressed to No. 48, Catherine-street, W.C.
Advertisements for the current week's issue must reach the Office before THREE o'clock on THURSDAY.
The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.
SPECIAL.—ALTERATIONS IN SEASIDE ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.
PERSONS Advertising in "The Builder," may have Reprints addressed to the office, 48, Catherine-street, W.C. free of charge. Letters will be forwarded if sent in envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, PARAPAY. To countries within the Postal Union, 25s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 48, Catherine-street, W.C.

Architectural Problems for Parliament.

At an early date the members of our Legislature will be invited to give their opinions and their votes on two architectural questions of considerable importance, though of very different nature; the new building for the Admiralty War Offices, and the so-called "restoration" of Westminster Hall. Indeed, the continuation of the first-mentioned subject was raised, or threatened (whichever way honourable members like to take it), for the actual act of re-assembling, on the 9th; but we were in the expectation that no definite decision will have been come to when these matters appear. To a considerable proportion of the House of Commons as at present constituted we fear that such questions are not more than those of pounds, shillings, and pence; at the time when the subject of the present building for the War Offices was first discussed in the House we took occasion to comment * on the mercantile and Philistine spirit displayed apparently gloried in by some honourable members, one of whom did not scruple to express his "horror of artistic buildings and artistic sites." To preach to these gentlemen a course, useless. But among the minority are not so enthusiastic in waving what Wilfrid Lawson once called "the glorious error of peace, retrenchment, and reform" may be some to whom the treatment of a building for an important public service is something more than a mere matter of expenditure; and to such liberal-minded members of the Legislature we would address a few words of exhortation in season.

Our first text in regard to the War Offices is on which we have preached over and over to deaf ears, and on the main point of which it has for some time back been too late to reach. That is, the question of site. A magnificent site for concentration of the whole Government Offices about the Great George-street and Parliament-street neighbourhood at once have been had at no exorbitant rate; it was neglected till it became, or was thought to become, too expensive to purchase as a whole, though in the meantime it had been piecemeal purchases to the extent of making a good deal of money in property which by itself was of no use for any great Government scheme. That is an old story, and we presume it is useless to revive it,

and that the vicinity of Spring-gardens must now be taken as the accepted site for the War and Admiralty Offices. But it is at least possible to avoid making an absolute and deplorable mistake with that site; and yet this will be done unless the Government pause before it is too late, and unless those who have some sense of the value of dignified architectural *emplacement* will exert themselves to stop the vote for the new building until a re-adjustment of the site, and, as far as necessary, of the plan of the building has been obtained.

The particular defect in the manner of arranging the site which we pointed out and protested against from the first lies in the false economy of neglecting to acquire the two banks, Drummond's and Biddulph's, and the buildings between them facing Charing-cross, and sending this portion of the new building skulking behind them, thus throwing away all chance of producing a grand and dignified facade towards Whitehall. The detachment of a small block or wing of the new plan running southward to meet the Horse Guards we do not object to; it offers a means of connecting the new building with the old one; which, however, has hardly been made the most of in the accepted design. But the cutting up of the northern end of the site, in order to leave the two banks and their surroundings intact, is a fatal mistake. We pointed out that it would prove so as soon as the Government plan of the site was published. Non-professional readers, of course, do not always understand or realise what the effect of such a feature in a building site will be until they see the building on it. But the new perspective views of the revised form of the design which have been got out, and which we published last week, seem as if specially prepared to give to the lay mind absolute and obvious proof of the validity of our objection. We know not whether the particular point of view selected for the drawing of the Whitehall front was chosen by the architects themselves, or directed by the Office of Works; but it could not have been more significant if it had been made on purpose to support our views. Copies of these drawings will be in the hands of members of Parliament, and we ask those who will have to vote upon the subject, before they do so, to look at that Whitehall view,—at the mean and incongruous effect produced by the irregular collection of buildings left in the north-east angle of the site, and the new building turned round into their rear, and we ask again, as we asked last week (and we are glad to see that our question has found an echo in the pages of many of our daily contemporaries) "whether that is a worthy way for a great and wealthy nation to carry out a building of the first im-

portance for the palace of its military and naval administration?"

"Great and wealthy." The latter adjective is still true, though one would hardly think it sometimes, to see the cheeseparing way in which we potter about great works of architecture, civil and naval. But is it possible that the first one is ceasing to be applicable to us as a nation? Indifference to great public works, which might be part of the glory of a nation,—which have been regarded as such by nations of the highest intelligence and aspiration,—is a bad sign. "Architecture," said Sir Henry Wotton, in words which have long stood as a text on our title-page, "can never want commendation where there are noble men and noble minds." Is it not a sign that such men and such minds are becoming scarcer and of less influence among us, when we find such an unwillingness to do any good architectural work in a manner worthy of a great nation? In another column we have occasion this week to comment on the noble liberality with which the small kingdom of Belgium has carried out its Palais de Justice, giving to the world a building faulty indeed in detail, but marked by the impress of genius and by the sumptuous liberality which disdains to carry out such work in a paltry and cheeseparing fashion. Surely the contrast ought to shame our authorities (and our tax-payers, whose money they control) out of this paltry, mean, insignificant way of doing things, and suggest to them a more liberal policy than to spoil the largest new public building of the day by an ill-judged economy. We may add that not only will the clearing out of this north-east corner of the site give the opportunity of making a homogeneous whole of the new building, of extending a somewhat cramped plan, and of possibly making a picturesque vista into the Mall, but it will also get rid of one building which is utterly unworthy of a fine position. It is a misery to those who care about seeing fine sites worthily occupied, to notice the commonplace and uninteresting buildings which are being got all round the new sites adjoining Charing Cross; and if Drummond's Bank were disestablished, one minor architectural *fiasco* would be got rid of, at all events.

In regard to the plan of the new buildings, the quadrangle, to the unhealthiness of which objections have been raised, has now been widened, though we are still in the mind that the closed quadrangle form, for a crowded and rather lofty building in London, to be occupied most fully during the hotter part of the year, is a principle of plan bad in itself. It was suggested by the present editor of this journal some time since, in an article in a monthly periodical, that the true sanitary way of em-

* See *Builder*, May 26, 1883, p. 699.

ploying the quadrangle form would be with open angles and partially open bridges of communication, at an angle of 45 deg. with the main blocks; and that such a scheme (which has never been tried) would prove not only good on sanitary grounds, as getting rid of the trenches of stagnant air in the angles of the courts, but susceptible of good and novel architectural effect. We repeat the suggestion as one worth considering. If the property at the north-east corner of the site is acquired, a re-modelling of the plan would be necessary as well as desirable. Whether any re-modelling of the design can be carried out is also "a question to be asked." It is useless to pretend that many persons who understand what architecture means are satisfied with it. In the main that cannot be helped now. We have, indeed, been urged, from various quarters, to press the suggestion that the whole competition should be re-opened. We have always declined to counsel any such course, for the simple reason that, after all, morality is above art, and no architectural improvement would in our eyes atone for what would amount to nothing less than a breach of faith. But it is impossible to shut one's eyes to the fact that the result of the judgment of a small and heterogeneous committee, apparently proceeding on a preconceived idea of plan, has been to cull out for us a design which is respectable no doubt, but (save in draughtsmanship) nothing more; and in some points, at variance with what among the most educated class of minds are now almost self-evident propositions in regard to architectural truthfulness and significance. We need only point to that illogical array of columns which mount guard along great part of the Park Front of the design; useless masses carrying nothing whatever, taken out of books and planted there as architectural scenery. The Romans did this sort of planted-on column business at each side of their triumphal arches, and it is illogical and unmeaning enough there, though those were essentially show constructions, but it is much more unmeaning to see it continued along a whole range of wall between the windows of offices, because the authors wanted something there and did not know what else to put. We do not mean to be unkind, but that is the plain English of the matter; and what is the use of Ruskin having preached architectural truth for a lifetime among us, if such a sham as this is to be put up in our largest new building? That little matter will bear consideration, at all events. The cost of that bit of scenery would form a handsome subscription towards purchasing the property in the north-east angle. And why are we to have those eternal unmeaning vases along the balustrade,—a worn-out piece of *rococo* which ought to have been buried long ago? We do not care to continue the list; but let us at least have one shot at those preposterous pots,—“a long shot, Sir Lucius, if you love us.”

The other matter referred to, that of Westminster Hall, is in some respects a less important architectural question, but also a more difficult one to come to a decision about, more especially as we have no doubt a great deal of dust will be blown in the eyes of the House when the subject comes to be discussed; not intentionally, but inevitable archaeological and sentimental dust. Now we wish briefly to put to those who may vote on the subject what the matter really amounts to. The removal of the old Law Courts laid bare the west wall of Westminster Hall and the buttresses: the latter very much decayed, and in very bad condition. The wall was found to contain portions of Norman masonry,—merely masonry, nothing to call architecture. On historical grounds no old masonry, bearing the marks of the hand of the ancient workman, should be removed if it can be avoided. On the other hand, it is not a fetish to fall down and worship, as some people make it. The buttresses absolutely require repair; the Norman wall requires preservation from the atmosphere. In the course of repairing the buttresses it would also be quite right architecturally to complete

their design in a manner suitable to their style: architectural completeness and fitness demand that. It might be a reasonable and a practical, though not a necessary course, to build a low cloister between them, which would strengthen them laterally and would at the same time afford a screen to the old Norman wall aforesaid. Those who have taken up the matter have gone much further than this, however. The able archaeological architect they have employed has found various traces in the remains which, with the assistant testimony of old plans and engravings, afford evidence of the existence of a double cloister and a probable battlemented parapet, between the buttresses. The actual design of these has perished; it is only a matter of inference,—probably correct inference as far as it goes, but nothing more. Historically, they are therefore valueless when built up again; architecturally they shoulder up the space between the buttresses, hiding the fine lines of the flying buttresses, and dwarfing the architectural surroundings by a big battlemented parapet, a form which is itself a bad and unmeaning survival from ancient military architecture. As all this “restoration” will be an expensive process, a use must be found for the rooms, and it is proposed to make them into committee-rooms, much smaller and lower than any existing committee-rooms in the House, and lighted with very small and inadequate windows, because indications of windows of that width were found on an old plan made by or for Sir Christopher Wren, showing some of the old walls and windows. It was attempted to find some use for the lower cloister as a carriage porch; but that idea has had to be abandoned by those who suggested it. Lastly, the foundations of another building at right angles to the Hall were found,—simply the barest remains of a foundation, that was all; and accordingly a building was to be built there, and a use found for that if possible, because there had once been one there; and this is called a “restoration,” although every trace of the original building has vanished.

Is this common sense? The question is to the point, for true architecture is a thing based on common sense. In every age when architecture has been a real living thing, people have built a thing because they wanted it *then*, and in the way they wanted it *then*, not because they had reason to think something of the sort had once been there before. The whole affair is a piece of foolish archaeological trifling, utterly unworthy of the name of architecture in its true sense; and those who may vote money for it will have wasted so much on a piece of sentimentality. They will, perhaps, be told, as they have been told before, that architectural journals usually oppose the architectural schemes of the Government. If the charge were true, which in that sweeping form it hardly can be said to be, is it not just possible that we may know something more about what architecture really means than the Chairman of the Westminster Hall Committee, or than some other previous officials who have not given special study to the subject?

But there is another point to be borne in mind in regard to this scheme for which money is asked. The great Palace at Westminster which Sir Charles Barry designed has never been completed. The erection of the proposed mean-looking building at right-angles to Westminster Hall would be a bar to the completion of Barry's design. The erection of the foolish committee-rooms between the buttresses of Westminster Hall would be doing badly what would be far better provided for whenever that design can be completed. We are told, on the authority of the Chairman of the Westminster Hall Committee, that the completion of Barry's design is a thing not to be thought of. Why, we are not told. But what are we to think of the sense of architectural fitness, dignity, and common sense on the part of people who can make all this fuss in favour of a foolish piece of sentimental restoration, and put aside, with a shrug of the shoulders, the question of the completion of the greatest national building by the greatest English architect since Wren (for Barry unquestionably was so), as a matter

of no consequence in comparison with the indulgence of their own archaeological whim of the moment?

THE DECORATION OF THE PANTHEON AT PARIS.

BY CHARLES YRIARTE.

THE Church of Ste. Geneviève at Paris, to which we commonly give the name of the *Pantheon*, will be, in future, in virtue of the pictorial and sculptural decorations which it has received, a national museum, the most complete example of the efforts made by the French artists of the close of the nineteenth century in the art of monumental decoration.

The Pantheon, for each of the successive Governments of France, has been a kind of Palladium, the possession of which they have demanded in order to imprint on it the character which has in turn distinguished them. The Monarchy, in consecrating the edifice to religious worship, would have placed Paris under the banner of Ste. Geneviève, the patron saint of the city; the Republic, in removing the edifice from the worship of that saint, raised the standard of free thought, substituted the patriotic for the religious idea, and, opening the vaults of the temple to the shades of the heroes who had died for their country, and the remains of those who would have honoured it, inscribed on the façade of the temple the fine inscription which we still read there:—

“Aux grands Hommes la Patrie reconnaissante.”

From the year 506 there existed there a sanctuary dedicated to St. Peter and St. Paul. King Clovis, on the eve of a decisive battle on urgent pressure from the Queen Clotilde, had consecrated himself to this worship; and it was in the crypt of the primitive edifice that the ashes of the king long reposed. Clotilde, the friend of Ste. Geneviève, wished that the body of her protector, who had also saved Paris from the invasion of Attila, should be placed in the same crypt after death, and the ashes of the queen herself were gathered there in 545. The hill which then overlooked Paris now the Butte de Montmartre, and then called Mount Leucotitius, acquired, in consequence of the pilgrimages of which the tomb of the saint became the pretext, the name of Mount Ste. Geneviève.

From the sixth to the sixteenth century the church passed architecturally through many phases, but it always preserved the character of a chapel for the worship of relics. It was King Louis XV. who was destined to take the initiative in the construction on that site of a temple which should be to the city of Paris what the Basilica of St. Peter is to the city of Rome.

Following a fashion in use in France since the Renaissance, and which came to us from Italy, he asked for a number of plans in competition from the leading architects of the day. The architect Soufflot presented the best scheme. In September, 1764, the king laid the first stone; and when Soufflot died, in 1784, the triple cupola only wanted its crowning finish. The architect had kept before him as his ideal the Basilica of St. Peter at Rome, but the levelling for the site having materially reduced the height of Mount Ste. Geneviève above the level of the Seine, Soufflot considerably modified his first project. He died full of grief in consequence of the deficient mass of the principal buttresses necessary to sustain the cupola. Four architects,—Brébion, architect to the king, Vielle de St. Maurice, Peyre, and Rondelet (this last a consummate constructor, whose technical treatise on stone cutting is still studied in our schools),—were entrusted with the completion of the temple of Ste. Geneviève. The cupola was far from moment in danger of being compromised through the result of settlements; with considerable effort and by works of consolidation which did not interfere with its general appearance, the architects brought the building to its final bearing and completed the work. Scarcely had the monument been completed when it passed into the hands of the Revolutionaries.

Government, who overturned the *culte* of Ste. Geneviève, and decreed that the temple constructed in honour of the patron saint of Paris should henceforth be consecrated to the glory of France and the religion of patriotism, under the title of the *Pantheon Français* (1791).

It is not out of place to recognise these various vicissitudes; they help to explain the plain and barren style of the actual decoration of the monument; the something indescribable of frigid and austere character, which is characteristic of the reformers of French society, great admirers of the sobriety and symmetry of the antique, wholly in favour of the re-action already provoked by the artists of the time of Louis XVI. This reaction both the Directory and the Empire tended to exaggerate to the extent of adopting no symbols in the decoration except those borrowed from classic antiquity. At less than a half-century's distance such a painting as the "Abduction of the Sabine Women," by David, excited the passionate admiration of a nation who had been previously admiring the *bergeries* of Boucher and the sentimentalities of Greuze; and the "Emile" of Rousseau became the gospel of a society which had just been admiring the poets of the *Œil de Bœuf* and the *petits levers* of Versailles and Marly. In architecture the *palazzo* of our pavilions and *petites maisons*, the ideal architecture of powdered "Marquises" in hoop petticoats and of gentlemen in silk with lace frillings, was succeeded by the austere outline of the Pantheon of Rome. The severe orders of Palladio, the decorations of the acroterion, the garland, and the palm-leaf, copied from the edifices of ancient Rome, constituted the whole ornamentation of a period whose object was to revive the memory of Brutus, and to establish the worship of the goddess of Reason.

The Restoration of 1815 effaced the fine device, "Aux grands Hommes la Patrie reconnaissante," and (a circumstance not easy to forget, whatever be one's political bias) cast the remains of Voltaire and Rousseau into a sewer near the Seine. This crime was enacted at night; apparently it was a kind of reprisal for the violation of the Royal tombs at the abbaye St. Denis by the revolutionary mob. For thirty years the Parisians and the strangers who have visited the crypt of the Pantheon have paid homage to these empty tombs; for there was no proof of this disappearance of the ashes of the two great idols of revolutionary France till 1848, when people behought themselves of opening the sarcophagi.

An experiment in decoration was made by the Government of the Restoration. Baron Gros had the commission for the painting in the cupola, which represented the Apotheosis of Ste. Geneviève. Baron Gérard was commissioned to paint the four pendentives; these were the sole points of colour which arrested the eyes in the great edifice, in the midst of are architectural lines and smooth grey acres. It might be said at the time that these fine paintings made a kind of spot in the architectural *ensemble*, and almost constituted a defect of harmony, the coloured portions attaching themselves to nothing. The revolution of July, faithful to the ideas of the first Republic, re-established the dedication to the *aux grands hommes*," but changed nothing in the general aspect of the edifice. David Angers, however, sculptured the fine pediment which has been still preserved; and, as such to give life to whatever in French sculpture kept up the fine old traditions of the country, as to complete a decorative *ensemble* in harmony with the architecture, artists received commissions for grand groups, historic subjects in keeping with the spirit of the monument, groups to be placed at the entrance of the peristyle and in the interior.

In December, 1851, Napoleon III., who copied complacently the decrees of Napoleon I., set himself the same task, to pacify and restore order, once again reconsecrated the Pantheon, from the "*culte aux grands hommes*" that of Ste. Geneviève. A sufficiently serious attempt was then made, which ended in nothing; a school of religious elocution was founded in the Pantheon, now once more

become a church, under the direction of the Abbé Dnquesnay, who lately died Bishop of Limoges.

The architect to the Pantheon was then M. Constant Dufeux, who enjoyed a great reputation in our national art-schools, and who nevertheless had never given the measure of his ability in any monument entirely constructed under his direction. He took in hand the Pantheon, to fit it for religious service, and as the funds voted were insufficient, he conceived the idea of a provisionary decoration which has lasted to the present day. This decoration consisted in coloured woodwork, in wooden altars draped with gilt hangings, on which sculptures were executed in distemper as in theatrical decoration. The shrine which contained the relics of Ste. Geneviève over the altar specially dedicated to her is the reproduction in plaster and joinery, painted and gilt, of the admirable work which Jean Goujon carved, and the four original statues of which, in wood, figure at this moment in the "Musée de Sculpture de la Renaissance Française."

It is difficult to understand why the Third Republic, which gave itself, in these latter years, to the programme of the abolition of religious orders and the secularisation of buildings devoted to the religious life, did not continue the tradition of the Convention in closing the church of Ste. Geneviève, to make it, as before, the national Pantheon. Quite on the contrary, however, it was the Government, and the very Ministry of M. Waddington, which, under the initiative of the Director-General of Fine Arts (M. le Marquis de Chennevières), in the year 1876, accepted the responsibility of covering the walls of the building with mural paintings, for the execution of which Parliament has been asked to devote a sum exceeding a million francs.

People bowed then, as now, to the idea of developing among French artists the taste for grand monumental painting, the tradition of which is fading day by day. It is certain that our French ideas of centralisation it is the State alone that can encourage such works, and that it is her mission to search among the annual exhibitions of painting for artists who give proofs of their disposition for decorative art, and exhibit facilities which they will know how to employ when great surfaces are confided to them. Some members of Parliament raised objections, and put the question whether, in fact, the most truly beautiful decoration of the Pantheon, that which was most appropriate to its severe style, the nobility of its lines and harmony of its proportions, was not the very immaculate whiteness of its great surfaces, the unity of tonality in monochrome which recalled the great conceptions of antiquity; whether any painting which trespassed strongly and with a blaze of colour on that harmonious purity, would not bring with it the loss of the solemn and grandiose effect produced by the architectural lines alone.

The thesis was a good one to argue upon, and there is nothing in it very repugnant to our feeling. "Rien c'est bien" is an architectural principle which may be often applied with good result; nevertheless, the "Direction des Beaux-Arts," through the mouth of M. Waddington, answered by an irresistible argument: they produced the design of the architect, Soufflot, who had conceived the idea of the Pantheon, in which he had indicated, at that stage of the project, a whole *ensemble* of painted and sculptured decorations, the execution of which was to be entrusted to the leading artists of his own day. No further objection was possible, and the funds were voted.

What was the general project agreed upon? The plan of the Pantheon gives a Greek cross with a peristyle in advance of it. At the intersection of the cross, four colossal piers supported a central dome. This cupola, as already observed, had received the paintings of Baron Gros and Baron Gérard. The scheme of the Director des Beaux-Arts was as follows:—Each arm of the cross presents a nearly unbroken surface of the height of the columns

* We think we have heard something like this on our side of the Channel.—Eo.

which support the entablature; and this surface, from the level of the floor to that of the capitals, only offers two slight projections, those of the engaged half-columns forming pilasters and repeating the colonnade, and (about two-thirds the height of the columns) a slight band or string intended to break the monotony of the wall-surface. It was in the four arms of the cross that the portion to be covered with painting was found; the embayment of the high altar, the *cellæ* of the lateral altars, and the two faces of the vestibule. These would thus be united to the coloured surfaces of the pendentives, and through them with the dome decoration itself. Never could artists find a more propitious field for the exercise of their talents; but with all this, those who had before their eyes their responsibility to future ages, and the consciousness of their own littleness, began again to ask, in the face of these noble expanses of yet virgin wall-surface, if it might not be better not to intrude on their purity. The names of those who were summoned to the honourable task of decorating the Pantheon are all well known, but in mentioning them to readers beyond the limits of their own country, to readers some of whom are perhaps not very familiar with the modern schools of art on other soil, it is perhaps as well to define a little. We are not here concerned so much to discuss the merit of their works, as to give an idea of the scheme adopted by the Director-Général des Beaux-Arts, and to state what is the result obtained from an architectural point of view.*

THE EAST PEDIMENT OF THE PARTHENON.

THE current number of the *Nineteenth Century* contains an article of great interest, by Dr. Waldstein, on the interpretation of certain figures in the east pediment of the Parthenon. Dr. Waldstein maintains that the two figures marked L and M in the Guide-book, and usually held to be two of the Fates, are, in fact, Gaia and Thalassa,—Thalassa resting in the lap of Gaia. Dr. Waldstein supports his view with his usual eager enthusiasm and with that personal conviction that is sure to carry weight, but, equally as usual, his arguments and what he calls his demonstration lag far behind his swift and sometimes prophetic imagination. The interpretation of figure M as Thalassa is not new. As far back as 1822 Weher (before the topographical school came in at all) suggested that the reclining figure might be Thalassa leaning against Amphitrite. Weher's conjecture was a mere isolated shot, not part of a well-considered system; but we think Dr. Waldstein, who so frankly and openly acknowledges his indebtedness to Professor Brunn, might have made some mention of this earlier suggestion.

We incline ourselves to attach considerable weight, if not as yet absolutely to give in our adherence, to Dr. Waldstein's conclusions, but we must decline to accept the mere analogies he brings forward as demonstrations. To turn to the so-called Theseus (which Dr. Waldstein quite rightly, we think, declines to call Theseus at all), Professor Brunn calls the figure the mountain god, Olympos. Dr. Waldstein says that on sarcophagi reliefs he has found a number of mountain gods "hearing in attitude and general type a strong resemblance to the figure from the eastern pediment." What precisely these reliefs are it would have been well if Dr. Waldstein had stated: local personifications are, of course, common enough, and a general statement like this, unless supported either by illustration or direct citation, amounts to very little. A little lower, Dr. Waldstein does cite one actual instance,—an instance already very familiar to all archaeologists, i.e., the mountain god in the Esquiline wall-painting representing the landing of Odysseus on the coast of the Lastrygonæ. About this mountain god he makes a statement which will, we think, astonish the most confiding disciple. "The immediate depend-

* To be concluded in our next.

ence of these types upon the figure in the eastern pediment of the Parthenon becomes, I venture to believe, actually demonstrable when we compare with the Parthenon figure the mountain god from the mural painting of the Esquiline." After this what Dr. Waldstein's notion of "actually demonstrable" is we are at no loss to conceive; he means, he can mean,—we think all who look at the picture and the pediment will agree,—nothing more than that there is a pleasant analogy between them, an analogy which will come in admirably when the question is demonstrated, but which does not, could not, demonstrate it. To have a personal conviction of the truth of a certain archaeological attribution is one thing; to be able to demonstrate it, i.e., make it a matter of necessary conviction to others, is quite another. That Dr. Waldstein has a personal conviction about the Olympos figure we do not doubt, and we even confess we are inclined to share it, but to talk of the matter as demonstrated is a grave confusion of thought, and one extremely likely to cause the ever-ready enemy of archaeology to blaspheme.

So far as literature goes, Dr. Waldstein undoubtedly has the Homeric hymn on his side; but he is too good an archaeologist to press very closely the comparison between literature and art. What we really want are a few substantial instances of art tradition as regards the conjunction of Gaia and Thalassa. For anything we know, Dr. Waldstein may have such instances *in petto*; all we can say is that in this article he does not produce them, and, therefore, his theory is still in the air. It is a little surprising that in a discussion of the figures of the east pediment, he does not even allude to the acute conjecture made by Mr. Murray about the so-called Iris figure. Mr. Murray does not dogmatically assert that this figure is not Iris, and must be Eileithyia; but he points to a long line of artistic vase tradition to show that it is a highly probable attribution. Eileithyia would serve Dr. Waldstein's theory as a transitional figure from the *dramatis personæ* to the cosmical setting, almost as well as Iris herself. Dr. Waldstein's conjecture is so suggestive and so brilliant that we can only regret that it is at present supported in a manner so unmethodical, and hope that he will eventually furnish us with arguments more substantial.

NOTES.

CONSIDERABLE excitement seems to have been caused by the recent discovery of a bronze statue in Rome. The statue, which is more than life-size, and in part in excellent preservation, was seen by a few immediately after its discovery, and rumour was instantly busy to give it a name and a date. It has now been removed to the somewhat jealous guardianship of Santa Francesca. In a warehouse close to the church the statue is housed for the present, and there, by the kind permission of the Director of the Excavations, Sig. Fiorelli, we were able to get a sight of it. The first view is pathetic enough. The statue lies flat on its back on some straw and matting, the uplifted left arm supported on a chair, and is the only occupant of a huge gloomy room. This flat position of the statue is a good deal against a fair estimate of the proportions of the statue, and, perhaps, accounts somewhat for the to us unpleasant effect these proportions produce. The head is extremely small for the body, and the features, especially the eyes and mouth, have a curious compressed,—almost pinched,—look, which contrasts oddly with the powerful finely-developed body. The hair is thick and massively-arranged, and just where it rises from the forehead there is a deep dent which adds to the troubled expression of the face. The surface of the right cheek of the statue is, from some accident of position, in perfect preservation, the original bronze colour is, for about 2 in. square, perfectly preserved, and every line of the working still observable; a growth of soft hair is indicated on both cheeks and extends over the lip and chin. The statue is perfectly nude, and apparently

stood in a somewhat Polycleitean attitude "nno crure"; but as both legs are badly damaged it is difficult to be sure in the present position. The left-hand was raised, and held some object. The right-hand is placed behind the back. There is a slight rift in the upper part of the right arm, but not enough to throw any doubt on the original position. Just in the middle of the body an inscription, as yet unexplained, is scratched, probably a Roman number, as follows: L·VI·T·XXIX. The statue was at first called a Heracles, an attribution suggested by the somewhat excessive muscular development. Perhaps when no authoritative dictum has been pronounced it may be rash to advance an opinion, but our own clear conviction is that the statue represents neither god nor hero, but is a portrait statue; further, that it has no claim to be of either the best or second best period, but that a certain realism of style and also a want of reserve in expression condemn it to at least post-Alexandrian days.

THE proposed system of charging for the names and addresses of sender and recipient in sixpenny telegrams is not likely to commend itself to the public mind. It is, to begin with, such a very decided change of system that it is not likely to be accepted without very strong and convincing reasons shown for its adoption; and the theory of the Postmaster-General that the sender's address is usually surplusage, has already received very strong contradiction on the part of business firms who make large use of the telegraph. In the case of what may be called private or social telegrams, no doubt the sender's full address often is superfluous, but not in the case of business telegrams. On the other hand, we entirely concur in the general principle that the telegraph system should be, if not remunerative, at least self-supporting; in other words, that those who do not send telegrams are not to be charged with any part of the expenses of those who do. A plausible suggestion is that of "Compromise" in the *Times*, who proposes that the address of the recipient should be uncharged, and that the telegram form should be headed only for the one address, leaving the sender to describe himself as far as he thinks necessary in the body of his message. This would effect half the desired saving in space and cost, and be a premium on brevity, without altering the general principle and method of procedure so much as the Postmaster-General's proposition must alter it. But we are against any tampering with the principle of freedom of address. Free addresses, and messages at a halpenny a word, would probably meet the public needs best.

THE promoters and the opponents of the Railway Rates Bills both held meetings last week to consider the present aspect of the question, and to decide upon future action. The latter, as represented by the Association of Municipal Corporations, expressed the satisfaction with which they received Mr. Chamberlain's statement that it was his intention, if the Bills were pressed to a second reading, to oppose them. The Royal Commission proposal does not commend itself to the traders so long as the Bills are in suspense, and the following resolution was arrived at:—"That, in the opinion of this Association, the issue of a Royal Commission, so long as the Bills are before the House, is inexpedient, as tending to show that the Bills had not been unconditionally withdrawn or rejected; but that this Association will hereafter concur in the subject being referred to a Commission which, both in regard to instructions and especially its composition, will command the confidence of the public." The General Committee presided over by Lord Henniker had previously expressed a strong objection to the matter being referred to a Commission, even though the Bills were withdrawn, and until this had been done, or the Bills rejected, they determined not to proceed with further negotiations. Now, as the railway companies had shown their willingness to accept Mr. Chamberlain's proposition, and had promised,—in order to facilitate negotiations,—not to introduce the Bills for the second reading before Easter, it is

not to be wondered at that they resent this, and at their meeting they decided "Not to withdraw the Bills under the dictation of the traders"; and although they do not expect to pass them, they wish to have the subjects discussed in the House. This is, after all, the best thing that could happen for both parties, and if a Royal Commission should be eventually appointed, they would probably find in the discussion some useful material for their work.

THE tramcar disaster which occurred at Bury on the 3rd current may lead us to congratulate ourselves on what has been sometimes regarded as unfortunate, namely, the limited area of the arches that cross over our railways. The tendency to carry a dangerously top-heavy weight,—which was the cause of the Bury overturn,—is thus adequately checked. It should be the care of the Legislature to provide some corresponding limit to contours in the case of tramways. The disposition to pile on a vehicle all that it can carry, and even "to stand up on the top" of the mass, is natural to men ignorant of mechanics; and this is a case which it is evidently dangerous to leave to the unassisted prudence of the English public. The tramway returns ordered by the House of Commons do not enumerate the number of accidents among either the 330 million of annual passengers, or the unenumerated servants, of the tramway companies. We apprehend that the list of casualties must be proportionately much higher than on railways. It would be doing good service if the honourable member who moves for the return of tramways up to next July would add a requisition for the statement of the numbers of servants, the numbers of horses, and the numbers of accidents on each line.

THE case of the Vestry of St. Marylebone v. Rose, which was decided on the 30th ult. in the Queen's Bench Division of the High Court of Justice, deserves a passing note. This was an appeal on a case stated by Mr. L. Rutzen, the police magistrate, with regard to a building erected in Finchley-road, near Marlborough-road Station, in advance of the general line. The questions for the opinion of the Court were,—(1) whether the certificate of the Superintending Architect, with plan annexed constituted a sufficient decision as to the general line of buildings; and (2) whether, the certificate were held to be sufficient, it was conclusive and binding upon the magistrate so that he had no power to fix any other line than that determined by the Superintending Architect. The Court gave judgment in favour of the Vestry, with costs. Mr. Justice Mathew remarked that the main question of the case had been disposed of by the decision of the House of Lords in the case of *Spackman v. The Plumstead Board of Works*, which we have already referred to (*Builder*, pp. 328, 405, *ante*), and replying to an objection that had been taken by the respondent that the Superintending Architect in the plan attached to the certificate had not made the general line of buildings, as found by him continuous, observed that he was not clear that the Superintending Architect was bound to do so; differing upon this point from the opinion of the Lord Chancellor, as expressed in the course of his judgment in *Spackman's case*. Mr. Justice A. L. Smith remarked that a decision of the House of Lords in *Spackman's case* had established that the Superintending Architect is the sole judge of what the general line of building may be, and that the magistrate has no power of supervision over him.

By careful and prolonged study of the Etruscan tombs, chiefly at Corneto, Professor Helbig seems to have succeeded in throwing a ray of light on a mysterious subject. The graves of Corneto (and also of Vulturno, in their earliest forms, two types. First and most ancient, the so-called "tomb of the pozzo," a hole pierced vertically either in the ground or through rock, and containing a vessel with the ashes of the corpse. Second

"tomba a fossa," a square grave containing an unburned corpse; graves of this second time are undoubtedly specimens of "Corinthian" style, and are undoubtedly the work of the Achaean people; so much is also clear of the "tomba a pozzo." The interesting point is that a whole series of hurrying-places have been found in the valley of the Po, which are of a character precisely identical to these "tomba a pozzo" and "tomba a fossa." This affords evidence, that is well nigh conclusive, to prove hypothesis advanced years ago by Professor Helbig, namely, that the Etruscans, like the Romans, came in from the North. This influx Professor Helbig thinks, about at the same time as the Dorian influx into Greece. The paper was read at the "Winckelmannsches" of the Archaeological Society at Berlin.

At the same occasion Dr. Curtius reviewed the work of the past year, and his summary is so valuable that we abstract the substance from the report of his speech in the *Philologische Wochenchrift*. The excavations on the Acropolis have led to important results for the history of archaic Greek art. Foundations of pre-Periclean date have been found here, and monuments, and above all inscriptions of the time of the Peisistratidæ have been brought to light. When we consider that a clean sweep the Persians made of all more obvious monuments of this date, the best residuum becomes infinitely precious. These excavations are still in progress. Especially valuable, too, for the history of archaic art, have been the discoveries of the temple at Delos. Any opinions on the sculptural schools of the Cyclades must now be based on the monuments gathered together in our newly-founded museum at Myconos. Excavations at Clazomena have brought to the first known monuments of early Ionic pottery. America has been busy at Athens, and the full publication of the results of their new excavations is eagerly expected. At little was left by the Prussians to be recovered at Olympia has been carefully worked together by the Greek Government; the east quarter of the great Palaestra has been cleared; and small fragments of the pediment of the metopes, a few bases of statues, some archaic bronze and stone works have been dug out. Popular interest will, undoubtedly be most excited by Dr. Schliemann's discoveries at Thyrsus, but to archaeologists they will interest to the investigations carried out at the Asklepeion near Epidaurus. Here unusually fruitful yield of inscriptions and architectural and sculptural remains has been found, and many details added to our knowledge of ancient medical practice. Our knowledge of pedimental sculpture has received important additions from the discovery of the masks in porous stone, with representations of the gods; Epidaurus has also yielded fragments of this particular department of sculpture. Further afield come the Lycian districts of Bendorf, which we have elsewhere mentioned in detail; and last, though nowise least, continuation of the work at Pergamon. The interest of these Pergamene excavations, in connection with the marbles of the great altar, but subordinate discoveries have followed beyond the limits of the altar terrace, and of scarcely equal value. The labours of the present year, the report of which has not yet reached us, may have much to show.

It is interesting to hear from Athens an exact statement of the money expended in archaeological work. Mr. S. Kumanandis, in giving the report at the annual meeting, stated that in the past year (1884) 35,000 drachmas (i.e., about 1,400*l.*) had been expended in excavations carried on in Eleusis, Delphi, Olympia, and Oropos, and 45,000 drachmas (i.e., about 1,800*l.*) on additions to national archaeological museums. The total is not a large one, considering the archaeological needs of the country; but it must, of course, be borne in mind that much work is done on quite independently of the funds supplied by the Greek Government. Dr. Schliemann has his own private resources; and Germany, and America, with their

Hellenic schools, are all at work. May the proposed British school at Athens be soon added to the number.

IN the *Literarisches Centralblatt*, No. 52, p. 1,883, appears an interesting account of the now notorious archaeological forgeries at Leghorn. An apparently fine collection of antiquities was presented to this Museum of Leghorn. It consisted of objects, chiefly vessels, of remarkable and hitherto unfamiliar shapes, and a number of undecipherable inscriptions. A good deal of speculation was aroused among archaeologists, but, happily, no one committed himself to any very serious opinion before Dr. Schliemann, with that happy "flair" for which he is famous, scented imposture and pronounced the whole thing a hoax. A full account is given under the title "Raccolta Archeologica Chiellini in Livorno, by Pellegrini," and reviewed in the *Literarisches Centralblatt*.

IN clearing the ground preparatory to laying foundations for a new museum at Treves, the workmen have come upon remains of a mosaic pavement, containing both figures and inscriptions. The design seems to have consisted of the Nine Muses engaged each in instructing some poet or prose writer. At present there have been made out the figure of Urania instructing Aratos; another Muse, name uncertain, instructing the logographer Kadmos; Euterpe teaching the Phrygian musician Agias and Polyhymnia. On the outside border of the mosaic are figures of gods with the names of the months attached. In the four corners are the seasons,—of which Autumn only is preserved.

LETTER FROM PARIS.*

THE exhibition of works in black and white, which we announced last month, has been opened in the Grande Salle des États at the Tuileries. It is, if we are not deceived, from England that our artists have borrowed the idea of this class of exhibition, which has not given, this time at least, all we hoped from it. Too great hurry in hanging, and, perhaps, too much indulgence in the admission of works, have produced results very inferior to what people were expecting. It would, however, be unjust not to note with appreciation the etchings by Gauchere, the engravings of MM. Boivin and Lalauze, the beautiful charcoal drawings of M. Maxime Lalanne, the drawings of MM. Bida, François, Gérôme, H. Leroux, and lastly the charming compositions of M. H. Pille, whose talent as a designer makes us forget his dull and sometimes disagreeable colouring as a painter.

This last observation would apply equally, in relative proportion, to Gustave Doré, whose works are at present exhibited at the Cercle de la Librairie; a singular exhibition, organised with pious care by M. H. Plon (the celebrated printer) and M. Duplessis, curator of engravings at the Bibliothèque Nationale, to whom we owe the biography of the artist.

Doré has been an incomparable designer, with a fecundity almost unprecedented, and his inexhaustible imagination has given birth to some *chefs d'œuvre*. There are in this collection works of extraordinary force, and a diversity of type, style, and manner which confound one. The colossal work of Doré is exemplified, but from the contemplation of it arises fresh in the mind of the visitor the conviction, already long ago formed, that, both as painter and sculptor, Doré has only pursued, without attaining these forms of a talent which only reached its full development when he took the crayon in hand to illustrate Cervantes, Dante, Rabelais, or to interpret his own impressions in his travels in France or Spain, or his residence in London.†

If posthumous exhibitions have their dangers, they form also, for some artists, a magnificent consecration of a talent too soon cut off. This is the unanimous opinion of those who have

* Concluded from last number, p. 476, ante.

† Yet Doré's London sketches were curiously unlike the reality; they were London seen through Doré's spectacles. But we quite agree with our correspondent as to the superior value of Doré's monochrome illustrations to Dante and Rabelais. Indeed, we doubt if he ever did anything superior to the Rabelais, which was a production of his early youth.—E.

seen, at the École des Beaux Arts, the collection of the works of Bastien-Lepage. What vigour, what truth, what masterly simplicity, what absolute respect for nature! Almost all his work is collected here, from his first drawings at the École down to the sketches for the pictures which were interrupted by his death. This exhibition shows plainly that the youthful master was far from having completed his task, and that the future would still have had masterpieces in store for us. There are more than 200 pictures and 117 drawings and water-colours. Without pretending to make a choice among so many remarkable works, we may notice, in passing, "Le Poins," the "Portrait de mon Grand-père," "La Récrite des Pommes de Terre," the portraits of Albert Wolf, Gambetta, and Coquelin, and that of Sarah Bernhardt, which is a marvel of delicacy and sentiment.

From this exhibition to that of the works of Delacroix is but a few steps, and the crowd issuing from the one betakes itself to the other, without the redoubtable neighbourhood of the great master in any way prejudicing Bastien-Lepage, who so little resembles him. Although already belonging to a past generation, and in spite of the oblivion into which romanticism in art has now fallen, the work of Delacroix maintains itself still in those serene regions where criticism cannot penetrate. Putting aside certain faults of method which are often and perhaps too much dwelt upon, there remain nevertheless beauties of the first order which give to that exhibition a strong attraction. "Le Martyre de St. Etienne," "L'Amende honorable," "Les Deux Pescari," "L'Entrée des Croisés à Constantinople," "La Barque du Christ," "Le Giaour," "Jésus au Jardin des Oliviers," and especially "Boissy d'Anglas à la Convention," that sketch so finely translated in the etching of Braqueumonard, are imperishable pages which one is happy to see united in an exhibition which has for its object to raise to Delacroix the monument which he should have long since had. And while on this subject let us add that the "Entrée des Croisés," which up to this date has been exiled at Versailles, is now to take its proper place among the treasures of the Louvre.

Following the example of the water-colourists, the pastellists of France are also about to constitute themselves a society and to exhibit their works every year in the galleries of M. Georges Petit. The first exhibition, organised by M. Roger Ballu, will take place this month, and will comprise works by MM. Emile Lévy, Lefebvre, Baudry, Gervey, Bessard, T. Berand, Cazin, John Lewis Brown, Jaquet, Adrien Moreau, Lhermitte, Philippe Rousseau, &c.; it will be rendered more complete by a retrospective exhibition, in which will figure the pastels of Latour, Rosalba, and other charming masters of the eighteenth century.

There is yet another exhibition very well suited to the Parisian public, which goes to indulge its curiosity in the Goupil galleries, Rue Chaptal, to see the drawings which Edouard Detaille has executed for a grand publication to be entitled, we believe, "L'Armée Française." M. Detaille's reputation is long since made; no one knows better than he how to render the military types of both French and foreigners. His drawings have marvellous precision, irreproachable correctness; his unerring pencil does not forget a fold of the cloth or a buckle of the helms, a bit of the braid or a button of the gaiters; it is impossible to imagine anything more carefully done. But does not this very exactitude weary one in the end? The personal details are given with such minute fidelity that life-like character disappears, and these admirable drawings seem like excellent photographs heightened by a tint of water-colour. Apart from this criticism one cannot but recognise the interest of this exhibition which passes in review before us, with so much learning, the variety of uniforms worn by the French army from the last century to our own days.

To finish with these special exhibitions, which tend to multiply more and more, we have an announcement of an exhibition of an entirely new kind, and which will certainly not want originality. A group of Republican journalists propose to collect the works of artists who have become celebrated, and who at the outset were refused admission into the *Salon* by a jury even more academic than that of to-day. It is one way of showing the public what the spirit of clique in matters of art is capable of, and what cruel injustice the Institute is to be accused of

against those whose talent posterity has recognised. "Tanta-ne animis celestibus ira?" It will certainly be piquant to find there, in touching posthumous confraternity, Courbet, Rousseau, Millet, Daubigny, Pavis de Chavannes, Troyon, Manet, and even—Delacroix!

Henri Lehmann, who was one of the most eminent and inflexible among those select judges of the old days of the Académie des Beaux Arts, carried to an extreme his horror at the novel tendencies of modern painting. Lehmann is dead, but his artistic hatred has survived, and in his will a sum of 30,000 francs was left to the Institute, to found a triennial prize of 3,000 francs in favour of the young painter who in his works should have shown the strongest practical protest against the fancies of the Impressionist school.

We must not forget to mention the splendid present which the Committee of the Société des Artistes Français have made to M. Bailly, President of that Society since its foundation. It is an album containing an original drawing by each of the members, and signed by fifty painters, twenty sculptors, nine architects, and ten engravers. This inestimable collection has been presented to M. Bailly by M. E. Guillaume in the name of all his colleagues. M. Bailly is known, beloved, and respected by all the artists in France, and in other countries, who have had the opportunity of appreciating the kindness of manner and goodness of his heart in his relations with his brother artists, and we are glad to register this homage rendered to the venerable President of the Société des Artistes Français.

SMOKELESS HOUSES AND MANUFACTORIES.

This was the subject of a lecture delivered at the Parkes Museum (by invitation of the Council of the National Smoke Abatement Institution), on the 26th ult., by Mr. Thomas Fletcher, F.C.S., of Warrington.

The lecturer said:—There is no possible doubt that all large towns can be made absolutely smokeless with economy, and also that the strongly acid nature of the atmosphere in all large towns and cities can be very greatly improved. How bad the state of things in London is at present may be judged from the fact that, wanting some litmus paper, which is used in testing for weak acids, I failed totally to obtain any, after a long search, which was not already turned in colour by the acid of the atmosphere, and I had to telegraph direct to the makers for some. I held a strip of this paper out of a railway carriage window for a few seconds, with the result that the exposed part was turned red by the acids in the air. The mud in the streets, the damp stone walls, and even the moisture on the leaves of plants, all gave a distinct acid reaction. I have seen the leaves of plants, miles away from the city, burned by a light shower after a fog in the city. When our towns are smokeless the total consumption of fuel will be decreased enormously, as I will prove to you, both in houses and manufactories. The most advanced users of fuel are beginning to see through the fog and smoke, and I believe it is now a question of a very limited time before we see the end of the nuisance. The question of smoke must be looked at from a money point of view, and smoke abatement must be either compulsory or profitable. Not one householder or manufacturer in a thousand cares how much smoke he makes provided it goes the right way up his chimney. My principal business to-night is to give you actual results obtained in my own works and house, which are, and have been for a long time, practically smokeless. The house was built with the ordinary fireplaces for coal, an open fire range with boiler, hot-water cylinder, and the usual appliances. What it would cost to work this with coal entirely I cannot tell you, for the simple reason that gas has been used, more or less, since the house was built. Those who have had experience with coal will be able to compare the figures as to comparative cost. In the first place, absolutely no alteration has been made with any existing fireplaces or fittings, except that a large gas-meter and good-sized gas-pipes have been fixed. The extensions as regards gas have been gradual, and in the last eight years probably 5l. may have been expended in gas fittings, to get a large service to every room in the house. The first cost of the whole of the appliances, gas fireplaces, cooking, water-heating, bath-heating, washing, drying, ironing, &c., at "Stores" prices, for the house, which

contains thirteen rooms, would be about 26l. Of the three sitting-rooms, two are used only at intervals, and fires are used in at least three bedrooms every night, and every morning for about seven months in the year, fires being also lighted whilst the bedrooms are being used as dressing-rooms. The whole of the cooking for ten persons, water-heating for baths, and general domestic purposes, and a portion of the washing and drying (sometimes all) are done entirely by gas. Now comes the question of cost. In the first place, it would be practically impossible to have coal fires in the bedrooms both night and morning, as we have them, and here gas scores one important advantage. If it were possible, there would be with us at least twelve fires to be lighted every day for six or seven months. This, and the consequent cleaning, would be nearly, if not quite one servant's work; in fact, if the extra labour in cooking by fire and the usual style of washing are added, there would certainly be quite the work of a servant, which, for seven months, would mean in food and wages at least 16l. Our total gas bill for twelve months has been, on an average, with gas at 3s. 3d. per 1,000, 8l. for lighting and 13l. to 14l. for all other service, i.e., fires, washing, cooking, and baths. This for the last two years may be considered an experiment, and, being so, no doubt has had extra supervision, which, when discontinued, may possibly mean 5l. or 6l. per annum in extra waste; but the fact remains that with ordinary care the work has been done in a style totally impossible with coal, for two years in succession, at about the same cost as coal, and with a great saving in servants, dirt, and inconvenience. Further than this, whilst one of the children was suffering from scarlet fever, we were enabled to maintain perfect isolation in the upper part of the house, and so prevent the spread of the disease—a matter almost if not quite impossible if gas had not been available for all purposes. From what I can learn, it would appear that in the districts where coal is plentiful and comparatively cheap, it costs about 7l. per annum for the kitchen fire and about 3l. each for sitting-room and nursery fires. In London, where coal is twice as costly as with us, I do not believe the actual expenditure per annum is, on the average, any higher, the fire-grates being very much smaller, and the lavish expenditure of coal common in the North is checked in this neighbourhood by its excessive cost. The necessary cost of fuel for any domestic purpose is exceedingly small, the actual cost bearing no proportion whatever to this, which is ruled by habit and education, rather than by necessity. The London fireplaces strike a visitor from the coal country with astonishment at their apparently ridiculous smallness, but they soon learn that, by a slight alteration in the method of dressing, they can keep themselves quite as comfortable, or even more so, than by a large fire. As the cost of fuel goes up in different countries, so do we see its consumption going down, whilst the same operations are being performed. This reduction in quantity of fuel is apt to strike those accustomed to more extravagant ways as mean and uncomfortable, but it is simply a question of habit. There can be no meanness in economy, nor is there likely to be any discomfort if the economy is not accompanied by meanness: a cook in India will do more good work with a pound of fuel than a North of England cook will with twenty pounds. Many English cooks will burn one hundred pounds or more of coal in preparing a dinner; on the other side, I may refer to some tests made for the Committee of the Gas Institute, and published in November, 1884. In one of them, with a consumption of 25 cubic feet of gas, which is in fuel value equal to about one pound of coal, the work done was 7½ lb. mutton roasted (not baked), 1½ lb. soles grilled, 5 lb. potatoes roasted, a rice pudding, rhubarb tart, and samples of puff pastry baked, the weights of the latter three dishes not being taken. The whole of the cooking was very well done. I do not wish you to imagine that even this small quantity of gas fuel was absolutely necessary, as the actual heat absorbed by the food whilst being cooked would not be one-fourth of this. There is a limit to excessive economy in the fact that the necessary arrangements for this are not always either cheap or easy to manage for such irregular work as domestic cookery. We have rather large and straggling plant-houses and conservatory, the boiler of which is heated by coke, this giving a smokeless chimney. I

am not an advocate of smoke prevention, but has been commonly dealt with, as an abatement which is desirable at any cost, and would not use any of the arrangements referred to except as a matter of direct advantage, and only an average mortal, and consider own pocket and convenience. One of the culprits with gas has been that for its purposes an open fire is sometimes a necessity, and this, the missing link between the old and new systems, I think we have at last succeeded in obtaining, by a gas fire which will bake, heat water, and warm the kitchen, a single burner. Those whom business has driven into closely-populated districts in the morning will, I think, agree with me, in private houses, as a whole, are as great a nuisance as regards smoke as manufactories. The people employed in a works will, as a make more smoke and create a greater nuisance with their house chimneys than is made in the works. The workman's wife can, by the use of gas, save herself a great amount of dirty work and reduce her expenses to a great degree even than those who are in a better position in worldly matters. There is no objection against the adoption of coal gas as a fuel for domestic purposes in the fact that it has been, and still is, almost invariably sold at a fancy price.

My recent statement in the *Journal of the Society of Arts*, that we carry on a manufacture employing 130 (and more recently 140) men, with the necessary steam power, forges, &c., without any smoke, has called forth many comments and expressions of disbelief. I only say that if our chimneys, which are five in number, have a smoky end it is outside in full view from the Warrington Station, the London and North-Western Railway, is used for the fires and forges, simply matter of economy, and the steam boiler worked also with coke, occasionally assisted by a very small quantity of slack, a space of half an inch being open under the furnace doors to supply a thin film of air to the surface of the fire. Our steam boiler, those who do not know it, is a joke; it is old-fashioned, externally fired, egg-shaped pattern, 15 ft. long, 3 ft. 6 in. diameter, a fire 3 ft. wide and 2 ft. 8 in. long, a shallow flue, 5 in. deep, the whole length of boiler, without return. It fortunately happens that Mr. Paterson, the President of the Manchester District Association of Gas Engineers, has been making experiments on the evaporative power of coke and coal in a double-flued cast-iron boiler, 18 ft. long and 6 ft. diameter, the cost of which is about three times that of iron, the space occupied being more than double. In this boiler, with two fires, he evaporated an average of 724½ lb. of water per hour, at 1 lb. of coal for every 8.05 lb. of water converted into steam. With coke in the boiler he evaporated 765.3 lb. per hour with an average of 7.8 lb. of water per lb. of coke. In a small boiler, with a single fire, we have evaporated in a twelve days' test 1,000 lb. of water, and the average fuel consumption of years has been, as near as I can possibly estimate, 1 lb. of coke to every 7½ lb. of water converted into steam: the exact figures to decimals are not available, because we use from the coke supply for the blacksmith's fires. The credit of the high duty of the boiler may be given to the width and shallowness of the flue and firebox, and with a very good result. The boiler inspectors objected to the flue, wanting proper external examination, so we were setting away, making a deep flue of usual form. As a matter of experiment, was left open for six months, and our fuel consumption went up about 20 per cent. We fill the deep flue behind the bridge with bricks, so that they can be removed for inspection of the boiler, and our fuel consumption has dropped to its normal level. You will find in mind that I do not recommend so small a boiler to be worked so hard as to evaporate 1,000 lb. of water per hour, as it is extremely difficult to prevent priming, but the fact we can on an emergency get, with a good expansion valves, about 30-h.p. indicator from a boiler 15 ft. by 3 ft. 6 in. with coke fuel, is, I think, an unanswerable argument in favour of a smokeless boiler. The fire bars 12 in. from the bottom of the boiler; at thick fires are used, and the boiler is, on inspection, reported to be in first-rate condition by the Manchester Steam Users' Association who are, perhaps, the most independent:

to please of any boiler insurance commission. If it paid better to have a chimney we should have one, so far as insurance inspector would permit. Steam have occasionally tried coke as a fuel and to keep up steam: an explanation of failure has been afforded by our having time to drive the boiler to its maximum power. After clinking the bars k mass of cold and possibly damp coke is on, which, under ordinary circumstances, affects the supply of steam at once. The time of firing, a thin scattering of is thrown on the top of the coke, a clear steam flame rises instantly, which keeps up until the coke is fairly incandescent capable of doing the work; if, when going our hardest, we had omitted to do so, like some others, should have failed to obtain satisfactory results, although this is a necessity. We have in the Lancashire district a large number of works which, in opinion of the proprietors, cannot be done on without making smoke. At the meeting of the Society of Engineers my own flameless combustion was received with curiosity, and the demonstrations were as laboratory experiments rather than as commercial facts. That they created an impression in the minds of earnest inventors was proved by the communications received from scientific men all over the world. The value of the possible application of a system of heating has been fully appreciated as an abstract idea, and endeavours have been made to reduce it to practice on a commercial scale. I think the honour of having applied it practically in large furnaces may be given to Mr. F. Radcliffe, the forger at the Royal Arsenal, Woolwich, the steel-making furnace of the simplest construction and of exceedingly low cost, he has used a gas-producer of almost unlimited capacity, from which the hot gas is taken direct to the furnace, a simple continuous regenerator and a furnace of a power which we may say is practically almost unlimited. With the introduction of the hot gas into the furnace he obtains a heat of any character, and a regenerator which is free from tarry to choke with burned pitch, and exceedingly simple and cheap in construction. The amount of waste heat which, in the experimental furnace, goes into the chimney, can be easily utilised to make steam for the engine which is always required for dealing with the products of the furnace. I have used this furnace whilst in full work, and also looked into the chimney, and both as free from flame and dirt as this room. I may take it as an accomplished fact that compact, and cheap furnaces can be which will make gas from the poorest fuels, will give a pure flameless heat of any character and of any required intensity. It is a question of form and detail to adapt a system, not only to the open hearth itself in which it is now used, but also for puddling, all classes of reverberatory work, glass-making, heating gas-retorts, and a fact any purpose where high temperatures continuous heat are wanted. The waste is always needed for steam raising, and in this there are many other industries to which any remaining heat could be applied. There are several purposes to which gas is used to a limited extent, and matters are at present in a state of transition. Amongst these I mention bakers' ovens and furnaces for red glass and enamels. No doubt, in a time, these and other matters will be used so fully as to make the adoption of a new necessity of the trades; a beginning is made, and a little time now is needed to effect the arrangements, which, up to the present, do not fulfil all necessary requirements, every trade as to simplicity, convenience, and economy. The ground has been cleared by independent experimenters, and I think it may be said that both houses and all manufacturing industries can be profitably carried on without smoke, and it is simply a question of time as to when this state of things becomes general throughout the world. The use of gaseous fuel is settled beyond all doubt on the best of all possible grounds, it is profitable to use, and users of solid will soon discontinue their present system until they learn their position in the matter.

COMPLETION OF NEW PALACE AT WESTMINSTER, AS DESIGNED BY ITS ARCHITECT, SIR CHAS. BARRY, R.A.

THE following letter has been sent by Mr. Charles Barry to Members of Parliament, and we are requested to give it further circulation, which we very willingly do, agreeing in general with the views expressed in it, and holding that the ultimate completion of our great national building of modern times is a matter which is not to be shelved at the instance of a committee, mainly composed of very amateur archaeologists, who are bent on carrying out a piece of 'fancy' restoration. Mr. Barry writes:—

"This important subject has, I think, been overlooked by the Committee on Westminster Hall in the smaller consideration of whether or not the west side of Westminster Hall shall be restored and left open to public view.

On this matter I submit the following remarks on certain designs for a cloister building between the buttresses on the west side of the Hall, and represented by painted models on the site, representing two modes of treating the question.

It seems a waste of public money to carry into effect a so-called restoration which is conjectural only, so far as design is concerned.

It seems a waste of public money to start with this idea of restoration, authentic or not, and then to try and find some use for a few rooms which would be contained in the new work.

If further rooms are wanted at the New Palace, the proper course would be to consider their number, use, convenient size, and convenient position, and then to find if and where such accommodation could be got in connexion with or addition to the present building.

Three or four rooms are contained in the proposed cloister and building at the north end of the same, and are said to be intended for committee-rooms.

Those between the buttresses are narrow (only 20 ft. wide), low (only an average of 13½ ft. high) have ceilings in part sloping; have two small windows in each, giving insufficient light, and they are isolated from the rest of the building, being approached only by stairs which would project very inconveniently into Westminster Hall.

Under these rooms an open arcade is proposed, practically useless for any purpose.

In short, the said rooms are, in my judgment, entirely unsuitable for committee-rooms, and no other use has been ever defined for them.

As to external effect, the two-storied building between the buttresses, which it is said is the one preferred by the Committee, dwarfs the side wall of the Hall (if it is to be left open to view), already low in effect, in spite of a lofty parapet proposed to be added, for which no authority exists, its existence, height, and design, being all matter of conjecture.

The above-named building at the north end of the proposed cloister, at right angles to it, and the design of which is also matter of conjecture, is, as designed, low, with little architectural character, and will, I think, have a very mean effect as seen from Bridge-street, Great George-street, or Parliament-street. The one room in it will serve no ascertained purpose, and is isolated from the rest of the building.

The general effect of the whole treatment thus proposed (viz., to attempt to restore the west side of Westminster Hall to what it may or may not have been in the time of Rufus), will be thoroughly incongruous with the far more important building of the New Palace at Westminster, of which it unavoidably now forms a part, since the style of architecture of the Hall is essentially different from the style adopted for the Palace. The details of the former are consequently quite out of scale with those of the latter, and the harmonious effect which should be preserved throughout so important a building will be entirely sacrificed. More or less picturesque it may be, but devoid of the dignity and unity which should be characteristic of an important public building.

I see that some architects who gave evidence before the Committee speak of this mutilation of architectural harmony as a 'pleasing foil.' Surely it is rather a violent and unpleasing contrast of two conflicting ideas.

No sort of reason is given for any of this work being done at present, save the protection of the now exposed and partly decayed side

wall of the Hall and its buttresses from the effects of the weather. This may be done in either of two ways, and at one-fourth of the cost of 25,000l. to 35,000l. now proposed to be spent on useless buildings, viz. —

(a.) Either by cutting out and replacing all decayed and decaying stone, as is being now done at Westminster Abbey;

(b.) Or by repairing the buttresses and covering in the side wall of the Hall with a low passage or cloister sufficient for that purpose only, and which cloister or passage might be constructed either in stone or other material.

I think the former the most reasonable course to pursue.

By this means the only area which exists adjoined to the New Palace available for the enlargement of that building, having regard to surrounding thoroughfares, if and when the need for such enlargements arises, will be kept free and useful when so wanted.

It has been admitted by all the witnesses before the committee, professional or otherwise, that when such enlargement shall be needed, the design of Sir Charles Barry in respect of this area should be carried out, as conceived by him and recommended to the Government in 1854, the design and plans of which are extant, though no doubt some modifications in detail (but not in principle) would be needed to suit the actual public requirements at the time.*

Mr. Shaw Lefevre has suggested, in his evidence before the committee, that the designs of Sir Charles Barry 'may be understood to be given up.' This is a gratuitous assumption. Now is the time for their practical consideration.

In any case I think nothing should now be done beyond replacing or protecting the decayed stone of the walls and buttresses of Westminster Hall, and preserving careful record of the foundations and remains of former buildings on this area, for the archaeological interest attaching to the same, by making measured plans and taking photographs of the same.

It may, I think, be further urged that consideration should now be given to the question whether Sir Charles Barry's design should not very soon be carried out, as it would effect a large saving annually of public money now paid for rents of dispersed buildings in London rented temporarily and expensively for various purposes connected with Government or Parliament.

Authenticated returns of such out-offices so rented would, it is believed, make this abundantly clear, while the convenience of concentration seems obvious, and has been repeatedly advanced by different Governments as one chief reason for the erection of the various public offices which have been erected from time to time. Such arguments would surely be equally valid in this case.

No evidence was given by the architects who were called in support of the proposed plan as to the accommodation it provides being either required or good of its kind (which it certainly is not), but they were agreed that Mr. Pearson had treated the matter 'qua restoration' with ability, which nobody has denied.

I contend, however, in conclusion, that such a restoration, which is practically useless for any public purpose, should not be the consideration in this case, but the true aim should be to do nothing which might conflict with the fitting completion of the most important building which this country possesses, and one acknowledged by Englishmen and foreigners to be an architectural work of which the nineteenth century may well be proud. And if this be so surely some regard is due to the recorded intentions of its architect how most fittingly to complete it.

I need hardly say that the part which I have taken in this controversy has been dictated by the duty which I owe both as son and as architect to my revered father's memory.

CHARLES BARRY, Architect.
No. 1, Westminster-chambers,
March, 1885.

Clerks of Works' Association of Great Britain.—The second annual dinner of this Association will take place on Monday evening next at the St. James's Hall Restaurant, Regent-street. Mr. Goymonr Cuthbert, A.R.I.B.A., will preside.

* A perspective view of Sir Charles Barry's design is on view in the Tea-room of the House of Commons.

Illustrations.

THE PALAIS DE JUSTICE, BRUSSELS.

A GLANCE at what the good people of Brussels have lately been doing in the matter of public buildings is calculated to take a little of the conceit out of the peripatetic Briton. The population of London alone is equal to that of the whole Belgian kingdom, and the population of Brussels is less than that of a first-rate English manufacturing city. But while we have been for twenty years or more hesitating to spend a poor half-million or so on the housing of two of the great departments of the State, although urged thereto by economical considerations, the Brussels Municipality has expended no less a sum than two millions and a half sterling on their New Law Courts, and, undismayed, is laying out an additional half-million in providing suitable approaches and surroundings to the building; sacrifices, made in great measure out of a pure love of art, which may without exaggeration be called heroic.

The new Palais de Justice,--of a portion of which we give an illustration on a larger scale than that of the view which has already appeared in our pages,--occupies a commanding site, and is seen from all the country round. Its enormous mass impresses all beholders, but the magnificent amplitude of the structure is only fully realised when the interior has been explored. It is essentially a monument of architectural art,--providing, incidentally, eight small law-courts and some minor accessories, which, however, absorb but a very inconsiderable fraction of the whole. The buildings cover an area of between eight and nine acres, the main frontages of the block being 656 ft. and 558 ft. respectively. The Central Hall is of vast dimensions,--279 ft. in height to the lantern,--and the subordinate apartments are proportionately magnificent.

The author of this stupendous work is said to have been an ornamentalist rather than an architect, and an examination of his work supports the statement. His architecture is full of eccentricities. They are not the result of ignorance of the principles of art, and can only be put down to a wanton defiance of architectural traditions. The most unwarrantable liberties are taken with the general proportions and dispositions, and the details are often little short of barbarous. One cannot help thinking that the project was never studied in perspective, and that the several façades were independently arranged without due consideration of their mutual adjustments. Our illustration shows one of many examples of a capricious treatment of the principal orders, the frieze and architrave of one being squeezed into the depth of an adjoining frieze, Ionic caps jostling against Doric triglyphs without rhyme or reason. Nothing is gained by such irregularities, which are far too numerous and very much to be regretted in this otherwise fine design. The central lantern was the subject of several trial models, and the result fully justifies the thought and care expended upon it. In contour, proportion, and detail it is by far the most satisfactory portion of the exterior of the building. The stately is exactly right in scale and treatment, and shows how very far our Continental brethren are in advance of us in this important feature of all really fine architecture. The sculpture and ornament of the interior are worthy of all praise, being abundant and of uniformly high excellence. Statues of heroic size,--Demosthenes, Lycurgus, Cicero, &c.,--already grace the broad flights of steps which lead from the porticos on either side of the main entrance to the *premier étage*, and funds are being ungrudgingly voted for the completion of the series. But, perhaps, the highest praise of all should be given to the ornamental plaster work in low relief with which the ceilings of the halls and corridors are adorned. In this part of his work the architect was thoroughly at home, and he has not spared himself either in the variety of his designs or their exquisite and delicate beauty. The exterior mouldings are almost always coarse and ill-designed,--and the angles of his blocks of building when seen *en silhouette* are clumsy and unartistic to a degree. But every line of the interior has been traced with a quite Grecian subtlety, and the curves of consoles and brackets are of surpassing grace and refinement. Nor is the breadth of the general effect less remarkable than the extreme beauty of the details. The courts are

adorned with Belgian and other marbles, and the fittings are of rare woods, of quiet and appropriate treatment. The only point in which a little more care might have been exercised is the ornamental metal-work, which, from some unexplained cause, is certainly below the general artistic standard.

Notwithstanding all its faults, and they are many and grievous, the building is beyond question a work of genius,--wayward and unequal if you like, but genius still. With pain one feels obliged to add that its gifted designer shared a too common fate of genius,--that the anxieties and responsibilities of his position, aggravated by the meddling of official mediocrities, first drove him out of his mind, and then led him to death. He has, however, lived to accomplish sufficient for fame. He leaves behind him a monument of amazing originality and power, which will not only perpetuate his own personal skill, but form an enduring and honorable record of his countrymen's unselfish love of art.

The constructive difficulties of the undertaking were considerable, and have been on the whole successfully overcome. An instance of the kind of perversity which the work exhibits in so many forms is the use of monolithic or trilobed columns carrying architraves formed of small stones which are obviously kept in position by concealed expedients. The weights of the enormous superstructure are prodigious, and of very varying incidence; but a careful scrutiny does not discover any very serious settlements, nor any of those serious fractures which one might reasonably have expected to meet with in a work of such unusual magnitude and complexity.

The building was commenced in 1866, and opened in 1883, and we congratulate our Belgian friends on their splendid achievement.

It will be some years before it can be said to be complete in all its details. But the work is going on. Fortunately the architect made careful provision for everything necessary to complete the building before illness, long foreseen, disabled him from supervising the execution of his designs. The whole will, therefore, bear the impress of a single mind. It is a building of which, in spite of faults of detail, any age might be proud. And in the roll of the foremost architects of the nineteenth century posterity will surely accord an honorable place to that of Joseph Poelaert.

THE CHURCH OF ST. HIPPOLYTE, DELEF.

THE view of this church, which we give this week, is drawn from the plan and geometrical drawings furnished to us by its eminent architect, Herr Cuypers. The site being limited in extent, the transept form could not be adopted on the ground-plan, but the line of aisles is broken by two quadrants, as seen in the view, to break the monotony of the side elevations. The main portion of the church is built in yellow and red brick. The shafts round the apse are in Swedish granite, the others in sandstone. The tower rests on piers driven deep into the foundation, about one yard apart from centre to centre.

The style of detail in portions of the building, more especially in the spire, differs very remarkably, as will be seen, from what we are accustomed to recognise in this country as in keeping with the feeling of Medieval architecture. It is partly, however, for that very reason that this design, by an architect of the highest eminence in his own country, may have a certain additional interest to our readers, as a practical exemplification of the influence of local habit and association on architectural taste.

DESIGNS BY THE LATE M. E. HADFIELD.

IN connexion with the illustrations of Churches by the late Mr. Hadfield, of Sheffield, we now give in full the memoir of Mr. Hadfield, which was read at a recent meeting of the Institute of British Architects--

"After being articled to Messrs. Woodhead & Hirst, of Doncaster, and improving his professional knowledge in the office of Mr. P. F. Robinson, Fellow, then an architect of note in London, Mr. Hadfield settled at Sheffield, where he commenced practice in 1837. In 1838 he entered into partnership with his fellow-pupil and friend, the late Mr. John Gray Weightman, an arrangement which lasted until that gentle-

man retired from professional life in 1858. From the first Mr. Hadfield was actively engaged in general professional practice, chiefly in the northern and midland counties, and among a variety of public and private buildings designed by him and his partner may be named the tower hall, Glossop, the Norfolk and Fitzalan market halls, also the Queen's Tower, Sheffield, Kneppington Manor, Boreatton Park, and later, in conjunction with Mr. George Goldie, who had been his pupil, the Farm, a local seat of the Dukes of Norfolk; Glossop Hall, for Lord Edward Howard; several schools, besides many important churches in England and Ireland. Mr. Goldie, after a partnership of eight years, commenced practice alone in London in 1861.

The revival of the Gothic style, which received so great an impetus forty-five years ago, found in Mr. Hadfield an active votary, and the churches and schools erected at the time from the designs of himself and his partner show the result of much zealous study.

The churches they built at Carlton, Worksop, Masborough New Mills, and Matlock Bath are earlier instances, followed immediately by others at Liverpool, Birkenhead, Manchester, Middleton, &c., and when Augustus Welby Pugin, writing in 1842, what he termed 'a review of the state of ecclesiastical architecture,' dwelt with all but exclusion on his own works as being worthy to form the text of his remarks, he pays Mr. Hadfield the compliment of describing and illustrating the little church there just built at Masborough, near Rotherham.

In 1844 was begun St. John's Cathedral, Salford, one of the very first 'revivals' of a large cruciform church with a central tower and spire. It is given by Mr. Eastlake as an instance, with an illustration, in his very interesting work. That this and several other of the architect's churches in Lancashire and elsewhere showed a great advance was universally admitted by those who hailed the Gothic revival as it gained ground.

The dissatisfaction which some critics were expressing as to copying too literally rather than developing from ancient models began soon to assume a decided form in the pages of the *Rambler* where may be seen, in its number of September, 1843, a view and description of St. John's. The article of Mr. Capes, in his magazine and review, the *Rambler*, were so talented and convincing as to induce several architects to offer designs and suggestions for town churches in its pages. The late Mr. C. Parker, the author of 'Vill Rustica'; Mr. W. W. Wardell, now a leading architect in Australia; and Mr. Hadfield, were of this number, the latter contributing a design in the Byzantine style to the January number 1850. Grieved by its sharp criticisms, and accustomed to little but adulation where church architecture was the question, an amusing and characteristic pamphlet next appeared from the pen of Mr. Welby Pugin, entitled 'Remarks on the articles in the *Rambler*,' which gives a lively insight of the progress of the 'revival.' In it the round-arched design, of course, came in for an unmerciful scolding, and expressions more direct than elegant testify to the wrong doing of a friendly rival, who could dream of deserting the pointed arch. Not that these remarks ruffled the temper of the peccant architect,--a smile, with a good-humoured verbal protest, was the reply. The design in question was afterwards carried out, with some modification, in the church at Malberry-street, Manchester; but the English Gothic of the fourteenth century remained, after all, Mr. Hadfield's chosen style, as instanced in the well-designed church at Burnley, 1845, and still more in a better-known work, St. Mary's, Sheffield, begun in 1846, which gained for its architect much credit.

This church, near to his home, completed only by degrees, and avowedly the favourite of all his works, may be taken as the ideal of his aims. Not of great scale,--150 ft. long and 85 ft. wide,--nor possessing any unusual or startling feature, its composition is even and well balanced, both in plan and elevation, without any without. The effect is thus just such as to give increased pleasure after a first acquaintance and to allow itself to grow, the simplicity of parts and the fitness, even richness, in the details of others, being most satisfactory,--neither oppressive or forced, but consistent with a placid worship, as, indeed, it was till near its end.

In the busy West Riding, the early growth of the railway system furnished much employment to Mr. Hadfield's firm, and in associating

COMPETITIONS.

with Mr. John Fowler, the engineer, they designed the Gorton depot, and various stations and works on large sections of the Manchester, Sheffield, and Lincolnshire Railway. These were followed by some important hotels built for this and the Great Northern Company,—the Victoria Hotel, Sheffield, 1860; the Railway Hotel, Grimsby, 1863; and the Great Northern Hotel, Leeds, 1865. This last commission, obtained in a limited competition, afforded scope for Mr. Hadfield's practical talent and matured experience. The plan is meritorious, and has proved to be well considered. As a design, the building is a very effective one. Profuse ornament is eschewed, and much judgment is shown in the application of detail, all of it suitable, and generally evincing originality.

Having practised alone for a few years, Mr. Hadfield took into partnership, in 1864, his only son, Mr. Charles Hadfield, who had completed his education by passing through the student's grade of this Institute. With continued activity a number of civil and ecclesiastical buildings were carried on,—Bleak House, the residence of Mr. Fowler, the engineer, and Thornbury, for Mr. Mappin, M.P.; the Sheffield Club House, the banks at Chesterfield, Rotherham, and Mexborough; the Gas-office, the Drill-hall, and the Intake Public Cemetery, at Sheffield; the Custom-house at Grimsby; the Market-hall, Howden; and the Institution for the Deaf and Dumb, near Tadcaster, besides various houses, schools, churches, and convents, that at Mount Pleasant, Liverpool, being one of the more effective designs. Between 1859 and 1865 a gate-house, a chapel, and some monumental works were carried out at Arundel Castle; a more recent commission from the Duke of Norfolk to Mr. Hadfield being the Sheffield Corn Exchange, in 1878. This was among the best works to which he gave serious attention. (It is a large and richly-executed building, in the Tudor style, comprehending an hotel, the Norfolk estate office, and other offices and chambers, with shops under, so planned as to enclose a central glazed court,—the corn-market itself.)*

Many of our members have enjoyed the acquaintance of Mr. Hadfield, who joined the Institute as an Associate in its earlier years, and who had become in time one of the elder Fellows, and had served on the Council.

In professional, as in private life, Mr. Hadfield was always genial, tolerant of opinion, and popular, though able to hold and express his opinions with weight; and among his townsmen he bore a high character. He took part in advocating several public improvements, and was one of the founders of the Gentleman's Club. Another object which he strenuously worked for was the School of Art, and providing a home for it in Arndel-street, Sheffield. After holding the office of President for three years, he continued to be a member of the Council.

Mr. Hadfield died on March the 9th of the present year at his residence, Knowl House, near Sheffield, at the age of seventy-two years.†

DETAILS OF THE "TITE PRIZE" DESIGN.

We give this week two of the sheets of detail from the design by Mr. J. A. Campbell for "A Pavilion at a fashionable watering-place," which gained the "Tite Prize" this year at the Institute of Architects. The general elevation and plan we gave in the *Builder* for March 25. The first page shows part of the external elevation, in which the author has contrived to impart to those time-honoured "properties," the griffin and the "swag," rather more than their usual effectiveness: the second page shows a portion of the interior of the music-room, the detail of which is elegant and suitable.

"Things one would rather have left unsaid."—Fair visitor at a studio on "Picture Sunday."—"Thanks so much for giving me this opportunity of seeing your Academy picture, Mr. McDuffier,—and good bye!" He. "Delighted to have seen you. I suppose you are now going to see Smythe's picture, over the way?" She. "Oh, no! I shall see that at the Academy, you know!"—*Punch*.

* Several of the buildings enumerated have been illustrated in the pages of the *Builder*. Of the Sheffield Corn Exchange we gave a large view and plan in our number for November 12, 1861. Another important and effective building, being the new offices for Messrs. Pawson & Brailsford, printers and lithographers, Church Gates, Sheffield, was illustrated in our pages by a large view and plan more than a year ago, viz., February 23, 1864.

Public Baths for the Borough of Stockport.—The award in this competition was made some months since, when the design submitted by Mr. J. C. Prestwich, architect, Leigh, near Manchester, was placed first, subject to the estimates for the work being obtained by the Corporation within the stipulated sum of 5,000*l.* given in the "Instructions to Competing Architects." The Sanitary Committee of the borough met on the 6th inst., when tenders were opened, the whole of which will be found in our list of tenders, the lowest and accepted tender being 4,865*l.* The work will be at once proceeded with, under the supervision of the architect.

Co-operative Stores, Jarrow-on-Tyne.—The building committee of the Jarrow Industrial Co-operative Society, having invited architects to send in competitive plans for their new premises in Hill-street, have received ten sets of drawings, from which they have selected those bearing the motto, "Commerce," by Mr. J. W. Hanson, of South Shields and Jarrow, and have appointed him architect for carrying out the work.

New Church Schools, Accrington.—It having been decided to erect new schools in connexion with the above church, in Hargreaves-street, Accrington, the Committee invited the following architects to submit designs, viz.:—Messrs. Maxwell & Tuke, of Manchester; Messrs. Stones & Gradwell, of Blackburn and Accrington; and Mr. George Baines, of London. The plans sent in have been on view for the last fortnight, and, on the 26th ult., a meeting of the members of the church was held, at which the recommendation of the Building Committee, that the design submitted by Messrs. Stones & Gradwell be accepted, was confirmed. The building will be erected on the site of the present school, which, however, will be enlarged by the acquisition of three houses adjoining. It is expected that the cost will be about 3,500*l.* The design chosen shows two entrances,—the main entrance in Hargreaves-street and one in Chapel-street. Accommodation is provided on the ground-floor for 304 girls, 176 infants, and 72 babies, with convenient cloak-rooms, lavatories, &c. There is also a private room for the mistress. A tea-making room is also provided, having a lift for communication with the upper floor. By raising a revolving shutter between this room and the adjoining class-room, a large room is obtained for cookery classes. There is ample playground accommodation, part of which is under cover. On the first floor there is a large assembly-room containing 337 square yards (exclusive of gallery at one end) and approached by staircases from both streets. There is also a lecture-hall containing 151 square yards, a large committee-room, and ante-room for use in connexion with the platform; also an ante-room to serve as cloak-room both for lecture-hall and assembly-room. For Sunday-school purposes the assembly-room can be divided into a number of classrooms. The style adopted is Gothic of a simple type.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association.—The seventh ordinary meeting of the current session was held at Queen's College, on the 31st ult. The Vice-President, Mr. W. H. Kendrick, was in the chair. A paper was read by Mr. H. Clere on "Artisans' Dwellings, the Artisans' Dwellings Acts, and cognate Acts of Parliament." The lecturer advocated the adoption of the flat system in preference to the vertical system for artisans' dwellings, and exhibited a number of plans and drawings of proposed and existing buildings in support of this view. A vote of thanks, proposed by Mr. F. Bailey, and supported by Messrs. Franklin Cross, Victor Scruton (Hon. Sec.), H. H. McConnal, T. W. F. Newton, and the Vice-President, was unanimously awarded to the lecturer. After a lengthy reply by Mr. Clere to many points raised in debate the meeting terminated.

Edinburgh Architectural Association.—On Saturday last about seventy members of this Association left Edinburgh by train for Roslin. The scene of the excursion was Roslin Chapel and Castle, and the party were under the leadership of Mr. Andrew Kerr, who read a paper. The lower chapel, which might be regarded as a separate building, with a priest's chamber on the south side, was, he remarked, said to have

been erected by Lady Elizabeth Douglas, and dedicated to the Virgin Mary. The upper chapel, or collegiate church, was founded by Sir William St. Clair, third Earl of Orkney, on St. Matthew's Day (21st of September, 1450), and dedicated to St. Matthew. The present chapel was intended for the choir of the complete building, which had been founded to its full extent. The foundations had been traced a considerable length; but those of the cross west wall were removed about the end of last century. The western part or nave appeared to have been intended to embrace a central, with a double aisle on each side, after the manner of the nave of Toledo Cathedral. The choir was confined to a single aisle on each side of the central one, and a double aisle at the east end, more properly, a retro-choir, embracing four chapels. The entire arrangement of the choir was almost a repetition of that of Glasgow Cathedral, only Roslin Chapel had been more carefully studied in the elaboration of the ornaments. The plan of thirteen of the pillars was the same as that of those in the nave of Segienza in Spain. One special peculiarity of Roslin Chapel was the "horizontal arches" over the side aisles. In these, however, safety arches were concealed by a face ornament on each side. In some parts of the chapel there appeared indications of representations of religious or other allegories, and in the western compartments of the roof Scriptural teachings were plainly represented in the sculptures. The entrance to Roslin Castle had originally been protected by a trench and drawbridge, which were replaced by a stone arch about the end of the sixteenth century. The castle formed an irregular oblong square, with gardens at the south and east sides. On the left of the court was the "Lamp" tower, known by that name on account of signal lights having been displayed from it. The keep or donjon tower at the south-west corner was erected towards the end of the fourteenth century, and the buildings on the west side connecting the towers were built about the middle of the fifteenth century. These contain domestic apartments and a chapel. The buildings existing upon the north-east side were erected between 1597 and 1622, and were arranged for additional servants' accommodation, including a great hall with a fireplace of characteristic design.—At the usual fortnightly meeting of the Association, held on Monday evening last, Mr. D. Purves read a paper on "House Drainage and the Sanitary Arrangements connected therewith." Referring to the question of water-storage, he recommended that cisterns should be placed as near as possible to where the water was to be drawn, and be of such dimensions that the water would be renewed each day; that each cistern should be fitted with plug-valve, and the bottom so sloped that this valve would entirely empty the cistern; that this valve should be connected with pipe and trap to waste-pipe arrangement, and have pull and cord in an accessible position, that the cistern might be emptied without trouble at any time. When it was necessary to have a large cistern a great benefit would be derived by having a division fitted in it, self-acting, with syphon arrangement between the two compartments, so that the whole water could be emptied out periodically instead of being mixed up from day to day. All cisterns should be carefully covered and placed in such positions and so fitted that the unskilled might inspect them conveniently.

Presentation to Mr. Thomas Seward.—At a meeting held at the Crown Baths, Kennington Oval, a few days ago, Mr. T. Seward, who is leaving the firm of Messrs. Higgs & Hill, of Crown Works, South Lambeth, was presented by them with a purse of gold, also with an album from the workmen, while a black marble clock and ornaments, inlaid with malachite, was presented by the foremen and clerks. The clock bore the following inscription:—"March 27th, 1885. Presented to Mr. Thomas Seward, by the foremen and clerks in the employ of Messrs. Higgs & Hill, together with a purse of gold from the firm, as a token of esteem and regard, at the close of thirty-five years' service with them and the late Mr. William Higgs." The annual entertainment afterwards was given by the firm to their employes and their wives, and of whom upwards of 1,000 sat down to a substantial meat tea. Such entertainments bespeak good feeling between masters and men.

REARS OF HOUSES.

SIR,—I think a little consideration will show that the "consensus of opinion" you mention in your issue of the 25th ult. [p. 464] will not be the opinion of the Courts, and for the following reasons. It is an established rule that no Act of Parliament, or any part thereof, can be annulled, except by express language in a subsequent Act, unless the wording of the subsequent Act leaves no doubt as to the cancellation.

Now, in sec. 29 of 18 & 19 Vic., c. 122, there are two classes of houses dealt with: those whose rooms can all be lighted from a street or alley, and those buildings which cannot. The Metropolis Management and Building Acts Amendment Act, 1882 (45 Vict., cap. 14), sec. 14, does not make any mention of any distinction of buildings, but deals with the area at the back, beginning by an increase of 50 ft. on the Building Act before mentioned.

Of course, if the Amendment Act were not an amendment Act, the language "every new building" would clearly mean every building; but as in the Building Act there are two distinct classes of houses, it appears as if it would commend itself to the Courts that buildings lighted and ventilated from a street or alley were not intended to be interfered with, but only those buildings which are lighted in part from the rear; and this really seems the intention, because the amending Act follows the wording of the Building Act, only giving increased air space.

You will notice, in confirmation of this view, the final words in the paragraph in the Amendment Act distinctly state that the provisions of this Act shall be in addition to, and form part of, the rules of the Building Act. Now the increased space is an addition, and there is no word indicating a radical change like the abolition of a right to build premises which can be lighted entirely from the street or alley.

I had my attention called some time ago to this paragraph in a responsible manner; for I received instructions to value for a mortgage a terrace of shops which had been created after the passing of the Amendment Act, and after much consideration of these clauses I advised my clients that the buildings were in conformity with the requirements of the Act.

All will admit the importance of removing all doubt; and, I trust, now you have called attention to the Acts, such a result will ensue.

BANISTER FLETCHER.

** We think that the construction put upon the Acts in our article was the right one, and that the maxim "Leges posteriores priores contrarias abrogant," which specially governs the construing of legislative enactments where they are opposed to each other, applies, and that buildings erected after the Act of 1882 must have the increased area, whether they can be lighted from the street, &c., or not. The rules of the Building Act do not affect the question, as they apply to other matters not within sec. 29 of the Building Act.

THE PROPOSED "GORDON" HOSPITAL AT PORT SAID.

SIR,—If my memory serves me aright, a house was purchased in 1882 at Port Said from Prince Henry of the Netherlands, for "strategic purposes," at a cost of 70,000.

If not made use of militarily,—which I fancy is not likely to be the case,—why should not this mansion be utilised for the memorial in question? I feel sure the nation would approve of its being devoted to such a purpose, and it would help to make the money now being subscribed go further than in the erection of an entirely new building.

C. E.

THE LOWEST TENDER.

SIR,—Whatever may be the legal bearings of the question, I cannot agree as to the expediency or the morality of rejecting the lowest tender, except upon grounds which might be held to justify the act, such as incapacity, or want of position, or previous bad work, which might be even subject of public inquiry if demanded by the builder. Much clamour has been made for many years by the public as to the dishonesty of builders. My belief is, they are as honest as any other class of tradesmen. But the unfair dealing of employers will not tend to make them retain their honesty; and I for one do not see the fairness of making a professedly public offer, equally open to all alike, with the foregone determination to employ some one else, "from neighbourly feeling," if only by their professedly public offer they can heat him down to the lowest penny.

I have had the lowest tender rejected from the want of capacity and position in the man tendering; and again from an attempt to revise the tender after being sent in. If any one

should wish to ensure the employment of a proper man, it is easy enough to invite only such as will satisfy their requirements. Anything like jobbery will only disgust good men, and architects who sanction it will find themselves in a position to obtain only second-class tenders. In a recent case I was on the point of rejecting the lowest, merely on account of its being so low that I feared the work could not be properly done. I feared that I should have lost a most capable and fair-dealing man. The highest was 6,600*l.*, the lowest 4,800*l.*

WM. WHITE, F.S.A.

FIREPROOF FLOORS.

SIR,—We thank you for the insertion in your number of Feb. 28th [p. 321] of our letter on this subject, and as the question raised by your note is one of considerable importance, we are writing again in the hope that the matter may be thrashed out, and a satisfactory conclusion arrived at.

In your note you state that a beam in good concrete requires no top flange.

This opinion, we take it, is founded on the supposition that the concrete and iron form together a compound beam, in which the former takes the compressive, and the latter the tensile strain. If this were so, a series of round rods under the concrete would fulfil the conditions of stability. But when spans of as much as say 16 ft. have to be considered with a thickness of only 6 in. of concrete (by no means unusual dimensions), the impossibility of carrying out such a construction becomes obvious.

Regarding the matter in another light, the weight of the concrete alone represents, in many cases, a large proportion of the total floor load to be supported; and it will be admitted that in making fireproof floors in the usual way, the whole of this load must be carried by the iron beams acting as girders and not as ties, because the concrete before it has set and whilst straining the iron by its weight cannot possibly afford any sensible resistance to compression.

We should also be glad to know your reasons for suggesting that a tee-iron is more effective than a girder section of equal area and weight.

If it could be shown that rolled iron joists with unequal flanges would reduce the cost and increase the efficiency of fireproof floors, we should be foremost in advocating their use; but no such advantages are now patent to its use, regarding the matter merely in its mercantile aspect, we should like to be assured of a sufficient demand before providing a supply with which to meet it.

ROBINSON, DREW, & CO.

** Our "reason" is simply our knowledge of the fact that concrete beams, with imbedded iron bottom flanges only, have been tested to very severe cross strains at Messrs. Kirkaldy's testing works. The sections so tested included various arrangements of iron and concrete, among them the precise one to which our correspondents refer, of a series of round rods embedded in the lower portion of the concrete beam. We have been permitted to refer to Messrs. Kirkaldy's books to confirm our recollection, but the results are not available for publication here. It is, of course, quite possible to have other tests made for the special object of investigating the point, and we should think it quite worth while.

COLLAPSE OF A LARGE-SIZED SEWER.

SIR,—A case of the above has lately happened in the execution of the Dorking sewerage works, and since, although they are not without precedent, such cases are happily rare, particulars doubtless will be of interest to your readers. The pipes were 21 in. in diameter, and 1½ in. thick (Jennings's make), and were first-class specimens of stoneware pipes. They were laid in a trench 13 ft. deep and 4 ft. 6 in. wide. The subsoil strata were alluvial,—upper green sand and gault clay; the latter was nohly and full of water when the trench was excavated, but was got into a dry good condition by means of small agricultural drains laid as subsoil pipes 6 in. below formation level on each side of the trench. The sewer-pipes were laid in the ordinary manner on their barrels, with joint holes for the sockets, which the latter probably touched throughout, but upon which they had no undue bearing. The joints were Stanford's patent (the chipping for which doubtless slightly weakened the pipes), over which a hard clay was worked to prevent leakage. The mode of filling in after the pipes were laid, carried out in accordance with the specification, was unique. The finest material was selected (sifted, if necessary), it was laid to a height of 2 ft. above the highest parts of the first three pipes; other similar material was then thrown upon that and carefully pushed along on to the next pipe, and so on, no ramming whatever being permitted until this fine soft filling material was 2 ft. above the highest parts of the pipes. The remainder was then thrown in and rammed, there being two rammers specified

* The publication of this letter has been unavoidably delayed.

to one filler. The pipes being thus without lateral support (for the loose filling could have been of no possible use in this respect), and practically arches without abutments, it is scarcely surprising that every pipe collapsed as far as the ground had been filled in. The ramming applied to the last 9 ft. of filling consolidated it into one mass, 4 ft. 6 in. wide, which settled bodily. There were 4 ft. of soft unrammed filling at the sides of the pipes, and only 2 ft. on top of them, so that when the mass subsiding had compressed the soft filling on the top of the pipe to its greatest density, the filling at the side was only half compressed; consequently, 13,000 lb. of earth ultimately settled upon each pipe, whose crushing strength was not equal to one-half that weight.

IGNORAMUS.

TEMPLE BAR.

SIR,—I think the site suggested in "Delta's" letter of the 30th ult. [p. 497, *etc.*] for the re-erection of Temple Bar a most excellent one, and in every way more appropriate than carting it away to Epping Forest, where it would be entirely out of its element. In the Temple it would still be "Temple Bar" and amid the most interesting associations, historical and civic; more than this, it would still be in the "City."

There is no difficulty, as we see in this case, in finding suitable sites not only for Temple Bar, but for the Burlington House Colonnade and York Gate, should it be found necessary to disturb the latter; the difficulty is in getting the proper authorities to do the work. With this view one is glad to welcome such letters as "Delta's," and the assistance of every one who cares for the preservation of such interesting monuments, and I sincerely echo his trust that you will kindly exert all your influence in favour of the movement so cordially taken up by the Institute the other night.

J. M. BRYDON.

LIME-MORTAR GAUGED WITH PORTLAND CEMENT.

SIR,—I notice that some builders are now using lime-mortar gauged with Portland cement in connexion with brickwork, and am informed that the work is stronger than when ordinary lime-mortar is used. I consider that the setting properties of the two materials when so mixed are opposed to each other, and cannot understand how any permanent cementing agent can result, and would be glad to receive further information.

MORTAR.

CHELSEA VESTRY-HALL COMPETITION.

SIR,—Being one of the competitors in the above I think it fully right, in fairness to others who may not have the opportunity of viewing the drawings (which are open this week to public inspection at the Cadogan Club, next Vestry Offices), to draw their attention to the fact that two out of the three sets, viz., Nos. 14 and 26, chosen by the assessor, have not complied with the instructions, having sent in coloured drawings, although it was specifically laid down that the "drawings are to be finished in line in Indian ink."

I wish to ask you, Sir, what good instructions are if they are to be flatly ignored? And also of what use are "Professional Assessors," who allow such things in dire contradiction to the same, as I have mentioned?

I enclose my card.

FIAT JUSTITIA REAT CÆLEM.

* The two competitors referred to kept, if we remember right, the spirit of the instructions, which referred mainly to the getting-up of the elevations. One of them did send a coloured detail of a bay of the large room, but we should hope that drawing acted against his chance of selection rather than in favour of it, apart from the question of regulations. We do not think the injustice is more than a merely technical one.

"STREET ARCHITECTURE OF LONDON."

SIR,—I have read the correspondence that has taken place in your columns [pp. 465, 498] in connexion with the above as applied to the new Street from Bloomsbury to Piccadilly, which is now being formed by the Metropolitan Board of Works.

That the entrance to this new street at the Bloomsbury end should be so greatly disfigured must be a matter of regret to all who have the slightest respect for architecture, leaving out of the question the dangerous curve there will be in this important thoroughfare.

It would have been thought that nothing less than insurmountable difficulties could have induced the Board to have so much marred what might have been one of the finest streets in the metropolis. But, from the letter of "A Large Ratepayer" in your last issue, it appears that the Board had every

facility afforded it for carrying out the work in a satisfactory manner.

That a serious blunder has been committed it is clear, and it is not to be wondered at that the parishioners, &c., feel themselves much aggrieved.

ONE OF THEM.

ARCHITECTS v. CORPORATIONS.

SIR,—I have read the decisions in Hunt v. Wimbleton Local Board, and Yeung & Co. v. Leamington Corporation, and as it is a question of interest to the whole profession, shall be much obliged to you, or to some readers, if you or they can inform me whether that law applies to all public bodies that deal with public money.

DUBIOUS.

PROVINCIAL NEWS.

Market Harborough.—Last week Major Tulloch, R.E., held an inquiry into an application by the Market Harborough Local Board for a provisional order to purchase land in the parish of Husbands Bosworth for the purpose of a water supply for this united district. Mr. Rawlins and Mr. Clark represented the Local Board; Mr. Owston and Mr. Thomas watched the proceedings on behalf of the Canal Company; and Mr. Wratistlaw and Mr. Stewart were present in the interests of the Rugby Board of Health. Mr. Owston produced the Grand Junction Canal Act of 1810, showing that the company had the right of water within a thousand yards of their property. He intimated that it was the intention of the company to resist the adoption of the proposed Walton Holt scheme. Mr. Wratistlaw pointed out that the proposed scheme, if carried out, would interfere with the Rugby water supply, and stated that it was the intention of the Rugby Board to oppose the scheme. Mr. Rawlins, Clerk of the Harborough Board, and Mr. Everard, of Leicester, engineer, contended that no one had a prescriptive right to water taken out of the bowels of the earth. Several persons held that the supply of water was in some instances cut off, and in others contaminated by the construction of the large sewers through the town. Major Tulloch laid great stress on the fact that Dr. Grant's report stated that there were in the Local Board district no fewer than 144 houses without water supply. Some doubt was expressed as to the truth of the statement, but the inspector pointed out that a water supply in the legal sense meant a supply on the premises of pure water. He mentioned that water might look beautiful and sparkling, and still be utterly unfit to drink. They could not tell whether or not it was dangerous without analysis. The Inspector, in answer to a question, said Mr. Everard, who was a very careful and painstaking man, told him that he had examined the whole district with a view to obtaining a water supply for the town, and as near to it as possible, and he was sorry to say that he had come to the conclusion that there was no available supply nearer than Walton Holt, which was about seven miles away. If, however, any one could propose a better one and nearer the town he would be glad to consider it.

Bedale.—New kennels for the Bedale Hounds have been provided on the premises known as the Low-street Stud Farm, which were acquired for the purpose. The buildings which formerly comprised the stud groom's cottage, loose boxes, and covered sheds for brood mares and foals, with chambers for provender above, are now converted into huntsman's and stud groom's houses, quarters for the helpers, corn, hay, and straw chambers, and saddle-room, with stabling for twenty-two horses, and lodging-rooms for the dog and hitch packs, whilst another wing, containing cooking-house, feeding-house, three spare kennels, with rooms for the whips, and meal-chamber above, has been newly built, and a room for drying saddlery, &c., a spacious washing-box for horses, and a fish-house or larder have also been added. A row of wooden houses, for hitches with puppies, given to the Hunt by Major Dent (the late master) has been removed from the old kennels and placed in a sheltered and dry situation, within a neatly-fenced grass yard in the corner of the kennel field, near at hand. Before commencing the alterations and additions required, the committee commissioned Mr. Henry Walker, architect, of Whitley, to visit Lord Middleton's kennels at Birdsall, near Malton, also other kennels, and when the plans were completed tenders were advertised for, and the contract for the work was let to Messrs. G. & B. Mackenzie,

builders, and J. Todd, joiner, of Catterick, Messrs. Mattison, of Leeming Bar, doing the ironwork, and Mr. William Wray, of Catterick, the painting.

Plymouth.—A West-country paper says that Mr. John Pethick, builder and contractor, of Plymouth, has ceased to be the Government contractor for repairs at the Royal William Victualling Yard, Royal Marine Barracks, and Royal Naval Hospital at Stonehouse. For a considerable number of years Mr. Pethick has been fortunate enough to secure the triennial contract for the repairs in these establishments and also in the dockyards at Devonport. But this year he loses both contracts. The work is to be done by the Director of Works Department at the Dockyard by Government instead of contractor's labour, contracts being entered into only for the materials. In the Hospitals, Victualling Yard, and Barracks at Stonehouse the old system of contracting for labour and materials is to remain in force, but the tender of Mr. Marshall has been accepted for the three years, commencing April 1st, instead of Mr. Pethick's. Why the Admiralty should continue the old system for the three establishments at Stonehouse, and abolish it for those at Devonport, is not, says the paper in question, very clear.

Oxford.—The venerable clock of New College, which has for so many centuries sounded the hours at this College, having become unfit for further service, is now replaced by one of new and superior construction, from Mr. J. W. Benson's Steam Clock Factory, on Ludgate-hill. Graham's dead-heat escapement, a compensated pendulum, and all the latest improvements have been introduced. The clock will strike the hours on a great tenor bell of 1 ton 3 cwt., and chime on eight smaller bells the well-known Oxford quarters.

Harrogate.—It is proposed to rebuild, on an enlarged scale, the Harrogate Bath Hospital, at a cost of about 15,000l., the old structure, built sixty years ago, having become too small and unsuitable for the demands made upon it. The site now comprises an area of four acres, and it is proposed to provide accommodation for 100 resident patients.

CHURCH-BUILDING NEWS.

Kingsbury.—Kingsbury Church, Middlesex, which has hitherto occupied the fate of suburban churches, is about to be enlarged and restored, at the instance, it is said, of the Ecclesiastical Commissioners, who have refused to divide the parish until the old church has been enlarged. The church is remarkable for its extreme simplicity, being a mere parallelogram on plan, about 70 ft. long by 18 ft. 6 in. wide, without aisles or chancel. It is almost entirely without decorative features, but impresses by its absence of pretension. It retains its original roof, which is celled and is, apparently, in good preservation, if one may judge from the firm line of the ridge externally and the general condition of the slating. The walls are of flint, with fire-stone quoins, and are coated with rough-cast, portions of which have been removed in places, it would seem, with a view to its entire removal. It is to be hoped, if there is such an intention, that it will not be carried into effect, as it will certainly render the church damp. On the south wall, near the altar, is a small brass, removed from a ledger in the centre of the nave, to Thomas Scudamore, described as a servant of Queen Elizabeth and King James for forty-seven years, who died in 1620. On the opposite wall is an upright ledger with a brass, to the memory of John Shephard, knight, who died in 1520, with effigies of himself, his two wives, and their eighteen children. There are marble tablets on the north wall to a Countess of Mansfield, who died in 1560, and were her daughter, who died in 1580, and were buried in the church, and a similar tablet to Lady Vernon, who died in 1553. Dr. Stukeley, in his account of the Brill, prefixed to his "Iter Boreale," supposes that the church stands within the site of a Roman camp, which was Caesar's second station after he had passed the Thames. Lysons asserts that the name of the place denotes a royal residence,—perhaps, of some of the Saxon monarchs. It is certainly a place of great antiquity, Edward the Confessor having made a grant to Westminster Abbey of one-third of the fruit growing in his woods there.

Manchester.—On Easter Eve the reredos

erected in St. Matthew's Church, Ardwick, Manchester, in memory of the first and late rector, was unveiled immediately before the evening service. The central feature is a cross of white alabaster, 6 ft. high, with a background of red veined marble, which stands under a boldly-projecting canopy supported by shafts. At either side of this central cross and canopy are two arches with back-grounds of coloured alabaster, and which contain carving emblematical of the eight Beatitudes. On each side of the head of the canopy are five cusped arches. A battlemented cornice completes the structure at the top. Immediately above the Communion-table is a shelf of red marble; and beneath the foot of the cross are carved the words "Till He Come." The narrow spaces between the reredos and the north and south walls of the sanctuary are filled with a diaper of terra-cotta and stone. The design has been made by Messrs. Medland & Henry Taylor, architects, of Manchester. The work has been carried out by Messrs. Earp & Hobbs, under the superintendance of the architect.—A carved oak pulpit, and lofty pyramidal canopy, have recently been placed in St. Paul's Church, Manchester. They have been designed by Messrs. Medland & Henry Taylor, of Manchester, who suggested the canopy, as a sounding-board was necessary to enable the preacher to be heard at all, and also to relieve a certain baldness in the appearance of the interior of the church.

Holbeck.—The Church of St. Matthew, Holbeck, after having been closed during upwards of three months for alterations and re-decoration, was re-opened by the Bishop of Ripon on Saturday last. Holbeck Church is an edifice capable of accommodating more than 1,000 worshippers. Prior to the alterations it was furnished with the old-fashioned, uncomfortable, and unsightly straight-backed pews, in five of which there were tables. The entire body of the church has now been seated with open pitch-pine benches of a uniform size, the seats being covered with carpet. The windows in the nave have been reglazed, and the walls painted in light colours so as to relieve the interior of its heavy appearance. Formerly the gallery ran to the chancel opening, but now the ends are rounded off, with the result that a considerable amount of additional light is secured. The pulpit has been brought out of the chancel and placed against the wall at the end of the gallery on the left-hand side. The gallery front has been painted and all the pews in the upper part of the church. The decoration of the chancel and the ceiling of the nave has been carried out by Mr. Powell, of Lincoln and London. The choir seats are of pitch pine, stained and varnished. The organ has been thoroughly overhauled by Mr. Sagar, of Leeds. Mr. Nicholson (Leeds) is the contractor for the builders' and joiners' work, and Mr. Jackson for the ordinary painting and glazing. The total cost of the alterations and improvements will amount to a little over 1,000l.

Aveton Gifford.—The restoration of the ancient parlous screens which formerly stood between the two easternmost bays of the south arcade in the parish church of St. Andrew, at Aveton Gifford, being now completed, they have just been replaced *in situ*, after an absence of sixteen years from the edifice. In the year 1869, being in a dilapidated condition, and seemingly past repair, they were removed from the church, and lay uncarved for and almost forgotten in the rectory cellar until last summer, when the Rev. W. D. Pitman, the present rector, felt constrained to restore them to their original position, and with this end in view enlisted the services of Mr. Harry Hems, of Exeter, to whom was entrusted their renovation. The screens now re-erected measure about 22 ft. in length, and show much delicate detail. The lower panels on the one side are traceried, and on the other are decorated by the raised "linen" pattern. The upper parts are of open work, and are surmounted by richly-carved cornices and crests. During the progress of the works just brought to a conclusion, fragments of some other screens were discovered. These are to be utilised by being formed into screens destined to occupy the two bays in the north arcade immediately facing those now erected. This additional work has also been placed in the hands of Mr. H. Hems.

Farmley.—The chief stone of St. Michael's Church, Farmley, was laid on Easter Monday. The church is being built in the place of one erected in 1761, which has become too small for

the requirements of the parish. The new building will be a stone-faced structure, with a few traceried windows, and will have a wooden porch, buttressed sides, and picturesque outline. It is designed to suit its special position, which is surrounded by the thick belt of forest trees forming the boundary to Farnley Park. Internally the building will consist of nave, north and south aisles, chancel, organ-chamber, and vestries. On each side of the nave and chancel will be an arcade of arches carried on columns, and crowned with a range of traceried windows. The roof will be of unvarnished pitch pine arranged in deep panels, with moulded principals forming regularly spaced bays. All the walls of the interior will be faced with buff-coloured terra-cotta blocks supplied by the Farnley Iron Company, the surface of which will be varied by one or two bands of ornamental work. All the columns, arches, and other stonework of the interior will be of red stone. The architects are Messrs. Cborley & Cannon, of 15, Park-row, Leeds; the builders being—Masons, Messrs. Wood & Sons, Churchwell; joiner, Mr. J. Taylor, Yeasdon; plumber, Mr. J. Woffenden, Leeds; slaters, Messrs. Sharp & Harper, Leeds. The entire cost of the building will be about 3,000l., exclusive of some of the fittings. The accommodation will be for 420 worshippers, exclusive of the choir. Towards this sum 2,750l. has already been raised, 1,000l. being the gift of the Farnley Iron Company, and another 1,000l. that of Mr. Porson, who laid the chief stone.

Queensbury.—Queensbury Church was reopened on the 2nd inst., after being closed eighteen months for restoration and enlargement. The church was built about forty years ago. For a long time it answered the requirements of the people of Queensbury, but during late years it has been too small for the increasing number of attendants. With the development of the business of Messrs. John Foster & Son, the population has gradually increased. Up to the time of the closing of the church for renovation accommodation was afforded for about 800 worshippers, and all the seats were occupied. By the recent alterations 150 additional seats have been provided. The extensions and improvements have been carried out at a cost of about 5,000l., which has been defrayed by members of the Foster family. The most important part of the improvements is the erection of a chancel, built from designs prepared by Messrs. Healey & Healey, architects, of Bradford, under whose superintendence the various works have been carried out. In harmony with the rest of the building the chancel is in the Early English style. On the west side of the chancel has been placed the new organ, the gift of the late Mr. William Foster. The oak screen and choir stalls have been furnished by Messrs. Marsh, Jones, & Crih, of Leeds. The renovations in the church have been of a complete character. The old-fashioned high-backed pews have been replaced with seats of pitch-pine. The stained-glass window in the chancel, representing scenes in the life of Christ, has been given by the sons of the late John and Ruth Foster, in memory of their parents. It is by Messrs. Strigley & Hunt, of Lancaster. The window in the south aisle, by Messrs. Winfield (late Camm Bros.), of Birmingham, is given by Mrs. W. Foster to the memory of her late husband. The various works in connexion with the alterations and additions have been carried out by the following firms:—Mason work, Messrs. Michael Firth & Son, Queensbury; carving work, Messrs. Farmer & Brindley, of London; joiner's, Mr. James Wilson, of Bradford; plastering, Mr. Dickson, of Bradford; painting, Mr. Harland, Bradford; heating apparatus, Messrs. Clapham Bros., of Keighley; plumbing and glazing, Mr. Michael Stocks, Queensbury; slating, Mr. James Smithies, of Great Horton; lightning conductor, Mr. Davis, of Bradford; tiling, Messrs. Taylor & Parsons, Bradford. The gas-standards and altar-rail have been fitted up by Messrs. Dutton & Power, of Manchester.

Penzance.—The parish church of St. Madron is about to be restored under Mr. Sedding's directions. The church is an interesting one, and it is the mother-church of Penzance.

Iron Storehouses for the War Department.—Having completed their Suakim contract, Messrs. Clarke, Bunnell, & Co., Limited, have received further instructions from the War Office to erect iron storehouses at the Royal Army Clothing Depot, Pimlico.

DISSENTING CHURCH-BUILDING NEWS.

Edgbaston (Birmingham).—The new Wesleyan chapel in Stirling-road, Edgbaston, Birmingham, has lately been opened by the Rev. Dr. Dale, M.A. Although intended eventually as a lecture-hall and school-building, the present structure has been adapted and fitted as a place of worship for the society and congregation, who will at once take possession of it. The architect has adopted the Gothic style of architecture, but has subordinated it to the object sought to be attained, namely, the adaptation of the building for its present and future uses. It has a central hall lighted with clerestory windows, with rooms opening out of it. The new chapel has been designed to consist of a main hall, 60 ft. by 23 ft., with ten compartments or class-rooms adjoining for the accommodation of the various classes when under instruction. These rooms, which are about 12 ft. square, are divided from the principal apartment by glazed and revolving partitions and curtains, so that when required they can all be made available for congregational purposes. Provision is also made for the addition of other class-rooms when necessary, and the position of the superintendent's desk enables him to overlook the whole of the class-rooms when occupied by the scholars. Including the class-rooms, the interior dimensions of the building are 55 ft. by 60 ft. In place of the conventional pulpit there is a rostrum at the recessed end of the building, and the floor is fitted with pews and chairs for a congregation of 400 persons. On the site, however, there is ample space for the future erection of what may be called the chapel proper, to seat 800 persons. The building is lighted by an imposing window at the main entrance, and by several side-lights, all of which are glazed in lead with coloured and tinted glass. The chapel is built of red bricks with red stone dressings, and a half-timbered gable. The cost of the new chapel and the circuit extension scheme is something over 3,000l. The architect is Mr. Ewen Harper, of 57, Colmore-row, Birmingham, under whose superintendence the work has been carried out by Messrs. James Smith & Sons, builders, of Great Tindal-street.

Teignmouth.—The Wesleyan chapel at Teignmouth has been reopened by the taking of the building has been lengthened by the erection of a portion of the school-room, and a new school-room has been constructed. The whole of the old-fashioned pews have been removed, and open pitch-pine benches substituted. A new rostrum takes the place of the pulpit, and immediately behind and above it has been fixed a large stained-glass window. The chapel has also been newly painted and decorated, both inside and out, and the result has been to give the whole building a much lighter appearance. By the enlargement accommodation has been provided for about 150 additional worshippers, and the building will now seat 600. The improvements have been carried out at a cost, including the price of the land for the new school-room,—of between 1,400l. and 1,500l. The work has been executed (from the designs of Mr. John Watson, architect, of Torquay) by Mr. John J. Hayman, contractor, the joiner's work having been entrusted to Mr. R. Valentine.

Truro.—St. Mary's Wesleyan Chapel, Truro, has been re-opened, after renovation and alterations involving a total cost of about 2,000l. Open seats of pitch pine have replaced the old pews. The whole of the works have been carried out from the plans, and under the direction of Mr. Silvanus Trevail, architect. The contractor was Mr. W. Battershill, of Truro, the sub-contractors being,—Mr. W. Glasson for glazing and decorating, Messrs. M. & J. Clements for the masonry, Messrs. Cook & Son, for the plumbing, and Messrs. Smith & Son, Birmingham, for the ornamental ironwork. The organ has been re-voiced, and several stops added to it, by Messrs. Brewer & Co., of Truro.

Scarborough.—On the 2nd inst. twelve memorial stones were laid in connexion with the new Wesleyan Methodist Chapel which is being erected on the South Cliff at Scarborough. The building will occupy a prominent position at the corner of Prince of Wales-road and Ramshill-road. It is designed in the Decorated style of Gothic architecture, and will consist of nave, transepts, and chancel, which, together with an end gallery over the vestibule, will accommodate about 550 persons. A large lecture-room and two class-rooms are arranged at the back of the chancel end, the organ-

chamber opening into the nave and chancel with wide arches. A spire will occupy a prominent position at the south-west corner. The architects are Messrs. Morley & Woodhouse, of Bradford and Bolton. The total cost, including spire, will be about 5,000l.

Church Furniture and Fittings.—Among the works executed by Messrs. Jones & Willis, of London and Birmingham, for use at Easter, are a carved oak reredos for Kirkby Ravensworth Church, and an oak pulpit for the Church of Magourney, Ireland. They have also in hand a memorial pulpit for Ballycastle Church, in memory of the late Dean of Ripon.—Messrs. White & Sons, of Oxford-street, London, have just completed some wrought-iron screens, wrought-iron entrance-door hinges, polished brass altar-rails, and polished brass chandeliers, &c., for St. Agnes's Church, Liverpool; also some work of a kindred character for St. George's Church, Cullinstown, near Newcastle.

Bronley Sewers.—Mr. Hugh S. Cregeen, Surveyor to the Bromley Local Board, writes to say that the sewers reported upon by Mr. Rogers Field, and referred to in a "Note" in our last (p. 474), were not designed by him (Mr. Cregeen), nor carried out under his superintendence.

The Student's Column.

DESCRIPTIVE GEOMETRY.—X.

WE have now become thoroughly acquainted with both the operations of changing the projection planes, and of rotating, which are to descriptive geometry the four rules to which the following problems will show us the method of reasoning we use in attacking any new question we may have to solve. We begin first by analysing the question and finding out what are the divers conditions which the result must satisfy.

Most often there is an infinity of elements (points, lines, or surfaces) which would satisfy each one of the conditions, and we have to determine the series of elements which would satisfy these conditions taken separately; if amongst the divers series of elements there be any one element in common, then that element (point, line, or surface) will satisfy all the conditions of the problem, and therefore it is the result required. A very simple example, taken from plane geometry, will illustrate our mode of reasoning. We are asked to find out a point situated at say half an inch from a point O and three quarters of an inch from a point r.

The first condition will be satisfied by all the points of the circle of $\frac{1}{2}$ in. radius round the centre, O, the second condition by all the points of the circle $\frac{3}{4}$ in. radius round the centre, r. It is evident that the points a and b, where the circles intersect one another, satisfy both conditions of the problem, and are, therefore, the points required. (See fig. 51.)

Fig. 51.

All the problems of descriptive geometry are really as simple as the above; they seem difficult on account of the trouble we have of realising what our drawings represent in space, and this we can only succeed to do by much practice.

Through a straight line, A, carry a plane, Q, perpendicular to a given plane, P.

In this problem we have two conditions, for each of which there are an infinite number of

Fig. 52.

answers; an infinite number of planes will pass through the line A, and an infinite number of planes will be perpendicular to any given plane P; but there is one plane which will satisfy

simultaneously both conditions. A plane is determined when it contains two straight lines; of course the requisite plane must contain the line A, condition number one; on the other hand, all the planes perpendicular to the given plane P contain lines perpendicular to the plane P; that is condition number two. Therefore, if through a point, C, of the line A we draw a line, F, perpendicular to the plane P, then the plane Q, which contains the lines A and F, will satisfy both conditions of the problem, and is, therefore, the plane required. (The projections of a line perpendicular to a plane are perpendicular to the traces of the plane.) (See fig. 52.)

We have gone fully into the preceding problem so as to initiate the student in thinking for himself; for we should be very sorry if he only got from us rule-of-thumb learning, with a bundle of recipes for solving a certain number of problems, and no more. In the following problems we shall cut our explanations short, and leave the student the task of reconstituting for himself the general argument on which each solution is based.

Through a point, C, carry a straight line, I, so as to meet two other straight lines, A and B.

We first draw a plane, P, passing through the point C and the line A; then we draw another plane, Q, passing through the point C and the line B, the intersection of these two planes is the line I required. The student will do well to carry out these operations on paper, but as they offer no novelty we shall dispense with giving a figure for the same. Nevertheless this is one of the most important problems which we shall often have to solve in masonry.

Through a given straight line, A, carry a plane, P, having an inclination equal to the angle α given.

The horizontal trace P^h of the plane passes necessarily through the point a where the line A enters the plane of the plan. If by a point, c, of the line A we draw a line, D, following the inclination of the plane P, the foot d of that

Fig. 53.

line D will be another point of P^h. If round a vertical axis, c^he, we rotate the line D until it be parallel to the elevation plane, the elevation of D^h will then give us its real inclination. We

know that inclination to be the angle α ; therefore, we can draw D^h, the foot of which is d^h. When rotating back the line D to its real position the foot d^h describes an arc of a circle around c^h to get to its position d; we conclude, therefore, that P^h is tangent to that circle. (See fig. 53.)

Given the angle formed by two straight lines and the inclination of each of them, find out the angle they project on the plan.

We can assume that the elevation plane contains one of the straight lines, say C S is its elevation, and L T its plan; this done, we shall take the other line through the point S. If we rotate it round the axis S^hS, we know by its inclination its position S^m when contained in the elevation plane, and that in rotating the point m describes a circle round S^h. If, on the other hand, we rotate the line S m round the first line, C S, as axis, we can again draw it when contained in the elevation plane, for we have the angle, α , it forms with C S. The point m will then be in m^h, and S m^h will equal S m^h; in rotating back, the elevation of the point m will travel on the line m^hm^h, perpendicular to the axis of rotation, C S, we

Fig. 54.

deduct therefrom m on the circle formed by m in the first rotation round the axis S^hS and m S^h S^m gives the angle required. A simplification is obtained by the fact that C m is equal to C m^h; therefore, by drawing a circle round C, with radius C m^h, we get m at its intersection with the circle round S^h. (See fig. 54.)

RECENT PATENTS.
ABSTRACTS OF SPECIFICATIONS.

86, Combined Door-knocker and Bell. R. H. Hepburn.

Causing the knocker and bell to sound simultaneously when the knocker is used, the prolongation or rod at its point passing through the door strikes on a bell. The rod may strike the edge of a bell, supported on a central stand, or, in another modification, a bell-crank lever may be substituted for the rod, one end of the lever being carried through the door to bear against the tip of the knocker. The metal piece against which the knocker usually strikes is preferably dispensed with, and a strip of leather may be used to further deaden the sound.

125, Hydraulic Lift. A. Clark.

The dead load of the cage rams, &c., is counterbalanced by a supplementary ram working in an independent cylinder, which is kept in constant communication with the pressure supply. The diameter of the ram is such that it cannot raise the cage by itself, thereby enabling the cage, when empty, to descend.

221, Suspending Corrosive Action of Acids, &c. D. Urphart.

The corrosive action of acids, &c., is suspended by mixing them with absorbent substances, such as infusorial earth. The mixtures thus obtainable are useful for many purposes, disinfectants, cleaning metals, &c.

512, Kitchen Ranges. J. Dean.

Consists in forming a hot-air chamber by a metal casing surrounding the oven, and fastening the same to the range, thus making the range complete in itself, and easily set in position.

1,088, Ventilating Drain-pipe. J. Becket.

An open pipe of U-shaped cross-section is inserted in the house-drain between the house and the sewer. On each side of the pipe the brickwork is built up to the surface of the ground, and the opening at the top is covered by a grating. These pipes may be utilised to form a continuous open drain, in which case the brickwork is dispensed with, and the gratings are laid immediately on the pipes.

6,388, Parquet Flooring. H. A. Duprené, Paris.

The strips or boards which form the floor are supported by an under floor or joists, and prevented from shifting by tongues of wood or metal which fit into suitable grooves made in the ends of the strips, the use of nails or screws being entirely dispensed with.

12,478, Roller Blind. J. E. Hopkinson.

A groove is made along the edge of the roller, either from one end of the roller or at intervals; into this a strip or strips of heavy metals is placed to counterbalance the weight of that part of the blind which is unrolled.

APPLICATIONS FOR LETTERS PATENT.

March 27.—3,910, T. Wood, Improvements in Boilers for Kitchen Ranges, &c.—3,916, E. Omerod and W. Horne, Rendering Cements Luminous and Damp Proof.—3,932, J. Homan, Improvements in Fireproof Floors.—3,945, D. Putzeys, Alarm Extincteur of Fires in Chimneys.

March 28.—3,956, H. Steven and W. More, Improvements in Spiral and other Stairs constructed principally of Iron.—3,958, H. Steven and W. More, Improvements in Sewer Traps.—3,965, E. L. Harmsome, Improvements in Constructing and Carrying up Concrete Walls and other Structures, and in Apparatus for same.

March 30.—4,014, F. Wildgose, Improved Safety Sash Ventilation Bolt.—4,018, E. and E. H. Ludlow, Adjusting and Attaching Door Knobs to Spindles.

March 31.—4,030, W. Willett and H. Ball, Improvements in Rock Drills.—4,067, C. H. James, Improvements in Latches or Fastenings for Doors and Furniture.—4,078, H. Gilchrist and C. Bellamy, Construction of Gas Pliers and Gas Tongs.—4,081, A. Mackie, Improvements in Heating Apparatus.—4,084, G. Redfern, Improvements in Bakers' and similar Ovens.—4,086, W. T. and C. Smith, Mathematical Drawing Instrument or Compass.

April 1.—4,068, J. Taylor, Improved Lock Furniture.—4,105, W. Neilson, Combined Latch and Bolt Locks.—4,119, E. Benn, Improvements in Cutter Bars, or Tool Holders for Turning, Planing, and Shaping Machinery.—4,125, S. Low, Jun., Apparatus for producing Upcast Draught in Ventilation.—4,127, F. Cooper and J. Stanley, an Improved Manufacture of Polishing Material.—4,131, H. Walker and G. Clark, Improvements in Dust Bins.

PROVISIONAL SPECIFICATIONS ACCEPTED.

15,325, W. Watson, Improvements in Decorative and Ornamental Designs—960, A. Graham, Self-acting Bolt-fasteners for Cupboard Doors, &c.—1,372, F. Naunstad, Ventilating Chimney Top.—1,848, F. Potany, An Improved File.—2,035, C. Price, Kils for Burning and Drying Bricks.—2,771, J. R. Cast, Apparatus for Setting the Teeth of Saws.—3,094, W. Sharp, Construction and Glazing of Street and other Lamps.—3,179, C. Nokes, Pulley-wheels for Chandeliers, &c.—3,191, A. Sweet, Improved Cisterns.—3,230, H. Taylor, Movable Ventilating Sewer Manhole Covers and Frames.—3,288, S. Collier, Cross Spring Tip Cart.—3,349, F. Egges, Spring Hinge.—3,346, H. Sans, Improvements in Hinges.—3,409, S. Hellyer, Improvements in Pedestal Wardrobes and Mounting same.—3,464, R. Eversed, Flushing Cisterns.—3,477, T. Wilson and B. Johnson, Chimney or Ventilating Cowls.—2,904, J. Prince, Improvements in Brick and other Kils.—3,000, S. Furnival, Moulds for Moulding Plastic Articles.—3,067, J. and H. Rust, Improved Vitreous Material for Paving Purposes.—3,215, J. Collings, Improvements in Wardrobes.—3,315, D. Macdonald, Damp-proof Walls.—3,422, D. Thomson, Improvements in Ventilating.—3,512, E. Summerfield, Adjusting and Fixing Door Knobs to their Spindles.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

5,931, R. Ormerod, Apparatus for Forming Domes and Circular Buildings in Concrete and Plaster.—8,750, J. Donald, Improvements in Fire Grates.—8,779, J. Johnson, Apparatus for Working Electric Bells.—10,331, V. Monsel, a New Economical Stove.—11,965, H. Curzon, Collecting Rain-water

for Storage.—12,181, W. Bahre, Apparatus for Preventing the Slamming of Doors.—8,899, C. Wenner, Ventilation of Buildings.—2,825, F. Grisler and A. Logemann, Smoke-consuming Furnaces.

MEETINGS.

SATURDAY, APRIL 11.

Architectural Association.—Visit to the Northumberland Avenue Hotel. 3 p.m.

MONDAY, APRIL 13.

Society of Engineers.—Mr. J. Dixon Gibbs on "The Distribution of Electrical Energy by Secondary Generators." 7.30 p.m.

Clerks of Works' Association of Great Britain.—Second Annual Dinner (St. James's Hall Restaurant). 7 p.m.

TUESDAY, APRIL 14.

Institution of Civil Engineers.—Mr. W. Shelford "On Rivers running into Tideless Seas, illustrated by the River Elber." 8 p.m.

WEDNESDAY, APRIL 15.

Society of Arts.—(1) Dr. B. W. Richardson on "The Removal of House Refuse Independently of Sewage." (2) Dr. Thomas Hawkesley on "A Proposal for the Abolition of Water-Carriage in the Removal of Effete Organic Matter from Towns." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Quarterly Meeting of Members. 8.30 p.m.

British Archaeological Association.—Mr. E. Maunde Thompson, F.S.A., on "Archbishop Wilfrid's Vocabulary." 8 p.m.

St. Paul's Ecclesiastical Society.—Mr. E. P. Loftus Brock, F.S.A., will read "Some Notes on the Churches of London." 7.30 p.m.

Manchester Society of Architects.—Council Meeting. 3 p.m.

THURSDAY, APRIL 16.

Society for the Encouragement of the Fine Arts.—Mr. George Aitchison, A.R.A., on "Architecture in the Nineteenth Century." 8 p.m.

Institution of Civil Engineers (Special Meeting).—Mr. Thomas Stevenson on "Tides and Coast-Works." 8 p.m.

Dundee Institute of Architecture.—Professor Erwing on "The Sanitary Inspection of Dwelling houses."

SATURDAY, APRIL 18.

Edinburgh Architectural Association.—Visit to Forth Bridge Works and Rosyth Castle.

St. Paul's Ecclesiastical Society.—Visits to St. Giles's Church, Gristlehead (8.30 p.m.); and St. Sepulchre's, Son-hill (4.30 p.m.), under the guidance of Mr. G. H. Birch.

Miscellaneous.

The Proposed Gordon Memorial Hospital.—The choice of Port Said for the proposed establishment of a Gordon Memorial Hospital appears to be adversely commented on by professional and public opinion in Egypt. It is strongly urged that by far the most suitable place is Alexandria. It is the seaport of Egypt, the centre of commerce, and has a population of nearly 200,000. Port Said is an outlandish insanitary little town, with only 12,000 people, of whom about six families are English. There is no highway to it from any part of Egypt except from Suez by the Canal, and ships passing through the Canal do not stop at Port Said. Nor is there any railway communication with it, so that a hospital there could benefit only an odd seaman landed from a passing vessel, or, perchance, a stray traveller. In Alexandria, on the other hand, with its extensive shipping, as the import and the export city of Egypt, a large number of British seamen every year are landed for resident treatment in a hospital. For this they have to depend on foreign institutions, and are attended by nurses that do not always speak their language. English residents, also, in the towns and villages of Egypt, that have no real home where they can be attended to during sickness, go to hospital in Alexandria as the commercial centre, and could not go to Port Said for want of railway communication.—*Lancet.*

The Removal of the Ruins of the Old Tay Bridge.—At the monthly meeting of the Perth Town Council on Monday, Lord Provost Martin referred to the successful issue of the litigation of the town against the North British Railway to have the ruins of the old Tay Bridge removed, and said it would be the mind of the Council that they should give notice as early as possible in the Court of Session for the company to fulfil their agreement. Alluding to the action of the company in asking Parliament to do away with the obligation, he said that it would form a most dangerous precedent were it given effect to.

St. Bartholomew's, Smithfield.—We are asked to mention that the illustrations of the Priory Church of St. Bartholomew-the-Great, East Smithfield, which appeared in the Builder of March 28th, were from a series of photographs taken by Messrs. Bedford Lemere & Co., No. 147, Strand, W.C.

British Archaeological Association.—The meeting of this Association on the 1st Mr. Thos. Morgan, F.S.A., in the chair. Sheraton reported the discovery of the foundations of a small Norman chapel, in a field Ludlow, which has been called "Chapel F" from time immemorial, although there were record whatever of any such building had stood there. The foundations showed it consisted of a simple nave ending in a circular eastern apse. A few encastings were found. Among various antiquities were exhibited by different members several of the singular objects manufactured many years ago by the Whitechapel firm "Billy" and "Charley." Their forged articles were exposed at the time by Mr. Cumyng, F.S.A. (Scott), and some other members of the Association, but so many articles are still current in old curiosity shops, that, in the interests of this generation of collectors, the selection exhibited had brought together by Colonel Adams, F. Mr. Loftus Brock, F.S.A., exhibited a fine bronze mounting of an old English cab, probably a relic of the Great Fire. elaborate paper was then read on Domesday Book, by Mr. W. G. Grey Birch, F.S.A. author treated at length upon the origin of Survey and of the mode of its compilation pointing out that it did not include the entire northern counties, probably an account of the disturbed condition. The three books of Domesday were fully described, and the peculiarities in these pointed out, attention being drawn the long misunderstood portion of the Cambridgeshire portion in the British Museum. The importance of collating the various MSS. dwelt upon, and it was suggested that would afford abundant and useful work for the Domesday Society. A paper by Dr. Alf Fryer, on ancient glass, containing an elaborate of analysis, had to be taken as read, on the lateness of the hour.

Archæology at University College London.—Arrangements have been made a course of five lectures on Greek Numismatics to be delivered by Mr. Barclay V. Ho Assistant Keeper of the Department of Coins and Medals in the British Museum. The following are the heads of the Syllabus:—Lecture I. (April 20), "Coin-types and Religious Symbolism,—Portraiture." Lecture II. (April 27), "The Babylonian and Assyrian Weights, and the Invention of Coined Money." Lecture III. (May 4), "Transmission of the Art of Coining from Asia to Europe." Lecture IV. (May 11), "The Trade-routes from Greece to the West-Magna Græcia." Lecture V. (May 18), "The Greek Coinage of Sicily in the fifth century B.C." The lectures will be illustrated by maps, diagrams, and casts taken from the original coins.

Death of Mrs. G. T. Clark, of Dowla.—We notice with much regret the announcement of the death of the wife of Mr. G. Clark, F.S.A. A Cardiff paper speaks in appreciative terms of her labours among the poor Dowla, a place which is described as "a simple hovel workshop covered with smoke and haunted with a howl which goes on incessantly night after night." In fine weather the east wind reveals sulphur fumes, and in wet, habitation, save the acclimatised, is horrible. How ladies refined and cultured, could elect to live in such a spot, and devote their lives in compassionate labour, with all the greenness of gladness in the world around them, notwithstanding, is one of those facts which do more to support one's faith than any exercise of metaphysics or philosophy.

Wood-block Flooring.—Messrs. Geary & Walker's patent system of wood-block flooring has been adopted for the New Science Art Museum at Edinburgh. This firm has also received instructions to lay their floors at several other important new buildings of various parts of the country. We have before noticed Messrs. Geary & Walker's patent system of laying this kind of flooring. In addition to their method of "keying" the blocks, they also use a new composition which, being very adhesive, forms an additional "key." It is claimed that this composition also preserves the blocks and is damp-proof.

The Institution of Civil Engineers.—The annual dinner of the members will be held on Wednesday, the 29th inst., in the Conservatory of the Inventions Exhibition. After the dinner there will be an informal private view of the Inventions Exhibition, more particularly of the electric lighting arrangements.

Improvements at Burntisland Harbour.
The new sidings and embankment-wall completed at Burntisland, at a cost of 2,800l., are now affording increased facilities for the coal traffic. The south hoist, on east quay of dock, and enlargement of return mains, were provided by Messrs. Armstrong & Co., for 751l., and the same firm substituted an iron framework, on an extended scale, at No. 1 hoist, for the decayed wooden frame, raising the lift from 15 ft. to 22 ft., at an expense of about 927l. Standpipes and tanks have been furnished for Nos. 1, 2, and 3 hoists, for relieving the back-pressure of the return mains, and expediting the lowering of the lifts. A new chimney, 600 ft. in height, is being raised at the engine-house, at an estimated cost, with brick flues, of 200l. Repairs on the dock-heads are almost completed, at an expenditure amounting in the

aggregate to 800l. The masonry has been thoroughly tied back with strong iron rods, fixed to concrete blocks, which is expected to obviate the shifting and cracking of the walls in this exposed quarter. The work of replacing the old cofferdam by a substantial stone quay-wall, running parallel with it, but taking in other 25 ft. of the tidal basin, is being carried out, in successive contracts, by Mr. Thomas Chalmers. This wall is founded on bearing-piles, driven down through clay and mud, a foundation being thus secured at 34 ft. from cope level. It is built with rubble concrete, faced with ashlar, and the remaining 600 ft. is intended to be proceeded with until a junction is formed with the embankment at the head of the tidal harbour. The works have all been designed and superintended by Mr. R. Henderson, the resident engineer.—*Scotsman.*

For Tonbridge Union Infirmary, Messrs. H. H. & E. Cronk, architects, Tonbridge Wells. Quantities supplied:—
 Parnor & Son, Margate £4,370 0 0
 Gullard & Son, Southborough 4,095 10 0

 Flintham 122 11 0
 Dearing & Son 109 0 0
 Edes 91 0 0
 Stevens 87 0 0

For English Congregational Church and schools, Colwyn Bay, North Wales. Mr. Gwen Edwards, architect and surveyor, Rhyll, North Wales:—
 Plan A. Plan B.
 Foulkes & Son, Rhyll £2,550 £2,300
 J. Berth Jones, Llanrwst 2,864 2,264
 Owen Lloyd, Colwyn Bay 2,450 2,263
 J. Williams & Son, Rhyll 2,300 2,077
 A. Dorkington 'Rhyll' 2,720 2,000
 E. Roberts, Conway 3,683 1,976
 * Plan B accepted with certain modifications.

For rebuilding 13, 15, and 17, Gray's Inn-road, Holborn as two shops and dwelling-houses, exclusive of shop-fronts and fittings to ground-floors and basements, for Mr. A. J. Hollington. Mr. R. W. Crawley, architect, 12, Trinity-square, Tower-hill:—
 Spaight & Co. (accepted) £255 0 0

For Waanstor Water Supply, for the Frome Rural Sanitary Authority:—
 Hardigg £361 12 10
 Barnes & Sons 321 2 1
 Read 297 0 0
 Vallis 284 10 0
 Bodman & Son 273 0 0
 Smith 252 1 11
 Wilcox 243 0 0
 226 7 0

For the erection of two villas, at Woburn Sand, for Mr. F. Moore. Mr. F. T. Mercer, architect. Quantities supplied:—
 Poole £955 0 0
 Sharrett 910 0 0
 George 890 0 0
 White 882 0 0
 Laughton 870 16 0
 Harrison 819 0 0
 Warton & Walker 814 0 0
 Young 817 10 0

For new drapery premises, for Messrs. Barrett & Greenland, High-street, Hereford. Mr. W. W. Robinson, architect, 21, King-street, Hereford:—
 Wm. Cullis, Victoria-street, Hereford (accepted).

For the erection of Baptist chapel and lecture-hall, St. Benedict-square, Lincoln. Mr. J. Wallis Chapman, architect, London. Quantities supplied:—
 Add if in Pitch-pine.
 Martin & Sims, Lincoln £3,380 £75
 J. & T. Hines, Lincoln 3,293 100
 Walter & Heuman, Horncastle, 3,068 163
 J. M. Harrison, Lincoln 2,982 75
 Richardson, Lenke, Boston 2,944 75
 Cross, Brayford-side, N. Lincoln 2,929 50
 Baines, Newark, Notts. 2,855 29
 Knight, Martin 2,880 29
 Young, Lincoln 2,823 70
 Greenwood, Mansfield 2,809 70
 J. W. Harrison & Sand, Lincoln 2,668 75
 Horton, Lincoln 2,511 35
 Otter & Broughton, Lincoln 2,510 35
 J. B. Harrison, Lincoln 2,490 45
 Storey & Son, Bourne, Lincoln 2,400 50
 J. Crosby & Sons, Lincoln 2,328 50
 * Accepted.

For additions and improvements to the Bull and Bush Tavern, Hampstead. Mr. H. Hardwicke Langston, architect, 9, Great James-street, Bedford-row. Quantities by Mr. F. H. A. Hardcastle:—
 Nightingale £1,930 0 0
 Falkner 1,895 0 0
 Eady 1,861 0 0
 Johnson & Co. 1,850 0 0
 Gould & Brand 1,773 0 0
 Harris & Wardrop 1,769 0 0
 W. & H. Castle 1,763 0 0
 Ridout 1,610 0 0

For the erection of a class-room adjoining the infant school, for the East Grinstead School Board. Mr. S. W. Haughton, architect, East Grinstead:—
 Charlwood Bros., East Grinstead £330 0 0
 W. Pledge, East Grinstead 297 0 0
 G. A. Taylor, Forest Row 285 10 0
 J. Morris, Ashurst Wood 265 0 0
 G. Quickenden, East Grinstead 250 0 0
 * Accepted.

For the erection of schoolroom, North End, East Grinstead. Mr. S. W. Haughton, architect:—
 Head & Wallis, Lingfield £351 0 0
 S. Wolbur, Crawley Down 315 0 0
 G. Beard, East Grinstead 307 10 0
 J. Morris, Ashurst Wood 260 0 0
 Charlwood Bros., East Grinstead 233 0 0
 Foster, East Grinstead 221 0 0
 W. Pledge, East Grinstead 177 0 0
 * Accepted.

For alterations and repairs to Edenbanks, Edenbridge. Mr. S. W. Haughton, architect:—
 Charlwood Bros., East Grinstead £219 0 0
 Beale & Son, Tunbridge Wells 235 0 0
 J. Tooth, East Grinstead 233 0 0
 T. Dives, Lingfield 223 15 0
 D. Smith, Tunbridge 223 0 0
 J. Jarvis, Tunbridge Wells 215 0 0
 Goodwin Bros., Edenbridge 181 0 0
 * Accepted.

Accepted for dwelling-house, bakchouse, &c., for Mr. Mortimer, Spring-road, Bedford. Mr. F. T. Mercer, architect. Quantities supplied:—
 Long £695 10 0

For the erection of public baths, for the Corporation of the Borough of Stockport. Mr. J. C. Prentwich, architect, Leigh, near Manchester. Quantities by the architect:—
 Total.

 * Extra for paving in white glazed bricks to bottom of plunge baths.
 † Extra for roof boarding in lieu of plaster ceilings.
 ‡ Accepted without boarding under slates.

For building four workshops, and repairing four houses, for Messrs. Sampson & Friedlander, at Greenfield-street, Whitechapel. Mr. J. Hudson, architect, Leman-street:—
 Gladding £276 0 0
 Jas. A. Taylor 830 0 0
 Heath 894 0 0
 Isaacs & Cohen 844 0 0
 Coulson Bros. 790 0 0

Accepted for supplying steam lifts to factory at Vauxhall, for Messrs. Barrett & Co. (Limited). Mr. E. K. Rawlings, architect, 3, Victoria-street, Westminster:—
 Waygood & Co. £735 0 0

Accepted for sundry sanitary works to workmen's dwellings, Tabor-street, Southwark, for Mr. E. C. Martin:—
 J. Jarvis & Sons £375 0 0

For new residence and stabling, Hart-hill, Luton, for Mr. J. Enrage. Mr. W. J. Pearson, architect:—
 F. White £1,585 0 0
 D. Parkins 1,559 10 0
 T. Neville 1,462 0 0
 Slough Bros. 1,475 0 0
 Dunham & Son 1,390 0 0
 H. Spencer 1,315 0 0

For alterations and addition to the Addington-square Baths, Camberwell, for Mr. Sparrow. Mr. E. Marsland, architect:—
 Greenwood £380 0 0
 Shipco 851 0 0
 Fisher 835 0 0
 Watson, Dulwich 825 10 0
 Downs 822 0 0
 Thompson 731 10 0

Accepted for alterations to Melford Lodge, Undeshill-road, Dulwich, for Mr. Paulin. Mr. J. G. Baynes, architect:—
 T. Watson, Dulwich £180 8 6

For house in Bath-road, Reading, for Mr. William Weldon. Messrs. Morris & Stallwood, architects, Reading:—
 Bottrell £1,015 0 0
 [No competition.]

For rebuilding 1, Frier-street, Reading, for Mr. W. F. Elandy. Messrs. Brown & Albury, architects, Reading:—

Woodruff	£3,067 0 0	Time.
Wornham	2,543 0 0	33 weeks.
Higgs & Sons	2,523 0 0	32 "

 Margetts 2,468 0 0
 Searle 2,440 0 0
 Bottrell 2,390 0 0

For alteration and new warehouse at 158, Old Kent-road, for Mr. A. Bennett. Mr. W. Barnes, architect, Choumert-grove, Peckham:—
 Hiling £179 17 0
 Nore 148 16 0
 Hardiman & Watts (accepted) 128 0 8

For alterations, repairs, and decorations to premises at No. 54, Oxford-street, for the Medical Battery Company. Messrs. Denison & Bargman, architects, 16, Essex-street, Strand:—
 Coils & Son £1,417 0 0
 McLachlan & Sons 1,324 0 0
 E. Triggs 823 0 0
 J. M. Alacey & Son 580 0 0

For a new disinfecting chamber, for the Bromley Local Board. Mr. Hugh S. Cregeen, surveyor:—
 George Gill £124 0 0
 J. Taylor & Son 110 0 0
 T. Crossley (accepted) 114 10 0

For alteration of premises in Albion-street, Leeds (previously occupied by the National Banking Company), for Messrs. Ford & Warren, solicitors, Mr. Thomas Wain, architect, 18, Park-lane, Leeds. Quantities by the architect:—
 Excavator's, Bricklayer's, Mason's, Joiner's, and Carpenter's Work:—
 John Hall Thorp, Leeds £598 15 0
 Franks & Evans, Leeds 585 18 0
 Nicholson & Son, Leeds 584 0 0
 Irwin & Co. (accepted) 550 0 0

Plumber and Glazier's Work.
 Thompson Bros., Leeds 85 0 0
 Lindley, Leeds (accepted) 81 0 0

Plastering.
 Franks & Evans (accepted) 49 10 6

For new laboratory, Reading School. Messrs. Chas. Smith & Sons, architects:—
 Wornham £283 18 0
 Higgs & Son 489 0 0
 Woodruff 487 0 0
 Simmonds 472 0 0
 Bottrell 470 0 0

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 46, Catherine-street, W.C., not later than four p.m. on THURSDAYS.

TO CORRESPONDENTS.
 J. S. L. (thanks) shall be glad to hear further.—H. E.—"Dover Camp" is thoroughly sympathetic with the sentiment, but it is out of our proper line.—"A Stone-carver" (architects who are worth anything will find out that for themselves. Your letter is hardly one we could publish.—H. J. G. F.—Positions who are worth amounts of tenders must be sent if publication is desired.—P. F. F. K. (thanks) having applied for the position.

All statements of facts lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out backs and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests of course with the author.

We cannot undertake to return rejected communications. Letters or communications (beyond news-items) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR: all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.
 CHARGES FOR ADVERTISEMENTS.
 SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS.
 Six lines (about fifty words) or under 4s. 6d.
 Each additional line (about ten words) 6d.
 Terms for Series of Trade Advertisements, also for Special Advertisements on front of the paper, by contract, &c. may be obtained on application to the Publisher.

FOUR Lines (about THIRTY words) or under 2s. 6d.
 Each additional line (about ten words) 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY.
 * * * Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINIER, Publisher, addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.
 The Publisher cannot be responsible for DRAWING, TRUST, MONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter OFFERS ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY morning.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C., free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.
 "THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. Payment, to countries within the Postal Union, 20s. per annum. Remittance payable to DOUGLAS FOURDRINIER, Publisher, No. 46, Catherine-street, W.C.

The Smaller Classical Museums of Northern and Central Italy.

N the matter of classical archaeology, modern Italy is doing her best to redeem a mis-spent past. Treasures of art she has always cherished with an eager, if somewhat ignorant, reverence; and the materia of archaeology, which has an interest and a charm, scientific instead of sensuous, she too often ruthlessly destroyed. Every lover of art has stopped to look at the wonders of Greek vase-painting gathered together in careful selection in the Etruscan Museum of the Vatican, but every archaeological student has ached with the remembrance of thousands of inferior specimens willfully broken up as mere unsaleable "roba," at the mouth of the tombs whence they were dug. But such things are of the past. The South sent her message of beauty to the North, and the North has made fitting answer by the colder voice of science. On the summit of the Capitoline Hill stands the German Archaeological Institute, and there North and South have met together and two,—that would be foes, and should be friends,—art and archaeology, have kissed each other.

The right method once inaugurated in Rome spreads quickly to the provinces. Arezzo, Cortona, Chiusi, Orvieto, Corneto, and the like, are all learning that honour, and even profit, come not from the blazoning forth of one or two show antiques, and the fabrication of countless shams, but from the careful and complete excavation of their own local necropolis, and the systematic exhibition and classification of the results. Even so late as five years ago exact information was difficult to obtain in any local collection. The student, as opposed to the purchaser, was a hybrid to be discouraged. Attentive study of a vase or a relief, was supposed to be the preliminary step to a course of bargaining. More vexatious still, the guardianship of archaeological treasures was given over into the hands of custodians as superstitiously jealous as they were ignorant. The old order is not quite passed away, but the new is steadily advancing; the local cicerone still lives, and alas! still lies, but, for the most part, he is supplanted by the authorised and scientifically compiled catalogue. We purpose to gather together a few of the instances in which, especially as regards collections of Greek vases, marked advance has been made.

If we wish to study Greek sculpture we must study what has been found, and still to a large extent remains, in Greek lands. If we want to study Greek vases we must, owing to the accident of Etruscan fashion and Etruscan trade, study what has been found and largely still remains in Italy. The museums of Northern Italy are, naturally, not rich in art treasures, which have been the chief yield of Etruria; but a few scattered treasures have found their way into the museums of Turin and Milan, though, because they are isolated, not into north Italian Guide-books. Egyptologists, of course, know their Turin, but for the classical student there is a small collection of Greek vases, which contains one specimen of special interest, a signed vase by Euthymides. Dr. Klein, in his recent list of signed vases, notes eleven by this master, and to his list we may add the Turin vase as a twelfth. In Milan, if the traveller can disengage his attention from the sensational architectural splendours of the city, he will find, in collections given over for the most part to Medieval "roba," one or two classical matters worthy of note. Foremost among these, in the Museo Archeologico,—now in the basement of the Brera Palace,—is a very primitive bronze situla. It was found in a grave near the Villa Giovia, about three-quarters of an hour from Lake Como. The situla is decorated with *repoussé* work, consisting entirely of a succession of dots. The designs are very crude and early: a frieze of men on horseback, or rather attached to the sides of their horses, for there is no attempt to depict them as riding,—men on foot; stags with branching horns; a doe suckling her young: this last drawn with a very vigorous naturalism. With the situla was found the armour of the dead warrior. The whole contents of the tomb are carefully published by Sig. Biondelli, who supposes the tomb to have belonged to a Gallic warrior. Anyhow, it is of the highest interest as a specimen of local Italian art, before it was subjected to Greek influence. Milan has a right, of course, to her own discovery; but we wish that these rare specimens of early Italian work could be collected together, as their juxtaposition might possibly make some sort of chronological classification possible. Beyond this situla the Museum has scarcely anything of classical interest. A fragment of a wall-painting from the Farnesina, a Roman lamp, representing Actæon and his dogs; and another, with a design of Cupid among flowers, and three small bronzes, *i.e.*, a Spinario, a crouching Venus, and a Mars resting in the pose of the Ludovisi Mars, a small marble copy of the Capitoline Satyr, and a Greek gravestone, complete the list.

The city of Milan has recently been enriched

by the gift to the municipality of the Poldi Pezzoli Collection. The collection under the title, "Fondazione artistica Poldi Pezzoli," is preserved in exactly the same state that it was at the death of the possessor, and the magnificent rooms, furniture, &c., add greatly to its attractions. No one will pass over the fine paintings of Leonardo da Vinci's school, nor the splendid specimens of sixteenth-century enamel work; but the catalogue recently issued makes no mention of the classical gems of the collection. In the Sala Dorata are two small one-handled wine-cups (*cyathoi*), white ground, with black figures. On the one is represented a scene of grape-gathering. Two satyrs perched high up in a vine are busy filling baskets with huge bunches of grapes; on each side of the grape-gathering scene are the familiar "Dionysiac" eyes. This cup is a marvel of delicate execution; the careful balance of the two satyrs, the symmetry of the clusters of grapes, and even of the two baskets, make it also a tiny marvel of composition. The companion *cyathos* is of exactly the same shape and technique, but slightly inferior workmanship. The design represents menads and satyrs on each side of a recumbent Dionysos. The design is framed on each hand by heraldic griffins. Two vases of such conspicuous beauty could not have so long escaped notice and publication, but that they are of small size, and are hidden in the depths of a museum mainly modern and Medieval.

Passing on to Parma, if the student can steal an hour from the study of Correggio, he will find in the Palazzo della Pilotta a small and remarkably well-arranged museum of antiquities, recently re-organised. Among them the contents of an Etruscan tomb found in 1852 near the Porta Garibaldi are especially noticeable, also collections of Greco-Roman antiquities found at Velleia. Among its vases the Parma collection contains the amphora with two scenes between Odysseus and Circe, a subject extremely rare on painted vases. This Parma vase is well known, but in the museum at Bologna we noted a second instance of the same subject, which seems to have escaped hitherto the notice of collectors and monograph writers. Nor is this a matter of surprise, for the vase had suffered severely from fire, and the design, though clearly traceable when once perceived, is, failing the clue, almost undecipherable. It represents Circe, who has started up in alarm from her seat at the threatening approach of Odysseus; to each side the comrades of Odysseus (all with beast-heads) are escaping in various attitudes of amazement and despair. Save for this vase the collection at Bologna is too well known, and through the courtesy of its director, Count Gozzadini, too easily accessible to students, to

need description. In spite of some recent acquisitions its principal attractions still remain the monuments from the Felsinean Necropolis, arranged, displayed, and catalogued in a way that is a model to all Italy.

The Greco-Etruscan museum at Florence is less sumptuously circumstanced than that of Bologna, but its arrangement is not less admirable. The director (Professor Milani) had before him a far more difficult task. In the case of recent excavations, such as those which have in the main supplied the Bologna Museum, the director has but to keep together the objects found in one tomb, and he secures a classification, if not absolutely chronological, at least highly instructive; but where, as in the case at Florence, the Museum is made up of odds and ends, vases that have come out of private collections, discovered no one knows when or where, then obviously classification must be based on internal evidence. Professor Milani is a good representative of the rising school of young Italian archaeologists, trained in Germany for the best of reasons, *i.e.*, that till quite recently Germany has been the only possible place for training. His museum is a model of careful, systematic work. Here, and here only, so far as our knowledge goes, has some attempt been made to classify the vases known as "buccheri nero." Nearly every painted vase of importance in the museum has been photographed, and is thus available for study all the world over. Perhaps the time will come when it will be part of the business of the director of every museum to see that the monuments under his care are thus made readily accessible. The catalogue of the museum is not yet complete.

To pass from Florence to Arezzo is a long descent in the archaeological scale, but Arezzo is fully aware of its importance as the ancient centre of a strictly local manufacture of a peculiar sort of red ware, with designs impressed in relief. The museum once in the charge of the *Fraternità dei Laici* is now in process of rearrangement, and the *Accademia Petrarca* has published a small guide-book in which scraps of archaeology are oddly mixed up with lives of the celebrities of Arezzo and notices of the principal alberghi. A fine collection of miscellaneous antiquities has been got together, and is most courteously shown to visitors, by a local architect, the *Cavaliere Fungini*; its chief strength lies in majolica, but one room is devoted to Etruscan urns and red Arezzo ware.

Leaving Arezzo, we come to the country proper of Etruscan shades, where every city and every museum is set on a hill, and results are not always duly proportioned to difficulty of access. Cortona still rests her claim to archaeological fame on her enigmatic "Muse" and her lamp with eight Sirens; but for these and the lovely view of the *Thrasymene* lake there is little to tempt the archaeologist to climb the hill.

It is otherwise at Perugia. The long-standing collection of Etruscan antiquities in the University has recently been increased by the bequest of the whole of the *Guarda-Bassi* collection. The *Cavaliere Guarda-Bassi* had been a collector from quite early youth, and one who had tempered his zeal with discretion, so that the collection is a fine one. It is a subject for great rejoicing when a private collection merges in a public museum. Family pride can be sufficiently gratified if the collection still bears the founder's name, and the risk of dispersion by illiterate or impecunious descendants is obviated. The gem of the *Guarda-Bassi* collection is, undoubtedly, a beautiful bronze mirror case, with *Bacchus* on a panther in relief. The vase collection of the University museum is not a large one, but it contains a few pieces of great interest. Most of these are catalogued in an admirable little guide compiled by *Angelo Lupatelli*; but there is one noticeable omission. Whether the vase we are about to speak of has been added since the publication of the guide we could not, in the absence of the director, ascertain, but in one of the wall-cases of the fourth room we came unexpectedly on the famous *Troilus* vase, by the potter *Euphronios*. The vase is perfectly well known, pub-

lished by *Gerhard*, and fully discussed by *Dr. Klein* ("Euphronios," p. 9). It was found at *Vulci*, and once belonged to the *Canino* collection; but *Dr. Klein* says of it that the last news of it was that it was sold by auction in Paris, and of the buyer no record kept. How it came into the *Perugia* Museum we are unable to say, but there it undoubtedly is, and, alas! in very bad condition. At *Orvieto*, just opposite the great cathedral front, within a stone's throw of *Luca Signorelli's* demons, are two fine vase collections,—one belonging to the Municipality, the other the private property of *Count Faina*, but, with the utmost generosity, always open to the public. In this latter collection, by far the finer of the two, are some fine specimens of the *Corinthian Kelche*. A complete catalogue is shortly to be published, and will be a very important contribution to the literature of vase painting.

We have kept *Corneto* to the last because it has an importance all its own. The excavations made year by year and still continued in the necropolis of *Tarquinii*, are fast raising the *Corneto* museum to the highest rank. It is at present under the able supervision of *Signore D'Asti*, and contains some of the finest specimens of Greek vase-painting extant. At present no classification is attempted; as year by year brings new material this material is set aside and marked with its date. This classification, though not, of course, attempting to be scientific, has, for the archaeologist who seeks to keep himself *au courant*, obvious advantages. Five minutes in the museum will tell him what is new since his last visit. The "find" of 1884 has not been a very large one, but it has yielded a remarkable archaic amphora inscribed and decorated with the exploits of *Herakles* and *Iphitos*. This vase is in process of publication by the *German Archaeological Institute* at Rome. In fact, at *Corneto* no one has a chance against the Germans; every archaeological prize of any importance is instantly pounced upon by the watchful Prussian eagle who sits upon the *Capitoline Hill*. Scarcely a day passes at *Corneto* without bringing to light some fragment of antiquity. As we went to the outlying Etruscan tombs we passed a trench newly sunk from which two heads of Etruscan type roughly carved had, the day before, been excavated; they lay still by the side of the trench.

A good many of the private collections once existing at *Corneto* have lapsed; the collections of the *Palazzi Bocconera*, *Falzacalpa*, *Margi*, are no more, but the *Bruschi* collection is still kept together. Perhaps nowhere does the vase-student suffer keener pangs. With all courtesy he is admitted; he is begged to honour the house with his name and signature; he is even permitted, though under strict vigilance, to handle the vases. But publish one, even sketch one,—never! And yet that collection contains a priceless *Centaur* cylix, signed by the potters' names, *Aristophanes* and *Erginos*, a matchless archaic amphora with the wrestling of *Peleus* and *Thetis*, a *Dionysos* in a racing galley on a black-figured amphora, beautiful enough to set any archaeologist's heart longing, and he must go away and leave them unknown and, what is worse, insecure.

On the whole, unatters are hopeful for local archaeology in Italy, but, there is no denying it, the subject has still its seamy side, and a seamy side apt to be excessively irritating to the student. The boundary line between *custode* and *direttore* is still in Italy of delicate and anxious demarcation. The civil *custode*, to whom last year you gave a couple of francs, is this year a *direttore*, hristling with importance and red tape. You ask him a question meekly enough, and as he makes answer the misgiving steals over you that this gentleman's academic baptism has not been by total immersion. Thinking in your simplicity that archaeology is neutral ground, you arm yourself with a letter from some Government official of high place and, gladly confident, present it at the local museum only to find that the director is an ardent son of the *Papacy*, and that the door is closed to you for ever. Or you arrive at some obscure

village on the festival of the patron saint: in two hours the diligence will start which is your only hope of return to civilisation for at least a week, and in those two hours the local museum is to be seen; local cults are interesting, but it is trying to find the director prostrate before his patron's skull with the museum keys in his pocket. The Italian innkeeper still survives, *splendide mendax*: as you wearily consume your almost impossible food he still spreads before you his cheaply manufactured "antichità," which, believe him, his own hands took from an Etruscan tomb; only last night he sold half his treasure to an English milord, and another is coming to-morrow; now is your chance. You decline indignantly and rashly embark in a protest against imposture, for next morning you pay the price of the rejected "antichità" in the shape of exorbitant charges for your sour bread and sourer wine. At another time you have come far to see some particular vase long enshrined in your memory, and you hear with some sinking of heart that the collection is about to be moved: the smiling *Sindaco* of the place conducts you three flights of steep stairs only that you may gaze panting on packing-cases sealed with official seals. You offer to return in three weeks or a month; when will they be unpacked? you ask, and the true Italian answer meets and confounds you, "Chi lo sa?" Or, worst of all, you see the object of your desire before you, but high aloft in a glass case, dark with dust and closely locked, and by your side is a boy or girl of ten years old, vested with municipal authority and the keys, or, perhaps, some half idiot old harridan, or all three, and in chorus they declare that the cases may not be opened, that their life is in danger if they do your bidding; but a franc all round soothes them, and the keys are in the lock, but they never turn,—probably never have turned. They are not keys that fit at all, only symbols to terrise the intruder and make him pay black-mail.

These and like sorrows await the seeker after knowledge in the byways of classical lands; but, for all that, if in his heart he carry some love of human nature and a great patience, and in his purse abundance of small change, he will leave Italy well instructed and still better amused.

THE DECORATION OF THE PANTHEON AT PARIS.*

BY CHARLES YRIARTE.

THE entrance of the vestibule, to the right and left, the two portions of cross wall, bounded by two pilasters, were entrusted to *MM. Bonval and Galland*; the longitudinal wall on the right was delivered over entirely to *M. Puvis de Chavannes*, and that on the left to *M. Delaunay*. *MM. Cabanel and Humbert* had the surfaces of the two transverse walls to the left of the cupola, along with *M. Paul Baudry*, the decorator of the *Grand Opera House*. *MM. Levy, Blanc, and Maillot*, were entrusted with the right arm of the cross. Lastly, the longitudinal altar, containing the high altar, was entrusted to *MM. Meissonnier and J. P. Laurens*. *M. H. Chert*, as an artist brought up in Italian traditions, was commissioned to make the cartoons for the mosaic to be executed in the bay occupied by the high altar, in accordance with the traditions of the Byzantine school, and of the *Basilicas of Ravenna* and of *S. Paolo Fuori Le Mura*.

Each of these artists, in the course of his career, had given proofs of his leaning towards monumental art. *M. Puvis de Chavannes*, whose appointment was most contested by the realist school, as well as by the Classicists (a rather singular fate), was, nevertheless, the one who was most in the secret of architectural convenances, and who knew how, abstracting himself from mere detail, to produce the most harmonious effect as a whole. The intervention of *M. Meissonnier*, who paints ordinarily in thoroughly *Liliputian* proportions, was very little expected in a company among whom

* Concluded from our last number, p. 507, ante.

special faculties for painting on a large scale were specially looked for. But it is no secret that the painter of "La Campagne en France," and of "1808," had dreamed for a long time back of an opportunity of showing that the talent of an artist is independent of the size of the surface on which it is displayed. The acceptance of such a work, if out of the line of his usual practice, was the result of an enthusiasm which is part of his very nature; perhaps also of the earnest solicitations of the "Directeur des Beaux-Arts."

What a singular spectacle, in truth, and what an astonishment for posterity, if it had had the opportunity of contrasting with the minute and microscopic productions of M. Meissonnier, the great walls on the Pantheon covered with giants created by the same pencil. But time has passed, and M. Meissonnier, engaged on numerous works, solicited on all sides, pressed by the demands of life, and already touched by the advance of age, has left the walls so far untouched, and it is pretty certain that those who will succeed us will have neither the surprise of contrast which the Directeur des Beaux-Arts wished to realise, nor proof of the efforts of which the artist believed himself capable. The other names which we have cited have their *raison d'être*. M. Alexandre Cabanel made his *début* more than thirty years ago, in paintings of heroic scale. At the Pantheon, with a conscientious punctuality which is rare among artists of any country, he executed with business-like rapidity the "Episodes in the Life of St. Louis." M. J. P. Laurens had for his subject "The Life and Death of Ste. Geneviève." He brought to the task his dramatic talent, his vigorous scale of colour, his conscientious research in archaeology, and a certain unity and spontaneity of style which seems to put out of question all idea of concession to circumstances. M. Levy, a young painter who has, year after year in our exhibitions, grappled with large surfaces, represented the incidents of the "Life of the Emperor Charlemagne"; and when people stand before his painting, there rise to the lips the names of Subleyras, Jouvenet, and other French painters of the seventeenth and eighteenth centuries. M. Blanc had been commissioned to recall the drama of "Attila," and "Clovis at the Battle of Tolbiac." Earnestly pre-occupied with the relation of architecture to decorative painting, he made it his object to produce *silhouettes* of a monumental character; and, the better to mark the epoch of his subject, in the frieze above the horizontal band before named, where most of the artists employed have introduced a procession of personages somewhat in Pan-Athenaic taste, he collected the portraits of most of the remarkable men of the political and social France of the period. M. Maillot, who was to represent, in the rear of the altar where the relics of St. Geneviève are laid, the part which the worship of that saint had played in the city of Paris in the Middle Ages, considered himself bound to look back to that time; and, studying in manuscripts, in frescos, in miniatures, in the sculptures of cathedrals and their beautiful gilt and painted redoses, the costumes, monuments, and manner of the epoch, he restored the epoch itself, and executed his compositions *à la carte*, in a distinctly archaic style. When those works shall have received the toning of time, they will, perhaps, he attributed, at first sight, to a date four centuries previous to that of their actual execution. M. Paul Baudry, the brilliant decorator of the foyer of the Opera House, drawn away from this work by the task of decorating the Château of Chantilly, has as yet executed nothing. M. Delaunay, MM. Bonnat and Gaultard have their works still in their studios, though in a very advanced stage; and, at the time of writing this, M. Humbert, the youngest of the party, is still waited for and has not fulfilled his task.

I hasten to quit these mere enumerations, which may be fatiguing to the reader, more especially since they are not supported by any representation of the compositions of which I am speaking. The most interesting point is in regard to the relation of each painter's

work to the rest, and of the whole to the architecture. The proper medium for such works should evidently have been fresco; but when we consider that our French artists are by no means familiar with this method, and that it is not very compatible with our climate and with our cold churches, it is easy to understand why this idea was abandoned, and it was determined to paint the works as easel pictures, and then attach them to the walls. There is one important point to be borne in mind in connexion with this part of the subject,—oil-painting induces a manner less broad; it is, on general admission, less monumental than fresco, and in total effect it must always lose something from the point of view of unity, for the painting is not so incorporated with the architecture. How is one to connect such paintings with the sober ornamentation of the edifice, and how can one pass without violence from the bare and cold walls to the brilliant vivacity of costumes charged with gold and precious stones, and to the brilliant lighting of the scenes represented?

One of the artists whom I have named, M. Galland, classed among "decorators," and whose speciality, till now, consisted in painting architectural devices, fruits, flowers, and monumental figures (one of the few French artists of the day who has put into practice that fruitful principle of the Renaissance period which wills that an artist should practise all arts simultaneously), was charged with the design of the borders which should unite the paintings with the architecture. He contrived a kind of frieze design, of intermediate type, of medium colouring, obtained by a mingling of gold with grey tones, consisting of wreaths and other decorative elements which achieved the transition, enclosing the compositions as in a border of tapestry. It has been observed that the broad surfaces to be decorated were divided by the engaged half-columns playing the part of pilasters. It was decided to leave the shafts of these half-columns their natural colour, and not to interrupt the three portions of the composition which were cut by these shafts exactly as the lead-lines of a stained-glass window cut through a figure. This was to leave to the architecture its natural rôle, giving at the same time to the painting the conventional character necessary to every composition executed for the decoration of an architectural monument with which it must connect itself.

The spectacle which is presented to the eyes and the mind by such a monument, finished, complete in itself, and which all the arts have united to decorate, may in many ways be compared to the effect of a grand musical composition in which all the instruments and voices have each their own part suited to themselves, but for that very reason contributing so much the better to the effect of the whole. It is rare, at any time and in any country, to find that each of the artists whose aid is called in by the architect (*the chef d'orchestre* whose mission it is to conduct the whole) has that perfect sentiment of discipline from which alone a harmonious whole can result. In the Pantheon, this stumbling block was more difficult to avoid than in any other edifice; for by the special disposition of the plan in the Greek cross form, the eye would take in, in quick succession, the two arms of the cross, and contrast the one with the other. It is easy to understand the risk of entrusting the wall on the right face to a colourist, and letting him have the full bent of his genius, and that of the left face to one who was more especially a draughtsman who would look for his effects in harmony of lines and in tone of retiring half-tints. One can hardly imagine, in short, Ingres and Delacroix summoned to figure face to face with one another in such a decorative scheme. Without saying that the contrast is quite so striking at the Pantheon as in the two cases we have supposed, one can see nevertheless M. Bonnat, whose tones are sombre, and whose shadows are deepened almost to blackness, representing a "Supplice de Saint-Denis," which takes place in an interior, face to face with M. Galland who paints the "Prédication de St. Jean" under the luminous sky of Palestine. Yet for all that, one can hardly expect of artists

who have already won renown (and who keep it by the very force of their temperament) that they should renounce their special gift to bend to the sober scale of the one who is least of a colourist among them. M. Puvis de Chavannes, for example, without troubling himself about the colour-scale of his next neighbour, has struck his habitual note, harmonious, sweet, and pale; and his paintings remind one of faded tapestries, gently and harmoniously discoloured by the hand of time.

The art of mosaic, born in antiquity in a sunlit land, practised later and with brilliant success by the Byzantine artists, and of which the finest examples are still those of Ravenna and of the old Basilicas, has become in our time, for the Western nations, a decorative element which they endeavour to acclimatise among themselves. In a vast *ensemble* such as that of the Pantheon, we must endeavour to make an application of it, and to give to our artists and French school of mosaicists the occasion to show how far they have assimilated the methods of the Italians, which have been looked to as their guides. M. Hébert, Director of the "Académie de France" at Rome, drawing his inspiration from the archaic compositions of the tenth century,—in regard to the necessary convention of form and contours, more bounded even than those of fresco,—must, nevertheless, remain *modern*, under pain of being in violent contrast with the painters charged with the decoration of the wall-surfaces surrounding the high altar. The difficulty may be said to have been surmounted; but one soon feels the necessity of uniting to the brighter surfaces which surround them the brilliant gold and the vitrified ground of the mosaic; and in this effort to apply coloured decoration to a building of which, till recently, the colourless stone was its only ornament, the artist who has conceived it and the architect who has to realise it, have been carried off their feet. It must evidently have been so; all those who have attempted to apply polychromatic decoration to a monument hitherto only adorned by its plain stone surface, know the fate that awaits them. They have not escaped it at the Pantheon. Little by little each day has done something more in adding a new decoration, resulting from the principal decorative scheme, with the risk of finding that, in place of having embellished the monument at the cost of the greatest sacrifices, one has compromised for ever the solemn grandeur and perfect harmony of the building. The mosaic executed in the neighbourhood of the high altar naturally called for a coloured frieze in the entablature; in its turn, this will demand painted fillets on the pilasters; and at this moment, in order that the colourless surfaces remaining may not cause a kind of hole (*un trou*) in the whole work, they have got to the point of ordering, from the manufactory of Gobelins, tapestries which will serve, so to speak, as a binding colour, a passage and transition between the cold surfaces of the columns, plinths, and surbases, and the surfaces covered by the artists; as one sees in the choir of the Cathedral of Cologne and of the churches of Nuremberg, and the majority of those of churches of the Middle Ages which still retain their original decorative furnishing. That done, it has naturally followed that the leading sculptors of the French school,—the Chapus, Falguères, Merciers, Dubois, &c.,—have been called upon, and groups in marble have been placed here and there of a tone warmer than the stone, which assist still further the transition between that and the coloured surfaces. And thus it is that the Pantheon is becoming, from day to day, a museum of contemporary art which will give the precise measure of what the French school can do, in the way of monumental decoration, at this latter end of the nineteenth century.

Obituary.—Mrs. Palmer, of the firm of M. A. Palmer & Co., builders, of 7, Old Gravel-lane, St. George's East, died on Good Friday, at the age of 74 years, of an attack of apoplexy. Mrs. Palmer was one of the oldest inhabitants of St. George's, had been all her life in the parish, and for more than fifty years in the premises in Old Gravel-lane.

THE METROPOLITAN BOARD AND BILLS IN PARLIAMENT.

THE Metropolitan Board of Works has presented petitions against several schemes before Parliament in the present session. Among others the Board has petitioned against the Columbia Market and Railways Bill, on the ground of the insufficient widths of the bridges over Hackney-road and Harwar-street, and that it is proposed to stop up and appropriate the site of certain streets without paying compensation. The petition against the Great Eastern Railway (General Powers) Bill, by which the company seek to obtain powers to widen their main line on the south side between Upper North-street, Bethnal Green, and Devonshire-street, Mile End Old Town, near the Globe-road Station, prays that provision be made for securing in every case an adequate span and headway for bridges over the public streets, for preventing any projections beyond the general line of frontage, for regulating the design of bridges, and providing that any bridge or arch over the public way should be made water-tight and sound-proof, and that any street or way bridged or arched over should be lighted at the expense of the company.

In the case of the Greenwich and Millwall Subway Bill, which proposes to extend the time for the completion of the works and to give compulsory powers for the purchase of land for the purpose of forming a subway under the river Thames between Poplar and Greenwich, the petition alleges that the inhabitants of the metropolis will be injuriously affected if such extension of time, &c., as is contemplated is authorised by Parliament, that the company is and has been entirely unable to obtain the necessary capital for carrying out the work, but that if the powers of the company are extended they will be made the basis of a claim against the Metropolitan Board for compensation in the event of the Board obtaining powers for establishing improved means of communication across the river.

The King's-cross, Charing-cross, and Waterloo Subway, which, although described as a subway, is in reality a railway, is petitioned against, the petitioners submitting that the construction of the proposed subway will involve grave inconvenience and damage which will far outweigh any public advantage which it may afford. It will interfere with the Northumberland-street sewer, the Middle Level sewer (Main Line and Piccadilly Branch), the Essex-street sewer (Main Line), the Fleet sewer, and the Victoria Embankment and Low-level sewer, and derange the present metropolitan system of drainage. It is alleged on the part of the Board that the construction of the subway will probably entirely prevent, and will certainly render more difficult and costly, necessary or desirable extensions and improvements of the Main Drainage system. It is further submitted that the powers sought to be acquired by the Bill with regard to the subsoil of the streets should not be conferred upon a company, but that such subsoil should be reserved for the various purposes for which it may be required by public authorities.

The London and Blackwall Railway Bill, for widening the railway of this company on the north side, between Little Prescott-street, Whitechapel, and Bower-street, Stepney, and on the south side between the last named street and Stepney Junction Station, is petitioned against on the general ground of the interference that would be occasioned to the Board's sewers, and the inadequate means of control provided by the Bill with regard to bridges and arches over the public way.

The London and South-Western Railways (Various Powers) Bill is opposed on similar grounds to the preceding Bill.

The London Central Subway Bill, by which power is sought to construct a railway from Liverpool-street to Charing Cross, is opposed by the Board on similar grounds to those set out in the petition against the King's-cross, Charing-cross, and Waterloo Subways Bill.

The Bill to extend the time for the purchase

of lands and for the completion of the market at Shadwell, authorised by the London Riverside Fish Market Act, 1882, will be opposed by the Board. The powers conferred by the Act of 1882 will expire on the 24th of July in this year, and the time for the completion of the works will expire on the 24th of July, 1887. It is proposed by the Bill to extend the time for the purchase of land for three years, and for the completion of the works for five years, from the time limited by the Act of 1882. The fifty-fifth section of the Act exempts the streets and buildings belonging to the company from the operation of the Local Management Act and the Metropolitan Building Act, and any by-laws or regulations made in pursuance of such Acts. The petition against the Bill alleges that the effect of the section in question will apparently be to exempt the company from the whole of the municipal legislation affecting the metropolis, and that the law with regard to sewerage, drainage, street cleansing, repair and maintenance, the prohibition of buildings constructed of improper materials, the removal of dangerous structures, the levying of local rates, the regulation of the construction of streets, and the various other matters dealt with by the above Acts, would be abrogated so far as the company's property is concerned.

The Bill promoted by the London, Tilbury, and Southend Railway Company recites in the preamble that the company have entered into an agreement for the purchase of the disused burial-ground of a community known as the Seventh Day Baptists in Mill-yard, Whitechapel, and that by reason of the Disused Burial Grounds Act, 1884, the company are prevented from dealing with the land in question, and they seek to be exempted from the provisions of the Act. This Bill is opposed by the Board, on the ground that it is contrary to public policy and Parliamentary precedent that the provisions of a public Act with reference to burial-grounds should be set aside in the manner proposed by the Bill.

The Metropolitan Railway (Various Powers) Bill is opposed by the Board. This company propose to acquire for the purpose of their undertaking an area of nearly two acres of land in the parish of Clerkenwell, on both sides of the railway between King's-cross Station and the Metropolitan Meat Market. This is objected to on the ground that the acquisition of such a large area of ground may lead to considerable crowding and obstruction of the streets in the neighbourhood. It is further submitted by the petitioners that if it should be considered desirable for the company to acquire the land in question the company should be required to widen that portion of King's-cross-road extending westward from its junction with Baker-street, and also to widen and improve the end of Granville-place leading into Granville-square. A portion of an open space forming part of Whitechapel-road is proposed to be taken by the company, and the petitioners suggest that if the company be empowered to acquire this land it should be left open for the use of the public.

The London and North-Western Railway Company propose to lay a single line of rails across Worship-street, Finsbury, for the accommodation of their goods traffic. This is objected to by the Board as being inconvenient and dangerous to the public. The company further propose to acquire the premises known as the Spread Eagle, Piccadilly-circus, for the purpose of their undertaking. The Board by their petition allege that they are advised that if the company are authorised to acquire these premises by their Bill, any building erected upon the site would be exempt from the first part of the Metropolitan Building Act, and they submit that the purposes for which the premises are to be used should be more strictly defined, and that any building erected thereon should be subject to the Metropolitan Building Act.

The South-Eastern Railway Company by their Bill propose to extend the time limited by their Act of 1882 for the purchase of certain additional lands in the parishes of Deptford, Greenwich, St. Martin's-in-the-Fields, and St.

Olave's, Southwark. This Bill is opposed on the ground that the Board has purchased, at a large expense, the land and buildings necessary for the widening of Tooley-street, and that the widening has been completed, but that by reason of the neglect of the company to elect, as they are empowered to do, whether they will purchase the surplus lands, the Board are unable to sell or relet the ground fronting upon the new street. The petitioners further submit that no adequate obligation has been laid upon the company with regard to the rehousing of the labouring classes who will be displaced by the carrying out of the works authorised by the Bill.

The Westminster (Parliament-street, &c.) Improvements Bill contemplates the formation of a company for carrying out certain improvements in the neighbourhood of Parliament-street similar in character to those proposed in connexion with the Parks Railway of last session. The improvements suggested are the widening of Parliament-street between Charles-street and Great George-street to 120 ft., the widening of Charles-street between Parliament-street and Delahay-street to 50 ft., the widening of a portion of Delahay-street to 60 ft., and the formation of a new street, 50 ft. wide, between Parliament-street and Delahay-street. This Bill is opposed by the Board on the ground that the streets are inconveniently planned, and that the estimate of the cost is inadequate for the work. The petitioners further allege that the proposed alterations are of considerable importance, and that, however desirable such alterations may be, they should not be carried out except in a manner to be approved by the Board as the representatives of the ratepayers of the metropolis. Attention has been called to this matter in the House of Lords, as we have already noted (see p. 440, ante). The petitioners refer to the experience gained by the powers conferred by Parliament on the Westminster Improvement Commissioners for effecting a somewhat similar improvement, namely, the laying out of Victoria-street, Westminster. The existence of the powers so conferred, it is asserted, caused great public inconvenience, and ultimately involved the public authorities in considerable expense, and the petitioners are apprehensive of similar results in the present case. If the improvements are commenced and left incomplete, or are delayed, the Board are apprehensive that themselves or the Westminster District Board may be called upon to complete the works.

The Board in every petition against a Railway Bill require that provision should be made in the Bill prohibiting the company from placing any notice, placard, or advertisement on any work or building in sight of any street, or public thoroughfare in the metropolis.

NOTES.

THE Parliamentary debate on the War Office site was reached on Thursday evening, the 9th, after all, but the vote carried merely amounted to a sum of 10,000l. for preliminary expenses. Mr. Beresford-Hopwood moved the reduction of the vote by 1,000l. in order to take the sense of the House in regard to a building which he rightly described as "sadly disappointing," regarded as a production of national art. It was "commonplace, and overloaded with ornament." Mr. Shaw-Lefevre lectured the House on the subject, stating that he had been mainly responsible for the progress of the matter so far, a fact which may account in some degree for the unsatisfactory result obtained. Mr. Shaw-Lefevre's claims to pose as an architectural instructor to the House may be gauged by the fact that he compared the design with that of the Houses of Parliament, to the disadvantage of the latter, and suggested St. George's Hall at Liverpool, as a parallel case of a fine design produced in a competition by an unknown man. Any one who can seriously make such comparisons shows himself entirely without perception of what constitutes greatness in architectural design. Both St. George's Hall

and the Houses of Parliament are emphatically works of *genius*,—marked by the force, originality, and unity of conception characteristic of genius. The new design for the War Offices is simply a draughtsman's design, put together from books and precedents. Mr. Hope's suggestion that the distribution of the rooms should be accepted, and the "carcase clothed with artistic features" is, we fear, one hardly possible to realise without absolutely throwing over the architects; and that, as we have said, would be a breach of faith. But it would be possible to associate with them an architect, say an able man of the modern French school, who would pull the whole design together and supervise the details. Mr. Hope's amendment was supported by 26 votes, as against 45 for the original motion,—a pretty fair support considering how indifferent the subject is to most members of the House. We do not regard the matter as settled yet; and we must caution members against accepting as their instructor in architecture the late First Commissioner of Works, who has made it evident that he has no qualification whatever for such a *role* except that furnished by his recent official position and by his apparently very abnormal self-confidence.

THE Joint-Committee representing the Meteorological Office and the Meteorological Society appointed to take into consideration the question of "the decrease of water in springs, streams, and rivers," and also "the simultaneous rise of the flood level in cultivated countries," have elicited replies containing several series of observations made by various well-known authorities in this country. So far as the available records go, there does not appear to have been either any marked general decrease or increase of the water supply in England, though there have been isolated cases where either or both have been occasionally experienced. During a period of sixty-five years a deficiency of water has occurred in sixteen, at intervals varying from one to eleven years, while there has been an excess in seventeen years. The dry years seem to have occurred at somewhat quicker intervals, for five years out of the sixteen have occurred at seven, nine, ten, and eleven years' intervals, whereas there have been only two intervals of seven and eleven years respectively in the wet year. The causes of fluctuation or increase in the height of the flood levels of rivers depend so much on the characteristics and configuration of the respective basins that it is impossible to base any general conclusion from specific instances, but the fact of any absolute progressive decrease in the aggregate water-supply of a country generally is quite capable of determination. Such decrease, however, has not as yet seemingly taken place in England, though the inconvenience arising from local droughts has been often experienced, and will continue to be felt until measures are taken to store some of the superabundance in certain localities for the purpose of distributing it in times of deficiency to others, or permanently supplementing a defective supply.

THE character of the lines of communication between Russia and the Afghan frontier is a subject of paramount interest for the moment. The basis of any Russian movement may be placed at Michailovsky, on the south-eastern shore of the Caspian, to which spot access is given by the steam flotilla on that sea. From Michailovsky the Trans-Caspian Railway was completed, in September, 1881, to Kizil Arvat, a distance of 144 miles. Thence to Askabad, a distance of 135 miles, the route lies chiefly through desert, or rather deserted country. From Askabad to Sarakhs is 185.5 miles, and from Sarakhs to Herat 202.5 miles, making a total distance of 667 miles from the shore of the Caspian to Herat. The distance from that city to the mouth of the Bokan Pass is 400 miles, as the crow flies, but the road makes a circuit of 600 miles round the foot of the mountains and by the valley of the Helmund River. Between Sarakhs and Herat the road lies through the Robat Pass of the Borkhut Mountains, at an elevation of 3,100 ft.

above the level of the sea, and about 900 ft. above the surrounding locality. Thus, from Michailovsky to Sibi is 1,266 miles, a distance through a difficult and deserted country for the most part, which nothing but a very tempting and definite object could induce a military expedition to encounter.

THE work of piecing together and arranging the shattered fragments of the Pergamene marbles is still energetically carried on at Berlin by the two sculptors, Frere and Possentis. Certain recent combinations have been made which lead Frere to think that the conjectural restoration of the great altar, published by authority, and now widely known, is fundamentally in error. He believes that the great stair-case which led up to the platform of the altar was not, as has been hitherto supposed, on the south, but on the north side. Further excavations will have to be carried out before his conjecture can be proved. Meanwhile, writers and teachers on the subject will do well to hold their doctrine on this point in reserve. Frere has further succeeded in putting together, out of fragments hitherto inexplicable, a very interesting group, in which one of the snakes,—in which so many of the giant figures terminate,—is engaged in battle with a monster somewhat like a crocodile. Probably this fight went on somewhere in the retinue of Poseidon, of whom no trace remains. Two colossal heads,—one of Trajan, the other of Hadrian,—are about to be set up in the Berlin Museum. They are reported to be of splendid execution, and are interesting as belonging to the class of acrolithic statues, *i.e.*, statues the trunk of which was of wood, with armour of bronze, while the extremities were of marble. The statues, reliefs, &c., from the Sabouroff collection, of which we spoke last year before they were shown to the public, are now exposed to view, with the exception of the beautiful Salamis bronze, which is being cleaned. In a paper recently read on the subject of this bronze, Dr. Furtwaengler came to the conclusion,—which, we think, no one will dispute,—that the Salamis bronze belonged to the beginning of the fourth century B.C., and was a work of the Argive bronze school. The long curls, of which slight remains are visible on the shoulders, make it probable that the statue represents Apollo. The statue is the only bronze of any size which we possess from the best period of bronze work. The Berlin *Philologische Wochenschrift* rightly observes that the acquisition of the Sabouroff grave-reliefs raises the Berlin Museum at once to a high rank as regards monuments of pure Attic work. Its fame no longer now rests on the Pergamene marbles only.

A CORRESPONDENT writes:—"On Thursday, April 2nd, another fine bronze statue was found at the new theatre on the Via Nazionale, Rome. It is in a much better state of preservation than that recently discovered; in fact, with the exception of flaws at the knees, it is perfect. The statue represents a boxer seated, and resting himself after the fatigues of the contest. The body is bent slightly forward, the legs are wide apart, whilst between them one hand rests upon the other, the thighs supporting the forearms. The head is turned towards the right shoulder, the open mouth seeming to draw in breath, replenishing the exhausted lungs, so the breasts are somewhat sunken. The thick, curly beard, moustaches, and hair denote strength, which is fully shown in the muscular body. The contest has evidently been severe: the hands are swollen, also the ears, neck, and nose, showing that, although he may be the victor, victory has not been achieved without leaving traces of a hard struggle. The *cestus* is bound round the hand and well up the forearm, ending in a fringe. It is very different from the simple strap, as represented in Canova's boxer in the Vatican, being loaded with a heavy piece of metal across the palm of the hand, thus adding weight to the blow. The statue was found within 4 in. of a wall of the Baths of Constantine, and was evidently buried when those baths were erected; and then narrowly escaped discovery. It was

found seated on the fragment of a capital which fortunately held the figure together, and enabled the workmen to excavate it, and carry it to the Magazine. It is unique, and we should say the man represented is not a Greek. The height of the seated figure is 4 ft. 4 in."

ROME is just now fated to be fortunate. Near the Porta Salaria a necropolis has been discovered, and already not only a number of ancient cippi, but also some sarcophagi, reputed to be of great beauty, have been dug out. These last are in excellent preservation, and still contain the dead men's bones. They are decorated with reliefs of considerable mythological interest. Among the designs are "The Rape of the Leukippidæ" and the "Nurture of Bacchus." It seems that there is some doubt as to whom the spoils belong to, and they are kept, as is usual with discoveries in Rome, as strictly invisible as possible. This habit of being mysterious about discoveries is based on the very commonplace desire to raise the money value in case of a sale, aggravated by the wearisome officialism which always waits upon ignorance.

DURING recent weeks some ordinary works of repair have been in progress in that portion of the crypt of Canterbury Cathedral known as the French Protestant Church. These works required the removal of a portion of the floor, and certain excavations were made. The workmen speedily came upon a large number of fragments of elaborately carved and moulded stonework. They were carefully removed to the office of the Cathedral Architect, Mr. Austin, where they remain, for the most part, for safe custody. They consist, without a doubt, of portions of a very elaborate monument or shrine, being very finely wrought, and coloured blue, vermilion, and gold. The style is that of the middle of the fourteenth century. The fragments are so broken that few of them join, and no portion is of large size. From the repetition of the parts it is possible to recover the design, and to show the nature of the monument to which they belonged. Many of the fragments are portions of delicately-carved canopy-work, indicating that there were many small niches to have such ornamental terminations. Among the fragments was a very small piece of a sculptured robe, evidently a portion of an ecclesiastical figure of life-size, and a single pearl remains embedded, as one of the ornaments of the robe, in the surface of the stone.

ON inspection of the cathedral it is found that several of the fragments of shafts agree in character with the remains known to be those of the shrine of St. Dunstan, on the south side of the choir, just to the east of Archbishop Sandbury's monument. There are here traces of a small projecting structure of which three moulded columns remain embedded in the wall. The return mouldings of the plinths are also visible, and since there are, as well, the marks where the arches and tabernacle work above the columns sprang from, it would be no difficult task to recover the design. The length is marked by the fragments in position, as is also the height. The details of some delicate diaper work agree exactly with what has just been found. Traces of very good wall decoration in colour remain between the plasters referred to, and these indications have additional interest from the discovery now made. The position of the shrine of St. Dunstan is given in the register of Prior Henry, now in the British Museum, printed in Dart's History of the Cathedral. It is expressly stated that his body was in "feretio suo juxta magnam altare versus austrum." The shrine was doubtless demolished at the Reformation, when many other of the wonders of the cathedral were removed. There were here pieces of Aaron's rod, of the clay out of which Adam was made, and several other such "curiosities," as they are called by Professor Willis. Some of the fragments found may prove to relate to some one or another of the shrines removed in the sixteenth century.

A REMARKABLY clear summary of the working of fifteen of the principal railways in the United Kingdom has been prepared by Messrs. Hollebone and Trench, which deserves the attentive study of all railway shareholders. During the six months ending with last December, the falling-off in the merchandise and mineral receipts of these lines amounted to 598,899l.,—a sum which the increase of passenger and other receipts reduced to 472,701l. The corresponding decrease in working expenses was only 50,791l. But the operation of the Cheap Trains Act, 1883, reduced the Government duty, to the advantage of the railway companies, by 136,849l. To the net decrease in revenue thus arrived at, which is 285,061l., have to be added the charges on new capital, amounting in all to 245,018l. On the Metropolitan line the prior charges on capital have decreased by 18,561l.; and on the North-Eastern by 3,746l. During the half-year on the London and North-Western the increase under this head has been as much as 62,728l.; the dividends paid by this great line having fallen off by 89,202l. The Great Eastern, with an increase in gross revenue of 25,287l., accompanied by a decrease of 11,653l. in working expenses (including saving of duty), has paid 28,883l. more in dividend, as well as 14,674l. for charges on new capital, in the year. But this is a solitary case. Four lines have managed not to reduce their dividends, but the balance of the falling off in the net revenue of the lines compared has been 285,061l. And thus a further capital, bearing interest to the amount of 245,000l., has been expended to earn a diminished gross revenue. The deduction from dividends on the ordinary stock of nine of the companies cited is thus as much as 524,754l.,—a loss, if not recouped, equal to a depreciation of more than ten millions sterling in the capital value of these lines.

FORTY-FIVE pounds is not a large sum as consolation for a whole family suffering from typhoid fever, and a son being compelled to take a voyage to Australia in consequence. But these were the damages which were awarded Mrs. Chichester by a jury in an action against her landlord for not putting the drains in order. It appeared in this case of *Chichester v. Lance*, which was tried before Mr. Justice Wills and a special jury, on the 14th instant, that the landlord of the house had undertaken to put the drains in order. We must assume from the case that he did not properly comply with his undertaking, and he has had to pay damages and costs. It will perhaps be a lesson that Baptist Ministers from Wales, for such was the defendant, should not purchase houses in London and then let them, unless they are fully alive to all the responsibilities of their lay as well as their clerical position. It must further be observed in this case that the landlord had agreed to put the drains in order. The tenant, therefore, showed more foresight than many of the class in making such an agreement, and considerable courage in seeking for her remedy in the Law Courts.

THE Superintending Architect of the Metropolitan Board of Works, having regard to the views expressed in the late cases of *Spackman v. The Plumstead Board of Works* and *The Vestry of St. Marylebone v. Rose*, has decided to remodel his certificate as to lines of frontage under section 75 of 25 and 26 Vic., c. 102, as the one now issued does not meet the present state of circumstances.

WE understand that the Buccleuch Memorial Committee have given up their first idea of an equestrian statue, and have commissioned Dr. Rowand Anderson to prepare a design of more architectural character. This, as embodied in the architect's first sketch, consists of a lofty pedestal having three stages of reliefs in bronze, twelve in all, illustrating incidents in the history of the Buccleuch family. A statue of the Duke, in his robes as a peer, surmounts the pedestal. Besides the reliefs there are small detached figures at the angles and heraldic and other emblems. It has been proposed to give the subsidiary decorations to resident sculptors, and to entrust

the statue of the Duke to Mr. Boehm; but nothing is settled as yet.

FROM some correspondence which has reached us it appears that something not very "straight" is going on about the competition for the Newcastle-under-Lyme public buildings. The Assessor, Mr. Lockwood, of Chester, chose, we are told, three designs, signed "For England, Home, and Beauty," "Mind and Body," and "Bonâ Fide," for the first, second, and third premiums respectively. Then it is announced in the local papers that, though the award has been confirmed by the Council, four other designs are to be taken into consideration for possible execution. This, if true, is simply making the competition a farce. If the first premiated design is not the best for the purpose, it should not have been premiated; if it is, it should be accepted for execution.

UNDER the title of the "Common-sense Drying Apparatus" we have before us the particulars of a patented system of drying timber and other things, which seems to us as perfect a one as can be needed or desired, and, beyond the first outlay, a cheap one. The apparatus used by the company who have introduced this excellent system, of which Mr. L. R. Fuller is the patentee, can be fixed to an existing drying-room for the purpose of seasoning all kinds of timber, cut or uncut. The room used requires to be fitted up specially to render the walls non-absorbent, and steam pipes are laid over the floor for warming the air. The timber is first "sweated" by sprays of steam, which dissolve the sap; the air laden with the moisture is extracted by a fan worked by steam and taken to a condenser kept at a low temperature; here the moisture condenses and the air, now dry, is returned to the drying-chamber to be again used to take away more moisture to the condenser, and this process it repeats until the timber is "seasoned." This is simple and we should say most effectual and speedy. The machinery is of American production, but an agency for it has been established in London. The Americans seem to be getting well ahead of us in matters of this kind.

THE subject of cremation is to be dealt with on Thursday, the 23rd, in a lecture at the Parkes Museum by Sir Spencer Wells. It is known that this eminent surgeon has given his strong support to cremation as the system of the future; and whatever may be the difference of opinion among scientific men on the subject (differences arising out of mere sentiment need hardly be taken account of,—they could only have a temporary effect), the systematic exposition of it by so high a medical authority cannot fail to be of great interest.

SCHOOL BOARDS AND ARCHITECTS.

TO the layman it seems very unjust that when a corporation has obtained the benefit of work, it should evade the responsibility of paying for it on the ground that the contract under which it was executed was not under seal. But, as our readers are aware, such is in many cases the law, as we have endeavoured from time to time to show, especially in reference to the latest of the decisions which have thus laid down the law, namely, *Young & Co. v. The Mayor of Royal Leamington Spa*. In delivering judgment in that case, Lord Justice Lindley pointed out that though it was perfectly clear that by the provisions of the Public Health Act, 1875, every contract exceeding 50l. must be under the seal of the urban authority, yet that the general law on the subject was somewhat in a doubtful state. We endeavoured, in a paper on "Contracts of Corporations,"* to explain what that state was; and now there comes another decision which,—at any rate, so long as it is not reversed on appeal,—settles the law as regards work done for a School Board. The case is the more important to our readers, because it settles without doubt,—if it settles nothing else,—that an architect at any rate has a right to recover against a School Board for work done, though the contract under which he has done the work is not under seal.

We refer to the decision of Mr. Justice Mathew, given after taking time for consideration, in the case of *Scott v. The Clifton School Board*. Law Reports, 14 Queen's Bench Division, p. 500 (April number). The work done was that which belongs to the usual business of an architect, namely, preparing plans for buildings,—in this case schools,—and for superintending their erection. The orders under which Mr. Scott acted were agreed to by resolution of this particular Board, and were recorded in the minutes of their proceedings; they were not, however, sealed with the seal of the Board. When work has been done, and it is evident that a person is entitled to some remuneration the law must be very clear to enable a judge to decide against such a claim. There is, however, in the Elementary Education Act, no provision, in so many words, that a contract must necessarily be under seal. But in that statute it is to be found a section which states that "any minute, if signed by the chairman, shall be receivable in evidence in all legal proceedings, without further proof." Mr. Justice Mathew having regard to this section, and to the cases which have decided that some corporations are sometimes liable, so to speak, give the go-by to the cases on the other side, and held that it was unnecessary that the order should be under seal, and that, having done the work, the architect was entitled to be paid for it.

But on a second ground the Judge held the Board liable, and this is, perhaps, even of greater importance than the other part of the case. The 35th section of the Elementary Education Act states that a School Board may appoint a clerk, and a treasurer, and other necessary officers. A part of the third schedule says "the appointment of any officer of the Board may be made by a minute of the Board, signed by the chairman and countersigned by the clerk (if any) of the Board, and any appointment so made shall be as valid as if it were made under the seal of the Board." Mr. Scott was appointed architect to the Board in the manner stated in the Act as above, and the subsequent orders were communicated in like manner by the clerk. The Judge, on this part of the case, held that Mr. Scott had been duly appointed architect to the Board, not for the temporary purpose of planning and looking after the erection of the schools in question, but as a permanent official. It was contended on behalf of the Board that an architect was not such a person as was contemplated by the statute; but said Mr. Justice Mathew, "although after the erection of the schools his duties might not be onerous, there is no reason to suppose that it was intended that he should not continue to act whenever his services were necessary. Further, the regulation is intended to be one of general application, and in large towns where there are many schools there may well be the necessity for the appointment of an architect as a permanent official of the Board."

The application of this case is therefore clearly two-edged; on the one hand, it decides that those doing work for a School Board which is essential to their business as such a Board, are entitled to be paid for the work so done. In this sense the case seems to apply as much to a builder as to an architect. On the other hand, it settles that a person appointed by minute in regular form architect to a School Board, even though the primary object of his appointment be that he shall perform a temporary duty, is a permanent official of the Board, and so is entitled to be paid for his work till his appointment is cancelled.

Association of Municipal and Sanitary Engineers and Surveyors.—A Lancashire and Cheshire District Meeting will be held at Burnley, on Saturday next, April 25th. The members will assemble in the Council Chamber, Elizabeth-street, at half-past eleven a.m. Mr. J. E. Stafford, A.M.I.C.E., the Borough Surveyor, will give a short sketch on subjects of local and of professional interest, and will show and explain the plans of the intended new waterworks, municipal buildings, and hospitals. At one p.m. the members will proceed to the Store Yard of the Corporation and inspect the "Refuse Destructor," "Elevator," and "Tool Sharpener," and afterwards to the new public Abattoirs, River Invert and Gasworks Walls, Danco House, Canal and Railway Bridges, Scott's Sewage Works, and, if time will allow, the Bank Hall Colliery.

* See *Builder*, Aug. 12, 1882.

AGRICULTURAL RESOURCES OF INDIA.

It was not till a rapid succession of famines within the last quarter of a century had brought home to the Government of India the fact that there was almost a total absence of agricultural statistics that any attempt was made to organise a systematic collection of data, agricultural and meteorological, whereby some idea might be formed of the possible annual out-turn of the food crops of the country during the respective seasons. After the last great famine the Home Government despatched Sir James Caird on a mission of inquiry, and, subsequently, special commissioners were appointed, who, in their turn, submitted a very able and exhaustive report, in which, amongst other suggestions, was recommended the formation of a distinct Agricultural Department on whom should devolve the collection of all the information possible regarding the commercial and economic products of India, with a view to their embodiment in periodical reports. At the head of the new department was placed Mr. Buck, a distinguished member of the Indian Civil Service in the North-West Provinces, who has recently given an interesting lecture on the subject before the Society of Arts, under the presidency of Sir J. Caird. As England has so great an interest in all that concerns the economic productions of India, and only a few persons had the opportunity of hearing Mr. Buck's lecture, a brief notice of it will, doubtless, be acceptable to many readers of the *Builder*.

Perhaps one of the points least capable of being correctly apprehended by persons not conversant with India is its enormous size. This Mr. Buck very happily illustrated by comparing it with Egypt—a country very similar in many respects, but with only one-fiftieth of its capacity in every particular. India, though so large in itself, is, after all, but a shred of the vast Asiatic continent, but yet the most valuable portion of it, owing to the fact of its possessing a treasure in its rainfall. This treasure, however, is not by any means equally distributed, and hence arise the great uncertainties in agricultural operations and the extreme oscillations to which the food output is exposed. The problem which has been exercising the Government of India for many years is how those oscillations may be mitigated, if not altogether obviated. Before describing the measures which have been undertaken, Mr. Buck gives a short description of Indian cultivators, and of the prevailing system of agriculture. The former he pronounces to be "the most patient, hard-working, and, in many cases, skilful agriculturists that can be found on the face of the earth. Inured to privation, accustomed to maintaining life on short meals, and with scanty clothing, they give their labour for the smallest return it is possible to conceive. The consequence is that, broadly speaking, the agriculture of the country is carried on by a vast human machine,—a machine of flesh and blood, which is cheaper in its working than it is possible for any machine of steam and iron to be"; and hence he concludes that, until wages have risen to a much higher standard, the question of increasing the products of India by the application of machinery must be considered a secondary one.

The system of agriculture he describes as that of *petite culture*, the country being split up into many millions of five-acre farms. It is to the maintenance of the holders of these farms in a normal condition of health and strength, rather than to the supplying a starving population with food in a time of famine, and to the adoption of measures to increase the produce of the country rather than to the distribution of the existing supplies in a time of scarcity,—in other words, the policy of maintaining agricultural operations at the highest attainable standard of efficiency, that the recommendations of the Famine Commissioners pointed.

Mr. Buck then proceeds to enumerate the measures necessary to secure that end, and, strange to say, he gives the place of precedence to the promotion of railways; that is to say, to the mode of carriage rather than to the means of increasing production, apparently in contradiction to the principle he just previously stated to be essential. He is quite correct when he goes on to say that "railways with few exceptions tend to ameliorate the condition of the cultivator mainly in two ways,—first, by insuring a better average price for his produce when he has a surplus for export; and secondly,

by bringing him food at a cheaper price when he has insufficient for subsistence." It is easily conceivable that there may be tracts blessed with a superabundance of food over and above the requirements of its inhabitants, and that the construction of a cheap means of communication between it and another tract where there is a redundancy of population with a deficiency of food may be the best and readiest method of supplying the wants of the latter; but on the principle, rightly advocated by Mr. Buck at the close of his lecture, that in legislating for the wants of India it is necessary to do so for it as a whole, and not for fractional portions of it only, surely the most obvious measures, when the well-being of the whole empire has to be considered, should be such as will not only secure from fluctuation its food supply, but will increase its out-turn. If so, the measure of first importance would rather be a reliable system of irrigation, and the next, the means of insuring its distribution. Perhaps it would be a truer economic principle that the two measures should proceed simultaneously, for to increase the outturn from the soil without providing the means for its subsequent distribution would be a doubtful benefit even to the locality immediately concerned, but to provide increased facilities for the conveyance of food which was not to be forthcoming in the hour of need would be productive of good to no one. There is, however, another consideration which does not seem to have occurred to any of those who have hitherto been engaged in these discussions, and that is, while the construction of lines of intercommunication is useful, nay essential, for the easy distribution of the existing food supplies of the country, its economic advantages are confined to transferring capital from one portion of the empire to another, and therefore it does not in any way tend to develop or increase its actual wealth. On the other hand, the construction of a class of works which tend to double the out-turn of agricultural and economic products, coupled with lines of communication for its conveyance to the markets of the world, directly leads to an increase of commercial transactions, and either by an interchange of commodities, or by actual specie payments introduces fresh and foreign capital into the country generally, and so conduces positively and tangibly to an increase in its resources and wealth. Hence there must be considerable reserve in assenting to Mr. Buck's conclusion that "the expenditure of capital on railways affords a quicker benefit to a greater number than irrigation or any other measure Government can undertake, and rightly heads the list" of remedial measures.

His remarks on canal and well irrigation are much to the purpose, as also his disposal of the objections which have occasionally been raised as to the evils resulting from irrigation. Those not conversant with the subject understand the term "irrigation" in India to be limited to the mere act of covering the land with water; whereas a proper system of irrigation combines drainage, with protection from floods where necessary, and water carriage where possible. Of this last point, it is to be regretted that Mr. Buck has made no mention. Advocating expenditure on railways with a view to facilitate and cheapen carriage, not only has he omitted to suggest any improvements to the waterways, but has not even made the slightest allusion to them, and yet if any country in the world stands in need of the cheapest of all methods of transit, it is India. A strange oversight on the part of the head of the Agricultural Department, with whom it might be supposed the extension of the wheat trade between India and England would of itself be of sufficient importance to suggest an inquiry into the reasons why that trade is still practically monopolised by America, when all that is needed for its permanent transfer to India is such a reduction in the cost of its conveyance to the ports for shipment as will admit of its being sold at a profit in London, even when prices are as low as at present.

Mr. Buck next advocates the reclamation of waste lands, estimated at 100 millions of acres, and the establishment of fuel and fodder reserves, the latter so necessary for the maintenance and improvement of the cattle which over the greater part of India are, as a rule, kept in very low condition. This measure is followed by that of emigration, on which there is a good deal to be said, judging from the very varying opinions expressed during the discussion which followed the lecture. Emigration to foreign

countries of kindred climatic conditions, styled by Mr. Buck "Greater India," but where the ratio of wages is three or four fold higher than in India, has much in its favour; but while there still remains so vast an area awaiting reclamation at home, it is open to question whether the better policy would not be to encourage a transfer of labour from where it is superabundant to home tracts where it is deficient.

The last measure treated is the improvement to be effected by new machines and new methods of culture. With very few exceptions, Mr. Buck thinks the time has not yet arrived when the introduction of agricultural machinery can be profitably utilised, not as respects a reluctance on the part of the cultivator to avail himself of it, as to the fact of which he has satisfied himself that his cattle are not sufficiently strong to work heavier appliances. The cultivator's readiness to use machines adapted to the power of his cattle has been already evidenced by his adoption of improved sugar-mills in parts of Bengal. Mr. Buck has a word to add on the favourite theme of many self-constituted Indian reformers, the indebtedness of the Indian cultivator, whose position, however, he considers to be not so bad as it has been represented; but, at the same time, he points out that the only way to keep him out of the hands of the money-lender is to eliminate, as far as possible, the uncertainty which now attends his harvests. While acknowledging that in some tracts the state of the Indian cultivator is "deplorable," he at the same time observes "that it is due not to the cruel treatment (as has often been so recklessly alleged) that he receives from his British rulers and their representatives, but from his mistress Nature and her capricious moods, against the tyranny of which every nerve is now being strained to protect him"; and he concludes with the gratifying assurance that though "much, very much, yet remains to be done, and though the work of protection is far from being accomplished, yet whatever picture may be drawn of local distress in some parts of India, in the greater part of the empire, the condition of the cultivator is materially better than it was fifty years ago." The charts which Mr. Buck states are in course of preparation by the Indian Survey Department, and which will illustrate the industrial and agricultural resources of the empire, cannot fail to be of the highest interest, and will, doubtless, be attentively scanned by thousands of visitors at the forthcoming Exhibition in 1886.

COMPETITIONS.

New Vestry-hall for Chelsea.—The Vestry of Chelsea considered at their meeting on Tuesday night a long report by the Committee of Works as to the various designs submitted by competitors for the new Vestry-hall. Seven plans had been selected as best deserving consideration, and of those the committee, advised by Mr. Henry Hunt, who had been appointed the professional assessor, recommended that Nos. 26, 14, and 18 be the designs, the authors of which should receive premiums of 100, 50, and 30 guineas respectively. The committee's recommendations were adopted, and it was then agreed to reveal the names. The author of the first (No. 26) proved to be Mr. J. M. Brydon, F.R.I.B.A., of 5, Cambridge-place, Regent's Park; the author of No. 14 was Mr. William Leck, of 20, Moore-street, Chelsea; and Messrs. Newman & Newman, of Tooley-street, London Bridge, were the authors of No. 18. Mr. Brydon was then by formal motion appointed architect for the enlargement of the hall, the cost of which will be 15,000*l.*

New Church at Mosley Common, near Tyldesley.—Mr. F. H. Oldham, F.R.I.B.A., of John Dalton-street, Manchester, has been the successful architect in a recent competition for a new church at Mosley Common, near Tyldesley, which is to be proceeded with at once. Mr. T. Worthington, a vice-president of the Royal Institute of British Architects, was the assessor.

Peterborough Cathedral.—It is stated that the Archbishop of Canterbury has given his award in the Peterborough Cathedral controversy. He advises the appointment by the Dean and Chapter and Restoration Committee of an executive of seventeen to decide the question; failing which, his Grace recommends that the first plan of rebuilding the tower, as originally provided for, be adhered to.

Illustrations.

MONUMENT DESIGNED BY M. DALOU.

THE monument, of which we publish an illustration from a photograph of the sculptor's model, is designed for the decoration of the "Place de la Nation," and the municipal administration count upon solemnly inaugurating it on July 4th, 1886. Surrounded by sparkling fountains and masses of green verdure, it will occupy the centre of the vast central basin of that "Place" which for some years has been called "Place du Trône," and which is situated at the extremity of the Boulevard Voltaire.

The artist from whom the city of Paris has commissioned this great piece of work is well known in England, which, indeed, offered him a generous hospitality. It was there that he lived during long years, and there that his fine talent became fully developed and ripened. M. Jules Dalou was the favourite pupil of Carpeaux, whose nervous and expressive talent his own recalls. For him, as for his master, nature is no dried-up convention, cold and stiff, but a living and palpitating model, communicating to the marble or the bronze which reproduces it its own life and animation.

The model of M. Dalou's design figured in an open competition, in 1879, for the monument to the Republic inaugurated on the 4th of July, 1883, in which competition M. Charles Morice was the fortunate victor. M. Dalou gained nothing officially then, not even "honourable mention," though all the world of the public and the press agreed in considering his work as quite out of the common groove,—frankly original and thoroughly decorative in treatment.

The Academic clique, even more than the restricted conditions of the competition, operated in excluding this most remarkable design from success; but the Municipal Council of Paris did itself the honour to repair the wrong done by this unexpected judgment, in voting the acquisition of the group of M. Dalou at a price of 70,000 fr., and granting, for the cost of casting it in bronze, a further sum of 140,000 fr.

It was then that the material difficulties commenced. The artist, whom the political amnesty had recalled to France, arrived in Paris, but with no notion where he could commence to model his figures, some of which would be nearly five metres in height. The Municipal Council, wishing still further to second his efforts, had an immense shed constructed in planks in the neighbourhood of the Champ de Mars, and it is in this hastily improvised atelier, with the wind blowing through the gaps of the hoarding, and the rain coming through the skylights, that, since 1880, M. Dalou has been working without cessation at this group and at the completion, at the same time, of two other groups now well known: "Le Triomphe de la République," an alto-relief for the Hôtel de Ville; and "Mirabeau aux États Généraux," commissioned by the Chamber of Deputies.

We will endeavour to give what must at best prove but a dry description of the work, which, in spite of all kinds of difficulties, is proceeding step by step and carrying out more and more fully the promise of the original model.

On a car drawn by two lions and guided by the genius of Liberty brandishing a torch, the figure of the Republic stands upright, in an attitude of triumph, command, and protection. To right and left of her, on either side of the car, two other figures representing Labour and Justice are pushing onward the wheels; the first represented under the aspect of an ouvrier, with naked torso, mallet on his shoulder, sabots on his feet; the second under the aspect of a woman richly draped. Peace, carrying the symbols of Plenty, marches behind the car, scattering as she goes flowers and fruits. The child figures symbolising Instruction, Equity, Wealth, &c., contribute to the decorative effect of the whole composition.

This rich composition, full of movement, rests on a pedestal divided, by great reversed consoles adorned with acanthus foliage, into four faces decorated with attributes in relation with the general idea of the monument. The lateral figures, as well as the animals and children, are treated with great spirit and knowledge, finely modelled, with a great feeling for decorative effect. The garlands and the other decorative adjuncts have been modelled and executed by

the sculptor himself, who is too rich in resources to have occasion to call in the assistance of specialists for those accessory details which sculptors generally leave to ornamentists.

It will be understood that the reproduction in bronze of such a work will be a long and difficult task, requiring the most minute care, especially as the artist has decided on employing for this work the system *d'cire perdue*, in accordance with the traditions of the Renaissance, and which is so favourable to the perfect execution of work in bronze.

Thus, although the model of the principal figure, as well as that of the car, is already completed and cast, and the other models far advanced in clay, M. Dalou does not expect to be able to hand over his colossal group to the City of Paris before 1886. Our readers are already aware that the French Government has not chosen to wait for that inauguration to give to the energetic artist the recompense so well earned by him. The jury who selected the work for execution in 1883 have already given him the most liberal recompense, and a few days after the *Journal Officiel* enrolled among the names of the new "Chevaliers de la Légion d'Honneur" the name of the most brilliant representative of the younger school of French sculpture.

R. B. FENWICK.

* * * The front view of the group we illustrated in the *Builder* of July 9, 1881, remarking at the time that the side view, which we now give, was even finer. We may eventually give a larger illustration of the completed work in the bronze; but we have thought it worth while to illustrate the original model of so remarkable a work, rather than wait for its completion.

LUBECK IN THE SIXTEENTH CENTURY.

The panoramic view of Lübeck is a reproduction of an old German wood-engraving on a very large scale. It is an example of a type of work which was not uncommon in the early days of wood-engraving, when representations of towns in this manner were rather popular subjects, and among these were some of the largest engravings ever made. The present example is about 10 ft. or 12 ft. long. Messrs. Kell have succeeded very well in reducing it to manageable size without losing clearness of definition.

THE COLLEGE STE. BARBE, PARIS.

We give this week two views and a plan of the Preparatory School of the Collège Ste. Barbe, Paris. In the *Builder* of June 21st, 1884, we mentioned, in connexion with the last Congress of French Architects, the visit of the members to the Lycée Janson de Sailly. But, among the institutions of this nature, rather private than governmental, there is one which has always maintained a foremost rank among houses devoted to secondary classic education, and given to the State an admirable example to follow; that is, the Collège Ste. Barbe, situated in the Place du Panthéon, and directed by M. Dnieff, member of the "Conseil Supérieur de l'Instruction Publique."

"Sainte-Barbe," as it is familiarly termed, comprises in its programme the whole circle of secondary education, from the elementary grammar classes carried on in its accessory establishment ("L'Internat de Fontenay-aux-Roses," or "Sainte-Barbe des Champs"), passing by intermediate classes to the rhetoric classes of the "Collège Ste. Barbe," in the Place du Panthéon (at once a boarding, semi-boarding, and day-school), and terminating in the advanced classes of literature and science with which the "École préparatoire" is more especially connected. This latter, in juxtaposition to the Collège, has its special entrance from Rue Valette, and, as its name indicates, is intended to receive, either as "externes" or "internes," the elder pupils who are preparing for Government schools, such as the École Normale, École Polytechnique, École St. Cyr, &c.

It is this "École préparatoire" which, having developed considerably of late years, has given rise to the construction of the new buildings in connexion with the Collège Ste. Barbe and grouped with it adjacent to the Bibliothèque Ste. Geneviève, and which deserve note for the arrangement of the plan, the suitable treatment of the façades, and the ingenious design of its furniture and fittings.

The architect of these buildings, which cover 2,000 square metres with five stories in height, and have cost nearly two million francs, is M. Lheureux, one of the sectional architects to the City of Paris.

Cast iron, wrought iron, and sheet iron, employed in columns, floors, stairs, and roofs; stone and brick in the façades; pine, oak, and pitch-pine for the interior woodwork; together with cement and mosaic, are the principal materials which M. Lheureux has made use of, and which he has turned to account in a manner always practical and often very worthy of study.

The most interesting portions of the new construction are the large refectory in which 500 can be seated at once, the dormitories and the private studies for the older pupils, the covered gymnasium and the drawing-school with lecture-halls adjoining; this latter apartment and the lecture halls or theatres can, by an ingenious arrangement, be in a few hours disencumbered of their special fittings and even of their platforms, in order to form a grand *salle de fêtes* intended to accommodate all the personnel of Ste. Barbe, scholars and teachers, as well as numerous visitors.

All these new portions, and the main stair-cases (of iron) which give access to them, are in other respects far more in common with the old Collège, and the two establishments have a common playground, the court, across which, at certain hours, the great shadow of the dome of the Pantheon extends. The larger view given in this number shows the exterior façade and entrance towards Rue Valette, and the smaller one the entrance from the inner court, at the end next to the Bibliothèque Ste. Geneviève.

The views are from photographs, and the plan is reproduced from that originally communicated by the architect to the pages of the *Encyclopédie d'Architecture*.

PORTION OF A DESIGN FOR A MUNICIPAL MANSION.

SOANE MEDALLION COMPETITION.

In the first number of the *Builder* of this year, in an article on "Architectural Illustration," we drew attention to the necessity of clear definition and uniform blackness of lines (however thin they might be) in drawings which were to produce successful results in photo-lithography. The drawings by Mr. J. Thompson, which obtained a medal of merit in the last Soane medallion competition, are an unfortunate example of this. We had intended to reproduce the perspective view (which, though too like a town-hall, looks very well as a whole); but owing to the author having aimed at producing softness of effect, by using half-tint ink for the lines in the middle distance and sky (and to a general want of sharpness of line), the result was such that it would have been impossible to publish it. The detail elevation, which we publish, gave better results; but even there it will be seen that the fluting-lines of the columns are very faint and "rotten" in effect, not the result of defect on the lithographer's part, but of the fact that the lines in the drawing were grey and not black. The lines could, of course, have been put in again on the stone, but we preferred to leave them as a practical example of the necessity of lines of black and even tint for photo-lithography.

Of course the author may say that he did not make the drawing with that object, but we are disposed to hold that a line drawing, properly so called, should produce its effects and gradations by management of line, not by weakening the ink for half-tints. At all events, those who wish their drawings to be eventually published in lithograph form would do well to bear this caution in mind.

Eastbourne Improvement Scheme.—The

Eastbourne Improvement Bill, now before Parliament, having caused much local interest and considerable opposition from some of the ratepayers and one or two of the magistrates of the borough, a poll was demanded, and the result made known on Wednesday last, the figures being:—For the Bill, 2,269; against it, 1,459, giving a clear majority of 810 in favour of the measure. The Mayor (Mr. G. Ambrose Wallis, C.E.), who is engineer to the sea-front works under the Duke of Devonshire, supported the Bill.

LÜBECK IN THE SIXTEENTH CENTURY FROM AN OLD GERMAN ENGRAVING.

THE NORTHUMBERLAND AVENUE
HOTEL.

VISIT OF THE ARCHITECTURAL ASSOCIATION.

THE sixth visit this year by the members of this Association took place last Saturday, to the Northumberland Avenue Hotel, Charing-cross, now in course of erection from designs by Messrs. Isaacs & Florence. The members assembled at three p.m., and were received by Mr. Lewis H. Isaacs, who was subsequently joined by Mr. H. L. Florence, his partner. A number of working and detailed drawings were shown. Mr. Charles Till, the clerk of works, was also in attendance. In explaining the drawings and building, Mr. Isaacs said great difficulties were encountered in preparing for the foundations of the hotel, in May, 1883, when a contract was entered into with Messrs. Perry & Co., builders, of Tredegar Works, Bow, who executed the works from the foundations, including the basement and part of the ground-floor. Owing to the nature of the site the excavations for the external walls had to be taken down to the great depth of 50 ft., to reach a solid foundation. A large quantity of running water was met with, which was found to come from an old river which took its rise at Highgate, and fell into the Thames about this point, and a powerful pump had to be worked by a 10-horse power engine, night and day, for six or seven months. The works were next stopped by the failure of the original company, and on the formation of a new one another contract was entered into with Mr. J. W. Hohhs, builder, of Croydon and Queen's-buildings, Southwark Bridge-road, who took up the work in September, 1884. The building has now been carried up to the fifth story. The intention of the first company was to erect an hotel with a frontage to the Avenue of 353 ft., but 53 ft. of land at the Charing-cross end being mortgaged, this, on the failure of the company, was lost. The services of the architects, Messrs. Isaacs & Florence, being retained by the new company, the design had to be largely remodelled to suit the present frontage of 300 ft. The site is in the shape of a triangle nearly, being 162 ft. deep at the deeper end, and contains upwards of 32,000 superficial feet. The building is to contain eight floors besides the basement, the main roof being 110 ft. above the ground-line. The style of architecture is the Italian Renaissance. The front elevation will be entirely faced with Portland stone, supplied by the firms of Messrs. Crickmay & Co., of Portland and Weymouth; Steward & Co., of Portland and Nine Elms; and by the contractor, Mr. Hohhs. The stone carrying is being executed by Messrs. Daymond & Sons, of Edward-street, Vauxhall. The cast-iron stanchions were supplied and executed by Young & Co., of Eccleston Foundry, Pimlico; and the iron girders and stanchions by Dibley & Son, Mansion House-chambers, Queen Victoria-street. A number of rolled iron joists have been supplied by Mr. Matthew T. Shaw. The ground-floor contains a large dining-room or *salle à manger*, 93 ft. by 42 ft., and has a circular apse at one end, and two side wings in addition; there will also be several coffee-rooms, and rooms for billiards and other entertainments. The large dining-hall will be 32 ft. high, or up to top of first floor. The first floor is reached by a grand staircase in the centre of the building, and the upper floors by two other large staircases, and two passenger-lifts.

Through the 53-ft. slice of land being cut off, accommodation for 100 rooms, as intended, was lost, and the upper floors will now contain about 600 reception and bed rooms, with conveniences, and the hotel as now planned will stretch from the National Liberal Club at the Charing-cross end to the buildings recently erected by the Society for Promoting Christian Knowledge. The basement is covered over the whole area with concrete 6 ft. thick. It contains, besides the accommodation for the heating apparatus and engine-room, a number of spare sitting-rooms, and extensive cellars. The area courts are faced with glazed white bricks supplied by Messrs. Cliff, Balfour, & Co., and by the Farley Company. In excavating for the foundations, Mr. Isaacs said a few specimens of Roman pottery were found at a depth of 32 ft. The entire cost of the structure as originally designed to cover the larger area was 200,000*l.*, the building now being proceeded with on the reduced scale will cost 160,000*l.* The whole of the works are being executed from designs by the architects, under the super-

intendence of Mr. Charles Till; the general foreman of the works being Mr. Shnto.

The visitors having inspected the various parts of the building as far as it has proceeded, returned again to the ground-floor, when Mr. H. D. Appleton, honorary secretary, proposed a vote of thanks to Messrs. Isaacs & Florence for their permission to view the building and to Mr. Isaacs for kindly explaining it.

THE ARCHITECTURAL ASSOCIATION
SOIRÉE.

No one can be always serious, and earnest students as the members of the Architectural Association are, they, twice a year, deign to amuse themselves; once, at the commencement of the season, they invite their friends to help them, and, on that occasion, the entertainment is usually of a decorously common-place description, and it needs a general hat-smashing to make the evening a very exciting one. But when they meet again in April it is with the object of enjoying themselves in more or less Bohemian style, the significant word "smoking" appears upon the invitation card, and we put on our hat to go with a pleasurable curiosity as to what the entertainment committee shall have provided for our amusement.

This year, for the second time, the *soirée* took place in the Westminster Town-hall, which was already well filled when, at half-past eight, Professor Eloc à Smada, a learned archaeologist of the twenty-second century, proceeded to address his audience upon the arts and architecture of the remote nineteenth in a lecture entitled "The Brass Age." The lecturer, in the course of his remarks, referred to a rare volume called "A Book on Building," evidently by a great authority on the subject. No actual domestic buildings of those days could be pointed to, because, in consequence of an odd, but legalised, custom, a house was liable to be forfeited a few years after its erection to the ground landlord, and the architects, being men of genius, contrived to erect buildings which would last until the time of forfeiture arrived. So accomplished were the architects of that time that they practised in all styles, but their preference was for the "Sanitation" style,* and some of the greatest minds of the age devoted their energies to designing traps and cowns, pipes, pans, and patent junctions, and other features necessary to its development. After some reference to the dress of the period, the learned Professor concluded by calling attention to the curious diagrams on the wall, including a conjectural restoration of a building in the Sanitation style, in which the serpentine windings of drain-pipes, surmounted by tasty cowns, and crowned with an elegant smoke-preventer, produced a *tout ensemble* not so unpleasant as it might have been. There were also drawings of stained-glass windows by Mr. E. C. Lee, representing the "airy-scrappiness" of the period, and a clever picture by Mr. A. B. Pitt, of the emaciated body of a cat discovered in Conduit-street, and represented clasping a pillar, which was the crest of the Institute of Architects.

The lecture was much applauded, and was succeeded by one of Professor Kerr's good-humoured speeches; and then, after a short interval, "The Ghost: a Burlesque Extravaganza Tragedy of Hamlet," as the programme had it, was introduced with a song by Marcellus, an office boy,—Mr. Killmister,—in which he informed the audience how he did not become an architect. A characteristic conversation with Tracio, the pupil,—Mr. Miller,—is interrupted by the appearance of the Ghost (Mr. Gotch) and Tracio, who, in another song, tells how the latter is the elder brother who is supposed to be dead, and to whose practice and wife John Claudius, the ignoramus, has succeeded; and how, taking advantage of his brother's taste for unsweetened gin, he keeps him in duration vile to do the work while he himself takes the credit and profit. This story is repeated to Hamlet & Beckett, the art-critic,—a part excellently played by Mr. Blagrove, whose mimicry of certain well-known persons was as entertaining as it was good-natured, and is confirmed by the Ghost himself, who, in strict accordance with precedent, will speak only to Hamlet. The latter threatens to expose the fraud, and sends Tracio for his diary, but John Claudius Thorpe,—Mr. A. Young,—enters and threatens an

* We fear the evidence the learned Professor could collect would hardly bear out this statement.—Ed.

action for libel, and Hamlet, recollecting a recent *cause célèbre*, dissembles. Then, in a scene between Thorpe and the Ghost, the former is posted for an interview with his client, Sir Thomas Tresham, and the drawings being examined, a chimney-stalk is found to be carried on nothing; but the Ghost excuses himself by saying that the matter can be "set right in the details" or "omitted in execution." Something not shown upon the drawings is sought for in the specification and eventually found among the "Provisional saus." Meanwhile Sir Thomas Tresham,—Mr. Booth,—is announced. The plans are shown him, and many absurd explanations, due to misunderstood hints from the Ghost, who has assumed the appearance of a statue, are given by Thorpe, but, when the crucial question as to cost is asked, the former says he'll be — if he knows; and, coming down from his pedestal and being recognised and seconded by Sir Thomas, threatens his brother with an action, and the scene closes with an agreement to refer the matter to arbitration.

The second scene is laid in the arbitration room in Conduit-street. Hamlet & Beckett appears as arbitrator, and Mrs. Gertrude Weldon Porfia, the actor of which part retains his incognito, is counsel for the Ghost. The witnesses are called and cross-examined by Porfia, and Marcellus is asked what are his duties in Thorpe's office, and mentions that, among other things, he has to

Take out the quantities, and sweep up the cinders,
To draw the details, and clean the windows.

The case for each side being concluded, the arbitrator proceeds to make his award, and first gives "every one a silver medal," but is disconcerted by the Ghost's claiming an "extra" medal on the ground of being a Scotchman. The affair is finally concluded by the elder brother receiving back his practice and his wife, and the younger being condemned by & Beckett, in a black cap and in solemn tones, to read his Book on Building,—a sentence which causes the criminal to fall fainting into the arms of his pupil.

The play was replete with audacious puns and comic references to the recent sayings and doings of the profession, and several pretty songs were introduced, the most effective being perhaps the final duet by Messrs. Booth and Gotch.

At the conclusion, the actors were twice called back, but repeated cries for "author" met with no response.

During the evening Mr. Stuart's Orchestral Society performed a selection of good music, and at about eleven o'clock dismissed the company with the national anthem.

The entertainment was a decided success, and the Association is very much indebted to the gentlemen who took so much trouble to provide it; but we think that some of the older members felt themselves a little aggrieved that there was so small an opportunity for friendly chat, and that the absence of so many familiar faces may have been partly due to the growing tendency of the annual *soirée* to become merely an entertainment. A. A.

THE DISTRIBUTION OF ELECTRICAL
ENERGY BY SECONDARY GENERATORS.
SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held on Monday evening, April 13th, at the Town Hall, Caxton-street, Westminster, Mr. Charles Gandon, President, in the chair, a paper was read by Mr. J. Dixon Gibbs on this subject.

The author laid down the following principles:—A complete system of electrical distribution necessitates the supply to individual householders of electrical energy to be applied at will to the production of light by means of any type of lamp, whether arc or incandescent, or to the production of mechanical power by means of production of mechanical power by means of motors, or to the production of currents suitable to electro-chemical purposes. Every lamp or other receiving apparatus must act independently of the others, and without affecting them. The regulation must be automatic, instantaneous in its action, and require no attention; and, further, must be of such a nature that the generating dynamo machine shall produce at each moment the exact amount of electrical energy necessary to supply all the apparatus in action. Nothing that has yet

Becker's Cooking Apparatus.

BECKER'S PATENT COOKING APPARATUS.

THIS apparatus, of which a longitudinal and transverse section are here given, has been in use for some time in Germany for cooking on a large scale in civil and military establishments, and it has been in use for some little time on trial in the kitchens of the St. Pancras work-house.

The following is the explanatory reference to the portions figured in the section:—

- (a) Funnel of overflow connected with condensing pipe leading to cistern, and serving to regulate the water bath.
- (b) Steam pipes provided with minute holes bringing steam to each compartment.
- (c) Steam valve and stop-cock affixed to the steam pipe of each compartment.
- (d) Steam distributor, whence the steam coming from the boiler is distributed through the valves *c c c* into the pipes *b b b*.
- (e) Cooking vessels or pans, fixed to the hearth-plate *i*, and surrounded by water.
- (f) Taps fixed to the pans *e e e*.
- (g) Hearthplate, in which the several cooking pans *e e e* are fixed, and which is covered with a layer of water of $\frac{3}{4}$ centimètres (1 in.).
- (h) Iron knee with valve and socket tap to let off water from hearthplate *i*.
- (i) Double walled covers to each compartment filled with insulating material.
- (j) Copper rim fixed to cover *l*, which, when the cover is down, dips into the water on the hearthplate *i*, hermetically closes the vessels and protects them from outer air.
- (k) Small movable cooking pans.
- (l) Taps to let off the baths.
- (m) Pillars with counterweights, chains and rollers, to balance cover *l*.

The apparatus fixed at St. Pancras is capable of cooking for about 500 persons, at an estimated expenditure of about 1½ cwt. of coal per day. The head cook of the workhouse kitchen reports very much in favour of the apparatus. It is, from what we saw of it, exceedingly compact and handy to work. All steam is kept out of the actual cooking vessels by their edges being trapped in a trough of water, as shown. The heat is well shut in by the double wall and cover of the whole; how little waste of heat there is is shown by the fact that during cooking, with the water at a temperature of 85°, the outer face of the lid is quite cool.

The apparatus can be left over-night at 85° (the usual temperature used), and will be found in the morning, without any attendance, to have sunk no lower than 75°: so we are informed, but of this we cannot speak from observation. The cook who has been in charge of it is of opinion that there is much less waste of nutriment in using this apparatus than with the ordinary copper; he puts the difference of loss at 7 per cent. as against 20 per cent. with the copper. The inventor, Mr. Carl Becker, is anxious to have the apparatus introduced to the notice of architects and managers of public institutions, barracks, &c., in this country. As far as our inspection of this one specimen goes, and the particulars we learned as to its operation, we should recommend it as well worth attention, where it is desired to have cooking done on economical terms, and with clean and compact working, for large numbers of people.

CLERKS OF WORKS' ASSOCIATION OF GREAT BRITAIN.

THE second annual dinner of this Association took place on Monday evening last at the St. James's Hall Restaurant, Mr. Geymour Cuthbert, A.R.I.B.A., in the chair, supported by a large number of the members and friends of the Association.

In proposing the toast of the evening, "Prosperity to the Clerks of Works' Association of Great Britain," the Chairman referred to the great services which intelligent and competent clerks of works were able to render to architects in these days of hurry and hustle, when architects were called upon to provide buildings for varied and often novel purposes. An architect who had a competent and reliable clerk of works could safely delegate to him a great deal of the general supervision of the execution of his buildings. It was because the Association had for its primary object the bringing together of all competent clerks of works with a view to their mutual benefit, that it was deserving of the warm support of the architectural profession. The Association had now been established three years, and from what he could see of it, it had a vigorous and useful career before it.

Mr. Dashwood, the Secretary, responded, stating, in the course of a humorous speech, that the Association now numbered nearly a hundred members, and had established a small monthly *Journal* as a means of communication between the committee, the members, and architects.

The other toasts included "The Architects and Surveyors," proposed by Mr. Wilkinson, and responded to by Mr. C. Hareton; and "The Hon. Treasurer" (Mr. John Oldrid Scott), proposed by Mr. Hocking, who referred to the great services which Mr. Scott had rendered, and continued to render, to the Association.

HARBOURS AND DOCKS.

SIR,—In your valuable article on my book on "Harbours and Docks," which appeared in your issue of the 4th inst. (p. 471), you express a desire for a clear explanation of the statistical diagram showing the tonnage of the vessels entering eighteen of the principal British ports each year, from 1873 to 1883, which appears on p. 628 of the book. Your reviewer states that the figures are not in accordance with those given in the "Statistical Abstract" for 1883, owing, apparently, to its omitting the important item of coasting traffic. My diagram was based on the Navigation and Shipping tables issued annually by the Board of Trade, and purposely includes coasting vessels as well as foreign trade. These official tables are clearly the proper source whence to derive such statistics. Moreover, in estimating the trade of a port, it would manifestly be most unfair and inexpedient to leave out of account the coasting or home trade, as the capabilities and prosperity of a port must be measured by its whole trade, and not merely by its foreign and colonial trade, which in some ports is of comparatively minor importance. Taking, for instance, the Tyne ports, which send so much of their coal to the British ports, the tonnage of the vessels entering in 1883, according to

been done in the way of lighting streets or isolated establishments by means of machinery on or near the premises can claim to amount to a distribution of electricity, which to be practical must be effected from distant central stations, and with the same facility as gas or water.

It is generally admitted that the limit of large conductors being soon reached, the future lies in the employment for distributive purposes of conductors of small diameter: this necessitates the employment of currents of small quantity and high electro-motive force, which, not being generally suitable for direct use, require to be transformed on the spot where the energy is to be utilised into currents of small electro-motive force and varying quantity, suitable in fact for any purpose. The Caillard-Gibbs Secondary Generators are such transformers. In the type now in use the inducing and induced circuits are composed of copper discs superposed, and furnished with ear pieces for the purpose of connecting them together. The simplicity of this method of construction is obvious; the weight and size of the apparatus are remarkably small in relation to the work it is capable of performing. The measurements made by Dr. Hopkinson, and by a Committee of the International Jury of the Electrical Exhibition of Turin, confirmed by practical experience, amply prove their return in effective work to be ninety per cent.

The currents obtained by means of induction are necessarily always alternating, and are not on that account adapted to many purposes, such as the driving of various kinds of motors and electro-chemical purposes: the inventors have sought and found a way of overcoming that difficulty by straightening out or redressing an alternating current. This is accomplished by a simple apparatus which has the property of taking, under the influence of a very small current, a speed which is synchronous with the changes of direction of the current which feeds it.

The employment of alternating currents of high electro-motive force, on conductors metallically closed, with the terminals of the dynamo machine, has been admitted by high authorities to be practically free from danger to the public.

An important installation is being prepared in Bond-street by Sir Coutts Lindsay & Co., Limited, under the Caillard and Gibbs system, of the merits of which the public will shortly have an opportunity of judging.

St. Clement's (?) Well.—We understand that an old well answering fairly to Stow's description of the position of St. Clement's Well, was come upon the other day in the at present waste ground adjoining the Law Courts, between Clement's Inn and the Courts. According to our informant, the well was bricked round and contained water about 30 ft. below the ground level. It was filled in, and nothing done to mark the spot, which seems rather stupid.

away any water that enters them. The bar, in one piece of metal, is open at the top, and the edges are turned over the glass to keep it in place. The glass is retained by the elasticity of the bar, which is sprung together to admit it. It is further secured either by a spring cap or by T-headed bolts, which hold on an outer cap and press against the under sides and thereby spread out the bar. When double glazing is required the bar is modified, so that the flange and trough are at a lower level. Sheets of glass are then carried in the two angles formed by the bars and pieces of metal.

APPLICATIONS FOR LETTERS PATENT.

MEETINGS.

SATURDAY, APRIL 18.

London Association of Foremen Engineers and Draughtsmen—Anniversary Dinner at Cannon-street Hotel 6 p.m.
Edinburgh Architectural Association.—Visit to Forth Bridge Works and Kossyth Castle.
St. Paul's Ecological Society.—Visits to St. Giles's Church, Cripple-gate (3.30 p.m.), and St. Sepulchre's, Snow-hill (4.30 p.m.), under the guidance of Mr. G. H. Birch.

MONDAY, APRIL 20.

Royal Institute of British Architects.—Tenth Ordinary Meeting. 8 p.m.
Surveyors' Institution.—Mr. A. J. Burrows "On Romney Marsh, Past and Present: a sketch of the Reclamation of this and adjoining Marshes." 8 p.m.
University College.—Mr. Barclay V. Head on "Greek Numismatics." 1. 4 p.m.
Society of Arts (Lecture Lectures).—Captain Abney, F.R.S., on "Photography and the Spectroscope." 1. 8 p.m.
Inventors' Institute.—9 p.m.
Leeds and Yorkshire Architectural Society.—Members' Soiree.
Edinburgh Architectural Association.—Mr. James Clark on "Ornament." 8.30 p.m.

TUESDAY, APRIL 21.

Statistical Society.—Mr. E. W. Brabrook, F.S.A., on "The Relation of the State to Thrift: Ten Years' Statistics of Friendly Societies and Similar Institutions." 7.45 p.m.
Birmingham Architectural Association.—Mr. A. Reading on "English and Continental Renaissance Architecture." 7.30 p.m.

WEDNESDAY, APRIL 22.

Artists' Benevolent Fund.—Seventy-sixth Anniversary Dinner, Freemasons' Tavern. 7 p.m.
Civil and Mechanical Engineers' Society.—Mr. T. M. Rymor Jones "On Rendering Wood for Building Purposes Non-Inflammable." 7.30 p.m.
Society of Arts.—Mr. Henry Cunyngnane on "Technical Education, with reference to the Apprenticeship System." 8 p.m.

THURSDAY, APRIL 23.

Parker Museum of Hygiene.—Sir Spencer Wells on "Cremona." 8 p.m.
Society of Antiquaries.—Anniversary. 2 p.m.
Society of Telegraph-Engineers and Electricians.—8 p.m.
York Architectural Association.—Mr. B. Priestley Shires on "Theatre Planning and Construction." 7.30 p.m.

FRIDAY, APRIL 24.

Architectural Association.—Professor T. Roger Smith on "A Prison for Architecture." 7.30 p.m.
Metropolitan Board of Works.—Election of a District Surveyor. 12 noon.

SATURDAY, APRIL 25.

Architectural Association.—Visit to the Church of St. Bartholomew-the-Great, West Smithfield. 3 p.m.
Association of Municipal and Sanitary Engineers.—Lancashire and Cheshire District Meeting at Burnley. 11.30 a.m.

The Manchester Ship Canal.—On Wednesday afternoon the Select Committee of the House of Lords appointed to inquire into the merits of the Manchester Ship Canal Bill gave their decision on the engineering portion of the scheme so far as the estuary of the Mersey is concerned. The Chairman stated that the committee were satisfied with the engineering portion of the scheme, and had decided to allow the Bill to proceed. The Committee will now commence an inquiry into the commercial aspect of the scheme.

The Student's Column.

DESCRIPTIVE GEOMETRY.—XI.

Produce a line, A, forming with the elevation and the plan the angles α and β .

WE assume that the line A passes through the point s in the elevation plane and require only to find its horizontal trace or foot, m. If we rotate A round the axis S' S, we know, by its inclination α , its position A' when contained in the elevation plane, and that in the rotation the point m describes a circle round S'. If, on the other hand, we rotate the line A round a horizontal axis of which the point s is the elevation, until the line A be parallel to the plan, we know that A¹¹ will be horizontal and A¹¹ will form the angle β with L T; besides which S¹¹ m¹¹ being the real length of the line sm, will equal sm'. In this second rotation m¹¹ describes a circle round the point s, and m¹¹ a parallel to L T; we deduce therefrom the plan A' and the elevation A" required. (See Fig. 55.)

Fig. 55.

Let A be a line of the elevation plane, B a line of the plan; from the point O where these lines meet we are required to draw a line, F, forming the angle α with A, the angle β with B.

If we make the line F rotate round the line A as axis, it will describe a cone, defined by the angle α which F forms with A. If, on the other hand, F¹¹ rotates round B as axis, it describes another cone, defined by the angle β formed by F¹¹ and B. The real position of F is therefore at the intersection of these two cones, as shown in fig. 56.

We can readily draw F¹ the intersection of the first cone with the elevation, thanks to angle α , and we can draw F¹¹ intersection of the second cone with the plan by means of angle β . If we take on F¹ and on F¹¹ the points m' and m¹¹ at equal distance from o, they will meet in m when rotating round their respective axes A and B. The point m' will move in a plane of which P¹ is the vertical trace; and the point m¹¹ in a plane of which Q¹¹ is the horizontal trace. If we take the plane Q as auxiliary elevation plane, we shall be able to draw on it the circle described by m¹¹ and the trace P¹¹ of the plane P; the intersection m¹¹ of these two lines is the elevation of a point m of the line F; we can find therefrom the original projections m' and m¹¹; then join them to the point O, which will give us F¹ and F¹¹ required. In fig. 56 we have shown the whole operation by a perspective view; in fig. 57 we give the operation itself as carried out in plan and elevation.

Find the distance from a point o to a line A. We give two ways of solving this question. Firstly.—We turn down the plane which contains the line A and the point o round o

horizontal line of that plane. When the plane is become horizontal, we can then easily draw a line, ox^{11} , perpendicular to the line A^{11} , and this is the distance required. We have not yet turned down a plane round any horizontal line thereof, but if we consider that we have lifted up the plane of the plan so that our ground line $L^1 T^1$ coincides with $o^1 c^1$, the elevation of $o^1 c^1$, the problem is brought back to one we have already dealt with, viz.:—turn

down a plane round its horizontal trace. In our diagram b is a point of the line A ; after the rotation of the plane it comes in b^{11} on a prolongation of $m^1 b^1$, perpendicular to $o^1 c^1$. The circle the point b describes in space has been turned down round the trace, $m^1 b^1$, of its plane, and b^{11} is the position of b on that plane, and $m^1 b^1$ is the radius of the circle described. (See fig. 58.)

Secondly.—If, as in sketch, fig. 59, we take a

vertical plane through the line A and from the point o take op perpendicular to that plane and px from p perpendicular to the line A , the distance ox from o to A is the hypotenuse of the right-angle triangle of which op and px are the sides. We carry out this operation in fig. 60 by making an auxiliary elevation on the vertical plane which contains the line A itself. We then take the distance $o^1 p^1$ from o^{11} to m , and mp^{11} is the distance required.

Miscellaneous.

Ecclesiastical Art Exhibition.—At the Church Congress this year, which is to be held in the diocese of Winchester, at Portsmouth (on Southsea Common), there will be the usual exhibition of ecclesiastical art, and from the historic wealth of the diocese it is expected that the lean collection will be more than usually interesting. The exhibition will be held in the assembly-rooms of Cawte's Esplanade Hotel, next to Congress Hall, and close to the pier. The promoters of the exhibition hope that the clergy of the diocese and others possessing interesting objects, suitable for the lean collection, will generously assist in making the exhibit of ecclesiastical art a representation capable of sustaining the high repute the diocese enjoys in the estimation of antiquaries and archaeologists. The loans may embrace goldsmiths' and silversmiths' work, ancient and modern, and ecclesiastical metal work in general, embroidery, needlework, tapestry, wood and ivory carving, ecclesiastical furniture, paintings, drawings, architectural designs for churches and schools, photographs, books, and MSS., and other objects of archaeological interest belonging to the churches of the diocese. The collection of disused communion plate is always a special feature of the exhibition. Contributors to the lean collection are requested to send particulars of any proposed exhibit to the manager of the exhibition, Mr. John Hart, 33, Southampton-street, Strand, W.C.

Lifting Buildings in Northwich.—Those unacquainted with the consequences of the rapid subsidence in the salt districts, now going on to such a lamentable extent, can scarcely realise the amount of its cost to owners of property. One of these consequences is that buildings have either to be pulled down and rebuilt, or they have to be lifted, if they are to remain tenable. Probably the case of the Wheatsheaf Hotel and adjoining premises, in Castle-street, Northwich, which has been lifted within the last three weeks, is the most noteworthy one, as having been raised the most—some 9 ft., at one simultaneous effort. This building, which, a month ago, was pronounced a dangerous structure, is now level, but how long it may remain so, with the rapid subsidence going on, remains to be seen. The next highest lift given at one time was probably that of the Winsford Town-hall, with five shops and a corn warehouse, all in one block, which was lifted, some time ago, 8 ft. 6 in., and that, we believe, without a dozen squares of glass being broken. Both these were carried out for the owners by Mr. R. Beckett, contractor, of Hartford.—*Northwich Guardian.*

The Harris Orphanage, Preston.—A Manchester paper says that the plans for the proposed Harris Orphanage have been submitted to the Harris trustees and approved by them, and they now only await the sanction of the Court of Chancery before the commencement of building operations. For the erection of this institution the trustees have granted 100,000*l.*, of which 30,000*l.* will be devoted to the building of the fabric, and the remainder for an endowment fund, &c. It is to accommodate 200 children who have lost both parents, and are not under three nor above thirteen years of age, providing the parents had lived within a radius of eight miles from the Preston Town-hall. The site of the orphanage is twelve acres of land at Fulwood, and it has been decided to adopt the cottage home system.

Railway Improvements.—An automatic apparatus has just been patented by Mr. W. R. Holyoake, and is about to be adopted for the purpose of exhibiting in each compartment of a railway carriage the name of the next station some time before arriving thereat. A bell is connected to each apparatus to call the attention of the passengers to the changing of the tablet. The difficulty hitherto found with all similar contrivances has been the want of an automatic action that would insure the changing of the tablets without the attention of the driver, guard, or porter, because, when the alteration depended on any of them, it was often forgotten; this invention dispenses with their assistance, and its mechanism is simple and inexpensive.

Artists' Benevolent Fund.—The seventy-sixth anniversary dinner of this Corporation is fixed for Wednesday next, at the Freemasons' Tavern, Viscount Hardinge in the chair.

Liverpool City Council.—At a meeting of this council, held on Wednesday last, it was (after some discussion) resolved, on the recommendation of the Insanitary Property and Artisans' Dwellings Committee, "That the sum of 100,000*l.* be borrowed under the Provisional Order of the 31st of May, 1884, confirmed by the Local Government Board's Provisional Orders Confirmation Act, 1884, and that application be made for the requisite sanction of the Local Government Board," and also "That the money so borrowed shall, with the express permission of the Council, be applied only for the purposes of the 7th and 8th presentments." Mr. A. B. Forwood, in moving the resolution, said the council, in the past fifteen or twenty years, had received power to borrow two sums of money, each of 100,000*l.* The first 100,000*l.* was devoted to the improvement of courts and dwellings—the pulling down of houses and improving the character of the courts. The second 100,000*l.* was being expended under the new powers obtained by the corporation in 1884. At the commencement of this year, something like 60,000*l.* of that 100,000*l.* had not been paid away, but there were other presentments that had been made, embracing a large number of houses. The committee were confining their attention to certain districts of the town which they desired to put into sanitary condition before they went further. They were dealing with Henderson-street, Worthington-street, Limekiln-lane, Carlton-street, Chisenhale-street, and Back Portland-street. To complete the work in these districts would require 10,000*l.*, perhaps 15,000*l.*, in excess of the borrowing powers at present possessed, but they required the 100,000*l.* because they had to provide dwellings for the people who were unhoused. All they had provided in the shape of dwellings for the poor was the Nash-grove dwellings.—At the same meeting it was resolved that the salary of Mr. T. Sheldermine, jun., Land Steward and Surveyor, be increased from 1,000*l.* to 1,100*l.* per annum, and that the salary of Mr. Clement Percunnie, City Engineer and Building Surveyor, be increased from 900*l.* to 1,050*l.* per annum, to be increased in twelve months to 1,200*l.* per annum.

"Quarrying and the Preparation of Setts."—A meeting of the Liverpool Engineering Society was held on Wednesday evening last at the Royal Institution, Colquhoun-street, Mr. W. E. Mills, President, in the chair. A paper, by Mr. C. H. Darbishire, A.M.I.C.E., on "Quarrying and the Preparation of Setts," was read by the author. The paper commenced by pointing out that the term "quarry" meant, primarily, the place where the stone was hewn and squared, whereas now it means the place where it is won from the rock, and not necessarily where it is squared. Attention was called to the fact that the dressing of stone, as far as is known at present, was probably one of the first accomplishments a man possessed when the race became distinctly human, and that in every age quarrying stone, and working it up to serve a useful, or even merely an ornamental purpose, has always been one of the leading industries. At the present day, when traffic has become concentrated into comparatively narrow streets of cities and towns, to the extent it has done, exceeding frequently 200,000 tons per yard width of street per annum, the preparation of stone for paving to meet the exigencies of the case is of the greatest importance. The quarry described is situated at Penmaennawr. The system adopted was fully dealt with, the various duties of the different sets of men being carefully gone into. Examples of the tools in use were exhibited, and they appeared simple enough in themselves, but it was explained that the art lay in using them skilfully. The paper concluded with a brief comparison of the system practically in force throughout North Wales with that under which quarrying is carried on in the large quarries of England.

Royal Academy: Architecture School. We understand that the class for architectural modelling will terminate for the session after to-day; and that Mr. Stanuiss will give a series of lessons on the Design of Architectural Ornament, on Monday evenings, from six to eight, as follows:—April 20, "Classification of Bands, Borders, and Strings"; April 27 and May 4, "Bands and Strings, and their Corners"; May 11, 18, and June 1, "Borders and their Angles"; June 8 and 15, "Friezes, and their Corners."

The Chancery-lane Safe Deposit Company's establishment, in New Stone-building, Chancery-lane, was to have been formally opened by Mr. Alderman Fowler, M.P. (now Lord Mayor), on Thursday evening last, but owing to the death of the late Lord Mayor the inaugural banquet has been postponed for a short time. Nevertheless, we believe it is the intention of the proprietor to open the place for business next week. The premises are so devised as to provide elaborate precautions for the safe custody of deeds and valuables of all kinds. The safes and strong-rooms have been constructed by Messrs. Milnor & Co. The vestibule and staircase are paved and lined with marble work by Messrs. Salviati, Burke, & Co. We defer a more detailed description of the establishment, which has been devised by and carried out under the superintendence of the proprietor, Mr. Thomas Clarke. We believe it is proposed to transfer it to the hands of a company now in course of formation.

Enlargement of Ilkley Hospital.—In July last the Committee of the Ilkley Convalescent Hospital decided that the accommodation should be extended, so that the number of patients might be raised from 70 to 100. Plans prepared by Mr. C. H. Hargreaves, architect, Bradford, were approved, and a portion of the work is now being executed under his supervision. As the hospital was originally constructed, there was no dining-room, the women's day-room having been used for that purpose by the whole of the inmates. By means of the extension a separate dining-room will be provided, there will be larger and better kitchen accommodation, and additional dormitories. The old building is of a plain domestic Gothic character, and the new buildings correspond with it. The enlargement of the main building is effected by extending the east and west wings. The cost of the additional buildings will be about 2,100*l.*

York Architectural Association.—On the 9th inst. Mr. George W. Milburn delivered a lecture on "The Decorated Period of Gothic Ornament" before the members of the above Society in the saloon of the Victoria Hall, Goodramgate. The President, Mr. A. Pollard, occupied the chair. The lecturer described at length and with numerous sketches upon the blackboard how the thorn, vine, ivy, oak, and maple were introduced in the formation of capitals, crockets, diapers, spandrels, &c. At the conclusion, the President moved a hearty vote of thanks to the lecturer, which was seconded by Mr. G. J. Monson, and carried. Mr. T. S. Worthington, of Blake-street, was elected an honorary member of the Association. The subject of the churches scheduled to be disused or demolished was brought forward, but after a short discussion the question, for want of time, was postponed for future consideration.

An Old Pulpit in a New Place.—A very fine oak pulpit, carved in the semi-classic style of the fifteenth century, has just been placed in the nave of Winchester Cathedral on a base of oak, a work which Mr. J. Fielder has carried out. The history and object of the pulpit is told in the following inscription on a brass plate:—"This pulpit, formerly in New College Chapel, Oxford, was given by the Warden and Fellows to Charles Mayo, D.D., formerly one of the Fellows of that Society, and it is completed and presented to Winchester Cathedral by members of his family in loving memory of Jane Mayo, his sister, who fell asleep October 8, 1884." There are other memorials of the Mayo family in the stained-glass windows in the north aisle.

Temple Bar.—The *City Press* says:—"The stones of old Temple Bar, which have been carefully stowed away by Messrs. Mowlem & Birt, will shortly be brought to light, and Temple Bar will be again set up in King's Bench-walk. Thus it will be almost within a stone's throw from its old site." It will be remembered that this site for the re-erection of the old gateway was suggested in the *Builder* a fortnight ago.

The Inventions Exhibition.—Messrs. C. Isler & Co., of Southwark-street, have secured a contract for supplying fifteen of their Improved Patent Registering Turnstiles to the International Inventions Exhibition.

Builders' Clerks' Benevolent Institution.—The Carpenters' and Masons' Companies have each voted the sum of ten guineas in aid of the funds of this charity.

The Disposal of Refuse Matter.—Under the presidency of Sir Robert Rawlinson, two papers dealing with the disposal of sewage and town refuse were read on Wednesday evening last at the Society of Arts. The first, by Dr. Thomas Hawkesley, related to the abolition of water carriage in the removal of offete organic matter from towns. The second paper, read by Dr. B. W. Richardson, had reference to the removal of refuse independently of sewage. This he comprised under the heads of house refuse, trade refuse, market refuse, street sweepings, condemned food, slaughter-house offal, and stable refuse; and quoting the authority of Colonel Hayward, Engineer to the City of London, he said that, refuse in the City under the first four heads alone amounted to about 61,230 cartloads per annum. The more rapidly the refuse was removed the better for the health of the community, and it appeared that in towns where there was quick removal there was less disease—a fact which showed that these agencies had an effect, indirect at all events, upon health. Everything connected with this removal, except perhaps in the City, was exceedingly bad in London and most large towns, but this should not be the case, seeing that a profit arose from it. The means adopted for removing horse and trade refuse in the City might be taken as an example for other towns in England; but in the case of seaside places he recommended a system of floating barges such as those in use on the Tyne. He condemned the common system of contracts, and insisted that the parish authorities should themselves undertake the removal of refuse.—The chairman said he felt himself debarred from taking part in the discussion, but, though he was silent, he did not wish it to be understood that he agreed with all the arguments adduced. This, however, he might say, that he considered scavenging as the root of sanitary progress.—A discussion ensued, in which Dr. Alfred Carpenter and other gentlemen took part.

Line of Frontage Case.—In the late frontage line case of the Vestry of St. Marylebone v. Rose, tried before the Divisional Court, and mentioned in our issue of last week [p. 508], an application was made on the 14th inst. to Mr. De Rutzen at the Marylebone Police-court for an order of demolition, which was granted; as also one in the case of an adjoining owner, both of the buildings being used as florists' shops.

The Westminster Hall Question.—Thursday's Standard says:—"The Select Committee on the Restoration of Westminster Hall will meet to-morrow to consider their report. Two draft reports have been prepared, one by the chairman, which substantially approves of Mr. Pearson's plans, and the other by Mr. Dick Peddie, which proposes that the buttresses should be repaired, and that the general question of the restoration of the cloisters should be deferred for future consideration."

The Safety of Cast-Iron Columns.—The safety of cast-iron columns in case of fire, as compared with columns of wrought iron, or pillars of stone, brick, or cement concrete, has been the subject of investigation by Professor Bauschinger, of Munich. It will be remembered that the Berlin police authorities, in consequence of unfavorable experiences with cast-iron columns in recent fires at Berlin, issued regulations forbidding the use of such supports in the construction of dwelling-houses, hinting the employment of columns of wrought iron and clinkers in cement mortar. Cast-iron columns may only be employed if they are surrounded with immovable mantles of wrought iron separated from them by an air space. Professor Bauschinger heated cast and wrought-iron columns weighted with burdens usually imposed in structures first to 300°, next to 600°, and finally to red-heat, and suddenly cooling them afterwards by a jet of cold water, as applied in extinguishing fires. The experiments demonstrated that cast-iron columns, although they were heated by red-heat, and showed transverse cracks when water was applied, supported the weight imposed upon them, whilst wrought-iron columns were bent before arriving at a state of red-heat, and were so much distorted by the application of water that a straightening was out of the question. In reality, they would have collapsed under the weight they had to support. Professor Bauschinger concludes from his experiments that cast-iron columns, notwithstanding cracks and heeds, would continue to support the weights imposed upon them, whilst wrought-iron columns would not. In examining pillars of stone, brick, and cement concrete, the latter proved to be the best. Concrete pillars withstood the action of fire for one to three hours; those of ordinary bricks, as well as those of clinkers set in cement mortar, displayed great resistance; whilst natural stone, granite, limestone, and sandstone,—were not fireproof.

TENDERS.

For new warehouses, corner of St. Mary Axe and Bevis Marks. Mr. E. Collins, architect, 61, Old Broad-street.

Quantities supplied by Messrs. Batstone Bros.:	
Lawrence & Sons	24,985 0 0
Pattman & Fobbingham	4,573 0 0
Shurmur	4,590 0 0
Brass & Son	4,250 0 0
Colls & Sons	4,216 0 0
Shepherd	4,200 0 0
Downs	4,184 0 0
Kirk & Randall	4,022 0 0
Nightingale	3,913 0 0
Morter	3,839 0 0
W. & F. Croaker	3,827 0 0

For part rebuilding, underpinning, and strengthening the tower of St. Leonard's Church, Hythe-bill, Colchester. Churchwardens: Messrs. Ebberts & Cobb, architects, London and Colchester:—

Chambers	£340 0 0
Errett & Son	740 0 0
Dobson	498 0 0
Aubrose	478 6 0

For a boat-house, Sea Front, Dover, for the Dover Rowing Club. Messrs. Cresswell & Freeman, architects, Dover:—

F. Clark, Dover	£123	Iron Roof.
Whelch & Co.	120	£105
W. T. Adcock	115	110

For alterations to the Angel and Crown, 235, Upper-street, Islington, for Messrs. Geelach & Co., Mr. M. A. Leworth, architect, Bishopsgate-street With.

G. Colls	£860 0 0
Shurmur	693 0 0
Larter & Son	674 0 0
Toms	646 0 0
Marr	645 0 0
Jackson & Todd	623 10 0

Accepted for new Baptist Chapel and school at Littleborough. Mr. F. H. Shuttleworth, architect, Littleborough:—

Masons and Joiners.—E. Taylor & Co., Littleborough	£1,471 0 0
Plastering.—T. Black, Todmorden	139 0 0
Plumber.—R. Hudson, Littleborough	104 0 0
Slatings.—S. Barnes & Sons, Todmorden	70 0 0
Painting.—A. Stanfield, Todmorden	60 0 0

Accepted for two houses at Littleborough, for Mr. Jno. Kershaw. Mr. F. H. Shuttleworth, architect:—

Mason.—B. Hartley, Littleborough	£328 0 0
Joiners.—E. Taylor & Co., Littleborough	110 10 0
Plumber.—J. Mills, Littleborough	32 0 0
Plasterer.—T. Black, Todmorden	28 10 0
Slaters.—S. Barnes & Sons, Todmorden	20 5 0
Painter.—C. Whitworth, Rochdale	11 2 5

Accepted for two houses at Littleborough, for Mr. A. Spencer. Mr. F. H. Shuttleworth, architect:—

Mason.—B. Hartley, Littleborough	£400 0 0
Joiner.—N. Rigg, Littleborough	100 0 0
Plasterer.—T. Black, Todmorden	29 0 0
Slaters.—J. Mills, Littleborough	28 10 0
Painter.—C. Whitworth, Rochdale	10 8 0

For the extension of sewerage through the upper portion of Freemantle, for the Shirley and Freemantle Local Board. Mr. Herbert L. Taylor, surveyor:—

Rowe	£450 0 0
Batten	425 0 0
Richardson	420 0 0
Fenny	393 0 0
Faulkner	385 0 0
Butt	380 0 0
Sibsey	348 0 0
Slings	329 0 0
Mears	317 0 0
Crook & Smith, Southampton	317 0 0

[All of Southampton and Shirley.]

* Accepted.

For building additions to Luton Foundation School, near Hereford. Mr. F. R. Kempton, architect, Hereford.

Quantities by Mr. F. Downing, 7A, Whitehall-yard:—	
Page & Son	£7,200 0 0
B. Wale	7,168 0 0
W. Cullis	7,100 0 0
Horsman & Co.	6,897 0 0
C. Edwards	6,859 0 0
T. Collins	6,459 0 0
R. Yates	6,361 0 0
Treasure & Son	6,198 0 0
C. Claridge	6,178 0 0
Jones & Son	5,687 0 0

For works required to be done in making alterations and additions to St. Paul's Church, Wandsworth, for the Building Committee. Mr. Henry E. Coe, architect.

Quantities supplied by Mr. H. P. Foster:—	
Lucas & Son	£1,098 0 0
H. Burman & Sons	1,098 0 0
T. Laphors & Co.	998 0 0
E. Parsons	911 0 0
T. Gregory, Clapham Junction	895 0 0
Stimpson & Co.	878 0 0
Turtle & Appling	878 0 0

* Accepted (subject to certain reductions) at 605/.

For additional wing and chapel at Princess Mary's Village Homes, Addlestone. Mr. T. Heggate Vernon, architect. Quantities by Mr. Cecil O. Saunders:

G. Candier, Streatham	£3,590 0 0
C. T. Adkins	3,480 0 0

Jas. Stevens (accepted).....	419 0 0

[All of Leicester.]

For the erection of a residence at Hampton Wick. Messrs. Bray, Webb, & Co., architects, 14, Warwick-court, High Holborn:—

Gibbs & Eves (Limited).....	£1,953 0 0
Harris.....	1,696 0 0
Thos. Wontner Smith & Son.....	1,645 0 0

For alterations, &c., at 55, Harley-street, Cavendish-square. Mr. Ernest Turner, architect, 248, Regent-street:—

Hebblethwaite.....	£745 0 0
Curtis.....	519 0 0
Alden & Flater.....	498 0 0
J. T. Howe.....	497 0 0
Thos. Wontner Smith & Son.....	498 0 0
Patman & Fotheringham.....	430 0 0

For the erection of a hospital for infectious diseases, for the Wrexham Rural Sanitary Authority. Mr. Alfred C. Bangh, architect, engineer to the Board. Quantities supplied:—

Johnson Bros., Hereford.....	£7,473 4 1
David Davies, Cardiff.....	6,460 0 0
Chaloner, Rossett.....	6,243 0 0
Griff. Griffiths, Colcieth.....	5,831 0 0
Hughes & Owen, Wrexham.....	5,841 0 0
W. E. Samuel, Wrexham.....	6,655 0 0
J. Hamilton.....	5,380 0 0
Davies Bros., Wrexham (accepted).....	5,239 10 6

For decoration and repairs at Stoke Newington Wesleyan Chapel. Mr. F. Boreham, architect:—

Bradford.....	£369 10 0
Richards.....	333 15 0
Stapleton.....	351 12 6
L. H. & R. Roberts.....	325 0 0
Chessum.....	311 0 0

For rebuilding 33 and 34, Great Portland-street, for Mr. T. Ebley. Quantities by Messrs. Barber, Boxhall, & Barber:—

Langridge.....	£5,400 0 0
Greenwood.....	5,368 0 0
Hign & Hill.....	5,340 0 0
Hall, Boddall, & Co.....	5,184 0 0
Wm. Oldrey.....	4,957 0 0
Wm. Oldrey.....	4,877 0 0

For additions and alterations at Raven Villa, Blytheshed, Stamford. Mr. J. Goldsack, architect:—

General Works.....	Bath extra.....
Carter & Son, New Broad-street.....	£239.....
G. Ruffell, Forest Hill.....	178.....

Accepted for five new houses, butcher's shop, stabling, sheds, and additional premises, at Stocksbridge, for the Stocksbridge Co-operative Society. Mr. Robert Dixon, architect, Barnsley. Quantities by the architect:—

Excavator's, Mason's, Bricklayer's, and Slater's Work.
Kenworthy & Brearley, Stocksbridge.
Carpenter and Joiner's Work.
James Thompson, Stocksbridge.
Total of above trades..... £1,427 17 8

Accepted for alterations and additions at the Prince Regent, North street, Walworth. Mr. Thos. Lock, architect and surveyor:—

Galland, Hoare, & Co., Walworth.....	2,685 15 0
--------------------------------------	------------

For proposed alterations at Bright Lodge, West Dulwich, for Mr. W. F. Hammond. Mr. H. I. Newton, architect, Queen Anne's-square:—

Lamble.....	£1,253 0 0
Godden.....	1,198 0 0
H. Cook (accepted).....	1,119 0 0

For the erection of a new house, shop, and bakehouse in Spring-road, Bedford, for Mr. H. Mortimer. Mr. F. F. Mercer, architect. Quantities supplied:—

T. Loughton & Co.....	£1,039 15 0
Warton & Walker.....	863 0 0
G. Harrison.....	859 0 0
Jas. Potter.....	854 0 0
J. P. White.....	839 0 0
G. Tedd.....	829 0 0
F. H. Long.....	695 10 0

For two pairs of villas. Finchley, for Mr. J. Winkler. Mr. T. F. Shaw, architect, Harlesden:—

Cooper.....	2,607 0 0
Pryor.....	2,600 0 0
Jones.....	2,400 0 0
Greenwood.....	2,300 0 0
Penny & Co. (accepted).....	2,250 0 0

Accepted for pair of villas at Craven Park, Willesden. Mr. T. F. Shaw, architect, Harlesden:—

G. Hardy.....	£1,350 0 0

The Peterborough Cathedral Question.

THE decision of the Archbishop of Canterbury as arbitrator in the contention about the treatment of Peterborough cathedral, published at length in the *Times* of Wednesday last, is a gratifying document to those who, like ourselves, do not entirely concur in its conclusions. The Archbishop has in the main vindicated his aim to be regarded as a suitable arbitrator in the case; and in contrast with all the exag-gerations, sentimentalities, cross questions, and crooked answers which the dispute has hitherto called forth, it is refreshing to read a document so cool, considerate, and business-like, and which takes in hand the whole case with such thoroughness and impartiality, as well as with a knowledge of the bearing of architectural and archaeological considerations, certainly not very often found outside the group of specialists in the study of such subjects.

The Archbishop divides his decision into two main heads: his criticism on the constitution of the committee, and that on the architectural schemes propounded. With the common-sense of a man of business, he points out that in carrying out any great work of the kind it is in the first place necessary that it should be understood who is to have the ordering of it. The Archbishop comments, with a certain sarcastic directness of expression, on the very peculiar constitution, or want of constitution, of the committee for directing the work. "The committee," he says, "consists of fifty or more members not appointed (I understand) on any systematic scheme. The Dean and residentiary Canons are naturally *ex officio* members of it. Its decisions are by majorities of members able to attend on each occasion. The Canons claim to control every decision, and state that they have originated every proposal and formed a decision on each step (until the proposal about the tower) before it came to the committee. They have practically conceded a veto on every step to the committee, but have 'not contemplated vesting themselves of any of the rights or responsibilities relative to the cathedral fabric which are inherent in the Dean and Chapter,' and 'that the committee was formed for the purpose of obtaining funds.'" When it is added that on this basis of constitution any three of the Canons acting together, as forming the majority of the residentiary Chapter, could in any difference have the entire control

of the proceedings, and that, on the other hand, their contract with the builder engages him only to look to the subscription fund for remuneration, most clear-headed folk will agree with the Archbishop that such a constitution is "absolutely hopeless" for the successful execution of a great work.

Dr. Benson accordingly recommends, as the first step, the formation of a committee on a sound basis. The general committee, whose real function is to raise the fund for the work, should appoint an executive committee to control the work; and here the Archbishop suggests a means whereby the *ex officio* members may retain their *ex officio* character and yet be hindered from exercising undue power. He proposes that the Dean and four Canons should be *ex officio* members of the executive committee; that they should nominate four other members, and that the general committee should nominate eight; giving an executive committee of seventeen members, the Dean presiding. This committee should in its turn appoint a sub-committee of three, to be on the spot and watch the work constantly. The general committee would then meet once or twice a year to receive reports and decide on large operations.

Having made this recommendation, Dr. Benson, before proceeding with his judgment on the architectural side of the question, points out that should such a committee be formed it would be the duty of that committee to consider and decide upon the architectural treatment of the cathedral; and he argues that had such a committee been constituted at first the deadlock which has led to his being called in as arbitrator would never have occurred. He therefore proceeds to give his judgment on the architectural question, with the proviso that if the new committee, as recommended by him, be formed, his arbitration on the architectural question may be considered as superseded, and the matter left to be decided by the committee. If those concerned decline to take his advice and form themselves into a committee constituted on a rational basis, then they are to be bound by his decision as to the treatment of the cathedral, and the choice of the various schemes that have been proposed.

These various proposals Dr. Benson simplifies, omitting those which have been practically abandoned, into two. The one, which he distinguishes as A, is the original one, to replace everything that had been taken down exactly as it stood, only giving such strength to the re-construction as to allow of a possible addition to the lantern, in the way of an octagon stage or otherwise, at some future time. The other plan, B, Dr. Benson describes as "what remains through successive stages of a proposal

for a high Norman tower to be erected (or erected) from the ground upon two ancient Norman arches, and two others to be substituted for the pointed arches east and west, with an upper stage of Decorated work, corresponding to the present lantern and following its main lines, but much heightened and embellished. Into the lower arcade of the tower, immediately above the great Norman arches, were to be worked the remnants which have been found of the original arcading, and the whole was, according to this proposal, to be crowned with a high spire." And these are further and more briefly summarised thus:—

"I am, accordingly, to choose between A, viz., the replacement of the pointed arches of A.D. 1380 east and west of the crossing; above these the present Decorated lantern of that date, as it lately rode the four great roofs, with provision for a future superstructure, possibly an octagon, as anciently;—and B, substitution of Norman arches for pointed; above these a Norman story, 15 ft. to 18 ft. high, working in the relics, which probably formed an arcade before A.D. 1380; above this the Decorated lantern, necessarily remodelled to its new position, battlement, and high pinnacles."

The Archbishop gives his judgment for A, which includes the rebuilding of the two pointed arches of the crossing (Sir E. Beckett's "good-for-nothing arches"). This question of the pointed arches is really the turning-point of the whole matter, and a very difficult one to come to a definite conclusion about. Our own conclusion, in considering the matter a short time since,* was that on the whole it was not worth while to replace the two pointed arches now that they were down; that once down and rebuilt, their historical interest would be much impaired, and that their introduction at all by the fourteenth-century architects was a defacement of the artistic unity of the architectural centre of the building. Dr. Benson's reason for taking the opposite view we will give in his own words:—

"In favour of abolition [of the pointed arches] it is urged that they are less 'fine and rich' than, indeed are 'poor and mean' in comparison with the Norman. But they are allowed to be good Decorated work, so that this criticism is only to be taken as a general disparagement of the Decorated style in comparison with the Norman. Against abolition is the fact that they are the central point of the fourteenth-century remodelling of the whole church. They correspond to the west windows and inter-advanced arch before it, to the groining of the choir roof, to the pointed labels so carefully inserted over every clearstory window (as well as over the side arches of the crossing), and lastly to the lantern itself, which they supported. With all these the pointed arches form one sequence. If they are abolished on principle in favour of Norman, much else ought to be abolished throughout the church as fast as opportunities occur, and probably the lantern itself."

* See *Builder*, January 10th of this year.

Of course that is the other possible way of looking at it. If you regard the pointed arches of the crossing in relation with the other Pointed work of the church, they are in place; if you regard them in relation to the crossing, which is the way every genuine architect (as opposed to archeologist), we should say, would regard them, they are very much out of place, and are in fact, eyesores. We naturally take the latter view; but we admit the reasonableness with which the Archbishop puts his own view.

We cannot say so much in favour of the reasons given for rebuilding the lantern just as it was before the failure of the tower. Dr. Benson appears to have made a misapprehension—singular in a document otherwise displaying such clear knowledge of the facts,—in regard to the lantern. He says "it would have to be singularly altered if suspended at a greater height. It was specially designed to ride close down upon the roof. . . . The blind panelling between the windows, which was so arranged as to fit down above the gable, would be without meaning when lifted a space above it." This is surely putting the cart before the horse. The arading stage, against which the roof would naturally have abutted, was removed when the crossing was partly rebuilt, to lighten the weight on arches which had shown themselves inadequate; and the peculiar treatment of the tower was cleverly devised to make the best of disadvantageous circumstances; but it was a kind of architectural makeshift. Having now strengthened the piers so that they will carry a much greater weight, why replace a design the distinguishing feature of which was especially forced on the fourteenth-century builders by the fact of a weak substructure? There may be historical reasons for doing this, but not architectural ones, as the Archbishop seems rather to think there are.

We cannot, therefore, say that we agree with Dr. Benson's decision, and we are disposed to hope that the committee will be reconstituted as he has suggested, and that a scheme more architectural and less archaeological will be carried out. At the same time we must say that the more archeological view of the question could hardly have been more ably or more moderately stated.

To give full weight to the Archbishop's views we subjoin his final summing up in his own words:—

"B has the recommendations:—

First.—Of recovering into its place the design of one of the stages of arading, and of incorporating an existing remnant of it. This, as a mode of gaining height, is recommended by its faithfulness to the past.

Second.—And of substituting copies (with some genuine fragments) of the earlier Norman arches in places of the actual past of the last five centuries. This is recommended on the ground of preference for the style, as well as of the pursuit of superior antiquity.

But B has the following disadvantages:—That 1. As against the principle of faithfulness to the past it obliterates the mechanical effort of 1380, and the chief features of the 'Pointed' remodelling of the whole church about that time; and

2. Alters the design and adaptation of the lantern to its place.

3. That it leaves a large space between the arcade and lantern, to be either a blank or to be used to introduce a novel and most prominent addition.

(4) That it presents an assemblage of features never before in juxtaposition; partly copied and partly old, the old altered in some characteristic points (lantern) to enable them to be fitted together, and the oldest portion appearing between the newest, and that which belongs to the middle period.

The disadvantages of B seem to me rather to outweigh its advantages, and, balancing merits and demerits in the two plans (which is all that I have to do), I cannot but recommend

That the first plan A be adhered to as originally intended and provided for, viz., of replacing in solid and durable work the form of the tower and arches which we received, providing at the same time what may be necessary as preliminary as to heightening the tower, whether by octagon or otherwise.

And that the recovered fragments be fitted together (as well as they can) in some place where they may illustrate the antiquities of the church."

The argument as to the intermingling of styles of various dates in what would be essentially a modern erection deserves serious con-

sideration. But our general summary of the matter is, as before, that the tower as it recently stood was a poor concern, and that Mr. Pearson is a nineteenth-century architect capable, if he has a fair chance, of producing something better.

THE HISTORY OF FREEMASONRY.

BY WYATT PAPWORTH.

THE third volume of Mr. Gould's exhaustive History,* which has now appeared, continues an investigation into "Early British Freemasonry in England." The details of the four chapters comprise,—Masonic Tradition, Sir Christopher Wren, Papal Bulls, Travelling Bodies, Annual Assemblies, the Caballa, Mysticism, the Rosierucians, Elias Ashmole, the Masons' Company, Plot, Randle Holme, the Old Charges, the Legend of the Craft, Light and Darkness, Gothic Traditions, Degrees, and Speculative Masonry. Testimony has already been borne to the great labour and research displayed by the author of this entirely new history of Freemasonry, culled as it partly is from all sources, ancient and modern, with much warm-hearted assistance from some few friends equally zealous with himself in searching for the truth connected with a series of events which have puzzled all investigators. Among the very numerous subjects, and points connected with them, and thoroughly investigated in this volume by Mr. Gould, there are two of much interest to architects. 1. The negation of the hitherto received assertion that Sir Christopher Wren belonged to the Society of Freemasons. 2. The hitherto unknown contemporaneous existence of the Guild of Masons in London and of the Society of Freemasons; while, partly arising out of the latter, is the query,—Did the older copies of the "Old Charges" now collected belong to the former or to the latter body? Discussing the merits of Ashmole's diary, our author conceives that the Sloane copy was in 1646 in use by operative and speculative body, and adds that "we are still in doubt as to what period above 1646 a monopoly, if any, of these ancient documents by the working masons can be viewed as probable." Further on Mr. Gould admits, from the words used by Randle Holme, that "there were then [1688] subsisting unions of practical Masons, in which there was no admixture of the speculative element." Throughout this review the two bodies will be distinguished by "Guild" and "Society," which latter, in an opinion formed by myself after very many years' researches out of the "old records" of the Society (the results of which were published in 1863, and have been largely referred to by Mr. Gould with kindly acknowledgements) much resembles the Hermit Crab, which quietly ensconces itself in the empty shell it finds convenient for its residence. In a previous review of this work it was pointed out that this "History" would be equally available in a "History of Architecture," and future writers upon it, treating of this period, will no doubt avail themselves of the treasures contained in these volumes.

In commencing chapter xiii. our author writes: "It is, I think, abundantly clear that the Masonic body had its first origin in the trade unions of mediæval operatives. At the Reformation these unions, having lost their *raison d'être*, naturally dissolved, except some few scattered through the country, and these vegetated in obscurity for a period of close upon two centuries, until we find them reorganised and taking a new *point de départ* about the year 1717. But by this time the Masonic bodies appear under a new guise. While still retaining, as was natural, many forms, ceremonies, and words which they derived from their direct ancestors, the working masons, yet we find that operative masonry was, and probably long had been, in a state of

decay, and a new form, that of speculative masonry, had been substituted in its place." As this word "speculative" has been used, I shall prefer to notice Mr. Gould's elucidation of it, contained in the closing pages of the volume. "It is," he writes, "a word the import of which has been but imperfectly grasped by members of the craft." It is used as contradistinguished from "operative or practical masonry." But, I would suggest, may it not have been introduced to cover the practice of admitting lay brethren into the local lodge or town guild of operative masons? The author has amusingly referred to a MS. constitution or charge (No. 2 in his list of some fifty others as now collected), wherein it is stated that "Edwin, the youngest son of King Athelstan, learned 'practical' masonry in addition to 'speculative' masonry, for which he was a master," which passage is held to mean that "this 'speculative' was a knowledge of geometry," that the writer of the book did not consider *speculative* knowledge as making the possessor a mason, for he writes, "and became a mason himself," i.e., when he had added the *practice* of that science to his speculative. He was, clearly, not a mason when only in possession of the speculative science." How many of the members of the present society, it may be asked, are qualified as masons under this explanation? It should be added that the manuscript from which the above is quoted is fairly supposed to have been written in the early part of the fifteenth century. Our author gives up several pages to a careful consideration of the date of this and the earlier (or Halliwell) MSS., assisted by the learned authorities in the British Museum and elsewhere.

The word "speculative" was in use in 1582, 1570, 1530, 1643, 1538, and later, as 1658, 1704, 1738, &c., as shown by the extracts and titles of several printed publications quoted at the end of this third volume. It is also important to notice our author's statement that "in England none of the *speculative* or non-operative members of the craft . . . in the seventeenth century were received as apprentices. All appear . . . to have been simply *made* Masons or Freemasons." Then, to what other body could the two earliest, and perhaps also some later, Charges have applied, except to a working Lodge of operative Masons, where the three degrees undoubtedly existed on their own showing? Mr. Gould quotes the two passages in the poem (2) relating to the apprentice; and Ashmole, on his own showing, was made a Mason in the form prescribed by the Old Charges, possibly (as pointed out by Mr. Gould) the copy made by Edward Sankey (No. 13 in Mr. Gould's list) having been read over to him, and his assent given in the customary manner. "Freemasons and Freemasonry, more or less speculative, existed certainly in Scotland, and inferentially in England . . . and if we cannot distinctly trace it back to a higher origin than the sixteenth century, it is only to be inferred that *proofs* of a more remote antiquity may be yet forthcoming." Mr. Gould also states,—"In my opinion, however, Masonry in its general and widest sense,—herein comprising everything partaking of an operative as well as of a speculative character,—must have been at a very low ebb about the period of Moray's death (1673), and for some few years afterwards."

"The road to truth, particularly to subjects connected with antiquity, is generally choked with fable and error, which we must remove by application and perseverance before we can promise to ourselves any satisfaction in our progress." This our author quotes from Dalcho, "Masonic Oration," il, p. 37, and he has acted on his advice. This is a sort of apology for his investigation of the common belief that the celebrated architect, Sir Christopher Wren, was a member of the Society of Freemasons, an assertion which appears to rest upon two sources of authority; first, an obscure passage in Aubrey's "Natural History of Wiltshire," and, secondly, statements in Dr. Anderson's "Constitutions" of 1738. These our author considers are quite irreconcilable with the

* The History of Freemasonry: its Antiquities, Symbols, Constitutions, Customs, &c., derived from Official Sources. By Robert Freke Gould, barrister-at-law, Past Senior Grand Deacon of England. 4to. Lond. n.; Thomas C. Jack, 1884. Vol. iii., 248 pages. The first of the previous volumes was reviewed in this journal in the number for the 3rd of March, 1883, p. 268, and the second in that for the 13th of July, p. 37, and the 23rd of July, p. 102, of the same year.

statements in Anderson's earlier publication of 1723. Aubrey's "History" was written and added to between 1656 and 1691, but only first printed in 1847, under the editorship of John Britton, F.S.A. The extraordinarily minute investigations by Mr. Gould to try and arrive at the truth of the statements and legend, may be very satisfactory to the author, but Masonic writers must be in despair at the result. In some forty pages devoted to the inquiry, we find the following statements:—

"From neither of the extracts from the *Parentalia* are we justified in drawing an inference that Wren was a Freemason" (p. 15). "The fable of Wren's Grand Mastership I shall not further discuss . . . it being sufficiently apparent,—as tradition can never be alleged for an absolute impossibility,—that he could not have enjoyed in the seventeenth century a title which was only created in the second decade of the eighteenth (1717)" (p. 43). "Assuming Wren to have been a Freemason at all,—and in my opinion the evidence points in quite another direction,—he would have had much difficulty in neglecting an office which, at the time named, did not exist!" (p. 49). "The belief that Wren was adopted a Freemason in 1691 [is] at once improbable and ill attested [and] must fall to the ground" (p. 52). (Lastly (p. 55), "The popular belief that Wren was a Freemason, though hitherto unchallenged, and supported by a great weight of authority, is, in my judgment, unsupported by any basis of well-attested facts. The admission of the great architect,—at any period of his life,—into the Masonic fraternity, seems to me a mere fragment of the imagination, but it may at least be confidently asserted that it cannot be proved to be a reality."

Such statements and strong opinions, founded on a most careful inquiry, require no comments at the hands of the reviewer, who, however, takes exception to the remark that the belief, as above stated, has been hitherto unchallenged; for, on reference to the Masonic journals of about twenty years since, it will no doubt be found that inquiries were made at that time on this subject, but without any practical result. However, so difficult is it to kill a legend when obtained from "old records," that Mr. Gould may rest assured that popular writers will continue to transmit the hitherto received statements down to the latest posterity, assisted by the present inscription on a silver plate let into the head of "the historic mallet employed to lay the foundation-stone of St. Paul's," and now belonging to the Lodge of Antiquity, which we are assured by Mr. Gould (p. 47), "presents no less than six misstatements." It will be found in full in *Notes and Queries*, 3rd ser., viii., 6, having been contributed by our old friend "A. A."

There appears to have been also a "muddle" as to the names of the members of the "Strong" family. The *Constitutions* of 1738 state that Wren's wardens! at work at St. Paul's Cathedral were Edward Strong, senior and junior. As the first "Edward" was only 22 years of age in 1673, neither he nor his son could have assisted at "levelling the footstones" in that year. "Thomas" appears to have been the mason who succeeded at the works by his brother "Edward" senior, who claims to have laid the last stone of the lantern, on October 25, 1708, whereas Christopher Wren (the son) also claims the honour of having laid the "highest or last stone" in 1710. It will further disappoint those relying on the "old records" to learn that neither Thomas nor Edward was a member of the Society of Freemasons, although it is now assumed that they did belong to the Company of Masons. That Inigo Jones may possibly have belonged to some body,—of Masons or Freemasons,—has been established by the recovery of his copy of the *Constitutions* or *Charges*, which is dated 1607, and has in it a drawing signed by himself; it is now in the possession of Rev. A. F. Woodford, of London. Any one, however, knowing how greatly Jones was interested in antiquities (in that year he was 34 years of age, and engaged on the *Masques* at the Court of James I.), might assume that he may have had this copy made out of sympathy with the subject,—as any one might do in the present day, were they not printed, and thus easily accessible.

In respect of the tradition of "travelling bodies of Freemasons," which appears to have been first mentioned in 1686, our author cites, for the first time, a very curious confirmation

of an English craft guild by Pope Lucius III. (1181-85), whose privileges had been already confirmed by the English King Henry II. It was Sir William Durdale who told Aubrey that about "Henry III's time the Pope gave a bull or diploma (patent) to a company of Italian architects to travel up and down over all Europe to build churches." Our author considers that "a solution of the problem must be looked for in the history of Italy," or "that in the annals of that period (*temp.* Henry III.) of English history will be found a clue to the explanation of which we are in search." The era (1216-72) of Henry III. is, he states, "especially memorable as a period when the ascendancy of the Pope was at its zenith in these islands,—that Henry was the first monarch of England who paid attention to the arts, and to his munificence are ascribed the most beautiful works of the Medieval age which we possess,—and, if we consider the partiality of Henry III. for foreigners, the constant communication with Rome, and that so large a portion of the English benefices were held at that period by Italians, it may fairly be assumed that these circumstances must have materially influenced the employment in England of the artists of southern Europe." Such a paragraph as this requires further consideration. No facts are given as to the employment in England of foreign artists, and though a few instances occur to the reviewer of such employment, such as those mentioned by Walpole, namely, Odo and his son Fitzodo, goldsmiths, &c.; Masters William and Walter, painters; and Pietro Cavallini, sculptor, I doubt if any of our historians would agree that the architecture of the period was at all affected by the employment of any foreign artificers. Our author then considers the establishment of the two Orders of Mendicants,—the Dominicans, 1215, and the Franciscans, 1210, confined 1274 with the Carmelites and the Augustinians,—all comprising the Friars, in contradistinction to the Benedictine Monks and the Augustine Canons. "These friars travelled wherever they pleased, instructed the people, gathered riches, taught and practised art,—they became possessed of ample buildings and princely houses." Are we to begin to assume that the larger number of edifices of the English Gothic are from the hands of foreign artists? The Abbé Bourassé is quoted as stating that the architects of the Dominicans followed one style and those of the Franciscans adopted another; that these styles are not specified, and that as the Franciscans had not architects of their own body they must either have availed themselves of exterior talent or had recourse to some member of the rival brotherhood. This last is hardly probable, judging from the jealousies existing among such bodies. "These friars," writes our author, "were Italians,—among them were many architects,—commingled with French, Germans, Flemings, and others. They procured Papal Bulls; they travelled all over Europe and built churches; their government was regular . . . and a General governed in chief . . ." as recorded in the *Parentalia*, and so stated by Dugdale and Ashmole! But the term "Freemasons" was not then known, for the very earliest uses of the term yet found are in 1376-7 and 1396, as is hereafter further noticed.

Having discussed the legendary "Grand Masters" and the "travelling bodies," we are taken to the "general or annual assemblies" mentioned in the old *Charges*; one assembly, it has often been stated, but on no good authority, was attempted to be put down by Queen Elizabeth in 1561. These *Charges* mention that the member is to attend, if he knows where the meeting is to be held, and if he be within five, ten, or fifty miles of the place. The annual assembly of a lodge of Masons was evidently a movable one,—due, in my opinion, to the locality of, and to the numbers in, the local body,—for the brother Mason might be at work at a distance, and in a place away from the usual line of traffic, by means of which he might only be able to obtain information! The author's amusing description of Medieval "legend making" need only here be adverted to.

"At what time the oral traditions of the Free-

masons began to be reduced to writing, it is impossible even approximately to determine." . . . nor "the period when they were moulded into a continuous narrative. . . . The curiosity of the early Freemasons would naturally be excited about the origin of the society. Explanatory legends would be forthcoming, and, in confounding as they did, architecture, geometry, and Freemasonry, Dr. Mackey considers that 'the workmen of the Middle Ages were but obeying a natural instinct which leads every man to seek to elevate the character of his profession, and to give it an authentic claim to antiquity' " (p. 58).

A portion of chapter xiii. relates to Elias Ashmole. A very careful investigation into his history; his initiation as a Freemason at Warrington in 1646; and his attendance at an admission at Masons' Hall in 1652, leads to the declaration that "whilst he [Ashmole] is stated to have regarded his admission as a great distinction, there is no direct proof that he was present at more than these two Masonic meetings in his life." He died May 18, 1692, in the seventy-sixth year of his age. This supposed abstention from the brethren has puzzled many of the critics; but Mr. Gould, after a careful scrutiny of Ashmole's diary, arrives at the conclusion that "it is probable that he did in some way keep up his connexion with the Freemasons, but that it was of such a slender character as not to merit any special mention. . . . His diary scarcely gives details on any point except his ailments and his lawsuits, but he would probably have made at least notices of his having attended Lodges, had he done so with any frequency, as he does of having attended astrologers' feasts. . . ." "My own view [writes Mr. Gould], therefore, is that the Ashmolean influence on Freemasonry, of which so much has been said, is not proved to have had any foundation in fact, although it is fair to state that I base this opinion on circumstantial evidence alone, which is always liable to be overthrown by apparently the most trifling discovery. . . . There is no trace, as far as any remaining evidence is concerned, that the Freemasons were in any way connected with any [of the societies he names], [but, on the contrary, that, although they [the Freemasons] had probably in a great measure ceased to be entirely operative, they had not amalgamated with any one of the supposed Rosicrucian or Hermetic fraternities,—of the actual existence of which there is proof,—still less that they were their actual descendants, or themselves under another name. To assume this, indeed, would be to falsify the whole of authentic Masonic history, together with the admittedly genuine documents upon which it rests."*

A NATIONAL LAND COMPANY.

NEW undertakings have ever been introduced to the public with a more imposing array of names than that which is associated with the proposed land company, whose title is yet to be determined. It is not often that Lord Carnarvon and Mr. Joseph Cowen, M.P., Professor Bryce and Mr. Ernest Noel, the Earl of Egmont and Mr. Burt, are to be found upon the same platform, and it may be regarded as a sign of the times that the subject to be discussed at Willis's Rooms, on Friday, is one in which great landowners like the Dukes of Argyll and Westminster, the Marquis of Northampton, and Earl Cowper; capitalists like Sir John Lubbock and Mr. Walter Morrison; and lawyers like Mr. Horace Davey and Mr. Westlake, appear to take an equal interest, though it is to be hoped they will not all take an equally active part in the proceedings.

The scheme, as sbndowed out in the prospectus that has been privately circulated, is definite in its purpose and perfectly intelligible. It aims at increasing the number of landowners (in England) by offering facilities for acquiring agricultural land in small quantities,—in other words, for resuscitating and enlarging the class of yeomen which, from a variety of causes, has almost

* To be continued.

become extinct among us. Granted that it be desirable that we should have a larger number of small freeholders, the questions that follow are, necessarily, whence and how are we to obtain them? The promoters of the company (which it is scarcely needful to say is both commercial and philanthropic) expect to draw their recruits from five distinct sources.

First, the *labourers* who may desire to purchase land either for the purpose of cultivation or for the erection of cottages for their own occupation, will be assisted. But by cultivation is to be understood not so much spade-husbandry, which under present circumstances does not promise much success, but dairy-farming upon a limited scale and cultivation by horse-labour,—the latter requiring a certain number of co-operative, or, at any rate, contiguous, labourers, in order to make it worth the while of any man to keep horses for their accommodation. The holdings would be from one to four acres in extent, and would not demand from their owners more work than could be given after hours, and with an occasional day or half-day at harvest times. As to cottage building, the company might itself undertake this work, or advance a certain sum in the shape of building materials, leaving the purchaser to find the labour.

2. *Small Farmers*.—Here, a certain amount of capital might be presumed to exist, and offers might be made of holdings varying in extent from 12 to 30 acres, a certain deposit being paid per acre before entering on occupation.

3. *Tradesmen*.—These would occupy a certain number of frontages on the main road, and, besides attending to their shops, would be glad to cultivate or employ for pasture an acre or two of land.

4. *Market Gardeners*.—Their holdings would necessarily depend upon the locality, and with them spade labour would be the rule.

5. *Immigrants from large Towns*.—"There is," says the prospectus, "a certain number of men in the large towns, who, having saved some money, wish to retire to country life, occupying themselves with gardening, bee-keeping, poultry-breeding, &c. Besides these it is probable that a proportion of those who now emigrate would, if land could be acquired on easy terms, attempt the experiment of home immigration. Should that take place, which is very desirable, some failures must be expected."

It is not proposed that the holders of the land should necessarily be, from the commencement, its purchasers. In some cases,—especially with the labourers,—it might be safer to hire with the right of pre-emption. But supposing the holder desires to become a proprietor, how is he, without any capital, to do so? The company offers to let him liquidate the cost of purchase either (1) by spreading it over a term of years with annual interest calculated upon the amount of principal still outstanding; or (2) by making the usual rent a perpetual payment. In this latter case there must be buildings erected by the purchaser as a security that the land shall not be returned on the hands of the company. Under any circumstances the holder would be at liberty to sell his holding, subject to any claims which the company might have upon it.

Where possible, the company would be willing to offer a suitable extent of land for co-operative farming upon the same terms of repayment as in the case of individual purchasers.

The funds of the company would, in the first instance, be furnished by the capital arising from the issue of shares. These would be of two sorts,—one limited to 5s., having priority and intended for labourers and workmen, whose active interest in the undertaking essential to its success. These shares would pay not more than 3½ per cent. The other shares, purchasable by the public generally, would be limited to 1/ in amount, and would pay not more than 4 per cent. Shares might be taken in part payment for land purchased.

Such is a brief outline of the undertaking which is about to be launched, and one cannot but wish it success. At the same time, certain obvious criticisms present themselves to our

minds, and, no doubt, will be offered in the course of discussion. Is it necessary, it may be asked, to start a limited liability company to effect objects which our great landowners might do for themselves? If the law of entail forbids them to part with land for such purposes as are here contemplated, there could be no difficulty,—in fact, every facility would be given,—in altering the law.

Next, we cannot but feel considerable doubt whether it is wise to let labourers build cottages for themselves. Efforts are being made to improve cottage accommodation, but, as a rule, labourers themselves are indifferent or even adverse to these improvements; and, if a better cottage costs, as must be the case, more money, and that money is to come, sooner or later, from the labourer's own pocket, can we hope that it will be so expended? Again, there is no class of men in the agricultural community which works harder for bare sustenance than the class of small farmers. Unless, therefore, the terms of the Company are exceptionally easy (and then what becomes of the 3½ per cent. and 4 per cent. on the shares?) it is difficult to see how they could possibly repay principal and interest, not merely upon the cost of the land but on that of the necessary house and farm buildings. Their annual payments must exceed the rent they now pay, and if it be (and, from personal knowledge we know it often is) a hard struggle to earn this, from what source can they hope to get the larger sum which will hereafter be due from them? These, and other considerations, make one at present hesitate to give cordial support to a scheme which, in its object, is unquestionably a good and useful one. It seems to need careful revision by thoroughly practical experts.

NOTES.

MR. RUSKIN'S retirement from the Slade Professorship at Oxford is an event which will be variously estimated, according as preference is given to genius and eloquence, or to sound and commonsense views upon the function and the history of art. Mr. Ruskin's recent lectures have been as remarkable for brilliancy and paradox as any of his earlier or later utterances. But even genius cannot entirely reconcile one to the constant utterance of brilliant paradoxes, and the substitution of fancies for facts, in one of our most important centres of higher education. It will be difficult, if not impossible, to find a successor who will interest audiences as Mr. Ruskin can interest them. It may be quite possible to find a safer and more judicious guide.

THE case of Hogg v. Brooks, which has recently been published in the Law Reports, is worth a passing notice, as it shows a difficulty which may arise in the relationship between landlord and tenant. The tenant in the present case held under a lease for twenty-one years, in which there was a clause that it should be lawful for the landlord to put an end to the lease at certain dates "by delivering to the tenant, his executors, administrators, or assigns, six calendar months' notice in writing" of his intention to do so. The tenant, during the continuance of the term, mortgaged the premises by means of a *sub-lease* to a solicitor, who let them, and who duly paid the rent named by his tenant to the plaintiff. Subsequently, the plaintiff, or rather his assignee (but the effect is the same), desired to discontinue the tenancy, and proceeded to put an end to it in the manner stated in the lease. But the original tenant had disappeared, and consequently the plaintiff served the written notice upon his relations, upon the solicitor, upon the sub-tenant, and upon every one in fact except the necessary person. Not succeeding in thus getting possession, he commenced an action of ejectment, but in this was defeated, since it was held that by the terms of the lease the notice must be delivered to the original tenant. So the landlord did not get his property, but only the trouble of paying the cost of a lawsuit. The moral of the case seems to be that

a lease should always contain the word "sub-lessee" in the proviso we have quoted above in order to enable the landlord to get the benefit of the proviso under all circumstances.

MR. WYKE BAYLISS and other correspondents have recently drawn attention in our columns to the way in which the eastern approach to the new street from Bloomsbury to Regent Circus is rendered both awkward and ugly by the retention of a public house which ought to have been removed. Another and equally striking instance of the manner in which the local "authorities" (such they can be called) allow modern street improvements to be spoiled is to be seen at Holborn Circus, at the corner of Hutton-garden, where a new building has recently been erected for a firm of woollen-draperies. Those who are familiar with Holborn Circus know how much traffic, both pedestrian and vehicular, converges there. For the latter kind of traffic, the wide roads and spacious circus afford plenty of room; while "verge enough" is provided for pedestrians, except at the corner to which we are now referring. The building at the south-west corner of Hutton-garden was the only one abutting on the circus which was allowed to remain without rebuilding at the time the Viaduct improvement was carried out, and the sharp angle of the old building jutted out unpleasantly and awkwardly trenching upon the footpath of the north-west "quadrant" of the circus to within 4 ft. or 5 ft. of the edge of the kerb, the other part of the pavement being 8 ft. or 10 ft. wide. In the new buildings which face the other quadrants or segments of the circus, the angle-facades have been canted or curved so as to secure the *alignement* of the buildings with the sweep of the circus, and it was only reasonable to suppose that when the old building at the corner of Hutton-garden was pulled down, the new building to take its place would be set back at the angle so as to prevent, not merely unsightliness of appearance, but inconvenience and danger to pedestrians. But a reasonable supposition was entertained without giving due weight to the idiosyncrasies and insurmountable ways of our local "authorities," and a new building has arisen on the site of the old one without opportunity being taken to effect an improvement not only desirable but absolutely necessary. The corner question is just outside the City boundary, but surely the Holborn District Board or Works or the Metropolitan Board of Works ought to have stepped in to rectify the line of frontage? As it is, the awkward effect produced is only exceeded by the danger and discomfort to pedestrians which must result from reducing a footpath 8 ft. wide to 4 ft. 6 in. or 5 ft., especially as the contraction occurs at the angle. The thing only needs to be seen to be condemned.

A CONFERENCE will be held in Brussels during the month of June to discuss the question of canal navigation, and the advisability of extending it very considerably throughout the country. Belgium is not the only country which feels that a mistake has been committed in allowing the railway interest to obtain a complete monopoly of the carrying trade. France has for some time past been engaged on the same subject, and the importance with which canals are viewed by French statesmen may be gathered from the fact that, by the Freycinet scheme, 713 millions of francs are to be laid out immediately in developing or improving the existing canal system. It would be a very good thing if the freighters of this country would wake up to a sense of the enormous injury that has been done to English traders by the utter neglect of the canals, which have been so swamped by the railways that they are practically useless. The majority of them have been bought up by the great competing companies, who prefer to see their waterways comparatively idle, in preference to offering the traders a choice of routes, or their acceptance of a lower rate of charge. A more short-sighted policy could not well have been devised. There is enough traffic in the land

to feed both railways and canals; and the offering of facilities by the latter for sending heavy merchandise, in the delivery of which there is no occasion for speed, would stimulate all kinds of trades in a marvellous fashion. If more speed were required than the old-fashioned canal boat can give, it would be perfectly feasible to use steam traction; and we venture to think that the construction of a few good, independent, trunk waterways would form a by no means bad investment, either for capitalist or country.

TANAGRA terra cottas are, among the most antiquity has left us, distinctly the most popular,—we might say, fashionable. Their artistic beauty is fully, and, we think, more than adequately, prized. This being the case Monsieur B. Haussoullier's book on the Tanagra necropolis* should have a wide interest. He has carefully, in the first part, classified the various kinds of funeral monuments, cippi, and stela, that are found at Tanagra, and is thus able to single out local peculiarities. By careful study on the spot he has obtained from the present inhabitants information as to the position *in situ* of stela now removed. One interesting fact he brings out is that the stela in its earliest form was really a primitive altar, its inscription intended rather for the service of the dead than the living. This is only another proof, if one were needed, of the religious, or, we might say, ritual, beginnings of Greek art. The second part of the book deals with the forms of the grave. Here, it appears, chronological classification is impossible, as all the various forms appear contemporaneously. The third, and by far the least satisfactory part of the book, deals with the contents of the grave. M. Haussoullier has not the thorough practical knowledge of vases and vase decorations which alone could see him safely through this portion of the subject. The book is illustrated by even plates, and, taken as a whole, is a valuable contribution to a subject but little investigated.

MORE railway amalgamation is being talked of. The shareholders of the Brighton and South Coast, South-Eastern, and Chatham lines think they can foresee improved dividends resulting from a fusion of those systems, and at a meeting of the Railway Shareholders' Association held last week a resolution was passed expressing the opinion of the meeting at such amalgamation,—or a working agreement,—was most desirable. This was an amendment to the original motion (which was very indefinite), and was carried unanimously. The shareholders consider that the three systems are serving the South of London district in an unnecessarily expensive manner, comparing the position of the three lines jointly with the Great Western. Their expenses bear much larger proportion to the gross receipts than do those of the company named, though the receipts are lower. The scheme seems feasible enough so far, but the question is, will the public be allowed to participate in the benefit? Their receipts are chiefly derivable from passenger traffic, whilst the goods traffic forms the largest item in those of the Great Western; and in our opinion competition,—while often an evil with regard to merchandise traffic,—is a guarantee that the public interest will be served both in the running and equipment of passenger trains. In the event of this somewhat visionary scheme being carried out, will increased dividends be accompanied by increased facilities, or the reverse? We are not prepared to express approval of the proposed amalgamation whilst this remains a questionable point.

It seems a matter of regret that the statue of Hermes carrying the infant Dionysos in the Boboli Gardens at Florence should be left exposed to the chances of weather or the slice of the casual passer-by. The statue is well placed, about a quarter of the way up a great avenue of pines. But, though it is there to great advantage, it would be

better safely housed in a museum. The Boboli Gardens are every Sunday the resort not only of the tourist but of the Florentine "Arry," whose views on art are probably much the same as those of his British contemporary. Already one little foot of the child Dionysos is broken away. The claim of the statue to the care of archaeologists rests on the fact that it is in general type the same as the famous statue of Praxiteles, with, however, certain differences, which have led to the general opinion that it is a copy rather of the work of the father of Praxiteles than of Praxiteles himself. In the Boboli statue the child rests on the right hand, instead of, as in the Olympia statue, on the left arm. The child is treated with much more knowledge of babyhood, but this, of course, is due to the Roman copyist. The figure of Hermes, on the other hand, is much squarer and more Polykleitean in type; it is, in fact, in conception, though not in execution, of just the sort that we might have expected from the generation that stood between Polykleitos and Praxiteles. It is noticeable that in the Boboli as in the Praxitelean group, Hermes looks away from the child in total unconcern.

A RECENT controversy between Sir E. Beckett and Mr. William White has given prominence to the subject of preserving wood or timber by the application of arsenic, and, although it may not be generally known, it is opening up a very old and obsolete question. Mr. William Chapman, who published the results of his experiments in 1817 under the title of "Preservation of Timber from Premature Decay," proved that arsenic afforded no protection against dry rot whatever. So conclusive were his proofs that in the latest work on the subject, "A Treatise on Dry Rot in Timber," by T. G. Britton, late surveyor to the Metropolitan Board of Works" (London: E. & F. N. Spon, 1875), the subject of arsenic as a preservative scarcely finds a place. It is noticed as being detrimental to vegetation; but, in the case of arsenical ores being removed from ground in Cornwall, where they have been stored, vegetation has followed in two or three years afterwards, which proves that it is not effective, unless the mineral is always present. There is nothing in its qualities as a preservative of timber that would warrant its introduction into buildings.

NOTES IN SPAIN, ARCHITECTURAL AND HISTORICAL.

I.—CATHEDRAL AND ALCÁZAR OF SEGOVIA.

ACCORDING to Colmenares, Tuhul colonised Spain, Hercules founded Segovia, and Hispan built *el puente*, "the bridge," as the aqueduct is popularly called. However this may be, it is a fact that among the ancient cities of Spain, of which the origin is so frequently lost in obscurity, Segovia is one of the most interesting. The city proper is located upon a natural fortress formed by perpendicular walls of rock rising out of the valleys around to the height of about 100 ft., and the natural strength of such a site was completed by the picturesque walls, with square and round towers, with which some 800 years ago King Alfonso VI. surrounded it. The shield of the city bears "the bridge," with the head of one of Pompey's sons looking over it.

According to the late Mr. Ford, the name of the city and its foundation are Iberian. Its monuments, ancient and Mediæval, are of the highest interest; and at every turn of its narrow intricate streets you come across some memento of the past. From many different points outside, there are exceedingly picturesque and striking views of the ancient walls, towers, and gateways of the Alcázar perched upon its promontory rock, and frowning above the cathedral rising above all its surroundings; or, finally, of the grand old aqueduct, compared with which all the rest of the picture seems to be mere background.

The Cathedral.

One especial interest in connexion with the Cathedral of Segovia consists in the fact that it was one of the last, if not the very last,

erected in Europe in the Gothic style. While the glories of that style were being elsewhere despised and forgotten in the rage for the revival of the antique, Gil and Rodrigo de Outañon, father and son, worked steadily on in the paths of their predecessors, leaving to posterity a splendid monument in the Christian style of the Middle Ages. It was begun by the father in 1535, and continued by the son, who died in 1577.

Our illustration of the cathedral is taken from the Plaza Mayor. It shows the eastern portion of the building, comprising a choir in the centre, with circular aisle or ambulatory, outside of which are the several apsidal chapels. Although it seems that the general plan and many details are similar to those of the late Gothic cathedral of Salamanca, of which the Outañons were also the architects, the round apse is a variation. In the centre is the chief dome, and beyond, a single western tower, both which in the general view accord fairly enough with the rest of the edifice. The worst fault of the tower is the want of an intelligible finial, the lightning-conductor being far from an artistic finish. It seems that the original Gothic spire was destroyed by lightning early in the seventeenth century, so that the actual summit is of that time.

The right of our illustration shows some of the old houses of the Plaza, underneath which are portales, or porticos of lintel architecture set on square columns, which afford shelter against snow and rain in winter, as well as shade in summer. There are balconies for every floor, supported on long projecting corbels. On the opposite side to the cathedral is the old Church of San Miguel, which has preserved its Romanesque campanile, and its original Gothic plan of nave, transepts, and aisle chapels.

As far as parapet and pinnacles the tower is Gothic, and the Perpendicular outlines are plainly marked, instead of being lost, as in many buildings late in that style, in a mass of details. The seventeenth-century addition consists of a turret, forming an octagonal drum, set in the centre of the Perpendicular tower; this first stage terminating with halustrado and hall, in place of the Gothic finial. This turret is domed, and terminates with a lantern ending in a blunt and emphatically pointless finial. The faces of the Gothic tower are panelled, though the heads of the panels are round. The lantern of the central dome is likewise of Renaissance character, having square-headed windows. However, as before said, the Renaissance character of these details is not so strongly marked as to destroy the generally fine effect of this, the last grand Mediæval cathedral.

The interior fully confirms the opinion here put down as to exterior. The height of nave, aisles, and dome, and the extent in other senses, appear to the eye all on a grand scale; and the actual figures bear out this estimate. The actual dimensions given by Madoz are those:—The nave rises to 120 ft., the aisles to 80 ft., the central dome outside to 250 ft., and the tower to 350 ft.; total length of the ground plan, 420 ft., width, 210 ft., and each side of the tower, 33 ft. Not merely in dimension, but likewise in style, is this cathedral very fine, especially if we bear in mind the century in which it was planned.

The stained glass is really very fine, especially the ruby, emerald, and sapphire; it looks like an excellent specimen of what Winston calls the Mosaic Enamel Style. The date 1544 appears in two windows on the north side. There is quite sufficient in this glass for a study by itself. The subjects are from the Old and New Testaments, apparently arranged as in earlier windows, and in ways like the *Biblia Imperium* and *Speculum Salvatoris*, in groups of types and antitype, one window containing the Crucifixion along with one of its types, the Brazen Serpent. Like the cathedral itself, the glass is evidently not all of the same date. The earlier windows, and more mosaic in style, are those towards the west end of the aisles and clearstory. Those towards the east end present a later, broader, more enamelled, and more pictorial character.

The choir,—in the centre, as usual in Spain, at least from the sixteenth century downwards,—presents the usual carved stalls. These are beautifully wrought in the Gothic style, though surrounded by a later halustrado. The ironwork (*verja* or *reja*) inclosing the Capilla Mayor and the choir presents foliage and flowers finely wrought, and, though later than the building,

* *Quomodo Sepulchra Tanagrarum decoraverint.* Parisiis: A. B. Haussoullier.

it accords well enough with its Gothic surroundings. The cloisters belonged to the older cathedral, which was situated nearer the Alcázar than the actual one, and dated from the twelfth and fifteenth centuries. They were taken down and put up again by Juan Campero in 1524. Geometric forms appear in the window tracery, very similar to those observed in the stucco decorations of the Alcázar. The retablo of the high altar is of beautiful marble, and presents to view the patrons of the city,—the B. V. M. and Child, San Hierotes, the first bishop of the see, and San Frutos, a hermit.

The history of the construction of the cathedral is not without interest. It was in 1510 that the removal from its original site was determined on, but on account of the events of the time, such as the death of Ferdinand the Catholic, in 1516, and the accession of Charles V., it was only begun in 1525. Once begun, the bishop, clergy, and people worked away with a hearty good-will, night and day, working days, and holidays, so that by 1558 sufficient was completed for Divine worship. It was finally completed in 1620, and only consecrated in 1768.

The Alcázar.

The keep of this ancient castle and royal citadel, shown in our illustration, is a lofty tower, the walls adorned with stucco in the Moorish style, and crowned by a parapet set out on corbels, and formerly with twelve salient circular turrets, or bartizans, two at each angle and two between the east and west respectively. Its present appearance shows but a wreck of what it was before the fire of 1862. The castle is admirably placed on a precipitous rock, rising abruptly several feet between two rivers, the Eresma to the north, and the noisy Clamores to the south, which unite at the foot of the cliff. The position of this royal castle on a promontory-rock, between defending streams, has been compared to a ship's prow dominating the waters' meet below, and it must have been in former days well-nigh impregnable. The city walls continue eastwards on either hand, and, to this day, the more ancient aqueduct brings water to the castle. The breadth of the rock at the entrance to the open plateau in front of the Alcázar, now an Alameda and parade-ground, but of old the site of the ancient cathedral, is only some 70 ft.

The date of the foundation of the Alcázar de Segovia, "no se sabe," said our guide, and to this same conclusion, due research being made, we are forced to come. Though, however, nothing certain can be affirmed as to the original foundation, the date of some parts can be fixed exactly. The picturesque bartizan tower bears the name of *la torre de Juan II.*, and belongs to that monarch's time, which includes nearly the first half of the fifteenth century.

The decorations of the Sala de los Piñas were executed by order of Henry IV. in 1452. There are a court and cloister of the time of Philip II., of which the granite pillars suffered greatly in the fire. In the Sala del Trono we observed walls and round-headed windows having every appearance of belonging to the twelfth century. The name Alcázar, which in Arabic means Palace of Caesar, points to a royal foundation in the time of the Saracen dominion. The latter came to an end when Alonso VI. reconquered Toledo in 1085, and there is reason to suppose that the older portions of the actual walls are at least as old as his reign, and so contemporary with those of the city then erected (1073-1108).

The history of this Alcázar represents a compendium of the history of Spain during the Middle Ages. Segovia having been assaulted and destroyed by the Moors in 1082, Alonso, after defeating them, confided the reconstruction of the Alcázar and walls of the city to Don Ramon, brother of Pope Calixtus II. At the same time the vacant city was repopled by "Gallegos, Leoneses, Asturianos," and "Rejanos." The date of all this was 1088. The Alcázar was a favourite residence of Alonso VII., "El Imperador"; and of Alonso VIII., husband of Eleanor, the daughter of our Henry II. Berenguela, their daughter, was horn therein. San Fernando, the conqueror of Seville, was brought up in the Alcázar. "Alfonso al Sabio," and tenth of the name, who counted a long list of kings among his vassals, also resided at Segovia. Tradition connects the name of that monarch with a notable incident in the year 1262, which is thus related by Colmenares, and

perpetuated in some degree by the name of the saloon formerly called "Del Pabellon," and, since the above date, named "Del Cordón." It was publicly rumoured that the king had asserted "that had he been consulted at the creation of the world, some things would have been done differently," and that the king, reproved for his folly by his brother's tutor, had persisted in it. That very night a terrible thunder-storm fell upon the Alcázar, which, according to some accounts, killed several among the courtiers, divided the roofs of the building, and penetrated to the royal apartments. The King, on the following day, made a public abjuration and expiation. In memory of the event the cord of St. Francis was sculptured all around the room.

In the fourteenth century, in connexion with the Alcázar, we find Alfonso XI. and Leonor de Guzman, Pedro el Cruel, and Enrique de Trastámara, whose son, the Infante, A.B. 1366, fell from the arms of his nurse from one of its windows into the precipice beneath, and was killed on the spot. In the fifteenth we meet with Enrique IV. and Isabella the Catholic. In the year 1474 she was here proclaimed Queen of Castile and Leon; the Governor, Andres de Cabrera, and his wife, Beatrice de Bobadilla, having much contributed to her accession. Two years later, a riot having arisen against Cabrera, she rode holdly out among the rioters and awed them into submission by her courage and presence of mind. In 1520 the Alcázar held out against the rebellion of the Comuneros, who, among other outrages, nearly destroyed the old cathedral, and so the place earned the gratitude of the Emperor Charles V. During the romantic expedition of our Charles I. to Spain, to pay his respects to the Infanta Maria, daughter of Philip IV., he was entertained here by the hereditary governor. Later on, the Alcázar was made a State prison, and at last converted into an Artillery College. It was burned in the year 1862. Whether this ever-to-be lamented destruction was voluntary or accidental has not, as far as we know, been clearly made out; however, in December, 1881, orders were issued by the Minister of Public Works for the preservation and restoration of the Alcázar. The restoration is being carried on exactly in its ancient style.

In the illustration the reader sees the Alcázar as it appeared after the fire of 1862, and before the actual restorations were commenced. Not all the salient turrets or bartizans there appear, and even of those which do appear, several were damaged, and had to be taken down. Two picturesque sharply-pointed towers defend the north and south-west angles, which are united by the remains of a corridor, called "Galeria de los Moros." The grand tower or keep of the castle is arranged in two chief stages, the curtained corner turrets and parapet being in part destroyed. The entrance on this, the eastern side, is across the ancient moat of the castle. Several views of the Alcázar as it was before the fire are extant, and in these the beauty of the building is greatly enhanced. In these we see high-pitched gables; lofty, conical, and octagonal spires; picturesque projecting turrets between the bartizans, and the "Galeria de los Moros" has likewise its roof and spirelets complete.

The walls, exterior and interior, are covered with what remains of the very artistic Moorish decorations in stucco, representing circles and other geometric forms, bearing a remarkable resemblance to the Byzantine sculptured ornament of the portal of San Martin already mentioned. The saloons, Sala del Trono and Del Reclimiento, were splendidly adorned in the time of Enrique IV., already referred to. These details are called "friso Morisco," and adorn most of the apartments. The Sala de los Piñas (pine apples) is so-called from the decorations in the roof taking the form of that fruit. Although these details were executed by Moors, the general style of this apartment is rather Gothic than Moorish. Under this head, we noticed a great similarity between the geometric forms of the window tracery of the cathedral cloisters, apparently of the century of Geometric Gothic,—the fourteenth,—and the mural decorations in the Alcázar. Other saloons present more of pure Moorish style. The Sala de los Reyes, now destroyed in the fire, was a very beautiful apartment. The chapel of the castle was erected in the Gothic style, and the groining and other details were delicately executed. The bartizans or turrets of the castle keep are called *almenas* (battlements),

and a tower, so defended, is known as *almenada*. The bartizans (original) on the west face, were, we understood, to remain, while most of the others required to be taken down on account of the damage they sustained in the fire. The stuccoed decorations on the outside of the tower are very effective and picturesque.

With the exception of the Sala de los Reyes, attributed to Alfonso el Sabio, most of the interior decorations we have mentioned belong to the reign of Enrique IV., or to about the middle of the fifteenth century. The style of these details, though showing Gothic influence, like other Moorish examples, from the thirteenth to the fifteenth century, was certainly the work of Moors, professing, doubtless, the faith of Mahomet, though living and working among Christians. This style is now called *Mudéjar*, from an Arabic word signifying *tributary*, and so applied to those Arabians in the Middle Ages who were subject to the Catholic monarchs of Spain. The *Mudéjar* style is now regarded as an important one, and some Spanish authors even advocate its restoration as a sort of national style. Edifices, such as the Alcázar de Sevilla, and the Casa de Pilatos of the same city, are sometimes classed as *Mudéjar*, though to an English eye they seem merely later developments of the Alhambra. In contrast to *Mudéjar*, though the two are often confounded,—even by Spaniards,—we have *Mozarabe*, a term applied as well to those Christians of Spain who were subjects of the Arabian monarchs as to the ancient Spanish rite of SS. Idefonso and Isidore, still in vogue in certain churches of Toledo.

NOTES ON FLINT WORK, ESPECIALLY IN THE COUNTY OF SUFFOLK.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The tenth ordinary meeting of the Institute took place on Monday evening, Mr. Ewan Christian, President, in the chair.

Mr. W. H. White, the Secretary, having read a long list of nominations,

Mr. Cates said it was satisfactory from one point of view to find that provincial architects looked so highly on the advantages of the Examination as an introduction to their candidature. He wished the same feeling was more prevalent in London, and hoped that the good example set by these young men would have more weight with their metropolitan brethren. There were not only candidates from several parts of the country, but also from the colonies, Mr. England, one of the candidates, being the third from New Zealand who had passed the Examination.

The President agreed with the remarks of Mr. Cates, and considered it was very encouraging to find men from the outside wishing to enter their ranks. He hoped that what had been said would be duly attended to by the young architects of the metropolis and the southern counties.

Mr. Baggally, a former Ashpitol prizeman, and Gold Medallist of the Royal Academy, then read a paper on Flint Work, commencing by referring to his indebtedness to those gentlemen who had lent him drawings, and notably to Messrs. Aston Webb, E. Preston Willins, of Norwich, and Mr. Goodall. The subject, he remarked, was one worthy of being thoroughly sifted. It had been first suggested to him by a visit to the picturesque city of Norwich, and its splendid churches, nearly all of which were faced with flint. He examined the flint-work of some twenty buildings there, and was led from astonishment to admiration at the accuracy of the cutting,—in some instances it was impossible to insert a penknife where the mortar had fallen out. He had desired to make a thorough study of the subject; but though he had visited sixty flint buildings in Suffolk, he had only seen half a dozen outside Norwich in other counties, and he would therefore add to the title of his paper the words "especially in the county of Suffolk." The interest chiefly centred in the flush tracery and panel-work, and this was essentially superficial. They had been told that unless a wall was of one substance throughout it was a sham; but the essence of an untruth was that it should deceive, or be intended to deceive. Did they suppose, however, when they saw a man in a broad-cloth coat, that his shirt was of the same material? Or, again, did any one who saw a green meadow, jump to the conclusion that the earth was a ball of grass?

For an eloquent defence of surface architecture he would refer them to Ruskin's "Stones of Venice." Flint was in itself practically inextinguishable. The advantages of such a material for monumental buildings was obvious; it was, at the same time, intractable, and, except in its rougher state, expensive. The small flints commonly used occurred in almost all geological formations, particularly in chalk, gravel, and alluvial soils. It must not be supposed that the different tones of the flints were always original; he believed that more often they were black or grey stones faded, and that a growth of lichens also gave a certain appearance of whiteness to them. Flints might be mixed with mortar and cement, and used as concrete,—indeed, the body of many of the old walls was probably made of this. They might also be built up, as gathered, into rough rubble masonry, as was the case at all periods from the early round towers to the latest Perpendicular churches. In many churches near the coast flatish pebbles from the shore were used in a sort of herring-bone pattern. The next step was to break the flints, and use them in courses, or otherwise, the first being the most usual and artistic mode. For facing only, a further improvement was to split the stones with greater care, and to knock the white coating off, the splinters being stuck into the joints, probably to get an even black surface. This was termed "galetting." Roughly-dressed blocks of stone were used to form a sort of pseudo-diaper, and probably suggested the chequer later on. Rough patterns were also formed by the introduction of brick diapers, as in the old Bishop's Palace at Norwich. Ganged flint work was only a facing material, and might be used in most of the different ways in which such material could be employed. The great difficulty of cutting it no doubt suggested that it was worthy of being set in a framework. The earliest flint buildings were the round church towers. The stones were laid so carelessly, and with so little regard to an even surface, that it seemed to have been the intention to cover their nakedness with a coat of stucco. The fact of similar towers on the other side of the German Ocean being nearly always stuccoed, lent some colour to this theory. The value of stone was remarkably accentuated in some of the earlier Suffolk churches, as at Debenham, for instance. He did not believe that flints were used otherwise than as rubble until towards the end of the Decorated Period, and, for a long time after, the use of split or ganged flint was exceptional. He did not find that the ganged description was introduced before 1450, as St. Peter Mancroft was finished in 1455, Southwold Church in 1460, Walberswick Church in 1479-93, and Saxmundham Church in 1493, &c. He had once thought that before this time bands of brick, tile, or stone had been used to tie the facing into the wall and for other purposes. It seemed difficult to understand how otherwise the flush panel-work of the later time was suggested. Clyffe Church in Kent had alternate bands, but this was too far off to have had an influence over the East Anglian churches. The north aisle of Ixworth Church was seen to be regularly banded with courses of tile, but there were not many examples of bands with random dressed flint facing. In one church he found the nave walls were of elaborate courses of brick and flint, but this church seemed to be of a late period. About the conclusion of the Wars of the Roses, a North Sea trade was established on the east coast, and in consequence of the prosperity which followed, some of the most magnificent ecclesiastical buildings were erected. The suddenly-developed wealth would probably have enabled the builders to fetch good stone, but they evidently desired to produce rich effects with the flint. Once started, this spread like an epidemic. Every man strove to outdo his neighbour in the next parish in the extravagance of his designs, and although many beautiful features were produced, the results were not all equally satisfactory, there being a perfectly bewildering mass of designs. Mr. Baggallay then referred to the different styles in which the flints were used, and notably to the circular and square panels. There were running patterns, and the commonest diaper was a common chequer, which was used in some part of one out of every three churches, as in Southwold and other churches, and also in the guildhall at Norwich. There were hands consisting of various tracery patterns, and the texts and mottoes so

frequently found, might be termed running patterns. He also referred to the different panel patterns, with heads trefoiled, cusped, &c., and stated that panels sometimes took the forms of Perpendicular tracery by the vertical division of the heads. The flint panel was applied to most features of the churches. Among the beautiful features of the late churches in the eastern counties was the light open clerestory, by which a large amount of light was admitted far above the level of the eye, in the same manner as it shone into the Renaissance churches of Italy. In England this effect was somewhat spoiled by the aisle windows, but in the great breadth of the Perpendicular churches a great breadth of design was reached; the manner in which the open roofs made one with the clerestory windows thoroughly satisfying one's sense of fitness. Mr. Baggallay here drew particular attention to the clerestories of the churches of East Stonham; Coddesham; Saxmundham, with its artistic detail; St. Clement's, Ipswich; Framlingham, Walsham-le-Willows, &c. Next to the clerestory, the porch was the most important part on which flintwork was lavished. The Suffolk porches would lead them to deny that the importance of the doorway had been overlooked in this country, and he would instance those of Halesworth, Blythford, Southwold, Mendlesham, and Ixworth. He next touched upon the use of flints in plinths and parapets, and alluded to the faces of the buttresses being decorated with flintwork, instancing the parapets of Woolpit and Walberwick churches, the former being a perfect architectural gem. The old builders seemed to have used the darkest flints in the lower courses, employing lighter shades as they ascended. Brandon in Suffolk had been for a long time the headquarters for the manufacture of gun-flints, and he went there to see the quarrying and cutting of the flints, which were doubtless almost the same as in Medieval times. Each pit was worked by one man only, and was a shaft 40 ft. or 50 ft. deep. On the surface was a stratum of sand from 7 ft. to 10 ft. deep, with chalk containing large numbers of small flints. Below this was chalk, in which at intervals were found the large flints, never more than one stone thick. The largest stones, weighing a hundredweight or more, were seldom got whole. These were all lifted from stage to stage by the man who worked the pit, and the tools used were of the most primitive description. The lowest flints were those most in demand, being regular in shape, fine in texture, easiest to work, and of a pretty grey colour, which, however, often faded. The best were cut into gun-flints and ganged flints, while the commonest were used for rough walls and concrete. In conclusion, Mr. Baggallay said:—It is surely unnecessary to argue in favour of the occasional adoption in these days of cut flint facing, when the opportunity occurs, if only for the sake of a little variety. It is sufficient to point out that if plenty of long bonders, either of the flint itself or of stone, are used, the work is perfectly sound; and also that if it once be granted that facing at all is permissible, then for concrete walls what facing could be better than random dressed flint? The material would be the same or very similar, only of a better kind to that of the body of the wall, and the large quantity of mortar used would cause it to settle almost equally. In regard to the flush panelling, a great deal of which would necessarily be executed in ganged work, the list of prices I have collected shows that the cost would not be prohibitive, and from the point of view which I have attempted to show to be the right one, in which surface architecture appears as not only no sham, but the most sensible and artistic, then its own intrinsic beauty, that it only recommendation for its revival, that it needs. And apart from mere revival, which is in truth but a backward step, it is surely capable of development, or at least of affording a few suggestions for those of us who desire to carry our art onwards. The most obvious of these is the substitution of other materials for the flints. Not to speak of ganged brickwork, which, treated in that way, would be at least as beautiful, there are varieties of marbles at command, at prices certainly high, but not, in these days of cheap carriage, altogether prohibitive. And in what range, although prohibitive. And in what range could marble be more appropriately applied to building than in slabs, cut to a form which does not suggest joinery, or any other material, and tied into the body of the wall by the stone frame which surrounds it; for, of course, we

should not be guilty of imitating the fifteenth century to the extent of making that too merely superficial. Then we could use in a similar way decorative panels of majolica appropriate to the external decoration, like those of della Robbia. Is it quite impossible to sink the panels slightly, and decorate them with frescos? I will even dare to suggest that a modern building, decorated with well-designed tracery of the kind executed in white marble, delicately moulded, and the ground filled with mosaics, would rival in richness and might easily be made to surpass in beauty, the gorgeous fronts of Siena and Orvieto Cathedrals; or a less extravagant proceeding would be to use or develop such banded work as that of Clyffe. The hands might be of a variety of materials—stone and flint, brick and flint, brick and terra cotta, brick and falence, &c. And any one who knows the beautiful effects of this handed work of the various Italian buildings will confess that it would be worth more than a mere trial. Probably some are thinking that these are impracticable suggestions, and there would be, of course, two difficulties in carrying them into practice,—one, to get, even so short a distance, out of the old grooves; and the other, to find a public who would appreciate or pay for our efforts to give them something worthy of this great, wealthy, and go-ahead nineteenth century. But surely difficulties should act but as spurs to our efforts, and I ask, at least, that the matter should receive consideration at your hands.

Mr. Cole A. Adams proposed a vote of thanks to Mr. Baggallay, and observed that the architectural Association last year visited some of the churches mentioned. Had he known the subject of the paper in time he would have placed some photographs taken by Mr. Robinson at the disposal of the Institute for exhibition.

Mr. Charles Barry seconded the vote of thanks, and said the subject had not received any extensive study by the architectural profession, partly, no doubt, from the want of a demand for flint-work. It, however, deserved a great deal more study than had been given to it, and it occurred to him that the flint architecture of England might well be made the subject for one of the essays of the Institute in the future. Except in England the flint architecture was, he believed, almost unknown, and, therefore, there was the greater necessity and opportunity for its study by English architects. It was curious that though the chalk formation where the flint strata was found prevailed over a large part of the country, the flint architecture seemed to be confined almost entirely to the eastern counties; for, though there was the same kind of architecture to be found in Sussex, he believed it was extremely rare in that country, and, at any rate, had not received the care and elaborate artistic treatment which had prevailed in Norfolk and Suffolk. They must, therefore, come to the conclusion that there was some object in adopting that style by the architects of the fifteenth and sixteenth centuries. What was that object? Most probably it was to obtain a greater development of the colour decoration which was known to have been the fashion of that period. The object could not have been economy, because the treatment seemed to be anything but economical. The object, therefore, was, most probably, to obtain colour represented in a durable material, together with a solidity of building. Colour decoration was again receiving the attention of the architect, and it might be that, inspired by these old examples which Mr. Baggallay had discussed, there would arise a desire to use the flint-work of our forefathers. He could not agree with those who complained that inattention had been given, with a few exceptions, to the entrances of the churches. An exaggeration of the doorway often proved to be a defect. The doorway was an important feature no doubt, and, in some cases, might be emphasised without making it the chief feature in the design, but its exaggeration was altogether out of place, as witness the doorway of the Army and Navy Hotel in Victoria-street, Westminster.

Mr. W. M. Fawcett believed that the reason why flint was used more in Norfolk and Suffolk than in Sussex was because it was more difficult to get stone in the eastern counties than in Sussex. It was easy to get Caen or Portland stone by sea to Sussex, but not so easy to get it to Norfolk and Suffolk.

Mr. Charles Barry remarked that there was the sea coast in both cases.

Mr. Fawcett replied that that was so, but the stone would have to be carried farther in the case of the eastern counties. The stone used in Norfolk and Suffolk appeared to have been obtained from Barnack and floated down the canals to Lynn and Norwich. As to colour, he thought that much ordinary colour was used on the churches described, but it had now totally disappeared except in one or two instances in which only traces remained, such as Cockfield Church, Suffolk, in the stone panelling work. The panelling at Isworth Church also suggested that colouring had been used on the stone. He did not believe that the plastering used in these churches was put on in the same way as concrete was now used, viz., with hoards and planks. With regard to the method of laying the stones, he believed they were then laid with greater care than now, the most care being taken that each stone should rest horizontally on its whole under-surface, instead of giving a degree of unrest to the whole wall by being tilted as at the present day.

Mr. Lacy W. Ridge remarked that there appeared to have been no influx of wealth in the thirteenth century, and the consequence was that almost without exception the twelfth-century churches existed. There was a good deal of square flint work in square panels, alternating with stone panels, but little beyond that.

Mr. Aston Wollf referred to Long Melford Church* as a model example of the use of flint and stone work in their most legitimate way. In the case of modern work it was necessary to use the stones in bands. The only modern example he knew was that of a house in Brighton built with flints, which was a charming example of their legitimate use.

Mr. James Fowler (Louth) said that in Lincolnshire and East Yorkshire he could not call to mind one example of this sort of work, because, although they were chalk counties, flints were very scarce there. He wished, for the sake of architecture, that there were plenty of them.

The President, referring to the round towers, said that these had been matters of interest to him for many years. He had examined them in all parts of the country, and had come to the distinct conclusion that they were not of a later date than the rest of the churches. With regard to the matter of decoration, he did not believe that any of the Mediæval work ever partook of the nature of a sham. These flints, which looked so nice and square in the panels, had at the back a strong affinity for the wall, and there was no stronger wall than a flint one, rubble-built. It certainly required a good proportion of flints and good lime, but he could give some remarkable instances of the tenacity of flint-work. The chancel of Cromer Church was destroyed some 200 years ago, and four years back he was asked to state what its restoration would cost. He spent seven hours over the work, and from the stone and flint work on the ground he was able to reconstruct minutely every detail as it originally stood, and give an estimate of the cost, which was 10,000*l.* He believed that in Mediæval times the rubble walls were plastered. In modern days people had been very much afraid of plaster, but if properly executed, with the right materials, it was a sound and legitimate mode of covering a rubble wall, only the old plaster was totally different from our modern cement. The making of inscriptions round buildings was one of his old fancies. It was an ancient and wholesome German custom, and had been made an ornamental feature in Norfolk. At Mendisham he got a coal-hammer and thumped away at the walls. It was like striking the granite rock; there was a solidity of sound about it which was delightful to hear. The vote of thanks was then carried by acclamation.

Mr. Bagallay, in reply, said that he had understood the Architectural Association's excursion was confined to the neighbourhood of Bryn St. Edmunds. He knew of no flint-work abroad, except some simple diaper-work near the coast of Normandy, which might be attributed to English influence.

The Society of Science, Letters, and Art of London has awarded the gold medal of the Society to Mr. W. P. Buchan, Glasgow, for "Practical and Literary Contributions towards the Advancement of Sanitation."

* See illustration in *BUILDER* for Aug. 23, 1884.

NOTES ON THE ANCIENT CHURCHES OF LONDON.*

It is proposed in this paper to refer to the group of churches existing or formerly existing within the walls of the City, or so close to the latter as to cause them to be a portion of the City, to all intents and purposes; to make some observations upon their dedications and orientation; and finally, to describe the portions of the ancient buildings which have survived all the visitations of time, the accidents of fire, and the hands of the "improver," to our own times.

An ordinary passer through the streets of our great City, so crowded during the day, and so deserted at nightfall, is not so impressed as must have been our grandfathers with the great number of churches within the limited area of the City. A glance at any old view of London is sufficient to show what a fine effect was produced by the towers and spires of these buildings rising high above the houses, of lesser height which then formed London. To a greater degree is this so if the view we are inspecting is that of the City before the Great Fire of 1666, which levelled so many of the sacred buildings of the City which were not afterwards rebuilt. Now the number is still further diminished, while the lofty nature of the buildings erected from one end of the City to another, often higher than the church-towers themselves, has completely destroyed the relative scale of proportion between the churches and the other buildings, and the appearance is diminished accordingly.

The number of parish churches existing before the Great Fire was 109, of which number thirty-five were not rebuilt after that event. If we add to these the names of the four churches removed in the fifteenth and sixteenth centuries we have no fewer than 113 churches as having once existed in London, apart from the cathedral and the great monastic establishments. There is record, too, that there were in the twelfth century three or four old parishes incorporated in the new Priory of the Holy Trinity, Aldgate.

Although these figures are well known, attention has not been drawn to the very remarkable grouping of these buildings. They do not cluster around the cathedral as in many other Mediæval cities, such as in Paris, for example, but they are the closest together more to the east of the cathedral. A reference to any old map where the churches are marked (Vertue's, for instance), shows this at a glance.

Let us, however, be a little more precise, and render the result of measurement. Taking the statue of King William IV. as a centre, and striking a radius of only a quarter of a mile, we find that the whole of the following churches formerly stood within this small space, notwithstanding that a large portion of the half-mile circle is occupied by the Thames:—SS. Michael (Paternoster Royal), John Baptist, Mary Bothaw, All Hallows the Great and the Less, Laurence Pountney, Martin Orgar, Michael (Crooked-lane), Swithin, Mary Abchurch, Stephen (Wallbrook), Mildred (Poultry), Christopher-le-Stocks, Bartholomew, Benet Fink, Mary Woolnoth, Nicholas, Edmund the King, Peter (Cornhill), Michael (Cornhill), Allhallows (Lombard-street), Benet (Gracechurch), Gabriel (Fenchurch), Allhallows Staining, Margaret Pattens, Andrew Hubbard, Leonard (Eastcheap), Margaret (Monument-yard), George, St. Mary-at-Hill, Dunstan-in-the-East, Botolph, and Magnus,—or thirty-five in all.

This extraordinary group of churches has not its parallel in any other city of Western Europe, Rome itself not excepted; and the reason for their being so crowded together is a problem far more readily proposed than answered. Its solution is difficult, but we may at least be content to consider the fact. If we enlarge the radius of our circle, we shall find that proportionately the number of churches is increased up to a certain distance, but no more; but the small space noted is sufficient for attention to be called to the remarkable fact indicated.

Following the analogy of arrangements in other cities, we may reasonably conclude that these churches were erected where the population was the thickest, and where, in consequence, they were the more needed, a conclusion which receives some support from the fact that

* A paper by Mr. E. P. Loftus Brock, F.S.A., read before the St. Paul's Ecclesiological Society, in the Chapter House of St. Paul's, April 15th, 1885.

away from the centre indicated, the churches gradually dwindle away until but a few only are found, one at each of the gates of the city, fewer still away from the walls, and still less along the line of the ancient thoroughfares of Fleet-street and the Strand. It will be observed, however, by reference to Faithorne's map of the City as it was before the Great Fire, which shows generally the outline of all the churches, that the orientation of these buildings was fairly perfect, showing that it had been carefully and purposely studied. I conclude from this that whenever these buildings were founded space was sufficiently at command to admit of this being provided for, even although they were erected in what were then the most closely-populated portions of the then existing city.

The periods of the foundation of these buildings ought to be clear to us among the mass of documentary evidences of all kinds that have been handed down to us, and by the painstaking researches of so many generations of antiquaries from the time of Stow to the present day.

Such, however, is far from being the case. Stow speaks again and again of the building of churches, money being left by will, one citizen helping in this good work of building, another in some other, and the like. This occurs from end to end of his carefully-compiled history.

His numerous continuators and successors have not added much in addition, except of the same kind. When we examine more closely these evidences, we must come to the conclusion that the works named were but the ordinary works of rebuilding upon an old, and not the construction of a new foundation,—in fact, that churches had been on the sites long anterior to the works named. Thus, for example only, it is related that W. and John Otewich were the founders of St. Martin Outwich; but it is evident that the church existed before their time, since John, Earl of Warren and Surrey, was its patron, temp. Edward II. St. Stephen's, Walbrook, it is related, was built in the fifteenth century, but a new site being mentioned, it is evident that the parish was not a new one, and we find a reference to its existence temp. Henry I. Allhallows, Lombard-street, was built in 1516, but there is a reference to it before the Conquest. Augustine's Papey was founded in 1430, but the church is mentioned early in the preceding century.

We glean, however, the following from older records than Stow:—

The Church of Canterbury was the patron of many churches in London, called peculiar, thirteen in number, which appear to have belonged to that foundation from a very early period. I can find no reference to the actual dates when they were presented to Canterbury but from this circumstance, the date is likely to be an early one, and the more so since some changes of patronage and transfers of later date have been carefully recorded. St. Martin Orgar is stated to have been given by Odgarus in early times, and Allhallows, Lombard-street, by Brightmens, citizen of London, 1053 or 1054.

There is reference to the patronage of several churches in London being held by the Dean and Canons of St. Martin's-le-Grand. They were possessed of these anterior to the Conquest, since William the Conqueror, by a charter so early as 1068, confirmed them in their possession. One of these, the Church of St. Alphege, is mentioned by name. The following churches are known to have been in their patronage at a later time, and they are probably those to which reference was intended in the charter referred to:—St. Anne, Aldersgate; St. Botolph, Aldersgate; St. Katharine Coleman.

We are informed by Newcourt, in his *Reperitorium*, that several churches were collated to the Dean and Chapter of St. Paul's. No evidence is forthcoming as to when they were bestowed, but we find that in the time of Ralph de Diceto, dean from 1181 to about 1204, a survey was made, and we know from this that the following churches were then in existence, as they had been probably for a long time before:—SS. Anthony; Augustine; Benet, Gracechurch; Benet, Paul's Wharf; John Baptist, Walbrook; John Baptist (Zachary); Mary Aldermany; Mary Magdalen; Michael, Queenhithe; Michael-le-Quent; Olave, Jewry; Peter, Paul's Wharf; Peter-le-Poor; Stephen Coleman; Thomas Apostle; and that St. Nicholas Olave was given to the Dean and Chapter by Gilbert Foliot,

Bishop of London in 1163. Had the others been presented at a later date, I think that there would have been a record. As it is, their gift seems to be lost in the dim past.

Matthew Paris relates ("Lives of the Abbots of St. Alban's") that in the time of Paul, fourth abbot, 1077, there were many churches in London belonging to St. Alban's, of which St. Alban's, Wood-street, was one. It is said to have been originally a chapel erected by King Offa.

St. Botolph is said to have been founded about the time of the Conquest, and St. Mary-le-Bow was being built at the same time.

St. Botolph, Billingsgate, seems to have been of early foundation, for the gate was called Botolph's Gate *temp.* Edward the Confessor.

The body of St. Edmund rested for three years in the Church of St. Gregory.

There was certainly a church at St. Helen's before the foundation of the Priory, and called by the same name.

St. Margaret Moses was given to the Priory of St. Faith, Norfolk, in 1105, by the founder.

St. Martin, Ludgate, is said by Robert of Gloucester to have been founded by King Cadwallo, who was buried there in 677. This reference is, however, of more value to show that the church was there at the early date at which this author wrote.

St. Martin, Vintry, was given to the Abbey of Gloucester in the time of the Conqueror, and St. Mary Woolchurch at the same time to St. John's, Colechester; St. Michael's being given to Evesham by Another the priest about the same time; St. Nicholas Acon being given to Malmesbury in 1084.

The evidences of new parishes are clear enough, but they are not numerous. They are as follows:—St. Mary Woolchurch appears to have been one, since it is called a new church. St. Mary-le-Bow was built *temp.* William the Conqueror. St. Mary Monmouth was a small chapel at first attached to the House of the Monks, St. Leonard, Foster-lane, was founded between 1231 and 1241. Holy Trinity, Minorics, grew out of the Nunnery at the Dissolution, as did Christ Church parish at the same date, on the suppression of two smaller parishes, following at this later date what was effected when Holy Trinity Priory, Aldgate, was founded at an earlier one, when three or four old parishes were suppressed. St. James, Duke's-place, was founded 1622, on the dissolution of this priory; and St. Anne, Blackfriars, 1597, on the demolition of the old parish church with the conventual one.

This is a brief outline of the recorded history of the London parishes, and it justifies the remarks made with respect to its meagre nature. This does not apply to the foundation of the Norman and later monastic establishments, of which the recorded dates are ample, numerous in later times, but apparently very few in number anterior to the Conquest. The later histories of the parishes, too, are precise enough, and no work of building of especial note appears to be without its record. All this, however, points to the uncertainty which hangs over the foundation of the great bulk of the London parishes; for it will be apparent from what has been named that the early records for the most part speak of the parishes as then being in existence. Not a word is said to justify the belief that they were new creations of that exact period. Had they been so it would, we may naturally expect, have been stated. This was so, in fact, as we have seen, in the one case which has been referred to, of St. Mary Woolchurch, and of the new buildings, also at St. Mary-le-Bow and St. Giles, Cripplegate. We know also the circumstances which called the parish of St. Leonard, Foster-lane, into existence. Should we not have had records equally precise if the other parishes were even of but moderately early date?

We are forced, I believe, to the conclusion that the vast mass of the City churches, crowded together as they were, were founded in times anterior to the Norman conquest.

This is a conclusion somewhat startling, and it opens up to us a field of inquiry of no small interest. What were the forces at work to produce so great a number of churches in so small an area, and when it is but reasonable to conclude that the population must have been small comparatively for the space? How was it that the foundation of other churches ceased to so great a degree at the Conquest? When did it begin? How was it that other churches were not founded to keep pace with the increase

of the population and the growth of the City westward?

When we come to consider the dedication of the buildings we find evidence which points equally to an early rather than to a late foundation. Let us consider the names of the saints to whom the churches are dedicated.

St. Alban, the proto-martyr of England, occurs once; Allhallows, the old Saxon form of All Saints, no less than eight times; St. Alphege, the archbishop, murdered by the Danes, once; St. Andrew, four times; St. Anne, twice; St. Anthony, once; St. Augustine, once; St. Bartholomew, three times; St. Benet, three times; St. Botolph, four times (at three of the gates of the City); St. Bride, once; Christ Church (as a parish), once; St. Christopher, once; St. Clement, once; St. Dionysius, once; St. Dunstan, twice, once at each end of the City, east and west, in fairly corresponding positions; St. Edmund the King, murdered in 866, once; St. Ethelburga, once; St. Ewan, once; St. Gabriel, St. Giles, St. George, St. Gregory, St. Helen, once each; St. James, twice; St. John the Baptist, twice; St. John the Evangelist, once; St. Katherine, twice; St. Lawrence, twice; a like number to St. Leonard; St. Magnus, once; St. Margaret, four times; St. Martin, five times, apart from St. Martin-le-Grand; St. Mary, fifteen times; St. Matthew, once; St. Michael, seven times; St. Mildred, twice; St. Nicholas, four times; St. Olave, three times; St. Osyth, once; St. Pancras, once; St. Peter, four times; St. Stephen, twice; St. Swithun, St. Sepulchre, St. Thomas the Apostle, the Holy Trinity, and St. Vedast, once each.

There seems never to have been a change of dedication. The names by which the churches are known in early times are those recorded in later ones. St. Osyth, however, was called afterwards by the name of its rebuilder, Benedict Shore, *temp.* Edward II. There is also reference in a list of the churches under the patronage of Canterbury to one dedicated to St. Werburg. St. Agnes occurs as a double dedication with St. Anne.

The mention of these names will at once show that many of them are of saints who were popular in Saxon rather than in Norman or later times, and thus evidence of another kind is adduced in support of the foundation of a large number of the London churches in times anterior to the Conquest. The dedications to SS. Alphege, Benet, Botolph, Edmund, Mildred, Osyth, Ewan, Olave, Dunstan, Ethelburga, and Swithun, are so thoroughly Saxon as to render it far more probable that they would have occurred when Saxon influence was strongest, rather than when it was weak. The dedication to St. Pancras is likely to be very ancient, since it was introduced by Augustine at Canterbury. So are also those to SS. Bridget, Anthony, Augustine, Benet, and Dionysius. St. Martin was always popular in England as he was in Wales, Gaul, and Switzerland, and from the continuance of his popularity from early to later times, no safe deduction as to the age of the dedication can be drawn from the naming of a church after him. Still, of the number of churches so called in the City it is within the range of fair reasoning to believe that some of them are of remote antiquity. We must, in this respect, bear in mind that it was to this saint that Augustine, on his arrival, found the little Roman Church at Canterbury already dedicated. It is desirable also to note that, of the other dedications, there are none, not even to St. George, that might not have occurred in Saxon as well as in later times. St. Mary, St. Michael, and Allhallows were, in fact, as favourite dedications in the earlier days of the church in England as they were in later ones.

There is, however, another statement referred to by more than one of the older historians of London, and it appears, too, in the church itself. This is the foundation of St. Peter's-upon-Cornhill by the British King Lucius, in Roman times. This is the Lucius who, in the year 156, according to Bede (although I do not think that the statement is more than a compilation from other sources), sent a letter to Eleutherns, Bishop of Rome, "entreating that by his command he might be made a Christian." This statement occurs also, much in the same terms, in the Saxon Chronicle and in the Book of Llandaf. All these, of course, were compiled long after the event; probably it occurs also in the other records, after the usual manner of the times, one compiler following another frequently

in the same words. On the face of it the statement appears more like a pious fraud of the seventh century than a contemporary record of the second. At that early time evangelical doctrine would prompt a man to appeal to the Great Head of the Church rather than to a pope for direction in the spiritual life. In the seventh, it was not unimportant to show to the ancient Church of Britain, flourishing in the un-Saxon parts of the country, and still independent of Rome, that in the earliest times popes were appealed to by the British Christians. The statement will not bear investigation, for, as has been shown more than once, Eleutherns was not Bishop of Rome until at least twenty years after the date named. There are two emperors named in the statement, Commodus and Verus, as reigning together, which they never did; and to this may be added that King Lucius himself belongs so entirely to the realm of romance rather than history that we have no reliable evidence of the actual existence of such a personage. I believe fully in the existence of Christianity in Britain in ancient Roman times, in that of a Bishop at London, and consequently of churches in this remote period; but we may dismiss the record of the foundation of St. Peter's-upon-Cornhill at this time as being too uncertain for service in our inquiry. The relics of the existence of Christianity in Roman times which have come down to us consist of personal ornaments, some plates of metal marked with the Chi Rho, now in the British Museum, and the like. They are few in number, but are important in their evidence. The reference to St. Peter's may be the dim indication of a remote tradition, similar to that which points to the foundation of the earliest cathedral on the site of the present building beneath whose shadow we are gathered. There is another tradition worthy of passing remark. Stow relates that the descriptive "Staining" attached to the Church of Allhallows, Mark-lane, was in consequence of the building being erected originally of stone, when so many others were of wood. Stow could not have foreseen the discussions among ourselves as to the erection or non-erection of stone churches in Saxon times, and his record of what was thought in his day to be the reason for this name is of interest to us, as marking a state of things likely to have existed in the City, but only in early times.*

ARCHITECTURE IN THE NINETEENTH CENTURY.

This was the title of a lecture delivered by Mr. George Aitchison, A.R.A., on Thursday evening, April 16th, at No. 9, Conduit-street, Regent-street, at a meeting of the Society for the Encouragement of Fine Arts. Mr. Ewan Christian, President of the Royal Institute of British Architects, occupied the chair.

The Chairman, in opening the proceedings, said he had no doubt the lecture to be read that evening would be an interesting one. It was upon a very interesting subject, but he was told that it was upon architecture generally, and not upon that of the nineteenth century in particular. Architecture generally concerned all; it concerned them in their homes, and in their walks abroad, and in the character of the nation. It concerned them in their homes because, unless their homes were made comfortable and pleasant by their surroundings, a great deal of the pleasure of their lives must necessarily be curtailed. It concerned them very much in their walks abroad, because there was nothing more miserable than to see, as they were obliged to see in some parts of London, miserable designs most miserably carried out. One of the tortures of his life was to walk through some of the suburbs of London, where one could see street after street of houses, supposed to be for the working classes or mechanics, — people who ought to be instructed in the knowledge of architecture, and, at any rate, ought not to have things put before them that were miserable specimens of bad taste. If, however, one walked through streets where there were beautiful buildings designed by good architects, and where mind was clearly shown in every detail as well as in the main outline of the work, then they had something which was a pleasure to look upon, and which added to the charm of their walks through the streets. He often thought how little architects were properly considered in that matter. There was

* To be concluded in our next.

no greater benefactor than a great architect. He was a benefactor to every person who walked along the streets. What would London have been if such a man as Sir Christopher Wren had not been living at the time when the Fire occurred? Where would have been the beautiful towers and spires of London? Where would have been that wonderful view,—the most beautiful City view he knew of, and which he did not think was to be surpassed anywhere in Europe,—the view looking up Ludgate-hill, with the beautiful spire of St. Martin's, Ludgate, backed by the magnificent dome of St. Paul's as the culminating point? In the City of London there was as fine a collection of towers and spires as was to be seen in the world. However, such a man as Sir Christopher Wren did not arise in every century. In the present century, when the Houses of Parliament were burned, there was fortunately a Barry to come forward to produce that magnificent palace at Westminster. People might and did quarrel with it, still it was a magnificent building. Then, again, the completion of Somerset House, towards Wellington-street, was one of the most beautiful things done in this century, according to his idea. Then there was the beautiful building of the University of London, which was one of the finest Classical buildings of modern times. Having mentioned several other buildings, the Chairman concluded by saying that the subject of architecture was one of the most important that could be considered.

Mr. Aitchison in the course of his lecture remarked that Sir H. Wotton said that "Architecture can want no commendation where there are noble men, or noble minds." Architecture was looked upon in England with very different eyes to-day to what it was in the first quarter of the seventeenth century. The finest buildings never excited enthusiasm, rarely even gratitude. No fine art existed unless there was an effective desire for it; and for architecture there was the greatest indifference. If architecture was to be excellent there must be a general and passionate desire for it; and amongst the architects a keen desire for appreciation and honour, and "that last infirmity of noble minds," fame, must be the incentives. It was just possible some of the fine arts might be cultivated for personal delight. To find the materials to follow the pictorial arts was within the means of all; and a lump of clay for modelling was easily obtained by the votary of sculpture. But that could hardly be the case with architecture, because that was an especially costly art, and could only be indulged in by wealthy persons and States, but when once embodied it could be enjoyed by everybody for nothing. Man was a thoughtless, selfish, ungrateful creature, for many of his greatest benefactors had begged their bread. Homer to wit. Many of the different arts that made up architecture could to some extent be understood by the present luxurious, practical, and prosaic generation. For example, the public could understand the advantage of a building not falling down; that it was not deformed by cracks and bulging; that it was well lighted, and could be easily and thoroughly warmed. It was the appreciation of architecture and of its treatment that he wished to enlarge upon. There was no fear of the Englishman of to-day not being keenly alive to anything that would touch his pocket. Architecture meant the rhythmical arrangement of the exterior of a building,—the proper proportion of parts to each other and of parts to the whole, the proper alternation of light and shade, the impressiveness or picturesqueness of the whole outline from various points of view, the arrangement of the interior in proper proportions. When all this was done, and done well, or should have, its own peculiar ideal. So far as he could see, the civilised world for some time past has had no ideal, and consequently the architects could not produce it. The leaders of architectural criticism were like the political leaders in the sister isle, they did not know what they wanted, but they were determined to have it. Architecture had always sprung from something, a cave, a hut, or a tent, and had been but slowly modified, improved, and perfected. The hope dearest to his heart was to see the public loving and desiring architecture, and making up its mind what it would like,—simplicity, grandeur, or picturesqueness. The most important thing for architecture was for people to love it, and, to love anything

much, it must be understood. People nowadays who spoke of architecture spoke of it disparagingly, and said they knew nothing about it, and, they might well add, they cared less. A good idea of what is the fate of architecture in the present day is that people only ask if they can get their work done at current prices. They all knew the miserable pittance a grateful country paid Sir Charles Barry for a labour of twenty-five years, 40,000*l.* Few living architects were known by name outside their own profession, and he did not believe there was a knight among them, but if there were he obtained the title in return for political assistance. Few men who could afford to build a house did so; they bought or hired a ready-made one. The wretched leasehold system went some way to make London the most common-place capital in Europe, for who would give time, money, and thought to a place when it must lapse to a stranger? Styles were only the expression of what people liked at a certain epoch. Each generation of architects acquired more skill and endeavoured to keep closer to the changes of its day. They had had the Gothic revival, which had done excellent service, but it was doomed from the first to be but ephemeral. Whether they were to have good work, or whether they were to have bad work, must be left for the present or future generation to decide. Until the public knew what they wanted, and until they learned to like something, how was it possible to invent anything for people's delight? The public, by its ignorance and apathy, lost one of the tasteful pleasures of life. Music and Architecture both suggested to men thoughts, feelings, that might be more important than words. It was impossible to give a reason why certain proportions gave pain or disgust; why others raised no emotion, while others gave delight. There were many fine buildings in London. The much-abused National Gallery was beautiful in its central portion, and the Reform Club was, perhaps, the most perfectly proportioned building in Europe. To render architecture perfect it must be associated with sculpture and painting. St. Paul's and Westminster Abbey were the epitome of London; the Pyramids, of Egypt; St. Peter's, of modern Rome; and Sta. Sophia, of Constantinople. When the glory and greatness of a city had passed away, nothing so forcibly reminded people of its former magnificence than the architecture of its buildings. Architecture was one of the expressions of national life, but it seemed in the present day to be entirely overlooked. It could not be denied that the small villas lately built in London were more tasteful than they have been since Medieval days. The striking characteristic of modern buildings was their flimsiness. They appeared to be built for temporary use, and a few years would see them in ruins, were it not for the fostering hand of man. They all bore marks of having been built for one man's lifetime, after which they would pass away. As to churches in good Queen Anne's time, they were expensive structures, costing as much as noblemen's mansions; while nowadays they were little better than sheds of rubble. It was almost a desecration to call some of the present buildings churches, for they only offered a place for prayer, rest, and shelter for one day in the week. England was said to be richer than she ever was before; but one was inclined to doubt it under the circumstances. They heard of colossal fortunes being made in manufacture, but what did the rich do with their money? It took three years' income of a labourer to build him a good cottage; yet what millionaire could point to a house in London that had cost him three years' income? Then, again, this country had a national income of 80,000,000*l.*; but in the last fifty years had one year's income been expended per annum upon public buildings? In conclusion, the lecturer remarked that he was afraid they would say they had heard nothing about the nineteenth-century architecture; but they must blame the printer for that, and not him, as he never said a word about the nineteenth-century architecture, and never intended to say a word about it.

The Chairman observed that they had heard a very interesting lecture on architecture, and Mr. Aitchison had told them some home truths. Mr. E. P. Loftus Brock (Hon. Secretary), thought Mr. Aitchison had said a great deal about nineteenth-century architecture, and they might look forward much more hopefully as to what

the architecture of the next century would be. He was glad to find that the nation could do without architects. He fully endorsed what the lecturer had said as to the nature of a building of some of the churches in the country. No house was built now unless it was made to appear with some style, and shopkeepers vie with each other in making their shops look pretty. The result was there was an amount of display in some of them which angred very well for what would be done a little later on. If they contrasted old buildings that were erected at the commencement of the century with those of the present day, what a difference there was. Then, again, at the present day, good materials were used, and they were not content with cement and shabby marble and things of that kind, such as I remembered being used thirty years ago. Architects must be content with small things. They were not days for building cathedrals or grand mansions, so they must be content with little small fish that were floating about in the present waters.

The Chairman proposed a vote of thanks to Mr. Aitchison, which was seconded by Mr. Edmeston, and agreed to.

Mr. Aitchison replied, and the proceedings terminated.

Illustrations.

THE CATHEDRAL AND ALCÁZAR OF SEGOVIA.

THE subjects of the two double-page illustrations which we give this week,—the Alcázar, Segovia, and the Cathedral of the same city,—will be found described and commented upon at some length in the article entitled "Notes in Spain, Architectural and Historical," printed on a preceding page (See p. 377.)

BLOCK OF BUILDINGS IN GREAT TOWER-STREET, E.C.

This block of buildings has been recently erected by the City of London Real Property Company (Limited) in Great Tower-street and Mincing-lane for office purposes.

The premises are five stories in height, and have frontages to Great Tower-street and Mincing-lane of 147 ft. and 83 ft. respectively. The street fronts are constructed of red sandstone, supported on pilasters and plinths of polished grey and red Aberdeen granite. There are main entrances in both streets, and subsidiary entrances to the ground-floor offices in the Great Tower-street front.

The basements facing the streets are well lighted and used as offices.

The staircases are of ironwork with Craigleith stone steps and landings. The dado on the stairs and in the corridors is formed with glazed tiles of suitable pattern and colour. The building is roofed with Brunseley tiles.

There is a large amount of ironwork used in the construction.

There are lavatories in various parts of the building; and water and gas are laid on to almost every room. The building is well lighted in every part.

It has been constructed from the design and under the personal superintendence of Mr. Edwin A. B. Crockett; the contractors being Messrs. E. Lawrence & Sons, whose general foreman was Mr. Chandler.

NEW SHOPS, GUN-STREET, READING.

THESE buildings, of which we give a geometrical elevation, have recently been erected from the design and under the supervision of Mr. Ravenscroft, of Reading; Mr. Searle, of the same town, being the builder.

The work has been substantially and satisfactorily carried out, and the street front, composed chiefly of red rubbing bricks and Luton bricks, has been very carefully executed; the whole of the moldings and carved portions being executed by hand.

Internally, these buildings are fitted with lifts and other business appliances; and the shops are warmed by means of hot water, and ventilated by shafts carried up in the chimney-stacks, &c.

The total cost of the two shops amounted to just over 2,200*l.*

OLD LONDON CHURCHES. All Hallows, London Wall.

INK-PHOTO, SPRAGUE & CO., LONDON

SEGOVIA.

OLD LONDON CHURCHES.

THE two views of Old London Churches are given in connexion with the paper on the subject by Mr. Loftus Brock, part of which is printed in this number [p. 580], and the remainder of which will appear in our next, accompanied by two other views of churches referred to, reproduced, like the present ones, from old engravings.

The view of Allhallows-on-the-Wall is taken from the series of engravings published in 1740, by R. West and W. H. Toms, and engraved by J. Poms. A tolerably full description of the church from Toms's book was quoted by Mr. Brock, in his paper, and for convenience we transfer it to this portion of our columns:—

"Allhallows-on-the-Wall. This church is so-called as being dedicated to All Saints, and is situated on the north side of London, a little easterly from Bethlem Hospital, and is in the ward of Broad-street, but the parish is in the wards of Broad-street, Bishopgate, and Lime-street. When it was first built I find not, but 1207. was laid out on it in the year 1627.

II. It is of the Gothic and Tuscan orders, and not having been consumed by the late Fire, is not so beautiful as those that are wholly new erected.

III. The church being pretty old and not large, the wainscot is not so considerable as some others, but it is well paved, and at the west end is a small gallery (whose front is adorned with shields and their compartments), elevated on small columns of the Tuscan order, which was newly beautified in the year 1639, at the charge of the parish. At the altar, the Ten Commandments, Lord's Prayer, and Creed are one in black, with Moses on the north and Aaron on the south side of the Decalogue, finely painted, all under a Cornish, in the middle whereof are the Queen's Arms, carved and put up at the charge of the parishioners, and the whole new beautified, in the year 1703. And a little sly [southerly] from this altar-piece is a piece of antiquity, being the Commandment one in an old character, with glass before them, in a triangular frame, nearly 5 feet high.

4. On the north side of the church is a large table of the benefactors to the poor, well done in gold upon black. Mr. Cromshaw gave 50*l.* Dr. Lewis, the late Rector, 40*l.*, and there are 24 others, many of whom gave near the last-mentioned sum. And close by this table is a very large piece of painting upon cloth in a strong frame, the Effigies of Queen Elizabeth lying on her Tomb with the Ensigns of Royalty and two golden Lyons, one at her Head, the other at her Feet, which piece was there placed in Memory of that Queen, as being (when alive) a nursing Mother to the Protestant churches.

Upon which piece are these lines:—

Read but her Reign, The Princess might have been
For Wisdom, call'd Nicaulis, Sheba's Queen.
Against Spain's Holofernes, Judith etc.
Dauntless gain'd many a glorious Victory.
Not Deborah did her in Fame excel,
She was a Mother to our Israel;
An Esther, who her Person did engage
To Save her People from the Publick Rage;
Glorious Patrons of true Religion,
In court a saint, in Field an Amazon;
Glorious in Life, deplored in her Death,
She was unparallel'd Elizabeth.

Yes, Mo. Davs. }
Born anno 1534 } Reigned 44 & 17.
Crowned anno 1558 } Dyed anno 1602.

V. The altitude of this church is about 21 feet; its length, 80; and breadth, 26. And the height of the tower is about 50 feet, wherein are bells to ring a peal, besides a small one, which is used to ringing the People to Prayers, & therefore called the Saints bell."

It goes on to give the name of the (then) incumbent, the tithes, the name of the then sturter, stating that here are prayers every wednesday, Friday, and holy day at eleven o'clock. It gives the composition of the vestry, mentions the names of the streets, alleys, and courts, and concludes by stating that the number of houses is 300.

St. Dunstan-in-the-West, the other church alluded to, was removed only about fifty years ago. It was taken down to widen Fleet-street, & Mr. Brock states that its foundations are still there.

Jambrian Archaeological Society.—This Society will make Newport its headquarters in its next. Lord Tredegar is to be the president, and Mr. T. D. Roberts the local secretary.

ON RENDERING WOOD FOR BUILDING PURPOSES NON-INFLAMMABLE.*

THE rendering of wood for house construction non-inflammable should be a subject of great interest to all. There is, however, little information obtainable from published works, though small hints on the subject may be sometimes met with in encyclopedias, &c. The preservation of wood from rot may be found treated of in several books, which contain also information on the physical construction of timbers, the various preservative solutions, and the methods of injection and impregnation. On all these points full information is necessary to enable us to take a comprehensive view of the matter.

Timber structures are often a necessary evil, either from fear of earthquakes or from scarcity of other material, either for the entire building or for the roofs only. I especially allude to Japan, China, South America, the Southern States of North America, and Jamaica, in which last the roofs are of shingles of willow, a very absorptive wood, and, therefore, easily treated with chemicals for resistance to fire. Let us see, then, how these wooden buildings may be preserved from destruction by fire in the best and cheapest manner, remembering always that though a single house so treated would not blaze, yet if in the midst of a large conflagration it would be carbonised and thus destroyed, so that it would be necessary to have a block of prepared houses together in order to stem the tide of fire in a large timber-built town. This might be done by Government order, by arrangement between the house-owners, or by a fire insurance company. The reduction in insurance rates alone would pay a handsome interest on the first outlay.

Let us, then, pass the various processes in review, with their advantages and disadvantages fully set out, and with their capabilities for preserving textile fabrics as well as timber from fire.

Should it be decided to impregnate the wood with chemicals this can be done, or a superficial coating over the wood may be applied of fire-proof and waterproof paint, or both, though many prefer the internal woodwork plain. Any preservative used in external situations should not be liable to be washed out by the rain. How far these non-inflammable salts which unite chemically with the nitrogenous matter in the wood are capable of resisting wet it is difficult to say with certainty, but there are some, which we shall proceed to give further on, which do effectually resist both water and soap.

Again, it must be a *sine quâ non* that, whatever the fireproofing material may be, it must be one which, when exposed to the action of fire, does not give off injurious or suffocating smoke. Also, if the impregnation of the timber is to be thorough, i.e., through the whole of the wood, it would be most advantageously done whilst the wood is green, and the sap uncongealed, otherwise the tubes become clogged, and the injection of the chemicals extends only to a certain depth in the wood if the latter is dry.

Impregnating the timber when green, and operating on large balks, would perhaps be more economical than upon smaller pieces when cut up, but the salts are said to cause shortness of grain, so that it might be difficult with the ordinary hand-saw to cut out the finer kinds of woodwork used for interiors. Lastly, if the woodwork is impregnated when green, the solution acts chemically on the sap, and destroys the germs of rot. Of course, the "shortness" of the wood caused by salts applies to balks, whether prepared when green or well-seasoned.

With regard to the construction of the tree itself, Dr. Boucherie considers that no connexion exists laterally between the vertical sap-bearing tubes, as is shown by applying a coloured solution under a moderate pressure to certain tubes at one end of a felled tree, when the same tubes at the other end of the tree, and only those, become coloured, and a pattern such as the name FARADAY so injected was found as perfect at any point of the tree where a cross section was made. Langton, however, points out that "in timber crosscut under pressure the creosote penetrates between 1 in. and 2 in.," showing that there is some lateral connexion, although so slight that if required to be done

thoroughly the injection should take place from the ends.

Although the solutions used generally for the preservation of timber from rot need not be the ones best suited for rendering the same fire-proof, yet the methods of application are similar.

The soft woods, such as Scotch pine and spruce, are usually best suited for treatment, their grain being coarse, the annular rings far apart, and the tissue soft and capable of great absorption, rendering them, when prepared, more lasting than closer grained woods, owing to the density of fibre not permitting the latter to be thoroughly impregnated. We are thus enabled to use the cheap quickly-grown woods, the processes for rendering them non-inflammable at once preserving them from rot and from the attacks of insects and worms.

The idea in the ordinary methods adopted for preserving timber from rot is to introduce into the pores of the wood some salt which, uniting chemically with the albumen of the sap, shall convert it into an insoluble compound. The best known of these methods are Burnettising, Kyausing, and Boucherising.

Burnettising consists in impregnating the timber with a solution of chloride of zinc of the strength of one of the salt to thirty parts of water.

Kyausing consists of impregnating with chloride of mercury (corrosive sublimate). The treatment by both these processes consists in immersion in open tanks or more thoroughly by pressure of 110 lb. to 150 lb. to an inch in closed wrought-iron cylinders; but it is questionable whether these methods are so good as Boucherising, as by them it is necessary to force the solution into the wood at right angles to its tubes thereby injuring its strength and letting the sap which is the immediate cause of decay remain, the coagulation of the albumen at any material depth below the surface being a matter of doubt, whilst the cost to obtain even that amount of saturation would, *ceteris paribus*, point to the *Boucherising* method of injection as most suitable to our purpose.

In this, newly-cut green timber (coarse-grained is most suitable), before the bark is removed, is exposed at the end (either end will do) to a slight pressure from a liquid column of sulphate of copper (1 lb. of sulphate to 5 gallons of water or 1 to 100 by weight, allowing 0.35 lb. of sulphate to 1 cu. ft. of timber) arranged in a tank 25 ft. to 50 ft. above the level of the log. The liquid drives the sap before it and forms chemical combinations which preserve the wood from decay. The sooner this is done after felling the better, as the resinous substances rapidly harden and prevent the movement of the liquid salt through the pores. The plant required is small and easily erected close to where the wood is cut, and can be quickly shifted to a fresh situation. The time for the appearance of the liquid at the top of the log is from two to twenty-four hours, when it drops into gutters placed to catch it, and is pumped up into the cistern to be used again. About three days are required for a 25 ft. log, and the process is complete when every portion of the top of the log is found to be saturated: this is known to be completed when a brown stain is left on timber by the application of a piece of potassium ferriocyanide. The cost of the process with sulphate of copper is about 2*d.* per cube foot for logs 25 ft. long. It has sometimes happened that the heartwood, which is more durable under ordinary circumstances, has, in Boucherised timbers, rotted, leaving the impregnated sap wood. Care should be taken to obtain the sulphate of copper as free as possible from iron, but as it is usually present in some degree it is as well to make a saturated solution, and allow it to remain exposed to the atmosphere as long as possible so as to allow the iron to deposit at the bottom of the vessel, after which it may be diluted. If the solution is too strong it is liable to contract the sap vessels and to crystallise at their ends. The water must be free from lime and perfectly clear. If it contains lime it is as well to add a little sulphuric acid to precipitate it, and either allow it to settle or filter the water through sand, for even the slightest cloudiness interferes with the injection.

All timber when treated by any of the preservative processes in general use becomes "short,"—that is, it breaks in two crosswise easily, and, when impregnated, its tensile strength becomes impaired. It loses when

* A paper by Mr. Thomas M. Rymer-Jones, Memb. Inst. C.E., F.R.G.S., and Mr. John Rymer-Jones, Memb. Inst. Tel. E., read before the Civil and Mechanical Engineers' Society on Wednesday, the 22nd inst.

dry a portion of its elasticity, but regains much of this when in a moist state. The shortness is easily tested, as, on trying to split with an axe a piece of dry preserved timber it will be found that the axe will not follow the grain of the wood. This seems a reason in favour of impregnating the wood, and especially the smaller pieces, after they have been cut and fitted into their several positions. No ungallanised iron should come in contact with wood impregnated with sulphate of copper (and the same point must be considered when using other salts), otherwise the copper of the solution will be reduced by galvanic action. The sulphur itself is injurious, not only attacking the galvanising of telegraph stay wires, but eating away the iron itself, showing that when salts are used for impregnating wood, some protection, such as paint say, must be used to preserve the iron fixings. Kyanising (chloride of mercury) is equally injurious. Another process of preserving wood from decay is by using borax to neutralise the decaying vegetable matter in the wood. This is also a very good non-inflammable solution.

We have entered thus fully into the methods of preparing wood with chloride of zinc, chloride of mercury, and sulphate of copper in particular, because whatever may be the non-inflammable solution selected as most suitable, some such method of injection will be necessary if the impregnation is required to be other than merely superficial. All these three being salts, will not only preserve the wood from rot, weather, insects, and worms, but will to a certain degree render it non-inflammable; but which solution is best, we shall be better able to judge later on. We may at once put chloride of mercury out of the question, as it is very expensive, and, when burned, is turned into vapour which is fearfully suffocating. Sulphate of copper is cheap, and free from this objection, but turns the wood a bluish colour when the surface is exposed to a damp air. Chloride of zinc and borax, the other two above-mentioned processes, preserve from decay and flame, and might be used for injecting green timber. But at present let us go through the information that can be gathered on the subject of non-inflammable compounds and solutions. Much of this relates to rendering fabrics non-inflammable, and this is done by steeping them in almost any saline solution. Thus, cotton and linen fabrics, prepared with a solution of borax, phosphate of soda, phosphate of ammonia, alum, or sal ammoniac, do not suffer active combustion, nor burst into flame. The salts act by forming a crust of incombustible matter on the surface of the fibres. They do not, however, prevent the carbonisation of the material at a sufficiently high temperature. For ladies' dresses, 1 oz. of alum or sal ammoniac to the last water used to rinse them is sufficient for safety from fire; a less quantity added to the starch would suffice. None of the above are used for fine muslins, as they render the fabric harsh, and destroy its beauty. Sulphate and phosphate of ammonia are efficacious, but interfere with the ironing. The salt which answers all conditions is tungstate of soda: steeped in a solution of 20 per cent. of this salt, muslin is perfectly non-inflammable when dry, and the saline film left on the surface is of a smooth and fatty appearance, like talc, easily ironed and adding a richness to the appearance of the material. The addition of a little phosphoric acid or phosphate of soda to the tungstate is recommended, as without this the tungstate is liable to undergo a chemical change, and become comparatively insoluble. For a solution of tungstate of soda of minimum strength dilute a concentrated solution of neutral tungstate of soda to a specific gravity of 1.14, and then add 3 per cent. of phosphate of soda. This solution is found to keep and answer its purpose well.*

Hatfield.—On the 10th inst. a public hall, a present to the town of Hatfield from the Marquis of Salisbury, was opened by Lord Robert Cecil. The hall is a building in the Queen Anne style, of red brick, with moulded terracotta ornaments. A portion has been fitted up and let as a restaurant, while another part has been converted into a Conservative club. In the remaining portion are two reading-rooms and a billiard-room, which are to be public, while a hall above is for entertainments. The building, which cost 2,000*l.*, is from plans by Mr. S. W. Shillito, of Hatfield.

* To be continued.

COMPETITIONS.

Proposed New Infirmary, Workington.—The plans submitted by Mr. Geo. Dale Oliver, of Carlisle and Workington, for the new Infirmary to be built at Workington, have been selected by the building committee. At a meeting of the Infirmary Committee held last week it was decided to adopt the plans recommended by the building committee, and Mr. Oliver was instructed to prepare working plans and specifications and get in tenders without delay.

Longton Board Schools.—The Longton School Board, having invited plans for two sets of schools at Normacott and Florence, each to accommodate 700 scholars, twenty-three sets of plans were sent in for the Normacott School, and eighteen sets for the Florence Schools. No professional referee was appointed. We are informed that the successful competitors were—For Normacott, Mr. T. P. Hulse, of Longton (motto "Education"); and for Florence, M. John Taylor, of Longton (motto "Fairplay").

ARTISTS' BENEVOLENT FUND.

The 70th anniversary dinner of the Artists' Benevolent Fund was held on Wednesday at the Freemasons' Tavern, Viscount Hardinge presiding. In proposing the toast of the evening, "Prosperity to the Artists' Benevolent Fund," the Chairman said that during the past year 54 widows and 14 orphans had received annuities, amounting in all to 1,141*l.*, and since the institution of the society 48,000*l.* had been distributed in relieving widows and orphans of artists whose circumstances rendered assistance necessary. He pleaded for increased support to the fund, so that the amounts of the annuities might be increased, and eloquently urged the claims of artists upon the public, who, however, were often so capricious as to disregard the merits of men who had deservedly made a name as artists.

The Rt. Hon. A. J. B. Beresford-Hope (President of the society), whose name was coupled with the toast, in responding dwelt upon the influence exercised by the artist, who, in the pursuit of his profession helped to civilise, to delight, and to elevate all that was human. Mr. Beresford Hope concluded by proposing the health of the Chairman.

Viscount Hardinge having briefly replied, the Secretary announced subscriptions (including 100 guineas from the Queen) amounting to nearly 500*l.*

Mr. Coomber, C.M.G., of Sydney, New South Wales, in proposing the toast of the Royal Academy, referred to the growing appreciation of art in Australia. Mr. C. B. Birch, A.R.A., replied.

Among the other toasts was, "The Artists' Annuity Fund," proposed by Mr. Forbes-Robertson and responded to by Mr. T. H. Maguire, who eulogised the services rendered to the public by the artists of the pictorial press in recent wars. Unearned, except with pencil and sketchbook, those artists braved the dangers of the battle-field in order that people at home might be able to realise the gallant deeds of our forces in action.

HEREFORD SEWERAGE WORKS.

The Hereford Town Council, at their meeting a few days since, increased the salary of the city engineer (Mr. John Parker) by 100*l.* per annum from the 1st January last, in consideration of the extra work performed by him in the preparation of the plans and bills of quantities of the proposed new sewerage works, the estimated cost of which is 20,000*l.* At the same meeting it was also resolved to allow him an extra assistant during the progress of the works.

Six miles of new outfall sewers will be required, and there will be erected at the pumping station engine and boiler houses, sludge-pressing room, coal and lime stores, &c., in addition to a covered reservoir to contain 550,000 gallons.

The average quantity to be treated will be 14 million gallons per day, and the settling tanks have a united surface-area of 15,000 ft., the precipitating agents being lime and other chemicals. The effluent water will be further purified after leaving the tanks by being passed over a limited area of land, which will, for that

purpose, be deeply under-drained. Eleven acres have already been purchased.

The sludge, which has ever been the bane of all defecation works as well as sewage farms, will gravitate by an underground conduit to a covered tank, and thence will be conveyed by compressed air to two of Johnson's sludge presses, which will at once deprive the sludge of 85 per cent. of its water,—the water passing back to the tanks for re-treatment. The residue will consist of pressed cakes, practically inodorous, and reduced to such a condition that it can be disposed of without nuisance to the neighbourhood on farms, upon which it will be used as manure, the sludge difficulty being in this way, at small cost, reduced to a minimum.

The contracts will be let in May, and the whole work is intended to be completed by the end of 1886.

Owing to an extensive bed of clean gravel underlying the site at a few feet below the surface, concrete will enter largely into the construction of the storage reservoir, the tanks, and other portions of the buildings.

There will be provided horizontal expansive condensing engines, with cylinders 16 in. diameter by 33 in. stroke, each driving 15 in. centrifugal pumps, vats, &c., the steam being generated by a pair of Galloway's steel boilers, 18 ft. by 6 ft. each.

A LAUDABLE EXPERIMENT.

On Monday afternoon last the new coffee tavern and workmen's dwellings erected by Messrs. Chubb in connexion with their works, Glengall-road, Old Kent-road, London, S.E., were formally opened by the Earl of Harrowby, acting for the Earl of Shaftesbury, who was prevented from attending by indisposition.

The buildings have been designed by Mr. E. Hoole, F.R.I.B.A., and consist of a large hall, coffee tavern, reading-room, kitchen, and retiring-rooms upon the ground floor. Above, three floors of dwellings have been constructed, consisting chiefly of single rooms, so grouped that they can be combined without alteration into two-roomed, three-roomed, or four-roomed tenements, according to the various requirements of the families inhabiting them. Water is obtainable, and a laundry is provided, on each floor; the flat roof furnishes an ample drying-ground. The various floors are reached by York stone staircases and landings, giving access to galleries situated behind an arcade of lofty arches, thus forming an airy verandah to each set of rooms. Every tenement is furnished with coal-bin, cupboard, and cooking-range.

Returning to the ground floor, the hall, named the Queen's Hall, is capacious enough to hold 300 people when used for meetings and concerts, and in the daytime it will afford dining accommodation for half that number; it has a dais at its upper end which will be serviceable when the hall is used for meetings or entertainments. The hall is 85 ft. in length, 23 ft. in width, and 16 ft. in height. Above the dado the walls are of red brick, with panels of plaster, upon which are some cleverly designed, and executed by Mr. James Allen, the subjects being illustrative of agriculture, the working of metals, &c. A panelled ceiling in pine completes the interior, which is lighted by a lofty range of semi-circular windows. The coffee tavern, which is immediately opposite the principal entrance, can be used in combination with the hall or not as may be desired. The reading-room, stocked with newspapers and other current literature, will, no doubt, prove very popular. The floors of the hall, reading-room, and coffee-bar have been laid with Mr. Roger L. Lowe's (of Farnworth) wood block-flooring. Provision is made for the extension of the buildings when necessary. The erection of this building was not undertaken before the firm had had a conference with the workpeople, and ascertained their wishes on the subject, and the management of the hall and coffee tavern will be intrusted to a committee of the *employés*. These premises, too, will be available for use by workpeople employed in other factories, and by residents in the neighbourhood. The various clubs and classes already formed in connexion with the works will, in future, have their headquarters in the new building.

Sir Richard Cross was amongst the speakers, and he suggested that the City Livy Companies would do well to devote some of their wealth in the provision of better dwellings for

the poor. It was also suggested by more than no speaker who took part in the proceedings that the laudable example now set by Messrs. (Whbb might very well be copied by other large employers of labour.

An inspection of the large works (covering wo acres of ground) followed, and much that was of interest to the visitors was to be seen. Among the jobs in hand is a large strong room or the National Bank of Scotland.

LINE OF FRONTAGE.

WILLIAM ELLIS was summoned at the Wandsworth Police-court by the Wandsworth District Board for building beyond the general line of frontage at St. John's Hill, Wandsworth, contrary to the 75th section of 25 & 26 Vic., cap. 102.

Mr. Young, solicitor, appeared in support; and Mr. Sheppard defended. Mr. P. Filitch, the Board's Surveyor, produced the plan of the Superintendent Architect, showing the line. He said the building, which was a shop front, projected 3 ft. 10 in. beyond it.

Mr. Sheppard called attention to a plan, and said here were bay-windows, but the shop-front did not project beyond them.

Mr. Shiel said the certificate of the Superintending Architect was conclusive. He made an order so much of the building as projected beyond the line to be pulled down, and also ordered the defendant to pay 5l. ss. costs.

ANCIENT LIGHTS.

In the Supreme Court, before Mr. Justice Day, the case of Crosby and Others v. The Glengal Workmen's Coffee Palace Co. and Another has been heard.

This was an action by the trustees of a Primitive Methodist Chapel in Manchester-road, Poplar, for an injunction to restrain the defendant Company and the builder employed by them from building on a piece of land adjoining the chapel so as to obstruct the ancient lights of the chapel and the schoolroom beneath it.

The wall of the building complained of had already reached a height at which it was alleged to darken the schoolroom windows, and an interim injunction was granted a year ago to prevent it being carried any higher. The rights of the plaintiffs were admitted, and the only question at issue was whether or not the plaintiffs' light was substantially interfered with, or would be so when the wall was completed.

The evidence was of the usual character in such cases, but the defendants endeavoured specially to rely upon the fact that it was intended to face the wall in question with glazed bricks, by which means any loss of direct light would be, to some extent at least, compensated by reflection, and counsel also contended that the question whether or not the diminution of light was substantial must be decided with reference to the use to which the schoolroom was put, classes being held there only twice on Sundays, and the defendants being willing to undertake not to carry the wall any higher nor to injure the chapel itself.

Mr. Justice Day, in giving judgment, held that the lights had been interfered with, and that the plaintiffs were entitled to the relief they asked for, and gave judgment accordingly without costs.

THE EARL OF HARRINGTON v. THE BUILDING SECURITIES COMPANY.

A MOTION for an interim injunction to restrain the defendants from continuing to build the Avenue Hotel, Northumberland-avenue, was heard before Mr. Justice Pearson, and the injunction was granted.

The surveyors on behalf of the plaintiff were Mr. Thomas Edward Cullcutt and Mr. Basilster Fletcher. The counsel were Mr. Cozens Hardy, J.C., and Mr. E. F. Buckley.

COOKING APPARATUS FOR LARGE INSTITUTIONS.

SIR,—I observe in your last issue [p. 566] an illustration of a patent "cooking apparatus recently patented up at St. Patrick's Workhouse. I enclose herewith to disclose the contract drawing of an identical apparatus designed by me (upon Captain Warren's principle) in 1872, which I fitted up at the new Lambeth Workhouse in 1873, and which has been at work there ever since. I am about to fit up similar apparatus at the new workhouse for the Wandsworth and Clapham Union, and the extension of the workhouse and infirmary of the parish of St. George-in-the-East.

THOS. W. ALDWINCKLE.

2, East India Avenue, E.C. April 23rd.

Board of Trade Surveyors.—The name of T. Chatfield Clarke, 63, Bishopsgate-street North, has been placed on the Board of Trade list of surveyors and umpires.

SOANE MEDALLION.

SIR,—The proofs of my drawing have just reached me.

I felt much surprise and disappointment on seeing the failure of the photo-lithography of my drawing in your paper; but it was with much greater surprise that I read your remarks in explanation of the failure.

You must be perfectly aware that the drawings were not made with a view to reproduction as photo-lithographs, and that photo-lithography is not, and never can be, the aim or the standard of such work. If the failure was unintentional and not anticipated, ought you not to have stopped the publication of the drawing altogether instead of endeavouring to throw upon me the responsibility of what was really the fault of the process employed? If, on the other hand, your original object was to illustrate the unsuitability of photo-lithography for a particular style of work, was it generous, or even consistent with common fairness, to apply for my drawings for publication under the pretence that they were to appear as ordinary illustrations, and without the slightest warning that they would be exhibited as a terrible example of what a drawing intended for photo-lithography ought not to be!

JOHN THOMSON.

** Mr. Thomson takes us a little too seriously, and is quite mistaken in supposing there was any "pretence" in the matter. We wished to give a good representation of his drawings, and found his method had rendered it impossible. As before said, we think the method itself a bad one; not true "line-drawing." Our experience is that the best line-drawings are also those which photolithograph best. But we did not call Mr. Thomson's drawings a "terrible example" or an "awful warning"; we only said "unfortunate,"—both for ourselves and him.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

APRIL 13.

C. D. FIELD & SONS.

By CRISPIN, MOORE, & HOLBORN.
Piccadilly—No. 199, a profit rental of 225l. a year for 17 years 1,510
Leatherhead—3, Swiss Cottages, freehold 280
8 and 10, Poplar-road, freehold 393

By DARR & SONS.

Chelmsford, near—Chalk's Farm, containing 135a. Or. 6p., freehold 1,200
Tilbury, near—Part of "Brickhouse Farm," 91a. Or. 17p., freehold 3,200
An enclosure of land, 94a. 3r. 17p., freehold 3,750
An enclosure of land, 99a. Or. 29p., freehold 1,400
Enclosures of land, 99a. Or. 29p., freehold 3,115

By W. B. HALLATT.

Battersea—22 and 24, Grandfield-street, 95 years, ground-rent 10l. 280
King's-cross—10 and 12, Wynford-road, 39 years, ground-rent 43l. 200

The Student's Column.

DESCRIPTIVE GEOMETRY.—XII.

Find the distance which separates two parallel planes P and Q.

Simply intersect them by an auxiliary plane R, perpendicular to their horizontal traces; $\alpha \beta$ is the length required. (See fig. 61.)

Find the distance between two straight lines A and B not in the same plane.

The direct method of solving this problem is as shown in sketch, fig. 62. We carry through a point c of A a line D parallel to B. Through the lines D and A we carry the plane P. Through any point e of B we draw the line F perpendicular to the plane P, and through the point g, where the line F meets the plane P, we make line I parallel to B; we get thereby the point m on the line A, and then the line K, parallel to F, gives us m', the shortest line between A and B.

Nothing looks less formidable than the above sketch. We draw the above operations in plan and elevation below, and behold what a complex network of lines. (See fig. 63.)

As an exercise of drawing, the student could not do better than solve this problem as above, but in practice we shall want something simpler.

Second Solution.—We draw through the lines A and B two parallel planes, P and Q. For this, through a point d of the line A, we make a line C parallel to the line B; we get thereby P^d, the trace of the plane which contains the lines A and C; as for Q^d, trace of the plane which contains the line B, it is parallel to P^d, and we find the distance of the planes P and Q, as we have done before, $\alpha \beta$ is the distance they are apart, and it is also the distance required of the lines A and B. (See fig. 64.)

Third Solution.—We change the planes of elevation and plan so that A, one of the lines, be perpendicular to the plan. The plan of the line will then be a point A¹¹¹, and the distance from that point, A¹¹¹ to B¹¹¹, new plan of B, will be the distance required. (See fig. 65.)

Fourth Solution.—Here, as in the former solution, we get the projection of the lines on a plane P, perpendicular to the line A, but, instead of carrying this out by changing the projection planes, we find at once the projections of both lines on the plane P, and turn down that plane with the projections it contains, so as to measure the distance required. According to our system of notation, we indicate in this drawing the projections on the plane P, after turning it down by the sign ρ ;

Fig. 61.

Fig. 62.

Fig. 63.

Fig. 66.

Fig. 64.

Fig. 65.

for instance, B² is the projection of the line B on the plane P.

In fig. 66 the lines A and B are given by their planes A¹ and B¹, their horizontal traces a and b and the height of a point of each such as B² on the line A and $\gamma^1 \gamma^2$ on the line B. If we make an elevation, and take our ground-line L T on A¹, the elevation plane contains the line A itself, which is identical with A¹; therefore the plane P perpendicular to the line A will have its vertical trace P¹ perpendicular to A¹, and its horizontal trace P² will be perpendicular to A¹. The whole of the line A is projected on the plane P in one point, a. To find the projection B² of the line B we get the projections γ^1 and γ^2 of two of its points as follows. We make an elevation on a plane parallel to one of the first elevation, and containing the point γ^1 ; such is the one on L¹ T¹. We see by the figure that P¹ is on the parallel to P², and from γ^1 , the real position of the point γ^1 , we draw a perpendicular to P¹, which gives us the point γ^2 . When we turn down the plan P, the point γ^1 comes to γ^2 by describing the arc of a circle of centre O. By a similar operation on the line L¹ T¹ we get b¹, and thereby B², the line C perpendicular from the point a to B² is the distance required. Note that in our drawing the point γ^1 is situated below the plane of the plan, for γ^1 is below L¹ T¹.

MEETINGS.

SATURDAY, APRIL 25.

Architectural Association.—Visit to the Church of St. Bartholomew-the-Great, West Smithfield. 3 p.m.
Association of Municipal and Sanitary Engineers.—Lancashire and Cheshire District Meeting at Burnley. 11.30 a.m.

MONDAY, APRIL 27.

Society of Arts (Caspar Lectures).—Captain Ahney, F.R.S., on "Photography and the Spectroscope." 11.8 p.m.
University College.—Mr. Barclay V. Head on "Greek Numismatics." 11. 4 p.m.

TUESDAY, APRIL 28.

Art Union of London.—General Meeting and Prize Distribution; Adelphi Theatre. 12 Noon.
Institution of Civil Engineers.—Special General Meeting of Corporate Members only. *To decide upon Proposed Alterations in the By-laws. 3.30 p.m. At the Ordinary Meeting, at 8 p.m., Professor H. S. Hele Shaw will read a paper on "Mechanical Integrators."

WEDNESDAY, APRIL 29.

Institution of Civil Engineers.—Annual Dinner in the Conservatory at the Horticultural Gardens (Inventions Exhibition). 6.30 p.m.

THURSDAY, APRIL 30.

Society for the Encouragement of the Fine Arts.—Mr. W. Cave Thomas on "The New Aesthetics." 8 p.m.
Society of Antiquaries.—8.30 p.m.
Institution of Mechanical Engineers.—Ordinary General Meeting. 3.30 p.m.

FRIDAY, MAY 1.

Lincoln Diocesan Architectural Society.—Bi-monthly meeting.
Institution of Mechanical Engineers.—Ordinary General Meeting continued. 7.30 p.m.

SATURDAY, MAY 2.

Edinburgh Architectural Association.—Visit to Ravenscrieg, Kirkcaldy, and Dysart House.

Miscellanea.

Birmingham Architectural Association.

The eighth ordinary meeting of this Association for the current session was held at Queen's College on Tuesday evening last. The Vice-President, Mr W. H. Kendrick, was in the chair. A paper was read by Mr. A. Reading, on "A Comparison between English and Continental Renaissance Architecture." The lecturer, with the aid of a powerful lantern, illustrated his remarks by views of some of the most important Renaissance buildings abroad and at home, and pointed out the successive waves of Renaissance expression, which differed very materially according to the country in which it was practised. The lecturer urged all admirers of this style to study the Early Italian Renaissance, as it was only to be found in that country in its simplicity and purity, and further strongly advocated, where the style was adopted in this country, the advisability of following in the steps of the Italians, and drawing from the pure Classic of ancient Greece and Rome, and adapting their forms to modern requirements, and thus in time forming a pure Renaissance of our own. A hearty vote of thanks, proposed by Mr. H. H. McConnell, and supported by Mr. Victor Scruton (hon. sec.), and the Vice-President, was unanimously accorded to Mr. Reading for his interesting paper. After a brief response from the author, the meeting terminated.

British Archaeological Association.—

At the meeting of this Association on the 15th inst., Mr. Thos. Morgan, F.S.A., in the chair, three crucifixes of thirteenth-century date were exhibited by Mr. W. H. Rylands. One of these was enamelled and set with turquoises and garnets, the others were enamelled, with blue colouring, similar to Limoges workmanship. A small representative collection of Persian art pottery was described by the Rev. S. M. Mayhew, some of the articles being of great interest and beauty. Mr. F. Brent, F.S.A., exhibited a bell of the time of Elizabeth, and, among other objects, an ancient triptych of Russian workmanship, from the Crimea, which was commented upon by Mr. Hodgetts. Mr. H. Watling sent a series of drawings of remarkable antiquarian objects, including a series of representations of St. Edmund, king and martyr, from churches in East Anglia; stained glass in Blythborough Church; and of the curious pewter vessels of Puritan times used in the Holy Communion at Imham Church. Mr. J. Willson described another of the Saxon crosses of which so many have been recently reported to the Association. It is in Hackthorne Church, and consists of a Latin cross incised on a large block of stone, the edges of the latter being ornamented with a cable moulding. Mr. Loftus Brock, F.S.A., exhibited three or four fragments of marble statues from Rome, including an arm of a Cupid, of excellent workmanship. A paper was then read by Mr. Maunde Thompson, F.S.A., on a hitherto unnoticed Saxon vocabulary compiled by Abbot Ælfric. It occurs on the margin of a Latin manuscript in the British Museum, written in a French hand of the tenth century. The Saxon words are neatly written, and of these fully forty in number do not appear in Anglo-Saxon dictionaries. An animated discussion took place, in which Messrs. Rylands, De Grey Birch, Hodgetts, and others took part.

Southampton.—

The foundation-stone of the new Clubhouse for the Royal Southampton Yacht Club was laid on the 9th inst. The building will occupy a site on the west side of Above-Bar-street, at its junction with Ogle-road and Manchester-street, thus giving the building frontages to three roads. The site contains in area about 4,400 square feet, and will be almost entirely occupied by the new buildings, a small space only being reserved in the rear for light and air to the south side, and the three principal fronts being kept back from the boundaries, but with sufficient space to admit of a broken outline, arcades, &c. The space between the boundaries and the building is to be paved with tiles and fenced in with a low ornamental iron railing. The building will be three stories in height, besides basement, and is to be faced with dark red local bricks, pointed with black mortar, the dressings being executed in red terra-cotta. The roof will be covered with slates, the ridges being furnished with crested-tile capping, with ornamental termination to gables and hips. The design is Domestic Gothic in character. The contractors for the whole of the works are Messrs. John Crook & Sons, of York Building Works, Southampton, the terra-cotta work being supplied by Mr. J. C. Edwards, of Ruabon. Mr. W. H. Mitchell, of Portland-street, Southampton, is the architect.

The Employers' Liability Assurance Corporation (Limited).—

The fourth annual report of the directors, to be presented at the annual meeting to be held on the 30th inst., states that though during the year the depression of trade has been intensified, and there has been no abatement in the severity of competition, the directors have continued to uphold rates, and they report a further increase of premium income, which now stands at 70,210*l*. The net unearned premiums, 21,999*l*, are reserved. After due provision for this and all charges there remains a balance of 3,737*l*. 19*s*. 7*d*., out of which the directors recommend a dividend of 2*s*. 3*d*. per share.

Death of Mr. Ansdell, R.A.—

Mr. Richard Ansdell, the well-known animal painter, died on Monday morning at his residence, Farnborough, Hants, from bronchitis, after three days' illness. He was seventy years of age. He was a native of Liverpool, and was educated at the Bluecoat School there. He was elected a Royal Academician in 1870.

Moscow.—

A new and large Anglican church, of considerable architectural importance, has just been completed and opened at Moscow.

Swanage.—

A new railway is about to be opened to Swanage, eleven miles from Wareham, and 125 miles from London, on the South-Western Railway. Swanage is a small, old-fashioned, stone-built town on the eastern coast of Dorsetshire, and promises to be a flourishing watering-place. It has a good bay and sands. The present town lies in a hollow between high sheltering hills, almost rivalling some of those in Wales, one side of the coast being entirely rockbound, and numerous legends exist of King Alfred, the Danes, and a spirit called "The Darl," which was supposed to inhabit the caverns in the rock now known as Darlston Head. Of late years Swanage has been reached by steamer from Bournemouth, which is about eight miles distant, the land route being twenty-five miles. It has a chureh with fine old pre-Norman tower, a new town-hall, of which the facade (an old one) was brought from London; an Institute, handsomely endowed by private generosity; a good hotel, at which Queen Victoria once stayed when young; and several other handsome buildings, public and private. The streets are quaint and in parts very narrow, all the buildings being of the native limestone. Corfe Castle, of historical renown, where is constructed a station on the new railway, is distant five miles. Swanage, hitherto difficult of access, has for years been the favourite resort of those few who were aware of its attractions and in search of retirement and repose. In the *Builder* for August 25, 1883, will be found an article entitled "The Fortune of Secluded Swanage," in which the aspects of the watering-place, present and future, are discussed at some length.

The East-End Dwellings Company.—

The second ordinary general meeting of the East-End Dwellings Company was held on Monday last at Toynbee Hall, Commercial-street, Whitechapel, under the presidency of Mr. Edward Bond. The chairman, in moving the adoption of the report, said that the block of buildings in Cartwright-street, which had recently been opened, contained 281 rooms, of which 167 had been let, 66 of which were occupied by tenants who had only one room. It would be remembered by those who were concerned in the early history of the company, that they looked forward to letting a number of their rooms to tenants of single rooms. He thought that they had every reason to be pleased with the way the buildings in Cartwright-street had been carried out. They were not so snugly as is expected in consequence of their desire to exercise economy. Mr. Crowder seconded the motion. In reply to a shareholder, the chairman said that unless there was a further application for shares they would have to call up more capital, but that would not be for four months yet. Mr. Rawlinson stated that there had been an enormous number of applications for single rooms rented at 1*s*. 6*d*. and 1*s*. 9*d*. to 2*s*., and it would be desirable to keep that in view when they erected their fresh block. The chairman said the suggestion would be taken into consideration by the Board. The motion was carried. [We gave some account of the operations of this company in our issue of March 28 last, when we published plans, sections, and elevations of the Cartwright-street buildings.]

The Temple Church, London.—

This interesting old church has lately been enriched by a stained-glass window in memory of the last acting Master in Chancery, Mr. Charles Beavan, M.A. It consists of three lights, is on the north side next to the organ, and contains as subjects seven miracles of our Lord in medallions as follows:—The sight of the man who was born blind restored; the nobleman's son cured; the widow's son raised to life; the lame man at the Pool of Bethesda healed; the demoniac boy cured; the woman with the issue of blood healed; and the ten lepers cleansed. The general ground-work of the window is formed of geometrical bands of colour and scroll ornament of tinted white glass. The window was executed by Messrs. Ward & Hughes, of Frib-street, Soho-square.

An Odd Fellows' Hall was opened at

Hythe on the 9th inst. The building has been designed and erected by Mr. W. J. Martell, of Hythe, and with the site has cost about 600*l*. It is built with red brick with stone dressings, and bears over the doorway a stone on which is inscribed the name of the hall. There are two rooms. The large lodge-room is 55 ft. by 20 ft.

Obituary.—We record with much regret the death of Mr. C. Clinton Hovey, which took place on Sunday last, in his fifty-fourth year, at his residence, South Hackney, after a long illness. Born near Dublin, he was intended by his parents for the architectural profession, and, with the view of attaining a good practical knowledge of construction, we believe he worked for some time at the joiner's bench, subsequently taking an appointment as Clerk of Works. A taste for literary pursuits led him to turn his attention to journalism, and he has been a valued contributor to the columns of the *Builder* for more than twenty years. We believe that for the last twelve years he has edited a professional journal published in Dublin, and that during the last few years he contributed articles on technical subjects to the *Evening Standard* and some local (Hackney) journals. He leaves a widow and one son to mourn his loss. He was hard-working, conscientious, and self-denying, and in him we have lost a contributor for whom we had great regard.

Gas as an Economiser of Coal.—The exhaustion of the coal supplies of the country has been the subject of discussion in some of the Manchester papers between Mr. Ellis Lever, of Bowden, Cheshire, and Mr. Thomas Newbigging, the President-elect of the Gas Institute. Mr. Lever laments the waste in getting the coal and in using it when got, whilst Mr. Newbigging is of opinion that the coal supply is not so close upon the point of exhaustion as many people suppose. Replying to this letter, Mr. Lever offers a sum of 20*l.* for the best paper or essay to be read at the forthcoming meeting of the Gas Institute in Manchester, on the subject of "Economising coal by the more extended or general use of gas for domestic and manufacturing purposes, and for the generation of steam." Mr. Newbigging, in his official capacity, has accepted this offer. *Gas and Water* says:—"The subject is one of vast importance, and must be carefully considered, and we question whether a premium of 20*l.* is a sufficient inducement to the preparation of an exhaustive paper. We shall, therefore, gladly supplement that sum by 30*l.*; or, alternately, we shall give a premium of 50*l.* for the best paper, and the 20*l.* offered by Mr. Lever might then be awarded as a second prize."

Measuring the Thickness of Boiler Plates.—An ingenious process for determining the thickness of iron plates in boilers, or places where they cannot otherwise be measured without cutting them, has been invented by M. Lebasteur. He spreads upon the plate the thickness of which he desires to find, and also upon a piece of sheet-iron of known thickness, a layer of tallow about 0.01 in. thick. He then applies to each, for the same length of time, a small object, such as a surgeon's cauterising instrument, heated as nearly as possible to a constant temperature. The tallow melts, and as in the thicker plate the heat of the cautery is conducted away more rapidly, while in the thin plate the heat is less freely conducted away, and the tallow is consequently melted over a large area, the diameters of the circles of bare metal around the heated point, bounded after cooling by a little ridge of tallow, will be to each other inversely as the thickness of the plates. The process is stated to have given, in the inventor's hands, results of great accuracy.—*Iron.*

Social Science Association.—The Council of the Social Science Association have, after due notice given, unanimously passed a resolution to the effect that, in prospect of a general election in the month of November, it is undesirable to hold a Congress during the present year. They have, therefore, been reluctantly compelled to decline the invitation received from the City of Bath to meet there in the forthcoming autumn, but they have expressed a hope that the invitation from the city may be renewed for the year 1886. It has, however, been referred to the Executive Committee for consideration and report whether a Conference of a more limited nature should not be organised in London on some special subject or subjects to which, in view of the opening of a new Parliament, it may be considered desirable to call attention.

Becker's Cooking Apparatus.—Mr. Becker writes to say that the consumption of coals per day for cooking for 500 persons by his apparatus is $\frac{1}{2}$ cwt., not $1\frac{1}{2}$ cwt., as stated in our notice of the apparatus. We gave the statistics as furnished to us and noted down at the time.

Architecture at the Royal Academy.

ARCHITECTURE has now for the first time a gallery of her own in the great art show at Burlington House. Though designed by Mr. Norman Shaw, it has none of the characteristics of that rare artist, and is far less ornate than the twin Water-colour Gallery by the same hand. The room is not large; but it will serve. In plan it is an irregular octagon, a figure which is better adapted to the display of pictures than a rectangle, with its comparatively obscure corners. The canted sides are carried up some 10 ft. in height, and the enclosed triangles afford the means of admitting fresh air à la Tobin. The floor area is less than in the old room; but as there is only one door instead of two the available wall-length is about the same. The height has, however, been very considerably reduced, being now only some 13 ft. or 14 ft. from floor to cornice. The walls will, therefore, accommodate four tiers of pictures at the most. This is, on the whole, a gain. Architectural drawings should be placed where architectural detail can be seen, and it is better that they should be rejected outright than contemptuously "skied" as of yore. In future the larger the drawing the less its chance of acceptance. Inordinate size alone has this year, it is believed, led to the exclusion of a great number of important and meritorious works. Intending exhibitors will thank us for the hint. It is better that the drawings should be rather choice than numerous. If every good architect would annually put his strength into one good drawing, instead of sending half a dozen indifferent ones on the chance of one getting hung, the Architectural Room would prove as attractive as any other in the building. Architecture is every year appealing to wider audiences, and meeting with a more intelligent appreciation. It remains for the architectural profession to turn the newly-awakened interest to the best account. As to which one word of warning may here be not inaptly spoken. The old room was a thoroughfare, and could not be altogether ignored; the new one is a *cul-de-sac*, and may be. Whether it shall be or not depends upon ourselves. *Verbum sap.*

The present exhibition consists of 220 drawings, and the majority of them possess very considerable merit. The line centres of the three sides are respectively occupied by

Mr. Waterhouse's New Liberal Club in Whitehall-place, of which we shall give a fac-simile next week; by Mr. Aitchison's Royal Insurance Offices, Pall Mall; and by Messrs. Aston Webb and Ingress Bell's premiated drawings of the proposed Admiralty and War Office buildings. It is noted,—not without surprise,—that, with the exception of a small sepia study by Mr. Marvin, this is the only representative of that quite recent and most exciting competition. Mr. Waterhouse's and Mr. Aitchison's designs are each flanked by careful drawings by Mr. Pearson,—one showing his proposed spire at Peterborough, and the other his proposed additions to Westminster Hall. Mr. Norman Shaw sends nothing this year, and his absence is sorely felt. Mr. Brooks sends a couple of churches marked by that masculine treatment which always distinguishes his designs; and Mr. Sedding has several ecclesiastical studies, which are both artistic and original. The Badminton Club in Piccadilly, and a very small portion of the new Conservative Club, are all Mr. Edis contributes this year. Mr. Blomfield has an elaborate drawing of his proposed work at Chester Cathedral, and Mr. Jackson several drawings showing his perfect mastery over that picturesque Early English Renaissance which he knows so well how to employ. It is needless to say that Messrs. Ernest George & Peto are as captivating as ever with a long series of domestic works, designed in the finest manner and piquantly set forth in brown line and wash. Why is it that, notwithstanding all this artistic cleverness, there is on paper, and on paper only, a forlorn look about their works? The "family" invariably out of town and slatternly servants for ever idling in picturesque lassitude in the dark recesses of the open doorways? Mr. Colcutt's "Business Premises in Oxford-street" is sent up aloft in company with Mr. J. O. Scott's design for a reredos for Canterbury Cathedral. The latter is a brilliant water-colour drawing, and gains perhaps by this enforced remoteness, but the other is in the (too) fashionable pen-and-ink manner, and is absolutely a blank. Mr. Ernest Newton, Mr. E. J. May, and other architects of their school, send the usual crop of clever designs which differ only in their titles from the previous works of the same artists. The timber gables, the bargeboards and finials, the oriel windows, the cramped doorways, the doggy little summer-houses and pavilions, nay, the very trees which garnish their designs, are all old favourites, and greet us with familiar looks. Mr. Halsey Ricardo repeats this year that severe and dignified manner which was noticeable in his house for Mr. Justice Bowen last year; comfortable, modest, English homes

are these; and Mr. Coad shows us in several brilliant drawings what he is doing at Lanhedrock. A design for a Military Hospital (in a hot climate), by Major-General Sir Andrew Clarke and Mr. Ingress Bell, is an important and novel contribution. It is not so much a building as an assemblage of buildings of enormous extent and, apparently, costly character, carefully designed, and grouped impressively along the summit of an almost barren rock.*

There is a perplexing ambiguity about some of the subjects exhibited. "St. Saviour's Church" is all that we are told about one design. Of another we cannot be sure whether it is simply a study of an old church, or an old church restored, and the restored portions not distinguished from the rest; or a new church drawn in such a way as to simulate the stains and scars of time. Still more bewildering is a drawing of a sixteenth-century hall, known and dear to us, coupled with the name of a living architect. We have sketched it more than once, and our sketches upon comparison tally with the drawing. In what relation, therefore, does the modern architect stand to the ancient hall? There is a good deal of merely representative draughtsmanship in the exhibition, and its presence leads to the suggestion that some distinction should, if possible, be made between drawings which are merely transcripts from old work and architectural designs. We should have some means of knowing in what capacity the author in each case is supposed to figure,—that is, of course, where there is reasonable room for doubt. Tom Pinch may sign all his drawings of Salisbury Cathedral and no one will for a moment accuse him of taking a liberty; but there are cases in which the little abbreviation, "del.," would make matters much clearer.

In brilliant and beautiful draughtsmanship the exhibition is particularly strong. Nothing of the kind has ever been better done than Mr. Barratt's Ruskin-like Italian studies, or Mr. Reginald Blomfield's tender pencilings, or Mr. Raffles Davison's poetic rendering of Miss Kate Greenaway's charming country-house, which looks as if it had stepped bodily out of her own pretty pages. Mr. Horsley and Mr. Flockhart and Mr. H. W. Brewer send drawings which, in their several manners, have never been surpassed; and the unusually numerous studies in decoration and designs for stained glass are also this year of unusual excellence. In subsequent articles we intend to take up the consideration of the several

* This also will be represented in our illustration pages next week. We purposely avoid giving any illustrations of the architectural work at the Academy until the exhibition is open to the public.

designs in detail. Meanwhile, without ignoring the very obvious amount of youthful talent which is pressing forward and every year making itself felt, we cannot but note regretfully the losses we have lately suffered, and feel more and more how great our losses really are.

THE HISTORY OF FREEMASONRY.*

BY WYATT PAPWORTH.

CHAPTER XIV. is reserved for the further consideration of Ashmole's "Diary," the entries in which relating to Freemasonry "are of the greatest importance in our general inquiry, since, on a close view, they will be found to supply a quantity of information derivable from no other source, and which, together with the additional evidence I shall adduce from contemporaneous writings, will give us a tolerably faithful picture of English Freemasonry in the seventeenth century." The first entry, the account of his initiation in 1646, has been carefully investigated, and "the composition of the Lodge" thoroughly overhauled by Mr. W. H. Rylands, through whose researches "a flood of light was suddenly shed on the subject, and who has so far proved the essentially speculative (or non-operative) character of the Lodge, as to render it difficult to believe that there could have been a single operative mason present on the afternoon of October 16th, 1646." Mr. Rylands has looked up the history of each of the seven brethren present,—one of whom was the warden,—who admitted Ashmole and Colonel Mainwaring on that eventful day:—

"Concurrently with this there is the valuable evidence of the MS. Charge in the Sloane Collection, No. 3,843, which bears the attestation of one of the seven members, with the same year, 1646, month, and day. . . . Thus we should have speculative, and, it may be also, operative masonry, co-existing with the actual use, by Lodges and brethren, of the scrolls or constitutions, of which this Sloane MS. affords an illustration in point. . . . We continue to direct our course up the stream of Masonic history, the evidence of manuscript constitutions successively dating further and further back, until the transcripts are exhausted, without apparently bringing us any nearer to their common original, may well leave us in doubt at what point of our research between the era of the Lodge at Warrington, 1646, and that of the *loge* at York, 1355, a monopoly of these ancient documents by the working masons can be viewed as even remotely probable."

Why this *loge* at York should have been brought in here is somewhat puzzling. The lodge at Warrington may have been only a speculative one, but certainly the *loge* at York was only a practical one, confined to the operative masons at York Cathedral, and meaning their workshop. To the entry of 1682 in Ashmole's Diary, a similar careful scrutiny is applied, with the interesting result that of the six new members then admitted into the "Fellowship of Freemasons," two were members of the Masons' Company in London, the nine others present were members of that body (the Masons' Company), and then there remains only Ashmole to make up the sixteen present "at the noble dinner prepared at the charge of the new-accepted masons."

We need not discuss the several coats of arms granted to the "Hole Crafte and Fellowship of Musons" in 1472-73 to the Masons' Company of London, confirmed 1520-21, and entered in the Visitation of London in 1634. Two existing MS. Charges, both dated 1686, have the coat of arms as figured by Stow in 1633 (*i.e.*, the chevron plain, not engrailed), and "are associated with the arms of the City of London, proving beyond doubt that both these rolls, which are handsomely illuminated at the top, were originally prepared for London Lodges of Masons or Freemasons," writes Mr. Gould; but this passage appears to be somewhat vague, and, to prevent error, it is suggested that they were originally prepared

for the Guild of Masons, or, perhaps, for two members of the Guild or Company of Masons of London. We may both mean the same, but the wording differs.

Further on Mr. Gould records how he has discovered that "Robert Padgett, Clerk to the Worshipful Society of the Free Masons of the City of London in 1686," whose name appears appended to the MS. Constitutions in the possession of the present Lodge of Antiquity, was not the Clerk of the Masons' Company, which company possesses an "Accompte Book," and under the date 1687 occurs: "Mr. Stampe, Clerk." . . . which establishes the fact that the "Worshipful Society of the Free Masons of the City of London" and the "Company of Masons" in the same city, were distinct and separate bodies. Mr. Gould is to be congratulated on making this very decisive discovery, proving, as it does, that there were two co-existing bodies of Masons and Freemasons as "distinct and separate sodalities." It is also assisted by the investigation into the persons attending at Masons' Hall in 1682 as just narrated. Mr. Gould, after stating that by all writers alike no adequate distinction between the Freemasons of the Lodge and those of the Guild or Company has been maintained, notes that the above-named "Accompte Book" specifies that from 1620 to 1653 the members were styled Freemasons, and then goes on to quote numerous later instances of the use of the term, but to the reviewer he appears either to mingle the uses of the term, or wishes to show that although a man was an operative mason he could become a Freemason by joining a Company of Trades, as at Oxford and Newcastle; yet he candidly admits that in the Gateshead register the two terms are taken as words of indifferent application. This might very likely be the case at the present day, even with the full knowledge of the presence in the town of a Lodge of modern Freemasons, and probably for that very reason! The archives of the City of London were searched in 1879 by one of Mr. Gould's friends for early instances of the terms, "Mason and Freemason." But apparently only the already known example, dating 1376-77, was found for the latter term, with "Mason" in Norman French, and "Cementarii" in Latin, previously. He remarks on the earliest use of the expression as yet found in connection with actual building operations, that is, in 1396, in the document in the Sloane Collection, No. 4,593, p. 50 (which fact was published by the reviewer above twenty years since, who lately communicated the full reference to one of Mr. Gould's friends who was assisting him), and then follow many later examples of the uses of the word. But surely the word used in 1376 in connexion with the Guild of Operative Masons is as good as the other reference of twenty years later, and both are Freemasons by trade. It would require a long research to ascertain whether these terms given by the author from tombstones, registers, and documents, after, say, 1700, relate to the Guilds or to the Society. The question for solution is, "Is there any instance of the term Freemason being put into a register or on a tombstone when the person has not been a mason by trade?" The more modern letters R.A., F.S.A., and so on, are often seen on tombs. The derivation of the term "Freemason" from Freestonemason, Freemanmason, and Freemason, or free of a Guild or company, will, he thinks, "afford satisfaction to every class of theorist," and "lies within the category of Masonic problems."*

Another use of the word "Freemason" of the date of about 1363, or a little later (fitting in between the two dates above referred to), was accidentally discovered by me only at the end of last September; it is used by no less a person than the Reformer Wiclif, in the following treatise:—"The Grete sentence of Curs expounded," printed in Arnold's edition of

"Select English Works," by Wiclif, 8vo., 1869-71, iii., 333, cap. xxviii. :—

"Alle false conspirators ben cursed of God and man. . . . Alle new fraternytes or gildis maad of men. . . . Also men of unel crafte, as fre masons and others, smen openly cursed bi this sentence. For thei conspir togidres that no man of her craft schal take lesse on a day that thei setten, though he schulde bi good conscience take moche lesse, and that noon of hem schal make save trewe work to lette othere mennes wyning of the craft, and that noon of hem schal do ought but only beve stone, though he might profit his mastir twenti pound bi o dages work bi leggyng on a wal, withouten harm opening himself. See hou this wickid peple conspireth agens truthe and charite, and comyn profit of the lond, and ponyschith hem that helpen frely here neigeboris."

This was written probably in 1383, the year before Wiclif's death, but possibly may be by a somewhat later hand. The MS. is stated to be in Corpus Christi College, Cambridge. This extract is interestingly illustrative, and confirmatory, if that be needful, of the popular outcry against many of the trades, and of the masons in particular, necessitating the Statutes of 1350-1, 1360-1, and later years, the inquiry into which has formed a valuable chapter in the previous volume;* it also proves the application of the word Freemason to the practical man, and not to the speculative, *i.e.*, Society of Freemasons. Mr. Gould points out fairly the non-use of the term Freemason, among the masons employed at York Minster, even when quoting one instance as late as 1522-3, qualified by his previous statement that "it is sufficiently clear that in the fiftieth year of Edward III. (1376-7) there was a use of the term Freemason, and that the persons to whom it was applied were a section or offshoot of the Masons' Company, though in either case probably reabsorbed within the parent body," which, he goes on to say, was effected, as may be proved by the words of Stow in 1633, "the masons otherwise termed Freemasons," and the existing tomb of William Kerwin, Freemason, of 1594, having the original coat of arms of the Masons' Guild, or Company, cut on it. "My contention is," writes Mr. Gould, "that the class of persons from whom the Freemasons of Warrington, Staffordshire, Chester, York, London, and their congeners, in the seventeenth century derived the descriptive title which became the inheritance of the Grand Lodge of England, were free men, and Masons of Guilds or Companies"; and a note seems to explain that he means that they possessed the freedom of the city. And further, "as cumulative proofs that the Society of Freemasons has derived its name from the Freemeu-masons of more early times, the examples in the Scottish records have an especial value." From this statement the reviewer presumes he means that a "free-gentleman" (that is, one free of the town) joining a lodge or guild of Masons, becomes a Freemason, and hence a member of the Society of Freemasons!

He then reverts to Ashmole to discriminate between his *undoubted* testimony and the opinions which have been ascribed to him. A very interestingly written research, but one which it is needless to revert to here, is therefore "taken as read." Dr. Plot's account of the Freemasons, 1686, follows; he, Plot, observed "that St. Amphibalus by judicious persons is thought to be rather the cloak than the master of St. Alban," a suggestion which is not so modern as has been supposed. Mr. Gould is not inclined to admit it, and writes,—"All accounts concur in representing St. Amphibalus as a priest or missionary from Rome. To suppose that this personage was merely the cloak of St. Alban. . . . is the ridiculous assumption of self-opinionated critics," is his severely-worded comment. He refers to Antoninus Bassianus being called "Caracalla" (a short Gaulish cloak); and that "Amphibalus would signify a long ample garment, such as a pilgrim might naturally carry with him." But Dean Stanley, in the *Contemporary Review* February, 1875, p. 480, states that "the caracalla, a long overall, was corrupted into casacalla, casaco, and cascock; it had a hood, and was called in Greek *amphibalos*, and as

* The History of Freemasonry: its Antiquities, Symbols, Constitutions, Customs, &c., derived from Official Sources. By Robert Freke Gould, barrister-at-law, Past Senior Grand Deacon of England, 4to. London: Thomas C. Jack, 1884. Vol. iii., 249 pages. See p. 674, ante. ↑ See p. 66 of vol. i. of this "History."

* I cannot help still believing that my discovery, about twenty years since, of the document of 1366, showing that the Latin term "*lathomas*" was rendered "*fre masons*" in the same line, is indisputable. The Latin words "*lathomi*" and "*ceamentarii*" are used previously. I had also referred at the same time to the list of 1376-7, as above stated.

* The Statutes relating to the Freemasons, ii., 328-380.

such appears in the account of the persecution of St. Alban (Bede, H. E., i. 6), where by a strange confusion the name of Amphibalus has been supposed to represent the name of a saint. Who shall decide when such learned men disagree so entirely? Then follows the inquiry into Dr. Richard Rawlinson; and into the three Randle Holmes with the *Académie of Armory* in 1688, in which occurs the term "Free Masons—Stone Cutters." I do not make out from the text of our author whether he considers the "Fraternity, Society, Brotherhood, or Company," &c., to use the words of Randle Holme, applies to a Guild or to the Society of Freemasons, which it is now to be recognised as in existence in 1688, or whether one of the Holmes has himself muddled up the two together. Mr. Gould desires to prove, however, that "the author of the *Académie of Armory*," the Freemason of Chester Lodge, and the copyist to whose labours we are indebted for the form of one of the Old Charges, now the Harleian MS. 9054, was one and the same person"; and this MS. is wished to be dated 1625, 1650, or about 1665, which latter would be midway between those of 1646 and 1686. In the same volume of MSS. in the British Museum, is a form of oath to be taken by a Freemason about "several words and signs"; and the next leaf contains MS. entries relating to it, supposed to be the Chester Lodge, which are considered with great scrutiny by the author, rendered easy by the labours of his friend Mr. Rylands, who has obtained from the Chester Register if Willis some verification of the twenty-six names contained on the leaf above mentioned, four of whom were actually "Masons," and the whole number in the list may have belonged to a "Society of Freemasons" of Chester.

Our author next groups the several versions of the Old Charges or Constitutions into six classes or divisions, to show the relative estimation in which,—according to his judgment,—they should be regarded as authoritative or credited writings. Then follows the description of the two plates of coats of arms of English and foreign companies of masons, carpenters, and other trades given for comparison, in which it is only needful to notice that the scalloped chevron in the coat of arms granted 172-3 to the London "Guild of Masons, otherwise called Freemasons," became a plain one, as noticed by Stow in 1633. Was the latter assumed by the Society Lodges, and (Stow) did not observe the difference? Chapter XV. is devoted to Old Charges, the legend of the Craft, Light and Darkness, Gothic additions. These "Old Charges," Mr. Gould states, are "the title deeds and evidences of inherited Freemasonry"; they would amply ward the closest and most minute examination." This cannot here be given to them, he, however, found it necessary to give a mere scrutiny to the "Harleian MS., 1,942" (1), dating seventeenth century, and the Roberts MS. (4) of the same period, the latter being, in his opinion, a reproduction or counterpart of the former, and "both parent and progeny stand on the same footing of utility." They are interesting as differing from all the other Charges known, in that the former contains "new articles," which form its distinctive feature; and the question arises then, if No. 1,942 "is an authorised and credited reading which has come down to us through a legitimate channel": "the Roberts et . . . stands upon the faith of the compiler . . . 27th December, 1663, when the regulations were made, of which only the first are given" in No. 1,942, though all are duly given in Roberts's. No exact date can be given No. 1,942 . . . its age, I think, "cannot be fixed any later than 1670. (Mr. Bond, principal librarian of the British Museum, estimates it as of "the beginning of the seventh century.") "These 'New Articles' I do not explain [he says], nor in my judgment an explanation material; it also contains the Apprentice Charge, which is peculiar to the versions only." But the reviewer would say: Is the oath more than the affirmation taken by a newly-elected Livyman on entering a London Guild? and would submit for Mr. Gould's consideration that this

1,942 Charge may have belonged to an independent Lodge in town or country, knowing nothing of other Lodges. The history of the Society itself is only now being thoroughly elucidated through the comprehensive grasp of mind of Mr. Gould and his friends, and, as before observed, it is not known to whom belonged these thirty-one copies of the "Old Charges or Constitutions,"—perhaps some to the Guild, some to its members, and some to the Society, the Lodge, or member of the Lodge. As before observed, the City arms, and the Masons' coat of arms, appear on some, as the latter does in No. 29, of about 1714, in my possession. It is known that a "parchment book containing an 113 annals of the antiquity, &c." was, before 1839, in the possession of the Masous or Guild or Company of London, and is classed by Mr. Gould as one of the number. Mr. Gould quotes "the Masonic tradition that prior to 1567 the whole of England was ruled by a single Grand Master," but does not state of what, and also seems to concur with his friend that "the Grand Lodge MS. Constitution (4) 'dating 1583,' or a previous draft originated all Constitutions (except 3 and 23), whether in Yorkshire, Lancashire, Scotland, or South Britain."

Among other subjects considered in this elaborate "History," as a necessary part of the inquiry, are the Mysteries,—of Egypt, the Ritual of the Dead, the Profession of a Benedictine Monk, Degrees, Symbols, Metaphors, and Emblems of the Freemasons; Lodge Elements and Appointments (but when invented?), Vehmic Tribunals, Dr. Armstrong and his Notions and Opinions, and the Opinions of "Dr. Leeson, Most Puissant Sovereign Grand Commander 33," read before the Royal Naval Chapter of Sovereign Princes of Rose Croix in 1662" (!) also Fort's work, mentioned above, of which our author writes, "he has succeeded where all his predecessors have failed,—that is, in rendering the study of our antiquities an attractive task. . . . He does not wish to say that Fort has withheld information from his readers; but having clearly established in his own mind certain facts, these appeared so incontrovertible as to justify the exclusion of the details by which they were supported. But no one, I am sure, would more heartily concur in the golden rule of criticism, that *truth* is the great object to be sought, and not the maintenance of an opinion, because it was once expressed." Mr. Gould remarks further on:—"Indeed, many of the Rites, Symbols, and Beliefs now prevalent among Masons, correspond with or are analogous to those supposed to have been common to the members of earlier and distinct societies." In a future chapter we may read when they were invented or introduced among the moderns. He, however, does add:—"To what extent these or any other portions of the existing Lodge ceremonial are survivals of more ancient customs, cannot be very accurately determined." But could they not all have been *invented* or *manufactured* as necessity required at or after 1717.

We are promised in the next volume (of which three more are due) an examination into the character of the Freemasonry which existed after the era of Grand Lodges; the proceedings of the few Lodges that can be traced between 1686 and 1717; as well as a comparison of the Masonry of Scotland with that of England; and also the question of degrees. During the careful perusal of this volume it has appeared very desirable that, besides an elaborate index to the whole work, a chronological list should be added of the dated facts laid before the readers, facts which Mr. Gould has shown that he knows well how to use and work in, in all their bearings one with another.

Turnstiles at the Inventions Exhibition.—Messrs. C. Isler & Co. have received orders from the Executive Council of the Inventions Exhibition to fix eleven more of their turnstiles, making a total of twenty-six. Fourteen are to be fixed in the subway (these are so arranged that they will register the number of persons going in and coming out) and twelve at the Exhibition entrance.

THE GROSVENOR GALLERY.

HERE have certainly been finer exhibitions at the Grosvenor Gallery than the present one, though it contains works of great interest, and some of the highest artistic power. The absence of Mr. Burne Jones deprives the exhibition to some extent of the peculiar *cachet* which has usually seemed to mark the Grosvenor collections as distinct in tone and feeling from other exhibitions of the day; and some of the most powerful works exhibited would have found their place as naturally at Burlington House as in Bond-street,—a fact which will be rather welcome than otherwise to those who look doubtfully upon affectation in art, even when it is the affectation of genius. Among those works which appeal to us by genuine and straightforward power none can rank higher than Mr. Millais's splendid portrait of Mr. Gladstone (54), a strange and remarkable contrast to that other portrait of the Premier which was in the Academy some little while back, and which has become the most popular and widely-accepted representation of the eminent Statesman. That three-quarter length portrait, in standing attitude with the hands clasped, represented the contemplative, it might even be said the pathetic aspect, of Mr. Gladstone's character; the present one, in which he is represented seated and in scarlet robes, with the face turned towards the spectator, is eager and energetic in expression. The other was all dark in colour; this is all brightness, but the artist has been quite successful in the difficult task of harmonising the face with the mass of warm colour in the costume, without unduly heightening the flesh tints,—how successful may be the better understood by contrast with the similar attempt made by Mr. Barrett Browning, in his portrait of his father in similar robes of collegiate dignity, where the great poet, in order to assimilate him to the costume, is represented with a countenance suggestive of much libation to Bacchus. So many-sided a man as Mr. Gladstone (to return to the immediate subject) could never be represented by a single portrait; but it is remarkable that one painter should succeed in realising, with equal power, two such different phases of character in the same person; or it would be remarkable, if the painter were not Mr. Millais.

Mr. Watts's "Love and Life" (30), if it he really meant, as has been affirmed, as a companion to "Love and Death," is far below that great work in artistic power and feeling. "Life" is represented by a thin figureless female, ascending a rocky step, and ready to faint, as her countenance expresses, unless upheld by the winged figure of love at her side. The allegory is well brought out; the picture is pathetic in a sense, but it is weak; "Love" is not strong or dignified, "Life" is painfully limp and feeble, even Love can hardly do much for such a Life. It is a very high aim, of course, and let us be grateful to a painter who always aims so high that it is no wonder if he sometimes comes short of his ideal. The opposite end of the room is occupied by a remarkable work by a painter not as yet known to fame, Mr. Mitchell, who has chosen for his subject that terrible moment when Hypatia, as described in Kingsley's semi-historical romance, stood on the steps of the altar making one last appeal for mercy to the mob of bigots who were bent on her destruction. The painter omits the monkish throng, however, showing us only Hypatia herself on the altar-steps,—a figure thoroughly studied in drawing and execution, and very pathetic in expression: perhaps the countenance does not convey all the terrors of the situation; but this, as well as the omission of her blood-thirsty persecutors from the scene, may have been intentional, in order to avoid a lapse from the pathetic to the purely painful. At all events, the painting is one which will make every one look with interest to the future productions of its author. The third central picture of the large room is Mr. Richmond's "An Audience in Athens during the Representation of the Agamemnon" (69), at the moment when Clytemnestra recounts how she

slew her husband. The spectator faces the audience, the scene being behind him. The idea of representing the play of feeling in the faces of the spectators at this stage of the tragedy is a very fine one, and there is much in the various countenances that is expressive and worthy of careful attention; but the picture is not life-like; the men and women do not appeal to our sympathies much. The composition is backed by a double Ionic colonnade skirting the circumference of the auditorium,—a scenic addition which has a good effect on the composition, but for which, as a portion of a Greek theatre, there is no architectural authority.

The charge of unreality cannot at least be brought against the two other much smaller antique subjects on the same wall, the two brilliant little works by Mr. Alua Tadema, entitled "Who is it?" (57) and "Expectations" (81). In these works the realisation of antique life, not only in the accessories but in the figures, is so complete that we feel as if the lapse of time was annihilated for us,—as if we really beheld that old-world life in its reality. In "Expectations," in which a young woman sits on a marble seat overlooking the dark Ægean sea, shading her eyes with her hand to look at a boat in the distance, the artistic effect and feeling is the most clear and complete of the two; but both are remarkable works, such as none of the artist's now rather numerous imitators have in the least degree approached. The perfect drawing and perspective of all the architectural details is as noteworthy in these as in other more elaborate works by the same hand.

In the East Gallery Mr. Walter Crane exhibits one of the largest and finest paintings he has produced,—*"Freedom"* (157),—illustrating a splendid passage from Swinburne's "Songs before Sunrise." A nude figure in the foreground, who has been fettered by the influence of priest and king on either side of him, is hailed by the winged genius of freedom, at whose call his fetters drop off. We are not over fond of allegorical paintings, but this has the merit of thoroughly telling its story and producing a remarkably fine decorative ensemble at the same time. Mr. Crane's other work, *"Pandora"* (16), is hardly a success; the attitude of the figure is rather painfully contorted, and the drawing of the head, hewed forward so as to hide the face, is not quite successful.

After these, the remaining portraits are the most noticeable works. Next to those already mentioned, perhaps Mr. Holl's "The Late Lord Overstone" (33) is the finest work; with just a suspicion of *chic* in the sparkle of the high lights, this is nevertheless a wonderfully solid and real portrait of which the face is painted with splendid finish and expression. Mr. Watts's "Miss Rachel Gurney" (62) is a beautifully-refined and characteristic portrait, a half-length, showing the lady in black half-leaving against a wall or screen behind her. Mr. Lehmann's portrait of Mr. Browning (10), hung as a pendant to Mr. Barrett Browning's painting before alluded to (with unhappy result to the latter) is an excellent likeness, and a good example of simple and unaffected portraiture. Among other portraits may be named Mr. Watts's "Mrs. F. Myers" (140*), a beautiful hit of colour; Mr. Collier's "Lady Loraine" (19); Mr. Stuart Wortley's "Miss Maud Waller" (161), an admirably-painted portrait of a young girl; Mr. Richmond's "Mr. A. Lang" (191) and "Lady Lloyd Lindsay" (174); and Mr. C. E. Halle's portrait of Mr. Chas. Halle (209), more remarkable as a likeness than for artistic effect, but certainly excellent in the former sense.

Mr. Nettleship, the animal-painter *par excellence* of the Grosvenor contributors, sends a very large painting,—*"Refuge"* (195),—of a lion and family who have got into a safe place from a jungle fire, joined by one or two more harmless animals which have forgotten their fear of the lions in the common danger. The big lion is a very fine beast, but his body seems rather lengthened out in perspective, considering the angle at which he is seen. In his peculiar faculty of conveying animal character, the painter is more completely

successful in his smaller work, "Bruin" (134), which is about the most bearish bear we remember to have seen on canvas.

Landscape is seldom very strong at the Grosvenor, and is less so than usual this year. Mr. Kocley Halswelle's "Kilchurn Castle" (8) is the most important work, and is remarkably effective in a sense; but the effect, with the hard-looking steel-like surface of the lake, is of the theatrical kind. Mr. Henry is less successful than usual in two rather large works; in "Homeward" (26), one of his favourite class of works, the water seems somewhat solid and un-watery. In "A Kerry Pastoral" (41) Mr. Mark Fisher's unfortunate tendency to what may be called dirty tones and consequent want of light reaches a climax, and it is impossible to accept this as a representation of outdoor effect. Mr. Henry Moore's "Queen of the Night" (120) is a really fine effect of moonlight on the sea. Mr. Watts sends a remarkable study of dark mountains, under the title "Ararat" (172).

Among the portraits we should not have omitted Mr. Tadema's "My Doctor" (1), obviously a portrait, where the doctor sits by a bedside feeling the pulse of a patient whose face is not shown. Mr. Holman Hunt contributes a head of a woman under the title "The Bride of Bethlehem" (14), a singularly unhappy-looking bride, whose face is finished with that hard and over-wrought minuteness of detail which has been the artist's great stumbling-block, and seems to petrify all the life out of his faces. Reverting to the absence of Mr. Burne-Jones from the exhibition, it may be observed that Miss Pickering seems to have regretted this in anticipation so much as to have endeavoured to fill the gap by producing a Burne-Jones painting herself, in the shape of "A Dryad" (43), and really with no had success.

NOTES.

THE result of the Archbishop's charge in reference to Peterborough Cathedral, on which we commented last week, seems to have been wonderfully pacifying. It is understood not only that the first part of Dr. Benson's advice, to reconstitute the committee, is to be acted upon, but that his licence to then reconsider the whole question, independently of his judgment, will not be accepted, and that the rebuilding of the tower on its old lines will be adopted in accordance with his opinion. Even Sir E. Beckett, that champion of the modern architect against the errors and superstitions of archeology, has given no open sign of rebellion against "the Archbishop's most fatherly rebukes," and might, perhaps, express his attitude in a slightly altered version of the words of the Psalmist,—*"I kept silence, even from had words, but it was pain and grief to me."* So we are all going to be good boys, and do as we are told. Let not a word be said here to disturb such an unexpectedly harmonious state of things. Perhaps, when the work is done, there may arise in some minds a qualm of conscience,—a dim perception that a great opportunity has been missed. A Mediæval architect would have felt so, at all events. But then, of course, we are not Mediæval architects: Q. E. D.

THE meeting held at Willis's Rooms on Friday last, "inaugurated" (to use the Chairman's expression) a new departure in land-holding. "The Small Farm and Laborers' Holding Company, Limited,"—a cumbersome title for a simple undertaking,—has been started with something more than expressions of goodwill on the part of its aristocratic backers. Sir R. Loyd Lindsay offered the company, on its own terms, a suitable estate of 400 acres in Berkshire, and the Duke of Argyll, in his interesting and somewhat autobiographical speech, indicated the county of Essex as a very eligible field for the company's operations. Some reference was made by Lord Ripon to an experiment of a similar kind made at Ralahueen, in Ireland, some fifty years ago, and also to what Mr. Bolton King has set on foot with no little success in Warwick-

shire, but none of the speakers said a word about what Mr. Gordon had effected by co-operative farming on his estate at Assington. His plan would seem to suit the temper of the times better than that of Lord Tollemache, where the feudal principle is still maintained, though tempered with so much justice, liberality, and common-sense as to win the approbation even of Mr. Chamberlain. The Peckforton estate is probably the only one in England on which are to be found no less than 270 cottages, with *three acres of land attached to each*. These Cheshire cottagers are, however, exceptionally fortunate, not only in their landlord and in their holdings, but in having good markets close at hand for the disposal of their produce and, above all, grass land suitable for dairy purposes. The cow is to them what the pig is to the Irishman,—a source of income and an object of interest. But, of course, these favourable conditions are not to be found in all parts of England, even where the landlord is as well disposed towards his tenantry as Lord Tollemache has shown himself to be. The country clergy, who are often at a loss how to let or to cultivate their glebes, might do much to encourage peasant proprietorship, and in so doing regain the influence over the labourer which has been largely lost. Co-operation would unite classes which have been getting wider and wider apart, and a new link would be forged which would attach the labourer to the soil and prevent him from injuring his fellows by seeking work in our already over-stocked towns.

IN the Annual Report of the Institute of British Architects, the substance of which will be found in another column, one or two facts are noted which will be received with regret by those who wish well to the Institute and to the higher interests of the profession. One of these is in regard to the non-appearance of any competitors for the Grissell Gold Medal for the last two years. This medal is really one of the most valuable offered by the Institute, being, as it is, especially designed to encourage the detailed study of construction. The neglect of it by the students and younger members implies that they care more to excel in competitions in draughtsmanship and in the external appearance of buildings, than in matters relating to scientific construction. This is putting the cart before the horse, and is not the way to raise the future profession of architecture in public confidence. The failure of the essay prize, though a matter of much less importance, is also to be regretted, as the faculty of logical and clear literary expression certainly requires more development among architects. The Report comments also on the unsatisfactory state of the case in regard to competitions; many architects having banded themselves together not to compete except where a professional assessor is employed, while a considerable number hold aloof in the apparent hope of thereby finding easier running in competitions not guarded by an assessor. The want of *esprit de corps* in such a mode of acting is anything but creditable; and we hope those who pursue these tactics will have their reward in being made ducks and drakes of by irresponsible competition committees. In regard to those who support the principle of an assessor, however, it must be remembered that it is a matter of proper loyalty to abide by the decision of the assessor. Some gentlemen seem always desirous to call it in question, whenever it goes against them. They should remember that in all games it is considered very bad form to question the decision of the umpire.

PUBLIC opinion has seldom had a more marked effect than in the case of the Railway Rates and Charges Bills. It is very doubtful whether Mr. Chamberlain would have promised to use his influence against the measures had it not been for the energetic action of the various Trade Associations, and the consequent flood of petitions against the Bills which poured in from all quarters; in fact, it is very probable that, at the outset, the Railway Companies reckoned upon the hon. gentleman's support. The statement made by Sir Joseph Pease on Friday in last week proves

that the Companies are at length convinced that it is useless for them to persist in a second reading. Sir Joseph said, that, as far as his Company (the North-Eastern) were concerned,—and he understood that the other Companies adopted the same views,—the matter would either be allowed to rest or an application would be made to the House for leave to formally move the discharge of the order. It is to be hoped that the latter course will be taken, as such an application would be accompanied by some explanation of the attitude of the Companies in the matter, and this would be very acceptable. It is a singular fact that the most practical outcome of the affair should be the thorough ventilation of a point not dealt with in the Bills at all, viz., the Preference Rates question. This, as we have before mentioned, will certainly not be allowed to drop, and a Government measure dealing with the subject may be confidently expected.

SIR SPENCER WELLS made a very powerful appeal in his lecture last week on behalf of cremation, mainly on practical, in part also on sentimental grounds. "What," he asked, "might St. Paul's and Westminster Abbey be if, instead of the coffins with their corrupting contents, occupying large space, and a source of danger to the living, we had the ashes only admitted, arranged in the urns along the sides of the cloisters or in chapels or crypt, or beneath memorial windows, slabs, or brasses? We should have the same change in graveyards and cemeteries, from danger and disgust to health and beauty, when the overcrowded cemeteries of to-day were converted into the God's Acre of the future." But surely we might go a step further and say, if it is false sentiment to keep the remains of the dead for slow decay, is it not equally so to keep in an urn the ashes remaining from their combustion? What can be the satisfaction in the possession of such relics? Sentiment is really best left out of the question. We are unable to understand the enthusiasm displayed by the advocates of this or that new system of disposing of the remains of the dead. To hear some of them talk, one would suppose they had discovered the elixir of life instead of a new form of treating the dead. The subject is a painful and unattractive one, take it as we will, and is best regarded from the practical or sanitary point of view. In this respect there is no doubt that with all who understand the circumstances the coffin system must be condemned, though it will probably take a long time to eradicate it unless Government see their way to special legislation on the subject. Whether Mr. Seymour Haden's "earth-to-earth" system, which we have always been disposed to favour, may not be extensively used without danger, is a point which has not yet received sufficient practical consideration. Our matured impression is that on sanitary grounds cremation is the best method; but we can quite understand the feeling against it on the part of many, not so much in regard to their own remains as to those of others, as Sir Joseph Fayer frankly expressed it in the discussion that followed the lecture.

THE case of Mellis and Pym v. The Shirley Local Board of Health, which was recently decided by Mr. Justice Cave, will probably find its way to a higher tribunal. It decided two important points which may here be shortly noticed. The first was that, where one Local Board makes a contract not under seal and a subsequently elected Board ratifies it with the seal of the Board, it is then a binding contract, even though a subsequent Board endeavours to set it aside. Of course it is imprudent of any person who contracts with a Local Board not to take care that the contract is under seal. The several cases, especially Hunt v. The Wimbledon Local Board, on which we have more than once commented, should have made this a matter of public knowledge. It is quite right, however, that a ratification under seal should be binding, otherwise even original contracts under

seal might be set aside by subsequently elected Local Boards, for there is no doubt that a *bona-fide* ratification is as binding as a valid contract in the first instance. The second point in the case may or may not have been rightly decided; looking to the words of section 193 of the Public Health Act, 1875, we are, if we may say so, in accord with Mr. Justice Cave. The contract for plans for a scheme of drainage for the Local Board was made with two persons, one of whom was the surveyor of the Board. It was contended on behalf of the latter that the contract was therefore void. But the judge held that this was not the result of the section which, in so many words, fixed the penalty for an infringement of it. That penalty is the payment of a sum of 50*l.*, and incapacity in future for holding any office or employment under the Act. There can be no doubt, we think, that Pym, the surveyor in this case, had incurred these penalties, but it is so obviously contrary to the public interest that any surveyor to a local Board should enter into a contract to do work for it, that we should like to see any such contract made void by the Legislature. In some cases it might be worth while to incur the above penalties, and make a large sum directly and indirectly out of a contract with a Board, and the public will not be fully secure against the mischief till the operation of the above section is enlarged, if the law as laid down by Mr. Justice Cave is correct.

THE reading a second time, without a division, of the London Street Tramways Extension Bill marks the advance made in public opinion with reference to this method of communication. It is probable that no modern invention has met with more opposition than the tramway. The first American tramway was the New York and Harlem line; a section of which was laid through the main thoroughfares in 1832, but which proved unpopular, and was for a time suppressed. The lines laid down in the Bayswater-road, in Kennington, and in Westminster in 1861, by Mr. Train, were also pulled up. Yet in spite of the opposition of Mr. Gregory and Sir H. Selwin-Ibbetson, the decision of the Committee which rejected the Bill last year has been overruled; and the arguments that "tramways are a great benefit to the public," and that they are "of special advantage to the working-classes as enabling them to get where there is pure air and cheap dwellings," were tacitly accepted. The movement of urban and suburban building can hardly fail to be affected by this change in public opinion. Being purely home industries, tramways pay, and this is so exceptional a case, with regard to investments in business, that the customers and the tramway-makers pull comfortably together.

THE authorities have at length recognised the necessity, which we have frequently pointed out, of some immediate communication at the Law Courts between the great hall and the northern corridor on the court floor, which is the most important space among the courts, forming as it does a kind of centre of communication. A small staircase is now being constructed on the west side of the passage into the great hall from the north up to a point by the side of the gallery, which overlooks the hall. It will soon be possible, therefore, to gain a comparatively direct route from the hall to the courts without wending a devious way through the crypt, among lavatories and refreshment-halls. It is to be regretted, however, that the authorities have not adopted a holder remedy, by making a staircase from the gallery overlooking the central hall. This is quite useless as it is at present; whereas if it had formed the landing to a flight of stairs it would at once have been made of practical use, and a fitting approach would have been made to the courts. We can scarcely regard the new side staircase as other than a temporary remedy, for it is most unfitting that the chief avenue of approach to the principal courts from the central hall should be by a winding staircase, which more resembles the servants' staircase in a large mansion than anything else.

THE determination of the Decoration Committee of St. Paul's to abandon the project of decorating the dome *sine die* is not one that causes us either surprise or regret. Some very fine work was, undoubtedly, done by Mr. Poynter for the purpose, but the experimental exhibition of the cartoons only proved that such painting was thrown away in that position, and none of the various schemes, as general schemes of decoration, recommended themselves as ideal methods of treating a domical surface in a decorative manner. In commencing anew on the choir, which is understood to be now the intention, the committee and their artistic coadjutors will have a better chance of feeling their way towards the realisation of a suitable style and scheme of decoration for further development, as they proceed to the larger spaces and more difficult problems presented by the crossing.

THE Exhibition of the Society of Painters in Water-Colours is a remarkably good one, most of the leading members being very well represented, and some, who have been rather defaulters of late, have re-appeared in force. Among these is Mr. Boyce, whose delicately finished paintings of old buildings in the midst of equally delicate and truthful landscape are a delight to the eye, "Brougham Castle" (103) being, perhaps, the finest. The exhibition contains an unusual number of architectural subjects; Roman studies by Mr. H. Rivière, Mr. A. Glennie, and Mr. Collingwood Smith; "Calais" (48), by Mr. S. J. Hodson; "A Suppressed Monastery" (95), by Mr. Goodwin; Venetian studies, by Mr. Callow, mannered certainly, but in a very effective manner; "The Gate of Justice, Jerusalem" (161), by Mr. Carl Haag; "Amalfi" (98), by Mr. Naffel; and "Flagstaff, St. Mark's" (70), by Miss C. Montalba, are among these. The recent member, Miss Forster, now Mrs. Mary Forster Lofthouse, shows still further powers in her two views of "Pembroke Castle" (234 and 244). Mrs. Allingham is at her very best (which is saying much) in "A Basket of Clothes" (17) and "Lessons" (181); the girl pupil in the latter drawing is a lovely child; the whole scene, an interior, is perfect in its way. The landscapes by Mr. Eyre Walker are notable for power and breadth of style. Among other specially fine things are Mr. W. Field's "Hamstead Heath" (59), Mr. Powell's "The Opalescent Sea" (254), Mr. Goodwin's "Abingdon" (97), and Mr. E. Waterlow's "Village by the Sea" (180), than which nothing more full of bright clear atmosphere could well be seen. The exhibition is a little more restricted than usual numerically; the screens are filled on one side only, but the quality of the exhibition generally is very high.

WE fear the same cannot be said of the much larger exhibition,—larger both as to numbers and as to the average size of the drawings, in the rooms of the Institute. The strongest member, Mr. Linton, contributes only two figures, "Waverley" and "Rose Bradwardine" (444, 464), not in his best way; the strongest landscape artist, Mr. Collier, has a fine work, "Near Burley" (734), in his usual broad and powerful style. But there is a lamentably large array of uninteresting and even coarse work, the coarseness of quality arising in some instances from painting up to the size of the rooms. Of Mr. Fulleylove's various contributions, "The Great Avenue, Hampton Court" (1,066), is the finest; but there is nothing equal to his splendid Versailles pictures of last year. The most important work, and a very clever one, is Mr. C. Green's large drawing of "Nellie and her Grandfather at the Races" (627), a scene crowded with figures, forming a remarkable study, not only of character, but of the costume and manner of a bygone period. The two principal figures form a very fine realisation of Dickens's most pathetic creation. Two humorous pictures, by Mr. Frank Dadd, especially "The Boy,—what will he become?" (412), where a loutish lad is examined by a phrenologist in the presence of his loutish father, are most successful in their way.

Among other prominent works are "How we Caught a Shoal of Pilchards" (192), by Mr. Napier Hemy; "South Harting, Sussex" (306), by Mr. Aumonier; "Hoveringham Ferry" (369), by Mr. Orrock; "The New Dress" (392), by Mr. Small, a figure of a lady, of exquisite grace and refinement; "Cuckmere Haven" (451), by Mr. G. H. Hine; "A Dartmoor Stream" (802), by Mr. Syer; "Sunset, West Coast of Ireland" (823), by Mr. Arthur Severn; "Finale Furioso" (867), a masterpiece of "still life," by Mr. B. W. Spiers; "An Old Song" (294), a large, but carelessly executed work, by Mr. Ahley, who has not done himself justice. We should be curious to know what hunting men think of Mr. R. Caldecott's "The First Flight" (438). His leaping horses do not look as if any of them would get clear over the fence.

AT the dinner of the Institution of Civil Engineers, on Wednesday evening, Lord Sudeley proposed the health of the President, Sir Frederick Bramwell, with such allusions to the great work of the engineering profession as were both true in themselves and suitable to the occasion. The Chairman, however, was hardly content with this, and amplified on the text to the extent of proving that engineering, which employed the sources of powers in nature for the benefit of man, was the most noble pursuit imaginable. In fact, the salvation of our souls seems to be due to it, for without the steam printing-press we could not have had cheap Bibles; the Bible itself being a minor incident of a preparatory nature, apparently, in the chain of events as viewed by Sir F. Bramwell. We certainly think the engineering profession a noble one, but the interests it serves are primarily material ones, and philosophers hold that mental and spiritual interests are even higher than these. We should be glad if we could now and then see on the part of engineers any perception that the universe may possibly be regarded from other than an engineering point of view.

NOTES ON THE ANCIENT CHURCHES OF LONDON.*

ATTENTION has already been called to the extreme attention that has been paid to the orientation of the London churches, for, although four are now built north and south, namely, St. Martin's, Ludgate; St. Edmund the King; St. Peter-le-Poor; and St. Botolph, Aldgate; yet Faithorne's map shows us that this was not the arrangement prior to 1666. This is also the case in the two little ancient Roman churches of Canterbury, St. Martin's and that now known as St. Pancras. It is the case, too, with some few very ancient churches which I have pointed out in Wales. It is worthy of observation that this custom, so remarkably characteristic of our London churches, while it has continued in England for so many centuries, does not appear to owe its origin to Papal Rome. A comparison of a map of Rome with that of London shows the curious fact that, while all our churches were fairly well orientated, notwithstanding all the difficulties of site, yet in Rome itself no attention has been paid to any such arrangement. The great basilicas point in all directions, St. Giovanni Laterano being due west instead of east; Sta. Maria Maggiore, north-west; St. Croce in Gerusalemme south-east; many of the churches north or south, or any other point indifferently, while St. Peter's itself has its main entrance at the east and its choir altar to the west. These arrangements are of early as well as more recent date, and indicate clearly enough that there never was any rule of orientation observed in Rome. The cities of Italy, in like manner, for the most part follow what we find in Rome, but across the Alps orientation begins to show itself, and at Paris and in most of the other cities of France the rule is observed as in England and Wales. These facts are curious and, perhaps, unexpected, for it raises the inquiry.—From what people did the ancient Roman Christians of Britain derive the practice, and how did it come about that the

Anglo-Saxons followed the older practice rather than that which was observed in Italy?

The churches which escaped the Great Fire of 1666, included in the area under discussion, were twenty-two in number. These were, doubtless, fairly typical examples of the whole; so far, at least, as one group of churches can resemble another, each building having, in fact, its own characteristics not to be found in another. The resemblance, therefore, of the churches which survived can be but a very general one, and nothing more, to those which perished in the terrible calamity referred to. Of these, no fewer than twelve have been since rebuilt, and two have been demolished, leaving but eight in number of those which survived. These latter have been so frequently described that their bare enumeration here will be sufficient. They are as follow:—Alhallowes, Barking; Andrew Undershaft; Ethelburga; Helen; Katherine Cree; Olave, Hart-street; Bartholomew the Great; and St. Giles, Cripplegate.

Our attention to the churches which have been rebuilt since the Fire may be more interesting and profitable than any further consideration of the buildings which still exist, and the more so since so little attention has hitherto been directed to the references to them which have come down to our time from the last century, when their rebuildings took place. These notices are, indeed, more exact and definite than many may be aware of. They consist not only of pictorial illustrations in a very complete form, but there are descriptive references in many old histories and magazines. The pictorial illustrations give us views of every one of the churches which have passed away, also—not very exact in several cases, and with the usual differences of proportion to be found in most English topographical prints more or less, one view giving a very different form, let me say, to the windows or doors, a different design to the window tracery, and such like. Still, there is sufficient to show what the general design were, and a critical eye will speedily detect what appears to be in good proportion, and what is distorted. The views by R. West and W. H. Towns, engraved about 1740 by the latter of these two artists, are by far the best. Then there are separate views of several of the removed buildings in the early volumes of the *Gentleman's Magazine*, as well as some now scarce tracts treating of separate churches. As to the descriptive evidences, it may be of interest to say that there are very ample and complete notices of each of these churches in a valuable little treatise on London generally, and particularly on its churches. This is "The New View of London, or an ample Account of that City," London, 1708,—a work which really should be better known than it appears to be, and which is certainly seldom referred to. It contains brief notices of each of the London churches, of its foundation, design, capacity; of its monuments, services, and in some cases of interesting points of ritual and church furniture.

It may be well to pass these churches rebuilt since the Great Fire briefly in review, and to afford an idea of the scope of the "New View of London," let us extract in detail the notice of one of these buildings, as a sample of the remainder. I have taken the description of Alhallowes-on-the-Wall, since it is short, and since I am able to accompany it by one of Towns's views.

St. Alphege was a church of poor design. The old steeple remains, and by the removal of the surrounding buildings it was recently visible. There are also an archway and some fragments of walls remaining.

St. Andrew, Holborn, still preserves its old western tower, heightened by Sir Christopher Wren. There is a plain Perpendicular window in its west front, and a plainer doorway below. The tower of the rebuilt Church of St. Bartholomew-the-Less still remains, with some good internal arches.

St. Botolph, Aldersgate, is shown in one of Towns's views. The present tasteless building, now the ugliest church in London since St. Martin Outwich has been pulled down, contains no portion of the picturesque but plain country church shown in the view referred to.

St. Botolph, Aldgate, had a good embattled fifteenth-century tower, with some picturesque buildings before it. It is shown by a scarce print in the Grace collection, as well as in that of Mr. Gardner, and in some others.

St. Botolph, Bishopsgate, is well described in the "New View of London."

St. Dunstan's-in-the-West, having been re-

moved only about fifty years ago, there are several engravings extant, showing the old building, with its tower at the north-west corner, its curious clock, &c. There is also a book of views showing the interior, and all the monuments. Being taken down to widen Fleet-street, its foundations do not appear to have been removed, for I saw them a few months ago only just under the modern paving, when some repairs to the road were being effected.

St. Olave, Southwark, is included in this survey, since some of the houses of the parish were on Old London Bridge. I know of no record of the old building, except that in the "New View," but there is a very good view by Towns.

St. Martin Outwich is shown by several old views, as well as by Wilkinson's pamphlet, which contains plans and views. It was a picturesque but plain and irregular building. In its rebuilt form, it had nothing whatever to recommend it, being probably the most miserable design for a church possible to be produced. The demolition of this building revealed the existence of a single Perpendicular window, of good design, on the south side. This remained visible for many months, and was only removed on the erection of the secular buildings on the site. The old monuments are now in St. Helen's Church.

St. Peter-le-Poor is well illustrated by old views and plans. It was not unlike, in the irregularity of its plan and design, the preceding church.

Holy Trinity, Minorities, was always a small plain church, now rebuilt in a poor, tasteless manner.

Of the two churches which escaped the Fire, but since removed, it will suffice to say that St. James's, Duke's-place, was a very plain building, of brick, with four wooden pillars internally; and of Alhallowes, Staining, the curious tower still survives, thanks to the care of the Clothworkers' Company.

Old London, prior to the Great Fire, must have had a picturesque aspect, with its forest of towers and spires, not clustering around the massive central tower of the cathedral, but following the indications already recited, thickest to the east of the cathedral, right and left, so to speak, of the northern end of Old London Bridge. Old views of London,—Hollar's and one or two others,—afford some indications of the designs of these perished churches. Thus we know that St. Mary-le-Bow had a steeple of open arches something like the present steeple of St. Dunstan's-in-the-East. That St. Lawrence Pountney had a lofty wooden spire, and such like. An inquiry has, however, never yet been made as to whether or not any fragments of the buildings which have passed away still remain to our time.

This inquiry I now propose to begin, and with it to conclude this paper. I cannot say that it can be considered at all as a complete one, yet since there is no other extant known to me, it will have the merit, at least, of some originality. Here let me indulge in the lament that the principles of church reparation which many of us are striving to enunciate,—that is, to preserve as much as possible of every old church requiring repair, and to destroy nothing,—was unknown to the builders who set to work after the Great Fire; would that it were thoroughly known even to the men of our own day. Were this so, we should not have to lament the loss of several interesting works and the mutilation of others at the present time.

The builders after 1666 found several of the ancient churches with their towers and walls standing. Their rubble facings did not accord with the well-wrought Portland stone then considered to be the correct style of building, and either a clean sweep was made, or the old walls were cased, in every instance the whole of the old materials being re-used as backing to the new walls, and hardly any attempt was made to preserve the monuments. We can show that this was as stated by the recent results of the demolition of some of these churches, which will be recorded further on.

There are remains of ancient work in the following churches, or there were so until the recent period of the removal of the buildings:—St. Stephen's, Coleman-street. There is a plain western tower, the walls of which are for a great portion those of the old building. The old masonry is visible on the north side. Above, the wall has been faced with Portland stone.

St. Vedast, *alias* Foster. On the south side

* A paper by Mr. E. P. Loftus Brock, F.S.A., read before the St. Paul's Ecclesiological Society, in the Chapter House of St. Paul's, April 16th, 1885. See p. 630, *ante*.

there are bases, and a good portion of two or three of the buttresses still remaining, as well as the connecting portions of the south wall. There are bold fifteenth-century plinth mouldings carried along and mitred around the buttresses, while the wall is original to a fairly good height, some of it without any casing. The old steeple remained after the fire until 1694, when it had to be rebuilt. St. Vedast was Bishop of Arras at the end of the sixth century. His death is recorded as having taken place A.D. 399. There is no sufficient recorded reason for the "alias Foster" after the name of this church, but in the register of Canterbury already referred to the name Amand occurs.

St. Nicholas, Cole Abbey. The whole of the south wall of this church is original. Before the formation of the Metropolitan Railway it was very distinct, being formed of squared Reigate stone, and having the remains of a moulded string course high up just below the parapet. The portion exposed bas, since the formation of the railway, been faced with modern ashlar with false windows. There were no signs of any windows along its whole extent, showing that old buildings had come close up to it.

St. Stephen's, Walkbrook. The south wall of this church is very similar, with the peculiarity that at the south-east end there were remains of a domestic building, one of the windows of which had its iron saddle bars remaining. More to the west were remains of another cross wall with a fifteenth-century doorway. To the east of the east end, going east and west, there is a wall of finely-squared masonry, going down to a great depth, entirely buried beneath the accumulated earth.

St. Mary Aldermay. The great bulk of the side walls of this fine church are ancient, as well as nearly the whole of the finer tower. This tower was finished in 1629, having been founded 120 years before by Sir Henry Keeble. Robert Pierson gave 200 marks on condition that it should be built to follow the ancient pattern. The cost was 1,000*l*. We are told by Newcourt that this "steeple, notwithstanding the church was burnt in the late dreadful fire, is still standing firm and good." Indeed, it may safely be said that the side walls and tower as we now see them are practically the same as before the fire.

The tracery of the windows was renewed after that event, and doubtless altered more or less, but the openings are almost entirely original. At the recent "restoration" of the church the ancient nature of the walling was very apparent. The walls of the vestry on the north side were also original, as well as its window, then laid open for the first time, perhaps, since the Fire, but all bas now been scraped, and the marks of the original surface obliterated. The tower, being a new one, was therefore in sound condition to resist the Great Fire.

St. Alban's, Wood-street, is another church which is almost the same as before the Great Fire. Its walls are, for the most part, original; the tracery even of one or two of the windows is also original, notably the north window of the tower at the ground level, where even the old saddle and stanchion-bare remain. It is expressly stated in the continuation of "Stow's History" that the walls were merely repaired. Would that we could still see in this church of most ancient foundation some of the curious capitals and Roman brick which Stow himself speaks of. The rebuilding, however, which he mentioned as being about to take place, did happen, and the remains of the church anterior to the Great Fire referred to are of that structure, erected in the seventeenth century. Here was another new church to meet the ravages of the Fire.

St. Mary-at-Hill possessed a large quantity of ancient work until a comparatively recent period. There were many old buttresses and some fairly good Perpendicular windows, but these have fallen, so far as outside observation goes, before the hand of recent builders.

St. Dunstan-in-the-East preserved almost the whole of the ancient side walls until the rebuilding in 1816. There is a view in Smith's "Antiquities of London" showing a portion of these, and, notably, a window with geometrical tracery of about 1260. The present east window is said to have been copied from an ancient one.

St. Christopher-le-Stock was almost entirely the ancient church repaired only after the fire. Old views show it with a Gothic tower with pinnacles, with poor inserted windows. It was removed to enlarge the Bank of England.

St. Bartholomew by the Exchange had a

curious octagonal turret on the north side, rising above the height of the north aisle. This, and a large mass of the walling, was original work. This church was removed about forty years ago.

The south wall of St. Benet, Gracechurch, was that of the original church. It existed until quite recently, after the removal of the church a few years ago. Indeed, a portion of it may still be seen doing duty as a party-wall between the block of shops erected on its site and the shop to the south now in course of erection.

The east wall of St. Magnus, London Bridge, is original, and it used to extend above the height of the present north aisle, where the old masonry was visible, but it was cemented over a few years ago. The tablet to Myles Coverdale is upon a portion of this wall.

When St. Michael's, Queenhithe, was removed a few years ago, it was found that the whole of the bases of the walls were original; a part of the old wall, indeed, was always visible on the north side. The mode adopted by the Mediaeval builders to raise their fabrics through the accumulated earth of centuries to the then level was very apparent. The foundations had been carried down to the solid earth, and this necessitated the building of thick solid walls up to the level required. These, for the most part, remain, having been utilised for the new clergy-house, &c., erected on the site.

The piling to pieces of the beautiful steeple of St. Antholin's Church, a very characteristic work of Sir Christopher Wren, so ruthlessly and needlessly done a few short years ago, made it appear that the great bulk of the walling had been formed of the former church demolished by the fire. There were evidences of fine work,—masses of neatly-wrought freestone, fragments of carving, and the like, the former in great abundance. These were of fifteenth-century date, doubtless fragments of the church rebuilt in the fifteenth century. The destruction of the fine steeple will be a subject of regret for all time, but the evils of disturbing an ancient burial-place were grievously shown in this case. After careful search had been made and every internment removed, as was supposed, five or six shells were hardly sufficient to contain other bones which were found by the excavators when the present shops were erected on the site; most of these bones were blackened by age. It was a wretched sight!

The foundations of St. Benet Fink, under the modern paving, are almost entirely those of the old church. They are just to the west of Peabody's statue.

There is an interesting paper by Mr. J. E. Price, F.S.A., in a recent volume of the *Journal of the London and Middlesex Society*, on the discovery of a large portion of the south aisle of the nave of Christchurch, Newgate-street. This was burned in 1666, and never rebuilt, the present church being on the choir of the old one. Mr. Price has also read a paper on the results of the excavations on the site of St. Dionis Backchurch, subsequently to the removal of that building. The little crypt discovered by Mr. Street, R.A., many years ago, was hermetically sealed at the closing of the graveyards, but doubtless reopened at the demolition. Mr. Price's paper is not yet published.

The old foundations of St. John the Evangelist, Friday-street, were recently cut through by the underground railway extension. Some old fragments of monumental work were found some years ago in making a sewer close to the site of St. John's, Zachary, and were deposited in the churchyard, but they are not now visible.

St. Laurence Pountney. A large mass of the walling of the north side of this church still remains incorporated in the houses forming the south side of the churchyard.

St. Leonard, Eastcheap. The site of this church was completely excavated a few months ago, and it now hangs in air, the level of the railway being many feet below it. Only a small piece of the old burial ground remains. The foundations showed a long chancel and a nave, the latter having masonry of great antiquity on its north side, made up with fragments of Roman brickwork.

St. Martin, Ludgate. Much of the old masonry of this church is incorporated in the buildings to the east of it.

St. Martin Orgars. The old tower of this church remained until about 1850, when it was removed to make way for the present rectory-

house. It was a plain low structure of fifteenth-century date, having angle buttresses and poor detail. It was built of chalk walling, and the marks of the Great Fire were very visible on its demolition, which I witnessed.

The fine old Norman crypt below St. Mary-le-Bow, the oldest piece of Norman work in any church in the city, needs only passing reference here, for the completeness of this list.

The old east wall of St. Mary Monmouth formed the wall of the burial-ground in Labour-in-Vain Hill, until the whole neighbourhood was remodelled.

St. Mary Woolnoth was one of the churches like St. Christopher-le-Stock, which were only repaired after the Great Fire. It was removed to make way for the present building. The "New View of London" gives fair details.

A small crypt belonging to St. Mary Magdalen, Monument-yard, was found a few months ago, and reported at the time in the newspapers. It was covered over, unfortunately, before I could see it.

St. Matthew, Friday-street, just demolished, was a brick building. There was much evidence that its ancient predecessor was also of brick. The removal showed a large mass of wrought stone belonging to the fifteenth century windows.

St. Michael, Cornhill, preserved its ancient steeple for a long period after the rebuilding of the church. Not being strong enough, however, for the fine peal of bells, having been weakened by the fire of 1666, it was rebuilt by Sir C. Wren as we now see it. The design is preserved in some old engravings.

On the removal of Gerard's Hall crypt, it was apparent that the south wall of St. Mildred's, Bread-street, was that of the ancient building. There was a private door of approach, now walled up, which probably still remains.

St. Peter, Paul's-ward. A mass of the ancient walling of this church was to be seen recently on the north side of the little burial-ground which forms its site in Thames-street.

The concluding church to refer to is that of St. Sepulchre, which preserves its ancient tower, its pretty south-western porch and the parvise over, as well as the mass of old walling of the north and south aisles. The design of the old windows has recently been brought back to the church, by the removal of the plain, large, semicircular openings, introduced in the middle of the last century. The church presents again much the same aspect that is shown in engravings of the period, one of which I exhibit.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ANNUAL REPORT OF THE COUNCIL.

The annual report of the Council of the Institute, to be presented and considered at the fifty-first annual meeting, to be held on Monday next, contains the following passages:—

The Council have much regret in recording the retirement from office of the senior Vice-President, Mr. David Brandon. At the same time Mr. Fraser, of Leeds, Mr. Honeyman, of Glasgow, and Mr. Paley, of Lancaster, have intimated their intention to make way for other non-Metropolitan representatives; and Mr. Blomfield has resigned, with an expression of regret at being obliged to relinquish the duties of his post.

The number of members in 1884 compared with that of the two previous years is here stated:—

	1882.	1883.	1884.
Fellows.....	427	478	412
Associates.....	682	1196	655
Hon. Associates.....	112	107	103
Hon. Fellows.....	15	15	14
Hon. Members and Hon. Corr. Members.....	69	74	57
	1270	1272	1276

The losses by death have been considerable, namely:—William Pettit Griffith, Matthew Ellison Hadfield (Sheffield), John Middleton (Cheltenham), Edwin Nash, Richard Makilwaine Phipson (Norwich), John Holloway Sanders (Derby), William Thompson, and John Whiohcord, Past President, among the Fellows; Alfred Bevan, Henry Blackwell, Frank Johnson (Bodmin), Charles Marriner, William Paice, and Herbert E. Tijou (Manchester), among the Associates; Charles Henman (formerly a Fellow), Henry Andrewes Palmer, and Sir Erasmus Wilson, among the Hon. Associates.

One foreign Member, Professor Lepsius, of Berlin, who received the Royal Gold Medal in 1869, is also deceased and at a very advanced age.

A comparison of the income derived from subscriptions (exclusive of arrears) shows 3,145l. 16s. in 1884 as against 3,069l. 1s. in the previous year, and 3,059l. 12s. in 1882. A similar comparison between the ordinary disbursements and receipts for the three years shows:—

	1882.	1883.	1884.
Ordinary annual income	23,423	23,757	23,768
Ordinary annual expenditure	3,910	3,99	3,554

[The estimate of income and expenditure for the current year, 1885, exclusive of all trust funds, entrance fees, arrears of subscriptions, special receipts and disbursements, shows a total of 3,735l. on the side of income, and of 3,515l. on account of disbursements, leaving a balance of 220l.]

Special disbursements will be required, during the year, in connexion with the Charter and the new Library Catalogue, and also for the purchase of the furniture in the Arbitration Room.

An Examination in Architecture was held at Manchester, during the week commencing the 23rd of February, 1885, under the auspices of the Manchester Society, assisted by the Chairman of the London Board of Examiners, Mr. Arthur Cates, who at the request of the Council attended at Manchester. Five candidates presented themselves and passed, namely:—

Benson, George, 10, Gray-street, York.

Ogden, Paul, Corporation Chambers, Corporation-street, Manchester.

Spencer, Norman, The Knoll, Fulshaw Park, Wilmslow, Cheshire.

Willink, William Edward, M.A. Cantab., Dingle Bank, Liverpool.

Wood, Edgar, Salford-street, Middleton, Manchester.

An Examination in Architecture was held in London, during the week commencing the 23rd of March, 1885, when nineteen candidates presented themselves, twelve of whom passed, namely:—

Berney, Henry, 61, North End, Croydon.

Cox, Alfred Arthur, 16, St. George's-terrace, Queen's-gate, S.W.

Bagshaw, John, Town Chambers, Ayr, N.B.

Ellison, Archibald Taylor, 4, Queen Victoria-street, E.C.

England, Robert William, Christchurch, New Zealand.

Farrow, Frederic Richard, 32, Craven-street, Strand, W.C.

Misty, James Andrew, 5, Lanhill-road, Paddington, W.

Nisbett Norman Clayton Haslow, 7, Euston-square, N.W.

Pink, Samuel Perkins, 3a, Gartholton-street, Leicester.

Watt, John, 14, Collyer-road, Upper Norwood, S.E.

Yates, Thomas Charles, 24, John-street, Bedford-row, W.C.

Young, George Penrose Kennedy, 24, Marshall-place, Perth, N.B.

Of the twenty-four gentlemen who thus presented themselves for examination at Manchester and London seventeen have received notice that they are qualified to become candidates for the Associateship; * four have been relegated to their studies for one year, and two for two years, with permission to present themselves again for examination after the prescribed period without further payment and without submitting probationary work. The Council have also to report that, in the opinion of the Board of Examiners, the merits of the candidates generally were not such as to warrant the presentation of the Ashpitel Prize, which has not been awarded for two years. The Council trust that the work of future candidates will be of a character sufficiently good to prevent a recurrence of these results.

The recommendation of the Institute that the Royal Gold Medal for the current year be awarded to Henry Schliemann, F.S.A., Hon. Corresponding Member (Achens), D.C.L., Hon. Fellow of Queen's College, Oxford, has received the gracious approval of the Queen, who has notified, through Sir F. H. Ponsonby, that Dr. Schliemann's services are well known to her Majesty. . . .

Among the donations to the library, the Council desire to make special mention of the present of a coloured copy of the great work collated, under the auspices of Napoleon, by the Institut de France, as a memorial of the expedition to Egypt at the end of the last century. For this the Institute is indebted to Mr. James Fergusson, who describes the work as the most magnificent of its class ever produced, and one without which no architectural library, like that of the Institute, can be considered complete.

Proofs of regard and interest from foreign

* Fifteen of these qualified candidates were nominated as Associates at the meeting of the Institute held on the 23rd ult.

† The Description of the Egypt, consisting of ten volumes of text and thirteen volumes of plates, and dealing not only with the antiquities of Egypt, but also its natural history, botany and geology, and other subjects.

Governments, from members of the architectural profession in various parts of Europe and America, continue to be received, and donations of works to the library from these sources have been numerous and gratifying. . . .

The Council have to express their regret that only one essay was submitted for the Institute Medal (with ten guineas), and that it was not of sufficient merit to warrant their recommending it for the prize. The same subject, "Pediments and Gables," has been set for next year, and in accordance with the general wish, expressed at the special meeting for the award of medals and prizes held last March, the sum of 25 instead of 10 guineas is offered as a premium to accompany the Institute medal for essays in 1885-86. They have further to report that neither in this nor in the preceding year have any designs been received in competition for the Grissell Gold Medal for construction, and they are compelled to believe that the principal reason for this marked abatement is the unwillingness or inability of architect-students to touch the important subject of iron construction,—a subject which was set in 1883, repeated in 1884, and is again set for the current year, with the addition of a premium of ten guineas to be given with the medal.

The list of modals, studentships, and other prizes for the current year is one of increased and unusual importance. The foundation of a new studentship, to be held, under conditions, for two years, for the study of architecture, more especially in regard to ornament and coloured-decoration, and the present of a special studentship, to be held in 1886, for the encouragement of the study of Classic architecture and of Classical Renaissance architecture in the kingdom of Italy, are welcome additions to the rewards in the gift of the Institute, for which the Council desire to record their warm thanks. With reference to the former, styled the Owen Jones Travelling Studentship, it will probably be remembered that the late Mr. Whichcord, at the opening meeting of the session 1880-81, stated, after the delivery of his presidential address, that it was the generous intention of the two sisters of the late Owen Jones to bequeath to the Institute a sum sufficient to endow a studentship in remembrance of their brother. Since then one of these ladies has died, and Miss Hannah Jane Jones, in pursuance of her deceased sister's most earnest desire, has transferred the sum of 1,250l. Midland Railway 4 per cent. stock to the Institute, for the purposes of the studentship. With respect to the special studentship of 50l. for the encouragement of study in Italy, the Council have only to add that it is the generous gift of an architect, although not a member of the Institute, namely, Mr. Thomas W. Aldwinckle, of London.

At the General Conference of Architects, held in May last, the following Papers, which form part of the volume of Transactions, 1883-84, were read and discussed, viz.—The duties, obligations, and mutual relations of architect, client, and contractor, with reference to English and foreign practice, by Arthur Cates, Member of Council; the Tenure of Land for Building Purposes, by Thomas Blashill, Fellow; the late George Edmund Street, R.A., President, by the Rt. Hon. A. J. B. Beresford Hopo, M.P., Past-President; the late William Burgess, A.R.A., Fellow, by George Aitchison, A.R.A., Member of Council; the late Eugène Emmanuel Viollet-le-Duc, as Architect and Art-historian, by Mr. Charles Wethered; the French *Diplôme d'Architecte* and the German System of Architectural Education, by R. Phené Spiers, F.S.A., Fellow; English Architecture Thirty Years Hence, by Professor Kerr, Fellow. A full report of the work of the conference appeared in the *Builder*, and an official record of it is preserved in the Journal of Proceedings, 1833-84, p. 161. An account of the same, * communicated by Charles Lucas, Hon. Corr. Member to the Société Centrale des Architectes, Paris, at a Conference of French Architects held in July of last year, is also published by that Society, with a commentary note by M. Paul Wallon, the Secretary and Director of the Paris Conference.

The Special Conference on the sanitary con-

* La septième Conférence générale des Architectes britanniques (Londres, 5-9 Mai, 1884).—Notes de Voyage et Extraits divers. See Conférences faites au siège de la Société Centrale des Architectes, 1884, pp. 59-81. See also the *Bulletin Mensuel*, No. 2, Feb., 1885, pp. 71-79, of the Société Centrale des Architectes, Paris, for an analytical report upon the two last volumes of the Transactions, 1882-83 and 1883-84, by Charles Lucas, Hon. Corr. Member.

struction of houses, which was held under the auspices of the Institute during three days in July last, at the International Health Exhibition, elicited some interesting discussions. A full report of the work of that Conference has been published by the Executive Council of the Health Exhibition and the Council of the Society of Arts, and it forms part of volume ii. of the "Health Exhibition Literature." An official record of it is also preserved in the Journal of Proceedings 1883-84, page 177. . . .

The Council have pleasure in stating that the Compositions Committee have made considerable progress in the work that lies before them. In the course of the year a circular-letter, setting forth the objects and aims of the architects who have signed the undertaking, has been sent to all the mayors and other public functionaries throughout the United Kingdom, as far as their names and addresses could be procured; and a letter, with the same intention, has been addressed to the editors of the leading metropolitan journals. The reason for this step was to acquaint those addressed, and the public generally, with the views of the large number of architects who had signed the undertaking; that they will not take part in any public architectural competition, unless an architect of established reputation is appointed to advise the promoters upon the relative merit of the designs submitted in that competition; and so to impress upon promoters the advisability of an assessor being appointed as the initial step. At the present time the number of adhesions from architects exceeds 1,400. From March, 1884, to the present date, the committee have been in correspondence with the promoters of forty-six competitions, and have been mainly instrumental in procuring the appointment of assessors in fourteen cases, over thirty per centum of the entire number applied to, a result which may be considered on the whole satisfactory, considering the short time the scheme has been on foot, and the long time it takes to reform any abuse. The greatest drawback to success lies in the fact that a large number of architects will still compete, no matter what the conditions are, so that promoters can easily procure architects to send in designs, without the condition of an assessor being appointed. Were support given by those who have not yet signed the undertaking reform would be very soon secured. The committee appeal to all those who have the honour of the profession at heart to aid them in their endeavour to procure fairness in the conduct of architectural competitions.

In respect to the Charter, the Council have carefully considered a memorial presented in November by more than 450 Associates, as well as representations received from non-metropolitan members, and, having availed themselves of the services of a solicitor who had large experience in advising on such matters, they are now in a position to consult with the Associates' Memorial Committee and with delegates from non-metropolitan societies. The Council therefore hope to be able shortly to lay the result of their inquiries before a special general meeting of the Institute, for the consideration of the general body of members.

The Professional Practice Committee have held four meetings, at which subjects of much importance have been considered and dealt with. An application to be admitted into the class of Fellows, which was received from an officer of the Royal Engineers, has been carefully considered by the Council, but it was found that no power existed under the Charter to admit as professional members such military officers, who, so long as they remain in the service, and whatever their particular employment may be, are eligible only for admission to the class of Honorary Associates.

The resignation of some non-metropolitan members having occurred at the close of 1884, on the sole plea that they are resident at too great a distance from London to attend the Institute meetings, the Council venture to urge that the corporate body of British Architects exists for a higher purpose than that of a general meeting, or for the maintenance even of a library. It exists for the advancement of architecture as a profession, as well as an art and a science, and in this country where the State remains neutral, academies, institutes, and such learned societies, depend entirely upon the support and co-operation of individuals, a matter, the Council think, of as much importance to architects throughout the country as to those of London.

ON RENDERING WOOD FOR BUILDING PURPOSES NON-INFLAMMABLE.*

TOMLINSON says that out of forty salts tried, four only were applicable to light fabrics, viz., phosphate of ammonia, chloride of ammonium (sal ammoniac), sulphate of ammonia, and tungstate of soda. The sulphate of ammonia is the cheapest salt, but causes brown spots on the muslin when ironed, and dissolves in water, so that it has to be renewed after every washing; tungstate of soda is, therefore, usually adopted. The oxides of tin withstand both water and soap, but render fabrics yellow; consequently their use is restricted to canvas, sails, and other coarse materials, but this would not affect their use with wood. This is also the case with borate and phosphate of protoxide of tin and arseniate of tin. These last are some of the attempts which have been made to fix some of the non-soluble compounds in textile fabrics.

The method of rendering sail-cloth permanently non-inflammable is to soak the canvas for two days in a protochloride of tin solution of the strength of two parts of the salt to one of water, and to leave it for a day in a concentrated solution of stannate of soda or carbonate of soda. The canvas is dried, and is then ready for use. So much for fabrics. Many of the objections to which the above solutions are liable would not affect their use for wood, and they may be well added to our list to help us to the selection of the most suitable one hereafter. The English Cyclopaedia says "many methods have been devised for making wood more or less fireproof. The substance which is most attracting notice now is silicate of soda." Mr. Abel, chemist to the War Department, England, and Mr. Hay, chemist to the English Admiralty, made experiments with this salt in 1857 on a wooden hut, painted three times inside and out with a solution of silicate of soda; but, unfortunately for the fairness of the experiment, the building (erected to try other experiments with) was constructed with a double boarding, so that it was only possible to coat or impregnate each plank on one side, but the value of the silicate was established beyond a doubt. A flame from a large heap of shavings played against the building for some minutes, but only succeeded in catching the end of one plank, and even that did not blaze, but only smouldered a short time. By the heat of the fire the salt was drawn to the surface of the wood, and formed a glaze upon it. Subsequently, when the whole hut was destroyed by fire, although the fierceness of the flame was such that few materials could have withstood it, yet several planks remained of the exterior coated portion. Upon examining the planks, the unprotected surfaces were found to be charred, but the charring only extended to those parts which had not been touched by the silicate. Asbestos paint has been used with nearly similar results. So far as experiment has gone, silicate of soda appears the most convenient and effective known for the purpose. Spon's "Workshop Receipts" says, respecting silicate of soda.—Deal boards become almost incombustible when painted with a diluted solution of silicate of soda, called glass water. The glass water is generally sold as a thick fluid like honey. This may be thinned out with water six or seven times its own bulk, the water must be soft, or boiled water will do, and apply the solution warm. In about twenty-four hours apply a second coat, and perhaps a third; use a new brush, and wash the brush clean after using, or it will become soft. Avoid grease or fat on the boards before painting them." In the same book is another receipt, as follows. The timber to be soaked four or five days in a solution of 1 lb. of alum and 1 lb. sulphate of copper to 100 gallons of water, in a tank sufficiently large to allow of the timber being kept immersed. The wood to be allowed to thoroughly dry before using. This would be a good plan to adopt with the large upright timbers after having injected them whilst green by the Boucherising process. Though owing to the blue tinge given by sulphate of copper that salt could hardly be suitable for interiors where the lighter woodwork was plain, yet chloride of zinc might be used for every part of the wood in a house,

injecting it while the wood is green, as it acts chemically on the sap and is white. Sir W. Burnett says, "Salt water only increases its efficacy. It is perfectly innocuous, and cannot endanger health. All the timbers and ceilings of a ship may be impregnated with the solution without the slightest prejudicial effect on the crowded inmates. It prevents the oxidation of metals, as has been proved repeatedly on copper and iron bolts with the most satisfactory results, and articles prepared with this solution resist combustion in proportion to the strength of the solution." By Maughan's process dry wood is saturated with an aqueous solution of phosphate of soda and muriate or sulphate of ammonia; a decomposition ensues, followed by an evolution of ammoniacal vapour, and the formation of an incombustible coating on the surface of the wood. Jackson's patent consists in the application of salts of zinc and ammonia. Mr. Payne's process of rendering wood fireproof is by pressing a solution of sulphuret of calcium or barium into the wood in a confined tank and allowing it to remain at a pressure of 110 lb. to 140 lb. per square inch for an hour, then drawing off the solution and treating the wood in a similar manner with an acid, or a solution of some substance such as sulphate of iron, which will unite with the barium or calcium and set the sulphur free. When the wood is to be impregnated with a large amount of solid matter it should be dried before the application of the two fluids. By this means an insoluble sulphate of lime or sulphate of barium is formed in the body of the wood, which is thus rendered nearly as hard as stone. Wood so prepared is now largely employed on English public works and railways. The most porous, the softest, and, of course, the cheapest woods, are rendered equal in point of usefulness, durability, and strength to the hardest and best descriptions of timber, and are susceptible of a high polish.

Professor Fuchs invented a solution of ten parts of potassa or soda, fifteen parts of fine silicious earth, with one part of charcoal mixed with water. This composition applied to the surface of the wood forms a vitreous coat which effectually resists the action of fire. Decisive experiments have fully established the efficacy of this plan, and the Royal Theatre of Munich was protected by the application of it. The surface covered was upwards of 400,000 square feet, at an expense of 200l., or 100 square feet for 1s.

A somewhat similar English composition consists of one part by measure of fine sand, two parts of wood ashes, and three parts of slaked lime, ground together with oil and laid on with a painter's brush, the first coat thin and the second thick. This forms a strong adhesive compound, both fire and water proof.

Saloman's patent consists in an application of two solutions to the surface of the wood. The first consisting of sulphate of alumina, glue, and water, the second of chloride of calcium, glue, and water.

In Spon's "Workshop Receipts" a wash composed of lime, salt, and fine sand or wood ashes, is recommended to be put on in the ordinary way of whitewash; it renders a shingle roof fifty-fold more safe from fire from falling cinders in case of fire in the vicinity. It has also a preserving effect against the weather, and the older and more weatherbeaten the shingles, the more benefit derived. Such shingles are generally more or less warped and cracked, and the application of the wash to the upper surface restores them to their original form, thereby closing the space between the shingles, whilst the lime and sand by filling up the cracks prevent them from warping. By the addition of a little lamp black the wash may be made of the same colour as the old shingles, and thus remove the offensive glare of a whitewashed roof.

Such is the information we are able to glean so far, and before offering any suggestion of our own, let us remember that to season timber in the ordinary way requires seldom less than three years', often six or eight years', exposure to the air freely. Whereas, by the Kyanising (chloride of mercury) process, rendered unfit for our purpose by the suffocating fumes thrown off on exposure to great heat, the Boucherising (chloride of zinc), the Boucherising (sulphate of copper), and the Bearing (borax) systems, the destructive principle (sap) is of all kinds, willow, birch, elm, beech, ash, poplar, &c., of considerable value for durable purposes.

We would suggest the following, giving pro-

ference to the solutions recommended in the order named:—

For houses already built, apply several washings of silicate of soda, sulphate of copper, or borax, to the fixtures of every description, and let all movable lighter wood, roof shingles (when used), mats (as used in Japan), &c., soak several days in the same solution.

Where shingle roofs are used let them be afterwards coated with lime, salt, and fine sand or wood ashes.

Where houses are to be built, impregnate the main or thick timbers thoroughly with chloride of zinc, sulphate of copper or borax, by pressure obtained as in Boucherising, whilst the timber is green, allow it to dry thoroughly before fixing, and paint the outside with silicate of soda three times when in position.

The lighter woodwork, shingles, &c., can be cut from large balks thus impregnated, and afterwards washed superficially with silicate of soda, or this woodwork may be saturated by steeping in silicate of soda, chloride of zinc, or borax, but with a coat of silicate of soda outside all.

By the use of the above comparatively simple and inexpensive remedies all complicated steam-pressure paraphernalia, vacuum pumps, &c., are avoided. The area of fires would be greatly reduced, whilst the insurance companies would be able to take risks which at present they refuse to do, even on stone buildings if the roofs are of shingle. In Jamaica and other parts this is much felt. The general application of these precautions in many towns would permit of a sufficiently large reduction on insurance premiums to, of itself, pay the interest on the initial cost of thus treating the timber used in our dwellings. We say nothing of the daily risks to life and property. In the foregoing paper we have freely borrowed from every authority we could meet with, but the occurrence of fires in timber-built towns, destroying areas up to one square mile and a half at one fell swoop, must be our plea.

Messrs. Jessop & Co., of 43, Mincing-lane, have kindly given us the following quotations, subject, of course, to fluctuations of the market and reductions in the price on taking large amounts:—

Borax crystals.....	443 0 0	per ton, for large quantities.
" " ground.....	46 0 0	" "
Alum crystals.....	6 0 0	" 2l.
" " ground.....	6 15 0	" "

ELECTION OF A DISTRICT SURVEYOR.

At the meeting of the Metropolitan Board of Works on the 24th ult., the first business was the election of a District Surveyor for East Kensington. There were thirty-one candidates, viz., Messrs. A. Ashbridge, T. Batterbury, H. H. Bridgman, C. W. Brooks, H. Cheston, S. F. Clarkson, J. S. Edmeston, G. Edwards, J. M. Ferguson, R. F. C. Francis, W. Grellier, J. Hamilton, W. J. Harcastle, A. Harland, E. Haslehurst, G. Inskipp, G. Jackson, G. A. Lean, H. Lovegrove, H. McLachlan, E. Marsland, T. E. Mundy, R. C. Murray, W. H. Nash, O. Renton, W. Smallpeice, L. Saloman, W. L. Spiers, W. H. Stevens, H. W. Stock, and E. Street.

In the preliminary voting, for reducing the number of candidates to six, the successful ones were Messrs. Ashbridge, Clarkson, Harcastle, McLachlan, Marsland, and Street. The subsequent voting was as follows:—

	2nd	3rd	4th	5th	Final
	Vote.	Vote.	Vote.	Vote.	Vote.
Ashbridge.....	21	13	—	—	—
Clarkson.....	16	15	16	—	—
Harcastle.....	24	22	16	10	—
McLachlan.....	14	—	—	—	—
Marsland.....	33	34	34	35	34
Street.....	24	21	29	22	10

* This tie was decided in favour of Mr. Harcastle. Mr. Marsland was therefore declared elected.

The Westminster Hall Restoration.—

On Monday the Select Committee on Westminster Hall restoration held their last sitting, under the presidency of Mr. Shaw-Lefevre, and agreed upon their report.—Times.

* A paper by Mr. Thomas M. Rymer-Jones, Memb. Inst. C.E., F.R.G.S., and Mr. John Rymer-Jones, Memb. Inst. Tel. E., read before the Civil and Mechanical Engineers' Society on Wednesday, the 22nd inst. See p. 659, ante.

Illustrations.

CHELSEA VESTRY HALL.

WE publish this week the selected design in this competition. The architect is Mr. J. M. Brydon, and the work is to be proceeded with at once. As will be seen from the drawings, the large hall is placed in the line of the present offices, and is reached by three entrances from King's-road. Corridors (lighted from the ceilings) on each side give access to the principal hall. Its dimensions are 51 ft. by 45 ft., and 35 ft. 6 in. high. A gallery is formed over the reception-lobby at the north end, and so does not project over the floor of the hall. Accommodation is provided for about 550 people in the area, and 150 in the gallery, or a total of 700 in all. The hall is lighted from the sides and ends, and has separate access to the platform at the south end. The retiring-rooms are on each side of the central corridor, which joins the reception lobby.

On the west side of the Vestry-hall is the secondary hall, lighted from the south and west. Its dimensions are 50 ft. by 31 ft., and 22 ft. high. Service-rooms adjoin it on the north side. The committee-room is in the corresponding wing on the east side, and measures 28 ft. by 27 ft., and 22 ft. high. Adjoining it is lavatory, &c., accommodation for the platform. Access is also provided to the corridor leading to the platform from Mauor gardens by the haement. There is a basement under the whole of the building, consisting of cellarge, heating-chamber, kitchen offices for public entertainments, spare room, lavatory, &c.

The style is English Renaissance, freely treated. Externally the buildings are to be faced with red bricks, with Portland stone for pilasters, cornices, window dressings, &c. Internally the halls and committee-room are to have dadoes and doors of wainscot or American walnut, and the walls above finished in plaster. The pilasters of the Vestry-hall are to be in marble or scagliola, but the question of further coloured decoration is reserved for future consideration, when the work will be thoroughly dry and in a fit state for painting. The estimated cost is 15,000l.

THE PINES, MIDHURST.

This house, the residence of Mr. John Costeker, stands in a prominent situation on the brow of a hill about a mile from Midhurst, overlooking the Chichester-road, and commanding extensive views of the South Downs.

It is built and finished in wood, no plaster being used internally either for walls or ceilings, and the foundations and chimney-stalks only being of brick. Mr. Frank T. Baggally was the architect, and Mr. T. Gregory, of Clapham Junction, was the builder.

THE CHURCH OF ST. MICHAEL, AT COSLANY, NORWICH.

The church is a good example of the Perpendicular Period; has nave, north and south aisles, a chantry chapel to St. John the Baptist, and chancel and fine tower with eight bells. The south aisle known as Thorp Chapel has on the exterior one of the most remarkable specimens of flintwork in the kingdom. The following extract is quoted from the parish books:—

"At the East End of this Isle, is a Chapel of beautiful workmanship made with Freestone and black flints: this is the Chantry Chapel of the Virgin Mary, which was built and endowed with lands and houses in Norwich, Barnham Broom, Huntingham, Sprowston, Heigham, and Wood-Dallyng, by Robert Thorp, the Founder, in the time of Hen. VII. He lies buried here under a stone which hath his own Effigies, and those of his three Wives and three boys, and two girls, but the inscription is lost, though the most part of it is preserved by Mr. Weever, folio 503. It had the Arms of Thorp. Arg. 3 Crescents Arg. on the first shield, and the same Arms impaled with those of his three Wives, his second wife's Arms remain, viz., a Tress nebuled between 3 wolves heads (erased). Pray for the soul of Robert Thorp Gentleman Citizen and Alderman of Norwich Founder of this Chappyll and He, with a Chantry prest, he to sing perpetually for the soul of Robert Thorp, the sowls of Elizabeth, Emme, and Agnes, sowls his Wyffs; the soul of

Chancel of St. Michael's Church, Coslany.—New Flint Tracery and Restored East Window.

John Thorp his kindry sowls and all Christen sowls, the which Robert . . .

The several Chantry priests that serv^d here are buried in this Chapel the first of which was Sir Richard Wallourne or Waller.

Anno 1524 Robert Long citizen of Norwich and Agnes his wife gave to Gonville Hall in Cambridge, the perpetual donation to this Chantry, on condition they constantly nominated an honest priest, or Fellow of their College, to reside constantly in the house belonging to Thorps Chantry priest in Norwich, and daily to serve the said Chantry."

It will be noticed that every compartment of the tracery is of a varied character, and the whole presents an excellent study of harmony and beauty in design. The south and east walls of the chancel consisting only of rough flint walling, and presenting a sad contrast to the Thorp Chapel, the opportunity was taken by Mr. H. Bullard to have the chancel walls faced with tracery flint-work. The east window was found built up inside the wall, and had for some centuries been blocked up. A new window on the old lines was therefore inserted, and the tracery on each side designed in proportion. The panels between the tracery are filled with black cut and squared flints, and laid so close (as in most good Norfolk flint-work) that the point of a knife can hardly be passed between the joints. The work has been executed by Mr. W. Hubbard, contractor, of East Dereham.

In the interior of the chancel the old choir seats have been removed, the floor of which has

been raised, and, with the sacarium, laid with a design of encaustic tiles by Messrs. Maw & Co.

New seats for thirty choristers, and reading-desk in pitch pine, have been provided, and a new organ has been built by Messrs. Norman & Co., of Norwich.

The whole of the works have been carried out from the designs, and under the superintendence of Mr. E. Preston Willins, A.R.I.B.A., Norwich. The ancient work is illustrated in the lithograph, from measured drawings furnished by Mr. Willins, and the accompanying cut illustrates the new work in the same style which has been added.

OLD LONDON CHURCHES.

This week we give views of two more of the churches referred to in Mr. Loftus Brock's paper, for which see pp. 580 and 612.

The National Liberal Club.—It may be remembered that in the latter part of last year some correspondence took place in a daily paper, and was noticed in our columns, to the effect that Mr. Waterhouse's original design for this building had been spoiled by official interference on the part of a Government office. Mr. Waterhouse's explanation of the matter, showing that this charge has been unfounded, will appear in our next. We have been requested to mention this in advance, as it is desirable that the misunderstanding should be removed.

"A PRISM FOR ARCHITECTURE."
ARCHITECTURAL ASSOCIATION.

The ordinary meeting of the members took place on Friday, the 24th ult., Mr. Cole A. Adams, President, in the chair.

A vote of thanks was passed to Messrs. Isaacs & Florence, the architects of the Northumberland-avenue Hotel, for permitting the members to visit the building. Votes of thanks were also accorded to the Clerks of the Merchant Tailors' and Fishmongers' Companies, and to Mr. W. Hilton Nash, Surveyor to the former Company, in connexion with the late visits.

The following nominations for officers for next session were announced:—For President, Mr. C. R. Pank; and for Vice-Presidents, Messrs. J. A. Goteb and W. H. Atkin Berry.

Professor T. Roger Smith then gave an address entitled "A Prism for Architecture." He said that if a cylinder were pared down into a polygonal straight-sided figure, triangular or square, the result would be a prism, and if made of a transparent substance it produced certain results on the rays of light falling on it, spreading them out into different hues. This was what he had in view when he talked about the prism, which latterly had become a remarkable instrument of analysis in the hands of scientific men. The spectrum, and the distinct rays of light thrown out by the prism were then described, and the results to be deduced from its investigations. Besides the coloured rays of the spectrum, there were also a certain number of rays which were invisible, termed the dark rays. The question had therefore suggested itself to him some time ago, whether it were possible to do for architecture,—or, at any rate, for building,—something like what the prism had done for rays of light. Could they hit upon some simple method of spreading out the different constituents of building, so that they might be examined one by one; and that instead of having a series of whole buildings, they might be cut into pieces? His prism was really a system of analysis by which the different parts of a building could be taken to pieces and examined. Its merit, if it had one, was that it provided a place for everything. He would not attempt to go farther than the material part of the building, although it was possible to find a parallel to the dark, as well as the light rays, of the spectrum. As in the case of the seven colours of the rainbow, so building fell under seven heads or categories. The first was the floor,—perhaps the most important part of the building. The whole purpose of a building, unless it were simply a monument, was to provide a floor, to protect it with walls, to cover it with a roof, to let light in by windows, and to provide access by doors and staircases. But the floor was the object of the care of all the other constituent parts. It was physically and intellectually the basis of the building, and might be simple in its outlines, as in the Pantheon; or complicated in shape, as in the plan of Westminster Abbey; or composed of an exceedingly large number of parts, like the Baths of Caracalla. It might be square or round, but whatever it was, it was shaped to meet the requirements and also the structural necessities of the case. They were in the habit of recognising the importance of plans, and in doing that they were to a large extent talking about the floor. The object of a plan was quite as much to define the floor as the walls, and practically the floor was the basis of the whole structure. The Professor here referred to the plan of an Egyptian temple, a large building containing a good many subdivisions, the part which produced a grand interior being the perfect forest of columns necessary to carry the roof. Assyrian temples were also complicated, there being an arrangement of long narrow rooms, arranged in or at round quadrangles. The next great building people, the Greeks, had structures far simpler in plan, and as a rule smaller. The Greeks also introduced the curved line, for the first time in architecture. Roman plans were at once varied and complicated, and the consequence was that their buildings were of almost every shape, and of the utmost degree of perplexity and complexity. Nothing could be a grander or more applicable plan than that of the great Baths of Caracalla. Christian architecture again depended largely for its plan on what the Romans had previously done. The first new departure in the Christian architecture of the West was the introduction of monastic buildings; but there

was no remarkable innovation in the way of planning until the Renaissance, when the plans began to resume the complexity of the Roman plans. As regarded the actual construction of the floors, no part of the building was so simple. There was not much in the way of ornament to be done, the only grand ornamental floors being the Roman mosaic floors, and the sometimes magnificent tiled pavements of the Middle Ages. Westminster Chapterhouse possessed one of the finest of these tiled pavements, and the Abbey itself had a specimen of Alexandrian mosaic on a large scale. The art of designing floors, and the walls connected with them, was necessary, and at the same time fascinating and interesting. The placing of all the columns and features of a building, and especially connecting together the various leading features in a complicated structure, was a thing requiring a great deal of imagination and skill, and in which the mind could exercise itself in the same way as in any other part of the design. The second feature was the walls, the object of which might be stated to be three-fold: first, to enclose the floors; secondly, to carry the roof; and, thirdly, to form an object to be looked at outside and inside. The shape of the floor dictated the length of the wall, whether it should be curved or straight, and its position; but beyond that, the builder had to exercise his ingenuity in the height, thickness, outline, and the simplicity or complexity of it. Perhaps the most important matter in connexion with this was the sky-line. In the majority of early building this was straight, as in the case of the Egyptian temple at Deudera, and this was the general outline in the majority of those temples, varied to some extent by the increased height given to the pylons. As far as was known, the Assyrian buildings were also straight-topped, but when they came to those of the Greeks, a remarkable innovation was introduced, viz., the pediment or gable. The gable once introduced was never abandoned; it was sometimes flat, and sometimes steeper in its arrangement, but it had remained as one of the most interesting features connected with the wall of a building. The next thing, introduced after the gable, was the tower, and this was almost, if not quite, a Christian introduction. There were some tower-like buildings in Assyria, but it was not until Christian churches began to be built that the tower was a usual element in the composition of a building. The lecturer here pointed to Romanesque, English Romanesque, German, and French towers, explaining that the tower developed into the turret, and also into the slender turret or minaret. One notable point with regard to the wall was its thickness, and this became less at those periods when structural skill was greatest. Construction was an element of great importance in wall building, and was a matter which deserved the utmost possible attention, as any mistake was sure to tell afterwards, and at a time when remedying it was almost impossible. The structure of a wall varied very much, as it had to be built in most cases of the materials ready to hand. It consumed so much material that, if brought from any distance, the expense was so great that men were generally content to use something within their reach; therefore, the geology of the world had a good deal to do with dictating what materials should be used for the purpose. Reference was then made to the Roman walls, and to the interesting methods by which these remarkable structures were built. In the Middle Ages brick went greatly out of use, especially in England and France, little else being used except stone in the Gothic period, after which came the omnivorous use of everything in the Renaissance. Another important matter was the compound construction of many walls, they being faced with other materials, more precious, or specious-looking, than what the heart was composed of. Almost every wall had a base, a body, and a top. In the case of the Greek temple the base might be said to be the steps; then there was the body; the top being the overhanging screen. A feature of Mediæval wall-building was the buttress. The Romans were in the habit of making the piers inside rather than outside, but the Gothic architects introduced a new feature in the buttress, a feature cultivated with most success in countries where the sunlight and the light during the greater part of the day were level, so that the best effects of shade were produced by the piers which projected from the wall. The third division was naturally the roof. In many countries, where the climate

was hot, people wanted to get on the top of the roof for coolness; therefore a roof that would serve as a terrace was frequently to be met with. One reason why the gable made its appearance among the Greeks was, he imagined, that the climate was sufficiently temperate for people not to trouble about having a terrace roof to all their buildings. Then the roof got sloping, and there were two or three other things which had to do with the pitch. In countries where rain, snow, and inclement weather were experienced, the roof was generally found to be steep, in order to throw off the snow, as in the steep-pitched roofs of Central and Northern Europe. This, again, was complicated by one or two considerations, there being some countries where in the summer it was hot, while in the winter there was much snow, and where this was the case, there was a disposition to keep the roof comparatively flat, and to extend its eaves; Switzerland being a good example. Lastly, the nature of the roof-covering made a considerable difference, there being always a tendency to take the most economical pitch. The highest development of the external steep roof was the spire. The speaker here referred to drawings of the magnificent spires of Lichfield Cathedral and Angoulême Cathedral, and of the roof of Westminster Hall, the masterpiece of European carpentry.* The vault began with the Roman use of the arch, and passed through the series of the wagon-headed vault, the cross vault, leaving the architect free to deal with the wall and space beyond. In the Middle Ages the vault developed through a series of wonderful transformations, until it reached its acme in such structures as Henry VIII's Chapel, Westminster, and King's College Chapel, Cambridge. Another kind of roof grew out of the vault, viz., the dome, invented by the Romans, and, after being largely developed by them, taken to Byzantium, the architects there producing magnificent domical structures, the climax of which was found in Santa Sophia. Western Christian architecture neglected the dome, and down to the Reformation there was no important domed Christian church except the Duomo at Florence. At the Reformation the Christian architects went back to the original Roman dome, and produced the great series of domical structures, of which St. Peter's was the largest, and St. Paul's incontrovertibly the finest. The dome was taken up by another offshoot of Roman architecture, the Saracenic, and treated in an entirely different, and at the same time exquisitely beautiful, manner. In addition to these, there were all the endless varieties of ceilings, timber and plaster, and combinations of domes with them, which came under the head of roofing. The fourth essential for building was the openings. Buildings, till the invention of iron girders, which had their openings covered with the lintel, had square-shaped and narrow openings. The moment the arch was introduced it began to be found that openings could be of almost any size and shape. The Egyptians had to carry their roofs by means of lintels, as in the case of the Great Hall of the Temple of Karnak. When the arch came in the whole system of construction and arrangement was altered, and the next great step was when the arch passed from the Roman to the Mediæval builders. The lecturer here referred to a section of Durham Cathedral, showing the arched openings occurring in the interior, and their grouping; also to an elevation of the Coliseum at Rome, showing that the grouping of openings in the design had begun to be of importance in the design of the architect. The filling up of openings in Mediæval times led to most magnificent results, as in the case of a drawing of the Ducal Palace at Venice, showing tracery for filling in the openings of the upper arcade. A drawing of part of Carlisle Cathedral showed one of the most elaborate tracery windows in England. There were other ways of filling openings which the circumstances of Eastern architecture required. In Arabic architecture they would find marble buildings, and that the openings were filled with beautifully-constructed grilles of simple and effective woodwork. Penetration began to be an important matter in design, and to take the place of the grouping of columns. These were the four most important elements of construction, and the remaining three were really architectural features. The first and most important

* An interior view of this roof, from a drawing by Mr. P. F. Dollman, appeared in the *Builder* for April 4 (see pp. 490-491, ante).

of these were the columns. A great number of buildings existed without columns, and were they not a beautiful architectural feature they would be absent in many cases where they are now to be seen. The column was divided like the wall into three parts, the base, shaft, and cap. In the columnar styles, viz., those where the column played an important part, there was infinite variety. The Greeks grouped their columns into three periods, or rather, into two, the Doric column with a moulded cap, and the Ionic column with an ornamented cap, these two being the parents of nearly every class of capital in use since. As soon as the arch came in the column sank from being an integral part of the structure to the position of an ornament. The sixth element was the ornamentation, which, leaving out colour, might be classed into two particular groups,—mouldings and sculptures. Mouldings had two different objects, one being to produce a profile, a Roman cornice being a good example, with its projection and shadow; the other object, and the most general in Gothic mouldings, being to draw a line, or series of lines, in the building. Mouldings in the hands of the architect were the same as a brush with dark colour in the painter's hand. An important matter for the artist was the size of mouldings relatively to their position. A moulding which was right when near the eye would be too small if placed high, and would also probably be in had proportion. In the same manner a moulding which seemed all right when one looked up at it would be too large when brought down near the eye, and would require correcting in its profile that the amount of foreshortening might be obviated. The relation of the profile of mouldings to the material was well worth consideration. In order to get light and shadow in stone mouldings, the features must be well defined, the projections considerable, and the hollows large. In the thirteenth century stone mouldings were undercut in the most extraordinary degree. White marble, again, was a material of exquisite surface, which was more easily got thin than thick, and the mouldings for it were comparatively flat, though producing, perhaps, a finer effect than the bold stone mouldings. Then there was wood, which had not the lustrous colour of the marble, and accordingly the mouldings appropriate for it were midway between those for stone and marble. Sculpture was sometimes included in the architecture, and sometimes added as an ornament, and framed in the architecture. Greek architects supplied examples of both modes of treatment. The seventh and last element was colour. It seemed that where there was the most sunshine there was found the greatest desire for colour. In Assyria, Persia, and Greece there was a large use of colour; while at Pompeii, again, there was a specimen of the brilliant Græco-Roman coloring. In Arabic buildings they found a finer feeling for colour and more success in its use than in the Western style. In Byzantine architecture it was largely used, and it was difficult to say how much colour was used in Gothic work. He believed a great many of our Medieval buildings were coloured, though not brilliantly. But as a compensation for that there was the most brilliant of all the inventions of the colourists, viz., stained glass. No invention in architecture had possessed the beauty of this, and possibly the reason why many of the buildings were not highly coloured was because they were so full of this brilliantly-coloured glass. He would remind them that no architectural work was perfect without colour, and, though they had to study it under great imperfections, it seemed as if things were a little more hopeful than they used to be. Having gone, then, through all the colours of his prism, he might be asked if he had anything to say about the dark rays. There was a side of architecture which could not be called bricks and mortar, but it was none the less as real and great a part of architectural success as anything he had referred to. This must be left for them to study elsewhere, or to be talked about another time. He would only say in conclusion that as he had referred to something which was, perhaps, a parallel to the seven hues of the rainbow, the other part of the spectrum had been brilliantly treated by one of the greatest masters of criticism the world had seen in "The Seven Lamps of Architecture."

The Chairman, in opening the discussion, said that there must be only one opinion as to the lecture they had heard. Its whole object

was to arouse their thinking powers. Speaking of roofs, when they looked at the drawings of Westminster Hall by Viollet-le-Duc and Dollman, they could only be grateful that the diabolical attempt a short time ago had not damaged to any appreciable extent this magnificent work of art.

Mr. Slater, in proposing a vote of thanks to the Professor, congratulated him on his lecture. At the same time, such an enormous ground had been covered that it was impossible in the discussion to follow him. The Professor had stated that the Egyptian temples were extremely complicated, but he could not quite agree with this, as they seemed to be simply reduplications of form. It had been also said that the fact of the buttress being used in Medieval buildings was accounted for by the desire to get shadows cast by the sunshine. This seemed to him to be rather far-fetched, and it appeared more likely that in the Medieval churches there was a desire to hear and see, so that they got rid of all the interior projections, and so put the buttresses outside. He would like to know why the Persepolitan base had not been perpetuated? What a curious thing a prism for architects would be, and if their rays were passed through it; for besides the bright lights, some of those gentlemen who dubbed themselves surveyors, &c., might cast a large number of dark rays.

Mr. Blagrove seconded the vote of thanks, which was very cordially received.

Professor Roger Smith, in replying, said that he could not throw much light on the base of Persepolis. The more ornamental one appeared to have given rise to the Ionic base, but why it was lost sight of by the Greeks afterwards he could not tell. One reason must be that the Attic base, which was in common use, was very suitable for the purpose, and was seldom departed from. There were, however, a good many eccentric varieties of bases in Greek architecture, and especially in Asia Minor. He agreed that the Egyptian temple was a simpler building than the Roman bath; but the step from Egypt to Greece was one he believed from complexity to simplicity. He did not quite like to give up his development of the buttress. Angle buttresses at the corners of towers were often introduced where they could well have been spared, and had England and France been countries like Italy or Egypt, we should have had thicker walls, like those in Italian Gothic, with the buttresses seldom beyond little strips. He therefore believed that the artistic effect had a good deal to do with the matter.

THE ALBERT EXHIBITION PALACE, BATTERSEA PARK.

We have from time to time mentioned the progress of this building, and its practical completion was celebrated by a luncheon given in the building on Saturday last to a large number of gentlemen interested, commercially or socially, in the success of the undertaking, which is one that has our best wishes. It overlooks Battersea Park, being divided therefrom only by the roadway which skirts the Park. The site of the Albert Palace and its grounds is held on lease from the Crown, and special mention was made of the facilities which had been afforded to the company by Mr. Shaw-Lefevre and the Office of Works, the Department preferring to let the ground for a place of wholesome recreation combined with an open space of considerable area rather than to let the land on ordinary building leases. The building, as will be known to many of our readers, is the glass and iron structure first erected in Dublin, and re-opened by H.R.H. the Duke of Edinburgh in 1872, with an Exhibition of Arts, Industries, and Manufactures, under the direction of Sir Edward Lee. The building as re-erected at Battersea Park consists of a nave 60 ft. high, 473 ft. long by 84 ft. wide, and with a gallery all round. There is an apse at the centre of the nave, 50 ft. by 84 ft. The annex, known as the "Connaught Hall," 60 ft. high and 157 ft. long by 118 ft. wide, with a double gallery all round, is adapted for musical entertainments of a high class, and it is in this hall that the grand organ is erected. This organ, one of the largest in the world, is the celebrated "Holmes organ."

The entire roof of the nave is covered with amber-coloured cathedral glass, in order to obviate the use of unsightly awnings or blinds. With the assistance of Dr. C. Dresser the interior of the structure generally has been deco-

rated in colour. In the decoration of the rooms appropriated to the refreshment department there is an entire absence of the "looking-glass and glitter" style of decoration which is so general in such places. On either side of the large dining-hall are some handsome white marble columns which came from Baron Grant's mansion at Kensington. The external masonry of the buildings consists largely of the masonry of the Old Law Courts at Westminster.

The gardens are being laid out by Mr. Frazar from plans prepared by Sir Edward Lee, and under his immediate supervision and direction.

The picture-gallery, extending nearly the whole length of the building, is excellently lighted. Nearly an acre and a half of the Palace ground has been set aside for a lawn tennis court. The conformation of the area renders the nave better adapted for promenade concerts than, perhaps, any other place in the metropolis, and here an orchestra, capable of accommodating 150 instrumentalists, has been erected.

The building is warmed by hot-water pipes from four large boilers of the Trentham Cornish type, fitted with smoke-consuming doors and every modern improvement. The pipes in the Palace are on the low-pressure principle, are 4 in. in diameter, and arranged in channels containing nine rows of pipes, the channels being so constructed that a supply of air is constantly brought up under, over, and between the pipes, and comfortably warmed, previous to passing through the gratings. The gas-lighting arrangements are very extensive. There are three large meters,—one 2,000-light meter for the main building, which weighs between eight and nine tons when charged with water,—one 1,000-light meter for the concert-hall, and one 300-light meter for the picture-gallery and side building. There are about eight or nine miles of mains and wrought-iron gas-pipes in the building. The building generally is lighted by groups of lights on large brackets, and the galleries are mostly lighted with star-lights. There are over 3,000 gas-burners in the building, and the whole of the work has been very well carried out by Messrs. Struce & Co., of Osnabrugh-street and St. Paul's Churchyard, E.C. The sanitary fittings are by Mr. George Jennings.

Seeing that the "Palace" is situate in the midst of a large population, and that it is easily approachable from all parts of London by three railways and by tramways, as well as by steamboats in summer, it ought to be a success, and no doubt will be, if well managed.

ARCHITECTURAL ASSOCIATION.

VISITS TO ST. BARTHOLOMEW THE GREAT, SMITHFIELD, AND TO THE CHARTERHOUSE.

The seventh afternoon visit this year of this Association was an archeological one, and was made last Saturday, the 25th of April, to what remains of the very interesting old Norman Church of St. Bartholomew the Great, West Smithfield. The members assembled at three p.m., and were received by the Rev. W. Panckridge, the rector, and Mr. Aston Webb, architect for the proposed restoration. Mr. G. H. Birch, architect of "Old London" at the Health Exhibition, was also in attendance. The Rev. W. Panckridge commenced by detailing the history of the ancient church and priory, from its foundation, in 1103, by Rahere, the founder of St. Bartholomew's Hospital, close by, down to the years 1863 and 1866, when it was restored to its present condition by Professor Hayer Lewis. He also pointed out the chief features in the church, and directed attention to the two chief monuments: one the tomb of Rahere, the first prior, on the north side of the choir; and the other, a large mural monument to Sir Walter Mildmay, Under-Chancellor of the Exchequer temp. Queen Elizabeth, 1558, and which is fixed in the south aisle. The tomb of Rahere, and the pulpit, &c., can be distinctly seen in the illustration we recently published of the north aisle and arcade.

Mr. Aston Webb next described some plans which were exhibited; one, which was drawn with the assistance of Mr. Birch, showed the exact condition of the church, and its nave and cloister, &c., as they existed in 1530; another plan, shown by way of contrast, of the church as now existing, was virtually the same as that published by us on March 28th. Mr. Webb explained what was proposed to be done if

funds were forthcoming, viz., the purchase of the fringe manufactory at the east end, and which partially overhangs the altar supported by an iron girder, as shown in our "Interior looking East," and on the small plan we published at the same time. These buildings, Mr. Webb said, may probably have been latterly used as a Prior's house, but in his opinion were undoubtedly first erected as a Lady-chapel. The north transept was now a blacksmith's forge (as they could bear). The total length of the church formerly was 280 ft. by 60 ft. wide, with apse, transepts, choir, and nave.

The visitors then perambulated the church, and the fringe factory, and also the crypt under the same, every corner of which was minutely examined, particularly its external walling, which appeared to consist of massive masonry of large stones, lately used as coal cellars and wine-hins, and which will require a good deal of excavation and clearing away of internal brick divisions, to form an adequate opinion of its former uses. Many of the members also mounted the old brick tower and belfry, from the summit of which a good view was obtained of the walls of the factory and other adjacent buildings, showing the extreme probability of the plan of the church as it was in 1530.

The members then departed under the leadership of the Rev. W. Panckridge and Mr. Aston Webb to the Charterhouse, through Cloth Fair, and noticed, en passant, the old Whittington Inn, which owes its preservation to the intercession of the London and Middlesex Archaeological Society, and a view and description of which were given in the *Builder* of January 14, 1882, under the name of the Stingo Tavern. The Charterhouse (a corruption, as every one knows, of Chartreuse) was so called from a monastery of Carthusian monks, founded in 1371, on a peat-horse field, by Sir Walter Manny, knight. The last prior was executed at Tyburn, May 4th, 1535. The Priory was then dissolved and was afterwards given by Henry VIII. to Sir Thomas Audley, Lord Chancellor. Queen Elizabeth granted it to Thomas, Earl of Suffolk, who sold it to Thomas Sutton, May 9, 1611, for 13,000*l.*, and he endowed it as a charity by the name of the "Hospital of King James." He died Dec. 12, 1611, before his work was complete, and was buried in the chapel of the hospital, beneath a monument, the work of Nicholas Stone and Mr. Jansen, of Southwark. The chapel and the tomb of Sutton, and other ancient portions of these interesting premises, having been inspected, the visitors departed.

THE ART-UNION OF LONDON.

ANNUAL MEETING AND PRIZE DISTRIBUTION.

The annual meeting of the Art-Union of London was held in the Adelphi Theatre on Tuesday last, Mr. James Hoggood, Member of the Council, in the chair, in the absence of Lord Houghton, the President, who is now in Italy.

Mr. Hallett, Member of Council, read the annual report, from which we extract the following paragraphs:—

The subscription of the year amounts to 8,768*l.* 8*s.*, and the Council would have been well pleased had they been able to announce a more favourable result, but, in face of the continued universal depression, they cannot but feel that the amount collected is more than could be reasonably expected. The accounts of the year have been audited by Messrs. Geddes and Hicks.

The following is a brief summary of the receipts and expenditure.

Amount of subscriptions.....	8,768 <i>l.</i> 8 <i>s.</i> 0
Allotted for prizes	£2,265 0 0
Set apart towards providing works of art for accumulation payments	561 0 0
For print of the year, almanac, exhibition, report, and reserve	2,538 12 2
Agents' commission and charges, advertisements, printing, postage, rent, &c.....	5,687 12 2
	3,118 15 10
	£8,768 8 0

The Council have lately had an opportunity of acquiring the copyright of a very faithful portrait-bust of the late General Gordon, by Mr. E. B. Stocks, a Gold Medalist of the Royal Academy, — and they have to express their acknowledgments to Sir Henry and Lady Gordon for having much time and trouble to the superintendence of the work with a view to obtain a satisfactory likeness. It has been pronounced a great success. The amount to be expended on prizes will be thus lotted:—Original paintings, "Vanguard," 21*l.*; 1 work of art, 15*l.*; 2 at 60*l.* each; 3 at 45*l.*; 3 at 35*l.*; 4 at 30*l.*; 5 at 25*l.*; 7 at 20*l.*; 12 at 15*l.*; 21 at 10*l.* In addition there were 6*l.* terra-cotta busts General Gordon; 8*l.* sets of designs from English story; 50 portfolios of 24 plates of animal life; these

making, with the prizes given to unsuccessful members, 515 prizes.

In our report for 1884 we noticed the death of Mr. Thomas Holloway, one of the most munificent patrons of art in late years. Mr. H. has left behind him an institution unparalleled in its philanthropic intention at this day. Some years before his death he called a meeting of persons interested in the higher education of women. It was well attended, but led to no practical results, and shortly afterwards he determined to take on himself the whole burden of building and endowing a college, on such a scale of liberality and magnificence, that we must go back to the time when kings and cardinals endowed colleges at Oxford and Cambridge to find any parallel to it. A splendid site, abut on a mile beyond Egham Station, on the South-Western Railway, was begun, from designs by Mr. W. H. Crossland, a pupil of the late Sir Gilbert Scott, — in whose earlier work for Mr. Holloway, the Gothic Sanatorium, at Virginia Water, the influence of his master is conspicuous. The building at Mount Lee, so the place is called, covers more ground than any college at Oxford or Cambridge except Christ Church, Trinity, and St. John's.

The purchase of several pictures of the English school by Mr. Holloway excited much attention at the time, and it is now known that these works will find their resting place at the new college, — it is expected that the whole institution will be ready in a few months to begin work, and then England will be in possession of the most magnificent endowment ever made in this country by a private individual. Taking the cost of the Sanatorium, and of the college, and the pictures placed in it, the total amount of Mr. Holloway's gifts to the nation reaches, if it does not exceed, a million sterling. It may be mentioned that the contract for some pictures of the college was signed in July, 1883; that the work was finished within the stipulated time; and that there was not a shilling of extras on the contract sum, — 267,000*l.*

There are not many vacancies in the ranks of the votaries of art to record during the last year.

In the early part of 1884, Mr. W. L. Leitch, V.P. of the Royal Institute of Water-Colours, died. Mr. Leitch began his artistic life as a scenic painter in a provincial theatre in Scotland, of which he was a native, at a few shillings a week, — but his perseverance was not to be mastered, — and the number of his sketches was so large as to form a few months ago the last part of the 700 lots offered for sale after his death. Soon after his removal to England he became instructor of painting to the Queen and her children. — An interesting biography has been written of him by Mr. A. McGeorge.

In the latter part of last year died Mr. F. W. Hulme, a landscape painter of repute.

Early this year the Royal Institute of Painters in Water Colours lost Mr. J. W. Jopling, who worked in a broad and striking manner.

On the 24th of February last died Mr. E. W. Wyon, the youngest and last surviving son of Mr. W. Wyon, chief engraver of the Seals to George III., an artist who flourished at a period when seal and medal engraving was considered to be a branch of fine art, and duly recognised as such by the Royal Academy, when designs in metal were made the subject of prizes awarded by that body. Mr. E. W. Wyon assisted his brother Benjamin in many of his works, and at a later date produced several statues. He was a frequent exhibitor at the Academy since 1831. With the Art-Union of London Mr. Wyon had an intimate connexion for some time. In 1841 it was determined by the Art-Union to endeavour to establish the production of artistic statues in bronze. So little was then known of the art in this country that Mr. Wyon (to whom was entrusted the selection and casting of the Society's first work, the beautiful Michael and Satan of Flaxman) had the greatest difficulty in finding workmen able to undertake the task, and he had actually to personally superintend and aid in building the furnace necessary for the purpose. However, by dint of perseverance, a very satisfactory copy in bronze of the above group was produced, and it was the inauguration of that series of bronzes to which we can point with satisfaction, as not yielding in excellence to the work produced by any other foreign house. Of the works of this kind in England this Society was undeniably the originator.

In Mr. J. J. Jenkins, the Royal Society of Painters in Water Colours has lost one of its most accomplished members. Born in London in 1811, he died on the 9th of March last, having for a considerable time suffered ill-health. To Mr. Jenkins the press owes that great accommodation, the present treatment of Exhibitions, which was instituted at the old Society, and rapidly followed by the Royal Academy and other bodies. Mr. Jenkins bequeathed to his Society 1,04*l.* and nine of the best of his collection of drawings by past and present members.

In November last died Mr. H. S. Leitchfield, sculptor. Mr. Louis Hazeb, Honorary President of the Institute of Painters in Water-Colours, died on the 9th of March, at the age of 79.

The death of Mr. Richard Ansdell, R.A., the well known animal painter, occurred at Collingwood Tower, Farnborough, Hants, a few days ago.

In a record of matters artistic during the year, it would be ungrateful to pass without a word of praise the reproduction of an old London street by Mr. Birch, in the International Health Exhibition.

A very interesting art-union exhibition was opened at Brighton in November last, — 139 works were exhibited, — almost without exception by eminent masters. There was also a series of rooms intended to illustrate seventeenth and eighteenth century interiors, — containing some quaint furniture and utensils. At Guildford, in July, was opened an exhibition of works derived from local sources which is worthy of notice. The county survey of the rich and historical elements of hygone days, which go back to a date long antecedent to the Conquest. The stripes on the tower of its most ancient church savour of a happy landing. It was done by the West side of the fair Elaine Basted. Guildford Castle, with its ancient hering-bone brickwork, has traditions of Alfred, and the spot is identified with the Aetolus of the poet. In the neighbourhood are the historical sites of Wotton, still held by an Evelyn; Sutton, with its whole chapel; Loseley, with its Elizabethan windows and its memorials of the Moors. The monuments, plate, pictures, &c., and other works of interest from houses such as these, made this loan exhibition worthy of a visit.

For the second time within seven years a fine collection of pictures, drawings, and other works was formed at Norwich, and was on view last year in the old ecclesiastical building called St. Andrew's hall. The exhibition contained a large number of old masters, many modern pictures, and a fair gathering of fine pieces of old plate and old French coins and miniatures by Cosway and his

contemporaries. The chief attraction was the remarkable display of pictures by what is known as the Norwich School.

Sixty years ago the University of Bonn founded a museum of casts from ancient sculpture for the use of students of classical archaeology. Cambridge has, as we followed this example, at a cost of 12,000*l.*, and no archaeologist will tax her with any undue forwardness in the matter. A museum of casts is as necessary to the teacher of art and archaeology as a chemical laboratory to the teacher of chemistry. As soon as Cambridge decided that the subject should be taught she was sufficiently logical to provide the proper means of teaching. Coming from the East Museum at Berlin, the largest and most complete in the world, which has grown by the accretion of years, it must be confessed that, for beginners at least, the Cambridge museum is the better place for study. Every cast museum must, to a certain extent, be a compromise between ideal arrangement, on the one hand, and the exigencies of space, on the other; but at Berlin constant new acquisitions have pushed this compromise to a point that is perplexing to the unaccustomed eye. Here are gathered together, from sheer want of space, representatives of schools and periods the most diverse. This is rather pleasant than otherwise to the expert, but the eye of the novice is unduly troubled. At Cambridge classification, beginning where material was far more copious, has had full and easy scope. In the matter of mere chronology he who runs may read.

Following the inauguration of the gallery of casts at Cambridge, an important addition to the many attractions at South Kensington Museum must be noted in the remarkable collection of casts in the new gallery which was opened last August. Here the visitor is enabled to see before him at a glance the progress of Greek sculpture, from the rude efforts and native expression of its childhood to the magnificent development, under Phidias, of an art perfectly balanced, intellectually and physically, and representing the strict ideal of humanity in the persons of heroes and divinities humanly represented.

It is a satisfaction to know that we have so many productions of the great age of the art left to us, as an eternal possession, now reproduced and multiplied in so many ways that we need never fear their loss, and may consider our leisure in what way we can best turn to account the lessons to be derived from them. The Art-Union may point to the busts of "Clytie" and "Apollo Belvedere," the "Ajax," and the "Townley" vase, to show that we have done something to make known to the public of this day and to put within easy reach of many a home these emblems of some of the finest specimens of ancient art. The proximity of this series of casts to the late Art-Union Exhibition, showing the beauty of the physically healthy body, and comparing it with some of the cases into which the human figure has been forced, as exhibited both in the historic dresses and in some of those seen near the altar in the building, suggests an appreciation of Shakespeare's remark, "What a deformed time this fashion is."

Thanks to a majority of more than 100 on the debate in the House of Commons, the references to the purchase of the Blenheim pictures, the equestrian Charles I. of Van Dyck and the Ansdell Raffinello, our National Gallery is no longer open to the reproach of containing no first-rate Raphael, and no great Van Dyck. These two new acquisitions place it at once on a level, in this respect, with the greatest foreign galleries.

It has been suggested to the Council, in several quarters, that an illustrated work, in continuation of the series of the "Norman Conquest," "The Ancient Mariner," and others, all of which are still in constant demand, would be acceptable to the subscribers, — especially as such productions are popular from not involving the additional expense of framing. The Council having been much impressed by the beauty of certain drawings by Mr. Percy Macquoddy, R.I., — exhibited some time since at Messrs. Cassell's, — and by two subjects which he contributed to the volume of "Animal Life," produced by the Art-Union, as well as several very merituous works exhibited by him at the Royal Academy, applied to him to prepare, in reply to some designs, and Mr. Macquoddy having suggested, in Walter Scott's poem of the "Bridal of Triermain," as a theme supplying abundance of material for illustration, the work was put in hand, and a set of fourteen subjects reproduced by the photorevue process, bound up with the text of the poem, will be the annual presentation work for next year. It may be well to state that these designs are not to regard the highly elaborate drawings, but the broad sketches, somewhat after the manner of the Spanish painters, Fortuny and Mad-zotto, and representing the modern school of black and white. General effect and powerful handling are aimed at rather than minute accuracy.

In concluding this report we would draw attention to an address, delivered at the Birmingham Social Science Congress last September by Mr. P. H. Rathbone, with a view to showing the importance of considering the economical value of art, independently of its ethical and scientific value. Mr. Rathbone called attention to the necessity of improving the art of our manufactures and infusing into them a large amount of esthetic element. He pointed to the remarkable development of our potteries under the auspices of Josiah Wedgwood, and to the fact that an extensive export trade in his manufactures has been developed since sound art entered into their manufacture. "Cultivate," the speaker said, "the taste of our population by galleries and museums, by concerts and lectures, and they will not only patronise them, but they will crave to possess as their own such forms of art to decorate their houses as may be within their means. The very plates and cups in daily use will be, not dearer, but in better and purer taste than has hitherto been the case. Taste will be elevated and purified till a demand for artistic work is created that will overflow the limits of the country and create an export trade which will do much to counteract the loss of supremacy in cheapness, hitherto our mainstay."

The Chairman, in proposing the adoption of the report, said he thought that they ought to be thankful, on looking around them, that they had been able to collect something like 9,000*l.* for the purposes of pure art, and for gratifying those tastes which might, under other circumstances, be smothered. The report had touched on the death of Mr. Holloway. There were thousands of men who hoarded their money to the last moment, and then when they could not

* Printed in the *Builder* at the time. (See p. 451 of our last volume.)

take it with them left it for some great purpose; but the man who applied it to such a purpose during his own life was a true man, and deserved their gratitude. The report also referred to the death of several artists. This was a matter of regret, but at the same time they must congratulate themselves that the vacant places were being taken by rising men, and that though artists died, art was living and flourishing.

Mr. E. E. Antrobus seconded the resolution, which was carried.

Mr. Francis Bennoch proposed a vote of thanks to Mr. E. E. Antrobus and Mr. Zouch Troughton, the Hon. Secretaries, for their continued efforts for the advancement of the Society's progress.

Mr. Hallett seconded the resolution, which was also agreed to.

The Chairman next moved a vote of thanks to Messrs. A. & S. Gatti for granting the use of their theatre for the meeting.

The resolution was seconded by Mr. Hallett, and cordially received.

On the motion of Mr. Bennoch, a vote of thanks was passed to Miss Jessels and Miss Higgins for their kind assistance in drawing the prizes, and to the scrutineers and auditors.

The drawing for the prizes then commenced, the principal prize, Mr. Briery's picture of "The Vanguard Attacking the Spanish Armada," valued at 210*l.*, falling to Mr. John Fore, of Monte Video.

COMPETITIONS.

The Three Cups Hotel, Colchester.—In the competition for the Three Cups Hotel, Colchester, the assessor, Mr. C. F. Hayward, F.S.A., has awarded the first premium to Mr. R. Stark Wilkinson; the second premium to Mr. R. F. Vallance, of Nottingham; and the third to Mr. E. B. Panson. A second competition between the above three is to be proceeded with on amended instructions.

Presbyterian Church, Whalley Range.—We learn that the drawings submitted by Messrs. Mangnall & Littlewoods, architects, 29, Brown-street, Manchester, in competition for the proposed New Presbyterian Church of England at Whalley Range, have been awarded the first premium.

OBITUARY.

Mr. G. Packham.—Mr. George Packham, architect, Exeter, died after a few days' illness (the result of cold), on the 23rd ult., at his residence, Exmouth. He was only forty years of age, and leaves a wife and six children to mourn his loss. He succeeded the gentleman to whom he was articled, Mr. Henry Cross, architect, of Exeter, who died from injuries received whilst skating in 1867. Some few years ago, Mr. Packham took into partnership Mr. Croote, formerly one of his own pupils, and since then, until the present time, the firm has practised under the title of Packham & Croote. Although not essentially a church architect, Mr. Packham restored the parish churches at Thelbridge and Venn-Ottery, in a very conservative and careful manner, and his schools in Exeter, Colebrooke, Okehampton, Heavitree, Woolfardisworthy, Whipton, and other places exhibit thought and skill, whilst farm buildings were a speciality with him, some of the most successful in the county having been erected under his supervision. Mr. Packham was also the architect for a number of building estates in the county of Devon, and was, in conjunction with his brother, the architect for various warehouses and business premises in the main thoroughfares of Exeter. He was hurried on the 28th inst., at the Exeter New Cemetery, the Mayor (Mr. Brown) and Corporation, together with a large number of the principal citizens, attending the funeral.

Mr. E. Martin.—The death is announced of Mr. Edward Martin (of the well-known firm of Martin, Wells, & Co., builders and Government contractors, Aldershot), which took place on the 16th ult., after a short illness. The business will be carried on by the surviving partners (Messrs. Henry Wells and George Wells), under the same style as before, viz., "Martin, Wells, & Co."

Mr. William Ward Lee.—The death is announced of Mr. William Ward Lee, architect, late of Finsbury-circus. He was for some

years architect to the Improved Industrial Dwellings Company (Sir Sydney Waterlow's), and several of the blocks of buildings erected by that company are from his plans.

BUILDING IN PRIVATE WAYS.

A GREAT many buildings of the Artisan class have lately been, or are about to be, erected in the Metropolis, and we think sufficient attention has not been called to the Act of 45 Vic., cap. 45, which was expressly passed by the Metropolitan Board of Works in 1882 to meet buildings of the above character; section 7 of the Act providing that no road, passage, or way should be thereafter formed or laid out for building as a street, either for foot or carriage traffic, without the consent of the Board, if the same did not afford direct communication between two streets. Section 8 of the same Act also provides that no footway should be thereafter laid out without the consent of the Board being first obtained. The first case tried under the above sections was the one of *The Board v. Hampton*. Hampton had erected a cluster of buildings of the above class in a way of less width than 20 ft., and without any outlet, and gates were placed at the entrance, and the way was proposed to be a private one, and was, therefore, supposed by the builder to be out of the provision of the above Act. On the hearing at the Lambeth Police Court he was convicted under the above sections, and, upon appeal to the Surrey Quarter Sessions, the conviction was affirmed, subject to a special case to the Superior Court; but the defendant did not avail himself of this, and has since made the way 20 ft. wide, and given two entrances. Another case of the same character and closed by gates was heard at the same time, and upon the decision in the above case the defendant pleaded guilty, and was fined 20*s.* on each of the summonses. Notwithstanding the above decisions, large blocks of buildings have been formed in Camberwell, Chelsea, and Poplar. All these buildings are to be closed by gates, and are alleged to be private ways, and proceedings are now pending against them, and, under these circumstances, we think the sections of the Act should be carefully considered before erecting buildings in a carriage or foot way which does not afford direct communication or forming a footway without first obtaining the consent of the Metropolitan Board of Works, as otherwise the builders may sustain very heavy losses while the proceedings are pending, as well as heavy penalties which may now be sued for at any time, and the more especially as we do not think the above sections can be evaded either by putting up gates or other obstructions against ordinary user by the public.

THE TILBURY DOCKS CONTRACT.

KIRK AND RANDALL V. WALKER AND ANOTHER. THIS was an action for libel, involving important matters of interest in connexion with the East and West India Dock Company and their new docks at Tilbury, and tried before the Lord Chief Justice on Monday last.

The plaintiffs, Messrs. Kirk & Randall, are contractors, and for some time previously to the publication of the libel now complained of were employed in the construction of the Tilbury Docks on behalf of the East and West India Docks Company. The defendants are the proprietors of the *Bullionist* newspaper, in which, on October 25th, 1884, the following paragraph appeared:—"Work at the Tilbury extension of the West India Docks Company, which has been interrupted by the failure of the original contractors, Messrs. Kalk & Rendell [meaning thereby the plaintiffs] will be actively resumed on Monday next. The new contractors are Messrs. Lucas & Aird." The publication of the libel was admitted, but the defendants alleged that in publishing it they had acted without actual malice and without gross negligence. They further pleaded that at the earliest possible moment, viz., November 1, 1884, they had inserted a full apology according to the provisions of Lord Campbell's Act (6 and 7 Vict., c. 93), and they had paid into court a sum of 1*l.* 1*s.*, alleging that to be sufficient to satisfy the plaintiff's claim.

Mr. Webster, Q.C., in opening the case for the plaintiffs, said that the libel complained of was necessarily of a character to do great injury to persons in the position of the plaintiffs. They had proceeded with the work under their contract with the East and West India Docks Company at Tilbury under which they were to be paid some 700,000*l.* up to June, 1884. The work had been found to be

vastly more difficult than had been anticipated (the soil proving to be quite different from what was expected); that upon the plan, originally estimated to cost only 50,000*l.*, the plaintiffs had, in fact, expended upwards of 200,000*l.* They had claimed to be paid by the Dock Company upon a basis which the engineer of the latter had refused to acknowledge. The result of the dispute had been that the Dock Company had taken the work out of the hands of the plaintiffs. There had been no sort of question as to their solvency and stability, and the dispute between the plaintiffs and the company had been solely due to the fact that the parties had taken totally different views of their rights. The plaintiffs' claims against the dock company were the subject of an arbitration now taking place.

The jury gave a verdict for the plaintiffs, assessing the damages at 250*l.*

BUILDERS' PLANT ON THE "HIRE-PURCHASE SYSTEM."

IN RE BARNETT—EX PARTE REYNOLDS AND CO.

THIS case was before the Court of Appeal on Tuesday last, before the Master of the Rolls and Lords Justices Baggallay and Bowen.

The case involved the important question whether a county court judge, sitting in banc, Reynolds & Co., brought an action by injunction an action in the High Court of Justice. It appeared that one Barnett, a builder, was adjudicated a bankrupt in October, 1884, in the Croydon County Court, and a trustee was appointed. At the time of the bankruptcy Barnett was in possession of certain machinery, which he had got from Messrs. Reynolds & Co., Acorn Works, Edward Street, Blackfriars-road, London, on "the hire-purchase system," part only of the purchase-money, which was payable by instalments, having been paid. This machinery the trustee claimed as having been in the order and disposition of the bankrupt at the time of the bankruptcy. Thereupon Messrs. Reynolds & Co. brought an action of injunction in the High Court against the trustee. The trustee applied to the county court judge for an order to stay proceedings in that action, and that he should determine the question of ownership of the machinery. The County Court Judge refused the application, but a Divisional Court, consisting of Mr. Justice Cave and Mr. Justice Wills, reversed the decision and granted the trustee an injunction restraining Reynolds & Co. from proceeding in the action until further order, on an undertaking by the trustee to be answerable for damages and to proceed with the motion in the Court below with due diligence. Messrs. Reynolds & Co. now appealed, and it was stated that the result of the action in the High Court would be of great importance to the trade, as it would be sought to set up a hiring custom in respect of machinery of the kind in question so as to take it out of the reputed ownership clauses, as has been done in the case of hotel furniture and pianos.

At the conclusion of the arguments the Court gave judgment allowing the appeal.

MR. EDWIN CHADWICK, C.B., AND TUBULAR DRAIN-PIPES.

SIR,—Statements have repeatedly been made as to the origination of the tubular system of house and drainage which implied that I had taken it from some one without acknowledgment. I wrote to the late Mr. John Roe for his account of the first order given on the subject, and the following is a copy of his answer, which I should be greatly obliged if you will insert in the *Builder*. EDWIN CHADWICK.
East Sheen, April 25.

9, Albert Villas, Clifton-road, South Norwood, Sept. 18th, 1868.

Dear Sir,—I have some thoughts of having an account printed of some of the various improvements introduced into sewage matters during the time I was acting under the Commissioners of Sewers in the metropolis. If I should, the salt-glazed stoneware pipe would be amongst the number named. The history is as follows:—

In 1842 Mr. Chadwick was taking evidence for the Poor Law Commissioners' Report on the Sanitary Condition of the Labouring Population of Great Britain. During the course of the inquiry Mr. Chadwick suggested to me the forming tubular pipes of small size for drainage with cement, and to ascertain the cost and efficiency. This I caused to be done at intervals during the years 1843, 1844, and 1845. On seeing Mr. Chadwick thereon he expressed a desire for a smoother surface than the cement or tile pipes presented.

Talking the matter over with some of my clerks of works one of them (Mr. Medworth) said he had a friend who was a manufacturer of glazed stoneware, and no doubt he would try and make me glazed pipes if I sent him models. I said we would try him, but I wrote at intervals during the year 1845, and sent to Mr. Northern, who was Mr. Medworth's friend, and to Mr. Davis, whose works were distant from Mr. Northern's.

The pipes were duly completed, and, singularly enough, they arrived at the Holborn and Finsbury Office of Sewers, in Hatton Garden, on the same day (Sept. 26th)

5). Mr. Francis Wigg, one of our Commissioners, afterwards our Chairman, coming into the office, I seeing the pipes, recommended them strongly for such was the commencement of salt-glazed stoneware, and such I should state in any particulars I might wish.

Will you kindly give me your experienced advice on this matter, and I shall feel obliged—I am, dear Sir, yours truly,
JOHN ROSS,
Edwin Chadwick, esq., C.B.,
Park Cottage, East Sheen, S.W.

COOKING APPARATUS FOR LARGE INSTITUTIONS.

Sir,—In reply to Mr. T. W. Aldwinckle's letter which appeared in your journal [p. 601, ante], with reference to the article of the 15th inst. [p. 566] on Becker's Patent Cooking Apparatus, I beg leave to state the following:

I have been since 1868 well acquainted with Captain's apparatus, and I am also in possession of patent; nevertheless, I was induced to inspect the apparatus which is in use in Lambeth Workhouse. I could find there neither a Warren nor an Aldwinckle apparatus; there was only to be seen an apparatus of the firm of Messrs. Benham & Sons, which I, therefore, take as the apparatus in question. This apparatus has nothing whatever in common with my invention, because it is nothing else but ordinary steam cooking apparatus, such as there have been in use on the Continent for the last forty years. I contest that this apparatus is possessed of any of those fine qualities, specified and protected by the letters patent which I have taken out, and I declare that neither in this nor in the Warren apparatus is the slightest trace of the peculiar effects of my invention. My apparatus is based on scientific principles which have been discovered, not by me, but some time ago by men like Von Liebig, Sir Henry Thompson, &c. It would take too much of your valuable space to go into the details of my invention, but I am prepared to put up in the Lambeth Workhouse one of my apparatus in order to enable an impartial commission to compare the two.

CARL BECKER.

12, Finsbury Pavement, E.C.
April 25th, 1885.

P.S.—To facilitate matters, I would gladly take your gentleman, appointed by such commission, to the Finsbury Workhouse, where one of my apparatus used, and prove to him by ocular demonstration superior merits.

ARCHITECTURE IN THE NINETEENTH CENTURY.

Sir,—I shall feel obliged by your correcting a slight error in the report of my lecture "On Architecture in the Nineteenth Century," published on the 15th, p. 582, middle column, lines from the bottom. The words "perannum" should be omitted.
G. AITCHISON.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

153, Cement. R. Stone. The improvements here consist in a form of grinding-mill, and also in the form of the moulding-chine, and the prevention of clogging by vibrating as under first grinding contact.

198, Opening and Closing Casements and Ventilators. J. Bruce. A slotted bracket secured to the window has a ring in its ends a screwed bar which can be acted by an endless cord over a pulley. A nut acting with a screwed bar has guides to enable it slide in the slots without turning, and a lug which works in the slot on a plate screwed to the window. When the window opens outwards inwardly the plate, a bar may be pivoted to it and nut. The invention is also applicable to louvre ventilators.

26, Combined Measuring Tape and Compass. Whitaker. The compass is let into the centre of those tapes that are worked by a spring. The tapes operated a handle have the compass affixed in the knob between the tapes.

200, Fireproof Floors, Ceilings, &c. P. Oles. Slabs of concrete or other fireproof material are divided with related edges, by which they rest in the joints. When the concrete floor is to be laid with boards a space is left between the slabs, which is filled up with a strip of wood. In cases the slabs fit in flush between the joints rest upon fillets nailed to them. For ceilings slabs may be either of a dish shape or flat, and rest upon fillets of wood or iron angle-pieces, and iron joints are used upon the lower flange.

587, Transportable Building. W. H. Dunlop. The building is composed of several separate structures, each standing on its own set of wheels,

arranged to be connected together to form a complete room for exhibitions or other entertainments. The windows are fitted with shutters sliding on friction rollers and connected together by rods, so that they may, by a handle conveniently placed, be simultaneously closed for the purpose of showing dissolving views. For standing on sloping banks the sections forming the building are without wheels, and are dorelled into a slanting base frame.

1,793, Ventilating or Chimney Frame. H. A. Phillips. A shaft is fitted with a curved collar which supports a number of vertical, radial, flat, or wedge-shaped bars. These are surmounted by a cover and support louvres to exclude the wind and the rain.

2,829, Drain Scrapers. J. Birch. The scraper consists of a long handle formed in lengths which can be screwed together when it is inserted in the drain, and of two spade-like heads, either of which may be attached according to the kind of work to be done,—whether the removal of solid, semi-solid, or liquid matter. Another kind of scraper may also be used for withdrawing paper, rags, straw, and such like material.

13,021, Door Spring. A. McMillan. A groove is made in the top edge of the door, and a spiral spring placed in it; one end of the spring is locked to a plate in the outer end of the groove. The door will swing both ways, but the tension of the spring will cause it to close at once.

1,224, Combined Lock and Lifting Latch. G. H. Bratt. The lifting latch is cut out in the lock case and the staple of the lock bolt and the catch of the latch are fastened to the front plate. A projection is formed on the outer end of the latch, so that it cannot be raised when the bolt is shot. A light spring presses down the latch, which may be raised either by a knob or a thumb-piece, both of which are attached to it.

2,640, Artificial Marble. A. Quattara. This is made from any variety of gypsum. The first method is without decomposition, the gypsum is dehydrated by heating to a specified temperature for each variety; then immersed in a bath containing a specified silicate solution for each variety, dried, reheated to a higher temperature, replaced in a bath and dried in the air. The various colourings to produce various tints are described. In a second method the gypsum is first reduced to small pieces, then dehydrated, soaked, dried twice, burned and cooled, and finely powdered. The powder is made into a paste with a silicate solution, pressed in moulds, and dried. Other and similar methods, with slight modifications, are also given.

2,764, Entrenching Tool. W. F. Blakeney. A pick has a broad end formed with a shoulder so that it can be used as a shovel, and a wooden handle fits into a socket, which is cased with hard metal at its end, so that it may be used for tearing down bricks.

5,211, Louvre Bricks or Blocks. J. C. Bothams. The bricks are made with slanting passages through them for building into walls where louvre openings are required. Several forms of brick are described, which are useful in ventilation, either together or separate. Bricks are also made with slanting recesses in them into which tiles, formed for the purpose, are inserted to be built into the wall for louvre filling.

APPLICATIONS FOR LETTERS PATENT.

April 10.—4,429, T. Redman, Fixing Sunburners or Ceiling Lights.—4,438, A. Oakden and W. Sharpe, Improvements in Cooking Ranges.—4,440, S. Wilkins, Burglar or Fire Alarm.—4,441, W. Tapp, Improved Construction of Tiles for Stairs.—4,444, D. Menzies, Ventilation of Houses and other Buildings.—4,449, T. Emsley, Improved Casement Stays.—4,469, B. Hewetson, Securing Slates used to replace damaged slates on roofs of houses.

April 11.—E. Ormerod, Apparatus for Making Paving Slabs, Blocks, Sinks, Manholes, Roofing Tiles, and other similar Articles in Concrete, Terra Cotta, &c.

April 13.—J. Davidson, Ventilation of Soil and Waste Pipes.—4,621, H. Yull, Water-waste Preventer.—4,539, H. Haddan, Improved Roof Covering.

April 14.—4,564, J. Corcoran and Others, Shaping and Reducing Timber.—4,566, J. Barwick, Improved Ceiling Ventilator.—4,582, G. Grace, Describing Ellipses in various Sizes and Proportions.—4,614, A. Clark, Bolts or Fastenings for Shutters, Blinds, Doors, &c.

April 15.—4,627, J. Watt, Door Springs or Automatic Closing Apparatus.—4,629, J. Miller, Improvements in Ventilators.—4,630, R. Roberts, Opening Doors from the Inside.—4,643, G. Ellis, Portable Dry-earth or Carbon Closet.—4,646, E. Showell, Improvement in Sash Fasteners.—4,663, E. Bowdley, Automatically Opening and Closing Ventilators.—4,668, W. Wilson, Improved Process of Ornamenting Wall and other Papers.

April 16.—4,681, J. Barwick, Improved Ventilating Pipe and Cap.—4,700, G. Blane, Apparatus for Closing Gates.—4,721, J. Fell, Pneumatic Door Check Spring.

April 17.—4,726, R. Jones, Improved Window

Sash Fastener.—4,727, M. Bouafield, Trilled Fire Front for Ranges and Stoves.—4,749, E. Palmer, Apparatus for Flushing Sewers and House Drains.—4,750, A. Elford, Improvements in Paving Blocks.—4,751, J. Garrett, Earth Closet Apparatus.—4,754, G. Osborn, Apparatus for Printing on Wall Paper, &c.—4,759, W. Luther, Sash Bars or Astragals.

April 18.—4,813, J. Dower, Bel-plates for Brick moulds.—4,819, J. Baker, Disinfecting and Deodorising Apparatus for Water-closets, &c.—4,827, E. Newton, Self-cleaning Cisterns or Tanks.

April 20.—4,851, F. Brown and S. Guiney, Locks and Latches.—4,869, R. Duncan, Improvements in Domestic Fire Grates.—4,873, W. Leggott, Window and Door Fastening Bars.—4,875 and 4,878, W. Lake, Manufacture of Nails.—4,886, J. Eaton and F. Morris, Improvements in Window Sashes.—4,888, T. Lownds, Urinals and Drainage Traps.

April 21.—4,891, R. Stoffert and T. Dykes, Construction of Girders.—4,901, W. Pinkerton, Improvements in Spring Hinges.—4,926, G. Wells, Water-closets and Appliances connected therewith.

4,921, W. and E. Murdoch, Improvements in Pavements.—4,927, J. Hopkinson and O. Gibson, Facilitating the Raising and Lowering of Windows.—4,943, F. Humphreys, Improved Joint for Pipes.—4,958, W. Lake, Decoration of Walls and Ceilings.

PROVISIONAL SPECIFICATIONS ACCEPTED.

2,057, S. Cowan, Improvements in Drain Traps.—2,412, J. Tulloch, Improved Sash Window.—2,788, E. Prince, Adjusting and Fastening Windows.—3,183, H. Ransom, Apparatus for Setting Saws.—3,186, W. Royston, Ornamentation of Woodwork.—3,227, E. and A. Marples, Construction of Spokeshafts.—3,714, C. Portway, Improvements in Fences, Dividing Walls, &c.—3,757, W. Miller, Improvements in Washhand Basins or Lavatories.—3,772, C. Anger and P. Gerlach, Improved Cooking Stove.—3,836, W. Brown and H. Clayton, Construction of Sinks and Traps.—3,840, H. Heron, Ventilating Closet, Soil-pit, or Privy, applicable also to Dust-bins.—3,897, J. Johnson, Manufacture of Artificial Stone.—8,174, J. Lamb, Ventilating Appliances.—1,915, C. Stewart and R. Colquhoun, Electric Bell Indicators.—1,366, W. Thiechen, Ventilating Rooms, and Excluding Draughts therefrom.—3,177, G. Collings, Ventilators for Dwelling-houses and other Structures.—3,802, W. Johnson, Improvements in Walls, Roofs, Partitions, &c.—3,884, H. Haddan, Window Fastenings.—3,916, E. Ormerod and J. W. Horne, Rendering Ceilings Luminous and Damp-proof.

2,803, E. Robbins, Manufacture of New Concrete Materials.—3,251, G. and E. Hammer, Writing Surfaces for Walls of Schools, &c.—3,488, G. Stephens, Ornamenting Glass.—3,932, J. Homan, Fireproof Floors.—4,067, C. James, Latches or Fastenings for Doors, &c.—4,081, A. Mackie, Improvements in Heating Appliances.—4,125, Sampson Low, jun., Apparatus for Producing Upcast Draught in Ventilation.—4,131, H. Walker and G. Clark, Improvements in Dust Bins.—4,150, J. O'Callaghan, Securing Door Knobs or Handles to their Spindles.—4,164, W. Stobbs and E. White, Preventing Down Draught in Chimneys, &c.—4,169, G. Holloway and H. Steaning, Window Fasteners.—3,970, J. Garrett, Heating and Ventilating Flues, &c.—3,656, F. Rogers, Improved Vane and Indicator.—3,723, J. Barrett, Apparatus for Opening and Closing Doors in Connexion with Hoists.—3,801, R. Keates, Dies for Tiles, Bricks, &c.—3,945, D. Patzeys, Alarm Extincteur of Fires in Chimneys.—3,956, H. Stevan and W. More, Spiral and Other Stairs.—4,205, F. Vorgard, Stoves and Fire Grates.—4,512, J. Powell, Cramps for Flooring, &c.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

8,434, J. Garrett, Apparatus for Heating Apartments, also applicable for Preventing Draughts.—6,918, F. and J. West, Building Slabs for Concrete Construction and Method of Manufacturing and using same.—3,228, J. H. Taylor, Improved Method of Constructing Pipe Joints.—3,921, T. Tobitt, Sliding Window Sashes.—3,993, H. Lake, Machines for Crushing Lime, Cement, &c.—12,907, E. Smith, Improvements in, and in Opening and Closing Windows.—15,036, E. Goodson, Manufacture of Cement and Making Articles therefrom.—15,875, W. Leiper, Electric Bell Pushes, Contact Makers, and Indicators.—623, E. Bailey, Securing Door and other Knobs and Handles.—3,021, J. Quirin, Parallel Vices.—3,371, J. Hughes, Rack Pulleys for Window Blinds.—3,383, W. Soutter, Improvements in Water-slide Gaseliers or Gas Chandeliers.—3,405, W. Lake, Improvements in Pavements.—3,174, J. Lamb, Ventilating Appliances.—8,256, B. Reynard, Improved Plates for Building in Concrete.—8,675, W. Middleton, Improved Method of Slating Iron Roofs.—8,683, W. Symons, Floors or Covering for Floors.—9,670, W. Fyfe, Improvements in Ventilators.—9,699, S. Frankenberg, Damp-proof Ceilings.—10,830, J. Gosling, Manufacture of Brass Hinges.—10,457, S. Gosling, Flushing Cisterns, &c.—2,181, A. Bout, Appliances for Cleaning Water-closets, Sinks, &c.—8,825, W. Baylies, Self-adjusting Pulley for Window Blinds.—9,888, L. de Liebhauer, Colouring Stones for Building, &c.—1,683, A. Clark, Improvements in Lathing.—2,319, T. Normanton, Improvements in Water Pipes and Flushing Cisterns to Prevent Bursting by Frost.—3,711, J. Krietschmann, Improvements in Water-closet Valves.

The Student's Column.

DESCRIPTIVE GEOMETRY.—XIII.

Through the point *c* draw a straight line passing at given distances from the points *a* and *b*.

THIS problem will test the student's capacity of realising in his imagination what our drawings mean in space, for unless he succeeds in doing this, it is hopeless for him to try to follow our diagram.

We must first consider that all the points that are at an equal distance from a given point, *a* or *b*, belong to the surface of spheres of which the points *a* and *b* are the centres, and the given distances are the radii. We conclude therefore that the line we have to draw will be tangent to both these spheres. The lines passing through a point and tangent to a sphere form the surface of a cone; the line required is therefore at the intersection of the cones, which have *c* for apex, and envelope respectively the spheres round the centres *a* and *b*. (See fig. 67.)

If we make two auxiliary elevations, the one by taking the line $a^h b^h$ for $L^1 T^1$, the other with $b^h c^h$ for $L^{11} T^{11}$, we shall have on these elevations the sections of the two spheres; and the tangents to these circles, such as $c^h m^h$ or $c^{h11} m^{h11}$ are the outlines of the cones we have spoken of above; c^h and c^{h11} are the two elevations of the same point *c*, therefore, if we make $c^{h11} m^{h11}$ equal to $c^h m^h$, when the lines in space *c m* and *c m* rotate round their respective axes *a c* and *b c* the points *m* will meet. The point m^{h11} rotates in the plane *P* perpendicular to *a c*, the point m^{h11} rotates in the plane *Q* perpendicular to *b c*, therefore the point *m*, where they meet, will be on the line *d e* intersection of the planes *P* and *Q*. The meeting of the traces P^h and Q^h gives us d^h ; thanks to auxiliary horizontal sections *I* and *K* by plane

R we find e^h ; we know that d^h and e^h will be on P^h . If we turn down the plane *P* round its trace P^h we shall get the circle described by the point *m* in rotating round the axis *a c*, and also the line of intersection $e^h d^h$ of the

vertical plane, which contains the trace P^h . The intersection of the line $e^h d^h$ with the circle gives us the points $x^h y^h$; we find the projections of these points in $x^h x^v$ and $y^h y^v$, and both the lines which join *c* to *y* or *c* to *x* satisfy the conditions of our problem, which has in this case two answers. The student can easily see also that there would be but one answer, if the spheres were tangent, and no answer if the spheres did not touch one another. (See fig. 68.)

Draw a line through a point *O*, and passing at given distances from two lines *a b* and *c d*.

The students who will have been able to master the preceding diagram will find no difficulty with this problem. If we suppose two cylinders having respectively *a b* and *c d* as axis, and the distances given as half diameters, the line required is bound to be tangent to both those cylinders, and, therefore, it is the line formed by the intersection of two planes, *R* and *S*, passing through the point *O*, and tangent to the above cylinders.

In the diagram fig. 69, we have assumed the points *a* and *c* to be in the plan, and the heights of *b* and *d* to be known. We take $a^h b^h$ as $L^1 T^1$, and draw the traces of a plane *X* perpendicular to *a b*. We project the point *O* on that plane *X*, which we turn down on the plan with the projection of *O* thereon, which comes in O^x (this operation is identical to the one we have already seen in fig. 66). We make $o^x t^x$ tangent to the base of cylinder round axis *a b*; the plane *R*, which contains the line $O O^x$ and $O^x t^x$ is tangent to the cylinder, we get its trace, R^h , by joining β trace of the line $O O^x$ with a trace of $O^x t^x$, which is, of course, in the point where the line $O^x t^x$ crosses X^h . In the same way we find S^h the trace of the plane tangent to cylinder round axis *c d* and the point *m*, where the traces X^h and S^h meet, is a point of

Fig. 67.

planes *P* and *Q*, in which the distance $e^h m^h$ is equal to βe^h , and $d^h m^h$ is equal to $d^h \beta^h$, for both the plane *P*, which contains the points *c* and *d*, and the plane of the plan, which contains the projections e^h and d^h , are perpendicular to the

Fig. 70.

the line required, which is, therefore, the line *cm*.

Draw a line parallel to a line *ef*, and passing at a distance *a* from the lines *a b* and *c d*.

We project the cylinder of axis *a b* and radius *a r* on the plane *X*, perpendicular to *a b*. Taking *a b* for *L T*, we draw *X c* and *X d* the traces of the plane *X*, and then turn down the plane *X* so as to have the circular base of the cylinder *a b* drawn thereon. Through the point *b* we draw a line *b p* parallel to *ef*, the point *p* where this line penetrates the plane *X* will be found on the turned down plane in *p'*. The plane *P*, tangent to the cylinder and parallel to *ef*, will be parallel to the plane which contains the lines *a b* and *b p*, of which *a p'* is the trace on the plane *X*; where *P'*, the trace of the plane *P* will be parallel to *a p'*. *P^a*, the trace of the plane *P*, on our plan passes through *β*, trace of the line of the cylinder along which the plane *P* is tangent, and passes also through *a*, where *P^a* cuts *X b*. By a similar operation on cylinder round axis *c d* we get *Q^b*, the trace of the plane tangent to the second cylinder. The point *m* at the intersection of *P^a* and *Q^b* belongs to the line *l* required. *l* is parallel to *ef*, and the elevation of *l* will be parallel to the elevation of *ef*, whatever elevation plane be selected. (See fig. 70.)

RECENT SALES OF PROPERTY.

Table with columns for property address, agent name, and price. Includes entries like 'Maida Vale-15, Clarendon-gardens, 63 years, ground-rent 10s.' and 'Hammersmith-11 and 13, Chapel-street, 29 years, ground-rent 6s.'

Table with columns for property address, agent name, and price. Includes entries like 'Stoke Newington-17, Gainsborough-road, 74 years, ground-rent 6s.' and 'Marylebone-36, George-street, 9 years, ground-rent 12s.'

MEETINGS.

Table listing various meetings and societies. Includes 'St. Paul's Ecclesiological Society - Visit to Merton Abbey and the Churches of Merton and Morden. Papers by Mr. S. W. Kersey, F.S.A., and Mr. Arthur J. Style.' and 'Royal Institute of British Architects - Fifty-first Annual Meeting.'

Miscellaneous.

Newbatle. - Two Munich stained-glass windows have just been erected in Newbatle Church, Dalkeith, in memory of the late Mr. Craig, and representing the two acts of Charity, Feeding the Hungry and Teaching the Young. The artists are Messrs. Mayer & Co.

Shortcomings of the Factories Act. - While it is not to be expected that the business of factories and workshops will go on without a measure of danger from accident and illness, the last return presented to the Home Office on this subject shows that the minimum of avoidable mishap is still far from being attained. A large percentage of reported cases of accident is evidently due to carelessness on the part of employers and employed. Among these are such as arise from insufficient fencing of machinery, from hurry in piece-work, and from the regrettable practice of entrusting the cleaning of machinery to young boys or girls. A part of the report of special interest to the sanitarian is that which deals with the atmosphere of work-rooms. Interesting facts are communicated with respect to overcrowding, and the varieties of trade phthisis which are apt to follow the inhalation of many kinds of dust-laden air. Of equal or even greater public importance are the statements contained in this return with reference to the condition of the class known as "sweaters," who supply the market, particularly in the clothing trade, with work done in their own homes. A house-to-house visitation by the Factory Act inspectors during 1884 has further proved the powerlessness of that Act either in controlling working conditions or in improving unhealthy domestic surroundings. The Act, indeed, was not meant to extend to the above-named body of operatives. We find, accordingly, that of 1,478 such workrooms visited by the inspectors, 734 were exempt from their jurisdiction in all respects, while 367 were equally free from their sanitary control, though subject to that of the local authorities. - The Lancet.

Crown Lands and Street Improvements. At the last meeting of the Metropolitan Board of Works a report was presented by the Works and General Purposes Committee, reporting, for the Board's decision on the subject, the circumstances relating to the claim of H.M. Office of Works, &c., in respect of Crown property in Hemming's-row and St. Martin's-place, required for the Charing-cross to Tottenham-court-road improvement. Mr. F. H. Fowler, in bringing up the report, stated that for this property H.M. Office of Works demanded 57,000l., but the Superintending Architect had valued it at 53,000l., which he considered a liberal valuation. The Commission of Works had refused to allow the matter to go to arbitration. Mr. Driver, as an independent authority, had been called in by the Board, and had put the value on the land at 50,000l. It was well that the public should know that the Government was standing in the way of this important improvement being carried out. Mr. Shepherd moved an amendment to the effect "That the solicitor be authorised to settle this matter on the terms specified in the committee's report, or on the best terms that he can obtain for the Board." Mr. J. Jones seconded this amendment, which was carried by twenty-five votes against fourteen, and subsequently put as the substantive motion, and adopted.

Southampton. - The new Primitive Methodist Chapel in South-front, Southampton, was opened on the 7th ult. The style of the building is Early English. It is built in red brick with stone dressings, and is lighted from the front and back walls. The front elevation has buttresses with pedimental cappings, with roll mouldings, and filled in with trefoil sinkings, and the front gable is finished with splayed stone coping and pointed stone turrets and ornamental metal terminals. The front is also filled in with a large four-light pointed and cinque-folled window, having hollow splayed mullions and jambs and tracery. This window has on each side of it one long two-light window, with moulded tracery jambs and mullions, and is relieved in length with intermediate stones with sunk panels and quatrefoil sinkings. The window arches are of stone, with hood-mouldings and carved terminals. The designs were prepared by Messrs. Korridge & Sons, architects, of Wisbeach, and the building has been erected under their superintendence, assisted by Mr. Butt, who has acted as clerk of the Works. Mr. Henry Wyeth, of St. Andrew's-road, Southampton, was the contractor. The contract price was 2,500l.

Twiggworth (Gloucestershire). - A three-light Munich stained glass window has just been erected in the parish church of Twiggworth, Gloucestershire, representing Our Saviour Preaching on the Mount. The artists are Messrs. Mayer & Co.

The "Black Autocopyist."—This apparatus, which has lately been considerably improved, affords a very simple and cheap means for the reproduction of documents, circulars, plans, sketches, designs, music, &c. The work done is similar in appearance to lithography, but neither stone nor press is required. The apparatus is light, and, therefore easily portable, and by it from 100 to 150 good black copies can be obtained in lithographer's ink of anything written or drawn with an ordinary pen on ordinary glazed paper, using the special ink provided, which is not only as fluid as the usual writing-ink, but also quite adapted for the use of etching or ruling pens, &c. Tracing-cloth is likewise exceedingly suitable for use. The *modus operandi* is as follows:—One of the prepared parchment sheets is moistened by simply spreading it on the frame of the apparatus and pouring some water on to it. After a few minutes the water is poured away, and the sheet fastened down on the frame and stretched perfectly tight by simply displacing two rollers which are underneath. The original is now placed on the sheet, on which an absolutely correct negative will at once appear. When passing the printing roller over the sheet the latter will, similar to the lithographic stone, remain quite clean, with the exception of the negative, which will immediately take the printing ink, and, in its turn, render it to the sheets of paper placed upon it, thus producing clear black copies of the sketch or handwriting, with a precision only to be equalled by that of lithography.

Liverpool Engineering Society.—The usual fortnightly meeting of this Society was held at the Royal Institution, Colquhoun-street, on the 22nd ult. The President (Mr. W. E. Mills) in the chair. A paper by Mr. W. Goldstraw, entitled "The Relation between Engineering and Architecture," was read by the author. The relations between engineering and architecture are, on a reduced scale, the relations between science and art. Engineering may be said to be that entire system of knowledge and skill which comprises all mechanical pursuits so far as they supply the material wants of men. Architecture, or the art of ornamental and ornamented construction, as applied to buildings, is the development and refinement of an important branch of engineering. They were both formerly practised by the same persons, but have become separate pursuits on the modern principle of the division of labour, and the requirements of science have made it difficult to follow both professions at once with success. It is desirable that the engineer should be more of an architect and the architect more of an engineer. At the same time the two pursuits should be kept even more distinctively separate than at present. But whilst the engineer or the architect practices his special calling only he should have a considerable knowledge of the other profession. Indeed, as both avocations are concerned with building, it would probably be a successful arrangement sometimes for an engineer and an architect to join in partnership. By this means if the work done were of good quality, they might get many commissions which either of them by himself would fail to secure, or would imperfectly carry out. In such cases the competing professions and the public would be mutually benefited.

York Architectural Association.—On the 23rd ult. the concluding meeting of the Association took place in the saloon of the Victoria Hall, Mr. Wm. Hepper, V.P., in the chair. There was a large attendance. The first subject which came under consideration was the scheme for decreasing the number of churches in York, and Mr. Geo. Benson, Grad. R.I.B.A., moved a resolution to the effect that the Association strongly protested against the proposed demolition of ancient ecclesiastical buildings as scheduled by the City Ecclesiastical Parish Boundaries Committee. Mr. W. Hepper seconded the motion, and it was agreed to unanimously. Mr. B. Priestley Shires, honorary secretary, afterwards delivered an able address on "Theatres, their Planning and Construction." A discussion followed, and a hearty vote of thanks to Mr. Shires for his address was adopted.

Female School of Art.—We are asked to mention that Her Royal Highness the Princess of Wales has graciously consented to be present at the Bazaar in aid of the Extension Fund of the Female School of Art, Queen-square, on the 26th of June next.

Overhead Telephone and Telegraph Wires.—The evidence that is now being placed before the Select Committee of the House of Commons engaged in inquiring into this subject points conclusively to the necessity of legislation for the control of the wires. The rate at which the number of overhead wires has been increasing was shown in the evidence of Col. Haywood, Engineer to the Commission of Sewers, who said that the increase had already become so great in the City that the wires now constituted a grave public nuisance. To show the number of wires stretched across the streets, he stated that there were 320 over Moorgate-street; 40 over Coleman-street, 312 Leadenhall-street, 240, Fenchurch-street, 160; and Queen Victoria-street, eight cables and 408 wires. At one spot in Fleet-street, viz., at Ludgate-circus,—there were to be counted two cables and 142 wires; across King-street there

were six cables and seventy-four wires; and over Cannon-street seven cables and 360 wires. Over some of the streets of the City there were something like from 1,200 to 1,500 lines a mile. With such evidence as this before us, and from the certainty that telegraph and telephone wires will be still more numerous in the future, it seems absolutely necessary to put them underground. We cannot, however, agree with the proposal that the expense of carrying out this work should be borne partly by the local authorities; in other words, by the ratepayers. The public might just as well be expected to contribute towards the expense of replacing level crossings on railways by bridge because the former are dangerous. What appears to be necessary to be done in the overhead wire case,—and done quickly, too,—is to pass an enactment forbidding private companies to erect any more such wires.—*Iron.*

Mowlem & Co., Grosvenor Wharf, Milbank	5,311	13 11
Turner & Son, Stanley Bridge Wharf, Chelsea	5,235	7 0
G. G. Ratty, Bromley-by-Bow	4,929	10 8

* Accepted.

For the erection and completion of a dwelling-house, No. 7, Ford-street, Glid Ford, for Mr. H. Roberts. Mr. G. A. Dunsage, architect:—

Oldrey	£485	0 0
J. G. Richardson	465	0 0
Steel Bros.	458	0 0
Johnson	441	0 0
Stewart	383	0 0

For alterations to bar-fittings at the Perseverance Tavern, Lupus-street, Pimlico, for Mr. McCallingham. Mr. Geo. Treacher, architect, 23, Carter-lane, St. Paul's:—

Ellis & Co.	£236	0 0
Turtle & Appleton	270	0 0
G. T. Williams	260	0 0
J. Beale	259	0 0

For rebuilding the Rum Punchon Public-house, Upper Whitcross-street, for Mr. Cain. Mr. Geo. Treacher, architect, 23, Carter-lane, St. Paul's:—

Lidstone	£2,625	0 0
Waddington	2,323	0 0
Turtle & Appleton	2,274	0 0
Schurmer	2,069	0 0
Jackson & Todd	2,045	0 0
J. Beale	1,920	0 0

For the erection of wind-screens, Bournemouth Pier, Bournemouth, Hants, for the Bournemouth Improvement Commissioners. Mr. R. W. Perrigne Birch, engineer. Quantities by Messrs. Curtis & Sons:—

Crook, Southampton (accepted)	£2,088	0 0
Jakes	£8,650	0 0
Benham	6,200	0 0
Berry	6,250	0 0
Fraser & Fraser	6,159	0 0
Hent & Son	5,975	0 0
May	5,800	0 0
Kirk & Randall	5,120	0 0

For reinstating premises damaged by fire, adjoining the Crooked Biller Tavern, Shadwell, for Messrs. Drew & Son. Mr. William C. Livermore, architect and surveyor:—

Nicholls	£210	0 0
England & Thompson	183	10 0

For repairing and decorating the Public Hall, Hastings, for the Hastings Assembly-room Company. Mr. Arthur Wells, architect, 27, Chancery-lane, and at Hastings:—

F. Foster	£136	0 0
A. Vidler (accepted)	120	0 0

For alterations and additions to stabling, fern buildings, &c., at Houlshelm, Bromley, Kent, for Captain Finch. Mr. Alfred J. Hopkins, architect, 10, Berners-street, London:—

G. & F. Penn, Pembury	£268	15 0
M. Tully, Tudeley, Kent (accepted)	229	0 0

For the restoration of the parish church at Oldbury-on-Severn. Messrs. Waller, Son, & Wood, architects, Gloucester:—

D. C. Jones & Co.	£2,289	0 0
J. Roach & Sons	1,944	0 0
A. King	1,888	0 0
B. Burton	1,663	0 0
J. Wilkins	1,640	0 0
Restall & Son	1,639	0 0
Wall & Hook	1,640	0 0
J. E. Davis	1,495	0 0
T. H. Lewis	1,447	0 0
C. Gyde (accepted)	1,421	0 0

For painting and decorating interior of Constitutional Club, Bedford-street, Exeter, under superintendance of Mr. Getavius Ralling, architect:—

Jno. Algar, Gandy-street	£145	0 0
Edwin Algar, South-street (accepted)	119	0 0

[Architect's estimate, 145.]

Congregational Church, Croydon.—Messrs. S. Belham & Co., of 155, Buckingham Palace-road, write to point out that the list of names for this building, in last week's Builder, by some mistake their name appeared as "Pelham, 10, 293/," &c. It should have been Belham, S., & Co.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 48, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.

R. B. Paris.—C. & C.—A. I.—F. J. C.—M. & C.—A. N. & C.—T. E. K.—C. E. G. H.—R. R. B.—T. R. H.—E. J. T.—E. & W.—C. B.—A. F.—C. J.—W. & C.—W. (Bank)—B. & W.

All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond mere news items) which have been duplicated for other journals, are NOT DESIRED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under 4s. 6d. Each additional line (about ten words) 0s. 6d. Terms for series of Trade advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

REVIVATIONS WANTED. FOUR Lines (about THIRTY words) or under 3s. 6d. Each additional line (about ten words) 0s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY. * Stamps must not be sent, but all small sums should be sent by Cash to Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

PREPAYMENT IS ABSOLUTELY NECESSARY. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the latter OFFERS ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY mornings.

PERSONS Advertising in "The Builder," may have Reprints addressed to the Office, 46, Catherine-street, Covent-garden, W.C. Fees of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied sixpence from the Office to residents in any part of the United Kingdom at the rate of 15s. per annum, PREPAID. To countries within the Postal Union, 25s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 48, Catherine-street, W.C.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [Adv.]

Bath Stone. ALL DESCRIPTIONS OF BEST QUALITY. PICTOR & SONS, BOX, WILTS. [Adv.]

Doubling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doubling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, No. 10, Craven-street, Strand, W.C. [Adv.]

Doubling Free Stone For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke - under - Ham, (Ground or Lump), Ilminster. [Adv.]

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Adv.]

The Inventions Exhibition.

UCH remains to be done before the exhibition can be called complete, and probably its term of existence will be considerably advanced before all the now vacant spaces are filled with the exhibits which they are intended, and all which is now in process of arrangement has been marshalled into complete order.

In one sense this is, perhaps, hardly a disadvantage to the undertaking. Public interest, when it has exhausted its first phase and the novelty of the collection is beginning to wear off, will be kept up and stimulated by fresh developments. It must not be supposed, however, that the exhibition is by any means, even now, in so incomplete a state as some may have been led to suppose by the graphic accounts which one or two daily papers gave of the state of things a day or two previously to the opening. The great central avenue, devoted to fire-arms, railway plant, and "prime movers" is complete in its general arrangement, and so are a good many other portions. Our old friend, the London Street, has its shops full of goods, and, in some cases, busy with workers, and its appearance is wonderfully improved in regard to realism by the substitution of a paved roadway for the unfortunate boarded floor, of which we complained last year, and which gave to the whole so much the appearance of a built-up scene in a theatre. The cobble-stones are not there, it is true, in their uncompromising reality; a merciful consideration has been given to the feet of thin-booted visitors; but it is, at all events, a veritable street, with a gutter down the middle, not, fortunately, put to the practical uses of an open sewer, which it probably served in the time intended to be represented. The Old Street, however, is one of the lighter attractions of the show, which we are glad to see once again, but which has no relation to the real object of the collection, any more than the lanterns and fountains in the garden.

The first cursory inspection of the Exhibition will probably produce on many, as it did upon us, the impression that a great deal is there which has only a very doubtful apparent right to come under the head of inventions. Such classes of exhibits as the carriages, the musical instruments, and some others, appear in the main to be merely examples of good workmanship in the several classes of objects illustrated. A second inspection, however, somewhat

corrects this impression. A considerable number of articles which at first glance present nothing but what one is accustomed to see every day, turn out to have claims in the way of improvements, sometimes only apparent on investigation, which give them a right to the general title applied to the whole collection. And apart from this, we think it will be found by those who go there to take their pleasure sadly, and not for mere lounging, that the exhibition, like other good things, grows upon one as it is better known. There are great opportunities for becoming acquainted with the principle and the working of many things which, though in every-day use, few persons who are not specially concerned with them know much about; and in this respect there is perhaps more for the public to learn, and more of general interest, than there was in the "Healtheries." It must be added that there appeared to be a spirit of inquiry abroad among the visitors, and that there was a great deal more of evident interest displayed in many of the exhibits, and desire to become acquainted with their points and their working, at least in this first week, than we observed in the great collection of last year.

A considerable proportion of the exhibits, of course, do not come within our special line of subjects; of those which do we will speak in detail from week to week; in regard to some classes of subjects which are of special interest to our readers, it may indeed be better to wait a little until they are in a more complete state than at present. Meanwhile, we may give a brief sketch of the general contents of the exhibition and the plan on which it is arranged. There is something rather painfully incongruous in the fact that in this exhibition, supposed to be one of inventions for promoting the progress of mankind, the visitor, on first coming in from the principal entrance, finds himself in the midst of a set of objects of the highest and most splendid finish of workmanship, and many of them of the greatest ingenuity of construction, "all designed," as we heard a spectator remark, "for killing people." However, we presume it will be a good while yet before this feature of an inventions exhibition will have suppressed itself; and as long as there are guns, we quite agree with Mr. Ruskin that we had better have guns that will accomplish their intention in a satisfactory manner. The central object facing the entrance here is the 8-inch 12-ton gun from the Royal Gun Factory, Woolwich, a long tube in three thicknesses, suggesting the idea of a gigantic telescope, constructed entirely of steel, polished like a mirror, and not to be touched, if you please, since every touch of the hand leaves its mark on the polished surface. This is a gun with an inner core, on which are shrunk the

breech-piece and front hoop, and upon these the trunnion ring and a tier of breech hoops. An example of the core, slotted for the reception of the outer rings, is to be seen here. This large gun, with its complicated arrangements for loading and sighting, is a centre of great attraction; and next to this the attraction of this department seems to be the Maxim machine gun, probably the most compact and deadly little instrument ever invented for wholesale musketry-shooting, which feeds itself automatically as long as the string of cartridges supplied to it lasts, firing at any required rate per second; the operator, having once started the machine, having only to turn it about in the direction he requires by the brass handle on the breech. The steel barrel of the gun is encased in a water-jacket to prevent overheating from the friction of the bullets. In the same department of the Exhibition visitors may study the various forms of the Nordenfeldt, Hotchkiss, Gatling, and other guns, and the Whitehead torpedo, which, like the twelve-ton gun, impresses one painfully with the discrepancy between its beautiful finish and ingenuity, and the poor use for which all this ability of mind and hand has been bestowed.

One can look with the opposite feeling, fortunately, at the central object of the next group down the principal avenue, the splendid compound locomotive, the "Marchioness of Stafford," turned out by Mr. F. W. Wehh, from the Crewe workshops of the London and North-Western Railway. This compound engine is really, too, an "invention" of recent date, not a mere specimen of work. Its special feature is a third cylinder in the centre of the engine, between the leading wheels, of larger diameter than the other two outside cylinders, and which works at low pressure with the exhaust steam from the two ordinary high-pressure cylinders. A cynical and heretical engineering critic remarked, "it is not only so ingenious, but it does quite as well as an ordinary engine"; but this was more witty than true. It means saving steam and, therefore, fuel; but it also gets the advantage of the grip of a double set of driving-wheels on the rails without the disadvantage of connecting-rods, which have a great tendency to work loose, and the action of which is only absolutely perfect when the circumference of the two sets of wheels is absolutely identical; an ideal perfection seldom attained. Here the ordinary cylinders, which are set a good way back on the engine, drive the back pair of wheels, and the low-pressure cylinder drives the front pair; and four of these engines are now working the London and North-Western Railway Scotch expresses, and taking them up the heavy incline at Shap without the assistance of an extra engine,

which has never been done before. In some positions of the pistons the engine is apt to "jib" a little on first starting, but the drawback is but slight. The finish of this engine, put together as it is "like a watch," is something to be enthusiastic about, and as an example of perfection of workmanship for an important end, we should be disposed to call it the central point of the Exhibition. Among important things in the railway plant department are several contrivances for automatic coupling, a matter which, in the case of goods trains, means, be it remembered, not merely convenience and saving of time, but of human life; for the category of fatal accidents from being crushed between or run over by wagons, in getting between them to couple or uncouple them, is far larger and more lamentable than the general public are in the least aware of. Of three of these inventions which we noticed in passing, that of Mr. Roe seems the most complete and simple; it may be described as a couple of iron loops on the two opposed ends of the wagons, one of which, on the wagons being pushed together, slides on the top of the other and drops into a hook at the back. Difference of height in the drawbars (within ordinary limits) is of no consequence, as whichever shackle is uppermost slides over the other one, and the hook is the same on both wagons. The Brocklebank coupling is nearly on the same principle, but does not seem to us quite so strong or so sure in its hold as the other. There is no question that railways ought to adopt something of the kind without delay, for the list of killed and wounded in shunting operations is at present painful to hear of, not to speak of the waste of time and stoppage of traffic by the present clumsy system of coupling wagons.

Those who are curious about railway matters will find in another part of the exhibition a very pretty working model of Professor Fleming Jenkin's telpherage railway, which is, perhaps, destined to be an important agency in the cheap conveyance of goods; the model shows a train of engine and carriages running balanced on central wheels on a wire, the load hanging below and keeping the running carriages balanced. But to return to the central avenue: the western portion is occupied, as we before said, by the class of machines generally designated as prime movers, or, in mill phraseology, "the power," for setting in movement machines for other purposes. In this department may be studied the making of engines and portions of engines, water motors, the Westinghouse brake (the practical operation of which is in constant display, both on the cylinders of the actual size, and on model wagons which are pushed along the rails and brought to a dead stop on releasing the pressure). Professor Fleming Jenkin figures with another exhibit here, called "nest gearing," a system of gearing "by which power is transmitted by rolling friction between drums so arranged as to bring no pressure on any bearing." To the right of this end of the central avenue is a large space, behind the narrow alley of "Old London," devoted to machinery for electric lighting, on which we can only here "look and pass." The Queen's Gate, further west, is occupied by "naval architecture" and carriages and bicycles. The carriage department conveys the impression, on a cursory glance, of being a good deal occupied by a mere show of typical models of carriages (there may be more than this when we have time to look for it); but the naval architecture department looks like business, and is occupied not only with mere models of craft, which are charming things to look at, but do not teach anybody very much, but with a great number of exhibits showing improvements in rigging details, gearing, and so on. Going north, parallel to the Aquarium, we find the West Gallery half-occupied by "Machine Tools and Machinery," and this section also, including such things as milling-machines, cutting-machine-tools, wood and stone working machinery, is a thoroughly business part of the exhibition, and likely to prove most attractive to those (who, we hope, will be many) who will go to the exhibition to learn something. In the

West Annexe is to be found hydraulic machinery, prefaced in the catalogue by a short dissertation from Sir William Armstrong. We may here observe that the special prefaces in the catalogue, all by good men, are of no little interest and value, as giving the general outline and bearings of each subject for those to whom it may be a new study. Among the exhibits may be named portions of hydraulic lifts for the Mersey Tunnel Railway, each lift capable of raising eighty to one hundred passengers. The remainder of the West Arcade and the West Gallery adjoining, are occupied by textile fabrics, of which more anon.

In the West Quadrant, connecting the galleries with the Albert Hall, will be found examples of indiarubber, cutlery, and pottery and glass, and in the Eastern Quadrant exhibitions of leather-work, and the lighter subjects of clothing and toys. Coming down the eastern side of the buildings, we find in the outer line of galleries the subjects of fuel and furnaces (which have been illustrated in this part of the building in so many exhibitions that one has got quite used to the appearance of the place), and, occupying a larger space, that at present highly important subjects of "Gas and other illuminants." On the inner line of these East Galleries comes China, which certainly appears to us to be rather at present a remnant from the Health Exhibition; at least, the general aspect of the rooms is wonderfully similar. South of China the same line is occupied by paper-printing and bookbinding. The *Graphic*, *Illustrated News*, and some other journals have established printing presses here, besides the printing machinery which is exhibited on its own footing, and which is various and will be of much interest while the majority of the machines can be got at work, as we suppose they will be. In this part of the building the uninitiated visitor may trace the process of a zinc block from the artist's original drawing, through the stages of photograph, photograph on zinc, states of plate after five or six acid baths, and the complete plate mounted on wood for printing. Here also the architectural draughtsman may interest himself in what we understand is the new invention of the "Lithoplate Company," by which a calcareous deposit of the same nature as lithographic stone is produced on a metal plate. The great advantage is the saving of cost of storage space occupied by, and labour expended in moving about, the heavy stones used by lithographers; and, of course, there is the consideration that the supply of the stone may not be unlimited. The matter seems well worth the attention of lithographers and draughtsmen.

The East Annexe, within the line of the last named gallery, is supposed to include "Food, cookery, and stimulants," we presume for theoretical study only. In the South Central Gallery, running east and west parallel with the London Street, are grouped furniture, jewellery, clocks, philosophical instruments, and chemistry. Of the foreign galleries, which occupy most of the space between this and the Central Gallery, one can only say that they appear to be, at present, nearly waste spaces. The Central Gallery takes the musical department of the Exhibition, and is well filled and in good order, but on the whole it seems to have less claim to the general title of the Exhibition than any other portion. Numbers of musical instrument makers, especially pianoforte makers, have collected show specimens of their make here, but we imagine that only in a very few will be found anything beyond good examples of the ordinary products of the trade; not inventions as generally understood. Organs of considerable size by various makers, known and unknown, are to be found, and each claims to have some patent speciality, but it is only a halfpenny worth of bread to all the sack. Among the pianofortes there are some few new ideas. One which we noticed is "Blüthner's" "aliquot scaling." We do not see the sense of the title, but the contrivance itself is ingenious and worth attention. It consists in the addition, above each group of three strings which are struck by the hammer, of a fourth string tuned an octave higher and not struck, but merely

left free to vibrate, and reinforcing the harmonics of the main strings. This deserves mention as a practical application of the doctrines of Helmholtz, and of the modern investigations which he and Professor Tyndall and others have made in regard to the physics of musical sound.

Finally, Agriculture and Horticulture are represented in the South Court, south of the Central Avenue. The main entrance hall from the Exhibition-road has been redecored by Messrs. Gillow & Son, with good effect. One other feature connected with this Exhibition must not be forgotten in this general walk round. The covered way which the District Railway have had made from their station to the Exhibition is admirably carried out, lined with white glazed bricks, and lighted by electric light. It is one of the most valuable adjuncts for public convenience and comfort which we ever knew a railway company to undertake. It is quite worth the penny charged for its use, and we congratulate the Company on the manner in which they have carried out the work, in the face of the foolish opposition and outcry which was made about it.

ARCHITECTURAL STYLE.

BY EDWARD J. TAUNER, LECTURER ON THE HISTORY OF ARCHITECTURE AT THE ARCHITECTURAL ASSOCIATION.

GOOD deal is being spoken and written just now about the style to be adopted for the proposed Liverpool Cathedral, some advocating one style and some another. Surely this is quite unnecessary,—not to use a stronger phrase,—while the four selected architects are already preparing their designs and have, no doubt, quite made up their own minds on the subject; moreover, such a discussion lays them open to the chance of being twitted with the adoption of some of these gratuitous suggestions, should their designs contain any feature or arrangement bearing a more or less close resemblance to them.

While we hope that the successful architect may have the advantage of the best site that can be found,—a point which is quite open to discussion,—the eminent quartette of competitors may be safely left to work out their respective designs without interruption.

The public, however, who are airing their views on the subject of architectural style may, perhaps, be not unprofitably reminded of the essential meaning of the word "style."

It may present the matter in a new light to state a truism, namely, that there could be no such thing as style unless all ancient architecture had been modern when it was built.

The proof of this statement is the entire history of architecture from its beginning up to the opening of the present century, since which time certain past styles have been revived and initiated. For it will be found that the style of any previous period was the result of the knowledge then possessed applied to the fulfilment of the wants then felt, and that it is this very fitness of the buildings to their purposes, and the execution of them with the best materials and knowledge then at command, that constitute that which we admire under the title of "style."

To say, therefore, that any past style is entirely appropriate to a building to be erected in the present day is to admit one of two things:—1st, That our wants, materials, and knowledge coincide exactly with those that produced the particular style that we prefer, and no other (for no two past styles are alike); or, 2nd, that we do not admire that past style on account of its fitness to the wants, materials, and knowledge that produced it. The only thing left to admire is its abstract beauty; and this is the sort of admiration that we evince by imitating sometimes one style and sometimes another.

Moreover, we have been in the habit of imitating one style for Civil and Domestic, and another style for Ecclesiastical architecture,—a distinction that never existed, indeed, was scarcely possible,—in any past age, although

the ecclesiastical buildings were easily distinguishable from the civil ones.

The Renaissance, even, was a new birth of all art, and adapted itself to churches as well as to houses.

In selecting, therefore, as is so usual, the Gothic style for churches, and the Classic, or other styles, for civil and domestic buildings, we are doing something quite different from that which was done by those very people whose works we admire.

The reason generally given for adopting the Gothic style for churches is that they still have to fulfil the same requirements as did those which were built during the Middle Ages; but it is probable that at least 95 per cent. of our clergy would be shocked if a Medieval congregation were to rise from their graves, and, under the direction of their priest-hood, were to go through their services as of old. Indeed, these ghostly visitors would look about in vain for the numerous side altars which even the remaining percentage of our present clergy might like to use, but may not.

So far, therefore, as there are differences between modern and Medieval ritual, there should be corresponding differences between modern and Medieval churches, and, so far as such differences are frankly expressed in the buildings, the result is honest and modern.

Looking, next, at the mere appearance of the revived styles, we may ask,—Is modern Gothic as beautiful as Medieval architecture?

In the hands of such men as the late George Edmund Street it very often is; but that must be because his sympathies were so eminently Medieval, as shown by him in his civil and domestic buildings,—a fact which should be carefully borne in mind when taking a broad view of his architecture as a whole.

Is Modern Classic as beautiful as Grecian, Roman, or Palladian architecture?

In the hands of such men as the late Sir Charles Barry it very often is; but our modern Palladian architects have generally turned to Gothic for church work, and have shown therein a want of complete sympathy with their Medieval models.

Thus, many of our elder architects have gained special reputation as Gothic or Classic designers, and are too loyal to desert the correct purity of whichever style they have taken up; indeed, some will decline to touch any other.

Surely these purists must feel the pinch somewhere, however much they may ignore it. A Classic exterior presents many features that are uncalled for by our climate; while a Gothic interior disregards all those improvements in joinery which have been created and developed during the seventeenth and eighteenth centuries, and amongst which we as certainly feel "at home."

A great architect, who has unfortunately passed away, carried his treatment of Medieval style to an extent quite beyond ordinary sympathies; he whose vigorous genius and thorough devotion to the thirteenth-century we must admire or confess ourselves unworthy of his teaching. Yet few of us could feel quite at ease in a room whose walls, ceiling, and furniture are crowded with the details of construction and the flood of Medieval lore that William Burges poured over them. So complete were his sympathies that, in his perspective views, he would represent the inmates in thirteenth-century costume, in order to avoid a striking note of discord.

Those of us who had the advantage of working with him may indeed be thankful for the insight that he gave us into the very bones and marrow of Medieval art, a revival being far more instructive when thoroughly grasped than when superficially adopted; but it remains a rival and nothing more.

Probably the architect who first decided upon adopting and combining the vigour of the thirteenth century with the internal comfort and dignity of the eighteenth, is one whose striking disposition has kept his name out of the public papers, and whom, therefore, it could be indelicate to mention here; but we do started practice early in the 'sixties, when, perhaps, by his example, the tide of revivals

had begun to ebb, are thus set free from parties of Classic or Gothic purism.

Is any sudden leap into a Victorian style recommended or even suggested? Certainly not. Such a thing as the sudden formation of a true style has never been known, and is no more possible now than at any former time. Every style represents the survival of the fittest elements of its predecessors, with the addition of such improvements as were wanted. Our chief difficulty is the *embarras de richesses* that we have to select from, and all that is urged here is that we should select and harmoniously combine the individual features that are really useful to us, and reject the rest, instead of adopting the collective features that constitute any past style.

In an important recent discussion, the chairman of the meeting said that "Gothic would die hard,"—a needless observation, for there is no reason why the useful elements of Gothic should die at all. Probably mischief has been done by dubbing this modern development as the style of a certain reign, and thereby classing it amongst the revivals. In such cases there is danger of wild extravagance amongst thoughtless followers of fashion; but it is fair to say that the worst results emanate, not from architects' offices, but from the designing "departments" of builders who persuade people to do without architects, and of upholsterers who are not content to upholster, but who, having caught the infection of inglorious nooks, plan houses with an infinity of nooks and corners that are the despair of the dusting housemaid, and are only fit for a game of hide-and-seek; while they obfuscate windows with unnecessary stained glass and make "features" of every fitting.

The public will soon learn to discern these from the unobtrusive and refined buildings that many of our architects are producing. These contain evidences of having been built in this century, and in no previous one. They combine the refinements of Renaissance with the climatic advantages of Gothic, and thus constitute a modern style of civil and domestic architecture, now of about twenty years' growth, and fairly suited to our wants.

Having brought the subject to this point, the next question is whether any advantage is to be obtained by applying this modern style to our churches; thus repeating that which was done in all past ages, except that in them both branches were developed simultaneously.

There is no difficulty in proving that this was so as regards the Gothic styles, by a very short review of them. Beginning with the round-arched Gothic or Norman style, would any one have the slightest hesitation in calling the "Jews' House" at Lincoln an obvious example of this style? The form of the arches, the section of the mouldings, and all the details, are the very same that we find in hundreds of churches of the same period; yet no one would mistake this house for a church; the general arrangement of its façade being quite different from that required in a church. In the next style, the Transition from Norman to Early English, we may see, in the hall of Oakham Castle, couplet windows that we should assign to the period if found in a church, and yet there is a distinction between this hall and the somewhat later but similarly planned church at Skelton. In the fourteenth century Penhurst Hall presents window tracery clearly belonging to that period, yet a glance at the position and surroundings of these windows dispels the notion of their belonging to a church. Somewhat later examples present the externally square-headed windows that some people consider peculiar to domestic architecture, yet there is no want of examples of them in churches, Tideswell having even chancel windows of this form. In the fifteenth century, which, being the most recent of the Middle Ages, presents the largest number of surviving examples, the universal character of the details in all kinds of buildings extends not only to the stone and brickwork, but to the fittings and furniture, and yet bears evidence of fitness to the several purposes required.

No doubt, these numerous examples of fifteenth-century woodwork inspired the first

Gothic revivalists with the fashion and passion for Tudor dwellings that had all the weight of precedent wherewith to awe the public, who were therefore willing to pay the price of carved joinery, in order to be completely correct in their interior fittings, and it is probably to the cost of carrying Gothic work thus completely through a dwelling-house that we owe the escape to the more easily-worked mouldings of the eighteenth century for panelling, &c.

Thus a more modern and homely feeling has come to pervade the interiors of our houses; our windows have become square-headed or slightly-curved, instead of pointed; and, on going out of doors to see the effect, we have added a few more details of the modern manner, and so, by degrees, the dissolving view is changing to a domestic style of our own from the less suitable Gothic, and civil architecture is following suit.

Now, is there anything in the Gothic style equally or in any degree unsuited to our churches? Our leading church architects would appear to think not; for, although they have, like the rest of us, adopted the modern style for their civil and domestic work, they use Gothic in their ecclesiastical architecture.

Why is this? Probably the answer to the question is to be obtained from our clients. It is they who shudder when any wandering from precedent is suggested, and it is with them, and especially the clergy, that it rests to tell us fearlessly what they want, just as they would in asking us to carry out their ideas in the arrangement of a house plan.

It is said that the plan of the Greek Temple, that marvellous thing of beauty that appears in a complete form in the first known example at Corinth, was dictated by the priests, who then handed their instructions over to their architects to supply the requisite skill in construction and the eye for beauty of form.

Our clergy are specially deficient in the matter of painting and sculpture, screening themselves behind the advice of Mr. So-and-So, the eminent church architect (especially when they want to go a little "higher" than those who differ from them), and here Medieval archaeology is allowed to exercise full sway. The Medieval artists did not trouble their heads about archaeology,—we should know nothing about the costume of their day if they had done so. The subjects and the truths embodied in them of course remain, and the clergy should be responsible for the selection of them, as part of their teaching, leaving us to express them in our modern language by brush or chisel.

In matters of plan the clergy can surely know better than any one else what is suitable to their requirements.

There are some to whom the sermon is the chief event in the service. It is not for architects to say whether this is desirable or not; but, if it be, why do the clergy of this school so often make themselves and their congregation martyrs to a three-aisled Gothic church with neck-twisting side galleries? If they will instruct the architect to give them a good auditorium, as distinct from a lecture-theatre as are the respective purposes of each building, he will not fail to produce a suitable result. He will, probably, not altogether expel pillars, in the shadow of which a sinner can feel that he is in God's house, and pour out his soul unnoticed by the congregation.

Or the clergyman may like a large free open space, in the centre of which not the pulpit but the choir may be placed in the midst of the congregation, and all lift their voices in unison.

Others regard the mere presence in church for prayer, praise, and thanksgiving as sufficient; to these a large proportion of pillars and piers will be no objection.

There may be other views of church planning not yet dreamed of by laymen, but which the clergy might recommend as the result of experience; that is, by carefully noting the advantage and defects of every church in which they happen to conduct service. They might draw up an outline list of rules and fill them in at their clerical meetings, and avoid saying

a word to any architect on the subject while doing so.*

Many of these points are already laid down in the printed suggestions of the church building societies; but it seems to be now time to revise them, and to omit the advice to copy Mediaeval styles. Although this advice was the best that could have been given as a reaction from the Greek revival, it must have fostered the hyper-archaeological zeal for restoration which most people now admit to have been overdone, and which has led to such astonishing evidence as the following, given by a witness in regard to Westminster Hall. He defended the windows in the proposed restoration (or whatever word beginning with "re" should be employed), he admitted that they would be too small to light the rooms, and he suggested that they should be supplemented by unseen skylights! When we find this sort of advice gravely offered to a Committee of the House of Commons, it is high time to claim our liberty to build what we want in our own manner.

The model of the proposed rebuilding of the western adjunct to Westminster Hall opens up a new era in the art of restoration, and appears to exactly hit off what is required in that delightful study.

That the archaeological knowledge possessed by many architects and amateurs should be wasted, and bear no fruit, would be a thousand pities, and here we have the most legitimate means of displaying that knowledge and of affording profitable instruction to the public by showing them what any imperfect ancient building looked like at any particular past period.

No vast sums of money need be soaked in the greedy sponge of "restoration"; but a far more modest expenditure in canvas and paint, in the hands of such cunning artists as those who executed Mr. G. H. Birch's "Old London Street" and the model in question, will give all the necessary effect.

Let such models be prepared, under architects' advice, and be harmlessly applied to our unrestored churches throughout the land, and be left up for a few months and duly photographed, and a new branch of trade will have been started; while the buildings themselves may await in safety such solid repairs or additions as the actual wants of each case may require.

We know the delight of contemplating genuine old work, and the beautiful and honest manner in which the problems have been solved; we watch with deep interest the gradual changes from one style to the next; we are even more excited in noticing different styles in the same building, and in assigning to each its proper date, and we only want sufficient faith in our own day to leave to posterity an equally unmistakable stamp on our architecture.

Individual personal character there is in the churches of our best architects, and this would come out all the more strongly in the solution of fresh problems, while the setting of these problems would not drive clients to these few, but to any skilled architect who can work to instructions.

The clergy would, we trust, be too conservative to give up any well-established arrangement, and the architects would be too conservative to ignore the glorious lessons of the past, and they would do as their forerunners did, and not what they did.

Serious Fires in London.—To the destruction of the "Japanese Village" at Knightsbridge on Saturday last, we refer in another column. Another very serious fire occurred on Wednesday morning, in Oxford-street, when the extensive workshops of Messrs. Jackson & Graham were destroyed by fire.

* For example, has a clergyman never been deafened just before service, by the booming of the organ placed over the vestry? Has he never been unheard by those sitting in the side aisle under high roofs and separated from him by massive arcades? Has he never been blinded by the glare of a low west window when glancing up from his sermon? Has he never been rendered nervous by conflicting crowds in narrow passages on their way to and from the altar?

THE ROYAL ACADEMY EXHIBITION.

AS usual, on private view day, people were to be heard gibbering that this was "the worst Academy they had ever seen," a pessimist view which is repeated annually during the first week of the exhibition. The exhibition is, in fact, a good, but not a brilliant or a striking one. The absence of any work of the first importance by the President makes a considerable gap; and the presence on the line of an unusual number of utterly ridiculous paintings by certain old Academicians, who ought to be plainly told, even for their own sakes, that they are unking themselves and the Academy a laughing-stock, no doubt tend to intensify the ill-humour of the disaffected visitor. But there is plenty of good work, for all that.

Mr. Tadema has distanced all former achievements in painting the texture and lights on marble in his "Reading from Homer" (276), in which the figures also are of more interest and beauty than is sometimes the case in his works. The slight glimmer of transmitted light on the under-side of the marble seat, where its edge turns over, is a marvel of minute realism, a positive pleasure to look at, though one always feels a regret that the possessor of such marvellous technical power seems unable to infuse more spiritual interest into his paintings. However, there are "diversities of gifts." By the way, is the curve of the seat quite true, on the right, where it is intercepted by the reader and his chair. It does not seem to us that the two sections of the curve, if produced, would meet quite truly, a point for criticism in a painting in which technique plays so important a part.

Mr. Millais's principal work, "The Railing Passion" (212), is an admirable painting, a little deficient in interest. The dying ornithologist (or taxidermist is he? it is not quite apparent which), still admiring his birds, is pathetic with a sort of work-a-day pathos; the face of the old man looks as if it had somehow come out of the pages of Dickens; but the idea is somewhat prosaic for an important painting. The family grouped round his sofa include various figures,—a woman, young children, and an older girl,—painted in the artist's best manner; the whole picture is a little low in colour, the plumage of the dead birds forming the only decisive colour; and we may suspect that the final turn given to the subject, making the dying man a bird-fancier, was in order to get in some bright colour in this way. It seems pretty obvious that the immediate point and title of Mr. Millais's pictures are not unfrequently determined in this way, *a parte post*, and that the actual title of the picture is an afterthought; and that is hardly the way to produce pictures that will interest a spectator deeply.

How much stronger, for example, is the intellectual interest of such a picture as Mr. Orchardson's "Salon of Madame Recamier" (172), apart from questions of technique. Here there is a real concentrated effort to do a thing which is worth employing the best power of painting on, to make a remarkable phase of human society live again. There is a *raison d'être* for such a picture. There are many pictures, by very able painters, in the Academy which seem to have no *raison d'être*. Mr. Orchardson's is a large work in his peculiar manner, very effectively composed. The young hostess, in white, is seated on a sofa, conspicuous as the centre of a group on the right, whose attention is directed to her; these include Bernadotte, Metternich, and Fouché. To the left is another group, just sufficiently connected with the rest in regard to grouping, but severed in action and attention; a group conversing in a desultory manner together before taking their turn round the queen of the mansion. Among these are Lucien Buonaparte, Talleyrand, Brillat-Savarin, &c., and the calm face of Canova is seen in the background. Madame Recamier's manner and expression seem a little deficient in *esprit*. A quotation given in the catalogue speaks of "the repose of her manner," which is, perhaps, what the painter has aimed at, but we do not think her quite

a success. The character and individuality of the men are admirably brought out.

Sir F. Leighton's principal contribution is "Music, a Frieze" (344), apparently a companion to the composition entitled "The Dance," which he has previously exhibited. In the centre is a golden-robed Apollo under a canopy; various groups of singers and listeners recede from this on either hand; the colour of the whole is very rich and fine, more so than in "The Dance," but the plain thin column shafts, painted dark blue, convey to the architectural eye a rather incongruous suggestion of cast iron. Among the President's other contributions are a very pleasing half-length of a modern young lady (194), with, however, a good deal of idealising in the texture of the face, which, like others by the same hand, seems hardly made of mere earthly flesh, and a charming portrait of "The Lady Sibyl Primrose" (281), the little daughter of Lord Rosebery, whose sister is painted by Mr. Millais as "The Lady Peggy Primrose" (275); the two almost infantine figures make a charming pair, illustrative of the styles of two great painters in the treatment of children's portraits,—a human parallel and an artistic contrast at the same time.

Among the three or four nude studies of importance the finest, to our thinking, is, perhaps, the one which will be least looked at, partly owing to its less favourable position; this is Mr. John Collier's "Circe" (810), which shows the goddess seated on the grass with her back to the spectator and her arm round a tiger lying by her. In one sense the picture would be far more effective if the painter had put some more ideal surroundings than his ordinary scene of grass lawn and plantation; he should have conveyed the idea of a kind of enchanted land; as it is, he is too prosaic; it is as if one took a turn round the environs of an English country-house and came on a member of the family sitting naked on the damp grass with a tiger by her side. The situation is improbable and chilly; and there is no look of "Circe" in the side-face turned towards us. In fact, of course the picture is painted for the sake of showing the artist's power of painting a woman and a tiger; but why could not he call it "Woman and Tiger," instead of pretending to represent Circe, that wild conception of the old Greek mind, the realisation of which would demand the highest imaginative power a painter could put into his work? Apart from this, the figure is a remarkable success, both in drawing, colour, and that suggestion of the framework underlying the outer forms of the body, without spoiling their soft lines, which is the triumph of nude painting. It was for Mr. Collier's benefit, it will be remembered, that Mr. Tadema's "sculptor's model" was painted; and the older artist may be proud of his pupil. Mr. Poynter's large version of "Diadumené" (a name suggested by the fact that she is in the same attitude as the "Diadumenos" of Polykleitos, tying a fillet round her forehead), hangs in the centre of Gallery IV. (322), and is a monumental and almost sculpturesque figure, in the midst of very elaborate architectural surroundings. The figure itself is a model of realistic (not idealised) symmetry; the texture of the flesh a trifle hard, perhaps to emphasise the monumental idea and assimilate the figure a little with its architectural surroundings. We could have wished there were a little more interest and heauty in the face: it is a fine, a learned, but hardly a very attractive work; in this sense the smaller edition last year was perhaps superior to it. Mr. Calderon's "Andromeda" (295) seems evidently intended as a kind of companion to his "Venus" of the Grosvenor Gallery last year; it is a most bold attempt in contrasts of colour; on the right a dark blue sea, the very deepest blue that you possibly venture to paint the sea; then a great splash of the whitest spray, then the figure of Andromeda draped below the waist, and behind her white body a thick mass of dark hair blown wildly about by the same wind that blows the mass of spray up; the combination is truly a bold and striking one, and the head and figure very finely painted. Yet here, again, we miss what we really want

from a painter of an ideal subject. Mr. Calderon is far more ideal than Mr. Collier; but still there is nothing in the face of his Andromeda of the agony of the struggle between the fear of immediate and terrible death and consciousness of a great self-sacrifice; she might have been cut off by the tide while bathing, and looking out for a boat, except for the chains; so that the picture fails of what should have been its highest motif. This is a trifle, however, to the absurd incongruity of Mr. A. Moore's figure, called "White Hydrangea" (356). Except when the nude figure is palpably and obviously a study, it expects to be idealised, and many of Mr. Moore's pictures are purely ideal. But this figure is so exactly the type of a modern society young lady, and so exceedingly realistic in her tripping walk, that there is a kind of ludicrous impropriety about it; it is as if we were sitting in a rather æsthetic drawing-room, and the young lady of the house suddenly tripped in, with a little conventional simper on her face, and an unfortunate but entirely innocent forgetfulness of the fact that she had nothing on but her cap. But the climax of prosaic treatment of the nude is reached by Mr. Calderon in his smaller work, "The Woodland Spring" (940), which seems to represent a plump country girl who is catching cold by sitting out naked on the bank of a brook; and to this the artist appends Milton's couplet,—

"Such sights as youthful poets dream
In summer eve by haunted stream"!!

Do they really? If some painters were a little bit more of poets, they would know better than to perpetrate such absurdities.

One of the most powerful and successful paintings in the whole collection has been relegated to the last room, "The Norman Archipelago" (1,106), by Mr. Brett. The general character of this work will be understood when we say that it is one of the painter's large blue pictures; an expanse of sunlit sea with crags and islands in strong light; but though the type has been repeated rather often, the work seems to grow in power and completeness with each repetition. This picture is superior to "Britannia's Realm," of which it rather reminds one, in that it shows more delicate atmospheric effect in the distances; as a representation of what the painter means to represent, it is a splendid success, and in this kind of power Mr. Brett and Mr. Tadema alone can be paired together. Each is somewhat restricted in his range, each is completely successful within it, and both leave us in doubt whether it is better to have wider range with less perfect execution, or whether such perfect achievement is not enough to atone for a restriction of power.

One landscape alone by Mr. Alfred Hunt appears, and that badly hung; three, we believe, were sent, and when we look at some of the monstrous things by Academicians which occupy central places on the walls, and consider what Mr. Hunt's quality is, the fact of the refusal of two works by such an artist seems really nothing short of disgraceful to those concerned with the admission of pictures. The one painting by which this finest of our contemporary landscape artists is allowed to be represented is entitled "Bright October" (756), and is a scene in a lovely secluded glen, with pools of water; a scene which he has painted before, if we remember rightly, from another point of view. The picture has Mr. Hunt's usual refined and poetic feeling, and total absence of mere paintiness; but in the corner position in which it is hung, the light falls on it in such a way as to rob it of much of its lustre, and interfere with its delicate effects. Perhaps the only other work of the landscape order which we should class with that of Mr. Brett and Mr. Hunt is the powerful seapiece by Mr. H. Moore, "The Newhaven Packet" (533), so called for distinction, as the packet is merely a distant object, the subject being the "swinging waters" (the phrase is Matthew Arnold's) of the sea, shown in a style to which Mr. Moore has accustomed us, but which he has never illustrated better than in this work. The difference between Mr. Brett and Mr. Moore on the one hand, and Mr. Hunt on the

other, is that they each have one especial effect which they have worked up to perfection; Mr. Hunt's speciality is that he has no speciality in dealing with nature; his pictures are on no fixed model, and in this point he stands alone among many English landscape-painters since Turner.

We have adverted to the leading works of the year, and will mention briefly some others in another number.

ARCHITECTURE AT THE PARIS SALON.

ARCHITECTURE is represented at the Salon of 1885 by 169 artists, whose exhibits comprise 187 numbers in the catalogue. There were 162 exhibitors in this class last year, and, in 1872, just after the war, there were only 48. However insignificant in comparison with the paintings, this progress shows that here, as in other branches of art, the flood swells and rises continually.

This ascending movement, which generalises what was formerly only the small domain of a few, is most perceptible among the painters. Architecture is a difficult art, exacting varied kinds of knowledge and a special apprenticeship, which discourages young people from taking to it. It is almost a science; never an art of mere enjoyment. One cannot make architecture a pastime, though Paris swarms with amateur artists, for whom the clay or the pencil forms an innocent distraction, and whose supreme ambition is to figure in the Salon alongside of eminent masters.

Yet architecture demands, in reality, more imagination than other arts. It has not, like painting and sculpture, the resource of models and of the expression of special sentiments. Its guides are harmony, order, and taste; and, if endeavouring to express through certain forms the idea of the beautiful, it must combine and develop these forms according to precise rules and proportions. Thus it offers to the general public apparently dry and dull details, which leave them indifferent or even drive them to the galleries of sculpture or of genre for the dramatic interpretation of sentiments or facts interesting to the sight and perception. And this is why every year the rooms devoted to architecture, and which are always placed at the furthest extremity of the Salon, are isolated and deserted, while in an adjoining gallery loungers crowd around pictures whose superficial and sensational merit fills them with idle admiration.

As usual, monumental architecture holds an important place in the Salon, while private architecture hardly shows its head. This is easily understood, for the annual Salon tempts only the young architects. Those who have already made a name have no more leisure for entering upon useless combats, since they have attained the summit of their ambition. In this respect there is a great difference among painters, sculptors, and engravers, who, whatever their position of fame or notoriety, do not hesitate to encourage their young confrères by their emulation and example. In architecture, on the contrary, the artists who are already known, absorbed by their work and by the exigencies of their profession, desert the field; and, with some few exceptions, you will find nothing here but the works of pupils in the competitions in the "École des Beaux Arts" or the "Envois de Rome," which naturally have for their object monumental architecture, especially of the Classic variety.

These various causes, and the conditions under which the projects have been executed, explain the small number of the designs having relation to civil architecture in its usual application, we mean in the way of ordinary dwelling-houses, &c. It is with difficulty that we find here and there some restorations of old manor-houses rebuilt in a naive fashion, or some modern constructions without originality or style, almost all built for the same patron and revealing on the part of their authors a forced subordination to the vulgar taste of the proprietor.

One cannot too much encourage architects

who exhibit designs which are conceived apart from the conventions of the schools and out of the usual professional groove. This praise is merited by M. Auburtin, pupil of the lamented Constant Dufeux, who sends plans and elevations of a private hotel which is being built from his design as No. 36, Rue d'Assas; the brick façades are in the style of Louis XIII., elegant without pretension, well studied, and of good decorative effect. We do not like so much the villa which the same artist has constructed by the sea-side at Benzeval, the rustic over-ornamentation of which repeats itself pretty uniformly along all the Normandy coast.

It required rather more courage for M. Fivaz to exhibit, among such Classic surroundings, a project for a restaurant. The one of which we speak is to be erected in proximity to the Bois de Boulogne, in the most elegant quarter of Paris, and the architecture is gay and the aspect bright and cheerful, as it should be for that locality; which is why we give it a place in the very restricted catalogue of *édifices privés*. Here, however, is the essence of "private architecture," given us by M. Lemenil, in the plans and elevations of houses built for the "Compagnie des Immeubles" of the Monceau estate, Rue de Logelbach. If the interior arrangements are comfortable and well ordered for domestic use, one may, at least, criticise the architectural uniformity of the façades, all the mansions resembling each other in nearly every detail, an unpleasant sequel to what used to be called the *Hausmannisation* of the new streets under the Second Empire, so many rows of enormous barracks without character of any kind. This reproach is the more emphasised in consideration of the neighbourhood, which is one largely inhabited by artists, and distinguished for its happy and picturesque mixture of styles of all countries and epochs. Is not this, at all events, better than that cold, rigid, perspective of houses, all the same height, which gives such monotony to the important new streets of Paris?

Besides these essentially Parisian constructions, we may mention a design for a school, by M. Hugues, for the town of Azeu; the "Caserne de Sapeurs-pompiers" by M. Calnaud, and the design for a *lycée* by M. Bardon, who treats the building a little too much like a hospital.

Among the civil buildings exhibited, we may mention the new Palais de Justice constructed at Meaux by M. Camus, of which the interior dispositions are well conceived, but which externally wants amplitude and elevation. The Ionic order of the peristyle supports a poor entablature, behind which rises a meagre dome. The *Mairie*, which M. Bernard proposes to raise in the Tenth Arrondissement of Paris, on the site of the St. Lazare prison, deserves mention also. We do not like so much the design for a town-hall which M. Paul Normand has prepared for Chesterfield (England); and M. Rives's Theatre for Marseilles satisfies us still less, with its overgrown ornament and its façade smothered in sculpture.

As to the hot-baths establishment with which M. Depasse wishes to gratify the Pyrenees; as to the establishment for Baths on the Seine projected by M. Le Roy; as for (lastly) the Indo-Chinese architecture inspired by the Eden Theatre, which MM. Hugo and Roux wish to inflict on the "Association Internationale du Congo," we can only confess our inability to comprehend these "Fantaisies abraçadabrantes," without style, intention, or taste.

In the department of monumental architecture the exhibition is infinitely more interesting. In the centre of the first room there rises the large model of the monument to Gambetta, of which the *Builder* has already given a description. The rest of that room is in some sort consecrated to this leading work, of which the plans, sections, elevations, and mouldings have been drawn by M. Bouleau, the architect. The general appearance of it is of a grand character; though a little heavy, perhaps, the monument is very decorative in character, but the principal figure, of which this is the apotheosis, is in no way monumental, neither in aspect nor in costume.

M. Nenot, who exhibits his design for the monument to Victor Emmanuel, is the victim, or, we might say, the hero of a misfortune which has rendered him the greatest service in bringing him while still young into full recognition. It is well known that after having been chosen as the most worthy in the competition for the Victor Emmanuel monument, he was subsequently excluded because he was a Frenchman. But his design was purchased nevertheless, and M. Nenot exhibits it with the authorisation of the Italian Government to which it belongs. The design, according to the intention of the author, should have been erected in front of the Baths of Diocletian at Rome. It comprises a semicircular portico enclosing a triumphal arch which recalls that of Constantine, and which is surmounted by two quadrigas in bronze. The porticos terminate on each side in pavilions, also surmounted with quadrigas. At the centre of the semicircle, a column carrying the statue of the king rises over a basement adorned with statues representing the principal towns of Italy. Four fountains arranged in front of the porticos complete the decorative elements of the design.

In the same room, two projects by M. Fornigé attract special attention. The crematorium, which the Municipal Council wish to confer on Paris, is a design well studied, of a severe character, perfectly appropriate to the destination of the edifice. A surbase, decorated with arcades, supports a monument, the door of which opens between two immense bronze lamps. The upper portion is decorated with garlands and funeral wreaths, and crowned by a dome, on a surbase of masonry, with a tall pyramidal chimney on either side. The same artist exhibits a sketch for a monument of the Revolution of 1789, for erection in the Champ de Mars. It shows a large surbase, to which access is given by stairs on each face. At the four angles are equestrian groups, which form the terminations of a balustrade, with antique tripods at intervals. On the platform thus formed is a rounded drum or socle, adorned with statues, and the walls of which are clothed with bas-reliefs. On this is a circular loggia, open on the four faces, within which is the altar of "La Patrie." Each opening forms an arcade framed between obelisks, decorated with allegorical sculpture in alto-relief. The whole is crowned by a dome, surmounted by a group symbolising Liberty, Equality, and Fraternity.

The competition designs of the École des Beaux Arts, and the work of the students at Rome, as already observed, occupy a considerable place in the Salon. Among the first we find the designs for a museum of ceramic art, a subject which has not been really well treated except by M. Bezemenet. It is the only one which gives the true character of such a work, in a manner simple, intelligible, and appropriate to the subject. With the exception of the work of M. Pied, which displays the conscientious work of a thorough student, the rest are pretentious and affected in style.

The competition opened by the city of Lille for a Palais des Beaux Arts is also represented here by a certain number of designs, among which we may mention especially that of MM. Chancel and Bonnier, which received the first premium. The palace which they present to us has a grand appearance, and the principal façade is of very fine character, with its two angle pavilions containing the great staircases, its bas-reliefs, its centre ornamented with caryatides and surmounted by a pediment with sculpture in high relief.

Among the works exhibited in,—or, we might rather say, banished to,—the interior gallery of the Palais de l'Industrie, we may remark a series of designs submitted in the recent competition for the Exchange at Amsterdam. That of MM. Larabrie and Stevens seem to us the only exception to a collection of mediocrities.

In regard to foreign drawings, a Belgian artist, M. Jean Baës, exhibits a view of the *Salle de pis Perdue* of the Palais de Justice at Brussels. This is a heavy architecture, crushed by a colossal dome and overlaid with ornamentation, but the perspective view is cleverly

executed. The same artist sends a set of designs which cannot be passed over in silence, though they enter rather into the category of water-colour drawings, and appear a little out of place among the architectural works. M. Baës brings before us the principal bell towers and turrets of Belgium. His style is free and pleasing, as well as interesting, from its individuality. We may notice especially one drawing in which a tower rises above a sea of red and grey roofs, treated with great delicacy of colour. While speaking of this class of work, we may mention the steple of Toskoff, by M. Mayeux, who has depicted with a loving hand the lace-like details of the tower forming a silhouette against a twilight sky.

Classic art and archaeological restoration are represented at the Salon by some very remarkable works. Thus M. Lefort, Architect-in-Chief to the Department of the Lower Seine, gives us a restoration of the Palais de Justice at Rouen, of which the details are treated with much learning and absolute respect for the primitive style of that admirable monument. We notice also the restoration of the arch of Titus by M. Gérault, pensionnaire at the Villa Médicis, the drawings by M. Blavette having for their subject the restoration of the Pantheon at Rome in the reign of Augustus, and the work sent from Rome by M. Guatezous. This young artist, who has already obtained the second "Grand Prix de Rome," sends two projects. The first, which is the property of the State, reproduces the central portal of the Church of St. Maclou at Rouen, the details of which are very ably drawn; the second, executed for the competition for the diploma of the École des Beaux Arts, represents a "Salle des Séances" of an Institute. This is also a very interesting design, with an imposing façade, a little spoiled, to our thinking, by being overweighed with a somewhat too ponderous dome.

We ought to make special mention of the *envoi** of M. Laloux, a pupil of M. André, who carried off the "Prix de Rome" in 1878. He exhibits ten drawings of the restoration of the Altis at Olympia. This is a really remarkable piece of work, showing both learning and imagination, and shaded with the hand of a master. The plan, executed from a comparison of the ruins with the description of Pausanias, is made out with convincing clearness and certainty; the elevations, especially that of the temple, show a designer of the first order. The bas-reliefs, frescos, and ornaments of the frieze are very boldly drawn. We were particularly struck by a panoramic perspective view of the sacred grove, with the temple of Jupiter standing out boldly against Mount Cronos, the barren slopes of which are very well delineated. This is more than the work of an architect; it is that of a painter and a decorative artist, with a knowledge of plan and perspective which enables him to produce almost an optical illusion in his distances. M. Laloux takes us successively into the Philippeum raised by Philip of Macedon after the battle of Charonea, into the Prytaneum, and into the Pelopieon, and lastly into the temple itself, surrounded by steles, tripods, and a whole pleiad of votive statues. Behind the altar of Jupiter extends the terrace of sacred treasures, where various glories of antique sculpture were dominated by the colossal statue by Phœdidas. Above, and by way of comparison, a large water-colour shows us the actual state of the ruins of Olympia, their bare desolation contrasting forcibly with the Pagan splendours shown in the restoration.

Considerations of space compel us to pass over many works worthy of mention. We may glance in passing at the interesting and correct but rather cold drawings of M. Boitte, the charming drawings in which M. Albert Ballu shows us graceful details of Moorish architecture, the water-colour by M. Grandin reproducing the Cour du Mûrier at the École des Beaux Arts, the sketches abroad of MM. Ruy, Le Chatelier, and Renaud, the Protestant church in Romano-Byzantine style by M.

* The works sent home to Paris by the French students at Rome are generally spoken of as "les envois de Rome," hence as "envois" simply. It is difficult to find an English equivalent in a single word.

Sortais, to which we prefer nevertheless that of M. Flandrin, the drawings of M. Devrez and M. Moynéau, &c.

From what has been said, it may be concluded that the architecture of the Salon of 1885 contains much that is very interesting, although no new class of work appears to break the circle of classic tradition. The projects exhibited, with some few exceptions, have no object but the restoration of the past. Without wishing to conclude that there is no originality in France and that the art of architecture is in a stationary condition, we may say that the present state of things is a necessary and inevitable consequence of the official and "classic" education given at the Écoles des Beaux Arts. Ought one to regret this? We think not, for the traditions of the École, against which it is the fashion in France at present to combat, have, at least for the architect, the advantage of keeping intact the respect for the great styles of antiquity and of preserving a standard of pure taste.

NOTES.

THE Committee on Westminster Hall have issued their report, of course in favour of Mr. Pearson's archaeological scheme in its entirety, a result which every one who noticed the composition and feeling of the Committee must have known was a foregone conclusion. The only point in Mr. Pearson's propositions which they decide against is the proposal to raise and give more architectural importance to the towers at the north end of Westminster Hall; in other words, the only portion of his proposition which is really architectural work, the rest being only archaeological trifling: so that so far the Committee are completely consistent in their absurdities. It may be observed that no mention is made, in the Report, of the fact that the staircases to the ill-lighted committee-rooms proposed between the buttresses will project 15 ft. into the Hall. Westminster Hall is now a grand unbroken interior: how will its suitability for a great coronation fête be affected by the obtusion into its area, on one side only, of these excrescences? The Committee have endeavoured to discredit the opposition to their scheme by representing it as coming entirely from "gentlemen objecting to any addition to or restoration of old buildings." Now, no opposition to the scheme has been stronger than our own, and we are absolutely opposed to the general views and principles of the clique referred to. The misleading and inadequate manner in which the affair has been misrepresented to the public in the *Times* can hardly be overlooked. Almost all the evidence against Mr. Shaw-Lefevre's views has been omitted in that journal, and in its account of the report of the committee, the alternative report of Mr. Peddie (the only architect on the Committee) is merely contemptuously referred to as of no consequence. We shall return to the subject when the evidence in full is printed; meantime we reiterate our opinion that the whole affair is a piece of silly archaeological twaddle, and, if sanctioned by Parliament, the Committee will find out eventually that they have made themselves a laughing-stock; but unfortunately that will not undo the mischief that will have been done.

THE recent report of Her Majesty's Factory Inspectors is in many ways satisfactory and reassuring, as showing that, in the main, owners and masters are ready and willing to co-operate in the prevention of accidents, and to do all that can reasonably be expected to insure protection from machinery in motion. Unfortunately, no efforts on the part of employers can guarantee the absence of carelessness on the part of the *employés*; and to this must be attributed a death and accident roll for the year, which is far too long. The total list of casualties numbers nearly 9,000, of which over 400 were fatal, the remainder resulting in various forms and degrees of mutilation. The most numerous, though not the most serious, accidents take place in textile mills, and are in a very large degree owing to

the reprehensible practice of allowing women and young persons to clean the machinery while in motion, a practice which is prohibited to children, and should certainly be forbidden altogether. Grindstones, whether in cutlery shops or flour-mills, are mentioned as having a good many victims in the course of the year, and circular-saws figure also as accident-causers far too conspicuously. One reason of this is, that the fret-saw cutters have enormously increased of late, and that they are usually occupiers of saw-mills, renting a room, and running shafting, pulleys, belts, and countershafts within a foot of the ground, quite unfenced. Such places are veritable death-traps for the young boys working there, and for the children who are sent by their fathers for wood. A great deal of attention is devoted by the Inspectors to the different subjects of ventilation and overcrowding, and much improvement has certainly been made in this direction. London is, perhaps, the chief offender under this head, containing, as it does, a vast number of underground and ill-ventilated workshops, into which no daylight or free air enters, and where a great quantity of gas is necessarily burned. The difficulty in this case is, not to introduce a rush of cold air, against which all working hands protest, but to give a gradual supply of pure air, which will do its work without being felt; and there are several kinds of ventilators which, more or less, fulfil this end at a small expense. It is marvellous to what foul atmospheres the lungs will accommodate themselves for a time, and what a thankless task it is to make operatives healthy in spite of themselves.

WITH reference to the late disastrous fire at the Japanese village, we would call attention to the great anomaly which exists at present in the regulation of buildings like the late one. The building occupied by the Japanese Village Company was known as Humphreys' Hall, and in the interior consisted of a number of streets and shops, laid out upon the Japanese plan, the streets being exceedingly narrow. The shops were composed of light wood and matting, and a variety of trades were carried on therein. The shops and streets were lighted by gas at night, and, considering the time the place has been open, there is very little doubt that the whole of the interior was of a most inflammable character. On the recent hearing of proceedings by the Metropolitan Board of Works against the promoter and manager, for not obtaining a certificate that the building was in accordance with the Board's regulations, made in pursuance of 41 and 42 Vic., c. 32, s. 12, it was said to comply with the regulations as to fire, exits, &c., made by the licensing authorities, and that therefore there was no necessity for obtaining the Board's certificate. The building, which was surrounded by dwellings, was completely gutted in an hour, and within a very short space of time from the fire breaking out escape would have been impossible had the performance been going on. The approach to it was by one principal main entrance and one other entrance in the annexe, which very few people would have found in a panic; and besides this, the principal entrance was completely blocked up by turnstiles. Section 12 of the above Act expressly enacts that it shall not be lawful for any person to have or keep open any house, room, or other place of public resort, unless the Board certified that such place of resort conforms to their regulations; but, notwithstanding this enactment, licences continue to be granted in the cases of music-halls, &c., without calling for the certificate of the Board. Efforts, we believe, are now being made by the Metropolitan Board to get this anomalous state of things altered by fresh legislation, centering in them the whole of the licensing for the Metropolis, and we have no doubt that the late disaster will have at least one good effect, by getting rid of three bodies dealing with the subject and substituting one for the whole Metropolis, and by this means prevent build-ings of a like kind being opened without first taking proper care as to the safety of the

public who might have been present when the disaster occurred.

THAT the Arabs would burn the sleepers, and steal the keys and pins, of any railways left unguarded in their country, might have been anticipated, even without the justification of a state of war. Daily accounts arrive of the perpetration of this very easy mischief. The experience already attained in laying railways through the desert has been quite overlooked in the present case. The true plan to adopt is to use the saddleback rail, invented, now many years ago, by Mr. Barlow. The economy of this rail depends on the price of iron. At present rates, the cost for the entire material of such a line would not exceed from 900l. to 950l. per mile, and an almost indestructible way would be provided. Riveted together with red-hot rivets, the Barlow way would offer much resistance to any force that the Arabs could apply, unless they were disposed to burn their ammunition for the purpose. The rails, weighing 90 lb. per yard, are not easy to trifle with, and the hollow underneath affords a safe and hidden course for the cable of the electric telegraph. When the price of iron (as at present) is such as to render this rail available, it possesses many advantages. Many miles of the South Wales Railway are laid on the Barlow system, and it was also introduced with great advantage on the Bordeaux and Bayonne Railway in 1857. There is a little hardness in the running of the trains, but, on the other hand, the shocks experienced at the points are less perceptible than on ordinary lines.

SIR JOSEPH PEASE was again spokesman for the railway companies in the House of Commons on the 1st inst., in opposition to the Regent's Canal, City, and Docks Railway Bill. He opposed it ostensibly on the ground that the payment of interest out of capital,—which is proposed in the Bill,—is vicious in principle, and had been previously condemned by the House. This undertaking, like many others, offers 4 per cent. interest on the capital subscribed, during construction, and one of the speakers who supported Sir Joseph's amendment gave it as his opinion that they could not safely guarantee this. But though the Company may consider this step advisable in order to attract capital without delay, there is no reason to doubt their ability to meet their engagements. Mr. Chamberlain hinted plainly enough that the opposition was due to the great lines being opposed to competition, and although Sir Joseph found 117 supporters there was a majority of 70 against his amendment. Of course, there are many concerns floated which ought not to attempt to pay interest until they begin to realise profits from their undertakings, but the opportunity for attacking the principle alluded to was ill chosen. The House was evidently of opinion that the attack was really directed against the Bill as a whole, the point in question being selected by the railway companies as being a vulnerable one. The Standing Order permitting this practice of payment of interest out of capital was only passed by a small majority some two years ago, and the matter is one still open to discussion. It was, however, certainly not advisable to introduce it on an occasion like the present, when the construction of important works would be delayed, and the employment of capital and labour hindered, and the majority against the amendment shows that this was recognised by the House.

WE recently noticed a decision of Mr. Justice Cave as to the 193rd section of the Public Health Act. A decision of the Court of Appeal which is published in the current number of the *Law Reports*—throws further light on this section, which makes any official of a local authority liable to a penalty who is "interested in any bargain or contract" with a local board or similar body. It was decided in the case to which we are now alluding that a clerk to a local board who was a

shareholder in a gas company which made an agreement to supply a locality with gas was liable to a penalty. There can be no doubt that the law in this instance dealt severely with the official, but, on the other hand, it is obvious that if an exception is made in the case of shareholders, it might in local matters and local companies open the door to arrangements undesirable in the public interests.

AN important step has now been made at Berlin in the direction of permanently affording those interested in hygienic science, the advantages which were so generally appreciated at the Hygienic Exhibition of 1883. A portion of the former Industrial Academy in the Klosterstrasse is to be fitted up as a permanent Hygienic Museum, at a cost of 3,000l., and a like sum is to be spent on the arrangement of a laboratory. In addition to the above expenditure, the *Centralblatt der Baweruealting* announces that a professorship of hygiene will be established in connexion with the new museum. It will be remembered that many objects left over from the Exhibition of 1883 are still available for the purpose of establishing a museum of hygienic science.

WE have received a short pamphlet on the mechanical characteristics of lightning strokes by Col. the Hon. Arthur Parnell, in which are detailed the observations that have been made on these phenomena for the last hundred and fifty years. According to Colonel Parnell, popular belief invariably represents lightning as an electric current descending to the earth from the clouds, whereas a close research into electro-static laws tends to the presumption that the direction of the lightning stroke is more often toward the opposed plate of the electrical condenser, &c., upwards. This theory is illustrated by a large number of actual observations made during the progress of a storm, and the conclusion is that we must regard the lightning stroke more as an electric mine or explosion than as a current, and that the explosion is attended with a variable development of mechanical force. Heat force is also a result of the explosion, although far less frequently than the former. A list is given by the author, in order to show not only the greater prevalence of mechanical force, but the materials which are most easily affected by either of them:—

Substances acted on.	Instances of mechanical work.	Instances of heat work.
1. Persons and animals	52	79
2. Textile materials	88	79
3. Masonry and rocks	416	5
4. Glass and china	82	2
5. Metal	296	173
6. Wood	254	98
7. Trees	63	4
8. The ground	60	—
9. Thatch, straw	—	11
10. Gunpowder	—	15
11. Gas	—	19
Total.....	1,221	485

If the data here given are to be relied on, it will be seen how greatly masonry and wood-work are affected by the mechanical force, and whether the fact may be turned into practical use of a preventive kind, it is, at all events, one of considerable value to those engaged in works of construction.

AN interesting example of labour-saving is now to be seen in the stone-yard at Burnley, the authorities of which town are laudably determined to be in the forward ranks of sanitary improvement. The arrangement in question is one by which the boulders that were formerly wheeled up by hand to be delivered to the tender mercies of the (Blake's) stone-breaking machine are, by means of an elevator, fed directly into the machine. When crushed, the broken stone is carried into a sieve driven by an eccentric rod, and so disposed that four sizes of chippings may be delivered direct into the cart below. Not only is a much larger quantity of material broken in a given time with better results, but there is an immense saving of labour, while the stone-breaking

itself works with greater regularity than it did when it was fed intermittently by hand. At the same establishment a pick-sharpener is employed by which one man can sharpen 800 picks a day instead of the old hand number of 180. The advantages of labour saving on a large scale are nowhere better seen than in municipal and parochial management, particularly when we consider the rapid and steady increase of expenses entailed by the extension of modern towns.

WE have received this year's instalment of the photographs taken for the Society for Photographing the Relics of Old London. This set are in the Temple neighbourhood, and include Churchyard-court, with the monuments to Hiccocks and Mead, and the slab to commemorate (it does not mark) Goldsmith's place of internment; the Garden House of Clement's Inn, with the sculptured sundial, sold in 1884 (where is it now?); Clifford's Inn; Staple Inn Hall; the interior of Gray's Inn Hall, with its richly-carved columns and frieze; Gray's Inn-Field Court; Inner Temple Gate-house; the doorway of No. 5, King's Bench-walk, with its half-columns of Corinthian order; Middle Temple Gate-house, the work of Wren, with its Ionic order and pediment; and Fountain-court. In addition is a sheet of small subjects of sculpture; among others a figure of a naval officer taking an observation, the figure which is said to have been utilised by Dickens, in *Dombey and Son*, and which was a few years ago removed from Leadenhall-street to the Minorities. The figure of the boy in Panyer-alley, Newgate-street, is another of this little collection, all the items of which are of archaeological interest. The whole set of plates form a very interesting record of characteristic corners of one of the most characteristic neighbourhoods of London.

AT a meeting of the "Art Workers' Guild," held in the rooms of the Century Club, on Friday last week, Mr. Geo. Simonds gave an interesting lecture on artistic bronze-founding, on much the same lines as that of his paper on the same subject recently in the *English Illustrated Magazine*, which we noticed at the time. The lecture was illustrated by diagrams, and the moral pointed was, that sculptors should be their own founders, as far, at least, as small works were concerned. The lecture, which lasted nearly two hours, was listened to with great attention.

WE have received from Messrs. W. & T. Brindle photographs of villas being erected at Orrell, near Wigan, as examples of ornamental stone-work executed by machinery patented by them about eighteen months ago, and in which the use of edged tools is discarded altogether. The workmanship, as they observe, is a series of flutings, dog-teeth, and rings, arranged to suitable designs to obtain various alternations of light and shade, and to produce harmonious enrichments "seldom seen on the flat surfaces of stone." In the latter statement we certainly concur. The promoters do not mention the name of any architect, and we presume the design is their own. They would have been wiser to have got some one who knew how to make use of such resources in a manner in harmony with architectural taste and knowledge, to design a building for them. We should recommend them to keep the designs they have sent us carefully from the sight of architects. But we do not, therefore, by any means necessarily condemn their method *in toto*. It is evident that the mechanical means which have been here used might, under better direction, be applied with effect to produce such features as rustication and general surface ornament of a simple kind, and which is composed of the repetition of small features; and as it is stated that the cost is 75 per cent. below what is required to execute similar work by hand, it may be of use under proper direction. But Messrs. Brindle had better not send any more of those photographs about. They will frighten architects away if they do.

ARCHITECTURE AT THE ROYAL ACADEMY.

CERTAINLY the most artistic of the ecclesiastical designs exhibited this year is that for the proposed memorial church at Streatham contributed by Messrs. George & Peto. There is no accompanying plan, but the church appears, so far as can be ascertained from the perspective sketch, to consist of a nave, chancel, shallow transepts, wide aisles, and a western narthex or porch. The aisles project in an unusual manner beyond the faces of the transepts, and with good effect. They are divided longitudinally into three wide bays, and are roofed transversely, covered with lead, and finished with plain gables of so low a pitch that a horizontal line at their springing is alone wanted to convert them into Classic pediments. It will have been inferred that the style chosen is a late phase of Perpendicular, very difficult to treat well, and treated in this instance with great mastery; vast areas of plain wall acting as a foil to the richly-traceried windows, and recalling involuntarily, though without the least suspicion of plagiarism, Mr. Norman Shaw's church at Ilkley, a drawing of which was exhibited eight years ago. The interior is of remarkably lofty proportions, and the line of ridge is level throughout, as in so many of the magnificent parish churches in the eastern counties. An octagonal turret marks the north-east angle of the north transept, and terminates in a conical spirelet, of which the angles of the upper half are broken into crockets. Below the springing is an open stage, each face of the octagon having a gabled head, and below this stage is a series of traceried panels, not pierced, but extremely effective, as affording an agreeable transition from the plain masonry of the lower portion of the turret to its more ornate heltry, for it is assumed that it is a hell-turret. A window placed high up in the transept gable is, however, louvred, and the bells may be placed there, in which case the turret is probably a staircase only. There are one or two little points in which the whole truth is not told, e.g., inconvenient down-pipes being omitted, and an ancient look has been imparted to the fabric, which this generation, at least, will never enjoy. But these are small matters. The design is singularly artistic, and, notably, in the evidences of a wise restraint which add a sense of power to its picturesque grouping and detail, and it is needless to say that this excellence of design loses nothing by Mr. Ernest George's exquisite drawing, which, without any appearance of labour, is beautifully bright and sparkling.

If Mr. Brooks may be charged with a want of versatility he may justly plead that he succeeds perfectly within the limited range he has adopted. In his Church of St. John-the-Baptist, Kensington, he is seen at his strongest, and all his merits shine out brightly. He is wise enough to give the first consideration to solidity of construction and beauty of proportion, and he never sacrifices these to mere luxury of ornamental embellishment. Thick walls are a greater help to architectural effect than most architects are aware of or will admit, and thick walls with Mr. Brooks are a *sine qua non*. Consequently his buildings show a breadth and simplicity which are not always found in the works of others, and with this quality he combines a propriety of detail seldom excelled in contemporary architecture. Carving, as a rule, he dispenses with, spending its cost on more essential matters. But when he allows himself a little treat of the kind his ornament is invariably good. In the particular design before us the growing fondness for an octagonal lantern at the transept crossing is exemplified; and is very successfully treated so far as the architectural effect is concerned. But it is a serious question how far the acoustic qualities of a large church would be jeopardised by this arrangement. The sounding board over the pulpit, which is placed against the eastern wall of the transept, shows that the architect's mind is not without some misgivings on this point. A Baldachino over the altar and an elaborate screen across the entrance to the chancel are noticeable features. The whole of the interior surface is intended, apparently, to be lined with ashlar, and the whole will prove a very fine church. Mr. Brooks does not, it appears, make his own perspectives, and may be considered fortunate in having an interpreter whose style of drawing in pen and ink is so well calculated to bring out the best qualities of his designs.

The same architect's design for a proposed church at Highgate does not please us so well. Its general composition is not happy, and its detail has but little to recommend it, while the arrangement of the transept rising up flush with the face of a long blank aisle wall is extremely unsatisfactory.

"Burnham Thorpe, Norfolk," is presumably an old church, and if so, it is only as an architectural drawing that it has claimed a place on the Academy walls. It has, however, no particular merit as a drawing, and its author may, indeed, be congratulated in getting it so well hung, when so much good drawing, and good design to boot, is known to have been turned away. And this offers a convenient opportunity for a word on the subject generally. It is beyond dispute desirable that the Architectural Gallery should be the exponent of contemporary architectural design. The mere representation of ancient architecture should take its chance with the bulk of the exhibits. If good enough as artistic work, it should go with Mr. Waterhouse's Taormina sketch of this year to the water-colour room,—or if in monochrome, to the room now provided for works of that class. If the architectural room is to be open to all pictures having architecture for their *motif* by whomsoever drawn or painted, it is not difficult to see that the unfortunate architects will illustrate the old story of the cuckoo in the sparrow's nest, and be gradually thrust out of their nominal home. There is an unusual amount of such drawing this year, and the designs of architects of acknowledged skill have been rejected, whilst leaves from students' sketch-books have usurped their place.

It is no doubt sufficient to put this view before the President and Council to ensure a more discriminating selection in future, and the reservation of the architectural gallery for architectural designs.

LETTER FROM PARIS.

THE great event of last month has been the Town-hall hall, of which we have before spoken, and which has not only been a great success, but has contributed to forward the interior decoration of the new Municipal Palace, and on that account merits a special word.

Undoubtedly the old Hôtel de Ville, with its artistic *chefs d'œuvre*, its ceilings decorated by Lehmann, Picot, Cahanel, Ingres, Delacroix, and so many other masters of the French school, its columns of marble and gold, its furniture, in a style rather heavy perhaps, but so completely in harmony with the ornamentation of the saloons, was an incomparable setting for the *fêtes* given under the Empire by Baron Hansmann. On this occasion everything had to be done afresh; the rooms are scarcely finished, the columns and ceilings still the colour of stone; no painting relieved that general crude whiteness. Furniture, tapestries, lustres, chandeliers,—all were lent for the State. Nevertheless, such was the ability of the architects directing it, that this improvised luxury had no appearance of anything unusual.

The evening before the *fête* at the Hôtel de Ville, a rich financier, M. Gaillard, inaugurated by a grand fancy dress ball, his new mansion in the Place Malesherbes. This is a beautiful building, the exterior aspect of which recalls the ancient portions of the Château de Blois. The architect, M. Favier, has endeavoured to revive the architecture of the royal residence constructed under Louis XII. In this he has succeeded remarkably, and the façade of the building, with its large windows with stone dressings, its decorative balconies, its walls ornamented with red and black tile designs, its roofs crowned with leaden ornaments, constitutes an original and elegant design, of which we hope to give an illustration before long.

In regard to the annual *Salon* now open, the contents whereof will be specially treated of in other columns of the *Builder*, we may note a recent important decision, due to a certain number of the members of the Société des Artistes Français, and which will be productive, probably, of very good results; we mean the inauguration of a lottery which will be devoted each year to the purchase of works of art exhibited. The price of tickets is fixed at 100 francs (4*l.*), and the drawing will take place the month following the closing of the *Salon*.

This is not the only innovation this year, and most of the persons accustomed to enter the *Salon* gratuitously on "Varnishing Day" were

taken by surprise on that Wednesday, when they found that, with the exception of exhibitors and art-critics, no one was permitted to enter the precincts under a fee of 10 francs, to go to the poor and the wounded at Tonkin. While speaking of the *Salon*, we may add that this year M. Ch. Garnier, Questel, Brune, Bailly, Vandremere, and Sédille were appointed the jury in the department of architecture, with M. Raoulin and Gainain as assistant members.

Since our last letter, which gave some account of the exhibition of the works of Gustave Doré, the paintings, water-colours, drawings, and sculptures of that remarkable artist have been dispersed by auction. The whole proceeds of the sale have been 96,000 francs, which is little enough. The highest price was given for the design entitled "Le Rhin Allemand," which reached 2,000 francs; the large drawing of Epsom Race-course sold for 900 francs; a magnificent water-colour of the London Docks went for 500 francs. Among the pictures, the "Mort d'Orphée" reached 2,400 francs; the "Marchant de Fleurs de Londres" sold for no more than 1,600 francs. This is evidently not the time for artistic sales. The preoccupations of politics thrust art on one side, and yet the private exhibitions have succeeded each other without interruption, and have drawn numbers of visitors. That of the pastellists, of which we have already spoken, is remarkable one, and does the greatest credit to M. Roger Ballu who organised it. Independently of the old masters, the retrospective exhibition of whose works is of the greatest interest, we see here, among the moderns, M. Lévy, whose nude figures are treated in a luminous and charming key; M. Duez; M. John Lewis Brown, whose chasseurs in red dresses and his cavaliers under the shade of trees are to be noted; M. Emile Levy, represented by a number of portraits; and, lastly, M. de Nidès, who, in spite of real talent, makes a serious mistake in offering a disagreeable change of affectation and deliberately chosen impressionism.

Affection is the fault with which one must so reproach M. Tissot, a French artist well known on the English side of the Channel. M. Tissot has always put one or another affection to his works. After having conscientiously imitated for some fifteen years the painters of the sixteenth century, in an archaeology more faithful than agreeable, he has now become an inverted modernist, and the fifteen pictures which he exhibits at Sodebmayer's, under the leading title, "La Femme à Paris," profess to detail the quintessence of the various aspects of the elegant Parisienne. Making allowance for paradox, the exhibition is not uninteresting. M. Tissot's painting is clear, bright, and amusing. He has learned a good deal among the masters of the English schools, and his paintings have a je ne sais quoi of piquancy, pleasing and ductive, like the slight foreign accent which sounds so well on the pretty lips of an English woman speaking our language.

The exhibition of the works of Delacroix has just closed its doors. The sum raised thereby for a monument to him is about 67,000 francs. A few days since the Salle Melpomène, at the Ecole des Beaux Arts, gave asylum to an exhibition of portraits "du Siècle," organised by a philanthropic society, and which counts not less than 400 pictures. We find among this collection the works of David, Gros, and Baron Gérard; Baudry, Ribard, and Fantin in Gros; Ingres is the neighbour of Manet. The pearl of the collection is unquestionably the portrait of Napoleon I., by Ingres.

Not far from the Ecole des Beaux Arts, at the foot formed by the Palais de l'Institut on the rue Malaquais, the statue of Voltaire will shortly be erected. The pedestal, of which the foundations are commenced, is the work of Formigé, whom the Municipal Administration have had the good fortune to engage in the capacity of architect for the "Service des Reménades." On the other bank of the river, in the midst of the Cour du Carrousel, the work has been commenced for the erection of a monument to Gambetta, of which M. Aubé, the sculptor and M. Boileau the architect, have completed a monument, about 23 mètres in height, imposed of a pedestal in the form of an obelisk adorned by two figures representing La Vérité and "La Force." On the principal face of the monument is the figure of Gambetta dominated by a genius unfolding a standard, and surrounded by soldiers whom he orders on to combat. Various inscriptions

taken from his discourses pronounced from the Tribune, and a winged lion placed at the summit of the obelisk, will complete the monument, which will be finished about the end of the year, and will stand just in front of the Arc du Triomphe of the Carrousel. Possibly the excavations for the foundations may lead to some interesting archaeological discovery on the site of the old Louvre, where already, some years ago, there were found, in installing an electric apparatus, fragments of balustrade ornamented with animals which came certainly from the ancient kings of Bernard Palissy.

Since we have come on the subject of statues we must not forget the new competition ordered to give Paris a statue of Jean Jacques Rousseau. We may observe also that the statue of Béranger, the work of the sculptor Doublemard, will be shortly inaugurated in the square of the Temple, not far from the street in which the famous "Chansonnier" died, and which bears his name.

It is announced that the Government intend at last to take steps to ensure, at an early date, the restoration and repair of the Porte St. Denis. Among the monuments which the age of Louis XIV. has left to Paris this is one of those which has been most sorely tried. The sculptures with which it is decorated are greatly damaged; the groups representing the Rhine and Holland captive, are literally falling in pieces; and the Municipal Council have already for a long time implored that the preservative measures which had become absolutely necessary should be taken. It is high time to do so if this curiosity of Paris is to be preserved and some fatal accident prevented. It was in 1678 that the Porte St. Denis was built, from the designs of Blondel.

It will be very necessary, on the same occasion, that the new "Ministre des Beaux Arts" should take some decision relative to the crowning of the Arc d'Étoile. The temporary group which M. Falguère built up there two years ago threatens ruin, and, in fact, the monument itself has no need of that adjunct, which disagrees with its architectural style and spoils its fine proportions. Let us hope that enormous timberwork of Damocles suspended over the heads of promenaders will soon disappear for good.

Lastly, as the Government is beginning tardily to occupy itself about works long since recognised as necessary by the general good sense of the public, it is time to take precautions against the complete deterioration of the celebrated hémicycle which Paul Delaroche painted in the "École des Beaux Arts." The climate of Paris is decidedly unhealthy to mural paintings, and the dampness which saltpetres the walls of public edifices will end by destroying that remarkable decoration, at the same time that it attacks the works of Flandr in at St. Vincent de Paul and St. Germain de Prés. Accordingly the Service des Beaux Arts of the Municipality has rigidly interdicted mural painting, and all the artistic works ordered now for the decoration of municipal edifices are painted on canvas to be applied to the walls.

To the list of works in course of construction, we must add the exhibition-room which it is proposed to create in the Musée de Cluny, between the buildings of the ancient Abbaye and the ruins of the Palais des Thermes. The construction of this work necessitates the removal into the garden of the hôtel of the portal of the ancient church of St. Benoît, which will be an operation requiring minute and delicate care.

With the exception of this portal, well known to archaeologists, and some other interesting bits of architecture, Cluny is really no more than a museum of decorative art and furniture of the Middle Ages and the Renaissance; while, for the comparative study of architecture, the new museum of casts at the Trocadéro constitutes a precious source of artistic and historic instruction. It is in this respect that we notice the new room which is nearly finished at the Trocadéro, and which contains casts of the finest work of the sixteenth, seventeenth, and eighteenth centuries. The art of sculpture is nobly represented, and the new room completes very happily a collection in which the national genius is represented in all its originality, thanks to the exact reproduction of the *chefs d'œuvre* of sculpture and architecture in their true dimensions. It is incontestable that the Museum of the Trocadéro is a creation of the highest value from the point of view of popular art education.

The Museum of the Louvre is also the object just now of important improvements. Besides the repairs and improvements in the picture-galleries, which will soon be completed by the junction with them of the ancient *Salle des États*, warming apparatus is being installed in the ground-floor, which will enable artists to work there at all seasons of the year.

We will conclude by giving a few lines to an artist of talent who has died at Paris in the prime of life; we refer to Auguste Laneyre, who was a draughtsman and etcher of real power. We may name among his works an interesting collection of drawings made in the Franco-German War; an album of drawings of animals, and some very curious studies which he collected under the title of "La Rue à Londres," and which constitute a work extremely interesting, original, and full of spirit.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE NEW COUNCIL.

At the fifty-first annual general meeting, held on Monday evening last, the Council were elected for the ensuing year of office, namely:—

President.—Mr. Ewan Christian.
Vice-Presidents.—Messrs. Edward Panson, F.G.S.; Alfred Waterhouse, A.R.A.; and Thomas Worthington (Manchester).
Members of Council.—Messrs. Cole Alfred Adams, George Aitchison, A.R.A.; James Brooks, Arthur Cates, Charles Roberts Chorley, J.P. (Leeds); Joseph Clarke, F.S.A.; Henry Curry, William Milner Fawcett, M.A., F.S.A. (Cambridge); Charles Fowler, James Fowler, J.P. (Louth); John Gibson, Edward Augustus Grining, Octavius Hansard, Professor Thomas Roger Smith, and Aston Webb.
Hon. Secretary.—Mr. John Macvicar Anderson.
Secretary.—Mr. William Henry White.

COMPETITIONS.

"Wesley" Chapel, Preston.—A limited number of architects having been invited to send in competitive plans for the enlargement and restoration of the above chapel, the building committee have decided to adopt the plans and designs furnished by Mr. David Grant, of Preston. It is proposed to begin operations at once, under the supervision of that architect.

Beverly Cottage Hospital.—The Building Committee, at a meeting on the 30th ult., opened the tenders for this building, and Mr. Blackburn's tender, reduced to 1,725*l.* 1*l.* 5*d.*, through the substitution of slates for tiles, was accepted, subject to the approval of the plan by the Charity Commissioners. At the same meeting the following letter was read, but no action was taken upon it:—

"Gentlemen,—We, the undersigned, beg to protest against the decision arrived at on the 8th inst., and the acceptance of the designs of Messrs. Smith & Broderick, on the following grounds, namely:—(1) That the accommodation required as set forth in the printed circular is not provided; (2) That the general plan and arrangement is limited, and far from satisfactory; and (3) That in our opinion at least six other designs were superior to the one accepted, five of which could have been carried out without any deviation for the sum allowed, viz., 1,700*l.* Under these circumstances we consider the appointment of these architects to be most unfair to those competitors who were induced by the advertisement to compete (on two separate occasions), on the assumption that their designs would be impartially considered, and that the best would be successful.—We have the honour to be, gentlemen, your most obedient servants,

WILLIAM HAWK,

R. COULSON,

LEGGERS & CARTWRIGHT,

W. T. BEILER (Health),

April 28."

Lowestoft Cemetery.—We are informed that the first premium in this competition has been awarded to Mr. William Donbieday, of Colmore-row, Birmingham, and the second to Messrs. Bellamy & Hardy, of Lincoln. About forty designs were submitted to the Burial Board.

International Inventions Exhibition.

It is stated that careful attention has been given to the drainage at the International Inventions Exhibition, and that Mr. Bennisson, the surveyor, has completed what was partially done at the Health Exhibition in applying the Banner system to the whole of the drainage of the exhibition by carrying up ventilating-shafts from all the principal drains and fitting the same with Banner extracting ventilators and Banner down-draught ventilators. These ventilators have also been used for the ventilation of the staff rooms.

Illustrations.

THE NATIONAL LIBERAL CLUB.

THE new buildings of the National Liberal Club will occupy an area of 23,750 ft. The site is bounded on the north and west by Whitehall-place and Whitehall-avenue; on the east it faces the gardens of the Thames Embankment, while on the south the club-house will join the new buildings of Whitehall-court. From the main entrance, at the corner of Whitehall-avenue and Whitehall-place, a vestibule leads into the hall or principal corridor, on the left of which is a reception lobby, and on the right beyond a porter's room, and a post and telephone office; a second hall leads into the conference-room. To this there is a separate entrance from Whitehall-avenue, so that it is accessible from the street without the necessity of passing through the Club. At the end of the hall, opposite the main entrance, is the principal staircase, which rises from the basement to the first floor. It is of elliptic form, and the steps, which are 8 ft. wide, are supported at either end by an outer and an inner wall. The outer wall is solid, but the inner is formed into a continuous ascending colonnade of various and richly coloured marbles; at the foot of the first flight of steps is placed the entrance to a passenger lift, which will connect the various stages of the Club. From the end of the hall a descending flight of steps leads under the main staircase to the level of the smoking-room, 8 ft. 6 in. below that of the street. This room, which is 102 ft. by 35 ft., and 23 ft. in height, is provided at its eastern end with a bar and an entrance for servants; while in the south wall a doorway leads to a short flight of steps which ascend to the range of billiard-rooms placed under the terrace. Of these rooms, which are 13 ft. 6 in. in height and average 25 ft. by 18 ft. in area, it is proposed to construct some with top lights for use by day. Under

the entrance to the conference-room there will be a tradesmen's way to the basement, where the steward's and receiver's offices are situated. The basement also contains, besides men-servants' bedrooms, a large room for members' portmanteaus and other effects, a boiler-room, an engine-room containing the dynamos for electric lighting, and a fresh air chamber, from which air will be conducted to the various up-shafts throughout the building. From the boiler-room, steam is provided for the cooking and laundry operations.

Besides the main entrance and that to the conference room, there is yet another entrance from Whitehall-place, at the foot of the tower in the north-east angle of the building. This is for the benefit of such non-members as may be admitted to the privilege of the Gladstone Library. This library is placed over the smoking-room, and will be 102 ft. in length, 35 ft. in width, and 24 ft. in height. It can be approached from the above-mentioned public staircase, from the dining-room, which overlooks the river, from the principal staircase, or from the members' library, into which a doorway leads off the raised dais at the west end of the room. To increase the space available for books, the library is provided with a gallery which runs entirely round the room between the detached columns and the wall, and is accessible from the staircase at either end. The two principal rooms on the upper ground floor, besides the Gladstone Library and the smaller library for members, are the grill-room and the dining-room. The first of these looks into Whitehall-avenue, and the second is on the east of the building. The service-room, which is supplied by seven lifts, lies between these two, which are also connected by a corridor, out of which a small staircase ascends to a mezzanine for lavatories. From the dining-room there is an access to an open loggia, and thence down a flight of five steps to the broad terrace overlooking the Embankment. The dining-room, it may be mentioned, is 108 ft. by

38 ft.; the grill-room 63½ ft. by 35 ft.; but these rooms being 24 ft. in height and 15 ft. 6 in. above the level of the street.

The first floor is occupied by a reading and writing-room, over the Gladstone Library; a smoker's reading and writing-room, over part of the dining-room; and a drawing-room over the members' library. There is also on the floor a private dining-room, and a committee room, which can be used as a dining-room. A long the eastern front there runs a balcony, accessible from a loggia between the two reading and writing rooms, and commanding a splendid view down the river. At this floor the principal staircase ceases, and with it the club proper; the upper storeys being reached by the staircase in the tower, or by the adjoining lift. The office of the secretary has been placed on a mezzanine between the first and second floors. His clerks will have a room on the first floor, reached from his office by a private staircase.

The second floor is devoted to chamber bedrooms, or bedrooms and sitting-rooms combined, some of which have spacious balconies placed over the bay windows of the floor below. The third floor is a repetition of the second, consisting of bedrooms, sitting-room, bath-rooms, &c. The fourth floor is partly occupied by chambers, and partly by rooms for officials and servants; but the two departments are kept entirely distinct. The steward's room, butler's room, pantry, &c., look into the central space over the skylight of the principal staircase, while the members' rooms occupy the external frontages. The kitchen and scullery are placed on this floor in the south-west angle of the building, in direct communication with the service-room, into which the lifts ascend. A joining is a large still-room, with lifts descending to the various serving-rooms. The laundry storerooms, housekeeper's rooms, and music bedrooms are provided on the fifth floor. The tower staircase ceases when it reaches the fourth floor, but from that point a smaller spiral staircase

DESIGN FOR A MILITARY HOSPITAL IN A

LIMATE — SKETCH OF FRONT OF CIRCULAR WARD

INK PHOTO SPRAGUE & CO LONDON

leads to the helvidere at the summit of the tower — from which, it is expected, an almost unique view will be obtained of the river and its bridges towards St. Paul's.

As regards the building generally, it may be observed that the whole of the structure will be fireproof; constructional wood-work is entirely avoided, and the beams and columns will be cased and filled with incombustible material. The apartments, generally, will be characterised rather by their size and cheerfulness than by elaborate decoration; though the main staircase, from its rich material and play of light and shade, will make the centre of the building more than ordinarily attractive, and enable the National Liberal to vie, at least in this respect, with the other club-houses of London. The style selected by Mr. Waterhouse has been that of the Early Renaissance; the exterior will be entirely of Portland stone, the roof being covered with green Westmoreland slates. The most noticeable external feature is the tower in the north-east angle, which, though severely plain in the lower stories, increases in richness and intricacy as it detaches itself from the gables which lead up to it on either side.

The foundations, in course of construction, are in the hands of Mr. Lovatt, of Wolverhampton.

SARACENIC CAPITALS.

of excessive interference made against the officials of her Majesty's Office of Woods and Forests ought to fall to the ground.

A. WATERHOUSE."

SARACENIC CAPITALS IN THE CASTLE OF ST. ALJAFERIA, SARAGOZA.

THESE three boldly-carved capitals are said to be all the remains that are left of the artistic work of this old Moorish castle, of which most of the original work has been obliterated either by time and ruin, or by alterations by Medieval builders.

A PROJECTED MILITARY HOSPITAL.

THE site for which this hospital has been designed consists of a rocky promontory, jutting into the Mediterranean, and rising from the sea at an angle of about 20 degrees. Its central ridge runs almost due east and west, thus giving an extended exposure towards the cool quarter, and to the healthy northern winds which fortunately prevail for nearly nine months in the year. The whole of the buildings have been disposed in such a way as to turn this characteristic of the site to the best advantage.

It is approached from the western side by a public road, and on the south-east is accessible by water from the barracks and garrison.

A considerable depression in the site renders it necessary to break the hospital buildings into two main sections, which are connected by a broad terrace, carried upon arches over the intervening valley, and inclosing the engine and boiler rooms, the coal-stores, water-tanks, &c.

Abutting on the public road are the official residences, and in an adjoining enclosure special wards for ophthalmic and other cases requiring isolation. Barracks for the medical staff corps or nursing orderlies, and wards for prisoners and lunatics, complete this portion of the establishment. A covered cloister-like passage

PRELIMINARY DESIGNS FOR THE NATIONAL LIBERAL CLUB.

THE two elevations for this building, of different dates, are published at the request of Mr. Waterhouse, who sends us the following letter in reference to them:—

"Sir,—In November last, writers, both in your journal and in the *Pall Mall Gazette*, appeared to have come to the conclusion that, owing to the undue interference of the Office of Woods and Forests, I was unable to carry out my original intentions with reference to the National Liberal Club in Whitehall-place. I sent a letter to the *Pall Mall Gazette* to

correct misapprehensions on the subject, but as I failed to convince its correspondent, "F.R.I.B.A.," and as I did not at the time reply to yours, "F.S.A.," I avail myself of your courtesy (as you are illustrating the National Liberal Club by a fac-simile of my perspective drawing) to publish a fac-simile of my first attempt, early in July last year, at the elevation towards the Embankment, with another of the same elevations as it had developed in November last.

A comparison of the two will prove at a glance that there has been very little change in the style of the elevation, nor more in the details than might reasonably have been expected, and that, consequently, the charge

gives sheltered access from this outlying series of scattered buildings to the hospital proper. The latter comprises nine pavilions for the sick, an operating-theatre, with preparation and recovery wards attached; a dining-room for convalescents; an administrative block, with medical officers' offices, dispensary, drug-stores, &c., and under the same roof the kitchen and accessories. Above this range of buildings the general stores for the hospital are accommodated.

At the eastern end of the site an important block of building includes the chapel, with vestry and chaplain's room, quarters for a small staff of nursing sisters, reading-room and library, and in the basement a complete series of salt water and medicated baths. A lofty water tower, of Florentine character, marks the opposite extremity of the hospital range. A special road on the south side of the rock leading to the engine-rooms, &c., enables the workmen to attend to their duties without entering the precincts of the hospital. Opening from this road on the lower level is an enclosed yard where the laundries, post-mortem room, mortuary, ice-making establishment, &c., are placed, out of sight of the hospital inmates.

The distinctive feature of the design is the use of the circular form for all the larger wards. These circular pavilions are 66 ft. in internal diameter and 22 ft. in height to the centre of the ceiling, which is an extremely flat semi-ellipse. They are each intended for twenty-six patients. Each patient will have a wall space of 8 ft., a floor area of 130 ft., and an air volume of 2,600 ft. An arcade 14 ft. wide surrounds each ward; concentrically on the north, but on the east, west, and south sides drawn in right lines tangential to the enclosing circle. At the south-east and south-west angles square towers enclose the sanitary services, the orderlies' rooms, and staircases. Above the ward an open arcaded story,—locally known as a "Baracca," and figured in Sir Gardner Wilkinson's book on Ancient Egypt as having been used thousands of years ago by that remarkable people,—will not only afford an airing-ground for those patients who are able to avail themselves of it, but also give the means of doubling the normal occupation of the hospital in times of emergency. From the centre of the ward ceiling, and carried by a ring of stone columns, a cylindrical ventilating chamber rises, built up through the "baracca" and terminating 20 ft. above its roof in a domed cupola. The wards are raised on a hollow basement 7 ft. high, and the whole site is made up to the highest point of the rock and enclosed by escarp walls broken picturesquely into shallow bastions. The ward windows are wide enough to allow of the exit of a bed on castors into the inclosing arcade. Fresh air is admitted behind each bed, and through lunettes at the springing of the domed ceiling, and is drawn out through the central shaft by a fan. The wards will be warmed when required by steam, and also by three majolica stoves near the central ring of columns. The actual centre of the ward will be occupied by a majolica fountain, which will add to what cannot fail to be an attractive and cheerful interior.

The locality furnishes excellent building stone at an almost nominal cost, which is worked at an extremely cheap rate, and this circumstance has enabled Sir Andrew Clarke to give to a design intended to embody the latest accepted principles of hospital construction a more than usually marked architectural character.

REMOVAL OF HOUSE REFUSE AND SEWAGE.

SINCE the notice in the *Builder* of the report of the Royal Commission on the Disposal of the Sewage within the Metropolitan Area, two papers have been read at the Society of Arts on the same subject, but suggesting a diametrically opposite mode of treatment; one by Dr. Hawkesley, the well-known advocate of the dry-earth closet system, proposing the abolition of water as the means of carrying off effete organic matter from towns; the other by Dr. Richardson for the removal of house refuse independent of sewage.

Of course, abstractedly considered, the correctness of Dr. Hawkesley's contention will be generally admitted, that the consignment of sewage matter to the soil is the best of all ways for its disposal, and that, as observed by him, the soil alone possesses the appropriate conditions for its reception and utilisation; but it is when the practical application of the method sug-

gested comes to be considered that there becomes apparent the existence of a great, if not greater, difficulties than are found in the system which Dr. Hawkesley so energetically condemns. To prescribe a single method as universally applicable for all places and in all situations is just as absurd as the claim of Holloway's pills or of the other hundred-and-one quack remedies to be specific for all the ills to which flesh is heir. There is no doubt that in dry climates, like that of Egypt and in parts of India, the earth system may be carried out with advantage, as has notably been the case in some of the Indian jails, where all the requisite surroundings are specially favourable for the purpose. It may be said, too, that the system has the sanction of antiquity in the sanitary rules which were of old enjoined on the Hebrew nation, being suited to the climate and circumstances amidst which they lived; but it is certainly somewhat straining "the good old helief in a providential adaptation of means to ends," to say that the earth system "presents a grand illustration of it, grand not only for its perfection but for its vastness," because Professor Way happens to have shown the power which various, and especially clayey, soils have of absorbing all such matters as it is desirable and even necessary in the interest of the health of crowded communities to be got rid of as effectively as possible. No one doubts the efficacy of "Earth, the bountiful mother of all vegetable life," as a purifying medium, but it is the practicability of its application, at least as far as experience has hitherto gone, that yet remains to be proved. Great credit is undoubtedly due to the late Rev. Henry Moule for the endeavours, in many cases successful, which he made for the introduction of his system but even he failed to see how the problem of its application to large towns, much less to great cities like London, could be solved. Efficacious though the ingenious apparatus devised by Dr. Hawkesley may be when employed under intelligent supervision, yet it was shown by several gentlemen who took part in the discussion on the two papers, that the system itself had proved very much the reverse where such intelligent supervision was wanting. In addition to the difficulty of practical application, the claim for it of economy was also called in question, while the possibility of its yielding a commercial profit seems equally unlikely.

The removal of house refuse independent of sewage in the manner suggested in Dr. Richardson's paper is a subject doubtless deserving consideration, but it is one which has already received a certain degree of attention in various parts of the metropolis. Similar practical difficulties as to its ultimate disposal, however, present themselves as in the case of sewage when it is proposed to do away with the aid of water carriage. It may seem extraordinary that so valuable a manure as stable refuse should not be able to command a sufficiently remunerative price as to cover the cost of carriage. One of the speakers asserted that the parish of Kensington finds a difficulty for the sale of its stable refuse to market gardeners "owing to the low price of vegetables"; but whatever may be the case with market gardeners, it is quite certain that private individuals in the suburbs cannot procure stable manure except at a price which ought to be sufficiently remunerative for any parish. Its employment in the manner proposed by Dr. Richardson for "growing mushrooms for the million" sounds somewhat ludicrous, and is suggestive rather of the possibility of having too much of a good thing. As the expense of transport seems to be the chief obstacle in obtaining a sale for stable refuse, the railways having refused to have anything to do with it, surely it is worth consideration whether it might not be practicable to construct small canals in various directions so as to reach suburbs to which water transport is not yet available; for by their means a sufficiently low rate of freight would be secured as to admit of manure and refuse realising a price which would, at all events, cover the cost of removal. At the present time, when capitalists find a difficulty in obtaining safe investments, they could scarcely do better than turn their attention to the promotion of a network of suburban water lines which could scarcely fail to afford a fair remunerative return if utilised for carrying off the vast quantity of refuse and manure which requires to be daily removed from the metropolis.

THE HUNGARIAN NATIONAL EXHIBITION.

THE National Exhibition, opened at Pesth on Saturday by the Emperor of Austria, is the most comprehensive enterprise of the kind ever attempted in Hungary. The Exhibition is situated in the City Park, which is approached by the splendid new thoroughfare called the Radial-street, bordered by palatial residences and charming villas. The space covered by the Exhibition grounds is 300,000 square metres. The Hungarian Parliament granted the sum of 1,000,000 florins in order to carry out the Exhibition in a style worthy of the country. The principal building consists of a vast structure in the form of a parallelogram, erected in the style of the new Italian Renaissance. This great hall of industry is flanked at each of the four corners by elegant pavilions, while the pavilions and entrances in the centre of each of the four front lines are connected with the various annexes. In the centre of the main building rises a large cupola or dome. The work of preparation made enormous strides during the last fortnight, prior to the inauguration, operations being continued through the night by help of the electric light. The Exhibition is divided into thirty-three independent sections or departments. One of the most important divisions is the hall of agriculture, where, in glass bottles and jars, an exhaustive series of specimens of all the agricultural products of Hungary is displayed. A very interesting portion of the Exhibition is that containing a series of rooms exemplifying the interiors of the ordinary houses and domestic arrangements of the country population of the various nationalities under the Hungarian crown, including Magyars, Serbs, Croats, Szeklers, Roumanians, and Germans. In each room are dummy figures, attired in the picturesque costumes of the different races. Another important portion of the Exhibition is that devoted to the different kinds of poultry and domestic animals. The exhibition of sheep, which takes place between the 20th and 30th of this month, and for which no fewer than 2,012 animals have been announced, will be the largest ever held on the Continent.

CLERKS OF WORKS' ASSOCIATION.

At a largely attended monthly meeting of the members of the above Association, held on the 4th inst., the President (Mr. E. Moore) delivered his address, in which he said,—

We have now entered upon the fourth year of our existence and have shaken off (so to speak) the swaddling clothes of infancy. We have arrived at that period in which it behoves us to take steps forward with courage not mixed with caution and prudence, or, as our American cousins put it, "First be sure you're right, then go ahead,"—our constant aim and watchword being proficiency and progress. It may, perhaps, not be desirable to dwell too much on the past. It is well, however, that we should bear it in mind so far as it may influence us for good in the future, meanwhile keeping our gaze steadily forward, fixed on the goal of our ambition. Speaking for myself, I confess I look back on the past year with almost nostalgic pleasure. There has been a steady increase of members, which we have reason to hope will continue. That in itself is most gratifying. Our *Journal* also has done, and I trust will do, great things towards bringing the Association prominently to the notice of all leading architects and surveyors. Is not this another cause for, I will not say complete satisfaction, but certainly for congratulation, that results have, so far, been favourable? Again, the isolated position formerly occupied by the clerks of works has become a thing of the past. Instead of being scattered and comparatively unknown to each other, we are, by means of this Association, drawn and linked together by ties of fellowship and good feeling, and as years roll on we shall, as we watch its progress, esteem and love this institution increasingly. A certain result of a body of men united in one common calling, whose aims and aspirations are essentially alike, must be social intercourse, mutual professional assistance and benefit individually, and the progress of the Association generally. Having briefly sketched a few of the benefits already conferred upon us by this Association, let us pause to consider one other point in connexion with which it appears to me that our

success has not been quite so gratifying as I could wish. I distinctly remember, when the rules of this Association were being drawn up, that our chief object was so to frame them as to ensure that every member enrolled should be a *bonâ-fide* and thoroughly competent clerk of works. It was ably argued, and, to my mind, conclusively shown, by gentlemen then present, that by adopting this course we should at once start the Association on a sound basis, and, as a result, not fail to secure the co-operation and assistance of architects generally. Our sanguine expectations in this direction have not, up to the present, been so fully realised as I could wish. We certainly have occasionally received good wishes and encouraging remarks and comments from some eminent architects, which have had their due effect in stimulating us to greater exertions. We have also received applications for the services of clerks of works from some few architects, which were promptly and satisfactorily responded to. But these must be not merely more frequent, but, to satisfy me, they must be continuous; the Association must eventually be the one source from which architects seek their practical superintendents of works. Architects and professional men generally must be made to understand that this institution undertakes the fulfilment of their constant and most important and pressing requirements. Their attention must be constantly drawn to the fact that the members of this Association consider the interests of architects to be identical with their own. Seeing that it exists for the purpose of increasing the practical as well as the theoretical knowledge of its members, how could it be otherwise? Why, then, have we not yet fully realised our hopes in this direction? It strikes me that the answer must be that we have perhaps been a little too apathetic upon this matter. Do architects, as a rule, yet realise the fact that this Association consists of the most experienced men of their class, who meet together for the purpose of acquiring additional professional knowledge and intellectual improvement by the reading of technical papers and general discussions thereon, and that the benefits derived therefrom must, of necessity, be shared more or less by them. Let them but become fully acquainted with this fact, and surely it must follow that our connexion with them will soon be largely increased. Any address from this chair would be incomplete if it omitted to mention the debt of gratitude we owe to Mr. John Oldrid Scott for his liberality and many kindnesses bestowed upon us from the first. Particularly must he be mentioned his gift of the free use of this office for our business purposes, which, to us, has been truly a gift of very great importance. I consider, also, that his kindness and patronage has in no small way contributed to our attaining our present position, and I am sure I only echo the sentiments of every member of this Association when I say that his name will ever be remembered by us all with lasting esteem and gratitude.

ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

At the closing meeting for the session of this body, held on Saturday, May 2nd.
Mr. E. Chadwick, C.B., the President, reviewed the sanitary progress of the session, and a closing address. Impending war, he said, unfortunately still delayed the promised sanitary legislation, though the preventible mortality in the metropolis alone exceeded that due to the direst of modern wars. After referring to the greatly diminished mortality in the British and Anglo-Indian armies and the continuance of a high death-rate in the Indian army, the lecturer alluded to the work of the Commission for Housing the Poor, and to the stum visitations recently made in London and Dublin by its President, H.R.H. the Prince of Wales. It was stated that the mortality of slums such as the Prince had visited was more than four times that of certain locational institutions in Dublin which H.R.H. had also visited, where a mixed physical and moral training was given to the children on the 14-time principle. Turning to the Metropolitan Sanitary Commission and the question of Thames Pollution, which Lord Bramwell, the chairman of the commission of inquiry, declared to be a disgrace to civilisation, Mr. Chadwick strongly condemned the combined system, which

with an original estimate of three millions, had actually cost more than six millions sterling, and led to a demand for a further outlay of four millions, in order that sewage which represented the sustentation of more than 200,000 cows might be thrown into the sea. On the separate system, which he advocated, the houses would have been purified by self-cleansing house-drains, and the streets by self-cleansing sewers, with no stagnant putrefaction and emitting no smells, while the river would have been comparatively pure, and the power of production of the land would have been greatly increased. The improvement to public health by the adoption of the separate system would be represented in £. s. d. by a saving of 2s. 4½d. per head per week throughout the metropolis, on the necessary provision for sickness and loss of work. The undertakings of the Local Government Board were characterised by a loose practice, the continuance of which was intolerable, with the increasing pressure of the local rates, now amounting for works, to between 30,000,000l. and 40,000,000l. a year. These were points that demanded to be considered in discussing the functions of the requisite Minister of Health. Mr. Chadwick suggested, in conclusion, that the officers of the sanitary service might render good service during the coming general election by giving information, to the representatives of each political party, of the preventible reduction of the natural duration of life and the preventible waste of 25,000,000l. sterling due to the racking rheumatisms, raging fevers, and painful existences which so largely diminished the working ability of the nation. The sanitary service might be insisted on as a "plank" of every political platform.

A vote of thanks having been accorded to Mr. Chadwick, the chairman of the Council explained that the matters at present before Parliament being of so urgent a character, it was not intended to bring the question of the system of drainage before the House until there was a better prospect of its receiving adequate attention. The necessity for the appointment of a Minister of Education had often been insisted on, but he thought a Minister of Sanitation was no less a necessity.

Mr. Rains (St. George's-in-the-East) pointed out that outbreaks of small-pox had formerly been occasional epidemics in London, but now, although in a milder form, the scourge appeared to have taken up its abode permanently. He should like to know the cause of this change. In closing the discussion, Mr. Chadwick replied to this question. The origin of small-pox, he said, did not appear to be accurately known, but pure air and personal cleanliness, especially by frequent bathing,—a precautionary measure now prescribed to the hospital nurses by the French physicians,—were the recognised preventives.

THE CHANCERY-LANE SAFE DEPOSIT.

Two or three weeks ago we briefly mentioned the approaching opening of these premises for business, and we have now to record the formal opening, which was celebrated by a dinner on Thursday evening last, in the hall adjoining the premises, the Lord Mayor presiding. This establishment forms part of an enterprise due to the initiative of Mr. Thomas Clarke, who has entirely rebuilt almost the whole of the block of buildings bounded on the west by Chancery-lane, on the south and east by Southampton-buildings, and on the north by the buildings on the south side of Holborn. Here, on ground the property of Lord Radnor, Mr. Clarke has effected quite a transformation, not, however, without obliterating some ancient landmarks. The new buildings have been erected for use as offices and chambers, and their central situation, and the proximity of the New Law Courts, will no doubt go far to ensure the success of Mr. Clarke's enterprise. It is to be regretted, however, that these long stretches of stone façades are of the most mediocre and monotonous description, architecturally speaking.

The Safe Deposit itself is erected in the basement of the block known as "New Stone Buildings," and the entrance to it is from the pathway beneath an archway of polished red granite, on one side of which is what is described as "the largest engraved brass plate in the world," giving some views of the interior arrangements. Wrought-iron gates, and a portcullis or grille,

which is lowered from above when required, protects the entrance to the upper external vestibule, at the further end of which is a commodious waiting-room, and in the centre a flight of stairs leading to the lower external vestibule. This portion of the building is decorated in good taste, the ceiling being of enamelled iron, and the walls lined with various coloured marble, with a dado of grand antique. The broad staircase is composed of white marble and mosaic work, with a balustrade on each side of Jura marble. Passing down, the visitor will notice two appropriate mottoes worked in the mosaic, the one being "Safe bind, safe find," and the other a short extract from one of Burke's speeches,— "Early and provident fear is the mother of safety." The construction of these vestibules has been carried out by Messrs. Burke & Co. Beyond this lower external vestibule iron gates again har the way to what may be called the lobby, on the left of which are the offices of the manager, and on the right the gentlemen's and ladies' writing-rooms, the walls of which are hung with leather papers of Japanese design, while the ceilings are of enamelled iron arranged in panels. And here it may be mentioned that before any one can gain access even to this part of the Safe Deposit he has to run a gauntlet of attendants for the purpose of identification as a renter of a safe, or depositor of valuables.

Passing through the inner iron gates of the lobby the visitor finds himself in the internal "safe" vestibule, and is confronted with the various strong rooms, occupying three sides of the area, which is paved with tiles in pattern. On the right hand is a strong-room for the deposit of plate by persons going out of town. On the left-hand is the strong-room for cash-boxes, which may be deposited every evening, and taken away again in the morning; but those who take advantage of this convenience can pass their boxes and receive them again through a grille into the sub-manager's room from the lower external vestibule, without the trouble of having to go further. The strong-rooms, four in number, for documents and other valuables, are on the side of the vestibule opposite the lobby, and form the chief and most interesting portion of the Safe Deposit. These rooms, which weigh 500 tons, with doors of 2 tons weight each, are divided into about 5,000 separate iron safes or compartments, ranged tier upon tier, of different sizes, and known by the name of "integers." The locks of these "integers" are, we are informed, so arranged that the key of the renter, as well as the key of the custodian, will be required to be used at the same time before an opening can be effected. For convenience of handling the papers and other valuables deposited, each "integer" is fitted with a box which is readily taken out and replaced, the writing-rooms before mentioned being provided so that renters may consult the contents of their boxes at leisure and in comfort. All the strong-rooms are built on iron columns in the vaults beneath, and are completely isolated from any external walls, so that armed patrols can by night walk round, over, and under them. On each of the doors there is a mechanical clockwork arrangement that only admits of the door being opened at certain hours. For instance, at a particular hour in the evening the doors are locked by the manager, and no one can open them until the hour on the following morning for which the clockwork locks are set; and it is so arranged that on the seventh day one day is passed over, and the doors will not again open till the Monday morning at the given hour; so that if any customer or any one connected with the deposit wished to get into the strong rooms during non-business hours, or on Sundays, it will be impossible to do so, even when the parties have the keys in their possession. The "armor plating" of the strong rooms, consisting of boiler-plates with steel plates between them, is the strongest ever applied to such a purpose. The deposit and its approaches are lighted by electricity (with gas in reserve), arranged by Messrs. Thompson & Ritchie, and everything seems to have been done by Mr. Clarke to consult the convenience and comfort of those who use the establishment. Messrs. Milner were entrusted with the special work of the strong rooms, and, at the inaugural banquet, their representative gave an interesting account of the rise and progress of such establishments, which appear to have had their origin and widest development in the United States.

We understand that architects, engineers, and

others interested in the construction of such depositaries may obtain permission to inspect the premises in Chancery-lane by applying to the proprietor or manager.

BUILDING IN PRIVATE WAYS.

At Westminster, Messrs. Mowlem & Co., contractors, of Grosvenor-road, Westminster, were summoned by the Metropolitan Board of Works for contravening the provisions of the 45 Vic., c. 14, secs. 7 and 8, by forming or laying out a road, passage, or way, leading out of the King's-road, Chelsea, as a street for foot traffic, in such a manner as not to afford direct communication between two streets; and further, for laying out a footway without the consent of the Board. They were further charged under the Metropolitan Management Act with building in a way not open at both ends, and of less width than 20 ft.

Mr. Horace Avory, instructed by Mr. Thomas Burton, appeared for the Board; and Mr. Cripps for the Chelsea Park Dwellings Company, the actual defendants.

The facts, as deposed to by the Assistant Architect to the Board, were admitted. The Chelsea Park Dwellings Company, of which Mrs. Courtney is secretary, has erected a block of buildings for the better accommodation of the industrial classes, abutting on the north side of King's-road, Chelsea. At the back there is an open yard, about 60 ft. wide and 75 ft. long, and this is approached from the main road by an archway, 12 ft. 6 in. wide and 10 ft. high. The passage-way was stated to be 27 ft. long. On the north side of the yard is a block of six dwellings; on the east and west sides are small two-story houses and foundations of outbuildings. The dwellings are built to accommodate several families, and the upper stories are approached by a gallery, after the manner of the Peabody Buildings. The backs open into the courtyard, and there is no other exit from the square except through the passage-way in King's-road.

Mr. Avory, in support of the summons, said the proceedings had been taken by the Board to prevent the formation of a *cul de sac*, the obstruction of public traffic. It was here proposed to close the archway by a gate, and in case of fire there was likely to be great danger; and he referred to the case of the Board v. Hampton as being a case in support of his contention.

Mr. D'Eyncourt suggested that Burlington House was an analogous case to the present one.

Mr. Avory thought every case should depend on its own merits. The word "street" had a very wide interpretation. There was nothing limiting it to a public thoroughfare or highway. It included even a news.

Mr. Cripps contended that they were not laying out a new street. It was originally a block known as Park-terrace Cottages, and now the site was simply utilised for better dwellings. The managers considered that privacy was essential, or otherwise it would become the resort of tramps and vagrants. The place was no more a public street than Bernard's Inn, Furnival's Inn, or Staple Inn, and he further contended that the Metropolitan Acts did not apply.

Mrs. L. Courtney then deposed that she was the secretary of the company, and that she and Mrs. Scott were going to manage the same under Miss Octavia Hill's system. It was their intention to have a gate at the entrance, and the tenants would have keys, and the place would be kept private.

Mr. D'Eyncourt, at the conclusion of the evidence and arguments, reserved judgment.

THE REFORM OF THE INSTITUTE.

Sir,—Having received so many letters from members of the profession, substantially approving the scheme which I have proposed to them, and finding it inconvenient to answer them immediately, I ask my correspondents to be good enough to accept a published acknowledgment. There seems to be a little misunderstanding in one or two cases of my notion of federation. I wish to say that I only advocate federation after the manner of the federation of the States of America; nothing could be further from my thoughts than the destruction of individual action. On Monday night, the President promised that the proposed change in the Institute's Charter should be printed and circulated amongst us, and that we should have three weeks to consider it. That being so, I would advise special attention be given to the manner of electing the Council. Practically, it is now self-elected, and if that is maintained it is useless to look for any reform. A better plan will be the following: three months, say, before the election, candidates should send in their names, those names should be submitted to a committee composed of one half Fellows and one half Associates, and they should eliminate the undesirables.

On Monday night there was a good deal of complaint made of the library regulations, and I think with some justice. A committee had better therefore be appointed to inquire into this when we get our new Charter.

T. E. KNIGHTLEY.

No. 106, Cannon-street, E.C.
May 6th, 1885.

"DECORATION OF ST. PAUL'S CATHEDRAL."

Sir,—I have no doubt that many persons besides myself will be glad to learn from the paragraph which appeared in your last issue that it is not intended to commence with the dome.

Surely the course recommended by the late W. Burges, A.R.A., when he was acting as architect to the Dean and Chapter in 1873, was the correct one, viz., to select a bay of the nave as the commencement of the work.

1. Because the architecture is fully seen from the pavement upwards, and no part is hidden by stalls, as in the choir.

2. Because, being a public part of the church, the public would have a good opportunity of seeing the decoration, and of becoming accustomed to it; and

3. Because, in the actual execution, the work would be gained which would be useful when the more select portion, such as the choir, would be undertaken.

JOHN S. CHAPPLE.

May 4th, 1885.

COOKING APPARATUS FOR LARGE INSTITUTIONS.

Sir,—Without prejudice I would like to state that I called at the St. Pancras Workhouse to examine and to see the working of a new cooking apparatus described by you on the 18th ult. It was about 11.30 a.m., and consequently a good time as the pans were then in full operation. I noticed a quantity of moist steam escaping when the outer cover and under-lid were lifted, and the water in the jacket surrounding the cooking-vessel just on ebullition, the thermometer outside standing at 93° to 94° C. (202° Fahr.). The time taken in cooking is about fifty per cent. longer than with the usual dry steam-jacket pans. The cost of apparatus, as stated by Mr. Becker, not ascertained or even estimated while working at the same time with other machinery from the same service.

The coolness of the outer case, made so much of, is equally apparent in all other apparatus, when they are felted and lagged. The advisability of leaving the jacket charged with water until the following day, because of its losing but ten degrees of heat (2/3) is a curious recommendation. With an empty jacket and dry steam an apparatus is in operation at once.

The greatest recommendation of the apparatus appears to be that it is the production of a foreigner, and, therefore, must contain some virtues assumed to be inseparable from other than home products.

ROBT. CRANE.

Sir,—Mr. Becker will not advance his case by misrepresentation. The apparatus in the kitchen of the Lambeth Workhouse referred to in my letter to you is not a Berghaus apparatus, as stated by Mr. Becker, nor is it, as he states, "an ordinary steam cooking apparatus." It is, I repeat, identical in principle with that of Mr. Becker. It consists of two copper pans or kettles surrounded by water, which water is heated to the desired temperature by a steam pipe, so that a different degree of heat can be applied to each compartment. There is also the water seal for the edges of the cover as described by you.

I have seen Mr. Becker's apparatus at St. Pancras, and the similarity of principle between that and the one at the Lambeth Workhouse is so remarkable that I am quite content that a competent and impartial commission shall compare the two and decide whether or no the principle of cooking is the same in each case. I also invite members of the architectural profession to see for themselves. The economical results from this principle of cooking, especially in the saving of loss of weight in the meat, are remarkable, and as the Lambeth Guardians have had the benefit of the saving from this apparatus for eleven or twelve years, it is rather late in the day to be told that English architects must needs go abroad in order to learn how to design cooking apparatus.

THOS. W. ALDWICKLE.

2, East India Avenue, E.C., May 6.

THE ALBERT PALACE.

Sir,—We should be obliged if you would repair an omission in your notice of last week [p. 634] respecting the Albert Exhibition Palace. May we ask you to state that the recent works at the Palace, comprising the completion of the present buildings and certain extensive additions, have been carried out from designs prepared by us and under our superintendence, as Architects to the Palace Association?

F. & H. FRANCIS & SONS.

34, Old Broad-street.

PROVINCIAL NEWS.

King's Lynn.—A new pulpit has been presented to St. John's Church, in memory of the late Francis Joseph Cresswell, banker, of that town. The pulpit is of Carr stone, octagonal in shape, with clustered shaftings at the angles of grey and red Devonshire marbles, from which spring the cusped arches, with sculptured head at the intersections. In the panels are shaftings of Stenna marble with interlacing arches. The work has been well executed by Mr. Ducker, of the Railway Road, from the designs of Mr. W. Adams, architect, King's Lynn.

Ascot.—A jewelled Irish cross in marble has just been erected by Lady Olivo Bayley in the churchyard of Ascot, in memory of the late S. Edward Olivo Bayley, K.C.S.I., C.I.E., who had interred there. The work has been executed by Messrs. J. Underwood & Sons, of Duke-street, Grosvenor-square.

Alfreton.—A meeting of the Alfreton Sanitary Parochial Committee was held on the 30th ult. at Swanwick Delves, to consider a report made by Mr. W. H. Radford, A.M. Inst. C.E., Nottingham, as to the disposal of the Swanwick and Lea Brooks sewage. Mr. Radford proposed to locate a suitable quantity of land near the Butterley Reservoir from Mr. Wood, and concentrate the sewage from the two districts at this point, where it would be dealt with by irrigation, the land being specially prepared, lightened, and drained for the reception of the sewage. The committee resolved to recommend the Belper Sanitary Authority to adopt the scheme in its entirety, and proceed to carry it out as soon as possible. The committee also recommended that Mr. Radford be ordered to prepare a scheme for dealing with the sewage, the whole of the remaining portion of the district, including Riddings, Somercotes, Slight Moor, Birchwood, Smotherly, and Pye Bridge.

CHURCH-BUILDING NEWS.

Southampton.—The new Church of St. Mary Southampton, erected as a memorial of the late Bishop Wilberforce, and which was opened on May last year, has just received the addition of a very handsome reredos, which was unveiled at Easter. The reredos, which is 21 ft. 6 in. long and 16 ft. 6 in. high, has been executed by Messrs. Earp, Son, & Hobbs, of London & Manchester, and has cost over 600l. It comprises five groups of sculpture, executed in relief, in pure white alabaster, the same material used, green and dove-colour being used in the architectural surroundings. There are the central arches, having crocketed gables, with ornamental cross in the centre, and finials on the two sides, resting on carved capitals, supported by green and red marble columns, which cluster round enriched buttresses terminating with pinnacles. The central subject is the Ascension, the heads of beholding disciples looking towards the other chief figures in the work, with which the other chief figures in the work correspond, the supporting groups right & left representing respectively the Agony in the Garden and Bearing the Cross. The two divisions have a horizontal treatment of tracer panelling resting upon double arches, enclosing sculptures of the Annunciation and the Nativity.

Bristol.—The design of the proposed new Church of St. Francis, Ashton Gate, have been sent in by the architect, Mr. John Bevan. It is proposed to build the church in four sections, viz.:—(1) Chancel and side chapel; (2) tower and spire. Of these sections, No. 4 will be aside at once; No. 1 will have the first plan and will accommodate forty choristers, and adjoining chapel, which will hereafter be daily service chapel, will for the present be to act as an organ-chamber, and it will accommodate forty people, and will be useful for small congregations on week days, Bible classes, &c. The cost of this portion will be 1,200l. No. 2, the nave, will accommodate 450 people, at a cost of 2,500l. No. 3, vestries, organ-chamber, and the aisle, which room will be left, in anticipation of parish growing larger, and which will accommodate another 190 people, will cost 1,800l. so that when the three sections are complete the church will seat 720 people, and the total estimated by Mr. Bevan at (minus the tower and spire) 5,000l. Half this amount is raised by the Church Extension Society, 2,500l. is, therefore, to be raised by parishioners.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

2,903, Portable Buildings. A. J. Boul (T. Arrow).

The framework of these buildings is composed of wooden bars jointed together by iron shoes of various forms to suit circumstances, covered with tarpaulin or any suitable waterproof material. The pipes may be jointed also in such manner as to form shelves or berths such as are required in barracks.

13,053, Girders for Fireproof Structures. V. H. Lindsay.

An inverted trough is bolted or riveted to the underside of the lower flange of the girder. The ending sides of the trough form the abutments from which the brick arches of the floor spring. The trough is filled with fireproof composition and covered with a thin plate. The object is to prevent the lower flange of the girder in case of fire from being subjected to sufficient heat to soften it.

384, Producing Ceramic Plates with Inscriptions in Relief or Intaglio. J. B. and E. Shaw. Moulds for the production of ceramic plates with inscriptions, &c., in relief or intaglio, made up of type similar to those used for letterpress printing. The clay, in the form of a back or in the dry state, is pressed into the mould and fixed in the usual manner. The face of the type may be bolted over with mineral colour if it is desired to produce coloured lettering on the plate. By this process letters for advertising or other purposes, and enamel tablets, may be produced.

625, Lock Furniture. E. S. Norcombe. The knob is made separately from the neck, and they are braced together. The spindle is square, and has on one face a series of square grooves; the neck with shallow square recesses in its face, is inserted in the neck, a square slide with spring bearing on one side of the spindle is then put into the recess, and over that a washer. The lower part of the slide in its normal position engages to the groove in the spindle, but by pressing down the pin or its equivalent, the slide is disengaged and the knob may be turned a required distance along the spindle. A set screw is made with brads on its back to fasten to the door.

728, Floating Flushing Valve. F. J. Alford. The discharge valve at the bottom of the flush-tank, and has a float attached to it of such dimensions that when covered by water it retains the valve in either an open or closed position. The valve is opened by a lever and hand-chain, and is closed by spindle with a nut on the bottom. Any light modification in balancing the float may be obtained by adding small lead weights. An air-lead into the discharge-pipe below the valve, and may be connected to the tank to serve as an overflow-pipe. When the valve is opened it remains until the water sinks low enough for the valve to be influenced by the current, and is then drawn to its seat, where it is retained till again lifted by the hand-chain. The float may be in the form of an india-rubber ball, guided by a perforated zinc wire guard; the ground valve is then dispensed with the ball itself closing on its seat.

1,819, Street and other Lamps. J. Nohle. A method of fixing the panes of glass in street or other lamps. The top panes rest with their outer edges in grooves in the lamp framing, and are held by thumb-pieces at the top, and the sides rest in side grooves in the framing, while the bottom panes rest with their outer edges in grooves in the frame, and are secured by a central thumb-piece.

247, Asphaltic. C. J. Lortzgang. Vaste waters from wool-washing, &c., are run into a tank and treated with water containing green vitriol (or other sulphate or sulphuric acid) in proportions determined by the nature of the liquid. The sediment is dried by firing or otherwise. For asphaltic mastic the sediment is ground upon a warm metal surface under pressure, or by a mortar-mill with heated rollers. The mass is melted, limestone or slag, &c., added, and is run into moulds. For compressed mastic the sediment is powdered and thoroughly mixed with powdered limestone, and then emulsified as usual. The addition of lime to the mastic may be avoided by increasing the amount of oil added to the waste water.

817, Artificial Marbles. A. Gnattari. Various objects, blocks, or powder soaked in hot water; for black marble.

1,175, Engineer's Reversible Level. C. F. T. Cooke.

The telescope is complete in itself and detachable, is fitted with two flanges of equal size to allow the telescope to be inserted from either end. The flanges fit into two sockets connected by a tube, carrying a spirit-level above. The telescope is justed at one end by the lock-nuts, the other being slightly rounded off and joined to the tube by a screw. The vertical axis is adjusted in ordinary manner by screws.

Salvation Army "Barracks."-Barrack buildings are in progress at Manchester, Mr. Holt, builder; Leamington, Mr. M. Gascoyne, builder; and Plymouth, Mr. T. Foote, builder. The total cost of the three buildings will be about 7,000l. "Barracks" are also about to be erected at Darlington, Runcorn, Wisbech, and Tunbridge, under the supervision of the architect's chief assistant, Mr. J. Williams Dunford. The whole of the works are being carried out from plans and quantities supplied by and under the direction of Mr. E. J. Sherwood, architect, 101, Queen Victoria-street.

The Student's Column.

DESCRIPTIVE GEOMETRY.-XIV.

SOLID ANGLES.

THE simplest of solid angles, such as the angle of a stone or a box, has at least three faces divided by three arrises, and containing three inner angles between the contiguous faces. To avoid Greek names we shall call such angles triangular solid angles. As in masonry, we shall constantly have to do with such angles, it is important that when we know some of their component parts we should be able to deduce the others.

Given the three faces of a triangular solid angle find the inner angles. (We mean by the term "inner angle," the anglely which we judge of the sharpness or the bluntness of an arris.)

Let aob, boc, cod be the faces of the solid angle; we cut them by a circle with centre o, so that ao, bo, co, do be equal. If we rotate the face aob round bo and cod round co the points a and d will meet in a point m, of which m^h is the horizontal projection; taking a m^h for L T we draw on this elevation the circle described by the point a on which will be m^v, and thereby know exactly the position of the third arris of the solid angle; m^h g m^v is one of the inner angles; m^h e m^v is another inner angle; for the third angle we carry out the same operation again after placing on the plan the face cod in juxtaposition with the face aob. We can see also by this figure that a triangular solid angle must have its largest face smaller than the sum of the two others, and that the sum of the three faces must be less than four right angles. The first is obvious; for if the face that is the angle boc were larger than aob + cod, the sides ao and do could never meet while rotating round the hinges bo and co; on the other hand, if the sum of the three faces were larger than four right angles, then the faces aob and cod would partly cover one another when laid down on the plan, and the sides ao and do, instead of meeting when rotating round the hinges bo and co will, on the contrary, move away from one another. The student will perceive this fact more clearly by making a small model of our diagram in drawing paper; to produce three sides larger than four right angles he will have to glue a piece on to one of the sides. (See fig. 71.)

Fig. 71.

Given one of the inner angles with the adjoining faces, find the other parts of the solid angle.

Let aob and boc be the adjoining faces of an inner angle agb, we see by fig. 72 how we

Fig. 72.

deduct m^h, from which a perpendicular to co will give us the point d of the face cod. (See fig. 72.)

Fig. 73.

Fig. 74.

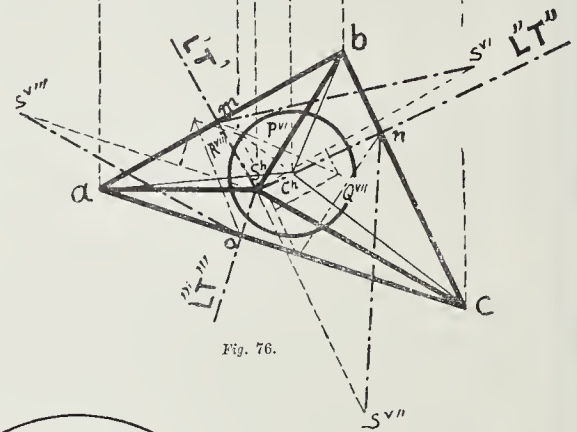

Fig. 75.

Fig. 76.

Fig. 77.

two faces and the inner angle opposite, find the other parts of the solid angle.

Let aob and boc be the given faces, and the angle given be that of the arria a o c. ... We will make a vertical plane which we as our elevation plane, and we shall have this elevation the circle described by the arc a c. If we call R the plane of the third arc a d, the intersection of its vertical trace with the circle described by the point c will be point m belonging to the arria d o red; from m a perpendicular to a o will be the point d of the face a o d, and these parts of the solid angle can be found required. To find the vertical trace R' we make an auxiliary elevation on L' T, perpendicular to a o, and the angle of the arria will give us the vertical trace R', and we cut therefrom R' in the ordinary way. (See 3.)

Given a face and two angles, find the other parts of the solid angle.

Let the students acquainted with solid geometry, we shall say that in the complementary angles of the faces are complements of the angles of the given solid angle. We solve complementary solid angle by one of the methods above and deduct therefrom the real solid angle. But we can solve direct allowing problem.

Given the face a o b and the adjacent inner angles, find the other parts of the solid angle.

Through the point a we take our elevation perpendicular to b o we have only to thereon the traces of the planes of the rising faces. We shall call these planes R' S'. The angle of arria b o allows us to cut at once the trace R'. As to the trace S', we get it first in S' on an auxiliary plane on L' T perpendicular to a o, and cut therefrom as before trace S' on the elevation plane. The intersection of R' S' gives us m, a point of the arria, and we then find as before the other parts of the solid as before. (See fig. 74.)

Describe a sphere to a triangular pyramid.

Let a sphere will touch the four angles of a pyramid. The centre of the sphere being an equal distance from each angle, it will be on the intersection of three planes, P, R, respectively, perpendicular to the faces of three arries of the pyramid. We then find that to find the traces of the plane P we first draw a horizontal line, F, of the plane through the centre of arria 4, 3. Elevation of F is horizontal, its plan is elevation of F, the plan of the arria is elevation of 4 3, the plan of the arria passes through a', vertical trace of the line is perpendicular to 4 3, elevation of the line; as for P, it is parallel to F. By the method we find the traces of the plane Q perpendicular to arria 1, 4, and of the plane R perpendicular to arria 2, 4. The intersection of the planes R and Q is the line a c, the intersection of the planes P and Q is the line b c, therefore c is the point where the three planes meet, which is the centre of the sphere required. We may only to find the real length of one of radii, such as c 1, and we can draw the rest. (See fig. 75.)

Describe a sphere in a triangular pyramid.

This would be the problem we should have to solve if we were asked to carve out of a piece of stone of that shape the largest sphere possible.

The centre of the sphere must be at an equal distance from the four faces of the pyramid, will therefore be found by the intersection of the planes which bisect the inner angles of the pyramid on the arries ab, bc, ca. To get the inner angles we cut them by vertical planes perpendicular to the arries as L' T, L' T', and L' T''; as these three planes all contain the apex S, we can draw on each the respective vertical traces of the faces of the pyramid such as a, a', and OS', which give us the inner angles of the arries ab, bc, ca. We then can on each elevation the traces of the planes which bisect the inner angles such as P', Q', and R', the horizontal traces of these planes are, therefore, the arries themselves of the pyramid. We must now find the intersections of the planes P and Q, also of planes P and R, the vertical traces of which belong to different vertical planes, a problem we have already solved in the Builder, fig. 21. Where the two

intersections meet we have C', the plan of C, the centre of the sphere, and can deduct from one of the auxiliary elevations its height, by which we get C'. (See fig. 76.)

Miscellaneous.

Amalgamated Society of Engineers.

The effects of the existing depression of trade are clearly shown in the thirty-fourth annual report of the Amalgamated Society of Engineers, just issued. The monthly returns of members out of work increased from 1,833 in January, 1884, to 4,090 in December last. This was chiefly attributable to the collapse in the ship-building trade, which made a difference to the labour market of 7,500,000. Other countries, however, are in a worse condition than our own, the depression having been universal. The report states that the total number of branches is now 430, as compared with 424 in 1883. The total membership at the close of 1884 was 50,681, being an increase of only 263 on the previous year. The income for last year was the largest in the history of the society, and reached the large total of 157,484l., showing an increase over the previous year of 22,835l. This was due to a special levy during the year, and it is pointed out that, even with its increased income, the society has been unable to keep up with its expenditure, which amounted to 172,811l., or 48,117l. more than was spent in the previous year. A considerable proportion of this outlay had been expended in out-of-work support, which had absorbed 59,056l. Sick benefit absorbed 27,977l., and superannuation 30,510l., while special strike expenditure had been very heavy. The total expenditure during the year amounted to 15,537l. more than was obtained, but deducting this from the previous balance of 178,125l., the society had still left an accumulated fund of 162,708l.—Times.

Bust of Coleridge in Westminster Abbey.

A portrait bust of Samuel Taylor Coleridge was unveiled in Westminster Abbey on Thursday afternoon by Mr. J. Russell Lowell, the American Minister. The bust is from the studio of Mr. Hamo Thornycroft.

Fire-Resisting Properties of Cyanite.—Some interesting tests of the fire-resisting properties of cyanite were afforded by the manufacturers of the material (the Patent Liquid Fireproof Cyanite Company, Limited) on Wednesday last, on the site of the abandoned Opera-house, Victoria Embankment. The material (of which mention has been made in our columns on previous occasions) is a liquid solution, of which silica is the basis, and it is applied with a brush direct to the surface of the woodwork, serving either as a priming to be afterwards covered with paint, or as a stain in lieu of the ordinary pale oak stain, which it much resembles in colour when applied to deal or other white woods, though it is also made colourless. It is claimed by the manufacturers that this solution sinks into the pores of the wood, and renders the timber for a considerable period proof against the attacks of fire. That the application of the solution has the effect of retarding the attacks of the flames for a long time was conclusively shown by the tests of Wednesday last. The tests were four in number. For the first one, a small flight of stairs, constructed of 1½ in. common white pine, was primed with two coats of cyanite, and underneath it a large heap of chips and shavings, plentifully besprinkled with benzoline, was ignited and burned for half an hour before the soffits of the treads and the backs of the risers were perceptibly charred. After the lapse of another half-hour, during which the under part of the woodwork of the stairs continued to smoulder, the stairs were proved to be strong enough to bear the weight of a man. Other tests, with packing-cases, were equally successful. The cases (three in number) were each about 2 ft. 6 in. deep, 3 ft. 6 in. long, and 2 ft. 6 in. broad. They were each stood up on end, and a large fire of shavings and chips sprinkled with benzoline was lighted in each. One of the cases was not coated with cyanite, and it speedily collapsed and became a mass of charred embers. The two other cases retained their form and position after the lapse of an hour, and it was only after the first half-hour's exposure to the flames that the wood became perceptibly charred and began to burn to any appreciable extent. It is asserted that this solution is permanent in effect and does not injuriously affect the woodwork to which it may be applied. If this be so, the solution has a wide field of usefulness open to it.

The Fatal Gas Explosion at Rotherhithe.—Mr. Langham resumed on Wednesday the inquiry at Cuy's Hospital concerning the death of Rebecca Ewington, late of 9, Eugenie-road, Rotherhithe, who died from the result of injuries sustained by the recent gas explosion in Rotherhithe. Workmen employed by the gas company stated that the gas-pipe was laid upon perfectly solid ground. The builders afterwards excavated under the main for gravel, about 12 ft. of earth being taken from underneath. During the work the main was supported by wooden props, and there were a large number of bricks stacked in the road. This would affect the gas-pipe very seriously. The jury returned the following verdict:—"In the opinion of the jury the deceased's death was due to the explosion of gas. The cause of such explosion is traceable to the excavations made under the main, but by whom the jury have no evidence to show. They are further of opinion that in September last, when the gasman was drawn out of the hole insensible, there should have been more care taken to have seen that the main was perfectly secure."

Association of Municipal and Sanitary Engineers and Surveyors.—A Midland Counties District Meeting is to be held at Nottingham, on Saturday next, May 16, 1885. The members will assemble in the Council Chamber at 11 a.m., to elect district secretary. The following papers to be read:—"Result and Advantages of the Meter System in Domestic Consumption," by Mr. George Winship, borough surveyor, Athingdon; "Five Years' Municipal Work in Nottingham," by Mr. A. Brown, borough engineer, Nottingham. In the afternoon visits will be made to Sir John Oldknow's lace manufactory; the Work and Ways Depôt; stables, &c.; the Health Depôt, —destructor and pail closet system; the London-road Paving Works; Trent Bridge; and Nottingham Castle Museum; and if time allow, other objects of interest. The members will then return to the Council Chamber and discuss the papers, &c. A pretty full programme.

A Monster Weighing-Machine.—Messrs. Henry Pooley & Son, Albion Works, McAlpine-street, Glasgow, and Liverpool, have just turned out a weighing-machine of exceptionally great capacity. It is on the suspension principle, and has been specially designed for weighing marine boilers and heavy castings for Messrs. J. & G. Thomson, shipbuilders and engineers, Clydebank, Glasgow. The knife edges and bearings are all of extra fine cast steel, specially made for this purpose, and the other parts are of best steel and Lowmoor iron. The breaking strain is calculated at 1,400 tons, and the machine has been tested at Lloyd's up to 120 tons. After testing, the machine was taken to pieces, and all the knife edges and bearings were found quite sharp and uninjured. The machine is suspended from the shears by a massive band of solid steel, weighing 15½ cwt., and the lower link and cross-head, from which the articles to be weighed are suspended, weigh 13 cwt. The levers and other working parts are all of the finest steel, and are enclosed in a waterproof box of great strength. The steelyard or index lever is also enclosed in a waterproof box, fitted with folding doors, and is graduated from pounds up to 100 tons, the indications being obtained by means of sliding poises, without loose weights. This part of the machine is nickel-plated, to prevent rust. Messrs. Pooley & Son, who were the pioneers in the introduction of the platform weighing-machines in this country, have recently made several special weighing-machines for home and abroad, including a weighbridge with a table 23 ft. square, another with a platform 40 ft. long, and an order they have in hand at present for a leading Scotch Company, is for a weighbridge of 80 tons capacity, fitted with eight separate weighing-tables.—*Glasgow News*, Sept. 26, 1884.

Cable Tramways.—At a meeting of the Society of Engineers, held on Monday evening, May 4, at the Town-hall, Caxton-street, Westminster, Mr. Charles Gandon, president, in the chair, a paper was read by Mr. W. Newby Colam on "Cable Tramways." The author, on introducing the subject of his paper, alluded to the number of years that vehicles had been propelled by wire cable, and explained that the novelty in the cable system of tramways was the invention which had enabled a cable to be used as a transmitter of power to tram-cars in such a manner that they can be drawn through crowded streets without interfering with the ordinary traffic. The author then gave an account of the history of the invention and its application to the first cable tramway, which was constructed up Clay-street-hill, San Francisco, in 1873. The great mechanical and financial success of this first line induced other tramway companies, at that time using various motors, to convert their lines to the cable, with the result that there are now over forty miles working most successfully in that city. The lines in San Francisco are more or less very steep, in places being as severe as 1 in 5; but the introduction of the system in 1882 into Chicago, which city is practically on a dead level, has demonstrated its great advantages under such circumstances, and in climates subject to extreme variations of temperature and heavy falls of snow. Over twenty miles of cable track is now in operation in that city, and, during the very severe weather of last winter, the cables were the only uninterrupted means of locomotion. The remainder of the paper was devoted to describing the construction of the Highgate Cable Tramway, to which the author is engineer.

Messrs. Steven Bros. & Co., architectural, sanitary, and general ironfounders, of 35 and 36, Upper Thames-street, E.C., have, we are informed, secured the lease of new and extensive premises at Nos. 3, Upper Thames-street, opposite the *Times* Office, Queen Victoria-street, and, after they complete their extensive alterations, they will be able to have on show what they believe will be the largest stock in London of kitchen ranges, marble chimney-pieces, marble kerbs, tiles, and tile hearths, slow-combustion stoves, stable fittings, hot-water apparatus, bakers' oven work, ornamental gates, railings, verandahs, spiral and straight staircases, baths, and fittings, &c., &c. Owing to the large and increasing demand for their manufactures, Messrs. Steven Bros. & Co. have found it absolutely necessary to remove their stock to warehouses where it may be seen to better advantage than has been the case, owing to want of space, at their present address.

The "Great Western Hall," Farringdon.—The "Great Western Hall," which has just been erected for the Salvation Army (on the site lately occupied by the Union Saw Mill situate in Burne-street and Lisson-street, Edgware-road, W., and containing a superficial area of 14,500 ft.), was opened on the 2nd inst. The buildings consist of a large main hall, with gallery running round the entire length, basements, retirement-rooms for male and female speakers, band-room, treasurer and secretary's room, officers' and caretaker's quarters, book and uniform stores, ticket-office, boiler-house, lavatories, &c. The public approach to the main hall is from Lisson-street, leading into vestibule, which is well lighted from the ceiling by means of marginal lights. From here access can be gained to the ground-floor, which is constructed in the amphitheatre style to the galleries, the corridors of which are constructed independently and of fireproof materials in accordance with the Metropolitan Act relating thereto; and to the basement, which has been specially designed for catering purposes on special fête days, but which will be used on other occasions as a week-night hall. The private entrances are in Burne-street, immediately adjoining the Edgware-road Metropolitan Railway Station. In the main hall and galleries seating accommodation has been provided for 3,200 persons, in the basement for 1,000, and the cost has been about 5,000l. The whole of the work has been carried out by Mr. G. Brick, builder and contractor, of Hendon, from designs and under the superintendence of Mr. E. J. Sherwood, architect and surveyor, 101, Queen Victoria-street.

Coal Mining in China.—It is stated that the Chinese Government, casting aside national prejudice, are on the point of working the coal-mines of China in a more systematic manner than has hitherto been done, calling in the aid of European miners. They recently applied to the Société Cockerill, Belgium, for a contingent of experienced miners to superintend the extensive collieries which they propose to open up in certain of the rich deposits already prospected. Very liberal salaries were offered, and it is said that the appointments were eagerly accepted. Thirty miners were engaged, and they are likely to be followed by another thirty, who will proceed to China on the chance of obtaining an engagement on their arrival. As the government will probably be glad to avail themselves of European aid, there is hardly a doubt that they will speedily obtain the appointment they desire. It is also probable that the Chinese will obtain the necessary plant to work their mines properly. But they will soon learn the proper methods of working, and in opening other mines they will adopt the system they have learned, dispensing in the future with the aid of Europeans. The Chinese, like the Japanese, learn things readily, and then conduct matters themselves. There are large deposits of coal in China, and, with the assistance now obtained, they will very quickly be developed, so as to be of more importance than heretofore.—*Iron*.

Cholera in Europe.—Rumours of cholera from time to time remind us of the prospect of a recurrence of the disease in an epidemic form during the coming summer. The most important announcements have come from Spain, where early in April a considerable number of cases were alleged to have occurred in the province of Valencia. The statement was, however, soon followed by contradictions, and precise information on the subject has since then not been forthcoming. France, however, imposed a three days' quarantine on arrivals from Spain. Since then we have heard that a case has occurred at Osio, not far from Bergamo, and a French newspaper has reported cases at Cairo. In the meantime, the postponed European Conference has again been postponed to May 15th, and it is stated that the India Office will send separate representatives. Switzerland will be represented by M. Davier, the Swiss Minister to Italy, assisted by Dr. Sonderberger and Dr. Reali.—*Lancet*.

Birmingham.—On 30th ult. the Bishop of Worcester consecrated the Lea Memorial Church at Birmingham, erected from the designs of Mr. J. A. Christy, of that town. Messrs. Jones & Willis have supplied the choir stalls in oak and the bishop's chair.

Fulham Road.—We are informed that the carriage-way of Fulham-road from Stamford Bridge will be closed for a period of six weeks for the purpose of being repaved with wood-paving by Messrs. Muldoon Brothers.

New Baths at Forest Hill.—The new baths constructed by the Commissioners for Public Baths for the Parish of Lewisham at Forest Hill were opened by Earl Dartmouth on the 2nd inst. The buildings are in the French Renaissance style of architecture. There are two swimming-baths (first and second class) each 30 ft. by 30 ft., lined throughout with white glazed bricks, the depth of water being 3 ft. 6 in. at the shallow end, and 5 ft. 6 in. at the deep end. Special arrangements are made for removing the scum which accumulates on the surface of the water in all swimming-baths, by means of overflow-hoses placed at frequent intervals round the walls of the baths, these serving also as spitoons. A special inlet at the surface level of the water admits of a jet of water being introduced at this level, thus inducing a current and driving the scum down the overflow hoses. The first-class bath is specially designed so as, in the winter months, to be used for the purposes of a public hall for entertainments, concerts, &c. It has an open pitch-pine roof, and a hold gallery round two

sides and one end. In connexion with this hall careful attention has been paid to the means of exit, there being no fewer than five large double doorways, the doors all opening outwards. There are also provided twenty-eight "slipper" or private baths, and the establishment is completed with the usual towel laundry, smithy, &c. A special feature of these baths are the engineering arrangements, which are of an exceedingly simple character, but are found in actual practice to adequately perform all the necessary work, such as heating the water, &c. The cost of the whole of the buildings and fittings will not exceed 10,000*l.* The architects, Messrs. Wilson, Son, & Aldwinckle, of 2, East India-avenue, Leadenhall-street, claim that these are, in regard to their size, by far the cheapest baths in London, while all necessary accommodation is provided. Similar buildings, at the same cost, and from the designs of the same architects, have just been opened at Ladywell. Plans and elevations of both these baths appeared in the *Builder* for December 1st, 1883.

For engine-house for 100-h.p. engine, for the Tottenham Local Board. Mr. A. H. de Pape, engineer. Quantities by Messrs. Campbell & Son, Tottenham —

	Engineer's Design.	Deductions from Engineer's Design.	Reduced Design.

TENDERS.

For new bakeries at Battersea, for Messrs. J. & B. Stephen, of Glasgow. Mr. Thomas, architect, 43, Pall-mall—

Bell, Hornsby, & Co.	£18,615 0 0
H. & E. Lee	17,613 0 0
Lucas & Son	16,650 0 0
W. & D. McGregor (accepted) ..	16,500 0 0
Peto Bros.	16,498 0 0
C. F. Kearley	16,365 0 0
Ferry & Co.	16,270 0 0
Cooke & Son	16,139 0 0
J. Richardson (informal)	15,541 0 0

* The sender of this tender writes—"This is scarcely fair to London builders, as the above firms were asked to tender by the architect."

For alterations and repairs at Prospect House, Dartmouth, for Mr. R. W. Soper. Mr. E. H. Back, architect, Dartmouth. Quantities supplied:—

E. J. Henley, Dartmouth	£290 0 0
O. Vesle, Dartmouth	267 6 0
B. Williams, Dartmouth (accepted) ..	213 0 0

For erection of new workhouse buildings at Fordingbridge, for the Guardians of the Poor of the counties of Hants and Wilts. Mr. Fred Bath, Salisbury and London, architect. Quantities supplied:—

James Edwards, Southbourne, Bournemouth	£18,572 14 3
Hopkins & Son, Wilton, Salisbury ..	14,859 0 0
Samuel Mundy, Bournemouth	13,741 10 0
W. J. & C. S. Young, Salisbury	13,259 0 0
Wm. Church, Weymouth, Briston ..	12,953 0 0
McWilliam & Sons, Bournemouth ..	12,530 10 4
Gilbert Harris, Salisbury	12,522 8 5
H. W. Jenkins & Sons, Bourne-mouth	12,520 0 0
John Shering, Fordingbridge	12,409 13 6
H. Vickers, Nottingham	12,250 3 1
Samuel Clarke & Daniel Hetching, Farnstone, Poole	11,983 0 0
James Ball, Cowes, I.W.	11,974 0 0
H. J. Sanders, Northam, Southamp-ton	11,802 0 0
James Longley, Crawley, Sussex ..	11,680 0 0
Joseph Bull & Sons, Southampton ..	10,779 0 0
John Greenwood, St. John's street, Mansfield, Notts	10,300 0 0

* Accepted subject to omission of infirmary block, boundary-walls, general fittings, &c.

For alterations to a residence known as Ferrymead, Stratham, for Mr. W. McDonough. Mr. Richard Peters, architect, 72, Wool Exchange, Coleman-street:—

T. Ennor Julian	£245 0 0
Kemp	262 0 0
Richardson Ross, (accepted)	191 0 0

For restoring building and shop after fire, 60, Clapham-road, for Messrs. Roy & Cartwright:—

John Beale	£396 0 0
------------------	----------

[No competition]

* Accepted. † Informal.

For the erection of a new Wesleyan Chapel, Bedminster, Bristol. Mr. Herbert J. Jones, architect, Bristol:—

Eastbrook & Sons, Bristol	£1,829 0 0
Stephens & Easton, Bristol	4,500 0 0
E. T. Hatherly, Bristol	4,562 0 0
Geo. Humphreys, Bristol	4,500 0 0
H. J. Rossiter, Bristol	4,240 0 0
Jewell & Son, Bristol	4,245 0 0
J. E. Davis, Bristol	4,234 0 0
W. A. Green, Clevedon, Somerset ..	4,163 0 0
Walters & Son, Bristol	4,121 0 0

Jas. Wilkins, Bristol	3,984 0 0
Geo. Wilcox, Clevedon, Somerset ..	3,835 0 0
A. J. Bevan, Bristol	3,790 0 0
Thos. R. Lewis, Bristol (accepted) ..	3,791 0 0

For alterations to Nos. 39 and 40, Wine-street, Bristol, for Mr. Walter Verrier. Mr. Herbert J. Jones, architect:—

W. Church, Bristol	£315 0 0
T. R. Lewis, Bristol	498 0 0
Eastbrook & Sons, Bristol	493 0 0
G. Humphreys, Bristol (accepted) ..	482 0 0

For the erection of schools, Lower Mortlake-road, Richmond, for the Holy Trinity Schools Committee. Mr. S. H. Seager, architect:—

Seal	£1,446 0 0
Sims	1,350 0 0
Sweet & Loder	1,289 0 0
Rodwell	1,224 0 0
Miton	1,195 0 0
Carless & Co.	1,167 0 0

For works to be executed at 64, Milton-street. Mr. Coult's Stone, architect:—

Smith	£189 0 0
Blow	152 0 0
Shore	150 0 0
J. O. Richardson (accepted)	136 0 0

For alterations and additions to Albert Villa, Finchley-road, for Miss Matthews. Mr. Wm. Musket Yettis, architect, 44, Finchbury-pavement. Quantities supplied by Messrs. Franklin & Andrews:—

Prestige & Co.	£3,776 0 0
Rider	3,779 0 0
Canning & Mullins	3,769 0 0
Macey & Sons	3,738 0 0
J. W. Falkner	3,675 0 0
Woodward	3,635 0 0
Morter, Stratford	3,541 0 0
Horns	3,439 0 0
G. & J. Green, Hackney (accepted) ..	3,385 0 0

For alterations at the Metropolitan Music Hall, Edgware-road, for Mr. Lake. Mr. E. Clark, architect:—

Langridge & Sons	£2,660 0 0
F. Mark	3,179 0 0
C. Wall	2,600 0 0
J. Anley	2,507 0 0
Johnson & Manser	2,490 0 0
T. L. Green	2,429 0 0

For proposed Dispensary and Cottage Hospital at Bevelay, Messrs. Smith & Broderick, architects:—

Grasby, Hull	£2,308 0 0
Bergeant, Hull	2,114 0 0
Simpson & Malone	2,033 0 0
H. Richardson	2,008 0 0
Stophenson & Son	1,938 0 0
