At a special meeting of the Lowestoft Improvement Commissioners, held at the Town Hall, Lowestoft, it was reported that the Paving and Draining Committee had received tenders for 15,000 square yards of concrete pavement from twenty-five different firms. Of these seven were selected; and of these again the following were finally decided on—Mr. J. H. Bryant (of the Patent Grano Metallic Stone Company), 5,000 yards at 4s. per yard; Messrs. Curzon Impervious Company, 5,000 yards at 3s. 6d. per yard; and Mr. A. Bidwell, Lowestoft, 5,000 yards at 2s. 9d. per yard.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 46, Catherine-street, W.C., not later than **Four p.m. on THURSDAYS.**

TO CORRESPONDENTS.

M. P. B. & C. (shall be attended to)—J. & Co.—S. & S. (thank)—G. P. E. & W. W.—L. and D. F. E. (it is not our custom; we receive more than we can find room for as it is)—W. D.—J. & Son.—J. D.
 All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.
 We are compelled to decline posting out books and giving addresses.
 Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author.
 We cannot undertake to return rejected communications.
 Letters or communications beyond mere news items which have been duplicated for other journals, are NOT DESIRED.
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

The Report of the Royal Commission on the Housing of the Poor.

THE first portion of the Commissioners' Report, now published, deals with the questions submitted to their investigation so far as concerns England. The further consideration of the subject

as regards Scotland and Ireland is to be carried on, and the result published in a future report. As the qualifying phrase "first portion" only refers to the fact that the present report does not include Ireland and Scotland, we may regard the report as complete so far as it goes, and consider what is the result it offers in the way of an escape from the lamentable state of things to which it refers.

The Report signed by all the Commissioners occupies nearly fifty-eight pages, and to this are appended other sub-reports conveying the special views of sections or individuals of the Commission in regard to points on which the whole of them are not in accordance. Thus, a brief Report, charging the system of leasehold building with many of the evils connected with overcrowding, unsanitary buildings, and excessive rents, is signed by Cardinal Manning, Lord Carrington, Lord Provost Harrison, Messrs. Lyulph Stanley, Gray, Torrens, Broadhurst, Jesse Collings, Godwin, and S. Morley. The Marquis of Salisbury follows with a memorandum rather in elucidation and amplification of various points of the main Report than in dissension therefrom, and the Bishop of Bedford concurs in this memorandum, except in regard to a proposal to dispose of present sites of prisons at cost price, as sites for workmen's dwellings, instead of at market price; but the Bishop does not give the reason for his dissension. A joint memorandum by Mr. Goschen and Mr. Lyulph Stanley is occupied in insisting on the establishment of a strong central Municipal authority in London, before any real progress can be made, in proposals for increasing the liability of owners (in which Lord Brownlow concurs), and in making further recommendations (to be noted hereafter), for facilitating commercially the provision of increased house accommodation. Mr. Morley adds his signature to this memorandum. Mr. Goschen, in a further memorandum (Sir R. Cross concurring), objects to a recommendation of the Report in reference to rating vacant land on its selling value, and not on its income. Sir R. Cross adds another memorandum on certain points in regard to the action of local authorities, who

should not, he thinks, compete with private enterprise, except in regard to the provision for the very lowest class,—the waifs and strays,—for whom it is desirable to have lodging-houses, which can be under the strictest official supervision. Mr. E. Dwyer Gray adds a very long memorandum containing propositions of a more stringent character than a majority of any Royal Commission could probably be got to agree in, and prefacing his remarks by a statement that while he had "no difficulty" in signing the general Report, he felt that even if all the recommendations therein suggested were adopted, "they would scarcely have an appreciable effect upon the terrible evils which the Commissioners have so laboriously elucidated." Mr. Broadhurst follows with a long memorandum suggesting plans for facilitating the transfer of land; Mr. Jesse Collings with another long one containing subsidiary comments on various important points, in which Mr. Broadhurst and Mr. Morley concur; Cardinal Manning and Lord Carrington concurring, except in regard to a paragraph laying strong stress on the necessity of municipal reform, and the Bishop of Bedford dissenting only from recommending the compulsory provision of cottage accommodation by landowners. Mr. Godwin concludes with a short practical memorandum in regard to cheap building materials, and the Family-Inst. of M. Godin-Lemaire and other large employers of labour in France,—a memorandum which is rather by way of supplement to, than dissent from, the main Report.

The number of these sub-reports or memoranda, however, their varied and generally incisive character as contrasted with the more cautious and measured recommendations of the main Report, renders it evident how much difficulty a Commission of seventeen persons must have had in finding common ground of experiences and recommendations in which they could all concur, and for us a significant illustration of the general difficulty and intricacy of the task before them. Having indicated the main divisions into which the various Reports fall, let us now turn back to the main Report and see if we can summarise within reasonable space the information which it contains and the recommendations on which that information is based; no easy task, we must confess.

The main report is classified under four heads:—(1) Law and Facts; (2) Causes; (3) Housing of the Working Classes in the Rural Districts; and (4) Remedies and Recommendations. The third head we regard as, comparatively speaking, of minor significance in this report; for it is over-pressure and its consequences in London that really gave rise to the appointment of the Commission. And the

first and main thing we look for in turning over the report, is for some definite principle, founded on ascertained facts, in virtue of which the attempt to give a dead lift to the condition of the working-classes in London in regard to their dwellings can be taken out of the region of eleemosynary work, and the objects of philanthropic legislation can be shown to be under such special conditions that special remedies, apparently at first sight at variance with sound social and economic principles, are reasonably justified and called for. For that is in reality at the bottom of the whole difficulty. It is comparatively easy for wealthy individuals or for the State itself to spend money in building better buildings, and to let them, as the Peabody buildings are let, at rents below the market rate. It is natural for people to say, seeing the horrible material and moral evils that are springing up out of the want of habitations enough for the populace, "At all events, this must be amended; whatever may become of theories of political or social economy, we must put an end to this miserable and scandalous state of things." But, philanthropic as such a feeling may appear at first sight, it is, at all events in this crude form, a false philanthropy which will end in making matters worse, in stereotyping the very evils which it seeks to relieve. When there are more people crowding into a neighbourhood than there is room for; when there are more seeking for employment in this or that branch of industry than it can possibly supply, the natural result is that the most able, thrifty, and steady get the work, and the more idle, weak, and unsteady go to the wall. Let your philanthropist now step in and say, "I will provide cheap house accommodation for these wretched ones, since they cannot afford to pay for decent lodgings, at a lower rate, and make up the difference myself"; and what is he doing but offering a premium on the further crowding in and multiplying of these idle and useless ones, and commencing a system to the development of which there is no logical termination, and which must end by coming down with a ran, and making the last state worse than the first? This, as we pointed out before, is the fallacy at the bottom of Lord Salisbury's well-meant propositions, which we reviewed eighteen months ago,* and the talk raised by which was the main cause of the present Commission being organised. If the supply of workers, or of those who ought to be workers, far exceeds the demand, no conjuring will alter such stubborn facts; and the system of subsidising the masses who cannot find enough to live upon is not only in the end injurious to them, but is really an attempt to find an easy way of evading a difficulty (for

* Builder, November 3, 1883.

giving out of the superabundance of the wealthy is really the idlest and easiest of all forms of philanthropy, instead of boldly facing the problem and its consequences, and endeavouring to meet it in a way that will promise permanent success.

The first thing that a rational inquirer asks, therefore, is this,—Are there any special circumstances such as ought not to exist, such as are abnormal, to account for the disproportionate costliness and had quality of the lodgings of such a large number of the poorer and poorest classes; any circumstances which put the case at all out of the usual category of supply and demand? Has any one done wrong, that these suffer, or are there merely, in plain English, more of them than can possibly earn decent food and lodging within the space they inhabit? We must look to the answer to this question before considering the reasonableness of any of the remedies proposed.

Now, in regard to the high proportion of rent to income, there are two or three suggestions to be gathered from the Report of the Commissioners, to show cause why special remedies should be adopted. One of these is mentioned under the heading, "Causes of High Rents." "High rents," we read, "are due to the competition for houses and to the scarcity of accommodation in proportion to the population."

"It might be asked, why cannot the pressure be relieved by the distribution of the now-crowded masses over the area of the metropolis, inasmuch as it is a well-known fact that for various causes certain districts contain a large number of uninhabited houses, many of which are suitable for the working classes. The answer to this query, which will have to be referred to again when the question of suburban residence is dealt with, is that an enormous proportion of the dwellers in the overcrowded quarters are necessarily compelled to live close to their work, no matter what the price charged or what the condition of the property they inhabit. It has been seen how crowded the poor central districts of London are, and one reason is that for a large class of labourers it is necessary to live as nearly as possible in the middle of the town, because they then command the labour market of the whole metropolis from a convenient centre."

Reference is then made to the cases of dock labourers, who must be near the docks, and of costermongers who must live near the neighbourhoods where alone they find a market for their wares, where they are, in fact, to a poor population what shops are to a rich one. But this is only applying to a district of London and to a certain part of the population what really applies in a wider sense to all London. House rents of all classes are abnormally high in London, office rents abnormally high in the City, because such a number of people must live or have their places of business in London. And then, in the case for instance of dock labourers, as in other cases, the overcrowding is not because the dock labourers who are employed must live near their work, but because so many more who cannot get employment except by mere good luck, also think that they must, for the sake of this chance, live in the same neighbourhood. If any one fact has been brought out more clearly than another lately about the working-classes, it is that the competition for dock labour is enormously in excess of the demand; and overcrowding, with all its attendant evils and high rents for wretched accommodation, is simply the result of the fact in this case that there are far more of the class than can possibly find remunerative employment. It is not the dock labourers who get employment who cause the overcrowding; it is those who do not get employment, who are too many for the labour market; and if these poor men were somewhere else in the world where their labour is wanted, there would probably be room for the decent housing of those who are wanted. The same may probably be said of men in or seeking other employments; we take the case of the dock labourers because it has been brought so prominently forward of late, and so many facts published about it. This is, then, not a question of the housing of these classes, or of overcrowding, except indirectly; it is simply the case of overcrowding of that particular market. It is of no use to talk of providing better house accommodation

for these men, because the plain fact is that, poor fellows, they have no business to be there at all; they are where they are not wanted, and to help to find them house-room there is really no better than a mockery. It is they who are making the overcrowding by staying where it is clear they cannot all get a living. No doubt, as Kingsley bitterly said in "Yeast," they have committed an unpardonable sin in being in the world when they were not wanted; but the business is to find out where they may be wanted, if possible,—not to help them into a false paradise by making houses for them and leaving matters still worse for their children. The fact that London is overcrowded, that it is no use people crowding into it to look for work, will have to be forced on the conviction of the working classes sooner or later; and the longer it is staved off by a temporary philanthropic measure, the worse it will be in the end.

We do not mean to imply that the Report of the Commission proposes any eleemosynary system of providing houses for these sadly superfluous workers. What they do propose is mainly (apart from the better sanitary regulation of houses, which is a separate question) in the way of increased railway facilities for workmen living out of London; but what we do feel is that the manner in which this part of the subject is touched upon appears to pass over the consideration that the fact of too many workers in the field is the first root of the overcrowding, and that the latter is only a secondary and inevitable result. The real remedy here we take to be, for the present, organised emigration with Government assistance and direction, and a trust in the gradual results of the better education of the next generation, which would lead to greater foresight, consideration, and self-restraint. But we presume this portion of the subject was not properly within the range of the inquiries of the Commission.

Leaving on one side the question of absolute overcrowding of workers, and coming to that of the dwellings of those who do find work, but who are ill-housed at rents much higher in proportion to their income than other classes of the community, do we find any special circumstances which justify the application of special remedies? In this respect the Report brings before us, we think, one special evil of the greatest magnitude, which ought not to exist, and which arises not out of the usual influences of supply and demand, but out of the fact that some people are not doing what they ought to consider their duty. The rents paid by a large proportion of the poorer of the working classes amount it seems, in many districts, always to a fifth, often to a fourth or more, of their small income. Even for this abnormally large proportion paid in rent they get only bad, unsanitary, and sometimes dilapidated dwellings. This latter portion of the evil is one with which, as we think the Report shows, there is at present ample legislative power to deal; what is wanted is not so much new or special legislation, as the stringent and energetic enforcement of the provisions of existing legislation. But if we ask why this high proportion in rent, then we come on what we take to be one of the greatest and most crying evils of the day in regard to the poorer class of house property, the existence and the practically irresponsible power of the middleman, the direct lessee of the property from the freeholder. He is the dragon who swallows up houses and families, and whom the modern St. George must set about slaying, and that with a will. The evidence on this point is glaring and unmistakable. The most important information in regard to it is to be found on page 22 of the Report, in a passage founded, as the Commissioners are careful to observe, not on the evidence of clergy, philanthropists, and local and other reformers who have agreed in condemning the system; "they have preferred to confine themselves to the testimony of two witnesses who are intimately connected with the leasehold system." And here is part of this testimony:—

"The first [of these witnesses], Lord William Compton, is the son of the owner of one of the

largest properties in London on which middlemen are found; the second is Mr. Boodle, the agent to the Northampton as well as to the Westminster estate. From the evidence of these two witnesses it appears that the existence of the system of house farmers is in some measure owing to the preference for middlemen on the part of both the landlord and his man of business. Moreover, this evidence shows that there is an indisposition on the part of landlords to avail themselves stringently of the provisos in their leases for re-entry and for the troublesome and costly process of ejectment of tenants in case of breach of covenant, the covenants usually including external and internal repairing, cleaning and painting, and the keeping in order of drains. Again, it was pointed out that landlords like to give short leases of decaying property, so that they may fall in when long leases expire, and the property can be dealt with as a whole more satisfactorily than it could be piecemeal. All these considerations appear to favour the middleman system, to which is attributed by Mr. Boodle the breaking up of houses built for single families into tenements, with all the evil and inconvenience attending that arrangement. This is also said to be the cause in great measure of the enormous houses in which it has been seen the poor chiefly live in the worst parts of London. On the Clerkenwell Estate, Lord William Compton went very carefully into some of the figures relating to houses leased from the Marquess of Northampton by certain house farmers. In Queen-street he ascertained that in what manner the repairs are carried out by persons of this class, who are also members of the Vestry of Clerkenwell.* At No. 10, for instance, he found that the weekly rent of the front room was 12s.; of the back room, 4s. 6d.; of the kitchen, 3s.; of the first floor, 13s.; and of the second floor, 7s. This amounted to about 100l. a year, and the rent which the householder paid to the Northampton was 20l. a year. The agent to the Northampton Estate allows that a middleman might in a particular instance be making 150 per cent. per annum, not counting his outlay for repairs, but that the repairs are only wanted once in three or four years, and, therefore, in the other years he makes his 150 per cent. In what manner the repairs are carried out has already been shown in the evidence which described the condition of the houses in this and other poor quarters of the town. The house farmer is not at all anxious to encroach upon his profits, whether they are at the rate of 50 per cent. or 150 per cent., by periodical repairs. Lord William Compton stated that he shrank from calling to account the middleman for neglecting to repair, fearing that a rise in the rents would be the consequence of such a proceeding. The average income of the tenants has already been mentioned, so it is not surprising that sometimes the middlemen find a difficulty in collecting the rents on a Monday morning, and their remedy in that case seems to be a threat to raise them still higher. It was stated by witnesses that if there were more official supervision, by means of improved local government to prevent overcrowding and to enforce sanitary requirements it would be impossible for middlemen to make the large percentages they at present secure."

This last sentence, after we have just heard that the two middlemen referred to are themselves "local authorities," is a fine piece of unconscious satire. But what we wish to point out is that here is a case of misery resulting not from a natural, but from an unnatural and immoral state of things. It is, in the first place, wrong that those whose duty it is to see that property is kept in a proper state of repair and sanitation should also be those whose interest it is to neglect this duty; it is still more wrong that they should place their interest above their duty. It is this kind of thing that leads to what we hear from sanitary inspectors and medical officers sometimes, that they dare not or cannot use all their powers in regard to sanitary improvement, because in so doing they are attacking the interests of the very persons at whose will they hold their appointment, and may be cut off not only from their own means of living, but (if they have the good fortune to be independent on that score, which probably is seldom the case) from the opportunity of doing any of the partial good which they may still effect. But is not the very root of the evil behind all this? Does it not lie in the whole facts of the leasehold system (as is, indeed, partly suggested in the above quotation), and in the fact that the great freehold owners, in this generation or a preceding one, have entirely forgotten that property on a large scale entails duties on a large scale as

* The italics are our own. These are the people who are officially concerned in seeing sanitary legislation put into operation!

well as rights? We do not accuse the two freehold owners mentioned above of wilful indifference; we should probably do them great injustice in doing so, and the same may, we hope, be said of others, though we fear not by any means of all. The more thoughtful and conscientious ones may be said to be at the moment in the grip of a system which they did not create, and which they are powerless at the moment to put down. But the fact remains that a man who is in the receipt of a large income from the leaseholders on a great property, and who confines himself to the easy duty of receiving the ground-rent through his agent, and permits the middleman, merely as the least troublesome medium to himself and his agent, to exact plunder from the poor sub-tenants on the estate without inquiry and without check, is guilty of culpable neglect of what—though the law has not yet recognised it as his duty—is no less his duty as a moral and responsible being; and the system which allows of such a state of things is in itself rotten and intolerable, and ought to be put an end to. There are those among the ground-landlords who would probably gladly assist in doing so; there are others probably who, without any actual intention of wrong, close their eyes to it out of mere indolence and indifference; like the brothers in Keats's poem—

“Half-ignorant, they turn an easy wheel,
That sets sharp racks at work to pinch and peel.”

But for all these things they must give account, and at no distant date.

As already observed, it is suggested in the first short supplementary report, signed by ten out of the seventeen Commissioners, that the system of building on leasehold land is a great cause in itself of the many evils connected with overcrowding, insanitary buildings, and excessive rents. Those whose signatures are appended to this supplementary report “are of opinion that the prevailing system of building-leases is conducive to bad building, to deterioration of property towards the close of the lease, and to a want of interest on the part of the occupier in the house he inhabits; and that legislation favourable to the acquisition on equitable terms of the freehold interest on the part of the leaseholder would conduce greatly to the improvement of the dwellings of the people of this country.” It has certainly been shown that there is great tendency on the part of ground landlords to renew short leases on dilapidated portions of a property, with the view of letting the lease fall in at the same time with other longer leases that have still a few years to run, and thus dealing with the property as a whole more advantageously and economically to themselves, and, perhaps, in some cases, in the end, more advantageously to the whole property. It has also been constantly said, ever since Carlyle's brilliant prophecy, entitled “Shooting Niagara,” in which he first suggested that the modern bricks were made to last out the short leases, that houses are built in a much more jerry manner than they would otherwise be, on account of the incidence of the leases giving them possibly but a short term of existence as the property of the builder. We incline to think that this influence of the leasehold system on practical building is somewhat exaggerated; at all events, that the man who would build rickety houses on that consideration would equally do so, in most cases at least, without the excuse of the leasehold system. But we would point out that a more stringent supervision of building by local authorities, aided, perhaps, by some additional legislation in the way of conferring upon them more arbitrary powers, would go far to check a great many of the evils for which not so much the leasehold system as the acquired and inherited tendencies of the jerry-builder are to blame. But we confess that, apart from this, we concur with Lord Salisbury's expression of opinion in his memorandum, that this question of acquiring the freehold has little to do with “the interest of the occupier in the house he inhabits,” in reference to the class of inhabitants with whom the Commission is concerned. They are not leaseholders, they are the tenants of the leaseholder; and, as Lord Salisbury ob-

erves, the power to force the sale of the freehold on arbitration, besides being “wholly novel in principle,” would, in reality, “have no other effect than to put the house farmer in the position now occupied by the ground landlord.” If the Commission mean to imply that the leasehold landlord, become a freeholder, would find it more to his interest to keep the property in good condition and to build more substantial houses on it, that may be true; but, considering the way the tenants are already ridden over by the middlemen or house farmers, it would seem a rather doubtful experiment to facilitate the accession of these gentlemen to a position in which they would be without even the nominal responsibility to a higher power which they are at present under. But what surprises us is the phrase about “the house he inhabits,” as if the tenants whose interests we are considering were themselves leaseholders, which certainly very few of them can be. The memorandum really seems to indicate a momentary confusion of ideas upon the subject.

The question of the influence of the house-farmer, however, in sending rents up to abnormal proportions, and of the want of proper thought of their responsibilities on the part of the great freehold owners, appears to us to be by far the most important one which is raised by the Report of the Commissioners, because there is here evidence of a forced state of the house-market arising from neglect of duty on the part of those who are finally responsible. Apart from the question of the sanitary condition of houses being properly looked after, and of the legislative power existing or required, which we will consider separately, this of the middleman appears to be the one great evil influence which is not due to the ordinary results of such evils as improvidence, drunkenness, reckless marriage, and over-population. A great deal of valuable though painful evidence is given on these subjects, as well as on the extent to which insufficient house accommodation in turn affects morality; but these matters are really part of a much larger question than the housing of the poor. To repeat what we have already urged, it is really of no practical use to take into account the problem of the better housing of those who, to begin with, are out of their place, are doing no good where they are, and who are hanging on the skirts of an over-stocked labour-market in the hope of picking up some precarious means of existence. They can only be housed by efforts which are really eleemosynary, and which as such can only avail to stop a gap in a way that cannot possibly be permanent. The real question is as to the better housing of the industrious poor, those who are a really valuable part of the working community. The two sides of the question in regard to them are, Can they be supplied with houses at lower rents than at present? and Can we ensure their houses being better built and kept in better condition? We have commented upon the principal light which the Report throws upon the first part of the question. In another article we will consider what it has to tell us as to the second portion of this very serious problem.

A SUGGESTION IN SEWAGE PURIFICATION.

N experiment has recently been made by a scientific man at Buxton, which may possibly exert an important influence with regard to the disposal of sewage. Nor is it a theoretic discovery alone. Works have been erected, at the cost of 4,000*l.*, for the treatment of the sewage of Buxton (which varies in quantity from 200,000 to 1,000,000 million gallons per diem), by the process to be described; and on the 9th of April the Buxton Sewage Works at Ashwood Dale were formally opened, and the occasion was duly celebrated by a public dinner.

The Rivers Pollution Commissioners have for some time past insisted that measures should be taken by the Local Board of Buxton to rid the Wye of the poisonous contents of the drains. In the case of a town chiefly

known as a health resort, the subject assumed even more than usual importance, and a deputation of the Local Board took the wise step of visiting various sewage works, of which the principles had been recommended for their adoption. They went to Birmingham, where they found a sewage farm, and also a long series of tanks, and pronounced the system a failure. No fish would live in the water. They went to Bilston, where the filtration system has been adopted. It was not, however, satisfactory. They also visited Coventry, where they saw the operation of the grinding-machines, on what is called the black-ash system, in which sulphuric acid is used. That they considered the best system they had seen. At Leamington they saw an immense sewage-farm, for the effluent of which, produced at a cost of 1,100*l.*, 400*l.* was received. This they regarded as a heavy loss, and a plan that would not answer at all. They visited Hertford, where phosphate of alumina is produced by the Phosphate Manure Company. That plan they found would cost 8*d.* or 9*d.* in the pound on the rates, if applied at Buxton. It does not appear from the report under what conditions Dr. Thresh was called in to advise; but this gentleman, in the course of experiments made from time to time as to the defecation of sewage, was led to examine the water flowing from an old coal-pit, which ran to waste in the Wye, disfiguring the Public Gardens of Buxton by its course through them. This water is, in fact, a strong chalybeate spring. It contains salts of iron, aluminium, sodium, calcium, and magnesium, chiefly as sulphates, but a considerable portion of the iron is in the form of a carbonate held in solution by carbonic acid. From 1.2 to 2.4 grains of metallic iron occur in the gallon of this water.

The effect of this iron water on the sewage is remarkably prompt. The method adopted has been to mix with this natural water a certain proportion of milk of lime, and then to allow it to mix with two or three times its volume of sewage. By agitating gently a flocculent precipitate forms, and rapidly settles, leaving the supernatant fluid beautifully clear. Analyses made by Sir Henry Roscoe at Owens College are appended to the report of Dr. Thresh, from which we abstract these particulars.

Additional interest attaches to this method from the fact that its principle is much the same as that first applied at Antwerp by Professor Bischof to the purification of the waters of the River Nethe by passing them through a mixture of spongy iron and gravel. The effect of iron in the destruction of organic matter suspended in water has thus not only been previously known, but the plan has been acted on, on a considerable scale, at the Antwerp Waterworks. In 1878 Mr. Bischof, as appears from the Proceedings of the Royal Society, advocated the use of finely-divided or spongy iron as a medium for the filtration of water. It was demonstrated, according to Dr. Frankland, that filtration through spongy iron destroyed much of the organic impurity, removed colour, precipitated finely-suspended solid matter; and, above all, destroyed the germs of putrefaction, and, probably, those of all kinds of epidemic disease. In 1879 a filtering apparatus was erected at Waelhem for the filtration of the water of the Nethe. A cast-iron tank, 18 ft. 6 in. square and 11 ft. deep, was coated at the bottom with cement concrete, covered with bricks on edge. On the bricks was laid a mixture of three parts of gravel with one part of spongy iron, 3 ft. thick, which was covered with 18 inches of fine sand from the Meuse. A second filter of a similar kind was placed at a lower level, so as to receive the water that had passed through the first. The results were so satisfactory that large works were undertaken, a description of which will be found in Vol. 72 of the Proceedings of the Institution of Civil Engineers. After eighteen months' experience, it was stated at the Conference on Water Supply held at the International Health Exhibition of 1884, by Mr. Anderson, M. Inst. C.E., that, as far as the purification of the water went, Prof. Bischof's process left little to be desired; but that the working of the system had been costly.

The increasing demand for water rendering extension of these works necessary, Mr. Anderson, M. Inst. C.E., whose duty it became to advise the directors of the waterworks, made an experiment, suggested by Sir F. Abel, on the principle of passing iron through the water, instead of passing water over the spongy iron. Mr. Anderson constructed a revolving cylinder, 4 ft. 6 in. in diameter, and 5 ft. 6 in. long, which was furnished with inlet and outlet pipes, and also contained shelves or ledges for scooping up the iron used, raising it to the top of the cylinder by the rotary motion, and thus letting it fall through the water. Running water through this cylinder at 12 gallons per minute, which gives a contact of about forty-five minutes, Mr. Anderson found the water to be very heavily charged with iron. At a flow of 30 gallons per minute, 1.20 grains of iron were dissolved per gallon, which was twelve times as much as the experience at Antwerp had shown to be necessary. At 60 gallons per minute 0.9 grain per gallon was dissolved. The result of the trial proving thus successful, the revolver was sent to Antwerp, fitted with large pipes, which sent 166 gallons per minute through it, and has been at work there ever since.

Thus the history of the application of iron to the purification of water comprises a number of independent experiments and discoveries, made by different men. More than twenty-five years ago Dr. Medlock and Mr. Quick, C.E., made a number of experiments on the purification of Thames water by metallic iron. The water of the river at Battersca was left in contact with iron wire and plates in a large tank, for twenty-four hours, and the improvement in quality was very marked. It is well known to naval officers (and has been mentioned in the columns of the *Builder*) that water stored in iron tanks that have been white-washed inside becomes remarkably pure and sparkling, and that the rapidity of distilled water is removed by such storage. The Antwerp filters represent a further step in the same direction; although the propriety of the mixture of gravel with the spongy iron has been called in question. Sir F. Abel's suggestion is marked by extreme elegance; as the weak point of all filters, that of becoming choked by their own action, is avoided by the very ingenious reversal of the usual method of producing contact with the metal. A no less original step has been taken by Dr. Thresh; and the review of the advance made in twenty-five years leads to the conclusion that much yet may be done towards the perfecting of the use of iron as a purifier of water.

Dr. Frankland, an unquestionable authority on the point, states that bacteria, which are indestructible by an atmosphere of pure oxygen, of carbonic acid, of nitrogen, of sulphurous acid, and of cyanogen, are killed by a short contact with iron. As all the known forms of bacteria are affected in the same way, it is thus probable that all forms of bacterial life will be thus destroyed; and iron is the only known substance which produces this effect. Thus far, therefore, the progress of the application of iron may be taken as highly promising.

Several questions, however, remain for solution. Mr. Anderson, Dr. Frankland, and other authorities describe the action of iron as rapidly destructive of organic as well as of organised matter. In the case of the water of the Nethe, which is very impure, a contact of nine minutes is enough to dissolve 0.9 grain of metallic iron per gallon, and a contact of three minutes and a half, which presumably will not dissolve much more than 0.3 grain per gallon, is found to be more than adequate to effect purification from organic suspended matter. Indeed, the waste of iron during thirty-three days is stated at 0.176 grains per gallon of water run through the cylinder. Dr. Thresh, however, speaks not so much of destruction as of precipitation, and even says that 100 parts of dry residue from the Buxton tanks contains fifty per cent. of organic matter. The difference is cardinal. But the Burbage chalybeate water contains, together with from 1.2 to 2.4 grains of iron per gallon, fifty grains of mixed crystalline sulphates. It is thus evident that when to this heavy proportion of mineral matter is added the milk of lime

thrown in to hasten precipitation, the total amount of sludge formed must be far in excess of the inorganic elements of the sewage. It is in the mass of sludge that has in some way to be got rid of that the essential weakness of all precipitation processes lies. In the present case it is intended simply to cart away the sludge in a moist state, and put it on land belonging to the Board. This mode of disposal, as Dr. Thresh justly remarks, cannot go on for ever, and sale of the sludge for manure is evidently looked forward to as a resource. Indeed, the presence of so large a portion of organic matter in the dry residue is evidently regarded as increasing the stimulating value of the manure. Now it is on the rock, or rather the quicksand, of the profitable disposal of the *residua* of city life that most of the schemes for sewage disposal have hitherto foundered. The true chemical value of the contents of sewage is so low as hardly ever, if at all, to be worth the cost of extraction. And the other materials, put in as precipitants, or added to "fortify" the manure, can usually be applied much better in their natural state to agriculture than as constituents of the heavy and unmanageable sludge. As far then as precipitation of organic matter takes the place of destruction, and as the addition of lime to the heavy chemical charge of the chalybeate water is required, the results which may be expected from the Buxton process by no means come up to what we think may yet be secured from the brilliant discovery of Dr. Thresh.

The works recently opened have been constructed by Mr. Joseph Hague, A.M. Inst. C.E., the Town Surveyor of Buxton. The chalybeate water is conveyed by gravitation through earthenware tubes, with joints of jute, spun yarn, and cement, from a disused colliery at the foot of the Axe Edge Hills for a distance of over two miles. It then enters a tank at the rear of the liming-rooms, adjoining the works, which are situated between the river Wye and the Midland Railway, in Ashwood Dale. A series of flushing-chambers, supplied with penstocks, is introduced at suitable places along the route, with a view to supplying the carts for street watering.

The liming and mixing rooms are erected over the River Wye, on a semi-circular stone arch, the liming-room floor being on a level with the adjoining highway, and connected with a siding on the Midland Railway by a tramway. One of Messrs. Bowes Scott & Read's liming machines supplies a cistern of 800 gallons capacity, which is provided with an agitating apparatus. The machinery is driven by an over-shot water-wheel, 16 ft. in diameter and 3 ft. wide, driven by water derived from the River Wye.

Outside the liming and machinery rooms are duplicate brick tanks, into which the main outfall sewer discharges. The tanks are furnished with wrought-iron screening-wagons, for the purpose of abstracting the solid and floating matter, which is estimated at 75 per cent. of the whole sediment. After passing through the screening-wagons the sewage runs through a brick conduit into a circular water chamber, furnished with horizontal paddles, where the iron, lime, and sewage, are thoroughly mixed; thence the mixture flows to the settling-tanks, the series of which is 266 ft. long by 73 ft. wide, built of brick in cement, with concrete bottoms. The bottom of each tank is an inclined plane, 3 ft. 6 in. lower at the entrance than at the exit end, an arrangement that has been found fully adequate to retain the deposited sludge. After passing through the tanks the effluent water finally escapes over a weir, and so into the river. It is stated that the cost of the erection and maintenance of the works will be covered by a rate of 1½d. in the pound.

The interest locally taken in this undertaking is very great, and the good example set by the Local Board of Buxton in visiting the sites of the various works suggested to them for imitation cannot be too well known. The plan may prove, however, to have much more than a local interest. Chalybeate water is of rare occurrence, and it is possible that the exact conditions utilised by the skill of Dr. Thresh and Mr. Hague may be unique,

But the attention that these works will cause to be given to the use of iron as a purifier has a wider scope.

NOTES.

THE appointment of a Parliamentary Committee to consider the subject of Irish industries is, so far, an encouraging sign, inasmuch as it shows that other ideas beyond those of rebellion and disloyalty are being allowed to creep in, and that the industrial resources of Ireland, hitherto most unaccountably neglected in official quarters, may have a chance of being properly inquired into. Some two years ago a good deal of attention was devoted to them by the Statistical Society and the press generally, but the hopelessness of restoring lost confidence and attracting capital rendered all proposals abortive until the dangers of the situation should be abated and the country be again in a condition to be regarded as having a *mens sana in corpore sano*. Few would pretend that, under the existing political difficulties, this millennium has yet arrived; but nowadays we are thankful for small mercies, and are, therefore, disposed to view the present move with some degree of sanguineness. Ireland possesses extensive coal and iron fields, with other mineral wealth of more or less value, but mining industries have never flourished, although history attests that it once had a fairly prosperous iron trade. The woollen trade was unmistakably brisk, but was killed by English jealousy and injustice; and the linen trade, originally introduced by the Huguenot refugees, is the only manufacturing industry on a large scale that remains. Even under this head the cultivation of flax is diminishing annually, although there is no reason why its growth should not be an agricultural feature of Wicklow, Cork, Kerry, and Connaught, just as it now is of the counties of Ulster. The directions in which Irish industry should be encouraged are those of a *la petite industrie*, which does not involve a large capital, but rather a patient and judicious endeavour to adapt the occupation to the character of the soil and the population. Adverse circumstances have contributed to make the Irish peasantry unreliable, unadaptable, and difficult to move out of the beaten track, but that this is not their real nature, is evident from the readiness with which they become skilful artisans when away from home. The question of Irish fisheries is one of immense importance, and, if they were properly developed, employment could be found for the whole of the South and West, to the enormous benefit of English fish-consumers; and, besides this, the materials for a vast canned food trade, second only to that of the United States, are all there, only awaiting a reasonable amount of energy and organisation. Were this industry set on foot, the other great desideratum of Ireland, viz., cheap railway communications, would soon follow, bringing many other industries in their wake.

MR. EDWIN CHADWICK has just published a somewhat incisive pamphlet styled "Commentaries on the Report of the Royal Commission on Metropolitan Sewage Discharge, and on the Combined and Separate Systems of Town Drainage." Mr. Chadwick contends that, instead of employing remedies to diminish the noxious results of discharging putrid sewage into the Thames at the outfall, measures should be taken at the point of discharge from the houses themselves to secure the removal of sewage while it is fresh, and before it has commenced to decompose, as therein lies its commercial value to the soil, a value which, he maintains, notwithstanding all assertion to the contrary by specialists, is but manifold more than the cost of its removal and application. He likewise denounces the plan of conveying the whole volume to a single outlet, and asserts that the scheme for radiating sewers in several chief directions, as has been adopted for the city of Berlin, could even now be carried out for London at far less expense than the estimated cost for remedying the

existing faulty arrangements. Mr. Chadwick runs a tilt also against the water supply, which he asserts is in amount more than double what it need be, and consequently greatly aggravates the evils inherent in the combined system. Its effect on the sewerage of the metropolis may be admitted, but though there is doubtless considerable waste in the method of distributing the water supply, yet that there is or can be a superabundance of water, or that the sources of supply should be drawn solely from subterranean reservoirs, are points certainly not yet established.

THE assent of the Committee of the House of Lords to the Manchester Ship Canal Bill has of course been received with the utmost satisfaction in Manchester, and admiration is at least due to the steadfast resolution with which the Chairman of the Provisional Committee and his supporters have devoted time, money, and high ability to support a fight in which they have been twice defeated. But the one fact given in evidence by the late Mr. Spence, that cotton could be sent to and fro between Liverpool and Manchester cheaper by road than by railway, is enough to explain the anxiety with which Manchester has watched the progress of the Bill. The possible effect of the work, even in the form now proposed, upon the scour of the Mersey *embouchure*, is, however, a matter to be very carefully considered.

WE are obliged to the *Saturday Review* for the light which it has thrown upon the spirit in which the Committee for the "Restoration" of Westminster Hall has been carrying on its proceedings. As the solution proposed by Mr. Pearson was also the one favoured by the Chairman of the Committee, we are informed that "the Committee resolved itself into a pleasant family party for editing his Report." This state of things is exactly what we hinted at some time since. The Committee was formed not to examine the question on architectural grounds, but to assist Mr. Shaw Lefevre in carrying out his own ideas. The *Saturday Review* repeats the unwarrantable assumption of the Report of the Committee, that the opposition to its scheme was entirely on the part of a set of people representing a "distinct school of archaeological opinion," viz., the "Society for the Protection of Ancient Buildings." The Committee chose to summon some members of this Society, but the statement that the opposition proceeds from them only is a quiet assumption on the part of the members of the Committee, entirely contrary to fact. It is a curious coincidence that the main supporters of the scheme in the press are the *Times* and the *Saturday Review*, the proprietors of both which journals are members of the majority on the Committee.

THE two cases of *Dunston and of Seely v. Neal*, which were actions heard together last week, and which were brought by a tenant and a landlord of property at Streatham, against the owner of a brickfield, will cause satisfaction to many householders, for Mr. Justice Cave granted an injunction to restrain the burning of bricks in such a way as to interfere with the comfort of the plaintiffs. The Streatham brickfield is not the only one which causes much discomfort to many people, and it is not improbable that householders will take heart from this case, and endeavour to restrain the operation of other brickfields. We much regret to perceive that the judge reflected strongly on the conduct of the sanitary inspectors of the Wandsworth Local Board, because it shows that Acts of Parliament are useless unless those who administer them can be depended upon to perform their work in a thorough manner. "The officers of the Local Board of Health impressed him," said the judge, "very unfavourably by the way they gave their evidence. The nuisance arising from the burning of soft coal had been going on for four years, and so had the nuisance from the heap of house refuse; yet the local inspectors had found out nothing about it. This consideration materially affected the

credibility of their evidence, especially when he remembered that Bartholomew and Finister, two of those witnesses, the latter the inspector of nuisances, gave their evidence with a strong bias in favour of the defendants." In brief, the judge found that these officials had, in the first place, neglected their duty, and in the second, instead of maintaining a proper impartiality, had actually sided with the person who had committed the nuisance. In view of certain portions of the recently published report of the Royal Commission on the Housing of the Poor, this portion of this recent case is noteworthy. Everything points to the immediate necessity of looking after our sanitary guardians very sharply indeed.

IT has been decided to hold a Great National German Exhibition of Industry and Art at Berlin in the year 1888. Among the guarantors are the Council of Merchants, who have voted 100,000 marks, and the Berlin Town Council, who have granted an equal sum towards the preliminary expenses, and to make up any eventual deficit. It is intended to ask both the Reichstag and the Prussian Parliament to contribute separate grants to the guarantee fund. It was at first resolved that there should be no foreign exhibitors, but the propriety of inviting Austria-Hungary, as the close ally of Germany, to participate in the exhibition has been mooted, and finds many supporters. The site selected for the exhibition is the charming park of Treptow, one of the suburbs of Berlin.

PROFESSOR KERR seems to have amused the last Annual Meeting of the Institute, as reported in the Transactions, with some useful if not agreeable truths. He makes out that each meeting costs 212*l.*, and wanted to know (troublesome people these who "want to know") what we got for it. He can remember the time when the Institute defeated a Government in the House of Commons (in regard to the Exhibition Building of 1862); he says we cannot do that now. He remembers when Lord Palmerston called the Institute in to strengthen his hands to carry a point in the House of Commons, and carried it. "No Prime Minister sends for us now!" he remarks. We may suggest that the fault, perhaps, lies partly with the House of Commons. There is an old Greek story of a philosopher who was asked by a king why philosophers were always found coming to see the kings, and the kings never came to see the philosophers. He replied that philosophers knew what was good for them, and kings did not. The House of Commons, perhaps, does not know what is good for it, and follows the lead of self-appointed amateur architectural critics. But part of the result is also due not to the Institute, but to those who stand apart from it and do not strengthen its hands as they might and should. Then they complain that the Institute does nothing for the profession. Why do not they come forward and set a practical example?

SINCE the year 1867 there has existed in Heidelberg a society for the protection, and, when necessary, restoration, of the castle. This year the society takes a new departure, it issues the first number of a series of "Mittheilungen," which are to appear at irregular intervals, and which will deal with the history of the building. The object of the publication is a laudable one, *i.e.*, to ensure that any work undertaken in restoring the castle should be based on a thorough acquaintance with every detail of its past. Such names as those of Professor F. Von Duhn, professor of archaeology in Heidelberg, and Dr. Woermann, director of the Dresden Gallery, are sufficient guarantee of the character of the work done. The society has its members in Italy and even America. At present England is represented honourably, but singly, by Prince Albert Victor; his example should be followed by all lovers of Renaissance architecture. The subscription is only three marks yearly. Probably life membership at fifty marks will commend itself in England.

A PARIS correspondent writes:—"The situation of the architects of departments, towns, and communes is threatened throughout France; not only do the frequent political changes in the offices of prefects and mayors render the position of the architect very precarious, but now an administrative measure is threatened which will strike a fatal blow at the profession. The 'Conseils Céntraux,' as regards the departments, and the 'Conseils Municipaux,' as regards the towns and communes, are more and more disposed to mix up works of architecture, properly so called, with those of roads, sewers, &c., and are anxious that the Civil and Government engineers and road agents should be entrusted with the direction of architectural works. The question will no doubt be brought before the thirteenth session of the Annual Congress of Architects in June next."

THE Scottish National Portrait Gallery is now an established institution of the country, although, in the meantime, the nucleus of the collection is only accommodated in a temporary brick building. This erection (which was opened to the public on Saturday, the 9th inst.), occupies the extreme eastern portion of the ground required for the permanent gallery, and consists of a single room 60 ft. by 20 ft., lined with timber, which is stained a dark brown, lighted from the roof, and warmed by hot-water pipes supplied from a furnace outside. The collection comprises 113 works, most of which are of great historical interest and artistic value, and which were included in the large collection exhibited last year in the rooms of the Royal Scottish Academy. The Scottish National Portrait Gallery originated in the offer of 10,000*l.* from an anonymous gentleman upon condition that a like sum should be provided by the Treasury. That sum was voted by Parliament. The same gentleman thereafter offered a further sum of 20,000*l.* for the purpose of erecting a building to accommodate the Portrait Gallery and the Museum of Antiquities upon condition that a suitable and isolated site should be provided. The present site, at the south-east end of Queen-street, was accordingly purchased at a cost of 7,500*l.*, of which 5,000*l.* was voted by Parliament, the remaining 2,500*l.* being provided by the Scottish Board of Manufactures from their own funds. The site secured has a frontage of 260 ft. to Queen-street and a depth of 70 ft. The permanent building, the designs for which are in the hands of Dr. Rowand Anderson, will consist of a centre and wings, and be of three stories with a basement at the back; the ground and first floor will be lighted from the sides and the upper floor entirely from the roof. The style adopted is Gothic of the best period (thirteenth century), and the elevations bear the impress of that mastery of detail which characterises the works of the architect.

ON Friday, the 8th, took place in Paris the election of a President of the Association of Painters, Sculptors, and Architects, as successors to the late M. Sommerard. M. W. Bouguereau, the eminent painter and member of the Institut de France, has been elected by forty-nine votes, as against forty-two for his competitor, M. Roger-Balla. The slight difference between the number of votes, M. Bouguereau having only just obtained the number necessary for election, in spite of the support given him by his colleagues of the Institute of France, and the number of votes obtained by his young competitor, indicate the tendency among the French artists at present to restrict the very dominant influence of the Institute.

A COMPETITION has been announced in which prizes will be given for the best designs for Irish lace, to be sent in to the honorary treasurer, Mr. Alan S. Cols, at the South Kensington Museum, on or before the 15th of July next. The several varieties of Irish lace-work are defined as follows:—(1) Flat needle-point lace; (2) raised ditto; (3) tape lace, with needlepoint fillings; (4) cut cambric, to imitate lace-work; (5) embroidery on net; (6) drawn-linen embroidery; and (7) crochet. The prizes vary from 5*l.* to 15*l.*,

and the work premisses will become the property of the promoters of the fund. The useful caution is given that "a more careful copy of a natural flower, leaf, or spray, or group, does not constitute a suitable ornament. The designer must give that ornamental character to subjects derived from the study of natural objects which is essential in the composition of patterns suitable for execution." At the time of the Irish Lace Exhibition at the Mansion House, we commented on the fine character of some of the work, and are glad to find that an effort is being made to further stimulate its development. The names of Lord Cardingford and Earl Spencer stand at the head of the list of promoters. Further particulars can be obtained from Mr. Alan S. Cole.

MR. CHAS. WALLIS has produced, for Messrs. Winsor & Newton, a small "Dictionary of Water-colour Technique," mainly intended for amateurs, and prefaced by a very useful series of preliminary "practical hints" on materials and manipulation. The dictionary portion we presume may be useful in furnishing starting-points and finger-posts for the guidance of those who are taking up the art, though probably Mr. Wallis will agree with us that recipes of this kind are not of much use except where there is very decided initial ability to turn them to account. The arrangement of every kind of subject in alphabetical order produces rather a singular combination. "Aerial tint" is followed by "Anchors and Chains," "Brook (see River)" by "Brown Madder"; "Mars Orange," "Meadows," and "Mist" follow in succession. Special colours and combinations are given for such things as "hedges" and "palings." May not hedges and palings be almost any colour, materially, in reference to conditions of light, general scale of the drawing, &c.? And can we really specify pigments for "cottage chimneys," "cottage roofs," "shadows on house" (on what kind of house?), and "stones"? The combinations may be labelled "David Cox," but the student will probably be rather disappointed if he hopes to catch Cox's mantle in that way. The intention is good, but there is something dangerously mechanical in the view of the subject that may be thus induced in the mind of the too confiding aspirant.

ARCHITECTURE AT THE ROYAL ACADEMY.*

MR. J. D. SEDDING'S work is often admirable and always interesting from its originality and freedom from the trammels of prejudice and mere tradition. His proposed new church in the diocese of Ely (1,753-66-97) is a very characteristic example of his manner. A curiously irregular site has provided scope for his ingenuity in planning, which he has exercised without stint. A nave, some 45 ft. wide, is separated from a wide north aisle by an intermediate narrow aisle or passage, which is carried quite round the church. The principal entrance to the church is by an internal western porch, carrying a gallery, but not designed to accommodate the organ, which is placed in a bay on the south side of the chancel. Flanking turrets give access to a gallery or triforium in the thickness of the east wall, the use of which is not clearly apparent. The eastern gable is surmounted by a "rood," and the conventional crosses on the other gables are omitted, although an indication of some irresolution on this point in the architect's mind is afforded by a pencilled cross which has been added to the finished drawing. The altar itself is raised upon twelve steps above the nave-floor level, and is separated from the east wall sufficiently to admit of the continuation of the narrow aisle or passage-way above referred to. Both the nave and aisle are covered by almost flat wooden ceilings with moulded ribs, but without any descending principals to mark the bays. The arches dividing the nave from the aisle are low and almost semi-circular, the central member of the piers being carried up and finished by pointed arches of high pitch, under which lofty side windows are

placed, with niches on each side of them. A band of formal and uninteresting gables runs along the sides of the nave just above the heads of the lower arches. The transverse section shows a suggestion for a large fresco of the Crucifixion in the east wall, which is traceried on the exterior, but unpierced by any windows. It is undoubtedly a clever, and, in many respects, a thoughtful design; but the detail is not exceptionally good, and we are somewhat doubtful as to the general effect.

St. Saviour's Church (where?), by the same author (1,811), is a long church, without aisles, and the design includes an attached presbytery. It is marked by the originality evident in all this architect's work, who has, however, in this instance carried a daring eclecticism to the extent of adding a Queen Anne turned wooden balustrade to an otherwise vigorously Gothic building. Those who admire Mr. Sedding's work extremely,—and he has many admirers,—will scarcely follow him to this length, nor will they yield unreserved assent to the sprawling quasi-Flemish tracery which covers his blank eastern gable. An unusual, if not an unprecedented, feature in the design is a doorway for the clergy pierced in the eastern wall, immediately behind the principal altar. The whole can scarcely be considered as an artistic success, although the severest critic could not accuse it of being commonplace.

We cannot but regard as of doubtful propriety the proposed reredos for Canterbury Cathedral (1,761), exhibited by Mr. John O. Scott, the central portion of which is a solid mass of carved and gilded woodwork, carried to the height of the caps of the main arcade. The open portions of the screen on either side are the centre with the piers on either side are as light as the central is heavy. It would, we submit, be a mistake to block out the charming vista afforded by Becket's crown by any such erection as is here proposed, be it ever so beautiful in itself,—a character which, so far as this drawing enables us to judge, by no means belongs to it.

Mr. Blomfield sends a careful geometrical elevation of his proposed south transept front of Chester Cathedral (1,788), and Mr. Reginald T. Blomfield, in addition to his excellent sketch of a "Madonna" finial at Clermont Ferrand (1,788), to which we have before called attention, sends a drawing of the Interior of Beckley Church (1,744) as restored by him. It is evidently a conscientious restoration, conservative in spirit and honestly delineated.

In the same category, we place the little Church at Alfrick, Worcestershire (1,828-9), as restored by Mr. Aston Webb. The interior shows a wagon-roofed chancel displaying its section towards the nave, the western truss forming a kind of wooden chancel arch with agreeable effect, the space above the tie-beam being filled in with half-timbered work. The whole is plain to severity; an elegant Late Decorated chancel screen, with traceried panels, being nearly the only ornamental feature in this otherwise unadorned little church.

In the design (now abandoned) for the spire for Peterborough Cathedral (1,798, 1,800), Mr. Pearson is seen at his very best,—grave, academic, correct, singularly graceful in outline and in detail. It is an eminently satisfactory effort. The Norman stage is surmounted by Late Decorated work of severe and simple beauty. The spire is "broached" and set behind a battlemented parapet, the pinnacles at the angles of the tower being supplemented by a second series of higher elevation astride of the broach, repeating an arrangement seen in one of Mr. Pearson's earliest and best works, the beautiful church in Bessborough-gardens. If this tower had been executed as designed, Peterborough might have challenged comparison with the best of our English cathedral spires,—Norwich, Chichester, or perhaps even Salisbury.

The tower and spire designed by Mr. Belcher for the church in Gordon-square is Early English in character, with a dash of French feeling in the detail; the outline and proportions are graceful and well studied, and the whole is well shown in a vigorous brush drawing by a well-known artist, who appears to better advantage here than in a characteristic drawing in pen and ink, illustrative of a block of business premises by the same architect. The courageous boldness of the sky is simply amazing. "My young remembrance cannot parallel a fellow to it," and the courage of the designer who could endorse this very free translation of his design is not less remarkable.

A very business-like drawing, comprising a plan and three elevations of the church of St. Mary Madley (1,822), by Mr. F. R. Kempson, shows a restoration of an interesting church which has been accomplished apparently with both skill and judgment. We "desire better acquaintance" with drawings of this nature, which show clearly and without trick or finess what has been done and how the architect has acquitted himself of his task. A drawing of the fabric in the condition in which it was placed in the architect's bands would usefully complete the record.

In connexion with this part of the subject we may note some excellent Renaissance glass by Messrs. Heaton & Butler (1,834), some very beautiful domestic glass by Mr. P. H. Newman (1,778), a window by Messrs. Ward & Hughes (1,782), and another by Mr. Dixon, which, beautifully designed and drawn, has, however, not a single speck of pure colour, which is, after all, the glory of stained glass. We must not omit to mention a charming and highly-finished study for wall decoration by Miss (?) Ella M. Bedford; and we may perhaps be allowed to wonder how 1754 contrived to find itself in such company.

The inscrutable decrees of Fate and hanging committees had almost cheated us of a sight of a beautiful drawing by Mr. Raffles Davison, showing the restored interior of St. Mark's, Worsley, by Mr. Kail Freeman (1,823), a most artistic rendering of excellent work, though, like Thackeray's Prince,—

"Condemned to foot it in the dust
While others to the saddle vaulted."

The present exhibition affords ample evidence that in the domain of ecclesiastical art there is not only abundance of skill, but steady progress, and that the nineteenth century will be able to show a more than creditable array of really beautiful churches.

THE INVENTIONS EXHIBITION. MACHINE TOOLS.

ONE of the most interesting sections in the Exhibition is that devoted to machine-tools, and amongst the examples shown there are a good many novel features which really deserve to be classed as inventions in the present day. We will briefly notice some of the most important exhibits in this class, returning to a few of these more especially interesting to us for a more detailed notice at a future date.

Before proceeding to do this it may be out of place to give a glance at the preface to this section, which appears in the official catalogue. The whole of the prefaces in the catalogue this year have been contributed by eminent authorities in their respective departments, and Mr. Trendell, the literary superintendent, has been especially fortunate in securing Professor W. C. Unwin for the group now under consideration. We have, in the present day, become so much in the habit of looking on the simpler machine-tools as the necessary adjuncts of civilisation that it will doubtless surprise many engineers to learn that the first planing-machine was introduced only sixty-six years ago, and the first slotting-machine nine years later still. The origin of the lathe is, we believe, lost in the mists of antiquity, but a modern machine lathe is so different a tool to the old treadle lathe with its wooden bed that the one can hardly be identified with the other.

Professor Unwin divides metal-working tools into the following classes:—

1. Compressing machines, such as steam-hammers, power hammers, riveters, and forging presses.
2. Abrading machines, including grindstones, emery wheels, polishing-machines, and the less properly-formed rose-cutters and mill-cutters.
3. Shearing-machines, such as ordinary plate-shears and punching-machines, in which the material gives way over a large area simultaneously in the plane in which the cutting edge produces a tangential stress.
4. Cutting-machines, in which a properly-formed cutting-tool removes the material stroke by stroke, or by a continual spiral cut over a surface of a required form.

The Exhibition is to illustrate the progress of invention since the date of the last great International Exhibition in London twenty-three years ago. Nearly all the machine-tools at

* See pp. 607, 650, ante.

present in use were, as Professor Unwin points out, introduced before the commencement of this period; and, therefore, in order to be strictly within the scope of the Exhibition, whole machines can only be introduced incidentally, as it were, in order to illustrate improvement in detail. By these details, however, the vast strides made in the progress of engineering practice have been rendered possible, and the cheapness with which machinery of all kinds can be turned out in the present day may be almost wholly attributed to the advance in machine-tools, more especially labour-saving tools. As a general rule, the more simple a tool the greater is the skill required in its use. For instance, only long practice will enable a workman to handle a chisel or a file with facility, while mere boys are often seen in charge of the most complex machine-tools. This is well illustrated by the productions of some of the large engineering establishments now found in most manufacturing districts in Great Britain, in which we often find young lads, by the aid of some special tool, which is capable of producing only one particular article, doing work that would have required, a few years ago, the best attention of a highly-skilled workman. There is probably no better illustration of the value of special tools than is to be found at the Otto Gas Engine Works of Messrs. Crossley Bros., of Manchester, in which, by the adaptation of each machine-tool to only its own work, there is no possibility of anything but accuracy being reached, and much troublesome lining off, in which, with the greatest care, some error is likely to creep in, is avoided. Another instance we might quote is that of Messrs. Tangye Bros., of Soho, who by the use of copying-machines and special tools are able to turn out well-finished and accurate work, such as could only be obtained otherwise by the most highly-skilled and painstaking labour.

To return, however, to Professor Unwin's classification: amongst his first group reference is made to the early form of steam-hammer, in which the blow was entirely due to the weight of the descending tup; but steam is often admitted above the piston now instead of only on the return stroke. Ryder's forging-machine, in which a series of rapidly reciprocating hammers are driven by eccentrics, is referred to, and also the pneumatic hammer introduced by Messrs. Player Bros., of Birmingham, in which the tup cushions into an air-tight cylinder. Reference is also made to the drop-hammer, in which a weight or ram is lifted by being grasped by friction rollers. These release their hold at the necessary moment when the hammer falls by its own weight. Very heavy forgings, such as ships' anchors, are made with such a hammer as this. Another and simpler type of drop-hammer consists of a weight attached to the end of a belt placed over an overhead pulley. So long as the belt is loose, the pulley slips beneath it, but on the operator putting his weight on the other end, the weight is drawn up, and falls by its own gravity when the tension is released. Large numbers of the parts of small engines are forged in dies by means of this apparatus.

Among machines of abrasion the emery-wheels naturally occupy Professor Unwin's first attention. These, as is well known, are artificially made, and can be turned up true by a diamond tool. Dry grinding with the emery-wheel is much used now in place of the file for getting up bright work, but skill is required in the operation. The same may, of course, be said of filing, but there are lots of men who can use a file fairly well, while the same cannot be said of the emery-wheel, outside special work. The applications of the sand blast are also mentioned, the use of which appears to be mainly confined to sharpening files, but that there is a promising field for this invention there can be little doubt.

Amongst cutting-machine tools the improvements made within the last twenty-three years have been extremely numerous, the competition from the United States (in which American ingenuity enabled our Transatlantic cousins to attain success in spite of many disadvantages) having resulted in a great many new appliances, either borrowed or of native growth. Amongst these, cast-iron lathes, separate tool-holders, hollow mandril lathes, self-centering chucks, improved return motion for planing-machines, slot-drilling, and twist-drills, the latter with their special grinders, may be mentioned.

One of the most important changes within

the last few years has been the more general introduction of milling cutters for general engineering work up to certain moderate sizes. We believe that the small-arms makers first used these tools on a large scale, and for such work as the actions of guns, in which a few parts have to be reproduced a vast number of times, milling machinery is especially well adapted. Milling is used for much larger work at the present time, Messrs. Smith & Coventry making a cutter to mill over a surface 3 in. wide. Much of the special work in Messrs. Tangye's well-known engines is done by milling cutters which will produce almost any contour, so long as there is no undercutting, the cutters being often built up of two or more parts.

The first exhibit in Group X, under which the machine-tools are classed, is that of Messrs. A. Ransome & Co., of Chelsea. Up to the present time full arrangements have not been made here, and all the tools are not in place, but judging from appearances there will be another machine coopeage such as attracted so much attention at the Fisheries Exhibition. In another part of the building this firm shows two examples of tree-felling machinery. These consist of a saw-blade attached to a piston-rod working direct from a steam cylinder. Probably connexion would be made to a portable boiler by means of a flexible pipe. The saw can be set to any angle. Close to Messrs. Ransome's stand some very interesting stone-working machinery is exhibited by Messrs. Brunton & Trier, of Westminster. The principal tool is a geared lathe, 12 in. centres, for turning granite columns. Two circular steel cutters work one on each side of the lathe bed, being carried by appropriately formed slide rests with automatic feed. The head stock in outward appearance is much like that of a metal turning-lathe of massive construction. For traversing a cutter-holder is used, taking a circular cutter, a special place being arranged in the tool-holder for the purpose. For granite and hard limestone steel cutters are used, but for gritstones, sandstones, and freestones chilled iron answers perfectly, the edge being as hard, or even harder, than steel. The steel cutters shown at the Exhibition, which were employed in turning up a granite post at the time of our visit, are conical in shape, but they are sometimes made in the form of flat discs. The cast-iron cutters are always conical, the advantage being that the edge is always on the chilled surface. Cutters are fixed on the chuck spindles by means of a split nut, and when properly set up never get loose while working. These lathes are made from 8 in. centres and 6 ft. long in the bed up to 20 in. centres, and 21 ft. long. They have usually double expanding beds for turning taper columns. It is said that an ordinary attendant will do as much work in one day with this tool as a skilled man will get through in a fortnight. There will be some other interesting stone-working machinery in this stand shortly, and we shall make further reference to it. Mr. H. R. Marsden, of Leeds, also shows stone-working machines, the principal amongst which is an improved form of his well-known stone-breaker and ore-crusher. In the older machine the power was conveyed through an eccentric motion, but this has been improved on by substituting a crank and adding a lever for working the jaws. This lengthens the bed somewhat, but the gain is no doubt very apparent in practical work. A modification has been also made in the movement of the jaws. The motion is first a striking one, followed by a rubbing or grinding action. This is obtained by an ingenious cam motion. A pulveriser, having a similar jaw-motion, is also shown. Another stone-breaking machine is shown by Mr. Robert Broadbent, in the same court. This is an improved form of Blake's stone-crusher, to which has been fitted a positive draw-back motion.

Messrs. Tangye Brothers, of Birmingham, show a novelty in machine tools in Robson's gas hammer, which has very much the appearance of small steam-hammer, but is somewhat different in the principle of its action. An inverted cylinder is carried by a cast-iron standard, and in this are two pistons, the lower of which is attached to a piston-rod, to which the top is hung. At the side of this cylinder are two powerful coiled springs, contained in a suitable casing. These are attached by means of a cross-head to the piston-rod, and, when neither in extension nor compression, hold the hammer at the upward limit of its stroke. The lower piston is then in the middle

of the cylinder. The top piston reciprocates in the upper half of the cylinder, and then moves upwards, draws in a charge of gas, which occupies the space between the two pistons, the necessary air for the explosion being also admitted at the same time. At the proper interval, the gas is exploded, and drives the hammer downwards on to the work on the anvil. In order to set the machine in motion, a turn has to be given to the fly-wheel, and after this the work is performed automatically, the force of blow being regulated by means of a lever working in a cam, by which the supply of gas is regulated. The admission port is also actuated by a cam motion, whilst the exhaust port is opened and closed by a slide operated from a crank on the fly-wheel shaft. On the same stand are shown Robson's gas-engine and other examples of Messrs. Tangye's productions. Messrs. Sannel Worsam & Co., of King's-road, Chelsea, show an example of their four-cutter general joiner. This has been rendered more useful by an arrangement which allows of the bottom adze being detached and taken out, so that the joiner's bench can work separately from the moulting apparatus. In this way two men can, if necessary, work independently of each other, or the whole apparatus can be operated as one machine in the usual way. On this stand is shown a hand-saw, in which the whole standard carrying both riggers can be shifted for angling. This excellent arrangement is planned so that at whatever angle the saw-hand makes with the table it passes through the latter at the same spot, and the work, therefore, need not be shifted. This does away with a fruitful source of danger in bandsaws where angling is required. The motion of the frame is obtained by a worm gearing into a toothed quadrant on the back of the casting. A self-acting saw-bench in which the feed may be obtained at will, either by vertical rollers or rope, is also shown by Messrs. Worsam & Co., on this stand.

There are two exhibits of pottery-ware machines shown in this section. The first of these is shown by Minton's, Limited, of Stoke-on-Trent; but as the arrangements are not yet complete, we will defer further mention of them for the present. Messrs. Thomas Willett & Co., of Burslem, are, however, in full operation on the next stand. They show a combination of what are known as a "jigger" and a "jolly." These are used for making ordinary crockery-ware coffee and tea cups, and work automatically, the operators merely having to supply the clay and remove the form. By this apparatus, which is also applied to the manufacture of saucers, basins, &c., vessels can be moulded accurately to size, and the thickness of material is absolutely uniform. The onp-making machine exhibited will turn out fourteen articles a minute, and does not require skilled attention. An automatic bat-making machine, shown by the same firm, is also an ingenious labour-saving tool.

A machine in this group already at work is a slotting and shaping machine, shown by Messrs. John Spencer & Co., of Keighley, Yorkshire. This is a convenient hand-power machine for cutting keyways in pulleys or wheels of any kind. The cutter is pushed through by a straight movement, communicated through a lever. The withdrawal of the cutting-tool from the work is effected by its own weight. When the motion is reversed in order to make the return stroke, the first action is to pull back a small wedge, and the cutter then falls. On again reversing, the wedge is automatically pushed forward, and so raises the cutter to the part to be operated on. The necessary taper is given to the keyway by means of a guide-plate fixed to the front of the machine, by which any angle may be arranged.

An apparatus that appears to attract a good deal of attention is the paper bag-making machine shown by Mr. F. D. Bumsted, of Hednesford. By this apparatus the whole of the operations necessary for making paper bags are carried out. It would be manifestly impossible to describe these without elaborate drawings, but the way in which the paper is converted into bags affords considerable amusement to the sightseers at the Exhibition. The special point about this machine is that it will make "square bottom bags," a refinement in bag-making which other less-gifted appliances are not capable of accomplishing.

Messrs. Sharp, Stewart, & Co., of Manchester, show a Sellars' patent planing-machine. In

this machine, the table is driven by a spiral pinion, keyed on a shaft running diagonally beneath the table, the pinion gearing into a rack placed also diagonally on the underside of the table. The motion is conveyed by a pair of bevel wheels. Since this arrangement was first introduced by this firm from the United States, they have made several improvements, especially in the reversing and quick return gear. A boiler drilling machine of a new type is also shown on the same stand. This will drill or ryer internally after the plates are in place, and either two drills, working opposite to each other, can be used at once, or one can be thrown out of gear and the other used. The feed is automatic. A neat model of a locomotive is shown on this stand, to which is fitted an arrangement for preventing oscillation upon going on to reverse curves. This, however, is outside the scope of our present notice. This stand is shared by Messrs. Sharp, Stewart, & Co., and Messrs. Anderson & Gallwey, of Chelsea, who show examples of machine riveters and other heavy hydraulic plant.

The two largest exhibits in metal-working machine-tools are contributed by Messrs. Greenwood & Batley, of Leeds, and Messrs. Hulce & Co., of Manchester. The former firm shows some very fine examples of milling-machines of highly ingenious construction, while Messrs. Hulce have novelties in planing and drilling machines, lathes, &c. We shall return to these again, together with other exhibits in this section, at a future date.

FURTHER NOTES ON ACADEMY PICTURES.

The central work in Gallery I. is Mr. Britton Rivière's "Sheepstealers" (24), a man and dog preparing to capture one of a flock of sheep by moonlight. We say of this as of many other moonlight pictures, that so much detail and so much light are never really seen in moonlight,—in this part of the world, at least. The dog and sheep, of course, are all that can be wished; but the picture has been over-rated. Opposite to it Mr. Yeames makes rather a success with a large painting called "Prisoners of War: 1805" (67), two midshipmen under the charge of a stolid French sentinel, one of them a mere child, regarded with great sympathy by the French women among the spectators. The character of the two lads is very well contrasted. Mr. Frank Dickson's "Chivalry" (53) is very fine in colour, utterly unreal in its personages; an eminently theatrical work. It is balanced by Mr. Hodgson's "Don Quixote and the Galley Slaves" (39): the Don hardly rises to the ideal of the character; the humour in the other characters is good and not exaggerated. Mr. Marcus Stone touches the well-worn chord of "The Gambler's Wife" (18) in a way not calculated to awake our sympathies; Mr. Marks gives us a pleasant bit of humour in "A Good Story" (30). A landscape by Mr. Oakes, "Cwm Eirian Moor" (61), and one by Mr. Peter Graham, "Evening" (73), are large and well-executed works, both partaking too strongly of mannerism to interest us. Mr. Orchardson's "Mrs. Balli" (72) is a fine harmony of tones; Mr. Calderon's "Mrs. Harry Rouse" (19), a finely posed and spirited portrait, uninteresting in colour.

In the "Language of Flowers" in Gallery II. (141) Mr. Leslie gives us one of the most pleasing works in his own vein that we have seen; two girls form a group that we have seen in style of beauty and tone of costume, harmonised beautifully in composition. There is a more thoughtful expression, more of feeling, in the work, than this painter has given us lately. The same room contains an example of Mr. Hook's river subject and sea subject, "The Stream" (140), and "After Dinner Rest awhile" (146), the quotation applying to certain be-glutted cormorants who serve to give a tide to a sea-piece. But we make a run for a moment into Gallery III. to note that Mr. Hook's great success (which we certainly ought not to have omitted in our first notice) is "Ye, leave oh!" (270), a sea-piece on a breezy day, where a group of men and women are hauling the net into the ocean, and "the lightning of the noon-tide" flashing beyond them to some purpose. The look, the very smell of salt water is in the picture; the artist has never done anything finer. Backing again into Gallery II., we note Mr. Dendy Sadler's clever work "The Salad" (136), the scope and

humour of which are best indicated by the quotation appended: "Pour faire bien une salade il faut être trois personnes; une sage pour y mettre du sel, un avare pour y mettre du vinaigre, un prodigue pour y mettre de l'huile." Mr. Brown's "Our Playground" (92) is a study of London children on the Albert Embankment, very clever in character, a little weak in executive detail: its grey and brown tones form a good foil to Mr. Prinsep's "Afternoon Gossip on the Banks of the Ganges" (91), a hard piece of powerful colour. Mr. Herkomer's "Earl of Ducie" (119) is a fine portrait.

We shall be glad to offer a reasonable reward to any one who will tell us the meaning of Mr. Goodall's picture (165) of an infant sprawling on his back, with a quotation from Farrar's "Life of Christ." The limelight is badly handled, for it falls on the floor round the child, and not his figure. But, on the whole, we give it up. Mr. Vicat Cole's "Sinclair Hill, Dorchester" (186), and Mr. Graham's stormy coast scene (190), are good examples of the work of the two painters, who produce effects, and fine ones, but do not take us to nature in her reality. Mr. Hook appears here with a fourth work of great power, "The Close of Day" (202), a golden sunset effect over sea, an impressive work, possibly a little exaggerated, the sunset laid on rather thick. Mr. Britton Rivière's "Vae Victis" (231), a combat à l'entrance between a wolf and an eagle, has a kind of screeching power about it; Mr. Marks's quiet and luminous painting (248), "A Treatise on Parrots," is in his best manner; Mr. Faed's "When the Children are asleep" (225) is a pleasing interior, with a freight effect; Mr. Pettie's "Challenged" (230), where a young gallant has been roused from his bed to receive an apparently very unwelcome challenge from a booted and cloaked person, who is making his retreat, is a pointed and humorous variation of an old theme. Portraits are numerous in Gallery III., among which Mr. Watts's "Miss Laura Gurney" (201), with its rich mellow tone, is a pleasure to see; and Mr. Hell's "Earl of Dufferin" and "S. Weir Mitchell, esq., M.D." (211, 219) are masterly in character, expression, and broad, solid execution. A rather harshly-coloured and "loud" portrait, by Mr. Wells, of Mr. D. F. Carmichael (255), a late member of Council at Madras, has, nevertheless, a good deal of force and character. Among other portraits of note, besides those previously noticed, are Mr. Outess's "Bishop of Worcester" (240), an embodiment of the "Church dignitary" type; Mr. Pettie's Mr. J. G. Orchar (185), a very forcible work; and Mr. Horsley's, the Academician, of his two daughters; and Mr. Sant's of a pretty little maiden, "Nesta" (179).

We have already mentioned the most noticeable works in Gallery IV.; but Mr. Herkomer's rather remarkable portrait of "Miss Katharine Grant" (360) claims a word. This is a portrait of a brunette dressed almost entirely in white, and against a nearly white background; it is a bold but an undeniably effective experiment. The attempt to portray the power of nature through the medium of allegorical figures is made by Mr. G. McCulloch in "The Cloud" (372), and by Mr. H. J. Stock in "Night covering the Sleeping Earth" (373); the latter has something fine about it, but Night is coming down headlong in a way that disturbs the repose of the scene, and suggests the idea that he is shocked at the state of poor Earth and anxious to throw some respectable covering over her at once. Such works are praiseworthy as an attempt to escape from the ordinary boundaries of prosaic subjects; but there is always danger of their trenching on the ground of the ludicrous, which we fear this one does.

There is little, indeed, to give us pause in the waste places of Gallery V. Mr. Goodall's great canvas, "Gardner's Last Messenger" (432), is what we suppose is called "a picture for the times." For ourselves, it is little pleasure to see the tragic loss of that great man to the nation turned to the providing of subjects for theatrical and unreal painting. The most impressive work in this room is Mr. Miller's "Mahalah" (490), a fine painting of a very fine young woman in seafaring costume. Some of the things, e.g., such as "Sweet and Twenty" (505), which might better have been called "The Ogress," make one wonder equally how any one could paint them and how any hanging committee could pass them; that is to say, we

should wonder, if it were not for the pictures by an Academician in the same room, and they are, as Rosalind says, "out of all whooping."

The central place in Gallery VI. is occupied by Mr. Fildes's "Venetians" (559), a picture which would be striking if seen for the first time, but which is really only a rather inferior repetition of his painting of last year. Mr. Leader's "Hedgerow Elms and Hillocks green" (555) is a very pleasing landscape, though not marked by any power; Mr. J. Knight's "Solitude" (605) is one of the best of his dark-green or brown-green studies, which reproduce only one aspect of nature, but reproduce it with great power and fidelity. Mr. Benham's "Winds that are Wild, and Waters that are Free" (618) is a fine work, and there is a certain individuality about a small dark painting of "Tintagel" (617), by Mr. H. Welsh.

In Gallery VII. Mr. A. Gow has chosen a very fine and pathetic subject, "Absolution for the Lost at Sea" (656), where a Catholic bishop and acolytes, with mourners, are assembled on a bleak windy height outside a church, to go through the solemn form of benediction over those who are lost in the sea below. Superstitious as the subject is, there is a keen pathos about it which the painter has evidently felt and makes others feel. It is not too often that we can say this about Academy pictures, many of which seem to have no cause of existence, except that the painter wanted to show that he could paint this or that other form or substance. Mr. MacWhirter's "The Track of a Hurricane" (662) in another way has also a definite motive, but strikes us as more ambitious than successful: we should be curious to know whether it was painted from any actual scene in the regions of hurricanes; the picture does not lead us to think so. Mr. Colin Hunter has made a great attempt to paint "The Rapids above the Falls of Niagara" (709), a large painting, in which the turmoil of the irregular heaps of water is well conveyed, but it is the movement, not the substance, of water; it is a material thicker and less translucent than water. Among other works in this gallery may be named "Sunday Morning" (672), by Mr. Arthur Hughes, a girl in a garden on the way to church, sending the dog back, the picture is filled with a wealth of blossoms somewhat too hardly painted; "Milton visited by Andrew Marvel" (663), by Mr. Boughton, who has reduced the Puritans to a very washed-out and weak-kneed set of people; "The Temple of Luxor" (680), by Mr. Frank Dillen; "Lake Lemna" (682), by Mr. Inchbold; "A Harbour in the Channel Islands" (689), by Mr. W. M. Willie; "The Coming Race" (691), an admirable study of puppies, by Mr. W. Strutt; another clever dog picture, "How now! a Rat" (713), by Mr. Yates Carrington; and "In Disgrace" (717), by Miss Cornillon.

In Gallery VIII. is a tremendous picture of a young Christian lowered into the arena after a fight with beasts, by Mr. Armitage (792), concerning which we cannot say much. It is altogether too big for our understanding. There is a very clever representation by Mr. Pettie of "Charles Surface selling the Pictures" (812). Mr. Pettie has got Charles and Careless to a T. They are the very men, and uncle Oliver is very good also. A little delicately-painted work by Mr. Percy Thomas, "The Old Sketch-book" (790), is well worth looking at by those who can appreciate its tender and regretful expression. It is a small painting, quite out of the line of the commonplace. How few of them there are, to be sure! "Honeymoon in Normandy" (780) is a clever work by Mr. Eyre Crowe, representing a young English couple tricycling through the street of a Norman town, to the respectful astonishment of the natives. As to Mr. Calderon's big wench, called "Morning" (774), supposed to be listening to the lark, unless he did it "for a lark" we cannot tell what he is at. Mr. Eyre Crowe's other work, "The Old Chantry at Auberville" (811), is a very interesting interior, with calm and placid sisters kneeling beneath their enormous eaves. Mr. Herbert has actually done a landscape, "On the Llugwy" (797), and it is not by any means so astounding as his figure pictures.

Gallery No. IX., the old Water-colour room, is filled mostly with small cabinet works, among which is a superb little painting by Mr. Brett, "The Lighthouse on Cape Wrath: Daybreak" (841). The painter has got the look of early morning wonderfully; the cold, dark, inky-looking sea and the pale gleam of the lighthouse light in the merring seem almost real as we

look into the picture. In this gallery is also a fine and poetical work by Mr. R. Bottomley, "Death's Betrothed" (906), a dead girl in her bed, and a visionary figure of Death standing up behind. We have before noticed Mr. Bottomley as a painter who looks for subjects out of the beaten track, and treats them with pathos and originality. Mr. Pettie's "Sir Peter and Lady Teazle" is another highly successful *School for Scandal* picture; and in the same room Mr. H. W. B. Davis exhibits a fine concentrated composition of landscape and sheep, under the title "Lost Sheep" (874).

In Gallery X the battle pictures find place. These include Mr. Crofts's "William III. at the battle of Landen" (1,051), illustrating a descriptive passage from *Tristram Shandy*. This is not so complete a success as the painter's "Marlborough" some two or three years ago, but it somewhat recalls that, and is full of characteristic and spirited figures. Mr. C. E. Frapp's "Last Stand at Isandhlwana" (1,065) and Mr. Douglas Giles's "Battle of Tamai" (1,038) we can only name, but Mrs. Butler's "After the Battle" (1,081), the arrival of Lord Wolsley and Staff at the Bridge of Tel-el-Kehir, is a striking work, hard and raw in colour, as this brilliant lady's works are, but full of force and reality in the look and action of the men. Mr. J. D. Linton has a large picture of "The Marriage of the Duke of Albany" (1,028), painted for the Queen; even Mr. Linton has hardly been able to make these formally-arranged groups and strongly-coloured uniforms interesting, but it is, at least, less hard and conventional than paintings of this class usually are, and those who were responsible for the choice of an artist showed their judgment in availing Mr. Linton. As to the public at the exhibition, they crowd and gaze round this representation of royal personage from morning till night, to show their enthusiasm for art. In the same room are Mr. Herkomer's "Found" (1,027), a large "Landscape with Figures" (as the old catalogues would have put it) with nothing of special interest in it; Mr. Tom Lloyd's "Tollers of the Sea" (1,040), a good oast picture; Mr. MacWhirter's "Iona" (1,043) and "Corrie Burn" (1,088), the latter, to our thinking, his best picture of the year; Mr. Joseph Clark's "Home Again," the return of a sailor to his family (1,067), not equal to Mr. Clark at his best, but interesting in the figures and face of the children; and an effective portrait of Mr. Bret Harte (1,077), by Mr. Pettie.

In Gallery XI are a couple of good landscapes by two of the more recent landscapists, "The Slopes of Ben Nevis" (1,126), by Mr. Johnson, and "Last Leaves" (1,136), by Mr. David Murray, who, however, seems to have acquired a favour in the eyes of the Academy which we cannot quite see justified in his rather tame though refined works. Mr. Storey's picture of the "five maidens" who were supposed to have sat to Zeus for his "Helen" (1,149) is far superior to another on the same subject which was recently exhibited in London, as the subject seems a stambling-block to artists, who are always at it, and never succeed in making anything very attractive out of it. Here is beautiful painting in the work, but the five maidens are coquetish and rather vulgar, and not worthy to supply models for a golden age. Mr. W. H. Bartlett sends an interesting picture, the studio of a deceased sculptor, where a wife and daughter, in deep mourning, are exhibiting "His Last Work" (1,160) to visitors; a figure is sufficiently expressive, and the accessories, casts and marbles, &c., painted in much care. Mr. Herkomer's excellent portrait of "Sir Watkin Wynne" (1,155), with a kindly and thoughtfully Welsh face, has a melancholy interest at this moment. Mr. Long exhibits a hard but in certain respects a fine and good portrait of Mrs. Chamberlain Starke (1,147), what we should characterise as a very ladylike portrait, and the artist fairly share the credit of that with his sister. Mr. Seymour Lucas's "From a Field of Sedgemoor" (1,128) illustrates wonderfully one of Macaulay's brilliant assumptions,—"The neighbouring villages long membered with what a clatter of horse-hoofs and what a storm of curses the whirlwind of valry swept by." A fugitive with a scythe-like weapon sits at the table with his head hid in his hands; the girl of the house listens with frightened face at the door: the picture very real and effective.

We will say something of the sculpture separately.

LEASEHOLD TENURE IN LONDON. ARCHITECTURAL ASSOCIATION.

The last ordinary meeting of the Session was held on Friday, the 8th inst., Mr. Cole A. Adams, President, in the chair.

Mr. Wm. Fawcett, of Cambridge, Diocesan Surveyor, was elected a member by acclamation; and Messrs. E. Carter, Owen Fleming, and T. Henry were elected members by vote.

It was announced that the next visit would take place on the 16th inst., to Tilbury Docks and Hotel.

Votes of thanks in connexion with the late visit to the Church of St. Bartholomew the Great, Smithfield, were accorded to the Rector and to Mr. Aston Webb.

The Association Travelling Studentship, it was announced, had been awarded to Mr. Henry Denison Walton, and the second prize to Mr. Roland Wilmot Paul. The prize drawings were exhibited.

Mr. W. H. Atkin Berry (Hon. Sec.) then read the report of the Special Committee appointed last session to consider the whole system of education as carried on in the Architectural Association. This report will be discussed at a special meeting to be held on the 29th inst.

The Chairman stated that the lecturer for the evening, Mr. Ince, had been prevented preparing his paper, and that Mr. Percy Hunter had kindly taken his place at short notice.

Mr. Percy Hunter then read a paper entitled "Leasehold Tenure of Property: its Prejudicial Results to London, both Socially and Architecturally," of which the following is a summary:—

The author, in the course of his introductory remarks, observed that while his paper dealt only with London, many of the facts stated and the deductions drawn applied, though in a lesser degree, to the other large towns throughout the country. The leasehold system might be said to paralyse in Londoners all personal interest either in the localities in which they lived or in the houses which they occupied, and consequently it depressed, if it did not actually destroy, any active expression of that interest which should be shown in the promotion and execution of public works of local improvement, in the proper maintenance, structurally and decoratively, of private dwellings, or in the general architectural adornment of this vast and wealthy metropolis. The growth of London in population and area during the present century had been extraordinary, and probably unparalleled in any other city that ever existed. In 1801 the census returned 950,000 inhabitants, so that in the last eighty years the population has more than quadrupled itself. It now continued to increase at the rate of 70,000 per annum. These figures, extraordinary as they were in themselves, became even more interesting if at the same time the plans of the London of the past were compared with those of the London of to-day. Between 1560 and 1818, i.e., in the long period of two centuries and a half, London only increased from two square miles in extent to six square miles. Between 1818 and 1834 it more than doubled itself in those sixteen years, and covered sixteen square miles. It was worthy of notice that up to 1834 the most outlying districts of the London of that day were within walking or easy driving distance of the business centres. The change, however, brought about by the development of the railway system between 1834 and 1881 was wonderful. In those forty-seven years the metropolis increased from an area of sixteen square miles to one of one hundred and seventeen square miles. If London continued to expand at the same rate, Stratford, Clapton, Highgate, Hampstead, Hammersmith, Putney, Balham, Blackheath, &c., will all be enclosed before the end of the century within bands of brick-work. When we find that nearly the whole of the property within the vast area of modern London is held upon short terms of leasehold tenure, we begin to realise the magnitude of the question of leasehold tenure. Lord Beaconsfield, speaking at an agricultural meeting a few years ago, stated that there were three values belonging to agricultural land,—firstly, the value of the ground-rent according to the freeholder; secondly, the value of the produce obtained from it by the farmer who put his capital into the cultivation of the land; and, thirdly, the value of the work of the labourer who had expended his labour upon the land, getting as an equivalent his daily wages. On the same principle Mr. Hunter defined three

values in urban property. There was the ground-rent belonging to the freeholder; there was the rental-value obtained by the leaseholder in return for the capital laid out in erecting suitable buildings on the land; and there was the value of this improved property to the occupier or sub-lessee, depending in amount upon certain relative conditions of suitability of site, &c., for the purposes for which he occupied it, whether for residence or business. But in London, grouped as it is all round a narrow central area of daily business, a fixed and inelastic quantity like that of land becomes of enormous value, and, broadly speaking, this value is proportionately greater or smaller according to its proximity to or remoteness from this central area. This initial value of land, therefore, directly affects the other two values mentioned above, and the consequence is that they together become too great for one individual to possess. Mr. Hunter next proceeded to detail the relations subsisting between the freeholder, the leaseholder, and the occupier, pointing out that generally,—and almost invariably in Outer London, with whose progressive condition we could practically alone hope to deal,—the leaseholder is a builder,—a speculative builder. This is not necessarily a term of reproach, though many people seem to think it so. But it is in its bad influence on the speculative builder that the evil of the leasehold system first manifests itself. The lease granted being for any period less than one hundred years, there is no personal inducement held out to the leaseholder to lay out capital in the erection of buildings that will outlast that period, for any such outlay on his part will obviously be for the permanent improvement of the freehold, in which, however, he has not the slightest interest. Besides, his occupation is building, not house-owning; therefore he builds to sell, and his object is gained if he can build in such a way as to get the greatest possible return on the least possible outlay. This result is now attained more surely by "showy" appearance than by sound construction. The direct consequences are at once painfully obvious in the meagre appearance of modern houses built under this system, with their cheap and generally hideous embellishments of Bath stone or stucco window-bays, porticoes, string-courses, and cornices, repeated *ad nauseum*, and they become still more obvious in the course of time, as the original unstable construction gradually makes itself apparent. These results, however, do not declare themselves until after the original lessee, the builder, has sold the property, and transferred his energies to fresh woods and pastures new. To prevent a too serious and rapid depreciation of the reversionary value of the property, a compromise is, to certain extent, arranged between the freeholder and the leaseholder at the commencement of operations, by means of the supervision of the freeholder's surveyor. But, in spite of this, the results cannot be said to be satisfactory to either of the parties, or to society as a whole. The freeholder does not get such sound buildings erected on his land as he would like to get; the lessee has to put more value into the property than he wishes to put there; and the public, who, as usual, have to pay for all this, do not get healthy houses to live in. The leaseholder, however, may, and often does, change his personality several times during an eighty or ninety years' lease. The original lessee, the builder, as we have seen, sells his interest as soon as he has established it on the basis he arranged in his calculations,—unless he has made a mistake in those calculations, in which case the property probably passes to his sub-partner, the mortgagee. In either case the leasehold interest is sold. But the direct interest of the lessee for the time being in the property is decreasing year by year as the term runs on; for about two-thirds of the lease the structural stability of the property is maintained by him, because that affects its marketable value; but after that period this value becomes so diminished that it ceases to operate as an inducement to maintain or repair, and he generally prefers to let the property at a reduced rental to a lower class of tenant to laying out a capital sum in the requisite repairs. Hence the growth of "rookeries." Such were some of the results of the leasehold system on individual properties. Its influence on localities was next discussed by Mr. Hunter, who pointed out that the freeholder, who surrenders, for a consideration, nearly all active interest in his

own property, does not as a rule concern himself in matters of general local importance. For the primary development of his land he may have formed the roads and laid the necessary sewers. But the annual rates for the maintenance of these, together with all rates and charges for paving, lighting, and maintaining the roads, all of which are of permanent value to his property, he devolves upon the leaseholder. Such matters of important local interest as the establishment of a free library, the erection of a town-hall or concert-room, or the formation of a public park, would all tend to the permanent improvement of property, but the freeholder's reversionary interest in it is, by the leasehold system, too remote to induce him to take any active share in promoting such works. If, however, in spite of this, they are carried out, he contributes nothing towards them. Now, the cost of all these works of local importance, whether of practical necessity or of general advantage, is defrayed upon all local rates. These rates are levied upon all property, and that, by the leasehold system, means upon the leaseholder, who is regarded as *de facto* the "owner." But the lessee is the builder, who builds to sell. If, therefore, the rates were increased to meet the cost of these educational or aesthetic works (which he would certainly regard as speculations), his financial calculations on his speculation would be upset, and he would therefore, in the Vestry, decidedly oppose their execution at the time when they could most economically and advantageously be carried out. When, at a later period, the neighbourhood has developed and settled down, the responsibility for the rates has devolved upon the occupiers. It might have been assumed that here, again, they would be personally and directly interested in its neighbourhood in which they reside, in its sanitary improvement and general healthiness, and in its architectural and horticultural adornment, all of which add to the enjoyment of the daily life. But the occupier's term being, as a rule, only a seven years' tenancy, his interest is too limited to induce him to promote works which will be a permanent improvement to property which is not his own, yet for which he will, as a ratepayer, be immediately pecuniarily liable. It is still less likely that he will concern himself much about his neighbourhood. Therefore, if he is on the Vestry, he opposes any increase in the rates, and if he is not on the Vestry he opposes everything by simple apathetic indifference. Moreover,—and here is one of the most serious and mischievous effects of the leasehold system,—the occupier is of a migratory disposition. Partly from these causes, and partly because of local government, the occupier has no inducement to share actively in local government work. Mr. Hunter next proceeded to discuss the effect of the leasehold system on London, architecturally. He observed that the law and order which we boast of in our civil life is absolutely wanting in the architecture of the metropolis. But the worst influence of leasehold tenure is more evident in Outer London, and is of course contemporaneous with its recent great development, for it is worth bearing in mind that with the exception of the great Bedford, Westminster, and Portland estates, the present extensive system of leaseholds was not fully developed until the period between 1818 and 1834, and then with the growth of the metropolis the system gradually affected with ever-widening circles the architectural face of the whole of greater London, where local government, with its slow action and divided counsels, has been unable to provide that guiding hand which is manifest on the great dual estates. Another reason is that the freeholder himself, in addition to being a less wealthy man, and holding, perhaps, only one or two acres instead of many, has, in the race for ground-rents, become, to a certain extent, speculative too. There is no use in vilifying the speculative builder. He is not really responsible for the sins he commits, nor has he been imposed by a wicked and tyrannical Government upon a helpless and down-trodden humanity; both he and his works are the natural offspring of the system of leasehold tenure of property. It was very difficult to suggest a remedy for the evils of the system, for just as surely as the existing condition of things has been the result of the development of one part of this economical question, so any alteration or reform that may be brought about must rather be through a correct appreciation of its evils by the general

public than by any fanciful or arbitrary schemes of legislation on questions of property. It has been said that "we can command Nature only by obeying her laws," and we can only hope to permanently improve the conditions of urban life by a correct appreciation of all its circumstances, and eradicating those evils which have been developed. It has been proposed of the freeholder to any leaseholder possessing an unexpired term of more than twenty years. There seems to be no logical reason for fixing on this arbitrary term of twenty years. If the principle is sound that any leaseholder should have the right to enfranchise the property which he holds if he is able and willing to do so, it must apply with even more force to a short term than a long one, as an insurance by the lessee against disturbance. Suppose, however, that by such fanciful legislation or a stroke of the pen we were able to enfranchise all leaseholds throughout London to-morrow, what would be the natural and inevitable consequence? We should simply find, the day after, that half the freeholders had realised the present value of their newly-acquired properties and had sold or mortgaged them for different terms of years at their market values. And chaos would have come again.

In the course of the discussion which followed,—

The Chairman remarked that this question would be considered to be one belonging more to the seniors in the upper room; but at the same time it was one which deserved the consideration of the juniors. The report of the Royal Commission, just issued, stated that the overcrowding in London was mainly due to the leasehold system. Perhaps some might take exception to Mr. Hunter's sweeping condemnation of London architecture. Many of the London streets,—the Strand in particular,—a variety of buildings,—had a remarkable picturesqueness of its own; and Ladgate-hill, and its approach to St. Paul's, had always struck him as being very fine, especially on a misty day.

Mr. H. G. Turner proposed a vote of thanks to Mr. Hunter, with whom he agreed that it was impossible to effect everything by legislation. The only possible way out of the difficulty was to improve public feeling, because really the public were much to blame in the matter. It was all very well to blame the system of leaseholds, and speculative building, but it was the public who made that, by being anxious to get a showy house at a much less price than such a house should be built for. Most of the houses built eighty years ago on the dual estates were substantial, but nothing was spent on outside appearance.

Mr. Brodie remarked that if the paper proved anything, it proved that what was wanted was that buildings should be carried out by the large landowners. He seconded the vote of thanks.

Mr. Ellison thought that Mr. Hunter had been somewhat hard on the majority of the freeholders. A remedy might be found were the artistic as well as the constructive merits of the plan to be submitted.

Mr. Blagrove believed that Mr. Hunter had proved his case. At the same time it was difficult to suggest a remedy, though it would be a good thing if the public could be educated to understand the value of good building. It ought to be the duty of every one before taking a house to employ a qualified architect or surveyor to examine it.

Mr. F. W. Miller thought that many of the evils Mr. Hunter had put down to leasehold tenure were due as much to a vitiated public taste, and to the operation of the law of supply and demand. Nearly all existing public buildings in the metropolis were built on leasehold tenure, so that whether they were good or evil, the good was due to the leasehold system as well as the evil. Mr. Hunter seemed to bear in mind rather a cheap class of property; but some of the houses put up at Hampstead and South Kensington, under the leasehold system, would be an ornament to any country. It was idle to expect that every man who wanted a house would buy the ground, as Mr. Ruskin would have him do.

Mr. Hunter, in returning thanks, agreed that there were many picturesque parts in the architectural appearance of London, of which they had every reason to be proud. But considering

the immense amount of capital spent, and the trouble taken, the results were far from being commensurate. His paper did refer to a good deal to a small class of property, but this supported the truth of his argument; because houses in the larger residential parts, where the houses approached to something like an absolute ownership, that it was worth while to give some attention to architectural appearance.

Mr. J. A. Gotch proposed a vote of thanks to the retiring President, Mr. Cole A. Adams.

Mr. Stannus seconded the vote, which was very cordially received.

A vote of thanks was also passed to the retiring Secretary, Mr. Atkin Berry, and to the retiring committee.

The Scrutineers, Messrs. Fawcett and Frase then presented their report on the voting of the new Committee, with the following results:—President, C. R. Pink; Vice-Presidents, J. A. Gotch and W. H. Atkin Berry; Committee, C. A. Adams, W. J. N. Millard, J. Slater, B. A. L. A. Stokes, F. E. Eales, W. A. Pite, E. May, W. H. Bidlake, M. A. F. R. Farrow, Young; Treasurer, J. D. Mathews; Assistant Treasurer, H. W. Pratt; Librarian, R. L. Colton; Hon. Secs., H. D. Appleton and T. E. Pryce; Solicitor, Francis Truefitt; Assistant Librarian, W. Burrell and J. Shelley Birch.

THE SOUTH TRANSEPT, CHESTER CATHEDRAL.

THE south transept of Chester Cathedral was built partly in the fourteenth and partly in the fifteenth century, and never to have been entirely completed. Springs were prepared for the stone-groined ceiling of the central and side aisles, but the flying buttresses were left incomplete, and only a bay of groining at the south corner of the eastern aisle was finished.

For three centuries this transept was entirely cut off from the cathedral, and was known and used as the parish church of Oswald, the original church being pulled down to make room for it. The congregation is now provided for in the new Church of St. Thomas the transept has been thrown open to the cathedral, and the much-needed work of preparation is by degrees being carried out.

The restoration of the exterior of the west and east sides with the flying buttresses was completed by Sir Gilbert Scott; since then the new roof has been put over the central aisle and the groined ceiling of the eastern aisle has been finished.

It is now proposed to restore the south front to something like its original form. Old fragments of the cathedral before the erection of the existing front, which (as mean a work as Gilbert Scott) is "in some ways a work as present value has produced," are vague, vary very much, but all agree in representing it as elaborately and richly decorated with niches and sculpture.

The design for its reconstruction must therefore be, to a great extent conjectural. Old fragments were fortunately left intact in two places sufficient to indicate what the details must have been. The great central window which was destroyed when the present front was built, appears to have belonged to the perpendicular architecture seen in the transept (perpendicular), but no reliable record of design is known to exist; it has been thought permissible to design the new window in harmony with those of the aisles which remain.

After the completion of this front, it is hoped that the remainder of the groined ceilings the repair of the interior may be taken hand.

PUBLISHING OFFICES FOR MESSRS. SEELEY & CO., ESSEX-STREET, STRAND.

This building, designed partly as a warehouse and partly as offices, has been lately built by Messrs. J. & J. Greenwood. Mr. Henry Coates is the architect. The two top floors are ware-rooms, and are of plainer design than the lower stories. It was originally intended to have three dormer gables at the top, one over each of the projecting bays, but difficulty of "light and air" intervened, and the two

The first part of the life of the subject of this memoir is passed in the most ordinary manner, and is not worth recording. He was born in the year 1750, at the village of *St. John's*, in the county of *Down*. His father was a gentleman of moderate fortune, and his mother was a lady of good family. He was educated at the *University of Oxford*, and afterwards at the *Bar*. He spent some years in the study of the law, and afterwards in the exercise of his profession. He was distinguished by his talents, and his industry, and his integrity. He was a man of a liberal and generous mind, and of a warm and affectionate heart. He was a friend to the oppressed, and a champion of the rights of the poor. He was a man of a high sense of honor, and of a strong attachment to his country. He was a man of a high moral character, and of a high reputation. He was a man of a high rank, and of a high position. He was a man of a high name, and of a high fame. He was a man of a high spirit, and of a high courage. He was a man of a high soul, and of a high glory. He was a man of a high mind, and of a high wisdom. He was a man of a high heart, and of a high love. He was a man of a high will, and of a high power. He was a man of a high strength, and of a high endurance. He was a man of a high courage, and of a high valor. He was a man of a high honor, and of a high respect. He was a man of a high reputation, and of a high fame. He was a man of a high name, and of a high glory. He was a man of a high spirit, and of a high courage. He was a man of a high soul, and of a high glory. He was a man of a high mind, and of a high wisdom. He was a man of a high heart, and of a high love. He was a man of a high will, and of a high power. He was a man of a high strength, and of a high endurance. He was a man of a high courage, and of a high valor. He was a man of a high honor, and of a high respect. He was a man of a high reputation, and of a high fame. He was a man of a high name, and of a high glory.

The Godwin Bursary Medal.

es had to be abandoned. The materials used were Portland stone, red brick, and, in the panels of the first and second floors, plain red unglazed tiles in herring-bone patterns, affording a workable surface. In the ground-floor story a sufficient amount of light and air has been obtained without making the building appear to rest entirely on sheets of plate-glass. A special feature in connexion with the work is the framing of the panels, &c., in the projecting gables. This has been designed and carried out throughout by Mr. E. Roscoe Mullins, the well-known sculptor, who had free scope subject to the general control of style, scale, and subject, which the architect considered necessary. Mr. Mullins desires us to state that the drawing, of which our illustration is a reproduction, was selected at the Royal Academy Exhibition this year.

WELLS VESTRY HALL COMPETITION.

We give this week the third premiated design in this competition by Messrs. Newman & Newman. The following is the architects' statement of their views in regard to arrangement and design of the building:—
"In the existing buildings the corridors being very long, it was thought undesirable to confine them to any greater length in one direction, and it was partly upon this consideration that partly to secure good light other than top light to the committee and cloak rooms, and to place the reception-room in proximity to the two lobbies that the plan assumed the leading lines. The conveniences are so arranged as not to interfere with the ingress of the people, and yet be close at hand, but retired from the halls and reception-room.
The position of the committee-room was fixed by the desire to have it near the present fittings, as it was thought that it would be used in conjunction with them, to keep it as near the hall as possible on account of the use, and to obtain direct light.
These considerations helped the working out of the main idea, viz., to have the two lobbies arranged en suite to present as large a front as possible to Manor-gardens for the improvement of that property.

The dimensions of the main hall are 77 ft. by 41 ft. and 32 ft. high. A gallery is formed over the servery with two staircases, one communicating with the interior of the building and the other with the street. Accommodation is provided for 530 people in the large hall and 70 people in the gallery, or a total of 600 in all.
The halls are lighted from the side and ends, and separate exits provided into Manor-gardens, which also lead to the retiring-rooms.

On the west side of the Vestry-hall is the secondary hall. Its dimensions are 41 ft. by 37 ft. and 27 ft. high to the ceiling. The service-rooms adjoin and are arranged between the two halls.

Externally red bricks, with Portland stone dressings, cornices, &c., were proposed.

Internally, in the halls, committee and reception rooms, it was proposed to have wainscot dados and doors, and the walls above plastered and finished in colour, while the vestibules, corridors, and lobbies were to be finished with marble mosaic floors, marble dados and columns, and the plastering finished with colour decoration. The dome lights to vestibules were to have had artistic glass to suit the style and finishings."

If we remember rightly, the retiring-rooms at the end of the Vestry-hall were not shown in the plan as sent in, but have been added since, to supply what was an obvious deficiency in the original plan. The arrangement of the approaches to the hall for the public is, as we have before observed, very pleasing and effective.

CONSERVATIVE CLUB, CARDIFF.

This club-house is to be built for the Penarth Conservative Association by a limited company, promoted by the association. It will be called the Penarth Conservative Club. The architects are Messrs. John P. Seddon and J. Costes Carter (of Cardiff), with whom is associated Mr. S. H. Snell, of Penarth, the resident architect on Lord Windsor's estate. The drawing is by Mr. Carter.

The club consists of dining-room, bar, and committee-room on the ground-floor, and on the

first floor of billiard-room and a room for public meetings, having a separate entrance from the road. This large room could be used for public dinners, &c., as it has a lift from the ground-floor near the kitchen. There is a large kitchen, besides the usual offices.

The walls are built of the local blue lias stone, faced externally with Penarth pressed red bricks, and the roof covered with Bridgewater tiles.

TWO OF THE INSTITUTE MEDALS.

We give here engravings, made by Mr. J. D. Cooper, of the Pugin and Godwin Medals of the Institute of Architects. The Pugin Travelling Studentship Medal has been established for a good many years, and is generally one of the best contested competitions at the Institute. The Godwin Bursary, originated and endowed by the late editor of the *Builder*, was established in 1851, and the Medal exhibits a portrait of the founder on the obverse. The Pugin Medal shows the Institute arms on one side and the Pugin arms on the other side. The special objects for which each was founded are well known to our readers. The Pugin Medal was modelled by Mr. J. Taylor Foot; the Godwin Medal by Mr. G. G. Adams, F.S.A.

THE CONGRESS OF FRENCH ARCHITECTS.

The Congress of French Architects, under the presidency of M. Questel, will be held at the École des Beaux Arts, from the 8th to the 13th of June (inclusive). We subjoin the full programme, in its original form:—

Lundi, 8 juin.

à 2 h.—Constitution du Bureau et ordre des travaux du Congrès.—Nominations des Commissions sur les questions suivantes: Concours publics, Honoraires, Hygiène, Propriété artistique, Responsabilité, Vieillesse, &c.—L'Architecture au Salon, par M. Hardy, architecte.—Visite des ateliers de M. Chais, imprimeur éditeur de la Société.

Mardi, 9 juin.

à 9 h.—Visite des fouilles archéologiques du Louvre, sous les salles des Crisatides, de la Vénus de Milo et de Melpomène, M. Guillaume, architecte.—Les monuments Sumériens du Louvre et les rois architectes de la primitive Chaldée. Conférence dans la galerie assyrienne, par

M. Ledroit, conservateur et professeur au Musée national du Louvre.

à 2 h.—Étude sur la céramique, par M. Deslignères, architecte.—A travers l'Espagne, conférence par M. Coquet, architecte à Lyon.

Mercredi, 10 juin.

à 9 h.—Visite des abattoirs de la Villette, fen Janvier, architecte.

à 2 h.—Le premier temple de Jérusalem, essai de restauration par M. G. Perrot, membre de l'Académie des Inscriptions et des Belles-Lettres, directeur de l'École normale supérieure, et M. Chérier, architecte.—Compte rendu du Congrès des Sociétés savantes, par M. Charles Lucas, architecte.—Études ou rapports des Commissions nommées le 8 juin.

Jeudi, 11 juin.

Excursion à Ronen, départ à 9 h. du matin, gare Saint-Lazare, retour à Paris, 11 h. 30 du soir.

Vendredi, 12 juin.

Matinée réservée à la Caisse de secours mutuelle.

à 2 h.—Études ou rapports des Commissions nommées le

Lundi, 9 juin.

Samedi, 13 juin.

à 9 h.—Visite aux ateliers de la Corderie d'art de M. Lebnitz.

à 1 h.—Distribution des médailles décernées par la Société Centrale des Architectes, à l'Architecture privée, à l'École des Beaux-Arts, aux Écoles d'Athènes de Rome, aux Écoles privées, au Cercle des Maçons, au personnel du Bâtiment, aux Industriels d'Art.—Notice sur la vie et les œuvres de M. Paul Abadie, membre de l'Institut, par M. Dames, architecte.

à 7 h. très précises.—Dîner confraternel, à l'Hotel Continental.

All inquiries should be addressed to the "Secrétaire du Congrès," at the offices of the "Société Centrale des Architectes," 168, Boulevard St. Germain, Paris.

COMPETITIONS.

St. George's Parish Church, Stalybridge.—The drawings submitted by Mr. John Lowe, architect, of Manchester, in competition for the proposed restorations of this church, have been awarded the first premium.

Co-operative Store, Chester-Le-Street (County Durham).—The plans of Messrs. Sept. Oswald & Son, architects, of Newcastle-on-Tyne, have been selected in competition for extensive additions to the Co-operative Store at this place (including stabling, abattoir, &c.), and also for laying-out the adjoining land in sites for dwelling-houses.

Bexhill-on-Sea Drainage.—In reply to the invitation of the Local Board, some time back, nine sets of plans were sent in for the main drainage of Bexhill, by, amongst others, Messrs. Davison & Sons, Windsor; Mr. J. B. Watt, Walbrook, London; Messrs. Orchard & Van Putten, Lewisham; Messrs. Lailey & Read, Westminster; Messrs. Francis & Robinson, Furnival's Inn; Mr. Coghland, St. Albans; and Mr. Fowler, Manchester. On Tuesday last the Board selected the plans of Messrs. Nichols, Birmingham, as being the most economical, subject to modifications, and they decided to offer Mr. H. C. Roper, C.E., Dudley, 141, for the retention of his plans, the Borough Surveyor of Hastings, in conjunction with the Board's Surveyor, having reported strongly in favour of the lines laid down on his scheme as being essential in several particulars. The unsuccessful plans are to be returned with thanks for the trouble taken. At present they are on view at the Surveyor's Office, Bexhill.

PUBLIC LATRINES.

The Vestry of Paddington has just had presented to it the report of its Public Lavatory Committee, appointed on the 4th of March, in pursuance of a resolution by the Vestry affirming "that it is highly desirable that public lavatory accommodation (with water-closets, &c.), for both men and women, should be provided for the use of every part of the parish." By the terms of the "reference" the committee was "to consider and report as to whether this accommodation cannot be provided in such a way as to be a boon to the immediate vicinity in which it is placed, instead of being a nuisance, as must be the case, more or less, where structures for this purpose are erected in the centre of the public thoroughfare." The Committee, of which, Mr. Mark H. Judge was chairman, answered this question in the affirmative, and in their report they say,—

"Your committee is of opinion that the opposition usually made to the construction of urinals in new places is mainly due to the unsatisfactory structures which have hitherto been erected, and they venture to suggest that not only should better designed places be provided, but that, as far as possible, they should be in charge of an attendant. The construction of one or two public lavatories on some plan similar to that proposed for the thoroughfare of the Harrow and Edgware roads would, it is thought, prove so satisfactory that there would be no opposition to the construction of others in similar posi-

tions, so that the present common stall urinals erected in the public thoroughfares might, in time, all be removed. The cost of an attendant would in most cases be in large part met if complete lavatory accommodation were provided, as a small charge should be made for the use of the closets and the wash-basins. In such positions as at the junction of the Harrow and Edgware roads a considerable profit would be realised."

The committee recommend:—1. That an underground public lavatory for men be constructed at the junction of the Harrow and Edgware roads, in accordance with the plans presented to the committee by the chairman, Mr. Mark H. Judge, A.R.I.B.A.; and that the Surveyor to the Vestry be instructed to obtain estimates for the same for the consideration of the Vestry. 2. That the urinal in the Uxbridge-road be removed, and that a new underground public lavatory be constructed near this spot, directly opposite the Queen's-road; the lavatory to be in two parts, one for men and one for women; the plan to be somewhat similar to that proposed by Mr. Judge for the Harrow and Edgware roads. That advertisements be inserted in the architectural journals offering a premium of 10l. for the best design for the said public lavatory; the premium to be awarded by three members of the Royal Institute of British Architects, to be selected by the Vestry.

What may be done in this direction is shown by the underground urinals and water-closets (for men only) erected by the Commissioners of Sewers of the City of London beneath the ground at the base of the Wellington statue in front of the Royal Exchange. Of these conveniences an official description is before us, and we extract the following particulars. The underground construction is formed around the base of the Duke of Wellington's statue, on the western front of the Royal Exchange. It is wholly beneath the street-pavement, and was excavated in the mass of solid concrete which surrounded the foundations of the base of the statue. The base of the statue being oblong, with a railing round it, forming an ellipse, that form suggested itself as best suited to the requirements of the structure. The area may be said to be divided into three rings, the outer ring being occupied by the water-closets, the middle ring by the passage-way or corridor, and the inner ring, or that which is closest to the base of the statue, by the urinals. The outer ring contains twelve water-closets, six on each side, divided by brick partitions radiating from the centres of the ellipse; space is provided at the ends for four additional closets, should they be required, or the space may be otherwise utilised, as may be found necessary. The outer ring contains also two rooms for attendants, one on each side of the entrance, and together they command a view of the whole of the interior of the structure. The corridor or passage-way is 3 ft. 6 in. wide, and gives access to the water-closets on one side, and to the urinals on the other side, and passes completely round the ellipse, giving a clear passage-way from the entrance to the exit. The internal dimensions of the structure are as follow:—Length 38 ft. 4 in., breadth 33 ft. 8 in. The depth from the street paving level to the floor of the corridor is 10 ft. There is no external evidence of the structure other than the entrance-steps leading to it; the cast-iron railing which heretofore surrounded the base of the statue is retained in its original position, and the levels of the pavements are unaltered. The street pavement over and forming the roof of the structure is carried by three rows of cast-iron ornamental columns, which carry rolled iron joists filled in with breeze concrete, the whole being covered with asphalt. These columns at the same time form the points of subdivision of the urinals. The structure is lighted by prism pavement-lights let into cast-iron frames lying outside the curb of the railings surrounding the base of the statue, and forming also the footway pavement, and is ventilated by perforated iron panels and gratings laid at the pavement level. An elliptical grating forming the outer border ventilates the water-closets, and the gratings immediately at the base of the statue inside the railings surrounding it ventilates the urinals. Ventilation is also obtained to the water-closets by open fluepipes over each of the doors to the same. The closet apparatus are of the best quality, the whole basin and trap being formed in one piece of white porcelain. The seats are constructed of hard light-coloured wood, polished and put together so as to be easily removed when neces-

sary, the seats are hinged with brass hinges, and the risers made movable. The urinals in the inner ring are fourteen in number, and are formed with enamelled slate backs, sides, and divisions, and fitted with white porcelain-lipped pans. The floor of the standing-place of each urinal is of slate, dished and covered with a brass grating, with a hinged gully and trap in the centre. The drains throughout the structure are to be inspected and kept clear by means of hinged inspection boxes, man-holes and covers, and have ventilating-pipes carried up the gas standards in the entrances. The floors throughout of the closets and the passage-ways are asphalted. The whole of the internal walls are faced with white glazed bricks with coloured borders and dado. The building is from the design of Lieut.-Colonel William Haywood, the Engineer and Surveyor to the Commissioners of City Sewers. The builder was Mr. Mark George, contractor, and all the sanitary fittings were supplied by Mr. George Jennings, of Stangate. Adjoining Whitefield Chapel, in the Tottenham Court-road, is a urinal lately erected under the superintendence of Mr. William Booth Scott, the Chief Surveyor to the Vestry of St. Pancras, which possesses some good features. It is of enamelled slate, and takes the place of one of the old-fashioned iron kind. The structure has been erected for the Vestry by Mr. George Jennings.

THE SURVEYORS' INSTITUTION.

The Council announce that the following candidates, whose names appear in alphabetical order, have passed the recent Professional Examinations of the Institution:—

For the Professional Associateship:—

Arthur Joseph Edwin Arch.	George Edward Hilliard.
John Arnott.	William Vincent Full.
Cecil Cantley Baker.	George Arthur Lansdowne.
Edwin Thomas Beard.	Charles Ralph Maddox.
Harry Blundell.	Arthur John Martin.
Alfred Virgove Buckland.	Frank Massie.
Herbert George Coales.	Sydney Perks.
Marcus E. Collins.	John Raad.
William Jacobus Gihhou.	John Moore Sturgess.
Robert Godfrey.	John Henry Titen.
Charles Henry Hehblithwaite.	John Watson, jun.
	George Arthur Williams.
	Sidney Williams.

For the Fellowship:—

Frank Arthur Bontor.	James Pain.
Thomas Arthur Dixon.	Philip Edward Pilditch.
Harold Edward Moore.	Henry John Treadwell.

DULWICH COLLEGE AND ITS FOUNDER.

MR. T. C. NOBLE, in a recent communication to *Notes and Queries*, says:—"In his carefully compiled 'Catalogue of the Manuscripts and Mementos of Alleyn's College of God's Gift at Dulwich,' 1881, p. xxiii, Mr. G. F. Warner, of the British Museum, gives a brief introductory account of the earliest purchases made by Edward Alleyn in the parish of Camberwell, and traces step by step the gradual acquisition of the large estate which was subsequently left for the support of that noble foundation Dulwich College. 'The precise date of Alleyn's first acquisition of property in the manor has hitherto been a matter of doubt; but, adds Mr. Warner,—It is now ascertained to have been October 1, 1605. This purchase, however, seems to have been merely a preliminary, in order to clear off a mortgage held by Sir Robert Lee since 1602, and it was followed, on the 3rd October, by articles of agreement on the part of Sir F. Caulton for the sale of the manor itself and the whole of his estate, excepting the Camberwell advowson.

The articles of agreement of October 3, 1605, stated by Mr. Blanch in his 'Dulwich College and Edward Alleyn,' 1877, p. 59, to be 'the oldest document in Dulwich College respecting the purchase of the manor by Alleyn,' was stated by Mr. Warner, in his 'Catalogue,' 1881, to be missing. His precise words are, 'The original of this document has been lost.' Such being the case, it must have been lost between the year 1875, when it was in the custody of Dr. Carver, the master of the College, and, in fact, is stated by Mr. Blanch to be at that date in the College, and 1881, when Mr. Warner compiled the 'Catalogue.' These dates are important, because it is now my pleasure to say that this precious MS.

has recently been discovered—in fact, was offered for sale at the well-known auction-room of Messrs. Puttick & Simpson, in Leicester-square, on March 5, 1885, being described as—

“Lot 106. Agreement for the leasing of lands in the paroch of Dulwich in the County of Surrey between Sir Francis Carlton, Knight, and Edward Alleyn. Dated 4 October, 1605. 3 pp. folio. Signed by both parties.”

It is only realised at the auction the insignificant sum of 2l., simply because many persons doubted its genuineness; and, if genuine, why was it there for sale? An explanation is certainly required; but it is to be hoped that by the time this note is printed the MS. has been deposited with the other papers at the College. It is not, then, immediate steps should be taken to secure it before it again becomes a loss.

When I printed my ‘Ramble round the Crystal Palace,’ in 1874, I had occasion to note down many curious hitherto unknown facts relating to the district. Among all the items there was one which I think is now worth reprinting, and is, perhaps, the funniest, and at the most deplorable evidence we have of the way the English people sometimes venerate the memory of ‘a worthy benefactor.’—

“1867, March. Mr. Webb, of the Half-Moon Inn, Dulwich, presented the College with the original grave-stone of Edward Alleyn, which for many years had been reserved by himself and father in the tea-gardens at the rear of the inn. I recollect seeing it there. It is now, I understand, ‘buried’ among other odds and ends in the luge storehouse.”

Where is it now, in 1885? The ‘Manor House,’ we know, was destroyed in 1880, and the site is now a building estate.”

THE FURNITURE TRADES' EXHIBITION.

The fifth annual Furniture Trades' Exhibition, which has been open at the Agricultural Hall, Islington, for the past fortnight, has been one of the dreariest of the many dreary exhibitions which have been held in that building during the last few years. The large amount of occupied space (notwithstanding the inclusion of several exhibits having nothing whatever to do with the avowed object of the Exhibition), the scarcity of visitors, and the generally dismal appearance of the “show,” go to convince us more strongly than ever that the mania for yearly exhibitions in particular groups of trades has almost spent itself. As I believed from the first would be the case, it has been found impossible to maintain the interest of frequently-recurring exhibitions of such a character, for the intervals between them are too brief to allow of material advance and improvement, and it necessarily follows that an exhibition after exhibition the same things are shown, generally by the same exhibitors. Even in this “age of exhibitions” this sort of thing begins to pall after a time, and the present Furniture Trades' Exhibition at Islington affords evidence that the public and exhibitors alike are of this opinion, for the visitors are few in number, and there is a marked falling off in the roll of exhibitors. Nevertheless, there are a few good things to be seen in the Exhibition. Amongst these we may mention some chair-frames exhibited by Messrs. G. S. Lucraft & Son, of Ty-road, containing some excellent inlaid work in brass and tortoiseshell. The design of these inlaid panels is of a flowing Renaissance character, and the workmanship throughout is exceedingly good. Messrs. William Woollams & Co., of High-street, Marylebone, have a very old display of their well-known paperhangings, good design, and free from arsenic; and they also exhibit specimens of a new material for wall-decoration named “Tergorine,” which texture and appearance is very similar to leather, and which is capable of treatment in any way in which real leather may be treated. The material is worth the attention of architects, and bids fair to become a serious rival to leather materials now in the market. Messrs. W & Co., of Bentham Works, near Ironbridge, show a cabinet and dado illustrating the application of faience as a material for inlaying culture, panelling, &c. Mr. A. Putney, of Edge-park, Harrow-road, shows his “Pavolo” solid wood flooring, of which we have on previous occasions spoken in terms of commendation. By its use architects may have a satisfaction of materially improving the character of the floors of the houses they set without any very serious increase of cost. The poorness of the floors in the vast

majority of modern houses in this country has on more than one occasion been referred to in the pages of the *Builder*, and we hope that the use of Mr. Putney's “Pavolos” flooring will help to effect a very desirable improvement in this respect. In addition to its better appearance when compared with the ordinary nailed and too-often gaping floor-boards, a solid floor, such as Mr. Putney has brought forward, has important and obvious advantages from a sanitary point of view. Messrs. M. C. Duffy & Sons, of Bermondsey, show some very excellent work in the shape of turned balusters, newels, and table and chair-legs; also handrails, &c. Their “Board School Wood-block Flooring” is also well worth attention. Messrs. W. R. Crow & Sons, of Clerkenwell, have also a good display of the same class of goods. Messrs. F. Walton & Co., of Berners-street, have a stand showing the now well-known capabilities of “Lincrosta-Walton” as a decorative material. Messrs. Henry Bassett & Son, of the West London Parquet Works, exhibit some good specimens of parquet floors. The miscellaneous exhibits include Mr. Renton Gibbs's admirable heating apparatus for buildings; Messrs. C. Kite & Company's excellent ventilators; the “Glacier” window-decoration, exhibited by Messrs. Perry & Co. as a cheap substitute for stained glass; cement for mending broken glass and china; Ridge's food for infants; and some other things whose claim to be admitted to a “furniture trades' exhibition” has apparently been that they were wanted to help to cover the vacant floor-space.

THE EASTERN PEDIMENT OF THE PARTHENON.

SIR,—It is evident that the writer of the article* criticising my paper on the Eastern Pediment of the Parthenon, in the April number of the *Nineteenth Century*, has to some extent misunderstood the nature of my work and the character and intention of my paper. Perhaps some remarks on pp. 664 and 669 of my article ought to have led your critic to consider it more than possible that, “for anything we know, Dr. Waldstein may have such instances *in petto*.” But I can quite see that the writer was not obliged to wait with some patience, and assume the presence of such arguments. On p. 669 of my article I refer to the necessary limits of space and to a note at the beginning of the paper (“It is chiefly with regard to this part of the work that the remarks in the introduction to this paper apply”). This introductory note, which might perhaps have caused the critic to wait, had unfortunately to be omitted.

The article was written at the desire of the editor of the *Nineteenth Century*, and is a popular abstract of an essay in the forthcoming volume of *Essays on the Art of Pheidias*. This essay has been in print for several years, and had to be reduced by more than one half to take the form of a magazine article. This reduction, again, I was obliged to reduce by more than one-third, omitting all the *pieces justificatives*.

In the eighteen pages of the article (a comparatively large space as such articles go) I was led merely to give the results of my investigations, which appeared to the editor of considerable interest to a portion of the cultured public. But I admit that it may fairly be questioned whether it is just or wise thus to give only the results of scientific investigation. On this point I have not definitely made up my mind, and I am willing to learn by the experience which the misunderstanding of the criticism on this paper offers.

For the *pieces justificatives* to my conclusions I can only refer to the forthcoming book, though I cannot be certain whether I shall there satisfy my critic. I there give a considerable number of the instances I have collected to show the prevalence of the personifications of nature referred to. But to realise how certain similarities necessarily point to some relation more or less direct in monuments of Classical or Mediæval art (nay, I might add, in objects of nature), it is essential that the student should have followed these types through the mass of scattered data, and should have developed in himself the feeling for what are criteria of similarity and difference, the power of testing importance or irrelevance in the coincidence of phenomena. And though I

give what I must consider a sufficient number of instances to prove my conclusions, they will only have adequate weight with those who have been trained in such observation. I have often found myself unable to discover important similarities of form and structure, or delicate difference within general likeness between objects shown me under a microscope, evidently because I was not trained in this class of scientific observation. In matters of art and archaeology, on the other hand, it has not yet been realised that efficient observation must also be studied or practised.

There are two points in which the statements in the criticism are misleading.

(1) The writer charges me with my neglect to acknowledge an indebtedness to a previous authority, namely, to Weher, who, in 1822, interpreted one of the two figures I call Thalassa and Gaia as Thalassa. On p. 156 of my book, which has been printed off for some time, I do refer to Weher. Weher's articles, quoted at second and third hand as Schorn's “Kunstblatt,” 1821, have, I venture to believe, rarely been seen in the original. They appeared in the art-supplement to a daily paper (*Morgenblatt für Gebildete Stände*), which was issued at Tübingen. Along with many other things I was obliged to omit in the article, there were special reasons why space could not be given to Weher's interpretation, as it would require additional explanation. I could in no way regard it as a confirmation or anticipation of my view. Weher mistakes the western for the eastern pediment, considers the subject of the eastern pediment to be the strife between Athene and Poseidon for the Attic land, and accordingly interprets all these figures as followers of Poseidon: Rhode, Amphitrite, and Thalassa. This mere guessing at Amphitrite and Thalassa on a mistaken basis surely required no mention when I was briefly giving my interpretation of Thalassa and Gaia.

I take a very conscientious view of the duty of acknowledging priority, as I also regret deeply and shrink from discussions concerning it. To avoid such discussion I always prefer to sink any possible claims I might have to absolute originality where any doubt might be maintained. But the remarks of my critic incite me to publish facts which I should otherwise have never published. In my book and in the article in the *Nineteenth Century* I have throughout acknowledged my indebtedness to Professor Brunn for the suggestion of the general cosmical (not “topographical”) conception of the scene in the eastern pediment. As a matter of fact, I formed my view of the interpretation of Thalassa and Gaia and of the general conception of the eastern pediment while a pupil of the late Professor Stark at Heidelberg in 1873, and I expressed my views to him, and, since then, to many others. In 1874 Brunn's completely original interpretation appeared, and, though my work has been independent, I thought it undesirable to make assertion of this fact, and have given full acknowledgment to his published work.

2. The second case in which the remarks of my critic are misleading is when he says:—“A little lower Dr. Waldstein does cite one actual instance,—an instance already very familiar to all archaeologists, i.e., the mountain-god in the Esquiline wall-painting, representing the landing of Odysseus on the coast of the Læstrygonæ.” This appears to imply that the analogy between this mountain-god and the figure from the Parthenon has already been made. This is untrue. If it is meant to imply that I am not the discoverer of these mural paintings it is meaningless. If it implies that these wall-paintings are exceptionally well known among ancient monuments, or, still more, that this one figure is very familiar, it is erroneous. In any case, as regards my comparison of two monuments, both of which have been published, such a remark is superfluous, and, naturally suggesting the first possible meaning, it is misleading.

I would, finally, add the closing passage of the Essay in the book to indicate the spirit in which I should like my interpretation to be taken. This passage I was also obliged to cut out of the article:—

“Much harm has been done to good and useful suggestions in that they have been overstated. Whoever brings forward a new theory or establishes a new fact becomes so enamoured of the new aspect disclosed before his eyes, that he is apt to overstate its importance, and claims to complete acceptance. The result is that others are stimulated to opposition by the element of excess in the over-

* See the *Builder*, April 11 (p. 507).

statement, and, on their side again, are carried away by opposition, to the destruction of any moderate or modified acknowledgment. Thus artificial antitheses and parties are formed with purely negative impulses and aims, to the detriment of truth. What is extreme in the statement as well as in the method becomes stereotyped, and the normal progress towards the recognition of truth is suppressed until the violence of opposing forces is spent, and time has so far elapsed the harshness of the extreme view as to allow the main questions to become again visible in their true importance and usefulness.

In offering this new interpretation of the two figures from the eastern pediment of the Parthenon, I have no desire to bring about a similar state of discussion.

Though personally I feel that this is the most probable of interpretations, I am not blind to the fact that, as matters now stand, we cannot hope to solve the question conclusively and for all time. We can merely hope to find that interpretation which, from the nature of other extant monuments, and the general spirit of Greek art in the time of Pheidias, is most in keeping with that spirit, and with the limited amount of undoubted data which we possess concerning that individual composition.

While writing this essay, I have not held before myself the probability that all authorities will or must straightway relinquish all previous notions, and accept my explanation. But I have felt strongly that, at all events, this view is one which, at least, has much in its favour; that it is one without which the list of possible interpretations is incomplete; and, above all, that it will explain many of the peculiarities in the artist's work itself, both in composition and in detail of execution, which would otherwise be unexplained. And I hold firmly that, of all things to be considered by the interpreting archaeologist, the recognisable indications of the artist's work by means of his peculiar language, is of primary importance.

I believe, therefore, that of the many interpretations offered, this is one worthy of consideration, and one which, in scientific duty, required to be published when recognised by the archaeologist.

CHARLES WALSTEIN.

ARCHITECTURAL STYLE.

SIR.—Will you kindly allow me to call attention to two errors that creep into my article on "Style" last week [p. 644, ante]. In the fifth paragraph, "initiated" should obviously have been "imitated." I hope that it is equally obvious that I did not wish to speak of the clergy as being "deficient" in matter of painting and sculpture,—the word should have been "deficient,"* the whole gist of the article being that they should, like house-building clients, dictate their requirements to us, instead of deferring to such ancient examples as we are forced to recommend, for want of fuller instructions. Obedience to the Prayer Book will, of course, check the introduction of any radical changes.

EDWARD J. TARVER.

THE TUBULAR SYSTEM OF DRAINS AND SEWERS.

SIR.—The origination of the tubular system of drains and sewers for houses and towns (see page 636, ante) is due to the strong advocacy of Mr. Edwin Chadwick, C.B., in his Report on the Sanitary Condition of the Labouring Population of Great Britain, 1842, and in subsequent Reports in 1844-45, on the Health of Towns. But the first to practically use tubos for such purposes in the metropolis was myself. This was while I was chief Surveyor of the Westminster Districts of Sewers. In 1844, or 1845, when most of the present surveyors were in their infancy, I wrote articles, which appeared in the *Builder*, on the great defects of brick drains, and recommending stoneware pipes to be used for drains instead. At that time no such pipes were made or to be had in the metropolis. Shortly after, Mr. Thomas Peake, of Tunstall, in Staffordshire, who was a manufacturer of ferro-metallic drain-pipes, and who had read my articles in the *Builder*, informed me that he had opened a depot at Macclesfield Wharf, City Basin, London, for the sale of his pipes and other goods. I thereupon ordered a large quantity of his pipes, which I used in the drains and sewers under the jurisdiction of the Westminster Commission. Previously to this I had used some hutt joint flue-pipes for the same works. Some time after I had been using Mr. Peake's pipes, Mr. Wm. Northew, of Lambeth, brought me two glazed stoneware pipes, 9 in. diameter, and 2 ft. long, for my inspection. As I understood he could make and supply these pipes, I reported on their suitability and superiority, and recommended them for adoption. This the Commissioners agreed to, and sanctioned my ordering a large quantity of them, 6 in., 9 in., and 12 in. diameter. I then went to Mr. Northew, who told me he could not execute the order, as he would be compelled to erect new shops for making and drying them, and now kilns for

burning them. Upon this I saw three other firms of potters in Lambeth, namely, Green's, Doulton's, and another of whose name I have forgotten, all of whom declined the order. At last I called on Mr. Thomas Smith, of Prince's-street, Lambeth, who by degrees manufactured and delivered the pipes. After that, all the Lambeth potters began to make them, and, at my recommendation and persuasion, architects and builders began to use them; and so bricks for house-drains and small sewers were entirely discarded, and stoneware pipes were used instead. This is the true history of the first use of stoneware pipes for drains and sewers in the metropolis.

While I am writing I may as well record the fact that a great advance towards the tubular system for house drains and sewers was started by Mr. Thomas Cubitt in Belgravia. With half-round tiles, 9 in. diameter and 1 1/2 in. thick, which were made at his brickworks in Kent, he formed the channels and crowns of his drains. These half-round tiles he solidly surrounded with concrete, and bedded and pointed the joints thereof with cement, so as to prevent the leakage of foul liquids and gases through them. In this method of constructing drains which had the nearest possible approach to the tubular system of drains. Mr. Cubitt took great interest in sanitary improvements. In these matters he was far ahead of many of the architects and builders of the time. I had frequent conversations with him on the excellency of his drains, and on the superior workmanship of the sewers he proposed for carrying off the sewage from the metropolis, and down to the sea, for intercepting the sewage from the Thames. The plan of separating the sewage from the rainfall, afterwards called the *separate-system*, was then simmering in my mind. Practical experience began to teach me that it was a great advantage to combine the two kinds of sewers in the same channels. I remember he favourably entertained my idea as to the separate-system, and encouraged me to systematise and propose it. When I subsequently did this, the then Royal and Railway Engineers of the Metropolitan Commission flatly opposed and burked it. The great engineer who afterwards made up and carried out a main drainage scheme, worked on the old lines; and hence the abominable condition the Thames has been in ever since. When the Westminster Commission in 1846 adopted my egg-shaped sections of sewers, Mr. Cubitt was the first to apply to the Commissioners for leave to build them in the squares, roads, and streets in London. He built 7,500 ft. run of these sewers during that year, and used thereby over 1,800 ft., and had infinitely better sewers than he would have had by the odd system of sewers with nearly flat bottoms and upright sides. Mr. Cubitt's drains before referred to, like all his works, and all his actions, were good and honest. If any one should ever write the "Lives of the Builders," the life of Thomas Cubitt would occupy a most interesting and worthy place among them.

JOHN PHILLIPS.

THE ASPHITEL PRIZE.

SIR.—At the Institute meeting, held on the 4th inst., Professor Kerr asked "Why the Ashpitel Prize had been withheld from the best of the seventeen candidates who had passed the examination for Associateship during 1884." Mr. Arthur Cates, in replying, "Expressed regret that the Council for two years had been unable to recommend any candidate as worthy of being honoured by this distinction,—a distinction which, if lightly given, would discredit the prize itself. It is the most distinguished honour which any candidate can receive; it is an honourable distinction which should not be lightly thought of, but should be secured by a recipient worthy of the honour of being designated in the list of members as Ashpitel prizeman."

This prize was instituted about 1873, and it has only been awarded four times in these twelve years, viz.:

- In 1873, to Hugh Stannus.
- In 1877, to F. T. Baggallay.
- In 1879, to Bruce John Capel; and
- In 1882, to Thomas Purves Marwick.

The prize has now assumed considerable importance. It is given to the candidate "who has, in the opinion of the Council, most highly distinguished himself in the examinations for the degree of Associate held during each year." It is thus the most important prize in the gift of the Council. The examination for the Associate degree embraces all the branches of an architect's training, and it follows that the man who all over is the most distinguished Associate of his year attains a highly honourable position, and one not easily gained.

For this high honour the Council award a prize of books valued at 10*l.*, while for essay writing they give a medal and 25*l.*; for design, a Soane medallion and 50*l.*; and for sketching, a medal and 40*l.* Medals are given with nearly all the prizes in the gift of the Institute,—the Soane, Grassell, Pugin, and Godwin prizes, as well as those for essays and architectural drawings. I venture to affirm that a medal is the most popular form of award; and I would suggest to the Council the propriety of adding a medal to the Ashpitel Prize.

I am perfectly sure that candidates going up for examination would prepare themselves thoroughly

to compete for this distinction. At present they give the minimum study in order to pass. Give an object to strive for in the shape of a good prize accompanied by a tangible record like a medal,—which one can show,—and you will not only give a zest to those preparing for examination, but you will increase the number of candidates for the degree.

The cost would be trifling, and I do not think that on another occasion Mr. Cates would have reason to complain of the lack of worthy candidates.

A. B. C.

COOKING APPARATUS FOR LARGE INSTITUTIONS.

SIR.—In reply to Mr. Crane's letter in your last issue [p. 672], I cannot understand how any one can assert that the escape of steam, on opening the cover of my cooking apparatus, is a defect. This, of course, quite natural, and Mr. Crane can no more avoid this than I can; besides, I only contended that no steam escaped during the process of cooking. Further, Mr. Crane says that cooking takes fifty per cent. longer in my apparatus than by the ordinary method; this is also a mistake, for I can cook just as quickly as in any other one if I employ the same temperature as used by others; but it stands to reason that if I cook at a lower temperature, I must of course take a longer time. Every cook knows that meat cooked slowly is more palatable and more nourishing than when it is cooked quickly, and this is the reason for my preferring this method. For instance, a piece of meat weighing 10 lb. if kept at boiling-point, is thoroughly cooked in two hours, i.e., 120 minutes; therefore it takes 120 minutes \times 100° Celsius = 12,000 minute-degrees; but if it is cooked at 80° Cel., it takes $\frac{12,000}{80}$ = 150 minutes, which is a very simple problem.

It is well known that when meat is cooked at 100° Cel. a great deal of the nutriment is lost.

The Student's Column.

DESCRIPTIVE GEOMETRY.—XV.

How to distinguish the lines seen from those that are hidden either in an elevation or a plan.

WE have said that in representing solids it was usual to dot the lines hidden by the solid itself. We are supposed to look down on the plan from above, and to look at the elevation from a position in front of it; therefore, if we pierce the solid by a vertical line, we shall see on the plan the highest point of penetration, whereas the lowest is hidden. On the other hand, if we suppose the solid to be transparent by a line perpendicular to the elevation, the point of penetration which is in front is seen on the elevation, whereas the one that is behind is hidden.

The projection of an object limited by plane surfaces is made up of the projections of its arrises; it is evident that these projections will be enclosed by a polygonal figure which will form the outline of the object, this outline separates the parts that are seen from those that are hidden. To determine which are the arrises that are seen, we select two arrises the projections of which cross one another, and we then find out which of the two is seen when this is done, we know that all the arrises connected with the one seen will be also seen up to the outline of the object, the others will be hidden. (See fig. 77.)

Fig. 77.

Draw the elevation and plan of a triangular pyramid.

Let a, b, c, d be the angles of the pyramid we join them, and find at once both the outline a¹, b¹, c¹, d¹ and a², b², c², d² on the plan at elevation.

On the plan the arrises a¹, b¹, and c¹, d¹ cross one another; consulting the elevation, we find that c¹ d¹ is at a higher level than a¹, b¹, therefore we conclude that c¹ d¹ is seen and a¹, b¹ hidden. On the elevation the arrises a², b²

* The word in Mr. Tarver's MS. was "deferent," and the printer unfortunately rendered it "deficient."—Ed.

Fig. 78.

Fig. 81.

Fig. 79.

Fig. 80.

Fig. 83.

Fig. 82.

b^o d^o cross one another; consulting the plan, we find that a c stands in front of d b, therefore a^o c^o is seen, b^o d^o hidden. (See fig. 78.)

Find the intersection of a plane P with a prism, the base of which is the parallelogram 1, 2, 3, 4.

We simply make an auxiliary elevation on a plane perpendicular to P^o, and then the elevation of the intersection will fall on the trace P^o, we have only to deduct therefrom the plan of the intersection a^o, b^o, c^o, d^o, and then its elevation a^o, b^o, c^o, d^o. (See fig. 79.)

Second method of finding the intersection.—Instead of making the ordinary projections perpendicular to the planes of elevation and plan, we make an oblique projection of both the prism and the plane P, the projection lines being made parallel to trace P^o. All the surface of the plane P will be projected on P^o, and therefore its intersection with the prism will be projected on P^o; we deduce therefrom its plan and elevation as before, remembering that the elevations of the projection lines are parallel to P^o, and their plans are parallel to L P. This system of using oblique projections simplifies the drawing, as seen below (fig. 80). In both these diagrams the student will find a great advantage in using rod ink for the auxiliary projections to distinguish them from the data of the problem. We have indicated the oblique projection of the prism by thinner lines than the data, and marked the angles by small figures without signs.

Find the intersection of the triangular pyramid 1, 2, 3, 4 by the prism of base 5, 6, 7, 8.

We begin by the method which uses oblique projections parallel to the sides of the prism, as it is so very much shorter than the ordinary method of making auxiliary elevations and plans. The base of the prism is, of course, the oblique projection of the prism itself. Where it cuts the oblique projections of the arrises of the pyramid we have the projections of the intersections of the two solids, and we can deduct therefrom their plans and elevations. There are, of course, two intersections in the surface of the pyramid, the one where the prism enters, the other where it comes out of the pyramid; 1^o, 2^o, 3^o, 4^o, marked with thin lines, is the oblique projection of the pyramid. The point, of which the projections a^o, b^o, c^o, d^o are marked, is a point of the intersection; the points b and c serve only to find the intersections of the sides of the prism with the sides of the pyramid. (See fig. 81.)

By changing the plan so as to get it parallel to one of the sides of the pyramid, and turning down the three other faces, we could obtain the pattern for constructing the pyramid out of a sheet of cardboard, and also for cutting out thereon the openings for the penetration of the prism. The cardboard pattern of a triangular pyramid is like fig. 82. The students are advised to draw the fig. 81 on a larger scale, and construct it in cardboard. In fig. 82 the parts shaded are those that are cut out by the penetration of the prism; 2^o, 2^o, 2^o are the different positions of angle 2 when turned down on each face.

The ordinary method of solving this problem is by making a plan on a plane perpendicular to the direction of the prism. For this, we first have to make an auxiliary elevation on L^o T^o, parallel to the prism, then make an auxiliary plan on L^o T^o, perpendicular to the arrises of the prism. In this last plan the intersection of the projection of the prism and the projection of the pyramid gives us the plans of the intersections required, but we have to deduce therefrom their original elevations and plans by working backwards first their auxiliary elevation, L^o T^o, then their real plan, then lastly the elevation, as in fig. 83. To avoid crowding we have in fig. 83 drawn the elevation of only one of the arrises of the prism, and the plan of the arris used as L^o T^o.

A Medallion Portrait of the late Peter Squire will be unveiled by Sir Spencer Wells, Bart., F.R.C.S., at the House of the Pharmaceutical Society of Great Britain, in Bloomsbury-square, on Wednesday, May 20th, at four p.m. Mr. Squire was one of the founders of the Society in 1842, was thrice elected President of it, and was its Examiner in Botany for twenty-seven years. He was Chemist in Ordinary to her Majesty for forty years. Mr. Squire wrote the widely-known "Companion to the British Pharmacopœia."

STAINED GLASS.

Kensington.—Two Munich stained-glass windows have just been erected in the south transept of St. Mary's, Boltons, Kensington. The subjects are Ruth and Boaz, and Christ blessing Little Children respectively. These windows, as well as the other two already in the church, are the works of Messrs. Mayer & Co.

Farnworth.—The parish church of St. John, Farnworth-with-Kearsley, near Bolton, has just been provided with a memorial stained-glass window in two lights, erected by Dr. Kershaw, of Farnworth, to the memory of his deceased wife. The subjects represented are, "Christ Blessing Little Children," and "The Baptism of our Saviour." The window, which is placed over the baptistery, is the work of Messrs. Barlison & Grylls, of London.

Newchurch.—A two-light Munich stained-glass window has just been erected in the parish church of Newchurch, Rosendale. The subjects represented are "St. Elizabeth teaching St. John," and "Giving Alms." The work has been designed and executed by Messrs. Mayer & Co.

Blairgowrie.—A stained-glass window has recently been erected in St. Mary's Church, Blairgowrie, representing the Presentation of our Lord in the Temple. The work was designed and executed by Messrs. Warrington & Co., of Fitzroy-square, London.

Kensington.—A Munich window representing Charity has just been erected in the south transept of St. Peter's Church, Cranley-gardens, Kensington. It is the gift of Mr. C. Dalrymple, M.P., the inscription at the foot recording the fact that it has been placed to the memory of Alice Mary Dalrymple, Sept. 2nd, 1884. The work is by Mayer & Co.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

1,901, Dwarf Window-blinds. W. Kay.

A solution of fluorescine or aniline in a gelatinous medium is treated with boroglyceride or other antiseptic substance, and in a film on a sheet, or between two sheets of glass, which may then be used for dwarf blinds or analogous purposes.

2,686, Device to Prevent Rattling of Sashes. A. B. Johnson.

A small lever is pivoted at each side of the sash by a screw to the inner head. The short end is made eccentric, and is heavier than the long end, so that when the sashes are open the lever hangs vertically, but by pulling the long end forward the eccentric end is pressed against the plate, keeping the meeting-bars together, and preventing the rattling of sashes.

11,108, Artificial Asphalt. F. Bosshardt.

Natural or artificial stones, ores, earth, sand, powdered glass, wood or paper substances, are powdered, mixed mechanically with pure bitumen, sprinkling the mixture if necessary with petroleum, and warmed in a rotating vessel.

13,075, Casement Window-frames. J. Elsley.

The fixed and swing frames are made of metal, rolled to an E section. One of the frames is fixed in the stonework, and the swing frame fits close to it by two rebate joints, being flush at front and back, and leaving a space between. In some cases two ribs may project, so as to bear alone against the stonework, and the space between the frame may be narrowed. The swing frame is hung by pivots taking into sockets at top and bottom of the fixed frame.

4,577, Portable Gas Lamp. J. E. Kelby.

A bracket or brackets are fitted with the usual cocks, burners and shades, which are attached to a sliding piece on a vertical rod upon a stand. The sliding piece is pierced by a curved tube for supplying gas to the brackets, and is fixed at any required height by the thumb-screw. The lamp is connected to an ordinary gas-bracket or chandelier by a flexible tube and metal coupling. The coupling screws into the place of the burner, or over the screw made for carrying the globe holder or gallery.

APPLICATIONS FOR LETTERS PATENT.

May 1.—5,369, W. Righty, Appliances for Opening, Closing, and Fastening Mill, Factory, Warehouse, and other Windows, and retaining same in any desired position.—5,374, G. Garrett, Machinery for Sharpening Circular Saws.—5,377, A. Adams, Improvements in Venetian Blinds.—5,384, J. Evans, Union Joints for Pipes, &c.—5,403, A. Rollason, Pipe Couplings and Connections.

May 2.—5,414, A. Paico, Expanding Writing Cabinet.—5,420, C. Falkenstein, Combined Electric Bell, push-button and incandescent Lamp-holder and Switch.—5,423, E. De Pass, Improvements in Gutters and means for connecting same.—5,432, R. Elmore,

Perspective Demonstrator.—5,437, A. Link, Preventing the Formation of Fog on other Atmospheric Precipitation upon Windows.—5,442, J. Ransome, Manufacture of Cement.

May 4.—5,456, C. Chapman, Improvements in Apparatus for Boring Wells.

May 5.—5,497, J. Akeroyd, Improvements in Cooking-ranges, &c.—5,506, R. Heap, Improvements in Water-closet Seats.—5,529, W. Richel, Improvements in Combining Cabinets, &c.—5,534, J. Alton and J. Ramsay, Improvements in Cookings and Heating Stoves.—5,537, G. Halbach, Improvements in Bow Saws.—5,555, J. Jones, Folding or Adjustable Bench or Seat.

May 6.—5,568, H. Fiske, Pavements, Facing blocks, &c.—5,570, G. Budd, Apparatus for Ornamental Turning and Shaping.—5,573, A. Dias and H. Goodey, Construction of Fireproof Hearths and other Parts of Buildings.

May 7.—5,629, A. Seggie, Machines for Grinding, Polishing, Graining, and Preparing Stones.—5,630, M. Wallace, Combined Ventilating and Flap Valve or Chimney-door for Kitchens, &c.—5,636, J. Coombs, Mechanical Door-check.—5,639, R. Hodgson, E. Lilley, Adjusting Door-knobs to Spirals.—5,644, T. Anastantine, Improvements in Movable Bottom Grottes of Ranges and Stoves, and Appliances for operating same.—5,661, J. Horne, Apparatus for Warming Houses and other Buildings.—5,663, L. Wesp, Improved Heating Apparatus.

PROVISIONAL SPECIFICATIONS ACCEPTED.

2,731, E. Deacon, Locks for Doors, &c.—2,781, J. Willis, Improvements in Pickers, Hammers, and similar Tools.—2,859, L. Bickley and J. Winn, Improved Paint Brush.—3,730, R. Payne, Fasteners for Sashes, Casements, Doors, &c.—4,209, F. Henderson, Flushing Apparatus for Water-closets, &c.—4,234, P. Jensen, Improved Arch or Span Bricks or Blocks.—4,398, C. Murray, Apparatus for Making Bricks, &c.—4,429, P. Redman, Fixing Sunblinds, or Ceiling Lights.—4,469, B. Hewetson, Security Slates used to repair damaged Slates on Roofs.—4,521, H. Yull, Water-waste Preventer.—4,614, A. Clark, Bolts or Fasteners for Doors, Shutters, &c.—4,736, A. Squire, Improvements in Venetian or Lat. Blinds.—14,463, E. Stacey, After-rush Apparatus for Water-waste Preventing Cisterns.—4,164, J. Best, Improvements in Chandeliers.—4,247, J. Crows and W. James, Cisterns or Flushing Apparatus for Water-closets.—4,486, E. Ormerod, Apparatus for the production of Paving Slabs, Blocks, Sinks, Roofing Tiles, &c., in Concrete, Terra-cotta, &c.—4,668, W. Wilson, Ornamenting Wall or other Papers.—4,681, J. Barwick, Ventilating Pipes and Caps.—4,721, J. C. Pneumatic Door Check Spring.—4,726, R. Jones, Window Sash Fastener.—4,819, J. Baker, Disinfecting and Deodorising Apparatus for Water-closets.—4,926, G. Wells, Water-closets and Appliances for same.—5,004, W. Lake, Preservation of Wood for Paving Purposes.—5,023, J. Smith, Improvements in Stench Traps.—5,047, T. Howie, Ventilating Rooms or Buildings.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

7,268, J. Thomasson, Improvements in Ventilators.—10,105, A. Clark, Improved Attachment for Squares for Builders and Joiners' Use.—10,125, J. Jagger, Slow combustion Stoves.—2,453, G. J. St. Messenger, Improvements in Ventilators at Chimney Cowls.—4,078, H. Gilbert and C. Blumy, Construction of Gas Pliers and Tongues.—7,864, C. Inwood, Improved Apparatus for Ventilating and Heating by Air.—406, M. Macleod, Laying Asphalt Roads, Pavements, Roofs, &c.—1,874, A. Putney, Improvements in Wood Flooring.—3,875, H. Ibbotson, Opening and Closing Sash Windows of any description.—4,248, H. Allisell, Improvements in Burglar Alarms.—4,297, H. Lake, Locks for Fastening Doors, &c.

MEETINGS.

SATURDAY, MAY 16.

St. Paul's Ecclesiological Society.—Visit to Chesham Old Church and other churches in Chesham, under the guidance of Mr. Somers Clarke, F.S.A. 3.30 p.m.
Association of Municipal and Sanitary Engineers a Surveyors.—Midland Counties District Meeting at Nottingham. 11 a.m.
Edinburgh Architectural Association.—Visit to Abdoucr.

MONDAY, MAY 18.

Royal Institute of British Architects.—Mr. Alexander Graham will read a paper entitled "Remarks on the Occupation in North Africa, with special reference to Algeria." 8 p.m.
Surveyors' Institution.—Discussion on Mr. Mathews's paper on "The Influence of Taxation upon Rent." 8 p.m.
Victoria Institute.—Dr. M. Eells "On the Results of Archaeological Research in North America." 8 p.m.
University College.—Mr. Barclay V. Head on "Greek Numismatics." 4 p.m.
Inventors' Institute.—8 p.m.
Edinburgh Architectural Association.—Annual General Meeting: President's Valedictory Address. 8.30 p.m.

TUESDAY, MAY 19.

Institution of Civil Engineers (1).—Discussion of Mr. A. H. Thompson's paper on "The Construction of the London and North-Western Railway; (2) fine permission Papers on Steam-engine Indicators and Indicator Diagrams, by Professor Osborne Reynolds and Mr. A. Brightmore. 8 p.m.

Historical Society.—Mr. A. K. Connell on "Indian says and When Trade." 7.45 p.m.

WEDNESDAY, MAY 20.
Archaeological Association.—Mr. Thomas Blashill the Cistercian Abbey of Dore." Mr. Alfred C. Fryer "Danish Crosses." 8 p.m.

Metropolitan and Clerks of Works' Institution.—
ary Meeting, 8.30 p.m.
Royal Meteorological Society.—Papers on "Wind
ities and their Measurement," by Lieut.-Col. H. S.
it and Dr. W. Köppen. 7 p.m.

Thursday, May 21.
Storey for the Encouragement of the Fine Arts.—Mr.
Storey, A.R.A., on "Footprints of the Beautiful."

Archaeological Institute.—(1) Mr. J. P. Harrison
Chevron Beads and Blue Bangles from Peruvian
(2) Mr. G. E. Browne on "Scandinavian"
Danish Sculptured Stones found in London, and their
on supposed "Scandinavian" or "Danish" Grigin
English Sculptured Stones." 4 p.m.
(3) Mr. G. E. Browne on "Scandinavian"
Danish Sculptured Stones." 8.30 p.m.
Institute of Architecture.—Mr. J. G. H.
ler on "Art-Work in the Middle Ages."

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table with columns for date (MAY 4), agent (By J. & R. KEMP & Co.), and property details (e.g., London-140 and 142, Praed-street, 38 years, ground-rent 10l., £1,900).

MAY 5.

Table with columns for agent (By Messrs. LEGER) and property details (e.g., London- Ground-rents of 40l. a year, reversion in 10 years, 1,900).

MAY 6.

Table with columns for agent (By DEVERE & Co.) and property details (e.g., London- A plot of land, area 9,000 ft. freehold, 16,000).

MAY 7.

Table with columns for agent (By FLEURY & Son) and property details (e.g., London- Green-The residences "Southdene" and "Highclere," 84 years, ground-rent 12l., 700).

MAY 8.

Table with columns for agent (By DEBENHAM, TEWSON, FARMER, & BRIDGEWATER) and property details (e.g., London- Dean-1 to 8, Felbrigg-villas, freehold, 3,760).

MAY 9.

Table with columns for agent (By WHITE, BERRY, & TAYLOR) and property details (e.g., London- 18-19, South-street, 10 years, term 39 years, 2,410).

MAY 10.

Table with columns for agent (By RUSSELL & STEVENS) and property details (e.g., London- ury, near "Bodicote House," and 33a, 1r. 3p., freehold, 14,000).

MAY 11.

Table with columns for agent (By HARRISON & MARRIOTT) and property details (e.g., London- ury, near "Bodicote House," and 33a, 1r. 3p., freehold, 14,000).

MAY 12.

Table with columns for agent (By G. A. BICKERTON) and property details (e.g., London- ury, near "Bodicote House," and 33a, 1r. 3p., freehold, 14,000).

New Fever Hospital, Coventry.—The new permanent hospital, which the Corporation are providing for the isolation and treatment of infectious diseases, is rapidly approaching completion,—indeed, it is practically finished, and might be made ready for occupation in a fortnight. The site has a frontage to the Stoney Stanton-road, and adjoins the Coventry and Warwickshire Hospital estate. The buildings comprise four detached blocks; the front building, which is 260 ft. from the road, is intended for the administrative department, and is of two stories, consisting of a surgery, 14 ft. by 13 ft.; a room of the same size for the matron; stores and kitchen; four bed-rooms, scullery, larder, and other accommodation. The next block, on the south side, 330 ft. from the road, is for scarlet fever patients, and consists of two wards, one for six beds and another for four beds, nurse's room overlooking the ward, and a bath-room. On the opposite or north side, at a distance of 119 ft., is a hospital of similar size for small-pox patients. The fourth side of the square, on which it has been proposed to erect a supplementary block for paying patients, is left open. The total accommodation will be for twenty patients. The architects are Mr. E. J. Purnell, City Surveyor, and Messrs. G. & I. Steane, Little Park-street, the drainage being under the supervision of Mr. Purnell. The gas-fittings are by Mr. Hodson, of Coventry, and made to special design. The contractor is Mr. Thomas Mayo, builder, Coventry, and the clerk of the works Mr. George Dalton. The cost of the building, which is upwards of 4,000l., will be defrayed by loan, to be paid off in thirty years.

Mr. David Brandon, F.S.A., and the Institute of Architects.—At the annual meeting of the Royal Institute of British Architects, held on the 4th inst., regret was expressed at Mr. David Brandon's resignation of the office of Vice-President. Mr. Octavius Hansard, chairman of the Library Committee, remarked that Mr. Brandon had long been a member of the Finance Committee, and had taken special interest in the financial prospects of the Institute. In a letter to Mr. Hansard, dated May 2, Mr. Brandon wrote:—

"As it is apparent that the expenditure will be greater next year than usual, in consequence of the publication of the library catalogue, and as I am desirous of preventing, as far as possible, the necessity which I fear will arise for selling-out part of the funded property of the Institute, and, in order to prevent a result which would be very undesirable, I shall be happy to subscribe the sum of 250l. towards defraying the expense of publishing the catalogue of the books, &c., in the library as now proposed. I presume that the actual cost cannot at present be ascertained with certainty, nor is it at all a necessity, as it is evident from the remarks in the annual report that funds will have to be raised for this special purpose, or part of our funded property appropriated in this way, which it would probably be thought desirable to avoid."

Mr. Brandon moved a special vote of thanks to Mr. Brandon for his liberal offer, which, after a few words from the President, was carried by acclamation and amid general applause.

Birmingham Architectural Association. On Saturday last the members of the above Society paid a visit to Worcester Cathedral and City. On the way to the cathedral the party visited Trinity Church, and inspected the fine ancient roof formerly over the Guesten Hall. On reaching the cathedral they were met by the Dean (the Very Rev. Lord Alwyn Compton, D.D.) and the Rev. Canon Catley, who drew attention to the most interesting features of the building. Before leaving the church the members inspected the crypt, cloisters, chapter-house, and bells, and obtained a fine view of the surrounding district from the top of the great tower.

Mission House, Poplar.—Princess Christian opened a hazard on Monday afternoon at Poplar Town-hall, on behalf of a new mission house, to be built in Giraud-street, in connexion with St. Saviour's Church. The building is to be Gothic in style, and of red brick, with York stone dressings, and is to cost 1,000l. The site, costing 500l., was given by the Bishop of London's Fund. Mr. Brett A. Elphicke is the architect.

An Interesting Discovery.—During the excavations for the foundation walls of the new Mairie at Arcueil-Cachan, Seine, an ancient burial-place, containing a considerable quantity of human bones, has been discovered. Every skeleton was lying with the head to the west and the feet to the east, whilst beside each skull was an earthenware vase pierced with holes, and ornamented with three series of six perpendicular lines, which are thought to have been intended to simulate tears.

Miscellaneous.

Building and Sanitary Work at Walthamstow.—The annual report of the Surveyor (Mr. G. B. Jerram) to the Walthamstow Local Board, for the year ending March 25th, 1885, says that during the past twelve months there has been a perceptible diminution in the number of houses being erected, in the formation of new streets, and in the laying out of new estates, compared with that of a year or two ago. 153 plans have been received for the proposed building of 519 dwelling-houses, two churches, two corrugated iron buildings, and fifteen stables and sheds, and including also additions and alterations to twenty-two buildings, and fourteen plans for new drains. There have also been seven plans received for the construction of new streets. Over 400 houses and one Board school, two churches, and two corrugated iron rooms, have been built or in process of erection, of which about fifty-six have been erected in districts where there is no system of sewers, thereby necessitating the construction of cesspools; of these 48 houses have been erected in the low-level district, west of St. James's-street and Black Horse-lane, but these are not all inhabited. The length of new streets formed on private estates is about one mile, one furlong; and about 24 miles of soil and surface-water sewers have been constructed. The works executed by the Board comprise the following, viz.:—New sewers, in Union and Prospect roads, and the alteration to the syphon in the northern main sewer; the widening of Clay-street, west of Greenleaf-lane; over 6½ miles of footpaths in the principal streets have been paved with asphaltic tar paving, and about 2 miles 3 furlongs of kerb have been laid in the public roads; some 2 miles 5 furlongs in length in main roads, and 1½ mile in length of other roads have been reconstructed with granite, by means of a special loan sanctioned by the Local Government Board.

Obituary.—Mr. Charles Moreing, who died at his residence, 37, Spring-gardens, on the 6th inst., at the age of 75, was probably but little known to the present generation, but he enjoyed years ago an extensive practice and amassed a considerable fortune. His most important work was Ingress Abbey, near Greenhithe, for the late Alderman Harmer, the proprietor of the Weekly Dispatch, who expended upwards of 120,000l. upon the building, which forms a prominent object in the landscape seen from the river. He also designed Messrs. Swan & Edgar's shop-front at the corner of Regent-street and Piccadilly-circus. Mr. Moreing had resided for the last few years at Hastings, he having taken over from the mortgagees the site of Warrior-square, upon which large sums had been expended, at first without any profitable result, but which eventually became a very lucrative investment. Mr. Moreing was unmarried, and although he had for some time past withdrawn from the active pursuit of his profession, was unremitting in his attention to business up to the last.

The Artists' General Benevolent Institution.—On Wednesday evening the annual dinner of this institution took place at the Prince's-hall, Piccadilly. The Right Hon. W. H. Smith, M.P., presided, and was supported by, amongst others, Mr. C. T. Newton, C.B., Mr. Horsley, R.A., Mr. Alma Tadema, R.A., Mr. Fribb, R.A., Mr. Poynter, R.A., Mr. Marks, R.A., and Mr. Linton (President of the Royal Institute of Painters in Water Colours). After the usual loyal toasts had been proposed and drunk, the Chairman proposed the toast of "The Army, Navy, and Reserve Forces," which was responded to by Col. King-Harman, M.P. The toast of the evening, "Prosperity to the Artists' General Benevolent Institution," was then proposed by the Chairman, who apologised for his inefficiency to do justice to such a toast. In the course of his speech the Chairman remarked that the profession of the artist seemed by some means or other to render him more liable than the rest of the world to those peculiar and exceptional misfortunes which claimed the sympathy of all who benefited by art; and when he said of all who benefited by art, he would remind them that within the last twenty or thirty years there had sprung up a sense of necessity for art which had not existed when he was quite a young man. The Chairman concluded by expressing his sincere hope that so deserving a charity would meet with the liberal support of all present, especially since its funds were not in so flourishing a condition as they had been in the past. Several other toasts followed, including that of the health of the Chairman, which was proposed by Mr. Gregory, M.P. During the evening the treasurer, Mr. Hardwick, announced subscriptions and donations to the amount of 2,456*l.*, which included a donation of 25*l.* from the Chairman.

Pietermaritzburg (Natal).—The foundation stones of a new Baptist Church here were formally laid on the 23rd of March last. The building will be a plain brick structure, having a length of 63 ft. and a width of 34 ft. To the main structure there will also be attached a minor building, which will be divided into two rooms by folding-doors, and forming two vestries, or class-rooms, capable of seating about thirty persons in each. The church, as at present designed, will accommodate 250 people, and, with the addition of a gallery, which is ultimately to be added, it will accommodate 350. The walls are substantially built, having a thickness of 18 in., and will support a tiled roof. The total cost of the chapel, it is estimated, will be 800*l.*, the site costing 500*l.*

Machine-worked Stone Ornament.—In reference to a "Note" in our last number, Messrs. W. & T. Brindle write to say that they did employ an architect to design their villas, their instructions to him being "to design villas having as much work executed by our machinery, and as various as possible, so that when completed the drawings or photographs should stand for us as an 'illustrated catalogue of designs,' and not as a model of architecture at all." We can only say what we did before, that the result was not such as to recommend the system to architects.

"The Chancery-lane Safe Deposit."—In connexion with the description of this establishment, given in our last, we are asked to mention that for the blocks of chambers and offices which adjoin and surround the safe deposit premises, Mr. James Hill, of Queen Victoria-street, supplied upwards of 1,500 sets of special locks and door furniture, the locks being all under master-key arrangements.

Ventilators.—We understand that Kershaw's Patent Pneumatic Ventilators, or their Patent Inlet and Air Diffusers, or both, have recently been used at several public buildings, including the post-offices at Stamford, Leeds, Newcastle, and Watford; the Newport Town-hall; the General Post-office, St. Martin's-le-Grand, London; and at a number of churches, schools, hotels, and other buildings.

The Late Mr. Edmund Reddin's Business.—We are informed that the lease of the wharves and the goodwill of the business carried on at Bankside by the late Mr. Edmund Reddin for upwards of fifty years has been acquired by Mr. R. H. Blatchford, who was for many years connected with Mr. Reddin in the business.

The Surveyors' Institution.—The annual dinner of the Surveyors' Institution will take place at the Holborn Restaurant (Venetian Room), on Monday, June 1st, 1885.

Appointments.—We learn that Mr. Sam. Abbott, M.Inst. C.E., of High-street, Lincoln, has been appointed chief resident engineer to the Buenos Ayres Great Southern Railway Company, and will leave England next month. Mr. Archibald R. Whitehead, who has been engaged with Mr. Abbott for several years on the engineering staff of the Great Northern Railway, and for some time past at Lincoln, will continue the practice at the same offices. —The Tottenham Local Board of Health have appointed Mr. C. J. Eastow, of Clarence-square, Gosport, sanitary inspector for their district, at a salary of 150*l.* per annum. Mr. Warring, of Birmingham; Mr. Jessop, of Battersea; Mr. Taylor, of Egremont, Cheshire; Mr. Loach, of Handsworth, Birmingham; and Mr. Wilkinson, of Bury, were the other selected candidates.

Civil and Mechanical Engineers' Society. The annual dinner of this Society was held at the Holborn Restaurant on Thursday, the 7th inst. The chair was occupied by the President, Mr. Thomas Cole, and a large number of members and visitors were present. The usual loyal toasts having been duly honoured, Mr. R. H. Willcocks, LL.B., proposed "Success to the Society." The President responded, and in the course of his remarks spoke of the usefulness of the Society and the benefit which had been derived from it by many of the members. He expressed the hope that the large increase in numbers which had taken place during the last year or two would be steadily maintained.

Cooking Apparatus for Large Institutions.—We understand that the Guardians of the Wandsworth and Clapham Union, having inspected Mr. Becker's apparatus at St. Pancras Workhouse, and the "Warrenising" apparatus at Lambeth Workhouse, fitted up in 1872 from Mr. Aldwinckle's plans, have decided upon adopting the apparatus at Lambeth as the model for the cooking apparatus at the new workhouse at Wandsworth.

St. Hugh's (Roman Catholic) Church, Lincoln.—Mr. Albert Vicars, architect, of London, is preparing the design for the above church and presbytery. The whole cost of the building, we understand, will be the gift of the Mayor of Lincoln, Mr. F. J. Clarko.

New Saw for Stone.—The *Dresden Industrie Zeitung* remarks that in consequence of stone-boring appliances having been successfully constructed with cutting surface black diamond, this material has now been adapted to a saw for stone. An Alsace factory has commenced the manufacture of this saw, which is put in motion by a steam engine of two horse-power. The quantity and quality of the work produced are said to be very satisfactory, and the saw is considered applicable to all kinds of stone.

Advantages of Glazed Floors.—The *Bauwerks-zeitung* remarks that large rooms which there is a good deal of moving about should never have wooden flooring, but should have slabs of stone or tiles, &c., as other the dust is insufferable. This assertion is confirmed by the fact that in the old Bank Exchange the principal room was always enveloped in a cloud of dust, while now stone flags have been laid down, nothing of kind is to be remarked.

Site of the "Cock" Tavern, Fleet-street. The *City Press* states that the Bank of England has purchased for 30,050*l.* the important site of the Cock Tavern and the vacant land in Fleet-street between Chancery-lane and Law Courts for the erection of new buildings for the accommodation of the large business of the Bank in connexion with the High Court of Justice.

Examination for Local Surveyors Inspectors of Nuisances.—We are asked to mention that the Sanitary Institute of Great Britain will hold its next Examination for Local Surveyors and Inspectors of Nuisances on Thursday and Friday, June 4th and 5th, at Parkes Museum, 74, Margaret-street, W.

New Government Buildings, Bloemfontein, Orange Free State.—The Government of the Orange Free State have appointed Lennox Canning, A.R.I.B.A., superintendent architect for the new Government Building to be erected in the City of Bloemfontein.

The Institution of Civil Engineers. The President's conversations will be held by permission of the Executive Council, in the International Inventions Exhibition, South Kensington, on Friday, June 5, from 9 to 12 p.m.

The Housing of the Poor.—II.

IN a previous article we considered the Report of the Royal Commission in regard to the light which it throws on the question of rents, and the extent to which the natural conditions of supply and demand are influenced by circumstances specially affecting the poorer classes of London. The other half of the question, as we then observed, is in regard to the possibility of ensuring that dwellings of the humbler class shall be better built, and maintained in better sanitary condition, than they are at present.

We have already said that the general conclusion adopted by the Commissioners, and indicated in their Report, is that there is not need so much of fresh legislation as of more energetic application of existing legislation. There are indications here and there, however, that the Commissioners do not regard the present legal powers as entirely adequate to the situation. On page 31, for instance, we are told that in regard to cellar dwellings and the operation of the Metropolis Management Act of 1885 (and of the Public Health Act of 1875 in reference to the Provinces) "evidence was forthcoming that there were cases of cellars inhabited both in London and in the provincial towns which were dark, damp, and unhealthy, and which could not be condemned because they came within the limits prescribed by the law. In Wilmington-place, Clerkenwell, to take one instance, there were said to be cellars totally unfit for human habitation, where the walls are dripping with wet ten months of the year, which the medical officer declines to condemn because they satisfy the requirements of the law, though in the opinion of two unprofessional witnesses they fall short of them. Without citing further instances, the mere recital of these legal requirements is sufficient to show plainly that an apartment may satisfy them all and yet be destructive to health, and totally unfit for habitation." Some of the evidence to this effect is summarised on page 12 of the report, and the Commissioners recommend that the provisions of the two Acts referred to should be amended with the view of securing greater height above the level of the street and larger area in front of the windows of all inhabited rooms that partake of the nature of cellar dwellings. And certainly regulations which only demand 7 ft. in height from floor to ceiling, of which one foot is to be above the street level, may be said to descend to the very lowest imaginable

limits of sanitary legislation for such cases. The question of dampness, referred to in the above quotation, is a portion of the subject which may and ought to be dealt with by the medical officer, and the allowance of such a defect appears to imply a very careless and lax exercise of his duties.

This leads to the general subject of the powers of sanitary officials and the manner in which they are exercised, in regard to which the Commissioners evidently think there is great room for reform. The qualifications of the sanitary inspector appear to be in some cases by no means what they ought to be, evidence being given of the appointment of persons as inspectors who had given no proof of any special qualification for the exercise of the duties with which they were to be entrusted; and without recommending so centralising a measure as the appointment of such inspectors by the Local Government Board, the Commissioners are of opinion that the said Board might, "pending future legislation with regard to London government," be provisionally entrusted with a veto on the appointments of inspectors. On the whole, however, we gather that the need for greater freedom and more scope for the exercise of their powers by sanitary officials is more pressing even than the need for greater circumspection in their appointment. This subject turns up in several portions of the Report. It is most strongly taken up by Mr. Dwyer Gray in his supplementary memorandum. He strongly urges that greater responsibility should be fixed on medical and other sanitary officers, and that to this end they should be placed in a position of greater independence. In regard to what may be done even in a democratic State, in the way of despotic action in regard to insanitary property, he quotes the result of the evidence given by Mr. Meyer, editor of the *Sanitary Record* of New York, and subjoins a suggestion with the view of placing our own sanitary officials in an equally independent position:—

"The New York Board of Health consists of four individuals, three appointed by the Mayor and one by the Governor of the State. The Mayor appoints one medical member of the Board, and one who is not a medical man; the third is an ex-officio member, being the president of the Police Board, who is appointed by the Mayor; and the fourth, also ex-officio, is the health officer of the port, who is appointed by the Governor. The Board thus constituted appears to have the most absolute power of closing and even of destroying unhealthy premises without compensation. They have gone so far that, failing attention to orders and notices, they one night employed three hundred men and demolished an unsanitary market and cleared it all away. On another occasion, finding fines ineffective, they destroyed a gut factory in a similar way, and compelled the owner to pay the cost of carting away the material of his buildings.

Until the local authority is made absolutely representative of the whole body of the community, such autocratic powers would possibly not be submitted to here, but something might be done in this direction.

Much good might be effected if upon the appointment of every medical or other sanitary officer his salary, the rate of increase on that salary, and the terms of his superannuation were fixed, as in the case of civil servants, and he were appointed to hold office 'during good behaviour,'—a well-understood legal term,—and were removable by the local authority only for misconduct or neglect of duty. This change would be no interference with the principle of local representative government, while it would have the effect of freeing sanitary officers from undue interference in the discharge of their duty after they had been appointed.

The sanitary officers should, if thus freed from undue interference, be held more directly and personally responsible for the abatement of nuisances in their districts. They should be empowered to institute proceedings upon their own initiative, and, in the event of their neglect, it should be open to the Local Government Board or other central authority, on the representation of any ratepayer, to investigate their conduct in this respect, and, if necessary, to dismiss them by sealed order in the same way as the Local Government Board at present may order the dismissal of a Poor Law official who fails in the discharge of his duty."

And, when we find that one Vestry Clerk frankly said in his evidence that "he and his Vestry had never turned their attention to the Act" (the Sanitary Act and the Sanitary Law Amendment Act), and find that members of Vestries own and draw profit from house property that is in an unsanitary and overcrowded condition, it certainly seems time that competent sanitary inspectors (and these are by no means wanting) should be freed from mere servitude to such authorities and placed in such a position that they can act independently.

At the same time it must not be forgotten, but on one page of the Report it certainly does seem to be forgotten, that energetic action in one district may have, often must have, only the effect of changing the locality of the evil, so far as overcrowding at least is concerned. On page 28 credit is given to two Vestries,—those of Chelsea and Hackney,—for the energetic manner in which they have enforced legalised regulations of various kinds. Chelsea especially is credited with having in one year effected the clearing of 300 houses, the improvement of 129 water supplies, and of 146 drainage arrangements, as well as a number of instances of preventing the evils of overcrowding and of sleeping in cellars, and of the occupation of sleeping-rooms by more than two adults of different sexes. "The consequence of all this energy on the part of the local authority is that in the whole of Chelsea there is, practically, no overcrowding." This is very satisfactory, of course, for Chelsea; but it stands to reason that the prevention of

overcrowding in this district in the way described, must drive out the superfluous ones to another district, and that it is only a local amelioration after all. This seems suddenly to occur to the framers of the Report on the next page, where they quote the Medical Officer of the District of Hackney to the effect that "one result of the enforcement of their regulations was that persons who did not like to submit to them, or for whom there was no room without overcrowding, had to leave the district and go to others where the local authority allowed the people to live in whatever condition they pleased." This illustrates, it is observed, the disadvantage of each local authority having its own sanitary system; but if all the local sanitary systems were made identical and carried out with the same rigour, that would only result in the fact that the less desirable among the population would be unable to find housing anywhere, and be left out in the streets. That might be an efficient, though rather a cruel remedy against overcrowding; but this inevitable result of such "energy" does not seem, so far as the words of the Report enable one to judge, to have been so distinctly present to the minds of its framers as one might have expected.

The question of the possibility of building healthy dwellings with sufficient accommodation at a lower rate of expenditure than at present is the subject, as we observed, of Mr. Godwin's memorandum or postscript to the Report, the recommendations being in the direction of concrete building as a cheaper method (in London) than brick, and of concentration of houses into larger blocks so as to have a somewhat smaller initial expenditure per domicile. Something also is to be achieved by the judicious planning of the property so as to have one portion capable of being let at tolerably high rates to a wealthier class of tenants, who will thus help in making an adequate return for the outlay. On this head we may as well quote Mr. Godwin's paragraph as it stands:—

"Arrangements for housing the working-classes by some of the large employers are made abroad which are less common in England; that is, tenements are provided by the employers in connexion with the works, and various social advantages are afforded to tenants. One remarkable example of this is the establishment of M. Godin-Lemaître at Guisa, near St. Quentin, in France, who has made a fortune as a manufacturer of stoves and ranges. The workmen,—700 or 800 in number,—and their families are here housed in flats, three and four stories high; nurseries for the infants and schools for the children as they grow up are provided without additional charge. The unmarried apartments are let at the rate of 3s. 9d. per calendar month per room. A furnished room for a single man (bed made and room set right every day) costs 6s. 8d. a month, and a bed in a dormitory can be obtained at one penny a day. This, it is stated, pays the employer six per cent. It happens that I gave some particulars of this establishment at a congress of the Social Science Association held in Sheffield in 1865. A view and plans of the building will be found in the Sheffield volume of the 'Transactions of the Social Science Association.' Illustrations are also given in 'Habitations Ouvrières en tous Pays,' par Muller, 1872.

In looking for the means by which the above result was brought about, it appeared that there were retail shops on the ground-floor where anything required by the tenants, meat, clothes, &c., could be obtained at a small per-centage above wholesale prices, and which yet gave a profit, and this was considered in settling the charge for the lodgings."

The suggestions arising out of this passage are highly important, for, as we have over and over again said, unless dwellings for the poor can be made to pay, at the rents which the poor can afford, the whole thing becomes merely eleemosynary, and to say that no lodgings can be made to pay at such rents, is only to say, in other words, that there are more people on the site than can make a living, and the sooner some of them go the better for the whole.

The evidence as to the Peabody Dwellings is naturally suggested by this portion of the subject, and the Report brings out emphatically the fact that this great and well-meant charitable bequest hardly touches the real problem we are dealing with at all. The evidence summarised on page 54 is to the effect that, in the first place, when bad

property was pulled down to build model dwellings, the persons dispossessed did not return to take advantage of the model dwellings; and, indeed, that they were often not a class who would be desired as tenants of a Peabody building: so that, as far as the lowest class are concerned, the action of the Peabody trustees is as inimical to them as that of the railway companies. Again, persons with large families, and persons following certain callings, such as costermongers, were not admitted in the Peabody buildings; the inhabitants of these form, in fact, a kind of working-class aristocracy. To keep the semblance, however, of providing for the poorer class, the maximum of wages to qualify for a Peabody tenant is 30s. a week, but the Report implies that this condition is often evaded, either because both husband and wife in the family are bread-winners, or because "it seems hard" to eject a well-behaved tenant from the buildings because by thrift and industry he has raised his earnings above the stipulated limit. Seems hard! why, it is the very climax of absurdity; it is against all the rules by which the relations of landlord and tenant are influenced in other walks of life. Just imagine any man, not a "philanthropist," letting house property on the understanding that if the tenant improves in circumstances so as to raise his income above a certain amount, and so become so much the more valuable and reliable a tenant, he is to have notice to quit! and even with this absurd theory (which we can well believe is not always acted on), the buildings do not house the class they were primarily supposed to be intended to benefit. Gratitude to Mr. Peabody for his large-heartedness and good intentions ought not to prevent our recognising, what portions of this Report bring out more clearly than ever, that his great bequest is a piece of fancy philanthropy, only producing perfectly unnatural and unbusinesslike relations between the Company and the tenants, and such as cannot possibly be permanently carried on upon the same principles, or regarded as any step towards a solution of the question before us.

The evidence as to the dispossessing of people in erecting these structures leads us to speak of another portion of the evidence, in regard to the effect of railway clearances on overcrowding. In reviewing Lord Salisbury's propositions eighteen months ago, we expressed an opinion that the effect of railways and new streets in leading to overcrowding had been much exaggerated, and we did not say this without special inquiry among those who had reason to be acquainted with the facts. The Report leads to the belief, however, that these influences have had somewhat more grave results than we had been disposed to think; though we still consider the effect of such public improvements in crowding up various quarters has been over-estimated. But what we were not prepared for is the evidence as to the cool and cynical neglect on the part of the railway companies of their legal as well as moral obligation to provide house-room equal to that which they remove. There are Standing Orders to this effect, and here is the summary of the Report thereupon:—

"The City Engineer of Newcastle-on-Tyne, who has had experience as a railway engineer, said that he had never known a single person to be re-housed by a railway company after clearances in connexion with railway extension. Sir Edward Watkin, speaking with greater authority, stated that he did not remember any case where a railway company, being under an obligation to re-house, had fulfilled it. Miss Hill corroborated this evidence without qualification, saying that the Standing Orders which were intended to provide for the re-accommodation of the poor are practically a dead letter. She pointed out that, even supposing they were satisfactory, and did compel the companies to re-accommodate, the companies would only be compelled to re-house the people they actually displaced, and they have a method of evading re-housing provisions by getting rid of the people privately before coming to Parliament. The witness said:—'Usually the railway company communicate with the landlords, and tell them, "We are going to take your property"; the landlord would only be compelled to re-house the people they actually displaced, and they have a method of evading re-housing provisions by getting rid of the people privately before coming to Parliament. The witness said:—'Usually the railway company communicate with the landlords, and tell them, "We are going to take your property"; the landlord would only be compelled to re-house the people they actually displaced, and they have a method of evading re-housing provisions by getting rid of the people privately before coming to Parliament. The witness said, and in spite of the advice of my follow-

workers, in Albert Buildings. In Albert Buildings, Lambeth, the tenants are told by the agents of the railway company that they will have to move, and that their best plan is to get out soon. This is before the Act is obtained. The companies, therefore, can go before Parliament, and say, "We do not displace people; there is nobody there." Therefore, it would seem to me as if the clauses, whatever they may be, should deal with the question according to whether houses that were formerly occupied by the labouring classes were displaced, and not whether the particular Act displaces them. The Rev. W. Denton, vicar of St. Bartholomew, Cripplegate, who for a quarter of a century has exerted himself on behalf of poor people forcibly evicted from their homes by railway companies, says that the Standing Order directing a return of the number of persons to be displaced by railway companies is systematically evaded."

Sir E. Watkin, it may be supposed, would stand up for railway companies, if any one in the world did, but on this point he seems not to have had a word to say for them; and it is stated on the next page of the Report that he has stated that in his opinion there would be no injustice in saying to people who control a private enterprise, and who remove the houses of working-class people in the construction of the works, "that they shall, before they commence their works, erect an equivalent amount of accommodation." Let us hope Sir E. Watkin will set the example.

The very important subject of special loans of public money for the purpose of facilitating the erection of working-class dwellings is dealt with in the Report at considerable length, and we can only here summarise very briefly the conclusions arrived at. In regard to Mr. Torrens's proposal that a portion of the balance in the hands of the Post-office Savings Bank should be applied for this purpose, the Report, after careful consideration of the arguments on either side, concludes that the desirability of lending money at lower interest for artisans' and labourers' dwellings should be considered on its own merits, apart from all question of the source whence it comes; and in this we entirely concur. The Commissioners then refer to Lord Shaftesbury's Labouring Classes' Lodging Houses Act of 1851, the general object of which is "to encourage the establishment of dwellings for the working classes by giving power to localities to adopt the Act, and to borrow on the security of the rates." The Commissioners appear to endorse Lord Shaftesbury's opinion that if this Act had been put into operation "it would meet almost everything that is required at the present moment," and that a trial should be given to it, if amended in certain respects so as to make it effective. To do this, it should be made for London, metropolitan instead of parochial; it should have more expeditious powers and less elaborate machinery; and, inasmuch as in its present form the Commissioners for carrying it out would have to negotiate for every separate interest in the property they proposed to acquire, and the owner of any interest, however trifling, could stop proceedings by refusing to treat, it is expedient that provision should be made conferring upon the local authority compulsory powers to purchase land under the Act, on the same footing as the powers given to railway companies and undertakings for general local improvements. This appears to us to be a perfectly sound and logical view of the matter. Subjoined to this is a paragraph recommending that vacant land should be rated at its selling value. "At present, land available for building in the neighbourhood of our populous centres, though its capital value is very great, is probably producing a small yearly return until it is let for building. The owners of this land are rated not in relation to the real value, but to the actual annual income. They can thus afford to keep their land out of the market, and to part with only small quantities, so as to raise the price beyond the natural monopoly price which the land would command by its advantages of position. Meantime, the general expenditure of the town on improvements is increasing the value of their property. If this land were rated at say 4 per cent. on its selling value, the owners would have a more direct incentive to part with it to those who are desirous of building." The Commissioners, therefore, recommend that these matters should be included in legislation when

the law of rating comes to be dealt with by Parliament. This, we suppose, would be one of the items in the Report which have been called in some quarters "very drastic measures"; but it seems only on all fours with other measures by which private interests are made to give way to public advantage.

Akin to this subject is the question of compensation for insanitary property. The Commissioners observe that there are arbitrators who, in assessing compensation, "seem not to exclude from their minds the improvement of the property which would be due to the [improvement] scheme itself, and give a prospective value to the unhealthy property in consequence of the impression that it would be increased in value when the improvement was effected." On this head they quote and ratify the opinion of Sir Henry Hunt, that if a house is in a dilapidated condition, and it would be waste of money to repair it, the value should be calculated on the principle of what the land and materials are worth, and the claimant should have that and nothing more. Our only astonishment is that it should at this time of day be necessary formally to lay down such a principle, which is, in fact, no more than simple justice. The compensation which, we believe, has often been obtained by owners or leaseholders whose property is purchased simply because they have allowed it to lapse into a condition which is a public nuisance and scandal, amounts simply to a premium on rapacity and selfishness.

There are two other points which touch the question of giving special advantages in favour of the erection of working-class dwellings. One of these is the fact that the owners of large properties are in some cases under a disability to grant long leases except on the best terms possible. "When the Duke of Westminster's re-settlement was drawn in 1874 a clause was put in to enable him to let land for the purposes of artisans' dwellings upon other than the best terms." If this means that, artisans' dwellings not being the best form of property, the owner was to be at liberty, nevertheless, to grant leases for this class of building when public wants seemed to demand it, that is a provision not probably contrary to sound economy in fact, though it seems opening the door to a rather dangerous principle. The same, perhaps, may be said of the proposition to convey to the Metropolitan Board the sites occupied by prisons in populous districts, in order to give more space for dwellings. In the abstract it seems most desirable, since there is no necessity to have some of these prisons on town sites, that the land should be freed for the erection of dwellings; but the suggestion is somewhat complicated by the remark that "in fixing the price at which such sites should be conveyed, due regard should be had to the purposes for which they are so required." Lord Salisbury, in his own memorandum, enforces this proposition strongly, urging that to part with these sites under their market value cannot properly be called "eleemosynary,"—"it is the surrender of an increase which has become unexpectedly disposable." We confess we cannot quite follow the logic of this. It may be a very indirect and in the main harmless way of being eleemosynary, but it is none the less so in principle.

In regard to this and other suggestions for granting special advantages, the question seems to be, how far public interests demand a special departure from ordinary commercial dealing. It is on the ground of public interests only, not of class interests, that any such departure from strict economical principles becomes justifiable, or, rather, ceases to be, properly speaking, a departure from such principles. Throughout the study of this remarkable Report, which we have endeavoured to summarise and consider, and from a careful perusal of which there is so much to be learned, two considerations have been always present to our mind: 1st, that no scheme of assisting the working classes to better dwellings can be of any real or lasting advantage which is not based on commercial principles, or which attempts to provide specially for them as a class under permanent special difficulties and claiming special condi-

tions to be made for them. How indeed, even if we admitted the principle, are we to define the class? Where does it begin and where does it end? The result of the Peabody bequest is surely enough to teach every one the difficulty of arranging matters so. Secondly, that the real initial difficulty and evil lie far behind the plane of enquiry of the Royal Commission. They have made valuable suggestions for securing that justice should be done to the industrious among the working classes, and that they should be protected from the consequence of private rapacity and of official neglect; but the root of the overcrowding evil lies in overpopulation, vice, ill-health, and want of foresight, and it will not be cured in a generation, commission we never so many Commissions. It is in the slow but certain influence of better education that the remedy will be found at last. All we can really do at the moment is to curb those who are wronging their neighbours, to spur those who are neglecting their duties; taking heed that in doing so we do not sap the moral and material strength of those whom we seek to benefit, by any hasty measure of false philanthropy:—

"'Twill be regarded for a precedent;
And many an error, by the same example,
Will rush into the State."

Since the above was written, the second portion of the Report, dealing with the question in Scotland, has come into our hands, but it is short and of very minor importance in comparison with the first portion. It goes to show clearly that the difficulties in London are exceptional and peculiar, and that the problem does not present itself in any such dire and perplexing dimensions elsewhere.

SCULPTURE AT THE ROYAL ACADEMY.

THE largest sculptural work in the Academy this year is Mr. Boehm's heroic group of "St. George and the Dragon," in the centre of the octagon. To his treatment of this very well-worn theme the sculptor has brought spirit, fine modelling of man and horse, effective grouping of the whole, but not much energy or greatness of conception. The St. George, who is nude, not armed (rather at variance with our associations with knight-hood) has quitted his reins to drive the spear into the dragon with both hands, while the horse rears in a rather *ménage* attitude. The dragon is carefully studied; he is a clever compound of lizard and serpent; his head is the flat one of a poisonous snake, and he twines his forked tongue round the shaft of the spear, which he catches in his jaws; behind the wrinkled eyes grow short horns, increasing the uncanny aspect of the head; but his limbs, where the lizard element comes in, are feeble and spongy-looking, and one does not wonder that a horse prances over him without much difficulty. The dragon, however, shows the most invention of the group, which, as a whole, can hardly be said to be imaginative, or to add anything intellectually to our conception of the legend, but it would make a fine monumental object for a central position, say in the courtyard of a palace.

Unquestionably the finest piece of modelling in this year's sculpture is Mr. Lawson's "Spartan Dancing Girl" (1,985). This is essentially a sculptor's subject; it is simply a modelling of the nude figure in a happy moment of repose; and in its complete representation of bodily structure, firm, well knitted, not without beauty, but striking one rather by its nervous energy, it is one of the best things of the kind that has been seen in the Royal Academy. We shall be able to give an illustration of this by which it is marked, just let the spectator compare it with the nerveless, mechanically-rounded, and polished limbs of such a thing as the "Ganymede" of Herr Kühn (1,994). The Germans, however, are behind every one in sculpture now; the French are before every one else, and we are a long way behind them; but Mr. Lawson's figure is one of a class of

works which will help us to make up our position, and we hope it will have worthy successors.

Another very clever and original work in the octagon-room is Mr. Mullins's "Autolyeus, son of Mercury" (1,990); not Shakespeare's Autolyeus, the name being merely used to typify the character of a petty deprecator. This is a nude figure of a youth, with a most amusing and cleverly-wrought expression of roguery in his countenance, and one hand drawn back preparatory to making a snatch at some piece of booty, in accordance with the sentence quoted,—"A snapper-up of unconsidered trifles." The whole figure is what one might call the idealised pickpocket, or what may be called the amusing side of him; it is half doubtful, perhaps, whether the subject was worth so much ability, but it is very clever and really original.

The pathos of the heavy German,

"With his sentimentalibus lacrymæ roat 'em,"

is delightfully exemplified in a work which on first view appears like a colossal heftle executed in plaster, but which on further examination is found to be a mass of drapery with a man donned up under it, and which is entitled "Overwhelmed" (1,981), with the addition, "O Thou, Eternal One! now let me die." This is the work of Herr Oscar Junck, who seems to have said to himself, "Go to! let us be sublime!" It is an easy way to be sublime, to hide all the figure and even the face out of sight, and let the spectator only see the cloak and the beard; you thus get rid of all the chief technical difficulties, and at the same time leave the imagination of the spectator entirely unfettered. Herr Kummer's "Lady Macbeth" (1,977) is better than this; the drapery is fine, but this and the heavy mass of hair overshadowing the brows are so much the repetition of a manner which pervades German sculpture that one is quite tired of it; and the attitude, though expressive, is somewhat too violent for sculpture. Two terra-cotta studies on either side of this, have a good deal to recommend them; one is Signor Lucchesi's "Oliver Twist" (1,975), the countenance of which is truly pathetic; the other, Miss Curtois's "Prayer" (1,797), a figure of a young girl kneeling, more expressive in attitude than in countenance, but a very pleasing ideal work. Signor Fabrucci's "First Love" (1,987) is a pretty child group; and among the portrait busts in the octagon may be noticed the "Earl of Beaconsfield" (1,973), by Mr. Adams-Acton; the "Marquis of Salisbury" (1,974), by Mr. Theed; "Mr. Henry Fawcett" (1,988), and the "Archbishop of Canterbury" (1,995), by Mr. A. Bruce-Joy. All these are busts with much character, and worthy of their subjects. There must have been a great weeding of busts this year, if we compare the generally good average of them with the crowd of tame and feeble things that we have so often found in the Academy.

In the lecture-room are two recumbent monumental effigies, which seem almost as if made to be companion works to each other, and which we publish as such, at all events, in this number.* These are Mr. Woolner's "Lord F. Cavendish" (2,130) and Mr. Armstead's "Dean Close" (2,132). Both, as will be seen, have the simplest of motifs; the portrait head and the cere-cloth covering the body, the form of which is only partially indicated beneath its folds. Mr. Onslow Ford sends the marble of his statue of "Mr. Irving as Hamlet," the model of which was before exhibited here, but we dwell with more pleasure on his other work, "In Memoriam" (2,084), a sleeping figure guarded by cherubs, the whole in very low relief, and set off with delicate ornament of a free Renaissance character also in low relief, and for which we fancy that a remarkable large circular monumental panel in the South Kensington Museum has furnished some hints. The attitude and expression of the figure are very beautiful, the whole is a most refined work and quite on one side of the ordinary paths of English sculpture. Beneath this is another really clever and superior work, three

* See this week's illustrations.

small panels in alto-relief (2,086-7-8) by Mr. Harry Bates, illustrating subjects from the "Æneid"—the first, "Dido looking after the departing ship"; the second, "Then, indeed, Æneas weeps"; and the third, "The form of the God returning with the same aspect, appeared to him in his sleep." These small sketches, for they are little more, are works of imagination; they illustrate the highest use of sculpture, and lead us to look with interest to what their author may accomplish in future.* We shall give an illustration of the work shortly. Mr. S. Fry's terra-cotta group of mother and child, called "Play" (2,113), is one of the class of subjects which Dalou may be said to have given the suggestion for, and is successful in uniting sculptural quality with natural realistic action and expression. Mr. Greenough's "Circe offering the Cup to Ulysses" (2,134) is a life-size marble of high finish of execution, but not remarkable otherwise, though the face has a fine expression of confident and deceitful triumph, which is in keeping with the idea; certainly this personage is more like Circe than Mr. Collier's painted Circe, to which we have before referred. Mr. Hamo Thornycroft's wax statue (small scale) for an equestrian statue of Edward I. is fine and monumental in character, and the horse is posed with a look of massive strength in his attitude, which comports well with the heavy armoured figure he carries. With Mr. Calder Marshall's "Eve" (2,114) we must confess we are disappointed.

Among smaller works round the wall of the lecture-room are several of considerable interest. We may instance a charming ideal bust by Mr. Armstead, entitled "Maidenhood" (2,069), a head not strictly beautiful, but full of expression, and marked by broad and free execution. One of the cleverest of the smaller things is a bas-relief of "Leda," by Mr. Montford, who sends also a terra-cotta statuette of a reclining figure of a "Tired Dancer" (2,092-4); the former is admirable from an artistic point of view, but it is about time that this very indecent Pagan legend were dropped as a subject for art. It was well enough for Michelangelo to do it in the Renaissance period, which was a Pagan and an indecent epoch in spite of all its genius, and his painting is too remarkable and characteristic a legacy of the age to wish it undone; but such subjects are, at any rate, anachronisms now. Mr. Mark Rogers sends a head of the Centurion (2,071): "I am also a man in authority, having servants under me," &c., which is a fine conception. Mr. W. Couper's two delicate medallions in very low relief, "A Vision," and "Before the Scenes" (2,047, 2,064), should be looked at; as also Mr. Mark Roche's "David entering Saul's Tent" (2,015),—is not David's right arm, by the way, rather long?—and Miss Rope's "David playing before Saul" (2,029), a very refined low-relief work. There are two busts of Gordon, neither of them satisfactory; a grotesque and wild-looking one of Mr. Ruskin, by Mr. Conrad Dresser (2,009); a powerful one of "The late W. Docker" (2,021), by Mr. Lawson; a very pleasing low-relief medallion of Lady Watkin (2,025), with a decorative effect produced by a lace head-dress carved in low relief; a very pretty and lively little alto-relief, by Mr. J. T. Williamson, called "Spring" (2,033), three little nude boys twining flowers; an expressive child statuette, "Pussy has scratched my finger" (2,035), by Signor Lucchesi; an admirable miniature study of a tiger (2,072), by Mr. Allen Hutchinson; a medallion portrait of Mr. John E. Sandys (2,080), by Mr. Henry Wills; a bust of Gray, the poet (2,090), to be placed in the hall of Pembroke College, by Mr. Hamo Thornycroft; a medallion of Mrs. Mirrilees, by Mr. Woolner; two small medallion portraits of Miss Ellen Terry and Miss Mary Anderson (2,115-7), by Mr. G. M. Curtice, admirable likenesses these; and a clever *repoussé* silver panel, by M. Morel-Ladenil, of the wedding scene from "Much Ado" (2,116).

* We understand that the Royal Academy had the intention of purchasing this work with the Chantry bequest, but it was technically unsuitable on account of its not having been executed in E. gland.

There is no great predominant work of the year, but there is in the sculpture of this year more to interest and more which promises that we are slowly progressing towards a better notion of what sculpture should be and what it is meant for, than we have observed in recent Academy exhibitions. The stupidity and indifference of the public about sculpture are the great obstacles to its advancement among us; but this, again, reacts on the sculptor, as many melancholy examples have shown. It is at least something to record that there are fewer such examples or warnings this year than is usually the case.

THE RAILWAY COMMISSIONERS.

A SHORT time ago the President of the Board of Trade was asked in the House of Commons whether, in his opinion, the Railway Commissioners had jurisdiction now to entertain questions of undue preference as between foreign goods and English goods. Mr. Chamberlain replied in the affirmative. The fact of this question being put in the House is an indication that the functions of this important body are not generally known, and a few particulars as to their constitution and duties may prove of interest.

Leaving the preference-rate question until later, it may be stated that the Commission came into existence in 1873, and consists of three members. Each of these is supposed to be experienced in railway law, or practically acquainted with the details of railway business, and thus thoroughly competent to give judgment in the cases brought before them. The appointment of such a tribunal had long been recognised as a necessity; for, without reflecting for a moment on the capability of the Court of Common Pleas, or of Her Majesty's County Court Judges, to deal with railway, as well as other disputes, it was very seldom that the companies did not appeal against an adverse judgment, and by taking the case from court to court, make it ruinous to the litigant, although he might be successful throughout. The power of appeal from the decision of the Commissioners is naturally limited, and, although the expense involved in bringing a case before them is considerable, there is much more chance than formerly of its being brought to a speedy and satisfactory issue. With a view of still further lessening the cost of litigation to individuals in cases brought before the Commission, a clause was embodied in Mr. Chamberlain's Bill of last year, dealing with railway matters, giving a *locus standi* to Chambers of Commerce, &c. This was one of the most useful provisions of the Bill, and it is unfortunate that this, at least, has not become law. It is, however, only a question of time, as it is probable that the Bill, or something similar, will be re-introduced, now that the attempt of the railway companies to settle the matter has proved abortive. However, the law as it at present stands, makes certain provisions tending to relieve individuals of the onus of laying complaints of contravention of the Acts by the companies before the Commissioners. A clause in the Act of 1854 authorised the Attorney-General to take proceedings in cases in which the provisions of the Act were violated; but that of 1873 goes further, and permits complaints to be made not only by a person aggrieved, but by any person appointed by the Board of Trade, or by a municipal or public corporation, if furnished with a certificate of the Board of Trade. This, as Mr. Chamberlain explained in the House on April 30th last, gives better facilities for the public to have their grievances brought before the Commissioners direct, than by leaving the Attorney-General to watch and enforce the due carrying out of the provisions of the law.

The duties of the Commissioners are mainly to see that the existing Acts relating to railways are duly observed, and to hear and determine any complaints of contravention of them. These Acts were in a manner consolidated by Mr. Cardwell's Act of 1854, which

may be said to be the most important enactment on the subject in the statute-books. This measure, among other useful clauses, contains the following, which is comprehensive enough to justify Mr. Chamberlain's reply as to the jurisdiction of the Commissioners in cases of preference.

"Clause 2.—Every railway company shall, according to their respective powers, afford all reasonable facilities for the receiving, forwarding, and delivering of traffic upon and from the several railways belonging to or worked by such companies respectively, and no such company shall make or give any undue or unreasonable preference or advantage to or in favour of any particular person or company, in any respect whatsoever, nor shall any such company subject any particular person or company, or any particular description of traffic, to any undue or unreasonable prejudice or disadvantage in any respect whatsoever."

This seems to include undue preference as to transit, accommodation, or charge, the words, "in any respect whatsoever," leaving no room for exceptions. Nevertheless, it would appear that even this was not clear enough; for in the Act of 1873, appointing the Commission (in which the provisions of Mr. Cardwell's Act are incorporated), there is a section commencing "Whereas it is expedient to explain and amend the said enactment," referring to and enlarging upon the clause just quoted.

Another clause in the Commissioners' Act provides that they may, on the application of any person interested, make orders requiring a railway company to distinguish in their rate-books how much of each rate is for conveyance, use of railway, locomotives, carriages, &c., and how much for other expenses, specifying the nature and detail of such other expenses. This has proved very serviceable, but the principle might with advantage be extended,—indeed, in the discussion on terminals caused by the Bills just abandoned by the railway companies, a step in this direction was proposed. This was to exhibit at each station the amount claimed for terminals at that station; but it would seem desirable for each station to be furnished with a list of the terminals charged at all the stations. With this, and a uniform classification and scale applicable to all companies, a rate could be fully tested without having recourse to the Commissioners, unless still more detail was required.

The powers of the Commissioners in "terminals" cases is defined in Clause 15, which may be quoted at length:—"The Commissioners shall have power to hear and determine any question or dispute which may arise with respect to the terminal charges of any railway company, where such charges have not been fixed by any Act of Parliament; and to decide what is a reasonable sum to be paid to any company for loading and unloading, covering, collection, delivery, and other services of a like nature. Any decision of the Commissioners under this section shall be binding on all courts and in all legal proceedings whatsoever." It will be noticed that these are what may be termed "handling" services, but the companies claim the right to make additional charges for all terminal accommodation, including all station buildings, &c., and expenses in connexion therewith, these charges being distinguished by the term "structural" terminals. In a recent case in which this question was involved, it was elicited that the following are among the items included in claims for structural terminals, in addition to goods sheds, warehouses, and offices:—Land, earthwork, ballast, turntable, weighbridge, gas, &c.; interest on capital expended upon and the cost of maintenance and renewals of the above, together with rates and taxes being reckoned as the estimated cost per annum. This is divided by the tonnage dealt with during the year, thus producing a rate per ton. In the case referred to it was 11.72d. per ton! Now, as explained in our article of March 7th last, the companies' Acts give them no power to make charges for accommodation of this description, and it is therefore held by the Commissioners that all such charges are included in the amount they are

authorised to demand for conveyance; but at the same time they are decidedly of opinion that it was really the intention of Parliament to allow something additional for terminal accommodation, though this does not find direct expression in the Acts. This has always been a sore point with the railway companies. The Commissioners have, of course, administered the law as they found it, and their judgments in these cases have invariably been against the railway companies. The main object of the latter in introducing their Rates and Charges Bills was to get the law on this point altered in their favour; but by adopting wrong tactics and asking for too much, they have got nothing, and the law remains as it was. The Commissioners have had many cases coming under this clause brought before them, and it has been shown that the most unreasonable charges have been imposed for terminal services and accommodation, the opponents of the Rates and Charges Bills being thereby furnished with powerful arguments against the legalisation of these charges, though there is no doubt that the companies are justly entitled to some payment in this respect.

The Commission only had a five years' lease of life, and although at the expiration of that term it was again renewed, it has proved itself of sufficient value to be constituted a permanent tribunal. The majority of cases, such as are brought before them, formerly went to the Court of Common Pleas, and the confidence of railway litigants in the ability of the Railway Commission is proved by the fact that many more cases are brought forward now than before their appointment. It cannot be doubted that a court dealing specially with railway matters would be more likely to bring them to a satisfactory issue than the Court of Common Pleas, with its varied practice, and the appointment of the Commissioners as a Court upon a similar footing to that just named would be a decided advantage. This will, no doubt, be accomplished when our legislators have a little more time to devote to internal affairs; for railway matters have been brought so prominently before them this session that they are not likely to be lost sight of.

NOTES.

SCIENCE, which is as restless as politics in changing old things for new, is pressing hard on our lighting and heating systems, and will soon end by transforming them altogether. Our gas, the purveyors of which have regarded with comfortable complacency the attacks of electricity, has just received a rude shock from a chemist of considerable note, Professor Armstrong. In a paper read before the Iron and Steel Institute, he remarked that the present mode of making illuminating gas was irrational; the yield was very small in proportion to the amount of coal carbonised; the gaseous product was poor in quality, owing to the high temperature that prevailed in the retorts; while the coke was also of low quality, and the operations clumsily conducted. The public was slowly awaking to the fact that gas was supplied with very indifferent illuminating material, and the Professor expressed an opinion that consumers would soon insist upon something far better, which could be used in much smaller quantity, and the evils arising from gas-burning would be thereby diminished. As to the other question, viz., fuel for heating, Admiral Selwyn has been leading a crusade at the United Service Institution against the use of coal on board of the ships of the royal and mercantile marines, as being bulky, costly, wasteful, and dirty. He advocates the employment of liquid fuel, which is already in vogue with the Russian fleet, and certainly has many advantages. There is great economy; no change is required in engines and boilers, and comparatively little adaptation of furnace; a whole army of stokers and trimmers dispensed with; the ship can receive her supplies at sea or any where, without resorting to a coaling station; there is no nuisance of dust and ashes, nor any liability to spontaneous combustion. The greatest point, however, is

that 46 lb. of water, according to experiments, can be evaporated with 1 lb. of fuel, giving power for full steaming for twenty-four days, whereas now that power is limited to four days. As each ship in the navy could remain on her station twice as long with liquid fuel as with coal, the saving on the expenses of the whole fleet would be about twelve millions sterling per annum. This is a serious and important matter, and we cannot see why the same application should not eventually be made to fuel for manufacturing purposes and domestic heating. Notwithstanding the warnings of geologists and mining surveyors, the output of coal increases every year, and little effort is made to check the waste and recklessness. As we have not, like the lucky Pittsburg folk, reservoirs of natural gas underneath our manufacturing towns, it is worth considering whether we cannot find some economical substitute, in the shape of liquid fuel.

THE evidence of Professor Sullivan, the President of the Queen's College at Cork, before the Select Committee on Irish Industries, described the neglected state of what might readily be made an unrivalled system of inland waterways. All the various rivers and canals, the President pointed out, had locks of different dimensions, so that, as to commercial utility, "the whole thing was a joke." The canal system of Ireland, according to the evidence given before the Select Committee on Canals (252, 1883, p. 232), covers a length of 775 miles. On 4,332 miles of inland water-way in England there exist, according to a table published by the Institution of Civil Engineers (Proceedings, vol. 76, p. 175), seventy-two sizes of locks, ranging from 45 ft. to 165 ft. in length, and from 6 ft. 10½ in. to 37 ft. in width. The Irish irregularity thus falls short of that which obtains in English waters. The capacity of a canal of ordinary section for traffic, taken from work actually done in England, has been calculated as two millions of tons of net load conveyed one mile in a year. The maximum work done on an English railway of mixed traffic, in the same time, was 1,410,000 tons conveyed one mile. But the railway cost more than five times as much per mile as the canal; and while the English railways on the average have not established a higher rate of net earning than 4.3 per cent. on the capital, the Trent and Mersey Canal has earned as much as 30 per cent. net profit in a year, and the Birmingham Canal a higher rate of dividend.

ALTHOUGH the traffic of the Irish Railways is very low, the result of their working is shown by analysis to bear comparison with that of richer and more populous countries. The gross receipts on the railways of the United Kingdom in the last year analysed in the "Index to our Railway System," were 3,551.7 per mile; those on the Irish lines in the same year being 1,257. For England alone the receipts were 4,220.7 per mile. But the capital spent on the English lines was 46,113.7; while that for which the Irish lines have been constructed was 14,187.4, stated at per mile in each case. And, notwithstanding their small traffic, the Irish lines were worked rather cheaper than the English; the coefficients of working cost being 53.97 per cent. of gross receipts in England, and 53.55 per cent. in Ireland. The outcome of all this is, that the Irish lines, out of a gross traffic amounting to 8.15 per cent. of their outlay, earned a net profit of 4.17 per cent. over their whole capital; while in the same year the English lines earned 4.38 per cent., and the Scottish lines only 3.99 per cent. net on their respective capitals. It is thus obvious that the judicious mode of laying out the Irish railways, for which the country is mainly indebted to the late Field-Marshal Sir John Burgoyne, affords a sound basis for a remunerative traffic, if Irish industry were to revive. The effect of a very small traffic in diminishing net returns is illustrated by the fact that while every railway servant in France earned 207.1 in a year (dividing gross revenue by total number of men employed) and in

England every one earned 193.1; in Ireland, in 1883, every person in the employment of the railway companies earned only 164.

THE reduction of 10 per cent. in the wages of the colliers appears to be becoming general throughout the country; and the Lancashire Miners' Confederation have decided to call a National Conference of Miners on the wages question. In South Yorkshire 2,000 miners are now working at the reduced wages; and the masters state that at the present price of coal it will be impossible to work many of the pits even on these wages. Under these circumstances, attention is being raised to the fact that out of a strictly limited quantity of coal we are now exporting upwards of twenty million tons per annum for prices that hardly keep body and soul together among the coal winners. Our export price per ton for coals in 1883 was less than half what it was in 1873, and is now probably lower. It was the estimate of the Coal Commission in 1871 that if the annual increase in the demand for coal, which was then tolerably steady, were to continue, our coal supply would be exhausted in 110 years. On the appearance of such calculations, the price of coal rose, and the rate of consumption was materially checked. Great prosperity accompanied the rise in the price of coal, but it is not clear what was the true source of the sharp demand then made for our produce at continually rising prices. At present our home consumption of coal is declining, although the exports, at an inadequate price, are rapidly increasing. It does not seem to be the English collier or coal owner who derives most benefit from this increment.

THE Architectural Association have issued to members a report of a Committee for "Amending and Consolidating the work of the Association." Among the suggestions are that two defined divisions be formed, the "Elementary Division" and the "Advanced Division," and that a "Committee of Advice" be elected each Session, whose duty it should be to recommend to new members the particular course of study which it would be advisable for them to pursue. This is an admirable idea, and a proposition made in a most generous and unselfish spirit. The committee particularly ask members to consider and give their views on proposition 19, how the advantages of the Association may be best extended to country members. There is one way we could suggest, but it would be a troublesome one for the sub-committees and visitors of classes, viz., criticism of designs in these various classes by letter. The question of publishing the papers read at the meetings has also been mooted, and of course this would very likely open up the question of raising the subscription. The latter is a point that the Association can best judge of for itself. We may point out that there is the alternative of publishing a selection only of the papers read, those that are the most practical and likely to be most permanently valuable. In some of the papers read we have noticed a great deal of discursive writing, not always in the best literary form, which would certainly not be worth printing in a permanent form. Of course there are other societies of which the same may be said.

BY an odd coincidence, just after writing the above remarks, we receive the circular of the Institute of Architects, announcing a proposal to be submitted by Professor Kerr at the next meeting (June 8th) for conducting "the higher operations of the Institute" by means of four standing committees, taking charge respectively of the Departments of "Art," "Science," "Literature," and "Practice." We will not dismiss the idea in a hurry, but it comes in a "questionable shape." Architecture is a combination of Art and Science, and Practice is intimately bound up with both; why split them up?

WITH reference to the case of the Metropolitan Board of Works v. Mowlem & Co., reported in another column, and in which notice

of appeal was given by the Board, it is to be hoped that the decision of the Divisional Court will be pressed for as quickly as possible, as the present state of uncertainty as to the law on the subject has not only caused great loss to some, but has also prevented spaces being used which otherwise might be utilised and made valuable.

IN Rome there is much building going forward in all directions, but principally in the district between the churches of Santa Maria Maggiore and San Giovanni in Laterano. There is a large square which promises well,—the Piazza Vittorio Emanuele,—and the new streets are being made much wider than was the custom in past times. One will be enabled to walk on the pavement without fear of being jammed by a passing carriage. If these streets turn out like the Via Nazionale, the Romans ought to be congratulated, for this is the handsomest street in Rome,—although much good work was destroyed to make it. It contains two recently finished buildings worthy of note, although of widely different character, the American Church, the tower of which is a fine design, and the new Museo di Belle Arti, a handsome Classical elevation. Mr. Street's English Church, in the Via del Labirinto, is progressing, but apparently rather slowly; the walls are nearly completed throughout, but the roof is not commenced. It is curious to see windows and arched English characterside by side with the nave piers, which are square in alternate layers of yellow Siena and red Perugia marbles; and between the larger piers a single column of green marble. The effect will be very rich when finished.

ACCORDING to the *Wochenblatt für Baukunde*, the first portion of the work of restoring the Palace of Diocletian at Spalato has just been completed under the direction of Professor Alois Hauser. The interior, with the exception of some trifling work to be done at a later stage, is now restored. The galleries and the organ-loft which defaced the building have been removed; the pulpit and the two Gothic altar canopies have been restored, and the whole interior has been cleaned,—that is to say, simply washed down. The effect of the whole space, we are told, which now appears much larger and wider than formerly, is such that the beholder cannot sufficiently admire the beauty of proportion and the grandeur of the monumental Roman architecture. Perhaps some "heholders" would have preferred it, dilapidations included, before the trail of the Teuton was over it all.

IT is matter of great regret that chance should have led Correggio to paint his magnificent domes in what is one of the dampest towns in Italy. It is only at Parma that the master is seen in all his greatness, and his work in the domes of the cathedral and in the church of San Giovanni Battista in that place is rapidly perishing. The greater part of the funds of the fathers of the latter church have been confiscated by the Government, so that little can be done to prevent injury. The brick pavement, however, which is reeking with damp, is about to be replaced with marble, in the hope of arresting the decay.

THE magnificent choir-stalls in the Duomo of Perugia, so long the admiration of architects, are being restored, so far as the intarsia work is concerned. Whole panels have been cut out and replaced with new, which, as regards the execution, is about as bad as the Italians know how to make it. There is none of the refinement and delicacy of the old work about it; in fact, the work is about up to the level of the English jobbing carpenter.

EVERYWHERE restoration,—and that generally of the very worst kind,—meets the eye of the traveller in Italy. What the lovely Upper Church of the Monastery of San Francesco of Assisi will be like when it has passed from the restorer's hands,—to judge from what has been already done,—Heaven only knows. There is much to be thankful for in

the fact that the greater part of the old work in the nave is still fairly perfect. Perhaps, however, this is only all the more reason why, from an Italian point of view, it should be restored.

IN reference to the Metropolitan Board of Works Bill, Mr. Bryce moved, on Tuesday last, that "The Board shall, under the powers conferred upon them by this Act, acquire the whole of the piece of land in the parish of All Saints, Poplar, No. 2 on the deposited plans (Greenwich Ferry, plan No. 4), and in the hook of reference, page 68, and shall lay out, or cause to be laid out, as a public-garden or recreation-ground, so much of the said piece of land as shall not be required for the purposes of the ferry between Greenwich Pier and Bark-street, Poplar, and the purposes mentioned in Clause 12 of this Act." The Bill, he said, took powers for the construction of a ferry between Poplar and Greenwich, and the piece of land, which was now a garden, would be only partially required for the uses of the ferry. Sir James Hogg resisted the motion on the very poor ground that it would add to the cost of the ferry by preventing the use of the site for building purposes. The clause was carried, however, by a majority of 136 to 50. It is gratifying to see that the Legislature seems alive now to the importance of open spaces and recreation-grounds in London.

THE managers of the American Exhibition which is to be held next year have secured what they consider "the best" site in London for their enterprise, a site of twenty acres at Earl's Court. The station for the District Railway will be in the Exhibition grounds, and "every railway in Great Britain," so we are assured, "will have facilities for immediate and direct connexion with the Exhibition building." The promoters evidently mean to make a big success. From the Report of the Director-General, Mr. Whitley, we learn that already more space has been applied for than will be available, but the management will continue to receive applications up to September 30th of this year, and then we presume the rule of *decur digniori* will be followed. From a paragraph in the report it appears to be supposed that, as we have had the "Fisheries," the "Healtheries," and the "Inventories," so the American Exhibition will be popularly known as the "Yankeries." We have already predicted that the exhibition is likely to be an exceedingly popular one, and it seems also likely to be a very large concern, and in fact, to apply the words of Artemus Ward, "The American eagle will be screaming all over the length and breadth of this bright and beautiful land."

THAT admirable French "Monthly," the *Revue Générale de l'Architecture*, is exceptionally good this month. Among its illustrations are some fine pieces of bold Renaissance ornament from Le Pautre, and a view and details of the beautiful Classic monument to Michelet, the historian, in the Cimetière de l'Est at Paris, designed by M. Pascal. There is a refinement and a variety of inventive fancy in the best of the contemporary monumental work of this type in France such as we must sadly confess we rarely see in England.

THE Duke of Bedford, we are informed, has made a donation of 50l. to the funds of the Society for the Protection of Ancient Buildings. This is an admirable stroke of policy on his Grace's part. There have been for a long time past more or less indignant outcries against the state of Covent Garden and against the market building itself, as an anachronism which calls for rebuilding. Against such demands on his purse the Duke of Bedford has now secured the valuable support of a Society which will allow nothing that exists, however bad and worn out, to be removed, and which will support the maintenance of the *status quo* in Covent Garden, not on the mean and sordid ground of economy, but on the highest moral and æsthetic principles.

UNDER the characteristic and grandiloquent signature "A British Matron," some rather ill-educated lady has been allowed to write a very silly letter in the *Times*, inveighing, on "moral" grounds and in no measured terms, against the nude paintings at the Academy and the Grosvenor. The writer would have done well to remember the rebuke once administered to a lady of similar prejudices, who observed to the company who were looking at a picture, that "it was a very indelicate picture," and was met by the comment that "the indelicacy was in the remark." We have ourselves criticised some paintings of the year, not on the ground of serious impropriety (which, in the case of any Academy paintings of this year, must reside in the spectator rather than in the painting), but on the ground of the prosaic incongruity of representing nude figures in no ideal connection, but as if they were subjects from common life. So far some attack on some of the Academy paintings of the year might have been justified. But as the "British Matron" (we like that phrase!) includes the Grosvenor Gallery in her censure, it is to be presumed that she numbers Mr. Watts's "Love and Life" and Mr. Mitchell's "Hypatia" among the things which "a modest woman cannot look on without a burning sense of shame." If so, there is only one conclusion possible;—the "British Matron" whoever she may be, is a vulgar-minded idiot. It is little to the credit of the taste or judgment of the *Times* to have published such a letter, and we are glad to observe that "An English Girl" made, in the succeeding issue of that journal, an indignant protest against it.

ARCHITECTURE AT THE ROYAL ACADEMY.*

THERE is no drawing in the architectural room which can for a moment compare for beauty of draughtsmanship with Mr. Waterhouse's design for the National Liberal Club (1,908). His power of composition, and feeling for harmonies of warm colour,—the swift dexterity and abandon of his fearless brush were never seen to greater advantage. In these respects he is admittedly without a rival. The design in question has been so recently illustrated in these pages that a minute description of its features is unnecessary. Its style could not be described in a word. The pervading feeling is that of a free Classical Renaissance, but the quasi-machioliolations of the cornice, the Romanesque arches of the tower, the Venetian character of the traceried arceding of the Belvedere and several minor points of detail, remove the work from any known style. We are far from saying that this is a fault. On the contrary, we are strongly of opinion that a puritanical adherence to one particular style, and even to a particular phase of a particular style, has done much in the past to rob our modern work of that picturesque quality which is so much admired in the ancient. We have too scrupulously avoided those incongruities which are a legitimate source of effect, and our work has been uninteresting in proportion to its self-imposed and straight-laced propriety. But while yielding the fullest admiration to the cleverness which this design everywhere displays, we cannot refrain from expressing our disappointment with it as a work of art. The object of the building is distinct and unique. It is to be the home and head-quarters of one of the great parties in the State. Not exclusively for the aristocracy thereof; but for the great multitude of educated men throughout the country who hold and profess in political matters the Liberal creed. It should therefore have a distinctive and appropriate character—and such a character it would not have been difficult to impress upon it. Fine architecture is not a mere matter of window and wall-space—of string and cornice,—of plaster and archivol. "Every building erected for public assemblage was considered incomplete by Greek and Goth unless it were adorned with sculpture or painting designed in accordance with the purpose of the building." Mr. Waterhouse has given us a building which will indeed be a jewel in comparison with the depressing mediocrity of its neighbours, but has risen to the full conception of the task committed to

* See pp. 617, 620, 684, ante.

him? Has he, in fact, given us a building eloquent of its *raison d'être*? Our Tory friends,—and we are thankful to say we have many such,—will perhaps reply in the affirmative. They will say that the Liberal party is a heterogeneous jumble of discordant elements, and that in scattering varied and inconsequent details over his work Mr. Waterhouse has exactly hit off the idiosyncrasies of his clients. In this side of the question we do not intend to enter.

"Politics we bar,
They are not our bent."

Personal feeling apart, it was the bonnden duty of the architect to put his clients' case as strongly as possible, bringing prominently and permanently before the public those momentous achievements which for good or ill have marked the progress of the Liberal party, and on the strength of which they claim the affruges of the nation. Portrait-sculptures of such statesmen as Peel and Palmerston, Cobden and Lewis, Mill and Fawcett, not to mention the names of those still happily living, might reasonably have adorned its walls; and surely there are dramatic incidents connected with the repeal of the Corn Laws, the passage of the First Reform Bill, and the more freshly-remembered Education Act, which would have provided our sculptors with themes worthy of their skill, and fit for record in the plastic and enduring *terra-cotta*. For all this we look in vain. The detail which gave voice and vitality to the natural History Museum is unhappily dormant. An exercise would have given us a companion structure having equal claims to our regard and our gratitude; instead of this we are put off with a merely facile combination of dumb lines and dead surfaces.

The architect had a great opportunity,—

"It might have happen'd but once
And he miss'd it,—lost it for ever."

We think that we have some reason to complain Mr. Waterhouse's treatment of himself, and only deplore the inexplicable and disappointing result.

No sound judgment can be formed of Mr. Waterhouse's design for the rival Constitutional Club upon his drawing of an inconsiderable fragment of the entrance-front (1,835); but, so far as can be ascertained, he also has taken an inadequate view of a great occasion. "To the mind of Pheidias to that of Pisani or Giotto it seemed desirable to have a good building first, of fine material and such masses and proportions as the spirit of wisdom within them ordered; and then to ornament it inside and outside with such historic or symbolic forms as should make the building speak for itself about its intention, and dwellers in it, and the work to be done in it, and how it came into existence."

We have unfortunately changed all that, and modern architecture is for the most part severely inartistic.

Mr. Snlman's design for the New Exchange in Amsterdam (1878) is a brilliant drawing, and too high for a critical examination of its details. The general balance of the composition is effective and pleasing. The building is of brick, with scanty dressings of freestone,—the roofs covered with brown tiles. The gables of wide span and high pitch, and are consequently conspicuously lofty, and being taken into curves and corbie steps, are picturesque in a way which is entirely accordant with the genius of the *locus in quo*. There are no more than four lofty towers visible in the drawing, effective and well designed, and agreeably varying the ensemble. We should have expected to see the *motif* of the whole,—the Exchange itself,—exteriorly expressed, and this is the only real objection to a very striking design.

We have, on previous occasions, spoken at length of the design for the proposed Admiralty War Office buildings (1,923-1,931), by Messrs. Aston Webb & Ingress Bell, and have no testimony to its many fine qualities. We will only add that it improves on further acquaintance. It is unfortunate that the revised design by Messrs. Leeming has not found a champion upon the walls of the Academy, and if it were, as reported, that its absence is due to tardy delivery of the drawings, we can only say that a rule, which is reasonable enough in general application, had been stretched a little in this particular instance.

'Detail of portion of a Public Building' (1,750) strikes one at first sight as the work of a French architect; but upon examination it

turns out to be by Mr. Phené Spiers, who has adopted the French system of drawing and shading which he has so often advocated by public speech. It has, no doubt, some technical advantages; but it is not without some artistic drawbacks. We are glad to see one drawing of the kind in the room, and should be sorry to see many; partly because we do not want to be Frenchified even to our advantage, and the advantage in this instance is at least doubtful. Those who would prefer it to Mr. Flockton's free and flowing lines (1,742), or Mr. George's piquancy (1,765), or Mr. Johnson's clearness and breadth of treatment (1,751), will, we suspect, be in a minority.

Sir Andrew Clarke's "Design for a Military Hospital" (1,957-1,958) was illustrated by us last week, and its leading characteristics have been fully dwelt upon. If built as proposed it will undoubtedly be one of the finest establishments of the sort in Europe,—local circumstances being, it is stated, favourable to the adoption of a more than customary elaborate architectural character, and a singularly fine site affording an unusual opportunity for its effective display.

Mr. E. S. Prior's "Martyn Hall, Cambridge" (1,793), is a vigorous drawing of a masculine design, in a sort of late Gothic between our insular Perpendicular and French Flamboyant. The circular staircase is a prominent feature; and it is a matter for regret that the need for lighting the great hall has apparently prevented this being carried up as a tower. We have only space to refer briefly to Mr. T. G. Jackson's several works, amongst which his Brighton College Chapel Hall and Gateway (1,831-1,838) may be particularised. There is a happy union of breadth and brilliancy about this architect's work which is always attractive, and his peculiar method of pen drawing in imitation of a now obsolete style of engraving is admirably suited to the qualities of his architecture. His later works show a chastened style, and are without defects of detail which detracted from some of his first efforts.

"An two men ride of a horse one must ride behind," and by the same rule we cannot all be hung "on the line." Mr. Conder's drawing "A Temple at Tokio" (1,849) is too high up for careful scrutiny, but its characteristic outline and brilliant colouring can be appreciated, and will no doubt be enjoyed by a public which is just now enamoured of everything Japanese.

NOTES AT THE PARIS SALON.
PAINTING.

THERE are no imposing or epoch-making works in the Salon of 1885; but it shows serious efforts and illustrates the new path on which modern French art has entered. Mythology is abandoned to a few painters of Classic prejudices, and artists attach themselves more and more to scenes of real life and its surroundings. These tendencies, to which Bastien-Lepage gave such an impulse, have for one result the substitution of realistic colouring for that of convention. In attaching himself to Nature, and interpreting her as she appears to the eye, the artist is under the necessity of modifying his palette, with marked results on the general effect of the collection. One may notice also the almost entire absence of the battle-pieces, for many years so numerous, while, on the other hand, there are some important works in the branch of the art which is more properly called

Historical Painting.—Thus, in the grand entrance, the eye is immediately caught by the immense triptych in which M. Bérond has endeavoured to recall the splendour of the great era of Venice, when Henri III. was received by the Doge with sumptuous hospitality. This composition, full of movement, but disagreeable in colour, shows, however, a strong feeling for decorative design. "La Fille de Jephthé" serves M. Cahanel as a pretext for an exhibition of Oriental costume, giving his composition more the aspect of a modern harlem than of a Biblical scene full of the sentiment of sorrow; but on the whole it is treated with great ability, which is more than can be said of the "Comédie, Mère des Gracques," of M. Boulanger.

Drawing is certainly not the special merit of M. Falguière's picture, entitled "Acis et Galatée." It is extraordinary that a sculptor, going out of his way to paint, should appear as if predetermined to paint coarsely, and scarcely to draw at all. At all events, M. Mercie,

another sculptor-painter, who represents "Michel-Ange dessinant un Cadavre," seems able to combine correct drawing with powerful colour.

Here are the eternal early Gallic scenes of M. de Luminais, whose "Prisonnières évadées" is infinitely better than his "Mort de Châléric." This year Gallicisms seem to be rather the fashion, too; but we will merely mention the enormous canvases of MM. Lehoux and Maillard, with MM. Maignan, Rochegrosse, and Clairin who are in the full Middle-age period. A chamber in disorder, a corpse whose tone is scarcely distinguishable from the draperies of the bed; that is how M. Maignan represents "Le Mort du Guillaume le Conquérant," a composition solidly painted, though hard in style. Cold as it is, however, we are tempted to prefer this picture to the melodramatic carnage of M. Rochegrosse and the false Orientalism of M. Clairin. The former has made scenes of blood his speciality for some years past. After exalting the massacres of ancient history, he serves us up to-day the atrocities of *le Jacquerie*. A chateau sacked by the mob, a group of women and children being slaughtered, is the sensational scene by which M. Rochegrosse endeavours to excite an emotion which is not forthcoming. It is a very old-fashioned art for so young a man. M. Clairin, who seems to wish to revive the glowing colouring of Henri Regnault, gives the title "Les Maures en Espagne" to the largest picture in the Salon. The stage figures in parti-coloured garments, with glistening ornaments, the women naked amid the bleeding bodies of the vanquished, all leave us unmoved, though there is a wealth of talent exhausted on them; in fact, this crowd grouped round the Moorish king, in the gay palace of Granada, suggests too much a *mise-en-scène* at the Eden Theatre.

Modern history is badly represented this year. The "Marie Antoinette," whom M. Flameng shows conducted to execution, looks with haughty contempt on the howling crowd. The figure is destitute of either likeness or sentiment, and certainly does not express the Christian resignation of the Royal martyr.

Religious Paintings.—Leaving Greek mythology alone for this year, M. Bouguereau shows us, under the same guise, two religious paintings. His "Adoration du Christ par les Bergers" and "Par les Mages" exhibit the same learning, the same absolute correctness, the same cold and expressionless colouring. He is at once powerful and commonplace, marvellous in *technique*, repellent in sentiment. "Le Martyre de St. Denis" of M. Bonnat is intended for the Pantheon. This vigorous composition is not characterised by any religious feeling, but one cannot see without astonishment the decapitated saint running after his head, to the surprise of his executioners. On the other hand, M. Olivier Merson has put genuine feeling into his small picture entitled "L'Arrivée à Bethléem"; all the poetry of the Bible narrative shines through this exquisite picture.

"Laissez venir Moi les petits Enfants," by a German painter, M. Uhde, shows original talent. In the kitchen of a farm-house children and peasants are grouped round a personage with a slightly monastic aspect. The Christ, in his long blue mantle, with thin and ascetic face, and sad and tender expression, recalls nothing of the legendary type of church art. There is a charming sentiment in the baby who stretches his little hand to the Saviour in the beautiful confidence of infancy; it is a strange and very individual work.

Allegorical Paintings.—Much attention is attracted by the "Solum Patria" of M. Fritel, and one looks with astonishment at this equestrian *danse Macabre* of gigantic cavaliers on the soil which they are prepared to defend against the invader. There is something to make a great chapter of here, and Delacroix would have produced a *chef d'œuvre* out of it. With M. Bandonin, allegory comes down from the clouds and shows itself under the form of our own day. He has no need, like his neighbour M. Chartran, of traditional shepherds and shepherdesses to illustrate "Les Financières." A workman, a pretty girl in a peasant's dress, a corner of a modern village, suffice for this decorative idyll, commissioned for the city of Paris. Here is a work which M. Humbert has executed for the Mairie of the Fifteenth Arrondissement. The day is ended, and the women sit at the waterside waiting for a boat which brings home the labourers. The scene is in open

air, the landscape calm and poetic. In the distance the outlines of a wooded coast are profiled against the sky; the oxen are returning from the plough. All these details are united in an ensemble of clear and pleasant colouring. We find the same qualities in "Le Veillé," by M. Pierre Lagarde, ordered for the same building. It is also for a Mairie in Paris that M. Emile Lévy has painted a picture of a young mother nursing her infant, other children playing on the grass at her feet. This picture, entitled "L'Enfance," is charming in style, colour, and expression, but it is a piece of purely neo-Greek archaism; and for a Mairie in which the principal facts of civil life are registered, we cannot but prefer subjects of real and actual life, without compromise with Classic recollections.

Belonging to another order of ideas, the decorative fragment which M. Besnard entitles "Paris" is very remarkable. In the midst of flag-bedecked vessels which float on the Seine is a raft, covered with flowers, on which stands upright a young woman, symbolising "the Republic," who carries in her arms two sleeping children. Behind extends the panorama of the quays, full of life, and glittering with lights, illuminating the perspective of the bridges, the Ile St. Louis, and the monuments. There, to our thinking, is a genuine piece of monumental decoration.

"L'Automne," by M. Pavis de Chavannes, is a variation on the picture at the Musée du Lyon. There is much charm in this graceful, though rather colourless, composition; but, unlike many other paintings, the works of M. de Chavannes certainly do not gain by being reduced to the dimensions of genre. They must remain of monumental scale, like those at the Pantheon and at Amiens.

Genre Paintings.—This class of painting occupies, as always, an important place at the Salon, except in regard to military subjects, which, as already observed, are at a discount this year. One cannot class among military pictures the works in which M. Flameng and M. H. Cain have dressed up models in the uniforms of ineffectual officers of the First Empire, and affected Hussars of the Revolution. M. De Neuville is very ill,* M. Detaille is not represented, and M. Protais alone holds aloft the standard of "l'armée française." His "Halte de Chasseurs à pied," cleverly composed in a rather colourless scale, has only the fault of being the repetition of a subject forcibly treated already. We prefer the "Soldats Hollandais partant pour les Indes" of M. Israël, who translates an interesting scene with charm and truth.

The "scène mondain," as it may be called, is, on the other hand, abundantly represented. It is regrettable that its painter-in-ordinary, M. Berand, should have quitted this year the "Soirées Parisiennes," in which he excels, to transport us to a "Hospice de Fons," a melancholy and disagreeable scene, in place of the spirit, the originality of type, the glittering effects of light which mark the works of his accustomed style.

The quality of elegance, which we regret the absence of in the works of M. Jean Berand, is what makes the success of the "Hunt Ball" of M. Stewart, where a brilliant effect of light, a gleaming of pearly shoulders set off against the scarlet dresses of the huntsmen, all contribute to the excess of this pretty picture. Elegance and taste equally characterise the works of M. John Lewis Brown, whose very individual talent recalls for us this year two episodes of the chase, entitled "Halls" and "Fauconniers," in warm and luminous colour, a quality absolutely wanting in the "Cavaliers à la Mer" of M. Max Claude, who seem lost in a fog.

The very Parisian taste of M. Heilbuth has taken this year for its object "Lawn Tennis," painted in charming fashion. M. Heilbuth excels in these kind of elegant scenes of "pleasure," which he treats with infinite spirit. There is much humour in M. Gervox's "Jury de Peinture" at the Salon, introducing the portraits of well-known artists, but the interest of the work could have been just as well realised on a much smaller scale. What are we to say of "L'Atelier" of M. Duez? Does he wish to prove to us that in this year of grace 1885, the studio of a painter à la mode is a sort of museum, where the amateur, astounded by the luxury around him, is to be frightened out of

* Since this was written, we regret to see that his illness has terminated in death.—Ed.

any question of reduction of prices? This fastidious care over accessories leaves us uninterested. How much do we prefer the fine profile of the young girl whom M. Lerolle has painted, in church, singing a hymn, "Dans le Tribune des Orgues." The figure is relieved strongly against the white walls of the church, in an attitude the naïveté of which is most attractive.

It is by simplicity, too, that M. Adan produces his effect in the two pretty pictures "L'Anniversaire" and "Le Retour du Travailleur." "La Mauvaise Nouvelle" of M. Beyle, and "L'Enterrement d'un Fermier" of M. Brispot, are scenes of manners closely studied and of delicate sentiment. "Les Loups de Mer" of Madame Démont-Breton is painted from nature with talent, but with rather heavy colouring. The peasant women of M. Pearce and M. Ridgway-Knight have nothing of the country about them but their costumes.

Though the remark may seem unkind, there is, nevertheless, in these scenes of rustic life a certain poetry, which seems to disappear com-

pletely in the realism of the occupations of the town workmen. In painting from nature "Les Tailleurs de Pierre du Chantier de Suresnes," M. Roll has shown a courage which is hardly crowned with success. This immense painting wants life, and offers only a grey tonality such as does not exist in nature. Everything in the scene, figures and materials, is of the colour of stone. To these sad and depressing "ouvriers" M. Lhermitte opposes the loud gaiety of the cabaret. Women and toppers crowd around a table stained with wine; the scene is brutal, but full of life, vigorous, and broadly painted.

As for M. Pelez, his delight is to show us every year misery in all its forms. His "Martyr" is a poor little mendicant dying of hunger and cold. His "Mère à l'Opéra" is sordid. Two *figurantes* are dressing, or rather undressing, to appear on the scene. They are exchanging their ragged things for spangled petticoats and red sashes. Under the paint on their faces is the sadness of submission to fate. It is a melancholy picture, but it is well painted and true in colour.* R. B. FRANKWICK.

A Music of Talim.

THE LION AND THE PALM.

NOTES ON RECURRING FORMS IN HISTORIC ORNAMENT.

ON Mr. E. Burne Jones's picture in the Grosvenor Gallery, King Cophetua's golden throne is patterned with designs in *repoussé* studied from ancient metalwork, known as Phœnician, although found widely distributed; these designs are two birds affronted and a lion tearing a bull.

In Venice on the Byzantine palaces these birds and beasts, symmetrically arranged, framed in panels, and altogether made much of, are frequently found. In the "Stones of Venice" several examples are drawn, and of them Mr. Ruskin says:—"The most remarkable point about them is that the groups of beasts or birds on each side of the small pillars bear the closest possible resemblance to the group of lions over the gate of Mycenæ. . . . the whole ornamentation of that gate is so like Byzantine sculpture that I cannot help sometimes suspecting the original conjecture of the French that it was a work of the Middle Ages to be not altogether indefensible"; and then follows a passage from Ezekiel (xvii. 3-7), suggested to his mind by these sculptures, to which I will couple another from the Prophet's vision of the Temple which he saw in the land of the "Chaldeans by the river Chebar." "And it was made with cherubims and palm trees, so that a palm tree was between a cherub and a cherub" (xli. 18).

In "Ariadne Florentina" also, Mr. Ruskin speaks of an old sampler of our great-great-grandmothers' time ornamented with these mystical birds, which again remind him of the Byzantine ones, and I have before me some printed cotton curtains, Persian work of today, on which, on either side of an immense Noah's ark tree, are peacocks, the whole making a composition exactly the same in intention as the mosaic at Palermo (thirteenth century), or an Assyrian design figured in Perrot and Chipiez: more than this, there are also two representations of a lion tearing a stag, and the "hom," or sacred tree, grows from a mound, like a heap of stones arranged in a pyramid, just like the tree and hill (Mount of Olives) in Middle Age art.

The great ideas expressed in graphic symbols, the struggle of good and evil by the lion and

peay, immortality by the "tree of life," and the peacocks, together with the zodiacal signs and chimæras of all sorts, had their origin in the East in remotest times.

I propose to put these few notes together more especially with reference to:—1. The lion's struggle. 2. The birds of immortality. 3. The tree of the desert.

The great work of Messieurs Perrot and Chipiez on Chaldean art, recently published will afford us examples of all these, but I quote here the descriptions from the catalogue of the British Museum of objects lately arranged in the Kouyunjik Gallery.

4. Cylinder.—"The sacred tree of the Assyrians seems to have been an emblem of the god Assur (chief deity), and the eagle-headed figures his attendants."

7. . . . "a staff, at the top of which is a tasselled disc supposed to be emblematic of the god Assur" (the staff and disc which thus take the place of the sacred tree is the symbol of the Mycæne gates and the Byzantine sculptures).

11. "Two winged figures making offerings to the sacred tree."

13. . . . "between the two animals a tree upon a hill of stones, perhaps another form of the sacred tree."

50. "A lion about to devour an ibex."

53. "Winged figure holding a staff, above two birds, perhaps emblems of the sun."

These small engraved cylinders are of Babylonian, Assyrian, and Phœnician workmanship.

The pattern, known as the "knop and flower," is either the lotus and bud, or the hom and its fruit alternately, and in both forms are the most frequent of Assyrian ornamental designs. From the first the Greeks derived their "egg-and-tongue,"† and from the latter the "honeysuckle and palmette" patterns.

We have just seen the Phœnician engraving seals for the Assyrians; let us now read the Bible account of their work in building and ornamenting the Temple and Solomon's Palace (Chief. 1 Kings v. to vii.).

"And the cedar of the house within was carved with knope and open flowers" (2 Kings iv. 18).

"And King Solomon sent and fetched Hiram

* To be concluded in our next
† We suspect the egg-and-tongue ornament goes a great deal further back than that.—Ed.

out of Tyre . . . and he made two chapters of molten brass . . . of lily work . . . the two pillars and the two bowls of the chapters that were on the top of the two pillars, and the two networks to cover the two bowls of the chapters" (1 Kings vii. 13-41).

"And he made a molten sea . . . it stood upon twelve oxen . . . all their hinder parts were inward . . . and he made the ten bases . . . on the borders thereof he graved cherubims, lions, and palm trees" (ver. 23-39).

Mr. Ruskin notices in the "Stones of Venice" the curious resemblance that the Byzantine reticulated and basket-work capitals have to those of the Temple, and suggests that perhaps they were an intentional carrying out of the above description. In the British Museum is an Assyrian pavement of stone carved into a geometrical network pattern in flat relief, with a border of "lily-work," and in the introduction to Owen Jones's "Grammar of Ornament" is figured a capital, said to be Sassanian Persian, and therefore many centuries earlier than the Venice examples; it is "howl"-shaped and is covered with a "network," each reticulation has a form carved in it, which suggests how the "two hundred flowers" were probably arranged in the Temple chapters, nor with all these resemblances would it be out of place in Venice.

The golden laver was, we have seen, carried on twelve bulls (compare lion fountain of the Alhambra), and the great winged Assyrian bulls in the British Museum were the impostors for the arches of the main entrances. On a slab also we have a lion bearing a column, which is seen at once to be like those of Lombardy, and this resemblance is pointed out by Perrot, who has engraved a real model for one of these lion bases to a column which was found.

Fig. 1.

Fig. 1 shows us this lion bearing the column;

Fig. 2.

Fig. 2, a column and parapet, afterwards revived by the Persians, and introduced wherever the Saracens had influence, either in Venice, Sicily, or Spain. Fig. 3 is a group of domes. All these are from the slabs, and engraved by Perrot and Chippiez, who say that the Romans probably derived their domes from Assyria (and it is almost certain the barrel-vault is well). Speaking of the resemblance to Byzantine art, they have the following passage:—"Isidore and Anthemius, the architects of Sta. Sophia, were the disciples and perpetuators of the forgotten masters, who raised so many millions of bricks into the air at the bidding of Sargon and Nebuchadnezzar." Phœnicia is the middle point in the Assyrio-Greek way in its set westward. Of the metal work of the Phœnicians,—principally bronze bowls in our museums,—few have no examples of the ideas we are tracing. A slight advance, and we find the earliest of the Greek pottery in

Rhodes, and the work probably of Phœnician colonists; here, too, are the struggling heasts and the knop and flower of lots, plainly, as we

Fig. 3.

see it on some of the vases, the origin of the egg and tongue (figs. 4 and 5).

Assyrian Pavement

Fig. 4.

Early Greek Vase

Fig. 5.

In the early Greek art of Asia Minor, the good and evil struggle is, of all subjects, the most frequent; a slab from Xanthus in the British Museum gives us a magnificent example of the lion and stag, and the Temple of Assos and a tomb at Myra of the lion and bull (see Texier and Pullan), and if we follow carefully the transition, it will be apparent that the tradition is Assyrian, even when the structure becomes modified by availing itself of Greek marble in the place of the burned clay of the plain, and by borrowing some constructive ideas from Egypt. I think it could be shown that the Greeks invented nothing (eliminated, rather, and perfected). Do we look for the prototype of the processional frieze, through Lycia we shall come to Assyria; for that of the great sitting Zeus let us go to Branchidae and Kalab Shergbat.

The earliest Greek coins are closely allied to Assyrian engraved seals; the Phœnicians seem to have worked for both peoples. A coin of Acanthus, of the sixth or seventh century, has the lion tearing the bull; those of Sybaris show that bull striking the ground with its hoof, of which there are so many Assyrian carved ivories; and, indeed, most of the types are of Eastern origin.

In fully-developed Greek art any symbolical import in these ideas had been forgotten, and although the sacred tree has become the almost universal palmette or honeysuckle, it is merely ornamental (see the palmette and gnollche on the Ninevite ivories). That we should find these Eastern ideas in all progressive schools, and lose them in all falling ones, is one great proof of the proposition I am trying to establish.

For one generation this great tide of art washes the rock of the Acropolis, and then its strength spent, it falls during later Greek and Roman times, still continues to fall in Romanesque, and is finally lost, leaving us only the stones which its power has channelled. Henceforth we must be careful to discriminate between this spent impulse and the one that follows.

In the third century of our era the old Persians rose under Artaxerxes, who founded the dynasty of the Sassanides; and here, again, in the land of Iran, are the beginnings of a

new cycle,—the second or Byzanto-Gothic, which culminated in Europe in the thirteenth century: at once our mystical heasts and birds are resumed as national symbols, and an architecture is founded on the old Assyrian dome.

As Phœnicia was our middle term in the first series, Syria was in the second; here the new art, which was the old, was adopted for Christian use. "La Syrie Centrale" of the Count de Vogüé shows us work which might be Venetian Byzantine, of the ninth century, or even Southern French of the eleventh, being done here from the fourth to the seventh. It will be useless my pointing out individual resemblances, the whole being so much to the purpose. The peacocks become Christian symbols of immortality, and decorate important positions, together with the sacred monograms and foliage of the vine, it will be well to notice, however, that this foliage is identical in character with that of the North Italian schools of the thirteenth century; and is, at the same time, the Assyrian relief. Those exquisitely-sketched vines and flowers of an Eastern "Paradise" which we find on the slabs, have no following, so far as I know, in Greek art.

It should be remembered that the emperors lived much in Asia at this time, and here at Nicaea was held the first great Council. Which ever may be the first Byzantine buildings on our side of the Hellespont, those of Constantinople or of Thessalonica, there can be no doubt of their Eastern origin, although, of course, they take to themselves much from the Old Greek. Persian gold is added to the Roman mosaic, and the Sassanian dome spheres over the centre of a Latin basilica. Sta. Sophia was commenced in 531, and but little later Eastern artists were at Ravenna, where we shall find our peacocks and palms on the golden field of the mosaics.

When in the seventh century the Saracens conquered the Persians, the latter became their artists, as the Greeks had for the Romans (the Arabs not being nor becoming architects); it was through the conquests and commercial relations of the Saracens, however, that this Eastern art acted on the West, and it is interesting to compare the buildings of Cairo and Damascus with those of Italy. In these cities we shall find the alternate courses of different marbles (Aladdin's Palace was of courses of gold and silver), and the embossed paravets, of many forms, derived from those shown us on the Assyrian and Lycian slabs.

The Persians, too, had revived the tresses for which Babylonia was so famed; and on these in all ages, from the veil of the Temple to the latest hanging by Morris, will be found the horn and the birds. Haroun Alraschid made a present of some of these textiles to Charlemagne, and in a few centuries, from the marts of Venice, Palermo, and Limoges, they were distributed all over Europe, and are the origin of all those luxurious brocades of the Renaissance painted by Veronese or Bronzino.*

W. R. LETHBRIDGE.

THE "INVENTIONS" EXHIBITION. FURNITURE AND ACCESSORIES.

A GREAT invention apparently would be to define an invention; for, although we are told that there is nothing new under the sun, there are necessarily many ideas which must be new to each generation, or, what is perhaps more to the point, the combination and application of these ideas to the working requirements of the time, invest them with a novelty which is sufficient to warrant the title of an invention. We must, therefore, expect to find in all branches a number of old friends with new or but slightly altered faces, and in Group XXII., comprising "Furniture and Accessories" (South Central Gallery), there is no exception to this rule. The smallness of the spaces allotted has, no doubt, prevented many would-be exhibitors from making an effort to be represented, as it would be impossible in such limited areas to obtain a satisfactory result. Owing to this the exhibits are numerically small also, and the indecision noticeable last year, as to which class or heading the various goods should come, again prevails; thus we find ironades and alloys in Group II.; household fixtures, Group III.;

* To be continued.

carpets and rugs, Group IX.; china and glass, Group XXIII.; and paperhangings in Group XXVI., and fancy goods classed also under this comprehensive arrangement. Furthermore, these subdivisions are often far apart in the building, and as some of the exhibitors are not yet ready, it becomes rather difficult to do otherwise than to follow a somewhat erratic course, and take them as they come.

The first on the list is Group XXII. (1,698), Messrs. A. Sanderson & Sons, 52, Berners-street, W., show the "Lionsdale Wall Decoration" and the Patent Ingrain Paper, which, although "washable, hygienic, and waterproof," looks much the same as any paper not credited with these characteristics. Some simple, yet fairly effective, wood panelling and lining (1,699), by Messrs. J. F. & G. Harris, 58, Wilson-street, Finsbury, may be noted, there being a wide range of colour obtained by the contrast of the various woods of a work-a-day useful kind, such as pine, mahogany, walnut, and others, with "not too much, but just enough" workmanship to make the most of the material. Messrs. C. Pratt & Sons, of Bradford, have some furniture and upholstery in a particularly small houndoir (1,703), in which sense of scale is lost, owing to the enforced crowding; the work is of unequal merit, the delicate plaster panelling to walls and ceiling being among the best. Messrs. W. Wallace & Co. send a combination bed-room suite (1,704), of simple design; some of the coloured inlay, however, would be better for a little more freedom of line. Old friends are recognised in Messrs. Cameron, Amberg, & Co.'s elaborate system of letter filing, the number of the stall being 1,706. There is a novelty (1,708) by Messrs. T. Wilkinson & Sons, of Birmingham, viz., their patent Pelican ware, or untarnishable electro-plate, decorated in colours, which is perhaps more curious than beautiful. Mr. James Allen, of Leeds (1,710), exhibits a chair of improved construction, for hotels, clubs, and general purposes, with immovable joints and without braces, or, in other words, larger than usual mortise and tenon joints are used instead. Now that so much attention is being called to the hardship imposed upon shop assistants, both male and female, by reason of the long hours and the prevailing prejudice against their sitting down during the day, it may be well to notice the pivot seats (1,712), by Mr. E. B. Fitton, of Great Malvern; these are specially designed for use behind shop-counters; here, however, an unfortunate selection has been made to illustrate a good idea, as some very poorly-constructed and finished examples have anything but an inviting look. We would suggest to one of the Early Closing Associations that their efforts could be well utilised in this direction by bringing the boon of a few minutes' occasional rest, so simple yet so great, before the notice of a vast number of people, and upon an occasion like this there would be an unusual opportunity of furthering their views. 1,713, by Arthur Foley, Fisherton Steam Cabinet Works, Salisbury, is a patent economic combination of chimney-piece and coal receptacle, and patent combined fender and coal vases to fit any size hearth; a placard calls attention to the fact that the limited space prevents due justice being done to the arrangement, and as the "arrangement" is in two tiers, it leaves the observer in doubt as to where the fireplace should be, and a few *repoussé* brass fittings do not tend to make the design any more clear; the workmanship, however, is satisfactory, though simple, and the desired explanation would probably be the same. Messrs. Gainsford & Co. show an improved writing-table (1,717), economical and useful, the lock to the centre drawer also fastening the locks in the pedestals. Above this hang two black-and-white drawings of interior decoration, both good in their way, and the same may be said of a similar subject in colour, such as we are accustomed to see elsewhere, for we believe this firm have only comparatively recently considered the subject of decoration. In 1,719, Messrs. W. B. Simpson & Sons, we find some very choice specimens of Anglo-Limoges enamels, with patented system of sectional jointing, as in stained-glass. The hearty and delicacy of these imperishable works in Mediaeval times are matters of renown, but now, by means of the system of jointing referred to, the composition of a subject can be carried to any scale without losing its characteristics, although the single "plaques" seem to attract greater artistic interest. The allegorical and poetical subjects are carefully chosen, and show able drawing

and manipulative finish, great care having been taken also to mount and surround the numerous works in such a way as to display them to advantage. Altogether it may be said that this exhibit is the most artistic and graceful we have seen for some time past, its value being emphasised by the particularly inartistic inventions frequently seen elsewhere. The next worthy of note is 1,722, by Messrs. Hampton, who send a small but good corner cabinet of oak, combined library steps and easels, on which are displayed two studies of interior decoration; a rich tapestry curtain helps to set off a useful and pleasant example of sound work. Patent wood mosaic is shown by (1,726) Messrs. William and Frank Brown & Co., Eastgate-row, Chester; this is formed of small blocks of different coloured woods end-grain upwards; the disadvantage of this is that it scratches very readily and would require constant oiling or polishing where a decorative effect is required, and this effect is its *raison d'être*. No. 1,727 is a new method of inlaying wood, particularly crude and raw, line and colour being as unsatisfactory as may be; the exhibit generally being unworthy of even the small space occupied. The New Patents Development Association (Limited), 49, Gleggall-road, Old Kent-road, have a creditable show of an unusual kind; a description of many lines in the catalogue may be summarised as "wood carving by machinery." There is some bold work, which, although missing the sharpness and "go" of manual labour, reminds us of much that may be seen in many an old church or hall after it has passed through the hands of even the most careful of restorers,—that is to say, after it has been pickled to remove the disfiguring paint; some portions look like leather, but if used at a distance from the eye the effect might be fairly good. Some specimens of painters' brushes and brushes for technical and manufacturing purposes are arrayed by Mr. Edward Ormerod, of West Drayton, Uxbridge (1,731), Messrs. Hinde Brothers (1,732), Horsey's Brush Manufacturing Co. (Limited), and Mr. John Masters. After passing a miscellaneous collection of travelling trunks and varied wicker work, we come to an ordinary collection of floor-cloth and linoleum (1,747) by Messrs. Hendry, Whyte, & Strachan, of Kirkcaldy; next to this is the (1,748) well-known "Lincrusta-Walton," shown by the Lincrusta and General Decorating Co. (Limited). Attention is here claimed for two novelties,—a patent combination mantel-piece with a sliding hinged grate screen, and new designs in their Lincrusta, i.e., the parts are specially bold and large, suitable for a great expanse of wall surface. The example given is a chocolate and dead-green dado, with a wall surface above of blue with a gold or rather bronze stamping of a large type, and suggesting a Persian pattern. The chimney-piece is of fumigated oak, with horizontal and vertical panels in high relief, the relief being the greatest yet obtained in this material. The screen to the grate is hinged so as to fold back, and then slides behind the jamb. When in use, this screen (which consists of four bevelled mirrors in framing) serves to hide the grate, which may thus always contain a ready-laid fire, no small advantage in a variable climate. Messrs. Story Brothers & Co., of Lancaster (1,749) show a new fabric in lieu of paper for the decoration of walls: this is of the nature of a printed cotton, and could apparently be fixed like an ordinary wall-paper, and be washable.

The Royal Pavilion has again been furnished by Messrs. Gillow, which is a guarantee of its fitness. The vestibule in the Arab style maintains the usual strongly-marked features, a Louis XIV. drawing-room contains among other luxuries some panels and chair-coverings of tapestry from the Royal Windsor works, and some inlaid cabinets and tables which have never been surpassed. The "Adam" dining-room looks thin in treatment occasionally; more might have been done with the ceiling, a feature which the "Adelphi Brothers" were seldom un-mindful of.

This concludes one section, which is by no means well represented, and bears no comparison either in quantity or quality to that of a like class in last year's Exhibition, the reason we have given, viz., the space allotted, probably accounts for the absence of many well-known names which we might reasonably expect to see; or possibly it may have been supposed that furniture did not present many points of contact with the professed object of the Exhibition.

Illustrations.

SCULPTURE AT THE ROYAL ACADEMY

WE give this week illustrations of the two monumental statues which form pendants to each other, as may be said, at the east end of the lecture-room at the Royal Academy: the late Lord F. Cavendish, by Mr. Woolner, R.A., and the late Dean Close, by Mr. Armistead, R.A. Both, as will be observed, are based on the same simple and suitable idea, the sculptured representation of the subject of the statue, lying as in his last rest, covered with full drapery which shrouds while slightly indicating the figure beneath.

It is right to mention that Mr. Woolner is of opinion that the expression and feeling of his work are seriously altered and impaired, in its present position in the Academy rooms, by being placed in too full a light, for which it was not designed. Only those who have compared the effect of the same sculpture under different conditions of light can fully appreciate the importance of such a complaint.

CHURCH OF ST. JOHN THE BAPTIST, KENSINGTON.

WE give a view of the interior of this church, from a drawing kindly furnished to us by the architect, Mr. James Brooks. The church is now in course of erection in Holland-road. Like all Mr. Brooks's churches, it is characterised by great solidity and massiveness of treatment, ornament being very sparingly used. In this example, it will be observed that in the purely architectural portion of the work—apart from furniture and accessories—the only carved ornament is the dog-tooth enrichment which is used to accentuate the capitals and the vaulting ribs. It is not implied that well-designed and executed carving, even profusely introduced (if in the right place), is hurtful to architectural effect and dignity, but that architectural mass and weight are the primary elements of dignified effect, without which no decorative accessories will give dignity and high architectural character to a building, and with which ornament is only a secondary consideration. The example of avoiding littleness of detail and seeking monumental expression in the first instance, which Mr. Brooks has consistently set in a number of churches built from his designs, has, we believe, exercised a considerable effect on public taste, outside of the architectural profession.

Whether the form of mediæval church here shown is the best adapted to the feeling and to the practical requirements of modern worship, is another and much larger question, in which others besides architects are concerned, and which we do not go into here.

DRAWINGS OF WENLOCK PRIORY.

THREE drawings were submitted in competition for the Institute Silver Medal for measured drawings, and gained their author, Mr. T. J. Worthington, a Certificate of Honour. Mr. Worthington sends the following historical notes to accompany the drawings:—

"The beautiful ruins which are situated at Much Wenlock, in the County of Shropshire, are commonly known by the name of 'Wenlock Abbey.' This is a misnomer. It should be 'Wenlock Priory.' Wenlock, together with about thirty other religious houses, belonged to a class of priories owing allegiance to the great Burgundian Abbey of Cluny (now itself a complete ruin), situated about 50 miles north of Lyons. The order of Cluny, founded at the beginning of the tenth century, was originally Benedictine. Though thus in rank but a priory, and subject to a rigid and extortionate control, Wenlock was the oldest and most privileged, perhaps the wealthiest, of the religious houses of Shropshire.

First Foundation.—The first foundation was by St. Milburga, granddaughter of Penda, King of Mercia, at the end of the seventh century, circa 680 A.D. This building was, however, destroyed about 874 by the Danes, who were then conquering Mercia.

Second Foundation.—The second foundation was by Leofric, Earl of Mercia, who revived memories of the life and death of St. Milburga. His work was accomplished between 1017 and 1035, in the reign of Canute, as recorded in the Domesday Book.

Third Foundation.—The third foundation was

about 1080, portions of which structure yet remain. Roger de Montgomery, a Norman, was in 1071 presented with the Earldom of Salop. The new Earl, between 1071 and 1086, rebuilt or restored the church of St. Milburga, at Wenlock. The year 1080 has been assigned as the specific year of this foundation of the Norman Earl, and with much probability, for Wenlock Priory was a younger house than Lewes, which was originated in 1077-8, and older than Shrewsbury, which was first designed in 1083. Of Earl Roger's charter nothing is known to exist. The particulars must be gathered from the Domesday Book, from which we learn that six years after its alleged foundation, i.e., in 1086, the monks of Wenlock were possessed of nearly all that had been owned by the church of St. Milburga, in the Confessor's days.

It was during the eleventh, twelfth, thirteenth, fourteenth, and fifteenth centuries that the Priory flourished, and to the eleventh and twelfth we may ascribe the beautiful and rich Norman architecture still to be seen in the rectangular chapter house, and traceable in the boss-covered bases of the choir piers. The nave, transepts, and tower were probably constructed at the beginning of the thirteenth century, and the Lady Chapel and the greater portion of the Prior's Lodge (now the residence of Mr. Charles Milnes Gaskell) at the beginning of the fifteenth century.

Wenlock Priory is one of the most picturesque ruins in the country, though the ruder portions of the original structure no longer exists, having gradually been quarried away during the last few centuries. Indeed, only delicate details can now be seen in the walls of the rectory of Much Wenlock, situated out half a mile from the Priory. The three walls of the south transept, the east wall of the north transept, the south-west portion of the nave, the rectangular chapter house, and the north and west walls of the choir, alone rise high above the ground to testify to the beauty and grandeur of this immense mediæval church. Traces can be seen of the whole of the choir and most of the nave, though the thick growing grass and vegetation greatly obscures the same.*

VILLA, GAINSBOROUGH GARDENS, HAMPSTEAD.

This villa, as shown by our illustration, is being erected and is nearly completed. It is situated near Well Walk, and adjoins the bath at Hampstead. Being on high ground commands an excellent view of the Heath one direction, and of London (in the distance) in another.

It has four floors, and contains the usual accommodation of a gentleman's residence of moderate size, having a tolerably large hall and staircase in the centre. It has also colonnades arranged at the east and south fronts, overhanging roofs, on purpose for the stables. Stables are also erected, as shown, in a rear.

The lower part of the walls and the chimneys are all executed in the best red brick of a dark pur. The upper parts of the walls are tiled with ornamental tiles, the proper effect of which, however, is not quite afforded by the view here given, being in bands of plain and ornamental tile-work. The millions and eels (where the latter are needed) are all best red Mansfield stone. Most of the ornamental joiner's work is of pitch pine. The floors are covered with Brosely tiles.

The exact cost of the building is not known at present, the work being done without a tract, but it is considered it will be about £100, including stables.

The villa is being erected for Mr. T. Clifford, under the designs and under the superintendence of Mr. Henry S. Legg, architect, of Christ's Hospital, London.

A large new Clock has just been erected at Asham Bois Church, Buckinghamshire, by Messrs. John Smith & Sons, Midland Steam Works, Derby. It is fitted with all the latest improvements brought out by this, and is guaranteed not to vary more than one second a month. The same firm are erecting large clocks with chiming machinery at Beaconsfield Church and for Winslow in the same county.

ROMAN REMAINS IN ALGERIA. ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The eleventh ordinary meeting of this Institute took place on Monday last, Mr. Ewan Christian, President, in the chair.

Mr. W. H. White (the Secretary) announced that the Institute had lost an Hon. Associate by the death of Sir Watkin Wynon.

Mr. Alexander Graham, Fellow, then read a paper entitled "The Roman Occupation of North Africa, with special reference to the Remains in Algeria." The following is an abstract:—

The author referred to this country as offering a great field for antiquarian research, from primitive times down to the Arab occupation, and to the great value of the numerous inscriptions, affording abundant material for a history of North Africa. Old writers do not furnish much reliable information about the towns, either Phœnician or Roman; but eighteenth-century travellers throw great light on the whole subject. Our indebtedness, as architects, is greater to Bruce than to any other explorer, on account of his careful drawings of some of the principal monuments, and his critical notes. The author then alluded to illustrated and other works by French travellers, and their general excellence, and then proceeded to explain the boundaries of the country known to the Romans as North Africa at the close of the third Punic war, showing how it was divided and what races inhabited it. The rise and progress of the Carthaginians were then traced to their final subjection to Rome, reference being made to the apparent absence of any influence exercised by Carthaginian over Roman art. The spread of the Roman colony was then traced from the sea to the desert, as evidenced by inscribed stones that strew the surface in every direction, sometimes where least expected. These stones form the real history of the country. There is a difficulty in assigning a precise date to some of the principal monuments on account of the fragmentary condition of inscriptions, but the reign of Severus may be credited with the largest number; a remark followed by an extract from M. Choisy's work entitled "L'Art de bâtir chez les Romains," explaining how the building art under the Empire made rapid advances, while Classic architecture, as an art, was declining. The author then referred to a map, showing all the principal towns in the colony of North Africa in the age of the Antonines, supplemented by a tabulated list of the principal cities, distinguishing the *colonia* from the *municipia*. Then starting from the eastern frontier of Algeria, that corresponded very nearly with the old boundary between Numidia and Africa proper, he tracked the Romans along the coast, and then into the plains to the slopes of the Aurès down to the military posts in the great Desert. Passing by Hippone, which has little left to interest us except as the scene of the labours of the good St. Augustin, the author touched at *Rusicada*, a place of considerable importance, judging from the numerous remains found there, drawings of the most important being exhibited on the wall. Then passing *Saldæ* and *Iconium* with slight reference, he gave a full account of *Julia Casarea*, the capital of Juba II., saying a few words about this remarkable man and all that he did to beautify the city of his choice. The author then alluded to *Tipsasa*, and gave a brief description of the few Roman remains to be found farther westward.* Returning by *Sitiffs*, in the plains, the author described the principal monuments at *Cicululum*, and then gave a full account of the remarkable mosaics discovered at Oned Alghenia, giving a little insight into the country life and habits of the Romans in the fourth and fifth centuries, and showing, by reference to inscriptions, how much encouragement was given by the emperors to the breeding and training of Numidian horses for the circus at Rome. A few words sufficed for a description of *Cirta*, the remains of the great Roman bridge there over the Roumel, and the tombs of *Præcilius* the silversmith, and of the family of *Lollius*. Then passing southward by the ruined monument known as *Es-Soumah*, the author described the principal remains of *Tiblis* and of the important town of *Calama*, referring also to the sites of *Khamisa* and *Medauri*, which, as yet, have

only been partly explored. Journeying southward a full description was given of the remarkable city of *Lambesis*, with its forty triumphal arches, its great establishment for an entire military legion, and of the many objects of interest still to be seen in the Museum there. Passing by *Verceduna*, the author gave an account of the ancient *Thamusas*, at the foot of the Aurès, describing the beauty of its situation and the striking character of some of the monuments, referring to the city as the Pompeii of North Africa. Continuing along the northern slopes of the mountains, the author gave a brief history of the ancient *Theveste*, its remarkable quadrifrontal arch, its little temple of Minerva and the ruined basilica of *Vespasian's* time that had been converted in the sixth century into a Christian Church. Passing over the Aurès the author completed his account of the Roman occupation of this part of the country by referring to the military posts far down in the desert. The value of these monumental remains was then considered; the author endeavouring to show that, although the triumphal arch, the great *Therma*, the basilica, and even the colonnade of the Roman are now no longer needed, yet the spirit that prompted these works is with us still, evidenced in a measure by our language, our literature, our laws, and even our festivals and calendar, concluding with a remark that, as citizens as well as architects, a study of the works of the Romans was of value as well as of exceeding interest.

The Chairman, in inviting discussion, remarked that Mr. Graham had brought before the Institute a fresh subject of considerable interest, illustrated by a series of drawings, which showed extraordinary industry, and were such as were rarely seen upon the walls.

Professor Hayter Lewis proposed a vote of thanks to Mr. Graham for his extremely interesting lecture, and magnificent series of illustrations. North Africa might be described as almost an unknown land, although it was within twenty-four hours' sail of Marseilles. Colonel Playfair, in his well known book dealing with the country, had given scarcely any plans, so that many of the drawings exhibited by Mr. Graham were of considerable interest, notably those of the mosaic which gave the façade of a Roman house. Every architect and archaeologist was very much puzzled and disappointed at finding that even in the great cities of the Phœnicians and Carthaginians, they got scarcely any Phœnician or Carthaginian remains. Mr. Davis, the British Consul, made some years ago at Carthage a series of excavations, with the view of unearthing old Carthage. In doing so he came upon a large number of mosaics, some of which were now in the British Museum. Mr. Davis believed that several of these mosaics were really Carthaginian, but he was entirely alone in that opinion; all the French and other archaeologists being of opinion that they were Roman, and possibly old Roman work. Even in the home of Carthage, at Tyre itself, large excavations were made some years ago by M. Renan, when the conclusion was arrived at that it was hopeless to recover the remains of the old Phœnician work there, because it had been buried under the *débris* of centuries. They would have had to search for it through the Mahometan, Roman, and Greek buildings, so that there was hardly any chance of recovering a large Phœnician work. Thus, at present, one's knowledge of Phœnician work amounted to little more than the knowledge of a few ornaments. At the same time they could well imagine that the Phœnician work must have been very grand, because Solomon, in his greatest work, employed a Phœnician architect, although he was connected in every possible way with Egypt, a well-known artistic land. Some extraordinary work was to be found in North Africa, dating before the time of the Romans; he alluded to the large Mausoleum of Medrasen, and to another termed the Tomb of the Christian Lady. If such works were met with in Etruria or Italy, they would be put down as Etruscan; while if met with on the West Coast of Asia Minor, they would be styled Pelagic. Then they came to the Roman works, and it was unnecessary to say anything about these, as the drawings spoke for themselves. He could not help, however, referring to the enormous extent to which Roman work was propagated in a comparatively small space of time over a large area. In any country of the old world Roman work was to be found, and work of a very

* Allusion was then made to the marble quarries of Numidia, and a brief account given of the principal marbles of North Africa, still to be obtained in large blocks and at a reasonable price.

peculiar kind, because, although the Romans used almost every form, they so altered it that no matter where it was met with, it had the stamp of the Romans upon it. He had found a very curious illustration of this a few months back in Greece. It had been generally supposed, until quite recently, that the circular temples, such as that of Tivoli, were pure Roman inventions copied from the Etruscan. This was not the case, however, for in Greece there had been found an exact copy, or rather original, of that form of temple. With the exception of the amphitheatre, he believed that every form used by the Romans was copied or adapted from the Greek, but was so altered and nationalised that in no part of the world could it be mistaken for anything but Roman work.

Mr. J. T. Wood, in seconding the vote of thanks, agreed with a great deal Prof. Hayter Lewis had said. He considered that the plans of Roman public buildings were worthy of the most careful study.

Mr. F. W. Percival agreed with Mr. Graham that the whole north coast of Africa offered a wonderful field for the study of Roman architecture. He was very much struck, in travelling in those parts, by the wonderful wealth of marbles. Over the whole of Tunisia the most marvellous variety of marbles was to be found, which might be made use of in the present day. The city of Kairwan, for instance, was a perfect museum of beautiful marbles. When the mosque there was built, the Roman cities in the neighbourhood had fallen into decay; the most beautiful marbles were therefore brought to the mosque, the remainder being built into the walls of the city and utilised as seats for the people. With regard to inscriptions, in every part of North Africa it was only necessary to excavate to arrive at a perfect treasure-house of inscriptions.

The vote of thanks was then carried by acclamation.

Mr. Graham, in replying, remarked that with regard to the Christian Basilicas, when he said that as far back as 328 their form was that of a cross with a cupola, he should rather have said it was that of a cross, the church itself at a later period being covered with a cupola. Referring to the tombs of Medrassen and of the Christian Lady, he had not mentioned these on account of the time at his disposal. He had, however, restored drawings of these tombs, which he had measured, besides some notes which he had made especially referring to the Medrassen, which was some two centuries earlier than the other. Professor Hayter Lewis, he believed, some years ago communicated a paper to the Institute on the subject of one of these tombs, and he would like to supplement the Professor's remarks by his own, which he would be happy to place at the disposal of the Institute. He would have liked to say a good deal about the Numidian marbles, having lately visited the great quarries, from which the Romans obtained their finest specimens. The quarries were extensive, the blocks of marble enormous, and the coloring very beautiful. These quarries were worked by a powerful Belgian Company, the manager of which informed him that it was contemplated to open a depot in London. At the meeting of the British Association this autumn, a valuable and exhaustive paper on the subject of Numidian marbles generally, would be read by Col. Playfair, and he hoped the Institute would have some one there to take notes for them. Mr. Percival had referred to Tunisia, many of the cities of which he (the speaker) hoped yet to visit, and to continue his observations as far as the borders of Cyrene. He wished that some of the members of the Institute would interest themselves in the matter. In a subject of this kind there was a wealth of intellectual delight, though the amount of reading requisite for a proper grasp of it was very great. Nothing could be more interesting than Roman history, and any one who would go a little out of the track,—which he must do,—would be well rewarded by what he saw and learned. If it should not be his good fortune to continue this first series of notes, he hoped it would be the good fortune of some one else to do so.

Westward Ho!—A new pulpit has been dedicated at Westward Ho! Church. It is octagonal on plan, and has been made by Mr. Harry Hems, of Exeter.

THE OLD WALL AT BLACKFRIARS.

ANOTHER, being the lower, portion of the old wall in Little Bridge-street has just been laid bare by the demolition, to its foundations, of the Cockin St. Martin's (or Cock) court, Ludgate-hill. That tavern stood at the south-western angle of the street and the court was named. The wall is now again visible to a depth of some 12 ft. or 14 ft. below the road surface at a spot over against Evangelist-court and a little northwards of Dolphin-court. Along the northern side of Pilgrim-street may be seen the continuation of the wall between its modern brick facing and the cheesemonger's shop, whereof the cellar rests against it, that stands opposite to the site of the Cock. In March, 1882, was pulled down so much of this wall as closed the roadway of Little Bridge-street into a narrow passage at its eastern and higher end. Our readers will perhaps remember the curious opening, with a recess for the deposit of burdens, cut through the wall; which opening communicated between St. Martin's-court and the Broadway opposite to the Blue Last beyond.

The Roman wall lay further eastwards, as is clear if only from the discovery in that direction of certain contemporary graves, which by the law must have been extramural. And this Blackfriars wall is not, as is commonly supposed, an actual relic of even the later wall that here, crowning the steep declivity at whose base ran the turbulent Fleet, protected London on the west. It is the wall which the Friars Dominican set up on their removal hither from Holborn, by Lincoln's Inn, temp. Edward I. The Black or Preaching Friars owed this their new settlement in Castle Baynard Ward to Gregory de Rokessli, mayor, a good friend to the Black and the Grey Friars alike. Another warm patron was Robert Kilwarby, archbishop of Canterbury, who contributed largely to the building of their monastery and church,—the latter conspicuous among the few fine churches of which London could then boast. They found high favour also with Queen Eleanor and her royal consort. The king, indeed, supplemented the gift to them of the ancient Montfitchett Tower for building material, by granting them a charter to demolish the existing London wall and to reconstruct it so as to include the new sacred precincts. For this work it is evident that the Friars used the original masonry. Thus it came about that the wall which until then ran due south between the Old Bailey and St. Martin's, Ludgate, to the Thames, turned westwards down the now Pilgrim and Little Bridge streets, and thence made a return southwards to the riverside at a spot between Water (antique Blackfriars) lane and the Fleet's mouth. After the fire at Ludgate-hill, 1792, a watch-tower was discovered, May 1st of that year, on the wall in this quarter. This barbaric, or burgh-kenning, stood about half the way down Little Bridge-street, say by the southern end of Dolphin-court. (See J. T. Smith's view, and that in Hone's "Every-day Book," vol. ii., columns 629, 630.) We find the tower's site marked in a plan by Hollar. We may add that a magnificent fragment of the London wall was unearthed three or four weeks since. It lies between the Church of Allhallows on the Wall and the corner of Blomfield-street,—formerly Brokers'-row,—and rested upon a level nearly 20 ft. below the neighbouring "made ground." Fresh buildings will soon conceal it from view.

ARCHITECTURAL ASSOCIATION. EXCURSION TO TILBURY.

The eighth Saturday afternoon visit this year by the members of this Association was to Tilbury, and took place on the 16th instant. The members assembled at Fenchurch-street Railway Station, and on arriving at Tilbury Station they first visited the new Tilbury Dock Hotel, where they were received by Mr. E. A. Grüning, the architect of the building, about three p.m. The hotel is now in course of construction, and Mr. Grüning explained the working drawings and the building. The contract has been undertaken by Messrs. Perry & Co., of Treadler Works, Bow, and it is estimated, the structure will cost about 35,000*l.*, exclusive of the foundations and basement. Mr. W. H. Perry is acting as clerk of the works. Owing to the nature of the site and soil, the hotel is erected on sheet piling. The piles are 14 in. square, and are driven to an average depth of 60 ft.

into the ground. Upon this piling the walls are built of stock bricks, with Fareham brick facings, but above the basement the walls are all of timber construction, and (externally) faced with plain and ornamental tiles by Doulton; this bearing lighter upon the foundations than brick construction. The basement consists of kitchens, and cellars, and lifts, the lifts are by Simpson. The ground-floor contains a large entrance-hall, which passes through the hotel due north and south; on the left are a reading-room, luncheon-room, and spacious bar; on the right are a large coffee-room, 86 ft. by 30 ft., exclusive of circular bay; serving-room, billiard-room, and principal staircase constructed of oak, 16 ft. wide; also three other staircases and offices. There are four floors above the ground-floor, besides attics, containing about ninety-eight bedrooms, with reception-rooms in addition. The iron girders and columns are by Messrs. Moreland, of Old-street, London, and the parquetry flooring is by Arrowsmith.

The party then visited the Tilbury Docks, which are in course of construction pursuant to an Act of Parliament obtained by the East and West India Dock Company upwards of three years ago (as noticed in the *Builder*, April 6th, 1882). The total area of the site of the docks is upwards of 500 acres, and is situated to the west of Old Tilbury Fort, by Gravesend Reach, and immediately facing the town of Gravesend. The main dock is 600 ft. wide, and is constructed on the plan adopted by the Mersey Dock Board at Liverpool, giving a maximum amount of lineal quay space, with a minimum amount of water space. The branch docks are each 1,000 ft. long by 300 ft. wide. The tidal basin is 17 acres in extent. The hydraulic engine-house is fitted with engines by Armstrong, which throw 640 tons of water per minute. The engineers are Messrs. Manning & Baines, and the present contractor are Messrs. Lucas & Aird. In the *Builder* for July 15th, 1882, and August 4th, 1883, will be found some further particulars of these very extensive works. Having explored the works the majority of the members returned to town by the 5 p.m. train, but several of them proceeded to view Old Tilbury Fort, and returned by the following train.

THE EAST LONDON INDUSTRIAL EXHIBITION.

WHITECHAPEL and South Kensington have at this season, a point in common. Each quarter has its own Industrial Exhibition "inaugurated" by royalty and enjoying aristocratic favour, for, in the Drill Hall, Whitechapel-road, will be found stalls conspicuous with the names of the Marchioness of Ripon, the Countess of Rosslyn, the Lady Edith Ashley, and other titled ladies, many of whom are actually in attendance to explain or to see the miscellaneous objects with which they are surrounded. The highest credit is, of course due to these ladies, who are thus devoting three precious weeks of the London season to the encouragement (as they deem it) of the industries of the East end. At the same time we think such support, which must savour of patronage, ought to be unnecessary, and that with management, careful but energetic, genuine East-end exhibition, representing what are really the distinctive industrial products of the quarter, would best promote the interests of the working classes if it were allowed to stand on its own bottom. The managers, however, would have to exercise a good deal of discrimination than seems to have been employed on the present occasion, when everything appears to have been accepted, and, might be expected, no classification of objects has been possible. The exhibition is chaotic and the catalogue bewildering. There may be—concealed in odd corners or overwhelmed with rubbish,—some rare specimens of art or inventive genius, but the general impression left upon the mind of the visitor is that of heterogeneous collection of stuffed birds, patent work counterpanes, and woolwork flowers, feebly and wonderfully made. A plaster exhibit what he terms "the model of a College made of Berlin wool, and somewhat resembling a Chinese joss-house. The grass around the building is intensely green and the industrial modeller has, with unconscious irony, written above it,—"Will last as long as most houses." Dr. Barnardo's boys are to be seen at White-

upon boots and shoes and firewood, and East-end philanthropy generally is well advertised. Day & Martin have a stall where the blacking sold is a contribution to the prize fund; and, marking, perhaps, the advance of civilisation,—no little space has been assigned to the tooth-powder of a local dentist.

The managers have recognised the fact (and the recognition is most important) that "boredom is the curse of the East End," and that, as at Kensington so also at Whitechapel, provision must be made for the mere lounge. In our visit we noticed a good many of all ages turning over the leaves of scrap-books which had been furnished for their amusement, or gazing at the curiosities lent by Mr. Jamrach. At intervals music of various kinds is performed and always secures approval,—in fact, the ear seems to have been better cultivated than the eye, for if the discord in colour which prevails were expressed in sounds there would be a general chorus of dissatisfaction.

But with all its shortcomings this East-end Exhibition has much to commend it, and will, we hope, be the precursor of something worthier of its name and less dependent upon the well-meant patronage of aristocratic stall-holders.

SCIENCE AND ART IN BUILDING.

LIVERPOOL ARCHITECTURAL AND ENGINEERING SOCIETIES.

THE following is an abstract of the paper read at the joint meeting of the above-named societies on the 13th inst. by Mr. Goldstraw.—The paper referred to the connection of science with building as "the application of exact knowledge of the nature of materials, and of the principles of mechanics to the planning and construction of buildings with a view to their safe and convenient use," whilst the connexion of art with buildings was said to be "the exercise of taste and skill in both design and execution for the purpose of producing a beautiful effect in the structure." Thus regarded, science and art, or utility and beauty, ought to be amalgamated in building work without neutralising each other; and the balancing of the two was the problem which every designer of buildings should endeavour to solve. For examples of this happy union reference was made to the dome of St. Paul's, the steeple of Bow Church, the Vienna Exhibition, and the arched vault over St. George's Hall. As instances where science had excluded art, mention was made of the Britannia Tubular Bridge and the new Tay Bridge. The man whose chief business it is to apply science to buildings is an engineer; but the architect must cultivate science and art together. The distinction between the two professions is very much an arbitrary one. Neither engineers nor architects have any exclusive right to the work of designing buildings and such like structures. There is no line of demarcation between the two professions. But there is a bond of union in the nature of their common pursuits.

ASSOCIATION OF

MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.

THE Midland Counties' District of the above association had a meeting at Nottingham on Saturday last. The President, Mr. W. G. Laws, of Newcastle-on-Tyne, occupied the chair, and about thirty members were present.

Mr. George Winship, the Borough Surveyor of Abingdon, read a paper on "Some of the advantages and Results of the Supply of Water by Meters." He affirmed that the meter system effects a great saving in the quantity of water consumed, and tends to equalise its cost, whilst water-rates often fall very unevenly upon occupiers of property in a district. The cost of meters need not be taken into account, as directly a meter was attached to a service, payment at the rate of 10 per cent. began, and it was not essential that a large stock should be kept on hand. The cost of inspection under the meter system was also greatly reduced, because it was necessary to inspect fittings for the purpose of detecting waste. At Abingdon, under the meter system, the consumption of water was gallons per head; but if it were 15 gallons, very ordinary quantity, 90,000 gallons of wasted water would flow into the sewers, and here it was necessary to pump this to a sewage

farm, a heavy, unnecessary cost would be entailed on the ratepayers. Besides, a still more important saving would be effected, as only about one half of the land generally calculated to receive the sewage would be required. He did not wish to go into the question of the kind of meter best suited for registering small flows of water, but at Abingdon he had found Taylor's meter satisfactorily met all requirements. Consumers at Abingdon appeared thoroughly satisfied with the meter system as a basis of charge, and he had similar testimony from Malvern, where it had also effected the desired object, the prevention of waste, whilst the sanitary state of the town was second to none.

Mr. A. Brown, Borough Engineer of Nottingham, also read a paper describing five years' municipal work in that borough. He first dealt with the great extension of building, consequent on the rapid and progressive increase of the population, and then gave details of the roads and streets. There were altogether 146 miles, of which one and a quarter was paved with wood, and fifty were at present private property, but would be taken to by the Corporation almost immediately. He expressed himself strongly in favour of new streets being executed by the Corporation, as it secured uniformity, and the one fault was the strain and responsibility it threw on the borough engineer and his staff. The amount spent on private improvements in Nottingham during the last five years had been 210,000. Nothing equalled beech-wood pavement, which cost 14s. per square yard, but it should always be laid on a thoroughly good concrete foundation. He then alluded to Nottingham having the reputation of having originated asphaltic footpaths and asphaltic macadam roads, and described some laid by Mr. Thomas Smart, in the London-road, about 1840. Then he gave details of asphalt, of which an area equal to 20 acres had been laid down in Nottingham, within the last five years, at a cost of 1s. 4½d. per superficial yard. He next described the Back Valley sewer, executed to save the district from periodical flooding. It cost 40,000l., and was carried under Sneinton Hill, the cemetery, and the Midland Railway, direct to the Trent. Mr. Brown next described the mode of dealing with the sewage by the pail system, which was introduced into the borough about twelve years ago by the late Mr. Williams. There are now 21,155 pails in use, and whilst in 1881 the number charged was 1,294,860, in 1884 it was 2,240,899, an increase in four years of 73 per cent. In 1884 there were 40,000 tons of matter brought in pails, and the sales amounted to 75,000 tons, including ash-pits and privies, and produced 7,145l., about 1s. 6d. per ton. About 6,000 tons of dry material were carted to Fryer's destructor and burned. The destructors did their work thoroughly and well, and he had not seen anything that answered the purpose better. The pail system was an undoubted advance upon the old midden system, but that it is a perfect system could not be maintained. Having described the Lenton and Gregory boulevards, and the Radford boulevard, the principal new streets, Mr. Brown summarised the expenditure of five years as 667,000l.

In the subsequent discussion on these papers, Mr. Pritchard (Birmingham) admitted that meters would naturally curtail the consumption of water, but it was very undesirable on sanitary grounds to restrict the supply of water to houses. Waste could be quite as effectually prevented by house-to-house inspection and other means as by meters.

Mr. Gordon (Leicester) also held that to restrict the water supply for household purposes by anything like a charge according to the quantity of water consumed, was altogether wrong in principle. It was a retrograde step to advocate meters being used for any such purpose; and the cost would fall still heavier on the lower classes, who ought rather to be encouraged to use water freely for baths and other sanitary purposes.

Mr. Fowler (Manchester), Mr. F. Carter (Leicester), Mr. Comber (Kidderminster), and the President expressed similar views.

Mr. Godfrey (Leicester) opened the discussion on Mr. Brown's paper, and spoke in commendation of everything they had seen, except the pail system of dealing with the refuse. He admitted that it was well managed, but, though they had the pail system partially in use in Leicester, he must, as a member of that Association, denounce the system as wrong in principle from beginning to end. The mixture of

light ashes with the contents of the pails, done in Nottingham by lifting the seats, helped to prevent the decomposition of the matter, but in the majority of towns it was left until it was in a condition highly dangerous to the health of the people using the pails.

The discussion was continued by Mr. Lohley (Hansley), Alderman Ford (Nottingham), and other gentlemen.

BUILDING IN PRIVATE AREAS.

THE METROPOLITAN BOARD OF WORKS v. MOWLEM AND CO.

AT the Westminster Police-court, the above defendants appeared before Mr. D'Eyncourt to answer four adjourned summonses,—first, for laying out a road, passage, or way as a street without the consent of the Board; secondly, for laying out a footway of less width than 20 ft.; thirdly, for forming the same without being open at both ends; and fourthly, for building without giving direct communication between two streets.

Mr. D'Eyncourt now gave judgment. Having stated the facts, which appeared in our issue of the 9th inst. [p. 672], he said that he was of the opinion that the place was not a "street" within the meaning of the Metropolitan Local Management Act, nor a "new street" within the scope of that Act. No doubt the widest interpretation could fairly be assigned to the meaning of the word "street" in the various Acts; it included any footway, lane, square, court, alley, &c., whether a thoroughfare or not. Still, it appeared, in his judgment, that the right of public use was always contemplated. In this case the owners reserved the right of excluding the public at night, and they would also light and pave the place. He could not see why it should be held to be a "street," because it was not covered over. In the case of Lord Auckland v. the Westminster Board of Works, a case cited and relied upon by counsel for the defendants, old buildings had been pulled down (as in this case) and new ones erected, and it was decided that the Metropolitan Board of Works could not call upon the builder to comply with the requirements as to new streets, but must proceed in another way, first giving compensation to the owner for any change. In the present case great care had been taken to avoid a dedication to the public. He dismissed all the summonses, and allowed ten guineas costs.

Notice of appeal was given on behalf of the Metropolitan Board of Works.

CASES UNDER THE METROPOLITAN BUILDING ACT.

SOFT BRICKS IN EXTERNAL WALLS.

THIS case, heard before Mr. De Ruten at the Marylebone Police Court, raised a point under the Metropolitan Management and Building Acts Amendment Act, 1878. The District Surveyor for St. Pancras North (Mr. Alfred Bovill) applied for a penalty against Mr. R. L. Fedrich, builder, for having used in the construction of the external walls of two houses in Estelle-road, Gospel Oak, bricks which were not good, hard, sound, well-burned bricks, as required by the By-laws of the Metropolitan Board of Works.

The summons was first heard on the 22nd of April, the evidence of the District Surveyor being that the bricks used in the internal parts of the external walls of the houses in question, samples of which he produced, were not such as were required by the By-law.

In support of his case, defendant's counsel called Mr. H. H. Bridgman, architect, who stated that the bricks used and complained of by the District Surveyor were good, hard, sound, well-burned bricks. The bricklayer engaged in executing the work also gave evidence to the same effect. The Magistrate desired to have further evidence, and adjourned the case for that purpose, and on the adjourned hearing (April 29th), Mr. F. Wallen, District Surveyor for St. Pancras West, and Mr. F. Hammond, District Surveyor for North-West Islington, gave evidence in support of the complainant's contention.

The defendant called, in further support of his case, Mr. Francis Chambers, who stated that he had a large experience in building, and was a Fellow of the Royal Institute of British Architects, and one of the Examiners appointed by the Institute for the qualifying examination for the appointment of District Surveyor. He had inspected the buildings and found them built of good bricks. The work of the three samples produced was such as he would accept as acting for a ground landlord, but not such as he would permit to be used for a private client.

In answer to the Magistrate, Mr. Chambers stated he should object to the brick in question for the latter purpose on account of its appearance.

Mr. H. H. Bridgman, re-called, said that he considered that the worst of the three bricks produced satisfied the By-law.

Evidence to the same effect was given by Mr. Wright, and by an assistant to Messrs. Drivers, surveyors to the freholder.

The Magistrate again adjourned the case in order

to enable him to inspect the buildings. On the 30th of April, the Magistrate made an examination of the work, accompanied by the District Surveyor, and (on the part of the defendants) by Mr. H. H. Bridgman.

On the 4th inst. the Magistrate stated that having heard the evidence on both sides, and himself examined the buildings, and also, since, the number of bricks, he came to the conclusion that the complaint of the District Surveyor was well founded, but he considered the better plan to adopt was to give the builder time to amend the work, rather than impose a penalty.

The case was, therefore, further adjourned for twenty-eight days.

FEEES FOR GREENHOUSES.

On April 21st, at Lambeth Police, before Mr. Chance, Mr. George Elkington, District Surveyor of Peuge, summoned Mr. E. B. Haynes, nurseryman, of Beckenham-road, Peuge, for H. District Surveyor's fee due in respect of a greenhouse erected by the latter.

The plaintiff proved that the defendant had recently erected a greenhouse, 22 ft. 6 in. long, 12 ft. wide, and 5 ft. 3 in. in height to eaves, the lower part enclosed to the height of 3 ft., with brickwork, the upper part consisting of the usual sashes, &c. The building was about 12 ft. distant from the road, but within 10 ft. there were other similar greenhouses. He had tried to obtain notice from the defendant, who denied his authority. Failing to obtain notice he sent in his claim for fee as the structure was, in his opinion, in conformity with the Building Act. He now quoted numerous cases in which magistrates had held that greenhouses were buildings.

The defendant, in the course of a long argument, contended that the structure in question was exempt, as it was used for the purpose of his trade, and under his lease he could remove it, and also that it was exempt by its construction and by distance, as it was more than 30 ft. distant from other buildings except greenhouses.

The learned Magistrate having intimated that he was so far in favour of the plaintiff, the case was adjourned at the request of the defendant until the 14th of May.

At the adjourned hearing, the District Surveyor was represented by Mr. Milner Jutsum, solicitor. Mr. Chance, after hearing further arguments, decided that the structure in question was a building within the terms of the Act. He, therefore, made an order upon the defendant to pay the amount claimed, and allowed one guinea costs.

THE REFORM OF THE INSTITUTE.

SIR.—As several friends have again written me to inquire the manner in which I propose federating the members of the profession, I find it more convenient to write one instead of many letters, and shall feel, therefore, obliged if you will insert this reply. I have taken, and still take, the Law Society as my model. We all know that before a lawyer can practise he must be articulated and pass an examination (serving articles I would not press; if the candidate on examination proves he is competent, I would not inquire of the channel through which the knowledge came to him); he can then, by paying an annual tax, practise, and, whether he belongs to any association or not, he is bound by the rules of the Law Society. In the provinces associations are formed for convenience, professional questions are discussed, papers are read, and the proceedings resemble those at the central association. At the annual meeting of the Law Society, all members of the profession may attend. If they are members of the Law Institution, they have the privilege not only of voting, but of using both library and club (a club should be attached to our Institute, and would prove a commercial success). It is usual to elect prominent provincial members on the council of the central body, and all must be loyal to it. The new Charter should cover all existing architectural associations. Some may demur to this, as it might be a recognition of doubtful merit in some cases; but this done, and the stream kept pure by examination, time would purify the original body. Can anything be more simple? There would be a gain all round, and no sacrifice of independence. And as to federation, unless the Institute stultifies itself it cannot ignore it, since it has admitted the principle by electing leading men from the provinces, and notably the President of the Architectural Association. I press this question of examination and federation upon the profession earnestly, in view of the torrent of draughtsmen that will be let out upon us by the technical schools and the

Board schools. That is the day of reckoning with which we shall be shortly confronted, and although "too late" is a fashionable policy just now, it is far better for ourselves, and it will be better for the public, if we at once federate, organise, and close the door.

TUOS. E. KNIGHTLEY.

CHELSEA VESTRY-HALL COMPETITION.

SIR.—In last week's issue of the *Builder* [p. 705] you imply that the retiring-rooms at the end of the hall in our design have been added since the plans were sent in, to supply a deficiency in the original plan. Will you allow us to say that the published plan shows the arrangements submitted on the competition drawings, and that no alterations whatsoever have been made since the design was sent in? The retiring-rooms were shown in two ways,—in one placed in the basement under the end of the Vestry-hall, approached by stairs in the corners of the hall, and in the other placed on the ground-floor, shown upon a flap as an alternative arrangement. This may have been folded back when the drawings were examined for your report, and the arrangements thus overlooked, but how the first arrangement was lost sight of we cannot quite understand.

As your remarks may lead some people to suppose that either we had friends at court, or a special favour conferred upon us, and thus obtained an undue advantage over the other competitors, we shall be glad if you will kindly spare the space for this in your next issue. ARTHUR H. NEWMAN.

* Our remark referred only to the plan we published, which certainly left on us (and on others who were present) the impression of having no proper access to the stage end of the hall.

MIXING PORTLAND CEMENT WITH LIME MORTAR.

SIR.—A few weeks since (*Builder*, p. 567, ante) I reply to a correspondent I gave my experience of the above. I forget your correspondent's name, and the initial letter which I subscribed to my reply; but I wish to draw his and your readers' attention to the following extract from the second edition of the book of Mr. Thorold Rogers, M.P., on "Ensilage" and the construction of Silos. He says, pp. 99-100, after describing lime concrete in the proportion of one part of lime to seven parts of other materials (sand and gravel).—"The addition of one-fourth cement (meaning Portland or similar cement), the lime being reduced to three-fourths of one part, and the cement being added after the mortar is mixed, makes a much quicker setting and harder concrete." This corroborates my experience, as given in my letter to you above referred to, both as to the *modus operandi* as applied to mortar, and as to the result; the only difference being that I ganged the cement with sand and water before mixing it with the lime mortar.

THE ASHPITEL PRIZE.

SIR.—A letter from "A. B. C." in your last issue [p. 708] calls attention to the fact that the Ashpitel Prize has been withheld for two years; further, that the prize was instituted about 1873.

Now the first Voluntary Architectural Examination took place in 1862; would it not be a gracious act on the part of the Council of the Institute to make the reward retrospective, and to give the two prizes not awarded to those candidates who passed the most successfully in past years? A precedent for this would be found in the case of the Pugin students who this year had medals awarded to them going back to the first recipient of the prize.

X. Y. Z.

UNEMPLOYED LABOUR.

SIR.—One missing link in the problem of unemployed labour is the absence of any adequate means for the diffusion of intelligence with regard to the wants of employers. Prisoners and paupers receive help; surely the class of deserving poor who seek for work often in vain are worthy of our attention. The friends of the Collier's Bents Mission have for some time past been quietly working, getting suggestions for men whom they have previously tested. And they could to a much larger extent succeed in alleviating the hopeless misery of men who wear out their strength and resources in the fruitless search for work, if they were only promptly made acquainted with the requirements of employers of labour. Will you kindly assist in making it known as widely as possible that in future a Register will be kept at this Hall of the requirements of employers, and that we shall be happy to attend to and register applications from employers free of charge? Address: honorary superintendent, Collier's Bents Mission Hall, Southwark, S.E.

J. B. RUDDUCK, Secy.

May 20, 1885.

The Student's Column.

DESCRIPTIVE GEOMETRY.—XVI.

Draw the plan elevation and shadow of a dodecahedron in any position you please.

BY the means of a succession of elevations and plans we get the projections as in fig. 84; the shadow is nothing but the intersection of a prism by planes: we can find it by any of the methods described above. To construct the plan and elevation of the dodecahedron in its first position when resting on the plane of the plan, we first draw on the plan the pentagon 1, 2, 3, 4, 5 (observe we do not put the sign α , because 1, 2, 3, 4, 5 are the points themselves, not their plans). Suppose that the pentagonal faces of this solid, which are contiguous to the face 1, 2, 3, 4, 5, have all been folded down upon it, and you open them up to place them in position, their points will rotate round the different arries of pentagon 1, 2, 3, 4, 5, until their right sides are made to meet. For instance, if the pentagon 1, 2, 3, 4, 5 rotates round its side 4, 5, the point 1 will travel in space in a vertical plane, the horizontal trace of which is 1, α ; if the pentagon rotates round its side 5, 1, then the point 4 will rotate in a vertical plane, the trace of which is 4, γ ; therefore, the point 6 α , where the traces 1, α and 4, γ cross one another is the plan of the point 6 in space where the points 1 and 4 have met; in other words, it is the plan of the point 6 of the dodecahedron. On account of the symmetry of this solid we know that all the other angles will be on the same circle as the point 6, and therefore we can easily complete the plan of the dodecahedron. To find the heights of the points 6 and 11 above the plane of the plan, we make an auxiliary elevation with L' T' taken on the line 1, α , and we draw thereon the circles described by the points 1 and 2 of the base pentagon when rotating round its side 4, 5, from which circles we deduct the elevations 6 α and 11 α ; their heights α , 11 α , and γ , 6 α , give the heights to be carried on our elevation for all the angles of the solid which are on the same level. As the dodecahedron is symmetrical, we can then readily complete the elevation and draw thereon a slab, as in our diagram.

The second position of the solid is theoretically found by making it rotate round a horizontal axis A, but practically the exact elevation is re-drawn in any position we like, and a new plan is deduced therefrom. Again, the third position is the result of a rotation round a vertical axis, which simply shifts the plan without changing its form, but gives an entirely new elevation.

There are three shadows to be considered and two shades. There is, firstly, the shadow cast on the ground by the rectangular slab; secondly, the shadow cast on the ground by the dodecahedron; thirdly, the shadow cast on the slab by the dodecahedron.

The shades are those parts of the slab and the dodecahedron which receive no ray of light. The shadows on the ground will be marked (1); the shadows on the slab (2).

We have already used oblique projections. To find the shadows on the ground we shall make oblique projections of the slab and the dodecahedron parallel to the direction of the rays of light R α , R'. The outlines of these oblique projections are the outlines of the shadows on the ground, and both in elevation and plan the arries which correspond to the outlines of the shadow form the separating limits between light and shade.

As to the shadow which the dodecahedron casts on the slab, we know the arries which will cast it, for they belong to the limits of the shade, and their shadows on the ground will fall within the shadows of the slab. Angle 11, therefore, casts a shadow on the slab. We could find its shadow, 11 β , by cutting the slab by the vertical plane which contains the ray of light through point 11; then finding the point 11 β , where the ray cuts it on the elevation. This would be the regular way to follow in most cases, but here we have used an artifice which gives us a more rapid result. Observe on the ground X α is the point where the shadows of the slab and the dodecahedron meet; therefore, if we travel backwards on the ray of light from X α , we shall find a point X on the edge of the slab, which belongs to the shadow on the slab of the arrie 11, 10, of the dodecahedron. Likewise, if we prolong 10, 11, shadow of the arrie 11, 10, until it meet

FIG. 84.

the shadow of the upper aris of the slab, we get a point, Y_2 , dealing with which as we did with X_2 , we obtain the point Y ; therefore the line $X Y$ is the shadow of the slab of the prolonged aris, 11, 10. At the intersection of the plan of the ray of light through angle 11, and the line $X Y$ we have 11's plan of the shadow on the slab of angle 11. By a similar operation for the point 13', we get the shadow point 13.

In the original drawing we have made for this problem on a large scale, we have used ink of different colours, so as to easily distinguish the different operations. The solid is drawn in black ink, the parts seen full, the others dotted; the projecting lines, both horizontal and vertical, are in red ink, whereas the auxiliary construction in the first projection is in blue ink, and so are all the lines of the shadow projection in the third position of the dodecahedron. In this drawing we have left out most of the projecting lines, and indicated the shadow projection of the solid by much thinner lines than the solid itself. So as not to confuse the projection and constructional lines of the shadow by etching, we give the effect of the last representation of the solid with shade and shadow apart, without any lines of construction, in fig. 85.

This problem ends that part of Descriptive Geometry which deals with lines and plane surfaces only. Candidates for admission to the Paris École des Beaux Arts are required to pass a severe oral examination in descriptive geometry up to this point, and have to present a complete series of careful drawings, called in French *épreuves*. Any students who have the intention of studying architecture at the Paris School may send in their names to Herbert D. Appleton, Esq., Hon. Sec. of the Architectural Association, 9, Conduit-street, and a class will be arranged for instructing them orally both in French and English, as well as directing them in the preparation of the requisite drawings.

We now come to the part of our science which treats of curved surfaces in general: cylinders, cones, spheres; surfaces of revolution, such as vases, caps and basins of columns; skew surfaces, to which belong various kinds of vaulting; helicoids, such as screws, handrails, and the soffits of winding stairs.

CHURCH-BUILDING NEWS.

Tintinhull.—The Church of St. Margaret at Tintinhull, near Yeovil, Somerset, has lately been re-opened by the Bishop of Bath and Wells after restoration. The church, which dates from the thirteenth century, though comparatively of small dimensions, contains examples of nearly all the different periods down to the Late Perpendicular. Among the noticeable features of the building are the early openings in the walls of the chancel filled in with Decorated tracery and a double piscina. The works of restoration have included the rebuilding the south wall of the chancel stone for stone; the removal of plaster ceilings throughout and western gallery; the re-roofing, re-seating, and repaving throughout, also heating apparatus and reglazing. A new four-centred traceried window replaces a debased window in the east gable. A good example of Jacobean woodwork is possessed in the dark oak pulpit reinstated on a new stone base. The works have been carried out from the drawings and under the direction of the architect, Mr. A. N. Hansell, of London, by Mr. Fred. Fane, of Stoke-

Fig. 85.

under-Ham, near Ilminster, contractor. The cost of the works to the nave was subscribed by the parishioners and friends in the neighbourhood; the chancel has been restored at the charges of the lord of the manor, Viscount Arbutnot. The glazing is by Mr. George Luxford, of Kentish Town; and the tile paving by Messrs. Malkin, Edge, & Co., of Staffordshire and London.

Streatham.—The new Church of St. Anselm is in progress, the memorial stone having been lately laid. The portion now erecting by Messrs. Bowyer, of Norwood, comprises chancel, vestries, and aisles, at a cost of 3,500l. The church, which is being built from the design of Mr. Withers, will, on completion, contain 1,000 sittings, at an estimated cost of 12,000l.

Rame (Cornwall).—The parish church of Rame, which overlooks the headland to which it gives a name, on the western side of the entrance to Plymouth Sound, was re-opened, after restoration, by the Bishop of Truro, on the 22nd ult. The work has been carried out at the sole cost of the Earl of Mount Edgcumbe, under the direction of Messrs. Hine & Odgers, of Plymouth. The church, which, though extremely exposed, is one of the oldest ecclesiastical structures in the country, consists of nave and chancel, with transept, porch, and vestry on the north side, and an aisle on the south. At the west end is a tower with broach spire of the thirteenth century, to which period the transept walls, a finely-proportioned three-light window, and the priest's vestry, with its original chimney-piece and narrow light overlooking the altar, also belong. A hagioscope commands the altar from the transept. During the restoration a portion of the altar-slab of the Early English church has been found, and a fragment of a still older church, namely, the carved tympanum of a Norman doorway. The aisle is fifteenth-century, and its wagon-roof has been restored, although nearly every timber was found displaced. New roofs of the same type have been constructed in the other parts of the church, as the old roofs were in a rotten and dangerous state; the ancient groin, however, at the intersection of the nave and transept roofs, has been

preserved. The new oak bosses have been carved by Mr. Hems, of Exeter, and at the point of intersection mentioned there is a large one, containing the Mount Edgcumbe arms. Buried under the former deal square pews were remains of the oak seating of the fifteenth century. These fragments, with some boldly-carved bench-ends, have been put together, and form a complete series of five ancient pews in the aisle. The new stalls, sedilia in sanctuary, and pews, are partly of oak and fir. The new pulpit, traceried, and for the most part open, is of oak on a stone base, and was made by Mr. Hasley, contractor, from the drawings of the architects. The ancient inscribed slabs have been relaid in the passages. The altar is of oak, the front being divided into seven carved panels. In the restoration of this church every fragment of old work (telling the story of changes in the past), which could be preserved, has been, from the Norman tympanum down to the quaint poor-box, of the seventeenth, and the font cover, with its gilded dove, of the eighteenth century. There is a new oak ligth-gate at the entrance to the churchyard, erected from the design of the architects.

Holywell.—The ancient parish church of St. James, Holywell, which has recently undergone enlargement and complete restoration at the cost of nearly 3,000l., has been re-opened. The work was undertaken by the vicar, the Rev. B. Williams, M.A., and from the plans of Mr. Mathew Wyatt, architect, of London, and it consists of the erection of an apse at the east end of the church, which forms a sacarium, a quasi-chancel having previously been formed by railing off a portion of the body of the church. The organ-loft, built in the tower, has been removed, and the massive masonry in the ancient part of the church, which previously was plastered, has been brought to view. The old pews have been removed. The sittings in the church, which are now free and unappropriated, are of oak and pitch-pine stained and varnished; the flooring under the seats is of wooden blocks, and the aisles are paved with tiles. A pulpit of carved walnut has been presented by Miss Jones, Tower Garden, Holywell; and a massive brass eagle lectern by Mr. Williams, of Chester, both of which were manufactured by Messrs. Jones & Willis of London and Birmingham.

Hawkesbury (Gloucestershire).—After undergoing extensive restoration, the ancient church of St. Mary, Hawkesbury, near Badminton, Gloucestershire, has been re-opened. The work of restoration was commenced in July, 1882, under the superintendence of Mr. William Wood Bethell, architect, of 7, Queen Anne's-gate, Westminster, by Mr. Gyde, builder, of Pitt-combe, near Stroud. The principal works which have been carried out are as follows:—Removing the whole of the plaster from the inside walls and roofs, except a few small portions of the Middleval painted work on the interior walls; relieving the gallery; putting a new oak roof on the nave, an exact copy of the old one, and covering it with lead; repairing the other roofs; altering and re-arranging the old oak seats; providing new oak stalls, sedilia, and altar-rail; laying wood block flooring under all the seats; re-laying the passages with the old paving stones and monumental slabs (the monuments remain untouched); repairing all the mullions, traceries, and string-courses and re-glazing the windows with cathedral glass; repairing the handsome stone pulpit; repairing the tower and fixing a lightning-conductor providing new oak doors, a tower screen wrought-iron chandeliers, &c. A heating apparatus by Grundy has also been provided. In carrying out the above works, among other interesting relics discovered may be noticed an Easter sepulchre; a double piscina; a monumental slab which once contained a brass; &c.

Stockton-on-Tees.—St. Paul's Church, Stockton-on-Tees, has just been consecrated. It is built in the Early English style, with nave and aisles, chancel, organ-chamber, two vestries and bell gable. It accommodates about 450 adults, at a cost of about 2,800l. The walls are faced inside and out with buff-coloured bricks relieved by red bands and quoins, and the dressings round the windows and doors are of white stone. The whole of the woodwork is of pitch pine. The chancel and gangways are paved with mosaic tiles. The windows are glazed with thick cathedral tinted glass, having borders of rich colours interspersed with roundels and relieved by coloured devices. The architect is Mr. J. P. Pritchett, of Darlington.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

39. Roofing Tiles. W. Finch. Tiles are corrugated, and butt against each at the top of the ridge. The meeting-faces of tiles are grooved for the purpose of forming ledges to carry down any water that may leak on them. The tile is first moulded with plain ledges, and then partially dried. The grooves are usual buttons and nail-holes are afterwards cut in a second mould.

34. Glass and other Roofing. C. Fowler, & Co. Sash-bars are rebated on the edge of the top and sheets of glass or slate, &c., are laid with edges in the rebates. The glass or other material is fixed by a strip of wood or metal, which is secured to the sash-bar, and between which and the layer of suitable packing is placed. Grooves run along the sash-bar on each side to carry the water condensing on the inner side of the glass.

55. Asbestos or other Millboard. R. L. W. Millboard is made impervious to the action of acids and of heat, and is rendered heavier by impregnating it while in a state of pulp with a large quantity of salt or other chemical substance of a nature. It may be thus used for fireproofing similar purposes.

47. Fire-grate. G. Dyer. Fire-bricks, instead of being round or square, made broad and thin, and inclined downwards to fire at an angle of about 45° to prevent the falling out when the fire is stirred.

43. Roofing Tiles. W. Vincent. Projecting lugs are formed on the upper edge of the backs of the tiles by which they are hung on the rafters. The corners are cut away and wedge-shaped pieces are formed of the backs of the tiles fit into these thus produced.

29. Roof Gutters. G. Kay. A screw or bolt by which the gutter-pipes are attached together at the joint is utilised to attach a pin by which they are fastened to the hangers on the roof.

APPLICATIONS FOR LETTERS PATENT.

By 8.—5,684, T. Helliwell, Glazing and Fixing of Glass, &c.—5,705, A. Blew, Fire Escapes, &c. also for Ventilating Buildings. By 11.—5,763, F. Walker, Improvements in Stairs.—5,767, G. Campbell, Improvements in Stairs.—5,769, G. Bodd, Ornamental Turning and Shaping Apparatus.—5,770, J. Shanks, Improvements in Lavatories.—5,773, H. Gull, Water-preventers.—5,774, S. Booth, Water Slide Chandeliers or Gasaliers.

By 12.—5,798, G. Croxther, Receptacle for Stains and Brushes.—5,801, C. Brother, Electric Bell Pushes, Contact Makers and Motors.—5,822, H. Haddan, Disinfecting Waters.—5,849, J. Pickford, Apparatus for Extinction of Fires.—5,855, A. Clark, Machine for turning off and boring Wheel Felles.

By 13.—5,868, A. W. Laxley and J. Langley, Combs for Gas Pipes and Pipe-cutting.—5,870, H. H. Giff, Chimney Tops.—5,896, J. Lewis, Improvements in Gas Burners.

By 14.—5,913, H. Waldron, Fixing and Securing of Knobs and Latch Lock Furniture.—5,916, J. Stalls, Improvements in Furnaces, Grates, and Fireplaces.—5,936, W. Lester, Astragal Sliding Bars for Roofs, Windows, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

17. E. Aldous, Ventilating Apparatus.—4,018, and E. H. Ludlow, Adjusting and Attaching of Knobs to Spindles.—4,314, J. Gibbard, Den Block Flooring and Lining for Walls.—6, W. Slidwick and J. Day, Latch Locks.—6, M. Conrath, Embossed Wall and Ceiling decorations.—4,449, T. Easley, Casement Stays.—6, G. Osborn, Apparatus for Printing on Wall, &c.—4,873, W. Leggett, Window and Door Sliding Bars.—4,911, I. Stiffert and T. Dykes, Sliding Grids.—5,042, J. Howlett and T. Orio, Water Waste Preventing Cisterns.—5,064, T. H. Hoarths and Checks of Grates and places.—5,102, H. Smith, Improved Paint or Cement.—5,613, F. Waite, Water Waste Preventers.—17,103, A. Mullor, Venetian Blind Laths.

41. W. Tapp, Improved Construction of Tiles for Roofs.—4,911, I. Stiffert and T. Dykes, Sliding Grids.—4,869, R. Duncan, Domestic Grates.—4,886, J. Eaton and F. Morris, Implements in Sliding Sashes.—4,901, W. Pinkerton, Hinges.—5,018, J. Walker, Cupboard Hinges.—5,086, W. Taylor, Circular Staircases.—5, S. Luke, Church Window Ventilators.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

46. H. Talbot, Ventilating Flue Bricks.—10, J. Forny and C. Keizer, Travelling Cart Hoist Apparatus.—10,622, C. Tebbutt, Bricks for Sliding Stables and Stable Yards.—10,705, A. Wood, Grilles for Protecting Shop Fronts.—

16,800, H. Marks, Self-acting Water Closets.—4,387, C. Marples, Attaching Nuts to Spokeshafts.—4,479, H. Ibbot-on, Opening and Closing Sash Windows.—10,429, W. Messert, Folding Shop-window Stand.—10,835, G. Gowing, Scraper for Cleaning Drains.—15,506, S. Owen, Improvements in Baths.—15,028, Baron de Liebhäber, Colouring Stone, Marble, and other Materials for Building.—79, W. Sanferson and T. Moffitt, Door Latches and Catch.—948, C. Longbottom, Door-knobs or Handles, and Fixing same to Spindles.—4,245, C. Longbottom, New Window-sash and Door Fastener.—4,539, H. Haddan, Improved Roof Covering.

MEETINGS.

THURSDAY, MAY 22. Society of Telegraph-Engineers and Electricians.—(1) Mr. B. J. Farquharson on "ship-lighting by Glow-lamps, embodying Results of Trials on H.M.S. 'Colossus.'" (2) Mr. J. N. Shuttleworth on "Electric Lighting at the Forth Bridge Works." 8 p.m.

FRIDAY, MAY 23. Architectural Association.—Special Business Meeting. 7.30 p.m.

SATURDAY, MAY 30. Architectural Association.—Visit to Buchan Hill Mansion, Crawley, Sussex (Messrs. Ernest George & Peto, architects). Train from Victoria, 1.30 p.m. Civil and Mechanical Engineers' Society.—Visit to the new Blackfriars Railway Bridge. 2.30 p.m.

Miscellaneous.

Inventors' Institute.—On Monday evening last, at a meeting of this Institute, Mr. C. E. Spagnoletti in the chair, a paper "On Electric Tram-Cars" was read by Mr. A. Reckeuzann. The author said that whilst a single electric tram-car only existed in this country, a paper on the subject might be thought premature. This solitary example is, however, the latest and only practical form. After a comparison of horse, steam, and compressed-air traction with electrical traction, the difference between the electric tram-cars and electric tramways and railways was pointed out to be, that, whereas in electric tramways the energy is conveyed from the generating station to the rails or other conductor communicating with the motor which turns the car-wheels, the electric car carries its own energy within itself, and is quite independent of external influence, and the car can travel over any road or rail for whatever system, ordinary or specially designed. The Electrical Power Storage Company having acquired the patents of Sellon, Swan, and Volkman in addition to Faure's, have step by step improved the mechanical details of the storage batteries, until they have arrived at a thoroughly practical article,—but the prejudices created in the public mind by the early failures have to be overcome. The cell for the tram-car is contained in a lead-lined strong teak box. In it are placed twenty-one lead plates, weighing together 26 lb., including terminals and fittings. Sixty such cells, weighing one and a quarter ton, are required to propel a car with forty-six passengers for about two hours over a road with ordinary gradients, curves, and sixty stoppages per hour. A diagram was shown, representing the car which has been running at Millwall and Battersea. The electric motor has to convert the electric current into mechanical power. For tram-car propulsion it is absolutely necessary that the motor should have high efficiency, and, at the same time, be of small dimensions and light weight. The author's machine has, he contends, these qualifications. For the car there are two motors, each capable of working up to nearly nine horse-power and weighing 420 lb.; each motor is carried separately upon a small bogie, in such a way that each bogie forms a small locomotive-engine upon which the car rests. One axle of each bogie is a driving-axle; thus are actuated four small driving-wheels. The speed of the motors is high, about 1,000 revolutions per minute when the car is running at seven miles an hour. Thus it is necessary to introduce reducing gear between the motor shaft and the driving-axle. Variation of speed and power is obtained by means of a compound switch, which arranges the motor circuits so that the machines shall work in series, in parallel or singly. The late Mr. Louis Haghe.—The residence at Stockwell of this well-known artist, whose death we recorded not long ago, was sold by Messrs. Barker & Neale at the Mart, on the 19th inst. The property in question, which is freehold, and known as "Fern Lodge," 103, Stockwell-road, consists of an old-fashioned family residence, with well-lighted studio, and large garden in the rear, the whole covering an area of 26,500 square feet. It realised 1,990l.

"The Paragon Theatre of Varieties."

Such is the title of the new building which has been erected in the Mile End-road on the site of Lusby's Music Hall, which was destroyed by fire some sixteen months ago. The new building and its annexes cover more than an acre of ground. The following are some of the dimensions:—From the line of footlights to the back of the auditorium measures nearly 100 ft.; the hall proper is 60 ft. in width, with a promenade on each side of 20 ft., making a total width of 100 ft.; the height from floor to top of the domed ceiling is 60 ft., and from the line of footlights to the balcony and gallery front is from 55 ft. to 60 ft.; the stage opening is 34 ft. wide by the same number of feet in height; the depth is 64 ft., the height to gridiron is 60 ft., with a cellarage depth of nearly 20 ft., and a width across of about 100 ft. The principal entrance is from the Mile End-road. At the end of the entrance-passage is found the crush-room. Through this is seen the grand promenade, an apartment leading to the foyer, which is fitted with marble bars, a grill, &c. The foyer leads straight away to the promenade which surrounds the ground-floor of the theatre, and which, being a few feet higher than the floor whereon the seats are fixed, enables a spectator who is promenading round to have an uninterrupted and perfect view of the stage. The hall proper consists of the gallery, the balcony with twelve private boxes on a separate level, and, on the lowest level, the pit, stalls, and fan-tails. The gallery will accommodate about 800 or more. The architect of the building, the designer of all the decorative and other ornamental details, and the planner of the stage, is Mr. Frank Matcham, of Bedford-row. Messrs. Merryweather & Sons supplied the hydrants and fire-extinguishing apparatus; the gasfitting has been executed by Messrs. Vaughan & Brown; the upholstery by Messrs. Lyon & Son; the scagliola marble by Messrs. Bellman & Ivey; the marble work of bars by Mr. Salter; and the whole of the decorative plastering and painting by the Frame Makers', Gilders', and Decorators' Association. The general superintendence of the works has been in the hands of the architect and Mr. Wheeler, the foreman; Mr. Snow being the clerk of the works. The building was opened to the public on Thursday evening last.

Wind Velocities.—At the usual monthly meeting of the Royal Meteorological Society, held on Wednesday evening last, at the Institution of Civil Engineers, Great George-street, Westminster, Mr. R. H. Scott, F.R.S., President, in the chair, the following were among the papers read:—(1.) "Velocities of Winds and their Measurement," by Lieut.-Col. H. S. Knight, F. R. Met. Soc. The author, after describing the various ways of ascertaining the direction and velocity of the wind, makes several suggestions for the improvement of Robinson's anemometer. (2.) "On the equivalent of Beaufort's Scale in Absolute Velocity of Wind," by Dr. W. Koppen, Hon. Mem. R. Met. Soc. The author refers to Mr. C. Harding's paper, read before the Society in December last, on the anomalies in the various wind velocities given by different authors as equivalents for the numbers in Beaufort's scale, and, as illustrating the point, calls special attention to the want of agreement between the velocities obtained by Mr. Scott and those subsequently obtained by Dr. Sprung, and confirmed by himself.

Competition for St. James's (R.C.) Church, Manchester-square.—The (R.C.) Church of St. James, in Spanish-place, Manchester-square, originally the Chapel of the Spanish Embassy, is to be rebuilt on the opposite side of George-street. Sixteen R.C. church architects have been asked to submit designs, and most of them have accepted the invitation. The church only, exclusive of the adjoining buildings and of all furniture, is to cost 20,000*l.*, and is to be 158 ft. long and 80 ft. wide, and to afford accommodation for five altars and 2,000 worshippers, 500 of whom may be provided for in the triforium. Besides the church, the buildings are to include a confraternity chapel and a committee-room in the crypt, two sacristies, a tower, and a presbytery. The style is to be "Early English Gothic as practised in the twelfth and thirteenth centuries," and it is hoped that the church will be characterised by solidity, simplicity, stateliness, and spaciousness. The architectural assessor is Mr. Fergusson, but it seems his functions are confined to advising as to the architectural merits of the designs.

Neglected Nuisances and Typhoid.

If any point in the history of typhoid fever may be held to be established, it is the constant and essential relation which exists between that disease and the presence of sewage impurities. We cannot, therefore, but strongly condemn the blind neglect of cleanliness in a case which affords us the latest recorded illustration of this truth. The circumstances were the following:—An inspector of nuisances at Darlaston was required by the Local Board of Health, at the instance of the medical officer of the Board, to clear away an accumulation of sewage matter at the back of a house in which there were four cases of typhoid fever. The medical officer and the Board in so doing were of course only taking the first essential step in the treatment of disease,—the removal of its cause. The inspector, however, had other views. He saw no need for interference, and left matters as they were. Under such conditions no remedies could be expected to effect their purpose, and we are not surprised to learn that out of four persons attacked by the disease three died, an unusually high mortality for enteric fever. It must be evident to all that the censure which this official justly incurred at the hands of his employers is but a light one, unless it implies an assurance that like offences will be prevented in the future.—*Lancet.*

The Preservation of Marble Monuments.—At the last monthly meeting of the Vienna Society of Art Industry, Herr Bucher discussed the question, first raised at Munich, and subsequently taken up at Berlin, whether monuments of marble should be covered up during the winter months. He recapitulated the opinions and observations made by Professor von Pettenkofer, Herr Pecht, and the *Deutsche Bauzeitung*, from which it appeared that the real enemy of marble was the deposition of sulphurous acid from the atmosphere, which gradually changed the surface of the marble into gypsum, which was in its turn dissolved by moisture, and permitted destruction by frost, &c. Monuments would consequently have to be washed, and without this procedure even covering them up would offer no protection. The lecturer then pointed to the perfect preservation of the marble sarcophagus brought from Asia Minor by Count Lanckoronski, and now in the Austrian Museum, and finally threw out the suggestion whether the polishing of marble would not offer after all the best protection, not merely on account of the smoothness of the surface, which did not facilitate the accumulation of dirt, but because polishing renders the surface more dense.

Sales of Building Land at Norbiton and Walthamstow.—During the present week Mr. Richard J. Collier has held two successful sales of building land at Norbiton and Walthamstow. The sale on Monday evening consisted of several sites on the Norbiton Park Estate at New Malden, Surrey, the sale taking place at the Norbiton Park Hotel. The estate, which belongs to the London and Suburban Land and Building Company, has for some time past been lying idle, no sales having taken place for the last three or four years. There was a numerous attendance at the sale, and several of the sites, which have frontages of 30 ft., with a depth of from 190 ft. to 220 ft. were sold, the total proceeds of the sale amounting to about 1,700*l.* On Tuesday evening Mr. Collier held another sale of similar property, forming a portion of the Church-hill House Estate at Walthamstow. The sale took place at the Tower Hotel, Hoe-street, Walthamstow, when sixty lots were submitted to competition, the several lots having frontages of 18 ft., and a depth of 100 ft. Of the entire number of lots offered fifty were sold, realising an aggregate sum of about 3,200*l.*

Civil and Mechanical Engineers' Society.—A party of members of this Society visited the works of the new Hammersmith and Putney bridges on Saturday last, by the kind permission of the engineer, Sir Joseph Bazalgette, C.B. Messrs. Dixon & Thorne are the contractors for the Hammersmith Bridge, and Messrs. John Wardell & Sons are the contractors for the Putney Bridge. These visits proved most instructive and interesting, particularly the one to Putney, as in these days of iron construction it is seldom that an opportunity occurs for witnessing the erection of a masonry bridge upon the scale to be seen there. The constructive details of this bridge were very fully illustrated in the *Builder* for Jan. 3 last.

Portraits of Handel.—In connexion with the coming Handel Festival, the editor of *Magazine of Art* has arranged for the publication of an article by Mr. R. A. M. Stevenson on "Handel and His Portraits." Its purport is partly musical and biographical, and partly one of art criticism. It will be illustrated by engravings of the "Chandos Portrait," painted by Thornhill, from the Fitzwilliam Museum of the fine Grafoni, in the same collection, Mr. Henry Littleton's famous Ronbliaz, "Vauxhall Statue," as it is called; of Zinograph and interesting miniature, now the property of Mr. H. B. Lennard; of the engraving by Schmidt, which Hawkins thought the likeness of all; and (by permission of Howo) of the full length, painted by Howo for Charles Jenkinson, the librettist of "Messiah" and from the first an ornament of the "Music Room" at Gopsal.

Zinc Roofing.—The various work done to the roofs of the Hôtel Métropole, as to dormers, lunettes, mouldings to hips, curbs, has been executed by Messrs. Fredk. Braithwaite & Co., of the Euston-road, London. These manufacturers have devoted special study to the formation of zinc tiles, both square and circular. The difficulty regarding large zinc sheets allowing for expansion and contraction is overcome by the combination in fitting of pieces of zinc with peculiar language designed to exclude rain and promote security of fit (above, below, and at sides), so as to resist the most violent gales. Above 8,000 ft. square the square-shaped zinc tiles interlocking diagonally, and 10,000 ft. of those curved, are used in the immense expanse of roofing, besides nearly 5,000 ft. super. laid in sheets, and above zinc dormers and lunettes.

Liverpool Water-colour Society.—Liverpool Society of Painters in Water Colours, have, with the permission of the Corporation Arts Committee, secured two of the finest rooms at the Walker Art Gallery in which to hold their spring exhibition, viz. the first large room the new addition, where the fountain will play; also, the large room in which the collection of the Royal Water-Colour Society shown at the last autumn exhibition. They have also thrown the exhibition open to outsiders, several special invitations having been sent to the members of the Royal Water-Colour Societies and other artists of the country principally, many of whom have sent works. The exhibition opened to the public on Monday last. The list of exhibitors includes some well-known names.

Another Thames Bridge.—On Saturday the Teddington Local Board issued a public notice inviting tenders for the erection of a suspension bridge over the river Thames at Teddington, and a lattice girder foot-bridge over the lock-out adjoining the same, according to drawings and specifications prepared by Messrs. Pooley & Thompson, engineers. The project has been approved by the Thames Conservators.

TENDERS.

For the erection of the National Agricultural Kensington. Mr. Henry E. Cox, architect. Quantities by Messrs. Franklin & Andrews:—

Trollope & Son	£132,362 0
W. Brass & Son	149,477 0
Holland & Hannen	141,890 0
Hall, Beddall, & Co.	139,320 0
Kirk & Randall	139,000 0
Berry & Co., Ltd.	134,593 0
Lucas & Son (accepted) ..	131,573 0

For the erection of a house at Ascot, Berkshire, for Chas. Stonor. Messrs. Ernest George & Peto, architects. Quantities by Messrs. Stonor & Sons:—

Walls	£9,995 0
Hall, Beddall, & Co.	9,963 0
Nash	9,938 0
Brass	9,715 0
Bywaters	9,651 0
Longley	9,604 0
Higgs & Hill	9,438 0
Peto Bros.	9,174 0
Roberts	9,054 0
Stevens & Bastow	8,906 0
Stimpson & Co.	8,829 0
J. O. Richardson	8,733 0
Godard	8,642 0
Watson	8,611 0

For pulling down and rebuilding shop premises, No. 6 Great Portland-street, Oxford-street, for Messrs. Ket Messenger. Mr. T. G. Langridge, surveyor, 7, Cradock-street:—

Langridge & Sons	£1,964 0
Manning	1,884 0
Oldrey	1,784 0
Greenwood Bros.	1,697 0

COMPETITIONS AND CONTRACTS:

Epitomes of Advertisements in this Number.

COMPETITIONS.

Table with 5 columns: Nature of Work, By whom required, Premium, Design to be delivered, Page. Includes 'Huff Drive and Promenade, &c.' with a premium of 200 gu., 100 gu., & 50 gu.

CONTRACTS.

Table with 5 columns: Nature of Work, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes 'Pump and Vertical Boiler, &c.', 'Closets, Alterations to Windows, &c.', and 'Erection of a warehouse, Rockingham-street.'

Table listing contractors and their prices for 'For new schools, Broomsleigh-street, Hampstead, for the London School Board.' Includes T. Boyce at £12,100 0 0.

Table listing contractors and their prices for 'For the enlargement of schools, Collingwood-street, Tower Hamlets, for the London School Board.' Includes Holloway Bros. at £2,964 0 0.

Table listing contractors and their prices for 'For alterations and additions to Nos. 46 and 48, Stroud Green-road.' Includes Mutton Bros. at £411 0 0.

Table listing contractors and their prices for 'The erection of a warehouse, Rockingham-street.' Includes K. Coleman at £2,970 0 0.

Table listing contractors and their prices for 'For main sewerage and works connected therewith, at Pouchyndendmat. Mr. Thomas Roberts, A.M.Inst.C.E., engineer.' Includes White & Green at £1,696 11 6.

Table listing contractors and their prices for 'Listed for alterations, repairs, &c., to warehouses and Nos. 4, 5, 6, and 7, Great St. Thomas Apostle, street, E.C., for the District Railway Company.' Includes George Shaw at £2,614 0 0.

Table listing contractors and their prices for 'For the erection of factory in the Holloway-road, for Mr. A. Monk, organ-builder.' Includes Lidstone at £1,849 0 0.

Table listing contractors and their prices for 'The erection of a new church, at Llanvair, Carmarthen. Mr. E. H. Lingen-Barker, architect.' Includes Jenkins, Casgruen at £764 0 0.

Table listing contractors and their prices for 'For the erection of twelve cottages at Broadwater, Worthing, for Mr. J. B. Knowles. Mr. R. W. Moore, architect.' Includes Bridger & Son at £1,920 0 0.

Table listing contractors and their prices for 'Two houses at Honor Oak, for Mr. E. J. Powell. Alfred Howard, architect. No quantities.' Includes Brown at £1,491 0 0.

Table listing contractors and their prices for 'Accepted for building warehouse in Ewer-street, South-wark, for Mr. Church. Mr. T. Willis, architect.' Includes J. A. Taylor at £392 0 0.

Table listing contractors and their prices for 'Private residence and stabling at Streatham Common, for Mr. C. Meigh. Mr. Jesse Christian Jenkins, architect. Bank-chambers, Westbourne-grove, Bays-water.' Includes House at £2,319 0 0.

Table listing contractors and their prices for 'For building residence, stables, coachman's house, garden walls and lodge, at Brynawen, Breconshire. Mr. Stephen W. Williams, architect. Quantities by the architect.' Includes R. Davies & Son at £6,149 8 0.

Table listing contractors and their prices for 'Law business premises, Westbourne-grove, Bays-water. Mr. J. Christian Jenkins, architect. Bank-chambers, Westbourne-grove, Bayswater. For a portion.' Includes House at £1,900 0 0.

Table listing contractors and their prices for 'For the erection of new Mission Chapel, Hackney Wick. Mr. J. Weir, architect.' Includes Lathey Bros. at £1,594 0 0.

Table listing contractors and their prices for 'Listed for alterations and additions to Ambleside, Surrey, for Mr. J. Pascall. Mr. W. H. Wood, architect.' Includes Henderson at £316 0 0.

Table listing contractors and their prices for 'For alterations, &c., to the Seabright Music-hall, Hackney-road. Mr. J. G. Buckle, architect.' Includes W. Shurmur at £1,440 0 0.

Table listing contractors and their prices for 'For new Young Men's Christian Association building, Gile-road, Southampton. Mr. W. H. Mitchell, architect.' Includes Stevens & Sons at £1,439 0 0.

Table listing contractors and their prices for 'For proposed Congregational church, George-lane, Woodford, Essex. Mr. Thomas Arnold, Basinghall-street, architect. Quantities by Messrs. Curtis & Sons.' Includes Higgs & Hill at £3,980 0 0.

Table listing contractors and their prices for 'Accepted for rebuilding the Bricklayers' Arms public-house, at the corner of Fordham-street and Settles-street, Commercial-road, E., for Mr. W. T. Wackrill. Mr. J. T. Newman, architect. 2, Fen-court, E.C. Quantities by Messrs. Curtis & Sons.' Includes A. Reed, Stratford at £1,487 0 0.

Table listing contractors and their prices for 'For the erection of medical superintendent's house and registrar's office, Harrow-road, for the Guardians of Paddington. Messrs. A. & C. Harston, architects, 15, Leadenhall-street. Quantities supplied.' Includes Belham & Son at £3,963 16 3.

Table listing contractors and their prices for 'For the completion of medical superintendent's house, lodge, &c., at the Western Hospital, Segrave-road, Fulham, for the Metropolitan Asylums Board. Messrs. A. & C. Harston, architects, 15, Leadenhall-street. Quantities supplied.' Includes Proctor at £3,692 0 0.

Table listing contractors and their prices for 'For painting works at the Wandsworth Infirmary, for the Board of Guardians of Wandsworth and Clapham Union.' Includes Turtle & Appleton at £283 0 0.

For alterations and repairs to 4, Bennett-street, Tottenham-court-road, for Mr. J. Bickly Smith, Mr. C. V. Stevens, surveyor, 27, Southampton-buildings, Chancery-lane:—

T. Taylor	£233 0 0
Brown	232 0 0
Gould & Brand	237 0 0
Arnold	202 0 0
W. Crockett	200 0 0
Norris & Lake	175 0 0
J. Watkins	139 0 0
E. Parker	120 0 0

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 46, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.
W. B. L.—W. R. M.—W. J. P.—T. W. A.—G. E.—J. S. T.—J. E. G.—T. F. (Banks)
All statements of facts lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.
CHARGES FOR ADVERTISEMENTS.
SITUATIONS VACANT, PARTNERSHIPS, APRENTICESHIPS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under, 6d. Each additional line (about ten words) 6d. Terms for series of twice advertisements also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.
SITUATIONS WANTED.
FOUR Lines (about THIRTY words) or under 2s. 6d. Each additional line (about ten words) 1s. 6d.
PREPARATION IS ABSOLUTELY NECESSARY.
* * * * * Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher, Addressed to No. 46, Catherine-street, W.C.
Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.
The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.
SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY meetings.
PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.
"THE BUILDER" is supplied annex from the Office to any part of the United Kingdom at the rate of 10s. per Annum. To countries within the Postal Union, 26s. per Annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Beat Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [A]

Bath Stone.
ALL DESCRIPTIONS OF BEST QUALITY.
PICTOR & SONS,
BOX, WILTS. [A]

Doubling Freestone.
These stones from this quarry are known as the "We Bods," and is of a crystalline nature, and doubtless one of the durable stones in England. Is of the same crystalline nature as the Chelvyck Stone, but finer in texture, and suitable for fine moulded work.

THE CHELYNCH STONE.
THE BRAMBLEDITCH STONE.
HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice. Prices, and every information given, application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [A]

Doubling Free Stone. For prices, &c., apply to JOHN HANN & SON, Quarry Owners, Stoke-under-Ham (Ground or Lump), Ilminster. [A]

Ham Hill Stone! For prices, &c., apply to JOHN HANN & SON, Quarry Owners, Stoke-under-Ham (Ground or Lump), Ilminster. [A]

Asphalts.—The Seyssel and Metallic Asphaltic Company (Mr. H. Glenn), Office, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and rooms, granaries, tun-rooms, and terraces. [A]

Asphalts. Seyssel, Patent Metallic Lava, and White Asphalts. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [A]

EVERY DESCRIPTION OF SEASONED WOODS AND VENEERS EXTENSIVE QUANTITIES.

B. J. HUDSON & SONS, Whitfield-street, W. Store-street, W.C., and Great Peter-street, S.W., London. Telephone No. 3,654, and Private Wire connecting Business Premises.

SHARP & CO.'S

System of Water Supply for Country Mansions, by means of Rams, &c.
"Sanctus-Bell Cot" System of Ventilation, for Churches and Chapels.
"Continuous" System of House-Drain and Soil-Pipe Ventilation.
Speciality—System of Drainage for Country Mansions, whereby all Sewage is utilised as Manure, and made a source of profit instead of danger and nuisance.
"Continuous" System of Sewer Ventilation, whereby the Sewers are thoroughly ventilated, and Gases prevented therefrom deodorised.
System of House and Billiard-Room Ventilation, by means of Air Inlet Bracket & Ornamental Extracting Ventilator.

HEALTH EXHIBITION AWARDS: ONE GOLD, ONE SILVER, FOUR BRONZE MEDALS.

FOR TESTIMONIALS AND FURTHER PARTICULARS APPLY

SHARP & CO. Hydraulic, Sanitary, & Ventilating Engineers, **11, HOLBORN CIRCUS, LONDON, E.C.**

Old and New Sarum.

LOSE to the spot where the wild and desolate undulations of Salisbury Plain terminate on the south through the junction of the river Avon and its tributary, the Wily, stands conspicuous a steep hill, almost detached from the high ground of which it is a projecting spur. By nature it is adapted to be a fortress of a primitive race. By primitive races it was made a fortress. Perhaps the Britons were the first to occupy it. They were assuredly followed by the Romans. After them came the Saxons; in course of time it was stormed and held by the Danes. Gradually, as more permanent means of fortification were adopted, it became the seat of a city and castle, which, under the name of Old Sarum, has filled archaeologists and historians with interest, and has excited the derision of every post-Reform politician.

Imagine a space of ground, somewhat larger than Kennington Oval, forming a tolerably level summit to this steep hill. Just where his miniature table-land begins its abrupt descent to the valley on every side, imagine a huge circumscribing ditch, deeper and wider than the moat of many a castle; rising from the midst of the table-land picture another steep mound, also surrounded with a tremendous ditch; clothe the ditches with shrubs and trees; fringe the edges of the scarps with bushes; scatter a plentiful sprinkling of flints over the ploughed surface of the main platform; leave the summit of the central mound undulating and grassy; and you have the present aspect of Old Sarum. The ditches are the remarkable part; their width, their depth,—if strength depends upon such qualities,—must have rendered the place almost impregnable. It is said that we owe them to the Saxons, not improbably to Alfred the Great. Certainly later comers made use of them when the city began to arise, and they were rendered still more secure by the erection of a flint wall on the inner edge. One little fragment of this still remains, as devoid of detail and as much like concrete as the fragments of the abbey at Bury St. Edmunds. It is strongly defended, lying at the junction of several important roads, and in the heart of the country the theatre of the principal events recorded in the early history of the island, Old Sarum became one of the most important towns in the kingdom. The city grew till it led the whole of the little plateau. Further

than this it could not extend, for there was the huge fosse, and beyond it a violent descent into the valley. On the central mound stood the castle, dominating the whole town; sloping away from it were thickly clustered houses, all ending abruptly at the wall and fosse. Perched thus on the summit of the steep hill, Old Sarum must have looked very much like the little cities which figure in the backgrounds of Albrecht Dürer's pictures, only the tapering spires would be wanting, and the general appearance would be sterner, straighter, and more sombre than that of the later German cities. Beneath the walls of the city, in the plains where Salisbury now stands, William the Conqueror held a review of his victorious forces four years after the great battle of Hastings. Two years later than this the city was further distinguished by the removal to it of the episcopal see, which hitherto had been at Sherborne, in Dorsetshire, and presently a splendid cathedral was commenced. After fifteen years of labour it was finished and consecrated in 1092, in the reign of William the Red, and was worthy to be compared with any of the numerous cathedrals and abbey churches which were then rising throughout the land.

The city was now complete. It had its castle, its cathedral, and hishop's palace, its miniature streets of grim houses thrusting themselves up to its grimmer walls. Man had done his best; but Nature was against him. The stars in their courses fought against Old Sarum. The place was bleak. It was exposed to every wind of Heaven. The rude north wind, after racing across the petrified billows of Salisbury Plain, burst in fury against the lofty city. Its elevated situation made it the sport of every tempest, and only five days after the cathedral was consecrated a thunder-storm destroyed the roof of the tower, and damaged the walls. The soil was unkindly, and refused to produce much besides flint. There was very little water, and what there was could only be obtained at a high price. A canon of Salisbury, Peter of Blois, who lived in those days, records the absence of water and the abundance of flints. "The wind rages there," he also says, "but the nightingale is silent."

"Sevit ibi ventus, sed Philomela silet."

All this might have been borne had the city not been divided against itself, but the union of Church and State bred quarrels. All was well so long as the bishop of the cathedral was also castellan, but when the constablership of the castle was given to a layman jealousies arose. Perhaps a dissolute soldiery chafed at the constant reproach implied by the hameless life of the monks; perhaps the erring priests saw in the soldiers a tacit condemnation of

their own evil courses. But whichever way it was, the secular arm was the stronger, and on one occasion asserted itself in a very aggressive manner. The clergy, in accordance with their regulations, wound solemnly down the hill one winter's day to visit a church somewhere in the valley. The soldiers seeing the whole mass of them fairly outside the gates for at least an hour or two, holdly resolved that they should stay out a good deal longer than they expected. When the monks returned they found the gates closed, and, amid the fierce blasts of a long winter's night, they had to divert themselves as best they could. It must have been excessively aggravating. A solemn procession in winter is but a cold affair; and not all the awe of an ignorant peasantry would be able to compensate for the absence of a good warm fireside. But when, instead of the reverential salutes of the good country people, they were met by the rude taunts of an irreverent and unbelieving soldiery, and the unyielding exterior of their own iron-bound doors, their exasperation must have been complete. If this was to live on a hill, "in God's name," as Peter of Blois said, "let us descend into the level." We can picture good Bishop Poore gazing from a terrace of his exalted palace across the broad valley in search of some place where his monks might be free from the intolerable arrogance of the soldiers. Undoubtedly the most suitable place was away there where the Avon received its tributaries, for already those fair meadows had become the home of many men from the little city whose bounds it was impossible to extend. Some people say the precise spot for the contemplated cathedral was revealed to the Bishop by the Blessed Virgin herself in a dream; others that a bow was drawn at a venture from the castle walls, and that the place where the arrow fell was chosen. But not the strongest of all the tormentors of the monks could have shot an arrow from Old Sarum to the new cathedral, even though burning with the desire to shoot his reverend companions as far away as a man might.

Be this as it may, on the 28th of April, 1220, 128 years after the consecration of the large cathedral on the hill, the first stones of the new and larger cathedral were laid near the river by Bishop Poore, and in a space of forty years the whole pile arose, much as we see it now, to the level of the top of the roof. The growth of the town kept pace with that of the cathedral. In the seventh year of the building Henry III. granted a charter, making the new town a free city. Seventeen years later the great west road, the Icknield-street, was diverted from Old Sarum to the new Salisbury. From that time the elder place declined. It gradually became deserted, its walls fell to ruins; its

cathedral was taken down in 1331, after a life of some 240 years, and went towards the finishing of the new building at Salisbury; and by the time of Leland, who wrote about the period of the Dissolution of the Monasteries in Henry VIII.'s reign, "not one house, neither within or without Old Sareshyri," was inhabited. Much notable ruinous building of the castle remained, and the ditch struck him as "a very deepe and strong thyng," but the place was dead and half-buried. Since then the work of destruction has been going on; the "notable ruinous building" has entirely disappeared save for the scrap of walling already mentioned; and the terrible fosses, those "deepe and strong thynges" which frightened good Mr. Pepys in the dark, afford perennial pleasure to children going a blackherrying; and, if any one wishes to realise what a task it would have been to take the place by assault with heavily-armed men, let him scramble up the sides in his mean nineteenth-century dress.

Splendour as was the cathedral of Old Sarum, it must have been far inferior to that which we see to-day. Its site was wild, weird, and picturesque, but in a forbidding fashion; magnificent no doubt it was, but heavy and sombre, with small windows and huge piers, remarkable, considering the age in which it was built, but what a fierce age it was built in! The younger cathedral was the outcome of greater knowledge and increased refinement. Clustered shafts replaced the cylindrical columns of the nave; graceful triplets superseded the old bare circular-headed windows; clean, delicate vaulting ribs leaped from pillar to pillar, instead of the cumbrous framework of the Normans; and in course of time the wonderful spire soared up 400 ft. above the placid level of the Close. As a specimen of a splendid phase of English architecture Salisbury Cathedral is unique. It has all the virtues and shortcomings of that which we aptly call Early English. No style has ever expressed its purpose in fewer lines than Early English. Its utterances are all simple, direct, innocent, yet sometimes crude, like those of an intelligent child not yet self-conscious. In design, so long as everything is straightforward, nothing can be more satisfactory; but how when there comes a difficult little corner? Take the east window of the choir at Salisbury. To pretend that the early masters, with their broken-backed arches, have coped with the problem as successfully as they would have done had they lived in the Perpendicular era, is to do violence to the meaning of language. But in the graceful simplicity of their nave arcades and vaulting, they far surpass the pedantic, synchoidal, bebossed work of their successors. The nave at Winchester, save for the colour, is not to compare with Salisbury. It is in colour that Salisbury loses so much; the bare clean walls, and the windows innocent of all brilliancy, give it a cold air, which a rather scanty congregation does not tend to dispel.

One of the abiding wonders of Salisbury is its spire, 30 ft. higher than the cross of St. Paul's. It is not everywhere that this enormous height tells. Seen from the close, and carrying the eye up from precipice to precipice, till the smooth slope of the spire itself terminates in the cornice of the ironwork at the summit, the effect is most impressive. So, too, is the view from parts of Salisbury Plain, where the spire is seen shooting up from a hollow, which engulphs every vestige of the town and the body of the cathedral. Every one praises this marvellous work, but does every one who speaks of it with undiluted commendation really mean that he absolutely approves of the way in which the springing of the spire from the tower is masked by the pinnacles? Not as a matter of principle, but as a question of graceful contour? Is it not possible that many of the verdicts about particular architectural features here and elsewhere are the result of rather antiquated classification, like that, for instance, which, without appeal, points out the monument of Giles de Bridport as the finest in the cathedral? This verdict clearly was given in the palmiest days of the Gothic revival, and would

find many cavillers in these days of renescent Renaissance.

More than 200 years ago visitors were treated to a set story, as they are now, although no architectural theories had then been broached. Does not the following note, still visible in faded ink on the fly-leaf of a certain seventeenth-century "Concordance of Yeares," and written by an occasional visitor to the cathedral, smack strongly of the verger:—

"Our Ladey Church in Salisbury was built by 3 hishopes; the first was bushop poore, hee built 11 yeares; the second bushop Bingham, hee built 20 yeares; the 3 was bushop yorke and built eleven yeares; it was a building 42 yeares & have ben built 4 hundred yeares in the yeare 1662. It have as many Chapells in itt as monthes, as many doores as weeks, & as many windowes as dayes in a yeare, and as many marbell pillors as howers in a yeare. The lenth of this Church is on hundred 45 yards long and soe is the steeple; and the 22 of september 1623 there was 2 men at the toppe of him and did roost a shoulder of mutton. The prince of denmarke wa' there then."

The only man who is now allowed to climb this dizzy height, the last few yards of which have to be surmounted by an external ladder, is the man who oils the vane; but there is no record that he cares, on his annual expedition, to stay and roast a shoulder of mutton there, either with the countenance of the Prince of Denmark or without.

Few, if any, of the English cathedrals can vie with Salisbury in the beauty of its Close. The great extent of the smooth sward from which the cathedral springs abruptly, like the mountains from the Lake of Lucerne; the ancient trees whose shadows sparkle, on a sunny day, with every passing breath; the liquid music of the rooks; the screen of ancient houses which completely surround it and shut out the busy, profane world; all these combine to form an ideal picture of dignified, placid content. Here the noise of the "maddening crowd's ignoble strife" falls faint and musical, blended with the happy gurgle of the rooks or the distant peal of the organ. Not often is the stillness broken save by the demizens of the place. Perhaps twice on Sundays it is enlivened by a stream from outside its gates, called thither by devotion or its frequent substitute, the love of seeing and being seen. But the tide ebbs as quickly and completely as it flowed, and the Close returns to its normal state of repose. Ah! could one but cast away doubts and difficulties, fling the consideration of problems to the winds, refuse to listen to the dry voice of logic, accept the belief that what is right, and take up one's abode in Salisbury Close as a calm contented member of the Chapter! How could not one study architecture then,—the architecture of delightful books and white-handed dilettanti,—free from the miseries of disputed accounts, scamped work, and the untuneful chorus of committees!

THE ÆSTHETIC ANALYSIS OF CURVES OF CONTRARY-FLEXURE.

BY W. CAVE THOMAS.

HAVE taken the above theme for a casual exposition of an æsthetic analysis based upon the quantitative or mathematical theory of taste. The curve of contrary-flexure, alternation, or undulation is one very widely obtaining in the fluctuation of nature from one state to an opposite. It is the curve of easy transition. The curve has its analogues in the graduation of colour, light and shade, and music. It is even by a curve of this kind that trains are smoothly transferred from one line of metals to another.

Hogarth never got to the top of the notion of which his line of beauty was a vague *aperçu*. That line, as he conceived it, was constituted of two equal but reversed curves, and was, in the absence of moderate contrariety in its proportions, in no strict sense a line of beauty. The more beautiful curves of contrary-flexure are those in which the two curves are moderately differentiated in magnitude, and in character; those in which a long obtuse curve alternates with a short acute, and *vice versa*. This is the type of the cyma.

Dilettanti writers are very apt to affirm that there is no equality in nature. Nature, nevertheless, refutes them; she exhibits equality as well as inequality,—she gives us equal as well as unequal days and nights,—equal as well as unequal divisions in the human frame, and regular as well as irregular geometrical figures. Still, it may be admitted that equality is not her general tenour. She avoids extremes, and steers a middle course, between the polar opposites of parity and extreme difference.

Equality and greatest difference are the extremes of quantitative relation, of ratio, and may be expressed as 1:1 and 0:1. Between these polar extremes nature generally oscillates, seldom deviating, but within the limits of moderation, from her golden mean. This, which is the principle of rectitude in nature, should also be the principle of taste. It was long since regarded as the principle of morals by Aristotle, and modern writers on this subject are beginning to see that right conduct is proportioned conduct. We may go a step further, and show that correct taste is proportioned taste. Dufresnoy must have felt this when he wrote,—

"And taste, like morals, loves the golden mean."

Perfect taste alike rejects the extreme of equality and of inequality in the quantitative constitution of objects designed solely for its gratification. The limits of moderate variation of ratio are 1:3 and 2:3; 1:3 represents moderate divergence or inequality between two quantities, and 2:3 (1:1½) the moderate approximation of two quantities to likeness, sameness, or equality. The ratio of absolute indifference or neutrality between the extremes of quantitative relation is expressed by the mean ratio 1:2. It is this ratio of which alone it cannot be said that the relation between its two terms is either too equal or too different. The following is the skeleton scale of the infinite series of ratios:—

Compass of moderate ratios.		
Equality.		Greatest dif.
1:1.	2:3.....1:2.....1:1½.	0:1
Extreme.	Mean.	Extreme.

1. *Curves of Contrary-flexure composed of Segments of Circles.*—The circle is the geometrical figure of extreme equality, every point in its circumference being equidistant from one within. And its curve is the curve of extreme grossness to sense. The cultivated sense alike revolting from excess and defect, the too much and the too little, finds its concord in "the moderate." For these reasons the circle is not found to obtain to any great extent in works of consummate taste, for the circle and sphere are too equal, too constant in curvature, and too redundant in mass and contour. The circle, however, occurs in the horizontal sections of works of nature and of art. In works of art the circular in plan is mitigated in perspective and appears elliptical. Curves of contrary-flexure composed of segments of circles are, therefore, seldom found in artistic design; that composed of two semicircles is perhaps the most disagreeable of its genus. A curve of contrary flexure of two flatter segments, or of arcs of 90 deg., is far preferable, and is very much the proportion of Hogarth's line; but both the foregoing combinations contain too great an amount of equality or regularity in their curvature and their alternation. A much more agreeable line than either is that which is composed of two unequal segments whose chords, and whose arcs, are in the mean ratio of 1:2, and of such there may be two modes, *i.e.*, one in which the longer chord carries the obtuser segment, and the other in which it carries the acuter. In these combinations an element of moderate contrariety is introduced which æsthetically improves them.

2. *Curves of Contrary-flexure produced by Combinations of the Ellipse.*—The next series of curves of contrary-flexure and of æsthetic superiority, as it would naturally be supposed, would be combinations of the ellipse. And, just as æsthetically the ellipse supersedes the circle, in sensuous opposition, by the greater amount of inequality or differentiation in its curve, we should expect elliptical curves of contrary-flexure to supersede those of the

entirely old or entirely new; a piece of patchwork it may be called; but then all our old churches have been pieces of patchwork for centuries, and must continue to be so unless posterity is to be deprived of them altogether.

NOTES.

DISCOVERIES as to the ancient topography of Pergamos go on apace. Dr. R. Bohn thinks he has fixed the site of the Temple of Dionysos. Dio Cassius, who was himself at Pergamos, mentions a Dionysion (Dio Cass., xli., 61), and Caesar ("De Bell. Civ.," iii., 105) speaks of the adyta of the same temple. A theatre has been laid bare at Pergamos, and an inscription settles that it was dedicated to Dionysos, the leader (*καθηγεμών*). There is no space for a temple close to the theatre, so Dr. Bohn looks a little further afield. On the lower market-place, close to the west wall, the foundations of an oblong building, unmistakably a temple, have been excavated. Happily what that temple is placed almost beyond doubt by the discovery of architectural and sculptured remains built into a neighbouring Byzantine wall. From these it appears that the temple was a Doric prostyle, presenting certain peculiarities, which Dr. Bohn shows in detail in his reconstruction. The waterspouts of the cornice are sculptured very appropriately into satyr heads, unmistakable from their long pointed ears. A marble slab has also been found, decorated with somewhat naturalistic designs of vine branches with leaves and fruit. Dr. Bohn conjectures that this formed part of the frieze of the inner cella. His paper on the subject was read before the last meeting of the Königl. Preuss. Akademie, at Berlin, and is now published as a *tirage à part* from the *Abhandlungen* of the Society.

AMERICA, with its slender archaeological resources, yet ventures to put forth a periodical devoted exclusively to the promotion of archaeological study. The "American Journal of Archaeology and of the History of the Fine Arts," the first number of which has just appeared, covers a wide field,—antiquities, Oriental, Classical, Early Christian, Medieval, and American. The journal undertakes not only to notice and illustrate important works contained in public museums and private collections, but also to record and review the whole field of archaeological discovery and investigation, and to furnish reports of meetings, summaries of papers, reviews of books, &c. We are glad to see there are nine editors, two general and seven special; we think they will have enough to do. England is represented by Dr. Waldstein. The journal is to appear four times yearly. The first number, which may be supposed to be fairly representative, contains a paper on J. J. Middleton, whose only interest is, we suppose, that he was apparently the first American archaeologist (we hope the paper will not lapse into mere antiquarianism); a discussion by Dr. Waldstein of the central slab of the Parthenon frieze; an account of some inscribed sepulchral vases in possession of M. Feuillant, of New York, by A. C. Merriam; an article on the revival of sculpture in Europe in the thirteenth century; and a paper by A. R. Marsh, which is in fact an analysis of Dr. Dürrfeld's *mémoire* on ancient brick construction and its influence on Doric style, which we noticed in detail six months ago.

THE Lillebonne mosaic is to be put up to auction at the Hôtel Drouot, Paris, and will go to no one knows whither. M. E. Babelon does, therefore, good service to archaeology by securing, if not the safety of the original, at least, a careful reproduction in the *Gazette Archéologique*, the current number. The mosaic was found at Lillebonne, near Havre, and belongs to a class necessarily rare, *i.e.*, monuments of Roman workmanship found within the limits of ancient Gaul. The few mosaics with pictorial, as opposed to merely decorative subjects found in France, have too often suffered destruction

from their inconvenient size. The centre of the Lillebonne mosaic represents Apollo pursuing Daphne; the lower part of the face and most of the figure of Apollo are destroyed. The inscription above and below this central design runs "Titus Sennicius Felix, citizen of Puteoli, made this, and his pupil Amer, citizen of Carthage." The outside field divided into four parts, represents four hunting scenes; the start in the morning with a tame stag, taken as a decoy, two hunting scenes, and an invocation to Diana. M. Babelon recalls the similar representation (also probably coming from Carthage) on the Præneste Phœnician bronze bowl, the subject of the famous *mémoire* by M. Clermont Ganneau. We shall be interested to learn where this valuable mosaic goes to.

WHAT the Egyptian Exploration Fund has recently done for Egyptology is by now matter for European fame; what it has done, what we confidently hope it will do for the history of Greek art, and especially of Greek ceramics, is less well known. Happily the Fund has had for its chief promoter a scholar whose sympathies are wide enough to embrace both East and West. From Nebelrah has just arrived a case containing samples of the treasure-trove. With a wise liberality these specimens are shown to the public in the right-hand wall case of the fourth vase-room of the British Museum. In a few weeks more eight large cases are expected. When these appear we shall hope to notice and comment on the find in detail. Till then we must be content to point out that, to the student of ancient pottery, and specially that of the archaic period, the fragments already sent are of the first importance. We note in particular a fragment painted in delicate colours, with a chorus of female figures dancing hand in hand, another fragment of a woman figure inscribed in archaic letters on either side, some fragments painted with red-yellow designs like the early Ephesus pottery, another with a chimæra of novel pattern, some fragments which seem to us to be of the Dipylon style. All these are marked by a specially delicate naturalism. Of the black figured period we have a fragment with a negro's head, very carefully executed; and last, though no wise least, a cylix nearly complete with the design of Odysseus carried by the ram.

THE completion of the Canadian Pacific Railway is not only a prominent incident, even in these days of gigantic engineering undertakings, but is one that directly affects British interests, as being the first successful effort to bridge the North American Continent across Canadian territory, and thus bringing the resources of the Atlantic coast into immediate connexion with those of the Pacific. In the more southerly portions of the Western Hemisphere, the Americans have already done this by the building of three enormous trans-Continental systems, two of which place New York in direct communication with San Francisco,—the one *via* Chicago, Omaha, Ogden, and Sacramento; the other by St. Louis, Kansas City, Topeka, Santa Fé, and Los Angeles. The third and most recent runs from Chicago by St. Paul, Bismark, and Helena, to Portland on the Oregon coast, and is known as the North Pacific Railway. In point of distance, however, the Canadian system has the advantage of them all, the mileage from Montreal to Port Moody, in British Columbia, being only 2,870, while that from New York to San Francisco is 3,331 by the shortest of the United States lines, so that, as a matter of fact, the two largest American cities are nearer to the Pacific by the Canadian road than by their own. The moral effect of the completion of this great artery to the British possessions can scarcely be over-estimated, either for business or governmental purposes. Troops can now be conveyed from Halifax to Vancouver's Island in seven days; and it is not too much to say that the quelling of Riel's rebellion has, to a great extent, been facilitated by the proximity of the rails to the disaffected country. A vast area

is now made available for agricultural undertakings, while the wheat crops of the far North-West, the cattle of the Rocky Mountain ranches, the fisheries of the North Pacific coast, and the gold mines of British Columbia will be brought within three weeks of the English markets. By the establishment of regular lines of ocean steamers, as contemplated, the time now occupied between England, China, and Japan will be reduced by at least one third, while, last but not least, one of the wealthiest points in the British dominions, and the least guarded against Russian aggression, will now be fortified a hundred-fold, both actually and morally. The Canadian Pacific has forged another great link in the homogeneity of the confederation, and the establishment over the sea of a vast British kingdom as large as Europe, and more than half the size of the United States.

THE truth that there are always two sides to a shield is sometimes illustrated in a remarkable and unexpected manner; and although dirt (euphuistically defined by Lord Palmerston as matter in the wrong place) is constantly found as a practical element in social life, it is rarely that it has apologetics hardy enough to defend its presence. But this has now happened, and in such a forcible way that many people will begin to doubt the doctrine of cleanliness being next to godliness. It appears that, amidst the Crofters' question, somebody has been describing in the *Times* the filthy condition of Highlanders' houses generally, as being dark, unhealthy, and miserable, the occupants, both man and beast, having no light or ventilation save from the aperture through which the smoke escapes. However, a Highlander has started up to do battle for the beloved bottles in which he passed his early days, and to which he attributes all the blessings of his subsequent life, including a herculean frame and constitution. Not only, according to him, is the ventilation singularly effective, if rather draughty, but the continued inhalation of peat smoke, which generally brings tears to the eyes of the unacclimatised visitor, exercises marked beneficial results in protecting the lungs from consumption and other diseases that depend on various forms of parasite. This view is strongly corroborated by a Manchester physician, who points out that there certainly is a remarkable immunity from phthisis amongst the Highland race, and this he ascribes very largely to the inhalation of peat smoke, which contains many antiseptic ingredients, such as tar, creosote, and tannin, together with other volatile oils and resins. It is worth noting also that the Highlander whom an unkind fate afterwards drives into an ordinary chimneyed building, thereby lowering his stamina, loses his charmed existence, and becomes as liable as other beings of a lower order to the ills and diseases to which flesh is heir.

THE Vicar and Churchwardens of Great Bookham, near Leatherhead, have given notice of their intention to apply for a faculty for the complete restoration of the parish church, for which purpose a sum of 1,700*l.* has been subscribed. A description of the intended alterations has been affixed to the church door, with an intimation that notice of objection should be forwarded to the Office of the Commissary of the Diocese of Winchester for the County of Surrey, 23, Knight-riding-street, Doctors' Commons, not later than the 7th of June. The church was partially restored some years ago, when the south aisle was refaced externally, a new roof put to the chancel, and the stonework of the arcading in the interior scraped and pointed. The most conspicuous features in the church at present are two monuments, one on the north side and one on the south side of the chancel, to the memory of William Moore, of Polesden, the eldest son of Archer Moore, of Fetcham Park, one of the Lords Commissioners for Trade and Plantations in the reign of Queen Anne, and M.P. for Banbury, who died in 1746; and of Colonel Thomas Moore, a younger brother of Arthur Moore, who planted Fetcham Park and built the mansion, now the residence of Mr. J.

Barnard-Hankey, but who is chiefly memorable for an amusing squabble with Pope, who, he alleged, plagiarised his verses. These monuments, which are of considerable merit and are very characteristic of the art of the period, are proposed to be removed and to be refixed on the north wall of the north aisle. It is proposed to re-arrange the memorial tablets in the chancel. If any of these have marked the site of an ancient interment this is a step which should not be taken unless absolutely necessary. On the north wall of the north aisle is a tablet to the memory of Louis Bazalgette, who died in 1830, but was not buried there, but in Marylebone Church, London.

AT the Church of San. Giovanni in Laterano in Rome, the works in the transept consequent on the moving back of the east end of the choir, with its beautiful mosaics, are approaching completion. As far as lavish expenditure can go, all is being done, but that "all" is in the worst possible taste. Marble inlaid work of bad design, and gilding smothering every enrichment, are placed side by side with thirteenth-century mosaics, and the *tout ensemble* is as jarring as possible. The beautiful cloisters attached to this church are still divided up by partitioning and glazing, which certainly neither preserves them nor improves their effect.

AN exception to the general condemnation of Italian restoration should be made in the case of Orvieto Cathedral. The roofs of the nave and north aisle are being replaced, and the latter, which is nearly finished, really looks very well, and suits the character of the building. In form it is a lean-to, very much like one of the English fifteenth-century roofs, but with very much coarser details. The nave is to have a tie-beam roof, of much the same character and similar in design to the old one it is to replace. It is very probable, however, that, as at San Miniato at Florence, the timbers will be painted in very glaring colours.

THE Irrigation Commission in America has given an interesting account of windmill irrigation at Florin, about eight miles from Sacramento. It appears that formerly the neighbouring district was irrigated by channels led from the Sacramento river, previously to which time it had been impossible to obtain water by sinking wells, but since the saturation of the soil has taken place water is found at depths of 10 ft. to 20 ft. One particular farm visited had fifteen windmills on about 40 acres, which were cultivated chiefly with blackberries, strawberries, and table grapes. The first-named fruit were a variety as big as plums, and yielded about 4 tons per acre, as also did the grapes, which without irrigation could not produce one ton. The blackberries and strawberries are sold for 6 cents per pound at the nearest "canneries," but the grapes are carried by rail over 2,000 miles, as far as Chicago, where they fetch 30¢ per ton. The soil at Florin, although poor on the surface, is underlaid by a "hard pan" formation containing lime and other elements, which, being brought into contact with water, decomposes and makes a rich mealy subsoil for sustaining deep-striking roots like that of the vine. The cost of the windmills varied from 12¢ to 20¢, and that of the pump, with 50 ft. of piping, was about 3¢. 12s.

AN endeavour towards imparting an artistic and attractive aspect to a very plain (nay, ugly) interior, has been taken in hand by a number of the students of the School of Design, in Edinburgh. The interior in question is an appendage to a mission church just completed at the north-west angle of the Grassmarket of that city. It would perhaps be too much to expect that the interior of a Presbyterian church should be decorated with mural paintings, but no objection could reasonably be taken to such decoration in a Sunday school. The church is lighted from one end and one side, and the blank wall surface would have afforded a wide field for decoration; and it may probably, in the course

of time, receive such. It is, however, in the Sunday-school, which occupies the ground-floor upon which the church has been superimposed, that the scheme of mural decoration is being followed out. The schoolroom, which is to be used for other quasi-clerical purposes, is lighted by square windows with central mullions; the ceiling is flat, and it and the walls are finished in plaster. The wall surface has been spaced out in upright panels by broad black lines, and each panel is to contain a cartoon in red chalk, taken from Millais's illustrations of the parables which appeared in *Good Words* several years ago. The figures are life-size, and the drawings are to be fixed by an after process. To make the scheme of decoration homogeneous, the spaces between the cartoons should be filled in by arabesques in pale blue or neutral tint. This experience affords to the students an opportunity for working on a large scale. If successful, it may lead to others of a like nature.

THE Exhibition of the Society of Painter-Etchers is one of the best and most interesting collections ever seen in the Dudley Gallery. It is very various in character, and offers examples of the many styles in which the beautiful art of the etcher can be used; not all, however, equally admirable or desirable. We have always held that the special power of etching lies, in addition to its peculiarly beautiful tone, in the facility it gives for absolute freedom of line and hand, and thus for the freest expression of the artists' individuality of touch and manipulation. Accordingly we do not see the highest or best use of the method in such elaborately and almost mechanically finished and shaded works as, for instance, Mr. David Law's "Bridge of Sighs" (74), which is only doing what engraving can do as well, and with more solid and permanent results. The other extreme, of scratching over a drawing with black ropes rather than lines, as in Mr. Aikman's "In Glen Lyon" (86), is perhaps also an exaggeration in the endeavour after force and freedom. Perhaps Mr. Ernest George's "The Bridge at Prague" (185), and Mr. Frank Duveneck's free and aerial-looking Venetian studies, best represent what etching can do with subjects in which architecture is prominent. M. Ford's "Notre Dame" (24) is fine in its way, but it is an affectation of mystery and loss of detail. Among the more solid and clear, but still not over-worked, architectural subjects, Mr. C. O. Murray's "The Virgin Porch, St. Mary's, Oxford" (175), is a good example, and Mr. Haig's "At the Fountain of St. George, Evening" (196). There are some fine landscape studies, and a variety of work of great interest. We have merely touched on a few which illustrate our special point as to the proper powers of etching, especially when dealing with architectural subjects, which, we may observe, form a large proportion of the collection.

OUR correspondent in Paris referred, in a communication some weeks ago, to the series of studies of the costumes and uniforms of the French army, which M. Detaille has been executing for the work to be brought out under the title "L'Armée Française," the text by M. Jules Richard. These drawings are now to be seen at MM. Boussod & Valadon's (late Goupil's), in New Bond-street, and are well worth a visit from those who appreciate brilliant drawing of figure and costume, and who are interested in the history of military appointments. Some of the photo-gravure reproductions, in monochrome and colour, which are also exhibited, showing the form in which the illustrations will eventually appear, are marvels of reproduction. One or two of the coloured ones it would be really difficult to distinguish from the originals except for the slight reduction in size.

THE exhibition of engravings by Woollett, now on view at the Fine Art Society's rooms in New Bond-street, forms a good illustration of the powers of the greatest of the old school of English line-engravers. These works want, of course, the refinement and some of the aerial effect which has been attained in

modern engraving, but they are marked by a power and solidity and a patient thoroughness of execution, which is a curious, and, in some respects, a healthy contrast to the easier and shorter methods of much modern engraving, with its sensational effects of high lights and dashes and slashes, and dim suggestion of detail which is not worked out.

THE most notable work in the exhibition of the Society of British Artists is of course the portrait of Señor Sarasate by Mr. Whistler, which has given a sort of *iclat* to this year's exhibition. It is a masterpiece of character in portraiture, but the face is very cadaverous in colour, a sacrifice to the scheme of colour of the whole, which is called "an arrangement in black," and, not to clash with this, the colour is driven from the face and the shirt-front (it is evening dress) reduced to a dirty grey. The result is not pleasing as a portrait, but as a painter's study it is eminently clever and characteristic. The best thing we saw at the exhibition, besides this, was a semi-impressionist "Picture of a Little Girl" (51), by Mr. Harper Pennington. Mr. Wylie's "In the Essex Marshes" (344) is a fine landscape.

A CURIOUS example of the prevalent indifference of scientific men to art is furnished in relation to the recent unveiling by Sir Spencer Wells of a medallion portrait of the late Mr. Peter Squire, at the Pharmaceutical Society's House in Bloomsbury-square. A copy of the Pharmaceutical Society's *Journal* has been forwarded to us, in which six columns are devoted to a report of the proceedings and of the speeches, in the whole of which report there is not a reference to the name of the artist who produced the medallion, although it was commended as a very good likeness, and the artist's name was, as we find, specially mentioned by Sir Spencer Wells in his speech. We presume that the members of the Pharmaceutical Society believe that a medallion which is "a very good likeness" is secreted by some spontaneous process of chemical action. We will supply the omission by recording that the sculptor whose work was commended was Mr. Brock.

THE lucubrations of the "British Matron" in the *Times*, to which we referred last week, led to a considerable correspondence on the subject of nude pictures, including a great deal of nonsense on both sides; for the artists who wrote in defence were as illogical in their reasonings, and as completely missed the real point at issue, as most of their opponents. A characteristic light was thrown on the distinction between prudery and modesty by a letter from a lady, evidently a very different stamp of person from the "British Matron," who said that her daughter of seventeen, who had before looked at and criticised the pictures at the Grosvenor, saw with surprise the correspondence in the *Times*, and exclaimed, "Why mother, we saw nothing improper at the Grosvenor." The correspondence had, however, the effect of eliciting a really valuable and thoughtful letter in the *Times* of Monday, the 25th, from a correspondent signing himself "H.," who has the rare faculty of seeing both sides of the question, which the artists mostly have not. We hope his letter has been read, marked, learned, and inwardly digested by both painters and public.

Huddersfield.—On the 9th inst. the memorial stone of a new junior mixed department to the Mount Pleasant Schools, Huddersfield, was laid by Mr. J. E. Willans, J.P., chairman of the Finance and Works Committee of the Huddersfield School Board. The original school was erected about ten years since. The new department will accommodate 460 children of both sexes, in the first and second standards. There is also a room for teaching cooking to fifty of the older girls. In the new works are included extensive playgrounds, and also covered play-sheds for the infants' department, and sundry alterations to improve the old buildings. The contracts have been entered into to the amount of 5,411£. The style of the building is Early Gothic. The architects are Messrs. Henman & Harrison, of London.

ARCHITECTURE AT THE ROYAL ACADEMY.*

If the truth must be told, the exhibition is not this year very strong in the department of domestic art. There are no works of exceptional importance in point of magnitude, and the smaller works are not distinguished by any great originality of treatment. If the walls were stripped of some half-dozen drawings there would really be nothing left for special comment, so far as this branch of architecture is concerned. As the footman in *Punch* thought it high time "some new hanimal was invented" to give the jaded appetite a fillip, we are tempted to think that the time is ripe for a new man who shall give to our house architecture a fresh impulse. This may be ingratitude; but it is, at any rate, human nature. Was it Edward III. who requested the literary lights of his Court to "boke some newe thing"? "Newe things" ever were and ever will be in request, and architects must not expect to escape the common fate. We tire of the best art if it is a repetition of the same art. When Columbus first made his egg stand on end it was doubtless looked upon as a very pretty feat; but when every one could accomplish it, and its only excitement of novelty had worn off, we may be sure that his companions soon discarded, and perhaps derided the stale trick. The architectural gallery is full of the work of second-hand Columbuses. We must, of course, except from these remarks the always original work of Messrs. Ernest George & Peto, artists in a double sense. The houses they build are every way excellent, and the drawings which they contribute are always amongst the freshest and most interesting in the room. But the houses are not like the drawings, and consequently the drawings are not true illustrations of the houses. As a fact their cornices are, like every one else's, ranged in scrupulously level lines, their chimney-stacks are in reality carefully plumbed, and do not totter to their fall and in hopeless disrepair; their casements are not "crazy" and their roofs do not "sag." Nor do the servants of the house hang out their hearthrugs from the outer walls or display their lingerie to break the long lines of balustrade and balcony. Even South Kensington has not carried its aestheticism to this pitch. Nay, we have even noticed that Mr. Ernest George's own beautiful residence is as correct and decorous in these respects as the most Philistine of its neighbours. It is only in his drawings that these aids to the picturesque are seen, and we would be the last to wish them away. There have been architects who could make exquisite drawings, but who could not translate their designs into bricks and mortar, and there have been others who could build divinely, but could not make such a picture of their works as would have a ghost of a chance with the Hanging Committee. In Mr. Ernest George we have an architect who can do both equally well, and long may he live to delight us alike by his buildings and his draughtsmanship.

The "House at Ascot" (1874) gains a special interest by the addition of an attached chapel, which is apparently designed to accommodate an outdoor congregation of (perhaps) tenants as well as the members of "the family." The axis of the chapel forms a very obtuse angle with the drawing-room front from which it projects,—an obliquity which is not, we think, expressed in the perspective. Ever since the house built by Mr. Shaw for Mr. Goddall, in which the studio was so aligned, the arrangement has been a favourite one. And where considerations of aspect,—such as obtaining a north light for the painter,—are present, the arrangement is not only defensible, but commendable. In the present case, the exact orientation of the sanctuary cannot have been the motive, and the departure from the right angle is too slight for attention in that respect. It is, of course, possible, that the object was to broaden the prospect from the drawing-room window, which fills the re-entering angle where the chapel and the drawing-room meet; or the arrangement may be merely fanciful, and, if so, savours a little of affectation. The plan of this house should be studied carefully, for it is perfect. To appreciate its great merit, the student has only to compare it with the plan on 1,945, which is also a design for a country house, by, we

should imagine, a very young man. The Ascot plan has all the agreeable quaintness which we desiderate in a country house, but comfort and convenience are never sacrificed, or even jeopardised, and light and air permeate every corner of it. Externally, the changes are artistically rung on features familiar in all this artist's works. The long series of flat gables, the bracketed oriels, the quarry glazing, the hanging tiling, the dodgy little windows in unexpected places, and at all sorts of levels,—we have them all once more. This species of design scarcely rises to the level of high art, being a revival of a manner which was a couple of hundred years ago accomplished by the unaided workman. Nevertheless, the difficulty of attaining a due soberness without dullness, and a becoming piquancy without a Cockneyified fussiness, is greater than most people think. That it is difficult is proved by the fact that, whereas so many attempt it, so few succeed. Woolpits (1,765) and Collingham Garden (1,854) are more ambitious, and, we think, less successful designs. But we can never be sufficiently grateful to the school of architects who give us these pleasant effective combinations of agreeable colour and picturesque outline. The real old English houses are fast vanishing, and it is a matter for sincere congratulation that their place is being filled by worthy successors, and that the country is not to be given over to the dreadful monotony of ugliness which so recently held undisputed sway in the land.

The Restoration of Naworth Castle, by C. F. Fergusson (1,844-7 and 1,883-6) is shown in two series of brilliant pen sketches by Mr. E. F. C. Clarke, which are deservedly hung where they can be well seen. This is unfortunately not the case with Mr. Halsey Ricardo's single contribution (1,808), "Westgates," near Charlwood, Surrey, which is too high for due examination. For this reason we cannot follow the plan at all, and can only say that the house is homelike and quiet in treatment, and late Tudor in style, artistically composed, and quite satisfactory in its general effect. It strikes one as an odd circumstance that only one small chimney-stack is seen. This fortunately comes in the precisely right place for the grouping of the building, and we must take the author's word that the others are duly accounted for.

The additions to Stowell Park (1,756 and 1,757), by Mr. J. Belcher, are shown in a beautiful geometrical drawing. An old and very fine Early Tudor house has been extended with so much of the feeling of the old work that it is difficult to say where the old ends and the new begins. We should have liked a plan in further explanation; but the only sure way to exhibit the plan is to draw it on the same sheet as the elevation, for we find that the committee are very apt to reject plans if separately sent, be they ever so interesting.

In 1,945 Mr. Fitzroy sends a "Design for a Country House," which, so far as the elevation goes, shows careful study of old work and much facility of composition and draughtsmanship.

With a reference to Mr. Flockhart's "House and Studio, Abhey-road, St. John's Wood" (1,742 and 1,745), we must close our remarks. As a design it is admirable for effective grouping and appropriate detail, and as an example of free pen-and-ink sketching it is a veritable *tour de force*. There are some other designs and drawings in the gallery which would deserve a more particular notice but for the fact that they are little more than repetitions, appearing under different names, of what we have before carefully analysed. So strong a resemblance do they bear to the previous works of the same authors that our first impression is that they are old acquaintances, and that in spite of their fixed rule the Royal Academy has admitted drawings after previous public exhibition.

Woodford (Essex) School Board.—This Board, having decided to enlarge their Churchfield Schools, consulted Mr. Edward Tedman, C.E. (who has, as surveyor to the London and Suburban Sanitary Association, just carried out a new system of ventilation and sanitation at these schools), and instructed him to prepare plans of a new infant school to accommodate 200 children. These plans were examined by the Board at their meeting on the 22nd inst., and approved, the architect being instructed to obtain the approval of the Educational Department, and to obtain tenders for the work, to be submitted to a future meeting of the Board.

NOTES AT THE PARIS SALON.*

CONTINUING our remarks on *genre* paintings, it is in that category that we must place the "Faust" of M. J. P. Laurens, a small picture of sober and harmonious colour,—a picture well fitted to console us for the "tableaux érotiques" which the jury tolerate, to the great prejudice of art and artists. Accordingly, in the mere interests of M. Henri Pille, we pass in silence a Rabelaisian scene unworthy of his talents, and which he entitles "Tentation." As to M. Roll, what does he wish to prove in his picture of a nude woman caressing a black bull in a sunlit landscape? It is the fancy of a painter taken with the play of light and shade on the flesh; but that sort of study belongs to the *atelier*, and not to public exhibitions.

The landscape and animal painters form a very numerous party in the class of *genre*. Among the first, M. Pasini, with his small finely-finished scenes, and M. Guillaumet, with his broadly-painted Algerian subjects, remain both of them faithful to the East. M. François, for his part, is eternally Italian; while MM. Harpignies, Emile Bréton, and Harmoteau, transport us here and there to those green fields of France, the poetry of which M. Jules Bréton also knows so well how to render. Here, again, we must distinguish the old school, represented by MM. Ciceri, Carzon, Bellel, and Vidal, whose mannered works bear an unmistakable date; and the young artists, such as MM. Paul Collin and Pelouze. The latter exhibits a cliff scene, bounded by the distant sea, of great simplicity of composition. This picture, and the views in Holland of M. Grandis, the luminous sea-paintings of MM. Bondin and Lapostolle, and the Breton landscapes of Madame Elodie Lavilette, merit especial mention among this group of painters, who love open air and the changing movement of the sea. MM. Lepine and L. Loir, they do not leave Paris, and confine their ambition to reproducing the various perspectives of the Seine, and the many aspects of the panorama of the Tuileries.

Among the animal paintings may be mentioned the cattle of MM. Barillot, Bonnefoy, Marais, and Julien Dupré, the dogs of M. de Penne, the powerful "attélagés de hœufs" of M. Princeteau, and the "toro colante" of M. Aimé Morot, a veritable reminiscence of Goya, which transports us to the Spanish bull-fight at once.

We may class among the *genre* painting the marvellous paintings of objects of art made by M. Blaise Desgoffe, from the collection of Sir R. Wallace. Why does he not confine his talent to this inimitable painting of jewels and precious stones? By the side of the still-life pieces of MM. Volland, Philippe Rousseau, and Bergeret, the fruits of M. Desgoffe went truth and texture. They are of agate, like the dish which supports them.

Portraits.—Under this class we must evidently place the graceful profile which M. Henner, the painter of pearly-toned nymphs, has given under the title "Fabiola." We prefer the portraits of M. Paul Dubois. This eminent sculptor often abandons the clay for the palette, and then reveals himself as a colourist of the first order. There is masterly power in his head of an infant standing out from a crimson background, which gives force and effect to an exquisite piece of modelling. His harmonious portrait of a young woman, entirely in brown tones, is more seductive than the brilliant colouring of M. Carolus-Duran. It would be unjust, nevertheless, not to praise the latter for the great ability with which he arranges his draperies and laces, and makes the lights flash from the silks. In his "Portrait of Miss . . ." the head with the aureole of blonde hair is charming in expression, but it has not the calm and masterly simplicity of the works of M. Delannay.

"Autour d'un Piano" is a collection of curious portraits of solid execution, which M. Fantin-Latonar has grouped with admirably studied realism. Very remarkable also is the portrait which M. Jean Sarjent exhibits this year. Perhaps he has cut out a little too hardly this silhouette of a young lady in a grey dress relieved against dark oak woodwork. Mr. Whistler's "Portrait of Lady Archibald Campbell" recalls the painters of the Spanish school. The sombre dress and the ottor fur are almost indistinguishable from the tone of the background, the head alone forms a luminous point

* See p. 607, 650, 664, 720, ante.

* See p. 721, ante.

and detaches itself, fine and graceful, from this artificial obscurity. There is remarkable talent in this portrait, which the public like little and do not understand at all.

Here you come to a picture at once political and impressionist. M. Raffaelli has represented M. Clémenceau at a public meeting, standing with his hand resting on a red tablecloth and surrounded by electors, certainly true to the life, in the triviality of types which they represent. This sensational picture, however, will not class M. Raffaelli among the great modern painters. With a different method, M. Jôhê Duval, who is a "classique," has arrived at nearly the same results. His colleagues of the Conseil Municipal of Paris, sufficiently true as to likeness, are shown in cadaverous and very disagreeable colours. In mentioning the study by M. Brosnan, entitled "Chez Soi," the charming head by M. Chartran, the elegant figure in Louis XV. costume by M. Léon Comerre, and the two finely-finished works by M. Mathey, we shall have mentioned, we believe, the most interesting portraits of the Salon. We have resched besides the limits of our space, which will not allow us to mention the drawings, water-colours, pastels, and engravings, which include, nevertheless, a great deal of interesting work; and there are many other things which we have been obliged to pass over. We hope, nevertheless, that among the 3,000 pictures exhibited this year we have made so impartial a selection as to indicate at once the high qualities of some, the errors of others, and the general sum of the talent displayed by the painters of the Salon of 1885.

Sculpture.—This essentially monumental art demands Municipal and State competitions to allow it free scope for development. This kind of encouragement has been slack of late. For two years the Municipality has made few purchases and the State still less; the artists, wearied of labour which brings nothing, and alarmed at expense without results, are discouraged in the fight and dare not put forth their powers for the Salon; and the present exhibition is thus inferior to its predecessors. There are many reproductions in marble and bronze of works already known, but few new and original productions. Considering the demands of the budget and the deficit in the *octroi*, what will become next year of the credit of the city in the fine arts, already too restricted in the present year?

Monumental Sculpture.—We notice first in this category the "Triomphe de Sillêus," by M. Dalon, a group full of spirit, but somewhat brutal in its feeling, though very interesting and composed with a feeling for decorative effect. We prefer, however, the memorial statue of "Blanqui" by the same artist, the rigid form of which is designed with great power beneath the shroud whence issues an emaciated arm. The head has an expression of suffering, and the crown of thorns placed at the feet symbolises the vicissitudes through which the old revolutionary has passed. The marble statue of "Madame la Duchesse d'Orléans," mother of the Comte de Paris, which M. Chapu has executed for the Chapel at Dreux, contrasts by its calm beauty with the nervous work of M. Dalon. This latter monument is of remarkable execution and fine sentiment. The same qualities are apparent in the figure of the young woman whom M. Mercier shows us veiled and sleeping. There is a sweet and melancholy feeling in this charming figure entitled "Sonvenir," which is to adorn the tomb of Madame Chas. Ferry, daughter of M. Allain Targé, Ministre de l'Intérieur.

This is a decisive year for M. Daillon, whose marble figure "Reveil d'Adam" is a work in a great manner, the property of the City of Paris. It is also for the municipality that M. Paris has executed his "Le Temps et la Chanson," a fine group in marble, and M. Vital Cornu his marble statue "l'Abondance"; and for the municipality also are commissioned the "Héran d'Armes" of M. Courdounier, the "Marat" of M. Baffier, and "L'Avengle et le Paralytique" of M. Michel. M. Daillon has also a group entitled "Bonheur," which merits special mention. Another work to be noted is that of M. Demaille, in which the principal figure, draped in antique fashion, seems protecting two young children, while with the other arm she embraces a young girl who regards her

tenderly. This group, entitled "Protection," has a fine decorative outline, and the manner is full of calm and noble expression. We like less the marble bas-relief by M. Hector Lemaire, intended for the Mairie of the Sixteenth Arrondissement, and which personifies "l'Hygiène." The general aspect is too flat, and the main lines are crushed by the architecture which surrounds it.

Among the commemorative monuments, numerous enough this year, figures the bronze statue of Francis Garnier, intended for the town of Saïgon. M. T. Noël has perfectly rendered the expressive head of the brilliant officer of marines killed in the first Tonkin expedition. We may mention also a group which M. P. Ogg calls "baptême gaulois," a young woman making her child kiss his father's sword. This is a work in a fine style; but unfortunately a little further on we meet with "La Sentinelle Gauloise" of M. Desca, the "Cuerriers Gaulois" of M. Quinton, the "Fierté Gauloise" of M. Vital Cornu; and in spite of the talent of these artists, we find, as in the rooms above, the "gaulois" idea somewhat overworked. It becomes monotonous. We must not forget the bronze statue of Cencral Joubert, intended for the town of Bourg, an energetic and stirring work by M. Aubé.

Genre Sculpture.—As in painting, so in sculpture, one can easily remark the tendencies of the modern school, which puts aside antique formulas to attack resolutely the realities around it. One may say that in this branch of art the revolution is already partly accomplished, although it is more difficult for the sculptor than for the painter to render the realism of fact with due regard to the decorative principle of his art. A too faithful interpretation essly borders on triviality, and that is why the "Jacques Bonhomme" of M. Baffier, with his well-developed muscles, his hard and wrinkled torso, and his grimacing head, is only a vulgar and disagreeable study. On the other hand there is the "Jeune Mère" of M. Chrétien, whose elegant form is so perfectly modelled under the coarse clothing of the peasant. The "Premiers Pas" of M. Henri Plé is equally a modern subject, graceful and well treated. Lastly, the robust blacksmith of M. Cauteris, personifying "Le Travail," is the work of an artist who knows how to give to a leather apron and the folds of a blouse the elegance of line indispensable to his art.

Among the *genre sculpture* we must class the "Molière Mourant" of M. Allouard, the elegant "Salomé" of M. Schenewerk, the "Diane Chasseresse" of M. Falguière, a work of great talent, but of which the posture and action are too exaggerated to please. We must mention also a delightful statuette in ivory by M. Moreau Vauthier, "La Peinture," heightened with gold-work and precious stones.

We terminate this rapid review by the series of busts and medallions which always occupy a considerable place in the Salon. Among the first, let us name that of the painter Harpignies by M. Helle, the bust of M. Antonin Proust by M. Rodin, who also exhibits some magnificent medallions; the bust of M. Coppée by M. Delaplanche; that of the architect Cuirain by M. Thomas; that of M. Marmontel by M. Barrias; that of Emile Augier by M. Francesci, &c. But space is wanting, and we must conclude by noticing the admirable medallion commemorative of the Hôtel de Ville by M. Chaplain, of which we hope shortly to give an illustration.

There are in this branch of art, as will be gathered, works of great merit, though in a lesser number than last year. We have given above our idea as to the causes of this momentary arrest of the onward movement of an art which is nevertheless very remarkably represented at the Salon. Yet one may say that in spite of certain deficiencies, the modern school of French sculpture continues worthily the traditions of Pradier, Rude, and David d'Angers, and that French sculpture is still the sound and robust art of which France has so many masterpieces, and of which France has just reason to be proud. R. B. FENWICK.

Association of Municipal and Sanitary Engineers and Surveyors.—The Lord Mayor has signified his intention of receiving and entertaining the members of this Association on the occasion of the annual meeting, which is to be held in London at the end of June.

THE INVENTIONS EXHIBITION.

PRIME MOVERS.—I.

OUR greatest of prime movers, the steam-engine, and its modern ally, the gas-engine, may, on the whole, be said to be fairly well represented at South Kensington; but the same cannot be affirmed of their predecessors who utilise the natural forces of wind and water—entirely absent. This is probably a case of the "survival of the fittest," but it is nevertheless to be regretted, as the use of water-wheels, turbines, and hydraulic engines, where a good fall or pressure of water is attainable, is of very great commercial value, unless the site be an isolated one. Windmills, too, may be made extremely useful for irrigation and drainage, and they have an advantage of requiring little or no skilled attention.

Returning to the steam-engine: during recent years the attention of the majority of engineers appears to have been devoted rather to simplifying and perfecting existing types than to venturing on fresh and unknown lines; this may, however, in a measure be attributed to the severe and long-continued trade depression under which the country has suffered, which has reduced the amount of money manufacturers can afford to devote to experimental purposes to a very small sum. We do not, however, wish it to be understood from this remark that invention with reference to prime movers has been at a standstill. The chief departures have been in the rapid development of the compound system in steam-engines, which, in addition to marine and stationary, is now to be found in portable, vertical, and locomotive engines. What are known as high-speed engines have also been considerably developed, and although they may be held to be as yet in their infancy, the value of some of them as motors for certain kinds of duty has been sufficiently proved, and still more interesting results may be looked for. Gas engines, too, have much advanced and come largely into use, and for small powers,—say up to 8-h.p.—are, without doubt, very valuable as motors. They are also interesting from the fact that unlike steam-engines they do away with the use of water as a medium for developing power, and are one step nearer the goal that engineering science has long striven for, viz., development of the heat contained in fuel directly into useful effect. Hot-air or caloric engines have made but little progress, although for very small powers they may be worked with economy.

The means of transmitting power from the prime movers to the receivers or machines driven have lately increased considerably, compressed air, water, and electricity now being added to the older methods of belts, ropes, toothed and friction gearing, &c. Most of these, but not all, are represented in the Exhibition.

Locomotive engines are not largely represented, as with the exception of Mr. Weh's compound, which we have already noticed, the exhibits are confined to a contractor's locomotive, fitted with a new form of valve gear, exhibited by Messrs. Manning & Wardle, of Leeds; and two steam tram-car engines by Messrs. Merryweather and Wilkinson respectively, with a small double bogie locomotive by the Fairlie Engine Co., Westminister.

A large horizontal engine, fitted with Wheelock Patent Expansion Gear, is exhibited by Messrs. Daniel Adamson & Co., of Dukinfield, near Manchester. The main frame of this engine is of the present popular girder type, which possesses some advantages,—notably cheapness of construction,—but also some disadvantages, upon which, however, we need not enter here. Perhaps the most important feature about the engine is the cut-off gear, which possesses, at any rate, the merit of extreme simplicity. The working parts are very few, and one eccentric works both the main steam and cut-off valves. The chief novelty claimed for this gear is, we believe, the suspension of the valves on hardened steel gudgeons and bushes; consequently the friction, and, therefore, the power required to work them, are reduced to a minimum.

The valves are all placed at the bottom of the cylinder, and effective arrangements are thus easily made for relieving them of water, &c. This is an improvement over the ordinary plan of placing valves above and below the cylinder, as a leakage may be taking place past the stems valves and into the exhaust for a considerable time without detection. In the Wheelock

* Yet this is in a year when, as our correspondent observes, less public encouragement than usual has been given to sculpture. What a lesson for our Government! —En.

engine this is rendered practically impossible by arranging the cut-off valves behind the main valves, so that, when they are open to the exhaust, before the steam can pass into the pipe, it must leak past both the cut-off and main valve faces.

The main valves are worked directly from the eccentric rod by levers keyed upon the valve spindles and the cut-off valves by a positive motion, obtained by means of bell-crank levers and a stirrup-link attached to a lever and riding on a loose collar. The cut-off valve has a concave face with double opening. This engine was in motion, but without driving anything, which is a pity, as it does not permit an inspection of the action of expansion gear under suddenly varying loads; but the makers inform us it has been largely tested in America, and in this country, for driving saw-mills, rolling-mills, callendering, &c., where the duty is intermittent and very severe, and that it will maintain a uniform rate of speed under all ordinary conditions.

Messrs. John Fowler & Co., of Leeds, exhibit several engines, including samples of their compound semi-fixed type. This class of engine has come largely into use of late, and, whether used as a fixture or a portable, presents several advantages not found in high-pressure engines of the ordinary construction. Chief amongst these is its economy in working: this is secured by using compound or high and low pressure cylinders, the steam in the hoiler in the first instance being maintained at a high pressure, say 120 lb. or more per square inch, and after being used in the high-pressure cylinder, it is expanded down to a low-working pressure in the low-pressure cylinder. Another advantage of this arrangement is that automatic expansion gear, which in some cases is of complex construction and liable to get out of order, is done away with; at the same time great steadiness in working is secured. Messrs. Fowler's engines combine strength and simplicity of design with excellent workmanship. The hoiler being required to work at a high pressure is made of steel, with an internal fire-box of Low Moor iron. The top of the fire-box is made circular, which, while adding to its strength, prevents the accumulation of sediment. We noticed that the hoiler was extremely well and carefully stayed, an example that might be copied with advantage by some other makers we could mention, as in high-pressure hoilers of this construction it is, to say the least, a matter of the highest importance. In utilising these engines for winding and similar purposes, Messrs. Fowler holt the bed-plate on to a wrought-iron tank, which being sunk in the ground the necessity of expensive foundation is avoided. In feeding the hoiler a separate donkey-pump, in conjunction with an injector, is used, instead of an ordinary feed-pump worked by the engine; the action of the engine in winding being intermittent, a more regular supply of water to the boiler can thus be secured. The winding drums and gearing are of steel, combining, as far as possible, strength with lightness.

An automatic expansive horizontal steam-engine is exhibited by Mr. R. Ogden, Ashton-under-Lyne (Ogden & Livesey's patent), which presents some features of novelty, notably in the construction of the cylinder. This consists of a pipe with flanges in lieu of a cylinder of the ordinary shape. The advantages claimed for this arrangement are that the expansion and contraction are uniform; that cylinders may be renewed very cheaply, the same valves and boxes being used again, and another, which we should consider a very duihous advantage, viz., that the cylinder waste-water taps are done away with, that duty being performed by the exhaust ports. Corliss valve gear is used. This engine has some good points in design, but instead of the cylinder being bolted to the end of the bed-plate we much prefer the old-fashioned plan,—still adhered to by some leading firms,—of an extended bed-plate with the cylinder resting on it. For small powers, a cylinder bolted on may pass, but for large powers we certainly,—to say the least,—fail to see any tangible advantages in the plan.

Messrs. J. T. Marshall & Co., Limited, Nottingham, show a compound under-type semi-fixed engine. The engine is mounted on steel girders, and the crank-shaft, plunger-blocks, and ash-pit, on which the fire-box rests, are in one casting. The piston-rod guides work in circular guide-boxes, and the governor is of the crossed-arm loaded type. The engine is

neatly designed and made, but presents no special feature of novelty.

A considerable number of other under-type engines are exhibited, but there exists between these such a remarkable family likeness that, having already described that of Messrs. John Fowler & Co., it may be considered a good representative of the whole.

The largest engine in the Exhibition is that exhibited by Messrs. Hicks, Hargreaves, & Co., of Bolton. It is of the Corliss type and fitted with Ingles's valve gear, and indicates some 150 h.p. at 60 lb. pressure. The cylinder is 20 in. diameter by 4 ft. stroke, is steam-jacketed, and built up with separate valve-chests. For driving, rope gear is employed, the fly-wheel being grooved for that purpose; the running of this engine is remarkably steady, and its general design is good, combining as it does strength with simplicity. In the same stand is an automatic barring engine for starting large engines when they stop near the dead centre: hitherto this has in most cases been done by hand, and is found very hard work. It would be difficult to describe the action of this engine without drawings; but, we may say briefly, it is fitted with a worn-wheel which gears into a toothed wheel attached to the fly-wheel of the large engine, and is so arranged that when it has set the large engine in motion, it immediately disengages or throws itself out of gear. The chief novelty of the engine is that both the falling in and out of gear movements are automatic, and the makers claim that theirs was the first engine made for this purpose in which the driving parts are arranged to throw out of gear by the starting of the main engine.

The electric light machinery is driven chiefly by under-type compound horizontal engines, fitted with automatic cut-off gear, and locomotive boilers, constructed by Messrs. Davey, Paxman, & Co., of Colchester. As these are the same as those used at the Health Exhibition, further description will be unnecessary. We noticed the hoilers and pipes were covered by what was apparently a very excellent non-conducting composition for the prevention of radiation and the condensation of the steam in the pipes. A novelty in the way of automatic steam cut-offs was exhibited by Messrs. Chapman & Reed, of Holloway. In this engine the ordinary steam-chest, slide valves, and rods, are entirely dispensed with, and the steam enters directly on to the piston, and is acted on at either end of the cylinder by the cut-off gear. By this arrangement the full boiler pressure is admitted at once to either end of the cylinder. In conjunction with this gear is used a sensitive form of governor, in which worm-gearing is employed altogether. The engine possesses several features of interest, the development of which we shall look forward to with expectation.

Amongst high-speed engines, the Armington-Sims engine, exhibited by Messrs. Greenwood & Bailey, of Leeds, attracted our attention, being of a type not usually utilised for high speeds, viz., the horizontal. In constructing high-speed engines after this fashion, the makers have evidently borne in mind the necessity of counteracting the increased wear and tear, vibration, &c., consequent on the high speed of running by combining in its construction, increased strength in the framework, larger area of bearings, and the best quality of workmanship and materials. The automatic cut-off is attached directly to the valve-rod, and varies the point of cut-off from the commencement to seven-tenths of the stroke without changing the lead. The makers claim that the variation in speed from an extremely light load to the full power of the engine does not exceed two per cent. If this result can be verified in practice when driving difficult machinery,—such as saw-mills,—it will speak well for the engine, it being a result rarely if ever attained. An engine of this type, with a cylinder 6.5 diameter by 8-in. stroke, is speeded to make 350 revolutions per minute, or a piston speed of 460 ft. per minute. These engines should be of service for electric lighting, ventilating, &c., purposes, where high speeds, without intermediate gear, are essential.

A somewhat remarkable novelty in the way of high-speed engines is the "Tower Spherical," exhibited by Messrs. Hernan & Proude, Newton Heath Ironworks, Manchester. To clearly understand the mechanism and action of this engine, a long description and drawings would be necessary, and even with these its working would not be by any means easy to comprehend,—in fact, it may be almost called a mechanical puzzle. We

may say, however, that it consists "of a system of parts contained within a sphere, and so united as to enable them under the action of steam pressure to impart rotary motion to a shaft." It is said the idea of its construction occurred to the inventor through watching the relative motions of the three parts composing a universal joint, and these motions of the engine may be said to be founded strictly on geometrical principles. In all high-speed engines one of the chief difficulties is the matter of lubrication. In the engine under notice, this has been got over with much ingenuity. A chamber in the bed-plate contains the lubricant, in which is immersed a small plunger pump. The plunger is raised by a slow and intermittent ratchet motion from the main shaft, and in its downward stroke is driven by a worm on the shaft, causing it to descend promptly. By this means a definite small quantity of lubricant is injected at adjustable regular intervals with perfect certainty; and, being applied by the quick stroke of the plunger, it is made to enter all the oil passages, instead of being absorbed by the oil only.

These engines have been tried for many months under varying and trying conditions, and with remarkable results, the working parts, which we inspected presenting no signs of wear. An engine, 7 in. diameter, is speeded to make 650 revolutions, and for electric lighting and other purposes where a self-contained high-speed engine is required, we predict a prosperous future for the "Tower Spherical."

Messrs. Davey, Paxman, & Co., of Colchester, exhibit a single-acting compound quick-speed engine for driving dynamo direct from the crank-shaft, also a double-acting compound vertical engine for driving dynamo by means of gearing.

Messrs. D. & W. Robertson, London, show a small horizontal engine with suspended governor. As to the advantages to be derived from this arrangement we are not at present quite clear.

Messrs. Galloway, of Manchester, have two large engines driving the machinery in connexion with a number of Lancashire hoilers, fitted with Galloway cross tubes. These hoilers should be of special interest to builders and saw-mill owners, as nothing can be better for driving wood-working machinery, for, being provided with ample fire-grate surface, they may be utilised for burning all kinds of waste wood; they are also easily cleaned, repaired, and managed. By the use of the cross-tubes the heating surface is increased and the circulation of the water improved. In Messrs. Galloway's hoilers the tubes are fixed so that they are nearer together at their lower than their upper ends; the strength of the back flue is thus considerably increased. The compound horizontal engine which was used for driving the machinery at the Health Exhibition has similar employment now, and we certainly prefer its general arrangement to the new engine recently erected.

At the stand of Messrs. Durham, Curchill, & Co., London, we noticed some practical-looking piston-ring packing. The makers claim that by its use a free yet steam-tight piston is obtained. It has a direct vertical and horizontal thrust, with neither thrust dependent on the other. This result is said to be obtained by the use of one spiral spring, or a series of compound springs. The compound spring is made out of a single rod, and is without sharp bearing points, these being flat vertically, and curved horizontally to the same radius as the inside of the piston rings. As a rule we object to the use of spiral springs when there is great variation in temperature or any constant and severe strains on them, as there is little doubt that in the first case the nature of the steel becomes altered, and they are liable to breakage, and in the second they become weakened and ineffective. The makers assert that for piston-rings they have stood all ordinary tests.

Messrs. Cochran & Co., of Birkenhead, show one of their vertical steam boilers, arranged with horizontal flue tubes; part of the shell is cut away at each side of the boiler above the fire-box, and tubes are fitted across. The space between the tube-plate and the shell of the boiler forms the combustion chamber on the one side and the smoke box on the other; doors are fitted to both sides of the tube-plate, that on the combustion side being lined with fire brick. By this arrangement the tubes may be more easily cleaned and repaired than in the case with the vertical multitubular form, and the boiler altogether must be pronounced a decided improvement on these, and can be recommended for small powers and where space is an object.

THE LION AND THE PALM.*

NOTES ON RECURRING FORMS IN HISTORIC ORNAMENT.

THE early German School, which we should call Byzantine rather than Romanesque (the latter having become by usage identified with the decaying school of Rome) arose under Charlemagne, the influence coming chiefly from Ravenna and Venice, at Aix-la-Chapelle he had a church built obviously founded on St. Sophia.

It was in Byzantium that the ancient art of casting in bronze was remembered; the fine lion of Brunswick, of the tenth century apparently, was removed from Constantinople by Henry the Lion, and two of the series of great bronze doors which led up to those of Ghiberti were brought to Italy. At Hildesheim are probably the earliest of these bronze gates made outside the Eastern Empire. They were made by Bishop Bernard after he had returned from Italy in the suite of the Emperor Otho; these doors bear large knockers, a ring depending from the jaws

of a lion, finely modelled in an Eastern manner. On the choir-screen of the same church we have niches covered with channelled domes of the Byzantine type; and the spandrels are filled with affronted birds with intertwined necks.

The next bronze doors we find at Augsborg, 1070; these are not so fine, but the designs are more to our present purpose, five or six of the panels being charged with lions, centaurs, and the lion and calf.

In Apulia in the twelfth century, there was a school of art of which the Pisan is an offshoot (Niccolo Pisano was probably born at Amalfi); here at Troja and Trani are some very fine gates by Barisannus 1150-79.

Bonnanno's doors at Pisa follow in 1180; the bottom panels have a row of symmetrically-placed palms. Both Barisannus, of Trani, and Bonnanno, cast gates for the cathedral of Monreale, in Sicily.

I shall not dwell on the Venetian school, as its Saracenic character has been sufficiently pointed out by Mr. Ruskin. In Florence and other Italian cities it will be found that the germinating principle is Eastern, but just as

the perfected Greek lost almost all traces of its origin, so it is with the great matured schools over Europe in the thirteenth century.

The most highly developed art of the twelfth century was probably that of Sicily; and it is at the same time the most evidently Eastern,—here the mosaics burst forth in sunset splendour, and in them we find beasts, birds, and palms wrought to an immense scale.

At Monreale in mosaic we find, as far as I know, for the first time, the bird and tree reduced to that more conventional form in which it spread to France and England, principally in encaustic tiles (these being, as has been well pointed out by Viollet-le-Duc, and amply substantiated by the form of some of the patterns of our Western substitute for mosaic). (See figs. 6, 7, and 8.)

In Jacquemart's "History of Furniture" there is illustrated a magnificent coronation robe now at Vienna; this bears an immense and truly Assyrian horn, and on either hand fierce conventionalised lions tear prostrate camels. This work bears the inscription (in Arabic), "Made in the happy city of Palermo

* See p. 722, ante.

... in the year 1181 of the era of our Lord Jesus the Messiah."

About this time, the palm finally stiffened into that form which became the ornamental foliage of Gothic Europe until the thirteenth century, and which with us was the origin of the "Early English" trilobed form: this is exactly parallel to the Greek anthemium, on which, perhaps, it is partly based, both varieties being found on the baptistery doorway at Pisa. (See figs. 9, 10, 11, and 12.)

Sicily under the Normans, Venice, and Spain transmitted the Eastern influence, and this was supplemented by the long residence of the Crusaders in Syria. It was probably in Sicily that the Byzantine style took that last imperfect step which entitles it to be called Gothic, and in the fully-developed and magnificent variety of Gothic to be found there the features can be traced back to Syria, where five or six centuries before the column became a colonnette: the cornice was transformed into corbel table, or string; and the pilaster became a buttress strip.

In France the Roman tradition lingered long, influenced by the East, from the time of Charlemagne. In the north-west of Europe, as far as it had not been modified by the same influence, the art was Scandinavian, a primitive offshoot from the East. Aquitaine was the centre from which radiated the new thought. At Limoges, in the tenth century, a commercial colony was founded from Venice, and at Périgueux the domed church of St. Front was built in imitation of St. Mark's, and other works Viollet-le-Duc says,—"Ont reçu leur influence directe de l'Orient." At Périgueux also, early in the eleventh century, was built a fine tower, surmounted by a conical spire, copied probably from the ancient campanile of St. Mark's, this spire, like many that followed it, is scaled exactly like the curious structure at Baghdad, called the Tomb of Ezekiel (figured in Foxier and Pullan's "Byzantine Art"). It will be sufficient to draw one of the Syrian tombs (fig. 13) to point out the source whence came the Italian campanile and the French spire. These tombs of Syria (see De Vogüé) are themselves a continuation of the tradition which built the pyramid-tombs of Mausolus and others.

For central type of the Byzantine churches of France, let us take Aries and St. Gilles,

especially the western portals, of which I have photographs before me. The columns are "diminished," and stand on lions. The acanthus-leaved capitals are of the crisp Syrian type, and have enormous cushion abaci,—all sure signs of their origin.

With us, as I have shown above, the palm developed into the Early English foliage; we find it while yet plainly the palm universal in the twelfth century. On the font at East Meon (1100) we find this form with the birds on either hand, but at Winchester (1110) the cross takes the place of the heathen tree of life (fig. 14).

A font in Berkin Church, Yorkshire, is surrounded by a series of panels, in most of which are lions devouring other beasts. At Exeter we find another instance, also the birds and an elephant; and in a late wall-painting in the Chapter House at Westminster are two other Eastern animals. They are affronted with a tree between, and in black letter is written **broandary: kamepl.**

To make an end: if we trace up any of the lesser arts we shall be directly led to the East. The finest pottery made in Europe was the Spanish copper lustre, which was introduced by the Arabs from Persia.

Medieval ivories are derived from the Ninevites through the Greeks.

The enamels of Limoges, which were, I suppose, introduced by the Venetians of the eleventh century, are of Byzantine and Oriental origin, as is also the art of the gem-engraver and lapidary.

Every tissue and stuff, from cloth of gold to printed cotton, is from the same source; and some directly from Persia, and others through India.

I would say that I have not endeavoured to show that we owe our arts to Asia in that its civilisation was before that of Europe; but rather as the perennial source from whence our ideas have come, as well in design as in language and mythology; and I have made an essay towards a theory of coherence in the history of art in attempting to show that there have been in the main but two great cycles of Western art. The first, in its germ Assyrian, and in its perfection Greek; the second, commencing as Persian, and culminating in Gothic.

DESIGN FOR ADMIRALTY AND WAR OFFICE.

THIS is a perspective view in one of the courtyards as it would have appeared in the design by Mr. P. J. Marvin which was submitted in competition for the New Admiralty and War Offices, had the design been carried out. The present drawing, of course, was not submitted in the first competition, from which perspectives were excluded, but like some others we have published and shall publish, has been made since to the author's intentions.

The illustration is reproduced from the water-colour drawing now in the architectural room at the Royal Academy.

SCULPTURE AT THE ROYAL ACADEMY.

We give this week illustrations of two of the most prominent and most able pieces of work in the Central Hall of the Academy Exhibition, the "Spartan Dancing Girl" of Mr. G. A. Lawson, and the "Autolykus" of Mr. E. Roscoe Mullins. We have commented sufficiently on both in our article on "Sculpture at the Royal Academy" (p. 717, ante). Mr. Lawson, however, sends us a few words which will assist in explaining the *motif* of the work:

"My intention in the 'Dancing Girl' was to give the feeling of perfect rest after (supposed) vigorous exertion; the unconscious abandonment and grace of a supple figure. 'Spartan' would account for the nude treatment, for, as you know, in the Lycrigan games the youths and maidens contended in the games nude; running, dancing, &c. In short, my aim may be summed up by 'purity and grace'; the idea of repose after healthy athletic exercise being sensibly distinct from that of the ordinary type of 'dancing girl repose,' of which we have had so many examples.

We asked Mr. Lawson for his reason for the differentiation of "Spartan" in the title of the work, which he gives as above. But in sculpture there is of course much more scope for the logical employment of the nude figure than in painting, because the form of art is much more abstract and ideal, and less imitative, than painting. Thus in Mr. Mullins's clever and expressive work, the object is to give the abstract idea of a certain type of human character. Dress would remove it from this abstract character, and fix it to a certain epoch and locality, which is exactly what is not wanted. Of course also the expressiveness of the actual figure, and the interest of modelling it, is far greater than that of modelling mere coverings. After the nonsense that has recently been written on the subject, a word or two on the point may not be out of place.

We should add that Mr. Mullins is anxious to have it understood that his figure is designed to be seen all round, and is not advantageously seen in its present position against the wall of the Gallery at the Academy.

THE CHURCH OF ST. MARY, ALFRICK, WORCESTERSHIRE.

THIS little church, by no means without interest, having fallen into a very dilapidated condition, required considerable repairs in order to preserve it.

The western portion of the nave is Norman, and retains its original windows, and will remain unaltered.

The north wall further west was in an unsafe condition, being much out of the perpendicular, and has been frequently buttressed up, and a portion of this is being removed for the new transept and vestry.

The general works include the removal of the plaster ceilings, bringing to light the original oak trussed roofs; the junction of the chancel and nave being marked by a half-timbered screen forming a chancel arch, and characteristic of Worcestershire work; in addition to which will be an oak chancel screen, the lower part of which is original, and was found on the removal of the high pews.

The space under the turret is being thrown into the church, and the upper portion enclosed with an oak-screen to form a ringing-chamber.

The church will be heated with hot-air by Mr. Constantine, of Manchester; the general contractor being Mr. J. Inwood, of Malvern; and the architect Mr. Aston Webb, of Westminster.

WESTMINSTER HALL.

IN preparing this design for *refronting* Westminster Hall in contradistinction to *restoring* (?) the grand old piece of national architecture, the author's chief aim has been to produce something to harmonise with the work of Sir Charles Barry, at the same time to fill up the hiatus which intervenes between St. Stephen's Hall and New Palace Yard.

The present aspect of this portion of the building is disgraceful, and the scheme herewith illustrated (by raising the parapet on the west side of the Hall to a considerable height, finishing it with enriched open panelling, the centre portion in each bay giving light to the interior, if required, in lieu of the hideous dormers now obtaining on the roof) would add the necessary dignity to the old Hall, in which it will still be deficient if the contemplated works are carried out.

By entirely removing the huge and worse than useless buttresses (for they do not help to support the roof timbers) and by substituting others of less projection and double in number (corresponding to the roof trusses inside), and by erecting the pinnacles to the height shown; the Hall would by such means be incorporated in the general design of the new palace.

Even supposing that the remains were ample to the purpose of erecting similar buildings to those which once stood here, the question would arise,—Is it desirable that such should be re-erected, and (by standing at the salient point of interest) catch the eye, to the utter detriment of that uniformity which a new front would at once and for ever realise?

One of the best views, if not the grandest view, of the New Palace is obtained from a standpoint near the fountain. Any unbiassed person taking up this position cannot help seeing that the elevation between St. Stephen's Hall and New Palace-yard is extremely mean and undignified, and the erections to be added thereto will tend to increase this effect. At present there are only the massive buttresses, but when the cloisters are introduced the result will be to dwarf the Hall still more.

The restoration mania is now, it is to be sincerely hoped, nearly carried to its utmost limits. If such notions of preservation had entered the heads of our ancestors, we should have had little if any change of style. Repairing a twelfth-century building in the fourteenth would have resulted in dead twelfth-century instead of the then living style.

Take, for instance, the destruction of the Chapel of St. Mary, at the east end of the Abbey opposite. Henry VII. and Sir Reginald Bray did not hesitate to remove it to make way for the sumptuous resting-place of the former. Many other cases might be referred to where

the exigencies and requirements of the times, rising above all misapplied sentiment (if any existed), led to new features and forms of architectural development.

The original idea of Sir Charles Barry to enclose New Palace Yard is, like all his schemes, grand enough, and worthy his genius; but I am inclined to think that by hiding the old Hall from the public, it would not be so satisfactory as retaining the open space, especially as the clock tower could not then be seen to such advantage as it is at present.

EDWARD A. HEFFER.

P.S.—Much more might be said on this burning architectural question of the hour. For instance, the unfortunate *low level* of Westminster Hall floor will be more apparent when the intended building is projected towards St. Margaret-street. The difference in the levels of the Hall and street will then be measured by the eye, and the result will be anything but satisfactory.

. We give Mr. Heffer's design as an interesting and clever suggestion, conceived in a true architectural spirit, and therefore worth publication at a time when the subject is being discussed; not as necessarily endorsing it, or recommending its adoption. We believe, however, that he is correct in his surmise that the old flying buttresses do not in reality play any part in supporting the roof; and in regard to the general idea, there is no question that an architect of the late Medieval period, if he had found the decayed buttresses left on his hands, and thought that he could do something better and more suitable himself, would have cut them away without thinking twice about it; and those who do not recognise that know nothing really of the spirit of the ancient architects whose works they profess to reverence.—Ed.

DOUBLE PISCINA, MERTON COLLEGE CHAPEL, OXFORD.

THE beautiful double piscina stands at the end of the south transept of Merton College Chapel, and is of the same period (late thirteenth century) and style of workmanship as the sedilia in the chancel. The drawing from which the illustration is reproduced is one of a set for which its author, Mr. H. D. Walton, was awarded the Architectural Association Traveling Studentship for this year.

THE HÔTEL MÉTROPOLE.

This vast hotel opens for the reception of visitors on Monday next. The size and importance of the building are such as to demand some description at our hands. While there is a great deal of good work to be seen in the interior, and while the sanitary and other utilitarian arrangements appear to be well calculated to insure the comfort and health of the guests and the easy and smooth working of what may be called the administrative service of the establishment, we greatly regret that externally the building is not, architecturally speaking, more worthy of its site. We certainly cannot agree with the encomium of one of the daily papers,—that the design of the elevation is imposing; it is anything but that. Making allowance for the difficulties which beset the architect of such vast hotels,—for the necessity of piercing the façade with a countless number of windows, and for the necessity, from a commercial point of view, of utilising every valuable site to an extent which would be incompatible with any material setting-back of portions of the building,—making allowance, we say, for all this, we cannot but feel that neither great architectural opportunity has been lost. The design as a whole is common-place and the detail coarse, with the exception of the sculptured spandrels over the principal entrance towards Northumberland-avenue, which have been executed by Mr. H. H. Armstead, R.A., and which logically represent "London." On the one side is a female figure with a shield containing the City Arms, with St. Paul's Cathedral in the background, while on the opposite side is a figure of "Father Thames," with shipping and the Tower of London in the rear. Some of our readers may remember that two years ago* we called attention to the sham legis-

lation which was supposed to give to the Royal Institute of British Architects the power to veto any designs for proposed buildings in Northumberland Avenue. At that time Sir James McCarell-Hogg, Chairman of the Metropolitan Board of Works, stated in the House of Commons, in reply to a question put by Mr. Story-Maskelyne, that "the design for the Hôtel Métropole was submitted to the Institute of British Architects, as required by the Act of Parliament, but after due consideration the Board did not think it necessary to put the tenant to the expense of carrying out the alterations suggested by the Institute, having regard to the fact that the plans* for the building had already been amended in accordance with the recommendations of the Board's Architect, who was himself then a member of the Council of the Institute." This reply seemed to us at the time to show (as we then remarked) such an extreme disregard for the requirements of an Act of Parliament that we turned to the statute† where we found the following words, which, as it seemed to us, gave the Institute no power to interfere at all.—"The architectural elevations of all buildings to be erected under this Act . . . shall be submitted by the Board to the consideration of the Council of the Royal Institute of British Architects previous to the commencement of any such buildings." The italics are our own, and the clause was shown to be a mere farce by the answer given to Mr. Story-Maskelyne by the Chairman of the Metropolitan Board of Works at a subsequent sitting of the House of Commons.‡ Sir James McCarell-Hogg admitted that the Board had received a letter from the Institute stating that "in the opinion of the Council, the design of the building, more especially as regards the ground-story, is unworthy of its intended position, and that the said design should be considerably modified before approval be given to it by the Metropolitan Board of Works"; but he contended that the Board had not evaded the conditions imposed by Act of Parliament, as suggested by Mr. Story-Maskelyne. "The wording of the Act," the Chairman of the Board went on to say, "was intended to convey no more than the suggestion of friendly consultation between the Board and the Council of the Institute, without binding the Board to carry out the suggestions of the Council." Without stopping to question the correctness of Sir J. McCarell-Hogg's interpretation of the intentions of the Legislature (which is certainly open to question), we hope that if in future our legislators are sufficiently enlightened to insist on some provision for ensuring tolerable buildings in prominent positions, they will profit by the lesson of the present *fiasco* and make the provision a reality and not a sham. We have recurred to this subject as so long because we feel that the lesson which it unfolds is one which ought not to be forgotten. But we now pass on to speak of the interior of the building, which contains a great deal of very satisfactory work. The building occupies a site which, roughly speaking, is the shape of an isosceles triangle, the rounded apex abutting on the Victoria Embankment. The principal frontages are towards Northumberland Avenue and Whitehall-place, that towards the first-named thoroughfare being about 315 ft. long, and that towards Whitehall-place being about 312 ft. long. There is also a frontage of 140 ft. to Scotland-yard. The building also abuts for about 120 ft. on the offices of the Ecclesiastical Commissioners. The site is about an acre in extent, and the hotel is said to be the largest in Europe. The height of the building is 118 ft. from basement-floor to parapet in front of towers, and about 150 ft. to top of Mansards. Without counting the rooms in the Mansards, the building contains eight stories, with the addition of a mezzanine towards Whitehall-place. The ground-story, which is faced throughout with Portland stone, rests upon a grey Aberdeen granite base, but all the stonework above the first floor (except cornices, sills, balustrades, chimneys, and other exposed portions) is of Bath stone, from the quarries of Messrs. Pictor & Sons. The roofs are constructed

* We understand that what is meant by this word is "designs" or "elevations." We believe that the only alterations made in the design by Mr. Vulliamy consisted in the deletion of some of the windows and in carrying up coupled pilasters instead of single ones in those parts of the elevations under the Mansards, so as to broaden and emphasise the design to some extent of intervals; and no doubt, so far as it goes, this is an improvement.

† The Charing Cross and Victoria Embankment Act, clause 30.

‡ See *Builder*, June 9, 1883, p. 787.

of wood and iron, with every possible precaution against the spread of fire, such as Parian skirtings, window linings, &c., the only exposed wood-work being the doors, and roofed for the greater part with zinc tiles.

The basement, which is 15 ft. high, and well lighted, contains two large billiard-rooms, two smoking-rooms, a servants' dining-hall, boiler-house, machinery rooms, lavatories, hair-dressing department, large wine-cellars, workshops, &c. The ground-floor contains, on the side facing towards Northumberland-avenue, the grand *salle à manger*, 105 ft. long by 45 ft. wide and 25 ft. high, and extending from the vestibule and entrance-hall in Northumberland-avenue to the Scotland-yard corner of the building. This fine apartment is divided up into spaces resembling the nave and aisles of a church by two rows of columns with Corinthian capitals with marble pedestals, supporting massive girders which carry the division-walls and corridors of the superstructure. To the left of the great entrance-hall is a large lobby, giving access to the grand staircase and lifts for passengers and luggage; to a reception-room, 47 ft. 6 in. by 33 ft.; and to a corridor giving access to another vestibule, Moorish in style, from which the library and drawing-room are entered. The library is 34 ft. 6 in. by 27 ft. Occupying the corner of the building at the junction of Northumberland-avenue and Whitehall-place with the Embankment is the drawing-room, a very fine apartment, measuring about 50 ft. by 40 ft. A good part of the remainder of the ground-floor frontage towards Whitehall-place is occupied by bedrooms, with a corridor between them, the rooms on one side of the corridor looking on to and being lighted from the street, and those on the other side getting light from the light-courts in the interior of the building. Owing to the great height of the principal apartments on the ground-story towards Northumberland-avenue, it has been easy to get in a mezzanine floor towards Whitehall-place, and is also devoted to bedrooms. The bedrooms on the ground-floor and mezzanine extend along the Whitehall-place frontage as far as the Whitehall-place entrance, the vestibule of which gives access to a secondary entrance-hall and staircase. To the left of this entrance-hall is the large Banqueting Hall, or "Whitehall Salon," about 80 ft. long by 42 ft. wide, with a circular bay at the Whitehall-place end. At the inner end of this hall is an elliptical recess or alcove for a dais; this alcove is top-lighted, and is decorated with some paintings by Mr. C. J. Durhan, hereafter referred to. Beyond this hall, and lighted on one side by an intervening light court and on the other side by windows looking on to Scotland-yard, is a large public dining-room, about 44 ft. by 36 ft. The remainder of the Scotland-yard portion of the ground-story is occupied by the service entrance and stairs, by still-room, serving-room, pantry, &c., with the necessary lifts, and other accommodation. Behind these rooms, and approached from the grand *salle à manger* and from the great entrance-hall, is a secondary *salle à manger*, called the Oak Salon, and measuring 49 ft. by 44 ft. This apartment, as well as an adjoining room (which is to be used as a private dining-room, and is to be known as the King's Room,—44 ft. by 22 ft., with a recess or alcove on one side), are not reached from the larger of the four light-courts, through stained-glass soffits, lights. Carried up in the centre of the building, between two of the light courts, is what may for convenience be called the sanitary block, containing water-closets, baths, &c., so that every water-closet has a window opening to the external air. The first and second floors are mainly occupied by bedrooms, some of which have sitting-rooms and dressing-rooms *en suite*. Each suite of private apartments is provided with its own bath-room and water-closets. The third, fourth, fifth, sixth, and seventh floors are nearly all taken up by bedrooms and sitting-rooms, of which the total number is between 500 and 600. The kitchen is on the fifth floor, and is very large and lofty. It is top-lighted. Adjoining is a large bakery.

Having now described the general arrangement of the building, we proceed to give a few details of its constructive and decorative features. The foundations are of Portland cement concrete, carried down in some parts (especially where the site covers ground reclaimed from the river by the Embankment works) to the extent of 35 ft. below the pave-

* See *Builder*, May 19, 1883, p. 636.

ment level. The footings are extended, and the walls are built in Portland cement up to the eills of basement, with about forty miles of stout iron hoops, 2 in. wide, embedded therein. The whole of the remainder of the structure is built with blue lias ground lime. Nearly all the bricks used in the building are the excellent light red bricks from the Ellistown works, near Leicester. Staffordshire blue bricks are used for piers and in other positions where great weights have to be borne. The light courts are all faced with the excellent white glazed bricks supplied by Messrs. Cliff & Sons, of Wortley. As a large number of flat-headed window-arches had to be put in, specially-made skewbacks of the same material were made, so as to save labour in cutting to form the abutments. The two principal staircases, which go from top to bottom of the building, are of fireproof construction, and are on the same principle as those constructed at the Grand Hotel and at the First Avenue Hotel, by Mr. Holloway, and which has been previously noticed by us in terms of commendation. They are of concrete, made of Portland cement and coke breeze, stiffened with iron internally, the treads and risers of the grand staircase being of marble up to the second floor, and those of the secondary staircase, near the Whitehall entrance, being of oak up to the first floor. The soffits of these staircases are panelled and very nicely moulded and finished in Parian cement. The service stairs, which go from top to bottom of the building, are of hard York stone. The corridors (of which there is a total length of $1\frac{1}{2}$ mile, and which have also been designed by Mr. Holloway), have their floors and side walls, from top to bottom of the building, constructed of fireproof concrete of the description before referred to, and the ground and first floors, and all the kitchens, bakery, &c., on the upper floor, are of fireproof construction throughout, on Dennett's system. The floors of the grand *salon* and of several other of the larger apartments in the building are of cement and coke breeze laid on top of the concrete. This makes a capital flooring surface where it can be carpeted. The same material forms the floor of all the corridors. Down the centre of each corridor runs a channel for the passage of gas-pipes, electric light and electric bell wires, &c. All the corridors will be covered with a thick felt carpet, so as to deaden the sound of footsteps, and so ensure quietude. In the upper floors the skirting-boards, window-linings, &c., are all executed in Parian cement, so as to reduce the amount of exposed woodwork to a minimum. Other precautions against the spread of fire are seen in the hydrants which, always fully charged with water, occur at frequent intervals in the corridors. There are about 1,100 tons of constructional ironwork in the building, all of which has been supplied by Messrs. Handyside & Co., of Derby, including some steel girders used to span the banquetting-hall, or "Whitehall Salon," as it is to be called, and which, by the way, has a very good oak floor, so that it may be used as a hall-room. Architecturally-speaking, the interior of this room, which is Renaissance in style, is perhaps the least satisfactory of all the large interiors. The detail exhibits one or two anachronisms, which we will not stop to point out now. Before going on to speak of the artistic effect of the interiors, however, we must say a word or two in praise of the ingenuity and skill exhibited in the planning, which reflects great credit upon its authors.

The building exhibits the practical working-out of several valuable "notions," as our American cousins would call them, for the saving of time, labour, and inconvenience, and so maintaining internal economy of administration. One of the most interesting of these are the "hot-water and boot boxes" provided in connexion with all the bedrooms. This, we believe, is the result of a suggestion made by the managing proprietor of the establishment, Mr. Gordon, and it has been very well worked out by his builder. In the corner of each bedroom nearest the door is a wooden pedestal covered with a hinged lid. By lifting up this lid the occupant of the room can deposit his boots in a receptacle about 12 in. deep. Access to this receptacle is obtained from the corridor by a small door, on opening which the chambermaid can remove or replace the boots of the occupant of the room, or can deposit a can of hot water. By this means not only is the convenience and privacy of the occupants ensured, but the corridors are not littered, as they often are in

other establishments, by cans of water and "too, too many pairs of shoes." Another admirable contrivance which is likely to be appreciated by the chambermaids, at any rate, consists of a small semaphore signal which will be raised outside each room whenever the occupant touches the "push" of his electric bell. In a building of some considerable length, and it is often likely to happen that when the chambermaid is at the end of the corridor remotest from her room she may hear the bell of the numbered indicator. Now without the aid of the small semaphore raised outside each room when its bell is rung, the maid would frequently have to traverse the length of the corridor to look at the indicator and then to return possibly to the remotest end of the corridor to the room where her services were required, instead of being able, as she will be by its aid, of at once seeing where she is wanted. Among other contrivances likely to be conducive to the convenience of visitors may be mentioned the bolts of the water-closets, which when fastened on the inside automatically display on the outside the word "engaged."

Tanks in the upper part of the building give a water-storage capacity of 30,000 gallons. There are two hydraulic lifts for passengers, working side by side, but independently of each other, in a square space enclosed by the grand staircase. These lifts work in a strong and well-designed framing of iron columns and stays. In order to obviate the unsightliness of the greasy guides and rams, and to partially conceal the cages in their ascent or descent, Mr. Holloway has, inspired by a happy thought, devised and worked out a method of filling in the iron-framed enclosure containing these lifts with perforated sheet zinc panels. The perforations consist of well-designed flowing arabesque patterns, and being glazed on the external face, and divided by mouldings of dark-coloured wood, this metal screen has a very rich effect, according to the walls of the rich marbles with which the walls of the staircase, hall, and vestibule are lined and decorated. Mr. Holloway has also adopted in this building the method which he devised for the admission of fresh air (warmed when necessary by steam pipes) into the larger apartments of the Grand Hotel and other buildings with which he has been connected. In the grand *salon à manger* of the *Hôtel Métropole*, for instance, the fresh air is admitted through the tops of the pedestals of the columns which divide that apartment longitudinally. The bedroom sashes are all provided with a simple ventilator invented by Mr. Alfred Holland, the manager of the Grand Hotel, which we described a year or two ago, and which is called the "Lazy" ventilator.

We have only a small space in which to speak of the decoration and character of the principal apartments of this monster *caravanseraï*. The large dining-hall or grand *salon à manger* is Italian in style, with marble dado and pilasters, and richly-decorated ceiling and walls. The smaller dining-hall, or Oak Salon, is panelled in oak. It is Renaissance in style, and devoid of elaborate detail. The walls contain large panels filled with French hand-woven tapestry. A rich frieze of Lincrusta-Walton, of bold design, surmounts the oak panelling. Adjoining is the "King's Room," which is lined with oak of a darker colour than that of the Oak Salon. It is Jacobean in character, and is more elaborate in detail than the room last mentioned. There are portraits of King James I., and of Raleigh, Bacon, Ben Jonson, and other celebrated men of his reign. These are painted in oil, and are the work of Mr. Albert W. Holden. The Whitehall entrance and staircase are treated entirely in oak, and are Renaissance in character. The Whitehall Salon, otherwise known as the Banquetting Hall, is Italian in style. In the alcove at the inner end of the hall are three paintings executed by Mr. C. J. Durham, representing scenes at an Italian marriage festival. This hall and some of the adjacent rooms have been temporarily retained by the Junior Carlton Club during the rebuilding of part of their premises in Piccadilly. Close to the grand staircase is the Reception Room, decorated in the Italian style. The tapestry in the four panels has been specially made at the Royal Windsor Tapestry Works, and represents views of the royal palaces. The *avorini* or cupids in the frieze have been painted by Signor Cordeña, a Spanish artist, while the birds, flowers, and smaller panels with cameo

centres (after those in the Gallery of Apollo in the Louvre) have been painted by M. Monblond. The Library, adjoining, is a fine oak-lined apartment, Elizabethan in style, panels of embossed leather being introduced. There is a boldly-designed plaster-frieze above the panelling, the ceiling being of oak. The vestibule adjoining is Moorish in style, and contains a great deal of costly work, imported from the East. The drawing-room is a richly-decorated apartment in the Louis Seize style, the decorations being after those in the Salon Rosso at the Tuileries. The hand-painted silk panels, representing musical trophies, with cameo medallion portraits of celebrated composers, have been executed by M. Monblond, who was employed on similar work at the Tuileries. Among other noteworthy apartments in the building is the Marie Antoinette chamber, on the first floor, which is stated to be an exact copy of Marie Antoinette's *boisoir* at Fontainebleau. The painted panels in this room were specially executed for Messrs. Maple & Co. by M. Galland, a well-known Parisian artist. Altogether the furnishing, upholstery, and decoration, which have been in the hands of Messrs. Maple & Co., reflect great credit upon that firm. The furniture, so far as we saw, is good in design and execution, and there is a pleasing variety of it, no two rooms being precisely alike either as to furniture or decoration.

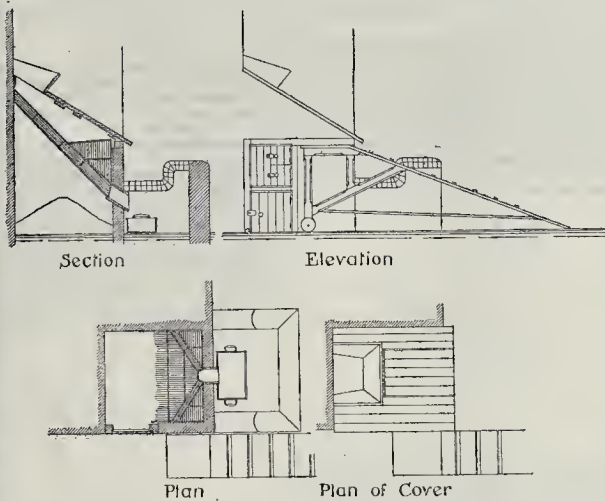

The whole of the structure has been carried out by Mr. G. H. Holloway, as builder for the proprietors (no contractor being employed), and under his personal supervision and direction. He has been ably assisted by Mr. W. Spencer, who has had charge of the preparation of the joiners' work (all of which we examined being very satisfactory), and by Mr. Parrall, who has acted as general foreman. The architects of the structure are Messrs. F. & H. Francis and J. E. Saunders. The entire furnishing of the building has been carried out by Messrs. Maple & Co., who also fitted and decorated the drawing-room, library, reception-room, the oak *salon*, the king's room, the Whitehall entrance, the grand *salon à manger*, and Whitehall *salon*. All this firm's work is characterised by great excellence. The marble and mosaic work is by Messrs. Burke & Co. The decoration in the grand entrance vestibule and staircase is by Messrs. Clayton & Bell, who also executed the stained glass throughout the building. The stonework and carving are by Mr. F. G. Anstey. The constructional ironwork is by Messrs. A. Handyside & Co.; and the iron balustrading of the principal staircase by Messrs. Braun, and Messrs. Richardson & Ellison; that of the Whitehall staircase is by Messrs. Sanson & Co. The hot-water service and kitchen fittings are by Messrs. Benham & Sons. The sanitary appliances and baths are by Mr. George Jennings. The passenger and service lifts are by the Hydraulic Engineering Company, of Chester. The electroliers are by Messrs. B. Verity & Sons. The gas mains and fittings throughout the building are by Messrs. Hulcutt & Co. The outside lamps and self-regulating burners are by Messrs. Snagg & Co., Limited. The zincwork is by Messrs. Braly & Co. The art-work is by Messrs. Simpson & Sons, and Messrs. Wilcock & Co., of Barnantofts, Leeds. The locks are by Messrs. Hobbs, Hart, & Co.; the bricks by the Ellistown Brick Company, and Messrs. J. Cliff & Sons; the fireproof floors by Messrs. Dennett & Ingle; the graining by Mr. Osmond; the fire appliances by Messrs. Merryweather & Sons; the electric bells by Messrs. Adams & Sons. The basements are illuminated by daylight, as far as may be, by means of Hayward's patent prismatic pavement lights.

The following are a few statistics as to the materials, &c., used in the construction of the building, the cubical contents of which are upwards of 5,000,000 ft., viz.:

88,750 ft. cube of stone; 6,617,000 bricks; between 30 and 40 miles of hoop iron; between 8 and 9 miles of $2\frac{1}{2}$ in. by $\frac{1}{2}$ in. bond iron; 151,750 ft. cube timber; 1,100 tons constructional ironwork; $1\frac{1}{2}$ mile iron channelling; 10 miles lathing, 1 yard wide; $5\frac{1}{2}$ mile cornices; $5\frac{1}{2}$ miles skirting; $1\frac{1}{2}$ mile length of corridors; 42 miles electric bell wire; between 6 $\frac{1}{2}$ and 7 miles gas barrel; 5 miles electric-light wire; 400 squares of roofing.

* The corridors are taken above the ground-floor to the seventh floor inclusive.

† These figures only give the materials used up to December 31st last, so that in some instances they have now been largely exceeded.

An Improved Dust-bin.

DUST BINS.

As this subject is now attracting attention elsewhere, we give a plan, section, and elevation of a dust-bin, from a model kindly lent to us by Mr. T. W. Erle, who has employed this arrangement at his own house. Mr. Erle writes:—

"The cinders, &c., as will be seen, are shot into the funnel at the top, and screen themselves by 'racing' down the wires, which are fixed. If the wires were movable, there would be a risk of their being taken out by some perverse slut, and of all sorts of putrescible refuse being thrown into the receptacle. The folding-doors prevent any dust from rising. The essential point of any good arrangement for the screening of the cinders is that it should be, as in this case, self-acting; that is to say, that it should give no trouble whatever. The ashes are removed by a shovel through the lowest door at the side. The smaller doors above this are for putting in broken crockery or other such refuse, which would not pass through the sieve, but would be out of place amongst the cinders. Two doors are more convenient for this purpose than one. Usually it is only necessary to open one. If any wet refuse were to be shot into the funnel, it would clog the wires, and would have to be picked off by hand. To introduce, by hand, any such refuse through the small doors at the sides would be a troublesome and unattractive process. According to my experience, it is never done; but if it were, I should fasten up the doors at the side (excepting the one at the bottom, which it would be impossible to misuse), and have broken hardware, &c., put at the side of the dustbin.

The slope, as will be seen, is easily moved away at a moment when access to the doors is required. Any girl can do this."

BUILDERS' BENEVOLENT INSTITUTION.

AN election of pensioners on the funds of this Institution took place at Willis's Rooms, St. James's, on Thursday last, Mr. Stanley G. Bird, President, in the chair. There were three vacancies,—two for men and one for a woman, and there were five candidates, of whom four were men. The following is a list of the candidates, with the number of votes polled for each, according to the report of the scrutineers and Messrs. Geo. Plucknett, J.P., and Thos. Birling, viz.:—John Richmond Bisley, Brompton; aged 74, builder (third application), 83 votes; Reuben Hurren, Notting-hill, aged 66, builder (third application), 1,170 votes; James Robert Rawley, Kingsland (formerly a subscriber to the funds of the Institution), aged 64, plumber, &c. (second application), 1,588 votes including 20 allowed for subscriptions; and Wm. Thornton, New Wandsworth, aged 66, miller (second application), 676 votes. Mrs. Caroline Harrison, of Lisson-grove, widow of Atwater Harrison, being the only candidate for the female's pension, she was elected, as a matter of course.

The Chairman declared the successful candidates to be James Robert Rawley, Reuben Hurren, and Mrs. Caroline Harrison.

A vote of thanks to the Chairman, moved by Mr. Plucknett, and thanks to the scrutineers and other gentlemen who had taken part in the proceedings, brought the meeting to a close.

OBITUARY.

M. Théodore Ballu.—The death is announced at Paris of M. Théodore Ballu, one of the architects of the Hôtel de Ville, who died on Friday morning of a malady from which he had been suffering for some little time past. He was born in 1817, and was a pupil of Hippolyte Lebas at the School of Fine Arts, where he succeeded in gaining the Grand Prix de Rome for architecture. Upon his returning from the Villa de Medici, and after a visit to Greece, he completed the Church of St. Clotilde, which had been commenced by Gan. Among his subsequent works may be mentioned the Churches of the Trinity and St. Ambrose, as well as the restoration of the tower of St. Jacques de la Boucherie and the Church of St. Germain l'Auxerrois. In 1873, when the Municipal Council opened a competition for the reconstruction of the Hôtel de Ville, he participated in it in collaboration with M. de Perthes. They gained the first prize, and were charged with the execution of the great work, to which he devoted all his powers.* M. Ballu, who was a Member of the Institut de France and Inspector-General of Diocesan Edifices, was elected as an Honorary and Corresponding Member of the Royal Institute of British Architects in 1876.

TEMPLE BAR GATES.

STR.—Can any of your readers inform me whether there is truth in the report that the curved wooden gates which once adorned Temple Bar have been allowed to lapse into decay? If so, it would be curious to know who is responsible for this neglect.

OLD LONDON.

YORK HOUSE WATER-GATE.

STR.—May I offer a suggestion as to the preservation of this beautiful relic of the taste and skill of Inigo Jones, which is now almost lost, and utterly useless in its present position? Why not remove it to the west end of the ornamental water in St. James's Park, opposite Buckingham Palace, where it would be seen to the greatest advantage from all points, and where it might even be restored to its original use, namely, a gate from whence to embark in boats on the water? If, however, objection should be taken to this latter part of the proposal, the gate would still remain an elegant ornament to the margin of the west end of the lake. The cost of removal of so small a structure need not be a very heavy item.

G. BYNG GATTE.

* The following illustrations of this building have appeared in the pages of the *Builder*, viz.:—External view, vol. xxxix., 1880, p. 323; interior view, Hall of Fêtes, vol. xliii., 1882, p. 402; and Council Chamber, vol. xlv., 1883, p. 463.

A QUESTION OF VALUATION.

STR.—I shall be greatly obliged if some kind friend and reader of the *Builder* will give me replies to the following questions at the earliest possible date, viz.:—What is the present value of a tithe-rent charge, commuted at 11%, payable annually? Also the present value of a land-tax assessed at 9s. the year? ONE IN A FIX.

PROVINCIAL NEWS.

New Brighton.—At this watering-place, at the mouth of the Mersey, a "Palace" and Winter Garden have been formed containing a large room for entertainments, 198 ft. long by 104 ft. wide in the centre, and 25 ft. high throughout. The walls are built in brick, with brick in cement piers, and the whole area is covered with a flat compound iron and concrete roof or floor, which is (average) 7 in. thick, having but 2 in. fall each way from the centre over the entire area, with a water outlet at the four corners. This roof and floor is carried upon cast-iron columns in bays, 30 ft. 6 in. by 22 ft. 6 in., upon brick in cement piers about 16 ft. below the floor-level, upon a foundation of concrete below ebb tide. Over the 30 ft. 6 in. span between columns and column in the width of building, rolled compound riveted girders, 2 ft. deep, stretch from side to side, supporting 12-in. girders which run the length of the room, and over all transversely are rolled joists, which are embedded in concrete, finished with Soyssal asphaltic rock. This portion of the contract has been executed by Messrs. Homan & Rodgers, of Manchester and London; and the internal plastering of walls and ceilings by Messrs. Tanner & Son, of Liverpool. A grand organ fills one end of the room, and the floor is laid with pitch-pine for dancing; the flat roof over is used for the same purpose and for skating, and constructed to carry a moving weight of 2½ cwt. to the foot, and was tested before use with a slip gauge below, and some hundreds of weighted bags of sand on one bay, and a body of workmen. The deflection was three-tenths of an inch on the 22 ft. 6 in. girder, which went back to the normal position after the weight was removed, and the whole has been thoroughly tested by crowds from time to time without producing the slightest crack in the ceilings below. From this room to the right are small concert-halls, aviaries, grotto, and other entertaining rooms, and on the left is a promenade conservatory, 135 ft. long by 59 ft. 6 in. wide filled with beautiful exotics and surrounded by vinerias and azalea and camellia houses, the whole being warmed with some 1,000 ft. of hot-water pipes. These buildings have been executed under contract by Messrs. McKenzie & Moncur, of Edinburgh; and the cement floors and tiled pavement by Mr. R. Lowe, of Farnworth. The dancing area, being about one acre on floor and roof, is brilliantly lighted at night by gas and electricity. The whole has been designed and carried out under the personal superintendence of Mr. T. C. Ebdy, architect, of Birkenhead. Upwards of 60,000, has been spent on the undertaking.

Toxteth Park, Liverpool.—The alterations to the offices of the Toxteth Park Local Board, situate in Lark-lane, Toxteth Park, Liverpool, have just been completed by the contractor, Mr. John Carruthers, of Toxteth Park, from the designs of Mr. John Price, Assoc. M. Inst. C.E., engineer and surveyor to the Board. The cost, including some fittings and furniture specially designed, has been 450*l*.

Bolton.—Mr. Jonas Proctor, M. Inst. C.E., having resigned his appointment as Borough Surveyor to the Bolton Corporation, has commenced private practice, and taken into partnership Mr. H. L. Hinnell, formerly his pupil, and late of the Borough Engineer's Office, Nottingham. Mr. Proctor has been retained by the Bolton Corporation to complete the Hacken Ornal Sewage Works, for the Borough and Rural Sanitary Authority.

Rochdale.—The new premises of the Manchester and Liverpool District Bank, which have just been opened for business, are situate at the corner of Hind Hill-street and Market-street, in the side space just opposite St. Luke's Church. The building faces both streets, the bank entrance being at the corner, and is Classic in style. The banking-room is spacious and well lighted. The safe is made of steel, and surrounded with thick concrete, and approached by double fireproof doors by Messrs. Chubb. This

safe contains another of Messrs. Chubb's patent cash safes. Attached to the bank is a manager's house. The whole of the place is heated with hot water, and great care has been bestowed upon the ventilation, both as to the admission of fresh air and the extraction of foul air. The premises have been designed and carried out under the superintendence of Messrs. Maxwell & Tuke, architects, Manchester and Bury, by Messrs. Diggle Bros. of Heywood. The block floors and ceramic tile work have been done by Mr. L. Oppenheimer, of Manchester; the hot-water by Mr. J. Downham, of Bury; the grates by Mr. John Kershaw, of Heywood; and the bank fittings by Messrs. Beahans & Company, of Manchester.

The Student's Column.

DESCRIPTIVE GEOMETRY.—PART II.

**I.
OF SURFACES IN GENERAL.
Curved Lines and Tangents.**

ALL curved lines can be exactly represented by two projections. They belong to two distinct categories. Firstly, *plane lines* or lines which are entirely contained in planes, such as a circle for instance; secondly, *lines of double curvature*, which are not contained in planes, such as the thread of a screw.

The *tangent* to a curve in any point is the limit of the direction of the cords which join that point to another point infinitely near to it. We conclude thereby that the projection of a tangent is also tangent to the projection of the curve; for, if on curve C we draw the cord *a b*, we see that when the point *b* nears *a* so will *b^h* near *a^h* in the projection, and when *b* becomes infinitely near to *a* so will *b^h* be infinitely near to *a^h*; and the cord *a^h b^h* prolonged will be tangent to the projection C^h in the same time as the cord *a b* becomes a tangent to the curve C itself. (See fig. 86.)

Fig. 86.

The use which is made of infinitely small dimensions and the notion of limits belong to the higher grades of mathematics, such as differential and integral calculus, and may seem strange to some students; but, in this second part of Descriptive Geometry we cannot escape using them also, and the student should do his best to grasp at once these ideas in the above simple example.

Generation of Surfaces.

All surfaces can be engendered by the motion of a line either of constant or variable form. For instance, suppose we cut a surface by a series of parallel planes infinitely near to one

Fig. 87.

another, and get thereby the lines G, G', G'', G''', &c., we can look upon these lines as the different positions of a line G, which engenders the

surface. We call that line the *Generator** of the surface. (See fig. 87.)

Principal Examples of the Generation of Surfaces.

Cylinders are generated by a straight line, G, bound to remain always parallel to a given line, K, and to touch another line, D, we shall call the *Director*. This is the definition of cylinders in general, what is commonly called a cylinder is only a special case in which the director is a circle, and the generator is perpendicular to the plane of the directing circle; such a cylinder is called a *right cylinder*. (See fig. 88.)

Fig. 88.

Cones are generated by a straight line, G, bound to pass through a point, *s*, named the *apex* of the cone, and to touch another line, D, called the *director* of the cone. Again, this is the definition of cones in general, of which the ordinary cone is but a special case, which is called a *right cone*. (See fig. 89.)

Fig. 89.

The directors of both cones and cylinders can be any line of their surface, but generally plane lines are selected, such as are formed by the section of the cone or the cylinder by a plane, and then the director is called the *base* of the cone or cylinder. We beg also to remark that cylinders are but cones where the apex, S, is situated at an infinite distance, and that we shall find, therefore, great similarity in the treatment of these two surfaces.

Surfaces of Revolution are engendered by a line, G, which revolves round an axis, A, to which it is bound. In this motion all the points of G describe circles; these circles are the sections of the surface of revolution by planes perpen-

Fig. 90.

dicular to its axis. The generator can be any line of the surface, but generally a *meridian* is selected for the generator G, that is, the section

* The standard works on Geometry use the words "generatrix" and "directrix," because a line belongs, both in French and in Latin, to the feminine gender; but we see no obligation in the English language to follow this example, and as the plural "generatrices" and "directrices" is inconvenient and strange we prefer in this popular paper to use the masculine form of "generator" and "director."

of the surface by a plane passing through the axis A. (See fig. 90.)

Tangent Planes.

If through a point, *m*, of a curved surface we draw a series of curves, such as *m a, m b, and m c*, the tangents to all these curves will be in the same plane; this is what we call the *plane tangent to the surface in m*.

In fig. 91 we have taken the points *a* and *b* on another generator G' of the surface; now, when the generating curve G' is taken infinitely near to the generator G, then the cords *m a, m b, and m c* become the tangents to the curves *m a, m b, and m c*; and, as the cords were contained in one plane, so are also the tangents. This remark is not restricted to any particular curves selected, but applies to any three curves whatsoever which cross one another in one point of the surface; therefore it holds good for all the curves, and we conclude that all the tangents to the surface in the point *m* are in one plane.

Fig. 91.

Planes tangent to cones and cylinders contain a generator of their surface, and are, therefore, tangent all along that line. In fig. 92 *Sa* and

Fig. 92.

Sa' are two neighbouring generators of a cone; they are contained in one plane. When these generators are taken infinitely near to one another the plane which contains them becomes tangent to the cone, for the cords *m m', a a'* have become the tangents *m t* and *a b*, and the generators have become united into one, namely, the generator *Sa*. We have said already above that the arguments applied to cones hold equally good for cylinders.

**RECENT PATENTS.
ABSTRACTS OF SPECIFICATIONS.**

350, Inlating Wood. H. Forester.
The design is cut in the wood in the usual way, and is then filled in with a plastic composition, which afterwards hardens in place of the wood or ivory commonly employed.

3,991, Fireplace or Grate. W. Rooke.
The frame is cast with a chamber at the back, in which are arranged a series of gills to warm the air which passes through it, and which is carried away by pipes fitted into sockets cast on the top of the chamber to assist in warming other rooms. Fire brick back and cheeks are fixed in recesses in the casting. A false grate is fixed in front of the frame by means of countersunk screws.

MEETINGS.

SATURDAY, MAY 30.

Architectural Association.—Visit to Buchan Hill Man-
sion, Crawley, Sussex (Messrs. Ernest George & Peto,
architects). Train from Victoria, 1.30 p.m.
Civil and Mechanical Engineers' Society.—Visit to the
new Blackfriars Railway Bridge. 2.30 p.m.
Edinburgh Architectural Association.—Annual excursion:
to Inchochuil, Doubristle, Dalgety, and Aberdeen.

MONDAY, JUNE 1.

Surveyors' Institution.—Annual General Meeting, 3 p.m.
Followed by Annual Dinner (at Holborn Restaurant),
4.30 p.m.
Society of Engineers.—Mr. Henry Fajls on "Port-
land Cement." 7.30 p.m.
Clerks of Works' Association.—Mr. G. R. Webster on
"A Simple Method of Perspective Drawing" (second
paper), 8 p.m.
Inventors' Institute.—8 p.m.
Royal Institute of the Architects of Ireland (Dublin).—
Council meeting.
Edinburgh Architectural Association.—Annual General
Meeting, 8.30 p.m.

TUESDAY, JUNE 2.

Institution of Civil Engineers.—Annual General Meet-
ing (under Revised By-Laws) to receive the Report of the
Council, and to Elect the Council for the ensuing year,
8 p.m.
Society of Biblical Archaeology.—(1) The Rev. H. G.
Tomkins "On the Topography of Northern Syria, with
Special Reference to the Karak Lists of Theonius III." (2) Mr. Theo. G. Pinches "On Specimens of the Familiar
Correspondence of the Babylonians and Assyrians." (3)
Professor A. H. Sayce on "The Site of This." 8 p.m.
Birmingham Architectural Association.—Ordinary Meet-
ing: Nomination of Officers. 7.30 p.m.

WEDNESDAY, JUNE 3.

Builders' Foremen and Clerks of Works Institution.—
Ordinary Meeting, 8.30 p.m.

THURSDAY, JUNE 4.

Society of Antiquaries.—Ballot for Election of Fellows,
8.30 p.m.
Royal Archaeological Institute.—(1) Mr. F. C. J.
Spurrell on "Some Early Sites and Works on the Margin
of the Thames (tidal portion)." (2) Mr. John E. Price
F.S.A., "Comparative Notes on Roman Remains at
Hitchin and Airedale." (3) Mr. R. S. Ferguson, F.S.A.,
on "Elizabethan Standard Weights and the Casside
Bushel." 8 p.m.

FRIDAY, JUNE 5.

Institution of Civil Engineers.—The President's Con-
cessions at the Inventions Exhibition, 9 to 12 p.m.

Miscellaneous.

Society of Arts.—The results of the Society
of Arts' examinations have just been published.
There was a satisfactory increase in the number
of candidates, 1,208 having presented them-
selves at 44 centres, whereas last year there
were 991 candidates and 38 centres. Of these
1,206 candidates 953 passed and 255 failed.
The number of papers worked was 1,321; of
these 145 took first-class certificates, 410 second
class, and 474 third class, while to 292 papers
no certificate was awarded. Eleven of the
thirteen subjects set down for examination
were taken up. In two no examination was
held, as the requisite number of candidates (25)
did not present themselves. The largest number
of papers worked (396) was in book-keeping.
Other favourite subjects were:—Arithmetic,
171; English (including composition and corre-
spondence and précis writing), 118; short-
hand, 253; theory of music, 243. In French
there were 96 candidates; in German only 28.

Great Eastern Railway, Essex Lines.—
The construction of the railway, about nine
miles in length, from Shenfield, near Brent-
wood, to Wickford, authorised by the Great
Eastern Railway General Powers Act, 1883, is
about to be commenced. The contract, which
includes the erection of stations at Shenfield
Junction, Billericay, and Wickford, has been
let to Mr. T. D. Ridley, of Harwich and Middles-
brough.

Domestic Electric Lighting.—The *Electrical Review* of the 16th inst. gives a detailed
account of an electric lighting installation lately
set up at Westwood House, Sydenham, the resi-
dence of Mr. Henry Littleton, the principal of
the well-known music publishing firm of Novello,
Ewer, & Co., which has recently been rebuilt
from designs by Mr. J. L. Pearson, R.A. This
rebuilding has been carried out by Messrs.
Voitch & Close. Westwood House and two
smaller houses, occupied respectively by Messrs.
Augustus and Alfred Littleton, stand in
grounds of about nine acres in extent, and
towards the latter end of last year Mr. Little-
ton finally decided to adopt the electric light,
placing the arrangements for illumination
entirely in the hands of his son, Mr. A. Little-
ton. The prime mover is one of the "Otto"
8 horse-power (nominal) gas engines, running
a few hours a day for charging accumulators.
The dynamo is a shunt-wound "Phoenix" of
Paterson & Cooper's manufacture, giving at its
normal speed 110 volts and about 50 amperes.
The accumulator-room is a spare loose horse-
box, well suited for the purpose. Here are
placed 100 galled cells, 1½ horse-power type
of the Electrical Power Storage Company's
secondary batteries, with the latest improve-
ments, and coupled up in twos. The lamps
used are made by Messrs. Woodhouse & Rawson,
and are chiefly of 20-candle power. The opera-
tions of fixing the lamps, wiring the houses,
laying the main cables, and generally carrying
out the work connected with the installation,
was undertaken by Messrs. Paterson & Cooper,
and this has been completed to the entire satis-
faction of Mr. Littleton. The various switches,
fusable plugs, and measuring instruments, are
from the same firm, but Messrs. Paraday & Son
have supplied all the fittings for Mr. Augustus
Littleton's rooms, and Messrs. Barkentin &
Kroll, of Regent-street, have designed very
original and unique fittings in hammered copper
and iron for Westwood House. The two small
houses are lighted throughout with about twenty
lamps each, and Westwood House will contain
more than double that number, and including
those for a small theatre, the total will be
nearly 400 lights. The whole installation will
be in charge of a youth of about eighteen years
of age, who will, however, spend but half his
time in this work. It is stated that since the
beginning of January, when a portion of the
lamps were first put into use, no hitch of any
kind has occurred.

A Proposed Art-Museum for Bath.—
A case before Mr. Justice Chitty in the Chancery
Division last week raised questions as to the
validity of bequests contained in a codicil of
the late Miss Holburne, of Bath, executed
three days before death, whereby she gave the
collection of the late Sir Thomas William
Holburne, consisting of antique plate, china,
&c., to certain persons for their own use abso-
lutely, and also a sum of 10,000l. and her
residuary estate to the same persons. She also
gave the house to them in which she lived.
These persons admitted that the testatrix in
making the gifts intended that they should act
as trustees and form an art-collection for Bath,
and that the 10,000l. and residuary bequest
was intended for the maintenance and protec-
tion of this collection. They produced corre-
spondence to that effect, showing such intention
on the part of the testatrix, and also that she
had during her lifetime contemplated buying
Sydney House, Bath, for the purposes of a
"Holburne Museum," and endowing it with
10,000l., but the negotiations fell through. The
questions were whether the gifts in the codicil
fell within the prohibitions of the Statute of
Mortmain, precluding testamentary dispositions
of land or houses, or money to be laid out in
land or houses, or of money to support or endow
houses or land. Mr. Justice Chitty said that
the first question was whether the gifts were
charitable gifts within the legal meaning of the
term. A public purpose of general utility, to
the exclusion of private business, was obviously
intended by the testatrix, as was shown by the
correspondence. It was intended that the
museum should be in Bath, and for that city,
and kept there. The question then arose
whether the gifts necessarily implied the pur-
chase of a house. His lordship thought not,
for the testatrix seemed to have successfully
avoided using any language which would justify
any such conclusion. It would be no breach
of trust for the trustees to hire a room in
which to have the collection in proper and
careful custody.

Overhead Wires.—Notwithstanding the
recommendations contained in the report of the
Select Committee on Telephone and Telegraph
Wires, which has just been issued, that the erec-
tion of overhead wires should be continued
subject to proper regulation and supervision,
care should be taken that the rights of the
public are not encroached upon. The Com-
mittee propose to authorise the Postmaster-
General to give notice of intention to erect
telegraph lines before obtaining the consent
of the road authority, such notice being public-
ly posted. All persons objecting are to send
the objections within a stated period. Such
objections should be referred to a competent
tribunal, empowered to authorise the erection
of the line on just conditions, and to make
orders as to the costs occasioned by the objec-
tions. This tribunal may be the county court
judge, with an appeal to the Railway Commis-
sioners, as at present, within a limited time.
Provisions of existing Acts inconsistent with
these suggestions are to be repealed, especially
the provision requiring the Postmaster-Gen-
eral to obtain the consent of every occupier with
30 ft. of the pole. It will be seen from the above
that far too much and additional power is
proposed to be placed in the hands of the
Post Office, as against the public. Private
rights cannot be too jealously guarded, whether
against monopolies or the State. Persons who
have had experience in resisting those who
powers are only too well aware how difficult
and how expensive it is to act by legal means
against them.—*Iron.*

Wings.—It may be taken for granted that
the introduction of wings into ornament
design was due directly to their symbolic mean-
ing. What more suggestive of the heavens
above, and all that pertains to it, than wings?
Once, however, admitted, they soon assumed
very important place in virtue of their abso-
lutely ornamental character,—and held it.
Accordingly we find that in the ornament of a
periods great decorative use is made of the wing
from the winged globe of early Egyptian art
symbol of eternity, to the winged love of modern
French design, symbol only of frivolity. Al-
yet, for all the ornamental character of the
wing, there has always been a difficulty in satis-
factorily combining it with animal forms
which nature had not made structural provis-
ion for it. The happy thought, at whatever ear-
ly period it occurred to man, was one of those
inspirations more poetic in its conception than
easy to realise in plastic form. The realistic
is almost inevitably a degradation of the ideal.
This is less the case in the earlier and more
archaic art, which touches us by its naïveté
whereas in work of later date we should
rather the comicality of it. What was possible
to the artist of the old world is not possible
to us. We may not attempt what came natural
to him to do, because to us it is not natural.
Art Journal.

Sanitary Supervision of Hotels.—The
Sanitary Protective League of New York City
has originated an entirely new sanitary move-
ment. It has prepared a Bill, which it will
introduce and get passed by the State Legislature,
and provides that in all towns and cities in which
there are Boards of Health, the owners and
keepers of all hotels and lodging-houses shall
apply to such Boards for sanitary certificates,
which shall certify to the good sanitary con-
dition of their houses. These certificates shall
not be granted to houses which have not
freedom from dampness of site or cellar, prop-
er drainage and plumbing, absence of foul ar-
dorous odours, adequate supply of water,
direct light in sleeping-rooms, and at least
600 cubic feet of air-space for each occupant.
Each innkeeper must obtain and display the
certificate, as failing to do so subjects him
damages for sickness of occupants during such
negligence, and, in case of death, the executor
of the deceased have cause for action.—*Sanitary
Record.*

Lostwithiel.—A site which has been vacant
for some years, adjoining the United Methodist
Free Church on the Bank, is about to be utilised
for the erection thereon of a minister's house
with a shop and premises at the angle of the
site to Queen-street and Bodmin-hill, a sub-
stantial space being allowed at the north end for an
extension hereafter of their church as may be
found expedient. The plans have been prepared
by Mr. A. E. Skentlebury, architect, of Lost-
withiel. The cost will be about 700l., and the
contractor is Mr. J. Reed, of the Kirkby Building
Yard, Plymouth.

the Mersey Docks and Harbour Board.—The usual meeting of this Board, held on the inst., Mr. Littledale directed attention to purchase by the Works Committee of certain machinery for a swing bridge, and for the reasons why this change had been decided upon. He complained that the bridge joining the connection between the east and west sides of dock "K" at its northern end had been long since ordered. He also inquired whether the swing bridge was in substitution of the other kind of bridge, and what would be the cost of the alterations in the quay walls to give the bridge. He concluded by moving the recommendations of the committee of its stand over for a week in order that the question might be inquired into. Mr. Lyster, the engineer, entered into a brief explanation, but Mr. Littledale contended that of his questions had been answered. As, however, there was no second to Mr. Littledale's motion, it fell to the ground, and the votes were confirmed. Mr. Littledale subsequently directed attention to the report of the pier on the deflection of the west wall of Brookbank Dock and moved that the report be made at the time of the bursting of a water-pipe, referred to by the engineer, be laid before the Board, and also that the works committee be requested to report that at which said bursting of the pipe occurred, and at the time the pressure of water was shut off, contending that neither the bursting nor the age of a water-pipe could, in the course of very short time, cause a deflection in the wall to the extent of 430 ft. in length. The deflection from the weakness of the construction

of the wall, and he therefore asked for the production of the report in order to test the accuracy or the inaccuracy of his statements. The Chairman explained that originally the report was only a verbal one, and its accuracy had since been fully confirmed by Mr. Lyster. If, however, it was wished to carry the discussion further, it would be necessary that the motion should be seconded. Mr. Littledale finding no second, his motion fell to the ground, and he remarked that "there is a day of reckoning coming for all that."—*Liverpool Journal of Commerce.*

A Memorial Brass, by Mr. James Forgyth, has just been placed in Prestwich Church containing the following inscription:—"In loving memory of Henry Mildred Birch, B.D., formerly Fellow of King's College, Cambridge, and Assistant Master of Eton College. For thirty-two years Rector of this Parish, Canon Residentiary of Ripon Cathedral, Chaplain in Ordinary to the Queen, also Chaplain and sometime Tutor to His Royal Highness Albert Edward Prince of Wales. Born January 12th, 1820; died June 29th, 1881."

British Archaeological Association.—At the meeting on Wednesday, May 20th (the Rev. Dr. Sparrow Simpson in the chair), it was announced that the annual congress would be held early in August, at Brighton, for the purpose of paying visits to many places of interest in West Sussex. Among these will be Arundel Castle, by permission of his Grace the Duke of Norfolk; the Roman pavements at Bignor, Chichester Cathedral, Steyning, Shoreham, and Sompting Churches, and many others.

For the erection of new additions to St. Giles's and St. George's Workhouse, Bloomsbury, for the Guardians of the Poor. Messrs. William & A. Boreford Pite, architects. Quantities by Messrs. Gardiner, Son, & Theobald.—

Badges and Bearings of Interest and Fame.

VER first and foremost on the long and glorious roll-call of the chivalry of the Middle Ages, investing history with all the charm and glamour of poetry and romance, appearing to us as a creation from the pen of the "Fairy Queen" rather than a veritable warrior incarnate, the hero of our youth, and the admiration and wonder of our maturer years, the very embodiment of daring and adventure, we hail "The Red Cross Knight," with his white coat of arms charged with the crimson emblem of our faith.

Familiar as these grand old arms will be to every one, we must just note that the Templar's cross ends in eight points, differing therein from that of St. George, which is carried through to the borders of the shield and shows no points. The renowned banner of these guardians of the Temple was their "Beauseant," black in the upper half and white in the lower, and it is generally understood that this signified their fierceness to foes and graciousness for friends.

They bore two badges, the "Agnus Dei" carrying the Red Cross banner, and a horse with two knights on his back; this latter was typical of their poverty when first instituted a state from which they soon passed to acquire great wealth, and Boutell mentions as curious fact that the "Pegasus" of the barister Templars of the present day is derived from it, the two riders having been mistaken for wings.

The order was finally abolished in the year 1312, after an existence of some two centuries, and its overthrow was accompanied by the most frightful cruelties; and perhaps this persecution has made the Red Cross heroes the dearer to us. They were accused of the most absurd and horrible crimes, but the acquisition of riches undoubtedly led to their suppression and a general scramble for the plunder. Whatever faults may attach to the Templars, they will ever remain a conspicuous and romantic feature of historic fame, and may we not say slightly varying Pope,—

If to their lot some human errors fall,
Look on their shield and you'll forget them all!"

But as the "Red Cross Knights" fade from our view, there arise before us their brothers in arms bearing the "white cross," the banner of the "Knights of St. John of Jerusalem," a bearing at least equal in renown, but perhaps

not so popularly known as the one we have been discussing.

These "Hospitaliers" were founded as an order in the last decade of the eleventh century (about the year 1092), and their white cross is also of eight points, and now familiar to us as the "Maltese Cross," from the knights having settled in Malta in 1530. It was borne upon a black ground. The order was suppressed in England in 1559.

We learn from history (and we learn it with the greatest reluctance and regret) that quarrels broke out between the bearers of the red and white crosses, which culminated in a pitched battle in 1259, from which conflict scarcely a Templar was left to tell the tale. Would that this dark page could be forever torn from the records of these famed champions of Christianity; but our paper is an heraldic one, and we must not linger too long on history even of such deep interest as this.

It seems "a far cry" from the crosses of our Crusaders to the next important bearing; but "The Bear and Ragged Staff" of the Warwick family has played a conspicuous part in our country's annals, and has furthermore been immortalised by Shakspeare. It is said to have been derived from the Nevilles and the Beauchamps. The origin is dubious, and goes back to "The Round Table" of King Arthur.

A most historic and interesting augmentation is to be found on the arms of the Duke of Norfolk, representing a Scottish demi-lion rampant pierced through the mouth by an arrow, and thus recording the disastrous defeat sustained by James IV. at Flodden, and the finding of the king's body after the fight pierced with arrows. This charge was granted to the Earl of Surrey, who was in command of the English army on that occasion.

The arms of the City of London is a white shield charged with the red cross of St. George, and in the first quarter is a red sword. The cross of St. George is said to be the most ancient of all the numerous crosses of heraldry. The sword in the City arms is a matter of dispute; one side claiming it as an augmentation granted to Walworth for striking down the insurgent Wat Tyler, while others say it was given to Philpot, who followed up the blow by despatching the rebel with his sword; but it is also thought that the emblem of St. Paul is the charge in question,—a solution that seems the more feasible of the three supposed sources, and the one that we prefer to believe.

The arms of Jerusalem are interesting partly from its being an infringement of the rules of English heraldry that "metal shall not be placed upon metal"; upon a silver shield is charged a gold cross between four crosslets of

the same (said to symbolise the five wounds of our Saviour), and conveying an allusion to the thirteenth verse of the sixty-eighth Psalm, "Though ye have lien among the pots, yet shall ye be as the wings of a dove covered with silver, and her feathers with yellow gold."

Amongst coats of arms innumerable, some of them of great beauty and very appropriate to their purpose, there is nothing more beautiful nor more happy in its adaptation than the arms of the Sees of our Australasian colonies, the shield being charged with the four stars forming the constellation known as "The Southern Cross," and to most of us dwellers in the northern hemisphere known by hearsay only. We believe that this arrangement of the stars adorns the walls of the mortuary chapel of Bishop Selwyn in Lichfield Cathedral, with other references to his missionary life at the Antipodes.

For paths we know of nothing more touching than the motto of the unfortunate Courtenays, a noble family of Devonshire,— "Ubi lapsus, quid feci?" "Whither have I fallen, what have I done?" Such was their reward for devotion to the bouse of Lancaster.

The crest of the Dudleys of Northamptonshire was a remarkable one, and it was the result of a most remarkable event. It appears that one of the family had some dispute with a neighbour over a piece of land, and it was decided that they should "fight it out" as to which was the lawful owner. On the day appointed for the combat the Dudley ancestor was too ill to attend, but his daughter armed herself, and met the neighbour, and, after a stiff encounter, overthrew him; and for this exploit was assumed a woman's bust rising from a ducal coronet, with hair dishevelled, bosom bare, and a helmet on her head. The name of this amazon was Agnes Hotot.

Sir Cloudesley Shovel, the great admiral of Queen Anne and William III., had a special grant of arms from the latter monarch, blazoned as follows: "Gules, a chevron ermine between two crescents in chief argent, and a fleur-de-lys in base or." The two crescents are to commemorate two memorable victories over the Turks, and the fleur-de-lys one over the French. Lower, in his "Curiosities of Heraldry," pronounces this to be one of the most appropriate coats he had ever met with.

As a sample of the bad taste often displayed in arms alluding to the profession or pursuits of the original bearer, Lower gives the instance of Bishop Hooper, of Gloucester and Worcester, the champion and martyr of the Protestant faith (whose statue is to be seen at the former place, adjoining the cathedral), who bore "a lamb in a burning bush, the rays of the sun descending thereon proper."

Of all extraordinary "supporters," the same

authority mentions two lawyers as chosen for that purpose by Sir George Gordon, a celebrated jurist, and the first Lord Aberdeen, and adds, "Every man to his taste."

The Stanley crest of "the eagle and child," born by the Earls of Derby, is a remarkable one, with a legend attached to it of the king of birds having taken an abandoned infant to its nest out of kindness, where it was discovered alive and well fed; but the story does not hold water, and many different versions are given. The crest itself is well known and frequently met with, and Cussan mentions having come across it as a public-house sign in the hamlet of Whitwell in Hertfordshire, and thereby finding out that the Stanleys had, at one time, been possessors of the manor, and although it had been some three centuries ago, local tradition had thus preserved this memento of the family, and he adds, "I only adduce this instance to show how extended are the historical lessons which may be learned by even a superficial knowledge of armoury."

At the interesting church of Elford, in Staffordshire, we meet with this Lathom crest (as it is at times called) with a singular effigy of "The Stanley Boy," with the fingers of the right hand raised to the temples, and the left hand holding a tennis ball, the inscription "Ubi dolor, ibi digitus" (where the hurt there the hand), thus showing the cause of his death.

The Lanes of King's Bromley, Staffordshire, bear an historic and royal augmentation for the devotion of the family to Charles II., whose life was probably saved by Jane Lane after the battle of Worcester; it consists of the royal arms on a canton added to the original shield, and for a crest "a strawberry horse bearing between his fore legs the royal crown."

Some of our Welsh neighbours are profuse in their numerous quarterings; the Lloyds alone have thirty-five, according to Ellen J. Millington, some going back to Edward I.'s reign, and an enumeration of a few of them is not very pleasant reading. The first, for instance, has "a chevron between three dead Englishmen's heads in profile, coupéd and bearded proper"; and the second "a Saracen's head erased at the neck proper." The crest is "a dead Englishman's head in profile, coupéd and bearded."

For this selection of a Welsh coat we are indebted to the lady above-mentioned, in her work entitled "Heraldry in History, Poetry, and Romance."

The arms of Shakspeare, granted to the father of the immortal poet, are of the allusive or punning order, and the blazonry is "Or, on a bend sable, a spear of the first," and the crest, "a falcon grasping a spear," is a very pretty one.

Chaucer has for crest a tortoise, and the arms are "Party per pale argent and gules a bend counterchanged."

Sir Walter Scott's crest was a woman holding a golden sun in one hand and a silver crescent in the other, the motto being: "Reparabit cornua Phœbe." His coat contains crescents and mullets or stars, with buckles and muscles.

We close this all too scanty sketch for such a comprehensive subject with the following extracts, the first from the preface to that most charming and valuable work, "Moule's Heraldry of Fish" (so beautifully illustrated by his gifted daughter), and the second from that rare and far-reaching research of Lower, and entitled "The Curiosities of Heraldry."

"To the architect heraldry affords an unlimited extent of enrichment in exterior sculpture; and the judgment of C. Barry, R.A., the architect of the House of Lords, has admitted it as an important feature in the principal façade of that splendid edifice. The introduction of arms in windows and pavements also renders it necessary that the architect should be acquainted not only with the rules, but with the peculiar character of the heraldry of different periods."

"The architect who should attempt to raise some stately Gothic fane, omitting the well-carved shield, the heraldic corbel, and the blazoned grandeur of 'rich windows that exclude the light,' would inevitably fail to impart to his work one of the noblest charms pos-

sessed by that noblest of all styles of building, and produce a meagre, soulless abortion."

If we cannot quite endorse this rather too sweeping conclusion, we can at any rate feel, with the enthusiastic writer of it, that heraldic distinctions form not only a most interesting, but a most picturesque and poetic manner of defining the historic relations of buildings and of those who have erected and inhabited them.

PUMPS FOR CONTRACTORS' PURPOSES.

BY M. POWIS BALE.

It cannot be denied that much annoyance and loss often arise through want of knowledge or judgment in the selection of a pump of a type best suited to the requirements of the user. We purpose giving here a few notes on the pumps we consider more especially adapted for contractors' purposes, with some general hints as to working and the points of construction to be desired in them.

In selecting a pump the features to secure, as far as possible, are simplicity, strength, and easy access to the working parts. Pumps of somewhat complex construction are in use which give high results theoretically, but, as a rule, these are rapidly counterbalanced by the extra cost of renewals, breakdowns, &c.

Where very large quantities of water have to be raised, as in mines, the Cornish or beam pumping-engine is undoubtedly the best and most powerful system to employ, but as comparatively few contractors have much occasion to use Cornish engines, we shall not extend our remarks in this direction, but pass to the contractor's pump *par excellence* for low lifts,—say up to 20 ft.,—viz., the centrifugal. For raising considerable quantities of water to a moderate height, it is one of the simplest and most useful forms of pumps made. For lifting water containing foreign matter, sand, leaves, &c., it is much superior to ordinary direct-acting steam pumps, as the steam valves of these latter are very liable to be thrown out of order, or the water ways to become choked. The working parts consist briefly of a series of curved discs or blades, which are made to revolve in a cast-iron case, in a similar manner to a fan-blower. The revolution of these blades produces a partial vacuum in the case, which brings up the water. On the proper proportion and construction of these curved blades the effective working of the pump chiefly depends. Motion is usually imparted by a belt, but a high-speed rotary engine is sometimes coupled directly on to the disc spindle; the great objection, however, to most of these engines is the large amount of steam they consume. For purposes of irrigation, a wind-mill or horse-gear can be used.

In the most advanced form of the smaller centrifugal pumps the main body of the pump is attached by a quadrant bracket to the bed-plate. It can thus be readily swivelled round to any angle it may be desired to work at. This arrangement will be found very convenient for foreshore work, or in awkward situations. At the same time the joints of the suction or discharge pipe need not be disturbed.

The casing of the pump should be arranged so that one side may be taken off to allow of the inspection or cleaning of the pump disc, and hand holes arranged with bayonet-jointed covers, fitted on either side of the suction-pipe, so that any obstruction may be readily removed. To dispense with the use of a foot valve and to save the trouble of charging the pump with water by hand, a small air-exhauster can be fitted and driven from the main-pump disc spindle by a belt. A check valve being fitted to the end of the discharge-pipe, the air is readily exhausted from the pump and pipes and the pump charged with water. The foundation-plate should be cast in one piece, the bearings be of ample area, and efficient means of lubrication secured. For the general purposes of a contractor these pumps are not surpassed by any other, bearing in mind their simplicity of construction, little liability to disarrangement, and low first cost. Rotary pumps

have also the advantage of great certainty in working. Wrought-iron suction-pipes are preferable to cast as they are lighter and less liable to breakage. It will be found convenient for surface drainage and such like work to mount the pump on two wheels; if, however, it can be fixed below the source of supply it will work better, as it does away with the suction. A pump of ample capacity for the work to be performed should be employed, and a broad flexible leather or India-rubber band should be used for driving. It is important that care be taken that the pump is made to run at its proper working speed, which will vary according to the height of the lift.

Another extremely useful pump for contractors' use is the chain. This is of simple construction, and will stand a great deal of rough usage without getting out of order. It is only adapted, however, for raising water to a moderate height, say 50 ft. The pump consists of an endless chain, and discs made to revolve round a wheel mounted in a framing of cast-iron. The chain and discs are arranged to pass down into the water, and up through a wooden or iron tube, carrying with them a certain amount of water, which is delivered into a trough or tank at the ground level. This form of pump is well adapted for lifting sewage, and it will lift,—without choking,—sand, mud, leaves, &c. The discs pass up the pipe horizontally, and should have a clearance of, say, $\frac{1}{2}$ in. to $\frac{3}{4}$ in. They may be made of wood, leather, india-rubber, or iron, as may be most suitable to the work.

The discs should be arranged about 10 ft. apart; putting them nearer does not add to the efficiency of the pump. The speed at which the chain is driven will depend somewhat on the nature of the water being lifted, but the speed for general purposes should be about 250 ft. per minute. A slight drawback to this pump is that it has (of course) a certain amount of slip in working, which has been calculated at about 20 per cent.; but this is to a great degree counterbalanced by its certainty of action and low first cost.

For light sinking purposes, owing to the constant liability to flooding, bucket-pumps are largely employed, but where the quantity of water has been pretty well ascertained, barrel pumps may be used with advantage. In selecting a barrel-pump care should be taken that the pump barrel, glands, valves, &c., are of gun-metal, and that covers are provided for their ready examination. For deep sinkings, wooden connecting-rods, clamped with iron, may often be used with advantage. The pump-rods should, in all cases, be arranged with guides, as they work much stiffer, and are less liable to bend or get out of truth. An air-vessel should be fitted to the rising main, as the flow of water is more equal, and the pump is relieved from shocks that may arise. The suction-pipe should have a foot valve and strainer. Very great care should be exercised in fixing the pump-plunger and connecting-rod exactly in a vertical line. Should they be out of plumb the valves will probably soon be broken to pieces. In fact, in one case we have known a valve to be broken to pieces and be brought to the surface with the stream of water.

Hard wood staging to support the pump is perhaps preferable to iron, as it is more readily fixed or renewed. Where pump gear is fixed at the top of a well or sinking, especial care should be taken with the foundations; and that the pump gear is perfectly level and free from vibration in working if it be driven by an engine and belt: the centre of the driving-wheel should be at least 18 ft. off.

There is a great variety of mechanical arrangements for pumping, especially suited to varied circumstances of site, depth, and nature of water, motive-power, &c. For contractors' purposes, where the usage is generally rough and the water not of the cleanest, the complex or delicate forms of direct-acting or reciprocating steam pumps should be avoided; many of them also consume a large amount of steam. Where, however, the water is clean and a large quantity of it has to be raised a considerable height, they are of great value, as this duty cannot be satisfactorily performed by either

the centrifugal or chain pump. It must be premised, however, that they are under skilful management.

In direct-acting pumps the steam valves require careful attention, and are somewhat liable to get out of order; those worked by tappets have the advantage of being rather more reliable than steam-moved valves. With regard to ram pumps the ordinary slide-valve arrangement is to be recommended. To secure steady and even working a tolerably large and heavy fly-wheel should be employed. In all piston pumps it is a matter of the utmost importance to their efficient working that the piston should be perfectly leathered and packed, and, consequently, completely air-tight. Long-stroke steam-pumps are generally to be preferred to short, as there is less change in the direction of the pump-piston, and, consequently, less inertia to overcome; and the water lost through the valves is, practically, the same in both cases. It is important that its motions are properly cushioned, and that it will start at any point of stroke on dead centre. When the pump has to be fixed a considerable distance from the boiler, and where the condensation of the steam in the pipes must necessarily be great, compressed air may be used instead of steam with advantage, although the cost of its production in the first instance is greater than that of steam, probably about 50 per cent. or even more; but, by its use, steam pipes are done away with, also their cost of fixing, flexible hose being used in their place. This is especially valuable when blasting, as the pump may be mounted on a suspended platform or on wheels, and it and the hose moved out of the way when a "shot" is fired. For rough usage we can recommend leather pump-valves and a simple fibrous material, such as hemp for packing, as these can be readily renewed without special skilled labour. India-rubber valves are quite unsuited for lifts above say 250 ft. For contractors' use we prefer to employ, wherever possible, the centrifugal or chain pump, as being better suited to the nature of the work than most of the direct-acting piston-pumps.

For working in difficult situations, or keeping foundations free from water, the pulsometer pump will be found of considerable service, and, as it has no delicate parts, it may be used for raising muddy water, &c., without detriment. It does not require skilled attention, and may be suspended by a chain, and can thus readily be employed to keep water under whilst deep-well or other permanent pumps are being repaired.

When it is necessary to raise water from one level to another, the work being of a temporary character, and it is not desired to go to the expense of a pump, a steam water-raiser or elevator can be used. This little apparatus consists briefly of pipes at right angles to one another for steam suction and delivery. The steam enters at one end, and creates a partial vacuum in the suction and delivery pipes, which will suck up water from a depth of about 20 ft. It can also be used for forcing, and will force water about 1 ft. high for each 1 lb. of steam pressure employed. It is very important that the suction-pipe used be perfectly air-tight, and a rose should be fixed on the end of it.

The disadvantage attending the use of this and other water-raisers and pumps which rely for their action on the formation of a vacuum by means of the steam used, is the loss through the extra steam required to work them, which is very considerable in many cases.

A number of hand-pumps more or less adapted for contractors' requirements are made, and some of these are very indifferent productions. To secure durability and efficiency in working they should in all cases have bored barrels and gun-metal valves and hockets, and a brass lining to the pump barrel is a decided improvement. A wrought-iron pump is much to be preferred to cast, as it is stronger and more portable, and it should be galvanised and supplied with a sliding suction-pipe to suit variable depths. Where water has to be raised from a considerable distance, the working barrel can be taken beneath the ground level,

and in lieu of a single handle the pump can be arranged with double lever handles for two or more men to work at. We recommend for these pumps pipes with flanged in preference to screwed joints, and the sliding suction-pipe should be fitted with a galvanised wrought-iron strainer. These pumps are, of course, only suited for small contracts.

All suction-pipes should be well tested, and the joints made perfectly air-tight; much trouble and loss is often caused through the leakage of the air and consequent failure in the working of the pump. In arranging the pipes avoid all bends as far as possible, as the friction of the water through the pipes is largely increased by them. If the pump has to draw above 6 ft. vertically, it would be well to have a retaining valve fitted in the suction-pipe close to the water.

The speed of the water through the pipes should not exceed 250 ft. per minute, as the friction in the pipes increases in the proportion of the square of the velocity. It therefore follows that if pumps are driven at a very high speed a considerable loss of power through friction occurs. When long lengths of pipe have to be used, allowance must be made for friction, and it is therefore advisable to select a pump somewhat larger than is absolutely required for the work.

In long lifts it is very important that the pipe joints should be very carefully made, otherwise with heavy pressures leakages are very liable to occur. It will pay well to have all joint flanges planed. We have seen joints made with a lead ring wrapped round with lamp cotton stand extremely well, but where the head of water exceeds 500 ft., we can strongly recommend the joint as shown by fig. 1. In

Fig. 1.

this joint the lower pipe is recessed, and the upper one made with a corresponding projection; a cord of gutta-percha is inserted between the flanges, and squeezed flat, when the bolts are tightened up. This joint has stood pressures of upwards of 700 lb. per square inch. Our illustration (fig. 2) repre-

Fig. 2.

sents another joint well adapted for pipes carrying compressed air, as it will be found perfectly tight in working, cheap, and readily fixed. The ends of the pipe are flanged, and an india-rubber washer inserted between them; they are then brought tight together by means of the bolts. These pipes should be made of wrought iron of good quality, so that should it be necessary to replace or joint them, they may be cut at any point, heated, and turned up by a smith, which is an advantage over screwed pipes, as they when cut have to be screwed at the ends to join them; at the same time, the

threads of the screws are apt to become worn, and make a leaky joint.

Owing to exigencies of site in using steam pumps it is sometimes necessary to fix the boiler at a distance from the pump, the consequence is there is very considerable condensation in the pipes. This can, however, be greatly modified by covering the pipes with non-conducting material; where, however, there is much water, such as is often met with in sinking operations, a suitable covering is at present not very easy to find. What is wanted is a hose to slip over the pipe and keep the heat in, and be not affected by it on the inside or by the water on the outside. India-rubber hose will keep the water off, but is itself more or less affected after a time by the heat of the pipes.

In lieu of the above, although somewhat troublesome to fix, we can recommend the following as being cheap and effective:—Box up the pipe in a triangular box neatly jointed at the angles, and fill in the vacant space with "silicate cotton" or "slag-wool,"—a non-conductor made from blast furnace slag,—which should be rammed tight. Asbestos packing is also very good for this purpose, but more expensive.

We need hardly say that, whatever pump is employed, all bearing surfaces should be well lubricated, and we can recommend the following mixture as giving very excellent results:—Good lard oil, 75 parts; plumbago, powdered very fine, 25 parts. This will be found to put a fine surface on the inside of steam cylinders, and can be used with advantage in most kinds of bearings.

THE LIBRARY OF EUMENES AT PERGAMON.

THE chief laurels of the Pergamene excavations have rightly been awarded to Dr. Humann, but an aftermath of glory remains for Dr. Conze, who, in his study at Berlin, has discovered the undoubted site of the great library of Eumenes. Archaeologists all knew that Pergamos boasted a library of many thousand books, that its fame as a literary city was little behind its repute as a health resort; they knew, further, that it was Eumenes who turned to such good account the "Attalæe conditiones" of his predecessors; that this same Eumenes "built the city, and out of his love of magnificence and beauty erected buildings as offerings to the gods, and founded libraries and made Pergamon the splendid abode it now is." But though the great altar was brought to light with such great rapidity, the site of the great library, scarcely less famous, has remained until quite recently undetected. At the last meeting of the Prussian Academy of Sciences, Dr. Conze read a paper, in which he proved beyond doubt the exact spot where the library is to be found. His paper is printed in the current "Berichte" of the Academy, pp. 1,259-70. What he maintains is briefly this. Behind the temple of Athene Polias, to the north and to the east, enclosing a considerable space, ran a colonnade two stories high. The arrangement of the colonnade and its position in relation to the temple can be seen in the authorised restoration of the Acropolis. Such alterations as have to be made in this restoration, and which we have noted elsewhere, do not affect the arrangement of the colonnade. Behind the north side of this colonnade ran a number of rooms, some in the upper, some in the lower, story. The rooms in the upper story are four in number, and the most easterly one is the largest. Within this room, on the north, west, and east sides, is a low piece of masonry, somewhat like a bench. On the north side it broadens out to the width of a basis large enough to hold a good-sized statue. On this basis originally stood the great statue of Athene, which is now placed with the other Pergamene marbles in the Assyrian room at the Berlin Museum. It stands at the far end. On the north and east walls, to the inside, have been found a regular series of holes. These, Dr. Conze thinks, contained the hooks on which the shelves for the

books were fastened. The statue of Athena would be very appropriate in such a place,—at least, so Juvenal thought:—

“*Hic libros dabit et foras mediamque Mineram.*”

An additional proof of the existence of this library is afforded by some inscriptions found within the precincts of the Athene temple; they originally belonged to portraits of Alceus, Herodotus, Homer, &c., and had reference to the literary studies that were carried on at Pergamos.

The discovery of this library, and the certainty of most of its architectural conditions, has a special interest, because it enables us to reconstruct in thought other libraries of the ancient world. This Pergamene library consisted of one large room and a number of smaller ones behind a colonnade, very like in arrangement, as Dr. Conze says, to the cells of monks running behind the cloister. Such probably was the form of many of the great libraries at Rome, that of Lucullus, Asinius Pollio, and the like; such was the library in the Roman forum, and that of Hadrian at Athens; such was the library at Herculaneum, famous for the papyrus rolls it has preserved. It is right to say that the conjecture so firmly established by Conze had been made before, as he himself is the first to own, by Christopher Belger.

NOTES.

THE next meeting of the Institute of British Architects, on Monday, the 8th, is expected to be a very representative one. The Royal Gold Medal will be presented to Dr. Schlie-manna, who is coming from Greece especially to receive it. Mr. Charles Barry will present to the Institute the portrait, painted by Mr. Holl, of the late President, Mr. Horace Jones; and the medals for the Soane Medallion, the Tite Prize, the Institute Medal, and the medals of merit gained in the competition for the Pugin Travelling Studentship. The actual Pugin medal for the year is not presented till after the completion of the student's tour, and the handing in of the sketches made during the tour; and the same applies to the Godwin Bursary medal. A large meeting is expected.

THE funeral of M. Théodore Ballu, the eminent architect, took place at Paris last week with unusual ceremony. The procession passed from the mortuary, a beautiful little building designed by the lamented artist himself, in connexion with the Church of La Trinité, one of his most important and successful works, to the cemetery of Père Lachaise, where his coffin was placed in the family monument, another work of his own, of charming antique sentiment. The pall-bearers were M. Kaempfen, Directeur des Beaux Arts (representing the Minister of Public Instruction and of the Fine Arts); M. Alphan, Directeur des Travaux de Paris (representing the Prefect of the Seine); M. Bouguereau, President of the Académie des Beaux Arts; M. Guillaume, the sculptor, representing the family and friends of the deceased; M. Bailly, President of the Société libre des Artistes Français; and M. Questel, President of the Société Centrale des Architectes; these two last being, like M. Ballu himself, Members of the Institut de France and Honorary Members of the Royal Institute of British Architects. These six delegates pronounced each a discourse. It is sufficient here to mention the eloquent *extempore* speech in which M. Alphan engaged, in the name of the Prefect of the Seine and, of the Conseil Municipal of Paris, to proceed as quickly as possible with the completion of the Hôtel de Ville after the designs for the interior decoration left by the deceased.

MR. PANSON, the senior Vice-President of the Royal Institute of British Architects, will attend the Congress of French Architects to be held next week in Paris, as the representative of the Institute.

THERE is a hot controversy going on at York in regard to what should be done with the superfluity of ancient churches, for which there appear, from all accounts, to be no sufficient congregations, and a meeting was held at the Corn Exchange, York, last Saturday night, under the auspices of the “Society for the Protection of Ancient Buildings,” to protest generally, after the manner of that Society, against everybody and everything. Mr. William Morris addressed to the meeting an eloquent protest against pulling down or removing old churches, and said that if these churches were pulled down “York would be a very commonplace city.” On the other hand, a gentleman, Mr. W. H. Hargrove, who spoke in support of the action of the Archbishop in the matter, accused the “S. P. A. B.” of having circulated the grossest inaccuracies in respect to the intentions of the Archbishop and the committee acting under him, and of having stated that half the churches in York were to be pulled down, when no such measure was contemplated. We cannot, of course, decide on hearsay report; we can only say that if the agents of the Society for the Protection of Ancient Buildings have circulated gross inaccuracies, it is exactly in accordance with their conduct on several other occasions, in regard to which we have been in possession of the facts. Not that we believe the Society would deliberately circulate what is not true, but that they are so utterly run mad on their hobby that they cannot wait to ascertain facts. We are taking means to get authentic information, and reserve our judgment till then. The anti-restoration party seem extremely exercised about a meeting held on the Monday after to promote the restoration of St. Crux Church, “when the Restoration Committee were requested to take steps to ascertain whether the promised subscriptions would be renewed for a new church, instead of a restoration of the old one.” The meeting went so far as to burke the restoration scheme and vote the return of the money. Whether they are right or wrong depends on the present state and the architectural and practical value of St. Crux Church. If it is dilapidated and unsuited for its present purpose, the proposal to build a new one is exactly what a meeting of Medieval churchmen would have sanctioned, at all events.

IN a paper read by Mr. Head at the recent meeting of the Iron and Steel Institute, a very interesting statement was given of the values of the by-products obtained at the gas works of the United Kingdom, as compiled by the late Sir William Siemens. They were given as follows:—

Colouring matter	£3,350,000
Ammonium sulphate	1,947,500
Pitch (325,000 tons)	365,000
Cresote (25,000,000 gallons)	208,000
Crude carbolic acid (1,000,000 tons)	100,000
Gas coke (4,000,000 tons, after allowing 2,000,000 for consumption in working the retorts), at 12s.	2,400,000
	£3,370,500

Taking the cost of the coals,—say 9,000,000 tons at 12s. per ton,—at 5,400,000l., there would be still left over and above the sum of nearly 3,000,000l., the excess value of the products. The practical result of this is, that the gas is obtained for nothing, and, indeed, it was stated that in a certain Yorkshire town the actual cost of the gas was only 1d. per 1,000 cubic feet. But by the use of the Siemens' gas producers, either the gas may be very greatly enriched or the extraction of tar and ammonia very much increased; while, in many districts, the coal costs nothing like 12s. per ton, or even half of it. Some of the northern coals are especially favourable for the recovery of sulphate ammonium, varying from 20 lb. to 26 lb. per ton of coal; and as the value of the ammonium sulphate is about 20s. 6d. per cwt., the recovery of 23 lb. is equivalent to 4s. 2½d. for every ton of coal used in gas producers. Simple folk, who are not manufacturers or proprietors of gas-works, but only compulsory gas-consumers, may, perhaps, be excused for thinking that it would not be unreasonable to

hope that some of the very substantial advantages gained by science should come their way occasionally, and that they should participate in the illuminating millennium, either by the reduction in the general price of gas or a very considerable improvement in the quality. Both these things are *desiderata* to the householder.

THE fifth annual report of the Executive Committee, and the third annual report of the Committee on the American School of Classical Studies at Athens, give evidence of substantial, though not very striking results. Excavations at Assos were carried on from February to November of the past year. The Agora of the city and the Nekropolis were explored, and the great Baths (of which we gave detailed notice in a past number), the Heroon, and the Stoa. A great number of inscriptions have been copied, a series of photographs made, and, for a time, this was all. The American School succeeded ultimately, however, in coming to terms with the Turkish Government, and an experiment was made by which one-third of the discoveries were to be the property of the excavators. Some important pieces of archaic sculpture have accordingly found a home at Boston, among them a heraldic sphinx from the east end of the Temple of Athene Polias, and a fragment of sculpture representing Herakles contending with Centaurs. The architectural fragments are of great importance for the study of non-religious Greek architecture. A full account of the excavations is in preparation by Messrs. Clarke, Bacon, & Koldewey. The cost of the whole undertaking is reported at 19,121 dol. (not much under 4,000l.). In the second year of the school the number of students were only two, the directorship held at first by Prof. Goodwin passed into the hands of Prof. Packard. He fell ill, and has had to rely largely on the help of Dr. Stenet. Among the treatises which have been completed by the school are the Assos inscriptions, by Dr. Stenet, and the Erechtheum, by Fowler; also in connexion with the school, a work by Mr. J. Stillman, on “Prehistoric Walls in Italy and Greece.” This work, so ably carried on by America, should rouse in English archaeologists a spirit of wholesome emulation.

THE statue of the closely-draped Venus, known as the “Venus Genetrix,” has long been a puzzle to archaeologists. Several replicas exist, one at Florence, one in Rome, one, the best known, in the Louvre. We are justified, then, in supposing that the original of the type was a statue famous in antiquity. A certain analogy has been noted between the head of this Venus Genetrix, of somewhat archaic style, and the head of the Hippodamia in the Olympian east pediment. Hence, M. Reinach, in publishing a small terra-cotta statuette which reproduces the same type, hazards the opinion that we have in all these replicas an echo of the famous Aphrodite of the Gardens (*ἡ κήρυκας*) of Alkamenes. Quite independently, Mrs. Mitchell arrived (“Hist. Greek Sculpture” p. 320) at the same conclusion. Probably both were led to this belief by the fact that the Alkamenes Aphrodite was specially noted for the delicate beauty of the hands. Though the coincidence of opinion is striking, we believe the original type of the Venus Genetrix must be looked for quite elsewhere. Dr. Curtius reminds us of a far more famous Aphrodite, namely, the draped Aphrodite whom Praxiteles made (*velata specie*) for the inhabitants of Cos, the rival of the nude Aphrodite chosen by the Cnidians. Now, it is a significant fact that the terra-cotta replica which M. Reinach publishes comes from the necropolis of Myrina. From this same necropolis have been taken as many as twenty small replicas of the Venus of Cnidus, by Praxiteles, and one of his *Epos*; why not then also one of his Venus of Cos? The almost ostentatiously draped character of the figure lends itself to this attribution. The subject comes up again, owing to the publication (in the *Gazette Archéologique*, 1885, fol. 11) of a small bronze statuette representing this type. It also was found in Asia Minor and is now

the property of M. Lavedorte. Praxiteles types would very naturally be found in Asia Minor, types of the date of Alkames scarcely.

THERE is to be found at Piacenza, in a remote quarter of the town, some of the loveliest terra-cotta work in Italy. It is in a cortile, part of the old Palazzo del Tribunale. Only a portion of one side is intact, the remainder having been bricked up between the columns, which are of granite, the caps and bases of stone (the former of beautiful shape). The arches and cornice are terra-cotta, with most delicately-designed ornament. The whole thing is in a lamentable condition. The court-yard is only used as the playground of a few children, and the rooms on one side are converted into stables and water-closets, as any one who pays the place a visit will soon discover, that is to say, if he is in possession of what the Italians do not seem to have,—a nose.

M. ROY'S excavations near Tunis, which for some time past he has privately carried on, have been rewarded by a considerable measure of success, both as regards architecture and sculpture. He has brought to light the peristyle of a large building, and within its precincts has found several marble statues of large size. M. Roy proposes to publish his discoveries in the "Bulletin Trimestriel des Antiquités Africaines," for the appearance of which we must wait for further particulars.

BY order of the Victorian Government a large scheme for irrigating the Tragowel Plains from the River Loddon has lately been investigated. The area to be watered amounts to 238,000 acres, and the project is estimated to cost 164,588*l.*, or nearly 44*l.* per square mile, or equal to 12*s.* 6*d.* per acre. If to this be added 7½ per cent. for interest and sinking fund, and assuming the working expenses at the rate of 3,500*l.* per annum, the annual cost per acre would be 4*s.*, allowing one-third of the entire area being irrigated each year. The channels designed for the scheme will, when running full, discharge 330 million gallons, or 48 million cubic feet, in twenty-four hours, with which volume it is calculated a depth of 6 in. may be distributed to 80,000 acres,—one third of the entire area,—in thirty-six days.

JUDGING by the description given of New Caledonia, its soil must be a veritable mine of mineral wealth, but for agricultural purposes, it is said, it will not produce more than sufficient for the wants of the country itself. Of metals, however, it apparently possesses the greatest variety, there having been found up to the present time gold, silver, nickel, copper, cobalt, chrome, antimony, iron, and galena. Not a tenth part of the country as yet been prospected, but 485,000 acres have already been bought or leased. Nickel is the most plentiful of all the minerals, being found nearly everywhere, and after many speculations in commercial speculations, it has become the basis of the colony's industry, and on its whole future depends. Up till now, however, the progress of the colony has been very slow,—a fact which it is somewhat difficult to reconcile with its reported valuable mineral capabilities.

WE quote from the Berlin *Philologische Wochenschrift* the report of a discovery which, if it be true, is of the greatest interest. We are bound to say that the *Wochenschrift* itself expresses grave doubts, which we readily endorse. From Carnuntum, in lower Austria, comes the news that a fragment of tinted pottery, apparently a piece of a Greek vase, has been discovered, and the design presents nothing less than a careful reproduction of the famous Hermes of Praxiteles. Archaeologists have been busy about conjectural restorations of the group,—the restoration makes Hermes hold a bunch of grapes in the right hand. A small statuette, embodying this ideal, and we think impossible, motive is to constantly seen, to our great regret, at the British Museum, where it doubtless misleads

countless visitors. A far more simple and congruous restoration gives Hermes a long caduceus in the right hand. This view has been supported with much learning, and a long catalogue of analogous monuments, by Mr. A. H. Smith, in the *Hellenic Journal*. The reputed vase fragment supports neither view,—it places in the missing hand a thyrsos. Such a restoration would be very satisfactory. We repeat, however, that we fear the reputed "find" is too good to be true. The fragment, true or false, has passed into the hands of Dr. Rollet, of Baden. If genuine, it will no doubt be speedily published.*

THE discoveries of the last few years, both at Sparta and Delos, have led most archaeologists to the conclusion that many of the peculiarities of early archaic sculpture are due to its derivation from a previous wood technique. Dr. Brunn, in a paper on "Tectonic Style" in the *Sitzungsberichte der Bayerischen Akademie der Wissenschaften*, seizes upon this notion, and in his usual suggestive original fashion applies the principle much more widely than its original advocates conceived of. Early sculpture was dependent for its existence on the softer material, wood, and long after stone had come into use the traditions of a woodworking school prevailed. In the sculptures of Assyria, where, as it seems, from the outset soft stone was chosen as the material, we see no such influence, and in Asia Minor schools, which seem to have depended a good deal on Oriental tradition, we see very little trace of anything of the sort. It is in the Peloponnesian school, with its square, thick-set character, its absence of rounded surface, and flowing line, that, according to Dr. Brunn, the influence of the post and beam and the plank of the early wood images (*κωνία*) is most apparent.

THE excavations of the French at Nemea during the past year have resulted in nothing of importance. Better fortune has attended their work in Elatea. Close to the remains of the temple they have found a basis inscribed with the name Athene Kranaia, thus fixing with certainty the already presupposed dedication. Outside the sacred precincts have been found also many fragments of vases and painted architectural remains. Inside the temple a number of fragments of sculpture were brought to light, and some vases inscribed with artistic names, Ergophilos and Polykles, also a number of inscriptions, including a long decree. To the north of the temple were found a number of fragments in bronze and terra cotta.

THE "Εβδομαχος (No. 61) publishes in a rough woodcut a recently-discovered gem, on which is engraved a design representing a male figure sunk upon his knee. The figure bears on his back the winged love-god. In the "Anthology" (ii., 255, 4) there is a somewhat vague description of a statue of Herakles by Lysippos, in which the hero is represented stripped of his arms and lion-skin, and tamed by love:—

"τις ἐὶ σ' ἔπεισεν
ὁ πτόρος ὄντως ἐς βαρὺς ἄθλος Ἔρωι."

It is just possible that we have in this gem an echo of the statue of Lysippos. We know so lamentably little of this sculptor that every scrap, even of inference, as regards his style is precious.

THE Architectural Association seem to have had a pretty sharp fight on the question of raising their subscription from half a guinea to a guinea, at their last meeting, and adjourned the consideration of the subject. We print a letter from Mr. Sedding about it in another column. The step is rather a serious one. The strength of the Association has been in numbers and in the valuable and practically almost gratuitous architectural education they have afforded to many poor students. We understand, however, that it is contem-

* Since writing the above we learn that the fragment has just appeared in the last issue of the "Archaeologische Epigraphische Mittheilungen aus Oesterreich."

plated that if the raising of the subscription is carried, a great advance will be made in the educational scheme, and the services of learned lecturers and Professors will be obtained towards this end.

ON the north side of the magnificent Church of Santa Croce, in Florence, there is an arcade which was originally part of the church, but which has for some years past been tenanted by carpenters and small shopkeepers. These have all been cleared away, and it is proposed to form a loggia nearly the whole length of the nave. This ought to be a great improvement. It will, however, very largely increase the stock of beggars at present attached to the church. Hitherto, there being no porch, they have not been so numerous as in most well-ordered churches. When the new loggia is completed, however, it will form a nice shady place for these pests to lay in wait for the unwary traveller.

WE are glad to learn from the Athenian correspondent of the *Athenæum* that Mr. Peoprose is engaged in further researches there, on the site of the Temple of Jupiter Olympius, a work which he is undertaking on behalf of the Society of Dilettanti.

THE mosaic of Lillebonne, to which we referred the other day, purchased in 1879 for about 1,000*l.*, taken from Lillebonne at the close of a curious legal suit and restored at Paris, in the studio of M. Faccina, mosaic-worker, under the direction of M. Chas. Lucas, architect, at the cost of about 750*l.*, was sold on the 16th of last month for 76*l.* to the Museum of the city of Rouen, where it will go to keep company with the fine mosaic found about twenty years ago in the forest of Bourthérolde. Fortunate museum of Rouen, to possess these two mosaics, so precious in the history of art!

THE appearance of serious cracks in the Ansidei Madonna since it was placed in the National Gallery is matter for great regret, and it calls for careful consideration as to the cause of this injury. It has been attributed to the dry atmosphere of the National Gallery causing the planks on which the picture is painted to shrink. We should hesitate to say that the National Gallery is over-warmed, which is the reason assigned in some quarters; but whatever the cause, the painful fact is undeniable, and we are astonished at Sir F. Burton's letter in the *Times* denying that there has been any change in the condition of the picture, and referring only to "a slight crack high up on the spectator's right, which was manifest enough [at Blenheim] to all who preferred to search for trifling blemishes in a great work rather than absorb themselves in its beauties." This is nonsense, and Sir F. Burton must fancy people have no eyes. There is a great and formidable crack on the left of the spectator, which no one could "absorb himself" sufficiently to ignore, and which was certainly not there when we saw the picture the first week it was in the National Gallery.

THE INVENTIONS EXHIBITION.

FRAME MOVERS.—II.

POWER rock-drilling for sinking, quarrying, and general contractors' purposes has during recent years made very great progress, with the result that,—except for small contracts,—hand-labour, which is both slow and costly, has to a great extent been abandoned in favour of power. The powers chiefly employed for driving rock-drills are steam and compressed air; the former does exceedingly well when the drill is not too far away from the hoiler, but in deep shafts or workings, where the steam has to be conveyed a considerable distance, it is difficult, if not impossible, to utilise it owing to the condensation which takes place in the pipes conveying it. Under these circumstances compressed air is employed: this is produced by means of steam-engines specially constructed for the purpose, of which several examples are to be found in the Exhibition. Amongst these may be mentioned one by Messrs. Hathorn &

Co., of London, which presents several features of interest, and appears to have been well thought out; the main frame is self-contained, which, with an extended bed-plate, insures steadiness in working, and it may with tolerable facility be moved from place to place, which is no mean advantage. The engine has two steam, and one air, cylinder, with two crank-pins, which form a throws for the slide-valves; the inlet valves are of cylindrical form, with central guides, and are automatic in their action. Springs for working the valves are disposed with, which is an advantage, as they are apt to clog or break, and their action is to a greater or less extent affected by constant usage, and by severe changes of temperature. The valves are so arranged that they may be examined without breaking the cylinder cover joints, which is an improvement. The air-compressor may be worked by means of water-power if available, the steam cylinders, of course, in that case being omitted. As showing the efficiency of compressed air for rock-drilling purposes, it may be as well to mention that a drill driven by it has pierced hard rock at the rate of 5.51 in. per minute.

Messrs. Walker Bros., of Wigan, exhibit an air compressor of massive construction. The engine is mounted on a box bed-plate with tank underneath. The air cylinders are placed in a line with the steam cylinders, and are jacketed with cold water. The air is brought below the floor-line, and the makers claim especial efficiency for the air-valves. The outlet-valves are fixed in the cylinder-covers. The air-cylinders and valves are so arranged that all the compressed air is expelled from the cylinders at every revolution. The general design of the engine appears to have been carefully thought out, and the workmanship is excellent.

Amongst the gas engines is to be seen a new form of horizontal, exhibited by Messrs. Andrew & Co., of Stockport. In this engine two cylinders are placed in line, the crank-shaft, connecting and piston rods working between them. One cylinder is used for compressing the charge, and the other for the ignition and explosion which takes place at every revolution, and considerable steadiness in working is thus assured. The valve for regulating the admission of the gas is of somewhat novel construction, and consists of two cones mounted on one spindle, which is controlled by suitable governor gear. The main frame of the engine is cast in one piece.

The "Otto" gas engine, by Crossley Bros. Limited, Manchester, is well represented. The operation of these is sufficiently well known to render a description unnecessary. One or two fresh departures have, however, been recently made, including a new self-starting arrangement, and the introduction in some of their engines of twin cylinders, in which there is an impulse at every revolution. This arrangement is to be recommended where extreme steadiness in running is required. A small-power vertical engine, which takes up little floor space, is also shown.

The British Gas Engine Company, 11, Queen Victoria-street, E.C., exhibit a rather extraordinary looking novelty in the shape of a gas engine, from which Mr. Atkinson, the patentee, expects great things in the way of economy. We may have something further to say about this at a future time.

Messrs. Korting Bros., of London, exhibit a "Korting-Meckfeld" gas engine; this is of the vertical type, and is arranged with the working cylinder open at the top,—this is also used as a pump to draw in and compress the charge of gas and air. The different valves are actuated by cams fixed on a supplementary shaft driven from the crank-shaft of the engine by toothed gearing, and it makes half the number of revolutions of the crank-shaft. The chief novelty of the engine, however, is the valve through which the mixture of gas and air is drawn into the ignition-chamber, and is so arranged that the mixture does not vary in proportion. The ignition is arranged to take place immediately the piston has passed the dead centre, and the piston is forced upwards on the return stroke, the exhaust valve is opened by a cam on the intermediate shaft, but part only of the waste gases are allowed to escape, the remainder being mixed with the next charge. The engine is compactly designed, and would appear to be useful for small powers.

A small vertical non-compression gas engine (Wither's patent) was shown by Messrs. Beynon & Cox, of Torquay; it is simple in construction,

but does not present any special feature of novelty. The charge is admitted by a single piston-valve worked by a cam, and there is an explosion at every revolution; the cylinder is provided with a water-jacket. As the charge is neither compressed nor wire-drawn the consumption of gas in this engine must necessarily be considerable.

Messrs. Wood, of Bolton, exhibit a horizontal engine of the Corliss type. In driving they adopt the rope system, the fly-wheel and a pulley being grooved for that purpose. The pulleys made by Messrs. Wood have wrought-iron arms, and a split and hooped boss; they are made much lighter than ordinary cast-iron arms, and can be run at a high speed. The exhibitors claim that owing to their lightness they adopt, and by method of casting which they adopt, and by splitting and hooping the boss, all contractive strains are avoided, and they can be worked in conjunction with toothed gearing without danger of "backlash." The system of driving by rope gearing has of late years been considerably extended, and amongst other advantages claimed for it is, that power may be conveyed from the driving wheel of the engine directly to several floors at once,—the number and size of the ropes being regulated according to the power to be transmitted; this often avoids the use of a considerable amount of intermediate gearing.

A Root's water-tube boiler is shown by the Patent Steam Boiler Company, Birmingham. In this boiler the principle of construction is the sub-division of the water and steam into tubes of small diameter,—small diameters being superior in strength to large ones. The tubes used are 5 in. diameter, and are made without riveted joints; and, being independent one of the other, the overheating or expansion in one part does not affect another. The water is contained within the tubes. We like the plan of placing the pipe-joints outside the boiler, as any fracture or leakage may readily be detected. In conjunction with this boiler Stollwerck's feed-water purifier is used. This consists briefly of two cylindrical chambers of sufficient capacity to cause a slow circulation of the water through them with room to collect the sediment thrown down. The water having passed through the first chamber is carried through a pipe to the front of the second chamber, where it is diluted with water and steam fresh from the boiler, which throws down a further deposit.

The use of feed-water heaters is considerably extending, and we can strongly recommend their adoption, as all waters contain a greater or less quantity of carbonate or sulphate of lime, &c., which, if not deposited, incrusts the boiler, cause a great loss of fuel, and renders the boiler plates or tubes much more liable to be burned, as the deposit prevents the contact of the water with the surface of the plates, consequently the heat of the fire cannot readily reach the water and be absorbed by it; the plates therefore become burned.

Messrs. Duncan Bros., Queen Victoria-street, London, show a simple reversing gear, in which the slide valves work on an intermediate plate with crossed ports. It is well adapted for launch engines, and does away with the necessity of link motion.

Messrs. Perkins, of London, have one of their compound donkey-engines, for working at a pressure of 500 lb. per square inch. Although this system of extreme pressure has now been introduced some years, we cannot help remarking on the very little progress it has made. We believe this engine is the sole representative of it in the Exhibition.

Messrs. Aylving & Porter, of Rochester, exhibit a well-designed traction-engine, fitted with spring wheels, so arranged that the whole weight of the engine is elastically supported. A noteworthy feature in the construction of this engine is the arrangement of the side-plates of the fire-box, which are extended upwards and backwards in one piece, and provide bearings for the crank-shaft, driving-axle, and counter-shaft. The driving-wheels are fitted with compensating motion, for turning short curves. For general contractors' purposes this engine can be commended, as it combines strength and portability, without cumbersome or complicated.

Hot-air motors are exhibited by Hayward Tyler & Co., Luton; Britannia Co., Colchester; Bailey & Co., Salford. These are all for small powers, and this last one is arranged to work from a gas-jet instead of with coke or small coal.

A tramway engine, worked by compressed air

on the Mekarski system, is to be seen in the grounds. Compressed air at some 450 lb. per square inch is employed; this is generated by a high-pressure compressor, manufactured by the General Engine and Boiler Co., London.

The corrugated furnace-flues for steam boilers, exhibited by Mr. Samson Fox, of Leeds, are worthy of notice as being a departure from the beaten track. It is claimed by the inventor that this form of flue gives not only greater heating surface, but considerably greater strength than the ordinary form.

Messrs. Burnsted, of Hedsford, exhibit a Chandler's patent high-speed engine, driving a dynamo direct by means of rope gear. The dynamo makes some 1,500 revolutions per minute, and provision is made for tightening up the ropes by means of a tension pulley. A special feature about this engine is the method employed for securing constant lubrication of the governor gear. This consists in providing a basin, through which the governor-spindle passes, which is partly filled with water made from steam condensation. On this water the oil is allowed to float, and thus lubricate the working parts. A waste-pipe is provided for carrying away any surplus water. The crank and cylinder are oiled in a similar manner, and this plan seems to have surmounted in a great measure a difficulty found in all high-speed engines, viz., that of efficient lubrication.

Messrs. Kitson, of Leeds, and Messrs. Thames Ditton, also exhibit high-speed engines, viz., that of efficient lubrication.

Messrs. Goodfellow & Mathews, of Hyde, near Manchester, show a high-speed compound tandem triplex engine, especially designed for driving direct, electric lights, fan-blowers, and high-speed machinery generally.

A "Census" patent vertical boiler is exhibited by Mr. H. Fletcher, of Gateshead-on-Tyne. The shell of this boiler is of the ordinary cylindrical type, but the fire-box consists of two truncated cones, the upper of which is inverted, and the two are joined together at their smallest diameters. In lieu of the ordinary cross tubes, diagonal tubes are fitted between the sides and the crown of the upper cone. Two uptakes are used, and it is claimed for this arrangement that the heated gases impinge on the whole of the heating surface, spreading out into the upper cone, and surrounding the diagonal circulating-tubes. By this arrangement ready access is given to the crown of the furnace and other parts for cleaning and repairs.

We were struck with the easy working of a very small but very useful "prime mover" in the shape of a hydraulic engine for blowing organs, exhibited by Mr. Blennerhasset, of Vernon-street, King's Cross, London. Two cylinders, somewhat after the fashion of a steam-engine, are employed, and the ports and slides are cut in such a way that the water is "wire-drawn," and the closing or opening of the ports is gradual, consequently the shock usually felt in engines of this class when the water is cut off suddenly, is removed and the necessity of employing an air-vessel is done away with. There is an arrangement for preventing the organ from being overthrown.

A somewhat novel method of driving a dynamo has been adopted by Messrs. Brunett, Lindley, & Co., of Manchester. This consists of making the pulley on the dynamo of compressed paper to secure increased adhesion, and causing the fly-wheel of the engine to come into direct contact with it and drive it by friction. To increase the contact if necessary, screwed rods are fitted from the crank-shaft of the engine to the dynamo shaft, and by tightening up the nuts almost any degree of adhesion may be obtained. They also exhibit a new form of governor gear (Lindley's Patent) attached to the vertical compound engine alluded to above: the novelty consists in the use of tension-springs attached directly to the revolving weights, in lieu of the levers and joints usually employed. It is claimed for this plan that the friction in working is considerably reduced, and that increased sensitiveness and simplicity in working is obtained. As a rule, we are not in love with the use of spiral springs,—at any rate, where the duty is severe,—as we have known more than one case where, owing to great variation in temperature, the springs have broken in use, and others where, the work having been very intermittent and severe, the springs have after a time become weakened and lost their elasticity. When these governors have been tested for a length of time under these conditions, say for driving, sawing machinery, callendering rolls, iron rolls, and such like, we should be better

able to judge as to the value of the invention. A very useful addition is the speed regulator attached to this governor, by turning which the speed of the engine can be instantly increased or decreased as may be required.

Messrs. Holman, Bros., of Cambrone, have, amongst other exhibits, an air-compressor, which combines several good points in its construction. The pistons of the steam and air cylinders are adjusted so as to have the maximum pressure of steam on the one when the other is compressing the air at its highest point, which allows the engine to be worked expansively and at a uniform rate of speed. The air-cylinder is jacketed with a cold water jacket. Springs are dispensed with in working the inlet and outlet valves.

Amongst the few water motors exhibited we noticed a turbine, by Messrs. Easton & Anderson, of Erith. This was arranged for working a centrifugal pump. Both these are made adjustable for varying falls of water or power required by raising or lowering the fans into or out of the annular troughs by which the fans or working blades are surrounded, the edges of which partially close both the receiving and discharging apertures.

A Ritchie's Patent Turbine is shown by Messrs. Duncan, Bros., of Queen Victoria-street. It is claimed for this wheel that, owing to the shape of the vanes and buckets, the water enters the wheel at its highest velocity and leaves it at the lowest, and that the gate is so formed that the angle of the water, as it enters the wheel, is the same whether the gate be opened more or less. Messrs. Hockey & Co., of Chard, show a Rotary Motor actuated by water. A very considerable number of adjuncts connected with prime movers are exhibited, such as valve-gears, feed-water heaters, boiler-feeders, safety-valves, piston-rings and packing, boiler-coverings to prevent radiation, and *id genus omne*. Many of these possess merits, but the exigencies of one space prevent more than a passing notice.

The exhibits relating to the means of distributing the power of prime movers are not very numerous. The Kirkstall Forge Company, of Leeds, exhibit specimens of their speciality, rolled black shafting, with friction couplings and adjustable bearings. The exhibitors claim that this shafting possesses 20 per cent. greater torsional strength, and 33 per cent. greater flexional strength, than ordinary turned shafting. The reasons they give for this are,—that it is rolled so straight round and true, that it does not require turning. We are not in a position to deny this statement, and with the special care taken in the manufacture, it may possibly be true, but we certainly should not recommend our readers to try the experiment of using the ordinary black shafting of commerce without turning.

An apparently effective frictional clutch pulley and coupling is shown by Messrs. Stern & Co. (Limited), of Glasgow, together with a Clerk's patent gas-engine, fitted with self-starting gear, but the operation of this latter is sufficiently well known that a detailed description is unnecessary.

Medart's patent wrought-iron pulleys are exhibited by Messrs. Richards & Co., of Manchester. A commendable feature in these pulleys, and one not usually found, is the support given to the rim of the pulley by the extension of the base of the arms where they join the periphery.

Wrought-iron pulleys are coming rapidly into use, and are to be preferred, especially where a number of pulleys running at high speeds are required, as they should combine the maximum amount of strength with the minimum amount of weight. Care should, however, be taken in selection, as we have heard of some of fanly construction springing in working. Where large power has to be transmitted, they should in all cases be made with double arms.

The Patent Power Pulley Company, of Manchester, show specimens of their pulleys, which are made of wrought or cast iron; but the peculiarity of construction consists in their having a number of holes made through the rim of the pulley. The advantage claimed for this arrangement is that the slip of the belt is greatly modified by the rapid discharge of the air through the perforations, and, therefore, the belt and the pulley have absolute contact. Before pronouncing an opinion as to the value of this plan, we should prefer to see the pulley tried under varying conditions against ordinary flat-faced pulleys, the

amount of slip and power transmitted being accurately measured.

Wrought-iron pulleys possessing more or less merit in construction are shown by Messrs. Mackie & Co., of Reading; Messrs. Hall, of Dartford; Mr. Macheth, of Bolton; and others.

In concluding our notice of the prime movers at South Kensington, we may add that although the display cannot be held to be entirely representative, there is nevertheless much in this section that should interest and instruct not only the engineer and student, but the public at large, and prove a capital school of technical information.

LETTER FROM PARIS.

STEINHEIL, the well-known glass painter; Regnier, the great actor who maintained so well the honour of the French theatre; De Neuville, the admirable painter of our soldiers and their heroic deeds; Ballu, the eminent architect of St. Ambroise, Le Trinité, and the Hôtel de Ville; and lastly, Victor Hugo, the immortal poet whose obsequies Paris has been solemnising, such is the death-roll of this month, which has seen successively disappear some of our greatest artistic lights.

We should have to greatly enlarge the usual scope allotted to these letters to undertake any adequate funeral eulogy on the great genius whom France has just lost. We can but give a few lines to the description of the last honours paid to his mortal remains, at their last halting-place between the Arc de Triomphe and the Pantheon.

With its grand architectural lines and exceptional situation, the Arc de Triomphe formed a very appropriate framework for such a funeral ceremony, and under its lofty vault was constructed the catafalque, 22 metres in height, the outline of which was visible far off, from Neully to the Louvre. Great mourning banners sprinkled with silver, antique tripods disposed around the place, scutcheons bearing the titles of the works of the poet; these formed the decorations contrived by M. Ch. Garnier for the monument where the body of Victor Hugo lay in state on Sunday, previously to being transported on the following day to the Pantheon, the Catholic temple which a recent decree has consecrated afresh to the sepulture of great men, and the decorations of which contrast singularly with the new destination which the French Government has given to the Church of St. Genevieve. The decoration of the cupola, it is true, symbolises the apotheosis of the patron saint of Paris; but as, in 1831, the "Gouvernement de Juillet," while "laicising" the Pantheon, had left intact the paintings of Baron Gros and Gérard, it may be presumed that the Republic of 1850 will in its turn respect those celebrated works.

Will it show itself equally impartial to the mural paintings of Puvis de Chavannes, Théodore Maillot, Henri Lévy, Jean Paul Laurens, and Cabanel, to which M. Charles Yriarte devoted an eloquent article lately in these same pages? Will it maintain intact the admirable mosaic of the choir, for which Hébert designed the cartoons? Let us hope, for the honour of French taste, that Parliament will comprehend that above the region of religious dissensions and political strifes there is an unchanging artistic truth and beauty, and that the Pantheon of great men may equally remain the museum of the artistic genius of the epoch as displayed in sculpture and painting.

For the moment, as it was impossible to do away with the emblems of the Catholic culte, all that was done was to drape the principal façade with black, and to mask the decorations of the choir under funeral hangings.

To return to our obituary: M. Steinheil, who died suddenly a few days ago, was the brother-in-law of Meissonier. He leaves behind him a considerable array of artistic work. The restoration of the windows and mural paintings of the Ste. Chapelle, executed in 1850, will have sufficed to ensure his reputation.

Alphonse de Neuville was too well known in England to render it necessary to recount his numerous works. We may recall here only the "The Taking of Bourget," the "Dernières Cartouches," the "Combat at a Railway Station," and the Panorama of Champigny, executed in collaboration with M. Detaillé; works which would alone suffice to make the reputation of this remarkable artist, cut off in the fulness of his powers; for De Neuville was only forty-nine years of age.

As to M. Ballu, his name will remain attached to a whole series of monuments to which he has devoted his talent and his whole life. Afflicted with a cruel malady for the last three years, he has nevertheless worked up to the last moment, and has barely had the satisfaction of putting the finishing touch to the municipal palace which he was commissioned to build immediately after the incendiary work of the Communists in 1872. He was a pupil of Hippolyte Lebas and student of the École des Beaux Arts, won the "grand prix d'architecture" in 1840, was member of the Institut (where he succeeded Vandoyer), commander of the Legion of Honour, and "Inspecteur Général des Travaux diocésains." He was born in 1817. He constructed successively the churches of Ste. Clothilde (commenced by Gau), Ste. Ambroise, Le Trinité, and lastly the Hôtel de Ville, of which the interior decoration is still unfinished. He leaves two sons, one of whom has already shown himself a worthy successor of his father in the profession.

During the past month has been laid the first stone of the new "Lyceé Louis le Grand," intended to replace the old Collège de Clermont, in which, by the way, Victor Hugo studied. The construction of this University building has been entrusted to M. Lecœur. It will stand behind the Luxembourg, a few paces from the Observatory and the Pantheon. A similar ceremony is announced for the 3rd of August next, when the first stone of the new Sorbonne will be laid. The architect, M. Menot, who gained the commission in the public competition opened by the Municipality of Paris, has kindly promised to give the *Builder* a perspective view of the future building as early as possible.

There will take place also shortly, on the occasion of the "Fête Nationale," the inauguration of the statue of Pinel, the celebrated lunatic physician. The monument, the work of the sculptor Ludovic Durand, is being erected opposite the Salpêtrière Asylum, on the Boulevard d'Hôpital.

Two other inaugurations will take place this month. One is that of the "Liberté" statue which M. Bartholdi executed for New York, and of which the American colony here have offered the city of Paris a reduced copy in bronze, 8 metres high. This is placed temporarily at Passy, in the Place des États-Unis. It will ultimately be placed, in the guise of a beacon, at the extremity of the Ile des Cygnes, opposite the Champ de Mars. Lastly, last Sunday there took place, at Villers Cotteret, the inauguration of the statue of Alexandre Dumas the elder, a remarkable work by M. Carrière Bellense.

We must not forget to mention the sculptor's competition, opened by the municipality of Paris, for the erection of a statue to Étienne Dolez, the celebrated printer and philanthropist, who was burned alive in 1846, in the Place Maubert, as a heretic. The statue, which will mark the place of his suffering, will be executed by the successful competitor in the competition, M. Guilbert, to whom we owe also the statue of M. Thiers, which is erected at Nancy.

To complete the information contained in a former letter, we may record that the exhibition of the works of Eugène Delacroix has produced, deducting expenses, 80,000 francs, a sum which will allow of the erection of a monument which M. Dalon has been commissioned to execute to the memory of the celebrated painter. No sculptor could be better fitted to do justice to the work and to interpret the expressive physiognomy and marked features of the great artist.

Last week the vote for the "Grande Médaille d'Honneur," in the section of painting at the Salon, took place. At the second round of voting, M. Bougreaud obtained the medal by 72 votes. As to the sculpture section, after three votings without a definite result, it has been decided that the médaille d'honneur for sculpture will not be awarded this year. Lastly, M. Lalou, the young architect whose restoration of the Altis at Olympia has already received its just appreciation in these columns, has carried off the médaille d'honneur in the architectural section; so that our presumptions in his favour have been fully realised.

This subject leads us to speak of the happy innovation introduced by the new Under-Secretary des Beaux Arts, M. Turquet, in respect of which the Government have suppressed the triennial Salon attempted to be created in 1858.

The next of these exhibitions should have opened on the 1st of May or June in 1886, but the experiment already has shown the inutilty of the undertaking, and the decision of the Government cannot but be approved.

We may remark, in passing, the re-opening of the Musée des Arts Décoratifs, and the two exhibitions of higher artistic interest installed, the one at the École des Beaux Arts, and the other at the Tuileries, Salle des États. The first includes only portraits signed by modern masters; the second, which will last to the 30th of June, is opened for the benefit of the orphans of Alsace-Lorraine. One may see in that collection *chefs d'œuvre* of almost every period from the earliest to the present day.

We must remark also on the new collection of furniture with which the Museum of Cluny has been enriched, including some marvellous examples of Spanish art of the sixteenth and seventeenth centuries. We must not omit either to mention the arrival in Paris of the delegates of the Commissioners of Sewers, who have come over from London to study our system of subterranean communications, and especially the telegraphic and telephonic apparatus in the *égouts* of Paris.

At the moment of writing this letter, we learn that the jury of the *Salon* has not awarded the first-class medals for painting this year. The first medals for sculpture have been awarded to M. Daillon for his work "Le Reveil d'Adam," bought by the Municipality of Paris (the merits of which we have already made known to our readers), and to M. M. Desca, Croisy, Cales, and Roly. The awards of the jury in regard to architecture were not divulged when this letter was sent off.

THE METROPOLITAN DRAINAGE OUTFALLS.

For some weeks past the officers of the Metropolitan Board of Works have been conducting experiments at the outfall of the southern main drainage works at Crossness, for the purpose of discovering the best mode of purifying the London sewage. The quantity of sewage dealt with is that of a million gallons in each twenty-four hours, Sundays excepted, and also omitting part of Saturday. A million gallons of sewage per day throughout the year would correspond to a metropolitan population of about 25,000, and so far the experiment possesses sufficient magnitude to afford useful results. It would appear that a large majority among the members of the Board feel sufficiently satisfied with what has been done to decide them in favour of pressing forward. It is perhaps unfortunate that the operations are complicated by the necessity of providing for the deodorisation of the whole of the London sewage during the ensuing summer. This will involve the adoption of chemical treatment of an imperfect and temporary character, to be carried on both at the Crossness and the Barking outfall. To meet the difficulty, the Board have lately authorised an expenditure of 10,000*l.* in addition to sums previously voted; and this extra sum would be obviously insufficient were it not that there is a large stock of chemicals on hand. That which leads of especial interest to these proceedings is the evident expectation of the Board that they will ultimately find themselves in the position of being able, by chemical means, to purify the whole volume of the London sewage. An active and prominent member of the Board, Mr. Solway, has incidentally mentioned that to make arrangements to do so would cost a million of money, and occupy two years of time. Of course, London has already paid for its drainage works. Now, having brought all the northern sewage to one point, and all the southern sewage to another, there remains the task of so treating the enormous aggregate that the Thames shall suffer no pollution from its presence.

The chemical method proposed for the accomplishment of this notable undertaking has been devised by Mr. W. J. Dibdin, the Board's chemist, who has also had the benefit of consulting with Dr. Dupré on the subject. Associated with Mr. Dibdin is the Board's engineer, Sir Joseph Bazalgette. These three authorities were engaged together during the spring of last year in experimenting on the sewage at the Western Pumping Station at Pimlico. Some useful facts were then ascertained, but the operations

were interrupted by the necessity of promptly deodorising the sewage at the outfalls. The broken thread has since been taken up again, and the chemical process has been more fully tested. Chemistry is not all that has to be brought to bear on this problem. When the solids in the sewage have been precipitated, there is the deposit to be dealt with,—the almost impracticable "sludge," difficult to dry, even in a partial degree, and hard to get rid of in whatever form it may be presented. Those who believe in the manual virtue of the precipitated matter may have it as a gift. At least, we presume the Metropolitan Board would be very glad if a fleet of barges would come day by day and carry off the entire stock, especially if the drying or semi-drying of the staff were not insisted upon. It has been proposed to barge the sludge down the river and cast it into the depths of the German Ocean. To this there would be objections, and the cost is reckoned at 37,000*l.* per annum, in addition to a capital outlay of 130,000*l.* for the barges. Instead of drowning the sludge it has been proposed to burn it, and another plan is to bury it. Out of all the schemes it is to be hoped that one will be found available, without offence, and without extravagant cost. The bare precipitation seems to present less that is problematical. It must be acknowledged that the quantities are startling. A grain in the gallon is ten tons in the day's sewage. This fact is enough of itself to shut out many chemical processes which look very pretty in a laboratory, but which are quite hopeless at the mouth of a metropolitan outfall. Mr. Dibdin uses 3.7 grains of lime and 1 grain of proto-sulphate of iron per gallon. In the joint report presented to the Metropolitan Board by Sir J. Bazalgette and Mr. Dibdin, it is calculated that the whole of the sewage can be thus precipitated, the sludge disposed of, and the effluent deprived of all offensive odour by a supplementary process during the summer months, at a total capital expenditure of a little under 1,000,000*l.*, and at an annual outlay of 100,000*l.* As a penny in the pound on the rateable value of the metropolis will produce 120,000*l.*, the financial prospect is not very distressing.

The Royal Commissioners who have reported on the main drainage outfalls have recorded their opinion that mere precipitation will not be sufficient to prevent the sewage from rendering the river offensive. They speak of "injury to fish and danger to wells." If fish will live in the effluent before it enters the river, there will be very little to fear in this respect. As for the wells, if they receive no harm from the sea-water which mingles with the Thames below Blackwall, they are not likely to be damaged by the effluent from the sewage works. The Thames, as affected by the outfalls, has no relation to any drinking supply. Hence the effluent need not possess the purity which otherwise might be demanded. But the Royal Commissioners consider that the effluent, if discharged at the present outfalls, ought to be filtered through land. This is a formidable proposal, and one which it is to be hoped may be avoided. If filtration cannot be adopted, owing to the want of land or its high price, the Commissioners recommend that the effluent should be taken down to the estuary of the Thames and there discharged into the river. Of course, if filtration is necessary, it must be accomplished, or the alternative plan adopted. But wisdom seems to suggest that the chemical treatment should first of all have a trial. If it proves insufficient, no serious harm will have been done. Land may then be bought, or the requisite conduits constructed to carry the effluent down the river. Experience, however, may show that these further proceedings are unnecessary, and there can be no doubt that a fair effluent will have a very different effect on the river compared with the raw sewage which now flows into it, with all its enormous hulk of solid and putrefying matter.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association.—On Saturday last the members of the above Association paid a visit to the new Liberal Club now in course of erection in Edmund-street, from the designs of Mr. Cossins. Amongst those present were Messrs. Cossins, W. H. Kendrick (vice-president), Victor Scruton (hon. sec.), A. Hale, F. Bailey, T. W. F. Newton, O. Essex, H. H. McConna, O. E. Bateman, A. J. Craddock,

J. Goodman, W. Midgeley, &c. Before inspecting the building, Mr. Cossins conducted the members to the clerk of works' office, where an inspection was made of the plans, sections, and elevations of the club, the arrangement and disposition of the various apartments were discussed, and much interest was shown in a novel device in case of fire, consisting of an iron hand-rail ladder running externally from the top of the building to the bottom. Under the guidance of Mr. Cossins the members then visited the whole of the building.

Liverpool Architectural Society.—The first meeting of the recently inaugurated Junior Debating Club, membership of which is free to all professional non-practising members (i.e., assistants and students only) of the Society, was held on the evening of the 1st instant, at the Society's rooms, No. 9, Cook-street, when Mr. Walter H. Brierley read a paper entitled "Piffalls," detailing the many errors the young practitioner is liable to, and showing how they may be avoided. Mr. James Nicholson was voted chairman for the evening. There was a good attendance, and an interesting discussion, in which Messrs. J. B. Hinks, E. P. Hinde, R. Holt, C. J. Anderson, C. R. Chidson, W. N. Stephenson, T. J. Dalziel (visitor), G. Hornflower, and the chairman took part, followed. The next meeting will be held June 15th, when Mr. S. J. Dalziel will read a paper entitled "Early Gothic Vaulting."

Edinburgh Architectural Association.—The series of Saturday afternoon visits in connexion with this Association was brought to a successful close for the season on Saturday last, when a party numbering over sixty members and friends made their annual excursion to Inchcolm Abbey, Donibristle House, Dalgety Old Church, Aherdour Castle and Church, under the leadership of Mr. Hippolyte J. Blanc. The party left by special steamer in the forenoon, and on reaching the island of Inchcolm the company assembled in the chapter-house, where an interesting paper sketching the history of the monastery and abbey was read by Mr. Blanc, and by a plan prepared from a survey of the buildings, together with a number of photographs, specially taken, the various features of the structure were illustrated in order. In connexion with Donibristle Mr. Blanc sketched the history and incidents pertaining to it, from its possession by the Abbots of Inchcolm down to the period of the fire in 1857, drawing attention to the fine specimen of hammered ironwork in the fine old gates and staircase railing; and of Dalgety, now a ruin, he noted its association with the Abbey of Inchcolm, as a chapel of ease, it is stated. The party next proceeded to Aherdour Castle, which, with its interesting and characteristic detail, was described and examined from the original keep with Norman and Gothic features, to the additions in succession down to the seventeenth century. The old church in ruins, comprising nave, aisle, and apse, was next visited. Mr. Blanc noted that as an example of very early work in Scotland it was most interesting, and could be made instructive to the archaeologist by a judicious clearance of the rubbish and debris in which it lies buried. At the close of a very enjoyable day a hearty vote of thanks was accorded Mr. Blanc for his series of instructive papers.

SURVEYORSHIP ITEMS.

West Suffolk.—An adjourned meeting of the West Suffolk Quarter Sessions was held on the 27th ult. at the Shire Hall, Bury St. Edmund's, for the purpose of appointing a county surveyor for the western division of the county. Mr. N. Barnardiston presided, and there was a large attendance of justices. The Finance Committee has received 68 applications for the post. Of these 68 gentlemen they selected four, the election ultimately falling upon Mr. Frank Whitmore, Chelmsford and London.

Hampstead.—Mr. Frederick Stone, of 31, John-street, Bedford-row, has been appointed Deputy District Surveyor for Hampstead, by the Metropolitan Board of Works.

Sculpture at the Royal Academy.—In the article on this subject in the *Builder* of May 23rd, the bust of the late Mr. Fawcett in the Academy was, by an oversight, attributed to the wrong artist. The bust, which is a very able one, is the work of Mr. H. R. Pinker.

THE ARCHITECTURAL ASSOCIATION.

A SPECIAL business meeting of the members was held on Friday, the 29th ult., to consider the report of the committee upon a scheme for amending and consolidating the work of the Association. Mr. C. R. Pink, President, occupied the chair.

The following new members were elected:—Messrs. B. Pithick, P. J. Dawson, J. C. T. Murray, E. G. Braybrook, and E. C. Bateman.

Votes of thanks in connexion with the late visit to the new Tilbury Docks were accorded to Mr. Grüning, the architect; to Messrs. Manning & Baynes, the engineers; and to Messrs. Perry & Co., the contractors.

The Chairman then said that the members had met to transact some important special business, and he would not by any prefatory remarks intervene between the meeting and its object. At the same time he would be wanting in a due sense of the honour they had done him if he did not avail himself of the opportunity of thanking them for his election as President for the ensuing session.

Mr. J. A. Gotch proposed the adoption of the report, which had been taken as read. He remarked that the object of the whole movement had been to simplify and systematise the work of the Association, so that any one on joining could see at once the best course to pursue so as to derive the greatest benefit from the classes and opportunities offered by the Association.

Some of the clauses of the report were of slight importance, while others contained the gist of the proposed alterations, which were mainly as follow:—The object aimed at was, first, to divide the work of the Association broadly into two classes, the advanced and the elementary. One of the most important features was that there should be a Committee of Advice, whose duty would be to advise persons joining the Association on the particular course of study they should pursue. This he considered to be one of the fundamental changes. Another important proposition was for the appointment of a committee of outside visitors, to be elected each session from all the classes. It was intended that the visitors should be men of eminence in the profession. At present the visitors were merely past grand-masters of the Association, and it was now proposed that some men of acknowledged eminence should, of their great kindness, attend the classes, and give instruction to the aspirants after fame. It was also proposed that there should be a permanent committee in connexion with the classes, so that the Secretary or President would be present to carry on the work of the classes from time to time, and this committee would be *ex officio* members of the committee of advice. These were the principal changes. It seemed to be the general opinion that the work they had tried to do in the elementary classes had been rather too ambitious, and it was proposed to somewhat lower the aim. The Elementary Class of Design was to be divided into two sections,—one for the study of ancient examples, and the other for design based upon ancient examples. The lectures on the history of architecture and on construction were also intended in future to proceed *pari passu* with the work of the classes. Another important innovation was the Class for the Study of Quantity-taking and Specification-writing. It was intended, moreover, that the study of Planning should be taken from the Class for Specification-writing, and placed where it ought to be, with the study of Design. Stress was to be laid on the strict carrying out of the rule as to members contributing to the work of their classes. One of the great prizes which the Association offered, viz., the Travelling Studentship, was to hang upon the recipient having gone through the work of the session. It was proposed to elucidate these matters by means of a chart showing the sort of curriculum which the Association offered. He might add that it was intended that no member of the Elementary Classes should be eligible to compete for prizes after he had attended two sessions in that class, which would be an inducement to get on as soon as possible. Arrangements were to be made for visiting buildings in progress of completion, and that during office hours. The proposal to extend the library would be hailed by all with gratitude, and a place where the members could read the professional journals, and get a cup of tea or coffee at a fixed tariff, would be a great advantage. Mr. Gotch concluded his

remarks, which were very well received, by formally proposing the adoption of the report.

Mr. John Slater, B.A., seconded the motion. He believed that the committee of advice would be an extremely good thing, and many of them would have been glad if they could have applied to such a committee in their early days. He considered that this report marked rather an important era in the history of architectural education. A great stride was made when the Institute established the Obligatory Examination, the advantage of which had not been so thoroughly appreciated as it ought to have been. If it were known to the public that it was necessary before a man could become an Associate of the Institute that he must have shown some knowledge of the subjects in which he was to practise, it could not fail to raise the status of the profession. Study and education must be good to a man, no matter what branch he practised in, and anything that could be done to systematise the course of study would be a great boon to the younger members of the profession. To his mind the present seemed to be the time for doing this.

The meeting then considered the report clause by clause, when a long discussion ensued, in which Messrs. Cole A. Adams, J. Donglass Mathews, H. Stannus, Aston Webb, H. W. Pratt, Stokes, Morgan, and others, took part.

A few changes and additions were made, and the report was adopted *nem. con.* in the following form:—

“1. That there shall be two defined divisions of study in the Architectural Association, to be called the ‘Elementary Division,’ and the ‘Advanced Division.’

2. That a Chart, as here given, be drawn up, explanatory of this principle for the use of Students and others.

CHART.

Elementary Division.		
Sec. I.—El. Class of Design.	El. Class of Construction.	Lectures on History and Construction.
See pages *	See pages *	See pages *
Advanced Division.		
Class of Design and Colour Decoration.	Class of Construction and Advanced Class of Construction.	Class for Quantity-taking and Specification-writing. Class for Land-Surveying.
See pages *	See pages *	See pages *

* Here would be indicated the pages of the Brown Book.

3. That a Committee of Advice, whose names shall be published in the Brown Book, be appointed by the Committee each session, whose duty it shall be to recommend to members on application the particular course of study it would be advisable for them to pursue in the Architectural Association.

4. That a Circular be published containing General Suggestions, the Chart, &c., for the guidance of Students and others, and the same be also included in the information afforded by the ‘Brown Book.’

5. That there shall be a Committee of Visitors appointed each Session to all the Classes, to conduct the work of the same. The Visitors to be *ex officio* Members of the Committee of Advice.

6. That the Classes be arranged in the following order, viz.:—

7. *Elementary Class of Design.*—Section I., for Study of Ancient Examples; Section II., for Design based upon Ancient Examples.

8. *Elementary Class of Construction.*—The subjects to be treated in a more elementary manner than has hitherto been adopted, but on the same principle.

9. *Lectures on the History of Architecture and Lectures on Construction.*—That the principle of *visd voce* questioning be adopted at the Lectures, and the subjects treated of, to work in conjunction (as far as possible) with those set down in the Classes.

10. *Class for Design.*—Conducted on the same lines as at present.

11. *Class for the Study of Colour Decoration.*—Conducted on the same lines as at present.

12. *Class of Construction and Practice.*—Conducted on the same lines as at present.

13. *Advanced Class of Construction and Practice.*—Conducted on the same lines as at present.

14. *Class for the Study of Quantity-taking and Specification-writing.*—That a New Class be formed, and that Planning, which has hitherto been taken conjointly with Specification-writing, to be now omitted from this Class, and embraced in the work of the Class of Design.

15. *Surveying Class.*—To be conducted on same lines as at present.

16. That Members of the Elementary Classes be eligible to compete for prizes in their Class during their first and second sessions only, but not after having attained the age of twenty-three years after the last meeting of the Session.

17. That the Rule as to Members contributing to the work of the Classes in future be strictly observed. That the amount of work in the various Classes be reduced.

18. That in awarding marks in the Classes of Design, greater stress be laid in future on the quality of the Draughtsmanship.

19. That the Session shall commence on the first Friday in October, and finish by the end of April or beginning of May.

20. That the Essay Prize be of the value of 5*l.* 5*s.*, and be accompanied by the presentation of a Silver Medal; that the A. A. Design Prize be of the value of ten guineas, and be accompanied by the Silver Medal.

21. That under necessary regulations, arrangements be made for the inspection of Buildings in progress by individual members during working-hours, and also to practical workshops, and if means are forthcoming, to provide technical and experimental instruction.

22. That after the year 1886 Candidates for the Travelling Studentship be required to show that they have passed satisfactorily through one or more of the Classes, except in the cases of Country Members, which shall be referred back to the Committee. That the names of the holders of the Studentship be published in the Brown Book, and that the satchel of each Student, which by the existing condition of the Competition becomes the property of the Architectural Association, be framed with the name of the Student and date of his year, and hung in the rooms of the Architectural Association.

23. That it is desirable that the Library accommodation be extended and be opened to Students on evenings in the week, and a General Meeting Room be attached where the professional journals, &c., can be seen, and tea and coffee obtained at a fixed tariff.

24. That the distribution of Prizes and delivery of Addresses be in future omitted at the *Conversazione.*

25. That at the Annual General Meeting the prizes shall be distributed, the President shall deliver his address (as heretofore) and that short Addresses be invited from the Senior Members of the profession.

26. That the following alterations be made in the Rules:—Rule 3, on 6th line, after ‘Classes’ to insert ‘and Lectures.’ Rule 35, on 3rd line, after the words ‘shall be’ to omit those to the end, and substitute ‘placed at the disposal of the Members, the Prizes shall be distributed, the President shall deliver an Address, and short Addresses be also invited from Senior Members of the profession.’ Rule 40, on 2nd line, after the word ‘Session’ to omit the words to the end of the Rule. Rule 41, on 2nd line, to substitute ‘May’ for ‘June.’

Mr. Cole A. Adams moved that the subscription should be increased to £1. Is., pointing out the great advantages offered by the Association, and believing that no one would grudge to assist in its development. The Association must advance with the times, and the increased amount of funds would be applied in providing technical instruction, in improving the library, and possibly in printing and publishing their papers. Out of 1,000 members to whom circulars were sent, 100 had replied, 60 being more or less in favour of the increased subscription, while 40 were decidedly against it.

Mr. Aston Webb seconded the motion, adding that it was necessary for the extension of the work of the Association.

Mr. J. D. Mathews strongly objected to the resolution. He had never connected with the Association for twenty years as treasurer, and he had never had any difficulty in meeting the expenses. The work was carried on at an almost nominal cost, and he must differ entirely on this matter with the proposer of the resolution. The success of the Association had been caused by the fact of its being purely self-supporting.

An amendment was proposed and seconded that the matter should stand over for future consideration.

In the discussion which followed Messrs. Gotch and Slater supported the original resolution, which was opposed by Messrs. Surr, Leberton, H. Yorke, Brodie, and Stannus.

Mr. H. W. Pratt proposed a fresh amendment, to the effect that the increased subscription be for town members only, defining the radius as twenty miles around London.

This amendment was seconded by Mr. W. Pite.

Mr. Cole A. Adams replied, amidst cries for an adjournment. The first amendment being put, 41 hands were held up in its favour and 41 against. Tellers were then called for, but, while they were being chosen, the chairman gave his casting-vote in favour of the original resolution. Tellers were still called for, but the demand was eventually withdrawn.

Mr. Stannus then moved the adjournment

of the meeting for a fortnight, when they would be less heated, and this, being seconded by Mr. Baggally, was put to the vote and carried. The proceedings then terminated.

AN ARTISTIC LAW CASE AT SIENA.

THERE is at present proceeding in the Assize Court of Siena a trial of somewhat more than ordinary interest concerning the theft of a work of art of considerable value. The work in question is a magnificent *piriale* or vestment, resembling a large mantle, and is worn by high-church officials on great occasions over the ordinary surplice, entirely covering the body.

This *piriale* is of thirteenth-century workmanship, and was one of four manufactured at the same time. Of these four two have been destroyed; one is, according to report, in London; and the other is the one at present under consideration. It was presented by Pope Pius II., secularly known as Aeneas Sylvius, of the Piccolomini family,—a family well known in the records of Siena,—to the Cathedral of Pienza, a small town in Tuscany, about fifty miles south of Siena, where he was born, and was one of many works of art with which he enriched his native place.

It is rumored that the destruction of the two out of the four *piriales* was caused by the habit of the Mediaeval Italians of hanging such valuable draperies from their windows on the occasions of festivals, &c., exposing them to every shower of rain, and then putting them away in a damp condition.

About two years ago an exhibition of works of art was held at Siena, and amongst the objects exhibited was the said *piriale*, which attracted much attention. In fact, soon after the exhibition an offer was made,—it is currently reported in Siena of 12,000*l.*, but this on examination turns out to be a myth,—to purchase it by Dr. Clifford, the Roman Catholic Bishop of Bristol. Soon after the exhibition it disappeared, and no more was heard of it until it was offered for sale by a Florentine antiquary to a French nobleman, who seeing the great value of it began to ask awkward questions, in the course of which it was elicited that it had been stolen and sold to this antiquary,—who had valued it at 70,000 francs,—for 2,000 francs.

A man and a woman were brought up charged with the theft, and the trial was held at Siena. The case against the woman failed,—so a second trial is proceeding against the man, who is a member of the *carabinieri* or *gendarmes*. The robbery appears to have been perpetrated in a very cunning way, as in order to get at the plunder it was necessary to obtain three keys, which were in the possession of three different persons. It is, therefore, to be supposed that the position of the accused as guardian of the peace was of some assistance to him in his craving after articles of *verbe*.

The writer of this article,—by the courtesy of the judge presiding at the second trial, whose acquaintance he had made,—was allowed, together with two English ladies and a gentleman, to inspect the *piriale*. The manner in which this inspection was permitted is somewhat amusing, and will appear strange to those who are accustomed to the sedate proceedings of our own courts of law. At the commencement of the day's proceedings the party above mentioned were ushered into court, and then shown to reserved seats between the jury-box and the dock occupied by the prisoner. After various formalities, such as the calling over of the names of the jury and the unsealing of various envelopes containing the keys which had been obtained for the purpose of the theft, at the invitation of the judge they were requested to ascend to the bench to inspect the *piriale*, which was displayed on chairs arranged in front of the bench, the case meanwhile being stopped. After a hurried inspection of about a quarter of an hour, polite bows were made to the judge, the party retired, and the case was allowed to proceed.

The *piriale* is semicircular in shape, measures at the diameter about 3½ yards, and is of exquisite workmanship. It is divided by flowing lines into irregular panels, which are embroidered with figures illustrating various Biblical subjects, there being about twenty-five of these panels, as nearly as could be guessed from so short an inspection. The panels are bordered with leaves and geometrical pat-

terns, exactly resembling in colour and design those that are to be found in illuminated missals of the thirteenth century. The figures are worked in very rich tints, the whole of the needlework being executed in silk and gold embroidery.

The question as to whether the Church of Pienza has the power to sell this valuable piece of Mediaeval needlework is in dispute, there being a law in Italy that no valuable articles of *verbe* are to be sold without the consent of the Government, so that it is extremely doubtful whether the second *piriale* will find its way, as the only other existing one has done, to England.

Illustrations.

BRIGHTON COLLEGE.

BRIGHTON COLLEGE was founded in 1845, and moved to the present site in 1847, where the first part of the school buildings was erected by Mr. George Gilbert Scott. Further additions were made by the same architect in 1854, 1859, and 1862. After the death of Sir G. G. Scott the college appointed as its architect Mr. T. G. Jackson, who was formerly a pupil of the school, and under his direction the play-ground was levelled and a cricket pavilion built in 1883, and an extensive scheme has been prepared for the completion of the college buildings, part of which is now in progress of being carried out. The entire scheme includes the erection of a new chapel to replace the present building, which is too small, a large schoolroom, additional classrooms, an entrance tower, four boarding-houses, a sanatorium, and gymnasium and lavatory.

The whole of these will be grouped within the college gates, and will form three sides of a spacious quadrangle of which Sir G. G. Scott's buildings will occupy the fourth. One boarding-house is now finished and occupied, and a second is in progress and will be completed within a few months. The gateway tower and porter's lodge are being carried up at the same time.

The materials employed are brickwork and terra cotta for the exterior faces, and flint facing with terra cotta for the walls that face inward to the quadrangle. It is believed that the superior durability of terra cotta will enable it to resist the trying climate of the south coast better than the ordinary building stones.

The illustration is taken from one of two drawings exhibited this year at the Royal Academy.

KING'S COLLEGE CHAPEL, ABERDEEN.

THE tower of this chapel, with its curious and picturesque "crown," will be remembered by all who have ever been in Aberdeen. The whole building is exceedingly characteristic, with its occasional pier or wide mullion up the centre of the windows, its foreign-looking hutch-finals, and its picturesque variety of fenestration and tracery. The careful measured drawings by Mr. J. C. Watt, which we publish nearly entire, and which gained a medal of merit from the Institute of Architects, form a valuable record of an extremely interesting building.

The following extract from the writings of John Spalding, recording in old Scottish spelling the disaster to the "crown," and its rebuilding in 1633, may be of interest here:—

"Vpone Thursday the sevint of Februar thair began ane gryt storme of snaw with horribill heiche wyndis, quhilk wes notit to be vniuersall throw all Scotland. Thir hideous wyndis wes markit to be suche as the like had never bein sein beir in thir pairtis, for it wold overturne countrie menis housis to the ground, and sun personis sddantlie smorit within but relief. It also threw down the staitle croun biggit of curious ashler wark, af of the steipill of the Kingis college of Old Aberdein, quhilk thairefter wes re-edefit and biggit wp lile inferior to the first."

SCULPTURE AT THE ROYAL ACADEMY.

"PLAN," BY MR. S. FRY.

WE give a facsimile, somewhat enlarged, of a pen-sketch of this work which the sculptor has been kind enough to send us. The group is in terra cotta, and, as we have already remarked, is a very successful example of the combination of modern feeling and realistic treatment with true sculptural effect.

GROTESQUES FROM NOTRE DAME, PARIS.

THESE figures stand at the angles of the south-west tower of Notre Dame, Paris, emphasizing its termination. I cannot vouch for their strict accuracy, as they have been made from such extremely rough notes as I was able to make on the spot; and I regret to find on comparison with Méryon's etching of the "Siryge," that my version of the creature resting on his elbows beyond the hooded birds is entirely incorrect. Still they give some idea of these masterpieces of "the true grotesque" works which show in every stroke of the chisel that they belong to the finest period of Gothic sculpture.

The energy of idea that could realise such fantastic imaginations as these is peculiarly Gothic. The sacred subjects that glorify the west fronts of the great cathedrals form an unequal parallel to the sculptured myths of Greece, but here in the grotesque we have a new element in art for which no prototype can be found in mature Greek, Egyptian, or Assyrian art. The point is that it is in mature work, as this Gothic work undoubtedly is, for it would be no answer to this to produce the crude efforts of primitive art, and it seems certain that the wild poetry of such figures as these would have been, one cannot say beyond the power, but outside the range of a first-rate Greek artist. He could not have conceived of that mixture of the foul and beautiful, of the sublime and horrible, which Gothic art has created.

An analysis of the mental condition of the men to whom such thoughts were possible would form an interesting study in psychology, but our ignorance of Mediaeval thought is still too great to admit of it on any historical method. Possibly it resulted from the strenuous vigour and imperfect culture of the races that superseded the older civilisation. But whatever its origin, it is the announcement of a new departure in art, of that romantic tendency which has formed so important a factor in modern European thought.

R. T. BLONFIELD, M.A.

OBITUARY.

Mr. John Parnell.—We much regret to record the death of Mr. John Parnell, senior member of the well-known firm of Parnell & Son, builders and contractors, Rugby. His demise took place after a long and painful illness at his residence, Brookfield, Rugby, on the 17th ult., in the 69th year of his age. He was one of the largest employers of labour in the neighbourhood. About forty years ago he commenced business in a small way, but the business gradually extended until the firm became one of the best known in the Midland counties. The firm was extensively occupied in works for the London and North-Western Railway Company, and the new station contract at Rugby was gained in competition by them recently, and the works are now rapidly proceeding. The firm has also carried out extensive works under most of the foremost architects of the last quarter of a century. For example under Mr. A. Waterhouse, A.R.A., the firm has executed several important works, the most notable being the new St. Paul's Schools at Kensington, and the new Congregational Chapel at Hampstead, both being very creditably completed by them. They have also done a great deal of work in the shape of barracks and military depôts for the War Department. They employed from 1,500 to 2,000 persons. While doing so much work in various parts of the country, they have ever been mindful of their native place, and all the work in the way of joinery and machine-work that could be done there has been executed at Rugby, where a staff of upwards of 100 men are continually kept employed. About eighteen years ago Mr. Parnell built for himself his residence at Brookfield, Rugby. He leaves a widow, two sons, and three daughters to mourn his loss. The funeral took place at Rugby Cemetery, on the 20th ult. Following the body were Mr. W. Parnell, of London, and Mr. J. Parnell, of Rugby, his sons, Mr. Allan and Mr. Heenan, his sons-in-law, and numerous other relatives and friends, besides clerks and foremen in his employ, and about 150 workmen.

The Gray Memorial at Cambridge.—Last week a statue of the poet Gray, the work of Mr. Thornycroft, was unveiled at Cambridge.

NEW BUILDINGS, BRIGHTON

B. Castle St. Holborn London. E.C.

MR. T. G. JACKSON, ARCHITECT.

Polytechnic School, Charlottenburg: Portion of Exterior.

Polytechnic School, Charlottenburg: Views in Principal Staircase.

THE NEW POLYTECHNIC SCHOOL AT CHARLOTTENBURG, NEAR BERLIN.

The new home of the technical high-school Berlin, in the creation of which three prominent architects, Messrs. R. Lucae, F. Hitzig, and C. Raschdorff, were one after another engaged, was inaugurated in the early days of November last. Neither the lately-opened University of Strassburg, nor that of Vienna, can compare in impressiveness with the mighty building which the professors of technique have

erected in the German capital. It is quite the largest building in Berlin,—much greater in its dimensions than the palace,—and is erected on a part of the site, near the boundaries of the city, destined by Schinkel as that of the Charlottenburg-road racecourse. It lies, therefore, at the westernmost point of the Berlin Zoological Gardens.

Owing to the size of the building, as well as to its situation, no point is to be found from which the eye can grasp the façade as a whole. We print a small view which, taken from the left wing of the building itself, gives some idea

of its length. We give also a couple of illustrations of the interior.

Both the principal front and the interior are richly decorated with sculpture. Thus, in the centre block are life-size statues of Schlüter and Leonardo da Vinci, and at the sides those of Watt, Stevenson, Bramante, and Erwin von Steinbach. In the great hall of the central building stand the five busts of Gauss, Schinkel, Liebig, Eytelwein, and Redtenbacher, and round the attic are eighteen life-size figures which represent the building trades, as, for instance, the joiner, the mason, and the carpenter.

ARCHITECTURAL ASSOCIATION.
EXCURSION TO CRAWLEY.

CRAWLEY, in Sussex, was, last Saturday afternoon, May 30th, the scene of the ninth and last visit of this Association for the present year.

Crawley, which is thirty miles from London on the Brighton road, consists of one good wide street. According to Horsfield's "Sussex," it belonged, in the time of King John, to the Poyning's family, and from them passed to the Percys, of Northumberland. The church, which is dedicated to St. John, is of the Decorated Period, but was enlarged and restored in 1880 with a new aisle, and was re-opened July 1st that year, after enlargement, including the restoration of the chancel to its original length, giving accommodation for 140 additional sittings.

Buchan Hill Mansion, which was the chief object of the visit, is between two and three miles from Crawley on the Brighton road, and to this the members walked. The house is being built on the site of an old one now removed, for Mr. P. Saillard, of London, from designs by and under the superintendence of Messrs. Ernest George & Peto.

The works were commenced July 7th, 1882, when the original contract was entered into with Mr. Mark Manley, the builder, for 45,000*l.*, but it is estimated that the mansion will cost about 55,000*l.* when finished, exclusive of coach-houses and stables. The members were received by Mr. J. G. Farrow, clerk of the works, and Mr. M. Manley, the contractor, and first escorted by them round the building. Externally the walls are faced with Lawrence's Bracknell red bricks, with Ham Hill stone dressings. The facing bricks were all specially made by Messrs. Lawrence & Son 2½ in. thick. The same firm also supplied all the rubbers used here.

The roofs are mostly covered with Gloucester stone slabs, and a small portion with Yorkshire stone. Having viewed the exterior, the members entered a large forecourt, one side of which is bounded by a tall wrought-iron enclosure and gates, manufactured by Messrs. Ellis & Rice, who have also supplied all the iron locks and wrought-iron hinges throughout the house. The mansion is entered from a carriage porch, and a lobby leads into the hall, which is 40 ft. by 28 ft. The entrance porches and vestibules are paved with mosaic, by Burke & Co., the conservatory being also paved with mosaic, by the same firm. The steps of the principal entrance are mosaic, and the risers are of vein marble. The large hall is oak-panelled to about 9 ft. high, the upper part being faced with the local Baronsap stone; it occupies the height of the two stories. The corridors are also faced with oak dado, 9 ft. high, and local stone above. In the entrance-hall is a large hooded chimney (between lofty windows) of red Mansfield stone. The ceiling is hand-painted, by Mr. Malins, who has also executed all the hand-painted tiles in the bedrooms, &c. On one side of the hall are the drawing-room, morning-room, &c.

All the dados, doors, seats, &c., in the drawing-room are of solid rosewood, the two rosewood chimney-pieces in the same room being executed by Messrs. Christie. The morning-room is panelled with deal, 9 ft. high, painted ivory-white, the chimney-piece executed in carved deal to match. The ceiling of the dining-room is of oak, the carved beams being of solid oak, as likewise the dados and window-fittings. The tile hearths are by Messrs. Craven, Dunnill, & Co. The floors of all the principal rooms have oak flooring on 1-in. deal sub-flooring. Adjoining the offices, by the garden entrance, are a schoolroom, lavatory, &c.; also Mr. Saillard's private room, which is wainscoted in oak. The principal staircase is in the tower, and is entirely constructed of oak, the treads and risers are cut out of solid oak, with moulded nosings and moulded soffits; carved oak open panelling being used as halustrading. All the stained and tinted glass is by Messrs. Lavers, Barraud, & Westlake.

The kitchen is spacious and lofty, and has an open roof with domed lantern-light for ventilation. The offices, ranged round a kitchen court, are all lined with white glazed bricks. The basement contains extensive cellars, and here arrangements are planned for all chimneys being swept from below.

All the first-floor corridors have oak dados and doors, and the rooms have deal panelled dados and doors; the door brass furniture is by Farady & Co.

The lavatories and other sanitary fittings are

by G. Jennings, of Lambeth. There is a lift to the top of the house by R. Waygood & Co., of London. There are five bath-rooms fitted with porcelain baths from Paris. All the water-closet fittings are by Messrs. Doulton, who have also supplied the terra-cotta chimney-pieces to the bedrooms in the south-east wing. The whole of the plumbing work has been done by the contractor, under his foreman Mr. Parrett. Altogether there are about thirty-two bedrooms. The housemaids' sink and apparatus have been specially made by Messrs. Doulton. The tower above the main staircase has large water-tanks to supply the house. Mr. W. Chard has acted as general foreman to Mr. Manley, and Mr. A. Burton is foreman of masons; and Mr. Adams has officiated as time clerk. The stone carving has been executed by Mr. Christopher Smith and Mr. Walter Smith. Mr. Smith and Mr. Knox executed the modelling of ceilings.

The whole of the wood-carving throughout, of oak and otherwise, is by Mr. Knox. The electric bells are by Strode & Co. The heating-apparatus and all the stoves are supplied by Longdon. The house is to be lighted by gas and electric light, both by Messrs. Strode. The kitcheners and hot-plates are supplied by Messrs. Benham & Sons, London. The butler's pantry is fitted with a strong-room, by Milner. "Tohn's" system of ventilation is used throughout. The mortise and other locks, not mentioned, are by Milner. The paper-hangings have been mostly supplied by Messrs. Woollams and Messrs. Jeffrey. The iron casements are by Messrs. Pearce & Co. The mansion is to have a terrace to the garden front, which is now in course of construction. The stables and coach-house, &c., were erected by Mr. James Longley, builder, of Crawley, from designs by the same architects, and cost about 8,000*l.* They consist of stalls for twelve horses, and eight loose and sick boxes, with harness-rooms, lofts, &c. The fittings were made and supplied by Messrs. Musgrave & Co.

ARCHÆOLOGICAL SOCIETIES.

London and Middlesex Archæological Society. A general meeting will be held at Tallow Chandlers' Hall, Dowgate-hill, on Tuesday next, June 9th, at 1.30 precisely. Mr. Edwin Knight, Master, has consented to preside. A description of the hall, records, and other matters of interest connected with the history of the company, will be given by Mr. M. F. Monier-Williams, clerk. The meeting will subsequently adjourn to the Church of St. Lawrence, Jewry, where an account of the building and the interesting series of parochial records will be contributed by Mr. Louis Stokes. A visit will next be made to Guildhall, for the purpose of inspecting the library and museum; likewise the New Council Chamber, and other recent alterations, also the crypt, some observations upon which will be made by Mr. Alfred White, F.S.A.

St. Paul's Ecclesiastical Society.—This Saturday, June 6th, the members of this Society will visit Chaldon and Merstham. Papers will be read by Mr. J. G. Waller, F.S.A., on the Wall Painting at Chaldon; and by Major Heales, F.S.A., and Mr. W. Bolton.

British Archæological Association.—Under the presidency of the Duke of Norfolk, E.M., the forty-second annual congress of the British Archæological Association has been fixed to take place at Brighton on the 17th of August next, and following days to the 24th inclusive. By the kindness of the Mayor and Corporation of Brighton some of the principal rooms of the Royal Pavilion have been placed at the disposal of the association during the week's proceedings, and there will be excursions to Arundel, Chichester, Goodwood, Cowdray, Bognor, Boxgrove, Worthing, Bosham, Wiston, Steyning, Bramber Castle, Amherly Castle, Hollingbury Copse, and other places of interest in South Essex. There will be extra days arranged for the following week, and which will probably include excursions to Lewes, Seaford, East-honrne, for Hurstmonceaux Castle, Pevensey Castle, and Hastings; a visit, it is also expected, will be made from Newhaven to Dieppe, under the auspices of the Leland Club.

Oxford Archæological and Historical Society.—A deputation from this Society visited Guildford on the 30th ult. to inspect the places and objects of interest. They were met by the mayor (Mr. Conncillor Mason) and other gentlemen, and proceeded to the Town-hall and inspected the

corporation plate. A paper was read by Mr. D. M. Stevens at the Town-hall, and the party afterwards visited Archbishop Abbott's Hospital, St. Mary's Church, the Castle, and other places.

Somersetshire Archæological and Natural History Society.—The annual meeting will be held in August, at Weston-super-Mare, under the presidency of Mr. E. H. Llewellyn.

PORTLAND CEMENT.
SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held on Monday evening, June 1st, at the Town-hall, Caxton-street, Westminster, Mr. Charles Gandon, President, in the chair, a paper was read by Mr. Henry Faija, on "Portland Cement."

The author said that, though much had been written on the subject, little was generally known, and contradictory conditions were often specified. He considered that the weight test is of little or no value to the purchaser, though it has a use for the manufacturer.

Specifications should be as simple as possible, and the author advised the adoption of the ordinary quality of cement, obtaining the different strengths required by varying the proportion of sand or aggregate, in preference to specifying unusual qualities.

The only points which need to be tested are,—fineness, tensile strength, soundness. After defining the degree of fineness which he considered most desirable, having regard on the one hand to strength, and on the other to economy, the author treated in detail the subject of testing. Experience showed that cements which set rapidly attain their full strength in a few months, and have then a tendency to fall off, while a slow-setting cement continues to increase in strength for an indefinite period. The best practice is to test the briquettes at three days after moulding, and again at seven days. At the former period they should not break under 175 lb. strain, or at the latter under 350 lb.

The author exhibited and described a machine that he devised some years ago, and had successfully used since, for gauging cement; also a testing machine, specially arranged to give the most advantageous rate of speed in applying the pressure, which he found to be 100 lb. per 15 seconds.

It was by no means safe to assume that, because a cement bore the required tensile tests, it was necessarily sound, and some cements were long in showing unsoundness, or "blowing." Means were, therefore, described by which this quality could be ascertained at as early a period as possible, by being artificially developed in an apparatus designed for that purpose.

A form of specification, founded on experience in these several respects, was then given, and the paper concluded with some reference to the chemical tests for purity, introduced in German practice by Dr. Fresenius, and with the author's testimony to the freedom of English cements from the adulteration against which these tests were intended to guard.

MAGNETO-INDUCTOR AND BRIDGE FOR TESTING LIGHTNING CONDUCTORS.

As the efficiency of a lightning-conductor depends chiefly on its electrical resistance being low, a good conductor should not have more than 10 ohms from the apex of the rod to the earth-connection, inclusive of the resistance of the latter; and exceptionally good conductors have only one-half of this resistance.

A high resistance is due either to flaws and breaks in the conductor, or to a had and faulty earth-connection. Defects of this kind cause a conductor to become a positive danger to a building, because discharges of atmospheric electricity frequently find a path to earth through some part of the building itself, of less electrical resistance than that of the faulty conductor.

The testing of lightning-conductors from time to time is therefore of paramount importance, as it is only by this means that any increase in their electrical resistance can be ascertained. When the tests show that the resistance becomes greater, it is evident that there is a fault in some part of the conductor; this fault must be found at once and removed.

Messrs. Siemens Bros. & Co., of 12, Queen Anne's Gate, Westminster, have designed a testing apparatus which admits of its being manipulated by workmen of ordinary intelligence; in fact, the instrument itself and the connexions to be made with the conductor are of such a simple kind that no special electrical knowledge is required for the work.

A perspective view of the apparatus is shown in fig. 1. The galvanometer is represented as

ring of German silver wire (forming the A and B branches of a resistance bridge), a contact-lever, P, which can be moved over the ring and used as a battery-key; a small horizontal galvanometer, G, four terminals, b, b', f, and c, and R the comparison resistance of the bridge. A small key, K, is fixed to terminal l, and the resistance, R, is underneath the bridge-board. A leather bag at the side of the wooden case (see fig. 1) is for holding the double conductor

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

removed from the compartment provided for it in the bottom of the case containing the magneto-inductor, and is in connexion with the terminals of the latter. Fig. 2 is a general plan, showing the connexions between the inductor, bridge-board, two earth-connexions, and the lightning-rod. The apparatus consists of a magneto-inductor, M, enclosed in a wooden case, and a bridge-board, on which are fixed a

leading-wire, which is used for connecting the magneto-inductor terminals with the bridge-board. The weight of the complete apparatus is 9 lb., and the dimensions are about 6 in. by 6 in. by 9 in.

By means of this testing-instrument, the electrical resistance of lightning-conductors and earth-connexions can be measured, the range of the instrument being from 0.01 ohm

to 500 ohms. The measurement of a resistance is read off direct without the trouble of making any calculation.

The connexions for testing are made as follows:—

Terminal l (see fig. 2) is joined to the apex of the lightning-conductor by means of a length of leading-wire, which may be either bare or insulated.

Terminal b' is put to earth, that is, a connexion is made by means of a stout piece of copper wire between this terminal and a gas or water pipe, or, should these not be at hand, any metallic body in intimate contact with wet earth may be used in place of the pipes. When no such earth-connexion is available a special copper plate (E') must be employed and put underground at such a depth as will insure all parts of the plate being in good contact with moist earth.

Terminals b, b' are joined to D', D' of the inductor by means of the double-conductor leading-wire. The bridge-board must stand as far away from the inductor M as the leading-wire will permit, so that the galvanometer G may remain as much as possible out of range of the magnetic and inductive influence of the permanent magnets and revolving armature of the inductor.

After the galvanometer needle has been set free, the bridge-board must be so placed that the needle plays freely over the scale, and finally points to zero when at rest. All connexions must be firmly made, and the attachments of the earth wires to a water-pipe, gas-pipe, &c., should be well soldered.

The tests are taken by two persons; one at the inductor and the other at the bridge-board. Whilst the handle of the inductor is turned, the key, K, of the bridge-board is depressed with one hand, and the pointer, P, with the other. The current from the inductor then traverses the bridge, and a deflection of the galvanometer-needle is produced; the key, K, still held down, and the pointer, P, kept depressed and moved a little to the right and left, observing, at the same time, which of these movements causes a decrease of the deflection. As soon as this is ascertained the pointer is kept moving slowly around the German silver ring until a point is found which brings the galvanometer-needle back to zero. The figure over which the pointer, P, now rests gives in ohms the total electrical resistance of the lightning-conductor and its earth-connexion, leading-wire between the apex of conductor and terminal l, and earth-plate E'.

The resistance of the leading-wire and earth-plate E' is so low that it may be neglected; the tests, therefore, can be taken as showing the actual resistance of the lightning-conductor and its earth-connexion E'. A resistance of more than 20 ohms shows the conductor to be in such a state as to have become a positive danger to the building to which it is fixed.

At the time a lightning-conductor is erected one end of a length of copper wire should be firmly soldered to the apex of the conductor. This wire is carried down loosely by the side of the conductor, and remains permanently in position so as to be available for connexion with the testing-instrument whenever the entire length of the conductor has to be tested. By this means the trouble and expense of attaching a fresh leading wire for every test are avoided.

A fault in a lightning-conductor is usually due to a bad earth-connexion arising from partial or entire fracture of the conductor just above or below the ground-line. In some cases, the lower end of the conductor is in dry ground and in others the earth-plate is either too small or is oxidised and broken. The earth-connexion should, therefore, be tested first of all, and for this purpose a strong brass clamp with a terminal screw should be secured to the conductor just above the ground-line and well soldered. A separate short length of leading-wire is then used for connecting terminal l of the bridge-board with the terminal screw on the lightning-conductor.

Double rod conductors, as shown on figs. 3 and 4, of the same, or a greater sectional area, a single one, can be erected, and the testing of conductors of this kind is very readily carried out. The upper end of each rod is well soldered to a joint common to both rods, and at the base the two ends terminate just above the ground-line. To the earth-plate E' are soldered two rods, which terminate close to the upper ones, and are joined thereto by means of connexion-screws T' and T''. Either of these screws can

be connected to the testing instrument by a leading-wire.

To test such a twin-conductor one rod at T' (see fig. 3) is disconnected and joined to one end of the leading-wire, the other end being connected to terminal I of bridge-board (see fig. 2). The test is then made, as described in the case of single conductors, and the continuity of the right-hand rod tried. The left-hand rod is tested in the same way, after the connections have been made, as shown in fig. 4. In erecting a double conductor the two rods must be kept some distance apart throughout their entire length, and not touch any piece of metal forming part of the building, so as to obviate all risk of the two rods being short-circuited. After the tests have been taken, the connections must, of course, be re-made, so that the continuity of the rods is uninterrupted.

The testing of lightning-conductors should be carried out in dry weather, as better and more concordant results are obtained than in a damp state of the atmosphere, when buildings are covered with moisture.

There can be no doubt that a considerable number of lightning-rods, which are supposed to protect their buildings against destruction from lightning, are in a very unsatisfactory state with regard to electrical continuity, and many are doubtless rather a source of danger than a protection, as, while they attract discharges of atmospheric electricity they are unable to conduct the same harmlessly to the earth as they are supposed to do, and the building is therefore endangered. Lightning-rods can only be considered as safeguards if their electrical resistance is kept low, and in order to be sure of this it becomes necessary to have them tested from time to time.

CHEAP, IF NOT EXPEDITIOUS, BUILDING.

CORDERY V. BOTTING.

THIS was a case recently heard in the Windsor County Court before Judge Wigham. According to the report in the *Windsor and Eton Express*, from which we quote, the plaintiff claimed 300l. penalty under a building contract. Mr. G. H. Charsley appeared for the plaintiff, and Mr. C. F. Dean for the defendant.

The plaintiff, Jonathan Cordery, lives at Stoke Poges. Botting is a carpenter at Slough, and he entered into a contract on the 8th of July, 1884, to build three cottages at Stoke for the plaintiff. The amount was to be 217l., and it was agreed the work should be commenced from the date of the signing of the contract and completed within twelve weeks, the defendant to forfeit 2l. a week for every week they were unfinished after that date. It was further agreed that Mr. H. Sargeant, of Slough, should act as umpire, and that his decision should be final in case of dispute. The plaintiff now claimed 2l. a week for fifteen weeks during which the cottages were unfinished, and said that he had to get some one else to finish them.

Mr. Dean contended that this dispute ought to have been referred to Mr. Sargeant, in pursuance of the terms of the agreement; but his Honour thought that the question of penalty was separate and independent. He, however, asked Mr. Sargeant's opinion on the matter, and Mr. Sargeant thought the time allowed for the completion of the work was a reasonable one, but considering the low price at which the contract was undertaken, he did not think the full penalty ought to be exacted. He thought 300l. would have been a fairer estimate for the work.

Mr. Dean submitted that the damages, if any, should be put at the amount of the rent which the cottages would have produced if they had been completed at the proper time. The rent of each cottage was 3s. per week. That was 3s. a week for fifteen weeks, 45l. He contended that the penalty was reducible according to the actual damage. This contract, he said, had ruined Botting, and he was now offering his creditors half his weekly earnings to save the expenses of bankruptcy.

His Honour gave judgment for the plaintiff for 10l.

The Hotel Metropole.—It should have been mentioned, in the account of this building which we published last week, that the wrought-iron wine-hins and the cellar fittings, &c., were supplied by the well-known firm of Farrow & Jackson, of Great Tower-street, who, as will be known to many of our readers, have for a great many years given special attention to such details.—Messrs. R. S. Newall & Co., of the Strand, write to say that their system of copper-plate lightning conductors was adopted, and the work of fixing carried out, by them.

COMPENSATION CASE.

UNIVERSAL MARINE INSURANCE COMPANY V. THE CITY COMMISSIONERS OF SEWERS.

A HEAVY claim for compensation for City property came before Sir James Stanger, G.C., M.P., Recorder, and a special jury, at the Guildhall, on Monday last, the Universal Marine Insurance Company claiming from the Commissioners of Sewers of the City of London upwards of 50,000l. for freehold premises, Nos. 72 and 72A, Old Broad-street, of which they were the owners. Mr. E. Clarke, Q.C., M.P., and Mr. Bremner appeared for the claimants; and Mr. Webster, Q.C., and Mr. Rose-Innes represented the Commissioners.

The property was purchased by the Insurance Company in 1867 for 13,000l., with the intention of occupying it as offices, but it was let on lease at 250l. a year until 1884, and they could not obtain earlier possession. In the meantime they were compelled to move to other premises, and they placed their Broad-street property in the market and gave the Commissioners of Sewers intimation of the facts.

The witnesses called on behalf of the claimants were Mr. Perry St. Quintin, of the firm of St. Quintin & Son, auctioneers and surveyors, 37, Threadneedle-street, who estimated rental value of 2,000l., fixed the capital value at 45,000l., including 10 per cent. for compulsory sale; Mr. Bousfield, of the firm of Fox & Bousfield, who agreed as to the capitalised value, but placed the rental at 2,250l.; and Mr. Farmer, of the firm of Debenham, Tewson, Farmer, & Bridgewater, whose valuation was 47,500l.

The evidence on behalf of the Commissioners of Sewers was that of Mr. E. N. Clifton, architect and surveyor, East India-avenue, who put the value of the property at 33,000l., inclusive of 10 per cent.; Mr. C. J. Shoppee, who made it 33,900l.; and Mr. G. Barnes Williams, who considered it to be worth 35,500l.

The jury returned a verdict for 41,911l. 13s. 4d.

THE ARCHITECTURAL ASSOCIATION.

SIR,—The adjournment of the debate upon the question of doubling the amount of the subscription to the Association gives me the chance of writing what I meant to say had I been present at the meeting.

If the resolution he passed, I hope it may effect all the good its authors anticipate. If, however, the criterion he the greatest good to the greatest number, I fear that the contemplated change will diminish rather than extend the usefulness of the Association. Double the subscription, and you at once weed out of its ranks the poorer students, who must need study proportion in money matters, though they may rarely find it in the architectural designs they spend their days in tracing. That the honours of this useful society should be thus narrowed by the exclusion of the poorer students would be a matter for sincere regret; and the change would appear the more significant and regrettable coming at a time when, in another realm of art, the College of Music is opening wide its doors to the poorest lad or girl in the land who has musical genius. It is well, I think, that this side of the question should receive consideration even if great gains are expected from the proposed change in other ways.

If, indeed, the sum of 3000l. (which I understand is the amount it is hoped to raise by means of the increased annual subscription) be so necessary to the effectual working of the Association classes, why not get the Institute to make a yearly grant of this sum and leave the funds of the Institute as at present figured? The ample funds of the Institute are at present expended in guarding the rights and decencies of the profession; but this scarcely fulfils his Britannic Majesty's intention when he granted its charter expressly for the advancement of art. Here, then, is a way in which the Institute can advance the study of architecture, and, at the same time, do something to redeem its name from the deserved contempt of honest men.

And it seems to me the bondden duty of the Institute to help this school of young architects in some such practical way as I have indicated. Is it not written in the articles which bind the pupil to the service of the F.R.B.A. that the indulgent master shall allow the pupil "all reasonable facilities" for attending classes at the Architectural Association or other kindred institutions? Why, then, should not the Fellows of the Institute contribute (at least indirectly) to the maintenance of a needy educational society which gives to their pupils that knowledge of architecture which they themselves are continually paid a good round sum to teach?

JOHN D. SEDDING.

CURVES OF CONTRARY-FLEXURE.

SIR,—In an article in the *Builder* for May 30, p. 752, Mr. Cave Thomas describes what he is pleased to term "Curves of Contrary-Flexure," made by joining two arcs of circles or ellipses together. These, however, do not form the true curve of contrary-flexure as understood by mathematicians, in which the curvature gradually decreases, or the length of the radius of curvature increases as the point of flexure is approached, the length of the radius becoming infinite at the point of contrary-flexure. In my treatise on "Practical Geometry for the Architect, &c.," I have shown how such curves can be drawn, and applied to the purposes of architecture, as in forming the ogival arch or the mouldings called ogee. By using the true mathematical curve of contrary-flexure a more pleasing contour is obtained than in the attempt to imitate it, by putting together two parts of circles or ellipses, as in the former the change of curvature is gradual, while in the latter it is sudden and abrupt. E. WYNDHAM TARR.

ITALIAN SILVER-GRAY SLATES.

SIR,—Accident has made me acquainted with efforts which are being made by enterprising Englishmen to develop some of the industrial resources and the natural products of Italy. I think it may interest some of your readers to hear, in outline, an account of one such effort which came to my knowledge as a stranger travelling in this favoured country. I write, however, as a traveller only, and not as a man of business; and I may premise that I have no interest in the undertaking, though I heartily wish it success. In the interests alone of Italy, I think that what I propose to say should be more widely known than at present the matter would seem to be known in England; for there are those acquainted with the conditions of the slate trade who think, that the Italian importation will seriously affect the English slate market of the future.

Inland from, and far up in the hills above Chiavari, on the shores of the Eastern Riviera, are situated certain rich slate quarries now being worked by an English firm. The products are carted to that town, whence they are transferred to the small, but deep and safe, harbour of Santa Margherita, Liguria, some eighteen or twenty miles from Genoa, by means of local boats. The slates are shipped abroad from the last-named port, which is the centre of the slate trade of this part of Italy. Owing to vessels requiring ballast for England, on their return voyage from Mediterranean ports, the slates can be loaded at almost nominal rates of freight, viz., from 3s. to 4s. a ton to Cardiff, and from 10s. to 12s. a ton to Liverpool or London. The actual prices of the different sizes and thicknesses of the slates, it is impossible to give in brief; but this is of the less moment as I desire to direct attention in general terms, rather than with mercantile exactness to the subject matter of this letter. It may be said, however, that these Italian slates can be delivered in England at a cost some 20 per cent. cheaper than the price of similar slates of the best quality, at the quarries in Wales; whilst the cost of carriage from the quarries in Wales makes the difference in the percentage still greater. As to the respective qualities of the Welsh and Italian slates, I am unable to speak from knowledge, but this can be easily tested; and I gather on the spot that the Italian are, at the least, equally good with the Welsh slates, and in some particulars they are even superior. They certainly gained the first prize in the Turin Exhibition last year; but I know not if Wales competed at Turin. Any way, the following are some of the virtues of the Italian slates. They can be obtained, I am told, of far larger dimensions than the Welsh. They harden, until they become like stone; and, twenty-four hours after quarrying, they cannot be split, and can hardly be broken. Of a blue colour at first, they become, on exposure, a silvery-grey colour or white, and they turn to a uniform hue. They are non-conductors of heat and cold, and thus are specially suitable for roofing purposes, the houses for which they are used being cooler in summer and warmer in winter. Lastly, the cleavage of the slates is said to be nearly perfect, the percentage of breakage being far less than that of English slates; and in use their wear is very durable. Besides

being suitable for roofing purposes, smaller sizes make excellent slates for schools, and larger ones are widely employed as "black boards" for classes; and both these have already acquired a reputation in England. Slates are also cut for making chimney-pieces, tops of washing-stands and chests of drawers. For mural decoration, in a damp climate, they will (I imagine) prove of value for decorative purposes, when enamelled and painted; and for the heads of billiard-tables in one slab, dressers in kitchens, counters in certain shops, and other uses, they will be invaluable. They would also seem to be serviceable for railway stations, docks, warehouses, sheds, outhouses, and houses of a single story. I will only add, that the quarries above Chiavari are now being worked by Messrs. Bnh & Co., of Santa Margherita, Liguria; and that machinery for developing the resources of these quarries more speedily and effectively, which will be worked by steam power, is now on its way from England.

AN ENGLISH TRAVELLER IN ITALY.

THE PARAGON THEATRE, MILE END ROAD.

Sir,—In the description of the above in your issue of the 23rd ult. [p. 745] I see it stated that the whole of the decorative plastering was executed by the Framemakers and Gilders' Association. This is not correct, as, with the exception of the auditorium, the plastering was executed by me.

T. HIBBS.

150, Hertford-road, Dalston, N.

PROVINCIAL NEWS.

Newcastle.—The Newcastle-on-Tyne local newspapers record that at an adjourned meeting of their City Council, held on May 15th, it was reported to the council that the Justices of the City Lunatic Asylum at Cologde, near Newcastle; and that they had accepted the tender of Mr. Walter Scott, contractor, Newcastle, the amount being 22,041l. Mr. Arthur B. Plimmer, A.R.I.B.A., of Newcastle, is the architect for the work. The matter was referred to the finance committee of the corporation to consider the best means of procuring the funds for the execution of the work, and to report thereon to the council.

Loughborough.—The Loughborough Local Board have elected Mr. George Hodson, C.E., as their chairman. Mr. Hodson was formerly their Surveyor and Waterworks Manager.

Stoke-sub-Hamdon (Somersetshire).—A new post-office has been opened in this village. The new building, which has been erected from plans and specifications prepared by Mr. H. Hall, F.R.I.B.A., London, is of Ham Hill stone. The interior of the office is semi-octagonal in form. The windows are partially fitted with thick crystal glass, and impart a good light to the office. The floor is paved with encaustic tiles, which were laid by Messrs. Wehh & Co., Euston-road, London. The contractor was Mr. F. Fane, of Stoke.

Southport.—On Saturday last, May 30, the Mayores of Southport (Mrs. Pilkington) laid the memorial-stone of a new children's ward now in course of erection in connexion with the local infirmary and dispensary. The new building, which will be known as the Pilkington Ward, and which is being constructed by Messrs. Fairbridge & Hatch, of Birkdale, from the designs and under the superintendence of Messrs. Mellor & Sutton, architects, Southport, will accommodate nine cots, allowing each a cubical air space of about 1,045 ft. The cost of the building will be about 700l.

Exeter.—At a meeting of the Exeter Town Council, acting as the Urban Sanitary Authority, on the 27th ult., it was resolved to purchase premises in North-street, formerly known as the George Inn, at a cost of 2,700l. with a view to further carrying out the street-line which was some time ago adopted by the Council. It was also decided to offer Mr. Faulkner White the sum of 2,500l. for the Phenix Inn and adjoining property in Goldsmith-street. Upon the report of the City Surveyor (Mr. Donald Cameron) the Council decided upon the construction of a new sewer in the place of that now known as the Larkbeare Sewer, owing to the defective condition of the latter. The estimated cost of this undertaking is about 1,400l.

Standon.—The ceremony of placing the

memorial stone of the Farming Home for Waifs and Strays, now being built in the parish of Standon, Staffordshire, took place on the 27th ult. The institution is in connexion with the Church of England Central Society for Providing Homes for Waifs and Strays. This Staffordshire home owes almost everything to the generosity of Miss Anderson, sister-in-law of Mr. Thomas Salt, M.P. for Stafford. Miss Anderson has given the site and 2,000l. for the building, and 50 acres of land, about equally divided between arable and pasture, has been leased on easy terms from Mr. Salt. The intention is to train outcast boys in farm-work, and afterwards send them to the colonies. Accommodation will be provided for fifty boys. Mr. E. Hoole, 104, Russell-street, W.C., is the architect, and the building is being carried out by Mr. W. T. Moss, of Stafford.

Sandown (I.V.).—A new Oddfellows' Hall, erected by the "Loyal Culver" Lodge, M.U., has just been opened at Sandown Isle of Wight. Mr. S. G. Tomkins was the architect, and Mr. C. Bennett the builder.

Chelmsford.—The Chelmsford Board of Health, having recently purchased six acres of land for a new cemetery, have resolved to lay out half of it first, and to erect the necessary buildings, &c., at a cost of about 2,000l. from plans prepared by the Surveyor to the Board, Mr. C. Pertwee.

Blackburn.—Messrs. Neill & Sons, contractors, of Manchester, have just begun the work of erecting a new passenger station at Blackburn, for the Lancashire and Yorkshire Railway Company, who are spending 100,000l. on the station and the site, in addition to erecting a new bridge of 150 ft. span, and doubling the width of the railway for a distance of two miles.

CHURCH-BUILDING NEWS.

Edale.—On the 22nd ult. Lord Edward Cavendish, M.P., laid the foundation-stone of a new church at Edale, Derbyshire. The old Edale Chapel was originally erected in 1633, and was rebuilt in 1812. This had become too small and antiquated for the present requirements of the parish. The new building is to be Early English in style, and is to consist of nave, 54 ft. by 24 ft. 6 in. wide, with porch, chancel, and vestry, a tower and spire, 88 ft. in height, the lower part of the tower serving as the organ-chamber. The church will be fitted up with open benches, to accommodate 200 persons, and is being built of stone from the neighbouring quarries, with open-timber roofs of pitch pine. Mr. W. Dawes, of Manchester, is the architect, and the contract has been let to Mr. Thomas Beck, of Matlock Bridge, for 1,314l. Other works bring the total cost up to about 2,858l.

Gedding.—The parish church here has just been re-opened, after restoration under the supervision of Mr. Bisshopp, architect, Ipswich. A few months ago the nave was a melancholy ruin. The tiles had been mostly stripped off the roof, leaving the exposed timbers to decay. Mortar from the walls, and rubbish from the plastered ceiling, lay in heaps among the ancient low oak benches and the modern high lead pews. The roof, a good specimen of fourteenth-century work, is of oak, and every available bit of the old timber has been worked up in its restoration. It is covered with red tiles, ancient and modern, intermixed. The removal of the patchwork stucco from the outside walls disclosed excellent flint work on every face, with two Norman loopholes in the nave, and a curious lepers' grating in the chancel, which carry back the date of the foundation to the twelfth century. These have been glazed in the antique style, and the walls properly pointed, to display the original flint facing throughout. A new buttress on the north side of the nave, with new doors both north and south, complete the external renovation, and make the building structurally sound, dry, and warm, a result to which an open brick drain all round will contribute very materially in the future. Internally the walls have been smoothly refaced, and the stonework cleared of green mould and whitewash. The huge "three-decker" was of necessity removed, together with the large parlour pews that harried the poor from rich, choked up the nave, and greatly limited the accommodation. The floor is laid with solid wood blocks on a concrete bed, leaving a 4-ft. central passage paved with red tiles, flanked by white brick. The whole of the work has been carried out by Mr. Robert Tooley, contractor.

Nottingham.—St. Mary's Church has just been enriched by the completion of a reredos and chancel screen, the gift of Mr. T. Hill, J.P., in memory of his wife. The works are from designs by Messrs. Bodley & Garner, architects, Gray's Inn-square, London. The screen, which stands at the entrance to the chancel, is of English oak, and in the Perpendicular style. The work has been done by Messrs. Rattee & Kett, of Cambridge. The reredos is of wood, carved by Mr. McEnloche, of Kennington-road, London, and is entirely covered with gilding and colour, the work of Mr. Powell, of Lincoln. It is over 20 ft. high, and contains eleven pictures from the studio of Messrs. Burlison & Grylls, of Newman-street, London. The coverings for the altar have been worked by Mrs. Henry Gee, from the designs of the architects, and have been made up, along with the rich side hangings, under the supervision of Messrs. Watts & Co., London.

Wolverhampton.—St. Paul's Church, Wolverhampton, was re-opened on Whit Sunday, considerable alterations and improvements having been made to commemorate the fiftieth anniversary of its foundation. The old high-framed pews have been removed, and replaced with handsome open seats in pitch-pine, with panelled hench ends and moulded cappings. The wood flooring of seats and the stone paving of aisles, &c., have been taken up and re-laid with new. At the east end of the chancel is erected a reredos of Late Decorated design, in Painswick stone and Derbyshire alabaster, and on the north and south walls of the chancel are fixed the tablets of Commandments, Creed, and Lord's Prayer. The whole of the interior has been painted and re-decorated. The ventilation and lighting are re-arranged, and a new hot-water apparatus provided. The reredos, the re-seating, and other builder's works, were contracted for by Messrs. J. & W. Cockerill, and the painting and decorating by Mr. M. Tatlow, both of Wolverhampton. The hot-water apparatus was supplied by Messrs. Jones & Atwood, of Stourbridge. The cost of the renovation is about 1,400l., and the whole has been carried out from designs and under the superintendence of Mr. J. R. Veal, architect, of Wolverhampton.

Downe.—A new oak porch has been added to Downe Church, Kent, at a cost of about 100l., by Mr. Balding, builder, of Bromley, from the designs and under the superintendence of Mr. St. Pierre Harris, architect, of 1, Basinghall-street, London.

The Incorporated Church Building Society.—The report of this Society for the year 1884 shows that the number of applications received for grants from the general fund was 105. Of these, 93 were granted, namely—30 towards building additional churches, 10 towards rebuilding existing churches, and 53 towards enlarging or increasing accommodation in existing churches by extension of walls, rearrangement of seats, and other improvements. The number of applications received for grants from the Mission Buildings Fund was 33. Grants were voted towards 28 mission churches, temporary churches, school churches, or hamlet chapels. The population of the 93 parishes and districts assisted is 312,706; the number of churches existing therein is 95, to which will now be added 30. The present provision of church room is 31,566, of which there are seats for the free use of the parishioners 24,954. To this provision of church room sittings will be added for 21,475; while the addition to the seats for the free use of the parishioners is 20,381. The general summary of the operations of the Society since its formation in 1818 shows that the total number of applications for aid was 8,959. The grants made were 7,393, namely, in aid of the erection of 1,963 additional churches and chapels, and of building, enlarging, or otherwise improving the accommodation of 5,430 existing churches and chapels.

New Board School.—On Monday Mr. Benjamin S. Olding, a member of the School Board for London, presided at the ceremony of opening a new Board School in Scawfell-street, Great Cambridge-street, Haggerston, the centre of a densely-populated district. The new schools are built from designs by Mr. E. R. Robson, to accommodate 1,193 children, and a large number of local interests had to be bought up to procure the site, which, with legal expenses, cost 13,490l. The buildings cost 11,464l., being an expenditure of 9l. 12s. 3d. per head per scholar.

The Student's Column.

DESCRIPTIVE GEOMETRY.—PART II.

Classification of Surfaces.

ANY surfaces belong to no category whatever; others to two or three categories at once.

In the same category are placed the surfaces which have one mode of generation in common; such are, for instance, right cones, right cylinders, and surfaces of revolution.

The following are some of the principal categories of surfaces to be dealt with:—

Ruled surfaces are all surfaces engendered by the motion of a straight line; they are divided in developable and skew surfaces.

Developable surfaces are those which can be spread out on a plane after being cut along a generator; such are, for instance, cones and cylinders. The series of tangents to a helix,—that is, the thread of a screw,—are contained in a developable surface; it is called the developable helicoid. It can be shown that the planes tangent to all developable surfaces are tangent along a generator just as in cylinders and cones.

Skew surfaces are not developable. The distinction lies therein that, in developable surfaces, two generators infinitely near are in the same plane, whereas in skew surfaces they are not.

The principal skew surfaces are:

The **hyperboloid** engendered by a straight line as generator hound to meet in its motion three fixed straight lines as directors not contained in the same plane.

The **paraboloid** is engendered as the hyperboloid with the only difference that the three directors are parallel to a given plane.

The **hyperboloid of revolution** is engendered by a straight line as generator revolving round an axis which is not in the same plane as itself.

Enveloping surfaces are engendered by the motion of a surface, such as S in fig. 93 called an enveloped surface.

If we consider two of these surfaces infinitely near to one another, we find an intersection, G; the surface is, therefore, formed by an infinite number of curves, G, as generators. In the case the enveloped surface is a sphere, the generator is a main circumference thereof. (See fig. 93.)

Fig. 93.

Surfaces of the second degree, so named because their algebraical representation involves equations of the second degree or quadratics, comprise the five following surfaces:—

1°. Ellipsoïds.

Let us make two ellipses a, b, c, d, and e, f, g, h, with their planes at right angles; if we

Fig. 94.

imagine a series of horizontal ellipses bound to have the extremities of their axes touching the

fixed ellipses drawn, an ellipsoïd will have been generated. (See fig. 94.)

2°. Hyperboloid of two sheets.

If we replace the two vertical directing ellipses by two hyperbolas, with their axes in common and their planes at right angles, the generating ellipses hound as before to have the extremities of their axes touching the directing hyperbola will generate the hyperboloid of two sheets. (See fig. 95.)

Fig. 95.

Note.—For persons unacquainted with conic sections we point out that an hyperbola is formed of two branches of infinite extent and of opposed directions.

3°. Hyperboloid of one sheet.

If, on the other hand, the directing hyperbolas have their axes parallel to that of the generating ellipses, we get the hyperboloid of one sheet. (See fig. 96.)

Fig. 96.

4°. Paraboloid.

If the two directing lines be parabolas with the same axis, and their planes at right angles, then the generating ellipses will produce the paraboloid. (See fig. 97.)

In the four surfaces above described, if the directing lines are equal, the generating ellipses becomes a circle, and the surfaces will be surfaces of revolution. The hyperboloid of one

sheet in this case can also be described by a right line revolving round an axis.

Fig. 97.

5°. Hyperbolic Paraboloid.

This surface is generated by two parabolas having their axes parallel and opposed in direction, their surfaces at right angles. One of the parabolas is fixed, the other moves along its outline with its plane always parallel. (See fig. 98.)

Fig. 98.

Of these surfaces, the second is never used for any practical purpose; the fourth is employed for reflecting mirrors. In building, the first surface has been employed for vaulting, but very rarely; the third and the fifth are the same as those we have called skew, and often occur in masonry.

Students who are not acquainted with conic sections may be puzzled by those definitions, but need not thereby be deterred from passing on to the practical applications, for they will find them quite within the grasp of any person accustomed to making working drawings.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

1,588. Locking Catch for Bolts, Window-fasteners, &c. J. Hummerston.

When the bolt is shot out it cannot be withdrawn until a small catch, actuated by a spring, be removed. The small bolt is inside, and independent of the main one, and by moving back the knob the small bolt is alone moved: this depresses the catch, and the knob then acting on the main bolt is able to withdraw it. In all cases the ordinary motion of the bolt or lever, although continuous, is in two parts, first removing the catch and then withdrawing the bolt or lever.

3,036. Chimney-pots. T. Anwyll.

The chimney-pot is formed with louvres and vertical radial partitions, arranged so as to form a number of equal flues. Currents of air striking against the louvres on one side are directed upwards, and are deflected laterally outward through the louvres by the partitions. This action is assisted by the closed top. The flues on the other side are meanwhile free for the egress of smoke.

3,927. Bench Hold-fast. W. Hayhurst.

The ordinary bent rod has a lever pivoted at its end. One end of the lever is provided with a hinged foot which presses on the work to be held, and the other with a cam or eccentric connected with a handle. The work is held or released by moving the handle.

14,482. Wood Planing Machine. J. Peirce.

In this machine the tables on each side of the cutter are on their lower surfaces provided with four inclined planes, which rest on four similar surfaces on a frame or slide. As the slide is movable by a

rew, the tables can be adjusted relatively to the extent so as to regulate the depth of cut. The knives blades of the cutter have two cutting edges, and are well bevelled off at the ends to fit into corresponding grooves in two collars, one of which is fixed on the spindle, the other is loose and held up by a nut. Each blade is also held by a screw passing through its centre into a boss on the spindle, and the cutter is driven by a pulley situated between the two collars above. The bearings of the spindle are lubricated by being connected with oil passages in the supports. These oil recesses are fitted with caps screwed on so that the oil is under pressure.

APPLICATIONS FOR LETTERS PATENT.

May 22.—G. 260, G. Barnard, Combination T. Square, Set Square, and Improved Clamp.—6,273, K. Boothroyd, Apparatus for Ventilating Sewers and Drains.—6,291, W. Taylor, Improvements in School Desks and Seats.—6,294, M. Shearer and J. Smith, Brick Pressing and Moulding Machine. May 23.—6,313, C. Clark and H. Coates, Apparatus for Lighting Gas by Electricity, applicable to the gas cutters. T. 15, Improved Improved Spindle for Door-knobs, and Method of Attaching Knob to same.—6,319, J. T. and S. Skinner, Bolts for Doors and other Fastenings.—6,326, B. Saunders, Safety Window Checks.—6,327, D. Rogers and D. Rogers, jun., Fire Grates for Domestic Purposes.—6,337, J. Harrower, an Improved Valve. May 26.—6,378, H. Buchan, Improvements in Water-closets.—6,407, T. Sutton, Portable Heating Apparatus.—6,412, H. Whiteley, Weather Guards, or Draught preventers for Doors and Casement Windows, also applicable for Preventing the Slamming of same.—6,421, J. Small, Improvement in Exhaling Apparatus.—6,422, H. Whiteley, Weather Indicators, or Weather-cocks.—6,439, J. Ellis, Improved Construction of Metal Rib for Bridge Floorings, Columns, and other Constructive purposes. May 27.—6,441, C. Foster, Improvements in Street Paving, and Manufacture of Blocks for same.—6,455, G. Haywood and G. Williams, Improvements in Ventilating Apparatus. May 28.—6,507, A. Fongadoiro, Improved Safety Door Bolt.—6,510, J. Johnson, Improvements in the Manufacture of Decorated Glass.

PROVISIONAL SPECIFICATIONS ACCEPTED.

3,754, D. Faulds, Improved Coupling or Joint for Pipes, &c.—4,269, W. J. & W. F. Rowe, Improvements in Waste preventing Cisterns.—4,520, R. Roberts, Apparatus for Opening Doors from the Inside.—4,939, T. Smith, Lighting Houses and other Structures by Electricity.—5,030, J. Simpson, Improvements in the Mechanism of Venetian Blinds.—5,060, H. Pearce, Opening and Closing Sashes, Fanlights, Skylights, &c.—5,278, B. Verity, Improved Warm-air Stove.—5,305, G. Maxstedt, Door Closing or Check Apparatus.—5,437, A. Link, Preventing the Formation of Ice and other Atmospheric Precipitations upon Windows.—5,555, J. Jones, Folding and Adjustable Bench or Seat.—5,556, A. Clark, Improvements in Window Frames and Sashes.—5,635, M. Wallace, Combined Ventilating and Flap-Valve or Ghimney Door for Kitchens, &c.—5,627, J. Woodward, Reversing the Latch Bolts of Locks and Latches that the same may be used either handed.—5,774, S. Booth, Water-slide Gas Chandeliers or Gas Fencings.—5,812, P. Brown, Improvements in Wire Fencing.—5,855, A. Clark, Machines for Sawing-off and Boring Wheel Felloes.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

10,564, E. Brown, Improvements in Spring Door Locks.—10,824, W. Burke, Machines for Cutting and Dressing Marble, Stone, &c.—11,549, W. Kent and J. Sutton, Improvements in Gasellers and Apparatus connected therewith.—13,033, L. Dattis, Improvements in Bakers' Ovens.—13,991, H. Fajia, Apparatus for Testing the Strength of Cement and other Substances.—14,611, J. Howard, Apparatus for Automatically Regulating the Closing of Doors, or for Preventing Noise or Slamming when closing.—4,801, R. Sayer, Improvements in Scavengers' Carts.—5,059, H. Haddon, Window Fastener or Stay.—5,112, J. Bonny, Connecting Fire Grates to the Flues of Chimneys.—10,876, J. Wilkinson, Improvements in Ball Castors.—19,412, F. West, Improved Adjustable Frame ascending and descending a Vertical Post, and specially applicable to Concrete Building.—15,816, A. Bickmore, Improvements in the Construction of Panelled Furniture, Doors, and similar Joinery.—5,193, H. Lake, Improvements in Sash-borders.—5,293, J. Adams, Semaphore Indicator for Electric Belts.

A New Temperance Hall for Kennington.—Mr. Arthur Pease, M.P., has promised to lay the foundation-stone of the new Temperance Mission Hall in Royal-road, Kennington Park, on this Saturday, June 6, at 4 p.m. Lady Brassey and Mrs. W. J. Armitage will also lay two tablet-stones on the same day. The architect of the building is Mr. Banister Fletcher.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing estate sales with columns for property description, agent, and price. Includes entries like 'Portman Estate—Improved ground-rent of 65l. 10s., term 10 years' and 'Bethnal-green—10 and 11, Parliament-street, 25 years, ground-rent 9l.'.

MEETINGS.

Table listing meetings with columns for date, organization, and time. Includes 'SATURDAY, JUNE 6' with 'Association of Public Sanitary Inspectors' and 'Monday, June 8' with 'Royal Institute of British Architects'.

Notes of Excavation and Discoveries in the Trenches of Boyam, on Bestrove, Island of Yell, Shetland, in 1833-35, &c.: By Mr. J. T. Irvine, F.S.A. Scot. 3 p.m.

London and Middlesex Archaeological Society.—General Meeting at Tallow Chandlers' Hall, 1.30 p.m. Birmingham Architectural Association.—Ordinary Meeting: Election of Officers. 7.30 p.m.

Society for the Encouragement of the Fine Arts.—Third conversation in the Galleries of the Institute of Painters in Water-Colour. 8 p.m. Society of Antiquaries.—8.30 p.m.

Miscellaneous.

Useful Timbers of New South Wales.—According to the Immigration Agent for New South Wales, that colony abounds in useful timber. He says that for constructive purposes in dockyards, piers, bridges, horse carpentry, coachmakers' and wheelwrights' work, railway building, fencing, and piles, nearly the whole of the Myrtaceae, of which New South Wales possesses something like fifty varieties, are extremely valuable, and certain of them incomparably so. For the uses of the cabinet-maker and the house decorator, the timber familiarly known as the black-apple, the Moreton Bay pine, the red cedar, coach-wood, Glarence light yellow wood, turnip-wood, rose-wood, Illawarra mountain-ash, tulip-wood, myrtle, cypress-pine, and others, is capable of being worked up into furniture and panelling, beautiful in grain, rich in colour, and susceptible of a high polish. The timber of the prickly-leaved tree (Melaleuca styphelioides) is said to be incapable of decay; that of the white tree (Melaleuca leucadendron) is said to be imperishable underground; that of the turpentine-tree (Syncarpia laurifolia) resists the attacks of the teredo navalis in salt water; and that of the brush-bastard or white box (Tristania conferta) has been known to preserve its soundness, when employed in building the ribs of a ship, for a period of thirty years. To the carver and wood-engraver the cork-wood (Duboisia myoporoides), the rose-wood (Diosydon Fraxinum), and the pittosporum (undulatum) commend themselves as a serviceable substitute for European box; while the cooper finds in the native ash (Elaeodora Australis), the silky oak (Grevillea robusta), the stave-wood (Tarricella actinodendron), the green and silver wattle (Acacia decurrens and Acacia dealbata), and the swamp-oak (Casuarina quadrivalvis) excellent material for staves. Other kinds of timber are specially adapted for oars, spokes and naves, tool-bundles, telegraph poles, and turners' work.

Continental School - Architecture.—Professor Vittanovich has recently contributed to the Politecnico di Milan some interesting details regarding the new elementary schools at Padua, built in 1880 by Signor Camillo Boito. He takes the opportunity of advocating the value of artistic excellence in the construction and furnishing of schools, maintaining that these points are of real importance as aids in education. This principle, it is remarked, has found acceptance in Switzerland, where school-architecture is regarded as being a subject of considerable moment, towns of 4,000 to 5,000 inhabitants spending on this object sums out of proportion to their geographical importance.

The Association of Public Sanitary Inspectors.—The second annual dinner of this Association will take place this Saturday, June 6th. The President, Mr. Edwin Chadwick, C.B., will preside. The following amongst other gentlemen have promised to attend, viz.—Earl Fortescue, Dr. Alfred Garperter, Dr. B. W. Richardson, F.R.S., Mr. James Seal, Mr. C. T. Kingzett, Mr. E. J. Watherston, and Mr. E. C. Robins.

Steel Cooking Utensils.—These, which are made of steel, and coated with pure tin, by Messrs. Perkins & Son, are said to be especially "sanitary" in character, and are in use, we understand, at the National School of Cookery. They obtained a medal at the Health Exhibition.

Society of Arts.—The Council of the Society of Arts have (with the approval of the President, H.R.H. the Prince of Wales) awarded the Albert Medal to Mr. Henry Doulton, "in recognition of the impulse given by him to artistic pottery in this country."

Wood Mantel-pieces.—Messrs. G. Hindley & Sons, of Oxford-street, send us an illustrated catalogue of their work in this class, showing a considerable variety of suitable and apparently by no means costly designs.

"The Future of the Working Classes."

This was the title of a paper read at the recent Co-Operative Congress at Manchester, by Mr. E. O. Greening, of London. In the course of it he said:—"We say to a capitalist employer who earnestly desires to raise his workers, 'Copy the example of Godin of Guisay; make your hired labourers into members of a co-operative republic of which you can become the proud and happy first president.' All competitive industry has been confessedly almost profitless for several years past; yet our established co-operative workshops have been steadily showing an average profit upon the capital they employ of nearly 20 per cent. per annum. The future of the worker, we believe, will be to work in societies which will practically be free states, of which they will be the citizens, owning their shares in the common property, voting for the Parliaments which will govern, and receiving a due proportion of the common results. These labour associations will be linked together in productive federations as our stores are linked together in distributive federations, and we hope that one common union will bind all to work together in reasonable harmony. How easily truly enlightened employers may convert their workshops into such social republics, and with what blessed results to themselves and all concerned, may be seen from the examples of Leclaire at Paris and Godin at Guisay. The summary of the results at Guisay of five years' working reads like a romance. Yet it is social reality. If co-operators, trade unionists, and enlightened employers agree to will the social emancipation of the worker, the great work can be accomplished in our own time and the wasteful strife between employer and employed ended like a dream upon awakening. The prospect even now is full of hope and encouragement." Mr. Odgers (Manchester), Mr. Dockery (Leeds), and Mr. Miller (Glasgow) criticised the paper; Mr. Dockery stating that the future of the working classes would be what they choose to make it.

An Electrical Railway for San Francisco.—There will shortly be in operation in San Francisco an electrical railway, running from the Southern Pacific Depot to the Union Ironworks at the Protrero. Experiments in this direction have been made for some time past by the Pacific Coast Electric Construction Company, which is now constructing the line. The road is similar to the San Francisco cable road, only instead of a cable underneath the track, there will be a negative and a positive wire. These, when brought together by the grip of the dummy, will complete the circuit and provide the motive power. When the car stops, the wires will be released; thus the power necessary to drive the car will be saved while it is at rest. The generating machines are also so arranged that, as soon as a car stops, they will cease to generate the amount of electricity to propel the car. Should the line become blocked from any cause, great saving will result. There is said to be no limit to the pace at which cars can be run by electricity, and experiments on the electric roads at present existing show that to propel a car conveying forty-four passengers costs only from 2d. to 2½d. for each mile run. It is stated that, should the experimental line prove a success, electricity as a motive power will be adopted on many of the tramways of San Francisco.—*Iron.*

Memorial to the Late Sir Henry Moncreiff.—A memorial mural tablet, erected by the congregation of Free St. Cuthbert's Church, Edinburgh, to the late Sir Henry Moncreiff, in the vestibule of the church, was unveiled by the Rev. Principal Brown, Moderator of the Free Church Assembly, on Saturday last. The tablet, which faces the front door, measures 5 ft. by 3 ft., and is of plain Sicilian marble. The design is Gothic. In an indented circle in the centre of the tablet a bust of stately marble by Mr. Hippolyte J. Blanc, architect, the Sicilian marble work was executed by Messrs. Johnston & Davidson, architectural sculptors; and the bust, which is a copy of one which stood in the Academy last session, was entrusted to Mr. John Hutchison, R.S.A., the general design being by Mr. Blanc. The total cost of the monument was about 100l.

Hospitals Association.—We are asked to mention that Mr. J. L. Clifford-Smith has resigned the office of Hon. Secretary of this Association.

More Archaeological Discoveries at Roche Abbey.

The explorations of the ruins of Roche Abbey, which form part of the Scarborough estate, are still being pursued. The unearthing of a large quantity of pieces of coloured glass, supposed to have been parts of the large chancel window, has already been recorded. These pieces, together with a white glass cross, have been made into a window 3 ft. by 18 in. The cross forms the centre of the window, and is approached by a number of small steps formed in glass. The border is made of various colours, and is of irregular pattern. This was executed by a York firm, under the direction of the Hon. W. T. Orde-Powlett, who also takes great interest in the explorations. At the beginning of the present year he presented the window to Lady Scarborough, and it has since been fixed in the lobby of the chapel at Sandbeck. Through the advice of Mr. W. St. John Hope, of Derby, who visited the abbey at Easter, the base of the dining-room of the monastery has been discovered. This was found only a few inches below the surface adjoining the chapter-house. Several parts of the interior in both the north and the south chapels have been restored. Outside the east of the church two more layers of sarcophagi have been found, and it is proposed to further excavate the north corner of the ruins. Three of the large columns of the nave are exposed to view, and altogether the explorations are of a highly interesting character.—*Leeds Mercury, May 30.*

Proposed Indo-China Railway.—On the 27th ult. an address was delivered by Mr. Holt S. Hallett, to the Glasgow Chamber of Commerce, upon "Railway Extension to South-West China." After describing the country through which the railway would pass, Mr. Hallett proceeded:—"The length of the railway from Bangkok to Kiang-Hsen, allowing fully for the necessary windings and turnings through the passes, would not be more than 510 miles. The cost of its construction on the metre-gauge, including rolling stock, &c., could not exceed \$4,000,000. The branch line, which will join the main line at Raheng, will be about 160 miles long, half of the distance being in British territory, and the other half in Siam proper. The cost of the branch will not be more than 2,000,000 sterling, one half of which would have to be guaranteed by the British Government, and the other half by the Siamese. Before leaving Bangkok I was assured by our Minister, Mr. Ernest Satow, that the construction of the railway wholly depended upon our Government, for he felt certain that if our Government would consent to guarantee the construction of the portion of the branch line from Maulmain to our frontier, the King of

Siam would have the main line completed as far as Raheng, as well as the portion of the branch line connecting it with our frontier. The section from Raheng to Kiang-Hsen could be put in hand after the completion of the two lines which would form its base, and connect it with the seaports of Maulmain and Bangkok."

Fire at a Builder's.—During a great part of Sunday last a large contingent of the Metropolitan Fire Brigade was engaged in endeavouring to subdue a very serious fire which broke out between eight and nine o'clock in the morning at the Crown Works, South Lambeth-road. The premises, occupied by Messrs. Higgs & Hill, builders, adjoined the Crown Swimming Baths in Kennington Oval, and comprised, amongst several timber-sheds used as stores, many large stacks of timber. The following is the official report:—"Called to Crown Works, South Lambeth-road, S.W., to the premises of Messrs. Higgs & Hill, builders; cause unknown; contents and building insured in the North British and Mercantile, Commercial, Union, Royal, Westminster, Phoenix, and others; damage,—several stacks of timber and building material, covering an area of about 130 ft. by 130 ft., severely damaged by fire and water; and two timber-shed buildings used as store, one about 115 ft. by 12 ft. and the other about 55 ft. by 10 ft., and contents completely burnt out and fallen down."

Essex-street Chapel, Strand.—It is stated that Essex-street Chapel, the metropolitan headquarters of the Unitarian body, is to be converted into "Essex Hall," at a cost of 22,300l. Sir J. C. Lawrence, Alderman W. Lawrence, and Mr. Edwin Lawrence, have contributed 6,000l. of the amount required. The building will be used in the same manner as the Memorial Hall is used by the Congregationalists.

A Church Burned Down.—St. Paul's Church, an ivy-clad structure, situated on a hill in the picturesque neighbourhood of Woodford Bridge, Essex, was on Monday totally destroyed by fire. No cause is assigned for the calamity, which seems to have originated in the Gallery.

Pinxton.—On Whit Monday two memorial-stones of a new Sunday school in connexion with the United Methodist Free Church were laid. The estimated cost of the building is 300l. The contractor for the brickwork is Mr. G. Goodall, of Pinxton, and for the woodwork the contract has been let to Mr. R. Dennis.

Macclesfield.—Another three-light window, by Mayer & Co., of Munich, has just been erected in Prestbury parish church, Macclesfield. It represents the Good Samaritan, and is the third already executed by the same firm for this church.

The Glasgow Corporation Waterworks.

On the 14th of October, 1859, a day of most inclement weather as it proved, Her Majesty, accompanied by the Prince Consort and retinue, arrived at Loch Katrine from Edinburgh,

and there formally opened the new water supply for the City of Glasgow. The Loch Katrine-Glasgow aqueduct, as designed by Mr. J. F. Bateman, C.E., was from the first recognised, and justly so, as one of the most stupendous works of the kind of any age; and the confident calculation was that the city, though admitted to be a manifestly growing community, had been endowed with a water supply which would certainly suffice in overflowing abundance for the better part of a century to come. The loch, which is from eight to nine miles in length, with a surface area of about 3,000 acres, in order to adapt it fully for the purpose designed had its level raised permanently by 4 ft., the new mark standing 362 ft. above the datum line of spring-tide high-water at Glasgow. The water thus additionally dammed was tapped at a point 3 ft. below the line of the old natural surface, in this way affording an available storage of 7 ft. depth very nearly over the whole of the 3,000 acres of loch area. The daily outflow stood, in the original estimate, at 50,000,000 gallons, but the impending friction within the many miles of roughly-blasted rock tunnelling had been considerably underrated, and it proved that a daily flow of 38,000,000 gallons, only, formed about the utmost stretch of the new works' capacity. Ample in every existing sense this supply was indeed found for a period of years; but Glasgow was all the while maintaining a growth-rate of quite unexpected vigour. Including its fringe of circumjacent burghs, which are now virtually portions of the city though nominally independent municipalities, Glasgow may be said to have very nearly trebled itself in size and population since the Loch Katrine water scheme was first practically taken in hand as a possible and likely project. The intramural house-clad elevations of which a considerable part of the area is composed first began to experience an intermittent absence of water, the gravitation pressure in certain instances proving insufficient for forcing the pipe-currents to their summit reaches, except at those seasons when the consumption over the city generally was at its lowest. By reason also of the wet closet system being universal and the presence of

built-in baths very general (small houses of only two apartments are occasionally found fitted with these) Glasgow possesses a singularly powerful capacity for a wholesale, not to say wanton, consumption of water, and this the Corporation officers have found it quite impossible to keep within anything like strictly economic compass. A large and still increasing volume of but slightly utilised water pours incessantly into the Clyde; the population, over all, borders upon a total of 800,000, while the Loch Katrine supply, magnificent as it no doubt has been and is, has all along remained inelastic. The authorities have thus been gradually forced onwards, until now they are brought face to face with the necessity of furnishing with as little further delay as possible a largely-increased supply.

Accordingly, a Bill passed before Lord Redesdale as an unopposed measure on the 18th of May of the present year, authorising the Corporation of Glasgow to extend their works in connexion with the supply of water to the city from Loch Katrine. Before entering upon the details of its powers, it will be interesting to briefly notice a few of the leading features of the existing works. In the first place, it was thought that the present tunnels could be widened, and so admit of a larger flow of water into the reservoirs at Mugdock and the new reservoir at Craigmaddie at present constructing, an Act for which was obtained in 1882. It may here be remarked that the immediate object of the Act of 1882 was to secure for Glasgow fourteen additional days' supply in the event of an accident to any part of the aqueduct. It had long been observed that the rough rock sides of the tunnels had a serious retarding effect upon the velocity of the water passing through them. Another suggestion was made to line them with concrete. Both ideas, however, were ultimately discarded as absolutely impracticable, as the consumption of water by the city is now so great that a very small margin of time can be allowed for the examination of the aqueduct and its maintenance in a state of repair. For this purpose five stoppages in the flow of water are made in the year for five days upon each occasion, and it is found that the twenty-five days thus gained are entirely taken up in the ordinary way of examination and repair. To give an adequate idea of the force of this remark, it will only be necessary to observe that the geological formations met with in a large portion of the aqueduct are mica-schist and clay-slate, and another long tunnel passes through compact sandstone conglomerate. The time consumed in the operations in the former hard material was simply enormous. When the tunnels were being formed the work was carried on night and day, and yet the amount

done was often less than three lineal yards per month at each face. Hand labour was preferred to perforating-machines for the drilling of the holes for blasting purposes, and very slow progress was consequently made, a bore-hole of 1½ in. diameter and the ordinary depth of 20 in. being driven on an average at the rate of one-fifth of an inch in one minute of time. A gang of men taking down with them at night 60 drills to an 8 ft. space, frequently returned in the morning with every one of their drills dulled. The tunnel passes through ten miles of this description of rock. It will be obvious, then, that the idea of enlarging the existing tunnels, and in that way providing for a larger flow of water, was preposterous. The consumption of water by the city is at the rate of 42 million gallons per day, and the present aqueduct only admits of the passage of that volume of water. The actual limit having thus been reached the situation at once becomes serious, and two possibilities force themselves upon the mind: first, the failure of any part of the works; second, a considerable increase in the demand upon the supply. In view of these contingencies a temporary alternative has been found in the use of Deacon's system of District Meters throughout the city, by means of which any undue waste of water can be detected and means taken to prevent its continuance. The system has worked so well that it is being rapidly extended. Our space will not admit of our enlarging upon this point. It may, however, with advantage be here observed that the waste of water from the use of improper fittings is often less serious than that due to the bursting or other injury done to main or service pipes, where the water, escaping into a sewer, passes off undetected. By the use of Deacon's Waste-water Meters such an accident is easily discovered. The saving of water in this way has averaged 13 gallons per head; hut, taking it at 10 gallons, the saving over the whole city would be 7½ million gallons per day, or about one-fifth of the water supply, and at an expenditure of one-third of the capital represented by this saving.

The existing Loch Katrine-Glasgow aqueduct, it should be noted, is thirty-four miles in total length; twenty-six miles between the loch and Mugdock service reservoir, and eight miles thence to Glasgow itself. After clearing the mountain girdle encircling the loch, its course pursues, in irregular form, a south and by east direction, passing Loch Chon and Loch Ard at close quarters, and shortly afterwards crossing the Duchray streamlet, which is part of the head waters of the river Forth, and, of course, flows eastwards. The valley of the Eudrick, whose course is westward into Loch

Lomond, is next crossed, passage thence being taken by way of Killearn village and Blane valley on to the small town of Milngavie, in the neighbourhood of which it discharges its freight into Mugdock reservoir, situated 311 ft. above Clyde high-water level, and possessing a capacity of 550,000,000 gallons. The distribution begins at this point by means of branching cast-iron mains 36 in. in diameter. The engineering interest, however, is confined exclusively to the other and much larger section. Leaving the loch, 2 miles below the "Roh Roy" landing-place at Stronachlacher Inn, and about four or five miles above the romantic gorge of the Trossachs, the aqueduct at once begins the piercing of a spur-flank of lofty Ben Venue at a crossing possessing a summit height of 600 ft. This is done by a rock-hasted tunnel 2,325 yards in length, cut through beds of gneiss and mica slate, and with a bore of 8 ft. diameter. The fall here and all along to Mugdock, except where syphon-piping is used in crossing valleys, is the uniform one of 10 in. to the mile. Where the surface is followed the conduit is composed of arched masonry of 8 ft. inside diameter, this alternating with tunnel-cutting and syphon-pipes where necessary, the 26 miles from Katrine to Mugdock being made up of 13 miles of tunnelled work; $9\frac{1}{2}$ of arched masonry, and $3\frac{1}{2}$ of iron piping. The works as here briefly described, inclusive of compensation awards, cost one million and a half sterling.

The reservoir in course of construction will hold 700 million gallons, or fourteen days' supply in addition to the ten days' supply already provided by the existing reservoir. It is not intended to proceed with the whole of the new works at once, but in the first place to duplicate some of the tunnels, especially those parts where it is known that the water is most retarded. This being done, an entirely new aqueduct is only a matter of time. This, however, will be delayed after the necessary duplicate tunnels have been made, till the storage at the lochs is increased, Loch Katrine being raised in level. The raising of the level of Loch Katrine will necessitate the construction of a new road on the north shore, a new hotel at Stronachlacher, and new landing-piers for the convenience of the steamboats plying upon the loch. The other items necessary for the completion of the aqueduct will be proceeded with as additional water is wanted.

When the proposed works are carried out, a continuous supply of 75 million gallons of water will have been provided. The limits of the present Bill are there reached, but the whole system will not then be complete. The intended aqueduct is designed on a sufficiently large scale to allow ultimately of the passage of 70 million gallons, while the existing one passes 40 million gallons. Allowing 10 per cent. for stoppages in the flow for examination and repairs, the supply will have been increased to 100 million gallons. The additional powers requisite are, however, an after consideration.

The new aqueduct will consist of 12 $\frac{1}{2}$ miles of tunnelling, 9 miles of open cutting arched over with masonry and bridges, and $3\frac{1}{2}$ miles of syphon pipes. It will follow the same line as the existing one at a distance of 22 yards from it, and will be upon the same level. The difference in the cost of constructing an aqueduct of the proposed dimensions and one of the existing dimensions is estimated at about 150,000l.

With regard to the sources of supply, water can be drawn from Loch Katrine and the other lochs in the immediate vicinity without injury to any interest whatever. Loch Katrine itself is so situated as to level that it forms a convenient centre into which water may be drawn from all the other lochs in the locality. During the winter months there is a very large overflow of water from Loch Katrine. In order to make it available for supply purposes it is intended to increase its storage capacity. It may here be remarked that the loch derives the full benefit of any rainfall that takes place, as it flows rapidly down the steep mountain-sides, thus admitting of very little possible evaporation or absorption. Calculations derived from carefully gauging the discharge of

water from the loch by the streams give the result that in very dry years, such, for instance, as 1869 (which was the driest year since 1850), when the present works were completed, a supply of 75 million gallons may be depended upon by raising Loch Katrine 5 ft. above its present high-water level, and converting Loch Arklet into a reservoir, by raising it 25 ft. in level. Loch Arklet is a small loch, situated between Loch Katrine and Loch Lomond, and has an area of 200 acres, which would be increased by the proposed alterations to 400 acres. Objection as to any possible difference in the water of the two lochs has been anticipated by the proposal to convey it, not directly into Loch Katrine, but to within a short distance of its outlet, where a portion of it will pass directly down the river into Loch Vennachar, and the portion remaining will be thoroughly mixed with Loch Katrine water, and exposed to air, before it can reach the inlet to the aqueduct five miles higher up.

The supply which the proposed works will render available for the city, calculating upon the most reliable data, will only serve the city for about thirty-six years from the present time. This is considered a sufficiently long period to anticipate. It means, however, less than double the present supply, while the works about to be undertaken for the supply of Manchester from Thirlmere will yield 2 $\frac{1}{2}$ times the present requirements of that city.

It remains to be said that the whole cost of the new works is estimated at 1,000,000l. sterling. The revenue of the Commission has gone on increasing so rapidly for many years past that it is not intended that the rates be increased even for a short time. Very little doubt is entertained by those in a position to judge, as to the possibility of completing the whole of these new works without the slightest further demand upon the pockets of the ratepayers of the city of Glasgow.

The passing of the Bill through Parliament has been throughout in charge of Dr. Marwick, Town Clerk, and Mr. James Gale, the Corporation Engineer. The construction of the works will be under the immediate direction of Mr. Gale, a gentleman long and worthily associated with Glasgow in the capacity of Water Engineer.

FOREIGN BRASSES.

THE publication of a series of facsimiles of foreign brasses by the Rev. W. F. Creeny fulfils a great want in the history of these Mediaeval monuments.* And the mode in which it has been accomplished, by making photo-lithographic reductions of well-executed rubbings, is the only one which had the slightest chance of ever being successful. The expense of accurate engravings would have been enormous, and the time during which such a work would run would have tired out every subscriber. Whatever deficiencies, therefore, the mode of operation involves, we must accept the result on account of the advantages and the truth of the general impression. No engravings in Gough's "Sepulchral Monuments," nor among those published by Cotman, are to be depended on; indeed, they are very inaccurate; but here we have real facsimiles, though in delicate details they necessarily sometimes fail. By means of this important work we can now enter into a general history of the monumental brass.

There is no doubt whatever that the incised slab was the forerunner of the brass, and there are examples of a very rude character, which must be dated very much before the brass recorded as once existing at St. Paul's, Bedford, viz., 1208. They continued in use, as well as the brass, until the end of the sixteenth century in a more or less degree. To what country we owe the beginning of the incised work on metal, as a more enduring and handsome material, is an unsolved problem, and although in this work we have the earliest example known, viz., that to Bishop Ysowilpe, 1231, at Verden, it does not help us in our difficulty. It accords

* "A Book of Facsimiles of Monumental Brasses of the Continent of Europe." By the Rev. W. F. Creeny, M.A., vicar of St. Michael-at-Thorn, Norwich. (To be had of the author.)

with no known type; conventional representations of features, in general so good a test, are here too rudely given to enable us to speak with certainty: the execution is by thin lines keeping to the same diameter, and the figure is not cut out to the outline as in English examples, but has for its background the plain metal,—the inscription being on the verge. Both arms of the figure are raised, supporting two models, one in each hand,—in the right a church, which is said to represent that of St. Andrew, in Verden, where the brass now lies, the tower of which he rebuilt; in the left the same tower appears within a fortified enclosure, as he is said to have put a ring wall about the city. It is worthy of remark, that there is yet in France a church within a fortified wall of the thirteenth century at Sentein, in the department of Arriège. The costume of the figure consists of a plain alb, with, as we consider, loose sleeves, those closer fitting to the wrist belonging to the cassock. There is chasuble, with dalmatic and a pallium, but as he was not an archbishop we can hardly, perhaps, apply that name to it. There is neither stole, maniple, nor amice. The mitre is of a very low, simple form.

Figures holding models are not very common in brasses. It is singular, therefore, that the two earliest of the foreign examples should show this feature; for that of Bishop Otto of Brunswick, 1279, at Hildesheim, given in the same page as the former, holds a model of the Castle of Woloebergh, of which he was the builder. Now, it must be remembered that our earliest English brass is that of Sir John Dauhernoun, 1277, at Stoke Dahernon, Surrey; it is useful, therefore, to make a comparison of the execution of the two, as far as possible. One can trace an analogy in the treatment of the drapery, as also in parts of the features. It is slight, but worth noting, as it tends to point to a common origin for this kind of monument, although one cannot fix upon that country which first set the example, and political boundaries go for little in the matter. In general treatment, having blank metal for background, it is in accord with the last-named.

Before we proceed further it is well to glance at the three divisions of the monumental brass, those of England, Flanders, and Germany; for France, having lost hers, is of little account; but if we judge by what evidence we possess in the character of her incised slabs, they would come as intermediate between those of the two first-named. The only example now in France is at the Cathedral of Amiens, and is given in this work, and its character is distinctly Flemish. The English brass is marked by being cut to its outline, whether of figure or architecture. The Flemish is generally known by its presenting a large oblong surface of metal, on which the figures are engraved, and surrounded by either the most elaborate architectural details or rich diaper-work. In general the German follows the Flemish principle, but differs in details, and it developed into a distinct type. But we have examples of the Flemish following the English habit, and some late English examples the Flemish. There is a separation between them in the mode of execution: the English use the graver or burin, properly so called, viz., a lozenge-shaped tool; the Flemings made more, indeed an excessive, use of the *scorper*, a chisel-cutting tool, which tended to confine them to lines of equal thickness, or nearly so, thus possessing less grace than our English examples. This defect may be seen in all those magnificent works which, now, for the first time, we have an opportunity of comparing one with another, as well as in those of St. Alban's, Lynn, and Newark, which belong to the same school, if not to the same hand. Before, however, we take this group, we must note that to Bernard de Lippe, 1340, at Paderborn, for this is treated exactly after the English fashion, and in general character might easily be taken to be of English workmanship, except for the disproportionate size of the two shields at the head, and their being placed diagonally.

The series of Flemish brasses of the fourteenth century here given comprises that of

King Eric Menved and Ingeborg his queen, 1319, at Ringstead, Denmark; two at Schwerin, 1347 and 1375; one at Lübeck, 1350; one at Stralsund, 1357; and one at Thorn, 1361. Those already noted, as in England, belong to this same time, and thus we have nine of the most elaborate specimens of Mediaeval engraving extant. All these show the figures set under canopies of the richest tabernacle work, which finds no parallel in our English architecture of the same epoch. The abundance of small figures introduced, the exuberance of the ornament and diaper work, the fancy everywhere displayed, commands our admiration; and we cannot wonder that Gough, speaking of those at Lynn, pronounced them to be the work of a Cellini of the fourteenth century. The plan observed in all these compositions is very much the same; the shafts of the canopies have their niches filled with small figures of the Prophets and Apostles, ranged together, the former distinguished by their holding scrolls, the latter by their emblems. The upper part above the heads of the figures exemplifies the redemption of the soul, which is sometimes given as being borne by angels in a winding-sheet to Paradise; sometimes as in the bosom of Father Abraham; and it is necessary to note that this figure is never distinguished by the crossed nimbus, as in the three persons or symbols of the Trinity. There are also instances of the combination of the two ideas. The first is seen in that at Ringstead; the second in the two at Schwerin, and that of Stralsund, whilst the combination is found in those of Lübeck and Thorn. Mr. Creeny states that, in this latter there is a distinction of sex in the symbol of the soul, and, if he be correct, as doubtless he is, it is a singular idiosyncrasy on the part of the artist, no such distinction having been usually recognised. There is a small brass to the memory of Walter Beauchamp, doubtless a child, at Chekendon Church, Oxfordshire, which simply consists of the sexless symbol of the soul, borne in a winding-sheet by two angels: date about 1430. In the brass at Ringstead, the figure of the soul is partially clothed in its winding-sheet, but this is not always observed, and only when in Abraham's bosom.

As a memorial to a king and queen, this brass fitly takes precedence in the group to which it belongs, as we have no other royal brass. The king is in a long tunic, richly emblazoned with three lions passant guardant in a field semée of hearts; and it is fastened on the breast by a small ring brooch, such as are occasionally met with, having amatory posies. And it is worthy of remark that the general outline of this is very much in harmony with one found near Scarborough, formerly in Lord Londesborough's collection, but probably of the seventh or eighth century. The figure of the queen has also one, but of simpler outline. Both have the usual mantles of estate, and are crowned,—the king, in right hand, holding up a drawn sword, that of Justice; in his left a sceptre. The queen holds a sceptre in her right hand and a hook in her left. This is an early instance of the introduction of the latter in monuments, especially when not to one of the clerical order. The richness of the detail can only be understood by a close examination of the fac-simile. The faces of the figures are not in brass, but are insertions, that of the king being of marble, the queen of alabaster. These are also restorations, and do not too closely accord with the conventional style of the time. It must be also remarked that the date, 1319, is much too early for the character of the execution, which is fully thirty years later.

Of the two at Schwerin, to the four bishops of the Bulowe family, that of Ludolph and Heinrich is the grandest, full of the pomp of heraldry and worldly display, and one of the finest brasses in existence, though yielding to that of Lübeck to Bishops Burchard de Serken and John de Müll. But the other, to Bishops Godfrey and Frederic de Bulowe, is the more interesting from its details, reminding us of the two at Lynn. At the foot of one figure is a haquet to a hairy king, served by hairy men, who cook before him. Beneath the other

is seen a wild man on horseback carrying off a damsel; he is pursued by a knight on horseback issuing from a castle. The hairy king is sitting in a tent; a wild man has apparently left it to receive the abducted damsel. It doubtless illustrates an old romance of similar import to Valentine and Orson. The inscription goes all round in a wavy fillet, making a Jesse tree with royal figures playing upon a variety of musical instruments. At the feet of the bishops of the Lübeck brass are the stories of St. Nicholas and St. Eloy or Eligius. The brass at Stralsund to Albert Hovener, 1357, has hunting scenes at the feet, and some details are so close to those at Lynn that it is almost inevitable to pronounce it by the same hand. It is to be regretted that these small subjects could not have been given in a larger size; as with the banquet on the brass of Robert Braunch, as well as the other subjects on that of Adam de Walsokne, at St. Margaret's, Lynn, we have a very remarkable series, which deserve great attention for their design and execution. Neither of the latter fine brasses is accurately given by Cotman, although boldly etched. The example at Brussels to John and Gerard de Heere, 1398, is a very inferior work, though belonging in date to our group.

When we get into the fifteenth century, the Flemish brass changes its character to some extent, rejecting architectural arrangements which it before rejoiced in. This new departure was larger in character, consisting of admirably-designed diapered backgrounds, often intermingled with heraldic devices. Two fine specimens at Bruges illustrate this new phase. One to Joris de Munter and wife, 1439, consists of figures in winding-sheets or shrouds, loosely arranged and in well-folded drapery; figures of angels with scrolls above and below. But we do not consider, with Mr. Creeny, that there is any idea of ascension intended to be conveyed, but that the figures lie, as in death, on the diapered ground. The diaper in this case is said by Mr. Weale to be similar in design to a specimen preserved, as he thinks, in Stettin Museum. One of the most effective of this class is that which forms our larger illustration. It is in the Cathedral of Bruges, and is to the memory of Martin de Visch, 1452, who is represented as a knight in armour with hands conjoined in prayer, and wearing a tabard of his arms, the sleeves terminating closely at the wrist. His head is bare, and beneath it is his shield emblazoned, the sole instance of one so placed; and above this his helmet and crest, seemingly consisting of a fish disporting betwixt two tails of a bird, encircled by a coronet. The mantling is finely arranged, and altogether it is one of the most remarkable of heraldic displays in the volume, and in no way excelled. The diaper of the background consists of the device of a talbot dog, with collar of bells, couchant, beneath which is the word "Moy," which Mr. Weale interprets "Gentillement," and all is interwoven with conventional floriated work, constituting one of the best examples of Flemish design. The inscription incloses this, having the symbols of evangelists at the corners and the centre, on each side, broken by the armorial hearings. An outside rim made up of a series of horses' bits, another device, completes this interesting and fine brass.

There is another at Lübeck, which belongs to this type, but, in this case, it is to a civilian, who is represented in a long richly-embroidered tunic, with furled cuffs, collar, and hounce, the execution of the fur being remarkably fine. This brass commemorates two of the same name,—John Lüneborch, 1461, and another John in 1474. Mr. Creeny is doubtless right in assigning the figure to the first, who was mayor of this city. The head has all the characteristics of portraiture, being full of individuality, and is an early instance of such. The background is composed of Flamboyant architecture and diaper, which, with the root of Jesse worked outside the inscription, has much that is earlier in character, resembling some of the examples previously alluded to. Before one passes from the Flemish brass, it is necessary, at least, to call to mind that which is on the title of the work, forming

merely an oblong border with a wavy fillet for the inscription, between which are disposed subjects illustrating the ages of man's life. It would be long to describe this fully, which is well done in the volume, and refer to an article on the general subject in the Proceedings of the London and Middlesex Archaeological Society, 1875. We must here, however, point out that the main divisions are six, each having three subjects, viz., Childhood, Boyhood, Youth, Manhood, Age, Decrepitude. It is exceedingly interesting in its details, calling to mind many incidents familiar to us as "household words" out of the play of our great poet. It is preserved at St. Mary's, Ypres, the date being 1489.

We now turn to the German series, and of these the earliest seem to emulate, and sometimes copy, the character of the Flemish, but at a distance, introducing variations of their own. There are the same oblong surfaces with elaborate architecture, but no embroidered backgrounds. The metal is often so cut away as to give a semi-relief to the work, which, therefore, cannot be quite satisfactorily rendered by a rubbing. Those most worthy of attention are from Erfurt, Breslau, and Posen. But the special character which distinguishes itself, as a type, not having any analogy with either Flemish or English examples, has more interest in our inquiry. One remarkable feature is that portraiture becomes the rule rather than the exception. In England this is not generally developed until the sixteenth century. There is also another peculiarity, the great heraldic display, with largely-proportioned escutcheons, crests, and mantling placed at the feet of the figures, and reaching a full third, and sometimes half up in front. An importance is also given to the figures by the rejection of all redundant accessories. That to Canon Georitus de Lewenstein at Bamberg, 1464, illustrates this phase of design; the head turns a little on one side, showing a three-quarter face, and holds a book, which is now frequent with ecclesiastics. The figure fills an arched recess, which has a diapered background. It is to be noted also that the characters of the inscription are Roman, showing the growing classic influences. But we find this alternates often with the Mediaeval types. There is another at Bamberg, evidently by the same hand, to Canon John de Limburg, 1478, but here the inscription is Mediaeval in its character. At Meissen there are nine examples of great interest, as they are all of one general type of the oblong plate, varying only in details, sometimes showing a clinging to Mediaeval forms, in others mingling them up with cinque-cento ideas. This is especially shown in the border of that to Frederick, Duke of Saxony, 1517. Many of them also rejoice in a great display of heraldry. One of these is selected for our smaller illustration, viz., that of Sidonia, the daughter of George Podiehrad, king of Bohemia, and wife of Albert, Duke of Saxony. She died in 1510. This brass has been ascribed to Albrecht Dürer; but, without attempting to decide such a question, it is impossible not to see that a refined hand has here been at work. The simplicity of the treatment, good drawing, well-arranged drapery, and, above all, the expression put into the face, declare the mind of a master. We seem to look through an arch into an oratory, the windows showing behind. There is a diapered curtain behind the figure, which holds a rosary and seems as if in prayer, and two coats of arms are at the feet. It is to be remarked that the inscription, arranged all round in two rows, is Mediaeval in its characters, which, in the brass of her husband, are Roman, though it is earlier in date. A very interesting account of this pious lady is given in the text. The later brasses at Meissen show a rapid degeneracy, but have some interest nevertheless. But to follow up decline is never a pleasant task. After the culmination of art in the sixteenth century, there were many causes,—social, political, and religious,—which hastened its decadence. When a tradition is broken, the dis severed links are not easily united.

This notice would be imperfect if it did not

glance a little hack to our English school, and make some comparison. Our brasses are in much greater numbers than those abroad, notwithstanding a large amount of destruction. In richness or exuberant fancy we can in no way compare with the Flemish type. But we have a speciality of our own, which is very interesting, as it declares the distinctness of the school from its foreign neighbours. Nor need we in any way lower our sails. If we consider such examples as that of Prior Nelond at Cowfold, Sussex, with its precision of execution, the light elegant treatment of its canopy; those of Cobham, Kent, to the memory of Sir Reginald Braybrook, and to Sir Nicholas Hawberk; that to Sir Thomas Beauchamp, Earl of Warwick, with its delicate *opus ponsatum* at St. Mary's, Warwick; that to Sir Nicholas Carew at Beddington, Surrey, and to Sir John Leventhorp, Sawbridgeworth, Herts; besides many others of the first quarter of the fifteenth century, we shall find, for simplicity, grace of execution, and qualities of drawing, there is no equal amongst the foreign brasses. This quality of drawing is finely shown in the hounds at the feet of Sir Nicholas Carew and Sir John Leventhorp, and these are but types of excellence found in many others of the period, of very varied design. It is most satisfactory, therefore, in making this comparison, that we can vindicate the claims of our English type; not only is it distinct from the foreign, but, as regards the period to which we have alluded, it is superior in those qualities which are demanded in the higher walks of art.

Something may be said on the process in making these fac-similes. It is a new idea, and Mr. Creeny demands our best thanks. But the heel-hall process, although showy, is liable, on account of the waxy nature of the material, to obliterate details of fine work, and also to take away from some of the precision of the larger parts. The finest rubbings we have ever seen from brasses have been executed on highly-glazed tissue-paper, with black lead mixed with linseed-oil, and applied by a rubber of wash-leather. Even when badly done, it gives more exactness, and is the *only* process where reductions are required for engraving. A rendering by the photo-litho process, here adopted, from rubbings done in this manner, would, especially in delicate details, make a very complete and satisfactory result, and it may suggest itself to others for the publication of such fac-similes as are here presented, many of the fine examples of Flemish and other brasses in England as yet unrecorded, or so imperfectly as to be behind the requirements of our time. The text of Mr. Creeny's book is full of interesting matter, very carefully put together, and showing a good deal of research, and the work commends itself as the only one on the subject.

NOTES.

IF any doubt prevailed as to the existence of a depression or uncertainty, such as has not been known in this generation, it would be at once dispelled by the enormously long list of country houses and properties to be disposed of, as shown in the columns of a recent issue of the *Times*. Look at it how we will, it is a most unsatisfactory testimony to the stagnation of trade, the decline of agriculture, and the loss of confidence that have so peculiarly characterised the last two or three years; and if, Asmodeus like, we could peep into the interiors of the various mansions, a pitiful tale of ruined fortunes would be disclosed. A noteworthy feature at the present time is the unusually large number of estates and houses of antiquarian or historic interest, though it is to be feared that the old associations will not add much to the sale price. Scotland figures rather prominently in the catalogue, the principal estate being that of Fyvie Castle, Aberdeenshire, in which Edward I. is said to have spent a night in 1296. It is built in the form of an L with three towers, of different dates, and called respectively the Preston, Meldrum, and Gordon Towers, the ancient

entrance being between the two first, flanked by round bastions. The Preston tower was built in 1390, when the estate came from the Lindsays to the Prestons, and on its summit is a statue of the Trumpeter of Fyvie, which is the subject of a well-known Scotch ballad. The Meldrum tower was added by Alexander Seton, who was made Earl of Dunfermline by Charles I. in 1596, and the Gordons subsequently erected the third tower in 1726. Like more than one Scotch castle, Fyvie possesses a chamber of horrors, which is walled up, from a tradition that indefinite trouble will ensue to the family whenever it is opened. Dunecht Castle, in the same county, is also for sale. It is a fine baronial structure, but with no traditional interest, although in the grounds is the most perfect ancient fortress in Scotland, with ramparts as regular as masonry. A third place is Mingary Castle in Argyllshire, which belonged to the M'Fians, Lords of the Isles, and where, in 1493, James IV. held his court to receive the submission of the island chiefs. The castle is not habitable, but the property around is valuable for its minerals. Kelbe Castle, near Arbroath, is also in the market, —but it is modern, and has no traditional interest.

IN Kent, Hall-place, near Bexley, and on the Cray River, is advertised. For many generations it was the residence of the Halls, the last of whom died in Edward III.'s reign, after which it became the property of Lords de Despances, who devised it to Francis Dashwood in 1781. The house has some fine architectural features, in the shape of a banqueting-hall and picture-gallery. Bower Hall, near Steeple Bausstead, in Essex, is a fine old house of Queen Anne style, which was restored in 1710 by the late Sir Henry Bendyshe, bart. Llantarnam Abbey, in Monmouthshire, is a beautiful Tudor building, erected by Wyatt in 1837, on the site of the ancient Cistercian monastery founded in the twelfth century by Ap Iorwerth, and rebuilt after the Reformation. In Surrey the picturesque ruins of Guildford Castle are open to a purchaser, together with the surrounding estate. As a specimen of a Norman keep, Guildford is one of the most interesting remains in England, but of the outer walls very little remains. The keep tower is about 70 ft. in height, and the walls are 10 ft. thick, cased with chalk, flint, sandstone, and ragstone, the centre being filled with rough unwrought stones, cemented by a strong grouting. The keep is divided into three stories, and one of the chambers in the interior, probably the chapel, has some interesting wall-carvings. For all its strength, it is singular that no stirring scenes of siege or battle are associated with Guildford. Tonge Castle, near Shiffnall, is a curious erection in the Brighton Pavilion style, which, however, does not look so *bizarre* as it might do, owing to the pleasantly warm tint of the new sandstone of which it is built. This architectural creation is due to George Durant, Paymaster of the Forces in 1761, who is said to have made a very good thing of his appointment, and amassed a large fortune. There was, however, a really ancient castle on its site, which was said to be the palace of Hengist the Saxon, —and a minute representation of this old mansion is the subject of a carving over the entrance-gate.

THE election last week of Mr. Burne-Jones as an A.R.A. seems to have caused all the surprise in artistic and amateur circles which it well might cause. The primary surprise is that the Academy should elect Mr. Burne-Jones, who has never, we believe, exhibited at Burlington House, and whose ways certainly are not as their ways, either in his faults or his excellencies. The secondary and larger surprise is that Mr. Burne-Jones should have consented to be elected. His art is sentimental, it is true, and has its full share of the shortcomings incident to sentimentality in art; but it is poetic and imaginative, and what place is there for it among those rows of unimaginative and matter-of-fact works which line the Academy walls every year? Is his election a sign that a

different tone is coming over the Academy exhibition? It is not too soon, though we by no means wish the prevalent tone to be that of Burne-Jones art. We sigh, however, for the poetry of art in some shape, and in one shape at least he can give it us. The election of Mr. Henry Moore, the powerful and learned sea-painter, requires no excuse, save that it is rather late in the day; but why is Mr. Alfred Hunt persistently passed over? Mr. J. W. Waterhouse has certainly good claim to recognition, but by no means so good or of so long standing as Mr. Hunt's. The election of Mr. A. Waterhouse to the full rank of R.A., which has now been accorded him, was, of course, only a question of time.

WE have received authoritative information that the reports which have been circulated (alluded to in our last) as to the possible or intended pulling down of "six, eight, or ten churches in York," are, as we supposed, absurd exaggerations. The scheme set on foot, under the authority of the Archbishop, is one for consolidating and re-arranging parishes with a view to the better working of them, and the utmost that was likely to follow might have been the removal of two churches. At present there is no likelihood of any more than one church being affected; and this from accidental circumstances. The church of St. Crux has been for some time in a dangerous condition, and the question of its removal was under discussion more than two years ago. The Society for the Protection of Ancient Buildings addressed the Archbishop, through their secretary, on the subject at that time; and the Archbishop pointed out to the Secretary that if the Society would set on foot a subscription for some pecuniary help, it would be quite possible to preserve the church. This appeal of the Archbishop's closed the correspondence. Without their aid, however, a considerable sum was raised towards the restoration; plans, &c., were prepared; and the roof of the church was removed. By this time, however, an influential committee of the clergy and principal laity had recommended, with a remarkable amount of agreement, the scheme for the re-arrangement of parishes. Upon this, the Building Committee of St. Crux, finding that under the proposed scheme St. Crux's parish was likely to be united to another parish with a large and sufficient church, whilst they had still a large sum to raise for the restoration, arrived at the opinion that they would not be able to complete their labours. They felt sure that many of the donors would rather not give their subscriptions to the restoration of a church that might not be wanted. Under these circumstances the Archbishop called a meeting of the parishioners of St. Crux, which was attended by a somewhat small number. That meeting came to a resolution that instead of restoring the old Church of St. Crux a smaller church should be erected at a moderate cost on the same site, and the Building Committee were directed to ascertain how far the promised subscriptions would be extended towards this new proposal. The Building Committee met and considered the subject, and it is understood that they resolved that they could not proceed with the undertaking, and that they would have to return the subscriptions. With this one exception, we are informed that there is no case in which a church will be removed. Only two other cases are likely to be dealt with at present, viz. the two St. Mary Bishop-hill Parishes and the Union of St. Mary's, Castlegate, with St. Michael's, Spurriergate. In both these cases the churches will be preserved and kept open. The most effectual mode of keeping a church open, it has been suggested by the ecclesiastical authorities, is in the hands of the parishioners. As long as they attend it in considerable numbers it is sure not to be closed.

THE statue in marble of Darwin, seated, and somewhat over life-size, which was, on Tuesday, formally accepted by the Prince of Wales on behalf of the Trustees of the British Museum, is a fine example of portrait-sculpture, and does credit to the powers of the sculptor,

Mr. Boehm. The overhanging of the brow is somewhat exaggerated as far as actual modelling is concerned, but it does not produce the effect of exaggeration in the actual result, and in the light in which the figure is placed the expression of the head is grand and powerful, perhaps more so than in the original; for artists, stirred by Darwin's fame and greatness, have on several occasions shown their desire to read into his countenance all the expression of power and genius which they think ought to have been there; and certainly, to convey the mind in the face, even more clearly than nature's realistic treatment sometimes conveys it, is a legitimate object of portrait art, whether in sculpture or painting. But the remainder of the figure raises again the question, so often raised by portrait-sculpture, whether a modern man in his habit as he lived (even with the assistance of a great-coat thrown over his knees for sculptural effect) can ever be a satisfactory object of sculptural treatment, and whether a bust with decorative architectural surroundings is not preferable. Here are the shoes in the Darwin statue, for instance; apparently old and ill-fitting shoes (for new boots would not be picturesque), with all their wrinkles and creases cut in the fine marble. Is that what marble sculpture was meant for?

PERILS of fire, as is but too well known, beset the toil of the coal-miner. The last week has shown how he is exposed to the opposite danger,—to peril by water. Not that this is by any means without precedent. The flooding of coal-mines has usually occurred from the same cause that produced the calamity at Houghton-le-Spring on the 3rd current. Water may accumulate in the empty spaces from which coal has been removed; and at times forms vast underground lakes. It often is but too probable that no accurate surveys of these workings exist, and in that case the new works may be carried on in close proximity to an unseen source of terrible danger. The reaction of a shot, or the chance blow of a miner's pick, may give passage to a jet of water which will enlarge its course with portentous velocity, and with no warning whatever. In the present case the first indication of what had taken place was a rush of gas, leading the men below to the conclusion that the shaft was on fire. This was followed by an inpour of water, which rushed through the galleries like a river. In such cases the men are at times swept before the current. In the case of one of the inbursts of the Thames into the Rotherhithe tunnel while in course of construction, Mr. Brunel was thus washed to the bottom of the shaft, narrowly saving one of the most important lives among the "makers" of modern England. In the present case, most of the men and boys underground, numbering some 120, were saved, many of them by the aid of the force of the current; but it is feared that some thirteen have been either drowned or cut off from all hope of escape by the rise of the water. As our coal-fields are rapidly being exhausted, the danger of accumulation of water is on the increase, and the importance of accurate surveys of all old workings, and of their careful study, increases daily.

AT the meeting of the Royal Institute of British Architects on Monday evening last, the large gas-burner, which usually makes the room almost unbearable, was removed, and a ring of thirty-six Swan incandescent lamps was arranged round the base of the dome. These lamps were worked from the engines and plant at the Grosvenor Gallery, from which as a centre Sir Coutts Lindsay expects in a short time to be able to distribute the electric current over a considerable area. The Gouland-Gibbs system of distribution is adopted, and two of their secondary generators were placed in a cupboard on one of the upper floors at the Institute, and the wires thence taken through the dome to the lamps, which were supplied and fixed by Mr. Verity, of Regent-street. The effect was very pleasing, and the difference of temperature from that which ordinarily prevails was most marked, but unfortunately just before the meeting commenced the driving-

belt of the steam-engine broke, so that the light could not be brought into action till nearly nine o'clock, and recourse was had to oil lamps. After the belt had been repaired, the electric lamps were turned on, but as the repairs were very hurriedly executed, the speed of the engine could not be kept uniform, and the lights consequently were not steady. The accident is much to be regretted, as it must necessarily make the Council hesitate before deciding to adopt the electric light permanently; but we should hope the recurrence of such an accident could be sufficiently guarded against.

THE case of Percival v. Dunn, which has been recently reported, is not without interest to those who are concerned with building contracts. A, we will say, lets land to B, to build upon, and in the lease he agrees "to make advances to the lessee for enabling him to roof in the messuages . . . in such sums and at such times as the said A shall certify in writing." B finds that he owes various accounts. Among others, he owes C some money for goods supplied, and accordingly he gives him the following note:—"Dear sir, please pay Mr. C. the amount of his account, 42l. 14s. 6d., for goods delivered at Park, and oblige.—B. To Mr. A." When A receives this note from C he refuses to pay the account, and C accordingly sues him for it on the ground that the note constitutes an equitable assignment of a part of the advances which he agreed to make to B. But the Court held that this note was no more than a "mere civil note by the writer, asking some one else to pay his creditor, and conferring no manner of right" against A, not constituting an equitable assignment, since it did not assign, in so many words, any fund, or any part of a particular fund. It is therefore necessary that persons who take such notes should be careful to see that they are worded accurately and clearly. If a moral is to be drawn from this case, we should say, spend 6s. 8d. on a lawyer, who will draft a note for the debtor to sign, and then you will have the money you require safely assigned to you.

IT is not improbable that an attempt will be made to place the whole of the theatres and places of public amusement in the metropolis under one jurisdiction. The Lord Chamberlain has intimated to the Metropolitan Board of Works that he will not be indisposed to relinquish his jurisdiction over theatres provided the Board will take powers to include in their supervision the music halls and other places of entertainment within the metropolitan area. This appears to be a step in the right direction. The Metropolitan Board has been for some time past the inspecting authority with regard to theatres, the Lord Chamberlain referring all matters of construction to the decision of the Board, and it seems desirable that the inspecting and licensing power should be vested in the same authority. At the present time the only means at the disposal of the Board to enforce compliance with their requirements is by summoning the offender before a magistrate,—a cumbrous and generally unsatisfactory procedure, which would be rendered unnecessary if the licensing were in the hands of the Board. The Lord Chamberlain proposes to retain the censorship of stage-plays, out of which his control of theatre buildings has arisen, and the public will probably not be disposed to grudge him the continued exercise of this "little brief authority."

THE Pergamene marbles have recently received an important addition, in the shape of a slab with the figure of a wounded giant, of very sensational appearance. The Turks seem to have been struck with the value of the slab, for they made great efforts to secure it for the Constantinople Museum,—efforts happily frustrated, though with much difficulty, by Berlin. The slab represents a giant falling towards the right, his mouth wide open, his face distorted with pain, his hair wildly dishevelled. Instead of fingers and toes, his feet and hands end in powerful eagles' claws, a new feature in the fantastic composition of giant figures. He

is winged, and ends in snake-coils, like so many of his brothers. The slab acquires additional interest from the fact that it joins on to the so-called Latona slab. In the garment of Latona two deep indentations have long been observed. Into these indentations the claw of the giant accurately fits. Undoubtedly he was the opponent of Latona.

FROM Rome we hear that an interesting monumental tomb has been discovered on the left of the Via Salara, a short distance outside the gate. The top of the tomb was struck 7 ft. 6 in. below the surface; it is a large circular monument 117 ft. in diameter; and, judging from the remains of the decorations, it must have been a striking object on the roadside. Fortunately the inscription is preserved; it is in beautifully-cut letters, once filled in with red colour, on a block of white marble 17 ft. long by 3 ft. 6 in. high, and reads as follows:—

V. M. LYCLIVS. V. M. F. SCA. PAETVS
TRIB. MILIT. PRAEF. FABR. PRAEF. EQVIT
LYCLIA. M. F. POLLIA. SOROR.

The marble cornice above the inscription has disappeared. The tomb is faced with travertine stone, with grooved joints, like the tombs of Cecilia Metella and the Plantii; and although a great portion of the travertine cornice has been taken away previous to the tomb being buried, fortunately enough remains on either side of the inscription to show what it was like. At present only as far as the base of the inscription has been cleared, but the proprietor is digging, and intends excavating the whole of the tomb.

FROM the *Philologische Wochenschrift* we learn that at Akraiphia, in the district of Thebes, a fine statue of Apollo has been discovered, which, according to present report, belongs to the best period of Greek sculpture.

THE works required to be done to the Sir Paul Pindar Public-house, 169, Bishopsgate-street Without, which had been reported to the City Commissioners of Sewers as a dangerous structure by Mr. E. Woodthorpe, the District Surveyor, were reported to have been completed at the fortnightly meeting of the Commissioners held on the 3rd inst., and there would appear to be a chance that this picturesque building may remain for some short time longer.

WE commented before on the injustice that would be done to Mr. Seddon if the completion of his remarkable building at Aberystwith were entrusted to other hands than his own, as was at one time intended. We are glad to learn that this matter has been reconsidered, and that the Council of the College have graciously made up their minds to appoint Mr. Seddon architect for the completion of his own building.

AT Messrs. Dowdeswell's, in New Bond-street, is at present to be seen a very interesting collection of the work of M. Rajon, the eminent etcher. This includes not only a considerable number of his etchings from well-known paintings, but also examples of his work in oil painting and crayon, mostly portraiture, exhibiting a remarkable versatility of talent in the handling of various methods and materials.

FROM a local monthly magazine, published at Windsor, we learn that there is prospect, at an early date, of some much-needed sanitary improvements being carried out in one or two of the worst lanes of the town, especially Bier-lane, which is described as "a dark blot upon a Royal borough, such as Windsor." Attention was drawn to the unsanitary and discreditable state of portions of Windsor in the *Builder* a good many years ago, and we believe the Rev. A. Robins, the Rector of Holy Trinity, Windsor, has been constantly agitating on the subject, and it appears that at last something is to be done.

THE eighth annual report of the Society for the Protection of Ancient Buildings is an amusing, though somewhat melancholy, record of childish and captious criticisms against everything that everybody proposes to do to any old building anywhere, intermingled with amusingly naive confessions of the indifference with which their remonstrances were received, and the occasional pretty direct snub they encountered. What state of things is dear to the mind of the "Anti-scrapes" is indicated in a doleful wall addressed to them by a sympathiser at Packwood, Warwickshire, and printed with obvious approval, in which the writer feelingly laments the loss of the old church, "its broken floor, stained walls, old mural tablets . . . the pews grey with age, the windows mended with glass of every tint," &c. It seems nearly incredible that any set of people should actually and seriously consider it a sacrilege to build a new church when the old one had come to that state; but that is the state of the "anti-scrape" intellect, apparently.

ARCHITECTURE AT THE INVENTIONS EXHIBITION.

ALTHOUGH Group III. of the Exhibition is described in the official catalogue as consisting of "Engineering Construction and Architecture," it can scarcely be said that architecture is adequately represented. The real architectural department is the Old London which Mr. Birch's skill has called into being, and which proves more attractive and charming than ever.

Lord Templetown contributes (226) a "Plan and Model of Labourers' Cottages," showing careful study of a difficult problem and a real desire to ameliorate the condition of his poorer brethren. These cottages have been erected singly, in pairs, and in rows, upon his lordship's Irish estates, and possess many noteworthy features. The ground plan comprises an entrance-porch, a good-sized living-room, two sleeping-rooms, a scullery, and outbuildings for fuel, dust, and other necessary uses. The living-room is carried up to the roof; but above the ground-floor sleeping-rooms an additional sleeping-loft is provided open to the upper part of the living-room and warmed in part by its fire. It is evident that this apartment would receive with the warmth from below much impure air, and the arrangement is one which calls for special means of ventilation, which are not shown to be provided. It would undoubtedly be an airy sleeping-place, and with a little care it could be made a fresh-air one,—that is, if the labourers on Lord Templetown's estate are unlike all other labourers and set store by that commodity. Adjacent to the living-room fireplace is a closet contrived for drying the labourer's clothes when he returns wet from his work, the steam therefrom being taken off by a fine specially provided for the purpose. This would be a real advantage not only to the labourer but to his family, and shows a carefulness as to their welfare which calls for gratitude. If, as the farmer said at the rent dinner, "All landlords 'ud do as this one do they wouldn't so many on 'em do as they do do"! We heartily appreciate the efforts which this considerate landlord is making in behalf of his dependents, and would suggest that a second window in the living-room would make it both more cheerful and more wholesome, and that the assistance of a professional architect would, with the same expenditure, lead to a desirable improvement in the somewhat cold exterior aspect of these otherwise excellent dwellings.

Mr. Arthur Baker exhibits (291) what is described as "Model of Church, showing method of carrying Central Tower," though no model is to be seen. There is a series of very interesting drawings,—four plans, four perspective views, and two small sections. The object is to provide for the support of a central tower, while dispensing with the customary angle piers, which obstruct the view, and by the undue attenuation to which they are subjected on this account frequently prove too weak for their burden. Mr. Baker's plan consists in hocking up with a solid wall one bay of the nave arcade on each side, and turning longitudinal arches of wide span from these solid bays to companion shutments afforded by the chancel walls.*

* This is only carrying a 14-ft. span, in fact, the expedient adopted by the Normans at Tewkesbury and elsewhere.

From the haunches of such arches the tower walls would rise. The section suggests a somewhat slippery pose for so heavy a mass; but criticism is disarmed in presence of the fact that the arrangement advocated has been carried out by the inventor in his church at Llanberis with complete success. A table shows the relative obstruction to a view of the pulpit by the new and the old method to be respectively '02 and '25, and that without a central tower the ordinary church plan obstructs the view to an extent represented by '17. The designs by which Mr. Baker illustrates his proposals are in excellent taste, and the only fault we have to find with his scheme is the interruption of the series of nave arches, which cannot, we think, be pleasing or artistically satisfactory.

Mr. Ingress Bell shows, by a well-executed model in plaster (392) one pavilion of a proposed military hospital for a hot climate, which he has worked out upon a principal devised and advocated by Major-General Sir Andrew Clarke, R.E. The drawings of this building are being exhibited at the Royal Academy*; but a general plan is appended to the model, and shows an important and elaborate scheme. The point of the whole is the adoption of the circular form ward, the complete isolation of the accessory services, and the defence of the roof and enclosing walls from the direct rays of the sun. The circular form of hospital ward is growing in public favour, and examples of its use may be seen at Greenwich, Hampstead, Burnley, Seaford, Graveyard, Antwerp, and will soon be seen in evidence at Hastings, where Messrs. Keith, Young, & Hall have, we are informed, a hospital on this system in contemplation.

These three exhibits may be said to exhaust the list of those which come under the head of architecture. Of building materials,—constructive, decorative, and otherwise,—there is no lack. Concrete building is copiously represented, and it is evident that this form of construction is exercising the ingenuity of many minds.

Mr. G. H. T. Beamish, A.M.I.C.E. (238), shows an improved method of construction with concrete or other blocks, arranged in such a manner as to admit of vertical settlement without lateral derangement. The blocks are cast in I and T sections and are arranged to interlock. There is no longitudinal bond, but the resistance to cross strain is considerable. It is not stated whether the plan has been tested in practice, but there seems to be no reason why, with certain precautions, it should not be effectual under particular conditions.

Another form of concrete construction for ordinary occasions is shown by Messrs. Frank & James P. West (275), who construct thin slabs of fine concrete, which, when set edgewise on the outer and inner faces of the wall, and keyed to its body, take the place of the movable wooden boarding used by Mr. Tall in his original system of concrete building. The slabs in question are about 1 ft. 6 in. long, 1 ft. high, and 1½ in. thick, the inner one would be roughened for plaster, or left smooth and painted. The cost of the slabs would be about 1s. 6d. per square yard. The chief recommendation urged in favour of concrete building is its reduced cost, but it is doubtful whether in walls of 1 ft. 2 in. and less thickness, the saving would be at all considerable. Messrs. West's plan would make a good wall, quite impervious to moisture, and very durable; and as the facing slabs may be self-coloured in various tints, the possibilities of a pleasant arrangement of coloured surfaces might, in skilful hands, be turned to good account.

The Croft Adamant Co. (272) send specimens of enriched mouldings, friezes, and plaques, of good character and design. Granite chip-pings are the basis of the material, which is said to be hard enough for paving, and yet may be sawn and cut with a chisel; non-absorbent; capable of being made in any size and shape; and cheaper than York paving.

Homan's "Simplex" fire-proof flooring (277) is a variation of the ordinary concrete floor with rolled joists imbedded therein, the peculiarity of which is the possibility of nailing the floorboards directly upon the concrete. This would certainly give a damp-proof and firm flooring, and would no doubt possess many advantages over the common hollow and unsatisfactory construction. The under surface would be roughened as a key for the plaster; lathing and rendering

* Some illustrations (including plans) of the proposed building were given in the *Builder* for May 9 last.

would be saved; and, from the absence of resilience, the ceiling would be less likely to crack or fall than is now unfortunately the case. Inventors are, as a rule, not sufficiently explicit on the question of cost. In this case it is said to be "about" the same as the ordinary construction; but it is probable that the excess of cost would, in fact, be sufficient to render its adoption in ordinary cases impossible.

The patent Myconian Marble Company (271) have an attractive exhibit of a sort of improved scagliola, in which various marbles are imitated with varying success. The prospectus is as florid as the "exhibit," and neither is in the very best taste. A neat little compliment to "modern architects" who are said to be "not less artistic than those of the time of Pericles" is judicious, perhaps, if not strictly true. Every virtue is claimed for the patent Myconian marble. It would answer for music-halls and restaurants, and certainly has some advantages over the fashionable wall tiling used for such purposes.

Of inventing sash-fasteners there is apparently no end. A great variety is here presented for the perplexity of the curious visitor. They are all very good, and it is hard to say which most perfectly fulfils its object. Gardner's patent, No. 298, is certainly amongst the best. The scientific burglar, as he walks the show and listens to the artless tales of the inventors of these articles, must smile at the confidence which they profess as to the certainty with which gentlemen's endeavours will in future be frustrated. He is generally credited with no ideas beyond the slipping of a knife between the meeting-rails, and if this manoeuvre can be foiled, the inventor is satisfied that his victory is complete. With what a bland expression of face would the late Mr. Peace have listened to these simple souls, and how gratefully would he have congratulated them on their successful ingenuity!

Various also are the devices for hanging the modern gullotine sash and for removing the same for cleaning it from the inside. Mr. John Carter's patent (290) balances the one sash against the other, and so dispenses with our old friend the "deal-cased frames." By removing the inside head, which is screwed to the frame, the sash can be removed, as the inventor deftly illustrates to all who will oblige him with their attention. Many incidental advantages are claimed, and if they do not all of them strike an outsider so forcibly as they appear to strike the inventor, they are, nevertheless, numerous enough to encourage architects and holders to a trial of his sash.

Messrs. W. B. Simpson have a tasteful little stall (276) showing the applicability of their decorated enamelled plates to ceilings and walls, and very pretty, very cheap, and very clean they are.

One of the most interesting exhibits is that of Mr. George Bower, of St. Neots, who shows a variety of metal articles (198), both useful and ornamental, treated by the Bower-Barff process for preventing rust, a treatment which has proved entirely successful and ought to become universal. The castings are well designed and of excellent quality.

Before closing our remarks, we would observe that a diligent examination of the various prospectuses which it has been our duty to peruse leads us to the conclusion that there is an opening for young gentlemen of literary talent and aspirations in the compilation of these very useful documents. An invention may be recommended to notice or made ridiculous by the terms in which it is brought before the public. The statement about it should be short and clear,—should not be ahead of the facts,—and, above all things, should not "verge on the poetical." We have, however, noticed that these pretty leaflets sometimes fall in almost every essential: they are diffuse, vague, outrageous in the claims they prefer, and sometimes unintelligible. A sanitary building block is said to "possess artistic features of the nicest exactitude and truth," that it "combats the ravages of the elements," and, moreover, that its durability is greater than that of stone, "having less weather-resisting properties!"

Another glowing eulogium awakes in the reader slumbering memories of "English as she is spoke," claiming for a certain decorative material "all the hygienic qualities previously referred to for themselves." We abstain from illustrating this matter further, merely suggesting that a Saturday Reviewer might find in a chance collection of these little pamphlets matter for an amusing article. But, seriously,

the inventor who spends a hundred pounds or so on a patent, and who is not necessarily as skilful with his pen as he is ingenious in contrivance, might do worse than lay out a guinea in the employment of a scholar to set down with as much modesty as cunning the real advantages of the inventor's achievement.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

PRESENTATION OF THE ROYAL GOLD MEDAL TO DR. SCHLIEMANN.

The last ordinary meeting of the session was held on Monday evening, Mr. Ewan Christian, President, in the chair.

The decease was announced of M. Théodore Ballu, of Paris, Hon. Corresponding Member. M. Ballu was one of the eight Architect Académiciens, and won the Grande Prix de Rome in 1840. He was known to have restored several Mediaeval churches, but would be best remembered as the architect of the Trinity in the Place de Chausseé d'Antin, and as joint architect with M. Deperthes of the Hôtel de Ville, Paris.

Several donations of books, together with money donations, to the library were announced.

Professor Kerr submitted a proposal for conducting the higher operations of the Institute by means of four standing committees, taking charge respectively of four departments,—of Art, Science, Literature, and Practice,—and asked the Council to appoint a special committee to consider the question during the recess. He said,—In the stately language of our Charter of Incorporation, there is assigned to us as a primary duty "the advancement of civil architecture" as "an art esteemed and encouraged in all enlightened nations"; every thing short of this supreme purpose is but the inconceivable commonplace of daily maintenance, the narrow things of the house. I submit that we are chargeable with having forgotten this duty. True to an instinctive feeling, the profession, both within and without, has of late years manifested a certain uneasiness in consequence. Hostile critics have gone so far as to tell us, if with sarcasm, not without sincerity, that we have permitted ourselves to degenerate into a trade union. This, at any rate, we have had sufficient spirit to deny; but certainly it has to be acknowledged that we are at this moment contemplating, under pressure, material reforms in our constitution. The recommendation I beg leave to offer is in direct harmony with this accepted movement. I presume to think that it will not be enough to introduce, in accordance with the spirit of the age, a more liberal or more popular administration for our corporate service; but that we ought to seek to discover also some broader basis for our organisation at large, whereby to facilitate the performance of those public functions which attach to the imposing name we bear, and to the glorious traditions of historical art and science which we therefore represent in this great nation and this great age. The academical work of the Institute to which I refer may be classified, of course, in various ways; but I think one of the most convenient forms of departmental division may be this:—(1) *Architectural Art*, the province of Taste; (2) *Architectural Science*, the natural philosophy of Building; (3) *Architectural Literature*, past and present; and (4) that miscellaneous field of private business which is commonly designated by the phrase, *Architectural Practice*. My proposal goes far enough if it goes no farther than this,—that these four departments of the higher work of a Royal Institute of British Architects should be carried on systematically by means of special machinery. For the sake of a little more completeness, but without going into detail, I will suppose that the Department of *Art* might accommodate archaeology also; that the Department of *Science* would be concerned not with construction only, but with all scientific problems which affect building operations; that the Department of *Literature* might deal with the Library, and perhaps conduct with advantage a certain portion of our foreign intercourse; and that the Department of *Practice* would not exclude the important and somewhat neglected province of professional etiquette and *esprit de corps*. Perhaps it might be matter for debate if I were to rely upon the principle in the abstract, that the most effectual mode of dealing with such great

public aims as I have indicated is to enlist the energies of the many rather than the few; but I may at any rate claim special consideration for such a policy in our own case, when I ask you to bear in mind that in the everyday exercise of our profession we are all so habitually engaged in the transactions of important affairs that no class amongst us, and, indeed, no individual, can be supposed incompetent to participate in the public service of the guild. For, indeed, there is no other profession whose practitioners, as I have often ventured to say, so efficiently combine the qualifications,—sometimes antagonistic in their essence,—which spring from the cultivation of the graceful accomplishments of art, the severe logic of science, and the worldly wisdom of business. Permit me to suggest further, if only as the conclusion drawn from my own experience within these walls, that it is to the great mass of the members that I would entrust the cause of progress, and not to those alone in whose riper years repose has taken the place of enterprise. I beg leave to suggest, therefore, that it would be expedient to appoint, through the Council, on a comprehensive and representative basis, a special committee of inquiry, to consider during the coming recess the general question of the organisation of the Institute for its higher work in what our charter calls the *Advancement of Architecture*. Personally I am of opinion that the best organisation may be found in the judicious employment of departmental committees for art, science, literature, and practice respectively, each having its own honorary officers and its own departmental action, and each, being under the necessity therefore of accounting for its stewardship. Whether such an organisation should be established upon the simple principles of the existing by-laws, or upon any improved system to be introduced into the proposed supplementary charter, it is not now necessary to inquire. Neither is it worth while at present to discuss the scheme of departmental classification which I have tentatively suggested. Nor would it, indeed, be desirable to lay down beforehand any precise line of investigation. All I propose is that the investigation should be entered upon; and I am bold enough to believe that the conclusions which would be arrived at, applying directly, as they necessarily would, to the question how to exercise the more elevated functions of a national architectural guild with dignity and efficiency, might at the present moment do more than anything else to enable the Institute to command the confidence of the profession and of the public.

The President promised that this should have the consideration of the Council.

The President then rose to present the Royal Gold Medal to Dr. Henry Schliemann, F.S.A., Hon. Corresponding Member, who attended for the purpose of receiving it. The President said:—Dr. Schliemann, the medal which I am to have the honour of presenting to you this evening is the highest distinction in the power of the Royal Institute of British Architects to bestow. It is given by our Patron, the Queen, but her Majesty entrusts to us the task, sometimes a very difficult one, of deciding, subject to the Queen's final approval, on the man most worthy to receive it. I say that it is sometimes a difficult task, not from paucity of men, but rather the contrary, because this Institute, having always taken, as I think wisely, a catholic view of its responsibility, has included within its scope of vision not only architects, archaeologists, and men of science at home, of whom there is no lack, but has also looked widely abroad, and invited to share with their brethren here of like pursuits with themselves the noblest and best amongst the learned men on the Continent of Europe. In the roll of Gold Medalists will be found the honoured names of men of Italy, of France, and of Germany,—great architects, learned writers, and archaeologists; and this Institute is proud to associate with that of the great Assyrian explorer, Austen Henry Layard, the now world-renowned name of Henry Schliemann. In you, sir, this Institute recognises not only the indomitable explorer, but the earnest student of the arts of past ages,—one whose youthful imagination, having been fired by the grand story of the great poet of antiquity, has shown so powerfully that noble enthusiasm which "scorns delight and lives laborious days," that dogged pertinacity so delightful to all true Englishmen, which, having once fixed the mind on the performance of an arduous

task, never wearies until it has been finally accomplished. Few things that I have read of late years have interested me more keenly than the simple tale of early struggles in the pursuit of knowledge under difficulties which you, sir, have given so freely to the world; a history of obstacles met only to be vanquished,—of determination to learn, under all circumstances, however disadvantageous, everything that could aid you in attaining what you have made the object of your life, the solution of the long-veiled question as to the existence and position of ancient Troy. It is a story such as in these days of luxury and self-indulgence deserves, for the admonition of our youth, to be written in letters of gold,—one that would teach them, if anything would, that success, to be real, must be the product of resolute hard work, and that nothing is denied to well-directed labour. That indefatigable industry such as yours, employed in the pursuit of commercial enterprise, should result in the acquisition of wealth is no uncommon thing; but that that wealth, so laboriously and honorably obtained, should without stint be freely expended on the realisation of the early aspirations of enthusiastic youth is a very rare and noble thing, and a most valuable lesson to all who are wise enough to ponder, or have the generosity to practise it. I will not venture to detain you, sir, or this meeting, by speaking in detail of the great work you have been able to accomplish towards settling the controversy to which I have already alluded, which has so long occupied the minds of many learned men like yourself Homeric enthusiasts; a controversy resulting in conflicts almost as dire as those we read of between the Greeks and Trojans of old. Your labours in this direction, and in the discovery of the Homeric tombs at Mycenae, with the wealth of gold and bronze ornaments which were then brought to light, and your exploration of the remains of the Treasury of Orchomenos, have added a new chapter to the artistic history of Greece, the full value of which has perhaps not even yet been realised by archaeologists, but the importance of which can hardly be over-rated. Of your labours at Tiryns, and the discovery, within the circuit of its well-known and long-celebrated Cyclopean walls, of the pre-historic palace, possibly older than anything at Mycenae or Troy, but still retaining its wall-paintings and decoration, we know enough to make us look forward with lively interest to the publication of your forthcoming work, which we cannot but believe will add to the fame you have already acquired, as one of the most liberal, undaunted, and successful labourers in the investigation of the un-revealed history of the past which this century has produced. Sir, I congratulate you very truly and heartily on the success you have attained, and with all humility, and yet with pride, rejoice to be the medium of presenting you with this medal, the well-earned acknowledgment of the distinction you have so honorably acquired by your disinterested labours. (The President's remarks were received with much applause.)

Dr. Schliemann, in reply, said:—Mr. President and gentlemen, I receive with profound gratitude the Royal Gold Medal, and am exceedingly proud of it; the more so as it is conferred upon me by her Majesty the Queen, at the solicitation of the Royal Institute of British Architects, and because this most distinguished body more than eight years ago elected me a Corresponding Member. I feared at the time that this high distinction was quite undeserved, but nevertheless I felt very much honored by it, and have done ever since everything in my power to show myself worthy of the office. Not being able to accomplish this by new inventions in modern architecture, which British genius has brought to the highest pitch of perfection and excellence, I thought I could not do better than to use my pickaxe and my spade to make some new discoveries in the architecture of the Homeric age, and to solve the architectural problems which had puzzled the wisest architects of all ages. In fact, our knowledge of the prehistoric architecture was very deficient, our sole informant being Homer, whose scanty information regarding the construction and the internal arrangement of the Heroic palace, was open to question. But I venture to hope that my discoveries and excavations of the great prehistoric palace of the ancient kings of Tiryns, the galleries in the walls with their eleven large ogee-like chambers, and the three chambers we have lately discovered in the

towers, will contribute greatly to explain to us the Homeric description. Mr. President and gentlemen, I beg you once more to receive the expression of my profound gratitude. (Dr. Schlie-mann resumed his seat amidst loud and continued applause.)

The President then presented the various prizes to the students and others who had won them.

The Pugin Travelling Student, Mr. William Henry Billake, B.A., received his Medal, together with the sum of 50*l.*, at the completion of his tour, and only after depositing his sketches, &c., made during the tour. A similar rule applies to the holder of the Godwin Barsary, Mr. Bradshaw Gass, Associate.

Two medals of merit, in connexion with the Pugin Travelling Studentship, were awarded, the recipients being Mr. Herbert Oshorn Creswell and Mr. Thomas Maclaren.

The Soane Medallion, with 50*l.*, to be afterwards paid under the usual conditions, was awarded to Mr. Arnold Bidlake Mitchell. In presenting the medal the President said that the work done by Mr. Mitchell had been of the most creditable kind, being a design for the best description of municipal mansion. The plan was a most excellent one. There had been a good deal of heresy lately as to the desirability of one man designing the plan and another the elevation of a building, but unless a man, when designing his plan, could see the elevation he was going to produce by the combination of his arrangements, he was only half an architect.

In the competition for the Soane medallion, two medals of merit were awarded, the first to Mr. Alfred Arthur Cox, and the second to Mr. John Thomson.

The Tite prize of 30*l.* and a certificate were awarded to Mr. John Archibald Campbell.

The Institute silver medal with ten guineas, for measured drawings, was taken by Mr. Ernest Albert Coxhead. It is usual only to present two medals in this competition, but such excellent drawings had been submitted that the Council had decided on this occasion to present four medals and one certificate of honour. To Mr. James Cromar Watt a medal of merit and ten guineas were therefore awarded, while Mr. John Holmes Greaves and Mr. Arthur George Adams took medals of merit, and Mr. Thomas Locke Worthington a certificate of honour.

Mr. Charles Barry then formally asked the acceptance by the Institute of a portrait of Mr. Horace Jones, painted by Mr. Frank Holl. Mr. Jones, he said, was one of their oldest as well as most honoured members, and was, he believed, one of the original few who really founded the Institute. He went abroad in 1841, accompanied by men of his own age, and whose names, like his own, had since become famous. His early career was a successful one, one of his first known efforts gaining the competition for the Town-hall and Law Courts at Cardiff, followed by a great many works of varied character.* In 1864 Mr. Jones was appointed to the honourable office of Architect to the Corporation of the City of London, which office he had served with distinction and credit, leaving his mark on several very important buildings. The present handsome roof of the Guildhall was due to Mr. Jones, replacing a flat and unornamental ceiling by a work of great merit. The same might be said of the new library at Guildhall. Mr. Horace Jones would also be known to posterity by the long line of markets, which were thoroughly well conceived, and had become models for markets all over the world. One of his most recent works was the great Council Chamber of the City of London, which was of very distinguished merit. Mr. Barry also touched upon Mr. Jones's large and successful experience of compensation and valuation cases, and his connexion with the acquisition of Epping Forest. The number of subscribers to the portrait fund was 124; the list was still open, and would afford the opportunity for making a more tangible present to Mr. Jones. Mr. Barry added that Mr. Holl had expressed his interest in the work of the Institute, and he would ask them to enrol that gentleman amongst their Hon. Associates.

The President, in accepting the portrait, referred to the fact that Professor Hayter Lewis, Mr. Horace Jones, and he were the only survivors of a party of friends who, forty years ago,

* Among his principal early works may be named the Surrey Music Hall (afterwards destroyed by fire); Mansion, Caterham Park, near Reading; the Telegraph Office, Threadneedle-street; and the Sovereign Life Office, corner of Piccadilly and St. James's-street.

trudged across the Campagna, and studied together the great works of Rome. The portrait did not exactly portray the young figure which he remembered then, but it gave the same face, though with the body of the substantial City magnate, which had accompanied him through life as his very good friend.

Mr. Atchison, A.R.A., next proposed a vote of thanks to Mr. Holl, which was carried by acclamation, and responded to by the recipient.

Mr. Thomas M. Rickman, F.S.A., Associate, then read a paper entitled "Professional Lessons from a Boulder: a Plea for Geology as Part of an Architect's Education," of which the following is an abstract:—The author described a particular boulder on the beach of Cardigan Bay, near the old Castle of Criccieth. This boulder, besides having been split, had been roughly shaped by Nature, had been weathered, coloured by the salt and spray, the lichen, the moss, and the sea-birds. It was there to tell many things; for all form and all colour, too, were history, if we would but read it. Should it be said that the mere outline of a stone could but give results, whilst the outline of a building reveals a purpose, the objector might be reminded of the form of every shell found in stone as adapted to the continuation of the species of animal once inhabiting that shell. The series of outlines, all to scale, parallel to the hinge-joint of a hivalve mollusc, and not less the continuous lines radiating from the hinge, the same in infancy and through later stages of growth, every one of them was the development of the meaning of the form, like the delicate mouldings of a mullion curving through tracery.

Let any architect study for awhile the serried outline of such a shell, with every change of form and size in its life's history marked in the clearest manner, and he would learn a lesson in the adaptability of curves and shapes which would bring him back to the design proper for his mouldings, should he ever have been tempted to go astray. So, again, should he compare the devolution of allied genera, in the matter of form, according to climate and life environment, he will come back, not un instructed, to the use of his timber, brick, sandstone, limestone, marble, iron or granite, but with the feeling that he has picked up ideas which will be his business to turn to good account. By studying the forms of orthoceras, ammonites, and such newer births of geological time as the nautilus; by taking note of their mode of growing straight or curved, or in coil, open, close, or involved, the outward form always corresponding with the position of the internal air-channel, the early year's growth of the individual still seen in the eye of the perfect and full-grown volute, the nodule shown in which the internal coil bursts into the wide outer rim, the last formed aperture appearing in the natural termination of the antecedent convolutions, the professional aspirant would come back to his task of designing any curved architectural form with his eye refreshed by the sight of outlines full of meaning for him, and would not dare draw for the purpose of execution in stone, in wood, or in plaster any unmeaning shape. Let the architect contrast the elements of form to be seen in the bivalve shell and its hinge with those exemplified in the nautilus on the one hand, and with those to be found in the multicellular shell on the other, and he will not fail to recognise distinctions of principle as great as can be traced in Classic architecture of the most trite style, or in Gothic, the most arcuated. Nature's mode of working, said Mr. Rickman, was not like the plasterer's zinc mould horsed upon a straight-edge. The mould which shaped the shells was the soft pulp of the living animal in its perfect state, and repeated ever with more and more significance, and with a set of different sections, but all fitting the mould. And from such studies of nature the architectural instinct would come back to the examination of an antique building, and would penetrate the purpose of the designer. That purpose would be divined from the privacy of the dwelling, the indispensableness of the castle's inviolability, the worship celebrated in the church. The problem would be studied in the light of the proved political condition of the country, the cleanliness or filthy habits of the population, the current modes of offence and defence, the depth of the people's devotion. All these helped to clear up the architect's aims. The history of a country was more to us than dates and names, and so the metamorphosis of an orthoceras into a nautilus conveyed

to the mind ideas far greater than those of mere changes in stratification. To an architect the study of these changes revealed the growth of motive and the history of form. Such researches made him an engraver of the annals of his race. By seizing on the clues thus furnished by Nature the course of architectural style would follow in the footsteps of political and race history, and architectural forms would tell of the religion which had influenced the lives of the profession and its clients. Progress or retrogression in our buildings would be the test of the education of the time. Whereas stones were mostly shaped by forces which it is the architect's business to control, the history of a boulder might help architects, not only in the criticism of old buildings, but of their own works also, and so help in the formation of a really original style. The essayist urged that natural sciences, and especially geology, might fill the place for an architectural curriculum of the study of a dead language. Geology and language were each to be valued as a phase in the delineation of thought, of purpose, and of mind,—language for the man of the day, geology for the architect, whose works were to tell to later eyes their own stone history.

In the discussion which followed,

Mr. P. Anson proposed a vote of thanks to Mr. Rickman. To the geologist whose mind was full of his subject, every stone was fraught with a wonderful history, and the lecturer had applied some of the lessons he had learned to the science of architecture. He would like to call attention to one piece of architecture which illustrated the history of past times, viz., the Temple of Serapis at Pozzuoli. Those who saw its stately columns could read the history of the extraordinary geological and volcanic changes which had taken place in the neighbourhood. These columns had evidently been from 15 ft. to 20 ft. below the sea, as the shells were embedded in them. The stones had been raised and sunk several times, and a history of these changes would be found in Sir Charles Lyell's works.

Professor T. Roger Smith, in seconding the vote of thanks, drew attention to the literary quality of the paper, which had struck him as being of a very high order. He had had the opportunity of reading the paper and of trying its methods, and he would like to recommend to those who sometimes attempted to analyse ancient or modern buildings, some of the suggestions which had been made as to the questions to put to a building with the view of getting such answers as might reveal a little of the mind of the designer and the skill of the constructor. He had lately tried some of these upon a famous London building, with results which, if there were time, he would put before the Institute. At that late hour, however, he would confine himself to seconding the vote of thanks.

The President said that the paper had reminded him of the old story of "Eyes, and no eyes." Mr. Rickman was clearly one of those who made use of his eyes, and, while wandering on the shore in search of health, found "Sermons in stones, and,"—no doubt,—"good in everything." He concluded by quoting an eloquent passage on stones, from Mr. Ruskin's works.

The resolution was then put, and was cordially received.

Mr. Rickman replied, and referred to the pleasure he had experienced in studying builders since his first introduction to one by Professor Roger Smith, in front of the hotel at Keswick.

The meeting then proceeded to elect the following members:—

As Fellows.—Mr. William Salway, Associate, of Melbourne; Mr. Horace Cheston, Associate, of Great Winchester-street; Mr. Keith Downes Young, Associate, of Southampton-street, Bloomsbury; Mr. Samuel Flint Clarkson, Associate, of Great Ormond-street; and Mr. Samuel Musgrave, Associate, of Hnll.

As Associates.—Mr. James Ledingham, of Bradford; Mr. Edgar Wood, of Middleton, Manchester; Mr. Norman Spencer, of Wiltshire, Cheshire; Mr. Paul Ogden, of Manchester; Mr. Harry Anderson Pacey, of Lancaster; Mr. George Benson, of York; Mr. George Penrose Kennedy Young, of Perth; Mr. Archibald Taylor Ellison, of Queen Victoria-street; Mr. Robert William England, of Christchurch, New Zealand; Mr. Samuel Perkins Pick, of Leicester; Mr. Thomas Charles Yates, of John-street, Bedford-row; Mr. John Eaglesham, of Ayr;

Mr. Henry Bernay, of Croydon; Mr. Norman Clayton Hadlow Nisbett, of Euston-square; Mr. John Watt, of Upper Norwood; Mr. Alfred Arthur Cox, of Queen's Gate, S.W.; and Mr. William Edward Willink, M.A., Cantab., of Liverpool.*

THE CONGRESS OF FRENCH ARCHITECTS.

WHEN these lines appear, the Congress of French Architects will have completed its thirteenth session, under the presidency of M. Questel, member of the Institute. We are obliged to defer to the next number the account of the main portion of the proceedings, and confine ourselves now to noting briefly the work accomplished during the earlier portion of the week.

It was on Monday, the 8th, that the Congress held its first sitting in the Hémicycle des Beaux Arts. This meeting was devoted to the election of the council and of the committees entrusted with the examination of certain questions of professional interest: public competitions, the code of professional charges, artistic copyright, responsibility in relation to public works, road construction, and sanitation were the subjects of these reports, to which we shall return. After this preliminary business, M. Hardy read an interesting paper on "The Architecture of the Salon of 1855," a subject which we need not follow up here, as it was treated of at some length in the *Builder* a few weeks back. The same day the Congress betook itself to 20, Rue Bergère, to the "Imprimerie Centrale des Chemins de Fer," founded, in 1840, by M. Napoleon Chaix, and the working of which occupies the hôtel built by the former-general, Lenormand de Mezières, under Madame de Pompadour. These well-organised printing-works employ 700 persons, and fifty printing and lithographic machines, among them a special press for the printing of posters, the largest which exists in France. To the printing-house is annexed a professional school for the instruction of apprentices who are afterwards to become workers in the establishment.

The next day the Congress was invited to visit the archaeological excavations in the Louvre, undertaken beneath the Salle des Caryatides, that of the Venus de Milo, and that of the Melpomene. It is to the late M. Lefuel that we must credit the initiation of that interesting piece of work, which was not, however, interrupted at his death, but has been continued for the last three years under the able direction of his successor, M. Guillaume. It forms a kind of completion to the excavations undertaken by the Municipality of Paris in 1866, and which allowed of the indication, by means of a line drawn on the ground surface of the Cour du Louvre, of the perimeter of the ancient substructures. Thus, one can now follow in their successive stages the transformation of the parts constructed by Philippe Auguste, St. Louis, and Charles V.

It is exceedingly difficult to give any account in detail of this long subterranean peregrination, in the course of which M. Guillaume successively showed the old walls and glacis where the Jardin d'Infantes now extends and which the river water formerly washed; the columns, with their fine lines, discovered in the alterations of the surface; the portions of the vault ornamented with grotesque heads; a vast piscina excavated not far from the sewer leading to the Seine, where one may still see a figure of a warrior curiously carved in stone; and, lastly, the fragments of paving, in terracotta, of the XVth century, with ornaments and figures identical with those which were found, in 1876, in the Hôtel de Jean sans Peur.

We cannot now reproduce the lecture given, as a sequel to that excursion, by M. Ledrain, custodian of the Assyrian Antiquities at the Louvre. The subject was "Les Monuments Sumériens et les Rois Architectes de la primitive Chaldée," especially Gonda, of whom there are seven statues in the Louvre. These statues which, according to the inscriptions translated by M. Ledrain, date from 3,900 years B.C., are of high interest in regard to the origin of architecture, for one can see, very well engraved, the plan of a palace which is almost identical with some actual designs, and one of

which bears a scale, the dimensions of which approach extraordinarily near to our metric linear measures. With much learning and spirit, the lecturer revived before our eyes the constructions built by Tello on the banks of the Euphrates, and the remains discovered by M. de Sarzoc, French Consul at Bassorab.

Two other lectures terminated the second day; one of M. Marcel Deslinières on "Céramique," the other by M. Coquet, architect, of Lyons, who led his hearers through the Moorish archaeology of Spain.

On Wednesday morning the Congress met at La Villette, to visit the abattoirs constructed in 1865-67, by the late M. Baltard, whose work was worthily completed by M. Janvier, who himself died in 1879. The abattoirs at La Villette, which have replaced the analogous establishments scattered throughout Paris, cover an irregular surface of nearly fifty acres, and the buildings cover about 58,000 square metres. The general aspect is rather imposing. The façade towards the Rue de Flandres shows a grille about 20 metres interrupted by pilasters intended for allegorical groups. From the principal front six large avenues radiate, intercepted by smaller cross ones. All the buildings have Cromij stone dressings with filling of rough-dressed masonry or of brickwork. The partition-walls are in hard brick covered with Portland cement. The floors are of iron, covered with plaster and bitumen, the roof entirely of tiles.

To give some idea of the importance of the abattoirs and of the service they render, we may add that the work of the establishment occupies 150 slaughter-houses contained in eight groups of buildings; that the dwellings for butchers and shepherds, &c., occupy ten blocks of buildings, and that the stalls can allow space for 2,000 oxen, 7,000 sheep, 2,700 pigs, and 2,000 calves. Each year there is some new improvement in the general arrangement. Now it is a special railway to be made around the line of enclosure, communicating with all the other railways radiating from Paris to the provinces; now another suspension railway is constructed for the quicker circulation of the meat, &c. Further on, three large pavilions are occupied in roasting pigs by gas; not to speak of other structures for the cleansing of offal, the triperies, the blood store, the extraction of alumen and animal oil, the preparation of calves' heads and sheep's feet, &c. For the purpose of having everywhere the indispensable element of cleansing, water from the Marne and from the Ourcy is received into sixty iron reservoirs which project into the establishment at all points.

This is not all, for when the buildings are completely finished they will cover a space of 87,000 metres, and contain 311 slaughter-houses, of which 179 only are at present in work. The works have cost up to this moment about 16 millions (frances); about 7 millions more will be required to complete them. The cattle market, which forms the complement to the abattoirs, and opens on the Rue d'Allemagne, was commenced in 1867, and has cost about 19 millions. We are indebted to M. Moreau, the present architect for the abattoirs, for the information furnished on the occasion of this visit.

In another article we will speak of the lecture given the same day by M. Perrot, member of the Institute, on the "Temple of Jerusalem."

GAS AT THE PARKES MUSEUM.

THE Exhibition of Domestic Gas Appliances at the Parkes Museum, for an inspection of which invitations were issued for Saturday, is in reality an exhibition solely of the exceedingly useful inventions of Mr. Fletcher, of Warrington. The exhibition has not, therefore, the wider interest attaching to a general display of the works of many minds, and it presents none of the critical aspects of comparison. But it has the one advantage of being a unique collection of goods of highest repute, crowned by gold medals and other awards by many international and other exhibitions, and of classes of articles of extensive and wide-spread use.

The star-burners, the concentric burners, the radial burners, are familiar objects in shop windows, and are universally accepted as exceedingly handy and useful; and the various less familiar modifications, such as those adapted for soldering irons, hatters' irons, laundry irons, and the drip-proof burner for

glue-pots and liquids liable to boil over are in great demand for their special purposes and applications.

There is another purpose to which gas heating is extensively applied, that of boiling water, and for this service many ingenious devices are shown. Of these, the most noticeable from its small size and its efficiency is the small instantaneous water-heater, formed by a cylindrical perforated burner, surrounded by a coil of twenty or more volutions, through which the cold water flows, under the influence of the gas flame, for the whole length of the coil. Thus, say, that the length of the burner is 12 in., and the diameter of the coil 3 in., the length of the pipe in which the water is beating in its passage past the flame will be, roughly, about 9 ft. It is easy, therefore, to see how water may enter at one end of the coil and go out at the other end hot. A very simple and perfect little instrument of this kind is shown, formed of a straight horizontal burner of about the above dimensions, for attaching to the walls of lavatories and other places where small quantities of hot water are frequently or occasionally required. The like principle of a coil is applied to the interior of the larger boilers for restaurants and hotels, around which in those cases the flame or hot air circulates freely amongst the volutions of the coil. There are also large hot-water vessels heated by the star and radial burners from below. The small coil articles, however, have a most attractive appearance, and are designed with that forethought and intimate knowledge of requirements which characterise all Mr. Fletcher's inventions.

Another very useful article remains to be noticed amongst the smaller goods,—the coffee-roaster. The atrocious manner in which coffee is commonly prepared needs an almost universal remedy, and the hope cannot be suppressed that these little instruments may have a very wide employment. In sizes they are made from that equal to roasting from 2 oz. to ½ lb. up to a large size for hotels for roasting from ¼ lb. to ½ lb. A quarter of a pound may be roasted thus in four minutes, and a pound in eight minutes, and we were assured by the attendant who showed the goods that a saving of 4d. per pound would be effected by the apparatus,—a strong recommendation to housekeepers.

Two other different applications of gas to its natural purpose of heating,—for cooking apparatus and for stoves for heating rooms,—are represented by many well-considered productions. The cooking-stoves are of excellent design, and the lecturer on cookery at the Parkes Museum speaks most approvingly of their practical application. Gas for cooking, however, is not popular with domestic servants, and gas stoves in the kitchen are even strongly disliked. But the objection to them is in the largest degree that there is no fire to be seen. The watching of the flames and glowings of a coal fire has universal attraction—even dogs enjoy basking in the warmth of its rays and in its wavering light. For them, no more than for servants, does the gas fire seem to complete the appearance and the comfort of home. It is the same in all classes of society. The open grate and the coal or wood fire is the symbol as well as the reality of home. And although Mr. Fletcher produces excellent stoves with asbestos fibre squares of unexceptionable quality, it is only for temporary purposes that such stoves have as yet in the world any actual occupation. They are very convenient in reception or other rooms, where visitors are intermittent, or occupation exceptional. They are also very handy at particular seasons, as late spring, or in autumn, when cold days interpose with warmer weather; but the gas fire for sitting-rooms and for bedrooms, in the present circumstances of the gas itself, is distinctly not a sanitary arrangement. That fault, however, is not separable from the gas companies. Nor can Mr. Fletcher do better until he can get gas, or, more correctly, pure hydrogen. For it is the pure hydrogen that is required for heating, and not the mongrel compound carburated hydrogen supplied for lighting purposes. The carbon deteriorates the gas for all heating purposes. It is the source of smoke and of fumes, and neither cooking nor domestic heating can be properly effected when such impurities arise. To avoid them requires under present circumstances very careful manipulation. For cooking, gas should indeed be the most perfect fuel. Its quantity can be perfectly regulated; its combustion equally perfectly assured, and consequently the exact temperature can be applied with

* All the gentlemen elected Associates have passed the Obligatory Architectural Examination.

unvarying certainty for any period of time, or the temperature can be raised or lowered in any way desirable. There is no waste of fuel. There is no time occupied getting up a fire, as with coals, nor any further time taken in letting down a fire once got up. There is no fire to be maintained whilst none is wanted against some future period when the fire will be wanted. The ingenious devices Mr. Fletcher puts forward in the shape of cooking-stoves are everything seemingly required for the application of gas, and they ought to tempt cooks to trials of them. The burners can be used singly or in multiple; they revolve so that by turning the flame downwards grilling may be performed by the radiation from them downwards, whilst boiling may be performed by the hot-air rising upwards from the flames beneath. Large square central chambers, clean whitewashed on the sides, and with gravy trays at bottom, afford admirable spaces for the cooking of joints or poultry. Double iron doors with silicate packing between the thin outer and inner sides stop all outward radiation of heat. The handiness, cleanliness, and convenience seem unexceptionable, but we doubt whether, whilst the companies carburet their hydrogen, gas-cooking will take extensive hold in general domestic service. The admirable way in which gas stoves can be used even now in large establishments by trained experts is indicative of what their application might become if the gas supplied were more suitable for the purpose.

The Parkes Museum authorities are doing well in submitting such an excellent series of special class goods to the public view, and which are so worthy of being selected as specially illustrating the sanitary conditions attainable even now by common gas in its present state.

THE OLD "CHESHIRE CHEESE" INN, WALLASEY.

This village of Wallasey in Domesday is called "Walea" in a charter of 1081, and was afterwards changed to Waleyseigh. After 1487 it is written Walesey and Wallsea.

Ormerod's "History of Chester" states that "in the reign of Elizabeth Wallasey had a little port to which there belonged three 'barks' and fourteen men, a very inconsiderable quantity, but nevertheless nearly one-fourth of the number of 'barks' and mariners which then were employed at the infant port of Liverpool on the opposite shore, as in the same year, 1565, a consents extant in the town records states the entire number to consist of only twelve 'barks,' navigated by seventy-five sailors."

The old Cheshire Cheese Inn is a quaint, squat, long, one-story building, thatched, divided into two rooms with a cook-loft over the kitchen. It is stated that King Charles II. slept in this old bed-chamber. The gable of the kitchen is built with freestone in regular coarsed work, having an angle fireplace and a two-light mullion window, now built up, with a modern window at one side. The entertaining-room has a large hooded chimney corner, used in the days of log fires, with two old-fashioned squab seats. The roof is framed with arched jaw principals in oak; the feet rest upon the floor for support, and the rafters are tied across here and there. The beer-cellar is opposite the entrance, which is direct into the room; here is a very pretty "Queen Anne" door and casings in panels and lattice work, and a cupboard of the same date is fixed in the chimney corner.

The road into the village at this point being narrow, the commissioners have purchased the land upon which the inn now stands from the proprietor of the Vale Brewery for the purpose of making the road wider, which will be a great improvement, and in a few weeks this ancient hostelry will be cleared away. The licence dates back 220 years. Mortimer's "History of the Hundred of Wirral" says:—"In 1690 the troops of William III. were encamped in the village and neighbourhood previously to their embarkation for Ireland in the year 1696, accompanied by his Majesty in person, and a brilliant staff, including the Duke of Monmouth, the Marquis of Ormonde, the Earls of Manchester, Oxford, Portland, and Scarborough, and many others. The host of the Cheshire Cheese takes pleasure in showing the kitchen, which is traditionally reported to have been selected for the royal dormitory. The Wallasey Leasowe was probably the oldest gentlemen's racecourse in the kingdom, being noticed by

Webb as existing in the early part of the seventeenth century. In 1633 the Duke of Monmouth rode as jockey a race which he won, and presented the plate to the daughter of the Mayor of Chester. Races discontinued 1750."

"Wallasey was once an island, its original name being 'Kirkby in Walley,' which means the church in the woody island, the parish being separated from the rest of the hundred by a small brook called the Birkin. Tree stumps and peat are still to be seen, the remains of a dense forest towards the sea." (Hume's "Ancient Meols.")

A new hostelry is now being built in the garden belonging to the old inn, in the Queen Anne style. The old wood, and other fittings will be refixed here, and the old oak timbers made into furniture, so that any architectural features the old house may be considered to possess will be preserved. The new building has been designed by Mr. T. C. Ebdy, architect, of Birkenhead, the contractors being Messrs. W. & J. Varty, of New Brighton.

SOCIETY OF ARTS PRIZE ESSAYS.

SOME time since, the Council of the Society of Arts undertook to award in prizes for essays on "London Reconstruction" and the "Housing of the London Poor" a sum of 1,200*l.* placed at their disposal by Mr. W. Westgarth.

The committee appointed to consider the essays sent in have reported to the effect that in their opinion none of the essays realise the requirements of the offer in such a manner as to justify them in recommending that the full amount of the prizes offered should be awarded. They recommended, however, that prizes amounting in all to 600*l.* should be awarded as under:—

Three prizes of 100*l.* each, to H. H. Bridgman, 42, Foultry, E.C. 1; J. Corbett, 24, Barton-arcade, Manchester; W. Woodward, 7, Duke-street, Adelphi, W.C.

Three prizes of 50*l.* each, to A. Wynter Blyth, Court-house, St. Marylebone, W., and R. Greene, Berry Wood, Northampton; Clement Dunscombe, City Engineer, Liverpool; C. Scott, Town Hall, Belfast, and J. W. E. Tilley, Royal-avenue, Belfast.

Six prizes of 25*l.* each, to A. H. Do Wind, Comber, County Down; J. S. Fairfax, 3, St. Paul's-road, Camden-square, N.W.; Victor Jetley, 8, North Audley-street, W.; T. E. Julian, 22, Palace-road, Roupell Park, S.W.; W. A. Newell, M.D., 201, Palisade-avenue, Jersey City, N.J., United States of America; G. W. Usill, Haldon Lodge, Southfields, Wandsworth, S.W.

The Council, after consultation with Mr. Westgarth, have accepted the report of the Committee, and awarded the prizes as recommended. It has been determined that the three essays to which prizes of 100*l.* were awarded shall be published on behalf of the Society.

PROPOSED NEW EXCHANGE, AMSTERDAM.

THE final award in this competition took place last week, the following members of the jury being present:—

Herr D. Cordes, President of Chamber of Commerce, Amsterdam; Herr P. J. H. Cuyper, Architect, Amsterdam; Herr L. H. Ebersson, Architect to the King of Holland; Herr S. Hepner, President of the Corn Exchange, Amsterdam; Herr J. R. de Kruijff, Director of the Art Schools, Amsterdam; Kgl. Baurath J. C. Raschdorff, architect, of Berlin; Oberhanrath Fr. Von Schmidt, architect, of Vienna; M. Paul Sédille, architect, Secretary of the Society of Architects, Paris; Mr. R. Phéné Spiers, F.S.A., architect, London; Herr A. L. Wurfhain, President of Stockbrokers' Society, Amsterdam; and Herr J. J. Van Ijssendijk, architect, Brussels.

The first prize of 10,000 gulden was awarded to the design bearing the motto Y, No. 175, its author being Monsieur Cordonnier, of Lille.

The second prize of 6,000 gulden to the author of "In hoc signo fioresco," No. 150. M. Groll, of London and Vienna.

The third prize of 5,000 gulden to "La bourse ou la vie," No. 20, M. Volkmar, of Berlin.

The fourth prize of 4,000 gulden to "Mercatura," No. 73, Messrs. Sanders & Berlage, of Amsterdam.

The fifth prize of 3,000 gulden to "Ammerack," No. 91, the name of the author not having transpired.

Illustrations.

ANCIENT BRASSES.

FOR information as to the two fine examples of ancient brasses, of which illustrations are given in this number, see the article on "Foreign Brasses" in another column.

"WESTGATES," SURREY.

THE house of which a view is given here is built from the designs of Mr. Halsey Ricardo, on some high ground on the road from Charlwood to Newdigate. The house faces westward, to command the view of Leith Hill and Holmwood. It is built of Bolney stone with Box-ground stone dressings, with a red tile roof. The drawing from which the illustration is taken is in the Royal Academy Exhibition.

THE COBOLZETTER THOR, ROTHENBURG.

THESE sketches, by Mr. A. B. Pite, taken from the interior and exterior of the gateway, give views of a very picturesque though simple bit of old German building.

SCULPTURE AT THE PARIS SALON.

WE give this week illustrations of two of the works which were mentioned with commendation in the recent articles in our columns, by "B. B. Fenwick" on painting and sculpture at the Salon Exhibition. The first, "Protection," is by M. Demaille, and was described in the article referred to (p. 757, ante). The second, "Baptême Gaulois," by M. Oge, is an example of the tendency of French artists at present to go back to early Gallic history and life for their subjects. This is an illustration of the warlike infancy of France, when it is supposed that the father's sword should be the most sacred object in the eyes of his children. The idea is perhaps too modern in feeling for the supposed period, but the work itself is a fine and robust one. "Protection," however, is the more intellectual work of the two, representing the highest use of sculpture for the representation of a purely abstract ideal.

MODEL PLANS FOR INFECTIOUS HOSPITALS.

THE Local Government Board have recently issued model plans for buildings for the isolation and treatment of persons suffering from infectious diseases. These plans, which are intended to serve as a guide to sanitary authorities in making the provision so necessary for the defence of their districts from invasion of epidemic diseases, have been prepared under the advice of the Board's medical officer and architect, and appear to have been very carefully designed, with the view to afford the greatest facility for the safe treatment of different diseases while involving the smallest outlay for building.

The group of plans at the top of p. 847 is for a complete hospital of the smallest kind, viz., for four patients, and shows a ward-block divided into two distinct portions each of which contains a ward-room for two beds, with a nurse's room adjoining. The rooms in one half of the building are arranged to open into an unenclosed verandah in front, while those in the other half open into a similar verandah at the rear, thereby tending to the more complete separation of the patients in one half from those in the other half of the building, while a railing across the verandah in each instance serves to hinder communication between the occupants of the two sets of rooms. The beds are arranged so that each patient will have the full benefit of the prescribed amount of space, namely, 2,000 cubic feet, 12 ft. lineal of wall-space, and some 150 square feet of floor space; the angles of the wards, both vertical and horizontal, are rounded in order to facilitate cleansing, and to prevent the deposit of infected dust; none of the four rooms in the building have any direct aerial communication with any other room, but a fixed window is provided in the wall separating the nurse's room from the adjacent ward-room. It is contemplated that, in so small a hospital, movable baths and dry-earth commodes would be used, with screens, in the ward-rooms; hence

The text on this page is extremely faint and illegible. It appears to be a historical document or a page from an old book, possibly containing a list or a detailed account. The content is mostly lost due to fading and the quality of the scan.

PLAN.
Scale of Feet.

SECTION.

ELEVATION.

PLAN.

Scale of Feet.

bath-rooms and water-closets have been dispensed with.

This plan shows also a small block of offices (wash-house, mortuary, &c.), which, like the ward-block has to be kept at a distance of at least 40 ft. from the boundary-fence of the site. An administrative block, or caretaker's cottage, is provided at the entrance, but if, from motives of economy or otherwise, this should not be built, accommodation is provided for the staff in an upper story of the ward-block approached by a flight of stairs from one of the verandahs.

The larger plan on p. 847 is designed on principles similar to those of the small ward block in the first plan, but the building is on a larger scale. Indeed, it may form the ward accommodation for a district of some magnitude, seeing that it contains ten beds in four distinct wards, or it may form one block of a hospital, where the rest of the accommodation is provided in larger wards. In either case such a ward block would be found most useful, as it affords facilities for the safe isolation of cases of different infectious fevers, for the isolation of any individual case sent to the hospital in so early a stage that the precise character of the disease may not have definitely shown itself, and which therefore it may be desired to keep separate for a while, or for any patient desiring, and willing to pay for, more privacy than is afforded in the general wards.

In this plan no administrative offices are shown as it has been assumed that the staff, &c., necessary to the supervision and care of so large a number of patients as might occupy the building either by itself or in conjunction with other ward-blocks, would involve the provision of more extensive indispensable buildings.

ASSOCIATION OF PUBLIC SANITARY INSPECTORS. ANNUAL DINNER.

THE second annual dinner of the members of this useful and growing Association took place on Saturday evening last, at the Holborn Restaurant, Mr. Edwin Chadwick, C.B., President, in the chair.

Dr. Cameron, M.P., in proposing "Success to the Association of Public Sanitary Inspectors," said he regarded sanitary inspectors as the regimental officers of the army of preventive medicine. Without the intelligent co-operation of sanitary inspectors no good result could be achieved. In the discharge of their duties they required great firmness and courage, and to be prepared to fight against both prejudice and ignorance, and still more against sordid interests. Under these circumstances it was important they should weld themselves into an association to maintain their views and to indicate to politicians unnumbered reforms of detail, which, without them, would be ignored. He supposed they would like to see the portals of their profession guarded in such a way that a man who entered it should be a credit to their body. He would couple the toast with the name of their president, to whom he paid a high tribute. Throughout the sanitary literature of the last half-century no name occupied a more honoured place than that of their president, who had been associated with everything done during the last half-century to improve the health of the nation and to lower the national death-rate. In conclusion, the hon. member expressed his hope that the Prime Minister in the next distribution of honours would do some justice to such men as their president.

The Chairman, in responding, observed that the perception of the power of sanitation, and demands for its application, are extending afar as well as near. But the great hopes of sanitary legislation are stopped by the delays of administrative organisation. To the devising heads of sanitation, the preventive engineer, or the preventive health officer, the sanitary inspector is the direct executive hand. After referring to Mr. Chadwick referred to the recent Sanitary Congress at Rome, and to the insatiable condition of many of the Italian cities. He continued:—"The well-intentioned French politicians of the last century promised to the most depressed of the population the attainment of the greatest good when they had attained for them 'liberty, equality, and fraternity.'" I forbear investigation as to what political or mental or metaphysical benefits

may have been gained by them under those terms. But as the object of my study and experiences, I cannot fail to note and lament the dire physical conditions under which a large proportion of the population of Paris and of France suffer. With a finer climate and site the death-rate of Paris is 27 against 20 in London, and throughout France the depression is even greater than that we complain of in England. Of the working classes in Paris, the excess of their special death-rate partakes of that of the general death-rates, and their physical condition, instead of being one of liberty is one of slavery, of slavery to disease, of the scourging of painful diseases, of fever, of rheumatism, and of phthisis, by which their working ability and their wages are reduced, and their lives shortened by from one-third to one-half. By examples achieved they may be shown that by effective sanitation true liberty may be achieved for them, the liberty of health and strength, freedom from the excess of preventable diseases, and an augmentation of at least ten years more of life. As to equality, its deplorable violation is shown in this; that, whilst death now trends once at the chateau, it trends at least three times at the cottage, and the mother there has to bewail the loss of half the children born to her before they attain the age of maturity. Sanitation, and sanitation alone, will effect a real equality in this respect. As to fraternity, what practical evidences of it are visible other than in admission to hospitals, where the working disability from sickness is augmented by one-half, and the chances of recovery greatly reduced? For fraternity I may claim having, with my colleagues of the Commission of Inquiry into the condition of young persons engaged in our factories, initiated a measure of centralisation for the people, in place of the centralisation really against the people (chiefly for the levy of military force and war taxes), our centralisation "for the people" presenting the elements of real fraternity of protection by inspection of the places of work, protection against accidents by machinery, and protection for children by the half-time principle against exclusion from education. This last protection is now proposed to be extended to the sanitary inspectors of schools to detect and deal with the premonitory symptoms of disease, a protection by sanitary inspection which it is now proposed to have extended to a large proportion of the houses of the wage classes from experience of the sanitary benefits conferred by such inspection on the inmates of the common lodging-houses. It was objected that the restriction of the excess of the hours of labour, chiefly by my former colleague, the Earl of Shaftesbury, must reduce productive power and reduce profits and wages. But greater force has been given to production in the reduced time, and wages and profits have been augmented. Such is the centralisation for the people comprising the elements of a real fraternity, of which the most heavily death-rated of the wage classes of Paris and of France are greatly in need. I must not now transgress further than to submit that our object should be to impress the new constituencies with their paramount interest in this subject; with the wastefulness of ignorance, of which the metropolis has presented so great an example; with economy of true science, and with the need of legislative securities, for its application in administration. To this end it will be requisite to bring together the sanitary functions, now scattered and weakened and wasted in different departments under distracted and divided attentions, and to consolidate them under the undivided attention of a Board of Specialists, presided over by a Cabinet Minister of Health. By such an arrangement the training for the specialities of the preventive service may be ensured for the colonies as well as for home. The need of the consolidation of the educational functions, now scattered and weakened and wasted in independent departments, is at length recognised, and it is proposed to bring them under the undivided attention of a Minister of Education, but the scheme at present displays imperfect conceptions of administrative organisation, in the omission of fundamental provisions for physical training, such as have been the greatest successes of our times, and also in the need of preventive sanitary inspection. I regret that we cannot have the presence to-night of our distinguished honorary member, Lord Shaftesbury, who served for five years as the most efficient

member of our first general Board of Health. If he had been here, I would have recalled to him the text he gave to us from St. Paul, at a parting dinner, a text of prophetic import:—"We are troubled on every side, yet not distressed; we are perplexed, but not in despair; persecuted, but not forsaken; cast down, but not destroyed." This is still true, but sanitation is yet living, is recognised, is advancing; and in desiring, as I do, with all my heart, "Success to the Association of Sanitary Inspectors," I am desiring for sanitation a further advancement for the foremost benefit of humanity.

Mr. William Rains proposed "The Houses of Parliament," and in doing so expressed a hope that the next Parliament would consolidate the laws relating to sanitary inspection.

Dr. Cameron briefly responded. Dr. Lory Marsh proposed "Unity of Administration in the Metropolis." To the division of local authority in the metropolis they were indebted, he said, for many of the abuses and had sanitation that existed in it.

Mr. James Beal, in responding to the toast, referred to an agitation got up many years ago against the gas companies, which resulted in a saving to the consumers of a million a year; and said the saving would have been much greater if there had been a municipality, and the same observation applied to the water companies, whose undertakings a municipality would have purchased for the sum they had cost.

Dr. Alfred Carpenter, in proposing "The Executive," said there was a general feeling that some means should be adopted to test the fitness of applicants for the office of sanitary inspector, and the subject was now under consideration. It was hoped before long to establish an Institute of Hygiene which should unite for common action all the societies concerned in sanitary work.

Mr. Jerram, the chairman of the executive, and Mr. Samuel C. Legg, the honorary secretary, spoke in acknowledgement of the toast.

Dr. B. W. Richardson proposed "Local Government."

Dr. T. Orme Duffield, in acknowledging the toast, said he believed the complaints that the vestries neglected to carry out sanitary legislation were unfounded. In Kensington, where he was an officer of health, he was not interfered with in the least; and he believed that it had been known how much sanitary work had been done in London during the last few years, the agitation against the vestries would cease.

ARCHÆOLOGICAL SOCIETIES.

British Archaeological Association.—The closing meeting of the session was held on Wednesday, June 3rd, the Rev. S. M. Mayhew in the chair. It was announced that the intended works of repair about to be undertaken at Waltham Cross had been considered and approved by the Council. It is contemplated to improve the position of the cross by removing and setting back the buildings which at present join it. The Rev. Prebendary Scarth rendered a report by Mr. Herbert Reid of some excavations near Newbury, where two circles of flints have been found, 3 ft. below the surface, with the remains of wood fires. They were evidently beacons used in Roman times. Mr. Greenhields sent a beautiful silver fibula, and the Rev. Canon Routledge reported the discovery of a hagiocope in the west wall of St. Martin's, Canterbury, partly built over by the thirteenth-century tower. The west wall proves to be ancient Roman work, similar to what has been traced on the south. The Rev. Dr. Hooppell described some remarkable interments of early date found within the ancient earthwork called Dane's Camp, Northampton, now being removed for iron ore. Mr. Loftus Brock, F.S.A., exhibited a Roman vase found at Colchester. The first paper was by Mr. T. G. Pinches, of the British Museum, on Babylonian Cylinders. He reviewed the whole history of these remarkable objects, illustrating his remarks by the exhibition of many specimens of great beauty and interest, several being of great antiquity, some being 2,700 years B.C., of very good workmanship. Dr. Hayes Ward, in the discussion which ensued, suggested that correct information should be obtained as to the actual localities where such cylinders were found. The second paper was by Mr. Romilly Allen, F.S.A. Scott, on some recent discoveries of Saxon sculptures

of interlaced patterns on stone, found at Rock- and Colsterworth, in Lincolnshire, and Bekhill, Sussex. At the latter church, a fine small Saxon tomb has been found, covered with patterns of very great beauty. A third paper was then partly read, on the Saxon tower of Barnack Church, by Mr. J. T. Irvine. A good deal of sculptured work here was illustrated, particularly a window filled in with a slab of stone pierced with an open-work pattern.

London and Middlesex Archaeological Society. A general meeting of the members and friends of this Society took place at the Tallow Chandlers' Hall, Dowgate-hill, on Tuesday last, the 9th inst., by permission of the wardens and court of assistants. Mr. Edwin Knight, the master, occupied the chair, and briefly welcomed the visitors, and introduced Mr. M. F. Monier-Williams, clerk and solicitor to the company, who read an interesting descriptive history of the charters, hall, and other matters of interest connected with the company. The earliest reference to it was in 1426, when letters patent were granted by Henry VI. empowering the Tallow Chandlers of the City to search for and destroy all had and adulterated oils. Their first charter of incorporation was obtained in 1432 from Edward IV. The original grant of armorial bearings is in excellent preservation. The minutes of the company did not state who was the architect of the hall. Some thought it was Sir Christopher Wren, but this was doubtful. The two oil portraits of William III. and Queen Mary were by Sir Godfrey Kneller. There are some handsome Chippendale chairs. The table was saved from the Great Fire, from which the Company suffered severely; but, owing to the energy of the then Master, the archives were removed from the Hall before the fire reached it, and it is recorded that he took them in his coach to Hampstead. Mr. Monier-Williams concluded by referring to the recent Underground Railway works, and regretted that the panelling of the hall and other rooms had been much damaged of late by the railway, which ran almost immediately beneath the building. Mr. Alfred White, F.S.A., proposed a vote of thanks to Mr. Monier-Williams. After inspecting the different rooms, plate, charters, and other chief objects of interest, the members and visitors adjourned to the Church of St. Lawrence, Jewry. Mr. Louis Stokes said this was one of Sir Christopher Wren's churches, and was generally thought to be one of his best, as regards the richness of decoration, stability of structure, and the wonderful manner in which the architect adapted himself to the peculiar wants of the place. There was very little known about the church before the Fire beyond what Stow said, that it was a large and fair building; he (Mr. Stokes) made special mention of the very great repairs which were executed in 1618, and said that in the old building there were two private chapels. Directly after the Great Fire a committee was appointed, and the church was commenced in 1671. One curious matter was that the Moorfields morass extended as far back as the church, and the architect was obliged to drive piles 12 ft. long to the depth of 7 ft. to get a foundation for the church on the north side. It was one of the most expensive of the City churches built, at that time costing over 15,000*l.* It took nine years to build, and the congregation meanwhile used the Chapel of St. Mary Magdalene, or the Lord Mayor's Chapel, which was on the eastern side of Guildhall-yard. When this was demolished many monuments were removed to St. Lawrence, Jewry. In the books Mr. Pearse was mentioned as the carver of the organ and other woodwork in the church. The building was wonderfully well adapted for hearing, one of the great points which Sir Christopher Wren always had in view. The windows were all modern, as also was the mosaic over the altar. There is a monument to Gresham, father of the celebrated Sir Thomas Gresham. Among the rectors were Tillotson, afterwards archbishop. After inspecting the ancient plate, &c., the visitors proceeded to the Guildhall, where they first inspected the Library and Museum, and then the new Council-chamber. Mr. Gannon, keeper of Guildhall, conducted them through these buildings and the old Council-chamber. Mr. E. C. Robins expressed his pleasure at inspecting the new Council-chamber, and said he was at the Royal Institute of British Architects on the previous evening, when a portrait which had been painted by Mr. Holl was presented to Mr.

Horace Jones. He thought the building was a great honour to the architect as well as to the Corporation. The visitors having descended to the crypt, Mr. Alfred White, F.S.A., said that the crypt or undercroft of most buildings was one of the most interesting parts, for many reasons. It told the history of the building above it better than any other part, and this was particularly the case with this one. This was a very small portion of the Guildhall, and extended under a small part of the east end of the hall, whether the rest of the Guildhall had an arched crypt of this kind there were no means of determining. On the south side of the Guildhall stood, as he could just remember, the chapel of the Guildhall. That was a building of very ancient foundation,—certainly as early as before 1300. The present hall did not commence till the year 1411, therefore there was a chapel there long before the Guildhall was built. But there were indications of a more ancient hall. There was a great peculiarity in the crypt. The crypts of domestic buildings had always a line of columns in the centre, as at the great hall of South Wingfield, in Derbyshire, which was of gigantic size. But he found the crypts of all ecclesiastical buildings there were two rows of columns down the centre, dividing them into three bays, and this was the case with the crypt of the Guildhall. This was the original crypt of the chapel of the Guildhall. In pulling down the old chapel of the Guildhall some interesting monuments were found, among them a slab which was now in the Guildhall Museum, to the memory of Geoffrey le Trompeur. Everything went to show that this was the site of the ancient chapel of St. Mary Magdalene, and that this was the crypt of the chapel itself. After inspecting the crypt, the members and friends adjourned to the Holborn Restaurant to dine, under the presidency of Major Alfred Heales, F.S.A. Mr. H. S. Milman, F.S.A., responded to the toast of the "Society of Antiquaries"; Mr. R. S. Fergusson, F.S.A. (ex-Mayor of Carlisle), for the Camberland and Westmoreland Archaeological Society; and Mr. Thomas Milbourn for the Surrey Archaeological Society.

"A DAY IN THE COUNTRY"

We have received the following circular from the Committee of the East London Mission, to which we gladly give publicity:—

"The Managers of the East London Mission, 263, Cable-street, Shadwell, E., earnestly solicit help to enable them to take 600 of the very poorest children from the courts and alleys of East London for a day in Kipping Forest. This annual treat, already eagerly anticipated by the little ones, includes dinner, tea, amusements, &c.

Contributions from benevolent and Christian friends are earnestly solicited, and should be sent to Mr. G. Hopkins, Superintendent, Mission Hall, 263, Cable-street, Shadwell, E., by whom they will be gratefully acknowledged."

BUILDING OVER THE DEAD.

GIBBONS AND OTHERS v. CHAMBERS.

THIS case, tried in the Queen's Bench Division on Wednesday last, before Mr. Justice Day, involved a legal issue of a very singular kind. The action was brought to recover two quarters' rent, amounting to 70*l.*, of a piece of land at Bethnal Green, known as the Peel Grove Burial Ground, the facts in connection with which were last year before the public and the courts of law. The action was brought under an agreement dated the 9th of February, 1883, between the plaintiffs and defendant, by which the defendant agreed to erect certain buildings on the land in question before the 25th of March, 1884; the plaintiffs agreed to grant to the defendant, when such buildings were erected a lease or leases of the said land and buildings; the defendant agreed to accept such lease or leases, and the defendant further agreed to pay rent to the plaintiffs at the rate of 140*l.* per year until such lease or leases should be granted. The present action was to recover such last-mentioned rent, the buildings not having been erected by the defendant under the agreement. The defence was that an Act of Parliament passed last session (47 & 48 Vict., c. 72) made it illegal to erect any building on a disused burial-ground, and that by virtue of this Act the agreement was illegal, and failed. On this ground the defendant denied his liability to pay any rent under the agreement, but at the same time paid into Court a sum representing an apportionment of the rent to the date in August last, when the Act received the Royal assent. One or two surveyors were then called to prove that it was impossible to build over the ground without removing the bodies, in consequence of the

certainty of subsidence of the soil, and that no local authority would assent to such building.

Mr. Justice Day gave judgment for the defendant. His lordship was of opinion that in this case the freeholder and the builder entered into a contract which necessarily involved a violation of the rights of those who had paid money on the faith that their friends and relations should lie in this ground undisturbed, and that this amounted to a conspiracy, which would in itself render the contract illegal.

Judgment was accordingly given for the defendant, but without costs, the learned Judge remarking that there were no merits in the case, and that it was an unholy proceeding altogether.

[We condense the foregoing from the *Times* report. Mr. Justice Day's decision will be gratifying to all those sanitarians who, with us, protested from the first against the proposal to build over this burial-ground. It is satisfactory to find that the day of retribution has come.]

THE REFORM OF THE INSTITUTE.

At the meeting of the Institute on Monday a short paper was read by Professor Kerr, in which he recommended that the work of the Institute should be divided and directed by several committees. To this proposition the Council, I believe, agree. To one of such committees I would suggest should be deputed the office of communicating with each Architectural Association in the land that their co-operation may be obtained with a view to federation. At present these associations have no power. They are so many scattered atoms, and when the proposed new charter goes up for confirmation by the Queen in Council the question will be asked, Why should the Institute ask an extension of its powers? Is there not a large number of mutual admiration associations in the country, and beyond mere chit-chat coteries, of what value are they to the State and the public? If the Institute wishes to widen its base, should it not be required to give in return to the public through its members increased efficiency and protection in case of malversation, so that the fear of a black mark against the name of any wrong doer may keep men straight, as in the case of the Law Society? At present the public are not protected, and the remark of the late Prince Consort to Sir Gilbert Scott that any one could set up as an architect expressed both truth and satire.

THOMAS E. KNIGHTLEY.

CURVES OF CONTRARY-FLEXURE.

SIR,—My paper, on the above subject (*Builder* May 30, p. 752), does not exclude any curve of contrary-flexure from consideration. It is designed to afford a clue to the rationale of the mental evolution or conception of a line of beauty, to those aesthetic conditions to which any curve of contrary-flexure, to be beautiful, must conform. In the wider mathematics all curves are mathematical curves. Many persons imagine that every geometrically or mechanically described curve must necessarily be beautiful. This is a very venerable and a very fallacious supposition. But that I stand alone in composing ogee curves of segments of circles, &c., as your correspondent intimates in the *Builder* of the 6th inst. [p. 814], is utterly refuted by Mr. Penrose's interesting Royal Academy lecture, only a few pages off [pp. 334, 371, ante], from that he might have learned that it was the practice of the Grecian and Roman architects to combine curves to form the cymatium as I have done, and that Mr. Penrose also denominates such curves, curves of contrary-flexure. The cymatium above the frieze of the Parthenon,—of the Parthenon!—was composed of segments of circles, a practice common in Roman architecture, but unusual in Grecian, in which segments of other curves were used. It would be interesting, however, to learn whether there be an instance of the use of that particular curve of contrary flexure, championed by Mr. Tarn, in either Classical or any other architecture.

W. CAVE THOMAS.

The Hotel Metropole.—We are asked by Mr. Edgar P. Jones, of the Melincourt Brickworks, Resolven, Briton Ferry, to state that he supplied a large quantity of enamelled glazed bricks for this building.—Messrs. Alfred Goslett & Co., of Soho-square, write to say that they executed the glazing.—Mr. John Smeaton, of Ludgate-circus, says he supplied his patent dust-shoots for this hotel, as well as for the First Avenue Hotel.

Messrs. Copland & Gilmour's Suggestion for the Widening of Old Broad Street.

A SUGGESTION AS TO THE WIDENING OF CITY STREETS.

SIR,—Our attention having been directed to the rapid increase of traffic along Old Broad-street to the neighbourhood of the Royal Exchange, which has been created principally by the erection of the new railway stations in Liverpool-street, and the consequent frequent blocks of vehicular traffic and crowded state of the footways,—particularly at the commencement and close of the ordinary business hours,—also to the fact that during wet weather no one can pass along the street without being much splashed by passing vehicles, we trust that as it is a matter of public interest, you will pardon us for intruding on your space by suggesting the cause of such inconvenience, together with a suitable and comparatively inexpensive means of remedying the same.

The obvious cause of the above state of things is the narrowness of the street, particularly at the south end, where at one part, by the Ocean Marine Insurance Company's offices, the footways are respectively 7 ft. and 5 ft. in width, and the roadway about 16 ft., thus only allowing of one vehicle to pass another, whereas a street with such an amount of traffic should provide for four, or at least three lines. It is well known that the City authorities are ever anxious to improve the facilities for street traffic, even when involving a large expenditure in the purchase and compensation for removal of valuable property. This item would form a considerable part of the expense of widening Old Broad-street, and if effected in the ordinary way would be likely to prove an almost insurmountable obstacle. We would therefore suggest that the existing buildings should be retained as a whole, the curb line at the east side being set back from its present position, as shown on the dotted line A, A, A (see above sketch plan), to the face line of the buildings commencing from the junction with Threadneedle-street to the City of London Club, a colonnade being substituted for the ground-floor frontages, a footpath of from 8 ft. to 10 ft. in width carried behind the same, and the offices and shops in the rear being lighted by continuous glazed fronts. Thus no serious diminution of light or rental value would be caused, except so far as related to the diminished area of the ground-floors. From this point northwards, the improvement would consist in throwing the spaces occupied by the areas into the footway, and lighting the basements by means of prismatic lights; the existing curb, as shown by the dotted line, being set back to the firm line in continuation of the proposed colonnade, and running into the present curb at the point marked X, opposite Pinner's-court.

By the above means, a minimum width of roadway would be secured, sufficient for three lines of traffic, besides obtaining more commodious footways. We also notice that, notwithstanding the congested state of the traffic, a pillar letter-box is so placed opposite Gresham House as to leave only sufficient space for two people to pass almost. We should have thought a wall-box behind the railings would have answered every requirement.

COPLAND & GILMOUR, Civil Engineers.
42, Old Broad-street, E.C.
May 28th, 1885.

P.S.—The above principle is not only applicable to Old Broad-street, but to several other crowded City thoroughfares.—C. & G.

The Conversazione of the Institution of Civil Engineers, on the 12th inst., was very largely attended, and the enjoyment by the visitors of the varied programme set before them was facilitated by the favourable weather.

"WESTGARTH ESSAYS."

SIR,—Every competitor, whether in receipt of a prize or not, should enter a strong protest against the action of the Council of the Society of Arts in their award of only half the sum offered by Mr. Westgarth.

The committee's report, "that, in their opinion, none of the essays realise the requirements of the offer," should bear some explanation. The offers as issued by the Society were for the best practical essays on the subjects, and although the Council reserved the right to withhold or deal with the prizes as seemed to them desirable, it is none the less a breach of trust to arrogate to themselves a standard of merit, and to deprive competitors of the full value of the liberal offer made by Mr. Westgarth. NEMO.

DOMESTIC WATER-SUPPLY.

SIR,—Permit me to occupy a small space in your paper to draw attention to the necessity for the inspection and cleansing of cisterns at this period of the year. It is a matter of urgent necessity that all cisterns should be examined and thoroughly cleansed. The trouble and cost are no moment as compared with the consequences which may ensue. Household holders will be astonished in many instances, at the amount and character of cistern mud deposits, and if these are neglected at this season water drawn from these sources may be expected to be more or less offensive. It is quite true that in most instances the cistern is used only for supply of water-closet; but it is equally the fact that in many cases the domestic supply from hot-water pipes for scullery use and of cold water for cooking purposes are drawn from cistern supplies, whilst in some few cases, perhaps, the domestic supply altogether is from this source. At any rate, I strongly advise householders to look to the cistern as a possible source of mischief and of family sickness of a dangerous or fatal character.

JOSEPH BRIERLEY, C.E.

ITALIAN SILVER-GRAY SLATES.

SIR,—We have been much interested by the perusal of the letter in your columns [p. 814, ante] descriptive of the above, and should like to know if the slates referred to are from the same "rock" which supplied this business with a cargo some years ago? If this should prove to be the case, we cannot agree with your correspondent in thinking supererogatory this "silver grey" rival.

Attracted by the moderate price noted by "An English Traveller," our predecessor speculated in the cargo above mentioned; but this sample lot was more than sufficient. The breakage was terrible. Instead of "hardening and becoming like stone," and presenting a substance which "can hardly be broken," the slates crumbled at the touch of the slaters' tools, and split in half when nailed on the roof. Indeed, so far from becoming harder, and excelling in durability, the process of decay set in rapidly, until the surface of the slate could be scraped like chalk.

We may mention that in some cases, for his business reputation's sake, our predecessor supplied other slates by his own expense.

Your correspondent refers to the habit which the slates he describes have of changing colour upon exposure, as a *virtue*. If giving the roof the appearance of being whitewashed be a *virtue* (from an architectural point of view), then the slates were certainly commendable; but, somehow, our customers were unable to appreciate this characteristic. We join most heartily with your correspondent in

wishing every success to the enterprise for developing the natural resources of Italy, but we cannot refrain from expressing a hope that the effort will result in something better and more useful than the sample of roofing-slates which that sunny land supplied to Alfred Braly, to whom have succeeded, yours faithfully,
E. & C. BRABY.

** We have received other letters to the same effect.

STAINED GLASS.

Ventnor.—On Ascension Day a painted three-light window, representing Faith, Hope, and Charity, was unveiled in St. Luke's Chapel of the Royal National Hospital for Consumption, Ventnor, being the gift of Mr. Stafford Henry Northcote and family, in memory of the late Mrs. Northcote, who was a warm friend and benefactress of the hospital. The work was executed by Messrs. Heaton, Butler, & Bayne, of London.

Kington (Herefordshire).—A four-light Munich window has lately been presented to the parish church of Kington, Herefordshire, in memory of the late Dr. G. Footo. The work has been designed and carried out by Messrs. Mayer & Co.

Felsted.—Mr. H. W. Stock and other members of his family have offered to put a stained-glass window in the apse of the chancel of Felsted School chapel, in memory of their relative, Cecil H. Stock, architect, who was at the school from September, 1870, to June, 1877, and who died prematurely in 1883, as we mentioned at the time. Mr. C. H. Stock will be remembered as the author of a useful book on "Shoring."

Burrington.—A stained-glass window has just been completed at the north-west end of this recently-restored church. It is a three-light window, and represents the appearance of Our Lord to Mary Magdalene in the garden. The window, which is by Messrs. Heaton, Butler, & Bayne, of London, is in memory of the wife of Prebendary de Moleyns, vicar of the parish.

Gibbs & Flew (Limited).—An extraordinary general meeting of the shareholders of this company was held at the Cedars Estate Office, on Monday, the 8th inst., when several special resolutions, which were passed at the general meeting held on the 21st of May, were confirmed. The report of the directors, which was duly adopted, after recommending a dividend at the rate of 7 per cent. per annum, proceeded to point out that the constitution of a Limited Company was not suited to the effective and economical carrying on of an active building business, it being impossible to avoid very heavy charges, legal and otherwise, which would not be incurred by a private firm. After some little discussion, it was determined that the Limited Company should resolve itself into a House Property Company, under the name of "The West Kensington Estates Company," and that the whole of the plant, machinery, and building business, and portion of the estates be purchased from the company by Mr. Gibbs and Mr. Flew, for the sum of 70,000l. Messrs. Gibbs & Flew will carry on the business of builders privately, as before.

DESCRIPTIVE GEOMETRY.—PART II.

III.

CONES AND CYLINDERS.

Representation of a cylinder and of a plane tangent to it.

THE cylinder is given by its basis on the plan and the direction of its generators. Every generator will have its projections, G^h, G^v , parallel to the projections of the direction given, therefore they can be readily drawn and, by marking the points where the generators enter the elevation plane, we get the vertical trace of the cylinder.

The plane P tangent to the cylinder along any generator G will be tangent to the base of the cylinder in the point g foot of G , and hereby we get P^h . If P^h meets $L T$ we get hereby a point of P^v and the vertical trace of P is another. If P^v meets $L T$ outside our paper, as in fig. 99, we take a horizontal line of the plane P through a point m of the generator G , and its trace will be a point of P^v . The outline of the cylinder, either in plan or

elevation, are the extreme projections of the generators, such as A^h, A^v on the plan, B^v, B^v on the elevation. (See fig. 99.)

Find a plane, P , tangent to a cylinder, and passing through a point, m , outside the cylinder.

We take through the point m a line parallel to the generators of the cylinder, and find its foot, t , on the plan; P^h goes through t , and is tangent to the base of the cylinder. It will be seen that through t two lines, P^h , could be drawn tangent to the cylinder, and we conclude that through the point m there are two planes tangent to the cylinder. This problem is identical with find the shade of a cylinder lighted by a candle; the limits of the shade would be the generators, G^h , along which the planes, P , are tangent. (See fig. 100.)

Find a plane, P , tangent to a cylinder and parallel to a line, A , given.

Through a point, m , of the line A we produce $m x$, a parallel to the generators of the cylinder; we connect the foot, x and y , of the lines A and $m x$, the trace, P^h , of the plane will be parallel to the line $x y$. Here, again, there are two planes that satisfy equally the question.

This problem is also identical with find the shade of a cylinder lighted by the sun's rays; the limits of the shade would be the generators, G^h , along which the planes, P , are tangent. (See fig. 101.)

Representation of a cone and planes tangent to it.

The cone is given by its basis on the plan, and by its apex, s , any line, G , which connects a point of the basis with the apex is a generator of the cone. The lines A^h are the extreme positions of the plans of the generators G , and, therefore, form the outline of the plan of the cone, and so do the lines B^v form the outline of the elevation of the cone. Given the plan of any point, m , of the cone, we find its elevation by drawing through that point a generator, on the elevation of which we will find the elevation of the point m . (See fig. 102.)

Find a plane, P , tangent to the cone on a point, m , of its surface.

We find the generator G , on which the point m is situated; P^h will be tangent to the base of the cone at the foot of G , and P^v will pass through the vertical trace of G . (See fig. 102.)

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

827, Locks and Bolts. W. C. Jones. The main bolt, which is of peculiar shape, is centred so that it always has a tendency to shoot in virtue of its own weight. It is drawn back by a follower on the knob spindle, and may be locked when shot by a small auxiliary lock.

2,315, Sash Fastening. W. Macvittie. The lever is pivoted on the meeting-bar of the upper sash, a coiled spring on the pivot tends to make it assume a position parallel to that bar. A hollow pillar fixed to a plate is secured on the meeting bar of the lower sash. A catch on a spring riveted to the plate of the fastener engages with a hollow arm when it is drawn across. By pressing the thumb-piece the catch is disengaged and the lever may then be pushed back.

2,777, Wall Ties. W. Monnery. The ties are intended for binding together double walls, between which a space is required, and are made with shoulders to prevent the walls collapsing. The branches within the walls are serrated.

5,396, Flooring Cramp. T. Thornton. The boards are clamped by a sliding-bar driven forward by a lever, which is an end piece falling below the bar. The tongue of the cramp is longer than the ordinary pattern, and when the boards are cramped up, a wedge is driven in allowing the tongue to return to its normal position and releasing the cramp.

6,014, Wall Ventilators. W. Cowell. The ventilator is of a boxlike form, and is provided on the outside with flaps or louvres, with air-spaces between. The bottom louver overlaps the bottom of the box, and each of the others overlaps the top of the one immediately beneath it, so that while permitting the passage of the air from within or without, the rain and moisture are excluded.

10,221, Window Frames and Sashes. R. Mason. The upper sash is pivoted at its centre to the window-frame, the lower one is hinged or pivoted at its bottom edge to the lower bar of the frame of the window. The sashes may be opened by cords for ventilation, &c. A strip of wood or other material is fixed by springs to the joints of sashes and frames to keep them tight.

The moulded articles are partially dried, and coated with white enamel. They are then fired in biscuit kilns, and afterwards coated with glaze, and fired in the glazing kiln.

APPLICATIONS FOR LETTERS PATENT. May 29.—6,521, T. Street, Construction of Lock Bricks and Apparatus for making same. May 30.—6,579, J. D. Denny, Double Lock Tiles for Walls, Ceilings, Partitions, &c., with Box, Plates, &c., for manufacturing same.—6,581, J. Billingham, Steam Excavators.—6,601, H. Lake, Improvements in Pipe and other Wrenches.—6,629, H. Lake, Electric Indicator.—6,639, F. Lyto, Manufacture of Refractory Bricks, Furnaces, Converters, and other Refractory Apparatus and Cement.—6,643, R. Hunter and J. Turnbull, Improvements in Kitchen Ranges.

June 2.—6,583, T. Bradford, Improved Disinfecting Apparatus.—6,675, W. Todd and A. Spedman, Improvements in Window Sashes and Frames.—6,683, P. Davies, Improvements in Fire-plugs and Boxes for Water Mains, &c.—6,693, H. Allison, Link, Mounting Circular Saws for Cutting Piles and analogous operations.—6,704, E. Beech and T. Wigley, Construction of Shutters or Guards for Shop Windows, Doors, &c.—6,705, H. and W. Schooling, Joints for Metallic Windows and Other Frames.—6,712, J. The residence, Florence Grove, and grounds,

JUNE 5. By BEAN, BURNETT, & ELDINGES. Beiford Park—1 and 19, The Avenue, 89 years, ground-rent 12l.

4, 9, 7, and 9, The Avenue, 89 years, ground-rent 39l.

Life interest in 282l. 9s. a year, secured upon shares in limited companies also a policy for 600l., life aged 54.

MEETINGS.

MONDAY, JUNE 15. Liverpool Architectural Society Junior Debating Club. Mr. T. J. Dalsiel will open a discussion on "Early Gothic Vaulting."

Investors' Institute.—8 p.m.

WEDNESDAY, JUNE 17. Royal Meteorological Society.—15 papers to be read 7 p.m.

Builders' Foremen and Clerks of Works' Institution. Ordinary meeting, 8.30 p.m.

Manchester Society of Architects.—General Meeting 3 p.m.

Society of Engineers.—Visit to the Tilbury Docks.

THURSDAY, JUNE 18. Society of Antiquaries.—8 p.m.

Dundee Institute of Architecture.—Business meeting and Election of Officers, &c.

Miscellaneous.

Sewer Accidents.—A serious accident happened at Kingsland, whereby two workmen named George Pimm and George Cobb, in the employ of Mr. W. Rigby, contractor for the Holloway and Northern High Level Sewer relief lines, have lost their lives.—Another serious accident, though fortunately not attended by loss of life, occurred on Monday evening near the Sloane-square Station of the District Railway, where a new sewer has for some time been in course of construction by the Metropolitan Board of Works. It is an iron one, and runs parallel with the old brickwork sewer which it is designed to replace. Shortly after three o'clock in the afternoon, the old sewer, which though still in use, appears to have been in a very unsatisfactory state of repair, suddenly burst, and discharged its contents through a cavity in the railway tunnel, which had been made to admit of the necessary operations in the construction of the new sewer. The station at Sloane-square soon became flooded with the matter which poured into the tunnel, and all traffic was necessarily brought to a standstill.

The Sanitary Institute of Great Britain will hold its Autumn Congress at Leicester from September 22 to 26 inclusive. The President of the Congress is Professor de Chaumont, the Sectional Presidents will be, in the department of "Sanitary Science and Preventive Medicine," Mr. Arthur Ransome; in the section of "Engineering and Architecture," Mr. Percival Gordon Smith; and in that of "Chemistry, Meteorology, and Geology," Mr. William Marcell, M.D., F.R.C.P., F.C.S., F.R.S. Papers are limited to twenty minutes in reading, and the discussion upon them to ten minutes each speaker. Each author should prepare an abstract of his paper and send it, together with the original manuscript, by hook-post, on or before August 26th, addressed to the Secretary, Sanitary Institute of Great Britain, 71a, Margaret-street, W.

The Albert Palace, Battersea Park, was opened on Saturday last, under very depressing circumstances so far as the weather was concerned. Nevertheless, the proceedings of the day argued well for the future of the Palace, which has already been described at some length in our columns.

Annual Dinner of the Architectural Association.—The retiring President, Mr. ole A. Adams, presided at the dinner on Wednesday last. There were not so many members present as usual, but the Duke's alou at the Holborn Restaurant was com- rately filled. The toast of the "Army and y, &c." was proposed by the President and sponded to by Mr. Henry Lovegrove, who rferred to the work of the Association, with hich he had been so long connected. Mr. ashill proposed the toast of the "Royal Insti- te of British Architects," and Mr. James ooks responded in a most able and energetic ay. Mr. Robinson proposed the "Visitors," nd Mr. W. P. Appleton (brother of the honorary ecretary) responded. Mr. Horace Cheston roposed the "Officers of the Architectural ssociation," and Mr. Douglas Mathews, Mr. rrett, and Mr. Berry responded. Mr. W. P. ppleton gave two capital recitations, and Mr. G. K. Killmister delighted the audience with his ianoforte performance.

The North Sea and the Baltic Canal.—The project for a sea canal across Holstein, nnecting the Baltic with the North Sea, pears at length to be on the point of realisa- on. The details which have just been sub- mitted to the Chancellor, Prince Bismarck, and rferred by him to the Prussian State Council, s well as to the Federal Council, will, it is understood, receive the formal approval of hose bodies at their next meeting. The esti- mated cost of the work is 156 million marks, or 800,000l., of which sum Prussia will find two millions and a half sterling, the remainder eing contributed by the other German States.

Wood Block Flooring.—Messrs. Geary & Walker's patent system of wood block floor- ing has recently been laid at the Royal Eye ospital, Manchester; Post-offices at Leeds, Liverpool, and Doncaster; St. Chad's Church, Ayr, and other places. It is also being aid at Glossop Hall, for Earl Howard; churches t Shilbottle, near Newcastle-on-Tyne; Wednes- day and Stoneford, near Accrington; also at several schools, hospitals, &c. We have drawn tention to Messrs. Geary & Walker's system of flooring previously, but may add that they how samples at the Inventions Exhibition.

New River Bridge betwixt Sunderland and Durham.—As an important district public improvement the erection of a new bridge over the river Wear at Low Coken has lately been commenced. The contract for masonry and piling has been let to Mr. R. Allison, builder, Sunderland, and the wrought-iron lattice girders, of 120 ft. span, with Lindsay's patent trough steel flooring, to Messrs. Head, Wrightson, & Co., Stockton-on-Tees. The works are being carried out from the plans and superintendence of Mr. D. Balfour, Assoc. M. Inst. C.E., Houghton-le-Spring, Sunderland.

New Mission Hall, Lavender Hill.—A new Mission Hall, in connexion with the Church of the Ascension, was commenced on Monday last. It is to be built in two portions, each to accommodate 500 adults, at a total cost of 2,667l. Mr. Charles Ansell, of York-street, Lambeth, is the builder. The architects are Messrs. Romaine-Walker & Tanner.

Female School of Art.—By command of the Queen, a fan has been designed and painted on silk by Alice Elfrida Manly, which is intended as a gift from Her Majesty to the Princess Beatrice on Her Royal Highness's approaching marriage.

Wilberforce Mission House, Newington Butts.—On Monday last the new works to the above were started by the Bishop of Rochester and Trustees of the Wilberforce Memorial Fund. In August last the Rev. C. H. Grundy entered the new house as first Wilberforce Missionary. The work has increased to such an extent as to demand the addition of a large reception-room for meetings of associations and persons engaged or interested in Church work in South London. An admirable site has been secured adjoining the Mission House. Messrs. H. Burman & Sons were builders to the work last year. Mr. Frederick Higgs is the builder of the additions. The entire works have been carried out from the designs and under the superintendence of the architects, Messrs. Romaine-Walker & Tanner, of Buckingham-street.

Inventions Exhibition.—We are informed that Messrs. W. H. Lascelles & Co. have supplied the walnut doors and fittings in the Council-room of the International Inventions Exhibitions.

For New Central Stores, Newgate-street, Newcastle-on-Tyne, for the Newcastle-on-Tyne Co-operative Society, Limited. Mr. Edward Sawbros, F.R.I.C.A., architect, Newcastle-upon-Tyne.—

TENDERS.

For rebuilding Knighton Workhouse, for the Guardians of Knighton Union, Radnorshire. Messrs. Jones & Parks, architects, Newtown. Quantities not supplied.—

Thomas, Watkins, & Jenkins, Swansea	£8,630 0 0
Price & Davies, Knucklins	7,969 0 0
Wells, Ludlow	7,450 0 0
E. Davies & Son, Newtown	6,751 0 0
Bowers & Co., Hereford	6,659 0 0
J. Williams, Knighton	6,659 0 0

* Accepted, after reductions, at 6,902l.

For the erection of four shops, Russell-street, Strand. Mr. J. Platt Lofthouse, C.E., architect.—

Geo. Drew, Chalford	£2,700 0 0
Bowers & Co., Hereford	2,519 0 0
Jas. Greenleaf, Stroud	2,300 0 0
W. Harper, Stroud	2,143 13 0
English & Son, Stroud (accepted)	1,975 0 0

Accepted for erecting the St. James's Temperance and Mission-hall, Royst-road, Kennington Park. Mr. Banister Fletcher, architect.—

Aldridge & Jenvey	£2,650 0 0
-------------------	------------

[No competition.]

For alterations at the "Star," corner of Old-street, City-road. Mr. R. A. Lowcock, architect and surveyor, Bishopsgate-street Within:—

Table with 2 columns: Name and Amount. Includes Battershill, Jackson & Todd, Marr, Anley, Walker, Steele Bros.

For the formation and metalling of new roads, and the laying of 6-inch pipe-sewer, on the Grengre-road Estate, Cambridge, for St. John's College. Mr. J. Carter Jones, surveyor, Cambridge:—

Table with 2 columns: Name and Amount. Includes Wm. Saint, Swann Bros, Geo. Honour, Thoday & Son.

For stabling and lodge, at Kidderminster, for Mr. M. Tomkinson. Mr. J. M. Gething, architect:—

Table with 2 columns: Name and Amount. Includes R. Thompson, Binnian & Son, Howard & Sons, H. Smith.

For office screens and fittings, at Kidderminster, for Messrs. R. Smith & Sons. Mr. J. M. Gething, architect:—

Table with 2 columns: Name and Amount. Includes Howard & Sons, Field, Snowdon, W. Atkins.

For new school for girls at Folkestone, for the Kent Wesleyan Methodist School Association. Messrs. Buck, Sand & Smith, architect, Maidstone. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes C. J. Slade, Hayward & Paramor, H. Clemmuss, Wm. Brooks, H. M. Moody, E. Webster, Geo. Prebble, W. J. Wild, E. C. Howell & Son, J. Bingham, H. Urwin, Walks & Clements.

For alterations to No. 43, Great Russell-street, and No. 33, Duke-street, W.C., for Messrs. Jones & Willis. Mr. A. B. G. Feunig, architect, 10, Lincoln's Inn-fields:—

Table with 2 columns: Name and Amount. Includes T. Rider & Son, J. Hooper.

Accepted for building new board-room and lavatories, and for other alterations, at No. 3, Great College-street, Westminster, for the Lancashire and Yorkshire Railway Company. Plans, specification, and designs by Mr. James Norris, surveyor, Vauxhall Bridge-road, Westminster:—

Table with 2 columns: Name and Amount. Includes Frederick A. Anear, Westminster.

Accepted for the erection of shops and cottages in Bridge-street, Greenwich, for Mr. Blackman. Mr. R. W. Crawley, architect, Trinity-square, Tower-hill:—

Table with 2 columns: Name and Amount. Includes H. L. Holloway.

For painting and repairing works at the Infirmary and Workhouse in the Fulham-road, for the Guardians of the Poor of the St. George's Union. Mr. H. Saxon Snell, architect, Southampton-buildings:—

Table with 2 columns: Name and Amount. Includes W. Bamford, Vigor & Co, C. F. Keadley, Munday Bros, Hindman & Worsley, F. Stevenson, W. Brown, W. G. Lily, Dicksee & Dicksee.

For sewerage, kerbing, channelling, and making roads and paths to east end of South-street, Colchester. Mr. G. H. Page, surveyor, Trinity-chambers, Colchester:—

Table with 2 columns: Name and Amount. Includes G. Leo, C. Cappin, A. Gladwell, G. Bowles.

For external painting at the school, &c., and internal decorative repairs, at the Asylum for the Deaf and Dumb, near Dartford, Kent, for the Metropolitan Asylums Board. Messrs. A. & C. Harston, architects, Leadenhall-street. Quantities not supplied:—

Table with 2 columns: Name and Amount. Includes H. H. Swan, W. Reid, A. W. Derby, M. McCarthy, Dicksee & Dicksee, Gibbin & Son, F. Stevenson, W. G. Lily, R. Proctor, Woolwich (accepted).

Accepted for alterations to the Imperial Hotel, Clacton-on-Sea, for Messrs. T. Daniell & Sons, West Bergholt. Mr. J. W. Start, architect, Colchester:—

Table with 2 columns: Name and Amount. Includes H. Wilkinson.

Making-up Mount View-road, Stroud-green.—Mr. Wm. Nicholls, road and sewer contractor, of Irurro-road, Wood-green, writes:—"Will you be kind enough to correct the list of tenders which appeared in your issue of the 6th [p. 818], for making-up Mount View-road, Stroud-green for the Hornsey Local Board. They evidently should not have been published. My tender having withdrawn, my tender being next lowest has been accepted. The last two items on the list should have appeared as follows:—

Table with 2 columns: Name and Amount. Includes Wm. Nicholls, A. Walker, W. G. Lily.

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 36, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS. A. D. & Co.—R. & E.—B. E.—"Bunderbus" (write to the Secretary of the Surveyor Institution)—J. B. (ask a lawyer)—G.—W. R. M.—E. L.—"170" (we have no greater facility for getting the information than you have)—H. M.—J. B.—Messrs. E. A.—J. C. B.—H. H. A. (thanks; sketch shall be duly returned)—"Doubtful" (there is no direct precedent as regards a Surveyor, but it seems clear that the Surveyor would not be liable unless he had been negligent or utterly ignorant of his business. See the point shortly discussed in "Notes on the Building Code," p. 818.)

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. The responsibility of signed articles, and papers read at public meetings, rests of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about ten words) 6s. 6d. Each additional line (about ten words) 0s. 6d. Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitive Contracts, Sale by Auction, &c., may be obtained on application to the Publisher. FOUR Lines (about THIRTY words) 2s. 6d. Each additional line (about ten words) 0s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. * Stamps must not be sent, but all small sums payable by Cash in Registered Letter or by Money Order, payable at the Post-Office, Covent-garden, W.C. DOUGLAS FOURDRINER, Publisher. Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. sent at the Office in reply to Advertisements, and strongly recommends that of the latter OFFERS ONLY should be sent.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY'S evening.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 36, Catherine-street, Covent-garden, W.C. advantage are sent, together with sufficient stamps to cover the postage.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied proxy from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum, payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Best Bath Stone. WESTWOOD GROUND, Box Ground, Combe Down, Corsham Down, And Farleigh Down. RANDELL, SAUNDERS, & CO., Limited, Corsham, Wilts. [Advr.]

Bath Stone. ALL DESCRIPTIONS OF BEST QUALITY.

PICTOR & SONS, BOX, WILTS. [Advr.]

Douling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Douling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, No. 16, Craven-street, Strand, W.C. [Advr.]

Douling Free Stone For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke - under - Ham, Ilminster. [Advr.]

Asphalte.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 33, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Advr.]

Asphalte. Seyssel, Patent Metallo Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [Advr.]

EVERY DESCRIPTION OF SEASONED WOODS AND VENEERS IN EXTENSIVE QUANTITIES.

B. J. HUDSON & SONS, Whitfield-street, W. Store-street, W.C., and Great Peter-street, S.W., London. Telephone No. 3,654, and Private Wire connecting Business Premises.

MICHELMORE & REAP, Manufacturers of

Crowe and Cavalcaselle's Life of Raphael.

THE second volume of Crowe & Cavalcaselle's "Life of Raphael" has certainly not been expected with very much impatience; nor is the fact at all hard of explanation. The co-ordination of our knowledge of the history of early Italian art was a work never thoroughly attempted, and certainly never approximately accomplished, till the authors of the "New History of Painting in Italy" took it in hand. Their labours were crowned with that highest of all success, which is proved by the fact that students instructed by their history have been enabled to advance beyond it, and to discover and manifest its shortcomings. A new generation of careful students of art history has arisen, furnished (owing to the vast preliminary labours of Crowe & Cavalcaselle themselves) with a critical apparatus of continually increasing complexity and exactness, and the honest and thorough forerunners, to whom we owe so much, are in danger of being thrown into the shade by students who, but for them, could not have attained the knowledge they possess.

The life of Raphael † offers no such vacant field as the early history of Italian art presented a few years ago. Raphael has been the subject for one biographer after another, and since the appearance of Passavant's work the amount of new matter likely to be brought together by a new biographer has always been relatively small. Nevertheless, in the last few years two important lives have appeared,—the German hook upon Raphael and Michelangelo, by Anton Springer, and the French Life of Raphael, by Eugène Müntz. Morelli's "Italian Masters in German Galleries" has likewise thrown a powerful new light upon the course of the great artist's early development. Altogether, there remained little for Messrs. Crowe & Cavalcaselle to discover, or even to re-arrange.

The disappointment caused, not in England only, but amongst all lovers of art in Europe, by the perusal of the first volume, arose, not because the book contained no new facts of importance, but because it neglected to make due use of the work done by Morelli, Müntz, and others. It took, in the opinion of the

majority of competent critics in England and abroad, a false view of the nature of Raphael's early career. It held Timoteo Viti to be Raphael's pupil rather than his teacher, and it accepted the so-called Venice Sketch-book as the product of Raphael's boyish hand. These two false judgments greatly diminished the value of the first volume.

The second volume deals with the last part of Raphael's career, from the time of his arrival in Rome to his death. In this period there are few such burning questions for a biographer to deal with. We know practically everything needful about the course and influences of his life. His pictures and drawings manifest a steady progression in a definite direction, and documentary evidence of various kinds exists in tolerable quantity. The character of the second volume could thus be foretold beforehand. There is little to correct in it, and there is little likely to attract. It is a solid piece of work, full of facts, duly catalogued, co-ordinated, and indexed. Its price is kept moderate by the omission of all illustrations, which the rapid increase in the number, excellence, and accessibility of photographs renders no longer needful. In this connexion, however, it is unfortunate that the authors have not given the names of the photographers and the numbers in their catalogues of the photographs of the pictures and drawings referred to. The example set in their German edition of the "History of Flemish Painting" might have been followed here with great advantage. A chronological list of the genuine pictures and drawings referred to would not have been difficult to construct and would have been useful to all students, besides that it would have given relief to the crowded alphabetical index.

The book is clearly the result of a great deal of work and research, but what is new in it is chiefly conjectural. Page after page presents its crop of suggestions, of possibilities, of probabilities more or less modified. Such a picture may have been suggested by such an event; such a drawing by the work of such and such an artist. Of this kind of thing we can readily have too much. Even the most specious conjectures are poor food. The worst of it is that sometimes, by the mere lapse of a few pages, a conjecture is turned into a fact. This is an old failing of our authors. It is one of their most annoying idiosyncrasies. Unless the reader be careful and critically disposed, he is liable to go away with the impression that a thing actually was the case when in reality it may have been quite otherwise.

This Bramante's connexion with Raphael assumes in this "Life" a more definite form than recorded facts can be quoted to prove. We know that the architect and the painter

were close friends, and that Raphael was on more than one occasion dependent upon Bramante for advice in architectural matters. But the exact nature of their connexion is not so clear as Crowe & Cavalcaselle would lead their readers to imagine.

One of the most interesting portions of the book is that which deals with Raphael's architectural works. When Bramante died in 1514, Raphael was appointed to succeed him as architect of St. Peter's. He immediately prepared a model and estimates, which, however, have not come down to us. Bramante's first idea was to build an edifice upon a plan of the form of a Greek cross, covering an area of about 26,465 square yards. He soon had to abandon these gigantic proportions. When the four great piers of the dome had been raised to a considerable height, their foundations were discovered to be insecure. Other defects in Bramante's scheme likewise made themselves manifest, and corrective measures had to be taken at a very early date. When the building was committed to Raphael he made no less alteration than the substitution of a Latin for a Greek cross in the plan. "The way in which Raphael worked out his design was severely criticised by contemporaries, and condemned by Michelangelo. Antonio Picconi da San Gallo ventured to call Raphael's aisle a lane; he pointed out defects in the ambulatories at the heads of the transept and choir, blamed the distribution of the weights on the pillars of the tribune, and the poverty of the cornices and their projections. But when Michelangelo afterwards came to express an opinion on Picconi's own plans he dealt blows of quite another kind, and called Antonio's model 'food for beasts and oxen, who knew nothing of architecture.'" "There is reason to believe," say Messrs. Crowe & Cavalcaselle, "that Raphael's talent as an architect was more genial than profound"; and in this judgment they are probably right. He could conceive a gracefully-proportioned general design, but he had not training and experience to enable him to follow it out in detail. Instead of being the master over his assistants, he was their slave. As long as Bramante lived, Raphael's lack of thorough knowledge of this branch of art was not perceived. He is said to have gone to Bramante for the designs which he employed in the backgrounds of his frescoes of the "School of Athens" and Heliodorus. He was only acquainted superficially and at second-hand with the writings of Vitruvius, until he got Mario Fabio Calvo to translate them into Tuscan for him. How lacking Raphael was in genuine architectural feeling is shown by his treatment of the two-storeyed *loggia* erected in the Vatican by Bramante. Raphael, without

* "Raphael: his Life and Work." By J. A. Crowe and G. B. Cavalcaselle. Vol. II. London, 1885.
† We adopt the spelling "Raphael," instead of "Raffaello," in accordance with the title of the book.

considering the strength of the structure, built on a third story, and then found himself obliged to close the arches of the lower colonnade to prevent the whole thing from crumbling to pieces.

Fortunately Raphael did not make much impression on St. Peter's during the time it was under his charge. The works went forward in a very leisurely fashion, so that when Michelangelo was placed in command, he was able at once to return to Bramante's scheme and continue that with slight modifications. But it must not be supposed that Raphael was half-hearted in his architectural studies. On the contrary, for a time, he was thoroughly absorbed in them. When he was painting in the Camera della Segnatura and dell' Eliodoro, he devoted much of his attention to the designing and execution of the frescos, but the Camera dell' Incendio was chiefly the work of his pupils; he did little more than generally oversee the work. Besides St. Peter's, Raphael is accredited with a good many architectural works. It is true Vasari's statements are couched in ambiguous form. For the Villa Madama, for instance, Raphael is said to have furnished the design, but the drawings made to scale, now in the Uffizi, are by Antonio da San Gallo. The "designs sketched" for S. Giovanni of the Florentines at Rome, and S. Lorenzo at Florence, were never carried out; whilst the Palazzo Pandolfini, for which also he "sketched" a design, was not begun till after Raphael's death. As for the Chigi chapel at the church of S. M. del Popolo, it is by no means certain that Raphael had anything to do with the structure, whilst his connexion with the Farnesina is involved in much obscurity. Altogether, it is probable that Raphael did little more than give to trained architects suggestions upon the practicability of which they had to decide. If possible, they carried them out, with the useful modifications; if impossible, they simply laid them on one side. In fact, Raphael's connexion with architects was just like Dürer's. Builders, sculptors, amateurs, all came to Dürer for suggestions, and they got what he had to give, and made whatever use of it they could. In this respect there is a great contrast between Raphael and Michelangelo, for Michelangelo was at heart a sculptor and an architect. The monumental structure of things fascinated him, and not their momentary outside appearance.

The second volume of Crowe & Cavalcaselle's "Life" is, of course, mainly devoted to Raphael's work as a painter. Each of his frescos and pictures is very fully investigated and unnecessarily fully described. Unless the reader have some kind of reproduction at hand the descriptive matter is wearisome, and in face of an illustration it is useless. Moreover, the descriptive passages themselves are often far from felicitous. The main virtue of the book, as it seems to us, is the thorough manner in which the authors have worked the history of the time into their discussion of the artist's works. They have made every possible use of contemporary documents and of the labours of others in the same field, and they have thus been enabled to approximate still further towards an accurate chronology. The period in the year 1511 at which Raphael finished the frescos in the Camera della Segnatura has been fixed by them with much probable correctness. They show that in the month of August both the walls of the Camera della Segnatura and the finished portion of the roof of the Sistine Chapel were bared for inspection. Several other such points of minute chronology receive discussion, and in more than one instance a welcome light is thrown upon what was previously obscure. We need not, and we do not, always agree with our authors' conclusions, but we cannot refuse them our thanks for untiring patience expended by them on our behalf.

It is the more annoying, therefore, to be obliged to say that much of the work the authors must have gone through has been wasted when it might have been turned to good service. There is no doubt that they have read the Raphael literature with much care, yet again and again they come to and

pass by controverted points without so much as a hint that the conclusions adopted by them have been already widely disputed. Just as in the first volume they assigned (without a word on the other side) the "Apollo and Marsyas" to Raphael,—a picture now almost universally accepted as by Perugino,—so in this volume they devote some three pages to the so-called "Fornarina" of the Barberini Palace, without so much as hinting that the large majority of students of Raphael consider him to have had no hand in its production.

In discussing particular pictures, they talk very glibly of the share this and the other assistant took in the work. They see here the hand of Giovanni da Udine, there that of Gian Francesco Penni, or Giulio Romano. It is impossible for a reviewer to express a decided opinion off-hand about the correctness of such discriminations, but their mere multitude is startling, and the *ex cathedra* tone in which they are pronounced is far from being reassuring. In one or two instances we know that we disagree with Messrs. Crowe & Cavalcaselle's conclusions, but it is only the experience to be derived by using their book in the face of the pictures themselves that can enable the formation of an authoritative judgment upon its merits in this respect. We have had occasion again and again to disagree with similar discriminations introduced by the same writers into their earlier works, which we have tested line by line in many a church and gallery. In this last hook of theirs the number of such authoritative statements is far increased, and they are just as tyrannically expressed as ever. We cannot but feel more than usual distrust in results so stated.

Our chief objection to the book as a whole is that it is merely a "life" of the same type as those that have gone before it. It is not, and does not attempt to be, final. It goes a step further in preparation of the way; it does something towards removing misconceptions, rectifying dates, and defining the existing productions of Raphael's art. It makes no real attempt to grasp the whole area of the man's work, and wrench forth from the tangle of tale and legend the man himself. If all Raphael's pictures were to be destroyed from the face of the earth, as, in the nature of things they some day will be, this "life" would avail no more than any of its predecessors to give to the memory of Raphael himself an enduring monument. The business of a biographer is not to index and arrange the works of his subject, but to manifest for all time the manner of man that he was. If no painting by Fra Angelico existed the artist-friar would still be a recognisable individual, owing to the vivid sketch of him printed amongst Vasari's "Lives." To all lovers of Raphael's art the painter's personality is well known. We want some biographer to come forward and make it his business to express that personality in writing. We want a psychological study of the man's mind to be made by some one capable of looking below the surface of a picture and seeing something more in it than an historical puzzle. It need not be said that the author who alone can produce such a hook must be himself an artist. Of course he must, but the artistic spirit is by no means rare. It can be traced in every mind, usually in a retrogressive condition. It needs fostering to make it a formative power. Let the historians of art of our day set themselves diligently to manifest not so much the technical as the spiritual development of the artists of the past; let them hear continually in mind that the interest in every picture lies not in the chance circumstances by which its making was surrounded, but in the "pictorial idea" it was produced to express. We shall then have volumes upon art history, whose interest will be lasting, and independent of the immediate proximity of the works referred to. Much of the writing upon art in the present day is mere cataloguing in disguise, and if Messrs. Crowe & Cavalcaselle had thrown two-thirds of their present book into catalogue form it would have been more useful to the student, and the residuum would have been more interesting to the ordinary reader.

ANCIENT LIFE FROM ANCIENT MONUMENTS.

NO works could he in form, manner, and intention more unlike than the two we here place together.* But they have this in common that they both represent the modern classical tendency to seek for knowledge of ancient life, customs, thought, religion, by examination of evidence rather monumental than literary. The archaeologist is much abroad to-day, the verbal scholar can no longer hold his old exclusive monopoly. Each must help the other if both would not perish in an interminable struggle.

We called attention to Dr. Baumeister's "Denkmäler" when the first number appeared and now that fifteen numbers have been issued amounting to six hundred pages of text, six hundred-and-thirty-five letterpress illustrations, and six full-page plates, it is time to ask whether the book fulfils the great expectations roused by the prospectus put forth a year ago. A very difficult task was before the editor: he proposed to lay under contribution the whole field of Greek and Roman art, so far as it could illustrate in any way any department of ancient life, and this was to be in dictionary form. The obvious difficulty of classification at once appears, and we do not think it is always quite happily overcome. For example, under the head "Laokoon," we should naturally expect to find the well-known Vatican group, but, as a matter of fact, we do not; the group appears under the heading "Agessandros," and though the classification is no doubt perfectly just, we doubt whether five out of six of the general educated public would be able to supply the necessary link. It seems, indeed, a general principle throughout the book that the *sculptors' names* should dominate classification. The editor even goes so far as to give us the lives of sculptors (e.g., Agoracritos) of whom no works survive at all. This, in a book entitled "Denkmäler," seems a little odd. Considering the title, we think throughout that the text, admirable though for the most part it is, has somewhat disproportionate space.

Turning to the illustrations, we note that where they are reproduced from original photographs they are done by the new Meissenbach process of "autotype." We are not quite sure whether this differs in any important way from the excellent process employed by Mr. Frætorius for the new British Museum illustrated guides. Both seem to have in common the ingenious factor of a line produced upon a photograph by taking a plate through the medium of some textile fabric, whereby printing is rendered possible. We note in the Meissenbach process that, faithful in the main though they undoubtedly are, and far preferable for archaeological purposes to the old falsifications of engraving, they yet suffer badly from the old light and shade difficulty, which in some cases amounts to positive distortion. The ideal method of illustrations combines the photographic basis with the final touch of the understanding artist; but this, alas! like all good things, is costly. Whether a method of reproduction really good, yet cheap, is possible, we venture to doubt; meanwhile we may well be thankful for "autotype."

Turning to individual articles, that on the "Alphabet" stands pre-eminent for completeness and for what is in this work a rarer quality, brevity. The tabular view of alphabets, Sæmic, Greek, and Latin, is simply delightful. The article on Athens is full and good, but it suffers from Dr. Baumeister's method of classification, for the important Varvakeion statue, the best reproduction of Athene Parthenos is reserved, evidently for the Phœdrias article. We are shocked at the plate representing the Acropolis, but we hope Mr. Freeman will buy a copy of the book at once,

* "Denkmäler des Klassischen Alterthums zur Erläuterung des Lebens der Griechen und Römer, in Religion, Kunst, und Sitten." Letztlich bearbeitet von B. Arnold, H. Blunier, W. Deecke, K. von Jan, L. Julius, A. Milchhöfer, O. Richter, H. von Rohden, R. Weil, B. Wölfflin, und dem Herausgeber A. Baumeister, mit etwa 1,400 Abbildungen, Karten & Farbendruckern. München und Leipzig: Oldenbourg, 1884, &c.

* "Mythologie Figurée de la Grèce." Par Maxime Collignon. Paris: A. Quantin, 7, Rue St. Benoît (Bibliothèque de l'Enseignement des Beaux Arts).

for there, well in view we have the Turkish tower which Pheidias never knew, and which the next generation will never see, and which, however dear to the mind of the comparative historian, can have no place in a book entitled "Denkmäler des Klassischen Alterthums." We do not think that the autotype process is at all successful for landscapes: we seem to see architecture and landscape alike through a piece of intervening muslin. We believe that many of the articles were already written before the first issue, but we think more pains might have been taken to revise them up to date; the article on "Chiton" might have been much improved if the author had read the "De Vestiaris Græcorum" of Dr. Boehlan, a tract which throws new light on the whole subject of Greek dress. Again, in the article on "Aerzte" (Physicians) the whole of the discoveries recently made in connexion with the Asklepeion, and recorded in the *Ἐπιγραφαὶ Ἀρχαῖαι*, are simply ignored: no one is more wishful than we are ourselves that this periodical could be persuaded to appear in any language except its own, but as that is improbable the duty of reading it remains. Dr. Baumeister has drawn such abundant and excellent illustration from vase-paintings that we wonder to see him wholly ignore vase-painters. He gives us, as we said before, an article on Agonismos, of whose works we know nothing: why does he ignore such vase-painters as Brygos, Duris, and Euphrosion, from whose works he is so ready to draw information?

But enough of carping: the book is, in method and completeness, far before anything we have, or are likely to have, in England. Specialists in each subject may grumble that each article is not posted up in the last new theory, but every student, and especially every schoolmaster, ought to rejoice that he has ready to hand the means of *realising* his literary work, of verifying his classical teaching. A first-rate index will simplify many complications, and we may add an English translation would be welcome to many who do not love to labour in the German idiom.

No one need wait for a translation to enjoy M. Collignon's "Mythologie Figurée." The book is just one of those light, delicate bits of popularisation which the first-rate French savant from time to time delights to give us, and which, after laborious acquaintance has been made with a subject, are so pleasant to read. The subject is touched so delicately that we sometimes wonder if due impression can be made on minds not already prepared. Figured mythology, or mythology from the monuments, is a subject of which hitherto we have had no handbook. We have had manuals of mythology illustrated from monuments, but that is not the same thing. What M. Collignon does is to build up the type of the god or goddess out of the representations ancient art has left us, to show us step by step how the formless stone, the *βασιλεύς*, grew by successive developments into the Athens of Pheidias or the Hera of Polycleitos. Before he takes the individual gods in succession he gives us an interesting chapter on the general subject of the "formation of figured types." "A Porigine cæme s'il faut en croire les textes anciens, le culte religieux s'adressait aux objets naturels que la divinité était censée remplir de sa présence. L'Artemis Soteira de Boie était un myrte, et à Orehomène une statue de la déesse, placée dans les branches d'un cèdre, consacrait le souvenir de l'antique dévotion à l'arbre sacré." The why of this worship M. Collignon is happily not called upon to decide. He may hold with Mr. Max Müller that the sight of the tree awakens "the awe-struck thought of powers infinite, invisible, divine, that the tree possesses a kind of life, an unknown and unknowable yet undeniable something," or he may be a reader of Mr. Lang, and have thereby lost his illusions; he may believe that tree-worship arose from the hope of catching a resident "possum," or a desire to tap the trunk for honey, or "probe in the bark for grubs." By the first illustration he gives we think M. Collignon inclines to this base, utilitarian creed. He figures the delightful coin of Myra, in which a rude

image of Kybele, the mother of the gods, is perched, half tree herself, among the branches of the tree. The practical savage, says Mr. Lang, even if he worship the tree for its grotesque form and tremble at the thought of the "boilyas" in its branches, will yet, probably, deal with the problem of its occult life by burning it round the stem, chopping its charred wood with stone axes, and using bark and branches as they came handy. This is just what is happening on the Myra coin, but we regret to say the print is so bad that few could make out the scene unless it was familiar. Two sacrilegious savages with their axes are chopping away at the tree, but the boilya does not gladly suffer their sacrilege. She sends out two rearing snakes to slay the impious ones.

The charm of M. Collignon's book is that he begins always at the beginning. We are introduced to no full-blown gods and goddesses. He understands to the full the charm of the *origines* of things. Though the remoter branches of archeology are freely laid under contribution and much obscure literature has been ransacked, yet we have no heavy pedantry; always the same light hand. Of course here and there we could wish a change. When the type of Athene Parthicos is in question we must, no doubt, have the Varvakeion figure, done to death though it is, but why not add the beautiful Petersburg medalion, with its grave, gracious style, full of the spirit of Phidias, and unique as a close reproduction of ehyselephantine style? M. Collignon is far at his best among archaic types. He flags a little (but who would not?) in Greco-Roman art.

SEWAGE AT AYLESBURY.

THE directors of the Native Guano Company have just published the Report of the experiments recently made on the A B C process by Dr. Tidy and Professor Dewar, the results of which, as recorded in diagrams and tabulated statements, certainly go far to establish the fact of its producing a satisfactory effluent. The experiments were conducted very carefully, precautions having been taken to guard against a possibility of particularly favourable or unfavourable conditions influencing the results, by collecting samples of the raw sewage and effluent every half-hour, and mixing equal portions of four consecutive half-hour samples for chemical examination. By this means, three series of experiments were obtained, differing in the quantity as well as in the strength of the raw sewage to be dealt with. The mode in which the process is carried out appears to be that the B C mixture is first run evenly into the sewage and completely and immediately deodorises it, no escape of offensive odours into the surrounding air taking place. The Alum solution is added afterwards, as it was found that the addition of the precipitating ingredients separately afforded better results.

In the first series of experiments attention was more especially directed to the matters in suspension and solution, both in sewage and effluent, and the relation between the organic and inorganic portions respectively, the quantity of organic matter being determined by the amount of oxygen required to oxidise it, and which was found to average 1.795 grains per gallon in the sewage, and 0.522 grain in the effluent, showing that 74.8 per cent. of the organic matter had been removed. Of the suspended matter, 89.3 per cent. had been intercepted, while the ratio of inorganic to organic matter was in the sewage as 1 to 1.18, and in the effluent as 1 to 6, which showed that the suspended matter left in the latter was principally organic. The matters in solution yielded a mean of 46.3 grains per gallon in the raw sewage, and 57.5 grains in the effluent.

The second series of experiments was devoted to a consideration of the character of the organic matter, both in the sewage and effluent, before and after filtration. The results obtained showed that 83.3 per cent. of the oxidisable organic matter had been removed by

the treatment in the unfiltered state, and 61.4 per cent. from the filtered sewage; also that one-seventh of the organic matter in the sewage, and one-sixth of that in the effluent, was volatile. The suspended matter removed in this series reached as high as 96.8 per cent., while a great improvement in the deposition of the sludge over that observed in the first series was apparent, although the quantity of precipitating material used was only slightly more than one-third of the total weight of sludge produced. This series of experiments was characterised by a very large flow, a greatly increased strength of sewage, and the improved working of the process.

The third series was taken principally on account of the very dry weather which had been prevailing, and the consequent unusual strength of the sewage. The results showed a removal of 86.3 per cent. of oxidisable organic matter, while the removal of the suspended matters, notwithstanding they reached the abnormally large amount of 246.3 grains per gallon, was so complete that the effluent was devoid of turbidity, and contained only 0.98 of a grain. The conclusion arrived at is that the A B C process is capable of producing a uniform effluent under very varying conditions and degrees of concentration of the sewage.

After concluding the experiments with the first part of the process, viz., the purification of sewage, the second process,—that of the drying of the sludge, and its conversion into a saleable manure under the name of Native Guano,—was subjected to examination.

The manure is, in fact, only the partially dried precipitated sludge mixed with some sulphate of magnesia and ground. One curious feature of the process is, it is explained, the large amount of heat developed in the interior of the heaps of the cylinder-dried manure both before and after grinding, which continues for many months in the stacked manure without any apparent diminution, reaching a maximum temperature of 113 deg. Fahr., at which it remains, without emitting steam or any apparent sign of heating on the surface of the heap, until it is turned over. Instead of any loss of ammonia resulting from this action, an examination of the gases showed that they contained only 0.1 per cent. of ammonia, and 5 per cent. of carbonic acid, suggestive of the action being due to oxidation, and not to any fermentative process. But direct experiments for determining the actual loss of ammonia in the preparation and subsequent heating brought out the fact that a manure was obtained containing only 20 per cent. of moisture without its manurial value being sensibly affected, so far as the loss of available ammonia was concerned.

It must be admitted that the experiments carried out by Messrs. Tidy and Dewar prove that the A B C process is unquestionably very effective, as far as the purification of sewage and the production of a sufficiently pure effluent are concerned. Of course the commercial aspect of the question is not one into which they were called upon to enter. How far the expense of the process will admit of its adoption in other localities, or whether any or what proportion of the outlay is recoverable from the sale of the manure, are points which must be determined or explained by the commercial results to the company itself. It has been repeatedly asserted by eminent authorities and experts that sludge, however treated, is not worth its carriage for agricultural purposes except under very exceptional circumstances. Sewage, however, cannot await the determination of its commercial value, but must be got rid of from all great centres of habitation as quickly and effectively as possible, and economically if practicable. Whether the last condition is an accompaniment of the A B C process yet remains to be demonstrated.

The late Mr. E. C. Page.—Mr. Arthur E. Northcote writes to ask us to mention that a painted window in memory of the late Mr. Richard C. Page has been erected at St. Alban's, Hobsorn. The name of the designer of the window is not communicated.

NOTES.

AN important meeting was held at the rooms of the Society of Antiquaries on Friday, the 12th, the Bishop of Durham in the chair, consisting of subscribers and others interested in the excavation of the Temple of Ephesus, from which Mr. Wood has already gained such important results. After an address from the Chairman, Professor Newton moved, and Mr. Beresford Hope seconded, the first resolution: "That the sculptures already found on the site of the Temple at Ephesus, and only forming a small portion of the entire remains, are incontrovertibly of the highest artistic value, while the inscriptions, now being prepared for publication, prove also to be of great value in both a literary and archaeological point of view," which was carried unanimously. The Dean of Llandaff afterwards moved, and Sir Talbot Baker seconded, a resolution to the effect that a new subscription list be at once opened, and a sub-committee formed to take such steps as may be necessary for completing the work: also carried unanimously. Professor Newton spoke eloquently and to the point as to the value and interest of the inscriptions that had been discovered, and urged that a proper and adequate sum should be found to enable Mr. Wood to continue his excavation. "To deal out niggardly grants of 50l. at a time was a reproach to the country." We concur entirely. The Government ought to make a liberal grant in aid of an Englishman who has distinguished himself and his country by such valuable discoveries at the cost of so much toil and perseverance. But there seems to be a hopeless and Philistine indifference to these subjects in official circles.

THE extraordinary solicitude which the members of the Conference on the Suez Canal have suddenly developed as to the sanitary protection of the European ports appears likely to have results which M. de Lesseps will be the first to resent. The blocking of the canal by the sinking of a dredge occurs at a moment when the question of delay is engaging the attention of the owners of vessels that now use the route. Forty-eight hours and thirty-six minutes were passed in the canal, on an average, in 1883, by every vessel that went through, for only nineteen hours and thirty-two minutes of which she was under way. With the speed attained by commercial steamers, which are now built of 24 times the size common in 1870, it requires but a little more delay to make the canal a more costly route than the old course by the Cape. In 1882, out of 923,147 tons of cargo shipped from Calcutta to Great Britain, 440,375 were sent by the Cape route. Thus it is evident that it is no vague threat on the part of shipowners that if the proposed quarantine regulations are imposed, with a view to injure English commerce, that commerce will take care of itself. The value of time is an ascertainable quantity, and the result of the attempt to injure England, if persevered in, may be the ruin of the canal.

THE serious delay occasioned by the sinking of a dredge, when the whole power and goodwill of the persons composing the service of the Canal are strained to the utmost in order to keep open the waterway, may give Englishmen some idea of what is likely to happen if the control of the Canal should pass into unfriendly hands, in the case of any complications involving the despatch of troops to India. With the mercantile navy, the chief object is to secure low freight; and as soon as the heavy charges of the Canal are aggravated by the delay of several days, commerce will seek the open sea-water. But for military service speed is of more importance than saving of expense. The route, once opened, cannot be closed; and the possibility that it might be opened to our enemies and closed to ourselves is one that we cannot afford to neglect. In the Tel el Kehir campaign the Canal was seized by surprise in the most masterly way. A fast steamer was sent up it by Lord Wolsey, which put a guard on each of the dredges, and thus effectually prevented

such a misadventure as has recently occurred. And when M. de Lesseps got up in the morning Port Said was in the possession of the English. The Canal authorities were frantically angry,—for their sympathies were altogether against us. But the affair was properly carried out. And anything that will prevent a defensive action of this nature on the part of Great Britain in the event of war, will be a serious danger to the Empire.

THE pertinacity with which railway companies endeavour to evade the effect of adverse judgments is remarkable. When appeal is out of the question they seem to cast about for other means to render the decisions of the courts of no benefit or advantage to their opponents. This was strikingly exemplified in a case decided before the Railway Commissioners last week. The plaintiffs (Messrs. Girardot, Flynn, & Co., of Derby) are corn factors and maltsters, but the issues involved affect all traders possessing private sidings. This firm obtained a judgment in their favour against the Midland Railway Company, in July of last year, in connexion with alleged preference given to the Burton brewers in freight charges on grain. The company, so far from accepting this judgment, appear to have adopted the course just indicated by "revising" their rates to Derby; and on plaintiffs declining to pay these charges, they refused to deliver their traffic at their private sidings as heretofore. The three Commissioners each delivered judgment on the case, one of them holding (as argued by the counsel for the company) that they had no jurisdiction in the matter. But the result was that the company are to resume delivering plaintiffs' traffic at their sidings, they paying the rates demanded, but reserving the right to object to such charges in a fresh action. Considering the expense involved in the construction and maintenance of private sidings (for which no allowance is made beyond a rebate for collection and delivery) it is satisfactory to find that they cannot be practically closed at the will of the railway companies.

WE are glad to see that the last issue of the *Archäologische Zeitung* (Jahrgang xliii. Erstes Heft Taf. I, 1885) the authorities of the Berlin Museum have at last published a very beautiful Greek terra-cotta relief which has been in their possession some three years. The relief is of the finest period of Greek art, fifth century B.C., of, we think, unique beauty, and, from its subject, of great mythological interest. It represents Charon in his boat just touching the shore; to him Hermes approaches leading a maiden figure. No publication could do justice to the severe decay of the original, but all that mechanical means can do is done in the prototype of the *Archäologische Zeitung*. On the original are faint traces of colour. In consequence of this the authorities of the Museum will not allow a cast to be taken, an added reason for this adequate publication. With it appear in the same number two beautiful Athenian white lekytho; with the same subject slightly modified. In both Charon brings his boat right up to the tomb itself, and seems to grasp at the funeral offerings. A very interesting paper by Professor F. von Duhn of Heidelberg accompanies the publication. He shows that the myth of Charon was of the purely popular sort, foreign to the aristocratic temper of epic literature, rising therefore to importance only in the fifth century, the century of democratic impulse. In the text he publishes also a fourth-century replica of the same motive, and, from the juxtaposition of the two plates, he deduces the whole moral of the contrast between the art and life of the fifth and fourth centuries B.C.

THE terra-cotta fragment to which we referred in a past number (*Builder*, May 6) as bearing the design of "Hermes carrying the child Dionysos" turns out to be, not as was at first supposed, a piece of a painted vase, but a bit of late Roman "terra sigillata." Such fragments have, of course, great archaeological value, because they not infrequently embody types borrowed from works of real artistic merit, and, no doubt, this is the case in the

present instance. The design is clearly Praxitelean; the execution, however, is so rough and blurred that it is quite impossible to say what Hermes holds in the right hand. This much is satisfactory, that the object held is not a bunch of grapes. It is a long shaft of some sort, possibly a thyrsos,—possibly, but less probably, a caduceus. It will be remembered that Dr. Treu, the finder of the Praxitelean statue, desired to restore it with the thyrsos in the right hand, and to this, his original view, he has steadily adhered. The fragment is published in the *Archäologisch-Epigraphische Mittheilungen aus Oesterrich*, Jahrgang viii., Heft 2, Taf. v., and is accompanied by a commentary by the finder, Dr. Rollett, and the editor, Dr. Benndorf.

PERSONS who supply men and plant to corporations will do well to make themselves acquainted with the recently-decided case of Jones v. The Corporation of Liverpool. The Corporation seems to be in the habit of hiring borses and men for purpose of working the carts which water their streets, and the employer of the men is the person by whom they are paid, and not the Corporation. One of these carts injured the plaintiffs' carriage, and Mr. Justice Day decided that the Corporation were liable for the negligence of the driver of the water-cart; but the judges of the Queen's Bench Division have thought differently, and have reversed this judgment, holding the Corporation not to be liable. The principle of the decision seems to be the same as that acted on in an older case, namely, that the person who chooses the servant and has the power of dismissing him is the person who is liable for his misdeeds, and not the person who, so to say, has the right temporarily to order him to do this or that. In the recent case an inspector superintended the watering of the streets, and directed the drivers where to go. This, however, did not seem to the Court to be sufficient to make the Corporation to such an extent their master as to make them liable for their negligence. It is obvious that this principle may have a wide operation.

WE understand that there is a scheme in hand for erecting dwellings for the labouring poor (more especially for women engaged in industrial occupations) in the parish of St. James, Westminster. A trust fund of the amount of 6,000l. has been placed at the disposal of the Vestry of that parish for the purpose, and it is intended to invite four architects, experienced in that class of buildings, to enter into a limited competition, in order to secure the best possible return for the money, in construction, arrangement, and accommodation. The architect whose design is selected will be employed to carry out the work.

CONSIDERABLE excitement has been caused by two fires which have taken place during the last few days,—that at Mr. Whiteley's establishment on Wednesday, and that at the Inventions Exhibition on Friday last week. The fire at Mr. Whiteley's assumed alarming importance in consequence of its rapid progress, which at one time seems to have threatened a more extended and very serious conflagration. The details have been fully made known through the daily papers; the only point for comment here is in regard to the statement made in the *Times* report, that "the iron doors that have been placed in the buildings seem to have had little effect in checking the progress of the fire." We do not suppose such doors ever would have much effect in the case of a large and fierce conflagration which has once made head; they are better than nothing, however, for they at all events assist to isolate a fire in its earlier stage, and give greater chance of checking it. The fire at the "Inventories" was not a large fire as fires go, but it was watched with painful interest owing to the imminent danger to the Indian collection, and also the great risk of an extended conflagration in the Exhibition if the flames had fairly passed the brick barrier of the building in which they originated. The point of junction between

this and the frail structure of the Exhibition entrance buildings was evidently felt to be a critical one, and every effort was made to meet and check the fire at this point. Watching the whole affair, we were rather impressed with the loss of time and apparent want of concerted action in attacking the fire; also with the entire failure of the chemical fire-annihilating bottles to produce any apparent effect. Crates of these were hoisted up to the roof of the Exhibition entrance (with several slips and breakages, owing to the incapacity of some persons to tie a knot that will not slip), and thrown at the fire with more or less dubious aim, and apparently with about as much result as throwing so many ink-bottles in. The bulk of the India Museum articles were got out, but more loss has been sustained in this department than was at first stated. Exhibition-roads was the scene of a complete *tapage* for two hours, in the midst of which was to be seen the artist of an illustrated journal quietly sketching the scene in the midst of the fire-engines and the general excitement. Others found their special interest in the spectacle. "What a colour for a dress!" exclaimed a lady, as the flame and smoke mixed into a ruddy orange; and then, after a moment's more critical consideration,—"at least, for a morning dress!"

WE wish to call attention to an admirable work which has been set on foot by the "Home Arts and Industries Association," a society having for its object to spread a knowledge of decorative arts and hand industries among the people. There are now about sixty classes established for this purpose in England and Ireland, and a few in Wales and Scotland, where instruction is given *gratis* by those who know enough of drawing, designing, and modelling to be able to teach others, or, at least, help them on their way in the work. The head-quarters of the Society are at 1, Langham-chambers, Langham-place, and in July an exhibition will be held at 3, Carlton House-terrace, of work done by the classes of the association.

THE Peel Grove Burial Ground was before the Court of Queen's Bench last week, as reported on p. 849, in connexion with the issue raised by the case of *Gibbons v. Chambers*. Some doubt at first existed as to whether the Act prohibiting the building on disused burial-grounds applied to the Peel Grove Burial Ground, building having been commenced by the defendant before the Act was passed; but we are now informed that the law officers of the Crown have been consulted upon the point, and have advised that in their opinion no buildings can be erected upon disused burial-grounds, and that if the present erections are in any way proceeded with the same come within the scope of the Act, and can be dealt with accordingly. The Metropolitan Board of Works are now applying for power to put the Act into motion, and this, it is to be hoped, will be the termination of what at one time seemed to be likely to prove a great scandal to public morality and decency.

WITH regard to the subject of building upon private areas, we understand the Metropolitan Board of Works have decided not to appeal against the decision of the magistrate in the case of the Chelsea Park Dwellings Company [p. 743, *ante*], but to select two other cases which are now before the Courts, as it is thought that the latter cases better illustrate the point upon which the decision of the High Court is wished as to building on private areas.

ONE of the most ancient of the few remaining old houses in Lambeth will shortly go the way of its more famous neighbour and contemporary,—the Swan. It is close to the waterside, being No. 157 in Lambeth-road, formerly Church-street, and over the wide entrance into Swan (or Palace) Yard: The large room, which occupies nearly all the first floor, has served for a conventicle, and is said to have been used by Bunyan on the occasion of his evangelistic visits to this

quarter from Bedford. Adjoining No. 157 is the cleared site of the Swan, pulled down some three years since, reputedly one of the earliest public-houses established in London.

A CORRESPONDENT writes:—"Signor Giacomo Boni, a Venetian architect, has reprinted from the *Ateneo Veneto* a spirited protest against the proposed demolition of the ancient thirteenth-century fortifications of Bassano, to which we have before referred. Signor Boni writes with a wonderful command of the subject, and quotes from the Greek Anthology, Ovid, Virgil, Shakspeare, Goethe, Heine, Ruskin, W. D. Howells, and others, in support of his propositions, and his citations are made with singular accuracy and propriety. His quotation from the "Tempest," act 1, scene 2, with regard to the injurious action of ivy on buildings:—

"The ivy, which had hid my princely trunk
And suck'd my verdure out,"

draws attention to a danger which was recognised by Pausanias, but which is too often overlooked by the custodians of ruins and ancient buildings, particularly the towers of Mediaeval churches. He also quotes with commendation the words of an Italian lady of the fifteenth century, Margaret, the daughter of Ruberto Acciaiuoli, a worthy daughter of her father, according to Vasari, who relates that she was the means of preventing the furniture belonging to her husband, who during the siege of Florence had retired to Lucca, being carried off to France. When Giovambattista della Palla, with permission of the mayor and Town Council of Florence, offered to purchase the property, she replied:—"So, you vile old-clothes man, you are ready to despoil this city of its most valuable and most honoured objects in order to embellish a foreign country. I do not wonder at you, despicable enemy of your country, but I wonder at the authorities of this city who have urged you to this abominable wickedness." Strong words for the fifteenth century.*

THE committee which has been formed to provide a suitable memorial to the late Sir John Goss, organist of St. Paul's, have adopted a design by Mr. John Belcher for the monument in the cathedral. A panel by Mr. Hamo Thornycroft, A.R.A., representing chorists singing, forms part of the design. Sir Arthur Sullivan is chairman of the committee, and Mr. T. L. Southgate hon. secretary. The monument to Sir John Goss's memory is only a portion of the scheme that the committee have in contemplation.

THE portrait of Gordon, by Mr. Lowes Dickinson, now being exhibited at 57, Pall Mall, is judged by relatives of the deceased here to be a good likeness of him; so we are given to understand. But the painting, representing him standing on the tower at Khartoum on "his last watch," draped in a cloak, and with a lorgnette in his hand, is hard, theatrical, and unreal, and we have no pleasure in seeing this kind of memorial to a man who, in his greatness, was also the simplest and most unpretentious of men. If there is to be any artistic monument to Gordon, the highest art we can command at present is hardly adequate to the occasion, and we have no wish to see him commemorated in second-rate art. We think of Burns's dying request to his brother,—“Don't let the awkward squad fire over me!”

WE have received from our esteemed contemporary the editor of the *Revue Générale de l'Architecture* an advance proof of some remarks in regard to the great ceremony at the obsequies of Victor Hugo in the early part of this month. M. Daly considers that those who directed the ceremonial did not rightly apprehend their task, and made a mistake and missed a fine point in draping the Panthéon in funeral array. He says, the lying in state of the body under the Arc du

Triomphe was the mournful side of the ceremonial; there the mortal remains of the poet were laid in state before reaching their last abode; but in entering the Panthéon he entered into glory and immortality; it was his apotheosis. It was right to drape the Arc de Triomphe with funeral emblems, but "il eût fallu draper de gloire le Panthéon, le temple de l'Apothéose, y faire ruisseler l'éclat de la pourpre et de l'or, comme le firent autrefois les Romains aux obseques de César." This is certainly a fine and suggestive idea, and worth bearing in mind on another such occasion; but, alas! there is not another Victor Hugo. Our contemporary remarks, in conclusion, on the happy idea which occurred to some one of gathering up the crowns and wreaths of natural flowers with which the steps of the Panthéon were strewn, and making them up into memorial bouquets, to be carried away as souvenirs, instead of leaving them to decay where they were laid. He was assured that "the poet" who conceived this idea was an engineer, M. Klein. "Où diable," says M. Daly, "la poésie va-t-elle se nicher aujourd'hui!"

THE CONGRESS OF FRENCH ARCHITECTS.

We left the members of the Congress* at the Auhattoir de La Villette on the morning of Wednesday, the 10th; the afternoon of the same day we find them at the Ecole des Beaux Arts, where M. Perrot, member of the "Académie des Inscriptions et Belles Lettres," and Director of the "Ecole Normale Supérieure," held us under the charm of his finished and fluent discourse.

What a fine theme for an archaeologist, that of the "First Temple of Jerusalem,"† that marvel of which all times have spoken, and the recollection of which has traversed history like a brilliant meteor, and the destruction of which marked the dispersion of a race which, in spite of the miseries of its exodus, its struggles and persecutions for ages, has kept itself so prodigiously tenacious of life and so faithful to its origin; that temple which seems the type of priestly architecture, and which, singularly enough, has been adopted as a mysterious symbol by the most diverse creeds and the most opposed form of religion and free thought; by Judaism, Christianity, and Freemasonry.

It was of this that our lecturer treated with learning, drawn from the best sources, endeavouring especially to defend the topography of the Temple, such as Hebrew tradition and written documents have indicated it, such also as it has appeared to be confirmed by English explorers, to whom M. Perrot rendered full homage, notably to Sir Charles Wilson, whose plans were reproduced photographically, to the great interest of the meeting. M. Chipiez, the architect, who has long been the collaborator of M. Perrot, completed the historic and philosophical exposition by technical explanations. For this last lecturer the Bible has served as a basis for a work of calculation, which has enabled him to re-establish with precision the cost, dimensions, disposition, and internal arrangement of the Temple, and even the decoration as described by the prophet Ezekiel. To use a distinctly Parisian expression, one may say that through his study and manipulation of the prophecies of Ezekiel, M. Chipiez has completely entered "dans le peau de personnage." His restoration is, no doubt, hypothetical, but so ingenious that one is persuaded, almost convinced, more especially when, in support of his demonstration, he brings before our eyes, with the optical illusion of shaded projections, the plan of the Temple with its first enclosure, into which strangers were admitted; the "parvise" of the Levites; then the *naos*, or Holy of Holies, where the high-priest alone could penetrate once a year: and, lastly, in the rear a sort of court, in the form of an Egyptian temple, surrounded by the principal dwellings reserved for the priests.

According to M. Chipiez, who relies in this a good deal on the work done at the close of the last century by the architect Cassas, to whom we owe drawings made in Syria, Phœnicia, and Palestine, which have become very scarce, it is

* See page 829, *ante*.
† And what a transition,—from the Paris abattoirs in the morning to the Temple of Jerusalem in the afternoon! Is there any other profession that is expected to embrace such diverse interests?

* Not at all. It was a time when strong words were in fashion.—Ed.

in Phœnician art that we should find the guide for the construction of the Temple as it must have existed, and it was, in fact, from Phœnician monuments that he derived the plan, elevations, façades, and perspective views which were successively exhibited to the audience.

The order of the day brought us, at the close of this long lecture, an account by M. Chas. Lucas of the ninth annual congress of the learned societies which was held this year at the Sorbonne. As this *compte-rendu* would lead us into too long a digression, we confine ourselves to mentioning only this part of the programme, which brought M. Lucas much applause. For the same reason we merely record that at the sitting of Friday, the 12th (almost entirely devoted to reports of committees), an excellent discourse was given by M. Dally on the necessity of pushing forward more vigorously the study of architecture.

On Thursday, the 11th, the Congress left by the Gare St. Lazare, which unhappily is now no longer the "ville des vieilles rues" celebrated by Victor Hugo, but in its numerous monuments still offers to visitors much matter for study of great interest.

Received at their arrival by the architects of the "Lower Seine," who offered them lunch, with its inevitable accompaniment of toasts, the members proceeded to the Palais de Justice, so well restored and enlarged by M. Lefort, the architect-in-chief to the department, of whose drawings we spoke with appreciation in our article on the *Salon*. After having admired the façade, of which M. Lefort offered each member a photograph, and the Salle de Pas Perdue, restored 1876, and of which the wood-work recalls some of the lost *chefs d'œuvres* of old Rouen, the Congress proceeded, under the guidance of M. Sauvageot, the diocesan architect, to the Church of Saint Patrice, an historic monument of 1533, restored by M. Barthélemy, where there are some admirable sixteenth-century windows. Rouen is besides pre-eminently the city of glass-painters, and the windows of the Church of St. Ouen, which have been restored by M. Bernard, of Rouen, are justly celebrated.

With so experienced a guide as M. Sauvageot, the Congress could see rapidly though in sufficient detail the churches of St. Godard, St. Venient, the cathedral where the wondrous portal rises between the two towers, and which contains that tomb of the Duc Do Brézé, of which the *Builder* gave a view in the number for June 21, 1884; the Church of St. Maclou, and the ancient parochial cemetery known under the name of Aître St. Maclou, where the grim sculptures of the *danse macabre* contrast so curiously with the Cupids, and female figures, and erotic subjects carved in the capitals of the cloister which surrounds it. It is to M. Sauvageot that we owe the museum actually in course of construction, and the new Théâtre des Arts, which replaces the structure burned in 1876.

Among the civil monuments, the Congress particularly remarked the Joan of Arc Tower, the Museum of Antiquities (one of the richest in France), the Fontaine Ste. Marie, the work of M. Deperthes, and decorated with sculpture by M. Falguère; the Lycée Cornille, the Hôtel de Ville, the remains of the Abbey of St. Ouen, the Hôtel Bourgtherould, that beautiful gem of Renaissance art now occupied by a financial establishment; the great clock, the old Hôtel des Finances (another Renaissance *chef d'œuvre*), and lastly, the quays of the Seine, which bring out finely the picturesque perspective of the ancient city and the modern town.

In the course of these peregrinations, M. Lehreton, the curator of the Museum, gave an interesting discourse on the celebrated faience of Rouen; and in the evening, after terminating this very well-occupied day by a banquet, the Congress returned to Paris, carrying away from the old Norman capital admiration of its numerous points of interest, coupled with the recollection of a cordial reception.

For some years the Congress has been in the habit, each session, of visiting one of the workshops for the fabrication of products employed in modern building. Last year they paid a visit to M. Didron, the celebrated glass-painter; the year before to M. Parville, the well-known maker of ceramic ware; the year before that to the model brickmaking yard of MM. Müller & Cie., at Ivry. This time it is again "céramique" which has tempted the French architects, and the visit on Saturday morning, the 13th, to the address of M. Leibnitz, Rue Pierre Levé, was

in some sort the sequel and the justification of the lecture of the Tuesday previously by M. Deslinières, a lecture which, owing to the superabundance of work in 1884, had been postponed to the present year.

M. Leibnitz is an industrial artist, of great ability, and one may say that with M. Deck, he holds the first place at the head of modern ceramic workers. His name is well known in Germany, where his terra cotta and enameled faïences constitute, especially at Berlin, one of the most important elements of the interior decoration of houses.

In 1810 his grandfather, M. Pechinat, invented the faïence panels which have come into such common use now; and it was he who first began to ornament faïence by means of decorations "au petit feu," as in porcelain, and this first attempt in this way figured in the Exhibition of 1844. He began with flowers and birds, then employed a kind of damask design, as in some form of textiles; lastly, he employed flowers and bouquets which an artist recently deceased, M. Julienne, gronped for him with great skill and fancy. The models were afterwards infinitely varied, and we had successively medallions with figures, reproductions of German stones, and panels of bright and clear colour offering means for a cheap decoration of façades. We may mention especially the terra cottas executed after the cartoons of M. Emile Lévy, and treated like fresco with very simple tones and a contour of engraved lines. This kind of decoration adorns the principal façade of the manufactory of M. Leibnitz, and has a very happy effect. It is surmounted by a frieze in faïence designed by M. Sédille.

It is to M. Leibnitz that we owe the execution of the grand gateway, designed by M. Sédille, to the south entry of the Pavillon des Beaux Arts in the Exhibition of 1878. This gateway, made in blocks of terra cotta, and enameled, showed to what a superb artistic effect ceramic art could rise. We came upon the portions of it in the course of this visit, as also on the panels which formed so fine a decoration to the ball-room in Arabic style, of which the ceiling presented large pierced ornaments very difficult of execution, and intended for the reception of coloured glass. But we have not space to enumerate all the varied models and artistic curiosities contained in the atelier, where M. Leibnitz has piously preserved also a collection of designs executed by the hands of the late M. Duban and of Viollet-le-Duc, *souvenirs* of the restoration at the Château de Blois and the Château d'Eu under the hands of those masters.

The conclusion of this last day of the Congress was devoted to the distribution of awards. This solemnity was presided over by M. Alphand, Directeur de Travaux, supported by MM. Questel (President), Hermant (vice-president), Paul Wallon (Secretary), Mr. l'Anson (delegate from the Institute of British Architects), M. Kaempfen (Director des Beaux Arts), M. Doulin (Director of Civil Buildings), and MM. Bailly and Sédille, architects.

M. Alphand gave an address comparing the works of modern architects with those of the engineers, both of whom concurred to assure to French art and industry an important place, and alluded to the social crisis of the moment, urging that we must be the friends of the working classes without flattering their false ideas and jealousies, often embittered and heightened by subversive social theories. M. Daumet followed with an address, unfortunately not always very audible, on the late M. Abadie and his works. Mr. l'Anson, who spoke with complete fluency in French, after referring to the works of MM. Abadie and Ballu, announced, amid much applause, that on the preceding Monday the Royal Institute of British Architects had nominated in their place, as Honorary and Corresponding Members, MM. André and Hermant, to whom he was charged to present the diploma of the Institute. In conclusion, Mr. l'Anson expressed himself warmly as spokesman for his countrymen on the admiration and esteem of the English architects for their comrades in France; a sentiment cordially responded to by M. Alphand, who expressed his belief that the two nations, who were "à la tête de la civilisation" would be always, in spite of passing political divergences which did not disturb the calm of their avocations,* united

* We may say this with the remark of an eminent English landscape-painter the other day, to a friend who was lamenting the littleness of modern politics:—"Well, of course, there always must be politicians; the best thing is to let them go on and take no notice!"

in marching hand in hand in the path of art and progress.

M. Sédille then made his report, in the name of the jury for awards, announcing that this year the honour to architects who had applied the resources of art and science to the amelioration of habitations had been adjudged to MM. Achille Hermant, Nicolas Escahier, and Louis Martenot, to whom were awarded the three silver medals of the Lesonfâché foundation.

M. Escalier, who obtained the second medal at the *Salon*, is both architect and painter. In the house which he has built, 33, Rue Galilée, and the interior of which he has ornamented with large decorative panels, everything, as M. Sédille expressed it, is united in a kind of general harmony. M. Hermant, who in spite of the criticisms formulated by the Conseil Municipal of Paris, will be remembered no less as the constructor of the remarkable *Maison de repression* at Nanterre, merits eulogy also for his buildings in the Rue du Mail; and M. Martenot, architect, of Rennes, is well known in the artistic world by his numerous works. After having announced the honourable mention of the jury as awarded to M. Étienne, M. Sédille bestowed a high eulogium on the Reverend Père de la Croix, member of the Society of Antiquaries of Poitiers. To this indefatigable explorer, who two years ago discovered the ruins of Sauxay, the Honourable Mention in the department of archeology was awarded.

The medals which the Congress awards every year to the pupils of the French schools at Athens and Rome remind one of the intimate union existing between architecture and archeology. In this department the jury had selected M. Pierre Paris, on account of the excavations undertaken by him at Eleata, to find the remains of the Temple of Athena Crania, and M. Laloux, already known to our readers, who will remember the description we gave of his restoration of the Altia at Olympia, for which he received the *médaille d'honneur* of the *Salon* Jury.

We note next the Destors silver medals, adjudged equally to MM. Francis André and Louret, both of whom have entered into residence for the *pris de Rome*; the Chaplain medal, awarded to M. Margotin fils, a decorative sculptor of great talent. The Rolland medal was awarded to M. Thibaron, and the Van der Goyen medal to M. Emmanuel Garnier. The silver medal, founded in 1877 by M. Paul Sédille, for art-industries, was awarded to M. Guilbert Martin, chemist, of St. Denis. In giving this latter award the Congress wished to recognise his labours in regard to mosaic work, which, after a journey in Italy, he introduced into practice in France. The materials for this work are made in his workshop at St. Denis, where he is forming a company of young mosaicists; it was there that the mosaics for the Pantheon, after Hébert's cartoons, were made. M. Guilbert Martin has already obtained the *médaille d'honneur* of the "Union Centrale des Arts Décoratifs," and has been charged by the Government to execute the cupola of the Grand Staircase of the Louvre.

The remainder of the sitting was devoted to the delivery of medals to the boys of the "École Municipal d'Apprentis," to the "Cercle des Maçons," a kind of professional school presided over by M. Daumet, and which has been of great service; and, lastly, to "Veterans du Bâtiment," as the recompense of a life of honourable hard work.

Among these venerable workers whom M. Paul Wallon, in an eloquent report, held up as examples to the young working men, while exhorting them to repudiate the detestable theories of the "déclassés" and the revolutionists, we may name M. Bertrand, joiner, of Paris, MM. Neand and Guibin in the same branch of trade at Lyons, and M. Bellais, foreman of the "Agence des Travaux du Palais Royal," who is seventy-seven years old, and has worked forty-eight years, without cessation, in the same building yard.

The tremendous applause which greeted this part of the report, and hailed the appearance of the venerable workman, formed a pleasant and gracious recompense, of a nature to give rise to some reflections in regard to those who thus seem to have understood so exceedingly well the "social problem." One may be pardoned for a remark on this subject, for, as M. Wallon well observed, in these times of social disturbance and revolution, it is touching to see, in the midst of all the squabbles of politics,

these simple and straightforward natures, going on unhesitatingly in the path of duty, and coming forward humbly at the end of their career, astonished at the applause which greets them, to receive the unexpected testimony of esteem and respect.

Giving then a rapid résumé of the work of the Congress, the President, M. Questel, pronounced the Session of 1885 closed, and in the evening a fraternal banquet noted for the last time at the Hôtel Continental, the Parisian members of the Congress, their colleagues from the provinces, and the visitors who had responded to the invitation of the Société Centrale des Architectes.

INVENTIONS EXHIBITION. HYDRAULIC MACHINES.

DURING recent years the utilisation of water pressure for mechanical purposes has made substantial progress. This has largely been due to the firm of Sir Wiliam Armstrong, whose enterprise in the construction of hydraulic cranes, dock-gates, movable bridges, &c., has fully demonstrated the value of water pressure for a great variety of mechanical operations not hitherto attempted. Workshop processes, too, of various kinds,—such as riveting, forging, stamping, &c.,—can now be carried out by means of hydraulic power with convenience and economy. Although in London and other cities hydraulic power may now be rented for working lifts, engines, and other machinery, there can be but little doubt that hydraulic engineering is still in its infancy, and ample scope remains for development and invention in this direction. Considerable advance has recently been made in the means adopted for obtaining economically the desired water pressure by the aid of steam engines and accumulators, and also in the transmission of the power when so obtained. For working hoists, and for many other commercial purposes, the pressure of water obtainable from the ordinary public, or Hydraulic Company's power mains, is sufficient, but where very considerable power is required separate force-pumps driven by an engine can be worked with advantage. An economy attending this latter plan is the very great saving effected in water, as after being used in the rams it can be returned over and over again to the pump tank. Perhaps the most advanced examples of the development of hydraulic power are the cranes used at Newcastle, Cardiff, and other ports, for loading coal ships, which duty they can perform in an incredibly short space of time with certainty and economy.

Before commencing our notice, we cannot refrain from remarking on the extremely satisfactory arrangement of this group, all kinds of machinery, either directly or indirectly connected with water pressure, being mixed up together, compelling the visitor to pick out the hydraulic exhibits as best he may. Riveting machinery and hoists are the best represented classes,—the latter possessing several novelties both in construction and working. Notwithstanding their increased first cost, and greater cost in fixing, ram-lifts appear to be making greater progress in public favour than suspended lifts. The chief reason for this is probably their increased safety and the absence of ropes, gear, &c., which must from their nature necessarily more or less rapidly deteriorate. There are several excellent samples of both types in the Exhibition, which we shall now briefly notice.

The Hydraulic Engineering Company, of Chester, have an interesting exhibit, amongst which is a hydraulic balance ram-lift on Ellington's system. This is worked from an accumulator, and is so arranged that counter-balance chains and weights are done away with, and there is no mechanism whatever above the cage. It is claimed by the makers that, as in ram-lifts, when the lift is at the bottom of its stroke, the lifting-ram is immersed in water in its cylinder, at the top of its stroke it is out of the water. The ram, therefore, weighs more at the top of its stroke than at the bottom, and to secure economy it is generally necessary that the balance should compensate for this variation in load. This compensation they secure in all low-pressure lifts, and in high-pressure lifts when desirable, by the proportion they adopt between the diameters of the lifting-ram and the balance-ram. The lift is controlled by a single valve, worked by a rope from the inside of the cage. A commendable feature in this lift, and one likely to prevent accidents, is the

fact that it is impossible to work it with the door of the cage open.

We also saw here in motion a Brotherhood's three-cylinder hydraulic engine, arranged with Hastie's patent variable throw, which adapts its piston stroke in proportion to the work done. Thus, the greater the load the longer the piston stroke. This is an improvement, as the same effect as expansion in a steam engine is secured, i.e., the amount of water used is in proportion to the work done. In most hydraulic engines with which we are acquainted, owing to water being non-expansive, the same amount is consumed, as the cylinder must be filled every stroke, whether the engine has a full load or is running empty. This variable throw arrangement seems, however, in a great measure to get over this difficulty, and is, to say the least, ingenious.

A Schmid's patent water-meter is also shown. This is a positive meter of the piston type. It consists of two vertical cylinders, with double-acting pistons, so constructed that the pistons act as valves, controlling the flow of the water to and from the cylinders. The two cylinders are connected by admission and exhaust-ports, and they work the two pistons, which are coupled at 90° on to a horizontal shaft. This meter is of simple construction, and should answer its purpose well. We noticed some samples of pipes for conveying hydraulic power, some of these, with ordinary flanged joints, had been broken under a pressure of 3,500 lb. per square inch, whilst the improved pipes, which are arranged with a modified form of spigot and facet joint, withstood a pressure up to 6,050 lb. We may add that the weight of metal in both pipes is the same, and the improved pipes are similar to those now being laid in London by the Hydraulic Power Company.

A novelty in the shape of hydraulic ram-lifts is exhibited by Messrs. Richmond & Co., of Kirby-street, Hatton-garden, E.C.; it is constructed on the telescopic principle, but the chief feature about it is, that instead of each section rising independently as in ordinary telescopic lifts, the water has to fill only the space underneath the lowest piston when all the sections rise simultaneously. Its action may be briefly described as follows:—Each of the upper sections of the lift when telescoped forms a space between it and the outside of the ram. This space is charged with fluid. Immediately the lowest ram begins to move, the fluid in the upper sections, having no means of escape, flows from the outside of each ram to the inside through an aperture, thus acting on the bottom of all the rams at the same time, and causing them to rise together. In descending the same fluid returns to the outer chamber as before, and as this can be used over and over again instead of water. An important saving is effected by this form of lift in doing away with the necessity of a deep well or bore holes as required by ram-lifts made on the ordinary plan. We congratulate the makers on their invention, which is a clever idea cleverly and practically carried out, and should from its merits secure extensive adoption.

A hydraulic hoist also on the telescopic principle is exhibited by Mr. B. G. Smith, of Halifax. The rams in this hoist are made to slide one into another after the fashion of a telescope, the whole when closed occupying about one-fourth the height to which the hoist rises. It can be worked by force-pumps or by water-pressure from the mains. The general construction of the hoist is simple, and, owing to the telescopic arrangement, deep foundations for the cylinder,—as in ordinary hydraulic safety hoists,—are unnecessary. The maker claims for it amongst other advantages a very low first cost, perfect safety, and ease of erection or removal. The rams are usually made about 10 ft. in length, and the cylinder does not require to be sunk below the basement more than the height of one ram, and, in cases where it is not necessary to lift from the basement, no sinking is required, all overhead gear is dispensed with. Unlike the telescopic hoist which we have just noticed, the lifting power of this hoist depends on the diameter of its smallest ram. For ordinary heights and loads this may not be very material, but for very high or heavy lifts it is a somewhat serious drawback, and we would recommend the inventor to tax his ingenuity to try to remedy this.

A hydraulic balanced passenger-lift is exhibited by Messrs. Waygood & Co., of Falmouth-

road, S.E. This is worked from an accumulator charged by a rotary pump. Without presenting any great feature of novelty, the general working arrangements appear to be simple and good.

Messrs. Archibald Smith & Stevens, of Battersea, show both a hydraulic balance passenger lift and a hydraulic suspended lift, a hydraulic accumulator and pumps, and a hydraulic single-action door-spring. The chief feature claimed for their new hydraulic balanced passenger-lift is the method employed in balancing. This is effected by means of a cylinder arranged with an upper and lower compartment, with a piston or ram moving between them. The lower compartment contains the same amount of water as the long cylinder of the lift, and this volume of water alternates between the lift cylinder and the balance cylinder, through a pipe connexion, so that when the lift-cage and ram are up, and the lift-cylinder full of water, the balance ram is down, and the lower portion of the balance cylinder empty, and when the lift ram returns, displacing the water from its cylinder, driving it through the balance cylinder, the ram of the latter is forced upwards. The counter-balance is made slightly lighter than the lift ram and cage, that the preponderance of the latter may always bring it to the bottom of its travel when the driving-pressure is removed. Suitable valve-controlling gear is fitted, and arrangements are made to prevent accidents should this fail from any cause.

Amongst the recent applications of water-power hydraulic riveting machinery holds a prominent position. A number of these, made under Tredwell's patents, are exhibited by Messrs. Fielding & Platt, of Gloucester. These are constructed of various sizes and types, as may be specially suited to the requirements of ship-builders, boiler-makers, and others. They are connected to an inverted type accumulator, weighted and arranged so that the water-pressure may be varied from 150 lb. to 1,500 lb. to the square inch.

The "Fielding" type-riveter presents several fresh and ingenious points in its construction, the cylinder being bored to a curve struck from the centre of the gudgeon, to which curve the ram also is traced. This obviates the necessity of jointing the ram or the chance of the dies swerving when in work. This machine is attached to a compound patent hanger, which allows of its being moved round whilst under pressure and worked in any desired position.

A double-ended portable riveter is shown fixed for work on a railway carriage under frame. In this machine the levers are made of unequal length, and a hydraulic cylinder is mounted on one of them, and its ram acts by means of tension links on the other. Various other machines and models are here to be seen, and illustrate well the very great development that has taken place during recent years in this branch of hydraulic engineering. The workmanship in the machines shown is all that can be desired.

An extensive show of hydraulic riveting machinery is made by Messrs. Hugh Smith & Co., Fossil Works, Glasgow. This includes machines especially adapted for boiler work, ships' keel riveting, bridge and tank work, &c.; and also an accumulator with direct-acting steam pressure pumps, a hydraulic crane and hoist, &c.

The crane is of the pillar type, but it can be modified to suit the varied requirements of foundries, boiler works, saw-mills, &c., and by mounting it on a centre post they can be made to swivel round in a complete circle. All the motions are worked by hydraulic power, including raising, swelling, and travelling on the job. The raising motion is fitted with Smith's Patent arrangement, which gives three powers of lift and three speeds. The changes to give different powers can be quickly made.

We also noticed a massive hydraulic boiler-flanging machine, especially adapted for flanging boiler-end plates, setting and flanging dome end plates, and other similar work. The main frame of the machine is mounted on trunnions, and when it is used for hending flanges, &c., it can be set over at an angle, so that pressure may be put on both angles of the plate. To prevent the end plate from buckling when the flange is being set, a small hydraulic cylinder with ram is made to bear upon it. The end plate is made to turn on an eccentric pin, with lever for relieving the plate when being turned round. For doing this class of work very great pressure is required, and, in the machine under

notice the hydraulic cylinder is arranged with duplex links, giving a leverage of six to one, a much greater pressure is obtained than with ordinary direct-acting cylinder, and the power required to work is reduced in proportion. For riveting the keels of ships for which a pressure of 100 tons per rivet is often required, Messrs. Smith & Co. make a special form of riveter, which they mount on a travelling carriage arranged with vertical and horizontal adjustments for bringing the centre of the steel snaps in a line with the centre of the rivets. Our space prevents a longer notice of the interesting exhibits at this stand, which we may add combine compactness of design, strength, and freedom from complication in a marked degree.

A considerable display of hydraulic riveting-machines with pumps, especially designed for working the same, is made by Messrs. Anderson & Gallwey, of Chelsea. Amongst the riveters we noticed a well-designed machine of the fixed type. The action of this machine is governed by a foot lever, and the riveting die is arranged with an automatic return stroke, which comes into action immediately the operator's foot is removed from the lever. The length of the stroke of the riveting die is regulated as required by means of tappet gear, which is an improvement, as it obviates the necessity of constantly changing the dies. We believe a riveter of this type has recently been constructed for the heaviest class of boiler work, which gives a pressure of some 120 tons at each stroke.

Several very handy portable riveters are also exhibited; these are modified in power and details to suit the requirements of bridge and boiler makers, &c., and include one of very simple construction for use in difficult positions. The pumps for working the riveters combine strength and simplicity of design with ready accessibility to the working parts, an important point not always sufficiently borne in mind by designers. The frame is cast solid round the upper part of the crank-shaft bearing, and therefore receives the strain of the upward thrust, which is an improvement.

Messrs. John Barker & Sons, Limited, Oldham, exhibit a very useful adjunct in connexion with hoists, in the nature of an automatic self-closing door, which can be fitted to any building, and prevents by its action the possibility of passengers falling down the well. A self-landing and self-delivering hoist is also shown here.

The East Ferry Road Engineering Company, Milwall, exhibit a specimen of Duckham's patent hydrostatic suspended weighing-machine, especially adapted for attachment to cranes. It is fitted with a self-indicating arrangement. Models are also shown of self-counterbalanced movable hydraulic cranes.

A duplex hydraulic lift, with pump and accumulator, are shown by Messrs. Clark, Bunnett, & Co., of Rathbone-place, Oxford-street, W.

NOTES ON A FEW "BITS" OF OLD GLASS.

THE skill and ingenuity of the old craftsmen in designing decorative detail is strikingly manifested in the painted windows of the time, and designers and students will find themselves amply repaid for the time devoted to the study of old glass by the excellence of the work brought under their attention. It is now pretty generally admitted on all hands that the art of glass staining and painting reached a degree of perfection in the fourteenth and fifteenth centuries that was denied the other art crafts of the time. The mural painting, for instance, is not of the same excellence as the hulk of the painted windows of the same date, though there and there may be found an altogether exceptionally good piece of painted work, which only serves to emphasise the comparative poorness of the rest of the painted decoration. The early glass-painters seem from the beginning to have recognised the important fact that glass staining and painting is essentially a "colour art," and that, whatever other excellencies a window should possess, it must, above all other things, be a beautiful "bit" of colour. It was not until the revival of the art, early this century, that this fact was brought home to glass-painters. Sir Joshua Reynolds and the school of glass-painters of the eighteenth century had quite lost sight of this important fact, that glass-painting is a "colour art," as the monuments of their misapplied talent and mistaken zeal attest to this day.

It is singular when we consider the question how the early glass-painters came to be so successful; for those who know anything practically about the craft of glass-painting are aware of the great difficulties that lie in the way of a successful painted window. And in looking at old glass onemust never lose sight of the fact that the early craftsmen had to overcome difficulties which a modern painter would deem insurmountable. The work of the early masters, in whatever way it be, must always be looked at from the standpoint of the artist who wrought it, and not, as we are so fond of doing, from the point of view of the present day. The early masters were our pioneers, and had the exceedingly difficult task of feeling their way in an unknown country. There is little credit due to us, who have centuries of examples to guide us, in succeeding; we have hardly any excuse, save our own incompetency, for failing, and we should be very chary of giving out a thoughtless, superficial opinion about old work, simply because we have not the modesty, taste, or sympathy to appreciate it. I have no doubt that a large number of people who go to the National Gallery to see the *Ansiedi "Madonnas"* by Raffaele will look in vain for their money's worth; for are they not aware that for 70,000, one might purchase the whole contents of some modern art galleries? I am not here finding fault with the conclusions many people arrive at on looking at this latest addition to our National Collection, but at the method whereby they arrive at their conclusions.

The way to appreciate old glass is to see it side by side with had glass. In New College Chapel, Oxford, may be seen a few good old windows, together with some leaded windows of the seventeenth century, about as bad as windows can be, together with that wholly mistaken effort in glass-painting, "the Reynolds" window, as it is termed. In Peterhouse, Cambridge, there is a fine specimen of Dutch glass in the east end window, and some very offensive Munich windows in the nave, said to have taken a medal at the '51 Exhibition! If that is so it only shows what a very "modern art" stained-glass painting is.

Perfection of result may be, and often is, due to limited means, and it was probably owing to the technical difficulties the early craftsmen had to overcome that kept their art so restrained and made their work so entirely successful. It is to be regretted that with increase of technical skill comes the desire of exhibiting one's skill. We see this in the works of many of the rising painters of the day,—this desire of showing the world "what a deuced clever painter I am." The early glass-painters could not do that. The difficulties of their craft restricted them, and imposed the necessary limitations upon them. They went the simplest way to work, contented to arrange large masses of colour effectively and harmoniously, and striving to obtain broad, simple *sculptural* effects. With increase of skill came the desire to exhibit their powers of technique, and with this desire the throwing overboard of all restrictions and limitations imposed upon them by their craft, to result, as time went on, in such deplorable examples of mistaken skill and misapplied ability as such windows as those instanced in New College and elsewhere.

There is such a wealth of material in the old glass that has come down to us, even in this country, that it is difficult, in attempting to give scattered examples of "bits" from old windows, to know where to begin, and still more where to end. The examples here offered are, in the main, taken from English glass, though the three-figure windows are from St. Ouen, Rouen. It will be enough for my present purpose if I append a brief note, with the various examples given. Figs. 1, 2, and 3 are taken from the Church of St. Ouen, Rouen. They illustrate a common practice of the early craftsmen of leading a figure richly coloured on to a background of quarries of tinted white glass. These quarries were, in many instances, traced with simple patterns and stained, and it is astonishing what a rich and varied effect is produced by these traced and stained quarry grounds.

Figs. 4A to 4F are examples of leaded borders from Canterbury Cathedral. The ingenuity of the old glass-painters is exhibited nowhere more strikingly than in the ornamental leaded borders. The interlacing and intertwining of the patterns, such a notable feature in early Celtic ornament, is managed always with great skill,

and is well adapted to the exigencies of the glazier. There are, it may be observed in passing, some very characteristic examples in Canterbury of the early cut up medallion windows, of which such splendid examples are to be seen in the Sainte Chapelle, Paris, and modern imitations in the Temple Church, Strand.

The seven borders, fig. 5, are also taken from Canterbury. The three "bits" of leaded borders, figs. 6, A, B, and C, are from York Minster. Nothing can be simpler or more effective than such borders. It will be noticed that the early glass-painters were not afraid of putting in plenty of solid back-ground. The places left white would be occupied with ruby or blue glass.

Figs. 7A and 7B are from Salisbury, and are fairly typical examples of geometrical leading combined with tracery. Fig. 8, of a different period to any of the foregoing examples, is taken from the Abbot's Hospital, Guildford. Figs. 9, 9A, to 9C are four "roses," from St. Andrew's, Cheddar. The five borders, fig. 10, are from St. Mary Redcliffe, Bristol, as are also the nine circular patterns, figs. 11 to 11I. The ingenuity of figs. 11B, 11C, and 11I is notable. Of the grotesques, 11C is probably symbolical of Eternity, and 11I we might term the germ of the art of the Renaissance, the striving after effects which the artists of the Renaissance carried to their logical conclusions. The three remaining examples, figs. 12A, 12B, and 12C require no comment.

Fig. 12A.

Fig. 12C.

Fig. 12B.

Very many people who receive the keenest and most exalted enjoyment from a visit to one of our noble cathedrals or abbeys have only an eye for the general effect, and almost entirely miss the wealth of detail with which the early craftsmen enriched the fabric of their buildings. And yet keen and discriminating as should be the enjoyment that the *tout ensemble* gives one, it will be found that the fullest enjoyment only can be reached by attention to detail, and though this remark is addressed to those who merely take an interest in old work for its own sake, and not as a part of the business of their lives, it is to be feared that students are too apt to be content with generalities,—with the impression of a building as a whole, to the almost total exclusion of the thousand and one details that go to produce the complete and perfect work.

FRED. MILLER.

Mosaic Work.—Messrs. Diespeker & Co., of Holborn Viaduct, have just finished the mosaic (about 700 yards) at the National Hospital for Paralyzed and Epileptic, Queen-square, Bloomsbury, which is to be opened on the 1st of July by H.R.H. the Prince of Wales, as a national memorial to the Duke of Albany. The same firm has laid the mosaic at the new Birkbeck Institute, which will be opened by H.R.H. on the same day. The mosaic in front of the altar of "Our Lady" in the Oratory at Brompton has also been executed by this firm, after the designs of Mr. H. A. Gribble, the architect of the building.

Illustrations.

DESIGN FOR ADMIRALTY AND WAR OFFICES.

WE publish this week a reproduction, by Messrs. Waterlow's process, of a perspective view, executed especially for our paper, of the design submitted by Mr. H. B. Garling in the recent competition for Admiralty and War Offices. The view shows the building as it would have appeared from St. James's Park.

As many of our readers will remember, Mr. Garling was the gainer of the first premium in the competition for the War Office in 1857.

NEW OFFICES OF THE DAILY NEWS.

The new buildings erected for the *Daily News*, of which we give an illustration this week, are practically in two blocks, having a frontage to Bouverie-street of 85 ft., and five stories in height, including the basement and a story in the roof. The front building is occupied, on the ground-floor, by the publishing and general offices; the first floor, by the management and editorial department; and the upper floors, by the printing and other offices. The rear building is wholly occupied by the printing-offices, paper stores, machine-room, stereotyping department, and engine-rooms. It is stated that the sanitary arrangements, the ventilation, and the fireproof division of the premises have been carefully studied. One feature in the execution of the work has been that the printing of the paper has not been intermitted for one day during the reconstruction of the building, while the new buildings have been erected over the printing-machines. The buildings have been constructed from designs prepared by Mr. T. Chatfield Clarke, F.R.I.B.A., and under his superintendence. The works were carried out by Messrs. Brown, Son, & Blomfield, in a short space of time. The ornamental carving, which includes heads of Milton, Johnson, and Goldsmith, Dickens (the first editor of the paper), Forster, and Douglas Jerrold, was executed by Mr. Anstey, and the ironwork was supplied by Messrs. H. Young & Co.

SCULPTURE AT THE ROYAL ACADEMY. SCENES FROM THE ANNEID, BY MR. HARRY BATES.

We before commented, in an article on the Academy sculpture, on this fine little example of ideal sculpture, which would have been deservedly purchased with the Chantry Fund, but for the technical objection in the fact that, though by an English artist, it was not executed in England. It is rather a pity the bequest was hampered with this formal condition.

The design was originally made for a scheme for the decoration of a dining-room, but, as it was much approved, the sculptor was asked to translate it into bronze. The design was modelled by the sculptor, Mr. Harry Bates, during his travelling studentship, and cast in Paris. We have not often seen work by a young sculptor manifesting so clear a perception of the real aim and scope of sculpture in giving a poetic rendering of an ideal subject. The groups and draperies are beautifully composed, and the figure of Dido, in the first panel, is particularly fine.

THE LARCHES, WROTHAM HEATH, KENT.

This house, situated on the main road between London and Maidstone, about one mile from Wrotham Station and about three miles from the town of West Malling, is erected on one of the most picturesque portions of the estate belonging to the Hon. Lady Caroline E. Nevill, and, occupying a high level, commands extensive views of the surrounding country. The accommodation on the ground-floor consists of drawing-room, dining-room, and morning-room, kitchen, scullery, butler's pantry, and other offices; on the first floor there are six bedrooms, housemaid's closet, sink, &c. The outside walls of the ground-floor story, built with a 2-in. cavity, are of Kentish rag stone, and lined internally with brickwork; the walls of the upper story are of solid half-timber work, with tile hanging in the gables. The roof is covered with red tiles.

The soil of the site is a sandy loam, and an excellent supply of spring water is drawn from a deep well.

The drainage system and sanitary appointments of the house have been carefully

designed and arranged; the soil and waste pipes, all ventilated, are conducted to a large water-tight cesspool, about 100 ft. from the house, accessible for emptying when required, and all the rain water is collected in a large tank in the ground, built of brickwork in cement.

The house has been erected and carried out from the designs and under the superintendence of the architect, Mr. Herbert Hardwicke Langston, of 9, Great James-street, Bedford-row, London; the contractors for the work were Messrs. Pryer & Co., of Maidstone.

BALLOON FRAMING.

The term "balloon framing" is applied, in Canada and the States, to a light kind of timber construction, which is practically independent of skilled labour; it is a rough-and-ready way of nailing sticks together, in an efficient and scientific manner, in the erection of various kinds of buildings, and is quite commonly met with in cottages, houses, and summer hotels in the north-western portions of America.

A descriptive account of the accompanying sketch will illustrate the principle of construction, and its applicability to numerous other structures much more pretentious than the fowl-house illustrated.

Having settled upon the dimensions of the work, we should proceed to the timber-mills and select stuff of the most suitable sizes, 2 in. and 3 in. by aliquot parts of 12 in. being the readiest scantlings, and 12 ft. to 16 ft. the usual lengths, though white pine timber is easily got up to 20 in. square and 30 ft. in length. In the building illustrated the outside studding is 3 in. by 4 in. mostly 14 ft. lengths, the joists 3 in. by 8 in. in 12 ft. and 6 ft. lengths, &c.; thus this part of the labour is dealt with at the mills, the planning of the building being based a good deal on these data, and the timber is brought to the site ready for immediate fixing.

Having got in rough foundations and raised them about a foot above the ground, we proceed to lay the cill, usually 8 in. by 3 in. hollow and spiked at the angles. I name foundation walls, but roughly-squared tamarac (larch) or cedar logs frequently take the place of stone walls.

On the cill the studs are raised and toe-nailed thereto, the angles and door-posts are formed by pairs of studs. On the illustration the angle posts are blocked apart to admit of nailing the end joist to the side studs and for better fixing the internal lining. The intermediate studs are spaced out from 30 in. to 36 in. from centre to centre, the window openings causing the variation.

In this case the ground-floor was formed with concrete, otherwise the ends of the joists would have rested on the cill, close up home to each stud, and have been spiked to cill and stud, forming additional support and perfect tie.

The first-floor is formed by nailing a 1-in. slash or girt, 4 in deep, on the face of the studs, at a level of the under-side of the joists; upon this the ends of the joists rest, close up home to each stud, and are spiked thereto, the combination forming a perfect cross-tie and a solid bearing. Sometimes these girts are let into a sinking on the face of the stud, forming a shoulder for its support, and sometimes the joints are notched over the girt, offering apparent advantages in support and tie; but considering the closeness of the joint and its downright bearing there, is little practical advantage to be gained by this great accession of labour, as will be more apparent when the structure is complete.

In the illustration the building was spaced for the stock length of 12-ft. joists, with half-lengths across the central passage. The joists, where they overlap on either side of the passage studs, are nailed thereto, and notched over the girt, so as to form practically a continuous tie. The joists next the ends of the building are nailed to each stud they pass, every third one being bolted so as to form, when floored over, a perfect longitudinal and transverse tie or diaphragm.

The studs run up the whole height of the structure, passing between the joists, and if any lengthening is required it is done by placing a piece hnt on the top, and splicing by nailing long 1-in. slabs on each side, as shown.

The wall or roof plate is 4 in. by 2 in., nailed to the top of each stud, the rafters notched over and spiked thereto, one directly over each stud; thus the points of support are always direct. According to the size and use of the building, ceiling joists may be used spiked to plate and

after feet, or collars to each rafter, or less frequently, as the case may be.

The frame-house is then covered externally (and by preference in construction internally also), walls and roofs, with 1 in. or 1½ in. grooved and tongued boarding in narrow widths. This provides longitudinal tie, and knits the shell into a tight-box. The framing and lining together form the essentials of balloon framing. The lining, particularly the internal lining, adding immensely to its strength, more especially if placed diagonally. When the floors are laid, and the lining all on, the building practically becomes a series of solid slabs knit and tied together in all directions, with no weight not directly supported and no thrust not directly counteracted.

Angle-ties, bridging, and other stiffening pieces are used in larger buildings for extra strength, where the bearings are long or the stories high, but there is nothing in the nature of the construction requiring skilled labour, or beyond the capacity of a man and a boy to raise, or needing any other tools than a saw and a hammer. In small buildings all the stuff would be out of 1½-in. plank. Except joists, these studs would be 1½ in. by 4 in. rafters, 1½ in. by 5 in. joists, 2 in. by 9 in. all spaced, 30 in. centre to centre.

Outside the boarding the walls and roof are covered with thin asphalted felt, called building paper. The roof in the building illustrated is finished with patent asbestos cement ¾ in. thick, which forms a thoroughly weather-tight roof summer and winter. Varieties of this cement are commonly used here for flat roofs; other roofs are covered with tinned iron roofing plates, welded or double seamed, as the edges, or pine shingles 1½ in. by 6 in. cut feather-edged, and slates, red, green, and blue.

In town districts these structures, such as that illustrated, are cased externally with half-brick walls, tied in and loaded with long rails or strips of sheet iron, thus presenting the appearance of an ordinary brick house; but in rural districts it is usual to finish the exterior with horizontal or vertical weather boarding or panelling. The former, which is called "clapboarding," is cut out of the best end of the log, about 7 ft. in length; the cuts are made with the circular saw from the outside towards the centre, as illustrated, leaving a core or heart of about 3 in., giving boards from 6 in. to 10 in. wide, about ½ in. on the outer edge. On knocking this core out the boards fall apart, and are ready for use. Clap boarding is fixed from the top downwards, the men working on a bracket scaffold screwed to the studs. Each board is driven up home under the edge of that above it, and a chisel nail driven through the two makes a sound and rapid job. The margin or weather face varies from 4 in. to 6 in. or 7 in.

In some cases the walls are finished internally with 1½ in. grooved and tongued lining only, and the space between the studs filled in with sawdust; sometimes they are battened over the boarding, and lathed and plastered in the usual way, or with wrought lining over the rough boarding.

If the inside is lined horizontally or diagonally, the outside may be covered with vertical boarding on horizontal stiffening pieces, or on horizontal or diagonal battens nailed to the studs. Sometimes the upper story is boarded vertically, and the lower one horizontally.

It is maintained that not only are such buildings some 40 per cent. cheaper to raise than brick and timber used in the usual English plan, but they are (for the climate) more comfortable to live in, warmer in winter and cooler in summer, free from all elements of damp, they can be put up with extreme rapidity to meet a want, and finished off at once, and are ready for immediate occupation.

The large hotel at Minnetonka, giving accommodation for some 400 guests, and a great summer resort, was thus built in 100 days. The system prevails throughout the north-west from the merest cottage to the first-class house and the largest hotel. The elaborate framing of English carpentry with dovetails, tenons, mortises, and pinning, "with oak or iron," expensive straps, heavy timber, close centring, &c., are unknown here, and yet these buildings stand perfectly, and would blow over without falling to pieces. Should a stick decay it can be readily replaced, and should alterations be contemplated, there is little or no difficulty to be encountered, and no expensive preparations are required.

THE ANNUAL REPORT OF THE METROPOLITAN BOARD OF WORKS.

OCCUPYING nearly 200 closely-printed pages, the Report of the Metropolitan Board of Works for 1884 is a record of much useful work done, and, on the whole, done well. Notwithstanding the anomalous constitution of the Board,—its members not being directly responsible to the ratepayers, but being the nominees or delegates of the various vestries and district boards of works,—and, although it only numbers forty-five members, it is entitled to the gratitude of Londoners for the manner in which it has performed the multifarious duties thrust upon it since its creation in 1855, now nearly thirty years ago. That it has earned the public confidence is proved by the fact that year after year Parliament entrusts it with new duties, some of which, however, are obviously only entrusted to the Board in the absence of a properly-constituted municipal governing authority for the metropolis. It may be news to some of our readers, for instance, to be told that the Board is the supervising authority, under the Infant Life Protection Act of 1882, of what are known as "baby-farms," the Board being empowered to fix the number of infants under the age of one year which may be received by any person, the premises themselves being subject to registration, which is refused if they are deemed to be unsuitable. Hampered as the Board has been from the first, by its very constitution, in the work of municipal government, it has, nevertheless, shown the value of unity of administration, so far as it has had authority to adopt it. There are many who think with us that unity of administration would be more easy, and, at the same time, more efficient, under a municipality directly answerable to the ratepayers.

During the past year considerable progress has been made with various new storm overflow and relief sewers supplementary to the main-drainage system proper. The Deptford storm overflow sewer, which cost 34,000*l.*, was completed last September. The new main sewer from Rochester-lane, Putney, to the Clapham-road, which will be carried across some low-lying land at Wandsworth for more than three-eighths of a mile in the form of an aqueduct, is in progress. The contract price is nearly 152,000*l.* New sewers for the relief of the Ranelagh and King's Scholars' Pond Sewers, passing through Piccadilly, Knightsbridge, and Chelsea, are in progress, and it was on the line of these works that the accident which flooded the District Railway the other day occurred. The cost of these sewers will be 96,300*l.* Various other extensive works of sewerage are in progress. As to the state of the Thames, into which all the metropolitan sewage goes, the Board's Report refers to the Report of the Royal Commission, and demurs to some of the conclusions of the Commissioners. But that the state of the river is very bad in hot weather is admitted by the Board, for, after mentioning the arrangements made last year for deodorising the river, the Report says,—“To prevent any difficulty in future from an insufficiency of chemicals, the Board has set up apparatus and machinery at the Crossness Pumping Station, which will enable it to manufacture promptly and in sufficient quantities the compounds required for deodorising purposes.” The Report next briefly refers to the experiments to ascertain the best means of treating the sewage at the outfalls with a view to its purification before being discharged into the river. These experiments were going on when the hot dry weather necessitated the immediate application of deodorising agents to the sewage. The experiments have since been resumed,* and arrangements have been made for a trial of a method of purification on a large scale. The Report points out that the average daily discharge from the metropolitan outfall sewers amounts to nearly 160,000,000 gallons, and says that it is only an experiment on a large scale which can enable a judgment to be formed of the practicability of dealing satisfactorily with such an enormous volume of liquid. The Report next states what was done by the Board during 1884 for the prevention of Thames floods by compelling the owners of riverside property to raise the level of their wharf and quay walls. Dealing next with metropolitan improvements, the Report mentions the new street from Tottenham-court-road to Charing Cross,

* Some particulars of them will be found in the *Builder* for June 6, p. 792, ante.

in connexion with which claims for property required amounting to 278,000*l.* were settled during the year. For the new street from Oxford-street to Piccadilly-circus, nearly all the property to be taken has been acquired, and attention has been directed to the maintenance of the houses in a proper sanitary condition until the ground can be cleared." On the Newport Market area new dwellings for the accommodation of 2,000 persons of the artisan class have been erected. In connexion with the widening of Gray's Inn-road, three sites have been let for the erection of working-class dwellings, "the total purchase-money for them being 3,405*l.* for 999 years' leases at shilling rents." We are pleased to notice that there is a prospect of the new street from Southwark Bridge-road to St. George's Church in the Borough, for which powers were obtained in 1877, being proceeded with without further delay. The street will cut through the once disreputable and now insanitary district known as "The Mint," the houses to be taken are of the worst class, and most of them have to be closed as soon as the Board obtains possession. It is but right to say that the delay in commencing this improvement seems to be due, not to the Board, but to the South-Eastern Railway Company, who obtained powers to construct a new branch railway through the district. Among the many other metropolitan improvements now in progress of execution or of negotiation may be mentioned the widening of Upper-street, Islington, and the Tower-hill improvement, the latter consisting in the removal of the block of houses between Postern-row and George-street, and in a readjustment of the levels, so that a complete thoroughfare, 60 ft. wide, may be formed from Eastcheap to the foot of the Minories. After stating what has been done under the Artisans' and Labourers' Dwellings Improvement Act and its amending Acts during the year, the Report recounts what the Board has done and is doing in the matter of Thames bridges. The foundations of Waterloo Bridge have been deepened and secured; Battersea Bridge, a dilapidated timber structure, is to be rebuilt; Putney Bridge is being rebuilt, at a cost, including approaches, of 210,000*l.*; and Hammersmith Bridge is having its southern pier underpinned, and is to have its superstructure entirely reconstructed. The Report also chronicles the unsuccessful efforts of the Board to get Parliamentary sanction for a subway or tunnel beneath the river at Shadwell and for a bridge at the Tower. An interesting part of the Report is that devoted to Parks, Commons, and open spaces, the total extent of such open spaces under the control of the Board being 1,835½ acres. After reviewing the Bills affecting the metropolis introduced into Parliament during the session of 1884, some of which (especially the London Government Bill) are freely criticised, the work of the Metropolitan Fire Brigade is detailed. The staff of the brigade now consists of 559 men of all ranks, without reckoning 66 coachmen and 14-licensed watermen,—the latter engaged on the steam fire-floats on the river. There are now 55 fire-engine stations in the metropolis, besides 23 street stations with hose carts, and 127 fire-escape stations. From a table contained in the Report, we find that whereas in 1866, when the Brigade passed into the hands of the Board, the total number of fires was 1,338, of which 25 per cent. were serious, in 1884 the total number of fires was 2,289, of which only 9 per cent. were serious. The increase in the number of fires may, we suppose, be accounted for by the increase in the growth of the metropolis during the last eighteen years; the great decrease in the percentage of serious fires is undoubtedly due to the increased strength and efficiency of the Fire Brigade since it passed under the control of the Board. The Board's action with reference to the gas supply of the metropolis is next passed in review, and it is stated that the gas supplied by the companies has been found, when tested by the gas examiners appointed by the Board, to be equal in lighting power and purity to the requirements of the Acts of Parliament. Some additional testing-places have been established. After a passing glance at the subject of electric lighting, the Report deals with the question of water supply, and expresses regret that another year has passed without anything effectual having been done towards giving the inhabitants of London control over their own supply of water. Most of the London companies made

arrangements during the year for extending the constant supply system, under the provisions of the Metropolis Water Act of 1871. After enumerating the tramway extension schemes which came under the consideration of the Board during the year, the Report narates the operations of the Board with regard to the prevention of cattle diseases, the Board being, by the Contagious Diseases (Animals) Act of 1878, constituted the local authority to carry out the provisions of that Act within the metropolis. The action of the Board in regard to the very necessary supervision of dairies, cow-sheds, and milk-stores is next detailed, and then follow particulars of their action with regard to the control of slaughter-houses and offensive businesses; and a reference to the exercise of the powers they possess for regulating the manufacture, conveyance, storage, and sale of explosive substances within the metropolis. In the matter of the storage and sale of petroleum, benzoline, &c., the Board exercises considerable and very necessary authority, having regard to the dangers of storing such commodities in bulk, but it complains of the inaction of the Legislature in not carrying out the recommendations of the House of Lords Committee of 1883 on this subject. After recounting its action under the Infant Life Protection Act, which, in the opinion of the Board, needs amendment with the view to greater efficiency, the Report deals with the financial transactions of the Board, which are certainly on a scale commensurate with the large amount of work done by the Board,—the extent of whose operations can only be appreciated by studying the Report itself, of which we only here give a brief outline. The Board's expenditure during the year amounted to no less than 3,373,170*l.*, of which sum nearly 2,000,000*l.* has been defrayed out of money raised by the issue of Metropolitan Consolidated Stock. An important section of the Report is that which details the Board's action with regard to the supervision of streets and buildings. The total length of new streets sanctioned by the Board during the year 1884 was about fifteen miles. The action of the Board in the direction of ensuring safety of life and limb to the visitors to theatres and music-halls is described at considerable length. Various other matters, such as the re-naming and re-numbering of streets, the supervision and demolition of dangerous structures, &c., are dealt with in this section of the Report, which concludes by saying that, whatever may be the future London local government, "in the mean time the Board has only to continue the course hitherto pursued, that is to say, to apply all its powers and energies, within the limits assigned by the Legislature, to the improvement of the metropolis and the promotion of the health, well-being, and comfort of the vast population resident within its borders."

The Report is supplemented by a number of appendices, including the Report of the Engineer (Sir Joseph Bazalgette), and that of the Superintending Architect (Mr. Geo. Vulliamy). In the first-named Report very full particulars are given of the sewer-works completed or in progress during the year, as well as of the new street improvements, new bridges, and other engineering works carried out by the Board. In the Superintending Architect's Report statistics are given of the building operations of the metropolis. One item of interest is that during the year only eighteen licences for the use of Portland cement concrete for the walls of buildings were granted.

THE ARCHITECTURAL ASSOCIATION.

The adjourned special meeting* of members was held on Friday, the 12th inst., Mr. C. R. Pink, the President, in the chair.

Mr. George Ashlin, of the Royal Hibernian Academy, was elected a member by acclamation, Mr. Harold Lane Brown being elected a member in the usual manner.

A vote of thanks was accorded to Messrs. Ernest George & Peto for permitting the members to visit Buchan Hill mansion, Sussex.

Mr. G. Somers Clarke, F.S.A., submitted a scheme for a monograph on Westminster Abbey. To produce the necessary measured drawings would entail considerable expense, but the work could be carried through at a nominal cost if he had the co-operation of the students of the Royal Academy, of the Royal Institute of

* See *Builder*, p. 719, ante.

British Architects, and of the Architectural Association. The illustrations would be in black and white, but to illustrate the royal tombs and other details coloured plates would be necessary; and for this work he believed he would be able to obtain the assistance of the students of the South Kensington Museum.

As the result of Mr. Clarke's appeal, the meeting authorised the issue of a circular asking for aid from those willing to assist in the work.

The Chairman intimated the reception of a petition signed by over fifty of the members, asking the Committee to arrange for Saturday excursions during the summer months. The matter had been before the Committee, who hoped to meet the wish of the petitioners.

Mr. H. Lovegrove, on the part of the younger members, had been deputed to impress on the committee the desirability of continuing the excursions. They would be very enjoyable during the summer time, especially if they could be carried out within twenty or thirty miles of the metropolis.

The meeting then proceeded to take up the business which had been adjourned from the 29th ult., viz., Mr. Cole A. Adams's motion for increasing the subscription from 10s. 6d. to 11s.

Mr. Hugh Stannus regretted that he would have to vote against the motion of a man whom they all respected so much, believing if it were carried it would be a victory for Mr. Adams which could be only less disastrous than a defeat. He hoped after Mr. Adams's long and excellent term of office he would not divide the Association into two hostile camps. He would, therefore, appeal to him not to press his motion, but to let it drop for a session. The members were all in accord with Mr. Adams in regard to the matter of education, but thought it would be better to postpone the resolution for one year.

Mr. Baggallay said the principal reason urged against the proposed increase of subscription was that it would press most upon the younger and poorer members, but when one entered the architectural profession he must have some money to spare beyond the premium which had been paid. Mr. Sedding had written to the papers stating that the Institute might subscribe largely in this direction, but many of the members of the Association would object to become Institute pensioners.

Mr. J. A. Gotch remarked that one of the reasons for increasing the subscription was for the publication of the papers, and if any one supported that perhaps he was the one. At the same time there appeared to be a considerable objection to their doing this, and he would therefore suggest that that object should be left out for the present. He hoped also that country members would not be compelled to pay a guinea, as the advantages of the Association were almost entirely to be derived by town members.

Mr. Cole A. Adams agreed to the withdrawal of the reference as to publishing the Transactions. The papers and discussions were so well reported and edited in the professional journals that there was no need for it.

Mr. J. D. Sedding believed that the reason for the increase was the advancement of education, but how could this be attained if many of the members withdrew? It would have the effect of debarring the poor student from taking advantage of the classes, and this would be to him a painful matter. In old days it was the dullard who went to the wall, but now he sheltered himself behind professional status. The amount proposed to be raised was a mere flea-bite compared to what was really required. He was sorry to hear Mr. Baggallay say that the Association should not receive any help from the Institute. If they raised this sum to remunerate paid lecturers and professors the Association would lose a grievance, for it was a shame that all the architectural education should be provided by the students and not by the architects. They were now like Lazarus at the gate, but if he became respectable Dives would take all the credit. They would be taxing themselves and playing into the hands of the Institute; they should, therefore, keep on agitating, and make much of their grievance.

Mr. E. W. Poley then moved as an amendment,—"That the question be deferred for twelve months." This was seconded by Mr. Arnold Taylor, and lost.

Mr. Brodie thought the decision on the question should be taken by a voting-paper.

The Chairman explained that under the rules a vote had to be taken by a show of hands.

Mr. Kemp next moved, as an amendment, that the subscription of members residing within twenty miles of London should be raised to one guinea, while that of members outside the radius should remain as at present.

Mr. Gotch seconded the amendment, which was opposed by Mr. Slaton, on the ground that it was difficult to make a hard-and-fast rule on this point, an opinion with which Mr. Pratt coincided. This amendment was eventually withdrawn.

Mr. Stannus then moved as an amendment, "That this Association approves of the improvement and consolidation of the educational scheme, and authorises the committee to go to any expense, not exceeding 100l., during session 1885-6, and postpones the question of increasing the subscriptions till some period towards the close of next session, when the experience gained during the session might guide us in our decision." There was some 200l., he believed, in hand, and they could therefore afford to expend half of it in this manner. Mr. Stannus also read a letter from Mr. R. Phené Spiers, in which he stated that after careful consideration he had come to the conclusion that it was preposterous to ask the members for an extra half-guinea to make a university of the Association. It would be far better, Mr. Spiers added, to have special fees for each class, and if a vote were taken it should be by polling all the members.

Mr. Lovegrove seconded, and Mr. J. Douglas Mathews supported, Mr. Stannus's Amendment.

Mr. Bashill thought they were departing from what had raised the Association from the position it held thirty years ago to that which it now occupied. He could recall the time when only three members turned up at a lecture, and they ought not to lightly depart from the position they had attained. It would be a great mistake to attempt to do that which should be done by the Institute, by appointing professors and paid masters. At the same time the Association should manage its own affairs without asking for heavy subsidies from any other body. He believed the Institute would soon do that which they were thinking of, viz., supply facilities for the higher education of the profession. He would support the amendment as an experiment.

Mr. Atkin Berry opposed the amendment, considering it would not give a sufficient chance of showing what they could do.

Mr. Ellison opposed, and Mr. Blagrove supported the amendment, which after a few remarks from Mr. Cole A. Adams, was put to the vote, and lost by 54 to 60.

The Chairman then put the original motion for increasing the subscription, which was lost on a division, the numbers being 61 in its favour, and 70 against. The result was received with cheers and counter-cheers, and the proceedings terminated.

AN OLD FRESCO AT LINCOLN'S INN.

A SINGULAR discovery has just been made in Old-square, Lincoln's Inn. Between the gateway and the late Sir G. G. Scott's new chambers northwards stand Nos. 2, 3, and 4, Old-square, or, as it is styled in the existing tablet, Old Buildings. These chambers date from more than 250 years since. They are solidly built, and contain a great amount of large-sized oaken timber. Having enjoyed immunity from fire they preserve their pristine condition, but must now fall in pursuance of an extensive scheme for rehabilitating the Inn. Behind the later deal panelling of a room on the first floor of No. 3, to the left hand of one ascending the novel stairs in the turret, is exposed a contemporary fresco, painted on the plaster between the uprights and transoms. Extending from floor to ceiling, it covers, over all, some 70 square feet. Limited to their respective divisions, the subjects include figures, monsters, heads, *amorini*, birds, fruit, flowers, scrolls, and the like,—all well executed, though in somewhat crude coloring. The Cupid discharging his bow, the Pomona (or Ceres), the swinging boy, and the husbandman tilling the soil are very good. The style of the spade used by the last-named is in itself enough to mark the age of a curious mural decoration for whose rescue some effort should be made. To the right is a capital composition of two dolphins depicted in conventional guise, supporting a vase or fountain, whereon are two parrots,

and above them a heart in flames. Going through the now dismantled chambers one recognises a *raison d'être* for the lofty chimneys which project at intervals from against the outer walls. Though it is mainly to them, together with the turrets, that Old-square owes its quaint and picturesque aspect, these chimneys are evidently of more recent origin, and are of "stock," as contrasted with the other smaller "kiln" bricks. They serve, in fact, the additional fireplaces for the lesser apartments into which most of the original large rooms have been subdivided. Nearly all the millioned stone windows are replaced with modern sash frames; one of them, however, remains in the room under review. We understand that the henchers are minded for the present to withhold their destroying hands from so much of the square, including the historic Thurlow chambers at No. 24, as lies south of the gate, and from the gatehouse itself. That venerable portal dates from the year 1518, and is one of the very few of its kind which survive in London. Here, in the top floor of No. 1 staircase, Lord Mansfield, when Mr. William Murray, had chambers; Sir Matthew Hale occupied the set immediately over the archway, looking into what was then known as the Gatehouse Court. Views of the Gatehouse and of the portion that is now being demolished are comprised in Mr. Alfred Marks's admirable photographs of relics of old London.

We are informed, singularly enough, that one or two sets of chambers in Old-square are freeholds.

THE LATE MR. HENRY EDWARD KENDALL, ARCHITECT.

The profession has just lost by death one of its oldest members, Mr. H. E. Kendall, the event occurring on the 9th instant at his residence in Burlington-road, Westbourne Park. He was born in London, and, at the time of his decease, was within a few weeks of being eighty years of age. His father, however (also a well-known architect), lived to the almost patriarchal age of ninety-eight!

The son was pupil to the father, and, from the first, was a facile draughtsman. In 1833 he gained the silver medal of the Royal Academy for measured drawings of St. Bride's steeple, London; and, in 1835, he was rewarded by the Society of Arts by a gold medal for his "Design for a country mansion in the Elizabethan style," having already obtained two other medals in previous years from the same Society for his architectural drawings. Upon entering practice on his own account he was fortunate in securing an extensive and influential connexion, and was employed in erecting or altering many important mansions, including Knoxworth for Sir E. L. Belver (afterwards Lord Lytton); and at Sluckburgh, for Sir Francis Sluckburgh; at Weybridge, Sunbury, and Isleworth, for the Earl of Kilmorey; at Farnborough, the picturesque residence now occupied by the Empress Eugénie; also at Pope's villa, Twickenham; and at Baling. He executed parsonages at Childerly, Foulmire, Stockton (near York), Shelford, Stock, Uffington, &c.; and schools at Bury St. Edmunds, Cambridge, Wilsden, Stannore, Hariton, Good Easter, and elsewhere. Making this latter subject rather a speciality, he published an excellent illustrated book of "Designs," at a time when an improved skill and taste in such matters was beginning to develop itself. His churches are less numerous, but the following may be mentioned:—Kensal-green, Hayward's Heath, Brentwood, and St. Patrick's, Brighton. He was architect to the County Lunatic Asylums for Essex, Sussex, and Dorset, as well as other large public buildings. He was appointed District Surveyor for Hampstead so long ago as 1844, and consequently his was one of the earliest names on the list. During his later years he was greatly assisted in his professional engagements by his son-in-law, Mr. Frederick Mow, and thus they were associated together in works at Staunton Harold, for Earl Ferrers; Gordon House, Isleworth, for Earl of Kilmorey; Madingley Hall, near Cambridge; and in the erection of the new vestry-hall at Hampstead, &c. Among his pupils were Mr. J. T. Wood, the discoverer of the remains of the Temple of Diana at Ephesus, and Mr. J. B. Waring, who will be remembered in connexion with the Exhibition of 1851, and as having produced, in conjunction with Mr. T. R. Macquoid, an elaborate

West's System of Concrete Building.

work on Renaissance architecture. The interment took place last Monday, in the family grave in Kensal Green Cemetery, not far distant from that of his father. J. DRAYTON WYATT.

THE "KENSINGTON" GREASE AND WASTE WATER TRAP.

ACCOMPANYING is a section of the trap made by Messrs. Jas. Stiff & Sons under this title. The object is to ensure entire disconnection from the house-drain. The principle is that of a double trap with a grease receptacle between them. We extract the following from the description given by the makers:—

"When used inside the house it should be furnished with the air-tight adjustable cover shown in the above drawings, and should be placed under, or close beside, the sink, and as near as convenient to the external wall of house. A short length of stoneware or metal pipe should be carefully connected with the

ventilating opening V and carried through the external wall to the open air. This will not only relieve all pressure of foul air on the two water seals of the trap, but will minimise the unpleasantness of removing air-tight cover when necessary to cleanse the trap. The stoneware cover, K, rests upon an india-rubber seating, a small bar of galvanised iron, is placed upon the cover and turned up so that its ends slip into specially-prepared grooves in the upper part of trap; a very slight turn of the screwed tap, S, will then be sufficient to press the stoneware cover firmly down upon the india-rubber seating.

When used outside the house, the ventilating pipe, V, and the air-tight cover, K, are both dispensed with, and the trap is furnished instead with an open grid of galvanised iron.

Should foul air ever force its way through the strong seal D, C, it will at once make its exit into the open air through the open grating, or the ventilating pipe, V, and will be unable to exert any pressure on the separate water seal in the syphon inlet A, B."

It appears to us to be one of the most complete and effective traps for disconnection that has been contrived.

"Lincrusta-Walton."—This material has been very extensively used (about 10,000 yards) at the Hôtel Métropole, the bulk of it in the corridors and for bedroom dados. It has been used in Messrs. Spiers & Pond's Exhibition dining-room at the Inventories Exhibition, the whole of which is decorated with "Lincrusta." It has also been applied in the Marquis of Hamilton's room at the Exhibition, and to a room in "Old London."

CONCRETE WALLING.

SIR,—In your notice of a portion of our exhibits at the Inventories Exhibition, in your last issue [p. 826], you say that our slabs, "when set edge-wise on the outer and inner faces of the wall, and keyed to its body," take the place of the movable wooden boarding used by Mr. Tall in his original system of concrete building." Such is not really the case, for when the slabs are keyed to the body of the wall, i.e., when the concrete filling has set, they merely become a permanent facing to the wall, whilst the boarding used by Mr. Tall is entirely removed when the wall has become sufficiently hard.

The chief points about our system are that, instead of forming a casing of wood as is ordinarily done in concrete building, we make a casing of concrete itself in the form of slabs, the courses of which are keyed together by means of a quick-setting cement (such as White's Hygeian Rock) which is poured into key-holes formed for that purpose in the horizontal edges of each slab. These key-holes are so arranged that they shall coincide. The face of each slab may have mouldings upon it, or may be ornamented in any way, and when the filling behind it has set, forms a finished and ornamented face to the wall. The mouldings are applied to the face of each slab by inserting them (made beforehand) into its plastic mass. Heavy mouldings are built up in this system as extra courses.

The enclosed small-scale drawing shows an isometric view of work on this system, and the larger scale drawing shows the slabs in detail.

We recommend this system chiefly on its simplicity, and also because no casings either of iron or wood, and, therefore, no special concrete plant, are required. With this system any ordinarily intelligent mechanic might build his own dwelling.

F. & J. P. WEST.

THE "INVENTORIES."

SIR,—In your interesting article on "Prime Movers," in the *Builder* for June 6th [p. 789], I notice that the writer speaks of a certain car worked by compressed air as being on the M&Karski principle,* from which your readers might be led to consider that that individual had been the inventor of a "system."

So far from this being the case, or the principle of imparting heat to the compressed air on its way to the working cylinder being the invention of M&Karski, it will, I have no doubt, be interesting to your readers to know that this plan was invented by an Englishman, one James Glazebrook, in the year 1797, as may be seen in his specification, No. 2,164 of that year, and in another which he took for further improvements, No. 2,564 of 1801.

It may hardly be credited, but it is, nevertheless, a fact that a few years since some Stock Exchange schemers and company promoters, as well as some financial speculators, aided by the efforts of a "highly scientific" consulting engineer, actually got up a company to purchase the "invention" of M&Karski for some 50,000*l.*, and asked the public to contribute 250,000*l.* to enable them to do so! This precious affair, on these facts, and to the ears of those on the board who were not cognisant of the state of the case, quickly caused them to "bust up" the whole concern, since which time it has not been heard of until I see it cropping up at the "Inventories," whence it is more than probable it may emerge as a wonderful novelty, and one of the greatest inventions of modern times, especially if the original schemers and Stock Exchange speculators are still connected with it.

* The italics are ours.—F. & J. P. W.

Before the public listen to or accept any statements which may be promulgated in regard to it, let me strongly advise them to read over and consider Glazebrook's specifications, and then read and consider No. 3,498 of 1875, that of M&Karski. It will not take a man of ordinary intelligence many minutes to see that in 1797 and in 1801 the wonderful invention and principle of M&Karski in 1875 were recorded in the Patent Office by an Englishman at those dates. C. E.

PUMPS FOR CONTRACTORS' PURPOSES.

SIR,—Referring to the practical article on "Pumps for Contractors' Purposes," by Mr. Powis Bale, in your issue dated June 6th [p. 783], will you permit me, through the pages of the *Builder*, to ask that gentleman, or any of your readers who have had practical experience, what form of valves they recommend as the best for direct-acting steam pipes; and whether those worked by tappets, or moved by steam, are to be preferred? I am told that tappets have been known to get jammed, and even sheared off when the water has been dirty: can you tell me if this is so? I may add that the pumps are required for tunnel-work in Italy, where centrifugal or other simple pumps cannot be made available. A. E.

KELLY CASTLE.

SIR,—Kelly Castle, near Arbroath, referred to in last week's *Builder* [p. 824], is not a modern building, as supposed by the writer of the paragraph in which it is alluded to. It is at least as ancient as the majority of the "keeps" which form so picturesque a feature in Scottish scenery. It stands on a rising ground, sloping precipitously on the eastern side of the castle down to the Elliot Water. The "keep" commands a very fine and extensive view,—in one direction across the Tay estuary to the Fife Hills, and in another to the German Ocean. It was restored some years ago [just so.—Ed.] for the occupancy of a Dundee gentleman, and buildings were then added to make it more fit for modern requirements. Otherwise it retains all the interest which pertains to buildings of its character and period. G. S. AITKEN.

GAS FIRES IN HOUSES.

SIR,—The statement on p. 820 that gas fires are not sanitary arrangements is surely a misprint.* The gas fire of the present time, if properly made and used with a flue, is at least as sanitary and free from all possible objection as the best coal fire; the heat is purely radiant, and every trace of the products of combustion is taken out of the room; the chimney allows free ventilation, and it would be hard to say how a more perfect heating arrangement could be devised. Gas is beyond comparison superior to coal for a fire, in the fact that the heat is always at command and under the most perfect control, whereas with coal fires the exact heat required is not obtained in practice for one hour out of twelve. As regards ventilation and unobjectionable character of the heat, a gas fire leaves absolutely nothing to be desired. We have used gas fires exclusively for years throughout my own house, and the rooms are at least as sweet and well ventilated as any room I ever enter. It is possible to have a had gas fire, and also to have a coal fire with a smoky chimney; but these exceptional cases cannot be taken as a guide in any way.

As to whether gas cooking will ever take exten-

* Not at all.—Ed.

vide hold in general domestic service, there is no doubt that it will eventually do so, and also that it has done so already in those districts where trouble has been taken to bring the use of gas into notice. In many towns, notably Leicester, gas cooking is almost universal, and nothing more is needed than the use of gas companies to assist intending users to make the use of gas universal. Gas has made its reputation, and its use is extending at an enormous rate.

THOS. FLETCHER.

Warrington.

CASES UNDER THE METROPOLITAN BUILDING ACT.

SIR.—The attention of my client, Mr. R. L. Fedrick, has only just been called to a report under the above heading in your issue of the 23rd ult. (p. 745).

I beg leave, while admitting the substantial accuracy of your report, to qualify your account of what the magistrate said in disposing of the case.

Mr. De Hutten stated that he thought the buildings were of a substantial character, but that a few internal bricks might be objected to, and adjourned the matter that my client might arrange with the District Surveyor for their replacement.

This, as I am instructed, has since been done.

MARCUS A. LEWIS,
Solicitor for the Defendant.

LABOURERS' DWELLINGS.

SIR.—The Liverpool Corporation invite architects and others to submit designs for labourers' dwellings. The gross rental per room is not to exceed 1s. 3d. per week, including the use of all necessary sanitary arrangements. If it is possible to let decent rooms at such a rent, and obtain a fair return for outlay, the proper housing of the poor will no longer be a difficulty. I am, therefore, looking forward with much interest for the solution of this difficult problem.

FRANK NEWMAN.

CENTRAL TOWERS.

SIR.—In your notice of my plan for carrying a central tower exhibited at the Inventories, a footnote is added, which states that I am only carrying a little further the plan adopted by the Normans at Tewkesbury and elsewhere. May I be allowed to point out that there is an essential difference between my plan and any of those adopted in Medieval times, when the weight was always carried vertically on angle-piers, as shown on my plan marked B, causing such an obstruction that 25 per cent. of the congregation cannot see the pulpit; whereas in my plan the tower is carried on great arches crossing each other, and having their abutments outside the area of the towers.

ARTHUR BAKER.

SANTA MARIA DELLE GRAZIE, MILAN.

SIR.—A proposal is on foot to restore the church of Santa Maria delle Grazie at Milan. The cupola and western doorway are attributed to Bramante. It is proposed to remove the western doorway, as not agreeing with the style of the rest of the church, or as an alternative to restore the whole of the church in harmony with the design of the doorway, substituting stone for the terra-cotta in the exterior. The proposal is so monstrous that one would hesitate to believe it unless it were vouched for on good authority. There are a plan and a perspective view of the church in Callet and Lesouere's "Edifices Publics de Turin et Milan," plates 22 and 23, which is in the Institute Library.

X.

PROVINCIAL NEWS.

Exeter.—For the past six weeks the premises of the Constitutional Club have been undergoing thorough internal embellishment. Heretofore the smoking-room accommodation was utterly inadequate to the requirements of a club numbering between 1,200 and 1,300 members; and it was determined to include a portion of the landing in the smoking-room. Mr. Rallig, of Exeter, was the architect called in, and, under his superintendence, the work and the improvement in the ventilation of the two billiard-rooms, as well as the decorations, have been carried out. Mr. W. R. Comings has been the contractor for the alteration to the smoking-room, Mr. T. W. Rice for the work of ventilation in the billiard-room, and Mr. Edwin Algar has carried out the painting and decorating work.

Hulme.—Two memorial stones were on Saturday laid in connexion with a new mission hall, which is in course of erection in Tatton-street, off Lower Moss-lane and Chester-street, Hulme. The new hall will be three stories high. There will be an infants' class-room to accommodate 200 children, a preaching-room, capable of holding a similar number of persons; a large schoolroom, with accommoda-

tion for 400 or 500 scholars; and class-rooms and other conveniences. The work is being carried on by Messrs. Peace & Norroy, from plans drawn by Messrs. Mangnall & Littlewoods, and it is hoped the hall will be ready for opening by the end of August.

Kingstone Bogpize, Berks.—New kennels (for fox hounds) and feeder's cottage have lately been built here for the Old Berks Hunt, from plans and under the superintendence of Mr. F. H. Barfield, F.S.I., architect. The buildings are of brick and slate, and are very complete. The principal floors are laid with "Imperial stone" paving. The lodging-houses have white glazed brick dados, and are fitted with iron bedsteads. The food is cooked and the water pumped by steam, and special attention has been given to the drainage. A neat iron fencing, with cast-iron coping, is fixed to the yard walls and the grass yard for young hounds. Extensive alterations have also been made to the Huntsman's and Whip's houses and the stabling near, and the cost of the whole, including boundary walls, new road, &c., has exceeded 2,200l.

DISSENTING CHURCH-BUILDING NEWS.

Bolton.—Bridge-street Wesleyan Chapel, Bolton, has been re-opened, after internal reconstruction, at a cost of about 3,500l. The plastering and decorating work was let to Mr. Wainwright; Mr. Robert Walsh (Danhill) received the order for the heating apparatus; Mr. Alfred Glover the stonework; Mr. Joseph Bell the plumbing and glazing; the remainder,—joiners' work,—being given to Mr. W. Townson. Messrs. Forster & Andrews (Hull), were requested to build a new instrument, at a cost of about 800l. The chapel will accommodate, as before, about 900 persons. The work has been carried out under the personal supervision of Mr. Osmrod, architect, Bolton.

Abercorn.—By the demolition, commenced on the 1st inst., of Abercorn Free Church, Wood-eud, one of the few old land-marks of the Disruption will be swept away. From 1843 to May, 1878, the congregation was an acknowledged charge under the Free Church, but after the death of their last minister, the Rev. Archibald Currie, the membership fell off considerably; so much so that the congregation were obliged to petition the Assembly of 1878 to reduce the church to a preaching station. This request being granted, the church has remained as such. Within the last few years, however, the membership has so rapidly increased that the congregation is now in a position to build an edifice of more prepossessing appearance than the one in which they have been worshipping so long. The new church will be a parallelogram, with octagonal end, where the pulpit is placed,—the front gable to the roadway being buttressed and terminated with a small helfry. The accommodation of the new church is about 400. The architect is Mr. Hippolyte J. Blanc, of Edinburgh.

Brighton.—The Building Committee having decided, upon the recommendation of the architect, Mr. Arthur Loader, of Brighton, to complete the restoration of Queen's-square Congregational Church, which had to be temporarily stopped for the want of funds, orders have been given to Mr. John T. Chappell, builder, of Lupus-street, London, and Brighton, to proceed with the work at once.

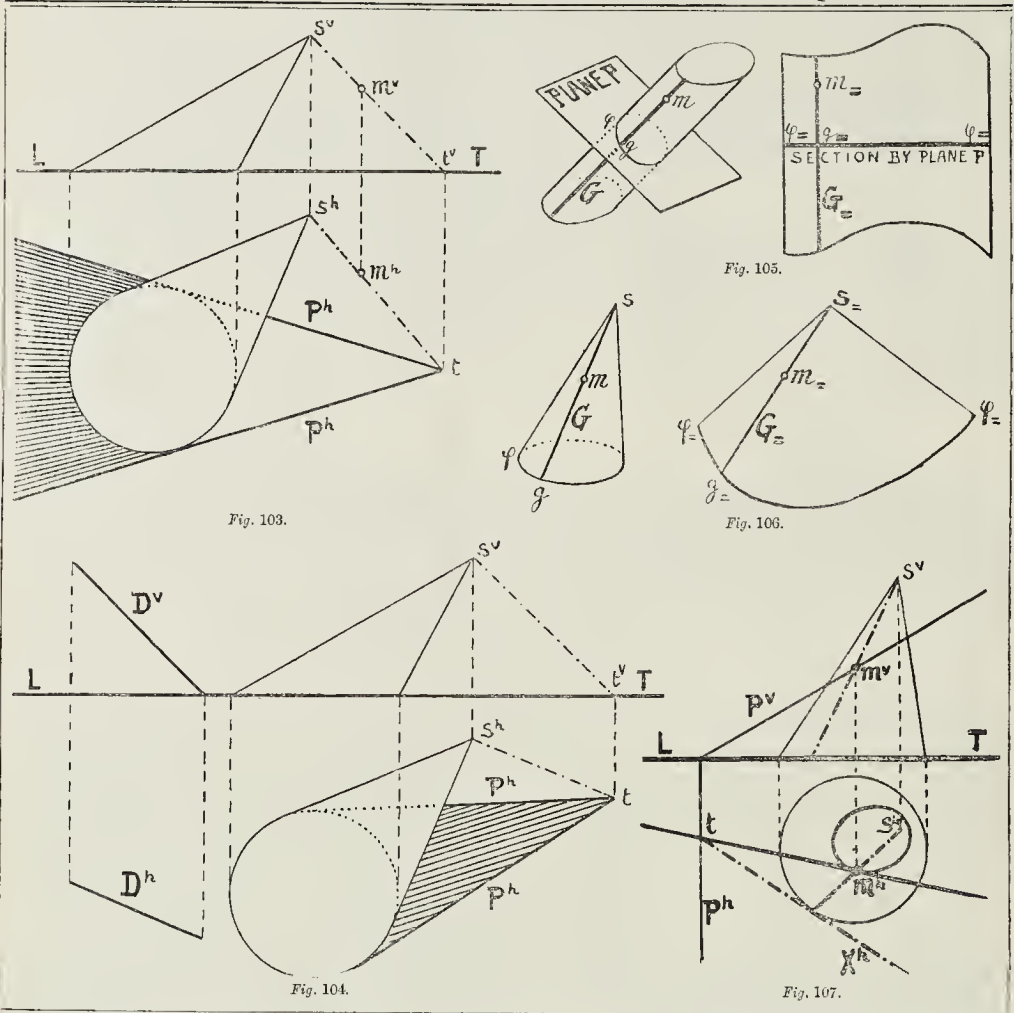

Bagworth (Leicestershire).—A new Baptist Chapel is to be erected here, together with schoolroom and two class-rooms. The new buildings are designed by Mr. John Wills, architect, of Derby, in the Early Gothic style, and will occupy the same site as the old chapel. The cost will be 1,000l.

VARIORUM.

The "City of London Directory" for 1885 (London: W. H. & L. Collingridge) is the fifteenth annual issue of that exceedingly valuable and creditably produced work of reference. It is the City Directory *par excellence*, and in it may be found information as to City institutions not elsewhere easily accessible. It is accompanied by a map on a large scale, prepared from the Ordnance Survey, showing every street in the City, with the boundaries of each ward and parish. A speciality of the work is the guide to the Livery companies, giving the officers of the City guilds, with the history of their halls,

charters, arms (illustrated), charities, and schools. — "The Twenty-fifth Annual Report of the Amalgamated Society of Carpenters and Joiners" from December, 1883, to December, 1884 (Manchester: Co-operative Printing Society, Balloon-street), is a valuable record of the work and position of one of the leading trade-unions of the country. During the year embraced by the Report the Society has opened thirty-three new branches. There was a gain of 1,945 members on the rolls, the total membership being 24,784. The net income for the year was 59,317l., and the net expenditure 57,933l. In "unemployed benefit" the Society paid during the year 23,262l., or 18s. 9d. per member as against 14s. per member in the previous year. In "sick benefit" the sum of 14,852l. was expended, or about 12s. per member. In "trade privileges,"—an item which is explained as covering the whole of the expenses of "trade movements," whether of a hostile or peaceful character,—2,140l. were spent, or about 1s. 9d. per member.—The "Report of the Health of Liverpool, during the year 1884," by J. Stopford Taylor, M.D., Medical Officer of Health for the City and Port (printed by A. Russell, Son, & Bayley, Moorfields, Liverpool), has just reached us. It is an interesting record of valuable work done, and is notable for the statement with which it commences, viz., that "the year 1884 will be memorable for the low death-rate of the city, 25.1 per 1,000, being the lowest on record." There is, of course, still room for improvement, of which there seems to be promise.—Several trade hooks have reached us lately. Mr. G. Shrewsbury, of 122, Newgate-street, sends us a pamphlet in which his "Nonparoil" Gas Conservatory Boilers, and other hot-water apparatus and appliances, are described.—From Messrs. Sharp & Co., of 11, Holborn-circus, we have received a pamphlet issued by them, entitled "The Science of Sanitation in Plain Language for the British Householder." Persons of the numerous class to whom it is addressed will find some useful hints in it.—Messrs. John Warner & Sons, of the Crescent Foundry, Cripplegate, have sent us descriptive catalogues of their boring tools and machinery and mining and quarrying machinery, which contain a good deal of information as to what may be effected in those branches of engineering.—The Eolons Waterspray Company, of 235, High Holborn, have issued a new catalogue of their increasingly-used system of ventilation.—That "accidents will happen" in builders' yards and workshops, and in the execution of building operations generally, many of our readers know from sad experience. It is often of vital importance to have readily at hand the means of dressing wounds and of making the patient comfortable until a doctor arrives. The "Red Cross Pocket Amulance," manufactured by Messrs. Russell & Everett, of Roehampton-street, Vauxhall, and which costs no more than a shilling, will be found very useful in giving first aid to the injured. Under the auspices of the St. John Amulance Association, many thousands of persons of both sexes have qualified themselves to render that aid, and their power of usefulness will be increased now that this compact pocket amulance is within their reach.—The "Trade and Industrial News," the oldest established paper connected with industry in Russia, has taken a new departure. Till very recently it was published in Moscow, in the Russian language, once a month only, but it has been found that the demand for current information was not met with issues so distantly separated as a whole month, and now the proprietors have commenced a weekly edition to supplement the monthly one. The weekly numbers will deal with current topics especially be devoted to explanations of engineering enterprises and publication of details, with illustrations, of new machinery and inventions. Mr. J. W. Vickers, of 5, Nicholas-lane, Lombard-street, is the sole English representative of the paper.

Ensilage.—A gold medal has been awarded to Messrs. F. W. Reynolds & Co., of Acorn Works, Edward-street, Blackfriars-road, London, at the Concours Générale d'Agricolture, Sétif, Algeria, for their patent mechanical appliances for compressing silage, for which they have also been awarded the medal at Montpellier, France.

The Student's Column.

DESCRIPTIVE GEOMETRY.—PART II.
IV.

Find a plane, P, tangent to the cone, and passing through a point, m, outside the cone.

ME join the point m to the apex S of the cone; P^m will pass through t, foot of the line m s, and be tangent to the base of the cone. We see by this figure that there are two planes P tangent to the cone through the point m outside it. This problem is identical with find the shade of a cone lighted by a candle; the limits of the shade are the generators of the cone along which the planes P are tangent. (See Fig. 103.)

Find a plane, P, tangent to the cone and parallel to a given line, D.

We take through the apex S of the cone a line, s t, parallel to the given line D; the tangent plane P must contain the line s t, therefore P^m will pass through its foot t and be tangent to the base of the cone. As in the preceding problem there are also two planes P tangent to the cone. This problem is also identical with find the shade of a cone lighted by the sun's rays; and the limits of the shade are the generators along which the planes P are tangent. (See Fig. 104.)

Intersection of Surfaces in general.

The method followed for finding the intersection of two surfaces, S and S', consists in cutting them by a third surface, X, the intersections of which with S and S' can be readily

found; then the points where the two intersections meet are, of course, points of the intersection of the surfaces S and S' themselves. The auxiliary surfaces X are most often planes, but not always; in some cases, for instance, spheres are selected. It is those simple cases of intersection we shall begin to study.

Sections of Cones and Cylinders by Planes.

Remember that it is very easy to change the vertical elevation plane for both these surfaces. For the cone, it means only making a new elevation of the apex; for the cylinder, a new elevation of one generator. Remember also that sections by planes are easiest when the planes are perpendicular to the elevation plane, for all the elevation of the section falls on the vertical trace of the plane. We beg, therefore, in the following diagrams to assume that the elevation plane has been selected perpendicular to the plane of the section.

For the purpose of constructing cones and cylinders out of card-board or sheets of metal, we shall say a few words about developing these surfaces.

If you cut a cylinder by a plane, P, perpendicular to its generator, and then cut the surface along a generator, you will find, in developing the cylinder, that the outline of the section by the plane P will develop in a straight line, and that all the generators of the cylinder will be perpendicular to that developed section. On the development any point, m, of the cylinder will be situated on the same generator as before and at the same height above the straight line

of section as its former distance from the plane P. (See Fig. 105.)

To develop a cone, cut its surface along a generator of same; any point, m, of its surface will be on the developed cone on the same generator, and at the same distance from the apex. (See Fig. 106.)

To avoid repetitions we shall call l the sections of cylinders or cones by planes, m any point of the section, P the plane of the section, G the generator on which the point m is situated. We shall indicate by the sign - placed below the letter as in L-, m-, the sections and points after the plane P has been turned down and laid flat on one of the projection planes, so as to get the real shape and dimensions of the section. In the developed surfaces we shall place the sign = below the letters which indicate the generators, the sections, and the points; we shall have, therefore, G=, l=, m=.

The tangent to the intersection of two surfaces, S and S', will be situated in each of the planes X and Y, tangent the one to surface S, the other to surface S'. We conclude, therefore, that the tangent to the intersection of the surfaces S and S' will be the intersection of the planes X and Y.

In sections of curved surfaces by planes, the tangent to the section will be the intersection of the plane P of the section by the plane X tangent to the surface of the object. For the section of a cone, for instance, we shall find the tangent to the section in the point m pass through t, the point where X^m cuts the plane of the section P. The plan of the tangent to the section is, therefore, m^h, t. (See Fig. 107.)

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

92, Destroying Noxious Gases. S. C. Dean. Sower gas or air contaminated with infectious matter is drawn through a ventilator, and rendered harmless by heat. The ventilator is preferably in the form of a cylinder, about as long as three times its diameter, fitted with a gas jet at top and bottom. Above the upper gas jet it is loosely filled with asbestos, supported on wire gauze. The upper jet only is lighted, a door being provided for that purpose near the top. The gas from the lower one mixes with the impure air, and is burned with it, while passing through the red-hot asbestos. In some cases a receptacle containing coke wetted with lime-water or caustic potash is placed above the ventilator to absorb the noxious gases generated. The ventilator is applicable to hospitals and works as well as to sewers. For ventilating soil-pipes and cesspools it may be smaller, and may be provided with a lamp instead of gas jets.

296, Ventilator and Air Filter. J. Walsh. The ventilator consists of a blind made of fabric, horsehair, grass, or other substance, which is rolled on a roller, and has at its bottom a lath of wood or metal fixed to the sash by a screw, and bent up to clear the centre rib. In opening the window, the blind pulls down with it, and so prevents soot, &c., from entering the room. In some cases the blind is fixed in a recess above the window, or it may be fixed to the bottom sash as well. It may also be applied to doors, railway-carriages, or any sliding window.

994, Wall Facing Bricks. W. Parry. Each brick is made with a weathered projection in front, which slightly overlaps the bricks below for the purpose of preventing the wet from permeating the joint. The vertical joints are protected by a groove formed in the sides of the projection, which provides a channel to intercept water leaking through, or which may be filled with pieces of glazed brick.

578, Wood Staining and Varnishing. M. Williams. A solution of varnish gums in methylated spirit coloured by aniline dyes is used. This varnish is applied in coats, and rubbed down with sand-paper after each coating. In imitation of different woods a black stain is first applied irregularly to imitate the grain of the wood required, and then the varnish suitably coloured is applied. All kinds of wood may be imitated.

3,004, Door Knobs. C. Priestland. The knob is made in two parts, the neck and an expanded elliptical part. The latter is pressed into its shape from a flat circular blank. Projections are made upon the neck, and engage in slots or a groove, so that when pressed together the parts are securely locked so as to form a door-handle of the ordinary shape.

12,935, Anger Bits. A. M. Clark. The auger-bit is formed by a single spiral blade mounted on a central stem terminating in a gimlet at its end. From the chisel-edge of the spiral blade it is very effective, and its form allows it to be used either by hand or machine, and it can be easily sharpened and repaired.

APPLICATIONS FOR LETTERS PATENT.

June 5.—6,533, W. Blackwell, Improvements in Window Sashes.—6,537, J. Corbett, Jointing and Connecting Lead or other Metallic Pipes without the use of Solder.—6,542, C. Grimmer and J. Cook, Window Fastener.—6,544, M. Schumann, Improved Metallic Paint.—6,543, J. Denny, Manufacture of Bricks.—6,559, J. Lorrain, Heating, Cooling, and Ventilating Apparatus.

June 8.—6,559, W. Paul, Window Slide Ventilator.—6,928, A. Ashwell and C. Cross, Indicating Door Fastenings for Apartments and Closets.—6,930, A. Allison, Draining and Cleansing Swimming Baths.—6,955, S. Groves, Improved Method of Producing Reponsé Work.—6,952, W. Chalk, Improvements in the Treatment of Granite and Granitic Stone.—6,963, H. Penrice, Rock Tumbling Machinery.

June 9.—6,961, R. Hill, Improved Sewage Trap and Gully.—7,033, G. Hookham and W. Tonks, Lines or Cords for Suspending Window Sashes, Chandeliers, &c.—7,052, M. Ingram, Automatic Flushings for Lavatories, Closets, Drains, &c.—7,053, M. Ingram, Discharge and Waste Arrangements for Baths, Lavatories, Cisterns, &c.—7,055, H. Johnson, Combined System of Warming and Ventilating.—7,065, E. and G. Warburton, Panel Planning and Thickening.—7,070, W. Morrison and J. Bonn, Construction of Folding Chairs.—7,082, J. Ebner, Composition for Securing Parquet Flooring to Stone, Concrete, Wood, &c.—7,086, H. Haddon, Joiner's Clamp and Screw Press.

June 11.—7,106, A. Patrick, Manufacture of Sewage Pipes, Glazed Bricks, &c.—7,111, G. Wigg, M. Steele, and W. Wigg, Manufacture of Pigments.—7,112, E. Marland, Securing Tops of House and other Chimneys.—7,143, C. Wilkes and W. Millar, Metallic Compounds for Flooring, Paving, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

16,444, R. Holt and Others, Apparatus for Preventing Smoky Chimneys, Ventilating Rooms, &c.—5,607, A. Clark, Caisson or Crib for Sinking

Wells, Shafts, &c.—5,554, E. Robbins, Novel Manufacture of Decorative Concrete.—5,956, W. Lester, Astragals or Glazing Bars for Doors, Windows, and other Lights.—6,225, R. W. Montgomery, Fire-resisting Cement.—6,465, G. Haywood and G. Williams, Ventilating Apparatus.—2,360, H. Fletcher, Improved Set Square.—4,750, A. Eford, Paving Blocks.—5,420, C. Falkenstein, Combined Electric Bell-pump, Incandescent Lamp-holder, and Switch.—5,805, J. Stewart, 45 degrees, and other Reflecting Instruments for Measuring Angles.—5,913, H. Waldron, Attaching Door-knobs, &c., to Spindles.—6,146, H. Haddon, Workmen's Controlling Apparatus or Timekeeper.—412, H. Whiteley, Weather Guards or Draught-preventers for Doors, Casement Windows, &c., also applicable for Preventing Slamming.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to opposition for two months.

11,276, W. Ayres, Window Sash-weights.—11,515, J. Eaton, Fastening Sliding Sashes.—15,197, E. Turner and J. Reynolds, Combined Circular Rack and Bar Machine for sawing Timber.—3,932, J. J. King, Improvements in Fireproof Floors.—5,579, A. Diss and H. Goodey, Improvements in the Construction of Fireproof Hearths and other Fireproof Parts of Buildings.—10,910, H. Pearson, Water Meters.—11,417, E. Colton, Stench Traps.—11,722, J. Hamilton, Wood Planing Machinery.—12,466, F. Hofmann, Sawing Machinery.—13,411, E. West, Liquid Concrete Refrigerator.—5,728, B. Capitaine, Cooling and Ventilating Apparatus.—5,832, H. Haddon, Disinfecting Water-closets.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

JUNE 8.

Hyde Park-square—No. 36, with stabling, 48 years, ground-rent 25l. 4s. 6d. 25,000
By M'CLELL, BOCKER, & Co.
Sidcup—Ground-rents of 32l. a year, reversion in 90 years 763
Limehouse—Dixon-street, &c., ground-rents of 94l. a year, reversion in 94 years 2,110
Peckham—Shards-road, ground-rents of 74. a year, reversion in 62 years 155
Battersea Park-road—Ground-rents of 24l. a year, reversion in 43 years 750
Horselydown—Church-grove, &c., ground-rents of 41l. a year, reversion in 44 years 623
Bow—31, Stephenson-road, the "Earl of Eglington's public house, freehold 4,200
Hackney-road—128, 128, and 148, freehold 2,450
Spitalfields—80, Brushfield-street, freehold 1,049
Whitechapel—14 and 16, Osborne-street, freehold 9,510
Tower Hill—22, King-street, freehold 710
11, Queen-street, freehold 510

By SIMMONS & GASSON.

Horley, Surrey—3, The Grove, freehold 1,150
By DENNISON, TAYLOR, & Co.
Fishery Park—172, 201, and 209, Blackstock-road, 85 years, ground-rent 32l. 1,403

JUNE 9.

Upper Holloway—Improved ground-rent of 27l. 10s., with reversion 495
Kilburn—181, Beilise-road, 65 years, ground-rent 10l. 429
Tottenham—5, 7, and 9, Gloucester-terrace, 39 years, ground-rent 36l. 600
Canberwell—42, 44, and 46, Camb-grove North, 78 years, ground-rent 7l. 4s. 520

By O. H. WHITE.

Chelsea—1 to 5, Foundry-place, freehold 650
Sheerness—The "Hit or Miss" public-house, freehold 160

By DRYER & Co.

Houndsditch—5 to 10, Finch-alley, freehold 2,140
The freehold cottages "Leslie Lodge," with grounds 1,050

By DOWSETT & WOODS.

By TOMES, WILLIAMSON, & Co.
Pimlico—120, Ebury-street, 38 years, ground-rent 12l. 985
122, Ebury-street, 38 years, ground-rent 12l. 1,005

By DENHAM, TAYLOR, & Co.

Morden, Kent—"Widhurst Farm," 231 a. 1 r. 7 p. freehold 5,000
Rotherfield, Sussex—"The Springs," 100 a. 1 r. 2 p. "Stone" Farms, containing 33 a. 2 r. 24 p. freehold 8,600
"Great Egg Farm," 91 a. 0 r. 2 p., freehold 2,000
Castellhill, "Brickfield Farm," 15 a. 1 r. 10 p. freehold 690
Heathfield, "Marl Green" and "Hugget's" Farms, 281 a. 3 r. 6 p., freehold 4,560

By E. FRANK.

Putney—22 and 24, Lower Park Fields, and ground-rents of 11l. 1s. a year, term 50 years 650
Near Haslemere—A plot of freehold land, 2 a. 3 r. 7 p. 142

By DANIEL SMITH, SON, & OAKLEY.

Forest Hill—The residence called "Danesfield," 80 years, ground-rent 12l. 10s. 1,250
The residence called "Springfield," 80 years, ground-rent 17l. 10s. 1,150

By RUSWORTHY & STEVENS.

St. John's Woods—72 and 74, Clifton Hill, freehold 1,886
84 and 86, Clifton Hill, freehold 1,650
Near Elstree—Two plots of freehold land 1,329

By J. G. & A. FRETHER.

Mill End—Copsey-street, the "Princess of Wales" public-house, 57 years, ground-rent 38l. 1,460
3 Nicholas-lane—45 years, ground-rent 34l. 10s. 963
Moody-street, a plot of freehold land 255
Hford—A plot of freehold land 15

By HORSLEY, RICHARDS, & Co.
Clapham—3, Beauchamp-road, 95 years, ground-rent 7l. 13s. 470
Westbourne Park—10, Appleford-road, 80 years, ground-rent 7l. 10s. 200
Brixton—168 to 144, even, Poplar Walk-road, 81 years, ground-rent 16l. 1,026

JUNE 11.

By ROBERTS & BARNARD.
Hackney—Freehold ground-rent of 108l., reversion in 20 years 2,740
Battersea Park-road—No. 225, term 77 years, ground-rent 8l. 600

By R. SMILEY.

Holloway-road—No. 209, term 25 years, ground-rent 40l. 330
Edgware-road—1, Chapel-place, 34 years, no ground-rent 70

By R. REID.

1 to 4 and 44, Hardington-place, 34 years, no ground-rent 823
474, 406, and partly 408, Edgware-road, 37 years, no ground-rent 100
115, Princes-street, 37 years, no ground-rent 160
Dorsel-square—No. 27, term 24 years, no ground-rent 455

By FURBER, PRICE, & FURBER.

Belgravia—47, Gloucester-street, 52 years, ground-rent 12l. 1,036
Bloomsbury—Ground-rents of 176l. 10s. a year, term 22 years 690
Essex—Great Wakering—Best chert of 64. a. a year 110

By DEBENHAM, TAYLOR, & Co.

West Dulwich—1, 3, 5, and 7, Park-road, freehold, 1,800
By NEWSON & HARRING.
Horsney—"The Elm," with grounds, cyphoid 2,640
Hamstead—1, Britannia-villas, freehold 690
Horsney-road—47, Isledon-road, 66 years, ground-rent 6l. 13s. 400

By E. STRIMON.

Walworth—75, 77, and 79, Rodney-road, 64 years, ground-rent 23l. 10s. 1,303
23, 24, and 24A, Steedman-street, 71 years, ground-rent 30l. 143

Kingsland—66, Ufton-road, 35 years, ground-rent 4l. 875
Midway Park—13, St. Jude-street, 47 years, ground-rent 4l. 300
Bexley Heath—1 and 2, Pett's Cottages, freehold 350

Brixton—27, Plato-road, 82 years, ground-rent 6l. 10s. 340
26, Josephine-avenue, 80 years, ground-rent 10l. 600

By NORTON, TRIST, WATNEY, & Co.

Highbury—An enclosure of freehold land, 144 ac. 18,200
17, 20, and 23, Highbury-terrace, freehold 5,650
12, 13, and 14, Highbury-terrace, freehold 5,880
7, 8, and 9, Highbury-terrace, freehold 3,190
1, 4, and 6, Highbury-terrace, freehold 4,170

Holloway-road—Ground-rent, 19l. 10s., reversion in 24 years 1,229
Ground rent, 66l., reversion in 19 years 1,920

By C. C. T. MOORE.

Barking-road—Nos. 394 and 396, freehold 1,140
Clapton—175, Evering-road, 85 years, ground-rent 12l. 840

Poplar—1 to 4, Flint-street, 77 years, ground-rent 13l. 13s. 825
82 to 92, Flint-street, 77 years, ground-rent 23l. 2s. 1,230

Bromley—55 to 63, odd, Devas-street, 63 years, ground-rent 10l. 68d. 400
41 to 53, odd, Devas-street, 36 years, ground-rent 16l. 750

2 and 4, Reeve's-street, 77 years, ground-rent 5l. 2s. 550
Bethnal Green—10 to 16, even, Gardner's-road, 61 years, ground-rent 18l. 1,340

12 to 17, Hartley-street, 41 years, ground-rent 17l. 1,910
South Hackney—66, Gore-road, 65 years, ground-rent 7l. 470

Bow—114 to 121, Antill-road, 62 years, ground-rent 18l. 2,610

JUNE 12.

By DALE & SON.
Whitechapel—86, Back Church-lane, 101 years, ground-rent 5l. 10s. 145

By BARKER & SONS.

Hanwell—The residence called "Hanwell Park," and 29 a. 3 r. 13 p. 7,100
Enclosures of land, 24 a. 1 r. 34 p., freehold 6,000
Shenley, Herts—Enclosure of land, containing 36 a. 3 r. 18 p. 3,130

Chiswick—"Sutton Court Lodge," and 9 a. 3 r. 13 p., freehold 8,650
A plot of freehold land adjoining 1,200

By G. A. WYLLIE.

City—16 and 16, Bishop's Court, freehold 1,140
Warwick-lane—Two freehold sites, area 4,275 ft. 10,625
Muswell Hill—Two enclosures of land, 15 a. 3 r. 22 p., freehold and copyhold 4,800
An enclosure of land, 8 a. 2 r. 24 p., freehold 7,100

MEETINGS.

THURSDAY, JUNE 20.

St. Paul's Ecological Society—Visit to Heddon and Cockham. Train to Taplow from Paddington, 2.30 p.m.

THURSDAY, JUNE 25.

Association of Municipal and Sanitary Engineers and Surveyors—Annual Meeting (at Institution of Civil Engineers). 1. Annual Report and other business. 2. President's Address. 3. Mr. W. Santo Crisp on "Street Lighting." 4. Professor Wanklyn on "Sanitary Gas-making." 5. (Time permitting.) Discussion on the Report of the Royal Commission on the Housing of the Working Classes, to be opened by Mr. E. B. Elton-Clark. 12 noon.—The Annual Dinner will be held at the Criterion Restaurant at 6.30 p.m.

FRIDAY, JUNE 28.

Association of Municipal and Sanitary Engineers (second day).—1. Mr. R. C. Meade on "The Highgate Hill Street Grade Tramway." 2. Mr. S. Gamble on "Dangerous Structures." 11 a.m.—Reception of the members at the Mansion House by the Lord Mayor, who

will entertain them to luncheon. 1 p.m.—Visit to the Holborn Viaduct Subways. 3 p.m.—Visit to the London Central Markets. 4 p.m.

STURDAY, JUNE 27.

Association of Municipal and Sanitary Engineers (third day).—Visit to Blackfriars Railway Bridge Works. 9.45 a.m.—Leave at 11.15 a.m. by train from Blackfriars (District Railway) for Putney, to visit the new Putney Bridge Works.

Miscellaneous.

Mr. S. Dutton Walker, F.S.A.—We regret to announce the death, at the age of fifty-two, of Mr. Samuel Dutton Walker, F.S.A., of the firm of Messrs. Walker & Howitt, architects, Nottingham, which took place at his residence on Monday last. The deceased evinced considerable talent, as may be seen by the buildings in various parts of the town erected from his designs. He also took an active interest in the management and welfare of the Nottingham School of Art, which institution benefited to no inconsiderable extent by his generosity and counsel. He was instrumental in founding two scholarships in connexion with that institution, the funds of one of which were devoted to enabling the holder to study church architecture abroad. For many years after its erection the School of Art presented an unfinished and by no means artistic appearance, owing to the capitals of the pillars being left as they came from the quarry in hand, and soon succeeding in obtaining the necessary funds, converted, by the aid of the mason and carver, what was once an eyesore into an ornament and source of attraction. Mr. Walker was ever ready to give the public the benefit of his knowledge and experience on architectural and other matters by reading papers before the various societies in the town.

The "A B C" Sewage System and the Acton Local Board.—At the meeting of this Board on Tuesday night it was resolved to accept the terms offered by the Native Guano Company to treat the sewage of Acton by means of the "A B C" system. This has reference, however, only to the sewage of houses built within the last two years, the sewage from all properties built earlier than this period being allowed, in pursuance of a judicial decision two years ago, to flow into the Stamford Brook portion of the metropolitan system. But this resolution of the Acton Board is important as affording the "A B C" Company an excellent station conveniently near London where their system can be seen at work. The company has agreed to treat the sewage and produce an effluent water up to the requirements of the Thames Conservators for an annual subsidy of 200*l.* (calculated on a basis of 300 houses, and a population of 1,500), and 5*s.* increase for each ordinary house over and above the 300 houses. The Board has to provide complete works and steam power, with the exception of the sludge-presses and mixing and other apparatus, which the company will supply and maintain. The local authority undertakes to deliver the sewage into the tanks free from rain-water; though some members were strongly of opinion that rain-water should not be altogether excluded, as it was the means which nature had provided for the flushing of the sewers. The company, moreover, deposit 500*l.* with the Board as security against failure, and indemnifies the Board against all loss from proceedings taken against the Board in consequence of the condition of the effluent water. On the whole, the terms were considered very favourable to the Board.

The Stewart Improved Electric Indicator.—In these electric bell indicators, by Messrs. Watford & Stewart, the coils and magnets are mounted on a casting which has two arms, on which hang the discs, exactly fitting into a hole out in the front of the indicator. When a signal is given the discs are drawn to the magnets (about an inch) and then swing backwards and forwards for from two to three minutes as required. The arrangement is so simple that it is impossible for it to get out of order. The discs are large, being 3 ft. and 2½ ft., so that they are easily seen, and are such as to lend themselves freely to decorative purpose, being made to harmonise with the decorations of the hall or room from which the signal is given. Two of these indicators are now fitted up at Mr. Stewart's exhibit, Stand No. 1,377, East Arcade, International Inventions Exhibition.

The Safety of Cast-Iron Columns.—The Berlin police authorities, in consequence of unfavourable experiences with cast-iron columns in recent fires at Berlin, have lately issued regulations forbidding the use of such supports in the construction of dwelling-houses, but permitting the employment of columns of wrought-iron and Dutch brick in cement-mortar. Cast-iron columns may only be employed if they are surrounded with immovable mantles of wrought-iron, separated from them by an air space. Professor Bauschinger, of München, has recently experimented with columns of cast and wrought iron, and pillars of stone, brick, and cement-mortar. His results appear to throw doubt on the discretion of the Berlin authorities. He heated cast and wrought iron columns weighted with loads usually imposed in structures first to 300°, next to 600°, and finally to red-heat, and suddenly cooled them afterwards by a jet of cold water, as applied in extinguishing fires. The experiments demonstrated that cast-iron columns, although they were bent by red-heat, and showed transverse cracks when water was applied, supported the load imposed upon them, whilst wrought-iron columns were bent before arriving at a state of red-heat, and were so much distorted by the application of water that straightening was out of the question. In reality, they would have collapsed under the load they had to support. Professor Bauschinger concludes from his experiments that cast-iron columns, notwithstanding cracks and bends, would continue to support the loads imposed upon them, while wrought-iron columns would not. In examining pillars of stone, bricks, and cement concrete, the latter proved to be the best. Concrete pillars withstood the action of fire for from one to three hours; those of ordinary bricks, as well as those of clinkers, set in cement mortar, displayed great resistance; whilst natural stone—granite, limestone, and sandstone,—were not fireproof.—*Iron.*

Safety of Theatres and other Places of Public Resort.—At the meeting of the Metropolitan Board of Works on the 12th inst., a report was received from the Building Act Committee, recommending that Mr. Spencer Chadwick be informed, in reply to his letter stating that he has been instructed by Mr. J. C. Humphreys to prepare drawings for the erection of the building known as "Humphreys' Hall," at Knightsbridge, which was recently destroyed by fire, and asking for a copy of the Board's requisitions for the original building, together with any other suggestions which may be considered advisable with respect to the proposed new building, that such requisitions are no longer applicable, but that if it is proposed to open the new building as a licensed place of public entertainment, it must be constructed strictly in conformity with the Board's regulation; and further recommending that a copy of such regulations be sent to Mr. Chadwick, and that he be also informed that he must submit his drawings and specification to the Board for their approval before the commencement of the works. Also recommending, with reference to the letter from Sir S. Ponsonby-Fane, stating that the Lord Chamberlain will be ready to consider the draft of a Bill transferring to the Board the licensing of theatres in London under his Lordship's jurisdiction,—provided the measure embraces the licensing of all theatres and places of public amusement within the Metropolitan District, and that, meanwhile, his Lordship hopes that he may be favoured with the advice of the Board as to the structural security of the theatres licensed by him,—that the letter and the whole question of further proposed legislation with respect to places of public entertainment in the metropolis be referred to the Works and General Purposes Committee, for consideration and report. These recommendations, with some others of a cognate character, were adopted.

The Holloway Sanatorium, Virginia Water.—On Monday last the Prince of Wales formally opened this institution, founded at the cost of the late Mr. Thomas Holloway. The architect of the building is Mr. W. H. Crossland. It has been fully described in past volumes of the *Builder*, and among the illustrations of the building which we have published is a large view of the interior of the Recreation Hall, in which last Monday's ceremony took place. This illustration, drawn by Mr. H. W. Brewer, appeared in the *Builder* for Jan. 7, 1882. Upwards of 300,000*l.* have been spent upon the building.

Cholera in Europe.—The increase of cholera in the east of Spain and the invasion of fresh towns may be regarded as an indication that the year will not pass away without a repetition of some of the calamities which marked the appearance of the disease in France an Italy last summer. As yet there is no confirmation of the report that Marseilles is again the seat of the disease; but there can be no question of its prevalence in Madrid, and as the season progresses and the warm weather of June and July has had opportunity to exert its influence, we shall doubtless hear of the extension of cholera into more northern latitudes. Whether England may come within the area of its operations during the present year, it is as yet too early to predict; but the fact that the second week of June has nearly ended without any sign of cholera in the direction which it usually follows before reaching this country is no criterion that we shall escape. The inoculations of Dr. Ferrás will doubtless excite more interest on the Continent than in England; our own defences against the disease are fortunately not only of a more trustworthy but of a more permanent character.—*The Lancet.*

International Inventions Exhibition.—Amongst the recent additions to the Historic Loan Collection is Queen Elizabeth's lute (lent by Lord Tollemache of Helmingham), which was left by the queen, in 1584, at Helmingham Hall, Suffolk, where it has been preserved until the present day. The lute is in an exceptionally fine condition, and bears the maker's name, "Joannes Rosa Londini Fecit. In Bridwell, the 27th of July, 1580." An extremely valuable collection of early manuscripts has also been received from the Stiftsbibliothek of St. Gall, including the celebrated copy of Notker's German translation of the Psalms, and the Antiphoner traditionally said to have been brought from Rome to St. Gall in the eighth century. Collections of portraits in oil have been received from the Royal Society of Musicians and the Bodleian Library. The decorated spinet made for Queen Christina is lent by Lord de Lisle; and autograph letters of Mendelssohn, Franz, &c., Beethoven's will, and many other valuable manuscripts, have also been added to the collection.

Liverpool Architectural Society.—The second meeting of the Junior Debating Club was held at the Rooms, No. 9, Cook-street, on the evening of Monday, the 15th inst. Mr. James B. Hinks was elected chairman for the evening. There was a good attendance of members. The paper for the evening was on "Early Gothic Vaulting," and the lecturer, Mr. Thomas J. Dalziel (visitor), prefaced his remarks by a rapid survey of the various styles of vaulting that preceded the Early Gothic. Mr. Dalziel drew attention to the capabilities of pointed barrel-vaulting, giving several examples of its adaptation to the roofing of polygonal apses and their aisles, &c. He advocated the use of ridge-ribs; but admitted that, unless in the case of vaults having intermediate ribs introduced between the diagonal and transverse ribs, they were constructionally unnecessary. A discussion followed the reading of the paper, in which Messrs. J. S. A. Mercer, Edmund Rathbone, J. H. Dawson, &c., took part, the proceedings terminating with the usual votes of thanks.

Public Works at Portsmouth.—The Mayor of Portsmouth has laid the foundation-stone of a new wharf in the upper part of the harbour, the contract, which was given to Mr. F. Bevis, of Landport, amounting to upwards of 30,000*l.* The quantities were taken out by Mr. H. P. Foster, of John-street, Adelphi, who has for some years acted as quantity surveyor to the Portsmouth Corporation, and has in that capacity been connected with the erection of a gaol and lunatic asylum, and the drainage works. A committee of the Corporation is now engaged in settling the question of a site for a Town Council House, and when that has been settled Mr. Foster will be instructed to take out the quantities for that building.

Cabmen's Shelter Fund.—The new cabmen's shelter recently placed on the cab-stand at Hyde Park-corner (opposite St. George's Hospital) was formally opened by Mr. F. A. Bevan on Tuesday afternoon. This shelter,—the gift of Miss Paris,—which is constructed of corrugated iron painted, has been built by Messrs. J. Arthur Young & Co., of Victoria-street, and is the thirty-sixth shelter erected in London by the Cabmen's Shelter Fund.

Re Tenders for Making-up Mount View-road.—Mr. T. de Courcy Meade, Engineer and Surveyor to the Hornsey Local Board, writes:—"I notice in last week's *Builder* your extract from Mr. Nicholls' letter re making-up Mount View-road. I beg to inform you that the prices supplied from this office were correct, the tender of Mr. Walker and not Mr. Nicholls having been accepted by the Board. Mr. Walker subsequently withdrew his tender, and consequently at the last meeting of the Board the tender of Mr. Nicholls, the next lowest, was accepted, subject to satisfactory references."

Wesleyan Methodist Schools, Folkestone.—Mr. D. Baker, of Toulme-street, Folkestone, writes:—"I find in your last week's *Builder* you omit my name as one of the tenderers; my tender, amounting to 5,634*l.*, was the lowest, and most unfairly passed over in favour of builders residing in the same town as the architects. It is omitted in your list." [We printed the list as it was sent.]

SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our Office, 48, Catherine-street, W.C., not later than Four p.m. on THURSDAYS.

TO CORRESPONDENTS.

A. B. J.—F. S. Two fear it is not a class of art which interests us much.—Rev. N. S. (two communications) and E. T. G. J. (shall be attended to).—W. K.—F. J. C.—W. S. (below our mark).—J. B.—H. R.—R. H. C.—H. H. B.—A. W. I. (they were mostly German).—G. M.—F. W. B. & Co.—A. W. I. (drawings received).—"Country House" (the only thing we can recommend under the circumstances is the "Patent Lead-cast Block-tin Pipe," a pipe manufactured with a lining pipe success in and suited with it; but it is not a W. B. & H. (shall have attention).—Rev. W. F. C. (thanks for your note).

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

Notz.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications. Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT RECEIVED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other auxiliary business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Bath Stone. ALL DESCRIPTIONS OF BEST QUALITY. PICTOR & SONS, BOX, WILTS. [Advr.]

Doubling Freestone. The stone from these quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England. THE BRAMBLEDITCH STONE. Is of the same crystalline nature as the Chelynch Stone, but finer in texture, and more suitable for finemoulded work. HAM HILL STONE. Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice. Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Advr.]

Doubling Free Stone For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke - under - Ham, Ilminster. [Advr.] BLUE LIAS LIME (Ground or Lump), Ilminster.

Ham Hill Stone! Ham Hill Stone!!! For Ham Hill Stone of best quality and workmanship, apply to JOHN HANN & SON, Quarry Owners, Montacute, Ilminster. Established 1837. Agents, MATTHEWS & GEARD, Albany Wharf, Regent's Park Basin, N.W. [Advr.]

Asphalte.—The Seyssel and Metallo Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Advr.]

Asphalte. Seyssel, Patent Metallo Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [Advr.]

EVERY DESCRIPTION OF SEASONED WOODS AND VENEERS IN EXTENSIVE QUANTITIES. B. J. HUDSON & SONS, Whitefield-street, W. Store-street, W.C., and Great Peter-street, S.W., London. Telephone No. 3,654, and Private Wire connecting Business Premises.

HOW TO USE DISINFECTANTS.

There is No GREATER ERROR than placing a Tin or Bottle of Disinfectant in the Closet-Room, as it is seldom used. For PERFECT SANITATION at all times PLACE a "POROUS DISINFECTOR" in the Closet Cistern, and the Closets will always be automatically Disinfected at every "Flush."

For Water Waste Preventing Cisterns ... Use 1 of 5*s.* size. For Cisterns of 200 gallons ... Use 3 of 9*s.* size.
 For Cisterns of 30 gallons ... Use 1 of 9*s.* size. For Flushing Tanks ... Use 3 of 9*s.* size.
 For Cisterns of 100 gallons ... Use 2 of 9*s.* size.

Two Seaside Resorts.

SEPARATED by some eighty miles of sea, but nearly one hundred and thirty apart by railway, lie on our southern coast old Torquay and new-fledged Bournemouth.

When Bournemouth was as yet but a dream of the future, comprising two or three private houses, a small tavern (only within the last month or two demolished), and a few cottages, Torquay was a well-known and well-frequented health resort, a small hut long-established port, and the chief centre of life in the ancient parish of Tor, whose simple and venerable church and tower look forth this day from the populous "God's Acre" around them, upon the two dozen or so of conformist and nonconformist fanes, which, in all the various forms,—good, bad, and indifferent,—of modern Pointed architecture, have sprung up to assert their predominance over the modest, solemn, old-world, grey stone church. What a tale is told of time and change, of life and death, of long quiet past, and busy, fussy present, by this contrast between the old parish church and its modern compeers, and how much of a people's history might be written with such a contrast for a text. Such, however, is not the theme proposed in "this present writing," the aim of which is rather a comparison between the two modern towns whose names are coupled above,—a comparison often essayed in one shape or another by visitors to both.

One of the most striking points of contrast between Torquay and Bournemouth is in the form of the ground on which they are built; Torquay, rising in almost amphitheatrical shape from the coast level, tier above tier, and terrace above terrace, to between 300 ft. and 400 ft. of elevation; Bournemouth, with a sand-cliff of some 100 ft. in height, ranging its houses parallel to its front, with the land sloping slightly inland to the heathery moorland which backs it to the north; save where the little stream which, draining some five square miles of country, and giving its name to the place, has formed a narrow valley, through which it travels, with no very high pace, to the sea. Here, as regards the picturesque,—one great element in sea-side attraction,—arises at once a marked point of difference, which must certainly be weighed greatly in favour of Torquay; for not only does the form it takes afford much of the more striking picture of the two, but it gives scope for much more extended enjoyment of the sea view; the dwellings even far inland

looking over their neighbours beneath them, and all in their degree looking out on the expanse of water, and catching the refreshing breath of the sea-breeze, as it flows inland. The geological character of the two sites is no less dissimilar than their visible form; the hard, marly limestone of the Devonshire hay forming bold rugged points and picturesque detached sea-girt rocks; while the sand and shingle-drift of Hampshire, rapidly worn by water from both above and below, form clear, well-defined sweeps of steep, warm-tinted cliff, broken at intervals by wooded chimes, and varied here and there near the sea level by the cool grey of underlying beds of "Dorset clay."

Both these characters of coast are eminently picturesque, and if in boldness and force the Tor Bay sea face he given the palm, aided as its effect is by the full rich foliage of shrubs and underwood, nothing can well exceed in beauty of colour the rain-swept scarps and hollows of the Bournemouth cliffs, the whole extent of which from Hengistbury Head to Poole Harbour, forming the main sweep of Poole Bay, are at once in view from the beach or from the cliff walks; and in the flying lights of a sunny breezy day afford a varying dioramic picture of great loveliness and interest. Facing so fully south, Bournemouth at mid-day suffers the full glare of reflection from the sea; but this very circumstance of aspect, adverse at noon, renders the moonlight effects to be seen there among the most striking which the English coast affords.

It is not very easy to say whether the more compact dimensions of Tor Bay, not quite four miles and a half across from Hope's Nose to Berry Head, or the nine miles span of Poole Bay he preferable from a painter's point of view. The moderate elevation of Berry Head, however, gains importance from its nearness as seen from Torquay; but the height and fine forms of the Purbeck Downs, seen in a like but more distant relation to Bournemouth, have a dignity which the corresponding view of Tor Bay lacks.

The view of the Isle of Wight in the opposite direction gives also a great charm to the Bournemouth sea view, which, however, has little, if any, nautical interest, as, although looking out southward on the full track of shipping up and down Channel, vessels, for the most part, keep so far out as to add nothing of life to the view; the coasters and steamers from Southampton by the Solent scarcely breaking to the eye the monotonous line of horizon at ten or twelve miles' distance; and the great area of sea overlooked from the cliffs, a surface of fully 130 square miles, is often for days undotted by a speck.

Taking Torquay on somewhat similar points; from its upper parts on the east, the fine out-

line of Dartmoor, with its peaks and tors, forms a striking background to the west, while its possession of a harbour and a coasting trade ensures some movement on its tides. Yachts frequent it too in the summer, and with the fine fishing smacks of Brixham across the Bay sailing in fleets of scores at a time, give the scene that life and stir which we English islanders are accustomed to associate with our salt-water surroundings.

To step ashore again. The pine trees of Bournemouth, the result of liberal planting some seventy years ago, have become almost proverbial, and evergreens and rhododendrons luxuriate there to the full; while not the less the almost tropical vigour of vegetation at Torquay clothes it with a richness of greenery which leaves little advantage to the Hampshire firs.

Not to dwell tediously on the natural features of the Hants and Devon health resorts, it may be noted that Bournemouth has the advantage in range of sands, and Torquay in picturesque seaside paths, while the depth and clearness of the water in Torhay make the effects of sea-colour finer than at Bournemouth; and a run of sea, too, gets up in a gale, which the shoal and sheltered water of Poole Bay cannot emulate, the rise of the highest waves at Bournemouth reaching but 10 ft. or so from hollow to crest; and residents there familiar with the English lakes assert that Windermere in a strong gale can show a much heavier "sea" than ever rises in this quiet centre of Poole Bay. Before passing to some notice of the artificial characteristics of these towns, one word as to climate. The difference in this respect is remarkable, although both places are recommended for those suffering from pulmonary disorders, it may be presumed, by a non-medical critic, of different characters. Torquay is warm, moist, and relaxing; Bournemouth dry, sunny, and comparatively bracing. The Torquay climate, affording comfort to those who, confined during the winter months almost entirely within doors, cannot hear the stress of a low temperature, has not a beneficial effect on strangers who are under no such restraint, London physicians finding obstinate bronchial cases for summer treatment among those who, in health, have accompanied, for a winter's sojourn at Torquay, consumptive friends for whom its mild temperature was prescribed. Dryness is the essential characteristic of the Bournemouth climate. Though the range of the thermometer is moderate, the winters there can, it is said, be cold enough to brace the nerves of any southern county native, and the summers are not too hot for agreeable exercise. If sunshine is to be had on the south coast it generally finds its way thither. As to the artificial features of the two, it must

he borne in mind that Torquay has grown and Bournemouth is growing, and that, too, under conditions of travel and of society which did not fully prevail while the Devonshire town was making its chief advances. Foremost among artificial advantages must be named, unquestionably, the charming public pleasure-grounds of Bournemouth, unique probably among English watering-places. The valley of the Bourne, happily offering itself for this purpose, was early and wisely appropriated, and laid out, length by length, in successive years, until there is now something like a mile of nearly continuous walks, grass-plats, and ornamental shrubbery, reaching directly inward from the outlet of the Bourne at the pier. These, with the walks along the pine-sheltered roads, may be held to compensate, in great measure for the want of any variety of country walks near at hand, in which, as before said, Torquay excels, the cliff walks and drives at Bournemouth scarcely giving the variety which visitors desire.

The natural difference of site, first noticed, produces, of course, an artificial difference of a very material kind in the entirely dissimilar character of the suburban roads and of the measure of interest they afford. At and about Torquay the reach and variety of view from the roads on the higher ground contrast greatly and favourably with the generally confined style of the landscape which can be enjoyed on the roads about Bournemouth. A railway journey of a few miles will, it is true, give those who are active pedestrians good starting points for long walks on the Dorset Downs and Hampshire New (?) Forest, but the roads laid out for drives and home walks rather give the limits for comparison in a notice like the present, and the architectural character of the two towns may now come under review. The elements for architectural effect exist, of course, much more largely in Torquay, with its terraced formation, than on the plateau which forms the general site of Bournemouth; and an appearance of more unity of purpose in the general planning and laying-out of building sites also marks the Devonshire town, and helps its natural features. A much more divided ownership in the Bournemouth land would seem to be one cause of this difference, and, possibly, a local control less wisely or authoritatively exercised over the laying-out of different centres of building; at all events, the impression of each planner doing what is good in his own sight exists much more strongly at Bournemouth than at Torquay. It is curious to note, as can as yet still be noted at Bournemouth, the common course of growth in such places of resort; the laying-out, in the first instance, of the principal roads and drives near the sea front, under the direction of some practised authority in such matters; the building on the lines of these, of modest two-story villas, comfortable-looking and unambitious; the gradually-added growth of larger and more important houses on the best sites, marked generally by the attention to arrangement and quiet style which belong to the English gentleman's house; and coeval with these one or two moderate-sized and unpretentious hotels. The first portion of a church will accompany these, and some very moderate speculations in the way of shop-building. Not long, however, does this sober process prevail. Enter the "speculative builder," and behold a new scene! The careful adaptation of building to site disappears; modesty of style and care of arrangement vanish, and a prevailing air of fuss and worry, of obtrusiveness and vulgar "look-at-me-ism" take their place; and flaring notice-boards announce that Messrs. So-and-so, "architects and builders," have these very eligible villa residences at their disposal. Torquay does not at the present time exhibit these symptoms of building fever in at all the same measure as its Hampshire rival. It has, as said above, "grown," though not probably to full stature; Bournemouth is most emphatically "growing," and where it will stop seems hard to guess, a strange notion having lately seemed to seize on its traders that it can be made a great town quite apart from its

health character (its only real plea for being), and really, as it seems, consequent on no existing cause! Buildings of pretentious, if not of very attractive, design, are carried up to five stories in height where three sufficed before; building sites fetch fabulous prices, and "premiums" over and above these prices are paid to some one or other, but not, it may be presumed, reaching the land-owners' purses.

The architectural visitor to places in this course of growth can learn almost all he may wish to know on local building practice and prospects by looking round the nearly completed "villas," "residences," and "mansions," on the look-out for buyers. He will not probably long have paced about a "villa" plot, and gazed in wonder, perhaps, at the particular brickwork and multi-styled features and decorations displayed, ere he will be accosted by an unmistakable "builder on speculation," with the inquiry whether he were on the look out for a house! This opens the way for general talk on the building subject at large, and the visitor will learn generally how very little, as a rule, architecture or architects have to do with the strange productions with which they are credited. "Do you design your own houses?" "Well—no, Mr. Dash" (a local architect whose name you know) "designed these for me." "Indeed! Did he design that porch, and the oriel over it?" "Well, no. When I say he designed them for me,—that is, partly, you know,—there wasn't no porch nor hang-out window in his design; but Smith, him as owns them next villas, has been getting of these things out on his, and buyers has got to asking for them, so I gets them out on mine; an improvement, don't you think?" If you go further, and learn what is paid in the way of fees for the design, "partly, you know," of these productions, you will conclude, most likely, that an architect could afford to bestow little thought or study on such work, and that the less he has to do with it the better, as the builder-proprietor is pretty sure to barter, by "additions and alterations" after his own heart, whatever of style or character may have been aimed at in the architect's work. There may be two sides to this question, and it may be said that if the speculative builder he left to his own devices, what horrors would result! But in the interests of art (if the phrase be not obsolete), were it not better that its name, even "partly, you know," were kept separate from what in its tolerably certain final shape can only couple it with vulgarity, often with absurdity and gross malconstruction. This is a digression not specially bearing perhaps on either Torquay or Bournemouth, but capable of some application to most of our salt-watering places, from Scarborough to Penzance or Tenby. One very general complaint is made of the want of medium-sized houses at moderate rentals; a gap generally being found between the pretentious high-rented, albeit probably very badly arranged, "villa," and the small, poky, inconvenient "cottage," with no accommodation beyond what would suffice for a retired shopkeeper or small tradesman: this applies to both Torquay and Bournemouth, more emphatically perhaps to the latter. The placing of the dwellings on their plots of land, and the management of the approaches from the road being, at Torquay, from its steep style of site, much more of a problem than at generally level Bournemouth, has led to much more apparent skill and thought, giving the impression that architectural advice, in its reality, has been more usually sought at Torquay; and, indeed, the sobriety and simplicity of design in the majority of the houses conveys a like impression in comparison with the Hampshire town; but the fact that the latter is in a brick district, and has the questionable advantage of easy use of varieties of coloured material may have something to do with this.

While Torquay has its harbours,—the new and the old,—Bournemouth has its pier, an iron-and-wood structure of some merit constructively, but most wonderfully Cockney in its approaches and embellishments. The fact that it was, as may be remembered, opened by the Lord Mayor of the day some years since,

may make this character rather appropriate, but the thought will occur of what will happen to these gimcrack appendages if some day a storm-driven sinking vessel has to be hauled up by all the force which can be mustered, and a stout hawser, manned by a score or two of boatmen and fishermen, should sweep along the balustrading! The materials for concrete so abundant on the spot (and have been well applied in the substructure of the pier approaches), that another thought occurs to a visitor; why should not a small harbour of concrete block masonry have been formed, large enough to hold a dozen yachts or so, and its bottom flushed by the dammed up waters of the Bourne? The water is shoal, but its depth at the pier-head would have sufficed if carried shoreward, and the means of scour suggested would apparently suffice too. No yachting men or their families will frequent Bournemouth, as there is no near shelter and no good anchorage; a yacht may occasionally drop her anchor for a tide or so off the pier, but the least show of foul weather sends her off post haste to Poole or Lynton; and here, of course, Torquay claims an advantage. Both towns carry their sewage into the sea; Torquay by a costly tunnel having its outlet at Hope's Nose; Bournemouth by three iron pipe discharges, one central at the pier, and other two at some mile or more eastward and westward. Is there never to be found a remedy for this surely false and injurious system? Is it at all possible, tides and currents notwithstanding, that the sea-water can escape pollution, and its use for bathing not be seriously damaged? And is it not a reproach to the economic chemistry of our day that such a waste of fertilising material should take place? The subject in its bearing on our present topic is an unsavoury one, but not perhaps the less suggestive.

In both Torquay and Bournemouth much of what architectural character exists is derived from the ecclesiastical buildings of each; and the principal building of this class in each is the work of the same architect, the late Mr. Street, R.A. St. John's Church, at Torquay, and St. Peter's, at Bournemouth, are both characteristic designs of their very able author, and both perhaps may be considered to illustrate his superiority in internal as compared with external design. Neither the tower of St. John's, Torquay, now just completed, nor the spire of St. Peter's, Bournemouth, added some four years ago, is a very successful work, but the interior effect of both churches is striking; that of the Bournemouth church, probably, the better. There is more of variety (as well as of number) in the Torquay churches, and more names of well-known architects, Mr. Salvin and others, attach to them. Mr. Street was the established adviser in such matters of the well-known church-building visar of St. Peter's, Bournemouth, the late Rev. A. Morden Bennett, and the parish church and several in outlying districts were of his design; a part of an earlier single-span St. Peter's, however, being retained in the south aisle of the present church. Mr. Norman Shaw, who, in this field of architecture may be regarded as one of Mr. Street's pupils, was the author of two other churches at Bournemouth, one, St. Michael's, being, in a modified form, for the present completed, and St. Swithin's, as yet a chancel only. An elaborate church, from the design of Mr. Pearson, R.A., is in course of building as a memorial to the clergyman just named, the nave being nearly completed; it is groined in stone throughout, and presents features more usually associated with larger buildings,—a triforium passage, for instance,—and is in other respects very characteristic of its author's style. Another incomplete church is St. Clement's, of Mr. Sedding's design; and a Lombard building, by Mr. Ferguson, of Carlisle, Holy Trinity Church, presents, in its plain red brick exterior, a marked contrast to its more ambitious neighbours of stone, its scale being, however, as large as any. No one can visit Bournemouth and converse with its residents there on the growth and history of the town without discovering how much of ecclesiastical influence entered into both, and

how largely Mr. Bennett contributed to make its fortunes. A High Churchman, zealous and liberal in promoting his views, he would seem to have aimed at forming a community of like views exclusively; but doctors would not so limit their recommendations, nor would the climate assume exclusiveness, and thus a separate interest grew up which resulted in the establishment of Holy Trinity church and parish. A rather remarkable design, in Belgian Gothic, is the Roman Catholic church by Mr. H. Clutton, with the comfortable clergy-house annexed to it, where the priests, under Jesuit direction, preside over a congregation consisting partly of those born in their communion, but largely recruited, it is locally stated, from among the surrounding "Anglican" congregations, well prepared, by ritualistic training, for migration to the Marian church.

An immense establishment (for such a town) is nearing completion under the title of the "Mount Dore," for hydropathic purposes, the intention being to localise the various mineral waters of the Continent. The speculation seems bold, and may prove successful, but an outsider may be pardoned, perhaps, for a little scepticism on the point. The varying popularity of health resorts, well evidenced, for instance, by Bath (and even by Torquay itself), should read a lesson to those whose material interests are wrapped up in them, as to the caution which should guide them in laying out building land and in interfering with their natural features. In the latter respect Torquay seems to have been fairly well guided; but the destruction of the pine woods, where not specially protected, about Bournemouth does not afford a similar assurance; and in both places ideas may grow up of unlimited demand for house accommodation which may not unlikely lead to ultimate grievous disappointment and loss.

NEW LIGHT ON A STATUE BY POLYCLEITOS.

 Do not pretend to know why Herr Anton Springer has been holding high festival on May 4th; we can only conjecture that, like Prof. Curtius, he has had an archaeological birthday fête. What concerns us is that, in true German fashion, each of his friends has written a learned tract to do him honour, and that to the volume thus collected Dr. Benndorf has contributed an essay* so original and so brilliant that Dr. Springer's birthday book (if birthday book it be) becomes at once for archaeologists "epoch-machende."

Literature dealing with the dark places of Pliny's art-criticism already abounds, but, as Dr. Benndorf remarks, it is not usually of a character greatly to encourage further enterprise. Sometimes, but very rarely, archaeological discovery, a statue, a coin, an inscription throws to the seeing eye unexpected light, and what was before of hopeless obscurity is instantly obvious. Just such a self-commending interpretation we believe Dr. Benndorf to have given of a passage hitherto torn and vexed by interpreters, given too in a fashion that throws light on literature as well as art.

In the *locus classicus* on the works and style of Polykleitos occurs the following passage:—"Fecit [Polykleitos] . . . nudum *talo incessentem*, *duosque pueros item nudos talis ludentes*" (Pliny, N. H., xxxiv., 55). *Talus* bears, of course, two meanings: either it is the ball-like bone of the ankle-joint anatomically, or it is the same bone used as a die to play with. Now in first reading the words, it would strike every one that, whatever *talus* means in the one passage, it must,—considering the close and seemingly intentional juxtaposition,—mean the same in the other; otherwise Pliny has given us a dull and awkward pun. "*Pueros talis ludentes*" can mean nothing but boys playing with knuckle-bones (*astragaloi*).

Groups of boys so playing are a perfectly familiar artistic type, and we can easily believe that Polykleitos made such a group. But when we come to "*nudum talo incessentem*," if we keep "*talus*" to mean the die (*astragalos*), what are we to make of the passage? Can we conceive that Polykleitos made the statue of a youth "*treading on a die*," or was it a youth attacking some one with a die in his hand? Archaeologists up to Benndorf's time have decided that the attitude of treading on a die, which from the literary point of view would give the natural meaning to Pliny's words, is from the artistic point of view a posture too unnatural to be maintained as the motive for a statue; the other alternative, "*attacking with a die*," is a motive worthy of a mere boy, but impossible for a serious athlete: it would turn the statue into a mere bit of *genre*. Driven thus to bay, archaeologists have tried emendation. "*Talo incessentem*" would give fair sense, but then it spoils the correspondence evidently intended between the two clauses. "*Talon incessentem*" gives sense, and turns the statue into a mythological piece representing *Talos*, the mythological, iron watchman of Crete; but this emendation again abolishes the necessary correspondence. Finally, archaeologists, by an almost unanimous consensus, decided to give up the "*die*" interpretation and credit Pliny with a stupid pun. "*Talo incessentem*" was to mean in some way attacking by means of the heel bone. Gesner ("*Chrestomathia Pliniana*," p. 920, 9) was the first to begin this line of interpretation,—he suggested "*talo incessentem*," kicking one foot against the other. This was not felt to be satisfactory either to art or language; and Otfried Müller ("*Handbuch der Archæologie*," s. 120, 3) went further, and fared much better. He ingeniously suggests that "*talo incessentem*" is the Latin form of the Greek *ἀποπτερίζω*, which may roughly be rendered, "to do the heel trick." Polykleitos then, according to Pliny as interpreted by Otfried Müller, made a statue of a naked youth doing the heel trick. Now, it will at once occur that if this was the motive of the statue the youth must have been "*doing the heel trick*" with nobody to do it on, as Polykleitos made a single statue, not a group. This, however, is not a fatal objection, as representations of preliminary practice, *i.e.*, the mock or shadow fight (*σκιμαγία*), were far from uncommon. Hence this interpretation has met with wide and almost universal acceptance. Ulrichs ("*Chrestomathia Pliniana*," p. 318) considers that this motive of the heel trick is an added instance of the "*ponderation*" peculiar to the statue of Polykleitos, *i.e.*, the fashion considered to be so characteristic of making his statues stand on one leg (*uno crure ut insisterent*), Prof. Brunn ("*Geschichte der Gr. Künstler*," i., p. 216) says decidedly that in the statue of the "*talo incessentem*" we have not a dice-player, but a "*wrestler whose peculiar skill consists in his use of the heel*." Dr. Overbeck ("*Geschichte der Griech. Plastik*," i., 397) takes up the same tale. Mr. Perry *more suo* repeats the second-hand verdict "*talo incessentem*," showing his art in the use of his heels ("*Greek and Roman Sculpture*," p. 354). Mrs. Mitchell, in like manner ("*History of Ancient Art*," p. 385), "*talo incessentem*," striking with his heel; only Mr. Murray, with fine caution, declines to translate the untranslatable, and writes "*talo incessentem*," "*whatever that may here mean*."

We think if such caution were a little more exercised it would promote sound progress; a blank, frankly acknowledged, stimulates inquiry, but a half explanation, even when known to be inadequate, soon becomes stereotyped and traditional, and lulls the archaeological conscience; it is also apt to pervert the instinct of beginners. Happily, however, there are men whose minds do not gladly suffer a half explanation, who will not strain language in the supposed interests of archaeology, but who know that these two are never really at issue, and who in cases of seeming conflict wait for the further light that brings evident reconciliation. Dr. Benndorf felt that the traditional interpretation of "*talo incessentem*" by "*doing the heel trick*" sinned first against language by not

providing the required correspondence in meaning between "*talo*" and "*talis*"; secondly somewhat against art by providing for a statue by Polykleitos a motive difficult, transitional, and unrefined,—a motive, in fact, which we should much more readily associate with the name of Myron than of Polykleitos. Last and chief, he maintains that Pliny could not be translating *ἀποπτερίζω*, because *ἀποπτερίζω* means something wholly different. This takes him to anatomy. The heel part of the feet has three bones, each with their clear and well-defined names both in Latin and Greek; the ankle bone (*τὰ σφυρά, malleoli*), the ball of the heel (*ἀστράγαλος, talus*), the heel bone (*πίρρα, calcx*). Dr. Benndorf does not deny that in common parlance a certain laxity would not naturally beset this terminology, but he maintains, and we think justly, that in translating a Greek term which described a perfectly well-known palestraic *schemata* there could be no reason why Pliny should not use the natural and correct equivalent *ἀποπτερίζω, calcx incessere*.

But Dr. Benndorf goes on to say, "Was Pliny translating *ἀποπτερίζω* at all?" What actually is this palestraic *schemata*? Here we must be content to state Dr. Benndorf's conclusion without going in detail through his arguments. The *locus classicus*, on this wrestling *schemata*, as in the "*Herolikos*" of Philostratos, p. 678; ii., p. 146. 4, from this and other passages it is abundantly clear that the *schemata* takes place when the wrestler who employs it is on his back, making a feint of defeat (*ὁ χαλεπὸν κείμενος τῶτος ἢ ὑπαισθόμενος*). It is the *schemata* which lends Pindar a fine metaphor (Isth., iii., 65), the *schemata* in which the man is in sleight as a fox (*μῆριν δ' ἀλώπηξ*), "*that spreadeth out her feet, and preventeth the swoop of the eagle*." The modern fox is no less crafty. Dr. Benndorf cites Reinecke Fuchs, xii., 163, where there is a long account of how the fox lies on his back feigning defeat, and as the wolf is delivering a homily on preparation for death, the prostrate fox deals him a fatal blow. Now had archaeologists taken the trouble to ascertain the strict use of *ἀποπτερίζω*, they would never have ventured to attribute to Polykleitos a statue representing a single athlete prostrate in this attitude.

Here Dr. Benndorf's destructive criticism ends; the "*heel trick*" theory he has, we think, disposed of for ever. With the field thus clear before him he returns to "*talo incessentem*." It is an ancient monument, not an ancient text, that has lent him the clue. On the 8th of April, 1878, in front of the steps of the terrace on which the treasure-houses of Olympia stood, there was found, a little south of the seventh treasure-house (counting from the west), a marble basis, in the form of a knuckle-bone die (*astragalos*). This *astragalos* is published in the "*Ausgrabungen*," taf. xvi., and a cast was made and sent to Berlin. Examining it, Dr. Benndorf found that on the top there are two distinct foot-marks, surrounded by holes for riveting, showing clearly that a bronze statue once stood actually on this very *astragalos*. Pliny can now be translated simply and naturally. As we have monumental evidence that a bronze statue actually stood once on an *astragalos* basis, there is no difficulty in supposing that Polykleitos made just such a statue, and that it was described as *γυμνὸς ἀστράγαλῳ ἐπιεπίσμενος*, which Pliny, not very clearly understanding, rendered "*nudum talo incessentem*."

But further there is a strong presumption that this *astragalos* basis is actually the basis of the statue by Polykleitos of which Pliny wrote. The marks of the feet show that the left foot was firmly planted toe and heel both on the ground, while the right foot hung behind in the true Polykleitan *uno crure* attitude. Of this attitude we have not only literary but positive monumental tradition. Of the many bases discovered at Olympia, one is certainly proved to have supported a statue by the elder and greater Polykleitos, and on this basis (published in the *Arch. Zeit.*, 1882, p. 190) there are marks of the two feet in a position exactly analogous to that of our *astragalos* basis. But now arises a further question. If we have in

* O. Benndorf, "Ueber ein Werk des älteren Polykleitos," Separatdruck aus: Gesammelte Studien zur Kunstgeschichte, eine Festschrift zum 4. Mai, 1885, für Anton Springer."

this basis the actual basis of Pliny's statue of the "talo incessentem," what was the motive of the statue? Whom did it represent, and why was he represented standing on an astragalos? Here we come to the last and perhaps most ingenious portion of Dr. Benndorf's argument. The astragalos must evidently have some meaning, must be in a sense attributive, show the character, or somehow mark the fortune, of the figure it supports. Now, about the symbolism of the astragalos, there is no manner of doubt it constantly indicates fate, good or bad, according as it was cast.

Without going into details of dice-throwing, we may note that of the two long narrow sides of the astragalos one, the broader side, was the easier throw, and consequently unlucky; it was called the *χῆρον*; the other and narrower side was more difficult, and hence the luckier, —it went by the name of *κῆρον*. On this, the lucky side, our astragalos stands. To the Greek eye this would have an obvious meaning. The figure standing on this astragalos in the *κῆρον* throw was somehow a figure of happy omen. It would have been quite possible to suppose the figure was that of a victorious athlete, or even that a pun was intended on his name,—that he was a Coan man, a man of Cos. Such punning monuments are quite in the Greek manner. But there lies at hand a simpler and a finer interpretation. It will be remembered that the astragalos basis was found in front of the terrace of the treasure-houses. Now, Pausanias tells us (v., 14—9) that as he was passing from the Metroon to the Stadium,—passing, therefore, close beneath the treasure-house terrace, as a glance at the plan of the excavations will show,—he noted two altars at the entrance of the Stadium,—one to Hermes Enagionos, *i.e.*, Hermes the patron of athletes, the other to Kairos. He goes on to say that the Chian poet, Ion, had written a hymn in honour of Kairos, and in this hymn made Kairos the youngest of the sons of Zeus. This hymn, it seems very possible, was written to celebrate the inauguration of the cult of Kairos at Olympia.

Drawing together the threads of his argument, Dr. Benndorf conjectures that Polycleitos, who would be roughly the younger contemporary of Ion, made a statue in the honour of this same cultus of Kairos, that the statue stood near the altar seen by Pausanias, and that of this first statue of Kairos we have the astragalos basis.

How probable,—how almost certain,—this conclusion is, we can only see if we examine for a moment the character of this divinity, Kairos. It is the merit of Dr. Curtius to have, in a brilliant essay published some years ago ("Die Darstellungen des Kairos Arch. Zeit." 1876, p. 1), given the god a new actuality. He is not among the ranks of the early Greek gods. Homer knows nothing of him; he is one of the secondary divinities (*δωδεκαθεα*), the religious conceptions that grew up to answer to the wants of a later and more self-conscious civilisation. Because of this, and because from the want of capital letters in ancient writing, it is hard sometimes to know if Kairos is a person or an abstract noun; he is apt to be somewhat shadowy in our minds. We associate him with late art, we accredit Lysippus with the invention of his sculptured type, and we charge him with a certain cold abstractedness for embodying such a vague personality. Sometimes, indeed, about these secondary gods there is a good deal of shadowiness; sometimes, as Dr. Curtius notes, they obtain in literature and find no place in art, *e.g.*, Angelia, daughter of Hermes; sometimes the reverse, *e.g.*, the god of contests, Agon, of whom statues were made, but who never appears in literature.

But, if we look at facts, Kairos is no such shadowy personage. He is a god, indeed, who is the very outcome of Greek character, and bears the sign manual of the national genius, a god common to Greek literature and Greek art; a god, too, who comes into real being just with the finest flowers of Greek genius, and who loses much of his meaning, all his distinct personality in the decadence of Alexandrian days. The distinction between Chronos and

Kairos was only possible to a language instinct with logic. Chronos, time the *continent*, time in its extension, an abstract conception, a condition indeed of thought, but merely the frame, the background of action. Kairos, time the *content*, time possessed by action, time seized and vitalised by human energy, made effective, made actual, time cut off (*εἰρω*), and made momentous, time the inert, transformed into Attic activity (*τὸ δραστηριον*). Chronos refused to be localised into a personality, but not so Kairos. He was at home in the palaestra, and there becomes, as an aspect of Hermes, the athlete god, most entirely personal. It was Kairos who seized the lucky moment in the wrestling bout, Kairos who grazed the goal so closely with his chariot-wheels, Kairos to whom all men offered sacrifice as they entered the Stadium, Kairos who guided the hand of the happy dice-player. The statue by Polycleitos we may conceive, then, as a young man fresh and "fit," alert, with winged feet, poised in delicate balance but yet at rest. Such a thought was very far from any conception of mere chance (*τυχή*), mere good luck; it was the man and the time come together,—man's ability and time's opportunity. But we can readily see how the thought could be vulgarised. Kairos is the god of the man with mind eager to think and body trained to act. Chance is the god of the sluggish and the fool. And, in fact, a thought so perfect as that of Kairos could not and did not tarry long; in the later monuments of art we have the youth balancing the scales of fate on a knife edge (*ἐπὶ ἑνὸς ἀκμῆς*), or again the clumsy figure halancing itself on winged wheels, risky, unrestful, and last we have the ugly, literal, unplastic outline of the figure with the bald crown and long locks of hair to the front. The earliest example Dr. Curtius quotes is a mere fragment of Athenian work, one leg and part of the body, but easily recognisable from the curious characteristic pose of the lower limbs thrown far forward.

If we are to believe Kallistratos, the figure of Kairos by Lysippus embodied all these ugly innovations. It stood on a rolling ball, had locks of hair falling on the forehead, and was shaven behind. But if Dr. Benndorf be right, we cannot credit Lysippus with the invention of the type: it must have been traditional in the Peloponnesian school, beginning probably with Polycleitos. It was a subject thoroughly athletic in character, and therefore perfectly suited to Polycleitos and Lysippus. It is quite possible that Lysippus softened the type, investing it with something of the pensive, slightly allegorical manner of Praxiteles, who seems at least as much concerned with the thought as the personality. Very possibly, too, as Mr. Murray suggests ("Hist. Greek Sculpture," ii., p. 340), the statue was "worked out in the older analogy of the god of sleep, Hypnos." Kairos and Hypnos were, indeed, but two aspects of the god Hermes, the god of human action,—Kairos, the effectiveness of actual energy; Hypnos, the no less real and necessary effectiveness of sleep. However, to reconstruct the statue of Lysippus is no part of our purpose; it is enough that Dr. Benndorf has given us new light on a statue by the elder Polycleitos.

Proposed "Shippers" Exhibition in Liverpool.—It is intended to hold in Liverpool during the year 1886 an Exhibition of Navigation, Travelling, Commerce, and Manufacture, in a building to be specially erected for the purpose. The site chosen is the Edge-lane Hall Estate, adjoining Waverter Park and the Botanic Gardens, of which an area of about thirty-five acres has been placed at the disposal of the Executive Council by the Corporation of Liverpool; and in addition to this it is hoped that the use of the Botanic Gardens, admirably adapted as they are for out-door *fêtes*, may be granted for that purpose on special occasions. At a recent meeting of the Exhibition Council, the secretary reported that the guarantee fund amounted to 30,025*l.* Sir James A. Picton's name was added to the building committee. Mr. Henry Summers was requested to act as consulting architect to the exhibition, of which there is every prospect of success.

NOTES.

THE irruption of water into the Houghton-le-Spring Colliery on the 3rd of June has been followed by an explosion of unusually fatal consequences at the Clifton Hall Colliery, near Manchester, on the 18th of the same month. Three hundred and forty-eight men and boys went down that pit on the Thursday morning; and out of this number 214 have been brought up alive, although four of them have since died. Twenty-three bodies were brought up in the course of the day, and forty-one more up to 5 p.m. on the 19th. Contrary to ordinary precedents, no opinion has yet been offered as to the probable cause of the calamity. Walter Travis, one of the miners who were rescued, gave an account of his experience in the case. Three seams of coal are worked from the same shaft. It was in the third, called the Trencarbonate seam, that the explosion took place. The depth below the surface is 540 yards, but the seam drops down a steep decline from the shaft, and seven side levels run from it in an oblique direction. "All of us," said Travis, "had been working with candles." No gas had been noticed in the workings; but at 20 minutes past 9 a.m., as the men were at breakfast, an explosion occurred, and the lamps and candles were blown out. The effects of the after-damp became immediately sensible, but the miners managed to put a brattice, and thus maintained such a ventilation as to save their lives. There seems thus little room to doubt that the mine was one ordinarily so free from gas that the dangerous practice of working it with open lights was followed; and that in one of those sudden disengagements of stored up gas, of which we have had so many examples, the blower came in contact with the naked flame, with the fatal result described.

ATTENTION should be directed to the large area of underground gallery that appears to have been worked from a single shaft at the Clifton Hall Colliery. There is a connexion with the Agricolt Colliery, about a mile away, but it is not stated whether this connexion is made in each of the three superposed seams of coal. There is also an upcast shaft, used principally for the purpose of ventilation, but which is provided with a capstan-rope. The cages, however, were jammed by the force of the explosion in the downcast shaft, and it proved impossible to descend to a lower level, so that the extrication of the imprisoned miners had to be effected from the Agricolt mine. One hundred and fifteen men, in one of the upper levels, although uninjured by the explosion, were in imminent danger of suffocation by after-damp. Fuller particulars will, no doubt, be forthcoming as to the ventilation of the mine; but it would seem, from the statement that "two great gaps in the wall of the shaft had opened a communication with the upcast shaft"; that the pits spoken of as distinct were, in fact, one, divided by a wall, for the purpose of ventilation. In workings covering such an area, in which so many lives are risked, it is essential that there should be at least two entirely distinct shafts. We do not mention this as throwing any reflection on the management of the Clifton Hall Colliery, as the connexion with the Agricolt Colliery, to which those rescued owe their lives, may possibly have been all that was needed. But of the need that two distinct shafts, and not one large shaft divided by a brattice or wall, should be insisted on as a condition of the working of a colliery we have here another fatal illustration.

THESE are the facts of the most recent case on the law of light, namely, *Bullers v. Dickinson*, to be found in *Law Reports 29, Chancery Division*, p. 155. There was an old woodman toll-house in Jacob-street, Bermondsey, which stood out into the road, so that its frontage of 14 ft. 6 in. was not in a line with the rest of the buildings. The ground-floor room was used as a shop, and almost the whole front was filled with a window, which had a right of light attached to it.

Ultimately this old house was pulled down by the owner, and the projecting portion was sold to the vestry for the purpose of widening the street. At once, on the remainder of the site, a brick building, one story high, instead of three, was erected, and a window was placed in this new building substantially on the same level as the old one. But it was several feet further back than the original window, and the room was not more than half the size of that the portion of the site of which it now occupied. In the report from which we take these facts, a small plan is published, any one who desires to refer to it will find it explains the case quite clearly. The light to the new window was obstructed by a new building, and hence an action arose, the contention of the alleged infringer of the right being that the owner of the window had abandoned his right by his treatment of the site. But Mr. Justice Kay held that there had been no abandonment of the right in question, because the rebuilding of the same sized windows in practically the same position, but further back, was not an abandonment of the original right.

IT must be confessed, however, that the judgment in *Buller v. Dickinson* appears to carry the law further than it has yet gone in favour of the owner of an ancient light. It is a comparatively modern extension of the right which allows the owner to claim the old right in regard to a window enlarged or altered in shape, but in such cases the window is in the same position, though not the same in size or form. Here we have a new window in a new place, and in a new wall, for the wall was set back 4 ft. at the west, and 7 ft. 9 in. at the east end, and except that the new window was of the same size and on the same horizontal level as the old window, it appears to have no connexion with it at all. It is easy to imagine a building which might have been an obstruction to the light of the old window, which would not be one to the new window. Hence it appears to us that the owner did not possess the same right of light in the two walls, and it is on the assumption that it is the same right that he is entitled to the protection of the law. It may be that the case will be carried to a Court of Appeal and will there be fully discussed; at present it must be regarded as extending the right of the owner of the dominant tenement in a somewhat startling manner, with a result not altogether to the public advantage.

THE proposed people's palace for the East-End seems to be growing up by degrees into a definite project, the realisation of which may be expected at no very distant date. At a meeting at the Mansion House on Tuesday it was stated by the Chairman, Sir Edmund Hay Currie, that whereas a year ago they were merely trustees of a fund of 11,000*l.*, they had now 40,000*l.* in hand. The Institution is proposed to include, when complete, a technical school, a library and museum, as well as means of recreation of various kinds. The Prince of Wales proposed the first resolution, "That this meeting views with satisfaction the progress which has already been made in furthering the great scheme of the Beaumont Trustees for providing opportunities amid the dense population of East London for rational amusement and technical education; and having regard to the eligible site now vacant in the Mile End-road, would urge the Trustees to complete the purchase of the land and commence the erection of the necessary buildings." The resolution was seconded by the Archbishop of Canterbury, and carried unanimously.

IT is to be hoped that those philanthropists who have been interesting themselves in the question of housing the poor will not rest satisfied with improving the slums and rookeries of our great towns, but that they will be able to keep an eye on the dwellings inhabited by artisans in special trades. Of these, colliers and miners are notorious sufferers, as everybody knows who is acquainted with mining districts, though it must be admitted that the barren and unprepossessing character

of the neighbourhood, with its dreary spoil-banks and slag-tips, give the locality the slenderest chance of looking attractive. Many a grimy and blackened exterior contains a comfortable home within, though the majority, whether in Durham, Staffordshire, or South Wales, are very far from being what they ought to be. One cause of this is that the ground, being so worked out underneath, is apt to settle, causing all kinds of irregularities and cracks in the walls of the dwellings; but the chief reason is that, as a rule, mine-owners are not the proprietors of the land around and about the mines, and are unable to build houses for their workmen, owing to the short leases generally allowed by the ground landlord. When colliery proprietors are also owners of the soil, and are inclined to do the right thing, as at Earl Fitzwilliam's pits in Yorkshire, and those of the Staveley Company in Derbyshire, the building of proper houses has had the happiest effect, not only on the good health and sanitation of the community, but in the prevention of that constant change and migration that is such a feature amongst men of this class. Owners should bear in mind that the investment in home comforts for their "hands" is always a paying one, and that a workman becomes more and more valuable the longer that he stays in the same place.

THE disused burial-ground in Union-street, Southwark, known by the ghastly name of the "Crossbones," was recently sold by the trustees of a local charity, to whom it belonged, for 2,300*l.* The Metropolitan Public Gardens Association, fearing that a further attempt may be made to utilise the ground for building purposes, have memorialised the Metropolitan Board of Works to take steps to prevent the ground in question being used for the erection of houses. It may be true, as the poet says, that "the earth rings hollow 'neath our feet, and warns us of her dead," and that in most ancient cities there are but few localities that have not, at some time or other, been used for the purpose of interment, but it is desirable that some time should elapse before "the house appointed for all living" should be converted into eligible building plots.

AT Pasadena, one of the colonies round Los Angeles, some 500 miles south of San Francisco, a system of irrigation is carried on by the agency of companies, who supply the water for agricultural as well as domestic purposes. Owing to its scarcity the water is so valuable that it has to be conveyed by pipes in order to save loss from evaporation and soakage. The head of water allowed to each 250 dollar share of stock in the Association is 25 inches for 1½ hour, sufficient to irrigate 10 acres, the original value of which, from 1½ to 2½ dollars only, has risen to between 250 and 350 dollars when set out with orange and other fruit trees, so enormously valuable is the effect of irrigation. The pipes, locally termed "laminated," are formed by inserting one sheet-iron pipe into another little larger pipe, and joining the whole together by filling the space between the two with asphalt. The two pipes are made in sections, 8 ft. long, rolled, lapped an inch, and welded by a composition solder that makes the joint actually stronger than the iron itself, as proved by experiments, in which it was found that the iron always ripped while the joint remained sound. The inner shell is telescoped into the outer while immersed in hot asphalt, specially prepared, giving a thickness between the shells of 1-16th of an inch, which prevents the possibility of corrosion and forms a strong band. Pipes 4 in. in diameter thus made are guaranteed to stand a pressure of 500 lb. to the square inch, whereas riveted pipes of the same size begin to leak at 150 lb., and, at 250 lb., are unfit to conduct water. The net returns from irrigated orange groves, after paying all expenses, are said to vary from 250 to 500 dollars, or roughly, from 50*l.* to 100*l.* per acre. The Irrigation Commission, deputed by the Australian Colonies to America, is publishing much useful information on the subject.

SOME time ago Mr. Gladstone intimated to the Lord Provost of Edinburgh his desire to restore the ancient city cross, removed about the beginning of this century from the High-street, as it was considered an obstruction to the thoroughfare, an incident referred to in Scott's spirited lines:—

"Dun-Edin's cross, a pillar'd stone,
Rose on a turret octagon;
But now is raised that monument,
Whence royal edict rang,
And voice of Scotland's law was sent
In glorious trumpet clang.
Oh! be his tomb as lead to lead
Upon its dull destroyer's head!
A minstrel's malison is said."

This cross was erected in place of an earlier structure removed in 1617 upon the occasion of the visit of James VI. to his native country. It consisted of an octagonal structure about 18 ft. in diameter and 15 ft. high, having at each angle Ionic columns, from the capitals of which were corbelled out small rounded turrets. Between these columns the wall-space was contained within semicircular arches, with key-stones and key-blocks. In the upper part of each arch there were sculptured medallions containing heads having no particular value historically or artistically. These medallions were secured by Sir Walter Scott, and are built into the garden-wall at Abbotsford. There they form a more interesting object than they would be if incorporated into the restored (or rather new edition) of the old cross. Access to the flat roof of the octagon was gained by a staircase, which was guarded at the foot by a heavy oak door studded with iron nails. In the centre of the platform stood an octagonal shaft about 30 ft. in height, having a capital of Late Gothic character, upon which was placed a rampant unicorn hearing the royal standard. This shaft now stands within the railings of St. Giles's Cathedral, where it was placed about ten years ago. The shaft is much chipped, and is encased in a coating of cement. It is proposed to incorporate this shaft with the new structure, but it would, in our opinion, be better to allow it to remain where it is to tell its own tale, and to make a facsimile of it for the new structure. Mr. Gladstone has entrusted to Mr. Sydney Mitchell, architect, the work of preparing the design, and the Town Council have fixed upon a site to the eastward of St. Giles's Cathedral, and to the westward of the Police Buildings, a site most suitable in all respects, and close to where the old structure stood.

THE progress of the works of Herr Krupp at Essen may be said to be one of the marvels of modern industry. The most recent and authentic data show that in 1860 the total number of workmen employed by Herr Krupp was 1,764. In 1870 they had increased to 7,084. At the present time (1885) the total number employed in all the establishments of Herr Krupp exceeds 20,000. If we add the wives and children dependent upon the workmen, the total number of persons supported by the Krupp works is not less than 65,381. Of this number fully 29,000 dwell in cottages built by Herr Krupp, and belonging to his works. There are eight separate and distinct departments belonging to this enormous concern. In the first place, we have the vast extent of workshops at Essen; secondly, three coal-mines at Essen and Bochum; thirdly, no fewer than 547 iron-ore mines in various parts of Germany; fourthly, several iron mines near Bilbao, in Spain; fifthly, an extensive series of smelting-furnaces; and sixthly, the ranges at Meppen, for the testing of the Krupp guns. Besides the eleven smelting-furnaces there are 1,542 puddling and heating furnaces. The number of steam-boilers employed on Herr Krupp's works is 439, and the total horsepower of the 450 steam-engines in use is 185,000. There are thirty-seven miles of railway in the works, on which the traffic is performed by eighty-eight locomotive engines, and a park of 893 luggage-wagons. There are no fewer than thirty-five telegraph-stations, with forty miles of telegraph-wire and fifty-five Morse apparatus in operation on the works.

IN reference to the recent Congress of French Architects, we are asked to mention that the morning of Friday, the 12th of June, was specially reserved for the consideration of the subject of the "Caisse de Défense Mutuelle des Architectes," of which we have more than once spoken. At that sitting the new association was constituted, and its statutes approved, subject to confirmation by a general assembly, to be held next November. The powers of the committee of organisation, now become the committee of administration, have been prorogued until the meeting of that assembly.

THE new branch offices for the Bank of Scotland in George-street, Edinburgh, form an important addition to the architectural features of that street. The building has been designed by Messrs. Kinnear & Peddie, who have adopted the severe style of Italian Renaissance practised in Florence. The ground-floor is boldly rusticated, and the windows consist of large circular-headed openings, divided by stone transoms supported by fluted columns. These are flanked by doorways, the western one leading to the bank proper being emphasised by a portico of coupled columns with a pediment filled in with the cognisance of the bank, executed by Mr. D. W. Stevenson, A.R.S.A. The first-floor windows are surmounted by pediments supported by fluted columns, and those in the third and uppermost floor are framed by moulded architraves, and the wall-head is finished by a boldly-projecting dentilled cornice. There is an unusual amount of wall space in the upper stories, which gives a dignified and severe aspect to the façade, in keeping with the purposes of the building, but the general effect, although every detail is perfectly correct, is cold and uninteresting.

AT Messrs. Bellman & Ivey's rooms at 37, Piccadilly, there is at present on view a collection of the productions of Mr. T. W. Maclean, the sculptor, which includes some very admirable work. The largest group is a marble one suggested by, or rather a reproduction in sculpture of, two figures in the painting of the "Spring Festival" by Mr. Alma Tadema. Mr. Maclean has succeeded very well in giving in sculpture the type of sensuous Roman face which we know so well in Mr. Tadema's paintings; but we prefer his more original figure entitled "Comedy," in which he has succeeded in imparting a very genuine *vis comica* to the countenance without transgressing the proper limits of sculptural expression. There are other fine works there, especially a marble bust, "Meditation," a monument (terra-cotta has-relief) to be erected in Weeting Church, Norfolk, and the terra-cotta version of the "Ione," which will be remembered as an object of attraction in the Grosvenor Gallery some time since.

THE SPECULATING BUILDER.

The speculating builder, like the long-suffering Israelite, is a member of a separate caste. Like him he is become a necessary unit in our social life, and like him is the bearer of much numerated obloquy. His very name sounds an alarm to suspicion and distrust. His astuteness, which all allow, is exaggerated at the expense of his integrity, which all are prone to deny. Abused and avoided, he is, nevertheless, secretly admired by an intensely commercial world as the possessor of occult and mysterious powers which make for wealth. His real business is not building, but finance; and in the skill or maladroitness with which he picks his way through complicated financial problems lies his good or evil fortune. In all this he reflects the characteristics of his ancient counterpart. And there are said to be other resemblances upon which we need not insist. As with other original and adventurous minds, the exercise of his genius is variously rewarded. The lives of some of the brotherhood are bound in shallows and in miseries; whilst others attain wealth, position, even rank, and the good or ill which these bring in their train. There have been, and there are, speculating builders of liberal

views and unimpeachable character; whose business calls for administrative powers of a high order, and who have found the wisdom of entrusting the architectural section of their works to architects,—but these do not fall within the scope of our little sketch. Mr. Balbus is a good typical illustration of the class with which we are dealing. Uneducated, or, at best, ill-educated, he was heavily handicapped in life's race, and his success is so much the more to his credit. Beginning life as a bricklayer, it soon became apparent that he was born for better things. From taking work by the job he speedily became a sub-contractor on a more comprehensive scale, and under his gentle compulsion an army of meager mortals called rapidly into being some miles of those elegant but precarious tenements which adorn our London suburbs. His spirit of enterprise was not to stop here. Backed by his small accumulation of capital and that of a friendly publican, he negotiated on his own account for a large "take" of land which was then in the market, and available for the erection of those genteel villas for which, the lessor intimated, an overflowing and excited population was absolutely clamouring. The land was situated in what is known to some as an "improving" neighbourhood. Now the improvement of neighbourhoods is our friend's *specialité*. In this he is *facile princeps*. His plan is simple and effective. Take a meadow, the larger the better. Cut down the fringing elms and grub up the hedges. Break up the surface into small sections of a few feet square by running tracks of broken rubbish through it. If the ensoulèd gravel dig it up and sell it. You will not, of course, save it for concrete, or the sand for mortar. We assume you are not a simpleton. Any extravagance of that kind would never prosper. You then fill in the pits with refuse matter, and proceed to build thereover small, slender, rickety brick shells, divided up horizontally and vertically by strips of deal. An artful arrangement of battens supporting a thin film of slate furnishes a roof; and the painter, plasterer, and paperhanger convert them like magic into the brightest, stickiest, and genteelst of villas, which are occupied before the paint is dry. They are damp. They are cold. They are hot. What of that? They let. The builder sells them: he sells the improved ground-rents he has created, and before his handiwork has time to come to pieces, he is off. He found a solitude, and leaves a slum, and he walks away serenely satisfied with the result, and looks around for some secluded spot in want of similar "improvement." A more questionable form of improvement consists in buying some fine old mansion, with its eight or ten acres of pleasure-grounds, such as you see will lately on the margin of our London commons, and within memory bounding many an open green within the postal radius. The house is pulled down, and sold piecemeal, the gardens desecrated, the birds are driven from their immemorial home, and a general havoc is made. Roads are driven longitudinally through the whole, and rows of showy houses stare at each other in long broken lines, as monotonous and uninteresting as the lives of their inhabitants. But his effrontery reaches the sublime when he leases a disused burial-ground for the basis of his operations, and builds houses for the living on the decayed and decaying dwelling-places of the dead. By such arts as these Balbus grows rich; and to be rich is to be respected. He is a member of the vestry, and eloquent on all questions affecting the sanitary legislation of the parish. He is also on very good terms with the surveyor, and particularly so with the inspectors of nuisances. It is needless to say that he is a staunch supporter of the local building societies, whose members relieve him of the genteel residences which he erects. He retains a few of the better-built for his misuse, and he appears to have some unexplained mysterious interest in many of those which have nominally passed out of his hands. He is a tall, dark, saturnine man, with a hard, weather-beaten face, and small, keen, restless eyes; able to say curt and even strong things to tenants who complain and want something done; but full of jests and pleasantries to "the little dears wot is a-going to pay." He drives a very shiny "village" cart, drawn by a very sleek and knowing pony, who evidently sees through his master, and disapproves of many of his ways. With this equipage he is always going to and fro upon the earth collecting his rents, looking after his men, and prospecting new localities

yearning for his improving touch. His own house is large and elaborate, and was built for a City gent, who did not live (financially) to inhabit it. An architect designed it,—an incipient architect, that is,—and the original design was by no means a bad one. But the builder's fatal talent for improvement could not be at rest. The instinct which leads little boys to embellish the theatrical posters by putting monstachios on the ladies' lips, and pipes in their lovers' mouths, induced our friend to add little twirls and flourishes to the work of his collocationeur. A good deal may be done with a sprinkling of terra-cotta vases, a few glazed tiles, and a dash of cast-iron crests and finials; and the free use of a miscellaneous assortment of these articles, bought cheap, added much artistic interest to the original scheme. The good man opens his own splendid front door in his shirt-sleeves and shows you his house and grounds, his carriage-sweep and greenhouse, his dodos and country flowers, with pardonable pride; and in the rustic summer-house in the remotest corner of the grounds, his friends from town on Sunday afternoons calmly smoke their long pipes and sip their brandy and water, listening contentedly for the hundredth time to the incidents of their friend's unbroken successes. As a rule he has rather a contempt for art, and looks upon it as "umbug." That which suits his customers and is pretty in their eyes is pretty in his. But his own house is an exception. There he has "garnered up his heart," and regardless of cost, has shown once for all that when so minded "Todgers's can do it." His sons will not follow the business. They know that they will be fairly provided for. One is to be a lawyer; for experience has taught his father that one way or another much of the current coin of the realm finds its way into the lawyers' pockets. His daughters have a dreary time with their upstairs neighbours, who keep persistently aloof. The fact is that Mrs. B.'s "ways are peculiar," and social intercourse is beset with some curious little risks and surprises. But the whole family share the paternal skill in finance, and the next generation will set these little matters straight. The old gentleman with his shirt-sleeves and long pipe, and the old lady with her strange orthodoxy, will have moved off; and the family of Balbus will take the position in the world to which their talents and their means entitle them. There is another side to the picture. The speculating builder, with too little capital and too much conscience, is like to have a hard time of it. Demands come upon him from all quarters. From lawyers and their mysterious City friends, from surveyors and timber merchant, and merchants innumerable. The outgoings are manifold and inevitable. The incomings are precarious and problematical. In the endeavour to live he is often unjust to others, and others are not always just to him. If, however, he were to consult their interest before his own he would be unlike the rest of the world. That his calling is not an abnormally profitable one is shown by the fact that his Israelitish counterpart does not engage in it. Perhaps he is too honest. And if our friend Balbus were too much overweighed with this quality,—well, he would never live in the house he does, and drive Mrs. B. to "the Oaks" in his own trap.

COMMON THINGS.

AN ARCHITECT'S NOTES.

As in other subjects of study, so in architecture, there is a great deal to be learned from the common things that we pass every day on our way to business. Putting aside the work of the last fifty years, which we may claim as our own, and which undoubtedly contains more good points than it is generally allowed to do, there is much pleasure to be derived from the study of the numberless quiet buildings previously erected and that did not come under the influence of the Greek and Gothic revivals.

The English Renaissance, if traced from the beginning of the sixteenth century to its interruption by those revivals, will be found to reveal several successive waves of style, each bearing on its crest a distinct individuality, and all moving forward towards an ever-distant shore.

The rock of revivals appeared itself and checked these waves in mid-ocean and broke

FAN LIGHTS.

No Scale. 3'6" average diam:

5

their crests into confused spray, which, however, is now gradually settling down again, and the wave is on its way, leaving, we hope, the rock far behind.

How interesting it is to watch the robust wood-work of the early part of the eighteenth century passing through softening changes until, towards its close, it becomes refined and delicate, and thoroughly thought out in every detail. If any one will take the trouble to examine a row of entrance-doors built about a hundred years ago, he will find such perfection of grammar in their design that the sight of haphazard details pitched together in the work of our own time will give him quite a shock.

For instance, there is a row of busses in Kensington Park-road, built probably under the influence of the Adams, in which there is a series of porticos that should satisfy the most fastidious taste; every projection is duly calculated for, nothing is left to chance.

Such doorways may be found in various towns; for instance, Deal teems with them.

In connexion with these doorways,—and, indeed, with many quite plain ones,—may be observed their very unpretending fan-lights, which exhibit an infinite variety of designs. One passes dozens of these in every neighbourhood, where there are houses old enough to contain them. Those that are illustrated on p. 897 may be seen on one side only of a suburban road, and within a range of about a mile and a half, and are exclusive of rectangular and elliptical fan-lights and of larger semicircular ones.

It will be seen that there are twenty-seven varieties in this short space, in which numerous similar houses may have been taken down, while many of the existing fanlights have been filled with plate glass and other kinds of glazing. And these twenty-seven examples, with two or three more, have been copied,—good, bad, and indifferent,—just in the order in which they came. It will, therefore, be readily inferred that in London alone there must be sufficient varieties to admit of making a selection of really good examples with a little trouble.

The houses of this period are no more sensational in style than a quiet Medieval church,—indeed, there is nothing in them to go into ecstasies over, whereas the village church might inspire the pen of a Ruskin; and yet, in a humble way, these fanlights exhibit the same kind of fertility in design that we admire in following the varieties of a series of stone tracery windows.

Many readers will know Billing's work on the infinite number of changes to be rung on certain leading forms of tracery. Here we have a great variety in the leading forms themselves. All that is provided is a semicircle, or the greater portion of one; the rest is a blank to be filled. And as it is *not* the object of the writer that even the best of these designs should be imitated, it would be good practice for a student to put these away and fill a dozen semicircles with fresh designs of his own.

As to construction, the earlier fanlights had wooden sash bars, which were necessarily thick and presented difficulties in the way of curved lines. These appear to be executed in lead or other soft metal, which can be easily "run" with moldings and rebate, and then be bent and soldered together. Where very delicate parts are used the glass passes entirely behind them, and a great charm of the treatment consists in the cast ornaments that are so happily combined with the bars.

Imitative architecture is not yet quite dead amongst us, and the last new book of photographs, even of the grossest and coarsest Flemish Renaissance work, is often used as a "crib" to re-appear in some of our fashionable thoroughfares.

If it be asked in what way these fanlights may bring legitimate grist to our mill, the answer is simple. There are, at least, three elements in every detail of architecture,—(1) purpose, (2) form, and (3) construction.

If, therefore, the purpose be the same, the modern designer should invent new forms of fanlights. If the forms of these old fanlights be found suggestive, they can be applied to other purposes, with other means of construction. If the constructive treatment be found applicable to other forms, we shall get another fresh departure.

It is by such means that the successive styles of architecture have been developed, but by direct imitation—never.

Illustrations.

SIR HENRY PEEK'S NEW PREMISES IN EASTCHEAP.

THESE premises have recently been erected, partly upon land purchased by the baronet from the Joint Committee of the Metropolitan Railway Companies, after the widening of Eastcheap in conjunction with the completion of the Inner Circle Railway, and partly upon the site of a portion of his own property. The frontage in Eastcheap is about 85 ft., and the return frontage in Love-lane about 65 ft., and the building contains two stories below the pavement level. The façades upon the ground story are composed of Argyleshire gray granite, finely axed, with slightly incised carving, and the remainder of Portland stone in large blocks, relieved with a minimum of carving executed in low relief. The panel of camels upon the circular corner is the trade-mark of the firm, and has been modelled and sculptured by Theod. The Mansard roof and the cupola are covered with red tiles and terra cotta, and impart a pleasing skyline and amount of colour to the structure. The joiners' work is of polished oak. Several of the floors are of concrete, and internally the premises are abundantly lighted, and are fitted up throughout in a substantial manner, with polished oak partitions and fittings designed to harmonise with the building. The lobby and vestibule are laid with mosaic, and the staircase, which is very spacious, has the stairs covered with Hawksley's treads. The premises are heated throughout by hot water, there being but two fireplaces in use. Mr. Alexander Peebles, F.R.I.B.A., is the architect; the contractor was Mr. J. T. Chappell; the engineer for the very considerable amount of iron construction was Mr. M. T. Shaw; the hot-water engineers were Messrs. Waller & Co.; and the gas-fittings have been designed and supplied by Messrs. H. Greene & Son; Mr. P. J. King being the clerk of works. Another portion of these premises, with a frontage of about 50 ft. in Saint-Mary-at-Hill, is in course of demolition, and will be re-built under Mr. Peebles's directions, to correspond with this building, by Messrs. Clarke & Bracey.

SCULPTURE AT THE ROYAL ACADEMY.

"EDWARD I."

BY MR. HAMO THORNYCROFT, A.R.A.

WE give this week, from a photograph kindly furnished us by the sculptor, an illustration of Mr. Hamo Thornycroft's wax model, on a small scale, of an equestrian figure of Edward I., which was, we believe, originally designed for a competition for statues for Blackfriars Bridge, for which position the powerful and monumental style of the design would have very well suited it, were there only a decent and fitting architectural pedestal on the bridge to put such a work upon.

The model of the statue is in the "Lecture-Room" at the Royal Academy Exhibition.

THE "HERAULT D'ARMES" AT THE HÔTEL DE VILLE, PARIS.

THIS equestrian statue, of which we have before spoken, was commissioned from M. Fremiet in 1882 for the decoration of the grand staircase of the Prefecture of the Seine, in the new Hôtel de Ville. The commission was simply for a candelabrum, but the artist produced the model in plaster of this work to serve that purpose, which was afterwards cast in bronze in the ateliers of Messrs. Thiebaut, at a cost of 10,000 francs, and placed in position in April last, on the occasion of the great fête given in aid of the poor of Paris.

With the exception of the blazon of the City of Paris, which stands out in coloured enamels on the mantel of the herald, the work offers now, in its general surface, a uniform golden tone or patina, which is very rich in effect. The statue, independently of artistic merit, is an example of the archaeological resource and knowledge of costumes and accessories which the works of M. Fremiet have always displayed; the trappings of the horse and the dress of the horseman are all according to the period, and taken from the most authentic sources. The jump itself was scrupulously copied from one figured in Viollet-le-Duc's remarkable and well-known work. The stem serves as a gas-pipe to feed six burners, disposed in corona form.

We may add, in conclusion, that M. Fremiet has been engaged in the study of a project for an addition to the decoration of the garden of the Trocadéro, and which comprises groups of animals emerging from the pool of water which falls in cascades in the midst of the lawns opposite the exhibition palace. This project will be submitted to the approbation of the Municipal Council when it proceeds to consider the treatment of the Trocadéro and of the Champs de Mars in view of the universal exhibition of 1889.

R. B. FENWICK.

ORATORY, ST. WILFRID'S HOUSE, EXETER.

THE Sisters of St. Wilfrid's House, or Home, Exeter, have, up to the present, rented a house for their occupation, but it having been thought advisable to establish a permanent home, a freehold, old-fashioned house has been purchased. This has been added to and altered to meet the requirements of the community. The old roof has been taken off, and another story built, which, together with the rooms in the new roof, gives nine additional bed-rooms, a bath-room, water-closet, &c. Great care has been taken to make the ventilation and sanitary arrangements as perfect as possible. The oratory is built in the garden at the back, and is connected with the house by a covered way. The walls are of local red bricks, with Cornham Down dressings; the roof covered with red tiles; inside the walls are plastered; the roof and other woodwork is of pine. The floors are formed of deal blocks, 6½ in. by 2½ in. by 2½ in. with borders of salt-glazed stoneware tiles, having patterns in low relief. These were specially made by Messrs. Cliff & Son. They are very true, and of a rich red-brown colour. The altar-steps are of Red Mansfield, the spaces paved with the salt-glazed tiles mixed with ordinary paving tiles. The east window, supplied by Messrs. Burlison & Grylls, is chiefly composed of white glass with silver stains, a small amount of colour being introduced to give tone. The other windows are temporarily filled with leaded lights. The stalls, &c., are not yet made, but are to be of English oak. Mr. Thomas Sharland, of Exeter, is the builder, and Mr. F. Newman, of Folkestone, the architect.

HOUSE AT KENSINGTON COURT.

THE house shown in our illustration is built from Mr. Jackson's designs, at Kensington, overlooking Kensington Gardens, and nearly opposite the Palace-gate. It stands upon a corner site, upon the ground formerly occupied by the house and grounds of Baron Albert Grant, and is the first house begun and finished on this estate.

The materials are red brick, with dressings of buff terra cotta.

The interior is finished with an oak staircase, oak floors and panelling in the best rooms, chimney-pieces and panelling of painted deal in other rooms, and pavements of black and white marble in the hall and passage.

The principal rooms and passages and offices are lighted by electricity, which is generated by dynamos the power for which is supplied by a gas engine.

The terra cotta was modelled from Mr. Jackson's designs by Messrs. Farmer & Brindley, and made by Messrs. Doulton. The general contractor was Mr. Estcourt, of Gloucester; and Mr. Robert Edwards was clerk of works. The hot-water apparatus is by Messrs. Haden & Son, and the electric lighting by Messrs. Strode & Co.

The illustration is from a drawing exhibited this year at the Royal Academy.

OUT-PATIENTS' DEPARTMENT AND NURSES' HOME, VICTORIA HOSPITAL FOR CHILDREN.

THE first stone of this building was laid by H.R.H. Princess Louise (Marchioness of Lorne) on Tuesday last.

This hospital, situated at the junction of Tite-street and Queen's-road, Chelsa, was established in the year 1866 for the treatment as in-patients of boys between the ages of two and twelve years of age, and of girls between the ages of two and sixteen; also as out-patients all children under sixteen years. It is also a training-school of nurses for children. The management of the building generally is conducted by a board, of which Mr. Harvie Farquhar is chairman, and

THE PHOTO SPRAGUE & CO LONDON

A Gable of an Old House... Orpington, Kent

Elevation of Centre Gable...

Mr. R. Martin Smith the treasurer; Capt. Blount, R.N., is the secretary.

The building now accommodates sixty in-patients, located in the old building originally occupying the site, and which has been judiciously altered to the purposes of a hospital. It is, however, intended, as soon as funds will permit, to add an additional wing, constructed upon more modern principles.

The out-patients are at present accommodated in the basement of the old building, and the arrangements are necessarily of a primitive and unsatisfactory character. The accommodation for the nursing staff is also very inconvenient, as part of it has to be located in premises situated on the opposite side of the Queen's-road. Hence the necessity for erecting the new building.

The architects of the new building are Messrs. H. Saxon Snell & Son, and the arrangements are such that the ground-floor is devoted to the purposes of an out-patients' department, and contains a waiting-hall, 53 ft. by 20 ft. and 16 ft. in height. Ranged down one side are the surgeons' and physicians' rooms, a dressing-room, and a small ward for the temporary accommodation of patients after having undergone operations. At one end is a dispensary with a separate small waiting-room for nurses coming for medicines from the main building. This department is entered by a gate from Tite-street, and the courtyard giving access to it has a low shed ranged down one side for the shelter of children's perambulators.

The upper part of the building is entirely detached from all communication with the out-patients' department upon the ground-floor. It consists of three floors, containing twenty-nine bedrooms for the nursing staff and Sisters, and in addition a sitting-room and bedroom for a superintendent. Two sitting-rooms are also provided, the one for nurses and the other for lady probationers. The basement of the building contains the porter's apartments, a mortuary, post-mortem room, a drug-store, and cellarage.

The entire cost of the structure will be 6,550., but with the funds at present in hand it will only be possible to complete the out-patients' department and the carcassing of the upper portion of the building.

The builder is Mr. Chas. Wall.

A GABLE OF AN OLD HOUSE, ORPINGTON, KENT.

This quaint old Kentish gable is one of many which tells us how fond our forefathers were of the picturesque, and yet how true and honest they were in their art of building.

The old building from which this gable is taken has a pleasing outline. The roof is steep-pitched, tiled, and hipped at both ends, whilst this gable rises in the centre of the front. The lower story is half-timbered, filled in with horizontal coursed brickwork; the upper story projects 1 ft. 9 in. on wood brackets, and is filled in with herring-bone brickwork. The windows have lead lights, with casements opening outwards. The carving in the pediment of the window is in wood. The Jacobean door, with its carving, together with the latch, catch, handle, and quaint knocker, are well worthy of a special notice.

The Carpenters' and Joiners' Companies awarded the author of this drawing their silver medal and 5l. at Carpenters' Hall last year.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association.—On Saturday afternoon last the members of this Association made an excursion to Alvechurch and Beoley churches. On arriving at Redditch the party walked a distance of about two miles to Beoley, where they were met by the Vicar, the Rev. C. J. Langston, who conducted them over the church, now being restored by Mr. E. Ray, architect, of Worcester. The church is an old stone building in the Norman and Early English styles, consisting of chancel, nave, aisles, a lady chapel, and tower, with six bells; in the lady chapel are many ancient monuments, most probably the work of Italian artists, to the Sheldon family, who formerly held this manor. The tomb to W. Sheldon and his wife, with recumbent effigies, is especially worthy of mention as being one of the finest and most elaborately-decorated examples of Elizabethan ornamental architecture in the country. After

a pleasant ramble of about five miles through the fields, the party reached Alvechurch, where an inspection was made of the church restored by Mr. Butterfield.

Liverpool Architectural Society.—At a meeting of the Council of the Liverpool Architectural Society, held at the new rooms, Cook-street, on Friday, the 12th inst., Mr. Thomas Mercer was unanimously elected president for the coming session.

BUILDING ON PRIVATE AREAS.

MR. FREDK. JNO. JOHNSON, of the Sussex Arms, Loughborough Park, Brixton, was summoned at the Lambeth Police-court, before Mr. Chance, for that he did unlawfully, without the consent of the Metropolitan Board of Works, form or lay out a certain road, passage, or way, leading out of Acorn-place, Camberwell, for building, as a street, for purposes of foot traffic, in such a manner that such road, passage, or way would not afford direct communication between two streets, contrary to 45 Vic., cap. 14, sec. 7; and further, that he did unlawfully form or lay out the above way as a street for foot traffic without the consent of the said Board, contrary to sec. 8 of the above-mentioned Act.

Mr. Avory, instructed by Mr. Thos. Burton, appeared for the Metropolitan Board of Works, and Mr. Bealey for the defendant.

Mr. Avory stated that the defendant had erected six blocks of artisans' dwellings in Acorn-place, Meeting-house, Camberwell. The blocks comprised three sides of an open quadrangle, of an average width of 60 ft., and about 79 ft. deep from north to south, the quadrangle being enclosed at the northern end, next Acorn-place, with an ordinary railing, in which gates had been put up, the central gate being 3 ft. wide and capable of admitting a wagon. Side gates had also been made, 4 ft. wide each, and led into two footpaths. The centre portion of the quadrangle was paved with wood, and a footpath, 6 ft. 6 in., was made round three sides of the quadrangle. The blocks had each a frontage of 33 ft. upon the quadrangle, and were three stories in height, each block containing six sets of tenements of three rooms each, in all, thirty-four tenements, capable of accommodating 144 to 200 persons. A caretaker resided on the premises; and at the south-west angle of the block was a gateway 10 ft. wide, leading to an open space at present used for storing building materials. In the rear of the blocks was a footway 4 ft. wide, with a doorway at the eastern end leading into High-street, Camberwell. The site of the buildings complained of was surrounded by property belonging to adjoining owners, and the only access was through Acorn-place. The buildings had been completed, and were partly occupied. The railing enclosing the quadrangle on the north side had been erected, and the gates, it was believed, were usually kept closed.

Mr. Avory called Mr. John Hobb, the Assistant Superintending Architect to the Board, and Mr. Henry Jarvis, District Surveyor, in support of the above facts.

Mr. Bealey, for the defence, contended that the blocks of buildings being enclosed by gates, which were not within the provisions of the Act, and that the defendant had done nothing to form or lay out a road, passage, or way, and cited several cases in support of his contention, and called Mr. Grace, the freeholder.

Mr. Chance, the magistrate, stated he should hold that the buildings in question came within the Act, and required the consent of the Board, and fined the defendant the nominal penalty of 10s. and 2s. costs.

Notice of appeal was given.

ANCIENT LIGHTS.

SCOTT V. POPE.

This case recently came up in the High Court of Justice, Chancery Division, before Mr. Justice North.

The plaintiff was the owner of a building on the west side of Denton Yard, Newcastle-upon-Tyne, which was erected in 1872 on the site of old building, the windows of which had undoubtedly been ancient lights. In rebuilding, the plaintiff had advanced the east wall by 2 ft. or 3 ft. nearer to the defendant's building. No record had been kept of the window in the old building, but, on arbitration, it had been ascertained that although none of them corresponded in their entirety with the new windows, yet some of them did occupy parts of the spaces of those windows. The defendant had pulled down his building and was erecting it to a greater height, so as to interfere with the lights of the plaintiff, who sought an injunction to restrain the encroachment.

Mr. Rigby, Q.C., Mr. G. Bruce, Q.C., and Mr. Wm. Druce were for the plaintiff; and Mr. Wm. Barber, Q.C., and Mr. J. Chester for the defendant. The point of law argued in the case was whether the plaintiff had not by altering the plane of his wall in 1872 abandoned his ancient lights.

His Lordship, after dealing with the facts of the case and the authorities, held that the defendant

had not established that which alone could justify him, viz., a clear intention on the part of the plaintiff to abandon his ancient lights, so far as he had not himself closed them up. No conclusive evidence of such intention had been adduced, and the law maintained the right in respect of any substantial part which was preserved of an ancient window. There were cases which showed that the "retirement" of a wall when altering buildings did not take away the previously-existing rights in respect of that wall, and the same principle must apply to the "advancement" of a wall. Notwithstanding the alteration the plaintiff was entitled to an injunction.

Costs ordered to be paid by defendant.

CASE UNDER THE METROPOLITAN BUILDING ACTS.

WHAT IS A "PUBLIC BUILDING"?

JOSELYN V. MEESON.

THIS was an appeal (heard in the Queen's Bench Division, before Lord Coleridge and Mr. Justice Mathew) from the conviction of a builder for a breach of the provisions of the Metropolitan Building Acts of 1855 and 1873 and the by-laws of the Metropolitan Board, in building an ambulance station without depositing plans and sections with the District Surveyor for East Hackney. It appeared that notice was given, but without the plans and sections as required by the Acts and by-laws in respect of "public buildings," and the question was whether this ambulance station was a public building within the Acts such as to require the deposit of plans and sections along with the notice. The statutory definition of "public buildings" was "any church, hospital, or building for any other public purpose." The ambulance station was erected at Homerton by the appellant for the Metropolitan Asylums Board, under the superintendence of Messrs. A. & C. Harston, architects. It was not actually connected with any fever hospital, though it was near one, and it was intended for the use of all fever hospitals in the metropolis by way of stabling for horses, &c. The builder being summoned before the magistrate for a breach of the by-laws, it was contended that he was not liable, as this was not a public building. The magistrate, however, thought otherwise, and convicted the builder, but stated a case to raise the question, and it stated that the public were not admitted to it under any circumstances.

Mr. Gye (instructed by Messrs. Rogers, Sons, & Russell, solicitors) appeared for the defendant, and argued that it was not a "public building" within the Act.

Mr. Meeson, the Surveyor of the Board, appeared in person, and submitted that it was a "public building."

The Court, however, were clear that it was not, and gave judgment for the appellant, with costs.

WHITEWASH.

SIR,—I trust that the unpretentious heading of this communication will not exclude it from your columns. It may be that in these days of scientific sanitation we dig deep and travel far for things of less value than those which lie upon the surface, and are close to our hand. The well-to-do and middle class may avail themselves of novelties, but we must look to the health of our poorer brethren, whom we have always with us, and who, in most instances, cannot help themselves.

Whitewash is a simple thing, but I believe that its application may be made an important aid to health amongst the masses thrust together and cooped up in our cities and towns. What we recommend for their use must be something very simple and very cheap, and my prescription meets both these requirements. Whitewash or limewash is so well known as to need no special description, but with your permission I will try to describe how to make it,—how to use it, and what benefits may be expected.

How to make it.—Get a lump or two of burned lime, slake it by pouring water upon it in a bucket or other vessel. It will fall away into powder, add more water, until it is of the proper thickness, stirring well all the time, and for about a penny you will have a bucket of limewash ready for use.

How to use it.—Clean down the wall, or other place to be washed, with a brush or broom, so as to remove all dirt, cobwebs, &c., and then lay on the whitewash, brushing it into every part, and giving it a good coat. By the time the first coat is finished, if it be a drab day, the wall will be dry enough to begin a second coat, and this done, you will have a sweet, clean, white wall to look at instead of a dark, dirty, depressing blank.

* See *Builder*, Nov. 22, 1884, p. 709.

Anybody can do it, but if the work be done by men used to the job the cost will be about one-halfpenny per square yard. But what I want is to encourage the working man to do it himself. I strongly recommend the tenants of cottages, especially in crowded places, to have the walls of buildings and back premises done for the sake of the light, health, and cheerfulness which will be imparted, and owners of such property might greatly help where the poorest of the poor live. The difficulty with the labouring class is the whitewash brush,—the cost of a good one being 3s. 6d.,—rather a large investment for a working man for one article only rarely used. To meet this difficulty, and to encourage the work, when I was Town Surveyor at Burnley, about twenty-five years ago, I advised the Commissioners (now Corporation) to purchase whitewash brushes and lend them to poor people at a charge of one penny each, and the result was very gratifying. It was a sight on Saturday afternoon, or in the evening of spring and summer days, to see the working men and women turning out the loose odds and ends of their dwellings, and working with a will at their simple wall decoration of sweet linewash. Hundreds of dwellings in the poorer districts were cleansed,—dark and dreary blank walls were made bright and cheery,—light was reflected into dark dwellings, and an appearance of neatness and cleanliness imparted, where, but for the penny brush and the lump of lime, it would have been unknown. Wishing to know whether this loan system was being continued at Burnley, I recently inquired of the very active and intelligent Sanitary Inspector, Mr. C. Slater, and herewith append a summary of particulars supplied by him, and extending over twelve years past:—

The number of brushes lent by the Corporation has been.....	26,541
The cost of the brushes.....	£125 6 3
The sum received for loans.....	124 18 1
Value of brushes in stock.....	10 0 0

showing an actual profit over and above the cost of the brushes lent!

It will be seen that this loan system has been a great success, and Mr. Slater says that much good has been done and few brushes lost. As before remarked, the brush is the difficulty with the poorer class. Lend them a brush, and supply a pennyworth of lime, or tell them where to get it, and you will see with what earnestness they will set to work to lighten up many a darksome and cheerless outlook. 26,541 whitewash brushes set to work in and about the dwellings of the labouring class, and the first cost more than repaid by the loan pence, is an instance of practical sanitary work I think worth knowing, and worth imitating by any Corporation or other body, Urban or Rural, having charge of public health. We are under no special panic just now, nor need be as to approaching cholera, but certainly the utmost possible precautionary measures are imperative and urgent, and I know no more cheap and simple safeguard against epidemic or illness amongst the working class than a liberal use of linewash.

JOSEPH BRIERLEY, M.Inst. C.E.

PUMPS FOR CONTRACTORS' PURPOSES.

SIR,—In reply to "A. E." in your last issue [p. 884], who asks my opinion as to the best form of valves for direct-acting steam-pumps (printed pipes) for contractors' use, I conclude "A. E." refers to the steam and not the pump valves, and he has asked a question that has long been a matter of controversy amongst engineers, and something may be said in favour of each system. For the purpose "A. E." names, i.e., tunnelling where the water is usually gritty and muddy, if he must use direct-acting pumps, I do not think he would do amiss in having them arranged with ordinary steam slide valves and the water passages made extra large.

M. POWIS BALE.

Impermeable Floors.—Medical men have long been preaching, and are now beginning to practise, the employment on sanitary grounds of flooring laid without interstices to catch the dirt, and with polished, or at least smooth, clean, and washable surfaces. Costliness has been hitherto a drawback to the adoption of such flooring. The solid 1-in. parquet floors of Bucher & Durrer (agents, Scheibler, Bros. & Co., 23, New Broad-street, E.C.) supply the needed element of relative cheapness.—*London Medical Record.*

ELEVATION WITH INTERIOR
A New Ventilating Hot-Water Coil.

NEW VENTILATING HOT-WATER COIL.

SIR,—The desirability of admitting warm fresh air into buildings for the purpose of ventilation has long been recognised. The methods usually adopted in the case of hot-water or steam coils are not always successful, even with and by the aid of deflecting plates, to say nothing of the cost of these extraneous fittings.

The coil here represented is made out of stout corrugated iron or steel, with waterway of 1 in. surrounding the air-chamber; the bottom and top boxes are of cast iron, and made suitable to receive the corrugated metal, with proper packing, afterwards bolted together.

The top is a loose cone, and perforated to admit the fresh warm air into the room.

It will be seen that the coil is simple in construction, and complete in itself. The effective heating surface is equal to a 20-in. pipe coil, 6 ft. long. It has been seen by one of the most eminent London architects, who pronounces the principle perfect, but suggests that the coils should be placed in window recesses,—with which, of course, I agree.

I may add that the body of the coil being made of wrought metal, the breaking from frost that so often attends the cast pipes will be avoided; and further, the place of the coil may have any shape suited to the position it would best occupy.

ROBT. CRANE.

"ITALIAN SILVER-GREY SLATES."

SIR,—We have only now seen, in your issue of the 13th [p. 850], a letter on the above subject from Messrs. E. & C. Braby, and in reply have much pleasure in informing them and others who may be interested in the matter that it is from quite a different and vastly superior rock that the slates for the English market are now procured, because that of which he complains was found to be unsuited for the purpose. The present quarries are altogether in another district, now rendered more accessible owing to the making of a new road and erection of a wire-rope tramway, thereby cheapening the cost of the slates very considerably.

As a proof of their durability we have only to mention the celebrated Church of Carignano at Genoa, which stands high and is very exposed; it was covered in about 1810 with these slates, and the roof has never been repaired; also the Church of San Fruttuoso, the burial-place of the Dorias, which is open to very severe gales, is roofed with the same slates, which have been on more than a century.

We could bring forward many more proofs of their marked superiority since the time to which Messrs. E. & C. Braby allude, and we feel certain that a trial made of them now "would result in something far better and more useful."

With regard to the change of colour it has come to our notice that houses in England roofed with them had quite an immunity from the heat of last summer, of which their neighbours were complaining, these slates being non-conductors of heat.

BUBB & CO.

Sta. Margherita, Liguria, Italy, June 17.

PROVINCIAL NEWS.

Bristol.—The new tobacco factories just completed in Redcliff-street for Messrs. Edwards, Ringer, & Co., constitute one of the largest blocks erected in the city of late. The building has been constructed from designs furnished by the late Mr. J. H. Hirst, architect, Bristol, and it has been carried out with but very slight alterations from the original plan, under the joint supervision of the son of the original designer, Mr. H. C. M. Hirst, and Mr. H. Crisp, architects. The front elevation was designed, chiefly, by Mr. H. C. M. Hirst, from ideas suggested by his late father. The treatment is Italian throughout. This frontage in Redcliff-

street consists of shops, with all necessary store-rooms. The central entrance to the works is picturesque, and is of an unusual width. The whole building is as nearly as possible a square of about 130 ft. The front part is of Mansfield stone and granite plinths, and the carving is by Mr. J. Steele, of 13, Kingsdown-parade. The manufactory is built of white, red, and blue Cattybrook bricks. The whole of the flooring is fireproof, and was laid by Messrs. Dennett & Angle, Whitehall, London, who also provided the ironwork for the central hall and roofing. The iron staircases and galleries near the entrance-gates are by Messrs. Macfarlane, of Glasgow. The factory will be heated throughout by the steam apparatus supplied by Mr. Hodges, Temple-street, Bristol. The general contractors were Messrs. Stephens & Bastow. Mr. George Salmon was clerk of the works. The plumbing and gasfitting were entrusted to Messrs. Jones & Hudson, Redcliff-street, who carried out the work most satisfactorily. Mr. C. H. James, C.E., will superintend the arrangement of the new machinery.

Liverpool.—The Edgehill Tunnel, Liverpool, which will be well remembered by travellers to and from the Lime-street Station, has been abolished. The *Liverpool Courier* says that when the tunnel was first opened, and for a long period afterwards, the trains used to be hauled up a wire rope attached to the stationary engine up at the head of the tunnel at Edgehill. The process of hauling up the trains by the fixed engine and rope was found not at all adapted to the rapidly-increasing traffic at Lime-street. Then it was determined to attach engines to the trains going up and down the tunnel. This certainly increased the speed of the journey, but not its pleasantness. The smoke and steam emitted from the many engines going up and down the tunnel lodged there, although all the improved means of ventilation and dispersion were tried. An atmosphere of a very noxious character accumulated, which, along with the darkness that prevailed, made the journey through Lime-street tunnel a disagreeable experience to many railway travellers. The noisome atmosphere was to some extent purified by the stupendous ventilating-shaft erected in the middle, and equipped with fan extractors of gigantic power. But all these expedients,—costly and laborious,—were unsatisfactory, and in the end the company decided upon the radical cure of taking the roof off the tunnel bodily, and converting it into a wide open cutting. This was a task of great difficulty and cost. When the tunnel was first made, the land above, between Lime-street and Edgehill, was but little built upon; of late years it has been covered by houses. All these had to be acquired, and the cost of opening up the great tunnel has entailed upon the railway company a large expenditure of money. Now, however, the work is accomplished. With the exception of a bridge across it in Trowbridge-street, the tunnel is opened now all the distance from Lime-street to Edgehill. Two additional lines of rails and sidings have been laid down, and other improvements facilitating the traffic have been effected, so that four lines of rails now exist where before there were only two.

West Hartlepool.—The West Hartlepool Commissioners have decided, on the recommendation of a special committee, to erect new offices for themselves and for the Board of Guardians.

Preston.—On the 18th proximo the Prince of Wales is to visit Preston, and, proceeding to

the works for improving the navigation of the River Ribble, he will lay the foundation-stone of a 40-acre dock, probably with the Masonic ceremony. The Ribble Improvement and Dock Works are being carried out on a slight modification of Sir John Coope's scheme by Mr. T. A. Walker, of Westminster, to whom the contract was let in September last for 456,600*l.* The enormous powers of the Corporation for these works amount to 650,000*l.*, but the general opinion now is that they will cost nearly 1,000,000*l.* The contract includes the diversion of the river, the construction of a tidal basin of 4½ acres, and a dock of 40 acres, with the necessary adjuncts of locks, lock-gates, &c. The diversion of the river will be from near Penwortham Bridge to the Chain Caul, a distance of about three-quarters of a mile, and it will skirt the wooded eminence on which stands the ancient church of Penwortham. There are now daily employed in the excavations on both sides of the river upwards of 1,000 men, and during the work many remains of extinct animals have been brought to light.

CHURCH-BUILDING NEWS.

Halifax.—The Church of St. Anne in the Grove, which has been remodelled from the designs of Mr. W. Swinden Bacher, has recently been re-opened. The greater part of the interior fittings, including the brass lectern and black wrought-iron gasfittings, were supplied by Messrs. Jones & Willis, of Birmingham and London.

Stanford-in-the-Vale (Berks).—The north aisle and porch of St. Mary's Church, in this parish, having become very dilapidated, are now being restored under the supervision of Mr. F. H. Barfield, F.S.I., architect and surveyor, of Faringdon, Berks, Messrs. Cadell & Son, of that town, being the contractors. The new roofs are of oak, with the timbers and boarding exposed, the aisle being covered with new lead, and the porch with stone slates.

Manchester.—On Monday, the 15th inst., the church of St. Agnes, Birch-in-Rusboldme, was consecrated, the foundation-stone having been laid by the Bishop of Manchester on the 19th of July, 1884. The church will comfortably seat 502 adults. It is built of brick, inside and out, the design having been carefully worked out in detail to suit the material. The roofs are covered with Ruabon tiles, with slight patterns of darker tiles. The chancel terminates to the east in a semi-hexagonal apse. The reredos is mainly of cream-coloured stone with moulded cornice, surmounted by a plain Latin cross. The communion-table is raised seven steps above the nave, and the nave floor sloping up about a yard towards the east, a very dignified elevation is obtained without an undue number of steps. The font, a bowl of cream-coloured stones with carved cornice, is supported by columns of Devonshire marble with carved caps. Various appropriate inscriptions are introduced in the floor tiling of the chancel, the entrance porch, the vestries, and other parts of the church. The doors and chancel fittings are of oak; the nave seats of pitch-pine. The windows are glazed with good glass in carefully-designed patterns. It deserves to be noted that this church, containing as it does a great deal of carefully worked-out detail, has been consecrated within a year from the date of the contract for the shell, or for the church without the fittings. It is built on the estate of Sir W. R. Anson, who has given the site. The various details have been worked out minutely by Mr. Medland Taylor, the architect, who has personally superintended the erection of the church.

SCHOOL-BUILDING NEWS.

Walthamstow.—Mrs. Gladstone, who was accompanied by the Honourable Mrs. Courtney Warner, on the 20th ult. laid the foundation-stone of the St. Michael and All Angels' Sunday Schools, Walthamstow. The building is from the designs of Mr. J. M. Bignell, architect, Clapham, the builder being Mr. S. J. Scott, of London-wall and Walthamstow.

Eglosayle.—The memorial-stone of new Sunday schools in connexion with the parish church of Eglosayle, near Wadebridge, has just been laid. The schools are intended partly as a memorial to the late Canon Shuttleworth,

who was for thirty-four years vicar of the parish. They will consist of a plainly-built edifice. The material employed will be local stone from Grogley Quarry, with dressings of buff bricks (from Messrs. Condy & Co., of Chudleigh), and granite. The windows will be fitted with pointed arches. The contractors are Messrs. J. Paul (masonry) and J. Goodfellow (carpentry), both of Wadebridge. Mr. W. J. Jenkins, of Bodmin, is the architect. The memorial-stone, which faces the church, consists of a block of granite measuring 3 ft. 6 in. by 2 ft. 4 in., and was cut by Messrs. Doney & Evans, of Bodmin. The cost of the school will be upwards of 400*l.*, including the cost of the site and transfer.

Moulsham.—Extensive alterations and additions are about to be made at the Moulsham National Schools. The infants and boys' schoolrooms are to be knocked into one, and the boys' and girls' classrooms are also to be united. A new infants' schoolroom is to be built to the north of the present one, with which it will be connected by an open porch. The new room is to accommodate 180 children. Mr. C. Pertwee is the architect, and Messrs. Crompton & Fawkes are the builders, the amount of their contract being 864*l.*

Birmingham.—On the 30th ult. Mr. H. G. Reid laid the foundation-stone of a new school and lecture-hall attached to the Congregational Church, Westminster-road, Birchfield, Birmingham. The new school is to be erected by Mr. W. Bennett, of Bennett-street, Lozells, from plans by Messrs. Ingall & Hughes, of Temple-row West, Birmingham. It will accommodate 400 scholars, or 350 persons when it is used as a lecture-hall. It will cost about 1,200*l.*

Eccleshill.—A new Wesleyan Sunday School is being built here, from designs by Mr. F. S. Smith, architect, Yeading. The building will cost 1,600*l.*, or 1,700*l.* The contracts have been let to Messrs. Baxter & Whitfield, masons; Mr. John Thomas (Idle), joiner; Mr. Thomas Norton, plumber; Mr. E. Walker (Idle), painter; and Mr. Jos. Thornton, slater.

Darlington.—The memorial stone of the Central Board Schools, Darlington, has been laid. These schools are intended to replace the Bank Top Schools,—the site of which is required by the North-Eastern Railway Company for the station extension,—the Skinnergate, and the Bridge-street Board schools, and will accommodate about 1,000 children. The schools are divided into three departments,—senior, junior, and infants,—with hat and cloak-rooms, playgrounds, and covered play-sheds for each department. Teachers' rooms are arranged conveniently to the playgrounds, so that supervision can be had over the children during play hours. The main entrances to each school are from Beaumont-street, separate entrances being provided in each case for boys, girls, and infants. The buildings are being erected with hand-made common bricks for the general walling, relieved by red pressed brick, string courses, pilasters, and arches, supplied by Mr. J. C. Edwards, of Ruabon. They are being carried out from the plans, chosen in competition, of Mr. F. W. Brooks, architect, at a cost of about 5,000*l.* The contractors for the different works are Mr. George Marshall, brickwork, slating, &c.; Mr. John Hewitt, carpenters' and joiners' work; and Mr. Emerson Smith, plumbing. The clerk of the works is Mr. T. W. Robson.

Ipswich.—On the 13th inst. the Rose Hill school for infants, just erected by the Ipswich School Board, was opened. The buildings, which are in the Tudor style, provide accommodation for 184 infants. The material used for the exterior is red brick, with Broseley tile roofs. The desks are very strong and well made, and are adapted to the Kindergarten system. They were supplied by Mr. Hawes, of Norwich. The contract was taken by Mr. R. S. Smith, builder and contractor, of Ipswich, for 1,303*l.*, and this amount has only been exceeded by a trifling sum. The whole of the work has been executed from the designs and under the supervision of Mr. E. F. Bishop, architect and diocesan surveyor, Ipswich.

Meanwood Institute, near Leeds.—The committee of the Meanwood Institute, of whom the Rev. Annesley Powys, Vicar of Holy Trinity, is the chairman, having decided to increase the accommodation by the erection of a Public Hall, &c., plans were invited in limited competition, and the designs of Mr. T. Butler Wilson, of Leeds, were selected.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Manchester.—On the 31st ult. special services were held at the Church of the Holy Name, Oxford-street, Manchester, to celebrate the opening of the Sacred Heart Chapel, situate to the east of the high altar. The chapel contains an altar, the panel forming the front of which contains a sculptured group of the Agony in the Garden. The angle shafts of the altar are of serpentine. The superaltar is richly diapered, and in the centre is to be a tabernacle, with door of *reposus* work, and the emblem of the Sacred Heart, encircled with the crown of thorns, and surrounded with jewels. The reredos has a lancet-shaped arch in the middle, with a standing figure of our Lord displaying His sacred heart. The altar and reredos are flanked by tall niches, in which are placed statues of St. John and St. Bernard, with sculptured pedestals, marble shafts, canopies and arcade of Painswick stone, with richly-carved diaper, foliated spandrels, and cresting of vine leaves. The whole is surmounted by a rose-window filled with painted glass. The work is in the style of the thirteenth century, from the designs of Mr. Charles A. Buckler, of Hereford-square, London, architect. The masonry and sculpture are by Mr. Boulton, of Cheltenham; the tabernacle by Messrs. Hart, Peard, & Co., London; and the glass by Mr. Pearce, of Chelsea.

Liverpool.—On Sunday evening, June 21st, the Catholic bishop of Liverpool laid the foundation-stone of a magnificent chapel, to be built on St. Francis Xavier's Church, and the initial cost of which will be 6,000*l.* The entrance to the new chapel is obtained out of the side aisle by means of a new archway formed in the space now occupied by the two aisle windows nearest the chancel. The arch opens into an octagonal-shaped chapel, in the walls of which are six arched openings, the principal one leading into the chapel chancel, around which are chancel-aisles, leading from church to house. The end of the chapel which is nearest the present belfry is planned for a small chapel, also with aisles, and called the Bona Mors chapel. The small chapel, like the chancel, is connected with the octagon by arched openings. Internally the whole of the materials will be Bath stone and marble, in large and smaller columns. The exterior will harmonise with the style of the church, and give the idea of a Lady or Sainte chapel. The builders are Messrs. Brown & Backhouse; the contractors for the marble-work, Messrs. John Stubbs & Son; and the architect is Mr. Edmund Kirby.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

1,322, Sliding Windows or Sashes. F. Oldfield.

A vertical screw fixed in a groove on one side of each sash works in a nut wheel attached to the frame. The wheel gears with a skew wheel operated upon by a handle. Spur-wheels keyed on shafts attached above the top sash and underneath the bottom sash gear, with racks fixed to the frame insure uniform motion in the sashes.

2,413, Roofs. D. Griffiths.

This roof is nearly flat, and is supported by wooden beams, the under-side of which are straight, and are utilised as ceiling joists. The beams may rest upon the internal as well as the outer walls, and may be strengthened in several ways described by the patentee. The roof is covered with tiles raised and grooved round the edges to suit various modes of jointing, all of which avoid having the tiles anywhere doubled. Special ridge hip-and-gutter tiles necessitated by the flatness of the roof, are also described.

3,254, Astragals, or Glazing Bars. W. R. Lester.

The glazing-bar consists of an inverted bar of T-section, on the lower part of which a sheath of thin metal forming a trough is applied, and upon which the glass rests. The glass is retained in its place by strips of lead bent over it, the strips being also bent, so that they are held by the sheath. The upper ends of the glazing-bars are entered into a groove in the top cross-bar, and the bottom ends are secured by means of brackets. The flanges of the T-bars may be bent upwards by being drawn through dies. Similar means are employed to put on the metal sheath and the lead strips.

3,873, Concrete-mixing Machine. J. Powell.

Boxes for apportioning materials, hopper, and mixer. The boxes are of rectangular transverse section, with adjustable hinged doors or slides, and are secured to forks resting on wheeled supports,

Fig. 108.

Fig. 109.

Fig. 110.

plane. In short, the plan of the intersection is the base E itself, and its elevation is a portion of P^v between r^v and r^v .

To find the real shape of the section we turn down the plane P round P^h , and lay it flat on the plan, an operation we have done often before. The tangent to the section through the point m is projected on the plan in $m^h t$, and as t is on the hinge round which the plane P moves, it will be a point of the tangent after the plane P has been laid flat on the plan; the tangent to the section will therefore be $t m$.

To develop the cylinder, we cut it open down one of its generators, such as the one whose foot is ϕ , and starting therefrom we can draw on the development a series of generators G_2 , remembering that the distance between ϕ_2 and G_2 is equal to the length of the arc of the base between ϕ and G . The base E develops in a straight line $\phi_2 \phi_2$, and if we carry above that line the series of points m_2 , where the generators are cut by the plane P, we obtain by joining them the curve I_2 , which is the development of the section.

The tangent to that curve in a point, m , will be found by making $g_2 t_2$ equal to $g t$, then joining $m_2 t_2$ we have the tangent. For we have formed by our construction a triangle $g_2 t_2 m_2$ equal to the triangle $g t m$, the real triangle formed by the tangent in space and its projection; therefore the lines $m_2 t_2$ and $m t$ form the same angle with the generator G , which is the very condition a tangent should fulfil on the developed curve. (See fig. 109.)

Find the section of an oblique cylinder by a plane, draw the real shape of the section, and develop the surface of the cylinder.

Here, again, the section has its elevation I^v on the line P^v ; by marking the intersections of a series of generators, G, by the plane P we get I^h the plan of the section.

To find the real shape of the section, we turn down the plane P round P^h and lay it flat on the plan as before.

To find the tangent to any point of the real section, we draw through the foot of the generator on which the point m is situated a tangent to the base; this is not, as with the right cylinder, the projection of the tangent to the section, but only the trace of the generator; nevertheless, the tangent to the section will go through t on the hinge P^h , round which the plane P moves; $m^h t$ will be the projection of the tangent, and $t m_2$ will be its position on the real section. (See fig. 110.)

To develop an oblique cylinder we must begin by cutting the cylinder by a plane, P, perpendicular to its generators, and find the real shape of its section; that section developed will form a straight line I_2 , from which we can measure the length of any generator so as to draw the curved line E_2 , the development of the cylinder's base.

Fig. 111.

To find the tangent to any point g_2 of the developed base, we take $t_2 m_2$ equal to $t m_2$ of the real section, and $g_2 t_2$ is the tangent required, for it forms the same angle with the generator G_2 , as the tangent did in space. (See fig. 111.)

Miscellaneous.

The Colombo Breakwater.—This great work, which has occupied in its construction about twelve years, received the ceremonial finishing touch at the hands of its designer, Sir John Coode, on the 22nd of April last. The exposure to which a work of this kind is subjected during the long period required to complete it furnishes a sufficient guarantee that it is fitted to withstand any influence attacking it, and the colony of Ceylon and its engineer may be congratulated on the successful termination of a work likely to contribute so greatly to the progress of the island. The closing ceremony consisted simply in the laying, by Sir John Coode, of the last square of concrete capping; and Mr. Kyle, the resident engineer, whose services have contributed so greatly to a successful issue, has finally reported that "the whole of the work reclaiming the inner harbour foreshore, including jetties, sheds, &c., has now been completed, and all hands have been withdrawn and the account closed." The total cost incurred from the commencement of the operations in 1873 to the commencement of 1885, is 8,125,433 rupees, or in round figures about 812,500*l.* There appears no reason to hope that for the present the local Government will entertain the carrying out of Sir John Coode's design in its entirety by undertaking the construction of a northern breakwater.—*Engineer.*

A New Water Supply for New York.—The New York City Water Company has submitted to the City Commissioners of the sinking fund a proposition to supply the dry goods district of New York with water from wells. The new company was organised in January last with a capital of 1,500,000 dollars. There is in New York City a water-bearing strata into which wells can be driven, which, it is estimated, would furnish a daily supply of 5,000,000 gallons of fresh water. This supply would be drawn from the wells and from storage tanks distributed through the district bounded by Chambers, Bleecker, and Centre streets and West Broadway. Hydrants would be placed at various points in this district, and water forced to them by powerful engines. The water would reach the flames at a height of 150 ft. without the intervention of fire engines. The company propose to furnish machinery and lay ten miles of service within one year from the acceptance of their offer. They agree to furnish water to the city for twenty years for a fixed price per hydrant, not less in the aggregate than 150,000 dollars a year. A city committee has been appointed to investigate the need of a special water supply for the dry goods district, the feasibility of the proposed plan, and the financial responsibility of the water company.—*Iron.*

Irish Artisans' Exhibition Medal Competition.—The *Belfast Newsletter* says that in the medal competition in connection with the Irish Artisans' Exhibition at Dublin, Mr. J. Quiller Lane, of Belfast, has been successful in securing the first prize. The competition was an open one. The reverse of his design is divided by five circles, the larger being in the centre, and containing an Irish cross, formed of strapwork, with a trefoil between each member. The four surrounding articles contain respectively symbols of Painting, Sculpture and Modelling, Architecture, Weaving, and Engineering. These are united by a wreath of laurel leaves, the additional spaces being ornamented by straps and scroll work. The reverse has the words "Irish Artisans' Exhibition, Dublin," on the outer band, the ground of which is formed of shamrock leaves. This is divided horizontally by a label extending right across the medal, the year 1885 being divided between the external wings, the centre space being left for the winner's name and the department in which the medal is awarded. The background is occupied with the old Irish harp, the ground being filled in with strap work.

Netley.—The new church at Netley is to be built upon a site overlooking the Abbey grounds, given by Colonel the Hon. H. Crichton. The tenders for the work (one of which is to be accepted) are now before the Committee, and it is proposed to commence the building immediately. The contract for the first portion of the work amounts to 3,000*l.* The walling is to be faced with Swanage stone, and the dressings to be of Donling stone. The architect is Mr. J. D. Sedding.

Curious Discovery at Folkestone.—A few days ago, whilst some workmen in the employ of Mr. Harry Hems, of Exeter, were engaged in erecting a rich arcade of polished alabaster and marbles around the chancel of the parish church at Folkestone, they removed some portion of the Early English, or possibly Norman, north wall in the sanctuary, and under a stone slab, supposed to be the original credence-table, they came across a leaden casket, measuring 18 in. by 10 in. by 6 in. It is of beautifully stamped diaper work, having straps of lead around it, and was found to contain female remains, consisting of a part of a skull, the thighs, fingers, and other bones. From their position and surroundings, little doubt exists that these are the relics of the Princess Eansyth, daughter of Eadwald, king of Kent. This princess, who is accredited, by legendary lore, with the power of working miracles, built a nunnery on Folkestone Cliff, and was ultimately buried herself within its Chapel of St. Martin. The encroachments of the sea finally destroyed this edifice, but not before the remains of St. Eansyth had been reverently removed to the then new parish church of SS. Mary and Eansyth, at Folkestone. Where they were put there, however, history does not record, and it has remained a mystery until last Wednesday, when, in the unexpected manner recorded, the workmen brought the remains to light. The works at present in hand at Folkestone Church are under Mr. S. Slingby Stallwood, architect, of Reading. The "find" is considered in antiquarian circles to be a most important one.

Railway Extension in Essex.—Southend-on-Sea as a health resort is rapidly rising in popular favour, and a new route to the bathing-place at the mouth of the Thames has just been commenced by the Great Eastern Railway Company. The new line leaves the Colchester and Ipswich main road near Brentwood, and proceeds through Billericay and Rayleigh, an ancient market town, direct to Southend. It will not only afford an alternative route to and from London, but furnish great facilities of communication to the whole of the eastern counties, and directly connect the important military centres of Shoeburyness, Warley, and Colchester. Branch lines will also be made to Maldon and Southminster, thus opening up a little-known corner of Essex. An illustration of the enhanced value acquired by land in the vicinity of the railways under construction was given at a land sale held a few days ago at Southend by Messrs. Baker & Sons, when for some building plots near the almost forgotten town of Rayleigh exceptionally high prices were realised. It is expected that quite a little township will spring up on the main road between Rayleigh and Southend.

The Medway Portland Cement Company (Limited).—The prospectus of this Company has been issued. The proposed capital is 60,000*l.*, in 12,000 shares of 5*l.* each. The first issue will be of 35,000*l.* in 7,000 shares of 5*l.* each, divided into 6,000 ordinary shares and 1,000 vendors' shares; the latter not ranking for dividend until a dividend at the rate of 6 per cent. has been paid upon the ordinary shares. The 1,000 vendors' shares fully paid will be allotted in part payment of the properties purchased by the Company, and the 6,000 ordinary shares are now offered for subscription. The Company has been formed for the purpose of acquiring and working the recently-erected cement, &c., works at Cuxton, on the river Medway, near Rochester, which have recently come into the market in consequence of the sudden death of the proprietor. The secretary *pro tem.* is Mr. W. F. Watkins, and the temporary offices of the Company are at 7 and 8, Ironmonger-lane, E.C.

Sale of Land at Cromer.—For the first time in the history of Cromer, the beautiful but much-neglected sea-side place on the north-east coast of Norfolk, a public sale of freehold building plots was held a few days ago, when 4,860*l.* was realised for the first sixty lots put up, the prices obtained being at the rate of 1,500*l.* per acre. This successful auction was undoubtedly due to the energy of Mr. Alfred Baker, of Baker & Sons, Queen Victoria-street, who conducted the sale. It may interest our readers to learn that among the works in immediate contemplation are the erection of a large hotel, with extensive recreation-grounds, and a new pier. It is stated that the service of the Great Eastern Railway to Cromer has lately been greatly improved.

The Trafalgar Institute, Montreal.

The *Montreal Gazette*, of the 10th inst., gives particulars of the project for the erection of the Trafalgar Institute, "which," we are informed, "is destined to mark a new era in the history of the development of the higher education of women in Montreal." The origin of the establishment is due to the late Mr. Donald Ross, years ago a prominent citizen of Montreal, who by his last will and testament left means for the purpose of erecting an institute for the purpose indicated. Recently the Hon. Donald A. Smith, following up the spirit of the bequest of Mr. Ross, has granted \$25,000 to carry the project to a successful issue. The work will be commenced on the 1st of October next. In answer to an invitation for plans for the building, the Trafalgar Institute Committee received designs from fourteen competitors, representing the architectural profession in all parts of the Dominion and the United States. Mr. T. C. Sorby, architect, 162, St. James-street, Montreal, was the successful competitor. At first the establishment will afford accommodation for only thirty boarders, but the plans contemplate, when it is found necessary, accommodation for a much larger number of pupils.

Plymouth.—Tenders for the erection of the new church of St. Matthias, Plymouth, to be erected on a fine site at North Hill, were last week received from six of the principal contractors of Plymouth. The tender of Messrs. Finch & Son at 8,778*l.* for the complete work,—being the lowest,—was accepted, and the building will be forthwith commenced. The design, by Messrs. Hine & Odgers, shows a church in the Perpendicular style, with clearstoryed nave, aisles, chancel, vestries, and tower at the west end of the nave, rising to the height of 112 ft. above the floor. The walls will be of local limestone, having dressings chiefly of Box ground and Portland stone. The Bishop of Exeter has promised to lay the foundation-stone next month.

A History of Hampton Court Palace.—A new history, dedicated, by special permission, to her Majesty, is announced under the title of "The History of Hampton Court Palace in Tudor Times," by Mr. Ernest Law, B.A. It is illustrated with 130 autotypes, etchings, engravings, maps, and plans. Messrs. Bell & Sons are the publishers.

The Late Professor Jenkin.—The Professorship of Civil Engineering in the University of Edinburgh has become vacant by the death of Professor Fleeming Jenkin, F.R.S., who expired on the 12th inst. from blood-poisoning, after undergoing a surgical operation.

TENDERS.
